FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903, BY FOREST AND STREAM PUBLISHING CO.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, JANUARY 3, 1903.

VOL. LX.—No. 1. No. 346 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

THE WILD HORSE IN AMERICA.

WHEN Europeans first came to this country the horse was unknown to its inhabitants, and the Spanish accounts of the landing of the conquerors in Mexico tell of the wonder with which the natives viewed the strange animals, and saw the people riding on them. More recently we have heard from the mouths of Indians how marvelous appeared to their fathers the sight of a man seated on a horse.

In post-tertiary times horses—scarcely, if at all, different from those which we know to-day—existed in great numbers on this continent. America was an original home of the horse, but before the present race of Indians had appeared, it had become extinct, perhaps swept out of existence by the great ice sheet which covered the northern portions of North America, or by climatic changes connected with this ice sheet. It may be that to the men whose bones and stone tools have been found along the southern limit of that ice sheet, the horse was not an unfamiliar animal, and yet it is hardly to be supposed that it should have inhabited a country ranged over by the musk-ox, as were the regions just south of the ice sheet—West Virginia, and the valley of the Ohio River.

The horse developed and increased here, after his second coming—an immigrant from the old world. The stock first introduced cannot have been large, and of this stock the number which escaped from captivity, and became wild on the plains of the southwest must have been small. Yet in 250 years the increase was so great that horses had spread over the whole southwest, east nearly to the Mississippi, north to the Yellowstone River, and all through what is now California.

The tribes of the southwest early learned the uses to which the horse might be put. They rode him, and made him drag the travois; and the knowledge of him spread north and east; yet slowly, since, as we have said, we have talked with aged Indians in the northern country who have told us how, in the generation before their own, their people first saw horses. Moreover, there were some tribes so conservative that they declined to use the horse, realizing that, in a certain fashion, the possession of horses added to their responsibilities, since horses must be looked after and guarded; while the dogs, which from time immemorial had been their only domestic animal, were held to them by ties of personal affection, and could be trusted never to desert them.

In the days of the earlier explorers of the west, wild horses were extremely abundant. While most of these were descended from stock that had been wild for many generations, their numbers were constantly being added to by escaped and stray animals, so that it was not uncommon to see among the herds, mules and branded animals, and others that bore marks of saddle or harness. These herds of wild horses were interesting features of the landscape, though they were not very often captured in the north. Yet often they served a useful purpose to travelers since, when game was scarce, the horses on the prairie were killed for food; or, others, purchased from the Indians, eked out, with dogs obtained in like manner, the meagre subsistence of starving voyageurs.

It was not only in the west that the horse became wild and flourished in America. Though the vast grassy plains of the trans-Missouri region, which they shared with the buffalo, the elk, and the antelope, offered to the horse conditions of life far more favorable than were to be found in mountainous or forest-clad regions; nevertheless, at various points, all along our Atlantic coast, there have been herds of wild horses which have been captured, subdued and domesticated within the memory of men still living.

The Spaniard left in Florida a stock of horses which grew wild and increased, and which were long known there as marsh tack[illegible] further north, in the Carolinas, horses left by Sir Walter Raleigh's expedition gave rise to a breed of bank ponies, ranging along the sea-beach, and pasturing on the tough grasses that flourished there. Still further to the north, at Chincoteague Island, there was a stock of ponies named from the island, as wild as any mustangs, the gathering and penning of which was an annual festival not more than forty years ago. Finally, far to the northward were the Sable Island ponies, the progeny of a few horses which reached the shore from a wrecked vessel, and which increased there until their numbers had become considerable.

Ponies are only dwarfed horses, and we may imagine that all the wild stock above enumerated were the descendants of the smaller, lighter, and more wiry horse, which is sometimes spoken of as the Oriental horse, in contradistinction from the western horse, which includes the heavier draft horses of Flanders, and France, and Great Britain. Certain it is that the horses of southern North America, coming as they did from Spain, were largely of Arab stock, first brought to Spain by the Moors, and carefully bred and nurtured by the Spaniards after the Moors had been expelled.

The horse is a tough and hardy animal, and fears little the biting cold or deep snows. In the wind-swept valleys of the high mountains of the west he grows a coat of extreme length and warmth, and under the long shaggy hair which hangs six or eight inches down from his body, has been developed in these cold regions a close warm wool, which is an admirable protection against the winter. Fearless of any animals which America produced, we can conceive that, with one or two hundred more years of time, the horse might have so increased as, in numbers, almost to have equalled the buffalo; and it is uncertain which animal would have survived in a struggle for existence. But with the settling of the country came the destruction of all wild life, and the horse, familiar to all as a domestic animal, took his place in the commercial world—a place that the undomesticated buffalo could never fill.

Over the high and arid sage plains of the West the horse still wanders in great droves, to all appearances, as wild as he ever was, yet each of these animals bears on his body the mark of the hot iron, which is the badge of his servitude; and annually each is gathered up with his fellows, run down, and driven into the corral, where by his actions he acknowledges that man is the master.

ST. HUBERT IN AMERICA.

THE story runs that Hubert, a nobleman of the Court of Emperor Theodoric III., was passionately fond of hunting, to which pursuit all his time was given. But it came to pass that on a Good Friday, about the year 650, as Hubert, hunting the wild boar in the Ardennes, was making his way through the thickets to slake his thirst at a pool, suddenly he was confronted by a snow-white stag, which bore between its antlers a shining crucifix; and Hubert heard a voice calling on him to repent and lead a Christian life. Obeying the supernatural summons, he repaired for instruction to St. Lambert, under whose guidance he devoted himself to a devout life, and whom he succeeded in the bishopric of Liege. St. Hubert's miraculous vision has been a favorite theme of the artists; he became the patron saint of huntsmen, and the shrines erected in his honor are familiar objects in the hunting forests of France.

One of the most elaborate and interesting of the modern chapels of St. Hubert is found in America, and constitutes a feature of a private estate and game preserve not far distant from New York city. The structure is of stone, with a belfry fifty feet high; and painstaking efforts have been made to reproduce in it, with artistic and historic fidelity, a chapel of the period when St. Hubert lived. The dedication of the chapel, by Bishop Wigger, of New Jersey, upon which occasion it was formally put under the patronage of the saint, has been commemorated in a bronze tablet set in the face of the outer wall, in which St. Hubert is depicted in bas-relief, with tunic, sword and belt, boar club and shield on which appears the snow-white stag; and by his side is a St. Hubert hound, one of the ancient breed which Hubert himself has the credit of having introduced into the Ardennes to hunt the boar. For the costumes and accessories of this piece, as of all the other historical reproductions in the adornment of the chapel, the artists went to the museums and art collections of Europe, and years were spent in research and study, to insure accuracy of treatment. The costume and equipment of St. Hubert, the sword and sword belt, and shield, even the buttons of the cloak, all were modeled from objects dating from Hubert's time, preserved among the treasured antiquities of Antwerp and other museums; and the hunting horn is patterned after the one preserved in the cathedral at Liege, which is reputed to have been used by the saint. Beneath the panel is the inscription: *Sancte Huberte ora pro nobis.*

Within the edifice the furnishings and decorations have been made to conform as closely as possible to those of St. Hubert's day, even the pattern of the mosaic floor is from one of the period; there is a huge fireplace, after the style of the ancient church fireplaces; and on the walls are displayed deer antlers, heads of wolf and bear, and other trophies of the hunt. The stained-glass windows picture, together with the conventional sacred themes of ecclesiastical adornment, the conversion of St. Hubert, and a series of woodland scenes. Among the sculptural adornments are five full-length figures portraying St. Hubert and three other saints, who, like him, were converted while following the chase—St. Germanius, St. Eustache and St. Xeno; and a fifth St. Michael the Archangel, who drove the wild beasts out of Paradise. All these antiquarian and artistic features, the expensive marbles of the altar and the costly vestments combine to render this American chapel unique and notable among those which commemorate the noble sportsman of Aquitaine, who in the forest of the Ardennes was confronted by the white stag on a Good Friday twelve hundred years ago.

"A DISGRACE TO VIRGINIA."

IN our issue of Dec. 13 a correspondent directed attention to the wanton practices of gunners in Princess Anne county, Virginia, who make war on the rafts of blue peters simply for the sake of killing the fowl, which are worthless. The butchery was truly designated a disgrace to Virginia, as it would be a disgrace to any State which permitted it to go on. We are glad to know that the subject will be brought to the attention of the Virginia Legislature, now in session, and a determined effort will be made to put the blue peter killing and all kindred slaughter under the ban of the law. There is every reason why the necessary legislative action should be promptly and unhesitatingly taken.

There is absolutely no justification for the wanton destruction of any form of harmless or useless animal wild life. Public sentiment does not sanction it. It is perpetrated only by individuals of coarse natures or diseased minds. It is contrary to every manly instinct. It is brutal and brutalizing. There is in it nothing akin to sport. Shooting for sport—the shooting that decent men indulge in—is the shooting of something which is good for something after it has been secured. This legitimate shooting for sport is in its essence different from the killing of blue peters or other luckless objects of human wantonness. If there be men calling themselves sportsmen who find gusto in potting the blue peter, we may beg leave to tell them that they are unworthy of an honorable designation upon which they bring obloquy. The sooner Virginia finds a way to suppress their practices the better will it be, not only for the hapless fowl but for the credit of shooters.

IT is very essential that fish and game protective clubs in New York should be incorporated, since by law the game commissioners are restricted to dealing with incorporated clubs in the appointment of special game protectors; and the employment of such protectors is the most efficient method by which a club may secure the purpose of its existence. Certain clubs have hesitated to incorporate by reason of fear that incorporation would bring individual responsibility upon the members for any financial obligations incurred. In a note elsewhere Mr. John W. Whish, secretary of the commission, points out that such fear is groundless. The incorporation of game and fish protection clubs should be the rule and not the exception.

The Sportsman Tourist.

A Lone Man's Thanksgiving.

AFTER I had ordered my turkey from the prim waiter I sat back and said to myself, "What have I to be thankful for? I am alone, far from any relative, and if not a wanderer, at least I have no place that I can call home." I then fell to thinking of the past, for, if we have nothing in the past to be thankful for we are indeed bereft. I thought of the one Thanksgiving that left nothing to be desired, and then of the summer and fall preceding it.

I could see the gay friends as they pelted a blushing but happy couple with rice and old shoes as they boarded a train bound for Bangor and the woods. That was before you had to hire a guide whether you wanted to or not. Well, in course of time, we arrived at our station, and the next day started up the old Penobscot with our fishing rods, rifles and the rest of our outfit packed in a light canoe. Our hearts were as light as the foams on the river, with never a care to bother us, it seemed, indeed, that life "was one grand, sweet song": and as we went up the river each day seemed to be more perfect than the one before. We caught what fish we wanted, and if it rained what cared we? We would throw back the front flaps of the tent and laugh at the weather. Hardly a day passed that we did not see deer; and now and then a moose would show his great, homely shape as we would round a bend in the river; and it did seem as though they knew that they were safe for two weeks more.

We, or rather I, had made Little Spring Brook our destination, and after we had been there a few days and had the camp made comfortable for a long stay, the game season was on, and we had venison added to our bill of fare, the first deer falling to her rifle. It was a clean kill, thus saving her the only disagreeable part of hunting, that of looking at a wounded deer's eye.

Many a pleasant hunt did we have over and around those hills; and on one of them, as we walked down an old wood road, we had an adventure that for an instant gave me the worst start I ever had, and showed that at least one woman had nerve. She was three or four steps in the lead, when with a growl that started my hair, a great bear plunged into the path not twenty feet ahead. Quick as a flash her rifle came to her shoulder and she fired, and hit him, too, as we found out later. As soon as the first start was over, we saw that the bear was fast in a trap, and the clog had caught in the thick brush so he could not move more than the length of the chain. He had dragged that great clog until he was worn to skin and bones. After we had put him out of his misery, we found the owner's name on the trap, and months afterward he got paid for a bear he never saw, and was told where he could find his trap.

And so my thoughts followed that outing to its close—how we drifted down the river after three weeks at Spring Brook, and then to our own little home, and how on that Thanksgiving we had sat down to a game dinner, the result of a short trip after birds; and when I asked her what she had to be thankful for she looked up from her plate with that look that we never see in but one woman's eyes, and said, "A good deal." I thought, "So have I," for I could not know that it was the only Thanksgiving that she would be spared to me, and that the next summer's trip was never to be enjoyed—I felt a touch on my shoulder, and "your dinner is getting cold, sir," brought me back, and with a sigh I said "A good deal." AL.

Recollections of the Rockies.

Editor Forest and Stream:

An article in Dec. 6 FOREST AND STREAM, "One Way to Burst a Gun," reminded me of an experience of my own which was most unaccountable and seemingly incredible.

It was early in the fall of 1891 that a party of six of us started out for a little pleasure trip over the continental divide of the Rockies. We had with us three saddle horses and a team and wagon, and planned to drive as far as we could, then pack our outfit on the two work horses and go where our inclination led us, the principal object being to have some trout fishing in the Elk River, on the western slope of the divide, and incidently to traverse some unexplored country (unexplored so far as our knowledge went, at least). The first day we stopped about 3 o'clock in the afternoon at a favorite camp ground in a beautiful glade along the creek which bears the not very musical name of Damfino, which was surrounded for many miles on all sides by heavily timbered mountains in all their wild and rugged grandeur. We took a very scanty supply of grub with us, and depended chiefly upon fish and game for our diet.

As we had not yet reached the land of trout, they not being found on the eastern slope of the divide, we went out to try and get a deer to supply us until we should cross the divide. We all returned at dark without meat. I had two shots at deer when near camp, but it was getting so dark that I missed. After supper was over, I proceeded to clean my rifle by drawing a rag through the barrel with a strap which I carried with me for that purpose. I did just what many another unlucky fellow has done—got my rag too large, and by starting it in at the breech where it is larger. It started in all right, but got tight. Believing the strap to be stronger than it was, I kept on pulling to force it through, when the strap broke down in the barrel, leaving the rag sticking about an inch and a half from the breech end of the barrel. I next cut sticks about six inches long, and made them just the size to fit the barrel loosely, believing that by filling the barrel with them I could drive the rag back. By so doing, the sticks became wedged in, probably by the piece of strap in the barrel, and every effort made matters worse. I got to the point of desperation where I was willing to take equal chances of blowing the contents out with powder or bursting the gun; but the rag was too near the end of the barrel to admit a cartridge, it being a .40-82 Winchester.

I drew a bullet out of a shell, and by much perseverance and hard work, managed to cut a shell in two, so that it would go in. It would then hold about forty grains of powder. This I put in, then fixed the gun inside of a little log shed or cabin that had been built there by some trappers, which was closed on three sides, with a roof, the front being left open. Tying a string to the trigger, and getting outside of the cabin, I pulled the trigger, but the hammer snapped, and nothing more.

I cocked and tried it twice more, with the same result; then I took the gun out to investigate, and what was my surprise to find the barrel warm, and on examining it found the powder to be burnt and the rag moved forward about three inches. Then with the satisfaction of a fiend awaiting an opportunity for revenge, I put in a full cartridge, bullet and all, and said to my audience, "Now, I'll blow it out or burst the gun!" Fixing the gun again inside the cabin, I pulled the trigger with the string, and the hammer snapped down as before; and a repetition brought the same result. I took the gun out and the barrel was so hot I could scarcely hold it. The powder had exploded and driven the bullet, with all the packing in the barrel, about nine inches from the breech without the least audible sound, except the snap of the hammer. There was not the least recoil or jar of any kind to indicate that any force was at work inside; and considering that eighty-two grains of powder was burnt, it seemed altogether incredible, and had there not been five reliable witnesses on the spot, I would have been loth to have told it, for it does not look reasonable, but it occurred as related, as L. W. McNulty, of Saratoga, Wyo., and G. O. Elmes, of Pearl, Colo., can testify. The present address of the others of the party I do not know. This, then, might be called "one way that you can't burst a gun."

Our trip was continued the next day, and 3 o'clock in the afternoon found us as far as we could go with the wagon, and near the foot of the Continental Divide. Some of the party went out for a little evening hunt, but no one found anything, except a young doctor from the East, principally for whose benefit the trip was made. He found "camp" after being about the worst lost and worst scared fellow that I ever saw.

There was a very heavy rain during the evening, making everything very wet. He had been lost perhaps two hours, and luckily crossed the wagon tracks where we had driven in to where we camped (we had driven two or three miles from the road, where no wagon had ever been).

It was getting dark when we saw him coming on our trail, dashing through creeks and wet willows as if he had no regard for wet, and we thought something must be wrong. He came right on, with a rush, not slacking speed even when within hailing distance, and when he came among us at camp, some jokes were passed about his reckless manner of going through the wet; but it was soon seen it was no joking matter with him.

His face had not the color of blood in it, and he had such a wild vacant stare as to cause some alarm. As he came up to the fire and sat down on a log he said, "I'm lost, and lost bad!"

From the remark and the awful horror depicted on his face, he did not seem to realize that he was safe in camp, and all fun was suspended for the time. When he became more composed he tried to give us some account of where he had been.

He saw some deer, and in his efforts to get a shot, he lost all idea of direction, and did just as nearly all inexperieneed people do who get lost—started on a mad rush, without trying to form any idea of direction, simply trying to get away from where he was. Never did I realize the awful mental condition of a lost person until I saw him.

Dark found us all in camp except the Elder, an old Presbyterian minister, and a few shots from camp directed him in. The next morning we packed everything we couldn't get along without on the two work horses and started over the divide. Three of us had to walk, and I let the Elder ride my horse, while I took his rifle and took a circle to try for a deer, as our grub pile was running low. I had not gone 200 yards from the party until I saw and killed a deer. While the party halted one of the boys came over and helped to skin the hindquarters, when he took them and went on with the outfit, while I finished taking off the hide, cut off all the meat from the carcass I could get and followed the trail, not overtaking them until they had reached a good sized stream of water and were preparing to camp. We all believed we must be on the Elk River, but no one could find any fish, and after spending the night there we moved on south and traveled all day, and camped that evening on what we believed to be a tributary of the Snake River. When starting out on the trip, I only purposed being with them four days, having an engagement back at the ranch on the morning of the sixth day.

It being necessary for me to make the trip home in a day, I desired to learn just where we were located, that I might lose no time the next day. For that purpose I started about two hours before sundown for the top of a very high mountain peak, perhaps two miles from camp. I took no gun, as we did not need meat, and my trip was full of interest from start to return. I had only gone a short distance when I saw a deer, and I sat on a log watching it while it came quite close to me and went on by without knowing of my presence. A short time before reaching the top of the mountain I heard a racket, and looking up the side of the mountain, saw six fine bull elk coming down the mountain side, walking single file. They were 100 yards away, and a fine opportunity was afforded to watch them as they filed past; and I did not move until they were out of sight. They all had antlers of exactly the same size, as nearly as I could tell, fine, large, and the sight was worth a long trip to see. I reached the top of the mountain just as the sun was setting. The mountain was bare of all green timber for quite a distance down all sides, having been burnt over some years before, and as it rose far above all the surrounding country, a better point could not have been chosen from which to get the lay of the country.

Had some gifted "pencil pusher" been there just then, who had a talent for expanding on glorious sunsets and grand scenery, he might have had an inspiration such as only comes occasionally. In all directions the country could be seen for wonderful distances, and in some directions it could be seen for a hundred miles or more—nothing but mountains, mountains, look where you liked; all wild, uninhabited by man and silent. But a glance at the ground showed that it was not a deserted place. Scarcely a rod could be traversed in any direction without crossing deer and elk tracks.

The ground was loose and soft, and all footprints showed as plainly as if on snow, and there one could read nature's diary, written by its four-footed inhabitants, of all that had taken place on the old mountain during the past few weeks. It is a pleasure to take a gun and hunt and kill game, but somehow when one is not after blood, there is realized a kind of silent, undefinable gratification and lasting satisfaction in wandering around far from the haunts of man, without a gun, and watching the wild creatures as they live and move in their native element, when not aware of the presence of enemies.

When hunting game to kill it, all the senses are centered on the one object of seeing the game, while most of the surrounding grandeur is overlooked. So, too, when game is sighted; everything interesting about the animal is overlooked in the eagerness to get a successful shot, and there is no time nor opportunity while watching them to note the graceful movement, the ever-watchful eye and shifting ear to catch the slightest move or sound that might mean danger, and to think of the constant danger lurking on every side of them, which serves to sharpen their instinct of self-preservation.

As I went back to camp in the gathering darkness of the evening, I disturbed a number of deer, one of which made that queer snorting noise sometimes made by deer when startled by something, and they cannot determine what it is. This was the first time I had ever heard or known of anything of the kind. After giving the others of the party the directions of different points, as they could be observed from my outlook, so as to enable them to determine in what direction to continue their journey, I mounted my horse at an early hour the next morning, and took a direct course for home, straight over mountains and anything that might come in my way. All day long I rode through wild country without seeing any mark or evidence of man, and without any trail other than that made by elk and deer, at one time riding past two deer within 75 yards, which stood and looked at me as long as I was in sight, probably never before having seen such a combination of biped and quadruped. Night found me safely at home. The others of the party continued their journey several days, finding good trout fishing in the Elk River and seeing great quantities of game, having seen at one time over fifty elk in one band, all being within gunshot; but no one fired a shot, although some of them had never killed an elk and had a great desire to do so; but they could not use or take care of the meat, and were "men" enough to refrain from shooting. Excuse me, but I have become so animated in living over again as I have been writing, the pleasant days of the past, that I nearly forgot about the gun I started to tell about. If you go back where we left the wagon, you will find the gun hidden under a log near the wagon. It was sent to a gunsmith at Laramie, Wyo., and relieved of its congested condition, but was never of much account afterward. EMERSON CARNEY.

MORGANTOWN, W. Va.

Major.

WHEN I was a small boy, in the spring of 1851, a man, who kept a grocery store in our neighborhood, had a Newfoundland pup about three months old that had taken the distemper.

This man, calling me into his store one day, handed me a dime and said, "Carry that pup to the canal or river and drown him; he is in my road here." The pup lay on the floor and every one coming in would tramp over him and start him howling.

I picked the pup up, then asked, "Can't I take him home and keep him, sir?'

"No, he has the distemper; you could not cure him; go and drown him."

I carried him down to an old doctor who kept a drug store, and asked him to look at the pup, telling him how I had got him and that I wanted to cure him.

"You can cure him," he told me, "if you choose to take the trouble to do it. I would not drown him. He is a full Newfoundland. Raise him and in a year you can get ten dollars for him."

The doctor gave me a box of salve and a big piece of brown castile soap and a package of sulphur, telling me that he would not charge me for these; he wanted to see the pup saved.

He told me to wash the pup's face in warm water and use plenty of this soap in it, then rub the salve in with my fingers, warning me not to touch my eyes with my hands when washing around the pup. Then he filled a small vial of some red colored stuff that stood on his shelf, I never knew what it was, and handing it to me said, "Give the pup half a pint of warm milk with a few drops of this and as much sulphur as will lie on a dime in it. He won't want to drink it, but make him. Don't let him have anything else, and he will."

I carried out the doctor's orders faithfully for ten days, and by that time the pup was nearly well, and I took him to the doctor again.

"He is all right, now," the doctor told me, "he will make you a fine dog. Keep him. Don't let that man you got him from have him again. A man who would drown a pup of that kind should not have one."

That man, when he saw that I had cured the pup,

wanted him badly and offered me a dollar, and on my refusing it, raised it to two dollars.

"No, sir," I told him "I want to raise him myself."

I called him Major, and always fed him myself. He began to grow now, and when two years old was one of the largest Newfoundlands that I have ever seen, and was a jet black; he did not have a white hair on him.

After he had got to be a few months old I kept him tied in the day time when I was not at home, but let him run at night. One Sunday morning, when he was only six months old, he came walking in to where I sat at my breakfast and dropped something on the floor beside my chair, then stood looking up at me. It was a new eight-blade pearl handle Congress knife, such as sold for $2 then; and this one had not a scratch on it. Some one had bought it the night before, then had lost it, and the pup no doubt knew exactly what it was. He saw me using my knife every day; so he had brought his find to me. I took Major and his knife up to the hardware store, where I usually got my powder and shot, just as soon as I had time the following Monday, and the dealer here gave me $1.50 in trade for the knife; then put it right into his showcase; it may have come out of that case last Saturday night. I invested half of this trade in the finest collar that was here, then gave it to Major, and took powder and shot for my half.

I was a newsboy at this time. The newsboy then was quite a different character from what he is now. I sold the first papers that were ever sold by a boy on the streets of Allegheny City. The editor of the Pittsburg Dispatch, Mr. Reese C. Fleson, had been on to New York the last spring and seeing the newsboys there, he came home and set three of us at it here. I had my own town to myself, the other two boys taking Pittsburg between them. One of those boys, before he died, owned one of the largest papers in Pittsburg himself, the Evening Leader.

I sold the morning papers and the eastern weeklies, and earned more than our laborers did; they got 80 cents a day then, while a carpenter got $1.25, and had to work 11 or 12 hours to get it, I only worked about 6 hours.

Each day, about noon, I would come home, then turn Major loose and from then until bedtime wherever I went Major did also. We put in most of our time in hunting. Major was not a hunting dog, but he was not gun shy. I would often kneel down and fire, resting my gun on his back; he would not move. I made wooden skewers for the butchers, and had a dozen of these butchers as my customers. When I was up at the market house selling my skewers Major would go along also; he was one of the few dogs that could go in there without having a steel or cleaver sent at him. Major would not touch their meat; a butcher would offer him a piece, but I would have to tell him to take it before he would touch it.

When Major was about thirty months old he and I were up in the market house one day, and one of my patrons wanted to buy him for a playmate for his children. "He is the dog you want," I told him. "He will let a baby crawl all over him and never even growl at it. I will sell him to you; there are but few other men though that could buy him. I know he will have a good home with you; he will cost you $20, though."

That was a big price for a dog, he thought. It was; $20 bought a good cow then.

"Well," I told him, "I would as soon keep the dog. I am not anxious to sell him."

He counted me out the $20, and I tied Major behind his stall; then going home handed my mother the money, and was given a raking down for selling Major.

"We have no use for $20 dogs," I told her. "A year's flour will suit us better; that $20 will buy it."

This man had a fine place just beyond the city limits. He had one pet, a black bear, that he had raised from a cub and kept chained at the slaughter house. I often paid the bear a visit, taking a stick of candy for him to hunt all through my pockets for, and he and Major were friends already. After the butcher had got Major I would often find them side by side fast asleep. The bear was two years old now, and a stranger would not have any business within his reach; but I had known him since he was a cub and still could handle him as I would a dog.

I started to raise another dog right off now, a mongrel that I got the day his eyes were open. His mother belonged to the bull family, his father may have been a registered dog, but I doubt it. I called this one Brandy, and used him to kill snakes. He could find and kill them as fast as I could count them. He finally got to be so bad tempered that no one but me could do anything with him. He stood in deadly fear of me, though; he was the only dog I ever owned that I had to whip; I gave him a whipping once a week. Finally he changed from snakes to sheep, and some farmer shot him.

After I had sold Major I paid him regular visits, stopping to see him at least once every two weeks. He would climb all over me in his yard, but never offered to follow me. His owner said that he would not take $50 for him now. A stranger could not enter his grounds after night; the dog paid no attention to them in the day time.

While the war was going on I did not see Major for four years, but in January, 1865, I came home and about the first thing I did was to hunt up Major. The man I had sold him to had been dead for several years, but his sons carried on the business here. The lady told me that Major was still here. "He is nearly blind now," she said, "and the boys wanted to kill him, but he will die here of old age if I don't die before him."

She was feeding him now as if he were a child.

He lay out in the sun fast asleep, and going to him I stooped down and called, "Major!" He raised up his head; then, after he had smelled me, began to lick my face and hands. He had not forgotten me.

He lived for two years after this, then died of extreme old age, and his mistress had him buried in the orchard.

I was not in that country again for twenty years, and when I next went back this family still lived here; but the place that had been a mile out in the country was now in the city, closely built up. The house had the orchard yet, though; and going to it I had no trouble in finding Major's grave. The daughter, who had been the baby when Major first came here, had flowers growing all over his grave.

ERIE, PA.

The Overdraft on Nature.

CONTIGUITY suggests comparison. One smiles at a department store advertisement in which a new edition of Xenophon's "Anabasis," among other books, is followed with a line of breechloaders. Yet the juxtaposition causes one to wonder what the leader of the Ten Thousand Greeks would say, were he now alive, to the alarming overdraft upon animal and bird life largely through these same weapons.

It is true that hunting nowhere finds a better apologist than that genial essayist and military expert. He declares in his "Essay on the Chase" that it is among the pleasures "productive of the greatest blessings," insists that it is a necessary part of a liberal education, an indispensable training for the soldier and a stimulus to patriotism, as well as contributing to health and happiness. "There are many benefits which the enthusiastic sportsman may expect to derive from its pursuit—in health which will thereby accrue to the physical frame, the quickness of the eye and ear, the defiance of old age, and the warlike training which it insures."

Even those who think that hunting is no business for women get no support from the author of the "Anabasis." "What," he queries, "has sex to do with it? It is not only men enamored of the chase, but among women there are those also to whom our lady Artemis has granted a like boon—Atalanta, Procris, and many a huntress fair." Indeed, the pupil of Socrates seems to have been as ardent a sportsman as he was expert as a soldier, as desirous of being in at the death as he was to bring his retreating army safely to the loud-sounding sea. He might have stood for the country doctor of sporting tastes in the old hunting song:

> 'To the poor he advice gave away,
> For the rich he prescribed and took pay;
> But to each one he said, 'You will surely be dead,
> If you don't go hunting to-day!"

There is no doubt, moreover, that in this fondness for the chase he had the support of public opinion in Greece, even though, when horses and hounds became badly mixed, his language may not always have been as chaste as that of the "Memorabilia." A little nation devoted to sports and games would share his belief in the healthfulness of hunting; and in any event an institution established by the aristocracy in a state ruled by aristocrats would die hard.

But the hunting which Xenophon praised was, in its disastrous effect upon animal life, a harmless sport compared with much of that practiced in this country. No doubt a military expert like the Greek leader sought game which tested his courage, and gave him the "wild joy of strife" whenever he could. But while an occasional wild boar may have rewarded his search, the hunting of which he discourses so pleasantly in his "Cynegeticus" was largely that of the hare, varied, perhaps, by a wolf or bear driven from the thicket-bordered hills by the baying of the hounds. Greece, so far as the larger quadrupeds were concerned, was an exhausted land; and expansion, which elsewhere has often furnished a remedy for such exhaustion, was there impossible.

It thus happens that we are deprived of the reflection of Xenophon upon the wasteful selfishness which had stripped his country of its larger game, with the improvement in weapons contributing thereto. If warnings there were of the inevitable limit of such selfishness, they must have been given long before Xenophon's time, and disregarded, just as they largely have been in this country within the last fifty years. It is discouraging to think that in another half century, despite our game laws, many of our larger wild animals will have passed so completely out of knowledge that some accomplished writer and sportsman may, like Xenophon, sing the praise of hunting the hare, as if larger game had never existed.

Unhappily, it is toward this condition that we are tending. If expansion as a remedy for exhaustion of soil and animal life was impossible in ancient Greece, it has not been so in the United States. The hunters and the fishermen have steadily moved outward toward the frontiers, leaving the center of the ring largely denuded of fish, animal and bird life. Warning of the final limit of this selfish and irrational policy has fallen upon unheeding ears, until some of the quadrupeds and birds once quite common on this continent, have disappeared as utterly as the great auk.

It is an old story; but in the later sixties an officer of the Hudson's Bay Company told the writer at a ford of the North Saskatchewan that, a few years before, he had camped on the same spot when the northbound buffalo herd was crossing the stream. The crossing began in the evening, and at 11 o'clock the following day he could see, though standing on a cart, no end to the herd in either direction! In an early year in the same decade the Hudson's Bay Company was reported to have purchased and stored in its line of posts along the Saskatchewan 32,000 bags of pemmican. As the flesh of two buffaloes is required for each bag, the output, with the requirements of the Indians and hunters, represented a slaughter of about 75,000 animals. In all that country to-day no vestige of the buffalo remains save its whitened bones amid the dark grasses of the prairie.

But the hunters were, of course, only following the old bent of the Caucasian in his treatment of wild animals. For when Columbus's sailors, searching for the imaginary province of Cipango, climbed to the top of an islet to scan the horizon for their missing ships, the first thing they did was to kill eight "sea wolves" they found there. Now these "sea wolves" were neither more nor less than the West Indian seal, common enough at that time throughout the Caribbean group, and off the Gulf and Florida coasts, but now virtually unknown along the mainland.

About a decade ago a report of the Smithsonian Institution, prepared by Mr. Frederick Lucas, called attention to the quadrupeds represented in the National Museum which had recently vanished or were menaced with destruction. Roused by its statements, other museums throughout the country instituted a search for the missing specimens, only to find themselves, in many cases, unable to secure them. Moreover, the discussion which followed threw a new light on the extent and rapidity of the process of extermination as it was then, and still is, going on.

To recall some of the statements of Mr. Lucas's report seems a good deal like repeating what everybody already knows. Yet it is only through publicity and repetition of those and kindred facts that there is any hope of checking and preventing the wasteful destruction so long in progress. Perhaps the most remarkable disappearance noted is that of the Arctic sea-cows, or rytinas, an animal from twenty to thirty feet long, with a girth of twenty feet. A sluggish beast, resembling the manatee, and feeding on seaweed and shore grasses, it was so much sought for food by sailors that in fourteen years after its discovery by Behring's men, in 1745, it had become entirely extinct. Much the same rapid disappearance was noted in the case of the great walrus, fairly common half a century ago along the coast of California. As they were rather ponderous creatures, their vanishing should have attracted some attention. But it did not, a search for them in 1884 disclosing the fact that they had passed away unnoticed, not a single specimen remaining.

It may be said, of course, that in point of rapidity of extermination, these are unusual instances. But readers of FOREST AND STREAM past middle age will recall many others in which, though the process of destruction has been less rapid, the result has practically been the same. This has notably been the case with some species of deer, and with a very considerable variety of other game now seldom seen in sections where it was once plentiful.

Turning to the birds, perhaps the greatest havoc has been wrought with the passenger pigeon, flocks of which used, fifty years ago, to fairly darken the sky; though the fact that a single American dealer is said to have sold two million bird skins in a year gives some idea of the destruction of bird life. In the Smithsonian report the statement is made that Audubon once counted in twenty-one minutes 163 flocks of passenger pigeons, and an estimate of the number passing over an area under observation places it at 1,115,136,000. Such a number seems incredible; yet a German naturalist asserts that he saw a piece of timberland nine miles long, in which every tree was occupied by nesting pigeons.

In some towns of the Northern Middle States, forty-five years ago, pigeons were exposed for sale by the wagon load. The writer remembers to have seen farmers thus bringing in birds netted by them about their nesting places a few miles away; and the wagons in which they were brought to market were piled to the top. In these same sections of country a passenger pigeon is now seldom seen, the great flocks which once passed twice every year having disappeared as if they had never been.

Of course not all the disappearances can be laid to the selfishness of the hunter. That of the California vulture, the largest bird on the northern continent, is due to its sharing the poison which farmers place in sheep carcasses to kill wolves and coyotes. The Pallas cormorant in the Behring Sea islands is said to have been destroyed in its chief haunts by an earthquake; and the total disappearance of the Labrador duck, whatever its cause, cannot be charged to the hunter.

But enough can be laid at his door to show that he has, and is, making a heavy overdraft on animal and bird life; that unless Time is allowed to aid Nature, the date is not far distant when the exhibits at the sportsmen's shows will be only those of extinct species. With the growing craze for furs, the skin hunters are killing everything with fur on it, the price making little difference. And though the Audubon societies seem for the time to have gotten the better of the bird skin sellers, only the utmost vigilance will prevent an evasion of the laws that will prove disastrous to the feathered tribes. If the skin and pot hunters can be eliminated from the problem, time may do much to restore the balance which they have destroyed, though in many ways the damage already done is irreparable.

H. M. ROBINSON.

A Correction.

Editor Forest and Stream:

As I would not willingly do injustice to anyone, please allow the following statement:

In my recent "Notes" I stated that my friend (Case I. of the Notes) shot and finished the moose that had been wounded by Case II., and that a guide held the torch for the killing shot. My friend informs me it was he who held the torch for Case II. to finish his own job, and that Case II. regretted the suffering of the moose as much as any one could. It was the fault of the guides that the quietus was not given sooner. I gladly make this correction, and wish I could as readily make one of another sort that is much needed. My friend tells me that on a certain Canadian river he and Case II. saw the bodies of six cow moose that had been shot in fly time by a certain man from New York, and their bodies left to decay in the water and pollute it without so much as a steak having been cut from one of them. The shooting was simply from the love of killing. Such wanton destruction of animal life should debar the perpetrator from ever thinking of himself as a sportsman until he repents and "brings forth fruit meet for repentance."

JUVENAL.

Natural History.

The Wild Horse.

EXCEPTING only the buffalo, no animal of the Western plains was more impressive to the early travelers than the introduced wild horse. By their numbers, their grace, and their beauty, they appealed strongly to the imagination of men who were familiar with horses, and whose life, indeed, for a large part of early Western exploration was inseparably bound up with the horse. So strong was this appeal to the imagination that a series of legends or folk tales grew up in different parts of the plains about certain horses which had been seen, and such tales, growing with age and gathering material from the imagination of successive narrators, finally developed into stories like that of the "White Steed of the Prairie," spoken of by Kendall and others, and used by Mayne Reid, in one of his tales, as a sort of animal hero, the ultimate capture of which brought the story's hero the favor of the girl he loved. There were other stories of a black stallion, and of a red stallion, each fleet beyond compare, and each of which had been pursued many, many times. One of the earliest tales of the white horse is given by Kendall in the following language:

"At sundown a drove of mustangs, or wild horses of the prairie, paid us a flying visit. They were first seen ascending a hill at the distance of half a mile, and as they were coming toward us were taken for Indians. When seen on a distant hill, standing with their raised heads toward a person, and forming a line, as is their custom, it is almost impossible to take them for anything but mounted men. Having satisfied their curiosity, they wheeled with almost the regularity of a cavalry company and galloped off, their long, thick manes waving in the air, and their tails nearly sweeping the ground. They are beautiful animals, always in excellent condition, and although smaller than our American horses, are still very compact, and will bear much fatigue.

"Many were the stories told that night in camp, by some of the older hunters, of a large white horse that had often been seen in the vicinity of the Cross Timbers and near Red River. That many of these stories, like a majority of those told by gossiping campaigners, were either apocryphal or marvelously garnished, I have little doubt; but that such a horse has been seen, and that he possesses wonderful speed and great powers of endurance, there is no reason to disbelieve. As the camp stories ran, he has never been known to gallop or trot, but paces faster than any horse that has been sent out after him can run; and so game and untiring is the 'White Steed of the Prairies,' for he is well known to trappers and hunters by that name, that he has tired down no less than three race nags, sent expressly to catch him, with Mexican rider well trained to the business of taking wild horses. The latter had nothing but a lasso or lariat with him—a long rope made either of hemp or horse hair, but generally the latter. One end of this rope is made fast to the pommel of the saddle, while the other is formed into a noose; the Mexican carries it coiled up in the right hand, and throws it with astonishing dexterity and precision, casting it directly over the head, feet, or even tail, of the animal he may be pursuing.

"The Mexican who was sent out to take the wild steed, although he mounted a fresh horse, as the one he was riding became tired, was never near enough the noble animal to throw a slip noose over his head, or even to drive him into a regular gallop. Some of the hunters go so far as to say that the white steed has been known to pace his mile in less than two minutes, and that he could keep up this rate of speed until he had tired down everything in pursuit. Large sums had been offered for his capture, and the attempt had been frequently made; but he still roamed his native prairies in freedom, solitary and alone. The fact of his being always found with no other horse in company was accounted for, by an old hunter, on the ground that he was too proud to be seen with those of his class, being an animal far superior in form and action to any of his brothers."

This horse, however, was said later to have been captured, but lived only a short time afterward.

Kendall seems to have had a great admiration for these wild horses, for he frequently refers to them, and always in terms of great enthusiasm. Once, when scouting far in advance of his expedition, he and his companions stopped to rest, and "we scarcely had time to establish ourselves comfortably before three or four mustangs were seen approaching at a rapid gallop. Ever and anon they would halt for a moment, throw up their heads as if to scan us more closely, and then, as though not satisfied with the scrutiny, would again approach at the same rapid pace. It may be that they could not see us while reclining under the shade trees, or mistook our animals for some of their own wild companions; be this as it may, they approached within a few hundred yards, wheeling and dashing about with all the joyousness of unrestrained freedom, and occasionally stopping to examine our encampment more closely. The leader was a bright bay, with long and glossy black tail and mane. With the most dashing and buoyant action, he would trot around our camp, and throw aloft his beautifully formed head, as if, after the manner of some ringleted school girl, to toss the truant hair from his eyes. Then he would lash his silken tail, shake his flowing mane in pride, and eye us with looks that plainly told his confidence in his powers of flight should danger or treachery be lurking in our vicinity. I had formed a strong attachment for my own powerful bay, for he was gentle as a house dog, and would run all day if necessity required it; yet I would instantly have 'swapped' even him for this wild horse of the prairies, with no other knowledge of his qualities than what I could discover at the distance of a hundred and fifty or two hundred yards.

"After gambolling about us for some little time, his bright eyes apparently gleaming with satisfaction, as if conscious that we were watching and admiring his showy points, he suddenly wheeled, and in a canter, placed himself at a more prudent distance. Then he turned again, to take another look, curved his beautiful neck, once more tossed his head, half timidly, half in sport, pawed the ground playfully, and again dashed off. Several times he turned to take still another look at our encampment, and even in the far distance we could distinguish his proud and expanded nostrils, his bright, flashing eyes, and the elastic movements of his symmetrical limbs as he playfully pranced and curvetted about. I watched him until he was but a speck upon the prairie, and then turned from gazing with regret he was not mine.

"The Indians and Mexicans have a way of capturing mustangs by running up on their fleetest and most untiring horses and noosing them with a lariat. The white hunters have also a method, which is often successful, of taking the wild horses. It is called creasing, and is done by shooting them with a rifle ball upon a particular cord or tendon in the neck, immediately under the mane. If the ball takes effect precisely in the right spot, the animal falls benumbed, and without the power to move for several minutes, when he is easily secured. Should it strike too low, the horse is still able to run off, but eventually dies. An attempt was made to crease the magnificent steed I have mentioned; but it was impossible to approach near enough to shoot with accuracy, and to endanger his life would have been a wanton act, which the most eager hunter among us would not have committed. When our provisions became scarce, several of these animals were shot for their flesh. It seems repugnant to the feelings to eat horse flesh; but the meat is tender and finely flavored, and a three-year-old mustang is really better food than either buffalo or common beef."

The term to "crease" a horse is one familiar enough to persons who traveled in the old-time West, and occurs in much of the literature of that day. It may be questioned whether the act was often practiced, but it was frequently talked about. It consisted in sending a ball through the nape of the neck, so close to the cervical vertebræ as to stun the animal. When it was properly done, the horse fell to the ground, and was tied before he recovered; but it took very good shooting to perform the operation. Years ago, a story used to be told of William F. Cody (Buffalo Bill), that in his young days he became greatly enamored of a black stallion that ranged on the Smoky Hill, and determined, after many vain attempts to run it down, to crease it. Watching the animal patiently for a considerable time, he learned that it usually watered at a particular place, and concealing himself there, endeavored to crease the animal when it came to water. The horse fell, and Cody hurried up and tied the animal's legs, but it did not recover, and a little investigation showed that he had broken the creature's neck.

Pike, during his journey through Texas, actually as a prisoner, but nominally as a guest of the Spaniards, saw many wild horses, and gave an account of the way in which they were captured there. Henry, at a little earlier date, speaking of the country of the Kutenais, then and now chiefly to the north of Flathead Lake, says of it, after enumerating the different animals to be found there, "Wild horses are also common, and frequently seen in large gangs. They are caught in winter, when the snow is deep, by running them down with relays of fresh horses, and driving them up the mountains, in the deepest snow, or into some narrow mountain pass. The noose is thrown about their necks; they are taken, exhausted, instantly mounted, and broken immediately to the saddle. Their respiration through the nostrils is much louder than would be imagined. When surprised they can be heard at a distance of four or five hundred yards. Some of them are exceedingly swift, well-proportioned, and handsome beasts; but they seldom attain the docility of our horses."

At the present day the Kutenai horses are wonderfully good, strong and well built, and are the best mountain horses in all the West.

During his journeyings across the plains, Pike had frequently seen and remarked on the wild horses, and in his description of the province of Texas—then, of course, a part of Mexico—he gives, as just stated, a more detailed account of them. In enumerating the animals of this province, he speaks of "buffalo, deer, elk, wild hogs, and wild horses, the latter of which are in such numbers as to afford supplies for all the savages who border on the province, the Spaniards, and vast droves for the other provinces. They are also sent into the United States, notwithstanding the trade is contraband. They go in such large gangs that it is requisite to keep an advanced guard of horsemen in order to frighten them away, for should they be suffered to come near the horses and mules which you drive with you, by their snorting, neighing, etc., they would alarm them, and frequently the domestic animals would join them and go off, notwithstanding all the exertions of the dragoons to prevent them. A gentleman told me he saw seven hundred beasts carried off at one time, not one of which was ever recovered. They also in the night frequently carry off the droves of travelers' horses, and even come within a few miles of St. Antonio, and take off the horses in that vicinity.

"The method pursued by the Spanish in taking them is as follows: They take a few fleet horses and proceed into the country where the wild horses are numerous. They then build a large strong inclosure, with a door which enters a smaller inclosure; from the entrance of the large pen they project wings out into the prairie a great distance, and then set up bushes, etc., to induce the horses, when pursued, to enter into these wings. After these preparations are made they keep a lookout for a small drove, for, if they unfortunately should start too large a one, they either burst open the pen or fill it up with dead bodies, and the others run over them and escape, in which case the party are obliged to leave the place, as the stench arising from the putrid carcasses would be insupportable; and in addition to this, the pen would not receive others. Should they, however, succeed in driving a few, say two or three hundred, they select the handsomest and youngest, noose them, take them into the small inclosure, and then turn out the remainder, after which, by starving, preventing them taking any repose, and continually keeping them in motion, they make them gentle by degrees, and finally break them to submit to the saddle and bridle. For this business I presume there is no nation in the world superior to the Spaniards of Texas."

It is well known, of course, that many of the Western, and especially the Southwestern, Indians, supplied themselves with horses largely by raiding into the Southwest and driving off the herds possessed by the Spaniards. Yet, over much of the Northern country, where horses were abundant, the Indians sometimes captured them in a fair chase. They were never able, however, to secure the best class of horses in this way, since the wild animals readily ran away from the Indian horses, each of which was handicapped by carrying a man. Moreover, at this period of time, and indeed up to about the year 1860, the plains Indians were, most of them, very inexpert in the use of the rope. Instead of throwing the lariat, as white men and Mexicans do, and indeed as the Indians themselves do at the present day, they used to stretch the noose of a rope on a large hoop made of willow twigs, to which the noose was attached at different points by strings, which were easily broken. So armed, a number of Indians would set out in pursuit of a herd of horses, and when a man overtook an animal, he passed the willow hoop over its head, and then pulling strongly on the rope, it freed it from the hoop, and the horse could be choked down.

Such chases were commonly undertaken in the spring of the year, when the horses were thin and poor, and the ground wet and muddy. As already said, the better class of animals were not captured; those taken were chiefly mares heavy in foal, or mares that had just dropped their foals, and were unable to run fast. However, such additions to the tribal property were not to be despised, since they were breeders from which useful colts could be raised.

Most Indian tribes have a distinct tradition of a time when they were without horses; and it is extremely common to hear an Indian tale of old times begin: "This happened long ago, before we had horses, when dogs were our only animals, and dragged the travois." Some tribes do not seem to understand where horses came from, and account for their presence in some supernatural way. Examples of this are seen in the names sometimes given to the horse, such as *Shúnka wakan*, Mysterious dog, or Medicine dog, which is one of the Sioux names for a horse; or, in the stories told, for example, by the Piegan Blackfeet of how the first horse appeared, coming up from beneath the surface of a lake. In this case, however, the name given to the horse had no relation to their mysterious origin, but they were called *Po-no-káh-mi-ta*—that is to say, elk dog, because they are large animals and shaped somewhat like an elk, and because they are used to carry packs, and to haul travois, as dogs were.

Attention has more than once been called to the change which the possession of the horse worked in the Indians. All the prairie tribes have traditions of a time long ago, when there was no war; when the tribes were at peace with their neighbors; or, if quarrels took place, and battles were fought, and men killed, this was only in angry dispute, and was an individual quarrel. "Their wars were probably not general, nor could they have been very bloody. When, however, horses came into the possession of the Indians, all this must have soon become changed. Hitherto, there had really been no incentive to war. From time to time expeditions may have gone out to kill enemies—for glory, or to take revenge for some injury—but war had not yet been made desirable by the hope of plunder, for none of their neighbors, any more than themselves, had property which was worth capturing and taking away. Primitive arms, dogs, clothing, and dried meat were common to all the tribes, and were their only possessions; and usually each tribe had an abundance of all these. It was not worth any man's while to make long journeys and to run into danger merely to increase his store of such property when his present possessions were more than sufficient to meet all his wants. Even if such things had seemed desirable plunder, the amount of it which could be carried away was limited, since—for a war party—the only means of transporting captured articles from place to place was on men's backs; nor could man, burdened with loads, either run or fight. But when horses became known, and the Indians began to realize what a change the possession of these animals was working in their mode of life, when they saw that, by enormously increasing the transporting power of each family, horses made far greater possessions practicable, that they insured the food supply, rendered the moving of the camp easier and more rapid, made possible long journeys with a minimum of effort, and that they had a value for trading, the Blackfoot mind received a new idea, the idea that it was desirable to accumulate property. The Blackfeet saw that since horses could be exchanged for everything that was worth having, no one had as many horses as he needed. A pretty wife, a handsome war pony, a strong bow, a finely ornamented woman's dress—any or all of these things a man might obtain if he had horses to trade for them. The gambler had 'hands,' and at the ring game could bet horses; the man who was devoted to his last married wife could give her a horse as an evidence of his affection."*

The Indians soon learned, also, that horses might be easily driven off, and that those who had taken horses from their enemies had a great advantage over the rightful owners who might pursue them; and it is quite certain that the introduction of the horse among Indians led almost at once to the practice of a warfare much more general than anything that had been known before.

Had the Indians of the plains not been supplied with horses from the herds sprung from the wild stock escaped in the South; had they not been expert horsemen, their wars with the white race during the latter half of the last century would never have been fought. Horses gave them the ability to move rapidly

* Blackfoot Lodge Tales.

from point to point; they possessed the knowledge of the country, which enabled them to scatter like a flock of birds, when too closely pursued, and they had for many years the buffalo, which furnished them an unfailing food supply. These things made it possible for them to resist the whites until the railroads, forerunners of civilization, pierced their old-time hunting grounds in many directions.

There have been from time to time in the FOREST AND STREAM, in years gone by, accounts of the wild horses of the hunting grounds of the West. We reprint two of them, one relating to Idaho, the other to Kansas and Colorado:

Death of the "Brown Stud."

South of Boise City, Idaho, there is a great tract of lava country bounded by the Snake River, which is only fit for pasturage. This vast expanse is seventy-five miles one way and from twenty to thirty the other way. No living streams or springs intervene, and in summer heat it is impossible even for stock to live in some parts of it. For ten or twelve years this desert has been the home of a number of wild horses, roving in bands of different sizes from five or six to twenty or thirty. Each band is led by a stallion, and he guards them like the most watchful sentinel. Snuffing the danger, away he gallops to some elevation, where in a moment he spies the intruder, and back he gallops to his band to lead them in an opposite direction. Many horses each year were lost, and only a short time elapses before the tame are all wild alike. This year these bands have been broken up and most of them captured in a great corral. This corral has wings spreading out to catch the animals as they were chased down by their untiring pursuers.

To the Dannskin brothers, of Boise City, belongs the credit of doing this. It involved great expense and took an iron will, endurance and good plans to accomplish. Among all these horses there was one noted for his surprising swiftness and nobleness of bearing. A hundred dollars had been offered for his capture, and when the different bands, numbering altogether 125, had been run down and captured, it was thought that by having twenty horses or more for relays stationed at points where the chase could be plainly seen, the noble animal would have to give up. Accordingly, on the 26th of May, a party started out from a dry camp twelve miles from any good water, to find and chase down the "brown stud,' as he was called. And no one ever supposed that his blood would redden the lariat's noose that night. He was sighted with his band near Dorsey Butte, and, after a most exciting run of about seventy miles in four hours and a half mostly over a lava country, rough and broken with fissures and naked masses, with high sage brush everywhere reaching to the knees, he was captured. Nine of the best saddle horses took him by relays, one of these, a celebrated horse called Portland, himself of great power and activity. This horse alone gave the stud a breathless chase of twenty miles on one circle. When tired, panting, but bright and noble to the last, the brown stud reached one of his old watering holes, pausing as if for some last farewell, he staggered and dropped struggling mightily against death. The terrible convulsions of the noble horse brought pity to the hearts of his captors. Everyone brought water in their hats to the horse and tried every remedy in vain. He had run his last race. Captured with him was a fine, fast, iron-gray gelding, which always ran with the stud and seemed his inseparable companion. As a usual thing, the stallion will not allow a gelding in the band. This was an exception. At night the iron gray was brought to camp, but he never rallied; toward night the look of death came over him, and in the morning he, too, was dead. The color of the stud was dark brown. He was six years old and weighed 1,000 pounds.

BOISE CITY, Idaho. JAMES M. HAMILTON.

Hunting The Wild Horses.

There is a strip of country between the Kansas Pacific and the Atchison, Topeka and Santa Fé railroads, having Cimarron and Grinnell, in Kansas, and River Bend and Pueblo, in Colorado, as its corners, that is sparsely settled. Broad, treeless prairies, small streams at long intervals, a few small rain-water lakes, filled by local rainstorms that flood one section and fill every hole so full that the water stands all winter, while a few miles away deeper hollows are bone dry. It is one of the last strongholds of the mustang in America. They range all over it in bands of from two to one hundred, generally from five to twenty-five in a band. They differ in color further west; in western Kansas they are mostly roan, on the Colorado line dark brown, and further on pinto or spotted black and white. There is one band of thirty-two head now on White Woman Creek, Kan., all roans, called the Dry Ridge Band, because they always strike straight west on a dry ridge when pursued; and another band of twenty-eight that are all black with white faces, called the Headlight Band, that range in the same vicinity. Tame stallions occasionally escape from emigrants or stock men and take a band of mares from the wild stallion and are not captured. In this manner the stock improves. It is a common thing to find tame branded ponies that formerly belonged to cattle men or Indians among them, and I have seen mules with scars on their shoulders from the collar that ran as fast and seemed as wild as their mustang companions. A band generally consists of one or two stallions, about ten mares and ten or twelve colts and yearlings. Of course, one of the stallions is "boss," and the other has to keep out of the way, but he stays around and will cut the bunch in two if he gets a chance, run them off and set up an establishment of his own. There are thousands of these mustangs, and catching them is a regular business during the summer.

It requires two or three men, two spans of good tough ponies broken to harness, well shod and fat; about six fast saddle horses, a light, strong, spring wagon, a twenty-gallon keg for water, lots of oats and a light camp outfit. Then find a bunch of horses that suits you and put the buggy after them with two men, the water keg, and a little feed in it. The band will run off and travel seventy-five miles the first day. Manage to keep in sight of them, follow all night if it is moonlight; by the next day at noon you will be back where the horses started from. Man No. 3 has made camp near water, and when he sees you coming is ready with the fresh team. Drive down to camp and slap in the fresh team, leave your most tired man to keep camp, and at them again another round of fifty to one hundred miles, and you come near camp again in about twenty-four hours with the mustangs badly tired. Change teams, put one man on horseback and make another round. It won't generally be more than twenty-five miles, for the horseman can turn the bunch a little. The next day with two saddle horses and no buggy, you can turn the band as you please, and everybody go to bed at night if it is dark, after that keep at them. In from seven days to twenty-one days you will tire them completely down, they are accustomed to the sight of the man on horseback and are not much afraid of him, and he can turn them where he pleases and get within one hundred yards of the wildest. If you have no corral you have to snare the best ones. Let the colts and the dead lame ones stop and round them up; they will be only too glad to stand, for you have been whipping them along for the last two days. The well ones will run off a little way, but when you get between them and the cripples they will try to get back, and you can shack round and round the cripples in a little trot, and the wild ones will make four miles to your one, and half a day will tire them down. Then lay ropes on the ground close to the cripples and drive the others over them. When they get used to them make nooses and catch them by the feet and hobble and side line them. To hobble is to tie both fore feet together, so that a horse can only hobble. To side line is to tie one fore and one hind foot together with about three feet space. The cripples need not be touched.

Now go home with your horses and you haven't secured much after all, for they are worn out and seldom recuperate. It is hard to break them gentle, and if they ever get away and find a band of mustangs you must have all your fun over again, if you want to catch them. There were about twenty outfits after mustangs last summer with varying success. Wild Horse Johnson, with his three sons, of Aubrey, Kansas, caught about 150 and got from $15 to $20 apiece for them.

Fat colts are shot and eaten by some people that follow them, and one of the wild horse hunters shipped six hindquarters of old stud meat to Kansas City for buffalo, and some people beside horse hunters' families know how wild horse meat tastes by this time.

I have lain and watched them play for hours when I was out antelope hunting. I had a band of eight run all around me at thirty yards three months ago, as W. P. Dixon, of Livermore, Pa., and I lay in a buffalo wallow watching them, but when they got our wind they ran clean out of sight in a bee line.

W. J. D.

CIMARRON, Kansas.

THE WILD HORSE OF CENTRAL ASIA.

That many horselike animals exist wild in parts of Asia to-day is well known. Most of these, however, are more nearly akin to the ass than to the horse.

One of the most recently discovered of these, found in the sand deserts of central Asia, is an animal named *Equus przewalskii*. It is regarded by eminent authority as the only wild species of horse which is closely related to our domesticated *Equus caballus*. For a long time this Przewalski's horse was known from a single specimen only, but more recently others have been obtained, and quite lately collectors sent out by Carl Hagenbeck, the well-known animal dealer, secured a considerable number, about 40, we believe. Of these, a pair have been purchased by the New York Zoological Society, and have just reached America. They are not yet on exhibition. Our illustration is from a photograph of two of the Hagenbeck herd.

It has been suggested that this horse, or its close relation, was the species first domesticated by man, but, however this may be, this horse is the nearest known living relative to the domestic horse.

A Winter Stroll.

PROVIDENCE, R. I., Dec. 14.—To-day I took one of the electric lines running out of the city and rode to the terminus, which is in the quaint old village of Pawtuxet, named from the river that here empties into the salt water.

Crossing the bridge, I pause for a moment and take in the winter scene. Up river there is an unbroken sheet of ice covered deep in snow and coming almost to the cap log of the dam, leaving a narrow strip of black water to pour itself over and swirl and eddy among the rocks below. In the cove is a large fleet of yachts laid up for the winter, they are of all sizes, from the long, narrow steamer Llewellyn, down to the one-handler knockabout, all held fast in a sheet of snow-covered ice, regardless of size and of bigness of owners' purse.

The northwest wind is searching, and I move on, thinking of that pleasant morning in August when I stood on that spot and caught white and yellow perch, sunfish and small bluefish, or skipjacks, in an eddy beside one of the big rocks. Up over the hill we go and find the walking harder as the snow is traveled less, but take the middle of the road and walk in the path made by the horses.

After nearly a mile of this, I turn off the road and pass through the bar way and am in the old home field with a small hill to climb and no path; up I go, every step knee-deep, but the distance is short and the air clear and bracing. Reaching the crest, there is a fine view, the blue waters of the bay extending for miles with hardly more than a ripple on its surface.

There are no vessels in sight, not even a coal barge, once a despised craft but now almost worshipped in these days of coal famine.

Down the hill to the house is made almost on the run, but I notice the gray tufts of golden rod and asters standing just above the snow, still beautiful and holding food for the juncos and tree sparrows, of which there are a few here.

I wallow through a drift up to my middle and gain the house, and the trip is ended. I find them fairly snowed in, and I abandon my trip to the old Brown place to hunt for winter birds, and shovel snow instead, and am derided by a solitary crow as he flies by. After dark we have a lunch of warm mince pie and doughnuts, such as a mother only can make, and then my brother and I start back for town. We had a full moon to light the way, and the road being broken out more, we found the going much easier. Having good luck in catching a car, we were soon bowling along toward our families, and soon ended a pleasant afternoon.

On cold winter evenings it is good to look over our old note books, and while most of the entries are commonplace enough, there are some that are worth experiencing again. We were spending the summer season down by the salt water, and one Sunday morning, in early June, I took my two children, a boy of five and little girl of three, for a short walk along the beach road, when, just in front of us I saw a spotted sandpiper in apparent distress fluttering with outstretched wings and keeping a few feet in the lead of us. We stepped off to one side a short distance and waited. Soon the mother came back, and running along in the middle of the road, began to call, and we could see small animated lumps come from hiding and go to her.

Keeping my eye on one, we walked back to the road, and as the old bird saw us she trailed her wings and tail along the ground, trying to draw us away from her babies, at the same time uttering a note that caused them to run and hide. The one I was watching crawled under a spear or two of beach grass and clung close to the sand, which he resembled so much in color, that had I not kept my eye constantly upon it, it would have remained hidden. I picked it up and held it gently in my hands, while the old bird would rush up within a few feet and then trail away as though injured, all the while calling to her chickens, and the one in my hand softly answered.

He seemed to be perfectly contented, snuggling down and partly closing his eyes, as though the warmth of my hand felt good to him. After letting the children touch it with the tips of their fingers, we put it back in the sand, and walked away a short distance. The mother came at once, and using a rolling call like unto the note of the hylas in April, soon had her babies around her, and I took mine and walked over to the south shore to see the white-capped rollers come tumbling in.

New Edition of Coues' Key.

Messrs. Dana Estes & Co. announce that the fifth revised edition of the Key to North American Birds, by Dr. Elliott Coues, will be ready in the spring of 1903. When Dr. Coues died in 1899 he left the manuscript wholly finished, but not in such shape that it could go to the printer. Publication has been delayed by the fact that the task of revision and preparation for the press required a great amount of extra labor. Some of the features of the work may be briefly summarized:

1. The detailed, careful description of species.

2. The accounts, much fuller than in former editions, of the breeding habits of birds—dates, nests, and particularly the detailed description of eggs, with measurements.

3. The full collation in the text of the nomenclature of species in the Key, with nomenclature and numeration of the American Ornithologists' Union Check List.

4. Full synonymes and bibliographical references in the case of nearly all species—a new feature.

5. The professional discussion of questions of classification and nomenclature.

6. The introductory descriptions of ordinal, family, and other groups, are much amplified over those in preceding editions of the Key, being of a broad scope, which make plain the comparative relationships of North American families, genera, and species of birds, with extralimital forms.

7. The explanation of the etymology of scientific names is retained.

The Doubting Didymus.

Editor Forest and Stream:

A man who manufactures stupid lies and palms them off on the public with intent to deceive, is a sort of nuisance; but there are such things as interesting liars. Mark Twain, for instance, whose munchausenisms are always filled with wit and fun.

I also feel like saying to your contributor, Frank Heywood, "You're another," for his preposterous lies are worked up in such a way that I cannot skip them; but if he expects to claim the prize in that line let him read the following extract from the last issue of FOREST AND STREAM on the Migration of Squirrels, and his ambition will be curbed. It is there recorded that myriads of squirrels came to the Mississippi River and hesitated, but said, "Leander swam the Hellespont, and we can swim this 'ere," and accoutred as they were, they plunged in. But some of them didn't swim this 'ere, for, before they got across they met with an obstruction.

The writer says he "has seen persons go along and pick them up by the tail, throwing them into sacks in any quantity desired, and has seen parties go out in boats to meet the swimming hordes, picking the squirrels up by the tails and throwing them into baskets and bags in the boat."

Now, as they were swimming, they must have been alive, and a live squirrel is about the liveliest thing alive, except a monkey, so picking them up by the tail must act like a powerful dose of ether, to kill them off so sudden!—which discovery scientists make a note of!

DIDYMUS.

ST. AUGUSTINE, Dec. 24.

Deacon Jones—"Don't you think it wrong for your husband to go fishing on the Sabbath?" Mrs. Brown—"Wrong? It's positively wicked the way he wastes his time and his money on tackle and bait, and hardly ever brings home more than one or two mean little fishes."—Boston Transcript.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

Redheads Near New York.

Editor Forest and Stream:

The subject of redhead shooting may prove of some interest to the readers of FOREST AND STREAM, and to call attention to the sport of ducking for these magnificent birds in a location which lies at our very door, may also be of value to many of our city sportsmen, who may be ignorant of the existence, so near our city, of such choice birds, the pursuit of which makes it possible to follow without the long, tedious railroad travel that reaching southern gunning points involves.

For many years, off and on, I have followed this favorite sport, confining my operations mainly to the south side of eastern Long Island. My favorite spot has been for many years from Reeves Island on the east to Pattersquash on the west in Moriches Bay.

This whole territory has, however, of late years denied access to the amateur gunner, because the Smith estate, having been confirmed in their contention that they owned the bottom of the bay, have leased the grounds to private parties, to the exclusion of every one, and therefore it became necessary to seek other fields or give up the sport entirely.

East of Reeves Island, however, the East Bay continues on till we reach the bridge that spans it, and thus affords access to the beach; in this body of water, brackish and fed continually by the fresh-water streams, many in number, grows in great profusion the wild celery with which we associate Mr. Canvasback, Mr. Redhead, Mr. Widgeon, etc., etc. As a result of the luxuriant growth of this plant, redheads, mainly, are attracted in great numbers, and so ravenous is the appetite of these "gourmets" that when routed from one spot they fly a few hundred yards and settle down in the midst of a feast again.

Spending very pleasantly a few weeks during the past summer at East Moriches, enabled me to get acquainted with the conditions of ducking, and having incidentally taken in a little snipe shooting, I was not loath to try the redhead when favorable opportunity presented itself. I placed myself in the hands of O. B. Tuthill, who, I observe, is an advertiser in your paper, and have been with him on two trips.

The last week in October and the first week in December I visited East Moriches for the sport. My bag on either trip would not appeal to the impatient and covetous gunner, but to the philosophic lover of nature, armed with a powerful telescope with which he may sweep over the expanses of the bay, such a one may experience the satisfaction that comes only to the modest, patient gunner, who feels amply rewarded with a medium bag of ten or a dozen birds. Mind you, these ten or a dozen birds will be worth, commercially, four or five times the quantity of broadbills or other inferior birds. I'd rather have a half dozen of these redheads than two or three dozen of the common varieties; but—and this is the unvarnished fact—if you wanted the common kind, you wouldn't get them, for they are not there; the redheads are there in battalions, in brigades, in legions, thousands, literally feeding voraciously, the surface of the bay presenting an animated and inspiring spectacle when viewed through a powerful glass, as the ducks alternately dive and dine.

Mixed among them are the hundreds of hen bills, oftimes such a nuisance to the ducker, impelling him to rout them out of the way frequently through the course of the day, for they entice the redheads from the mute yet almost lifelike counterfeits, the wooden decoys.

On Monday, Dec. 1, I got just twelve of these choice birds, and further east, four gunners secured fifty.

The element of luck enters very largely into the conditions of a ducking trip. One may be doomed to disappointment, trip after trip, and another may have phenomenal success on a trip taken at a hazard. The redheads remain in the bay until it freezes over. "When the springtime comes" you may get your fill of broadbill shooting, and though I have not yet tried it in the spring, I doubt not that goose, redhead and an occasional canvasback will reward the persistent enthusiastic gunner.

VAN.

In a North Dakota Camp.

LA CROSSE, Wis., Dec. 12.—*Editor Forest and Stream:* I inclose an article describing the hunters in North Dakota. Knowing who the men are, I think it deserves a place among the good things in FOREST AND STREAM.

H. E. WEST.

The party of Grand Forks hunters who for the past two weeks have been hunting deer in the vicinity of Ft. Buford returned home yesterday after the most successful and pleasant experience they have ever had in that line. The party consisted of A. F. Turner, Stephen Collins, W. F. Perry, William Budge, E. C. Cooper and O. Overby.

The hunting grounds were situated 20 miles from Buford on the east side of the Yellowstone, and between that river and the Little Missouri. The camp was completed when the main body of hunters arrived, and was complete in every respect. The services of two men were secured for the trip in addition to Cook LaTrace, and to the skill of the latter in dishing up swell grub, one of the chief pleasures of the trip is due.

The river is still open and the party crossed on the ferry. There had been a good snowfall, just prior to the arrival of the party, and the hunting was good from the very start. Not a day passed during the entire stay in camp but what deer were sighted and good shooting secured by at least some members of the party.

The same general plan was followed this year as last. Under the direction of Capt. Turner, each day's work was planned, and every move was made strictly according to Hoyle. To this concerted action the good results of the hunt are due in great measure. After the long tramp each day the hunters returned to camp in the evening with appetites that were whetted to a keen edge and the result of the efforts of LaTrace were assailed in a manner that would make a hotel keeper desire to close up shop and engage in some other business.

One pleasant feature of the hunt was that every member of the party shot a deer. Two days before camp was broken every one had bagged a deer but E. C. Cooper. The other members were anxious that he should drop at least one buck even if the buck had to be lassooed in advance and tied to a tree.

On the day mentioned, Overby and one of the camp attaches were heading for camp late in the afternoon, following close to the river. About a mile from camp their attention was attracted by a splashing in the river, and on investigating they saw a fine buck struggling in the river. It had slipped on the ice and broke through, and as the bank was steep was unable to get out. It had evidently been struggling for some time, as it was about "all in" when they discovered it. A happy thought struck Overby. Here he thought was Cooper's chance. He sent his companion to a house near by, instructing him to return with a hay rope. Meanwhile he watched the deer.

On the return of the man, the deer was caught, and securely tied to the rope, after which it was pulled from the river and tied to a tree near by.

With all speed the two men then hastened to camp, and all but Cooper were put on to the deal. They told him that a deer had been seen in a certain neck of the woods, and the entire party volunteered to engage in a drive, and it was planned that Cooper should station himself in a position that would insure him a shot. The plan was quickly executed, and Cooper was instructed to proceed to where the deer was tied. Overby by a circuitous route hastened to where the deer was and concealed himself under the river bank near the animal, and supplied himself with a few clubs to cast at the deer when Cooper approached.

When the crackle of brush announced the approach of Cooper, Overby shied a club or two at the crippled deer, and it jumped to its feet and let a snort out that could be heard a mile. At this juncture Cooper sighted the deer, and with eyes sticking out of his head as though he was being run through a wringer feet first, he drew a bead on the animal, which was facing the other way, and pulled the trigger.

Bravo! The buck fell with a sickening thud, and Cooper highly elated made a sprint for his fallen victim, closely watched by the balance of the party, all of whom were peering at him from behind trees at a distance. When Cooper reached the buck and found he was tied to a tree, he stood speechless. Then he peered about to see who was looking, and saw the entire party taking gapings at him. Budge was drawn up in a bunch convulsed with laughter. Overby's haw haws could have been heard a mile. Perry drew in his belt a notch to keep from bursting, Collins was roaring off in his corner and Turner was throwing a fit on the river bank.

Cooper retained himself wonderfully, though great drops of sweat stood out on his forehead, as he realized that he was the victim of a plot. He studied for about 10 minutes before uttering a word, and then broke out with "Gentlemen, I'll buy."

The incident furnished amusement to last the rest of the trip, and Cooper has been explaining ever since his return that the party were all "agin him."

Steve Collins was dubbed Daniel Boone by Cartwright, the mail carrier, but the manner in which he earned the title is withheld from publication for the present at least.

The hunters devoured two deer in camp, and the 18 others will arrive by freight soon, and friends all over the city are very much interested in this part of the programme. Every member of the party avers that the trip was the best they ever enjoyed. Not a single accident marred the hunt, and all return in better health and better humor than when they left.

In Other Days.

TOPEKA, Kas., Dec. 15.—The picture of the boy, dog and two grouse, or "partridges," as we called them in my boyhood days in Tompkins County, N. Y., brings up from memory's pages my first one, when a boy 10 years old, and I have never walked with the same pride since the day I carried him home. I was on my way to look at some mink traps (two flat stones set with a figure 4), but after I killed the grouse, the traps were forgotten, and I had to return home to show my game to my brothers and sisters.

The birds were quite plentiful when I lived at Sabula, Iowa, in 1876 and 1877, along the bluffs of the Mississippi River, and when I think of the pheasants, as they were termed there, I remember going to the bluff one morning with my dog and 16-gauge muzzleloading shotgun after squirrels. On loading the gun, at the foot of the bluff, I found I only had two loads of shot with me, and each of these killed a fine large fox-squirrel, and then the dog made the greatest fuss I had ever known him to make. On looking him up I found him at the foot of a dead tree by an abandoned stone quarry, and perched above him were six pheasants. What a situation to be in! I watched them for some minutes and then loaded the gun with small chips of stone from the quarry, and fired the first barrel without effect, and then with a more careful aim I fired at the same target, the lowest bird, with no other effect than to send the entire lot up over the bluff as fast as their wings could carry them.

When I went after them later in the fall, in November, I would always find them in a mingled thicket of hazel brush and wild raspberry and blackberry canes, but it made no difference from which direction I would approach the thicket, and start the dog in, they would always run to the opposite side of it before they would take wing.

After half a dozen failures to get a shot, I took a friend with me one day, and leaving the dog with him with instructions to start the grouse by sending the dog in from the east side when I signalled by a shout, I took my station over on a sloping bank of a gulch, up which their flight generally carried them about a half-mile from the thicket. Giving the signal he started the dog in and in a very few minutes I saw the first one start, and as it flew by me at a distance of about 30 yards, just over the tops of the young trees, it seemed to have entirely forgotten its hurry, and flew along at a moderate gait as if bound upon a pleasure excursion, until the borrowed 10-gauge breechloader spoke, and the bird went out of the flying business. One after another came in quick succession, to meet the same fate until five had fallen, and then from some cause that I never could reason out, either I or the gun got off, for the three that brought up the rear of the flight followed the same course and each one was saluted with two barrels, but I could see no effect of the shots except to wake up the bird fired at.

Gathering up the five dead ones, I started back toward the thicket and met my friend, who asked, "What have you been shooting at? There was not one single pheasant in that whole thicket." But when I told of the eight the dog had driven out and showed the five saved and mourned the loss of the three, he only grunted, "Some folks would like the whole earth with a fence around it, and a man that hain't satisfied with five pheasants out of eight shots had never ought to get another one as long as he lives."

We spent a good half day trying to relocate the other three, but could not, nor could we ever find another one in that thicket, and as I moved further west to the prairie section of the State in the spring I have never pointed a gun at a grouse since I missed the last one of the three, but I hope some time in the near future again to match my skill against their cunning "before I cross the range for good."

W. F. RIGHTMIRE.

Jersey Lightning Justice.

David R. Moffit, a constable of Basking Ridge, N. J., received a complaint some days ago that some persons were breaking the law by shooting and hunting on Sunday. He succeeded in finding the guilty person. Going to the quarry where the man was employed he was about to arrest him when the manager of the quarry asked him why he could not settle the matter over the telephone. The constabale called up Justice Bowers and briefly stated the case to the justice. When he had finished the justice said, "Fine 'im $20 and costs." The prisoner paid the fine to the State game warden and was released.

Game in Greater New York.

Editor Forest and Stream:

Considerable interest in and wonder at the occurrence of game birds within the limits of Greater New York have of late been manifested in FOREST AND STREAM and in the New York dailies. Game birds and animals abandon with reluctance haunts that afford protection and food; and it is due to the fact that the greater city still contains many marshes and covers, that grant a fair degree of immunity to disturbance, that we have, at the present time, small numbers of nearly every indigenous bird and animal.

The remarks that follow refer chiefly to that portion of the Borough of the Bronx that before annexation consisted of the towns of Westchester, Pelham and part of Eastchester. The topography of this section is twofold. The shore line, along the East River and Long Island Sound, is interrupted by several tidal creeks and bays, with extensive salt meadows and marshes bordering upon them; while in the interior the surface of the country is sufficiently uneven to be described as upland. Much of this latter land has been built upon and is thickly populated, but there are many large estates and acreages intact and unimproved. The timber upon these properties is principally second growth and brush with many swamps of alder and willow; but many fair-sized tracts of the original timber remain, with the exception of a few acres on either side of Pelham Parkway that have been filled in, the salt meadows are quite as they have always been.

Of the game birds still inhabiting this neighborhood, aside from shore birds and wild fowl, quail are the most numerous. From personal observation, and from the information of competent observers, I should estimate the number of quail in the entire Borough of the Bronx at the commencement of the present open season at between 150 and 200. This is a very conservative computation. There were, to my personal knowledge, at least three bevies at Eastchester, another between Williamsbridge and Westchester, and a fifth on the extreme southern end of Throgg's Neck. I do not know how many birds located in Pelham Park this year; but there are always quail there in considerable numbers, and the same statement is true of Van Cortlandt Park and the adjacent country. These are not the original quail of lower Westchester county. While there have always been a few of the birds here, they are from year to year becoming more plenty. Furthermore, intelligent old sportsmen of these parts assure me the present birds are not so large as the former occupants. My own knowledge of the Bronx dates back but eight years. The present quail unquestionably entered the Bronx from a New Rochelle preserve by way of Pelham Park. I have noted their movements from year to year. They have spread very generally throughout the Annexed District, but never until this year have they come so far south as Throgg's Neck.

Woodcock not only stop over during migration, but a few likewise breed here. Owing to the clearing and filling in of many swampy areas, their covers have become somewhat contracted, but the birds have by no means been driven away. The locations frequented are near Williamsbridge, Eastchester, Van Cortlandt Park, a small cover on Throgg's Neck and a spot near Morris Park Race-track. I have shot woodcock at the commencement of the shooting season and after ice had formed; of course there is no way of computing, even approximately, how many woodcock drop in of a season. But there have always been enough to make it worth while hunting them.

Plover still visit here spring and fall. I have often seen them on the upland meadows. A large flight of these birds occurred at Eastchester two years ago.

Pheasants, like quail, have found their way out of a New Rochelle preserve and are spreading over a considerable area. They are mostly seen near New Rochelle, Mt. Vernon and Bronxville, but several have been potted near Pelham Park and Eastchester. There is some chance of their increasing, as in the case of the quail, if they are given any show.

I have never seen a ruffed grouse anywhere within this borough and I do not believe there have been any here in many years. The last bird seen nearby, so far as I can learn, was killed above New Rochelle—out of the Bronx—six years ago. If by any possibility there should be a stray bird or two here, it would likely be in the upper part of Van Cortlandt Park, or between that point and the Mount Vernon line. Old residents tell me they have not killed or seen grouse east of the Bronx River within thirty-five years. But at least a few of the birds certainly remained in or near Van Cortlandt Park much later than this. It would be interesting if some of the older readers of FOREST AND STREAM would contribute their experiences upon this point. Wild fowl are still plenty in Pelham Bay and in the many tidal creeks entering the salt meadows. Battery shooting is employed on Pelham Bay each winter and a good many ducks are killed. Line shooting is no longer practiced this side of Sand's Point and the ducks are too wild to permit of much success in shooting over stools from a blind, although a few are got in this way. The most common varieties are broadbills, black ducks, coots and old wives, with an occasional teal and sheldrake. Loons and grebes are also frequently killed in Pelham Bay. Geese are often seen, usually flying high, and are only rarely killed. One was secured on the meadows below Unionport two winters ago.

Of shore birds the most frequently met with are yellowleg snipe. They are here spring and fall in very considerable numbers and many are killed. I saw an unusually large flight on the meadows near Baychester three years ago. I had killed three or four birds of a flock, and was calling the remainder, as I slipped in new shells, when my whistle was answered from the edge of the meadows near the land. As the first birds did not decoy, I worked in the direction of the new call with my dogs close in. I had nearly reached the spot I knew the birds would be on, when a crow sailed lazily out of the woods and directly over the snipe, which got up in alarm and circled. There were hundreds of them. I squatted down and called and the birds came back toward me, the crow following. The snipe were anxious to continue their feeding and flew round and round the meadows, endeavoring to shake off the crow. The latter stuck to them, however, and I devoted my energies to killing the crow, knowing if I succeeded in this I could do business with the yellowlegs. I could not get within range, however, and the snipe, with the crow in pursuit, continued moving in gradually increasing circles until they had passed out over the bay and beyond my reach.

Next to the yellowlegs, Wilson snipe are most often seen. They are never numerous; they come later and stay but a very short time.

Sandpipers are here constantly.

The Virginia rail is commonly met with, while the sora is infrequently seen.

I killed a long-billed curlew on the meadows four or five years ago; the only instance of meeting with this bird.

Of the birds allied to game birds that are common may be mentioned the green and blue herons, mud hens and bitterns, all of which, with the possible exception of the blue heron, nest here. Of course meadow larks and crow and redwing blackbirds are here in flocks.

No doubt many other shore birds drop in and are away again before they are observed; but those enumerated above are so constantly present as to be regarded as regular inhabitants.

Of game and allied animals gray squirrels are the most abundant. They are very generally distributed, as many groves of oak, chestnut, hickory, butternut and walnut remain. These squirrels are by no means limited to Bronx and Pelham Parks.

Rabbits are scattered pretty much all over, wherever a small brush lot is found.

There are many raccoons at Clason Point, Westchester, Eastchester and elsewhere in the Bronx. 'Coon dogs are still kept by colored and white hunters. Only a day or two since I read in a local paper of the midnight disturbances caused by the 'coon hunters around Wakefield and of the mounted police having been directed to break up the practice.

The mink, muskrat and skunk are still represented by fair numbers in this metropolitan fauna, and a colony of woodchucks is located at Castle Hill.

Foxes are found near Eastchester and around the upper city line. One was killed before hounds at Eastchester two years ago.

J. W. D.

BOROUGH OF THE BRONX, Dec. 18.

Editor Forest and Stream:

I have been interested in the accounts printed from time to time in FOREST AND STREAM of game in New York at the present day, for I myself, within the past year or two, have seen, or have had reported to me by relatives, such occurrences as woodcock and wild geese, both within easy gun shot.

Such occurrences recall various observations of earlier date, which I ask your permission to record here, even though they be nothing more than my personal memories. Perhaps even that will not be urged against them, for an interesting feature of FOREST AND STREAM is that it has to do largely with the personal experiences of its contributors.

I am an old New Yorker, and my boyhood days—until I went away to school and college—were passed on upper New York Island not very far from the old homes of Audubon, the naturalist, and of that other eminent ornithologist, Mr. Geo. N. Lawrence, who was well-known to a large number of your readers. My first surreptitious shooting excursions were undertaken at the age of 10 or 12 years, and for a number of years thereafter were pretty constant during the open season.

At that time, the part of New York Island where I resided was not laid out in streets and avenues, as it is at present, but was divided by a few old country roads, one of which running about north and south had been the main artery of travel between New York and Albany, and the others—cross roads—were chiefly country lanes, leading to the different farms and places which were located along the shores of the two rivers which bound the island.

Even at that time there was little game to be found about my home; but there were memorials of the wild creatures that in earlier years had inhabited the country. Thus, each season there was a considerable flight of wild pigeons from north to south over the island, and I recall that when quite a big boy, we used to get up on top of the house to shoot at these birds as they passed over. I do not recall the killing of more than one or two of them by this means, but quite frequently we used to get a pigeon or two when they came to the wild cherry or the dogwood trees to feed on the ripened fruit. Much earlier than this—some time between 1850 and 1860—I recall very well going to the front door before breakfast one morning, and seeing a dogwood tree, which stood a few yards from the door, absolutely covered, as it seemed to me, with pigeons which were feeding on the berries. The birds almost at once took flight and rose in the air—an innumerable multitude, as they appeared to my childish eyes, though I cannot say whether there were 50 or 100. At all events this flock of pigeons has always impressed me as by far the largest that I ever saw close at hand.

It was in Harris' woods, north of 158th street, and between Eleventh and Twelfth avenues, that I killed in my very earliest shooting days a ground dove (*Columbigallina passerina*)—identified by John W. Audubon, the son of the naturalist. Of course the specimen was not preserved, though it is very unusual so far north as this, but was carried home by the proud small boy who captured it and served on the family table—flanked perhaps by a robin and a high-ho.

In those days the Hudson River in winter was often full of ice, on which crows and white-headed eagles seemed to find abundant food. It has never been clear to my mind what it was that they ate, but great numbers of the bird were seen there constantly. We knew that the eagles subsisted in part on fish, for I recall very well an occasion when three eagles flew over our place, two in hot pursuit of the leader, which held in its claws a fish freshly captured. The pursuers pestered the lucky fisherman so much that it alighted in one of the trees in the place, and in doing so dropped the fish, which we recovered. In those days it was quite common for eagles to alight in the great trees in the place.

There was then a cedar crowned hill on the east side of the Harlem River and lying between 154th and 147th streets, and in these cedars great numbers of crows used to roost, and each morning at daybreak to fly nearly due west to the North River, where they spent the day, returning at night. Some times, if the weather was foggy or the wind blew strong from the west, the crows flew very low, and some times I used to shoot at them from an upper window of the house. I knew nothing whatever about wing shooting, but on one occasion I succeeded in killing a crow, which, falling from a considerable height was buried in the soft snow which covered the ground to the depth of a foot or two. My pride and satisfaction at this shot were enormous, and I endeavored to stuff and mount the crow, but as this was my first attempt at such work I failed completely.

At that time a stretch of country, now largely occupied by tall flat houses and stores lying between 165th and 175th street, and between what are now known as Amsterdam avenue and the old Kingsbridge Road, was open pasture and swamp land; the swamp land being overgrown by great water oaks and gum trees and under them by a growth of smaller brush.

Here the little green heron bred in considerable numbers, and from this fact, we boys called it the Green Heron Woods. Undoubtedly a pair of two of woodcock bred here also, and a few migratory birds dropped in during the flight; but at that time woodcock were far beyond my power to shoot, and though I knew the bird by sight and sometimes started one, I never saw them until it was too late. Moreover, as I did not know how to shoot on the wing, and was convinced that I could not hit a flying bird, I always waited, watching the bird as it passed, in the hope that it would alight within range and give me a "sitting" shot.

During the migration, we used to see woodcock frequently and in all sorts of places. And indeed in recent years they have been seen often in the city parks and even in the people's back yards. Quail, however, were much less common even in those days. During our expeditions to "Bronson's"—now Van Cortlandt Park—after blackbirds, robins, meadow larks, highholds and such large game, we frequently started flocks of quail on or near the old Van Cortlandt place, in what is now Van Cortlandt Park. At little to the northeast of Van Cortlandt Lake, there were some wet places from which often English snipe used to get up, and fly away followed by the longing looks of the small boy hunters. Incidentally I may remark, that on the hill lying northeast of Van Cortlandt Lake there was for many years a fish hawk's nest in a tall chestnut, and in early spring I often watched the birds for hours while they gathered material to put the nest in order for the coming season. I recall also a flock of four or five black ducks of enormous size—as we believed—which lived among the water bushes in Van Cortlandt Lake, and when alarmed—as they always were long before we got within shot of them—they used to fly northeast, as we supposed to some pond or spring beyond the hill where the fish hawk had its nest. Very likely they went over to the Bronx River, or perhaps to the Sound.

Quail were occasionally seen on the island as far south as the old villages of Carmansville, or even Manhattanville, but I always suspected that these were birds which had escaped from the place of Mr. Shepherd F. Knapp, a great sportsman, who frequently had game birds of one kind or another in captivity.

One of our great shooting grounds was the old Dykman meadows, north of where the speedway now ends, and where Dykeman street crosses the island from the Harlem River down to what we used to call Tubby Hook—now Inwood. Here tiny sandpipers were often to be found in the marshy meadows, sometimes English snipe were started, and on rare occasions a few yellowlegs were seen and captured. To us these last seemed as important and desirable as the elk or moose to the modern big game hunter, while the occasional wild duck, that was patiently stalked and finally potted on the water by the eager boys, represented, let us say, the charging grizzly of to-day.

In those days there was no dearth of rabbits or squirrels. Rabbits were especially abundant in what we used to call the Blind Asylum Woods, lying a little west of north of the present Institution for the Deaf and Dumb at 165th street and Boulevard Lafayette; and gray squirrels have been increasing ever since, so that they are very abundant all over the island.

To go back to other wild life, not game; hawks and owls were common enough, the barred and long-eared owls being the two more familiar species. I have not seen either of these for years in New York City, but some pairs of little screech owls still breed at different points on the upper part of the island, and their plaintive cry may be heard on almost any evening from February until May.

These details of old times may have some interest for the younger generation, and it seems to me that it would be a useful thing if the older men among your readers would set down their boyhood memories of such matters. These details cannot fail to be interesting to residents of American cities which in these days are changing so rapidly. I understand that Mr. Haswell, still living in New York I believe, used to shoot snipe on the Lispenard Meadows, near where Canal street now is, and there are unquestionably many jolly old fellows, contemporaries of mine, who, if they would take the trouble, could give most interesting stories of the game aspect of what is now New York, 50 or 60 years ago.

Plovers' Eggs in England.

NEW YORK, Dec. 23.—*Editor Forest and Stream:* I read a letter from Didymus in your issue of the 13th inst., regarding the destruction of plovers' eggs in England.

Any one who did not know would infer after reading his letter that the eggs were those of the small plovers, that are good eating; whereas, the eggs sold in the markets are those of the pewit, which is about the size of a small sea gull. Instead of being a fine game bird, very few are shot at, as they are not fit to eat, but the eggs are excellent, and when a boy I often hunted for their nests, which are difficult to find. In the winter pewits flock together in great numbers, and are comparatively tame to the other plovers.

K. A. T.

The National Park.

From the Superintendent's Annual Report.

Boundary Survey.

The boundaries of the Park on the north, west and south sides have been carefully surveyed and fairly well marked. There still remains unsurveyed about fifty miles of the boundary on the east side of the Park, extending from the monument established by Capt. Charles S. Bromwell, United States Engineers, on the boundary east of the Yellowstone Lake to the northern boundary of the Park. I have been informed that the necessary funds to pay for the survey and marking of this portion of the eastern boundary have been appropriated, and that the Commissioner of the General Land Office has been directed to complete this survey. It is believed that it is the intention of the General Land Office to finish this work early next summer. It is of the greatest importance that the boundaries of the Park should be thoroughly established and well marked, and it is therefore urgently recommended that this work may be done just as soon as possible.

It was my intention during the past summer to send out detachments for the purpose of cutting a wide swath along the entire boundary line of the Park wherever timber existed, and also for the purpose of setting up additional monuments where the country was open, and thus marking the boundary in such a way that it would be impossible for any one to cross it without being aware of the fact; but this I was unable to accomplish, owing to the frequent and unavoidable changes of troops stationed in the Park during the past season.

Game.

The large game in the Park continues to be one of its most interesting features to the tourist, and during the early part of the season large bands of elk and many deer and antelope were seen by them. Late in the summer, when the tourist travel becomes heavy and the flies and mosquitoes become troublesome, nearly all of the elk and deer move back into the high mountains, and are seldom seen by the tourists who travel through the Park by stage or wagon; they, however, can easily be found by any one who knows where to look for them, or who is sufficiently interested in the matter to take a horse and ride out into the mountains for the purpose of finding them.

Last winter was an exceedingly favorable one, and there should be a considerable increase in every species of large game throughout the Park; but this cannot be determined until after the snow falls, and the game is driven down from the high mountains to their winter feeding grounds.

Already a number of mountain sheep have been seen on Mount Everts, where a band of 56 wintered last year. There were several young ones among those seen, and I am greatly in hopes that there will be a considerable increase in the band. These rare and interesting animals could be seen any day during last winter feeding along the hillside and close to the road between Gardiner and Mammoth Hot Springs, and they were so tame that one could approach within thirty yards or nearer on foot without their being in the least disturbed.

The antelope are still protected by the laws of Montana, and are rapidly increasing. A number of bands of from fifty to one hundred could be seen at any time last winter on the northern slope of Mount Everts and in the vicinity of the town of Gardiner. The inhabitants of Gardiner have become much interested in the preservation of these beautiful little animals, and not only refrained from killing them themselves, but saw to it that no one else in their vicinity disturbed them. I believe that there were but two antelope killed on their range along the Yellowstone River last winter. This killing was done by two Italian miners from Horr, who were arrested by Scout McBride; but while he was bringing them in to the Springs during the night, his horse fell with him and the men escaped, but lost their guns and equipments, which remained in the hands of the scout.

The bear have certainly increased in numbers, and continue to be a great source of interest to the tourists, for they can be seen at any time during the season, feeding at the garbage piles at the various hotels and permanent camps.

They are perfectly harmless as long as they are let alone and kept in a perfectly wild state, but when they are fed and petted, as some of them have been in the past, they lose all fear of human beings, and are liable to do considerable damage to property and provisions at the various hotel and camp kitchens. They are also liable to frighten tourists by following them with the expectation of being fed. The black and brown bears are the ones that become the most friendly, and consequently give the most trouble. Three of these animals became such a nuisance during the past summer that it became necessary to have them killed.

It is a difficult matter to make some of the tourists realize that the bear in the Park are wild, and that it is a dangerous matter to trifle with them. The possibility of an accident or injury to some indiscreet individual was anticipated, and on Aug. 8, 1902, a circular was issued and posted at all of the hotels and permanent camps, absolutely prohibiting the interference with or molestation of bear or any other wild game in the Park, etc. It was also forbidden for any one to feed them except at the regular garbage piles. A violation of the instructions contained in this circular resulted in the serious injury of Mr. R. E. Southwick, a tourist from Hart, Mich. Since the accident to Mr. Southwick, barriers have been put up at all of the garbage piles, and signs indicating the danger of approaching too near the bear have been posted.

It is recommended that the gist of the circular relative to the bear be made a part of the regulations governing the Park, in order that any cases of violation of its provisions may be promptly brought before the United States Commissioner. A copy of the regulations, amended so as to cover this point, is appended hereto. In my opinion, a strict compliance with the requirements of this circular is all that is needed to render the bear in the Park perfectly harmless, and during the next season timely measures will be taken to see that they are complied with.

The beaver have also apparently increased, and fresh signs of their work and their dams and houses can be seen along any of the streams in the Park.

The scarcity of birds of all kinds has frequently been noted, and it has been suggested that the capercailzie and black cock, game birds of northern Europe, might be introduced in the Park. The capercailzie is said to be the largest of grouse species, and is found in large numbers in Norway and Sweden. Its home is in the pine forests, and when the deep snows come it can live on the pine leaves. The black cock is a fine game bird, and I believe it would also do well in many places in the Park. If these birds could be successfully raised here, they would spread into the neighboring country, and soon afford fine bird shooting where there is little or none at present.

There are some blue and ruffed grouse in the Park, but they are by no means numerous.

In order to afford perfect protection to game in the Park, it is absolutely necessary to have public sentiment of the people surrounding it on our side, and every possible effort has been made to secure their good will in this matter. The friendly spirit that has been shown by the large majority of these people has been very encouraging, and it is my opinion that they now realize the fact that the protection of game in the Park is a matter in which they are, or should be, quite as much, if not more, interested than any one else in the whole country. The recent formation of a game protective association in the Jackson Hole country, and the promise of this association to back up the game warden of Wyoming in his efforts to execute the game laws of that State, is an indication of what is being done along the southern border of the Park.

The following extract from the monthly report of the non-commissioned officer in charge of the Soda Butte Station will show to some extent the amount of game that can be seen in the Park during the winter:

Extract from monthly report of Soda Butte Station for month of December, 1901:

Dec.	From—	To—	Game seen.
2.	Station	Devil's Well	8 elk
2.	"	Fort Yellowstone	200 elk
3.	"	Slough Creek	1,000 elk
5.	"	Slough Creek Cabin	1,000 elk
6.	Slough Creek Cabin	Boundary line, on creek	100 elk
7.	" " "	Hellroaring Cabin	20,000 elk
8.	Hellroaring Cabin	Knowles Cabin and return	3,000 elk
9.	" "	Fort Yellowstone	800 elk
9.	Station	Fort Yellowstone	4,000 elk
10.	Fort Yellowstone	Hellroaring Cabin	600 elk
10.	" "	Station	3,000 elk
11.	Hellroaring Cabin	Station	8,000 elk
13.	Station	Cache Creek	400 elk
14.	"	Trout Lake	200 elk
16.	"	Fort Yellowstone	2,000 elk
17.	"	Cache Creek	1,000 elk
18.	"	Chalcedony Creek	
18.	Fort Yellowstone	Station	2,500 elk
19.	Station	Willow Creek Cabin	400 elk
20.	Willow Creek Cabin	East line of Park	18 elk
21.	" " "	Vicinity of cabin	8 elk
22.	" " "	Station	200 elk
23.	Station	Fort Yellowstone	2,000 elk
26.	"	Yancey's	500 elk
27.	Yancey's	Fort Yellowstone	14 deer
27.	Fort Yellowstone	Station	800 elk
28.	Station	Yancey's	1,500 elk
29.	Yancey's	Fort Yellowstone	
30.	Fort Yellowstone	Station	1,500 elk
31.	Station	Trout Lake	8 elk

This report covers only that section of the Park along the northern border, from the Mammoth Hot Springs to the eastern boundary. That portion of the Park where these elk were seen is the only good winter range that we have which is located within the limits of the Park, but reports from scouts and other stations made at the same time as the one referred to above showed that many other large bands of elk wintered in various parts of the Park.

The chief winter range for the elk that summer in the southern part of the Park is located in or about the Teton Forest Reserve. It is therefore to be hoped that some day both this reserve and the entire Yellowstone Park Forest Reserve may be either included within the limits of the Park, or that they may be designated as game preserves.

Buffalo.

Near the close of the last session of Congress I was called upon to submit an estimate of funds required to build a suitable inclosure, and to purchase from thirty to sixty buffalo, with a view to starting a new herd of these animals in the Park. The estimate submitted for this purpose amounted to $30,000. The appropriation which was made by Congress amounted to $15,000.

Mr. C. J. Jones (better known as "Buffalo Jones") arrived here on July 16, 1902, and in compliance with instructions from the honorable Secretary of the Interior, reported to me for duty in the Park as game warden. Shortly after his arrival here we proceeded on a trip through the Park, with a view to determining the best place on which to construct a corral or inclosure for the buffalo, and after carefully examining and considering all of the available places in the Park, we finally agreed upon the place which was originally suggested by myself to the honorable Secretary of the Interior as the most suitable point on which to locate the corral or inclosure.

It is situated about one mile from the Mammoth Hot Springs, and will afford considerable shelter and feed for the buffalo in the way of timber and grass during the winter. A fine stream of clear, cold water runs through it, and it is easy of access from this point at all times during the summer and winter. As soon as the location of the corral had been determined upon, steps were at once taken to proceed with the construction of the necessary wire fence. Proposals for the construction of the fence were solicited, but all bids received were so high that it was determined to purchase the material and set up the fence by day labor. Pending the construction of the fence, correspondence was had with all of the owners of pure-bred buffalo in the United States, with a view to ascertaining at what price per head they could be secured and delivered in sound condition in the corral to be constructed.

The necessary Page woven wire fencing was purchased, and the fence is now completed and ready to receive any buffalo that may be purchased. A contract has been entered into for the delivery in the corral of fifteen cows from the Allard herd, located on the Flathead Agency, in Montana, and three bulls from the Goodnight herd, in Texas.

In addition to the large corral that has been constructed near the Mammoth Hot Springs, a small corral has been constructed on Pelican Creek, with a view to capturing therein the few remaining in the Park. During the past winter we succeeded in locating twenty-two of these animals on the head of Pelican Creek, and there are probably a fey more that we were unable to find. This herd is exceedingly wild, and will probably never increase in size, and may possibly die out completely. It is thought that we can catch up some of the young animals of this herd during the ensuing winter, and bring them in to this point and turn them out in the inclosure with the other buffalo that are to be purchased.

It is my opinion that if we succeed in raising a new herd of buffalo under fence they will become very tame, and when the herd is sufficiently increased in numbers we can gradually turn them loose in the Park, and they will become so accustomed to seeing people about them that when turned loose they will not be frightened out of the country or driven into the high mountains by the appearance of the summer tourist.

It is considered desirable to introduce new blood in the new herd to be started in the Park, and it is with this view that part of this herd is purchased from the animals located on the Flathead Agency and part from the Goodnight herd in Texas.

This mixture of blood will further be increased by the capture of a few animals from the wild herd that we now have in the Park.

It is our intention to feed and handle the new herd of buffalo in the same manner that domestic cattle are handled in this country, and before turning them loose to brand them "U. S." in such a way that they can always be identified as United States property.

Since writing the above, fourteen buffalo cows have been received in fine condition and safely located in the inclosure built to receive them. Before turning them loose, they were branded "U. S." on the horn, in small letters, and on the left hip in large letters, such as are used in branding Government horses.

The cows came from the Allard herd, and were delivered under contract with Mr. Howard Eaton, of Medora, N. D.

Mr. C. J. Jones has gone to Texas for the purpose of selecting three buffalo bulls from the Goodnight herd, and they will probably be delivered in the Park some time before the end of October.

From Chipmunk to Moose.

I have just finished reading the score or more of interesting contributions in the last number of FOREST AND STREAM, and pause to consider which of its many breezy articles has afforded me the greater amount of satisfaction, and as my mind reverts to the various epistles, each replete with much that is attractive, indeed I may say lovable, the thought occurs to me, "What have I done in the way of contributing to this fund of sportsmen's fireside good things?"

The reply may be briefly stated in a single word—nothing. Is this quite fair, I ask myself, for one who began with the single muzzleloader, taken for a debt by my father, at the fabulous price of two dollars, and presented me as a Christmas gift in 1865, and with which, commencing with the chipmunk, skillfully brought to bag from the corner of an old worm fence, I advanced step by step until one crisp October morning, having lain awake nearly all the previous night, in blissful anticipation of a test of skill with the wary gray squirrel, I succeeded in "out-cunninging him," and returned with him snugly stored in my coat pocket—barring the streaming tail, which carefully trailed like a yacht's pennant at full length outside, and why? Surely no boy need be asked that question, it is pride, pure unadulterated pride. In this case it was justifiable, too, for has not my older brother on previous occasions accomplished this mighty task? And now I need no longer look up to him as a mightier nimrod than myself, I feel myself on an equal footing with him, in all matters, and in future, when the dinner pail containing the school-day lunch for three is opened by him, and the three pieces of pie are carefully "sized up," and the largest is appropriated by him, I dare for the first time in my life protest against his taking a bite from the apex of mine, and insist henceforth on fair play. And does he accord it? He does, and wisely throwing off his feeling of superiority, accepts me as a full partner; and in future these wondrous hunting expeditions are conducted by mutual consent by the "full board."

And of the nearly twoscore succeeding years, their various successes and failures, much may be told, for I have had my full share of the various field sports the country affords—of quail and partridge shooting—of angling for the speckled trout, the black bass and pickerel. I have camped in the mighty forests of Maine, and of Canada, during the banner month of October for eleven years, and have my quota of moose, caribou and deer heads in their several ports of honor about my home. An interesting bit of history, of pursuit and conquest, accompanies each individual trophy, often affording me generous comfort in the retrospective, and might it not

afford the same to others, if given the readers of FOREST AND STREAM? I am sure they would, were I gifted as a Didymus, a Hopkins or a Hastings. By the bye, what has become of that very interesting writer, W. W. Hastings? I miss his witty effusions so much, and many the article from his gifted pen has found a permanent resting place within the almost sacred leaves of my scrap book.

UNKNOWN.

Old Man Bassford's First Gun.

WE have heard about many a one's first gun and first quarry brought to bag, but I think Mr. Bassford's first gun story differs a little from all others. As usual, it was back in Old Calais, up in Maine, and it all happened right after he was fired out of the village school. Why was he fired out? I'll tell you as nearly in his own way as possible.

"I was fifteen years old and was attending our village school, a studious and attentive boy, mark that. On the particular evening, it was a cold and frosty one in January, and I can just hear the old sheet-iron cordwood stove crack and tremble with heat as I look back. The day before my father, for some good deed I had done, presented me with a horn-handled jackknife. It was my first knife, and when I was not whittling with it I was holding tight on to it in my pocket. And what was more natural for me to take it out when the teacher was giving us our morning lesson? When and just how it was done I do not remember, but I do know that I saw that knife disappear into the yawning mouth of that roaring stove. I did not shed a tear, although my heart was broken, but I do know all the devils in me—and I had a score or two of them allotted to me—were aroused. When school was dismissed I went home concocting mischief. Hunting through the cupboard I found an empty mustard bottle, one of those old-fashioned dropsical kind. I appropriated it. I went down to the blacksmith shop and collected a few rusty nails and small bits of iron, and returning home I hunted up my father's powder horn, and making a fairly good mixture of scrap iron and powder I packed the bottle and corked it.

"I now hunted in the attic for a discarded rag doll of my sister's, and found it. Emptying the sawdust from the body I inserted the mustard bottle, and all being ready, I hid it in the barn, awaiting the opening of school the next day. And at the proper time I drew out the doll and began to jiggle it on my desk. Like a hawk striking a quail, the teacher pounced upon it, and like a flash it went into the stove, and then the fireworks instantly went off, and the lid of the tough old sheet-iron stove went through the plaster ceiling, accompanied with a roar like a bursting charge of shrapnel. The pupils lit out like bees. The air was full of smoke and spurts of flame began to arise from where the stray embers had fallen on desk and floor. The fire or bucket brigade was soon on hand, and further than a damaged ceiling and a ruined stove no great amount of damage was done. That's how I came to be fired from school. I have a dim recollection that my father had to pay the bill for a new stove and fixings, but I recollect clearly what went on in the wood shed.

"And then I was apprenticed out and put to work. My school days were over, and when the early spring came the ducks began to come in before the ice was fairly out of the rivers. I borrowed a neighbor's gun—he valued it at $12. Lord! how well I remember it—and Sunday morning at daybreak I sneaked out to the river. Well, to make a long story short, I was soon floundering in the deep, icy river. I held on to the gun, but I quickly realized that I must decide between my life and the loss of the gun, and I let go the gun. How I managed to scramble out upon the ice I cannot tell, but I turned up home with my clothes frozen like boards and shivering like a boy with the ague. And who should be standing in the front yard talking to my pa but the man who owned the gun—that had gone to the bottom of the river. Pa yelled at me, 'Where have you been?' and the man yelled at me, 'Where's my gun?' Gee whiz! but I can remember every crack and cranny in that old wood shed. They were impressed not only on my mind but on every bone in my body. And when I came out of the wood shed the man again asked for his gun. 'Don't say gun to me again as long as you live. When I can pay for it I will.' During the six years of apprenticeship my time was not my own, and I had no money. But the years rolled around and when my 21st birthday arrived I was free. My time was now my own. What I earned was now mine. The first twenty dollars I saved above my expenses I put in my pocket and walked up to the man's store. 'I want my bill for that gun I lost,' said I. 'You said it was worth $12. Now figure $12 with compound interest, tell me the amount and I'll pay it.' I knew the amount better than he did, because I had computed it year by year as the time went. And I paid him, I think, something like $20, and that was the story of my first gun and I have never forgotten it.

"Many years after I went back to Old Calais for a visit, a reasonably prosperous man in my profession. One of the old inhabitants invited me to go up and visit the old red schoolhouse, and I went. I could yet outline the repaired ceiling and some of the burnt holes in the thick pine floor I could yet notice. I was asked to make a speech to the children and I reluctantly consented. I started off by telling them how, as a boy, I had attended that very school and sat upon those very benches. I pointed to the very seat I sat in and asked the occupant of it he could not find E. P. B. cut on the bench—and he found it. I went on to tell them what a nice, good boy I was. At this one of the little girls in the front row put her hands over her mouth to keep her from exploding, but she he! heed! right out.

"'What's the matter, my little girl?' said I. 'Speak up, so all the scholars can hear you.' And what did she reply but that her grandma told her that morning that as a girl she had gone to school with Ed. Bassford and that 'he was the worst boy in the whole school.' And I cut short my speech then and there. There was no use of my quoting scripture to that school."

CHARLES CRISTADORO.

CHICAGO AND THE WEST.

Disastrous Quail Season.

The close of the quail season this week—for in spite of the lack of legal protection on this bird, all Illinois sportsmen still regard the season as closing Dec. 20—ends a shooting term which has been actually disastrous, so far as sport with this bird has been concerned. Those shooters who were out early in the season could not find the birds and said that the trouble was that the vegetation was too high. Those who waited until later in the season were even worse off. They found but a scattered supply of birds and encountered the most villainous weather imaginable. For ten days we have been having nothing but rain, slop, sleet and slush; and if there should come a sudden freeze, the poor Bob Whites would have a serious time of it even thus early in the winter season. There has been no good sport at all in this part of the country this year, and unless prospects brighten, we shall feel a little discouraged in regard to the crop for next year. I do not discover that the usual number of quail shooters have been out, but it is certain that those who have been shooting have brought back but poor stories regarding the supply of this standard game bird of the Middle West. Without our quail we are entirely ruined, so far as shooting is concerned, in this part of the world. Duck shooting has come to be a matter of preserves. Prairie chicken shooting is practically at an end, and so is the snipe shooting, barring an occasional haphazard flight in the spring. In the last few years we have had good sport with the quail. Let us hope that things will wake up next year, for if they do not we shall be in a bad way.

Changed Habits of Quail.

I continue to hear stories from sportsmen which inclined me to believe that the mention earlier printed in these columns regarding the changed habits of the Bob White quail is matter based upon excellent foundation. I was talking to-day with Mr. Oswald Von Lengerke, a gentleman who perhaps goes out as often after quail as any one of my acquaintance. He tells me that the quail "act different" from what they used to. He agrees with me that they fly further, scatter more widely, run further, rise more wildly, and secrete themselves more mysteriously than was ever the case before. Mr. Von Lengerke has noticed these changes in the habits of the Bob White quail within the last six or seven years of his shooting in this country. I never before fully realized that these birds were becoming more wary, less valuable as sporting birds indeed, until certain experiences of my own this fall. I am disposed to believe that Bob White is learning to take care of himself to the extent that he is losing just a shade of his original sporting quality.

The gentleman above referred to cited several instances of his own experience this fall. On one occasion he put up a bevy which split, a half dozen alighting apparently on an open, frozen field and about a dozen going into scrub oak. He had good dogs and went directly to the place where he saw the birds light in the open. He hunted for half an hour in the center of the field and then around the edges of the field, but could get absolutely no trace of these birds. Following the rest of the bevy in the scrub oak, he saw them get up wild ahead of the dogs one after the other, giving practically no shooting. Again on his last quail shoot he put up three bevies, which scattered in practically the same fashion. In the morning he killed eight birds out of nine shots. The weather was wet and freezing and in the afternoon the birds were simply impossible. He fired 18 shots and only killed three birds in the afternoon; and I may say that he is a very steady quail shot. Any quail shooter will realize that this means conditions under which the birds will not properly lie to the dog. He says that the birds would run every way, going up behind him, flying out of trees, in fact acting entirely different from what Bob White used to in the good old days. I am satisfied that this is to be the history of quail shooting in all this northern country. The species, harried too hard, is learning of mother Nature how to take care of itself.

Bear Dogs in Old Mexico.

I met my tall friend, Mr. Fred. M. Stephenson, of Menominee, Mich., in town to-day, and asked him to give me the true story of his bear and lion hunt in Mexico last year, when he had down John Goff, of Colorado, and his pack of dogs, to see what could be done in running the silver tips of the Sierra Madres. Mr. Stephenson says that they had some sport in Old Mexico, but believes they would have killed more bear without the dogs than with them. The trouble with the Goff pack was that it was made up in part of fighting dogs and in part of trailing dogs. The latter could outrun the former. It was no trouble at all to start a bear, or rather to get a bear trail. Then the running dogs would trail off and soon go out of hearing, jumping the bear perhaps entirely out of hearing. Mr. Stephenson once saw a good grizzly going up a mountain side with six dogs following behind it, not one of which had courage to go in and nip the bear. The fighting dogs did not seem to be able to keep the pace and would frequently come back to the hunters, leaving the rest of the pack still running and unable to bay up the game. This sort of thing might tire a lion, but would not stop a bear. The country was very rough and it was impossible to ride to the dogs with any kind of success. Mr. Stephenson was ready to say that bear hunting with dogs, or at least with this pack of dogs, was not a success in that part of the world. Yet he says that he hears Mr. Lyons of New Mexico very often kills grizzlies, cinnamons and silver tips by means of his own pack, which manage to stop a bear even in the roughest country.

Mr. Stephenson and his friend ex-Alderman William Kent, of this city, shot deer together in the north woods this fall, each killing his limit in Wisconsin and in Michigan. They were intending to have a hunt with the Bobo pack of bear dogs in Mississippi this winter, but I presume that the sudden and wholly unexpected news of Col. Bobo's death will, of course, end all plans to this effect.

The Fate of Our Game Birds.

This afternoon my friend Graham H. Harris and myself were prowling along South Wather street in search of feathers for our winter fly tying operations. We stopped at the commission house of George Sloane & Company and talked for a while with Mr. Sloane himself.

"Mr. Sloane," said I, "I would like to ask you as a man widely experienced in the game supply, what you think as to the future of our game birds? Do you think that our supply of game birds is going to hold out?"

"There will be game birds in this country as long as there are men," replied Mr. Sloane.

"How do you figure that out?" said I.

"Well, this way," was Mr. Sloane's reply. "They will be raised and protected by men on their own lands."

"But how about the poor man," said I.

"There is no place in this world for the poor man," said Mr. Sloane sententiously. "There will be no shooting in America for a poor man. We will have birds, but they will be preserved and protected birds. We will come to the same system that they have in England."

I expressed my discontent over this prospect. Mr. Sloane went on: "There is something in the trade in game birds on the street this fall," said he, "which is not generally known. I want to say to you that more than half of the game which we sold on South Water street this season came not from the American West, but from across the Atlantic, from England. We sell a great many grouse here which come from Liverpool, Eng., and are passed with the average man as prairie chickens. They are not quite so good a bird. Now we can sell these English birds—we get them at Liverpool, but I do not know where they are killed—for just about one-half what the American grouse will cost. We get some English partridges also, and a great many pheasants. Now, if you ask me what is to be the future of the American game birds, I simply tell you these facts. We will always have game, but we will not always have the old days of open shooting in America, where every man, even the poor man, could have sport for himself."

There is small comment to be added to the labove except that Mr. Sloane is a man of very wide experience in the selling of game. He is accepted to-day as practically the head of the game trade on South Water street.

A Bird-Eating Man.

The following is the latest Wishinninne story. About two years ago Messrs. C. S. Dennis, W. L. Wells and Eddie Pope, all of the Wishinninne Club, were hunting with Ed. Sidler near Wheatland, Ind., and in the course of their travels put up a bevy of quail near a country school house from which, at the time, the children were emerging with the merry laugh and shout usually accorded to school children in books of poesy. One of the dogs pointed and Mr. Dennis managed to knock down a wing tipped bird, which fell at a hedge not far from the schoolhouse. Running on ahead, he retrieved the bird, and, taking it up, proceeded to bite the neck to kill it, after approved sportsman fashion. Just as he had the neck of the bird in his mouth, Billy Wells, who was somewhat in the rear, called out: "Run! run! boys and girls," he said. "Stop that man! He eats up every one of our quails that he can get to!"

The children, somewhat startled, gazed for a moment at the bird-eating man, then turned and ran to the schoolhouse, where they confusedly expressed their horror and fear of a man who would eat live quail. The school teacher, witnessing Mr. Dennis standing near, with his long flowing beard decorated with quail feathers, was much assured of the truth of her pupils' attitude. By that time Mr. Dennis had put the quail in his pocket. It would be difficult, however, to persuade either pupils or teacher that he did not insert it into his stomach instead, feathers and all.

Selected Quail for Planting.

Mr. H. A. Noyes, of Hyde Park, Vt., writes under date of Dec. 10 in regard to this same question of changed habits in the Bob White quail. He wants some selected birds for a preserve in Vermont. I shall let him speak for himself as below:

"I was particularly interested in reading in FOREST AND STREAM the account of your recent quail hunt in Minnesota, my special interest being due to the fact that I have for some time desired to do in a small way some quail stocking in this part of northern Vermont, and would have put out the birds the past season could I have secured them. Of course the question has always been, will quail survive the winters of this section? Your account of the number of birds in Minnesota would lead one to believe that the right birds would. For the past few years quail have been put out near Lake Champlain, but as to whether they hold their own or survive the winters in any numbers reports are conflicting. In this part of the State, which is hilly and mountainous, with an abundance of cover, there might be a little more snow, but very much less danger from thaws and crusts. Snow "to stay" usually comes about Dec. 1, and continues for three to four months. I would greatly appreciate your advising me if it would be possible for me to secure a few of the Minnesota birds for stocking purposes, and if you can suggest anything in the way of winter protection or feeding."

I am very sure that Mr. Noyes will not be able to get any Minnesota quail for planting, desirable as that might be, from the Vermont standpoint. I do not know how the situation is in Ontario, Canada, which is closer to Vermont. They had a very severe winter there a while ago, and it nearly cleaned out their birds. I found the Ontario birds very large and hardy, and believe these would be as desirable as the Minnesota quail. It is difficult to obtain any quail for planting from Northern States, as the local supply is none too generous or secure at best. I doubt if the birds would do well in "mountainous country," with heavy snow for three months. They need a country with some farms, to furnish feed, liking wheat, buckwheat, sorghum or corn. As to providing shelter, there is little to be done. If the birds are to survive they will find

their own shelter, and a country which does not give them enough protection would hardly be suitable. Yet I saw some brush heaps, rude roofs piled up, and provided with corn, on the preserve of a Canada club (Ontario). E. HOUGH.

126 HARTFORD BUILDING, Chicago.

The Adirondack Deer.

JAMESTOWN, N. Y.—*Editor Forest and Stream:* I have been watching the papers since the closed season in this State on deer, so as to compare notes with former years, in regard to the number killed and shipped. But so far have seen nothing authentic on the subject. I doubt not that many people would be interested in the inspection of such a record. Notice has again been given out by certain game protective associations as the sense of the members that the open season on deer be shortened by cutting off fifteen days of November. The argument set forth leading to such a conclusion (justice to all parties being considered) is hard to imagine. If the present law gives the hunters a privilege to slaughter more than the yearly increase, would it not be preferable to limit the number each hunter could lawfully kill to one deer rather than shorten the open season? Why keep a law that gives those living near the hunting grounds a monopoly of the sport? Should not those domiciled in the southern half of the State share equally with those in the northern half? What justice in enforcing a law that allows one party to ship only one carcass home with him at the end of his outing, while the other party (by private conveyance) is allowed two? If he hunts on the 15th or last day of the open season and kills one or two deer, which would be lawful, there is no way provided for shipment after that date. What can he do? Leave his game where it fell, give it away, or try and smuggle it through boxed-up as potatoes or some other commodity?

Why not cut off the month of September, a month in which but few sportsmen outside of the woods care to spend in still-hunting for deer, and add on to the open season the latter half of November, when the temperature would be cool enough for the preservation of game during shipment, and the economical use of it after arrival at its destination? This would also be highly appreciated by many of our sportsmen who make annual trips to the Maine or New Brunswick hunting grounds, who are now, by the Lacey Law, debarred from bringing game lawfully killed home with them. Cut off the month of September from the open season, not only on deer, but also on ruffed grouse, woodcock, black and gray squirrel. Limit the number of each to be killed. Stop the sale of all kinds of game, and you have killed the business of the market-hunter, and saved the lives of many deer slaughtered by jacking them in the night time and when brought in the next day, registered as having been bagged by still-hunting. In my judgment the cutting off of two weeks in November would not materially affect the professional gunner residing in the wilderness or living in close proximity thereto, while it would debar many others from engaging in the sport or enjoying any of the fruits thereof. OLD SHEKARRY.

Some Ways of the Pheasant.

CUMBERLAND, Vancouver Island, B. C.—*Editor Forest and Stream:* In your issue of Dec. 6 I notice an article on the pheasant, written by Mr. W. B. Savary.

As I have studied the habits of this bird considerably, a few lines from me might be of service to him as well as others, who may be introducing them. In my opinion the pheasant is the game bird par excellence, both in the field and on the table. They are fairly hardy and easily domesticated, that is, to a certain extent. If fed and encouraged they may constantly be seen in and about the barnyard, but when approached will run for the nearest cover. Of course, I am speaking of birds in their wild state. In some parts of England, where the climate is not conducive to the successful rearing of young birds, owing to heavy rains during the summer, the gamekeepers have orders to gather all the pheasant eggs they can find and these are set under good motherly fowls in the cover adjoining the keeper's lodge, and the foster mother looks after them in first-class style until such times as they feel that they can do for themselves, when they leave, returning only at intervals to see how she is getting on. As a further protection during the inclement winter weather, sheds are erected close to good covers, where the birds are known to congregate, and in these the keepers sprinkle grain two or three times a week.

On an estate in Devonshire, over which I have frequently shot, one of these sheds was not far from the keeper's lodge, and his fowls used to wander down, help themselves and mix sociably with the pheasants. One year, while shooting in that neighborhood, the dogs put up several black and white birds, showing that they had crossed with the keeper's fowls.

The pheasant is a bird, which, if it does not inherit, soon learns the first law of nature, i.e., self-preservation.

In the early part of the season, which opens Oct. 1, they will be found in coveys. The birds then (never having been disturbed) lie close to the dog, and when flushed, offer an easy mark to an average shot as they are generally found in the open fields. A covey when fired into, will usually scatter and drop in cover if there be any at hand. When hunting up these scattered birds, they begin to show their shrewdness. A well-trained cocker is the best dog for this work. He strikes a scent and his stub tail suffers from a severe attack of the shakes, you follow at a reasonable distance with gun at the ready. He trails it into a thicket of willows or hardhack and the bird goes out on the other side, always taking care to keep a goodly supply of twigs and branches between itself and you. As the season advances, the birds become more wary, the coveys split up, and by the beginning of November you will very seldom find a bird in the fields unless they are close to cover. By this time, too, they have learned what follows a dog, and will invariably run 50 or 60 yards when they hear one approaching, before they take wing; therefore, it is advisable at this time of year to keep close up to the dog.

Pheasants (as Mr. Savary remarks) do occasionally help themselves out of the garden, but what little damage they do is more than repaid by the countless number of bugs, worms and insects they destroy. They appear to like feeding round damp and swampy land, such as an alder bottom, and I have frequently found their legs covered with mud when shot in such places.

When fully feathered, they are by no means an easy bird to kill, and if only winged, it takes a swift dog and considerable time to bring them to bag, as they are wonderful sprinters. I have seen one fly 200 yards, though mortally wounded. I only know of two instances in which pheasants have treed, and to one of these I was an eye witness. It happened on the first day of the season last year, when a young hen took to a tree on being flushed the second time.

They were introduced here some nine years ago, and put out in the farming district at Courtenay, although the nesting season here is, as a rule, against them, being wet, they have multiplied so steadily that it is now possible to find them on every farm in the neighborhood. The shooting of these birds was allowed for the first time last year, and then for cock birds only. This is a good law and one which is enforced on a great many estates in England; it assists largely in keeping up the number of birds, too, as they are not monogamous. FRANK RAMSAY.

The Ring Neck Pheasant

As a Future Game Bird for Massachusetts.

ABOUT ten years ago I turned out the first English, or ring-necked pheasants, in Beverly, and the next year a few more, in all about twenty-five. Since then they have spread and increased, and I believe others have been introduced nearby.

Having had a good deal of opportunity to watch these birds, to observe their habits and to work them with the dog, I want to say the following, for I am convinced at the present time that as a future game bird for this State they cannot be relied upon in the least. It seems to me there are several reasons for this view. In the first place the pheasant is a bird of the open and easily hunted districts, and never, unless under cold weather, does he appear to take much interest in swamps and timber. This makes him an easy prey for even a very ordinary hunter. Of course, it is possible that under heavy shooting he may more or less change his habitat.

In the second place, he is a large bird and offers a tempting meal to anyone, and his habit of scratching up gardens and fields makes him very unpopular with the farmer, who, unless he happens to be a firm believer in the game laws, is more than liable to take a pot shot at him from behind a fence, as the bold intruder struts about among his crops. This pernicious habit of the pheasant will tend to become a perfect nuisance if the bird ever becomes very plentiful.

In the third place, he is not a thorough gentleman, and cannot ever rank with either quail, partridge or woodcock as a sporting proposition. The young birds often lie very close to afford excellent points for the dog, but these birds usually rise so slowly and in such easy cover that there is no satisfaction in knocking them down. After they are grown and educated, they seldom lie to the dog at all, and usually tend to run in open country. Many an old cock I have trailed for half a mile or more, either to find he has silently flipped away, or to catch a glimpse of him sailing over a distant ridge. I have seen them run in complete circles, like a hare or rabbit, and have often caught sight of them a hundred yards ahead of the dog doing a race-horse act between two patches of cover. This sort of hunting becomes very monotonous and is more than liable to make the dog unsteady.

Again, it is my personal belief that the very year the law goes off these birds they will be practically exterminated here. Their excellent table qualities will make them the prey of every market shooter, and many men will hunt them as long as they can kill one or two a day.

There are, of course, several arguments in the pheasant's favor. He is a fine, large, handsome bird, and most excellent eating, better, in many persons' opinion, than either quail or partridge. He is extremely hardy, and as far as I know never suffers from our winter climate. Apparently, he can eat anything, even the very coarsest of berries, nuts and seeds, including cranberries.

These birds are also very prolific, and the young are well able to take care of themselves, but they lack the essential qualities of a game bird for a thickly settled and over-shot country.

Now, the ruffed grouse has all the qualities which are essential for his maintenance here. Hardy, shy and non-migratory, we should look to him before either quail or woodcock, and most important of all he is by far the most difficult of any of our native birds to kill with gun and dog, and if snaring and selling were entirely done away with, he would, I think, not only hold his own, but increase.

What more can a man wish than to be able to start in a day's hunt from fifty to one hundred of these brown rockets. Even if the shy fellows do not always lay close to the dog, even if they are sure to be found in the toughest, roughest and thickest piece, a pair well killed will afford more real satisfaction and require ten times the skill than a dozen great lumbering pheasants shot in the same way.

I merely wanted in this letter to emphasize the fact that we should not rely on a foreign bird when we have a native one as good as the ruffed grouse, and that although the pheasant may increase to goodly proportions, and, with strict laws hold his own, he cannot at the present time be looked upon as the future game bird for Massachusetts. JOHN C. PHILLIPS.

Deer in Westchester County.

OSSINING, N. Y.—*Editor Forest and Stream:* A few days ago a full grown buck weighing about 180 pounds with fair sized antlers was killed by an early train on the N. Y. C. & H. R. R. R. track about a quarter of a mile above the Ossining station. The man who first found the carcass left it lying at the side of the southbound track where he found it, being afraid of the law governing deer, etc., waiting for the coroner I suppose. He told about his find and two upper dockers (local term) carried the carcass down to the village. It was badly broken up and but 20 pounds of good meat was secured.

There have been three deer seen in this vicinity lately, some have decided that they have escaped from Graaf's place at Oscawana, while others are of the opinion that the deer have "gotten wise" to the fact that we passed a law prohibiting for five years the shooting of deer in Westchester County, and are looking for a place of immunity. Faint hope for the deer, for between the railroad and a colony of Italians here who shoot everything from a humming bird up, the three deer have probably by this time been all accounted for. C. G. B.

Reloading Brass Shells.

AUBURN, Me., Dec. 14.—Under the heading of "Hints and Wrinkles," Bristol Hill's experience in reloading rifle shells reminds me of my own. As the old saying goes, "It is so different." His method of lubricating the bullets after the shells are loaded reminds me of my first attempt at reloading, for I did as he says he does, only to have about two out of three of the brass shells spoiled when fired; for without the grease properly put in the grease grooves in the bullet, when fired the lead takes the brass along with it and renders the shell useless for further use. There is also one other point which I fail to take in as to how he closes the brass shell on the bullet without inserting the same into the shell below the grease grooves in the proper manner. My first attempt without the grease properly applied was so disastrous to my shells I have never tried it since; but with the lubricant applied to the bullet before it is inserted I have no trouble whatever and have shells which I have reloaded many times and are good now. I am always looking for new wrinkles, but these of Bristol Hill have puzzled me some.

Massachusetts Game.

WHITINSVILLE, Mass., Dec. 12.—*Editor Forest and Stream:* The season just passed has proved a good one for partridge shooting with us. We have been able to start twice as many birds as usual—that is, for several years back. We think this is largely the result of the no sale clause in our game laws. The benefit of this feature is now admitted by almost every one; some that were against it three years ago now say it is a good thing. We do not believe it will be difficult to renew this feature of the laws, which will undoubtedly be done.

Quail have been fairly numerous, but I do not think so many birds were found as were expected from the early summer reports.

Woodcock did not seem so plentiful as a year ago, though my personal score was better this year on these birds.

The best bag that I was concerned in contained fourteen birds—woodcock and partridge, mostly woodcock. This was for two guns for a short day's shoot. We were fortunate enough to strike a flight that day and secured every woodcock that we started.

I send a photo of my old dog on woodcock, which serves to remind me of the good sport we had this particular day, though the picture was taken earlier in the season. C. A. TAFT.

Ohio's Poor Season.

MIAMISBURG, O.—The hunting season just closed has been a complete failure. Squirrels were found to be extremely scarce in localities where they were formerly quite numerous. Duck, quail and rabbit shooting was the poorest in my recollection.

Hoping to find conditions better further north I and my brother went to the Grand Reservoir in Mercer County. We found ducks by the thousands, but we also found the water so low that it was impossible to reach the good shooting ground. We spent the greater part of the day on the reservoir and only succeeded in bagging two. Another party from this place went to the Lewistown Reservoir and have reported the same results. I may say, however, with some satisfaction that song birds are increasing rapidly, while English sparrows are decreasing in proportion. CLARENCE VANDIVEER.

A Michigan View.

MT. CLEMENS, Mich., Dec. 18.—*Editor Forest and Stream:* The New York League talking of the abolition of the sale of woodcock and ruffed grouse killed within the State, seems too foolish for sportsmen to talk about. Stop the sale of game by putting into effect the entire FOREST AND STREAM's platform. There may be a distinguishing mark to tell New York from Michigan woodcock and ruffed grouse that I do not know anything about. How would it do to have New York woodcock wear a green ribbon around their necks, Michigan ones a red one? J. P. W.

Thirty Ducks at a Shot.

Editor Forest and Stream:

I see reported in the morning paper that Orf Tuttle, a hunter, of Eastport, L. I., has made a new record for killing the largest number of ducks at one shot, having secured thirty at a single discharge. The ducks were closely huddled in an air-hole in the ice. What do they use down there for artillery, punt guns?

TEMPERANCE.

"Ah, I knew 'high-balls' would be my finish," sighed the wild goose as a rifle bullet struck him in mid-air and brought him to the real estate.—Judge.

The Antelope's Tenacity of Life.

IN the Nov. 22 number of the FOREST AND STREAM is an interesting article on the time the pronghorn antelope sheds its horn sheaths. My observations are that the antelope sheds its horn sheaths almost universally in November, except some of the younger members, which, in my experience, shed a little later, i.e., about the first week in December. Another interesting fact is the enormous amount of vitality a pronghorn possesses, much more than a deer, and equal to an elk or moose, though I admit the last three named are shot at a much closer range than the antelope, and this would make some difference in the striking power of a bullet.

The following incident will tell of the tenacious hold on life the antelope has:

When I was guiding Sir Arthur W—y in his hunting trips through Montana, with saddled horses and pack animals, we started for the Crazy Mountains to hunt silvertips. After we left Judith Gap for the Musselshill River, we came to a big coulee, near Hopley's Hole, and as the wind was sharp and cold, I proposed we should ride along the bottom of the draw as far as we could go, as we would be protected from the wind. On ascending the side I saw a small band of antelope feeding about a mile away. As they had evidently not seen us and there seemed no way for us to stalk them where they were, I told Sir Arthur to remain where he was and I would ride down the draw far below them, and then go at right angles until they saw or winded me, when they would run in his direction, and he could get his shot. My plan worked to a charm; they ran quite near him, when he dropped their leader, and this caused them to turn and try to run across me. I saw the smoke as he emptied the magazine of his rifle, and noticed through my field glass that one of the antelope was trailing behind. As they passed me I refrained from shooting, as we now had all the antelope meat we could use. As the hind pronghorn passed, I thought I could see a dark line trailing behind him, and in a few minutes I saw him collapse in a heap. As I rode toward him I saw something on the ground. They were his entrails, strung out their full length. One of the shots, I found on examination, had disemboweled him, and he had run over a half-mile dragging them, as subsequent examination showed, for I found bits of them now and then on the sage brush for the whole distance.

The antelope with his large, gentle eyes and graceful limbs, like the old landmarks, is passing away. Let us try and save them both. E. A. M.

Game of British Columbia.

CUMBERLAND, B. C., Dec. 16.—*Editor Forest and Stream:* The deer season closed on the 15th, and it seemed as if they turned out en masse for the benefit of the hunters on the last open day, as the number brought to town verified the reports that it was no trouble to get deer that day; the number killed was somewhat in the neighborhood of forty.

I have never tasted nicer venison nor seen deer in better condition than they have been this season. Several fine heads have been fetched in, and our local taxidermist, Mr. O. H. Fechner, is doing good work on them.

Ducks are here in large numbers, but unfortunately, the majority of them are not edible, owing to their disgusting habit of feeding on the decaying salmon lying along the banks of the rivers. I think if we had some wild rice sown around the marshes and swamps here we might possibly induce the mallards and other fish eaters to leave the putrid salmon alone, as I firmly believe they only resort to this diet for the want of something better.

The quail (Bob White), which were introduced here two years ago, are rapidly spreading, some have been seen twenty miles from where the Kansas birds were released. FRANK RAMSAY.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

The St. Maurice.

PROMINENT among the many Canadian sportsmen's associations is the St. Maurice Fish and Game Club, of Montreal, which numbers among its hundred and odd members many well known New Yorkers and a score or more of residents of other cities of the United States.

The club was organized about six years ago by Dr. W. H. Drummond, of Montreal, whose beautiful descriptions in prose and poetry of his observations in the Canadian wilds have tempted many travelers and sportsmen the world over to visit the scenes which inspired his literary labors. Through the efforts of Dr. Drummond the club secured a twenty-year grant, with fishing and shooting privileges of two hundred square miles of territory located in about the central part of the Province of Quebec, about the headwaters of the St. Maurice River.

This immense and almost primeval tract of forest, wooded mostly with pine, birch and spruce, and watered, besides the St. Maurice, by the upper and lower Bostonnais and Middle rivers, abounds in lakes, among them the Big and Little Wyagamack, the Bostonnais, St. Thomas, Allen, Travers, the Brunnelles and Little River lakes, all of which fairly teem with trout, muscallonge and other varieties of fish. The region furnishes excellent moose and caribou hunting; partridges are plentiful, and in the fall months the lakes and rivers swarm with ducks. The majority of the members of the club, however, are devoted fishermen, rather than hunters, and visit the region in the spring when extraordinary catches of fish are made.

Besides the comfortable clubhouse on the St. Maurice River, the club has built a fine log camp on the Little Wyagamack and a similar one on the northwest shore of the Big Wyagamack on the way to the Bostonnais lakes. Portages have been cut and cleared for many miles around the lakes in which fishing is best, and it is the club's intention to build additional camps as the requirements arise.

Mr. Edward A. Richard, one of the New York members, tells an interesting story of his recent visit to the club reservation. "Starting from Grandes Piles," said Mr. Richard, "and accompanied by Mr. C. F. Shallcross, also of New York, we paddled up the St. Maurice River, which we found almost as smooth as a mill pond, to the falls of Mattewan, where there are six miles of rapids, two miles of which are exceedingly rough and dangerous. We passed over this stretch without mishap, however, and reached Thebaud's, where we put up for the night. Thebaud's is a station for lumbermen bound to spend the winter in the great woods near La Toque, the first port in that region of the Hudson Bay Company.

"The horrors of that night I don't think we shall ever forget. The lumbermen made the hours hideous with quarreling, fighting and bawling out songs, and sleep was impossible. Having had scarcely any rest, we resumed our canoeing the next morning and twenty-six miles further up the river reached Rat River, a settlement owned by Adams, a genial Scotchman, known thereabout as the father of that region, who offered us the greatest hospitality.

"Leaving this spot, not without regret, we proceeded twenty-eight miles further up this beautiful and picturesque river when we came in sight of La Toque Mountain, and encountered the grand falls of the St. Maurice. These are a series of cascades or shooting rapids, passing through a deep cañon, and at the settlement of La Toque emptying into a large pool where muscallonge and whitefish are to be caught in astonishing numbers.

"In an hour's fishing I landed eleven muscallonge, the largest weighing twenty-two pounds. I felt somewhat elated over the catch of my largest fish until shown one weighing thirty-two pounds, which had been caught the day before our arrival by 'Old Man' McGregor, 86 years of age, and the oldest employee of the Hudson Bay Company. That night we slept in the comfortable cabin on the banks of the pool owned by the St. Maurice Club, and which marks the entrance to the club grounds.

"The next morning a pleasant walk of about three miles brought us to the Bostonnais River, where, embarking in our canoes, we paddled up the stream until we reached Bonton Pond, where we found fishing extraordinary. The pond is literally alive with large trout and muscallonge, the former of the brook variety, speckled and with square tail. As muscallonge are known to be a fierce enemy of trout, we thought it exceedingly odd that both should be found in the same pond, until the fact was accounted for by John Allen, the guardian of the St. Maurice Club, who explained that the trout came down the Bostonnais River over very rough falls into the pond, and that only the larger ones survived the journey, and these were able to hold their own with the muscallonge. The trout we caught were all of a large size, weighing from four to six pounds.

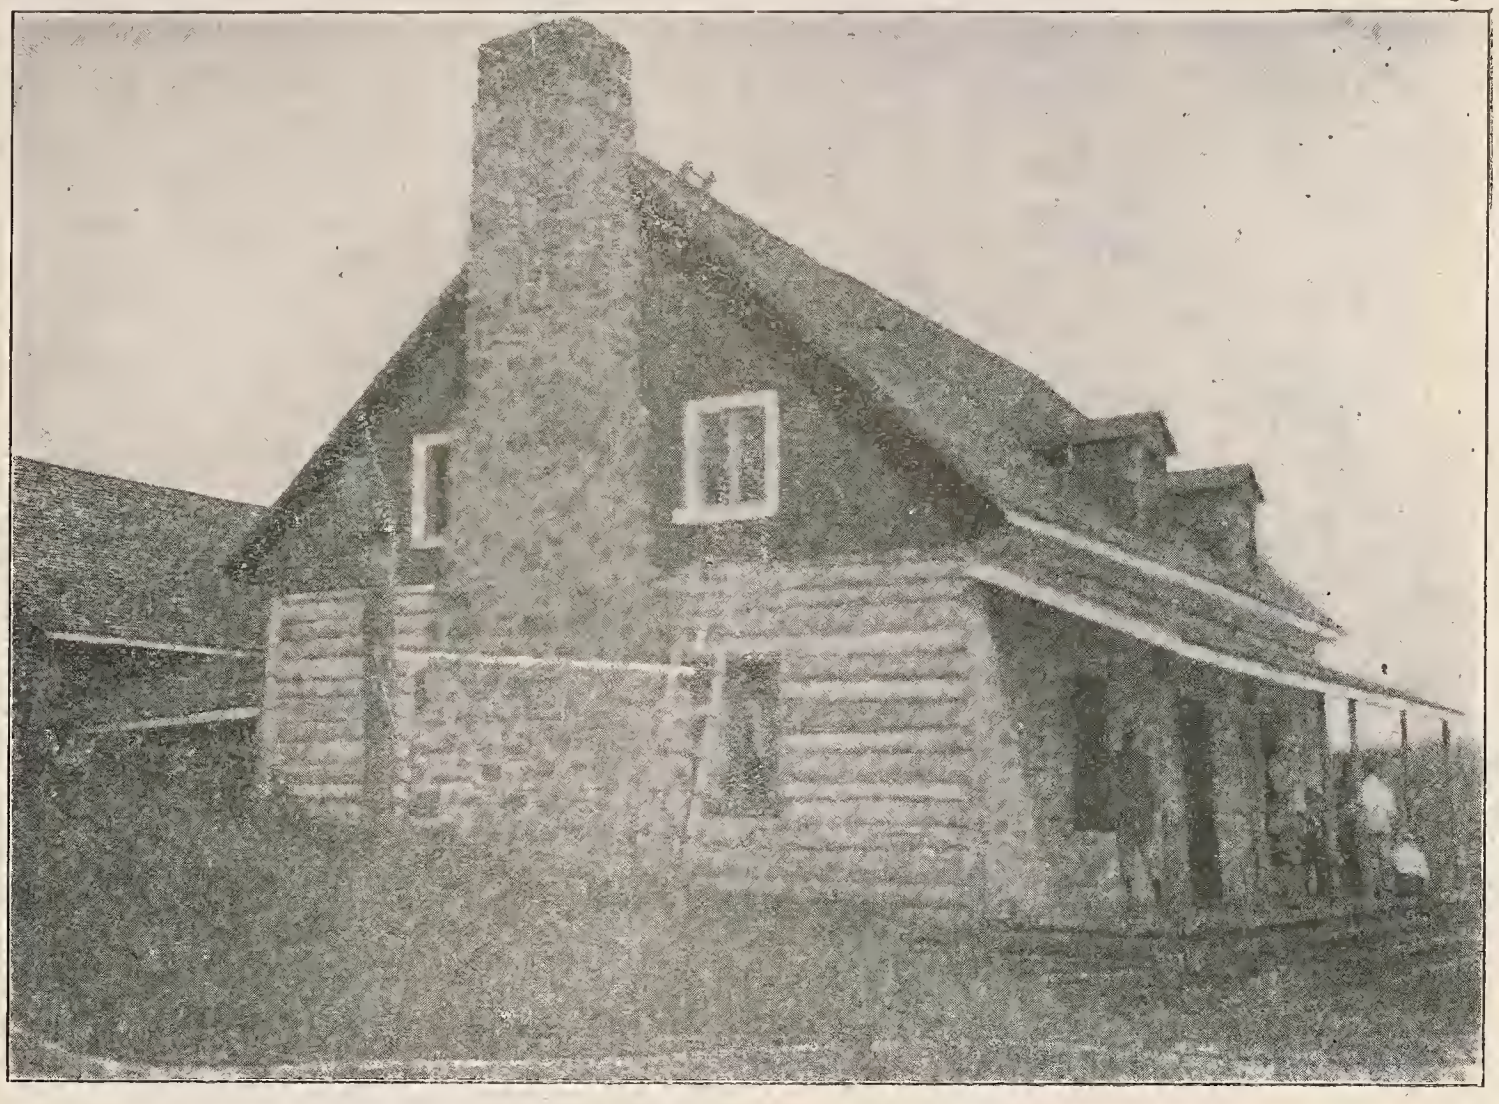
"We then fished up the Bostonnais, enjoying the best of sport until we came to the lower dam of the Wyagamack, where Allen met us with canoes, and in half an hour we were inside the cozy clubhouse located on Big Wyagamack Lake, which also abounds in trout. After resting three days, we proceeded to the falls of the upper Bostonnais, where we fished the pool with great success, trout rising at every cast, the largest one weighing four and a half pounds.

"While fishing the pool one of the guides called out, 'A moose, a moose!' We got to shore in a jiffy and above a dam about a hundred yards distant, was a fine three-year-old moose swimming across the river. As soon as he reached land our Mausers began to bark, and he was down with three shots. Tents were pitched and we passed the first night of our journey under canvas.

"With the help of Allen, who knows the country thoroughly, we were led to the Bostonnais Lakes where many tracks of moose and caribou were seen, and a fine specimen of the latter animal was shot. A few days later we started northward through the almost impenetrable woods until we again struck the St. Maurice River. Two days more of such journeying brought us to another post of the Hudson Bay Company, it being virtually on top of the Hudson Bay divide, and about one hundred and fifty miles from Jamestown at the foot of Hudson Bay.

"Game tracks getting scarce we struck off to the southeast, encountering numerous lakes and ponds on our way, the game tracks, however, increasing as we proceeded. Reaching Lake Travers, a small spike moose was shot, as fresh meat was much needed. We found no fish in the lake except chubs, which resemble little suckers. The next day, after arduous and fatiguing journey, we came to Middle River, which Pelang, the lumberman made famous by Dr. Drummond in his works, guided us to from a map on birch bark.

"We had deemed the fishing we had enjoyed hitherto most extraordinary, but the trout fishing in Middle River is simply beyond belief, and I hesitate to tell of it as my reputation for veracity may be called in question by many. As a matter of fact it was no uncommon thing to catch three trout on a leader at the same time. The trout caught by the members of our party averaged four pounds each, and one was caught which weighed nine pounds and a half! Before leaving New York a mutual friend had made a wager with my companion, Mr. Shallcross, that he would be unable to catch ten pounds of fish in twelve casts. In the language of horsemen, he won his wager in a canter, Mr. Shallcross landing nine and one-half pounds of trout in four casts, the rest being easy. And it is proper to say that Mr. Shalleross does not consider himself by any means an expert fisherman.



THE ST. MAURICE CLUB HOUSE.

"After enjoying this almost unparalleled fishing to the full, we again took up our journey, and six days later slept on Lake Travers. The next day we crossed the big swamp which adjoins that lake and reached Little Wyagamack, where we found a good comfortable camp had been prepared for us by our guides, Mon. Xavier and Fontain, and where we met Edward Mercier, son of old Mercier, known throughout that region as a great character who fought in the Egyptian campaign of '54, and whom Dr. Drummond has pictured so entertainingly in "The Habitant."

"If, by the way, there ever were a Gaston and Alphonse in real life, they were our guides, Xavier and Fontain. Although comrades for years in the wilderness they always observed the strictest formality addressing each other. It was always Monsieur Gaston and Monsieur Alphonse with them, and the sight of their continual bowing and touching of hats, accompanied by the asking of each other's pardon over the slightest matter or incident, kept the party ever in good humor. They were indeed a most extraordinary pair.

"Here again, we found the fishing as fine as one could fairly wish, and we simply reveled in the sport of shooting sawbills and blackduck, which were found in the lake in great numbers. So easy were they to get that shotguns were put aside for the nonce and only rifles used in shooting them. A few days later we made our way back, passing down the upper Bostonnais to the Big Wyagamack, reaching the St. Maurice clubhouse completely tuckered out, but with fit appetites to do justice to one of Mrs. Allen's famous suppers of trout and caribou meat.

"We had passed the weeks, from Sept. 12 to Oct. 15, in the woods and found the weather, as a whole, delightful, there having been but little rain and no snow whatever.

"I heard from Allen the other day, and he reports zero weather in Canada, and in addition tells of shooting at an unsusually large moose with fine bird shot. It seems that he regularly uses shot cartridges in his .44 rifle for killing partridges, and in coming upon a lake unexpectedly, ran into two large moose immediately ahead of him, and in the surprise forgot how his gun was loaded. To quote his own graphic language, 'I walked up to a lake and there stood two large moose, and I forgot that it was shot that was in the rifle, and I shot at that huge moose standing looking at me so close that the fine shot hit him and made him

jump into the woods. I can't forget it.' Personally I should hate to be haunted by such a recollection."

The officers of the St. Maurice Fish and Game Club are as follows: President, Dr. W. H. Drummond; First Vice-President, C. R. G. Johnson; Second Vice-President, Charles S. Haight; Secretary-Treasurer, S. H. Smyth. The directors are W. H. Parker, Dr. F. A. L. Lockhart, H. M. Brigham, Waldo K. Chase, Frank Presbrey and William Herrick.

My Record Bass.

THE sun was sinking into a labyrinth of elongated, milky clouds in the west, after bathing old earth all day in a hazy light and warmth that made it seem an effort for the sober looking frog to utter his monotonous croak and the tree toad his prolonged drone.

We stood beneath majestic pines, upon the great brown carpet of their needles, woven by Nature's master hand, the softness and beauty of which cannot be equalled even in the finest tapestry. At our feet lay that exquisite sheet of water, Lake Nagog; its placid surface stretching away a mile or more like a huge mirror, reflecting tree, rock and vine, accentuating in the reflection the grandeur which towered above.

It was due to the black bass that we stood at the edge of beautiful Nagog, drinking in the grandeur of the scene as the sun began to irradiate the silver-tinted clouds in the west, throwing a mellow glow upon the great overhanging gnarled oaks and towering pines along the rocky shore. Clear as crystal is the water of Nagog, clearer than any other lake water I have ever seen; a dime can be readily seen at a depth of ten feet on its clean gravel bottom.

There were three of us, bent on measuring cunning with the wily bass—my wife, myself and Smith. Each had a boat and each an attendant to ply the oars.

"Too calm for the fly," I remarked; so setting up my rod, a new nine foot ten ounce split bamboo I had just bought, I proceeded to carry my new "never-break" through the guides. This accomplished, a barrier was encountered. What lure should I use? After a short semi-scientific meditation, it was concluded that the most sensible and best adapted bait to the conditions was a small Skinner spoon with a No. 1 hook, and soon the flashing lure was dangling at the end of the line by a trace swivel.

We embarked, each taking a different course. I instructed my boatman to row slowly and cautiously along the northeasterly shore, which is very rocky, surmounted here and there by rustic camps nestling among the verdant trees that tower far above them. My objective point was about an eighth of a mile above, where the water makes into a narrow causeway, across which a wire fence is extended. Here abundant aquatic vegetation shows on the surface—it being conspicuously absent in nearly the entire rest of the lake. At the edge of the pads a huge rocky ledge, with overhanging profile, breaks the ripples of the lake, and jostles the mighty oaks that spread their massive arms above it and far out over the water.

Cautiously we glide over the placid water, well out from shore. Cast after cast is made right to the very brink, retrieving nearly to the boat, and yet no strike. Ahead I see the lair. It is instinct, telepathy, or what that sets the blood tingling at sight of the massive ledge and overhanging branches at the edge of the pads? I warn my boatman to go slowly and a trifle further awater; closer and closer we approach; I make a cast three feet from the rock and pads; then carefully measuring the distance, I make a cast à la Henshall; the bright, glistening spoon ruffles the first pad and starts outward. What's that! A swish—a splash—a gleam, and the instinctive turn of the wrist sets the hook in the gallant foe. "Back for deep water, man," in sharp tones, to the boatman. How the reel sings, as with a mighty rush he makes for his lair beneath the ledge. Now rod, your mettle; now line, your strength; for I give him the butt, and true as steel the weapons bear the mighty strain. He is headed the other way. With a swish the line cuts the water as he dashes away at an angle of forty-five degrees from the boat—a sudden turn, and he leaps from the water, the crystal liquid dripping and sparkling from his broad, gleaming, copper sides. In angry fright he seems to stand erect on his great tail, shaking his head, as a terrier when shaking a rat, in an effort to eject the stinging hook. The line is slackened, then drawn taut quickly, as he plunges back to his crystal abode. Then comes another wild dash of fully fifty feet, the multiplier singing in sweetest cadence.

Gradually I lead him back near the boat, and for the first time I observe my boatman as I tell him to prepare with net. There he sits with wide, open mouth that would do justice to the fish at the end of the line; eyes protruding, apparently as much interested as if he were watching Hercules striving to land a Greenland whale with the North Pole.

We have worked out to spacious water, and the gallant fish is fighting with Gen. Grant's stubbornness, and, metaphorically speaking, it seemed to me it would take all summer to fight it out on this line. Again he leaves the water, and again I slack the frail-looking silken line.

What a beauty and a monster, a race horse game to the core, fighting every inch of the home stretch to the wire.

Gradually the strain, long and steady, of the elastic bamboo is doing its work. I have him close to the net at last, but with a sudden dash he is away again, right under the boat. "Heavens! my rod is gone." Not so, however, for dexterously I pass it astern and give line, the battle continues on the other side. Again, I reel in, at least for the twentieth time. He leads obedient till near the boat, which, no doubt, awakes his declining spirits, and as if in a last despair, he makes a mighty plunge—down—down—in the very depths of the lake.

I lead him gently back; he is wellnigh all in; the bright, gleaming side of golden green and copper glistens at the very side of the boat. "The net," I almost whisper to the boatman. A sudden commotion behind me—he grasps the net, stumbles over and over, pitches heavily against me with the force of a bail of hay falling on an unwary passerby. I am pitched forward on the gunwale of the boat with my circumspect attendant piled upon me—a wild gasp and we are both floundering in the water. I hear a voice calling my name in the distance. I grows more distinct; I make it out at last; it's my wife's: "George! George! Get up! There goes the quarter of seven train."

"'Twas but a dream,
Contorting grandeur of the rose
That blooms in thought ere night's repose."

SINGLE HOOK.

Fish and Fishing.

Fiish and Fish Food.

ONE of my friends was fishing an inland Canadian lake for trout during the late summer season, and was told by an old resident of the locality an interesting story of the enormous quantities of these fish, and of their great size, which were taken there nearly half a century ago, when he was a boy. For very many seasons past it has been carefully preserved and only fished a very little by sportsmen. Yet neither in number nor in size does it contain anything like the fish which were taken out of it years ago, when it was unprotected, and wagon loads of trout taken from its waters were annually shipped to market. Like the teller of the story, my friend was rather surprised at the alleged falling off in the supply under the circumstances related. Later on, in the course of the conversation, however, something was said that started my friend a-thinking. The old-timer remarked that when the big catches of large trout were taken out of the lake for market, it was the custom of the market fishermen to cart the offal of neighboring slaughtering houses to the lake and throw it into the water in order to bring the fish to the place where it was desired to take them. Further inquiry elicited the fact that the entrails of the animals slaughtered were fed to the fish in considerable quantities, and there can be no doubt that herein is to be found the explanation of the size and number of the trout taken from this water in former times. When that particular food supply was interrupted—the lake not being particularly well furnished with natural food—the larger trout were driven to the necessity of feeding upon their smaller relatives, and as these decreased, there were fewer to reach maturity, and still less food for the few survivors to thrive and fatten upon.

Salmon for Hatcheries.

Complaints have been made from time to time that some of the salmon waters in Canada, which are leased to anglers, are injured by being excessively fished by the officers of the fishery department, in their efforts to obtain parent fish for stripping for the hatcheries. As many as five hundred salmon are often taken for the supply of eggs for a single hatchery. It is, therefore, with very much pleasure that I notice in the last report of the department of Fisheries at Ottawa that a system has been adopted in New Brunswick which should be followed in connection with all the salmon hatcheries of the country. The salmon hatcheries at Grand Falls, N. B., and Bedford, Nova Scotia, are supplied with eggs obtained from fish confined in a salt water pond located at Carleton, opposite the city of St. John. The fish are purchased from bona fide fishermen, and confined in this pond until ready for spawning operations in the autumn. The fish are caught by the actual fishermen, and if not purchased by the department, would be placed on the market; but owing to the present policy, they are a means of increasing their species, and by being returned to the water, afford a second source of revenue to the fishermen.

The Netting in Lake Champlain.

It is sincerely to be hoped that something may yet be done to put an end to the netting of the pike-perch on their spawning grounds in Lake Champlain. I know that Canada is largely responsible for the outrage, as already stated in this column, but it is melancholy to learn, from what a Burlington man told me to-day, that the destruction of fish is now even greater on the American than on the Canadian side. As the authorities in Vermont claim a readiness to prohibit the netting if Canada will do the same, another effort should certainly be made with the Canadian authorities. For this movement, the best possible opportunity that could offer will be afforded by the meeting, in the third week of January, in the city of Ottawa, where the Dominion's Department of Fisheries has its headquarters, of that important international body, the North American Fish and Game Protective Association, which has already taken the matter up conjointly with the Vermont Fish and Game League. Largely through the personal influence of Mr. John W. Titcomb, of the U. S. Fish Commission, who happened, last year, to be the president of both those bodies, the then Canadian Minister of Fisheries was induced to prohibit netting in Lake Champlain altogether; though political pressure, later on, compelled the withdrawal of the prohibition. The present Minister of Fisheries is a new man in the office, and the association may be able to have him present at its meeting in Ottawa, to be informed of the iniquity of the present condition of affairs. It appears to the officers of the association to be very important that the U. S. Fish Commission should interest itself in this matter, and they have consequently invited it to be represented at the approaching meeting. Mr. Titcomb has this matter at his fingers' ends, and if he cannot straighten it out with the Canadian authorities, if sent to Ottawa for the purpose, on such an occasion as that referred to, it may be taken for granted that nobody else can.

Fishing at Kootenay.

A friend sends me an interesting extract from a letter concerning the fly-fishing for rainbow trout in the Kootenay River, British Columbia. Though this water is less widely known and discussed than those western streams in which steelheads are taken, there seems to be no possible doubt that execellent sport awaits the angler who is fortunate enough to cast his flies over it. The rainbow hereabouts run up to about eight pounds each, are described as extremely gamy, have not yet been made shy by overfishing, and rise greedily to almost all the angler's ordinary flies, the coachman, hackles and March-brown being found exceptionally good. Life in the rapids seems to have given the fish strength and courage, and an angler with a light fly-rod has been known to have been kept for over half an hour killing a two-pound Kootenay trout. They are said to snatch at the fly with a dash and splash and whirl of gleaming sides that is often quite disconcerting to the novice, unused to their ways.

E. T. D. CHAMBERS.

Advanced Ideas in Farming, Trapping and Woodcraft.—IV.

THE impetuous editor of the Zephyr met with an accident one evening while pursuing the hazardous occupation of Kansas journalism, which while not necessarily as fatal as accidents of that kind sometimes are, but which effectually interfered with his duties in the editorial chair, or, to be more exact and literal, on the editorial soap box. He was in the act of descending with some haste the ladder that was for such cases made and provided, leading from the second story window at the rear of the building in which the Zephyr was domiciled, to be used in case of sudden invasion by the libeled populace. It appears that an armed invasion by one of the said populace had occurred on the night aforesaid, precipitated by some personal allusion in one of the Zephyr's characteristic personal items—well meant, perhaps, but highly injudicious. The person who had in this way been injured in feelings and reputation, paid the editor a call, but his progress up the stairs was too tumultuous and his language somewhat too lurid to admit of any doubt as to the nature of the proposed interview. Somebody was to be dealt with. The editor had possibly experienced other conferences of similar nature and had made use of the always ready avenue of escape. On this occasion, however, the hasty retreat down the ladder was more precipitous, and the man of usually methodical movement, missed the second rung of the ladder and fell seventeen feet, landing with great precision in the cyclone cellar, without which appendage or annex no house or habited building in that State is complete. When you read of a residence or a boarding house having all the comforts of home, it has reference to the thoughtful provision of a cyclone cellar. He went through the cellar door without a stop, and lay on the floor a promiscuous heap of disabled editorial functions. This was probably all that saved his life, for the invading force was hunting for him everywhere else with blood in his eye and a doubled-barreled shotgun in his hands.

He was found the following morning, and considering the shake up received, his anatomy was in pretty fair condition. He was under the impression that there had been a cyclone, and let it go at that. He sent for me the first thing and plaintively laid the case before me as clearly as bandages, splints, poultices and plasters would admit of, and said he could see his finish right there if I did not consent to take hold of the Zephyr and write things for three weeks until he could get around. Think of a man with thirteen damaged specimens from a busted menagerie and circus on his hands, running a farm in his uncle's absence, with a reputation to sustain, assuming in cold blood a country newspaper, which was the organ of the greenbackers at one time in the State of Kansas. Well, as I said before, there's no accounting for tastes! I did it.

The first thing I printed was an appeal to all the subscribers in the county to act as associate editors and send in their copy. It was a howling success. The postmaster was obliged to get one of his nieces to help him, and the mail of the Zephyr increased from sixteen pieces a week, exclusive of exchanges and duns, to a soapbox full of letters the second week. Some were written on the blank portions of old envelopes, some on both sides of pieces of wrapping paper, some on pages from school copy books, some on grocery bills, very old and not receipted. One of these came very near accomplishing my ruin as managing editor. The intelligent compositor printed the bill entire as a communication, without looking at the other side, and I seemed in danger of another invasion.

However, there were some excellent treatises on agricultural matters, a good deal of poetry, an occasional obituary, personal reflections on the conduct and character of neighbors, in connection with church socials and the support of the ministry. Like this, for instance:

"It beats me how a certain young man Thet wears a red necktie and a light drab overcoat can hire a horse and buggy every Saturday and take a certain young lady with a big hat and a light blue sack out ridin' when he don't seem to be able to pay his subscription to the missionary circle. Mebby the chap can't get credit at both places to oncet, and mebby the girl don't know just where he is at." THOMPSON.

But one on the status of the crops by Melancthon Kraddock was the right stuff. Here it is:

Krop Noats.

Watter mellons wus a bountiful Krop, whitch wus to be Expected in veau of the large Amount of Watter planted last Spring in various Sexions. The Krop of agricult'ral impalments Appearantly want wuth getherin; I cum to this konclusion after seein' the number of implamence left into the feelds where they growed. This is all right fur the machine Agunts, but It shows that The Krop of lasey shifles farmers is about ez big ez yousual.

Rye was allers a pop'lar Krop. The propper kwantity to plant to oncet is about 3 fingers, with a leetle water, but thare ain't no fixed rool about when or How often it should be planted. Thats a Good deal a matter of Taste. If doo cair is taken in cultivatin' of it it yeelds a Brilliant rose-colored Blossom. Korn likewise pans out harnsum in this respeck. Onyuns is allways a Strong Krop for the farmer, and iz doin more probably to Break up the Kissin' habit than most enny other Krop.

The Krop of fools, Kranks and embezzlers has been hevy all over the country, and thrashin' ort to be kep' up lively right along, and even then I skacely think we can git tbroo before another krop will be ripe. It seems an orful pitty that there aint no furrin demand fur this Krop. Lord! how quick we could pay orf the nashonal dett if there wus any markit for half of this ere Krop.

Theres one Krop that haint been harvested yet, tho it seems to be gittin ripe tolerable fast. The fellers thets hen sowin' the seed

and a cultivatin' roun' the country peers to me hav' been too bizzy at that to think much about the wind up. Mebby thay aint so verry anxyus to reap the harvest, nuther; I shouldn't think they wood. I now refur to the doggoned Trusts and Combines. I'm mighty 'fraid that when folks kind er get impatient like and turn to fer a big harvest Dance it'll get to be so cussed hot fur them seed sewers thet they won't half enjoy it. Me and my wife looks four some orful lively goins on when people git too feelin' too tired of the monotiny. Yours for Reform,

MELANCTHON KRADDOCK.

Melancthon was congratulated on having his guessing machine in good running order, and invited to become a regular contributor.

Jim Skinner sent a fox story that must not be lost to the world; neither will it be.

Bill Herkimer also departed from the strictly agricultural sphere to tell what he knew about the best way to domesticate the gray squirrel and make him a useful member of society.

Then Perry Worden thought there was not enough attention paid to raising peanuts and guarding this delicate crop from early frosts.

Lincoln Johnson Hayes' boy, who was home from business college on a vacation, wrote an able treatise on football and the best way to avoid sudden death in connection with the game.

'Lige Bennaway said he "had wrote for papers before," and one of his stories being on the subject of fish, he sent in an excerpt from a back number of some paper, name not given. As a study from nature and Gidder's pond, it is valuable, and is given herewith entire:

"There's been a heap o' talk around these parts," said Squire Miller one night while the crowd was sitting around the front porch of the hotel, "about eddicated animules. Some o' you fellers hev told some pretty tall stories about eels what become as gentle as dogs, an' rats that to all intents an' purposes was cats, an' a lot o' stuff like that. Now, as yer all through, I jes want to tell you a true story about a fish, a common, every day old gar pike, what become the scourge o' Gidder's Pond.

"Yes, sir, that's jest what this old gar got ter be. A regular scourge. He became the best fisherman that ever went nosing around Gidder's Pond, and I want to say thet there's been a lot of right good fishermen around them parts. But this ole gar pike fish beat 'em all.

"You all remember old Ike Puterbaugh thet used to do a little farmin' and a little blacksmithin' and a little huntin' and a little fishin' over at Gidder's Pond? Well, the ole man was a' industrious 'nough feller, but I guess he deversified too much. He wuz never able to git much money ahead fer his fambly, and they lived most of the time jest about from hand to mouth, and sometimes they wuz purty near next to starving. Then thet summer hotel started down at Waynesville, and there wuz a great demand for fish ter feed the hungry boarders with. The proprietor of the hotel allowed thet he would buy all the fish thet wuz brought to him, and a lot of fellers commenced fishing over at Gidder's Pond to supply the hotel. This wuz ole man Puterbaugh's chance, and he went fishing more'n ever, but he wuz a poor sort of fisherman some way er other. Seemed to have best sort of poles and good lines, and the best kind of bait, too, an' patience enough ter put on er monument. But somehow er other he didn't have fisherman's luck, an' he didn't ketch any fish.

"Well, one day th' ole man ketched a little baby gar fish. O' course, every fisherman. jest natcherally hates gar fishes. They hain't no earthly good but ter eat bait up, and break lines an' everything, an' generally when a man catches a gar fish he don't throw it back in the water, but tosses it out on the shore an' lets it die. Ole man Puterbaugh he was a-goin' ter let the little gar fish perish the same way, but somehow when he took a good look at it he didn't have the heart.

"So he put it in a bucket and took it home an' put it in the horse trough, an' two or three times a day he ust ter go an' throw it some crumbs er some fish worms. The gar fish grew like the mischief, an' he got so he would wait fer the old man's comin' an' bob rite up out of the water as soon as the ole man would begin to whistle when comin' down the hill toward the tank. The gar would swim rite up to Puterbaugh, an' the ole man would pat him on the head an' talk to him, an' the gar would wag his tail jest like a dog.

"One spring a turrible freshet come on an' made a reg'lar lake all around the horse trough, which was down in a holler. The tank overflowed an' the gar fish he got out an' swam in the flood to the creek an' disappeared.

"When the gar pike hed made his escape the ole man wuz dreadful lonely, so he took to fishin' ag'in, with about the same kind o' luck.

"One day while he was sittin' down by the pond a-fishin' in a sore o' disconsolate way an' a-wonderin' why he didn't get a bite, he suddenly saw a big gar pike stick its long nose up out of the water an' kinder wink at him.

"'By jing,' ole man Puterbaugh said, 'if thet hain't my ole gar pike, I don't want er cent!'

"Sure enough, thets jest who it was. The fish swum right up to ole man Puterbaugh, an' the ole man rubbed his head and fed him a handful of worms. After the gar pike hed eat a lot o' worms he turned aroun' an' swum away, an' ole man Puterbaugh begin ter weep, an' he says ter himself, 'Even a' ole gar pike likes me fer jest what he can git out o' me. After he's done been fed he hain't got no further use for me until he's hungry again.'

"But just then the ole man see a lot of ripples on the water, an' the old man says, 'Gee whiz, here's a lot of black bass a-headin' this way!' Sure enough, pretty soon the ole man lookin' down saw the water wuz full o' bass. They wuz all swimmin' as hard as they could, an' seemed to be tryin' to get away from somethin'.

"'They're scart half to death,' says the ole man; 'somethin's a-chasin' 'em'. The bass all swum fust one way an' then another, as though tryin' to escape back to the middle of the lake, but try as hard as they could, they wuz made to keep right ahead, an' swum into a little creek, which got shaller awful quick.

"When they got in there ole man Puterbaugh jest jumped in behind 'em and pulled some brushwood in, so they couldn't git out, an' then he jest natcherally got inter the shaller part of the creek an' pulled black bass out by the tail fer ten minutes, an, by jing, if he didn't get twenty-five of 'em, every one of 'em weighin' over five pounds, and four of 'em weighin' ten or 'leven pounds apiece.

"When the ole man hed got through he looked back at the pond, and see the ole gar pike a-winkin' at him, an' he realized thet thet thar ole gar pike hed been a-roundin' up the black bass, an' hed driv' 'em on purpose into ther shaller creek, whar the ole man jest hed to pull 'em out by the tail.

"Inside o' two weeks thet gar pike hed jest natcherally rounded up every eatin' fish in Gidder's Pond, an' the ole man wuz makin' money hand over fist. Then th' ole man took the gar out an' went up to Red Bear Lake an' made a killin' up there, an' the ole man cleaned thet lake out, an' then he went to Injun Lake, and cleaned thet out; an' all this time he wur jest natcherally coinin' money, an' finally he hed enough tew pay off the morgidge on the house an' put a thousan' er so in the bank. He'd be fishin' with thet ole gar pike yet, but the gar pike got tew ambitious, er made a mistake er something.

"Ole Tom Lewis, the guide, wuz swimmin' in Injun Lake one day, an' the gar thought Tom wuz a new kind o' black bass er somethin', an' he jest went for him an' tried to drive him in shore, an' Tom out with his knife, him having his clothes an' his belt on' an' he jest natchally slew the ole gar pike. Ole man Puterbaugh wuz awful sorry, an' he brought the body of the deceased gar pike home an' planted it with honors in the peach orchard, an' erected a nice tombstone to his memory.

"Thet wuz certainly a most remarkable gar pike."

And so the merry time went on. It was the busiest three weeks in all my eventful career. But nothing startled me so much as a letter received one morning from my Florida uncle, announcing that he would be in my vicinity in the course of the week. The letter was quite forcible and explicit, and the language unmistakable, not necessarily for publication, but as an evidence of good faith on his part that he would straighten things out when he got home.

FRANK HEYWOOD.

CHICAGO AND THE WEST.

Species of Muscallunge.

CHICAGO, Ill., Dec. 19.—An angler of somewhat extended experience among northern waters writes as below in regard to the different species of the muscallunge:

"In the FOREST AND STREAM of May 21, 1898, under the heading of 'Pickerel, Pike and Mascalonge,' Mr. Fred Mather wrote as follows: 'I have seen this fish (the mascalonge) among the Indians about Crow Wing and Mille Lacs, Minn., in the '50s, but never saw one that would weigh over 10 pounds with them. These were black spotted.' In the same article he writes that 'the Wisconsin fish (mascalonge) are spotted.' Jordan and Evermann in their recent book, 'American Food and Game Fishes,' say regarding what they term the *Esox immaculatus*, 'This muskallunge is known only from Eagle Lake and other small lakes in Wisconsin and Minnesota. From the Great Lakes muskallunge it differs in having the body entirely unspotted.' Query, Are both varieties found in Wisconsin and Minnesota?

"I once saw a muskallunge from the Ohio River that was black spotted like those of the St. Lawrence River. This is not in accordance with the description given by Jordan and Evermann in their book named above (published in 1902), under head of Chautauqua Muskallunge, wherein they describe the muskallunge of the Ohio River. The same book quoting Genio Scott says, 'The pompano is not a game fish and never takes a hook except by mistake.' Now, I want to say that the pompano is decidedly a very game fish and does take a baited hook, as many anglers well know."

In the study of these species of fish, just as in the study of a great many other species of animals, I imagine we shall find that the scientists have not yet reached the end of the road, nor have they been able as yet to establish definite fences which shall separate one species from another nearly akin. In regard to the two varieties, spotted and unspotted muscallunge, I would say that they are both found in Wisconsin and are both recognized by the guides of that State. I remember to have heard one of the best oarsmen of Manitowish state that the unspotted muscallunge was found only in the region of the Shaky Lakes. I do not believe this statement to have been wholly correct, but there is at least rumor and belief of the existence in Wisconsin of the unspotted muscallunge.

I do not doubt that Mr. Mather was correct in his statement as to the Minnesota muscallunge, which is usually about the same in general characteristics as the Wisconsin muscallunge. My own experience does not show the spots of these muscallunge to be so round and detached as those I have seen on some specimens of the St. Lawrence muscallunge. The Wisconsin and Minnesota muscallunge are usually not so much distinctly spotted as marked with dark and irregular zig-zag blotches. In smaller Wisconsin muscallunge I have sometimes seen these dark markings to extend up and down across the fish, not parallel to the longitudinal axis. These zig-zag or rail fence dark markings showed upon a green background, lighter in color than that of the adult muscallunge. These specimens weighed three or four pounds, and I think marked the young form of the fish rather than the adult specimen.

Mr. Mather does not apparently state that 10 pounds is the extreme weight of the Minnesota muscallunge. Indeed Minnesota produces some of the heaviest specimens of that fish caught in the West. Forty-one and three-quarter pounds I have known reached and I think heavier weights have been captured in the State in the last two years. Of course the average weight of the fish taken in Minnesota and Wisconsin grows less from year to year.

In regard to Ohio River muscallunge which is reported black spotted, I must say that this description is precisely in accordance with the markings of the muscallunge taken in Taggart Creek, Kentucky, by a gentleman of Ironton, Ohio, the head of which fish was sent to the FOREST AND STREAM office. Even the backs of the gill covers showed distinct round spots, as round as the head of a lead pencil. The captors of this fish described it as marked with distinct round spots. This seems to be quite like the common markings or at least the occasional markings of the St. Lawrence muscallunge.

In regard to the accuracy of Messrs. Jordan and Evermann in their elaborate book on fishes, I presume it will be considered impertinent on my part to take issue with some of their statements, but the truth is that they are inaccurate not only in regard to muscallunge, but in regard to other fishes. I will not say that they are inaccurate in regard to their own observations, but they make some statements in general which assuredly are not universally correct. Their nomenclature of the muscallunge is entirely different from that given by other scientific writers up to date, which latter have given the scientific names in common use by the anglers of the country. I may be irreverent, but I can see no use in the multiplication of similar and indistinct species, and in the continual changes and additions to the nomenclature of our game animals. More than that, I claim the right as an American citizen, to differ with the scientists when their observations do not tally with my own. This is not to say that the unspotted muscallunge is not or cannot be found in the Ohio River. It is more specially to reiterate my previous statement that Nature does not set up any distinct fences between her creatures. I believe that our correspondent is just in his desire for further information.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

About Disheartened Sharks.

In your issue of Dec. 1 I note an article copied from the Mobile (Ala.) Register headed "Shark That Lost Its Heart Swam Away." To confirm this statement let me say that some three years ago, when five hours out of San Juan, Porto Rico, in the month of May, on the Red D Line steamer Caracas, while drifting and repairing a broken shaft, I induced the captain to have a fishing outfit fixed up to let me try and capture a shark. It was got ready and baited with a large piece of salt pork, and in a few minutes I had hooked a seven-foot shark. He did not fight very hard. He was escorted by a pilot fish on each side of him, and they accompanied him to the side of the ship, where he was hoisted on board, opened, and his heart taken out. He was then thrown overboard. The two pilot fish having remained in wait for him, the three swam away from the ship for some fifty feet, and then appeared to dive down into the water. The heart, when in the sun, pulsated plainly for fifty-five minutes.—E. G. Russell in New York Times.

Incorporation of New York Fish and Game Clubs.

ALBANY, N. Y., Dec. 20.—*Editor Forest and Stream:* At the recent annual meeting of the New York State Fish, Game and Forest League at Syracuse, the question as to the desirability of incorporating fish and game protective associations or clubs was somewhat discussed. It became evident that the reason why so many of the clubs do not incorporate is a well defined fear, prevalent among the members, that by the act of incorporation they individually become liable for any debts which may be incurred.

The Forest, Fish and Game Commission, which is restricted by law to dealings with incorporated associations, in the hope of removing this impression, has secured from the Attorney General of the State an opinion in the matter. This opinion shows very clearly how erroneous the general impression relative to the results of incorporating a game protective association is. Attorney General Davies in his opinion, refers to Section 31 of Article 2 of the membership corporations law, which in substance states that five or more persons may incorporate by filing a certificate as provided. Section 11 of Article 1 of the law, so far as fish and game protective associations are concerned, provides that the directors of such associations only are jointly and severally liable for debts contracted while they are directors, and payable in a year or less from the date when contracted, if an action for collection is brought within a year after the debt was due.

The Attorney General in explanation cites the case of McCabe vs. Goodfellow, 133 N. Y., 89, 95, to the effect that "the individual liability of members for contracts made by the association, or its officers or committees, depends upon the application of the principle of the law of agency, and authority to create such liability will not be presumed or implied from the existence of a general power to attend to or transact the business or promote the object for which the association was formed, except where the debt contracted is necessary for its preservation."

It would seem desirable that this information should be possessed by every association organized in the State for the protection of fish and game.

JOHN D. WHISH,
Secretary.

The New York State League.

LYONS, N. Y., Dec. 23.—The objects and purposes of the New York Fish, Game and Forest League have been brought to the attention of every thoughtful sportsman in this State. The League is doing all in its power for better fish and game legislation, the enforcement of the laws, and the building up of a public sentiment favoring the preservation of our fish and game forests.

It is the medium through which all sportsmen should work, and is dependent upon the influence of every such individual in the State. To the extent that it can obtain such influence will it be successful in its efforts. A representation should be had from every county in New York.

All sportsmen throughout the State are particularly urged at this time to associate themselves with us. In localities where there is no organization, and it is not possible to effect such an organization, we hope the matter may be taken up by individuals, and that they will associate themselves with us as individual members.

Application blanks for clubs and associations will be forwarded by the secretary upon request. Individuals may connect themselves with the League upon the payment of $1, and such applications may be sent to the secretary, with full name and post-office address.

A full attendance upon the meetings of the League is desired; however, much good work can be done at home, working with members of Legislature and assisting in the enforcement of the laws. Outline of the present legislative work of the League will be furnished by Law Committee to members on request.

Immediate action and co-operation is needed. Cannot you see that your locality is represented, either by an organized effort or by the personal interest of leading sportsmen. Yours truly,

W. S. GAVITT,
Chairman Organization Committee.

100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

88

BAYPORT, L. I., Nov. 8.—The following story which is true in every detail, which can be vouched for, and in which I was one of the principals, will no doubt interest some of your readers. I went out battery shooting on Tuesday, Dec. 2, on Guide Le Roy Still's handsomely fitted up sloop, the Ulrica. We rigged out the stool about mid-day on what is known as The Porgie Bar, and had a fairly successful shoot. About 4 P. M. we prepared to start for home. They placed me on board the sloop while Tim and his assistant in a skiff hauled up those 150 wooden ducks. I had around my neck a heavy silk handkerchief fastened with an ordinary shaped scarf-pin. In adjusting it I dropped the pin overboard in about five feet of water. There was no one else on board, and by the time Tim and his assistant came on board some half-hour afterward, the incident of the pin had escaped me and I never mentioned my loss to anyone.

The following Thursday evening I was sitting in the hotel bar when in walked Tim just off the bay full of excitement and to tell me the way to find diamonds while duck hunting. I told him I had often read of people finding pearls in oysters, but diamonds in ducks, never. Judge of my surprise when he took from his vest pocket carefully wrapped in a piece of newspaper and with the blood still on it, the very pin I had dropped overboard two days previously. I exclaimed: "Why, Tim, that's my pin." I would never have convinced him it was had I not produced one of the missing points of the star which had been broken off a short time before. He then proceeded to tell me how he came by it. That day he had

taken out his cousin, Mr. G. Still, of New York, and rigged out his battery near the same place we had shot two days before. Mr. Still had a very good day (got twenty-five broadbills), and they were returning home, which is about four miles from the dock, when Mr. Still suggested to Will, the assistant on board, that he pick him a couple of those broadbills ready to prepare for the table. Will picked up the first duck he came to out of that bunch of twenty-five, when something pricked him on the hand and he proceeded to investigate the cause, when there, protruding from the side of the duck's beak, was the point of a pin. He pulled it out with some difficulty, and there was the pin I had lost two days before firmly wedged in that duck's throat. A stranger coincidence it would be hard to imagine than that one duck should be shot out of the vast flocks in the bay by a party on the same boat I was on, and that Will should get that same duck to pick it, and that Tim should bring the pin direct to its original owner to show without having the slightest idea to whom it belonged. The supposition is the duck had seen it shining on the bottom, and dived and got it, and the pointed ends of the star got stuck in its throat. If any of your readers have ever met with a like experience I would be pleased to hear of it in your columns. Tim Still has that pin still, and no amount of argument or money will persuade him to part with it.

HENRY STOKES.

Hints and Wrinkles.

Readers are invited to send for publication under this head hints and wrinkles drawn from practical experience, and pertaining to shooting, fishing, camping and outdoor life.

Triangular Awnings.

THERE was a time when wall tents or wedge tents were more generally used by campers than any other variety, but now the single pole tent is preferred, as it may be just as roomy, yet less in bulk and weight and easier to pitch than the other kinds. Most of these single pole tents have awnings attached, but some of the awnings are small and other tents have none. It is not always convenient to pitch camp under shade trees, and even if so, it is nice to have outside shelter near the fire or over the table. The simplest awning for this purpose is a triangular one made of thin muslin waterproofed. It may be any size, but fifteen feet is about the limit for each side if it is to be expected to stand in a heavy wind. The seams all along the edges should be heavy and strong, with the corners strongly reinforced. Three-quarter-inch rings should be sewed in all the corners, and midway between corners brass grommets should be set. The other seams need not be especially strong. Such an awning, made of muslin, may be folded as small as a Sunday newspaper, yet, when set, provides a large shelter from sun or rain.

It may be set over the front of a wall tent in several positions, but is best for a single pole tent, in which use one corner is hooked over the spike in the top of the pole, the second is fastened down on one side with a tent peg, and the third is caught over the end of a pole seven feet high and held there by a guy rope, the other end of which is staked where needed to keep the awning taut. In the morning it will be needed on one side of the tent, and on the other after noon, but this merely necessitates changing the stake and two pegs. The slope of the awning, when set thus, is so great that no rain will penetrate it if it is first treated with a light coat of paraffin and turpentine, as mentioned in a previous wrinkle.

Hickory and Metal Tent Pegs.

It is not unusual to see novices, whose tents are small affairs, carry enough pegs with them to stake out a good-sized circus tent. And the size of the things—why, each peg would furnish material enough for an Indian's evening camp-fire. In fact, the trade furnishes one size of peg, evidently, and as these are more than a foot long and very clumsy, suitable for 18x24 tents, the novices and some old-timers, too, seem to think nothing else will hold down their 7x7 shelters.

The fact is, that a very small and slender peg will hold well in anything but loose sand, hence it is a waste of energy to lug a cord of wood about with you. Metal pins with turned-over tops are now used by some campers, and others employ common ten-inch steel loop-top meat skewers that they buy at the hardware shops. These skewers are made as long as 18 inches, if I am not mistaken, and they are of good steel and will last several seasons.

For 7x7 tents, pegs 12 inches in length and three-quarters of an inch in diameter are sufficient if they are made of sound second growth hickory. Being long, they may be driven at an angle sufficient to prevent the guy ropes slipping over their tops. Good hickory is not so easily obtained in some parts of the country as in others, but tack hammer handles may be obtained at any hardware shop that will answer the purpose admirably. I have seen these finished with a notch a half-inch deep on one side and the point sharpened slightly. One of these will outlast the trade tent peg and is less than a third as bulky.

PERRY D. FRAZER.

The Kennel.

New York Bench Show.

JUDGES for the Westminster Kennel Club's twenty-seventh annual dog show, to be held in Madison Square Garden, New York, Feb. 11, 12, 13 and 14, are as follows:

Miss A. H. Whitney, Lancaster, Mass.—St. Bernards, Newfoundlands and pugs.

Miss Elizabeth Marbury, New York.—French bulldogs.

F. Freeman Lloyd, New York.—Bloodhounds, mastiffs, deerhounds, Russian wolfhounds, greyhounds, English foxhounds (except packs), retrievers, Dalmatians, old English sheep dogs, whippets, chow chows, Welsh terriers, Skye terriers, black and tan terriers, schipperkes, all toys and miscellaneous classes.

C. H. Mantler, New York.—Great Danes.

Wm. Tallman, Brooklyn, N. Y.—American foxhounds and all setters.

G. Muss-Arnolt, Tuckahoe, N. Y.—Pointers, Chesapeake Bay dogs, Griffons, bassethounds and dachshunds.

Geo. Douglas, Woodstock, Ont.—Sporting spaniels.
Wm. C. Hunter, Fayetteville, Pa.—Collies.
Chas. D. Bernheimer, New York.—Poodles.
E. K. Austin, Brooklyn, N. Y.—Bulldogs.
W. S. Gartner, New York.—Bull terriers.
John L. Arden, New York.—Airedale terriers.
P. J. Brickley, Boston, Mass.—Boston terriers.
A. J. Purinton, Palmer, Mass.—Beagles.
O. W. Donner, Rye, N. Y.—Irish terriers.
W. P. Fraser, Toronto, Ont.—Scottish terriers.
The judge of fox terriers will be announced later.

JAS. MORTIMER.
Superintendent.

Great Dane Club of America.

AT the regular quarterly meeting of the Great Dane Club of America, held in New York City, Dec. 16, 1902, there were present: Messrs. J. Blackburn Miller, G. Muss Arnolt, James Mortimer, G. F. Eggert, Frank Rappolt, J. O. Dutton, Wm. Smith, R. T. Harrison and C. H. Mantler. Mr. J. Blackburn Miller in the chair.

The minutes of the previous meeting and the report of the treasurer was read and approved.

Upon motion duly seconded, it was resolved to nominate Mr. C. H. Mantler as judge of Great Danes at the Westminster Kennel Club show, to be held Feb. 10-13, 1903.

It was further decided to offer at the show, the following special prizes: President's Challenge Cup, the Grand Challenge Cup, the Dunollie Cup, the Great Dane Club Grand Challenge Trophy, three silver cups, and in addition club silver medals to all first prize winners in the regular classes, including winners' classes.

Motion made and seconded, to write to the New England Kennel Club to submit the name of the judge of Great Danes before the club will take action to offer special prizes at their coming beneh show.

In reference to the communication received from Mr. G. H. Walker, Ashbourne, it was decided to write to Mr. S. Loog regarding the registration of the dog which Mr. Walker purchased from him.

It was decided to hold the annual meeting on the second day of the Westminster Kennel Club Show, at the Ashland House, at 8.30 P. M.

C. H. MANTLER,
Secretary.

Yachting.

Hoosier.

Hoosier was designed by Mr. Isaac B. Mills, of Boston, and built by John Bishop, of Gloucester, Mass., for Col. W. R. Nelson, of Kansas City, Mo. The boat was built solely for cruising, and one of the owner's requirements when ordering the boat was that she should be able to cross the Atlantic with her topmasts on end. The overhangs are short, the freeboard high and the rig small. A liberal bulwark adds security to those on deck.

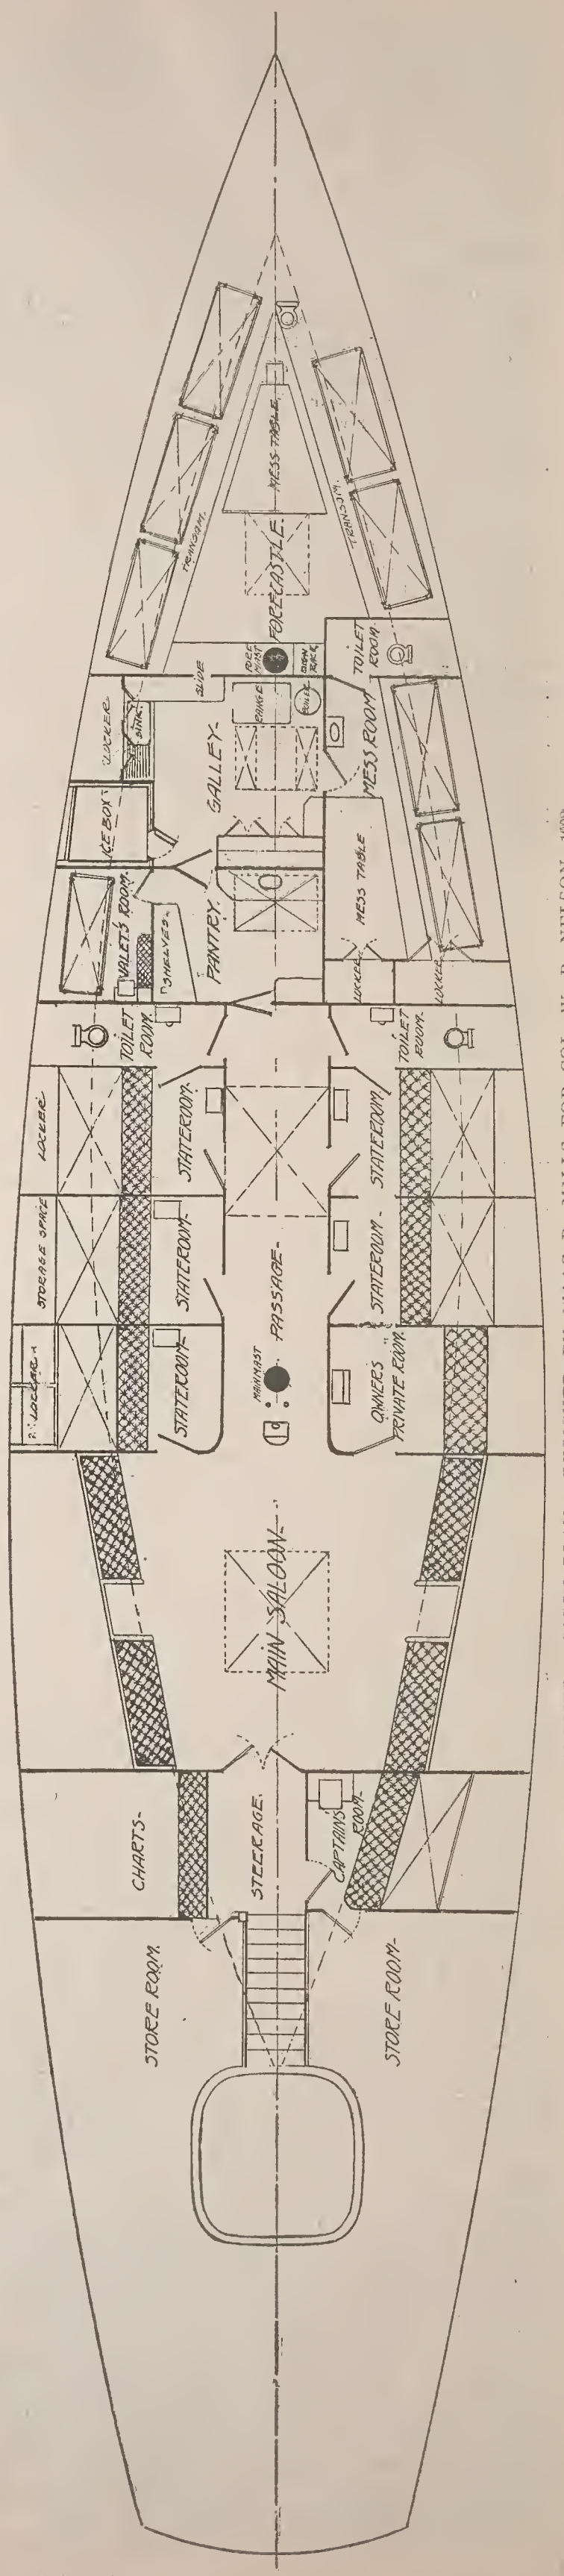
There is a good deal of room below, and the accommodations were laid out to meet the requirements of the owner. The companionway leads to a steerage, which is used as a chart room. On the starboard side, opening from the chart room, is the captain's cabin. Forward of the chart room is the main saloon, which is 15ft. long and runs the full width of the boat, wide sofas extend along either side, and behind these are lockers for china, silver and linen. A skylight 6ft. by 5ft. gives ample light and ventilation. From the main saloon, running forward, is a passage 5ft. wide. On each side of the passage are three staterooms, making six in all, with a toilet room on each side at the forward end.

The passage opens into the pantry, on the port side of which is the valet's room. The galley is reached by a door from the pantry. The galley is large, being 9ft. long and 8ft. wide. On the starboard side of the galley is the officers' mess room, and just forward of this is a toilet room for the officers. A bulkhead separates the forecastle from the galley. In the forecastle there are berths for ten men.

The dimensions follow:

Length—		
Over all	125ft.	
L. W. L.	104ft.	
Overhang—		
Forward	8ft.	6in.
Aft	12ft.	6in.
Breadth—		
Extreme	25ft.	
Draft—		
Extreme	12ft.	6in.
Freeboard—		
Bow	11ft.	
Least	5ft.	6in.
Taffrail	7ft.	

Hoosier is commanded by Captain Ozier.

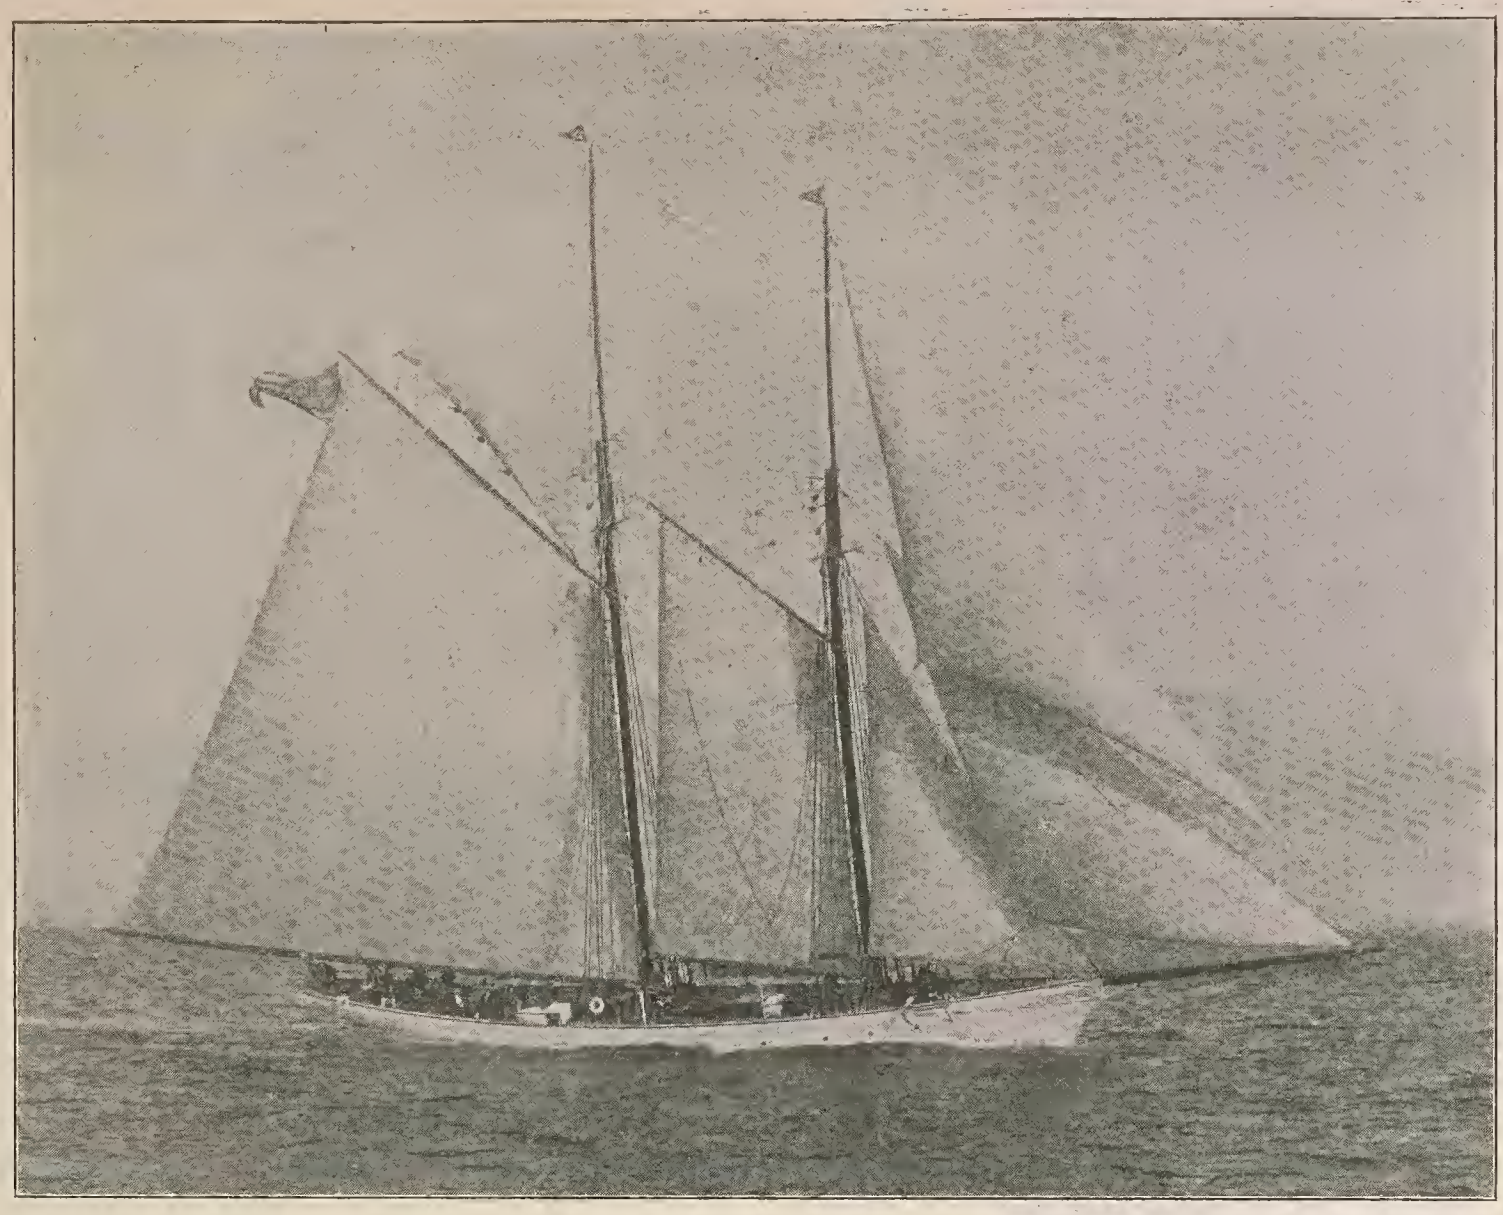


HOOSIER—CABIN PLAN—DESIGNED BY ISAAC B. MILLS FOR COL. W. R. NELSON, 1902.

The next regular monthly meeting of the Yacht Masters' and Engineers' Association will be held at Vett's Hall, Fifth avenue, corner Twenty-third street, Brooklyn, on Thursday, Jan. 8, 1903. The meeting will be called at 1:30 P. M., and at 3 P. M. Mr. Reuben Riley will lecture on Valves and Valve Motions.

* * *

Mr. Lawrence Jones, of Louisville, Ky., has chartered the schooner Attaquin for a cruise in Southern waters.



HOOSIER.
Designed by Isaac B. Mills for Col. W. R. Nelson, 1902. Photo by N. L. Stebbins, Boston.

Boston Letter.

BOSTON, Dec. 28.—Another order for a 22-footer has been heard from. This boat will be designed by Fred Lawley and built by the Lawley Company, but Mr. Lawley will not say who the owner is to be. From all that has been heard, however, it looks as though the yacht will fly the pennant of Vice Commodore H. H. Wiggin, of the Annisquam Y. C. Her keel has been turned out, and she will be set up in the east shop this week. The decks of the Clark 60ft. schooner and the Adriance 34ft. yawl are being finished up. About all of the cabin work has been put in the 50ft. ketch for Mr. J. H. Cromwell. The boiler and engine are being made ready for the new steam yacht for Mr. C. A. Fletcher. Her joiner work has been turned out and is all ready to go in her. At present the workmen are busy on her decks. The frames for the Emery steam yacht are being bent.

Crowninshield has been at work on a number of designs. Two of his orders are for yachts to comply with the new rating rule of the New York Y. C., and two of them are to be built for the tonnage rule on orders from Stockholm, Sweden. In his designs, under the new rules, he has gone to great length on the waterline. One of his Stockholm orders is a 12-tonner for Avel Winstrom. The tonnage rule there being arrived at by figuring length and sail area; Crowninshield has figured his displacement as low as possible. He has put the weight well down, and, at the same time, has given much initial stability to the form of his boat. This boat will be about 52ft. over all, 30ft. waterline, 10ft. 6in. beam and 8ft. 2in. draft. She will carry 1,800 sq. ft. of sail.

The other Stockholm boat will be a 5-tonner for A. Plym. This boat will be 43ft. over all, 24ft. 6in. waterline, 9ft. beam and 6ft. 9in. draft. She will carry about 961 sq. ft. of sail. The same argument is carried out as in the design of the larger boat, except the effort to shorten the waterline has been carried to a greater proportionate degree.

A 55ft. waterline, shoal-draft auxiliary schooner is being designed for Lawrence Jones, of Louisville, Ky. The new boat will be about 83ft. over all, 55ft. waterline, 20ft. beam and 3ft. draft. She will be supplied with a 25 horsepower kerosene engine. Mr. Jones has a place in Florida, and he is desirous of having power so that he may get up the narrow, crooked river channels in a head wind. At present Mr. Jones has under charter the schooner Attaquin, owned by Durbin Horne. She was also designed by Crowninshield. The Attaquin has been fitted out for a Southern cruise.

Another design is a 30-rater for O. B. Weber, of New York. The lines for this boat had been drawn, but the work had to be done over again on account of the changes in the New York Y. C. rules. She will be 44ft. over all, 29ft. waterline, 9ft. 6in. beam and 6ft. 9in. draft. She will carry about 1,100 sq. ft. of sail. Her builders will be Tuthill & Higby, of Greenport, L. I.

A 43-rater has been designed for Trenor L. Park, which is now being built by Lawley. She will be about 72ft. over all, 41ft. waterline, 11ft. 6in. beam and 8ft. 8in. draft. She will carry about 3,500 sq. ft. of sail. This boat will be of composite build. Her framing amidships will be of a composition known as naval bronze, and the rest will be steel. She will have single mahogany planking.

The lines of a small fisherman have been turned out for H. Hughes, of Seattle. She is intended for ocean work, and will be used in the halibut fisheries. She will be 71ft. over all, 50ft. waterline, 17ft. beam and 9ft. 4in. draft. She will be of about 30 tons displacement, and will carry 2,600 sq. ft. of sail.

There is now building at Lawley's, from lines by this designer, a keel cruising sloop for W. B. Rogers, to be used on Lake Champlain. She will be 59ft. 6in. over all, 36ft. 6in. waterline, 13ft. beam and 7ft. 10in. draft. She will have considerably longer keel than most modern boats.

A 50ft. waterline schooner has been designed for Capt. L. D. Baker. She will be a centerboard boat and her construction will be very heavy. She will be 77ft. 8in. over all, 50ft. waterline, 17ft. beam and 5ft. 8in. draft. She will carry about 2,800 sq. ft. of sail and her ballast will be all inside.

T. A. McKinnon has ordered from Crowninshield a 21ft. keel raceabout, which is now being built by Graves, of Marblehead. This is the first order for a new raceabout to be used in Massachusetts Bay waters that has been heard from. She will be 33ft. 6in. over all, 21ft. waterline, 7ft. 7in. extreme beam and 5ft. 6in. draft. She will have a sternpost rudder and will not be a scow. The raceabout being built by Smith, of Quincy Point, for Joshua Crane, Jr., will also be a keel boat. She is 36ft. 5in. over all, 20ft. 8in. waterline, 7ft. 9in. extreme beam and 6ft. 6½in. draft. She will also have a sternpost rudder.

Burgess and Packard have received another order for a 22-footer. Mr. Burgess would not state for whom she is to be built, but it is believed that she will be for Mr. Edward McWilliams, of Dwight, Ill., who summers at Marblehead, and is a member of the Corinthian Y. C. The three orders for 22-footers received by Burgess and Packard and the one received by Fred Lawley, are the only ones that are believed to have been actuall placed. Mr. Burgess reports that the first Seawanhaka challenger is all planked at Manchester and that the second one will be started in a few weeks. One of the four orders received by this firm for 25-footers is from Commodore J. E. Doherty, of the Columbia Y. C., who owns Early Dawn, in the same class. Hollis Burgess has sold to W. Starling Burgess the old cutter Edith, designed by J. Beavor Webb, and built by Lawler, of East Boston, in 1880. The yacht has been the property of W. B. Stearns. Some alterations will be made on her, and Mr. Burgess will live on board during the summer months.

Mr. E. T. Bigelow, of Medford, has ordered from the Marblehead Yacht Yard a 25ft. launch, which will be fitted with a 15 horsepower engine. She will be designed by W. B. Stearns. At this yard the work on the 41ft yawl for Mr. J. P. Elton is going ahead, and it is expected that the boat will be in frame this week. A new stern has been put on the 40-footer Gorilla, and alterations have been made on the cabin of the naphtha launch Enola.

E. A. Boardman has received an order to turn out the lines for a one-design class for the Royal Nova Scotia Y. C., of Halifax. It is expected that a number of these boats will be built. He has also received orders for two 14-footers, one a keel, and the other centerboard. Two 18-footers of his design have been laid down at White's yard, Manchester.

A new one-design class is to be built for members of the Lynn Y. C. from lines by Charles D. Mower. They will be 23ft. over all, 15ft. waterline, 7ft. beam and 7in. draft. They will carry about 400 sq. ft. of sail. In general form they will resemble the champion 15-footer Vitesse, which Mr. Mower designed and built in 1897. It is expected that six will be built by Bezanson, of Beverly. One will be for Mr. Mower and will be raced by Thomas Fleming Day at Cottage City.

JOHN B. KILLEEN.

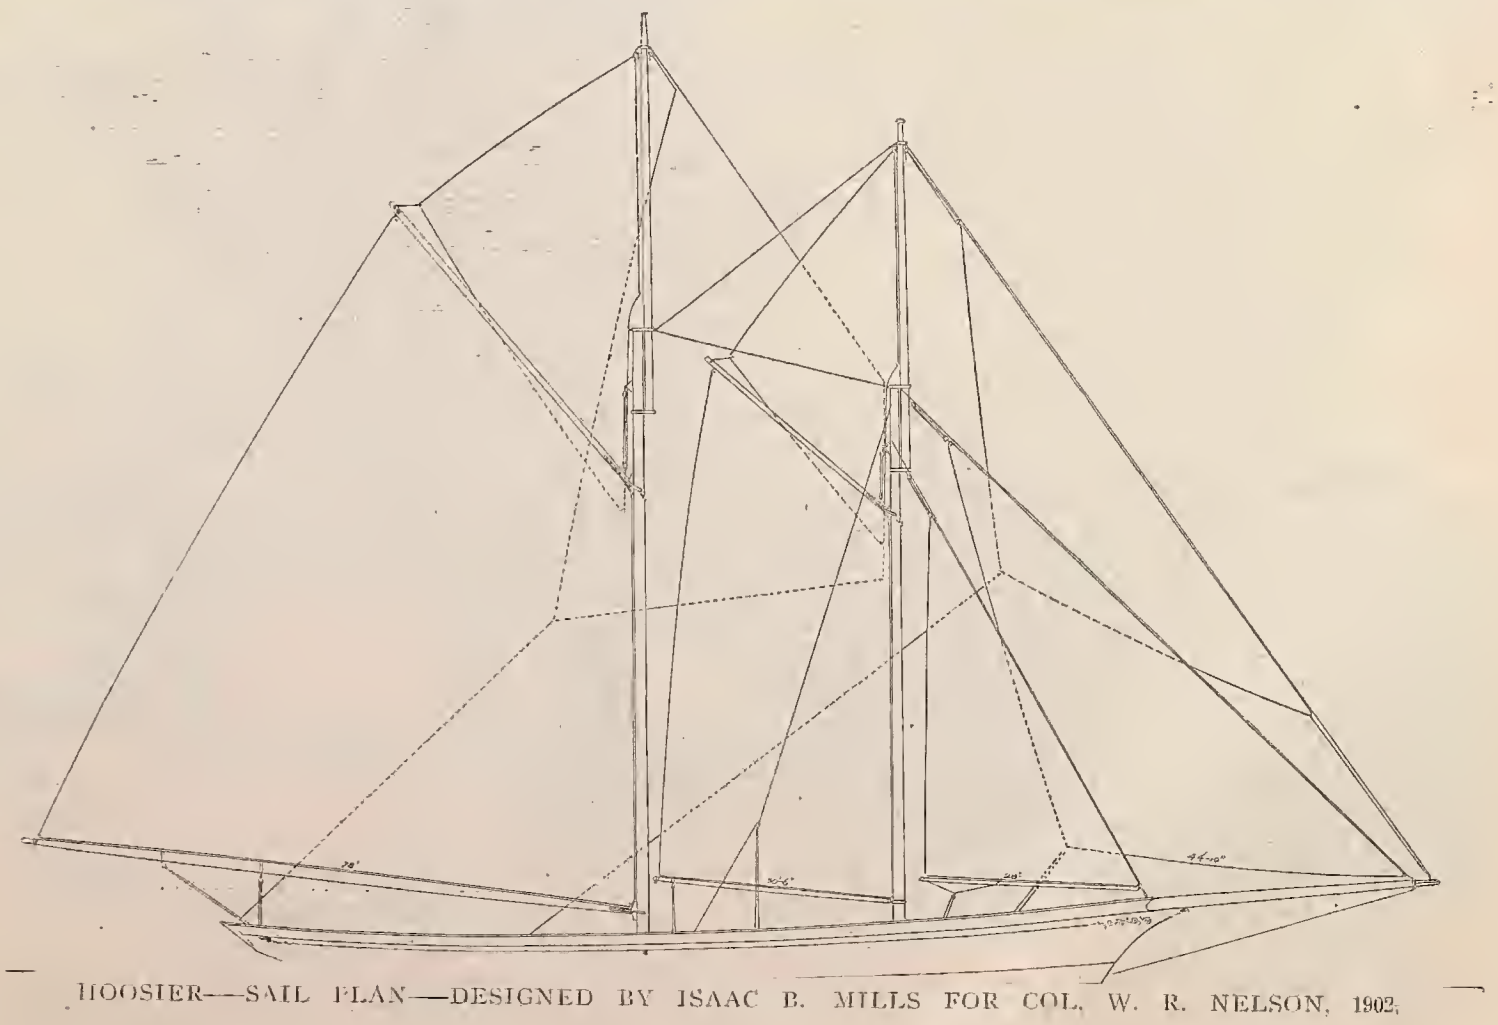
Rosamond.

THE photograph of the 40ft. waterline auxiliary yawl Rosamond was taken as she was entering Kenosha Harbor on Oct. 22, 1902. Rosamond was designed by her owner, Mr. William J. Starr, of Eau Claire, Wis., an amateur designer of considerable ability. The boat has proven herself a fine cruiser, able, fast, safe and comfortable. With power she does better than seven miles an hour under reasonably favorable conditions. Her very satisfactory performances under all conditions of wind and weather on Lake Michigan during the past three seasons, have made many yawl converts.

