CHAINS AND ROPES.

The following Tables give the Admiralty requirements as to chains :—

Admiralty Tests, &c., of Stud-Link Chain Cable.

Dia. of cable in inches.	Breaking strength in tons.	Proof load in tons.	Weight of 100 fathoms in cwts.	Dia. of cable in inches.	Breaking strength in tons.	Proof load in tons.	Weight of 100 fathoms in cwts.
$\frac{7}{16}$	4·90	3·5	9·25	$1\frac{1}{2}$	56·70	40·5	108·0
$\frac{1}{2}$	6·30	4·5	12·0	$1\frac{5}{8}$	66·50	47·5	126.7
$\frac{9}{16}$	7·70	5·5	15·25	$1\frac{3}{4}$	77·17	55·125	147.0
$\frac{5}{8}$	9·80	7·0	18·75	$1\frac{7}{8}$	88·55	63·25	168.7
$\frac{11}{16}$	11·90	8·5	22·75	2	100·80	72·0	192.0
$\frac{3}{4}$	14·17	10·125	27·0	$2\frac{1}{8}$	113·75	81·25	216.7
$\frac{7}{8}$	19·25	13·75	36·75	$2\frac{1}{4}$	127·57	91·125	243.0
1	25·20	18·0	48·0	$2\frac{3}{8}$	142·10	101·5	270.7
$1\frac{1}{8}$	31·85	22·75	60·75	$2\frac{1}{2}$	157·50	112·5	300.0
$1\frac{1}{4}$	39·37	28·125	75·0	$2\frac{3}{4}$	181·02	129·3	363.0
$1\frac{3}{8}$	47·60	34·0	90·75	3	204·12	145·8	432.0

Up to and including $2\frac{1}{2}$ inches diameter the above proof loads are equal to 630 lbsr per circular $\frac{1}{8}$ inch of section of one side of link, and are the same as those required by the China Cables and Anchors Acts; but for $2\frac{3}{4}$ inch diameter the load is reduced to 598.5 lbs. per circular $\frac{1}{8}$ inch, and for 3 inch diameter to 567 lbs. The formula for proof loads of chains up to $2\frac{1}{2}$ inches diameter may also be written,—

Proof load in tons $= 18 \times (\text{diameter in inches})^2$.

The breaking strengths are placed at 40 per cent. above the proof loads.

Table I. Ultimate and Elastic Strengths of Materials and Co-efficients of Elasticity, in lbs. per sq. in.

...	...	...	...

The proof loads for short-link chains are $\frac{3}{5}$rds. those for stud-link chains.

The rule may be written,—**Proof load in tons = 12 × (diameter in inches)²**. The breaking strengths of short-link chains are placed at $2\frac{1}{2}$ times the proof loads.

Lloyd's requirements as to chain cables, &c., are given in Table 257; the proof loads and breaking strengths are those required by the Act of Parliament; the breaking strengths for chain above $1\frac{1}{2}$ inch diameter are the same as required by the Admiralty, but for chains of $1\frac{1}{8}$ inch diameter and under, Lloyd's require a slightly higher breaking strength.

LLOYD'S TESTS OF STUD-LINK CHAIN CABLES.

Diameter of chain in inches.	Proof load (Statutory) in tons.	Breaking strength (Statutory) in tons.	Diameter of chain in inches.	Proof load (Statutory) in tons.	Breaking strength (Statutory) in tons.
$\frac{1}{1}\frac{1}{6}$	8·5	12·75	$1\frac{5}{8}$	47·5	66·57
$\frac{3}{4}$	10·125	15·125	$1\frac{1}{1}\frac{1}{6}$	51·25	71·75
$\frac{1}{1}\frac{3}{6}$	11·875	17·8	$1\frac{3}{4}$	55·125	77·125
$\frac{7}{8}$	13·75	20·625	$1\frac{1}{1}\frac{3}{6}$	59·125	82·75
$\frac{1}{1}\frac{5}{6}$	15·8	23·7	$1\frac{7}{8}$	63·25	88·5
1	18·0	27·0	$1\frac{1}{1}\frac{5}{6}$	67·5	94·5
$1\frac{1}{1}\frac{1}{6}$	20·3	30·4	2	72·0	100·8
$1\frac{1}{8}$	22·75	34·125	$2\frac{1}{1}\frac{1}{6}$	76·5	107·1
$1\frac{3}{1}\frac{3}{6}$	25·375	38·0	$2\frac{1}{8}$	81·25	113·75
$1\frac{1}{4}$	28·125	42·125	$2\frac{3}{1}\frac{3}{6}$	86·125	120·5
$1\frac{5}{1}\frac{5}{6}$	31·0	46·5	$2\frac{1}{4}$	91·125	127·5
$1\frac{3}{8}$	34·0	51·0	$2\frac{5}{1}\frac{5}{6}$	96·25	134·75
$1\frac{7}{1}\frac{7}{6}$	37·125	55·625	$2\frac{3}{8}$	101·5	142·1
$1\frac{1}{2}$	40·5	58·7	$2\frac{7}{1}\frac{7}{6}$	107·0	149·7
$1\frac{9}{1}\frac{9}{6}$	43·9	61·4	$2\frac{1}{2}$	112·5	157·5