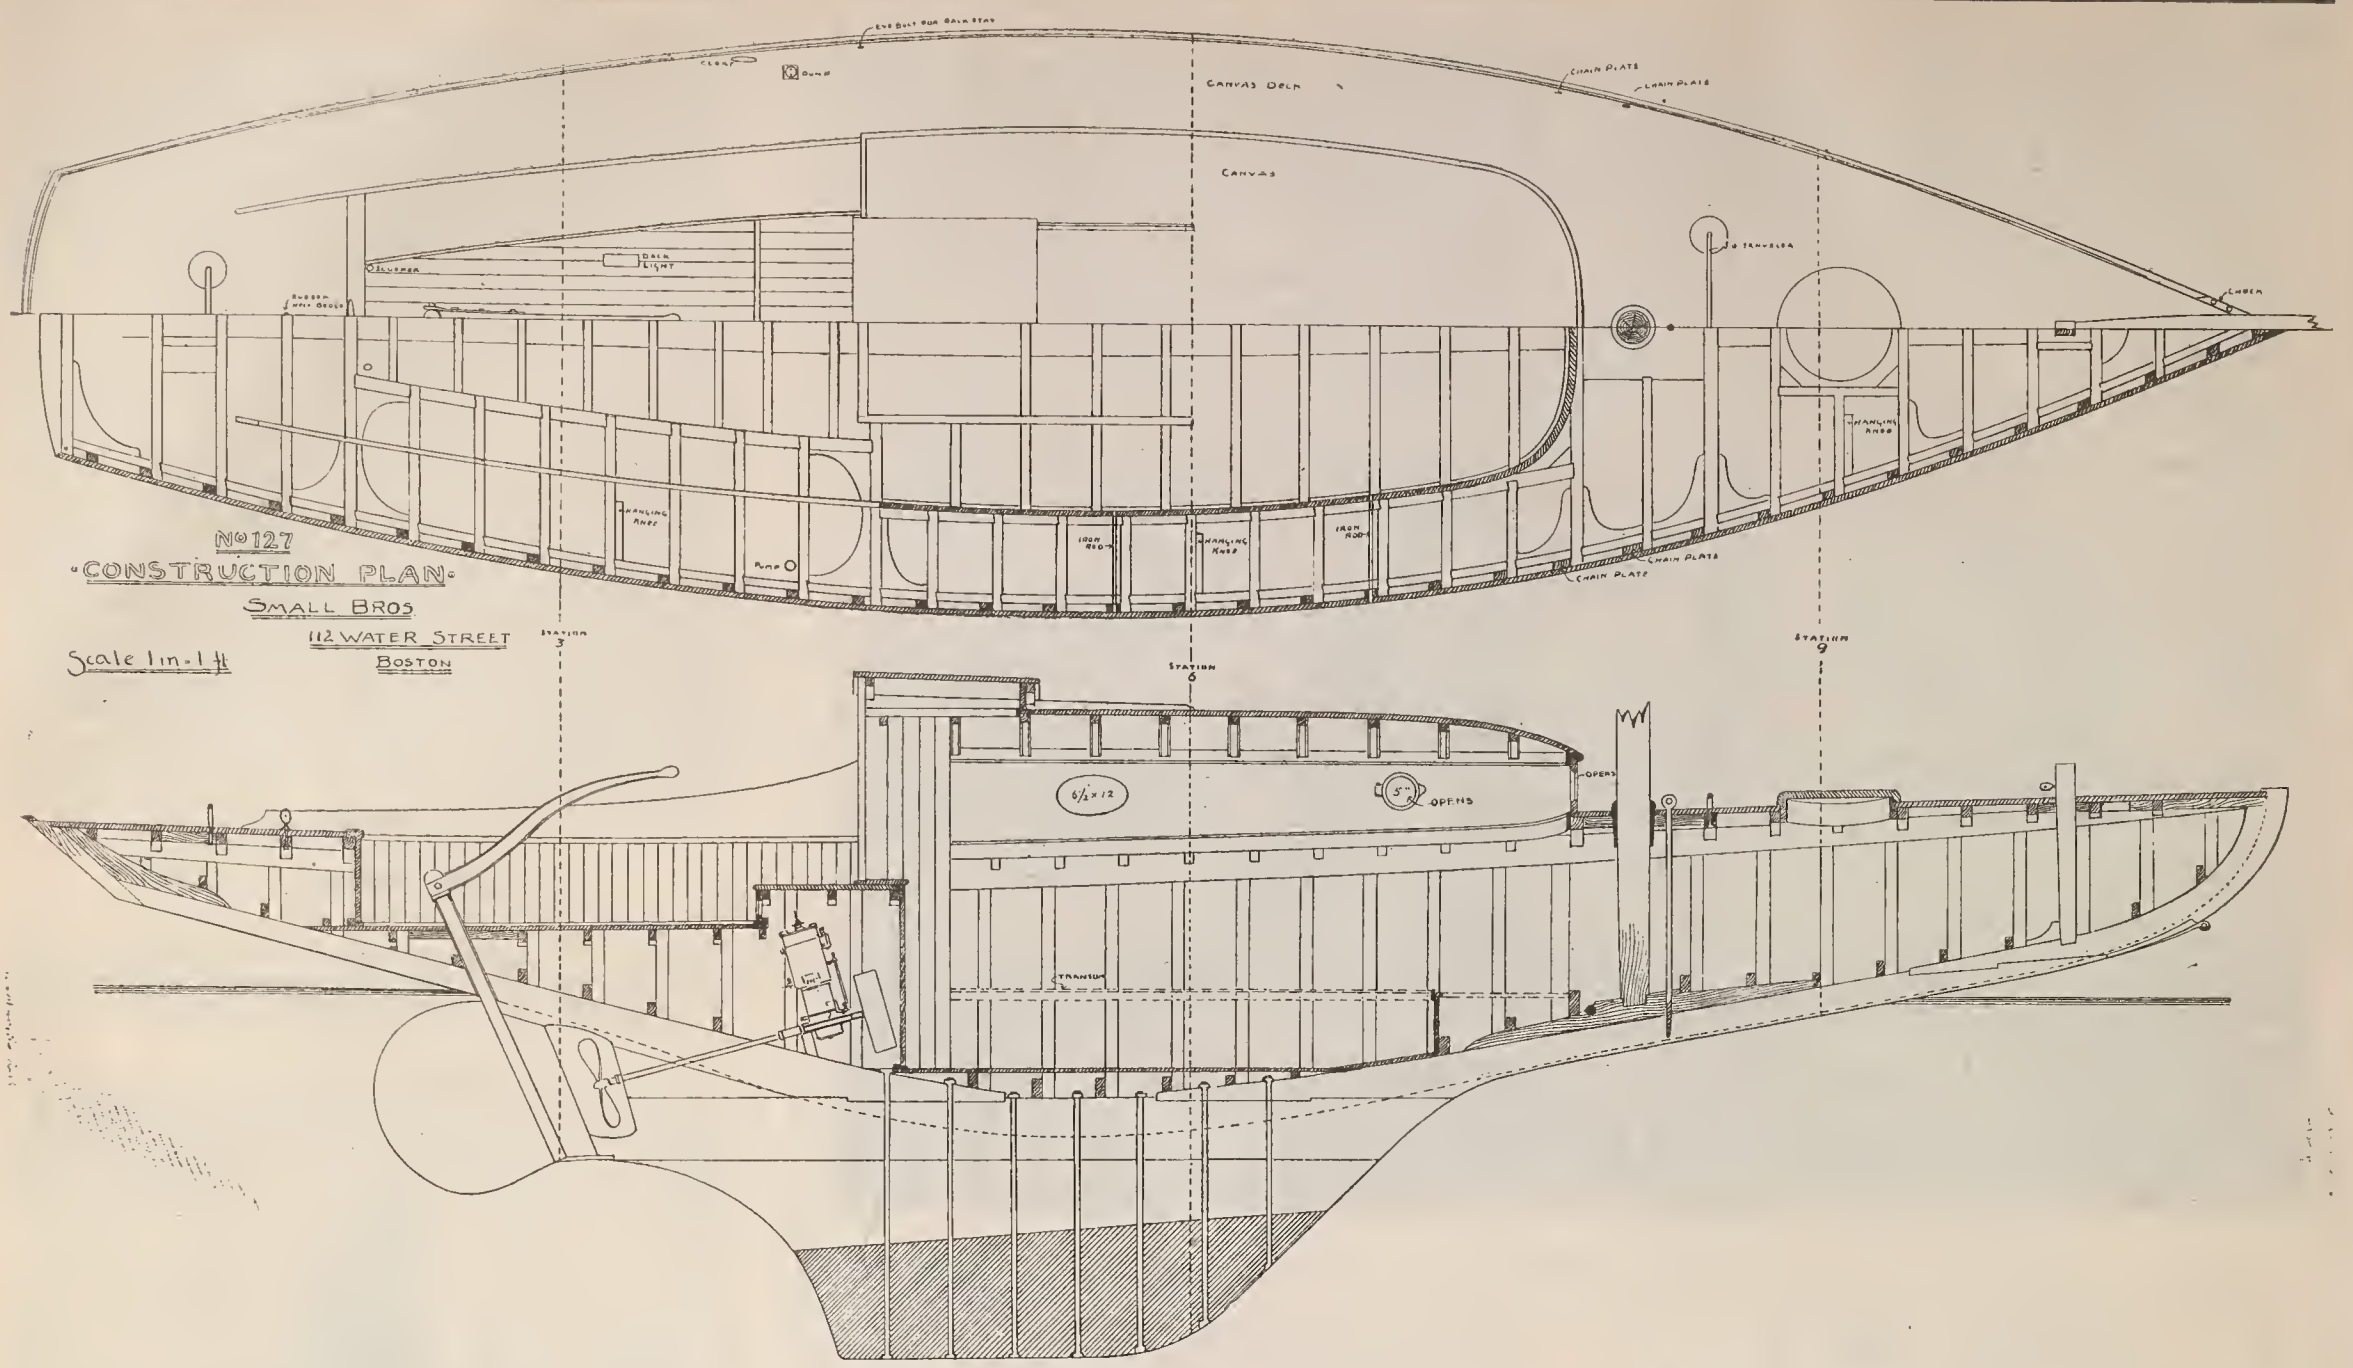
ROSAMOND.
Owned by Wm. J. Starr, Eau Claire, Wis.

A complete description of Rosamond, together with her plans, appeared in FOREST AND STREAM of April 14 and 21, 1900.

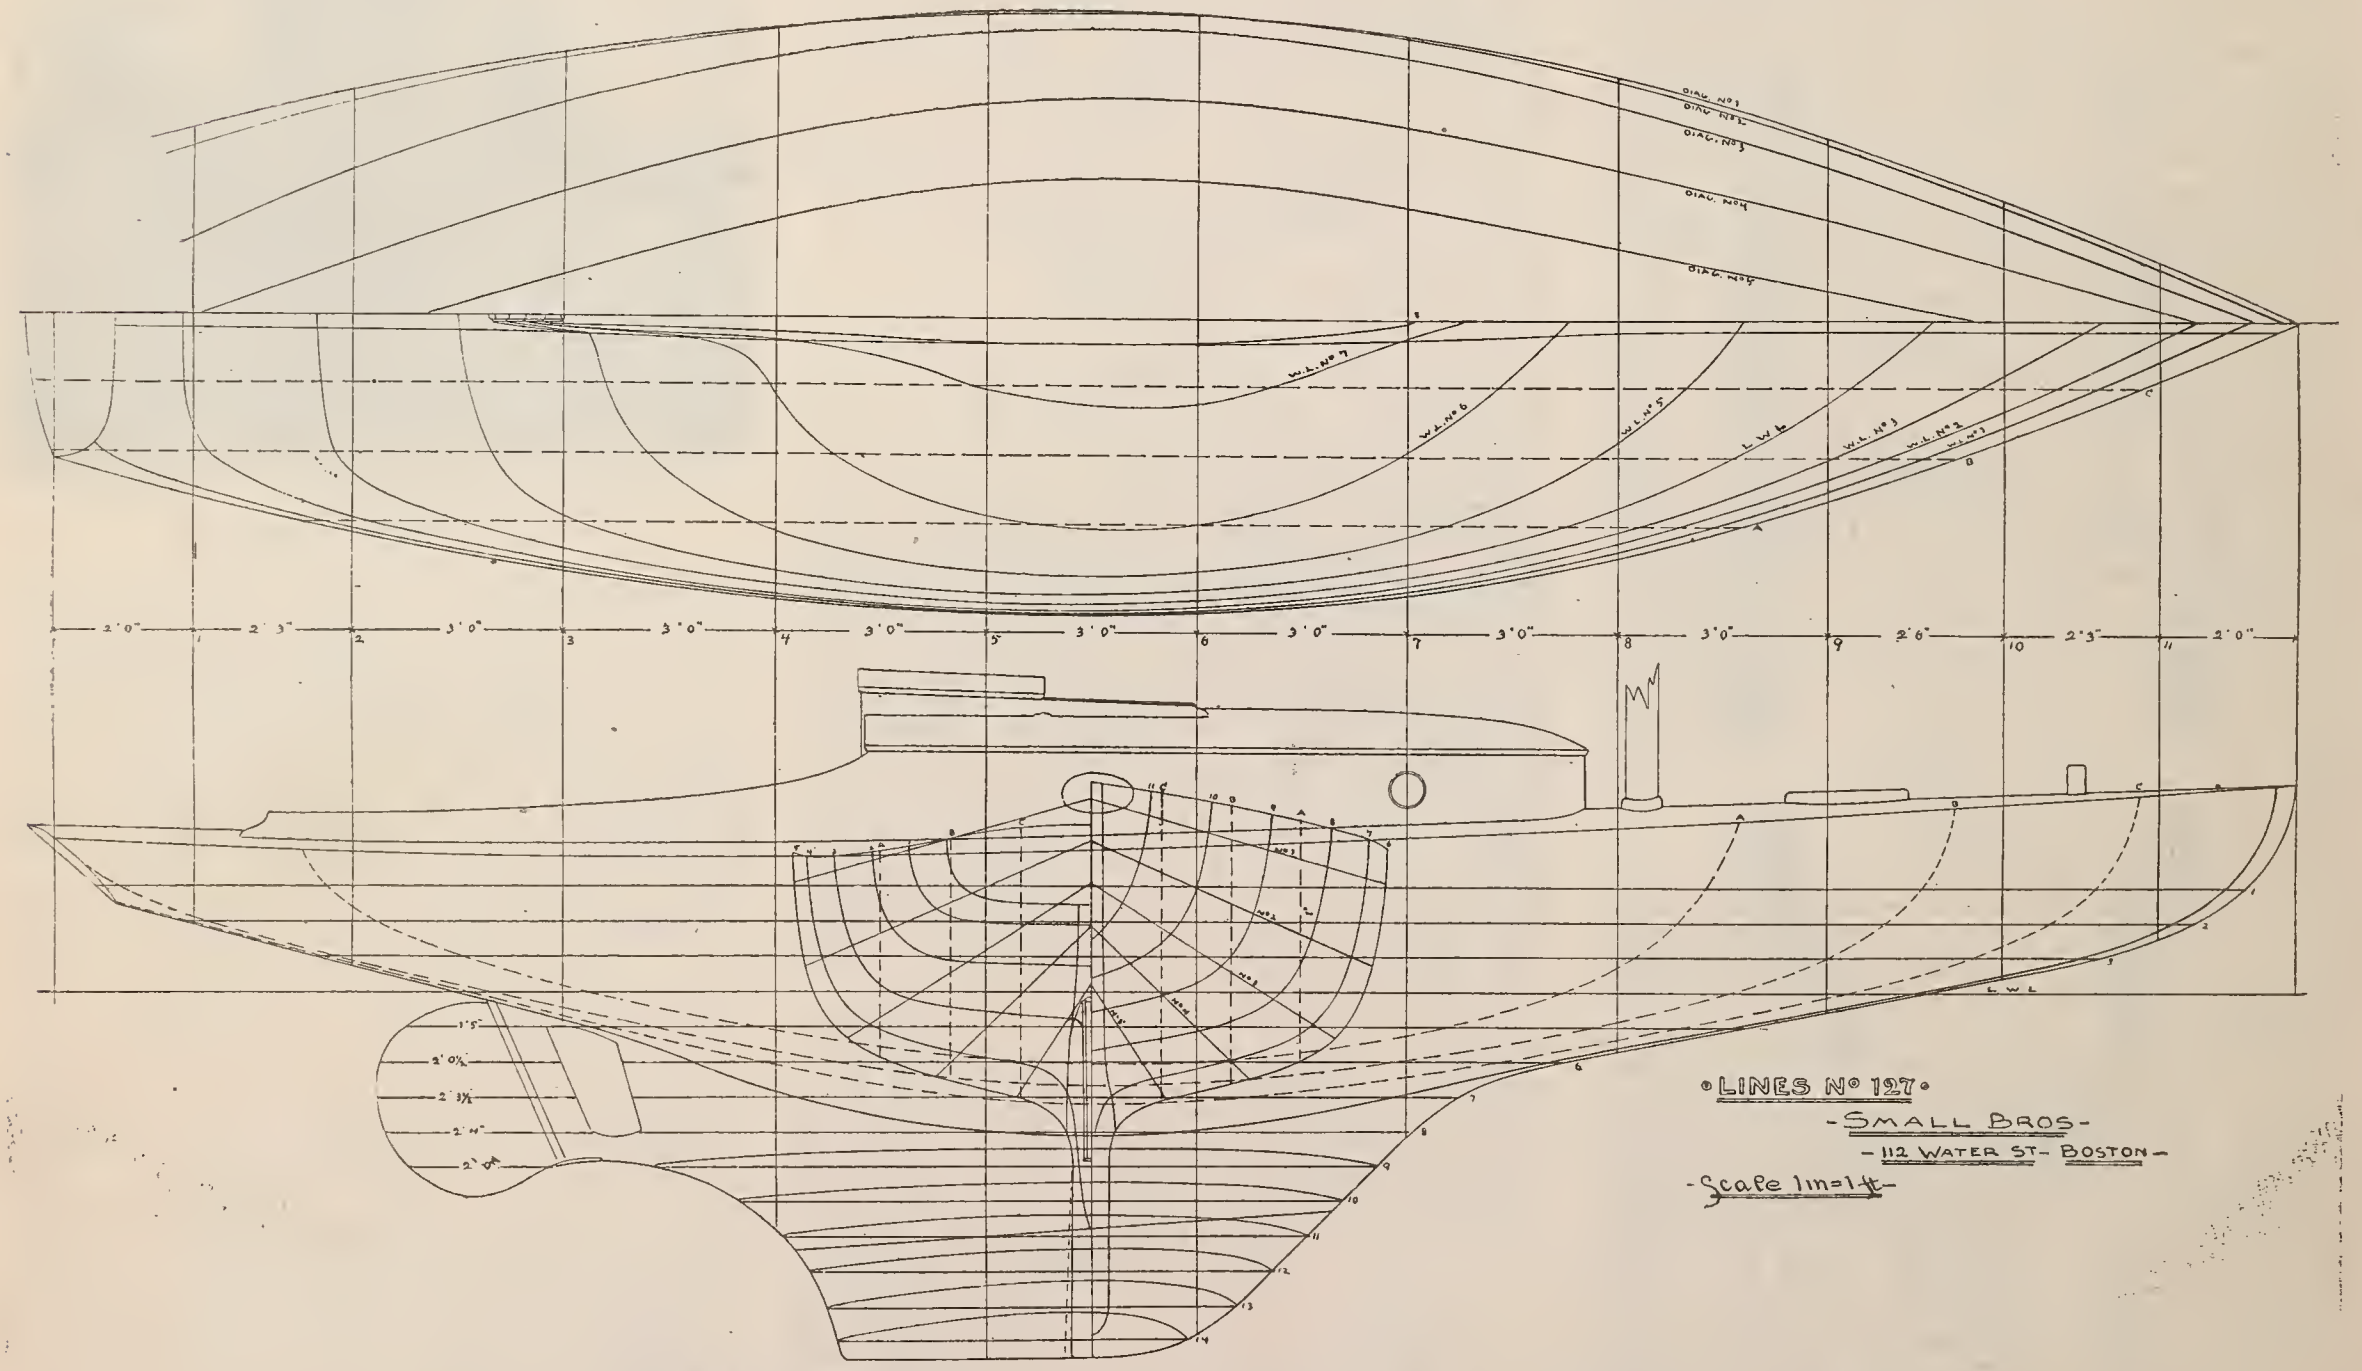
The steam yacht Hanoli has been sold by Mr. Frank M. Smith to a member of the New York Y. C.



HOOSIER—SAIL PLAN—DESIGNED BY ISAAC B. MILLS FOR COL. W. R. NELSON, 1902.



21-FOOT AUXILIARY YAWL—CONSTRUCTION PLANS—DESIGNED BY SMALL BROS. FOR E. A. CHADWICK, 1902.



21-FOOT AUXILIARY KNOCKABOUT—DESIGNED BY SMALL BROS. FOR E. A. CHADWICK, 1902.

21-Foot Auxiliary Knockabout.

THE accompanying plans of a 21ft. auxiliary knockabout were made by Small Brothers, of Boston. The boat was designed for Mr. E. A. Chadwick, of Lynn, Mass., who will use her for afternoon sailing and short cruises. While the design shows no unusual features, the boat should be an able, comfortable little craft, with a fair amount of speed, and can easily be handled by one man. A three-horsepower motor is placed under the cockpit, where it is out of the way and yet easy of access. The cabin house is 10ft. long, and there is 5ft. headroom under the carlins. The cockpit is 7ft. long and is watertight.

The dimensions follow:

Length—	
Over all	32ft. 3 in.
L. W. L.	21ft.
Overhang—	
Forward	5ft. 3 in.
Aft	6ft.
Breadth—	
At deck	8ft. 6 in.
L. W. L.	7ft. 11 in.
Draft—	
Extreme	5ft. 3 in.
To rabbet	2ft. 1 in.
Freeboard—	
Forward	3ft.
Least	1ft. 11 in.
Aft	2ft. 4½in.
Ballast outside	3,000 lbs.
Sail area—	
Mainsail	435 sq. ft.
Jib	92 sq. ft.
Total	527 sq. ft.

Rating Rules.

Editor Forest and Stream:

The many racing rules of to-day are so complex and so often changed that many gentlemen hesitate to build and no wonder. Taxing girth at bow and stern discourages freeboard, and to find the beam at a point one-eighth aft and forward of bow and stern is rather a complicated job to the average yachtsman, and people say, "Hang the racing rules."

All rules mean by length AT waterline, the distance from A to B along the line A C B (see figure). Now my plan is to get the length OF waterline, which

really is A D E B, and we will call it for convenience curved waterline and express by the letters C. W. L. This line is longer in scow racers than in boats with V sections; therefore, tax it, and so as not to discourage beam, subtract one-half greatest beam at waterline. This gives us C. W. L.—½, greatest beam at W. L.

Scale 1in=1ft.

21-FOOT AUXILIARY YAWL—CABIN PLANS—DESIGNED BY SMALL BROS. FOR E. A. CHADWICK, 1902.

=W. L. Now for sail area-tax we'll use the Seawanhaka rule of W. L. + V sail area divided by 2 = R. L. This gives us C. W. L. — ½ beam at W. L. + V S. A. divided by 2 = R. L.

By using the Seawanhaka rule with mine it makes it advisable to build a powerful boat and discourages the builder from building a long over-hanger, or a boat too sharp to obtain seaworthy qualities, which my rule used alone would do. E. F. CHAMBERS.

PHILADELPHIA, Pa.

YACHTING NEWS NOTES.

The 45ft. waterline sloop that is building at Wm. P. Kirk's yard, Toms River, N. J., for Major J. Fred Ackerman, from designs made by Mr. Henry J. Gielow, will be named Selnada. The plans of Selnada appeared in FOREST AND STREAM Nov. 29, 1902.

The Morrisania Y. C. has elected the following officers to serve for the year of 1903:

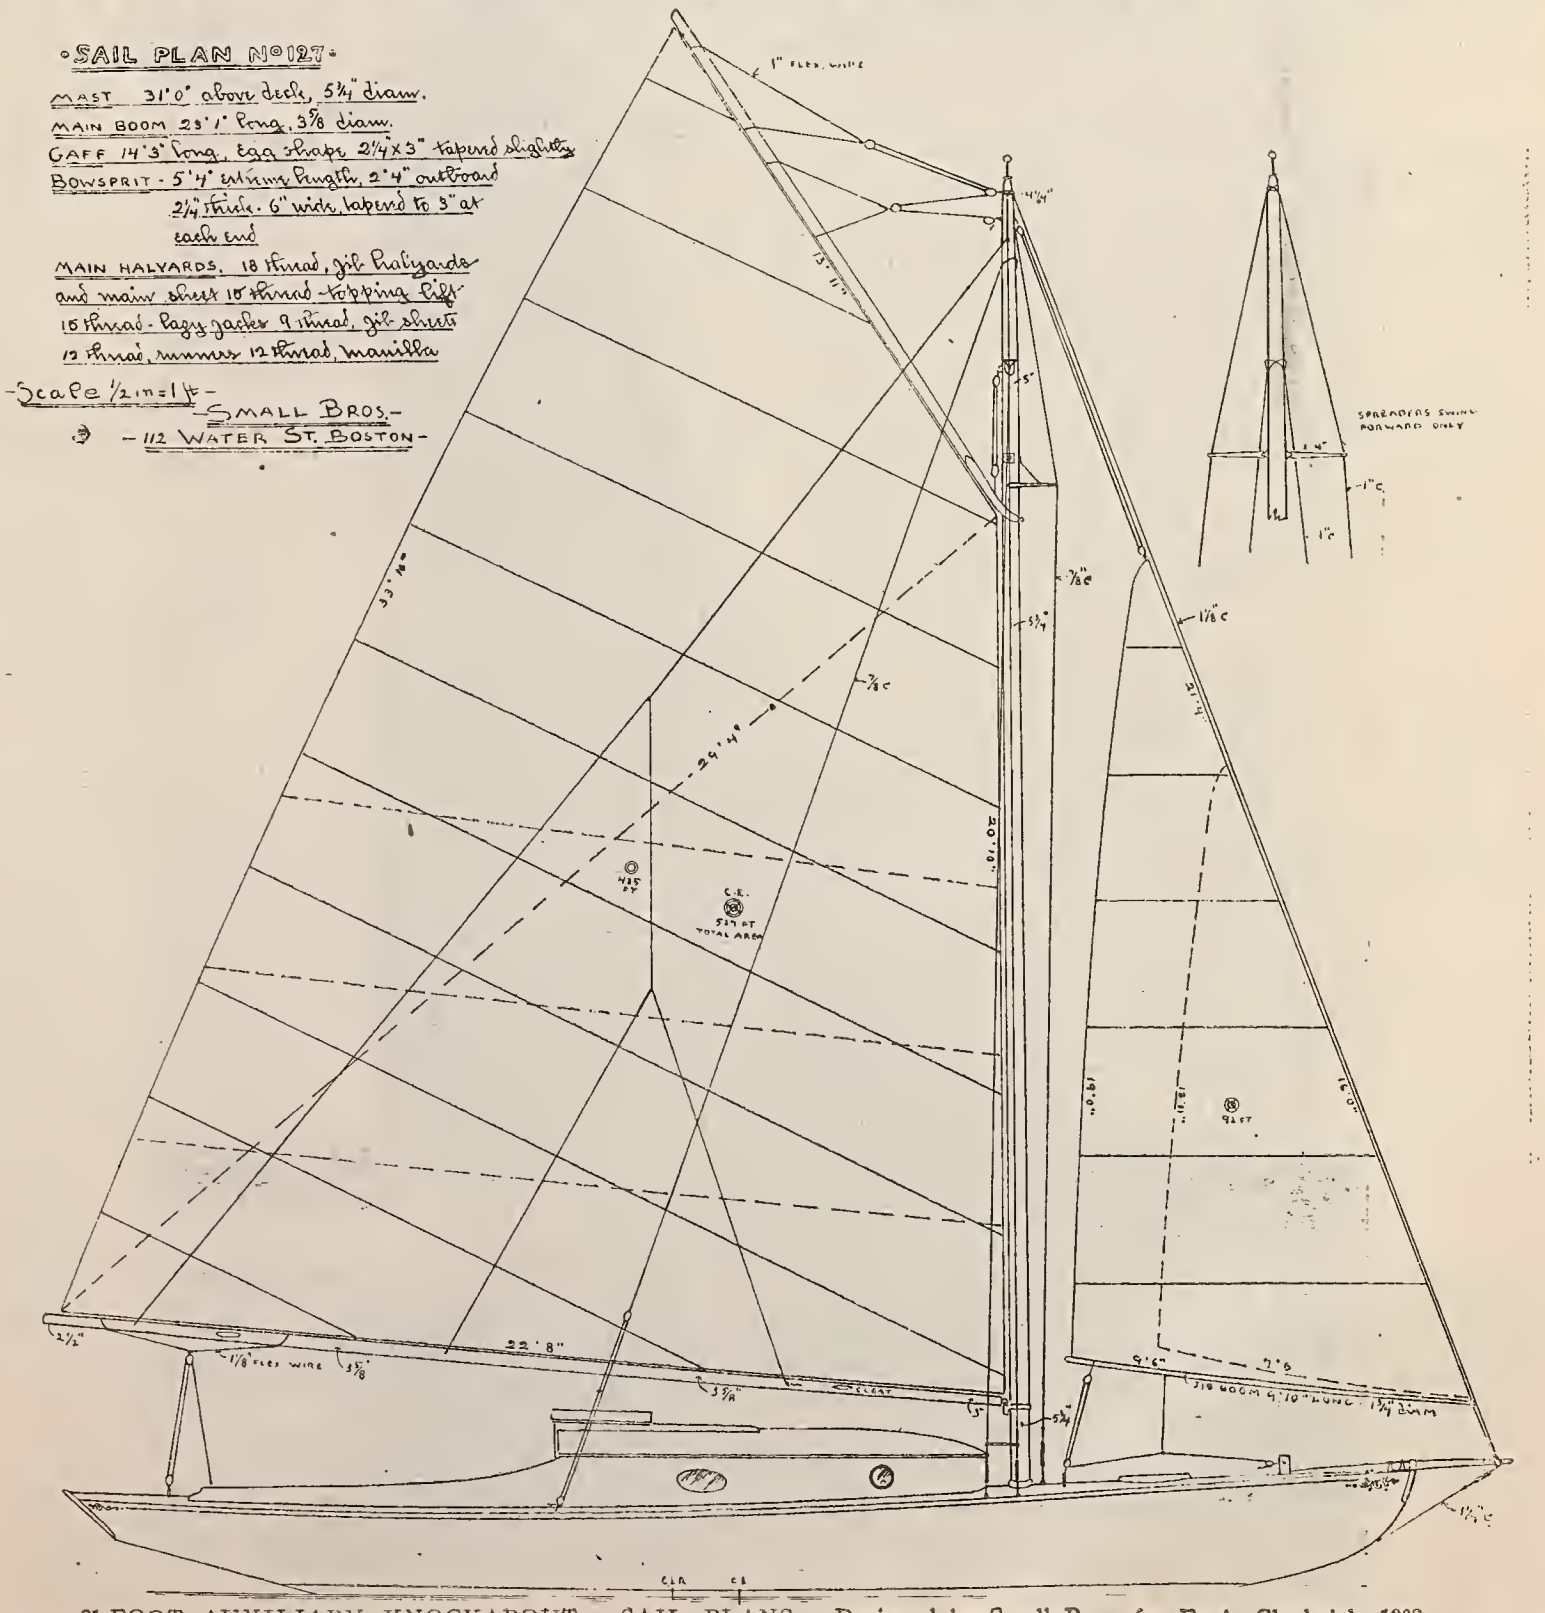
Commodore, George J. Selz; Vice Commodore, Ernest F. Bartro; Rear Commodore, John Schroder; Treasurer, Wm. E. Ritchie; Financial Secretary, Fred. Starke; Recording Secretary, Arthur W. Haire; Measurer, Frank Schroder; Sergeant-at-Arms, Benj. Rehm. Board of Directors, J. H. Curtiss, two years; P. G. Schumacher, two years. House Committee, Samuel Rosenfeld, Chas. Loock, J. Kohm, A. White, F. Kaiser, George Schroeder, H. E. Elkema, H. J. Bartro, C. Hendricks. Regatta Committee, E. Delevante, C. F. Huebert, A. A. Crosbie, J. Custance, F. Foth. Membership Committee, Fred. Daum, Fred. Foch, L. Jackson. Auditing Committee, Adam Gumbrecht, H. J. Bartro, Geo. J. Oakes. Press Committee, J. Schappert, C. Loock, R. Johnson. Nominating Committee, V. E. Bauer, C. Hendricks, William Dent.

Sir Christopher Furness has chartered his new turbine steam yacht Emerald, through the agency of Messrs. Gardner & Cox, to Mr. George J. Gould. Captain Donald Tod will go to England in the early spring and bring the yacht back to America. The following account of Emerald is from the London Field:

"The new yacht which has been built to designs by Mr. F. J. Stephen, is a vessel of very handsome appearance, no extent of accommodation having been sacrificed to obtain speed. The intention of the designer is to obtain a speed of 16 knots with an entire absence of vibration and an exceptionally low coal consumption. Dimensions: Length over all, 236ft.; breadth, 28ft. 8in.; moulded depth, 18ft. 6in. She has been constructed under Lloyd's special survey to Class 100 A 1, and has a fine cutwater stem, with a beautifully carved figure head; a long stern and a range of teak-panelled deckhouses extending amidships for about 118ft. A promenade deck from side to side of the vessel is carried the whole length of the deckhouses, and on it will be placed the boats—one of which is a high-speed launch—and a large teak deckhouse for deck lounges and navigating room.

"The erections on the upper deck include staircases, deck lounge, cloak room, dining saloon, smoking room, drawing room, drying room, pantry and gulley casings for boiler and turbine machinery and an open deck shelter at the extreme after end. A half topgallant mast, about 31ft. in height, is fitted with a steam windlass and chain and anchor gear. Below, in the 'tween decks, there are seven officers' rooms, sixteen berths for the crew and also bath rooms and lavatories. The bulwarks fore and aft are of steel, with teak top rail and inside paneling of teak. Two cellular double bottoms have been fitted, one forward and one under the turbines, for purposes of draft when the vessel is cruising light, or for a supply of fresh water for the boilers. The dining-room occupies the forward portion of the group of public rooms in the range of deckhouses, while the drawing room and smoking room are at the after end. From the entrance to the dining-room one stair communicates with the owner's suite of four staterooms, and another with the lounge and promenade deck above.

"The accommodation for guests comprises six bed rooms. The style of designs in the entrances and public rooms is a free treatment of the English and French renaissance. In the dining saloon the panelings are of time-mellowed elm, with bone inlaid figures in the panels. The drawing room is of eighteenth century work, the paneling of dado and door being of fine-toned satinwood, and the walls of Tynecastle canvas.



21-FOOT AUXILIARY KNOCKABOUT—SAIL PLANS—Designed by Small Bros. for E. A. Chadwick, 1902.

A Practical Application of the New York Y. C's New Rule.

WE publish herewith a table which was made up for a comparison of results of the old New York Y. C. measurement rule and the new one recently adopted.

The table shows the practical application of the new rule, and as the race was sailed in a true, steady and strong breeze, it affords an excellent test. All the boats sailed in one class for the Rear Commodore's Cup, the schooners being rated at eighty-five per cent. of their measurement. The time allowances under the new rule are figured with the sixty per cent. increased to eighty per cent., as provided for in the amended rules:

THE REAR-COMMODORE'S CUP.
Glen Cove, Sept. 11, 1902—30 Miles.

Effort	5 03 51	42.91	0 11 39	4 22 12	50.0	0 52 27	4 11 24

The smoking room wall paneling is of teak framing, with soft, green-stained wainscot panels, the frieze being of tinted carved wood on a field of soft bluish-green. All the staterooms, passages and bathroom are designed in the same character as the public rooms, the paneled walls painted an ivory tint, with the furniture in hardwoods to harmonize. Electric lighting and bells are fitted throughout.

"The vessel has three sets of turbine engines, three shafts, and five manganese bronze propellers—one propeller on the center shaft and two each on the side shafts. All these have been supplied and fitted on board by the Parsons' Marine Steam Turbine Company, Limited, Wallsend-on-Tyne. The hull has been specially strengthened to prevent any vibration in the structure, owing to the great speed at which the shafts will revolve. In the engine room, beside, the three turbines, with their condensers and the duplicate electric lighting machinery, there are a large number of auxiliary engines of all kinds. The main boiler, which is of very large diameter, is fitted with Howden's feed draft. The yacht is being fitted out in the most complete manner, and when rigged with her two long masts and thin spars she will have a fine appearance. The ceremony of naming the Emerald was performed by Miss Furness."

Agatha.

Agatha was designed and built by the Marblehead Yacht Yard in 1900. She is 60ft. over all, 39ft. 9in. waterline, 13ft. breadth and 8ft. 8in. draft. Agatha is now owned by Mr. C. W. Sherburne, of the Hull, Massachusetts, Y. C.

AGATHA.

YACHT CLUB NOTES.

The Philadelphia Y. C. will hold a meeting at its clubhouse, Tinicum, Delaware County, Pa., on Wednesday, Jan. 14, 1903, for the purpose of nominating flag officers and trustees for the ensuing year.

The annual meeting of the Seawanhaka-Corinthian Y. C. will be held on Tuesday, Jan. 13, at the city clubhouse, 12 West Forty-fourth street, at 8:30 P. M. The following gentlemen have been nominated to serve during the coming year:

Commodore, Arthur Curtiss James, auxiliary brigantine Aloha; Vice Commodore, William J. Matheson, steamer Laverock; Rear Commodore, Frank S. Hastings, yawl Peggy; Secretary, Francis G. Stewart; Treasurer, Frederic P. Moore; Measurer, John Hyslop; Fleet Surgeon, N. Bowditch Potter, M. D.; Fleet Chaplain, Rev. George R. Van De Water, D. D.; Trustees, Colgate Hoyt, Franklin A. Plummer and Henry H. Landon; Race Committee, Johnston de Forest, Charles W. Wetmore, Clinton H. Crane, Daniel Bacon and John R. Maxwell, Jr.; Committee on Lines and Models, John Hyslop, A. Cary Smith and St. John Smith; Law Committee, Henry de Forest, William A. W. Stewart and William G. Low, Jr.

Rifle Range and Gallery.

A Nation of Marksmen.

Editor Forest and Stream:

In the days of Agincourt and Cressy those victories were the fruit of the marksmanship of the English bowmen. The archer with his long yew bow and cloth yard shaft made the English army what it was—invincible.

The French had good reason when singing their litany in church to include in same, "From the arrows of the English may the good Lord deliver us."

History is repeating itself once more, and the battles of the future upon land will be won by the men behind the rifles. Close formation and point blank volleys are things of the past. Smokeless powder and long distance rifles become of no immediate practical value in the hands of the inexperienced soldier.

The English grew into the use of the long bow as did our Minute Men and Green Mountain Boys grow into the use of the rifle, but under differing surroundings. The English boy was at an early age through the stimulus of prizes, encouraged to shoot with the bow at a mark erected on the village green. Days of merry-making always included the sport of archery upon the programme, and even was the practice at archery made compulsory by law.

Our forefathers virtually plowed with one hand and held a rifle with the other. The seal of Minnesota shows a husbandman at the plow, his rifle and powder-horn upon a nearby stump and skulking redskin in the distance. It was force of circumstances that made marksmen of our forefathers, defense against the Indians and wild beasts, and the necessity of supplying the larder from the forests. During our Civil War, soldier for soldier, we had no such marksmen in the ranks as in the Revolutionary Wark. Times had changed, men were recruited from the city and the workshop, and not as of yore, from the frontier, where stood a rifle ready for instant use behind each door.

The late Boer war was an illustration of pitting men unused to a rifle against those who understood the arm and were as familiar with it as a schoolboy with his jackknife.

Now, as a general rule, a few days' hard drilling will turn an awkward squad into some semblance to a military company in carriage and step, but it means months of incessant labor to make marksmen of those unfamiliar with the rifle.

Compulsory practice with the rifle has been successfully carried out in Switzerland, but it would not apply to the United States. The love of the rifle must be brought about in some other way.

Now, as a suggestion. Make a reward sufficiently inviting and there are those who will strive for it. Let us suppose that a yearly distribution of, say, $100,000, were made in prizes; $50,000 to the marksmen of the year; $25,000 to the second best; $15,000 to the third, and $1,000 to the next ten in rank. Whether the amount of $100,000 per year was made up out of the United States Treasury or came from other sources, makes no difference. The question is, what would the effect be upon the country after ten consecutive years of such prize offering?

I think every village in the country would have its rifle range, and few of the youths who could give the time to practice but would become applicants and contestants for the prize.

The primary contests would be shot at the home villages or cities. The winners would in turn contest among themselves within a certain district, and the successful one in each district be delegated to the final contest, to be held at some central point. Here, under conditions that could admit of no charge of partiality, would the final contest be held. Targets at fixed and unknown distances, moving objects, etc., would call into practice the very highest skill of the marksmen. The prizes would certainly be more tempting than a marksman's badge or a silver cup. In these days of $1,000,000 salaries and "melon-cutting" dividends in Wall street, perhaps a $50,000 prize might not tempt some of our gilded youth to forego the golf stick and the tennis racquet for the rifle. Yet, when you come to think of it, there are those who, with perhaps a little truck farming to help out, might worry along peacefully with a prize of $50,000 in cold cash to their credit in the bank. So the grand prize of $50,000 with the great majority of young men might be considered a tempting prize, enough so to warrant an investment in a rifle and ammunition and the giving over of a part of Saturday to the weekly practice.

There is many a "hundred thousand" that goes to make up the quota of a "billion-dollar Congress" that is spent for purposes far less meritorious than prizes for rifle proficiency among the youth of the country.

What would be the effect of a plan of this kind being carried out after say, ten or fifteen years? That's the question. We hear of Peace Congresses, International Arbitration, Total disarmament, etc., etc., but we see no diminution of the standing armies and navies of the world. Improvements in war materials go on. We no sooner improve the unpenetrability of armor than some new shell is perfected with superior penetrating powers: and so the race goes on. Guns that carried 12 miles now carry 21. Not content with fighting above the water, the sea warfare of the future seems destined to be fought out beneath the waves. Rifles of greater penetration and carrying power are being successfully put forward. All this would seem to prove that for some years to come the theory will be held that the one best equipped on a war footing in time of peace will be virtually guaranteed from neighborly interference. And if all this be so, this country must keep abreast with the times. Her ships must be second to none, and while our standing army need be kept to a minimum, yet like the Spartans, every man in the Republic should

be a brick, he should become expert in the use of a rifle, and if the time ever came when his country needed him, he could step into the ranks a soldier requiring but a minimum of preliminary drilling to bring to a plane of soldierly prefection.

CHARLES CRISTADORO.

Rifle at Shell Mound.

SAN FRANCISCO, Cal., Dec. 15.—The somewhat wintry weather did not deter enthusiastic riflemen from visiting the range yesterday. Scores in some of the annual events are so close as to keep the competitors very anxious. Dec. 28 will be the closing shoot of the year. Scores of to-day:

Golden Gate Club: L. C. Hinkel 93; P. A. Becker 91, 87, 83; J. R. Trego 81; F. E. Mason 80; J. W. Thompson 79, 79; F. Krueckel 16.

Pistol handicap: F. C. Washburn 92, 92, 89; J. Kullman 86; M. Blasse 81.

Pistol, gold medal: J. Kullman 86.

Handicap match: C. Henderson 226, 225, 222, 219, 212.

Glindermann trophy: C. Henderson 223.

Gold medal: J. F. Bridges 206, 201; W. Ehrenpfort 195, 169, 166, 161.

Gold and silver bars: G. Tammeyer 222, 217, 214, 208, 212; M. Blasse 222, 213, 209, 205, 205.

Germania Schuetzen Club, monthly medal shoot: First champion class, F. E. Mason, 225, 221; second champion class, C. Bremer, 224, 223; First class, J. D. Heise, 217; second class, W. Goetze, 209; Third class, J. Beuttler, 193; best first shot, F. Brandt, 25; best last shot, E. H. Goetze, 25.

Competition shoot: E. H. Goetze 74, J. D. Heizer 71, N. Ahren 71, J. Utschig, Sr. 71, F. E. Mason 70, O. Bremer 69.

Trophy shoot: F. E. Mason 227, A. Pape 227, O. Bremer 225, J. E. Heinzer 217, A. Gehret 213, H. Huber 212.

San Francisco Schuetzen Verein's monthly medal shoot: Champion highest score, A. Pape, 437; champion medal, not filled; first class, not filled; second class, L. Heino, 407; third class, not filled; fourth class, Ed Doell, 347; best first shot, A. Pape, 25; best last shot, J. Gefken, 24.

ROEEL.

Columbia Pistol and Rifle Club.

THE Columbia Pistol and Rifle Club held its regular bi-monthly shoot ot-day at Harbor View. H. Kroeckel, of Stockton, beat the club record one point in the .22cal. rifle match, making 15. He will receive a Columbia gold button for the feat. He leads in this match, with 173 for the ten best scores of the year, with H. G. Hoffman, 176, and C. M. Daiss, 180, close seconds. The other scores follow:

Columbia target, offhand shooting, 200yds., rifle: F. O. Young, 44, 51, 52, 56; G. Mannel, three-shot match, 17, 21.

Military and repeating rifle, Creedmoor count: H. Hinkel, 49, 47, 46, 46, 45; A. H. Pape, 49, 47, 47, 46, 45, 45; W. R. Berry, 45, 45, 44, 42, 42.

Fifty-yard range, pistol: E. Hovey, 37; F. Knostman, 43, 65; G. M. Barley, 46, 50; A. J. Brannagan, 49; H. Baker, 59, 63, 66, 68; R. Schneider, 64, 64, 64, 71, 73, 77, 77; J. R. Trego, 70, 78; G. Mannel, 74.

Revolver: A. J. Brannagan, 44, 56; Dr. H. W. Hunsaker, 46, 64, 68, 72, 73, 74, 82; F. O. Young, 51, 58.

Rifle, .22 and 25cal.: H. Kroeckel, 15; club record, 17, 18, 21; W. G. Hoffman, 17, 17, 18, 20, 21; Dr. H. W. Hunsaker, 18, 27, 30, 34, 35; F. O. Young, 19, 20, 24, 27; Dr. J. F. Twist, 20; H. Strecker, 21, 28, 32, 39; Mrs. C. F. Waltham, 31, 39; E. A. Allen, 38.

The above was Dec. 7, 1902, shoot. This ends my ten-year term as secretary, as I have resigned, from over-work.

F. O. YOUNG.

Cincinnati Rifle Association.

CINCINNATI, O.—At the regular meeting of this Association on Dec. 21, the following scores were made under a tricky wind, from 3 to 6 o'clock. Gindele was champion of the day with the score of 90. Conditions, 200yds., offhand, Standard target:

Gindele	90 88 86 83 80	Lux	82 75 75 72 71
Payne	89 88 86 85 83	Freitag	79 74 70 67 66
Roberts	88 87 86 84 84	Jonscher	77 74 69 67 67
Hofer	86 78 77 77 74	Trounstine	76 74 70 68 67
Nestler	85 85 79 78 77	Drube	75 73 72 69 66
Odell	85 84 84 82 81	Hoffman	72 72 70 70 67
Bruns	82 77 76 74 73	Topf	70 62 60 57 54

Honor target: Gindele 26, Payne 23, Roberts 24, Hofer 25, Nestler 20, Odell 26, Bruns 21, Lux 25, Freitag 21, Jonscher 17, Trounstine 23, Drube 26, Hoffman 15, Topf 14.

Ossining Gun Club.

OSSINING, N. Y., Dec. 29.—In the non-members' contest at 50ft. on ¼in. 25-ring target, Frank Tompkins is ahead with a score of 237, Jas. Schmidt second with 229, Fred Tompkins third with 223.

C. G. Blandford made a good string at 75ft., shooting with arm extended—233, 236, 242, 243.

A limited re-entry match has been instituted for members on the 75ft. range; prize, a cup. Best 10-shot score to win; re-entries limited to five. Winner of last members' prize handicapped by having 1 point deducted from every score. E. F. B.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Jan. 1.—Poughkeepsie, N. Y.—Inter-county shoot and tournament of the Poughkeepsie Gun Club. Max Condit, Capt.

Jan. 1.—Paterson, N. J.—Open live-bird shoot of the Jackson Park Gun Club.

Jan. 1.—Rutherford, N. J.—New Year's Day target shoot of the Boiling Springs Fishing and Gun Club. C. B. Axford, Sec'y.

Jan. 1.—Interstate Park, L. I.—New Year's Day target tournament.

Jan. 1.—East Rutherford, N. J.—Match at 50 live birds, $100 a side between C. Fleishman and John Heflich, at Hackensack River Bridge.

Jan. 1.—Towanda, Pa.—Annual tournament of the Towanda Gun Club; live birds and targets. W. F. Dittrich, Sec'y.

Jan. 1.—Wissinoming, Pa.—New Year's Day target tournament of the Florists' Gun Club; open to all.

Jan. 1.—Newark, N. J.—New Year's Day shoot of the South Side Gun Club.

Jan. 8.—Newark, N. J.—Match between J. W. Hoffman, New Germantown, Pa., and C. Steffens, New York, 100 live birds each, $100 a side, on Smith Brothers' grounds.

Jan. 13-15.—El Paso, Texas.—Grand midwinter carnival shooting tournament, under auspices of the El Paso Gun Club. W. H. Shelton, Sec'y.

Jan. 13-16.—Hamilton, Can.—Hamilton Gun Club's thirteenth annual grand Canadian live-bird handicap tournament.

Jan. 26-30.—Brenham, Texas.—Second annual Sunny South Handicap; live birds and targets.

Jan. 15.—Guttenburg, N. J.—Eastern three-man team live-bird championship, $7.50 per team, birds extra. For information address Gus Greiff, 318 Broadway, New York.

Feb. 9-14.—Detroit, Mich.—Open tournament under the auspices of the Tri-State Automobile and Sporting Goods Association. Targets and live birds. John Parker, manager; S. G. Lewis, Secretary-Treasurer.

Feb. 20-21.—New Orleans, La.—First tournament of the Mississippi Valley Trapshooters' and Game Protective Association; Carnival Week, under auspices of the City Park Gun Club. Percy S. Benedict, Sec'y.

May —.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament, under the auspices of the Lincoln Gun Club. T. E. Mockett, Sec'y.

June —.—Schenectady, N. Y.—New York State shoot, under auspices of the Schenectady Gun Club.

June 9-11.—Cincinnati, O.—Seventeenth annual target tournament of the Ohio Trapshooters' League. Chas. F. Dreihs, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

The programme of the grand thirteenth annual tournament and Grand Canadian Handicap, to be held by the Hamilton Gun Club, Jan. 13 to 16, can be obtained of the secretary, Mr. John Hunter, 335 Cannon street east, Hamilton, Canada. The Rose system will govern the division of the moneys in both the live-bird and target events. Handicaps in live-bird events, from 26 to 33yds. The afternoon of Jan. 12 will be devoted to practice. Targets, 2 cents. The management has given a bond to the customs, guaranteeing to American shooters the free entry of their guns on shipment to Thomas Upton, Hamilton, Can. Mr. John Parker, of Detroit, will assist in the management, and will serve on the handicap committee with Messrs. C. J. Mitchell, Brandford; E. N. McCarney, Buffalo; T. A. Duff, Toronto, and Dr. Overholt, Hamilton. The sliding handicap will be used in target events, 16 to 22yds. The management announces that the sum of $1,200 in prizes is guaranteed.

Mr. J. H. Outwater announces that there will be an all-day live-bird shoot at his Riverside grounds, Carlstadt, N. J., commencing at 10 o'clock sharp. There are three events on the programme: The Erie Gun Club Handicap, 7 birds, $5; the New York German Handicap, 10 birds, $7; the Hell Gate Handicap, 15 birds, $10. At 1 o'clock, Mr. W. B. Widmann, of Yardville, N. J., will endeavor to score 21 out of 25, 30yds. rise, 50yds. boundary, for a stake of $50. Jersey City, Hoboken and Paterson trolley cars pass the grounds.

Mr. Harry M. Brigham, of Brooklyn, who for many months has been shooting in expert form, distinguished himself most pleasingly in the December shoots of the Crescent Athletic Club by winning the December cup, his three best scores from scratch being 47, 49 and 47, a trifle over 95 per cent., which he scored.

Mr. F. B. Cunningham, the secretary, writes us as follows: "The Missouri State Game and Fish Protective Association's twenty-sixth annual tournament, will be held April 21, 22, 23 and 24, 1903. Three days at targets and one day at live birds."

Messrs. J. H. Lau & Co., 75 Chambers street, New York, informs us that at The Gun Club, and Hurlingham Club, England, Ballistite won more than twice as much as all other smokeless powders combined, the total amount being £19,548.10.

The tournament to be held under the auspices of the Tri-State Automobile and Sporting Goods Association, Detroit, Mich., Feb. 10 to 14, will be under the management of Mr. John Parker, assisted by Messrs. J. L. Head and A. D. Caldwell.

In the report of the Christmas Day shoot of the Haverhill (Mass.) Gun Club the secretary, Mr. S. G. Miller, mentions that the club will begin actively for 1903 on Patriot's Day, April 19.

Messrs. W. Sanders, H. Pape and F. Ehlen have arranged to shoot a match, 25 birds, and $25 per man, Jan. 8, at Guttenburg, N. J.

The Mountainside Gun Club, of West Orange, N. J., will hold a shoot on New Year's Day.

BERNARD WATERS.

Regularity Between Barrels.

IN a previous article it was pointed out that one of the chief openings for improvement in the modern shotgun lies in the boring of the barrels. This is not because, strictly speaking, there are any new principles to be discovered or applied, but because the barrel of the average gun is, more often than not, the worst part about it. Judging by what has been written on the subject, and by the records that have been made in the past, it seems almost beyond comprehension that the specification of the all-round good barrel was not laid down long ago.

It is often regarded as a fluke if a gun shoots well, and it is a fluke in many instances; but overwhelming evidence could be adduced to show that barrel boring is a more exact science than is generally believed, and that bad shooting is mostly traceable to obvious mechanical defects. There are really two schools in barrel boring; the one seems to imply that the whole subject is a mystery, and that certain things produce certain results either for reasons unknown or on stated grounds, the quasi-scientific character of which is based on imaginary laws that are at variance with known facts. The other school appears to recognize that a connection really does exist between accurate workmanship in the boring of the barrels and regular and effective patterns. We hold with the last-mentioned view of the case, and we do so in the knowledge that the firms whose barrels give the best results employ the highest quality of labor in the preparation of the barrels. It might aid the further consideration of the subject if we were to explain what we consider to be desirable qualities in a barrel or pair of barrels. In the first place, there must be the greatest possible strength for the available weight of metal. This is a question primarily of design, and afterward of workmanship. Design shows where the metal ought to be; workmanship puts it there. Handiness of balance is involved in the foregoing, the barrels being made as light forward as is possible, not a quarter of an ounce being left that is not considered essential to comply with the standard of strength laid down.

The remaining qualities of the barrels are mainly involved in the shooting. They must be of a nature that will enable any well-loaded cartridge to give standard velocity and penetration. That is to say, the shot must not only leave the gun at a good speed, but the pellets must pass out of the muzzle in a condition to cover a sporting distance without undue depreciation of velocity. We thus place strength and safety first and velocity second, and we emphasize the fact in order to show that we put pattern third. We know that it is the most difficult to attain; but we say that it is a waste of time to attempt to many any serious deductions as to pattern unless it is first clear that the velocity is correct. It is not sufficient to know that a given lot of cartridges have a good velocity in some one else's gun; there must be a certainty that the cartridges give a good velocity in the gun which is to be tested for pattern. The conditions that enable a good cartridge to give a good velocity are a chamber true to the size of the cartridge, a well-shaped cone, and a barrel true to gauge. Generally speaking, there is a good velocity with a close-fitting chamber, and with a barrel small to gauge that holds the wads tightly, while the velocities are low when these things are on the large size. The question is not one of preventing the powder gases from getting past the wads, but of seeing that the full amount of gas is produced by the proper combustion of the powder, and this is only to be secured when the explosive is effectively confined during its period of action.

What, therefore, the well-instructed shooter wants is the amount of regularity and closeness of pattern that is consistent with good velocity. It might be, and often is, argued that the shooter does not always want a lot of velocity, particularly when recoil has to be studied in relation with light guns. The reply to this is that a certain value of velocity is essential, and that the reduction of recoil below that limit should be effected by altering the charge of shot rather than its velocity. Many well-informed writers have studied the relation of pattern to game shooting so closely that there is no need here to traverse the old ground. Suffice it, therefore, to say that the choke is less popular than ever among sportsmen—we except those of the order who like shooting sitting rabbits at 60 yards—and that best guns are almost universally bored to deliver 140 pellets out of the standard charge on the usual 30-inch circle at 40 yards. This, or any other, average pattern value can be obtained by regulating the amount of choke, so that quality of boring must be understood as applying mainly to repeating that pattern shot by shot with a minimum of variation, and by producing as regular a spread as is practicable.

Where experts seem to be at variance is as to the means of attaining the desired result. Gunmakers are not even agreed as to what is the standard diameter of a 12-bore barrel. The proof rules tell us that twelve spherical lead balls of a certain specific gravity weigh one pound when their diameter is .729 of an inch. This is the nominal 12-bore size, and seems simple enough at first sight, but as the inquiry proceeds, further complications arise. One eminent gunmaker, and a leader of opinion in such matters, is credited with making his barrels nearer to .740 of an inch than .735 of an inch. Others observe the absolute .729 of an inch, while a further proportion get as near as .729 of an inch as the proof rules allow, while qualifying the barrels for marking as of 12-bore. The remainder of the barrels are bored so as to be anything from .710 of an inch to .750 of an inch, as chance may decree. The result is anarchy of an extreme kind; but even then not so marked as the diversity which characterizes the different systems of boring—that is, the manner in which diameters vary from one part of the barrel to another, in accordance either with imaginary views of some supposed connection between experimental results obtained at the plate and the boring that may have seemed to be responsible for the idiosyncracies occurring.

We have made our readers familiar with our meaning when we speak of the freak-loading of cartridges, and we hope eventually to be equally emphatic in connection with freak methods of gun-boring. It is visibly more difficult to gain the knowledge necessary to arrive at a sound judgment where guns are concerned. Their cost places a limit at once on the number of varieties that can be tried, and it must further be recognized that there is so much of the human element in gun-boring, and exact standards are so difficult to maintain, and so many variations of result occur when there seems to be nothing to explain them, that he would be a bold man who would advance by more than single paces over so difficult a journey. However, progress can never be made without taking some risks, and we must, therefore, be content to limit those risks as far as possible, trusting meanwhile to arrive at something useful. Those who have studied mathematics can show how many thousand barrels would need to be tested in order to try every combination of varied boring that might be suggested. Taking a more practical view, we think it will simplify the task of working out a standard boring if the obvious and simple is first of all examined. If a barrel of standard chamber and suitable cone be bored a true cylinder right away to the choke, and prove to give good results, then the need for inquiring into fifty alternative methods of greater complication disappears. Our present frame of mind is a strong conviction, based on a variety of experiments, that the average gun would be a better average performer if it were bored truly to some accepted standard specification than if it were adjusted and regulated so as to reach a high standard of perfection with some particular cartridge the like of which it might never encounter again. When once a barrel starts to humor a barrel, relieve it a little here, ease off a trifle somewhere else, smooth off the cone, square up the choke, there is no knowing where it will lead him, though there is a fair probability that the last state of that barrel will be worse than the first. By all means, let every gun be tested at the plate, but only make those consequential changes that are designed to remove obvious defects, or are otherwise of a kind that experience shows can be no detriment.—Field (London).

ON LONG ISLAND.

Crescent Athletic Club.

Bay Ridge, L. I., Dec. 27.—The December cup was captured by Mr. Harry M. Brigham, at the last December shoot of the Crescent Athletic Club to-day. Shooting from scratch, his best three scores were 47, 49, and 47 out of 50.

One trophy event at 15 targets, was won by H. B. Vanderveer. The other, at 25 targets, resulted in three ties.

The first shoot-off was a tie. In the second Frank Stephenson and Thomas W. Stake were still in the race. On the toss of a coin, Stake won. The scores:

Shoot for December cup, 50 targets: H. M. Brigham (0) 47, L. C. Hopkins (12) 47, F. B. Stephenson (2) 45, G. G. Stephenson, Jr. (4) 45, W. W. Marshall (12) 43.

Shoot for trophy, 15 targets, handicap: H. B. Vanderveer (2) 15, Dr. O'Brien (2) 14, Edward Banks (0) 13, D. C. Bennett (2) 13, W. J. McConville (3) 13, Dr. Pool (2) 12, F. B. Stephenson (0) 12, F. D. Mead (4) 12, W. W. Marshall (3) 11, G. G. Stephenson, Jr. (1) 11, L. C. Hopkins (3) 9.

Trophy shoot, 25 targets, handicap: F. B. Stephenson (1) 25, L. C. Hopkins (6) 25, T. W. Stake (5) 25, H. B. Vanderveer (3) 24, W. W. Marshall (6) 24, H. M. Brigham (0) 24, R. E. Wigham (5) 24, G. G. Stephenson, Jr. (2) 22, Dr. O'Brien (5) 21, Grant Notman (4) 21, Edward Banks (0) 20, C. H. Chapman (8) 19, L. M. Palmer, Jr. (2) 16.

Shoot-off, 25 targets, handicap: F. B. Stephenson (1) 24, L. C. Hopkins (6) 24, T. W. Stake (5) 24.

Shoot-off, 25 targets, handicap: F. B. Stephenson (1) 25, T. W. Stake (5) 25, L. C. Hopkins (6) 24.

Highland Gun Club.

GORGAS STATION, Pa., Dec. 27.—There was a good attendance at the shoot of the Highland Gun Club to-day. The club championship event, 15 contestants, Dalton and Cantrell tied on 22 out of 25.

Club prize event, 25 targets: Dalton 22, Cantrell 22, Laurent 20, Harper 18, Green 18, Schaeffer 18, Dr. Cotting 18, Hinkson 18, Doc Wentz 17, Meehan 16, Denham 15, Brewster 15, Wayne 13, Mitchell 11, Davis 10, Wolf 9.

In the cup shoot Dr. Wentz and P. Laurent tied on 18 out of 25, and in the shoot-off at 10 targets they tied on 6. It was then too dark for further competition, and the tie was not shot off. The scores:

Club cup event, 25 targets: Laurent 18, Dr. Wentz 18, Green 17, Dr. Cotting 16, Meehan 16, Cantrell 16, Dalton 15, Denham 15, Hinkson 12, Wayne 12, Mitchell 11. Shoot-off: Laurent 6, Wentz 6.

The open sweepstake events were at 10 targets, 16yds. rise, unknown angles. The scores:

First event: Laurent 9, Dalton 8, Dr. Wentz 8, Harper 7, Dr. Cotting 6, Mitchell 4.

Second event: Laurent 10, Dr. Cotting 10, Dalton 9, Dr. Wentz 8, Hinkson 8, Wayne 7.

Third event: Laurent 9, Dr. Cotting 9, Dalton 8, Dr. Wentz 8, Hinkson 8, Wayne 7, E. Wentz 7.

Cincinnati Gun Club.

CINCINNATI, O., Dec. 20.—In connection with to-day's contest Mr. A. W. du Bray gave a handsome prize to be shot for under the same handicaps at 100 targets. Parker made high score with 89, but not being a member was not entitled to the prize. R. Trimble was high, with 86, from 22yds.

The first 50 are counted in the regular cash prize contest. Quite a number of changes took place, eight out of the nine high men bettering their scores. Standing of the nine high men now is: R. Trimble 455, Ahlers 439, Gambell 420, Randall 420, E. Trimble 418, Coleman 417, Van Ness 409, Medico 408, Osterfeld 405, Block 404.

The scores of the twenty-sixth contest cash prize:

	1st 50.	2d 50.	T'l.		1st 50.	2d 50.	T'l.
Coleman, 18	45	39	84	Maynard, 18	39	31	75
R Trimble, 22	44	42	86	J B, 18	38	36	74
Van Ness, 18	43	42	85	Falk, 16	38	33	71
Medico, 18	43	32	75	Kirby, 17	36	40	76
Randall, 20	42	37	79	Roanoke, 16	36	37	73
Gambell, 19	42	41	83	Ackley, 16	32	23	55
Ahlers, 19	42	41	83	Dreihs, 17	32	40	72
E Trimble, 17	41	42	83	Corry, 17	31	35	66
Block, 17	41	42	83	Herman, 17	23	29	52
Parker, 17	41	48	89	Bauer, 16	22	28	50

Ossining Gun Club.

OSSINING, N. Y.—A few members showed up for practice today. Foley tried his new Remington, and was very much pleased with it. The clay birds were thrown about 55yds., and as they have been frozen up for some time, they were hard to break. The birds used in the next two strings of 10 were brought in by the fire and thawed out before they were shot at. The results were better. After the third event, Foley tried 10 more birds and scored 9 of them dead. When shooting the 25-bird event we noticed many dusted birds. On retrieving them they were found to be shot full of holes.

A team of seven men from this club goes to Poughkeepsie on New Year's Day to try and bring back the inter-county cup:

Events:	1	2	3	Events:	1	2	3
Targets:	25	10	10	Targets:	25	10	10
W Coleman	15	8	6	C Blandford	17	8	8
A Bedell	14	..	..	J Foley	14	6	8

C. G. B.

IN NEW JERSEY.

Trap at East Rutherford.

East Rutherford, N. J., Dec. 15.—On Heflich's grounds there was a live-bird shoot to-day which was pleasant and good in every particular. The birds were excellent, but were blinded by the snow, and for that reason were not so prompt in flight. Mr. Heflich exercised his best endeavor to make the event agreeable, and succeeded admirably.

North River Gun Club.

Edgewater, N. J., Dec. 25.—This was a handicap merchandise shoot, but the following are the actual scores made. The shoot, taken all together, was a great success, considering the disagreeable day, and every one expressed himself as highly pleased. There will be another merchandise shoot on New Year's Day:

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6

Mountainside Gun Club.

West Orange, N. J., Dec. 27.—Event No. 1 was a turkey shoot at 25 targets, 25 cents entrance, at the Christmas Day shoot of the Mountainside Gun Club. Mr. H. Wethling was high with 22. There was a good attendance, and the scores were good, considering that the day was devoted to a heavy snowstorm by the weather clerk.

The turkey event resulted as follows:

J McDonough	1110111111100011111001111—19
A Baldwin	1101101111101111110001010—17
Ziegler	1111010011110101111001011—17
F Wright	1011101011001100010010011—13
G Ziegler	0111111111110111010011011—19
R Baldwin	0101101100000011111111001—14
W Germain	1100111101110001111010111—17
H Wethling	1111111111111111101011011—22
Ray Baldwin	0101001000010010011111001—11

No. 2, for recoil pad:

J McDonough	1100010101111011110000111—15
A Baldwin	0110111011110001111110111—18

G Ziegler	1110101010— 6	1001100111— 6
C Ziegler	1111010111— 8	1100111110— 7
H Wethling	0101111100— 6	0110111111— 8

Jeannette Gun Club.

Guttenburg, N. J., Dec. 20.—The December shoot of the Jeannette Gun Club was held on Intermann's grounds, Guttenburg, to-day. Mr. L. H. Schortemeier, in the club event, won Class A, L. Wohleib won Class B. Schortemeier and Greiff tied on 10 straight, and in the shoot-off, miss-and-out, Schortemeier won in the sixth round. The scores:

F Ehlen, 28	0220021121— 7	C Thyssen, 28	1111122010— 8
H Pape, 28	2111011222— 9	J Luhrman, 25	0221222020— 7
Job Lott, 30	1221221211—10	W Rinckhoff, 28	11200*1121— 7
C Meyer, 30	2112122212—10	G Greiff, 28	1222122212—10
J Interman, 28	2121*01122— 8	C Steffens, 30	2112212211—10
F Kastens, 28	01*1110220— 6	A Wohleib, 25	1210221110— 8
J Kroeger, 28	0221100121— 7		

Challenge medal, 15-bird handicap:

C Meyer, 30	201212102001110—10
H Pape, 28	111*10221202122—12

Team race:

H Pape	22202—4	Ehlen	22101—4
Steffens	12222—5	C Meyer	12211—5
Interman	012*2—3	Kroeger	11101—4
Thyssen	02200—2	Kastens	01011—3
Rinckhoff	11*11—4—18	Wohleib	10221—4—20

Bound Brook Gun Club.

Bound Brook, N. J., Dec. 22.—The Bound Brook Gun Club held a target shoot on Dec. 22. Three members took part in the prize cup event. The scores follow:

	Hdcp.	Brk.	Tot'l.		Hdcp.	Brk.	Tot'l.
Dr Parde	0	37	37	Brampton	8	26	34
Dr Bache	1	36	37				

Mr. Neaf Apgar was present, and made a run of 50 straight, 25 from the 20yd. mark. MEMBER.

Munson—Reed.

Lake Denmark, N. J., Dec. 23.—A match was shot here to-day between Mr. Reed, of Middlesex Driving Park, and Mr. Munson, of Dover, at 25 live birds, $50 purse, loser to pay for birds. The lost birds were all dead out. The rise was 30yds. The scores follow:

Reed	2222222222222222*2*22*222—22
Munson	22*2222*2222222222222222—23

Carlstadt Gun Club.

Carlstadt, N. J., Dec. 25.—The 25-target event was free to all members, at the shoot of the Carlstadt Gun Club, held to-day. There were five prizes. The ties were shot off miss-and-out, and the winners were: First, Peter Rasmus; second, Dr. Chas. Brooks; third, M. Rasmus; fourth, T. Gempp; fifth, J. Rasmus. The next shoot will be held on Jan. 1. The scores follow:

Events:	1	2	3	4	5	6	7		8
Targets:	25	25	10	10	10	10	10	H	25
T Gempp	12	17	7	3	4	6	6	3	18
H Krug	14	19	8	10	8	5	8	..	14

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., Dec. 20.—That the Inter-county shoot and tournament of the Poughkeepsie Gun Club, to be held on New Year's Day, will be well attended and consequently a success, there seems to be no doubt, Capt. Condit having heard from the several clubs along the river, each assuring him of their support. The trade, too, is rapidly falling in line, and will favor us by sending their representatives here, several having already assured us of their support, and we have good cause for believing that other prominent manufacturers will send their representatives to this shoot.

Owing to the unfavorable weather conditions for several weeks past, not much has been done toward getting our men in shape for the team shoot in defense of the cup that we were so fortunate in winning at Ossining on Thanksgiving Day. To-day, however, eight men faced the traps, and a strong north wind, which seemed to delight in raising the birds to a lofty height, in six events, with the following results:

Events:	1	2	3	4	5	6	Shot	
Targets:	10	25	15	25	15	10	at.	Broke.
Adriance	4	..	6	13	..	..	50	23
Traver	9	19	12	..	10	8	75	58
Wettereau	5	..	6	18	..	..	50	29
Briggs	5	2	..	13	..	..	40	20
Spencer	4	..	5	18	9	5	75	41
Winans	8	..	8	17	..	..	50	33
C A Clay	..	17	..	..	13	8	50	38
Condit	..	23	..	..	10	..	40	33

Briggs dropped out of event No. 2 after shooting five rounds.

POUGHKEEPSIE, N. Y., Dec. 27.—Christmas Day was not such a day as shooters like, the weather being decided unfavorable for good scores. Notwithstanding that there was a snowstorm in progress, and that no regular shoot had been scheduled, five men could not resist the temptation to face the traps. They shot 100 rounds each, in four 25-bird events as follows:

Buckley	17 19 22 19—77	Winans	15 18 16 16—65
Perkins	12 15 13 14—54	Du Bois	15 18 21 20—74
Condit	21 20 16 21—78		

To-day (Saturday), at the regular weekly practice shoot of this club, fine weather and a close proximinity to the inter-county shoot and tournament to be held by this club on New Year's Day, had the effect of bringing out eleven men. Six events were shot off, with results as shown by following scores:

Events:	1	2	3	4	5	6	Shot	
Targets:	25	10	15	10	15	10	at.	Broke.
Adriance	15	6	12	..	..	..	50	33
Wettereau	18	9	13	..	..	..	50	40
Perkins	19	7	10	7	11	..	75	54
Condit	20	8	15	..	..	..	50	43
Claymark	11	7	12	10	9	..	75	49
Du Bois	16	6	11	7	12	9	85	61
Briggs	18	7	10	..	..	..	50	35
Spencer	13	6	9	4	..	..	60	32
Corlies	13	3	2	..	..	..	50	18
Winans	23	6	10	..	14	7	75	60
Traver	20	7	13	8	14	..	75	62

SNANIWEH.

Schenectady Gun Club.

SCHENECTADY, N. Y., Dec. 20.—Twelve contestants participated in a practice shoot of the Schenectady Gun Club to-day. The weather was pleasant and favorable for trapshooting. A number of team shoots was the competition of main interest.

First race, 15 targets per man, resulted as follows:

Warnick 14, H. E. Greene 14, Adams 12, M. P. Rice 7, A. A. Green 10, Wallburg, 14; total 71.

Levengston 14, Hull 12, Borden 11, Lovejoy 12, Valentine 14, Arnold 10; total 73.

Second race, same conditions:

Wallburg 12, H. E. Greene 13, Hull 12, Adams 13, Lovejoy 13, M. P. Rice 10; total 73.

Valentine 13, Warnick 14, Levengston 14, A. A. Green 13, Arnold 11, E. W. Rice 8; total 73.

Shoot-off: This race being a tie, the match was decided by a 10-bird race, as the approaching darkness would not allow a longer race:

Valentine 7, Warnick 10, Levengston 8, A. A. Green 9, Arnold 5, E. W. Rice 8; total 47.

Wallburg 6, H. E. Greene 10, Hull 6, Adams 8, Lovejoy 4, M. P. Rice 7; total 41.

Mr. Levengston was obliged to leave before the tie was shot off. Mr. Warnick was allowed to shoot for both himself and Mr. Levengston.

During the afternoon Mr. M. P. Rice and Mr. Lovejoy shot a challenge match for position on the second team of the club. Mr. Rice was defeated by a score of 25 to 31 in a 50-target match.

There will be no shooting on Christmas Day, but the last shoot of 1902 will take place on Saturday afternoon, Dec. 27. Members are earnestly requested to come in the early afternoon, as darkness prevents shooting after 4:20.

There will be shooting on New Year's Day from 9:30 A. M. until 3 P. M., on the grounds, and it is expected there will be a large turnout.

The total scores made during the afternoon are as follows:

Events:	1	2	3	4	5	6	
Targets:	25	25	25	15	15	15	Av.
Warnick	22	25	24	14	..	..	.944
H E Greene	19	22	23	14	..	..	.866
Levengston	18	22	..	13	14	..	.837
A A Green	20	22	..	10	..	..	.800
Valentine	15	20	..	12	14	..	.762
Hull	16	20	18	..	..	..	.726
Borden	14	18	..	13	13	11	.726

Wallburg	13	18	..	9	14	..	.675
Arnold	16	15	..	9	10	..	.641
Lovejoy	12	17	..	8	11	12	.631
M P Rice	13	17	..	11	8	7	.590

Haverhill Gun Club.

HAVERHILL, Mass., Dec. 27.—We have not been dead, only sleeping; woke up and had a very nice little shoot Christmas Day. The weather was anything but fine, but cold and snow could not dampen the ardor of a few of the faithful, and some very fine scores were made. Our general utility man, Will Kirkwood, who cannot go to a shoot and enjoy himself unless he does all the work, and Miss Jennie Kirkwood, of Boston, braved the cold and snow, and said they had a good time, and all hope they did. Messrs. Spofford, Follansbee, Lockwood and Hatch were over from Amesbury, and Messrs. Brown and Bateman made their first visit, and we hope to see more of them. The number of shooters who participated was not large, but what may have been lacking in numbers was fully made up in enthusiasm and good fellowship. We have probably laid away our plaything until about April 19 (Patriot's Day), when we hope to start out for an unusually successful season at the traps. The summary follows:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	
Targets:	10	10	10	10	10	10	10	10	10	10	10	10	10	10	10	20	Av.
William	9	9	8	7	7	7	8	..	..	..	..	..	..	..	..	..	.785
Lockwood	9	8	7	8	6	8	9	9	7	7	6	5	8	..	..	..	.746
Spofford	8	7	10	9	7	10	8	8	9	4	7	7	..	..	..	..	.783
Hatch	5	9	7	7	9	7	8	8	9	7	9	9	7	..	..	..	.776
Miller	7	9	6	9	8	7	8	7	8	4	5	5	3	8	9	12	.676
Childs	8	5	8	8	6	7	7	8	7	7	9	8	7	10	10	..	.766
Cole	5	8	5	5	6	9	7	3	7	7	5	5	6	6	4	..	.520
Bateman	1	3	3	..	..	..	..	..	..	..	..	..	..	..	..	..	.233
Brown	10	6	10	..	..	..	..	..	8	..	..	..	..	..	..	..	.850
Tozier	6	8	7	9	8	7	8	9	10	10	10	9	7	7	..	..	.821
Follansbee	..	10	8	8	9	8	8	8	4	8	6	..	..	..	..	..	.770
George	..	..	8	8	9	9	8	9	10	10	8	8	10	9	9	..	.884
Lloyd	..	..	..	..	..	..	..	..	..	..	..	4	5	10	..	..	.636
Griggs	..	..	..	..	..	..	..	..	..	..	..	..	6	7	6	19	.760
Brooks	..	..	..	..	..	..	..	..	..	4	5	..	..	..	..	..	.450

The conditions were alternately regular and unknown angles.

S. G. MILLER, Sec'y.

Trap Around Reading.

READING, Pa., Dec. 26.—Owing to the cold and snow, only a few shooters participated in the target events of the South End Gun Club, on its grounds on Boyer's Island, yesterday. The averages made were decidedly not up to the standard, the dark background interfering very much in that respect. Walters made the highest individual average of the day, with 103 targets out of 130. The scores:

Targets:	1	2	3	4	5	6	7	8	9	10	11	12	13
Targets:	10	10	10	10	10	10	10	10	10	10	10	10	10
Walters	5	10	7	10	7	9	8	9	9	7	5	8	9
Yost	8	8	5	8	7	8	7	7	5	8	5	7	7
Eshelman	8	8	8	7	3	8	8	7	7	6	6	8	9
Schultze	8	6	7	8	5	7	8	7	6	5	5	8	8
Jones	7	7	7	8	6	7	7	6	5	7	7	5	6
Gerhart	6	7	8	10	5	6	5	7	7	5	9	6	5
Farrer	6	5	6	9	7	3	7	4	8	6	4	5	8
Miles	6	7	7	5	6	6	5	8	5	7	7	7	6
Gicker	7	7	8	7	7	7	7	7	4	8	..	..	..
Matthias	7	8	9	5	10	8	6	..	..	..	..	..	..
Snyder	5	3	6	8	9	8	8	6	8	..	..	..	..

Oakbrook, Pa., Dec. 24.—On the grounds of the Oakbrook Gun Club to-day Richard D. Bechtel, John B. Kurtz and Peck Brendel took part in a shoot at pigeons. The first match, at 7 birds, for $25, resulted as follows: Bechtel 7, Kurtz 6, Brendel 2.

Second match, at 3 birds, for a purse of $7.50, resulted as follows: Bechtel 2, Kurtz 3, Brendel 1.

Reading, Pa., Dec. 20.—The Court of Common Pleas of Berks County to-day, on motion of J. Bennett Nolan, granted a charter to the Schuylkill Rod and Gun Club, of Millmont. The trustees for the first year are Oscar Croh, Jacob Weitzenkorn and Howard Harvey.

Dec. 27.—A live-bird shooting match was held at Tulpehocken and Greenwich streets, to-day, under the auspices of Albert and George Krick. The scores:

U Rittenhouse	1100101111—7
J Dearolf	1111010101—7
M Katzenmoyer	0111111111—9
H Ball	1011011010—6

Robesonia, Pa., Dec. 20.—The live-bird shooting match held here to-day under the auspices of the Robesonia Rod and Gun Club was a grand success, and attracted sportsmen from Reading, Strouchsburg, Wernersville, Richard, and Womelsdorf. The scores follow:

First event, 7 birds, $3 entrance: G. McClennon 2, F. Reed 3, W. Spatz 6, H. Caldren 4, G. Zeller 5.

Second event, 7 birds, $3 entrance: G. McClennan 1, F. Reed 1, W. Spatz 5, H. Coldren 6, G. Zeller 4.

Lorane, Pa., Dec. 25.—The target shoot of the Lorane Rod and Gun Club held on William K. Lutz's shooting grounds to-day was well attended, shooters being in attendance from Reading, Baumstown, Birdsboro, Gibraltar and Monocacy. The scores follow:

Event No. 1, 10 targets:

J Quinter	0111111111— 9	Smith	0011101110— 6
F Dearolf	0110100000— 3	G Killion	0010111111— 7
Rittenhouse	1110000011— 5	Lutz	1010100111— 6

Event No. 2, 15 targets:

G Killion	0101001111111010— 9	J Eberhart	1000111111110100— 9
Rittenhouse	0000010000000001— 2	Smith	1010101000011000— 6
Brown	1101110101111011—11	Katzenmoyer	0101010110100— 6
A Hass	0110000110100001— 6	A Killion	0010001101111101— 8
F Dearolf	1010100010000010— 5	Witherhold	1100000111000000— 5
H Brown	0110100101011000— 7		

Event No. 3, 15 targets:

F Dearolf	1011110111100011—11	G Killion	0000100000010100— 3
Smith	0000000100010000— 2	Kohl	1010000000000000— 2
Rittenhouse	0101110001111011— 9	Killion	1000001101011000— 6
Clauser	0010010010011000— 5	J Brown	0101111111111111—13
H Brown	1001100010110100— 7	G Huber	0000110101000000— 4
A Killion	0011100110101110— 9	Smith	1111111100101000—10
C Dearolf	1010100011101100— 8		

Special match between Heber Brown, of Gibraltar, and W. K. Lutz, of Lorane, 25 targets, $5 a side, resulted in a victory for Lutz, who scored 19 to his opponent's 4. Brown was shooting a strange gun, as he broke his gun in practice on Dec. 24, and was compelled to use a borrowed gun, which he blames for his defeat. The scores:

H Brown	0000010000100000010000100— 4
W K Lutz	0111110111110111111100110—19

DUSTER.

PUBLISHERS' DEPARTMENT.

A New England Lady down South Discovers a Practical Use for the Passion Flower.

THE Passion Flower that is prized so highly in the North as an ornamental flower, is a common field vine down South that overruns the farmers' corn patches and gives him trouble to keep it weeded out. In the South it comes to full maturity and has on it a fruit the size and shape of a hen's egg. The skin is rather tough. The inside of skin or rind is covered with a jelly-like substance somewhat similar to the pomegranate, but is a creamy whiteness, and has a very peculiarly fragrant perfume, unlike any other fruit or flower.

Mrs. Geo. R. Morgan, a very thrifty New England woman, who went South with her husband to Pinebluff, N. C., the winter health resort located on the Seaboard Air Line Railway, last winter to build up a home in the South, has discovered that the fruit of this peculiar flower (the Southerners call it Maypop) makes the finest kind of jelly, possessing a flavor not equaled by jelly made from other fruit. Mrs. Morgan has put up several hundred packages of this jelly, and the demand for it is so great that she is selling it for twenty-five cents a tumbler.

There are many things down South that the enterprising Northerners, who are settling there find they can put into practical use.

This is the season when salmon anglers must make their preparations for the fishing, which will begin next June, and it is now that the Labrador Company, of Montreal, advertise their rivers on the north shore of the St. Lawrence River, a list of which is found elsewhere. Some of these rivers are short, and others long, and they are variously expected to yield from 300 down to 25 salmon. After the salmon season is over, grilse and sea trout are abundant in these streams, and furnish good sport.

Every angler needs a minnow bucket for carrying live bait. The Hall's telescopic buckets have three compartments, for minnows, frogs and for ice, which keeps the living bait fresh and in good condition. The Hall Manufacturing Company, of Cleveland, O., tells us that these buckets may be seen at all tackle dealers, but if by chance a dealer does not have them, one may write to the manufacturers for a description.

"Miss Simplicity" is the attractive name of the motor manufactured by the St. Joseph Motor Co., of St. Joseph, Mich. Certainly there can be no more desirable quality in an efficient piece of machinery than simplicity; and this motor is sold under a guarantee that there is nothing of higher grade on the market, either for material, workmanship or equipment.

Mr. H. M. Brigham, a scratch contestant of the Crescent Athletic Club won the club's December cup with three best scores, 47, 49 and 47 out of 50, a total of 143 out of 150, at Bay Ridge, L. I. Another member, Mr. F. B. Stephenson, on Dec. 27 broke 95 out of 100. Each used Peters High Gun shells and Infallible powder.

In the match at 25 live birds per man, for a $50 purse, between Messrs. Reed and Munson, at Lake Denmark, N. J., Dec. 23, Mr. Munson won. Score 23 to 22. Munson used U. M. C. Arrow; Reed used U. M. C. Trap shells.

Mr. W. Fred Quimby arrived in New York last week in time to enjoy the holiday season with his family and friends in the East. He was looking as fine as a two-year-old racing colt, a testimonial to the healthfulness of the great West.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903, BY FOREST AND STREAM PUBLISHING CO.

$4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, JANUARY 10, 1903.

VOL. LX.—No. 2. No. 346 BROADWAY, NEW YORK

FOREST AND STREAM is the recognized medium of entertain- instruction and information between American sportsmen. ditors invite communications on the subjects to which its are devoted. Anonymous communications will not be re- l. While it is intended to give wide latitude in discussion rent topics, the editors are not responsible for the views of pondents.

scriptions may begin at any time. Terms: For single , $4 per year, $2 for six months. For club rates and full ulars respecting subscriptions, see prospectus on page iii.

w and evil are the days of all the forest likely e, while Man, both barbarian and civilized, ents them with fires, fatal at once to seed- , and at length to the aged also.

Dr. Asa Gray.

A WINTER DAY.

ER the soft gray fringe of slender twigs, which the swamp, the red ball of the sun is slowly ris- to begin his journey over the low arc which he rs during the short winter day. The air is very but still, and looking toward the sun, one can see ads of tiny floating particles of frozen moisture, h glitter like snowflakes in the bright rays, yet only the thinnest haze in the atmosphere. Each and grass blade and weed stalk and fence rail is ened by crystals of frozen moisture—jewels more iant than any that ever came from the mine— se sparkling changes every instant, as the sun hes them at a different angle.

is wonderfully still. There is no sound of bird east; nothing but the sharp squeaking of the crisp w under foot, or its occasional breaking as the dog s back to meet us and then starts on again. But enly there comes faintly on the quiet air the mellow ic of distant hounds, which quickly dies away.

s the day goes on, the temperature will rise; per- s the snow will begin to melt, little birds will come from the sheltered places where they have been dling for warmth, and will hurry across the white ds or alight in a close flock in some tree, perhaps ely to rest in the sun, perhaps to seek for food at ends of the twigs or among the crevices in the k of the larger branches.

s we make a long round on foot, we may read in snow the story of some of the happenings of the ht. Up among the rocky and brush-grown hills fol- ing a stone wall that runs through a grove of cedars, een the track of a fox made last night. When he sed along he was no longer looking for food, had started away from his hunting grounds, back some safe place where he might rest during the , lying at ease in the sun, sheltered from the wind, l waiting until appetite should move him to start on another search for food.

Before his footsteps have been followed far, it is in that this will be a busy day for him. He has pped, looked around, and has then changed his y trot to a long gallop, and a little further on are nd the tracks of two hounds, which will keep him ng for the day. It was their musical clamor that heard faintly as we first started out this morning.

Turning back, and coming down the hill, we pass on other side of the swamp behind the barn, and here ong the tall weed stems that project high above snow, are many traces of the winter birds, that are ways here but are so seldom seen in the bitter ather. The light snow is trampled in all directions tiny tracks, and is strewn with the torn fragments seed vessels of the weeds. Passing through the rner of the swamp, we come suddenly on the old g, forgotten for the last few moments, standing ozen on the track of a ruffed grouse, which shows ainly in the snow. A moment later, far ahead, but ainly heard and distinctly seen through the naked ee stems, the great bird rises from the ground, and ales off toward another piece of woods. The sea- n is closed and we are without a gun, yet, as our rection is that which he has taken, we follow him. issing under the naked branches of the great oak d crossing the road, the woods are entered, and here erywhere are signs that the gray squirrels have been at work unearthing the nuts providently buried at a more clement season. Their tracks—or, perhaps, it is the track of only one—lead in many directions, and every few yards the snow has been scraped away and a little hole dug, from which no doubt a nut of chest- nut, or hickory, or beech, has been taken. Further along in another swamp, now hard and frozen, over which one may walk with comfort, are the tracks of Brother Rabbit, who has wandered here and there with devious footsteps, apparently without aim, but no doubt with a very clear notion in his head of what he wished to do. The dog is kept in and the tracks followed, un- til suddenly the rabbit is seen to have taken the alarm at something, and with six-foot jumps has made his way toward some distant cover, whither we shall not follow him.

Toward evening, another round is taken; by the pond, where rosy-cheeked children are skating merrily, up through the hollow into black cedar gorges, where the light is dim and now and then a snowclad sapling stands like a ghost, lurking in the sombre winter twilight.

Across the already darkening sky in a scattered flock the crows are faring homeward to some inland roost from their feeding grounds along the shore, silent so far as we can tell, for they are far away. Nearer at hand a sharp-shinned hawk is hunting through the tops of the woods, flying swiftly but aimlessly. Soon he, too, must abandon his quest.

Passing out of the wood and into the road, we come upon a great birch tree standing by the wall, on whose catkins white-throated sparrows and blue snowbirds and tree sparrows have been feeding, scattering their fragments over the snow beneath the tree. The sun is just dropping below the horizon, and here in the shadow of the woods has been long out of sight, and now the birds in little groups on softly fluttering wings, are making short journeys along the hedgerow, seek- ing some thick clump of bushes or the close-set foliage of some cedar in which to pass the night.

Clambering to the top of a high rocky knoll, we look off toward the west and see the absolutely un- clouded sky, which the sun has just deserted, red be- low, and then yellow, and then green, changing to blue and then almost to black as the eastern horizon is reached. The first stars are just looking down from the windows of the heavens. Every feature of the landscape toward the west stands sharply outlined against the brilliant sky. We recognize each hill and valley and undulation, and even each individual tree and its relation to surrounding objects.

The air is as cold and clear and dry and still as when the day began. The tramp over hill and valley, through field and wood, has made the blood flow joyously through the veins.

WE print in another column an appeal made by the New York League for the cooperation of sportsmen throughout the State to secure the adoption of the amendments approved at the late meeting of the League in Syracuse. The method adopted to gain the atten- tion of the Legislature is to work through the local members of the League to interest the support of the Senators and Assemblymen from the several counties. It is very important that such work should be done now; that each member of the Legislature may be ad- vised of the wishes of his own constituents, and thus may be prepared to act intelligently when the amend- ments shall be brought up for consideration. It is reasonable that the changes proposed by the League should have favorable action by the Legislature. The League is a representative body; in spirit, and in fact it represents in a broad way the sentiment of the State. There will always be differences of opinion on the game laws. No one law ever devised will suit every- body. But when the League has given its approval of a law, that may justly be accepted as an expression of the will of the majority, and the enactment of that law by the Legislature may well follow.

The famous New York cold storage game case, which is a suit by the People to recover something over a million dollars in penalities for the possession of game in the close season, was to have come before the Court of Appeals at the present term; but on Mon- day of this week a postponement was asked for because of the illness of counsel. The constitutionality of the law imposing a penalty for the possession of game out of season is one of the points at issue; and the magni- tude of the interests involved is such as should insure carrying the case to the highest courts, where the question may be finally settled for all time.

The report which Mr. E. Hofer sends us on the game conditions in the Yellowstone National Park makes most interesting reading. Elk, buffalo, deer, mountain sheep and antelope are present on every hand and in increasing numbers. Even the buffalo, which have been so long re- garded as a species of doubtful perpetuity, under the new conditions promise to survive for a long time to come. Thus the National Park is fulfilling that one of its purposes, which is to furnish refuge and security for the American big game, which without such a harbor must perish. The wild creatures are not only quick to learn that the Park is a place of safety for them, but under the immunity there given them they soon come to lose in a measure their fear of man, and the most grati- fying feature of the Park game supply of to-day is the friendliness which holds between brute and human. The present conditions in the Park are due in large measure to the interest, ability and tact with which the preserve is administered by Capt. Pitcher, the acting superinten- dent. It is a pleasing subject to which we shall recur.

The ancient story of St. Hubert's miraculous vision of a stag wearing between its antlers a shining crucifix, referred to in these columns last week, has brought out from a highly esteemed Boston correspondent a bit of higher criticism which makes this point:

> One hates to say anything destructive of old traditions, but your paper of to-morrow has an article on St. Hubert, in which it says that on Good Friday, A.D. 650 that worthy man saw a white stag with a cross between his antlers. Supposably, Good Friday in A.D. 650 was about the same time of year as now: Is there a man living who has seen a deer with antlers in April?

This recalls the story of the artist who had painted angels without the conventional wings, and when a critic exclaimed, "Who ever saw an angel without wings?" retorted, "Who ever saw one with wings?" We are free to say that a person who will disbelieve the St. Hubert legend because of the April antlers has no poetry in his soul. The tale of St. Hubert's apparition, like that of the fierce wolf of Gubbio, converted by St. Francis, demands for its acceptance a state of mind; and when one has that, the condition of April antlers or no antlers will not mar his appreciation of the legend.

The carrying of firearms into the game country in close time should be prohibited. To forbid the shooting of game, while at the same time permitting the presence of game shooting implements, is an unreasonable condition. Whatever may be the subterfuge by which the bearer of arms seeks to justify his having a gun, the real reason is that he has provided himself with the weapon in order that he may shoot game. Whether in a woodcock cover in summer or the Maine woods in summer, this is the true reason for having firearms along. There are laws already in some States which provide that the having in possession firearms in the fields in close time shall be *prima facie* evidence of a violation of the law. Is there any sufficient reason why such a rule should not be of universal application?

The Chicago game dealer who expects one of these days to receive consignments from private game pre- serves stocked with pheasants is probably very near to the truth of what is to come in the future of American game conditions. The preserve system will be commonly adopted. When the FOREST AND STREAM first proposed the absolute prohibition of the sale of game, objection was made by some of our English correspondents that such a rule would shut out from the market a supply of food from the game preserves. The sufficient answer to this at the time was that there were no game preserves in this country which could supply game to the markets. That was nearly ten years ago, and the conditions have not yet changed.

The Sportsman Tourist.

An Elk Hunt in the Tumbled Lands

BY THE PARSON.

ANYONE looking on the map for the Tumbled Lands would fail to find where they are located, as the name died with the breaking up of the first hunter's camp ever pitched there. They are in Custer County, Nebraska, and the picture here drawn is as they were seen many years after the events described took place, on a cold gloomy evening, requiring a fire to bring anything like a pleasant memory out of the past. But as the blaze freshens and roars merrily up the chimney and its genial warmth spreads we begin to see things that are colored by the comfortable feeling we enjoy. The shadows of the grate bars turn to the shadows of tall cedars, and the walls of the room turn to the cut bank walls of a deep canyon. The fire is of red cedar logs piled high and keep up a merry popping and snapping. It is built in a little pocket made by a washout in one of the walls of the canyon, and is surrounded and overhung by green cedar boughs and trees.

Game had become scarce in the vicinity of the main camp with so many coming and going. A week before a settler had come from below after a load of meat and we had advised him to go far back into the Tumbled Lands whither most of the game had retreated. The Tumbled Lands were the high hills where all the creeks and canyons running into the middle Loup River headed. We called it Tumbled Lands because all the hills looked as if they had tumbled into their present position and would tumble some more on the slightest provocation. There was no water in the Tumbled Lands, and so we helped the settler cut ice from the river and load his wagon with the cakes that his temporary camp might be supplied with water.

When he got discouraged and went home he had told us there was one cake of ice left. On the strength of this Will and I had decided on a camp trip to the Tumbled Lands. We had carried the cake of ice a mile or two further into rougher hills and deeper canyons and pitched our camp in the most secluded and sheltered spot we could find. Our quest was elk and the hills were full of them, and as we sat in the warm glow of the fire with our backs against a log we felt deeply complacent within ourselves, for we had read and talked of hunting adventures long years before we had ever dreamed of anything like this.

By daybreak we were climbing the walls, thrilled by the vigor of health and bright anticipations. From the top of the wall we looked on a tumbled and jumbled mass indeed. Cut bank canyons showed all about zigzagging this way and that, and intersecting each other. Here and there the evergreen top of a cedar showed a few feet or a few inches above the tops of the walls. Here and there cedars clung up and down the face of the walls wherever they could gain a foothold. Some of these trees grew to be two or three feet in diameter before the wash of time loosened them and sent them down. Along these walls where no grass grew they were safe from destruction by prairie fire. Most of the canyons had abrupt endings, or beginnings rather, dropping away fifty to a hundred feet from the first break in the rod above. Around these abrupt beginnings usually grew a cluster of cedars clinging to any inequality in the walls, while at the bottow would be a great mass of dead and fallen timber that had been dislodged from the walls from time to time. The bottoms of the canyons were usually wide and smooth, and here and there plum thickets would start and get quite a growth before deadened by the fire. Solitary elms, too, were a feature, having escaped until they gained such strength as to defy the heat made by the burning of thin and scattered bunch grass. Some of these elms were giants in girth and spread of branch. Over such a country we were to hunt for the next two days, that being the time we calculated our ice and provisions would last. We were at high tension when we started out, for everywhere were signs of elk and deer. When we reached the top of the main divide we separated, Will following it in one direction and I going in the opposite. From the top of this main divide we could look down on to a lower country on either hand and get a far better idea of the tumbled condition of things. Rows of canyons and gullies headed on either side of it, and we could look down into all sorts of pockets and chasms. Slowly I worked on, carefully scanning each hillside ravine, stopping often to more closely examine suspicious looking objects.

Twice I saw moving objects in the distance which I knew to be elk or deer, but too far away for my purpose. Once a black-tail buck broke cover only a few hundred yards away and crossed the divide in front of me, but I did not want to take chances of alarming possible other game on an uncertain shot. At last I smelled elk. The wind came from the direction of a canyon which headed just below and I climbed down into it to examine. There were fresh elk signs all about, but I saw nothing of the elk and went back to the crest of the main divide. There I selected a good point for observation and sat down and kept a close watch all about for something to move. Soon my eye fell upon what at first seemed a cluster of dead scrub bushes with the bark off the smaller branches, leaving them white-tipped. Under closer inspection some of them took on the shape of elk horns. The body of an elk gets quite white in winter and very closely resembles dead buffalo grass in color. My attention once fixed, however, they all came out plain, and there lay six bull elk on a little knoll in open view.

They were closely bunched and each carried a splendid pair of antlers, making a very fair imitation of a thicket of dead scrub. I laid out my course from where I sat, marking each ravine or divide I should follow by tree or cut bank, and finally the mouth of a ravine up which I should go to a certain peculiarly marked knoll that was just opposite the elk. From the top of this knoll I would be in easy range. I could walk up behind it and creeping to the crest be in perfect position. Just below me was the head of a small canyon into which I must drop without being seen. I was in plain sight, but trusting to distance for a screen I worked my way down feet first and was soon concealed in the shadow of the canyon.

In the bottom I again smelled elk and was alarmed lest a bunch be started and they in turn start the objective bulls. Elk smell like sheep, and the bed ground of a bunch of them smells like an old sheep yard for hours after they are gone. I have smelled elk several time in a day's hunt without seeing a single animal, and that, too, in a country where I should be sure to see them at some point in their flight if any had been started.

Once in the canyon the stalk was easy, as all I had to do was to carefully note the land marks and turn in at the right side draw. Climbing the knoll I had marked and creeping to the top, I looked over, keeping as much of a screen of grass between my face and the game as possible. And, indeed, there was something to see. The six patriarchs lay in close bunch 200 feet away. They were all old and each head held aloft a splendid set of horns. They did not seem heavy bodied animals, for the immense horns they carried made the animals seem small in the shadow beneath.

Few people realize, I think, how small an animal an elk is compared to the size of his head gear. When an elk is running, standing or lying down, with the head held naturally, the main beam of the horn cants back at an angle of about 45 degrees. Take a six-year-old bull with an ordinary growth of horns and drop a line from the point of the main beam and it will very nearly reach the middle of the spine. Bend the head back until the beams of the horn lie parallel with the spine and the point of the main beam will touch the point of the hip. Imagine a rather wizened old bull with an abnormal growth of horns and you have an idea of the nearest of the six. Back this up with five other heads about equally well crowned; six points to the beam (the natural number) or 72 points in all, and all polished and gleaming white, and you see what I saw as I lay there shivering with excitement. Beneath this tangle of horns lay the elk.

First was the smaller bull with the larger horns lying broadside to, and partly obstructing the view to the others. Head, neck and withers dark with dark line running down the spine and partly down the sides; lower side and flank, dusty white. Such was the target I had to aim at. The rest of the bunch of same contour, but of much darker shade. The old fellow semed to be looking straight at me as I shoved the needle gun cautiously forward to take aim, yet he made not the slightest move. My nerves were in considerable of a tremor, yet as I lay with my arms on the ground I could hold the gun as in a vise. Locating the position of the heart I drew as fine a bead as was possible with a gun so coarsely sighted and pulled the heavy trigger steadily. At the report the elk bounded to their feet and stood facing me. I had aimed too low and only broken the bull's leg at the bottom of the brisket. The heart lies but little above the brisket and the shot was not so very wild. I grabbed for a cartridge, and in trying to force it into the gun fumbled it. I had ample time to load and shoot again, but before I discovered that I was trying to force my jack knife into the gun the elk wheeled and were off, the one with the broken leg leading the band on three legs.

There was a deep canyon lying in such shape as to force the elk to curve to the left, as the game trails seldom cross the deeper canyons, but usually parallel them, sometimes on the divides and sometimes along the walls or in the bottom. I could see about where the elk would come out in rounding the head of the canyon and took a straight course for the place at a lively run.

Elk, if not too closely pursued, will stop to look back from the top of every rise for the first mile or two after being alarmed. These short halts allowed me to gain, and when they rounded the head of the canyon and stopped to look back, I was ready, and put in another shot. The gray bull flinched, but still kept with the band on up the divide at a full canter. I now commenced shooting as fast as I could load, and finally a bullet that went over struck in the game trail ahead and threw up a great puff of dry dirt. This turned them, and again I thought I might cut them off by running down a side divide and waiting for them to cross a certain hill. I was now a trifle short of wind, though, after my long run, and the elk stopped on the top of the hill, when I was still some five or six hundred yards away. Desperate at the prospect of seeing that head fade out in the distance, I stretched on the grass for a last random shot. I aimed upward at what seemed to be the proper slant for the distance (it might have been twenty or it might have been forty feet) as near as I could hold in line over the wounded elk's shoulder, and launched my guess. When a rifle begins to get foul the hard cakes that collect in the barrel scratches the bullet and makes it rough, which in turn increases the hiss of it into its flight. My gun was foul enough, so that I could hear the bullet hiss during its entire flight. A bullet fired from a clean rifle makes very little noise as it passes through space. There was a long but not over anxious wait; I did not expect anything from the shot, as the bullet hissed across the intervening space, and then a sudden commotion among the elk.

The gray bull's feet flew into the air, and he seemed to land square on his back and then roll over on one side, after which he never made a move. The rest started down the ridge, and soon settled into a long sweeping trot, and as long as I could see them they were still going. When elk settle into a trot, it is useless to follow them. As long as the Pawnee Indian could keep a bunch of elk in a canter they had hopes, but let them get settled into a trot, and hope faded, as the average pony could do nothing with them.

At first I could find only one bullet hole in the elk, but on taking out the heart, I found it shot square through the center. Falling to work to dress the game, I was surprised by Will before I had finished. He had heard the shooting, and turned that way. We dressed out the elk, and there being no tree handy, we piled it up where it fell. It was still early in the afternoon, and as our mission was accomplished, we decided on returning to the main camp. We took only such of the meat as we could conveniently carry, burning powder round the balance and hanging a jacket on it as a protection against wolves. Before we got to camp we met a party of cowboys with a wagon. They belonged to a ranch a hundred miles to the southwest of us. They were out hunting and looking up new ranges for cattle. It was a hard matter to get a wagon over that country, and we directed them to a rib divide they could follow and have a smooth trail to the main spine beyond which they could follow another rib down to the valley of the next stream. Going up, once on a rib divide, one is sure of a smooth road to the main spine. Going down, it is different, as one is likely to follow a short rib into a split canyon and have to turn back. There was no water they could possibly reach in that direction that night, and we gave them directions for finding the balance of our cake of ice.

Well! They found and used it, camping there for the night, as we learned later. They also found our elk, which they took, meat, hide and head, not even refusing the jacket. This we learned after it was altogether too late to do any good.

Among the few acquaintances I had in that country I became quite famous as a hunter, and my feat of shooting an elk through the heart at a quarter of a mile was often told. Not that I ever tried to make it appear other than what it was, but because man needs only a slender thread on which to hang the most wonderful tales. I suppose, though, that my reputation was as well founded as that of a great many more celebrated hunters. The desire to tell of wonderful things, and impossibility of disproving them, accounts for nine-tenths of the wonderful deeds of history.

On the Old National Pike.

Editor Forest and Stream:

My hunting grounds, when a boy, had extended over parts of Allegheny, Butler, and Armstrong counties, with once in a while a side trip up to Brownsville on the Monongahela River, whenever I could get the captain of a coal towboat to carry me.

On one of my trips up here I met a party of men and boys who were going out to the mountains of Summerset County to hunt turkey; and two of the boat captain's boys going with them, their father got me taken also to keep his boys from being hurt, he said, though I was only a boy myself. We had put in two weeks here then and I was anxious to see that country again. I left this part of the country, though, in 1861, going out with the Volunteers, and from them I went to the Regulars, and for the next twenty-five years I did all my hunting in the West, with a side trip of fourteen months to the South Pacific. Here we hunted whales; I would have said fished for them, only I don't want any professor to rise to a point of order and tell me that a whale is not a fish; I have been told that they are not fish many moons ago, and since then have found out that I had been correctly informed.

Most of my trips when a boy were made on foot; I could make them on a wheel now, and do at times, but we had no wheels then that were not on wagons, and I would use the wagon when I could persuade some farmer to let me ride with him after I had carefully deposited "that thar gun" in a safe place on the bottom of the wagon, or I might tell him that the gun was not loaded, then spring my ramrod to show him that I was not lying about it.

I had an old farmer tell me once that "he would about as soon meet the devil as meet a boy with a shotgun; he was always either shooting himself or someone else."

In the summer of 1885 I was turned out of the army, not exactly branded with an I. C., "inspected, condemned," as the horses and mules are, but was let go for the same reason that they are got rid of; we were both too old. Had I been able to hang on about three years longer I might have been retired on half pay; they do that with us now if we can get the thirty years in, but at that time only an officer could get retired. They only condemned "the men."

After getting home I made several trips out through the country with a borrowed gun, as soon as it had got late enough in the season to use one and not get landed in jail for using it. I knew by this time, of course, that I could not shoot rabbits, quail, or pigeons, there were none of them here to shoot now, though when a boy I had shot lots of wild pigeons here, but now I could not shoot anything but crows or snakes all the year round and keep out of the game warden's clutches, if he caught me.

After making a trip up through Butler County, I next planned one out through Summerset County, meaning to extend it across the next county, Bedford, if the snow did not stop me.

I would need a gun of my own now; these men I had been borrowing from might want theirs themselves; I had sold my guns when leaving the army; I had a .45-90 Marlin and a 12-gauge Parker, but the state of my finances now would not allow me to get many Parkers, not new ones, at least, so I had to look around for a second-hand one. There was a Hebrew gentleman, not a Jew—there is a distinction and a difference between the two—who had a store in Pittsburg, a kind of an auction establishment. He dealt in jewelry, musical instruments and guns; all second-hand ones. He had about one specimen of every gun made. Going into his place I took down a Fox gun, I had carried one of them for years and knew them; then, after I had seen that the gun was all right, both inside and out, I asked "How much?" "Let us say $5 for it," he told me.

I got the $5 out before he had time to say anything else; then getting my shells from him I left, taking a train now for Connellsville, Fayette County, and from there took the railroad cross ties south to Uniontown, it is only a few miles away.

I had not been here for nearly thirty years now, and everything here was strange to me. After stopping one night I struck out on foot next morning on my way to Summerset.

The National road leads out from Uniontown and climbing the mountains here, starts for Cumberland, Maryland. This road was built by the general government away back in the '30s, and runs from Baltimore to Parkersburg, on the Ohio River. In its time, before the era of railroads, it was about the only means of travel by land between the East and West.

About every fifteen miles along the whole length of it, there had been fine taverns built, the ruins of them still stood here; many of them, if let alone, may be still here fifty years from now, they are built of stone.

When I first knew this road as a boy, these taverns were still in use; now I could not find one that was being occupied, and I went as far as Cumberland.

There are a number of small towns on this road now, some of them had been hamlets then; others had not been here at all; the soft coal mines had built these towns; this is the country out of which the Connellsville coke comes.

There was one thing along here that I had need to keep away from, "moonshine" stills. This is the moonshine country where old Bill Pritts and his friends made their whiskey and shot the U. S. marshals between times; and a stranger wandering around here with a gun might get hurt. The "revenues" come in here every once in so often, and these fellows had a habit of shooting first, then asking what a man's business might be, afterward. He might be a revenue collector. I kept close to the "Pike," the national road, the first day; and at about 3 o'clock in the afternoon a young man driving a horse and buggy, a farmer's son, passed me, then stopped and asked me to ride, and I climbed in; I was wearing a pin, the corps mark of our division of Volunteers; it is known all over the State—the blue Maltese cross. This young man noticed it, and telling me that his father wore it, asked me to go home with him, and I did so.

He lived off the main road, about thirty miles from Uniontown, and we got there just before dark.

The old gentleman made me welcome, then brought out his whiskey right away. When you are offered whiskey in this part of the country don't begin to look at the bottle, you might be looking for revenue stamps, you might find them on the barrel that this whiskey came out of, the chances are that you would not, though, and if you happen to be a stranger, don't ask if this is moonshine. Drink it and let it go at that.

With this old gentleman I would not be in any danger if I did ask, but I was not hunting up any revenue. There are men in Pittsburg who get paid for doing that; if they get shot, then it is their funeral, or will be when they are buried.

Geyer was this old farmer's name. He had a fine farm of about 180 acres, about all of the farming land here; the rest seemed to be mostly mountains. His place ran back between two of these mountains for over a mile, a creek that headed in there somewhere passed his dooryard. I had left home on Monday, and this was Tuesday; day after to-morrow would be Thanksgiving. I had forgotten all about it; but at the supper table to-night the old lady wanted to know what she would get for Thanksgiving? Her son had brought in a load of groceries that he had been sent clear to Uniontown for, these were for Thanksgiving; but she needed a turkey.

"Then kill one," the old man told her.

No; she would not; she had none now that were fit to kill. She was not going to kill her hens; she would need them next spring.

The old gentleman explained to me that he had sent all his young turkeys to Pittsburg.

"Then cook chickens," he told her. "I would as soon have them." Then to me, "You must stay here until after Thanksgiving." I said I would.

"How would a few wild turkeys do?" I asked the old lady.

One would do if she had it.

"There should be some in here, I think, are there not?"

"There used to be plenty, but they have all been killed off," the old gentleman told me. "They and the deer are scarce now, the dogs have run off the deer."

"I think both are coming back, though," young Charley Geyer says, "Gibson's boys told me—they live down in that small house you passed just below there—they told me that they had seen quite a flock of turkeys up on the mountains several times this summer."

"Did they ever have a roost near here?" I asked.

"Yes; their old roost was up on the creek near the head of it; I have got them there, but not for several years now."

"Well, if I were not so tired I would go up and see, but I'll hunt them to-morrow, it won't be worth while to hunt them there then, though."

"No," he told me, "I'll show you where to go. I wish I could go, too, but we have too much work here now, and I have lost two dogs on that trip to Uniontown, besides."

Next morning, after a good breakfast of hot biscuits, buckwheat cakes and sausage cakes (not sausages, but the meat made into cakes, then friend; I have never seen them anywhere else but at these farmhouses) I got ready to hunt turkeys.

Charley Geyer told me to take a trail that began just across the creek from the house, then to follow it a mile or more; it ran along the base of the mountain; then if I saw no signs of turkey, to climb the mountain on this side and skirt it half way around, but not to go too far around, I might get lost. Men have been lost up there.

"Well, I won't be lost, not this week. I am not a city man; I have had to find my way out of far worse places than you have here. The Rocky Mountains are a good place to get lost in. I have been in them."

Getting across the creek, I followed the path, a dim trail, a mile or more, not seeing any signs of turkeys yet. There was tall timber here, most of it hard wood, with very little underbrush.

At last I stopped under a big chestnut tree and began to scrape the leaves aside to see if the squirrels had left any nuts. They had, and while I was hunting them up I happened to look ahead of me on the trail and saw a doe coming down it as though the dogs were after her.

She saw me now and stopped, then looked back the way she had come, as if in doubt as to whether to come on, or go back or go somewhere else.

I stepped back from the trail, then said, "Come on, now, I won't hurt you." She trotted right up in front of me, then stopping again, stood here staring at me; she was not more than a year old and probably had never seen a man this close to her before.

"Go on out of this," I told her; "I don't want you, but some one else may; get out, now," and making a jump at her, she started off, and in half a minute was out of sight.

"It won't take her many minutes to get to that creek now, and when she does those dogs, if any are after her, may as well go home," I thought.

She had been gone about five minutes when the dogs came in sight. There were two of them, and they were in no hurry; they were not the kind of dogs that do anything in a hurry.

I ran to where I had left my gun, and picking it up, said, "I'll stop you fellows, anyhow"; then I stood in the trail with the gun held across it, and the dogs coming up now, stopped and stood looking at me. One of these dogs, the smaller one, was part pointer, but not enough of a pointer to be registered, but the sooner part of this one would spoil him for anything in the shape of a bird; he might do to point a beef steak. The other dog, a big black one, seemed to be a pure sooner, I don't think there was any cross about him.

"Go and lie down, there," I told them. The little one lay down without asking any questions; but the black one wanted to go on, but seemed to be in fear of the gun.

I have never yet met a dog that would offer to hurt me after I had spoken to him; so grabbing this one by the neck I dragged him over to where the other dog lay, and shoving him down here I asked, "How many times need I tell you to do a thing. Lie there, now, will you?" He lay down and began to whine, and I sat at his head to keep him here. In about five minutes the men came in sight; there were two of them, both carrying shotguns. One of them was a man of about my age, a farmer, I thought; the other was hardly more than a boy yet, about 20, probably; he looked like a city boy; he was, too, out of my own city, as I afterward found out.

They came up to where I and the dogs lay here, and the boy looked at us, then began to grin. I thought he knew that I had put up a job on them.

"Your dogs, sir, missed the deer by about a mile, and were ready to quit when they got here. I called them off."

"How far ahead was the deer?" the young man asked.

"Oh, a mile or two. She passed here ten minutes ahead of your dogs."

"It was a buck, was it not?"

"No, a yearling doe."

"I sent those dogs after a buck, sir."

"You may have sent them after a bear, but if you did it was a doe by the time it got here. I have been hunting deer since long before you were born, sir, and I probably know a doe now when I see her. That one was a doe."

"Why did you not shoot her? We are not hogs. I would not claim her."

"Nor would I, if I had shot her. You would be justified in claiming half; but I am not shooting deer with a shotgun nor a doe with any gun."

"We all hunt them with shotguns here," the old gentleman says.

"Yes, sir, many do. I have heard of them being hunted with an ax. Then they were run into a snow bank and clubbed to death. It all depends on how you look at it whether we use a shotgun or not."

"Well, we can't use a rifle here."

"I can. I don't see anything here to prevent me or you from using a rifle."

"You could not use it where we started that deer. There is too much brush there."

"Then I would let them get into the open and give them a chance. They hardly have half a chance now with our rifles if we know how to use them. We are not now hunting them with old muzzleloaders. You and I have done it, I have no doubt."

"Yes, sir, I am older than the first breechloader."

"We both are. Well, the deer have no better defense now that they had then. Let us not use a gatling gun on them."

"Those dogs of yours are valuable animals, ain't they, uncle?" the young man said.

"Well, they are not worth over one hundred dollars each; but they did not cost me that; in fact they cost me nothing; I raised them."

"They were not built to run deer. They probably can run a tramp off all right, sir. Don't convict these dogs before hearing their defense. I appear for the dogs. We won't ask any delay, we are ready for trial now."

The young fellow looked at me, and asks, "Are you a lawyer, sir?"

"No, sir, but I had been thinking all along that you were one."

"I am trying to be one," he said; "I am a law student."

"Well," the old gentleman said, getting up, "We may as well go home, which way are you going, sir?"

"I came up here from Mr. Geyer's after turkeys, but I don't see any signs of them."

"They are here then. I saw them only a month ago; but I have better ones at home that don't need hunting."

"Suppose you go on in there, uncle, and let this gentleman and me hunt them up. If we find them it will save the ones you have at home."

"Go ahead then," his uncle told him. "I don't want to climb that mountain to-day. Bring a turkey home, though, if you find any."

The dogs still lay here.

"Don't leave the dogs here, uncle, I don't want them to get lost if they are not so valuable."

"Oh, never mind the dogs. They won't get lost. See that you don't; it would not be the first time you did, you know. I had to hunt that mountain a whole day for him a few years ago," he said to me.

The young man and I started out, and I asked him whose office he was reading law in. We started another argument and proceeded to retry the case of the City of Allegheny versus The Pittsburg and Western Railroad.

This case had been tried, appealed, reversed and remanded, then tried again in our State courts. We gave it another hearing to-day and came near forgetting all about the turkeys.

It was a suit to determine the railroad company's title to Smoky Island, which was not an island at all, but a strip of river bottom land in Allegheny City.

I had been born within gunshot of it and we used the island as a play ground, hunting Indians among the trees there with bows and arrows—the negro boys did for Indians in this case; and hunting "greenies," green frogs, with clubs.

I appeared for Allegheny City now and not the dogs, while the young lawyer defended the railroad, and we told each other all about the rights of eminent domain, riparian rights, and rights of possession, and were still busy trying the case and had got up to near the top of the mountain and well around to the right side of it, when happening to look ahead of me I remembered what had brought us here. The turkeys were here, plenty of them. Just ahead of us and a little below us was an open place nearly clear of trees and in the middle of it about fifteen turkeys were scattered around feeding.

There was a fringe of bushes and blackberry vines between the turkeys and us here, and we dropped down out of sight.

The young lawyer proposed that he should go down and around this place out of sight of the turkeys, then get above them and send them down to me; I, in the meantime, to get in through the bushes, then do the rest. The turkeys were too far off now for us to reach them from these bushes and we could not get in closer on them here.

He started, while I crawled in through the bushes, then lay here. I could see him as he went dodging behind the trees on his way up and at last the turkeys saw him and came right toward me.

I let them come to within thirty yards; had I my old Fox gun sixty yards would have been close enough, but I did not know this gun; I had never fired it.

They were in among some dead weeds now, and I sent them the contents of both barrels, then jumped up to load. The turkeys ran back, then began to fly and the young man gave them both of his barrels and got two, the rest dropping down just ahead of him to run again. A turkey does not want to fly any longer than he has to, he can't fly far anyhow.

The young man was going to follow them, but I called to him to let them go, we had enough now. I did not know yet how many I had, the weeds hid them, but I must have at least two, and going over to them I found I had three, two small ones and a big one. He brought his two down now and I told him to take as many as he wanted, I would take the rest.

He would like the big one, he said.

"You have it; take it and one more at least. I only want two."

I would have to take all four or else leave them. He had four miles to go; he would have to return the way we came, while I could get to Geyer's in about two miles and a half.

"Well, these four will make a load for a pack mule; but I am not shooting turkeys to feed 'coons. I'll take them."

I tied them together in pairs, got the heaviest pair across my gun, then got the gun on my shoulder and taking the other pair in my hand we started, the young man leaving me now after telling me where I could find him in the city.

I kept on straight down the mountain, he having told me that at the foot of it here I would find an old stone quarry and lime kiln, and a road ran from it past Geyer's but I might have some trouble in finding the road, it had not been used for years now.

"It will be used to-day though," I said. "I have followed too many Indian trails not to be able to find a wagon road."

The turkeys really weighed about sixty pounds in all, but they felt as if they weighed half a ton, and I had to stop and rest every quarter of a mile, but got to the quarry at two o'clock, and from here the roadhouse was plain enough, and a mile and a half over it took me to Geyer's.

I left my turkeys outside, then went in the kitchen.

Mr. Geyer wanted to know if I had found anything.

"Only a few turkeys, sir. I met a doe but did not want to shoot her; I let her go."

"I guess she came here. A doe came in here from across the creek and ran in among my cows in the pasture; Charley's dog went after her but Charley called him off, then she left."

"That was right, she had all the dogs she wanted before I met her, I called them off."

The old lady examined the turkeys and then said that two of them would be all she could use; she would send the others to a widow below here who had a house full of boys to eat them. Then she called in her son, who was at work in the barn, and sent the turkeys off with him. Next she spread me a good dinner on her kitchen table; it was long after dinner now, but she had been keeping mine for me, she said.

Mrs. Geyer's daughter and her husband came in here late this evening from Meyersdale to spend Thanksgiving with the old folks. They had driven across here in a buggy. It snowed to-night, the first of this season, but it was only a "rabbit snow;" the next one, and it looked as if it were coming soon too, would be more than a rabbit snow, so I would not hunt on foot clear to Bedford Springs this time.

The two young men here, Charley Geyer and his brother-in-law, wanted to hunt rabbits to-day. So did I, but they had only one gun between them, and I gave them mine. They were out until nearly dinner time but got a big bunch of rabbits.

The snow was still on the ground the next morning, and it looked as if more were coming. The young son-

in-law of Geyer's was going back home this morning, but he left his rifle here at her father's and asked me to go with him, and I went. I could cut across the country from Meyersdale to Cumberland, then go home by railroad.

I stayed two nights and a day in Meyersdale, then the second morning started for Cumberland on foot. I might have gone by railroad but I wanted to see the country.

I only got about half way to Cumberland the first day. I was in no hurry. I stayed that night with a German farmer who had Kansas on the brain; he wanted to sell out here and go there. I told him all I knew about Kansas, and when ready to leave next morning he refused to take any money from me—none of these farmers out there would—and gave me a pint bottle of "Schnaps," that is what he called it; it was moonshine though, "to keep the cold out." It kept it out and I had half of it left when I got to Cumberland.

I was walking down a street in Cumberland looking for a second-class hotel where I would not feel like a fish out of water in a canvas shooting coat, when a man across the street called out, Column, halt! Then calling me by name, said, "Come over here and report, sir." Going over, I looked at him, then holding out my hand, said, "I am glad to see you, captain, or is it only Jim, now?"

"Only Jim," he told me; "I dropped the captain as soon as I had got home. I found more captains there than would patch a mile. The half of them could not tell you the difference between a platoon and a column of fours. They have never been nearer the front than Harrisburg."

This man had been one of us boys who had hunted Indians in Smoky Island back in 1845. I had lost him after this and next found him in the regular cavalry during the "late unpleasantness." There he got a captain's commission in the United States Colored Volunteers. These commissions were going a-begging then; non-com. in the cavalry could get one if he wanted it. Some of us did not want it; we ranked a major of colored infantry now, or thought we did.

I would have taken one in colored cavalry; but we had no colored cavalry then. When we did get our two colored cavalry regiments later on, I asked for a second lieutenant's commission and was told I would get it; but it probably got lost in the mail; I never got it.

When Jim's regiment was mustered out at the close of the war, he was a major. Then he was given a company in a new white regiment. In a year or two they began to reduce the army again, it was too large, though we have had as large a one since; but we were dangerous then, we might march on Washington some day, and "elect" a president of our own if the one we had did not suit us; so the army was reduced to 25,000 again and Jim was out of a job again; he was offered a company in the new colored infantry that was then formed, the 24th and 25th, but he would not take it, so he was given a year's extra pay and let go. I had not seen him since.

He was a baggage master on a B. & O. train between here and Pittsburg now. I took supper with him, then got into his baggage car and in the morning was at home again. I had done considerable traveling in the last ten days and had only paid one fare, the one to Connellsville.

CABIA BLANCO.

ERIE, Pa.

An Embarrassment of Literary Riches.

Editor Forest and Stream:

Your Christmas number is simply a poem in prose, except Alma's contribution, which is certainly a poem indeed. I can unreservedly praise the Christmas number from cover to cover because I am not in it myself. I am afraid had the editor forgotten himself and inserted anything of mine it would have appeared much as a man does who attends a banquet at the Metropolitan Club in a business suit—out of place. Let us run through the number.

As to the editorials. I think I once saw at the head of my writing copybook in school in fine Spencerian script, "What is perfect cannot be improved." So, Mr. Editor, will you let YOUR work go at that, and allow me to pass along on my way?

If there ever should be erected a Temple of Fame for wild life photographs, then high up in a niche I want to see the bust of Jordan alongside that of Wallihan's. He certainly has put the atmosphere into the pages of FOREST AND STREAM, so true and realistic that no flight of the imagination is necessary to hear the put, put, of the wary turkeys. I never stalked a turkey, but I'll wager that the man who has, will exclaim, upon looking at Jordan's photographs, "How the devil did he do it?" When Mr. Jordan ever prints a full-size copy, 8 by 10, or whatever it may be, of "The Evening Meal" and wants to dispose of it, there is a customer waiting for it right here. See the glint in the eyes of those foxy old birds! Why does he regret that his color values and actual tones are lost? I say not. They are all there, gun barrel, metallic lustre and all. The gloaming of those piney woods in the "Unsuspicious" picture is something superb.

And I, too, with Von W., have ere this, many times lighted my pipe and dreamt of the shadowy brook that went rippling toward the sea, and have I heard the "woodcock's whistle" from the springside covert; and heard the "grouse burst forth with thundering wings." And when the rod and gun are safely stowed away, certainly there are pleasures of memory as you sit by the glowing grate fire, watch the frost-encased storm-windows, and hear the wind whistle around the corner of the house with a twang that means nothing more or less than twenty to thirty below. And you wonder what the partridge and quail are doing such a night as this. Surely the Lord must temper the wind to the shorn lambs.

"The Wolf at the Door" was wisely selected, and Tim Mulcahy with his Irish bulls makes me think of the Irishman who requested in his will that he be not put into the frozen ground during the winter because he would freeze to death.

Mrs. Churchill is always good, and that comes from writing of those things whereof one knows. If those who wield the pen would but follow the rule of truthful writing we might not have so many books "marked down to 39 cents after the holidays" staring us in the face on the bargain book counters. An observant eye and a fluent pen make a great and most pleasing combination, and one appreciates that when reading of Samoa and vicinity in the FOREST AND STREAM.

Mr. Robinson impresses one as having spent day after day behind the yelping huskies, skurrying over the unbroken snow-clad prairies. Simply another case of a man knowing his subject first and writing afterward, instead of doing the other very common thing.

If Coahoma does not, like the pitcher that goes for the last time to the well in a sound state, come to grief with those rattlers, I will be surprised. I may be prejudiced against rattlers, because I at one time came near cutting off the rattles of a live snake in the open (I was like the boy with the "unloaded" gun—I thought he was dead), and at another, in crossing over a snake fence all but stepped into the coils of a six-foot *Crotalus horridus*. So if I am nervous about Coahoma when I read of his stroking the necks of his rattlers—comatose or otherwise—I have cause.

And here's Alma! What can a man do but just shut his eyes and walk the stubble with him. There is really nothing else to do. You are simply carried right along. In our country, where storm sash and weather strips and storm doors go on with the first blasts of November, and do not come off until the yellow dandelion blossoms thrust their blooms from among the brown grass of last year, it means an airtight house—and under such existing conditions I plead that furnaces taking in the cold, sharp, clear, microbe-free air, warming it up and distributing it through the house, flooding the whole house with warmed oxygen, as it were, is the proper thing for a dwelling, as compared with hot water or steam radiators. But a furnace means care and attention; but then that is true of other good things beside furnaces. On cold mornings when the notes of the distant locomotive bells hum on the cold, still air like so many tuning forks, you turn out and "see to the furnace."

Once up, say at 6:30, you remain up. And when the tribe comes down to breakfast the 70-degree mark is already reached on the mercury tube.

But there's an interregnum, an hiatus, as it were, between 6:30 and breakfast, and as a matter of fact I am at this moment filling up that hiatus with pen and paper. I once remember reading of a professor who wrote a book, putting in ten to fifteen minutes at it every morning at the breakfast table while awaiting the completion of his wife's toilet and her presence at the family board. And so do I propose to do; in fact, am now doing. It will be a book that will have some reference to quail and their wild life. It will be dedicated to my little boy, and illustrated by the son of the father who is leading his class of 600 in the art school in New York.

And all this brings me back to Alma. If that book be ever finished and duly illustrated, its opening page shall be duly inscribed with that part of Alma's poem that begins "Since wild life ends in tragedy," and that ends with the life of the quail "By sudden burst of fiery hail."

I do not know that Alma need feel proud over such a proposition, but then there are times when the spirit must be considered in conjunction with the act, and this is one of them.

And I go along from article to article and page to page, finding nothing but readable stuff of the first order.

I think the sentiment shown in that old French widow preserving her husband's fowling piece and seeing that for forty-seven years it was, spring and fall, taken from its case and cleaned, as he no doubt would have cleaned it had he lived, was simply exquisite. She loved, for his sake, after death the things he loved during his life, and his fine, hand-made flintlock, silver-mounted, shotgun was, next to his good wife, the one thing very likely he most prized in this life. Am I right, good readers?

And Capt. Bobo is no more!—gone to the happy hunting grounds. I met him once in Mr. Hough's office in Chicago. At first sight he struck you as no different from the other ten thousand lean and lank Southerners this minute whittling shingles and squirting tobacco juice from the front porch of ten thousand general stores. His clothes did not "make him"; they were good, yet weather stained. The brown slouch hat he twirled on his knee had no doubt "done him good service for years," and if I mistake not, he wore an outing flannel shirt. The quotation from Shakespeare that "The apparel oft proclaims the man," I remember once seeing in a tailor shop, which might be balanced by the saying that "Fine feathers make fine birds"; but all this was set at naught in Bobo's case, for when you looked into his face you saw the man and forgot all about the clothes. He impressed me as a man of iron will and determination, one of those kind of men who, when following a wounded deer, will carry out the programme until one of them dies in his tracks. His clear eye and sinewy hand, both as steady as the earth itself, boded no good to the deer or bear upon which he drew a bead. He, I thought, would make a good and firm friend, but a bad enemy. It is easy for me to imagine the wave of his hand to those who tendered him a half dollar for the meal taken at his board. He has gone to join Daniel Boone, Kit Carson, Davy Crockett and the scores of other mighty hunters who have crossed the silent river. Peace to his ashes!

And now we come to the "Old Angler." Truly may the shadow of his pen never grow less, and may his inkwell, like the brooks he has fished, be supplied by an everlasting supply of limpid and free-running fluid.

Some day the FOREST AND STREAM may, and no doubt will, publish a book made up of the writings of the "Old Angler" like unto Mather's "Men I Have Fished With." I want right here to subscribe my name for the first copy of this book that comes from the press. That's my way of expressing myself as to the writings of that gentleman—Mr. Venning, I think his name is. I think his remarks about the *Salmo fontinalis* and *Salvelinus* would rank in smoothness and polish with the very best that ever came from the pen of Addison, and they say he was a master of the art of expression. As free as the winds and as smooth as the flowing spring do the words come from "Old Angler's" pen. But will his friends, the alphabetically burdened scientists, fond of differentiation, heed, and turn their microscopes to other purposes and leave the *Salmo fontinalis* alone? I doubt it. But, like the Raven in Ingoldsby, roundly cursed by the Bishop who

> "Cursed him with bell
> And cursed him with book;"
> * * * * * * *
> Nobody heard such a terrible curse.
> "But what gave rise
> To no little surprise,
> Nobody seemed one penny the worse."

So when the scientists have solved the *Salmo-Salvelinus* problem to their hearts' content, then will the *Salmo fontinalis* still be hatched, and still will he fight for his life and haunt the pools and swim the riffles and for and after all that may be said, writ and done, be not "one penny the worse."

How easy to imagine old Father Izaak resting on the banks of a heavenly trout stream under the shade of a spreading hemlock over in the Great Divide, where, if things are well regulated, they have such things as trout streams and other things, and laughing at the alphabeticals!

May you live for many a year to come, "Old Angler," and may your pen continue to delight and enthral the readers of the FOREST AND STREAM is the wish of

CHARLES CRISTADORO.

Bears on Old Baldy.

Editor Forest and Stream:

Noticing by the enclosed clipping that Mr. Terrell, of the Austin Land Office, has invited President Roosevelt to a bear hunt in the Davis mountains of Texas, I am reminded of my own experience with bears in these same Davis mountains in October and November of 1884. The clipping sets forth conditions as they existed at that day—probably they have changed but little since. It might be a good place not only for President Roosevelt, but also for some more lowly and humble nimrod of the FOREST AND STREAM family who has an appetite that can be assuaged only by bear steaks cooked over a campfire amid mountain scenery. At the time of which I write I had not acquired the excellent habit of keeping a note book, so must now give my experience from unaided memory—we all know what a treacherous ally that can be. My story, consisting as it does of rather trifling and unimportant details, will not trench upon the credulity of my readers, however.

During the autumn above cited I was engaged on a military expedition in making a map of western Texas. Major W. E. Livermore, of the Engineer Corps, was in charge of the expedition, assisted by three lieutenants, of whom I was one, and some twenty or thirty enlisted men and civil employes of one kind and another, such as teamsters, packers, blacksmiths and expert topographers, and six Seminole negro-Indian scouts. The latter were the descendants of the negro slaves of the Seminole Indians. These negro slaves had lived with the Seminoles so long that they had in a great measure acquired their arts and were expert scouts, hunters and trailers; by some redistribution of Indian affairs they had years ago been separated from their former masters and located at Fort Clark, Texas, as enlisted scouts of the U. S. Army, and as such had, before my time, rendered service more or less valuable under McKenzie, Bullis and similar pathfinders in expelling the Comanches and other marauding tribes from western Texas. Though there were no longer any Indian troubles in this part of the West, these simple negroes were regarded as a kind of ward of the Government, and still continued in service—useful on an expedition like Livermore's, but otherwise of little value. Our system of operations consisted in separating into two or three parties, and, having established these several parties on the most commanding elevations, surveying the entire horizon with instruments, sketching the intermediate detail and then occupying some new station at a distance of ten or fifteen miles. One can readily understand that as our observations were conducted from the tops of the highest mountains in a virtual wilderness, we could not properly be complained of as "coffee cooling"—to use the military parlance of the day—for a snug billet. We liked it, though; the scenery and mountain air was grand; our muscles soon accustomed themselves to an almost constant climb, and we no longer noticed it, indeed some of the men laughingly used to say 'twas easier to climb than to walk on a level; and as far as vigor and physical hardness were concerned we would have been fit companions for Bonneville or Lewis and Clark.

On one of these occasions Major Livermore located me with a small party on the top of a peak he called "Old Baldy," named, as he said, after a general officer called Baldy Smith. 'Twas the highest point in the Davis range—something like 8,000 feet, if I remember correctly. The extreme top of this mountain consists of a single bare rock, about the size of an ordinary dwelling house when you were fairly on it, but in the distance appearing little more than a dull point. We had a good climb getting there. Major L. had along a 22-inch Troughton and Simons theodolite that he employed for his most accurate work. When packed in its double case this instrument could be carried readily by four men over ordinary ground. Major L. now determined to use this one at the summit of Baldy, and he got it there, but only after an enormous effort. I had two six-mule wagons with me, and for quite a distance up the side there was an old trail where evidently logs had been dragged down the mountain side in times past. We concluded to take the instrument in the wagon up to the end of this trail, if possible. I put the entire twelve mules on one wagon, loaded it with nothing but this instrument and took it as far as wheels could go up the trail, and I'm sure had the makers of that instrument been along they would have held their breath for its safety over a part of the

way. In quite an experience with teams, I have never seen a wagon climb a hill like that one elsewhere. When mule flesh could do no more, the men took it, and little by little finally placed it on the summit—about a week's work, as I now recall it. I have now gotten to the bears. This mountain seemed to be fairly alive with them. Until I reached its foot I had never seen bruin in his wild state. While the men were unloading the wagon preparatory to making the ascent with the big instrument, I wandered a short distance away in search of a spring of water, as the day was warm and all were thirsty. At this part of the mountain the country was fairly well timbered, and one could see but a short distance ahead. I walked quietly along observing the ground for some evidence of a small seep spring, until I saw immediately before me a large black bear. I stopped short in my tracks and gazed in wonder and admiration at my first bear. I had come upon him partially from the rear, so he had not seen me; the soft carpet of moss and damp leaves had prevented his hearing me; though not above 25 yards distant, I presume he was not aware of my presence. After satisfying my curiosity and enjoying this unusual spectacle, I slipped quietly back to the wagons for a carbine and belt and hastened back to my previous position as carefully as possible, but my game was gone. The wagons were not far away, and I suppose he had heard the noise incident to the transfer of the load, and concluded that discretion was the better part of valor. My duties from then on kept me closely with the instrument, and I saw no more bears on this mountain, but the men who were at liberty to roam about saw them, or, at least, reported having seen them daily. One day Major L. himself saw five pass within sight of the men's camp, about half way down the mountain, and scarce a day went by but some one told about seeing one.

After I had gotten the instrument established on the top of the rocky summit and my own tent and that of two assistants just below this rock, I was delayed for quite a number of days by a long, cold rain storm, which made it exceedingly disagreeable. We had but few supplies with us at the summit, having expected to rely upon the daily visits of a small detachment with a pack mule or two to keep us supplied with what we needed as well as informed of what went on below. When the storm came on these detachments stayed snugly in their camp and abandoned us to our fate. The principal duty had been to pack water up for our use; and, realizing now that we needed none during the storm, and that it was dangerous for them to attempt the ascent for fear of getting lost in the mist, they had stayed faithfully away. Texas itself may ordinarily be a hot country, but the tops of its mountains are very much like the tops of all other mountains, especially in a storm. Our tents blew down in spite of all we could do; we ate up all our food; were wet through constantly; we could scarcely keep a fire going, and we were generally uncomfortable. We ordinarily had made such short stays on the mountain tops that it had never occurred to us to provide ourselves for eight or ten days, and we were fairly caught napping. At last it cleared away, the sun shone again, and what seemed surprising to us, though, of course, a mere natural phenomenon, as we were on the most elevated point in the vicinity, it cleared away first right where we were on the rocky summit. The sun shone nice and bright there, while all around and below us was a sea of black clouds, and so continued to be, as I recall it, for an hour or so. Gradually, however, one peak after another worked its way up through the clouds and mist till at last the whole scene burst into view below us—a welcome and joyous sight. Our packers shortly after reappeared with supplies, and we hastened to complete our work in the clear, bright air that followed. One of our assistants was handy with stone cutters' tools, and on the highest point of the rock he cut a U. S., with the date of our visit in letters sufficiently deep to last out the current geological epoch. The eagles may occasionally cast a glance at those inscriptions, but I much doubt if they have been beheld by human eyes since our departure.

Getting down the mountain was a much simpler and shorter operation than getting up. As soon as we reached the wagon I took off all but the two wheel mules, securely fastened each of the four wheels, so that none could turn, placed the big instrument in the wagon, and started the team without a driver down the trail. The wheelers being old hands at it, settled back on their haunches and slid, steadying the wagon as well as they could. The speed obtained bore some approximation to that of a toboggan. The dust and sparks rolled out from underneath the wheels as the wagon bounded along and tore through rock and earth, but finally all brought up safely at the foot of the trail, and with light hearts we proceeded on our way.

We had made but a few miles when right before us a big black bear crossed the road. All else was immediately dropped and our energies devoted to bear hunting. We took after bruin at once, most of us on foot; every one who had a weapon fired at him as rapidly as he could reload, and we followed helter skelter upon his course. He gained on us rapidly. About the time we would reach the top of one ascent we would see him about disappearing over the top of the next one, and he was soon lost to view. I had no rifle with me, but wore at my belt a revolver mainly for the purpose of making or answering signals under Major L.'s code. I had continued to fire at the bear with this pistol as opportunity offered until I had entirely emptied it—probably without great harm to bruin, as I don't suppose he was nearer than about a hundred yards to me at any time, and he soon greatly increased that distance. I followed on, though, for some little distance to see what would be the outcome of the chase. The party had gotten pretty well scattered by this time, but I observed a big negro named Black jogging along quite near me, and I concluded to have a little amusement at his expense. Black had no weapon whatever, having just jumped from his team to join in the chase as a spectator, pure and simple. I suddenly turned to him and said: "Black, what should we do if we should come up with the bear now?" He replied, "Why, de lieutenant (referring to me) would shoot him with his six shooter." I said, "I couldn't; my pistol is empty now and my ammunition is in my saddle pocket down at the trail." This put bear hunting in a new aspect to Black. He stopped, turned round, and, though I've no doubt by that time the bear was at least a half mile away, he made about as good speed in rallying on the wagons as he had in his forward pursuit of the bear. I followed slowly after him, enjoying his masterly retreat, and supposing that I had seen the last of the bear. It seems, however, that the two Seminoles, as we called them, knew a little more about bear hunting than the rest of us, and while we had foolishly taken after the bear on foot, they had put their ponies to their best speed and had managed to gain a point in advance of the bear, and had there ambushed him. Shortly after my return to the wagons one of these men came back and informed me that they had killed the bear and wanted me to let him take a wagon by a roundabout way and bring in his carcass. The Seminoles claimed the hide, but distributed the flesh. The hide was a fine one, and had five bullet holes in it, so I suppose some of our numerous and hasty shots must have taken effect.

On reaching camp that night we prepared to gratify again our curiosity by tasting bear's meat. I told the cook to broil me a steak with great care, which he scrupulously attended to. It looked fine and gave out a savory odor, but oh how tough! He must have been an old sinner. The cook next tried boiling it, and incidentally produced some excellent broth, but, as I now recall it, he never by any artifice succeeded in getting the flesh cooked so it could be eaten. Later on, in a conversation with a resident of that part of the world, I was told that the apparent abundance of bears in the mountains was due to the fact that at that season they are all astir in search of some suitable place for hibernation, and that at other times but few were seen.

WM. F. FLYNN.

JEFFERSON BARRACKS, Mo.

The newspaper dispatch to which reference is made is as follows:

AUSTIN, Tex., Dec. 27.—Honorable J. J. Terrell, Commissioner of the General Land Office of Texas, has forwarded to President Roosevelt an urgent invitation to visit Texas next fall and join him in a genuine bear hunt in the Davis Mountains in the extreme western part of the State.

This personal invitation on the part of Mr. Terrell is to be supplemented by a visit to the President by Governor-elect Lanham and members of the Texas congressional delegation, all of whom will set forth in the most alluring language the splendid hunting that exists in the region where it is proposed the President and his party shall visit.

It is believed that the President will accept the invitation when the matter is laid before him. The hunting ground is within forty miles of Toyah, Tex., the nearest railroad point, and a more desirable place for an enjoyable outing is not to be found in the whole country. Mr. Terrell has just returned from a hunting trip in these mountains. Although he spent but a few days there, he killed six bears. Four of these were black bears, and the other two were of the "silver tip" species. He says that had he arrived there two weeks earlier and before the cold weather set in in the mountains, he could have killed a score or more bears.

"It is the most wonderful bear range there is in this country to-day; at least, I know of no other locality that equals it. An old guide at Toyan told me that there are fully 5,000 bears in the Davis Mountains, and I am prepared to believe it," continued Mr. Terrell. "The mountains are easily accessible and the trip is not at all fatiguing. One evening while standing at my camp I chanced to look across a deep gorge and there I saw seven bears, all in a row, climbing up a mountain trail. They were big black fellows, and had evidently been down in the valley feeding. It was a sight that would arouse the enthusiasm of any sportsman. They were some distance off, and I did not chance a shot at them, preferring to follow them up next day. This I did and I had no difficulty in killing two bears.

"The mountain sides are covered with a small bush, upon which a most delicious black berry grows in a profusion of clusters. I do not know the name of these berries, but they have a good taste, and the bears are fond of feeding on them. They ripen the latter part of October, and from then on until the middle of November the bears come into the mountains by the hundreds and feed upon the ripe berries. The undergrowth and bushes where the berries grow are so tramped down by the bears that the feeding grounds had the appearance of a herd of cattle having stampeded there.

"If President Roosevelt will go to the Davis Mountains next fall I will guarantee that he will see and have an opportunity of killing more bears than there are to be found in the whole State of Mississippi. There is not a residence within forty miles of the hunting ground, and no guard will have to be posted around his camp to keep a curious crowd from intruding. In addition to the bears, there are plenty of deer and antelope, and, all in all, it is a veritable sportsman's paradise."

Shasta Mountain 'Coons.

ORDINARILY a coon hunt implies a great deal of exertion and aggravation. Boys sometimes find it fun, or think they do, which same indulgence of the imagination has a great deal to do, I believe, with field sports generally. That there is "nothing either good or bad but thinking makes it so" is a piece of philosophy not to be hastily endorsed, but it is an axiom embodying truth enough to encourage much speculation.

There are people who will preach you long sermons upon the cruelty of shooting, the disgrace of gambling, the depravity of intemperance, the viciousness of a thousand and one things to which, to the credit of human consistency it may be said they are not themselves addicted, always. Many heavy editorials have been launched in newspapers that reach hundreds of thousands of readers, about the iniquity of things that they are constantly receiving pay for promoting. The great difficulty with human philosophy seems to be that most virtuous things are purely theoretical. There is not enough pleasure or money in being virtuous to make it a fascinating occupation; but it is a great theme for discussion.

Another difficulty that obstructs the progress of humanity is in the inconstancy of our instincts and natural inclinations. As boys we may go fishing Sundays, steal watermelons, fight, or play marbles for keeps, while later in life we may desire to preach the gospel. Then, too, the gospel we preach to begin with will be undergoing continual and constant change (perhaps improvement) until we are too old to learn. There are supposed to be certain fundamental principles in all religion, but they seem susceptible to revision, differing interpretation, and interpolation. Perhaps there is nothing absolute but Truth and the North Star, the one sometimes seeming as inaccessible as the other.

Probably it is easier to discern truth in a natural wilderness than in artificial regions. It may be just to assume that hunters and fishers like out-of-the-way nooks for this reason—and others. But other things besides truth abound in and sometimes come out of the woods. I could, without much pain, compile some tales truthful in the main, but which nevertheless might be read somewhat cautiously.

I believe raccoons abound throughout North America. Webster says they are a carnivorous mammal about the size of a common dog. That there are two species in the United States, *Procyon lotor,* found east of the Mississippi River, and *P. hermandezzi,* or black-footed raccoon, of Texas and California. Webster's definition is not brought entirely up to date. Firstly, because the mammal is not generally known as raccoon; secondly, because "the size of a common dog" is indefinite; thirdly, because a river is not likely to divide the species, and finally because he does not mention the third species, which is not a mammal rodent, but a biped and allied to the human race, obtaining upon both sides of the Mississippi.

It occurs to me at this juncture that the coon has not received the recognition he deserves, particularly from sportsmen. In view of the wide scope of opinion as to what constitutes a true sportsman, I believe the coon should be brought into the discussion as an element or factor, for reasons following, to wit: Sportsmen are born, like poets; not made, like pajamas. A sportsman in youth should have the natural symptoms of his kind. The American youth who has not been addicted to coon hunting, or who has not had the ungovernable desire, only being prevented by insurmountable impediment, will rarely develop sufficiently to rank as thoroughbred. The boys in this great country who have hunted coons, or wanted to very much, lack the real afflatus that inspired Esau and Nimrod and Izaak. Boys that have no notion of coons or coon-hunting will likely hold bags patiently for midnight snipe, but that virtue is not necessarily an attribute to sportsmanship. Those boys who go through seven miles of woods and brambles of a cold night following coon dogs are, without mistake, the real thing. The baying of a coon dog on a dark, cold night will oust a sportsboy from his bed with more precision than anything known, if it is in him.

Whether the American Indians gave much time to coon-hunting or not is not a matter of history. It is well to assume that if they had coon dogs they did. About 20 years ago I went after a coon with a California Indian. I furnished most of the ambition and had most of the fun, but Dick did the best he could to keep up. But he finally fell down. We were at a ranch and wayside hotel, in a good region for coons. There were four dogs of assorted sizes and styles at the place, and about ten o'clock one dark, cold and drizzly night the dogs flushed something down the creek and after running a short distance treed. No one about the place was likely to be interested but Dick, a rather corpulent Indian, about 25 years of age. I found him preparing for bed, but without much persuasion he agreed to go with me and see what the dogs had. We got the big muzzle-loading shotgun, put in about "four-finger" loads in each barrel and, with a big tin barn lantern, set out.

A mile from the house we found the dogs making a great fuss under a dense live-oak, thick hung with wild grape vines and plenty of briars. The tree was a large one, and the foliage and vines so thick upon it we could see nothing. We couldn't shine the eyes of anything. Whether I suggested it, or whether Dick volunteered to climb the tree, I have forgotten, but up the tree went he. He was a big fat Indian and it was slow work for him in the tangle of vines, taking the lantern with him. I stayed below with the gun, inspiring him with praise and encouragement. After much grunting and breaking of branches and vines Dick said: "I see him! Do you see him? He's a coon, a big feller!"

I looked but could see nothing but the lantern and Dick's fat, red face, about 30 feet from the ground. I said, "I can't see him."

Dick climbed up a little higher, held the lantern over his head, and then I could see the coon about six feet above him, looking ready to run down the tree.

"I see him," said I. "He is a big one!"

"Shoot 'um," said Dick. "Shoot pretty high, you see me, I'm here, shoot pretty high!"

I could see the coon, but, as he held the lantern above his head, Dick was invisible. I was in doubt about shooting. The gun might scatter.

"Better shoot 'um," shouted Dick, "he's coming down now!"

Four dogs were making enough noise for forty. They bayed, howled, tried to climb the tree, and snarled at each other as they became entangled in the vines. Dick was cussing in mixed lingo as a branch partly broke under him. I was getting excited myself.

"He's comin'," cried Dick again. "Shoot 'um! Shoot pretty hi—"

I had decided to shoot, and Dick's voice was drowned in the roar. It seemed like the blaze from the old gun reached up into the tree, and what, in our calm moments, we call the recoil of the gun, all came my way. There was an instant's pause, a dark silence—and then other things came. There was a bang from the tin lantern, and then more things came out of the darkness overhead than I ever brought down at one shot before or since. As near as I could judge everything loose in that tree dropped down without hesitation. Although there was a jingle of tin and glass, the snarl of a coon and the crashing of branches, the main commotion seemed to be caused by the unpremeditated descent of Dick.

Anxious as the dogs were for something to come down the tree, they were completely bewildered when it did

come. There were yelps, snarls, and activity of all kinds in that pile of briars and vines at the foot of the tree. The night was very dark, but the tree stood on a sand-bar. The sand was comparatively light, and presently some dogs scrambled out. After a little delay a large dark mass rolled out on the sand. This dark mass, I inferred almost immediately, was Dick, yet he had more to say and said it with more energy than is usual to those of his race. I regretted it, but it seems it is natural for even an Indian to cuss with almost civilized eloquence when sufficiently encouraged. After a time we got a light and found that after all the excitement and noise nothing of consequence had been accomplished. Dick was scratched a little about the face, either by the coon or by the briars. The coon had escaped to the water in the bewilderment of the dogs. The dogs were uninjured, but much rattled by the ferocious descent of the fat Indian at an unexpected time. As near as could be ascertained, at the explosion of the gun the coon had jumped into Dick, the light went out, Dick thought he was shot all to pieces, and he let go.

The foregoing is a true tale and I have enjoyed telling it before. But somehow I never could get the funny things all in. The best parts of funny stories never get into print. Since that time I have engaged in other coon hunts, but of late years have not made them a specialty. I commenced this writing to tell of coons I bagged only three nights ago, but it was not a real coon hunt, though I got all I could carry.

My shack, which I had perhaps better allude to as a mansion now, as it has a woman in it, is on the bank of Mountain stream. At this season the stream is a roaring torrent, icy cold. From the verandah (that I am in the habit of calling a porch) night before last I heard, even above the roar of the stream, the clatter of coons. They were evidently fighting, but they are not of the species that do it with razors. I called Shep, my dog, who is always ready for business, and he came promptly. I went a few steps toward the creek and told Shep to fetch 'em.

He seemed to know what was wanted, for he went directly in the proper tangle of vines and alders, immediately treed something, and began barking excitedly. Believing it to be a coon or coons I went into the house, got my .22 rifle and a lantern and went to investigate.

Shep was barking up a clump of alders that overhung a deep pool in the rocky bed of the stream. There was a surrounding jungle of vines, briars and shrubbery, and although not two hundred feet from the house it was a difficult place to reach by night. After scrambling through the little jungle to the trees I tried for some time to throw the light of the lantern so that I could see whatever might be overhead. The night was very dark but there were some stars visible. Several times I mistook stars shining through the trees for the glint of animal eyes, but it was half an hour before I caught the flash of the real thing. Suddenly about half way up one of the trees there was the gleam from two luminous spots, but for some time they would appear but for an instant. By shaking and snapping the bushes I finally fixed the shining eyes upon the light hung behind me. The same light sent its rays along the barrel of the little rifle which gave its spiteful snap and sent the shot between the glaring eyes. Then there was a brief struggle up the tree and coon number one dropped with a splash into the pool in the dark under the bank. A second splash told that Shep was in after him. In a few moments the snorting of the dog and sound of his movements in the vines on the bank below informed me that our coon was laid out. Thinking it probable there was another, I resumed operations with the lantern. After some time again I caught the glint of eyes, but to get the light in the right position to catch the sights of the gun and the eyes at the same time was a long and tedious task. The animal was unusually shy about looking at the light and would do so but an instant at a time. Out of patience I began shooting by guess, without the light, and fired a half dozen shots to no purpose. Then, trying the lantern again, I shortly caught the gleam of eyes at the right instant, and coon number two dropped into some bushes from which Shep secured him before he could flounder into the water.

I now had a good bag of coons, as both were big, fat specimens, but I considered that there might be more, and if they were coming into my dooryard after trouble or chickens I would give them plenty of the former. I turned the light down, looked up through the tree tops to the sky, and soon saw a dark bunch that might or might not be coon, still higher up the tree. I had about given it up to be a bunch of vines or branches, when with the lantern I again caught the unmistakable gleam of fiery eyes. Number three was more wary than the others about looking at the light and it was a long time before I got a shot, bringing him with a splash into the stream. Shep plunged in after, but the coon apparently sank in the swift water and was swept down stream. Shep hunted faithfully, shivered with his ice cold plunges, but we did not find number three until morning. Yesterday the three coons were skinned and hung up arow. They are fat as pigs and ought to be good meat. I know of no recipe for cooking coons. Do sportsmen eat 'em?

The pelts are apparently in their prime, and when tanned will make very handsome fur. The natural history I glean from this experience with coons is, that they are not very shrewd animals when up a tree. Under the circumstances and in the situation they were, two at least might easily have jumped down and made their escape. By daylight I would have been ashamed to shoot such silly creatures. As it was it took me over two hours to get them, but I might have done it in ten minutes with a shotgun, and some one to hold the light. There may have been more of them in the trees, but I had enough coons for the time. Shep, and Thomas, the cat, shall have coon meat to their utmost capacity.

RANSACKER.

SHASTA MOUNTAINS, Cal., December.

"I marvell, therefore, so much the more at them who are of opinion that fishes and beasts in the water have no sence. Why, the very cramp-fish torpedo knowes her own force and power, and, being herselfe not benummed, is able to astonish others."

"Wonderfull in my conceit is the wit and subtletie of some fishes."—Pliny.

Natural History.

The American Rabbit.

BY R. B. BUCKHAM.

THE American rabbit, *Lepus sylvaticus,* has always been a favorite with the sportsman. Even in early times, when the woods were well stocked with game of all kinds, hunters and woodsmen preferred a rabbit stew, now and then, to anything else, and time and again the deer and the bear has gone undisturbed while bunny was hotly pursued. The rabbit always was abundant, and is to this day. Every swamp and wooded marsh, sufficiently retired from the vicinity of man to afford any promise of freedom from molestation, has at least one family of these animals living in it, though their presence is often quite unsuspected.

On almost any occasion it is a comparatively easy undertaking to find the whereabouts of a rabbit. Though he is constantly hunted by all sorts of animals, of both earth and sky, he yet sets them all at defiance and his tribe continues to multiply. It is always safe to count on fair success at rabbit hunting.

There are three principal reasons why this timid and defenseless animal should be so constantly on the increase. First of all, he is very prolific, rearing such families as would put most of the wood folk to shame, though they boast such superiority over him in valor and fighting qualities.

And again, food is always abundant with him. He can make a very fair dinner off from almost anything in the way of a plant or tender shoot coming in his way, and so the woods is one vast storehouse for him, filled to overflowing with innumerable good things. But in addition to this, say what you may, he has no mean or ordinary skill at evading his pursuers, and leaving them safely in the lurch.

Two traits which the rabbit displays serve the hunter as means of locating his probable whereabouts at once. One familiar with these can detect with a mere glance of the eye over the woods, where is the proper place to look for him, as unerringly as though the secret was written out in characters so large that they could be seen for miles away.

One of these is his domestic habits. He is a home boy, a stay at home, and usually spends the day within the circumference of a circle which a great oak could compass with its shadow from the rising to the setting of the sun. He does not waste much of his time in roaming aimlessly about, though he could run through two counties, without feeling any unpleasant after effects, if he so desired.

The other is his mode of selecting a feeding ground. He always prefers the vicinity of the lowlands, since they afford more succulent verdure, which with its shelter and abundance of moisture, longer defies the attacks of the late autumn frosts. Always look for him about the swamps and the low grounds. You will rarely find him elsewhere.

Strange as it may seem, though so fond of home, he is content with almost anything in the way of a resting place. He displays no exacting and fastidious tastes in the selection of the location of his form. A thick clump of ferns, or a pile of brush, or hollow log satisfies him completely, and in such an exposed situation as this he will live winter and summer, unmindful alike of cold and rain and snow.

Though the rabbit generally is known as a burrowing animal, the American species does not resort to this method of supplying himself with a shelter. The writer has never been able to detect him engaged in such a purpose. But he will on occasions adopt the abandoned burrow of some other animal as a home, provided that it serves his purposes well.

The annals of science record that a European rabbit's burrow played a large part in determining the antiquity of man's existence upon the earth. A French peasant while attempting to dig out one of these animals, suddenly came upon the now famous Aurignac cave, in which were found human skeletons, together with the bones of several extinct species of mammals. Doubtless the cave had long been the home of some carnivorous beast, however, which having been abandoned, bunny had appropriated, and so made himself a place in history.

The farmer is always glad to see the hunter after the rabbit, for in the dead of winter, when food becomes scarce, he will girdle young trees in such a manner as to kill them in large numbers. Indeed, it is one infallible method of determining whether a certain locality is the habitat of these animals, to look closely for any signs of girdling on the small wood and underbrush about.

When bunny has once located his home, the next thing is to render it as secure as possible. This he does by searching out all the densest bramble patches and brier bushes about, and cutting himself a way through them, blazing it with his nibbled twigs. Now when his dreaded enemies, the fox or the dog, press him hard, he turns to these pre-arranged havens of refuge, and running through them, leaves his pursuer in the lurch, he being unable to follow. Thus he gains a long lead on his foe, and possibly even succeeds in eluding him altogether.

There is no other animal in all the woods that has so many pursuers after him as does the rabbit. He is so harmless and defenseless that all the cowards in the woods are after him, day and night. Yet he is as placid and contented in spite of them, as can be, not seeming to take the situation in the least seriously, and strange to say usually getting the better of the whole tribe of them, and growing fat and lazy at it.

That terrible, treacherous fellow, the fox, that skulks so noiselessly through the woods, like a yellow ghost; the lynx, with its great green eyes and cushioned, silent paws; the prowling dog and house cat; even the skunk and the weasel, every one are looking for the chance, constantly, of getting the better of poor bunny. Then, too, there is that horrible bugaboo of the night season, the owl, which with his quick wing and sharp talons would swoop down and bear him away in a moment, if the opportunity once fairly presented itself. But the cottontail knows them all well, of old, and is familiar with all their ruses, with the result that they usually go hungry if they devote themselves constantly to him.

The rabbit knows how to take good care of himself. He can keep out of sight as cunningly as any of the wood dwellers. He can steal abroad and feed without stinting himself in the least, and yet keep his movements from being observed as skillfully as any animal that lives. He is an expert at it. It is his only safeguard, and he knows it. To keep out of sight of the enemy is the best means of defeating him, is the code of the tactics to which he resorts.

But now and again, in spite of himself, he falls a prey to the skilled woodcraft and quick aim of the sportsman. The well trained hounds soon learn some of his weaknesses, and among other things that he cannot stand the apprehension of lying long in his lair while their clarion note rings through the woods. He must necessarily jump up and run for safety.

Thus the dogs soon tease him into the chase, and once his trail is come upon fresh and warm, they are able to follow him, no matter whither he may choose to run. Nevertheless, the hunter who wends his way homeward with one or more of them in his gamebag, may congratulate himself that he has outwitted as crafty and sly and cunning a fellow as runs in the woods.

Game in the National Park.

GARDINER, Mont., Dec. 28.—*Editor Forest and Stream:* Mr. C. J. Jones ("Buffalo Jones") has lately killed at Livingston, Mont., five buffalo steers. These were from the Goodnight herd in Texas. The meat was sold in the markets in Livingstone. The heads are to be mounted and sold. A few other bull buffalo, ugly ones, from the Allard herd, purchased by Howard Eaton, have been killed, and their heads mounted by Frank Tolhurst, of Livingstone. Every one of these buffalo can be accounted for.

One buffalo cow was killed at Livingstone this spring. This cow was one of the carload Mr. Howard Eaton sold to the Government for the Yellowstone Park, where they were to be delivered in good condition inside the inclosure. The cow was hurt in loading, and was not received by Mr. Jones. It was taken back to Livingstone and killed. All the loss fell on Mr. Eaton because he received pay for only those delivered inside the inclosure. Mr. Eaton, when he first purchased the herd of buffalo (he now handles and is selling), killed several stags or steers and a few ugly bulls, and will continue to kill off any that are too dangerous to handle. Young bulls are being exchanged with Mr. Goodnight and others who have buffalo. The buffalo purchased for the Park from Mr. Eaton were cows. The bulls are from the Goodnight herd in Texas. All are looking well.

Lately I have been paying more attention to the animals I see from the streets of Gardiner, Montana, and along the roads between here and Golden Gate.

On Christmas day, evening, a few moments before the sundown gun was fired, I saw ten mule deer walking and feeding toward the gun. The gun was just around a point of Capitol Hill from me. Major and Mrs. Pitcher and I walked up to the Hot Springs and returned about five or ten minutes after it was fired. The gun is just across the road from the guard house, and constantly in sight. Those deer were close—some less than 20 yards—when the gun was fired, and were even less than that distance from the gun when we returned. It don't seem possible that they should lose all fear of the report of guns (cannon) and rifles. Truly the gun is fired but twice a day, morning and evening. Last spring, while the troops were at target practice, deer were often seen. Once a band of mule deer came walking and feeding across the line of fire, and in such a way that the men had to stop firing and drive the deer away. At the same time a band of elk came to the brow of the hill under which the firing was done and stood there looking down on the men, and finally lay down. The deer are feeding all among the buildings at the Fort, and the hotels and dwelling houses. Some of the people living at the Mammoth Hot Springs and around the buildings at the post have small grass plots. These the deer frequent every evening, and paw for the grass through the snow. One officer came out of his quarters, and just as he shut the door saw a deer within three feet of the house, feeding. The jar of the door startled it a bit, but it did not go far. It is nothing for people at the post to see from ten to twenty deer every evening, and so tame, one can scarcely believe they were ever wild. Some very fine photographs have been taken of them. Major Pitcher has scattered some hay for them, but they don't seem to care for it, now and then taking a little. When the snow gets deep they will be given alfalfa, something they are fond of.

On Dec. 27 I went out as far as the Silver Gate. Along the road I saw eighteen very fine bucks and seven does, and at about dusk five more does walked out from between the "K. O." office and guard house.

While looking at the deer Major Pitcher and I with glasses saw over 200 elk on Mt. Everts, and quite a number down part way to Gardiner River.

Saturday, while coming down to Gardiner, I saw one band of thirteen and one of thirty-two mountain sheep. One of the rams with the larger band was extra fine. I also saw six whitetail deer and a lot of antelope. Speaking of antelope, there is never a time during a clear day when they cannot be seen from the Front street of Gardiner.

About two weeks ago the camp of road-builders at Lower Falls saw a band of elk crossing the Yellowstone above the mouth of Lower and Antelope creeks, coming off Mt. Washburn country and going up on to the west point of Specimen Ridge. They did not stop to count them, but the elk were timed, and it took two and a quarter hours for the band to cross. They were constantly moving. I have seen elk crossing at this point many times, and would venture to say there were not less than 1,500 that crossed during the two and a quarter hours the road crew saw them. This is a regular crossing, and the only good one for many miles. The trails leading to the ford are more like wagon roads than trails.

A goodly number of coyotes have been poisoned, trapped, and shot, and one mountain lion shot, which I mentioned. The latter are very plenty in certain parts of the Park, and though efforts are made to kill them, so far very few have been killed. They are particularly destructive and partial to mountain sheep, of course killing elk and others of the deer kind. Some special effort will have to be made to kill or capture them.

I have said so much about the quantities of game animals to be seen about here that it's only repeating the same story. Still, some one may take advantage of the opportunities and come out here in winter, and see for themselves.

I believe Mr. Hough has been the only Easterner who has seen the game here in winter. If there is any one who wants to see game by the thousand, they can do so now with comparative ease.

The road to Soda Butte is open, and a team can be driven through, or they can go on the regular mail. If they are wanting a little "roughing it" they can get it, and a "touch of high life" by making a snowshoe trip.

There are a few comfortable, cheap hotels open at Gardiner. The Cottage Hotel at the Mammoth Hot Springs, and Uncle John Yancey, twenty miles from the Mammoth Hot Springs, in the midst of the game country, will see that one has enough to eat and plenty blankets over him. I have heard many say when they have seen small bands of elk, that "they were worth a trip from New York to see." Now they can see thousands, notwithsanding Mr. Fullerton, of Red Lodge, has killed most all the elk off—on paper—and is starving the rest—on paper. Still, I suppose it is very hard to get away from a comfortable fire and make a railroad trip of more than a thousand miles and a snowshoe or sleigh trip of twenty-five or fifty miles. If the party would be satisfied with the sight of say 1,000 elk, 500 entelope, 75 mountain sheep, 100 mule deer, 6 whitetail deer, and some small things, they can get them or see them all within a half circle of ten miles from Fort Yellowstone—most all the animals less than five miles from the Cottage Hotel. I am sure the manager of the hotel would have to keep the shades down at dinner time so that the Eastern guests would not leave the table to watch the deer in front of the hotel; otherwise the food would get cold.

Something like this happened early last spring. While a party of railroad people were at the Cottage Hotel at dinner, some one raised the shades and said, "Look at the deer." The dinner got cold. Still there was no kicking.

I would like to see the President, and the Secretary of the Interior out here for a few days. Then they would know we were not telling "fairy tales" about the game in the Yellowstone National Park. E. HOFER.

Reddy.

IMAGINE a small squirrel with a very red back, large, shining eyes, ears just visible, a very scant tail, and you have a picture of Reddy.

In the early part of last summer my father came from the woods with Reddy in his pocket. He was a very scared squirrel, but did not offer to bite. I wished to keep him, but thought it impossible, as we had two cats, and the dog that had discovered him. I decided I could keep these animals away from him, so I took a box with wire netting over one side, put in one corner some cotton for a nest, and in another some bread crumbs, a dish of milk and last of all, Reddy, who seemed pleased with his new home.

Later in the summer we moved into a cottage in the woods, and of course Reddy moved too. On pleasant days I put him on a bench outside the door where other squirrels came and talked to him and tried to obtain his food through the netting. After a great amount of chattering, Reddy would drive the intruders away. At night I kept him in the house, and each morning while he was still asleep I took the cotton off his back, then he would come out of his nest, wash his face cat-fashion, and eat his breakfast.

One day the wild squirrels bothered him more than usual, and I think this made him cross, for when I took him out of his box, as I had many times before, I was suddenly aware of a bite in one of my fingers, and—Reddy was gone.

For several days I saw nothing of him, when one morning I heard a familiar chatter, and sure enough there was Reddy on a nearby tree. It was impossible to mistake him, for he was so nearly earless. After several attempts, I succeeded in shutting him in his box, which I placed on the bench.

This taste of freedom made Reddy uneasy, so one day I let him go. Many times after this I watched him come in the cottage and sit on the shelves and talk to me. In a few minutes he would carefully make his way to the table from which he would carry crumbs, and sometimes a cookie, to a safe place, and then would come back for more.

Each morning while the family was eating breakfast I placed a dish of milk on a shelf for him, and he would come in and drink it, by dipping his forefeet in the milk and licking them clean. After finding that he was free from danger, he became very tame and mischievous, and we were obliged to put things in a closet which he could not reach, or he would hide them in a place known only to himself.

Since we moved from the cottage, Reddy has made it his home, and in an old basket under the shelf he has made himself a nest from leaves and grasses. I am afraid he has grown very selfish and proud, for I saw him early in the winter running around the cottage, and from a safe perch he looked down and scolded me for trespassing in his world.

MABELLE ANNIS COOK.

A Good Day for 'Em.—"What luck did you have fishing yesterday, Pennybunker?" asked an Austin gentleman of a well-known impecunious character who owes everybody. "Splendid! While I was out on the wharf twenty men with bills called at my house to collect money."

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

The Corbin Game Park.

SINCE the death of Mr. Austin Corbin in June, 1896, practically nothing has found its way into print in regard to his pet project and estate in Sullivan County, New Hampshire, known to the public and sportsmen generally the world over, as Blue Mountain Forest Park, the largest private game preserve in the United States.

It was Mr. Corbin's intention that this immense tract of land in the wilds of northern New Hampshire around the township where he was born should remain intact and always be used for the purpose for which it was established. To this end stock in the property was divided among the various members of his family and ownership vested in the "Blue Mountain Forest Association," incorporated under the general laws of New Hampshire.

A little over two years later, however, in September, 1898, those interested in the estate found it rather burdensome to keep and maintain, and partly to help pay the expenses of the vast estate, and partly to get assistance in its management from practical sportsmen and to attract influential persons to the place and its immediate neighborhood, there sprang into existence the Blue Mountain Forest Game Club, the members of which were granted certain fishing and shooting privileges.

Membership in the club was limited to thirty persons, and from its inception it has been generally regarded as the most exclusive and close organization of its kind in this country, scarcely anything as to the doings of its members on the estate, or anything in relation to the general welfare and condition of the property, having since been made public. As this article deals at some length with both these subjects, a brief introductory sketch is given of the park in its greatly improved condition of to-day.

The park proper embraces twenty-five thousand acres, and includes Croydon and Grantham mountains, with their foot-hills and valleys on either side. It takes in part of the towns of Croydon, Grantham, Plainfield and Cornish, and comprises farms and uncultivated lands purchased from two hundred and seventy-five different individuals, covering over sixty farms and sets of farm buildings.

The contour of the park is nearly oval, extending with the range of mountains northeast and southwest, measuring from end to end about ten miles and five miles across its greatest width. Croydon Mountain lies to the south and Grantham to the north, while between, almost in the center of the range, is a deep gorge of wild and picturesque beauty, through which passes the "Notch Road," connecting the eastern and western sections of Croydon township.

Croydon Mountain is the highest elevation in Sullivan County, being nearly 3,000 feet above the level of the sea. It commands one of the most extensive and beautiful prospects in the State. To the northeast rise the majestic peaks of the Presidential range, with Mount Washington at the head, while to the east in seeming solitary grandeur, like some grim sentinel, stands Kearsarge on guard, and beyond the far-off lands of Maine. To the southeast the dark and rugged brow of Sunapee watches its own shadow in the crystal lake at its feet.

On the south are the Washington and Unity hills, while the western horizon is bounded by a clear and well defined view of the Green Mountain range of Vermont. Nearer to the east and south are the lesser hills of Croydon and the peaceful picturesque valley of the Sugar River, with its fertile farms dotting the landscape, and the prosperous village of Newport eight miles away.

The land within the park touching the Sugar River Valley is rich and productive; higher up the mountain sides it alters to pasturage and forest, overtopped in turn with lofty piles of granite crowning the whole as if to place the seal of nature on some of her grandest work.

The boundary lines of the park follow, as nearly as was found practicable, the established highways of the towns that skirt it, but wherever deviation was necessary, connecting roads have been built and are maintained by the estate at its own expense. The public highways running through what is now the park were abandoned by the respective towns and are now kept in good condition, as well as broken out for passage during the winter, entirely at the expense of the estate. The towns have thus been relieved of a charge for work on the mountain roads that was no small item of expenditure, especially in winter.

Although now under private ownership and subject to taxation with other property of the park, these roads are, for all practical purposes, still public highways, as no one is refused permission to travel over them, the only condition being the procuring of a pass—which can be obtained at a number of convenient places—and registering of name at point of entrance to the park. There are six public or pass gates, each in charge of a keeper, who lives at hand in a comfortable lodge, whose additional duties are to patrol daily the section of boundary line in his district, see the fence is kept in repair and report the habit of animals coming under his observation.

The driveway of the roads encircling the park is about thirty miles in length, along which has been erected, to enclose the park, an eight and a half foot, and in some places nine foot, barbed and meshed wire fence. The fence proper is twenty-five miles in extent, built at an expense of one thousand dollars a mile. At each fence post was planted a white pine or willow tree, and the planting is being continued from year to year with the intention of building a complete hedge of trees around the park. At intervals of four miles along the driveway, granite watering-troughs have been placed supplied with cool, clear water from the mountain springs, adding materially to the comfort of man and horse during a drive around the park, which is doubly interesting from the beautiful scenery constantly unfolding to the eye, and the glimpses of wild animals confined within the fence.

There are very nearly fifty miles of well-kept drives through the park, to which the best ideas of road-making are being applied under the direction of the superintendent of the park, and a large corps of assistants. About thirty miles of roadway have been reconstructed with gravel bed and proper drainage, and a drive over them is an enjoyable privilege that any one may have, as the park is open to the public from May to November. One can never drive through without getting sight of some of the animals, the bolder ones coming to the stone walls along the road to peer with interest at the passer-by, while the more timid gaze curiously from afar.

Duly organized and incorporated, the Blue Mountain Forest Game Club, numbering thirty members, secured among other concessions from the Corbin estate the privilege of shooting per member each season two deer, one elk and one boar, the shooting of any number of smaller game and certain rights in the lakes and ponds on the preserve. Since then these privileges have been curtailed or extended each season, varying with the increase or decrease each year of the various species of game. This season one elk, three deer and two boar are allowed each member, and during the last two seasons lots are drawn among the members for the privilege of shooting six moose.

Among the rules and regulations adopted by the club are the following: Boar may be shot from September 1 to March 15. Elk, deer, and moose, from Sept. 15 to Jan. 15. Gray squirrels and raccoons from Sept. 15 to Jan. 1. Hares from Sept. 15 to April 1. Woodcock and ruffed grouse from Sept. 15 to Dec. 15. The open season for trout is from April 1 to Aug. 1; for bass from June 15 to April 30.

Central station is the business headquarters, at which are the boarding houses for the employes, barns for the work animals, fenced inclosures for the detention of newly arrived animals that their characteristics may be studied, winter quarters for the buffalo, dog kennels, stables and yards for fine breeds of cattle, and such other buildings and inclosures as are required.

For the purpose of shooting the park is divided into four sections: North and south of the Notch Road, and east and west of Croydon Mountain, and these sections in the busy season are again sub-divided in two. Any member going into the park to shoot must notify Central station into which section he intends going, having previously ascertained that no other member has secured it, and he must confine himself to that section, which will be reserved for him for one day. When necessary the different sections are drawn for by lot each day. A section may be sub-divided by mutual agreement between members, in which case Central station must be notified of the exact location of each shooting party. This rule is regarded as of strictest importance, and all members acquaint themselves, as nearly as possible, with the location of shooting parties in the forests, so that the danger from the use of long-range rifles in a place of limited area is minimized. How closely this rule is adhered to may be gathered from the fact that there has not been a single shooting accident on the preserve in the almost fifteen years that it has been in existence.

A further rule is that all wounded animals must be followed up and, if possible, killed, by members who wound them or by their guides; if the animal escapes, and is, in the judgment of the member, mortally wounded, it is counted against his score.

The comfortable club house which was built out of the funds paid in as initiation fees by the members, is open all the year, and from Sept. 15 to Jan. 15 board and service is provided for members at the nominal sum of two dollars a day. At other times members make their own arrangement with the superintendent of the association. A member may bring ladies to the club house for luncheon or dinner in passing through the park, but ladies may not remain over night at the Central station under any circumstances. A member may, however, establish himself at any camp with his family.

The officers and active members of the Blue Mountain Forest Game Club comprise: Messrs. L. Q. Jones, President; Henry S. Redmond, Vice-President; William A. Russell, Secretary and Treasurer; Frederick H. Allen, Franklin S. Billings, Samuel P. Blagden, Jr., Arthur J. Brooks, William Astor Chanler, Winston Churchill, James M. Green, William A. Hall, Frank A. Kennedy, Philip Lydig, I. W. Morton, James S. McCallum, Lyman Nichols, A. S. Nichols, Myron M. Parker, Redfield Proctor, Henry S. Redmond, William H. Remick, W. F. Richards, Charles L. F. Robinson, William A. Russell, Charles D. Sias, Marion Story, George N. Talbot, Lloyd Warren and W. Seward Webb.

Members of the Blue Mountain Association entitled to the privileges of the club are William E. Chandler, A. N. Parlin and William Dunton, as directors of the association, and the following, as stockholders and the members of their family: Mrs. Corbin, Mrs. Edgell, G. S. Edgell, Corbin Edgell, S. M. Edgell, G. H. Edgell, A. C. Champollion and A. Corbin.

Young Mr. Austin Corbin, who has succeeded his father as head of the estate, gives the following interesting and entertaining account of the shooting and fishing now enjoyed on the great preserve and of the habits and condition of the various game and animals as they exist in their, so to speak, semi-domestic state:

"As to the buffaloes," said Mr. Corbin, "we began with a herd of seventeen, which now numbers one hundred and thirty-five head. At first we had considerable trouble with the calves, many of whom died; this, we found later, being due to the fact that the hay fed to the mothers was too tender in quality, poor milk being the result. Now, however, we have a regular natural increase each year, and all are in perfect health. The twenty-seven calves this year have all survived. In fact, they thrive and are treated like ordinary domestic cattle, being turned out to graze on the

mountains all summer and driven into yards in the winter season. Fifteen of the buffaloes we sold to various zoological parks. A herd of twenty-five, however, that we sent to Van Cortlandt Park all died of a disease, something akin to tuberculosis, I am told, caused by drinking stagnant water.

"As a whole, the buffaloes are a well behaved lot, but occasionally a bull will get terribly vicious, and is consequently shot. An instance of this kind occurred not so long ago, when two of our men and a team of horses in their care narrowly escaped serious injury, if not death, by being tackled by one of these infuriated bulls. The men were engaged at the time in stocking one of the lakes with trout when they were charged by a mad buffalo and compelled to spring out into the water and swim for it to save their lives. The excited animal, thus baffled, turned on the horses standing nearby and would surely have killed them had they not succeeded in breaking their hitching strap and bolting wildly away. I arrived on the scene just at this moment and was chased by the old fellow for fully a half mile through the woods, it being a game of hide and seek about the stumps and trees that I did not at all relish at the time. Finally we lassoed him, however, and he was finally shipped out West.

"Another exciting episode not so long ago was a terrific fight between one of the old bull buffaloes and a great bull elk whose temper had evidently gotten soured. The animals lunged away at one another in the most vicious manner for quite awhile, the struggle ending in the elk being badly licked and scampering away for dear life.

"The biggest bull in the lot and the king of the herd is called Grover Cleveland. A season ago he killed his mate in a desperate battle and was then set upon in turn by an ugly Galloway bull. Cleveland, weakened by his hard tussle with his mate, was rather easily routed by the Galloway and put to flight. After resting in the woods out of sight for a couple of days, however, he sought out the Galloway and would surely have killed him had not the keepers interfered.

"A herd of about fifty polled Angus cattle was the result of the importation of one bull and twelve cows from Aberdeen, Scotland, secured from the late Duke of Marlborough about eight years ago. It was intended to cross these animals with the buffalo, but no practical result was achieved. The bull buffaloes all took a fancy to the domestic cows, who were unable to bear their calves owing to their large size, and all the mothers and calves died in this way. We then gave up the experiment and sold all of our Scotch cattle. I understand that 'Buffalo Jones,' as he is known out West, has successfully raised quite a large herd of crossed stock, and that the hide of these animals is highly prized for its fineness of texture. Our buffalo herd has for the last few years been increasing steadily at the rate of about twenty-five annually, and each year we are compelled to build new yards in order to accommodate their increasing numbers.

"The moose on the estate have increased but slowly on account, it is thought, of the terribly severe winters. In the beginning twenty were turned loose in the preserve, and it is now estimated by the keepers that there are about seventy-five of these animals at large. They live high up on the mountain sides, and are seldom seen, Senator Proctor having succeeded in killing the only one shot on the place.

"Starting with only one hundred and thirty elk at first, they increased rapidly until in 1897 it was estimated that they had increased to a thousand in number. The severity of the winter of that year, however, killed off about nine-tenths of them by starvation, only about one hundred surviving. The snow was piled up everywhere several feet in depth and the elk, unable to reach the grass and shrubs beneath it, ate all the bark off the saplings as far us as they could reach, as well as the tender twigs and branches. They perished of hunger before anyone about the place was aware of it, and they were later on found dead almost everywhere, as many as twenty or thirty bodies being found in one spot.

"In order to obviate such a happening again, however—a calamity which was due also to the fact that there were too many animals on the preserve—men go about the woods every winter, and here and there chop down numbers of trees so that the elk will be enabled more easily to get at the tender twigs and bark and not be dependent on what they could otherwise get.

"During that winter about threee hundred deer died from the cold and starvation, the number not being greater because these animals are native to the climate. Of the elk raised on the place about fifty have been sold to zoological gardens, and there are now estimated to be about three hundred at large.

The deer have increased wonderfully, and starting with one hundred it is now estimated that their number has increased to about two thousand. In fact, they are increasing so fast that action will have to be taken this season and the keepers told to shoot a good portion of them off for market. As many have been given to the State of New Hampshire as it cares to take, and about two hundred and fifty of them have been sold. About sixty bucks were shot by the club members last season, and the same number of does were sold to zoos, the total of one hundred and twenty not equaling the natural increase for that year. They are nearly all of the whitetail variety, with but few blacktails among them.

"Thirty antelope were brought to the park and a small herd of reindeer, but all died, the former by reason of severe and changing climate, and the latter because of the lack of suitable food, there being in the forest but little moss, which is an essential article of their diet.

"In 1889 fifteen wild boar imported from the Black Forest in Germany were turned loose in the preserve. These animals have bred well and it is now estimated that there are about five hundred of these fierce animals on the range.

"Hunting the wild boar is generally considered the most exciting sport the Blue Mountain forest affords. They are at all times difficult to get sight of, and are off to their haunts and dens at the slightest unusual noise or sight of dogs and men. They are surprisingly fleet of foot, and if given a fair start in an open field can maintain a pace almost equal to the fastest horse or hound for from fifteen to twenty minutes. When brought to bay they are savage and dangerous to encounter, as they charge directly at a horse, often cutting its shanks to the bone with their keen tusks, and if the turn is not quickly made, the result may be disastrous, not only to the horse, but to the rider as well. The season for hunting the wild boar begins in September and ends in December, if the intention is to eat the animal when slain, as the flesh is not good for food after that time. Before the club was started the boars were hunted with dogs, the men following on horseback. Half a dozen Austrian boarhounds were killed hunting them in this way; but now dogs are no longer used in the chase, only still-hunting being permitted.

"As an instance of their ferocity a young male boar was placed in a small inclosure, and a young Great Dane was let in to practice on it. The boar was fast killing the dog, when the keeper entering, fired at the boar, but missed his aim and killed the dog. The enraged animal then rushed at the keeper, who fired six bullets into him before he lay *hors de combat.* They are left to care for themselves the year around, except that in the winter time corn is distributed from time to time from bins scattered over the mountainsides.

"As a matter of fact, the country is entirely too rough to hunt them with horses and dogs, and the still-hunting indulged in now is much preferred to the other method. These animals are certainly about the toughest and gamest creatures one would care to deal with. As an example of this, I shot one last summer, breaking his forelegs, and although so badly wounded, I tracked him for three miles by the great streak of blood he left behind him before coming up with him. Although he had lost almost every drop of blood from his body, he still had the strength and courage to charge us when we unexpectedly came upon him, my companion narrowly escaping serious injury from his spear-like tusks.

"When President Roosevelt was on his New England trip last summer, he visited the park as the guest of Senator Proctor, and spent a day in hunting over the preserve. He was accompanied while hunting by several newspaper men and secret service agents, and the pace he set them was certainly a killing one. The President apparently did not know what was the meaning of fatigue, for he walked up the entire side of a mountain and down on the other side without once stopping for a rest. When he did finally come to a halt he was apparently as fresh in body as when he had started out, while all his companions were almost dead with weariness.

"The President finally came across a large boar in an apple orchard feeding on the fallen fruit, and killed him with a single shot. He appeared as elated as a schoolboy over his achievement, and fairly danced about with joy. Mr. Roosevelt is certainly a mighty good hunter, and a very merry one.

"There are a great many squirrels in the park, and chestnut trees have been planted to encourage them to remain. The wild boar is also fond of these nuts, and it is said that a liberal chestnut diet, accompanied by acorns and beech nuts, is what gives the flesh of the wild boar its superior excellence over that of the domesticated pig.

"Formerly we had a commodious and well arranged kennel, occupied by dogs of many breeds, including English foxhounds, trained for deer and elk; French boarhounds, Great Danes, a pack of bloodhounds, trained for wild boar, and fox, rabbit and bird dogs of numerous breeds.

"These, with few exceptions, have now all been sold, given away or dispersed in other ways. The pack of foxhounds was sold to Mr. P. F. Collier, and many of the boarhounds died of diseases contracted at the various dog shows in which they were exhibited. As I stated before, only still-hunting is now permitted on the estate, and there is little or no use now for sporting dogs of any kind.

"Since the foxes are not now trapped, or hunted with dogs, they have increased rapidly, and played havoc with the wild turkeys, ruffed grouse and woodcock which formerly were so plentiful. The club members, however, prefer to shoot foxes rather than birds, as they declare there is more sport in it. The estate is located too far north for the propagation of quail, and most of those turned out died from the rigorous western climate.

"It is estimated that there are now about five hundred foxes in the park. Formerly frequent excursions were made through the park for the sole purpose of establishing by force of arms a more fitting percentage of foxes to game birds, and on such occasions the local sportsmen were frequently afforded opportunities for the enjoyment of a 'fox hunt.' Lynx are seen now and then in the park, and occasionally there is seen a puma or mountain lion.

"The beaver, which were introduced in one of the streams, have all departed, leaving the ruins of their dam behind them. Beaver are rather shy of the presence of men, and it is thought that the near proximity of men working in the fields scared them away. At all events, they dug their way out under the fence, and are now enjoying life in a stream in a neighboring township, where they are protected by the authorities.

"There are several ponds within the park well stocked with bass, which have multiplied wonderfully, and about fifty miles of trout brooks, the latter running out at different points along the boundary, affording those who may not be privileged to fish inside the confines admirable opportunities to catch the speckled beauties, as they venture forth from their asylum home."

The lease of the fishing and shooting privileges on the property by the Blue Mountain Forest Game Club, which was taken for five years, expires next September. Mr. Corbin and the members of his family do not know as yet whether the lease will be renewed or not.

The Maine License Plan.

NASHUA, Dec. 30.—*Editor Forest and Stream:* As a regular reader of FOREST AND STREAM, may I be permitted to advance an idea in connection with the proposed Maine legislation requiring non-resident sportsmen to pay a license fee to hunt in that State.

Those of us who sometimes hunt there are naturally interested in preserving the supply of game, and if more money is necessary to enforce their laws, it should be raised—even if a license fee does help to kill the goose that lays the golden egg. But if the advocates of a license are honest in their contentions, let them go further, and, figuratively speaking, have a general house cleaning while the subject is fresh. Let them, first of all, appoint a board of fish and game commissioners who will enforce the Maine laws as they find them, and not with mental reservations and winking at their violations—which I sincerely believe is at the root of the wholesale slaughter that is carried on in Maine, both in and out of season, not only by visiting sportsmen, but by residents—and largely by residents. It is a well-known fact that venison is served in close season on the tables of a large share of the Maine sporting camps—sometimes as early as June.

This is done, so I have been informed by guides and camp keepers, by the tacit consent of the commissioners who can put a stop to this whenever they see fit, and without levying a contribution on men like myself, who try to respect their laws and who leave among them some $100 on each trip to the woods in payment for transportation, guide and board.

Second—Let these commissioners enforce their laws by allowing each hunter to take out only the deer and moose actually killed by him, personally, without assistance, in shooting, by the guide he employs. Personally, I do not believe that more than two-thirds of the deer brought out of the State of Maine are actually killed by the persons claiming them at Bangor. Some guides I have talked with say that the sportsmen do not shoot 25 per cent. of the deer claimed by them, the balance being killed by guides in their employ.

That this is done by tacit consent of the commissioners I have no doubt—my evidence being the general "understanding" of guides and camp keepers, and conversation on the subject with commissioners themselves. The transaction is "winked at," and the merry slaughter goes on—when an honest effort to restrict it and to compel (if necessary) all sportsmen to take oath that the game claimed by them was killed by them and not by some one else, would put a stop to a large part of it. Though it would sadly reduce the boasted "record" of Maine game killed each season, used to advertise the State—and railroads—it would also lead successful sportsmen to be congratulated, or envied, instead of being objects of suspicion, as is now often the case.

Inefficiency, or personal construction of law, on the part of officers who are supposed to enforce laws, and not make them, will breed lawlessness on the part of people, whether in Maine or any other State.

Let this much vaunted board of commissioners enforce the laws of Maine as they find them on the statute books, impartially, and without attempt to interpret them as they may think the environment requires. Then, if more money is necessary let them pass the hat to all sportsmen, both resident and non-resident, and I believe they will more cheerfully contribute than they will under existing conditions. Meanwhile, why tax visiting sportsmen only for lack in enforcement of the laws, by residents of Maine? As a resident of New Hampshire, I perhaps ought not to "kick," as we can offer deer and trout in quantities sufficient to satisfy any reasonable sportsmen. We exact no license fee from any one, and I hope never will. Canada is too near, and license fee here would drive many (like the writer) out into Canada—just as it will from Maine, if this license law is passed.

W. H. B.

License as a Remedy.

GANSEVOORT, N. Y., Jan. 1.—*Editor Forest and Stream:* I wish to indorse the views of L. A. J. as expressed in FOREST AND STREAM, page 512. His strictures on the high license idea, and the legitimate object of the license system are clean cut and to the point. The reason why lumbermen and local hunters are allowed to violate the law with impunity is not only clearly pointed out, but the remedy is also suggested. That the laws are constantly violated in the way he describes is a fact that cannot be disproved. During my recent hunt in the Adirondacks the wagons which conveyed our party and camp equipage were overhauled by a zealous game warden in search of concealed deer hounds long before we had reached our hunting grounds, and our camp was visited by this warden and others, three times during our short hunt.

One would naturally infer from this that these wardens were enforcing the law. We were visiting sportsmen who did not employ local guides. How was it in the case of local hunters and guides and the sportsmen whom they were guiding? We heard dogs running deer nearly every day we were in camp. It happened that one of the hounds was missing after it had run its race, and the owner called at our camp in search of it, saying it was a valuable animal, had already earned him $40 this season, and that he disliked to lose it. I suggested that quite likely the warden who had overhauled our wagons had shot the hound, as he was known to be in that locality, and it being his duty to kill hounds found at large in deer forests. "Oh, no," said this guide, "he would not shoot that dog, for he knows that it belongs to me. Why," said he, "that dog has lain on that warden's feet in my camp, etc."

This was the zealous warden who overhauls the wagons of visiting sportsmen in search of hidden dogs, long before they reach the deer forests. The reason why this warden was too good a warden in the one case and no warden whatever in the other, was made plain to me by the fact that he lived near our hunting grounds and was acquainted with the local guides and hunters. If there is any other reason it is suggested by the following short dialogue which occurred between this same warden and a noted local hunter in Aiden Lair Lodge. The warden asked the hunter if he had killed his quota

of deer. Said the hunter in reply, "Yes, I began killing them in June, and I'm going to kill about a half ton more of them for my winter's supply of meat, and d—— you, don't you get between me and any deer I want to kill, for I shoot a Savage rifle that'll put a bullet right through a man and kill a deer beyond him."

I do not wish to impugn the courage of our wardens, but I cannot help believing that threats like this have something to do in subjecting sportsmen, who have no desire or intention to violate the law, to the indignity and annoyance of search and close surveillance, while notorious violators of the law are let severely alone.

L. A. J.'s suggestions are so complete that it is unnecessary for me to add anything, further than to point to the obvious fact that the plan he proposes for Maine would work equally well in New York.

JOS. W. SHURTER.

Puget Sound Ducking.

SEATTLE, Wash.—The genuine hide-bound, give and take duck hunter is truly a bird of stormy weather. The roar of the wind, the angry tossing of the waves and the creaking of the house have only one significance for him—the ducks will be moving.

Pressing business and that alone will keep him from donning his old togs, grabbing his gun and hastening away to the flats and marshes. If he is a millionaire he may take his dog along, but out in this country it is getting to be too much of a luxury. Dog transportation is a problem that will soon some up for discussion among those who rely upon the electric roads to carry them to and from the hunting grounds. I am told that it costs more to take a dog to any point in the White River valley than it costs for the transportation of the hunter. Perhaps the company has adopted a wise course so far as the convenience of the general public is concerned because a crowd of hunters with an army of dogs is truly a formidable array.

Every dog in the bunch is the greatest dog that ever retrieved a duck. The dogs seem to know this, and all being the "greatest" there is bound to be a disagreement about the place of honor. Up in Alaska, when two dog teams meet they fight for the fun of it; when a mob of Puget Sound hunting dogs meet they tell one another many things that would not look well in print. Sometimes they get beyond the strict rules of etiquette and argue in a manner that suggests flying fur, fricasseed ears and bloody noses. This doesn't worry the hunters because they have worried so much over the ducks that didn't come that they are beyond reach. As a rule it takes about a minute to stop a political argument between old water-dogs and about thirty seconds to start another.

Some hunters are pleased to have general attention attracted to the dogs because less is said about the game bags. If there is a lucky man in the bunch you will have no trouble finding him. He always carries his ducks right out in sight, and when he rests at the depot or on the dock he throws his bag down with an air that tells you, "That is the way I do it. Wasn't a very good day, but I managed to knock out a few doubles." If anyone suggested that it was a good day for pot shooting, every other hunter in the crowd would immediately ask for the meaning of the word. Going to the blinds and coming home everybody shoots on the wing. It is just as easy to kill them that way, so long as the other man didn't see the shooting, and it sounds so much prettier.

The matter of fact man who says in a laconic voice that he got only one little green-winged teal and potted him at that, throws a cloud over the entire party. To be in fashion he should say that he got only one shot; the bird came in like a bullet from the left quarter; he never did like swinging to the right, but it was up to him for quick action and he got down to business. If he is given to the snap-shooting system he should say that he threw the gun to his shoulder and locating the bird just filled the air so full of shot that there was no escape for the quarry. The man who swings on his bird should say that he centered the little fellow, and then moving the barrel ahead according to his idea of the speed and distance pulled the trigger, and had the inexplicable sensation of seeing the wings droop, the head fall back, and then he put in another barrel just to make sure.

Duck hunting, when you get right down to business, is like fishing in some respects. If things are coming all right the average shot will give the birds a fair chance for their lives, but if feathers are scarce a pot shot is not to be overlooked. Everything counts on the string and the best hunter is the one that brings in the game. Just so with the fisherman; he will use the fly if it works, but when the pinch comes he is not above using a fresh string of salmon eggs.

Wing-shooting is to the nimrod what fly-casting is to the angler. One equally adept at both games finds it a difficult matter to choose between them, but one who has more skill in one branch than the other cannot see where there is anything approaching an equality in the two sports. Judging by the amount of ammunition sold I should say that Seattle took more interest in wing-shooting than fly-casting, but there is no denying the statement that Seattle is fast becoming a home of sportsmen. Some of them obey the game laws fairly well, but in the matter of duck shooting the sport has been so uncertain during the past few years that the tendency has been to kill beyond the legal limit when the opportunity afforded itself.

A large majority of the hunters in Seattle, and I think the same statement applies to all the cities along the shores of Puget Sound, do not get more than one or two long duck hunts during the year. During the remainder of the time they are held so close to business that they can get out into the marshes only once in a while. Most of them go out Sunday. When there is no opportunity of selecting a day the chances are that the weather will be just opposite to what it should be for good shooting. Take for instance the first three Sundays in December of the year just passed—not a breath of air was stirring; hardly a wing showed above the horizon after the first flurry at dawn until the shadows of night had settled. The country fairly swarmed with hunters, but they stood in their blinds all day long with hardly a chance for the indescribable thrill felt when the whistle of wings comes to the ears.

I have seen as high as twenty guns on one Inter-urban car on a Sunday evening, yet there were not enough ducks to make one good bag. Human nature is human nature, and when a man has hunted week in and week out with nothing but bad luck he will come pretty near taking everything in sight when he strikes a good flight. Exasperation often makes a game hog out of a man who is ordinarily reasonable and law abiding.

Optimistic sportsmen of the Puget Sound country try to make themselves believe that the duck shooting is as good to-day as it was ten or twelve years ago. They point to large bags, which are made quite frequently on the Nesqually and Swinomish flats, Squak Slough and at different points along the White River valley between Seattle and Tacoma, as evidence to sustain their views.

They say that thousands of ducks may be seen on a calm, sunny day, floating idly and playing in the salt water off the shore from any of the big marshes along the shores of the Sound; that the fall and spring migrations bring immense flocks of mallards, teal, redheads, bluebills, widgeon, butterballs, goldeneye and sprigtails; that the air is often alive with honking geese and that once in a while the beautiful long-necked swan may be seen winging its way north or south. These statements are undoubtedly true, but I know from my own experience that I cannot get the same quality of shooting to-day that I could ten years ago without going farther or taking more time from business. In the last few years that I had the right to shoot on McKinley's pond, which is located eight or nine miles south of Seattle, I did not kill a handful of ducks; A. E. Greenus, who watched weather conditions closer, did well once in a while. Ten years ago one could take a Madison street car, ride out to Lake Washington, take a boat, row around into Union Bay and in the course of a day get several good shots. I picked out one of the best duck-weather days this year, and despite wind and waves got into Union Bay without a mishap. Did I get any sport? Not a bit; I saw one little flock, but they did not come near enough for me to tell what they were. One year ago I put in several days at the head of Hood Canal with L. F. Murdock and Frank Drolet. We worked hard, but the sum total of our efforts was fourteen. Three or four years previous Murdock, C. J. Coatsworth, of Buffalo, N. Y., Frank Reed of Buffalo, a Mr. Barnes and myself spent a few days at Clifton on Hood Canal, and, despite the fact that tide, moon and weather were against us, bagged seventy-six.

The situation on Puget Sound is fast reducing itself down to the point where there is no other way to get good shooting than to preserve land. Already the best places along the Sound have been leased and now it is useless for a hunter to visit the White River valley or Squak Slough unless he belongs to some club. Where the preserves are managed properly the shooting is limited with the result that good sport is had frequently. Without the preserves the ducks would continue their flight to the Columbia River, where they are better fed than they have been in this part of the country up to a recent date. Those who object to the preserve system might as well get into the band wagon because it is here to stay. The sportsmen spend thousands of dollars every year; their benefit comes in the form of recreation and health; the farmer, the merchant and the transportation companies get their benefit in cash, which they in turn pass on to other sources. Each duck killed during a season figures up a pretty penny, but such sport is not figured on that basis.

PORTUS BAXTER.

With Gun and Dog in Georgia.

I THINK that the prevailing impression among northern sportsmen is that they cannot get good shooting at Thomasville, owing to the fact that of late years large tracts of land and plantations have been so bought up and shooting privileges so leased that there is no place left for the "dropper in." While this impression is in a degree true, there is still a big lot of land outdoors there where birds are plentiful and the shooting good. Thomasville is a small city, situated in the center of a very sparsely settled country; in other words there is no other town or city near it, and even if they should go on selling plantations for the next ten years, there will still be some on the market. Of course, one must drive out some distance, and this very drive adds greatly to the pleasure of the outing. A one-legged man can shoot here. You just keep on driving, and when the dogs find the birds you drive up to them, get out and shoot, and then drive on. So the day is spent.

I can imagine no more delightful journey than to drive to Monticello and Tallahassee and return, hunting all the way there and back again. The trip takes two days. However, this is general or superficial; the details for a journey of this kind or for shorter trips can be arranged for by the Piney Woods, the Mitchell House or the Masury hotels. The Piney Woods stables, of which Mr. M. R. Elder is the proprietor, is thoroughly equipped with good horses and platform spring wagons expressly for this work, and each driver is a pathfinder of no small merit.

It was my good fortune to have with me that ebony veteran, Jesse Daniels, for many years the woodland pilot of Drs. Metcalf and Thompson, and many others who will recall their days afield with him with reverence. Jesse has four good dogs that so love the sound of his gentle voice that the whip is left at home. (He breaks his dogs alone.) In one short day we found a good many bevies of quail, and I came in at night thoroughly refreshed and with sufficient birds to show—well, to show that occasionally an accident did happen. Jesse carried a gun, his dogs work better that way.

Dogs afield have always appealed to me, but always with a greater intensity should the day supply an "incident." The incident may be in the seasoning of the gravy, the touch of perfection, or the undoing, the lengthening of a pretty sunset, or the upsetting of the milk pitcher, and this day among many others is on the sunny page.

Velox was backing Maud in high sedge, both drawn out until it seemed as though they needed another pair of legs to support them in the middle. Jesse directed me to step in and flush, which I did. Between two pines a pair of birds fell to my right barrel; at almost the same instant two more fell to the left of the little pine, while the rest of the big covey passed on beyond the woods. We retrieved our birds, and I remarked: "You only shot one barrel, Jesse," to which he replied, "Dat's all you shot, Mr. Batten, en it did seem as though we shot the heart out of dat covey, sure."

I shall ever bless the fact that confusion restrained me from using my second barrel, when a higher instinct curbed my friend. We did not follow those birds.

I owe much to the courtesy extended to me by Mr. W. A. Torry, the manager for Harvey and Wood, notwithstanding the fact that he is working overtime to get the Mitchell House open Jan. 1, and The Piney Woods Jan. 15. He was of infinite service in having me meet Robert Thomas, Jr., and Hon. H. W. Hopkins, both sportsmen that I wish all sportsmen could know. In the meantime I was comfortably located at the Masury.

Great interest is felt in Thomasville in the coming of the Eastern Field Trials, to be held Feb. 1. Judge Hopkins tells me there are seventy entries in the Derby alone. The trials should be very successful from the standpoint of comfort, as well as from a bird point of view, as never before in the history of field trials has it been possible for the members to have at their disposal such fine hotel accommodations as they will enjoy in Thomasville this year. Then, too, I am under the impression that all grounds are open for this event.

The Georgia Field Trials' Association, organized Nov. 25, 1902, for the improvement of the pointer and setter by actual field competition, and for the betterment and enforcement of the game laws, is, of course, in its infancy, but bids fair to become a factor in the dog and game world, with such men at its foundation as their roster will show: President, Hon. H. W. Hopkins; First Vice-President, Dr. T. R. Garlington; Second Vice-President, F. I. Stone; Secretary and Treasurer, P. M. Essig. Governors: C. D. Jordan, H. N. McIntosh, Dr. Floyd W. McRae, J. E. Miller, S. Grantland, W. H. Davis, W. S. Elkin, Jr.

This organization proposes some changes in the game laws of Georgia, and it wouldn't be surprising if retaliatory measures were to be adopted, although this does not suit Georgia's idea of old-fashioned hospitality a bit. But when a Georgian has to pay $25 to shoot a bird in Minnesota, he thinks the Minnesotian should pay something for bagging a bunch of birds in Georgia.

I was fortunate in being able to present Judge Hopkins with a copy of "Game Laws in Brief" at this particular time; from it he hopes to learn how the clever man can take advantage of the wise ones, and still maintain his dignity as a legislator.

I should be lacking in my duty to FOREST AND STREAM and to its readers, if I did not say my only regrets in leaving Thomasville are that I can't stay longer. Its pretty homes, parks and rivers, club grounds and fine hotels; its balmy climate and Southern hospitality are all equally delightful.

On the journey here it was my good fortune to be attached to the same train that pulled a chartered sleeper containing twelve members of the Chelsea Club of Georgia, who are now doing their annual two-weeks' shooting on their club grounds. The party consisted of Messrs. Nathaniel P. Smith, Jas. B. Baker, W. H. McCord, W. W. Greene, O. M. Eidlitz, W. C. Post, B. E. J. Eils, F. K. Gaston and King Smith, of New York; Percival Roberts, Jr., and R. A. Hatfield, of Philadelphia, and V. J. Hedden, of Newark.

These club members seem to have solved the problem of comfort and success by carrying with them all the comforts of home. The culinary department and dogs had gone on a week ahead, so that housekeeping affairs were in order and their numerous "skyscrapers" were down to real edge and birds well exercised on their arrival. Our train reached Savannah eight hours late, but the side shipment of supplies for the Chelsea Club removes the responsibility of delay from them.

Mr. Nathaniel P. Smith furnished me with many interesting details of the famous old plantation and mansion now owned by these members; and I regret not being able to visit it on this trip, so that I might tell of the changes time has made in the fortunes of one of these historical spots. This club is limited to twenty members. They own six thousand acres, and lease the shooting privilege of eighteen thousand more. On their annual outing they appoint a paymaster who settles all accounts (except those contracted playing "ping pong" and "old maid"), and renders to each member his account on the return to New York, thus they "dutch" it and buy their own cigars and soda water—surely an admirable scheme. "Gun and Dog" advice was not needed on that car, and as in the affairs of the world a good thing was quickly recognized. I mentioned the fact that a "well worn" sportsman in Delaware would sell his Cincinnati's Pride dog. In fifteen minutes it was telegraphed for; and Mr. Gaston was not sure whether they had twenty-eight or thirty-two dogs down there. Mr. Baker claimed that the sire was so good a one that the dam didn't make much difference. "When and where to shoot" is likewise so well known to these Blooming Grove Park Association members that their charter carries with it the privilege of making their own laws regarding "when to shoot," and their vast preserve gives them the "where." Among these veterans of outdoor life a missionary of shooting ethics would find dry picking.

T. E. BATTEN.

We doubt if any repartee ever surpassed in delicacy the reply made by an East Indian servant of Lord Dufferin, when he was Viceroy of India. "Well, what sort of sport has Lord —— had?" said Dufferin, one day, to his "shikarry," or sporting servant, who had attended a young English lord on a shooting excursion.

"Oh," replied the scrupulously polite Hindu, "the young Sahib shot divinely, but God was very merciful to the birds."

A Roman journal says that two ships, which were of the nature of floating palaces, and which have been submerged in the lake of Nemi ever since the time of the old Romans, are to be brought to the surface by artificially draining the lake.

CHICAGO AND THE WEST.

Ducking El Dorado.

CHICAGO, Ill., Dec. 27.—There seems to be a new ducking El Dorado at Moses Lake, some twenty-one miles southeast of Ephrata, which latter is about fifty miles east of Wenatchee, Wash., the latter being the point where the Great Northern Railroad crosses the Columbia River. Moses Lake is twenty-two miles in length and a mile wide in its widest place, but for the most part very much narrower. It is fed, according to the story of a Seattle, Wash., paper, by Crab Creek, a strange stream which is not particular whether it runs over ground or under ground. The Indians call this a bewitched water, and will have nothing to do with either stream or lake. Not so two sportsmen of Seattle who visited this region a few weeks ago. Messrs. D. H. and Virgil Hall, who brought back after their little hunt a splendid mixed bag of birds, which included three swans, four geese and about one hundred mallard ducks, not to mention a few mixed varieties of big ducks. The lake itself is a great breeding ground, and although the ducks forsake it after the breeding season they return and spend their winter there. There is one settler, Charles Lewis, a big stockman, whose homestead is on this lake, and he is the only inhabitant within very many miles. It may be supposed that in this remote region where the birds are almost wholly undisturbed two Seattle shooters had royal sport. They seem not to have abused their privileges, and expect to return for another visit to their lonesome ranchman. They describe a small island in one arm of the lake on which the ducks and geese are said to nest in thousands during the summer season. This would indeed seem to be a ducking El Dorado worth remembering, and for that matter, worth preserving.

The Wisconsin Duck Law.

The state of the duck law in Wisconsin is not at this time one wholly satisfactory, and if the threatened changes in other phases of the Wisconsin game laws shall be made, that commonwealth will be in a position to show its neighbors a set of game laws as inefficient as they were formerly good.

The protective sentiment in Wisconsin seems to go by waves, and the game laws do not seem to show any settled sentiment as to the general desirability of the protection of wild game. This State, it may be remembered, for a long time supported the famous dog in the manger law, by whose terms it pledged itself to stop spring shooting as soon as Illinois did. This principle of legislation has always seemed to be about as puerile as any that could be devised.

In spite of waves of lawlessness and waves of penitence, however, Wisconsin did for a long time lead the sentiment of the Mississippi Valley in the matter of good duck laws. It stopped spring shooting, at least upon the marsh ducks which breed in some numbers in Wisconsin marshes; and although this half way measure was of course inherently weak, it showed the Wisconsin heart was in the right place. Moreover, the old law, which restricted shooters to the natural cover of the rushes, and forbade open water blinds, was one of the best measures which could have been devised by that State to induce the migrating birds to tarry for a time upon her marshes. I remember that when I first began to visit Wisconsin ducking grounds, the burlap blind, put out in the open water on the feeding beds of the ducks, was a common device and used with success by all of the market-hunters and by greedy sportsmen who are just as bad as the market-hunters. After a time the numbers of these blinds, more especially in Fox Lake and adjoining waters, rendered it almost impossible for a wild duck to get a place where it could alight in safety or feed in quiet. The deep water diving ducks, redheads, bluebills, ringbills, and sometimes canvas backs could not even get out into the middle of the lake in twenty feet of water without running against one of these blinds. The result was that the birds were hammered and pounded out until they finally settled the question by rising pretty much en masse and getting out to another part of the world.

Then came the revulsion in sentiment which abolished these open water blinds and confined the shooter's concealment to the rushes or a blind built somewhere within the indefinite line of "natural cover." These old open water blinds were usually made of burlaps. The hunter would take some poles 15 or 20 feet in length and sink them in a parallelogram out in the open water. Around three sides of these projecting stake tops he would stretch a strip of coffee sacking or burlap. The blind was left open at one end, and the shooter pushed his boat in and lay riding in perfect concealment and with a very decent wind break. By tying his boat to one of the stout poles he could manage to ride a very heavy sea, and of course in heavy weather and a good big flock of decoys he was very apt to get good shooting. This was all very well while it lasted.

The Illinois law, like the Wisconsin law forbidding shooting from a blind beyond the edge of natural cover, was subject of much argument and construction and misconstruction. At last the objectors in Wisconsin overruled those who had stood out for some protection for the birds, and recently the Wisconsin open water blind law was killed in effect by the introduction of a clause which renders it lawful to shoot on any of the open waters of the State between sunrise and sunset from a paddling or rowing boat, propelled with an oar or oars from the side or sides of such boat.

This change of the old law has already produced the results which might have been expected. The sportsmen of the State declare that the new law has destroyed hunting on the lakes where formerly there was great sport. The present law permits the chasing of the birds by boats, and the ducks are pressed so closely that they never find rest; hence they simply leave feeding grounds which otherwise they would use. There is a large element of decent and tolerant sportsmanship in the city of Milwaukee which protests at this law. It is to be hoped that this element may prove leaven sufficient to affect popular sentiment at the State Legislature, where still more radical changes are threatened.

As to the details regarding the change in the law, the following letter from Henry Overbeck, Jr., State game warden of Wisconsin, should remove any doubt and settle any discussion which exists even to-day:

MADISON, Wis., Dec. 20.—*E. Hough:* In reply to your telegram and letter regarding the shooting of ducks in open water, would say that as the law now reads in Sec. 65 on page 42, open water duck shooting is allowed. The section reads, "Provided, that it shall not be unlawful to hunt, kill or pursue any acquatic fowl on the open waters of this State between sunrise and sunset of the same day with a paddle boat or row boat propelled with an oar or oars from the side or sides of such boat." I enclose the whole of the section referred to. Trusting that this will furnish you the necessary information you desired, and that it reached you in time. Truly yours,

HENRY OVERBECK, JR.

The section referred to by Mr. Overbeck follows in full:

65. Prohibited Methods of Hunting Aquatic Birds.—Section 12, Cbapter 258, 1901.—Section 4563b of the statutes of 1898, is hereby amended so as to read as follows: Section 4563b: Any person who shall use, in the pursuit of any wild duck, goose, brant or other aquatic bird, upon the waters of this State, any sneak boat, or boat propelled by an oar or oars operated from the stern of such boat, or any sail boat, or boat propelled by steam,, naphtha, electric or other engine or machinery, or any battery, sink box or similar device, or who shall kill or attempt to kill or to pursue, while occupying or using any boat, box or other device outside or beyond the natural covering of reeds, grass or other vegetation growing above the water, any wild goose, duck, brant or other aquatic bird, or who shall construct or use for the purpose of hunting, outside of such natural covering or upon the ice, any fixed or artificial blind or ambush, shall be punished by a fine of not less than ten dollars, nor more tban fifty dollars, or by imprisonment in the county jail not more than thirty days or by both such fine and imprisonment; Provided, that it shall not be unlawful to hunt, kill or pursue any aquatic fowl on the open waters of this State between sunrise and sunset of the same day with a paddle boat or row boat propelled with an oar or oars from the side or sides of such boat; Provided, however, that in the waters of Lake Koshkonong in the counties of Dane, Jefferson, Rock, and in the water of Fox Lake in Dodge county, no float, paddle boat, scull boat or sneak boat, shall be used in the pursuit of any aquatic fowl beyond the point where the hunter may by law set his decoys.

It will thus be observed that the sneak boat hunting on canvasbacks on Lake Koshkonong will continue to be unlawful. This sculling or sneak boat hunting as practiced on that lake was in the early times developed into an art most destructive to the canvasback. It was an interesting art, showing well the skill and perseverance of the hunter in outwitting his game, but its result proved fair to be the destruction of all sport on the deep water ducks. It is comforting to know that at least this form of open water shooting continues to be illegal.

There is still another phase of the Wisconsin ducking law which ought to be called to the attention of those who think that all restrictions are off in regard to duck hunting in Wisconsin. From a lay inspection of the law as bearing upon public nuisances, it would seem to be evident that duck shooting in the open water for more than 200 feet from cover will continue to be illegal. The clause bearing upon public nuisances reads as below:

11. Public Nuisances, What Are.—Section 1498o, W. S., 1898.—The following are declared to be public nuisances:

1. Any net of any kind prohibited by law while set, placed or found in any waters where such net is prohibited by law from being used.

2. All seines or other devices, traps or contrivances set or found in any waters in a manner prohibited by any law relating to such waters, and any and all boats found in use in the taking of fish in violation of any of the provisions of these statutes.

3. All set lines, ropes or cables with more than one line attached thereto, either directly or indirectly. Set lines are construed to mean any line not held by the person using the same, whether having one or more hooks. This sub-division applies to inland waters only.

4. Any nets spread upon or under the surface of any of the waters of the State which shall or migbt entrap or ensnare any wild fowl of any kind.

5. Any trap, snares, spring gun, set guns or other device or contrivance which might entrap, ensnare or kill any animals, birds or water fowl protected by law.

6. Section 8, Chapter 312, 1899: Any boats, lamps or lights when used in the unlawful taking or attempting to take fish or game.

7. Any pivot or swivel gun or other firearm, not habitually held at arm's length, and discharged from the shoulder, while the same sball be in unlawful use.

8. Any screen set in the public waters of the State to prevent the free passage of fish, or set in any stream which shall have been stocked by the Commissioners of Fisberies.

9. Any boat, floating raft, box or blind set in open water or outside a natural growth of grasses or rushes sufficiently high to conceal the boat, raft or blind, or an artificial blind set in open water for the unlawful pursuit, hunting or shooting of any wild duck, goose or brant.

10. Section 9, Chapter 312, 1899: Sub-division 10, Section 1498o, Wisconsin statutes of 1898, is hereby amended to read as follows: Sub-division 10, Section 1498o: All decoys set in any of the waters of the State, during the close season for the hunting of any variety of water-fowl as prescribed by law; and any decoys set in the water more than two hundred feet from the cover, which said cover shall be construed to mean the weeds, rushes or other vegetation in which the hunter may locate, or any place in which the hunter shall wholly or partially conceal himself.

11. The unlawful use of any of the articles mentioned in this section, contrary to the provisions of law, shall forfeit the same to the State, and upon their being found under any of the conditions which shall render them public nuisances as specified herein they may be immediately destroyed.

Thus the duck hunter in Wisconsin may chase ducks in the open water, but may not shoot over decoys set more than 200 feet from cover. Sometimes it takes a certain amount of study to figure out the real meaning of a game law by the time the legislators are done with it, and even then there is nothing established until after the courts have finished their work. By that time we are usually ready for another change in our game laws. It is not beyond hope that Wisconsin will see some of the error of her way and refuse to do some of the things which she threatens to do with her game laws at this session of the Legislature.

Ducks in the South.

That veteran Western duck shooter, Abe Kleinman, of this city, told me to-day that he was rather hopeful that he might be able to get South for a little duck shooting this winter. "I am afraid to take my gun out of the case," said he, "for fear I might get it dirty. It has been there for a long, long time."

Abe thinks that a good duck country might be found along the new rice grounds of Louisiana and Texas rather farther to the east than the points which hitherto have been commonly accepted as the best ones for shooting along the Gulf Coast. I have not heard much from High Island or Galveston for some time, and do not know what the outlook is in that part of the world, but there ought to be some shooting left in those regions.

Abe tells me that our old friend Billy Griggs is not shooting for the market this winter, but is running a fishing station somewhere down in Georgia. Happy Billy, to get down in the South in the winter time and escape these Northern winters. For we are having winter here in Chicago for keeps just now, a cold wave with somewhat blizzardly accompaniments having taken the place of the snow and slush.

Hounds and Quail.

Every once in a while some authority on dogs bobs up with the statement that somewhere in the remote past a good strong hound strain was introduced into that breed. There may be color for that statement. At least I am willing to say that the fox hound or coon dog of commerce will, upon occasion, take naturally to quail. The other day, when I was down shooting with Warren Powel, the latter gentleman undertook to put his two coon dogs into the same wagon with a string of quail. He heard a loud yell from the driver, and arrived in time to see the last of quite a bunch of quail disappearing down the throat of one of the coon dogs. "He just took 'em off the string like he was eating peanuts," said the driver, excitedly. I never saw anything like it! I have no doubt that if rescue had not arrived, we should have seen nothing of our bunch of birds excepting the string and a few heads. Mr. Powel said he was sure this dog was swallowing quail without even getting his throat tickled by the wing feathers.

Slaughter of Deer in the Northwest.

Major M. G. Baldwin, of Kalispel, Mont., recently returned from the West Fisher district, and says that large bands of Indians have been hunting in that district ever since the opening of winter, and that they have killed at least 2,000 deer, not to mention other game. One miner reported seeing at an Indian camp sixty deer brought in as result of two days' hunt. These Indians are Flatheads and Kootenais. Their manner of hunting is to go in a large body on horseback with large numbers of dogs and to deploy at the base of a mountain on which they intend to hunt. They then advance up hill, dogs and horsemen beating out all the cover. The deer run toward the top and are shot down in large numbers in this kind of a circle hunt. The Flatheads, returning to their reservation, brought back an immense quantity of hides and had hundreds of horses loaded down with deer meat. They had lived nearly four months on deer meat beside what they brought back. In that part of the mountains there had been two mild winters, and the deer wandered high up, but this fall the snow drove them down and the Indians had no trouble in slaughtering deer in great numbers.

Tennessee Man Gets Moose.

Dr. Chas. E. Wait, of the University of Tennessee, is another American who went to New Brunswick this fall and enjoyed a successful moose hunt. Dr. Wait got a moose with 58-inch spread, with 25 points and a web of 11 inches. Experienced big-game hunters report this to have been the finest head seen for a long time, it being very perfect and symmetrical. Dr. Waite used a Winchester .45-70-500, smokeless powder, metal patched, and killed his moose with one shot. He says that he has with the same rifle and load killed four moose and two caribou, and needed only one shot in any case. It is not believed that very many moose heads have ever been seen within the confines of the State of Tennessee, and it surely must be a source of pride for Dr. Wait to know that he has brought home so grand a specimen.

But Not the Biggest.

The Wait head must have been something of a moose head; but what shall we say to the moose killed this season on the Northwest Miramichi by Mr. Sterling Trevors, one of the employes at Burchill's lumber camp? This head is reported to have had a spread of 72 inches, which is getting directly into the Alaskan class. Mr. Trevors is stated to have been offered $200 for the head, but did not think that was enough. This head is reported by the Chatham World, but I cannot say whether or not the measurements are accurate. They are so extraordinarily large that it seems there might have been a mistake. The New Brunswick heads are the grandest ones to be had near the Eastern Coast, but 60, 61 or 62 inches has been pretty near their limit.

Indians Not so Bad.

By the way, speaking of our Indians out in Montana and their deer killing, how about the sportsmen of Maine and vicinity? It is said that 8,000 or 10,000 non-resident hunters shot in Maine this year. Some say that 7,500 deer have been shipped. Some say that 20,000 deer were killed. Others say 15,000; yet others say 5,000 deer, and perhaps 200 moose. Pile all this game up in a pile, and it might set a fellow thinking. The pile of dead and wounded human beings would also give one occasion for thought, since we read of nine deaths and twenty-one serious wounds in the deer hunting field, one of the dead being a registered guide. We do pretty well in our deer season out here in Wisconsin and Michigan, and kill nearly as many men out here as they do in Maine. I do not believe, however, that we kill quite so many deer, and if these Maine figures are reported accurately, I doubt if we send as many hunters into the woods as go into the wilderness of Maine.

Life and Adventures of a Tin Cup.

The other morning when I went down to my office I found on my desk a tin cup. It was not a very distinguished looking vessel, being old, a bit dirty and very much blackened by the smoke of many camp

fires. On the handle it had the letters U. S., and about the rim there was a bit of wire still entwined. The cost of this cup was, as I personally know, only about six cents in the first place, but as it stood I would not have taken a few hundred dollars for it. In short, this was the same tin cup which, more than a year ago, I lost in the snow in the middle of New Brunswick.

Originally this cup started on its travels when Billy Hofer and I discovered the Yellowstone Park in the winter of '94. Capt. George S. Anderson, now a colonel in the Army, stationed in the Philippines, was then superintendent of the Park. He made me a present of this cup, which was then fresh from the sutler's store. I tied it to my belt with a piece of coffee sacking, and at the belt it remained through every winter trip, and a good many summer trips which I have made since that time long ago, the old cup getting gradually blacker and blacker. It was along when McChesney and I discovered the Two Medicine country of the Blackfeet. It was along with me, as we have discovered, when I went with Adam Moore on my first moose hunt out from Nictor Lake, in New Brunswick. At last, when finally the rotting coffee sack string parted, I lost my tin cup high up in the big hills, six miles from camp, just where none of us could tell. With it went my luck, as I told in our story of the New Brunswick trip with Adam Moore and Henry Braithwaite. Last spring, as I have already mentioned in these columns, Adam, stumbling around in the woods, where all our snowshoe paths had long since disappeared in the spring, blundered on this old tin cup of mine! Adam thought to sequester this as a souvenir, and indeed I hated to rob him of it, but could not find it in my heart to part with my old mascot. This fall Mr. Geo. Henneberry, of Chicago, was out with Adam, and Adam gave him the tin cup to bring back to me. Mr. Henneberry, after several calls, finally left the cup on my desk. I do not know what further adventures this ancient vessel may yet encounter, but I think I must leave it to Adam Moore in my will.

Moose and Grizzly.

Speaking of New Brunswick reminds me of my oft-time repeated assertion that if you stand in the middle of Chicago, you will presently see pass by every living soul you ever met in any corner of the world. I was sitting at my desk the other evening when in stepped Mr. Fred Irland, of Washington, who, so far as I know, has not been West for some time. Mr. Irland's many hunts with Henry Braithwaite in New Brunswick have often been chronicled in the columns of FOREST AND STREAM and in the monthly magazines. He is an old and experienced moose hunter as any that go into that province, and retains that fondness for the New Brunswick wilderness which seems to be carried away by everyone who ever visits that country. Mr. Irland was in Chicago but for a few brief moments. He says, however, that in the spring, about April, in all likelihood, he will start West from Washington for a grizzly hunt in Siskiyou County, California, where he has a friend who thinks he will get a grizzly well worth while. As Mr. Irland will have a couple of months off, the chances are that he will meet his grizzly and take him into camp. If he does, I am sure we will have a very interesting story about these California bears. Old hunters of the eastern side of the Sierras always said that the grizzly bear was never found east of California. Scientists divide the bears into all sorts of species, and even the hunters themselves now do likewise. Formerly they were of only two species, the grizzly and the black. The hunters were more liberal in the past and had all sorts, the silver tip, bald face, roach back, etc., although the most widely experienced of them always agreed that the California bears were bigger than those of the Rocky Mountains. Mr. Irland thinks that in Siskiyou County he may perhaps be fortunate enough to meet with one of the bears which sometimes kill cattle among the ranches out there. It takes a good-sized grizzly to kill a steer. My own new grizzly country, which I am holding in reserve for myself until times get easier, is another one where the grizzlies sometimes kill cattle. Now, if only I could visit my country at the time Mr. Irland goes to Siskiyou, what notes we might have for comparison along about the first of June! At any rate, good luck to a good fellow.

Changes in Western Game Laws.

Reference has already been made in regard to the proposed monkeying with the Wisconsin game laws. No one can tell what will happen up in that part of the world in these days. One of the planks of a late gubernatorial campaign—happily an unsuccessful one—was a flat-footed opposition to all game laws, and the declaration that a wide open policy in regard to shooting was the only one which ought to be tolerated in the State. There is a proposition to change the deer law of Wisconsin, to add 10 days to the shooting instead of cutting 10 days off. The great loss of life in the deer hunting field moves one legislator to forecast a bill limiting the charge in rifles, "so that the rifle will not shoot over 200 yards." This is a very wise measure indeed, as will be readily seen by all sportsmen! I am glad to add, however, that there will be an attempt made in Wisconsin to pass another bill limiting the bag of game birds to 25 per day. There has been a great deal of talk over the outrageous slaughter of ducks carried on along the Illinois River by the Powers boys and their friends, and one result of this may be the gradual growth of the limited bag idea. These outrages bring their own remedy with them in the course of time. If Illinois would put a limited bag clause in her laws, straighten out the quail and woodcock season, and insert a Stop the Sale of Game clause, she would have a pretty good law; at least a better one than she would enforce.

From Michigan also come reports of troublous times in the Legislature. One writer says: "There are all sorts of foolish notions being advanced. The fact is, the politicians do not take enough interest in this matter to give it the correct attention it deserves." The trouble with the politicians is that not all of them are sportsmen and not all of them are men of real breadth and grasp of affairs. They are supposed to represent the people, but they sometimes do so by means of views based on a very narrow personal horizon.

Down to Rabbit Hu ting.

As for sport in this part of the country, we are pretty near down to rabbit hunting now. Indeed, it is an easy guess that molly cottontail will become more respected in this State as the years roll by. The latest thing in rabbit hunting is a possible expedition of the Wishininnie Club, some time within the next ten days, for a big rabbit hunt, probably in the neighborhood of Custer Park, in this State. It is said that a few beagles can be obtained, and local guides say that as many rabbits could be killed as the visitors cared for.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Good Work of the California Game Commission.

WHILE the case of Corriea, the San Francisco commission merchant, who, as told in FOREST AND STREAM of Dec. 20, circularized the market-hunters of the State, offering them weighty inducements to violate the game laws, is dragging out its slow length in the police court, the California Game and Fish Commission is making it decidedly sultry for his dupes. Mr. T. E. Craighill, of Paso Robles, received one of the Corriea circulars and yearned with a yearning that surpasses words to gather in the $2 a dozen and expenses which the worthy commission merchant was offering for illicit quail. Mr. Craighill garnered twenty dozen, and is out of pocket on the transaction the quail, expenses of packing and shipping them, the costs of his trial and $50 fine. He stated that he preferred to be tried by jury, as he expected to receive "substantial justice" from their hands. He got it. Mr. McPherson, of San Luis Obispo, also received a circular and thought that a little Christmas money would not come amiss. His shipment was thirty dozen, and the deputy caught him just as he was about to move with his entire family to Los Angeles. He pleaded guilty and was let off with a minimum fine of $25. The decision in the Corriea case is looked for now any day.

A Trial by Long Distance 'Phone.

Mr. Frederick Rabb is the superintendent of the Ralston Mine, which is situated in Placer County about 30 miles from anywhere. The nearest hamlet is Michigan Gulch. Mr. Rabb killed a deer the other day and shipped it to a friend in this city as a Christmas present. Chief Deputy Vogelsang appropriated the present, and wrote to Mr. Rabb, giving him an option of appearing before the nearest justice and pleading guilty, or having a deputy sent up to the mine to arrest him. Rabb thought it over and telegraphed to Vogelsang that it would be very inconvenient for him to leave the mine just at present, and inquiring if the business could not be done over the long distance telephone. The Fish and Game Commission were willing to accommodate him. The justice of the peace at Auburn was connected with Mr. Rabb and read the complaint to him over the wire. "How do you plead?" inquired the justice. "Guilty," replied the mining superintendent. "Very good," aswered the justice; "the court accepts your plea and finds you guilty and fines you $25 and the costs of this trial, including telephone service, $6.45." Mr. Rabb remarked that the next time he wanted to send a Christmas present to a friend, he would send him a nugget, as he thought it would come cheaper in the long run.

Meat Hunters Bagged.

Despite the game laws, for many years it has been the custom for the owners of mines, lumber camps and other industries in the unsettled portions of this State to contract with professional hunters to supply their crews of men with venison during the winter. In many of the camps this is the only fresh meat consumed during this season, and the slaughter of deer to supply this demand is simply appalling. Neither age nor sex is respected, and every wild thing on four legs represents just so many cents a pound, usually twelve, to the illicit meat contractor. To this occupation he adds that of hide-hunting, as there is a ready market for green deer skins since the law went into effect prohibiting their sale.

Owing to the remote field of operation of these gentry, it has in the past been extremely difficult to obtain evidence against them; but the California Fish and Game Commission this year is better organized than ever before in the history of the State, and it has its trusted deputies practically everywhere. Mr. W. R. Walsh, the deputy at Red Bluff, in the Shasta Mountains, succeeded last week in effecting the arrest of eight of these meat hunters. Mr. Welsh surprised the gang of doe hunters red-handed, in their camp in one of the most remote canyons of the Tehama wilderness, the second day after they had got to work. They promptly admitted killing two deer, and, in fact, a denial was out of the question, as the carcasses were in the camp when the deputy arrived. Several of the men concerned have hitherto borne good reputations. Their names are J. D. Cameron, Guy Cameron, Ed Cameron, Peter Cameron, Walter Gosney, John Schultz, Albert Sykes and J. D. Barber, all residents of Red Bluff. As usual in such cases, they have all pleaded not guilty and demanded a jury trial, which will commence on the 6th of January. In speaking of the occurence Chief Deputy Vogelsang, under whose personal direction Deputy Welsh was acting, said: "I have determined to stamp out this meat-hunting business, and I am glad to see that the citizens of Red Bluff are sufficiently aroused to the necessity of protecting the game to hold a mass meeting denouncing the violations of the law which have taken place in Shasta and neighboring counties." After securing his men Deputy Welsh penetrated further into the mountains and discovered a well-built camp containing ten fresh deer hides, five deer heads and a portion of a carcass, likewise a new .30-30 Winchester rifle, a set of spurs, roll of blankets, etc. The occupant had fled.

MARIN.

SAN FRANCISCO, Dec. 27.

New York League Amendments.

THE NEW YORK STATE FISH, GAME AND FOREST LEAGUE, Syracuse, N. Y., Dec. 30.—At the annual meeting of The New York State Fish, Game and Forest League, the following amendments to existing laws were proposed. Every sportsman and thinking man appreciates the need of more stringent laws and better enforcement to prevent the absolute extinction of the game of the State. Each one of the amendments proposed by the State Association is designed to better protect the remnant of our game and make it possible to secure the enforcement of all existing laws.

The interests involved demand of every sportsman that he give his most earnest efforts to advancing these several measures. Will you take it upon yourself to see that your representatives are fully acquainted with the conditions as they exist, and that an important element of the community demands their favorable action?

The sportsmen of the State can control conditions if they will make their aggressive force felt. Will you do your part? Ask your friends to see members of the Legislature at once and urge them to further these amendments.

C. H. MOWRY,
F. C. EDDY,
W. S. GAVITT,
R. P. GRANT,
Legislative and Law Committee.

1. Prohibiting the sale of grouse and woodcock that are killed within this State.
2. Closing the season for killing gray and black squirrels same time as grouse and woodcock, viz: November 30.
3. Closing the season for killing quail same as grouse and woodcock, viz., November 30.
4. Special Game Protectors appointed by the State Forest Fish and Game Commission, shall have the same power of search as the regular protectors, if in the employ of Boards of Supervisors or incorporated associations for the protection of fish and game.
5. Closing the season for killing grouse in the counties of Ulster, Sullivan and Greene at same time as the other counties, viz., November 30.
6. Prohibiting the spearing of fish in Seneca Lake.
7. Prohibiting the sale of web-footed wild fowl after March 1 in every year until the open season.
8. Web-footed wild fowl not to be killed earlier than September 16 or after December 31, but not to provide an open season where none exists, or to extend an open season in any locality where it is less than above.
9. Prohibiting the sale of venison in the Adirondack Reservation, viz., that territory within the "Blue line."
10. Strike out the exception to right of search in New York and Kings counties by protector without warrant.

Some Observations.

Editor Forest and Stream:

I observe that my esteemed antagonist Coahoma is still in court with his contention "That the procurement of something useful is an essential element of true sport." My sympathy goes out to him in his hopeless struggle, for persistent and heroic effort like his deserves success. Unfortunately for him, the court having jurisdiction in the matter is the noble fraternity of sportsmen, and this court has rendered its decision adversely to him, and is constantly reaffirming its decision; witness the many forms of diversion which offer no opportunity for the "procurement" of anything which is "useful" which are recognized and pursued as sport by the members of this fraternity.

I regret that my worthy opponent has got himself into hot water, and trust he will not hold me responsible for the predicament in which he finds himself, but will realize that it is the result of his efforts to controvert the logic of facts.

I will review briefly the evidence presented in his latest appeal.

He objects to a suggestion of mine as irrelevant on the ground that the owner of pork would not refuse to sell it at 25 cents per pound, which is the sum B said he would not accept for his quail.

I think the court will overrule this objection on the grounds. 1st. The current market quotations on pork and quail fixes the price of a quail at about the price of three pounds of pork. 2d. There is no evidence in the case to show that B regarded the quail he killed as more "useful" than other quail which he could buy in the open market, therefore, it may be assumed that, other things equal, he would sell his quail just as quickly as he would his pork at regular market quotations.

3d. The suggestion objected to did not refer to selling either quail or pork, but to wasting or throwing away these articles of food, and was offered to show that the killing and possession of game divorces it from the realm of sport and places it on a level with other articles of commerce, therefore the suggestion must be relevant to the issue.

Coahoma is evidently unjust to the Swan lake sportsmen when he attributes mercenary motives to them, and is clearly wrong in his deduction from the Swan lake "circumstance." As well might he say there is no sport in shooting clay pigeons which cannot be had in possession after breaking as to say there is no sport in shooting ducks which cannot be had in possession after killing.

The Swan lake sportsmen are no doubt sportsmen in fact as well as in name, and prove the fact by refraining from sport which occasions a waste of game.

I am pleased to assure Coahoma that he need have no fear of more "hot water," so far as I am concerned, because of his observations on the different modes of fox hunting. I can fully indorse all he says in regard to this kind of sport. But what pleases me most is his reference to fox hunting as sport. Fox hunting! from which little or nothing is "procured" that is "useful," and which exacts the expenditure of so much that is useful. Coahoma, accept my congratulations and my hand. I am proud of the progress you are making and predict that you will soon be numbered with the great majority of sportsmen who pursue sport solely for sport's sake.

JOS. W. SHURTER.

GANSEVOORT, N. Y., Jan. 1.

A Deserved Recognition.

BOSTON, Jan. 3.—*Editor Forest and Stream:* Governor Crane and his council, at their last meeting for 1902, voted to increase the salary of the Chairman of the Fish and Game Commission by the addition of seven hundred dollars. This will be received by all our sportsmen with much rejoicing in view of the earnestness with which the Captain has carried on the work of his department and the cordial manner with which he receives all who have occasion to transact business at the office of the Commission at the State House.

The opening of such an office was one of the first benefits secured by him within a few days of his induction to the position of Chairman of the Board. This action of the council on the recommendation of Governor Crane shows him to be a thorough believer in the work of that department and shows also that his advisers hold similar views.

The advent of Captain Collins to the position he holds marks the beginning of what may be called a new era in the care of fish and game in Massachusetts.

The Captain, from the first, has shown himself a believer in such recreation as the woods and streams afford and has manifested a desire to assist in carrying out the plans of organizations formed for the purpose of fostering legitimate sport with rod or gun. But notwithstanding the advance made in the last three years the department is not without its enemies. In a recent issue of a Boston daily appeared an editorial savagely attacking the Commission for what it termed the "arbitrary manner" in which the laws are being enforced.

By the knowing ones the article is considered as highly complimentary. Every sportsman will say "*enforcement* is what we want" and that without fear or favor.

So we say congratulations are in order not only for the Chairman personally, but for the course represented by his department.

Returning Sportsmen.

President James R. Reed, of the State Association, returned from New Brunswick a few days ago and several of his friends tell me he made their hearts glad by a Christmas present of most toothsome caribou meat.

Since his return he has given the boys of the Young Men's Christian Association a talk on "Angling," which interested them greatly.

Hon. George W. Wiggin has just returned from his second autumn trip—this time from New Brunswick.

I met another well-known nimrod, Mr. Ward Nicholas Boylston, who is planning to remain in Boston for a few weeks.

The Legislature will convene on Wednesday, Jan. 7. All are interested in the make-up of the Fish and Game Committee, and it is generally expected that the Senate Chairman will be Senator Bagley, of Boston; the House Chairman, probably, Mr. Moody Kimball, of Newburyport.

CENTRAL.

Lubricating After Loading.

I NOTE in your issue of Jan. 3 a correspondent's unfavorable experience with bullets lubricated after being seated in the shell. He found that they took a part of the shell along with them when fired. That happened with me just twice in hundreds—perhaps thousands—of shots. The shells in these cases were very old and much used, and it did not occur to me to attribute the breakage to the style of lubrication. Of course this method requires that the bullet be only slightly seated in the shell, so that nearly the whole bearing surface is lubricated. The particular bullet which I have used in this way is the 86-grain .25-caliber. My loader, the old Maynard tool, seats them with one band, one groove, and part or all of the second band in the shell. The hold thus given, unless the shell is too much worn, is firm enough for all practical purposes, while it has never pulled the neck off the shell except in the two cases mentioned, and I doubt whether the break in those cases resulted from the lack of lubricant in one groove. Your correspondent's wording might refer either to shells actually broken, as in these two instances, or to a loss of brass from the inside; either injury being due to excessive friction between the lead and the brass, caused by the lack of lubricant. Reloading, long enough repeated, will be sure to wear away some brass from the mouth of the shell, but I have found it a long while before the wear is appreciable with such reloading as I have described.

BRISTOL HILL.

Measurements of Big Game.

THE Boone and Crockett Club has recently sent out to its members the following self-explanatory circular:

"At a recent meeting of the Executive Committee of the Boone and Crocket Club, Casper Whitney, Archibald Rogers and James H. Kidder were appointed a committee on measurements.

"The object of the committee is to agree upon and establish a uniform standard of measurements for all the large game of America—and as soon as that is determined upon, to gather data of record heads.

"In deciding upon a standard and proper method of measurement, it is the aim of the committee to get the advice and help of members who have had experience with the several different kinds of wild game.

"Will you kindly give this matter your special consideration, and advise the committee of your views in establishing a standard of measurement upon the species of large game with which you have had the greatest experience?

"The committee would also be extremely pleased to receive suggestions from you upon the subject at large."

The subject is one which interests all big-game hunters, and one on which most men who use the rifle have ideas of their own. It would be interesting to hear from our readers on the points mentioned.

An English lady who visited America many years ago used to tell the following story: On the voyage she was one day shocked by seeing a ship's officer knock down one of the crew who was inclined to mutiny. So much did the sight affect her that she retired to her cabin, and did not again appear on deck until land was sighted. Then she perceived at the wheel the man who had received the blow. Approaching him, she asked, with deep sympathy: "How is your head now?" "Wes-and-by-nor', ma'am," was the answer.

Camp-Fire Flickerings.

"That reminds me."

THE flight was on, but we could do nothing with them, as it was a mild, clear morning and the ducks pursued the even tenor of their way just out of gunshot, paying no attention to the 150 wooden counterfeits we had carefully, even scientifically, arranged for their (and our own) benefit. After we had watched the aerial parade for some time a snort of disgust was heard coming from the sneakbox occupied by N., followed by the exclamation: "Gee, boys, this don't suit me a little bit! These birds will never stool a day like this. They've all got their compasses adjusted and courses set. My motto is: 'If they won't come to me, go after them.' I want some action!" And with that he put in a couple of shells about a foot long and then said: "Now let another bunch come along within 100 yards and you'll see me hurl some of this goose food at 'em!"

Presently a large flock came along the well-surveyed course, and as they were nearly opposite us N.'s heavy artillery spoke twice. Open order, double quick, seemed to be the command for all the feathered company except two; one fell with a resounding splash into the water and the other started in exactly the opposite direction, climbing higher and higher until lost to sight.

"I rather think I joggled that one's compass if I didn't do anything else," remarked N.

"He's hit in the head, probably in the eye," said the old bayman as he pushed out to get the dead bird.

"They go up pretty high when they are shot that way, don't they?" queried N.

"Sometimes a little higher than others," replied the veteran. "I remember once—been 20 year ago, I reckon—I was shootin' from Sloop Sedge one mornin' 'bout like this and along come two widgeon. Wasn't in gunshot hardly, but I throwed it at 'em just to show there wasn't any hard feelin'. Well, one of 'em took the sky route just as you seen that feller do. How high did he go? Well, of course that's something we can't measure, but it was 13 minutes past 7 when I shot him, and at exactly 9 minutes past 12 he fell dead in the blind.

"Will I have a drink? Now that you speak of it, guess I will dampen my tonsils a leetle."

OCEAN.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Reminiscences of an Octogenarian.

Part V.

BY THE OLD ANGLER.

(*Continued from page* 515.)

Sometimes, but not often, pleasure can be combined with official duty. Once in the course of this duty the writer had to visit and report upon the salmon fishing in the Tobique River, the largest affluent of the St. John, which debouches a short distance above the pretty village of Andover. At that time the settlers on its banks were few and far apart. Then the plaster quarry had not been developed and the only industries on the river were lumbering and farming, which every settler pursued in a desultory fashion. Salmon were plentiful in the river all summer and formed a large item in the subsistence of the settlers, furnishing them fresh and smoked fish in summer and salt fish in winter. There was no net fishing on the whole river; none were caught except for home consumption, and the implement of capture was the spear. The settlers had neither money to buy nets nor time to set and tend them if they had. In a single night's successful spearing they could take enough for a fortnight's consumption. When spawning time approached and the fish began to gather in the Serpentine and Mamozekel, a fair night's spearing gave them their winter supply of salt salmon. Continual complaints besieged the Department at Ottawa and earnest requests were made for the appointment of fish wardens to guard the river and prevent spearing. The Indian village at the mouth got its principal food supply from the Tobique. Indians, in those days, were allowed to spear salmon for their own use and it was notorious that, under cover of this permission, large numbers of speared salmon were sold to the farmers for many miles up and down the St. John River. The Tobique and its branches are the principal spawning grounds for the salmon that ascend the Saint John. As the valuable fisheries in the harbor and all along the river, between St. John and Woodstock, depended largely on the fish bred in Tobique, the loudest and most persistent complaints, of course, came from the harbor and river fishermen. The members of Parliament for St. John and the river counties could not afford to turn a deaf ear to the complaints and requests of their constituents, so the department was forced into compliance with their demand that fishery officers should be placed along the whole course of the Tobique to protect the salmon. Then an unforeseen difficulty arose. Not a man residing on the river or near its mouth would accept the office, or act as warden. No man from the St. John would undertake the duties for less than a dollar a day and his provisions. Three men were hired and placed on the river at this rate of pay and they soon became the jeer of every settler on it. They were worse than useless; for while they made the fishery laws a laughing-stock, they encouraged contempt for all other laws. These wardens were camped miles apart, with orders to join and assist each other in cases of necessity. A single man in a canoe is helpless against two men in another canoe. So little did the spearers, red or white, care for the wardens, that they would not even extinguish their torches; they simply poled away a few miles, spearing as they went, and recommenced their pursuit of family supplies. To follow them was only labor wasted and the warden, like a practical man, went back to his camp and slept the sound sleep of conscious rectitude; he had sworn "to do his duty to the best of his ability," and he had kept his oath. This farce was continued for two seasons, when the writer succeeded in convincing the Minister that he might as well throw money into the river as pay it to useless wardens. At this stage of affairs, in the month of August, I was ordered to investigate and report fully. Are not these true reports in the treasure-house of the Department even unto this day!

There was a choice of three routes, by any one of which the river could be reached. One was to proceed by steamboat to the mouth of Tobique and ascend the river by canoe. Another was to take train to Bathurst on the I. C. R., ascend the Nepissiguit, cross the short portage of only three miles into Nictor Lake, the principal source of the Tobique, and proceed downward. The third was to leave the train at Matapedia Station, on the Restigouche, ascend the Upsalquitch, a large affluent of that river, take its north branch for twelve miles, cross a very difficult portage of about nine miles and strike the Tobique some distance below its source in Lake Nictor. This last route was little known; no hunters, except Capt. Dashwood and his companion having ventured its hardships, especially as good hunting and fishing could always be found nearer home with much less labor and expense. It was as cheap to send a canoe with Sachem Gabe and Joe Sebattis from Fredericton to Campbellton by rail, as to take Indians from Mission Point to the mouth of Tobique; so I decided to take the least known route. Sending Gabe plain orders, I had no more trouble, for in two days he was in St. John, and the next morning we were in Campbellton, where Gabe laid in his supplies and by ten o'clock we were fairly on our way for the mouth of Upsalquitch. Stopping to fish the pool near its entrance, a fine salmon of 25 pounds gave us all we wanted for several days. The current of this river is much less swift than that of Restigouche, and the water much more shallow, but still it is a fine stream with good arable land, and has now some thriving settlers. At that time, after leaving its entrance, for a few miles nothing broke the silence of the wilderness except our own voices, the rustling foliage and murmurs of the flowing stream. Salmon were plentiful in the pools, and it was hard to resist the temptation of throwing a fly over them. Unlike their brethren in the main river, they rise much more freely, but do not attain anything like their size. The weather was fine and our half-tent of light cotton canvas was all the shelter required. There is a charm in the virgin forest known only to those whose thoughts and feelings are attuned to the surroundings. Some fresh view is disclosed by every turn of the stream; sometimes we would come on a moose, with body half submerged to escape the torturing flies; sometimes a couple of deer was discovered drinking, and often a bear was seen shambling along the banks. The great drawbacks of life in the woods in July and August are the persistent attacks of mosquitoes, midges and black flies. These pests are the angler's penance, which he must make up his mind to undergo along with his pleasures. The midge and mosquito are sufficiently annoying; but the small black fly is perfectly maddening to those unfortunate enough to possess a very sensitive epidermis. Pertinaciously they persist in their atrocious attacks and find their way into ears, eyes and nostrils and through every unguarded aperture in the clothing. Their bite generally brings blood and always leaves an intolerable itching which scratching serves only to increase. After a time, however, the process of inoculation is completed and their bites cease to be painful, but never cease to be annoying. The initiatory process, however, is far from agreeable, and for some persons quite destroys the pleasures of forest life. But for your true sportsman there is a charm in its freedom and surroundings that more than compensate for these and all other *désagrémens.*

We were several days ascending to the portage, which, though only eight or nine miles, was the worst piece of forest tramping the writer has ever done. But after hours of weary labor, in which each had to share, the river was reached and our troubles over. A hasty examination of the Serpentine disclosed but few salmon, and as there were no spearers, red or white, to be seen, we hastened to the head of the settlements. The clearing highest on the river at that time, belonged to a Capt. Bullen, formerly an officer of the Thirty-fourth Regiment, who, attracted by the splendid hunting and fishing the country afforded, had purchased a tract of land on the Tobique and intended making a farm and a fortune by engaging in the lumber business. He spent his first summer in building a plain, comfortable house and then sailed to England from St. John, and the following spring returned with his wife and two children. Then followed the almost inevitable experience of English gentlemen who have settled in the wilderness. Without an income from "home," the great majority of them would starve. Capt. Bullen and his wife had been five years on his farm and his family had increased by the birth of two girls. Had it not been for the attachment and devotion of her Irish foster sister, who accompanied her, Mrs. Bullen must have sunk under her trials. The captain was a true sportsman; to kill a gravid salmon was a crime surpassed only by killing a mother moose or caribou. He had frequently appealed to the Member for the County to do something to prevent the destruction of salmon that had reached the spawning grounds after having escaped the maze of nets in the harbor and along the whole course of the St. John and the red and white spearers of the Tobique. He had also written to the Department for the same purpose, and I was directed to see and consult with Capt. Bullen on my official trip. On presenting my card, I was welcomed with expressions of satisfaction that at last something would be done. He sent for his neighbor, a very intelligent and prosperous farmer and lumberer, who shared his views as to the protection of gravid fish and game, but who had a much better knowledge and ap-

preciation of the difficulties, moral and physical, that beset the question. The captain was opposed to spearing, whether by white men or Indians. Macdougall, his neighbor, set forth the plea for both Indians and settlers, in stating his own case. Ten years before he and his wife, two children and all their earthly wealth were loaded into a scow, and he and his wife's brother, with a span of horses, started to tow to the upper waters. After incredible hardships they reached a pleasant flat where three brooks emptied into the river. Here he built his first cabin, and had it not been for the salmon and trout and game the river furnished, he never could have made good his footing. As for the Indians, he said, no Government could be justified in preventing them from taking salmon for their own sustenance in a river their tribe owned before the foot of a white man trod the soil of the Province, and the spear was the only implement their fathers had used or taught them to use. As to the settlers who had faced all sorts of difficulties in making the wilderness habitable, it was rather too much to ask them to abstain from taking the salmon at their doors—which they and their families needed—for the sole benefit of fishermen in the harbor and along the river St. John, who had no need of the fish for their own subsistence. As Mr. Macdougall very forcibly put it, addressing the writer, "would you deprive your wife and children of necessary food in order that the city fishermen may grow rich?" As for the spear, the settlers could see no difference what the implement was so long as the fish was killed. Capt. Bullen could not deny the force of the settler's plea; his own experience had taught him its peculiar logic; but he still urged that after the gravid fish had reached their spawning grounds they should not be disturbed. In this Mr. Macdougall agreed, and the Department was petitioned to place a warden to guard the spawning grounds after September. This was done, and no doubt some good was effected; but until the river is more thickly settled and public opinion in the neighborhood radically changed, both red and white men will continue to angle for salmon in the Tobique with what old Mr. Bateman facetiously called his "hickory hackle."

The following year Mrs. Bullen's health began to fail, and the captain, heartily tired of his experience in the wilds of New Brunswick, returned with his family to England. The writer bade him farewell as he boarded a ship bound for Liverpool, and that was the last he ever heard of Capt. Bullen, who, little fitted as he was for farming or lumbering, was a true sportsman. But life has other duties beside sporting, and not always can sport and duty be combined. Should these lines chance to meet his eye, perhaps he will be interested to know that spearing salmon in the Tobique has continued ever since he left the river, and in all probability will continue for years to come.

On descending the river we stopped at Rocky Brook, and lower down, at Three Rivers, small affluents of the Tobique. At these places and at several other pools the Old Angler took a number of fine salmon, which rose freely to the fly. To the angler who can stand in a canoe, cast a fair line and handle his fish properly, the salmon of the Tobique will give fine sport, for, though seldom exceeding 15 pounds, they are active, lively fish and leap freely in their fight for liberty. We stopped at the mouth of the river, overhauled the canoe, newly pitched the seams, replenished stores at Andover, and next morning proceeded down river. The only incident on this trip, apart from visiting overseers and wardens, was a drive from Eel River to Canterbury, and thence to Skiff Lake, in which are found the same fresh-water salmon as were then so plentiful in the Schoodic lakes. No doubt in times of high freshets, they found their way from the Upper Schoodic waters into this and Palfrey lake, the only waters in the Province in which the Ouananiche is found. Skiff Lake, studded with its many islands, is the most beautiful sheet of water the writer has seen in his numerous tramps through the wilds of New Brunswick. It has since become a noted resort for anglers, among whom Joseph Jefferson, the great actor, was once a yearly visitor. Subsequently, the more exciting salmon fishing of the Southwest Miramichi allured him from this charming place. Whether, since the death, in 1899, of Sandy Wood, his old companion and the writer's most intimate friend, the veteran angler still visits Camp Jefferson at Clear Water, on the Southwest, the Octogenarian cannot say, as he is now "out of the swim" in the secluded inland town of Sussex. A nice trout stream, running through the farm, affords him all the fishing he is now able to do, and serves to remind him of past pleasures and the days of auld lang syne.

V.

[TO BE CONTINUED.]

The Birth of Salmon Hatching on the Pacific Coast.

IT is now over thirty years since the United States Fish Commission made its first effort at collecting salmon eggs on the Pacific Coast, and although such extensive results have followed, it was at the time a very doubtful experiment. Indeed, it was like sailing out into an unknown sea without chart or compass, for thirty years ago not only were the spawning grounds of the salmon very difficult of access, but what was worse, no one could be found who could tell where the spawning grounds were.

It was Mr. W. W. Montague, the masterful engineer, who overcame the prodigious difficulties of building a railroad over the Sierra Nevada Mountains, who furnished the first information in regard to the whereabouts of the spawning salmon, and all he could tell about it was that once when he was surveying in the McCloud River Cañon he saw ripe spawn dropping from salmon that the Indians were spearing there. Now the McCloud River was in a nest of mountains fifty miles from Red Bluff, the nearest railroad point at that time, and Red Bluff was 250 miles from San Francisco. Acting, however, on this slight but most fortunate clew furnished by Mr. Montague, Mr. Livingston Stone, then Deputy Commissioner for the Pacific Coast, and Mr. John G. Woodbury, his assistant, who were both at San Francisco, started immediately for the McCloud River, and within forty-eight hours of getting the much-needed pointer from Mr. Montague, they saw with their own eyes the very things that he had seen and described to them. There were the Indians spearing, there were the salmon and there were the ripe eggs dropping from the fish.

Appearances plainly indicated that the spawning season was far advanced, and that no time was to be lost. At an enormous expense, two loads of lumber were rushed to the McCloud River Cañon. Three days later a rough pine cabin had been built, and a week later hatching troughs had been put in place out in the open air and a mountain stream was running merrily through them. Salmon were now procured from the Indian spearers, and their eggs fertilized and placed in the troughs, and everything looked encouraging; but one hot afternoon, *horribile dictu*, every egg was discovered to be white and dead, and the thermometer registering 84 degrees Fahrenheit in the hatching water. The spawning season was indeed now nearly spent, and it seemed as if only a hope of the most forlorn kind was left, but fortunately a few more spawning salmon were secured, the troughs were filled up again, the eggs were eyed, and on Oct. 23, 1872, the first California salmon eggs ever matured artificially, and the first ever sent across the continent were shipped to Dr. Slack's trout hatchery in New Jersey, where they were hatched, and the fish subsequently planted in tributaries of the Atlantic.

These were the humble beginnings of the hatching of Pacific salmon, which has now, through the agency of the various hatcheries of the U. S. Fish Commission, of State hatcheries, and of private parties, assumed proportions of such magnitude on the shores of the Pacific.

SALMO.

CHICAGO AND THE WEST.

Carp, Muscallunge and the Law.

CHICAGO, Ill., Dec. 27.—Carp seining under the supervision of the State Fish Commission went on all last season in the waters adjoining Fox Lake, Grass Lake, etc., of upper Illinois. It is not generally known what tremendous quantities of fish are taken in this way. I am advised by one observer who has a cottage at Fox Lake that he saw in one corral seven and one half tons of carp. Among these fish were several which would have weighed 30 to 40 pounds. These fish are shipped to the Chicago market, most of them being sold in the Ghetto district.

Once in a while in this carp seining the fishermen take fine wall-eyed pike, muscallunge and other fine fishes. Do you think that they always throw them back in? If you do you are very much mistaken. I can produce chapter and verse regarding one 46-pound muscallunge thus taken which was shipped to Henry Kleine at Chicago, who, it is stated, had other fish, such as wall-eyed pike, etc., sent him. Over these fish, and one or two other matters, there arose a very pretty little lawsuit, which implicated the warden detailed to supervise the netting. The latter was cleared of any kind of complicity with law-breaking. I am disposed to think some time that there might be a very pretty little story found in connection with this muscallunge, these carp seiners, the deputy warden and other persons. In short, I have an informant who has given me his sacred word of honor that he will give me all the facts one of these bright days, in which case we shall see what we shall see. The seining is not going on now, but will no doubt be undertaken again under the same auspices next summer. I hear that the carp bring 2 or 3 cents a pound. It is understood that the game fish are not disgraced by having a market price put upon them. Great as a popular institution is his honor, the German carp.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Sea Trout and Brook Trout.

I have the following letter from Mr. W. B. Mershon, Saginaw, Mich., one of our best known Western anglers and owner of a good fishing on the Cascapedia. Mr. Mershon's remarks may be premised by the statement that he is a careful and accurate observer of the habits of game animals of all sorts. He writes:

"I have seen quite a lot in FOREST AND STREAM lately on the subject of sea trout. I see my friend Hallock believes they are different from brook trout. I do not like to dispute a man whose knowledge on a subject of this kind is superior to mine, but my observations on the Cascapedia River extending through a good many years lead me to believe that there is no difference between brook and sea trout. This year, the river, when the ice broke up, was full of large trout. They apparently were going to the sea and must have remained in the river later than usual, or through the winter, and when the ice broke up and the freshet was on, they worked down to the mouth, where there is no question of there being an immense amount of food. It seemed to me that the water is so cold in the Cascapedia and so little food in it anyhow that the fish have to go to the mouth of the river to subsist. When they came in from the sea, which they usually do about the 20th of June (though this year no trout came in at all, strange to say, until very late), they are bright and silvery. The black spots are more pronounced than the red ones, but the markings of the brook trout are there just the same. The longer they are in the fresh water the darker they become, and finally lose their silvery cast and take on the hues that make the brook trout so attractive.

"Why they did not return at the usual time this year, I cannot say, but it was unusual to find enormous quantities of large trout in the lower 12 or 15 miles of the river in the spring time and also unusual not to meet them coming up-stream in this same water in midsummer.

"Now if they followed the salmon to live on their eggs, why is it that this same lower part of the stream, I mean that strip covering 10 or 12 miles from the mouth up, also contains large quantities of these trout usually during the summer and fall?

"My guides tell me that the little creeks or bayous putting into the Cascapedia are full of these trout spawning in the late fall and even in the winter time. In the old days they used to catch very large ones through the ice in these same little inlets and bayous. I have been there late in August and found the fishing most excellent, getting trout that would weigh from 3 to 6 pounds. One evening after the middle of August I took 10 trout that weighed 33½ pounds. Every one of these were dark, highly colored fish. I caught them in a favorite deep pool of mine about 7 or 8 miles above the mouth of the river. All of the little eddies or shallows are full of highly colored little fellows from 6 to 8 inches long in the spring and summer."

The Sea Trout.

Editor Forest and Stream:

Permit me, through your columns, to thank Mr. Charles Hallock for his too flattering allusions to the Old Angler in your issue of Dec. 20, and also for the courteous manner in which he attacks my positions on the sea trout question, as set forth by the Octogenarian.

Mr. H. says he has "the key to the problem, which should reconcile all variances"; but instead of turning the key himself, he hands it over to two of his friends, who each gives it a yank, in his efforts to turn it as Mr. H. wishes. One of these, Mr. Gregory, the Octogenarian met years ago in Ottawa, and has ever since regretted that he could not meet him often and enjoy that *bon camaraderie* for which he has a distinguished and deserved reputation. Mr. G.'s working at the key has brought forth both facts and opinions; but the latter are very slightly supported by the former. The facts stated by Mr. G. corroborate those set forth by me at some length in your issue of Dec. 20. Not one of my statements is questioned, while all of them receive support from Mr. G. as long as he deals with facts. He is aware that many rivers become well stocked with sea trout, which go a long distance up stream; are a nuisance in salmon pools and after a time disappear. In these facts we are agreed. On this slight foundation of *fact* Mr. G. bases the following erroneous *opinions:* That sea trout are gregarious and migratory shore fish, which come and go periodically to and from the sea; that they subsist on littoral food, and are looked for only at stated periods of the year. While Mr. G. does not formulate it in express terms, he leaves us no room to doubt that his opinion is they spawn in salt water. This is all that Mr. G.'s yanking at the key discloses as an offset to the array of facts—not opinions—set forth by the Old Angler in your issue of Dec. 20.

Mr. Hallock then puts forward his "clincher" from the pen of Mr. John Manuel, of Ottawa, owner of the River Godbout, which he has fished annually for twenty-five years. As this gentleman is a Brother of the Angle, I tender him my compliments and beg his patience while I examine the working of the key in his hands. Let me, then, separate his facts from his opinions and see how far his testimony adds weight to Mr. Hallock's contention. His facts are, that sea trout go up the Godbout in large numbers; that he has seen them netted in large numbers at the mouth of this river; that large schools of trout go up this river in July and August; that most of these remain there all winter and come down when the river breaks up in May, as was stated in my presentation of the facts. His *opinions* are: That they go up river in July and August to feed on salmon eggs, that are not deposited until October and November; and, finally, he thinks with Mr. H. that sea trout are littoral or shore fish, which, he leads us to infer, spawn in salt water. Mr. Manuel's deposition certainly is a "clincher"; but on my side of the argument!

After his two friends had shown their skill in twisting the key, Mr. H. thinks that all the irrefragable facts stated in your issue of Dec. 20 can easily be reconciled with his sea trout theory if I will only "allow that the sea trout ascend rivers to eat spawn and not to deposit it," as we all know the *fontinalis* do. I think I see the twinkle in Mr. H.'s blue eyes, as he wrote this sentence. But even with this admission, all the other facts I have stated, if they are not confuted, are fatal to his sea trout cult. Mr. H. will hardly risk his reputation as a Naturalist by endorsing his friend's opinion that this variety of the *Salmo* family spawns in salt water; nor will he, I think, contend that a slight difference in the texture and color of the gills of *fontinalis* when in fresh water, is sufficient to make it a separate variety from its brethren who cannot reach salt water!

The Old Angler opines that Mr. H. will have to work his key himself or else get the assistance of more careful observers than his amiable friends, whose hastily formed opinions are poorly supported by partially observed facts.

VENNING.

The Accord Fox Club's Hunt.

Crippled and scarred in the battle of years,
Over the mountains he nobly steers;
The dogs on his track send an answering bay
Down through the valley as if they would say:
"He's coming; be ready; don't miss him to-day."
Only a cracker left in the box,
Four of us hungry awaiting the fox.

A stir in the bushes, a rustle of leaves,
The old fox has passed us; each one of us grieves,
For the dogs look their thoughts as they pause on their way,
And their thoughts put to words mean, "Who is to pay?
"We drove him, you missed him." They are off and away.
Only a cracker left in the box,
Four of us hungry awaiting the fox.

Again to the mountains, the dogs on his trail,
Through the brush of the forest he enters the vale;
As he leaps o'er the brown sedge, four echoes recall
The camp-fire's story, where nobody falls;
You ask me the moral, "Go home," that is all.
Only a cracker left in the box,
Four of us hungry awaiting the fox.

ACCORD, Mass. WILBUR LINCOLN.

The Kennel.

Points and Flushes.

THE hosts of friends of Dr. H. Clay Glover will deeply regret his withdrawal as veterinarian of the New York dog show. He recently sent to the Bench Show Committee of the Westminster Kennel Club the following: "I beg to herewith tender my resignation as veterinarian to the Westminster Kennel Club, which position I have occupied for about twenty years. The duties have become quite arduous to me, and I believe the interests of the club would be best served by the appointment of a younger man. To my successor I shall be most happy to give, by advice, the benefit of my long experience." Let us hope that the successor will be as eminently able, conscientious and popular as Dr. Glover is and ever has been.

The premium list of the Westminster Kennel Club's 27th annual bench show, Feb. 11-14, is now ready for distribution and may be obtained of the superintendent, Mr. James Mortimer, Room 70, Townsend Building, 1123 Broadway, New York. Entries close on Jan. 26.

Yachting.

30-Foot Waterline Auxiliary Yawl.

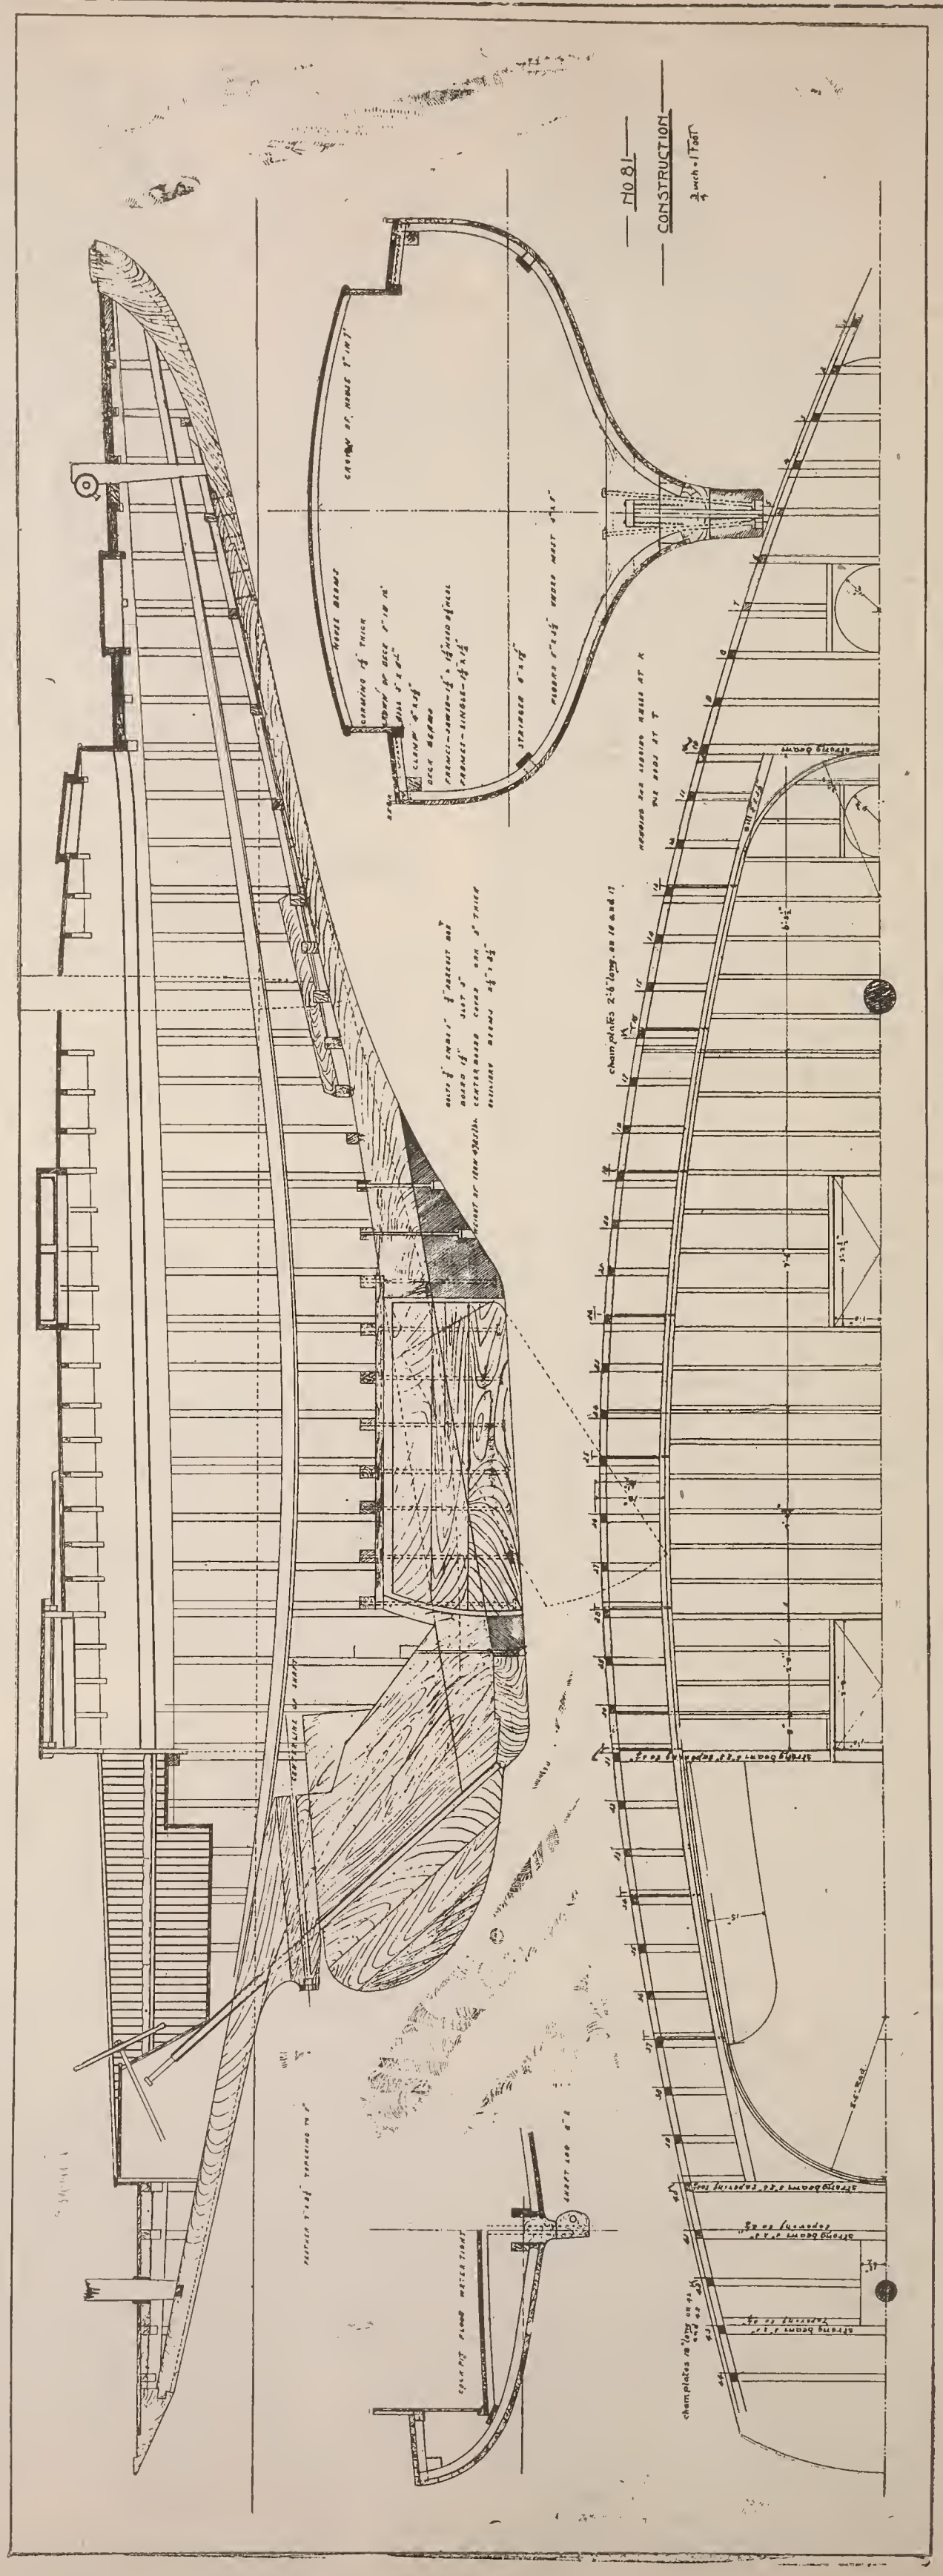
THE design of the 30ft. waterline auxiliary yawl which we reproduce this week, was made by Mr. W. Starling Burgess for Mr. J. B. Wilson, of Buffalo, N. Y.

The boat is intended primarily for cruising, but her design embodies many of the modern ideas, and she should be fast and comfortable. The propeller is placed above the rudder and a little to one side. This plan is unique, and is new so far as we know, the usual method being to cut out a place in the deadwood just inside the stern post for the propeller. The boat's draft is moderate, being just over 5ft. with the centerboard up, and in consequence she will have access to most of the harbors along the coast. The centerboard houses under the cabin floor. The cabin house is 21ft. long, and the mainmast comes down through the forward end. At the after end of the cabin house a heavy beam runs athwartships. The motor is placed under the forward end of the cockpit, and is reached by moving the companion stairs. The cockpit is 9ft. long.

The companionway is on the port side, and its leads to a steerage, on the port side of which is a berth. A sliding door on the partition to starboard opens into a stateroom 7ft. long. Here is a wide berth, and at the after end is a bureau and a clothes locker. Forward is the main cabin, which is 7ft long and runs the full width of the boat. On either side are wide transoms. At the after end is the sideboard, and forward there is a locker on each side. From the main saloon forward there is a passage on the port side, which leads to the galley. On the port side of the passage there is a large ice box, and on the starboard side is a toilet room 2ft. 9in. wide. The galley is roomy and well fitted, and there is full headroom under beams. A hatch over the galley gives plenty of light and ventilation. There are two pipe berths in the forecastle for the men.

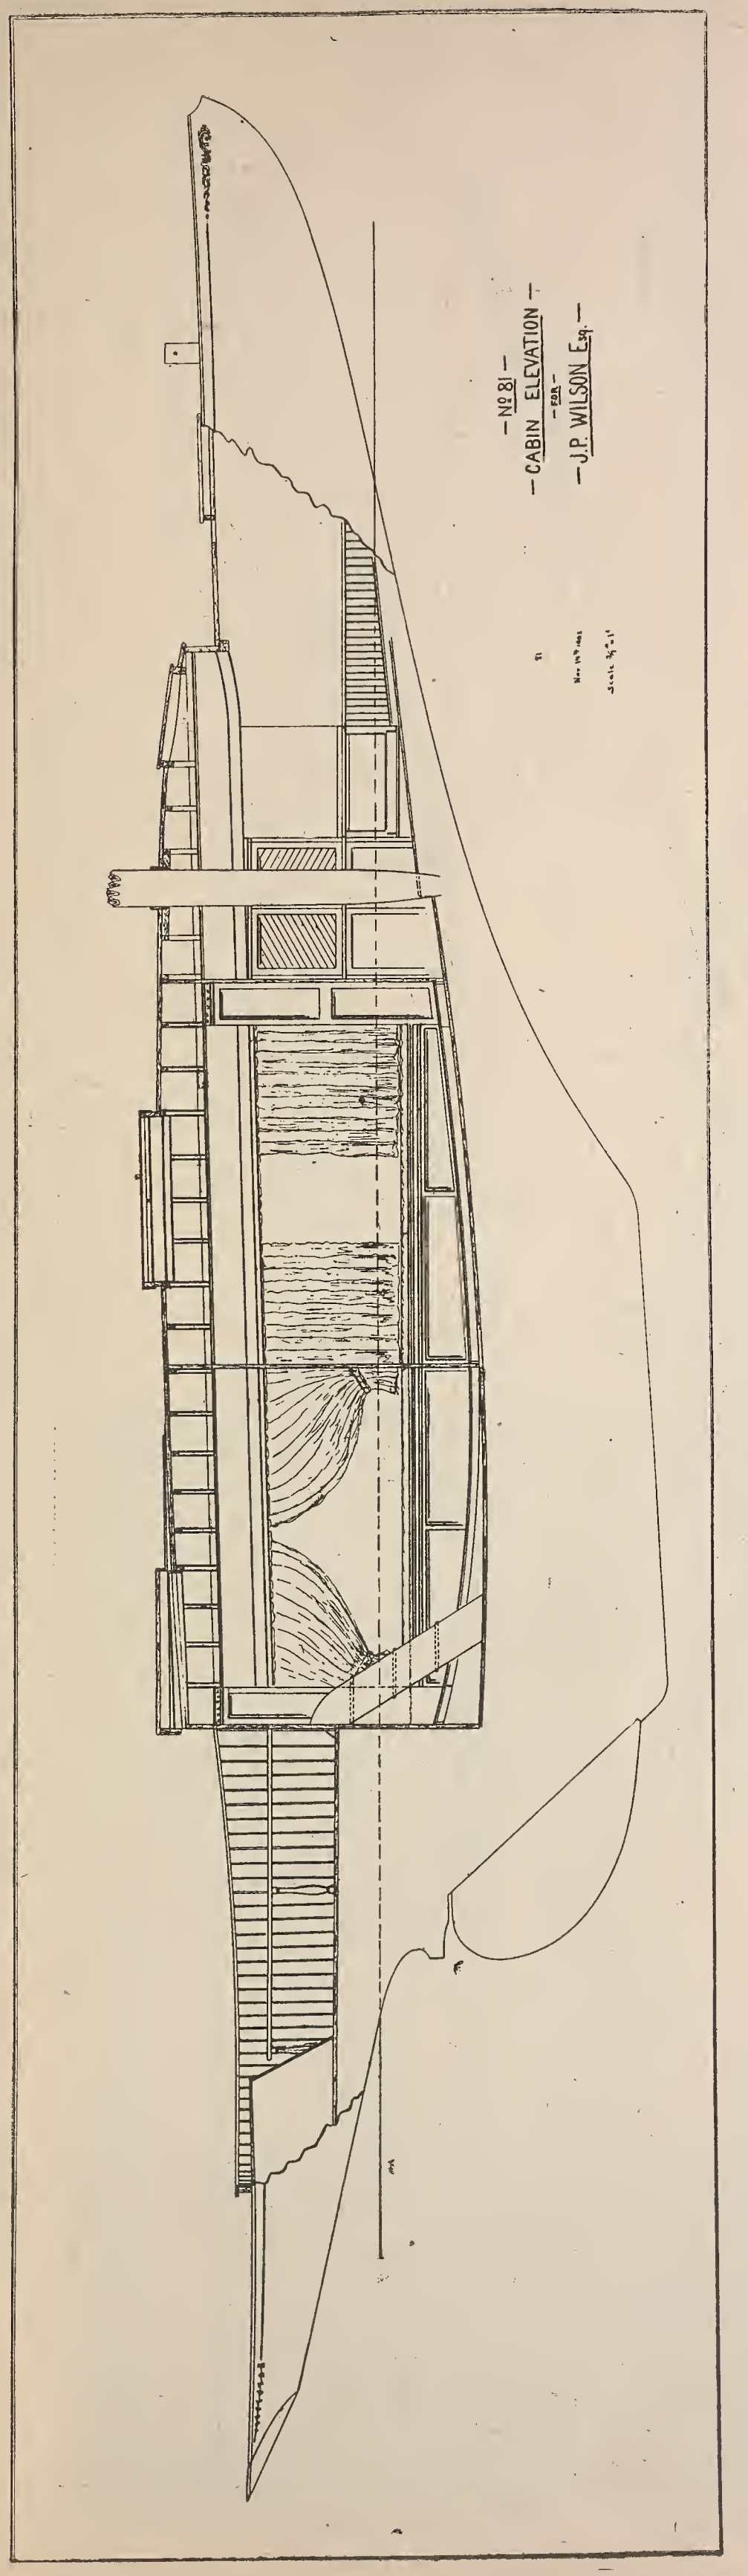
The dimensions follow:

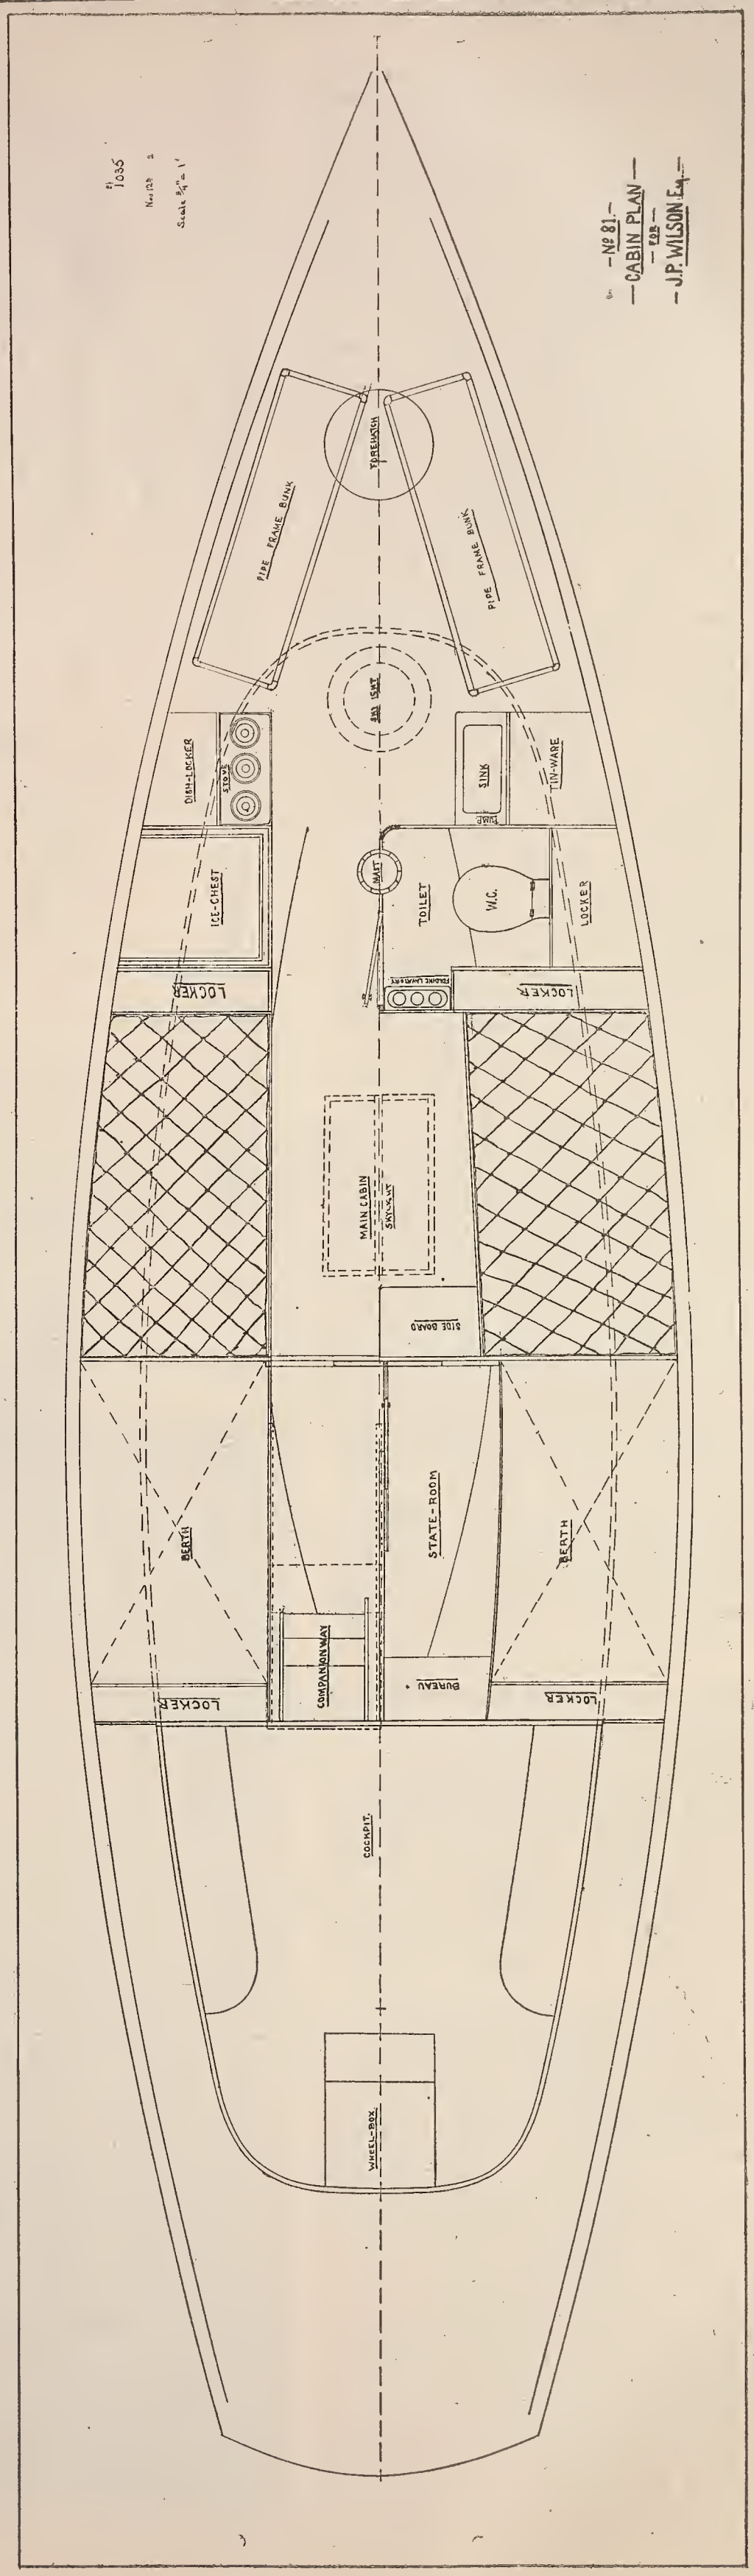
Length—	
Over all	46ft. 9 in.
L. W. L.	30ft.
Overhang—	
Forward	7ft. 8 in.
Aft	9ft. 1 in.
Breadth—	
Extreme	12ft. 4 in.
L. W. L.	11ft. 9 in.
Draft—	
To rabbet	3ft. 10½in.
Extreme	5ft. 4½in.
Board down	8ft. 9 in.
Ballast outside—	
Iron keel	4,785 lbs.
Freeboard—	
Bow	3ft. 4¾in.
Stern	2ft. 5 in.
Least	2ft. 3 in.



Boston Letter.

BOSTON, Jan. 5.—It has been decided by the Manchester Y. C. to make the trial races to select a challenger for the Seawanhaka Challenge Cup open to all American clubs. It is said that the policy will be somewhat different from any that has yet been adopted. A meeting of the Executive Committee is to be held Tuesday afternoon, at which it is expected that all arrangements will be made. The principal thing, however, is the fact that other American clubs will be allowed to compete. This will undoubtedly lend a greater interest in the quest for the cup than would have been evinced had there been only the two boats competing, which have been ordered from Burgess and Packard by the Higginson-Boardman syndicate. One of these boats is now well along toward completion, and the other will be started in a short while. In view of the fact that the races will be made open, it is likely that there will be at least one more candidate for challenger built by North Shore yachtsmen. There is talk of several more, but it is not thought that there will be any great flock of them owned by yachtsmen in the vicinity of Boston. It is known that several western yachtsmen have been desirous of competing in the trials, and it is thought that at least two or three boats will come from the Lakes. It is considered likely that the trials will be held very early in order that the yacht which is selected will have an opportunity of be-





30-FOOT WATERLINE AUXILIARY YAWL—INBOARD PROFILE AND CABIN PLAN—DESIGNED BY W. STARLING BURGESS FOR J. P. WILSON, 1902.

ing thoroughly tried out in the waters in which she is to compete for the cup.

Five new 25-footers are now in process of construction. This will make a fair class if they will all race together throughout the season, and it must be said that the prospect for racing in this class looks better than it has since the close of last season. Four of these boats are from designs by Starling Burgess, and the fifth has been designed and is being built by Walter Kelley. They will all be of extreme over all length and will have considerable beam. The boat for Mr. F. G. Macomber, Jr., is said to have truss bracing which comes up through the floor of the standing room. It does seem too bad that it should be necessary to put such bracing in a yacht that has been built for an alleged restricted class, but such features may be the means of bringing about good results in changes in rules that have been thought necessary. Com. Doherty, who has ordered one of these boats from Burgess, seems to be considerably in doubt as to whether these extreme features are going to be good for the class. In his own boat he has asked for considerably more headroom than is required under the rules, and is also going to get along without any of the braces, which have been heretofore seen in Quincy cup boats and in abnormal 18-footers of the unrestricted class. It is the claim of some that the new boats will pound themselves to pieces as soon as they have been put to a test in a seaway, while there are others who believe that they will come through a rough chance all right, the angle of heel giving them sufficiently sharp entrance to prevent pounding. Just what will happen to them can only be found out when they are put to the test, and that time will not be long in coming now.

Starling Burgess is to have the cutter Edith altered into an auxiliary. She will be given a short mast and a kind of jury rig, which is thought best suited to the purposes for which Mr. Burgess wants her. She will have a Murray and Tregurtha 4-cylinder engine of good power, which, with her lean underbody will be considered sufficient to drive her at a fair rate of speed. Mr. Burgess will use her for cruising and will live on board throughout the summer.

At the annual meeting of the Chelsea Y. C., held last Tuesday evening, the following officers were elected: Commodore, Thomas Harrington; Vice Commodore, W. F. Birch; Treasurer, William Thirkell; Financial Secretary, E. J. Bailey; Recording Secretary, George Barrie; Measurer, F. E. Walters; Board of Directors, R. W. Wagner, J. F. Cooper, W. S. Young, C. G. Lenfest and F. W. Jaynes. The annual dinner of the club will be held at the Quincy House, Boston, Feb. 21.

The annual meeting of the South Boston Y. C. will be held at the clubhouse, Columbia Road, Wednesday evening, Jan. 7, at which the officers for the year will be elected. The report of the secretary shows the membership to be 384, and he also reports that a substantial sum of money has been paid over to the treasurer during the past year. It is announced that the 35th anniversary ball of the club will be held in Paul Revere Hall, Wednesday evening, Feb. 4.

The work of bending the frames for the Emery steam yacht is still going on at Lawley's, and the decks are being finished up on the Fletcher steam yacht. The east shop is now pretty well filled with boats, and there are others to be started there as soon as the ones under construction are finished. It is noticeable that in this shop, as in the shops of other builders, the majority of yachts being built are for cruising classes, or are out-and-out cruisers, without regard to class.

Power dories and launches have been brought into great favor among the yachtsmen, and there is scarcely a yard where there are not some of these boats being built. Nearly all of the owners of yachts of 25ft. and over are to have power tenders, while many others are ordering them for skimming around in the harbors.

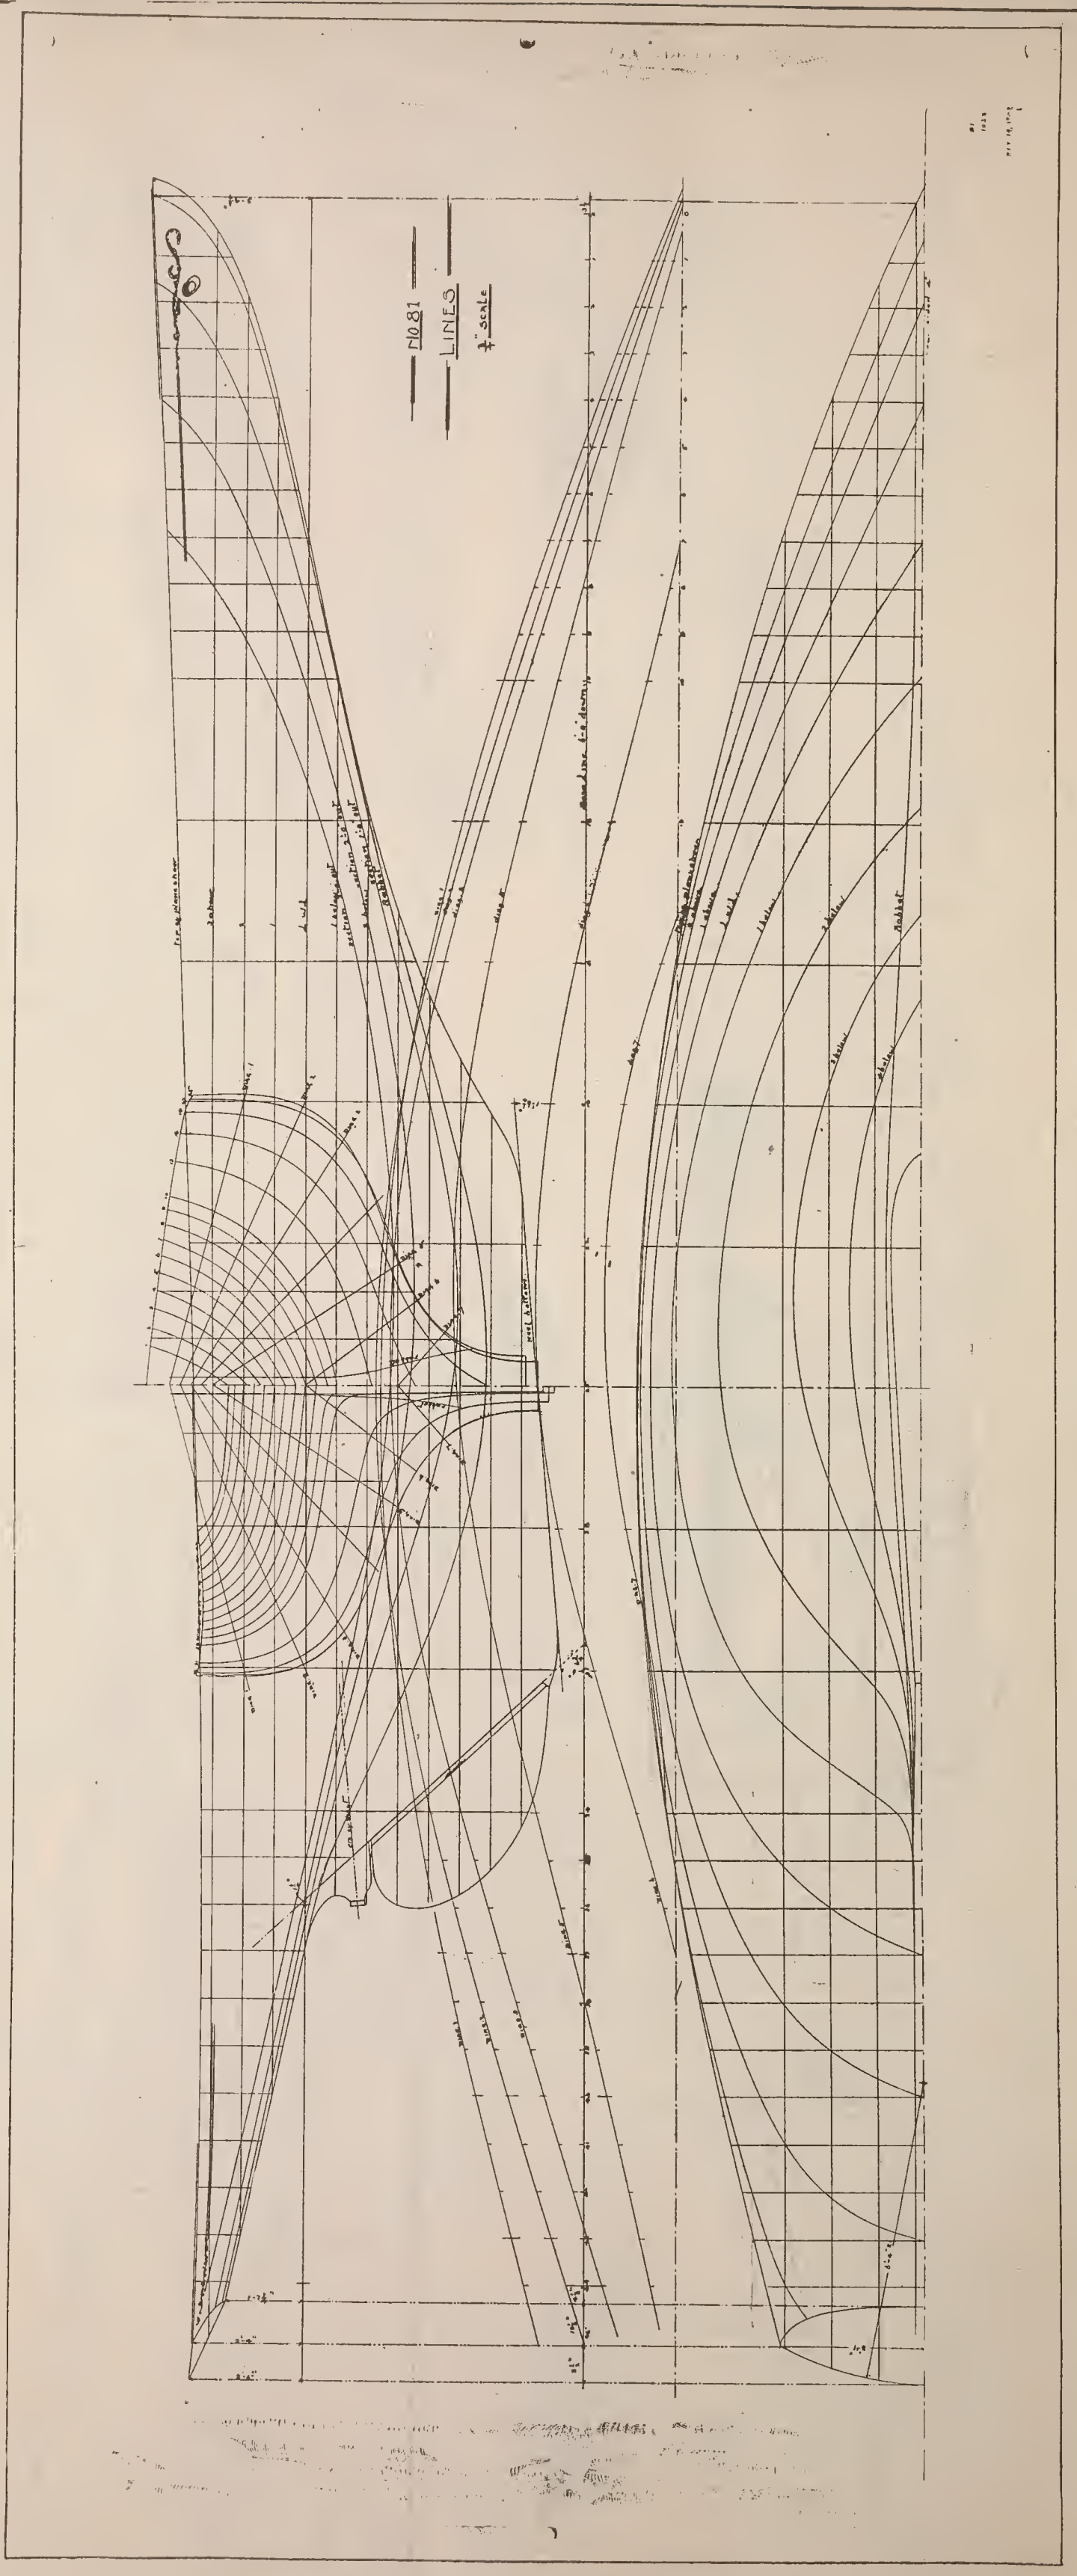
JOHN B. KILLEEN.

Ice Yachting on North Shrewsbury.

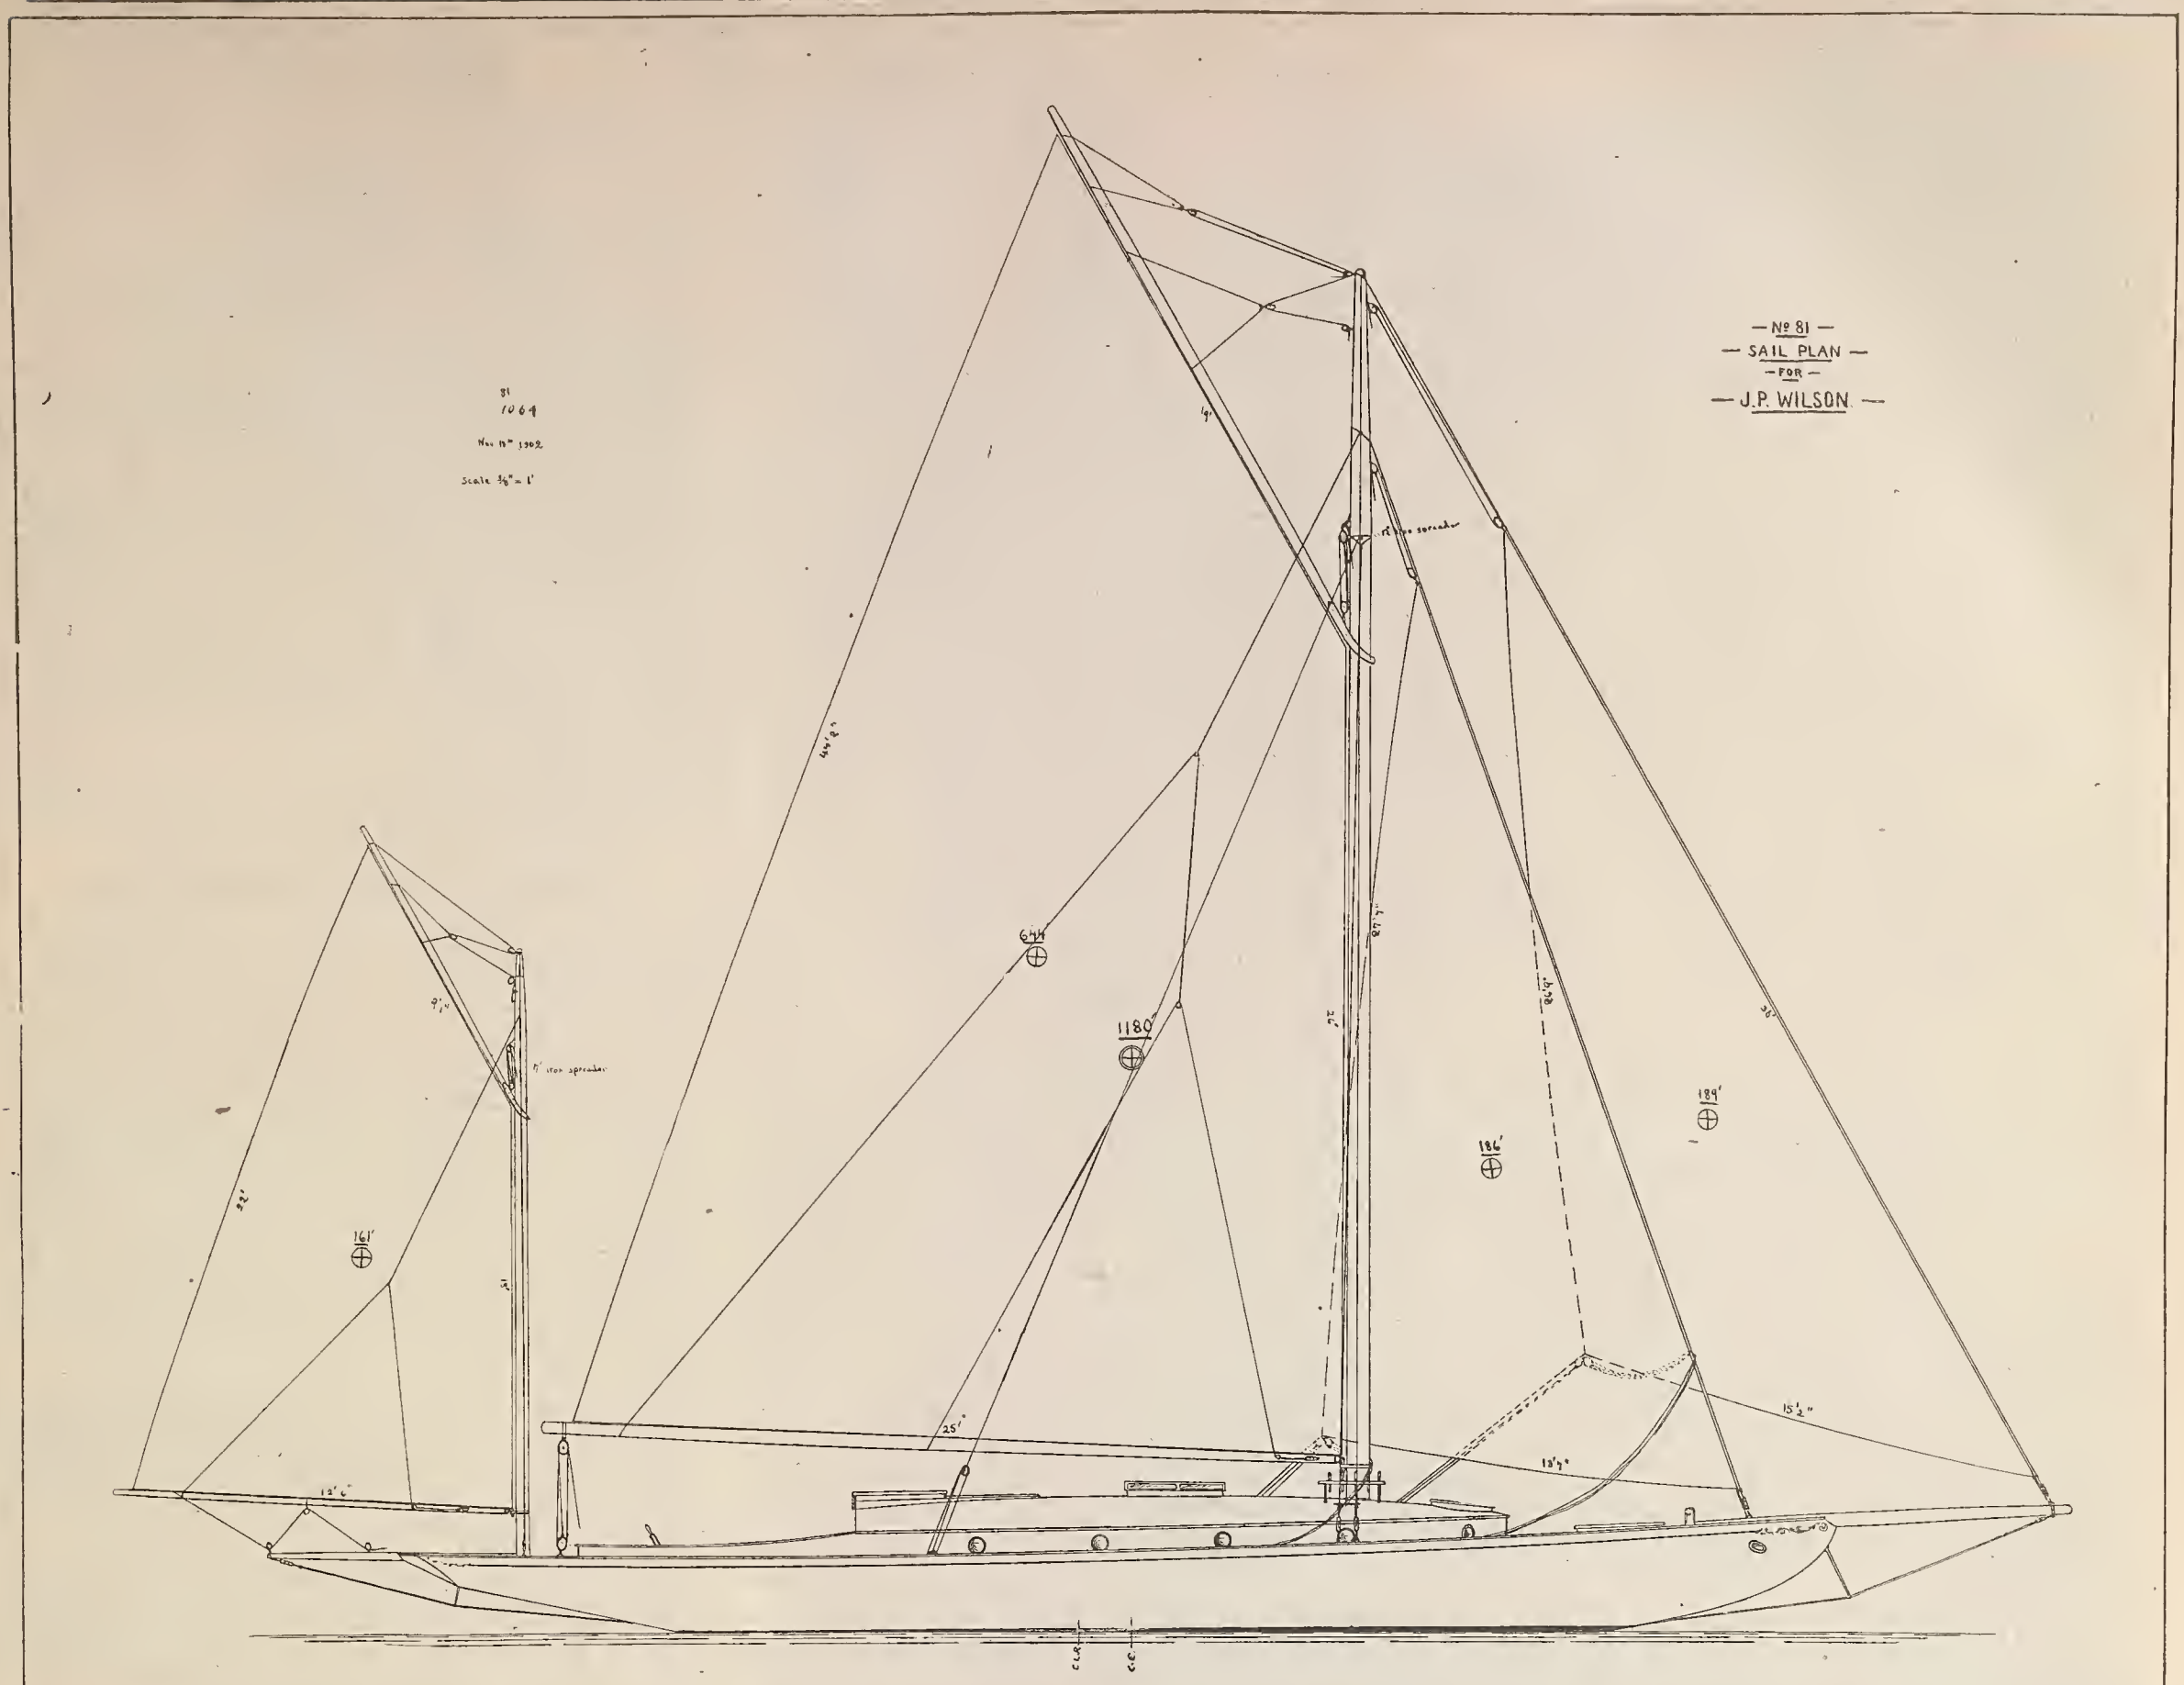
Editor Forest and Stream:

The ice yachtsmen of the North Shrewsbury River have been for some time making preparations for the winter. Several new ice yachts are about completed, and several others have been rebuilt, or radically altered. The type of boat most in favor at Red Bank, which is the headquarters of the North Shrewsbury Ice Y. C., is the lateen, of just under 350 sq. ft. of sail area, and 15 to 16 feet track, locally known as third class. The fourth class lateens carrying up to 250 sq. ft. of sail are also in great favor on account of ease of handling combined with a high degree of speed, considering the size.

There are two distinct types or classes of lateen ice yachts, and concerning the respective merits of each class the experts are at odds. The distinguishing feature is the method of hanging the sail. In one case it is pivoted at the tack of the sail or point of the boom to the end of the bowsprit. In this method of rigging the yard is drawn up closely to the crotch of the sheer poles, and acts as an inclined mast, while the boom is free to move or to lift, in case of easing the sheet. The advantages are simplicity of rigging, no after stays or spreader being required, and greater speed off the wind, the sail acting like a large jib. In the other class the boom is encircled by a band at from one-third to one-quarter of the length of boom from its forward end, which band is connected by a turntable to the keel at a point varying from 2 to 4 ft. forward of the runner plank. While this type of ice yacht may have a shorter keel than the former, it requires afterstays to the sheer poles, as well as fore and after spreaders. But the sail may be trimmed flatter, and the yard swings with the boom, further out, or less than the boom, depending upon how far inboard the boom is caught. The weight of opinion is that the first-mentioned class is better off the wind, and the latter is better on the wind. The latter class without doubt sticks to the ice the better.



30-FOOT WATERLINE AUXILIARY YAWL—DESIGNED BY W. STARLING BURGESS FOR J. P. WILSON, 1902.



30-FOOT WATERLINE AUXILIARY YAWL—SAIL PLAN—DESIGNED BY W. STARLING BURGESS FOR J. P. WILSON, 1902.

INDRA—Owned by Henry F. Noyes. Photo by N. L. Stebbins, Boston.

The South Shrewsbury Ice Y. C., at Branchport also appears to favor the third class, but pins its faith to the jib and mainsail rig. The members of this club own several flyers of the third class, and there are new yachts now building or completed.

Good racing is looked for in each club, and there is a prospect of the best two ice yachts of Red Bank and Branchport coming together. On last year's form the favorites should be the Wizard of the North Shrewsbury, and the Mildred, of the South Shrewsbury River, the new boats being unknown quantities.

T. H. GRANT.

RED BANK, N. J., Dec. 29.

YACHT CLUB NOTES.

The annual meeting of the Corinthian Y. C. of Philadelphia, will be held at the Union League Club, Broad and Sansom streets, on Monday, Jan. 12, at six o'clock.

The officers and standing committees of the club will submit their reports for the past year, and an election for the officers and standing committees of the club for the current year will be held.

The trustees have announced the following nominations for the various positions to be filled: For Trustees to serve for three years, Frank H. Rosengarten, Dr. Richard H. Harte. For Commodore, Alexander Van Rensselaer, steam yacht May; for Vice Commodore, Robert J. W. Koons, schooner Crusader; for Rear Commodore, E. Walter Clark, Jr., sloop Cherokee; for Secretary, Addison F. Bancroft; for Treasurer, George E. Kirkpatrick; for Measurer, J. Murray Watts; for Race Committee, Addison F. Bancroft, Harvey J. Mitchell, John A. Inglis; for Committee on Admissions, Charles H. Brock, Alexander Van Rensselaer, G. Herbert Millett, Frank H. Rosengarten, Brereton Pratt.

The Annual Subscription Club Dinner will be given at the Union League Club, at 7:30 o'clock, upon the adjournment of the annual meeting.

YACHTING NEWS NOTES.

The schooner yacht Coronet has been chartered by Mr. Louis Bossert through the agency of Messrs. Macconnell Brothers, to Mr. Samuel B. Stevens, of Rome, N. Y. Coronet is now fitting out at South Brooklyn, and when the work is completed she will proceed to Charleston, where Mr. Stevens will join her, and then a West Indian cruise will be taken.

Maria, the steam yacht owned by Vice Commodore Frederick G. Bourne, will be renamed. In the future she will be known as Delaware. The yacht is being

CHANTICLEER——Owned by Geo. W. Weld. Photo by James Burton, New York.

overhauled at Hoboken. A chart house will be built on top of the forward deck house and a flying bridge will be added. New pole masts will take the place of the old masts and topmasts, and the jib boom will be replaced by a short bowsprit. Below decks the arrangements of the cabins will be slightly changed, and all will be refitted and refurnished.

The Metropolitan Boat and Launch Co., Astoria, L. I., will build eight boats for the Red Bank Y. C.'s one design class.

Messrs. Tams, Lemoine and Crane have gotten out plans of a fireboat for the City of New York. She will be 110ft. waterline, 25ft. breadth and 9ft. draft. There will be two Scotch boilers and engines of 750 horse-power. The pumps are of 300 horse-power. The vessel will be built of steel. The contract for the building has not yet been awarded.

Six men have signified their intention of building boats in the New York Y. C.'s one design class. Messrs. August Belmont, C. Oliver Iselin, J. B. M. Grosvernor and Paul Dana are among the number.

The work of putting the schooner Muriel, owned by Mr. Charles Smithers, in shape for her southern cruise, is practically completed. The refitting was done by the Greenport Basin and Construction Co., Greenport, L. I. More substantial fittings have been put in the cabins in order to make her as comfortable as possible below. New and heavier hatches have been fitted in place of the old ones, and the rig has been reduced materially. Captain John Barr will be in charge and her owner expects to make Bermuda, Cuba, Puerto Rico and Venezuela.

The schooner Indra was designed by Mr. Fred D. Lawley and built in 1900 by the Geo. Lawley & Son Corp. Indra is built of wood and is 71ft. 6in. over all, 45ft. 9in. waterline, 15ft. breadth and 10ft. draft. She is now owned by Mr. Henry F. Noyes, New York City.

Chanticleer.

Chanticleer was designed by Mr. Charles L. Seabury and built by the Gas Engine & Power Co., Morris Heights, N. Y., in 1902, for Mr. George W. Weld, Boston, Mass. She is 118ft. over all, 79ft. waterline, 22ft. breadth and 12ft. 6in. draft. Chanticleer is built of steel.

Rifle Range and Gallery.

Rifle at Shell Mound.

SAN FRANCISCO, Dec. 29.—Yesterday was the last shooting day of the year, and there was a fine turnout of marksmen at Shell Mound.

The Golden Gate club closed the season with a banquet in the evening. The most notable shooting of the year was that of J. E. Gorman, who made 924 on the Standard target in 100 shots with revolver at 50yds.

F. E. Mason won the first prize, $60, in the Germania club contest, champion class. J. D. Heise won the first prize, $40, offered to all except champions.

Scores of the day for the Schuetzen Verein:

Herman Huber 123, F. Brandt 161, Louis Bendel 303, J. C. Waller 309, Henry Meyer 317, John Utschig 388, F. P. Schuster 424, D. B. Faktor 452, John de Wit 453, J. Lankenau 488, August Pape 567, R. Stettin 657, D. Salfield 735, A. Bertelsen 806, Edward Goetze 812, William J. Goetze 815, August Goetze 839, William Ehrenfort 854, George H. Bahrs 904, Otto Lemcke 997.

ROEEL.

Cincinnati Rifle Association.

CINCINNATI, O.—At the regular meeting of this Association on Jan. 4 the following scores were made. Roberts was champion for the day with 91. The conditions were: 200yds., offhand, Standard target. Wind 4 to 7 o'clock:

Roberts	91 86 84 82 80	Hoffman	80 80 80 79 75
Odell	89 89 85 83 81	Trounstine	77 76 69 68 66
Gindele	89 88 88 87 85	Freitag	77 75 73 66 63
Payne	87 85 85 84 83	Drube	74 71 67 67 ..
Lux	82 79 76 75 75	Topf	62 61 61 61 61
Jonscher	81 79 77 76 71		

Honor target: Roberts 25, Odell 22, Gindele 29, Payne 26, Lux 21, Jonscher 26, Hoffman 21, Trounstine 21, Freitag 15, Drube 18, Topf 18.

Ossining Gun Club.

OSSINING, N. Y., Jan. 5.—The following 5-shot scores were made on the 50ft. range, possible 125: H. S. Orchard 120, 120, 115, 121, 117, 116, 114, 114; C. H. Sidman 118.; F. Tompkins 121, 117, Geo. Terwiliger 108, 100, 113; R. Ballard 118, 114, 115, 115; H. Guernsey 113, 114; Ezra Ledorc 114; F. Schmidt 114; Willie Wheeler 110; G. Tompkins 122, 121.

Ten-shot scores at 75ft., possible 250: C. H. Sidman 221; C. G. Blandford 238, 238; H. Orchard 226, 221, 213; Dr. E. B. Sherwood 230.

In the non-members' re-entry match, H. S. Orchard is first with 241; Frank Tompkins second with 240. E. F. B.

Trapshooting.

Fixtures.

Jan. 8.—Newark, N. J.—Match between J. W. Hoffman, New Germantown, Pa., and C. Steffens, New York, 100 live birds each, $100 a side, on Smith Brothers' grounds.

Jan. 10.—Paterson, N. J.—Jackson Park Gun Club shoot.

Jan. 11.—Brooklyn, L. I.—Fulton Gun Club's shoot.

Jan. 13-15.—El Paso, Texas.—Grand midwinter carnival shooting tournament, under auspices of the El Paso Gun Club. W. H. Shelton, Sec'y.

Jan. 13-16.—Hamilton, Can.—Hamilton Gun Club's thirteenth annual grand Canadian live-bird handicap tournament.

Jan. 15.—Guttenburg, N. J.—Eastern three-man team live-bird championship, $7.50 per team, birds extra. For information address Gus Greiff, 318 Broadway, New York.

Jan. 26-30.—Brenham, Texas.—Second annual Sunny South Handicap; live birds and targets.

Feb. 9-14.—Detroit, Mich.—Open tournament under the auspices of the Tri-State Automobile and Sporting Goods Association. Targets and live birds. John Parker, manager; S. G. Lewis, Secretary-Treasurer.

Feb. 20-21.—New Orleans, La.—First tournament of the Mississippi Valley Trapshooters' and Game Protective Association; Carnival Week, under auspices of the City Park Gun Club. Percy S. Benedict, See'y.

May —.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament, under the auspices of the Lincoln Gun Club. T. E. Mockett, Sec'y.

May 27-29.—Fort Wayne, Ind.—Three-day live-bird and target tournament of the Corner Rod and Gun Club. John V. Linker, Sec'y.

May 30.—Detroit, Mich.—Winchester Gun Club's Decoration Day third annual tournament; all day. Rose system and average prizes. Sliding handicap, 16, 18 and 20yds., D. A. Hitchcock, Sec'y-Treas.

DRIVERS AND TWISTERS.

The Tri-State Automobile and Sporting Goods Association programme for the tournament to be held under its auspices, Feb. 10 to 14, Detroit, Mich., is specially attractive to trapshooters. Some of the main events are as follows: Sportsmen's handicap live-bird championship trophy; International live-bird trophy; Sportsmen's handicap target championship trophy; Sportsmen's expert target championship trophy—all to become the property of the winner, except the International trophy. There also is the Sportsmen's Grand Handicap, 25 live birds, $35 entrance, birds included; handicaps 26 to 32yds.; International live-bird event, 15 birds, $15 entrance; Sportsmen's grand handicap target championship event, 100 targets, which is split up into 20-target events; and the Sportsmen's expert target championship event, 50 targets, split into two 25-target events. It may not be amiss to mention that a handicap is not a championship, nor can the term be properly used in that connection. High guns will govern in live-bird events; Rose system in target competition. Target handicaps, 16 to 21yds.; live-bird handicaps, 26 to 32yds. Average money each day, and grand average trophy. Added money, $500. All entries for Grand Sportsmen's Handicap at live birds must be made on application blanks, a copy of which will be found in each programme, for which address the secretary, Seneca Lewis, P. O. Box 5, Detroit, Mich.

Messrs. J. A. R. Elliott and J. Hildreth are visitors in New York at present. The former has recovered with astonishing quickness from the surgical operation for the removal of tumors from his shoulder, which he underwent in Cincinnati, O., a few weeks ago. There was more than one tumor, and some rather deep cutting was necessary to remove them. With true gameness, he refused to be considered an invalid, and was up and about soon after the operation.

Mr. Elmer E. Shaner, secretary-manager of the Interstate Association, sent us the following communication under date of Jan. 3: "Please announce in the trap department of FOREST AND STREAM that the Interstate Association has made arrangements to give a tournament at Warm Springs, Ga., June 16-19, under the auspices of the Meriwether Gun Club, and for one at Viroqua, Wis., July 30-Aug. 1, under the auspices of the Viroqua Rod and Gun Club."

At the shoot of the Poughkeepsie Gun Club, held on Jan. 1, the Intercounty cup match was of special interest. As a result, the cup meandered back to Ossining. There were seven men on a side, 25 targets per man, and Ossining scored 154 to 133. It seems as if Poughkeepsie will not rest calmly under present conditions, hence will send an expedition to Ossining to recapture the cup.

Three of the Messrs. Mallory brothers and Mr. Stewart, of Parkersburg, W. Va., arrived in New York on last Sunday, and will be visitors in that town for some days. On Wednesday of this week they will be the guests of several distinguished shooters, members of the Crescent Athletic Club, at the country house, at Bay Ridge, and some trapshooting will be a part of the entertainment.

At a meeting of the stockholders of the Interstate Association, held in New York last week, Mr. Edward Banks resigned as secretary of the Association, and Mr. Elmer E. Shaner was unanimously elected secretary. Mr. Shaner is now both manager and secretary, and his ability to fill both positions efficiently is beyond question.

The first win on the January cup, at the shoot of the Crescent Athletic Club, Bay Ridge, L. I., last Saturday, was scored by Dr. J. J. Keyes, who made a total of 48 out of 50. He was closely pressed for first honors by several of the other ten contestants, four of whom scored 47.

Mr. Percy S. Benedict, secretary of the City Park Gun Club, New Orleans, desires that, at the tournament of the Mississippi Valley Trapshooters and Game Protective Association, Feb. 20 and 21, held under City Park Gun Club's auspices, the club add $500.

At Reading, Pa., Jan. 1, two regular army officers, Capt. Wesley Richards Parker, of Spokane, Wash., and Lieut. D. Frank Keller, of Reading, shot a match at 25 live birds, 28yds. rise, for a large purse. The scores were: Parker 19, Keller 17.

Mr. Elmer E. Shaner, secretary-manager of the Interstate Association, will be a visitor in Kansas City, Mo., this week, with a purpose to make the preliminary arrangements for one of the two Grand American Handicaps at targets.

The Winchester Gun Club, of Detroit, Mich., announce a Decoration Day tournament May 30. Conditions, Rose system, average prizes, sliding handicap, 16, 18 and 20yds. Dr. D. A. Hitchcock is the secretary-treasurer.

Mr. John M. Lilly, of Indianapolis, Ind., arrived in New York on Monday of this week. He tarried there but a few hours, he being en route Southward, where he anticipates much pleasure in hunting the beautiful quail bird.

In the contest for the live-bird championship of Cumberland county, Pa., held at the shoot of the Carlisle (Pa.) Gun Club shoot, Jan. 1, Mr. Charles E. Humer was victor, by a score of 20 out of 25 live birds.

The Corner Rod and Gun Club, of Fort Wayne, Ind., announce a three-days' tournament to be held on May 27, 28 and 29. There will be competition on live birds and bluerocks, and there will be $100 added.

The next shoot of the Fulton Gun Club, Brooklyn, L. I., will be held on Jan. 11. Shooting will commence at 1 o'clock. Mr. Albert A. Schoverling is the secretary.

The next shoot of the Jackson Park Gun Club, of Paterson, N. J., will be held at Jackson Park, Jan. 10, commencing at 12 o'clock.

BERNARD WATERS.

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., Jan. 3.—The inter-county shoot and tournament of the Pokeepsie Gun Club, held on New Year's Day, was well attended, and financially, a big success to the club. Isaac Tallman carried off first average money with a percentage of 95. Max Condit came in for second, with Fred Tompkins third, making 90 and 88⅓ per cent. respectively, $10 being divided between them, $5 to first, $3 to second and $2 to third.

In the 100-bird event, open to the world, there were not as many entries as were expected, but eight men facing the trap in this event. DuBois, Traver and Winans, shooting for birds only, left $40 in the pot to be divided in two moneys, 30 and 10. First money went to Sim Glover, who succeeded in breaking 98, Tallman capturing second with 95.

Mr. Neaf Apgar, and Thos. W. Morfey were the only trade representatives present. Mr. Morfey was late in reaching the grounds, therefore did not compete in the 100-bird event.

In the intercounty cup match, Ossining vs. Pokeepsie, the seven men "from down the river" won a glorious victory, making a remarkable score, and defeating the home team by 21 points. It will be noticed, by looking the scores over, that unfortunately for Poughkeepsie, several of our men fell far below their previous average. Had our men all been able to hold up in this event, Ossining would not have given us the drubbing that they did. Ossining made a big score; that we cannot deny. But was it not natural for them to shoot better when they saw the hard luck that we were running in? As it is, it is up to us to "ramble" to Ossining again. We have some material that, with the right kind of coaching, can be developed into winning form. When we "ramble" to Ossining again, we are going after that cup so vigorously that we think we can foresee the result.

At this shoot 3,215 targets were trapped, out of which 2,793 were broken.

June, a substitute for a long name, did some very clever work, and had he shot through the whole programme, would have given them "a run for their money."

Events:	1	2	3	5	6	Shot

Adriance ..... 19 20 22 23—84

SNANIWEH.

Florists Gun Club.

PHILADELPHIA, Pa., Jan. 2.—The Florists' Gun Club held a very successful open target tourney on their grounds, at Wissinoming, yesterday. The programme was arranged for an all-day shoot, to commence about 10:30 A. M., and while there were a few of the faithful on hand at the appointed hour, the greater number of contestants did not arrive on the grounds until 1:30 P. M., making a crush at the last hours of daylight, so that it was impossible to finish the programme.

The sweepstake programme was shot through, and the 100-target merchandise event was practically finished, although the last two squads would have to finish in such poor light that the management decided to allow them 20 targets in their last string. The five-man team match had to be cut out altogether.

This made the merchandise event the principal feature of the tourney, and the system of handicapping made it a very interesting contest. The handicaps were added to the score, and were based upon the scores made in the second and third strings, allowing 75 per cent. of the lost targets for the handicap. The conditions remaining secret until the last gun was fired, the result proved very satisfactory, as the scores show. The tourney was under the direction of J. K. Starr, assisted by George Anderson, V. V. Dorp and Dr. Goebel.

Sweepstake events:

Events:	1	2	3	4	5	6	7	8

Dickey Gun Club.

OMAHA, Neb.—The New Year's Day shoot of the Dickey Gun Club was held on the grounds of the Omaha Gun Club. The day was very pleasant. The events were well supported. The birds were of the gamest sort, there being not a single "sitter" out of nearly 400 that were trapped.

George Toozer, of Omaha, who is comparatively a new man at the traps, started the afternoon by killing 5 birds straight in practice. Then in his match race with Will Sherwood, 25 live birds, he killed every one. Next he made another perfect score on 10 birds, making 40 live birds straight; but the number was not the prettiest part of his work. His every shot was well timed, and he centered his birds in a way which many said had not been equalled here. The scores in the match race between Toozer and Sherwood gave the former the victory by 25 to 21, as follows:

G Toozer, 30.....1222212212221212221211122—25
W Sherwood, 30.....2011222*2212201211*12121—21

Eighteen entries responded to the call for the 10 live-bird event. Four men—Toozer, Morrill, Wagner, and Fogg—killed straight. Rogers, Gallagher and Johannes made 9 each. These seven divided the money. The scores were:

Fogg, 33.....2222222222—10
Voorhies, 29.....2120111102— 8
Downs, 30.....*221*22221— 8
Cole, 28.....0222000222— 6
Morrill, 29.....2111222212—10
Kinnear, 27.....2220202222— 8
Toozer, 30.....1112112212—10
Brooks, 26.....01212012*0— 6
Diamond, 26.....2100016020— 4
Driesbach, 27.....1212012212— 7
Nicholson, 27.....2122221200— 8
Kaller, 27.....2100*2101*— 5
Sherwood, 29.....10220*1122— 7
Rogers, 28.....1222211012— 9
Wagner, 30.....2221111212—10
Gallagher, 30.....2222212201— 9
Johannes, 30.....2101112112— 9
Parker, 30.....1121121001— 8

There were two target events. The first was at 15 targets and had sixteen entries. Downs took first money, and Fogg, Toozer and Nicholson were second. The scores:

Kinnear .....110101101110111—11
Downs .....111111111111111—15
Fogg .....111111111011111—14

Trap at St. Louis, Mo.

AN all-day programme at targets and live birds was presented Jan. 1, at Dupont Park, St. Louis. About twenty-five enthusiasts participated, and the contests, especially at live birds, were very spirited. Shooting interest is looking up decidedly here, and manager Mermod looks forward to a busy season. The scores:

Sweepstake, 15 birds:

Bauman 22022101220w
Selzer .....1122221212222*11—14

JOHN WATSON.

Catchpole Gun Club.

WOLCOTT, N. Y., Jan. 1.—The Catchpole Gun Club had fair weather for its shoot to-day. The targets were thrown hard and fast. The scores made were as follows:

Wadsworth shot at 100, broke 90; Fowler shot at 100, broke 58; Sage shot at 60, broke 28.

SEC'Y.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

ON LONG ISLAND.

John Wright's Shoot.

Interstate Park, L. I., Dec. 25.—The Christmas Day target shoot held here to-day by Mr. John Wright, was not so well attended as expected, owing to the wintry storm. A heavy snow fall, from early morning till midday, was a deterrent to those who had a thought of comfort. The scores are appended:

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7

Trophy, 15 targets: F. T. Bedford (1) 15, Brigham (0) 14, A. W. Palmer (2) 14, L. M. Palmer (1) 14, Vanderveer (2) 14, F. B. Stephenson (0) 14, Notman (2) 14, Hopkins (3) 14, W. W. Marshall (3) 13, Dr. Keyes (1) 13, Bennett (3) 12, Chapman (4) 11.

Match, 10 pairs, scratch: G. G. Stephenson 15, Brigham 11, Bedford 11, F. B. Stephenson 11, L. M. Palmer, Jr., 9, Notman 9.

Of the four special trophies placed in competition the first was won by W. W. Marshall, the second by David C. Bennett, the third by A. W. Palmer, and the fourth by F. T. Bedford, Jr.

Felix—Ridge.

PHILADELPHIA.—On Jan. 1 the Point Breeze Gun Club held an active shoot, the main event of which was a match at 50 live birds, 30yds. rise, for a purse of $50 a side, between Howard Ridge and Anthony Felix, two local wing shots. Felix won the match by 47 to Ridge's 45. Ridge scored but 21 out of his first 25, but shot a strong race, killing 24 out of his last 25. It is likely that the men will meet in a return match on the Keystone grounds at 100 birds for $100 a side.

In the open sweepstake event, unfinished from Christmas Day, there were thirteen entries left for the bridle and blanket, and the competition proved close and interesting. Several of the men entered had others shoot for them, one man shooting three different scores. In the first round of 10 birds, Felix, Baun, Mink, Miller, C. Young, and Fisher killed 9, and in the shoot-off of ties at miss-and-out, Harry Fisher, of the Clearview Gun Club, won the blanket by a score of 10 straight.

Oliver and Morris tied with 8 kills for the bridle, the tie being decided by tossing a coin. Morris won. Several practice events were shot off after the main events. The scores:

Match shoot, 50 live birds, 30yds. rise, $50 a side:

Steever	6	8	7	7	8	8	Detz	..	..	..	..	7	..

A match, to be shot at Smith Brothers' grounds, Newark, N. J., was arranged between Mr. S. M. Van Allen, of Jamaica, L. I., famous as one of the most expert shots of New York, and Mr. R. Smith, of Manchester, England. Mr. Smith is one-armed, and shoots fairly well. He was anxious to secure a few pigeon matches in this land of new civilization. A gentleman of a philanthropic turn of mind put him in communication with Mr. Van Allen. The match was arranged to be for $100 a side, at 25 or 50 birds, 28yds. rise, and Mr. Van Allen allowed his opponent one extra bird in 25, or two in 50, to shoot at. Mr. Smith, it was said, had had quite a successful experience with the bluerock pigeon in his own country; therefore, the American bird was presumed to be an easy mark. Mr. Smith had a preliminary match with Mr. J. H. Outwater, for the price of the birds, with the result that he desired to call off his match with Mr. Van Allen. The latter very obligingly acceded, but they shot the match without any purse on Saturday last, Mr. Van Allen allowing his opponent two birds extra to shoot at in 25. Van Allen killed 21 out of 25, Mr. Smith killed 19 out of 27.

IN NEW JERSEY.

Bound Brook Gun Club.

Bound Brook, N. J., Dec. 27.—The Bound Brook Gun Club held a target and turkey shoot at their grounds to-day. The weather was clear and cold. Neaf Apgar led the day by breaking 25 straight. Messrs. Glover, Wells and Butler were present from New York.

Mr. Anderson, of the home club, won two turkeys and a fine revolver. Mr. Glover also carried away a fine turkey.

The attendance was not as large as was expected, but the shooting was greatly enjoyed by those present. Mr. Glover also gave an exhibition shoot of putting a charge of shot through a barrel at 150yds., paced, of course.

The next club shoot will be held Jan. 10, 1903. Visitors are welcome.

Turkey shoot, 15 targets, handicap: Apgar, 21yds., 12; Glover, 21yds., 13; Anderson, 18yds., 8; Pardoe, 16yds., 9; Dr. Pardoe, 16yds., 11; Schenck, 16yds., 8; Tilton, 16yds., 4; Henry, 16yds., 3.

Turkey shoot, 10 targets, handicap: Apgar, 21yds., 8; Schenck, 16yds., 5; Pardoe, 16yds., 8; Dr. Pardoe, 16yds., 8; A. K. Smith, 6; Anderson, 7.

Shoot-off of tie: Apgar 6, Pardoe 9, Dr. Pardoe 5.

Event at 25 targets: Apgar 25, Wells 20, Butler 20, W. Pardoe 19, Glover 20.

Twenty-five targets: Apgar 24, Wells 20, Butler 18, W. Pardoe 20, Glover 23.

Twenty-five targets: Apgar 21, Wells 21, Butler 19, Dr. Pardoe 17, Glover 24.

Twenty-five targets: Apgar 21, Wells 21, Butler 20, Dr. Pardoe 21, Glover 22.

JAS. R. MERRILL.

Fairview Gun Club.

Fairview, N. J., Jan. 1.—Appended are the scores of our very successful shoot of even date, for silver trophy, put up by gun club of this place. Fairview is on the Northern Branch of the Erie Railroad, eight and a half miles (twenty minutes) from New York city. Club shoots second Saturday of each month. The grounds overlook the station at Fairview:

H F Bruik	1111111111111111111111111—25
Dods	1111110111111011111111111—23
Hurley	1001111111111111111111111—23
C H Sedore	1010111001101011110111011—17
Lambrix	1111101111001111110111110—20

Con Sedore	1011011111011011011111110—19
H G Brink	1111001001101011010110111—16
Williamson	1010110100111001010100110—13

Weather clear and bright. Wind light, northwest, across the score. Trophy, a handsome silver loving cup, to become the property of the member winning it three times. To be shot for four times a year.

ROBT. J. HOPKINS, Sec'y.

Riverside Shooting Association.

Carlstadt, N. J.—The star attraction was the match between Messrs. Outwater and Smith, a 20-bird race for the price of the birds. This was of special interest, as there was a match on between Mr. S. M. Van Allen, the Jamaica crack, and Mr. Smith, who is recently from England, the conditions of which were 25 or 50 birds, 28yds. rise, Van Allen conceding his opponent one extra bird to shoot at for each 25; that is to say, if the match was at 50 birds, Mr. Smith would have 52 to shoot at. This match was later declared off by Mr. Smith.

Following are the scores:

	No. 1.	No. 2.
Von Lengerke, 28	2012222021— 8	2010212112— 8
Smith, 28	0010121212— 7	1221121111—10
Dr Brooks, 28	2121121111—10	.....

Match, Smith and Outwater:

Smith, 28	1212012020100021100O—11
Outwater, 28	1222120121*11*1110221—16

Afternoon sweejs, same as Nos. 1 and 2:

Kelley, 28	.....	0111111120—8	111211—6

No. 3 was a miss-and-out.

Mountainside Gun Club.

West Orange, N. J.—A large crowd of enthusiastic sportsmen participated in the shoot held by the Mountainside Gun Club on New Year's Day. The weather conditions were ideal, and most of the events were closely contested.

In the first event, Mr. George Ziegler won a large turkey with a score of 13 out of a possible 15. Other scores in the same event were: W. Hollum 12, A. W. Baldwin 11, C. J. Ziegler 10, J. McDonough 9, G. Falkner 8, J. Gantz 7, P. Staunton, F. Wright and H. O'Hagan each broke 5.

In the second event, first prize, a silver match-safe, was won by A. W. Baldwin with a score of 11 out of a possible 15. J. McDonough took second prize, a sterling scarf retainer, with a score of 10. Next in order were G. F. Ziegler 9, W. Germain 9, G. W. Falkner 8, P. Staunton 7, H. O'Hagan 6.

A number of sweepstakes followed, of which the following is a partial list:

Fifteen-bird sweep: G. F. Ziegler 13, C. J. Ziegler 13, W. Rollinson 13, A. W. Baldwin 9, C. W. Falkner 8.

Five-bird sweep: G. W. Falkner 4, A. W. Baldwin 4, G. F. Ziegler 4, J. McDonough 4, C. J. Ziegler 3. The tie between Falkner, Baldwin, G. F. Ziegler and McDonough was shot off and resulted in the division of the pot between A. W. Baldwin and G. W. Falkner.

Five-bird sweep: G. Falkner 4, A. W. Baldwin 4, J. McDonough 3, J. Gantz 3, C. J. Ziegler 3.

A trophy for the championship of the club for 1903 will be put up at the next shoot. This is a silver loving cup, which is now being designed by a prominent New York jeweller.

Trap at Newark.

Newark, N. J., Jan. 3.—At Smith Brothers' grounds to-day, a match for the price of the birds, was shot between Messrs. S. M. Van Allen and R. H. Smith, of Manchester, England. This match was first arranged for a stake, but, as Mr. Smith wished to withdraw the money feature, Mr. Van Allen very generously acceded. Mr. Van Allen allowed his opponent two extra birds to shoot at in 25. The scores were Van Allen 21 out of 25; Smith 19 out of 27.

Sweepstakes at 10 birds, $5 entrance, were shot as follows:

Birds:	10	10	Birds:	10	10
Steffens	7	10	Van Allen	8	10
Koegel	8	10	Smith	8	6

The ties in the second event were shot off miss-and-out, as follows: Steffens 10, Koegel 6, Van Allen 11. The birds were a good lot.

Jackson Park Gun Club.

Paterson, N. J., Jan. 2.—The all-day shoot of the Jackson Park Gun Club, on its grounds, near Little Falls, on New Year's Day, was witnessed by one of the largest crowds that ever came out to attend a shoot in this city before. Both the platform and the club house were filled. Those who witnessed the shoot were well paid for their visit, as the events were well filled, and some fine scores were made. A number of visiting shooters from out of town were on hand to take their chances, and were received with open hand, and were well taken care of. Koegel seemed to have gotten a little the best of the handicapper, as they were all shooting from the 28yd. mark, and he appeared about two or three yards better than the rest of the boys.

Only three events were shot, but these were well filled, and took up considerable time. They would hardly have been finished but for the work of Capt. Lenone and Mr. T. C. Wright, who kept the shooters on the jump from start to finish, so that very little time was lost.

The first event, at 7 birds, $3, had nine entries. Christy and Hoffman seemed to hold out the best. Hassinger and Koegle dropped their last bird.

The second event, at 15 birds, had ten entries, and Capt. Lenone called for $5 entrance. Koegle proved the best man, with Geo. Hopper a close second, with 14. Several were close up. Mr. Bruyere broke his gun the first of the week, and would not stay away. He brought out a pump, but could do very little with it. He tried several others, and then quit. Mr. Sidway was apparently enjoying himself, shooting for birds only. Friend Hoffman came out with Frank Butler, and seemed to be getting some of the real enjoyment out of his favorite pipe and trapshooting combined with the ideal weather we had for our shoot. I don't think there ever was a finer day for shooting than we had for New Years. Before this event was finished every car dropped its load at our entrance. The passengers included a number of the shooters from the city and surrounding country, all eager to enter the next event, which was all ready scheduled as a 10-bird, $5 affair. Our own boys decided to stay out, and let those who had come to visit us have a chance to get in, and the event started with fifteen entries. It proved very interesting for the visitors. Capt. Lenone gave the younger shooters an idea of shooting, gun below the elbow, using his second barrel but twice on 25 birds, and scoring 21 on good birds. A large majority of the birds were of the first order; a few sitters, but good on the wing; a very few incomers.

At the time for starting the 10-bird event, it was seen that there was just about enough birds on hand to finish it with the fifteen entries, and I would not receive any more. The event was finished about 4 o'clock. G. A. Hopper got in for a little exercise after looking after the comfort of the visitors all day, and cleaned up 10 straight. Capt. Lenone took general charge outside, with the assistance of T. C. Wright, and the writer looked after the entries and took charge of the money, as he just came out of a sick bed after a week. Everything went off nicely. We shot off nearly 500 birds, including practice birds before 7-bird event:

	No. 1, $3 entrance.	No. 2, $5 entrance.

DUTCHER.

Ames Gun Club.

AMES, Ia., Dec. 30.—The amateur shooting tournament given by the Ames Gun Club was well attended, seventeen shooters taking part in to-day's programme. Dr. C. M. Proctor managed the shoot. Mr. L. C. Whitney had charge of the office.

The shooting was from one set of three traps, Sergeant system; targets thrown about 50yds.

The programme had sixteen events, and all but event 11, at 25 targets, were open to all amateurs. This event was for the Story county championship, and open only to residents of this county. The purses were divided 35, 30, 20 and 15 per cent. The club gave $1 for each entry that shot through the open programme, for high averages, divided 40, 35 and 25 per cent.

The weather was clear and cold. The shooting commenced at 10 o'clock, and the programme was finished by 4:30.

Dr. C. M. Proctor, holder of the county medal, broke 24 in the medal shoot, and won without a tie. John Frees, of Stratford, won first average with 93 per cent. Budd was second with 90. Adams and Proctor third with 87.5.

About 3,300 targets were thrown. The traps worked nicely, and but little delay occurred in the shooting.

HAWKEYE.

Cincinnati Gun Club.

CINCINNATI, O., Dec. 27.—The Troisdorf medal handicap event at 50 targets resulted as follows: R. Trimble, 22yds., 43; Van Ness, 19yds., 42; Ahlers, 21yds., 39; Jay Bee, 17yds., 38; Falk, 17yds., 36; Maynard, 18yds., 36; Herman, 17yds., 35; Joe H., 17yds., 35; Corry, 17yds., 34; E. Trimble, 18yds., 33; Coleman, 21yds., 31; Medico, 19yds., 28.

Schenectady Gun Club.

SCHENECTADY, N. Y., Dec. 27.—The weather was bright and clear. There were eleven members present. About 1,150 targets were thrown. Mr. Ferguson's challenge to Capt. Wallburg for the latter's position on the second team was accepted, and the result was a spirited race. The Captain successfully held his place by a score of 48 to 46 out of a possible 50 targets. Mr. Wallburg made 34 straight. Mr. Levingston promptly challenged the winner. The tables were turned, as Levingston broke 46 to Wallburg's 42 out of a possible 50 targets.

The conditions of the first team shoot were 25 targets per man, five men on a side, which resulted as follows, the Messrs. Levingston and Warnick choosing sides:

First team race, 25 targets:

Levingston 22, Wallburg 21, Adams 14, Levingston, Jr., 21, Arnold 16; total 94.

Warnick 24, Valentine 20, Ferguson 21, Lovejoy 16, Miller 21; total 102.

Second team race, conditions same as first race:

Levington 24, Wallburg 21, Adams 19, Levingston, Jr., 25, Arnold 22; total 111.

Warnick 23, Valentine 23, Ferguson 19, Lovejoy 17, Miller 15; total 97.

The third team race was a 15-target affair, three men on a side, chosen by Messrs. Wallburg and Valentine:

Wallburg 12, Adams 12, Lovejoy 13; total 37.

Valentine 11, Arnold 13, Rice 10; total 34.

The total scores made during the shoot Saturday are as follows:

Events:	1	2	3	4	5	6	7	Shot at.	Broke.	Av.
Targets:	25	25	25	25	15	15	10			
Warnick	24	24	24	23	..	..	..	100	95	.950

Adams	17	14	19	..	12	..	..	90	63	.700
Lovejoy	15	16	17	..	13	11	6	115	78	.678

On New Year's Day there will be shooting from 9:30 A. M. until 3 P. M., individual matches for team position, double-target shooting, and teams of three and four men on a side, will be the features. There will also be the regular shoot on Saturday afternoon, Jan. 3, as usual.

Jan. 2.—The following scores were made at the New Year's Day shoot of the Schenectady Gun Club. The day and the sport were glorious. Everything was in combination to delight the heart of the most enthusiastic or the most lukewarm.

Mr. Ferguson challenged Mr. Wallburg for his position on the team, and Wallburg won, 40 to 36.

Mr. Levingston defeated Mr. Lovejoy for team position, 46 to 27.

During the day there were several team matches, double shooting and miss-and-out contests that made things lively.

Two teams of four members each had an interesting race of 25 targets each, as follows:

Levingston 24, Hodges 18, Ferguson 18, Arnold 16; total 76.

Wallburg 18, Valentine 22, Hall 19, A. Green 19; total 78.

Team race, 15 targets:

Levingston 13, Valentine 14, Hodges 11, Ferguson 8; total 46.

Wallburg 13, A. Green 13, Borden 10, Arnold 12; total 48.

Other scores during the day:

Adams	34	..	..	..	..	17 ..
Murday	..	..	..	..	..	16 12
Lovejoy	27	..	..	..	..	14 ..

The usual shoot will be held on Saturday afternoon. The annual meeting of the club will be held at the rooms of Vice-President Everett Smith, No. 251 State street, at 8 o'clock in the evening. The annual reports will be ready and the election of officers will take place.

Winchester Gun Club.

DETROIT, Mich.—The annual meeting held Dec. 20 was well attended, and the prizes for 1902 were awarded as follows:

For the ten best scores in the club event of 25 targets, first prize, Class A gold medal, to T. M. Brodie, scoring 218 out of the 250. Second prize, a sterling silver cup, Robt. Shiell, 213. Third prize, six months' dues succeeding year, Thos. Reid, 189.

The same prizes in Class B: First, H. J. Guthard, 211; second, D. A. Hitchcock, 209.

Same in Class G: First, J. A. Ford, 194; second, A. D. McAdam, 144; third, O. E. Barthel, 84.

The Fletcher special hammerless, beginners' prize, was also won by Mr. Ford, but no one landed the straight score silver cup.

The report of the Secretary-Treasurer showed the club to be in a sound financial condition, with prizes all paid and no outstanding bills, and the equipment in first-class shape.

The following officers were elected for the ensuing year: President, Thos. Reid; Vice-President, T. M. Brodie; Secretary-Treasurer, D. A. Hitchcock; Captain, H. J. Guthard; Lieutenant-Captain, O. E. Barthel.

The programme for 1903 includes, beside the club event, a special 25 target event for a valuable trophy on a sliding handicap basis of 16, 18 and 20yds., with the annual tournament Decoration Day.

The first shoot will be held Jan. 10, and every two weeks thereafter to Dec. 12.

PUBLISHERS' DEPARTMENT.

Tar and Turpentine Woods of the South.

AND WHAT THE YANKEE IS DOING DOWN IN DIXIE.

A GREAT many of the wide-awake New Englanders have found that the sandhills of North Carolina that are covered with the long-leafed pines from which turpentine and tar are made, is the finest land in the United States for the growing of early grapes, peaches and plums, and a variety of early vegetables, and especially sweet potatoes, which can be grown and placed upon the Northern market two or three weeks earlier than those grown in New Jersey, and on this account, and on account of the health-giving qualities of the air and water of that section, several towns are being built up by people from the North and West, the larger majority being from the New England States. The two most prominent settlements are at Pinebluff and Southern Pines, Moore county, N. C. Mr. John T. Patrick, of the Seaboard Air Line Railway, who has induced many people to go South, and whose home is at Pinebluff, can give information to those wanting to know what has been accomplished by the Yankees in the South.

The Winchester Repeating Arms Co., of New Haven, Conn, sends us the following: "The shooters who are ranked first under the respective classifications in Sporting Life's "Trap Shooting Review for 1902" all indorse Winchester factory loaded shells. This is the third consecutive year that substantially all the principal shooting honors have been won by shooters shooting Winchester factory loaded shells. This speaks a volume for the reliability and uniformity of this famous brand of shotgun ammunition."

Mr. E. J. McMahon, the able manager of the Lake Shore and Michigan Southern Railway's Advertising Department, has sent out to the friends of his company a Christmas greeting, felicitous in text and apropos in illustration. The Twentieth Century Limited, rushing through the night, forms a heading, while a spray of holly, green of leaf and red of berry, hold place in the foreground. The greeting is "Wishing you a New Year filled with much joy and gladness, peace and plenty."

The Graphine Gun Wad Co., of Muncie, Ind., have placed a stock of their wads with J. H. Lau & Co., 75 Chambers street, New York; with Hibbard, Spencer, Bartlett & Co., Chicago, Ill., and the Canada trade is supplied through Archie MacFarlane, 125 Crescent street, Montreal.

Spratts Patent (America), Ltd., Newark, N. J., have issued a calendar for 1903, which is illustrated with rare skill, and which will be sent to those who apply for it.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903 BY FOREST AND STREAM PUBLISHING CO.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, JANUARY 17, 1903.

VOL. LX.—No. 3. No. 346 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

THE YELLOWSTONE PARK.

FOR some weeks interviews credited to one James Fullerton, "of Montana," making charges of mismanagement of affairs in the Yellowstone Park, have been going the rounds of the papers. These charges, so far as printed, are entirely vague and without particulars. At the same time they may, perhaps, make some impression on people unfamiliar with the Park and its history, and should therefore receive attention. Fullerton is reported to have written a letter to the President, repeating to him the charges so liberally scattered about in the newspapers.

As it happens, Fullerton, a long time before he got into the newspapers, visited the office of FOREST AND STREAM and made verbally the charges that have since been printed. He talked with us freely and at length. We have been familiar with the Yellowstone Park for between twenty-five and thirty years, have kept close watch on the reservation, have crossed it many times in all directions, and up to within a few years perhaps knew it as thoroughly as almost anyone. Fullerton's statements about mismanagement on the part of army officers stationed in the Park and as to abuses existing there were general; questions were asked him, and when an effort was made to bring him down to specific statements of fact in detail, it was found that he had no facts to give—that he was talking of matters of which he knew nothing. He talked like a man without any knowledge whatever of the reservation, but who had picked up a lot of the old gossip that continues to float about in the neighborhood of the Park, or like one who had been primed with a lot of old stories by some one whose feelings were hostile to the Park or to those who are administering it.

The FOREST AND STREAM has been deeply interested in the Park and in its preservation since the year 1880 or thereabouts. It is anxious to have the reservation well administered, and it wishes to know if anything is going wrong there. And while the utmost surprise was felt that any criticism should be made of officers of such high standing and such eminent abilities as Major John Pitcher and Capt. H. M. Chittenden, nevertheless a patient effort was made to learn from Fullerton just what he knew. At the close of an interview lasting some time the conclusion was forced upon us that Fullerton knew nothing, that he was repeating a lot of traditionary gossip, much of it many years old, and was telling about things that are reported to have happened between the years 1880 and 1890.

Among the foolish statements made by Fullerton was one that 800 elk had been killed for their teeth, at one time and in one place, in the Park. Such a statement carries its own contradiction to anyone who knows anything of the habits of elk or of the possibilities of killing them.

The whole matter is one of absolutely no importance, the charges being made by a person who is entirely unworthy of credit or attention. Yet, since these charges have had a more or less wide currency it seems best flatly to deny their truth and to declare the irresponsibility of the person who made them. Major John Pitcher and Capt. Chittenden are, as is well known, men of the highest standing and need no backing from anyone. Each of them can stand on his own record. At the same time it is fitting that public witness should be borne to the admirable work that each has done in his own line in the Yellowstone Park. Major Pitcher has succeeded in changing the sentiment of the inhabitants of Montana and Wyoming near the Park from one of destructive hostility to the Park to one of pride in it. They now wish to protect it and to support the authorities there. In the engineering work Capt. Chittenden has done the utmost possible with the means at his command. If engineering mistakes have been made in the past—prior to his appointment in charge of the Park roads—it has not been due to any fault on the part of the engineering officers in charge there, but to the parsimony of Congress, which has refused to provide funds to build proper roads, making it necessary to construct makeshifts.

A VIRGINIA NON-EXPORT LAW.

AMONG the game protective bills in the Virginia Legislature is a measure to prohibit the exportation of game, except that the non-resident sportsman may carry with him a reasonable amount, to be accompanied by him in transport. The anti-export law as here outlined would be most admirable, and in adopting the system Virginia would be following the examples of numerous other States, in all of which the limitation of the export privilege to the owner of the game has been of very great benefit. To cut off the marketing of game, as experience has proved wherever the plan has been tried, is the most effective expedient of game protection. Stop the sale of game, prevent its shipment to market, and on the instant the problem of protection is so simplified that the solution is easy. The killing for market consumption is a factor so considerable that to suppress it is to accomplish nine-tenths of the work of protection. This is not theory; it is a simple statement of what has been demonstrated in the actual experience of more than one State. If Virginia shall adopt the plan, and make necessary provision for enforcing the law, the same beneficent results will follow there.

We learn that an effort has been made to have wildfowl exempted from the application of the non-export law. To do this would be to commit a great mistake. Virginia wildfowl demand protection quite as much as any of the other species and should be given full benefit of the anti-export law. The ducks are in a peculiar degree the prey of the market-hunter. The destructive devices of big-gun and night-light are employed by the gunners who slaughter fowl for export to the game dealer. The enforcement of the non-exportation law as applied to wildfowl would go very far to suppress the use of big-guns and the night-shooting which are among the chief abuses with which the authorities have to cope; it would accomplish this end because when the marketing is done away with the chief incentive to these modes of slaughter is removed.

We trust that Virginia may adopt the proposed non-export game law, and that its provisions may be extended to wildfowl.

A movement is on foot to improve the guide service in the Laurentian district north of Quebec. The guides there are Indians, half breeds and French Canadians, and they are not educated up to a standard of proficiency that compares with that of Maine guides. A few who do considerable hunting and trapping in the winter months are good hunters and fairly familiar with the handling of a canoe, but the majority are simply carriers without knowledge of the country or a canoe, and sadly lacking in what may be termed "guide duties."

There are some fifteen clubs in this district, the rights being leased to them by the government. The Triton Club, leasing some seven hundred square miles, about one hundred miles north of Quebec, has appointed a committee whose duties are to raise the standard of men who serve as guides in that district. It is the scheme to have committees appointed by each club and to have these committees work together under a general plan.

Success will be slow in coming even under the best of conditions, but the movement is a good one and should receive the hearty support of all the clubs of that district. Every club member should take a personal interest in this step forward.

Communications from any club members, bearing suggestions or criticisms will be thankfully received by Andrew G. Weeks, Jr., No. 8 Congress street, Boston, acting for the committee of the Triton Club.

THE statistics of the deer shipped from the Adirondacks last year appear to show an increase in the supply there. The shipments of carcasses and saddles in 1900 were 1,109; in 1901, 1,165, and in 1902, 1,477. This means, if the figures are correct, that the conditions which now rule in the North Woods are favorable for the continuance of the deer supply, and the tabulation prepared by Secretary Whish demonstrates what has recently been shown on Long Island, in Vermont and Massachusetts, that if the deer is given the necessary immunity the stock will replenish itself generously. Under right conditions we may breed our wild deer like our domestic sheep, and there is no good reason why the permanent and abundant supply of one should not be as well assured as of the other. It is safe to say that after the experience of New York, Vermont, Massachusetts and Connecticut in the protection of deer, and the repeated demonstration of the increase following protection, in all these States we shall have the species in perpetuity.

AMONG the changes proposed for Michigan is an amendment which will give the non-resident sportsman the privilege of taking home a deer. Michigan is now among the States which exact a good round license fee from the shooter who crosses the line, yet churlishly deny him the satisfaction of carrying his game back with him. The plan now proposed is much more reasonable, and is nothing more than just. That it is not in conflict with good protection is sufficiently demonstrated by its operation in many States which permit the export of game in limited amount when accompanied by the owner.

IN his message to the New York Legislature, Governor Odell shows a want of clear understanding of the abuse of special game and fish laws. In one sentence he deprecates the enactment of special laws and in another recommends that county supervisors, under direction of the commission, shall be given authority to make special laws at will. He says:

> Amendments to the game laws, special amendments to the charters of villages and cities, should be discouraged, and relief afforded through general enactments whenever and wherever practicable. The Legislature could well afford, under the direction of the Forest, Fish and Game Commission, to accord to the boards of supervisors the right to regulate, under a general statute, the game laws for their own particular localities.

The authority Governor Odell would confer upon supervisors is something they once had and used so well that they got the game and fish laws of the State into inextricable confusion. Local legislation became such a nuisance that in 1886 the State spent some thousands of dollars to pay for a codification of the statutes, and took away the authority of the supervisors. Since then the laws have been made at Albany, and the changed order has been satisfactory in its operation. To restore the old system of special legislation by the supervisors would mean to bring back the old confusion and insure a condition which the Governor himself justly deprecates.

IN his message to the Maine Legislature, Governor Hill recommends the adoption of a non-resident license tax. Public opinion in the State has been in large degree influenced by the misleading figures put out by Commissioner Carleton, and is said to indorse the scheme of taxing the visiting sportsmen. Among many of the guides the feeling prevails that their patrons would be quite willing to pay a license fee, which would be a small item in comparison with the total outlay which an excursion to Maine already involves. The probabilities are that the Legislature will adopt the measure. Meanwhile the wholesale consumption of venison in lumber camps will go on; and we may not look for any change in the qualities of a commission which reserves to itself the option of punishing game law violators or not punishing them, as the authorities may elect. One thing that would go far to advance the cause of protection in Maine to-day would be the existence of a game commission in whose absolute impartiality and official straightforwardness guides and the public and the visiting sportsmen could have implicit confidence.

THE Department of Agriculture Biological Survey, which is engaged in extensive study to determine the food habits of birds, has been devoting some attention to game birds "to ascertain the true economic position of the different members of this group in order to determine to what extent their preservation is demanded by reasons other than those founded upon their value as food or the desire to kill them for sport." Dr. Judd has been pursuing the investigation, and it is announced that a bulletin will shortly be issued detailing the results of his studies of the grouse and the woodcock. Other bulletins to follow will treat of the food of waterfowl and shore birds.

The Sportsman Tourist.

Two Years' Outing Across Siberia.

Boating on Cibirian Rivers.

THE great north-flowing rivers of Russian Asia—as the Irtish, Tom, Enecei (erroneously spelt "Yenecei," or three or four other variations), Ob, Angará, Amur, etc.—offer the greatest contrasts and varieties for shooting and fishing parties. Native-made rigs are purchasable at both towns and most villages; there is nothing nice about them, but they are serviceable and not high-priced.

Do not expect, however, even in the best of the dirty big villages of Cibiria called towns, you can procure imported western boating conveniences. Take them along with you! Thus, you could not procure a folding boat anywhere in the country, because one has never been seen there. And if you gave an order to a local importer to get one, it would take from six months to a year before you received it. And a pretty bill of charges there would be to pay—"surprises" for you—in customs, dues, and the elastic "extras."

The Russians are very strong, when "on the make," in their use of invoice heads printed on long strips of paper. Their bills are purposely made out on the elongated strips—which you will never forget—to accommodate the "extras."

Not alone did I never perceive a folding canvas boat anywhere, nor a steel boat, nor a rubber boat, but even a boat made of bark is apparently unknown to the Cibiriaks. They are great ones for rafts, and make them pay at both ends. Thus, a trader upstream will build an immense cut-timber raft, procure all the transient passengers he can (making them pay in advance), build a rough log house on the raft for their convenience, and float downstream for a thousand versti or so; then, at a town or townlet where timber is scarce and high-priced, he will break up and sell the raft. He will return upstream again either by a chance paddle steamer, bearing with him local products, or get back by roundabout caravan route.

Sometimes the raft will be devoted exclusively to trading, and fitted up with small bazars, having some pretense even to ornamentation. It is curious to note how, conformably to law, they sell everything by weight. Kaviar and kerosene, wools and whiskies, soaps and samovars (even those heavy, lead-lined teaurns, which are one of the minor glories of the land of Tolstoi), all are sold by the one unique system of weight—i.e., the funt, or pound. This is the concentrated essence of simpleness in selling—simpler than the decimal or metric system—simple as the single-tax theory.

If babies were merchantable in Cibiria, the native might sell his baby by the pound. Fortunately, however, family ties are strong among the slafs.

Cibirian Village Sports.

Most of the villages run up a simple combination of planks and poles, and call it a gimnazia. This is usually to one side of the one wide, straggling street. It is much used in summer time, and all the year round is handy as a hitching post for cattle, or while shoeing horses. In appearance, the gimnazia uprights and cross-piece look at first sight for all the world like execution scaffolds we see depicted in illustrations of the shuffling off of offenders; and this view of their reason of being was seized on once by an English rush tourist, who, not having known enough of Russian to ask and learn the truth, exclaimed, "Ah! these rascally Russians! So this is the way they civilize Cibiria, by erecting execution scaffolds in every village! And of course those executed are the unhappy political exiles!" Or words to that effect, the purveyor of the information being a Russian who had heard it from another, and that "other" from somebody else; so I give the version for what it is worth.

Apart from the gimnazia, the poor mujik has no other mentionable diversion than to get drunk. But even that he does better than the average westerner, in that he never gets into an ill-humor in consequence.

One Sunday noon, in a trans-Baikal village, I saw two boys diverting themselves "playing plowing" in the thick dust of the deserted street. One was guiding a miniature plow made from a couple of staves filched from a kaviar barrel; the other boy played horse. Poor little bare-footed chaps! They enjoyed the fun in their own way. Thus were they getting their hand in, in play, what was to prove their hard lot in life—plowing. Who ever heard of hand-plowing being easy work?

Yet the Cibiriak is not unhappy. He is far better off than the Russ in agricultural products for home consumption—plenty of meat, milk, eggs, vegetables, etc., though of fruits and sugared confections he knows very little. For my own part, I would find life miserable without sugar, and in some parts of eastern Cibiria, where sugar could not be obtained, was for days in a discontented state of mind. On arrival at a bazar, however, the first thing I would buy would be sugar (50 kopeks a pound), and, presto! after getting through a few lumps, one's disposition would get sweeter! Fact!

The good effects of sugar or things sweet, I have often noted. Once with a party of engineers on the circum-Baikal, after being out all day in the drizzling forests, wet to the skin, we reached the village of Kyltyk in the dark, still raining a coldest of rains, and the whole company in a bad temper, especially after the flounder in the deep mire of the pitch black street. Just beyond the church, camp was pitched for the night, and the soldier-cooks prepared the soup. The chief of this party was the military engineer Schultz, a Russian sure, though with a Teutonic name. After the dinner—partaken in silence almost, for everything had seemed to go wrong that day—coffee was brought in, but no sugar! The chef had ordered it days before from Ipkytck, but it had not arrived. The feelings of us all were like those of the man who has vainly spent his last match over that pipe he had so contemplated enjoying. Who can appreciate black coffee without sugar?

Suddenly I thought of the ounce of saccharin crystals in my baggage coat. Though a most unsatisfactory substitute for sugar, because it lacks the body or syrup of the real thing, it proved a little godsend to that company—all of whom had heard of, but never tried, the concentrated sweetener. A ripple of laughter at the novelty, the "ice" (of a wretched day) was broken, and over the sweetened coffee and cigarettes and little glasses of cognac, an evening of bantering laughter and merriment was spent till turning-in time.

How Engineers Combine Work and Sport in Cibiria.

For the information of those who have never been engaged on nor assisted in railway location work, I would say that the members of a party take care to have a full quota of creature comforts in their supplies, making the government—that is to say, the people—pay for it; or, if a private enterprise, making the shareholders do so! I call to mind some of their lists of supplies—which is not headed "bill of fare," but simply worded "available"—and is for the information chiefly of the chef (cook) and chief. Here are some of the items: Ham and eggs, beefsteak and onions, liver and bacon, ham and tongue, ham and chicken, roast mutton, roast turkey, etc. Desserts: Strawberries and cream, wine and walnuts, milk and honey, peach and honey, etc. Liquors: Brandy and soda, cognac simple, champagne dry, port, burgundy, etc. And so might be quoted scores of other good things.

For actual sport, the engineers carry along guns, fishing tackle, traps, etc., and take advantage of the numerous saints' days to suspend work altogether, and scour the region for both business and sport. They

REPRESENTATIVE SLAF TYPES.

have learned at Petersburg the value of fur-bearing animals, and are after skins that will bring money, not mere pot-shot killing. Their guns are both British and American, and each country's arms have a good reputation.

If anything, to a stranger in Cibiria, village life is better than town life. The peasants are better people. They are truer, simpler, more genuine. Somebody once said the most honorable classes in the world are the poorer classes. The mujik is quite hospitable, and will share equally with you.

The Russian Bana.

Then he always has his baña (bath). The most ignorant slaf will run up a vapor bath house in his backyard—which is always a pretty large one—and get a piping hot steam bath once a week, preferably on Saturdays. It is quite simple to make one of these bath houses—some planks thrown together, banked up and over with earth to secure a certain amount of nonconductivity, in other words, to keep the heat in and the cold out, and a pile of stones heaped up over the rude fireplace in the middle of the hut. An iron caldron of water is atop of this stone pile, and water is taken from it for washing purposes. When vapor is required, a little water is dashed over the hot stones, and soon the baña is filled with almost apoplectic-producing steam.

When suffering from rheumatism, the practice is to rush from the inferno-like bath house, roll over on the snow naked, then dart into the seething hot house again. Is it any wonder that such a shock to the system—equivalent to the work of a powerful faradic battery—gives such a fright to rheumatism as to cause it to loose its grip?

But the foregoing only refers to the democratic baña of the mujik or peasant. Of the bigger variety—well, they are too well acclimatized in our own cities to need any description here.

Cibirian Town Architecture.

Architecturally regarded, Irkutck is the chief town in Cibiria. It has over 50,000 population, is in the heart of Cibiria, on the swift current Angará, and has a cathedral that is an optical illusion—being of a light color, sandstone, it looks in the near distance a gigantic edifice, almost sufficient to stagger the imagination. But on close approach it seems to suddenly dwindle to proper proportions. At a half mile distance I never saw in my life, during a quadrupled tour of the world, such a look-big effect. If happening, as I expect, to pass through Ipkytck again in the not distant future, I will stop over expressly to see again this architectural illusion, if for nothing else.

The governor-general's palace is the usual imposing white edifice; and I saw at Ipkytck (like Goldsmith at Paris) the exteriors of many other fine houses. There is a million-rubli theater, completed a couple of years back. It was only half up when I inspected the interior in the fall of 1896. It follows closely the Garnier opera houses at Geneva and Paris. As to churches, Ipkytck has more per capita than Brooklyn. You will find them—big buildings all—on well nigh every street. Unfortunately this religious ostentation has about as much moral effect on the slaf as the religion of the seven-prayers-a-day musselman has on Turkish officials or the manager of a syndicate of harems—the oriental "harem trust."

What a Cibirian Town is Like.

Continuing to cite Ipkytck as a representative Cibirian town—for I know more of it than of any other Asiatic town, except a few south of the Himalaya range. A couple of months spent here, naturally took me all over the place. My stay was prolonged from two weeks to two months involuntarily, as I had to wait for baggage from the Pacific. Now, as to the houses, they are almost always of wood, with spacious yards to each. There are few conveniences. Those of means have bell batteries, burglar pocket-torpedo alarms, and force-water supply from roof cisterns.

The sidewalks are of wood. They have to be watched by the police, as the natives seem to consider they have a right to them at nights for fuel. The streets are all poorly made, all dusty in dry weather, and all muddy—better write miry—in wet. The only time they are clean is when under the prolonged snow-ice of winter. But you should see their state during the fortnight's thaw! It is poorest economy, but it is just like a Russian, to build a million-rubli opera house, and yet cause an annual loss of a million in injury to health and commerce by foul, miry streets.

The society of Ipkytck consists of two species—those who have been convicted and those who ought to have been.

Blessing the House—A Queer Cibirian Custom.

On the completion of a house—even a two-roomed *dom*, the local priest offers up a blessing. A small established fee is charged for this, but the equivalents of many more fees go in the drinking bout that ensues, in which the priest becomes hopelessly and helplessly involved. Being a temperance man, I was never affected when invited to assist at one of these imbibing functions, and was referred to as a Christian. The Russians do not call themselves Christians, but npaboclabni (pronounced prabo-clabni), meaning literally "verily illustrious," or in other words, "verity credulous" or "verity believers." Literally, the vernacular is almost untranslatable.

A Brief Insight into the Cibirian Professional Man's Life.

He is called, for instance, civil engineer. Thus to call himself he must have a diploma. Would it be believed, that in paternally-run Russiadom, any man who passes an exam. in theory, can dub himself engineer so-and-so, although his practical qualifications are nil. Influence, favoritism, tips, or purposely to "lose" at table or cards a few hundred pybli to the list of persons who have to be bribed, are the bases of "promotion" in the slaf country. Merit has no "pull" whatever. I was informed of one noteworthy instance at Peterburg. One civil engineer, who was opposed to bribery, attempted to secure a leading position without tipping a kopek. His merit was undeniable; he was passed—that is to say, accepted—when there loomed up what the French call a *maitre-chanteur* (literally, master-blackmailer). This individual was named Kepbetc. He had the final word. He found he could not extract any tip, nor promise of one; so he reported, "for private reasons, cannot recommend." Could anything be more damaging or insinuating to a man's character? You see, no charge is made against the successful candidate; and the board thus reported to, gets the opinion that something very serious has been discovered against the applicant. The latter has no remedy at law, for his traducer made a private and privileged communication, and even if called upon by the board to explain, would only say, "Well, the reasons, as stated, are private." This loathsome stab in the back implied insinuation is not actionable per se, and the complainant who tested it in court would lose his case (legally, but not morally) before any law-tribunal on earth.

It subsequently transpired that this Kepbetc, or Kepbetz, was implicated in extensive frauds in the construction of the trans-Cibirian and recently finished trans-Manchurian railroads, disappeared, and is now "wanted," with many others, by the Russian police.

The foregoing is a good illustration of incidents in every standard Cibirian professional's life, and is one of the rotten features of Russian official transactions.

Poor Wages in Cibiria.

A Cibirian architect is poorly paid, to give another illustration. The average earnings will be 100 rubli monthly—little over $50. The purchasing power, indeed, is less than our $50. At that, he will put in twelve hours' work per diem. He has few creature comforts. He is usually married, therefore respectable, and manages to save a little money where he could not in the non-marital state.

Curios in Church Architecture in Cibiria.

The principal edifices in Cibiria are the churches; and of all church architecture on God's footstool, I have come to the conclusion that Russian church architecture is the ugliest. It is an eyesore to any landscape. It is a slavish imitation of the Byzantin, yet without any of the chastity or striking originality of design of the old Turkish or Saracenic motifs, or the grace or elegance of other eastern architectural styles, like the Moorish, Egyptian or Indian. The Russians seem to have at some time in the ages past, hit upon the most unfortunate and ugliest of Byzantin styles, and made "con-

fusion worse confounded" by clapping on or merging into it a mongrel or nondescript native idea; whence the eyesore Muscovite church "standards" of to-day.

Your writer speaks entirely from personal observations, because having covered the whole of Cibiria and Russia—not in a globe-trot of a few weeks, but on, as hitherto mentioned, a protracted tour of inspection lasting two years.

Military Buildings.

Next in size after the grotesque churches, are the soldiers' barracks. They are all huge packing-box edifices, built square, with such a profusion of windows arranged exactly opposite each other on all four sides, that in the distance, when you see the sun setting behind one of these brick wildernesses, four or five stories high, the structure looks like an abandoned ruin, of which only the walls remain.

The barracks accommodate two to three thousand troops. At Vladivoctok, on the Pacific, you see a dozen of these painfully barren brick edifices, and they are enough to give anybody a dolorous first impression of the country. You see the same thing at the chief towns overland all the way to Peterburg. I have been through these barracks, and the interiors are worse still—soiled whitewashed walls, benches around all sides on which the inmates sit and sleep, long greasy tables at which they have their repasts, and downstairs, in the yards, are sanitary conditions which pigs even would not tolerate. When the inspector makes his "see-him-coming" round once a month, things are cleared up a bit, then allowed to relapse for another month into the unspeakable.

Official Residences.

The governors' residences are the next biggest specimens of building in Cibiria. Some of them are fine, built with double walls—leave a Russian and his wife and plenty of peculated funds alone for that! The edifices are either sandstone or freestone, sometimes brick, painted white. In some towns, where the governor has no chance to steal much, he has to be content with a wood residence—comfortable withal. These timber buildings are not a particle like our American farmhouses. Our thin wood walls would not do at all for keeping out the rigors of the Cibirian cold, beginning with 20 below zero, centigrade, the middle of September, reaching 52 below in January (equal to 58 degrees Fahr.), and winding up with an icy blizzard the middle of April, while the chunk ice on the rivers will not permit of navigation for a month later. So in this part of Russian Asia the house walls are often the actual tree-trunks roughly planed down on two sides with hatchets, and mortised into each other at the corners. The interstices are filled up with vermin-breeding vegetable fiber refuse (a kind of jute debris), which have given so unsavory a reputation for insects to Cibirian houses.

I was through divers of the governors' palaces. None are above three stories in height, many are only two, and some wood executive mansions are entirely confined to the ground floor. There is always one grand zala, or salon, for receptions, annual dances, etc.; a waiting room, where you await the pleasure of "his highness the nabob," and are supposed to arise and remain standing when "his almightiness" makes his appearance and rapidly runs through his list of callers. The governor being usually a soldier, disposes of his visitors with refreshing military celerity. Pity our American law courts are not handled by soldiers!

Cibirian Educational Institutions.

Fourth, architecturally considered, on the list of buildings in Cibiria are the schools, seminaries and the few technical institutes and museums. These are never more than a couple of stories in height. They are mostly of wood (tree lengths) and plaster, and all have double windows, to exclude the cold and prevent condensation of moisture on the glass. This last precaution is usually a failure, as the joints are not air-tight, and consequently air circulates between the outer and inner windows.

Through Cibirian Prisons.

Fifth and next in importance in size of buildings, are the hospitals and prisons. My visits thereto, especially the latter, have already been described in FOREST AND STREAM, and more extensively in the medical press, particularly the (Manhattan) Medical News.

Since it always interests readers, I may repeat that George Kennan's exposures in the Century over a dozen years ago, did a lot of good. All that he wrote, as before pointed out, was true; in fact, not true enough; but the conditions he described exist no longer. Of course the Russ will not admit the change is due to Kennan; but it is significant that Kennan's exposé sprung a sense of shame into the guilty ones.

Cibirian Domestic Architecture.

Now we come to the domi or houses in common of the Cibirian inhabitants. Rarely are two stories encountered in the townlets; but in the towns, they are common enough, and even in places like Ipkytck, Iakytck, Omck, Kpacnoiapck, you will see some of three flights. They are always of wood. Fireplaces or stoves, as we know them, are unknown. One big stove and oven combined serves to heat a four-roomed house. By being placed in the middle of the house, exactly in the center of the dividing room-walls, the chambers are equally heated simultaneously. I must admit the heating and ventilation of Cibirian houses in winter is efficient, with all its crudeness. The home of the poorest Cibirian mujik is better off in this respect than that of the fellah of Egypt in the cool (often too cool) season, or of the atorante of the Chilean Andes, or the miserable drafty hut of the walla south of the Himalayas. The Asiatic slaf is often better housed than many European peasant families.

My own range of architectural observations and travels has extended from America to Argentina, Albion to Australia, Canada to China, Hispania to Helvetia, India to Italia, France and Germany to Mexico, and Korea, and from Japan to the whole of northern Asia; but in no speck on this mundane sphere is there less of interest to the builder and architect than in that huge part of the globe known as northern Asia. North America has its glory in its modern buildings, and the prehistoric monuments of the Indians.

The Trans-Cibirian Railroad.

A paragraph on this railway, for the edification of western travelers across Cibiria. I have already most fully described it, technically and generally, illustrated with scores of views, in journals like Railway and Locomotive Engineering, Manhattan; Railway Age, Chicago; Railway Magazine, London, and have had to sum up against it in every case. It is throughout a second-grade road, and will not for another quarter-century even begin to compare with a first-class American railway. The "quick time" we occasionally read of as being done on it—"Moekba to Port Arthur in fifteen days"—are only isolated instances of speeding, engine and one car. If you were to do the journey, say, next summer, it would take you from twenty-two to twenty-six days to get through.

Two Streaks of Rust 5,000 Miles Long.

In the engineering press I have already expressed my views of the fate of the trans-Cibirian after a couple of decades. It will but serve as an impulse to the construction of more southerly trans-Asiatic railroad systems, free from the wintry obstructions and rigors of the Cibirian climate. This competition would mean commercial ruin to the Russian road, and we should ere long see its 5,000 miles of track rusting under very limited local requirements and military transport.

As it is, the trans-Cibirian is operated at a heavy loss. True, it has all the traffic it can manage, but as this traffic is mostly governmental, it does not yield a penny of profit. Two-thirds of the passengers are officials—of course, traveling on free passes. In short, I do not believe the road will in any year for the next twenty years, show a margin of profit over operating expenses—a pretty white elephant indeed. But then it must not be forgotten, the trans-Cibirian was built for military reasons. Its commercial possibilities were entirely subsidiary.

Careful Packing Necessary.

Goods traversing Cibiria could not get a rougher handling in any other part of the globe. The tarantas is the native vehicle of transport for passengers (apart from the railroad), and the telega for goods. Neither have springs, so the shaking up can be imagined on the torture roads. Both these conveyances are four-wheeled, and used only during summer. In winter, it is the sani, or sledge. So that, outside of the railroad, sporting goods sent to Cibiria will have to be strongly packed, and yet easy of inspection in a strongly suspicious country, where even a sheet of model patterns is submitted to the frontier censor before it is allowed to pass. It is for this reason that forwarding agents on the Russian frontier have a lucrative calling, seeing after repacking and forwarding of goods that have been dissected by the frontier customs. For this, they charge the Cibirian merchant an agreed-on rate.

L. LODIAN.

[TO BE CONTINUED.]

A Game Dinner I Did Not Eat.

MEMORY is proverbially fickle, but there is perhaps no matter about which it so often suffers total eclipse as that of the dinners we have eaten. Failure to recall the kind of food of which we partook at a given feast, the people we met, and the character of the talk constitutes one of the surprises of life. It is the more unpleasant because it involves a measure of thanklessness of which we would not willingly be guilty. We want to remember dinners, if only out of gratitude to the friendly hosts under whose hospitable mahogany we have thrust our legs.

But endeavor to recall them leads only to a vague and indefinite consciousness of this or that dinner. What there was to eat, what we saw, whom we met, what we heard have disappeared as if they had never been. If any detail remains, it is likely to be the talk; which would indicate that it is what we hear, not what we taste and see, that abides longest with us.

It is a curious fact this failure of memory to preserve the details of occurrences which at the time were deemed of much importance. For unless digestion and that feeling of comradery common to all men were wholly lacking, we had when eating these dinners a very definite impression of their goodness or badness.

No doubt, however, the very frequency of dinners tends to obliterate details from memory. To the ordinary diner-out dinners come in such rapid succession that the details of one runs into another, and so quickly become confused and lost. The man who dines diversifiedly—at a private party on one evening, at his club the next, and again at a quasi-official function—does so too often to retain any lasting impression of a particular feast. If he dined only on Christmas Day, the dinner might become immortal.

Then, too, there is a certain monotony about dinners. In the very nature of things, the food itself cannot greatly vary. There is the same general foundation upon which its superstructure is reared. The difference is chiefly in the degree of comfort and content which one experiences, in the brightness or dullness of the talk, and the character of the decorations. And these depend on the composition of the company and the taste of the host. Neither the things eaten nor the quality of the cooking do much to reinforce the memory of any particular feast.

Of course there are exceptions to this general rule—cases where the food is the chief attraction, when what is eaten longest endures in recollection. Again, there are instances when failure to partake of certain dishes, when the mouth, so to speak, was set for special viands and disappointment ensued, cling most tenaciously to memory.

I recall a "poudre" day on that lake in the far north from which the continent abandons its northeasterly trend and slopes squarely away toward the Frozen Sea. Now, a "poudre" day in the open is not a thing to be pleasantly remembered. For it means a day on which the spirits in your thermometer sink down toward the bulb and stay there; when the cutting wind so fills the air with frozen snow crystals that all landmarks are lost, and the range of vision is limited to your leading dog; and when the struggle against cold becomes a fierce fight for existence.

The morning had been pleasant enough. When we left our night camp in the pines and descended upon the ice, the white expanse rolled away clear and distinct before us. The two dog trains held steadily toward the north, the drivers, with blanket capotes pulled close, having little to do.

It was not till the first traverse had been covered and we emerged from the lee of the projecting point upon which we had taken breakfast to enter the broader expanse of the lake, that the wind began to rise. At first it was a mere breeze, a thing that only twists the smoke above the lodge poles. Then miniature coils of snow began to circle over the smooth surface, followed by drifts of larger proportions, until all landmarks were lost in the swirl of the tempest. The cold with such a wind was intense. To sit in the sledge was to freeze; to run against the bitter blast was well-nigh impossible.

Still we struggled on, the dogs with low-bent heads, the half-breed drivers muffled to their ears. Nothing was visible a dozen yards ahead of the sledges, and our shouts to each other were lost in the roar of the storm. After a time the dogs began to give way and to face about in the harness. The men kept on from the mere impulse of progressiveness and the knowledge that safety lay in rapid motion. But it was two o'clock in the afternoon before we made the projecting headland which marked the end of the traverse and climbed up the bank among the pine trees.

Now, a pine-clump is not an inviting habitation with the snow two feet deep and the temperature at thirty below. But, coming out of the wrack and drift of the tempest, it was a veritable haven of rest. It was the more welcome because in the midst of it was piled high a circle of snow, within which the ground had been scraped bare, and a good fire of logs burned brightly. Dog gear hung in the branches of the scrub; two sledges were close at hand, and, standing about the fire, were a Scotch "company's" officer and his two Indian drivers. Never was greeting more hearty. Even the dogs bayed a welcome, only prevented from becoming warmer by the shouts of the men.

As every camping party in the woods is communistic in its tendencies, the snow circle was quickly enlarged and piled higher to form a break against the wind. Harness, extra moccasins, etc., were hung in the trees to keep them out of the way of the dogs. Then more wood was cut, the kettle filled with snow and set to boil, and provisions unpacked from the sledges. There was not much of the latter left, but what there was was the best of its kind—moose nose, briskets and tongues, berry pemmican, with steaks of the wood buffalo traded the day before from a Chipewyan hunter, and plenty of tea.

The Scotsman's pots were already boiling merrily. A few frozen whitefish were thawing before the fire, to be transferred, a little later, to the skillet. Most welcome sight of all were the Scotch bannocks, the sweet cakes and sugar which the trader had brought from the fort at the forks of the river. Indeed, no vagary of the appetite is more singular than the yearning one develops for bread and sugar after a continuous diet of pemmican, moose meat, grease and tea. With a bakery on every corner, the devotion of the small boy to sweet-cakes and crullers is a matter to smile at. But eliminate flour and sugar from the bill of fare on a fortnight's sledge journey, and the taste of them is a gratification one would not lightly forego.

Of course the dogs were hungry, too. Capitaine had eaten his boots, and Mistatim, that thief of the world, had been caught gnawing at the lashings of a freight sledge. But it was early yet to feed them. So they had been driven off, and seeing no sign of dried moose meat cutting, they had rolled themselves up into separate balls on the lee of the tree trunks or sat on the top of the snow circle watching us, like an audience in an amphitheatre. Not a movement escaped them, and when the pots had done boiling, and the fragrance of frying fish reached their nostrils, excitement and desire to share the feast showed in every shining eye and quivering muscle.

Beyond doubt it was a dinner that the most blase diner-out might have longed to eat. Moose nose, trembling and opaque as a vegetable conserve; delicious tongues, juicy buffalo steaks, fat whitefish hot from the pan, pemmican and Saskotoom berries; hard, crisp bannocks, round sweet cakes and tea with sugar in it, all spread out on a canvas sledge cover. As Mr. Squeers would have remarked: "Here's richness!"

True, save the fish, it all came on the board in one course. But refinement of cookery and multiplication of courses are only a mockery and delusion to men who have tramped fifteen miles in a blinding snowstorm since breakfast. Moreover, it fulfilled Thackeray's idea of a dinner, in that its chief object was to feed the guests. Flowers, he insisted, had no place in an atmosphere composed of the fumes of ham and gravy and soup. "Have the central ornaments as handsome as you like, but be hanged to the roses, I say."

Now, the central ornament in this case was the pot of moose nose, and the side decorations the six hungry men squatted about the cloth. They were very, very hungry. And the way they set to promised to reproduce the feasts of, say, a century ago, when dinner parties began at three in the afternoon and ran their course through the whole evening.

I recall that we had just finished the fish when an exclamation of the half-breed drivers called our attention to the dogs. It must be confessed that the spectacle presented was not a cheering one. For the hungry brutes, excited by the savory odors of the meal, and yet denied food, had fallen foul of each other, and in an instant were engaged in a general melee. There was no divisions into parties, one against the other. Every dog did battle on his own account, indifferent whether he attacked the head of the foe nearest him or the tail of the one in front. The entire snow barricade and the regions about it was transformed into a battlefield. The round balls at the roots of the trees uncoiled themselves, and, leaping into the fray, bit and tore the first adversary

they found. Dogs fought singly, in couples, in quartettes. Then the whole mass seemed to roll itself into one huge ball, from which projected innumerable tails and multitudinous legs. Huskie, Yukon and yellow mongrel were tangled in an inextricable knot.

Inevitably the excitement communicated itself to the men. Into the struggling, yelping throng they pushed with whip and club. But for a time blows seemed to have no effect, other than to intensify the strife. For every dog struck, thinking himself bitten by an antagonist, only fought the harder. But the lashing and the shot-like imprecation began in time to tell. Little by little the fighting pack separated until the last half-dozen dogs released their holds and with a wild scurry dashed across the camp.

Alas, with that dash our game dinner disappeared. For every dog in his wild leap from the snow wall struck the center of our improvised table as unerringly as if shot from a rifle.

It was all over in a twinkling. The tremendous impact of the flying pack left nothing of the feast. Pots and pans rolled away overturned, like toy balloons in a gale. Moose nose and brisket mingled with tongue and pemmican in the half melted snow and mud about the campfire. A half-burned log whose projecting end had been struck by the leaping dogs, turned somersault and lay across the tablecloth, its further end resting in the pan of Scotch bannocks. And Mistatim, true to his thievish instinct, was bringing up the rear of the flying column with his mouth full of sweet cakes!

The night came softly down. The gray owl sounded his lonely cry, the pine tops stirred in the wind and the aurora streamed down like a great tent dyed in all the colors of the rainbow. The dogs, full-fed with dried moose meat, curled into balls about the tree trunks. The men on their beds of pine brush pulled the blankets closer and tried to sleep. But never from the waking brain went the consciousness of something lost, the longing for a game dinner they did not eat. MARTYN.

The Call of the Wilderness.

COLD FOOT, on the Koyukuk, is a far cry from New York city, but I have just had news of a man who stepped from one antithesis into the other. From the lofty mountain at the head waters of the Koyukuk, the polar ocean is visible, and if there is a colder or more inaccessible region anywhere, it can only be in the constantly lessening portion of the Arctic waste that has never yet been trodden by the foot of civilized man.

Shortly after my return from Alaska in 1898, a stranger introduced by a mutual friend, called on me in a New York flat, and asked about the new mining country. He was the manufacturer of an artistic specialty, well along toward middle life, with a wife and family, and a successful business. He was unfamiliar with the rudiments of camp life and had never been in a cold country.

His questions ranged from moccasins, muckluks and metasse through all the details of outfit and supplies, to maps and routes and the latest mining strikes, and though he made no explanation, and in view of his age and the settled certainty of his life, the idea seemed preposterous. I was forced to believe that he contemplated a prospecting trip into one of the hardest and most dangerous countries men have ever penetrated in search of gold.

I will call his name Brown, as possibly he might object to having the history of his tenderfoot days recalled.

I told Brown that the Klondike was a sucked orange, and that as far as the average man was concerned, the gold might as well be in the sub-treasury in Wall street, and I did what I could to dissuade him. He persisted, however, in getting at all I knew of the mining country, and among other things I told him of the coarse gold strike on the Koyukuk.

After that the conversation centered on the Koyukuk, though I knew next to nothing of the country, and that only by hearsay. Two facts seemed to satisfy him—gold had been found there and the country was difficult of access, and, therefore, not overrun by prospectors.

A year later I met the mutual friend to whom I was indebted for Brown's visit. In the course of the conversation, he remarked, "By the way, Mrs. Brown has had recent news from Mr. Brown. I suppose you know that he went to Alaska?"

I told her that I had not known, but that such being the fact, I felt sure I could name the part of Alaska to which he had gone, and upon mentioning the Koyukuk, she said I was right. When Brown went away he had cautioned his wife to tell no one of his destination, and she had kept the secret till it became impossible—for nearly a year.

He had turned his business over to a brother, and had for the time being cut away all connection with his old life.

A year later I heard that Brown was home again on a visit, but I could get no definite information as to his success. He went back to the Koyukuk, and for two years more I heard nothing of him. Finally, last fall, I learned that after four years within the Arctic circle, Brown was coming home again, this time as owner of one of the best of the placer claims in the whole mining country.

Mr. Brown is no longer a tenderfoot. A Seattle paper, before me, quotes him as a "pioneer of the Koyukuk," who "joined in the 1898 stampede and located on Myrtle Creek, the oldest as well as one of the richest creeks in the camp." The paper treats his conclusions as to the richness of the district with deference, and quotes him at length as to the probable output of gold, Dry, Vermont and other producers. not failing to mention the "distressing scarcity of water during the past summer" as a factor in lessening the output.

I am glad that Brown has been successful. He is a Scotchman and his racial persistence has got him what he went after. The thing that interests me most in him, however, is the motive which impelled him to give up at the eleventh hour the comfortable things of life for the uncomfortable. It was, I think, a reaction from and a rebuke to the refinements of our modern way of crowding the most people into the least space and teaching them to get along like babies reared in a barrel and fed through the bung hole by artificial means, substituting oxygen for ozone and electricity for sunlight, that made him choose the cold and blackness of the northern night. Crowded cities have some advantages, but for those in whom the old adventurous spirit still lives, the wilderness never had greater charms than it has to-day. J. B. BURNHAM.

One Kind of a Moose Hunt.

EARLY last summer something told me that I ought to have a nice moose head to add to my collection of hunting trophies, and with the hope of being able to secure this, I left New York by way of the New York Central Railroad at 7:30 P. M. on Sept. 29 last.

The following morning at 9 o'clock I arrived at Montreal, and after looking to the transfer of my baggage, and seeing to its passage through the hands of the custom house officers—which caused me not the least bit of trouble—I then spent a couple of hours looking around the city, leaving there at 12 o'clock over the Inter-Colonial Railroad for New Castle, Northumberland county, New Brunswick. Along toward evening we passed by on the opposite side of the river from that old and interesting city, Quebec. From our train we had a very good view of Dufferin Terrace and Montmorency Falls. I had spent some little time there just sixteen years previous, and this old city, surrounded with its walls, sitting on a high bluff, looked just as it did on my former visit.

From Quebec the ride to New Castle was not particularly interesting, as the road lay mostly through timber land. After an early breakfast on the train the next morning, our train pulled in to New Castle at 7:25, and I was met there by the man sent by Mr. John Robinson, Jr., game overseer of Northumberland county, with whom I had previously corresponded, and who had made all the arrangements for my hunt. He drove me down into the town proper, which lay alongside the Miramichi River, and there I found Mr. Robinson waiting for me. (I want to take this opportunity to commend both Mr. Robinson, as well as my guide. The former for the very careful manner in which he attended to my arrangements, as to securing guide, license, provisions, etc.; and to the latter for his untiring efforts toward making my hunt a successful one.)

Soon after the arrival of my guide, Mr. Carl Bersing put in an appearance, and as all our camp baggage and provisions had already been arranged for and sent out ahead by Mr. Robinson, we loaded my personal camp baggage on a two-horse spring-wagon and departed on our forty-mile drive to the first camp. A couple of hours out we picked up our cook, and at noon stopped at Ways, twenty miles out, the last house among the settlements, for lunch, and immediately after leaving there we entered the timber land. Worse roads than we encountered during the remainder of the forty-mile drive I have seldom found.

Just before dark we stopped at a little run called Stonybrook, where we "boiled" (the Provincial term to indicate building a fire, making tea and getting a lunch). Leaving there, we journeyed on to our main camp called Sevogle Cabin, where we arrived at 10:50 P. M., or a little more than forty-eight hours after leaving New York.

We found the camp, a log cabin, with wood floor and birch bark roof, to be both warm and dry, with a stove in one end and bunks in the other end. The cabin had just, two days before, been vacated by Mr. George Dominick, Jr., of New York city, who had spent a couple of delightful weeks there, during which time he had secured a nice moose; but while absent from camp one day a bear came in and ran away with the scalp of the moose. They never again saw either the scalp or the bear. On my arrival at New Castle, I had received a short note from him telling me of this, and saying, "If you see this old bear give him one for me, too." When I read this note I had little expectation of seeing this or any other bear; but subsequent events turned out differently, and this only goes to show what a degree of uncertainty attends hunting.

Early the next morning, we packed up some provisions, our sleeping bags and a small canvas lean-to and took the trail to Peabody's Lake, a distance of about four miles, there to go into camp and try our first luck at moose hunting. We walked (as I might say, we always did, there being no horses or trails for horses in that section) all the way through close timber. When about half way out a young bull moose came out on the trail a short distance ahead of us, but on hearing us quickly ran out of sight. He had but small horns, and we made no attempt to secure him. It was a very interesting sight to me, however, as it was the first moose I had ever seen outside of captivity, and I was greatly surprised at the appearance it presented.

In color the body was a dark brown and black, while the legs shaded off a little lighter. The ears seemed very long, and he traveled and looked to me not unlike a mule; in fact, he looked so different from what I had expected that it took me a few minutes to realize that it was not a domestic animal.

On our arrival near the lake we stopped to make camp, but first walked to the lake to take a look for moose. I found it quite a pretty body of water, very shallow along the edges, about three-quarters of a mile long and one-half mile in width, and surrounded on all sides with heavy undergrowth and timber, right down to its edges. We saw nothing, so we returned to the camping place, and the boys proceeded to make camp, put up the tents, and get lunch.

They built what they called an "A lean-to," by putting up two posts about five feet apart, with a small pole across the top, and stretching canvas from this pole at an angle of 45 degrees back to the ground, about eight feet, thus leaving an opening in front, directly in front of which a camp-fire was then built; and in this open tent, or lean-to, we slept comfortably.

Toward evening we went back to the lake, hauled out the boat, which we found hidden in the bushes, and rowed across, where we stationed ourselves behind an old treetop, and Carl then proceeded to give the moose call with his birch bark horn. This horn was made of birch bark rolled up and fastened with a string, making an opening about three-fourths of an inch in diameter at the mouth and four inches in diameter at the big end and about twelve inches long. After calling for some time, and getting no answer, we rowed out into the lake and caught a fine string of trout for our supper, after which we again returned to the shore and called until evening, but without success, returning to camp just as darkness was setting in.

Carl soon had a fire going, and in the absence of a frying-pan, he cut a "skiver," stripped some trout on it with a piece of bacon between each, and sticking one end of the "skiver" in the ground and the other end in front of the hot coals, he soon had the trout broiling nicely.

The following morning we were up at daybreak, and again at the lake, calling. After about an hour's time a big cow moose came out to the lake on the opposite side and stood in a listening attitude for some little time. Then she started to walk along the edge of the lake in water about eight inches deep, and continued on around until a little more than one hundred yards from where we were stationed, and there she turned and walked off into the timber. We heard her walking and thrashing around in the timber near us for more than an hour. We saw nothing more, and late that evening we returned to our main camp at Sevogle Cabin.

The next morning we packed up and started for Clearwater Camp, twelve miles distant, Carl, Will the cook, and Fred the packer, all carrying packs on their backs. After a tramp of five hours, at all times through dense timber and underbrush, and over mostly a flat and at times very swampy country, we arrived at our destination, and after eating a lunch, Carl and I went to the lake, and we again tried calling, but without success.

Our camp at Clearwater I found to be a cabin constructed somewhat similar to that of Sevogle, but not quite so large.

The next morning Carl suggested that we take a walk up along the brook a few miles and see what signs we could find up that way. After walking a mile through dense underbrush and timber, we sat down on a log and listened for something, but heard nothing, and again continued on about another mile. We were moving quietly along the trail, when we heard a slight noise to our right, close by the trail; and on looking first saw a slight movement of a bush and then what appeared first to me to be a big log or stump, but which on second examination I found to be a big black bear. He lay partly crouching by a log, and just 21 feet from where I stood. I fired two shots quickly, both striking him in the back of the neck—the first one for myself and the second for Mr. Dominick—and he dropped. After making sure that he was dead, we went to him and found a very nice specimen, measuring 4 feet 10 inches across his forearms and breast, and 6 feet 9 inches long from the tip of his nose to the end of his hindfeet when lying on his back, without being stretched. His hindfeet measured 7 inches long, and we supposed him to weight about 400 pounds.

I am free to confess that my first sight of him gave me somewhat of a start, and for a moment we thought we would surely be in for a scrap. After Carl removed the hide and head, we then returned to the camp, where we arrived about 4 o'clock, first having cached the skin and head just outside of the cabin.

Immediately upon entering the cabin, we lamented about there being no game in the country, etc., and about our luck in not securing anything, and I told Will the cook that I had fired a bullet into a tree to see how it would mushroom, and showed him the bullet I had gotten out of the bear's skull. After commenting a little on it I told Carl he had better bring a piece of the tree in and show it to Will; and a few moments afterward Carl stepped into the doorway with the bear skin and head, with its mouth open, and said to Will, "There is the tree." He was lying down on one of the bunks at the time, with his back to the door, and turning his head, looked over his shoulder to see the section of the tree. On seeing the bear's head and open mouth he gave one jump and landed in the middle of the floor, regardless of his lame leg, and exclaimed, "For the Lord's sake! if I had known these animals were roaming around these woods I never would have stayed in camp alone without a gun."

It furnished a topic for conversation for the remainder of the day, and a couple of hours afterward I heard him say to Carl out in the woodyard, "I might have known you fellows were lying, for I knew you had no ax with which to chop a tree down."

During that night it commenced to rain, and was still raining the next morning when we got up, and in fact continued to rain the whole day long. Notwithstanding that, however, we left camp about 1 o'clock and still-hunted until dark, returning to our camp wet through.

The next day we spent a couple of hours in both the morning and evening at the lake, calling, and still-hunted the balance of the day, but without success. The following day we decided we would take the trail for Bald Mountain, fifteen miles distant.

We traveled all the way through an unbroken forest, following a blazed trail most of the way.

Along about 4 o'clock in the afternoon, when just about a mile from South Fork Brook, where we intended going into camp for the night, we saw a bull moose close by the trail, and although he stood for a few moments in plain sight of Carl, yet he was in such a position that I was unable to see him until he started to run away. He ran some distance parallel with the trail and then came out on it, but I did not fire at him. I afterward thought, and still think that I should have done so, but my reason for hesitating was that I thought I might only wound him, and felt that unless I could stop him I would prefer losing the chance rather than that he should go off wounded.

When we went into camp I felt as though I would

ave liked to have been any place in the world but here, and I have an idea that Carl wished any other ellow in the country had been there instead of me; ut gradually our spirits arose, and we turned our inds to expectancy of the next day, and subsequent vents proved it to be a big day.

We were up at daybreak, and after a breakfast of iscuit, butter and coffee, we again hit the trail for Bald Mountain, still some four miles distant. Up to this ime we had been in camp ten days, and with the exception of some trout, some grouse and one meal of poiled ham, we had not a bite of meat.

We had left our main camp with a very light provision supply, feeling certain that it was time for our uck to again change and bring us some fresh eat.

On our arrival at the foot of Bald Mountain we sat own on a ridge overlooking the first open country I ad seen since coming into the forest. We soon saw young bull caribou pass along the side of the moun- in some eight hundred yards distant; but he was too r away to try to get him, and was traveling pretty st, so we concluded to let him go.

After watching him until he disappeared, we again aded up our packs and passed down the side of this nall ridge, across the divide and up the side of the ountain. We got to the top, which was not over 000 yards from where we had first stopped, and from ere we could see a big lot of country, most of it open nd mountainous. While there, we discovered a cow oose some two miles distant, passing along the edge f some timber.

After a stop of perhaps ten minutes we took up our acks and started down the side of the mountain to our rposed camping place, which was not more than 1,000 rds from where we then were. When perhaps one- ird of the way down, I stopped and said to Carl, "See ere, I believe that is a deer." He said, "I can't see ything." But drawing him to one side, he saw it, d said, "No, I believe it's a young caribou. Take our glass and look." I took my glass, and at once saw at it was a young deer. Carl said, "Take him, quick, r meat," and I fired. The deer jumped and disap- ared behind a couple of small pines, and I thought I d missed him. We ran down, and perhaps when out one-half the distance to where the deer had opped, I saw another standing slightly to one side. I ed at it, and it dropped, and I said, "Well, we have at st gotten some fresh meat."

We walked down to where the deer lay, and laying wn our packs prepared to take a snap shot of it. hen just in the act of doing so, I looked up and saw cow caribou coming up the hill right towards us. I id to Carl, "Look there!" He took his horn and ve a couple of caribou calls, and I ran down with my dak, and suceeded in getting a couple of snap shots her as she ran by. I then ran back to where the er lay, and was just in the act of pressing the button hen Carl said, "Look there!" I looked and saw a ll caribou coming toward us. I threw down the dak and grabbed my gun. He continued to come on ntil without about 125 yards of us, and then stopped. fired a couple of shots at him, but they did not seem hit him. One shot, Carl told me, went between his re and hind legs, and kicked up the dirt behind him, d he then started to run, circling around us.

As soon as he started, Carl said, "Let him go; he s only a small head." So I dropped my gun and took the kodak, and as he circled around us, I got a uple of snap shot pictures of him.

When he had gotten up on a level with us and in the en, I got a better view of his head, and saw, that hile small, it was very finely proportioned; so I ran ck and again grabbed up my gun and fired twice, and dropped. Just after he fell Carl called to me, There's your other deer!" I turned, and sure enough erc lay the two deer and the one caribou, all three in row, the two furthest not more than 150 yards apart. seems I had hit the first deer, not knowing it, and he d run behind the trees before dropping, so that I did t see him after first shooting.

This all took place in less time than it takes to write as I do not suppose there was an interval of more an five minutes between the first and last shot.

It certainly did make things lively for a while. I, wever, regretted killing both the deer, as I should t have shot the last one had I known I had gotten the st, as the meat from one of them was as much as could use. Again, had I known we would get the ribou so soon, I would not have shot either of the er.

We found the caribou head to be a very choice one, ough small, but the meat was unfit for eating; so after , we made good use of the deer. We took them to mp, and the remainder of our trip we enjoyed as fine eat as one could wish. What a difference a few hours' nc had made. The night before we had no meat in mp, both of us wore a disgusted look, and we were st about ready to turn back and go home. This night had two kinds of meat, three nice skins for rugs, e small but beautiful caribou head with nineteen ints, and one fine buck deer head, all as souvenirs of e of the most exciting day's hunts one could imine. During the afternoon two other hunters with o guides passing through that section went by our mp, and they were the only persons we saw on our p while in the forest.

The next day we returned to Clearwater Camp, get- g some more grouse on the way in. We also saw ore caribou, and were able to secure snap shots of me of them before they ran away.

We saw a big cow and calf moose, and succeeded in llowing them some little distance. When we came up thin 40 yards of them we found them looking our y. We could see the nose of the cow turned up as e sniffed the air, trying to get our wind, with ears awn forward and standing in a close, watchful and xious attitude. As I looked, I could not help but ink what a magnificent picture it would have made; t the underbrush was too dense for us to attempt a ture. The calf stood just behind her, and looked most as big. They soon became startled, however, d ran away, the cow leading, and as they passed an opening some 80 yards to our left, we got another good view of them.

One sees lots of interesting sights when traveling through a good game country, and while always anxious to secure some nice specimens as trophies of a hunt, yet these sights are not the least interesting part of the trip.

The weather thus far had been very cloudy and heavy, and the high winds doubtless interfered with successful moose calling. Then again, there had been no snow, making still-hunting very uncertain.

I understand that the snow gets very deep all through that section during the middle of the winter, sometimes as much as three to four feet deep on the level.

After a few more days of still-hunting, Carl and I moved our temporary camp up Clearwater Brook to what he called Christmas Pond, some four miles away. We went into camp about a mile from the pond, and spent considerable time calling moose at that place; and it was there, I might add, that the greater portion of this was written.

I remember one evening of sitting on a log behind some bushes with my sweater and heavy coat on and a blanket wrapped around me. Carl stood near by, every few moments giving the challenge call of the bull moose. I had heard this call so often that I sure did wish some old bull would answer, so that I could hear the original. We watched till almost dark, and then trudged back to our little camp, made a fire and cooked supper, sat around the camp-fire until about half-past eight, and then crawled into our sleeping bags, only to get out again the next morning, and try it again. Oftentimes, when on these hunting trips, when cold and tired, I wonder what ever possesses a fellow to leave civilization, families and all his home comforts to tramp out into the wilderness, and live the life of a savage as a matter of choice for a period of two to four weeks at a time. But, unfortunately, after the return from a successful hunt a fellow forgets the days when he tramped through mud and water, and was wet and cold from early morning until late at night, and came in disappointed; he forgets the nights he lay and rolled from side to side inside his narrow sleeping bag, almost frozen and longing for morning to come; he forgets getting up on a cold and frosty morning, sometimes without a tent and sometimes in snow; he forgets the time he sat down to burned meals cooked over a camp-fire, everything seasoned with ashes, and all thoroughly flavored with camp smoke; and he only keeps in mind the day of success when he returned to the camp with some nice trophies, with his mind still filled with the excitement of the chase, and with visions of the fine ornaments he has for his den, and of the stories he will have to relate to his hunting friends during the long winter evenings that follow.

While he doubtless returns every year with the determination that he will now rest on his laurels and lay aside for some long future year all his camping and hunting outfit, yet the next spring usually finds him looking around for some place to go for his next fall's hunt.

And now you have the story of my moose hunt without the moose. I was absent from home about three weeks, and secured in all one caribou, two deer and one bear, to say nothing of having plenty of trout fishing and grouse shooting.

Perhaps I may be permitted to return to that section next year, and if I do, maybe I can give you a moose story with a moose.

Natural History.

Buffalo Domestication.

Editor Forest and Stream:

I was very much interested in the report of the superintendent of the Yellowstone Park as given in the current number of the FOREST AND STREAM, particularly that part of it relating to the buffalo. The facts that he gives about the black bear only served to amuse me.

Those fellows are easily made pets of; and when the job is finished there is probably only one other animal that we are likely to make a pet of that will turn out to be a greater nuisance than the bear, and that is a pig. Either of them, when he is made a pet of, can always be found just where he is not wanted, and can be depended on to be found back there just as often as he is clubbed out of it.

The Park superintendent seems to think that after he has raised these buffalo in captivity, they may be turned out to be made pets of. The cows might be, but I should not care to be found in close neighborhood to a three-year-old bull unless I were mounted. He may be all right one minute and all wrong the next, and when he is offended—and it don't take him a year to get offended at some trifle, either—then the further you can keep away from him the safer you are.

If those Park buffalo are not kept under fence and watched the time will come, and it won't be one hundred years in coming, either, when there won't be any of them left; for, as long as a man can be found who is willing to pay several hundred dollars for one of their heads, just so long will some one be found who is willing to risk being shot to get that head.

When the FOREST AND STREAM gave its account of those private buffalo herds some months ago, I missed Charley Goodnight's herd among them, and thought that probably he had abandoned it years ago, for his was one of the first to be got together and he did not begin it any too soon; but on writing to a friend of mine, who has the W. H. S. Ranch in Hemphill County, Texas, he told me that the herd was still there. The buffalo were getting to be very scarce when Goodnight formed his herd. The year 1879 saw the last of them in that country, the Texas Panhandle, at least. The last buffalo I have ever seen, except in a park, was shot by a Comanche chief and myself in November, 1879, at what is called the Adobe Walls, at the head of the Canadian River.

Years before Goodnight began to get his herd together, he probably meant to cross the buffalo with domestic cattle. When he formed that herd, I had been thinking of trying to get some cattlemen to do just what he did; for all of us who gave the matter a thought could see that the buffalo would be gone in a very few years. A herd could easily have been formed then just as he no doubt formed his; the calves could be got then without any trouble. When our cavalry would be scouting in the buffalo country early in the spring, we would often surprise a bunch of cows and their calves grazing; the cows would run off, leaving the calves, which were too young yet to be able to keep up with them. Then the calves would often follow our horses all the afternoon, and when we camped they would remain with us and hang around our horses all night; the horses were used to buffalo and would not try to hurt them.

We could handle these calves; they were only a few weeks old and had no fear of us.

I often spent an hour working with them. I would first offer one of them salt, and after it had licked up the last grain it would next try to swallow my hand. They would eat bread out of my hand, and follow me for more of it, and they no doubt could soon be taught to eat corn. We did not have any corn with us or I should have tried them with it, also.

When we would be leaving in the morning, a man would have to be left back there to keep the little calves from following us.

I found by watching them that the older ones at least would eat grass. There is no doubt that these calves if put under fence, would have got along all right.

Capturing Alaskan White Sheep.

A Narrative of the Expedition Sent to Alaska by the New York Zoological Society. By J. Alden Loring, Field Agent to the Zoological Society.

SINCE the eminent naturalist, Mr. E. W. Nelson, in 1884, discovered and described the Alaskan white, or Dall's mountain sheep (*Ovis dalli*) they have been eagerly sought by the museums and sportsmen of the world, but owing to the great expense and difficulty of penetrating the country they inhabit, it is only within the last few years that naturalists have been able to secure groups for mounting. The distribution of the white sheep as far as known, extends over most of the mountain region of Alaska and extreme northwest British America. The mountains along the Knik River where I found them, rise abruptly from the river bottoms and are heavily timbered with birch, balsam, poplar, spruce and hemlock. This gives way to a thick growth of alder which terminates at timber-line. Between here and the rocks occurs a steep grassy slope of about two thousand feet, while the tops of the mountains are a mass of rocky crags. These slopes and crags are the home of the sheep.

Once in the heart of the sheep country, the collector faces danger and hardship before he succeeds in packing the speimens on his back, from the rugged mountain peaks down to the coast. To collect their skins for mounting was thought difficult enough, and the idea of capturing them alive for zoological parks had probably never been seriously considered until the spring of 1901, when the New York Zoological Society sent an expedition to Alaska, one of its objects being to attempt to capture lambs of the species under consideration.

Securing the adult animals with a lasso, while not impossible, was impracticable, for aside from the hazard of the undertaking, the chances of their surviving both the rough mode of capture, and the excitement of being transported from above timber-line to tidewater, were small. For this and other reasons, it was thought best that the expedition should attempt to capture the lambs only.

It was known that the "bighorn" of the Rocky Mountains, a species allied to the white sheep, was extremely difficult to rear in captivity, but owing to the latter species living in a moist climate, somewhat similar to that of the east, it was hoped that if they could be successfully transported to New York, their prospects of surviving would be more favorable than in the case of the Rocky Mountain animal.

Upon nearing my destination, the encouragement I received was far from satisfactory. While a few persons "thought it likely" the expedition would be successful, the majority were of the opinion that owing to the almost inaccessible places which the white sheep inhabit, and the strength and agility of the young when born, it would be impossible to capture the lambs. Others maintained that it was too late, as the lambing season was already at its height.

On April 24 the Alaska Commercial Company's steamship "Bertha," on which I was a passenger, poked her nose into the mud opposite the Indian village of Tyonook, near the head of Cook Inlet, and my outfit was soon unloaded upon the beach. Through the kindness of Mr. Thomas W. Hanmore, the "company's" agent, who, with his assistant, Mr. Finch, were the only white persons living there, I was comfortably quartered in a large log cabin.

I soon made the acquaintance of Mr. H. H. Hicks, who had just come out from the mountains where he had spent the winter. He had been in Alaska, prospecting, trapping and trading with the Indians for several years. He knew the country thoroughly, and could speak the natives' language fluently, so I engaged him to accompany me on the trip, and here I wish to say that I found his advice and good judgment invaluable. After several hours of conference with him regarding the locality we should visit, during which the advantages and disadvantages of many places were considered, we decided that the Knik Mountains, at the head of Knik Arm, an extension of Cook Inlet, were the most advantageous. By boat up the Knik River we could penetrate the mountains and would not

be obliged to transport the captured animals any great distance by land.

Snow to the depth of three feet covered the flat on which the town was situated, and in the timber on the high bluff back of Tyonook it was much deeper. As four years had elapsed since I had done any hard walking, or mountain climbing, I occupied the three days which were necessary to repair the boat that was to convey us to Knik, in taking long shoeshoe trips through the timber.

On the morning of May 2, in company with Mr. Hicks, McQuin, the owner of the sloop, and an Indian "deck hand," we left Tyonook for Knik village, some 75 miles northeast, where we hoped to secure our Indian help and prepare for the trip proper. It is useless for a small craft to attempt to navigate Cook Inlet unless the strong tides are in its favor, so we started with the first of the flood. Not a breath of air was stirring, so the oars were used most of the day, but late in the afternoon the wind rose and whipped the calm water into a choppy sea. On nearing the gap in the mountains at the mouth of Turn-again Arm, it blew almost a gale, and as though our helmsman did not have enough hindrances, floating ice was encountered, the bowsprit broke and we were compelled to furl the jib, which made it difficult to dodge the chunks. The storm tossed our little craft about in a most uncomfortable and alarming manner, and she frequently bumped against cakes of ice; a forerunner of what might be expected should we come in contact with larger pieces. Slowly we worked along under reefed sails, and at last ran in under the lee of Fire Island, and as the tide was turning, anchored for the night.

At the head of Cook Inlet, and in the adjoining arms are mud flats, miles in extent. At low tide these flats are exposed, and during the winter as the tide ebbs and flows, ice forms and increases with each tide, until it reaches the thickness of the highest winter tide, from eight to ten feet. In the spring these fields of ice break loose in great masses, and float back and forth with the tides, a severe menace to navigation, especially to small craft. So long as the floe is in motion a boat can float in its midst, but should the ice become stranded the entire pack jams and the unfortunate craft that is so caught is crushed like an egg.

A watch was kept during the night to fend off stray pieces of ice which might drag the anchor and set us adrift. When the tide turned in our favor it was too dark to proceed, and we lost two hours' time, consequently were unable to make Knik village on that tide. We spent the ebb tide on a mud flat and as soon as the water had gained sufficient depth to float the boat we crossed to the opposite of the arm, where large quantities of ice compelled us to take in the sail and float with the pack.

When within sight of Knik we saw that the ice on the flat in front of the village had not broken loose, but extended westward in a long arm; a wide channel of water to the south, and an extremely narrow one close to the north bank—the side we wished to take. At the

THE TWO LAMBS WERE CAPTURED ON THE OTHER SIDE OF THE MOUNTAIN BEHIND THE CROSS.

mouth of the channel the floe was so compact that for a time it seemed as though we would be unable to force a way, and would be carried up the other side of the inlet. While the men used their oars, I jumped upon the ice and crowded the boat into the passage, and we floated up a channel between walls of ice.

On nearing the village we were met by Mr. Tool and Mr. Palmer, agents for the Alaska Commercial and North American companies, respectively. Knowing that the channel opposite Knik was blocked, they had walked down the beach to warn us not to approach nearer, as there was danger of being caught in the jam at high tide. Acting on their advice we hauled in behind a chunk of stranded ice, and with the help of the natives, quickly unloaded the boat. When the tide turned, McQuin and his Indian "deck hand" started back. We watched them until they left the narrow channel and were lost to view in the ice pack.

Mr. Tool kindly placed his cabin at our disposal and assisted us in many other ways while we remained. Fortunately, I had brought my outfit from Seattle and was not dependent on the traders for supplies, for we found that neither of them had a pound of food of any sort for sale, and the Indians were sadly in need of provisions, although there was an abundance of game, but they were too lazy to hunt.

From here we had an excellent view of the range some sixty miles away; it was a mass of snow, and the Indians prophesied that we would have to use snowshoes, and said also that the ice in the Knik River had not broken up.

From Mr. Palmer I rented a large flat-bottom river boat, properly called a "bateau." The majority of natives had gone up the Matanuska River to a "potlatch" given by their kinsmen and we had difficulty in securing the three good men needed. At last Mr. Hicks made arrangements with two young men, known to the traders as Billy and Andrew, to accompany us. The conditions were that they should receive a dollar a day, and five dollars each for every animal captured. They were to remain as long as their services were required, and if they deserted the amount

"OLD BILLY" ON THE GRASSY SLOPE.

due them would be forfeited. The third Indian we hoped to secure had gone on a hunting trip, and learning that he was camped near the mouth of the Knik River we thought he could be found on our way to the mountains. The day before departing, Andrew coolly informed us that he had decided not to go, fearing he would not be paid. There was no other Indian capable of taking his place, so Mr. Hicks told him as he had accepted provisions on credit for his mother he must keep his agreement. On May 6 we bade good-bye to Knik; its apology for civilization, and left for the mountains.

From the start we encountered ice, but got away with the beginning of the flood tide, so managed to keep out of its way the first day. Near the head of the arm we saw smoke from Indian camps, and thinking that Jim's camp might be one of them, landed and prepared for night.

No sooner was a fire built than it was surrounded by a crowd of Indians. Upon learning of my object, they guyed my men unmercifully and said the plan was impossible. They gave me to understand that the young sheep as soon as born could climb with almost the agility and ease of their parents, and could easily escape both white men or Indians. While I had no doubt that we could capture the lambs, I did fear that they might not live.

Jim, who was with the party, had just returned from Hope City, and said that he had been told that a white man was coming from far away to catch sheep to "put in a box," as interpreted by Mr. Hicks. Jim was hired and left with us the following morning.

The ice was running so thick that the oars could scarcely be used and our small boat was in danger of annihilation many times during the day. Had it been nipped in the ice, we probably could have reached shore by jumping from cake to cake, but its loss would have meant certain failure to the expedition, for it would have been impossible to secure more supplies and return to the mountains in time for the lambing season. To say that I was relieved as the tide grew weaker and weaker, and we finally met the current of fresh water at the mouth of Knik River, and went into camp at midnight, well out of reach of the treacherous ice and tide, does not express it. To our joy we found that the ice had left the Knik River and that the valley was free from snow.

Here Jim left his family camped in a cabin they usually occupied only during the trapping season. The following morning after his squaw and daughters had made for him several pairs of rough moccasins, we continued our journey under new conditions. The river was swift and shallow and we were obliged to tow or "line" the boat; one person remaining in the stern to guide it, while the others walked along the bank or in the edge of the water carrying the towline. Several times it was necessary to lighten the boat and reload it again after passing over shoals. Quick-sand was a source of trouble as well as amusement, for one could not help laughing at his companions as they suddenly dropped the line and frantically splashed through the water to more solid ground. Jim ran no risk when at the head of the tow line, but carried an oar which he used to test spots that appeared suspicious, and to assist him when he did get into trouble. As none of the Indians were able to get boots off the traders at Knik, they were wet to the hips in ice cold water most of the time.

We made a permanent camp at the outlet of a small stream running into the river about thirty miles from its mouth. This was to be our base or supply camp, and by clearing away the brush and cutting down a few trees we had an excellent view of the mountains some two miles distant. From the time of our arrival, sheep were in sight constantly; three to the west and three almost opposite camp, while a solitary old ram led a hermit's life on a mountain a little to the eastward. We derived considerable pleasure watching "old Billy," as we named him, descend to his feeding grounds from the lofty retreats where he passed the night. His hunger appeased, he spent the day sunning himself on prominent peaks, or loafing about the grassy slopes until night, and then returned to the crags. One afternoon while I was away Mr. Hicks secured several fine photographs of the old fellow, who appeared little alarmed at seeing him. If the Indians or wolves have not killed "old Billy," he probably haunts that locality yet.

At this time of the year, the ewe sheep gather by themselves and keep close to the crags for protection. They become very watchful as the lambing season approaches, and at the proper time a female will separate from her companions and seek the rocks, where the lamb is born. It remains with its mother until strong enough to join the band. It was my intention to locate several bunches of ewes and watch them closely until the lambs appeared, then to attempt their capture. We intended not to approach nearer than was absolutely necessary to distinguish rams from ewes, which with the field glasses could be done from a distance of two miles.

We remained at this camp long enough to determine that all the sheep seen were rams. During this time Mr. Hicks and one of the Indians took a two days' trip to the westward and crossed the range, but saw no ewes.

It was about then that our Indians became troublesome. My mission was somewhat of a novelty to them. Undoubtedly they had expected to shoot everything they saw, and on learning that it would not be allowed they complained and became sullen. I called them together and explained that I had traveled a long distance to catch sheep, and could not permit firing, as that would frighten the animals and ruin our prospects, but they could not see it in that light. Jim said he was hungry for meat, and that he had never before worked for a white man who would not allow him to kill game. They had shown an inclination to disregard my orders, and once refused to leave camp because I prohibited the carrying of fire arms. I accused them of acting like children or old persons, an allusion that undoubtedly cut deep, for they dislike such comparisons. The climax was reached one evening when I saw a ripple some distance up stream, and believing it to be a muskrat, gave Andrew permission to shoot it with the twenty-two rifle, which would make little noise. After pushing the boat from shore, he discovered that the animal was an otter. Jim rushed into the tent for his large caliber rifle, which if discharged would alarm the game for miles. In answer to my command not to fire, he replied that the otter was worth four dollars and he proposed to kill it. Snatching my rifle, I threw it to my shoulder and shouted "Big gun scare sheep, no shoot, Jim!" Whether it was the tone of my voice, or the click of the lever as the cartridge slipped into the chamber,

BRINGING A LAMB DOWN FROM THE CRAGS.

that caused him to turn, I know not, but when he saw the muzzle of my "Savage" pointed at his head, he dropped his gun in the mud and replied, "All right, me no shoot," then jumped into the bateau and the two went in pursuit of the otter with the small gun only. While this incident did not prevent Jim from grumbling continually, he never again refused to obey orders.

Our two pairs of field glasses did not lie idle, for while some of the party were in camp scanning the mountains, others made excursions in the hope of locating more sheep, or finding a locality more favorable for our work. Having discovered that the sheep within sight were rams, we left the base camp on May 16, and with ten days' provisions went up the stream as far as possible, drew the boat upon the bank, and shouldering our packs of about fifty pounds each, continued on foot. At noon, after crossing a "muskeg" or peat bog, we stopped for lunch and while making tea a band of five sheep was seen high on the rocks almost opposite.

It is remarkable how far Indians can see game. Many times they discovered sheep with the naked eye that could scarcely be detected with the glasses. Yet, when one remembers that they never use their eyes in artificial light, and that from infancy hunting has been their only education, it is not so surprising.

Our next camp was pitched on the bank of a stream about 15 miles east of the one just left.

Jim had become very disagreeable of late. I noticed that he had considerable to say to the other In-

dians whenever Mr. Hicks left camp, and knew from his speech and manner that he was complaining. While I had no fear that he would do us bodily harm, there was danger of his influencing the other Indians to desert us, or, worse yet, persuade them to return to the base camp, steal provisions and then take to the mountains to hunt bear. Under these circumstances I deemed it advisable to pay him off and allow him to return home. This I did, after warning him to go direct to Knik, and saying that if I found his tracks about our base camp, or heard him shoot, I would burn his cabin and kill him when next we met; a bluff that worked.

During our stay here, Mr. Hicks and Billy patrolled the river bottom east of camp for a distance of about five miles, and with the glasses they could see sheep fully three miles further. They located eight ewes the first day, and watched them until May 2, when the band divided, leaving but five sheep for them to look after. It fell to myself and Andrew to watch the sheep seen west of camp, so in all we had fully fifteen miles of the best sheep country under close observation. Every morning we patrolled the valley a mile and a half from the mountains, occasionally stopping to look for sheep, and at a point five miles from camp, we made tea, ate luncheon, and put in the remainder of the afternoon watching the four ewes previously discovered. While lying in the shade for hours watching sheep may seem monotonous, nevertheless we found it very interesting work. Usually we had little difficulty in locating them soon after arriving at our station, but on several occasions, after watching nearly all day without success, we were about to return to camp when a ewe would appear from behind a point of rocks, then another, and another, until they all stood before us mere specks to the naked eyes. Again storm clouds obscured the mountains, hiding them from view, and when next seen they were perched thousands of feet above, on rocks so jagged that it seemed impossible for any creature other than a bird or squirrel to secure a firm footing.

For several days, two old rams had occupied a position some distance west of the ewes, but one afternoon they appeared to tire of their feeding grounds and sought new pasturage. Leisurely they made their way toward us, crossing snow-drifts, climbing over rocks, and pausing every few hundred yards to look about or munch a mouthful of grass. They did not make the astonishing leaps so often credited to mountain sheep, but, on the other hand, seemed reluctant to cross dangerous places. Carefully sliding over the face of a cliff, they clung as though deliberating, then gathering themselves sprang to the ground, and a few seconds later, assisted by the momentum, rushed up the opposite incline.

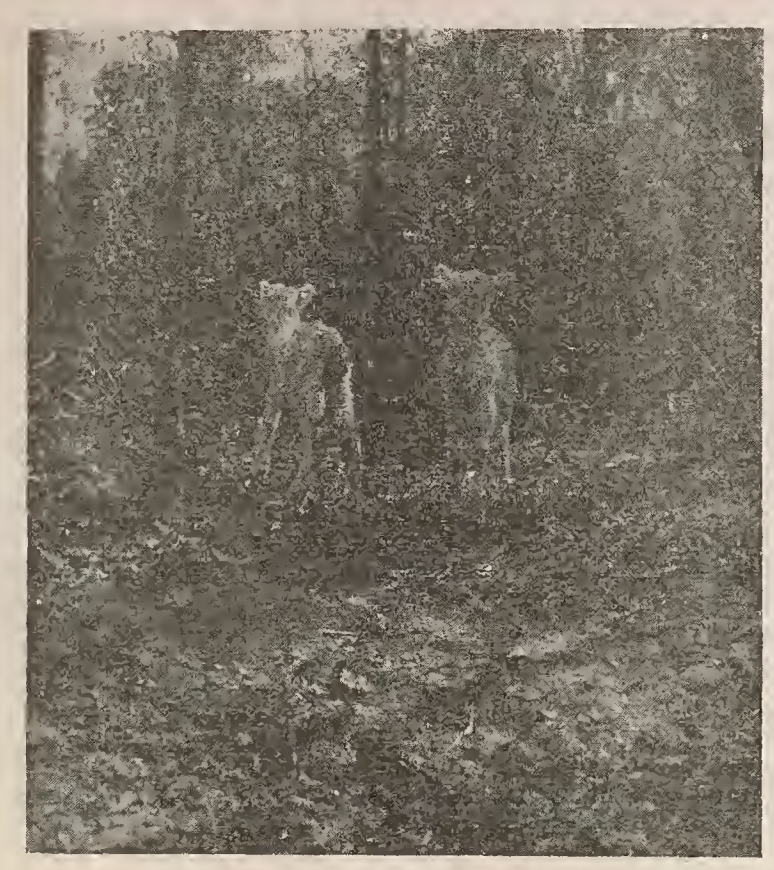
Every night Mr. Hicks reported on the movements of the sheep under his care, and one evening said that judging from the actions of one of the ewes, which did not mingle much with her associates, but lay about at the edge of the rocks, he thought a lamb would soon be born.