Note.—Unstudded close-link chains will be admitted as cables if proved to two-thirds the load required for stud-link chains, and if the breaking strength is not less than twice such proof load.

In some recent tests of the chain cables of large steamers a $2\frac{5}{8}$ inch cable gave an average ultimate strength of 212 tons, and a $2\frac{9}{1}\frac{9}{6}$ inch cable gave 223 tons as the lowest and 229 tons as the highest of seven tests.

The safe working load on chains should not be taken higher than half the proof load; if this proportion be adopted the formula becomes:—

Working load in tons = $\begin{cases} 9 \times (\text{dia. in inches})^2 \text{ for stud-link,} \\ 6 \times (\text{dia. in inches})^2 \text{ for close-link.} \end{cases}$

For ordinary crane chains and slings $4 \times (\text{diameter in inches})^2$ is high enough.

ADMIRALTY FLEXIBLE STEEL WIRE ROPES.

Size of rope (circumference) in inches.	Number of wires in each strand.	Weight per fathom in lbs.	Minimum breaking strength in tons.	Torsion test; No. of twists each wire must stand.	Ductility tests, &c.
8	30	53	148	9	Each rope to consist of 6 strands. Wires to be of best crucible steel galvanized with pure zinc. The rope is to be laid up evenly and uniformly as regards size and angle, and is to contain a proper sized hemp core. A latitude not exceeding 5 per cent. over or under the prescribed weights will be allowed. Elongation will be assumed to commence when one-sixth of the breaking-load has been applied. Test A (torsion).—Each wire to stand being twisted through the number of revolutions stated in column 5, in a length of 8 inches. Test B (bending).—Each wire to stand coiling around itself eight turns and back again. If, in being tested, one wire in seven fail, but the other six give fair and uniform results, the average being up to the standard, the rope will be considered satisfactory in that respect.

$1\frac{1}{4}$	12	$1\frac{1}{4}$	$2\frac{7}{8}$	47	
1	12	$\frac{3}{4}$	$1\frac{3}{4}$	60	

Proportions of links of chains.—The standard proportions of the links of chains, in terms of the diameter of the bar from which they are made, are as follows : —

	Overall length	Overall breadth
Stud-link	6 diameters	3·6 diameters
Close-link	5 „	3·5 „

The stud has usually a diameter at the centre of ·6 × diameter of chain and at the ends 1 × diameter of chain.

Weight of chains.—The weight of stud-link chain cables is given very nearly by the rule,—

$$W = 55d^2$$

where W = weight per fathom in pounds, and d = diameter of bar from which chain is made.

For close-link chain the rule becomes,—

$$W = 58d^2$$

The above rules give weights about mid-way between those required by the Admiralty and those required by Lloyd's. The weight is of course much affected by the length of the link used.

STEEL WIRE ROPES.

The Admiralty requirements with regard to flexible steel wire ropes are given in Table 260 on previous page.

Steel wire ropes for standing rigging are required to be made of fewer wires of larger diameter, are rather heavier, and must be of rather greater ultimate strength.

The following Table shows the breaking strengths that steel wire hawsers, &c. must show in order to be accepted by Lloyd's:—

BREAKING STRENGTHS OF STEEL WIRE ROPE BY LLOYD'S RULES.

Size (circumference) in inches.	Breaking strength in tons.	Size (cirumference) in inches.	Breaking strength in tons.
2	7	$3\frac{3}{4}$	29
$2\frac{1}{4}$	$9\frac{1}{2}$	4	33
$2\frac{1}{2}$	...	$4\frac{1}{4}$	35
$2\frac{3}{4}$	$15\frac{1}{2}$	$4\frac{1}{2}$	39
3	18	$4\frac{3}{4}$	47
$3\frac{1}{4}$	22	5	59
$3\frac{1}{2}$	26	$5\frac{1}{4}$	71

A short length of each of the wires composing the hawser, &c. will also be required, after being galvanized, to show a tensile strength equivalent to that given in the above Table, and the aggregate strength of the wires must not be less than 10 per cent. in excess of that strength.