We had been watching the ewes a week, when one morning as we were about to leave camp, three sheep were seen skirting along the base of the rocks from the direction of the band Andrew and I had been watching. We correctly surmised that these were the ones, for after spending the day at our accustomed stations, we returned without having seen them. It was evident from their actions that they were not alarmed, but were simply changing their feeding grounds. The following morning, in company with Andrew, I started up the mountain to locate our wandering sheep, which, owing to the character of the mountains, could not be seen from the valley. From the top of a knob above timber-line we had a grand view of the surrounding country, but it was not until late in the afternoon that the sheep were located far to the eastward. They were in an almost inaccessible mass of crags and there was little chance of reaching them should a lamb then be born.

Shortly after returning to camp, Mr. Hicks and the Indian came in carrying a beautiful little lamb. Mr. Hicks stood it on the ground in front of him, and I took its photograph at once. It had become attached to him through being carried in his arms since noon.

For some time after Mr. Hicks and Billy took their station that morning, they were unable to locate the sheep, but finally saw a ewe walk from behind a ledge, closely followed by a lamb, and later the four other sheep made their appearance. As usual, they were in a mass of crags about half a mile above timber-line. After mapping a route, the two men began the hazardous ascent, and were crawling along the edge of a precipice, when Billy lost his nerve and trembled, so a halt was called for him to recover. In spite of Mr. Hicks' advice to keep his eyes above, it was so far to the bottom of the cliff, the Indian could not resist looking down. On nearing the lamb, they parted, Billy followed up the canyon to the right, while Mr. Hicks made a detour to the left and finally crept between the lamb and the ewes, which were separated by a few feet. The lamb was on a ledge of rocks hidden from the view of the old sheep, so Mr. Hicks allowed them to see him and they bounded up the crags and had soon crossed the divide unknown to the little one. Both men then advanced from opposite sides. At the sight of them, the lamb, which was lying down, sprang to its feet and scampered back and forth, but did not attempt to jump over the ledge. Finding both passages blocked, it seemed dazed, but as they closed in, ran into Billy's arms and was our captive. In descending the mountain, one of the men would climb over the difficult or dangerous spots, and take the lamb from his companion, who then followed. Strange as it may seem, the lamb struggled but little and did not bleat until after it had arrived in camp.

It had not been with us more than half an hour before it was attacked by the expected and dreaded disease, diarrhœa. I was well provided with medicines to cope with such troubles, and administered some at once. The lamb was inclosed in a pen made of poplar tree trunks, and took its capture quietly so long as someone was near it, but when left alone it became restless and ran back and forth, bleating and bumping its head against the uneven rails. Our first attempts at feeding it were somewhat awkward and amusing. It was perfectly willing to accept the condensed milk from the nursing bottle, in fact it was too anxious. If the milk did not flow quite to its liking it dropped to its knees, bunted at the person feeding it, switched its tail from side to side, and bleated and danced about so lively on its hind feet that it required a person to steady its hind quarters until after it had finished eating. The first night it worried and ran about so much that we



IN THEIR WIRE CAGE.

finally doubled its feet under it naturally and placing it in a piece of cheese cloth, brought the sides over its back and pinned them, then laid it on the blankets close to my head, where I could talk to and care for it. It finally went to sleep, but with every blast of wind awoke with a start, and after sniffing at my face a few times its little eyes slowly closed, and with each beat of its heart its head sank closer and closer until it rested on my cheek. I could not stir without arousing it, and lay in one position until forced to move, securing little sleep that night. As I sit writing, and occasionally glance at the enlarged photograph of the little fellow lying in one corner of the inclosure. I fancy I see him walking all over me, utterly regardless of my face or feelings. When it snoozed off I quietly stole away for a brief rest, but often had no more than straddled the rails when it was upon its feet bleating and running frantically about, and I was obliged to return to comfort it. It weighed eight and a half

MR. HICKS AND THE FIRST LAMB CAPTURED.

pounds, was ten and a half inches high at the shoulders, and two days after its capture had four front teeth.

It lived but a few days, for in spite of zealous care and treatment it rapidly grew weaker, and on May 27 it died lying on my blankets where it had slept every night, nor had it been out of my sight fifteen minutes, save when I was asleep.

After the lamb arrived I was unable to leave camp, but Mr. Hicks and the Indians kept close watch of the sheep we had relocated. It was of little benefit, however, for a continuous storm enveloped the mountains in clouds, giving us only an occasional view of them when the mist lifted, and at last the sheep were lost altogether.

Packing up we returned to the base camp and remained there until satisfied there were no ewes within the area of observation, we then pulled stakes and started down the river to a mountain which a month before was so covered with snow that we passed it by. An early camp was made to allow the men to unload the boat and pack the outfit around a shoal that a loaded boat could not pass over. During the afternoon two ewes and a lamb were seen high on a mountain on the south side of the river. It was then too late in the day to start in pursuit, so we spent the time planning a route and watched them until dark.

The following morning the sheep could not be found until about 9 o'clock. Not feeling well, I thought that my presence would be a hindrance to the party rather than an aid, so remained in camp while Mr. Hicks and the Indians started off.

When within a few hundred yards of the ewe and lamb, Mr. Hicks sent the Indians around to the left—the right side being guarded by a perpendicular wall—while he attempted to get above them. The Indians in a spirit of rivalry laid caution aside and rushing ahead, mounted a boulder in full view of the quarry. Of course the vigilant mother saw them instantly and made for the top of the divide, closely followed by her offspring. The lamb scampered over the rocks with remarkable agility for an animal so young, but was unable to keep pace with its mother. At one time, however, there was hope of its capture, for while crossing a deep drift it became fast in the snow, but finally floundered out and disappeared over the mountain.

Black bears were common. During the time we were in the mountains, fifteen were seen. They were usually found far above timber-line feeding on roots and the berries that had been preserved by the early snows of the previous year. One evening an old bear and two cubs were seen back of camp. The Indians were anxious to take after them, but as sheep were in sight I feared the firing would alarm them. They finally worked into a canyon where one shot could not be heard any great distance. Two of the Indians each took a gunny sack to put the cubs in, and Billy carried my .22 rifle, which Mr. Hicks had told him was all right, if he "shot the bear in the head." The idea of an Indian attempting to kill so large an animal with a ".22 short" was amusing. I think that Jim understood that it was not quite the kind of arm for that purpose, for he did not seem particularly anxious to join in the hunt. I had my "Savage" rifle, so there was no danger of the bear injuring us should it become infuriated. Unfortunately our fun was spoiled, for the bear either heard or scented danger and escaped.

June first found us in a new camp on the bank of the river at the base of a high mountain somewhat isolated from the main range. The following morning we shouldered light packs, and after a hard climb reached timber-line and followed a steep grassy slope between it and the rocks, until we reached a position directly opposite our camp on the other side of the mountain. We camped, and after eating luncheon crossed a small stream and valley to a ridge where an excellent view of the sheep country was had. A band of five sheep came into sight over a rise of ground, and twelve more soon followed, but there was not a lamb among them. This fact established, the glasses were turned upon the rough mass of crags directly in front of us, which had been scrutinized once before, but without success. From the animated manner of the Indians, I was certain that something unusual had attracted their attention. After a few seconds Billy handed the glasses to me and pointing to the rocks said, "Little sheep, one!" Sure enough, there was a lamb and its mother carefully picking their way down the mountain. Camp lay directly in our route and we were about to start, when the ewe suddenly ran to the top of the mountain; the lamb attempting to follow. After describing a wide circle she returned and the two lay down in almost the spot where first seen. Evidently she had been giving the little one a practice run.

The slope for a few hundred yards below the rocks was extremely steep; so steep in fact, that I found it necessary to crawl on all fours. The Indians kept well ahead of me until we reached the crags, when I put on moccasins and was then able to keep up with them. From fear of detection, we were unable to select the most favorable places, but after crawling along ledges and scrambling over peaks managed to reach a position well above our game. In the meantime, the ewe and lamb were lost sight of, and the Indians in their eagerness to secure the honor of finding the game ran great risk of scaring it, and finally became so reckless that I ordered them back and kept them with me while Mr. Hicks cautiously crept to a high bluff and scrutinized the country. He soon returned and informed us that hidden by the rocks not more than three hundred yards above was another ewe, but he was not certain that she had a lamb. Protected by a high point, we worked carefully along; many times it seemed as though we could advance no further, but a narrow pass, or niche in the rocks where a footing could be secured was always found, and we managed to sneak within one hundred yards of the ewe and found a lamb lying by her side.

The mother seemed reluctant to leave the little one, but when finally she walked around a point out of its sight we allowed her to see us and she hurried off and was soon lost to view. In attempting to get above the little one we lost sight of it. While I held the Indians back, Mr. Hicks climbed a cliff and signaled its position to me. I then sent one of the Indians to the opposite side; stationed the other one below it, and then Mr. Hicks came down from his perch and the lamb was surrounded. Everything in readiness, we moved forward carefully, but such caution was unnecessary, for when we came upon the little fellow quietly lying at the base of a cliff, he looked inquiringly at us with his big innocent eyes, and scarcely attempted to escape. It was a tiny creature only a few hours old. I could not help thinking of all I had been told about the activity of young lambs, which though a few minutes before had caused my heart to throb with excitement and anxiety.

The lamb and ewe seen first had heard or suspected danger and had taken over the range. As two persons could easily carry the captured lamb, I sent both of the Indians after the escaped one, although their chance of success was small.

As Mr. Hicks and I were about to start for camp an eagle swooped down and with wings bowed, made straight at him, and for a second it appeared as though the big bird would snatch the lamb from him, but when about ten feet away it sheered off and disappeared as quickly as it came. Had it appeared an hour sooner it surely would have cheated us of our prize.

Cutting about a foot from a cotton flour bag, we doubled the lamb's feet under it and placed it in the

sack, then pinned the sides over its back, allowing its head to protrude from a rip in the cloth, and thus it rested naturally. We took turns carrying it suspended around our neck.

Taking the lamb from the rocks to the grassy slope below was rather hazardous, but by assisting each other it was accomplished. We were hardly to camp when, on looking to the eastward, we saw Billy about a mile off, tearing down the mountain-side at break-neck speed. The glasses showed that he had another lamb in his arms, but from the reckless way he was traveling there was doubt if either of them would reach timber-line alive. Arriving at camp, we found Andrew lying in the shade waiting our return; the wretch had left Billy to do the work alone.

Billy had climbed to the top of the mountain after leaving us and saw the ewe and lamb making their way along the summit. At long range he shot the old sheep, and after a lively chase cornered the lamb in a crevice and captured it. It was a beautiful animal, by far the oldest and healthiest of the three captured. It was so overcome by heat and excitement that for some time it took no interest in its surroundings, and when placed upon the ground scarcely moved. Regardless of noise it soon fell asleep and slept for two hours. Both lambs were perfectly contented; they frequently sniffed at each other and seemed much interested in what was being done about camp, watching us as innocently as their name implies.

I tested the milk from the ewe Billy had killed, and found it rich as cream, and as Nestle's prepared food seemed more suitable than condensed milk, I decided to feed it to the lambs. Mosquitoes being thick, even at this high altitude—for we were camped at timberline—a mosquito-proof covering was made, and we placed our captives under it. I slept beside the inclosure, and was up several times during the night to attend to them.

It was decided that myself and Andrew should take the lambs down to the river camp, while Mr. Hicks and Billy remained. The younger lamb gained strength during the night and looked quite promising, but we had greater hope of the other one, it appeared so strong and robust. Arranging another carrying sack, we put the lambs into them and started for the valley. They behaved perfectly en route, but about noon the puny one showed symptoms of diarrhœa. On reaching camp, a movable wire cage was made, and during the day the lambs were kept in it, but at night I took them into the tent, and as soon as they were asleep removed the cage and carefully covered them with mosquito netting. On awakening one would raise its head, look about, and finding its companion beside it, and everything quiet, doze off again. At feeding time they climbed all over me, and while one was being fed the other chewed my ear, or nosed about my face, as shown in the illustration.

Two days later Mr. Hicks and the Indian returned. They had seen a lamb, but after a long hot chase it escaped. Mr. Hicks was satisfied that the sheep had been driven away, and as the lambing season would be over before we could reach another sheep country, we decided to return to Knik village.

About this time the smaller lamb became hopelessly sick, but the other one maintained its health so wonderfully that we felt confident it would live. On the afternoon of June 5 a partition was made in one end of the boat in which to keep the lambs during the trip back, and we prepared for an early morning start. At 8 o'clock that night the healthier lamb became suddenly and violently sick, and by midnight was past recovery. In the morning both lambs died, and an hour later we left for Knik, disheartened, but convinced that everything possible had been done to make our undertaking a success.

Since the expedition fully demonstrated that it is not impossible to capture lambs of the Alaskan white sheep, it would seem that the most advisable course to pursue would be to transport milch goats to a base camp near the locality where the lambs are likely to be found, and as soon after their capture as practicable, hurry them to the domesticated goats. In this way it is quite probable that a few lambs could be brought out of the country alive.

Down the Potomac.

MIAMISBURG, O.—One of the most delightful, as well as interesting, river excursions that I have taken, was a moonlight ride on the Potomac from Washington to Norfolk. For several years I had planned such a voyage, but for various reasons the trip was always deferred. While visiting Washington, the long wished for opportunity arrived and I immediately availed myself to it. Taking passage on the Newport News at six o'clock in the evening I arrived at Norfolk early the next morning. Although the night was very cold I enjoyed myself very much. The moon, shining from a cloudless sky, transformed the river into a veritable river of silver and also made objects on either bank appear almost as plainly as in daylight.

To the sportsman, the angler and the student of history, this river will prove interesting. During the trip I saw hundreds of ducks and was told that they were becoming more numerous each year. As to historical connections I know of no river that surpasses the Potomac, for on its banks the "father of the country" was born and now lies buried; on its banks the site for the nation's capital was chosen over one hundred years ago, and in the great and bitter struggle of '61 it proved a great line of defense for the National troops. After leaving the river you enter the Chesapeake, that noted resort for duck shooters, and after passing the beautiful summer resort of Point Comfort, enter Hampton Roads, the scene of the world's greatest naval encounter, and then pass into the harbor of Norfolk.

What an ideal region this section must be for the lover of outdoor life. The river furnishes excellent fishing, the bay abounds with water fowl, and the Dismal Swamp nearby furnishes a splendid field for big-game hunters.

CLARENCE VANDIVEER.

The Coyote as a Strategist.

Editor Forest and Stream:

I had the pleasure recently to enjoy reading a copy of the FOREST AND STREAM, and I was interested in nearly all its contents. I wish to introduce to your readers some facts about the coyote. It has been the subject of some finely pictured and apparently well deserved reproach. It occupies in common esteem the place of a plunderer and a sneak thief. Its vices, its hunger, and its running qualities no one seems to question. The hand of every man is against the coyote. The laws of many States put a price on its head or ears. And yet the coyote increases and multiplies. The coyote is never fat, yet it lives on the fat of the land when it can be got, and if any predatory animal can, the coyote can. The traditional wisdom of the serpent is foolishness, when compared with that of the coyote. I claim that the coyote is a strategist which throws all other animals far behind it for cunning in pursuit of its prey. I have known it to cut out a sheep or a lamb from a band of a thousand sheep and kill it, when the sheepherder was within sight, and at a distance of two hundred yards from him, and yelling at the top of his voice.

But the best specimen of the cunning of the coyote is illustrated by the way in which it captures young pigs from their mother. In this kind of a chase two coyotes combine their efforts. One of the two attracts the attention of the sow, bites at it, and fights it and leads it away from the young pigs. The other coyote then snatches up the pig and away it goes with its little porker. This instance is well authenticated, and has happened more than once in districts where hog raising is common. Can any of your readers furnish a better instance of cunning or strategy on the part of any wild animal? Should it not be conceded that the coyote is a close observer, and even a pretty close reasoner? Is it not entitled to some respect for its cunning as a hunter? I, at least, give it some credit.

A. MEACHEM.

WASHINGTON.

Prehistoric Relics Wanted.

ANDOVER, Mass., Dec. 18.—*Editor Forest and Stream:* Phillips Academy, Andover, Mass., has recently established a Department of Archæology. My object in writing you is to encourage the preservation of stone, bone and clay prehistoric art forms. In your section of the country are frequently found various "Indian relics." These have a direct bearing on the history—or rather pre-history—of America, and as such should be preserved in fireproof buildings for the study and edification of present and future generations.

I am persuaded that there may be persons who have found some remains of the ancient Indian tribes, "Mound builders," etc., and that, possibly, they would be willing to send them to us. We shall be glad to pay express charges on any and all boxes of specimens sent to us, to mention the gifts in our report and to give the donors due credit in our exhibition cases.

All these axes, pipes, spear heads, clay vessels and "strange stones," should be carefully preserved somewhere, where they may be of service to the public and to science. Archæology—technically followed—is a new science in the United States and it is more important than the average reader imagines, for these "stone relics" have a direct bearing on the antiquity of man.

I shall be glad to correspond with persons who have "relics" in their possession.

WARREN K. MOOREHEAD, Curator.

The Reindeer's Antlers.

Sir: According to all tradition, Santa Claus drives a pair of reindeer. European artists generally picture him with reindeer. American artists generally picture him with wapiti or with nondescript members of the deer family. This would indicate a fundamental lack of artistic sense in our artists. Reindeer are common in all of the northern parts of America, from Maine to Oregon, and their antlers are, next to those of the red deer, the most common head trophies on our walls. Consequently, there would seem to be no good excuse for the failure of our artists to give us reproductions of the beautiful curves, palmations, and brow antlers that are so distinctive of the genus Tarandus, and that are so well known to every big-game hunter. On looking over a number of American magazines and papers to-day, I fail to find Santa Claus with reindeer excepting in one instance, while all of the European artists took the trouble to be correct in their choice of antlers. I noticed at the grocery also that a brand of preserved goods was labeled "Reindeer Brand," and the label carried the picture of the head of a wapiti. This carelessness amounts almost to an offence, and must make a disagreeable impression upon thousands who possess even ordinary fondness for accuracy in matters artistic. Will some artist explain?—Robert T. Morris in N. Y. Evening Post.

The Linnean Society of New York.

A REGULAR meeting of the society will be held at the American Museum of Natural History, Seventy-seventh street and Eighth avenue, on Tuesday evening, January 27, at 8 o'clock. C. William Beebe, "Some Notes on the Psychology of Birds;" L. B. Bishop, "Some Apparently Undescribed Eggs of North American Birds," with presentation of specimens.

A German correspondent in the Canton Tessin writes that the Swiss police do not dare to enforce the law against shooting birds, because their own lives would thereby become endangered at the hands of Italian hunters who are little better than brigands. The song birds are openly sold in the markets in bunches of twelve to fifteen for thirty cents a bunch.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

In Wisconsin Deer Woods.

WHEN George Hedrick, Chas. Bender and the writer stepped off the train at the little station of Sayner, Wisconsin, at 1:30 P. M., on Saturday, Nov. 8, 1902, we found nothing as we had left it five years ago. Where the big buck tore his way through the brush, crossed the railroad and landed in Plumb Lake, which he swam in his escape from the hounds and rifle balls of Mr. Saltsic and his friends, we found a desolate waste in the south, some small empty buildings, a meadown of a couple of acres, then more down timber and desolation down to the edge of beautiful Plumb Lake. When camped on Plumb Creek five years ago John Bishop and I had a bushel of sport after rabbits among the tall "shintangle" in the heavy pine woods on the east side of the creek, near the railroad. It was a pretty good test of marksmanship we thought to get these fellows with our Winchester rifles, as they dodged through this natural cover. But the cover is a thing of the past, and in its place is a small farm. Plumb Lake is there, but the forest, especially the pine, is about all gone. The change was so marked that when I got back to the station from looking over the old camp site, I told George and Charley that we would better camp where we were until we found a location to suit us. I made a trip to the lake a half mile away for a pail of water, and the boys opened our stove and grub boxes, set the stove up east of the station buildings, got wood and were ready to boil the kettle by the time I got back. After a good warming up within and without, we fell to speculating on our next step, and finally decided that about the only place for us was out on Big St. Germain Lake, or somewhere in that direction. The summer hotel and the lumber camps seemed to be filling up with hunters, and our desire was to get away from the maddening throng. But as yet we had no idea of what we might run into. Mr. Sayner came to the station for a wagon load of baled hay, and we had a talk with him, and an understanding that he would haul us out when we finally decided where we wished to go and was ready. He unlocked the larger building, tumbled several bundles of hay inside, and we also tumbled. We got the key, adjusted the bales of hay into foundations for two beds, carried our trunks inside, got out our bedding, made a fire in the stove, and were comfortable for the night. We would have been content to continue to bunk right there, but there were difficulties to be encountered. The mass of down timber, brush, briers and old stubs on both sides of the railroad was sufficient cover for deer, and they frequently crossed the railroad, but there was no water, and we had no right to the use of the station house, except as passengers.

After a good night's rest and breakfast, Charley and I started to explore the country some four miles south on the north of Big St. Germain Lake. There is a pretty good wagon road from Sayner to this lake, and on around the east end of it, fetching up, I am advised, at Eagle River on the N. W. R. W., 30 miles from Sayner. We found more or less deer sign all the way for about 3 miles, and when we reached Lost Creek crossed it on a dam, then followed the road along a sandy ridge to within a fourth of a mile of Big St. Germain. We agreed that we had no desire for a better camping site than the one we dropped on to, where there is a drinking hole at the edge of Lost Creek 50 yards from the road. The wagon road was cut up with deer tracks, and we concluded that by squatting down there in the dusk of that Sabbath evening, remaining quiet and attending to business, we could get our legal quota of deer very near camp. So we hurried back and waited for Mr. Sayner, whom we met going to meet a man from Eagle River. Mr. S. promised to be home by noon, but he was disappointed in not meeting his man, who was to come half-way with some heavy harness. When he arrived home cold and hungry, he had to change his harness from his small team to his heavy horses, grease his wagon, and hitch up, so that it was near 2 P. M. when he drove up to the station for us. We loaded our five pieces of baggage, and a bale of hay for our bed. Hedrick got on to balance the load, and Bender and I hoofed it. That made about 12 miles walking for Bender and me, but we got there, and had our tent up, boxes and trunks inside and beds made before dark. We had sold both of our last camp outfits, and this one belonged to a friend. The tent had never been used in cold weather and had no hole for a stove pipe, so we got supper and breakfast on the stove set up outside the tent. We enjoyed this first night, although the air in the tent was a little raw, for we were tired and had an abundance of bedding. Our tent faced the creek, which here runs in a southeasterly direction, and was about 30 feet distant.

This Lost Creek was so named because it does not seem to know where it is going. It would be difficult to picture an imaginary creek whose turnings and windings were more absurd. Its source and mouth are Lost Lake and Big St. Germain Lake respectively. They are not over one and a half miles apart, but this erratic stream, albeit it has a swift current, must flow 6 to 8 miles, mostly through marsh land and bordered with tamarack and other swamp brush, and does not go far out of its general course, either. These swamps furnish excellent hiding for deer, rabbits and grouse.

Monday morning Nov. 10, was the first day of the open season, and found us up and doing. The air was chilly, and we spent the morning near camp. When I came in George and Charley had the stove up in the tent, on a sand platform, held in place by a frame of small logs. They had also driven four stakes into the ground across the end of the tent from the stove, sawed them off on a level, and nailed on to them for a table a door we had picked up at the station.

Our tent was 12x16, with 3-foot wall, 8-ounce army duck. We were now able to prepare our meals and eat them inside the tent. We had everything we brought with us inside the tent except the stove box and water bucket, and the tent itself. George had brought along about three yards of oil cloth to cover our table, and it was my habit after washing the dishes to put them on one end of the table and turn the cloth over them, thus doing away with the stove box as a cupboard.

After lunch we scattered out, each one his own guide. I went east about a mile, which took me through the old burned and brush-grown chopping that extended east, north and west from our camp a mile or more, and struck into the green woods. There was deer sign here and there, and at one place two bucks had that morning been engaged in a sanguinary struggle. Bushes were broken off or mashed down, old logs torn to pieces, dead limbs broken into bits, and at a point where one evidently gave up the fight and ran, there was hair and blood. I swung around to the left and came back to camp past the east side of a marsh that lay northeast from our camp. This marsh has no doubt been a lake. Lost Creek plays hide and seek in it, while high ridges border its boggy shores and patches of evergreens give color to its otherwise gloomy appearance. Neither of us saw any deer that day, and Tuesday, the 11th, we tried it again.

George and Charley acted on the theory that if a half dozen or more deer crossed the wagon road every night one or more would certainly cross or attempt to cross in the day time before long, and they could afford to watch this open chopping for such a prospect.

I went further up the left or southeast side of Lost Creek this trip, getting pretty well up to Lost Creek. All I saw was a rabbit, and I took him home, for we were hungry for wild meat. Soon after I turned campwards, rain began to fall. I gave up hunting and tried to dodge the wet bushes and weeds, and when in sight of the old chopping that led to camp I hooted for Charley, who had come down between me and the marsh. He answered me, and then followed the crack of his gun four times. When I got to where he was standing, on the point of a ridge east of the marsh, he told me our shouting had scared three deer out of the evergreens down in the swamp, and he shot at them as they ran toward the edge nearest our camp. George had gone to camp and did not see them. After dinner George and Charley went out again, but I stayed in camp. Some time in the night the rain ceased. Our tent leaked some until it got well soaked, and then we were not bothered any more.

The morning of the 12th we all went north up the road. George turned off and up the ridge running around the marsh on the southwest. Charley stopped further up, while I went across the dam and explored some hills and hollows southwest of it. When I returned I saw both Charley and George between the road and marsh, and was advised by the latter that while he was on the south side of the marsh, a doe swam the creek down in the center of the marsh headed west, followed soon after by a large buck. They were too far away to reach with his rifle, and he had headed them off, and had them treed in a large clump of tamarack in the edge of the marsh.

I left the boys on watch while I went back to the road, then up north of the cover, but found on investigation that both deer had passed the cover, reached the ridge and run north along the side half way up. They kept the tamarack trees between George and themselves and escaped unseen. I believe George's .45-70 would have reached them when they came up out of the water and stopped to shake themselves. I know if I had been in his stead there would have been some thunder and lightning. But George thought he could slip around and get nearer, with the result as above.

Going on to camp, I met a gentleman from southeast of the lake in a spring wagon. He wanted to know if we intended to let the deer eat us up. He said while coming along a half mile east from our camp he saw three deer loping over a ridge. I went on up there, and while standing watching saw a deer make a couple of jumps, but it was a long way off, and I saw no more of it. Then rain began to fall, and I went home. Rain fell all the afternoon and most of the night.

The morning of the 13th broke damp and cloudy. George stationed himself west of the swamp, while Charley went east to a point southeast of the swamp and about a fourth of a mile from George, and the same distance from camp. I went east along the wagon road to where the road forks near a trapper's cabin, and took the left branch, which runs to the south side of Lost Lake and on east. I tramped on into the green woods about a mile from camp. After freezing out on a stand midway between the lake and woods, then turned and was retracing my steps when I heard Charley's gun about half way to camp. I ran forward to a log near the top of a ridge where the road crossed, jumped on it, turned half round and was ready, as a doe and her two grown fawns came dashing by about 50 yards distant. I shouted to them and they all stopped just as I got my gun to my face.

Now what followed could be omitted in this narrative on the presumption that I am on trial and under no obligation to convict myself, but I have an excuse. For two years I had been chained to business, and in that time had been led to doubt my eyesight, therefore was wearing glasses. I had not tried shooting with the glasses on sufficiently to test them at different distances, and though I aimed at that doe's heart, when my gun cracked she whirled one-fourth way round and dashed off behind a large stump, near which she had stopped, the fawns with heads and tails up leaping away over stumps, logs and brush, followed by two bullets from my rifle. I was simply amazed. I could hit a pine squirrel's head the same distance, and I knew I had a bead on that doe all right. In fact, I should have killed her in her tracks, and got at least one of the fawns. However, it should be remembered that the earth's surface in these northern woods is uneven, almost beyond belief. When a deer flees from immediate danger, he seeks the best shelter possible, and as he goes over a large log the hunter would do well to catch him in the air, for ten to one when he lights it will be in a hollow and he will be out of sight, and once out of sight, might as well be also out of mind.

But I hit that doe. There was hair on the ground where she stood, and I took up the trail on the bare ground among logs, stumps and brush. Where the trail went into the green woods a quarter of a mile north it took to the hazel brush and dodged and twisted about, always on the jump. But the jumps were very short, 4 to 8 feet, and the foot prints were wide apart. The trail led me through the roughest, hilliest ground within reach for more than a mile straight, during which there had been immeasurable twistings, doublings and turnings and finally lost itself in a walk among other deer tracks, leaving me to plod homeward nursing my disappointment, and sorry both for our camp that was without meat, and for the poor deer that I felt confident I had mortally wounded. Charley said there was also hair on the ground where the doe stood when he shot at her at long range. After dinner we all went back to where I left the trail, but could do nothing with it. Going back to camp Charley killed a pine squirrel and I a rabbit.

There was a good deer crossing just below our camp and another near the mouth of the creek. We had now been in camp nearly four days, and had not been on the west side of the creek, so after returning to camp I took my ax, went down the creek about 100 yards and felled a small tree across it. The tree was about 10 inches at the base, but it did not reach to the west shore and sank beneath the surface, except for some 20 feet of the butt part. My tramps after the deer and the chopping, which I was unaccustomed to of late, tired me, and I went to camp and sat by the fire. George had not come in yet, but when he did come he stopped only long enough to lay off his hunting traps, then picked up the ax. I told him about the foot log, and he said he would go and finish it, which he did and then fell to cutting stove wood.. Presently I heard him say, "Why, here's a cat," and there followed him into the tent the most forlorn piece of feline I ever saw. Charley explained that she belonged at the trapper's cabin, and it was evident that she had at some time belonged, temporarily at least, to a trapper, for she was minus one forefoot and the other one had also been caught, and was cut partly through the flesh, leaving her with only her hind legs and a part of one fore one to go through life on. She was very hungry, and after getting a bite to eat and taking a survey of the camp, hobbled to a warm side of the stove and squatted on the ground. I dubbed her Misery, and she must have had some insight into my thoughts, for it was not many hours before, on hearing the word misery spoken to her, she would look up and answer with a plaintive little me-ow. We all pitied her, for her master had deserted her for the more comfortable quarters of Sayner Hotel, though, as we learned later, Mr. Brown was a human being in a general way, and came out the four miles periodically to feed his cat and look over his possessions. He had also left a cat hole in the padlocked door of his one room log cabin that Misery might not be homeless.

At this point my notes say, "Grub low; no venison; no mail; no license."

Being fully convinced, as I have heretofore stated, that the object of so high a non-resident license was for the purpose of keeping out of the State men who have no money to throw at birds, I thought that on this trip we would try buying supplies from the people who furnished us the sport. So a box that contained our tent held also a scant assortment of provisions, among which the bread, meat, potatoes and beans were not more than half a full supply. We had forgotten crackers entirely. As to our licenses, we had made out our applications here before starting, and the following day sent them with U. S. Express money orders enclosed, to the State game and fish warden at Madison, Wis., from the office of the general passenger agent of the C. M. & St. P. Ry., Chicago. We had not felt like waiting for our licenses before proceeding to hunt, knowing that we had done our part. However, we would have felt more at our ease had these licenses been in our possession, for there was no knowing when a deputy game warden might call on us.

Friday, the 14th, opened with rain and continued all day, mixed part of the time with sleet. George and Charley went up the wagon road for a couple of hours in the morning, but gave it up and came in. I stewed the rabbit and squirrel for dinner, and we spent the remainder of this, our fourth day, in camp.

Some time in the night the rain ceased, and on Saturday morning we started out filled with hope that we would have no more rain for a few days at least, and wishing for snow in its stead. A short distance from camp Charley saw a doe turn and dodge back into a tamarack thicket. George and I went east along the road. He went on to green woods, then came back part way. I stepped on a small elevation where the road crossed a ridge, near where I had shot at the doe and two fawns, and while standing there, saw over my right shoulder a deer on the jump, down toward the lake. I put in three shots at it zig-zagging through the brush, stubs, stumps and logs, but it seemed so far away that I had little hopes of hitting it, and was not surprised that it escaped, apparently unharmed.

George and Charley hunted in the afternoon, while I went up to Sayner postoffice. I got a couple of letters, and inquired of Mrs. Sayner for mail for George Hedrick and Charles Bender, but our licenses did not show up.

I was tired after that eight-mile walk. I could not get any smoked meat nor bread at Sayner, so we had to content ourselves with fried mush and bean soup with some remnants of the fast disappearing shoulder we had brought from home, using sparingly at the same time of our few remaining loaves and what potatoes were left from a measure full I had carried up from my barn to the store to be packed with our outfit. Our coffee, tea, butter, lard, salt, pepper and condensed milk only held out. So when Sunday, the 16th, dawned, and found us without meat, and short on bread and potatoes, we shut our eyes to the old Bible injunctions and sallied forth the same as other days. The ease seemed to us much like our predicament of the Sabbath before, i.e., we were justified in dragging the ox out of the ditch.

Well, the result of it was that I crossed the creek on our foot log, went west over a hill that was burned over, then skirted a marsh with a small lake in the center and dotted on the west side with clumps of low evergreens. While on the hill south of the lake or pool, I saw a fresh track going toward the pool. The day was cloudy and damp, and withal chilly, so that I was wearing gloves. My glasses were covered with moisture and I took them off to wipe them, but chanced to let them fall. Just as I stooped to pick them up, two deer broke cover among the swamp evergreens, going off to the northwest. I had to straighten up, adjust my glasses, and get my gun in position, and by the time I had done this the deer had run 50 yards at least. I fired a couple of shots at them as they showed themselves between the bushes, and then had my attention called to a third one that was going off to the north. I turned on him and no doubt he heard the whistle of bullets, but he was in the edge of a thicket when I last saw him, and I hope none of the bullets did more injury than to give him a good scare.

Monday morning we turned out early, feeling that camp meat was a necessity. Charley said he would take a morning hunt, then an early dinner and walk out to Sayner, and take the 1 P. M. train to Star Lake to see the town and get some meat and bread. George agreed to start later, get the mail that might come in at 1 P. M. and be at the station to help Charley to camp with his supplies when he returned at 4:16 P. M. I went up the road to the dam, crossed the creek, and then circled west by south and was standing on an upturned pine tree about 8 feet off the ground and a mile and a half from camp when a doe ran over the brow of the ridge in front of me. She saw me and stopped behind a bunch of sprouts. Presently she stepped clear of them and I whistled. She stopped. I said to myself as I was drawing a careful bead on her just back of the shoulders, "No failure this time. Camp meat sure," but when the gun cracked she went like a streak for a thicket of pine a few jumps ahead, and escaped with a flying shot as she disappeared. I got down off the tree trunk, tried to find the trail, then returned to the position from which I had shot, located the spot she stood on, then stepped off 170 paces to her hoof marks. There was no sign of a hit and I went straight to camp, unloaded my gun and laid it up. Bender had been in, eaten and gone to Sayner. George and I sat down to bean soup. After our repast was over, I did the dishes, and George took my .22 Marlin repeater and started to keep his appointment with Charley. I sat smoking and thinking it over. A pine squirrel was chattering in the brush a few steps from the tent door. Were my shooting days over, or was it the gun? I got up, and washed my gun out thoroughly. looked through it, seing only certain small specks of rust that I had noticed before, then filled up the magazine and strolled down the road toward the lake. I took quite a turn but came back without seeing any game.

Charley was at the road, though, acting in a suspicious manner, when I came up, and I soon discovered what he was trying to partially conceal, the trail of a deer carcass that had been dumped off a wagon and dragged down to camp. Charley was feeling pretty good, and I confess I felt better, for we now had camp meat. Charley had carried his gun, and as he neared a deer crossing in the thick woods about half way out to the railroad, he saw an eight-point buck coming across in front of him. The buck was walking with his nose to the ground and just after he stepped across the wagon road Charley cut loose and the buck dropped. A teamster coming out brought Charley and his buck to camp, and the trip to Star Lake was given over until the next day.

I told Charley about my bad work and he agreed with me that if it was not my gun it was my glasses that were responsible. Now I had given up the idea of being able to see both the mark and the notch in the hind-sight of my gun at the same time with the naked eye sufficiently clear, and had adopted the glasses as a necessity. With these glasses I could see the sights distinctly, also the mark stood out more clearly defined. I had been bothered a lot with the moisture on my glasses, and the water that filled my eyes, caused by the cold winds to which I was unaccustomed, and after thinking the matter over, and plunking a couple of balls from the gun I had been doubting into a stump at about the proper distance and spot, I walked back into the tent and voted it a draw.

George came back from Sayner with two pine squirrels, two loaves of bread, and a peck of potatoes. We had something to eat now and all felt in better spirits. But we were a little nervous because our licenses had not arrived. George had asked for mail for Charlie and me, just as I had done for him and Charley.

The next morning Charley made a short hunt, then took an early lunch of deer brains, and again started for Star Lake. George persuaded me to take his Winchester, while he would take his double barreled shotgun, into the left barrel of which he had slipped a rifled barrel that shot a .45-70 cartridge. The other barrel he could shoot either bird or buckshot from, as he chose. He went west across the creek and while standing on a stump in a cotton-wood thicket got a shot at what he declares was the largest buck he ever saw. At his first shot the buck almost fell, then whirled half round and ran, George giving him a parting shot as he went out of sight. I was about half a mile north of him, and hastened up, only to find George looking in vain for sign that the deer had been properly hit. But he soon realized that the buck was gone, and I felt truly sorry that I had taken his gun. He had only a short time before our leaving home got a new rear sight placed on the left barrel of the shotgun and had not tested it fully. It was this new sight that bothered him. It was made too thin and threw a shadow, causing him to overshoot. But it was done and I knew how to sympathize with him.

After dinner George went west again, but he took his Winchester. I went up the road to meet Charley, and met him about two-fifths of the way out, in the woods where it was so dark we could with difficulty tell a hill from a hole. Charley had our licenses. They had been at the Sayner post-office for a week. The envelope was addressed to Charles Bender and was not given to either Hedrick nor myself, though we called for Bender's mail. We supposed it was a precautionary measure.

Charley had rustled for bread up at Star Lake, but succeeded only in getting four loaves. They explained that there were so many hunters calling for bread that they were cleaned out. What Charley succeeded in finding was at a private house, and was all they had, the lady remarking that she could bake warm bread for supper. (Respectfully submitted to the consideration of Mr. Carleton, Game Commissioner, Maine, U. S. A.)

Charley was pretty tired and had contracted a headache which staid with him, and kept him in camp the following forenoon. He had left a letter for one of two men from Minocqua, who were occupying a shack on the road near where he killed his buck the day before, and brought a letter to George that belonged to the other party, so George started on this Wednesday morning to exchange the letter, intending to then swing to the west and south, then east to camp. I agreed to go out west to where he had lost the buck and stand guard until he came. He directed me to a blind or lookout that he had arranged the afternoon before and we set out. I found his crow's nest without any difficulty, but was afraid of the twigs that intervened between me and the runways, so left it and took a position further out on the northwest corner of the flat elevation I was on, which here dropped off both to the west and north, with an extensive swamp on the west and the one out of which I had driven the three deer, lying northeast, and leaving a neck of dry land between. This neck formed the southern terminus of a patch of pine that had been cut last year, the brown tops of which lay where they fell.

Deer that were driven from southwest or north were nearly certain to pass between these two swamps, as trails indicated which I had investigated the day previous. So I took a stand on an old root and faced to the north in the hope that George or some other hunter would drive a deer my way. But mark you, I left my glasses in my pocket. There was a raw, brisk wind from the southwest and in ten minutes I was chilly. That would not do. A shivering man cannot shoot, so I set my gun down, took my tomahawk from my belt, hurried and cut two evergreens and stood them among the roots south of me. I knew a deer might show up at any moment, and kept my gun in front of me as I reached up to twine a couple of limbs together to keep the trees from falling down. I was facing to the south with my hands among the branches when like a streak a doe dashed across in front followed by a buck. As my hands dropped to my gun standing in front of me and brought it to my face the buck came opposite, saw the movement and stopped. The doe had passed on. When my gun spoke that time it told a different story, for the buck, a handsome 8-point, turned, ran a few jumps, stopped a couple of seconds and fell over. I dressed him, went to the foot of the hill, washed my hands and returned to my stand. These two deer had come from the southwest, so I faced to the north, knowing that George would show up from that direction, and might bring something before him. I don't think I had waited more than 15 minutes when off to the northwest along a runway that skirted the big swamp on the west, came two larger deer, a doe and a buck, at break-neck speed. It was a game of hide and seek, and instead of coming on around the swamp and near me, the doe led off eastward through the tree tops. I shouted to them without attracting their attention, so opened fire on the buck, he being in more open ground. Just after my second shot the doe disappeared behind a large root that was the beginning of sufficient cover to hide her from further view. At least I was so busy with the buck that I didn't see her again. But the buck's curiosity got the better of him, and he stopped short within a few steps of the old root. Again my old .38-40 spoke and the buck walked about 10 feet and fell. He was a 10-point. I dressed him, then went back to my stand and waited for George. He came presently, walked right on to the last buck, looked at the number on the license coupon, then looked up on the hill for me, for he knew my number. But when I walked him up to the other one he was no less surprised than pleased, and he volunteered to remain on guard while I went for Charley. It took us till late noon to get them to the creek across from camp.

This was the first time I ever helped to drag deer on the bare ground and I think it will be the last time. In my haste I forgot to take either nails or enough rope from camp. A supply of either would have enabled us to make a litter. One man at each end of a litter properly constructed, will carry a deer carcass faster and easier than it can be handled in any other manner I know of.

After dinner George and I set to work and constructed a raft from some partially rain-soaked poles that lay back of our tent with an upper deck of dry pine. We had some doubt about this raft floating, but when completed George got a push pole, and together we worked the raft into the water by using round sticks of firewood as rollers. Then I got a couple of trunk ropes, crossed the creek on the foot log and watched George battling with the current. Those soggy poles sank below the surface and grounded some 10 feet from shore, so I pitched George one end of the rope and he tied it to the stern of the raft, and with my pulling from shore and his pushing with his pole we got the raft near enough to dry land to load a deer on to it. Then George coiled the rope on the raft with a green cudgel tied fast to one end, so that if the current was too strong for him, he could throw one end of the rope to me on shore; and poled his raft quartering up stream. I was at the landing place by the time he was in mid-stream, and as the struggle with the current looked like an uneven one in favor of the stream, persuaded George to shy the club at me. He acknowledged after landing that it was doubtful if he could have made it without my help. Then we made another trip for the larger buck, and this time the raft came very near spilling both the deer and George in mid-stream. We got them over, however, without wetting the meat and hung them up. We were just about tuckered out, and my right knee made a nervous kick, that called for a rest. Charley was out looking for his other deer, but didn't find it.

Thursday, the twentieth, broke foggy. George and Charley went west but returned at noon empty handed. I did the kitchen work, got wood in, took some notes and rested. Misery had as usual found a fold in the bed cover and crawled in. During all my bad luck I had kept a weather eye on that piece of a cat, and George's old umbrella. It was my first experience in a hunting camp with either an umbrella or a cat, much less a cat like that, and while I did not want to think that misfortune could be brought or sent into camp through any such mediums, I had occasionally made some suggestions to George for the purpose of finding out what he thought about it. But George didn't seem to have an opinion about it, and I let it go at that.

Now, it was different. I called to Misery, and heard a plaintive "me-ow," then as the fog lifted I was tempted to go out though I had my legal number of deer. But I had traded one of them to George for one he was to kill, and then I was entitled to a lot of birds, so got my gun and went east as far as Brown's Cabin, then came back west along the shore of the lake to the mouth of the creek, cut a pole and tried to catch some of the "20 pounds of fish, or two such fish," as the Wisconsin law puts it, that I was entitled to bring home. But I got no strike and was not disappointed either. There were fresh deer tracks in the sand, and it struck me like a brick to think that no matter what opportunity might come to me I could not legally kill another deer in Wisconsin for a whole year, though only one-half the open season had passed, and we had only one-half our legal quota of deer. While coming back to camp through the thicket I heard something whistle in a patch of green timber half way between the mouth of the creek and camp. Charley was west of the timber and heard the whistling too. We both thought it a hunter whistling to a companion. Whatever made the noise moved about and finally quit sounding its peculiar note. The sound was clear, distinct, and in every particular like that of a human being whistling, but it must have been an animal. It was neither human nor bird or we would have seen it. The note would start about G on the treble clef, fall a couple of degrees then slur upward. Then again it would end with the falling inflection, but within about the same compass, and with the same clear, flute-like tone. I would like to know what it was that did the whistling. Just before reaching camp a flock of mallards went overhead, but I did not get one. This was a very foggy day.

By Friday, the twenty-first, the wind was so chilly that I froze in with three pair socks, two pairs drawers, four shirts, one vest, one coat, hat and gloves on. I put on another vest and coat and tried it again, but got chilled and came to camp. Then along about 10 o'clock the clouds broke up, and the sun peeped through. Charley and George were out, and I had to look after the deer hearts that were boiling. I had relieved myself of the extra clothing except the third shirt and other things to correspond and was ready to tackle something. We just couldn't be still up here. George even kicked in his sleep, though he declared he never dreamed. George had brought up one large pole, and four small white birch poles, then gone hunting, so I went out, picked up his double bitted ax and fell on to those pretty white poles. Now, I don't like an ax that cuts both a comin' and a-goin', but the poles tempted me and it wasn't long until they were piled up inside the tent.

I was a little afraid George would be disappointed, but when he came in he simply laid off his hunting traps and coat, got his cross-cut saw and cut up the large pole, carried it in, then set to frying mush for dinner. After dinner I walked out to Sayner post-office. The afternoon was pleasant but with evening came wind, and it howled and shook our tent all night. From this on to our breaking camp on the 29th the programme, though varied, was in no sense sensational. The deer had all left except a doe and two fawns and they covered so large a territory that we failed to connect with them. I got a couple of running shots in an effort to help George out, but failed to score.

Thanksgiving was a blue, cold, windy day. Charley said we would start for home the next day. That settled it, and Friday morning I went out to Sayner for a team, walked back to camp by 11 A. M., packed up and was ready for the wagon at 1.30 P. M. We took train at 4.16 P. M., got to Chicago 7.20 A. M. Saturday instead of 7; missed connection with train for Ft. Wayne and arrived home Sunday morning instead of 2.17 P. M. Saturday. We brought our deer home, and for that privilege alone, we vote this the most pleasant, albeit the most expensive one of our hunting trips.

We had no snow, all our trailing being done on barren ground or on leaves, consequently we may have killed (by mortally wounding) more than our legal number of deer. A department warden did call on us but found everything straight. The same day he found two hounds at another camp, and as the hunters denied ownership he shot a black one and took a white one prisoner.

Taking Aim.

Editor Forest and Stream:

In investigating some matters wherein sight plays an important part, I am led to think that possibly information as to how marksmen succeed in hitting the mark, may help me to some light. We know that the boy throwing a stone, or "slinging" one, can attain a very fair degree of accuracy without taking aim. Also that an archer does not, and cannot, take aim. The same in the case of revolver shooting from the pocket, or gun shooting from the hip, or in hitting balls thrown in the air, the marksman being blindfolded (in this case, the ball is first thrown up several times with the shooter's eyes open, and the word "up" being given at time of throwing). Now in most of these performances, the object is still and a sense of direction plays the principal part (at least, as I understand the performances). But how is it in *quick* shooting at moving game, where anything like deliberate sighting would seem impossible? Does the marksman actually bring the sights of his gun to bear on the object, as in shooting with time? Or does he just shoot by a sort of unconsciousness? The point interesting me is: Is there the same unconscious "feeling it" in the case of shooting at a moving object that there is at a fixed one? The application is whether there is an ability to detect motion, distinct from actually seeing objects. Any information on the above matters will be a great favor to

Stray Items from Maine.

The regular hunting season being over, our sportsmen are turning their attention to the unprotected rabbit or fishing through the ice. There is also a little fox hunting going on, but owing to the scarcity of reynard's numbers, as a consequence of the deadly work of the trappers, there are now but few followers of this sport, which a decade ago was in great favor here. Some very good catches of pickerel have been made, a fellow-townsman who has been teaching school in the town of Naples, nearby, informing me that an old hunter and trapper of that town recently showed him a big catch of these fish, including two specimens that weighed just 5 pounds each. Many are looking ahead to the open time on trout, for there are several ponds which can be depended upon to yield quite a number of the speckled beauties annually to those persistent anglers who are willing to do a great deal of fishing in proportion to the number of their catch.

Squirrels were plentify in season, and many good bags were made. Woodcock were in fair numbers; grouse very scarce. Why not stop the shooting of grouse entirely in New England for at least five years?

Deer gave us better sport than ever before. True, not many were killed, but there were enough lurking about at all times, so that by simply stepping across the river (Ossipee) into Oxford county one was pretty sure of finding sufficient "sign" to keep him in a delightful state of expectancy, if nothing more. Six deer were killed near here by residents of this town; two by G. W. Adams, one each by Erskine Watson and Arthur Colcord, two by Winfred Ayer. The last-named had phenomenal luck with them. He began rising at light, and hunting in the early morning before going to his work. About the third morning, just after crossing the bridge into Oxford county, he saw a fine doe coming towards him, but the sound of an approaching team frightened it away. Following after it, upon coming to an old orchard he jumped a big buck. This he brought down the first shot, but as he rushed up to it to cut its throat, carelessly dropping his rifle, the big fellow sprang to his feet and made into the woods. Greatly crestfallen, Win was following the trail by the occasional blood spots when he started a doe, which he promptly downed to stay. All this happening in less than an hour after leaving his home. A few days later Win came upon a big buck in a dense growth of small stuff. He began pumping away at him as he ran, until, with the sixth shot, he was chagrined to find that his magazine was empty. He had seen the buck waver at the last shot, but he was without cartridges and he struck out for the village to procure some. There he induced another sportsman, E. L. Watson, to return with him. They had separated but a few minutes when Mr. Watson shot a doe, and the sound of the shot alarming the wounded buck it ran right on to Win, who finished it.

Two more of our hunters, Daniel Chaplin and Jesse Irish, visited the country above Moosehead, each getting his two deer. W. H. Hatch, a former resident of this place, but now living in Fryeburg, who also visited the North woods, sent two deer and a bear here to a licensed dealer, the deer being killed by his wife, who accompanied him into the wilderness. Next fall the law comes off in our own county (York), and we are all making great reckoning on the increased opportunities this should open up to us. How we fare I may tell you in some future number.

The Bears of Old Baldy.

Editor Forest and Stream:

Captain Flynn's account of "The Bears on Old Baldy" in the current number recalls to me the time that I climbed Baldy in August, 1875.

Our troop of cavalry was in camp then at the foot of Old Baldy for several days, and I concluded to see what was on top of the mountain, and starting one day at noon I followed that old trail over which Captain Flynn afterwards took his wagon, and when up near the head of the trail I was met by one of those bears; they were then there and may be still there yet.

This one had been up the mountain, and he saw me before I saw him, and as he did not need all this country it seemed he started off to leave me what part of it I needed.

I cut loose on him at about 300 yards with a Springfield carbine. I might as well have had a Flobert rifle, though, for all the harm I could do him with this gun. I had a good Marlin rifle at the fort, but the Captain I was serving under now would not let me use it. "That would not be according to the regulations, sir." These regulations can cover a great many subjects if you only know enough, or sometimes not enough, about them. I managed to get a number of shots at the bear while he kept up his retreat, some of them at least hit him, and at last he stopped, some 600 yards away. I was in hope that he had made up his mind now to come and tell me that he did not intend to give me all of western Texas and part of New Mexico as my share of the country; then if that was what he meant to do, I could do my explaining with a Colts pistol when he had got far enough back here. I had two Colts here, one of them was outside of the regulations, also; it was my own; but this captain let me carry it with the understanding that I must myself pay for the cartridges I shot out of it, if I did not use it injudiciously. Those I paid for, though, never bankrupted me, not as long as I could go to the First Regiment's room and help myself to them; the Captain did not know that, though.

The bear had only stopped to examine where I had hit him last; at least that is what he seemed to be doing, and while he was doing it I hit him again; that was the last time I hit him, too; he slid down behind a small ridge he had been on top of and when I had got to it he was no longer in sight, and I let him go now.

He and I had wasted so much time that it was too late to climb to the top of that mountain to-day, so I gave it up. I had started too late at it, anyhow, I saw now. I would know better next time.

The second day after this I tried it again, taking only my pistols and a canteen of water. I had seen no water when up here the first day, but to-day I found a spring close to where I had met the bear. I saw no bears and did not hunt for any and after a hard climb got to the

top long after 12 o'clock noon; then proceeded to take in all the country as far as the eye could see, and it can see a long distance here, too.

Had I been the master of my own time I should have camped there below the top until next morning, then have got up here again in time to see the sun rise; it would have been worth coming this far to see it, but I had to hasten down and get back to camp.

I knew those Seminole negro scouts that Captain Flynn had with him, and I liked them. When General Makenzie had them about Fort Clark I did a good deal of scouting in their company. That was in 1873. Makenzie thought a good deal of them, and he knew a scout when he saw one.

General R. S. Makenzie, "the big chief with the crooked finger," of the Indians, was probably the best liked officer with some of us, and the most hated among others of any officer I have ever served under. I never had any fault to find with him, though; he was always a good friend of mine when I needed one; I often wished we had more officers like him.

His father was Commodore Makenzie, who hung the then Secretary of the Navy's son to his ship's yardarm for mutiny in the ante-bellum days. The general has been dead for about fourteen years now. Peace to his ashes.

CABIA BLANCO.

ERIE, Pa.

Massachusetts Game Interests.

BOSTON, Jan. 10.—*Editor Forest and Stream:* The wheels of legislation were started with a rush on Friday, Jan. 9, when Speaker Myers, of the House, and President Jones, of the Senate announced their committees. Such promptness has been unheard of in the Massachusetts Legislature. Committees have not usually been announced until several days after the inauguration of the Governor.

The Committee on Fisheries and Game is composed of Senators Henry R. Skinner, of Watertown; A. D. Bagley, of Boston, and David G. Pratt, of Middleboro, and House members Moody Kimball, Wm. B. Phinney, Dwight F. Lane, J. J. Mellen, M. J. Mahoney, Wm. A. Fahey and Messrs. Walker and Hinckley. The four last-named are new to that committee. Senator Pratt was one of the most zealous workers last winter against the bill to allow the menhaden seiners to operate in Buzzards Bay. Your readers will remember that, under the leadership of the late Attorney-General Hosea M. Knowlton, the Fisheries Company made a very determined effort for the passage of that bill, and that the attempt failed by reason of the unanimous action of the towns on the bay, and of the hook-and-line fishermen generally, against the measure. From seventy-five to one hundred men appeared every day for nearly a week at all the hearings, so intense was the opposition.

While the committee gave a majority report in favor of the bill, it was permitted to be killed later on, and never went to the Governor.

Whether any attempt to regain lost ground will be made by industrial fishermen the coming winter remains to be seen. But the tendency in Massachusetts of late is to restrict the use of seines in bays where the residents of the shore are opposed to them.

It is claimed that good fishing is one of the greatest inducements to attract city people, and residents of shore towns derive a good deal of pecuniary advantage from such visitors.

The Poultry Show at the Mechanics' Building will open on Tuesday, the 13th inst., and bids fair to eclipse all previous displays of the kind in Boston. Sportsmen will find, among other attractions, several well-stocked aquariums, pigeons of all varieties, rabbits and pheasants, etc.

W. F. Beal, of Nahant, will exhibit cages of wild water fowl. E. S. Conness, of Mattapan, ring-necked and golden pheasants, and many well-known names of gentlemen from various parts of the country appear on the list of patrons and exhibitors.

The Brunswick Fur Club invitations have been sent out from Barre to hunting men to participate in the fourteenth annual hunt of the club, to be held the coming week.

The N. E. Kennel Club is making great preparation for the 1903 show, which, it is believed, will eclipse all previous ones. The show of sporting dogs is expected to be the finest ever seen in New England. Mr. Thos. W. Lawson, who has fine kennels at Dreamwold, has offered $300, to be given in prizes.

Governor Hill, in his message to the Legislature, has recommended a hunters' license. He says: "In twenty-five States of the Union, and in the Dominion of Canada, licenses must be secured before non-residents may hunt certain game, or hunt at all." The State Sportsmen's Association, at its meeting this week, voted to recommend the plan, ex-Commissioner Oak being the only one who raised his voice against it. From this distance, it looks like a "foregone conclusion" that a license law of some kind will be enacted. The idea of being obliged to resort to this plan for raising a revenue after what Governor Hill had to say concerning the condition of the finances of the State and the general condition of its various inductries, seems a little like nonsense. However, I will admit there are other reasons. The State authorities—Commissioners—should know how many deer and moose are killed each year, as nearly as possible, and by whom they are killed. Col. E. C. Farrington, secretary of the State Association, says, "There is no close time except on the statute books. Protection in Maine," he says, "is a farce. The safe breeding places of our game are a thing of the past." He speaks of the constant extension of lumbering operations, and says camps are liberally supplied with game. He says "game laws are nullified and set at defiance by a large class of men." No doubt winter killing for lumbermen's camps should be wholly prevented. The men, whether residents of the State or non-residents, who seek recreation in the forests will pay more money for the privilege than can be derived from game in any other way, and those who secure a deer or a moose will be willing to pay a reasonable sum for every one they can kill. But it should be remembered that not all who hunt are able to get game. Why not charge a small fee for the privilege of hunting and a larger sum for each deer or moose obtained? This, of course, on the assumption that some license plan is to be adopted. Massachusetts sportsmen are waiting patiently to see what plan will be adopted by the assembled wisdom of the State sitting at Augusta.

CENTRAL.

CHICAGO AND THE WEST.

Muscallunge and Duck.

CHICAGO, Ill., Jan. 2.—Occasionally we hear stories about ducks being devoured by large fish, pike or muscallunge. Usually these stories have to do with young ducks and it is more than a fair guess to believe that very often a mud turtle is the cause of the disappearance of the duckling concerned. There are, however, incontestable instances of full grown ducks being devoured by large pike or muscallunge. A few years ago I printed in these columns the account of a giant pike which was found dead on the beach of Lake Minnetonka, which had evidently met its death in the attempt to swallow a wild duck, the wing of which protruded through the gills and caused its death. In yet another instance a Chicago angler, A. S. Trude, has found in the stomach of a muscallunge the partly digested carcass of a full grown wild duck. All these stories are interesting, but the following, told me by one of the witnesses, Mr. James Keely, managing editor of the Chicago Tribune, surpasses any duck or fish story yet recorded.

The incident described occurred last October on one of the lakes near Manitowish, Wis. Mr. Keely was one of the late guests at the resort in question, and although he and his guide got a good many muscallunge, they found the weather a bit rough. It was at the season of the year when the ducks begin to drop in around the wild rice lakes of Wisconsin, and it was no unusual thing to see ducks in the course of a day's fishing. Therefore, no great interest was aroused when the two fishermen saw a good sized wild duck in the water a hundred yards or so ahead of them. At length, however, the attention of the fishermen was attracted by the movements of the duck, which seemed to be attempting to rise from the water, but was unable to do so.

"I'll make him fly," said the guide. Picking up his rifle, a .30-30, he fired a shot which landed a few inches from the duck. The shot cut up the water in a good sized swirl, but yet the duck did not rise.

"That's funny," said the guide, and picking up his oars, he pulled up within a few yards of the duck. He now picked up the rifle and standing up in the boat was about to fire again at the bird. "Why, a fish has got hold of it," said he. And the next instant he fired at the head of what he and Mr. Keely both took to have been a 30-pound muscallunge. The shot blew off the fore part of the head and one of the jaws of the fish, which, however, sank and was not secured. The duck was killed by the shock of the shot. When picked up it was found that its legs had been badly bitten by the fish, as well as the lower part of the body. The muscallunge had evidently seized the bird by the legs and was worrying at it. The duck was a full grown specimen of the dusky duck or black mallard, which, as all sportsmen know, is the very largest of our inland ducks. The bird had its wings spread out on the water and was apparently struggling against the efforts of the fish to pull it under. The wing expanse of a full grown mallard would, of course, offer considerable resistance, although one would suppose that a very large muscallunge must have been able to overcome this resistance. Mr. Keely ate the duck and only regrets that the muscallunge sank, this latter part of the story being almost its only unsatisfying feature, though as to the truth of the incident there can be no doubt at all. I have heard of muscallunge striking at the copper tip of an oar, of their striking a tin cup from the hand of a man as he dipped it over the side of a boat, and all sorts of other strange things. Perhaps this old fellow took the red feet of the duck to be some new kind of spoon hook.

Game in Manitoba.

Mr. W. F. Ellis, of Manitou, Manitoba, paid this office a visit this week. Mr. Ellis is a very well known breeder of English setters and is a sportsman of very many years' standing. Largely connected with business affairs in his province, he has none the less always found time to keep up his interest in field sports, both in shooting and in big game hunting.

Mr. Ellis says that the prairie chicken crop still holds good in the vicinity of Manitou, so that it is worth while to breed good dogs and plenty of them for the sake of that sport. He says also that the big-game hunting east of him, in the Rainy Lake country, is excellent, and states that one would have no difficulty at all in getting his legal limit of two moose. He says that nearly all of those who went in last fall with the deliberate intention of getting moose did so without any trouble. The non-resident license is $25, the same as charged by the State of Minnesota; but the Manitoba season being so much longer, really offers one a much better chance for getting his moose than Minnesota with its open season of but a few days. Mr. Ellis cheerfully offered all kinds of inducements in the matter of getting a moose if I cared to go up in his country next fall. It is not beyond the bounds of possibility that fortune may some time give me the opportunity of investigating the moose question either in Minnesota or Manitoba, or both. We hear so many stories about the shooting up there that I am disposed to think there must be some fire where there is so much smoke.

The matter of guides seems not to be so well worked out in Manitoba as in New Brunswick, and I hardly think the moose are as good specimens as those of New Brunswick. As to the nature of the hunting, I can learn very little, except that it is done in the swamps. Calling does not seem very generally practiced, and Mr. Ellis said that the "first snow" is the best time to go moose hunting, from which I infer that they still-hunt in that country. He speaks with absolute confidence of the certainty of getting moose if a man is a hunter.

Mr. Ellis also tells me that the elk are not quite all gone in Manitoba country not far from Rainy Lake. There are still a few elk left in Minnesota, perhaps 40 or 50 in all, and the Manitoba range is similar in general respects to that of Minnesota. Mr. Ellis last year got word of four elk not far from the place where he was stopping, and a hurried drive brought him and a friend in sight of the game. They opened a running fire and Mr. Ellis was lucky enough to stop one bull elk with his double express rifle. He says the head is a beautiful one and is much admired. He heard of one or two other elk being killed in that part of the country, one head that sold for $50.

Mr. Ellis adds another bit of information which indeed has been made public in the columns of the daily press for some time. That is to say, he mentions the tremendous influx into the Canadian Northwest of American citizens of the better type, hardy farmers who are purchasing in great numbers the cheap lands of Canada. Without doubt the American West is gone. The next West is to be in Canada, partly in Ontario, partly in Manitoba and Alberta. The Saskatchewan valley is receiving a great deal of this new population. Edmondton, in the opinion of Mr. Ellis, is to be the next great city of the Northwest. It is with great regret that an American sees this exodus into Canada of this splendid class of American citizens. Our loss, however, is Canada's gain; and after all, Canada and the United States grow closer together every year; so that whether our settlers be Yankees or Canadians, they are practically brothers after all.

Wild Pigeon Stories.

With permission I print a little wild pigeon story told by Mayor Harrison of this city at a late luncheon of the Wishininnee Club. The old Harrison homestead in this city was established by Carter H. Harrison, Sr., formerly mayor of this city, who made his home at Ashland avenue and Jackson boulevard, in the west division of this city. Here Carter H. Harrison, Jr., lived during his youth. He speaks of the fact that there were a few large cottonwoods which grew near the edge of the grounds, and states that one day he saw a couple of wild pigeons light in one of these cottonwoods. This was about the year 1872, at which time the big fire in Chicago had done its work, although the city was by no means a wilderness, but, on the contrary, thickly built up far beyond the situation of the Harrison residence. A boy of the neighborhood, known very well to the Harrison family—by name Gib. Harris, now in business on West Madison street, in this city—was standing near the carriage house door at the time these pigeons alighted in the cottonwood trees. He had with him, boy-like, a sling-shot, and taking hurried aim at one of the birds at a distance of many yards, perhaps 50 or 60 yards, he fired his sling-shot and killed one of the birds, which act Mayor Harrison remembers with perfect distinctness. Gib. Harris was some years ago winner of the championship in the Illinois State Sportsmen's Association tournament at Watson's Park, Burnside. His proclivities as a shot began early in life, it seems. Mayor Harrison remembers also seeing this same young man come in with a back load of upland plover which he had killed near the west edge of Chicago as it then existed. The date of 1872 is at least quite within the memory of a great many of us, and it seems not a little strange that in those days wild pigeons not only passed here but actually alighted within the limits of the greatest city of the West.

Others present at the little luncheon above mentioned went on to tell wild pigeon stories. Mr. W. L. Wells stated that when he used to live as a boy at Monwouth, Ill., he saw upon more than one occasion a flight of wild pigeons which lasted throughout the daylight hours of an entire day. He said the flight reached from one edge of the horizon to the other. The birds flew in a long string, "a column about as wide as this room," said Mr. Wells; and at a height above the ground which left it possible to kill them with an ordinary shotgun. Naturally the people were out in force to take advantage of this flight. At the report of a gun, which nearly always killed a bird out of the solid column, the line of the pigeons would bow up, and, passing on, resume about the original level, only to bend up again at the next gun discharge further along on the line of flight. Mr. Wells stated that he had known boys to arm themselves with long cane fish poles and with these to knock down numbers of birds from the low-flying line of the pigeons as they crossed a hedge.

Others present at the little symposium above mentioned added their personal observations to the sum total; there was hardly a man who had not seen the wild pigeon in greater or less numbers. There was general interest expressed in that never answered question, What became of the wild pigeons? The almost instantaneous disappearance of these birds is paralleled only by the disappearance of the northern herd of buffalo in the year 1883. People talk about the mysterious agencies which must have destroyed the pigeons. The agency was the same in the case of the wild pigeon and the wild buffalo. And now we mourn these facts in our history.

Large Pompano.

Our little pigeon symposium took place on the occasion of a Wishininnee banquet given at the club meeting house by Mayor Harrison. Judge R. N. Ogden, of New Orleans, a near relative of Mayor Harrison, had sent the latter a splendid pompano, whose weight, by the way, was exactly 26 pounds, about five times that which the average man supposes is the top weight ever attained by this fish. This splendid pompano was prepared for the Wishininnees and they held one of their impromptu sportsmen's meetings then and there. It is to be said that this fish in delicacy of flavor seemed to rival the quality of the same species in lighter weights. The average man who eats pompano sees a fish of one pound to perhaps three or four pounds weight. Appreciative of the courtesy, the Wishininnees sent a round robin of enthusiastic thanks to their old time friend, Judge Ogden.

Lost, Strayed or Stolen.

The Wishininnees have been very industrious for the last ten days in town. On last Saturday night they were the guests of Mr. Montgomery, publisher of the Chicago Tribune, who, after dinner, took them through the plant and new building of that able journal. A number of the

Wishininnees were present, among these Col. Bill Haskell, sometime known as "Old Bill" Haskell. In the linotype composing room of the Tribune "Old Bill" managed for a time to stray away, and Mr. Montgomery as a joke hurriedly wrote a little Lost and Found advertisement and handed it to one of the linotype men to set up. It read: "Lost—Old Bill Haskell. If found, notify at once Main 447." The latter number is the city hall, where Col. Haskell is employed as high chief inspector of paints, varnish and paraffine. The composing room in some way got word to the city room, and the city room set up a touching notice in regard to Mr. Haskell's unexpected and mysterious disappearance, and it all went forward as part of the grist of the big monster, a great daily paper. Meantime the exploring party passed on down into the press room, and presently the morning run of the giant presses began. Mayor Harrison took from the press the first copy of the paper printed that morning. As it happened, it was the advertising section, and on the first page thereof, in a prominent position, read the notice, "Lost—Old Bill Haskell." At that moment Old Bill was in a corner of the press room practicing the Wishininnee war whoop. When shown the notice in the newspaper he was somewhat surprised, and disclaimed having been lost or misplaced. Since that time inquiries from different parts of the country have come in asking how the disappearance of Old Bill Haskell actually came about. This is how it happened.

Turkeys in Arkansas.

Mr. Ernest McGaffey, of this city, dropped in the other day and gave me further particulars regarding his recent hunt in Arkansas with some friends of Cairo, Ill. The party went to Monette, Ark., thence inland by wagon about 26 miles, landing in a country which must have been a very fine one for mixed game. The party killed several deer, as reported, got three big wildcats, had a couple of bear chases and lots of other fun with the trailing dogs, could have killed any desired quantity of ducks and geese, and did kill five turkeys. Of the latter, four fell to Mr. McGaffey's gun, and as the manner in which they were secured seemed to be a little unusual, I give the facts. On one morning when one of the local guides was out calling turkeys for the benefit of another member of the party, Mr. McGaffey and his hunting companion heard an answer to the guide's call, and hurrying up ran into what proved to be the line of the approaching birds. Presently they found themselves directly in the middle of a flock of these great birds, which rose almost at hand. Promptly Mr. McGaffey made a double, and they went to camp that morning feeling mighty well content, although they had rather cut off the line of flight of their friend and his guide. On the following morning Mr. McGaffey was out once more in the big woods and saw flying above the timber a large flock, 20 or 30 of these great birds. He says that they always started straight up and topped the timber before they started on their horizontal flight. These birds were so high they were quite out of range, but as he watched them he saw them presently drop and knew that they were alighting. Running as hurriedly as possible to the spot where he saw them drop, he was lucky enough to walk almost directly over one of them, which he killed promptly as it arose, using No. 000 shot in the second barrel. The first barrel of No. 6, fired into the bird at a distance of about 30 yards or so, did not seem to jar it in the least. A day or so after this lucky incident he walked up still another turkey and killed it also, thus getting four birds to his four opportunities, certainly a very good performance and under rather unusual circumstances. He says that if he had a bird dog when he marked the big flock scatter and alight, he could surely have killed a number of them, as they were lying as close as quails in the heavy briars which matted the undergrowth. Mr. McGaffey thinks this was about the best hunt of his life and hopes to return to that favored region at some later time.

Skunks.

Our old time friend, Mr. W. J. Dixon, formerly of Cimarron, Kansas, now writes from Dodge City, that State, and asks would I please tell him where he can sell a large variorum edition of skunk hides which he has got together this fall. I don't see why all fur buyers do not regularly advertise in the columns of FOREST AND STREAM. I have, however, given Mr. Dixon the addresses of one or two parties who will probably take his skunk skins off his hands and set them forward in the process of their later reincarnation as Alaska sable. I wish Mr. Dixon would tell us his method of trapping these odoriferous birds, and how he handles them to prevent the usual odor. It would seem that the old valley of the Arkansas, always prolific in skunks, has not yet lost its reputation as a producer.

Winter in the West.

At this date the big western blizzard prevailing over Montana, the Dakotas, Iowa and Minnesota has reached Chicago. The storm brings a cold wave and a little snow, although not so much as has fallen at points west of here. Thus far the weather cannot be said to have been very destructive to our quail, for although there has been a little rain and subsequent freezing, it is not thought that the food has been sealed away from the birds under an icy cover, as sometimes happens. This cold weather with dry snow is not so dangerous as wet and freezing weather. We have none too many quail in this part of the country this fall, and it is to be hoped that the elements will be kind to the surviving breeding stock; for if there should be a severe winter, we would face pretty nearly a quail famine next fall.

Proposed Changes in Michigan Game Law.

In a letter at hand dated Jan. 3, Mr. C. E. Brewster, chief deputy game and fish warden of Michigan, outlines the policy of friends of protection in that State as it will be pursued in the Michigan Legislature this coming season. The bill, it will be seen, has received the indorsement of the united sentiment of the sportsmen of Grand Rapids, a town which is full of thinking and conservative sportsmen. Mr. Brewster writes in the following terms:

"The new general game bill indorsed by the Consolidated Sportsmen's Association of this city has just been completed by me and turned over to Senator D. E. Burns, of this city, who will introduce it and watch it through. There are some radical changes contemplated, and every one of them, with a single exception, are along the line of practical protection, and an advance step.

"One of the changes contemplated allows one deer to be transported out of this State by a non-resident killing same in a lawful manner and at a lawful time, and provides for the shipment to be made under the direction and control of the game and fish warden department. Under the present law non-residents are allowed to come here and hunt for deer upon the payment of $25 for a non-resident license, residents paying 75 cents. But they had no right to take out of the State any part of a deer.

"We now permit spring shooting of wild water fowl. The new bill eliminates it entirely.

"The present law allows the killing of three deer; the new bill reduces the number to two.

"The present law allows a person to kill an unlimited number of birds (game) during the open season; the new bill restricts the killing by any person to twenty-five birds (game birds collectively) in any one day, or to have to exceed 100 in possession at any time.

"The present law makes unlawful the sale of any protected game at any time. The new bill permits the sale of male deer from Nov. 15 to 30. This, in my judgment, is a step backward, and looks bad coming from a sportsmen's association. (Note.—Many of the more prominent members of the club repudiate the sentiment, and declare for 'No sale of any protected game or game fishes.')

"The new bill makes a uniform season for upland birds, water fowl and game generally, from Oct. 1 to Dec. 15. The old law allowed the killing of water fowl from Oct. 1 to Nov. 30, inclusive. Squirrels from Oct. 15 to Nov. 30, and upland birds from Oct. 20 to Nov. 30.

"The deer season remains as formerly, Nov. 8 to Nov. 30, both inclusive."

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Protection of Birds and Game.

From the Annual Report of the Biological Survey, Department of Agriculture.

DURING the year work under the Lacey Act has been continued along three main lines—(1) publication of information on game protection; (2) improvement of the inspection service connected with importation of foreign birds and animals; and (3) cooperative work in restricting interstate shipment of game contrary to law.

During the year 287 permits were issued for the entry of about 200 mammals and 50,000 birds, an increase of 101 permits and 43,000 birds, and a decrease of 150 mammals, compared with the transactions in 1901. The figures are, however, subject to revision, as the number of birds actually imported is often less than that called for in the permit. There has been a decided increase in the number of birds entered at New York, while the number imported at San Francisco has decreased, particularly in the case of Australian species. This decrease is attributed to the long-continued drought in Australia and the consequent difficulty in securing birds there. Among the most noteworthy mammals imported may be mentioned a musk ox captured near the mouth of the Mackenzie River and entered at San Francisco. This specimen, the first musk ox in captivity in the United States, is now in the collection of the New York Zoological Society. A number of North African ostriches, the first of this species of ostriches to be brought in for propagation, were imported for the ostrich farm at Pasadena, Cal.

Importations may be divided into two general groups—game birds imported for propagation in captivity, and birds brought in to supply the trade in cage birds. Of these two classes, the latter greatly exceeds the former in numbers. The consignments of cage birds are often of considerable size, and to prevent any injurious species from entering unnoticed amid a large number of harmless ones, arrangements were made through the Secretary of the Treasury, in July, 1901, whereby all big consignments of cage birds arriving at New York, the main port of entry for birds, were subjected to examination by the inspectors of this department. Approximately, 200,000 birds, including about 180,000 canaries, were entered at New York, most of which were inspected. The new duties thus created necessitated the appointment of an additional inspector at New York, making three in all now on duty at that port.

On Jan. 1, 1902, the inspection service was extended to the Territory of Hawaii and a special inspector appointed for Honolulu. Owing to absence of cable communication with the islands this inspector has been authorized to issue permits subject to general instructions from the department. In May, at the earnest request of the Chamber of Commerce in Honolulu and of some of the sugar planters of Hawaii, an order was issued requiring permits for all reptiles imported into the teritory and prohibiting the entry of poisonous species.

Twelve foreign species of mammals and birds are now known to be acclimated in Hawaii, four of which—the mongoose, the English sparrow, the mina, and the Java ricebird (*Munia nisoria*)—are injurious. In Porto Rico the mongoose is acclimated and also two species of African weaver birds, whose exact economic status is not yet known. A few specimens of the mongoose are still in captivity in the United States, but these are, as a rule, in public zoological gardens where their safe-keeping is assured.

So far as known, no prohibited species have been brought into the United States during the year. Entry has been refused in the case of one mongoose at San Francisco and two fruit-eating bats and one kohlmeise at New York. The principal importers of foreign birds and animals have shown no disposition to attempt the importation of prohibited species and have uniformly complied with the requirements of the law.

By an act of Congress, approved June 3, 1902, the prohibition against the entry of eggs of game birds which has existed since 1894, has been removed, and these eggs can now be imported, under regulations of this department, for propagation. The regulations necessary to carry out the law were promptly promulgated, and within a few weeks after the bill was signed the first importation of eggs arrived at New York.

Interstate Commerce in Game.

The provisions of the law regarding interstate commerce in game have necessarily been carried out very largely through cooperation with State officers. Special mention should be made of the services rendered in this connection by the State game commissioner of Illinois and the State game wardens of Iowa, Michigan and West Virginia. Through the cordial cooperation of the attorney-general, the cases referred for action to the Department of Justice have been taken up as promptly as possible and many of them prosecuted to a successful termination. During the year 39 cases, involving the illegal shipment of about 5,000 birds, were reported to this department, as against 57 cases, involving the shipment of about 16,000 birds, during the preceding year. This decrease in number of cases does not necessarily imply a more careful observance of the law, for it is probable that only a comparatively small number of violations are brought to the surface. The proportion of convictions, however, will probably be larger, for the cases of this year have been supported by much better evidence than those of 1901, and their prosecution is likely to prove much more effective. Of the cases arising this year, only two have been dropped for lack of sufficient evidence, and one is still awaiting action; the others have been referred, 23 to the Department of Justice, and 13 to State officers. Four of the State cases have already resulted in conviction. Since the passage of the act 24 convictions have already been secured in cases passing through this department—14 in the Federal courts and 10 in the State courts; and 30 or more cases are still pending in the Federal courts.

New Hampshire Game Laws.

YEARS ago there were game laws in this State; not much attention was paid them. In those days the woodcock season opened in July. Many a young grouse was killed by the woodcock hunters. Quite a number of grouse also during the entire winter. Things are very different now. Never were our game laws better enforced. Our fish and game commissioners are very active and energetic in following up the faintest reports of illegal shooting. One such conviction has a wholesome effect on other would-be violators. For the past two seasons there has been no open market for the sale of grouse and woodcock. This closing of the markets must be of great benefit to the game. In this vicinity when there was an open market, our coveys were hunted persistently by men who made shooting pay. To-day such men have given up to a great extent. They say they cannot afford the time.

Our Legislature is now in session. Whether or no there will be any tinkering with the game laws remains to be seen. I understand that there will be an effort to have an open season on deer in our lower counties. It is only within a few years that deer have appeared in this and similar localities. Ten years ago even the track of a deer was rarely seen. To-day the deer are seen frequently. They are at home and are increasing. That old and often told story of the damage deer do to crops is being told. I think one coney rabbit or woodchuck will do more actual damage to any crop in this section than three deer. Another objection to the presence of deer here or their protection or increase, there are a number of "hound dogs" owned in this vicinity. They are kept to hunt foxes, 'coons and rabbits. The law says, Dogs must not chase deer. Some of these dogs do not regard the law, and their owners do not like the notices they receive from the game wardens. It is said that a dog which will chase a fox will also chase a deer. I know that some good fox dogs will not notice either a fresh deer track or even the sight of a deer. I also am quite sure that a dog which has once chased a deer will do so again, and that he cannot be broken so that he will stay broken any more than can a dog which has once chased or killed sheep.

As for the deer in this section, they are increasing. I say protect them for some years to come. As for their damaging crops, let the owners of said crops prove any such damage if they can. There may be no attempt made as to an open season on deer in the lower part of New Hampshire. Should there be, I predict that the damage to crops and demoralizing of hound dogs will be mentioned.

As to hunting licenses. New Hampshire will wait to see how it works in our neighboring State of Maine. Commissioner Carleton, of the latter State, has kept on hammering at his pet scheme until it looks as though he would get it. Try it and see how it works. Your correspondent from Nashua, N. H., gives his views and states some cold facts. It is some years since I made hunting trips to Maine. I spent a good deal of time and considerable money when hunting in Maine. In my day the guides were not registered. I do not believe that there has been very much moral reformation in the personnel of the average Maine guide by being registered. They look after the dollar as they used to. If there are any hunting grounds where game is killed by proxy, Maine stands near the head. Years ago (before the days of the Bangor and Aroostook Railroad) I was on my way by stage from Mattawamkeag to Patten. We met an outgoing party of Massachusetts sportsmen. They had nine deer. I looked over the deer and the men, and said to my stage driver, "I will bet that those men did not kill one of those deer." The driver said, "Just as like as not." Later I saw one of the guides employed by this party. I knew the guide well, and I asked him about it. He said, "Those men did not try to hunt; they stayed in camp and played cards all the time. I was

one of three guides they hired. They told us to get them some deer. We killed eleven deer for them, and thy never saw one of them until we dragged them in." Now, I know of other instances where moose and other game were brought out which had been killed by proxy.

As Mr. B., of Nashua, says, Put the outgoing sportsman from Maine under oath as to whether what he takes out is of his own killing. It will result in one of two things, either there will be a large falling off of the much advertised number of deer and other game going out via Bangor and other outlets of Maine, or there will be a number of false oaths.

C. M. STARK.

DUNBARTON, N. H., Jan. 9.

Notes on Game.

Black Duck Shooting in Mid-Winter

It is stated by one of my correspondents that a great many black, or dusky ducks, are being shot during their visits to open spots in the ice, with which most of the ponds are now covered, to secure drinking water, fresh water being indispensable to them.

It is a great pity that these birds, which, having escaped the gunners until now, cannot be spared, at least for breeding stock, for another year, if for no other reason.

In fact, it is sheer wastefulness to kill them in winter, for they are poor in flesh, and, subsisting as they do at this season of the year, on small shell fish, mollusks and other marine animals, their flesh is strong-flavored and unfit for the table.

It is true that a large number are sold in the markets in winter, but the purchasers are certainly not among the epicures, and have never tasted the bird when it was in prime condition.

The dusky duck is one of the so-called river ducks, and is one of the best-known of all our water fowl. It breeds in all the New England States, but is found more abundantly in the northern sections of them in the breeding season. The country around Lake Umbagog, Maine, and the extensive range of meadows on the Magalloway River, seem to be favorite nesting places for them. In the swamps and meadows around Big Lake, the lower one of the Schoodic system, these birds formerly bred in great numbers, but they were forced to seek other nesting places by the numerous large pickerel, which seized and devoured their young. They breed also in the meadows and swamps of Nova Scotia, where the writer has repeatedly seen families of them feeding in the near vicinity of farmhouses. While localities in or near meadows, near ponds and lakes are favorite nesting places, they often hatch their young in a swamp in which a small brook is the only water for miles around. Early in September the dusky duck gathers in flocks of fifteen or twenty. It now becomes one of the most shy and wary of birds. It remains with us through nearly the whole year, and moves southward only in very severe winters. In the autumn, while it subsists on seeds and tender aquatic plants and roots, it is one of the best-flavored of all our water fowl, hardly being excelled by the mallards or by those epicurean morsels, the teals; but later it has much of the fishy flavor of the sea ducks.

Owing to the extreme wariness of these birds in the autumn, the experienced gunner seldom attempts to stalk them; but, knowing the localities most frequented by them—generally meadows in which streams or small ponds of water abound—builds a blind (or stand, as it is sometimes called) near the water, six or eight feet square and five or six high, of the limbs of pines or other dense foliaged trees, in which he secretes himself at daybreak, armed with one or two heavy double-barreled guns, and provided with a number of tame decoy ducks, generally the progeny of wild ones of this species.

One of these he anchors or moors out in the water half a gun shot from the blind. The decoy, soon becoming lonesome, begins to call, when, if there are any wild ducks in the neighborhood, they answer the note and soon fly to join the caller.

The sportsman, watching the approaching flock, holds one of the other decoys ready to throw, and as soon as the wild ones approach, he tosses up and toward the anchored duck the bird held in his hand, which is secured from flying off by a strong line fastened to its legs. The bird moored in the water, seeing her mate flying toward her, immediately redoubles her cries, when the wild ducks, after flying back and forth to reconnoitre, alight beside her. As soon as they alight they gather in a bunch away from the decoy, and it is then that the sportsman pours in his first shot; he again fires when the ducks are rising from the water, and is often able to get four shots at a flock before it escapes out of gun shot. It is, as a rule, only early in the morning and late in the afternoon that these ducks can be shot in this manner, and if they are much hunted they approach the stand with great caution.

Expensive Sport.

A condensed resumé of the annual report of the Fish and Game Commissioners of Maine, as published in the Boston Herald, shows that the year 1902 has witnessed greater activity in this department than in any year since its creation. "A careful canvass shows that 133,885 persons came during the past year to spend an extended vacation. Among these were 3,240 who hunted big game. From returns it is shown that $1,371,201 were expended by the visitors for board alone, exclusive of what was paid for other expenses, so that a conservative estimate places the amount expended annually at from $6,000,000 to $12,000,000. There are 1891 registered guides, and the number of moose reported killed during the year was 461. The conclusion seems irresistible that at least 20,000 deer have been killed in the State during the year."

Work for the Game Officers.

As I chanced to pass a market game stall about the middle of last December, I noticed a number of bunches or ruffed grouse hanging up exposed for sale. Following my usual custom of handling a game bird when I have the opportunity, I examined some of the grouse and smoothed their feathers, for my old instinct as a taxidermist always crops out on such an occasion. To my surprise, there was not a shot mark on four-fifths of the birds, and I examined them all; but the marks of the deadly snare-noose were plainly apparent. It seemed to me that such a matter as this should be looked after by the game officials, for the law expressly provides by the game officials.

E. A. SAMUELS.

With Gun and Dogs.

[From a Staff Correspondent.]

LONG before reaching Jacksonville, Fla., a stranger in a well-known land, in quest of climate and game and a bit of fishy diversion, I was "warned" to look out for Col. B. W. Sperry of this gateway city, inasmuch as his reputation as a walking, talking woodcraft and fish lore bureau of information of all of Florida and much of the South further north convinced that he would be just the man to put me right and keep me next.

Upon calling upon him in his private office in the Duval Hotel, the first thing to greet me was a gun cabinet well stocked in goodly assortments. Fish rods of yielding and unbending natures, and a book rack containing FOREST AND STREAM back for the last thirty years, some of them bound and others that should be. Mr. Sperry was not in, but that for the time being didn't make any difference. I was in the South; this fact assures one of a welcome in most cases, and then there were my old friends of a lifetime, so I took off my hat and went to housekeeping with a willingness to deposit my money there uncounted without a receipt.

It was here that the genial, gentle spirit of Mr. Clarence William Smith came into my life for a permanent engagement, indulging me with reminiscences of the pleasures of days afield. Mr. Smith told of hunting men and game long before and during the war with equal humanity; for he is a follower of Johnson and Shakespeare alike, an admirer of Robinson and other lovers of woodland echoes, and still a student and practitioner in the forest, and on the stream a past master, yet still the apprentice of gun and rodology—that hour is with me yet.

With Mr. Sperry it was "How long can you stay and how soon can we match natures akin in the field?" Notice was soon served that that office would be closed until forced circumstances would open it again; letters with twelve cents postage were soon in the mail, and the aid of telegraphy was invoked to further a cause so desirable and intensely just. Grips were packed and goodbyes said and we were off for Live Oak, eighty miles west of here on the Seaboard Air Line, both glad that it was an "air line." There should be no curves in a railroad running into a game country, for it takes too long to go around them; coming back they should all be freight trains, they carry one away so much slower. At Live Oak we found adjoining rooms at our disposal at the Hotel Bon Air, and Mr. MacGregor awaiting our pleasure for the morning, with team, dogs, guns and himself.

At 6:30 the next morning we were away, behind a good pair of horses and with three racily built pointers, all of one family, very much in love with each other; Hugo, the father, and Steve and Kid, the son and daughter. A short distance from town the kid's tail was doing such gamy stunts, indorsed by pop, and agreed to by the methodical Steve, that Mac told us to get out our guns. I am afraid my increasing respiration flushed that covey ahead of time, and for the time being saved some of their lives; not all, however, as Mr. Sperry's long experience in running a hotel had schooled him in self-control and made him master of himself on all occasions; and he laid some feathers in our nest. Very soon we were after the singles. Mac had marked them down with his whip; a point is secured, and I am placed in the van; I flush, only to find my safety and the bird safe. Then a kill by Mr. Sperry and a miss by me, and yet my gun made just as much noise as his. Before we scared out (by me) and killed out (by him) that cover, we walked into another. Then another covey was exercised, and some were found fit for broiling. At ten o'clock we returned to our carriage with nineteen birds, with Mr. Sperry and the dogs mostly to blame. Then we drive on, not in a road, but just on, on, anywhere, everywhere, the only inclosures being around a family pet, the razor back; the dago ranging the wood in quest of birds, we lazily reclining on the back seat of the carriage behind our pipes, indulging in the difference between recrimination and sucess, with me handling the more difficult subject.

This day was a series of incidents; some days only have one. Many are barren, yet in a day that bubbles over with good things there is always one that sticks to the rim of the cup of sweet things, and this becomes different from those that slop over or stay behind. We had returned to the carriage on one occasion and deposited the birds in a basket under the seat and climbed in and were driving on when the question arose, "Where is Hugo?" Steve and the kid were ranging easily along, but there was no pop. The horses were stopped, and by the side of the left hind wheel patiently stood good Hugo with a dead quail in his mouth. Mr. Sperry had dropped one in the road while transferring them from his pocket to the basket (it wasn't I; one can't be careless with what they haven't got). Hugo couldn't tell us, so he just brought it along. The man who kicks a dog kicks his better.

We found plenty of birds and always had open shooting, and undisguised sportsmanship. Here the fellow that is wind-broken and gouty can rid himself of both complaints and go gunning. It's easy and healthy. The dogs and horses do all the work and the birds the sprinting.

Mr. Sperry fits his reputation. He is only too glad to direct sportsmen where to go and find game and fish, and would circumstances permit, would always be one of the party, and each party would be the better for his presence and the bag fuller by the judicious care he takes of his gun.

I had the pleasure of a luncheon with Capt. MacDonnell, the general passenger agent of the Seaboard Air Line here, and the total absorption of our gray matter on game and fish and where and when to find them, makes me forget what we had to eat. The captain is always at his desk when he ought to be, and is ever ready to stay over hours talking to visiting sportsmen.

At Lake City the game is very plentiful, and good accommodations can be had at the Hotel Blanche; and here, as in Live Oak, Mr. Chappell has all the prerequisites to entertain the shooter. It's a gamy country. Deer, turkeys, quail and doves are plentiful. The natives are courteous; a Mr. Ross walked a mile to welcome us to his and his neighbor's plantation, telling us we were welcome, and that his neighbor was all right, concluding with, "Sometimes a mean man gets among us, but, well, well, he don't stay long. You see it's easy moving here; everybody helps."

T. E. BATTEN.

JACKSONVILLE, Fla., Jan. 10.

The Adirondack Deer.

ALBANY, N. Y., Jan. 10.—*Editor Forest and Stream:* The Forest, Fish and Game Commission takes pleasure in submitting some statistics relative to Adirondack deer, which will answer several questions recently asked by your correspondents. We have just finished compiling the returns of the shipments made by the American and National express companies from various points in the Adirondack region, and find that the totals are as follows, those of previous years being added for comparison:

Year.	Carcasses.	Saddles.	Heads.
1900.....	1,020	89	95
1901.....	1,062	103	121
1902.....	1,364	113	193

These figures show an increase which, taken with the common report, amply authenticated, that there are more deer than ever in the woods, would seem to be a sufficient argument in favor of the protection which this State provides for the Adirondack deer. Taken with the fact that a very large number of the shipments reported weighed over 200 pounds dressed, the figures also indicate that the contention of this department is correct that the Adirondack deer properly protected will develop in size and weight to equal fully and even to surpass those of the same species in any other locality in North America. We have one record of a deer shot by William Coulter of Johnsburgh which weighed 415 pounds. For the information of your correspondents, it may also be stated that we figure that at least four deer are killed and eaten in the woods for every one shipped out.

JOHN D. WHISH,
Secretary.

Big Guns in Virginia.

Editor Forest and Stream:

I inclose a clipping from the Daily Press of Newport News, Va., which the public ought to read. It seems to me that this is a more wanton destruction of wild game than the account of the slaughter of the blue peter in Princess Anne county, as given in FOREST AND STREAM Dec. 13.

RICHMOND, Va., Jan. 2.—Small cannons are reported in use this season by duck hunters in the marshes of the lower James and Potomac rivers. These guns are about nine feet long, and are used both in blinds and pivoted on the bows of small boats.

Some idea of the destructiveness of the implements of death may be gained from the statement to-day that a prominent tugboat captain, who made duck shooting a business, managed to kill 225 birds in one shot. So great is the roar of the cannons that the myriads of ducks are frightened away after each discharge, so that only two or three such shots can be made during the week.

Many of these duck hunters have large marshes of their own, some of which are 5,000 acres in extent. No one is allowed to trespass, it is said, so there is little danger of the law taking effect. These marshes are carefully baited the year round with tons of corn and feed to attract the water fowl, so when the game season opens they are feeding in countless numbers.

It is said in the markets that only through this method of wholesale killing can the cities be supplied with game. While each shot from the cannon may kill ten to seventy-five pairs of ducks, there is scarcely any perceptible decrease in the number of birds. Some say the loss during a whole season is not over 1 per cent. of the entire flock.

The ducks killed in the Virginia waters are said to be the fattest and best flavored on the Northern markets. They are eaten mostly in the large hotels and restaurants.

It doesn't seem possible that such conditions could exist in any State without the law coming to the rescue. There must be a law in Virginia covering such cases, I should suppose.

J. R. S.

Hounding vs. Still-Hunting in Ontario.

Editor Forest and Stream:

As usual, after the close of the open season for deer in Ontario, the regular annual agitation has commenced for alteration in open season and prohibiting the use of hounds. Previous to the passage of the Ontario Game Prohibition Act of 1892 the Government appointed the Ontario Game Commission, the members of which arranged for the holding of meetings in nearly every available portion of the Province, for the purpose of securing evidence from sportsmen and hunters regarding the proper open and close season for all species of game in Ontario. In accordance with the evidence so procured, the present game laws were enacted by the Legislature. That these laws have been productive of much good in the matter of game protection no one will deny who has given the subject any consideration. Many young and inexperienced hunters on their return from the woods, from the innermost recess of their verdant understanding, want the game laws altered to suit their personal opinions. We have the periodical outcry from a few still-hunters who want hounding prohibited. Others want the open season to be the last half of November, instead of the first half, as at present. Those clamoring for these changes evidently have not considered the impossibility of the Government changing the open season with every change of weather. The past month of November was the warmest November since 1848, and it may be fifty years more before we have another November with a similar temperature.

Were the hounding of deer prohibited in Ontario 90 per cent. of the hunters would never see a deer during the fifteen days' open season. Then, we must take into con-

sideration that a large portion of our northern country, in which lumbering operations have taken place, is covered with a dense second growth, in which still-hunting would be impossible. Last, but not least, objection to still hunting for deer in Ontario is the large number of hunters that are killed and wounded in the States of Maine, Michigan, Wisconsin, and other States where still-hunting prevails in contrast with the absence of such accidents in Ontario, where for several years there have been at least ten thousand hunters in the woods of seven or eight of our northern counties during our short open season for deer. We had better let well enough alone. Our chief game warden will call a halt when the supply of deer fails to equal the demand. RANGER.

Venison in Maine Lumber Camps.

NEW YORK, Jan. 7.—*Editor Forest and Stream:* I want to bring to the notice of sportsmen and more especially those living in Maine the condition of the game warden force in that State. I have recently returned from my fourteenth shooting trip in the north woods, and am sorry to say that I found deer and grouse less plentiful than ever before.

This condition is easily accounted for. The wardens throughout that section traversed by the west branch of the Bangor & Aroostook R. R. and the C. P. R. R. with one exception are a miserable lazy lot of hotel loungers. Their work consisted mostly of being at the station at train time to examine returning sportsmen's trunks for a possible hidden bird, whereas all around them illegal killing was constantly going on.

Practically every man living in that section kills over two deer each season. I met one man on the fifth of October who was returning home with the fifth deer he had already gotten that season. This game, of course, was sold to commercial men going home, or to runners for Boston meat markets. The lumber camps practically live on deer meat all winter. The men all hunt Sundays, and it is customary for men who are going on an errand of any kind to be supplied with a gun by the boss with instructions to get something. One boss told me that 278 deer had been used in his camp last season. The camp consisted of thirty men. Probably an equal number were wounded and left to die by these wild shooting Canadian workmen. I visited several camps this trip and found them all using venison lavishly. Wardens seldom visit these places as they dislike the accommodations. Occasionally they stop over night at them when necessary. But I have never in my tramps, at which I spend about three months each year, heard of a single lumberman being arrested for illegal shooting. There is only one remedy for the relief of this slaughter, that is, to impose a resident as well as a non-resident shooting license and employ competent wardens to see that every man with a rifle possesses one. GEORGE O. PETE.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Fishing for the Leaping Shark.

DETROIT, Mich., Jan. 9.—*Editor Forest and Stream:* According to promise, I send you the following short description of fishing for leaping sharks in the waters of the Gulf of Mexico.

As I told you in a late letter, I caught my first specimen of this species about the end of last October at Aransas Pass, Texas, but since then I have landed a dozen more, including the longest one on record, so now I feel competent to tell your readers something about this fish and the method of its capture.

As far as I know, no sportsman starts out deliberately to fish for leaping sharks, because they are not sufficiently plentiful in any one place; but they are caught occasionally on tarpon tackle when one is fishing for that king of all game fishes, the *grande ecaille.*

It is seldom that a sportsman takes more than one leaping shark per day; nevertheless I landed five one afternoon and lost another by the breaking of a wire snell.

The condition most favorable to the sport is extremely clear water. This is possibly because these sharks do not like muddy water, but more probably because, when the water is clear, they can see the bait from quite a distance.

The only place on the Gulf that I know of where they are caught is Aransas Pass; but they surely must be found at other localities. Perhaps some of your readers will give through your columns some information concerning this point. I have never seen or heard of leaping sharks at Tampico; but they may frequent that locality, notwithstanding; for I have been there only in winter, and have never made inquiry of the natives concerning them. They certainly leave the Texas coast on the approach of cold weather, so must go south. It is probable that they were migrating from the Aransas Pass waters the afternoon that I made my big catch, as after a day or two later there were no more caught or seen there.

The leaping shark is easily distinguished from all other kinds of sharks by its slimness and agility. Its lines are the embodiment of speed, and its great tail and fins indicate immense power for its comparatively small weight. In these respects the leaping shark is to the common "man-eater" as a rainbow trout is to a Missouri River catfish.

My largest leaping shark measured seven feet seven inches in length, the previous record being less than seven feet. Unfortunately, I neglected to measure the girth, so can make no close estimate of its weight; but imagine it to have been somewhat in excess of two hundred pounds, while a "man-eater" of that length would weigh probably twice as much.

The leaping shark does not always leap when hooked, but generally does so. This large one of mine did not, but instead made a fierce rush that took out between three hundred and four hundred feet of line. It gave me a full half hour of very hard fighting, and I was indeed glad when I landed it on the sandy beach near Point of Rocks. I saved its jaws, and my boatman cut out the backbone to manufacture into a walking cane by running a steel rod through it. Such a cane, although perhaps not very serviceable, is certainly quaint and curious.

It was my intention to send you with this letter a photograph of a leaping shark, but I was unable to obtain one. Perhaps some day I may be more fortunate, in which case I shall forward you one for illustration.

Few tarpon fishermen do justice to the game qualities of the leaping shark, most of them claiming that it is a foul fish and not worthy of a sportsman's attention. On this point I must take issue with them, because, pound for pound, the leaping shark puts up a stiffer fight than the tarpon, and is much harder on both the tackle and one's nervous energy; but it does not jump so often nor so high as does the tarpon. Again, one misses the delightful uncertainty that always exists in handling a tarpon; because, after the leaping shark is once hooked, it very seldom escapes except by breaking the tackle, while a tarpon is liable to get away even after it is almost hauled out of the water.

The jump of the leaping shark is long but not high, and sometimes when in the air the creature spins around on its longitudinal axis. It has, too, a trick of twisting the line about its body, and, as its skin is like sandpaper and its tail sharp, it behooves one to use a long wire snell when fishing in waters frequented by the leaping shark.

The mad, wild rushes of this fish are unequalled by any other fish that I have ever hooked: even the first run of a kingfish cannot quite compare therewith in either length or speed. Using a Vom Hofe No. 36 line, I have tried to hold a 5½-foot leaping shark with three brakes set simultaneously, and in spite of all my efforts it has taken out fully three hundred and fifty feet of line.

After a long run of this kind, the shark is liable to turn suddenly and rush back straight toward the boat about as quickly as it went away, thus keeping one busily occupied in reeling up the slack.

I make a practice of shooting sharks before attempting to remove the hook, whether I take them ashore or not. This is mainly to avoid the danger to my boatman from teeth and tail.

In concluding this subject, I beg to advise all sportsmen who enjoy tackling large game fishes to give the leaping shark a trial, and to this end would suggest that a discussion in your columns concerning its habitat and characteristics would be both interesting and valuable.

No special tackle or apparatus is necessary for this sport, as the ordinary tarpon outfit will suffice, provided only that the wire snells have ample length.

It has not escaped my memory that I promised you a paper on "Further Notes Concerning Tarpon Tackle." Sooner or later I shall keep this promise, but I have often to wait quite a while before finding the opportunity to write papers on sporting subjects, as my professional work at present demands nearly all of my time. It is when stranded in a hotel, as I am to-day, that the opportunity for writing comes; and I shall avail myself of the first similar occasion to prepare the said promised paper.

Ever since last summer I have been trying to write you a couple of short articles on trout fishing, one being entitled, "Rainbow Trout versus Black Bass," and the other "Trout Fishing in Montana Waters." These papers I shall send you probably within a few months.

J. A. L. WADDELL.

Random Notes on Fish.

BY EDWARD A. SAMUELS.

Change of Habits in Salmon.

OF the ten species of *Salmo* in America but one is indigenous to the Atlantic coast. This fish is called the *Salmo salar* by scientists, and in common parlance it is known as the "salmon," "sea salmon," and the "Atlantic salmon." This species is usually anadromous in its habits, coming in from the sea in the spring and early summer, and ascending fresh-water rivers in which, and in the lakes to which they are tributary, they spend the summer and early autumn, until the time for spawning arrives, this being usually in October or November, when the temperature of the water is lowered by cold and frosty weather.

There have been, in years long since past, a large number of these fish which abandoned the anadromous habit, wholly, or in part, and instead of returning to the sea after the period of spawning had passed, they moved into large, deep lakes, where they recuperated and remained through the winter.

These fish have, improperly, been called landlocked; but they are not and never have been prevented from returning to the sea; they apparently remained in the fresh water from choice, or because they found the conditions as regards food, etc., such that there was no need of going to the sea, and the habit became fixed in time, so that now they never attempt to descend to the ocean.

Among the so-called landlocked salmon, those which have for a very great many years made their home in the Schoodic Lakes and in the Grand Lake Stream, a tributary of the St. Croix River, which forms the boundary for a number of miles between Maine and New Brunswick, are perhaps the best known to anglers of all the so-called landlocked fish. The writer, as far back as the early sixties, made annual visits to those waters, and the sport that he obtained there has hardly been excelled in any other localities. For gaminess and pluck they were fully equal to a fresh-run grilse, and they were so abundant that one could take them by hundreds if he so desired.

In fact, Grand Lake Stream was often visited by anglers "who fished for count," and some of the stories that were told of them at the time aroused the indignation of those who are endowed with true sportsmen's instincts.

Thaddeus Norris, in his "American Angler's Book," states that the catch by some of these parties in the three years, 1856, 1857 and 1858, was by three rods, six days, 634 fish; weight 872 pounds. Three rods, six days, 432 fish; weight, 642 pounds. Two rods, eight days, 510 fish; weight, 725 pounds. The average time of fishing was four and a half hours per day.

One can hardly conceive of a greater and more wanton waste than such sport (?) entailed, for, although most of the fish caught were returned to the water, a very large proportion of them died from the injuries they had received, and my Indian guides informed me that the banks of the stream were in some places covered with decaying fish after the so-called anglers had completed their work.

Now those fish in the years I have named averaged less than two pounds in weight, and in the sixties they were not much larger; their food was far from abundant and cannibalism was their chief resource to appease their hunger. Their natural history was so little known that they were called the "Schoodic trout," and the "white trout," by anglers and writers generally.

The average size of the fish had in late years increased considerably, as will be seen by the following memoranda furnished the writer by Mr. W. T. Buck, who supervised the work at the hatchery on Grand Lake Stream in 1886-7, in which year I visited many of the principal hatcheries in the States and in the Dominion of Canada on a tour of scientific investigation, and witnessed the modus operandi pursued in the different establishments.

Mr. Buck says:

*"Comparison of records shows a gradual increase in size of the Schoodic salmon handled at the spawning season, and a marked increase in the yield of eggs per fish: Thus, 235 males, weighed and measured in 1877, averaged 16.8 inches, 1.8 pounds; 247 males, weighed and measured in 1886, averaged 20.3 inches, 3.46 pounds; 343 females, weighed and measured in 1877, averaged 16.1 inches, 1.9 pounds; 505 females, weighed and measured in 1886, averaged 20.1 inches, 3.58 pounds."

This increase in size may be accounted for by the greater abundance of food that the fish have had, compared with their "short commons" of forty or fifty years ago.

The food supply of smelts is now very great; in fact, wherever these little fish have been introduced, the Salmonidæ have thrived most wonderfully.

Like the salmon, the smelt is naturally an anadromous fish, living chiefly in the ocean, but ascending the fresh-water streams in the spring to spawn; but if it or its progeny are debarred from returning to the sea it quickly becomes accustomed to a permanent home in fresh water.

The Maine Fish and Game Commissioners, taking advantage of this peculiarity of habit, are introducing the smelts into all waters that they stock with salmon; in fact, for the successful establishment of the salmon in new waters the introduction of the smelt seems to be a sine qua non.

This desideratum is set forth in one of the reports of the Commissioners in the following language:

"We have known these salmon to grow to thirteen pounds in six years; but to obtain that size they must have plenty of fresh-water smelts for food, deep, pure water, and large lakes or ponds, with large, quick-running streams, and a gravelly bottom for spawning ground. Without these streams, they never will multiply and be abundant. We consider it of very great importance to have our lakes and ponds stocked with the fresh-water smelt. It is the favorite food of the trout and salmon."

As I have already stated, the Schoodic salmon are not landlocked, and never have been. Such a condition could only arise from some great convulsion of nature, and there is no evidence whatever of such an event having occurred in the lower St. Croix system. They always could have run down to the sea at any time, and until the big dam was built at Milltown, they could have returned up the river.

Mr. George A. Boardman, of Calais, Me., who is well-known as a naturalist and angler, wrote me years ago:

"I do not regard the fish a landlocked salmon, for the water must always have had an outlet to the sea, and the fish could go if they chose; and in fact, when I was a boy, sixty years ago, they were abundant in the river, even to the salt water."

This change of habit is not peculiar to these fish, the ouananiche, or winninish, of Lake St. John, P. Q., which is called a landlocked species, and which is precisely the same fish as the Schoodic salmon, having also abandoned the sea-going habit, although the Saguenay River is open all the way to the St. Lawrence.

That the fish content themselves with remaining in the fresh water is not to be wondered at, considering the immense range that is available to them.

Lake St. John is a vast inland sea, nearly fifty miles in length and from twenty to forty in width. Emptying into it are eleven large rivers, besides many smaller streams. Two of the larger rivers, the Peribonca and Ashuapmouchouan, are of great size and length. The Peribonca has been ascended about six hundred miles, and the other for a great distance also. So that the ouananiche may wander at its own sweet will, and never have occasion to go to the ocean to recuperate from the labors of reproduction.

That this fish is a *Salmo salar* has been proven by high scientific authority. I confess I had my doubts concerning its identity until I examined specimens with considerable minuteness, and then, that there might be no doubt in my mind whatever, I visited St. Felicienne on the Ashuapmouchouan River, about ten miles above the lake at a season of the year when no fish could be taken at the Grand Decharge, and captured a number, which I sent to the Museum of Comparative Zoology at Cambridge, Mass., where they were identified as dwarfed specimens of *Salmo salar.*

Professor Goode, the eminent ichthyologist, has stated that he is inclined to the view that the natural habitat of the salmon is in the fresh water. If such is the case, the sea-going habit is of course an acquired one, and those fish that abandon it simply revert to their original traits and instincts.

The Pull at the Reel.

In the FOREST AND STREAM for Dec. 27, 1902, Mr. Venning states that he would like to have his angling readers guess the number of pounds of tension there

*Printed in "With Fly-Rod and Camera."

was on the rod in the experiment that he describes, to which the editor appends the opinion that no authentic decision has ever been given on this vexata questio.

In the FOREST AND STREAM of June 14, 1902, I had the following:

"Now the sheer pull at the reel of a salmon in the water when opposed to the upright, or, rather, perpendicular, spring of the rod is not nearly as great as most people imagine it to be. (If the rod, however, is by carelessness or accident allowed to become horizontal, or nearly so, the pull of the fish is vastly greater, and I doubt if anything weaker than a cod line could hold him.) Repeatedly have I asked for the opinion of anglers in relation to this, and their guesses have run all the way from ten to forty pounds. Of course, a forty-pound pull, or anything like it, is quite out of the question, for no casting line is strong enough to stand it.

"Ten pounds is nearer the right figure, and this may be easily demonstrated by fastening a spring balance on the lawn, to the ring of which hitch the casting line, and lift the rod perpendicularly; by winding the reel the line is tautened and the rod begins to bend, and if this is continued until the rod describes a half-circle, or as great a bend as any salmon at any time could give it, the experimenter will be surprised to find that the scales show a pull of no more than eight or ten pounds, and very pliable rods will circle at even a less strain.

"Now I know very well you will say that a ten-pound live pull is quite different from a dead one. Of course it is, but your casting line will stand only a given strain, 'be it alive or be it dead,' and it behooves the angler to 'take due notice thereof and govern himself accordingly.'"

Catching the Albacore.

[From "Moose Hunting, Salmon Fishing and Other Sketches of Sport," by T. R. Pattillo.]

DURING the summer and autumn large bodies of herring and mackerel frequent the harbors of Nova Scotia, pursued thither by their relentless foes the albacores, sometimes called the horse-mackeral, from their great resemblance to the mackeral—in fact, they are considered to belong to that family. If my readers have seen a mackerel, and, moreover, hooked one with a jig and line, they can conjecture, from the smartness of the ordinary mackerel, what kind of sport an overgrown one of 600 pounds, fastened to hook and line, would be likely to afford. Certainly he would be no plaything. I have helped to capture them in fish-traps 11 feet long and as big as a vinegar-cask. When these fish are among the shoals of small fish, they rush and leap out like salmon and pollock, and are so ravenous they are often dangerous to fishermen picking their nets, as they rush from beneath the boats after the fish falling out of them. Albacores, though not generally eaten by Englishmen, yet are very nice eating, and are more highly prized by Portuguese and Spaniards than any other fish they take, and sell for the highest prices.

Prompted by the desire for a little excitement, a friend and I decided to attempt the capture of one of them. As we knew the gear required must be first-lass, we procured two of what in fishing parlance are called 18th hemp cod-lines, each 32 fathoms long. Then we had a hook made for each out of steel three-eighths thick, 8 inches wide, with a 3-inch shank, and long heavy beard. With our lines attached to swivel-reels to run them on and off, we felt we were equipped for the expected spree, so, having secured a stiff medium low boat, we proceeded one morning quite early to the netting-ground. There we found the nets well fished, and knew by that our game would be on hand.

We procured a number of herrings with which to bait them up, and then lay on our oars, awaiting developments. Presently one of the fishermen called out, "Halloa, boys! here's a fellow!" meaning an albacore, followed by a shout from another and still another, that they were about their boats; so we slowly moved outside the range of the boats, throwing over a herring every few yards to toll them along with us. When we considered we were far enough away, we took the precaution to secure the reel to the thwart, for we were a bit afraid of the fish we expected to grapple with. Then I threw over a herring, to see if there were any albacores near us, and to our delight a monster rushed for it just under the surface, so I threw another loose one and another attached to the hook. He rushed for the first one, whirled and took hold of the other, and we had hold of him. Then for a few minutes we had a good imitation of the antics of a wild prairie horse when first haltered. He jumped his full length out of the water, which gave us a very vivid idea of the monster we were attached to; then he started at an awful pace across the harbor.

The line was running out swiftly, so that we had to move as quickly to get it into the notch in the stern, which we had wisely thought to make. Then I seized an oar and placed it for steering, while we both got positions to trim the boat. What we feared was that, when he had run all the line out, if the boat was motionless, something might break; so to obviate that, my friend succeeded in grasping the line partially, and thereby gradually starting the boat, while I helped by sculling, so that by the time it was all off the reel, she was moving faster than ever she did before, and it is doubtful if she ever did after. The fish kept up the pace for at least ten minutes, towing us directly into the harbor; then he made a jump, turned, and took us straight back for the fishing grounds. The men in their boats had been watching us with great interest, not supposing for a moment they were to have any part in it, but when they saw us going directly for them, the shouting and hooting and swearing that suddenly started from them would have been laughable to any disinterested spectators, but we could see plainly that, if he continued the course he was then taking us, nothing short of a collision with one or more of the boats would follow, and the most of them were half loaded with herrings.

The way those fellows were shouting was as if Pandemonium were let loose, and tended somewhat to disconcert us. The nearer we approached them, the greater the peril seemed of sinking by contact one or both of our boats, so I jumped with my knife to free him, but in the rush to do so my foot slipped, and I went headlong on top of my mate, and my knife flew out of my hand—confusion worse confounded. Before we could disengage ourselves, the boats came together with a heavy crash, filling the other's and washing a lot of their herrings overboard. This additional drag caused the albacore to spring again, when, to save ourselves from being all thrown overboard; one of the men cut the line. The first salute we poor fellows got was, "You d—d fools!" followed by language not altogether classical English, nor yet pure Anglo-Saxon, having a large percentage of the swear element in it. After their first ebullition was over, we got into a hearty laugh over the ridiculousness of the affair; then they baled their boat out, and went on with their work.

We poor disgruntled fellows rowed around among the other boats, finishing up the first part of the spree with roars of laughter. Of course, after the danger was over, the whole affair appeared so funny that we all had to shout and halloa or burst.

Our freed albacore paraded himself all over the harbor, jumping dozens of times, with the line still attached to him, all through that day. In the course of an hour, by seeing these big fellows rushing about us in the bay, the sporting temperature rose again, and we decided to try our other line on another fellow. The fishermen hesitated to supply us with bait, fearing a repetition of the same peril, if we got fast into another. After a little coaxing, we got what we wanted, and started off shore, occasionally throwing a herring as we went. When we thought ourselves out of the danger limit, we stopped, got the gear into shape for immediate action, if necessary, not knowing then if there were any fish near.

This was soon decided when I stood up and threw over a herring, for it scarcely struck the water before it was grabbed. Then I threw over the baited hook, and he seized it just as fiercely; and this second fellow was fast, rushing and jumping even more fiercely than the first. He began towing us directly away from the boats for some time. To make his speed less rapid, we crossed our oars and held back water, which acted like a drag. Suddenly, like his predecessor, he turned at right angles to the current he had been following, and led us in that direction fully ten minutes, then took a range leading directly for the boats. Up to this time we did not feel at all anxious—apart from the long row that seemed before us when he was leading off shore. Now, however, there appeared to be evil in his eye, and if he should take us up there this time, the results might be much more serious than before, for the boats were all deeply loaded.

What was to be done? While we were trying to plan some feasible way out of it, and at the same time save our fish, he made a leap out, and fell very heavily, thus showing he was weakening, and from that time we found the boat was moving more slowly, and we therefore became very hopeful. As we looked in shore, the men had their hats off, and were gesticulating fiercely, giving us to understand we ought to cut him free, which we would probably have done had we not noticed his faltering. The speed of the boat kept slackening very fast, so much so that in a short time we were able to gather in the line to within a few fathoms of him. He had towed us to within 150 yards of the fishermen, when suddenly he stopped short. We hauled up the line, and the fish with it. What a beauty! Ten feet long, weighing 600 pounds. We soon had a rope through his gills, and towed him to the shore in through the boats. The men and boys came to see him after their nets were picked, and helped us haul him on the beach, and finished by giving three cheers, which made us feel like heroes. Our cranky friends of the collision had long ere this got over their pet, and all enjoyed a hearty laugh over the exciting time. "Hang it!" said an old chap, "we were getting worked up when you were coming right for us again, as we would have been in a bad plight, with our boats all loaded down, if the scamp had got you there." We had had all the sport there was to be obtained out of the fish, so we gave his body to the men who had lost their herrings through us, thus reimbursing them well, as the fish was worth at least $20. If any of my readers are at any time on our Nova Scotian shore, and are seeking sport, they can have it equal to that enjoyed on the Pacific Coast in the capture of the albacore. This fish is so voracious that it is no trouble to bait him up, but see that your gear is good, and don't fear he will eat you, if by chance he should haul you overboard. He does not fight long, but he means business while at it.

The Sea Trout Controversy.

Editor Forest and Stream:

Are there no definite anatomical data which are known to distinguish the sea trout of our Eastern coast from the brook trout? I have never had specimens side by side for comparison, but some one must have made the study. The idea that sea trout ascend the river for salmon spawn would have no bearing in the hundreds of smaller streams which have their annual migration of sea trout. I have caught sea trout in very many northern streams, and have also caught the sea-run brook trout in our more southern streams, and the two fish have a very different appearance, even when both are in the silvery stage of coloration. They are different in habits also. The sea-run brook trout when frightened in a stream will run for cover, while the sea trout does not attempt to seek cover at all. The sea-run brook trout when frightened will stir up the mud at the bottom with his tail for protection, while the sea trout does not resort to this trick. The sea-run brook trout likes to remain near cover, or under it, when in the stream, while the sea trout lies in the middle of the most open pool. The sea-run trout while in the stream is timid, and will not rise to the fly if he sees the fisherman upon the bank. The sea trout cares very little about the presence of the fisherman in full sight, and will rise freely to the most clumsy cast. Sometimes when fishing for camp we step out to the stream and look over a large number of sea trout, and then hold the fly over one that is about the size that we want for dinner. The sea-run brook trout does not show himself near the surface until he is directly beneath the fly. The sea trout often rises near to the surface and makes a wake like a muskrat before getting to the fly. The sea-run brook trout runs for cover when hooked. The sea trout keeps in the open when hooked, and splashes about near the surface. Both the sea-run brook trout and the sea trout ascend streams to spawn, and both feed freely while en route. The flavor of the two is very different, but that might occur easily enough from difference in food supply.

I have fished in very many waters containing both sea trout and what I have called brook trout. Why should one lot go to sea and another lot remain in the ponds? The ones remaining in the ponds average larger, I think, than the ones that go to sea where food supply is supposed to be more abundant. Take, for instance, Serpentine River and Harry's Brook, in Newfoundland. The sea trout in the former seldom weigh three pounds, while there are any number of trout in the lake that will go pretty close to ten pounds. The sea trout in Harry's Brook seldom weigh four pounds, while in George's Pond, at the head of the brook, the "permanent residents" are monsters. I have not weighed any of them, because they are a nuisance, and not very good to eat when compared with the sea trout. We get our flies out of the way when we see an old ten-pounder coming, and do not let him get hooked if we can help it. The smaller, fatter sea trout, and the salmon, are all that we need to bother with. In both of these streams there are seldom any brook trout in rapid water that will weigh four ounces. This is a rather curious fact. The large trout are all living in the sea or in the ponds, excepting during the migrations to the spawning beds. It would be an easy matter for an ichthyologist to get trout from both of these typical waters mentioned, if the question of identity has not been fully determined as yet. I suspect that the matter is well understood, and that differences in opinion are simply differences in information on the part of correspondents.

ROBERT T. MORRIS.

NEW YORK, Jan. 10.

Ciscos in Lake Ontario.

WITHIN the last two or three years ciscos (*Argyrosomus artedi*) have made their appearance at the eastern end of Lake Ontario in phenomenal numbers. In the words of the fishermen, "tons and tons of them are caught there." They seem to be increasing in numbers also every year. Off "The Ducks," a small group of islands about 25 miles southwest of the Cape Vincent lighthouse (Tibbetts Point Light), and in the Bay of Quinte, near the Canadian shore, enormous quantities of these fish were caught last summer and the summer before. It is quite probable that an attempt will be made next fall by the U. S. Fish Commission to collect the eggs of this fish and hatch them at the Cape Vincent Station, which is situated at the head of the St. Lawrence River. As the appearance of these fish in such numbers was coincident with the time that young fry from Lake Erie and Lake Michigan eggs (understood to be whitefish eggs), distributed from Cape Vincent Station should mature, it was strongly suspected, at first, that the new fish were the grown up whitefish fry distributed from the Station, but samples that were sent to Washington for identification were pronounced to be ciscos, so they could not be the matured product of the Cape Vincent Hatchery, unless some of the eggs sent to the Cape Vincent Hatchery from Lake Erie and Lake Michigan were cisco eggs.

Hints and Wrinkles.

Readers are invited to send for publication under this head hints and wrinkles drawn from practical experience, and pertaining to shooting, fishing, camping and outdoor life.

A Bullet Sinker for Fishing.

KNOXVILLE, Tenn., Jan. 4.—I have many times desired a better fishing line sinker than is on the market. Here is the way to make them. Get a round bullet mould of .38, .40 or .44 caliber. Enter between the halves of the mould from bottom, half way up, a bit of cardboard about thickness of G. line and then run the lead. You will then easily pull the card out of the bullet and your sinker is ready for use. Bullets or shot split with knife are not good, because when you close the sinker on the line it is apt to bite, and hence make the line weak at this point. In my way of making the slit in the bullet there is space provided for the line and you can close the slit without a bite on the line. Try it, and my word for it, you will have the best sinker you ever had.

WM. S. TEALL.

Shoes.

Thick soles for one's shoes are invaluable if one is taking a long tramp either into the woods or along the highways. The notion that old shoes that "fit the feet" are best for walking explodes violently when the uppers rip and the sand percolates through the seams. Heavy shoes, with soles that give only the faintest spring are not only more lasting but hold the ankles and insteps to their business. The bottoms do not yield to the pressure of pebbles and twigs, so there is less likelihood of stone bruises and blisters.

A close fit which does not allow any part of the shoe to slide or grind at any part means comfort. A shoe should have a lining to hold the tops close around the ankles, or higher, closing and keeping closed the top of the shoe. Most shoes are sure to stretch at the top, and the scuffling throws everything from dust to sticks into the ready opening.

Iron pegs, tacks or nails make a shoe much colder than wood or brass. For shoes brass is best for all round use. The heads of brass tacks wear down uniformly with the leather on most soil, and so the tack is not likely to be driven up through the leather to become "a nail in the shoe." Brass, too, does not rot the leather. More taps can be put on with brass than with other nails.

In case of the tops of the shoes stretching so much as to allow sand or other stuff to get into them, a piece of cloth, with a round hole in the middle, puckered by a rubber twine, to draw on over the stocking and the edge hank down over the shoe top will be

found useful and comfortable, though not lovely to look at. Another band around the outer edge of the cloth—wristlet fashion—insures sandless shoes.

Of course soles wear through faster on sandy or frozen ground than on clay or loam, as in the woods. For all purposes of walking a stiff half-inch sole is about right. One used to thin soles is likely to have a sense of clumping at first, but this is soon lost, especially if the heel is not raised so high in proportion as in the thin-soled shoes. R. S.

Canine Elegies and Epitaphs.

XXXII.—March.

CARTHAGE, O., Dec. 24, 1902.—*Editor Forest and Stream:* Inclosed find elegy written upon death of a handsome spaniel that accompanied me during two years of touring in the Adirondacks.
E. S. WHITAKER.

MARCH.

He was only a dog; but do you know
How great an attachment will sometimes grow
Between master and dog; and how he will show
By expression of eyes and move of tail,
Plain as words can tell, what feelings prevail;
And by bound or bark, or touch of a paw
Convey meaning as plain as written law,
And show knowledge of what he heard or saw?
Such an one was March, spaniel, red and white,
With a kindly eye so lustrous and bright;
Gun-shy at first, so that he ran away
From camp to hotel, eighteen miles, to stay,
And remained till his master came next day;
But with gentle training soon learned to love
The crack of rifle, and quick did he prove
A retriever of note for partridge or duck,
And showed at one time wonderful pluck
By towing to shore a wounded buck
Which he caught in mid-river, and clung to an ear,
And so hastened the death of the stricken deer.
He was loving and kind, with beauteous eyes,
And my guide and self both thought him as wise
As some other fellows of greater size.
But no more will he go over the trail,
Ne'er again with us in bonny boat sail,
Nor climb o'er the mountains towering high,
For March is dead, and a tear comes to eye
While inditing for him this fond good bye.

Toby Distinguishes Himself.

TAYLORSVILLE, N. C., Dec. 31.—Toby is a twenty-months old setter pup, with exceedingly active and enduring little legs. He weighs only about fifteen pounds, but has a head that looks as if he had a high hat on. He is owned by my friend, Mr. Cobb, with whom I have been shooting daily for over a month, and observing and admiring Toby. Toby is great on singles and fair on coveys. He belongs to our best team, which, beside another dog, staunch on singles, includes Old Sport, the best covey dog I know of. The days we take out these three we feel sure of a good many birds. Now Old Sport is a fast goer and a far ranger, and has a habit if we don't soon find him to leave his covey to hunt us up and take us to it.

Yesterday Toby found a covey, but we couldn't find Toby. Sport, however, found him and backed him, but we could find neither. So Sport must have told Toby, "Go find those stupid fellows and bring them here. I will watch the birds until you come back." So Toby came to us in a great fluster, jumping around us, said something we couldn't understand and started back, we following, and away among the pines, in a briery thicket, we found both Toby and Sport and a big covey. How is that for a 20 months old pup?

Later in the day Sport duplicated his usual performance: He was again lost and evidently had a covey somewhere, but we couldn't find him. I whistled him in. He stated in a manner we now understand, "I have some birds, come on." But he went back so quick I again lost him. He is a big strong dog and very active, so I whistled him in again. This time he walked slowly in front of me, just keeping a little ahead and led us quite a distance to a full covey in a briery swamp. J. M. B.

Long Island Kennel Club.

BROOKLYN, N. Y., Jan. 10.—The Long Island Kennel Club held its third regular meeting Wednesday evening, Jan. 7, 1903, in the Johnson Building, Flatbush avenue and Nevins street, Brooklyn, N. Y., forty members being present. Application was made to the American Kennel Club for membership, and if accepted we shall at once proceed to dog show work, and appoint a bench show committee.

The membership of the L. I. K. C. is now 128, with a prospect of more than doubling that number.

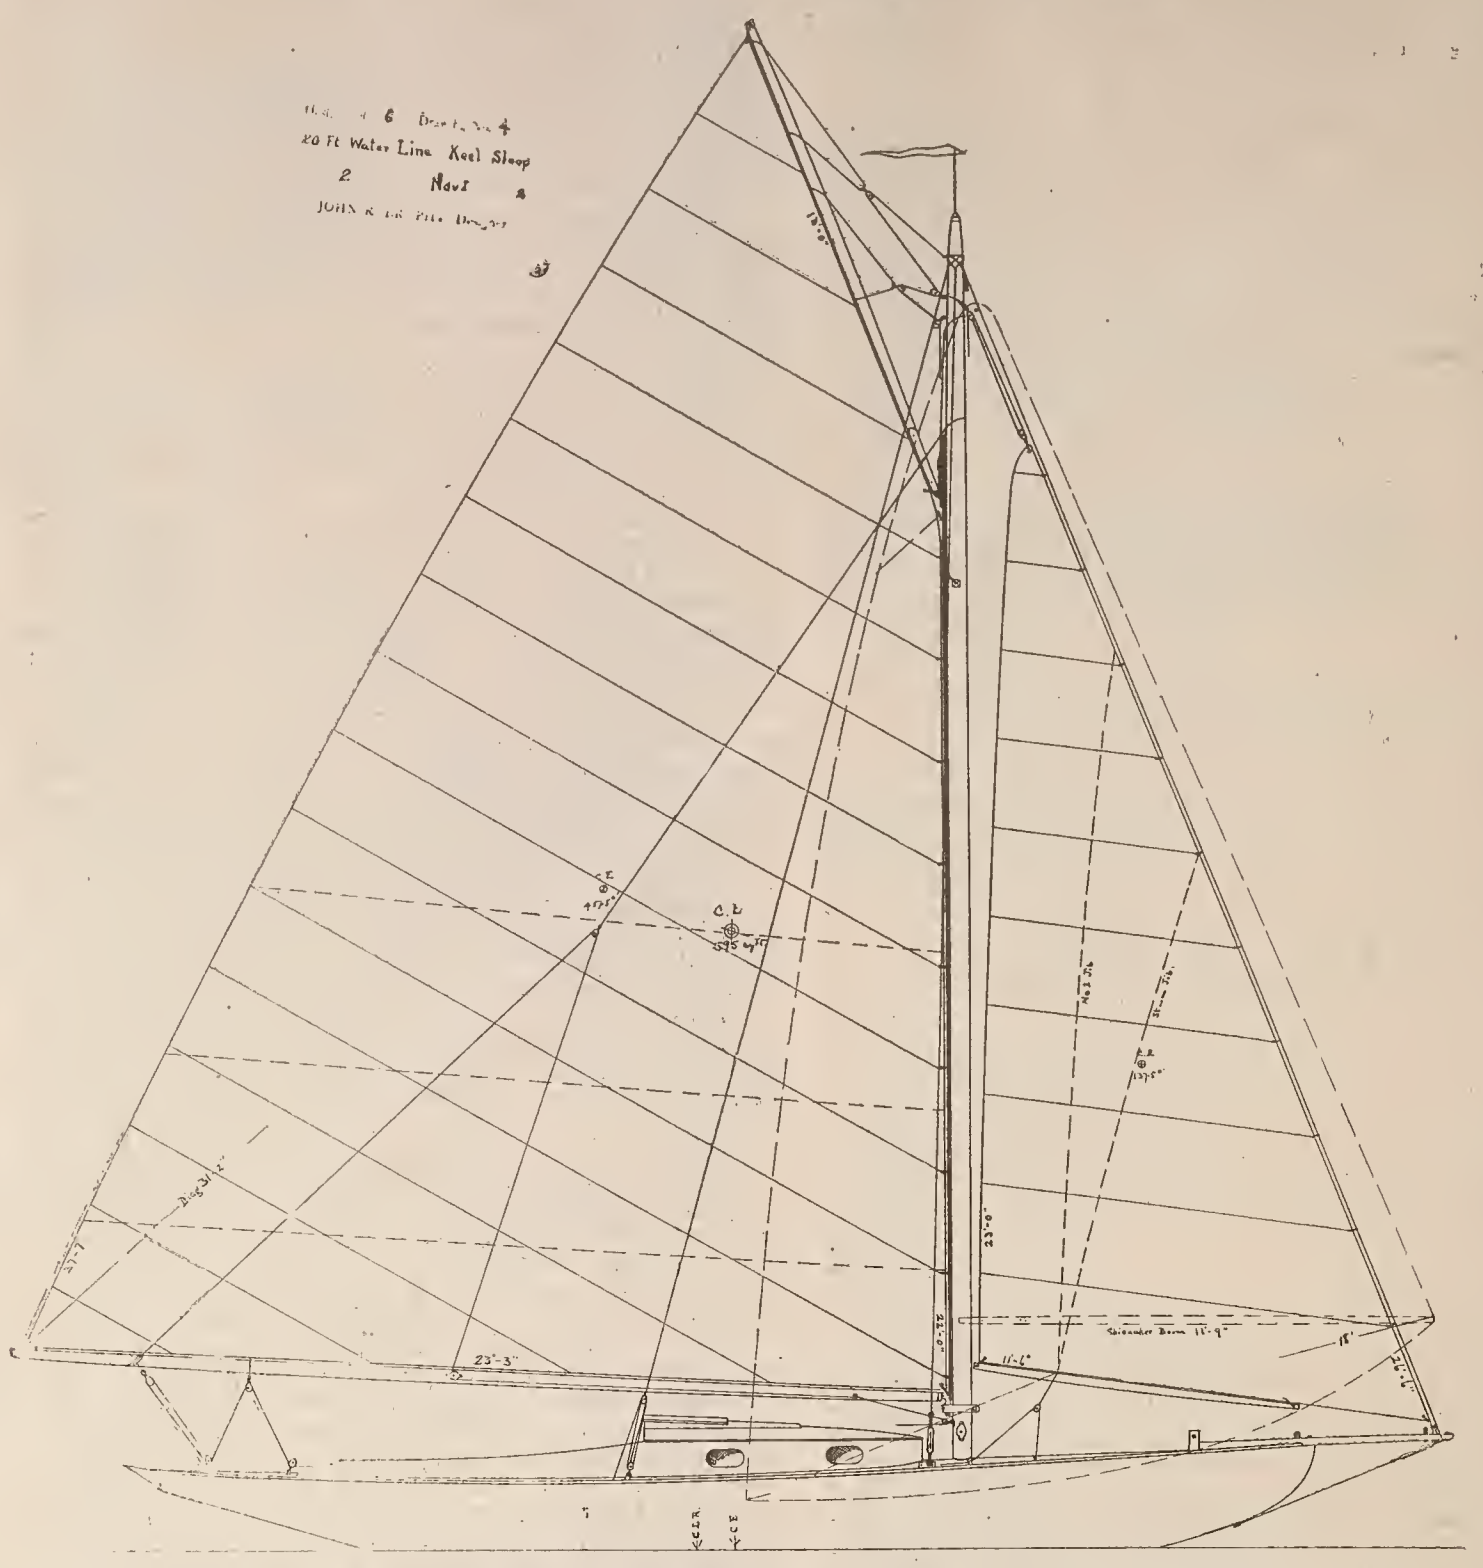
It was decided at the meeting to give a dinner at the Ashland House, on Thursday evening, Feb. 12, 1903, to the exhibitors of the W. K. C. show.

Membership is not limited to residents of Long Island. We now have members from every State in the Union. Those who wish to join (and by so doing help promote dog shows, etc.), will apply for particulars to the undersigned, 153 Myrtle avenue, Brooklyn, N. Y.
Jos. M. DALE, Secretary.

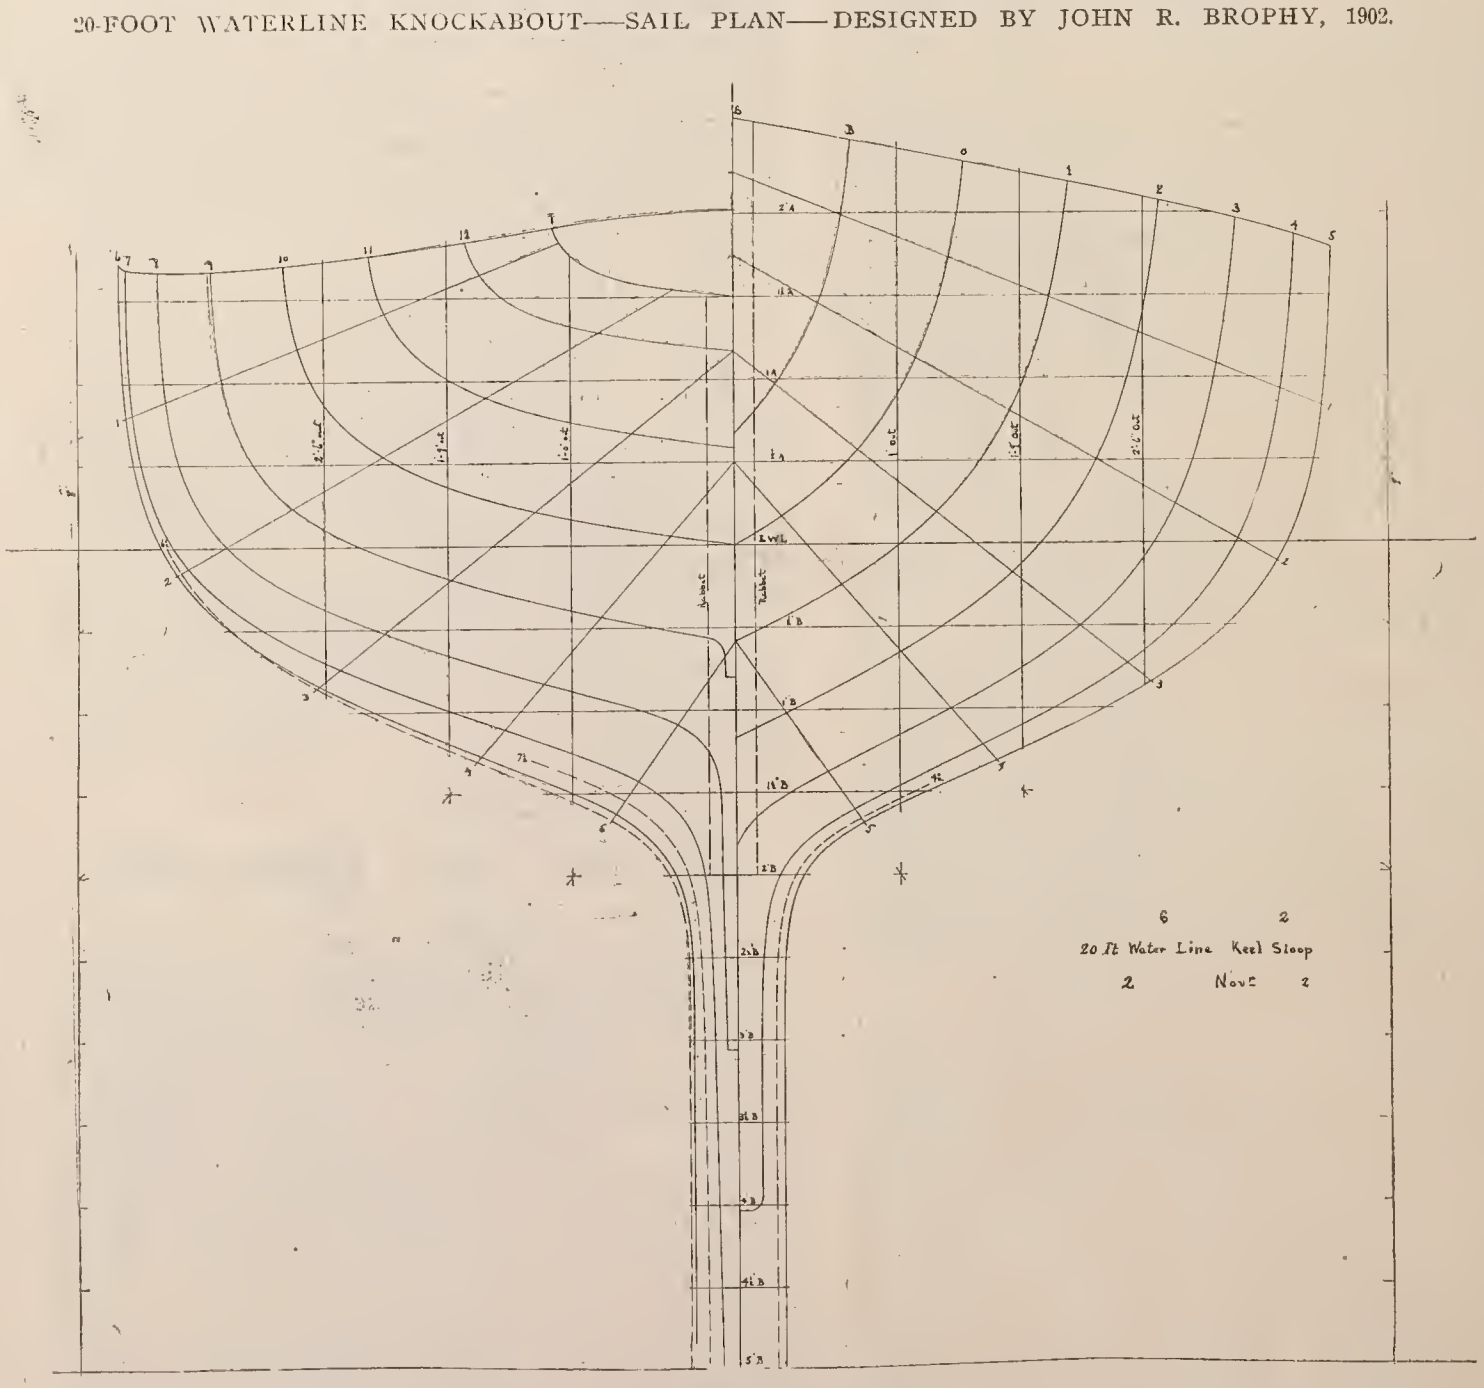
Jackson I. Case.

AT his home in Racine, Wis., Jackson I. Case, son of the late Jerome I. Case, millionaire threshing machine manufacturer, died on Tuesday of last week. He was born Oct. 23, 1865, in the city in which he died. He was famous in racing, trap shooting and field trial branches of sport and was conspicuously successful in each. He owned and drove the famous trotter J. I. C., afterward converted to a pacer, and many of the dogs of his kennel hold a high place in the records of successful winners. Concerning his demise the daily press reports:

"He was given the best educational advantages in the Racine public schools, the Racine Academy, the Michigan Military Academy and the Massachusetts Institute of Technology, at Boston. He began his business career in 1883 as bookkeeper for the Fish Brothers Wagon Company, and later was appointed private secretary to his father. He also had almost the entire charge of the latter's extensive stable, which included such famous trotters as Jay Eye See and Phallas. At one time he was identified with the J. I. Case Threshing Machine Company, the J. I. Case Plow Works, and was a director of the Manufacturers' National Bank. He was appointed postmaster in Racine by President McKinley and retired last April. He was a thirty-second degree Mason."



20-FOOT WATERLINE KNOCKABOUT—SAIL PLAN—DESIGNED BY JOHN R. BROPHY, 1902.



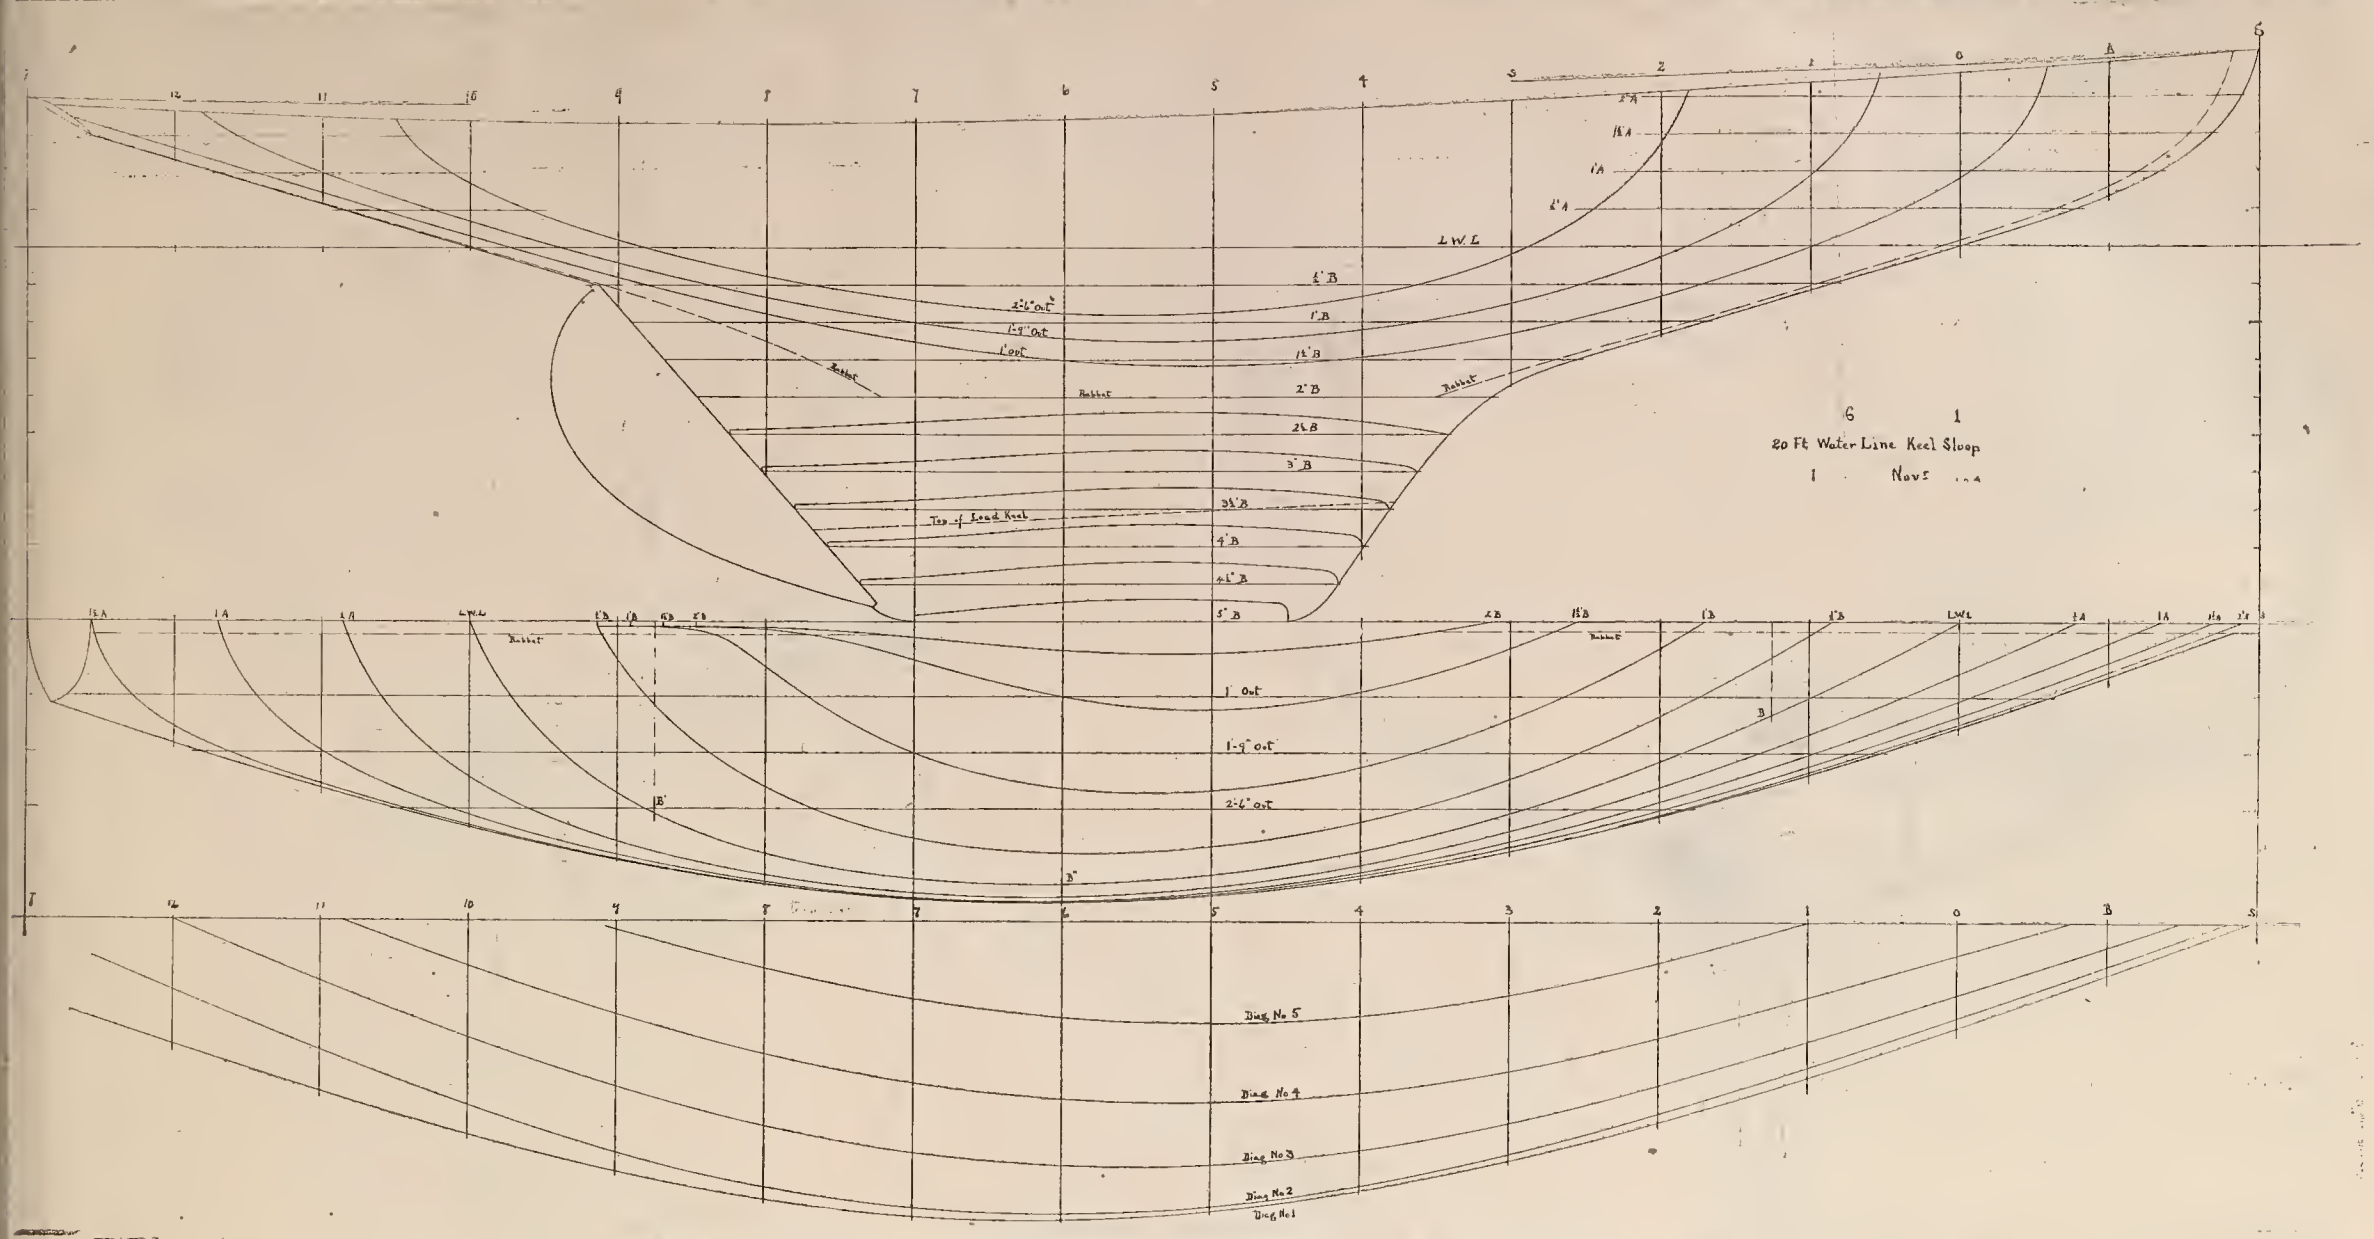
20-FOOT WATERLINE KNOCKABOUT—BODY PLAN—DESIGNED BY JOHN R. BROPHY, 1902.

Detroit Show.

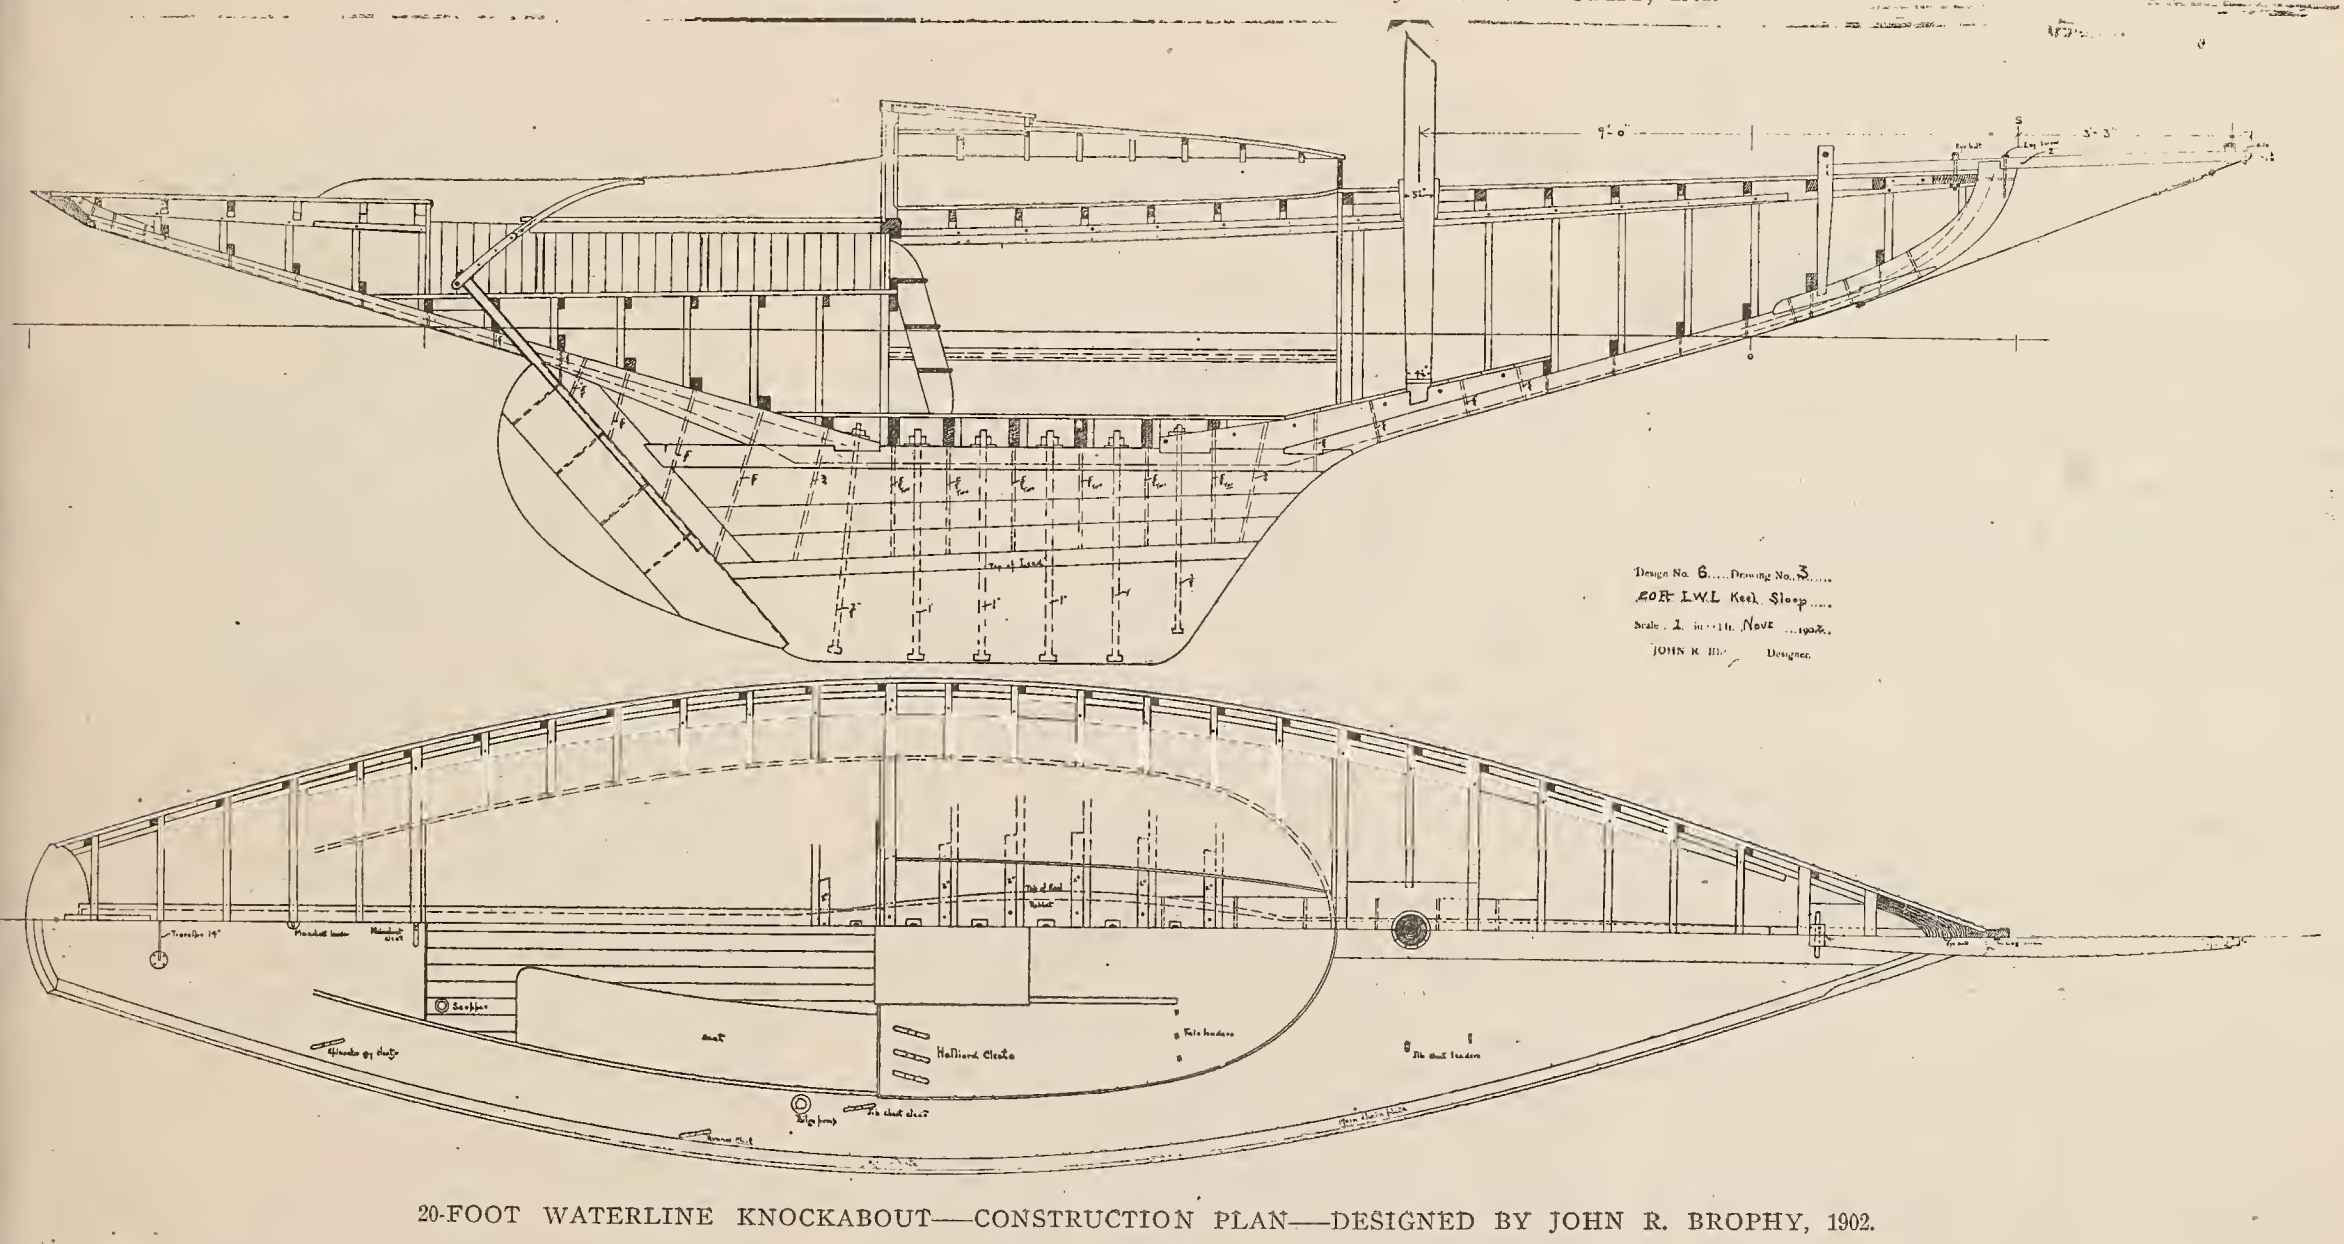
Detroit sportsmen's show, Feb. 10-14, is beginning to attract attention now, especially by reason of the tournament, which will be managed by Jack Parker, J. L. Head and A. D. Caldwell, all prominent in the sporting goods trade and sure to influence others of like prominence. It is not thought Chicago will hold a show this winter, so the boys can concentrate on Detroit, and see there the newest things in guns, autos, and other necessaries of life. E. HOUGH.

American Championship Field Trial Club.

CHICAGO, Jan. 10.—Mr. Charles B. Cooke having resigned as secretary of the American Championship Field



20-FOOT WATERLINE KNOCKABOUT—DESIGNED BY JOHN R. BROPHY, 1902.



20-FOOT WATERLINE KNOCKABOUT—CONSTRUCTION PLAN—DESIGNED BY JOHN R. BROPHY, 1902.

Trial Club, I hereby appoint Mr. J. E. Isgrigg secretary pro tem. Mr. Isgrigg has kindly consented to assume the duties of the position until the annual meeting of the Club, to take place at Chicago during the last week of March, next, at which time officers for the ensuing year are to be elected. All communications relating to the American Championship Field Trial Club should be addressed to Mr. J. E. Isgrigg, Chicago, Ill. Box 166.

JAMES PEASE,
President American Championship Field Trial Club.

The Hardy Catalpa.

THE Bureau of Forestry of the U. S. Department of Agriculture, of which Mr. Gilford Pinchot is chief, has recently issued a very interesting and useful Bulletin, giving a description of the hardy catalpa in commercial plantations by Mr. Wm. L. Hall, superintendent of tree planting, to which is added remarks on the diseases of this tree by Hermann von Schrenck, Pathologist in charge of the Mississippi Valley Laboratory.

It has not been generally known that the catalpa is of great value as a commercial tree, especially for such purposes as fence posts, telegraph and telephone posts and railroad ties, but its value has recently been fully demonstrated. It ranks with locust and osage orange in durability while surpassing them in rate of growth and other qualities. Its value has led to extensive plantings west of the Mississippi River, and it has proved itself to be a useful tree and one which returns a good yield on capital invested. The tree is native to the Ohio Valley, but it has been planted in Southern Iowa, Nebraska and eastern Kansas, with very favorable results.

The report at hand considers four large plantations, concerning which a multitude of facts are given and many beautiful illustrations, and then draws conclusions from the study of these plantations. Mr. von Schrenck's paper shows that this tree is subject to very few diseases.

Yachting.

Twenty-Foot Waterline Knockabout.

THE lines of a 20ft. racing length knockabout published in the current issue are by Mr. John R. Brophy, of Brooklyn. The craft is designed for sailing principally in the lower bay, and when completed will be enrolled in the New York Canoe Club and the Brooklyn Y. C. She will be entered in all of the races occurring on Gravesend Bay, to which she is eligible.

The drawings call for a staunch boat of large displacement and small percentage of ballast, designed to the Yacht Racing Association of Long Island Sound rules. The boat, however, measures practically the same under the new rule of the New York Y. C. For the sake of comparison the rating under each rule is given.

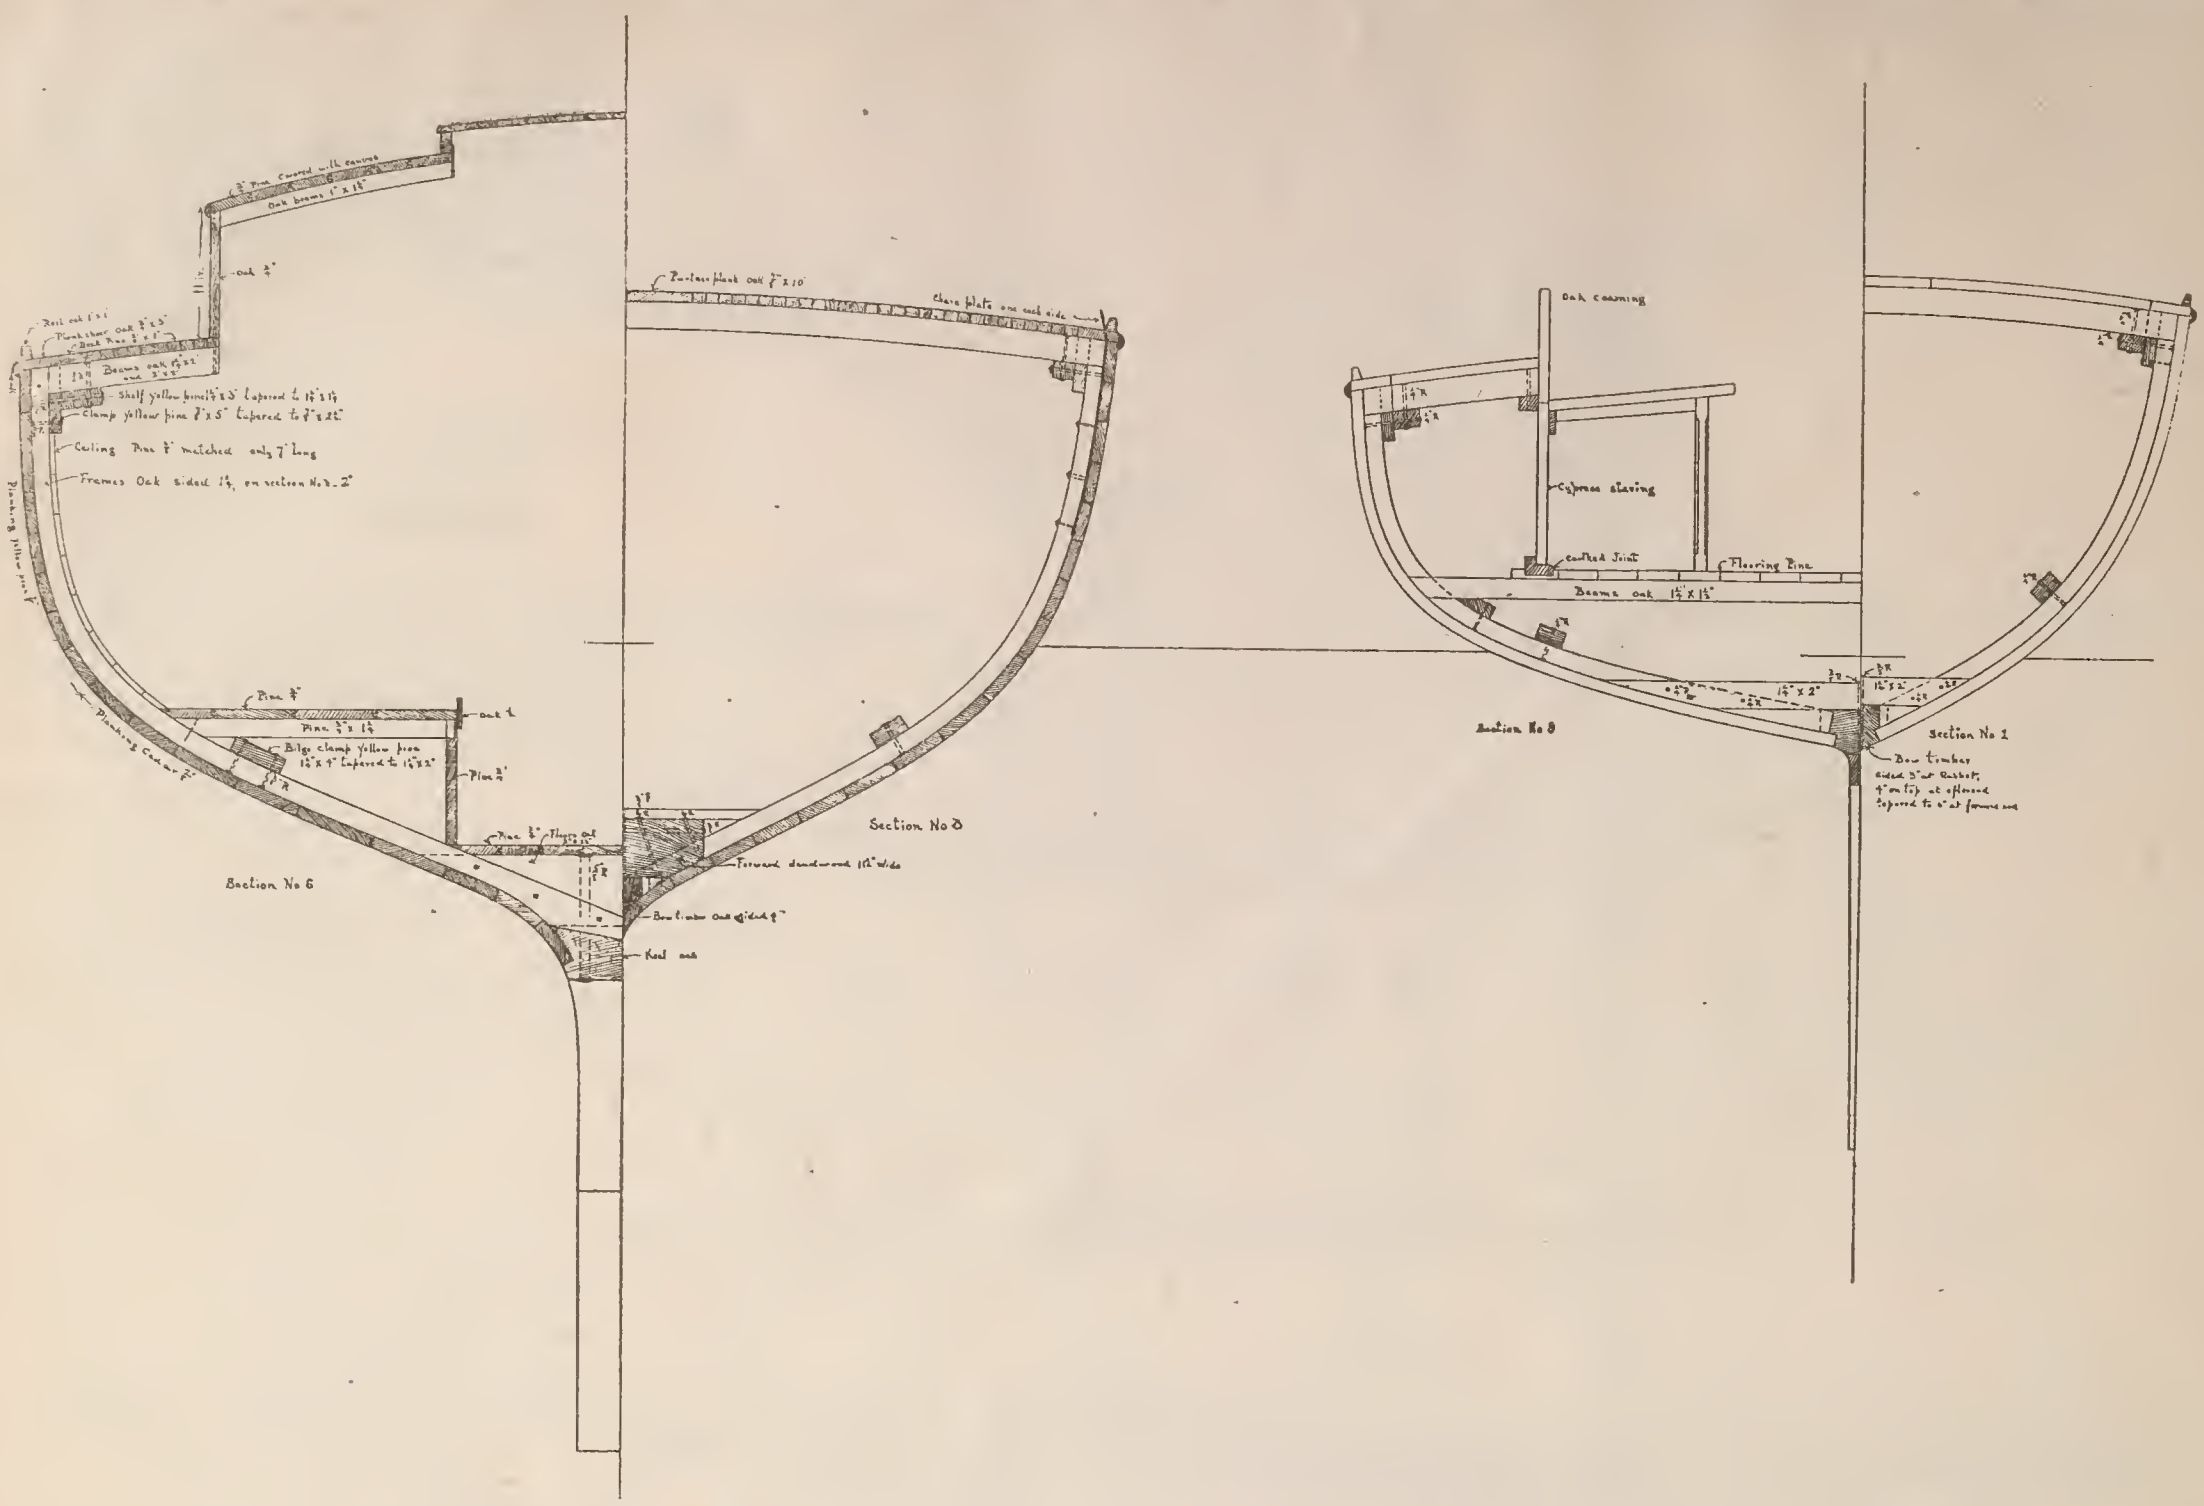
The dimensions follow:

Length—	
Over all	30ft.
L. W. L.	20ft.
Breadth—	
At deck	7ft. 6in.
At L. W. L.	7ft.
Draft—	
Greatest	5ft.
To rabbet	2ft.
Freeboard—	
Forward	2ft. 7in.
Aft (at side line)	2ft.
Least	1ft. 8in.
Displacement (100 cubic feet)	6,400 lbs.
Lead keel	3,000 lbs.
Sail area—	
Actual	595 sq. ft.
New York Y. C. new rule	626 sq. ft.
Y. R. A., L. I. S.	614 sq. ft.
Area of midship section—	
Submerged (No. 5½)	10.62 sq. ft.
L. W. L. plane	97.91 sq. ft.
Lateral plane, including rudder	58.66 sq. ft.
R. M., new rule New York Y. C.	20.2 ft.
R. L., new rule Y. R. A., L. I. S.	20.89 ft.
Center of buoyancy, from fore end of l. w. l.	10.8¾ft.
Center of gravity, from fore end of l. w. l.	11.0¾ft.
Center of lateral resistance, from fore end of l. w. l.	11.8 ft.
Center of effort of sails, from fore end of l. w. l.	10.8¾ft.

The Origin of the Centerboard.

Editor Forest and Stream:

Having seen from time to time some controversy in various papers of the country relative to the centerboard and the invention thereof as applied to sailing vessels, I thought I would give you my version of the same which



20-FOOT WATERLINE KNOCKABOUT—SECTIONS—DESIGNED BY JOHN R. BROPHY, 1902.

I have every reason to believe to be true.

During the last quarter of the last century the farm adjoining the hotel property on the south side of the mouth of Woodbury Creek, fronting on the Delaware River, was the homestead of John Wilkins, one of the judges of old Gloucester County, New Jersey. He had four sons, one of whom was named Benjamin, and who was elected sheriff of the county in the year 1818. He was allotted this farm and occupied it after his father's death. An indentured apprentice, Joseph Curtz, father of the author of this history, was trained to manhood with these hopeful boys. The father being wealthy and having a large business could afford to allow his boys to spend their time in making bateaus and skiffs and sailing them on the river and creeks when not engaged in other light employment. The farm adjoining Woodbury Creek on the north was at this time owned by John Whitall, who had a son named Mark. He was a friend of the Wilkins boys and like them, spent much of his time in boating. The Whitall farm is the well known Red Bank, the site of Fort Mercer, where the Hessian regiment was repulsed by Colonel Christopher Green with his Rhode Island regiment on October 22, 1777. It is a remarkable coincidence that Red Bank's defenders should belong to a place famous in later years for sailing yachts. Of the many cruises taken by this party in their small boats, one is worth mentioning. They were present at the execution of the two pirates convicted in 1799, who were hung on the lower end of Windmill Island, which at that time extended to a point opposite Washington avenue.

The Wilkins boys at an early day began to experiment with a board slid through the bottom of their skiff. How much they were aided in this manner by Mark Whitall and young Curtz it is impossible to say. This was then termed the slide in the keel or in common parlance, sliding keel. In a few years the neighborhood termed it centerboard, which name it has retained to the present. The first large boat built by these boys was the property of both families and was built on the Whitall farm in or about the year 1820. She was very properly named Red Bank, and was used for carrying produce to market, in fact none of the craft ever built by these families were designed as racing machines. The centerboard proved so successful that this craft outsailed all the Philadelphia boats on the lower Delaware. After the Philadelphia races were won they went to Baltimore on a challenge to race with boats on the Chesapeake. After the first Baltimore race was over one of the beaten crew said to the owners of the Delaware boat, "You have got something stuck down through the middle of your boat; I know it for no boat can sail so close to the wind without something to hold her and I have come here to see what it is." "Here is the board that holds her," exclaimed Captain Wilkins, "a Jersey invention and one you will have to adopt." For the first time he saw a centerboard boat, the invention of Wilkins and Whitall. In the winter of 1821-2 two boats were built, one named Mark Whitall and owned by that family, the other named James Lawrence, in honor of the naval hero in the war of 1812 and owned by the Curtz brothers, Peter and Joseph, who then occupied farms in the neighborhood. The dimensions of these boats I am unable to give, the owners and designers being unostentatious, and therefore never dreamed that they were making history. It is believed that they were about the same size and had but little variation in the style of their centerboards. The height of the Lawrence's mast I learned incidentally. After the U. S. S. North Carolina was launched she was taken down the river and laid for some days at Fort Mifflin. Father Curtz visited her, going there in the Lawrence. In after years I heard him remark that the gunwales of the ship were just thirty feet above the water and the top of the Lawrence's mast was just on a level with it. The fourth boat with a centerboard was named "Count Donop" in honor of the Hessian Colonel, who commanded the attacking force at the battle of Red Bank, and who is buried there, having died the day after the battle. This craft was owned entirely by Benjamin Wilkins, who built it in the spring of 1828. She lasted about 20 years, being known from the Bay up to Bordentown, and she served as a model for all the centerboard boats of the age. Of course she was the favorite of the neighborhood, but the principle having become thoroughly adopted, retirement from business caused it to be the last boat built by the inventors. In later years, racing having become a popular sport, the rules governing it became fixed on what was deemed just principles. One was that boats were restricted to a certain length and allotted to a class consistent with their length. Therefore, Rufus G. Wilkins, son of Benjamin, who was in the boat building business in Camden where he started nearly sixty years ago always constructed his boats in a shape that resembled an inverted flatiron approximately. A boat named Megonigal was brought out by Wilkins in 1854. In a certain regatta she outstripped the fleet so much that her fame reached the seaboard towns of the Eastern States. Two gentlemen interested in the racing of yachts came from Rhode Island specially to see the Megonigal. They were shown the craft by Captain Wilkins and on seeing it they said they were boatmen and not greenhorns and had come in the interests of other yachtsmen, their object being to see the boat in order that they might obtain some points that would enable them to construct craft of greater speed than those they had at the time. Captain Wilkins took them to Cooper's Point Hotel nearby and had his boat and himself identified and his truthfulness guaranteed.

About fifty years ago a Mr. Clark of a New York boat building firm attempted to claim the invention of the centerboard as belonging to a Rhode Island party. Captain Wilkins took up the matter and opened correspondence with Mr. Clark. His father was then alive and he furnished all the details which were sent to the New York parties. Mr. Clark at once yielded the claim squarely and honorably, remarking that he felt sure that it was a Yankee invention and that he did not heretofore know that the inventors were Jersey Yankees.

It is astonishing that an invention so simple should not have been generally used long before it was. A century has passed since the Wilkins boys began their experiments. It was adopted in their neighborhood when their market boats became known. They never applied for a patent. In this respect they were like Professor Henry, who, when a college boy at old Nassau Hall, invented the magnetic telegraph, that is, the little magic coil of wire, designated as the magnetic stop. This is the soul of the principle. While using the invention to communicate between the college and his boarding house, a prominent citizen said to him, "Why, professor, do you not get out a patent for your valuable invention?" "I am not a patent man, he replied: "I can earn as much money as I need without taking out patent rights, therefore, if this invention is of any use to the public they can take it and use it as they please." So with the Wilkins family, they imitated Jefferson, then the country's President, and despised the patent system. Mark Whitall was very enthusiastic over the invention. On a certain occasion when at a hotel in Philadelphia, now known as the Ridgeway House, he was told of a circumstance of fast boat sailing in some other waters, perhaps in the Delaware Bay. His informant declared that neither Philadelphia boats nor any other could beat her. "Can't beat her! Can't beat her!" exclaimed Mark, warming up and instantly springing to his feet. "I will take Christ Church steeple, put on a cat rig, run a centerboard through it and beat it to hell." An old Quaker happened to be standing near, and being horrified at this profanity, laid his hand on Mark's shoulder and solemnly said, "Ah, my young friend, thee can beat it to hell, but thee will have a hard beat back." It is proper to tell the reader to observe that the boats which thus served as pioneers of the idea were not mere racing machines. Utility was never sacrificed in their construction or their safety, and carrying qualities were always well considered.

The reason the invention was not generally adopted is mainly owing to the force of precedent. Notwithstanding the fact that John Bull was perhaps clumsy, he was mostly looked to by New York and New England men for the model in boat building. This in turn tended to deceive the English people and led them to believe that a cutter was the ne plus ultra principle. Had the owner of the yacht Thistle gone to Philadelphia and South Jersey to investigate the merits of the centerboard, the chef d'œuvre of American yachtsmen, he would never have brought a cutter here to win a race. Whenever modesty and merit come in contact with approbativeness the latter is apt to meet with disappointment. Had a New York or New England man invented the centerboard it would have been adopted long ago in England; but South Jersey and its trading metropolis, Philadelphia, were looked upon by them as the Jews looked upon Nazareth. The hesitancy with which New Englanders adopted the centerboard evidently tended to lead the English people into their mistake. In conclusion I wish to say that it seems strange to me that this history has not been brought forth before, as these are well-known facts in the neighborhood where they occurred.

H. L. SHAW.

PHILADELPHIA, Pa., Dec 29.

Boston Letter.

BOSTON, Jan. 13.—A meeting of the Executive Committee of the Manchester Y. C. was held last Tuesday at which it was voted to allow the yachts of other clubs to compete in the trial races to select a challenger for the Seawanhaka challenge cup. It may be well doubted, however, if the yachtsmen from other clubs will be very anxious to build boats under the conditions laid down by the committee. While it is provided that outside yachts can compete, it is stipulated that the handling of any of the boats may be confined to one crew selected by the Manchester Y. C., and that this crew shall have the whole say in regard to which boat shall be selected. The sense of the vote upon the question is as follows:

"Whereas, the agreement between the Royal St. Lawrence Y. C. and the Manchester Y. C. contains the following clause:

"'Article 22.—The provisions stating that the helmsman must be named in writing 24 hours before the first

race is waived, and, in lieu thereof, the Royal St. Lawrence Y. C. and the Manchester Y. C. shall furnish, each to the other or their representatives, a certificate of the following terms: Messrs. (giving names), who are chosen to sail on the representative yacht of this club, are members of the club and are amateurs in the spirit of the word.'

"Therefore, it is voted that a committee of three be appointed by the executive committee from among the members of the Manchester Y. C. to select any number of boats which they may see fit to represent the Manchester Y. C. in races on Lake St. Louis next July; and that the committee be also empowered to select from among members of the Manchester Y. C. a crew of four men to handle such boats, and that this crew be allowed to name such substitutes as they see fit from among members of the Manchester Y. C., and that they shall also have the full decision as to the boat which is to represent the Manchester Y. C. in the Seawanhaka cup races."

The committee of three elected as provided above were E. S. Grew, H. B. Pearson and A. M. Merriam.

An 85ft. auxiliary schooner has been ordered from Small Bros. by Mr. W. Amory Gardner, who is at present owner of the old cup defender Mayflower. The model for the new schooner was worked out by Capt. Small, who has been Mr. Gardner's sailing master for 16 years, and the layout of the ship was also devised by him, while the lines were perfected by Small Bros. The yacht will be built by Rice Bros., of East Boothbay, Me., and it is expected that her cost will be about $40,000. Her sails will be made by Wilson and Silsby. She will be entirely of wood construction, very heavy for cruising purposes. There will be 50 tons of ballast, 40 tons of which will be on the outside and 10 tons inside. She will carry a 40-horse power gasoline engine.

The principal dimensions of the new yacht will be 125ft. over all, 85ft. waterline, 24ft. beam and 12ft. draft of hull. She will be a centerboard, and, with the board down, will draw about 20ft. Her displacement will be 138 tons and she will carry 8,285 square feet of sail in her working sails. The lines show a well-turned boat, with easy lines. Her overhangs are generous, although not abnormal, and she has a very pretty sheer. She should be a good handler in a seaway and should also be able to get along at a good clip under sail. Her motor will take her along in calm weather at the rate of from 5 to 7 miles an hour.

Below decks she has been well cut up and there is the appearance of freedom and room all over her. There is an exceptionally well appointed galley with the maximum of space and light. The officers' and crew's quarters and the galley are finished in butternut. The main saloon and staterooms are finished in mahogany and white enamel. There are 5 staterooms in all.

At the annual meeting of the Squantum Y. C. the following officers were elected: Com., Hon. C. M. Bryant; Vice-Com., G. W. Glover; Rear-Com., C. J. Hendrie; Sec'y, E. M. Tribou; Treas., A. L. Hill; Meas., F. M. David; Trustee, F. J. Stewart; Regatta Committee: W. J. Croucher, E. J. Hendrie, E. J. Patterson and Dr. F. A. Locke.

The Volunteer Y. C., of Lynn, has elected the following officers: Com., W. B. Newhall; Vice-Com., U. S. Hogan; Fleet Capt., C. W. Macomber; Sec'y and Treas., O. M. Farley; Meas., C. B. Taylor; Directors, F. W. Martin, O. N. Robbins and H. A. Alley; Regatta Committee, G. G. S. Butterick, P. J. Heaslip, F. S. Sawyer, F. R. Humphrey and F. S. Sherry.

At the annual meeting of the Hull-Massachusetts Y. C., held at the town house last Saturday, the following officers were elected: Com., E. P. Boynton, schooner Magnolia; Vice-Com., G. E. Hills, launch Kasagi; Rear-Com., Alfred Douglas, sloop Shyessa; Sec'y, William Avery Cary; Treas., Dexter M. Smith; Meas., W. E. Sherriffs; Executive Committee for two years, Charles Hayden and L. M. Clark; Membership Committee for two years, B. S. Permar and Arthur Prince Shaw; Regatta Committee for two years, Foster Hooper and C. C. Clapp.

Kiley's yacht agency has sold the 62-ft. schooner Recruit to Edward F. Blake, of Mystic, Conn., the 30-ft. naphtha launch Flirt to E. H. Dickinson and the 28ft. cat Stride to Frank B. Darrow, of Newport. The same agency has sold the 90-ft. steam yacht Eileen to George L. Goodwin of St. Louis, who will use her on Lake Champlain.

The 35-footer Bacchante has recently been sold through the agency of Frank N. Tandy to T. H. Dougherty, of Philadelphia, by the George Lawley & Son Corporation. Mr. Richmond, the former owner, gave the Bacchante in part payment for a larger boat, which Lawley is now building for him. The Bacchante was designed by Fred Lawley and built by Lawley in 1900. She is 55ft. over all, 35ft. load waterline, 12ft. 6in. beam, 8ft. draft.

JOHN B. KILLEEN.

English Letter.

I MUST correct the list of names of owners in the new South Coast one-design class, as given in my last letter. Capt. J. Orr-Ewing is not a member of the class. He is a very ardent yachtsman and a member of the Y. R. A. Council. His attitude has been bluntly opposed to the new class on the ground that it will take the place of open racing. The list of names as I gave it, was published in many London papers, but it appears to have been sent to them anonymously, and the inclusion of Capt. Orr-Ewing's name was probably due to inadvertence, such as causes tradesmen to send in their bills occasionally after they have been paid.

The boats are to be 33ft. on the loadline by 9ft. 6in. broad, and the good sail spread of 1,550 sq. ft. They will have one cabin, with lavatory forward of it, and a good cockpit aft. In fact, they are pretty certain to be good little boats, but the better they are the more harm they will do.

The sub-committee appointed by the Y. R. A. Council to consider what alteration, if any, should be made in the luffing rule, has returned a report that they have examined all other rules on the point, and can advise no change, but that an explanatory footnote to the rule should state that a leeward vessel's right to luff ceases when, if she luffed, or continued her luff, her bowsprit, or stem, would strike the weather vessel abaft the main rigging. I fancy there is still room for dispute in a case where the weather boat protests on the ground that she was luffed too long and when no foul occurs. According to the "explanation," as I read it, a foul is the only conclusive proof as to whether the rule has been violated or not, and many an owner on a breezy day will prefer to be luffed far off his course rather than risk a foul, lodging a protest afterward.

To my mind, the simplest rule is to let the lee boat luff as she likes, and hold the weather boat responsible for all fouls, provided, of course, that the weather boat has, while on that point of sailing, had the option of taking the lee passage. I can see no hardship in this, once the rule is thoroughly understood. If a vessel is disqualified by receiving a "parting kick," it would be her fault, not her misfortune.

A very instructive example of the way in which our Y. R. A. works has been afforded in the matter of the handicap classes. For months the yachting press has been hammering away at the necessity for the Association departing from its custom of official blindness to handicap racing, and taking steps to encourage it on a sound basis. Not an eyelid stirred among the members of the council, so far as the public is aware, and the upshot is that all the leading yacht owners met together on Dec. 16 and drew up a scheme (and a very complete one) for the better regulation of handicap racing. Having done this, they sent a spokesman, in the person of Colonel Dick, secretary of the Royal Thames Y. C., to wait upon the council at its next meeting, which was held a few days later. He submitted these plans, and, on behalf of the owners, asked for their adoption. The council promised to consider the matter, and will hold a meeting this month for the purpose. Now it is pretty safe to say that the council dare not refuse to recognize handicap racing after this, and even to follow very closely the suggestions made by the owners. To pursue the policy of masterly inactivity will at this juncture assuredly lead to a rival association being established by the owners. That seems to me to be a very weakening position for the Y. R. A. to occupy, and yet it is absolutely characteristic. A thoroughly well-meaning body, no doubt, but hopelessly slow in intelligent anticipation. The following are proposals made by the owners. It will be seen that they deal with every class, down to the smallest:

For the purpose of classifying and for ascertaining any alteration of yachts, we strongly recommend that all yachts in the recognized handicap races be measured and have certificates granted to them under the following formulæ:

$$\frac{\text{L. W. L.} \times \text{S. A.}}{6{,}000} = \text{Handicap Classification.}$$

That Y. R. A. Rules 17 and 63 shall as far as the same are applicable apply to such certificates.

That the clubs be strongly recommended to divide, as far as may be practicable, their handicaps into the following classes:

First Class.—Yachts exceeding 65, handicap classification.

Second Class.—Yachts exceeding 30 but not exceeding 65, handicap classification.

Third Class.—Yachts exceeding 15 but not exceeding 30, handicap classification.

Fourth Class.—Yachts exceeding 9 and not exceeding 15, handicap classification.

That the maximum time allowance, in each of the above classes, be limited to one minute per mile over the course.

That a handicap committee be appointed by the Yacht Racing Association.

That handicaps be framed for a series not exceeding five races, after which the committee shall meet, if considered necessary, to re-adjust the handicaps.

That owners or their representatives authorized, in writing, be given the opportunity of attending before the handicap committee, and tendering such information as they may consider necessary for the proper framing of the handicaps.

It is reported here that Mr. George Gould is negotiating for the charter of the new turbine steam yacht, lately launched for Sir Christopher Furness. The vessel is not nearly ready for her trials, therefore such an arrangement is somewhat unique.

Several new steam yachts have just been ordered for next season. Mr. Andrew Coats, owner of the 52ft. racing cutter, Camellia, has ordered a vessel of 450 tons, yacht measurement, to be built by Messrs. D. & W. Henderson, Glasgow. Mr. F. C. Capel has ordered a steamer of 250 tons, and Mr. P. M. Inglis, of Glasgow, has ordered a vessel of about 400 tons. Mr. Inglis is the owner of the 65ft. racing cutter Nevada, designed by Mr. C. F. Herreshoff, during his stay in this country.

E. H. HAMILTON.

Rifle Range and Gallery.

Ossining Gun Club.

OSSINING, N. Y., Jan. 12.—That good shooting with both rifle and shotgun cannot reasonably be expected of the same person is no news to old shooters, and we are beginning to appreciate the fact from bitter experience. All of our members who have taken an active part recently in trapshooting, and who have made good scores at clay birds, have dropped far below their average in rifle practice. Blandford held up for a long time, but after breaking 34 out of 35 clay birds, all swift ones, he, too, succumbed. Following are our scores for week ending Jan. 10:

Five shots at 50ft., ¼in. 25-ring target: Frank Tompkins 119, 121; H. Gurlach 112, 111, Fred Tompkins 112; Willie Wheeler 116, 112, 111; James Schmidt 114; H. S. Orchard 119; D. Brandreth 122; C. G. Blandford 120, 116, 113, 120, 123, 122; Amos Bedell 107.

Rifle matches at 50ft.: N. Tuttle 115, 116, 112. Wm Fisher 107, 112, 105. Wm. Fisher 112, Jas. Schmidt 106.

Pistol scores at 50ft.: Wm. Fisher 42, N. Tuttle 73. E. Ball 100.

Pistol matches at 50ft.: C. G. Blandford 104, 106, E. F. Ball 99, 101.

Ten-shot scores at 75ft., same target: Geo. Tompkins 225, A. Bedell 217, C. G. Blandford 237, 227, 233; E. F. Ball 224, 224, 230; D. Brandreth 225.

Matches at 75ft.: C. G. Blandford 223, 237, 220; E. F. Ball 218, 226, 212.

In the re-entry match for non-members, Frank Tompkins is high with 242, H. S. Orchard second with 241. E. F. B.

Trapshooting.

Fixtures.

Jan. 13-15.—El Paso, Texas.—Grand midwinter carnival shooting tournament, under auspices of the El Paso Gun Club. W. H. Shelton, Sec'y.

Jan. 13.-16.—Hamilton, Can.—Hamilton Gun Club's thirteenth annual grand Canadian live-bird handicap tournament.

Jan. 15.—Guttenburg, N. J.—Eastern three-man team live-bird championship, $7.50 per team, birds extra. For information address Gus Greiff, 318 Broadway, New York.

Jan. 26-30.—Brenham, Texas.—Second annual Sunny South Handicap; live birds and targets.

Feb. 10-14.—Detroit, Mich.—Open tournament under the auspices of the Tri-State Automobile and Sporting Goods Association. Targets and live birds. John Parker, manager; S. G. Lewis, Secretary-Treasurer.

Feb. 20-21.—New Orleans, La.—First tournament of the Mississippi Valley Trapshooters' and Game Protective Association; Carnival Week, under auspices of the City Park Gun Club; $500 added. Percy S. Benedict, Sec'y.

Feb. 23.—Ossining, N. Y.—Ossining Gun Club's Washington's Birthday shoot. C. G. Blandford, Capt.

April 14-17.—Kansas City, Mo.—The Interstate Association's fourth Grand American Handicap at targets, at Blue River Shooting Park. One thousand dollars added to the purses. Elmer E. Shaner, Secretary-Manager, 111 Fourth avenue, Pittsburg, Pa.

May —.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament, under the auspices of the Lincoln Gun Club. T. E. Mockett, Sec'y.

May 27-29.—Fort Wayne, Ind.—Three-day live-bird and target tournament of the Corner Rod and Gun Club. John V. Linker, Sec'y.

May 30.—Detroit, Mich.—Winchester Gun Club's Decoration Day third annual tournament; all day. Rose system and average prizes. Sliding handicap, 16, 18 and 20yds., D. A. Hitchcock, Sec'y-Treas.

June —.—Schenectady, N. Y.—New York State shoot, under auspices of the Schenectady Gun Club.

June 9-11.—Cincinnati, O.—Seventeenth annual target tournament of the Ohio Trapshooters' League. Chas. T. Dreihs, Sec'y.

June 16-19.—Warm Springs, Ga.—The Interstate Association's tournament, under the auspices of the Meriwether Gun Club. Chas. L. Davis, Sec'y.

July 30-Aug. 1.—Viroqua, Wis.—The Interstate Association's tournament, under the auspices of the Viroqua Rod and Gun Club. Dr. R. W. Baldwin, Sec'y.

Aug. 19-20.—Ottawa, Ill.—The Interstate Association's tournament, under the auspices of the Rainmakers' Gun Club. Paul A. Selembier, Sec'y.

DRIVERS AND TWISTERS.

The programme of the second annual Sunny South Handicap can be obtained on application to Mr. Alf. Gardiner, Brenham, Texas. The dates are Jan. 26 to 31. The Sunny South Handicap is fixed to take place on Jan. 28 and 29. The conditions are 25 live birds, $20 entrance, birds included, handicaps 26 to 31yds., four moneys, 40, 30, 20 and 10 per cent., and in addition to first money, the winner will receive a handsome silver cup, value $100. Entries close Jan. 20; forfeit, $5. Penalty entries may be made after Jan. 10, up to the time the last man fires at his second bird by paying $5 extra. The Grand American handicaps of 1902 will govern. A special committee will handicap those who did not shoot in the G. A. H. All ties for trophy will be shot miss-and-out. The first day, Jan. 28, has two events, one 8 birds, $5 entrance, birds included, high guns; one 12 birds, $8 entrance, high guns, four moneys in each event. On the second day the Preliminary Handicap is on the programme, 16 live birds, $10 entrance, birds included; class shooting, 50, 30 and 20 per cent. On the fifth and sixth days, the programme is devoted to target competition, the last event being the Sunny South Handicap at targets, 100 targets, $10, five moneys, handicaps 14 to 20yds.

Mr. Elmer E. Shaner, secretary-manager Interstate Association, Pittsburg, writes us as follows: "Please announce to the readers of FOREST AND STREAM that the Interstate Association has made arrangements to hold the fourth Grand American Handicap at targets at Blue River Shooting Park, Kansas City, Mo., April 14, 15, 16 and 17. One thousand dollars will be added to the purses. Programmes containing detailed information will be ready for mailing March 4." He also adds that "the Interstate Association will give a tournament at Ottawa, Ill., Aug. 19 and 20, under the auspices of the Rainmakers' Gun Club."

"The Western Girl" is playing to crowded houses in central New York State, and Mr. F. E. Butler was glowing with a feeling of just pride in Sportsman's Row, New York city, for several days past, in consequence, for the heroine is Annie Oakley (Mrs. Butler). For does not the support of the public signify the success of the actors? Is not the star the genuine "Little Sure Shot," famous for years as the incomparable lady shooter of Buffalo Bill's Wild West, and socially as a peer of true ladyhood. All her hosts of friends rejoice.

Mr. Carl Von Lengerke, who is well known as a popular trade representative, started early this week on a three months' trip through the Middle West, where he will visit the trade in the interest of his company. Nearly all the great cities north of the Ohio and west of the Rocky Mountains will be within his itinerary. He is an able business man, and most entertaining socially, so that his visit will be a distinct gain to those who have the good fortune to meet him.

Mr. D. S. Daudt, famous in the annals of Pennsylvania trapshooting competition, and Mr. T. W. Morfey, have made a match at 100 live birds each, $100 a side, to be shot some time in February next, at Rittersville, Pa. The date of the match will be announced in ample time for the information of all who are interested.

The Jackson Park Gun Club, of Paterson, N. J., contemplates broadening its sphere of action, as set forth in detail by our correspondent, Mr. Wm. Dutcher, elsewhere in our trap columns this week.

The second win on the Crescent Athletic Club's January cup was scored by Dr. George E. Pool, at Bay Ridge, L. I., on Saturday of last week. He scored 49 out of a possible 50.

At Seidersville, Pa., on Jan. 10, Mr. D. Daudt won a silver medal in a 12-bird event, killing 11 straight and shooting out his opponents in the eleventh round.

BERNARD WATERS.

Keystone Shooting League.

PHILADELPHIA, Jan. 10.—At the League's grounds, Holmesburg Junction, to-day, the two main events were the club shoot, 10 birds, handicap rise, and the officers' trophy event, 15 birds, handicap, best twelve scores out of twenty-two contests to count. This was the second contest of the officers' series.

The weather was exceedingly cold, yet there was a fairly good attendance.

In the club shoot, Rothaker and Budd were the only contestants who killed straight. The scores:

Rothacker, 29	2222222222—10	Butler, 28	00010101*2— 4
Russell, 28	0*2202222*— 6	Coffin, 28	2***110122— 6
Jackson, 30	*222222020— 7	Budd, 29	1111111122—10
Morris, 27	12011*1112— 8	Campbell, 28	*001212022— 6

Jackson was high in the officers' event with 14 out of a possible 15. The scores:

Rothacker, 29	222222202002222—12	Coffin, 28	0222211222*1121—13
Russell, 28	020222202222*12—11	Budd, 29	2202*2222021102—11
Jackson, 30	2222222221222120—14	Campbell, 27	2001222120220*2—10
Morris, 27	0111012022221l2—12	Van Loon, 28	112021*11101220—11

Special miss-and-out, 30yds. rise:

Van Loon	21221* —5	Jackson	2220 —3
Budd	2121111—7	Coffin	2122210—6
Morris	2212111—7	Campbell	2220 —3

ON LONG ISLAND.

Trap at Bay Ridge.

Bay Ridge, L. I., Jan. 7.—Some members of the Crescent Athletic Club—Capt. Money, Messrs. Banks and Marshall—entertained the Messrs. Mallory and other friends at the grounds of the Crescent Athletic Club to-day. The event was marked by excellent shooting. Following are the scores:

Targets:	25	25	25	25	25	25	25	25	H	T
F E Mallory	21	18	24	22	24	24	24	23	0	23
E W Mallory	20	19	21	23	20	21	23	20	2	22
J W Stewart	20	18	18	18	18	18	22	13	2	15
J T Mallory	20	23	23	22	22	22	21	21	0	21
A J Stanchcliff	20	18	18	24	22	20	20	18	1	19
Capt Money	22	22	20	22	18	10	19	18	..	..
J T Skelly	23	22	22	22	23	21	21	21	..	..
J G Ewing	11	10	10	11	17	14	14	12	..	..
E Banks	21	23	18	23	22	24	20	25	..	..
Marshall	..	..	15	14	..	..	..	..	..	.

Crescent Athletic Club.

Bay Ridge, L. I., Jan. 10.—The second contest for the Crescent Athletic Club's January cup resulted in a victory for Dr. George E. Pool.

The first event, at 15 targets, resulted in a tie between Messrs. W. W. Marshall and F. W. Bedford, Jr., and this tie was shot off in the contest for the January cup.

Trophy, 15 targets, handicap: W. W. Marshall (3) 13, Bedford (1) 13, Shepard (4) 12, Pool (0) 11, Banks (0) 10, F. B. Stephenson (0) 10, G. G. Stephenson, Jr. (0) 10, O'Brien (2) 9, Bennett (3) 9, Hopkins (0) 9.

January Cup, 50 targets, handicap:

	H.	B.	T.	H.	B.	T.	Total.
Dr Pool	3	23	25	3	21	24	49
E Banks	0	23	23	0	24	24	47
F B Stephenson	1	24	25	1	19	20	45
R E Wigham	5	19	24	5	16	21	45
F T Bedford, Jr	3	20	23	3	18	21	44
L C Hopkins	5	16	21	5	17	22	43

W W Marshall	6	16	22	6	9	15	37
Dr O'Brien	5	14	19	5	10	15	34

Trophy, 25 targets, handicap: Bennett (5) 25, Bedford (3) 25, F. B. Stephenson (1) 22, Dr. Pool (3) 21, Wigham (5) 21, Dr. Shepard (7) 20, O'Brien (5) 19, Banks (0) 16, W. W. Marshall (6) 15.

Shoot-off, same conditions: Bennett (5) 25, Bedford (3) 22.

Shoot for trophy, 25 targets, handicap: Bedford (3) 25, G. G. Stephenson, Jr. (2) 24, W. W. Marshall (6) 23, Stake (5) 22, O'Brien (5) 22, Hopkins (5) 20, Sykes (4) 17, Wigham (5) 17, Pool (3) 16, Banks (0) 13.

IN NEW JERSEY.

Pape—Sanders—Ehlen.

Newark, N. J., Jan. 8.—The three-cornered match for $25 per man, between Messrs. H. Pape, W. Sanders and F. Ehlen, was won by Mr. Pape, with a score of 17 out of 25, Mr. Sanders being one less in his score, as the following will show:

Trap score type—Copyright, 1903, by Forest and Stream Pub. Co.

H Pape..... 2 0 * 2 2 1 0 2 2 2 2 2 1 0 0 * 2 2 1 0 2 0 2 1 2 –17

W Sanders..... 2 2 2 1 0 2 2 2 0 0 2 2 2 2 2 0 1 2 0 0 2 2 0 0 0 2 –16

F Ehlen..... 2 0 0 0 0 1 0 0 1 0 2 0 2 1 2 0 0 0 0 0 2 0 * 1 0 – 9

The rise was 31yds.

Riverside Shooting Association.

Carlstadt, N. J., Jan. 8.—There were some special events of unusual interest. Mr. W. B. Widmann failed in his attempt to kill 21 out of 25 of Mr. Outwater's oak-tanned birds, he having no chance at the sixteenth round. Count Lenone's attempt to kill out of 10 was a failure also. The scores follow:

W B Widman, 30.....2001101210112120—11
Lenone, 30 .....0100100000 — 2

Sweeps, $5 entrance, 10 birds:

Widmann, 30	1101221110— 8	1201111110— 8
Lenone, 28	0011000000— 2	1111011011— 8
Heflich, 30	1220222222— 9	2222222222—10
Wells, 28	2222020202— 8	.....
Outwater, 30	0010000010— 2	2011111211— 9
Kattengill, 28	0102022221— 7	0212201201— 7
Flishmann, 28	1212202220— 8	2222202211— 9

Three-dollar sweep:

Hesper, 28	00011—2	Barbari, 28	20021—3
Solderina, 28	00122—3	Beamer, 28	12011—4
Galls, 28	21120—4		

Jackson Park Gun Club.

Paterson, N. J., Jan. 10.—The shoot of the Jackson Park Gun Club this afternoon was quite a success.

Nine shooters put in an appearance with guns, and several without them. Capt. Money came down early, and along with Garry Hopper went out to the grounds and had a little 15-bird contest by themselves. A great many of the birds were exceptionally good; in fact, as Garry and the Captain put it after two or three misses, "Those birds actually beat me that time." When you hear expressions of this kind from such shooters as Capt. Money and Garry Hopper, the birds must be good. There are a number of cases of sickness among the members of this club at the present time, and such good shots as Aaron Doty has not been able to get to the grounds for several weeks. Billy Stalter is down. Johnny Powers has serious sickness at home, and several others are on the sick list.

The crowd was quite large to-day. The club house was comfortably filled, and nicely warmed for their comfort. We shot 300 birds to-day, starting at 1 o'clock and back in town again by 4:30.

The club expects to enter two teams in the Eastern team contest, Jan. 15. Capt. Money, Garry Hopper and Arthur Bunn will represent the first team; Morgan, Geo. Hopper and Ed Klotz the second team.

The Jackson Park Gun Club has under consideration at the present time a matter which I think will take final shape, and is what you may term a team shoot at live birds for amateurs belonging to organized gun clubs in the State of New Jersey, barring all paid representatives. The Jackson Park Gun Club, of Paterson, was organized for the purpose of promoting the sport among the amateur class, but it does not bar any gentleman shooter, whether paid or not. We always extend a cheerful welcome to any one who wishes to pay us a visit, and everybody is welcome to take part in the shooting.

If the Jackson Park Gun Club agrees to take hold of any shoot such as we have under consideration, we will endeavor to show the shooting public that we don't do things by halves. It will be either a three or five-man team, at about 15 birds, with a valuable trophy for the winning team, and a division of the purse made up from the entrance money.

WM. DUTCHER.

Ossining Gun Club.

OSSINING, N. Y., Jan. 10.—The regular shoot of the Ossining Gun Club to-day was well attended. The drawing cards were two cups, which were hotly contested for. The first handicap was won by C. G. Blandford, the only scratch man with 25 straight. Hans, with his handicap of 4, misses as breaks, also made 25, but as he did not enter for the cup, Blandford took it without a shoot-off.

The second cup was not won so easily. Barlow and P. B. had a spirited shoot-off, in which Barlow won on the last bird. Coleman had the misfortune to break his gun stock, which made him flinch on most every bird. P. B. very thoughtfully brought along a box of cigars, which were enjoyed by the shooters.

Our next big shoot will be on Washington's Birthday, Feb. 22, a copy of the programme of which is herewith appended:

The following are the scores:

Targets:	25	*	T	25	*	T	5	10
P B	20	3	23	22	3	25	4	..
W Coleman	15	3	18	18	4	22	5	9
E Ball	20	1	21	21	1	22	5	9
R Kromer, Jr	w	1	..	..	..	..	4	..
Hans	21	4	25	20	4	24	5	8
J Barlow	18	5	23	21	5	25	..	..
C Blandford	25	0	25	..	..	..	5	9
J Foley	15	6	21	11	7	18	5	..
A Bedell	22	1	23	..	..	..	..	9
W Fisher	15	4	19	..	..	..	4	10
A Rohr	8	9	17	12	12	24	3	..
E Becker	..	..	..	16	2	18	..	6

*Misses as breaks.

The programme of the Washington's Birthday shoot, Feb. 23, is as follows:

Events 1, 2, 3, 4, 7 and 9 are at 15 targets each, $1.30 entrance; No. 5, inter-county team shoot, seven-man teams, 25 birds each, optional sweep.

While No. 5 is being shot, No. 6, a 25-bird match, will be run over a set of expert traps, Sergeant system, all at 16yds., entrance $2. First high gun, silver cup and first money.

Event 8, 10 pairs, $1.40 entrance.

Event 10, 50-target handicap, 25 over magautrap, 25 over expert traps, handicaps, 14 to 20yds., open to all.

Shooting commences at 10 A. M. sharp. Rose system, except No. 6, which is high gun. Those shooting through entire programme, except No. 5, will get a rebate of half a cent per target. Professionals may shoot for money in event No. 10 only. Magautrap and expert traps used. Prepay shipment of shells to J. Curry Barlow, Ossining, and they will be delivered free. Trolley cars direct to grounds every ten minutes; fare 5 cents.

C. G. BLANDFORD, Capt.

WESTERN TRAP.

Trap at Cripple Creek.

CRIPPLE CREEK, Colo., Jan. 2.—The following are the scores made here at a little shoot gotten up on New Year's Day at the Cripple Creek Shotgun Club's grounds. The shoot was at targets only, and a magautrap was used.

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14

CAMEO.

Cincinnati Gun Club.

CINCINNATI, O., Jan. 5.—Herewith is the complete record of those who finished in the Cincinnati Gun Club cash prize contests, which wound up Saturday, Jan. 3., with their ten best scores, distances at which they were made, their average distance, and their percentage; also the total number of targets shot at by each contestant who qualified (to do which they had to take part in eighteen contests), with percentages in full.

There were twenty-seven contests in all, or 1,350 targets. As you can see by sheet, Ed Trimble was the only one to take part in all contests:

Distance, yards....	20	19	19	19	20	20	20	20	20	22	Av. Dist.	19.9

White Plains Gun Club.

WHITE PLAINS, N. Y., Jan. 1.—The appended scores were made by members of the White Plains Gun Club and visitors from neighboring clubs on R. Blake's club grounds. There was a very nice gathering of shooters. The day was a grand one. There were twelve events shot during the day, most of which were at 15 targets. The scores:

Events:	1	2	3	4	5	6	7	8
Targets:	10	10	10	10	10	15	15	15
G Molenaor	8	7	7	8	6	10	..	..
D McAndles	6	6	5	8	5	..	9	11
J Carpenter	..	..	..	..	9	..	11	..

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., Jan. 10.—To-day's practice shoot brought out eight men. With the temperature close to the zero point, a strong west wind sweeping across the grounds, and an inexperienced boy riding the trap in "a steady-by-jerks" fashion, made shooting difficult, and good scores impossible.

Four events were shot off, however, including one 25-bird four-man team event. In this event the Hitters, captained by Mr. Adriance, defeated the Missers, captained by Mr. Spencer, by four points. The Missers next week will try to turn the tables on them, in which event they will succeed to the better title. We admitted three new members the past week, two of whom are experienced trapshooters, and whose names have been prominent in these columns for some time, having been identified with other clubs. There is a general feeling among members that another tournament, held some time before warm weather comes on, would be a good thing for the club, and in all probability one will be announced in the near future.

Events:	1	2	3	4	Shot

Spencer	7	17	8	..	50	32
Perkins	6	18	10	..	50	34

SNANIWEH.

Point Breeze Gun Club.

PHILADELPHIA, Pa., Jan. 10.—The main event was a miss-and-out for a gun. William Butler (McCoy) killed 15 straight and won the prize and $5.60; Fisher was second and won $14; McFalls was third and won $8.40.

A 10-bird match to-day between Fred Miller and A. Felix resulted in a tie, both men killing 6 birds. Scores:

First event, shoot for gun; money divided 20, 50 and 30 per cent.; miss-and-out:

McCoy, 30	222222212222222
Fisher, 30	12212221221221*

Paist (27), Delaney (28), Free (27), Wake (27), Hallowell (27), Wood (26), Fisher (30), and Felix (30) all lost their first bird in the first round.

PUBLISHERS' DEPARTMENT.

A Startling Fact.