Each wire must also be capable of being twisted around itself not less than eight times, and of being untwisted and straightened again without breaking.

The strength of steel wire ropes, relatively to their girth, depends not only on the quality of the wire used, but also on the amount of hemp core used; usually there is a central hemp core, and sometimes each strand has also a similar core, but there are no hemp cores at all. There would be no particular difficulty in obtaining ropes to stand twice the test given in the above Table, but such ropes would probably be wanting in flexibility, and would require drums of very large diameter if they were to work satisfactorily and to last any time.

HEMP ROPES.

Hemp is laid up right-handed in yarns; and yarns are laid up left-handed into strands.

A hawser is composed of three strands laid up right-handed.

A cable is composed of three hawsers laid up left-handed.

Shroud-laid rope has a core surrounded by four strands.

The strength of hemp ropes depends on the quality of the hemp used, on the type or make of the rope, and on its condition (*i. e.*, wet or dry, tarred or untarred).

The twist diminishes the strength, but increases the solidity and durability, and the strength therefore depends to some extent on the twist.

When a rope is wet or tarred its strength is reduced by about one- fourth.

The working strength is commonly taken is $\frac{1}{8}$th. of the breaking strength.

The Admiralty requirements as to various sizes of hawser-laid cordage in common use are gived in table 263; the 11-inch rope is specified to be of tarred Petersburg hemp, but all the smaller sizes are to be of tarred Riga hemp; all are to be three strand.

ADMIRALTY TARRED HEMP CORDAGE.

Size of rope (circumference) in inches.	Size of yarn.	Number of threads in the rope.	Standard breaking strength.		
			Tons.	cwt.	qrs

$4\frac{1}{2}$	,,	201	6	9	0
5	,,	249	7	18	0
11	25	1008	36	10	0

All sizes are specified to be formed at an angle of 27°, hardened at 37°, and finished at 42°.

If the smallest size be excluded, the above Table gives breaking strengths which approximate very closely to those given by the formula.—

Breaking strength in cwts. $=(6{\cdot}2 \times \text{girth in inches.}^2) \div 2$

The weight in pounds per farthom of hawser-laid hemp ropes is given approximately by the rule,—

Weight in lbs. per fathom $=\cdot 17 \times (\text{girth in inches})^3$ for dry ropes.

,, ,, $=\cdot 21 \times (\text{girth in inches})^3$ for wet or tarred ropes.

The diameter of drums and sheaves should be about thirty times the circumference of the rope.

For shaft winding at high speed one-tenth of the breaking strain of a rope is sometimes taken as a fair working load.

For inclines the proportion of load to breaking strain varies according to gradient conditions, and friction should be allowed for.

ADMIRALTY TENSILE TESTS.

Note.—* If the pitches are to be unequal the mean of the two squares must not exceed the square of the pitch here given.

BOARD OF TRADE RULE REGARDING COMPRESSIVE STRESSES ON TUBE PLATES.

Working pressure (lbs. per square inch).

$$= \frac{(D-d)T \times 16{,}000}{W \times D}$$

where D = least horizontal distance between centres of tubes, in inches;
d = inside diameter of ordinary tube, in inches;
T = thickness of tube plate, *in inches*;
W = outside width of combustion chamber, in inches,—from tube plate to back of box, or from tube plate to tube plate in double-ended boilers, with common combustion chambers.

LLOYD'S RULE REGARDING COMPRESSIVE STRESSES ON TUBE-PLATES.

$$T = \frac{P \times W \times D}{1{,}600 \times (D-d)},$$

where P = working pressure in lbs. per square inch;
W = width of combustion chamber over plates,—in inches;
D = horizontal pitch of tubes in inches;
d = inside diameter of plain tube in inches;
T = thickness of tube-plate in *sixteenths of an inch.*

BOARD OF TRADE RULE FOR GIRDERS SUPPORTING COMBUSTION CHAMBER TOPS, &C.

Working pressure (lbs. per square inch).

$$= \frac{C \times d^2 \times T}{(W-P)D \times L},$$

where W = width of combustion chamber,—in inches;
P = pitch of supporting bolts ,,
D = distance from centre to centre of girders,—in inches;

Continued.

L = length of girder in feet;
d = depth of girder,—in inches;
T = thickness of girder ,,

$$C = \begin{cases} 550 \text{ when girder has one supporting bolt,} \\ 825 \text{ ,, ,, ,, two or three supporting bolt,} \\ 935 \text{ ,, ,, ,, four ,, ,,} \end{cases}$$

LLOYD'S RULE FOR GIRDERS SUPPOTING COMBUSTION CHAMBER TOPS, &C.

Working pressure (lbs. per square inch).

$$= \frac{C \times d^2 \times T}{(L-P)D \times L},$$

where L = width between tube-plates or tube-plate and back plate of chamber;
P = pitch of stays in girder;
D = distance from centre to centre of girder;
d = depth of girder at centre;
T = thickness of girder at centre;
} All in inches.

$$C = \begin{cases} 6{,}600 \text{ when each girder has one stay,} \\ 9{,}900 \text{ ,, ,, two or three stays,} \\ 11{,}000 \text{ ,, ,, four or five ,,} \\ 11{,}550 \text{ ,, ,, six or seven ,,} \\ 11{,}880 \text{ ,, ,, eight or more ,,} \end{cases}$$

ADMIRALTY REQUIREMENTS AS REGARDS STAYS.

At the test pressure steel stays under $1\frac{1}{2}$ inch diameter may carry a load of 16,000 lbs per square inch of net section, and those of $1\frac{1}{2}$ inch diameter and upwards, 18,000 lbs. Rivets or bolts used for securing stays must be at least 25 per cent. stronge than the stays.

SURFACE THAT MAY BE SUPPORTED BY ONE STAY. (Board of Trade rule.)

Diameter of stay.	No. of threads per inch.	Area at bottom of thread. sq. in.	Maximum number of square inches of plate that can be supported by one stay when strained to 9000 lbs. per square inch.