THERE is a calamity steadily but surely falling upon the people of the Northern and Western States, one that the physicians talk about and the newspapers of the country warn the people against, but little attention seems to be paid to the warning by those in power. We refer to the growning tendency of tuberculosis, lung and throat troubles. There should be provisions made by every State, and incorporated city and town, to get tuberculosis cases away from the people who are in ordinary health, so as to keep the disease from spreading. Attention is given to smallpox, because it is a quick-killing disease, yet tuberculosis is more terrible in every way—in the long suffering and sure death of the invalid. In the Northern and Western States there is hardly one chance out of a thousand for the tuberculous patient to get well, and as the disease is recognized as contagious by ninety-nine out of every hundred of the very best physicians, why is it some provision is not made to isolate the diseased person. What would be better than for each State and city to arrange to have a sanitarium in the pine woods of North Carolina and send those there who are not financially able to go themselves, and require those who are financially able to go there, for there many cases are permanently cured, and it seems that there is little or no chance for the disease to spread among the attendants and nurses. The large amount of ozone in the atmosphere seems to kill the tubercular germ as soon as it strikes the air, or at least before the sputum becomes dry, and it is admitted by specialists in lung troubles that there is little danger of the sputum until it becomes dry; therefore, if the germ is killed before the sputum dries there is no danger of the disease spreading in the pine woods referred to. The American Invalid Aid Society of Boston, a volunteer organization composed of such men as Rev. Edward Everett Hale, Mr. Upham, of the Youth's Companion; Mr. Clement, of the Transcript; Dr. J. Warren Achorn, and others, has, through the assistance of Mr. John T. Patrick, of the Seaboard Air Line Railway, sent many consumptives to the pine woods, and many of them have been permanently cured. Recently they commenced the erection of little houses down there, where the patients can be cared for, but this is only a start. What these benevolent minded men are doing ought to be taken up officially by the city of Boston and every other Northern city and State, and done in a wholesale way. We suggest that the health boards of our cities write to Mrs. E. W. Waite, 707 Tremont Building, Boston, secretary of the society referred to in Boston, and get some information on the subject, and perhaps, this society can lend some aid at once to get the invalids away this winter, and save the lives of many invalids and prevent the spread of the disease.

Washington.

THREE-DAY PERSONLALY-CONDUCTED TOUR VIA PENNSYLVANIA RAILROAD.

THE next Pennsylvania Railroad personally-conducted tour to Washington leaves Thursday, Jan. 29. Rate, covering railroad transportation for the round trip, hotel accommodations, and transfer of passenger and baggage, station to hotel in Washington, $14.50 from New York, $13 from Trenton, and $11.50 from Philadelphia. These rates cover accommodations for two days at the Arlington, Normandie, Riggs, Ebbitt, Shoreham, Cochran, Gordon, Barton, or Hamilton hotels. For accommodations at Regent, Metropolitan, National, or Colonial hotels, $2.50 less. Special side trip to Mt. Vernon.

All tickets good for ten days, with special hotel rates after expiration of hotel coupons.

For itineraries and full information apply to ticket agents; Tourist Agent, 263 Fifth avenue, New York; 4 Court street, Brooklyn; 789 Broad street, Newark, N. J.; or address Geo. W. Boyd, Assistant General Passenger Agent, Broad street station, Philadelphia.

The Union Metallic Cartridge Co., Bridgeport, Conn., informs us that at Springfield, Ill., Dec. 3 and 4, G. T. Hull won first average, scoring 362 out of 390 targets. Hugh M. Clark defeated him in a private match by a score of 95 out of 100 targets. On Christmas Day, at Dover, N. J., T. W. Morfey killed 24 out of 25 birds, winning first place. F. C. Riehl won first at the Dupont shoot, St. Louis, New Year's Day, killing 31 out of 32 birds. O. N. Ford, secretary of the Wapsie Gun Club, Central City, Ia., writes that he has won sixteen high averages during the past trapshooting season, averaging over 91 per cent. for the year. Mr. Ford has made seven runs of over 50 straight.

The catalogue for the year 1903 issued by the Andrew B. Hendryx Co., of New Haven, Conn., is a ponderous volume of 400 pages, describing and illustrating the very large variety of articles which they manufacture. Of these, to the readers of FOREST AND STREAM, the last 200 pages of the volume, devoted exclusively to fishing tackle, would seem to be the most interesting; but the first half of the book, containing a great variety of articles for the home, with bird cages as a specialty, will also interest many people. Those who are interested should write the Hendryx Co. for a copy of this catalogue.

This is the season at which people are beginning to contemplate the planting of their gardens for the coming summer, and seeds of all sorts must now be selected. The 1903—their one hundred and second successive annual—catalogue of Thorburn's seeds gives in its 128 pages what would seem to be a complete list of all the flowers and vegetable seeds, and the gardening tools, that one could need on a place. Those who are fortunate enough to possess gardens or facilities for growing plants should see this list.

Mr. Carl Von Lengerke, traveling representative of the American E. C. and Schultze Powder Company, left New York in the early days of this week for the purpose of visiting all the great cities of the Middle West, in the interest of his company.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903, BY FOREST AND STREAM PUBLISHING CO.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, JANUARY 24, 1903.

VOL. LX.—No. 4. No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

MAN AND NATURE.

THE economic value of wild life to man is as yet very imperfectly understood. Very few people think of or appreciate the fact that the wild creatures that civilization is constantly crowding more and more out of existence have to this same civilization a value in dollars and cents which is very great, though as yet we do not know how to measure this value.

Owing to the labors of persons interested in birds during the last fifteen or twenty years, many people have come to comprehend in slight measure the great services rendered to humanity by birds of almost every kind. Less than a generation ago an oriole singing in the garden in spring was thought to be destroying the peas, a robin in the cherry tree in early summer was regarded as an enemy because of the fruit he ate, while hawks and owls, no matter how small and feeble they might be, were thought of as capable of carrying off the farmers' geese and turkeys. In the face of many discouragements the bird lovers kept on preaching their doctrine. Nearly twenty years ago the FOREST AND STREAM gave birth to the Audubon Society idea, which now, taken up by a hundred associations throughout the land, is doing a vast amount of good. It is realized that not only insect eaters, but hawks and owls and gulls and terns and many other birds have a useful place in nature, and should not be wantonly destroyed. These are the more familiar aspects of the protection afforded to human society by wild things. But there are many others. And as our knowledge of nature and its processes increases, we are learning, though slowly, which are our friends in the animal world and which our enemies, and are learning also how to make use of one against the other.

It is not so very long since the California orchards were attacked by a scale insect which promised to destroy the trees and so to ruin their owners, but by the introduction of certain beneficial insects which preyed on the noxious ones, the California orchards were largely protected and a great encouragement was given to further attempts to protect plants from their enemies by setting upon these enemies their enemies—creatures which preyed on them.

In the same way, a few years ago the orange and lemon groves along the river Tagus in Portugal were attacked by a scale insect thought to be an immigrant from Australia. It was apparently without enemies in Portugal, and increased so as to threaten appalling injury to the orchards. Nevertheless, by importation from this country of a few specimens of a little predaceous beetle, known as *Novius,* which were at once bred in large numbers in captivity in Portugal, the ravages of the scale insect were checked. Colonies of the beneficial insect were established on about 500 estates, and these colonies sent out others, so that gardens and orchards that were completely infested by the scale insect and had been almost ruined, became clean and free from the pest that had so nearly accomplished their destruction.

The ravages of these minute injurious creatures are scarcely known except to those people whom they directly affect and to students of science. But cases of this kind are continually occurring. Only recently it is announced that the authorities of a parish on the Mississippi River in Louisiana have passed a local law forbidding the further destruction of alligators. This low-lying parish is protected from flooding at high stages of water in the Mississippi by the levee—a great dike which keeps the river from overflowing the fields and making the country uninhabitable. Muskrats abound along the river, and burrowing into the levee weaken it, and if their burrows pass entirely through it, cause leaks which are likely to destroy the structure.

Alligators were formerly very abundant here, and, according to the authorities, fed chiefly on the muskrat, but since the hides of the alligators became valuable they have been so closely pursued by hunters that they are almost exterminated. The muskrats are now without enemies to check their increase; their injury to the levee becomes constantly greater; more repairs are needed, and the inhabitants of Plaquemines Parish have to pay for these repairs. The authorities are now calling on nature to help pay their taxes.

CAVIAR.

THE New York Evening Post recently printed a report of the growing scarcity of caviar, and of the importance of the supply furnished by the United States. The Post's figures and deductions have been widely copied, and it is worth while, perhaps, to note their lack of accuracy and to correct the erroneous notions created by them relative to the part America plays in the supply of the world's caviar. The article ran:

> The time is said to be not far off when caviar will be as expensive as canvasback duck or diamond-back terrapin. Though supposed to be a foreign delicacy, it is almost exclusively American. At one time all the caviar on the market was of European origin. European waters have been nearly fished out of sturgeon, however, and to-day the German and Russian manufacturers who have a practical monopoly of the finished product, rely upon the United States for the sturgeon's eggs, out of which the finished delicacy is made. The same process of extinction is going on in this country at a very rapid rate, and thus far no steps have been taken by either the National or the State Government to regulate the industry. At the present time the three centers of sturgeon catching are the Delaware River, the Great Lakes, and the Columbia River. A limited number are caught in Puget Sound, and according to ship captains, there is still a vast and untouched supply in the waters of Southern Alaska. The waterways which run from Vancouver northward along British Columbia are another field of considerable promise.
>
> But the first quality, and the one which all epicures prefer, comes from the Delaware. That of the Great Lakes is inferior in flavor, while the Pacific article is altogether too rank and coarse for the most refined palate. It was the latter which was described by an Irishman as a shad roe dressed in cod liver oil. Up to the present century there were many sturgeon in the Hudson and Connecticut, in New London and Narragansett bays, as well as Long Island Sound, but the number has grown steadily smaller and to-day is scarcely worthy of consideration.

That caviar is almost exclusively a delicacy our own, and that to-day Germany and Russia rely upon this country for the material forming the finished product is a bit of misinformation that will surprise most intelligent Americans, who hardly need to be told that the output of the two countries mentioned is vastly in excess of that of our union. In the ten months ending November 1, 1895, the Russian export alone was of a value of $726,160, while in the eleven months ending December 1, 1902, the export from the United States was only $39,763, being about one-half that of the previous year. European waters, or at least those of Russia, are very far from being fished out, as alleged by the newspaper writer. In connection with Russia's great fishery exposition of last year it was stated that the export of caviar for that twelvemonth was in the neighborhood of a million dollars' value. It will be news to the epicures that the first quality, the caviar that they prefer, comes from the Delaware. Our consul at Hamburg, Germany, reports officially in 1897 that nearly one-half of the caviar imported from the United States comes from the Delaware River, and that it goes to cheap restaurants. The best Russian caviar sells for four or five times the price of the American or German, neither of which last assumes to compete with even the second grade of the former.

Nor is the vaunted Delaware product wholly from that stream, a large proportion coming from South Carolina waters, the Edisto and tributaries of Winyah Bay, where the earlier season invites the operations of the Delaware fishermen before the opening of their own, the southern product being sold as Delaware caviar. Another outgiving of this writer, "that lake caviar is inferior," is opposed by the assertion of the United States Consul that "our lake caviar is preferred to that of the rivers on account of its larger roe, the latter being small and black in the river caviar." Furthermore, it may be said that no small proportion of the alleged United States product is and has been of Canadian waters. Our consul states that there are three sturgeon fisheries on the Fraser River in British Columbia that in 1897 exported over a million pounds of sturgeon flesh to the United States, and that with each carload of 20,000 pounds there was sent a thousand pounds of roe which went to Germany to appear as caviar. Even the salt with which it is cured is a German product, being shipped to the far Pacific for that special purpose. The sturgeon fishery of our Great Lakes is substantially exhausted, even the Lake of the Woods, lakes Winnipeg, Manitoba and other waters of the far Canadian wilderness have ceased to furnish a fair supply. Another inexact statement is that neither our State or Federal Governments have taken steps to regulate the industry. The Delaware fishery has been subjected to specially restrictive legislation by the States of New Jersey and Delaware, and the general government has endeavored, but with ill success, to resuscitate the exhausted fishery by artificial propagation. Finally, it may be said that while the caviar output has very seriously declined in this country, that of Russia still holds out, and there is seemingly no more danger of a caviar than there is of a lobster famine.

The Russians make a considerable portion of their caviar from the roes of other fishes than the sturgeon, that of the white sturgeon (*A. huso*) selling for the highest price. If the roes of our cod, pollock and many other fishes could be thus utilized, instead of being discarded as offal, the life of a now almost extinct industry might be indefinitely prolonged. The myriad salmon slaughtered on our Pacific Coast should alone constitute the basis of a flourishing trade, for the roes of the Baltic salmon afford the Russians material for their coveted delicacy. Our moribund industry was initiated in 1867 by a consignment to Hamburg of twenty-five kegs of caviar, where it brought only two cents a pound; but so scarce and so highly valued is the same article to-day that it commands from $1 to $1.25 a pound in the home market. The development of an American taste for this foreign tit-bit has materially contributed to the diminution of our export trade, of which next year may see the entire extinction. To the home purchaser the domestic product masquerades as foreign, and he accepts as Russian an article that in price and quality is much below the genuine. Nevertheless the absorption of our entire output is unlikely to check advancing prices or to arrest the lamentable decline of the fishery.

In Russia the semi-barbarous Cossack of the Don freely and willingly imposes upon himself a set time for his sturgeon fishery, and only during three weeks of the long year is the harvest sought to be gathered. Lack of respect for the law is unfortunately a failing of the average American, and his contempt of restrictive fishery statutes seems to render the local extinction of various forms of aquatic life almost inevitable. Living men can recall the time when our noble Hudson abounded in sturgeon, when the loud splash of the leaping monster was a familiar disturbance of the nocturnal stillness; but that sound is now hushed and its awakening all but hopeless.

The "gentle art of woodcraft," as Frank Forester styled it, is rapidly lapsing into one of the lost arts in this country. The settlement of the country, the passing of the frontier, the lessening of the numbers of pioneers and wilderness settlers, all these mean a smaller proportion of the population which by force of stern necessity learns the tricks and expedients of woodcraft. The town and the city still draw from the country, but there are fewer men of this day than there were a half or even a quarter century ago whose youth was a schooling in the lore of field and wood; and there are fewer to whom, in mature years, an outing means taking up once again the woodcraft acquired in boyhood days. The sportsman is all the time growing more dependent upon his guide. The guide's occupation is all the time, in corresponding degree, becoming more important and filling a larger place. It is a widening field which will enlist the men who, in the conditions of an earlier stage, would have been fur trappers or market hunters, or just backwoods dwellers. With the new importance of the work, we are likely to see an increased efficiency in the guide service, and a conventional recognition of the calling as one demanding ability and training.

WE printed last week a note from a correspondent writing from North Carolina, who related how his setter Toby had the dog-sense to return out of the thick cover to report that the other dog was holding a covey there. The story brings up the account of the reporter dogs of Sweden, which was sent to us some years ago by Minister Thomas, and which is good enough for another reading, and so it has place on another page this week.

The Sportsman Tourist.

Notes from Central America.—IV.

TRUXILLO, HONDURAS, Dec. 8.—Seated in the little park, or plaza, here at Truxillo, sheltered from the direct rays of the morning sun by one dome of the old cathedral, below and before me the beautiful expanse of blue formed by the waters of the bay—now quiet and serene, but easily aroused to activity and violence by winds from north, northwest and west—behind and above, the mountains that here rise almost directly from the shore of the Caribbean Sea till they pierce the lingering clouds, giving a strong background to the scene.

Gazing seaward one can see, far toward the horizon, the Bay Islands. To the northeast and across the point of mainland known on the coast chart as the Cape of Honduras, is plainly visible the mountainous island of Bannaca (Guanaja); more directly to the northward is Roatan—whose friendly harbor of "Coxen Hole" affords the most available protection from "northers" for vessels plying this portion of the north coast—while to the northwest are the "Cochinos" or, as they are called in English, the Hog Islands.

In all directions the view is varied and pleasing this bright December morning, and even the town itself is not without attraction as the sun plays upon white walls, red tiles and galvanized iron roofing. The old Spanish fort, now in ruins, is both picturesque and interesting, but it does not appeal to me so much because it was once somewhat imposing and commanded by gallant and gay Spanish soldiers and the scene of martial activity, instead of as to-day a field of ruins in the campus of bare-footed Honduranian soldiers, but it interested me most in that it was alongside one of the walls still standing where the intrepid filibuster, Colonel Walker, was shot, and as I gaze upon the spot where his blood was shed, I cannot forget the villainous officials of the foreign gunboat who were mainly responsible for his ignominious death. What that he, an American, with a handful of followers, was victorious in Nicaragua and even became President of that republic! What that he fell, shot like a dog, by Honduranian soldiers—were they in any sense victorious over him? No. Can Nicaraguans claim the honor of his defeat? *Tampoco.* One has but to review carefully the history of the Gulf Coast of Central America during the past century, the foreign occupancy of the Bay Islands, and the so-called protectorate of the Mosquito Coast, to know that Colonel Walker was a greater patriot than he is commonly declared, and to appreciate, in a measure, the courage and bravery he possessed, in virtue of which he dared to oppose not so much the arms of a new republic, but the avarice and caprice of a mighty power. If there had been more Americans with the spirit of Colonel Walker, intent upon establishing colonies of *Americans* in this part of the world, and if there had been less bending of the knee to those who finally and traitorously handed Walker over to his slayers, there would long ago have been a higher regard, in this part of the world, for the stars and stripes and for the people to whom that flag is dear.

Truxillo, though to-day a typical Spanish-American town of the sleepy variety, with only an occasional steamship in port and difficult of access from the interior, is, nevertheless, comparatively speaking, in a healthy, flourishing condition. Here are a number of large general stores where one may purchase almost anything, form a safety pin to a sewing machine, from a penny's worth of bread to a barrel of American loaf sugar or a case of finest French cognac. From here are shipped annually large quantities of fine Honduras sarsaparilla, many hides, considerable rubber, and thousands of cocoanuts.

Here on the hill and surrounding the plaza are, in addition to the old fort and white-walled cathedral already mentioned, the *cabilda municipal, cuartel, aduana* (custom house), postoffice, etc., while still further back are the stores and houses of the Spanish inhabitants and foreign residents. A short distance down the hill, in the direction of *la playa,* is the old jail, which has been partly rebuilt and is still in use. The stone, mud-plastered walls that surround the inner court are topped with broken beer and whisky bottles, serving in lieu of sharpened steel and iron.

On either side of the hill on which the main town of Truxillo is situated are Carib villages—that to the east being known as Rio Negro, not because of the color of the people who occupy the mud-wall, thatched-roofed houses there built, but rather because of the mud-colored water of the creek that here reaches the beach. The Carib settlement on the western side of the town is the larger and more picuresquely located, and is called "Crystales," though its denizens are just as black as those of "Rio Negro," but the little river that here flows to the sea is sparkling and "clear as crystal," and, as in the other instance, has given a name to the locality. It is from this "crystal river" that Truxillo derives its generous supply of excellent water, pipes conveying it in liberal quantity to all parts of the main town.

Yesterday morning, while strolling along the beach, I came upon a group of Caribs hauling a seine in the bay. The catch was considerable, and included "drummers," "jacks," red snappers, a sort of brim, etc. A good many of these were sold on the spot, and excellent value given the purchasers—two reales (the equivalent of about ten cents U. S. currency) buying from four to six fair-size fishes. The remainder were carried to the Carib village of "Los Crystales."

In the afternoon I called on the *Comandante* and obtained permission to enter the ruins of the old fort. Aside from an excellent view of the bay, I found there very little of interest and practically nothing more to see than can readily be observed from without. It is one of those things to which distance lends enchantment. Ten old dismantled iron cannons and a few heaps of rust-eaten cannon balls still remain within the environs of the crumbling walls.

Truxillo has not been entirely neglected in literature, for we find it noted in fiction as well as in history. My friend, the author of "The Spider of Truxillo," has assured me that the experiences of himself and companions in this locality thoroughly warranted the narrative in question. *Quien sabe?* Those here who remember the Colonel's visit, tell a different story, and one that accounts, in a measure, at least, for wild scenes and vague imaginings.

Speaking of human spiders, among the most dangerous that come to Truxillo and other ports in Central America are specimens of *genus homo* not native to this soil, whose webs have here but nest and outlet, for their fibres reach across the waters of the Gulf and entwine about unsuspecting and gullible individuals who give up their hard-earned cash at the call of falsifying and silver-tongued promoters and concessionists, to be squandered in visionary and impossible schemes or stored in the meshes of the web itself. A home in the tropics! An interest in a grand enterprise! Dreams of wealth! One has only to visit the locality and feel for a few days the pressure of conditions as they actually exist to be utterly disillusioned.

J. HOBART EGBERT, M.D., PH.D.

Wild Horses.

Editor Forest and Stream:

The writer of the very interesting article appearing in the FOREST AND STREAM of Jan. 3 upon the wild horse, in referring to the Indian traditions as to the domestication of that animal, fails to allude to it as being, in some instances, at least, a matter of record. That the wild horse of North America was first caught and used by the Dakotas (the tribes comprising the Sioux, Cheyennes, etc.), about the year 1812, appears to be substantiated by the evidence of divers so-called "Winter Counts," or chronological Indian records made in successive winters, and commemorating the most notable event of the year immediately preceding. One of the best known of these aboriginal chronicles is a pictorial chart made by Lone Dog, a Dokota Indian, a colored photograph of which appears in the tenth annual report of the Bureau of Ethnology. The original record was emblazoned in various colors upon the back of a buffalo robe, each year from 1800 to 1871 being indexed by a device emblematic of its most notable event: Thus the year 1801-2 was the smallpox year, indicated by a rude figure with red spots on its body; 1802-3 was signalized by the capture of some shod horses, the exploit being registered by the pictograph of a horseshoe. Inasmuch as the Indians did not shoe their animals, the theft was evidently that of a white man's property. 1803-4 is distinguished by the "lifting" of a number of curly horses from the Dakota's hereditary enemies, the Crows. These animals were a peculiar breed, their hair growing in closely curling tufts, their capture being recorded by a device representing a horse with black spots indicating the tufts. 1812-13 records the absolute utilization of the wild horse, that being the year in which they were first lassoed and broken in, its attestation bearing simply the device of a lasso. The year 1833-4, memorable for its fall of meteors, and 1869 for its solar eclipse, appear in these annals with appropriate devices and afford evidence of the accuracy of the chronological record.

Another winter count is that of Battiste Good, also a Dakota, which purports to extend a number of centuries back of the year 1700, assuming, however, a reasonable degree of certitude only subsequent to that date. The years 1714-1716 are indicated upon this chart as memorable because of the attacks of mounted enemies, not unlikely Comanches or other Indians of the south. In the year 1757 the Dakotas appear to have first essayed a war party upon horseback, which, by reason of a possible insufficient mastery of their steeds, seems to have failed of encouraging result. To the year 1811-12, or the season prior to Lone Dog's chronicle of the first hunting and capture of the wild horse, is ascribed the first chase of the buffalo on horseback.

Other evidence there is that about this period the northern tribes finally achieved a complete mastery over their thenceforward inseparable companion. Grinnell, in his "Story of the Indian," states that he learned from an aged aborigine that horses first came into the possession of the Piegans, an Indian tribe of northern Montana, about the year 1804. From various references made by Lewis and Clark it would appear that in their expedition of 1804-1806 the horse was in fairly common use among the Indians with whom they came in contact. Their report asserts that the animal was principally distributed upon the plains of the Columbia River, and the Shoshones of that region are mentioned as being very superior horsemen. The possession of numerous mules besides herds of horses by this Oregon tribe, as well as the frequent bitting of their steeds with Spanish bridles, would suggest that their advanced equitation was the result of their contact with a superior race. The explorers fail to state that the horse was employed by the Dakotas and neighboring tribes in war and the chase, which circumstance was to Catlin, a generation later, an impressive feature of Indian life upon the plains. It is noteworthy that despite the Indian's extreme adherence to ancient custom, that in a couple of generations following their complete dominion over the horse, their habits were so revolutionized as to render them utterly helpless, both in war and the chase, when deprived of their four-footed ally.

To the Indian's tenacious conservatism and sluggish mind may be attributed his slow and gradual utilization of the most serviceable of animals. By degrees, during his probable two centuries of acquaintance with the wild horse, the Indian, beginning perhaps with a use of the animal's hide and flesh, then with his employment as a beast of burden, finally crowned his effort by becoming so identified with his four-footed servant as to prove himself the most daring and the most expert of horsemen.

It is probable that the northern Indian's first knowledge of the horse was acquired during the sixteenth century, certainly at its close the animal should have become abundant in their domain. It may reasonably be assumed that it was with the derelict animals of Coronado's famous expedition that the wild horse of the plains originated. The explorers' furthest point of attainment has been assumed to have been the confines of Western Kansas in 1541. About the same time, 1537, the horse was turned loose upon the pampas of South America, and, in forty-three years he was heard of, according to Darwin, at the Straits of Magellan; thus, in that time, diffusing his species over a range of fifteen hundred miles, that distance being the attainment from the banks of the Plata, where the animal was landed. It will doubtless, in the light of this experience, be conceded that the horse of our western plains extended its range within half a century of its introduction over at least an equal area, and should, therefore, within that period have become known to the northern tribes.

As further instancing the slowness with which savages adapt themselves to new conditions, Darwin mentions that, during his visit to Tierra del Fuego, an aboriginal tribe was undergoing a change from foot to horse Indians, although their prior acquaintance with the animal must have extended through two centuries. The Sias, a harmless tribe of Pueblo Indians upon the upper waters of the Rio Grande, although keeping horses, seldom or never use them as beasts of burden, perhaps, in this respect, manifesting an initial stage of savage domestication.

If, with a full knowledge of the horse's accustomed servitude, its full accomplishment by the savage imposes centuries of effort, how much more prolonged must have been the blind, unguided endeavor of primitive man? In certain caves recently explored in France there have been revealed wall pictures of a big-headed, clumsy-necked brute suggestive of the Asiatic wild horse illustrated in the FOREST AND STREAM in connection with the article first alluded to. This hairy and uncouth creature was doubtless the progenitor of the modern cart horse, the thoroughbred being of probable North African origin. Associated with the rock pictures of this vanished horse were others of the mammoth, reindeer, elk and other animals now locally or wholly extinct, and it is asserted that not only was the primitive horse domesticated by the ancient lake dwellers, but that there are even indications of his servitude to the cave men. If this be so, if these be the beginnings of the creature's bondage that thus feebly glimmer out of the obscurity of time, the measure of their remoteness is beyond intelligent speculation.

A. H. GOURAUD.

True Camp Stories.

In the Canadian Adirondacks.

WE had gathered around the camp-fire for a quiet smoke and talk. The day had been a fairly successful one, and we could boast of a fine caribou with splendid antlers which would make any hunter envious. The guides were in an extremely talkative mood, as the day's sport put everybody in good humor. It is at times like this that you sometimes hear interesting talks of the woods, which would make good reading matter were it possible to remember the different details and the manner in which they are related. The Canadian guides with us on the present trip were all old experienced men, and had roamed the Canadian Adirondacks and further west for many years. Their lives were full of interesting reminiscences. Oliver was as good a cook as I ever had in the woods, and at the present time of writing is guardian for one of the best fish and game clubs in northern Quebec. Although born in Sillery, near the quaint old city of Quebec, he wandered to a lumbering city of Michigan when still quite young, and here he found employment for a few years in the shanties. With a quick aptitude for the cuisine he changed his place of abode and followed lumbering operations of the Upper Ottawa as cook for a big camp. The district was frequently bothered with prowling Indians, too lazy to build themselves a lean-to for the night. They preferred to seek shelter and food among the lumber men. The nuisance became unendurable to the foreman of the camp at which Oliver was engaged, and orders were given that no more Indians would be accorded a night's lodging henceforth. It was not long after the order was issued before the camp had a visit from a member of one of these roving tribes. It was four o'clock in the afternoon and Oliver was alone preparing supper for the men when they would return from work. The Indian asked for protection for the night, but was informed of the orders and left immediately. He came back later on and again solicited admission, trying to make us understand that he had a special reason for making the request that night. The foreman, however, was resolute in his determination of putting a stop to what he considered a bad practice of the indolent redskins, and the unfortunate Indian was again refused the hospitality of the camp and forced to depart to do the best he could for the night in the forest. Nothing more was thought of the incident. In the morning, about six o'clock, one of the men who had gone out of doors, returned to camp and called the foreman away. In a few minutes they returned with the huddled up form of a woman in their arms and laid her on the floor. Following was the poor Indian who had pleaded so humbly the night before for lodging. As we gathered around to see the face of the woman, a faint, low cry from the arms of the poor squaw wrapped in a dirty blanket told the story. During the night a little Indian boy had come to life on the cold hard snow-covered ground about twenty paces from our cofortable camp-house. Not a soul in that camp but felt a twinge of sympathy for the poor Indian and his squaw and the night they had experienced. Everybody took compassion upon them, and poor as the men were, a small subscription was raised and handed to the mother of the child, who was given food and shelter for a week, before continuing on their wanderings among the Canadian forests. After they had left the foreman changed his orders, and the boys in camp never forgot poor old See Weed, his squaw and the little papoose, when a hungry Indian came to seek a night's shelter.

* * * * * * * *

This narrative put Joe, one of the other guides, in mind of a story which had occurred while he was shantying some years previous. He first of all told us of his experience a few weeks before when he was out with an American gentleman. They came across a sick caribou, who was so ill that he could hardly move along the ground. To relieve him from further suffering the sportsman finished him with a rifle shot.

It was afterward discovered that the poor animal had been suffering from tuberculosis. This is, I understand, a very rare sight in the Canadian woods. But the principal story which Joe started out to relate was in connection with his lumbering on the Quebec & Lake St. John Railway some years back. He was one of a large camp of men who for some days had been complaining of a bad odor which hovered over the camp. The stench became so great that the men complained to the foreman, who was encamped some distance away. The log house was given a thorough cleaning out, but the odor remained just the same. Then a search on the outside. The mystery was solved. The rotten carcass of a big buck caribou was found within two hundred feet of the camp. A closer investigation illustrated the cause of death. His two hind legs had got caught between two rocks, and there he remained wedged in as tightly as a steel trap could hold him. All sportsmen know the strength of the caribou and moose, and it was surprising even to the shantymen to believe that he had come to his death by staravtion. He was unable to extricate himself from between the two rocks. Nevertheless, such was the case, both his legs having been broken in his efforts to break loose, and as he bore no other marks of having been shot by any hunter, there could be no other reason ascribed for his fatal end, which was considered an extraordinary death for the fleet-footed caribou.

* * * * * * * *

Now it was Albert's turn! This staunch old guide I had employed for many years. He was on a hunting trip with a well-known friend of mine. The latter had been successful in badly wounding a big caribou, which Albert had called down from the mountain side to the edge of the lake. The shooting took place in a canoe, and the huntsman and guide paddled ashore and entered the woods to find their prize. He was lying on the ground, to all appearances dead. Albert pulled out his long knife and straightaway commenced the first act on an occasion of this kind, which was to insert the blade into the animal's neck and allow the blood to flow. He had stooped down to do this, when the supposed dead buck gave a grunt, followed by a leap into the air, and before the two astonished men knew what had happened, was off into the woods again. The huntsman, quick with his gun, succeeded in following him with a shot, which broke one of his hind legs and penetrated his body. After a mile chase in the woods they came across the buck once more on the ground. This time dead in reality. Examination of the first two shots fired from the canoe was made, and they were found to be so insignificant that to this day the guide or my friend have never been able to discover the reason the caribou lay down and played the part of death to such perfection as to deceive them beyond any doubt.

* * * * * * * *

Ned was the only English-speaking guide in the group, and, although last in the recital of camp yarns, his was none the less interesting. The whole of the Canadian Adirondacks are mountainous and abound with rivers and lakes, as all those who have hunted or fished in this grand country can very well testify. The preserves we were in were particularly so, and the more I wandered through them the more surprising grand and mystic they seemed. While the Tourilli Club, of which I am a member, boasts of only a hundred or so lakes, I am sure the number is more like a thousand. This is very much in evidence with all the fish and game clubs in the northern part of Quebec. They control so much territory that it is almost impossible for the clubs to keep track of the numerous lakes and rivers which are contained in their preserves. One thing sure, Ned knew of three times as many lakes as the best informed members of the club. His father was guardian of one end of the limits, and his winters were spent trapping and hunting, and his summers in acting as guide to the members. It was while on one of his trapping expeditions that he found himself in one of the prettiest valleys in the whole preserves. The mountains towered thousands of feet above him on all sides. He was returning home when he espied a small herd of four caribou within easy range of his trusty rifle. He first fired at the largest and missed. It was long before the fish and game laws of the Province of Quebec were so strict as they are to-day, and Ned had no scruples as to how many he would shoot if he had the chance, but it came to him in a most unexpected manner. After the first shot, the small herd ran in an opposite direction to where he was, then as suddenly turned and came back almost straight to where he was standing, under cover of a small growth of swamp foliage. Ned had no idea of what had occurred, but imagined he was in for an exciting battle. He came to the conclusion the caribou were going to attack him, so he prepared for the onslaught. On came the small herd at a frightened rate of speed, bounding in leaps and jumps over the snow, which at that time was not more than a foot deep. When within a hundred yards a second shot from Ned's rifle brought the foremost animal to the ground. The firing only had the effect of hastening their speed, and a third and fourth shot laid low two more of them. But it was only a minute's work. One of the three wounded animals arose and continued on with the fourth, and passed Ned in such flight that he missed fire the next two shots, and his Winchester being empty, he did not have sufficient time to reload, and follow the fleeing animals, but instead gave his attention to the two on the ground, which he desired to make sure of by firing two more shots into each before approaching. And now for the secret of the peculiar action of the caribou in running straight into danger. It appears that the echo of the surrounding hills had misled them to think that the sound came from the opposite direction, and at first impulse rushed into close range of the hunter, who was evidently a quick and accurate shot, under the circumstances, to bring down two out of the four while running at full speed past him.

* * * * * * * *

The fire had gradually been burning itself out, and when the guides asked if they would heap on more logs, I said, "No, boys," we have had an interesting night of it, and we had better get some sleep for tomorrow, as we may have some novel experiences of our own to relate at the next camp gathering. And so we had.

F. C.

The Reporter.

[*From* FOREST AND STREAM, *Dec.* 10, 1889.]

I WONDER if we have reporters in America? What a question! Are not our newspaper reporters the best and most indefatigable in the world? But I do not mean the reporting *homo*; it is the reporting *canis* I am wondering about. Do we have reporting dogs in America? If so, I have not seen them, neither have I heard of them. Our stories about the pointing dogs revolve about "the point," and of the dog's sticking to it like grim death. "He's so steady on a point that you can't kick him forward on to the bird," says the dog trainer in highest praise of the brute he is trying to sell. And we all recollect the story of the crack western dog, that was lost at the close of a day's shooting. Search was made next morning, and the dog was found in the brush, close to where he was missed the night before, and still pointing the game he had come upon as darkness overtook him. So I doubt if we have "the reporter" in the Land of the True, and perhaps a word about him may not be uninteresting to American readers.

I was out partridge shooting in the south of Sweden in the fall of 1884. I had a sprightly fellow, Joseph, as guide and bearer of cartridges and game, and was shooting that day over an old German pointer a friend had loaned me, so that I could give my own dog a day's rest. We had enjoyed a fairly good day's sport, and toward evening were returning down the valley of the river Nissa, toward our headquarters at Oscarstrom. We were tired, the shooting was over, and our dog was allowed to roam at will. As we sauntered along I saw old Lila make her appearance over the top of a distant heathery ridge. She looked up and down over the valley, and as soon as she caught sight of us came toward us in a straight line on a brisk gallop, wagging her tail in a joyful sort of way. Coming in she raised a forepaw, placed it on my leg, looked up in my face, wagged her tail briskly, turned about, took a dozen leaps back in the track she had come, then looked around at me and wagged her tail again.

"Well, what does all this mean?" asked I.

"Oh, Lila has a covey of partridges over the hill yonder, and has come in with the report," answered Joseph.

"Nonsense!"

But Lila rushed on a dozen steps more, looked back, and seeing I did not follow her, came in, put up her paw and again went through all her motions.

"Well, old girl, lead on!" I said at last, "we'll follow and see what you've got at all events." So over the hill we went, Lila leading and ever and anon looking back—down across a valley, then straight up the further hillside where she came to a point at a bunch of bushes. Before I got within shot the partridges began to whirr up; at least a dozen flew, but old Lila stuck now to her point, and on my reaching her side the last bird of the covey flew, which I knocked over and Lila retrieved. We now hunted along the bosky hillside, and Lila pointed and I shot six more of this covey, bringing up my bag for the day to nineteen partridges and a hare.

"You din't know Lila was a seporter?" quoth Joseph.

"No, I did not know before this day that there was such a dog in the world."

Since then I have made the matter of "the reporting dog" the study of some leisure hours. The reporter occurs most often among German pointers, or in crosses between German and English pointers, but even among them not more than one trained dog in twenty is a reporter. The trait is rare among English full bloods, and I have never yet seen a setter report.

It is asserted that a dog cannot be trained to report. The reporting instinct must be born within him, and then he takes to it naturally. I, however, am inclined to think that any dog that "rings" game, or from any cause breaks his point to take up another, may be trained to report, by whistling him in, whenever he comes to a point, and then advancing with him to the quarry. "Reporters" have different ways of imparting their information; not every dog is so clear as old Lila. Some come back only till they make themselves seen, then return directly to the game. Others hop up on a hillock or stone and jump and wag their tails till you approach.

Here in Sweden a reporter readily sells for one-third more than an equally good dog without this faculty, and I can assure American sportsmen that the report lends an additional pleasure to the chase.

As the shooting season approached this year I looked about for a reporter, and at last bought a large, powerful pointer, a cross between the German and English. The German dog is exceedingly kind, faithful and obedient, but too heavy and slow. The English pointer, with all his good quality, is apt to be too hot and headstrong. The half-breed is best for Swedish shooting, and, I believe, admirably adapted for America.

I shot black cock and capercailzie over Nero, and as the season advanced partridges, but as I always kept well up with him never saw him report, and had half forgotten that he possessed the accomplishment. One day my boot hurt me, and leaning my gun against a fence I sat down, took off my boot, pulled off my stocking and made a general readjustment. As I was lacing up my boot in came Nero over a rise of the field, and looking up at me turned about and came to a half point, then looking up once more shot along the track whence he came. Following over the hills I came in view of the blue waters of Lake Nefode; Nero was still rushing on in a straight line over the field. When he reached the lake shore he came to a point at a tuft of dry rushes. But it was an easy kind of a point. Every few moments he looked back at me, and expressed his satisfaction at my approach with one wag of the tail, which instantly stiffened into business again. Reaching his side a little flock of seven partridges hustled up, and I had the pleasure of dropping a couple, and Nero the satisfaction of retrieving them. Since then I let Nero hunt as far and wide as he pleases, confident that he will come in and report all game he finds out of my sight. I frequently whistle him in when he points at a distance, and then advance over the field side by side with him. Sometimes when Nero points at a distance, and is sure that I see him, he will lie down, so as not to scare the birds, rising on his forepaws now and then and looking back at me if I make any unreasonable delay.

The other day he came to a point far away over a vast plowed field. Looking around and making sure that I saw him, he backed in his tracks a dozen steps and then disappeared from view as absolutely as if the black plowed field had swallowed up his white body. We kept on toward the spot where he was last seen, and after some five minutes' plodding over the soft upturned earth, Master Nero arose out of a dry ditch just in front of us and quietly resumed his point. Coming up with the dog, two great coveys of partridges arose, my friend made a right and left shot out of the flock to the right and I took a bird with each barrel out of the left covey.

The trait of reporting causes a dog to be freer and easier on his point, he is less like a cast-iron statue, more like a reasoning being.

As Nero and I advance on a running covey, he lifts his ears, looks up at me and takes in the situation, "like a little man," pointing now here, now there, and ringing the game in between us if necessary.

A reporter really seems to go through a chain of reasoning something like this, "Here is game, but where is my master? Of myself I can do nothing. Here's for it. I'll go hunt him up, for it takes both of us to do the shooting."

Frequently when Nero makes game I hide to see him go through his motions. Gradually he stiffens into a solid point, then looks around, first one side, then the other. No master in sight. Then he slowly backs out of it, step by step, a dozen steps or so; next he turns round as slyly as a snake, then sneaks away, and in another moment is in full gallop toward where he last saw me. I always meet him with a pat on the head and a "Bravo, Nero!" It seems to me that the advantage of a reporter is at once apparent, whether it be on the wide prairies of the West, in the hill country of the East, or in the dense woodcock coverts of New England. What a comfort and luxury to have a dog who will come in and report game and then lead you quietly to it. How many forced marches in the alder swamps one might save, and how lazily he could saunter along the ridges, leisurely waiting for the report of his faithful four-footed friend. Americans are never satisfied with anything short of the best. If we have not the reporter in America, we have not the best possible pointing dog.

Is not the subject worthy the attention of our dog breeders and dog lovers? Why not import the German reporting pointer and cross with our best pointers of English blood? Or why not develop and perfect the reporting instinct whenever it manifests itself among our own dogs?

Of one thing I am sure, the American sportsman who has once shot over a reporter has experienced a new joy in life, and this joy he will ever keep, if he can, among the many pleasures which give zest to the life of the true lover of the chase.

MARSTRAND.

STOCKHOLM, Sweden.

Besieged by Indians.

Editor Forest and Stream:

Every once in a while we get a more or less interesting Indian story in the columns of the daily papers. They are written sometimes by a man who does know an Indian when he sees one, but as often as not they may have been gotten up by a man who met his Indian in front of a cigar store.

This account of the siege of Flat Top by Comanches has started its rounds lately—I have seen it in two different papers already—and it is no doubt still going; I don't expect to stop it; it is a beautiful story, only it does not happen to be true.

"A short time ago," writes a correspondent, "I took a buckboard at Stamford, Jones county, which is the northwestern Texas terminus of the Texas Central Railroad and drove to Flat Top Mountain, a distance of twenty miles, through a pasture which incloses under one fence 100,000 acres of grazing land. Flat Top is one of thousands of buttes scattered irregularly in that region. From its pinnacle one can see as far as vision can reach. It is now a land of farmers and stock raisers, but when I was there, between twenty and thirty years ago, it was a land of death and danger.

"In 1876, the year of the Custer calamity on the Little Big Horn, being then a Texas Ranger, I halted at Flat Top with a squad of eight Rangers. By some strange means the Comanches and Apaches just beyond the Texas border had learned of the incident of the Little Big Horn, and elated with the success of the Sioux, the Southern savages were bent upon massacre. Reynolds, a sergeant, called 'Mage,' was in command. Standing on the peak of the butte, he saw through his telescope a string of warriors, two hundred in number, moving rapidly toward the site now occupied by Stamford, where a dugout sheltered the family of a buffalo hunter. 'We must save them,' Reynolds said, and in less than five minutes seven men were trotting toward the advancing line of Comanches. The eighth man was galloping southward to secure re-enforcements.

"The wife and children of the hunter were taken up behind the Rangers, and by a rapid march a rugged hillock was reached just in time. The Rangers were armed with carbines and revolvers, and Mrs. Carr, the wife of the hunter, had a long-range buffalo gun, left at home by her husband, who started a week before to trap beaver on the upper forks of the Colorado. The Comanches were allowed to ride within close range, when a volley unhorsed five of their number and disclosed our position. Surprised, and no doubt badly frightened, they retreated in confusion. Our horses, which we had abandoned, were running over the range, and were soon caught by our foes.

"By the number of horses they ascertained our strength, except that Mrs. Carr was not figured in their calculations, and the warriors began preparations for a siege. We had a few pounds of jerked buffalo meat and a little bread. Water was at first a grave consideration, and we felt the more concerned because of the fact that the children were already crying from thirst. After dark we found a small spring at the foot of our natural fortress, and we soon filled out canteens. The food supply was placed in Mrs. Carr's hands, and she proved a vivandiere worthy of the trust. We ascertained afterward that during the thirty-six hours of the siege she ate nothing, dividing her share among her little ones, and leaving all the rest for the men.

"To cut the story short, the Comanches made desperate efforts to rush our fortress, each time retiring with loss, Mrs. Carr slaying a big buck with a bullet from her heavy carbine. Our courier returned at sunset on the second day of the siege, accompanied by Mr. Carr and thirty cowboys from a Coleman county ranch. After a fierce battle the re-enforcing men broke through the cordon of savages and entered our fortress, bringing plenty of food, ammunition and water. The next day the Comanches raised the siege and departed toward the Double Mountain fork of the Brazos River. They left their dead, seventeen in number, being in a hurry to get away, because, as we afterward learned, Major John B. Jones, the commander-in-chief of the Ranger force of Texas, was approaching the scene from the Pan-Handle with three

troops of his noted Indian fighters, following the trail of the raiding redmen.

"The youngest of the Carr children died of croup during the siege. Three of our garrison were wounded by the bullets of our foes, having been incautious in the efforts to obtain advantageous shots. One of the three, John Ward, died. We buried the child and the Ranger in the same grave, one of the men reading the Episcopal burial service.

"The grave of John Ward and little Lucy Carr can still be discerned by the inscription it bears, roughly cut with a tomahawk on the sandstone monument we placed at the head of the double grave. It is rugged stone, honeycombed, and lichen-grown, weighing two tons or more. It took our combined force to turn it over. All the tomahawks we could procure were worn out chipping a smooth surface for the epitaph, which reads:

"'Here lies John Ward, a Ranger, and Lucy Carr, in whose defense he died. Soft rest the prairie turf upon the breasts of the Ranger and the little child.'

Major Jones overtook the warriors, recovering our horses and many more the raiders had captured. While retreating and fighting the Rangers, in reverse, they ran into a squadron of United States Dragoons, and between the Rangers and the regulars, the Comanches were pulverized, losing, together with those slain in the siege of the butte one hundred and fourteen of their two hundred warriors who started that moon on the warpath."

When the Custer massacre took place the Comanches were on their reservation many miles from Flat Top, and they remained there. I happen to know they did, for I was among them myself then, and had 200 of them, or two of them, left there, I was there to tell our officers about it. That was what they had me there for.

The Flat Top and the Double Mountains are just where this narration of the siege places them, and they are likely to stay there, too; they won't be moved. I know something of both of them. I came as near to being frozen on top of Flat Top in November, 1869, as I ever care to come, unless I am frozen to death while asleep.

An intelligent captain of the Ninth Cavalry camped his negroes and thirty-six of us on top of it all night in a norther. He did it to punish his negroes and forgot about us. The Comanches out here had whipped his negroes and had driven them in to our post, Fort Griffen. Thirty-six of us white men were sent back with him to whip the Indians, but when we struck them he would not let us fire a shot; he made his negroes whip the Indians, and they did it, too. We were right behind them; whether that had anything to do with their whipping the Indians I don't know.

There were plenty of Comanches out there then; there were none in 1876 though, nor for several years before that.

If two hundred Comanches, or a hundred of them, or even fifty of them, had got after those seven Rangers, then the Rangers would have been wiped out so suddenly that they never would have known how it had been done. This correspondent sent the wrong band of Indians out when he began to build up his story. When he next tries his hand at it, let him take Kiowas or Cheyennes. Seven white men may stand them off; but I would not want to be one of the seven white men who would take a contract on two hundred Comanches. I happen to know them.

We have had no Dragoons in the army since 1861. All the Dragoons that were in that country then were six troops of the Fourth Cavalry. I belonged to one of these troops, and we did not have to go after any Comanches that year, nor the next one, either; the Comanches were good Indians then, "heap good." Two hundred Indians would have been about all the fighting men the Comanches could muster then. The camps upon the Wichita would have had to be left to the squaws to defend; and they could do it, too.

This would not be an Indian story if it did not have a tomahawk in it, so we find one here, of course.

I have lived with these Comanches, hunted and traveled with them, and am enough of a Comanche myself now to use the name they gave me, and I have never seen a tomahawk among them.

I was about to go into deep mourning when I learned that the Dragoons, or the seven Texas Rangers, or the man who was telling me about it twenty-six years after it happened, had killed off one hundred and seventy-five of my brothers, until I happened to remember that I had been with them all the following winter, and had not missed one of them; they were only killed on paper.

If I were not as old as I am, I would take a trip out to Flat Top one of these days. I may take it yet. I have friends in Texas that the Comanches have not killed yet. I want to see that country again; I know every square foot of it, and if I do go I must hunt up that boulder that all those tomahawks were worn out on. It is there yet, of course; it must be, if it ever was there at all; it of course is not on Flat Top though, unless they carried it up there; and I hardly think they did. It only weighs two tons; but seven men could no more carry it up on top of Flat Top than they could whip two hundred Comanches.

But to cut the story short, as the correspondent did when he wrote his story, that narrative of his is a beautiful one—for boys. They want Indian stories. The only thing wrong with this one is the fact that it never happened.

CABIA BLANCO.

In Minnesota Pines.

AT last, after months of anticipation, four of us from an interior town in central Iowa, found ourselves one evening last September encamped among the pines along the shore of a small but beautiful lake in the extreme northern part of Minnesota; and as we sat, at the close of a hard half day's work pitching tent and arranging camp, we could not help admiring the beautiful scene before us as the rays of the fast sinking sun were cast far out upon the quiet waters of the lake, followed by the lengthening shadows from the pine-clad shores to the west.

We were on a "general outing"—to hunt, fish and learn what we could of the region, its natural history and inhabitants.

We had hired a buckboard to take us out fifteen miles from the little settlement where we had directed our luggage and camping outfit to be sent, paid our teamster four dollars for the job and sent him back.

We had found the country everywhere heavily wooded with jack pine, tamarack and a few other species of trees, all of them with that peculiar habit of sending out their branching roots close to the surface; one reason for which seemed to be that only six or eight inches of fertile soil covered the prevailing sands of the whole region.

The creeping vines and low spreading conifers made it almost impossible to penetrate far into the timber without following the blazed trails of the "lumber jacks." The lumber jack of these northern woods is a peculiar and very often a questionable character. He has no permanent abiding place, but roams the woods when not engaged in the lumber camps. Many dark deeds in this practically unsettled region are laid to his charge.

A few settlers are here and there to be found, and like the pioneer settlers of most every region, they are very "neighborly," generous and free-hearted toward one another. They seem to be satisfied with what the day brings forth, and have but little thought for the future.

Seldom does their clearing consist of more than two to four acres, but here they grow surprisingly fine vegetables of different kinds. Their houses are all small primitive log dwellings. They know but little of the doings of the outside world, and their neighborly conversation and gossip reminds one of that of grown-up children. One good settler's wife told us she "hadn't been to the settlement in three years." They say they "came to this region to stay awhile and then sell out." As game in this region is plentiful, the settlers depend upon it for their meat supply, and are able to "fare sumptuously" in this respect. When not carrying his rifle, the settler carries his revolver, so as to "be prepared for an emergency" should one occur.

Throughout nearly all the northern part of Minnesota, there are many large lakes, and interspersed among them are almost innumerable small, wild and picturesque sheets of water, making it in many respects an ideal region for the sportsman and fisherman. An unpleasant feature of this region, however, is the extensive tamarack and rice swamps almost everywhere to be met with.

A sportsman should not be without his canvas canoe, for in order to traverse the region in the direction he often wishes to go, he must often take to the water.

One morning we left camp to go to a point several miles distant, but in order to reach it we were informed by the few settlers here that we would be obliged to go around the "great tamarack swamp," near our camp; but as this would make us an exceedingly long and tedious journey, we determined to cross the swamp, in spite of the strong protests not to do so.

For a time we managed fairly well to make our way through the swamp, but when near the center found that our weight in stepping upon the exposed roots and fallen tree trunks which formed an almost impenetrable mass, would shake the trees and undergrowth for many rods around. We also discovered this swamp to be simply a lake of unknown depth, overgrown and carpeted by a dense growth of tamarack and other vegetable growths, and that a single misstep might precipitate a man into the deep coffee-colored water below with but little chance of his getting out again.

Black bear, wild cats, "bob cats," innumerable muskrats and occasionally a porcupine make these swamps their home. In the fall, also, wild fowl frequent the rice swamps and lakes in myriads, although we were on the ground a little too early in the season to obtain the best shooting.

We were informed that a little to the north of us some beaver and otter still existed, although none were met with by any of our party, neither were any of our party fortunate enough to get a glimpse of a moose or an elk, although we learned from reliable sources that both still existed in small numbers in the densely timbered region to the north.

An interesting habit of the moose, and one apparently not known to sportsmen in general, is described by Herrick, in his "Mammals of Minnesota." He says: "The pursuit of the moose is rendered difficult by the keenness of his senses and extreme wariness. To stalk the animal even with firearms taxes the patience and skill of the Indians. When, however, the snow becomes covered with so firm a crust as to support the hunter and impede effectually the progress of the heavy animal, the chase of the moose becomes comparatively easy to one familiar with its habits and haunts. When hunted at such times the herd passes in single file, each stepping so accurately in the footprints of its predecessors as to lead any but an experienced person to suppose that but a single animal had formed the trail. When moving rapidly, the leader becomes weary of breaking the way and steps to one side, falling in behind the others, and in this way they change in rotation, although a very chivalrous care is exercised in aiding the weaker members of the herd."

Deer we found quite plentiful, but at this early season difficult to secure, although several had been seen by our party, yet not until the evening prior to our final breaking camp did we manage to secure one. A settler had informed us that deer were, at evening, in the habit of visiting his turnip patch in a small clearing some distance from our camp, and that if due caution was observed we might get a shot at one. When we reached the clearing just at dark, we could see no signs of deer, and concluded we were doomed to disappointment, when at the further end of the clearing we heard a crash and caught a glimpse of a deer bounding into the underbrush. I fired at random in its direction, and it disappeared. On reaching the spot, however, we found that in some unaccountable manner I had managed to kill a beautiful buck.

As we couldn't use this venison on account of breaking camp the next day, we disposed of it to one of the settlers.

We were informed that the prevailing method of stalking the deer in the more open woodlands in this region was for several to unite, some to station themselves in the known runway, while the others beat the dense underbrush in hope of starting the animal. The fortunate sportsman into whose beat the deer strikes, has no intimation of its approach except the crash which precedes his appearance; and the hunter must be quick and sure in his aim if he brings down his game.

Small game, such as rabbits, squirrels, "pine grouse" and partridges, we found in great abundance, especially the two latter. We found no sport in shooting either of these birds, however, as they were so abundant and so tame that they would simply run a little way, turn and watch us, and allow themselves to be shot without attempting to fly.

During the winter the settlers say the cold is often intense, the thermometer not infrequently registering sixty degrees below zero. There is but little wind, and the air is exceedingly dry, consequently the intense cold produces but little inconvenience to those exposed to it.

Hunting during the winter is, for several reasons, often attended with less difficulty, and greater success, than during the fall season.

One trip in a buckboard over the usual wagon road of this northern region would convince one of the truth of the assertion made by the settlers as to the absence of "ague" in this swampy region. They say the reason is that in traveling over these roads the "shakes" received is so great in comparison to the "ague shakes" that the latter clears out in disgust.

These roads are constructed by cutting a strip through the pines and laying the logs, which measure perhaps a foot in diameter, close together, side by side, with a big "bolt" between each one. They are, in fact, identical with the famous corduroy roads, so often seen in the dismal swamp regions of Virginia and Carolina.

To the fishermen, these northern lakes are a veritable paradise. So abundant are the finny species that the settlers look with disgust upon the pike and pickerel which in more southern waters are esteemed so highly.

As those familiar with camp life know, one after a time begins to hanker for fresh milk to sweeten the coffee. This was preeminently the condition of things among the members of our crowd, and so the boys determined to alleviate their sufferings in this direction if possible by milking one of the settler's cows they had seen running around loose not far from our camp.

The same day this decision was reached, I happened to be going along one of the lumber jack trails, and saw a most comical sight. Three of the boys had captured the settler's cow, and one was holding her with all his might by the horns and another had her by the tail, while the third was making a vain effort to milk her. But she was farrow, and consequently would kick and hist up behind every time an effort was made to induce her to give down the lacteal fluid. Finally they had to give it up as a bad job, but not before we had made a sketch of this laughable performance, which, however, we were careful not to show the boys, as we knew only too well what the consequences would be if we did.

CLEMENT L. WEBSTER.

Natural History.

Coahoma's Snakes.

Editor Forest and Stream:

I will submit my final notes on the rattlesnakes by way of obituary, both being now defunct.

On December 26, at 10 o'clock A. M., the temperature being then twenty-three and a half degrees, the snakes were found with some power of movement in the neck and upper part of the body. Also a slight protrusion of the tongue was observed, betraying some degree of consciousness remaining. During the day, with a maximum temperature of thirty degrees, the larger snake having been stretched out into a hoop shape, managed to resume the customary position of repose in a coil.

On December 27, with a temperature of twenty-two degrees, they were again observed and again showed a slight power of movement, though the manifestation was very faint. I had taken the larger snake out from under some gunny sacks and straw, and thinking he would get some sunshine during the day, he was left exposed, where he remained forgotten during the following night, with a minimum thermometer reading of seventeen degrees. The following morning I found that the rats that had been fellow prisoners with the rattlers for several months in apparent harmony, had attacked this snake's lower jaw, and had eaten the flesh away from the jaw bones. The snake seemed then completely inanimate, so I laid them both out on the floor, picking them up in my hand, and severed their heads with a hatchet Both bled freely, and the two or three inches of neck remaining attached to the head of the smaller one was found half an hour later curled around so that the stub end nearly touched the head.

The larger head was dissected by Dr. J. W. Gray, the object being mainly to locate the poison glands and the exact position of the poison sacs. We were unable to locate the glands that secrete the venom. The poison sac is contained mainly in the cavity of the bone enlargement to which the base of the fang is adherent. I say adherent to the bone enlargement because there is reason to believe that when the old fang is displaced to make way for a new one, the plane of severance is between the base of the fang and the bone enlargement. The perforation through the fang for the ejection of the venom does not extend through its base and into the bone cavity that contains the sac; but there is an orifice through the wall of the fang just above its base, on the outside of its line of curvature, in a position similar to that of the "vent hole" of a cannon with reference to the breech. This organ is so enveloped in loose folds of fleshy matter that it is difficult to discern the relations of the poison sac to the orifice at the base of the fang; but it (the sac) must necessarily project outside the bone cavity, and fold over so as to embrace the orifice.

It seems a singular coincidence that the half dozen rats that had occupied the box with the snakes for several months, as soon as the latter were removed cut a hole through the end of the box and made their escape. Had this been done earlier the snakes might have escaped also, at least the smaller one.

In dissecting the snake's head the usual assortment of extra fangs were found in varying stages of imma-

urity, in form bearing out the idea that the bony enargement to which the fang is attached is permanent, he fang proper only being removed.

The pet squirrel has grown so fat and dropsical that e has lost all of his agility. He is no longer able to limb up the window facing to get on top of the cabinet vhere his nest is located, but must be helped up. Instead f gamboling over me as formerly, he stretches himself ut in lazy fashion on my arm or knee to be scratched, vhich he enjoys very much, and bites at my fingers to nake me resume the scratching when I quit.

He will not bite through a nut, even a thin-shelled ecan, because he is accustomed to having them broken or him. This I have observed is usual with pet squirels. When a whole nut is given him, after gnawing a litle he hides it with elaborate motions of covering it up vith dirt, after hammering it down with his nose. This norning a round pebble was given him which he treated n the same manner, hiding it in a crack with the usual eremonies.

Mr. Charles Cristadoro, in his commendatory remarks bout the contributors to the Christmas number of FOREST AND STREAM, does me the honor to mention me n a kindly spirit, for which I desire to make acknowldgment, as well for the solicitude he expressed conerning my supposed danger in associating with the ratesnakes in some degree of intimacy. The danger inolved in getting into proximity to venomous snakes is reatly exaggerated in the minds of most people. The ery reason given by Mr. Cristadoro for his prejudice gainst rattlers, that he "all but stepped into the coils of six-foot *Crotalus horridus,*" should have created an impression favorable to the snake, since doubtless it could ave struck him if so inclined. But very many similar pportunities have been neglected by rattlesnakes; in fact, nly a small percentage of such experiences have resulted "snake bites," and those were when the snake had me special provocation, or was in a state of nervous xcitement and alarm. The other incident of the rattles at were not cut off, mentioned by Mr. Cristadoro, I lieve I remember the recital of at the time of the occurrence. Either Mr. C. or some other writer in FOREST ND STREAM whose identity I fail to recall, related such incident several years ago. He was riding along a ad, and seeing a dead (?) rattler extended on the ound with its head concealed in the bushes on the adside, the writer's first impulse was to dismount and t off the rattles. But reflecting that he would soon me back that way, he deferred the operation until he turned. On again arriving at the place it appeared that e snake had crawled away, and his being dead was only semblance.

In this case the writer probably made a narrow escape, the rattles are the most sensitive part of a rattler's natomy, about which he shows much jealousy, and interference with this appendage is quickly resented. Morever, he can double back upon himself with great suddenness and celerity. One might advance his hand within a few inches of a rattler's nose, in front, the snake ing fully extended, without danger of a sudden strike, r the obvious reason that the snake must draw his body rward before he can reach out any further; but it is uite different when it comes to fooling with any part his corporosity behind the head—especially the rattles. It is probable that Mr. Cristadoro was the writer of e narrative referred to, whose facile pen always leaves interesting trail behind it.

I am glad to welcome again friend Ransacker to his ace in FOREST AND STREAM, after a long interval of lence on his part. His latest story, about the coon nt, would excite the risibles of a hypochondriac.

The continuance of the name of Mrs. Llewella Pierce urchill among your contributors, after the publication her very entertaining and instructive book, affords particular gratification to the writer. I have read her lightful book, "Samoa 'Uma," and it is now going the unds among the younger members of my family.

My friend, Mr. Jos. W. Shurter, again throws open the or for a resumption of our little controversy about the rue principle of sport," or "the principle of true ort." I must, however, decline his invitation, as the aders of FOREST AND STREAM have doubtless long since ade up their verdict on the merits of the case, and would obably vote a further disputation on it as "stale, flat and profitable." I will therefore, out of charity for your aders, yield to Mr. Shurter that sort of triumph that is pposed to be so dear to the feminine heart, of "having last word." If, however, Mr. Shurter still insists on ntinuing the controversy, I suggest that he meet me in nt debate on the stump. In that case, I propose that we et on the Fourth of July next on the top of Shasta ountain, where we shall have Ransacker for referee d his coon dogs for audience; or vary the arrangement d make Ransacker the audience with the coon dogs as erees, taking care to have some easy climbing trees reach. COAHOMA.

A Call for Crow Stories.

FOUNTAIN CITY, Ind., Jan. 16.—*Editor Forest and Stream:* Mr. Meacham's note about the cunning of the yotes in catching young pigs reminds me that the ow isn't so slow when it comes to tricks in catching ne. An old turkey hen one day led her young brood o the pasture where the grass was short. A crow ghted within a few feet of them and was at once sed by the old hen, the crow going off as though ppled, and allowing the turkey to keep within less n two feet of him. When the chase was some fifty ds away from the young ones, the crow flew quickly k to the young ones, picked up one and was off to woods with it. I don't know much about coyotes, if the crow can't give him cards and spades and t him, the coyote will do. As this is a closed sea- on game, suppose you invite the folks to send in at coyotte and crow stories they may have personal wledge of, just to see which is the cutest. If Satan any imps incarnate on this earth, the crow is one hem, and in all probability the coyote is as well.

O. H. HAMPTON.

Hens and Other Birds.

NEW YORK, Jan. 14.—*Editor Forest and Stream:* I was much interested in Mr. Chapman's remarks on Joseph Addison, of the Spectator, in reference to the hen. It is very difficult to draw the line between instinct and reason in animals. But with the hen—well, she does not seem to have much of either. For of all the fools in the animal kingdom the hen takes the ribbon. Geese, it is said, saved Rome; but who ever heard of a hen saving anything or anybody? "As mad as a wet hen" is an old, old saying, and as completely apropos as any of these old saws. Did you ever throw (I mean in your boyish days) or see thrown a pail of water over a hen? Great Scott! how she can scold. With vociferous vituperation in hen's billingsgate she can discount the most obstreperous Xantippe.

The query has often been raised in my mind as to how birds carry their young. During the last season I watched for some time from my window an English sparrow in her endeavor to get a young one down from a limb near her house to the ground. One of the youngsters had reached terra firma in safety, but the other little one seemed to be a pusillanimous coward, and in vain did the mother coax or threaten the youngster to make the trial. It was afraid to launch out. After a long and it seemed a very serious talk the hen dropped to a limb a little lower down and from there called back, then flew back to beside the little coward, and finally, almost pushed off by the mother, it dropped to the lower limb, and shortly after having gained courage reached the ground. Now, I suppose it was instinct that taught the mother bird that the pinions were sufficiently developed to make the descent in safety.

I was once a July woodcock shooter. I am not now. About the middle of July, some years ago, I brought down one of these splendid birds (splendid in October), and when I came to pick it up, I found a little downy thing clasped tightly to its breast between its feet. The chick could not have been more than a few days old—one of a late brood. But that settled July shooting for me.

I remember once when a boy we had a woodduck that nested in a tree in a swamp through which was a running brook. The hole in the tree was some forty of fifty feet from the water. From a tacit understanding these birds were never molested by us. The only clear place where we could view the nesting place was across the creek some ten or twenty rods (we used to measure by rods in those days), and many days we boys watched to see the ducklings come out and see how they would reach the water.

One day our patience was rewarded to a certain extent. While the mate sat on a limb beside the nesting, the duck suddenly appeared from the hole and launched toward us, striking the water but a few feet from where we crouched, and from here sailing on the water as if always used to it, a wee downy thing. This was repeated until the whole brood was sailing around, but we could not make out for sure how she carried them there. I thought on her back. Some of the boys were positive that she carried them in her bill one at a time.

JACOBSTAFF.

Animals and Electric Wires.

As electric lines increase in extent, says the Electrical Review, the numbers of mishaps caused by animals and birds become more and more prominent. The builders of the telephone and telegraph wires in Mexico first congratulated themselves that the absence of sleet would allow them to economize on the construction, but the ring-tailed monkeys and parrots soon availed themselves of the opportunity to congregate on these lines at night, and a heavier construction became necessary. In like manner, when lines were first built through forests the absence of municipal supervision did not allow the full range of anticipated economies, for the bears, mistaking the humming of the wires for concealed hives of bees, were active in their search for the hidden sweets, gnashing the poles until those of moderate size were severely weakened. And now come the birds to add to the trouble, for the power circuit at Anaheim, in Southern California, was short-circuited by an owl, causing trouble at the power station, and the wires falling upon telegraph wires caused difficulties on those lines.

If the eagles which alighted on wires of opposite polarity in the Fresno power circuits had remained in peace and harmony it would have been better for both birds and plant, but the first blow of a fight caused the simultaneous defeat of both eagles, and the arc short-circuiting the wires made the inevitable trouble at the central station. A heron recently alighted on the power circuit of the Trenton Falls line, a few miles north of Utica, N. Y., and stepping across from one wire to the other, made a burnt offering of himself and trouble again at the central station. Along the Atlantic coast in eastern New Jersey the fishhawks establish their nests on the telegraph and telephone poles, and defend their homes with such pugnacity that the linemen are obliged to carry sheath knives in their belts for defence.

There are numerous instances of rats causing crosses at switches in electric lighting lines, and some of the fires in the underwriters' bulletins have been ascribed to this cause. It is but a short step from rats to cats, and a cat at Lockport, retreating up the pole of a power line to escape from a dog—from the danger she knew to the perils she wot not of—at the cross-arm made a cross from one circuit to the other in such a manner that the arc melted the wire for a long distance, and also caused some difficulty at the power house at Niagara Falls. The use of the expression "bugs" for specific trouble is not entirely of ethical significance, because the insects are an omnipresent difficulty for outside lines. The larvæ of small insects, secreting formic acid, have opened circuits by corroding away the fuses. Hornets congregate on the poles, and indicate their umbrage at the disturbance, when the lineman opens the door, in a most vigorous manner.

N. Y. Zoological Society.

THE Board of Managers of the New York Zoological Society held its annual meeting January 20. Prof. Henry Fairfield Osborn, First Vice-President, occupied the chair. Officers and members of the Executive Committee for the ensuing year were elected as follows: President, Levi P. Morton; First Vice-President, Henry F. Osborn; Second Vice-President, John L. Cadwalader; Secretary, Madison Grant; Treasurer, Percy R. Pyne; Executive Committee, Charles T. Barney, Chairman; Henry F. Osborn, John S. Barnes, Philip Schuyler, Madison Grant, Samuel Thorne and William White Niles. The Board of Managers consists of Levi P. Morton, Andrew Carnegie, Morris K. Jesup, John L. Cadwalader, Philip Schuyler, John S. Barnes, Madison Grant, William White Niles, Samuel Thorne, Henry A. C. Taylor, Hugh J. Chisholm and William D. Sloane.

The Aquarium Committee was re-elected as follows: Prof. Charles L. Bristol, of New York University; Prof. Bashford Dean, of Columbia University; Dr. Alfred G. Mayer, of the Brooklyn Institute of Arts and Sciences; William E. Damon and R. M. Shurtleff. This committee advises on all scientific matters with the Director of the Aquarium, Charles H. Townsend, formerly of the United States Fish Commission.

One of the important results of the year has been the completion of the lion house, which, as it is the most modern of all structures for large carnivorous animals and has been built with the determination to make it the most convenient and best for the animals, the society and the public, is naturally a remarkable building.

It is situated on the southeast corner of Baird Court, and so overlooks the lower Bird Valley, and—especially from that point of view—is a very imposing structure. It is built of buff brick and stone, and is highly ornamented with sculptured stone and terracotta representing large cats, so that it is really a beautiful building. Its main hall is 192 feet long and 28 feet wide and contains a number of cages along its eastern side, while without the eastern wall is a series of exterior cages of large size. The cages within the building are 21 feet deep while those without vary from 24 feet to more than 42 feet in depth. The total length of the building is 240 feet and its width 110 feet. In general architectural style it resembles the other building in the park.

There are 12 of the interior cages, six of them 18 by 22 feet and six 12 by 22 feet. The larger ones are for the use of the best lions and tigers and for families of young, while the smaller ones are to hold leopards, jaguars, pumas, and smaller cats. The floors of the cages, which are three feet above the floor the visitor stands on, are of strips of maple set on edge. In each cage there are two sleeping dens, which can be cut off at any time from the outer cage. Above the sleeping dens in each cage is a gallery for the inmates, reached by stumps of trees, cut so that the animals can ascend them. The floor of the balcony is five feet high.

An important change in the ordinary method of confining dangerous animals is seen in this house. The ordinary lion cage is fronted by heavy iron bars, but here a woven wire netting takes the place of bars and of course gives a much more pleasing effect. The mesh of the netting is three inches square, but the wires are so strong that there is no possible danger of the animals breaking out, since each horizontal wire has a tensile strength of 4,500 pounds.

Through this wire screen these dangerous animals can be seen just as plainly as the buffalo or the deer in the outdoor paddocks can be seen through their wire fences, and the improvement is very great.

The wires, all the iron work, and the tiling at the back of the cages are a dull green color, which sets off the animal and makes it clearly visible.

The outer cages for the use of the animals in summer will be fitted up between now and the time when the lions and tigers can be turned into them with rock work, tree trunks and other accessories, making a playground for these great cats far more attractive than is had by any other assemblage of captive felines in the world.

Within the lion house is the studio, a large and well-lighted room at the north end of the building, large enough for twenty artists to work in. Here has been built a cage 16x20 feet deep, and to this cage may be transferred by means of the transfer cage and over the railway running out of sight beneath the building, any animal that the artists may wish to paint.

A Tragedy in the Lion House.

From the (New York) Zoological Society Bulletin.

THOSE who are responsible for the care and management of wild animals in captivity are constantly reminded that it is impossible to know what deed of violence an animal is liable to perform until it is actually done. Often the cunning of a caged animal is past finding out, until the event occurs. Then we are all post-mortem philosophers. As a particularly striking and painful instance, take the case of "Lopez," the jaguar.

From the day of his arrival at the park, last May, "Lopez" has never been one of the snarling kind. On the contrary, he constantly manifested what was considered a playful disposition. Most large felines of savage disposition show it by snarling and charging against their bars. "Lopez," on the contrary, seemed anxious to play with anyone who came near his cage, and had a trick of rolling on his back, with his paws in the air, quite after the manner of a good-natured house cat.

In Hamburg, a female jaguar, very nearly full grown, was purchased as a cage-mate for him. "Lopez" was the first animal placed in the first finished cage of the new Lion House, weeks before the workmen had completed the other cages. Inasmuch as the female had been six weeks in her traveling cage, and sadly cramped for room, it was decided to place her in the Lion House without delay. In order to ascertain the temper of "Lopez" toward her, her cage was raised to the level of his, and the two were placed with their bars in close proximity. "Lopez" was greatly interested by the stranger, and attempted to play with her through the bars. She observed him without any manifestation of fear, and seemed to be interested by the prospect of a larger cage and a companion in captivity.

For two days the female's cage stood in the position described, and during all that period "Lopez" manifested not the slightest ill-temper or displeasure toward the new arrival. At the end of that time the director held on the spot a consultation with the keepers, and it was agreed that it would be quite safe to admit the female to the cage of "Lopez." The doors were opened, and without the slightest fear or hesitation the female jaguar walked into her new home.

Instantly the whole nature of "Lopez" changed—or rather his real nature came to the surface. His scheming for an advantage had been successfully carried out. With a savage growl he rushed upon the unsuspecting female, seized her by the right side of the neck and held on, biting savagely. From the first instant the female seemed utterly powerless. With an iron scraper and a hardwood pole ten feet long "Lopez" was beaten over the head and prodded in the face; but he only shut his eyes and tightened his grip on the neck of his victim. In the midst of his punishment he rose from the floor, carrying the female in his jaws as a cat carries her kitten, and walked to the opposite side of his cage. It was nearly a minute before the savage creature was forced to quit his hold and resist the attacks made upon him by the keepers. When he released the female she lay upon the floor motionless, and in two minutes more was quite dead.

At first it was supposed that one of "Lopez's" canine teeth had penetrated the jugular vein of his victim, but the autopsy made by Dr. Blair revealed the astonishing fact that two of the neck vertebræ had been completely crushed, and the spinal cord penetrated by fragments of bone. The injury was inflicted by a square bite, with no wrenching, and the murder was fully premeditated. As an exhibition of the terrible strength of the jaguar's jaws it was quite as astonishing as it was unexpected and shocking. As a consequence of this act of treachery, "Lopez" will live in solitude the remainder of his life.

The Onondaga Lake Squid.

A SPECIMEN of the squid recently taken from Onondaga Lake, New York, to which reference was made in FOREST AND STREAM a few weeks ago, was sent to Prof. A. E. Ortman, of Princeton University, and by him identified as a common species of our North Atlantic Coast.

Illex illecebrosus is from twelve to fourteen inches in length. It is abundant from Cape Cod to Newfoundland, but is found south of that range only rarely. It is extensively used for bait.

Prof. Ortman finds it difficult to believe that this species lives in Onondaga Lake, and suggests that it may have been taken thither to be used as bait there. This may be true, but hardly seems probable.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

The Killing of My Big Moose.

My hunt with Harry Braithwaite was pleasant from start to finish, thoroughly fine in every way, but of course the crowning event was the killing of my moose.

We reached Grove Lake Camp Friday night very late and very tired.

No sun arose the next morning, daylight only preceded a drizzling rain that was far from pleasant. The morning was spent by us in a trip down the "Deadwater" to the scene of a terrific fight between two big bulls (this is another story, however), and as the mist continued I rather expected we'd spend the afternoon in camp, but Harry was as keen as I and the result was our starting for Grover Lake as soon as we had our lunch.

When we found the canoe we discovered a bear had found it first. It was a question for a time whether it would do any more work for us, but Harry's ingenuity soon got it in "usable" shape and off we started.

For the first time I left my camera behind. This I soon regretted, for the mist stopped and the first turn brought us in sight of a young bull in the lake eating pond lilies. We got quite close to him, amply so for a good photo before he got on to us and decamped. We skirted the south shore of the lake, Harry calling caribou from time to time, but with no success. The mist had stopped for only a few moments and had gradually gotten heavier until now it was a steady down pour of actual rain, but after reaching the farthest point and turning back along the other shore, Harry gave a moose call, which was quickly answered. "It's from a small barren off this shore," said Harry, and to shore we paddled. I held the canoe under a leaning spruce and Harry took the trail to the barren to investigate. He soon returned quite wet and reported nothing in sight but a calf. After going a half mile further he gave another call and instantly got an answer. We both knew from the sound that it was a big bull. Straight to the shore we went and hopped out on to the barren and made ready for His Majesty. A large deadwater came into the lake here, and across the outlet was a beaver dam, over which the water poured freely. We were at the west end of this dam and on a wet bog where we had to watch every step, for the holes seemed bottomless. Our moose came on slowly. As he came he grunted occasionally, but so mildly and peculiarly that he fooled Harry completely, and he actually concluded the bull was across the lake. "No," I said, "he's out there, I'm sure." I couldn't explain his peculiar grunting, but I was sure he was out on the other barren. We scarcely breathed, but at last I got a glimpse of a horn and motioned so to Harry. Then we saw the top of his horns. Still, we could be sure of neither their size nor shape. So there we were; patience alone could help us. He was motionless; seconds became moments, and it seemed to us that moments became hours. Finally he moved again. Now we could see head and horns but nothing more. His head was up and nose advanced, so we could determine nothing yet as to size and shape of the horns. After motioning me not to move, Harry slipped to one side, filled his horn with water and let it filter through his fingers, and then with the horn imitated the splashing of a moose walking in the water. This brought him. Into sight he finally came, his head and horns and part of his chest. "It's a great head," said Harry.

The moose was behind a thicket of spruce. It was close work, but with every nerve in tune, I took careful

HARRY BRAITHWAITE.

aim as I could through the trees and cut loose at his cheek. He was still an instant, then wheeled. "Give him another," said Harry (yelled Harry, I mean). I could not see him at all, but running a few feet to the left got a sight of his shoulder, and with a hasty aim let him have another. Off he started and out of sight again, but slowly. "Run over to the beaver dam," yelled Harry, that's the head of the season. "We'll mire," I cried. "Let me go first," yelled he. "No," I said; "I can stand it if you can." And off I put on the run expecting to go up to my neck every step, but got over safely, although just

THE TROPHY OF THE HUNT.

as I reached the other shore my right foot sank into a beaver hole, and heels over head I went, but held to my Holland, and on to my feet and off again, and soon we were in sight of the big fellow, standing perfectly still and glaring at us. "What a head!" we both shouted in the same breath. Instantly I gave him another bullet just behind the shoulder. He did not even wince. "Give him another," said Harry, and I did. We both saw that more lead was unnecessary; in fact, he was then dying, and the last two were wholly unnecessary. But big moose are scarce and cartridges cheap. "Ah!" said Harry, "that's the head you want, Mr. DePauw," and it was.

He was an immense brute; next to an elephant the largest live thing I have seen. Around he writhed in his death agony, tearing down small trees, his eyes green and glazing, blood flowing from his mouth and sides—and how he did try to get at us! He fought to the last second. No gladiator ever made a braver fight, and we could not help feeling sorry for the brave fellow. He died on his feet, his eyes sank into his head, and when he went over he had already breathed his last. His legs were stiffened before he toppled and stayed perfectly straight. He fell so we could manage him, and so excited were we that we skinned out the neck, cut off the head and got it into the canoe, and put off for camp a proud and happy pair.

Harry is very honest in his measurements, for with his foot rule he figured the head out at 59½ inches, but when we got it to camp and put my five-foot tape on it, we found it over 62 inches. At Fredericton Mr. Flemelling, of the Crown Lands Department, measured it 62½ inches, and told me it was the largest head he had ever measured. He not only had a big head, but he was a big brute every way. As his legs were set, I could measure him accurately, and he was from bottom of hoof to point of shoulder over 7 feet 1 inch. The head was 32 points; the left horn, which is the largest, measures 12¼ inches around the burr and 18 inches across the blade, and the blade is 40½ inches long, the scalp is perfect and there is a fine bell; in fact, it's a beauty head in every way.

In thinking over the events of the day that night I became satisfied that the first bullet I fired at the Jumbo moose must have hit something else before it hit him, the hole in his chest was so much larger than usual; so I went up with the boys after breakfast, when they went to dress him out. I found it just as I surmised, the ball went right through the center of one small spruce tree and it cut the sides of two others. As the bullet held together, this made its effects the more terrible. The second bullet grazed two trees also, and to our surprise we found it had smashed his shoulder. We saw no evidence of it at the time.

It's now quite clear that the first bullet killed him and the others were really unnecessary.

How cunning these old bulls are, and how they contrive to hide themselves. At first I supposed it was chance that always made them stop in such protected positions, but after watching two bulls approaching each other one rainy evening, I found there was no chance about it. It was all a matter of the most careful calculation.

It was only after all was over that we appreciated one ludicrous incident which is worth repeating.

When I fell after crossing the dam I made a complete summersault, and on regaining my feet I found myself facing a cow moose that had accompanied His Majesty. She had, of course, heard the rifle shots but had seen nothing of us until I rolled into her presence. The expression plainly visible of her astonishment and alarm was so laughable that we both had many a chuckle over it. It is needless to say that she immediately had business elsewhere, and if she kept up the pace at which she started, I'm sure she got there quickly. DEP.

The Maine License Plan.

MELROSE, MASS., Jan. 12, 1903.—*Editor Forest and Stream:* It is rather hard for me to understand why anyone should criticise so capable and efficient a board of fish and game commissioners as that of the State of Maine and yet not have sufficient courage to sign his name to the article. While there is some truth in a very few of the assertions W. H. B. makes in FOREST AND STREAM of Jan. 10, his insinuations about the commissioners are entirely unwarranted by the facts. Venison may be, and no doubt is, served at times out of season on the tables at some so-called sporting camps. The assertion that it is done "by the tacit consent of the commissioners" is simply untrue.

I have visited Maine annually for some twenty years and previously lived there. I have fished and hunted all over the State and there is no town or city of any size but I have visited. I have met many of the guides, am acquainted with quite a large number of the residents, have a personal acquaintance with one of the commissioners, and write from my own observation and knowledge. If W. H. B. had been so thoroughly posted on this matter, why did he forget to mention some of the proprietors of camps and hotels who have contributed from $40 to $500 to the State in the way of fines? At a very little or no trouble to himself he could have learned some of these facts. If I am not much mistaken in the party, he has a personal grievance rather than a sportsmanlike interest in this subject.

Human nature is essentially the same everywhere. Maine wants to protect her game, save her own money and reap the harvest of coin annually from the visiting hunters and fishermen. The sentiment of most of the residents expressing any opinion is that the visitors should contribute a good round sum to the fund for game protection, rather than that they should give up any of the shekels they receive. Now, as every visitor to the hunting and fishing regions is put to an expense of from $50 upwards, all of which nearly goes to the guides, hotels, stores, and transportation companies, it would seem to be reasonable and just that these beneficiaries should contribute a share of their spoils to game protection funds. It is hardly to be expected that the farmers and lumbermen would be very enthusiastic over a tax which does not benefit them directly, and of course they favor putting it on the visitors or any old thing so long as they escape. Unless the commissioners can have more money to use for protective purposes, decent hunting in Maine will very soon be a thing of the past. They should have at least eight or ten wardens to patrol the boundary line and visit the lumber and sporting camps, where they now have only two, and for a part of the year only at that. While I am not in favor of the license plan, yet I can readily see the need of more money for wardens, etc.

If writers like W. H. B. want to contribute their ideas they should try to be fair and just to all parties interested. And then, if hunting is so good in New Hampshire, why not stay at home to hunt rather than visit Maine and then go home to abuse people and purposes he so evidently knows nothing about? There is so much to be said on all sides of this subject that I will not trespass further on your valuable space. Maine will settle this question regardless of such contributions to the sporting papers. If they don't make that license too big, I shall go again this year and "here's hoping" they won't.

FRED H. ROUNDS.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

A Dream that Did Not Come True.

REVERE, Jan. 3.—*Editor Forest and Stream:* Shortly before leaving Boston on my annual trip to the woods, my wife had a dream. She dreamed I was chased by a wounded moose and trampled to death. She has wonderful dreams at least once a year. She felt sure that something was going to happen if I persisted in going. She urged that "so many men were shot by careless hunters," etc. I listened very meekly to her pleadings. Then, to prove to her how deeply I was moved, I began to pack my grip for Maine. As it fell out, I not only escaped being kicked, but did not even see the track of a moose.

Frank Guntner and Ralph Supplee, of New York, were my chums on the trip. We arrived at Grindstone on the Bangor & Aroostook road on October 28 in a fierce rainstorm. Bert Fiske met us at the station with a buckboard and a lively pair of colts for a six-mile run over a muddy course. How the mud did fly on that wild ride! We did not turn out for rock or hollow, but plunged wildly on through the blinding rain and mud.

We had several narrow escapes from being tossed into the bushes that fringed the road. But we did not mind little things like that, for we were in the promised land. We found a warm welcome and a smoking hot dinner awaiting us at the farmhouse, and were soon in an enjoyable state of mind.

Al regaled us with stories of deer and moose while we were eating dinner, and we were anxious to get into harness and try our "unerring aim" on the light-footed tenants of the woods.

It had rained for a few days previous to our arrival, and the woods were soaked. Pools of water were on the ridges and in all parts of the woods, and the footing was very bad.

We wore the low moccasin and three pairs of socks, but we were soon wet through and had to return to the house.

On the third day of our stay the thermometer dropped to the freezing point. Then our hunting stopped. One could not get in sight of a deer, owing to the ice and frozen earth and leaves. We tried sitting down and waiting for them on the ridges, but beechnuts were scarce this year and the deer were not working on the ridges. They seemed to keep to the swamps. And you would soon find your teeth chattering and your knees knocking each other after you had sat for two or three hours. We found plenty of signs, but failed to get near enough to see game.

Frank had brought small traps with him, and had an enjoyable time catching minks and musquash. He got one mink that he thought making a pet of. The mink would allow us to stroke his back and head and appeared to be satisfied to live a civilized life. Frank contemplated presenting him to the Zoological Park in New York. But the mink changed his mind one day and buried his teeth in Frank's thumb. I pried his jaw open with my knife, but the mink took a new hold and his keeper howled with the pain. We finally freed Frank, and he will not again attempt to play with a mink.

Al went out one afternoon to wait for a deer to show up. He heard a wildcat calling, and decided to try and bring the cat up to him. He uttered an unearthly howl, as near alike to a cat's as he could, and waited. After a minute or two the cat seemed nearer. Al repeated the soothing sound, and in a short time the cat came up to the log on which he was sitting. He covered his new arrival with his gun and waited to see what would occur. The lucifee's eyes snapped fire, and she advanced right along the log to within fifteen feet of the sitter. Al did not care to have an argument, so he pulled the trigger and dropped the feline. She only weighed eleven pounds, but looking at her claws and teeth one was forced to conclude that she could make things warm for an unarmed man. She certainly would have sprung on to Al in less than a minute if he had not stopped her.

Ralph, being a green New Yorker, we determined to have some fun with him. We arranged that Frank and he should go to the spring for water after dark. Frank took a shotgun and Ralph took the lantern and pail. The lucifee was placed in the bushes and Frank was to fire at the object he saw near the spring. The choppers at the house were let into the deal. The boys went to the spring and shortly after we heard the gun. In a few minutes Ralph burst into the kitchen holding the monster by the neck. He was almost breathless as he recounted the story of the mixup with the cat. He "saw its eyes flash as it gave a mighty spring fully twenty feet into the air. Then he dashed into the bushes after it and plunged his knife through its neck two or three times." Frank did not want the skin destroyed, so he dragged him off before he could do any more damage.

As Ralph was telling his story, the boys began to smile, and finally the worst of them had to turn their faces to the wood-box to conceal their blushes. He wondered why the body felt so cold when he picked it up, but Frank told him it was a cold-blooded animal, and he appeared satisfied with the explanation.

The conditions for good hunting remaining bad, we decided to start for Hinch's camp, which is about three miles from the house. Upon arriving there we were confronted by the same scarcity of visible game. Tracks and signs were plenty, but nothing to be seen. It was the worst hunting season for us of any of our trips.

Ralph had a struggle with a hedge hog, and came out on top, but not on top of the hog.

We found plenty of partridges, but we were not shooting partridges in deer country. They are so tame that you often can knock them over with a long pole.

Frank was the lucky one of the party. He found a doe feeding in the field near the house, and after she had given a few bounds towards the woods he dropped her just as she was passing from view. He shot a buck while running through the hardwood, and tracked him by blood spots on the leaves, finally discovering him dead.

About the middle of November we had a fall of snow and all hands felt jubilant. G. J. Brann and his young son joined our party on the eleventh of November. Mr. Brann is an old-timer at deer hunting, and the snow made his heart glad.

The snow ceased during the afternoon. A slight amount of rain and hail set in, which soon formed a hard crust over the snow. Then our spirits sank way down. No use in hunting under such conditions. I remained three weeks and the hunting was discouraging during all of the time. Brann hunted for nearly three weeks and failed to get near anything. His youthful son had better luck, for he shot two small bucks. Funny, is it not, how the youngsters get ahead of us old codgers at times? My boy got two last year while I failed to score.

Although I have visited Maine for three seasons, and have failed to shoot any deer, yet I have found something of far more value than deer meat.

I have found health and strength in the pine woods. I have imbibed courage and vigor from the pure and invigorating air. I have been taught many lessons from the humble but vigorous people of her woods. They are without many of the advantages that city people are burdened with, yet they would not change places with us. They are their own masters. They care not how high prices soar on food or fuel. The mighty woods furnishes meat and fuel for them. They can sit easy when winter storms howl around their doors, for their cellars and bins are full. They are not compelled to struggle with the toiling mortals of congested centers. They are not pushed and jostled by the nervous workers of life. They go along quietly and contentedly with their faces showing health and vigor, while worry and discontent are indelibly stamped upon the visages of our city toilers. They have no costly temples of religion to sit in and hold communion with their fellows, but they have the temples erected by no man, God's everlasting woods and mountains. They can look up "through Nature to Nature's God" and find solace and content.

In Nessmuk's "Woodcraft" I find the following forceful lines:

"For brick and mortar breed filth and crime,
With a pulse of evil that throbs and beats;
And men are withered before their prime
By the curse paved in with the lanes and streets.

"And lungs are poisoned and shoulders bowed
In the smothering reek of mill and mine;
And death stalks in on the struggling crowd—
But he shuns the shadow of oak and pine."

I would therefore urge all who are tired and heavy laden to go to the woods. Go in the springtime, go in the summer or go in the winter. Mother Nature has her arms extended always to greet you. Tired brains and muscles will find rest and renewed life in her turbulent brooks and silent paths.

Cast yourself out from civilized life at least once a year. Throw away books and papers; cut the line that connects you with the busy life of cities and towns, and you will soon find the spring of eternal youth.

JAY PEE.

Massachusetts Association.

BOSTON, Jan. 18.—*Editor Forest and Stream:* The annual meeting of the Massachusetts Fish and Game Protective Association for the election of officers and other business was held at the Hotel Westminster on Wednesday evening, January 14, when about sixty members gathered about the tables and partook of an excellent dinner.

The report of the treasurer and of the fund committee showed the association to be in good financial condition, and the officers whose names had been presented at the December meeting were favored with unanimous election as follows: President, James Russell Reed; Vice-Presidents: George W. Wiggin, C. M. Bryant, William S. Hinman, Heber Bishop, M.D.; Dr. A. R. Brown, Salem D. Charles, C. H. Moulton, J. T. Herrick, M.D.; Benjamin C. Clark, Robert S. Gray, Edward J. Brown, George H. Payne, M.D.; Dr. B. V. Howe, A. B. F. Kinney, A. C. Sylvester, Dr. D. S. Woodworth. Secretary and Treasurer, Henry H. Kimball. Librarian, Dr. E. W. Branigan. Executive Committee: J. N. Roberts, Heman S. Fay, Dr. Maurice H. Richardson, Loring Crocker, N. Leroy, C. W. Dimick, John C. Phillips, Rollin Jones, A. C. Risteen, George H. Moore, H. H. Hartung, M.D.; C. B. Corey. Membership Committee: Thomas H. Hall, Waldron B. Hastings, Richard V. Joyce. Fund Committee: Geo. W. Wiggin, William S. Hinman, Adelbert D. Thayer.

During the year 1902 the association has lost many valuable members by death. Among them Ex-President Col. Horace T. Rockwell and Mr. Charles G. Gibson, of the executive committee. A committee of which Vice-President A. B. F. Kinney was chairman presented resolutions upon their death and Ex-President Benjamin C. Clark made the following report on other deceased members:

"The Massachusetts Fish and Game Protective Association, at this, the first meeting of the new year, desires to place upon its records the heartfelt expression of its sense of loss in the removal by death during the past year of the following members:

"Joseph B. Glover, the generous, sagacious and high-minded merchant of the old school.

"James H. Jenkins, one of the last of the old master mariners and possessed of their admirable characteristics.

"Warren Hapgood, a practical sportsman to the end of his long life and always a loyal friend, seeking occasions of service.

"Daniel T. Curtis, one of the charter members of the club and one of its most genial and useful friends.

"Charles F. Sprague, a liberal, public-spirited man who was always found faithful in every position which he was called upon to fill.

"With the exception of Mr. Sprague, all of these gentlemen lived far beyond the limit of ordinary life, but without exception they were all men upon whom our association could count in every exigency and whose many kindly qualities of character were equalled by their faithfulness in the discharge of every duty."

Mr. Glover was a life member; Messrs. Jenkins, Hapgood and Curtis were honorary members.

Mr. Sprague, when a member of the State Senate and afterwards as a member of the National Congress, was an earnest worker for protective laws.

Col. Rockwell was active in efforts to protect smelts even before our association was organized. While president of it he was vigilant in looking after its interests, and ever since he retired from the first office, serving as a vice-president, he has rarely missed a meeting of the association or of the board of management.

The question naturally arises, who will fill the places of all the good and true men whom the association has lost the past year? Yours truly,

HENRY H. KIMBALL, Sec'y.

The Cuvier Club.

THE annual meeting of the Cuvier Club, of Cincinnati, was held Jan. 10. The officers elected were: President, Alexander Starbuck (which makes his eighth term in that office); First Vice-President, J. M. Doherty; Second Vice-President, Henry Hanna; Third Vice-President, P. Roach; Trustees, to serve three years, H. C. Culbertson, George Gerke and E. M. Pattison. The report of Prof. Charles Dury, the custodian of the museum and librarian, showed sixty books and pamphlets and six birds donated. The game warden reported a total of twenty-four cases, of which twelve were convicted, the fines of same amounting to $250; there are also four cases pending. The reports all show a very prosperous condition of the popular organization.

President Starbuck said in his annual address:

"The fish and game laws passed by the last Legislature have, up to the present date, been found to be very efficient, only one weak spot so far having been developed in them. This was, however, of little consequence, it being the rabbit law, which inadvertently permitted having legal possession of the 'cottontail' at any time, though the killing of it is confined to the close season specified, viz, between November 10 and December 2, and at any time when it is discovered nibbling forbidden fruit or sharpening its ivories in the orchard.

"From authentic sources we are satisfied that there has been less violation of the game laws in Ohio the past year than for a long time. Our warden, Mr. Chas. I. Ryan, has made many searches for forbidden game among the market purveyors, clubhouses, hotels, markers and cold storage warehouses. A few days before the open season he made a most thorough search in the cold storage houses and other places, but not an illegal feather did he secure. He was not a welcome visitor, we assure you, and had he been less firm and resolute than he was he would not have been permitted to cross the threshold that led to the icy chambers.

"What we desire our Legislature to do is to correct the rabbit law, discontinue the spring shooting of ducks, give deputy wardens a fair salary so as to insure officials of good character, and a more thorough enforcement of the laws, make an appropriation of $50,000 for the Fish and Game Commission, so as to more effectually carry out the work of propagation in its fish hatcheries, as well as a more vigorous enforcement of the game laws.

"That just such action is needed we have only to consider the terrible destruction to the fish and game that has been carried on for the past ten or twenty years. Look at the depletion of Lake Erie of its finny inhabitants; look at the broad and rippling streams that are the receptacles of sewage and the poisonous refuse of factories; look at the destruction of our great forests that once afforded magnificent cover for the game; look at our green fields and meadows that are tramped by an army of poachers; look at the cold storage warehouses that are rapidly multiplying throughout the States and that enable the market-hunter, as well as the pot-hunter and all that ilk, to dispose of their game at all seasons. In fact, look anywhere and you will soon realize that the traditional goose of the golden egg is to be again slaughtered."

Guides at the Sportsmen's Show.

THE general plan of the Ninth Annual Sportsmen's Show, to open at Madison Square Garden, New York, next month, has been perfected. The arrangement will be not unlike that of last year, in that the center of the arena will be given up to a miniature lake with wooded islands and surrounding camps and hunters' cabins. Several departures from the plan of past shows, however, that it is believed will be appreciated by all sportsmen will be made. The space heretofore devoted to aquariums and game animals will be given up to experienced and reliable guides, not only from Maine and the Adirondacks, but from many sections of the Dominion of Canada, from Montana, Idaho, Colorado and all other big-game and fishing regions of the country. During the past three months Manager Dressel has been in direct communication with reputable guides in all parts of the United States and Canada, and outlining to them his plans for the show of 1903, has asked their co-operation.

"I want," said Capt. Dressel, "to have every hunting section of the country represented at the next show by well posted and experienced guides who know every square foot of their respective districts, and can impart their information to visitors to the show. I want these guides to reproduce, as nearly as possible, their own camps and cabins in Madison Square Garden, and to bring with them as much of their original camp furniture and fixings as will give these cabins a realistic and true-to-life appearance; I want them to bring their game heads, skins, rifles and trophies of all kinds, and if they have any camp pets, such as cub bear, young deer or moose, foxes, raccoons, or other game animals, to bring them along and make them features of their respective camps. There are hundreds of sportsmen who visit our show for no other purpose than that of procuring information that will be of value to them in selecting territory for a hunting or fishing trip for the season ahead. Consequently, the presence of a big delegation of guides will be of advantage to these visitors and to the guides themselves, in that it will enable the latter to establish a new list of patrons, and will insure to visitors the information they are after. To this end I have secured the co-operation of well-known guides from many points in the far West and Northwest; Maine and the Adirondacks will of course be represented; three guides from New Brunswick will be on hand to talk of the advantages of that great caribou section, and I have arranged for a novelty that will no doubt be appreciated by every practical sportsman who enters the Garden, in the presence of a quartette of turkey hunters from Virginia. These men were born to the craft, and each and every one of them can give a dozen or more parties of city sportsmen all the sport they want at the end of a night's ride from New York City."

California Goose Shooting.

DID you ever enjoy a day's shooting on wild geese that stands out prominently in your memory whenever you wish to recall the "shoot of your life?"

If so, it must have been in California, for nowhere else in the world is such sport to be found on this fine feathered denizen of the air, and only in a limited area of that vast State and only during the spring migration can it be found even there. Ex-President Harrison, who enjoyed a goose hunt here years ago, stated before he returned to the East that although he had enjoyed fine goose shooting east of the Rockies, he had never seen anything to compare with it. The sport and the system connected with it, so far as I know, have nothing like them elsewhere.

This State is about 700 miles long and 350 to 400 wide. Its coast line from Crescent City on the north to San Diego on the south embraces almost exactly the same latitude as the Atlantic Coast from Boston to Savannah, or approximately between the thirty-second and forty-second degrees of latitude. And by the way, through a provision of the Constitution which sportsmen hope to see amended this year, and which prohibits any and all special legislation, the game law must apply to the whole State, except in such cases as supervisors of counties may see fit to shorten the open season. Think of trying to have a game law that would be the same for the whole Atlantic Coast!

But this is digressing. The annual southward migration of geese from the Arctic regions where they breed begins in August, and a few scattered flocks drop in to visit California sportsmen during that month. The majority of them, with the young birds, tarry on the lakes and marshes near the Oregon line until the first or middle of September. The great valleys of California are rainless from about the first of May until October, and millions of the geese pass on to Mexico and spend the winter. Many other millions stop at different places in the State and fatten on the grain in wheat fields which is shelled out by the north winds. Their favorite feeding grounds, however, are in Solano, Colusa and Glenn counties, where are found wheat ranches numbering thousands of acres each. Here they are found through the winter, and still more so during the spring migration, in countless numbers. Flocks of them literally cover acres of ground, and such a nuisance do they become to the farmers, eating to the ground acre after acre of wheat, that they employ men who do nothing but shoot geese with rifles and shotguns, to drive them from the grain fields, and even this affords only partial protection, as they come back at night to feed.

The sportsman's enjoyment and the method pursued are best illustrated by a description of a day's shoot by three Sacramento sportsmen, Messrs. Newbert, Brinker and Geary. A three hours' ride on the cars brought them to Norman, Glenn county, where Crump, Stewart and Kagee, three professional hunters of many years' standing and two of whom are considered the best "goose callers" in the State, have prepared grounds and decoys. They found Stewart waiting for them at the station, and were rapidly driven to the cabin for a change of clothes and then taken in a four-horse wagon to the shooting grounds. These are a flat plain, as shown in the illustration. It is sparsely covered with what is known as pepper grass and is full of puddles early in the season, but in March, when the shooting is at its best, is dry. The land is good only for sheep grazing, and is generally known as "the goose pasture."

At the grounds they found Kagee and Crump. Three holes had been dug, two of them about 20 yards apart, for the shooters, and a third, about 25 yards away, for the caller. The holes are about three feet deep, round, and about 30 inchs wide. In these the shooters kneel, places being hollowed out for their toes, in order that they may be as comfortable as possible. All around the edges of the holes are set decoy geese on wire frames. Around the holes are scattered from 150 to 200 dead geese and decoys, also set up on wire fences, besides about 25 live wild geese. The latter are birds that have been crippled and captured and kept in captivity until they became tame; in fact, so tame that they are more so than the ordinary tame goose. They care nothing for the gun, and will treacherously lift up their voices when a flock of their wild brethren approaches and help to decoy them.

Of course, it makes a most killing lure, and the success is proportionate. They are placed in inclosures formed by two very fine nets that are almost invisible to the approaching flocks. The nets are 2½ feet high and 20 feet square, and are held in place by stakes of ¼-inch wire. The geese make no effort to escape, and if one accidentally gets out he tries to get back again. They are taken from the wagon in boxes, which are placed inside the netting and the doors opened and they walk out as if they knew their business. One box is of white geese and they are placed in a net by themselves. The other lot are brant, which are known in California as China brant (Hutchins' brant), and large Mexican brant. The outer joint of their wings has been taken off and they are unable to fly. Stewart has had some of these geese for seven or eight years, and they have never been known to breed in captivity.

Often during the shooting a goose drops dead inside of the net, but they have never been known to be hit by it, and will ruffle up their feathers and show fight. During this shoot a slightly crippled goose fell into the inclosure and as soon as he straightened up he began talking to them, as much as to say, "You got me into this fix." When he had had his say, the others all pitched into him and he had to be rescued in order to save his life.

PUTTING OUT THE DECOY HONKERS.

After the sportsmen were in the hole and everything was ready, Stewart called "Here comes a lead from the west." They hugged the ground closely and he began calling and said: "Get on to them, Betsy." The live geese take up the call and the distant flock swings in, unsuspicious of danger. They change their course and come directly for the decoys. "Lie low," cautions the caller. At the first swing the ycome within perhaps fifty yards and the caller says, "Hold on, they'll swing again." With tense nerves and eager eyes the shooters wait and they swing in between the two holes, not more than fifteen or twenty yards away. Indeed, they often come directly over the holes, so close that the shooter could almost spring up and grasp them. Then comes the command, "Punch 'em," and the shooter delivers his two barrels as well as he can and with a "pump gun" may get in three barrels, but shooting at long range is discouraged.

It seems an easy matter to hit a large bird like a goose at short range, but the holes are small and the shooter cramped, and the best shots in California have found it very easy to "punch holes in the air."

Flock after flock is decoyed in this way, and as the shooters soon learn to remain motionless until the word is given, toll is taken from every flock, and the score mounts upward rapidly. On one occasion during the day 23 geese were killed in 17 minutes. It is astonishing how accurately the callers can distinguish the species of geese in a distant flock by the shape of the flock in flying, and by other indications. The sport went on through the afternoon until dark, when all adjourned to the cabin.

The next morning the sportsmen were routed out early and the wagons conveyed them to the ground before daylight. Geese killed the day before were set out on wire frames again, with sticks to hold their heads up. Some were laid on the ground, their heads held up by sticks, as if resting or dusting themselves, and so artfully are they posed that it is no wonder the wary birds are deceived. "As foolish as a goose," is a trite saying, but if anyone thinks it applies to a wild goose he will soon find himself mistaken, for there is no bird more suspicious until his suspicions are allayed, and the least movement will send the flock off without a shot.

Everything is in readiness by daylight, and the shooters are soon enjoying the excitement again. Flock after flock swings in, decoyed by the perfect arrangement of the decoys, the inimitable calling and the treacherous signals of the live geese, and each leaves its quota to swell the total score. Frank Ruhstatler, of Sacramento, holds the highest record for an individual, having killed 240 in a morning shoot, and one party of four killed over 700 in two days. During one week of this season 2,000 were killed without any apparent diminution of the supply. Holes are dug in other parts of the plain, which extends for miles in each direction, and when the geese become shy of one locality, a move is made to another.

The Newbert party killed 444 geese during the afternoon and morning shoot, and their friends were the recipients of much of the game after they returned. None of the geese are wasted. What the hunters do not care to take home with them are given to people in the neighborhood or shipped to San Francisco, where they find a ready market. The terms are $12 per day, which includes the best of board, cigars and liquors, in fact everything but ammunition. There is a nice cabin, a good Chinese cook and everything is clean and comfortable, and as Stewart and his partners employ three assistants and have their teams to keep, there is but little money in it for them.

It would seem like wanton slaughter to kill so many birds, but the season lasts only about three weeks and the supply is unlimited. The men employed by the ranchers to protect their grain do not bother themselves much about picking up the geese they kill, but of those killed by sportsmen none go to waste. There are very few "honkers" or Canada geese in the spring flight, as most of them have already gone north. The principal varieties are the white-fronted goose, known here as the "speckled breast" or "gray goose," the white or snow goose, the "China goose" or Hutchins' brant, and the Mexican brant, so-called.

Stewart keeps his live decoys at his farm on Grand Island during the summer, where he has about an acre of ground inclosed and offers them "all the comforts of a home."

The illustration shows how the geese and shooters are taken to the grounds and disposed of for the hunt.

ANSER.

Pheasants in Ohio.

IN his annual report for 1902, President Rogers, of the Ohio Fish and Game Commission, says of the imported pheasants:

"Owing to the fact that the General Assembly at its last session reduced the appropriation for the pheasantry at London to the minimum amount required to maintain and to distribute young birds of this season's hatch, it was necessary in the summer to suspend operations, and, therefore, for the immediate future there will be no pheasant raising under State auspices. It is to be doubted greatly whether it is wise to continue the hatching of pheasants, as the reports received by the commission from various places in the State where these birds have been placed are such as to lead to the conclusion that an effort to stock the State can never be a great or even a qualified success. In certain sections the pheasants apparently have done well, and notably in the marshes in Lake Erie in Erie and Ottawa Counties. In other portions of the State the birds appear to have suffered from some cause, and many counties which have yearly received a large quota of pheasants have recently reported that they are extinct. A cross between the ring-neck and Mongolian pheasant, which has been produced at the pheasantry does not appear to be a bird suitable for this climate; either that, or they afford too tempting an object for men with guns or to the predatory animals."

With Rod and Gun.

[From a Staff Correspondent.]

An Hour with Didymus.

ST. AUGUSTINE, Jan. 4.—Anyone visiting St. Augustine for the first or last time, whether in quest of game, fish or any other pleasure, should fortify themselves with a clear understanding of this historical old spot and thus escape the uncanny mixture of local imaginative history. From an historical standpoint St. Augustine, as we all know, has no peer on this continent for interest; the landmarks are here, and many of them show the weight of time, and tell a story of a time in which I am glad I didn't live. Most any local historian in the garb of cab driver can make one's hair stand on end, and thank Heaven he wasn't born a Spaniard with a yearning to be good in those times.

I visited Fort Marion, the old city gate-way, "the oldest" and "next" to the oldest houses. In the Vedder Museum we saw the old fireplace and the old rifle suspended there.

But my visit here was not wholly in search for history. I came here to investigate the conditions relating to the taking of fish and game, and to take some of both if I could. But instead of doing this I visited Didymus.

In a very recent number of FOREST AND STREAM I find an article of much feeling and nicely told, signed Unknown, of which the writer said he wished he had the pen of a Didymus or Hastings and others, and asking what has become of Didymus. I don't blame him; nor is his pen the only thing to envy this sage of the FOREST AND STREAM, this nestor among the best and only true school of lovers of woodcraft. It is the soul within that moves the pen and brush alike in painting on canvas nature's benediction, or on common brown paper a story that we can see. English phraseology can butt against the moss-grown jungles of Florida and the north pole and leave them colorless; it's "the artist" that can give touch and color to a speckled trout leaping through a rainbow or a broken down hayrake; and this is Didymus. I found him tall and erect and clear of eye at eighty-three, active and strong, and ever ready for action. With him I hunted and fished in many lands. My new hammerless guns of improved makes look like foolish things beside his beloved and well used old fox gun of obsolete design, between whose hammers his keen blue eye has shone on victory so many times, and will many times to come. (It was only a slight local affliction soon mended that kept us from the woods.)

In the charming appointments of this home, the many windows where the sun can come in, the hanging of a drapery, the adjustment of pictures, the rugs harmonious, the prettily groomed lawn overlooking the water, presided over by Her who should rule all our destinies, I spent a delightful hour. The best hunting trip of my life was experienced in Didymus's library. It was so real.

It was in St. Augustine, too, that I met Dr. Dewitt Webb, whose love for metaphysics is only beaten by a neck by his love for his pointer Val and his gun. I was obliged to ask the doctor to start a "time factory" so I could join him indefinitely, but we found that "the old fellow with the scythe" had cornered the market.

St. Augustine presents many pleasant inducements for the sportsman. The Magnolia Hotel is as cozy as home. Mr. McDowell is always glad to see the man with gun-looking baggage, and he is equally anxious to further his sport by securing good horses and guides, both for hunting and fishing, and they catch anything there a man wants. A few miles out quail are found; in another direction, a bit further, a bag of snipe can be had. Hunting here is mostly done horseback, which, to my mind, doubles the pleasure of the outing, which can only be made brighter by a call at the Gate of Didymus; and should your bag be a small one, call at the Gate of Dr. Webb, he has a way of cheering one up outside of his medicine chest, and FOREST AND STREAM is always on file there.

Palm Beach and Lake Worth.

PALM BEACH, Jan. 6.—To come to Florida and not visit Palm Beach is like going to France and dodging Paris, and while it is a long way from the Bowery, modern railway service has overcome all obstacles to the extent of a fine hotel on wheels, including the "taking out of a license." The Atlantic Coast Line, or the Seaboard Air Line, picks you up in New York, and in thirty-six hours of sleep and other comforts places you in the hands of Mr. J. R. Parrott, of the Florida East Coast Line, and I am convinced from actual observation that Mr. Parrott spends most of his time on wheels to see to it that all who start for Palm Beach get there in comfort, and he keeps them there as long as they can stay. There is no hardship in the staying; such hotels are the outcome of taste and cash, and one can get anything he wants from the roof to the subcellar in the way of price.

The Palm Beach Hotel, it occurs to me, is in the right spot and in the right hands for the tourist sportsman. Mr. Ormes, the manager, has employed four of the best guides in this important section for the use of his guests, and their motto is "No game, no pay." This includes deer, turkey and quail shooting, and there is a fine line of buzzards always in sight which I find, on inquiry, are migratory, just like people who flock to this modern Eden; with the departure of the winter guest, so goes the buzzard, his taste for a chosen branch of society is manifest. In crossing Lake Worth to "The Palms," at West Palm Beach (a charming home-like place presided over by Mr. J. C. Stowers, our postmaster, who is in close touch with the game country and providing men to show one where and when to shoot), I saw hundreds of wild ducks always within gun range; in fact, so tame that they are fed on both shores alike, but are not shot within two miles of White Hall, the palace of Mr. Flagler. Fish of many varieties are taken here, just out of doors; and two miles back from West Palm Beach you want to load your gun, for deer and quail and turkeys are found in goodly quantities in this locality, and the pretty gun cases are becoming more numerous every day. In other words, the southern flight of a lucky people has begun, and the sweet strains of orchestra and voice are heard when the stars in a southern sky are the brightest. I venture to say that there is no other place on earth where the canvas hunting clothes and the swallow-tail coat are used to so finished a purpose in the same given space—plunging through a Florida jungle at five, from victory afield to heroic efforts of another sort amid the glimmer of modern, well-gowned society at six. Dear Palm Beach, you don't belie your peaceful name. Surely your lot is a graceful one.

Along the East Coast of Florida.

SEABREEZE, Jan. 10.—At Miami everybody goes fishing, and every incoming train bears evidence in the baggage car that the catch will be great; yet each year the supply of fish lingers there in undiminishing numbers.

Those who have never fished before get the fever here, and go away seasoned anglers. It may be possible that Congressman J. W. Babcock, of Wisconsin, has been a fisherman for many years, and his wife, too; but be it as it may, they have gone at it with increased energy this year at Miami, with the kingfish as their specialty. Each day finds them afloat, and each night ashore radiant with success; and while the kingfish seems to please, amberjacks (21 pounds), mottled groupers and black groupers find a place in their trim launch, with Mrs. Babcock a close second in her share of the catch.

At Rockledge I found a place to live, a place to shoot, a place to fish and a place to dream. In breaking camp here one is pulling at the tender cords that bind. Rockledge is situated on the Indian River, halfway between St. Augustine and Palm Beach, on the Florida East Coast Line, in the heart of the famous orange groves which have made the Indian River known the world over—since which time this pretty body of water has become recognized on account of its own beauty, its broad expanse of water and tropical shores.

Here is the pretty Rockledge Hotel, and landlord Shares, who will be found ever ready to help the sportsman secure a full measure of the good things Rockledge has to give the searcher for sport.

I stepped out of the hotel at six A. M. and found Boatman John Moore nearly ready for me, pushed out into the river, and in five minutes was blazing away at broadbills. Returned at seven thirty, dined with her who sweetens our coffee with sugar and smiles, and with her pushed off shortly afterwards trolling for trout. Returned for lunch with eight spotted beauties, weighing from 2 to 3½ pounds each, and only the shortness of time kept me from going after channel bass in the afternoon, black bass in the lake next morning, quail shooting on Merritt's Island in the afternoon, duck shooting on the Banana River next day, and repeating indefinitely this appetizing programme. Here I found established for the winter Mr. Fred J. Simmons and his charming wife, of Detroit. Mr. Simmons has his own launch and boat house, and is particularly generous to the rod and gun visitor. Mr. Chas. A. Paescke and family, of Milwaukee, stopped there for a few days and was still fishing when I left. Judge Neushafer, of New York, is here, and has made his own trail from the billiard-table to his boat and back; the judge plays billiards well, only because a billiard cue is so much like a fish rod.

I, however, wanted to visit Seabreeze further north, and other places of interest in Florida; and, too, in a given length of time; so I pulled out for Daytona. Just across the Halifax River, on a narrow peninsula, overlooking the ocean, is Seabreeze, happily chosen spot, appropriately named. The Colonnades Hotel is here with its pretty lawns, long sun parlors, cheerful office with its big open grate fireplace, dining-rooms open on all sides, overlooking tall pines and palmetto trees, and the Halifax River on one side and the ocean near by on the other. The house is presided over by Mr. Chas. H. Creighton, an educated twelve-bore sportsman of twenty-bore instincts.

A day afield here promises much. We left the hotel early. Mr. Creighton, Mr. Ralph Valentine (of Ohio) and myself, in the care of Isham Bennett, Esq., who acted as guide and proved a philosopher as well. We went, after a deer, on our way to the haunts of our quest. We bagged some quail. Later we started a deer and our hearts to going; but that perverse deer always kept just out of range, and is there yet. Then we got on the track of another one that had cold feet, and this one, too, still has a warm heart. In the meantime Mr. Valentine and I were having some fun with English snipe, while Mr. Creighton was bottling his energy near the wagon. Turkey tracks were in evidence, while the sun wouldn't be long; so we began the homeward drive with Sport, Mr. V's pointer of great promise, and Mr. C.'s Don, an Irishman of many gifts in the role; while the intrepid Bennett sat on the front seat sounding like a bunch of quail lost to each other. As a bird finder, however, Sport was the best of the three; yet Bennett "can find birds," and is a good guide for the man who wants to make a bag.

It is here that a long pier has been built out into the ocean, to accommodate the fellows who want to take big fish, and they do get them. Between Seabreeze and Daytona is the long bridge where visitors exercise from early morning until Florida sundown trolling for trout. Men, women and children just walk and fish. North from Daytona, a few miles, is a lake famous for black bass; near its shores is the haunt of the wild turkey; from its low banks in the meadow-like country, are the feeding grounds of the snipe; on the higher ground quail are found—and so would I be if duties did not call me where quail are as hard to find as a professional game of poker.

At the Colonnades I had the pleasure of a luncheon with Mr. John F. Hazen, ex-vice-president of the American Tin Plate Co. Mr. Hazen has led himself to believe that he is only a reminiscent sportsman, telling me that reading FOREST AND STREAM for nigh on to forty years has cost him more money than the support and education of his family, and that he don't regret a dollar of it, proving this by asking my advice about the best gun to get for Florida shooting near a comfortable front porch. He will be heard from again. E. H. Molton, Jr., accompanied by his wife, are here, fishing-tackle laden.

Ducks on the Banana River.

JACKSONVILLE, January.—On reaching Jacksonville this morning I was presented to Capt. F. H. Coolidge, of Atlanta, who, in company with Steven A. Ryan and W. O. Conway, all members of the Atlanta Gun Club, have been living the sweet existence of hermits on one of the many little islands formed by the Indian and Banana rivers and tributaries and the ocean near Rockledge, for four or five days, shooting ducks. The bag made by these Georgia marksmen shows their trip was a regular powder-shot-meat success, and an express bill of $18 would indicate that their friends at home were not forgotten in the slough of the duck pond; 300 bluebills (broadbills), 100 pintails and 80 mallards fell to the crack of their guns, which shows that our Barnegat and Great South Bay shooters didn't get 'em all last fall. These gunners believe in good timber. Capt. Coolidge has with him a gun of steel and gold—and Mr. Ryan carries one of gold and steel.

T. E. BATTEN.

CHICAGO AND THE WEST.

The Doubting Didymus.

I have read with interest the comment of Didymus upon the account given to me by Col. R. E. Bobo, regarding migrations of squirrels in the State of Mississippi, which account I believe to be perfectly true in every particular, as Col. Bobo was an observer and a gentleman, and in this case had the advantage of being upon the ground and seeing what he described. I infer that Didymus has never seen such a migration. None the less, it may have occurred. Indeed, it did occur, and as described.

Illinois Tinkers Game Law.

CHICAGO, ILL, Jan. 13.—The merry game of tinkering the game laws goes forward here the same as elsewhere, as witness the following advice this morning received from Springfield:

"State Game Commissioner Lovejoy, acting in conjunction with the committee from the State Sportsmen's Association, has prepared a revision of the Illinois game law. The purpose in revising the entire law has been to include protection for all classes of game, some birds and animals having been omitted in the previous laws.

"One feature of the bill which will appeal especially to sportsmen and those interested in preserving the game of the State prohibits the killing of any sort of game for commercial purposes. To secure a better enforcement of the game laws the bill provides a fund from which the game wardens and deputies shall be paid. This fund is to be created by charging a resident license in addition to the nonresident license. Commissioner Lovejoy thinks the laws can be enforced by a fewer number of wardens provided they are paid regularly for their services.

"The bill provides general protection for all sorts of game, game birds and song birds, rabbits affording the single exception. The open seoson for the killing of various sorts of game are as follows:

"'Quail during the month of November.

"'Grouse and prairie chicken during the month of September.

"'Woodcock and doves during the months of October and November.

"'Snipe and plover, September 1 to April 25.

"'Wild geese, duck or other water fowl, excepting the mud hen and coot, from September 1 to April 15.'

"It is made unlawful to kill deer and wild turkeys at any time.

"The provisions of the present law are preserved in the section providing against the selling of Illinois game in the market, but allows game from other States to be sold in the open market from October 1 to February 1, unless it is unlawful to ship such game from the States where it has been killed. It also prohibits the selling of ducks, which heretofore have not been included in the list of game birds not to be sold in the market."

Now, let us see what we would have if this bill went through as proposed. First, we should have one most excellent feature, the stopping of sale of all sorts of Illinois game—one more proof of the excellence and growing quality of the FOREST AND STREAM platform plank. This would cut off such outrages as the butchery done on the duck marshes by such shooters as the Powers boys and their friends, who in a year kill and sell many thousands of ducks, as reported in these columns at earlier dates. It is very likely that this excessive slaughter on the Powers boys' marsh has been the immediate cause of the introduction of this "Stop the sale of game" clause in the bill above mentioned.

As against this stopping the sale of game in this State we have the inevitable loophole, so often ignorantly or intentionally left in game bills by the framers—the permission to market game "not killed in this State." In effect, experience has shown that this means about the same as no restriction whatever in the marketing of Illinois game. It may not seem so to those who are beginning the study of game laws and their workings, but it surely will so seem to anyone who has attempted to enforce the game laws of this State against the dealers of South Market street. I imagine, therefore, that the game dealers will make no objection to the "stopping" of the sale of Illinois game. Of course, the clause is better on the books than off, but it will not be enforceable. It might stop a few extreme and well-spotted cases like those of the Powers boys, or other market-shooters along the Illinois River.

The clause requiring a resident shooting license will, in all likelihood, defeat this or any other bill carrying it. Theoretically this may all be very well, and it might

please some sensitive soul who thinks a non-resident license is "discrimination" to be allowed to pay a resident license himself, but practically the same opposition will meet this clause which always meets any attempt to put in a clause stopping spring shooting. The farmers will not stand for it, and the lower half of the State will kill it.

As to using fewer wardens, we want none of that doctrine. We want more wardens and better ones, just as many as we can get and just as good. The non-resident license raises a considerable amount of money, and would raise much more did we stop spring shooting and have something for non-residents to shoot when they come here.

To cut off twenty days from the quail season and allow that bird to be shot only in November is a good movement right now, for we are almost sure to be up against a short quail crop next fall. The clause will, however, meet opposition from many Chicago shooters, who don't really want the quail protected so much as they want themselves protected. There will no doubt be a fight on this clause.

To allow shooting of woodcock only in October and November means, in this State, a perpetual prohibition on that bird. Even so, let it go, if thereby anything shall be gained in regard to another bird, for few woodcock are killed now in Illinois. To open a legal season on doves for those same two months is to invite destruction for that bird in many localities where it is abundant. It is to make it a game bird, whereas it has heretofore been shot as a sort of side issue by the chicken hunters more especially, and the quail hunters in less extent. The woodcock and dove would under this bill in all likelihood be shot more especially by the quail hunters, or by those who would deliberately go out after doves; for we see, a little further on, that the chicken season is open only in September.

Thus we see that in its features as to upland birds, the proposed law does not in the least stand analysis as a sportsmen's measure, well intended as it may be. It is a step backward in practical legislation for game protection, as any well-informed shooter knows. The whole tendency now in advanced protective thought is toward a uniform shooting date. Suppose we opened the season on all game birds October 1 and closed it on all birds November 31. That would be protection. We should soon grow used to these dates, and would not worry about any months but October and November. If we saw a man out with dog and gun any other time we could with warrant ask why he was out and what he was doing. In this proposed official game law we have a season on one bird or other which begins September 1 and ends three months later. Our existing game supply will not stand three months' hammering, supplemented with a spring shooting season on wild fowl. Theoretically we do not have such a full season, but practically, as any well-posted deputy warden knows, a great many shooters will kill chickens after the law is out, quail before it is legal, snipe, woodcock, doves, or anything else as they find them, all being grist to the gun as found, and irrespective of dates. The practical thing is to keep gun, gunner and conscience at home a longer time, and not to trust too much to either of these three at any time of the year. This long and broken season in the fall shows a poor law, and experience with it would be sure to prove this true. It is one of those inferior, infernal, long-tried and always wanting loophole laws which are the same as no laws at all. This and the partial permission to sell game, in this city will practically amount to no law at all for this State.

The deer and turkey clauses amount to little. It is difficult to see why mudhens should be protected any more than ducks, and difficult to see why there should not be at least an attempt made to protect snipe and plover in the spring. Such an attempt might defeat the whole measure, but there is probability that it will hardly go through as it is drawn.

Concluding, the proposed bill, which I take it is Mr. Lovejoy's first game bill, does not show that he worked with able advisers, or that, if he did so, he failed to take their advice. Mr. Lovejoy himself admits little acquaintance with sport prior to his term of office, but wants to do his best at what is right. The only real step in advance is the proposed stopping of the sale of Illinois ducks. I have a notion that, for reasons earlier stated, this stopping of duck selling in this State will just about go through, as a great deal of agitation has gone on in the lower part of this State over the market-shooting above mentioned, and it is the lower part of the State which makes the Illinois game laws.

The bad features of the law proposed lie largely in the broken shooting dates on different birds. October, the shooting month of all the fall, is closed except as to woodcock, a minus quantity, and doves, which ought to be left a minus quantity.

There is no State in the entire United States which is riper than Illinois for a thirty days' or sixty days' shooting season in the fall. We have no chickens left to afford a real sport at chicken shooting in September. An early date on that bird pleases a few, but benefits a very small class. To cut out September would leave the corn field shooting still open on chickens. It would also leave more birds for this corn field shooting. I would far rather see a hundred birds a day in October and kill a dozen than to see fifty in a day in early September and kill two dozen. The two months of October and November would cover all our duck shooting closely enough, all our snipe shooting and all our upland shooting. With a law like that and the sale of *all* game stopped in this city, we should have plenty of game here in Illinois, and what is still more important, plenty of game in all the other western States; for Chicago legislates for all the West, since all the West ships her game, in season and out.

But we shall not see such a law for a time, shall probably never see it. That would be protection. The people of Illinois and the West do not want protection. They only want to talk about it, to make bluffs about it.

Out West.

Mr. W. A. Jones, formerly of this city, and well known as President of the Garfield Gun Club, member of the Poygan Gun Club, of Wisconsin, etc., this fall found his health breaking down and removed to Flathead county, Montana, where he has taken to ranching, with what he thinks will prove good success. He writes this week that he is well and happy, and wants to see the best paper on earth. He has done a little knocking about, killed a few deer and taken a few trout, and thinks he is in God's country. He is. The West will make him well. It is the only country on earth worth living in or loving.

Getting Ready for Tournament.

Mr. Wm. Mills, Jr., of the firm of Wm. Mills & Son, New York, called at this office to-day. Mr. Mills is in town looking after the trade in fine rods, etc., and says that the stock of the famous Leonard rods was never in better assortment. He is getting ready for the big bait-casting competition at the Sportsmen's Show in New York, and is inquiring as to the exact size, weight and personal appearance of the artificial frog as used in the Chicago contests. Mr. Mills is very welcome in the West, and I am sure will find the Chicago boys full of ideas about rods and tackle of all sorts. I even told him how to build a rod my own self, it being the privilege of all mankind to tell makers of rods, guns and newspapers just how to carry on their respective businesses. I never made a rod myself, but can cheerfully tell anybody how it ought to be done. I wish Mr. Mills would send over a few rods to England to take (if possible) some of the conceit out of our English cousins in regard to fly rods. I will back a Leonard against any English rod I ever saw of twice its weight, and this under the hardest of their fishing conditions in England. This ought to be liberal odds for our English friends.

Mixing of Dogs.

I suppose there will always be troubles in the world of dogs, troubles over dogs which are not as represented, dogs which die on the way to or from their owners, and dogs which are well meaning, but inefficient. A little dog story happened here not long ago, however, which shows still better the possible ramifications of the dog industry. Mr. W. P. Mussey, very well known in Chicago sporting circles, ordered of a man in London, Ont., a red cocker spaniel for home consumption. As soon as the spaniel in Ontario was ready for shipment, its owner sent it to Mr. Mussey by express, and so advised him. Meantime, however, that gentleman had left town, and the crate containing the alleged cocker spaniel was received by his employes at his billiard emporium. It so happened that Gene, the head cashier of the hall, is a very pleasant gentleman, but does not know a dog from a beef critter. He thought that the charges of $3.15 were regular, saw that there was a dog in the crate all right, and hence cheerfully signed the receipt in the expressman's book and called for one of the colored boys to take the top off the crate.

When the crate was opened, it was seen to be literally full of dog, so much so that the occupant thereof when standing erect projected some inches above the top of the crate. Just how so much dog got into so small a crate was something which, in Mr. Mussey's absence, puzzled Gene very much. Finally a further shadow of perplexity came over his brow. He sent for an expert dog man, and began to question him:

"Here," said he, "is this dog a cocker spaniel? We sent for one, and this is what we got."

"Cocker! Cocker spaniel!" replied the other. "That's just as much cocker spaniel as it is bulldog or dachshund. It's mixed, that's what it is. I don't believe the best dog sharp on earth could tell what breed or breeds there are involved in this product here. The best thing you could do is to kill the dog and leave the country before Billy Mussey comes back."

I don't know what Gene did in regard to this cocker, but there is a rumor to the effect that one of the colored boys around the hall took it home, and that it is now as big as a yearling steer and still growing. This, however, is not all there was to the story. Mr. Mussey gave $25 for the cocker spaniel which he was to have gotten, and the shipper, thinking to save Mr. Mussey some duty at the United States line, valued the dog at only $5. There was no question that somebody had substituted for Mr. Mussey's thoroughbred red cocker this mixed dog, which was not worth more than 5 or 10 cents at the outset. The question of proof, however, as to the actual value of the dog actually shipped, the tracing of the package from start to finish, etc., occupied a great deal of time, and caused considerable annoyance. The probabilities are that at some depot along the line an admirer of cockers saw this little fellow in the crate, pulled a slat or so loose, extracted the cocker, picked up a common or garden dog which may have been running near, chucked him in instead, and again nailed down the slat. The matter, after much international complication, was finally adjusted, and if I am not mistaken, Mr. Mussey was finally able to get a cocker in the place of the one which went astray. The express company does not know to this day just who juggled the dog, but finally, with many tears, it settled on the basis of $25.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

In Oldtime Maryland.

FOWLS of all sorts and varieties dwell at their several times and seasons here in *Mary-Land*: The Turkey, the Woodcock, the Pheasant, the Partrich, the Pigeon, and others, especially the Turkey, whom I have seen in whole hundreds in flights in the Woods of *Mary-Land*, being an extraordinary fat Fowl, whose flesh is very pleasant and sweet. These Fowls that I have named are intayled from generation to generation to the Woods. The Swans, the Geese and Ducks (with other Water-Fowl) derogate in this point of setled residence; for they arrive in millionous multitudes in *Mary-Land* about the middle of September, and take their winged farewell about the midst of *March*: But while they do remain, and beleagure the borders of the shoar with their winged Dragoons, several of them are summoned by a Writ of Fieri facias to answer their presumptuous contempt upon a Spit.—From "A Character of the Province of Maryland," by George Allsop, 1666."

Brown's Tract Guides.

SOME very interesting points in regard to the protection and preservation of fish and game, and particularly concerning deer, were brought out at the annual meeting of the Brown's Tract Guides' Association, held at the Forge House, at Old Forge, Thursday evening, Jan. 8. The Association was organized in 1898 and incorporated in 1900. It has 500 members, of whom about 100 are guides, and the remainder associate members. Much good work has been accomplished by the Association since it was formed, and the beneficial results obtained through the united efforts of the guides and sportsmen have been very apparent. The annual meeting was largely attended, and the various matters of importance were considered. The secretary and treasurer of the Association, A. M. Church, in his annual report, said, among other things:

"The main object of the Brown's Tract Guides' Association is to protect the fish and game of the forest about the Fulton Chain, more properly known as the Brown's Tract region, and the main part of our work has always been done in that locality. In the spring of 1902 the State Forest, Fish and Game Commission appointed John E. Ball, a member of the Association, a game protector. This in a measure relieved us of much work and expense, and our disbursements in that direction have been much less than usual. I think we may say, without a doubt, that our section has seen fewer violations of the game law the past year than ever before. The fishing the past season, as you know, was not as a whole satisfactory. Early fishing was good. The snow disappeared much earlier than usual, and the streams and lakes were in good fishing condition much sooner than is usual in this locality, but the latter part of May rain set in, which continued through the summer with such frequency that little or no comfort could be taken in fishing, and it was a rare occasion when a sportsman secured anything like a nice basket of trout. The hunting was more satisfactory, and there seemed to have been plenty of deer for all, notwithstanding the fact that there was no fall of snow during the hunting season. Most hunters secured their deer, and as usual there were more killed than there should be. Of grouse and woodcock there were practically none. A year ago they were very plenty, and large coveys of grouse were to be found readily, but for some reason not accounted for, they seemed to have almost disappeared. Weather conditions are probably in a measure responsible for this state of affairs, but there is another very plausible reason for their disappearance, the little red squirrel who, it is well known, has a particular liking for young birds, and is a robber of the first order. He was abnormally plenty, and no distinction does he make, robins, bluebirds, grosbeaks and others, all come in for their share, eggs or young, half-grown or large, he takes them all, and why not a nice partridge egg? There were no spruce seeds, and the world owes him a living! During the past year the State, through the Forest, Fish and Game Commission, has liberated upward of fifteen moose in the Adirondacks, most of them in the region covered by our operations. Much to our regret, one of them was killed by some hunter on Oct. 19, between Seventh and Eighth Lakes. Early in June the city of Binghamton, through John B. Rogers, a park commissioner of the city, presented William Dart with a herd of five elk. Mr. Dart in turn presented them to the Brown's Tract Guides' Association, and about the middle of September they were removed from Binghamton to Second Lake, and here they are being fed and cared for until spring, when they will be liberated. To defray the expenses of their removal subscription books were issued, to which our sportsmen friends responded most generously. The total receipts from this source were $248. The expenses of removal and keeping to date have been $271. It is necessary that more money be placed at the disposal of the secretary for this purpose. In removing the elk from Binghamton to the woods, the Delaware & Lackawanna Railroad very generously gave us a half-rate on actual weight, the freight amounting to but $9, while the New York Central Railroad carried them and the accompanying messengers free, and afforded us every help needed. Notices warning hunters and others against shooting or killing elk or moose, and offering a reward of $100 for information to convict any party or persons of killing moose or elk, have been issued and posted by the Association. It is a matter of pride to all that none of the members of the Association were ever concerned in any of the so-called shooting accidents, and this bears out the statement so often heard that 'the guides of Brown's Tract region are as faithful and reliable a body of men as can be found in any walk of life.'"

The report was duly approved.

The report of the committee on resolution was received, and was as follows:

Whereas, The Brown's Tract Guides' Association was organized by about fifty of the leading guides of that section for the purpose of protecting the fish, forest and game of the Adirondacks. They were encouraged in this undertaking by all true sportsmen and law-abiding citizens who loved the forests, and native inhabitants of the woods and waters. They were led to this action by practical knowledge of the destruction of fish and game, both in and out of season, in this region, and fully realizing that some radical measures must be taken to prevent the wanton destruction of game, they have banded themselves together to prevent, as far as lies within their power, its rapid and unlawful destruction by irresponsible persons, market and pot-hunters; and

Whereas, During the past season the Association has been instrumental in placing in the Adirondacks five elk, thus showing their interest in propagating and preserving the game of the forests, it is earnestly urged that the public show its appreciation of this action by aiding in every possible way to preserve them from destruction, whether by the acts of lawless pot-hunters or others who would depopulate the woods of these and all other noble specimens that are the pride of all true sportsmen; therefore be it

Resolved, That it is the sense of this Association and meeting that the State should increase the number of game protectors and assign more protectors for the forest preserve.

Resolved, That this Association condemn buoy or anchor fishing, and respectfully request the Legislature to pass a law prohibiting fishing buoys or anchors in waters inhabited by trout within the forest preserve.

Resolved, That this Association recommend the close season for wild deer from Nov. 1 to Aug. 31, both inclusive.

Whereas, In years past many men have been mistaken for deer and shot; and

Whereas, Hunters and sportsmen, in their eager pursuit of deer,

have not used sufficient precaution to distinguish the difference between deer and men; and

Whereas, The time has come when radical measures must be taken for the further protection of the deer in the forests, which are fast being depleted; therefore, be it

Resolved, And this Association most strenuously urges that no does or female deer shall be killed at any time within the forest preserve.

Resolved, That this Association condemn the sale of deer, venison, grouse, woodcock or quail; also brook or lake trout taken from the inland waters of this State, except the sale of live fish or game raised in confinement for the purpose of stocking or restocking the forests or waters.

Resolved, That the close season for black bear shall be from May 1 to Sept. 30, both inclusive.

Whereas, There is much talk of the appropriation by the State of from twenty to eight millions of dollars for the enlargement and improvement of the canals of this State; whereas such improvement and enlargement would call for a much greater supply of water for their operation; therefore, be it

Resolved, That it is the sense of this Association and meeting that the Legislature appropriate sufficient funds to purchase lands in the Adirondacks to the end that the supply may be increased and not diminished by the cutting away of the forests.

Whereas, The question of lumbering the State lands within the forest preserve is now being discussed, and

Whereas, This, in our judgment, not only means the destruction of the forests, but the destruction of the water supply of the State as well: therefore be it

Resolved, That this Association most strenuously protests against lumbering or cutting timber from State land.

Whereas, If Section 176 of the game laws of the State gives to the State game protectors the right to search without a warrant, and withholds it from the special protectors appointed by the State, and

Whereas, The special protectors are much hampered in their work by their inability to make such search without a warrant;

Resolved, That the right of search without warrant, being given to the State protectors by law, it should also be extended to the special protectors.

During the discussion of the resolutions Charles H. Smith, of Beaver River, said the proposed law to prevent the killing of does was impracticable. In shooting at a deer five times out of six the hunters did not know whether it was a buck or doe, and if they found it to be a doe, they would leave it to rot. The hunter would claim the privilege of killing two more deer. Let a hunter kill a doe as the law is now, and he will kill only two deer; otherwise when he kills a doe he will leave it to rot and not take it.

Hon. H. D. Grant, of Boonville—Last year I was against the adoption of this resolution, but I have changed my mind. One reason is we want something for the game protectors to do. They will not allow people to kill does and leave them to rot. There has been a scarcity of bucks this season. We must do something to increase the number of deer.

Mr. Smith—How can the protectors watch a thousand hunters?

Mr. Grant—We have nearly a hundred active members who would see that the law against killing does was enforced.

Frank Sperry, of Old Forge—I am glad this subject has been brought up, and that there are converts to this belief.

David Charbonneau, Old Forge—It would be difficult for a sportsman to tell whether the deer was a doe or not. The animal is in the brush, not out in the field, and it would be a hardship to prosecute a man for shooting what he believed to be a buck.

Mr. Sperry—That is the reason I wish this law. The hunters shoot deer without knowing it is a buck or doe, or even a man. I want does protected, because I want men protected.

Mr. Charbonneau—This fall I saw a doe and shot, and when I found the animal it was a buck, but its horns were not more than two inches long.

President Richard Crego, of Boonville, said he favored the resolution.

The resolution regarding the killing of does was voted on and lost, after which, on motion of Nelson Chandler, of White Lake Corners, the resolution was changed so as to limit the number of deer shot in a season to one, and as thus changed was passed unanimously. The other resolutions were adopted by nearly unanimous votes.

The following officers were elected for the ensuing year: President, Richard Crego, Boonville; Vice-President, Gary Riggs, Boonville; Secretary and Treasurer, A. M. Church, Boonville; Executive Committee, David Charbonneau, Old Forge; William Stell, White Lake; Francis Youngs, Beaver River; John G. Ball, Old Forge; John Hines, Honnedaga; H. D. Grant, Boonville; E. R. Ainsworth, Big Moose.

After adjournment the Association enjoyed its annual banquet. At the post-prandial session Hon. H. Dwight Grant, of Boonville, presided, and Rev. Father John Fitzgerald, of Old Forge, delivered an address of welcome. Speeches were also made by Hon. Garry A. Willard, Boonville; Leslie W. Kernan, Utica; Harry V. Radford, New York, and others.

UTICA, N. Y., Jan. 10. W. E. WOLCOTT.

Taking Aim.

Editor Forest and Stream:

What should we do without you as a clearing-house of items of interest to so many? Here's one, now:

Brother Wade is a little off in his statement that archers do not aim. Now, I have had some experience at drawing the long-bow (ahem!) myself. I hit a playmate in the ear, once, and it wasn't a big ear, either; just ordinary size, something less than a dinner plate. But to the point, especially the arrow-point.

We will proceed to demonstrate by geometry. Let Brother Wade, armed and equipped, plant himself before a mirror. With a foot-rule or a yardstick let him measure the distance between his eyes and stick a pin in half way. If he objects to pins as feminine, a blob of putty will do as well, or some pitch, if he chances to be in camp. From said pin, or the center of the above pitch or putty, let him drop a plumb line to his chin, standing meanwhile with soldierly erectness, and he will find that line will strike the exact center of his chin—if the nose admits; if it gets in the way a proper curvature of the spine may be arranged to counteract while performing the experiment.

Thus we disclose the fact that the center of the chin is in the perpendicular of the exact center between the eyes.

Now, ye archer standeth with his left side toward the target, and his face swiveled round owl-fashion over his left shoulder. When his arrow is drawn to the head for a point-blank shot the feather of the arrow tickles his chin, even as Pharoah of old delicately touched the same of his feminine adorers, if his statues do not lie. The eyes are fixed on the bullseye. The arrowhead is between said eyes and the bullseye, and when those eyes get hypnotized till there arises a stereoscopic effect so that they see nothing but the arrowpoint and the bull, that bull is going to be transfixed the next second. The old English archers drew to the ear, since it gave some inches further draw, hence greater range. Doubtless for them the "sense of direction" played a large part. But I'm talking about the long-bow of to-day. Sabe?

J. P. T.

Editor Forest and Stream:

In connection with Mr. Wade's article on this subject in your issue of January 17, I suggest that in "quick shooting at a moving object" the gun becomes a part of the shooter and follows the object sought to be shot just as his hand would in pointing at a moving object. The eyes do not see the gun, they see only the game.

CROTON.

NEW YORK, Jan 15.

Vermont Game.

SPRINGFIELD, VT., Jan. 10.—Gray squirrels were plentiful all through the last season. Ruffed grouse were also fairly plenty. Woodcock, as everywhere, were rare. Deer are becoming more plentiful every year; they are moving into the southern part of the State. The largest number were killed in Windsor county this year. Deer were seen in large numbers and more were killed this year than in any previous season. Have you ever observed that no one has ever been shot in this State in mistake for a deer? This may be owing to the fact that the hunters are mostly local nimrods, countrymen born and bred, and who know a deer from a farm horse; but in my opinion it is the wise provision of our law which prohibits the taking of does. If a man waits till he sees positively he is shooting at an animal with horns, he will make no such mistakes, as the number of men in Vermont who grow horns is comparatively small.

This law protecting does is rigorously enforced. Only four or five does have been found. They were left where shot. One old unregenerate in this town shot a doe and boasted of it. He is now in the workhouse working out his $100 fine. What sport is there in shooting a doe? I would as soon think of striking a woman. Old Vermont may be a bit slow, but she knows how to take care of her game.

An effort was made at the session of the Legislature just closed to lengthen the open season on deer. It failed. The open season remains the same, the last ten days in October. Two amendments to the game laws were made, one limiting the number of gray squirrels to five to each gun for one day and another providing that all squirrels, partridges, etc., taken must be consumed as food within the State. We are having a real old-fashioned winter up here, lots of snow. Good snowshoeing already.

W. W. BROWN.

How I Closed the Quail Season.

NYACK, N. Y.—The last day of the hunting season of 1902 in New York was as unfavorable and cheerless a day as could be imagined. It was cold and a heavy sleet, driven by a strong northeast wind, cut the face like a whip. Although the day was so unfavorable, as I had a new dog I ventured out and tried to find a well-known bevy of quail.

Near where I live is a piece of land containing perhaps ten acres that is covered mainly with scrub oaks and a tangle of briars. This is a favorite place for quail. There is a long narrow strip of woods this side, through which we first hunted and found tracks that we followed northward into the lot first mentioned; here the fresh tracks were so quickly covered by the sleet that in the open blew fiercely in my face that the dog could not surely follow the game, and we were forced to give up the hunt.

On our way down the road leading home, my setter swung quickly out and made a pretty point at a brush pile by the roadside, and immediately a quail walked out on the opposite side.

If he should fly into the thick woods beyond, I felt sure that I should lose him. Should I do so unsportsmanlike a thing as shoot a quail walking? No! Yes!

My dog was green, but he behaved splendidly, and I wished to encourage him by killing this bird. I took a snap shot and the bird flew away—the charge had passed over his head.

Thus one enthusiastic hunter closed the season of 1902.

There were seven bevies of quail within the city limits here this fall. There are many left. They are wintering well.

Moose and Salmon.*

UNDER the title "Moose-Hunting, Salmon-Fishing and Other Sketches of Sport," Mr. T. R. Pattillo, of Nova Scotia, has brought together a series of chapters of personal experiences which range from moose calling in Canadian forests to dolphin fishing in southern seas. Much of the shooting and fishing is of an uneventful character, considered from a sportsman's view point; and the pages are marked by a simple directness of style which tells the story in many instances vividly and with life and movement. Mr. Pattillo's chapter on albacore fishing was printed in our fishing columns last week. Here is an incident in which the "still small voice" spoke right out loud. The moose hunt was on snowshoes on a crusted snow, and the dogs had thrown down the moose:

"The poor fellow lay there apparently helpless, and my trusty rifle might have kept him there; but, reader, that was not the kind of sport that pleased me, even if it was to capture a moose. I said he was helpless. When, however, he saw us approaching him, his tremendous power, for he was a large fellow, flung Rover off him, and sent Ready with a kick 12 or 18 feet behind him. Then he sprang up and stood facing me, a picture of bold defiance. My rifle was raised, ranged for a blank shot. *'Coward!'* sounded in my ears. From whence came the sound? It must have been an inward consciousness that it was a shame to shoot him when he had no fair chance for his life. The word was spoken loud enough to hold my hand, and the rifle was not fired by me."

*Moose Hunting, Salmon Fishing and other Sketches of Sport. Being the record of personal experiences of hunting wild game in Canada. By T. R. Pattillo. London: Sampson Low, Maraton & Co. New York: Forest and Stream Pub. Co. Price, $3.

A Hunter Lost for Two Weeks.

B. R. LOGAN, the young man of Igerna, Siskiyou County, who, having gone on a hunting trip in the wild mountain region of the Umpquas in southern Oregon, disappeared from camp and was lost for two weeks, was found by a searching party yesterday. After leaving camp on Dec. 1, he became lost in a snow storm and wandered around for three days before he reached the cabin of a trapper named Acker, at whose place he arrived in a famished state. After resting and recruiting his strength there, he was started out on his return to the hunting camp. He again lost his way and for several days wandered hopelessly in the densely timbered mountain region, following the water courses until he came across a mountain ranch near Perdues. Exhausted and hungered, he was in a terribly weakened condition when arriving at the mountain ranch, and it took careful nursing to revive him. The searching party sent out from Igerna found his tracks and followed them to the Perdue ranch. There was great rejoicing when he was found alive, for hope of finding him had been almost abandoned.—Portland Oregonian.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

More About Sea Trout.

THE discussion relative to the sea trout, between Charles Hallock and Mr. Venning, which has recently been printed in the columns of FOREST AND STREAM has brought out many exceedingly valuable facts concerning this fish.

I have had many years' experience in studying its habits, distribution, etc., and possibly I may be able to add a little more light to that which has been thrown on its identity and peculiarities.

I suppose that the readers of FOREST AND STREAM understand that this fish is not the so-called sea trout of the Atlantic coast south of the Delaware Breakwater, for that is an entirely different species, the northern sea trout being a genuine member of the family *Salmonidæ*, while the other is one of the weakfish, and is very similar to the common squeteague, not only in the spines of its dorsal fin, but also in its general appearance, except that its silvery sides are thickly spotted with black spots, which are usually of about the diameter of a swan shot, or smaller.

In addition to being called the sea trout, this species is known to anglers as the "spotted silversides" and the "spotted squeteague." It is a much more gamy fish than the common weakfish, and is one of the most beautiful of the salt water fishes of the Atlantic coast, its back and sides being of a silvery gray with bluish and iridescent tints running through it, and its belly and lower fins being white without the yellow tinge which characterizes the common weakfish.

It is found along the coast and in the estuaries of the Southern Atlantic States nearly the entire year, but it takes the hook most freely from June to December, its favorite bait being shrimp, small crabs and "shedders." It is a game fish worthy of the high estimation in which it is held, but it is strictly a marine species, even breeding in the tidal waters and never ascending the fresh water streams for the purpose of casting its spawn, as do the members of the salmon family.

The northern sea trout is a spotted trout pure and simple, but it is of anadromous habits, living during a portion of the year in the salt water, but ascending the fresh water rivers, in the spring, chiefly probably, from the instinct which prompts all the *Salmonidæ* to leave the salt water for the purpose of spawning, but largely also for the food which the rivers contain. In these streams they remain during the summer, and in the autumn until the "slush ice" drives them back to the sea. That they spawn in these streams I have no doubt, for I have repeatedly taken specimens late in the season in which the ova were in a very far state of development.

The northern sea trout is found more or less abundantly in most of the rivers of Newfoundland, Labrador, Nova Scotia, New Brunswick, Prince Edward Island and in most of the tributaries of the mighty St. Lawrence, as far up in its course, at least, as Quebec, and perhaps further.

So abundant is it on the Newfoundland shore that it is seined by the barrelsful to be used as cod bait.

The southern limit in the range of the sea trout is probably Long Island (N. Y.) into the streams of which the salt water trout, so-called, often ascend. These fish are bright and clean cut, but they lack the silvery tinge of their more northern mates.

Robert B. Roosevelt, in his valuable book on "The Game Fish of the North," mentions these salt water trout of Long Island in a dozen places, and always in the belief that they are the "dearly loved old friends, the speckled trout." The next northerly point at which these fish are taken is in the Marshpee, or "Mashpee" River, Cape Cod, Massachusetts.

In this stream they are called "salters," and they differ but very little from the Canadian fish. Mr. Roosevelt gives in the book above named the most charming accounts of the capture of one of these fish that was ever put in print. I wish I dared to take space to quote it here. It is an enthusiastic and most scholarly piece of angling literature. I would state *en passant* that the trout weighed 3 pounds 14 ounces.

Following along the coast to the north, I know

of no other streams in Massachusetts, nor any in New Hampshire or Maine, into which the sea trout enter, and I know of none which empty into the Bay of Funday, either in New Brunswick or Nova Scotia, in which they are found.

I have been informed that they are occasionally taken in the Tusket River and in the Clyde, but I am pretty familiar with those streams, and have never seen one in them. In the Mersey River, near Liverpool, a few are taken, but no large ones.

In the other streams of eastern Nova Scotia, from the Port Medway River to the Indian River, the sea trout are rather plentiful, but they are mall, hardly averaging a half pound in weight; in fact, although I have fished all those streams a great many times, I do not remember ever taking a sea trout in them that would tip the scales at three-quarters of a pound.

North of Halifax, however, particularly about and in Mascodoboit River, they run considerably larger. In the Middle River, in Cape Breton, about twenty miles from Baddeck, and in the Mira River, near Sydney, one may be reasonably certain of taking several that will weigh from two to three pounds in a catch of fifteen or twenty fish. I have repeatedly done this, and have no doubt that large fish may still be taken in those streams.

In the Margaree, that magnificent salmon river, the weight increases considerably, three-pound fish being rather common, and four and even five pounders being by no means rare. They are so abundant in the pools at and above Northeast Margaree as to be a perfect nuisance to the salmon angler, for they are much quicker in their movements and seize the fly as soon as it touches the water, and long before the lordly salmon can reach it. Of course, if a large sea trout is hooked he flounces and splashes arouund and disturbs the pool so much before he is brought to the landing net that the salmon becomes alarmed, settles down to the bottom of the pool and refuses to rise to the fly, perhaps for several hours after.

Not only this, but their numerous fine teeth, as sharp as needles, work sad havoc with salmon flies, which are, as a rule, costly, and sometimes difficult to be replaced. There is a large pool about two miles below Northeast Margaree called the Brook Pool, which would be one of the best salmon pools on the river if it were not for the numerous trout which abide in it. It is one of the deepest pools on the river, and it forms the junction of the river and a very large brook.

I have in a day's fishing in this pool alone killed fifteen or twenty fish that would overrun two pounds, some being of four pounds' weight, and they showed every grade of coloration from the silvery white of the fresh-run sea trout, through grays and yellowish-brown to the deep rich tints of the fish which had been in the river the entire season, and called by the natives the "river trout."

About twenty miles from the settlement is Lake Ainslee, a magnificent body of water many miles in length and breadth. "Near the head of this lake is a stream of considerable size which emptics into it. This is spanned by a bridge, below which is a large, deep pool worth a long journey to see. The water is as clear as crystal, from five to twenty feet in depth, and throughout the summer it is absolutely packed with sea trout.

"As I crossed the bridge I looked down into the water below, and such a sight I never before witnessed. The trout were in thousands, and large ones most of them were, too. This pool is celebrated throughout this portion of the island, and many fine catches have been taken from it. It has been badly poached in years past, as many as three barrels of those splendid fish having in a single day been jigged out of it."*

After passing the Gut of Canso there are no streams in which sea trout abound in Nova Scotia. I have never been able to find any in the streams which empty into the Mines Basin, except a very few small ones in the Cobequid River, near Truro, and those were not bright-colored fish.

In the bays, estuaries and rivers of Prince Edward Island the sea trout are more or less abundant, although I confess I have never seen such fish as are described by Mr. Perley in Frank Forrester's book on "Fish and Fishing," who says that "The sea trout fishing in the bays and harbors of Prince Edward Island when the fish first rush in from the gulf, is really magnificent; they average from three to five pounds each. I found the best fishing at St. Peter's Bay, on the north side of the island, about twenty-eight miles from Charlottestown; I there killed in one morning sixteen trout which weighed eighty pounds."

I have fished in the waters of this island considerably, and have never been so fortunate as to find a sea trout that would weigh over two pounds, although I have been informed that in the Dunk River three-pound fish are sometimes taken. I found the largest average to be in the stream near Malpeque.

On the New Brunswick shore there are many sea trout rivers; in fact, it would be more difficult to name a stream in which none are found than the contrary, even the little Shediac River containing them, as I have proved on several occasions. The Miramichi and its tributaries, the Tabasintic, Tracadie, Nepisiquit, Jacquet, Upsalquitch on the south shore of the Baie des Chaleurs and the Restigouche, Nouvelle, Great and Little Cascapedia rivers on the north shore, and following the coast, the grand St. John's, York and Magdelaine rivers actually teem with these fish, and their size averages large, too, a catch of thirty fish in the Bonaventure River weighing over sixty pounds.

So much for the distribution of the sea trout. Now I have time and again fished most of the rivers I have named; was for five years one of the lessees of one of the best of them, and have thus had good opportunities for observing and studying this fish, and am convinced that it is not a distinct species, per se, but believe it to be our old darling the spotted or brook trout, but clad in a silvery-bright armor, which, if a number of them are thrown in a pile, gives them the appearance of so many herrings fresh from the sea. This brightness, however, is replaced by a more sober livery after the fish have been in the river a while, and late in the autumn their color is about the same as that of the spotted trout that have lost the anadromous habit.

This change of color, however, is not peculiar to the sea trout, for the slamon also loses the brilliancy of its silvery coat after it has been in the fresh water a month or two, and later in the season it becomes of a dirty, brownish, gray color, with numerous spots and markings scattered over its body.

Coloration is often of no great value in determining species, but anatomical peculiarities are an unfailing guide.

"Scientists insist that the carmine spots which appear on the sides of the sea trout after they have been in the river a long time, together with the same number of rays or spines in the fins prove that they are identical with the spotted trout."

To determine the identity of this fish, I visited the Jacquet River (N. B.), in the winter of 1886 "for the purpose of obtaining specimens for the Museum of Comparative Zoology at Cambridge, Mass., but not a single one could I find, although I visited pools which had teemed with them in the summer, but the spotted trout were there in numbers; at Campbellton, however, near the mouth of the Metapedia, I had no difficulty in getting as many as I wanted, and they were all silvery-white."*

These fish were pronounced at the Museum to be the spotted or brook trout. Now, if there were no salmon in the rivers I have named, the sea trout would amply repay an angler for taking the long journey that is necessary to reach them; but the salmon is the great prize that tempts him to visit those streams, and he has no desire to waste time on trout, no matter how large and gamy they may be.

So far as gaminess goes, I believe that for straight fighting qualities this trout is one of the leaders. Large ones weighing four or five pounds are particularly obstinate in refusing to come to the landing net, and they often make as good a fight as a seven or eight pound salmon.

Among the streams of New Brunswick the Jacquet is well known as being not only a good salmon river, but also one of the most abundantly stocked with sea trout of any in that Province. They begin to come into the river early in June, when the smelts, in incredible numbers, make their annual ascent of the stream for the purpose of spawning. So numerous are they that the water seems literally to be alive with them, and, of course, the trout have an abundance with which to gorge themselves.

Some of the local fishermen used to make great catches at this season, using smelt for bait, and large numbers were packed in snow or ice and shipped to the St. John and Quebec markets, snow being stored in that section as ice is packed elsewhere.

After the run of smelts is over the sea trout ascend the river leisurely and make their homes in the largest and coolest of the upper pools during the summer, the famous Kettlehole Pool being the highest point that the large fish reach, and it is filled with them.

When the salmon begin to spawn the trout are on the qui vive, and they rush in and seize the eggs as fast as they are dropped by the other fish. I have been informed of this fact by a number of guides and river men who have witnessed the act. The male salmon makes strenuous efforts, of course, to keep the pilferers from his mate, but usually with poor success.

As for flies for sea trout, it would be difficult to name one they will not rise to, and they manifest no distrust or timidity when their companions are taken from the water. The largest specimen I ever killed was strong six pounds in weight, but larger ones have been taken, even as heavy as seven or eight pounds.

EDWARD A. SAMUELS.

Shark Catching Near New York.

ALTHOUGH during the summer months sharks are occasionally seen and now and then caught with hook and line in New York Bay and along the adjacent coast, few persons have seen fit to indulge in the pastime of angling for the ugly fish in these waters.

The sport has generally been regarded as a discredited one and not at all looked upon with favor by the lovers of fishing, except those of a certain class; and then again it has been supposed that the sharks were too few in number to make the fishing for them worth while.

Some years ago sharks were seen in great numbers off the Jersey shore in summer, and there was very little sea bathing indulged in at the resorts along the coast. It was at this time that Mr. Herman Oelrichs made his famous offer of $500 reward to any person who could produce authentic evidence that a man-eating shark had ever been caught in this latitude.

As it is understood that Mr. Oelrichs' offer, widely published at the time, still remains good, and so far has remained unclaimed, and as Mr. Oelrichs, who is a noted swimmer, repeatedly ventured out in the ocean in the places where sharks were observed to be plentiful at the time, it is quite safe to say that the sharks visiting the waters hereabouts are harmless, at least so far as an appetite for human beings is concerned.

If fishing for sharks has not been considered a very great sport, nevertheless there are a dozen or more men in New York harbor who are not averse to angling for them. It is in August when the weakfishing season is at its height that sharks make their appearance in the lower bay, following up the sea trout and other small fish that frequent these waters.

Pound fishermen in and around Gravesend Bay, where menhaden are caught for lobster fishermen, have their nets spoiled by these sharks, who get entangled in them. While rarely more than four feet long, a number measuring between eight and ten feet in length have been reported caught. The smaller ones often get on weakfish lines, and if the angler does not know how to handle them he loses his line. The shark becomes so entangled in the line that it has to be cut.

When they once land a small shark, fishermen sometimes take a cruel revenge by bending or breaking the pointed nose of the fish so that it stands up, and then throwing it back into the water. This, they say, prevents the shark from swimming beneath the surface, and it swims about with its nose standing three or four inches out of the water until it turns over and dies.

The fishermen who angle for sharks use a big hook with a small chain attached. A piece of pork or other meat serves for bait. A stout hemp line is attached to the chain, the end of the line being made fast to the boat. When a shark is hooked he comes to the surface of the water as gently as a sunfish. It is only when he gets close to the boat that the fight begins. The fishermen keep pulling him in and letting him out again, until he is exhausted. Then they watch their chance, and when his head is lifted out of the water by a pull on the line they club him to death. Sometimes they row ashore and beach them.

So much in regard to the fishing for shark in the waters hereabouts, which is merely introductory to the aim and purpose of the present article, which tells of the new—so far as the public is concerned—and exciting sport of harpooning sharks, as indulged in by a handful of enthusiastic sportsmen and fishermen in certain New York waters and not a score of miles from City Hall Park.

Odd as it may at first seem, this sport, conducted within so close a range of the business center of the metropolis, has never before been described in public print, this doubtless being mainly due to the fact that those who indulge in it have been loth to impart the knowledge to others except their immediate friends, who have been occasionally bidden to take part in the pastime.

The exact spot where this unique sport is indulged in and the manner in which it is conducted, as told in the following words by Mr. George Thompson, a well-known New York yachtsman and sportsman, and a prominent resident of the summer colony at Oyster Bay, who, with his brother, Mr. Walter Thompson, are the foremost devotees of the sport, will doubtless incite many others next season to try their hand and skill in this novel and exciting pastime.

"I was first made acquainted with the sport," said Mr. Thompson, "about six or seven years ago by old Joe Lockwood, erstwhile captain of our famous international cup defender, the Mayflower, and who is well-known about the waters of the Sound, and particularly the Oyster Bay district, where, in addition to a number of other aquatic accomplishments, he taught President Roosevelt how to sail a boat.

"Of late years, however, Capt. Lockwood has rarely indulged in the sport; my brother, a few friends and myself being about the only ones to participate in it. The sharks are most plentiful in the months of August and September, when I have often in one day seen scores of them in the stretch of water off the shore of Center Island, extending along the shore from the country house of Mr. Le Roy Dresser to Bayville, a distance of about a mile.

"This appears to be the favorite lurking place for sharks in the waters of New York, and the only way that I can account for it is that they congregate there in great numbers to feed on the refuse which comes up from the harbor along this point at certain times during the day in great quantities.

"Along the stretch of shore already described there is a reef of sand which extends in some places a quarter of a mile out in the Sound. The water over this reef is quite shallow and just at the water's edge, which is marked by a line of sedge grass, the bottom suddenly shelves to a depth of from six to ten feet. It is along the edge of this shelf and on the deep water side that the search for the sharks is made.

"Let us assume that it is a fine day in August or September and that we are about to set forth on our expedition. It is absolutely necessary that a day be selected when the water of the fishing grounds is at almost a dead calm, as it is very often at certain periods of the day during these months.

"The start is made in an ordinary flat-bottomed boat, one man pulling the oars, which it is not necessary to have muffled, even on the scene of action, while his companion, seated in the bow, harpoon in hand, is ready to deliver it at a moment's notice. The reason that a day must be chosen when the waters are calm and unruffled is so that a clear view may be had of the sandy bottom, which a ripple on the surface with its consequent shadows would prevent.

"The weapon I use consists of a nine foot pole fitting into the socket of a foot and a half iron harpoon. Attached to the socket is an iron ring to which is tied an ordinary clothes line, kept coiled in a keg in the bow, and the tail end made fast to the painter of the boat. The only other implements necessary are an ordinary spear or two.

"Arrived on the scene, one man stands in the bow with the harpoon poised for instant casting, while he tells the rower in which direction to pull along the edge of the shelving bottom. It is here that the sharks lie, easily discernible through the calm water, and they fall an easy prey to the harpooner.

"As it is only the bigger sharks—those between six and ten feet in length—that furnish the greatest excitement, the smaller ones seen are passed by until the ones sought come into view. They lie close to the bottom, and are apparently unheedful of the noise made by the rower, and of the close approach of the boat, not stirring from their resting place until actually disturbed.

"Although I have engaged in the sport for years, I have never failed to thrill with excitement the moment I have detected a big fellow lying within reach of my aim. The harpoon is hurled and the pole is wrested in a twinkling from its iron socket, now deeply imbedded in the shark; the rower has shipped his oars and leaped to the stern seat, while just as quickly I have seated myself in the middle thwart of the boat.

"Meanwhile, in the instant or two of time taken up by these movements, the shark is off like a flash, the hundred feet of line has run out and is drawn taut, and the next moment taking things at our ease, while we make ready our spears, we are being drawn at a lightning clip over the still waters of the Sound.

"The sensation of being thus propelled through the water by an invisible motive power at a really extraordinary rate of speed, once experienced is never forgotten. Although I have indulged in numerous outdoor sports, I have yet to engage in a more thrilling and pleasurable one, and on these points the companions on my many such expeditions have always agreed.

"Compelled at length to stop by sheer exhaustion, the shark ceases to run, there is a slackening of the line, which is at once drawn in and a few moments later we are again overshadowing our big, ugly enemy. At our approach, however, he is off in an instant, and again we are taken on a short but swift spin over the waters of the Sound.

"I have never forgotten the experience we once enjoyed while thus being towed along, of passing across the bows of the steam yacht of a friend coming along the Sound, and the expression of wonderment exhibited on the faces of those on board as to the source of our wonderful and invisible motive power.

"Generally, after two such bursts of speed, the shark, thoroughly worn out by his efforts in tugging two men in a rowboat a mile or so over the waters, comes to a dead halt, and again taking in the line, we are enabled to approach near enough to dispatch him with our spears. The iron harpoon is then cut out from his body and the carcass of our late foe left to sink to the depths for the crabs and many fishes to feed on.

"Of course it is only the larger of the sharks harpooned which furnish the sport above described, and very often before they are finally dispatched there is a tremendous thrashing of the water, which adds not a little excitement to the sport. The smaller sharks are generally killed at the first thrust of the harpoon, and sometimes the larger ones receiving a mortal thrust make no attempt at running away.

"But taken as a whole the sport of harpooning sharks in the manner described is one that will doubtless commend itself to many, and is bound to furnish no end of fun and excitement to those who may venture to indulge in it as a summer pastime.

"Newspaper reports to the contrary, I have never yet seen a shark of the man-eating variety in these waters, and doubt if any have ever been captured. While this takes away a certain possible element of danger, the mere statement may encourage many others to indulge in it."

What it Costs.

ROCHESTER, N. Y., Jan. 5—*Editor Forest and Stream:* I have frequently wished that your journal would take up the question of appropriations made by our State Legislature each year and the expenditure thereof by our Forest, Fish and Game Commissioners. Thinking it might interest the readers of your paper, I have taken from the statutes for the years 1892 and 1902, the items of the general appropriations. I have done this that the readers might readily see how the expenses of the commissioners have been increased for the past ten years.

The appropriations for the year 1892 were as follows:

Chapter 588, reappropriated unexpended balance for game and protection	$2,$00.00
Chapter 660. Appropriation for compensation and expenses of game protectors	9,986.31
Chapter 322. For compensation for fish and game protectors	15,000.00
Chapter 324. For Commissioners of Fisheries, to be expended as they may deem proper to replenish lakes and rivers, etc., with fish	34,000.00
For salary of clerk of Commission	1,500.00
For expenses of Clerk of Commission	2,500.00
Total	$64,986.31

For the Year 1902.

Chapter 593. For salaries of Commissioners	$5,000.00
Expenses of Commissioner and associate commissioner for so much thereof as may be necessary)	3,000.00
Assistant secretary	2,000.00
Audit and pay clerk	1,000.00
Stenographer (or so much as may be necessary)	1,200.00
Chief protector	2,500.00
License clerk and clerk of chief protector	1,500.00
Two assistant chief protectors, $1,200 each	2,400.00
Thirty-two protectors, $500 each (or as much as necessary)	16,000.00
For expenses of chief, assistant chiefs and protectors while in discharge of their duties (or so much thereof as necessary)	16,900.00
Expenses, maintenance of fish hatcheries, and hatchery stations, and distribution of food, and game and fish fry, other than salaries (or so much thereof as may be necessary)	50,000.00
For rents, stationery, printing and office expenses of Commissioners, other than salaries (or as much thereof as necessary)	3,750.00
Chapter 595. For salaries and expenses of twelve additional game protectors	11,400.00
Total for year 1902	$116,650.00

It will be seen from the above totals there has been an increase of expenses of $51,663,069 in past ten years.

Is it not pertinent to ask at this time of the commissioner whether the food and game fish have increased in proportion to the appropriations. I believe the verdict will be no.

Is it not a fact that this department has degenerated into a part of the great political machine of the State?

Can the people ever hope that we shall have any proper administration of our fish and game interests until such time as some competent person shall be at the head of the commission and hold office during good behavior.

The commissioner, as I am informed, and some of his associates, as I know, have private business that demand all their time, and quite naturally they devote time to their personal affairs, and fish and game matters are only incidentals to them.

Since our Governor has rededicated his best services to the State, is it not a good time for him to place some of our departments beyond mere politics, and let this be one of them.

If he would ask the present Legislature to amend the forest, fish and game laws so that he might appoint a commissioner to hold office during good behavior, and then appoint Major Pond as such commissioner, our hopes might be renewed for protection and propagation. The Major is fully alive to the many needs of this department, and doubtless more familiar therewith than any other man in the State.

The above appropriations do not relate to or include the large sums appropriated for forest protection or preservation or the protection of shellfish and the oyster department.

What has become of the 44 additional protectors? They have been unheard of in this vicinity, where, as I am informed, our bays, etc., are practically unprotected and net fishing is continuous. It is reported that our local protector is closely watched by the illegal fishermen so that his services are of little value as a protector. If our protectors could be shifted from place to place in the State, better results could be expected.

JOHN R. FANNING.

Fish and Fishing.

Some Scores from a Salmon River.

SOMETIMES the question has been asked me what I would consider a good day's fishing on a salmon river, and lately I have been favored with a copy of the scores made by a number of anglers last season, while fishing the waters of the Godbout on the north shore of the Gulf of St. Lawrence. Mr. Charles Hallock has called this river, "the best of all for scenic attractions and a stated supply of fish," and Mr. Hallock knows from personal experience what he is talking about. There are rivers where an average of two or three fish a day is considered very good sport, and a salmon fisherman who is not satisfied with such a result is possessed of a very unenviable disposition. Under certain conditions of weather and water, some of the best salmon fishermen that I know of have fished two and three weeks at a time upon excellent Canadian rivers without killing a single fish. There have been many blank days on the Godbout, but on the other hand a record of over forty salmon in a single day has been claimed for Mr. Comeau. In another season, 509 fish have been killed in this river by anglers, between June 15 and July 15. Col. Alexander relates that in 1847, Capt. J. M. Strachan took forty-two salmon out of the Godbout in parts only of two days' fishing. The Colonel believed this river to be one of the finest in the world for the angler, though he found by experience that it varies much in different seasons. In 1861, 252 fish were killed in the Godbout between June 6 and July 24, inclusive. The largest number of fish killed in any one day in that year was twenty-one, and the second best day yielded fifteen fish. It is gratifying to note as the result of a comparison of these figures with the score for last season that, thanks to the excellent protection which this river has received, there has been no deterioration during the last forty years, in either the size or number of its fish.

In 1902, no less than 543 salmon and ten grilse were killed between June 11 and July 23, inclusive. The best day's fishing was on July 11, when twenty-nine fish, weighing in all 300 pounds, were killed. On the 10th of the same month twenty-eight salmon were taken; on the 12th, twenty-seven; on the 7th, twenty-five; on the 5th and 8th, twenty-four each.

During the greater part of the season the river was fished by four rods. Mr. John Manuel, of Ottawa, who has to his credit 216 of the 543 salmon and five of the ten grilse, has fished the river for more seasons than anybody else, and did not miss a day's fishing during last season. He killed twenty salmon on July 11, thirteen on another day, and eleven each on three other days. He had only three blank days during the season. Col. Whitehead and Mr. James Law, both of Montreal, fished most of the time together, which means that as a rule one fished while the other rested, the two anglers using only the privileges of a single rod. Their best day also gave twenty fish, of which eighteen are to the credit of Mr. Low and two to that of Col. Whitehead. Mr. F. L. Wanklyn, of Montreal, only fished from June 12 to 24, inclusive, killing twenty-six fish. Mr. A. Paterson, of Montreal, arrived on the day that Mr. Wanklyn finished fishing, and from that date to the end of the season ran up a score of sixty-seven salmon and two grilse.

Nobody can read the above scores without coming to the conclusion that the Godbout is a wonderfully well-stocked river. The fish do not run nearly so large as those of the Moisie, for instance, nor average more than half the weight of the Cascapedia salmon. The average of last season's fish was 10.86 pounds, and the grilse avcraged 4½ pounds. No less than seventeen pools were fished last season, though three of them only yielded a single fish each. The upper pool proved by far the best on the river, yielding 150 fish.

Curious Fish Story

A Halifax newspaper published the following remarkable story a few days ago: "An immense codfish was captured in a peculiar manner by William Rolston and John McCallum, two young men of the west side, on Monday afternoon. They were out shooting at Sheldon's Point, when they saw a great commotion near the water's edge. They soon perceived that a sea dog was struggling with an immense fish, and had finally landed him. They immediately fired at the sea dog; this frightened him away, when they rushed down to the shore and captured the fish. It proved to be a codfish weighing over forty pounds, and measuring 4 feet 8 inches long.

The Fish of the Illinois.

The value of the coarse fish annually taken out of the Illinois River is really astonishing. A gentleman interested in the industry was here the other day and told me that the commercial catch of fish in that river during the last two years would be shown by a forthcoming report to have been fully 30,000,000 pounds, a large increase over the product of the preceding two years. No less than 5,000 residents of Illinois earn their living to-day entirely by fishing in this river, and for several months in the height of the season fully 10,000 are so engaged.

A Pike Story from Scotland.

One of the last numbers of the Westminster Gazette contains the following account of the capture of a huge pike, from a correspondent in Scotland:

"The gillie in attendance upon two ladies had left them for a while to procure some fresh baits, and the ladies pushed out into the loch. The younger and more adventurous of the two flung the bait, which still adhered to the flight of hooks, overboard, while the elder plied the oars. There came a swirl like a whirlpool in the calm water, the line ran screaming off the reel as the biggest pike 'wot ever was seen' explored the depths of the loch. According to the account vouchsafed by the heroines of the adventure, they were towed round about that sheet of water for hours. Sometimes the great fish showed its huge side broadside on; sometimes it came near the boat and surveyed its would-be captors with gaping jaws and dull, menacing eyes. And then it was not only the reel that screeched. But rescue was at hand. Watching his opportunity as the boat came into shallow water, the gillie waded out up to his middle, clambered on board, and in the absence of gaff or net, succeeded in landing the great fish by the simple process of inserting his fingers in the sockets of its eyes. Its weight was a trifle over 40 pounds."

E. T. D. CHAMBERS.

Some Big Salmon.

COMMENTING on the remarkable trio of salmon which has just reached this country from Norway, Mr. H. Ffennell gives the dimensions of three Rhine salmon which were brought to England in 1889, and formed a trio hardly less notable. The three from Norway weigh together 157½ pounds, the biggest turning the scale at 56 pounds and measuring 48½ inches by 28½ inches, the next weighing 55½ pounds, and measuring 51 inches by 29 inches, and the third weighing 46 pounds, with a length of 48 inches and a girth of 26 inches. Of the Rhine salmon, the heaviest nearly turned the scale at 56 pounds, and measured 51½ inches by 28 inches. The larger of the two other fish scaled just 4½ ounces under the 50 pounds, measured 47½ inches in length and 27½ inches in girth, while the other salmon was 6 ounces under the 50 pounds, and measured 47 inches by 27 inches.—London Globe.

Canadian Rivers.

Editor Forest and Stream:

If any of the readers of the FOREST AND STREAM are acquainted with the salmon rivers on the north shore of the St. Lawrence River, particularly the Mingan, Manitou-Mingan, the Corneille and the Little Watischou, they will confer a favor by addressing me as below. This letter is written with the hope that it may be seen by some sportsman who has fished those rivers and who may not consider it too much trouble to communicate with me.

NOAH PALMER,
The Wilbraham, Cor. Thirtieth street and Fifth avenue, New York City.

The Kennel.

The Dogs of India.

THE dogs to be found in India are of a distinctly varied nature. When walking along Malabar Hill, Bombay, one may come across a magnificent St. Bernard in the charge of a "dog boy," and belonging to an opulent Rajah. Other wealthy natives will possess themselves of greyhounds, setters, retrievers and prize fox terriers, all being imported from England. Others, again, set their affections on Maltese terriers, pugs and French poodles, huge sums being paid for these "fancy dawgs." It may, in this connection, be pointed out (for the benefit of those fanciers and breeders who desire to enrich themselves by catering for the moneyed colored man) that the Rajah is an imitative creature. Consequently, if he is given to understand that the King has a favorite Irish terrier, and that some society notability, such as Lady Warwiek, patronizes Great Danes, he will promptly send an order to Europe for canine luxuries of a similar nature. It may be deduced that in India a market awaits the exporter. At the same time it should be borne in mind that the Oriental notability is lamentably dishonest. Indeed, the greater his revenues, the more difficult is it to prevail upon him to pay for his pleasures. Well-to-do exiled Britons and penniless subalterns are also dog fanciers on a small scale, while "forest officers," "opium wallahs," "P. W. D." officials, "collectors," and even the missionary element, provide themselves with fox terriers, bull terriers, Skye terriers, and other varieties. Of long-haired dogs, however, there are but few in India; for, owing to the intense heat which prevails for two-thirds of the year, it is only fox terriers, bulldogs and other short-haired specimens which are found to be capable of withstanding the climate well. And even the breeds mentioned, when first brought out from England, often take some months to become acclimatized. It occasionally happens that a valuable prize animal is imported, to succumb to the heat shortly after its arrival in the country. But a short time ago an ardent infantry captain went on "plague duty" in order that he might save up sufficient to send "home" for a well-bred bulldog. A year after its arrival the unfortunate animal expired of heat. In the hill stations, however, the climate is perfect for man and beast alike. Consequently dogs which are unable to stand the heat of the plains during spring, summer and autumn months lead a pleasant enough existence in such places as Simla, Mussoorie, Poona, Naini Tal and Darjeeling. In fact, owners often find it advisable to send their treasured animals to these places during the dreaded "hot weather."

Although English dogs are in such request in India, there is also some demand for the beautiful Thibetan sheepdog and the Rampur hound. The last named is bred in a small native state in the northwest provinces, and is useful for hunting purposes. It is a smooth-haired dog, not unlike a Great Dane in some respects, and is to be found in abundance in its native

place. The Thibetan sheepdog, on the other hand, is somewhat rare. Occasionally it is brought down from Thibet by itinerant pedlars, when it invariably fetches a good price. It is somewhat like the collie in appearance, and possesses much the same characteristics. Another breed indigenous to India is the "Pi dog," sometimes known as the "Pariah." It is, in other words, a mongrel, and is practically to be had for the asking. Sometimes it is thought to be worth money, the price offered being a rupee or so (the rupee equal one and fourpence). The "Pi dog" is not to be congratulated on possessing good qualities, for it is cowardly and useless. Yet it is to be found in every part of India. Two or three may be seen slinking about the barracks in every cantonment station, while they also go to make up the scratch packs owned by Bengal indigo planters. Often a soldier will possess himself of one of these unattractive animals, and many of India's "Dakbungalows" provide them with a home. Sometimes the poor brutes are to be seen limping about a "station," their bodies covered with hideous sores and diseases. At certain periods of the year they are destroyed, with other stray dogs, by order of the Government. In addition to the variety referred to above, there are thousands of mongrels of other sorts all over India—the property of the Eurasian element. For, though the half-caste is not given to allowing himself luxuries, he has an extraordinary partiality for surrounding himself with yelping curs. Indeed, one can hardly enter the house of a colored postmaster or telegraph clerk without being surrounded by a dozen or so of these snarling and unpleasant animals. One may thus make the acquaintance of dachshund and Skye terrier crosses and similar monstrosities. At the same time it should be pointed out, in justice to the semi-white community, that if they are blessed with wealth they are very ready to expend a portion thereof in importing good stock from England.

A certain number of expatriated Englishmen, who are provided with much leisure, make quite a business of breeding dogs and selling them, through advertising in India's daily papers, often obtaining good prices. With a view to meeting the demand, they import suitable stock from England, retailing the produce at a fair rate of profit. It may, in this connection, be added that dogs which are born in the country often weather the climate far better than does the imported article. At the same time it should be observed that many Anglo-Indians imagine that by "importing direct" they are getting better value for their money. As a matter of fact, this is sheer snobbishness on their part. And there is no snob like the Anglo-Indian Staff Corps officer, be he white or of mixed parentage.

Although one sometimes comes across dachshunds, Yorkshire terriers, greyhounds, Ayrshire terriers, Scotch terriers, Dalmatians and pug dogs, it is the fox terrier which is in evidence throughout the length and breadth of the land. Being common, they are cheap, and are thus within the reach of all. In fact, it is quite a common thing to find railway engineers, canal employes, and other officials who lead a solitary life, surrounding themselves with half a dozen dogs of this description. When going on leave they will assiduously endeavor to ascertain where they can obtain a couple of good fox terriers for breeding purposes. Returning with their purchases to the land of their exile, they will sell each litter, thus recouping themselves for the initial expenditure, and making a handsome profit into the bargain. In fact, one or two men of commercial instincts have neglected their work for puppy farming, thus calling down upon themselves the wrath of their inspecting officers. But it is seldom that they get into trouble, since, in India, the official class are allowed to take their work easily. They make up for this laxity by treating their pleasures as though they were the more serious objects of life. A patriarchial and white-bearded commissioner will thus play Badminton and musical chairs with all the zest of a child of ten. He will even go down on all fours and romp with a puppy as though his life depended on it.

The British soldier is another devotee of the dog. His work being over for the day—with the exception of a short evening parade—by twelve o'clock, he is able to devote a considerable portion of his time to teaching his dog tricks, and to busying himself in looking after its toilet. Occasionally he becomes possessed of exceedingly well-shapel animals. Should he, however, be unable thus to gratify his tastes, he will make shift with the best substitute he can command. Sometimes he is in luck's way, for an officer of the regiment may, when going on leave, hand over his dogs to one of the men as a parting gift, or he may entrust them to the care of a soldier pending his return, paying him for looking after them. And as the man of war in either case has the benefit of their company he is rendered happy. At certain periods of the year a large number of the dogs in India find it necessary to go mad, their example being followed by jackals. It is then that the authorities issue stringent regulations regarding the destroying of stray dogs.

It may, in conclusion, be pointed out that though the native does not share the Eurasian love of dogs, he is always polite to those of his employer. Thus, should a Rajah import a prize bloodhound, each of his ragtag and bobtail officers of State—from the Prime Minister downward—will fawn on the animal, though keeping at a safe distance the while. Should the Nizam of Hyderabad, a half-civilized Oriental potentate, purchase a toy terrier, his native Lord Chamberlain and half-caste valet will vie with each other in paying the animal attention. In the same manner should the Inspecting Forest officer make his appearance in a station, the "baboos" (native clerks) and Parsee subordinates of the local forestry office will pay their respects to his dog, much as they loathe any animal possessing sharp teeth and an aggressive bark. Nor are native servants fond of dogs. They are, however, capable of stimulating an affection for those of their employer.—George Cecil, in Our Dogs.

Sheriffs and Bloodhounds.

To Mr. Charles Hallock we are indebted for the following clipping:

Senator Hobbs, of Prince George, has prepared his bill outlined in the Richmond News several weeks ago, looking to an appropriation by the State for bloodhounds, to be placed at the disposal of the sheriffs of the counties in hunting down criminals. The hounds are to be kept at the State farm. The bill, which will be introdueed, is as follows:

"A bill to provide for the raising and training of bloodhounds for the use of the sheriffs of the Commonwealth.

"1. Be it enacted by the general assembly of Virginia, That it shall be the duty of the superintendent of the penitentiary to proeure, upon the most advantageous terms possible, one male and two female bloodhounds of suitable breed, which he shall keep on the penitentiary farm for breeding purposes; that he shall have them and their progeny properly cared for and trained to traek criminals.

"2. The superintendent of the penitentiary shall, upon the order of the Circuit Court, or Board of Supervisors of any county, furnish one of said bloodhounds to the sheriff of such county, free of eharge, the said bloodhounds to be conveyed to their destination at the expense of the counties ordering them.

"3. Whenever the supply of sueh bloodhounds shall exceed the demand for the same, under the provisions of Section 2 of this aet, the superintendent is authorized to sell the surplus ones to other parties, the revenue arising therefrom to be accounted for as a part of the annual revenues of the penitentiary farm."

It is quite apparent that the legislators are not informed on several points concerning bloodhounds. As a commercial article, they are few in numbers, they are exceedingly difficult to raise, and they are not at all superior to the foxhound as trailers.

100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

89

A dispatch from Bucyrus, Ohio, says that Kincor Beaston, while trying to dig out a chipmunk from under a dairy which his grandfather used forty years ago, found a can of gold coin. There was over $850 in the can. The house had not been used for years and it is supposed the grandfather secreted his money during the war.

Yachting.

Chicago Yachting Notes.

OF course the most talked of subject is the races of the Columbia Y. C. for the Sir Thomas J. Lipton Cup, which have been set for Aug. 27, 28 and 29, which it is hoped will be personally witnessed by Sir Thomas.

Several individuals are making preparations to defend this trophy for the Columbia Y. C., beside the syndicate formed to build two boats for the express purpose of defending the Cup. One of the syndicate boats is to be built from a design of Small Bros. of Boston.

In order to stir up interest in Lipton Cup races among yachtsmen of the other Great Lakes, the Columbia Y. C. is mailing a copy of Deed of Gift, complete rules and full particulars regarding races, and the gold badge given winner, to each member of each yacht club on the Great Lakes, the aim being to make this event as great on the Great Lakes as the America's Cup races are on the ocean.

The Columbia Y. C. have elected for 1903 the following officers:

Commodore, J. F. McGuire; Vice-Commodore, Vernon C. Seaver; Rear Commodore, Oscar Daniels; Secretary, Louis T. Braun; Treasurer, W. C. Heimbuecher; Historian, Le Roy Cook; Delegate to L. M. Y. A., E. T. Balcom. House Committee, C. J. Duggan, Chairman; James A. Davis, W. W. Weightman, H. E. Marshall, H. Boyd-Brydon. Regatta Committee, E. T. Balcom, Chairman; A. G. Wainwright, O. O. Ogden, W. C. Ruhl, S. C. Stewart. Finance Committee, R. C. Rittenhouse, Chairman; A. V. Konsberg, W. Y. Perry. Membership Committee, J. A. Adams, Chairman; C. W. Coleman, W. S. Bougher, E. H. Habersham, U. J. Herrmann. Binnacle Committee, Carl T. Worst, Chairman; Fred. D. Porter, W. C. Ruhl.

The Regatta Committee have announced the following schedule:

May 30, opening race, all classes, with entertainment and presentation of prizes in evening at club house.

June 6, 11th Annual Michigan City race, with guest-boat to follow race. This date is selected, as it is the only full moon Saturday in the month.

July 4, Annual Open Regatta for all classes; and contest for Thos. H. Webb cup open to all seaworthy Lake Michigan cabin yachts from 18 to 30ft. l. w. l., having berths for crew—on time allowance; and first race of series of ten for Thos. H. Webb Cup for 1903, championship of 21ft. cabin class, open to all yachts in class on Lake Michigan, its bays and inlets.

Stag entertainment and presentation of prizes at club house in evening.

Aug. 1, race to Highland Park for Hotel Moraine Cup; and 4th Annual Waukegan race. Then cruise to Milwaukee for L. M. Y. A. Meet—or cut out race to Waukegan and race right through to Milwaukee.

Aug. 7 and 8, L. M. Y. A. meet at Milwaukee for all classes. The races in 21ft cabin class to be second and third races for Thos. H. Webb 1903 Championship Cup.

Aug. 27, 28 and 29, Sir Thomas J. Lipton Competitive cup races. These races to count as fourth, fifth and sixth for Thomas H. Webb Cup for 21ft. cabin class 1903 championship.

Sept. 5, cruise to Indiana Harbor.

Sept. 9, 10 and 11, seventh, eighth and ninth races for Thos. H. Webb Cup for 21ft. cabin class 1903 championship.

Sept. 12, Twelfth Annual Fall Regatta, open for all classes; and tenth race for Thos. H. Webb Cup for 21ft. cabin class 1903 championship. Entertainment and presentation of prizes at club house, and awarding of 1903 championship flags.

Boston Letter.

BOSTON, Jan. 19.—Six boats have been ordered for the new 22ft. class, and from the present outlook it would seem that the class is to be a go. Differences of opinion still exist as regards the value of the boat, but the main fact is that a sufficient number of the yachts are to be built to warrant clubs giving the class their attention. Burgess and Packard have orders for three, two of which are now building by Hodgdon Bros. at East Boothbay, Me. One of these, for Mr. Sumner H. Foster, is all planked, and the other, for Mr. Herbert White, is in frame. The third boat from these designers is for Mr. W. H. Joyce, of Philadelphia, who summers at Gloucester. She will be built by Lawley, and work upon her has been started. Fred Lawley has designed a 22-footer for Mr. Sanford C. Winsor, of the Duxbury Y. C. The keel and molds for this boat were turned out at Lawley's and shipped to Duxbury, where she is now being built. Mr. Frank Neal has ordered one of the boats, which is now being built by the Hanley Construction Co. Mr. John Greenough, of New York, who summers at Gloucester, has ordered Archie Fenton, of Gloucester, to design and build him a 22-footer. There has been a rumor to the effect that Fenton is to build another, and it is thought that this boat may be for Mr. B. A. Smith, for whom Fenton built the 25-footer Seboomook, last season.

It is expected that all of the boats will race on the Massachusetts Bay circuit, and that they will keep together as much as possible. To bring this about, Mr. John Greenough will offer a special prize for the season's work, in addition to the regular prizes the yachts may win in the regular races. It is considered that other yachtsmen who are interested in the class, will also offer special prizes.

The 18ft. knockabout class will undoubtedly be the largest one that has ever been raced in Massachusetts Bay. There are so many new boats building for this class that it is next to impossible to trace them at this time. They are being built all along the coast, many of them in Maine, and it is likely that the full complement will not show up until the racing season has fairly opened. There must be at least 15 new ones being built. They are owned by Duxbury yachtsmen, members of the Hull-Massachusetts Y. C., and several will be owned in Marblehead and at places along the north shore. In each race of the midsummer series of the Hull-Massachusetts Y. C. last season there were 10 entries in this class. It is not at all unlikely that under the same conditions, as many as 25 will show up at the starting line in races this season.

Nothing has been heard of in the line of new 21-footers, and what will be done with the class is a question. It is likely, however, that the owners of the yachts will get together and make some arrangement. There are five 25-footers being built, which vary in over all length, although there is none that is very short in this respect. The longest is 55ft. over all, while a moderate one is 48ft. On one of them there is a truss bracing which comes up through the center of the standing room floor. While this kind of construction is not admired in a yacht that is supposed to be a cruising yacht, it is considered that it will be an object lesson upon the advisability of changing rules. It is not generally believed that a yacht so constructed is to be recommended either as a racer or a cruiser.

At the annual meeting of the Corinthian Y. C., held at the Algonquin Club last Tuesday, the following officers were elected: Commodore, J. O. Shaw, Jr.; Vice Commodore, D. C. Percival, Jr.; Rear Commodore, Butler Ames; Secretary, Everett Paine; Treasurer, J. B. Rhodes; Measurer, Parker H. Kemble; Executive Committee, Francis E. Peabody and W. H. Rothwell; Regatta Committee, G. W. Mansfield, H. S. Goodwin, W. W. Keith, G. H. Mayo and E. A. Boardman; Membership Committee, Percival W. Pope, O. W. Shead and C. D. Wainwright; House Committee for three years, A. K. Simpson.

The Cottage Park Y. C., of Winthrop, has elected the following officers: Commodore, A. T. Bliss; Vice Commodore, Lemuel C. Moody; Secretary, C. C. Ehrman; Treasurer, Alfred Rogers, Jr.; Directors, G. F. Payne, William Handy, H. J. Cook and Thomas Copeland; Measurer, E. P. Morse; Membership Committee, W. H. Britton, F. W. Nickerson, Albert Dunham, H. A. Magee, F. E. Drew, C. E. Cowan and F. P. Anthony; Regatta Committee, A. B. Freeman, Russell Gardner, William McMillan, A. S. Richards and W. H. Williams; Entertainment Committee, W. J. Kershaw, C. E. Trasker, C. H. Ide, F. R. Pratt, H. Buchanan and W. H. Williams.

The Dorchester Y. C. has elected the following officers: Commodore, T. W. Souther; Vice Commodore, W. H. Cutler; Rear Commodore, W. A. Rumpf; Secretary, William Mace; Treasurer, G. H. Collyer; Measurer, C. W. A. Bartlett; Regatta Committee, L. M. Clark, T. W. King, M. L. Crow, Hjalmar Lundberg and J. P. Mead; Directors, C. H. Nute, Coolidge Barnard and H. W. Smith; Membership Committee, C. W. A. Bartlett, Thomas Cotter, A. P. Nute and Albert Foster; House Committee, H. Lundberg, G. J. Foster and Theodore Winds.

The South Boston Y. C. has elected the following officers: Commodore, Franklin L. Codman; Vice Commodore, E. A. Shuman; Rear Commodore, D. N. Palmer; Secretary, P. J. McMahon; Treasurer, W. H. French; Measurer, F. H. Borden; Fleet Surgeon, Dr. T. G. Reed; Trustees, J. T. Hurley and W. H. Godfrey; Regatta Committee, G. W. Armstrong, Maurice Lee, Arthur Leary, E. J. McKee and A. T. Otis; House Committee, H. S. Brown, G. P. Field, Thomas Harrison, M. J. Lynch and H. T. McArdle.

The following officers have been elected by the Savin Hill Y. C: Commodore, J. P. Hawes; Vice Commodore, J. E. Robinson; Rear Commodore, J. E. Scott; Secretary, H. T. Washburn; Treasurer, C. A. J. Smith; Directors, A. Coombes and W. H. Besarick; Measurer, C. H. Conant; Membership Committee, W.

R. Beetle, E. L. Bragg, A. Coombes, W. S. Harvey, L. T. Howard, G. C. Scott and C. R. Willard.

The Columbia Y. C. has elected the following officers: Commodore, F. E. Grainger; Vice Commodore. Hiram Patterson; Rear Commodore, M. B. Roach; Secretary, C. N. Stream; Treasurer, A. E. Justice; Measurer, J. R. Young; Fleet Captain, G. H. Cobb; Trustees, J. E. Doherty and A. E. Justice; House Committee, R. J. Huntley, A. F. Brown, G. H. Cobb, W. A. Paine, J. W. Booth, T. A. Shepard and J. F. Mathieson; Regatta Committee, F. P. Pfund, J. R. Young, J. E. Hunt, J. E. Dillihunt, C. H. Heath, E. A. Shepard and G. H. Winans; Membership Committee, Joseph Spry, F. W. Frazer and James Leveredge.

Hollis Burgess has sold the 25-footer Tiger, owned by W. C. Allison, of Philadelphia, and the 21-footer Otillie, owned by H. L. Banks, of Dorchester. They have been purchased by Boston parties, who do not wish their names mentioned.

Small Bros. have orders for a 28ft. waterline cruising yawl for J. A. Nicklett, of Toledo, and a 28ft. cruising yawl for E. and S. H. Eldridge, of Boston. The latter will moor at Yarmouthport, and will be used for cruising on the Maine coast. The same firm has an order for a 29ft. cabin launch for a Boston yachtsman.

Burgess & Packard have an order for a one-design class of keel 15-footers. The order was given by W. C. Rhoades, of Providence. The cutter Edith, recently purchased by Starling Burgess, is at Murray & Tregurtha's, where the joiner work on her interior alterations will be done and her engine will be installed.

E. A. Boardman has a sketch of a Seawanhaka challenger, which he may build for himself. She will be about 41ft. over all, 26ft. waterline, 8ft. 2in. beam and 5½in. draft. Her after body will be peculiar, the deck and the body planking meeting at the stern, there being no transom. She is sharp forward, with a 10ft. overhang, and the jib will be set well inboard. The formation of the stern will allow her to slide through the water that is taken on deck. A truss will be used to keep the stern stiff. She will have bilge boards and a single rudder.

Crowninshield has an order for a 25ft. cruiser for L. C. Wade. She will be 42ft. over all. She will be named Apache II. He has also an order for a racing 30-footer for George Wright, of Halifax.

JOHN B. KILLEEN.

Origin of the Centerboard.

Editor Forest and Stream:

Your Philadelphia correspondent, H. L. Shaw, who in FOREST AND STREAM of this date discusses the origin of the centerboard, treats of an interesting subject, and makes out a strong claim for the Wilkins boys, of New Jersey, as inventors of the device. It has often happened that the same idea has occurred to different men widely separated and wholly unconscious of each other's existence. Perhaps the young men spoken of by Mr. Shaw were actual inventors of the centerboard, and that if they had applied for a patent would have been entitled to receive one on the contrivance. But that they were the original and first inventors of the centerboard is improbable in the face of evidence which seems to fix the date of the invention at least some twenty years prior to 1820, the year in which Messrs. Wilkins are said to have built their first boat.

Some few years ago, when searching for material out of which to weave a sketch of the history of this city, I was fortunate enough to meet with a book of travels written by John Maude, an Englishman, who made a journey on horseback through the Genesee country in 1800. His book contains many interesting observations on the men and things he saw between the Hudson and Niagara Rivers. The particular item which he jotted down that pertains to the conterboard was dated at Geneva on August 17, 1800, and is as follows, italics and all: "Captain Williamson is now building a sailboat with a *jumping keel lee board,* a new invention, the keel itself acting as a leeboard, and so contrived as to slide, or *jump* into a box fitted for its reception the instant it strikes ground. Its design is as a lee-board to prevent upsetting, and its *jumping keel* is to adapt it to shallow water." This is a fair and concise description of the centerboard in common use, and establishes the fact that the invention was known in 1800. Mr. Maude does not say that Captain Williamson was the inventor, and on that point we may have to remain in the dark. The Captain Williamson spoken of was a Scotchman who became agent in this country for the London owners of a vast tract of land in western New York, surrounding the site of Rochester and including Spring Creek, on which the State Fish Hatchery at Caledonia is situated.

While Maude's reference to the Williamson boat is not conclusive as to the origin of the centerboard, it sets a remoter date for the invention than 1820. Perhaps someone else can show that it was known before 1800.

E. REDMOND.

ROCHESTER, N. Y., Jan. 17.

Seawanhaka Corinthian Y. C.

THE annual meeting of the Seawanhaka-Corinthian Y. C. was held at the club's quarters, 12 West Forty-fourth Street, on the evening of Jan. 13. Commodore A. Curtiss James presided, and the meeting was well attended. The following officers were elected:

Commodore, Arthur Curtiss James, auxiliary brigantine Aloha; Vice Commodore, William J. Matheson, steam yacht Lavrock; Rear Commodore, Frank S. Hastings, yawl Peggy; Secretary, Francis G. Stewart; Treasurer, Frederic P. Moore; Measurer, John Hyslop; Fleet Surgeon, N. Bowditch Potter, M. D.; Fleet Chaplain, Rev. George R. Van de Water, D. D.; Trustees, Colgate Hoyt, Franklin A. Plummer, and Henry H. Landon; Race Committee, Johnston de Forest, Charles W. Wetmore, Clinton H. Crane, Daniel Bacon and John R. Maxwell, Jr.; Committee on Lines and Models, John Hyslop, A. Cary Smith and St. John Smith; Law Committee, Henry de Forest, William A. W. Stewart and William G. Low, Jr.

The report of the Race Committee was interesting.

LATONA—OWNED BY HENRY C. ENO, M.D.

The number of races sailed last year was 35 as against 20 the preceding year, 323 yachts started as against 216 in 1901, and 138 prizes were awarded, an increase of 54 over the preceding year.

The Center Island cup for Seawanhaka knockabouts was awarded to Marcia. This boat had a point record of .857, Gowan was second with .750. Marcia also won the knockabout series races.

An interesting circular has been sent out by the club relating to the new 15ft. class. Six of these boats are completed and twenty-two have been ordered. The net cost of each boat is $546.25, the sails cost $56, and $30 are allowed for incidentals. All the boats will be completed by May 1. The boats are building at Nyack, on the Hudson. Mr. Clinton H. Crane gave one of the boats a trial some time ago, and the following is the report submitted by him to the members of the club:

The writer recently gave No. 1 of the Seawanhaka 15ft. class a trial and sail on the Hudson River off Nyack. The temperature was 8 degrees above zero and a fresh breeze was blowing from the west-northwest. This made the wind under the shore very light and puffy, but further out in the river a fresh and very nice little breeze was blowing.

The boat went out with three men on board, and handled very satisfactorily even in the strongest puffs, carrying sail so well that no one of the men on board paid any attention to his position in the boat, that is, whether it was to windward or leeward. The boat steered on all points of sailing with the tiller practically amidships, and handled with marvelous quickness.

It would have been more satisfactory to have tried the boat again in a reefing breeze, but as the river was fast freezing up it seemed impractical to keep the boat in the water longer, and she was, therefore, hauled out and dismantled. Certain details of rigging and cleats were changed, and the fleet as a whole will have the benefit of this trial. It seemed to the writer that the seats in the cockpit were unnecessary, but as they have been nearly all made, it was decided to leave them as originally shown on the plans, with the idea that the individual owners could leave them in the boat or take them out, as they saw fit.

The boats are a very beautiful job of work, and should compare favorably with any of the highest class of small sailing boats.

CLINTON H. CRANE.

Latona.

THROUGH the courtesy of the designers, Messrs. Tams, Lemoine and Crane, we are able to reproduce in this issue the plans of the 70ft. waterline cruising schooner Latona, that was built by the George Lawley & Son Corp., for Henry C. Eno, M. D., in 1899.

Latona is a centerboard boat of moderate draft. Her construction is composite. Mr. Eno uses the boat for cruising along the coast, and she has proved herself not only a good sea boat but quite fast, and is just adapted to the owner's requirements.

The dimensions follow:

Length—	
Over all	97ft. 3in.
L. W. L.	70ft.
Overhang—	
Forward	11ft. 4in.
Aft	15ft. 11in.
Breadth—	
Extreme	19ft. 4in.
L. W. L.	18ft. 10in.
Draft—	
Without centerboard	8ft. 7in.
Freeboard—top of rail—	
Forward	7ft. 6in.
Least	4ft. 10in.
Taffrail	5ft. 6in.

Latona has a large amount of room under a flush deck, and it has been economically disposed of. The companionway leads to a steerage or chart room 4ft. long. A door gives access to the ladies' cabin, which is aft. This room is nearly 8ft. long and extends the full width of the boat. The room is arranged in the usual way, with berths on each side and transoms in front, and the bureau and hanging lockers at the after end. There is a skylight overhead. On the starboard side forward is a bath room 4ft. long.

The main saloon is 10ft. long and runs right across the boat. Wide transoms with shelves behind, extend along each side. At the after end is a desk and fireplace, while the sideboard is forward on the port side. A short passage on the starboard side of the centerboard trunk gives access to two staterooms. The smaller is 6ft. 3in. long, and the larger is 6ft. 7in. long. Both are fitted with wide berths, bureaus, set marble basins, etc. On the port side, opposite, is a stateroom 7ft. 9in. long, very completely fitted and a separate toilet room 2ft. 6in. long.

One of the prime reasons which makes Latona such an ideal cruising vessel is owing to the unusual size of the pantry, galley, storeroom and ice box. They are remarkably large, well arranged and completely equipped; the pantry is 4ft. 7in. long, the storeroom 4ft. 4in. long, and the galley over 6ft. long. On the starboard side, opening from the mess room, is the captain's cabin, 6ft. 2in. long. There is also a cabin for the stewards, which is reached from the galley. The forecastle has accommodation for eight men.

The drawings of the sections give a good idea of the thorough manner in which the boat is constructed. The sail plan shows a graceful and well balanced rig. Latona steers with a wheel, and she carries three boats on the davits, a launch, a gig and a dinghy. Everything about the boat is of the best, and no expense was spared to make her one of the most complete cruising boats of her size afloat.

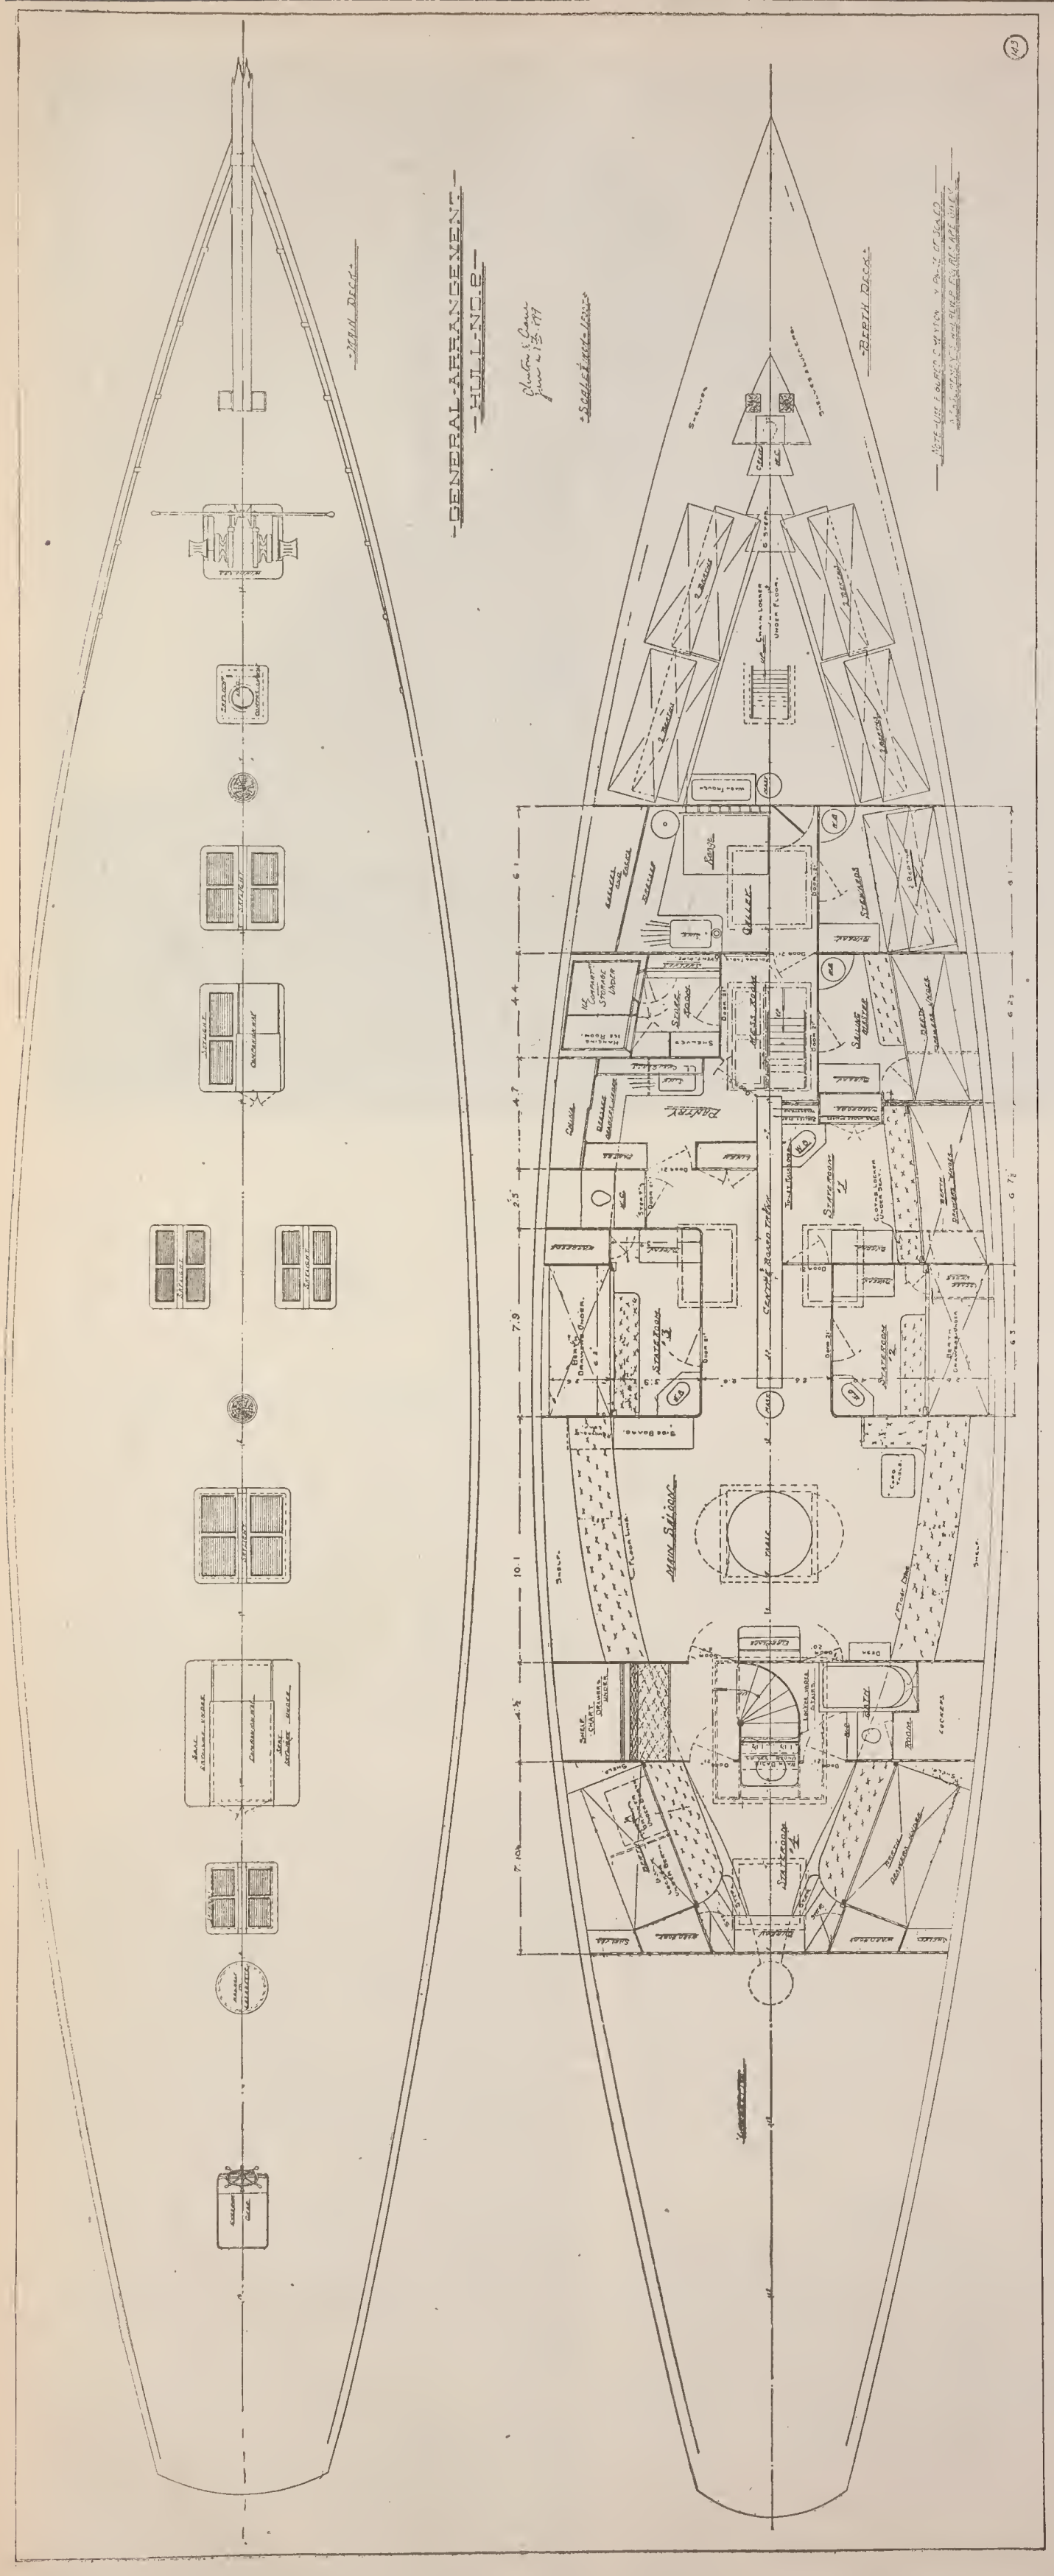
Mr. William H. Ketcham, chairman of the Regatta Committee of the Columbia Y. C., has sent the following letter to officers of all yacht clubs in the vicinity of New York:

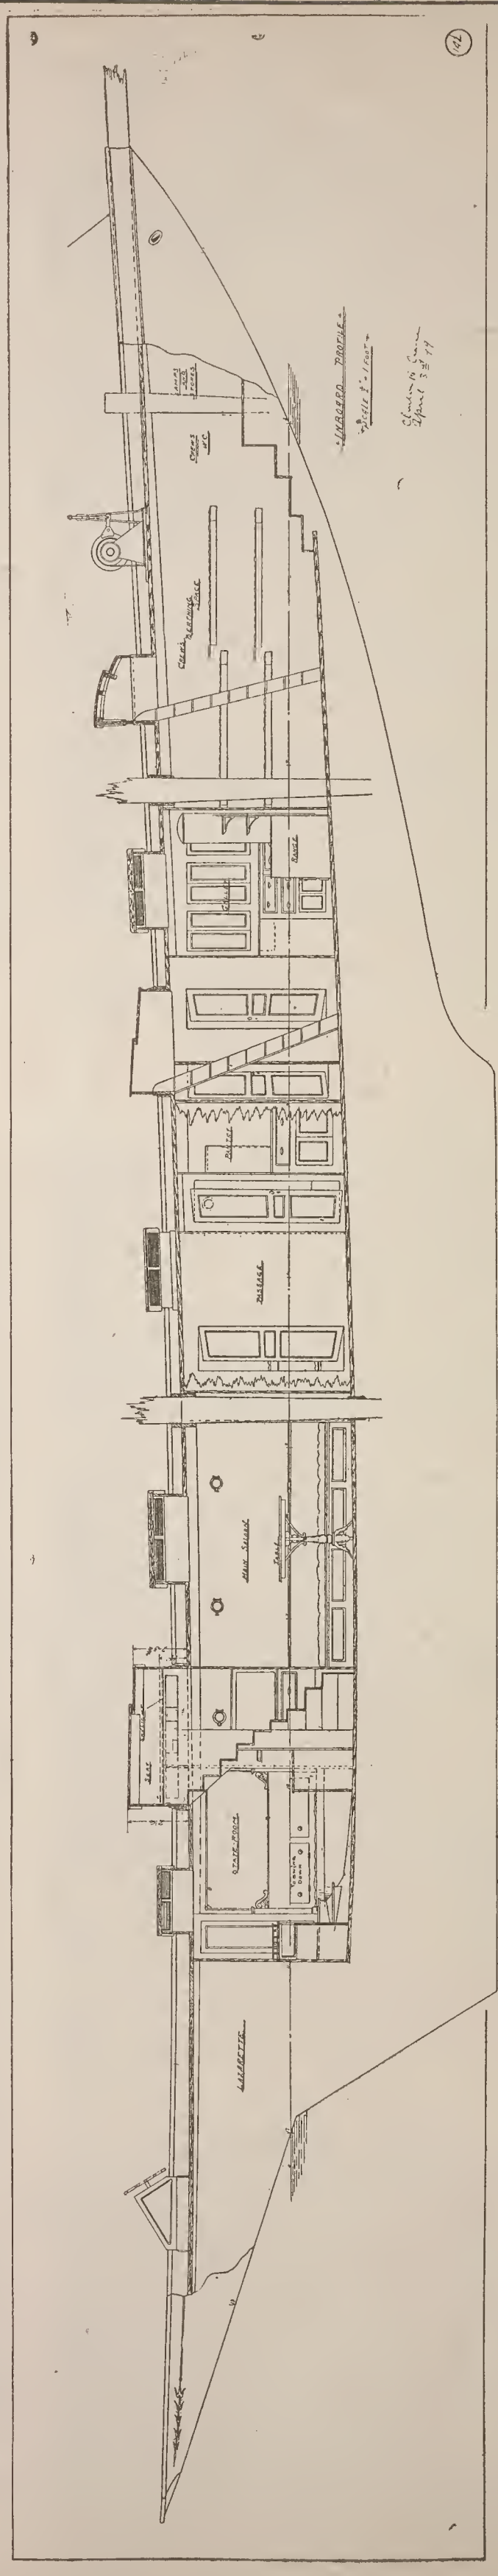
We beg to cordially invite you and any members of your club who may be interested in motor boat racing to meet the members of this and other clubs at our club house on Tuesday evening, Jan. 20, at eight o'clock.

It is our intention and desire to promote the sport of power boat racing, and to this end we wish to incorporate rules and formulate a table of time allowances to govern the same.

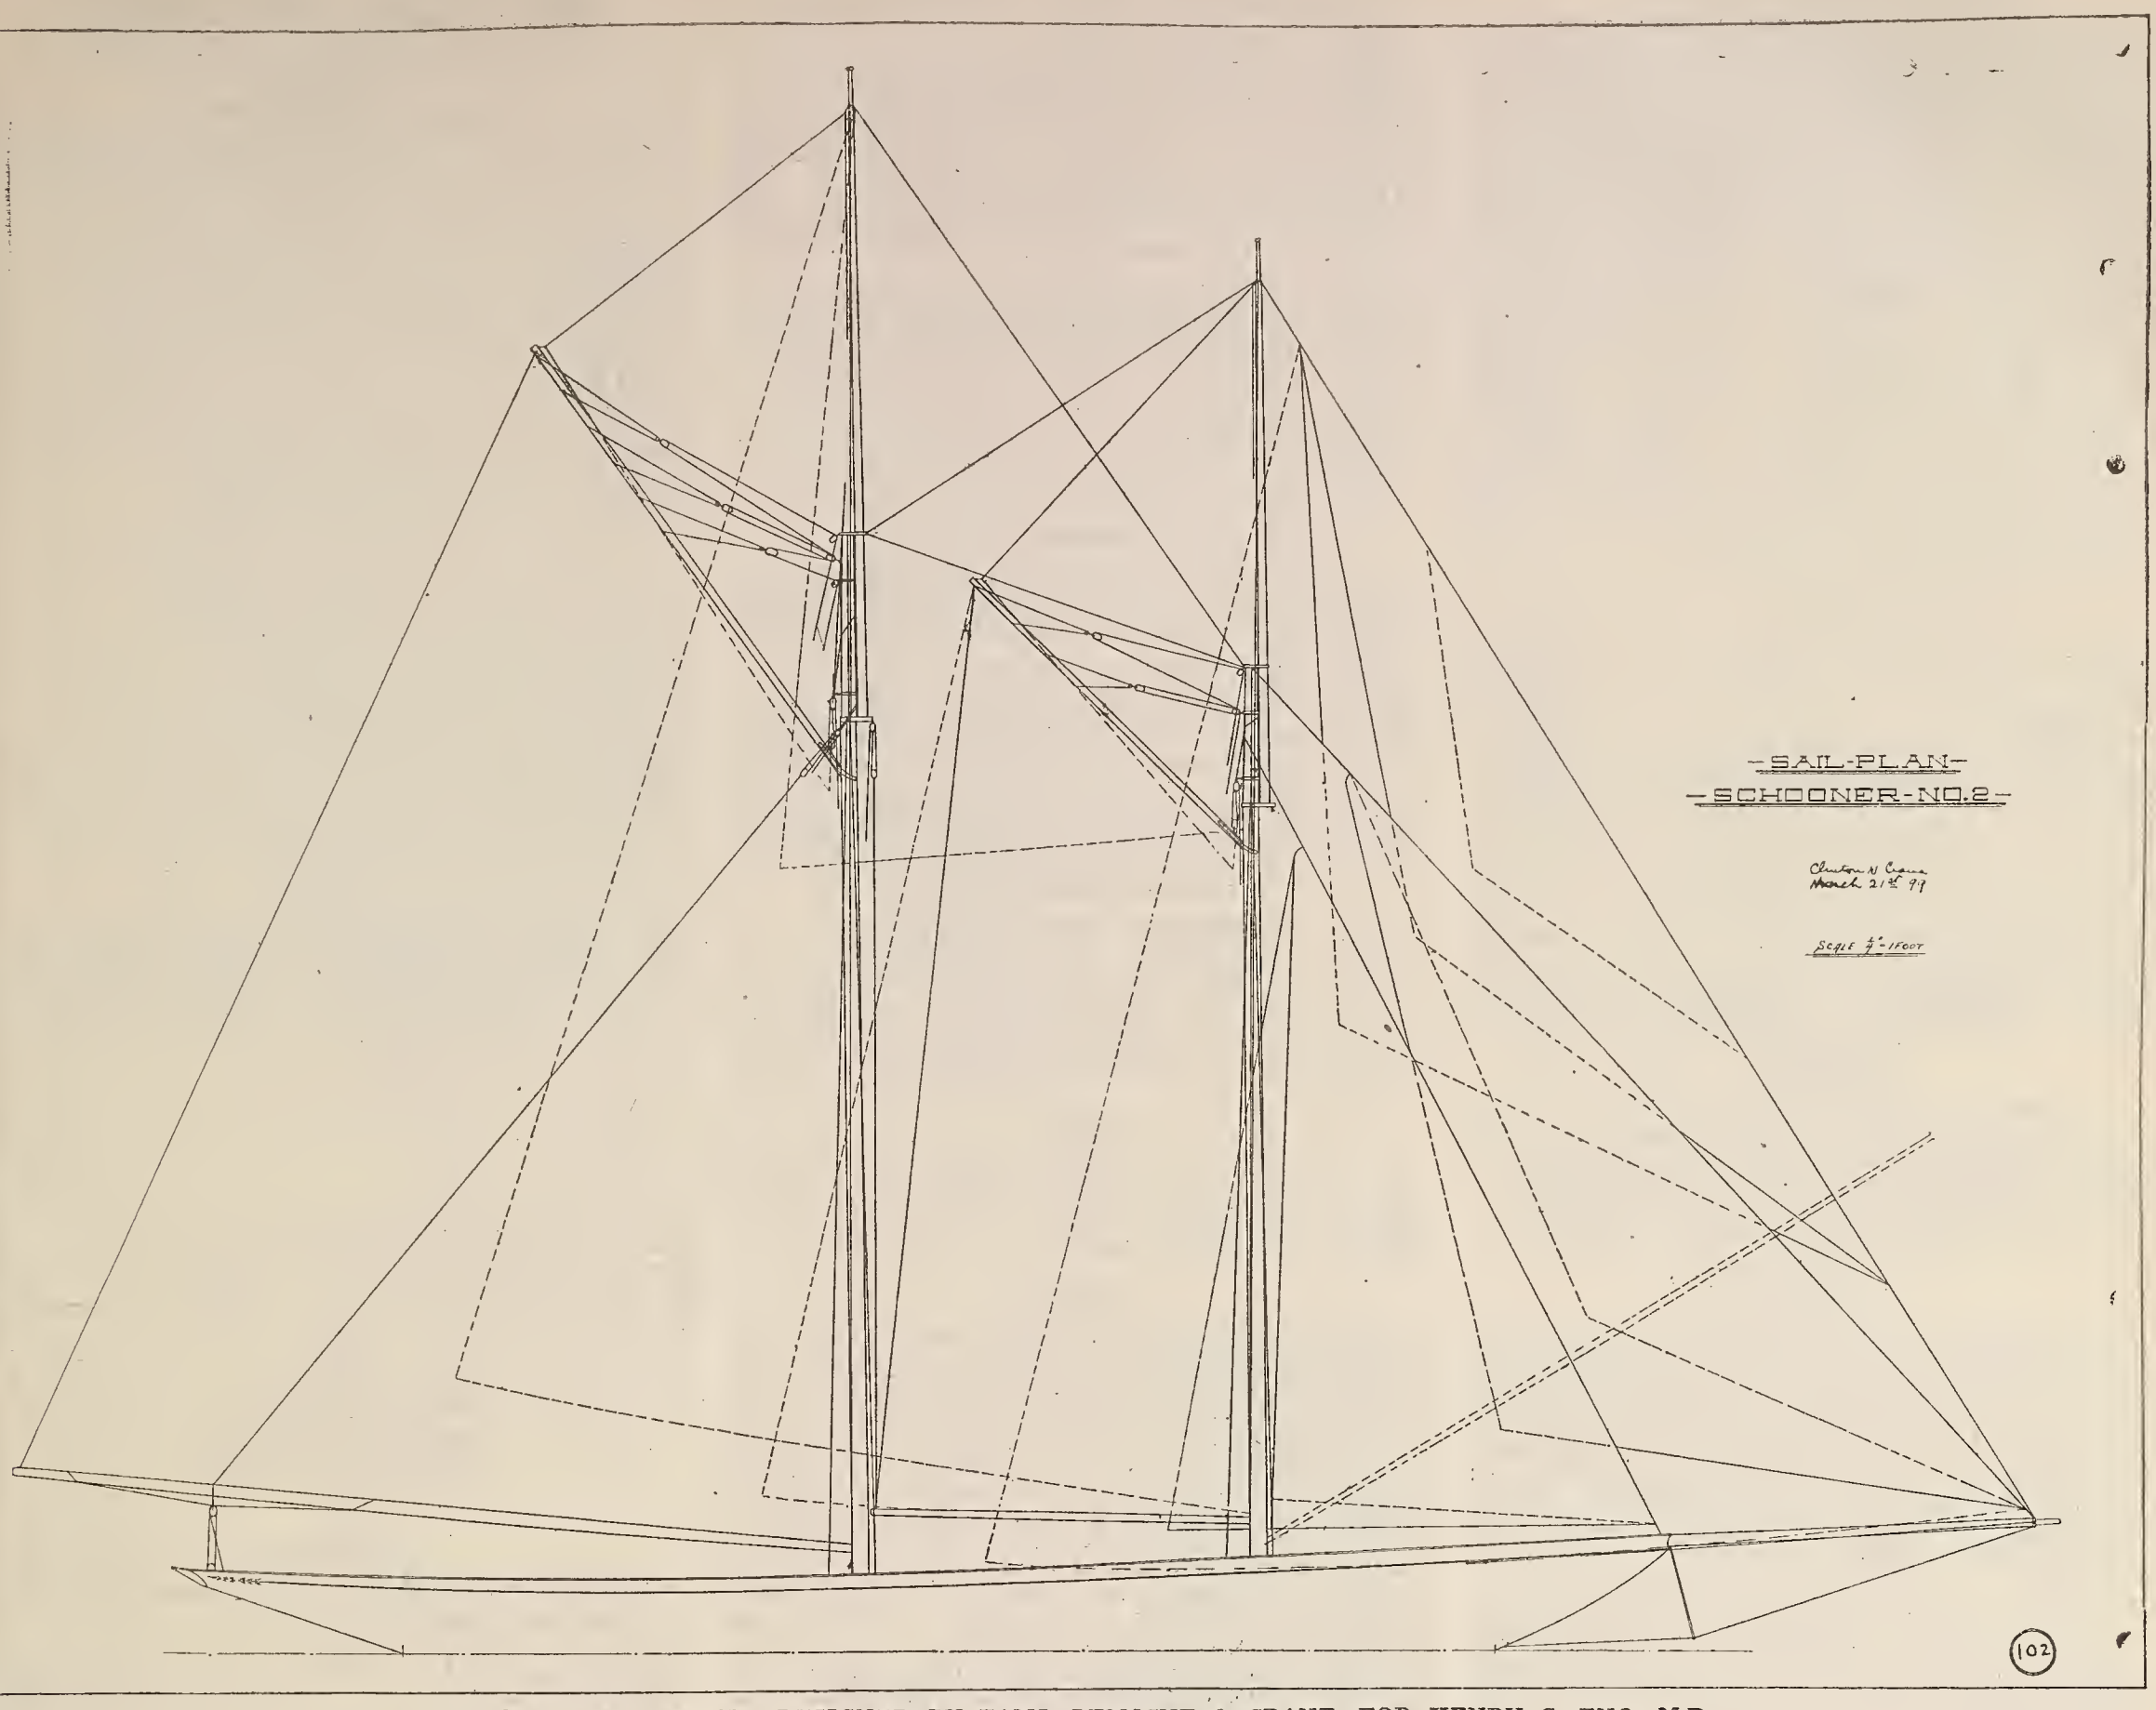
Any data which you may have or can obtain relating to the matter we shall be pleased to have presented at the meeting.

Will you kindly advise us what action you may be willing to take in this matter, and, if possible, give us some idea as to how many of your members we may expect to have present at the meeting, and oblige?

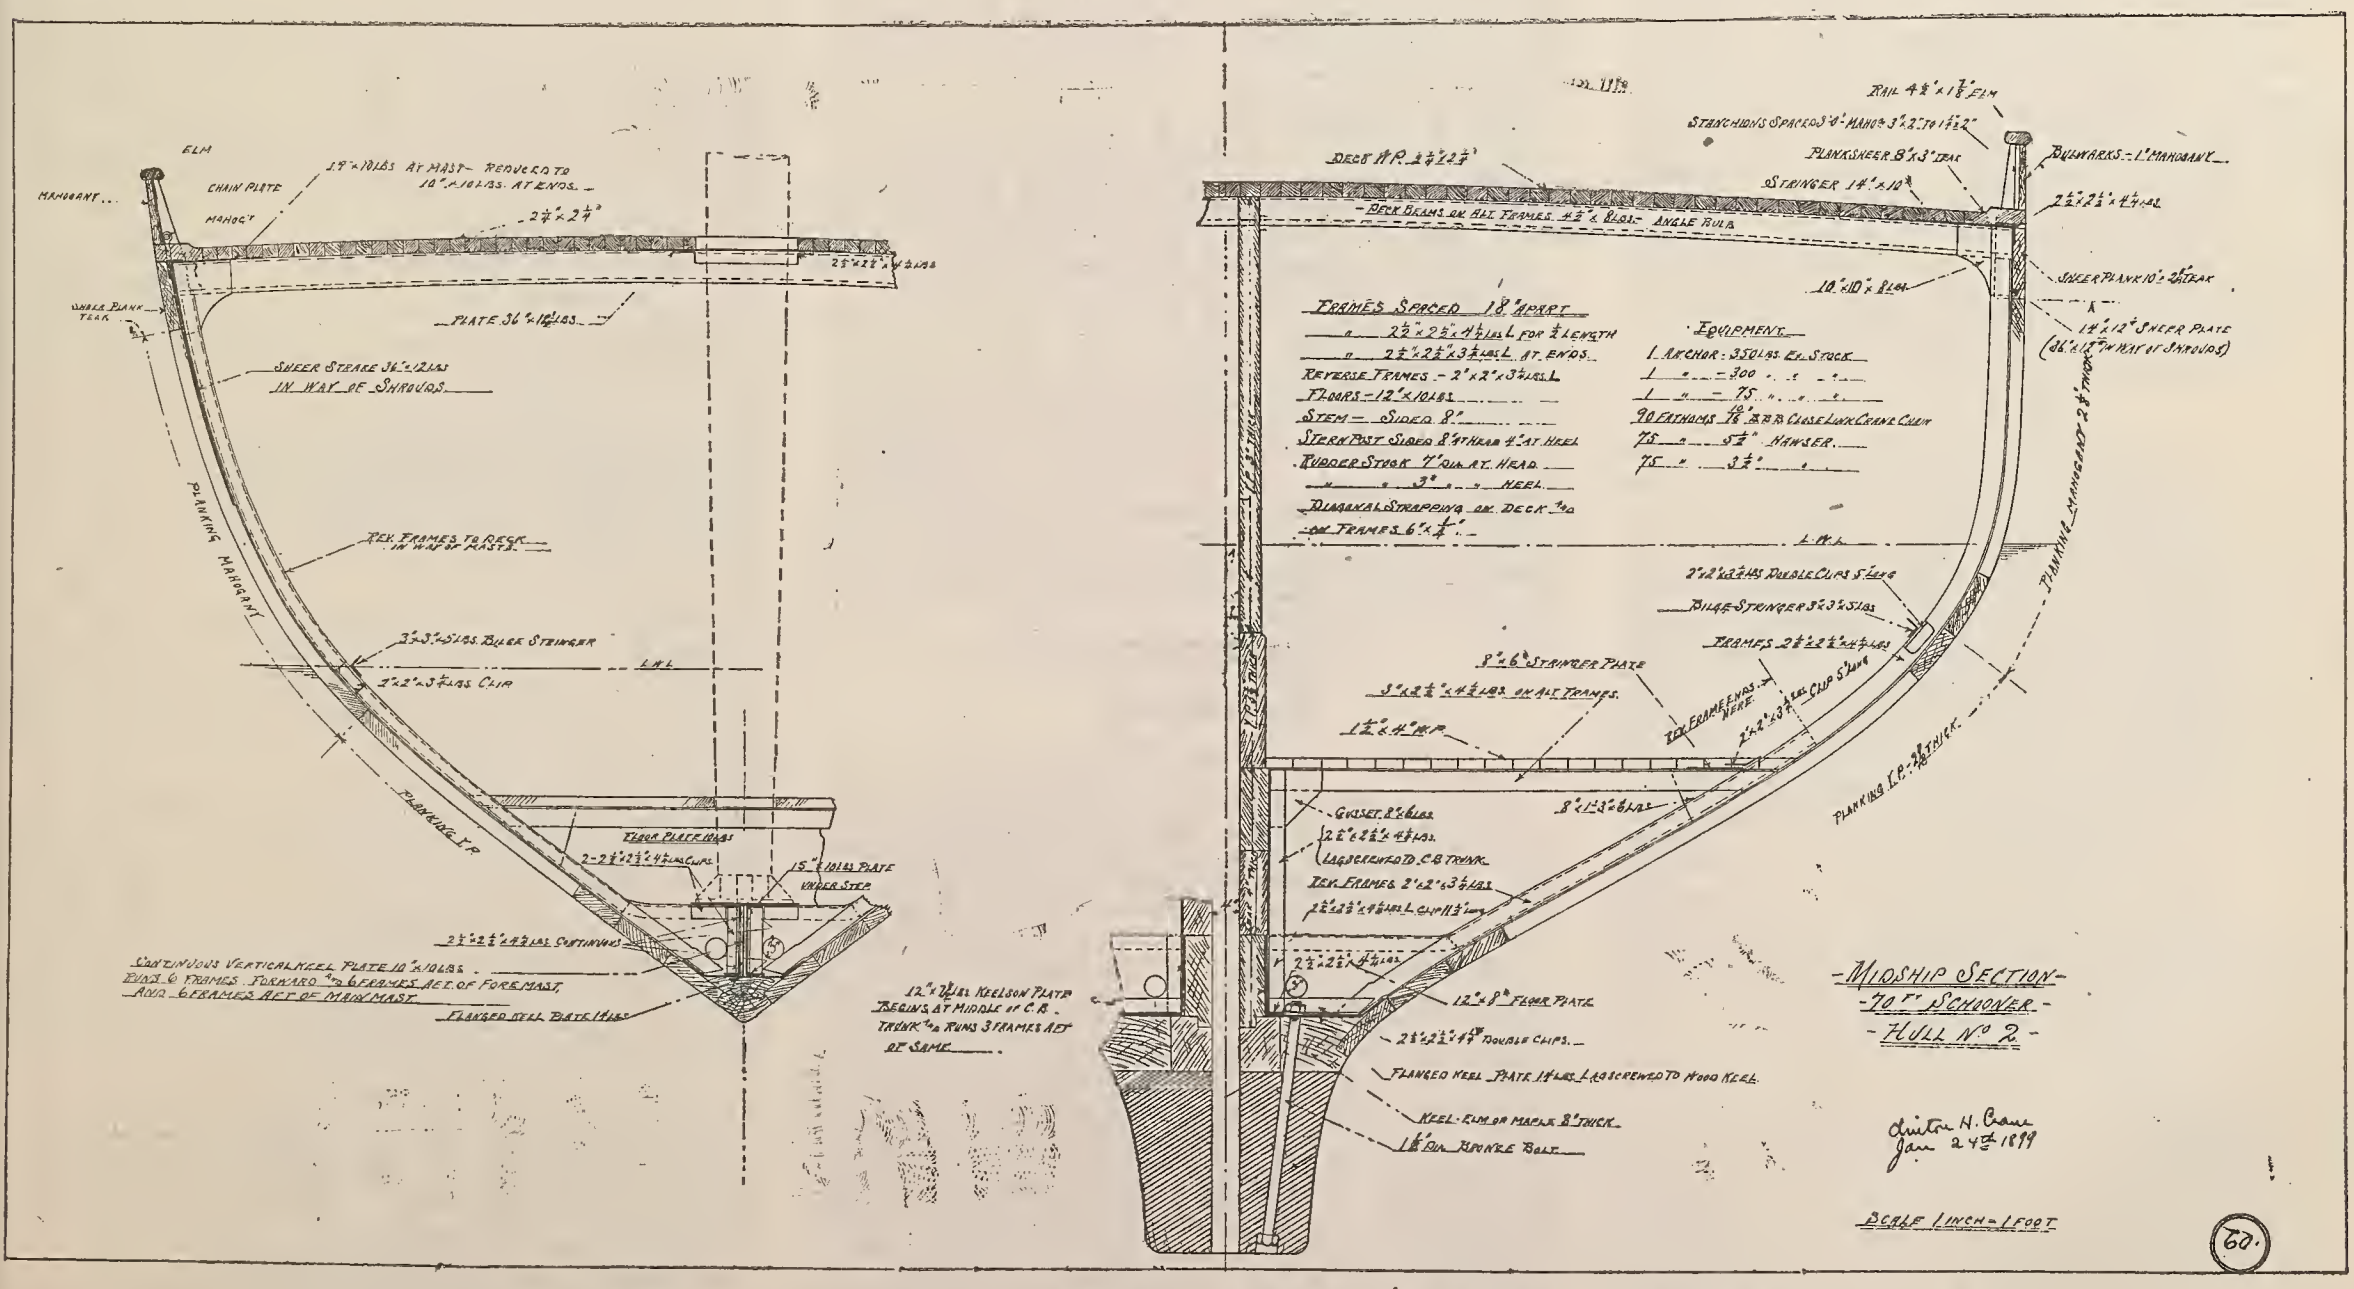




LATONA—INBOARD PROFILE, CABIN AND DECK PLANS—DESIGNED BY TAMS, LEMOINE & CRANE—OWNED BY HENRY C. ENO, M.D.



LATONA—SAIL PLAN—DESIGNED BY TAMS, LEMOINE & CRANE, FOR HENRY C. ENO, M.D.



LATONA—SECTIONS—DESIGNED BY TAMS, LEMOINE & CRANE, FOR HENRY C. ENO, M.D.

YACHT CLUB NOTES.

The Nominating Committee of the New York Y. C. has selected the following gentlemen to serve in the several offices and committees for the coming year:

Commodore, Frederick G. Bourne; Vice Commodore, Henry Walters; Rear Commodore, Cornelius Vanderbilt; Secretary, George A. Cormack; Treasurer, Tarrant Putnam; Measurer, Charles D. Mower; Fleet Surgeon, J. M. Woodbury, M. D.; Regatta Committee, S. Nicholson Kane, Newbury D. Lawton and Edward H. Wales; Committee on Admission—Henry C. Ward, Frederic Gallatin, Cornelius Vanderbilt, Henry S. Redmond and James A. Wright; House Committee, Thomas A. Bronson, Commander J. D. Jerrold Kelley, U. S. N., and Henry Sampson, Jr.; Library Committee, Lewis A. Stimson, Thomas A. Bronson and Albert Bradlee Hunt; Committee on Club Stations, William H. Thomas, Henry H. Rogers, F. Augustus Schermerhorn, Augustus C. Tyler, Charles Lane Poor, C. L. F. Robinson, Harrison B. Moore, Henry C. Ward, W. Lanman Bull and J. Rogers Maxwell.

The annual meeting will be held at the club house on Thursday evening, Feb. 12.

* * *

The annual meeting of the Hudson River Y. C. was held on the evening of Jan. 7, and the following officers were elected:

Commodore, F. J. McLaren; Vice Commodore, Owen Reilly; Rear Commodore, Paul Wetzel; Secretary, Louis C. Maurer; Financial Secretary, Louis H. Schwiers; Corresponding Secretary, C. H. Frerichs; Treasurer, L. J. Dirig; Librarian, Louis Adler; Measurer, John J. McCarthy; Fleet Surgeon, D. Benthman Spence, M. D.; Steward, John Wallace; Fleet Captain, H. Van Buren; Trustees, M. R. Ranhofer, J. Hargreaves, William H. Donaldson, William Lumbine, Charles Whitehouse, O. C. Hoddick, Paul Voegeli, M. Friedman, Everett Ryder, and George A. Steigleder; Regatta Committee, Henry C. Camenden, R. Entwistle, J. W. Smith, C. J. Everett and D. W. Trenifidi.

* * *

At the annual meeting of the Stuyvesant Y. C. the following officers were elected for 1903: Com., W. C. Cartwright; Vice-Com., Robt. Ten Eyck; Rear-Com., J. McGregor; Treas., C. S. Ogden; Meas., J. Babst. Board of Directors: W. Moeller, chairman; W. T. Hogg, F. P. Buell, H. Mertens, M. Fauth. Regatta Committee: J. Kraus, G. F. Zeiler, R. Ten Eyck, J. McGregor, O. Arland.

* * *

The Williamsburg Y. C. elected the following officers at the annual meeting: Com., William E. Long; Vice-Com., William B. Nallen; Rear-Com., Robert Chapman; Sec'y, James Spears; Cor. Sec'y, Thomas H. Doremus; Treas., James Schussell; Meas., Henry Schneider; Steward, Edward Padbourg; Sergeant-at-Arms, Ralph Olleio; Fleet Captain, Charles Hartman; Trustees, Adolph Kling, Henry Schneider, Paul Schmidt, A. Monroe and A. Silk; Regatta Committee, H. Schneider, James Spears and A. Kling.

* * *

The following officers were elected for 1903 at the annual meeting of the Harlem Y. C. held a short time ago: Com., John Wimmer; Vice-Com., C. G. Branneck; Rear-Com., F. L. Muhlfeld; Treas., T. Benjamin Bates; Financial Sec'y, W. B. McAllister; Recording Sec'y, J. Francis Proctor; Corresponding Sec'y, S. L. Schider; Fleet Surgeon, George H. Wilson, M.D.; Treas., Emil Miller; Chairman of the Race Committee, Edward M. Hartman; Trustees, Adolph G. Austin, Frank McDermott, L. Bigelow, William Turner, William Strauss and Walter S. Sullivan.

* * *

The annual meeting of the Philadelphia Y. C. was held on Jan. 12, and the following officers were elected:

Commodore, Alexander Van Rensselaer; Vice Commodore, Robert J. W. Koons; Rear Commodore, E. Walter Clark, Jr.; Secretary, Addison F. Bancroft; Treasurer, George E. Kirkpatrick; Measurer, J. Murray Watts; Race Committee, Addison F. Bancroft, Harvey J. Mitchell, John A. Inglis; Committee on Admission, Charles H. Brock, Alexander Van Rennselaer, G. Herbert Millet, Frank H. Rosengarten, Brereton Pratt; Trustees, to serve three years, Frank H. Rosengarten, Dr. Richard H. Harte.

* * *

The first meeting of the Indian Harbor Y. C., since its incorporation under the laws of the State of Connecticut, was held on Jan. 14, and the following officers were elected: Commodore, Frank Tilford; Vice Commodore, George Lander, Jr.; Rear Commodore, H. P. Whittaker; Treasurer, Richard Outwater; Secretary, Chas. P. Geddes; Measurer, Morgan Barney; Trustees, Edwin C. Converse and F. S. Doremus; Regatta Committee, Frank Bowne Jones, Charles E. Sims, Thomas J. McCahill, Jr., F. Sterne Wheeler and Harry C. Nash.

The committees of the Manhasset Bay Y. C. for the season of 1903 are made up as follows:

Regatta Committee, E. M. MacLellan, Robert Jacob and Charles D. Mower; House Committee, James W. Alker, G. Searing Wilson and Roy M. Lincoln; Library Committee, James R. Thomson, Bartholomew Jacob and Thomas Fleming Day; Law Committee, David Provost, S. B. Hamburger and James W. Pryor; Art Committee, Robert W. Jackson, Julian Rix and Charles A. Harriman; Entertainment Committee, Hazen L. Hoyt, Thomas Wilson, Jr., and Charles H. Hoyt; the Finance Committee consists of the Commodore, the Secretary and the Treasurer.

* * *

The Committee on Lectures of the New York Y. C. has given out the programme for 1903, which is as follows:

Jan. 22—"Recent Improvements in Aid to Navigation," Captain William M. Folger, U. S. N., inspector in charge, Third Lighthouse District.

Feb. 5—"Reminiscences of Navigation and Storms and the Treatment of Storms," Captain Charles D. Sigsbee, U. S. N., chief of Bureau of Naval Intelligence, Navy Department.

Feb. 19—"Recent Advances in Telescopic Astronomy," Professor G. M. Ritchey, Chicago University, Yerkes Observatory.

March 5—"The United States Marine Corps," Major-General Charles Heywood, U. S. M. C.

March 19—"What the Hydrographic Bureau Has Done for Our Maritime and Commercial Interests," Commander W. H. H. Southerland, U. S. N., chief of Hydrographic Office, Navy Department.

April 2—"Field Work of the Peary Arctic Club, 1898-1902," Commander Robert E. Peary, C. E., U. S. N.

April 16—"An Evening with a Stereopticon; Yachting, Ice Yachting and Hunting Wild Game," former Rear Commodore Archibald Rogers, N. Y. Y. C.

April 30—"Coaling Stations," Rear Admiral Royal B. Bradford, U. S. N., chief of Bureau of Equipment, Navy Department.

May 7—"Yachting in the Caribbean," former Vice Commodore Anson Phelps Stokes, N. Y. Y. C.

May 14—Music, "An Evening with the Commodore."

* * *

Indications point to a great year of yachting on Gravesend Bay. It is as yet rather early to learn anything definite. There is, however, lots of agitation regarding new boats.

The Brooklyn Y. C. is to have a new house on the end of the north pier of the new yacht basin now building at a point just below Ulmer Park. The B. Y. C. location is some 400 feet out into the bay and should prove admirable.

Work is being rushed on the basin, which is of comprehensive proportions, and this feature is expected to help along greatly yachting on Gravesend Bay.

YACHTING NEWS NOTES.

Mr. J. H. Smedley, of Detroit, is having built at the works of the Gas Engine and Power Co. and Charles L. Seabury Co., from their own designs, an auxiliary yawl. The boat, which will soon be put overboard, is 57ft. over all, 41ft. water line, 14ft. breadth and 4ft. 6in. draft.

* * *

Rev. Lindsay Parker, Ph. D., of Brooklyn, is having a catboat built by J. T. Logan, New Brunswick, Canada, from designs by Henry J. Gielow. She is 27ft. 6in. over all, 20ft. waterline, 10ft. breadth and 19in draft.

* * *

Vice-Com. Chas. W. Lee, of the Manhasset Bay Y. C., has recently placed an order with Huntington, of New Rochelle, for a thirty-two foot waterline auxiliary cruising yawl from designs by Mr. C. D. Mower. The plans show a keel boat of moderate draft, good beam and a generous displacement with an unusual amount of cabin accommodation for a boat of her length. A gasolene motor of about 12 horse-power will be installed under the cockpit and is expected to give a speed of at least six miles an hour under favorable conditions. In order to make the motor more accessible, the companionway is placed over to one side, an arrangement which is most convenient in several ways. The main cabin is about 8ft. long and has a clear floor space of 4ft. between the transoms. Back of the transoms there is a wide berth under the deck. Clothes lockers at the aft end of the cabin with sideboards and lockers at the forward end give an abundance of good stowage room. Forward on the starboard side is the owner's berth, and instead of making a small stateroom with fixed partitions, heavy portieres will be used, so that in the daytime this space may be thrown into the main cabin, making it unusually large and airy. The toilet room is on the port side opposite to the stateroom. Forward there is a large galley under the cabin trunk and hanging berths for two men. The cabin will be finished entirely in mahogany and handsomely furnished.

The specifications call for an unusually strong construction, and the whole design has been worked out with the view of making an extremely weatherly and able sea boat. The rig is comparatively small, and shows a pole mast with small topsail and double head sails. On deck she will have wide water ways and a large cockpit.

The yacht is already laid down and will be in commission early in the season.

In addition to the design for Mr. Lee's boat, Mr. Mower has turned out plans for a one-design class for the Lynn Y. C., a 25ft. waterline auxiliary yawl for a Boston yachtsman, a 32ft. cruising launch now building at Morris Heights; a 25ft. waterline yawl building in Canada for a Toronto yachtsman; a one-design boat for Shinnecock Bay, a racing cat to compete for the Sewell cup and Barnegat Bay championship, and has an order for a boat for the 30ft. class of Great South Bay to race against Arrow and Electra.

Canoeing.

The annual meeting of the Knickerbocker Canoe Club was held at its club house on the Hudson, at the foot of One Hundred and Fifty-second Street, the night of Jan. 8. Among the new officers elected for the year were the following: Commodore, Louis C. Kretzmer; Vice-Commodore, Wilbur Andrews; Secretary, Henry W. Dempewolff; Treasurer, W. R. Farrell, Jr.; Measurer, James E. Taylor. The vice commodore is also chairman of the House Committee, the other members of that committee being B. Frank Cromwell and R. L. Roberts, Jr. While the Knickerbocker is one of the oldest canoe clubs in America, and has had its ups and downs, it has acquired much new blood in recent years, and now a has a membership which is limited to fifty, while its boat room contains forty-eight canoes. The members stick to canoes more strictly than in some canoe clubs, for at present only one member owns a boat larger than a canoe, and that one is a St. Lawrence skiff. Nearly all of the canoes are rigged for sailing, and the majority are decked canoes, there being only a few canvas-covered open canoes in the boat room.

Rifle Range and Gallery.

Central Shooting Bund.

ST. LOUIS, Mo.—On the evening of Jan. 16, in Delabar's Hall, St. Louis, a meeting of the Central and St. Louis Sharpshooting associations was held. The object was to prepare for the national shoot scheduled for June, to be held in St. Louis. The two bodies combined for the occasion, and elected Robert Bethmann president, and August A. Busch fest president for the ensuing year. It was decided that $6,000 will be given in prizes at the national meet.

More than 200 local sharpshooters are represented in the combination of the two bodies. The union will be known as the Central Shooting Bund, of St. Louis. The national shoot will be conducted by the combined bodies, and it is believed that one of the most successful meets in the history of shooting can be pulled off.

Besides the presidents of the bund, officers were elected to fill the remaining places as follows: Sheriff Joseph A. Dickmann, Vice-President; Dr. E. H. Kessler, Treasurer; Horace Kephart, Corresponding Secretary; Adam Fellhauer, Secretary, and Louis Schweighoefer was appointed Shooting Master.

Jacob Frank, C. W. Bauer, Sam G. Dorman, Dr. Kessler and Martin Kacer were elected to form a shooting committee, which next Monday will decide upon the programme to be followed at the shoot, and upon the apportionment of the $6,000 prize money.

This committee and the presidents will report next Friday the progress of the work. Three events will be reserved for members of the Central Bund, and the remaining events will be open to all visitors. Michael Reinagel resigned as president of the Central Sharpshooters to give an opportunity for a joint president of the two bodies to be elected.

Besides Vice-President Dickmann, other vice-presidents will be appointed to attend to details of the work, and they will be made known at the meeting Friday. The shoot will be held at the range in Bobringville, and will be entirely for rifles on the regular programme. Revolver events will be scheduled as a side issue, in all probability.

All shooting will be done at 200yds. It is thought that the event will attract several hundred shooters from all over the United States, as the Saengerfest will be in progress here the week of the shoot. Resolutions were adopted that the officers of the Saengerfest be tendered an invitation to the shoot.

The event will attract the best marksmen in the country, on account of its character and the amount of the prize money offered. The institution of revolver shooting is regarded likely to create much interest, as many members of the bunds favor this sort of work. Capt. Edmond P. Creecy, of the Seventh District, is a member of the body, and will likely participate in the revolver and pistol contests of the occasion.

Ossining Gun Club.

OSSINING, N. Y.—Scores made at 75ft., on ¼-inch, 25-ring target, possible 250, were as follows: Geo. Tompkins 214; E. F. Ball 223, 232, 230, 239; Amos Bedell 209. E. F. B.

THE New Jersey State Rifle Association held a meeting recently and elected a list of officers, as follows: President, Governor Franklin Murphy; First Vice-President, Major-General P. Farmer Wanser; Second Vice-President, Brevet-Brigadier-General G. E. P. Howard; Third Vice-President, William Hayes; Treasurer, General Bird W. Spencer; Secretary, Lieutenant-Colonel Charles W. Parker; Assistant Secretary, Lieutenant Albert S. Jones. There are 162 members in good standing.

Trapshooting.

Fixtures.

If you want your shoot to be announced here send notice like the following:

Jan. 22.—Newark, N. J.—Live-bird handicap, Smith Brothers' grounds.

Jan. 24.—Interstate Park, L. I.—Weekly shoot; main event 100 target handicap; 16 to 21yds.

Jan. 24.—West Orange, N. J.—Championship trophy of the Mountainside Gun Club. G. F. Ziegler, Sec'y.

Jan. 25.—Brooklyn, L. I.—Shoot of the Fulton Gun Club. A. A. Schoverling, Cor. Sec'y.

Jan. 26-30.—Brenham, Texas.—Second annual Sunny South Handicap; live birds and targets.

Feb. 3-4.—Savannah, Ga.—Forest City Gun Club's invitation shoot at live birds.

Feb. 10-14.—Detroit, Mich.—Open tournament under the auspices of the Tri-State Automobile and Sporting Goods Association. Targets and live birds. John Parker, manager; S. G. Lewis, Secretary-Treasurer.

Feb. 18.—Allentown, Pa.—Two days' target tournament at Duck Farm Hotel. Alfred Griesemer, Prop.

Feb. 20-21.—New Orleans, La.—First tournament of the Mississippi Valley Trapshooters' and Game Protective Association; Carnival Week, under auspices of the City Park Gun Club; $500 added. Percy S. Benedict, Sec'y.

Feb. 23.—Ossining, N. Y.—Ossining Gun Club's Washington's Birthday shoot. C. G. Blandford, Capt.

April 7-10.—St. Joseph, Mo.—Tournament of the Missouri State Game and Fish Protective Association. F. B. Cunningham, Secretary-Manager.

April 14-17.—Kansas City, Mo.—The Interstate Association's fourth Grand American Handicap at targets, at Blue River Shooting Park. One thousand dollars added to the purses. Elmer E. Shaner, Secretary-Manager, 111 Fourth avenue, Pittsburg, Pa.

April 19.—Springfield, Mass.—Spring tournament of the Springfield Gun Club, Patriots' Day. C. L. Kites, Sec'y.

May —.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament, under the auspices of the Lincoln Gun Club. T. E. Mockett, Sec'y.

May 6-7.—Lafayette, Ind.—Lafayette Gun Club's tournament.

May 9-10.—Chicago, Ill.—Spring tournament of the Grand Crescent Gun Club.

May 12-15.—Interstate Park, L. I.—The Interstate Association's fifth Grand American Handicap at targets; $1,000 added to the purses. Elmer E. Shaner, Secretary-Manager, 111 Fourth avenue, Pittsburg, Pa.

May 19-22.—Wissinoming, Philadelphia.—Thirteenth annual tournament of the Pennsylvania State Sportsmen's Association, under auspices of the Florists' Gun Club of Philadelphia. V. V. Dorp, Sec'y.

May 21-22.—Kenton, O.—Shoot of the Kenton Gun Club. A. G. Merriman, Sec'y-Treas.

May 27-29.—Fort Wayne, Ind.—Three-day live-bird and target tournament of the Corner Rod and Gun Club. John V. Linker, Sec'y.

May 29-30.—Union City, Ind.—Spring tournament of the Parent Grove Gun Club.

May 30.—Detroit, Mich.—Winchester Gun Club's Decoration Day third annual tournament; all day. Rose system and average prizes. Sliding handicap, 16, 18 and 20yds., D. A. Hitchcock, Sec'y-Treas.

June —.—Schenectady, N. Y.—New York State shoot, under auspices of the Schenectady Gun Club.

June 3-5.—Parkersburg, W. Va.—Sixth annual tournament of the West Virginia Sportsmen's Association, under auspices of Ohio Valley Shooting Association.

June 4-5.—Greenville, O.—Spring tournament of the Greenville Gun Club.

June 9-11.—Cincinnati, O.—Seventeenth annual target tournament of the Ohio Trapshooters' League. Chas. T. Dreihs, Sec'y.

June 16-19.—Warm Springs, Ga.—The Interstate Association's tournament, under the auspices of the Meriwether Gun Club. Chas. L. Davis, Sec'y.

June 16-18.—New London, Ia.—Seventh annual midsummer target tournament of the New London Gun Club.

July 30-Aug. 1.—Viroqua, Wis.—The Interstate Association's tournament, under the auspices of the Viroqua Rod and Gun Club. Dr. R. W. Baldwin, Sec'y.

Aug. 19-20.—Ottawa, Ill.—The Interstate Association's tournament, under the auspices of the Rainmakers' Gun Club. Paul A. Selembier, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

The Eastern team championship at live birds, contested at Guttenberg, N. J., on Thursday of last week, had the remarkably large number of fifteen entries, three men to a team. The conditions were 10 birds, 28yds. rise, $7.50 entrance, birds extra, three moneys, 50, 30 and 20 per cent. to first, second and third. Each member of the winning team received a silver loving cup in addition, Mr. Gus Greiff making the presentation of them to the members of the winning team soon after the contest finished. First prize and honors were captured by the Jackson Gun Club's team No. 1, whose members were Capt. A. W. Money, A. Bunn and Garry Hopper, the former two scoring 10, and the latter losing 1 dead out, thus leaving the good total of 29 out of 30. The Jeannette team was next with 28. The members of it were Chas. Steffens, G. E. Loeble and Gus E. Greiff, the latter killing straight. Third was divided between the East Side Gun Club team and the Brooklyn Gun Club team No. 2, each scoring 26.

An invitation shoot at live birds will be given by the Forest City Gun Club of Savannah, Ga., on Feb. 3 and 4. There are five events each day, a summary of which is as follows: Friday—Nos. 1 and 5, 10 birds, $10, 30yds.; No. 2, 10 birds, $10, cup added, 25 to 30yds.; No. 3, same as No. 2, excepting cup; No. 4, Forest City cup, 20 birds, $20, 25 to 31yds. Second day—No. 1, 10 birds, $10, 30yds.; No. 2, 10 birds, $10, 30yds.; Nos. 3 and 5, miss-and-out, $5, 25 to 31yds; No. 4, Sunny South cup, 20 birds, $20, 25 to 31yds. Carteret rules will govern. Shooting commences at 10 o'clock. Birds extra in each event. Boundary 30yds. High guns, 60 and 40 per cent. Ties decided miss-and-out. Twenty-seven and twenty-eight-yard men allowed one no-bird. Twenty-five and twenty-six-yard men allowed one miss as a kill.

The Boston Gun Club, of Wellington, Mass., has issued a card of information concerning its prize handicap series for 1903. The first contest will be held on Jan. 21, and continue every Wednesday until the completion of the series, May 6, 1903. There are nine useful prizes. The conditions are: Entrance free; open to all shooters; distance handicap; seven best scores out of the sixteen to count. Score each day to be made on 30 targets from magautrap. A special prize, the B. G. C. gold badge, to the shooter making the longest run of consecutive breaks at handicap distance. Targets 1½ cents. All shooting under B. G. C. rules.

The Winchester Gun Club, of Detroit, Mich., have issued a programme of its shoots for 1903. Beginning Jan. 10, regular shoots, including the club medal and handicap events, will be held every other Saturday afternoon. The third annual tournament, open to all, will be held on Decoration Day. The club grounds are situated near Woodward and Davieson avenues, Highland Park. Visiting shooters are always welcome.

Elsewhere in our trap columns we present the preliminary war cry of the Sunday Call, of Newark, for hostile action against the sport of pigeon shooting at the traps in the State of New Jersey. It bears the marks of resolute determination to abolish trapshooting. Only by the most energetic and united opposition on the part of the trapshooters and their adherents is there any hope to preserve trapshooting within the realm of things which are legal in New Jersey.

Concerning the great annual Pennsylvania trapshooting event, Mr. V. V. Dorp, secretary of the Florists' Gun Club, writes us as follows: "Please announce our claim of May 19 to 22 for the thirteenth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Florists' Gun Club of Philadelphia. Many valuable prizes. Programmes later. A. B. Cartledge, corresponding secretary, 1514 Chestnut street, Philadelphia."

In the activities of the trapshooting world, a match between Messrs. L. Z. Lawrence and Charles E. Lock, the latter of Winslow Junction, Camden county, N. J., is among the possibilities of the future. This has been under consideration since September, and the principals so far have agreed on 100 targets and 100 live birds per man, and Waterford, N. J., as the place. A stake of $500 to $1,000 a side is contemplated.

The programme of the regular weekly shoot, to be held at Interstate Park, Queens, L. I., Jan. 24, has six events, of which two are at 15 targets, 75 cents; one at 20, $1; two at 25, $1.50 and a handicap at 100 targets, $4 entrance. Moneys divided Rose system. Handicaps 16 to 21yds. Targets, 2 cents, included in entrance. Those who so wish may shoot for targets only. Shooting commences on arrival of 1 o'clock train.

The ten-man team shoot between the Baltimore Shooting Association and the Keystone Shooting League, 25 live birds per man, took place on the grounds of the latter organization on a day of last week, and resulted in a tie, each team scoring 211 out of a possible 250. A return match is fixed to take place on Jan. 29, at Baltimore.

Mr. John S. Coggeshall, secretary of the Aquidneck Gun Club, Newport, R. I., was a visitor at the Eastern team championship contest at live birds at Guttenberg, N. J., on Jan. 15. He contemplated a visit in New York of several days' duration, and participation in some of the club shoots of New York gun clubs before his departure.

May 12-15 are the dates fixed upon for the fifth Grand American Handicap at targets, at Interstate Park, Queens, L. I. This great event will have $1,000 added to the purses. The address of the secretary-manager, Mr. Elmer E. Shaner, is No. 111 Fourth avenue, Pittsburg, Pa. Programmes containing full information will be ready on April 6.

Mr. C. G. Blandford, the energetic captain of the Ossining Gun Club, sets forth the programme for his club's shoot this week, which is of exceptional interest. He also mentions that the prize in event 6 of the shoot fixed to take place on Feb. 23 instead of a silver cup will be a pair of antlers, which were presented by Mr. H. W. Bissing.

Mr. A. A. Schoverling, corresponding secretary of the Fulton Gun Club, of Brooklyn, L. I., announces the next shoot of the club will be held on Jan. 25. An important club meeting will be held on the club grounds on that day. Special matches also will be a part of the programme. Shooting will commence at 1 o'clock.

The two-man team race at the shoot of the Brooklyn, L. I., Gun Club, on Saturday of last week, between Messrs. Krugg and Baron on side and C. Banta and J. S. Wright on the other, 50 targets per man, resulted in a victory for the latter team, the scores being 75 to 68.

Mr. F. B. Cunningham, secretary-manager, St. Joseph, Mo., under date of Jan. 12, writes us as follows: "Please announce change of our dates for the Missouri State Game and Fish Protective Association shooting tournament to April 7, 8, 9 and 10, instead of dates sent you."

The final shoot for the Dupont trophy was shot at St. Louis Park, St. Louis, Mo., on Jan. 11. Mr. W. D. Kenyon came out victorious. Four had tied on 24, and the finish, the shoot-off, was miss-and-out, Mr. Kenyon winning in the fifth round.

Mr. John S. Wright, manager of the Brooklyn Gun Club, informs us that his club will hold a shoot on Lincoln's Birthday, Feb. 12, commencing at 1 o'clock. The particulars will be published later.

The Kenton, Ohio, Gun Club, through its secretary-treasurer, announces a shoot for May 21 and 22. The programme will be ready for distribution in ample time for the information of shooters.

A two days' target tournament has been arranged for Feb. 18 and 19 by Mr. Alfred Griesemer, proprietor of the Duck Farm Hotel, at Allentown, Pa., at which place it will be held.

The Springfield, Mass., Gun Club, through its secretary, Mr. C. L. Kites, announces a spring tournament to be held on April 19, Patriot's Day.

BERNARD WATERS.

Anti-Pigeon Shooting Sentiment.

THAT our trapshooting readers may be informed of the contemplated action of the New Jersey Legislature against pigeon shooting, we publish in full the following taken from the Sunday Call, of Newark, N. J., bearing date Jan. 18:

To-morrow night Assemblyman Edgar Williams, of Orange, will introduce into the lower house of the Legislature a bill to abolish in this State the shooting of pigeons from traps. It will probably be referred to the Committee on Game and Fisheries, of which Assemblyman Brown, of this city, is chairman. As chairman of the same committee last year he reported the bill favorably, and he will doubtless do so again.

The Assembly passed it last March by a vote of 43 to 7, and then Senator Lee, of Atlantic county, strangled it in his committee, so that the Senate had no chance to vote on it. What fate it will have in the Senate this year remains to be seen. Mr. Williams introduces the bill early, so that there may be time to fight it through both houses, if possible.

It is probable that there will be a hard-fought contest over the bill. The trapshooters have prepared to oppose it. Last spring the Carteret Gun Club was organized, and it has held many shoots on its grounds at Westfield. It is said to be composed mainly of New York men. Trapshooting was abolished in New York last winter, and it was said then that bird butchers would make this State their slaughter ground thereafter. This has come to pass. Only last week fifteen teams, representing clubs in the Eastern States, competed for the championship of the East as pigeon shooters at Guttenberg.

The Carteret Gun Club has issued a little tract of eleven pages called "The Rights of Sportsmen Involved in the Shooting of Pigeons from Traps." Here is one of the arguments put forth in defense of the so-called sport: "Practice with the gun under laws specially enacted for the encouragement of such practice, that men may be of service to the State in time of war; the skill acquired in pigeon shooting by the users of the gun; the creation of a large and cheap supply of wholesome food; the profiting of the farmers, who raise that food; must all these be given up on account of a few wounded pigeons?"

It has commonly been supposed that the State provided rifle ranges at Sea Girt and in national guard armories to train men in marksmanship. If it is right to cause suffering to pigeons in order that men may be fitted for the army, why not go further, and let them shoot at sheep and cattle in the meadows? This would also result in the "creation of a large and cheap supply of wholesome food," and what matters if "a few wounded" animals wander off into bogs and thickets to die lingering deaths, as do the pigeons?

The plea is made also that the abolishment of pigeon shooting will "touch the pocket of the man who sells guns." It is explained that "already dealers in these articles are complaining of their diminished sales in States where pigeon shooting has ceased, some of them reporting a falling off of 50 per cent. in the sale of such goods," and the fear is expressed that "the stopping of pigeon shooting and the consequent stoppage of the making of the pigeon gun will undoubtedly open the way to the using of cheap and dangerous shotguns."

The pamphlet is full of the veriest balderdash in defense of trapshooting. It would not merit notice but for the fact that it shows the humane people of the State that they must stir themselves if they hope to place New Jersey with New England, New York, Delaware and the other States that have made trapshooting unlawful. Accompanying the Carteret Gun Club's tract is a petition to the Legislature against the passage of the Williams bill.

On the other hand, the New Jersey Society for the Prevention of Cruelty to Animals will send out this week an appeal to the journalists of the State to support Mr. Williams' bill. This reads in part, as follows:

"Trapshooting is condemned by humane persons, not because the birds are killed—for they are usually bred to be killed, like poultry, sheep and cattle—but for the reason that many of them are not killed speedily. Poultry, sheep and cattle are killed instantly, and there are no escapes. But official reports of trapshooting matches, even when expert marksmen fire the guns, show that from five to twenty per cent. of the pigeons escape out of bounds. But they do not all get away unhurt. Many of them are found in the neighborhood of the shooting grounds, disemboweled or with legs blown off, and in other states of horrible mutilation. When poor marksmen engage in the so-called sport, the number of birds that escape wounded is still larger.

"Trapshooting is mean, and therefore unmanly. The birds are often confined for several days in small boxes, and frequently crowded so closely together that some of them are suffocated or trampled to death. Those that survive are then placed in the traps, and suddenly find themselves released. More or less dazed by the reports of the guns about them, they rise on wings weakened by the long confinement. At this moment the sportsman, who has been standing a few yards away, with his gun ready, discharges it at the poor creature. We say that beside being cruel, the so-called sport is mean and unworthy of comparison with shooting in the field.

"Under the general act against cruelty, trapshooting was held by the courts of New Jersey to be unlawful. In 1889 men who wanted to slaughter pigeons at the traps succeeded in having the statute amended so that trapshooting was legalized. It is now proposed to undo what these men accomplished fourteen years ago.

"We respectfully appeal to the journalists of New Jersey to use their influence, as so many did last winter, for the passage of the act which shall abolish this abhorrent pastime in our State, and place us, in respect to it, in line with the humane people of New England, New York and other parts of the country."

St. Louis Trap News.

THE final contest for the Dupont trophy was decided on Jan. 11, at the St. Louis Park. It had been in the field for nearly a year, and those who had in the semi-monthly shoots made ten perfect scores met to decide the question of ownership a week ago. At that time four men tied on 24, the finals being postponed for lack of birds. When they met yesterday the weather was bitterly cold, and a heavy snow covered the ground. H. B. Spencer forfeited his chance by non-attendance, and among the remaining three, the miss-and-out proved but a brief affair, W. D. Kenyon winning on the fifth round.

Following this event a 10-bird race was shot, for birds and a small prize, and then three miss-and-outs were shot, each at 5 birds. Scores:

Dupont trophy finals, 30yds. rise:

Kenyon	22122	O'Trigger	210
Jonah	12220		

Ten-bird prize shoot, 30yds. rise:

Dr Clark	1020102222— 7	O'Niel	*2222122*2— 8
O'Trigger	11**220122— 7	Riehl	21*2212212— 9
Orvis	0220222222— 8	Sultan	0112210202— 7
Kenyon	1222220112— 9	Jonah	11122*2222— 9
Sims	1222212222—10	Weber	1022011*10— 6

First miss-and-out: Weber 5, O'Niel 5, Riehl 5, Kenyon 5, Dr. Clark 3, Sims 2, Jonah 0, Orvis 1.

Second miss-and-out: Weber 5, O'Niel 5, Riehl 5, Sultan 5, Jonah 2, Orvis 1, O'Trigger 1, Sims 0.

Third miss-and-out: Weber 5, Riehl 5, Orvis 5, Sims 5, O'Niel 4, Sultan 1, Jonah 0.

KILLMORE.

Patty—Burnham Tournament.

LINDEN, Ia., Jan. 14.—Seventeen shooters took part in Patty and Burnham's tournament to-day. The programme had ten target and five live-bird events. The weather was pleasant, but a strong wind made the shooting difficult, and but few straight scores were made. Event 14 was for medal representing championship of Dallas and Guthrie counties. Mr. Patty, of Linden, broke 24 out of a possible 25 targets, and won the medal without a tie. Owing to medal event being open only to shooters residing in Dallas and Guthrie countries, the scores in this event were not counted in the average. Budd won high average by a small percentage over Patty and Burnham.

Targets:	10	15	15	15	10	10	10	15	15	Broke.	Av.
Events:	1	2	3	4	5	6	7	8	9		
Budd	7	14	12	13	8	10	5	13	13	95	.826

Event 12, 5 birds, $2.50 entrance, three moneys:

C Harkens	21012—4	Black	10111—4
Burnham	11112—5	Budd	21112—5
Goodwin	11001—3	Patty	01202—3
Binns	10212—4		

Event 13, 7 birds, entrance $3, divided 50, 30 and 20 per cent.:

Black	1001011—4	Jones	0111110—5
Budd	1101011—5	J Harkens	1011222—6
C Harkens	1101111—6	J C Knapp	0111202—5
Burnham	1110111—6	Patty	1121112—7
B Shaffer	1001100—3	J Shaffer	0121222—6

Miss-and-out, entrance $1, Budd won:

C Harkens	1120	**Patty**	0
Burnham	2110	Budd	1111
Black	10		

Championship medal of Dallas and Guthrie counties, 25 targets: Jones 6, Campbell 23, Binns 16, Knapp 8, Burnham 17, Goodwin 11, Chas. Harkens 22, Smith 9, Petticord 14, J. Shaffer 17, D. Knapp 11, Rosenberg 17, H. Petticord 18, B. Shaffer 9, Black 18, Patty 24.

HAWKEYE.

Bonesteel Gun Club.

BONESTEEL, S. D., Jan. 10.—Some of my good friends among the sporting papers have been asking for a resumé of the shooting season of 1902 at this place, and I take this opportunity to say that while the Bonesteel Gun Club has only a membership of fourteen, we have shot during the season a total of 9,770 targets—a pretty good showing for a town of 300 inhabitants who have been unusually busy building railroads and selling town lots and farms, etc.

We have also had time to run off two or three small tournaments, which added very much to the interest in the sport, and also had four contests for the individual championship trophy donated by the Peters Cartridge Co. to the Bonesteel Gun Club, representing the championship of Gregory county.

This trophy was first put up in open competition on the occasion of the first annual of the Bonesteel Gun Club, on July 22, and was won by Carl Porter, of Fairfax, after shooting off a tie with Spatz and Orion Porter, and a second tie with Orion Porter.

T. J. Thompson soon got the championship bee in his bonnet, challenged Porter, and was defeated by the score of 46 to 42 on the Fairfax Gun Club grounds, Aug. 15.

Then Johnny Spatz, of the Bonesteel Gun Club, thought he would take a fall out of Mr. Porter, and he shied his castor into the ring, and the race came off on the Fairfax Gun Club grounds on the afternoon of Aug. 26, and Porter was again the victor by the very good score of 46 to 42.

Johnny came home a sadder and wiser man, and after looking glum for a few days Leach suggested that he and Spatz shoot a 200-bird race, and the winner would challenge for the trophy. This was done, and Spatz won by one bird, and accordingly challenged Porter, and the race was shot on the grounds of the Fairfax Gun Club on Oct. 29, Spatz winning easily by a score of 41 to 37 in a screaming gale of wind. This ended the fun for the season, so far as the trophy was concerned, and Spatz still holds it.

Following are the ten best scores of the members who shot that many strings of 25 each during the season:

											Per Cent.
Spatz	23	23	22	22	23	24	22	24	24	23	.920
Lucas	14	17	17	17	16	15	15	18	16	15	.640
Leach	22	22	21	22	21	24	22	22	23	23	.888
Thompson	19	22	17	17	15	17	16	15	14	15	.692
McFayden	18	13	16	12	10	17	16	14	13	18	.585
C Law	..	..	..	..	..	18	11	17	16	16	19	.647

In justice to Messrs. Thompson, McFayden, Lucas and Law, it might be well to say that they shot comparatively few targets as compared by the two leaders, and their chances for making good strings was correspondingly small.

The Bonesteel Gun Club purposes to give a large tournament during the coming season, that will be of such proportions as to attract lovers of the sport from all over the shooting world.

LEACH.

Ossining Gun Club.

OSSINING, N. Y., Jan. 17.—Herewith find scores of the Ossining Gun Club, made Saturday, Jan. 17. To-day's shoot was sort of a side issue, as the boys had got wind of the big treat prepared for next Saturday, the programme for which is herewith appended. Shooting to begin at 2 P. M. sharp. First cup, 25 birds, handicap, "gun down." Second cup, 10 pairs, all scratch. Third cup, 25 birds, handicap, club rules. Fourth cup, special handicap, Consolation cup, offered by the president of the club; handicaps to be based on best previous scores in prize competitions. All ties to be decided in one of three ways, optional to the man in the tie nearest scratch. Members should make a special effort to be present on the 24th, as this will be a banner club day.

In the programme of the shoot we are to hold on Feb. 23, we mention as a special prize in event No. 6, a silver cup. This we will change to a pair of antlers presented by Mr. H. W. Bissing.

Scores to-day:

Events:	1	2	Events:	1	2
Targets:	25	10	Targets:	25	10
Hans	18	8	WFisher	..	9
C Blandford	23	9			

These scores were made with Blandford's gun. The others, not intending to shoot, failed to bring their shooting irons. Bedell and Edgers were also present, but would not shoot with a strange gun.

C. G. B.

Peters Annual Re-union Tournament.

CINCINNATI, O.—From Jan. 12 to 16, inclusive, were days of reunion of the salesmen of the Peters Cartridge Company at Cincinnati. Each of the days had its special programme. Monday the salesmen assembled. Tuesday afternoon was devoted to a theater. Wednesday the factory and dinner at King's Mills in the forenoon; banquet in the afternoon. Thursday, a smoker. Friday, luncheon at the Cincinnati Gun Club, and shoot.

The men were divided into thirteen-man teams, 25 targets per man, and the result was very close, 248 to 247. The scores follow:

Peters 24, French 21, Apgar 23, Parker 12, Storr 24, Miller 20, Lemcke 20, Osborn 20, Reid 23, Keller, Jr., 14, Myers 12, Gross 21, Frolinger 14; total 248.

T. Keller 20, Wade 23, Bartlett 18, See 21, Kirby 21, Kauffman 17, Spencer 24, Mackie 21, King 9, Bates 21, Litzke 13, Tuttle 17, Hightower 23; total 247.

IN NEW JERSEY.

Eastern Team Championship.

On Jan. 15, at Guttenberg race track, Guttenberg, N. J., the Eastern team championship at live birds, arranged by Mr. Chris Inteman, took place according to programme. In its support there was an unexpectedly large entry, and there was an earnest and close competition. The conditions were: Three men of any club, 28yds. rise, 10 birds per man; entrance fee, $7.50 per team, birds extra. Each of the members of the winning team received a silver loving cup. Money was divided into three parts, 50 per cent. to first; 30 per cent. to second; 20 per cent. to third.

Fifteen teams entered the competition, making a total of forty-five individual contestants. First prize and place was won by the team of the Jackson Gun Club, the members of which were Capt. A. W. Money, A. Bunn (each of whom killed 10 straight) and G. Hopper (who scored 9, his second dying out of bounds). Thus this team had a total of 29 out of 30, an excellent performance. The Jeannette Gun Club was close up with a total of 28. The members and scores were: C. Steffens 9, G. E. Loeble 9, G. E. Greiff 10. The Brooklyn Gun Club's team No. 2 and the East Side Gun Club team tied on 26 and divided. Out of the forty-five contestants, five—Capt. A. W. Money, A. Bunn, G. E. Greiff, S. Glover and A. Kyte killed straight.

The sky was overcast, and the light was dull, yet not unfavorable for good shooting. There were two sets of traps, facing nearly north and south. A stiff westerly wind blew steadily across the traps, helping the birds materially many times to escape out of bounds. The birds were a mixed lot, with now and then one of the swiftest. Following are the scores:

DUTCHER.

Mountainside Gun Club.

West Orange, N J., Jan. 12.—The Mountainside Gun Club held its fifth annual meeting in the club rooms on Valley road, West Orange, last Tuesday night, when the following officers were elected for the year: President, John Gantz; Vice-President, Harry D. Wethling; Secretary, G. F. Ziegler; Treasurer, Fred Wright; Referee, A. W. Baldwin. Several new members were elected and several applications for membership received. The treasurer's report showed the club to be in a good financial condition.

The next regular shoot will be held on Saturday, Jan. 24, when the championship trophy will be shot for for the first time. This trophy is a large silver cup of beautiful design, to be won by the member making the highest number of points during the year. The cup will be competed for twice a month, at the regular club shoots, each shoot to be at 25 birds per man. The man winning first in each shoot will be credited with 5 points; the second man with three points, and the third with one point. Beside this first prize, another prize, a fine shooting jacket, will be awarded to the member making the highest score at any one of the club shoots during the year.

On Saturday, Jan. 31, the club will hold a match shoot with the Nishoyne Gun Club, of Orange, on the latter's grounds.

Nishoyne Gun Club.

West Orange, N. J., Jan. 17.—The Nishoyne Gun Club has decided to hold an open shoot on Washington's Birthday, in the afternoon, when two matches at 50 birds each will be shot for prizes. The contestants, all club members, will be A. Mosler, of Orange, and William Drake, of South Orange, and Ralph B. Baldwin, of Orange, and F. W. Moffit, of Glen Ridge.

To-day the club held a shoot in which several superior scores were made:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	25	25	25	25	25	25	25	25	10	10

Hudson Gun Club.

Jersey City, Jan. 11.—Following are the scores made at the last shoot of the Hudson Gun Club. The day was nothing extra for shooting, but some good scares were made.

These are the regular shooting dates for the coming year: Jan. 11 and 25; Feb. 8 and 22; March 8 and 22; April 5 and 19; May 3, 17 and 31; June 14 and 28; July 12 and 26; Aug. 9 and 23; Sept. 6 and 20; Oct. 4 and 18; Nov. 1, 15 and 29; Dec. 13 and 27.

This club will hold an all-day shoot on Feb. 22, at which refreshments will be served free to all shooters. There will be a number of prizes, as well as sweepstakes. The handicapping will be done by a committee chosen from the shooters present. The limits will be 16 and 20yds.

At the annual election these officers were elected: President, Joseph Whitley; Vice-President, George Brewer; Financial Secretary, Thos. Kelley; Corresponding Secretary, James Hughes; Treasurer, E. G. Heritage; Board of Directors: L. S. Schortemeier, Dr. A. D. De Long and Jos. Doran; Shooting Captain, Chas. Banta.

J. R. MERRILL, Sec'y.

Hell Gate Gun Club.

Carlstadt, N. J., Jan. 16.—There was a good start for the year's shooting on the part of the Hell Gate Gun Club, at Outwater's grounds to-day. Mr. Tony Losi was the only one to kill straight in the main event. The scores follow:

J H Outwater, 30...0*12201122— 7

ON LONG ISLAND.

Trap at Interstate Park.

Interstate Park, L. I., Jan. 17.—There was some busy competition at Interstate Park to-day, all the contestants being men of long experience with the shotgun. The park presents an interesting programme for the weekly shoot, to be held on Jan. 24. Following are the scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13
Targets:	15	15	20	25	25	50	25	25	25	25	25	25	25

Ramapo, 16	..	9	8	..	..	30	15	..	..	..	..	..	..

No. 6 was a handicap, the distances of which are given next the list of names.

Brooklyn Gun Club.

Brooklyn, L. I., Jan. 17.—John Wright had an unusually bright aggregation of students at his weekly shoot to-day. A special attraction was a team shoot between Messrs. Banta and Wright on the one side, and Messrs. Krug and Baron on the other, the results of which are appended:

Baltimore—Keystone.

PHILADELPHIA, Pa., Jan. 17.—Baltimore and Philadelphia renewed their old-time friendly rivalry for pre-eminence in trap-shooting, each city being represented by powerful organizations in the way of shooting interests. Baltimore was represented by the Baltimore Shooting Association, and Philadelphia was represented by the Keystone Shooting League. The contest was a ten-man team shoot, 25 live birds per man, and it was close from start to finish, and thus was ever in doubt and full of interest. At the end, the result hung on the last bird. Each team killed 211 out of a possible 250, a tie. The contest took place on the grounds of the Keystone Shooting League, at Holmesburg Junction. It was the first of a series of three shoots between these organizations. The grounds and club house were crowded with enthusiastic spectators. The birds, aided by the gale of wind, were very fast, and a great number of good kills were made by members of both teams.

Baltimore held, at one stage, a comfortable lead of 8 birds, but this lead was reduced bird by bird until a tie was made, and then the enthusiasm broke out, for the local team looked like winners.

The conditions were teams of ten men, 25 live birds per man, 29yds. rise. The teams were paired off, each shooting out its score before the next pair faced the traps. On the side there was an optional sweep of $10, divided 50, 30 and 20 per cent., class shooting.

Lester German and John Rothacker were the first pair. German killed 24 to 22 for Rothacker; Baltimore led by 2.

Dr. E. G. Darling and H. L. Landis were the second pair. Landis reduced Baltimore's lead to 1 bird, killing 21 to his opponent's 20.

J. W. Chew and Fred Schwartz came third in order. Schwartz scored 24, Chew 22, and Keystone led by 1.

The fourth pair, George Burrough and Edward Johnson, resulted in disaster for Keystone. Johnson killed only 18 to his opponent's 22, thus giving Baltimore a lead of 3 birds in the first 100.

A. R. Middleton outshot Charles E. Geikler in the fifth, and thereby added 2 more birds to Baltimore's lead. Geikler scored 17; his opponent 19.

S. D. Thomas and F. W. Van Loon, the sixth pair, tied on 19.

Of the seventh pair, Jack Dunn, a player on the New York baseball team, started well, but could not stand the fast pace set by F. M. Hobbs, who scored 24. Dunn lost 5. These scores reduced Baltimore's lead to 1 bird, and made the followers of the local team confident of winning, as their strongest men were to follow.

Keystone gained the lead in the eighth combination, in which Dr. George D. B. Darby outshot Harry Ducker by a score of 23 to 21.

J. R. Malone and Howard Ridge were the ninth pair, and finished with a tie on 22.

When the last pair faced the traps, Hood Waters, for Baltimore, and I. W. Budd for Keystone, the latter organization had a lead of 1 bird. They tied in the tenth round.

The match was tied again in the twenty-second round, when Budd lost a driver, and to the spectators it looked as though the match was lost, when Budd missed again in the twenty-third round. Waters was shooting well, and it seemed almost impossible for him to miss his last bird; he drew an incomer and hit it hard, but could not stop it inside the wire.

Trap Around Reading.

READING, Pa., Jan. 16.—The third of a series of live-bird shooting matches between Lieut. D. Frank Keller and Walter Jones took place on the Spring Valley grounds. Each shot at 50 birds, and Keller won the match. Out of the first 50 each killed 34. In the shoot-off at 15 birds, there was another tie, each man killing 12, but in the final shoot-off at 5 birds Keller killed 3 and Jones 2. The first two matches were won by Jones. The final one was the most even that has been seen in this vicinity for some time, and the betting was about even. Jones had hard luck in his first match, 4 birds dropping dead out of bounds.

West Chester, Pa., Jan. 14.—Arrangements for a live-bird shoot are being made by the members of the West Chester Gun Club on their grounds, south of this burgh, on Jan. 31, and it is their desire to make it the most interesting of any held here for many years. Sportsmen from many points have signified their intention of being present.

Reading, Pa., Jan. 16.—The following officers were elected this evening by the Independent Gun Club of this city for the ensuing term: President, Sherman Hoverter; Vice-President, William Dillon; Recording Secretary, Calvin Bucks; Financial Secretary, Marion Larkins; Treasurer, Harrison Posey; Board of Directors, George P. Moyer, Logan Trout, H. F. Mayer, Harrison Posey, I. H. Tobias; Captain, Charles Henry.

York, Pa., Jan. 17.—The York City Gun Club will hold an all-day target shoot on its grounds, south of the city, on Thursday, Jan. 29. The various events will attract the crack shots from all over this and adjoining counties. Two special events will be held as follows: The championship target trophy of York county, between Eli Spangler, of this city, and Allen M. Seitz, of Glen Rock, and the live-bird championship trophy of York county between Michael Lauher, of this city, and Mac Miller, of Felton.

DUSTER.

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., Jan. 17.—Nine men, including Mr. Wickes, of the Hyde Park Gun Club, took part in to-day's practice shoot. Four 25-bird events were shot off, and some good scores were made. Condit set the boys a good example by breaking his first 25 straight, and afterward following it up with 24, making 49 out of 50 shot at. Several visitors were present, who, while taking no part in the shooting, seemed to enjoy the sport quite as much as the shooters themselves. Visitors are always welcome, their presence adds to the pleasures of a shoot. The scores:

SNANIWEH.

PUBLISHERS' DEPARTMENT.

Sweet Potatoes Grown by a Massachusetts Mechanic.

MR. GEO. R. MORGAN, a pattern-maker of Revere, Mass., went down to Pinebluff, North Carolina, last winter as one of the advance guard of the New England colony who are settling near that place. Mr. Morgan was to experiment and report results as to what a mechanic could do. One of his crops, on land that he cleared from the woods, was sweet potatoes, and he reports that the yield will average more than one hundred and fifty bushels to the acre, and at a rate of fifty cents a bushel, which is the least they sell for at Pinebluff, the potatoes will yield $75 an acre. The land cost Mr. Morgan $10 an acre, clearing, fencing and cultivation $25 an acre, leaving him a net profit of $40 an acre. That speaks well for a New England mechanic. To show that land will make enough to pay for itself and all expenses and $40 profit is certainly a good showing. Mr. Morgan's place is located on the Seaboard Air Line Railway, the Southern road that is doing so much to induce Northerners to locate on its line.

Golden Gate Tour.

UNDER THE PERSONALLY-CONDUCTED SYSTEM OF THE PENNSYLVANIA RAILROAD.

The first Pennsylvania Railroad personally conducted tour to California for the present season will leave New York and Philadelphia on the Golden Gate Special, Jan. 29, going via Chicago, Kansas City and El Paso to Los Angeles and San Diego. An entire month may be spent on the Pacific Coast. The Golden Gate Special will leave San Francisco, returning Tuesday, March 3, stopping at Salt Lake City, Glenwood Springs, Colorado Springs and Denver. Rate, $300 from all points on the Pennsylvania Railroad east of Pittsburg, covering all expenses of railroad transportation, side trips in California, and herth and meals going and returning on the special train. No hotel expenses in California are included. Tickets are good for return within nine months, but when not used returning on the Golden Gate Special they cover transportation only. For detailed itinerary apply to Ticket Agent, or address Geo. W. Boyd, Assistant General Passenger Agent, Broad Street Station, Philadelphia, Pa.

So many people from all over the country now spend their winters in Florida that the demand for yachts and house-boats for use in Southern waters has greatly increased. The dangers encountered by yachts taking the trip down the coast during the winter are well known. Owing to the scarcity of builders familiar with yacht work in Florida, most of the boats have been built hy Northern yards. This is no longer necessary, however, for the Merrill-Stevens Engineering Co. have established at Jacksonville, Florida, a fine plant, and they will make a specialty of building yachts and house-boats adapted for use in Southern waters.

We wish to call attention to the advertisement of Messrs. Wallace Brothers, of Norfolk, Va., which appears in these columns for the first time, this week. This firm deals in high-grade marine and stationary gasoline engines, and they also build launches and working boats. The automobile department is an important feature of their business.

At the Patty-Burnham tournament, London, Ia., Jan. 14, the championship of Dallas and Guthrie counties was won by M. Patty. He used U. M. C shells and Schultze powder. Mr. C. W. Budd won high average, same tournament; he used a Parker gun, U. M. C. shells and Schultze powder.

The Hazard Powder Company, Wilmington, Del., has issued a circular to its patrons, announcing that on Jan. 31 its New York branch office will be discontinued, and that after Jan. 17 all correspondence and orders should be addressed to the home office.

DUCKING BLIND AND SCHOOLHOUSE.

ALONG the coast south of the mouth of the Chesapeake Bay lies a flat country, half swamp and half sandbar. It is overgrown in many places by forests of tall, straight pines, and is bordered by wide sounds and inlets of shallow water, which are cut off from the ocean by a narrow sea beach, over which the winds blow constantly, heaping up mountains of sand, and then picking up these mountains and carrying them on a few hundred yards and piling them up in new places. In the shallow waters which lie to the landward of this sand beach grow the grasses and other water plants on which wild fowl delight to feed; and here each year congregate in uncounted numbers the ducks, the geese and the swans which have been forced away from their northern homes by the closing of the waters by frost.

The people who live along the main shore are simple, honest and kindly. They are far from main lines of travel. The railroad is twenty miles away, and a queer little steamboat, plowing its way down the Sound three times a week is their only means of getting their produce to a market. They farm, and fish, and gun; and the earth, and the waters, and the air contribute to their support from year's end to year's end. Their amusements and their interests are few, yet their lives are happy. Like people who live crowded closer together, they have their loves, their hopes and their fears, and they live simple, kindly and hospitable lives.

In winter the waters are visited by many gunners, whose homes for the most part lie in great centers of civilization, and during his visit each visitor has for companion on his shooting days one of the residents of this shore; some one who understands the handling of a boat and the ways of the birds, and who can put a stranger in the way of getting shooting. And since the stranger goes out after the fowl every day when it is lawful to do so, and spends all his day in the blind waiting for birds to come; and since there are many blank days when there is little shooting, it follows naturally that the gunner and his boatman talk to each other a good deal, and after a time grow to be well acquainted. Perhaps the gunner tells the boatman stories of distant lands, or of great game, or of wonderful sights that he has seen in European cities; while we may be sure that after his shyness has worn off the boatman talks to the gunner about his farming, about the prices brought last year by his sweet and his Irish potatoes, about his wife and his little ones, their illnesses, the comfort that they take in going to church when the rare preacher visits the community, and about all the other things that most interest him.

Since most men are sympathetic, it does not take very many days for the gunner and his boatman to come to think well of each other; and if their association continues year after year—for a few days each winter—it is not very long before a genuine attachment springs up between them. The boatman works hard for the success of the shooter, and takes a pride in his success. The gunner feels that a very little money, properly applied, might greatly help his boatman and family, and might render their lot a happier one; yet it is hard to offer him money. But there are other forms of help that may be furnished.

Not long ago there came to our notice a little story that is worth telling here. It is suggestive and may offer a hint to others.

The gunner had grown to have a high regard for his boatman, who, like many of the men of his community along this shore, was absolutely illiterate. He belonged to a good family of the county, he was generally respected and liked, but neither his father nor he, nor his children, had ever been to school; no one in these three generations could either read or write. The gunner determined that there was something wrong about this condition of things, and he decided to do what he could to remedy it. He spoke with a dozen or fifteen of his friends, who were accustomed to shoot in the same region, and from each of them secured a small subscription, which, in the aggregate, proved enough to hire a school teacher for a year, as well as to rent a house for school purposes. But when the school was about to be started it was discovered that the schoolhouse was without furniture, and that the community could not raise money enough for books, or any of the necessary apparatus for teaching children. The gunner was not discouraged; he made an appeal to the shooting club of which he was an officer, and the club, on his representation, appropriated a sum of money sufficient to furnish the schoolhouse and set the school in successful operation.

When the school was opened, the man who had practically founded it, who had done all the hard work, raised all the money, and launched the enterprise, went down to this little community and made a speech to the children and their parents there assembled to witness the opening of the first yearly school that had ever been established in the county. In simple language he gave the children and their parents some good advice, and concluded by saying that the school had been founded in order that each one of the little ones might have a chance to make the most of what was in him. He urged each child to do his best, and to try to become a better citizen of his county, of his State, and of his country.

And the point of the story? Well, sometimes gunners do other things besides killing birds. And this is only one instance of many of which nothing is known, because the men who do this good do it in secret.

OYSTERS PURE AND IMPURE.

THE death of the Dean of Winchester from typhoid fever ascribed to the eating of polluted oysters and the death of a number of other persons believed to have been due to the same cause has directed attention in England to the oyster as a possible disseminator of typhoid. The particular oysters which are believed to have caused the illness were taken from beds which have been described in the reports of former investigating committees as "saturated with sewage," a condition which one would think might account plausibly enough for the typhoid, even if salt water is a speedy purifier and destroyer of disease germs. It is no marvel that Great Britain has had an oyster scare, and under the circumstances it was wise on the part of the New York Forest, Fish and Game Commission to assert through the State Department the purity of the Long Island beds from which American oysters are exported to Europe. "East Rivers" and "Blue Points"—famous the world over wherever oysters are known—Shell Fisheries Superintendent Wood certifies, come from deep water beds far removed from any possible contamination. As for the sewage-saturated beds of England, it is high time for boards of health and sea fishery boards to combine their forces, following the example set by Massachusetts, where this admirable system is in operation, as provided by the public statute:

Section 113. The State Board of Health may examine all complaints which may be brought to its notice relative to the contamination of tidal waters and flats in this commonwealth by sewage or other causes, may determine, as nearly as may be, the bounds of such contamination, and, if necessary, mark such bounds. It may also, in writing, request the Commissioners on Fisheries and Game to prohibit the taking from such contaminated waters and flats of any oysters, clams, quahaugs and scallops. Upon receipt of such request, said Commissioners shall prohibit the taking of such shell fish from such contaminated waters or flats for such period of time as the State Board of Health may prescribe.

Sec. 114. Whoever takes any oysters, clams, quahaugs or scallops from tidal waters or flats from which the taking has been prohibited as provided in the preceding section shall forfeit, etc.,

LEGISLATIVE TUMBLING.

AMONG the quaint monastic tales of the Twelfth Century is that of "Our Lady's Tumbler," which relates how a certain tumbler or professional acrobat, having been converted and joined a holy order, was much distressed because, being unlearned and untrained in such accomplishments, he could not do his share at mass in praying or singing or any of the several other offices in which each brother bore his part; until at last he bethought him that he could tumble; and so in his simplicity, withdrawing to a secluded shrine, he leaped and vaulted and turned hand-springs before the image of Our Lady, dedicating his strenuous performances to her honor, and beseeching her to look with favor upon this, the only service he had to offer. This he did day after day as often as the others were at mass, and much to the edification—when he was discovered—of the Abbot and brothers, until at last he died in the odor of sanctity, bequeathing to us the story of his tumbling as an incentive to do our best in whatever field, each one according to his gifts and his lights.

The tumblers did not all live in the Twelfth Century; they are with us to-day; nor are they confined to monastic orders. They are found occasionally in Legislatures, where their tumblings not infrequently take the form of freak bills relating to fish and game. Here, for a current instance, is a measure introduced at Albany by Mr. Coutant, from Ulster County, which provides that a non-resident and non-taxpayer of any county who wishes to hunt in the county must first take out a certificate from the supervisors of the town in which he wishes to hunt, paying therefor a fee of $25, and that such certificate shall authorize him to shoot for one month in the town—not the county—to which the certificate applies. For the high crime and misdemeanor of hunting without a license the county non-resident shall be liable to a penalty of not less than $100 nor more than $200, or a year in jail, or both; and $10 for each bird or animal taken. For refusal to show his license to any Tom, Dick or Harry, man, woman or child who may demand sight of it, he must pay a fine of $50.

This is, of course, all highly ridiculous, and at first thought one might be inclined to laugh at it. But we shall see it has a pathetic side as soon as we realize that it is a case of legislative tumbling. Just as "Our Lady's Tumbler," in his mortification upon seeing his brothers at their functions, while he could do nothing but tumble, set himself to leaping and vaulting and capering as his mode of worship, so the author of this bill, having got himself sent to Albany, and there seeing his fellow members all busily engaged in preparing bills and making laws, bethought him that he, too, must do his part, if nothing more than to tumble, and so he set to to do his stunt as a legislative mountebank, and gave us this grotesque non-resident license bill. It has had just one reading in the Assembly and will never have another; but it ought not to be let pass into oblivion without prompting us to give credit to the highly commendable spirit of wanting to do something, if only to tumble, which prompted its introduction.

WE print in another column the measure introduced by Senator Perkins authorizing the President to set apart certain selected areas of the forest reserves to be game reserves. The bill is very simple and direct, and is free from the financial complications which caused the defeat of the game reserve bill last year. No appropriation is involved, and Mr. Cannon will not again be impelled in the excitement of debate to tear off necktie and collar and call upon the "boys" to "stand by him" and kill the bill. The purpose sought to be attained by the Perkins' measure is the provision of a number of game refuges, those harbors of safety and breeding which are absolutely essential if our big game species are to survive. The establishment of such protected reserves will work no hardship; on the contrary, their purpose and operation will be to increase game in surrounding country where hunting will be permitted.

The readers of this journal have been kept fairly well-informed of the character of the administration of fish and game interests in Massachusetts since the accession to office of the present board of commissioners. In the light of our knowledge of the admirable record which has been made by Chairman Collins and his associates, natural astonishment is felt at the proposition to abolish the commission as it stands and substitute in place of it a new commission of six members, who will hold meetings once in three months. The movement has its origin in Pittsfield. The plan is one which does not deserve a moment's serious consideration. It cannot have been devised from a sincere desire to advance the interests of Massachusetts fish and game protection. The way to help that cause is to hold up the hands of the present commission, to give it the sinews of war—more adequate means to work with. Chairman Collins has labored faithfully, intelligently and successfully; he has made the laws respected; has protected the game and the fish, and is protecting them. He has made the department a terror to the snarer. Any movement to interrupt the good work now being done, while it might gratify some personal feeling, would be directly opposed to public interests.

The Sportsman Tourist.

Initiating the Old Man.

My son Clarence is a student in the New York School of Fine Arts. I visited New York the other day and expressed a wish to see him at work in his class along with the other art students. "Come along if you wish," said Clarence, "but if anything happens, don't blame me. I will not be responsible for what the 'push' may do to you."

I went up. Seated in a well-lighted and well-warmed room on low stools only a few inches from the floor, with inverted chairs in front of them for easels, sat in a circle thirty or forty bright and earnest young men. In the center, upon a rostrum, stood an athlete in the altogether, posed as Ajax defying the lightning. His muscles stood out upon his body like bunches of rope and he was the embodiment of strength combined with grace and suppleness.

Around and upon the walls hung sketches done by the pupils present and past, and there were also many and varied dabs of paint, as if the students had used the wall surface as a palette on which to blend their colors. Many of the class were making a study of the model in crayon, and the grating of their pencils could be heard above the stillness as they swayed them to and fro over their paper.

My boy, on entering the room, doffed his coat, and in a moment was in his shirt sleeves seated upon his stool, sketching like the rest of them. I think he said something to the monitor of the class as he took his seat, for out of the stillness came a deep bass voice:

There's a bullfrog in the pool
And a stranger in the room!

The whole class taking up the refrain, yet not looking at me nor ceasing their work.

And then came the question:

What does a stranger do?

And in perfect unison came the reply from the whole class:

Treat!!! Treat!!! Treat!!!

And if I mistake not my boy was in the refrain with the rest.

Then came:

What will make hair grow on bald heads?

And in strong accents came the unanimous reply:

Beer!!!

This was getting a little personal, but withal, interesting.

Will he "dig" up? came next, and the answer followed:

Of course he will!

The class certainly was fixing things to suit themselves.

Then came in a deep bass voice:

When?

And in all sorts of voices came back:

Now!

I took the hint, and sidestepping over to where my boy was drawing, I simply queried "How much?" "Oh! a V will do," and as I passed him the bill the leader started with:

Oh! He's a jolly good fellow,

in which all joined with a will.

The money had but hardly passed, seemingly, to the monitor when a case of beer, another of ginger ale, then sandwiches, pickles, olives, crackers, jam and what not were brought in and piled in a corner awaiting noon recess, then near at hand.

When time was called the model left his throne; chairs and stools disappeared; a large sheet of brown paper was spread on the stand, and in a moment the provender was ready and free for all. Corn thrown to a flock of hungry chickens could not have disappeared more quickly than did the food upon that table, and in a moment the boys were each armed, in one hand with crackers, cheese or sandwich, and in the other with beer or ginger ale, as the case might be.

They treated me as a guest, and ascertaining my wants, brought me some of the provender.

I certainly felt I was a boy again among those youths, and before I had completed my Bohemian meal cries went up for a speech, but I declined to face that crowd on an empty stomach, and ate on.

My meal finished, a chair was placed in the center of the room, which I ascended, and when I raised my hand to gesticulate and opened my mouth to speak, I could neither hear myself nor could they hear anybody but themselves. My boy was making as much noise as anybody. I looked at my watch and inwardly wondered how long this thing would last, when finally silence was proclaimed.

I started in by saying to them that inasmuch as they had asked me to speak and yet would not let me, yet would I compromise by telling them a story, the same story Tom Reed told the Gridiron Club in Washington under somewhat similar circumstances. The committee from the club waited on him and urged him to be present, but he knew and he declined positively. But the club must have him, and so anxious were they that the committee was authorized to do something never yet done at a banquet of the club, pledge a speaker against heckling, and accepting the solemn pledge of the committee Mr. Reed promised to attend.

And as he arose at the coffee and cigars stage of the banquet and began his oration, a member, who had heard nothing of the pledge to silence, broke in by asking Mr. Reed "what he knew about the Czar."

For a moment it staggered Mr. Reed and abashed the members present, for a solemn pledge had been given and broken. The offending member, seeing that he had transgressed, in a nervous, apologetic voice explained that he had not heard of the compact.

Like a flash Mr. Reed recovered his equanimity, and addressing the offending member, said he would tell a story, and this was the story:

"It was an occasion when a universal peace pledge had been entered into by all animals and birds of the air. It was to last a week and all were bid to be present at the convention. A gander waddling along was accosted by a fox. 'Where are you going?' said the fox. 'To the great peace convention,' replied the gander. 'I'll go with you for company,' said the fox. And they went. Presently the faint baying of a pack of fox hounds was heard. The fox halted and pricked up his ears. 'Come along,' said the gander, 'they are, like ourselves, bound for the peace convention! And again they waddled and trotted on. But the pack came nearer and nearer, until the baying was almost deafening; in fact, the hounds could be seen in the adjoining meadow as they came nosing the ground and running along. This was too much for the fox, and shutting off any further remarks from the gander, he said, 'I think this convention may be all right, and no doubt the hounds, like ourselves, are going there, but what if some fool hound in the pack hadn't heard about it,' and with that the fox lit out'"—"and boys," I said, "that's what I am going to do right now."

But before I could get my coat and hat I had to shake hands with all the boys and promise to come again, and my boy and I left the room amid a storm of cheers. And as we got into the street once more my boy, addressing me, remarked, "Pa, you're all right."

CHARLES CRISTADORO.

The Half-Breed Indians.

IT would be interesting to know the exact numerical strength on this continent, north of the Mexican boundary, of that people which, neither Indian nor white, owes its existence to the union of the two races. No doubt the census bureaus of this Government and that of Canada might furnish some statistics, though we have never seen them. But they must at best prove faulty and inadequate.

For a large part of the mixed people, though really constituting a race apart, would in any enumeration be counted either to the Indians or the whites. The full half-breeds, being found in largest numbers in the Indian tribes, or about the tribal reservations, would be numbered with the Indians. On the other hand, that much larger body which in color shades away to that of the Caucasian, would find place among the whites. The difficulty of any exact enumeration would thus be very great. In the case of the latter class, with whom a certain sensitiveness must tend to prevent disclosures of the red line of descent, it would be well-nigh insuperable.

But while trustworthy statistics are lacking, the number of half-caste Indians—including in that class all who have Indian blood in their veins—on the northern continent, must be very great. Any one who travels much in the West, and especially any one who has hunted over it, cannot fail to be impressed with this fact, and with the extent of their distribution quite outside the reservations. Among many of the Indian tribes, moreover, their number is far larger than at first appears. For the half-breed on the reservation marries the full-blood Indian woman, with the result to further continue the strain of white blood.

In some of the tribes, notably in the Indian Territory, or in southwestern parlance, "The Nation," the development of the new race has made startling progress. Especially is this true among the Cherokees, where the full-blood seems in danger of entire submergence. General Abercrombie once said that in fifty years the Cherokees would all be white, the Creeks all black. The prediction is being verified so rapidly that even now the tribes have markedly changed color and characteristics. The Cherokee country is almost a white State, while, as respects color, the Creek is becoming a second Hayti.

With the former the change may largely be attributed to the desire of white men to share in the Cherokee lands, a desire which could only be gratified by marriage with the native women, and thus practical inclusion in the tribe. In the case of the Creeks the change is due to adoption of its former slaves by the tribe under the treaty of 1867 with this Government. By this act the negro was given the same status as the Indian, sharing equally in the government, the lands, annuities, etc., an equality which easily paved the way to intermarriage. In both tribes the new race is, if anything, more law-abiding than the old, working out its own destiny as peacefully as adverse conditions will permit.

But while the mixture of white and Indian blood among the tribes themselves has thus attained large proportions, the increase in the number of Indian half-castes scattered throughout the white population is considerable. This increase is not, of course, full half-blood. It is quarter and eighth blood, and of the lesser degrees of consanguinity approaching the pure white. For numbered with the latter are very many persons who, on the maternal side, trace their ancestry back to the Indian. They are found in every State in the Union, and are the descendants of the early settlers and hunters, who, in the lack of white women, or through close association with their Indian neighbors, took wives from the tepees. They have no color, are classed with the whites, are never suspected of mixed blood; and if they recall the fact themselves, do so much as they would recall their European ancestors when "wild in the woods they ran." Yet they are widely distributed. Two of the proprietors of one of the greatest dailies of this country belong to this class, as do a number of officers in the army; and in the South and the Eastern States not a few well-known families may claim blood relationship with the red man.

Ethnologically, however, the Indian half-breeds are a new race in this country, dating back scarcely more than two generations. Its life is synchronous with the comparativcly recent settlement of our Western States and Territories; the development of the race east of the Illinois line being inconsiderable when compared with that west of that frontier. On the other side of our northern boundary the race is older, having its beginning in the invasion of the wilderness west of the Great Lakes by the agents of the rival fur companies during the early years of the last century. There are thus half-breeds whose great-grandfathers were half-breeds, and communities, or districts, in which, until quite recent years, at least, they formed the bulk of the population.

By far the larger section of the race is French-Indian. It had its beginnings, on the paternal side, in the *coureurs des bois,* or wood-runners, a class which owed its existence to the competition of the X. Y. and Northwest companies with the Hudson's Bay Company for possession of the Indian trade. These men were French colonists from eastern Canada, who became in time hunters and traders, and gradually spread themselves over the whole region east from the height of land west of Lake Superior. As traders with the Indians, they were outfitted by the Canadian companies with the necessary goods to barter for furs; and the story of their wanderings and conflicts with the agents of the rival English company is one of the most interesting in border history.

Following the coalition of the competing fur companies in 1821, however, and the consequent loss of their employment as traders, the *coureurs des bois* gradually pushed further westward into the interior, past the Lake of the Woods and on to the fertile prairies of Manitoba and the valley of the Saskatchewan. Here they became hunters and trappers rather than traders, disposing of their furs at the trading posts scattered throughout the country and near which they invariably settled. To this they added employment as canoe-men and freighters for the fur company, and, in time, acquired small land-holdings and engaged in agriculture on a limited scale. Up to the early sixties, however, their chief dependence was upon freighting and the great buffalo hunts, in which practically all the adult male population engaged.

Very naturally, the wood-runners, being social in disposition and gregarious in habit, and cut off from the women of their own race, sought wives from the various Indian tribes. The object was attained generally through barter—so many blankets or so much ammunition for a wife. And though the marriage ceremony lacked the essentials of bell, book and candle, the unions thus formed were generally happy enough, and a numerous progeny speaking Cree, Ojibway and Assiniboine, swarmed about them. As the latter married in turn, and always young, the new race increased rapidly; and as its daughters proved comely and attracted the attention of white traders and settlers, it gradually lightened in color until among the probably five thousand French-Indian half-castes at the date of the transfer of the country to Canada, the white blood clearly predominated.

Of the remaining half-breed population, the larger part is made up of the offspring of the Scotch and English employes of the fur company. Like the *coureurs des bois,* these men were in a way forced to find wives among the Indian tribes, or the half-caste daughters of the hunters and voyageurs, And so attractive did the latter prove that the readiness of the fur company to import wives for its officers from the British Isles failed materially to alter the custom.

Very naturally, as the majority of these marriages were, in the first instance, those of whites with half and quarter-bloods, with the intermarriage of its descendants, this section of the new race has bleached out even more rapidly than the French. In fact, it is, as a rule, almost indistinguishable from the white. Singularly enough, too, it exhibits something of the same prejudice against the other moiety of the race that is borne by the pure whites against both; though until the present generation their avocations and habit of life were largely identical.

It is probable, of course, that in the case of the Scotch and English half-breeds this prejudice is due in part to social and economic differences. The latter are descendants of the better class of the fur company's employes, many of them of the officer class, while the forebears of the French half-castes were hunters, freighters and voyageurs. And the tradition of authority, of fixed position, of superior emolument, on the one hand, and of service, of desultory labor, and hand to mouth existence, on the other, still lingers.

Again, the Scotch and English half-breeds have, as a rule, attained a greater degree of material prosperity than the French. Many of them are wealthy, the majority are well-to-do farmers. They are well-clothed and housed, their sons and daughters intermarry with the whites, especially with the descendants of the old officers of the fur company, with whom, owing to long association, race prejudice is reduced to the minimum.

The French section, on the other hand, still maintains much of its original gregariousness. Intermarriage with the whites is less frequent. No doubt this is due in part to difference of language, the new immigration with which it is surrounded being largely English speaking. But in larger part it is due to clannishness, to race feeling, and to closer adherence to old methods of living. The disposition is to settle in little communities by themselves; an inclination fostered by their spiritual guides, who naturally desire to keep their flocks separate, with the mission church as a center. So far as possible, moreover, the French half-castes follow their old pursuits. They are still freighters and hunters and guides, preferring these callings to farming, though the latter has now become their chief means of livelihood as a class. There is thus less of thrift than among the Scotch and English; less ambition to advance in the social scale, to possess the appliances, comforts and conveniences which go so far to make up what we call civilization.

Inevitably this difference of wealth and social status tends markedly to separate the two sections of the race. The divergence is accentuated by the desire—unacknowledged yet existent—of the Scotch and English to escape the prejudice which attaches to a mixed race and which identity with the French Indians would entail. For this prejudice operates against the half-breed wherever he is found, and tends constantly to perverted judgment of his real worth.

Apparently there is little consciousness of this prejudice among the quarter and eighth bloods on our own side of the line; at least in localities where the half-caste and Indian population is massed. A partial explanation

of its absence may be found in the fact that they do not live among the whites, as do the Scotch and English half-breeds of the boundary. They do not, therefore, notice the extent of the prejudice against a crossed race with a color entertained by white men everywhere. But it is beginning to appear in the nation, especially among the Cherokees. And, no doubt, in time it will manifest itself in much the same way that it does across the border—that is, by a drawing away of the lighter half-breeds from those of fuller blood.

It may be said of the French half-breeds that they are probably more fairly representative of the new race as a whole than any other of its sections. That race, it will be remembered, is a cross between the Indian and the white, shares in the characteristics of both peoples from which it sprang, yet is wholly repudiated by the one and largely so by the other. Remember, too, the conditions and associations with which it has been surrounded since its birth; that on the maternal side its ancestry has been largely savage and pagan, and that if there is anything in heredity its potency cannot be destroyed in a generation. It is not surprising, then, that the French half-caste in his occupations leans toward those of the Indian rather than the white; and that in character he is a composite of the peoples from whom he sprang.

This is not to say that the race is inferior in capacity, manly qualities and morals to its forebears. The popular notion that it is so is due to the unreasoning prejudice against a mixed race with a color, to its present habit of life, and to the assumption that any people to be capable and manly must be like Americans. But its present habit of life is only what might be expected of a people so recently little removed and still slowly emerging from semi-savagery. And just why we should set up a standard for a separate race and insist that the standard shall be our own it is not easy to explain. That the Indian half-breed is unlike us does not prove his inferiority any more than a similar unlikeness proves the inferiority of the Hebrew and the Bengalee, who constitute the intellectual aristocracy of the human race.

Certainly the mixture of blood has not resulted in the deterioration of the qualities which contribute to manhood. Army officers are unstinted in their praise of the courage shown by the half-castes during the Civil War; and the writer recalls a pleasant conversation in the Southwest with a quiet little man, in clothes of the latest fashion, but half an Indian, whose dauntless bravery on the battlefield once challenged the admiration of the country. Nor has any conclusive evidence of the intellectual deficiency of the new race yet been presented. No one looking at the intelligent faces of the half-castes in the Indian Legislatures in The Nation would suspect them of any less measure of mental ability than the whites.

President Diaz of Mexico is an Indian half-breed, yet has shown himself even more competent as an administrator than as a soldier, laying broad and deep foundation of his country's prosperity. A half-Indian provincial premier in Canada was at least the equal in ability of his fellows, and the half-caste Presidents of Peru and Ecuador have conducted successful administrations. There are half-breeds in nearly all the learned professions, as there are in trade; and we once heard a half-caste judge pronounce decision in an intricate case with much of the wisdom of Solomon and all the dignity of Arungzebe.

With respect to morality, no doubt there are bad half-breeds. But missionaries everywhere testify that they can be good men, as do the lives of many half-caste Indian pastors. If we recollect aright, the percentage of church membership in The Nation is larger than that of the country as a whole; and the court records charge an astonishingly small percentage of crimes to the new race.

Natural History.

Intelligence of the Wild Things.

Tiny and the Chickadees.

BY HERMIT.

(*Continued from Vol. LIX., page 264.*)

IN the series of nature studies, published in FOREST AND STREAM's natural history columns, Tiny was briefly introduced to the public. Tiny is a red squirrel, the son of Bismarck. The latter was a grizzled old warrior, the hero of many a fierce battle. Why he gave the cabin door-yard to Tiny is one of the mysteries of squirrel life. He had held it against all squirrels, red or gray, for ten years, and now gave it over to Tiny to have and to hold, without reserve.

A return to Bismarck's life history may throw some light on this peculiar transaction.

Bismarck's family, April, 1900, consisted of a wife and four children. Mrs. Bismarck, at that time, left her children to the care of her husband, while she made a new nest in which to rear another family. It was Bismarck's duty to finish the education of the young squirrels and to marry off the daughters, to young males of another family, and to locate his sons on territory which they would ever after own and for which they would fight to the death.

Tiny was not half so big as his only brother. Perhaps that was the reason why Bismarck favored him and brought him to the door-yard. It was an unusual act, for Bismarck insisted that his sons should remain on the territory upon which he had located them.

When Tiny had acquired full possession he proved to be a "chip of the old block." His motto, "No trespass," was impartially enforced. He raced his brother, sisters, father, mother, as well as strangers, out of the door-yard, and fiercely attacked any squirrel that did not depart after the first warning. It was laughable to see Bismarck, the grizzled old warrior, run as if for life when caught trespassing by Tiny. When Tiny approaches through the treetops and finds a squirrel in the door-yard, he stops and sounds his war cry. This cry is long drawn out and is something like the buzzing of an old wooden clock when running down and striking the hours. After this warning he makes a rush for the interloper, and if he catches him the fur flies.

Tiny had a lively experience with a wharf rat. The rat was a monster. What caused him to take to the woods is a mystery. Probably he was a rat Christopher Columbus, and had started out to discover a new world.

When he found my door-yard he seemed satisfied. From a rat's standpoint it proved to be "A land flowing with milk and honey."

Wheat, corn, meat, bird seeds, with no bloodthirsty human being to make life miserable. After two days of feasting the big fellow disappeared to appear again three days later with a mate. Doubtless the sly old

rogue thought that he was able to support a family on the fortune he had discovered in the woods.

I trapped the small rat, but found the big one too crafty to enter a trap.

At first the rat did his foraging in the night time, so Tiny had no chance to make his acquaintance. Later he became bold enough to feed in the day time, which, in the end, brought him in contact with Tiny. I was talking to some visitors from one of the big summer hotels, telling them the history of the rat, while he was eating from a loaf of bread in the dooryard, when I heard Tiny's war cry. I told my visitors to look out for a hot time. Tiny ran out on a limb about six feet above the rat and told him in vigorous squirrel language that he was a thief and a robber. The

rat looked up, wondering what the angry little animal could be, that was talking in an unknown tongue, and pounding the pine limb with his hind feet. It never entered his head to be afraid of such an insignificant foe. Tiny ran down the tree trunk, landing on the ground not four feet from the rat. The latter stood on his hind feet and squealed a warning.

A lady visitor urged me to drive the rat away. "Rats are great fighters," said she, "the poor little squirrel will be killed." I offered to bet on the squirrel, but before she could answer the fight was on. Tiny caught the rat by the neck. For a few seconds all that could be seen was something brown whirling in a cloud of pine needles. The rat soon found that his little foe was a cyclonic fighter, and he made desperate efforts to escape. He dragged Tiny to a stone wall, leaving a trail of blood behind. When he entered the wall Tiny let go and returned to the bread and coolly proceeded to eat his dinner, none the worse for his fierce battle.

The rat did not return. He either died from the effects of Tiny's savage bites, or, if he survived, left in disgust.

Tiny was not always full of fight. He formed a friendship for a young towhee bunting after a singular encounter. The bunting was eating from a loaf of bread, which was staked down in the dooryard, when Tiny appeared. The squirrel thought that the bird would run away, but instead, the latter set its wings and lowered its head in preparation for battle. Tiny was astonished. He sat up, folded his forepaws on his breast, and looked on the gamy little bunting with wide-eyed wonder. The bunting soon turned to the bread. Tiny brought his forepaws down hard on the ground, evidently to frighten the bird. Again the plucky little bunting set its wings and lowered its head. Again Tiny sat up and looked the little fellow over. This time there was a comical expression on the face of the squirrel that said as plain as words could tell that he appreciated the situation. That he admired the pluck of the bunting was evident by his action. He crept quietly to the opposite side of the loaf of bread and allowed the bunting to eat unmolested. After this the two would eat together whenever they chanced to be in the dooryard at the same time.

Tiny did not allow other buntings near his food, and I thought he would forget his bird friend when the buntings returned in the spring migration, but not so. He knew his friend at once and chuckled some kind of a greeting, while the bunting said something in bird language that seemed to my ears to express joy.

The red squirrel is quick witted and full of resources. If new and unusual conditions confront him he is equal to the occasion. I have had proof of this hundreds of times.

I will relate one instance: I feed hemp seed to the birds. The red squirrels and chipmunks are fond of the seed, and unless I stand guard, will manage to get the lion's share. The chipmunks stuff their pouched cheeks and would carry away a bushel every day if it was fed to them.

When Tiny is present no squirrel or chipmunk dares to meddle with the food. He does not molest the birds, and I really think that he knows that the seeds belong to them.

Last fall I placed a wire netting over a shallow box, so the birds could pick out seeds, while the squirrels could not get their noses through the mesh. The chipmunks were puzzled, and one after another gave up in disgust, to fall back on bread and corn. When Tiny found the box he got mad all through. He crowded his nose against the wire netting, biting savagely meanwhile. I laughed, and Tiny instantly stopped his efforts and looked in my direction. All at once he got the idea into his head that I had blocked his game and had caused the trouble. In three bounds he landed on the trunk of a pine tree, and running to a limb just over my head, he told me in wicked squirrel language just what he thought of me. In his anger he pounded the limb with his hind feet, stopping now and then to charge down the tree trunk, as if he were about to attack me.

After ten minutes of this hot work he became quiet, except a sob, which he uttered from time to time. Finding that I would not help him, he returned to the box. He tried the wire a short time, then sat up and folded his paws across his breast and fell into a brown study. Like a flash he came out of his trance, grasped the box and turned it completely over, then he began to eat, saying something to me, while he jerked his tail in a defiant manner. After this, whenever he found seed in the box he quickly turned them out. For a week or more I allowed him to have his way. I wanted my visitors to see how cute the little scamp could be on a pinch. Later I drove stakes across the box to hold it down. I returned one day to find that Tiny had managed to dig a hole beneath the box and had gnawed through the bottom. I tried another scheme for the purpose of testing the intelligence of the squirrel. I stretched a cord between two trees and half way suspended a box, open at the top. Tiny saw the birds eating from the box, and he quickly understood that it was another device of mine to outwit him. He ran up one of the trees and tried the limbs that hung over the box. He soon found a slender limb that would bend under his weight and let him into the box. After he had used this highway several days I cut the limb away. When Tiny found a fresh stub instead of a limb he understood what it meant. He knew that I was the guilty one, and he swore at me, if a squirrel can swear, for twenty minutes. His next move was to investigate the line where it was attached to the trees. He thought he could reach the box over the line and started out. When about a foot from the tree the line turned and Tiny jumped to the ground. He tried this three times and met with failure. The fourth time, when the line turned, he clung to it and made his way to the box, hand over hand. I thought he deserved a reward for his continued effort and intelligence, so since then I allow him to eat from the box whenever he feels like it.

Tiny made a cosey nest in November of moss, leaves and grass. It was in the top of a pine tree that hangs over the cabin door yard. Some wretch shot this nest to pieces when I was absent. I returned to find empty shells in the door-yard and fragments of the nest hanging to the tree. Tiny made another nest in a nearby pine, and lives in it at this time. The past two winters Tiny made his nest in my summer house. Why he did not occupy the house this winter is a mystery. Perhaps he heard me say that I should take down this house and put it into a new log cabin that I had in contemplation.

Tiny is a widower and childless. His wife and children were shot to death by the gunners that swarm through the magnolia woods.

I think Bismarck is dead. In cold weather he made it a practice to sly up to the cabin, just at dusk, for a doughnut or a bit of bread. For some time I have missed him. I went to his nest to find it shot to pieces. Still further away I found Mrs. Bismarck's nest in ruins, and silence reigned in that part of the woods.

Tiny is now an orphan, a widower and is also childless. He occupies in squirrel life the same relative position that the hermit occupies in human life. Tiny's

misfortune has brought the man and squirrel a little nearer together.

Chickadees that can Count Four.

The chickadee is my favorite bird. At the present time the flock of chikadees that come to my cabin for food will number not far from forty individuals. Many of this number are old friends that have become tame enough to eat from my hand. When the cabin door is open they fly in and out perfectly fearless.

Several years ago the late Frank Balls, in one of his visits to my cabin, was told by me that the chickadees could count four. Mr. Balls replied: "I confess to being quite a crank on birds, but I can hardly grant my pets a knowledge of mathematics; where do you get your proof?"

I threw some hemp seed into the door yard and called the chickadees down. While the chickadee is fond of hemp seed, it is a fact that he cannot crack the seed in his bill. He has not the cone bill of the finch family, so must take a seed to a small twig, hold it between his toes and beat off the hull. Young chickadees take one seed from the door yard, but the old ones take as many as four. These old birds are intelligent enough to save their wings by crowding four trips into one. One old bird picked up four seeds and flew to a pine limb directly over Mr. Balls' head. It placed three seeds in the rough bark of the limb and hopped to a small twig and proceeded to pound the hull off the fourth seed. I quietly pushed one of the three seeds off the limb. When the bird had disposed of the two seeds in sight it searched for the missing seed. Not finding it in the bark, the bird dropped to the ground and soon recovered it.

After witnessing this performance several times, Mr. Balls admitted that the chickadee knows some mathematics and can count four any way.

I have observed this thing for eighteen years, and it proves to me that my pets possess intelligence far beyond the knowledge of the general public.

For several winters one of my chickadees has formed the habit of rapping on the window when he wishes to come into the cabin for food. After rapping he will fly to the door, for he knows that I will let him in. Other chickadees imitate this one, so far as perching on the window sill, and bobbing their heads, but they do not tap on the glass, so I do not let them in when they fly to the door.

In many ways the chickadee has changed his mode of life during the eighteen years that he has inhabited my door-yard. This is especially evident in the departure in nest building. Some of the birds make a nest wholly of cotton batting, which I supply. The fact is, these birds are partly domesticated, and let me say this: I could remove a number of them to Boston Common, feed them for awhile, and they would remain to become permanent residents. They breed rapidly, and other parks could be stocked from this colony. But the English sparrow stands in the way.

It is a burning shame that we should have imported this quarrelsome nuisance when we possessed a native bird in every way fitted for park life.

The chickadee nests in dead trees, woodpecker fashion. Ninety per cent. of the nests are in small paper birch trees. The birds take turns in doing the work. A neat round hole is pecked through the tough bark, then the rotten wood is removed to a depth of about ten inches. Moss is placed in the bottom and on this squirrel's or rabbit's fur. The eggs are white, with numerous specks, and number from five to nine. They look so pretty and cosey nestled in soft fur set off by bright green moss that one is reminded of jewels in a case.

If these birds are ever introduced into parks, the nests could be cheap affairs. A tube about one foot in length would answer.

The New York Zoological Society.

THE report of the executive committee of the New York Zoological Society is too long to publish in full, but some of the more important events of the year 1902, which has shown the most satisfactory progress since the Society's establishment, should be mentioned.

The transfer to the Society of the New York Aquarium is an event of great municipal importance and a gratifying evidence of the confidence felt in the Society by the city authorities. As noted in FOREST AND STREAM, the transfer took place last October, and the Society has been fortunate enough to secure Mr. Chas. H. Townsend as director of the Aquarium. The city provides a maintenance fund of not less than $45,000, and the Society has chosen an advisory committee to act with the director.

The enormous attendance at the Aquarium, averaging about 5,000 visitors daily during the year, makes the proper conduct of this institution a matter of the greatest importance, both from a popular and a scientific point of view.

The completion of the lion house has been already alluded to, and the antelope house will probably be finished during the spring of 1903. Even before it is stocked with antelope, this house can be used, for the Society is already very short of room for its tropical animals.

Plans have been completed for a bird house, and bids are being advertised for. This will be located on the northwest corner of Baird Court, and will afford cage room for a great number of specimens. It will be provided with several flying cages, both within and without.

The growth of the Society's collections has been so rapid that the maintenance fund provided by the city has hitherto usually fallen short. It is hoped that future provision may be on a more liberal scale, in order that the Society, which already bears the expense of providing collections and housing them, should not also be forced to pay considerable annual sums for their maintenance.

The franchises of the park produced last year about $7,000, the proceeds of which are devoted to the increase of the collections. Yet with each new building the cost of increasing the collections becomes greater, and the Society must look to its general fund to meet this added cost. This fund depends on the annual subscriptions of new members, and strong efforts should be made to increase this membership, which now is only a little over 1,200. It ought to be three times as great.

As usual, the gifts to the Society have been very generous. A member presented a magnificent antique Italian fountain, which is now being erected, and a great number of rare and expensive mammals has been given by other members.

Allusion is made to the useful work done by the Society in representing to Congress, to the authorities of Newfoundland and to the Canadian Minister of the Interior, the importance of taking steps to preserve certain species of animals that are threatened with extinction. Through the efforts of Hon. Jno. F. Lacey, assisted by Dr. C. Hart Merriam, a game law was provided for Alaska which seems to have been working well. Wise action to protect the caribou has been taken by the Newfoundland authorities, while the Minister of the Interior in Canada has set on foot measures for the protection of the wood buffalo and the musk ox.

As a whole, the report of the executive committee shows very gratifying and good work done by the Society during the year. This work is purely a labor of love, and it is earnestly hoped that the public may show their appreciation of this effort by lending their support to the gentlemen who are so efficiently carrying out the wise plans of the Society. A larger membership is greatly needed, and those who are interested in the subject should apply to Madison Grant, secretary, 11 Wall street, New York, for blanks for application to the Society.

Our Wood Inhabiters in Winter.

TO THOSE who love to be among our woods, who delight in penetrating the dim, mysterious vistas which stretch away among the grand old forest trees, the charms which meet him on every side in the balmy days of summer, are innumerable and of the most varied character.

The songs of many birds, the fragrant aroma from the incense-breathing foliage, the bright and fragrant flowers which dwell only in those secluded retreats, the many-colored butterflies which fly across his path; all these are enjoyable in a high degree; they are something which to the lover of nature surpass all other sources of pleasure.

But though they are in those halcyon days so thoroughly enjoyable, they do not entirely eclipse the delights which a visit to those scenes in winter affords.

It is true that most of the sounds of nature are hushed in a great degree, but there are almost numberless phenomena to engross the attention and to afford recreation and study to those who delight in witnessing the wonderful happenings around him.

A ramble in the woods in winter brings with it a peculiar degree of enthusiasm that is not found at any other season. Our blood courses rapidly through our veins as we drink deep draughts of the glorious air, and as we crunch through the crusted snow our respiration is full, our eyes brighten and we feel as if we want to sing and even shout. The oxygen of the winter woods is working all these wonders. It is exhilarating, almost intoxicating.

As we pass through the old fields and pasture and the outlying thickets, and enter the forest growth, the first greeting we receive is from two or three bristling little birds, the chickadees or blackcap titmice which, climbing about among the small branches and twigs of the trees, hover about us with an air of half inquiry and half sociability that they voice in their peculiar tinkling notes, "Chick-a-dee-dee," which are characteristic of the species.

These hardy little feathered mites remain with us in the Middle and New England States throughout the year, being migratory in but a very small degree. While this species is properly a wood bird, it often visits the orchards and farm gardens, and so sociable is its nature it is frequently seen among the ivy and other vines which climb about the porches of the farmhouses, busily engaged in its search for the larvæ and eggs of insects upon which it chiefly subsists. It also hunts among the gray, lichen-clad shingles of the house itself for the torpid insects and their larvæ, and the spiders which hibernate among the weather-beaten boards; and in such places the hardy little bird finds sometimes an abundance of food that one would hardly imagine could be there.

Sociability is not the only good trait in this charming little bird's character, for it is gifted with a sympathetic nature that is rarely excelled by any of the other birds.

Often have I in my forest rambles imitated the cry of a bird in distress for the purpose of ascertaining what species were within hearing distance from me; this cry, if it can be called such, is made by loudly kissing the back of the hand, the sound produced being exactly like the cry of a young bird or some small matured species in fright or pain.

Although there may, perhaps, be no birds visible before the cry is sounded, as soon as it breaks the stillness of the forest, birds fly out from hidden places in astonishing numbers and variety, the thrushes, vireos, Maryland yellowthroat and other species of sylvians gather around the intruder scolding vehemently at my presence and at the pain I am apparently giving some feathered victim, and among these the chickadee is, if within hearing distance, the first to fly to the rescue and the most solicitous of all concerning the pain and peril in which one of its mates, perchance, is placed. I have carried on this deception to such a length that some of the more belligerent species have actually attacked me, flying at my face and evidently determined to punish me for molesting one of their neighbors.

The chickadees hovered around me sometimes so closely that I could almost touch them, and their every tone and movement expressed the keenest anxiety and solicitude. And this sympathetic feeling, as shown by the chickadees, is not confined to the nesting or breeding season, but is manifested at all periods of the year, as I have repeatedly proved.

On one occasion, as I was enjoying a winter ramble in the woods, I sat down in a sheltered, sunny spot for a short rest and smoke, and as I was preparing my pipe, I absent-mindedly whistled the air of one or two songs, and finally took up the melody of "Stride la Vampa" in "Il Travatore." It is not exactly in a minor key, but as I whistled it I remember that it sounded very plaintive. I had whistled but a few measures when I heard the notes of a pair of chickadees in the thicket near by, and the birds quickly drew near me, chattering and uttering a peculiar note of commiseration that was unmistakable. I continued the whistling in a lower tone and drifted into a melody that was in a distinctly minor key, when the birds became more and more anxious, and one drew nearer and at length alighted on the toe of my boot, and looking up into my face, said as plainly as bird could speak it and full of sympathy, "What is the matter, you poor thing? Are you in pain? I wish I could help you." For a few minutes I kept the birds almost in a delirium of anxiety, and then ceasing to whistle and making a quick movement of my feet, I startled them, and they soon flew away.

The blackcap titmouse, subsisting as it does on a variety of food, is rarely put on "short commons," while it chiefly depends on the eggs, larvæ and imagos of various insects; it often visits the farm-yard and claims a share of the food that is thrown to the poultry.

Gentry says that if the woodhouse door is carelessly left open the chickadee will gratify its curiosity by entering, and, if anything edible is to be found, it is not too bashful to appropriate it, "even the bacon strip which is used to grease the saw and which is a noticeable feature in every woodhouse, disappears before its keen appetite."

I have often been visited by these sociable little birds when tenting on a salmon stream, and they lost no time in gleaning among the fish bones and other débris from the table that was strewn upon the ground.

The chickadee is the impersonation of restlessness; it is ever on the move, and as has been truly said, it combines in a remarkable manner "the twofold character of an expert creeper and skillful flycatcher moving circuitously up the trunk and along the horizontal branches freely suspending itself in an inverted manner by the aid of its claws with the nimbleness and gracefulness of the brown creeper." It moves from one tree to another quickly in foraging and generally travels in pairs, male and female. If the birds become separated, the male utters its anxious call notes, which quickly bring his mate to his side.

Another of the common wood inhabiters met with in the winter is the red squirrel or chickaree. This little animal has a wide geographical range, being common throughout the Middle and Eastern States and in the Canadian provinces, wherever the pine and spruce occur, and in most of the Western States east of the Mississippi River it is also abundant.

Its natural home is among the evergreens, the cones of which, particularly those of the black spruce, form its principal article of food. It readily adapts itself to other localities, however, and often takes up its residence in the neighborhood of the farm, where it makes frequent forays to the corn fields and the grain house.

Unlike most of our other squirrels, the chickaree collects an ample supply of food for winter use, consisting of nuts, corn and other grains if they are to be obtained, acorns and seeds, and as it is active throughout the entire season, this stock of provender is freely drawn upon.

This food is deposited in hollow trees, under logs and rocks, and is occasionally cached in the ground. The ever alert boy often finds these hidden hoards of nuts, and as a matter of course, has no scruples against appropriating them for his own use.

In winter the peculiar tracks of this little animal are seen everywhere in the snow, and they almost invariably lead to a hoard of provender or to a pile of spruce cones that the squirrel had detached from the tree for food.

The chickaree, while it sometimes seems to tolerate the presence of man in the neighborhood of its retired home in the forest, as a rule objects very strenuously to his coming there. I have often, in one of my winter rambles, drawn near one of these little animals, and sitting upon a tree stump or boulder, watched its movements: for a brief time it remained quiet, watching me evidently with curiosity and awaiting my next move.

If I remained perfectly quiet the squirrel came out openly and scrutinized me closely, and then doubtless, in disapproval of my tout ensemble, it set up the vilest tirade of abuse against me that a squirrel could utter: jerking its tail up and down and spasmodically moving its body in nervous irritation, every note and every motion indicated that it held me in utter contempt, abhorrence and derision. I doubt if there is another animal that can scold as venomously as can one of these chickarees; but all the time it is scolding it keeps its weather eye open, and is otherwise fully on the alert, and if a hand or foot is moved, away scampers the squirrel, realizing, perhaps, that it deserves a condign punishment for the abuse it had showered upon me.

In addition to the variety of food that I have named, the red squirrel eats the eggs and young of birds, and devours grasshoppers and such other insects as it can capture. I have often had specimens in captivity and have experimentally thrown to them grasshoppers and grubs, and these were quickly eaten.

On one occasion, as I was quietly following a trout brook through a swamp, I heard a fluttering in the thicket, a sound as if some kind of struggle was in progress, and on investigating the cause of the disturbance, discovered that a chickaree had a young woodcock in its mouth, which it was endeavoring to bear away despite the protests, wing blows and other demonstrations from the mother bird.

By good fortune I succeeded in knocking the marauder over with a well-aimed stone, and found that the chick was dead, and the head was bitten through and partly eaten.

I am aware that in the opinion of some observers this squirrel is not a flesh eater, but I have proved the contrary on many occasions. Repeatedly have I

had these animals come into my tent when I have been on a fishing outing, and irrepressible and expert thieves they always proved to be.

Biscuit was a favorrite article of plunder to them, and the size of the piece they could carry off astonished me. Cooked fish was also readily taken, and if salt pork or bacon was left where they could get it they invariably confiseated it.

That they will destroy young birds I have proved more than once. My father had, at one time, a pair of breeding canaries hanging in a room from a window casing, and near their cage was another in which a red squirrel was kept as a pet. It had become so thoroughly domesticated and tame that during half the time its cage door was left open and the squirrel "had the run of the room." In the canaries' nest were four young birds about three weeks old. Callow little things they were, of course, and their size was small. One night a canary chick disappeared and not a trace of it could be found, and on the next night there was another little one taken, and that, too, utterly disappeared. That the squirrel should be the guilty depredator was never for a moment imagined, and the blame was laid to mice and rats. But on the morning of the next day the squirrel was found in the canaries' cage, he having sueceeded in lifting the door from the outside and entering. Both of the parent birds were dead, their heads having been bitten into and their brains eaten.

Here was proof positive that the chickaree was the aggressor. He had found no diffieulty in entering the cage, but the door on the inner side shut down on a metal flange, which prevented the rapacious little animal from escaping. EDWARD A. SAMUELS.

[TO BE CONTINUED.]

Wild Pigeons.

Editor Forest and Stream:

Mr. Hough's notes of the wild pigeon in the current number interested me so much that I read and reread them again.

This explanation, or opinion, rather, of the cause of their disappearance, seems to me to be hardly the true one, though. We know why the buffalo have disappeared; we have killed them off. But in the pigeons' case that can hardly be so, for before they finally disappeared it was not unusual to see floeks of them that would number at least a quarter of a million. I have seen a single flock that had at least that many in it, and this one was only one of half a dozen that passed over our part of the country in a single season.

A year or two before our buffalo finally disappeared I happened to be in the Menger Hotel in San Antonio, Texas. This was the principal hotel there then, and there were present at the time a number of tourists from the North and several cattlemen. The conversation drifted around to the buffalo, and why they were getting to be so scarce. I and the Texans agreed as to what was the cause of it: the white skin-hunters who were killing them off in season and out of season without any regard to age or sex.

A gentleman here, one of those tourists, whom I afterwards learned was a college professor in the North, after he had listened to me condemning the hunters, said to me, "Let me tell you something. Your buffalo would disappear about as fast as they are now doing if you never fired a shot at them; they have run their course, and are now about to disappear, just as those prehistoric animals whose bones we find from time to time have disappeared."

I knew but little about those animals in comparison to what he did, but we all knew that the surface of our globe has changed greatly since these animals were on it; that might account for their disappearance; but it was not changing now, and the buffalo had the same food and a large part of the same range now that they had always had. I could not indorse his opinion in regard to the buffalo, but if he was correct in that, might not the same cause explain the disappearance of the pigeon?

When I was a boy the wild pigeon was so common in our part of the country, western Pennsylvania, as not to attract any more attention than a flock of ducks or geese would when they flew across the country.

The last large flock of them that I ever saw was in 1854. There were more or less of them there the two following years, but I was not there then. I had gone west to fight Indians, just as our boys do yet, or try to do. The poliee generally stop them in this side of the Indian's country now, but after I had got to the West I formed a truce with the Indians, and we both went to hunting buffalo. When I returned two years after this the pigeons were all gone. These pigeons, when on the march, would fly in a solid column, sometimes only a narrow one, then again I have seen one all of a quarter of a mile wide and just high enough to clear the tree tops. Then if they were passing across a wide open space they would drop down nearer the ground, but still would keep up their column intact.

When hunting them I always tried to get into an open spot, as far as possible from high timber; then getting under them, fire into them as they passed over my head. If there was no gun there but mine, my firing at them did not seem to disturb them much; they would sometimes fly a little higher after passing my gun, but those behind would not rise, and they would not rise ahead of me high enough to be out of gun shot.

I used a single muzzleloader with shot, if I had it; if not, then small slugs did as well or better; I found that with them I could get more birds than I could using shot. I did the shooting while two small boys, who were too young yet to use a gun, retrieved them for me.

One of these boys would often get nearly as many birds with a long pole that he had just for that purpose. Then he would work away behind me, where the birds would be flying low enough for him to reach them. The most of his would only be stunned when they fell, but the other boy was there to finish them. The birds that we got were never wasted, no matter how many we had; if we did not use them all, others did. I have heard of their being fed to hogs, no farmer in our part of the country would do it. They were not in the habit of feeding anything to hogs that would bring money, and these birds would if they were hauled from 5 to 20 miles to the nearest large town, and they would be taken there if enough of them could be got together to warrant it; in fact, the last considerable number of them that I ever saw were in a farmer's wagon; he had hauled them up from Lawrence County to Allegheny City, he must have had half a ton of them. I have seen these pigeon roosts after the birds had left them; the trees then would look as if they had been struek by a hurricane, limbs being broken off in every direction where the birds had overloaded them.

I never shot them on the roost; they were not protected there, but I could get as many of them as I wanted in the day time.

Now, if there were any of them here to shoot I could not shoot them within a mile of the roost, the penalty for doing it is $50. CABIA BLANCO.

Is "Protective Coloring" a Myth?

"'PROTECTIVE coloring' is one of the doctrines of the modern naturalist, and there can be no denying that eggs, furs and feathers, not to mention forms, in some of the lower ereatures, often harmonize with, or imitate their surroundings wonderfully, but is this harmonization protective? Eggs laid in holes in trees and burrows in the earth are nearly invariably white, though in one ease they are blaek, or nearly so; but eggs laid in full view of the sky are also often white, as those of many water fowl, sea birds, etc. Now, eggs hid away require protection as much as those laid on open ground, but stoats, weasels, squirrels, rats, snakes, etc., know as well as you and I that hollow trees, burrows and so on are the nesting places of hundreds of birds, and habitually enter such holes in seareh of their eggs. Where does the protcetive doctrine come in here? Again, variegated and colored eggs are usually laid in more or less bulky nests. Do you think a weasel or snake cannot see such nests in bushes and trees as well as you? Or that he is not quite as well aware as you what such nests are likely to contain? Yet, again, the eggs of eagles and some other birds of prey are beautifully mottled, and others which build in precisely similar spots, precisely similar nests, lay pure white eggs; as some vultures. Does not the vulture require as much protection from nature as the eagle? And with regard to the coloring of birds' plumage and the skins of animals, is it not ridicuolus to talk of such animals as tigers, jaguars and pumas requiring protection? In this case I shall probably be told that the protective coloring is to enable them to approach their prey; but that will not do. For I know that such beasts of prey never approach their victims except under cover of jungle, etc., and that the first intimation the latter receives of the vicinity of their destroyer is the fatal roar and rush with which he breaks cover. Besides, birds especially, which agree in habits and haunts, must necessarily require the same amount and kind of protection, at least, so it seems to me; but they certainly do not get it. Two or three species of bell bird are dull colored songsters, easily hid, but at least one species is pure white, one of the most conspicuous colors in nature. And I could cite hundreds of parallel cases. The conclusion to which I come is that the doctrine of protective coloring is based on erroneous grounds. Nature's idea is to create a pleasing and curious variety to gratify the eye of man, nothing more; and in that opinion I am confirmed by the knowledge I have that neither coloration nor mimicry (the resemblance which certain animals, and particularly certain insects, have to other animals or inert objects), serves the purpose which naturalists have supposed it was intended to serve. For all these creatures which are "protected" by color or mimicry, furnish a full quota of the prey of ravenous animals. Then, again, birds of the ostrich kind all lay their eggs on the bare ground, and mostly in very exposed positions where it is impossible for them to escape the eye of any chance passerby; yet some ostriches lay pure white eggs and others dark rifle-green ones. Why? No reason but a purely speculative one can be given. It may be urged that the African ostrich hides her eggs in the sand. I only know that she does not always do so. At all events, American and Australian ostriches do not hide their eggs, but rather seem to wilfully expose them."

So writes Mr. Paul Fountain (a noted British traveler) in his new and most interesting work entitled "The Great Mountains and Forests of South America." I thought it well worth while to make an extract of his words and send them to FOREST AND STREAM. What have your many naturalist readers to say about them? My own opinion (offered with all modesty and without any claim to expert knowledge) is, that Mr. Fountain is probably wrong. No doubt he has made out a very strong case, but it seems to me he has not gone deep enough or far enough.

Now, it need hardly be said, there is the very best of reasons for protective coloring, which is implied by the phrase itself. Granting this, we may ask, How does the process develop? In the first place, then, it is a well-known fact that all birds and animals have an inclination or fondness for a certain environment (partly for material and partly for spiritual reasons). Frequenting this habitually they, through the operations of sympathy, superadded to the desire for safety, would come to assume the tones of the environment; so, likewise, their eggs: not all the tones, of course, but selected ones. (This process, it should be remembered, is by no means ended.) We see the bear and ptarmigan of the polar regions are white like the snow, while their congeners of the Rocky Mountains are brown, like the rocks. This may be stated to be the general rule, but like nearly all general rules there are many exceptions to it. And yet there may not be so many after all. For, suppose, we see a black or a white bird amid a mass of greenery; perhaps if we used our eyes we should discover something matching their color not very far off and which would be instantly fled to should a hawk appear. But that there are exeeptions there appears to be no doubt. How, then, are we to account for these exeeptions? Well, perhaps, through an uneertain disposition and lack of sympathy. Nature eertainly works from within, and when there is a strong sympathy or desire she responds in unison. I am reminded here of Mr. Fountain's conelusion that "Nature's idea is to ereate a pleasing and curious variety to gratify the eye of man." This doetrine might have gained credence—nay, did gain it, and universally almost—in ante-Darwin days, but in these—well, I am afraid it might excite a smile in certain quarters, at least. The eye of man, indeed! Nature doesn't eare a fig for the eye of man. Man, to be sure, in his sublime egotism, has dubbed himself the lord of nature, but he really has no more control over nature than the cat in his kitchen. He can kill and destroy, it is true, but ean he create a single thing barring his own speeies? But he has the sense of beauty! some one objeets. He has, and it is well for him if he cultivates it, but let him not imagine for a moment that when the birds bedeek themselves with gay feathers and certain plants with gay flowers that they do so to please him. They do so to please themselves, if you please, and nobody else. When there were no men here in America but howling, benighted savages, the birds and flowers were as bright and lovely as they are to-day. And Mr. Fountain himself has noted that in the most desolate regions of Brazil he observed the most beautiful orehids and hummingbirds he ever saw.

Yet all nature is one, in a sense, though working in diverse ways to some mysterious end. Oh, the mystery of it all, and the futility of trying to expound a certain doetrine on even one single phase of it, such as the coloration of birds and animals. But of one thing we may be sure and that is, that all is governed according to law. No hair or feather changes its hue except in obedience to some compelling principle. Properly, there is no such thing as chanee in nature.

FRANCIS MOONAN.

Michigan Mule Deer.

MENTION was made some weeks ago in FOREST AND STREAM of the report that black tail jumping deer were occasionally killed in Michigan, and the report, while not confiremd by specimens, is interesting.

We know that in northwestern Minnesota there is a form of the mule deer of the northern plains, which, under the name *Cariacus nacrotis* var. *virgultus*, was described in FOREST AND STREAM of May 27, 1899, by Mr. Chas. Hallock. Just what relation this dark form of mule deer has to the typical mule deer of the plains is not known. As Dr. C. Hart Merriam points out to us, the type of the plains mule deer (*Odocoileus hemionus* Rafinesque) came from the Sioux River of South Dakota, but specimens from this region have not been compared with those from the forests of northern Minnesota, and it is therefore uncertain whether the very dark Minnesota form is the same as the typical mule deer from Sioux River. If it is not the same, Mr. Hallock's subspecies would be a good one.

It is a long way from northwestern Minnesota to Michigan, and it will certainly be very interesting if it should be found that the form of mule deer occurs in Michigan. Nothing definite can be known on a point of this kind until specimens are had from the region in question.

Hibernation of Snakes.

MORGANTOWN, W. VA.—*Editor Forest and Stream:* A diseovery has been made here, which, while it may not be new to naturalists, was a very great surprise to me, as it no doubt would be to others. On the sixth day of this month, while James Kinsley and D. W. Breakiron were quarrying stone near here, they came upon six snakes in their winter quarters, all coiled up together, and they proved to be two copperheads about thirty inches in length, two blackheads about five feet long and two house snakes about thirty-six inches long.

They were very much alive when found, as they were in out of reach of frost, but soon became numbed with the cold when brought out.

They were taken by a son of Mr. Kinsley and put away in a haymow, and will be brought out in the spring and their actions studied.

It may be known that different species of snakes hibernate together, but to me it is entirely new.

EMERSON CARNEY.

Those Mississippi Squirrels.

ST. AUGUSTINE, Fla., Jan. 24.—*Editor Forest and Stream*: Mr. Hough comes out in support of his friend, the late Col. Bobo, but he doesn't throw a flood of light on the matter in dispute. Col. Bobo was a great bear hunter and knew the animal from nose to tail, and I don't. Therefore, if Col. Bobo had stated that he had seen bears in countless thousands swimming the Mississippi and had rowed among them in a boat, picking them up by the tail and throwing them in a basket, I wouldn't have dared to doubt it; but when it comes to squirrels I'm at home and will stand by my guns. If those amphibious little animals had been killed before being thrown in the bags and baskets I would never have expressed a doubt, but they were not, or such an important item would not have been overlooked by Col. Bobo. I infer that Mr. Hough has never seen such a migration. Yet he says, "Indeed *it did occur* and as described." Now, hearsay evidence is not accepted in a court of law, and I call for *proof*.

DIDYMUS.

This Deer Goes to Church.

FLORODORA, a handsome fawn owned by the children of H. H. Bridgman, a wealthy resident of Norfolk, Conn., followed Mr. Bridgman and his family to church the other night. The deer succeeded in getting into the vestibule and was about to pass up a side aisle when the sexton ejected it from the building. The fawn waited outside the church until the service was over and then returned home with the family.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

The "White Flag" in Coos.

IT seems queer to find the compatriots of Molly Stark in 1778 carefully looking after the pelts of deer, when their own skins seemed much more in danger of being peppered. The preamble of a New Hampshire law, passed in November, 1778, discloses a bit of history of the actual conditions. It reads thus:

"Whereas, the killing of deer at unseasonable times of the year hath been found very much to the prejudice of this State; great numbers thereof having been hunted and destroyed in deep snows, when they are very poor and big with young, the flesh and skins of very little value, and the increase thereof greatly hindered."

Therefore they created a close season, between Dec. 31 and Aug. 1, and fixed a very substantial penalty for violation of the law, fifteen pounds, making at the same time the possession of venison, "newly killed," proof of the crime.

As early as 1740 there were laws in this colony for the protection and preservation of deer. This law of 1778 seems to have existed but a short time, and a hundred years after the deer had ceased to be thought of as numerous enough in the greater part of the State to be hunted successfully.

A recent article in the FOREST AND STREAM spoke of good hunting in Coos County, and we thought it a proper time to apply a practical test. We had been there a dozen years ago, and knew that then it was not "up to" the "Maine Woods." For ten successive years I have tried still-hunting on the snow in the good old State of Maine in early December, and have become a great lover of that locality. Last November rumors of small-pox near the hunting territory made us shudder with pictures of unvaccinated deer scattering contagion through the woods. Surely it would never do to go there.

The greatest authority, your paper, has recently declared that uncounted carcasses are exposed in lumber camps there, with no vigilant warden to record the manner or cause of their death.

And so our party of three, on the 25th of last November, took a morning train in a border city of the Granite State for far-off Colebrook in Coos. One of the party, John, had hunted tame deer in the Sportsman's Show, and to him we looked for surprises. One tipped the scales at three hundred, and to him we looked for a couple of "old big ones." Errol was our objective point and George C. Demeritt our host. We arrived at Colebrook early in the evening and found George C. at the station with assurance that early in the morning we could start to make the nineteen miles through Dixville Notch to his home. Everything was working according to our schedule.

The morning of Nov. 26 came out of her chamber sour, cloudy and raw. We had no snow at home to bring with us, and we looked to Coos to celebrate with a storm, because it was her reputation that was at stake.

Eight o'clock found us covering the ten miles to The Balsams at Dixville Notch. There we restored our circulation by walking over the "pitch" and down the long incline of a very excellent road. No man can easily keep his eyes off the rugged, inspiring scenery of that famous gap, with its threatening wall of tall peaks sharply serrated against the sky. A bitter wind through the Notch threw squalls of snow in our faces, but so long as there was snow on the wing we were reconciled and cheerful. The last nine miles were soon over, and best of all the air was getting so thick with white flakes that we were beginning to wonder if we had missed it in leaving our snowshoes at home. After all they are of little use when actually hunting, however comfortable for getting from point to point in deep snow.

We sat by the open fire that evening telling stories and discussing the morrow, and every now and then sent a watchman out to hold the "storm-blast" by the power of his "skinny hand" or "glittering eye." Thus, we held a tight grip on our fortunes until bed time, when we felt secure with full five inches of the best snow. That was not quite enough to smother the noisy bed of frozen leaves, but it was a mighty promising foundation upon which to build hopes for Thanksgiving Day. We were off for the woods early in the morning with our guides, hunting three and a half miles to the log camps, where we were to make our home for the trip.

Our host followed with the supplies on a buckboard. We scattered to the right and left of the road, and in the middle of the afternoon met at the camps and compared notes of what we had seen. Only one of the party had burnt any powder and no one had drawn blood.

As usual, the sum of the first day's work was information upon which to act on the morrow. Our x-quantity, John, had found powder would go off, and so would the flicker of a "white flag." We had a generous increase of appetite at the evening meal and discovered that the buckboard had anticipated this. We had packed a big box of extras, and at the head of the table sat McGregor, for five days dispensing turkey, chicken, sausage, hogshead cheese, cranberries, jelly, olives, mince and apple turnovers, popcorn and what not. He was a very square-jawed fellow, deep and capacious. There he presided and accepted our respects and humble petitions until exhausted, not a spoonful was left to line his internals.

It was hard to come down to spring beds, matresses and sheets, when for years we had been tickled with coarse blankets and medicated with fir boughs. We endured the change with some kicking, there being no alternative. We had a camp all to ourselves, a great hardship because we could not watch the preparation of our meals and gather the fragrance from venison stews, that celestial incense that makes camp life a little foretaste of better things than conventional mortals shall ever enjoy.

But now, what about hunting? When you have spent a day in getting the "lay of the land" and have found where the animals are roaming and feeding, you cannot get into camp the second night and sit at the table on a ticket of flimsy excuses. Something in the shape of a liver must come in on a forked stick. We were off bright and early and each on his mettle. Our road into the camps was flanked on the west by a long ridge of hills, broken by a few gaps and valleys, and way back of the hills was low ground, swampy in places and stretching four miles or more to the Swift Diamond. On the east of the road it was about evenly divided into ridges and swamps; the ridges good hunting, the swamps a useless temptation, a waste of effort. A large buck led one of us over the heights to the west. He played the usual trick of watching while we climbed the hill, and when we reached the crest we could see where he had made his bow and gone jumping for the flat country of swamps. We did not expect to catch him with a shot when we saw where he was going, but we have often found a jumper leading to the territory where deer were feeding. This experience was again repeated. Just a little down the slope we struck a logging road, and, going very slowly but a little way, on our left, all at once we saw a buck watching the hill from which we had come, standing in the midst of a clump of small trees. This was not the one we had jumped. The eyes of deer seem slow to catch glimpses at the side. Carefully our .45-70 came to shoulder, and the next instant we saw a floundering brown patch under the trees. It was a safe shot through the back over the fore shoulders, and a good test of the operation of the new "high velocity" special cartridges for this rifle. We were satisfied with the result: a six-prong buck, young, and as fat as the best "stall-fed." One of his prongs was broken off short; but never mind, we had got tired of using the taxidermist; we had had our sport, and it was only ten o'clock in the morning. Up over the crest, the guide, sweating and puffing, dragged him, and down the hill he went tobogganing against the trees. In an hour we had him hanging up in a lumber camp at the foot of Beaver Pond, and then the guide, Bert, and I consulted the mince turnovers and sausages to see what course we had best take for the rest of the day. It took us a half hour to get the oracle into good deciding condition, and then a "bluff" of a hunt to keep our legs in shape for the next day seemed to be the wisest answer. Such we made it, and at night we came in proud with a red liver on a forked stick. This gave us undisputed seats at the evening table; but we were not alone in our glory. Our heavy comrade reported a spike-horn hanging upon a stump by the road, and John brought back a lost guide, after making him climb a tree for bearings, a matter of great consolation to us.

Days of deer hunting are very much the same in Maine and Coos. All of us had settled the question of the abundance of game. The difficulties in the way of getting a successful shot were just the same as in other sections; the nature of the ground was practically the same and the deer were equally wild and wary. There seemed to be more large bucks and less does proportionately than we had met with in Maine. We would have had better sport and equal success had we stuck to our log camps, but one of our guides declared that over at Millsfield Pond the "woods were full of 'em," and as John had been creasing too many trees, and shooting at too many flickering tails to make him perfectly happy, we packed our duffle after five days and hunted our way out to the house of our host, while he came in with the buckboard. There was another good reason for the change. The large man and his guide had got on to the fresh track of a cub bear. They found where he had caught and eaten a "Whiskey Jack" that day, and it was not clear that his appetite would not change to a desire for the human. To be out of his den in such cold weather looked very desperate, and we had nothing but .45-70 pop-guns for protection. We couldn't send for Roosevelt, and to depend on a little black dog, wont to curl up under the stove, was plainly foolhardy.

And so we went where "the woods were full of 'em." How do you suppose we came out? Just as all uneasy fools do. We wasted two days in discovery, and made but one happy find, and that was John's, namely, that the back sight of his rifle would stay anywhere his stray thumb or a stick would push it. Thus he had been shooting everywhere for seven days, missing nothing so certainly as the deer upon which he turned his weapon. Lots of chances gone into the land of waste! A clean miss with a short range and a deadly chance disturbed him the second day at Millsfield. When he came home that night he set about unearthing some explanation that would secure our forgiveness. The use of the target disclosed the trouble, and so the guide fitted him out with a little .38-40 carbine for the morrow. Every fisherman knows the importance of testing a leader when angling for landlocked salmon or large trout. No doubt it is equally wise to watch the sights of a rifle, making sure that they are firmly wedged into their sockets and closely centered on the barrel. It saves lots of vain repining and long waiting for the next year in which to redeem one's self.

Our unknown quantity, John, had now but two days in which to do the whole work of the trip. He had shown exceptional staying powers, and one day had been manipulating a forked hazel stick. There might be a ragged edge of surprise right upon us. When the northeast wind opened her door Friday morning she had a wide apron full of snow and she shook it with wild and rugged will. All day long that door stood open, and that apron was still scattering snow when the shades of night came down.

A drive of two miles brought us to Errol Hill, where we were to scatter in various directions. The first fresh track fell to John before we had separated, and ten minutes later we heard his little carbine beating a rapid tattoo. It was a cheering signal to us that had waited so long for the untried.

We were in a position to be reached by any frightened deer, and as none came by us, our confidence was strong that the shots had counted. After a long day's fruitless hunt over against Umbagog, with snow falling so fast that old and new tracks in half an hour were undistinguishable, we pulled our weary legs back over the hill to where we had separated in the morning, and there found our comrades just getting ready to drag to the road an eight-point buck, the fruit of the early shots we heard.

Now, of course, a man who comes to the front with a desperate rush will be expected to take breath and not go tearing ahead the next moment. We tried to convince John that he had scored a bullseye and need not count on doing it twice in succession. He did not believe in the mathematics of chance, nor would he be kept down by Dame Fortune to one bullseye.

Next day we divided up the territory nearer our home quarters, and the victor of Friday took the swamp and low ridges north and east of Aker's Pond. At half past nine he was on a fresh track, one that he followed steadily for four hours, expecting every moment to sight his game. At half past one Mr. Buck was holding up a set of eight prong antlers against the branches of a small spruce, all unsuspicious that any friend had been so long trying to overtake and salute him. The introduction was informal, short, and sweet; a heartier greeting could not be conceived.

The rest of us at four o'clock were toasting and refreshing ourselves by the open fireside and talking about another set of antlers that had a spread of twenty-one inches, and could not be dragged in till the morrow. We did not know what had happened over beyond the swamp, and as the moments passed the mirth and cheer began to desert us and give way to uncanny speculations as to where the other boys were, for it was growing very dark and the day had been bitterly cold. With the mercury but a little above zero, the snow a foot deep, it was no night to bunk in the woods without ax and "grub." Would they resort to some abandoned logging camp, or would they find none, and, stirring to keep from freezing, get deeper and deeper into trouble? Everyone had a suggestion and nobody any helpful project except to fire a signal. No answering shot! The mercury of our thoughts was sinking little by little. But someone announced that the moon was up and doing pretty well for its size. What should we do with the supper, all hot for the table? We could not think of sitting down at once, it would taste so much better to have our full company. It seemed like sacrilege to be eating, with the glory of the preceding day lost in the swamp. But in the midst of all this tangle of conjecture and anxiety, we heard the stamping off of snow on the porch, and rushing to the door we fairly yanked the boys into the house, where we broomed the snow off and put them through the catechism. They "hadn't been lost" and "they hadn't fallen into Aker's Pond." They had been running a road through the woods, and hanging back, just to scare us and let us find out how well we liked them. When we found out what the young man had done, we expressed fervent thanks that he had not discovered the trouble with his rifle the first of the trip, for if he had he would have been ready to go home the third day. That would have used us all up, for if there is anything we can't stand, it is less than a ten days' trip.

But supper was ready, and how it tasted after such a happy return. There was an old-fashioned chicken pie, baked in a dish as big as a milk pan. It was done to the finest brown, with upper and lower crust. There were all sorts of the best things to go with it, and when we arose from the table we rejoiced that the old county of Coos is rich enough to "spread" with two Thanksgiving dinners.

And now the long-looked-for hunt is over, and we must wait for another Thanksgiving time, following the sport in our minds meanwhile, and outwitting many a wary listener on the ridges, chewing his cud with eyes on the back track.

If the State of Maine passes a hunter's license law and it disturbs the feelings of those who "want the earth" at the other fellow's expense, here in Coos is a fine chance to keep up the sport under the most promising conditions.

DAN HOLE.

Maine Game.

Editor Forest and Stream:

Some of those who write of Maine game and a great part of those who read their articles have a very imperfect knowledge of our laws and the conditions of our game. Two recent writers state that unless the laws allowing one moose, one caribou and three deer to be killed by one person are repealed our game will soon be extinct.

Now, as to caribou, we have had none for several years. They were not killed off, but migrated. Besides this, there has been an all-year close time on them.

As to deer, it is years since any one was allowed to kill over two. A writer in a Boston paper tells us that we only have 100,000 deer in the State; that this year 20,000 were killed, and that at this rate they will last only a few years. Allowing his statements to be correct (and they are not), we should now have 80,000 left. As deer are usually born in pairs, one of each sex, it is fair to call one-half of these does—each doe has two fawns. Now allowing a loss of one-half for barren does and fawns which died before maturity, and we should have an increase of 40,000 a year for the first year. I should like to know how long it would take for a race to become extinct, which increases 40,000 in a year and only loses 20,000.

I have had, perhaps, as fair a chance to estimate as most men, and I believe that 10,000 is a plenty large enough estimate of all killed in this State, and as to the 100,000, I think we have twice that. Our commissioners have tried to ascertain the number killed by having the guides report the number killed by parties they guided. They make out some 6,000. Doubtless they intend to be earnest; but as often only two men will have three guides, and larger parties four to six,

it is evident that the same deer get reported from two to six times, and the results of these figures are of no value. The only reliable figures are those given by the railroads, which are something over 5,000. This covers all carried out of the State by visiting sportsmen, and includes all their guides had shot for them, and certainly this is half of them, and hundreds bought by them, and all those taken by residents of our cities and towns near railroad stations. To double these figures will, I think, account for all illegally shot or those which die from wounds. This last, I think, will be fully one-fourth as many as those secured.

Men lately in from some of the grounds which were hunted as hard as any, report deer as very plenty, and can see no decrease. I believe our deer are more likely to suffer from lack of food than any other cause.

Many people have an idea that they can kill bears by coming to Maine. In August and September, when the skins are worthless, a few are killed on blueberry grounds and near streams, and a man might possibly stand one chance in one hundred to get a shot; but in the open season for deer and moose the chances are not one in one thousand to shoot a bear. I think I have handled at the lowest 5,000 bear skins. In buying some 200 a year I have rarely bought over two or three well-formed old bear which were shot out of a den. Our bears are nearly all trapped. We have a good many bears, but the bears reported to be shot by ladies or carried home by sportsmen, were mostly in traps when shot, and I have known of old skins being shot and carried home as trophies.

We hear a great deal about the abundance of small game in Maine. Close around cities and towns we have a very few ducks, plenty of rabbits and some ruffed grouse. I have no acquaintance with the region west of the Kennebecs, but know most of the country east and clear up to the north corner monument, and can say that we have extremely little small game. I have traveled the woods over fifty years and have never seen a gray squirrel away from the settlements. I have many times been out from four to eight weeks and never seen a single rabbit, unless I was near some burned land grown up to poplars. As to ducks, except sheldrake, we have very few except on the seashore. If a party should shoot a dozen ducks in a month they would do better than the majority do. Ruffed grouse are usually very scarce in the deep woods. What few are seen they can usually kill, but if a man can average killing one a day when away from settlements he will do better than I ever did, and I have spent years in our woods. I can usually start more grouse in a day near here than in a week in the woods. I can find more grouse near Portsmouth, N. H., Andover or North Hampton, Mass., than I can in any place in Maine I ever saw.

If a man comes to Maine after moose and has a guide who understands his business, he stands a fair chance. If he wants deer and knows anything about hunting he can get his quoto. If he thinks he can shoot a bear out of a trap, he will be likely to go home empty handed if he hunts ten years. If he expects to get small game he had better hunt close home, as it is not here.

M. HARDY.

TRENTON, N. J., Jan. 19.—*Editor Forest and Stream:* I read with much surprise an article by Mr. George A. Pete, in which he deals out his criticisms of Maine, her wardens, her laws, etc., with a most generous hand.

He says: "The wardens are a miserable set of lazy hotel loungers." I have lived in Maine a number of months of the past years, very much longer than Mr. Pete, according to his story, and have had special facilities for knowing the game wardens and their work, and I am glad to be able at this time to say that they are conscientious, energetic, hard working officials, who deserve the highest commendation for the impartiality and vigor with which they enforce the law. Whenever it becomes necessary to stop at a hotel, the visit is always of the briefest, unless there remains very good reason for prolonging it. Winter and summer alike their time is spent in endless crossing, to and fro, over the sections where the game and fish need their protection. Many of them seldom even drive, but strike into the deep forests afoot for very great distances.

I have no doubt that some of the farmers or lumbermen do kill an occasional deer illegally. For this the game wardens are not responsible. It would be absolutely impossible for any man to capture a poacher of this description without first having some information to work on, and then one would have to camp on his trail for weeks perhaps without getting the necessary evidence to secure a conviction. In spite of this, however, a surprising number of clever captures are made.

As to this bugbear of lumber camps being supplied with illegal venison, it is the veriest rot. There have been cases, but they are invariably found out and punished. The logging crews are nearly all known personally to the wardens, and if a camp has one or more characters in it who would be likely to shoot game out of season, that camp would pretty certainly get its full share of close surveillance. The bosses themselves have more to lose than to gain by allowing illegal venison to be served, for past experience has taught them that the warden is apt to turn up at any time.

Mr. Pete says that in one camp of thirty men 278 deer had been served in a single season. Before believing this one ought to find out how many days these men spent in the woods, the approximate amount of this meat a man could eat in a day, and also how many of the crew did absolutely nothing but hunt deer in season and out. By the time he figured out these items he will have come to the conclusion that Mr. Pete is one of the most gullible of mortals. At any rate he is greatly to be censured for not giving his information, if he really possessed any, to the authorities. Perhaps, in the open season, venison was constantly served, but one must not forget that these men were entitled to sixty deer.

I would like to know how Mr. Pete found out that the wardens seldom visited the lumbering camps "because they did not like the accommodations." Did any warden ever tell him so? As for the number of arrests of lumbermen for illegal shooting, the information can be had for the asking. If Mr. Pete really believes that "no lumberman has ever been arrested" he must have gone very deep into the woods, and, I fear, has not come out yet.

Maine game is increasing all the time, and it is greatly owing to the indefatigable zeal of the wardens that this is so. They are greatly responsible for the good time Mr. Pete has there or he wouldn't go, would he? He does go, does he not?

OLIVER KEMP.

Thanksgiving Mallards.

HARTFORD, Mich., Jan. 20.—*Editor Forest and Stream:* Reading in a recent number of the FOREST AND STREAM of Uncle Eph's desperate struggle to get a turkey for Thanksgiving, reminds me of a struggle which my youngest son Ned and I had in getting a brace of mallard ducks for a Thanksgiving dinner. The boy and I wanted a chicken for Thanksgiving, but the madam insisted that nothing but a brace of mallards would fill the bill. "Well," I said, "if Ned will paddle the canoe down the Paw Paw River, I'll endeavor to get a pair." So bright and early the day before Thanksgiving we started down the river, Ned in the stern with the paddle, I well forward with the trusty Parker, ready for immediate use. We had gone down several bends and were rounding a sharp point where tall willows grew to the very water's edge, when there sprang from the water three lusty mallards. Quick as thought the gun was brought to bear below the tops of the willows, between myself and the ducks. The result was a shower of small twigs and limbs, and we saw the much coveted birds with their long necks headed down stream. The boy censured me for not waiting until they had got further away, but I protested that it would have been no better had I waited, and that it was on account of the willows that the shot had not been successful. Ned says, "Never mind, the ducks have settled below the railroad bridge, and I can soon put the canoe down there," and so we continued down the rapid river which makes a natural flow of about three miles an hour, and were soon down to the bridge, but as luck would have it, the crafty mallards had chosen a wide, straight place in the river in which to light. As we swung around the point in plain view, they, with their long necks and keen eyes, were at least 60 yards away. "Change your shot," said Ned. "Take out the 6's and put in some BB's." While I was changing my shot, the wary ducks took flight, and away they went down the stream again. "Shall we follow them?" "Yes," said Ned, "it's ducks or no Thanksgiving." So away we went.

The Paw Paw River is the crookedest thing on earth, in some places making a detour of a mile to get eighty rods on its general course. He said, "I'll paddle until we get one more shot, as they seem to be the only ducks on the river; and if you don't get them we'll have to come down to chicken and be thankful in proportion." So away we went, I helping the boy with another paddle the first mile or two. Finally coming to a place where we thought they were likely to light, Ned says: "Pa, lay down your paddle and take up your gun. They are liable to spring out of these crooked places anywhere." So I got ready for instant action. The boy was getting tired of the long paddle and said: "If we don't find them down this side of the big bayou, we'll give it up as a bad job." That was but a short distance ahead, and we had got in sight of where we were going to stop, and I said: "We'll have to give it up," when just then, directly ahead of us 40 or 50 yards, the three mallards we had sought for swam out into the river. They were well away, but I yet had the BB's in as before mentioned, and the boy said, "Give it to them, pa. It's your only chance." I instantly pulled the right barrel, and three beautiful mallards lay dead on the water. Ned said: "I'm thankful now, and if the madam isn't thankful we can't help it."

SULLIVAN COOK.

Looking Backward.

Do you remember that day on your last ducking trip? The soft sky, blue and cloudless, the wide expanse of water, dead, flat, oily; the scattered beds of wild fowl, the crackling cackle of the brant, the honking of geese, and the ever-present soul-rasping "south, south, southerly?" How you fretted for wind—how you prayed for wind—how it was just your luck, and then—lightly from over your shoulder a soft wind touches your cheek. The dead expanse is broken in a million little pimples, all sound is hushed save the tinkle, tinkle of the little wavelets as they ripple over the wings of your battery, while stronger and stronger blows the brave south wind. Ah! there they come! How flat you try to make yourself, how your heart sort of lumps up big and thick, how tight you hold the gun. Closer, closer—there they are! Now! No, you don't shoot; there are no ducks, you were just thinking of that other day long ago. The silken rustle of hurrying wings was only the morning paper falling from your hand. Or perhaps the sky was dark and stormy, with swift driving clouds blotting out the sun. How muddy and thick the waves look; how hard they strike the battery; how the water goes foaming and boiling over the deck, as if it would cover you. You feel sort of timid out there all alone in the angry waters; you raise up often and look to see how far the sloop is away, and then you think of the captain's last words: "Fix yourself comfortable, there is no danger." You take courage and look again to see if he and his little boat are near. Then you have your hands full. My! how they fly. How often the gun cracked you cannot remember. You were shooting, yes; you know that—shooting lots. If you only had that chance over you know you could beat it; you would wait longer on that big bunch; you would raise a little quicker on that side bunch, you tell you know it now. Do you? I see them all, the young and enthusiastic on their first trip, so anxious to know and to try; those who have been before and have plans and theories worked out in the long hours since the last trip; then the old and seasoned who know it all and don't care. Yet I find, way down in some corner of the heart, is that desire to kill, that strictly human desire to get that which is hard to obtain. No indifference, no coolness, no long years of reasoning will hide it; sooner or later on every trip their own words or actions will convict them.

I guess the readers of FOREST AND STREAM know that I break out this way every now and then and will forgive me for straying away from plain business. But you see, Mr. Editor, for the last two weeks we have had freezes, and drifting ice, and all sorts of things to spoil our shooting. So I just concluded to write and make a lot of others feel bad and wish they were shooting. "Misery loves company." There are a good number of fowl in the bay now, and by the first or second week in February all danger of drifting ice and cold weather will be over, so we should have fine, clear shooting from that time on. This last fall's work has not been up to the standard; the long spell of warm weather kept the fowl north, so that they drifted here very slowly, and as they keep working down all the time, they did not congregate here in quantities to make many extra days. The going back will be different, as they crowd in here to wait the time of their final northern flight. We have plenty of feed on the shoals and a good warden on the Virginia side. More geese have been killed this season than for many years past.

At the close of the season I have never seen so many quail in the county. A party here on the last day of the season, January 15, flushed over twenty coveys of large strong birds; the day before, at no time over half a mile from the house, they flushed seven coveys over one very old, inferior dog.

O. D. FOULKS.

STOCKTON, Md., Jan. 20.

Duck Shooting by Night.

WATERTOWN, N. Y., Jan. 11.—*Editor Forest and Stream:* It is a long time since I have seen any news in FOREST AND STREAM from Jefferson county, the home of Commissioner Middleton, and the one county in the State where the spring shooting of wildfowl is prohibited. I have little to say in regard to wildfowl, except that they nested here in larger numbers than in 1901, and that we had more birds here on opening day than ever before. Our shooting on black duck, mallard, teal and woodcock, however, was a disappointment last fall, as most of us from the vastly increased number of these birds expected a corresponding increase in the size of our bags. As a matter of fact, I do not believe that there were one-quarter of the number of these fowl killed in this county in 1902 that were in 1901. One of the best feeding spots in the county, for these birds is Black River Bay, which contains hundreds of acres of wild rice. This bay is connected with Watertown by trolley and is hunted every day during the open season. In 1901 nearly everyone who hunted the bay brought back a fair bag of mallards and blacks, killed in a legitimate sportsmanlike manner by jumping them from the rice in daylight, the law permitting shooting from sunrise to sunset only. This law, which prohibited night shooting, was not satisfactory to some of the shooters, who objected to having so many ducks flying around within easy range an hour before dark, and as one prominent sportsman (who has done more shooting and less work to secure the law which gave us this good shooting than any other man in the county) expressed it, "knocking their hats off," and by industriously circulating a misstatement (to put it mildly) as to the manner in which this law was secured, aroused such an opposition to it that we modified the law in 1902, making the shooting hours from daylight to one-half hour after sunset. I have always believed that the quickest way to spoil the shooting on a good duck marsh was to permit night shooting, and the results on this bay have convinced myself and and I believe the other shooters (not excepting the above mentioned gentleman) that I am right.

Although on August 31 the marsh was alive with ducks, variously estimated at from four to ten to one more than in 1901, when daylight came on September 1 a small army of sportsmen, who had been shoving into the rice from all directions since three o'clock, were there, and the birds had learned lesson No. 1 (get out before daylight). During the day a few attempted to return, but the long-distance shooters who are always conspicuous on opening day performed their duty well. As the hour of sunset drew nigh the night shooters pushed into the quill weeds and flag beds and made ready for the slaughter. Did he slay? Not many. For the long-range shooters were still there, and the birds learned lesson No. 2 (come in after dark). The black duck learns easily; one or two lessons are all that are necessary, and the difference between these educated birds of 1902 and the non-educated ones of 1901 has set a lot of the boys to thinking hard. I had always supposed until last fall that persistent night shooting would drive them to other parts, but it does not. I have a shanty on the shore of this bay and spent many nights there last fall. I find that the number of ducks visiting the rice beds increased in numbers as the season advanced until they seemed to number thousands.

I have heard large flocks of black duck quacking and lighting in the water as late as 11 o'clock, when it was so dark that I could not see my hand before my face. Directly in front of my shack is the most extensive rice bed in the bay, and it was a favorite rendezvous for the birds. And although it was visited nightly by hundreds of black duck, I never put up a duck after daylight or found a feather floating on the water, and the oily condition of the water showed plainly that the birds had been feeding during the night.

This night feeding habit has always been the main argument of the night shooter that the proper time to shoot these ducks was in the late evening or shortly after dark. That the shooting at these birds as they come to roost or feed in the evening should after one or two lessons cause them to come after dark is not at all surprising, but that it should also keep them from coming in the day time is not so easy to understand. But that it does so has been proven by our experience on this bay the past two years. In 1901 when no shooting was allowed after sunset, good shooting was had in the morning, and ducks were coming in continually through the day: and our shooting improved as the season advanced. In 1902, when night shooting was permitted, few if any ducks were found in the morning, and still fewer came in during the day. Our shooting grew poorer each week, until finally about all the ducks that were killed by daylight were cripples knocked down in the night. The small number of ducks killed on this bay and the constantly increasing number of ducks which fed in this bay nights proves conclusively that as a measure for the protection of ducks for our southern shooters the law permitting night shooting is a

decided success, but as a reward for the self-denial of our sportsmen in stopping spring shooting and permitting these ducks to nest and breed here it is a dismal failure.

It begins to look as if there would be something doing at Albany this winter. I see that our old-time friend (?) Deputy Comptroller Gilman has found a better (?) job, and if I read the Governor's message right, he is willing to listen to us this year. If we fail to let him know what we want (as many of us did last year), it won't be his fault if we are disappointed.

We want the good old FOREST AND STREAM plank, "Stop the sale of game." The spring shooting of wild-fowl prohibited. A uniform open and close season on all upland game from September 16 to November 30. That special protectors shall have the same powers of search as regular protectors. That the hours for shooting wild-fowl shall be from daylight to sunset.

If the sportsmen of this State will make the same effort that they did last year we shall win. As regards special or local laws, the conditions are not alike in all counties. In many counties, by reason of a denser population, game is becoming very scarce, and any law which shortens the open season or closes it entirely should receive the support of all true sportsmen. W. H. TALLETT.

Two Nights and a Day.

I WATCHED the coals in the open grate fire grow gray, heard the lamp sputter its remonstrance over a long session, laid aside a cold pipe, and still lingered—even drew nearer to the declining warmth, reluctant, indeed, to leave even for bed, the place of all places on earth where we can live the yesterdays of the past "and dream those dreams again" in retrospective contentment.

As the lamp died out the lesser light in the grate assumed a grander proportion, and left me in the glow of a Florida sunset, calling back to memory dear the active and attractive day so soon ended of my recent stay where the magnolias grow—"way down upon the Suwanee River."

In this afterglow I see Creighton and his ten-bore embarrassment, Judge Hopkins, in his strenuous life; Mr. Simmons nursing his temper and cold; Mr. Hazen measuring his muscles and zeal; Mr. Poeschke fishing from sun till sun; Mr. Molton trolling from the bridge; Mr. Smith loving his gun; Mr. McGregor and his bull-baiting sweater; Mr. Valentine teaching Sport to sing; Jesse Daniels, my ebony companion afield, and many others grouped in the same picture. And who is this in the center, whose light blue eyes seem to look you through and through, whose quick tread resembles the youth in love, whose erect carriage denotes an undiminshed vigor, and whose hearty laugh is music to hear, "whose money never runs out?" It's the Colonel. South Carolina, Georgia and Florida all know him, and so should the rest of the world could I introduce him. Coal is high and even scarce, but it's not wasted, dear Colonel, when writing of two nights and a day with you. Then, too, it is at least an illogical excuse for another pipe.

From the first moment I met the Colonel I determined to share nearly anything I had with him, and I began that day by asking him to share my portmanteau, thus reducing our baggage. It was at two P. M. that he appeared at my door with a U. S. weather report in one hand and canvas clothes and shoes in the other. The Colonel's white hair was not smoothed down to a degree of neatness to denote a really tranquil spirit within, and I asked him the cause. He replied by saying: "Look at that darned weather report for Northern Florida." Sure enough, prophesy had its hand on the spigot, and nothing but rain was in sight. However, I told the Colonel that we had a high priced, high minded, high principled weather prophet in New York who didn't know it all, and I guessed they were all alike, honest and scientific, but often mistaken. So we would go. "All right," said the Colonel. "A hunting trip only begins with the packing and only lets up when your wife puts away your clothes after you get back."

An hour later our dogs had been sandwiched between trunks and I was listening to the life-history of Harry Stillwell Edwards told by one of his friends; and I was outlining to the Colonel the story of the forgetful lawyer for his use, when next his friends should hear his clarion tones and see the tears run from his blue eyes. We reached Live Oak at 7:30. At the hotel the manager told us he could give us a nice big room with two beds in it. "Just the thing," said the Colonel. "That will give me a chance to practice my new story before a critical audience that won't dare throw things at me." In this room we found an open grate fireplace and beside it a pile of pine wood; and I started to ring for a boy to build the fire. "Not much," says the Colonel, "here is one of the rare pleasures of life that one can't find in his own home, that of starting a light wood fire and then watch it, smell it, feel it burn. Oh, that odor! don't it melt your heart?"

At 5:30 next morning Jumbo Green by name came in and the Colonel set him building the fire; however, the effect was soon manifest. The Colonel did a breakdown *en deshabille;* with him the sere period of life will only occur when his name is carved on marble.

I found the Colonel at the breakfast table with an orange in one hand and that blessed weather report in the other, while the waiter was hanging out the window gazing at the heavens making his report, which seemed more favorable than the more gifted guesser could promise us. Mr. Allen, our guide for the day, awaited us with a good pair of horses and a top spring wagon on the road.

Mr. A. was a wise one. His aim was to find birds, and this he did, about seven miles out of town in a country that all looked alike to me. The horses were stopped and the dogs turned loose; not at all a dangerous expedient, for they only wandered away about a hundred yards and looked around wondering what we were going to do. It was then that I heard for the first time that this pair of dogs were owned by a white man of fine reputation and broken by a negro. As the Colonel put it, "What good sense they started with in life is soon knocked out of them, and they absorb a nature foreign to their native gifts and become shiftless." So the only thing for us to do was to hoof it and lead them on.

Solicitous always for the comfort of others, the Colonel asked me if I was in condition for a day's tramp. I reminded him of my Pike County days with two guides and assured him I was *toujours prêt.* It was but a short time before we had those poor misguided dogs straightened out in the rear of a covey of quail which we flushed and both sampled, and while for miles in every direction that woods, or what had been a woods, was alike, we could not mark those birds down; but while trying to find them, we covering the same amount of territory as the dogs, we found another covey. Again in looking for singles we fell across another bunch, which, when they lit, surrounded another bevy, and we warmed our guns. With each flight poor Alto, a liver-colored pointer, would follow to mark them down, while little flee-bitten Winnie would satisfy her chewed up ambition retrieving. On one occasion, while carrying in a dead bird, she stopped and pointed another. We had both seen this done before, and so have many others, but, as the Colonel says, "Think what that bitch might have been. I would have just as soon expected to see a braying jackass win the Brooklyn Handicap as see that sight. Dear little Winnie, you have retained some of your native instincts, haven't you?"

At noon we (we and the dogs) had scattered fully a dozen big bevies in a radius of not more than two hundred acres and had bagged thirty odd birds, and had a pair of dogs that seemed tired before we started and that were tired in dead earnest now.

Again the Colonel warms his hands over the burning

HUGO AND STEVE, AND THE COVER WE HUNTED IN.

pine; does a cake-walk beside a fallen tree; sings snatches from forgotten operas; introduces a new step of a recent dance, and settles down to drink in the aroma from the boiling coffee pot and says:

Ah, this sunshine of ours!
I'm sure 'twill never set;
For as it shone so long ago,
It's blazing on us yet.

And then he burned his weather report.

At sundown we laid brave Winnie in a blanket and put her in the carriage, while friend Allen put Alto in a straight-jacket beside him on the front seat. We sang in the gloaming "Home, Sweet Home," as we entered the town, our voices were the only part of us that wasn't tired and satisfied to rest. Immediately after dinner we went to our room and had a fire built, in front of which the Colonel settled down with our basket of birds before him. One at a time he lifted them tenderly out, pulled away the rumpled feathers, straightened their pretty necks and graceful legs and laid them side by side on the carpet, fondling and petting them, and after a silence remarked, and that, too, with a sweet reverence: "Little fellows, you have given us great pleasure, taxing, as you have, our skill and zeal. I would that you could know that in death you are beloved and cared for; groomed in your feathered beauty, laid by carefully and with affection; in this care and in this love only am I better than the hawk."

Dear Colonel, in your age of wisdom and feeling you do on more occasions than this, but particularly on this occasion, show that nature I will always try to copy. I think it is better to carry one's game in a basket. I will never string them again.

The logs were still burning when slumber made us as oblivious as our little friends outside the window, and my claim of sleeplessness will never be believed by the Colonel, as he informed me the next morning "That the noise from my bed had caused him to dream that he was at sea in a fog." I was naturally delighted, assuring him that for once in my life I could prove an alibi. Of these two nights and a day in Florida, in justice to my friend, I must claim that the best hours and the most profitable ones were not spent afield.

The accompanying picture shows Hugo and Steve, two excellent dogs the Colonel and I shot over when here ten days previous to this visit, owned by Mr. McGregor, of Live Oak. Alto and Winnie will, however, outlive this pair in memory dear. T. E. BATTEN.

ELIZABETH, Jan. 22.

Fish and Game in Florida.

In my freshly groomed recollection of "Two Nights and a Day," I have undoubtedly exposed a sentiment of regret in leaving Florida so soon. Yet where duty is I must; so there is but one thing left for me to do, and that is seek others to take my place in that congenial clime and then tell us all about it.

Many others have gone before and thoroughly covered the ground in their gamy research, yet an overmastering modesty or a secret too sweet to tell has confined their history to the limited space of their own firesides, and the sportsmen's world can gain no wisdom from their experiences.

To the touring sportsman I am inclined to believe that no other one section of Florida contains more "first night" attractions than the Land of Manatee. Its geographical position insures comfort at all seasons, it is easy of access, and as convenient to Tampa and Tampa Bay. Sarasota Bay presents to the angler about every variety of fish known to these southern waters, while the mainland will entertain the hunter during our generation and a large remnant of another to come. The recently published pamphlets by Morton M. Casseday, and issued by Mr. C. B. Ryan, of the Sea Board Air Line, are so accurate as to conditions in this section that I cannot do better than refer to them, and they can be had for the asking.

Those who have taken it, tell me that for a month of life with nature and a few chosen companions, where the new acquaintances daily are game in variety and fish of different tribes, one should take the trip beginning at Kissimmee by small steamer south through Lake and River Kissimmee into Lake Okeechobee; thence west through the canal into Lake Hie-po-che, Banner Lake, Lake Flint and Caloosahatchee River to Fort Myers. These trips are arranged for many times during the winter months, and are never regretted by those fortunate enough to make them.

Fort Myers and Punta Gorda are favorite tarpon fishing grounds; the silver skyrockets are often taken here late in the season, and are seen at play nearly every month in the year, but seem to have their seasons for striking.

In crossing the State of Florida one can find quail shooting near most any station on either the Atlantic Coast Line or Seaboard Air Line; and in many instances can find in addition to quail wild turkeys and deer. This is particularly true of Sanford, Orlando, Deland, Ocala, Palatka, Fort White, Tallahassee, Live Oak, Lake City and intermediate towns, and in those places mentioned one will find pleasant hotel accommodations, a list of which will be found in the FOREST AND STREAM office.

There has been much said by the nervous ones about snakes in Florida, and the danger the sportsman assumes in hunting there. I personally know a brave man who loves the woods and valleys only next to his wife and children, who could not, under any circumstances, be induced to hunt there for fear of the rattler, the moccasin, and other varmints of their sort. He succeeded in "chilling" me into buying a pair of aluminum-lined leggings. My purchase, however, was not completed without embarrassment. Mr. Justus Von Lengerke assured me that he "thought any man extremely foolish to miss the rare yet possible opportunity of drinking a quart bottle of whisky all at once." I really think his ridicule about fits the case, and that we can all hunt in Florida and come home sober, provided we don't yield to the more tangible temptations.

I hunted with a man who has tramped the State in quest of game for twenty years, and during that time has killed just four rattlers. I know a man in Massachusetts and another one in Pennsylvania who can beat that record silly.

Upon entering or leaving Florida nature and the railroads have decreed that one must pass through Jacksonville, which in itself proves a far-seeing providence. Here one can see snakes and alligators at close range with impunity. M. I. Cohen, on West Bay street, has a number as seen before and after death. Just across the street are the offices of the Atlantic Coast Line, presided over by Mr. Frank Boyleston, a sportsman in fact and on purpose; his trim launch is nearby on the St. John's River, and he does like to run it when his duties will permit. Then go up to the Duval and call on the Colonel and keep on multiplying your regrets until you are sorry you came because it makes you so sad to leave.

For a time only, farewell Florida. With all your charms, rods and gun must give way to mitts and gum shoes. Only in reminiscence are you with me now, yet you are a real yesterday of yesterdays.

T. E. BATTEN.

NEW YORK, Jan. 24.

Boone and Crockett Club Meeting.

THE annual meeting of the Boone and Crockett Club was held at the Metropolitan Club in Washington on Saturday last.

The meeting was called to order by President Wadsworth at 7 o'clock. The report of the treasurer showed the finances to be in a flourishing condition. Of the reports of various standing committees, that of the Big Game Protection Committee was one of the most interesting. The chairman, Madison Grant, reported that the new Alaska game law, passed last year largely through the efforts of the Hon. Jno. F. Lacey, of Iowa, was working very well. He read a letter from Andrew J. Stone, the well-known Arctic explorer, stating that the customs and other United States officials were endeavoring to enforce the law and that the exportation of heads and hides had almost entirely ceased. Mr. Stone, however, observed that certain mining companies, notably one located in Unga Island, were regularly killing caribou for meat, because it was a cheaper food than beef, and that great numbers of these animals were being destroyed.

An amendment to the constitution was adopted.

The election of officers for the ensuing year resulted as follows:

President, Major W. Austin Wadsworth; Vice-Presidents, Chas. F. Deering, W. B. Devereux, Howard Melville Hanna, William D. Pickett, and Archibald Rogers; Secretary, Madison Grant; Treasurer, C. Grant La Farge; two members of the executive committee to serve for three years, Alden Sampson and Owen Wister.

At the close of the business meeting dinner was served. At each plate lay a beautifully modeled little plaster cast of a weathered buffalo bull's skull, melancholy reminders of what once was but is no more. The souvenirs are the work of Mr. A. Phimister Proctor, the sculptor, a member of the club. Many of the diners were puzzled by one dish served to them. It

proved to be a fat and juicy mountain lion, sent on from Wyoming by Thomas Elwood Hofer.

Among those who sat down were Major Austin Wadsworth, Senator Burton, of Kansas; Maj. Jno. Pitcher, Superintendent Yellowstone National Park; Col. Geo. S. Anderson, for many years superintendent of the National Park; Hon. Jno. F. Lacey, of Iowa; Admiral Willard H. Brownson, Mr. Owen Wister, Dr. Lewis R. Morris, Mr. Robert Hill Prentice, Mr. Whitehouse, Dr. A. Donaldson Smith, Mr. Arnold Hague, Mr. W. J. Boardman, Mr. D. M. Barringer, Mr. Geo. Bliestein, Mr. Winthrop Chanler, Mr. Paul J. Dashiell, Mr. Geo. Bird Grinnell, Mr. Madison Grant, Mr. Geo. H. Lyman, Mr. Henry May, Mr. R. A. T. Penrose, Jr., Mr. A. P. Proctor, Dr. Jno. Rogers, Jr., Dr. J. L. Seward, Mr. Philip Schuyler, Mr. Henry L. Stimson, Mr. M. G. Seckendorff, Mr. Alden Sampson, Col. Walter S. Schuyler, Dr. C. Hart Merriam, Prof. Henry S. Osborn, Col. Cecil Clay and Mr. Gifford Pinchot.

An interesting address was made by Mr. A. A. Anderson, of New York, supervisor of the Teton Forest Reserve, who told of the reorganization of the forestry force of the reserve and the work done in the short time since he had taken office. He spoke of the ravages of the sheep and of the forest fires, and of the difficulties met with in his work, but also of the improved local sentiment for game and forest protection among the people of Jackson's Hole and vicinity.

Maj. Jno. Pitcher, the Superintendent of the Park, told of the conditions there, especially in winter, of the starting of the new buffalo herd, which consists of 18 cows and 2 bulls, the last from the Goodnight herd of Texas, while the cows are from the Allard herd of western Montana. There are thus two distinct strains of blood and hopes are entertained of securing a third strain. Maj. Pitcher also spoke in warm terms of the changed sentiment among the population adjacent to the Park in regard to game protection. These people now feel a distinct pride and interest in the reservation and its prosperity, and will do anything in their power to assist the superintendent in his work. Maj. Pitcher spoke with absolute confidence of the ability of the Park authorities to protect the game while it was in the Park, but alluded to the small area of the winter range within the reservation and to the territory controlled by Mr. Anderson, as that especially needing protection.

Prof. Henry Fairfield Osborn, the eminent paleontologist, spoke next. He alluded to the millions of years that it had taken nature to develop from much more generalized animals the big game which we know to-day on the North American Continent, and yet here was civilization armed with its improved rifles undoing—by the extermination of these animals—in a century the work that had been going on for uncounted ages.

Prof. Osborn was followed by Mr. Gifford Pinchot, who has just returned from an examination of the Philippine Islands. He spoke encouragingly of the change of feeling in regard to game and forest protection that had recently taken place. During much of our nation's history the forests had been regarded as the enemy of civilization and of progress. Now the view taken is a different one. We must keep on working hard for a few years longer, and there is great hope that a proper system of laws and means for carrying them out, will be set on foot and so firmly established that they will endure.

Senator Burton, of Kansas, made an interesting and somewhat humorous address, alluding to the fact that, as chairman of the forestry committee of the Senate, he had that morning favorably reported Senate Bill 6689, which the club strongly advocates, and expressing his hope that it might pass the House, as well also as the bill for the Appalachian Park.

Hon. Jno. F. Lacey, of Iowa, made a ringing speech alluding to the various bills that he had introduced with the purpose of preserving natural objects in this country, whether living or inorganic. It was a splendid and eloquent effort.

In response to certain questions Maj. Pitcher gave further information about the Yellowstone Park, and the abundance and tameness of the game there in winter, and later Col. Geo. S. Anderson, that sturdy friend of the Park and gallant soldier, who has made for himself so superb a record in the Philippines, told something of the time when he was superintendent of the Park, and of the difficulties that he met and overcame. He paid a splendid tribute to the late William Hallett Phillips, whose untiring devotion to the Park is still fresh in the minds of those who knew him best. Other speakers made interesting remarks.

The meeting is, by many of those present, regarded as one of the most interesting that the club ever held.

A War Cry.

Editor Forest and Stream:

There isn't a man in this State handling a gun or a fish-rod who does not know that the game laws of the State are inadequate, contradictory, and in some particulars absurd.

Why don't you get up some enthusiasm, have a general round-up of evils to be corrected, and picking out a small number for treatment, enlist the united efforts of all sportsmen for their passage?

No firing into the "brown," however. We must pick our marks. Two or three sound, well-considered measures solidified into law are worth any amount of random, disjointed discussion and grumbling over existing conditions.

FOREST AND STREAM is the best medium for the consolidation of interests.

I think you represent the best thinking, believing and acting body of sportsmen.

You do not attempt to boost your circulation by forming a more or less useful protective league, making FOREST AND STREAM the club monthpiece and organization register, nor do you lampoon manufacturers and dealers whom you cannot induce to advertise with you, though for the matter of that, I believe your advertising columns will show all standard goods.

Mighty good reading you have, too.

With the exception of my own stuff, I think I enjoy reading the stories signed Cabia Blanco more than others.

One evident policy of your paper I admire.

It is the intention to throttle anything that looks like a long-winded discussion over some never-to-be-satisfactorily-answered problem, as, "How does the Woodcock Produce its Whistle?" or, "Setter vs. Pointer," and so on. There are a number of old fossils that corruscate in your columns occasionally, to whom a never-ending discussion would mean the indefinite prolonging of their lives, so great would be their interest and so determined their purpose.

You undoubtedly have the unexpressed thanks of hundreds of nervous readers for sidetracking these old smoothbores.

To come back to our mutton, however.

If I were the FOREST AND STREAM (and ROD AND GUN thrown in), I'd publish something every week during the sitting of the Legislature tending to awaken and maintain interest in the game protection problem and publish twice as much during the close season for Legislatures, when Senators and Assemblymen are hibernating and candidates are awakening.

There must be some power in concerted action, and you are the medium for developing and transmitting.

PORT RICHMOND, N. Y. WAR-CRY.

[And now that the subject of zoological classification is before the house, will War-Cry kindly tell us where to place an old "fossil" that "corruscates," or a "smoothbore" that can be "sidetracked?"]

Washington's New Game Law.

SEATTLE, Wash.—The sportsmen of Eastern and Western Washington are in harmony regarding the new game law which will be presented to the State Legislature in the near future. It is hoped that there will be no amendments, because past experiences in this direction have proved that the result was a general upsetting of conditions rather than a settling of important questions.

There are few hunters who will object to the payment of a dollar gun license. All they desire is that the money derived from this source be applied properly to the protection of game. The old objection to the license that it was necessary to take out a license in every county has been avoided by a provision that one license covers the entire State.

Changing the date of open season on grouse, quail and ducks from August 15 to September 1 is a good move. Last fall the young grouse were very strong on August 15, but as a rule they are too weak during the middle of August to have a fair show with the expert wing shot. It is only fair to give them a little chance.

It seems almost useless to protect Mongolian pheasants until 1908, because these beautiful birds have been exterminated, so far as I can learn, on Whidby Island and in the White River Valley. The last time I was hunting in the vicinity of Oak Harbor on Whidby Island there were very few Mongolians, and I have been told that this fall witnessed the extinction of those remaining.

Harry Pauley, who is well informed on conditions in the White River Valley, told me recently that the little band of Mongolians that had been protected by the residents of the valley in hopes that they would multiply and eventually afford good sport, had been wiped out of existence by an unknown hunter from either Tacoma or Seattle.

Elk will be protected until 1908 if the law passes. There are none too many of these magnificent creatures in the Olympic Mountains now, and while it is extremely doubtful if a protective law will keep the Indians on the west side of the mountains from killing, it may be that the destruction of the bands which work up into the Hub or Second Divide country and the First Divide section, will be materially decreased. From what I have heard and known personally about the hunters at the head of Hood Canal and around Lake Cushman they have always shown good judgment in killing elk. As they have observed the law, generally speaking, they will probably object to the cutting off of their favorite sport.

PORTUS BAXTER.

A Crippled Doe.

MASSACHUSETTS papers published the other day a report of deer suffering from the foot and mouth disease which it was feared they might communicate to domestic stock. Commissioner Collins, in reply to an inquiry on the subject, writes as follows, showing that the whole agitation came from the peculiar actions of a crippled doe:

BOSTON, Mass., Jan. 19.—There was really little or nothing in the story that deer in Dracut or vicinity were suffering from foot and mouth disease. I think it was the day before Christmas that Commissioner Wentworth, of New Hampshire, who chanced to be in Lowell on other business, telephoned me that the people along the northern border of this State, where the deer move across the boundary line between Massachusetts and New Hampshire, claimed there were one or two lame deer which it was feared had the hoof and mouth disease. In the condition of public feeling at that time, it was considered wise to settle the question, if practicable. Authority was therefore given Mr. Wentworth to kill any deer found on this side of the State line which appeared to be in a condition that might cause people to believe it was afflicted with the dreaded hoof and mouth disease.

Mr. Wentworth acted promptly. On December 25 he wrote me as follows:

"I went to Tyngsboro to-day and made inquiries and looked the section over where they claim the diseased deer were seen. They all agree there is one deer, a doe, that is lame in one hind foot. One woman said she saw deer there often; that last Sunday they saw two deer, a buck and a doe. The doe was lame in one hind leg. They looked it over carefully with an opera glass. One of the toes seemed to stick up into the air; the leg was swollen and quite black. They thought it a gunshot wound. I did not find these deer, but did see a very large buck and within easy rifle shot of it. I started it and the first few jumps it made was from 12 to 15 feet long. If I ever saw a well deer that was one, and if signs count for anything, there are a number there. I don't believe in this sick deer yarn. But as this section is within a mile of the New Hampshire line, I am anxious to know the truth of it."

The accuracy of this conclusion, so far as hoof and mouth disease is concerned, was demonstrated next day, January 26, when the lame doe—a large one—was shot. Writing on that date, Mr. Wentworth reported as follows:

"I have cleared up the foot and mouth disease in Massachusetts that they thought was among the deer. There came a good tracking snow last night, so I went to Tyngsboro this morning. Started a buck and doe. The doe did not go all right. I started her up three times. Shot her then. I could have shot her either time. The trouble was she had been shot, breaking the hind leg, so that every time she stepped the [ankle] bone went into the ground. * * * I got Dr. Eaton there and he pronounced the deer all right, *except for the wound.*"

Mr. Wentworth sent me the broken leg, which was broken just above the fetlock, and the bare bone was pushed through the skin. A fistula was formed below the fracture.

The leg was turned over to the State Bureau of Animal Industry, as the gentlemen of the bureau thought it a rather interesting specimen.

New Brunswick Guides' Association.

Editor Forest and Stream:

The annual meeting of the New Brunswick Guides' Association was at the Barker House, Fredericton, January 13. In the absence of President Sanson, Henry Braithwaite occupied the chair. There was quite a number of the prominent guides present. Officers were elected for the ensuing year: President, Geo. E. Armstrong; Vice-President, Arthur Pringle; Secretary-Treasurer, A. R. Slipp. Membership Committee: Henry Braithwaite, Adam Moore and David Pringle. Executive Committee: H. Braithwaite, W. H. Allen, Charlie Cremins and the officers.

Some time was spent in discussing the game law, and all present seemed to be of the opinion that it would stand some amending. The meeting favored increasing the resident hunting license from $2 to $5 and having the big game season open on September 1 instead of September 15, as now.

As a means of keeping out non-resident guides the association thinks that an amendment should be made to the game law, making it compulsory for the holder of a non-resident license to employ none but resident guides. The association does not favor increasing the non-resident license fee at the present time.

The guides all spoke of the game season just closed on December 31 as the most prosperous they had ever experienced, and they considered the outlook for the future to be exceedingly bright. During the evening the guides were treated to a liberal supply of fruit by G. T. Whelpley, the well-known grocer, and adopted a resolution thanking him for his kindness.

It was unanimously decided to hold the next annual meeting at Perth, with a view of encouraging more of the Tobique guides to become members.

There will be seven of the association guides at the New York Sportsmen's Show. They expect to leave Fredericton February 21. G. E. A.

Canadian Camp-Fire Club.

THE Canadian Camp-Fire Club will give a dinner to sportsmen in Madison Square Garden, N. Y., on February 20.

The Canadian Camp-Fire Club is a very strong organization and is composed of some of the best known sportsmen and writers in the United States and Canada. Its President is Dr. G. Lenox Curtis, of West Fifty-eighth street, New York.

Forest Reserve Game Reserves.

Senate Bill 6689, introduced by Senator Perkins, of California, reads as follows:

A bill for the protection of wild animals, birds and fish in the forest reserves of the United States.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the President of the United States is hereby authorized to designate such areas in the public forest reserves as should, in his opinion, be set aside for the protection of wild animals, birds and fish, and be recognized as a breeding place therefor.

Sec. 2. That when such areas have been designated as provided for in Sec. 1 of this act, hunting, trapping, killing or capture of wild animals, birds and fish upon the lands and within the waters of the United States within the limits of said areas shall be unlawful, except under such regulations as may be prescribed, from time to time, by the Secretary of the Interior; and any person violating such regulations shall be deemed guilty of a misdemeanor, and shall, upon conviction in any United States court of competent jurisdiction, be fined in a sum not exceeding $1,000, or be imprisoned for a period not exceeding one year, or shall suffer both fine and imprisonment, in the discretion of the court.

Sec. 3. That it is the purpose of this act to protect from trespass the public lands of the United States and the wild animals, birds and fish, which may be thereon, and not to interfere with the operation of the local game laws as affecting private, State or Territorial lands.

At the annual meeting of the New York Zoological Society last week the following indorsement of the bill was adopted as an expression of the sentiment of the Society:

Whereas, The greater part of the big game, especially wapiti or elk, remaining in the United States is now gathered in and around the Yellowstone National Park; and

Whereas, The number of wapiti or elk and other game animals is rapidly decreasing owing to the killing for elk tusks and for meat; be it

Resolved, That the Board of Managers of the New York Zoological Society respectfully urge upon Congress the enactment of Senate Bill No. 6689, introduced by Senator Perkins, of California, empowering the President of the United States to designate such areas in the public forest reserve as should, in his opinion, be set aside for the protection of wild animals, birds and fish. And be it further

Resolved, That the Board of Managers of the New York Zoological Society respectfully request the President, in the event of the passage of Senate Bill 6689, to set aside the Teton Forest Reserve, or such part thereof as may be advisable for a game reserve, and to establish therein the same principles of absolute protection of animal life as are now in force in the Yellowstone National Park. And be it further

Resolved, That a copy of these resolutions be forwarded to the President of the United States, and to the proper officials in Congress, and in the States of Wyoming.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Reminiscences of an Octogenarian.

Part VI.

BY THE OLD ANGLER.

(*Continued from page 88.*)

"Sorrow is knowledge; they who know the most
Must mourn the deepest o'er the fatal truth,
The tree of Knowledge is not that of Life."
—Byron.

"Ah! little did thy Minnie think,
That day she cradled thee,
What lands thou shouldest travel round
Or what death thou shouldst dee!"
—The Ettrick Shepherd.

WE live in a wonderful age, and though in the last half century science has made gigantic strides, the Octogenarian is much impressed by the profound wisdom of the didactic Dutchman, Hans Breitman, immortalized by Charles G. Leland: "So much longer as we lif, so much by Gott more we don't know!" *Messieurs les Savants* have so confused us about trout and char—*Salmo* and *Salvelinus*—that the angler of to-day loses half his potential pleasure in beating his brains to discover what he is carrying in his creel. Gay, in his fine poem on Eaton College, wisely says: "Where ignorance is bliss, 'tis folly to be wise," and has not Pryor told us in his letter to Charles Montague: "From ignorance our comfort flows; the only wretched are the wise." In our young and salad days when we were innocent of any knowledge of the banal and the murderous microbe, how jocund did we indulge our youthful appetites for all the good things that bountiful Nature has spread in generous profusion around us. We swallowed with infinite gusto the succulent oyster without a fear of the deadly diseases secreted within its shells. We gayly ordered our redolent roasts, our fragrant fries and our sustentatious stews in happy ignorance of murdering millions of mighty microbes that accompanied them all to our capacious and confiding stomachs! The appetizing clam and the sustentatious chowder were enjoyed without a suspicion of the malignant microbes that entered into their composition! We boast of the triumphs of science and the diffusion of knowledge in these our days; we get the most gorgeous colors from coal oil, and extract the most powerful perfumes from rancid butter and ancient fish oils! But are we any happier? Does it add to our pleasure to know, as we swallow the luscious strawberry that so delighted good old Dr. Boteler, that we have sent to our stomachs some millions of microbes, any one of which, if it has luck and gets in its work, can "play hell" with our whole system? When we add to the delicious berry a generous modicum of rich cream—which even by itself is so pleasant to the palate and so soothing to the stomach—and make a combination fit for the gods of high Olympus, does it add to our happiness to learn that to the baneful bacillus of the berry we have added the mighty microbe of the milk? When science shows us how fearfully and wonderfully we are made—as the *Savant* observed as he examined a flea under the microscope—are we any happier in the knowledge that we ourselves are the home and abiding-place of microscopic microbes? Is it gratifying or even amusing to know, as Dean Swift reminds us:

"That naturalists observe a flea
Has smaller fleas that on him prey,
And these have smaller still to bite 'em,
And so proceed ad infinitum."

If we are to believe Pasteur and his disciples, that all the diseases which beset us from the cradle to the grave are but the work of microbes, which are conscientiously carrying out the work for which they were created; if it is true that all our physical ailments are caused by microbes; if cancer and catarrh, cholera and consumption have each its appropriate bacillus, may we not logically infer that murder and madness microbes are prowling about and striving to disturb and distort our normal cerebration? If so, may there not be a microbe whose presence and action in the brain has made *Messieurs les Savants* mad as March hares about Chars and *Salvelinus*, vomers and fin-rays, operculi and gill-covers?

In all seriousness, is not *Salmo Salar* at once the enigma and the reproach of Scientists? Questions discussed by Socrates are unsettled yet, and the salmon, exciting more curiosity than any other denizen of the water, has been more than any other, the object of visionary theories, narrow empiricism, stiff assertions, easy credulity and obstinate unbeliefs. The fish can be but obscurely and occasionally observed during one-half of the year; during the other half it is not only invisible as to its habits, but it is quite unknown as to its habitat. After the salmon has left our rivers we are ignorant, not only of what it is doing but of where it has gone. Science is perplexed, but sciolism plunges in with a few half truths gathered from a merely local experience. The nonsense that has been published about salmon and trout under the name of Natural History is appalling in amount, variety and utter worthlessness. In questions regarding the natural history of the salmon, people who have seen most are inclined to say least, and those who have thought most are most at a loss what to think. Not so the *Savants!* Those of them who never saw a salmon alive, either in salt or fresh water—those whose only knowledge of them has been acquired by blinking through the lens of a microscope at vomers, fin-rays and gill-covers, speak *ex cathedra* in such strident tones as make us of the *hoi polloi* wonder at our dense ignorance while lost in admiration of their vast erudition. They tell us of a sea trout which they dub *Salmo trutta marina*—the White Sea Trout—which, according to their own showing, in no way differs in internal structure nor in outward appearance from *fontinalis*, but has a different habitat and entirely different habits. They tell us that it is an anadromous fish whose home is the sea; but which comes in vast schools to feed along the shores; that they ascend fresh water rivers not to deposit their own spawn, but to eat the ova of *Salmo Salar*, and they lead us to infer that they spawn in salt water, which, it is well known, kills the ova of all other varieties of the salmon family. The *Savants* tell us that this unique species abounds in the Gulf of St. Lawrence from the head of Bay Chaleur to the Straits of Belleisle; but, strange to say, is found in no other part of the world. So widespread is the delusion about sea trout that every writer on fish or fishing discourses of what he don't know, and tells about a fish he has never seen.

What little is known about the salmon may be told in very few words; for this little we are not at all indebted to the *Savants*. All their theories have been proven false and all their generalizations erroneous, because all are founded on erroneous or insufficient data. For the little real knowledge we possess we are indebted principally to intelligent and observant anglers and fish culturists. From them we know that *Salmo Salar* performs its reproductive functions only in fresh water. We know that females deposit their eggs between October and December; but we are utterly ignorant what proportion of these are fertilized by milt from the males, or what proportion of these fertilized eggs are hatched. We know that the newly-hatched fry are about an inch in length, with the bulk of the original egg attached to the umbilicus; in four months they are about two and a half inches. The year-old salmon is from four and a half to five inches, and the two-year-olds about seven inches long. How many smolts reach the sea as the result of the deposit of a thousand eggs, we do not know. Of the travels of the smolt in the sea we are entirely ignorant; but we know that they are never caught in the estuaries of their native rivers, and here our knowledge ends. After all the experiments made in the hatcheries of Europe and America, we are yet uncertain when smolts return as grilse or when grilse return as salmon. We are not quite certain that all return to their native water, as many marked fish have been taken in other rivers. Some marked kelts have gone down to sea from Scottish rivers in spring and returned to breed in autumn; while other facts point very strongly to the conclusion that the great majority are not yearly, but biennial breeders. Where salmon go when in the sea we do not know. We are also ignorant what that food is which so stimulates their growth and furnishes the fat which makes it such nourishing and palatable food for us.

While giving us little or no assistance in acquiring this limited information, the *Savants* now step in, get their scalpels at work and, blinking through their microscopes over the stomach of a salmon forty-eight hours from the sea, they tell us with an air of profound wisdom that the salmon eats no food during its stay in fresh water; though during that stay both eight hours from the sea, they tell us with an air of profound wisdom that the salmon eats no food during its stay in fresh water; though during that stay both male and female perform functions that, in all other creatures, call for well-nourished bodies, while its near cousin—which they erroneously call a sea trout—is a most voracious feeder, whether in brackish or fresh water. The *Savants* tell us, with grave faces of firm faith in their superficial studies, that from June until November, say six months of every year—half of its whole life—it maintains an unbroken fast! That one of the most highly-organized, strong, active and voracious of its whole class of fishes, should stand alone among animals as passing half its life without food, is asking of anglers rather more than we are prepared to concede. For himself, the Old Angler simply says, "*Credat Judæas Apella, non ego*," and for this reason, that he has frequently found in the stomachs of salmon which have been weeks from salt water, small particles of stone and large grains of sand, such as form the agglutinated coverings of the chrysalides of several insect species. From this fact it seems more probable that such larvæ and other quickly-digestible matter forms food suitable to its changed habitat, than that it does not eat at all. In its struggles for freedom when hooked, it is more than probable that the contents of its stomach are voided. All fishermen will recall how often they find their worm or other bait threaded some two feet up the line, showing that trout have the power of ejecting with considerable force. Is it not more than probable that salmon have the same power?

Leaving all these speculations to the *Savants*, who part their names at the side and their hair in the middle, the Old Angler will state some facts which are too well known to be successfully denied. He has caught in the spring, at the breaking up of the ice in April, kelts that beyond doubt spent the winter in fresh water. These fish were much emaciated; the heads of the males were so deformed that they bore no resemblance to the head of a salmon fresh from the sea. They were most voracious, and greedily took any kind of bait—a piece of fat pork being best. The tributaries of the St. John every spring furnish specimens of these kelts, which from choice or necessity, have wintered in fresh water. The salmon bred in River Philip, Cumberland County, Nova Scotia, winter in its waters in considerable numbers. Before the Dominion Fisheries Act of 1868 was in force, fishermen went regularly to the head of tide as soon as the ice broke up, for the express purpose of catching these kelts with rod and line. They would greedily seize anything that attracted their attention, and sometimes as many as six and eight were caught in a single tide. The last the writer saw were caught in the month of April by a party of three, two from Boston and one from St. John, at whose instance the Boston men were induced to take the journey by boat to St. John and by rail to River Philip. To the credit of the Boston anglers be it said, that a single tide sufficed them. They caught, among them, over a dozen black, dirty, famished fish, which, as a curiosity, they brought to their hotel—the Dufferin—when it was under the management of that genial host, Geo. W. Swett, whose subsequent management of the Windsor in Montreal made him known to hundreds of readers of FOREST AND STREAM. Here are facts which demand explanation from *Messieurs les Savants*, or they must revise their hastily formed opinion about the *Salmo Salar* not taking food in fresh water. The salmon of St. John River and those of River Philip ascend these rivers the last of May and all through June and July. Kelts are taken, as stated above, in the months of April and May. Now *Messieurs*, with the long string of letters after your names, do you seriously believe that a fish organized as *Salmo Salar* has lived ten months without food? Of course, you have a perfect right to hold any opinions you choose, provided you can give a reason for holding them; but the Old Angler must question your right to state, as a fact, that salmon do not feed in fresh water, simply because some of you have failed to find undigested food in the stomachs of the very few you have examined. Go to, *Messieurs!* Bring more common sense and less Science to your work. Study the live fish in his summer habitat of rushing rapids and placid pools. Fight him with a rod and line for a couple of hours, and when you have landed him, ask yourselves if he could put up such a fight on an empty stomach? Vomers and fin-rays may amuse you, but they will add little to your practical knowledge of the fish they came from, and less to the information of the *oi hoddoi!* Has your science yet discovered the use of the "hook bill" on the male salmon? Do you know whether he ever gets rid of it after it has once developed? Do you know why grilse never have this hook, or why they are so scarce in the Restigouche and Cascapedia, and so plentiful in Nepissiguit and Miramichi? Do you know whether the Pacific salmon ever survive the performance of reproductive functions, or what is the cause of their dying in such prodigious numbers after having performed them? Do you know whether the male parr or smolt can impregnate the ova of the full grown salmon, as some well-known writers contend they can and do? Do you know whether, in America, the female grilse has ever been found with fully developed ova, as they are said to be often so found in Scotch and Irish rivers? In short, *Messieurs*, do you really know anything at all about either trout or salmon, except the "vomers," "gill-covers" and "fin-rays?" Until you can clear up these mysteries and a dozen others connected with live salmon and trout that any angler can ask you, would it not be as well to apply the soft pedal to your scientific "yawp" and dogmatize in a lower key?

Meantime, the Old Angler will state some facts in his own practical experience. As an angler before he was a fishery officer, he never caught a grilse or saw one caught in Nepissiguit or Miramichi without opening it and examining it carefully in search of milt or ova. The males always had lobes of milt more or less developed; but never did he find sign of an ovum in any. Careful inquiry for many years among Indians and canoe-men corroborated by his own experience. Billy Bateman, whom the writer especially engaged in this search (he was for many years employed all summer as canoe-man for the anglers who fished the Nepissiguit, and had special facilities for pursuing it), entirely failed to find ova in a grilse. All he could find was a tradition on the river that Jack Buchet's grandfather once "speared a grilt with the pea in it." In after years, when his official duties brought the writer in close contact with the managers of the several hatching houses, he instructed them to pay special attention to this matter, and if they found a grilse with developed ova, to wire immediately and keep the fish alive until it could be examined. In fifteen years' experience but one manager, Isaac Sheasgreen, who still manages the Miramichi House, reported that he had a grilse with ova. My intention was to have the eggs of this fish placed on marked trays and their development carefully watched. On arriving at the hatching house next day, Mr. Sheasgreen went to a large tank in which the fish had been placed, but could not find it. In one end of this tank was a pile of zinc trays, which during the night had fallen over, but to facilitate his search the water was run off. Under this confused mass of trays, to my extreme regret, the fish was found quite dead. I examined it carefully; the ova were well developed, as large as those of a full-grown salmon, though the fish weighed but five pounds—and looked healthy. This grilse was shorter and thicker than usual, but in all other outward respects was a normal female. After considering the facts, and knowing little about vomers and gill-covers, the Old Angler considered it more probable that the fish was a dwarfed salmon—one that, from some cause, had not developed normally. In this opinion Mr. Sheasgreen agreed, as it was the first time in his experience that he had ever seen "a grilt with the pea in it."

Leaving all these questions with *Messieurs les Savants*, and a number of others when they can answer these—the Old Angler will take his readers with him and a friend to Price's Bend, on Southwest Miramichi, where he caught his first grilse. In those days—62 years ago—it was an outing both tedious and expensive to go to Burnt Hill, spend a week on the river and return to St. John. The only mode of travel was by stage to Fredericton, 79 miles, and then 40 miles to the Miramichi. At that time Boiestown was a thriving lumbering center, with several stores, where all necessary supplies could be procured. Here we hired our canoe-men, to whom we agreed to pay a dollar a day and feed them. From motives of economy we tried the experiment of hiring only one canoe and two men to serve us both; but we soon discovered that too economical a disposition should form no part of an ambitious angler's outfit, and that when he cannot afford to go-a-fishing *en bon prince*, he had better stay at home. In those days the Old Angler was much in the position of a gentleman he met many years after when he was wandering over the burnt district of Chicago, a week after the great fire of 1871. This gentleman was his obliging guide, and pointed out all the remarkable features of this wonderful city, which, in the writer's childhood, consisted of a few hunters' huts on the shores of Lake Michigan. Standing on rising ground in the unburnt part of the town, which in its elaborate architecture and asphalted pavements bore every appearance of an old city, he made a sweep of his arm toward the lake and said, "I could have bought all that once for a pair of boots." "Why in the name of common sense did you not?" "Oh! I had'nt the boots in those days!" Dollars in those days

were none too plentiful with the two ambitious fishermen who were making their first plunge as salmon anglers, and it was a matter of necessity that an effort should be made to combine sport with economy—a combination that usually ends in reduced sport and increased cost.

We started in a single canoe, poled by two men; we seated in the middle, the stores, in two boxes, reposed at the feet of the canoe-men, one in the bow, the other in the stern. When we reached Price's Bend, a few miles above Boiestown, we made the discovery that, beyond a certain point, economy would not combine with sport, and after a consultation on ways and means, we concluded that "in for a penny, in for a pound," was a saying peculiarly applicable to our case. We sent the men back to Boiestown for another canoe and two more hands, while we made our first essay in the fine pool at the bend, which was then and is still, famous for the number of grilse which make it their haunt. While waiting, let me describe the canoes which were then and are now the vehicle best adapted for traversing the upper waters of the Miramichi. The birch-bark canoes of the Indians require too much care in their handling among rocks, rapids and shallows and consequent loss of time to suit anglers. The dugout is made from a single pine log; the length as great as the log will allow, generally from 20 to 25 feet; the depth fifteen to eighteen inches; the gunwale is not more than two inches thick; the sides gradually increasing in thickness toward the bottom, where they are about three, and the bottom itself is usually left three and a half to four inches thick, which allows of occasional planing when the wood becomes rough from contact with rocks and shallows. This shell is strengthened by small knees placed at intervals along the inside and bottom. To those unaccustomed to them, they seem the most frail and unsafe shells that could be contrived; but in reality they are very strong, more steady than a birch, and admirably adapted for the rough and rapid waters in which they are employed. They are propelled by poles instead of paddles, and the skill with which they are managed by those who almost live in them, is really wonderful. To the dweller on the banks of the upper Miramichi, his canoe is both horse and wagon. Capable of carrying a large load when properly stowed, it is his usual mode of transport, and is to the white settler what the birch is to the Indian, with these advantages: the log canoe is steadier in the water, and from its greater strength is better adapted for passing over the rough bed of the stream and shooting among sunken rocks that lie hidden in dangerous rapids. When the writer was last at Burnt Hill, in 1885, good canoes were getting very scarce on the river, and suitable trees to make them growing scarcer every year. Pirougues, made from two smaller logs, each furnishing half, joined by dovetails across the middle of the bottom, and flat-bottom boats called skiffs, were fast taking the place of the old single canoe. With the log canoe will be lost one of the fine arts of frontier life. Already the art is confined to a few of the oldest inhabitants, and these do not equal their fathers in producing canoes of graceful lines and easy propulsion. As a curious coincidence, Abe Munn and Tom Hunter were again my men in a canoe of their own making, elderly men, but still among the best on the river. Alas! the companion of my first visit with Abe and Tom and most all of those who were the companions and canoe-men of many subsequent visits, have paid the debt of Nature and the Octogenarian, while awaiting his call, oft in memory reviews the pleasures of past days and the faithful services of his old guides.

While waiting at the Bend for the canoes we had each caught our first grilse and ungrateful dogs that we were, had grown impatient to reach the Clearwater pools, in which salmon are sure to be found all summer. At length they arrived; dividing the luggage, each had a canoe and two men at his disposal, all of whom knew the river perfectly and every pool where a salmon rested; they started for Clearwater at their best speed. Our men were all young and among the best on the river. Each was equally good in bow or stern. The former must possess a good knowledge of the river, the several rapids with their hidden rocks; he must be quick, skillful with the pole and sure-footed; the latter must have thews and sinews of iron; strength to force the canoe over water too shallow to float her entirely, and dexterity to second the quickest motion of the bow-pole, who sees the hidden danger and intimates its presence by the motion of his pole. Our men took as much pride in their canoes as city swells take in their horses, and plumed themselves as much on their management as the latter do on their driving. The post of honor is always in advance; it is comparatively easy to follow in the wake of a good leader—and each of our crews strove for the honor, although it involved more trouble and labor. We arrived at Clearwater rather late for evening fishing; but while the men were pitching tent and getting fir boughs for our beds, we had reached the height of our ambition and the fulfilment of many a dream; we were casting our flies over a pool which never fails to hold salmon from June till September. We soon had each a fish on the line; but truth compels the confession that we lost both and our flies as well. Next morning we were early at work. We had not then learned what subsequent experience taught us—that salmon will rise as well between nine and eleven o'clock as they will between seven and nine. After several more losses of flies and leaders, which is pretty sure to be the footing the novice must pay—we each succeeded in catching our first salmon, and congratulated each other on the gratification of many youthful longings and the realization of many day-dreams. No matter how cool and skilful the angler may be when casting for trout and bringing them to creel with scarcely a loss or an accident, he will get flurried and nervous when for the first time salmon rise to his fly. Accustomed to strike as the trout shows, he instinctively does the same when he sees the swirl of the salmon. Generally he strikes too quickly and always too hard. The consequence of the first error is that he does not hook his fish; of the second that he loses fly or leader. No other instruction can be given in these cases except the oft-repeated "don't do it!" A good many years after, the Old Angler was fishing the same pools at Clearwater in company with that "all white" man, excellent actor and enthusiastic angler, the late J. W. Lanergan, whose too early death many hundred readers of FOREST AND STREAM learned with sincere regret. He had gone through all the lower grades with gad, twine and worm on the brooks of Massachusetts and Vermont. He had taken double-first with rod and reel on the lakes and streams near St. John; he had graduated with honors among the landlocked salmon (ouananiche) of the St. Croix lakes; and now he was up in exams. for his M. A. diploma among the *Salmo Salar* of the North Shore of New Brunswick. He stumbled just where we all do and must if we would penetrate the arcanum of angling. He found it very difficult to avoid striking too forcibly, and the writer, standing behind him, took hold of his rod and gave the indescribable turn of the wrist which tightens the line without jerking it.