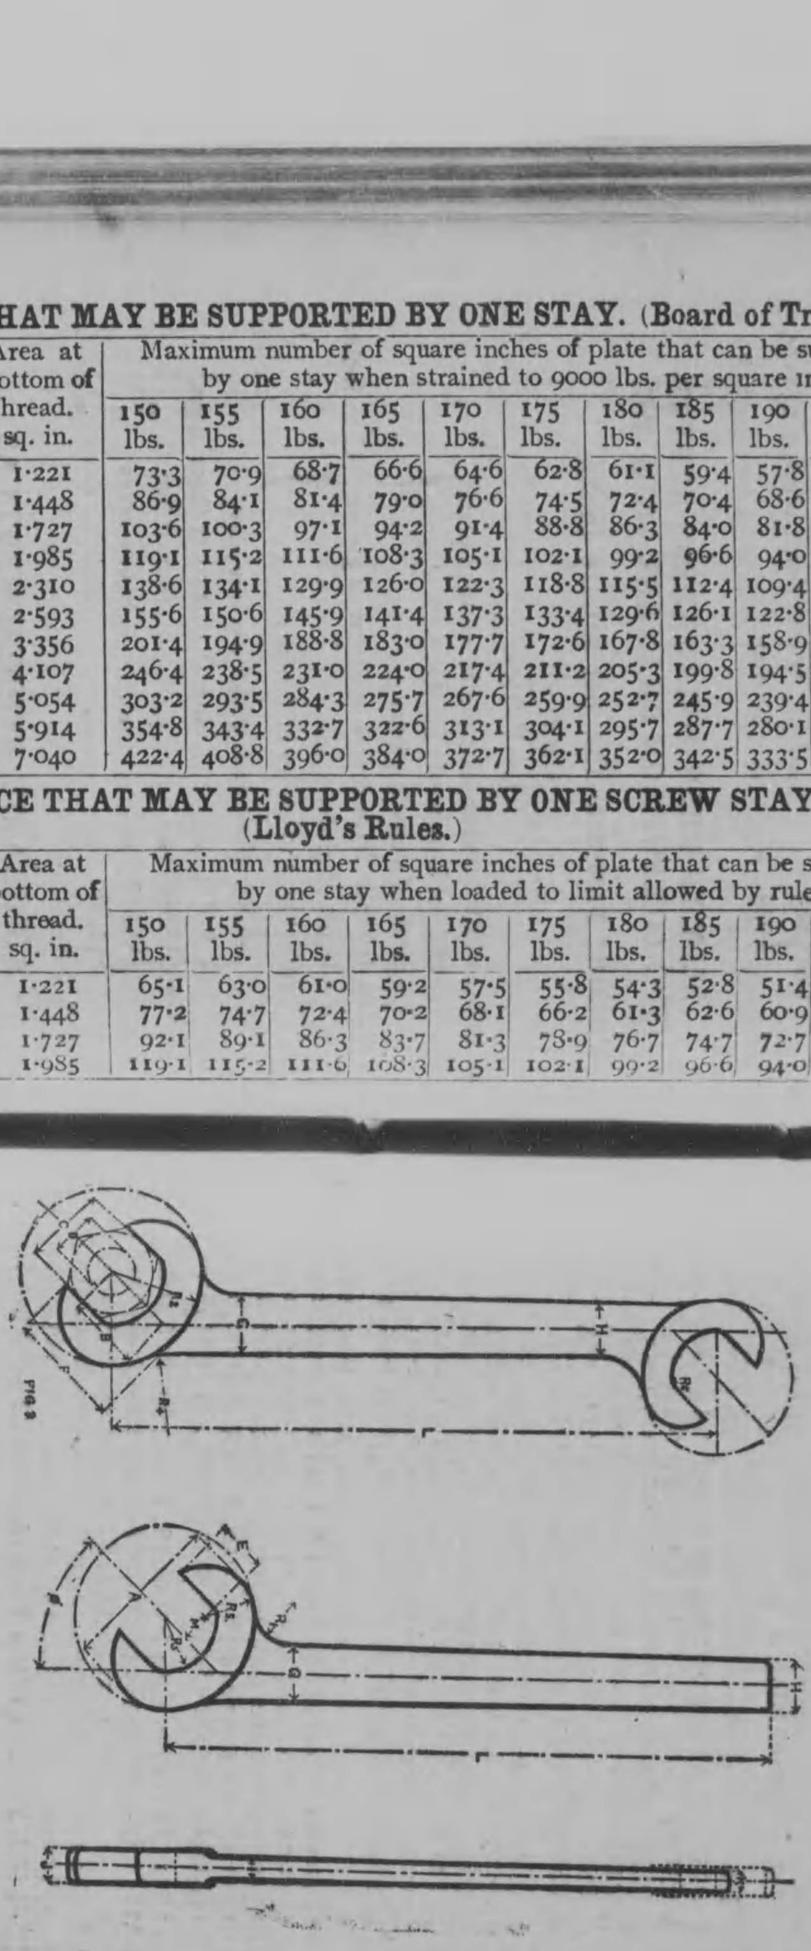
BRITISH STANDARD SPANNERS.

(Dimentions for Double-ended Spanners up to 2 ins. and Single-ended Spanners up to 3 ins.)



The figures in smaller type are only inserted for use in the Drawing Office. In practice it will be found sufficient to work to two places of decimals, with the exception of the dimensions specified in columns 2 and 3, which must be accurately observed. The dimensions in the Table are intended to apply to double-ended Spanners up to 2 ins., and single-ended Spanners up to 3 ins., and refer only to Spanners manufactured from Steel or Wrought Iron.

THICKNESS OF COPPER PIPES. (L.S.G.)

Continued.

Blow-off and scum pipes.									
Diameter of pipe in inches, ...	1	1¼	1½	1¾	2	2¼	2½	2¾	3
Thickness, L.S.G.	10	10	10	9	9	8	8	7	7

Feed discharge pipes to be as steam pipes for 30 per cent. higher pressure ; but in no case to be taken lower than 125 lbs.

Receiver pipes to be as steam pipes for half the test pressure of the cylinder to which they lead steam; but in no case to be taken lower than 50 lbs.

The above gauges refer to straight pipes only; bends to be suitably strengthened.

DELIVERY OF FEED PIPES.

Diameter of pipe.	Delivery in cubic feet per minute. (C)	Delivery in lbs. per hour.	Diameter of pipe.	Delivery in cubic feet per minute. (C)	Delivery in lbs. per hour.

Good proportions for the flanges of copper pipes for modern triple engines are given in the following Table :—

FLANGES FOR COPPER PIPES.

Diameter of pipe in inches.	Diameter of flange.	Thickness of flange.		Diameter of bolts.	Radius of bolt circle.	Number of bolts.			Pitch of bolts nearest sixteenth		
		Steam, feed, blow off, &c.	Auxiliary exhaust, water pipes, Waste and eduction, &c.			Steam, feed, blow-off, &c.	Auxiliary exhaust and water pipes.	Waste and eduction pipes.	Steam, feed, blow-off, &c.	Auxiliary exhaust and water pipes.	Waste and educt. pipes.