"Can't you do it so, Jim?"

"If I could, do you think I'd be throwing away my flies and leaders here?"

In camp, after dinner, he related an anecdote of the great actor, Edwin Forrest, somewhat as follows: "When I was quite a novice on the stage I had a small part in a scene with Forrest which always 'brought down the house' at his splendid acting when he played Spartacus. At rehearsal I made a sad mull of my lines, which aroused all his irritable humor. Contrary to his usual habit, which was not amiable at rehearsals, he placed me in position and speaking the lines said, 'Can't you do it so?' 'If I could, I'd not be wasting time here at ten dollars a week!' Mr. F. appreciated the subtle compliment of this reply, and was always kind to me afterward." Dear old Jim! He lived to kill many a salmon on Nepissiguit and Miramichi, and some years after hooked, played and gaffed a salmon "all his lone" from Governor's Rock, below the mouth of Burnt Hill Brook—a feat never done before and but seldom since. But to return to older memories of Clearwater when the Old Angler himself was passing his novitiate.

Fish were plentiful in the river; we were the only anglers that had been on the stream for several years, so we had good luck and fine sport. We stayed two days at Clearwater and had several fine fish in the smokehouse. Just here let me mention that Clearwater is a very considerable stream, which takes its rise in a large lake fed by several brooks. At its mouth, along its course and in the lake, are fine trout, running from one to three pounds. These are the sea trout which, a month earlier, were in the tideway and at Indiantown. We moved up to the pools at Rocky Brook which Abe assured us had not yet been disturbed by spearers. Here we had fine practice, and before leaving for Burnt Hill—the goal of all anglers who visit the river—sent a dozen salmon to swell the contents of our smokehouse at Clearwater. Between Rocky Brook and Burnt Hill are Three-Mile rapids, where the stream is so swift that continuous and prolonged efforts of the canoe-men are necessary to ascend them. Very often poles are broken or lost, when others must be seized at once. There are generally spare poles made before entering this rapid, the whole passage of which is exciting both to men and passengers. The country bordering this part of the river is hilly, the banks are steep and the scenery wild and impressive. The hills were then well wooded; but the lumberer has since culled every trunk that could be made into a merchantable deal. We did not reach Burnt Hill until the shades of evening were falling and we missed the afternoon fishing. But the evening was soft and balmy; the moon would soon rise and add its beauty to the sylvan scene. The murmurs of the stream mingled with the louder music of the river rushing on its downward course among the rocks and boulders which make the pools at Burnt Hill a favorite resort for salmon. We sat around the door of the camp, smoking and anticipating great sport for the remaining two days we had to spend on the river. While thus engaged my companion called attention to the rising moon which, seemingly, had just become visible above the trees some distance up stream. A single look assured me that our fishing was done for that season. The rising moon proved to be a "grille" with flaming pine knots in the bow of a canoe on its first spearing trip down the river. We asked the men to spare the pools at Burnt Hill, as those below would give them all the fish their canoe could carry. They wanted ten dollars, which, unfortunately, we were not then in a position to give them, as our expenses home would exhaust our finances. "We hadn't the boots in those days." All that night the best pools on the river were gone over several times and in the morning the spearers left with their canoe half full of the largest salmon in the river. As it was useless to fish the pools for a week at least, we followed them down river with sad hearts at the sport we had lost. The only halt we made was at Falls Brook, an insignificant stream in summer. About half a mile from its mouth it pitches over a perpendicular ledge of considerable height, making a very beautiful miniature fall. Ages ago it must have been a large and deep stream; at the fall was a circular basin 100 yards in diameter, with almost perpendicular sides of crumbling rock. While we were examining this relic of a past age, two of our men climbed the cliff and by means of levers launched over the edge a fallen tree lodged on the brink. In its fall it brought with it large masses of rock, which came thundering down, giving us a faint idea of what an avalanche in the Rockies might mean. At Clearwater we took aboard a dozen smoked fish, the carriage of which, by stage, cost more than they were worth before we reached St. John—everyone our friends received cost us at least five dollars. To-day the sport is even more costly, for the whole river is monopolized by lessees of the Provincal Government, and its best pools are held by wealthy Americans, who, the writer was informed this summer, charge five dollars per day for the privilege of fishing a single pool. The facilities for reaching the rivers now contrast strongly with the difficulties of former days. Leaving St. John by a morning train, the tourist can now step off at Boiestown and in the evening camp on the river, or he can leave St. John in the morning, step off at Matapedia station, camp on the Restigouche the same night, or go on to New Richmond and the Grand Cascapedia. But unless he is the fortunate possessor of "the boots," he cannot fish a single pool in the Provinces.

Among the various and ingenious arrangements and combinations by means of which the millionaires have always been masters, they have made an "angling trust," and none but those who possess "the boots" can now aspire to angle for salmon. The Restigouche and its club house is not the only example of the millionaire's idea of sport. They have grabbed the Cascapedia, the Bonaventure and all the salmon streams about Gaspé, and have introduced on these fine rivers the same dilettantism in fishing, that some of them display in art. Before the Old Angler, as he pens these lines, is an *édition de luxe* of a small book describing two visits to the Grand Cascapedia. One of the full-page illustrations depicts an angler (?) seated in an armchair beside a salmon pool, one leg crossed over the other, a cigar in his mouth and an Indian standing behind his chair with a birch bough, brushing the flies away from the luxurious sybarite! The line is fast to a fish, and the text thus describes the situation: * * * "Sitting down as coolly and unflurried as if he were casting up the interest on a long note [he is a banker] instead of fighting a hard battle (?) with a forty-five pound salmon." Of course he lost the fish, and the author moralizes thus: "I had always admired the serenity with which my friend had borne the crosses of life; but on this occasion his serenity touched the verge of the sublime! Happy man, who can thus lose a fifty-pound salmon without intermitting a single puff of his cigar!" Ho! ye of the Old Guard. See how the *jeunesse doré* have improved on your antiquated ways! The Old Angler used to be somewhat vain of his skill with rod and line, acquired by many years' hard practice on the Miramichi, the Nepissiguit, the Restigouche and the Cascapedia; but—

"Chapeau bas! Chapeau bas!!
Honneur à Marquis de Carrabas!!"

he humbly doffs his hat to the millionaire who, on his first visit to a salmon river (so says the text) tackles forty-five pound salmon seated in an armchair with his legs crossed and a cigar in his mouth! But perhaps it is presumptuous to suppose that the *hoi polloi*, with only a limited supply of "the boots," could in any way compete in skill with multimillionaires! However that may be, the Old Angler confesses that he never in his best days killed a salmon with a cigar in his mouth; and he may add that he never attempted the feat! Nor could he, in his palmiest days, though fairly skilful with rod and line, capture "sixteen large trout (from half a pound to three pounds) in thirty minutes, with an eight-ounce rod, without a landing net." If he could do it and indulged in this kind of slaughter, which he is glad he cannot, he would certainly lack the "gall" to proclaim himself an angler. But he still retains the old-fashioned opinion of Dame Berners and Father Izaak that

Angling is not alone to fish,
Nor sport mere killing game.

Were the mere killing of fish the sole object of the angler's outing, all whom the writer has ever met would have to yield the palm to the *habitan* he saw at tide-head on Cascapedia. He had a long sapling fir pole, twenty yards of mackerel twine for line, at the end of which was a bunch of domestic mallard feathers tied with black thread on a mackerel hook, whose shank was wound with red yarn. He scorned reels and leaders; but he could slash out the full length of his line with considerable skill; when he hooked a fish, which he did at almost every slash of his line for a time, he hauled it into his canoe with as little ceremony as he jigged makerel in the midst of a school, at which he was an adept. But *Messieurs les Millionnaires* are waiting. Not content with their wheat and corn trusts and corners; steel and iron trusts; sugar and oil trusts; cotton and wool trusts; tobacco and cigar trusts; hard and soft coal trusts, that raise the price of all the necessaries of life, the millionaires have now made a "corner" in salmon fishing and raised the price of its luxuries! On the principle that "might makes right," this may be all correct; but it grates harshly on the Octogenarian, who, in behalf of his brother anglers whose stock of "boots" is limited, would submit the question, whether they are not, in fairness, entitled to a reasonable share of those pleasures which Nature provides for all her votaries without money and without price?

We have before us a problem which affects not alone our pleasures but our very existence, should the millionaires so manipulate the "Coal Trust" that great masses of their fellow creatures must perish of cold. Perhaps the Octogenarian's mind has not kept pace with the rapid progress of these latter days; but to his plain "horse-sense" it seems clear that there must be some linch-pin loose in our much-praised Car of Progress. Progress! when the rich are becoming richer and the poor poorer with every revolution of its wheels. Whether our "Progress of Civilization," taken in some of its aspects, is a blessing or a curse is an open question. While we must believe that Progress is the Order of the Universe established by the Infinite, we cannot shut our eyes to the fact that to the masses it has brought a curse rather than a blessing; that only the favored few reap its rich rewards, while the great majority of mankind are no better off, if, indeed, they are not worse off than ever they were before. The Car of Progress seems to be rolling over the heads of the millions instead of under their feet, crushing into the dust those it should bear into heaven. Capital is the child of Labor, but the creature has become lord of its creator. On every hand we are beset by problems which must be solved; but by far the most important—the one which may be said to embrace all the others—and to which the Octogenarian respectfully calls the grave attention of *Messieurs les Millionnaires*, is simply this: "How can the masses secure a more equitable division of the wealth that labor produces, and assure to every able-bodied man willing to work an opportunity to earn an honest living?" The working classes are, thanks to our free-school system and the spread of knowledge, fast coming to under-

stand the great truth that lies at the foundation of all systems of Politieal Economy, viz: "Every cent collected by any method by any department of government comes out of the purse of labor, the only source of wealth. They are beginning to understand that the capital of the millionaire came from labor, and that, in ninety-nine cases out of a hundred, the laborer and not the millionaire produced it all. They are beginning to see, more clearly than ever before, that accumulation is not production, and they are asking each other by what right one man possesses a hundred million dollars while thousands of his fellow citizens are starving for want of employment? And yet, one of the popular preachers of the day, whose discourses form a feature in the orthodox press, is reported to have preached from his pulpit: "The laborer should be content in that sphere where God has placed him. But for the Bryans, the Debses, the Gompers and the Mitchells he would be docile enough." If this is true, it is only necessary to "remove" the labor-leaders as fast as they appear and all will be well. These platitudes from the plutocrats' pulpits will not serve their intended purpose much longer. Among the solid chunks of practical wisdom that great and good man, Abraham Lincoln, left to his fellow citizens is this one: "You can fool some of the people all the time, all the people some of the time, but you cannot fool all the people all the time." The masses have been fooled all the time. "Strikes" hitherto have only strengthened the faith of the millionaires in their own shibboleth—"Labor cannot coerce Capital," and the most intelligent labor leaders have grieved over the sad truth that labor has furnished the weapons that have ever beaten it into subjection. Like Byron's eagle stretched along the plain—

> "Keen are their pangs, but keener far to feel
> Their own hard labor formed the fatal steel."

When Tennyson wrote "Knowledge comes, but Wisdom lingers," he must have seen in the distance such economic idiots as this popular preacher. Never before in the history of civilization has such an object-lesson been presented to thoughtful minds as is furnished by the "coal strike" now in course of settlement. Never before has the world seen 3,000,000 intelligent operatives, thoroughly organized under men who can spare a hatful of brains to the millionaires, demand from those whom their labor has enriched a more equitable remuneration for that labor. With so large a contingent hovering on the verge of want, and the farmers sympathizing openly with the strikers, who defy the laws, wreck property and sacrifice human life in their blind rage, would it not be well for the millionaires to reconsider matters and ask themselves if they have the power to lay the monster which, like Frankenstein, they have called into existence? Labor being the Atlas that supports the social world, would it not be wise for *Messieurs les Millionnaires* to inquire from time to time how he gets on with his job—especially when they hear him complaining very audibly that his burden is getting too grievous to be borne, and he manifests a growing disposition to turn his pack into a foot-ball and play a game which may jeopardize not only the lives of the millionaires, but even the continuance of our representative institutions. This game has been played before and the millionaires and *noblesse* came out second best. We all know how that moral thunderstorm cleared the social atmosphere and how much better off have the *hoi polloi* of France been ever since. When this social storm of thunder and lightning breaks over the United States and England the millionaires will be the worst sufferers and will curse their own stupidity that made them blind to the signs of the times. V.

[TO BE CONTINUED.]

Devil Fishing.

EVERYBODY cannot go bobbing for whales, nor can many of us enjoy swordfishing, but there is always good sport hunting big game in the Gulf Coast waters of Florida for those who go prepared for it. The man who wants his game in ton chunks should seek the manta, or devilfish, in Lemon Bay, San Carlos Bay, Charlotte Harbor, or Tampa Bay. The further south they are sought, the earlier they will be found.

The devilfish (*Manta birostris*) is a thoroughly harmless big skate, except when he happens to hunt a light boat by accident, or while struggling on a harpoon line. Specimens thirty feet in width have been killed, and the average width across the flippers is probably twenty feet. It is doubtful if a devilfish has ever been weighed, and the ordinary guesses at their weight are valueless. A ton is a fair estimate for a devilfish seventeen feet in width. The length and breadth of these fish is about the same when the whip-like tail and the flippers at each side of the wide, toothless mouth are included in the measurement. The open mouth laterally measures one-sixth of the whole width of the fish. The fleshy flippers at each side of this gaping orifice are used for fanning food into the maw of the fish. Its food is evidently minute crustacea, and it feeds much as the whalebone whales do, by screening the water through fine interstices. On the under side of the devilfish are four pairs of gill openings, fitted interiorly with a most elaborate system of filtering screens, which appear as if woven with wire in long, narrow meshes, like those of a locomotive spark arrester, though much finer. Beyond its bat-like wings the manta has no means of locomotion. It has one steering fin close to the root of its apparently useless tail. In depth the devilfish is about one-ninth of its extreme width.

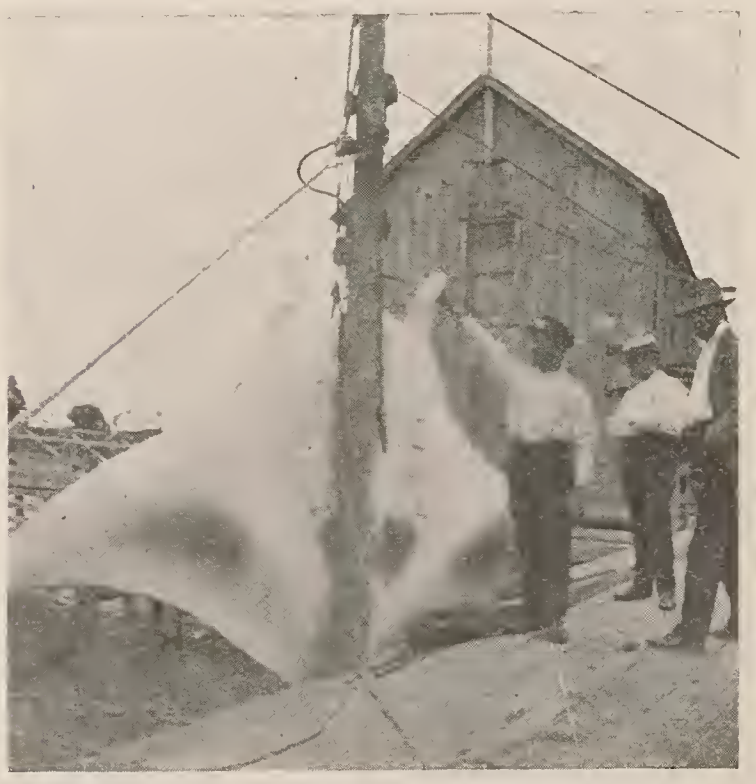
Devilfish are usually seen in pairs in early spring. They swim side by side, careening so as to show alternately above water a foot or more of one of their wings. When in the bays, or close along shore in the Gulf, they are easily seen from a distance because they seem to be constantly playing on the surface, occasionally flashing their shining backs in the sunlight, and once in a great while leaping entirely out of water. In the shallow bays they follow the channels closely and are never known to venture upon the oyster bars or reefs except when wounded by the harpoon and trying blindly to escape to sea. On rare occasions schools of six or eight devilfish have been observed in summer circling and somersaulting in deep, clear water. They appear in San Carlos Bay about the first week in March and their numbers increase as the weather grows warmer. April and May are the best months for devilfishing, and one of the best places to start out from is Punta Rasa on San Carlos Bay at the mouth of the Caloosahatchie River. This is great tarpon ground, too, and one of the best places on the Gulf Coast for channel bass, jackfish, spotted weakfish, bluefish, Spanish mackerel, sheepshead and other species.

The outfit for devilfishing should comprise a stiff sea boat capable of carrying four persons comfortably. A cat rig is preferable, and it should be of light draft and broad of beam. In the equipment should be at least a thousand yards of three-eighth-inch manila line, divided into two coils. Two harpoons, preferably of the lily-iron type, should be provided, together with two lances, a hatchet and a double shotgun or heavy repeating rifle. A large, sharp and strong gaff is an accessory which may be found useful at any time, and there should always be a powerful marine glass at hand. So much for the characteristics of the misnamed creature and the tools needed to circumvent him. Now for the story of how

ON EXHIBITION.

one was taken by a thorough enthusiast who went to great lengths to equip himself for the sport and has followed it for a number of years at odd times.

E. H. Tomlinson, of St. Petersburg, Fla., built himself a catamaran 35 feet in length and 15 feet beam. It was rigged with jib and mainsail and a dandy mizzensail. The bowsprit is a short, stout stick and upon its outer end is a pulpit made of iron pipe, waist-high. Amidships is a flush cockpit with coamings 30 inches high. This forms the walls of a tent at night, or when at anchor in rainy weather, and the main boom forms the ridge pole of the tent. The hulls are flat-bottomed and the craft is extremely stiff in any weather. There is ample room around the fence-like coaming for a footway and roomy decks fore and aft. The cockpit contains a refrigerator,



UNDER SIDE SHOWING GILL OPENINGS.

a stove and the water cask, besides a folding table and half a dozen camp chairs.

When several anglers had reported sighting devilfish last March, Mr. Tomlinson had his catamaran high and dry upon the shell beach at Punta Rasa between George Shultz's hotel and the cattle wharf. He sent to St. Petersburg for two of his favorite cadets, quiet, husky boys of 17 and 19 and brothers. They came down within two days and the catamaran was quickly gotten into commission after the spiders, centipedes, ants and other insects had been evicted with sulphur fumes. Then the boat was equipped and one fine morning in the last week of March we sailed away, over the bay toward Sanibel Island. A light breeze was blowing from the southeast and the water was so smooth that there was no difficulty in seeing the little bunches of scaups floating upon the surface all around us. We were all watching for devilfish with our eyes almost popping out of our heads. A big shark fin cutting the water 200 yards away raised a false alarm before we had cruised more than a couple of miles, and we all began to think we were going to draw a blank when one of the bright-eyed boys quietly remarked: "I think I see two sea-bats over toward Estero. Please let me have the glass."

Putting the powerful marine glasses to his eyes he studied the water for fully half a minute and then said: "Yes, there's a pair of them just come out of Matanzas Pass and they're heading this way up the channel. They're just to the north of red buoy No. 2."

Mr. Tomlinson took the glasses and saw the two fish at a glance. Just then one of them showed his shining back in the sunlight, and although it was jet black it shone like a mirror and instantly revealed the location of the game to the naked eyes of all on board. We had to beat up to head off the two fish, which were lazily swimming up the bay. Not a word was spoken as the boat and fish drew together on each port tack. Mr. Tomlinson was forward arranging his harpoons and lines and one of the boys was tending sheet while the other steered. When we came within a hundred feet of the big fish we could plainly see their bat-like forms in the limpid water, and doubtless they saw us, too, but they showed no fear and did not change their course. The owner of the catamaran was in the pulpit now with his lily iron poised. The steersman had his eye upon the larger of the two fish and was cutting close into the wind to bring it under the bowsprit. I believe we all held our breaths until Mr. Tomlinson launched the iron with such power that it passed clear through the devilfish and locked its pivoted trigger on the bellyside. There was a wild flurry when the fish felt the iron, but it did not make any more commotion than its mate, which was untouched. Both lashed the water into foam and the uninjured fish sprang clear out of water, curling its body in the air and diving head foremost with its wings curled upward. The harpooned fish was meanwhile taking out line and going seaward like a torpedo boat, coming out of water every few seconds and making a foaming wake like that of a sternwheel steamer. He was getting lots of rope, but Mr. Tomlinson was preparing to snub him while he was going in the same general direction as the boat and the sails were drawing. The line was passed around a cleat with a single throw and one turn and there was only a slight shock when the line drew taut, but this restraint was enough to make the big fellow redouble his efforts to escape and he towed the big, awkward raft of a catamaran so fast that the sails flapped idly. The boys quickly lowered all canvas and stowed it away. Mr. Tomlinson took another turn of the line around the cleat and holding the free end in his hand stood watching the struggling fish. On it went, past the Point Ybel and out into the open Gulf. There was nothing for us to do but wait until it tired out. Several times it sounded and sulked for a rest, coming to the surface again slightly refreshed. The hours went by and the fish changed its course abruptly several times, once heading straight back for nearly three miles toward Sanibel Light. The wind freshened and the spray broke over the catamaran continually. Several times all hands manned the line and succeeded in getting in a portion of it by pulling the boat toward the fish, fastening all we gained. After four hours of fighting, winning and losing by turns, we had the devilfish close under the bow and as it turned over to dive, Mr. Tomlinson sent another iron through it from belly to back. The two harpoons crossed each other, so closely were they driven together. The second iron took all the fight out of the fish, and it flapped its wings idly as the line was hauled taut and belayed. Now the sails were hoisted and we started for Punta Rasa with a stiff wind on the starboard quarter. It was slow work towing the ponderous fish, but we wanted it for an autopsy. The sun went down as we entered the bay and we had nearly four miles to tow the quarry against the tide, but the catamaran buckled down to the task and we reached the hotel wharf at 8:30 that night. The devilfish was beached and secured by tying the harpoon lines to stout posts. In the morning a mast and tackle blocks were rigged to the side of the wharf and the fish was hoisted clear of the water and six or seven cameras were repeatedly snapped at it. While it was hanging up, one of the negroes let himself down into the mouth of the fish and stood there concealed to his hips. The autopsy was then made and the intricate system of screens was the most interesting feature of it. It was an unpleasant task, owing to the overpowering odor exuded by the monster even when freshly killed. After the "innards" of the creature had been explored, it was placed aboard the catamaran again and dumped overboard in the channel to float away on the ebb.

HARRIMAC.

Death of Gardner M. Skinner.

We regret to learn of the death of Gardner M. Skinner at his home in Clayton, N. Y. Mr. Skinner was maker of the spoon baits bearing his name, which have been used by thousands of fishermen in all parts of the country. Born in Gananoque, Ont., and a resident of Clayton, he was all his life a dweller on the St. Lawrence, and was enthusiastic in his appreciation and praise of the Thousand Island region. His interest in fishing was intense. In every movement to foster and enlarge the resources of the Thousand Island waters he was ever found foremost. It was largely through his instrumentality that the Canadian fishing authorities made the prevailing concessions to American anglers crossing over into British waters for bass fishing; and the American and Canadian cooperative laws for the protection of fish were in large measure due to his intelligent and persevering efforts. To him also we are indebted for the part he took in persuading the Legislature to set apart public camping ground reservations among the St. Lawrence River islands. Thus in many ways, quietly and without self-seeking or any plea for public recognition—for he was one of the most modest of men—Mr. Skinner served in his day and generation, and is held in grateful memory by those who knew him.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

The English "Oyster Scare."

To the Forest, Fish and Game Commission:

GENTLEMEN—The death of the Dean of Winchester from typhoid fever, in England, has evoked widespread sympathy throughout the United Kingdom and in the United States, and the unfortunate circumstances attending his last illness have engendered a sensational state of public alarm, which is alluded to in the English press as "The Oyster Scare."

The assertion is made that the typhoid bacilli were, in this case, conveyed by oysters eaten at a Lord Mayor's banquet given in London, and in consequence the English oyster trade has been well nigh prostrated.

It should be noted that the oysters used at the banquet in question *were not American oysters*, but were taken, it is stated, from beds located in the south of England, and it is charged that over some of these beds "an outfall of sewage has been permitted to flow."

Whether oysters are ever the medium of distribution of typhoid germs is of course a question for medical men to determine. It is claimed by some authorities that the connection between typhoid and the oyster has never been scientifically established. Our chief duty and interest, however, is to thoroughly inform ourselves and the public concerning the purity of the sources of the oyster supply of our domestic and export markets.

On the third instant I received from the Forest, Fish and Game Commission a letter requesting that some guarantee of the wholesome character of the Blue Point and East River oysters be sent to the commission for the information of the Governor of New York State, that the Governor might communicate with the Secretary of State at Washington in order that the representatives of the United States Government abroad might have the proper assurances of the freedom of New York oysters from contamination. Upon the same day I forwarded to the commission certificates as follows:

This will certify that the oysters known in the trade as "East Rivers" are taken from beds situated in Long Island Sound, an important arm of the sea extending for 120 miles between the south coast of the State of Connecticut and Long Island, in the State of New York, its greatest width being about twenty miles, narrowing to about two miles at its western extremity; averaging about twelve miles wide. These beds are remote from any possible contamination by sewage or otherwise, many of them being at a depth of sixty feet under pure sea water.

Dated New York, Jan. 3, 1903.

B. FRANK WOOD,
State Superintendent of Shell Fisheries.

This will certify that the oysters known in the trade as "Blue Points" are taken from beds located in Great South Bay, a great expanse of salt water lying along the south shore of Long Island in New York State, and with its extensions, known as Moriches Bay and Shinnecock Bay, having a total length of about sixty miles. These bays are from two to six miles wide, and separated from the Atlantic Ocean by narrow strips of sand beach, through which are many inlets, allowing the ocean tides to regularly ebb and flow. The oyster beds are at an average distance of about two miles from shore. The south shore of Long Island is sparsely settled, and there is no possibility of sewage or other contamination.

Dated New York, Jan. 3, 1903.

B. FRANK WOOD,
State Superintendent of Shell Fisheries.

I immediately requested Mr. John E. Overton, one of the State oyster protectors, to interview some of our leading physicians, particularly those residing near our oyster grounds, upon the subject, that I might have their views. The letters which follow speak for themselves.

New York State Department of Health,
Daniel Lewis, M.D., Commissioner.
Albany, Jan. 10, 1903.

Mr. B. Frank Wood, Superintendent of Shell Fisheries, 1 Madison avenue, City:

My Dear Sir—Since I have been connected with the State Department of Health, first, as president, and recently, as commissioner in charge of the department, no case of typhoid fever has been reported to the department in which the cause of the disease was attributed to the eating of oysters.

In my private practice, where I have seen many cases, and in patients who habitually used oysters as an article of diet, I have never met a case in which I had the slightest suspicion that the infection had been communicated through diseased oysters. The legitimate inference, from my experience as a health officer, as well as in private practice, is that the infection of oysters by typhoid germs is practically unknown in this city and State. And it is my opinion that there is no danger of contracting typhoid from the free use of the oyster as a food. Any suggestion to the contrary is a mere speculation, unsubstantiated and unworthy of serious consideration. Very truly yours,

DANIEL LEWIS, Commissioner.

From the neighborhood of the Blue Point beds come the following letters:

Patchogue, N. Y., Jan. 8, 1903.

This is to say that I have been in active practice among the residents and oystermen along the shores of Great South Bay during the past seventeen years. Oysters constitute the principal meat diet during the season of many of these people, and they are as free from contagious diseases as any people upon the earth. The oysters taken from the bay are absolutely pure and free from any germs of disease.

W. S. BENNETT, M.D.

In regard to the possible contamination of Great South Bay oysters with typhoid germs I write to say that I have never known of a case of typhoid fever which seemed to be caused by eating oysters from Great South Bay.

ARTHUR H. TERRY, M.D.

I wish to add my testimony to show how groundless is the English fear of typhoid fever coming from Blue Point oysters. In the first place, the south side of Long Island is exceptionally free from typhoid fever and all other infectious diseases. This can be verified by the State Health Board. Secondly, the infection of oysters from typhoid cases is almost impossible, for almost no sewers at all empty into the bay, and the few that do so, are from single and detached houses. Thirdly, we folks all eat oysters in all forms, and I am sure that no more typhoid is found during the oyster season than at other times during the year. As to this point, I am emphatic.

Trusting that the prejudice against the product of which we are the most proud may soon be removed, I am, yours truly,

FRANK OVERTON, M.D.
Health Officer of Patchogue Village.

From the north shore of Long Island, along which are cultivated the East River oysters, we have the certificates of James E. Gildersleeve, M.D., a practitioner for fifty years; J. A. Dildine, M.D., practicing ten years, and D. F. Many, M.D., who has practiced for fifteen years, who unite in saying that they have never known of a case of typhoid fever which could be traced to eating oysters.

Wm. E. Sylvester, M.D., who is in the service of the State, and connected with the shellfish office, writes:

Hon B. Frank Wood, 1 Madison avenue, City:

My Dear Sir—Relative to the contamination of oysters, I will say that, after a long and extensive experience among people where it was an important article of diet, I have never seen a case of typhoid fever resulting therefrom. From a personal knowledge of the oyster industry about New York, I am satisfied that no oysters obtainable are freer from objectionable influences than these.

Yours, very truly,
WM. E. SYLVESTER, M.D.

"In 1896 a very careful examination was made in England by Professors Herdman and Boyce, of University College, who were furnished with oysters from almost every bed in the United Kingdom, on the Continent, and also in America. Not a single case was found in which there was anything in the oysters injurious to health. One of their tests was to inject typhoid germs into oysters which were then placed in salt water. The germs gradually disappeared, and in the course of a few days the oysters were clear of them. As a more severe test, oysters were placed at the mouth of a drain which connected with a dwelling in which at the time were typhoid fever patients, and the oysters were afterward found to be free from the slightest infection."

Clear sea water is a well-known purifier, and it seems to have been demonstrated that in it disease germs cannot long exist.

A considerable portion of the supply of good and wholesome food for our immense urban population, and much for export, is taken from the clear sea water surrounding Long Island and from Raritan Bay at Staten Island, and any suspicion concerning its purity is without reason or foundation.

New York, Jan. 10, 1903.

B. FRANK WOOD,
State Superintendent of Shellfisheries.

The Kennel.

Fixtures.

Feb. 11-14.—New York.—Twenty-seventh annual show of the Westminster Kennel Club. James Mortimer, Supt.
Feb. 18-21.—Newark, N. J.—Show of New Jersey Kennel Association. C. G. Hopton, Sec'y.
Feb. 20-21.—Denver, Colo.—Bench show of Colorado Kennel Club.
Feb. 23-26.—Boston, Mass.—New England Kennel Club's nineteenth annual show. W. B. Emery, Sec'y.
March 4-7.—Pittsburg, Pa.—Show of Duquesne Kennel Club, of Western Pennsylvania.
March 10-13.—Rochester, N. Y.—Show of Rochester Kennel Club.
March 12-14.—Coshocton, O.—Show of Coshocton Kennel Club.
March 17-20.—Uhrichsville, O.—Show of Twin City Kennel Club.
March 25-28.—Chicago.—Show of Chicago Kennel Club.
March 30-31.—St. Louis.—Show of St. Louis Collie Club.
March 31-April 3.—Buffalo, N. Y.—Show of Buffalo Kennel Club.
April 1-4.—New Orleans, La.—Show of Southwestern Kennel Club.
April 1-4.—Victoria, B. C.—Show of Victoria Kennel Club.
April 8-11.—Atlantic City, N. J.—Show of Atlantic City Kennel Club.
May 29-30.—Hempstead, L. I.—Open air show of Ladies' Kennel Association of America.
Nov. 3-6.—New York.—Annual show of Ladies' Kennel Association of America.

National Beagle Club of America.

National Beagle Club of America, Camden, N. J.—The regular quarterly meeting of this club will be held on Wednesday, Feb. 11, at 8:30 P. M., in the café at the southwest corner of Madison Avenue and 27th Street, New York City, at which time any and all business will be transacted which shall be brought before the meeting. By order of the president. Dated Jan. 22, 1903.

CHAS. R. STEVENSON,
Secretary.

Points and Flushes.

The annual meeting of the American Fox Terrier Club will be held at Madison Square Garden, on Feb. 11, immediately after the fox terriers are judged. A meeting of the executive committee will follow immediately after the club meeting.

Yachting.

Southern Y. C.

NEW ORLEANS, LA., Jan. 18.—*Editor Forest and Stream:* The Southern Y. C., of New Orleans, La., has adopted a new racing measurement rule which may be interesting to yachtsmen in other sections of the country. The formula being 85 per cent. of the square root of the sail area (as measured by the Seawanhaka Y. C. rule) equals the racing rating measurement; or,

$$\sqrt{S\ A} \times 85 = \text{Rating.}$$

The club has used the old Seawanhaka rule for years and it has gone very slow about making a change, preferring to wait and watch results in the North and to profit, if possible, thereby, the state of affairs here permitting this, as its fleet of racers had not been modernized to any great extent. Now that the leading clubs have made their changes in measurement rules none seem to fit the requirements in this part of the yachting world. Any rule requiring displacement calculations or girth measurements, while very well in their way, were considered too complicated, or at least not practical along this coast. As the tendency of the times would seem to show that measurement rules were getting more and more complicated, the latest introduced requiring that a vessel be hauled out to be measured for rating, and that the idea was to penalize a certain form of freak that probably never would have been introduced had it not been created to cheat a measurement rule, in this case the waterline part of the rule, the question arises, Why measure and tax the hull at all?

Forty or fifty years ago the Southern Y. C. used a rule that called for measuring the length on deck only, and the result was that yachts were encouraged that were monstrosities, longer on the waterline than on deck, with "ram" bows and sterns much the same shape, the celebrated "Stingaree" being a well-remembered example. In later days in taxing the waterline another form of freak is encouraged with the "overhangs" in the air and with a different set of reverse curves at the waterline. Why now adopt a rule with some other hull measurements just to penalize this latter style of boat and perhaps, as was the result in both cases mentioned, encourage as bad freaks along some other lines?

When the waterline rule was evolved it was thought to be a perfect one, but in the light of present practices it is clear that it might have been better had l. w. l. never been taxed as it was—that it should not be discouraged at all.

It is clear that we must have a new rule for measurement that does not place a premium on waterline, and a displacement rule is out of the question when we consider the fleet we are dealing with and the conditions under which we race. Therefore it is evident that there is nothing left of the hull to measure that we see can give promise of better things. So we will answer the foregoing question and not measure it at all. It is not even necessary to measure it for classification, and hence matters are more than ever simplified and that bugaboo of whether to measure with crew on board or not is escaped. But account must be taken of the size of some element of a craft for the sake of classification and rating for time allowance, the latter only until all building is up to class limits, as the allowance rule should encourage. As the sails can't be "freaked," "scowed," nor inflicted with overhangs to cheat the system of measurement, they will be used alone for measurement.

The present simple rule for ascertaining the sail area will be used and as before the square root of the area will be taken. The result on the average yacht would be a figure considerably larger than that obtained by getting the racing length by the Seawanhaka method, so 85 per cent. of the square root of the sail area will be taken, which will reduce the figure down to somewhere between the boat's waterline and the racing length as found by the old formula, thereby affording a better indication of the yacht's size in the figure of the rating.

These ideas were advanced by the writer and they met with the approval of the members of the club, the regatta committee taking the initiative and indorsing the rule, and after being duly considered and discussed it was unanimously adopted. There was no intention to place a tax on sail, but that a certain proportion of it should serve as a limit for the various class sizes. To this end it was desired that the time allowance should be in favor of the larger boat and building to class limits would be encouraged by every means. The Herreshoff time allowance tables were considered too complicated, and after much figuring on the boats in the fleet and their past performances and not forgetting those that might be built, an arbitrary limit of five seconds per foot difference per mile of course was suggested by Measurer Holmes Harrison, of the club, and adopted. Later, if found desirable, this figure of 5 seconds can be altered to suit different classes; as, for instance, if it is found that the proportion should be smaller for the larger and larger for the smaller classes, as is indicated in the Herreshoff allowance tables. Without being proven in practice, five seconds seems to be a reasonably good proportion for the classes we have to deal with.

Simplification was the desideratum desired in both the rating rule formula and the time allowance method, and if they prove reasonably adequate matters will be made easier for the regatta committee and the measurer, and owners will be enabled to more readily know the standing of their yachts, one to another.

There is nothing in the measurement rule to put a check on the scow, that not being necessary nor desired, as they are relegated to classes by themselves, where no restriction is placed on design. The scow classes will be encouraged equally with the model classes and trust placed in the survival of the fittest. It is believed that with this arrangement there will be few cabin scows and that the open boats of this style will run, as at present, to small sizes, say under 25 feet measurement, where they give excellent sport.

In connection with the preceding rules quoted it will be interesting to know what are the classes and what comprises the cabin yacht rule of the Southern Y. C., so both are herewith appended:

FROM THE RACING RULES SOUTHERN Y. C.—CLASSIFICATION SEASON OF 1903, BASED ON RACING RATING.

Model Yachts.

Class A—Schooners.
Class B—Cabin sloops 30ft. and over.
Class C—Cabin sloops under 30ft.
Class D—Open sloops.
Class E—Cat boats.
Class F—Motor and steam launches.

Special Classes of Different Types.—Including freaks, scows, skiffs, and other racing machines. The allotment of a yacht to either the Model or Special Classes shall be decided by the Regatta Committee. A Model boat may, however, sail in one of the Special Classes if she so desires.

Class G—Cabin sloops.
Class H.—Open sloops.
Class I—Cat boats.

Crews—There shall be no restriction, except that the helmsman must be an amateur.

Course—To be ten miles; over an equilateral triangle of five miles, twice around.

Definition of a Cabin Yacht—A cabin yacht must be a seaworthy type of cruising or racing yacht, substantially constructed, with ballast on keel or fixed below the floor, if any is carried, with either a flush deck or with cabin trunk on deck. A cabin yacht must not carry shifting ballast.

The only exceptions to the following limitations shall be yachts over 20ft. racing length that have sailed as cabin yachts in a regular Southern Y. C. race prior to April 3, 1902, provided the cabin is the same as before used, and if the sides and front of it are not closed in solidly, she must carry curtains and have same strapped down.

1. The top, sides and ends of cabin trunk must be permanently constructed and closed in with wood, with proper windows or port lights and regulation entrance. Cabins must not be less than 7ft. long on top and have a width of floor space not less than one-fourth the greatest beam of yacht.

2. The cockpit floor shall be above the waterline, with scuppers draining outward. The top of sill of cabin entrance door must be not less than 8in. above the cockpit floor line.

3. The minimum size of cabin interior must be such as will accommodate two berths 6ft. 6in. long by 1ft. 6in. wide, which must be in place. The height of the cabin house in the clear, from the floor line to the under side of cabin top beams, over full area of cabin required, must be not less than 3ft. 6in. for yachts under 30ft. rating, and

not less than 4ft. 6in. for yachts of 30ft. rating and over.

4. The measurements required in these limitations must be made by the official measurer of the club, and they must form part of the regular rating measurement certificate to be filed with all entries.

L. D. SAMPSELL, Secretary S. Y. C.

The Defense of the Canada's Cup.

TORONTO, Jan. 24.—Unless future developments change matters materially, the Royal Canadian Y. C. will have no choice in the selection of a Canada's cup defender. The match for this great international trophy is due to be sailed off Toronto Island August 9, 10 and 11, 1903, although the Rochester Y. C., the challengers, would like an earlier date. When Invader brought back the cup from Chicago in 1901, enthusiasm ran high in Toronto, and half a dozen syndicates were talked of for the building of defenders for the next match, but for some reason or other the only defender now definitely in view is one which is being built for Mr. Norman Macrae, of Toronto. Her construction has not progressed very far as yet, because her frames, which are being furnished by her English designer, have not yet arrived in Toronto. There is talk of a syndicate to build a second defender, and in the interests of yachting it is to be hoped that there will at least be enough defenders for the holding of trial races. As the contestants are 40-footers under the new regulations they are an absolutely new class, and while there are plenty of boats of approximately the same size, there are none built to conform to the latest rules. For instance, the original Canada and Merrythought, Vreda, Aggie and Zelma are all of about the same size as the new boats, and these yachts and the larger flyer, Gloria, may be utilized in races to tune up the Toronto defender; but it would be much more satisfactory for the Royal Canadian Y. C. to be able to choose their defender from a number of new 40-footers. If no other defender is built the craft with which Mr. Macrae has come forward will have to be utilized, as she will be the only yacht in the R. C. Y. C. fleet which will conform exactly to the requirements of the new rules.

The Macrae defender for the Canada's cup promises to be a fine ship, whether she successfully defends the cup or not. She is no racing machine. Her owner wanted a smart pleasure craft, somewhat larger than his present yacht, the Watson cutter, Vivia, and was easily persuaded, since the cup needed a defender, to give an order for a yacht of the competing class—the new 40-footers. Since so much depended upon the new boat, the best of designers and builders known to Toronto men were chosen—A. E. Payne, of Southampton, England, for the lines, and Capt. James Andrews, of Oakville, for the construction. A. E. Payne designed the fastest all-around sailing craft Toronto has ever seen—Gloria, the famous winner of the Coupe de France, and Beaver, the defender of the Canada's cup in 1899. Beaver lost then, but she did not get her weather. Capt. Andrews, on the other hand, has built every Canadian craft that has ever had a look-in, as far as the Canada's cup is concerned.

Payne has turned out an able looking craft in the Macrae defender. She is roomy but not bulky, according to her lines. Her profile greatly resembles that of Beaver. The curve of her stem is a little less abrupt, and her counter is carried out a little further aft; her midships section shows a somewhat easier bilge than Beaver's, and more body; in short, there is less fin and more boat. This is probably the outcome of the new restrictions, and whatever the effect on speed, more headroom in cup challengers and cup defenders is to be encouraged.

The new craft will be within a few inches of 60ft. over all—probably 59ft. 6in. will be her length from stemhead to taffrail, and on the waterline she will just come within the limit of the 40ft. Under the new regulations the yachts are classified according to length on the waterline, hence the new 40-footers will be pretty big yachts for fresh water craft. The new boat will be of 13ft. beam on deck, and a little less at the waterline. Her draft is quite moderate for her other proportions, being just 8ft.

These dimensions are very close approximates to the actual ones, the publication of the latter being held in abeyance for a little while yet, a matter of fairness to the owner of the defender.

It is interesting to compare the new craft with the Watson-designed cutter Vivia, with which the Messrs. Macrae have been associated for years. Vivia has long been known, under the old measurements, as a "40-footer," but the new craft is 8ft. longer on the waterline and 10ft. longer on deck, and has 18in. more beam. Her section shows more curve than Vivia's, and she draws 15in. less. Her sail area is greater by a thousand square feet, so that the new regulations appear to have produced a bigger boat with more driving power and less draft, and the "long legged" craft are becoming less and less desirable on Lake Ontario. The famous Gloria, for instance, was brought to Toronto for Mr. H. C. McLeod two years after her Mediterranean victory; and while a magnificent craft in many respects, she has the somewhat doubtful honor of having grounded in every harbor on Lake Ontario that she has entered—and she only draws ten feet. Whether statistics bear it out or not, every old sailorman will tell you that there is less water in Lake Ontario harbors than there used to be, in spite of all the dredging.

The coming contest will witness a return to the club topsail regime that prevailed when Canada first won the cup. We have had jib-and-mainsail defenders and challengers ever since, but the Macrae craft will have a full cutter rig, and it is expected that the other contestants will follow suit. Twenty-six hundred square feet of canvas is a lot to handle in two pieces, so the jib-and-mainsail will probably be replaced by the cutter rig in all the 40-footers. The Macrae boat has a shipshape sail plan, her horn being of generous length and not stubbed off in modern fashion. Her biggest clubtopsail is not very large, and the mainsail will furnish most of the driving power. Her mainmast is 33ft. from deck to hounds, and her topmast is 20ft., so that she has pretty good hoist for, 40ft. of waterline. The mainboom is long, but not abnormally so—47ft.—and the gaff is 28ft. None of her three headsails are abnormal in size. The sail plan is pleasing, and, like everything else in the boat, has nothing freakish about it. Its total area is a few feet under the 2,600 limit.

Commodore Æmilius Jarvis, of the Royal Canadian Y. C., he who first brought home the Canada's cup, and who has sailed for it in every contest, will probably be at the helm in the latest defender. His health has been giving his friends some anxiety, but a winter in the bracing atmosphere of Muskoka is working beneficent wonders with him and his return to yachting activity is looked forward to. Of course there are many other good sailors in the Royal Canadian Y. C., and such skippers as J. Wilton Morse or H. C. McLeod, of Toronto, or Capt. J. E. Fearnside, of Hamilton, would be able to handle the defender well if Mr. Geo. E. Macrae did not care to take the responsibility or could not afford the time. Mr. G. E. Macrae is a well-known racing sailor, and they relate of him how, in the last Canada's cup races, he saved Cadillac from losing her mainboom when she jibed all standing at the second turn. Mr. Macrae was the Canadian scrutineer, but the sailor outweighed the patriot, according to the story, and he threw the turns of the lee backstay runner off just quick enough to save the American from losing her mainboom or possibly being dismasted. Mr. Norman Macrae, who is the sole owner of the Macrae defender, is less of a racing sailor, but has been associated with his brother in the cutter Vivia, and is well known to Lake Ontario yachtsmen.

CHARLES H. SNIDER.

Boston Letter.

BOSTON, Jan. 24.—The annual meeting of the Boston Y. C., to be held at Parker's on Wednesday evening next, will be a most important one, not only to the Boston Club, but also to the Hull-Massachusetts Y. C., and all yachtsmen of the East as well. At this meeting action will be taken upon the question of whether or not the Boston Y. C. and the Hull-Massachusetts Y. C. may be amalgamated. This subject has been under consideration by prominent members of both clubs throughout the past year, but the time for decisive action has not been considered ripe until now. The matter came up before the Hull-Massachusetts Y. C. at its annual meeting, but was laid over, and in regard to that meeting I must correct an error made in a recent letter on the election of officers of that club. It seems that the matter of election of officers was laid over, on account of the possibilities of amalgamation, although the officers had been nominated as announced.

There is no doubt that the amalgamation of these two clubs will be of great benefit. The Boston Y. C. is the oldest in New England, and has among its membership the names of yachtsmen who were first identified with the development of the sport in the East. The Hull-Massachusetts Y. C. is a very active one, its activity having been more marked within the past few years. If they join forces the new club will start with a membership of over 700, and will have a good equipment in the way of stations. There will be five of these in all, located at Boston, City Point, Dorchester, Hull and Marblehead. Having these stations under the management of one club will be of immense advantage to cruising yachtsmen. There is no doubt that the membership in the new club would increase rapidly from the time of amalgamation, and, with such a large prospective membership, it would be a very easy matter to establish stations at different points along the coast, as the demands of the cruising yachtsmen might require. Thus it would become one of the strongest yachting organizations in the country.

The nominating committee of the Boston Y. C. has presented the following names for election at the annual meeting, although it is likely that the nominations will be laid over, as in the Hull-Massachusetts Y. C., until action upon amalgamation has been determined: Commodore, B. P. Cheney; Vice Commodore, Walter Burgess; Rear Commodore, Elmer F. Smith; Secretary, A. C. Fernald; Treasurer, William H. Bangs; Measurers, W. Starling Burgess and Jefferson Borden; Trustees, Commodore (ex-officio) and W. C. Lewis; Regatta Committee, Walter Burgess, Bertram D. Amsden, Charles A. French, Charles G. Browne and Sumner H. Foster; Membership Committee, Commodore and Secretary (ex-officio), Walter C. Lewis, Edmund H. Tarbell, William D. Turner, Charles E. Lauriat, Jr., and Everett Paine; House Committee, T. Wolcott Powers, William D. Turner, Willard B. Jackson, Herbert W. Wesson and Charles G. Browne.

Hollis Burgess has sold the 21-footer Recruit, owned by Mr. F. B. Rice, of Quincy, to Wagener Bros., of Penn Yan, N. Y.; 22ft. waterline yawl Edith, owned by Mr. F. H. Green, of Wollaston, to Mr. H. W. Hand, of New York; 21ft. raceabout Shawsheen, owned by Mr. George Atkinson, Jr., to Vice Commodore Walter Burgess, of the Boston Y. C.; 18ft. knockabout Shrimp, owned by Vice Commodore Burgess, to George Atkinson, Jr., and 25-footer Kalama III., owned by Mr. David Rice, to Mr. H. N. Richards, of Boston.

Small Bros. have an order for a 21-footer for the defense of the Lipton Cup from a syndicate of members of the Columbia Y. C. of Chicago. They have also an order for a cruising 21ft. waterline yawl for F. W. King, of Olneyville, R. I. They have sold a 17ft. waterline knockabout to Mr. F. H. Cheetham, of the South Boston Y. C., and the 26ft. Cape cat. Alma, owned by Mr. S. H. Eldridge, to Mr. R. J. Pond.

Mr. E. A. Boardman has gone ahead with the plans of a Seawanhaka challenger, and is now quite sure that the boat will be built. He will own her with another Boston yachtsman, whose name has been withheld. Mr. Boardman has an order for a 22-footer. He has sold his 18ft knockabout Sioux to Mr. P. W. Clement, who will sail her on Lake Champlain.

The Winthrop Y. C. has elected the following officers: Commodore, William D. Allen; Vice Commodore, John J. Nicholson; Secretary, Charles G. Bird; Treasurer, Edgar H. Whitney; Measurer, Albert S. Richards; Directors, James R. Hodder, William I. Kelley, Joseph L. Rankin and Charles A. Rouillard; House Committee, Albert S. Richards, Charles G. Bird and William E. Watkins; Regatta Committee, Frank H. Byrne, Charles O. Whitney, Charles W. Gray, John P. Feehan and Charles F. Chipman; Membership Committee, Albert Partridge, Joseph J. Devereux, Daniel J. Langlands, Frank H. Byrne, Charles H. Kelley, Frank H. Beckler, Albert M. Crowe, Frank H. Mason and Charles H. Sawyer.

At the Marblehead Yacht Yard, the 41ft. auxiliary yawl designed by W. H. Stearns, is in frame. Work has been started on a 25ft. speed launch. R. K. Longfellow's cutter, Wyvern, is being altered. The cruising 25-footer, which has been designed by Crowninshield for Levi C. Wade, will be built at this yard.

Work has slowed up somewhat on the Seawanhaka cup challenger that is being built from designs by Burgess and Packard, at Manchester. There is no great hurry at present for the boat, and there is no doubt that she will be ready when wanted. The plans for the second boat for the Higginson-Boardman syndicate have not yet been finished, and it may be some time now before she is started. These two and the boat designed by E. A. Boardman are the only candidates for challenger that have been heard from up to date.

JOHN B. KILLEEN.

Thames Houseboats.

BY C. E. THOMAS.

IN the event of no earlier writer having worked off the ancient wheeze, I may perhaps be pardoned the suggestion that the original houseboater was inspired to build his craft by the description in Holy Writ of the Ark, the name, by the way, of one of the earliest of English craft of this character, and still used. Certain it is that the skipper of this most ancient of houseboats could not have been an American, or he would have rigged her up with power of some description. He is more likely to have been an Englishman, for the present day English houseboat is still practically a barge with a few rooms built thereon, and there has been no development in the direction of fitting with a motor or sails. In fact, the most notable exception, a species of combined houseboat and launch, once owned by Colonel Fitz-George, son of the Duke of Cambridge, was quite an early craft.

The reason for this apparent slackness in the country which introduced the pleasure houseboat is that on the Thames, the houseboat river *par excellence*, the conditions of life and traffic regulations only admit the possibility of what is practically a stationary floating home, and not one to be moved every few days or so.

Different conditions prevail, say, on the Broads, the fine waterways of Norfolk and Suffolk, where the pleasure wherry, a development of the ordinary craft of commerce on these waters, with its one huge sail, is, perhaps, more in keeping with the American idea of a houseboat. But the wherry does not represent the English idea, for which one must visit the "silvery Thames" in the height of the summer season, notably during Henley Regatta week, when numerous fine craft form an attractive background to this grand aquatic picture.

The early history of the Thames houseboat is not very easy to trace, but there is little doubt that the inception of the idea came from Oxford. At any rate the first of these craft seen there was of very remote date. Originally it was a barge, used, before the days of railways, as a "fly-boat" for carrying purposes between London and Oxford, when the river was indeed the Thames Highway, the barge, with its team of eight horses, making a pretty quick journey. When this craft had served its time of usefulness for traffic purposes, a house was built on it, and it was devoted to boat-letting purposes by Messrs. Davis and King, the predecessors of Messrs. Salter Bros., the promoters of the Oxford to Kingston launch service, which is so popular with American visitors to this side. Mr. Davis and Mr. King lived in alternate years on board their roomy craft (she is 107 feet long and 17 feet 9 inches broad, and the largest in Oxford, for it is still in existence). The barge was an old boat when taken over by Messrs. Salter in 1858, but remains in use for boat-letting purposes, and is known as "Salter's green barge," forming a landmark in boat race practice. It has been in its present position for between 60 and 70 years; for a few years no one has lived on board, but for 40 out of the last 44 years Messrs. Salter's manager has resided on her.

Other craft responsible for the introduction of houseboats, too, were the stately old city barges, belonging to the various London companies. Many of these, on their retirement, were taken to Oxford, the first probably between 1850 and 1860, and were used by College boat clubs as quarters; they have all disappeared now, but the Oriel College barge of to-day was designed on the lines of one of the old city barges, and most of the modern craft have retained much of their ancient appearance.

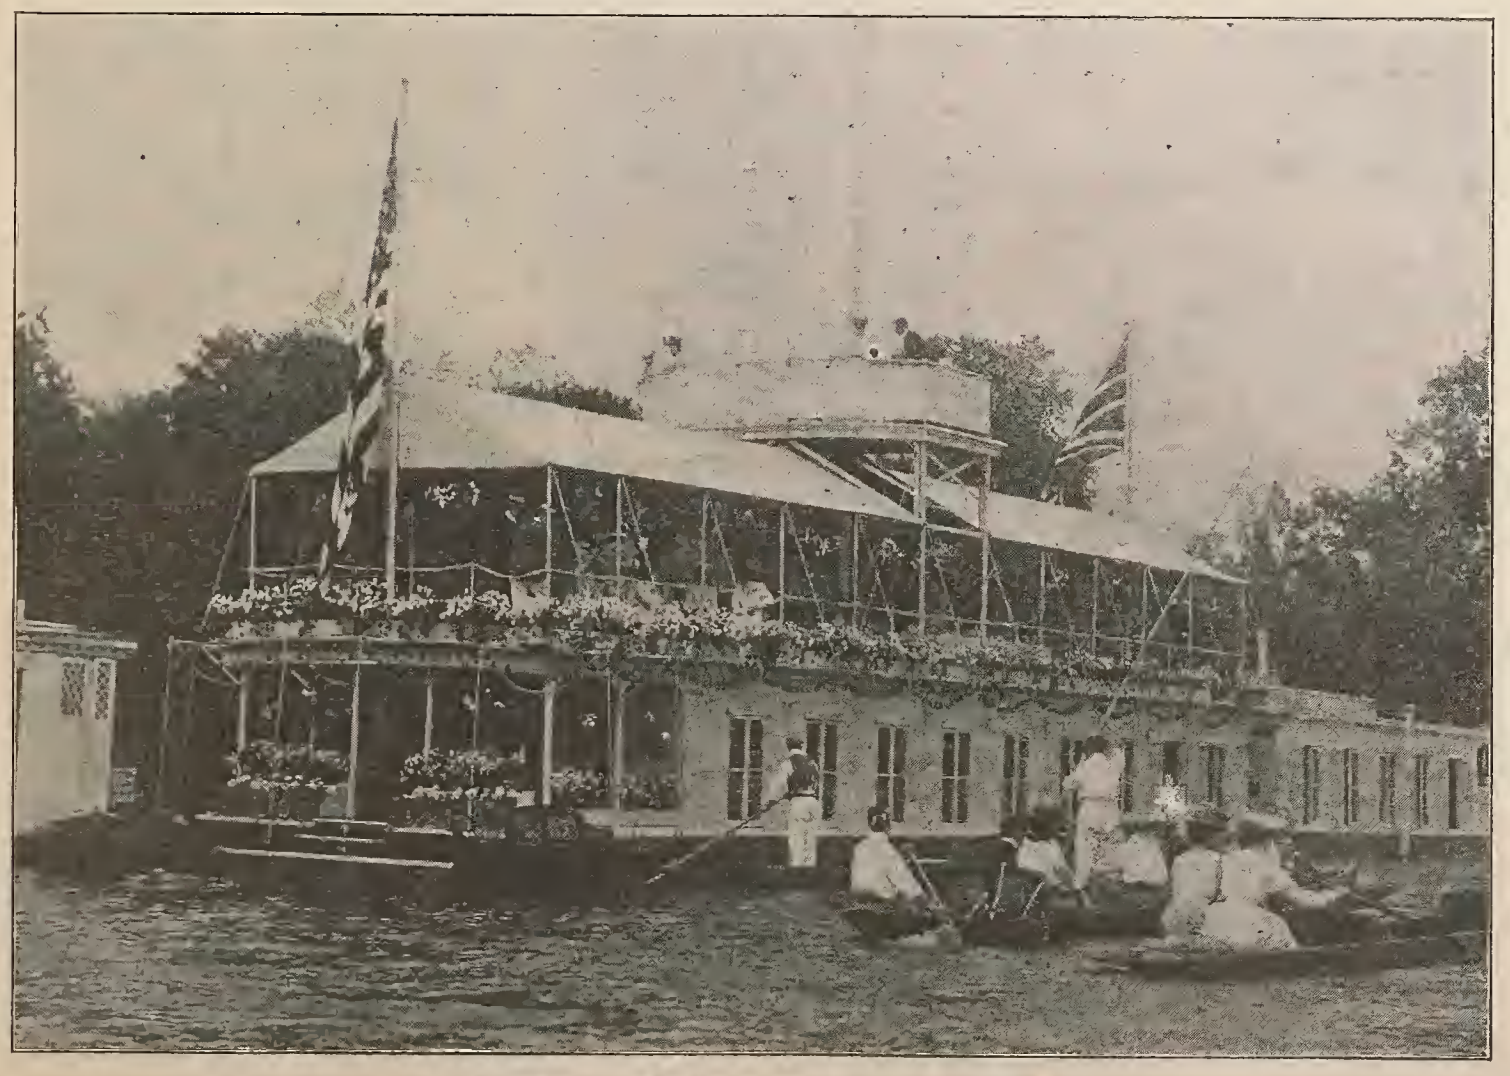
Many well known architects and artists have designed these graceful and handsome college barges, among them Mr. J. G. Jackson, R. A.; Mr. J. O. Scott, Mr. A. Waterhouse, R. A., and Mr. H. Wilkinson Moore. The last named, an Oxford gentleman, has designed several of the more modern barges, most of which have been built by Messrs. Salter, and by the courtesy of the designer and builder I am able to give the design and photographs of the Keble College barge, built in 1899, and one of the handsomest of the Oxford College boats. The dimensions, etc., are given in the plan, and the photographs show the graceful and old-world appearance of one of the most striking craft on the long line of college barges at Oxford.

The last of the city barges to be used for pleasure purposes was the Maria Wood, which ceased her excursions only a few years ago. She was towed by horses to Hampton Court, and was always filled with frock-coated, white waistcoated and tall-hatted magnates, most inappropriately attired for a river trip, who, with their woman-kind, threaded the mazy waltz on a hot summer's afternoon, to the amusement of what Mr. Rudyard Kipling would probably describe as the "flanneled fools" in sculling boats. Her departure seems to remove one of the last links with the old-time life on the Thames, and many rivermen have heard with regret that the ancient craft is now doing duty as a floating dock.

Doubtless the early pleasure houseboater seized on a ready-made hull on which to construct his floating residence, and as the Thames Conservancy regulations as to places for mooring, etc., were not so numerous in bygone

OXFORD COLLEGE BARGE.

THAMES HOUSE-BOAT KELPIE. (See plan.)



THAMES HOUSE-BOAT IBIS, AND TENDER.

days, he built a small craft which could be moved without much difficulty, and many of these little boats are still to be seen. The accommodation was limited, but Bohemianism and the concomitant delights of roughing it were the features of river life before Fashion stamped the Thames as her own, and much quiet enjoyment was obtained from these small boats.

But Fashion alters all things, and it has changed the Thames. The old-fashioned hostelry has become the modern hotel, the "neat-handed Phyllis" has made way for the imported dress-suited waiter, and mine host's charges have increased accordingly. Old World villages are being enveloped in streets of modern villas, while ineligible riparian land is being built over, providing the conditions wittily described by the late Edmund Yates, the river being at the bottom of your lawn in the summer, and your lawn at the bottom of the river in the winter. Launches and small craft of all kinds have increased amazingly to meet Society's demands, and so the houseboats have increased in numbers and to their present stately proportions.

[TO BE CONCLUDED NEXT WEEK.]

YACHTING NEWS NOTES.

The Wilson Yacht Building Company, Ferry Bar, Baltimore, are to build from their own designs for Mr. George C. Thomas, of Philadelphia, an auxiliary cruising schooner. She will be 110ft. over all, 90ft. waterline, 24ft. breadth and 6ft. 6in. draft.

Messrs. Herreshoff and Wells are working up plans of a speed launch for Mr. C. Oliver Iselin. The boat will be 37ft. over all, 32ft. waterline, 6ft. 2in. breadth, and 2ft. draft. The power will be furnished by a Howard motor, and it is expected that the boat will develop a speed of twelve or thirteen miles.

The Whitestone Hollow Spar and Boat Company will begin work at their new plant at Whitestone, L. I., with a couple of orders for high speed launches. Both the boats will be 70ft. in length. One is for Mr. George R. Bidwell, of New York, and the other for Mr. J. Charles Davis. The boats will be narrow, their greatest breadth being only 8ft. The power is furnished by a new make of kerosene motor. The entire machinery will weigh only 1,800 pounds, but the engines will develop great power. The builders guarantee a speed of 25 miles an hour, or a continuous run of 118 miles in five hours. According to the contract, the boats must have made their speed trials before May 15, and be ready for delivery to their owners on that day.

The Marine Construction and Dry Dock Company, Mariner's Harbor, S. I., are building a cruising launch for Mr. Alexander Stein from designs made by Messrs. Colven & Bickman. She is 61ft. over all, 55ft. waterline, 9ft. 6in. breadth and 3ft. 3in. draft. The boat has considerable cabin accommodation, and she will be driven by a 45 horse-power engine.

The two big auxiliaries building by the Townsend & Downey Shipbuilding Company, Shooters' Island S,. I., are under way. Both are 120ft. on the waterline. One is for Mr. J. M. Masury and was designed by Messrs. A. Cary Smith and Barbey, while the other is for Mr. Wilson Marshall and was designed by Messrs. Gardner & Cox.

Sir Thomas Lipton has offered another perpetual challenge cup, all the boats belonging to Pacific Coast clubs being eligible to participate. The races are to be sailed at San Diego, Cal., under the auspices of the Corinthian Y. C.

The annual meeting of the Marine and Field Club was held at the club house on Gravesend Bay, Tuesday evening, January 13, and the following officers were elected: President, Edmund H. Driggs; Vice-President, Edward C. Platt; Secretary, Charles Martin Camp; Treasurer, J. Edward Way. The directors are Daniel E. Woodhull, class of 1904; John Mason Knox, Wadsworth Baylor, Willard F. Spalding, Palmer H. Jadwin and Alexander Chandler.

The Capital Y. C., of Washington, has elected the following officers: Com., George Bright; Vice-Com., C. C. Wilkison; Record.-Sec'y, John E. Taylor; Cor.-Sec'y, E. P. Nussbaum; Treas., D. H. Fowler; Meas., W. W. Grier; Assist.-Meas., O. A. Danzenbaker; Governors, W. A. Frankland, L. H. Dyer and G. D. Fischer.

The Brown University Y. C. have elected the following officers: Com., Colgate Hoyt, Jr.; Vice-Com., R. G. Ostby; Sec.-Treas., C. S. Allen.

The following have been nominted to serve the Atlantic Y. C. during the coming year. The annual meeting will be held on February 9, when the ticket will be voted on: Com., Robert E. Tod, schooner Thistle; Vice-Com., Edwin Gould, steamer Alleen; Rear-Com., J. H. Flagler, auxiliary brigantine Allita; Sec'y, Louis F. Jackson; Treas., Charles T. Pierce; Meas., George Hill. Regatta Committee: Henry J. Gielow, Charles E. Schuyler, Frederick Vilmar. Membership Committee: William E. Sperling, George D .Provost, T. Alfred Vernon. Library Committee: S. L. Blood, Walter H. Nelson, Franklin D. L. Prentiss. Entertainment Committee: Edwin Hollis Low, Clarence H. Eagle, William A. Barstow. Trustees: J. Rogers Maxwell, Frederick T. Adams, Alfred W. Booth, J. Fred Ackerman, Spencer Swain, Robert P. Doremus. Nominating Committee—Spencer Swain, Benjamin M. Whitlock, Henry J. Robert, Charles J. McDermott, S. Edward Vernon, Walter Nelson.

The trustees of the New Rochelle Y. C. have made the following nominations for officers and committees. The annual meeting will be held on February 7, at the club house at New Rochelle: Com., Henry Doscher; Vice-

THAMES HOUSE-BOAT MAVIS.

OUTBOARD PROFILE AND PLAN OF THAMES HOUSE-BOAT KELPIE, SHOWING CENTER SALOON ARRANGEMENT.

Com., E. R. Dick; Rear-Com., J. P. Donovan; Sec'y, W. E. Moore; Treas., John A. Van Zelm; Meas., F. R. Farrington. Members of the Board of Trustees: W. A. Stadelman, C. P. Pierson and W. N. Bavier. Members of the Regatta Committee: O. H. Chellborg, J. D. Sparkman, L. D. Huntington, Jr., D. W. Thomas and Stanley M. Seaman. Members of the Law Committee: John F. Lambden and F. H. Seacord.

The Moriches Y. C. held a meeting recently and adopted the changes in the rules adopted by a conference of the Associated Clubs of the South Side of Long Island, and suggested to the different organizations; also passed favorably on the schedule of dates agreed upon by the conference and added two innovations in the way of regattas in these waters, namely a "Novice Race," open to catboats owned or chartered in East and Center Moriches (to be sailed by an amateur, not necessarily a club member) that has not won a prize in a regular club regatta. All the crack boats being debarred, this race is given to encourage a race between boats that usually have little chance in the regular club races. Boats entering this regatta must be under 21ft. racing length. Another new proposition for 1903 season is an "Open Ladies' Race," open to boats owned or chartered anywhere on the south side of Long Island; helmswoman and crew to be ladies, one man allowed on the sheet rope. This is only man to be allowed aboard. This race is open to catboats under 21ft. racing length. Prizes of silver have been donated for these races by Commodore Dr. Wm. Carr; Secretary Harry Growtage and Governors John McAleenan and W. B. Growtage. It is thought that these races will add

OUTBOARD PROFILE AND PLAN OF A TYPICAL THAMES HOUSE-BOAT, SHOWING FORWARD SALOON ARRANGEMENT.

interest to the yachting in these waters and help a great deal to promote the sport. The principal change in the rules is that which governs the racing length or change to the measurement rule, which adds one quarter the overhang forward and aft to the waterline length. The schedule as it now stands will be as follows:

Saturday, July 11—Regular club regatta.
Saturday, August 8—Novice race.
Saturday, August 15—Special members' race.
Wednesday, August 19—Ladies' regatta.
Wednesday, August 26—McAleenan cup race.
Monday (Labor Day), Sept. 7—Annual open regatta.

* * *

At the annual meeting of the Buffalo Y. C. the following officers were elected:

H. N. Vedder, Commodore; G. W. Maytham, Vice Commodore; N. O. Tiffany, Secretary and Treasurer; F. D. Wood, Measurer; Dr. E. P. Hussey, Fleet Surgeon; W. F. White, G. D. Hayes, S. C. Ryan and L. F. Kendall, Directors; Walter Hayes and R. A. Henssler, Regatta Committee.

Canoeing.

CANOEING NEWS NOTES.

To the Members of the American Canoe Association:

Mr. H. Lansing Quick, of Yonkers, N. Y., is Acting Secretary-Treasurer until further notice, in the place of Mr. Louis Simpson, deceased.

American Canoe Association.

YONKERS, N. Y., Jan. 23.—*Editor Forest and Stream:* As you already know, Mr. Louis Simpson, Secretary-Treasurer of the American Canoe Association, died on December 11, 1902; I am taking charge of Secretary-Treasurer affairs pending the election of his successor.

In looking over the correspondence of the office, I fail to find any record of his notifying you of the action of the executive committee at the November meeting, in which the FOREST AND STREAM was named as an official organ of the Association, and trust that such action will be agreeable to you.

I will notify the vice-commodore and pursers of each division to send to you such canoeing notices and news items as they may get during the year.

H. LANSING QUICK,
Acting Secretary-Treasurer.

Canoeing at the Sportsmen's Show.

An event of interest to all canoeists will be the canoe tilting matches to be held on the artificial lake at the Sportsmen's Show in Madison Square Garden, New York City, February 21 to March 7, inclusive.

The prize list is a most liberal one and consists of:

Two Abercrombie & Fitch $40 paddling canoes and four gold medals donated by the Sportsmen's Association.

Two pneumatic canoe cushions donated by the Pneumatic Mattress and Cushion Company.

Two brass canoe lights donated by C. B. Durkee & Co.

One double and two single blade paddles donated by New York Boat and Oar Company.

Two aluminum folding lanterns with leather cases donated by C. H. Stonebridge.

One Bristol steel rod with agate and German silver trimmings donated by Horton Manufacturing Company.

One safety ax No. 1, one canoe knife No. 2, one Handy Compass No. 2 donated by Marble Safety Ax Company.

Aside from the sport, which can be practiced under ideal conditions at the garden, the prizes, which are particularly adapted to canoeists' needs will make this series of contests one long to be remembered by the canoeing fraternity.

Applications for entry blanks, rules of the contests, etc., should be mailed to E. T. Keyser, P. O. Box 654, New York City.

Rifle Range and Gallery.

Manhattan Rifle and Revolver Association.

NEW YORK, Jan. 11.—The Manhattan Rifle and Revolver Association, of this city, has recently obtained new quarters, and these have been opened within a few weeks to the members. For a long time the Association's headquarters and range were on Lenox avenue, near 127th street, but changes in the building and the increase in membership made removal to larger quarters imperative. A large basement at 2628 Broadway, just below West 100th street, was leased, and this has been fitted up for a club room and range. Although the new quarters are not entirely finished to the satisfaction of the club, they are in such shape that shooting is carried on every Thursday night, which is the regular weekly shooting night, and judging from the increased attendance at the few shoots that have been held in the new range, the club is in a fair way to become one of, if not the largest, organizations of its kind in Manhattan.

The arrangement of the range is as follows: On entering the basement from Broadway, one finds himself in a large room, at the opposite end of which are the revolver and pistol firing stands, eight in number, while on either hand, by ascending a couple of steps to a closed platform, one finds two rifle ranges, each separated from the other by a narrow partition. By this arrangement the four rifle ranges are raised above the revolver ranges, and separated from them by partitions and walls. Not only is the space for shooters enlarged, within the limits of the basement, but the full length of the basement is obtained for rifle shooting, making these ranges 75 feet in length, while those for revolver practice are the regulation length of 20 yards. Thus the riflemen shoot over the heads of the devotees to revolver shooting, and the 5 yards or more of space saved by this means is given up to tables and chairs for the convenience of members while they are not shooting, and for the comfort of visitors.

Each shooting stand for the revolver men is provided with a door some 7 feet high by 2 in width; a shelf for arms and ammunition, a towel, and a large wheel with a handle, which is connected with and controls the "trolley" carrying the paper target to and from the bulkheads in the rear of the basement. It is hardly necessary to explain the working of this "trolley" system of handling targets for the benefit of shooters in general, but for those who have not shot in ranges where this system is used, it should be said that each range is provided with a set of wires, extending overhead from shooting stand to bulkhead, and on these wires an iron clamp or hanger is suspended and so arranged that through the wheel, pulleys and cords the hanger bearing the target may be sent down to the bulkhead to be shot at, and returned when a score is finished, all by a few turns of the controlling wheel, which is made fast to the partition beside the shooter. As these "trolleys" alone handle the targets, and there is seldom need of any person entering the range itself, the danger of accidents is to very large extent eliminated. Another precaution is taken in the strict rule which forbids the loading of any weapon except in the actual preparation for shooting, and only then when the arm is pointed toward the target.

Entering one of the four rifle ranges, one finds it boxed in completely to a point beyond the revolver shooting stands, so that these, too, are safety ranges. Each one has its bicycle wheel and handle, and, as the targets must be propelled a distance of 25 yards instead of 20, as in the revolver ranges, some of the wheels are geared up and act as multiplying reels do in taking up line for the fisherman. In this manner the energy of the rifleman is saved for shooting.

The basement has good stone walls, but every target is provided with a large steel plate, which stops and flattens the bullets, so that they drop harmlessly to the floor. Every plate is made fast to its backing at a slight angle from the vertical, so that when a bullet glances with any force, its direction must be downward into bins placed to catch it. Only one of the revolver ranges is less than the regulation length of 20 yards, and this one is for the use of beginners, or those who wish to try small pocket revolvers with plain sights, which would hardly do good work at 60 feet; and for testing squib charges in the revolvers. The targets are lighted with gas jets, but the club's lighting arrangements are not as yet complete, as in a short time the best lights and reflectors known will be installed. Only nitro powder ammunition is used by the revolver shooters as a rule, and even when a number of men are shooting large caliber revolvers, the ranges are never unpleasantly filled with smoke. Steam heat renders the place comfortable in winter, while in warm weather—for the members shoot on their indoor ranges throughout the summer—the large doors at the entrance may be left open.

The initiation fee and the dues of this club are very reasonable, while the hand of welcome is held out to all persons who are fond of practice with either the .22-caliber rifle, the revolver or the pistol. The club is young, and yet it has made some satisfactory records in matches with other clubs. It also holds shoots every Saturday afternoon in Armbruster's Park at Greenville, N. J., at 50 yards with revolvers and pistols, and at 200 yards with rifles.

Cincinnati Rifle Association.

CINCINNATI, O.—At the regular meeting of this Association on Jan. 18 the following scores were made. Mr. Hasenzahl was out again after a six weeks' illness, and shot in his usual good form. Mr. Payne was high man with 90. Conditions, 200yds., offhand, Standard target:

Payne	90 88 84 84 84	Gindele	85 83 82 80 78
Hasenzahl	89 89 89 86 83	Hoffman	82 81 77 73 73
Nestler	88 85 83 83 82	Trounstine	81 79 74 73 68
Lux	88 81 80 78 74	Hofer	78 77 77 76 74
Roberts	87 85 83 84 83	Jonscher	78 74 72 69 69
Odell	86 79 78 74 74	Freitag	74 73 71 70 67
Strickmeier	85 84 83 82 79	Drube	73 65 62 .. ..

Honor target: Payne 25, Hasenzahl 30, Nestler 27, Lux 25, Roberts 25, Odell 23, Gindele 29, Hoffman 19, Trounstine 26, Hofer 16, Jonscher 18, Freitag 21, Drube 20.

Trapshooting.

Fixtures.

If you want your shoot to be announced here send a notice like the following:

Feb. 3-4.—Savannah, Ga.—Forest City Gun Club's invitation shoot at live birds.

Feb. 10-14.—Detroit, Mich.—Open tournament under the auspices of the Tri-State Automobile and Sporting Goods Association. Targets and live birds. John Parker, manager; S. G. Lewis, Secretary-Treasurer.

Feb. 12.—Rutherford, N. J.—All-day target shoot of the Boiling Springs Gun Club on Lincoln's Birthday. C. B. Axford, Sec'y.

Feb. 18.—Allentown, Pa.—Two days' target tournament at Duck Farm Hotel. Alfred Griesemer, Prop.

Feb. 20-21.—New Orleans, La.—First tournament of the Mississippi Valley Trapshooters' and Game Protective Association; Carnival Week, under auspices of the City Park Gun Club; $500 added. Percy S. Benedict, Sec'y.

Feb. 23.—Ossining, N. Y.—Ossining Gun Club's Washington's Birthday shoot. C. G. Blandford, Capt.

Feb. 23.—Lynn, Mass.—Holiday shoot of the Birch Brook Gun Club.

April 7-10.—St. Joseph, Mo.—Tournament of the Missouri State Game and Fish Protective Association. F. B. Cunningham, Secretary-Manager.

April 14-17.—Kansas City, Mo.—The Interstate Association's fourth Grand American Handicap at targets, at Blue River Shooting Park. One thousand dollars added to the purses. Elmer E. Shaner, Secretary-Manager, 111 Fourth avenue, Pittsburg, Pa.

April 20.—Springfield, Mass.—Spring tournament of the Springfield Gun Club. C. L. Kites, Sec'y.

May —.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament, under the auspices of the Lincoln Gun Club. T. E. Mockett, Sec'y.

May 6-7.—Lafayette, Ind.—Lafayette Gun Club's tournament.

May 9-10.—Chicago, Ill.—Spring tournament of the Grand Crescent Gun Club.

May 12-15.—Interstate Park, L. I.—The Interstate Association's fifth Grand American Handicap at targets; $1,000 added to the purses. Elmer E. Shaner, Secretary-Manager, 111 Fourth avenue, Pittsburg, Pa.

May 19-22.—Wissinoming, Philadelphia.—Thirteenth annual tournament of the Pennsylvania State Sportsmen's Association, under auspices of the Florists' Gun Club of Philadelphia. V. V. Dorp, Sec'y.

May 21-22.—Kenton, O.—Shoot of the Kenton Gun Club. A. G. Merriman, Sec'y-Treas.

May 27-29.—Fort Wayne, Ind.—Three-day live-bird and target tournament of the Corner Rod and Gun Club. John V. Linker, Sec'y.

May 27-29.—Williamsport, Pa.—The Interstate Association's tournament, under the auspices of the West Branch Rod and Gun Club. H. A. Dimick, Sec'y.

May 29-30.—Union City, Ind.—Spring tournament of the Parent Grove Gun Club.

May 30.—Detroit, Mich.—Winchester Gun Club's Decoration Day third annual tournament; all day. Rose system and average prizes. Sliding handicap, 16, 18 and 20yds., D. A. Hitchcock, Sec'y-Treas.

June —.—Schenectady, N. Y.—New York State shoot, under auspices of the Schenectady Gun Club.

June 3-4.—Boston, Mass.—The Interstate Association's tournament, under the auspices of the Boston Shooting Association. O. R. Dickey, Sec'y.

June 3-5.—Parkersburg, W. Va.—Sixth annual tournament of the West Virginia Sportsmen's Association, under auspices of Ohio Valley Shooting Association.

June 4-5.—Greenville, O.—Spring tournament of the Greenville Gun Club.

June 9-11.—Sioux City, Ia.—Ninth annual amateur tournament of the Soo Gun Club. B. F. Duncan, Sec'y.

June 9-11.—Cincinnati, O.—Seventeenth annual target tournament of the Ohio Trapshooters' League. Chas. T. Dreihs, Sec'y.

June 16-19.—Warm Springs, Ga.—The Interstate Association's tournament, under the auspices of the Meriwether Gun Club. Chas. L. Davis, Sec'y.

June 16-18.—New London, Ia.—Seventh annual midsummer target tournament of the New London Gun Club.

July 30-Aug. 1.—Viroqua, Wis.—The Interstate Association's tournament, under the auspices of the Viroqua Rod and Gun Club. Dr. R. W. Baldwin, Sec'y.

Aug. 19-20.—Ottawa, Ill.—The Interstate Association's tournament, under the auspices of the Rainmakers' Gun Club. Paul A. Selembier, Sec'y.

DRIVERS AND TWISTERS.

The programme of the first grand sportsman's handicap and shooting tournament at live birds and targets, to be held at Detroit, Mich., Feb. 10 to 14, under the auspices of the Tri-State Automobile and Sporting Goods Association, is now ready for distribution. Competition is open to the world. Added money $500 in cash. The managers are Messrs. John Parker, J. L. Head and A. D. Caldwell, all thoroughly experienced and competent gentlemen. The programme is as follows: First day, targets, eight events; six at 20, $10 added; two at 25 targets, $15 added, entrance $2 and $2.50. Second day, eight events at 20 targets, entrance $2; $10 added. On each of these days shooting commences at 9:30, and $10 cash is added for best average each day. Third day, commencing at 9 o'clock, live birds: Event. 1, 6 birds, $6, 30, 25, 20, 15 and 10 per cent., high guns. Event 2, 9 birds, $9, 22, 18, 15, 12, 10, 8, 6, 5 and 4 per cent., high guns. After these, the main event, the Gilman & Barnes international live-bird trophy, 15 birds, $15, $50 added, high guns, three moneys for every ten entries. Fourth day, commencing at 9 o'clock, the sportsman's grand handicap trophy is next in order. Conditions, 25 live birds, $25; $200 added, high guns; three moneys for every ten entries. Entries must be made on application blanks, a copy of which is sent with each programme. Fifth day, commencing at 10 o'clock, the grand sportsman's handicap will be finished, and ties on the trophy shot off miss-and-out. Handicaps in live-bird events, 26 to 32yds.; on targets, 16 to 21yds. Grand average money, $50. Grounds open for practice Feb. 9. Ship shells, etc., to J. A. Marks, 93 Woodward avenue, Detroit. Three sets of live traps, and three sets of target traps. Handicap committee, W. W. McQueen, C. W. Phellis, Emil Werk, E. J. Cady and H. D. Bates. Apply to Seneca G. Lewis, corresponding secretary, P. O. Box 5, Detroit, Mich., for catalogue and other information.

The Interstate Association will hold a meeting in the near future, probably on Feb. 4, for the purpose of readjusting the official staff of that body, as a consequence of Capt. J. A. H. Dressel's resignation, which he sent to the I. A. several days ago. The severance of Capt. Dressel from active participation in trapshooting interests has caused profound regret among all classes of trapshooters. Could Capt. Dressel have heard even a fraction of the regrets expressed at his withdrawal, and the spontaneous expressions of personal esteem and friendship, he would discover that he held a host of warm friendships which were entirely apart from mercenary considerations.

Mr. Paul R. Litzke, of Little Rock, Ark., under date of Jan. 23, writes us as follows: "We are arranging to hold an open contest for the live-bird championship of the State and the Peters Cartridge Co. trophy, emblematic thereof, on Feb. 18. The conditions of the events are 25 live birds per man, 30yds. rise, entrance simply price of birds, though an optional sweep will be run in connection therewith. Owing to the fact that it is customary to decide these events in one day, we are forced to restrict the entries to residents of the State, and those who desire to participate must make their entries by Feb. 10, and this must be accompanied by a forfeit of $5, which can be sent to Paul R. Litzke, Little Rock, Ark., secretary of the Arkansas State Sportsmen's Association."

The large circle of friends of Dr. Wm. Wynn, who is eminently distinguished both as one of Brooklyn's best citizens, and one of America's best trap shots, will rejoice on learning that he is convalescing steadily from his recent attack of typhoid pneumonia, which at one time was exceedingly serious. So soon as his condition will warrant the effort, he will go to Florida to recuperate, where the air is soft and sweet, where flowers bloom perennially, and where the game birds and the game fishes dwell with the latch string always hanging on the outside. May good health quickly return to him, and his charming companionship be saved for many, many years more to his friends.

Mr. J. S. S. Remsen, best known to trapshooters as one of the most skillful trapshooters of the Crescent Athletic Club, is convalescing from a severe attack which was very close to developing pneumonia. He was a visitor in the gun colony this week, and while feeling well, was still somewhat pale and drawn. He contemplated a southern trip to Palm Beach, Florida, stopping off en route to participate in the live-bird competition of the Forest City Gun Club's invitation shoot, Feb. 3 and 4; but now, while he will take the trip to Florida, participation in the great shoot aforementioned is impossible.

The Birch Brook Gun Club, Lynn, Mass., have arranged for a shoot to celebrate Washington's Birthday, on Feb. 23. There are twelve events on the programme, alternately 15 and 10, a total of 150. Events 5, 6 and 7 will constitute a prize event; prizes, $5, $2.50 and $1 in gold. Handicaps in prize event, 16 to 21yds. All other events will be shot from the regular distance. No entrance fee. Targets, 1½ cents. Lunch free. Loaded shells obtainable on the grounds. Shooting commences at 9 o'clock. Committee: Messrs. J. C. Hamley, J. Walter Hay, C. F. Lambert and Frank Hilliard.

Capt. J. A. H. Dressel, successfully eminent in the ammunition trade, in trapshooting competition, and peerless in the realm of good fellowship, resigned his office with the U. M. C. Co. early last week. His show interests have grown so great, and are becoming so profitable that he at present contemplates devoting his whole attention to them, their scope covering both New York and Chicago. While the show interests are distinct gainers by the change, trapshooters and trapshooting are correspondingly distinct losers. We heartily wish Capt. Dressel every success.

Old Cyclone is dead. He died a few days ago. He was famous in connection with trapshooting competition in America, and as he died of old age, it is proof that trapshooting is conducive to longevity. He was well known to trapshooters far and near. He was better known as "Old Cy," the old pointer-retriever of Watson's Park, Burnside Crossing, Ill. He retrieved birds in some of the most important events, matches and tournaments, that ever were shot.

The corresponding secretary, Mr. A. A. Schoverling, informs us that the next shoot of the Fulton Gun Club, Brooklyn, N. Y., will be held on Lincoln's Birthday, Feb. 12. Prizes will be offered for competition. Lunch will be served free. Shooting commences at 10 o'clock. Take Kings County L from Brooklyn Bridge to Crescent street station, or Broadway L from Twenty-third and Forty-second street ferries, to Crescent street station.

The shoot of the Ossining, N. Y., Gun Club, on Jan. 24, was a distinct success. In the "guns down" event, the prize was won by Hans with a clean score of 25. The next trophy event, 10 pairs, all contestants at scratch, was won by the energetic captain of the club, Mr. C. G. Blandford. The consolation cup, a handicap contest, was won by Mr. A. Bedell. The next cup shoot will be held on Lincoln's Birthday, Feb. 12.

Mr. Elmer E. Shaner, secretary-manager of the I. A., writes us under date of Jan. 24 as follows: "The Interstate Association has perfected arrangements to give tournaments at Williamsport, Pa., May 27, 28 and 29, under the auspices of the West Branch Rod and Gun Club, and at Boston, Mass., June 3 and 4, under the auspices of the Boston Shooting Association."

Mr. Harold Money is due in New York this week. For some weeks past he has been visiting in England, taking a needed vacation, and at the same time resting his injured eye, which, fortunately, is fully recovering from the effects of the gunshot wound which was accidentally inflicted while shooting ruffed grouse last season.

Mr. C. B. Axford, secretary, writes us as follows: "The Boiling Springs Fishing and Gun Club, of Rutherford, N. J., will hold an all-day target shoot on Lincoln's Birthday, Feb. 12, 1903. All shooters are welcome, and especially local gunners are requested to be here on that day. Handicap events. Lunch on grounds."

Secretary C. L. Kites informs us that the fixing of the Springfield, Mass., Shooting Club's tournament on April 19 was an error, and that the date of that tournament has been changed to April 20.

Mr. Edward Banks left New York on Friday of last week, Southward bound to Richmond, Va., in which historical city he will spend a week visiting his brother, who is engaged in business in that city.

The fourth contest for the January cup of the Crescent Athletic Club was won at Bay Ridge, L. I., on Saturday of last week by Mr. L. C. Hopkins, who scored a full 50 under the conditions of the contests.

The Soo Gun Club, of Sioux City, Ia., through its secretary, Mr. W. F. Duncan, announces that its ninth annual amateur tournament will be held on June 9, 10 and 11.

The Oceanic Rod and Gun Club announces that a regular contest at targets will be held on Feb. 1, at Rockaway Park, L. I. Targets, 1½ cents.

The Emerald Gun Club, of New York, will hold its last shoot of this season on Feb. 17.

BERNARD WATERS.

ON LONG ISLAND.

Crescent Athletic Club.

Bay Ridge, L. I., Jan. 17.—Mr. W. W. Marshall scored a win on the January cup at the shoot of the Crescent A. C. to-day.

In the shoot for the special scratch trophy, Harry M. Brigham and F. T. Bedford, Jr., scored 87. In the shoot-off, decided in the January cup contest, Brigham won. The scores:

January cup, 50 targets, handicap:

	Hdcp.	Brk.	Tot'l.	Hdcp.	Brk.	Tot'l.	Total.
W W Marshall	7	19	25	7	18	25	50
L C Hopkins	5	20	25	5	19	24	49
A W Palmer	4	22	25	4	20	24	49

Match, 25 targets, scratch: A. W. Palmer 20, R. I. Wigham 17, F. T. Bedford, Jr., 11.

Brooklyn Gun Club.

Brooklyn, L. I., Jan. 24.—There was an unusual gathering of shooters at John Wright's Saturday matinee to-day. There were some newcomers, whose advent at the traps hereabouts is a decided gain. These were Mr. Nash, recently of Indianapolis, now of New York; Mr. McGraw, of New York, who was shooting a strange gun, which, fitting badly, punished him severely and impaired his shooting. Mr. T. Elmer Batten had a new gun, which fitted him admirably, and although he had not shot at the traps in years save recently once or twice, he was smashing his targets in good time, centering them well, and holding his own well with the regulars. The weather was cloudy and uncomfortably raw and cold, a stiff wind blew most of the time, and there was a dark, wintry light, which presaged a downfall of snow. The making of good scores was exceedingly difficult under the weather conditions and numb fingers. Mr. W. Hopkins, of Aqueduct, was the leading contestant of the meeting. He broke an even 90 out of 100 targets. The scores follow:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	10	10	15	15	25	15	25	10	15	15
Waters	6	8	9	13	17	12	..	9	12	..

Nonpareil Gun Club.

CHICAGO, Ill.—Following are the scores of the Nonpareil Gun Club, made at Watson's Park, Burnside Crossing:

W D Stannard.....1001111111110011111010111—19
1111111111011101111111111—23—42

R Kuss.....1111111111111111111111110—24
1101011010111111110110000—16—40

S Young.....1000100111001111000100110—12
1001011111111110111111111—21—33

Practice: Kuss shot at 65 and broke 47; Stannard shot at 45 and broke 35; Young shot at 15 and broke 13.

JOHN WATSON.

Ossining Gun Club.

OSSINING, N. Y., Jan. 24.—I am sending herewith scores of our most successful cup shoot, held Jan. 24. Fifteen was a good turnout for a bleak January day. If the weather had been warm probably twenty-five members would have put in an appearance. The first event was for a handsome silver berry dish. Some of the boys have been itching for an event to be shot "guns down," so this first event was made guns down. This term was interpreted somewhat differently by the shooters. Some held gun below elbow, notably A. Rohr; some below armpit till the bird appeared, while others called "pull," and in the slight interval between the word and bird put their guns to shoulders, which was different only in a very small degree from ordinary clay bird form. However, as no particular position was designated, it was a case of "everything goes." If at any time in the future prizes are offered for "guns down" position, very close refereeing will be necessary. Hans showed up very strong in this event; with his handicap allowance of 4 misses as breaks he got a clean score, which gave him a lead of 4 birds over the next highest, 21 made by Barlow and Coleman:

	Brk.	Hdcp.	Total.		Brk.	Hdcp.	Total.
P B	17	3	20	J Barlow	17	4	21
D Brandreth	17	3	20	W Coleman	18	3	21
R Kromer, Jr.	14	1	15	A Rohr	4	10	14
J Carpenter	17	3	20	C Blandford	17	0	17
Hans	21	4	25				

The next cup was at 10 pairs, all scratch. This was won by C. G. Blandford with a score of 17 out of 20, with Coleman and Clark but one bird each behind.

P B	10	10	11	10	10	10	10	10	11	10—12
D Brandreth	11	10	00	10	11	10	11	11	10	00—12
R Kromer, Jr.	10	10	11	10	11	11	00	11	10	11—14
Hans	10	11	10	00	10	10	10	11	10	11—12
J C Barlow	10	10	10	11	11	10	10	11	11	10—14
W Coleman	11	11	00	10	10	11	11	11	11	11—16
C G Blandford	10	11	11	11	11	11	10	11	11	10—17
W H Hyland	11	10	11	11	10	10	10	00	11	00—12
W Clark	10	11	11	10	11	11	10	10	11	11—16
A Bedell	11	11	10	11	10	11	10	10	11	10—15

The third cup was, from an entrance standpoint, the most popular. The handicaps were well placed, as the scores well testify. Clark and Barlow were the high men, with possible scores. Clark, who had the say by right of lowest handicap as to how the tie should be decided, generously allowed Barlow the choice, who chose to shoot under original conditions. Clark won out on the next event by one bird.

	Brk.	Hdcp.	Total.		Brk.	Hdcp.	Total.
D Brandreth	21	3	24	*C Blandford	24	0	24
R Kromer, Jr.	16	1	17	W Highland	16	7	23
J Carpenter	18	3	21	W Clark	22	3	25
*Hans	14	3	17	W Fisher	19	5	24
J Barlow	21	4	25	E Ball	19	1	20
W Coleman	21	3	24	J Foley	16	7	23
A Rohr	9	12	21	A Bedell	20	1	21

* Shot along.

While on account of approaching darkness it was deemed advisable by most of the shooters to postpone the shooting for the handsome consolation cup offered by the president of the club, Col. Franklin Brandreth, some thought it should have been shot for. There were six left eligible to shoot for it, and the handicaps were changed according to the scores made in the previous events of the day. Coleman, who had missed final action on all three of the other cups, won out, and all were glad of it.

The last event was for a 12-pound striped bass fresh from the Hudson, presented by Thanny Tuttle, distance handicaps 16 to 18yds. Bedell won with a straight score of 10, while Barlow and Fisher divided the money.

The next cup shoot will be held on Lincoln's Birthday, Feb. 12. Two cups will be shot for; one a handicap, and one scratch; both to be won three times to own.

				C. G. B.	

Poughkeepsie Gun Club.

POUGHKEEPSIE, N. Y., Jan. 24.—The regular weekly shoot of this club to-day brought out eight men, all regulars except Mr. Smith, who is a new member, this being his first attempt at trapshooting.

Under most unfavorable conditions of the weather—it being extremely cold—with a strong north wind blowing directly into the faces of the shooters, sending a chill through the whole body that seemed to freeze the very blood in one's veins, these eight enthusiasts—in this case, cold enthusiasts—shot off three 25-bird events.

Event No. 2 was for a box of fine Havanas, donated by Mr. A. J. Du Bois, the popular secretary of the club. Mr. W. A. Adriance, notwithstanding the unfavorable weather conditions, scored 24 in this event. He didn't carry off the prize, however—not he! He just passed those cigars around among the boys, and for a while there were "cigars to burn" around the old club house.

The next and last event was a four-man team event, Missers vs. Hitters. The Hitters "made a hit," and the Missers missed it by two points; therefore had to pay for the other fellows' fun. But revenge is sweet. Next week let the Hitters beware, the Missers have it in for them. The Missers may become Hitters, and the Hitters, Missers. The scores:

Events:	1	2	3	Events:	1	2	3
Targets:	25	25	25	Targets:	25	25	25
Adriance	15	24	22	Traver	13	19	16
Wettereau	22	16	13	Du Bois	15	16	19
Spencer	14	19	13	Winans	16	14	19
Condit	19	19	20	Smith	7	8	10

SNANIWEH.

Keystone Shooting League.

PHILADELPHIA, Pa., Jan. 17.—There was a fairly good attendance at the weekly shoot of the Keystone Shooting League to-day. The birds were a good lot. Hobbs killed straight in the club handicap, 26 to 30yds., 10 birds. The scores:

Delaney, 26.....00*1201120— 5
J Morris, 27.....0120112222— 8
Hobbs, 28.....2222222222—10
Jackson, 28.....2200022022— 6

Hantz	5	..	8	..	..	..	18	..
Hawthorn	..	..	..	6	..	9	..	..

Chicago—Milwaukee.

MILWAUKEE, Wis., Jan. 17.—The Nonpareil Gun Club, of Chicago, and the South Side Gun Club, of Milwaukee, met in friendly rivalry to-day, the competition being an eleven-man team match, 10 birds per man. The Nonpareil won by a score of 101 to 89. There was a large attendance of spectators, many of whom were friends of the shooters. From beginning to end, the meeting was a pleasing success. Four straight scores were made, one by Mr. C. P. Shumway, of the South Side team, and three by Nonpareils, namely, Messrs. Lord, G. Roll and O. Von Lengerke.

The Nonpareil team was composed of some of the most reliable shooters about Chicago, and it was expected that they would perform well to a certainty. At the close of the shoot Mr. Rutledge, in a neat speech, told the members of the Chicago team how glad the South Side Gun Club was to meet them socially, but that there was a tinge of regret connected with their professional acquaintance. The visitors were asked to come again, and promised to do so. The local team will probably shoot a return engagement in Chicago in the near future.

It was a hard day to shoot at live birds. The only thing favorable was the light. It was in this respect perfect. The wind was strong and in the wrong direction, and it was so cold that before a man had shot his 10 birds, he was often numb with the cold, which interfered with his shooting.

The team shoot had results as follows:

South Side Gun Club Team.		Nonpareil Gun Club Team.	
Bush	01*12*2212— 7	Willard	1210222212— 9
Rutledge	0222222222— 9	Barto	2202222222— 9
Hare	22221222*2— 9	Amberg	2220222222— 9
Shumway	2122122122—10	Lord	2222222222—10
Jack	2000111101— 6	Hess	222022*222— 8
Clark	222*220222— 8	Myrick	22222222*2— 9
Schultz	0222*02222— 7	Kuss	2202222222— 9
Kaufmann	2220222000— 6	J Graham	222222*222— 9
T Thomas	2202222222— 9	E Graham	2222220222— 9
Dering	2022222222— 9	Roll	1222212122—10
Dodge	0122221222— 9—89	Von Lengerke	2222222222—10—101

The first event of the day was a target shoot of 10 birds each with sixteen entries, all local. Schultz and Dering made clean scores. After the team match had been shot, a miss-and-out event with three moneys, and a target event with three moneys, were shot. Owing to having exhausted the supply of live birds, the first event was drawn, and the money divided among six men. Darkness interfered with the later event.

Sweepstake, 5 live birds, $3 entrance, three moneys:

Von Lengerke	22222—5	J R Graham	22222—5
Dering	22020—3	Rutledge	*0222—3

*Guests.

Brunswick Gun Club.

BRUNSWICK, Me., Jan. 23.—Following is the report of the annual meeting of the Brunswick Gun Club:

The annual meeting of the Brunswick Gun Club, also the election of officers for the ensuing year, was held at the room of G. B. Webber, Wednesday evening. The following officers were elected: L. C. Whitmore, President; David W. Scribner, Vice-President; Oscar B. Nason, Treasurer; Gilbert M. Wheeler, Secretary. Executive Committee for 1903: L. C. Whitmore, G. B. Webber, S. Whitmore, I. L. Dunning, C. H. Storer.

This will be the third year of the club's existence, and promises to be the brightest. It now has an equipment for the sport that is complete in every feature. The members seem to feel that they can break targets in better shape, and that in the State shoot of 1903 they will not have to act as the rear guard, as has been the case formerly. Some new shooting timber will participate this season in making the representative squad of five men that can go along "right smart."

The five men making the highest average per cent. from April to September are the chosen five to go against the other clubs of the State.

Last year they were S. Whitmore, G. M. Wheeler, D. W. Scribner, A. S. Merrill, I. L. Dunning.

The date for holding their tournament this year has not been decided.

G. M. WHEELER, Sec'y.

Hamilton Gun Club.

HAMILTON, Can.—The weather at the beginning of the shoot being very cold kept a number of shooters away; but those who came seemed to enjoy themselves. Our club house was very comfortable, and as our shooters did not have to stay out very long nobody got frozen.

On the second day there was a larger attendance, and altogether the shoot was a success.

Maurice Reardon, of the Hamilton Gun Club, won the Grand Canadian Handicap with a straight score, and A. D. Bates the medal presented by the New Troisdorf Powder Co., for high average in live-bird events.

Mr. E. C. Griffith won high average on targets for the three days, with J. Head a close second.

Jan. 13, First Day.

The weather was unfavorable. It was very cold. There was a strong wind and a bad light. The scores:

Events:	1	2	3	4	5	6	7	8	9	Shot

El Paso Tournament.

EL PASO, Tex.—The El Paso Gun Club's first tournament was a success. Besides those residing in the State, there were shooters from Arizona, New Mexico, Nebraska, California, Kansas, Dakota, Louisiana, and Colorado. There were other attractions, a carnival being in full blast across the line, in Mexico. Shooting commenced at 9 and ended at 1 o'clock P. M.

Mr. D. Curran, of Ennis, Tex., won the Schmelzer cup, for which he shot off a tie with Mr. J. A. Jackson, of Austin, Tex., at 20 targets. He scored 19 to Jackson's 18. The scores:

First Day, Jan. 13.

For the three days, Mr. F. M. Faurote was high average with a score of 226 out of 240; Heikes second with 224; C. B. Adams third with 223; J. S. Fanning fourth with 222.

Cincinnati Gun Club.

CINCINNATI, O., Jan. 17.—A new series of cash prize contests commenced on the 17th inst. The conditions are changed materially from the contests just finished. There are now two classes, where heretofore there was one. Each class has a purse of $100 divided into five prizes, $30, $25, $20, $15, $10. All contestants remain in the class in which they start. These changes have been made for the sole benefit of the less skillful members, who, it is hoped, will show their appreciation by taking an active part in these contests.

Scores of first contest of C. G. C. cash prize series follows: B. Trimble (21) 43, Block (17) 41, Corry (16) 41, Faran (16) 41, Barker (17) 41, Leever (17) 41, Ahlers (20) 39, Randall (18) 39, Verges (18) 39, Falk (16) 38, Parker (17) 38, Dreihs (16) 37, J. B. (16) 37, Coleman (18) 36, Roll (17) 36, Medico (16) 36, Herman (16) 36, Manyard (17) 34, Farmer (16) 29, Ackley (15) 29.

Sam Leever, of the Pittsburg Baseball Club, shoots with us now and then, and as will be seen by the scores, can handle a gun as well as a baseball. He is always a welcome visitor.

St. Joe Gun Club.

ST. JOSEPH, Mo.—Following are the scores of an afternoon practice and medal shoot held Jan. 18th, on the St. Joseph, Mo., Gun Club grounds. The weather was raw, and not conducive to good work, but the boys kept firing away until the sun disappeared in the timber line beyond the Missouri.

This club will have the honor of opening the Western circuit the first week in April, and presenting the introductory to the Grand American Handicap at targets, which follows at Kansas City a week later, and it will prove itself well worthy of the trust when the time comes. This club has been recently incorporated under the laws of Missouri, and is headed by a corps of efficient young officers who will come pretty near setting the pace in trapshooting in this section during the year. The new officers are: R. G. Conser, President; Louis Moine, Vice-President; F. M. Brinson, Secretary-Treasurer; F. B. Cunningham, Manager; J. H. Felt, Captain; E. G. Walker, Albert Toole and J. H. Felt, Directors.

Scores on the above occasion were as follows:

Events:	1	2	3	4	5	6	7	8	Shot	
Targets:	15	10	15	10	15	10	25	20	at.	Broke.

No. 7 was the club handicap of the New York County Gun Club at its shoot.

Rockaway Beach, Jan. 20.—There was a high northwest wind in squalls. Thermometer 30 degrees.

L. H. SCHORTEMEIER, Pres. N. Y. C. G. C.

PUBLISHERS' DEPARTMENT.

What is the Money Value of a Human Life?

A Society in Boston, Mass., Organized and Officiated by Prominent Doctors, Divines, Editors, and Business Men to Save Human Life.

THE commercial value of the African slave was $300 to $3,000, according to his intelligence and mechanical skill. It is said that every able-bodied man is worth $1,000 to the community in which he lives, but sometimes thousands and thousands of dollars are paid to save the life of a man, woman or child. Recently we had an instance in which Americans raised more than $50,000 to save the life of Miss Ellen Stone, who was held by the Turks for a ransom.

The society in Boston, Mass., known as the American Invalid Aid Society, started under the direction of such men as the Rev. Edward Everett Hale, the eminent divine and author, J. Warren

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1903, BY FOREST AND STREAM PUBLISHING CO.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, FEBRUARY 7, 1903.

VOL. LX.—No. 6. No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

AN INDIAN CHIEF.

WHITE CALF, CHIEF OF THE BLACKFEET, DIED AT WASHINGTON, JAN. 29, 1903.

FOR sixty years as boy, young man and fierce warrior he had roamed the prairie, free as the other wild creatures who traversed it, and happy in his freedom.

He had been but a little fellow when the white men first came into the country to trade, but he was old enough to have been present, and was well enough thought of in the tribe, at the signing of Gov. Steven's treaty with the Prairie People in 1855, to affix his mark —as The Feather—to that paper. As yet the coming of the white man meant little to him and to his people. It furnished them a market for their robes and furs, for which they received in exchange guns and ammunition, which made them more than ever terrible to their enemies. The whole broad prairie was still theirs to camp on and to hunt over. Their lodges were pitched along the streams from the Red Deer River on the north to the Elk River on the south, and their war journeys extended south to the country of the Mexicans.

More than twenty years ago happened the greatest misfortune that ever came to his tribe. The buffalo disappeared and never returned. From this time forth they were forced to depend on the food given them by the white men, and, in order to receive that food, they were obliged to stay in one place, to confine themselves to that little corner of ground, their reservation.

Long before this he had become the chief of his tribe—the father of his people. Already he was putting their welfare before his own, was thinking first of them and of himself last.

For it was the duty of a chief to look out for the well-being of his people; to care for the widows and orphans; to make peace between those who quarrel; to give his whole heart and his whole mind to the work of helping his people to be happy. Such were the duties that the old time chief studied to perform. And since on his example and his precept so much depended, he must be a man who was brave in war, generous in disposition, liberal in temper, deliberate in making up his mind, and of good judgment. Such men gave themselves to their work with heart and soul, and strove for the welfare of those in their charge with an earnestness and a devotion that perhaps is not equalled by any other rulers of men.

And this devotion to his fellows was not without its influence on the man himself; after a time the spirit of good will which animated him began to shine forth in his countenance, so that at length, and as they grew old, such chiefs came to have the beneficent and kindly expression that we may sometimes see on the countenance of an elderly minister of God whose life has been one long loving sacrifice of self to his Maker and to his fellow men. And if the face was benevolent and kindly, not less sweet and gentle was the spirit that animated the man. Simple, honest, generous, tender hearted, and yet withal on occasion merry and jolly. Such men, once known, commanded universal respect and admiration. They were like the conventional notion of Indians in nothing save in the color of the skin. They were true friends, delightful companions, wise counsellors—men whose conduct toward their fellow men we all might profitably imitate. We do not commonly attribute a spirit of altruism to Indians, but it was seen in these old time chiefs.

Such a chief was White Calf, long chief of the Blackfeet. In his day he had been a famous warrior, and in the battle which took place in 1867, when the great chief Many Horses was killed, White Calf with two others had rushed into a great crowd of the enemy—the Crows and Gros Ventres—who were trying to kill Wolf Calf, even then an old man, and, scattering them like smoke before the wind, had pulled the old man out of the crush and brought him safely off. It was not long after this that he put aside the war path forever, and since then had confined himself to working for the good of his people by the arts of peace. No sacrifice was too great for him to make, if he thought that by it the tribe might be helped; yet he possessed a sturdy independence that bullying and intimidation could not move—even that threats of soldiers and the guard house could not shake. When he was sure that he was right he could not be stirred. Yet if reasons were advanced which appealed to his judgment, no man was quicker to acknowledge error.

Though nearly 80 years old, the chief was not bowed with the weight of time nor were his natural forces greatly abated. He was still erect and walked with a briskness and an elasticity rare for one of his years. Yet in a degree he felt that his powers were failing, and he sometimes avoided the decision of important questions on the ground that he was getting old and his mind was no longer good.

A little more than two weeks ago he stood in the presence of the Chief Magistrate of the nation, who shook him warmly by the hand and talked to him and the others of his people present. A few days later, just as they were about to leave Washington for their distant prairie home, the old chief caught cold, pneumonia set in, and just before midnight on the 29th of January, he peacefully passed away.

He was a man who was great in the breadth of his judgment, and in the readiness with which he recognized the changes which he and his people were now obliged to face and adapted himself to these changes; but greatest of all, in the devotion that he felt for his tribe, and in the way in which he sacrificed himself for their welfare. Buffalo hunter, warrior, savage ruler and diplomat; then learner, instructor, persuader and encourager in new ways; he was always the father of the people. Just as for many years he had been constantly serving them, so now, at the end of his long chieftainship, he gave up his life in the successful effort to protect them from a great calamity.

SNAP SHOTS.

NORTH CAROLINA is considering the imposition of a license fee upon the non-resident shooter. The scheme has its origin with the Audubon Society, and the purpose is to provide funds for the employment of game wardens. Public opinion in North Carolina is reported to be warmly in support of the proposition. This is not to be wondered at, for it means the protection of game for resident and visitor alike, but altogether at the expense of the visitor. That is a scheme much in favor nowadays. The non-resident tax idea has taken hold upon the New York Forest, Fish and Game Commission. In the current report is a recommendation to tax the non-resident $50 unless he happen to be a member of an incorporated club. This proposal is contained in the same report which estimates that "millions of dollars are annually spent because of the attractions of the woods and waters for health and pleasure seekers and sportsmen." A non-resident hunting license fee of $50 would be just the thing if the purpose were to confine Adirondack hunting to the ultra-wealthy who can afford to pay an added $50 for their sport without feeling it; but the excessive fee would, of course, be prohibitory as to the average man. New York can well afford to continue to extend, as now, a warm welcome to the sportsmen of the country at large to visit the Adirondacks to hunt and fish and enjoy the woods and the waters and the mountains. If for these outdoor privileges the State is to tax one, let it tax all, not the non-resident deer hunter only for hunting deer, but the non-resident angler for taking trout, the non-resident hotel guest and cottager and the camper. It takes money to propagate fish, why should not the non-resident pay for his fish? It takes money to pay for protecting the forests, why not make the non-resident pay for his enjoyment of them?

The system formerly in operation in this State governing the possession of game in close season was one of absolute prohibition. By the terms of the law a dealer who had a stock of game on hand at the end of the open season for selling was given the alternative of selling it, sending it out of the State for cold storage, or storing it clandestinely in the city. Some dealers shipped their surplus to Boston or across the river to New Jersey; some kept it in New York cold storage vaults, as witness the Arctic Freezer Company seizure now before the courts. Last year a new system was provided by amendment of the law, whereby dealers were permitted to retain in storage whatever game they had on hand at the close of the season, and to keep it in bond, duly inspected and sealed by the authorities. This change was favored by the Forest, Fish and Game Commission, and when the law went into effect at the close of the season, Chief Protector Pond and his assistants visited New York and bonded the game. An amendment to repeal this provision and to restore the old system has been introduced by Assemblyman Wainright.

The theory upon which the bonding system was advocated was that its operation would remove from reputable game dealers the hardship of destroying a valuable stock, and would give them an opportunity to retain their surplus game, dealing honestly with the State and being secured in their property rights. It was further assumed that by reason of the bonding the dishonest dealer would be prevented from disposing of his stock illicitly in the close season. The theory upon which the system was opposed, and we opposed it, was that the enlarged opportunity to store game would encourage the overstocking of the market, and would in consequence stimulate the killing for market. If a dealer could sell or keep his game, he would be very apt to buy more lavishly and acquire a larger stock than if he were given only the open season for selling it and must then destroy or dispose of what he had on hand. The actual operation of the law should have demonstrated which of these theories was the right one.

A newspaper published in Cody, Wyo., comes to hand with a suggestion that every non-resident of the State should be prohibited, under penalty of a tremendous fine, from killing big game within the borders of Wyoming. As there are numerous citizens of Wyoming who for their subsistence depend largely upon what they can make out of the non-resident sportsmen for whom they serve as outfitters, packers and guides, it is clear that the Cody editor will not find public sentiment and unanimous hoop-la in support of his mediæval proposition. A person who proposes seriously to keep non-resident hunters out of Wyoming shows his ignorance of the commercial value of big game on the hoof. In the wilderness where cash is scarce and barter is the rule, the money brought in and expended by the non-resident for pack horses and saddle horses and provisions and guides and cooks and accessories is sometimes about all the actual cash the recipients receive from one year's end to the other. The money is extremely acceptable to the men in the mountains. The next proposition to come from the logical Cody editor will be for a law prohibiting outsiders from buying cattle and horses in Wyoming.

WE referred last week to the preposterous bill of Assemblyman Coutant, at Albany, to tax the non-resident of a county $25 for the privilege of shooting in any one town in the county. Mr. Coutant has been a laughing stock for the newspapers throughout the State, with the single exception of the Kingston Freeman, which takes Mr. Coutant in dead earnest, and hails the bill as a measure of lofty statesmanship. The Freeman editor has for many years been waging against the sportsmen of New York a campaign which, we feel confident, would produce the greatest consternation among them if they should ever happen to find out about it. From this day henceforth let it not be said that we have failed in our duty of warning them against the ferocious Kingston man.

SOMETHING of what money value the protection of game in this country represents is hinted in a remark quoted on another page from the London Spectator, that the deer killed in New York last year amounted to a number which "at the ordinary rate reckoned per stag in Scotland (£40) would represent a sporting outlay of £169,000." In other words, the man who killed deer in the public lands of the North Woods enjoys a privilege for which the Scotch deer hunter would pay $200; and the total cost of the deer so reckoned for a year would amount to $845,000. These figures are fallacious, for no such value attaches to game in this country. Nevertheless it costs many a successful deer hunter more than $200 to get his venison.

The Sportsman Tourist.

Notes from Central America.—V.

Mosquito Coast of Honduras—The Bay Islands.

Much has been written concerning the Mosquito Coast of Nicaragua, and the lagoons between Cape Gracias á Diós and the Bluefields River, have been presented to the world through the pages of English history as well as through other channels. But the Republic of Honduras also has a Mosquito Coast and remarkable lagoons—notably those of La Criba, Brewer, and Caratasca—included between Cape Cameron and the Nicaragua border, in the department of Mosquitia, Honduras.

La Criba Lagoon receives the waters of Rio Negro and opens to the sea at the town of Black River, just east of Tocamacho and Port Burchard. This lagoon is very picturesque—containing numerous islands and having a background of high mountains to the south

HARBOR OF COXEN HOLE, ISLAND OF ROATAN, HONDURAS.

and west. It is the outlet for much produce from the interior, natives bringing down the river rubber, sarsaparilla, hides, etc., which are shipped by schooner to the United States. The bar at the mouth of the lagoon is navigable for craft drawing from four to five feet of water, while a good channel runs through the lagoon to the river—which latter is navigable for miles.

Brewer's Lagoon, which receives the waters of Toomtoon Creek—an offshoot from the Patuca River—and numerous smaller streams—is larger and deeper than La Criba Lagoon, but has no deep-water connection with the interior. Two very picturesque rocky islands—at present occupied by an American—rise precipitously from the stretch of waters. This lagoon affords an excellent harbor, but the bar at its mouth is not safe for vessels having a draft of over six feet. Like the other lagoons of this region, alligators, crocodiles, ducks, sharks, etc., here abound, while quantities of wild pigeons are found along the shores of both lagoons and rivers, and jack snipe inhabit the marshes. Any doubt that might have formerly been entertained by the writer as to the existence of crocodiles in this region was dispelled a few weeks ago by his killing, in a small lagoon between Brewer's Lagoon and the Patuca River, a true crocodile seven and a half feet long. These saurians are very numerous in these lagoons.

Between Brewer's Lagoon and the Wanks River we find Honduras' largest lagoon—viz., Caratasca Lagoon—a beautiful body of water about thirty-five miles long, five miles wide and having a practically navigable bar and good inside channel, but receiving from the interior the waters of no large river. On either side of this elegant lake is low, flat land, populated by Mosquito Indians, while behind it—to the southward—rise the high peaks of the Colon mountains—in and about which are said to live Toacos Indians, but concerning which but little is known, for the country for nearly a hundred miles to the south and southwest of Caratasca Lagoon remains practically unexplored, and is usually marked on the map of the country *"desconocido."* That this region is rich in mineral is shown by the gold found in the streams that flow from the foot hills of the mountains into both Caratasca Lagoon and the Wanks River, but the region is difficult of access, wild and rugged, far from law and order, and its inhabitants certainly not more than semi-civilized, and said to be decidedly treacherous. Personally, the writer has as yet visited only the outskirts of this region—that is, the Colon mountains—but fondly hopes to explore them thoroughly in the near future.

Deer are plentiful in the mountains, as also jaguars, tigers and wild bears. Monkeys and snakes—large and small—are common along the rivers. The scenery, viewed from a pitpan, as one passes up or down the rivers, is grand. The curving, flowing stream; the dense and varied foliage of the forest; the towering mountains—sometimes far in the distance, at others rising almost from the banks of the stream; the chattering of monkeys, parrots and macaws; the call of the toucan; the flight of wild fowl and birds of bright plumage—all attract eye or ear, and were it not for the song and bite of countless mosquitoes, for sand flies, gnats and even deer flies, for the difficulty of obtaining proper food, for the indolence and avarice of the natives, for the prevalence of malaria, etc., the locality might, for a time, at least, appear quite enchanting.

Here in the lagoon region is the home of cassava and mishla—the former the chief food of both Caribs and Mosquito Indians, the latter the great drink of the Mosquito Indians and Sambos. Cassava, bananas, and fish, with occasional fresh pork, constitute the daily diet of the people of the lagoon region. Mishla, also from the cassava, is a vile beverage of most disgusting manufacture. Washed and grated cassava is chewed by the women and spat into a wooden tub or small canoe, water is added and the mixture allowed to ferment in the sun—the ptyalin of the saliva converting the starch of the cassava into unstable sugar which, rapidly fermenting, produces a mildly alcoholic, though none the less intoxicating, beverage. Aging bananas and other fruit are sometimes added to the mixture.

A "mishla lay-out" generally calls together the natives of the entire village, who drink and dance to music furnished by revellers, who beat with wrists and hands on drums resembling barrels with the wooden heads replaced by a single head of tightly stretched hide. The orgie continues sometimes for days, according to the amount of mishla on hand. It is said that young girls chew the cassava in the preparation of mishla for the chiefs, but the writer has seen almost toothless old women occupied with the preparation of the beverage.

Leaving the Mosquito Coast, the writer sailed from the mouth of the Patuca River to Truxillo, making the trip in an open 18-foot sailboat in two days and one night. Obviously, the wind was fair. From Truxillo passage for Puerto Cortés was obtained on the Honduranian gunboat Tatumbla. We left Truxillo Dec. 21 and would have arrived in Puerto Cortés before Christmas, had not a norther set in, which prevented the Tatumbla from being able to land cargo on the open beach at La Ceiba, and determined her putting in at Utilla—one of the bay islands of Honduras—for at the town of Utilla, on the southern side of the island, is a small harbor affording excellent protection from winds from north and northwest.

Coxen Hole, at the Island of Roatan—to the east of Utilla—is also a good harbor during "northers," and is very picturesque—having an outer and inner basin and a background of rather high mountains.

If the harbor of Utilla, owing to the absence of mountains on the island, is less picturesque than Coxen Hole, Roatan, the town of Utilla certainly appeals to the weary mariner as affording a snug retreat for the individual as well as a harbor for his ship, since a more genial and hospitable community would be hard to find. It was our fortune to be in Utilla on Christmas Day—for the wind continued to blow from the north, and it was evident that the beach at La Ceiba was still washed by heavy breakers that rendered impossible the launching of lighters and the landing of cargo. Christmas afternoon an invitation to visit the home of one of the merchants of the town, who are nearly all either English or American—was brought us by Mr. Morgan himself, and so, late in the afternoon, Colonel Don Abelardo Varela, commander of the Tatumbla, Lieutenant Hernandez and the writer went ashore and were greeted, not only by the family of Mr. Morgan, but by most of the foreign residents of the town. The ladies played the piano and sang for us in both English and Spanish, and Commander Varela and Lieutenant Hernandez, who are both expert guitarists, added their quota to the entertainment. About eight o'clock invitations to attend the ball that had already been arranged for the evening, were extended and accepted, and after dancing and feasting until—well, until Christmas had certainly passed—we returned on board, and the next morning sailed to La Ceiba, and Friday morning were in Puerto Cortés.

Throughout Honduras Utilla has the truly merited reputation of possessing hospitable foreign residents and many "maidens fair."

Dr. J. Hobart Egbert.

Puerto Cortes, Honduras, C. A., Dec. 31.

The Charm of Furs.

We wonder what the root of the attraction of furs really is. As an article of wear by primitive man, liking for these would seem a semi-savage taste, liable to disappear with the development of civilization. Yet the modern man, while regarding the "raw" furs worn by the Indian as an evidence of barbarism, displays the same skins, dyed and shorn of their long hairs, as a mark of the highest cultivation. Moreover, the ancients liked furs just as much as the fur-loving Russians and Americans do. And in the older civilizations of the Far East love of them has so endured that the furriers in their treatment of them can now fully claim almost to have improved upon nature. A rich Chinese official may follow the custom of his country and eschew jewelry. But in summer he will wear silks that can stand alone, and in winter fur robes which in tint, lustre and thickness excel those of Western kings.

So tenacious an admiration must have some basis in human nature, and it would be interesting to know just what it is. In the case of the choice furs it may be that the liking partakes of that which many people have for gold and precious stones—the attraction of concentrated value. They represent so much accumulated wealth, and are treasured as standing for the many things they would buy. Yet this is only a partial explanation. For the wearers of the rarer furs are, after all, comparatively few, and to the majority of mankind furs of any kind have a charm of their own quite apart from their value, though not from excellence of manufacture. Besides, the love of gold and gems more nearly approaches to lust than that of furs; though, were the latter not perishable, and so could be hoarded, the attraction might be much the same. Many men like to feel gold, are so drawn by its glitter and color that they like to see and handle it as they do nothing else. Their admiration is for the metal itself, not for its value, or what it will buy.

ALONG THE SHORE OF UTILLA, ISLAND OF UTILLA, HONDURAS.

As for the attraction of gems, did not the late Shah of Persia love to plunge his arms up to the elbows in precious stones, a pleasure in which his wealth and passion for collecting enabled him to indulge? He liked the feel of them against his bare skin, found his dull imagination stirred by their colors and glitter, and his love of luxury gratified by this unique hand-bath of sparkling jewels.

The attraction of furs must, however, be of another sort. For while the handling of them is a physical pleasure, there is no lust for furs as furs as there is for gold. Again, the love for gold, though accentuated by the knowledge of the security against discomfort and poverty it gives, can be trained out of men, as witness

bank tellers. But men who have spent their lives in the fur trade still find an endless and indefinable charm in furs themselves. Doubtless the fact that they have been used since man first turned hunter, and so have become fixed in the popular mind as an object of desire, may account in part for this admiration. But there is something else, and that something is in part the vanity of the sexes, the love of ostentation, and desire to relieve the monotony of the human scenery.

It is the fashion, of course, to credit the love of display entirely to women. The assertion, therefore, that the basis of the liking for furs is woman's love of ornament in costume will find ready acceptance among men. True, the latter are always ready to march about in the uniforms and regalias of this or that order, behind a brass band, indifferent to dust and the hot sun and the jeers of the street gamin. But men have always sacrificed themselves to a sense of duty; and the cynical people who attribute this willingness to contribute something of brightness and cheer to a dull and colorless world to a masculine love of display fail to understand our civilization.

Nevertheless, that women do love furs as an ornament in dress will be admitted. Beauty is to them more essential to successful getting on in the world than it is to men. Any article of apparel or adornment that tends by colors and contrast to enhance it, is, therefore, always admired. And as the color and lustre and richness of furs breaks the sombreness and monotony of ordinary costume and sets off beauty as nothing else does, the taste for them has taken deep root in feminine nature. No doubt their warmth has much to do with this liking. In the choice furs, such as sealskin and sea otter, the under fur is so close that small particles of air are held between the hairs, and this air is warmed by the heat of the body, while the fur itself acts as a non-conductor to the cold. The body of the wearer is thus inclosed in a miniature warm-air chamber. And though the coarse furs do not possess this quality, they still are warm enough to resist medium and even low temperatures.

It may be questioned, however, whether if the beauty of furs were lacking, they would, as a mere protection from cold, attract womankind as they now do. As a matter of fact, much the same protection may be had from the lining furs, such as muskrat, squirrel, etc., or from fur clipped from the skin and woven into the cloth. One of the warmest garments possible is the sheepskin coat of the Russian peasant, woven with the wool inside. But though men wear furs manufactured in this fashion, women do not; and it is probable that men wear them only because of their diminished cost, and because in their work furs worn outside would speedily be destroyed.

One charm of furs for the gentler sex is therefore that they gratify the taste for ornament and ostentation; though that men are exempt from this attraction there is no reason to believe. True, there is among the masses a prejudice against their use by men, as there is against the wearing of much jewelry, and for the same reason. But the rich and the cultivated wear them as far as custom will justify; and were prejudice removed, the leisure class would no doubt use them largely. As it is, men buy furs for women to wear; and though they may do so from desire to please their wives and daughters, they do so also to please their own eyes, to see attractive and beautiful things. The prejudice of the masses may debar men from any large use of furs as savoring of vulgar ostentation. But the workingman buys his wife or sweetheart the prettiest fur he can afford, and likes to feast his eyes upon it; and so long as he does that the taste for furs as ornament will not die out any more than the liking for beauty in woman or for gems as flowers made eternal.

But the real basis of the charm of furs is, we believe, something more than warmth, or concentrated value, or beauty as ornament, or the ease with which they lend themselves to ostentation. It is the gratification of the innate love of luxury. For, like jewels, furs belong in the higest class of luxuries, those at once artistic and sumptuous. The mere feel of furs is a physical pleasure greater than that given by contact with the finest grade of velvet, while their tints and colors, the alternations of reflection and light, make them a never-ending delight to the eye. The very warmth they contribute to the body has an exhilaration that nothing else can give. Even when lying on a chair, or hanging from the wall, they have a softness and richness and sumptuousness that invite repose while stimulating perception and appreciation of luxurious living. The mere ownership of a dyed muskrat skin gives its poor possessor the feeling of sharing the sumptuousness of the world with the rich and cultured. Doubtless few persons have ever analyzed these sensations, but they are real, nevertheless; and, indeed, the more the attraction of furs is considered, the greater the wonder that love for them is not deeper than it is.

A good deal of this charm depends, of course, on the excellence of manufacture. For there are comparatively few furs the beauty of which is not enhanced by the furrier's craft. Singularly enough, it is to China, not to the industrial West, that we look for the perfection of this art. Northwestern Manchuria and the western plateaus of the empire, are veritable reservoirs of furs, and Pekin is the great center of the fur trade of the Eastern world. The cold climate of these remote regions seems specially suited to the development of fur, which attains there a peculiar fineness and thickness. Even the hair and wool grown on these high plateaus take on many of the qualities of fur. The Manchurian dogs, for example, develop a real under fur in winter, and are bred in great numbers for their coats. The Manchurian cat skins have a higher value than those of the Bavarian Alps, while lamb skins, after treatment by the Chinese furriers, are almost as beautiful and sumptuous as the rarer furs.

Despite the great yield of furs throughout the empire, the export trade in them has, however, been very small, only the lighter and less valuable kinds finding their way abroad. The choicer and finer furs are reserved for the domestic market, which among a people fond of personal luxury and substituting sumptuousness of costume for other adornment, is very large. Inevitably with such a demand the processes of manufacture have undergone great development, and with their infinite painstaking and disregard of time, the Chinese furriers have, save in the dyeing of special skins, become past masters in their art. In fact, should the furriers of Pekin and Moukdeer ever release their finished stocks for export, Europe and America will gain a new luxury comparable to that of Chinese silks and Japanese satsuma pottery. For these men, if they do not in their delicate processes improve upon nature, do produce dressed furs which in tint, lustre and richness are unrivalled in the Western world.

Some years ago the London Spectator, in commenting on Li Hung Chang's furs, described several of the masterpieces of the Pekin furriers' art owned by that statesman, and exhibited in London. It appears that the great Viceroy derived a part of his vast revenue from a tribute of furs from Northern Manchuria; that he maintained in Pekin large warehouses filled with the rarer furs; and that his punishment for the substitution by his agents of inferior for good skins were so terrible that no choice furs were diverted from his stores. Possessed of this supply of rare skins, the Pekin furriers had, of course, ample resource for the exercise of their highest skill. And in a robe made to imitate a sable skin enlarged to the size of a beaver skin, they seem to have reached the perfection of their art.

The task they set themselves was not only to reproduce nature on a greatly magnified scale, but to improve upon nature by making the fur lie the same way, instead of following the bends of the body. To accomplish this, they cut small pieces from the best part of sable skins, on which the fur was of the same length, tint and thickness. These pieces were so minute that when sewed together three or four of them made only a square inch of skin. And the patches were, in turn, so sewed as to give no indication of joining, and to impart to the front of the robe a uniform and unbroken appearance. The beauty and sumptuousness of a robe thus made can readily be imagined, even by those not keenly alive to the attraction of furs. But not content, the furriers added ornamentation as unique as it was admirable in effect. They inserted in the robe the skin of the fore paw and shoulder of the sable, which, when sewed down on the uniform fur, formed, owing to the difference in their lie and texture, an ornament like the "eye" seen in a peacock's tail. The robe thus presented the appearance of an enormous sable skin ornamented with peacock's eyes in sable damask; a creation which, it is safe to say, cast in the shade any personal luxury devised by the purveyors to Solomon.

No doubt the Chinese furriers chose the sable not alone because of its color and richness, but because of the uniformity of fur; though a second robe, rivaling in effect the first, was made of skins of the red fox, of the differing shades of red amber, with eyes formed of the bright black foot of the animal. In the fur of the sable both long hairs and the under fur are exactly uniform in size and texture, so that the skin has the appearance of evenness imparted by manufacture as well as the usual qualities of a raw fur. Naturally this superiority augments its value, the demand for the choicer Russian sables being so great that a bunch of ten of them, unfinished, easily commands $2,500. The fur of the sea otter, an animal now nearly extinct, has much of the same qualities as the sable, is, if anything, more beautiful, and owing to its rarity, brings a much higher price. Another fur, now scarcer even than the sea otter, is that of the Antartic seal, the most lustrous and thickest of all the seal fur.

As London is the center of the fur trade of Europe and America, it should be possible through the records of the great January and March sales of Sir Charles Lampson and the Hudson's Bay Company, to secure fairly accurate knowledge of the rate at which the rarer furs are decreasing. Through these sales are distributed the major part of the vast annual catch of furs on the Western continent, Siberia and Australia. How large this catch is may be judged from the statement that, a few years ago, in four days' sales, lasting six hours each day, more than three million fur skins were disposed of. While apparently the rise in price of the better class of furs at these sales in recent years has been due in part to the demands of fashion, yet in the main it may be attributed to diminished supply, caused by the extermination of the animals bearing them. According to the Spectator's estimate, based on the evidence of these sales, the seal, sea otter, silver and blue fox and beaver are the fur-bearing animals earliest destined to extinction.

That this loss can be replaced is, of course, impossible, though the opening of China to outer trade would give to Europe and America a stock of the rarer furs which might last for some time. Failing this, the prospect is that, in the apparent impossibility of producing a substitute for fine furs, or breeding the animals bearing them in numbers sufficient to keep up supply, mankind will have to fall back upon the lighter and poorer furs, and the hair and wool producing animals. Lamb skin, in the hands of skillful furriers, can be made almost as beautiful as the choicer furs; hare skin can be so manufactured as to resemble sealskin, and of a good many of the smaller fur-bearing animals we are insured a fairly permanent supply. Prices will increase, doubtless, but as concentrated property that will only augment the charm of furs, which, as a gratification at once of the admiration for ornament and the love of luxury, will no more die out than the liking for flowers and sunsets. No doubt time will modify a good many of our ideas, but it will not change the desire of men to see things beautiful in themselves and especially to see their wives and daughters made attractive by the additional grace which rich costume imparts.

H. M. ROBINSON.

The American Dipper and Trout.

MORGANTOWN, W. Va.—*Editor Forest and Stream:* S. E. Loud, of the Centennial Fish Hatchery, of Wyoming, says that the bird known as the American Dipper, a description and illustration of which is given in Bulletin No. 55, "The Birds of Wyoming," by Professor W. C. Knight, of the University of Wyoming, is one that is very destructive to young trout, trout fry or the eggs of trout; having seen one of these birds eat a half dozen small trout at one meal, diving under the water in the fish ponds and staying until it secures its prey.

The bird is about the size of a robin, is a dark blue slate color, has a short tail and small wings. It is found along the mountains and small streams. He urges sportsmen to kill it on sight.

EMERSON CARNEY.

Sporting Reminiscences.

NEW YORK, Jan. 27.—*Editor Forest and Stream:* There is one superiority which no one will dispute with you: that is the superiority of age. And although that preeminence is not one of unalloyed advantage, it has the quality of enabling its possessor to remember more and further back than those who were born after him. Youth, after all, is a sort of disreputable appurtenance which every one gets over as fast as he can and is sure in the end to dispose of.

Look at the condition of the unhappy young men of the present day, who try to call themselves sportsmen. Sport! Clay pigeons. For the mawkish modern sentiment of combined newspaper nonsense and protection of animal hypocrisy will not even allow them the feeble sport of killing live pigeons with a gun and demands that they shall wring their necks mercifully without giving them even a chance for their lives. There is a certain exercise of skill, and that exercise of skill is precisely the pleasure of shooting which the silly people who have never enjoyed it attribute to love of slaughter and common brutality, and in so far there is sport in both these occupations, but the feeblest sort of sport it is. I remember when it was a common thing for me to go out in the glorious brown autumn when the air was becoming crisp and the leaves had turned to brown, and driving up Third avenue half way to the Harlem River, hitch my horse to the fence alongside the road, which was then a country dirt road, and going into the adjoining fields, kill a fair day's bag, say fifteen quail, two or three rabbits and a woodcock or two. And then I would get back into my buggy, and be home to a home dinner and good company at the usual hour.

There was good woodcock and English snipe shooting in Central Park long after it was laid out, and Mr. Alfred W. Craven, for years park commissioner and a devoted sportsman, used to invite me frequently to shoot with him along its water courses and muddy branches before it got into its modern elegance and development. Then, again, we would drive out to Jamaica, and shoot on the meadows or kill rail, as many as forty in a day, on One Mile Creek, just beyond the village.

In Jersey was most glorious shooting almost at our doors. The Big and Little Pieces, the Troy Meadows and a dozen other spots which I knew well then, but of which the very names have escaped my memory now, gave us the grandest shooting without exception in the world at snipe and woodcock, the kings of game birds. On one August day four of us bagged sixty woodcock that had come out into the flooded open meadow, and on another occasion, during two weeks, four of us averaged seventy-five a day in the big swamps of Jersey, a little further away. The farmers, too, were glad to see us, and often went with us and allowed us to shoot on the first day of July a few days before the law was up, as they then legally had the right to do. Further back still, when I was a very little boy, I used to see men fishing on the bridge from the Battery to Castle Garden, good fishermen, too, with the finest of reels, rods and tackle, and catching striped bass and weakfish in abundance of more than fair size.

And what a grand lot of sportsmen they were, that old guard, who never killed a bird unfairly and who trained their dogs, till there was hardly a more beautiful sight than to see a couple of them on a point, and perhaps one or two more backing. Frank Forester, William Henry Herbert, not a first-rate shot and a disagreeable man with his rude English manners, but a splendid writer, who has never had an equal in sporting matters. General Dix, who used to shoot bay snipe in his old days with Colonel Post at a special hole in the pond in the meadow east of Quogue, which they had purchased for the purpose and where they built a cover which enabled them to read when the birds were not flying. And Colonel Post himself, of whom the old darkey guide who accompanied them used to say, "The Colonel am a werry destructive man, a werry destructive man in a flock of snipe." Judge John K. Hackett, the most perfect shot, whether with gun or pistol, who lived in my time. Haywood Gibbons, who lived at Madison, where the famous racer Fashion was bred by his father, and who may be living still, for he went South during the Rebellion and I have not seen him since. Peter Vredenburgh, of Eatontown, N. J., with whom I have killed a half bushel basket of fall woodcock in a few days' shooting, and who was himself killed while fighting for his country in the Civil War. Charlie Banks, a splendid shot and good fellow who is still with us; Charles E. Whitehead, another like him; George Penniman, the man who discovered Currituck by rowing on an exploring expedition the entire length of the sounds of the North Carolina coast till he reached that paradise of duck shooters, where he has killed in a single day and to his own gun, a hundred and fifty of the best ducks that fly. Judge Gildersleeve, a young man to be in this category perhaps, who partly won his way to the bench through his preeminence with the rifle. William C. Barret, who, if he did get into financial trouble in his later days, was "a good fellow" all through, and cast the fly beautifully. My intimate old friend, Charles Carow, the father of the lady of the White House, who cast the fly simply to perfection, and with whom I have fished many and many a day on the waters of old Long Island and elsewhere as well. Charles Hutchinson, Mayor of Utica, a capital fly-fisherman. Cassius Darling, who accompanied me on many a trip into the forests of Canada to kill the glorious salmon. Judge Beebe, of Beebe, Dean & Donohue, the well-known lawyers, who, for a bet once dragged a light wagon from Vails, near Smithtown, to the railway station, five miles distant. Barret and he were there fishing, and when they were going home the wagon was brought out and left before the door, while there was some delay in hitching up the horse. Barret was uneasy, and said they would be late, when Beebe responded, "I could drag that wagon myself there in time for the train."

"I bet you $50 you could not," retorted Barret.

"Done," replied Judge Beebe, and without more ado he hitched himself in the shafts and off he started. Barret took another wagon and followed. Beebe won the bet, getting to the station just as the train was in sight.

And with that story I will stop, not that I need to stop, for the list was a long one and the times we had were good.

One dinner, perhaps, I shall tell about, however. A lady living at Madison, mother of one of the gentlemen whose name I have mentioned, ironically remarked one evening when we were making great preparations for the morrow's expedition, that she would have cooked all the woodcock we would shoot and give us all the champagne we could drink besides. We returned next evening with forty-two birds, and to this day I can see the lady's face when we produced them. She did not quite cook them all, and the dinner was a little late, but we had all that even a young man with a hunter's appetite could enjoy, and the champagne was frappéed to perfection.

In conclusion let me say, in the words of another good sportsman, General Davies, "Remember no man ever caught a trout in a dirty place."

Robert B. Roosevelt.

Natural History.

Yellowstone Park Game.

Editor Forest and Stream:

Four more buffalo cows have been added to the herd in the Park, purchased from Howard Eaton. They are from the Allard herd. They are quite contented with their companions from the same herd. Hay is fed to them every day, but they go out in the pasture to pick up a little range grass. There is a number of mule deer and a few white tail deer in the same inclosure. I took a ride the 8th down Gardiner River, and on to MacMinn's Bench (a shoulder of Mt. Everts). From the time we left Ft. Yellowstone until we returned we (Major Pitcher and I) were not out of sight of game for a moment. In fact, deer were in sight when we mounted our horses. We saw on the Bench back from the cliffs at Eagle Nest, about 150 antelope (I counted that number). There were in one band over 200 elk, and lower down, on Turkey Pen No. 1, we saw a band of 32 mountain sheep. Elk, antelope and mule deer were all around the place, where the sheep were, and scattered all over the side of the mountain toward the town of Gardiner. Elk, antelope and deer were on top as far as we could see. With field glasses we could see heads and backs of animals, their bodies hid by the turn of the hill. Across Gardiner River (to the west), at the springs above Ice Lake, there was one band of 118 elk. At Ice Lake I could see elk lying down along the shore, elk in the quaking asp groves, elk feeding and one drinking at an open place in the ice on the lake. Elk and deer were lying down and feeding on the ridges above the lake (to the north). Game was in sight in every direction. We could see bands of antelope on the flats close to the town of Gardiner. Returning, we saw 19 mule deer in what is known as the Company Garden (soldiers' garden). While we were looking at them others came down the hill and joined them, first three, then two, then three; then others were coming from the aspen groves and willow patches. It was now almost sunset; we did not stop longer, but started home. Across Gardiner River (we were now on the west side) were three very large bull elk close to the river, several others were up the river on the lower slopes of Mt. Everts. Mule deer were all along the road home, and at no time were we out of sight of some of the larger game.

Monday evening, or, rather, an hour before sundown, Howard Eaton and Major Pitcher started for a walk and to call on Buffalo Jones and to see the buffalo. They had their cameras. I was too lazy to go along, but not too lazy to stand on the veranda and watch them photographing a bunch of deer in front of the quarters. The deer paid very little attention to them or any one else. Three wood teams were on the road to the northwest; along the walks were several people, one lady with a baby carriage and a soldier scout horseback. The deer, nine of them, were surrounded on all sides by people. They were feeding on upland hay Major Pitcher had placed there for them. At first they used to pay very little attention to the hay, now they come to it every afternoon, and at most any time of the night some of them can be seen out there.

I had been curious to see the effect of the firing of the sundown or evening gun on them. So when I heard the bugle sound I watched them. Two soldiers came from guard house to the flag staff, two others went to the gun, the deer were between the two parties. The sentry and others of the guard were in front of the house. The two men at the flag staff were less than 100 feet away. The bugle sounded, the gun was fired and the flag commenced to lower at the report of the gun; the deer raised their heads, but did not stop eating. They paid more attention to the men with the flag. After all the men returned to the guard house, parties of ladies and officers were still in front of the quarters calling to each other and making remarks about the deer.

Sometimes one or two will pretend to be wild. One the other evening grabbed a mouthful of hay, and the loose hay hanging down to below its breast streamed back as it bounded away with the peculiar jumps and then trot. I called to it, "Oh, you wild fat rascal, come back with that hay." Another deer started up, bounded off about 100 feet, turned, bounded back past the other deer, trotted around a bit as though it was warming itself by a little exercise. The one with the bunch of hay in its mouth stood eating it 200 feet away; suddenly it whirled and went bounding toward the others, moving its head with a backward and forward movement at every jump. I called it "putting on style." I talk "baby talk" to them, as our friend Col. Pickett calls it. Call them "villins," fat rascals and wild things, and tell them they will starve to death if they don't keep away from that hay; but they pay no attention to my talk until I cry like a young deer or a coyote, then their heads are up, for a while they are all attention, their ears out like small wings, but soon with a toss of their heads they are eating again, saying "it's nobody but that old, foolish Billy Hofer trying to make us think he can frighten us." They all seem to know that no one wants to hurt them.

Back of the commissioner's house is a favorite place for about 20 deer; these may be seen most any time. Along the road toward Golden Gate may be seen from 20 to 50 deer any time; these are most all bucks. One has a peculiar growth from each horn, a branch forward toward its nose, making it look a little bit like a caribou. I call him the caribou deer. Several shots have been taken at him with a camera. I hope some of the shots were true and that we will have his picture Monday evening. We were out that way, and the doctor shot both deer and elk with his faithful 4x5. One fine buck was about 50 feet from the road; a wood team had just passed; we stopped to let the doctor have a shot. I called, but the deer would pay no attention to us until I gave him the coyote cry, then he looked up for a second, long enough for a shot, but went to pawing snow and eating; his actions seemed to say, "I wonder what's the matter with that crowd? Wonder if they think I'm going to pay any attention to them!" Indifference would be a good name for his picture.

Howard Eaton, of Medora, went out on McMinn's Bench with Major Pitcher, Lieut. Cullen and Scout McBride. Howard says he saw and counted 600 elk, 400 antelope, 30 mountain sheep, and did not try to count the mule deer, but saw many, over 100. Mr. Eaton counted these animals not estimated. All this game was within less than three miles of the town of Gardiner, Montana, and at that only those animals on the east side of Gardiner River and in the Park. There are people who doubt these statements and who even say, "I don't believe it." They make me think of the gentleman whom I met at the Grand Cañon Hotel along toward '89. I was telling a friend of mine about the buffalo in the Park. This gentleman "chipped in" and said "he did not believe there was any buffalo in the Park." I looked at him a moment, and then said I was not worth much, but would put my outfit up against $500 that I would show him buffalo within less than ten miles of the lower Geyser Basin. But he would not go out, said he could not ride horseback. I wonder if he expected to see all the game in the Park along the wagon roads? Why! of all the game to be seen here now; around Gardiner, Ft. Yellowstone and other parts of the Park, animals by the hundreds and thousands, hardly one can be seen by the time the tourist season opens. People who make the tour of the Park along the usual traveled routes see very little of the game range of the country, while in the timber they can see but a few feet each side of the road, and usually see only one side at that. Even in the open country they see very little of it, and while there is game to be seen in the open country in summer, it is not usually where wagons travel. How very little of a country one does see closely enough to distinguish an animal if it were in sight, very few people realize, and yet they talk of seeing a greater part of the Park when they have traveled some of its wagon roads, and say there is no game in it because they did not see it. Once I was taking a party through before the days of wagon roads; we had seen considerable game, and were traveling along the shore of Yellowstone Lake. One of the gentlemen of the party said he did not believe there were any trout in the lake because he could not see them. A gale was blowing at the time; the lake was rough and the season was late October. I told him I would try to catch some trout that night, but it commenced to snow and snowed all night and all next day. I did not attempt to take trout and he did not see any. I told him I could not help what he believed, but the trout were there just the same. So it is with the game. I don't care much what people believe or disbelieve. The game is here just the same. I would like to have some of my friends come out here and see it, not that I think they doubt my word, but because it is such a glorious sight—four and five thousand elk and other animals, to say nothing of ducks and other water fowl. I have been from Florida to Alaska, from the Atlantic to the Pacific; I have been on the plains in the buffalo days when they could be seen by the thousands; I have seen antelope by the thousands and other animals in great number, but never was where I could see so many different animals and in such number at one time and all so tame, as can now be seen in the Yellowstone National Park. As I write I can see from the window eight does and one large buck mule deer feeding on the hay in front of the quarters. This in the bright sunshine at 3:10 P. M.

Jan. 12 Howard Eaton went with a party from the post to Specimen Divide. Between Ft. Yellowstone and Yancey's he counted 749 elk, 21 mule deer and 1 coyote along the trail. Just before reaching Yancey's they ran into a large band of elk. It was getting late, and as the elk were in timber as well as the open country, they could not get a careful count, but made out the band to consist of not less than 400. On the 13th, from Yancey's to half-way to Soda Butte, they counted 1,120 elk, 2 mule deer, 1 white tail, 5 coyotes; this along the road; 800 elk were estimated in small bands on hills in sight, but too far to count. Now this trip was made in fine weather; the elk were back from the road on the higher feeding grounds. By leaving the road they could have seen a great many more or had the snow been deeper. Howard is satisfied there are a few elk left.

The wild mallard ducks are getting tame, too; they feed in large flocks on refuse close to Ft. Yellowstone, and can be seen in the road picking up oats scattered from the loads freighted from the railroad. There duck are the only ones that can be called tame; several other kinds are wild yet, and they will fly when teams pass closely.

C. J. Jones got a fine lion in his trap the other day, making two killed this winter, to date. This is not killing them fast enough.

A party of eastern people have at last seen some of the game. They came up here Monday, the 19th, and returned next day to Livingston; they were en route to the Pacific coast. They were well satisfied with what they saw during their short visit.

We are very much disappointed because Mr. Grinnell did not come out. All the Boone and Crockett Club should visit the Park once in winter. H.

Animal Tracks and Trailing.

I remember as if it were but yesterday, the first trip that I took into the real wilderness. It was in the overflow lands of eastern Arkansas, a region of canebrakes, cypress sloughs, tupelo brakes and vast stretches of flat-woods in which sassafras grew four feet thick and persimmons rose slim and straight as masts to a height of ninety feet or more. It was indeed a new country to me, a Northern man by birth and breeding, and everything puzzled me. I remember how surprised I was to find that fish poles, on their native soil, have leaves. And I remember, when we first saw a cypress swamp, with the great "knees" protruding, how one of my companions from the North exclaimed: "Well, some fellow must have had a dickens of a lot to do to come here and sharpen all those stumps!" But the tracks of animals puzzled me most of all. The guide would say, "Here went a doe, here a big buck followed her, here he jumped over this log," and so on; and he always wound up with a "Can't you see?" No, I could not see. My eyes were sharp enough over the rifle sights, but they could see nothing to show what animals had passed, or what they were doing at the time. It took me a week to distinguish with confidence a deer's track from that left by a razor-back hog.

I thought at that time that if some competent person should publish accurate illustrations of the feet and tracks of our principal wild animals, together with others, showing how they differed from tracks left by cattle, hogs, and dogs, it would go far toward initiating a novice into the mysteries of tracks and trailing. And it would.

That such a thing is practicable has recently been proven in Germany. In the latter part of 1901 there was published by J. Neumann, in the little town of Neudamm, in Prussia, a book that does for European sportsmen what I wish somebody would do for Americans. It is entitled "Fährten und Spurenkunde," which, freely translated, means The Art of Tracking and Trailing. The text is by Eugene Teuwsen and the illustrations by Carl Schulze. There are 163 capital wood cuts, mostly life-size, showing with more than photographic exactness the tracks left by European game. The drawings are from nature, and are so faithful that, by their aid and a little study of the text, a small boy should be able to tell, on moist earth or snow, what animal had made a given track, and at what pace it was traveling. The descriptive matter and illustrations fill 132 octavo pages. The book retails at 6 marks ($1.50).

As an example of the author's method in teaching the art of trailing, we may cite his treatment of the red deer's tracks. He first gives descriptions and life-size drawings of the under side of the hind feet of the mature male red deer, fallow deer, wild boar and roebuck. As the drawings stand side by side, on opposite pages, one can take in at a glance the essential differences between the feet of these four beasts. Following are illustrations showing the slight difference between the track of an old and feeble red deer and that of a sturdy buck fallow deer; also the resemblance in size between the foot prints of a red deer fawn in July and that of a doe fallow deer. Drawings are also given showing the marked difference between the feet of red deer stags and hinds. The author then discusses the length and breadth of tracks of stags, hinds and fawns; their length and width of pace; the extent to which they "toe-out" in walking; the impression of the dewelaws; the "balling" of tracks in snow or mud; the overreaching of the hind foot in walking; the signs left on moist leaves, etc.; the marks made by the antlers on bushes and trees; the indications of different paces in walking, running and jumping; and many other nice points in reading a deer's movements. The chapter concludes with a dissertation on the droppings of deer of different ages and at different seasons. The various sub-headings are accompanied by 30 illustrations, conscientiously drawn from nature by an artist thoroughly familiar with his subject.

In like manner, though at less length, the book describes and illustrates the tracks of the moose, fallow deer, roebuck, chamois, wild boar, hare, rabbit, squirrel, bear, wolf, dog (for comparison), fox, wildcat, badger, otter, woods and stone martins, polecat, various weasels, and, among fowls, those of the capercaillie, black-cock, hazel grouse, moor-hen, quail, pheasant, curlew, bustard, crane, stork, heron, swan, wild goose, wild duck and rook.

The text is hard to read, owing to the multitude of words unfamiliar to an average reader: for the German language of sport is so technical as to require a glossary of its own.

This book shows us what can be accomplished by type, and especially by well-executed drawings, toward preparing a novice for the practical study of this most difficult branch of wildcraft. A book alone cannot make a good trailer of anyone, but it can teach him what to look for, and can save him many a blunder. It shortens the curriculum. This is all that the best of manuals can do—but it is a great deal.

Cannot some one give us a similar book on the tracks of American game animals? It would be interesting, not to hunters only, but to everyone who loves outdoor life.

Horace Kephart.

Is "Protective Coloring" a Myth?

NEW YORK, Jan. 27.—*Editor Forest and Stream:* Most naturalists, I take it, will agree with the comments made i nyour issue of Jan. 31 by Mr. Francis Moonan on Mr. Paul Fountain's views on protective coloration, or, to speak more fully, with regard to the adaptation of form and color for purposes of concealment.

Moonan, however, does not call attention to the fact that Mr. Fountain distinctly contradicts himself on a number of occasions. Speaking of the ant bears and sloth he states pp. 124-5 that they "look, even when you are close to them, so much like a bundle of the dried herbage that they often escape the eye of the hunter, and would be sure to do that of the novice."

Further on, speaking of the ant bear and its habit of turning its large, bushy tail up over its back, he says that it does this "in such a manner that when the animal is squatting on the ground it is completely hid under it, and looks like a tuft of dead grass."

Still further along, he says of the two-toed and three-toed sloths that they "so much resemble a bunch of dead dried-up twigs in the trees that they are not easily discovered except by experienced eyes."

All this, of course, agrees very ill with his earlier statement that coloration is no protection whatever to the human eye; and that the practiced hunter is never deceived by it unless as the result of his own carelessness.

NATURALIST.

Potato Bugs and Quail.

MILFORD, Conn., Jan. 26.—*Editor Forest and Stream:* In Prof. Attwater's published investigations regarding the usefulness of our bird fauna to the husbandman, he states that he found 101 potato bugs in the body (stomach) of a single quail. This raised the question in my mind as to the possibility of quail being poisoned by the paris green solution that is universally used in New England and elsewhere, to clear our potato fields of these beetles. The fact that we have had more quail in the season just past than ever before and almost no potato bugs during the summer, and consequently very little "paris greening," may or may not be a case of cause and effect.

Has this theory ever been advanced, and is the potato bug a favorite with the quail—a *bonne bouche?*

DR. MORTON GRINNELL.

[This suggestion has been made before, but we know of no observations to show that quail are ever affected by the poison which is used against the beetles.]

The Wild Pigeon.

A CORRESPONDENT sends us a press clipping dated Denison, Tex., Jan. 23, and relating that "Dr. A. T. Canova and Mr. Marklin passed through here to-day en route to Chicago. They have spent the past two years in the district of Valladolid, Yucatan. Dr. Canova thinks he has cleared up the mystery surrounding the disappearance of the wild pigeons from the United States. He saw thousands in Yucatan, and within the past year they have appeared in portions of Mexico. The doctor predicts that they will again appear in the United States as numerous as ever."

But the pigeons Dr. Canova found in Yucatan are not the wild pigeons of this country, and consequently their existence does not clear up the mystery of the disappearance of our species.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

A Boy and Some Crows.

Editor Forest and Stream:

A correspondent in a late number of FOREST AND STREAM thinks that the crows should have some mention in its pages, and so do I. The crows were the first birds I ever shot, though I would not kill one of them now, nor let them be killed if I could prevent it.

When a small boy in Pennsylvania I spent most of my summers on a farm of my uncle's that was part of it in two counties; it was right on the line, his house being in Allegheny County and his barn in Butler County. This country, though it was only a few miles out from Allegheny City, was a backwoods then in 1845, the houses being often several miles apart. My uncle's house stood half a mile from the main road, and a lane led up to it; one side of the lane had heavy timber on it all the way up, while a large corn field occupied the opposite side.

A colony of crows, there must have been nearly, if not all, of a hundred of them, had their roost out in this timber, and every morning soon after sunrise they would fly down to the cornfield and stay in it nearly all day.

Farmers thought then, as most of them still think, that the crows only damaged them and were of no benefit to them. I was too young then to think, but when hunting these crows I almost always found them on the ground between the rows of corn; they were after insects, not corn, then, though they did attack the corn once in a while. The ears were only just forming then. Later they might do more damage. My uncle had scarecrows all through the fields, but they did not scare many crows; I do not believe we have a bird that can see any further through a ladder than a crow can, or can put this and that together more quickly than he can. I had one of these crows for a pet for a year and learned something about them; these crows had no doubt found all about these scarecrows long since.

Some of these scarecrows were long poles planted in the ground with a clap board, a rude oak shingle, hung to the top of the pole by a rope. In theory this board was supposed to swing with the wind and scare a crow clear out of the country. In practice it did nothing of the kind. My uncle had several old suits of clothes stuffed with straw and planted on poles; I shot a crow that was perched on a hat on one of these bogus men; it had not scared that crow.

One of my cousins had made me a bow of stout hickory and a number of arrows; some of them he had tipped with sharp horseshoe nails to kill birds with, he said; I killed the crows with them.

I began to practice first on a tree and kept at it until I could hit the tree 30 feet away, then began on my aunt's chickens; and now my uncle called my attention to the crows, telling me that he would pay me one cent each for every crow I killed and brought to the barn, where he could count them. I don't suppose he expected me to kill many of them, but before I had part of these crows killed and the rest driven off for good I had him nearly bankrupt.

A cent then looked almost as large to a farmer as a dollar does now. The old copper cent that we had then was as large as a half dollar is, and these farmers made most of their payments in trade; if they could get money enough to pay their taxes they were satisfied. I began on the crows while they were seated on the top rail of the fence before they went to work in the field each morning. They seemed to be holding a kind of meeting here; they may have been calling the roll; they made noise enough, anyhow. At first they paid no attention to me; I have since thought that they may have taken me to be a little girl. I looked like one, I thought; I was dressed much like one, we had no knee pants for boys then, and the most of us could not get long trousers before we were six years old; I was that age now, but still had the skirt on, it would now be called a kilt suit, a short heavy skirt and a jacket. I began by crawling along close to the fence, then when near enough to a crow I would send an arrow into him. These arrows of mine would not kill them very often, but the crow would drop, then I caught and finished him. I got six in all the first day, and was paid for them in silver, a Mexican "fip"; they were current then, four of them making 25 cents.

Part of these I got off the fence, the rest I got by following them through the corn and sneaking up on them; but after a day or two I could get no more off that fence; they had me marked now, and as soon as I would show myself a crow would call out caw—"there he comes," I reckon; then they would get out of that. Next I lay in the weeds behind the fence and got a few; then they quit calling the roll here on the fence and went straight from the timber to the field. I kept after them every day except Sunday for just two weeks; and finally, on going out to meet them one morning, not a crow came; they had emigrated, and they did not return that summer.

There was one thing I got while hunting them that pleased me, I had always wanted to get out of this petticoat, as I called it. I got out of it now, my aunt made me a pair of trousers so that I could get through the corn easier; I never had to wear the skirt again.

I have forgotten exactly how many crows I got in all, I think about 30 though. A few days before they left me for good, I shot one, and on going to pick him up he got up and bit me, I had only stunned him. I kept him alive, and taking him home, my cousin clipped one of his wings to prevent him from flying, then I got a flour barrel, and laying it on its side put him in it and fed him all the corn he could eat, he seemed to be contented here. He had the run of the yard, and was not here a week before he was in the house and all over it; there was not a hole or corner that he could not get into. There was nothing that crow could carry off that he did not try to steal; I have known him to have my aunt's scissors, her thimbles, sewing thread and half a dozen teaspoons, all in his barrel at one time; I found my cousin's finger rings, all her hair pins and a pair of ribbon garters, all in his barrel one day; she had not missed them yet. I once saw him try to carry off a large brass candle stick. Any thing that was bright was what he seemed to want. I took him with me to town when I went home and kept him there all winter, then brought him out to the farm again the next summer.

These crows that I had hunted last summer or others—I think they were my old friends though, they seemed to know me—were here again; I got after them again, but did not have to go after them often; they left, and took my crow with them. I had let his wing feathers grow; I did not think he would leave me now, but he did.

Late that fall he came back alone and stayed in the barn all winter; he would let them feed him, but never would let himself be caught now. I think had I been there I could have caught him. He left in the spring and never came back. My cousin had another pet for me this year, a young raccoon, that he found one cold morning in April half frozen on the barn floor. He brought him to the house and thawed him out, then kept him for me. I had him for two years, and while I had him I was the only one he would let handle him without biting them, I could carry him around in my arms, he never offered to hurt me. I forgot to leave him water one night and he slipped his collar and left.

While I had the crow there was a lady living across the street from me who had a parrot that her brother, who was a sailor, had sent her, and I think that her brother, if it was he who had taught the parrot English, must have been a mate and a profane one, too. This parrot seemed to have mastered about all the cuss words in our language, but he knew nothing else. I tried to teach him some of our boys' slang, as "go choke yourself" and "soak your head," but I would get in return, "Go to Hades you lubber."

I found out that the parrot hated the sight of my crow. That suited me. I would carry the crow over to the parrot's cage, then hold him here, while the parrot ran the whole string of cussing, all he knew.

He had a string of oaths that he would repeat, and as soon as he had got to the end he would begin at the beginning again; he never got his remarks mixed; he would always address me and the crow as d—d lubbers, that is why I think a mate had taught him. The lady would stand his conversation for a while, then run the crow and me off with her broom.

CABIA BLANCO.

California Jottings.

SAN FRANCISCO, Jan. 20.—The California Game and Fish Commission has won its case against John F. Corriea, the commission merchant, who has been a persistent violator of the game laws himself and the instigator and beneficiary of countless violations of the law on the part of others. Police Judge Mogan rendered his long delayed decision, found Corriea guilty and imposed a fine of $40. Corriea has signified his intention of appealing. The case was a most important one by reason of the principle involved, and also because the offender was not a mere market-hunter, but a man of substance, employing numerous agents and hunters, not alone in this State, but throughout the Pacific coast. In view of the magnitude of his transactions, the fine imposed appears insignificant, but the commissioners are content. Their aim has been for months to secure the conviction of some prominent commission merchant under what is known as "the possession clause" of the act, and this they have now accomplished. The clause in question reads as follows: "Every person who, during any one calendar day takes, kills, or destroys, or has in his possession more than twenty-five quail, partridge, snipe, curlew, or ibis, or more than fifty doves, or more than fifty ducks, or more than twenty rail, is guilty of a misdemeanor." Mr. Corriea was caught with just twenty-six quail in his possession, which had been shipped to him by the deputy game warden at Oroville, and he is the first commission merchant to be convicted under this particular section of the Act. It will be readily seen that if the higher court sustain the construction which has been placed upon the Act by the police court and the commission enforces the law in the future as rigorously as it has done in the past, the sale of game in California will practically cease, for to carry on the business with a stock of an odd dozen or two of assorted game birds would never pay.

A Record Wildcat.

The largest wildcat that has been killed in the neighborhood of San Francisco for the last ten years, was secured by Dr. W. F. Jones, of San Rafael, while shooting quail on the Lucas Ranch, about three miles from that city. Like all the wildcats in the vicinity, this one was of the lynx species with tufted ears, whiskers and a ruff about the neck. He was extremely fat, and his pelt was in fine condition. He measured, unskinned, and without stretching either the truth or the cat, from the end of his nose to the tip of the bone of his tail, thirty-eight inches. I have read of them in the newspapers measuring five feet and upward, but this one was five inches longer than any wildcat out of fifty odd that I have seen.

Ducks and Quail.

The season for ducks and quail closes on Feb. 1 in this State, and in some of the counties the quail season closed on the 15th inst. Sportsmen are unanimously agreed that valley quail this year have been scarcer than ever before in the history of the State, and the duck shooting has been nothing like as good as it was last year. Prevailing climatic conditions furnish a satisfactory explanation of the dearth of ducks. There have been no high winds or severe storms this winter, and foggy days and a more or less unceasing drizzle are anything but favorable for the sport. As to the valley quail, each year it is becoming more evident that something must be done to prevent the wholesale trapping of these birds by Portuguese and Italian-Swiss ranchers, who own or lease nearly all the dairy and other agricultural properties within easy reach of San Francisco. This year, while shooting quail, I have personally smashed 15 quail-traps on as many ranches; but as it is only the work of 10 minutes to construct a new one out of an old fruit-box, it is questionable whether any particular good is done by smashing them. What is needed is a liberal appropriation for the fish and game commission and a rigorous enforcement of the law, and this last cannot be had without the appropriation. Unless this is done, within a few years, open quail shooting in the neighborhood of San Francisco will be a thing of the past. Limiting the bag to 25 birds, as under the present law, can accomplish very little toward preservation, because it is impossible for even the most expert shot to bag 25 birds in a day in this neighborhood. My best bag this season over unpreserved ground, was 14 birds, and the best bag of the best shot of my acquaintance over similar ground was 19 quail. Even in the preserves there were few days when anybody got the limit. As for ducks, I do not know to my own knowledge of a single instance when 50 birds were bagged in a day by any one sportsman, although I heard of three such cases, and upon investigation found that in no instance had the shooter reached the limit, although they had come close to it. The San Francisco commission merchants are responsible for the wholesale trapping of quail by ranchers, as almost all birds so trapped are shipped to the city and sold in direct violation of the law. Very few are sold locally.

Game Commission Items.

Deputy Game Warden L. N. Kercheval ran down to Bakersfield the other day and stepped into the Louvre for luncheon. He had heard that they were selling quail there, and although they did not appear upon the menu, the only game entry being "squabs," he asked for quail, got quail, ate one of them, pocketed the other and paid the 50 cent check. "Who is running this restaurant?" he inquired of the cashier. "Mr. D. M. Sill is manager. You will find him right over there, sir." Deputy Kercheval arrested Mr. Sill, who evinced no surprise, but prepared to accompany him. "Surely you knew it was against the law to sell quail?" queried Kercheval. "Certainly I did. I have been in the hotel business thirty years and have to serve what my customers call for. I have been expecting to be arrested every day. I shall plead guilty and pay whatever fine the justice may assess me"; and Sill was as good as his word; paid the $25 fine, shook hands with Kercheval

and went back to his restaurant. L. Byer, a local merchant of Santa Margarita, who was acting as a shipping agent for San Francisco commission firms, was also fined $25 last week. The eight men who were arrested in the mountains of Tehama County, red-handed, and were charged with slaughtering deer out of season, were all acquitted by an intelligent jury of their peers after a two days' trial at Red Bluff, Shasta County. Game protection does not appear to be popular in the northern counties. MARIN.

The Adirondack Deer.

From the forthcoming report of the New York Forest, Fish and Game Commission.

IN response to a continued and growing demand for information about the larger animals of the Adirondack region, the Commission has followed its usual course in collecting various facts and statistics relating to the fauna of the woods. Great care has been exercised to have the facts and figures given represent accurately the conditions as they exist, and it is believed that the camper, the sportsman, and even the resident of the Adirondack counties will find something of interest and value in what follows. The proof that the herds of deer are steadily increasing will of itself give much satisfaction, and the success that has attended the effort to restore moose to the woods will undoubtedly prove gratifying to the many citizens interested in the movement. The introduction of elk is at best an experiment, but it has thus far proved to be successful, and the people of the State are indebted to a public-spirited citizen for generous donations of these valuable animals. Many letters received by the Commission attest the pleasure which the vast army of visitors to the Adirondack region has experienced and is yet to experience from the introduction in this territory of the animals mentioned.

The Adirondack Deer.

One of the very best evidences of the value of protection is furnished by the marked increase in the number of deer secured by hunters in the Adirondack region annually. In spite of all predictions to the contrary, the herds of deer have steadily grown; and although the army of hunters is continually increasing, as shown by the heavy travel to the woods during the hunting season, the inroads made yearly have not appreciably diminished the number of these animals within the State's forest domain. In response to the continued demand of those interested in this subject, the Commission has collected, with the aid of the American and National Express Companies, a record of the shipments made during the hunting season of 1902. These figures, and those of the two preceding years, are as follows:

	Carcasses.	Saddles.	Heads.
1900	1,020	89	95
1901	1,062	103	121
1902	1,354	113	193

From the increase in the number of carcasses shipped it will be seen that, in round numbers, about thirty per cent. more deer were secured by hunters in the Adirondacks during the season of 1902 than during the previous year. By following the generally accepted rule, that four deer are killed in the woods for every one shipped out by rail,* the great increase in the returns secured by sportsmen as a result of protecting these animals will readily be seen.

The interesting statistics furnished by Supt. John L. Van Valkenburgh, of the American Express Company, and Supt. T. L. Smith, of the National Express Company, who vouch for the accuracy of the figures given, are as follows:

Season of 1902—Shipments of Deer from Points in the Adirondack Region.

Total shipments	1,354	113	193

From the weight of the carcasses recorded in the shipping bills of the express companies, it will be readily seen that the Adirondack deer, when properly protected, will develop a size and weight fully equal to or surpassing that of the species in any other locality in North America. The following are some of the shipments reported which seem worth noting:

Railroad Station.	Consigned to.	*Dressed Weight.	Live Weight.
Big Moose	C. P. Floyd, Remsen, N. Y.	203	254
Eagle Bay	J. Larsehn, New York city	200	250
Hinckley	J. L. Roberts, New York city	225	281
Lake Clear Jct.	J. Mulholland, Saranac Lake, N.Y.	206	257
Benson Mines	C. Simmons, Ogdensburg, N. Y.	200	250
Benson Mines	H. Miller, Jr., Harrisville, N. Y.	202	252
Boonville	W. A. Brown, Utica, N. Y.	225	281
Carthage	D. Mosher, Watertown, N. Y.	200	250
Castorland	Harry Waugh, Fulton, N. Y.	209	261
Glenfield	Geo. Bacon, Herkimer, N. Y.	208	260
Lowville	L. Freis, New York city	200	250
Lowville	A. G. Lewis, Buffalo, N. Y.	205	256
Lyons Falls	H. L. Smallinger, Utica, N. Y.	200	250
Newton Falls	D. Gayne, Watertown, N. Y.	208	260
Prospect	Geo. Windheim, Utica, N. Y.	211	264
Johnstown	J. Stewart, Albany, N. Y.	200	250
Northville	J. Reeifer, New York city	235	294
Northville	C. C. Weimer, Albany, N. Y.	202	252
Northville	H. M. Bowler, Amsterdam, N. Y.	210	262
Northville	R. Christian, Amsterdam, N. Y.	210	262
Northville	J. Osborne, Johnstown, N. Y.	215	269
Dolgeville	Ralph Graham, New York city	204	255
Winthrop	F. F. Stevens, Ogdensburg, N. Y.	200	250
Otter Lake	W. E. Champayn, Corning, N. Y.	226	282
Tupper Lake	A. W. Lasher, Canajoharie, N. Y.	250	313
Port Henry	J. E. McGue, Rouse's Point, N. Y.	204	255
Stony Creek	G. A. Lawton, Hadley, N. Y.	220	275
North Creek	Mrs. Chas. Smith, Glens Falls, N. Y.	219	273
Riverside	F. Pallarand, Saratoga, N. Y.	240	300

By adding one-fourth to the dressed weight, the live weight of the animal may be determined with reasonable accuracy.

Under the appropriation of $5,000 made for the purpose of restoring moose to the Adirondacks, the Commission will, by the time this report reaches the public, have procured and liberated in the forest a dozen of these animals. It is expected that as many more will be secured in the near future. The restrictions on the shipment of moose from other States and from Canada have made it extremely difficult to procure these animals, and carload lots are practically an impossibility. Stringent laws exist in Canada and elsewhere against the shipment of live moose at any season. Those which have been secured and placed in the Adirondacks have done well, and Protector J. Edward Ball, who has had charge of the work of liberating the animals, reports that they are now in excellent condition. The moose were set at liberty near Uncas Station and have yarded for the winter in two places—one just south of Raquette Lake and the other about three miles east of Big Moose Lake. The report of the protector says: "The moose are doing well, and there seems to be no reason why they should not increase in the Adirondacks. They have plenty of food, and will do well if let alone." He further says: "The residents of the Adirondacks are taking great interest in the work of restocking the woods with moose, and, with the railroad employes, render all possible assistance in handling the animals." One of the moose liberated last summer was shot by unknown campers in the vicinity of Eighth Lake, and the department is now investigating the matter. The work already done toward procuring moose, under the appropriation furnished, has greatly encouraged all those interested in the effort to secure the return of this magnificent animal to the Adirondack region.

In addition to the 22 elk placed in the Adirondack forest a year ago, which were the gift of Hon. William C. Whitney, 40 others have been shipped by him from his private preserve at Lenox, Mass. This generous gift will be thoroughly appreciated by all lovers of the Adirondack forests, and entitles Mr. Whitney to the thanks of the people of the State. The elk were donated from Mr. Whitney's October Mountain estate, and were shipped to Long Lake West. Five other elk were given during the year by the Binghamton Park Commission to Mr. William Dart, of Dart's Camp, near Big Moose Lake. They will be cared for during the winter by the Brown's Tract Guide Association and liberated in the spring. Mr. Harry V. Radford, who is an enthusiastic supporter of the plan to restock the Adirondacks with elk and moose, recently paid a visit to the woods for the purpose of estimating the number of elk now there. His figures show that there are upwards of 80, which include those liberated and those born in the forest. Both the elk and the moose are greatly admired by visitors to the Adirondacks, of which there are thousands every summer, and it is believed that these animals will thrive and become an important feature of the northern wilderness.

The same forces which united to secure the restocking of the woods with elk and moose are now interested in an effort to protect the Adirondack black bear. Reports from all sections of the forest indicate that this is a move in the right direction, and that, with suitable protection, the bear will soon multiply to such an extent as to become again an important factor in the game of the region. No estimate has been made of the number of these animals in the Adirondacks, but there is no doubt that unless proper protection is given, the black bear is in danger of becoming extinct in northern New York.

* A large number of deer are taken out of the woods each season in wagons by farmers and sportsmen who live near the borders of the Great Forest of northern New York; and a large amount of venison is consumed in the hunting camps, lumber jobs, hotels, and by the "natives" or residents of the woods.

* As weighed and billed by the agent of the express company.

Experience as a Teacher.

Editor Forest and Stream:

During fifty-five years of shooting my experience has been varied, much of it pleasant and some bitter. Up to five years ago I was never injured with a gun nor injured anybody. At that time several of us were hunting rabbits in the woods, and one of the party exclaimed, "There goes a rabbit." I looked quickly, and saw a rabbit scooting for all it was worth right past me, 15 feet distant. At the same instant he fired, and I received a number of the No. 7 shot deep in my thigh. He stood but 4 or 5 rods from me. If any of my readers have ever felt the sensation which I experienced, I have no need to describe it to them, as they will ever remember it. It seems that a portion of the charge struck the side of a tree and glanced off the slippery surface under the bark and came straight for me, when the shot found both easy and warm lodgment.

The shot cause me no inconvenience whatever, and I will carry them to my grave none the worse for them, but I do not care to repeat the experience, and I suggest that we had all better be just a little more careful, perhaps, when we are shooting among the trees.

Some three months ago a friend and I were shooting quail in Connecticut. We were in adjacent fields some 60 or 70 rods apart, with a stone fence between us. He fired at a bird and dropped it, and at the same time I felt a stinging sensation in my left eye. It was found that a piece of a No. 9 shot had passed through the eyelid and lodged on the white of the eye. A stray shot must have struck the wall and deflected. Eight weeks of torture caused me to visit the Williamsburgh Hospital, where Drs. Butler and Cameron made a thorough examination of the suffering member, and advised its removal, especially if I wished to retain the other (my shooting eye) in good condition. Well, I did, of course, and the following day I climbed upon the operating table (the same one, by the way, where a darling daughter had laid three months before, and is now hearty and well), and performed the operation, which was a splendid success. They have given me another eye, which (although it cannot see) would astonish you—it is so perfect and life like. Glass eyes usually stare, because the removal has been clumsily done. If any of my brother sportsmen ever have the misfortune which came to me, let them write me and I will direct them to the best doctors in the country, and they will thank me as long as they live. Four weeks since I parted with that dear old eye which had done me good service for sixty-seven years, and now I am about ready to shoulder my little Baker hammerless again and make acquaintance with the ducks, as of old. A Happy New Year to editor and brother sportsmen, one and all. UNCLE DAN.

ORIENT POINT, N. Y.

Call Ducks.

MADISON, N. J., Jan. 25.—*Editor Forest and Stream:* I belong to one of the best clubs on the Virginia beach, the Princess Anne, and we use live decoys, geese, ducks and swan. Our ducks are bred as near mallard and black as possible, but some member of a nearby club recently sent down a stand of what he said were call ducks.

Will you kindly give me your opinion as to their worth as decoys for mallard, black, sprigs, widgeon, etc. Also, where I could procure some eggs to hatch under hens or ducks? I have suitable water—a good pond covering nearly two acres—in which I have had some English swans for three years. If these call ducks are not the "proper caper" for decoys, can you recommend any other variety suitable for our use in Virginia? I write simply as a member of the club aforesaid, with personal interest only. M. T.

[Call ducks are a strain of small domestic ducks said to be imported from Holland, but no doubt common enough in this country. Often they are white, but usually resemble in color the mallard, from which they are no doubt descended. The name is given them on account of their noisiness, for they quack and gabble more than most ducks. We have seen them call to all sorts of birds flying by, and, of course, this practice is very useful to the gunner who is using them as decoys. They would be useful as decoys for all the species mentioned. We do not know where these ducks or their eggs may be procured, and shall be glad if any of our readers can tell us.]

New Hampshire Fish and Game.

In their report for the year ending Dec. 1, 1902, the New Hampshire Commissioners of Fish and Game say:

From reports received from all sections of the State, we think we can safely say the fishing and hunting in New Hampshire has not been better in the last twenty years than in the past two seasons.

The brook trout fishing has been especially fine. Partridge, woodcock and quail have been very plenty.

It has not been uncommon for two hunters, in the last two seasons, to bring in a string of from ten to fifteen birds as the result of a day's hunt.

Ten years ago the snaring was common in many parts of New Hampshire; to-day we seldom hear of a snare being set, although this fall we had the pleasure of breaking up one of the worst gangs of snarers in New Hampshire. One of the gang is serving a jail sentence, and the others are under suspended jail sentences during good behavior. These parties were sending their game to New York, where they were getting as high as $1.25 each for partridge.

It is a fact beyond question that the law prohibiting the sale of game is doing much to help your commissioners to enforce the laws. By stopping the sale of partridge, and the practice of snaring, by regulating the length of the open season, and with New Hampshire's increasing area of sprout land and forest, this noblest of game birds (which has no peer in the country) will be spared indefinitely.

As a rule we are opposed to changing the fish and game laws, but we are of the opinion that it would be far better to have the open season commence Oct. 1 on all kinds of game, rather than on Sept. 15, as it does at the present time. On Sept. 15 many of the partridge are not full grown, and some of the bevies of quail no larger than sparrows.

Last winter the snow came so early that the partridge were driven to budding in November and December. They are then slaughtered by parties who drive round the wood-roads between sunset and dark, killing the birds from forest trees where they can do no possible harm.

If a law could be passed to prevent this killing of partridge while budding (we would say make the open season October, November and December), we would then have full grown birds that are able to take care of themselves, and when secured, of some account.

Three years ago we liberated fifty dozen quail. They were turned loose from the southern border, and as far north as Lake Winnipesaukee. It is impossible to reckon upon these birds living through some of our severe winters, but the last two winters have been remarkably favorable, and during the last fall excellent quail shooting has been had in many parts of New Hampshire.

We believe that for the amount of money expended in purchasing quail, no better results have been obtained from the same sum of money. We would advise that a sum be appropriated annually to stock our covers with quail.

The woodcock is virtually protected only from the time when it reaches us in the spring until Sept. 15. Our hunters commence killing them then, and continue until they start on their migration south. They are killed all the way on their flight south, and after they arrive there, all through the winter in many of the southern States. With the existing state of affairs, it is a question how long we will have this noble game bird with us.

We think no one can question that your commissioners are doing all in their power to enforce the fish and game laws of New Hampshire. We should have fish and game detectives—three at least—who should be paid a living salary, to work with your commissioners.

Massachusetts is paying to-day more for the support of her fish and game wardens than New Hampshire is expending for its commission and all work of its commission.

We receive many favors and kind words from the press all over the State—from the Manchester Union especially. We take the liberty to copy from its editorial columns of Oct. 13, 1902, the following:

THE GAME LAWS.

The Fish and Game Commissioners are doing what they can for the enforcement of the game laws, and should receive the support and assistance of all good citizens. It is impracticable to frame any set of laws that will suit every one in all particulars. It is probable, however, that the present laws for the protection of game come as near meeting the approval of the majority of the citizens of the State as is possible. At all events, they are laws, and should be enforced. It is obvious to every one who thinks at all, that unless New Hampshire people are willing to witness the utter extinction of many species once abundant, there must be protection, and the laws designed for such protection must be rigidly enforced. Effective firearms were never so cheap as now, and the extension of electric roads has made it easy for any one to take a considerable journey into the country and return the same day. Of course, one citizen has the same right as another, but it is obvious that without rigidly enforced laws there would soon be no game, and what is worse, there would be a great diminution of insect-eating birds, for many men and boys, when out with guns, feel little or no compunction at trying their skill on any living thing they see. It is necessary, therefore, if game and even song and insect-eating birds are to be preserved, that there should first be an intelligent public sentiment for their preservation, and next, that every law-abiding citizen should assist the Fish and Game Commissioners and their representatives in every possible way. It is not a pleasant duty to make complaints, but it is a duty nevertheless.

By the advice of the present Governor and council, we have been able to perfect the station at Colebrook, so that to-day we think we can safely say that this station has not a superior in New England as a State hatchery.

From this station we shall largely supply the State with fingerling and yearling brook trout. Two million eggs can be handled at this station. With a station similar to this located at Laconia, or somewhere in that section, where we can grow our lake trout and salmon to fingerlings or yearlings before they are planted, we can stock our lakes with far better success than we are having at the present time.

Although the lake trout fishing is excellent, and the salmon fishing is improving, especially in Lake Winnipiseogee, yet we question if your commission will ever be able to stock these waters sufficiently well to allow parties the privilege they have at the present time of killing these fish for the market. As a commission we are thoroughly opposed to the sale of lake trout, brook trout, and salmon. Never in the history of New Hampshire have so many summer homes been built near our lakes and ponds as in the last two years, and many of the owners are attracted here by the fishing in the waters near where they build. For this reason, if for no other, it is our duty to do all we can to keep these waters well stocked. At the present time most of our ponds are stocked with bass and pickerel. As we do not propagate these fish, the only way to keep up the supply is by regulating the open season. The bass and pickerel are able to care for themselves, and will increase if given a fair chance, but where a pond is covered with lines, as is done in ice-fishing for pickerel, the pickerel have got to go, for if they are all caught in the winter, they are not there to be caught in the summer. We think all ice-fishing should be stopped, except on the large lakes.

The deer in New Hampshire are rapidly increasing, so much so that it is frequently suggested to us that an open season be made all over the State, allowing one buck deer to a person. We often have complaints of damage done by deer. We have investigated frequently, and have as yet been unable to find where any serious damage has been done. But if the State expects to protect her deer, she should pay for damage done by them. With the abandoned farms all over New Hampshire, and its rapidly increasing area of sprout land, southern New Hampshire would be an ideal deer country if it were not for the worthless dogs (with just enough hound in their make-up to make them sheep and deer dogs) which are allowed to run at large all through the close season, eating the eggs of all game birds, running down and killing the young of all kinds of our four-footed game, from the deer down to the rabbit. Many farmers in our State find it impossible to keep sheep to-day, owing to these worthless dogs. There should be some way to suppress this nuisance.

During the last two years we have lost by resignation and death two members of our board of commissioners. Mr. F. L. Hughes resigned on account of the increase of his business. He was a first-class commissioner, and is honored and respected by all who know him.

In the death of Judge Shurtleff, New Hampshire lost one of the best fish and game commissioners that ever served her. With his knowledge of law (in fact, many of our most important fish and game laws on our statute books to-day were framed by him) and his extended knowledge of the forests and streams of our State, especially of northern New Hampshire, and with his vast acquaintance in every part of the State, he was an ideal man for a commissioner of fish and game. He was not only thoroughly acquainted with the different varieties of fish which our waters contain, but knew every animal and bird that inhabits our forests. He was an expert with the rifle and the shotgun, and we have yet to see his superior with the rod. He was a lovable, whole-souled man.

Charles B. Clarke,
Merrill Shurtleff,
Fish and Game Commissioners.

CHICAGO AND THE WEST.

The Quail Question in Texas.

San Antonio, Tex., Jan. 24.—It has long been the custom in the North, and, indeed the South, also, to believe that after all the rest of the world was exhausted, there would still be Texas. For years the men of the Lone Star State, accustomed to a world of vast spaces and vast resources, have regarded it as certain that Texas would always furnish abundance for all, whether in lines of agriculture, industry or sport. It has so long been the custom to see millions of acres unoccupied, millions of cattle almost unowned, millions of birds apparently coming from sources inexhaustible, that it has hardly occurred to the average man that there might perhaps be a limit even to the vast natural wealth of Texas. The old doctrine of this immense territory of the Southwest was that there was enough for all. If a thousand cattle died on the range it mattered little, and caused no concern. There were more cattle. Land was too cheap to be worth the holding. Men bought it at five cents an acre. There was enough for all. Northern shooters came down here and butchered the Texan game birds. It mattered little. There was enough for all.

Within the last few years the inevitable change has begun to manifest itself. Cattle are worth money in Texas now, and they are cared for. Horses bring fifty or sixty dollars, where formerly they could be had for three or four dollars each. Land is steadily going up all over the State. Population is pouring in, recognizing the value of this enormous and little understood kingdom of the far Southwest. With these changes come those of personal interest to sportsmen. One now hears that ducks are not so abundant on the coast. He is asked to wait till the birds begin to go northward, or to come a little earlier in the fall next time, as the birds go southward. There are special days for shooting at the local marshes, excuses, explanations, reasons why the shooting is not just as good as it formerly was. One is told that the quail migrated, that the food is not quite right this season, etc. Indeed, most wonderful of all, one hears talk among these big hearted Texan shooters that, whereas, in the past they have thought there was enough for all manner of Northern shooters, now it may be better to be not quite so free with sweeping invitations and sweeping practices upon the part of those invited and arrived. There are murmurs that this is to be a good year for trapshooting in Texas, because the field shooting is going to be so poor. In short, there are at hand, one must admit with sorrow, the unmistakable signs that this grand empire of Texas, almost the last of the open and free realm of America, is at the door of change, that she is preparing to repeat the history of all the American West. Texas is learning to-day that there was not, after all, enough for all.

And now comes a very interesting juncture of affairs, wherein the sportsman is not the prime mover, yet wherein he is much interested and may be much affected in spite of himself. The germ and the gist of it all is a certain little modern insect pest known as the boll weevil, which seriously jeopardizes the welfare of the cotton planters pretty much all over the State. We have the potato beetle and the chinch bug in the North, and the boll weevil in the South. Also, in both sections, we have the great North American member of the Legislature.

Hitherto in Texas the legislator has been of about average density and dullness in matters of game laws, not caring much for the game birds, and not believing that the supply could ever be exhausted. The game laws of Texas are not well made and not well enforced, this being part of the old fallacy of enough for all, so dear to have, so hard to relinquish in the American mind. But this very ignorance on the part of Texas legislators in game laws and in natural history—an ignorance fully shared by their brethren in the North—presents to-day a strange phenomenon which may amount to protection even more sweeping than sportsmen would care to see enforced. In brief, the Legislature of Texas, assured that the quail is a bird, and that birds eat boll weevils, is fairly upon the point of passing a law prohibiting the shooting of quail for a term of ten years. And in the opinion of many well-posted men of this State, they will just about pass it, too. Exit then the Northern market shooter, the Northern real sportsman and the Northern pseudo sportsman, not to mention the local sportsmen of Texas. Enter the day of trapshooting at targets, of useless field dogs, of a great many other things allied thereto.

It does not seem to have occurred to the minds of the legislators of Texas that perhaps the quail does not eat very many, if indeed, any boll weevils. Perhaps the truth is that they do not. If you open the crop of a quail, as we have done lately, even in fields where they are burning the cotton stalks to destroy the weevil, you will not find anything distinguishable except the small black seeds of weeds upon which they feed. The quail will eat grain as large as corn, and wheat it dearly loves. It is a grain-feeder by all means, though occasionally it eats insects. It will make its living in Texas, even in case of a general prevalence of the boll weevils, in precisely that way which seems easiest to it. Hence, in all likelihood, it will continue to eat grains and seeds for the most part, even though the weevil disports itself most alluringly. This is the wrong time of year to test the weevil-eating quality of the quail, but no one seems to have tested it at any season of the year. Hence the sportsmen may perhaps have a snap judgment taken upon them by their Legislature.

There is no use becoming unduly concerned over this matter before it is matter of fact, and not of supposition, but just supposing this law should be passed, what would be the result? Naturally, at first a great deal of violation of the law, combined with a great deal of outcry regarding it, possibly followed later by repeal of the law. Incidentally, however, there would come also the first of that agitation which must forerun any American recognition of the value of the wild game. We may come to believe in Texas, after a while, that the quail is a good thing to have; that it ought not to be exterminated, that there are not quail enough for all. That will be the beginning of the foundation of an intelligent game code in Texas, and an intelligent enforcing of the laws. It will, in short, be education.

Now, if education shall come in Texas, even largely, sweepingly, wastefully, after the vast Texas fashion, shall we indeed feel constrained to sit down and weep over this freak of the Legislature in regard to the quail and the cotton weevil? For one, though I love this State more each time I see it, I should, for one, be willing to put up my gun and not shoot at all for the term of years which might be designated, provided that thereby a great many others might be taught what I think I have, from he nature of an almost life-long employment, learned to know, namely that in America there is no longer enough for all. It is humiliating, it is distasteful, but it is true. One can have small patience with men not big enough to see that it is true.

Habits of Texas Quail.

As to Bob White in Texas, he is still in evidence, albeit in lessening numbers. The other day, in the neighborhood of a ranch located some miles down the lovely valley of the San Antonio River, a little party of us put up several bevies in the course of a morning walk across country, with no canine company except a young and unbroken dog. Our party was made up of Col. O. C. Guessaz, of this city, Mr. R. O. Heikes, of the U. M. C. missionary forces, Mr. R. N. Stites, of Chicago, and myself. The four guns, with no appreciable effort, picked up a couple of dozen quail, not to mention nine brace of fat doves in the period of a couple of hours or so. Then we went home again. It was a very lovely day, the air soft and warm, and I fancy nobody felt very murderous. The bevies were all full and the birds well-grown and more than able to take care of themselves. We all thought we distinguished a distinct change in the habits of the quail in this part of the world. The Texas birds were always greater runners than the Northern Bob Whites, but this time they seemed almost more like blue quail than Bob Whites. The first bevy we put up ran across a forty-acre cotton field at a rate which fairly kept us on the trot, and which quite prevented any dog work at all. We kept on following after, seeing them all the time ahead, and hoping they would scatter and lie. They did drop out, one at a time, as they crossed the field, until at last, when we reached thick grass at the farther edge, we put up only half a dozen, though there were fully four times that number which started across the field.

Cunning enough is Bob White: wherever you put him.

In the North he takes to the trees, where you cannot see him, and the dog cannot smell him. Here in Texas the trees are short and bare, so he has not that refuge. Much persecuted, he learns a new wrinkle, and instead of lying in grass tufts for the dog to find him, he takes to his heels over the hard ground, which carries the scent but illy at best, and so puzzles both dog and man over his sudden and mysterious disappearance. It takes a specialized dog to handle Bob White here. As to the bird itself, it is not exactly like our Northern bird, not so heavy and plump, nor so red and russet in color. The shade of the general body color is ashy or gray, to match this gray soil. The constant running makes the bird thinner and much tougher to eat than the Northern bird. The flight is much the same, though not so strong here as in the North, the bird being an easier mark in the open here than in the woods or thickets of the North in the late autumn days.

An Amiable Tenderfoot.

I have mentioned one member of our party, Mr. Stites, of Chicago. That gentleman is a partner in Rector's well-known restaurant, which methinks almost anyone in New York or Chicago is apt to know; and by this token Mr. Stites ought to know a good bird or the like on sight by this time. Perhaps he has dined too well, too often, and not so wisely as too much, for of late his doctor has told him that he must get out of dors or become a has-been. Partly on my own advice he stopped off here at San Antonio on his way to California, and we took him with us on our little ranch trip. In the opinion of all he proved a most amiable tenderfoot. He had never shot at a quail in his life, yet he began to stop them very nicely, to our joint delight, so that he did his part of the bag very easily. Then we took him over to the Mitchell's Lake Club Reserve after ducks. It was a clear, bright, warm day, and it was certain there would be no flight unless we could stir up the birds, so we had resort to boats. These craft, by reason of the shallow and weedy waters, are not built like warships, but are easily capsizable. When we came to round up in the evening I met Mr. Stites and observed that he appeared damp, but supposed that he had been perspiring. I told him that my boat had leaked so much that it had gotten half full of water, so that I was afraid to shoot out of it lest I should go overboard.

"Why, are you afraid of that?" said he. "I ain't, not a bit."

"Did you get in?" I asked him. "Twice." was his reply, with a happy smile. "I don't mind it. I like it!" He had indeed upset his boat twice, and one time his gun was under water fifteen minutes before he could recover it. He pointed out with great pride that the gun and shells would "go off just as good as ever," and, indeed, he seemed none the worse for his adventure. Happily, the water was not above shoulder depth.

That night, by request, Mr. Stites did a turn at broiling quail for the gang, attired for the time, thanks to his late bath in the lake, in a long ulster, which came down about his heels. I don't know what some of the swell patrons of Rector's would have thought had they seen the urbane manager acting as cook at a Texas ranch house, but I am here to testify that his cookery was voted excellent. We named him Rosa then, and he had no trouble holding his job as chef. In fact, I never saw anybody get a job easier than he did that one. Nor did I ever see a cook eat much more freely of his own cooking. "That doctor has been stringing me for six years," said Mr. Stites. "There ain't anything the matter with me at all!"

Comfort in the Wilderness.

I have a friend up North who runs a pine woods hotel for anglers, and it is his boast that he makes his patrons comfortable in the wilderness. He has his hotel provided with hot and cold water, nice hair mattresses and all that sort of thing, and it is his claim, perhaps well founded, that he has the best equipped wilderness hotel in the West. He asks me to come up and see him, but I have always told him I would rather go anywhere else in the whole wild world. I can get hot and cold water and hair matresses at home, and have good society there, too. As to the wildernesss, it is no place for the softenments of civilization. I don't think Big Adam Moore and I missed any hot water or hair matresses up in New Brunswick. Neither do I think we missed that sort of allurements at the ranch in the Santone Valley the other day. When I start my own wilderness resort I am going to have a tin washpan on top of a stump back of the cabin, and if that is not good enough washing facilities for any patron of the place, the quicker he can get out the healthier it is going to be for him. The dragging of city life, or would-be city life, into the real wilderness is one of the things which make me continually regret that there is a legal close season on some sorts of human beings. The old nigger man was right. Said he, "It ain't fitten." If I could run the world for a while it would be a most excellent good world. Still, I suppose there will always be an element who want hot and cold water and hair matresses and fresh beef in their "wilderness."

Big Country.

This is a glorious region, this Texas country. We traveled a day and a night west from New Orleans to get to old Santone, and to get to El Paso we would have to travel a day and a night more, all on Texas soil. It is hours' run between towns, days' run between cities. It is all big, open, free, magnificent, good for people who have been feeling that much has been depending upon their personal attention to the affairs of the world. The keyed-up nervousness of the North falls away like a garment here. To-morrow is good as to-day; indeed, better. We have been going down to the salt water for a sail now, for nearly a week. We are going to-morrow. Excellent institution, this to-morrow! This sunlight is full of to-morrow.

Tame Deer.

My friend, Col. Guessaz, has a tame deer, a young buck, which he caught last summer on his ranch, and the little creature is as good an example of absolute fearlessness as one ever saw. It plays with the dogs and chickens, fraternizes with all human beings, and when it feels disposed walks into the house and prowls about quite as one of the family. Apples, bread, cake, sugar, or almost anything else seems to it proper food for the *Cervidæ*, and one day it stalked into the cupboard and ate a pie, full proof, if any were needed, of the universal beneficence of the peculiar American institution, pie.

Horse and Dog.

We should not to-day be grieving so much were the brotherhood between all animals so distinct as that existing at my friend's household. A dog commonly loves a horse, and a horse a dog, but the Texas horse is different from all other horses. The other day, while we were unhooking the team down at the ranch, Col. Guessaz' old pointer, Waif, another member of the family, and loved very dearly, passed close by one of the horses, and the latter, with no reason in the world save that of malice, kicked her savagely, breaking two or three ribs and wellnigh killing her on the spot. That was four days ago, and even yet we are not sure that Waif will get over it, though she can now eat and drink and sleep lying down. It was pitiful to see her stand with drooping head all day and all night long, unable to lie down by reason of the broken ribs. Nature is especially kind to dogs, and heals their ills with great rapidity, so that we hope that, even in spite of her twelve years of age, Waif will live to point another quail or so before her race is run.

Ducks.

They say the duck season is not a good one, for that most of the flight goes on down to Mexico. This may be in part true, though no doubt there are a few birds to be found on the coast even yet. We are waiting word from Kemp's place, at Rockport, and may stop there for a day or so, but the truth is no one seems to care for shooting ducks at this time of the year. The best time to see wildfowl in Texas is nearly the same time that we have our best shooting in the North, October or November. So far as the neighborhood of this city is concerned, the shooting will be better in February, when the northbound migration begins. I suppose it would be spring shooting then to shoot ducks here. I doubt if any of our little party will do any duck shooting. Quite a number of shooters left town to-day for Mitchell's Lake, but we were too tired to go along. The birds are as tired as their pursuers these warm days, and will not fly unless chased up by numbers of shooters.

The End Not Yet.

The end is not yet in prohibitive legislation. Word comes to-day that the Legislature proposes to stop the shooting of all sorts and species of birds, tame pigeons included, for a term of some years. There is report also that the great ammunition companies of the North are telegraphing local agents in Texas to have the bills killed at any cost. There is also rumor that the "any cost" side of it all has been carefully considered by certain of the framers of some of these numerous bills at Austin. There is such a thing as a bill going a little way and then not being heard of again. In any case, the enire shooting population of the State, not to mention very many firms who sell large amounts of goods in the State, is very much exercised over the matter.

Game Parks and Other Things.

Editor Forest and Stream:

We Americans used to think the common people of England were trampled down to the condition of slaves by the lordly landed aristocracy, but what are we Americans coming to in these days of selfish millionaires?

"The public be d——d," is apparently their motto, and they seem to delight in depriving others of everything in the way of recreation. The people of North Hempstead prove that they have too much self-respect and common sense to place themselves in the position of serfs for the paltry sum of $50,000, knowing that if the New York man could get control of the lake no man would dare to catch a fish, or sail a boat, or even take a bath in its waters. They are wise in holding it, for as the millionaires improve their suburban property their own will be increased in value greatly.

From the rapid progress the millionaires are making in getting control of land, it will soon be difficult to step outside the public road without committing trespass.

One of my friends has just returned from a visit to an Eastern man who has brought down the wrath of the whole community on his head by inclosing a deer park of several thousand acres.

He has to be always on his guard, but some of his enemies say they are bound to "git him" some day. Now, rather than live such a life I'd go a thousand miles for my deer and elk.

If men were not so selfish they would not be so liable to make enemies, but some of the trust clubs buy up from one to half a dozen lakes in the Adirondacks simply to control them and keep others out.

Some of these men pretend to be Christians. They say their prayers and attend to all the surface matters of religion, but they trample on the Golden Rule and read the warning of their Lord and Master in this way —"It is easier for a needle to go through the eye of a camel than for a rich man to enter the kingdom of Heaven." Then, to insure their future safety, they try to pull the wool over the eyes of their Divine leader by giving a mere pittance now and then from their vast hoards of wealth to some church or college, while the poor are left to starve and freeze, and during all these terrible times of suffering not a single one of the crew of millionaires has lifted a finger to relieve it. The Hon. Abram S. Hewitt said, "There need be no suffering among the poor if the rich would do their duty, but they go on praying and let the Lord take care of the poor."

Winter Hare Shooting in Germany.

From the London Field.

Whatever changes have come over the manners and customs of Germans, it still remains true that a Teuton is seen at his best out shooting. Sport is practiced on sporting lines in the Fatherland, despite the number of parvenu "shooters" who have entered the field within recent years, and for those who have leisure and inclination to devote to it, there are opportunties in Germany for the use of the gun which can hardly be found with such comparative facility anywhere else in Europe. Red deer, fallow deer, roebuck, capercaillie, blackcock, pheasants, wild boar, partridges, wild duck, bustards, woodcock, snipe, wild geese, quail, hares and rabbits are plentiful, and almost every species of game here enumerated may be obtained within easy access of the capital of the empire, the greater number in its immediate vicinity; while there is also good chamois shooting in the Bavarian Mountains.

The laws and customs of venery are perhaps most strictly observed in North Germany, i.e., Pomerania, East and West Prussia, and Silesia, where the land is chiefly in the hands of large landed proprietors, who are themselves good sportsmen, the knowledge and passion for the craft having been handed down to them from generation to generation. In Central and South Germany things are done on a laxer scale, as the shootings are almost all in the hands of tenants, who hold leases for periods of about six years—in Wurtemberg, indeed, for three years only. These tenants, in the ordinary run of things, attach more weight to obtaining good bags during the period of their tenancy than to the preservation of a good stock of game. Moreover, as the shootings are generally put up to public auction, it is open to persons of every class and rank to acquire them. Unfortunately, not only men of intelligence and taste and good manners who have acquired a fortune as manufacturers or in other branches of business thus get the command of the market, but tradesmen, such as butchers and confectioners and publicans, circus owners and innkeepers participate therein. To be the proprietor of a shoot has long since come to be accepted in Germany as the right of riches. The individual in question may know nothing about sport, and, indeed, have no love for it; but he has the opportunity thereby of inviting a number of guests and of entertaining them luxuriously. For this reason the price of conveniently situated shootings has considerably increased of late years. Such, at least, is the constant complaint of German sportsmen; but, like all generalization, it must be taken cum grano salis. There is a priori no reason why rich men as a class should not derive as keen pleasure from shooting game and should not be as good sportsmen as men of moderate means or as those who have to work hard for their living. It is well to give weight to this argument, for it cannot be denied that in general, if wealth be directed to the preservation of game, sport must inevitably gain very considerably therefrom. Among wealthy manufacturers and merchants there are as good shots and sportsmen to be found as among those feudal families who claim to have by birth the sole privilege to kill game. Most certainly you can count on the fingers of one hand the number of real sportsmen among the crowned heads and scions of ruling sovereign families in Germany. The late King Albert of Saxony was among the number, but Kaiser William is not what one would call a "lover of sport," nor was his father, nor his grandfather before him. On the other hand, many of the highest nobility of Germany and of the large landowners are strict preservers of game, and are second to none as sportsmen. The royalties have their big battues, and their parties for the most part consist of shooters only, clad in forester's green. The Kaiser is an excellent shot, but he does not care for sport as such. He shoots hares with an 18-bore gun specially made for him, and seldom misses. It has been noted that he never makes his hares turn a somersault like other good shots; they always fall flat on the ground.

While the sovereign princes of Germany, with the aid of the gentlemen of their courts, are slaughtering the required annual number of big game—deer and wild boar—their subjects are occupied with hare driving. These drives take place for the most part in the months of October, November and December. Hare shooting opens in September and closes in January, but it is very rightly considered to be unsportsmanlike to hold a drive so early as September, and it is generally unwise to shoot hare too long in January. In September the mother hare generally still carries milk, and the disposition to breed commences very early in the year, quite irrespective of the temperature out of doors. It is a thousand pities that the close time is not pushed on to Oct. 1. The close times for game vary according to the different States, and, funnily enough, some of them make a difference between forest hares and field hares. It thus happens that in the beginning of the season you can shoot a hare out in the stubble, but not in the adjoining forest. Red tape legislators never see what is as plain as a haystack to ordinary people! Of course, it constantly happens that a forest hare comes out on to the stubble or the meadow to feed when it is no longer close time for the field hare. What is one to do? Perhaps the sportsman has not seen him issue from the shade of the trees, and yet the quarry is a forest hare right enough, although *en voyage*.

In Germany hares are generally shot in circular drives in November and December, and, provided there are none of your careless shots about, there need be no fear of danger. Unfortunately, these are not to be blotted out from the face of the earth, so that guns and beaters occasionally get a sprinkling of shot either direct in the legs or body or some grains in the face that have ricochetted from the ground. There are the circular drives in the open, and the so-called Stand-

Treiben in the forests. In the latter the guns assume a fixed position in or outside the forest, and the beaters drive toward them. In the former a big sort of circle is made by the guns and beaters taking up ground to the right and left in a circular direction from the starting point, and, when the circle is joined, advancing toward the center. When they have approached to within a certain distance from one another a horn is blown, whereupon the guns remain standing and the beaters advance. From this moment no hare may be shot within the circle. Where there are plenty of hares this circular driving is very amusing sport, either in November, when the weather is generally pretty open, or in December, when there ought to be snow on the ground and some degrees of frost in the air.

In the dark December mornings shortly before Christmas, it is a treat to be a member of a party about to enjoy a day's hare shooting. The proper way is for all the guns to arrive at the country house or the village inn the night before, so as to start out in the field not later than eight o'clock in the morning, but, of course, it often happens that people with town occupations cannot get away till the morning of the shoot, in which case they must leave by an early train for the rendezvous. Many Germans turn out in costumes that are fearfully and wonderfully made, so that at the railway station they look in the early dawn more like brigands than sportsmen.

The Magdeburg district is well stocked with hares, while in the march of Brandenburg, where the land is light and sandy, there are relatively fewer. In the Palatinate, on the banks of the Rhine, the shooting is let out on lease by the peasant holders, and very often the bag consists of from 600 to 1,000 hares in a day, and even more. I can record one of 1,600 with thirty guns. The peasant holder in the Palatinate and Hesse is a born sportsman, and a good man of business to boot, not like those skin-flint and slim chaps in Brandenburg and other northern Prussian provinces. He clearly comprehends that the commune can get more rent for the shooting if there are plenty of hares, and he feels real pride when he hears that the sportsmen have had a good day over his lands. "We should be ashamed," they say, "if we were no longer in a position to feed a few hares." One must not forget, however, that these men are well-to-do yeomen, who would pass in the north as country gentlemen and lords of manors. In the neighborhood of the German capital—say, a distance of an hour or two by rail—there is plenty of fun to be had in good company out hare driving, and here, too, the greater part of the shooting is in the hands of the communes and let on lease. With some twenty guns and about eighty to a hundred beaters the bag may, perhaps, not exceed a couple of hundred head, but you often get an exciting cannonade at rabbits as a *pièce de résistance*. Shooting from a country house in Pomerania is entertaining, and if chance should lead one to West Prussia, where one gets among a Polish population, a foreigner may carry away with him recollections of sport and customs that he will not easily forget. Here is a specimen. Some six country wagons start off with the men and women beaters—it is not at all uncommon for women to join the gathering with big baskets strapped on their backs. Then follow the conveyances with the guns and a long, big wagon for the game. Some of them are drawn by four horses, and the coachmen are first-rate drivers. The forests are taken, and the bag consists of foxes, pheasants, woodcock and hares. Foxes are shot in Germany; it is only possible in very few districts to hunt them with hounds, and a Teuton sportsman is very proud if he can account for a fox, which is as good in his eyes as half a dozen hares in his bag. Among the women beaters will often be found very smart-looking girls, graceful as Polish women generally are, wearing stout wooden sabots and rough gray woolen stockings, but with pretty red kid gloves on their hands. The men are fond of sport, and in former times the foresters had a good deal of trouble with the laboring population, for no sooner had a young fellow saved enough money for the purpose than he showed himself even more ready to purchase a gun for the nefarious practice of poaching than to furnish a house for a bride.

In Germany it is hardly feasible to shoot hares, except by driving them. The country is open, as there are no hedges. In the early part of the season, that is to say, when one is out partridge shooting, it would be possible to kill as many hares almost as one saw; but, as said above, it is too early to shoot hares then. In the winter time—in November and December—it is not easy to get at them behind a dog or by beating them up singly. The tendency is to have large parties of guns for the circular drives. No doubt a good old steady shot does not like this. He naturally prefers a small and select company of sportsmen upon whom he can rely; but, after all, no strict rule can be laid down. The number of guns must in any case be regulated by the nature, the size, and lay of the "shoot." December is the real season for hare shooting in Germany. Those who are in the swim receive then more invitations for hare drives than an ordinary society dame obtains in the course of a London season. A friend of mine at the begining of this last December had to issue sixty invitations for his annual drive before he could get together even eighteen guns, and this was over a very pleasant terrain, where we had good walking and a very fair bag.

Some people insist that circular driving injures the stock of hares. This is one of those general statements that are not quite accurate. It depends upon circumstances. Other kinds of driving can, for the same reasons, be deleterious to the stock. By careful observation, it is possible to watch how the stock is and to omit the drive for one year. One often hears that the right remedy against the falling off of the stock is to shoot only the buck hares and to let the does alone. This sounds very well, but few who talk like this know the difference. A story is told of one of these wiseacres who was loudly giving advice of this kind. He shouted out, "buck," "doe," as the hares got up, and then shot them both to prove his theory. This done, he could not even tell the difference.

Circular driving is dangerous if the guns are inexperienced or careless. One only has to collect the accounts of accidents among sportsmen in the course of a year to see how important it is to be strictly prudent as to the way to carry and handle a gun. German insurance companies have taken note of this, and send round to every known sportsman an appeal to insure his life against accidents with the gun. One generally hears at the commencement of the day an appeal to the assembled company at a circular drive to be careful to observe certain well-known rules. Some people go so far as to inflict money fines for any breach of these rules. In such cases, a gun leaving his place without unloading has to pay 5s.; if he fires into the circle after the horn has been blown he must pay 10s., etc. By the new German Civil Code the responsibility incurred both by a person wounding or killing a person out shooting and by his host is very great. In ordinary cases the man who inflicts the wound pays, but in the event of his being impecunious his host is responsible.

A hare in Germany is one of the most useful of four-footed animals. Take his scut, which the Germans call Blume (flower). It is very much in demand in the country, especially among the beaters, who put it in their stockings, in order that their feet may be warmer. Here, as elsewhere, the skin is used by hatters. This year a hare skin fetches 6d., being specially high in price. A hare's liver when fried is a great delicacy, and a dish called Hasenpfeffer, is made out of the lower ribs, the head, the runners (claws), the heart and lungs, while the entrails are given to the dog. Roast hare comes on to table larded, without its head and lying quite flat in the dish, and is served with cream sauce. The price of a hare about Christmas time was from 3s. 9d. to 4s. Among the country people roast hare is the traditional New Year's dish. Those who have done anything special for the preservation of the game generally get a present of a hare after a drive about the middle of the month, which is allowed to hang till New Year's Day.

Even in the case of a hare German sportsmen are very particular as to the terms they use. His eyes are called "optics or seers" (Seher); his ears, "spoons" (Löffel); his legs, "runners" (Läufe); his scut, "flower" (Blume); his hide, "Balg." The nickname of a hare is "Lampe"; he is mixed up also with the ancient lore of the land. Cotton or linen, if dipped in the blood of a hare shot on the first Friday in March, is said to have healing powers, a tradition still believed in by many foresters.

J. L. B.

Taking Aim.

THE communication of Mr. Wm. Wade, of Oakmont, Pa., published in FOREST AND STREAM of January 17, contains a subject of more than passing interest. The inquiry contained in it is far reaching. To reply properly, one needs to go thoroughly into an analysis of the shooting art. All the essentials of it are involved in a reply to that query.

The matter of aiming a shotgun or rifle at a moving object is not analogous to the use of the bow and arrow at all, other than in a few remote general principles. The matter is peculiarly mystified by a reference to a boy throwing a stone without taking aim, or revolver shooting from the pocket, or gun shooting from the hip, or in hitting balls thrown in the air.

Let us dispose of these matters first before considering the matter of taking aim. The boy attains skill in throwing a stone in the same manner that a writer attains skill in using a pen and ink—by practice. The hand acquires a certain subordinate intelligence of its own which in the medical or psychological world is called reflex action. The same labored and awkward first attempts of the student in penmanship embarrass the first attempts of the student in the art of shooting. The right hand of most men, by constant practice, to which may be added the predisposition imposed by inheritance, is the master hand. Let any right-handed man attempt to throw a stone with his left hand, or to write a line, or in fact attempt anything with it which requires manual dexterity, and the result will be puerile and ridiculous in nine cases out of ten. In short, the left hand, holding and guiding the gun barrel, is the hand which has nearly all the responsibilities in assisting the eye in taking aim. From its utter inefficiency it cannot respond with any degree of accuracy in the first attempts at shooting, hence the first attempts of the shooter are not devoted so much to the art of shooting as to the development of manual dexterity in a weak and awkward limb. The shooter in nearly all cases is unconscious of the real reason of his poor success.

Shooting a revolver from the pocket is generally done at close quarters, and requires only an ordinary sense of direction, just as one standing close to a barn door could kick it to a certainty at every trial.

Shooting from the hip is another misleading comparison, for the reason that a very open gun is always used in game shooting, and the distances are in most instances very short. Shooting objects in the air is largely a repetition of the same shot over and over again to infinity. There is the same flight, the same speed, etc., so that it in time becomes almost a muscular act.

There are so many abstruse problems involved in game or trap shooting that the ordinary shooter doesn't know what causes his ill success. He cannot see the load of shot as the boy can see the stone, or the archer the arrow, so he is ever groping in the dark.

The gun does not become a part of the body, in a shooting sense, as stated by one of your correspondents. The body swings right and left, up and down, and to a certain degree may act as if they were a whole, but there is always a large field of accommodation in which the hands and eye take part independent of the movement of the body. The gun and body may move in unison till the muzzle covers the target or moving body, then, if the muzzle does not point right there is an instantaneous readjustment in which the eye, hands and shoulders all take an intelligent part. This is illustrated in a way by the use of the eyes. The head turns on the neck and the eyes turn on their sockets, thus, while they are a part of the body, they have powers of accommodation independent of it.

Now, in shooting at moving objects, there is no arbitrary rule which governs how to shoot right, left, up, down and straight-away. The shooter may take some shots in which gun and body move as a whole, while other shots are made with a rapid readjustment with the hands and eye. Neither is shooting at a moving object a mechanical act. A shooter may go quickly after a flying bird and discover that his gun is out of proper alignment. He glances along the barrel, readjusts it instantly and correctly, and points it anew. It is all done so quickly and delicately that an ordinary onlooker would not discover that anything went wrong at all. The gun, by habit, is placed to the shoulder, cheek and hands in the same position every time, by the skilled shooter, and he becomes habituated to certain fixed points of contact with it. Let any one of these get out of adjustment and he feels it instantly. Thus the sense of touch in time becomes quite as much of a factor as the sense of sight. The shooter knows where the muzzle of the gun is pointing whichever way it may be swinging, both from a subconsciousness, from the sense of sight, and a consciousness from the sense of touch. Some men never become skillful shots at moving objects because they never develop the left hand to any degree of skillfulness, or because they never develop either hand to any degree of skillfulness, because they have defective eyesight, or because they never can work hands, shoulder, eyes and body in proper combination and co-ordination.

EXPERTE CREDO.

Report of the New York Commission.

From advance sheets of the report of the New York Forest, Fish and Game Commission to the Legislature.

THE Commission in presenting its final report as at present constituted has the pleasant satisfaction of knowing that its work has had the commendation of the public, and that the value of what has been done for the protection of fish and game and the reforestation of denuded woodlands in the Adirondack and Catskill regions has been recognized both at home and abroad.

Standards of comparison are not as well established as yet in our own country as they are in other parts of the civilized world for such matters, and an occasional criticism is consequently to be expected either from the uninformed or the unthinking. But it is certain that, dollar for dollar, the State of New York is getting more for its expenditure for the business which the Commission has had in charge than any other locality at present known. The work of the forestry department has developed in value to the extent that its success is frequently commended and its documents are considered very desirable for public distribution. Advice on important questions is sought from our Department of Fisheries by the experts of other countries, and the game laws of this State are frequently used as models by other lawmakers.

The sagacious editor of the London Spectator, in reviewing a recent report of this Commission, after paying a high tribute to the wisdom shown by the State of New York in providing adequately for the preservation of its forests and the increase of its fish and game supply, says:

> Omitting moneys spent on purchasing land and maintaining forests the total cost of fish propagation, fish and game protection, the shell fish department and taking deer to the forests, with some items for printing was about £30,000. The fish cost a little over £11,000, the game keeping generally £10,000 and the shell fish (a remunerative item) £2,000. In return for this the public had free fishing of every kind over a vast territory, and killed deer to an amount which, at the ordinary rate reckoned per stag in Scotland (£40), would represent a sporting rental in this country of £169,000!

In the same line of testimony is the following quotation from a scientific monograph produced in our own State by an expert of well established reputation. In a recent Bulletin on "The Clam and Scallop Industries," issued by the State Museum, Dr. J. L. Kellogg says:

> Every one is familiar with the extensive and remarkably successful work of the United States and the various State Fish Commissions in the propagation of marine and fresh-water market fish. In many cases the continued supply is probably directly and entirely due to the artificial hatching and judicious distribution of the young fish. These institutions have made it very clear that public moneys could not be better expended for the benefit of all classes of people than in their support. * * * If the fact were only recognized that this extinction of forms really is occurring, these Commissions and similar institutions would receive much greater support in the form of legislative appropriations. * * * It is money most profitably invested for rich and poor alike.

Such testimony and approval of the work that is being done could be continued at length, but the facts are for the most part known to your honorable body and to the well informed taxpayers of the State at large. The value of the Adirondacks as a wealth producing element in the State is properly shown in one of the appended reports, and the figures given indicate that millions of dollars are annually spent because of the attractions of the woods and waters for health and pleasure seekers and sportsmen. To preserve and build up the forests has been the constant care of the Commission, and many members of the Legislature can testify from actual knowledge as to what has been done toward providing trees to fill out the denuded places. The nurseries for producing the young trees are well established, and will increase steadily in value as the work advances. In time the State will be able to provide from them not only all the trees necessary for use in the forests, but also for beautifying roadsides and the streets of our cities, as well as for renewing the old and neglected woodlots of our farms.

Attention is also called with pride to the work done in protecting the forests from fire. The State now has a most excellent organization for this purpose, and the result is readily seen from the fact that our forests have practically escaped damage from this source. Reports from other States do not show such immunity. The statements in detail in the reports of the Superintendent of Forests, the Chief Protector and the Superintendent of Shellfisheries, which follow, are well worth the attention of every sportsman and every taxpayer as well. Therein will be found ample evidence that the money appropriated for the propagation of fish and the protection of game has been well expended, and that the result secured has merited the favorable comment already quoted. Communications received from time to time bear witness to the fact that line fishing in the waters of the State was never better, while the returns from the net fishermen prove that a far greater variety of cheap food fish of the

best quality is easily procurable on account of the constant care exercised by the State in stocking its waters. The increase in the number of deer taken is also worth noting, as an evidence of the wisdom of existing laws. So also is the suggestion which experience has shown to be necessary for the preservation of certain fisheries by stopping fishing through the ice. Protective action would also seem to be necessary to keep the black bear from extermination.

The Commission in conclusion takes pleasure in calling attention to the success which has thus far attended the work of restoring moose to the Adirondacks, and to the valuable additions made to the herds of elk during the past year.

The following recommendations are presented for your consideration:

That the number of expert foresters be increased to four, and their compensation be made such as to retain them in the service of the State.

That the John Brown house be repaired so as to preserve this historic structure.

That spring shooting of wildfowl and birds of all kinds be prohibited.

That the shooting of black bear in the Adirondack region be prohibited for a period of five years.

That a license fee of $50 be imposed on non-resident hunters excepting members of organized clubs in the Adirondacks, who shall present certificates of membership, and Adirondack land owners.

That provision be made for the licensing of guides.

By the Commission.

John D. Whish, *Assistant Secretary.*

Massachusetts Association.

Hearing on Deer Law.

Boston, Jan. 31.—*Editor Forest and Stream:* The first hearing given by the Committee on Fisheries and Game was on Tuesday, January 26, the House Chairman, Mr. Moody Kimball, of Newburyport, presiding. Heman S. Fay, Esq., as counsel for the Central Committee, presented Mr. Henry A. Estabrook, of Fitchburg, the chairman of the executive committee, as the first witness.

Mr. Estabrook spoke of the good results of the five years' close time, as shown by the frequency with which deer have been seen in many parts of the State where, until recently, there have been none. But a few days ago, he said, three had been seen together within the limits of the city of Fitchburg. He had heard of deer being seen in several neighboring towns, and was desirous of seeing the experiment which was begun in 1898 continued for five years more. His testimony was corroborated by Representative Knight, of Townsend, who, however, said some of the small farmers of his section, who were excellent shots, as a rule, would be very likely to protect their crops from injury by deer. On the whole, he approved the passage of the bill.

Dr. James B. Paige, member of the House from Amherst, spoke strongly in support of the re-enactment of the law continuing the close time for five years more. Others gave similar testimony.

President James R. Reed, of the State Association, favored the measure and gave very interesting information on the history of legislation in Massachusetts affecting the killing of deer.

He stated that up to about 1882 there was a law applying to the whole State prohibiting killing at any time except for a few days in the month of November. Mr. John M. Forbes, one of the greatest philanthropists of the State, and the owner of the Island of Naushon, at his own expense stocked the island with deer, which became very numerous, and he invited friends to join in an annual hunt, usually in October. His attention was called to the fact that the deer on the island could not be considered as "tame" deer, and therefore killing them at any time except the few open days in November was not permissible, and as there were at that time no deer except those on Naushon in any county of the State, with the exception of Barnstable and Plymouth, the law was changed and made to apply to those two counties only.

The credit of initiating the movement in 1898 which resulted in securing the present law is due to Mr. W. H. Fowle, of Woburn, who induced a member of the Legislature to present the petition for the passage of the bill. A letter from Commissioner Wentworth of New Hampshire, stating that he had caused several deer to be liberated in southern New Hampshire, and that one had been shot just across the line in Massachusetts, also that unless this State would protect them the Commissioners of New Hampshire would not release any more in the southern portion of the State, had a potent influence in securing the passage of the bill.

In the course of the hearing on Tuesday, one member of the committee remarked that he had heard some complaint of injury to crops by deer in his section of the State, but when the chairman called for remonstrants, no one appeared. Favorable consideration by the committee seems more than probable. What the House and Senate will do about it remains to be seen. A request for payment of damages done by deer has been made by a lady in Newton. It is doubtful whether such a request will receive serious consideration by the Legislature.

Farmers in Vermont tried to get up a scare some years ago; in Maine they are doing it this winter.

The hearing on the re-enactment of the anti-sale law affecting partridges and woodcock, which your readers know expires this year, has not been appointed, but as no new business can be admitted in the Legislature without a four-fifths vote and therefore all bills are supposed to be in already, the committee will no doubt fix the date of the hearing on the bird law very soon, and all who believe in the continuance of the present law should make a sacrifice, if necessary, in order to be present and support the bill before the committee.

At the last meeting of the State Association, there was an informal discussion of the hunter's license in Maine. Several prominent members, men accustomed to visit the State once or twice a year, denounced the plan as an "imposition." All expressed the opinion that it is uncalled for.

The question of having an annual dinner was referred to the Board of Management with full powers. The board met on Thursday evening and the following members were appointed to arrange for the dinner, the general expression of opinion being in favor of having it at the Algonquin Club. Committee: President J. R. Reed, Benjamin C. Clark, Nathaniel LeRoy, C. W. Dimick, Heber Bishop, Maurice H. Richardson, Robert S. Gray, Thomas H. Hall, H. S. Dodd and the secretary. The time will be decided later on.

Henry H. Kimball, *Secretary.*

A Secret Service Fund.

Editor Forest and Stream:

I read with much interest Mr. J. R. Fanning's article in January 17 number, and quite agree with him as to the uselessness of a protector who attempts to do business in his own locality where he is well acquainted and his every movement konwn to the law breaker. Not only that, they form friendships, and one does not like to soak a friend. Then, too, I have known of instances where they have lost their position by hitting some person with a strong political pull. I have noticed that if a stranger violates the law, he is pretty apt to go before a justice, and it usually costs him something. A gentleman from New York City parted with fifty dollars last spring for a few minutes' sport shooting ducks in Jefferson. I believe that with a very little effort the protector who officiated in the ceremony could have landed a few of our own people for the same offense.

Our game protectors are paid the munificent salary of $500 per year and $450 for expenses. Out of this allowance comes their necessary railroad fare, livery, hotel bills, boats and boatmen, and incidental expenses. This is one of the principal reasons why Mr. Fanning has seen so few protectors in his vicinity. It has been suggested that the expense account be increased to $1,000. This would mean an increased expenditure of $27,500 for the 50 protectors and would probably not be allowed. If an appropriation of $10,000 or $15,000 could be secured, to be placed at the disposal of the commissioner or chief protector as a secret service fund, he could then select his best men to investigate complaints, and with the aid of the local protectors secure a much better enforcement of the law. I believe that with this small appropriation the efficiency of the department could be more than doubled. We have had three prosecutions for violations of the game laws in this county in 1902—the gentleman from New York, two parties in Carthage who are described as respectable and worthy citizens, whose names are withheld as a matter of courtesy, and who parted with $25.75 and $50.85, respectively, and a young farmer of Tylerville, who paid $35 for the privilege of shooting two gray squirrels the day before the opening. When respectable and worthy citizens and farmers can be prosecuted, convicted and made to settle for a violation of the game law in any county, it shows that there is a mighty good sentiment in that county for the enforcement of these laws.

The fact that the penalty account for violations of the game laws for 1902 was $20,000, an increase of $8,000 over 1901, doesn't show any great incapacity or lack of attention to business on the part of Commissioner Middleton or our State protectors. If the sportsmen who really want the game laws enforced would send their plans and specifications, names of violators, dates, nature of complaint, etc., to the department at Albany, instead of to the local protector, I am certain they would obtain better results. And I believe that if we could secure the secret service fund, the way of the transgressor would be hard.

Watertown, N. Y., Jan. 31.

Currituck Ducks.

Currituck Sound, N. C., Jan. 26.—*Editor Forest and Stream:* At this moment there are more canvasbacks in the northern half of Currituck Sound than we have had here in fifteen or twenty years; and they are in splendid condition, owing to a very large crop of wild celery in this end of the sound. They are very shy and seem to know a stand of decoys every time, unless it is raining or snowing. They seem to prefer to associate with blue peters and swans. I think the natives who hunt for market will manufacture (blue peter) decoys on a large scale next fall. Forty-six canvasbacks have been the largest bag made recently, but I expect to hear of at least 100 to one gun some day this week if it proves stormy.

I am much afraid our ruddy ducks will become extinct in five years. They are exceedingly scarce now and have so little protection I see no hope for them. I think there must be some mistake about the great slaughter and waste of blue peters in Back Bay, Va. Norfolk, Va., which is not over twenty-five miles away, stands ready to pay 10 to 12½ cents each for all that can be shipped there, and the natives of Princess Anne County have known it for fifteen years, and not being overburdened with the coin of the realm, I hardly think they allowed such waste as reported. Besides the blue peter is a fine bird, when properly cooked. There is only one way to do this, i. e., skin like a rabbit as soon after being killed as possible, dress and wash clean, hang up for one day or night, dip in dry flour and fry brown, make a nice bowl of brown gravy and tell your guests it is fried canvasback. Nine chances out of ten he'll say he never ate finer ducks anywhere. We are to have some changes in our game laws this season, but I cannot tell just what they will be this time. Will report later. All other ducks seem quite as abundant as last season, except broadbills and mallards; they are both rather scarce.

More Anon.

Evenly Matched.

Macon, Ga., Jan. 20.—We have had a good many quail in our section this winter. I have hunted but very little. I had one very good hunt with a friend in December. We found a good many birds and bagged seventy-one. We shot together all day with only one bird more to his bag than to mine.

Holmes Johnson.

Boy and Cat.

Clarion, Pa., Jan. 20.—I inclose a photo of one of the largest wildcats shot around here this season.

It was shot on the river hill within half a mile of our city by a young lad of this place, who deserves great credit for the bravery he showed in the conflict.

Although these animals are not usually considered dangerous, they put up a savage fight when wounded.

The lad was hunting rabbits, accompanied by two hounds, when the cat was treed after a short run. At the boy's first shot the cat came to the ground badly wounded and immediately put the dogs to flight, and then turned on the boy. It took three more shots from

A CLARION COUNTY CAT.

his 12-gauge with No. 6 shot to give the finish. The animal has been mounted in very skillful manner and makes a fine trophy and ornament. I think the lad did very well considering his age. Although Clarion County is not to be compared with some of the wonderful game fields we read about in Forest and Stream, it is about as good as any place I know of in Pennsylvania.

Birds were scarcer the past season than usual, but rabbits, foxes and 'coons furnished considerable sport to their patrons.

A few of our local sportsmen were lucky enough to get deer, and several bears have been reported in the neighborhood. Several men, while hunting bear, got shots at them, but have not been lucky.

Samuel J. Sloan.

A New Hampshire Game Preserve.

Inclosed I send a clipping taken from the Concord, N. H., Daily Patriot, of Jan. 26:

Lancaster, Jan. 26.—W. H. Griffith was here a few days ago and disposed of the entire property of the Groton Lumber Company, located in the town of Groton. The property sold consisted of 5,400 acres of timber land, on which is located the famous Darling pond, which it is said furnishes the best trout fishing in America. The price paid was $30,000. Mr. Wright has purchased an additional 3,000 acres adjoining, and it is announced that he will form a company to convert both tracts into one large game preserve. The land is admirably fitted for such a purpose. The original spruce has nearly all been cut off, and the dense undergrowth that is springing up will give the best of feed and cover for deer and other animals. As soon as the few remaining trees are removed, which will be done this season, it will be given up entirely to the preservation of game. Mr. Wright is contemplating building a club house in spring, and by the time the trout season opens there will probably be commodious quarters for those who visit the lake for the purpose of fishing. The entire property is also very desirable on account of the growth of young timber, which would be ready to cut in a few years.

In many parts of New Hampshire there are miles of wild land from which the timber has been cut. When the spruce has been taken and the succeeding growth is hard wood, the land is of little value. Practically about all it is good for is to harbor game. For some years, at about every session of our Legislature, there has been more or less discussion as to preserving the forests of the White Mountain region. The cutting of them goes on just the same. A few years since, while on a hunting trip, I met one of our largest lumber operators. He said, "I own something over 120,000 acres of timber land." The only thing which seemed to trouble him was that he would not live long enough to cut it.

As for the Darling Pond mentioned in the clipping, I never heard of it before, and I have been on a number of fishing trips to that region. The last annual report of our Fish and Game Commissioner gives a long list of the ponds and lakes in the State and does not mention the above pond.

C. M. Stark.

Hunting Quotations.

There is no more fascinating sport than the legitimate hunt for quotations.

We use the qualifying word deliberately. There are varieties of this occupation that are in no sense sport. The hunt which has a commercial taint cannot be included. Mere utility is not a proper object in the pursuit. The man who goes page by page, line by line, through an author with no higher purpose than the attainment of verbal accuracy in quotation may be a wholly reputable member of society, a faithful husband, and a kind parent, but he is not a sportsman of letters, and he can never hope to feel the thrill which the perfectly practiced hunt for quotations can convey to a soul attuned to its delights.

In the first place the quotation must be given a chance of escape. That is a fundamental condition of the game. Index traps and even the ingenious contrivances of

mnemonics cannot be approved, though the latter are often so deceptive in their apparent utility that they are not to be condemned unqualifiedly. The hunter who adopts the mercenary and commonplace plan of Aesop's husbandman and "leaves no stone unturned" is likely to be rewarded with a certain banal success, but obviously he loses the real joy of the chase. To secure that, the hunter must be a little in doubt as to the exact quotation he is after and very much in doubt as to where or how it is to be found. It is only on these conditions that he will be tempted to wander wide and deviously, sometimes in promising paths and on elusive trails, but more often under wayward impulses that have little or nothing to do with the particular passage he had in view in starting. It is in these unexpected and practically aimless divagations that the finest opportunities of the chase present themselves, and the hunter who is obedient to their charms gets much more than he dared to expect. His eye may not light on what he "went out for to see," but it will light on many a bewitching glimpse of beauty, many a surprised and surprising source of pure pleasure, so that he may return from his quest baffled but fortunate. As for the game he sought and did not get, that remains the incentive for further hunting, the excuse for further wandering.—New York Times' Saturday Review.

Iowa Game.

HUMBOLDT, Iowa, Jan. 17.—*Editor Forest and Stream:* The past hunting season in Iowa has been a remarkable one from many points, and now that it is closed it is not out of place to give a review of the season.

It opened Sept. 1 on ducks and prairie chickens. The latter bird was scarce in Iowa this year; it is practically extinct. The northern section of the State afforded the only shooting to be had, and that was very poor. The duck hunting was great. Old hunters must look back many years before they find a year equaling it in abundance. Every country slough was filled to overflowing, and large numbers of ducks bred here during the summer. The quail were scarce this year. The winter has not been very hard on them so far, and they will probably winter all right. In Iowa last year there was a strong example of wet weather, influencing the supply of quail. Had it not been for the continued rainy season in the summer, there would have been good hunting here last year, but the little quail were nearly all drowned out.

I see that the plea on no spring shooting is getting stronger among thinking sportsmen. Iowa has no law in prohibiting it as yet, although the Legislature next winter may be induced to pass a law.

Rabbits are quite plentiful in this region this winter, and I have been having some good sport with them. Frank Jaqua, of this town, and two other hunting companions, killed twenty-five of them in about an hour one afternoon, and what surprised me most, Mr. Jaqua tells me that they shot four fat mallards. They found them in some spring holes along the Des Moines River a few miles north of here.

I inclose a photo of my hunting partner, Lou Shockley, placing out the decoys on a country slough not far from here. We had some good shooting at teal on this pond several times. B.

The Massachusetts Commission.

THE Pittsfield Evening Journal of January 30 says: The members of the Pittsfield Rod and Gun Club claim that they have been misrepresented in statements issued to the press regarding the movement towards having the western part of the State represented on the State Fish and Game Commission.

No less eminent authority on fish and game than FOREST AND STREAM has been either maliciously or intentionally misinformed of the intent and purposes of the Pittsfield Rod and Gun Club. The editor of FOREST AND STREAM holds with certain North Adams papers that the Pittsfield Rod and Gun Club is to turn down and out the present commission. This is absolutely untrue.

One of the leading members of the Pittsfield Rod and Gun Club said this afternoon that there was not a sportsman of the club that had anything against any member of the Fish and Game Commission. It is stated that the local club recognizes the intelligent and successful work of Commissioner Collins, and that the local club likes his methods. What the club does want is a representative on the commission from the western part of the State. That is what it is working for.

The members of the commission are: Chairman, Joseph W. Collins, Boston; Edward A. Brackett, Winchester; Jno. A. Delano, Marion; all living within the vicinity of Boston. The commission has no representative for the central and western part of the State, and in western Massachusetts, with its fine forests and streams, there is as much if not more need of a commissioner than in any other part of the State.

The Pittsfield Rod and Gun Club has no grievance against any game warden; it is not working against anyone and is not playing any political or "long" game in their efforts for representation on the commission. All they ask for is just representation.

It Wears Well.

CENTRAL FALLS, R. I., Jan. 22, 1903.—I have taken the FOREST AND STREAM most of the time for over twenty-five years and like it just as well as ever.

GEO. T. EARLE.

Take inventory of the good things in this issue of FOREST AND STREAM. *Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?*

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Reminiscences of an Octogenarian.

Part VII.

BY THE OLD ANGLER.

(*Continued from page 92.*)

WHEN the Old Angler first fished the Cascapedia, none of the rivers flowing into either side of the Bay Chaleur was leased; all were free to every angler whose love of sport induced him to take the long and unpleasant journey necessary to reach them. The only steamer on the route made but one trip a week from Shediac to Dalhousie. The roads to New Richmond were so rough that it was more convenient to hire a boat at Dalhousie and make the trip by water, which occupies but a few hours in ordinary weather. Take it all in all the Cascapedia is perhaps the best angling river in America, if not in the world. The fish run from 20 to 45 pounds—oftener 30 than 20. They are not so numerous as they were 45 years ago, when the Old Angler first cast his line in its transparent waters; but they are still plentiful enough to give the angler all the fishing he wants for a week or two. The scenery is beautiful and magnificent, offering a new picture at every turn of the stream, which runs through a mountainous country with a current from four to five miles an hour, according to the state of the water. The rapids are numerous; many of them difficult, some dangerous to ascend, and almost as dangerous, though much less difficult, to run. Indian Falls is the most broken, rapid and dangerous place on the river; but so great is the skill of the Indian canoe-men that accidents rarely happen. The pools are numerous, and from July till September all are generally well stocked with fish. Between tide-head and the forks there are 50 miles of the finest salmon waters in America. Most of this distance the river runs through deep gorges with high and steep mountains on each side, generally wooded to the water's edge. At the forks, or junction of the two large streams which form the main river, are several pools always full of fish, which do not rise so freely to the fly as they did lower down the river. But the surroundings are the ideal of the angler who can enjoy the beauties of nature as well as the pleasures of fishing. Good angling will always raise some of the numerous salmon lying in these pools. Unlike the lazy fish of the Restigouche, the salmon of the Cascapedia rise gallantly to the fly and generally take it on the surface. Their great size, surprising strength and persistent pluck, added to the strength of the current and the force of the rapids, all combine to make angling in this river the very finest sport that rod and line can afford. In no other has the Octogenarian ever fished where there is such scope for scientific work with fly, rod and gaff. The Old Angler has never seen a Cascapedia fish on a *fin de siècle* split bamboo rod. No doubt in competent hands—such as those wonderful artists who fish from armchairs with crossed legs and glowing cigars—they would give a good account of themselves; but, for himself, the Old Angler would much prefer a longer, heavier and stronger rod, with but one splice and no ferrules. The rod with which he fished on his first visit was made by Bob Tannahill, whose boyhood was spent on the Tweed, where the fish are as heavy as those in Cascapedia. It was 16 feet long, in two pieces; the first 8 feet was well seasoned ash, saturated with raw linseed oil; the second consisted of four feet of greenheart and four of lancewood; the extreme tip was exactly three-sixteenths of an inch in diameter, and these two joints of 8 feet each were joined by a long scarf carefully and closely wound with strong waxed thread. With the reel two feet from the butt, the rod was nicely balanced; sprang evenly from butt to tip, and cast 80 feet of line with an easy swing; a slight extra effort sent the fly 90 feet straight ahead in any desired direction. With this old-time, plain-looking and cheap rod, which cost just five dollars, the Octogenarian had such angling that the mere memory of it sends a thrill through his old nerves. *Ay de Mie!* These were pleasant days, and not all the pleasure of angling was in catching fish! Just here the Old Angler would say to those who are desirous of casting a *long* line, that they will succeed as soon as they have learned to make the middle of the rod do the work instead of the tip. Those who have seen and wondered at a Tweed angler send out a side line in a succession of waves, will try in vain to imitate him as long as the tip of the rod is made the center of force. Of course, the millionaire of the Restigouche has little need of skill in casting his line; as long as he can keep his fly under water and imitate the jigging of the small boy with his worm, the fish will hook themselves without any more assistance. Skill in such fishing is quite unnecessary—it would only be wasted if used. Those of the *jeunesse doré* who fish from armchairs and are ambitious to combine fighting a forty-five pound salmon with the *dolce far niente* of kid gloves and glowing cigars, have nothing to learn from any angler, old or young. Hat in hand the Octogenarian sits at their feet, lost in astonishment, as well at their "complacent serenity" as at their peculiar ideas of sport.

Though we had good sport at the forks, the desire to fish new waters and to enjoy new scenes—a feeling always strong in your true angler—tempted us to visit the falls about ten miles up Salmon River, the largest of the two branches whose junction with the main river makes "the forks." These falls are impassable to fish, and the memory of the falls pools on Nepissiguit stimulated the desire to visit the highest point that Cascapedia salmon can reach in their native stream. True, our guides told us fearful stories of the difficulties of ascending the stream; strong currents, foaming rapids with jagged rocks, and generally "a hard road to travel," rather dulled the edge of our desire; but, truth to tell, the scant supply of "boots" was the strongest argument, and so we concluded to make all speed down stream and intercept the steamer due at New Richmond the following afternoon. Our course down the river was the most pleasurable trip the Old Angler has ever taken in a canoe. We ran all the rapids safely, and in eight short hours retraced the course it had taken two and a half days of hard poling to ascend. The descent of this fine river, running, as it does, through scenery that cannot be surpassed, was worth the expense even without the finest sport that angling affords its votaries. Although in after years the writer made several visits to this king of salmon rivers, when "boots" were easier, limited time and the fine fishing afforded by the lower pools left no inducement to go as high as the forks and so the falls' pools are yet a *terra incognita* to the Old Angler. As many more pairs of the "almighty boots" are now required to get access to this aristocratic river and its "blue-blooded" denizens than sufficed 40 years ago, the *hoi polloi* of the brotherhood cannot aspire to wet their plebian lines in its sacred waters. But the Nepissiguit and the North and Southwest Miramichi, with their smaller fish and their more subdued scenery, are yet within their reach and will have to satisfy ambitious longings. But they can console themselves with the knowledge that either of these rivers and some of their many tributaries will give them angling of a much higher class than the millionaire can find in all the waters of the Restigouche.

* * * * * * *

The most incorrect and unfounded statements have been made of the vast increase of salmon in all the rivers that have been monopolized by the millionaires. The only foundation for these silly statements is the alleged annual increase of the anglers' catch. After every net has been removed from the river above Campbellton, and all spearing prevented in its upper waters, it would be strange indeed if more fish did not get into the Restigouche. The same must be said of the Nepissiguit and the Miramichi. Nets are no longer set above tideway and the fish these formerly caught are now added to the anglers' stock; but still there is no denying the fact that the number of salmon is rapidly diminishing in all the rivers of Nova Scotia and New Brunswick. In the writer's early manhood a couple of spearing raids on any of these rivers would, in a few nights, take more salmon than all the anglers on either of them aggregate in the whole season from June to September, to say nothing of the still greater number formerly taken in the nets set in all of them above tidewater. This alleged increase is attributed to artificial culture and the millions of fry distributed from the hatching-houses at Gaspé, Restigouche and Miramichi, and the wildest hopes are indulged by American anglers that fish-culture will, ere long, re-stock all the rivers of the States. Some 34 years have elapsed since Seth Green in the States and Samuel Wilmot in Canada commenced the artificial culture of salmon and trout eggs, the former to re-stock the streams of New York and New England, the latter to re-stock those flowing into Lake Ontario. The writer has never heard nor read of a single adult salmon taken from any river re-stocked by Mr. Green. He has read, however, that it costs about two dollars for every pound of trout taken from streams in which they were not indigenous. Mr. Wilmot himself told us the result of his costly operations. In his Report for the year 1881 is the following:

"I cannot disguise from myself that the time is gone by forever for the growth of salmon and speckled trout in the frontier streams of Ontario. But this fact could not have been evolved from intuition. I reached the conclusion through observation and experiment; through depositing fry in certain ponds and waters, and ascertaining that they languished and died there, though forty years ago these same streams and waters swarmed with the same fish and sustained life in the highest degree. The change is, therefore, in the waters; and that change is due to the clearing of the forest off the land in the neighborhood of these streams and their feeders, and the consequent reduction of water volume by reason of the increased evaporation and defilement by the surcharge with vegetable matter, field filth and other foul matter."

Mr. Wilmot has been dead some years; if the total failure of his hobby and his hopes did not hasten his end, it must have added much to the gloom and lassitude of his last days. Poor Wilmot! Fortunately he cannot know how complete this failure was, nor how uniformly it has gone on in the Maritime Provinces as well as in Ontario. After eight years' costly experimenting in a new hatching house, and the planting of over 6,000,000 fry in the rivers of P. E. Island, the result was total failure; the hatching-house was abandoned and has since rotted down. In 1874, the year the first hatching houses were built in New Brunswick and Nova Scotia, the whole catch of salmon in the former Province, as given in the Blue Book of the Department, was 3,214,182 pounds. In 1901, the last year for which the figures are given, the catch was only 1,235,350 pounds, a decrease of nearly two million pounds. In Nova Scotia the catch in 1874 was 1,758,818 pounds; in 1901 it was 557,802 pounds, a decrease of nearly a million and a quarter. In P. E. Island salmon are no longer quoted as part of the annual yield of its fisheries. And yet the work goes on under an imported Professor who combines in his own person, as we gather from his platitudinous verbiage, the offices of Scientific expert, Superintendent of fish culture, Commissioner of fisheries and General Inspector of all the fisheries in the Dominion of Canada. Under the direction of a professor who has to perform duties so multitudinous we can scarcely look for much improvement, when Mr. Wilmot's whole time was fully occupied in the management and supervision of fish-culture alone, with the above result.

Our rivers, like our forests, must submit to the law of Nature. As civilization and cultivation extend, the "kindred of the wild" must recede. Our legislators and sportsmen must recognize the undeniable truth that the past wasteful destruction of fin, fur and feather must cease and that true protection must take its place. No doubt the game laws of Europe are hard on the masses for the sole benefit of the classes, and yet we are forced to admit that without the game laws of Britain there would be neither fin, fur nor feather in England, Scotland or Ireland. Let us hope that a more enlightened public opinion is being created and that the masses as well as the classes will see the wisdom of preserving and perpetuating, as far as that can be done, the wild denizens of the forest and stream. V.

The Veteran's Pool.

Fly-fishing for trout is undoubtedly the most sportsmanlike and enjoyable way in which to lure the game fish from his native haunts, but when the conditions prevent the casting of a fly or when it is late in the season, other pleasant modes of fishing may be employed.

Sometimes on a stream, especially one flowing through woods or forest, the overhanging trees, thick bushes and undergrowth along the banks make it impossible to cast a fly, and if the angler would be successful he must adopt a stout bait rod.

Near our camp in the North Woods flows a large and beautiful trout stream. Rising on a small woodland lake it passes windingly through the forest, gradually broadening out, and finally joining the Beaver River some miles from its headwaters. For the first mile or so the water goes tumbling and leaping over moss-covered rocks and logs, here and there sinking into a shallow, pebbly basin. Below these series of miniature cascades are found the trout pools, although sometimes they are separated by falls and swift water. At times the stream on its course passes into a bright open beaver meadow, flowing quietly through the tall yellow grass and alder bushes and finally wanders back to the shadowy, fragrant woods. In the depths of the amber-colored water the trout lie lazily moving their broad tails and hungrily waiting for the fisherman to drop his bait.

One bright, clear morning toward the end of August, the "Veteran," always the leader and instigator of the fishing and shooting expeditions, proposed to Freddie and me that we should go over to the stream that morning and try the fishing. Did we want to go? Of course we did. The assent was only too readily given and the prospect hailed with delight. The "Veteran" informed us of a very good hole he knew of where the trout were especially plentiful. This pool was easily accessible if a person knew how to reach it, but very inaccessible to those who did not know the way. In fact, the "Veteran" was about the only one who knew the best route, and so we decided to try our luck in this pool.

We now gathered the fishing tackle together, which consisted of a couple of light bait-rods, hooks, lines, sinkers, etc., and then proceeded to fill the bait can liberally with large, fat earth worms. These, together with a bottle of "fly pizen" carried by the "Veteran," formed our outfit for the expedition, and about half past nine in the morning we were ready to start.

The morning was an ideal one. Huge, flakey white clouds floated against the azure blue sky, and the woods as we drove through them were filled with pleasant sights and sounds, while the pure, sweet air that filled our nostrils was like a strong, healthful tonic.

Having driven about one and a half miles from camp we reached a large clearing in the forest, and here the wagon left us. The "Veteran" now took the lead and struck off on an old, rough carry.

The walk through the woods was as enjoyable as the drive over, if not more so. The sunlight streaming in fell on the rugged trunks of the forest trees, turning the gray bark to a golden brown, and here and there a quivering ray enveloped a bunch of delicate ferns in a sparkling misty haze. Bluejays uttered their sharp, wild cry above our heads, and we now and then caught the warble of a red-eyed vireo, that faithful summer songster. We kept to this carry for half a mile or more, and then the "Veteran" turned to the left on another worn path, and after walking a few minutes we came suddenly on a wide, deep brook. The old corduroy bridge had been swept away, probably by spring freshets, and only a shaky log remained on which to cross. The "Veteran" went first and passed over safely to the opposite side. I followed and hopped across frog fashion, for the log was as slippery as glass and the dark, cold waters beneath looked far from inviting. Reaching the other side I stood up beside the "Veteran" on the remnant of the bridge, when, without warning, crash! he went through the rotten logs, only saving himself from going in by gripping a small bush. In the scramble and excitement which followed, the bottle of "fly pizen" fell in the brook. At first we were much dismayed over the loss, but fortunately for us we were not annoyed by any "punkies" or mosquitoes that morning. Freddie crossed the treacherous log in safety and we continued our way, leaving the path and shortly after climbed a beautiful ridge covered with tall pine and spruce trees. The view as we looked out between the smooth massive trunks of the trees was exquisite. A vista of rolling wood-clad hills, here and there broken by a clump of huge stately pines, and far to the northeast a faint blue line of mountains. We stood for some time enjoying the beauty of the scene, and then descended the ridge. At the bottom there was a level stretch of marshy ground and when we had traversed this we suddenly caught the murmur of the stream. In another minute we stood among the alder bushes bordering its banks and gazed with eager eyes into the dark, cool depths of the coveted pool. "Well, here we are," said the "Veteran." "Now bait up and go to work. Two fishing in a hole like this is enough at one time, and I have done a good deal of this fishing, whereas you two have not." And lighting a cigarette he seated himself under a tamarack where he could watch the proceedings while Freddie and I baited our hooks with feverish haste on the bank.

Taking our places some feet apart, and standing well back in the alder bushes, we began operations by carefully letting the bait drop slowly into the water. No sooner had mine become well submerged than I felt a sharp tug on the line, and, giving a terrific jerk, out came the hook, bait gone, but no trout. A shout at this moment from Freddie attracted my attention, and I looked over in time to see him swing a nice fish from the pool. The fun now became fast and furious. No sooner would the bait disappear than a lusty trout seized it hungrily. Our fingers became thumbs as we struggled to fasten the wriggling worms to the hooks, for each and every time the wily fish would snap it off.

Once a strong, sudden jerk nearly took the rod from my hands, and I struck sharply, but failed to hook the fish. Baiting up as quickly as the excitement and conditions would allow, I threw in again and was rewarded by feeling the tug repeated, this time with success. A wide swirl, followed by two or three desperate rushes, and with a shout of triumph I succeeded in swinging out a fine pound trout. How his red and gold sides flashed and gleamed as he lay flopping in the grass! It was a pity he could not have fought longer, but splashing and noise in a small pool intimidates and frightens the other fish, and thus spoils the fishing for some time after. Highly elated over the catch, I baited up quickly and dropped in again. Gradually the lure sank into the dark water, and before it had reached the bottom there was a slight twitch on the line. Breathlessly I waited for it to be repeated. Another shake, this time stronger, the line was pulled suddenly taut, and the fish was hooked. Away he went, plunging and rushing, here and there, but in a few minutes shared the fate of his comrade. He weighed three-quarters of a pound and the two made a very pretty brace of fish.

Hearing another shout from my fellow fisherman, accompanied by a splash and a laugh from the "Veteran," I perceived Freddie in the act of crawling out of the bushes on the bank. With a wild effort he regained his feet and clambered to a place of safety. In trying to throw the bait under the bank on the opposite side he had taken a step too near the edge and had fallen in. Fortunately only one leg received a ducking, which did not interfere with the fishing, only causing a good laugh.

Once in swinging a fish from the pool I saw that the trout had become uncontrollable, and was coming straight for my head, and failing to duck in time, he caught me a sounding smack on the side of my face, which turned the laugh on me. More beauties kept on coming, and all under size were of course thrown back. Finally the "Veteran," who had been packing the creel with trout, called out: "This basket is chuck full, and not another fish will go in, so I guess you had better quit fishing." In a few minutes we were ready to start, but before leaving threw the remainder of the worms into the pool, and then, shouldering our traps, we bade a reluctant farewell to this lovely spot.

On climbing the pine knoll we had another glimpse of the beautiful view. A gentle breeze stirred softly among the tree tops, and the sweet, clear note of a white-throated sparrow reached our ears from the swamp below. Plunging down the hillside we soon came to the stream with its treacherous log. Crossing over this time without any mishap, we continued our way and in less time than it takes to tell were at the wagon. We reached camp after a brisk, pleasant drive, dirty, hungry, but happy. Counting the fish we found we had thirty-three, the largest weighing a pound, and the others varying from eight to fourteen ounces.

In the evening, when we were gathered around the comfortable old stove in the sitting room discussing the adventures of the day, Freddie and I came to the conclusion that the "Veteran's" pool had proved a grand success, and neither of us would ever forget the pleasures of the trip.

Camilla.

The Sea Trout of the Escuminac.

Editor Forest and Stream:

For the last three years I have enjoyed the privilege of fishing the above-named river in the Province of Quebec, and the discussion which has arisen between Mr. Venning and Mr. Halloek relative to the proper classification of the sea trout, has suggested to me that perhaps a few items from my experiences might be interesting to some of your readers.

The Escuminac is a beautiful, clear, cold stream emptying into the Bay Chaleur from the north, and about forty miles from Matapedia, and like the Nouvelle, is essentially a trout river.

If the season be a normal one we expect the first run of trout about July 1, and the second run ten days later. An abundance of spring rains delays their advent into the river some seasons until the last of July, but the majority of first runs will be during the first week of the month. While on the river the first two seasons we made our headquarters with Dan Brown and family, near the mouth of the river. "Uncle Dan" as he is called, was for a number of years guardian of the river, and aside from being an exemplary, God-fearing citizen, he is a born angler and a beautiful caster. To Uncle Dan (may his shadow never lessen) I am indebted for much interesting tradition concerning what the angling was in the river years ago, and of the coming and going of the trout. From the mouth of the river up to the falls is about twenty miles (it depending not a little of whom you may inquire), and that is as far up as we ever fish. Above the falls the water seems to be just as plentiful, but no trails have ever been swamped, and the angling ends on that stream with the trails.

Now, to me it seems a very curious fact that the pools and reaches of the lower five or six miles of the river never contain any large trout, but such is the case. There are grand pools, an abundance of shelter under banks and alders, but never a trout could I get to rise. And I have wondered much thereat. But in the very lowest waters, that which was affected by each incoming tide, I have seen countless thousands of fingerling trout. We see fry all the way up the river, but in no such numbers as the fingerlings in the tidal waters. Two hundred miles above its mouth the river is crossed by the Bay Chaleurs railway. As I have always had a yearning to see these trout on their journey to the nuptial pools, I have stood on the bridge hour after hour and watched for some member of the ascending hosts, but not one did I ever see. "I wonder why." Do these fish enter the river at night and move steadily on until daylight, or a given point is reached? It seems very strange that not one could be seen.

As there was no fishing on the lower waters, and stopping near the mouth necessitated a great deal of travel, a year ago this winter a nice commodious camp was built sixteen miles up, which locates us right in center of the fishing and—the black flies. These have been known to annoy some people. During the early fishing the trout remain in the pools, but when the water begins to yield to the effect of the sun they seek the shelter of the banks and the overhanging bushes, and then to get your fly where the concealed fish can see it requires skill, patience and profanity. Alas! oftentimes much of the latter. But they are there, great spotted beauties and as plenty as angler can wish. When you fasten to a four pound fish, after digging him out from under the alders, he is very liable to exhibit a frantic desire to return to cover, and the angler who is content to wield a 4-ounce rod crowds big wads of experience into five or ten minutes, if he saves his fish. But it is worth all the disappointment if he brings one in three to net.

Before we started on our first trip to the river, I wrote to Uncle Dan and asked his advice about the proper flies, rods, etc. His reply was to the effect that all the flies we needed were two varieties, viz., the "thunder-and-lightning" and the "mouse-lure." I failed to find either one of these patterns at any one of the Boston tackle houses, so we concluded to chance the first trip with different varieties of salmon flies, and a good assortment of Rangeley Lakes bugs. You can judge of our chagrin and mortification when we realized that the Escuminac trout would rise just as quickly to a Japanese umbrella, as they would to any fly in our possession. Here was a dilemma. I sent to Mr. Baillie in St. Johns. He did not have them. Then we sent to Campbellton, and a dealer there telegraphed to Quebec, and we got the much desired thunder and lightning, and trout. I see it frequently stated that the sea trout will rise to "any old thing." I guess the Escuminac trout are a bit particular.

For size our fish averaged good. We seldom net one under two pounds in weight, and I have taken three fish successively which aggregated over sixteen pounds.

I have netted a fresh run trout whose silvery sides would rival a salmon's, spots just faintly showing, the median line alone pronounced. And late in the season I have taken them robed in colors that would make a rainbow look like a pneumatic tire.

In conclusion, I wish to add that it is my humble, unscientific opinion that these fish ascend the river to deposit their spawn and observe the various functions of reproduction.

J. W. B.

Trolling for Bass.

Cincinnati, O., Jan. 19.—*Editor Forest and Stream:* Dr. Henshall, in his "Book of the Black Bass," makes the assertion that he formed the acquaintance of one fish in the Miami River, near Cincinnati, but I am afraid it would tax the good doctor's skill to the fullest extent to strike up a flirtation with that grand game fish in that stream at present. The Little and Big Miamis and the Whitewater rivers are within easy access of this city, but the fishing, so far as the black bass is concerned, is nil. These streams appear to be splendidly adapted for the bass, but seiners and dynamiters have wrought his undoing, and he is not found.

But there are several stocked ponds in this neighborhood that yielded some fine fish the past season, and proved a boon to those fishermen of this vicinity who had no opportunity of visiting more favorable localities. There were quite a goodly number of four and five-pound bass captured, and one caught and weighed in my presence tipped the beam of a grocer's scales at seven pounds and six ounces. As several of your correspondents, who have visited the most propitious angling regions, seem to consider a bass of four or five pounds a leviathan, it appears as though the humbler brethren of the angle of this neighborhood might go further and fare worse.

Most of the larger fish were captured with surface casting trolls, and as I believe I was one of the first in this vicinity to use a lure of that description in angling for bass, I feel myself in a measure responsible for their introduction. It was to draw out some expressions of opinion as to the merits of surface casting trolls from a sportsmanlike point of view that this was written.

While I am merely an enthusiastic neophyte in the art of angling, it may not be regarded as presumptuous in me to state what I regard as the meritorious features of these lures, which are as follows: Effectiveness, as on comparison with other baits they produce better results, both as to size and number of fish taken. (Flies are excepted in this statement, as I have never had the good fortune to witness the performance of an expert in that branch of the art.) They are more humane than live bait, and this, to me, appears to be a good and sufficient reason for their indorsement, as I never could and probably never will, be able to impale a live minnow or frog on a hook without feelings of compassion for its suffering, as evidenced in agonized writhings, which some of my philosophical friends assure me are merely the manifestations of reflex action, but I am not persuaded of the truth of this. They are not pot-fishing devices, as it requires plenty of perseverance and more skill in casting them than the average pot-fisher possesses to produce good results. Indeed, I have never seen a poor bait caster accomplish anything at all with them. These features, together with the fact that they are economical and do away with the trouble of procuring and preserving live bait in good condition, in my opinion, place them before any other form of lure, except the artificial fly, in the use of which it is my ambition to acquire dexterity in the coming season.

The chief objection to these trolls is the multiplicity of hooks they contain, usually two and sometimes three triples, but from their size and conformity this cannot well be avoided, and leave them with adequate hook presentment.

It was with the hope that this species of lure would receive what its merits or demerits deserve from some of your correspondents who are versed in the ethics of the art that this was written, and I pause for reply.

A Fish Story from the Pension Records.

WASHINGTON, D. C., Jan. 28.—One would think that about the last place to look for a fish story would be among the Revolutionary pension cases, many of which have not been disturbed for fifty years and which, upon being opened now, give forth clouds of dust, literally the dust of ages.

No general pension law for the benefit of Revolutionary soldiers was passed until 1818, so that from the deaths of comrades and the imperfection or absence of records, proof of service was difficult, hence applicants were required to give names of officers of low or high rank, describe the country through which they passed and relate incidents of their various campaigns as minutely as possible. In the claim of Job Phillips, dated May 23, 1833, he stated that he served in a Pennsylvania regiment during the years 1776-77-78, and that Lieut.-Col. Russell, while crossing the North River, had both thighs broken by a sturgeon leaping into the boat, in consequence of which he—the colonel, not the fish—died.

That seems rather a robust yarn, but as there was no motive for exaggeration, it may be accepted as truth, or what the soldier thought to be truth.

The weight of the fish was not stated.

P. ENTION.

Artificial Culture of Salmon in America.

LONDON, Jan. 17.—*Editor Forest and Stream:* Could you or any of your readers give me authentic information as to where it has been proved that the salmon has been successfully introduced into and has stocked rivers in the United States in which it has been practically or actually extinct.

I see that Salmo, in the Jan. 10 issue of your delightful paper, says that the hatching of Pacific salmon in the various U. S. Fish Commission hatcheries has assumed gigantic proportions.

I have always understood that the results were also gigantic and of immense value, but certain scientific gentlemen in this country deny that it can be proved that artificial culture of salmon has been a success anywhere, as far as the stocking rivers with fish is concerned. They say there is gigantic success in collecting ova, hatching out fry and planting by the million, and that is about all there is to it, and they have used their influence to prevent the use of public funds for salmon stocking purposes in this country.

It would be a great help to advocates of fishculture all over the world if you could publish unquestionable proof of the benefit derived from the artificial cultivation of salmon in America.

May 29-30.—Hempstead, L. I.—Open air show of Ladies' Kennel Association of America.

A Dog by Express.

LLANO, Tex., Jan. 25.—As Mr. Hough has told a dog story, I would like to relate a similar one. While messenger for the ——— Express Company fifteen years ago I took on at a small station a genuine "nigger" hound valued at $50. He was a vicious fellow, and I did not try to cultivate a close acquaintance. We traveled all right for 100 miles or so, when all at once the dog came tearing out of the crate. I did not try to stop him, but just let him go. When we stopped at a water tank I did not try to close the door, but let him "hit the trail." In fact, I helped him all that I could by throwing coal at him (by the way, I was on top of the highest pile of trunks in the car), this being all that I could pick up to defend myself with except my Colt .45, and I knew better than to shoot the dog.

I was drawing only $60 per month then, and when that dog left the car I saw $50 of it pinned to his tail. Well we pulled out, and I was in a "peck o' trouble." I could not afford to pay $50 for a dog, and worse still, losing my job, was out of all reason. We had still to run one hour and fifty minutes, and I had that time to think it over. So by the time we reached S—— I had made up my mind to make a report of the whole matter and pay for the dog. Of course, I was blue. When we stopped the agent came to the car, and when he saw me he said, "Great Scot! Kid, what have you been crying about? Did you bet rattled?" I said "No, sir!" At that moment a negro boy came along with an exact counterpart, except the biting qualities, of the lost dog, and I said, "Say, Bill, you want to sell that dog?" "Yas, boss." That made me feel good.

Well, I bought his dog for 50 cents and put him in the crate; and until this day that dog man is selling full blood "blood hounds" from that 50 cent dog—or his get. I have visited his kennels and have heard him blow about his fine dog that he paid $50 for at P——, and I smiled and drifted.

OLD EXPRESSMAN.

Old Dog Ponto.

SPRINGFIELD, Mass., Jan. 27.—*Editor Forest and Stream:* I take the liberty to send you a scrap clipped from the Springfield Republican, suggested by a kinsman of mine pertaining to the age, habits, training and native characteristics of an old worn-out English setter belonging to me. His worth as a first-class dog in the field could not have been excelled by any dog of his breed. Perhaps you may think it not out of place in your highly valued paper as a tribute to dogs, the valued companions to all sportsmen that are not so selfish as to deny to the brute creation a just recognition of worth.

HENRY R. MERRITT.

With Things at Sevens.

With things at sevens, or out of joint,
And stale-worn runs the craze for gain;
'Tis blest relief in fields to jaunt,
Up fill the hours with moments sane.

I call my dog, Forespent—he's old,
His years show record in his face;
But not for me his love is cold,
Nor lost his lineaments of grace.

From Nature heart he purposed came;
Her pleasure mold—she made him true;
No blemish marks he bears of shame,
No evil done his dog life through.

In field or run, or marsh, or wood,
He's played his part, to flag nor fail,
How well his work he understood,
His count may show of grouse or quail.

Staunch, kind, and true, by nature wise,
Presuming not, nor gross, nor vain,
A world of goodness in him lies—
His life filled out without a stain.

And is revealed, when from my hands
He takes some dainty that he loves,
A will to bide but those commands
His instinct prompts, or, well approves.

His work is done. But I can see,
When by the winter fire he dreams,
His native traits by sleep set free,
To match the best in huntsmen's themes.

I love him much, as he loves me;
We're joined in all, as dearest friend;
His wants now few, the simple fee,
Bed, food and drink, fill out the end.

He comes to me; he seems to know
That I have wrestled some with years;
Has he a soul? I trust 'tis so,
So well the fact his love declares.

Aye, love like his can never die;
Immortal 'tis—To live! To live!
From earth to heaven, it reaches high,
Death thralls it not, nor wound can give.

CHRISTOPHER C. MERRITT.

SPRINGFIELD, Jan. 21.

Westminster Kennel Club Entries.

The number of entries of each of the different breeds, and the total of all the entries for the forthcoming show of the Westminster Kennel Club are as follows: Bloodhounds 17, mastiffs 8, St. Bernards 71, Great Danes 93, Newfoundlands 3, deerhounds 9, Russian wolfhounds 47, greyhounds 21, foxhounds 11, pointers 119, English setters 104, Irish setters 39, Gordon setters 17, Griffons 6, retrievers 6, Chesapeake Bay dogs 4, sporting spaniels 183, collies 165, old English sheep dogs 61, Dalmatians 8, poodles 63, bulldogs 177, French bulldogs 82, bullterriers 107, Airedale terriers 53, Boston terriers 177, chow chows 3, Basset hounds 11, beagles 87, dachshunds 59, foxterriers 143, Irish terriers 65, Scottish terriers 48, Welsh terriers 25, black and tan terriers 23, whippets 11, Skye terriers 6, Bedlington terriers 8, schipperkes 7, Yorkshire terriers 17, Maltese terriers 6, toy terriers 9, pugs 28, Pomeranians 30, toy spaniels 102, miscellaneous 7. Total, 2,346.

Irish Setter Club.

CHICAGO, Feb. 2.—The annual meeting of The Irish Setter Club of America will be held at the Madison Square Garden on Friday, February 13, at four o'clock, P. M.

GEO. H. THOMSON, Secretary.

Yachting.

Work is being rushed on the new boat building for the cup defense by the Herreshoffs at Bristol, and it is now believed that she will be ready for launching by the middle of April. The frames are all set up and the work of plating has commenced. Some of the interior bracings and trusses are already in place, and as all the material is on hand there will be no delay on that score. The steel mast is nearly finished, it being constructed very much as Constitution's was, and the topmast will house inside. Little authentic news can be learned about the new boat's design, as the greatest secrecy is being exercised in every branch of the yacht's construction.

The steamer Diamond State has been purchased by Mr. August Belmont, and she will be used as a tender to Constitution. The vessel, which has been used as a passenger and freight boat between Philadelphia and Wilmington, will be entirely refitted to meet her new requirements. She will be in charge of Captain James Price, who has been in command of Scout, Mr. Belmont's steam yacht. Diamond State was built at Marine City, Mich., in 1894. She is 172ft. long, 25ft. breadth and 10ft. draft. Her engines are of 2,600 horse-power, and she has a speed of 22 knots.

The steamer Sunbeam has been chartered by Mr. C. Oliver Iselin and she will be used as a tender to the new cup defender now building at Bristol. Sunbeam was built at Essex, Mass., in 1900 and since that time has been in the fruit trade plying between Boston and the West Indies. She is 132ft. 6in. long, 30ft. breadth and 10ft. 8in. depth. She has a speed of about 12 knots.

Thames Houseboats.

As the Thames became more thickly populated, it was necessary to increase the regulations for public convenience and for health, and consequently the rules regarding houseboats are now very strict. The Conservancy issue a long list of places where these craft may not moor, on account of interference with the traffic or with private rights, and sanitary regulations to prevent pollution of the river have been much more stringent in recent years, not even a lavatory basin being permitted to drain into the Thames. So it comes that houseboats are forced into certain districts, chiefly where there is opportunity for obtaining a plot of land, and these inclosures are often made picturesque little gardens. This grouping together gives a most charming appearance to certain reaches, those, for example, at Molesey, Staines, Datchet, Bourne End and Henley, and there is not a great deal of movement during the season, except about Henley time, when many craft are taken up or down to the famous regatta town by their attendant launches or by tug, while some other regattas will attract a few houseboats from their accustomed moorings to the respective courses.

Several Thames boat builders have made quite a reputation for houseboats, one of the chief being James Taylor, of Chertsey, and to Mr. W. Bates, the manager of the firm, I am indebted for the accompanying plans. This builder is taken particularly as he introduced a distinct novelty a few years since in the center-saloon houseboat, and the plans show clearly the difference in design of the two types. Little description is necessary, as the dimensions and interior arrangements of two typical English boats are shown clearly on the plans. These craft are perfectly representative of Thames houseboats of the larger class, and are the most useful description to purchase, as they are readily sold and easily let. It is better to purchase what one may describe as "self-contained boats," with kitchen, etc., on board, and then, if cooking operations are objected to, a small craft may be obtained for culinary purposes, and for the accommodation of servants. Boats at permanent moorings, however, when there is land available, often have a kitchen and domestic offices in their garden plot. For those who do not require such large craft as those mentioned above, there are numerous small craft to be obtained, say from about 35 feet long upwards, with saloon, three bed rooms, etc.

With regard to the number and sizes of houseboats on the Thames I cannot do better than quote from one of the registration lists of the Conservancy, who for inhabited craft charge an amount of £5 for a boat of 30 feet in length and £2 for each six inches over 30 feet. Boats not used are exempt from payment, and those used as dressing places or storerooms are only charged one guinea each per annum.

A list I have before me is the first issued last season, and contains the names of 125 pleasure boats. The following are those of 50 feet and over:

Athens 55ft, Annie Laurie 63ft., Aida 79ft., Albatross 59ft., Arcady 53ft., British Queen 74ft., Bohemian Girl 50ft., Banshee 50ft., Bedouin 60ft., Balaclava 71ft., Cigarette 119ft., Cecil 75ft., Cardinal 65ft., City of London, 69ft., Chez Nous 65ft., Czarina 50ft., Caprice 50ft., Dabchick 65ft., Dunottar 80ft., Empress 66ft., Eileen 67ft., Frog 59ft., Folly 78ft., Fair Maid of Perth 119ft., Glowworm 68ft., Guinevere 63ft., Gloriana 103ft., Golden Butterfly 50ft., Golden Grasshopper 80ft., Genesta 65ft., Geisha 71ft., Hirondelle 60ft., Happy Thought 60ft., H. M. S. Pinafore 65ft., Ibis 113ft., Idler 53ft., Kittiwake 95ft., Kelpie 63ft., Kingfisher 74ft., Kopperty 50ft., Kismet 90ft., Kelpie 66ft., Lazyland 55ft., La Reine 60ft., Lelia 50ft., Lotos 50ft., Lotus 50ft., Minnehaha 65ft., Mirabelle 50ft., Madcap 50ft., Maid of Kent 60ft., Miranda 79ft., Nepoo 50ft., Nautilus 70ft., Nightingale 111ft., Rouge et Noir 50ft., Red Rover 85ft., River Home 52ft., Rippledene 50ft., River God 50ft., Swan 61ft., Siesta 91ft., Stella 71ft., Sunbeam 88ft., Syrinx 76ft., Summerholme 74ft., Thistle 90ft., Venezia 66ft., Venice 68ft., Yahnehune 50ft.

In some cases the extra size includes tenders. A further list contains about 40 names of rowing and swimming club barges, and what are really floating boathouses, the Oxford College barges, of course, figuring largely.

As an instance of the popularity of houseboats on the Thames, it may be stated that the registration fees add well over £900 to the Conservancy funds each year.

In the special list of places where houseboats may not moor, the Henley Regatta course is included, but this restriction is waived during the regatta week, when positions are allotted to subscribers to the funds, chiefly according to their liberality in this direction. Owing to certain unnecessary regulations regarding sub-letting, Henley houseboats were considerably reduced in number for a season or two, but last year there was again a good muster, and several of the accompanying photographs were taken during the regatta, when every effort is made by artistic decoration, floral and otherwise, to make these charming craft more than ordinarily beautiful, and Henley week on a well-appointed houseboat may be safely recommended as an excellent method for disposing of superfluous dollars. A good boat will fetch £150 for the week, subscription to the regatta fund means an extra £20 for a good place, and there are no limits to hospitality for those who mean to do the thing well.

At ordinary times a good boat will fetch £10 a week, so that altogether there are worse investments than a houseboat on the Thames; in fact, it has always been a surprise to me that some company has not worked a small corner in them. A boat of, say, 60 feet long with good accommodation will cost to build from £400 to £500, and furniture, small craft, etc., could be obtained for another £100. On such a craft one would be very unfortunate not to clear £100 for several years, and then there would be an asset worth £400.

There are generally plenty of boats on the English

A THAMES HOUSE-BOAT SALOON.

market, for in comparatively few cases does the houseboat craze last for long. A man will buy one, and be enthusiastic over river life for a year or two, but he will then, perhaps, want to sell, for naturally there is, under Thames conditions, some monotony about houseboat existence. Fortunately there are always others to take his place, and so as each season comes round, one sees the same fine display of floating homes on the Thames, and, to gain a thorough acquaintance with river life afloat in this country, I can strongly recommend the American visitor to spend a month or two on an English houseboat. He will not encounter many startling adventures, perhaps, but if he has a soul for the beauties of nature, he cannot but be stirred by the quiet glories of Thames scenery, enjoyed in all its phases by the lucky occupant of a houseboat moored in some charming reach of the river. And if he has a mind for sport, the months of July and August will give him all he can desire in the many and varied contests typical of the regattas of the season. We English are sometimes taunted with the enthusiasm we display for "Our River," as the artist-author, Mr. G. D. Leslie, styled it in his charming book, but those who have lived on its banks or afloat on the bosom of the stream, can stand all this and are ready with Milton to say "Thamesis meus ante omnes."

English Letter.

HOPE springs eternal in Sir Thomas Lipton's breast. He has just been reported as having said that the new Shamrock will embody three if not four improvements over previous challengers, and that he has safe grounds for anticipating victory in the next struggle. Now, this all depends upon the magnitude of the "three or four improvements," and whether Herreshoff has not made five or six of equal importance. We all hope for the new vessel's success (and many of us expect it), but it is not a question of arithmetic. Of all challengers, Sir Thomas is undoubtedly the most optimistic, and that is a very charming feature in his disposition.

The new yacht will be launched in April, and will, as soon as possible, be put through her paces with Shamrock I., first on the Clyde and then in the south of England. The races between the two will be on strictly business lines, proper courses being laid out, and guns fired in the usual way. Also there will be money prizes which will reward the exertions of the victorious crews.

The Council of the Yacht Racing Association has adopted the resolutions of the owners in the handicap classes, almost entirely. The chief alteration made is to classify the boats by the old Thames tonnage rule. Each boat, however, will be measured for length and sail area, and on these the allowances of a strange or new boat will be based until she shows form. The main point, however, is the recognition by the Association of handicap racing and the appointment of an official handicapper. If one man only and not a committee is selected to arrange the handicaps, it is pretty safe to guess that he will be Mr. Andrew Thomson. For many years he has been in great request among clubs giving handicap races, and probably no man has acquired so much information on the subject. A handicapper better qualified for the office could not be found.

The originators of the new Solent one-design class have recognized the size and style of boat originally chosen by them. Mr. Mylne will design the fleet, but the dimensions are considerably enlarged, so that the yachts will be roomy and comfortable little cruisers. It is said that the type will also be more "wholesome." In size the new boats will be of about 42ft., Y. R. A. rating. This will remove all danger of their destroying the 30ft. open class, but I am afraid the 36-footers will still suffer an eclipse. If only the managers of the class could be brought to see the virtues of a short maximum handicap combined with a rigid rule for building, the loss of the 36-footers would not be felt, for a far better class would take their place.

Meantime comes news of two more one-design classes in addition to the host of others that are sapping all interest in racing among the small fry over here. Both of these are from Mr. Mylne's design also. One is for a Clyde club and the other for Dublin Bay. One-design classes seem to have caught on in Ireland more than anywhere else.

Mr. A. L. Barber's new turbine steam yacht was launched on the 14th inst. by Messrs. Ramage & Ferguson. She is to be called Lorena. Her dimensions are: L. O. A., 300ft.; L. W. L., 253ft., and beam, 33ft. 3in., the tonnage (Y. M.) working out at about 1,650. She has three independent compound steam turbines and two condensers. There are one high pressure and two low, with the latter of which the reversing turbines are connected. There are two propellers on each of the outer shafts, and one on the middle one, all five being of manganese bronze. There are four cylindrical tubular boilers containing 8,500 square feet of heating surface, and about 220 square feet of grate area. The power expected is about 3,200 horse-power with the turbines working at 530 revolutions for the middle shaft and 750 for the outer shafts.

Above the main deck there is a promenade deck extending the whole length of the vessel to within 20ft. of the stern, and on this is a deck house 100ft. long by 14ft. wide. On the main deck there is a range of deck houses nearly 170ft. long with alley-ways on each side 5ft. broad; 50ft. of this erection is taken up by the owner's stateroom, boudoir and toilet room. At the after end are a library, stateroom and toilet room. The question of the advantage of turbines over reciprocating engines has been clearly decided in vessels of high speed, but whether this type of machinery will be found well adapted to ordinary yachts has not yet been demonstrated. Lorena's performances will be regarded with very keen interest, and if the result is satisfactory it will have an immediate effect on future steam yacht building. The result of the Emerald's trials are said to have been good, but no details have been published.

American motor-makers will be wise if they direct their attention to engines of many small cylinders as opposed to those of one or two large cylinders for export to this country. The 2-cycle type in large cylinders is not popular, and makers of similar powers in three small cylinders are doing good business. But, as I have often said, there is a great demand for 4-cycle engines. Good machines of

Photo by Ackerman & Dutcher, Nyack.

this type, running at a moderate speed, will be saleable here. French engines of this type are now being advertised in our papers—4-cycle engines with about 750 revolutions per minute. For marine work this is much more satisfactory than the fast-running car engines, the use of which has hitherto given the 2-cycle type an excellent chance of attaining popularity.

E. H. HAMILTON.

Chicago Y. C.

Editor Forest and Stream:

The following schedule of events has been adopted by the Chicago Y. C. for the season of 1903:

Saturday, May 30—Cruise to Indiana Harbor. Start 1:30 P. M. This will be an impromptu race only.

Saturday, June 6—Free for all handicap race over club's long course. Start for limit boat, 1 P. M.

Saturday, June 13—Races for one-design yachts and for club knockabouts.

Saturday, June 20—Handicap race around cribs and then to Indian Harbor. Start for limit boat at 1 P. M.

Saturday, June 27—Races for one-design yachts and for club knockabouts.

Saturday, July 4—Race for Pfister cup, over club's short course, 10 A. M. Free for all handicap race over club's long course. Start for limit boat, 1 P. M.

Saturday, July 11—Races for one-design yachts and for club knockabouts.

Saturday, July 18—Class races for the Warrington and Lillienfeld cups.

Saturday, July 25—Class races, all classes. Start 2, 2:10 and 2:20 P. M.

Saturday, August 1—Races for one-design yachts. and for club knockabouts.

Wednesday, August 5—Start at 9 A. M. for Milwaukee. Impromptu races.

Friday, August 7, and Saturday, August 8—Races at Milwaukee under auspices of Milwaukee Y. C.

Sunday, August 9—Start from Milwaukee on cruise to northern ports. Rendezvous at Charlevoix. Cruising race from Charlevoix to Harbor Springs. Cruise to end at Harbor Spring. Instructions and sailing directions to be given from day to day by the commodore.

Saturdays, August 15, 22, 29, and September 5—Races for one-design yachts and for club knockabouts.

Tuesday, September 1, Labor Day—Special and impromptu races.

Saturday, September 12—Handicap cruising race to Kenosha. Start for limit boat at 8 A. M.

Saturday, September 19—Races for one-design and for club knockabouts.

Saturday, September 26—Free for all handicap race over club's long course. Start for limit boat at 1 P. M.

Saturdays, October 3, 10 and 17—Races for one-design yachts and for club knockabouts.

Last season we first tried, and, as far as we know, were the first club to successfully try, the handicap races. Our members are by a large majority in favor of these races, consequently you will notice on this schedule that most of the events will be handicap affairs. We start the boats on their time allowance according to an arbitrary handicap made up by a competent committee, and the first boat in wins. This handicap is made in the same manner as handicaps in other sports, that is, the boats are equalized as close as human judgment can do so, according to the actual performances and merits of the different yachts. We have found by experience that we can better equalize the fleet in this manner than we can or ever could according to a theoretical rule or set of rules. And of course the more nearly the boats are equalized the better the sport. We recognize that when boats are being built for a given race, such as the international races, then the arbitrary restrictions in the measurements of the boats, or some good rule of time allowance according to racing lengths, is not only necessary, but are good. But when the builders' contest has bee nsettled, then we believe we should provide races in which the best sailors rather than the best boats should win, and races in which the best sailors shall exert themselves to do their best in order that they may win.

EDGAR S. BELDEN,
Chairman Regatta Committee.

CHICAGO, Ill., Jan. 31.

Origin of the Centerboard.

BOSTON, Jan. 27.—*Editor Forest and Stream:* Referring to a recent article in your columns in regard to the invention of the centerboard, I may say that something over thirty years ago a friend in this city lent me a book published in England in 1800 or 1801, which gave the lines and description of a boat built in Boston in 1774, by Captain John Schank, of the British Navy; the boat had a centerboard, or rather, a sliding keel, as it moved up and down in the well bodily.

Later on he built in England a vessel with three sliding keels, which made a successful voyage to New South Wales.

I am unable to give the name of the book, as it was burnt in the great fire of 1872, but I have frequently seen allusions to it, and doubtless some of your readers know it.

H. B. J.

YACHT CLUB NOTES.

At the annual meeting of the Penataquit Corinthian Y. C., the following officers were elected: Com., J. Adolph Mollenhauer; Rear-Com., Willard L. Candee; Sec'y, Joseph E. Owens; Treas., Richard A. Bachia; Meas., Moss K. P. Fuller; Fleet Captain, J. Campbell Smith; Fleet Surgeon, William A. Hulse, M.D. Regatta Committee: Harry M. Brewster, chairman; George A. Ellis, Jr.; Robert W. Haff, Regis H. Post and Bryce Metcalf. Board of Governors: John R. Suydam, J. Campbell Smith, Edward C. Blum, W. A. Tucker, George W. Burchell, Rawson Underhill, Allan Pinkerton and William A. Hulse, M.D.

The Knickerbocker Y. C. held its annual meeting at the Hotel Manhattan a short time ago and elected the following officers: Com., James N. Norris; Vice-Com., J. B. Palmer, M.D.; Rear-Com., W. B. Beam; Treas., G. H. Cooper; Sec'y, J. O. Sinkinson; Meas., W. C. Leiber; Fleet Surgeon, G. D. Hamlin, M.D. Board of Directors: F. E. Barnes, G. E. Allen, T. Wilson, C. W. Schlesinger, H. Stephenson, R. Sands and F. H. Stillman.

The annual meeting of the Bergen Beach Y. C. was held at the club house at Bergen Beach on February 1, and the following officers were elected: Com., George E. Fitzmaurice; Vice-Com., E. Bohm; Treas., E. A. Chapman; Finan. Sec'y, A. Miller; Sec'y, C. A. Gregory; Meas., Z. Allan; Fleet Captain, H. Breene; Fleet Surgeon, Dr. Emerson. Board of Trustees: John Sutter, Sr.; Z. Allan, H. Breen and A. A. H. Frohne.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

YACHTING NEWS NOTES.

The Greenport Basin and Construction Company, Greenport, L. I., has recently closed contracts for two steam suction dredges for the United States Government. They will be 200ft. long over all, 40ft. breadth, 23ft. depth, and will have a capacity of 1,400 tons. They will be driven by compound vertical engines of 1,000 horse-power, and each vessel will have two Scotch boilers. In addition to this Government work, this firm is doing considerable yacht building. Nearing completion is a cruising yawl for Dr. B. H. Wells, of New York City. She is 41ft. 2in. over all, 27ft. 6in. waterline, 10ft. breadth and 5ft. 6in. draft. On the keel there will be about 7,000 pounds of lead. The boat was designed by Mr. Theodore Brigham. There is also building a 33ft. open launch for Dr. H. W. Greene, of Springfield, Mass., for use on the Connecticut River. She will be equipped with a 5 horse-power Toquet engine. Two smaller launches to be used for fishing boats are also well under way. Hauled out in the yard and lying in the basin are a number of well known yachts. A new railway of 1,600 tons capacity is being put down and will be ready early in the spring. Vessels drawing 22ft. can then be hauled out.

Messrs. John Twigg & Sons, of San Francisco, are building a large gasoline launch for Mr. Fred Cole, of San Mateo. The yacht will be known as the Idlewild, and will be used on Lake Tahoe. She is 60ft. over all, 10ft. breadth and 5ft. 6in. deep, and 4ft. 6in. draft. The power will be furnished by a 65 horse-power engine, and she will be lighted by electricity.

Captain Charles W. Foster, of New Haven, Conn., is building a 50ft. launch which is to cross the Atlantic next summer. The boat, which will be known as Eric the Red, will be equipped with a 50 horse-power Craig gasoline engine.

Mr. Davis B. Smith, of Gloucester, Mass., is having Mr. Arthur D. Story, of Essex, Mass., build for him a 65ft. auxiliary cruising schooner.

Mr. Frank Bowne Jones has made the following sales: Leda, owned by Mr. Harry L. Maxwell, to Mr. Stephen H. Mason; Surprise, owned by Mr. Charles R. Smith, to Mr. L. D. Martens, and Volsung, owned by Mr. C. Abbott Gardner, to Mr. W. Albert Swasey.

Mr. Vaughan D. Bacon, of Barnstable, Mass., has recently completed plans of a cruising yawl for Mr. T. W. Hobron, Commodore of the Hawaiian Y. C. The new boat will take the place of Gladys, Mr. Hobron's present boat, which was also designed by Mr. Bacon. She is 50ft. over all, 35ft. waterline, 12ft. 8in. breadth, and 7ft. draft. She will be built at San Francisco and will be sailed out to Honolulu.

Word has been received to the effect that the centerboard auxiliary schooner La Barbera, owned by Dr. Everett M. Culver, dragged her anchors and went ashore at Jupiter Inlet, Fla., on Thursday night, January 29. The yacht was on her way to Miami, where the owner and some guests were to join her. The yacht is said to be a total loss. She was built by the Gas Engine and Power Company and Charles L. Seabury Company, Morris Heights, in 1901. She is 68ft. waterline, 75ft. over all, 15ft. 6in. breadth and 3ft. 9in. in draft.

Canoeing.

The Special Cruising Class Canoe.

DANIEL B. GOODSELL, a well-known member of the American Canoe Association, has gotten out plans for a new type of racing craft known as the special cruising class canoe. Provisions for this boat were made at the last annual A. C. A. meeting, and the craft to be built from the designs of Mr. Goodsell are the first to be brought forth in the United States.

The cruising class has been in use by English sportsmen for some time. Twelve of the boats are owned by members of the Royal Canoe Club of London, England, and have provided interesting sport. Linton Hope was one of the first canoeists to become interested in the type and has always been its staunch supporter.

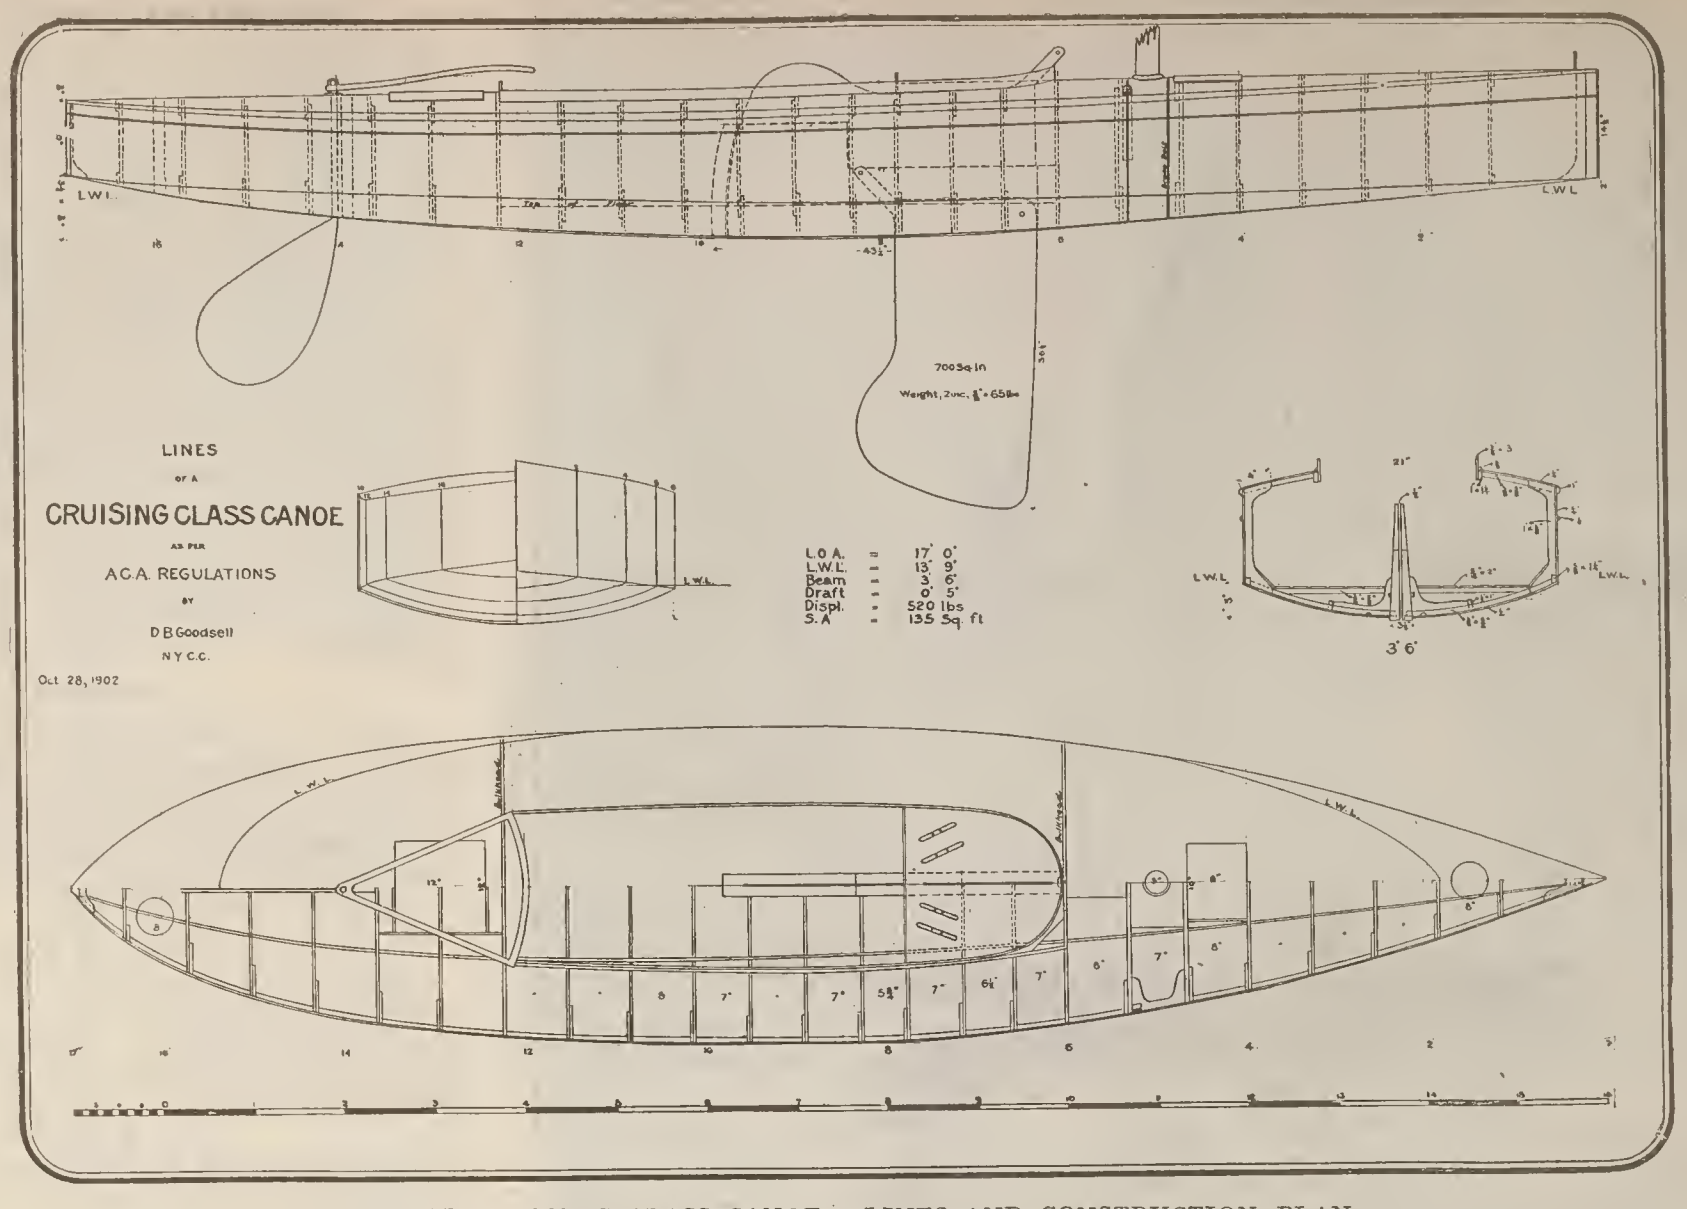
The sport of our cousins across the water is watched with eagle eye by devotees in this country. The cruising class appeared to offer so many possibilities that its recognition by the association governing the sport here came as a matter of course.

New York Canoe Club members are to be the first to build into the new class. Besides Mr. Goodsell, the designer, F. C. Moore and Herbert Turtle will own boats of the new type. Their success is awaited by every canoeist in the land. The positive announcement that some one is really building under the new regulations is expected to give impetus to a number of others in different parts of the country.

The boats are to be put together by W. F. Stevens, of Bath, Maine, known as the most expert builder of racing canoes in America. They are expected, when completed, to cost a bit under $125.

To the sportsman used to the old style of racing canoe the cruiser offers many interesting innovations. The first great difference noted by the eye of the initiated will be the absence of the sliding seat and a jib and main sail rig. This cuts out the acrobatic features of sport with the old style canoe and brings fun with the new class within the powers of all.

The hull is straight sided with rounded bottom and deck. An underbody rudder is used instead of the old style hung to the stern post. The boats can be rowed or paddled, although distinctly built for racing purposes. A



SPECIAL CRUISING CLASS CANOE—LINES AND CONSTRUCTION PLAN.

leg-o'-mutton mainsail and small jib are used, the latter being rigged to boom out and act as spinnaker.

The new boats are to be 17 feet over all and 42 inches at the greatest beam. The sail plan calls for 135 square feet of canvas figured according to the English rule. The restrictions of the present racing canoe provided for a boat 16 feet over all, 30 inches beam, carrying 112 square feet of sail.

The cruisers are to be painted on the outside, except the top strake, which will be varnished. Each boat will be fitted with water-tight compartments, making it non-sinkable. The straight features of the sides and the cockpit arrangement will make it impossible to fill the craft, even though the sail be lying flat in the water. A zinc dagger centerboard of the Linton Hope type, weighing 65 pounds, will be used.

A feature of the boat is three feet clear cockpit space aft of the centerboard trunk. She will draw 5 inches. With the board down the draft will be 3 feet. The hull will weigh 200 pounds. The total displacement with crew of one aboard will be near 510 pounds. Hollow spars will be used. Boats building for New York Canoe Club members will be raced at the annual A. C. A. meet which occurs this year at Sugar Island, the new Association property at the Thousand Islands.

A. C. A. Membership.

The following gentlemen have been elected members of the A. C. A.: R. D. Mansfield, West Medford, Mass.; Lewis K. Conant, Medfield, Mass.; Geo. M. Henderson, Newton, Mass.; W. H. W. Bicknell, Winchester, Mass.; Wm. J. Hyde, Arlington, Mass.; Chester H. Morse, Taunton, Mass.; Jackson Palmer, Lowell, Mass.; Harrie A. Wheeler, 28 Oliver street, Boston, Mass.; Geo. S. Hudson, Winchester, Mass.; Guy B. Garland, 76 Porter street, Somerville, Mass.; Wm. H. Bolewin, Woburn, Mass.; Raleigh B. Adams, 2 Gleason street, Dorchester, Mass.; Frank T. Viles, 5 Warren avenue, Hyde Park, Mass.; J. B. Booth, Manchester, Mass.; Charles E. Guild, Milford, Mass.; Wm. S. Harding, care S. S. Pierce Co., Boston, Mass.; C. G. Johnson, Winchester, Mass.; Herman A. Harding, Chatham, Mass.; F. P. Lewis, Woburn, Mass.

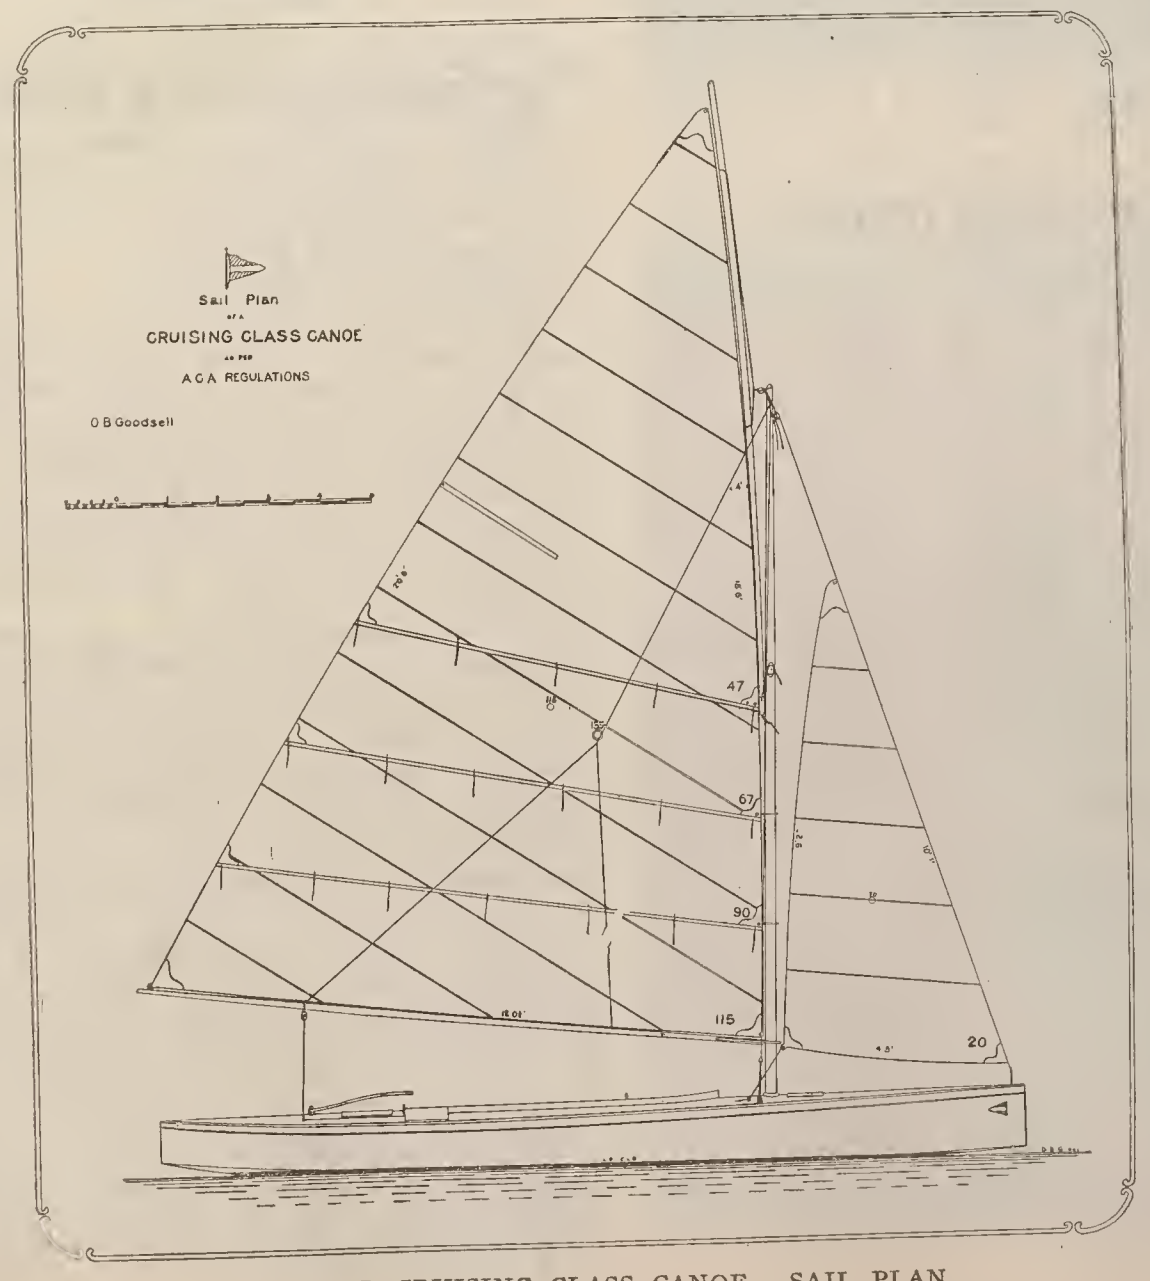
Rifle Range and Gallery.

Cincinnati Rifle Association.

Cincinnati, O.—At the regular meeting of the Cincinnati Rifle Association on Feb. 1 the following scores were made. Conditions 200yds., offhand, Standard target. Light very poor:

Gindele	89 88 86 83 77	Lux	77 77 76 73 72
Hasenzahl	87 85 85 82 80	Hofer	77 71 71 69 69
Odell	87 83 82 82 81	Bruns	77 75 74 71 69
Nestler	84 84 82 79 75	Jonscher	73 72 72 69 68
Roberts	84 82 82 81 80	Freitag	73 67 65 61 61
Payne	83 82 82 81 80	R Uckotter	70 65 64 61 55
Hoffman	77 77 75 73 71	Drube	57 .. ..
Trounstine	78 73 69 69 68		

Honor target: Gindele 28, Hasenzahl 25, Odel 26, Nestler 24, Roberts 25, Payne 20, Hoffman 22, Trounstine 18, Lux 24, Hofer 20, Bruns 21, Jonscher 18, Freitag 22.



SPECIAL CRUISING CLASS CANOE—SAIL PLAN.

Trapshooting.

Fixtures.

If you want your shoot to be announced here send a notice like the following:

Feb. 7.—Paterson, N. J.—Jackson Park Gun Club's live-bird shoot; open to all. G. A. Hopper, Sec'y.

Feb. 10-14.—Detroit, Mich.—Open tournament under the auspices of the Tri-State Automobile and Sporting Goods Association. Targets and live birds. John Parker, manager; S. G. Lewis, Secretary-Treasurer.

Feb. 12.—Paterson, N. J.—Jackson Park Gun Club's live-bird shoot; open to all. G. A. Hopper, Sec'y.

Feb. 12.—Rutherford, N. J.—All-day target shoot of the Boiling Springs Gun Club on Lincoln's Birthday. C. B. Axford, Sec'y.

Feb. 18.—Allentown, Pa.—Two days' target tournament at Duck Farm Hotel. Alfred Griesemer, Prop.

Feb. 20.—South Bethlehem, Pa.—Live-bird shoot of the Lehigh Rod and Gun Club, of The Bethlehems. D. S. Daudt, Manager.

Feb. 20-21.—New Orleans, La.—First tournament of the Mississippi Valley Trapshooters' and Game Protective Association; Carnival Week, under auspices of the City Park Gun Club; $500 added. Percy S. Benedict, Sec'y.

Feb. 23.—Paterson, N. J.—Washington's Birthday shoot of the Jackson Park Gun Club; first of three-man team series of contests, 45 birds per team. Garry A. Hopper, Sec'y.

Feb. 23.—Ossining, N. Y.—Ossining Gun Club's Washington's Birthday shoot. C. G. Blandford, Capt.

Feb. 23.—Lynn, Mass.—Holiday shoot of the Birch Brook Gun Club.

April 1-3.—Grand Island, Neb.—Consolidated tournament of the Buffalo Bill Gun Club, of North Platte, and the Grand Island Gun Club; two days targets, one day live birds. Managers, Geo. L. Carter, North Platte, and Gus Sievers, Grand Island.

April 7-10.—St. Joseph, Mo.—Tournament of the Missouri State Game and Fish Protective Association. F. B. Cunningham, Secretary-Manager.

April 14-17.—Kansas City, Mo.—The Interstate Association's fourth Grand American Handicap at targets, at Blue River Shooting Park. One thousand dollars added to the purses. Elmer E. Shaner, Secretary-Manager, 111 Fourth avenue, Pittsburg, Pa.

April 20.—Springfield, Mass.—Spring tournament of the Springfield Gun Club. C. L. Kites, Sec'y.

April 28-May 1.—Lincoln, Neb.—Nebraska State Sportsmen's Association's twenty-seventh annual tournament, under the auspices of the Lincoln Gun Club. F. E. Mockett, Sec'y.

May 6-7.—Lafayette, Ind.—Lafayette Gun Club's tournament.

May 9-10.—Chicago, Ill.—Spring tournament of the Grand Crescent Gun Club.

May 12-15.—Interstate Park, L. I.—The Interstate Association's fifth Grand American Handicap at targets; $1,000 added to the purses. Elmer E. Shaner, Secretary-Manager, 111 Fourth avenue, Pittsburg, Pa.

May 19-22.—Wissinoming, Philadelphia.—Thirteenth annual tournament of the Pennsylvania State Sportsmen's Association, under auspices of the Florists' Gun Club of Philadelphia. V. V. Dorp, Sec'y.

May 21-22.—Kenton, O.—Shoot of the Kenton Gun Club. A. G. Merriman, Sec'y-Treas.

May 27-29.—Fort Wayne, Ind.—Three-day live-bird and target tournament of the Corner Rod and Gun Club. John V. Linker, Sec'y.

May 27-29.—Williamsport, Pa.—The Interstate Association's tournament, under the auspices of the West Branch Rod and Gun Club. H. A. Dimick, Sec'y.

May 29-30.—Union City, Ind.—Spring tournament of the Parent Grove Gun Club.

May 30.—Detroit, Mich.—Winchester Gun Club's Decoration Day third annual tournament; all day. Rose system and average prizes. Sliding handicap, 16, 18 and 20yds., D. A. Hitchcock, Sec'y-Treas.

June —.—Schenectady, N. Y.—New York State shoot, under auspices of the Schenectady Gun Club.

June 3-4.—Boston, Mass.—The Interstate Association's tournament, under the auspices of the Boston Shooting Association. O. R. Dickey, Sec'y.

June 3-5.—Parkersburg, W. Va.—Sixth annual tournament of the West Virginia Sportsmen's Association, under auspices of Ohio Valley Shooting Association.

June 4-5.—Greenville, O.—Spring tournament of the Greenville Gun Club.

June 9-11.—Sioux City, Ia.—Ninth annual amateur tournament of the Soo Gun Club. B. F. Duncan, Sec'y.

DRIVERS AND TWISTERS.

The Lehigh Rod and Gun Club, of The Bethlehems, of which Mr. D. S. Daudt is the manager, will hold a 15-bird race, handicap, at their grounds at Rittersville Park, on Feb. 20. "Twelve entries or under, three moneys; over twelve entries, four moneys. Shoot will start at 1 P. M. sharp; $10 entrance, birds included. Tom Morfey, of Dover, N. J., and D. S. Daudt, of South Bethlehem, will shoot a match of 100 birds per man **in the morning, starting at 9:30 A. M. sharp. All are invited."**

Mr. Tom Donley, St. Thomas, Ont., announces that he will hold a big pigeon shoot about April 1. A summary of his programme is as follows: One hundred live birds, $100 entrance, $1,000 in gold and sterling silver trophy to the winner; balance of money divided on Interstate Association plan; handicap rise, 28 to 32yds.; fifty entries or no race. Entrance must be accompanied by $10 deposit, which is forfeited except in case of illness or the necessary number do not enter. Mr. Donly has some interesting literature on the subject, which he will send to applicants.

The Carteret Gun Club, through its secretary, Mr. Walter H. Mead, has been active in distributing literature, two booklets, which presents the matter of trapshooting from the trapshooters' viewpoint. One booklet is entitled "The Rights of Sportsmen Involved in the Shooting of Pigeons from Traps." The other is entitled "Voters in New Jersey Who Petition the Legislature in Favor of Pigeon Shooting." It contains thirty pages of names, and at the conclusion is the following: "The names of two thousand additional petitioners will follow the foregoing list." A copy of each booklet was sent by the Carteret Club to each member of the Legislature.

Elsewhere in our trap columns Mr. Wm. Dutcher, of Paterson, presents information concerning an interesting series of team shoots at live birds to be given by the Jackson Gun Club, the first of which will take place on Feb. 23. Prizes, $100, $50 and $25, respectively first, second and third. Three men to a team, 15 birds to a man. The club will also hold live-bird shoots on Feb. 7 and 12.

The managers, Messrs. Geo. L. Carter, of North Platte, Neb., and Gus Sievers, of Grand Island, Neb., announce a consolidated tournament of the Buffalo Bill and Grand Island Clubs, at Grand Island, April 1, 2 and 3, two days at targets, one at live birds. At this shoot a team of ten men from the State and ten from Omaha, South Omaha and Council Bluffs will shoot a match, 50 targets per man.

Messrs. L. West and L. C. Wright, both of Dover, N. J., shot a match at 50 live birds, for $50 a side, on Bunn's grounds, Singac, N. J., on Jan. 29. The scores were: West 42, Wright 36. Mr. West is only about seventeen years old. He shot a few matches previously, and is a consistently good performer for one so young in years.

There was an excellent contest at Philadelphia on Jan. 29, between Mr. Howard Ridge, of the Keystone Shooting League, and Mr. F. Miller, of the Point Breeze Gun Club. The conditions of the match were 100 live birds, $100 a side, loser to pay for birds, 30yds. rise, American Association rules. The scores were: Ridge 93, Miller 91.

John S. Wright, manager of the Brooklyn Gun Club announces a shoot for Feb. 12, commencing at 1:30 sharp. The programme has five events, two of which are at 10 targets, 50 cents; one at 15 targets, 75 cents, and two prize shoots at 25 targets each, $1 entrance. All ties are to be shot off at half the original allowance.

Mr. Elmer E. Shaner, secretary-manager of the Interstate Association, arrived in New York on Monday of this week to attend the Interstate Association meeting fixed to be held on Feb. 4, and to arrange some of the preliminaries for the G. A. H. at targets to be held at Interstate Park.

Mr. F. E. Mockett, secretary of the Nebraska State Sportsmen's Association, writes us that the State shoot of that organization will be held at Lincoln, on April 28, 29 and 30, and May 1.

Mr. Paul R. Litzke, under date of Jan. 29, writes us that the live-bird shoot fixed to take place on Feb. 18, has been postponed to some day in April not yet definitely fixed upon.

Mr. John Burnham won the championship of Dallas and Guthrie counties at the C. E. Black tournament, held at Adel, Ia., on Jan. 27, with a straight score of 25 targets.

BERNARD WATERS.

Plans of the S. R. and G. Club.

SCRANTON, Pa., Jan. 30.—Members of the Scranton Rod and Gun Club met in Mr. C. H. Von Storch's office last evening and outlined a series of shoots, prizes, etc., which goes to show that trapshooting is not a forgotten sport in this city. The club comprises fifty-two members, and will begin on its new schedule of shoots April 4.

Apropos of developing the shooters, various inducements are offered to the members. To the members who break 80 per cent. of 100 consecutive clay targets at any regular shoot will be given his targets at half price during the season ending Oct. 3, 1903.

Further, the club offers its members $50 in cash prizes for meritorious shooting. The prizes will be distributed as follows: One prize each of $10, $8, $6, $4; two of $5, and twelve of $1. These matches will be shot during the season on the following conditions: Ten targets each, entrance 10 cents, targets extra. Intentions must be declared and entrance paid before shooting; re-entries unlimited. The ten highest scores of the season will count for prizes. Ties will be decided at 25 targets per each contestant.

Secretary J. D. Mason was instructed to correspond with neighboring clubs, with the view of arranging for some club shoots during the season.

A committee was also appointed to arrange conditions for the Peters Cartridge Co. trophy match. The members are enthusiastic over the prospects for this year.

J. D. MASON, Sec'y-Treas.

Poughkeepsie Gun Club.

POUGHKEEPSIE, Jan. 31.—To-day's shoot was not productive of high scores. Notwithstanding that the scores are low, the boys were nearly all shooting in good form. This seems like a rather inconsistent statement, doesn't it? Nevertheless, it is a fact. This is how it goes. Eight men met at the club house to have a little practice shoot. Not a few of these eight men felt as if they could "smash 'em all," but oh, how disappointed were they. They began shooting, they were careful, they were using the best of judgment, they thought; but still the bluerocks—yes, rocks—would not break. Some of the targets were hit so hard that they were knocked several feet out of their regular course, but still they would not break. Upon investigation it was found that the targets were frozen so hard that it was impossible to break them after getting any distance from the trap. The scores:

Events:	1	2	3	4		
Targets:	25	25	25	25	Shot at.	Broke.
Adriance	18	20	20	19	100	77
Traver	14	16	18	16	100	65
Nelson	9	15	19	17	100	60
Wicker	12	7	13	17	100	49
Claymark	..	11	18	18	75	47
Winans	..	19	17	15	75	51
Du Bois	..	12	20	18	75	50
June	..	9	13	13	75	35

SNANIWEH.

Postponement.

NEWPORT, Ark., Jan. 29.—Kindly state in the next issue of FOREST AND STREAM that the live-bird shoot for the Peters Cartridge Co. trophy, announced to occur at Little Rock, Feb. 18, has been postponed until some time in April, date to be set later.

The reason for this is that we deem it advisable not to attempt to hold a live-bird shoot in the Capital City while the Legislature is in session, as we learn that there is some hostility against it on the part of some of the members. PAUL R. LITZKE.

Recently at Atlantic City, N. J., a gun club was formed with an influential membership, some of whom are County Clerk Lewis P. Scott, Louis Kuehnle, City Solicitor Harry Wootton, Robert T. Dunlop, James B. Reilly and City Clerk Irelan. The club house is located at Linwood, on the mainland.

IN NEW JERSEY.

Jackson Park Gun Club.

Paterson, N. J., Jan. 31.—The board of directors of the Jackson Park Gun Club, of Paterson, N. J., have decided to run off a series of team shoots to be held on their grounds at Jackson Park, near Patersou, N. J. The first of the series will take place on Washington's Birthday, Feb. 23. Each team is to consist of three men from any regularly organized and incorporated gun club of the United States. The members must be certified as regular members for at least three months previous to Feb. 1.

The Jackson Park Club will guarantee $175; the first prize to the first team, $100; second team, $50; third team, $25. Each man of the teams to shoot at 15 birds, or 45 birds to a team. Ties, if any, to be shot off to decide the three places.

The traps will be ready at 10 A. M. or earlier, if necessary. There will be open sweeps. The birds will be the best that money can buy. Retrieving will be done with dogs. Everything for the comfort of the shooters and guests will be well looked after. Other information will be furnished by Capt. Charles F. Lenone, or Secretary Garry A. Hopper, 30 Main street, Paterson, N. J.

The Jackson Club also will hold shoots on Feb. 7 and 12, open to all; live birds. Traps ready at 12 o'clock. Refreshments on ground. Plenty of shells on hand

Herewith are scores of match and sweeps shot on Jan. 29, and also scores of sweeps shot on Jan. 31 at Bunn's grounds, Singac, N. J. There should have been another match to-day, but Wright, of Dover, failed to show up.

WM. DUTCHER.

North Side Gun Club.

Herewith you will find scores of a newly organized gun club known as the North Side Rod and Gun Club, of Paterson, N. J. The members are all hard-working men, employed in the different factories around the city, and are banded together for mutual pleasure, which they gain through these Saturday afternoon holiday and regular holiday shoots. They journey to these grounds at Haledon, N. J., and have their medal shoot, concerning which they are very enthusiastic. There are thirty-three members at present. They have a shooting house, three traps, and have had a handsome group picture taken, which I will try to send later.

Medal shoot, Jan. 31:

C Teddis	0110111111111111111111101—22

JAMES R. MERRILL, Sec'y.

North Branch Gun Club.

North Branch, N. J., Jan. 31.—The weather conditions on Thursday, Jan. 29, were unfavorable. A light rain and foggy atmosphere made it difficult for the shooters to see the targets, consequently good scores were out of the question. Among the visitors present were Neaf Apgar, Dr. Pardoe, of Bound Brook; Hon. Geo. Cramer, of High Bridge; Thos. Howard, of Bedminister; J. Osborn and L. H. Ten Eyck, of Far Hills; E. Van Arsdale and R. Duyckinck, of Pluckamin, and Thompson, of Cramer's Corners.

The club will award a $10 gold piece to the member having the best score at three consecutive shoots, with an allowance according to each member's percentage.

A summary of the shoot follows:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Targets:	25	15	15	15	10	10	10	10	10	10	10	10	10	10	10

H. B. TEN EYCK, Sec'y.

ON LONG ISLAND.

Crescent Athletic Club.

Bay Ridge, L. I., Jan. 31.—The January cup was won by Mr. L. C. Hopkins, he having the three best scores made in the January series for this trophy. The best score in that contest to-day, however, was 45, made by Mr. W. W. Marshall.

January cup, 50 targets, handicap: W. W. Marshall (14) 45, Dr. Pool (6) 43, L. C. Hopkins (10) 39, Capt. Money (2) 33, C. J. McDermot (10) 27.

Fifty targets, scratch: H. Money 42, Capt. Money 48, Brigham 44, L. M. Palmer, Jr., 35, F. T. Bedford, Jr., 42.

Trophy, 15 targets: F. B. Stephenson (0) 13, Vanderveer (2) 11, L. M. Palmer, Jr., (1) 13, Bedford (1) 12, Marshall (4) 13, A. W. Palmer (3) 14, Bennett (2) 9, Hopkins (3) 15, Sykes (2) 10, McDermott (3) 15.

Shoot-off: McDermott (3) 10, Hopkins (3) 14.

Trophy, 25 targets: Bedford (3) 17, F. B. Stephenson (1) 19, O'Brien (5) 15, L. M. Palmer, Jr., (2) 21, Bennett (5) 20, Pool (3) 24, Hopkins (5) 17, Capt. Money (1) 24, H. Money (0) 20, Vanderveer (3) 25, Marshall (7) 22, A. M. Palmer, Jr., (4) 20.

Trophy, 15 targets: Bedford (1) 11, Marshall (4) 13, F. B. Stephenson (0) 13, L. M. Palmer, Jr., (1) 13, O'Brien (3) 12, Chapman (3) 8, A. W. Palmer (3) 9, Capt. Money (0) 8, Vanderveer (2) 12, Hopkins (3) 12.

Trophy, 15 targets: F. T. Bedford, Jr., (1) 12, L. M. Palmer, Jr., (1) 14, Dr. O'Brien (3) 15, F. B. Stephenson (0) 13, Bennett (2) 12. Chapman (4) 13, A. W. Palmer (3) 15, Capt. Money (0) 10, H. Money (0) 11, Vanderveer (2) 12, Hopkins (3) 9.

Shoot-off: O'Brien (3) 12, A. W. Palmer (3) 9.

Trophy, 15 targets: Dr. O'Brien (3) 14, Marshall (4) 14, Hopkins (3) 10, A. W. Palmer (3) 13.

Shoot-off: O'Brien (3) 15, Marshall (4) 10.

Event at 50 targets: Capt. Money 29, H. Money 46, Brigham 40, L. M. Palmer, Jr., 37.

Brooklyn Gun Club.

Brooklyn, L. I., Jan. 31.—There were eleven at John Wright's shooting matinee to-day, and of these, two were new-comers, the Messrs. Pearsall, who proved to be sportsmen every inch. It was Mr. H. C. Pearsall, Jr.'s, third attempt at the traps, and in view of this circumstance, his performance was excellent, as the scores will show. There is a steady increase of the gentlemanly amateur element in attendance at John Wright's shoots, and a corresponding increase in the enjoyment of participation in them. The scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	11
Targets:	10	10	15	10	15	15	25	10	15	15	20
Welles	3	6	8	6	12	13	..	8	12	12	14

Nos. 2, 4 and 8 were at 5 pairs.

Ridge—Miller.

PHILADELPHIA, Jan. 29.—The 100-live-bird match to-day between Mr. Howard Ridge, of the Keystone Shooting League, and Mr. Fred Miller, of the Point Breeze Gun Club, was won by the veteran Mr. Ridge, with the excellent score of 93 to 91. The conditions were: 100 birds each, 30yds. rise, $100 a side and loser to pay for the birds. This was Mr. Ridge's first match at 100 birds, and though the score was high, considering Mr. Ridge's well-known skill, it was not of the things unexpected. There was a murky sky, and the light was unfavorable, particularly so to Mr. Ridge, it affecting his eyes. The birds were a good lot, with an occasional gladiatorial flyer. They required hard hitting to bring them down.

The luck of the draw was about even.

Miller was two in the lead at the first half of the race. Ridge killed his third 25 straight to Miller's 20, and had the race safely in hand thereafter to the finish. Miller shot a strong finish, killing 24 out of his last 25 to Ridge's 23, which was also strong finishing.

Mr. Ridge's victory was a popular one. He was opposed to a concededly strong opponent. The excellence of the performance of both men made a high class contest. He was strongly backed by his fellow members of the Keystone League.

Another match has been arranged to take place on the Keystone grounds in a short time. The match will be at 100 birds for $200 a side. Frank M. Eames looked after Ridge, while J. Frank Kleinz handled Miller. Mr. Walter Sterling acted as referee. Scores:

Ridge	2220222122222222222222202—23

Trap at Lansingburg.

LANSINGBURG, N. Y., Jan. 27.—Yesterday we had a shoot here. Mr. G. Vandercook and C. W. Campbell chose sides, the losing side to pay for a box of cigars. Each man shot at 21 single at 16yds. rise. The scores were as follows:

First Team—G. Vandercock 18, H. Campbell 18, M. Campbell 18, E. Darby 12; total 66.

Second Team—C. W. Campbell 17, F. Vandercock 16, A. Campbell 6, E. Dewey 18; total 57.

After shooting the singles, each man, with the exception of E. Dewey and E. Daby, had 5 doubles, with the following result:

First Team—G. Vandercock 6, H. Campbell 7, M. Campbell 8; total 21.

Second Team—C. W. Campbell 7, F. Vandercock 7, A. Campbell 2; total 16.

It was a beautiful afternoon, and all had a jolly time.

HARVEY C. CAMPBELL.

A Defense.

Editor Forest and Stream:

As you have kindly informed trapshooters of the contemplated action of a member of the New Jersey Legislature against pigeon shooting by publishing on Jan. 24 an article taken from a New Jersey newspaper, which links an account of that action to some girlish remarks on the subject, I infer that you will allow trapshooters to learn through the same medium (your columns) that their friends are presenting to the same Legislature thousands of petitions in favor of pigeon shooting, and are backing them with statements of fact and with arguments, among the latter being several contained in the tract the newspaper aforesaid refers to, and which are as follows:

"People who oppose pigeon shooting because they think pigeons, for the reason that they are pigeons, should not be killed, are beyond the reach of reason and ought to receive no attention. Those who oppose pigeon shooting because a few of the birds get away from the shooters, wounded, and die of their wounds, should remember that in field shooting this happens ten times oftener than in pigeon shooting, for the reason that the latter is done in open places where the wounded birds can easily be found by those appointed to find them in the interests of the revenue of the gun clubs. Moreover, the bird, if only wounded by the shooter, is killed by the trapper's assistants before another shot is fired, and wounded birds which go beyond the club's grounds are immediately put to death by other employes of the club; while in field shooting not less than twenty out of a hundred birds shot at are wounded and not retrieved, and are left to die out of sight. The percentage of pigeons which, wounded, escape the retrievers, dogs and men, is exceedingly small—in properly conducted gun clubs not over one and one-half per cent."*

"The claim that clay birds call for as much skill from the man with the gun as pigeons, is too absurd to discuss. Nothing artificial has ever been devised to equal a flying pigeon in the uncertainty and irregularity of its movements, to follow and defeat which, with gun and within the boundary, makes pigeon shooting the most difficult of all bird shooting, and the sport which best prepares men to shoot in the field.

"If it be cruel to shoot pigeons from traps, it is cruel to shoot decoyed wildfowl from blinds, deer in runways; in fact, to kill any innoxious animal with the gun is, therefore, cruel."

"The statements that pigeons are abused on the club grounds before being shot or on the way there carry their own refutation. Two things are insisted on by pigeon shooters: that the birds shall be of the most vigorous type, and that they shall be carefully handled to avoid injuring them. They are transported in crates of ample size, because all dead birds in crates are charged to the shipper. * * *"

"In their hysterical zeal the opponents of pigeon shooting overlook other sports in which what they term cruelty is practiced. Why should they not attack the angler, the man who takes from its native element the fish, struggling, gasping, with a sharp hook piercing one of its eyes, its body dyed red by the blood flowing from its lacerated mouth, and throws it into his basket to throb and die in lingering agony. This is the sport of the 'gentle angler.' He sometimes varies his sport. He hooks the vigorous tarpon and kills him after inflicting upon him hours and hours of acute pain and frightful torture. There seems to be more real cruelty in 'playing' one fish to death than in shooting a score of pigeons.

"The pigeon shooter supplies the poor man's table with a cheap wholesome food, shot pigeons costing 75 cents a dozen, as against $3 a dozen for pigeons slaughtered by hand."

"The newspaper complaints when not furnished by that society which seems to have them on tap and of the most lugubrious and misleading kind, are written by office editors and office people, and are largely academic. The newspaper men who report the doings of sportsmen and who know all about pigeon shooting never published an article condemning it."

"Let such societies (S. P. C. A.) direct their admirably trained men to suppress not the shooting of 'pot-pie' pigeons, but the abominable practice of destroying our pretty song birds, many of whom now find our guarded public parks their only place of safety on account of the prowling Italian gunners and their congeners, who shoot in all seasons every feathered wild thing they find in the woods near our cities. These people lurk under the trees at dayhreak and 'pot-hunt' without mercy. To them the robin, the bluebird, the beautiful oriole are simply meat. The game wardens are too few in number to cope with these men, but aided by the intelligent forces of the humane societies, they would surely catch and make deterrent examples of some of them."

It is strange that users of the gun do not realize that this crusade against pigeon shooting is the opening wedge to the abolishment of game shooting. Inspired by the repeal of the law permitting pigeon shooting in New York, certain members of its Legislature have to-day bills pending there to impose such license fees on gunners as practically to prohibit game shooting in that State, which is the real but concealed object of their introduction.

WALTER H. MEAD.

NEW YORK, Jan. 26.

*See sworn testimoney used before Committee N. Y. Legislature, February, 1902.

Western Pennsylvania Trapshooters' League.

WE are indebted to Mr. Charles G. Grubb, of Pittsburg, for the following clipping, under date of July 29, taken from a daily:

"The Western Pennsylvania Trapshooters' League was organized yesterday afternoon at a meeting held at 622 Smithfield street. The principal clubs of Western Pennsylvania had representatives at the meeting. The clubs admitted were Northside, Brownsville, Irwin, Beaver Falls, New Castle, Ruffsdale, Ligonier, Herron Hill, Kittanning and Millvale. Louis Fleming represented the Northside club; J. Daugherty and Samuel Thompson, Brownville; John Withrow and Edward Brown, Irwin; W. R. Keiler, Beaver Falls; James Atkinson, New Castle; Richard Dennicker, Ruffsdale; James Denny, Ligonier; Harry Vandergrift, Herron Hill; Dr. J. R. Jessup, Kittanning, and Ed Hickey, Millvale.

"No president was chosen yesterday, but an election will be held in the near future. Charles G. Grubb, secretary, was the only officer elected. John Withrow, Richard Dennicker and Louis Fleming were chosen governors.

"The League will hold twelve tournaments during the season, and each club must be represented at all the shoots. The schedule adopted follows: Northside, April 8, 9 and Oct. 6, 7; Herron Hill, April 22, 23; Irwin, May 5, 6, Sept. 1, 2; Brownsville, May 26, 27; Ruffsdale, June 10, 11, Sept. 23, 24; New Castle, June 24, 25; Ligonier, July 7, 8, Oct. 20, 21; Beaver Falls, July 21, 23; Millvale, Aug. 19, 20; Kittanning date has not yet been decided.

"Each club at yesterday's meeting paid $5 as an entrance fee, and this money will be used in paying for a trophy, which goes to a team of four shooters that wins the League championship. The teams must compete in seven towns to qualify for the prize. The programme adopted, which governs all the shoots, calls for a $75 general sweepstake shoot as the first event on the card. The third, fourth and fifth events are for the team men, and each man will shoot at 15, 20 and 15 targets, respectively. A club holding a shoot has the option as to how many days it shall be held. The Rose system of dividing the moneys was adopted."

Bramhall—Holmes.

ST. JOSEPH, Mo., Jan. 25.—Appended are the scores made in the match between J. W. Bramhall and Alex. Holmes, both of Kansas City. The match was shot off on the grounds of the Metropolitan Gun Club, of this city, Jan. 22. Mr. Bramhall won by one bird. The birds were good, strong "farmer" birds, and swift flyers.

Considering the birds, the scores were exceptionally good. Miss-and-out- matches, and one sweepstake event were shot off, with the result shown:

Bramhall	20222122212222022222201222—22
Holmes	201*2212111*2111110122222—21

Misss-and-outs, $1 entrance; ties divided:

Cunningham	2222	2212222221	Bachellor	21 2	*1110
Bramhall	1222	2221210	Zimm	22*	222220
Holmes	120	212222222	McGee	20	*
Libbe	20	*	Consor	10	*

Ten birds, $5 entrance:

Holmes	0121211211— 9	Vogle	0222020200— 5
Bramhall	2201220222— 8	Libbe	2122212*22— 9
Richter	222*221222— 8	Cunningham	2*1202*222— 7
Zimm	222*022222— 8	McGee	0101022222— 7
Consor	2122222222—10		

F. B. CUNNINGHAM.

Boston Gun Club.

BOSTON, Jan. 21.—The first shoot of the new spring prize series of the Boston Gun Club for 1903 was held on their grounds at Wellington to-day, and although only nine shooters faced the decidedly inclement weather, it was as auspicious an opening as could be wished for. It was surprising, to say the least, how much enthusiasm there was; but after all, the trapshooter's enthusiasm has been bottled up in this section for the last few months, and this was his first good chance to give vent to a part of it. Every one had something new; one a new pump gun guaranteed to kill within a mile; another a new load, impossible to make a miss; another a single trigger warranted not to trip or balk, and to double with it, why, it is simply impossible. Well, so it was all around, and after all these had been talked over, it drifted to last fall's hunting, which was talked and re-talked, with the result that each had the best dog, best luck, and could not be bettered.

It seemed kind of strange after looking over the crowd, not to find Leroy and Woodruff, but it will be only a short time before they are with us again, the former being a little out of health at the present time, and the latter enjoying a three weeks' trip among the quail of North Carolina.

From the scores, we all must have been out of gear, with the prize match, breaking his targets in A1 style, and leaving no doubt as to scoring them; Kirkwood, second, with 26; Puck, third, 23; J. Safford fourth, 22. Other scores as follows:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13
Targets:	10	15	10	10	10	15	10	15	15	15	15	10	15

SECRETARY.

Interstate Association Matters.

PITTSBURG, Pa., Jan. 28.—*Editor Forest and Stream:* Mr. J. A. H. Dressel has requested me to send the inclosed communication to the sportsmen's press for publication. Will you please be kind enough to publish it in full, and oblige

ELMER E. SHANER, Secretary-Manager.

NEW YORK, N. Y., Jan. 21.—Mr. Elmer E. Shaner, Sec.-Mgr. Interstate Association, 111 Fourth avenue, Pittsburg, Pa.: Dear Sir—Having severed my connection with the Union Metallic Cartridge Company, and with the ammunition trade or kindred interests, at least for the present, I feel it my duty to resign as president of your Association, and also as a director.

It is well known that it was entirely through my efforts that the Interstate Association was saved from a disreputable wreck, and I am pleased to say that my efforts, with those of my colleagues, have made it to-day the grandest and most authoritative body of its kind in the world.

I hope it will continue so, and if at any time I can assist toward that end, I would be glad to do so. Yours respectfully,

(Signed) J. A. H. DRESSEL.

PITTSBURG, Pa., Jan. 28.—*Editor Forest and Stream:* A special meeting of the stockholders of the Interstate Association will be held on Wednesday, Feb. 4, at 2:30 P. M., in the office of the Laflin & Rand Powder Co., 99 Cedar street, new York city.

The election of a director to fill the vacancy caused by the resignation of Mr. J. A. H. Dressel, and other matters of importance will come before the meeting.

ELMER E. SHANER, Secretary-Manager.

Chicago Gun Club.

CHICAGO, Ill.—The Chicago Gun Club board of directors held their annual meeting Tuesday, Jan. 27, and elected the following officers for the ensuing year, viz.: President, G. V. Weart; Vice-President, Lem Willard; Secretary-Treasurer, A. A. Walters.

In addition to these, the board of directors includes A. W. Morton and W. D. Stannard; all of these gentlemen being well known in local trapshooting circles.

Inanimate target shooting will no doubt receive a lively impetus this season, owing to the fact that live-bird shooting has been stopped in Chicago. The club contemplates furnishing a very attractive programme for the coming season, and arrangements are now being made—full account of which will appear later in these columns. The grounds of the Chicago Gun Club are located at Seventy-ninth street and Vincennes road, Wentworth avenue cars touching the grounds, being easily accessible from the center of the city.

Handsome merchandise prizes were awarded by the Chicago Gun Club to its members at the close of last season. Four cash prizes of $20 each for the three high guns with handicap, and high average without handicap, were also awarded. In addition to these prizes, the club also donated $2 each week in the 15-bird handicap sweeps and $6 in merchandise prizes, divided in three moneys, at the end of each month in the trophy shoot. Handicaps were based on the percentage of shooter's average, proving the most equitable and satisfactory plan that had ever been introduced in the club, giving all an equal chance.

Blank applications for membership can be secured from A. A. Walters, secretary, Exchange building, Union Stockyards, Chicago, Ill.

C. E. Black Tournament.

ADEL, Ia., Jan. 27.—C. E. Black's one-day tournament, held on the Fair Grounds, in this place, to-day, had seventeen entries.

The weather was cold and chilly. The shooting was from one set of three traps. Targets were thrown about 50yds.

John Burnham, of Linden, made high average and won the championship medal of Dallas and Guthrie counties.

Events:	1	2	3	4	5	6	7	8	9	10	11	12

Championship of Dallas and Guthrie counties, 25 targets, $2.50 entrance, three moneys: R. S. Binns 16, Robt. Goodwin 19, John Burnham 25, Jim Shopper 20, J. Cortells 22, T. M. Winfield 20, R. R. Patty 17.

Cincinnati Gun Club.

CINCINNATI, O., Jan. 24.—The scores made in the fourteenth contest for Troisdorf medals, at the shoot of the Cincinnati Gun Club are appended: Ahlers (21) 45, Van Ness (19) 44, Medico (18) 43, Maynard (17) 41, Phil (21) 40, Day (16) 39, Coleman (20) 37, Randall (20) 37, Herman (16) 36, Falk (17) 35, Dwyer (16) 34, Jay Bee (17) 33, McB. (17) 33, Corry (16) 33, Block (17) 32, Steinman (19) 31, Dreihs (18) 26, Ackley (15) 23.

The scores of Van Ness and Medico were void. They shot at 16yds.

PUBLISHERS' DEPARTMENT.

The Trusts Can't Hurt the Southern Section of the United States.

RECENTLY Mr. John T. Patrick, one of the officials of the popular Seaboard Air Line Railway, of Pinebluff, North Carolina, the much-talked-of Yankee settlement in the South, was in New England to meet and address a colony of New Englanders who are forming in the city of Revere to go to North Carolina, and in part he said: "One great advantage the South has over any other section is, no matter how many trusts are formed; no matter how many people are thrown out of employment by the big combinations that are being organized all over the world, the farmer and Northern settler down South on a two to ten acre tract of land is as independent as the King of England. He can, if necessary, grow his own cotton and wool, and make his own clothing on his spinning wheel and loom; raise his own bread stuff and meat, grow his vegetables and fruits; cultivate sugar cane and make his syrup and sugar; grow his own tea, and if he will be contented to drink cereal coffee, which is the healthiest drink, he will not need to spend a dollar. He can grow two crops of white potatoes on the same ground from March 1 to Sept. 31, and then sow it down to turnips and have growing turnips the winter through. Sweet potatoes can be grown and then the land sowed down to rye for a winter grazing for cattle or poultry. Cut the rye in May and plant to corn or potatoes. These are facts which the committee your society sent down to investigate will bear me out in as being absolutely true. Some of your people, who went down last winter, have made enough to pay for their lands and lumber to build houses and are to-day living in their own homes paying no rents. They have eaten melons and vegetables the first summer from their own farms, and to-day have many bushels of sweet potatoes banked for winter use and for sale. If any one has doubt of my statements write to Mr. Geo. R. Morgan, Mr. E. Pike, and Mr. A. L. Allen, Pinebluff, N. C., men you all know as going down from Revere as pioneers in the movement you have inaugurated of building up a small farm colony enterprise. These men have shown what can be done by mechanics who have had little or no experience in farming. Like many of you, they were afraid they would be crowded out of their occupation up North as mechanics on account of the improved machines that take the place of human beings, and that are managed and owned by the moneyed men of the country. I am not blowing moneyed men. (There is hardly a person here to-night but what would act just as they do if so situated), but I do blame the mechanic and the thrifty laboring men who will not investigate, as you are doing, by sending your committee and your advance pioneer and thereby providing for the conditions that will surely be brought about on account of labor-saving machines and the concentration of capital in working the machines. You working people must plan to be more human than simply a part of machines, dependent upon a corporation. When I go into your factories I see you merely as a part of a machine. You call yourself a shoemaker, but you cannot make a shoe any more than I can. Fifty years ago shoemakers could make shoes. To-day they can only cut out the uppers or manage a machine that puts in the eyelets, or sews the buttons on or pegs the sole. I invite you and urge you to not only think of the future and provide for yourself and family a home and a support where you are only dependent on your own exertions, but to tell to the thousands of other mechanics what you have found in the South, and what success your advance guard has had."—*Adv.*

We have received from the Roberts Safety Water Tube Boiler Co. one of the latest pamphlets issued by them, entitled "Illustrated Opinions." This litle magazine contains about one hundred pages of nothing but photo-lithographs of yachts and steam vessels of various kinds which are using Roberts Safety Water Tube Boilers successfully, and in conjunction with each cut, is reproduced a photo-lithographed letter, stating the success and satisfaction with which each boiler is being used. This firm has built up to date nearly fifteen hundred water tube boilers, and in a good many cases, have sold fifty to a hundred boilers to the same parties. On Jan. 1, 1900, their books showed that they had exceeded their best previous year by over 100 per cent., which is certainly another good proof of the reward their customers consider due the Roberts Water Tube Boiler Co. for the high merit of their product. We would suggest that all our readers interested in this subject send for a copy of "Illustrated Opinion."

As two men were talking the other day about out-door life, one said, "I would never go into the woods without a pneumatic mattress." To which the other replied, "I have never used one, but I have seen the day when I wanted one. Sleeping on the glaciers in Alaska, it takes the ice just about half an hour to send the cold up through your blankets and into your very bones; and then you have to get up and take exercise to get warm for another half hour's sleep." This conversation is recalled by seeing the interesting pamphlet entitled "The Evolution of the Air Bed," which is issued by the Pneumatic Mattress and Cushion Co., of 2 and 3 South street, New York.

In this self-shaving generation there is nothing so essential to our comfort, either at home, afloat or ashore, as a good razor. In the "Centaur Razor," advertised in this issue, Sperry & Alexander Co. assure us that they have reached an enviable degree of perfection in razor building. The razors are made of Sheffield steel, honed in Germany, and each one is built here by an experienced workman. All this should insure a good article. The razors come in ⅝-inch blades, which the experience of the manufacturers dictates is the best for individual use.

The Lefever Arms Co., of Syracuse, N. Y., have issued a catalogue, which thoroughly illustrates the different grades of guns which it manufactures. The fine half-tone illustrations and the minute particulars set forth in the text, present all the information concerning the different grades which any sportsman may require. There is also much valuable matter presented under the head of "General Instructions."

Hazard powder has long been a household word among sportsmen, and many of us can remember the old-fashioned screw top cans in which our rifle powder came thirty or forty years ago. But, like other energetic business concerns, the Hazard Powder Co. has moved on with the years, and the record for its smokeless powder in the Grand American Handicap and numerous individual matches is one to be proud of.

The growth of the yachting interest in this country is seen in the constantly increasing number of yacht designers and brokers, and in the constant broadening of their field, which once seemed a narrow one. Messrs. Gardner & Cox, naval architects, engineers and brokers, attend also to marine insurance, the supplying of crews, and the fitting out of yachts. Their advertisement is seen elsewhere.

Among the various brews of beer consumed in this country, that of Schlitz, the beer that made Milwaukee famous, stands in the front rank. The reasons for this deserved pre-eminence are given in the advertisement of this concern, and in these days when we hear so much of adulterated beer, it is certainly worth while to be sure of obtaining a pure article.

The Osgood Folding Boat, whose name has so long been familiar to sportsmen, is now manufactured by the Michigan Consolidated Boat Co., of Battle Creek, Mich. The same concern also manufactures Bullard steel launches, row and pleasure boats, which, we are told, are always dry, and are everlasting. Their catalogue shows many improved designs of steel, wood, and canvas boats, and new engines.

The careful angler is already looking over his fly-book and considering how he shall replenish it for the next spring's work. Messrs. J. Bernard & Son, of 45 Jermyn street, St. James, London, have been established for ninety years, and make a specialty of flies, leaders and casting lines. They will send catalogue on application.

To bring boat building materials within the reach of amateurs at a moderate cost is a praiseworthy ambition, in these days, when so many amateurs do their own construction. This is the object of Mr. Fred Medart, of St. Louis, whose catalogue will be sent on application.

The Marlin Fire Arms Co., New Haven, Conn., have changed and improved the standard Rocky Mountain sight, concerning which they have circulars giving illustrations and full description, which will be sent to those who apply for it.

The Peters Cartridge Co., Cincinnati, O., informs us that, notwithstanding the large supply of calendars for 1903, it ordered and received, the edition has been exhausted, and the company will be unable to fill any more mail orders.—*Adv.*

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

THE FUR SEALS.

FOR several years there has been before Congress a bill empowering the President of the United States to endeavor to reopen negotiations with the British Government for the purpose of putting an end to pelagic sealing and affording better protection to the fur seal herd of the Pribilof Islands. A bill (H. R. 133387) entitled "An Act to Prevent the Extermination of Fur-Bearing Animals in Alaska and for other purposes," with amendments, authorizes the President to open negotiations with Great Britain to conclude a *modus vivendi* with that Government, whereby the killing of fur seals on land or sea by subjects of either Government shall be prohibited—except a few hundred young male seals annually for the food of the natives—and if these negotiations shall fail and a *modus vivendi* shall not be concluded, and regulations to preserve the Alaskan seal herds shall not be put in operation, then the President is authorized to kill all the fur seals on the Pribilof Islands, except ten thousand females and one thousand males. The bill passed the House last week.

The ground taken by the advocates of this measure is that by pelagic sealing—which means the killing of females and the annual starvation of many thousands of pups—the Alaskan fur seal herd is being surely exterminated; that the completion of this process is near at hand and that it will be more humane to destroy the herd at once than to let it perish by driblets, and in large part by the cruel method of starvation. Incidentally, it appears to be believed that the threat to kill off the seals will force Great Britain to negotiate for regulations which will better protect the seal.

The bill appears to be permissive, not mandatory; and if it should become law it would be for the President to decide what action should be taken in the matter.

What the fate of the bill will be when it reaches the Senate cannot be known, but in view of the nearness of adjournment, it may be doubted whether any action will be taken on it.

PIGEON SHOOTING.

IT is a fact that from the trapshooter's viewpoint the sport of trapshooting is likely to have added legal limitations. The outlook for it in the United States, so far as tests of skill on live birds at the traps are concerned, seems to be exceedingly cloudy for the year 1903.

The Legislatures of some of the States are bestirring themselves actively against it, while others view it askance with unfriendly eye.

If we consider that Legislatures, as a rule, voice the sentiments of the people, the fact cannot be ignored that there must be some profound public sentiment forcing and supporting the legislative hostility and activity in reference to pigeon shooting at the traps. The hostility is most persistently in action, and is spreading over ever increasing areas. Forces are at work which are constantly active and uncompromising in this matter. Victory in one State does not end the matter. It is but a stepping-stone to victory in several other States.

To one who has given the subject any thought, it is self-evident that the purpose of the anti-pigeon shooters is the abolition of live bird shooting at the traps throughout the United States. The hostile forces are powerfully organized and powerfully supported. The S. P. C. A. Societies of the different States are the central organizations, vested with legal powers which give them great prestige and force in accomplishing their purposes. They are reinforced with a strong public sentiment, as shown by the unanimity of the daily press in denouncing the sport of pigeon shooting, and warmly indorsing legislation against it. While some of the opposition to live bird shooting has its source in demagogism, there is undoubtedly much of it which is genuine. When an issue grows from local into national interest, persisting from year to year, it is absurd to maintain that it is insincere, or unimportant, or ephemeral.

Last year live bird shooting at the traps was practically made illegal in the State of New York by the repeal of the law which specifically sanctioned it. The issue had been carried over from the Legislature of the previous year. The anti-pigeon shooters won.

Last year the New Jersey Legislature had the matter of live bird shooting at the traps under consideration, but no decided action was taken on it. This year the anti-pigeon shooters had an anti-pigeon shooting bill before the New Jersey Legislature almost as soon as the session began, and it has now progressed so far as to be considered by the committee which has it in charge.

Several other States have the matter under consideration more or less formally, or informally, and are likely at any time to prohibit it.

So long as the trapshooters remain unorganized politically or as trapshooters, they cannot hope to make good their contention when opposed by organized bodies, by public sentiment and by the daily press.

The history of past struggles on this issue shows that the trapshooters do not consider the matter important enough to make of it a political issue. In fact, many of them, who approve of it, would not care to make it a matter of public discussion at all, as while they believe in the sport as being good, they do not consider it important enough to make of it a political issue. If it is prohibited, there are still many other forms of shooting left.

Without any formal organization or general unity of action, the trapshooters whose fancy is competition on live birds as objects on which to test their skill, cannot hope to stem the tide of public sentiment as shown by the hostile action of State Legislatures. If the lawmakers suspend action at one session of the Legislature concerning live bird shooting, it is simply a postponement of the issue till the next session, if history concerning this matter is true data by which to judge.

REFUGES FOR BIG GAME.

THE importance of preserving from utter extinction the large mammals of the world is coming to be more and more appreciated. In this country it is at present a sentiment cherished only by certain advanced thinkers; but in portions of Africa, ruled by the British, it has already become an established fact. We in America who call ourselves a practical people are usually found far behind the British in matters which relate to the protection of game and fish. In certain portions of Africa, it is true, some great and marvelous mammals, like the white rhinoceros and the elephant, have become absolutely extinct, just as on the western plains our buffalo has been exterminated; but the disappearance of the African species stirred the British to action, positive and definite; while we Americans, who prate constantly of our practicality, only talk about what ought to be done. We would rather have a thousand buffalo robes to-day than the herd of a thousand buffalo and all the increase they would give us through all the coming generations. In this we resemble the Indians and other primitive people.

That we here in America have ready to our hand a means of preserving practically every species of large mammal that is not actually extinct is well understood. In the vast area of our western forest reservations, which have been wisely set aside by Presidential proclamation, there is room for a number of game refuges, which, if wisely chosen, would afford ample room, and give summer and winter range for all the species of great game indigenous to this country. The abundance, the tameness, and the rapid increase of game in the Yellowstone Park furnishes perpetual argument in favor of establishing in all our forest reservations refuges where game should be absolutely safe from pursuit by man, and where, if protected from that pursuit, they would increase with marvelous rapidity; and, as they increased, would overflow into the surrounding country and furnish hunting to American riflemen for all time to come.

If the facts as to the increase and tameness of game in the Yellowstone Park are not convincing, many similar examples might be cited of the rapidity with which large mammals, even though slow breeders, increase when not pursued by man.

An example of this in FOREST AND STREAM only a few weeks ago was cited in the rapidity with which the horse, a large mammal, without natural enemies, increased during the first two and a half centuries of its existence on this continent, spreading as it did over almost all portions of North and South America that were best adapted to its mode of life. On many of the islands of the western and southern seas, fur seals formerly occurred in numbers too vast for estimate; but as soon as the destroyer man got among them he slew them in so wholesale a manner that from most of their haunts they soon disappeared. In a few places, however, their taking, being in a measure regulated by the government owning the islands, they have continued to exist in numbers almost as large as ever; and so long as only the surplus non-breeding seals were killed the supply always kept up. At the time of the transfer of the Pribilof Islands from Russia to the United States, there was a short period when there was no law enforced, and during this time there was a rush of hunters there, which, if they had not fought among themselves, would have resulted in the extinction of the fur seals there. As it was, they were killed down very low; yet after a few years of protection they became once more as numerous as ever. Other cases have occurred where the seals have apparently all been killed off from some hauling ground that once contained great numbers, which has therefore been deserted by sealers for a number of years; and later visitors have found that some small surviving remnant being undisturbed have so greatly increased as once more to furnish large catches of skins.

In certain restricted localities in South Africa, even the greatest of mammals has shown what protection will do for it. South of the Zambesi and Cunene rivers the African elephant is practically extinct. Ivory hunters, the natives, and cold-blooded butchers, who loved to slaughter the vast brutes, have swept that country, in which they once abounded, absolutely bare of these great beasts. But about the year 1830 the British Government prohibited the killing of wild elephants in Cape Colony.

There is no known animal against whose increase and survival so much might be urged as the elephant. Its vast bulk, the length of time that it carries its young, and the fact that it produces but a single offspring at a birth, would lead us to imagine that this was the one animal that it was hopeless to try to protect. Nevertheless, in Cape Colony, in the great forests which exist within a few miles of the towns of Port Elizabeth and Mitehagen, great troops of wild elephants are found to-day, although after leaving there one may travel to the northward fifteen hundred miles without seeing a single elephant track. This is the result of absolute protection, and if this protection is continued it is not to be doubted that Cape Colony will have elephants long after they have become extinct over most parts of Africa.

In our game birds, and in some of our fur-bearing animals, we have many similar examples of what freedom from molestation by man will do for a species. In certain of the Eastern States the quail or the partridges periodically are hunted down so near the point of extinction that it is impossible to get them. The gunners having learned after a year or two that there are no quail in the locality, cease to go out to look for them and wholly abandon their pursuit. No longer being molested, the birds increase in numbers, and suddenly the gunners become aware of the fact that there are more birds in the neighborhood than there ever were before. Then the pursuit is resumed, the birds are once more killed down almost to the point of extinction, and are again neglected until they have again increased.

There has never been so good an opportunity as the present offers to establish in the mountains and on the high dry plateaux of the West, refuges for big game which shall insure for future generations the existence of the animals that we in recent times have known so well. Such refuges should be set aside by Presidential proclamation, and their boundaries should be determined by competent authorities. There is now before the Senate a bill authorizing the President to do just this thing; and if this bill shall pass, we may feel sure that he will act on it just as promptly as possible. Himself a keen sportsman and ardent game protector, and the founder of the Boone and Crockett Club, he, better than most men, appreciates the importance of doing at once something for the preservation of game. Moreover, he himself has so good a knowledge of portions of the western country, and so good a knowledge of the men most familiar with the various parts of the West, that we may feel sure of the wisdom with which he would act in this matter if Congress should give him the power to act.

There remain but a few days of the session, and it is perhaps too much to hope that in those few days Congress should take any action on a matter of this kind; yet we are convinced that but a short time will elapse before this will be done, to the very great benefit of sportsmen at large, and to the still greater benefit of every State and Territory in which one of these game refuges shall have been established.

The Sportsman Tourist.

Forest Frills and Furbelows.

That the women of Vaiala were gravely agitated was apparent on the most cursory examination of the events that were taking place in staid and orderly succession on the town green or malae. The opportunity to give more than a cursory examination was afforded by the fact that the Consular premises occupied almost the whole sea-front of the Vaiala green, and that all public ceremonies took place as it were in our own backyard, or, at least, no further away than the great house of the town, which faced the Consulate from the inshore end of the green. Everything in Samoa is done in the plain sight of all, you can stretch one glance through half the houses of a town if they chance to be in line and see all that is going on under every roof; no house has walls, therefore there can be no hiding places. Notwithstanding all this openness, it is not to be supposed for a moment that Samoa is a plain and straightforward proposition. Nothing of the kind, it wouldn't be Samoa if it were straight. It is certainly a place where the more you see the less you believe. That's a part of the difference.

Day after day the whole of Vaiala had been spread out in my sight in the comprehensive view from my verandah, and my strolls in and out of the houses should have hid nothing from me. Yet, here was evidence that a great matter had been under the most minute discussion, and I had never had the slightest inkling of its existence. It may not be very flattering to one's powers of discernment, but it is true none the less. The safest theory to go on is that the Samoan is going to permit the average white person to know so much about Samoa as the Samoan deems advisable. Beyond that modicum the superior white person is going to obtain a very large amount of information about Samoa, but it is going to be principally all wrong. That's why the globe-trotters in their six hours on the beach come away with such remarkable impressions of Samoa, they obtain them from the old residents and they from the wily Samoans. They are all in the same story, these simple children of nature, they hang together most consistently in their intent to deceive, about the only thing in which Samoans can agree or be consistent. I used to hope to be able to sift the facts out through the young children who loved me dearly for a fist full of sugar or a motto candy. But it was no use. Apikale, aged four, a chunky maiden with a head like a billiard ball and an air of the utmost gravity, was already fully equipped with the art to keep from my knowledge the things she knew.

The great house of Vaiala was filled with an orderly crowd of the housewives of the town and a woman's parliament was under full headway in that dignity of order and ceremony without which the Samoan can do nothing. Not a man was in sight, and it was only by an inference based on experience that it was possible to interpret the general smack of smoke and cookery that floated along the air from the oven yards in the back of the village and to divine therefrom that the men were cooking a feast while the women debated. Nor was this the only source of food. While the Vaiala ovens were yet smoking, a procession came along the beach with noise of much singing, and with the flash of gay clothes and freshly oiled skins. A young chief sojourning in a town not far distant was sending in the hands of his young men a slight token of his esteem to the women of Vaiala. The procession advanced upon the green, a sufficiency of floor mats were brought out from the nearest house and the young men sat in rows in the shade of the cocoanuts, while their leader stood almost at the edge of the sea and shouted his compliments along the green and to the women in the house beyond. Then the burden of food was presented with the most precise depreciation of each article and the most consistent belittling of the numbers. But the women had their spokeswoman, Tofi, the chief governess of the village maid, and in her speech of reply every taro was counted for two, every spindling chicken was a full grown hen, and the proper degree of exaggeration was practiced. Then the visiting young men drifted back into the rear of the town where, I have no doubt, they sat about the oven yards with the men of Vaiala and told stories and puffed at banana husk cigarettes until it was time to open the pits and take out the cooked food for the feast.

Tonga sat on the verandah with me and watched the procedure with no show of interest, at any rate she volunteered no word of explanation of what was taking place, and I did not ask her, for it was plain that for some reason or other she was in one of her most aggressively civilized moods when all things Samoan were measured up alongside her civilization on the Midway in Barnum's circus, and quite naturally suffered by the comparison. When that mood was on her she was about as tractable as a wet hen, and it was never safe to stir her up. She sat sewing with her back against one of the outer verandah posts, and ostentatiously turned upon the green and the great house and all the ceremonies. I might have gone by myself to the great house and have been sure of a courteous welcome, but I feared to go without Tonga lest I make a break in some one of those niceties of island etiquette in which the Samoan never makes allowance for the unfamiliarity of the white person and never forgets to recall as an insult what was no more than a blunder.

But Tonga was soon forced out of her civilized mood, and I myself was advised of the purpose of the meeting, and to a certain extent included therein, the inclusion being based on the geographical position of my verandah, which put me in the most public spot of the Vaiala town green, but at the same time it was due in a far greater degree to an expectation of favors to come in the shape of corned beef and hard tack and such other dainties. Tanoa emerged from his retirement in the cook house, passed us on the verandah with his unfailing reverence of a crouching posture and the word "tulou," went into the office and began to pitch out floor mats in a stream. When he had collected as many as he thought necessary, he made of them a platform at some little distance from us, but on the same shady side of the verandah. This done he returned to the office, only to reappear with the rod and fly-flapper of office, and then proclaimed in his best manner that the ladies Salatemu and Fa'afili would wait upon me to declare the result of the meeting. From the fact that Tanoa did all this without any prompting I knew that it must be all right. He was born to the tulafale rank and had been trained in the intricacies of making speeches, and by nature he was so literal that there was not even a spark of genius sufficient to lead him into a mistake. When Tanoa had made his announcement he passed the rod and the fly-flapper over to Tonga and dropped out of the incident, for it was clearly an affair of women. With no very good grace she took the emblems of office and prepared to play her part.

In front of the great house Tofi stood forth with rod and the inevitable fly-flapper and proclaimed the tabu of silence on the town because Salatemu and Fa'afili were about to set forth on their call on me. All this is most formal, but no one can begin to understand Samoa until he recognizes how completely enwrapped in formal etiquette and ceremony is every slightest detail of life.

Salatemu was an old friend, wife of the chief of Vaiala, Le Patu, just at that time; therefore Talolo's mother of the current series. Fa'afili was a newcomer from somewhere up the coast. It turned out that she also was one of Talolo's mothers, and that was sufficient to establish her place in Vaiala. This question of who was Talolo's mother always proved too much for me. Here was Salatemu, who was Patu's wife and Talolo's mother. He was Fa'afili, who was Talolo's mother, yet never had been Patu's wife. There were others who had been Patu's wives without being Talolo's mother. Talolo himself would never formulate a general theory, but he was able to certify of any given woman whether she had yet been his mother.

All such considerations were dismissed by the arrival of the reporting party. Tofi proclaimed the full names and titles of the two whom she escorted and saw them seated on the pile of mats. It was now Tonga's turn to do a tulafale stunt, and she made her little speech of welcome, in which she took occasion to say how the coming of the party was like the sun shining after a rain and a few such spontaneous tributes. Then Tofi took up the line of talk. She allowed that they were most disgracefully poor, and that there was almost a famine in Vaiala just then, but they had struggled to get together just a few things to eat, which they were now fetching over to me, not that they supposed that I would touch such stuff, but I could feed it to any no-account person who might chance that way. This served to introduce the section of underdone pork that I was supposed to be entitled to enjoy together with taro and chickens, and a by no means shabby supply of food. Tonga in turn replied with a supply of ration beef and salmon, and the preliminaries of this social call were thus disposed of.

When it was possible to get right down to the matter it was made to appear that Vaiala had decided to marry its Tama'ita'i Samalaulu to a young chief from Manu'a, the impelling circumstance in the romance being that the chief in question had offered to make presents of fine mats and other gear on such a scale of insular magnificence that no prudent town but would snap at such a match. In this case it happened that Samalaulu skipped out of town before the date set for the marriage, eloped with herself, in fact, and Vaiala had to hustle to find another Samalaulu in time for the wedding. The groom seemed perfectly satisfied with the substitution, and courted one girl and married the other without a word of complaint. But all this is long ahead of this stage of the story. The present meeting had been called to figure on what was to be done to make the wedding a success. When it came to a show of fine mats Vaiala was able to make as good an appearance as any community, owing to its comparative immunity from the ravages of war. There were pigs enough to provide a slight collation to those who would come to the wedding, and there would be no difficulty about side dishes so long as the bush was full of taro and breadfruit, and the sea swarmed with fish, to be had for the mere scooping up.

After all the preamble Fa'afili began to get around to the real object of the call. "Therefore," she continued, and she was a remarkably good speaker, too, among a race born to oratory, "the conclusion of the fono is that at the wedding there shall be for all only the best attire and paths of new tapa cloth to walk upon. But Vailala and the whole Vaimaunga is very poor, we are as the wind and as nothing at all, and thus we come to thee in our deep distress because thou art very loving to us. The meeting of the women has reasoned upon all our needs, and the conclusion of the meeting is that to make us all new dresses we must borrow thy hatchet."

To reflect that I had sometimes seen clothes that looked that way was not a sufficient elucidation of the request of the women's parliament of Vaiala that they might borrow my hatchet to help them to make new clothes. For explanation, an appeal had to be made to Tonga.

"These two women," she said, with a fine disregard of logical sequence, "these two women my 'lashe,' belong same family and me, therefore I think so they fool women and the unwise. Just like the heathen they don't make 'faloka' on the sewing machine for the wedding of Samalaulu. But they borrow hatchet and they borrow ax, and they take a big knife here and they take a little knife there, only the headchopping knife they don't take, I think so they fraid the 'mana,' that's Samoan thing same like 'hoodoo' in America, and then they go into the bush and they chop down trees to make siapo for clothe them with it. But wherefore are they not like the heathen, these two women, for they never went to Chicago and they never went to the circus?"

While it was true that Vaiala did not steal, partly owing to the strict tabu whereby my premises were made "sa," yet Vaiala was not inclined to be prompt in returning a borrowed article. It was in a measure due to this circumstance that I would lend no article unless I myself went with it, an additional advantage being that in this way I was able to find my way naturally into a large amount of the domestic economy of my neighbors, which would otherwise have escaped me. Greatly to Tonga's distress I agreed to the proposal of the women that my hatchet be borrowed on the condition that I be borrowed with it. Tonga, I fully believe, thought that I was on the brink of a plunge into barbarism despite my unlimited opportunities to acquire civilization through Barnum's circus, where, in fact, she had first met me. I mean, of course, that she was a part of the show and that I was one of the great public.

It was now my turn to make a procession to the great house of Vaiala under the escort of my visitors and with Tonga to make my speeches. While this was essentially a feminine affair, I found it impossible to restrict my procession. From some lurking place Talolo was found at the gate of the compound prepared to exercise his prerogative of carrying my parasol. Both his mothers tried to shoo him off, but he knew what his rights were and nothing could detach him from his position. Tanoa, also, who always did just what was right, Tanoa attached himself to the hatchet. He gave me a collection of resounding words for hatchet, all of such exalted rank that there were only two or three in all Samoa who were entitled to use them with me, for in Samoa there is rank and precedence even in the vocabulary. On matters of such grave importance my faithful, stupid, devoted Tanoa simply would not permit me to break through the proprieties of etiquette. In some way perfectly plain to himself and acknowledged by Salatemu and Fa'afili my hatchet had a rank so high that it called for one of at least tulafale rank to bear it. And it wasn't much of a chopper at that.

With these additions to my company, we crossed the green and took our places in the meeting. Tanoa and Talolo sat in the shade of the spreading mango outside with their backs up against the tombstone of some long departed chief, Talolo clinging fast to my parasol, Tanoa industriously rubbing the hatchet on the concrete monument of the chief in a laudable effort to remove some of the marks of its use in the cook-house.

There is one excellent trait about the Samoans. They may be lazy in the extreme, but they are not dilatory. In this particular instance they had postponed holding this meeting until almost the last moment, but when they had at last settled what they were going to do they were going to set about it at once. As soon as I had told them that I would accompany their party with the hatchet, it was with difficulty that I secured a postponement long enough to change into my bush clothes, for all assured me that this performance would be no mere stroll along the beach. The Samoan jungle had by this time no terrors for me, and there was nothing to deter me from plunging once more into its recesses to see women chop down dresses and go shopping with a hatchet.

There is only one need of the South Sea islander, which it is beyond the scope of the cocoanut to supply. It will feed him, it will house him, it will carry him over the sea, it produces nothing that goes to waste in the simple economy of those who dwell beneath its clattering feathers, but it affords nothing out of which one may make comfortable or pleasing clothing. This need is supplied by several trees which have a layer of bast between the bark and heart wood of their trunks. Of such there are two in particular, the fau, or hibiscus, and the tutunga, or Broussonetia papyrifera. In Samoa, where both trees abound, the hibiscus is used only for the making of string, and the tutunga is distinctively the cloth tree.

We had a swampy way to go from the moment we left the town and the beach behind us. At the eastern end of Apia the coastal plain, on which are the houses of Samoans and foreigners, is undoubtedly formed by the rivers, which there come down to the sea, and it is so imperfectly formed that everywhere back from the immediate beach is swamp and backwater, with every here and there a sluice or creek. But when this is once passed and one gets on the slope of the hills, the going is better because dryer. It is on the first slopes of the hills that the tutunga finds its best growth.

Under conditions where the Broussonetia finds good soil and an abundance of light and air with plenty of room, the tree grows tall and branches over an extended space. But those are ideal conditions which never can exist in the theater of the fierce vegetable duels in the island forests. Every tree must battle for light and air, room is something that none has, the lianas tie and choke all weak growth, and that which comes out of the contest with the right to live is something far different from what it was in the germ within the seed. But the islanders have been quick to observe that in the case of the Broussonetia the worse off it was as a tree the better it was for their uses. That is to say, while the tree growing to its full extent will give them a bark that can be converted into so-called cloth, still just in proportion as the tree is forced to grow spindling so much the better is the bark. It results, then, that the islanders make it a practice to cut down all the large Broussonetias they can discover in the bush in order to force a second growth of saplings. There is no risk of failure in such a crop. The active roots will start new shoots from every foot that was shaded by the parent tree, and all the art of the forester is to thin out the saplings as they grow in order to establish a thicket of hardy poles.

In an imperfect sense such a cluster of second growth tutunga may be classed as a plantation, but the way to all those which we visited was that of the roughest kind of bush work. The women knew where their trees were and they knew how to get there, but not they nor anybody could make the way easy. There was no danger of being lost, for few Samoans can go

silent in the bush. At frequent intervals one starts a long hoot, and after an interval some other replies, and thus the party keeps in touch. One may now be quite too good a Christian to confess it, but it is not so very long ago that these woods were filled with heathen devils ready to make things busy for the intruder on their domain, and if one hoots now and then in the bush, it certainly does no harm and might scare away any devil that hadn't heard of the arrival of the missionaries. So on we go with hoot answering hoot, and Tonga carefully explaining that she hooted because she wanted to make sure just where Fa'afili was, but Tanoa, who has never had circus advantages and civilization and things, is frankly scared out of a year's growth, which makes it all the more commendable that he sticks so close to me in all the expeditions into which my wish to investigate things is constantly leading him.

At last we reach the thicket of tutunga without having actually seen any devilish aitu, though there were some funny sounds that would be hard to explain except on the devil theory. Now in this art of dressmaking with an ax, there is only one stage of the proceedings that calls for the deepest jungle as its scene. This account will keep within better bounds by being restricted to the woodsy operations, leaving the account of the final stages for some later occasion.

OLD JESUIT CHURCH.
Photo by Fred S. Wheeler.

The problem of the Vaiala housewives is this: given a thicket of second growth timber, to convert those saplings into the new clothes and the cloth pathways wherewith Vaiala, man, woman and child, shall rise and shine on the day when the Manu'a chief comes with pigs and mats and dancers and song to marry Samalaulu. To the Vaiala woman the problem is easy, her first task is to peel those saplings. At it they go. They have actually made Tanoa work. The hatchet is to chop down the trees, and if he thinks his old hatchet is too almighty fine for any one to use, why then, it's about his day to chop the saplings down himself, for down they must come until Fa'afili says that enough have been laid low. As fast as the saplings fall (they run just about the thickness that will fall to one clean, sharp cut), Talolo hauls them out of the way and lops off the upper end just below the first appearance of branches and tosses back to the waiting row of womankind long, slim poles of a length of anywhere from six to ten feet. Whoever gets the pole next gives it a thorough good beating with a short billet of wood, being careful, however, not to break the bark. Down along the line it goes to those who slit the bark from one end of the pole to the other. From these experts—and to cut a straight line on three yards of small sapling is no easy thing to do—it goes to the last line of the women. Theirs is the task to strip the bark from the wood and roll it up in a close coil as they strip it off the wood, leaving the inner side of the ribbon of bark on the outside of the coil. As soon as the coil is made up it is firmly lashed with threads of the waste bark and passed back to Salatemu and myself, who are in the rear rank of all in the highly important act of keeping tabs on the work done. Salatemu, who has the imagination of a sheep, always drifts into some such sort of a job. For myself I soon found that I was in a fair way to pull off my finger nails before I learned how to roll up the bark coils. Still we were as busy as bees at our respective posts, and long before Tanoa had awakened to the fact that he was indeed working like a horse, Salatemu announced that the rolls of bark had reached the number settled upon and that we should go home with our raw material.

And all the way home Talolo kept enlivening us with questions as to whether we had seen the keenness of his strokes in lopping off the ends of the saplings. And Tanoa began a plaintive song about the girl who went out to chop tutunga, and when she was putting the bark rolls to soak in the river her brother's corpse came floating down stream; Tonga explains that the song is so very ancient that only about six people in Samoa know what it means, and they won't tell common people, but it's a song that every one knows, and it's the proper thing to sing it when coming back from chopping tutunga. Just as if Tanoa would ever omit one of the proprieties or be found singing the wrong song under any circumstances! But Talolo returns to the charge with his skill in chopping the ends off the sticks and happily assured us that it took a man to do that sort of thing, only a man could handle a knife so as to chop things off, heads, for instance, in war. But he got a smart to his feelings because of his brag, for Fa'afili—and she had been a mother to him once, too—asked the cutting question: "Man, indeed! And when wert thou tattooed, Thy Afionga Baby?"

LLEWELLA PIERCE CHURCHILL.

Relics of Old Days.

THE vicinity of the great Kettle Falls of the Columbia is rich in mementoes of former days and times.

Two considerations quickly decided the Hudson Bay Company to locate one of their principal fortified posts near this place.

First, the salmon fishery of the Indians at the cataract, where occurred the annual gathering of most of the tribes of the Pacific Northwest east of the Cascades and south of the British line; and, secondly, the wide level plat of bottom or lower valley land on the left bank of the Columbia, where, about a mile above the falls and on the same side of the great river as where the best of the fishing ground was located, was found the most perfect site for a fortified trading post.

A level valley some four miles long up and down the river and about two miles wide lay spread out apparently for their convenience; and here on a gentle rise of ground about a mile above the falls a palisaded fort, about 100 feet square with bastions or block houses of heavy logs at each of the corners, which were built two stories in height, pierced for cannon and loopholed for musketry, and covered with a hip roof, made a fortification proof against all Indian attack.

A small brass cannon of some 80 pounds weight was brought across the continent, and the formidable weapon added greatly to the armament of the big stockade.

When I first saw the old fort in 1885 two sides of the old palisaded wall—or the most of them—rotten and crumbling with age, leaned over in waiting for their fall; and now nothing but one of the old block houses at the northwest corner of the old fortification remains.

As nearly as I can ascertain, the fort was built in 1814 or 1815.

In the inclosed photograph the view is toward the southwest.

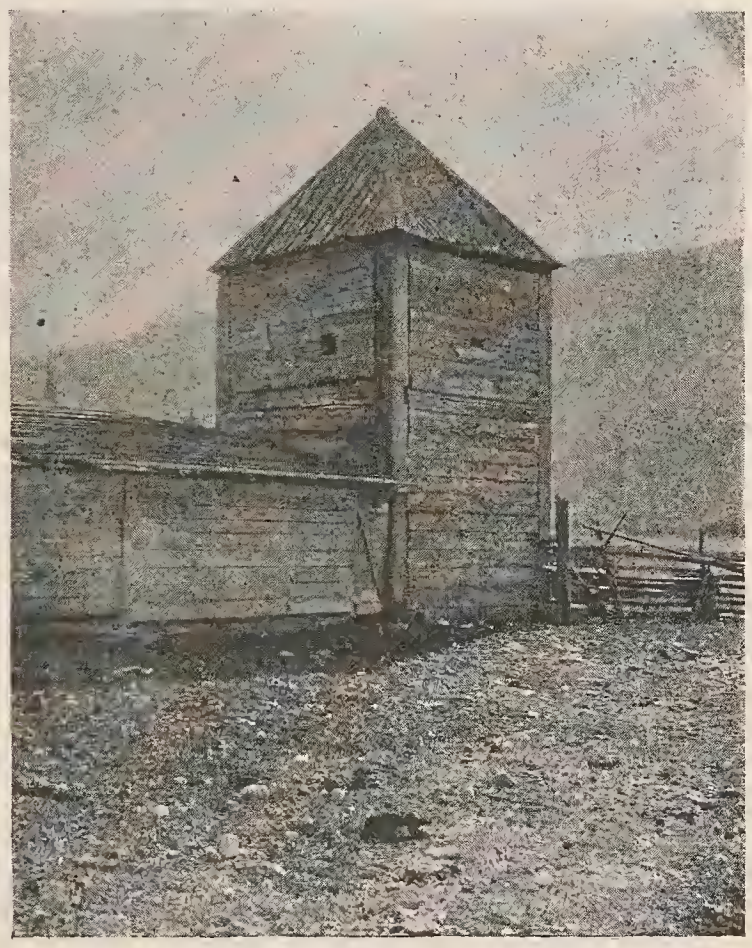
To the right of the block house, just over the top of the old rail fence, is a glimpse of the Columbia a short distance above the Kettle Falls, which is hidden from view by the cattle shed on the left of the old relic.

A small quantity of seed wheat was brought to the fort, and in 1816 a windmill was built, and two blocks of granite were shaped into millstones, but the wind power proving unsatisfactory, the mill was moved some five miles south of the fort to the falls of the Colville River, now known as Meyers Falls, where, after being thoroughly worn out, they were replaced by another pair formed of two big boulders of conglomerate taken from the bed of the Columbia River at the Grand—or Rickey—Rapids, some five miles below Kettle Falls.

These were well shaped by a master hand, and after having been used for many years still remain in position in the old unused mill.

The old granite millstones, worn "to a frazzle," and with the lines of the old furrows scarcely distinguishable, lie on the hillside above the old mill and already half buried in the soil.

A vandal "Professor" from Pullman College—without so much as a "by your leave" from Mr. Jacob Meyers,



THE OLD BLOCKHOUSE.

the owner—broke off a piece of the old relic and bore it away in barbarous triumph.

Between the fort and the cataract on a bluff of land one hundred feet or more higher than the site of the fort, a church was built by the Jesuits in 1839 or in 1844—the exact date cannot be determined.

The old ruin is well shown in the photograph, the view being toward the northeast.

When it is borne in mind that the lumber for doors, casings, gables and cross pieces for the rafters was worked out with whipsaws, that the building itself is 50x80 feet in size, and that the lower log or "sill" shown in the picture is a solid log hewn on four sides, 12x18 inches in size and 80 feet in length, it is easily understood that the crumbling ruin is a monument of patient industry.

Near the north end stands an old adobe fireplace of huge dimensions, the top of its chimney having crumbled below the roof; and here, on the wide face of the chimney, in the main room of the building—for a partition across the building formed a small living room in the north end—hung the most singular painting I ever saw.

It was about 3x4 feet in size, representing a vision of the abode of the saved in heaven.

Frame, canvas and pigments were evidently gathered by the zealous artist from among such materials as were possible to the place and time; and the brush used might well have been the end of a cat's tail.

The crudest, rawest daub ever hung up to charm—or paralyze—a crowd of savages; every characteristic of the old painting united to make it priceless.

As before stated, my first view of the old ruin was in 1885, and as I stood admiring the old painting, still hanging in the long-abandoned building, I deliberated long regarding the propriety of stealing the crude affair for the purpose of preserving it for some yet-to-be-formed antiquarian society; but my somewhat shadowy recollection of the eighth commandment tugging at my conscience finally drew me away.

Proceeding homeward I pondered more and more over the matter, and finally made up my mind that when next I passed the old ruin I would steal the painting, "wher no," as Uncle Remus says.

But, alas! when I hurried back to the old church at the first opportunity, some other "antiquarian" had been ahead of me, and the adobe wall of the old chimney stood stripped and bare.

Scythe in hand, Time, the iconoclast, moved on. The net and salmon wheel of the avaricious paleface sweeping

KETTLE FALLS.

the mouth of the great river bare of its finny wealth have left the rocks of the great cataract unfretted by the plunging spear of the hungry Indian; and the puffing locomotive, tugging its load of mineral, or the palace car of the thoughtless tourist, up the steep grade a mile eastward of the old fortification, has changed the old brass cannon into a curious memento of the turbulent days gone by, leaving the decaying logs of the old building only a crumbling marvel to curious eyes, and a time-worn hunter, seated pen in hand, gossiping to the readers of FOREST AND STREAM of days gone by forever.

ORIN BELKNAP.

The Joys of Living.

THE morning is fine, with clear air and bright skies, and as I arise and step out on to the piazza a few breaths of ozone are almost intoxicating. What a joy to fill one's lungs, flaccid and inelastic from breathing the furnace-heated, germ-laden stuff which passes for air in our city houses, with the life-giving oxygen of "out doors."

The prime requisite for enjoyment of living is, of course, perfect physical health, and then, if we add a full measure of appreciation of the marvels enacted every day by Dame Nature, we find joy without stint.

We look with delight and amaze upon the paintings of the artists who have faithfully depicted a beautiful sunset, a doe deer, a speckled trout, and pay fabulous prices for them, all of which is right and to be recommended, for the paintings are the art preservative of what in nature is eternally changing.

The sunset is fleeting, the deer is out of sight in a moment's time, the trout are as the lightning's flash, so we hang their counterfeit presentments on our walls and are happy in their company. But who of us that are sportsmen lovers of nature would swap for their pictures material, their pictures mental, covering years of enjoyment on the deer's trail, the stream's bank, the mountain's top?

On a day in October I sat on a runway in the glorious Green Mountains of Vermont watching for deer. The woods were a blaze of glory, and the crisp dead leaves on the forest floor made anything like a quiet stalk out of the question. Therefore I sat down on a log. Soon I heard a slight footfall and saw the back of some creature bobbing down the mountain in my direction. I dropped down on one knee, and a fawn appeared, soon followed by its mother, a large doe. The law allows killing of bucks only, but at first I was unable to see whether the creature carried horns or not, so my rifle was at a ready. As she came into clear view I saw she was a doe, and my eye ran through the sights to her shoulders, but my finger did not pull. Instead, I kept still, and watched the handsome creature play with her fawn, which strayed within two rods of me. It finally ran away, she following slowly, unconscious of my presence. I crept upon the log again, but the movement, slight as it was, caught her attention, and her head swung in my direction, her great ears came forward, and then with that so often fatal curiosity ascribed to the feminine gender she turned and came toward me, her delicate nostrils quivering for my scent. There she stood and stamped her little hoofs, the most beautiful thing in the whole forest, until, her curiosity satisfied, she turned, and whistling for her fawn, in a few jumps was gone. That is a mental picture I shall long carry, and I rate it as one of the joys of life.

Only perfect health will enable, and a desire to get into the woods will impel one to leave the warm couch before daylight and trudge out into a swirling snowstorm to see if some of nature's children are abroad. With my double barrel in my warmly gloved hands, and a sweater pulled up around my neck, I was perfectly

comfortable one morning last October as I walked along the road during the first snow. I was stopping at a farm in New Hampshire and carried an opinion I should like a partridge for breakfast. Well, I carried the opinion back home, but the grouse flew away.

The wind blew the flakes across the road and stung my cheek, but when I passed through a bar-way and into the shelter of the pines, what a change! Compared with the boisterous open, it was warm and comfortable in the woods, and what a marvel of whiteness! The snow was too dry to adhere to the deciduous trees, but the thick foliage of pine, and spruce, and hemlock, supported it. I looked ahead along the trail, thinking "No fool-creature out but myself," but stepping carefully and noiselessly as the few inches of snow enabled me to do, my trail was not a quarter of a mile long, when from the rear I heard the "yap, yap," which is only Mr. Fox's way of inquiring who was after his partridge ahead of him. Dawn now made things visible at some distance, and scanning ground and trees I crept silently forward. Suddenly, like a bomb exploding, a partridge jumped into full flight amid a cloud of snow. Hit him? I didn't even fire—never could hit skyrockets under full speed. Home to eat a breakfast big enough for two.

It is summer, and Diana and I are outfitted for trout. We are, in fact, beside the brook, watching the play of sunlight through the trees, showing in patches on the white sand at the bottom of the still pools, and listening to the music of the splashing, gurgling water. Is there any sweeter music to the real, genuine, dyed-in-the-wool, trout fisherman than that of a mountain brook? None that I know of. Baiting our hooks (the trout are too sophisticated where we were to accept feathers for food, and Diana too well-seasoned a trout fisher to balk at a barnyard-hackle), we cast into the purling waters and once more feel the "wireless telegraphy" (ante-dating Marconi) of *Salmo fontinalis*—the most beautiful thing that swims—a living, palpitating, scintillating, speckled trout, fresh drawn from the swift flowing element in which he darts and flashes. I call to mind one particularly pellucid pool, in which it did not seem a trout could find cover. Still, keeping low down, almost creeping, a squirming bait is dropped into the water, and instantaneously a substance, though seeming shadow in its swiftness, has that blessed worm in its mouth and is unceremoniously jerked out on the bank. Only eight inches long, but a subject of much gloating and a true joy of life.

His shape, his spots and color, all may be truly transferred to canvas—but his life, the electric flash from under bank to your bait, the sunlight, the babbling water—these may not, yet they are the joys of life. As Whittier says,

"Aloft on sky and mountain wall,
Are God's great pictures hung,"

and happy is he who appreciates his opportunities of seeing the daily panorama of earth, and sky, and the wild life of nature's children. NIMROD.

Past, Present and Future.

Editor Forest and Stream:

Somewhat frequent reference in your columns are made to the fact that pigeons, once so plentiful, have almost entirely vanished, and a very interesting question related to their disappearance is, Where have they gone? When I was a boy there were more pigeons than there were people, and in those days I saw single flocks which, it seemed to me, outnumbered the population of the State of New York. In their flights such flocks would cast dense shadows upon the ground, and the humming of the flight could be heard long distances away. Large numbers of exhausted birds would drop from the flocks only to be caught by both men and boys, upon the ground, and pigeon nets would catch them by the thousand, to be sold for twenty-five or fifty cents a hundred, according to circumstances.

In my judgment, their extinction must be accounted for on some hypothesis other than their slaughter, though they were persistently hunted in field and at roost. Their disappearance was exceedingly sudden, much as was their coming, but armies of hunters could never have killed the last one.

Is there not a natural, perhaps indefinable law of nature which has always been in operation—an evolution, if you please—which may have been responsible for the decrease or extermination of the last animal, fish or bird of certain kinds? Must we believe that the last wolf and the last moose absolutely met death in the Adirondacks? Was it absolutely the rifle which almost exterminated the buffalo? Have many other animals disappeared before the hunter? And have certain fishes, once plentiful but now quite unknown, found their last resting place in the angler's creel?

I shall not attempt to explain what changes in terrestrial conditions have effected these changes, for I do not know; nevertheless, I believe that science could account for them. We know much of the changes in animal life which occurred in the long gone past, centuries and ages ago, and if extinction and creation was the order then, then why not now? Let some philosopher pursue the subject and question further.

I have also noticed in your columns frequent allusions to red squirrels and their habits, and last week some one discovered that they love meat. Yes, they do, but it must be sweet and tender meat, like birds in the nest, and the very young of mice and other squirrels. I have seen all these eaten by "reds." They are fond, too, of the eggs of birds, and in various ways are ravenous little creatures, akin to crows in cunning and in taste in these particulars.

Speaking of squirrels, I observe that Didymus is skeptical in relation to that Mississippi story about multitudes of them having been gathered in bags while they were swimming across the river. I have forgotten who wrote the story, but he was a good joker. He left the fact unstated, but, of course, those squirrels all escaped when they reached the shore. Why should they have refused aid?

And then that funny deer. But here's his match. In years long ago a missionary was sent into the western country to establish a congregation in a rude church in some settlement. He apparently met with much success, and his Sunday services were well attended. On a certain Sunday morning the little church was unusually well filled, which gave such inspiration to the clergyman that he was at his very best. In the middle of his discourse all eyes were upon him and he felt that his truths were sinking deep into the hearts of his hearers. Suddenly the tongues of hounds were heard, and in a twinkling the little church was deserted, except that one man on crutches remained. The minister was so overcome with blasted hopes and misjudgment of his own intensity of speech that he laid himself across his pulpit and literally groaned with disappointment on seeing the congregation so readily chase a strange god in the form of a deer. His heaviness of heart so excited the sympathy of the lame man that he sought to console the minister, and said in sympathetic tones, "Don't you worry, deacon, I know them dogs well and that deer'll never get away; they'll git him inside of a mile, or you may cuss me for guesser."

I have read every number of the ROD AND GUN and FOREST AND STREAM printed these many years, and seen the constant evolution, until I dare to say that FOREST AND STREAM has no equal in the wide, wide world in the field it occupies. This is not to flatter the editors and the management, but to give utterance to truth, which I believe every one of its many thousand readers will affirm. It has come to be not only an excellent story paper, but also a superior educator. It is always clean, too, even in its advertising, which, by the way, I read as regularly as I read its other pages, for in that there is also much to be learned. I do not always agree with its views upon some subjects, but it ought not to change its own views on that account, yet I wish it would print one or two pages more of its well-written editorial matter, even if it should go wrong, according to my beliefs and opinions.

Although FOREST AND STREAM has been instrumental in my expenditures of several hundred dollars, aye, twenty of them, for hunting and angling outfits, all the way from a patent lamp that wouldn't burn to a big tent which I didn't need, I forgive it; yes, I heartily thank it. My life has been made longer and happier by the possession and use of this collection of everything having not only the nearest but also the most distant relationship to the field, forest or stream, or even to places other than these, such as were but ninth cousins to them.

I can no longer "chase the antelope over the plain," not even "draw a bead" on a woodchuck, but I can still hunt and get good fishing right here in my "den," filled with remembrances, almost the faces, of many, many friends whom I have met a-field. And here I recall what W. H. H. Murray (Adirondack) wrote in dedicating one of his books to me:

"As years go on and heads get gray, how fast the guests do go! Touch hands. Touch hands with those that stay. Strong hands to weak, old hands to young around the Christmas board. Touch hands!"

How hard it is for every lover of nature to bear to see the devastation of that so dear to us by not only the individual, but by the State of New York. Our forests are almost wholly without protection from vandalism, save those goodly portions which men of wealth have taken from the people and inclosed with dead lines. The people are paying large sums of money for so-called protection, yet lumbermen go where they please and do as they please, even to the subsisting of their men engaged in nefarious work upon deer which, like the timber, belong to the people. No other country but "free America" would tolerate for a moment these abuses of our forests which began long ago and will continue until the last tree outside of the wire fences of vast "preserves" is cut. And this will go on with the tacit sanction of the State in direct contraversion of "protective" laws passed to hide some of the shame, but which it never enforces, in fact.

I do not wonder that FOREST AND STREAM is discouraged with the lawlessness of State law-makers and now looks to the Congress for the last hope of relief.

SYRACUSE, N. Y., Feb. 7. D. H. B.

Skunks and Quail.

PARKERSBURG, W. Va., Feb. 3.—Our sportsmen blame the skunk for the scarcity of quail this fall, as under the protection skunks have become very numerous and a great nuisance. C. L. SLAYTON.

D. E. H., May 30, 1833.

BALTIMORE, Jan. 29.—*Editor Forest and Stream:* I was much interested in an account, which you recently published, of the finding of a stone in the Missouri River with the initials of some of the old trappers scratched on it, and the date of the engraving.

I came across something similar this fall on the Lewis Fork of the Snake River, about three miles above Jackson's Hole, at the nearest point to the lake where you could ford the river.

On a large cottonwood tree about 2½ feet in diameter were cut the initials "D. E. H., May 30, 1833." The downward cut in the "E" had grown to be five inches wide. As the tree had been badly cut by the beavers some time ago, and was rotting fast, I had the tree cut down, and brought the section containing the inscription home with me, in order to preserve so interesting a relic. You will recall that it was late in the preceding fall that Vanderbourg, of the American Fur Company, was killed by the Blackfeet, a little to the northwest of this, in his effort to follow the trappers of the Rocky Mountain Fur Company, and it was only a month later than the date of this inscription that Bonneville crossed the lower end of Jackson's Hole and passed up the Hoback River from his wintering place on the Snake River, in what is now Idaho to his spring rendezvous on the Green River.

Kit Carson, the famous scout and trapper, who was afterwards guide for Captain Fremont in his exploring expeditions, had his winter camp in 1832 and 1833 a little to the northwest of where this tree was, and it was near here that he had quite a fight with the Blackfeet Indians, who had stolen his horses. In the spring of '33, when the carving was made, he and his party were trapping somewhere on the Lewis Fork of the Snake River, but whether on the upper or lower portion I do not know.

It was at about this point that Coulter, who was with Lewis and Clark and left them on their return near the mouth of the Yellowstone, crossed Jackson's Hole on that memorable trip that resulted in the discovery of the wonders of what are now known as the Yellowstone Park.

THE RECORD OF THE COTTONWOOD.

Weyth, that unfortunate New Englander, whose attempt to force himself into the fur trade resulted in the loss of all of his men and outfit, had just returned from his trip down the Columbia River, and at this date was at the spring rendezvous on the Green River with Fitzpatrick, of the Rocky Mountain Company, who was the man that led Vanderbourg into the Blackfeet country, where he lost his life.

I doubt if there is a period in the early history of the West of which we have more records than in that particular year, but I can find no name to fit these initials. Possibly some of your readers can furnish it.

I am sending you a photograph of the carving under separate cover. TAHENA.

The Southwest.

Editor Forest and Stream:

No doubt many readers of FOREST AND STREAM will join the writer in thanking Cabia Blanco for his unvarnished and therefore intensely interesting stories of life in the Southwest about the end of the Indian and buffalo period. That day is as completely a thing of the past now as if a century had gone by instead of a single generation. Cabia Blanco is doing the cause of history a real service in writing fully of his experiences. I hope he will visit this region again and thereby refresh his memory and give us some more extensive histories of the stirring days of the sixties and the seventies. There are not many men left who can say of those days and events, *quorum pars magna fui,* and not many of them are able to tell the story as simply and clearly as this ex-Comanche. By the way, the first half of his name bothers me. Is it Indian? I do not recognize the word as Spanish. AZTEC.

SAN ANTONIO.

Honduras Boars and Bears.

Editor Forest and Stream:

In my mention of the wild animals found in the Department of Mosquitia, Honduras, in "Notes from Central America"—V., FOREST AND STREAM of February 7, "wild bears" should read "wild boars." While there are said to be bears in the mountains of Honduras, the writer has never encountered any there, while, on the other hand, he has found the wild boar (*jabali*) comparatively common in the region of the Wauks and Patuca rivers.

J. HOBART EGBERT.

Natural History.

Birds of the Western United States.

Mrs. Florence Merriam Bailey has done an admirable piece of work in her Hand-book of Birds of the Western United States, Including the Great Plains, Great Basin, Pacific Slope, and Rio Grande Valley; published by Houghton, Mifflin & Company. Such a volume was greatly needed, and completes for the United States what was begun by Mr. Frank M. Chapman, in his "Hand-book of Birds of the Eastern United States."

Mrs. Bailey has had good preparation for the work that she has so well accomplished in the several seasons that she has spent in different parts of the West, in California, Texas and Arizona, and the field work that she has done has left its impress on this most excellent volume. Besides this, as she tells us in her prefatory note, the preparation of her book has been facilitated by the good offices of many ornithologists; and she has had access to the collections of the National Museum, and of the Biological Survey. Such well-known Washington ornithologists as Dr. A. K. Fisher, her husband, Mr. Vernon Bailey, Mr. E. W. Nelson, Mr. H. C. Oberholser, and others whom Mrs. Bailey names, have contributed to the work.

In her introduction she gives still further credit for assistance received, and works consulted. Here are found also a chapter on Collecting and Preparing Birds, Nests and Eggs, a paper on Life Zones, drawn from the investigations made and laws laid down by her eminent brother, Dr. C. H. Merriam, and illustrated by a full page map drawn by himself, together with some Notes on Migration and Economic Ornithology. A brief chapter on Bird Protection, by Dr. T. S. Palmer follows; and then come a number of local lists by Messrs. A. W. Anthony, W. H. Kobbé, Walter K. Fisher, Joseph Grinnell; a List of the Birds of Fort Sherman, Idaho, taken from Dr. J. C. Merrill's Notes in The Auk, in 1898; of the Birds of Cheyenne and Vicinity, by Frank Bond; of the Birds of three counties of Arizona, from W. E. D. Scott's papers of 1886, '87 and '88, in The Auk. An important list of books of reference, and some remarks on the Use of the Keys, so freely furnished throughout the volume, close an Introduction of ninety pages.

The first and general Key to the Orders of the Birds is followed by the Key to the Families of Water Birds; and then begin the descriptions of the birds in their order, interrupted as we pass along by Keys to genera, preceded by descriptions of the families. Each species and sub-species bears the name and number used in the A. O. U. Check List of North American Birds; but in the vernacular names of the birds Mrs. Bailey drops the possessive form, where the species bears the name of an individual, and speaks of Steller jay, instead of Steller's jay, and of Attwater prairie hen, instead of Attwater's prairie hen.

The descriptions of the birds are extremely clear and good. They are not in the least technical, but the author has seized on the salient features of each bird, and has described them so clearly that it seems that even for a novice it should not be difficult to find here what he wants.

For a beginner—a more or less untechnical student—a book made up wholly of descriptions of birds, no matter how excellent they may be, is useful only as a book of reference, a sort of dictionary in which to look up a specimen about the identity of which he is more or less in doubt. No book is more useful than a dictionary, but at the same time one would hardly choose a dictionary for light reading. Mrs. Bailey's book is made very attractive to the least technical nature lover by her brief notes on the ways and lives of the birds. There is a charm in the paragraphs commenting on its habits or its distribution which follow almost every species. Many of these are written by her husband, Mr. Vernon Bailey, and all are most attractively phrased. Often it is merely a touch which is given, but it is always a touch of nature, and so is vivid. Without these paragraphs of natural history the book would lose much of charm, and somewhat of usefulness.

Here, for example, is a paragraph about the scaled quail, a bird known to few sportsmen, which conveys interesting information: "As the bluish-gray birds run from you over the gray ground, dodging this way and that among the bushes, the most conspicuous thing about them is the white tuft of their crest, and from its suggestion of the cottontail they have been well dubbed cottontops. Perhaps because they are so protectively colored, they usually trust to their feet to carry them out of harm's way, rarely taking flight unless hard pressed. But when a flock does scatter, the birds are astonishingly hard to find, though but a few yards away."

Of another bird, the valley quail, a much more familiar species, it is said: "The brushy parts of Golden Gate Park in San Francisco abound with quail, and from the benches one can watch the squads of plump hen-like little creatures as they move about with stately tread, or stand talking sociably in low monosyllables. If they hear a footstep on the walk they start up and hurry across the path like hens before a wagon, topknots dropped over their bills, necks craned forward, and legs stretched as they patter along in double-quick time. When less in a hurry they run in a stiff, prim way, the cocks with a dignified gait, the hens with a demure feminine air. Outside the parks, when the flocks are feeding, the old quail act as sentries, to the wrath of young hunters, who complain that the cocks 'tell on them!'"

Mr. Bailey makes interesting mention of the Rio Grande turkey, a species which was once extremely abundant in southern Texas.

"Over most of the country, where the wild turkeys were once plenty, they have now become scarce or extinct, but in a few places may still be found in something like their original abundance, living much as their ancestors lived, breeding unmolested, strolling through the woods in flocks, and gathering at night in goodly numbers in their favorite roosting places. Perhaps the best of these undevasted regions are on the big stock ranches of southern Texas, where the birds are protected not by loosely formed and unenforced game laws, but by the care of owners of large ranches, who would as soon think of exterminating their herds of cattle as of shooting more than the normal increase of game under their control. Here, at least, through the breeding season, the turkeys are not more wary than many of the other large birds, and as we surprised them in the half open mesquite woods along the Nueces River, would rarely fly, merely sneaking into the thickets, or, at most, running from us.

"The ranchmen say that the turkeys always select trees over water to roost in when possible, and no doubt they do it for protection in this region where foxes, coyotes and wildcats abound. On the edge of the flooded bottoms of the Nueces River they roosted in the partially submerged huisache trees. A loud gobble just at dusk led us to their cover, and crouching low to get the sky for a background, we could see the big forms coming in singly or in twos or threes, and hear the strong wing beats as they passed on to alight in the huisaches out in the water. When the noise of their wings and the rattling of branches had subsided, with a few gobbles from different quarters they settled down for the night. The next morning, as the darkness began to thin, and a light streak appeared in the east, a long, loud gobble broke the stillness, followed by gobble after gobble from awakening birds in different parts of the bottoms, and before it was half daylight the heavy whish-whish of big wings passed overhead, as the turkeys with strong, rapid flight took their way back to the higher ridges."

The systematic part of the book takes up about 475 pages, and this is followed by a few pages of a Field Color Key to genera of some of the common passerine birds. This will be found very useful to beginners who are not collectors and who have not access to collections of skins. It is a useful addition to the volume, which contains about 600 pages—xc + 512.

If the text of Mrs. Bailey's book is useful and attractive, no less so are the illustrations, which are scattered all through it with most liberal hand. There are thirty-three full page plates, by Mr. Louis Agassiz Fuertes; thirty-six full page plates in all, the other three being Dr. Merriam's zone map, the topography of a bird, and a very beautiful photograph of white-tailed ptarmigan. Besides this there are a very large number—over 600—of figures in the text, some of them heads of birds drawn by Mr. Fuertes, some photographs of bird skins, some outline drawings of structural features, by Miss Frederika Weiser. Besides this, certain publications of the Biological Survey, some periodicals, and the earlier works of the author contribute a few figures.

Mr. Fuertes is known, of course, as the first of American bird painters of the day, and of his plates and the heads of water birds especially, which so freely appear in the text, it need only be said that they are altogether admirable—though perhaps not all of equal quality. A very few of the smaller figures of skins in the text are so reduced by photography that they do not show very much. On the other hand, of most of the cuts it is fair to say that they are distinctly helpful to the text.

Of the volume as a whole, only good words can be spoken, and Mrs. Bailey, and those who have so admirably worked with her to produce so excellent and so useful a volume, are much to be congratulated on the result.

A Winged Chorus.

Time, three A. M. in the leafy month of June. Place, a Pullman sleeper in a wooded ravine on the top of the Alleghany Mountains. The audience, an occupant of an upper berth. A danger signal had been given up the tracks. The brakes were set tighter and tighter, the car became a turmoil of noises as the woodwork creaked as the brakeshoes gripped the wheels and racked the car from end to end. The confusion of noises from this putting on of the brakes culminated in one fierce crunch and grind as the train came to a dead stop. For a moment, just long enough to notice, but too short to measure, a dividing line of imaginary stillness followed the war of friction, when out of the silence came flooding in through the open car ventilators such a heavenly chorus as one may hear but once in a lifetime upon this earth.

From out of the sylvan depths on each side of the ravine came in upon the still, cool morning air the notes of a thousand feathered choristers, each singing his own pæan of praise, yet fitting into the great chorus like a single stone in a grand musical mosaic.

The woodland's leafy aisles of nature's cathedral echoed and re-echoed with the limpid notes of the thousands of feathered warblers, each vieing with the other in one melodious burst of Orphean harmony.

Like the swell of the ocean on a calm and peaceful day, the undulating melody gently rose and fell upon the ear of the listener. So perfectly blended were the notes of the tiny warblers with the gentle whispering of the forest leaves as they shed the dews of night upon the russet leaves below, that to distinguish any one particular bird was impossible. How long this chorus lasted I could not say, for I was the sleeper who had been suddenly awakened by the change from motion to rest. It may have been seconds, it may have been minutes that I enjoyed this feathered chorus, be this as it may; but when the signal of a clear track was given, the wheels turned, and, like a pleasing thought, the music passed into a memory, never to be forgotten as the cars again moved and closed the hearing to all but the breathing of the iron horse as it panted under its snake-like burden. It was a heavenly choir that once heard can never be forgotten.

Charles Cristadoro.

All communications intended for Forest and Stream should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Doubting Didymus.

Editor Forest and Stream:

The world owes much to doubters; they are the touchstone of truth, but they should not doubt derisively.

In your issue of Dec. 20, your Chicago correspondent included in his usual batch of interesting items a statement made to him by his friend, Col. Bobo, concerning the occasional migrations of squirrels in myriads, that droves sometimes swam across the Mississippi, arriving so exhausted upon the opposite bank that they were picked up in quantities by the tail and flung into game bags; and doubting Didymus disbelieves the tale. Now a squirrel's tail is very plain, and it is a plain tale than shall put doubting Didymus down. He states in your issue of Jan. 3: "A man who manufactures stupid lies and palms them off on the public with intent to deceive is a sort of nuisance." What is to be said of a man who can't see the truth when it looms up before him like an office building? In reply, Mr. Hough stands to his guns, and in Forest and Stream of the 31st ult., Didymus explodes his skepticism once more and clamors for proof.

I am a man of peace, but not wishing that this controversy should enter upon an acute stage, I interpose amid the trumpetings and the snortings, the pawings and the dust, in the hope that a little spray from a perhaps acknowledged fountain of truth will cool heated tempers and lay that dust. I quote from Ernest Ingersoll's "Wild Neighbors"—page 15:

"Godman says that the gray coat was a fearful scourge to colonial farmers, and that Pennsylvania paid £8,000 in bounties for their scalps during 1749 alone. This meant the destruction of 640,000 within a comparatively small district. In the early days of western settlement regular hunts were organized by the inhabitants, who would range the woods in two companies from morning to night, and vying as to which band should bring home the greater number of trophies, the quantities thus killed are almost incredible now.

"Out of those excessive multitudes grew the sudden and seemingly aimless migrations of innumerable hosts of squirrels, which justly excited wonder half a century ago. Thousands upon thousands of this species usually would suddenly appear in a locality, moving steadily in one direction. These migrations occurred only in warm weather, and at intervals of five years, and all that I have been able to find notes upon were headed eastward. Nothing stopped the column, which would press forward through forests, prairies and ploughed fields, over mountains and across broad rivers, such even as the Niagara, the Hudson and the Mississippi. This little creature hates the water and is a bad swimmer, paddling clumsily along with his whole body and tail submerged. A large part, therefore, would be drowned, and those which managed to reached the opposite shore were so weary that many could be caught by hand."

I myself have made notes upon squirrel migration, but they fail to show that uniformity of direction to which Mr. Ingersoll refers. For instance, in a migration at Baraboo, Wisconsin, three or four years ago, eight years had elapsed since the previous one, and the direction was south. It would be of much interest if information could be gained upon these points, the migrations are common and due observation would doubtless cast some light on the mystery. As is well known, this wandering fever periodically seizes all rodents. Rats will quit ships, barns, etc., in a body, and a few years ago a great drove was seen crossing the Thames at London, their movement being so orderly, so simultaneous, as to indicate intelligent oversight or direction. Rats have been known to swim various rivers, the lemming will swim till he dies or makes land, which he very often fails to do, various other rodents invite watery graves, and Mynheer squirrel, in his aquatic zeal, keeps up the traditions of the family.

A. H. Gouraud.

Squirrel Migrations.

Cincinnati, O., Feb. 7.—*Editor Forest and Stream:* I am grieved at Didymus. He shows a most ungracious incredulity about those Mississippi-River-swimming-and-landing-all-tuckered-out-and-by-the-tail-picked-up squirrels as observed, described and attested by Bobo of bear fame. Now, I propose to do nothing less than to convince Didymus, and to do it so thoroughly that he will feel called upon to own up that he may have been hasty in questioning the Bobo story. I shall do this by simply overwhelming him with testimony taken *in extenso* and *non disputandum* from the Report of the Geological Survey of Ohio, Vol. IV., Zoology and Botany; Part I.—Zoology, published in 1882. The "Report on the Mammalia" is by A. W. Brayton, and on page 110-111 is given an account of some squirrel migrations which appear to me to bear out at least the plausibility of the Bobo story; and which—to adopt the formula of the writer who wants the editor to print a retraction, or he will know the reason why—"I must ask you to give the same prominence as that of the original article," to wit, that of Didymus.

Western Reserve.

From the Ohio Geological Survey.

The remarkable migrations performed at times by this species constitute a most interesting feature in their history. They congregate in the autumn in immense numbers, and move off in the same general direction, not turning aside for the largest streams, though usually averse to water. Dr. John A. Kennicott relates that during one of these migrations innumerable squirrels swam across the Niagara near Buffalo, New York, landing so exhausted as to be easily taken by hand or knocked down with sticks. Mr. Kennicott has the following notes in regard to these migrations:

"The reason for these migrations is not satisfactorily explained. That they are caused by want of food is hardly probable, as the squirrels are found to be fat at the time, and as often leave localities abound-

ing with food as otherwise. After one of these grand migrations, very few of the species are found in the localities from which they have moved, and these, as if alarmed at the unusual solitude, are silent and shy. They rapidly increase in numbers, however, and in a few years are as abundant as before. I am not aware that they ever migrate except when exceedingly abundant. Of these immense hordes but few probably survive. No sudden increase in their numbers was heard of in southern Wisconsin after the several migrations from northern Illinois. Many are drowned in attempting to cross streams; not a few are destroyed by man; some die from utter exhaustion, and when forced to travel in an unnatural manner, upon the ground, they fall an easy prey to rapacious birds and mammals, all of which feast when the squirrels migrate."

I learn from Dr. Hoy that one of these migrations is said to have taken place in 1842; he witnessed another in 1847, and a third in 1852. From these facts, and from observations made in Ohio and elsewhere, he is of the opinion that the migrations, in most cases at least, occur at intervals of five years; and if he be right, the squirrels, which are now exceedingly abundant again in southern Wisconsin, may be expected to migrate in the autumn of 1857* He further says that the migrations observed by him in southern Wisconsin occurred when the mast was exceedingly abundant and the squirrels in good condition. Near Racine they were observed passing southward in very large numbers for about two weeks, at the end of September and the beginning of October, and it was a month before all had passed. They moved along rather leisurely, stopping to feed in the fields, and upon the abundant nuts and acorns of the forests. So far had they departed from their accustomed habits that they were seen on the prairie, four or five miles from any timber; but even there, as usual, they disliked to travel on the ground, and ran along fences wherever it was possible.

* Since writing the above I have received the following letter from Dr. Hoy:

Racine, Wis., April 2, 1878.—Dear Sir: Black and gray squirrels did migrate in 1857, as predicted. Whether there is a precise interval between their migrations I will not pretend to state; yet they did migrate in this section in 1847, 1852, and 1857, since which they have become so scarce that I could not determine whether there was an attempt to migrate or not, as they are nearly exterminated now in this vicinity. In 1857 I knew one negro who stood by a tree, in an open space on the line of a fence, and shot over twenty in one afternoon. In other years one might stand at the same place six months and not see one individual.

Yours,
P. R. Hoy.

English Pheasants in New York.

The Utica Observer reports: English pheasants, for which there is closed season till 1905, are becoming a positive nuisance in the section round about Canandaigua. They have grown so numerous and so bold that they invade the barnyards and house with the fowls, and steal as much of the latter's feed as they can without being detected by the farmers, who are compelled to drive them off the premises. They roam the fields and woods this time of the year in large numbers, and, since food of which they are fond is scarce, they must needs find their way to the farm houses. They roost near the barns and have no fear of anyone or anything. They may even be seen searching for food alongside the highways in more unfrequented sections.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in Forest and Stream.

Hunting Along Simple Lines.

It often strikes one that we sportsmen put a wrong valuation on the joys of a well-stocked game country. We tell of our big bags, of our long strings, of a country that swarms with game, and forget the days of travel, the bother and expense of guides, the end of the trip before we have really gotten accustomed to the life. In the gluttony of our kill, we forget for the time that it is not meat that we are out for, not mere pleasure of destroying life, but for old Mother Nature, the excitement of the chase, the meeting of wariness in beast nature with the cunning of man and of conquering with our superior intelligence the less scientific but more experienced woodsmen and the *ferae naturae*.

Here the common experience that that which is most rare is most to be desired is forgotten, that when one's dog puts up birds right and left, or when one's guide is so skillful in his art that one has killed his whole allowance of deer and moose in one day, it is apt to cheapen the sport with one through sheer surfeit.

Some of the most delightful little hunting trips that I have ever enjoyed have been on some Saturday afternoon when I have stolen surreptitiously from my office with a rifle of small caliber, caught the trolley and been whirled off some ten miles into the country, where I have spent the afternoon in pursuit of gray squirrels.

No long days of preparation or of anticipation never realized. Clothed in a presentable, if somewhat worn, business suit, a small box of cartridges about the size of your match-safe in one pocket, your take-down rifle making a small brown-paper parcel, you pass for a suburbanite returning home for over Sunday, and you have nothing to fear but "cow lice" and perhaps a little mire to soil your attire in your afternoon in the woods.

Then there is that long-forgotten sensation surging exultantly in your breast—once more you are playing "hookey" and all the other boys and girls (your professional brethren) are slaving away at their desks, using up the gray matter and spoiling their tempers as they look out and see the glorious autumn day going to waste.

And then the end of the car line is reached; before you is the howling wilderness of the outlying country. You look about you and settle on the hill over there with its tall chestnuts and browning hickories for a place beloved of the squirrels. So you tramp up the grass-grown woodland path, drinking in the perfume of the forest and the clear upland air in large draughts. Insensibly you are affected by the scenery, although your eyes roam from right to left of the path in search of your furry victims to be.

Now you hear the piercing chirp of the chipmunk, bluejays scream discordantly about you, protesting your passage, and occasionally you hear the call of a quail.

You leave the path, after you are fairly in the woods (for along this most hunters will have gone), and strike off independently into a clump of cedars with here and there a glimmering white birch. Here there are no leaves and you steal along with the softness of a cat. The excitement of the chase, the glamour of the silent forest steal over you, you even feel a slight palpitation of the heart, and if your imagination be good your pleasure is commensurable with that of moose hunting. And then something catches your eye. You cannot tell what it is, or where, but instinctively you feel that somewhere eyes are fixed on you—and wild eyes. Then you are struck with the peculiar gray of that fallen cedar, near its up-rooted base, some fifty yards ahead of you. How like a—yes. *it is,* for you have seen the unmistakable bushy tail of the gray squirrel. You follow its flattened form, which seems the bark of the tree itself, to the beady eyes watching your every movement in fearful curiosity. Now that he knows you see him he will be off like a flash, for in this country there are more hunters than game, and the latter correspondingly wary, so you give him a shotgun sight and the rifle pings out. You have caught the squirrel through the shoulders as he was turning; he drops limply off the cedar. You are as proud as though he were a big buck. Indeed, he is a more difficult thing to hit at that. You pick him up with a smile of satisfaction and tuck his soft, plump body away in your coat pocket with visions of squirrel pie already stealing hungrily in upon you. Yes, you do feel rather cruel, heartless—like a huge bully—but then (you ask yourself) what easier death than this could one ask for? And then, too, the gray squirrel of these woods, as you know, is no easy prey to find and no easy mark for a rifle when found.

After having justified your aboriginal instincts, you make your way through the cedars to the taller chestnuts beyond. As you come out on the edge of these, some hundred yards or more away, you catch a glimpse of a dash of gray, darting along limbs, jumping from tree to tree in a fury to reach his hole before he is seen. Of course you blaze away—that is what you are out for—and equally as a matter of course you miss and the squirrel disappears into his inviting hole to stay there for an hour or two; so you leave him and tramp on slowly and watchfully. The leaves rustle loudly and the twigs crackle under foot; you feel that you might as well be announced to the squirrel by a brass band as far as getting near him is concerned. The woods appear to be deserted now and you stop to rest a moment. Before you rises a low, rock-strewn knoll where pines mingle with the chestnuts. There is something moving up there between you and the open sky, and again with a start of pleasurable excitement you recognize it as a squirrel. A good hundred yards you reckon it, and when the ring-sight circles it the little fellow is nearly hidden by the head, but he is seated on a limb now, so you take a long, careful aim and fairly let the trigger drift off. A second later you realize to your amazement that he is still there; you are so far away the report has not frightened him. You hurriedly screw the rear Lyman up a notch, shove another cartridge in and again take aim. This time, when the puff of smoke drifts away, the squirrel is gone, too. You run to the tree and there at its foot he is, a nut still between his teeth.

So you go on through the ripening afternoon, your pockets bulging on either side and your luck indifferent. Then walking along a prostrate forest monarch you, in turn, hear the erratic pattering of small, wild feet, and all afire you charge in the direction of the sound in the hope of running the little fellow up the wrong tree. But no, you see the bushy tail disappear in the tempting crotch, high up in a chestnut. Big? He is the largest thing in the squirrel line that has ever gone uncaught (which, by the way, are always the largest); so you decide to wait for him to come out. You select a large, fallen trunk with a limb branching out conveniently for a back, and sit waiting patiently the pleasure of his royal highness. The charm of the warm autumn afternoon steals upon you, the drowsiness of the silent woods soothes you; you lean the rifle against the trunk near at hand and lay your head back, and then——

When the cool of the twilight awakens you, you start up bewildered, and then, far up above you, you hear the staccatic bark of the squirrel who has been making the most of his shining hours as you slept. You take up the rifle softly and steal carefully around the tree, for you cannot see him here. Back you step, shunning all leaves and twigs until at last you place him, far up in a bunch of chestnut burrs. He is outlined sharply against the whitening sky, the Lyman sight fits around his head like a halo. Gently you press the trigger and something comes hurtling down through the foliage and lies still before you.

But now the afternoon is gone, your sport is done for the day. You tuck your rifle tenderly under your arm, for it has done good work to-day, and with loaded pockets make your way down through the darkening woods, the fresh air pumping into your lungs, a pleasant weariness in your limbs, and your tired brain rejuvenated and ready for another week's work, with a prospect of this recreation at its end.

Edwin C. Dickenson.

Fish and Game at the World's Fair.

St. Louis, Feb. 3.—*Editor Forest and Stream:* I have the pleasure of advising you that the building to be occupied by exhibits of the Fish and Game and Forestry Departments will be located on the Tesson Tract, immediately west of the grounds and buildings of the French Government. It will have a frontage of 600 feet on an avenue, by a width of 300 feet. Because of its commanding position all of its facades will be highly ornamented. It is a pleasure to be able to state further that great interest is being manifested in applying for space for displays in this building. Not only our own people, but many representatives of important foreign countries have already filed applications. Everything at present indicates a full participation in the competition for awards in 1904.

Tarleton H. Bean,
Chief Department of Fish and Game.

Massachusetts Fish and Game.

Boston, Mass., Feb. 7.—*Editor Forest and Stream:* Among the bills referred to the Committee on Fish and Game is one to extend the right of search by deputies without a warrant in suspected places, except in private dwellings, for game illegally killed. Last year several members of the House declared they would not vote authority to search a man's domicile without a warrant. One of these was a member of the State Association, Hon. E. L. Osgood, now a member of the Senate. It is thought that it will stand a better chance in its present form.

Another bill before the committee makes fishing on Sunday, in salt water, legal. Another is designed to recuperate the lobster fisheries by prohibiting the taking of all those over 10½ inches in length, granting permission to take small lobsters of any length. This may please the lobster fishermen about Martha's Vineyard and in waters contiguous to Rhode Island, where there are none reaching the present legal requirement and have not been many for several years, if we may believe the testimony of the fishermen who have appeared before the committee from time to time from that quarter during the last five years.

Has not the experiment of taking all sizes and throwing back none been thoroughly tested in the waters of Rhode Island and Connecticut? Everybody knows what has been the result. Looking at the subject in the light of the experience of those States why should not Massachusetts do the same thing and thus hasten the day when there will be no lobsters caught of decent size in her waters? This would show everybody the necessity of a close season for a period of years. A law to be good for anything must be fairly easy of enforcement, either from its inherent nature or by its being in accord with public sentiment.

The difficulties of securing a complete enforcement of our present lobster law have, hitherto, been too great to be overcome. Some of the fishermen believe in it and live up to it. Many do neither. The same is true of the dealers, possibly of consumers. An absolute close season for a period of years seems to be the inevitable result of failure to regulate the catching by limiting the length. Some concerted action on the part of all the coast States of New England is demanded in order to perpetuate a supply of this crustacean, so much enjoyed by all good livers.

From Maine comes news that the gentlemen interested in the preservation of forests and the regulation of timber cutting would be willing to have a portion of the money to be derived from hunters' licenses to defray the expenses of that work. Who comes next? Do not all speak at once, for there may not be enough to go around. Already some Massachusetts sportsmen are making provision to secure hunting and fishing regions in Vermont and New Hampshire, where there still remains stretches of land abounding in streams and forests as attractive as those of Blue Mountain Park or even the northern wilderness of Maine, though not so extensive.

The following brief extract from the Boston Herald may interest some of your readers in the Pine Tree State:

"The hearings on the proposition to levy a big tax on non-resident hunters down in Maine has brought out the fact that game is decreasing down there and that this tax is needed to restrain the hunters. Also that game is constantly increasing there and that the proposed tax is neither wise nor generous. This evidence looks as if the question would have to be decided on its unrevealed merits."

Mistaken for a Caribou.

From New Brunswick comes news of another victim—this time a lumberman, who left his two companions in order to gather gum. Such carelessness, it seems to me, is no less than a crime, and deserves to be punished as such.

Among the witnesses who have given testimony before the special committee of the Legislature which has been investigating the condition of the coal trade in this State, is a well known sportsman and a vice-president of the Massachusetts Fish and Game Protective Association, Hon. C. M. Bryant, Mayor of Quincy.

In this case, as always, Mr. Bryant showed himself a man who is not afraid to speak his mind, and from his official position he possessed a knowledge of facts not familiar to the ordinary citizen.

Representative Wm. B. Phinney of Lynn, is one of that committee. Mr. Phinney was for several years the president of the Lynn Fish and Game Protective Association.

On Monday evening, Feb. 9, occurs the twelfth annual concert and ball of that club, which is always one of the events of the Shoe City, and is likely to do much toward replenishing the treasury.

Central.

North Carolina License.

Much interest is felt in the bill chartering the Audubon Society and protecting song and sea birds. The slaughter of the terns and gulls has practically exterminated them, but with protection they will again multiply. A man named Gould, in Dare county, is the one who slaughters birds for milliners' use. He hires men to shoot them. The shooting is largely done during the breeding season, "dust" shot being used. Of course the young birds, their parents killed, die in the nests, and the eggs decay. The committee has so amended the bill that it does not conflict with local laws regulating the killing of game birds. The law as to these is shamefully abused. Mr. W. W. Smith, of this city, during a recent trip to the Coast found that the people who shoot by "fire light," at night, were killing 50 or 60 ducks at a shot. These law breakers will be knocked out of their nefarious business by the game wardens provided for by the Audubon bill.—New Bern (N. C.) Journal.

Extradition for a Moose Killer.

Gov. Bates, of Maine, has granted extradition papers to the Maine authorities for the return to that State of Lawrence Mott, who was indicted by the grand jury in Washington county, Maine, for killing a cow and calf moose near Calais on September 12.

Montana Fish and Game Interests.

THE semi-annual report of the Montana State Game and Fish Warden, W. F. Scott, for the term from June to December, 1902, contains an amplification of the paper read by Mr. Scott before the Wardens' convention last summer, and printed in our columns, setting forth in an intelligent and convincing way the great value of fish and game as natural resources demanding efficient protection. Mr. Scott's summary of the work of his department for the first year is a testimony to his own earnestness and ability in office, and reflects credit upon him and upon the State. The report is profusely illustrated with pictures of Montana scenery, game country and dead game. We quote the warden's story of the work of the department:

Upon assuming the duties of this office on April 1, 1901, I had no easy task before me. The office had just been created by the Legislature, and as I had no predecessor's footprints to guide me, nor his records or system to go by, I had many obstacles to surmount which under any other conditions would not have existed. Nor were these the worst with which I had to contend, for I found a general ignorance and disregard of the game laws and public sentiment somewhat arrayed against me. The bill provided for the division of the State into game and fish districts, and for the appointment of not less than five nor more than eight deputies, one to be stationed in each district and whose salary should be $100 per month in full of all services and expenses incurred while traveling in their districts. The two questions, "districts" and "appointments," necessitated careful consideration and study, and consumed a great deal of time to settle them as nearly satisfactorily as possible, for while the law on its face seemed fair enough, the vast area of the State was in all probability overlooked. Thus, as the law read, the State, with its 146,850 square miles, made it necessary for me, even though I appointed the maximum number of deputies, to assign each an average district of 18,606 square miles, over which he must patrol and preside whenever needed or sent, receiving therefor, in full for all services and expenses the small sum of $100 per month. It is true, though, with all the above unsatisfactory conditions, I had nearly 1,000 applications for the eight appointments and several thousand letters of endorsement. This was probably due to the fact that they did not realize what work and traveling would be required of them, but those appointed are now fully aware of these conditions, for in a great many instances their allowance is almost taken up by traveling expenses, one deputy reporting that in one month he spent all but $9.40 of his salary for traveling. The deputies are not allowed the fees for the service of warrants, or mileage for themselves or prisoner when making arests as are sheriffs and constables, and in not a few instances they have been obliged to stand the expense of bringing a prisoner from some out of the way place.

There were many points considered in laying out the districts, but the principal points were, the amount of game in the section, the physical geography and the railroad facilities, thereby giving the easiest access to the greatest part of the district and assuring quick and efficient service from the district deputy as well as making his expenses as light as possible.

I made the districts as follows:

No. 1, Flathead and Teton counties.
No. 2, Choteau, Valley and Dawson counties.
No. 3, Missoula, Ravalli and Granite counties.
No. 4, Deer Lodge, Powell, and Lewis and Clarke counties.
No. 5, Meagher, Cascade and Fergus counties.
No. 6, Beaverhead, Madison, Silver Bow, and Jefferson counties.
No. 7, Gallatin Park, Sweet Grass and Broadwater counties.
No. 8, Carbon, Yellowstone, Rosebud and Custer counties.

I appointed the following gentlemen as Deputy State Game and Fish Wardens:

No. 1, J. H. Boucher, Altyn, Teton county.
No. 2, Taylor B. Greene, Malta, Valley county.
No. 3, A. E. Higgins, Missoula, Missoula county.
No. 4, Samuel Scott, Deer Lodge, Powell county.
No. 5, John H. Hall, Great Falls, Cascade county.
No. 6, Henry Avare, Butte, Silver Bow county.
No. 7, Henry Ferguson, Bozeman, Gallatin county.
No. 8, Thos. T. Thompson, Miles City, Custer county.

(Thos. T. Thompson, deputy for District No. 8, and located at Miles City, resigned on Sept. 18, 1901, and Charles L. Smith, of Billings, appointed in his stead.)

Since the creation of this office eighteen months ago more arrests and successful prosecutions for game violations have been made than in the whole previous history of this territory and State. The work of this office or the benefits derived therefrom can by no means be measured by the court's record alone. Much more has been done in the prevention of violations and the education of the people, of which no record or estimate can be made. Heretofore the game laws were considered dead letters, and public sentiment was against their enforcement, but it is most pleasant and gratifying for me to report the revolution that has taken place in the last year regarding this proposition, and that the people are now much in sympathy with the cause and are assisting us greatly in our work.

Through the hearty co-operation of Major John Pitcher, acting superintendent of the Yellowstone National Park, much able assistance has been rendered me by his scouts. These men I have appointed as special deputies, to act without pay, and they have done much efficient work along the borders of the Park. I will call your attention here to the following letter:

DEPARTMENT OF THE INTERIOR, Yellowstone National Park, Yellowstone Park, Oct. 25, 1902.—Mr. W. F. Scott, State Game and Fish Warden, Helena, Montana: Dear Sir—I am greatly indebted to you for the prompt and thorough way in which you have at all times co-operated with me in our efforts to protect the game in the Yellowstone National Park. The results have been very satisfactory, and up to the present time I do not believe there has been a single case of poaching in the Park along the Montana line.

From the reports of parties who have been hunting and killing game outside of our line, and in accordance with the laws of your State, I am of the opinion that the game in the State of Montana is being well protected, a fact that all true sportsmen will be delighted to know.

I am glad to say that a very large majority of the people now living in the vicinity of the Park are beginning to take an interest in the matter of game protection, both in and out of the Park, and are also beginning to realize the fact that whatever work we may do in this line, is intended for their benefit, as no game can be killed in the Park, and the surplus all goes out into the neighboring States, where it can be hunted and killed in accordance with the laws of those States. Yours very truly,

JNO. PITCHER,
Major 6th Cavalry, Acting Superintendent.

It is marvelous what an effect a few successful prosecutions will have on a community which has heretofore borne the reputation of paying no attention to the game laws. In many cases the persons who respected the laws the least are now assisting us greatly in their enforcement.

The hide, head and market hunters have been practically driven out of the business by the enforcement of the laws, and the results are very evident at the present time. Large game has been more plentiful this season than in the 10 years last past. Deer and elk have been found in large numbers in places where they have not been seen for years. In many instances this season they have been killed within a few miles of town, and it is not unusual to hear of them being seen while driving along the country roads and in some cases even in the gardens close to the farmhouses. So numerous are they this year that almost every hunter who went out has returned with a good kill and reports game plentiful everywhere. Only a few days ago Miss Josie Talbott, a young society lady of Columbia Falls, killed a deer on the river bank in front of their beautiful residence. Mrs. G. H. Stoiber, of Silverton, Colorado, while on a hunt in this State last October, killed a fine bull elk and two brown bears, one a very large specimen. This lady also enjoys the distinction of being the first woman to take out a non-resident hunter's license in this State.

The bountiful supply of game this season can be

STATE WARDEN W. F. SCOTT.

directly attributed to the protection it has received by the rigid enforcement of the laws.

The greatest large game sections of the State are the extreme northwestern and southwestern parts, but more especially the former, as almost every species of native North American game is still to be found there. This section is composed of the whole of Flathead, portions of Teton, Powell and Lewis and Clarke counties. The other section is that which is adjacent to and borders on the National Park, and is made up of portions of Gallatin, Madison, Park, Sweet Grass and Carbon counties.

Both of these sections are sadly in need of more deputies to patrol them. One can do but very little of this work owing to the rough and unsettled conditions which compels the use of pack-horses and makes traveling slow and laborious. The other west and middle west counties have a very liberal allowance of big game, while in the eastern part of the State, along the Missouri River, in the breaks, is found the finest whitetailed deer shooting in the world. On the prairies of this section the remnant of antelope live and range.

Judging from the data gathered and reports received, the game which is protected at all times is rapidly increasing. This is especially true in regard to antelope and beaver. Antelope are becoming numerous in some sections of the State where they were almost extinct two years ago. We now hear of famillies of beaver everywhere, and in some instances they have had to be killed to protect property. Moose are often seen, and a caribou is occasionally found.

With quail and Chinese pheasant we are not so fortunate. These birds have been imported and turned loose year after year, but their propagation so far has proven anything but a success. It is true that in the State of Idaho, where the same climatic conditions seem to exist, they are becoming plentiful and doing well. There have been many theories advanced by people who have studied the question, one being that as they are both ground roosting birds, the ground vermin, so plentiful in this State, kill them off. Another, that the cover is too scant and the winters too severe, and in the case of the Chinese pheasant that a sudden change in the weather will often freeze him fast to the ground, thus holding him a prisoner until he is eaten or dies of starvation and exposure. It is claimed that in the Bitter Root Valley quail seem to be multiplying and that the notes of the Bob White are no uncommon sound in the early morning hours.

Of the game for which we have a lawful open season, all are plentiful and seem to be on the increase, with the exception of the Rocky Mountain goat. They, like the mountain sheep, are only found in the Rocky Mountains, and as they are permitted to be killed they are becoming very scarce. But still, in regard to these, we are very fortunate, as we undoubtedly have more than any other State. Elk are increasing and are gradually working back into their old haunts, which are still unsettled. I have been endeavoring to secure reliable reports of the number seen the last year, so as to make some estimate of the number still existing in the State. Taking the report of the Superintendent of the National Park into consideration, as well as those received from scouts, deputies and old mountaineers, I think twenty-five to thirty thousand would be a very conservative estimate to place thereon. Blacktail deer are no doubt multiplying, as more have been seen and killed this season than for many years past. They are being found quite numerous in sections which have been considered hunted out. The little whitetail deer, the most beautiful and graceful of all wild game animals is still found in large numbers along the bottoms and breaks of the Missouri River. They are also found in other sections, but not to any great extent. These I would consider holding their own, if not increasing.