Steel Steam Pipes.

For steam pressures over 200 lbs. per square inch steel pipes are now being largely used. Up to 6 inches diameter they may be solid drawn, and above that, welded.

The thicknesses, whether for solid drawn or welded pipes, may be those given by the following rule :—

$$\frac{9000 \times (T - \frac{1}{16})}{D} = \text{Working pressure ;}$$

or, $$T = \frac{\text{Working pressure} \times \text{diameter}}{9000} + .1$$

where T = thickness in inches ;
and D = inside diameter in inches.

Table exhibits the thicknesses given by the above rule in inches, and also in Legal Standard Wire Gauge.

Thickness of Steel Steam Pipes.

Diameter of Pipe in inches.	Thickness in inches and nearest L.S.G.														
	200 lbs. $T = \frac{D}{45} + .1$		225 lbs. $T = \frac{D}{40} + .1$		250 lbs. $T = \frac{D}{36} + .1$		275 lbs. $T = \frac{D}{32.7} + .1$		300 lbs. $T = \frac{D}{30} + .1$		325 lbs. $T = \frac{D}{27.7} + .1$

ngineering Laboratory of the College of Engineering Tokyo, Japan, by

some of the Committee of the Earthquake Investigation Board (Shinsai Yobo Chosakwai). The test pieces were appro-

ximately square in section, the dimensions of the sides ranging from 1 $\frac{15}{16}$″ to 2 $\frac{3}{16}$″, and the length about 36″. Each piece

was supported in the testing machine by two paralled edges 32 inches apart and the load was gradually applied at the cen-

tre by means of sliding weight till the piece broke. The values of the ultimate strength f were calculated from the formula

$$W = \frac{2}{3} f \frac{bh^2}{l},$$

where W is the breaking load in lbs. applied at the centre, f the breaking stress in lbs. per sq. in., b the breadth of test piece in inches, h the depth in inches and l the distance between the two supports. The values of the modulus of direct elasticity E were calculated from the formula

$$\delta = \frac{Pl^3}{40h^3E}$$

where δ is the deflection in inches measured at the middle while the deflection is proportional to the load producing it, E the modulus of elasticity in lbs. per square inch, and the three other letters have the same meaning as before. The values of δ and P were taken from the stress-strain diagrams obtained by a self-recording arrangement attached to the testing machine.

(B)

These tests were carried out in 1894 in the Imperial Naval Dock yard at Yokosuka, Japan, by some of the Committee of the Earthquake Investigation Board. The testing machine employed was that manufactured by Greenwood and Batley, Leeds, England, capable of exerting a maximum force of 180,000 lbs. All the test pieces which were prepared from the same timber as in Table A, were supported by parallel edges 55$\frac{1}{2}$″ apart, each end projecting about 9″ beyond the support and the load was gradually applied at the middle by means of a pressure pump worked by hand power, till the piece broke. The formulae for calculating the values of f and E were the same as in Table A.

日本帝國々立製鐵所製品目錄

鋼質試驗法（製鐵所規定）

シーメンマルチン鋼及ベセマー鋼

各出鋼番號（同一爐ニテ同時ニ熔製若クハ吹製セシ鋼全量ニ附シタル番號）毎ニ下記四種ノ試製品ヨリ夫々試驗片ヲ作リ之ヲ試驗シタル成績ニ依リ同番號鋼ヨリ製出シタル製品ノ鋼質ヲ定ムルモノトス但シ製品ノ寸法丸角鋼十三粍以上形鋼厚サ八粍以上ハ第一種．丸角鋼十三粍未滿形鋼厚サ八粍未滿ハ第二種．鋼板厚サ八粍以上ハ第二種同厚サ八粍未滿ハ第四種試驗片試驗成績ニ依ルモノトス但丸角徑十粍未滿形鋼及板厚サ六粍未滿ハ强弱試驗ヲ行ハズ

種別	試製品寸法	試驗片寸法	標點距離
第一種	丸角 20-25 粍又ハ形鋼厚 8 粍以上	徑 20-25 粍又ハ形鋼原厚幅 30-50 粍	200 粍
第二種	丸角 13-16 粍又ハ形鋼厚 6-8 粍	徑 13-16 粍又ハ形鋼原厚幅 30-50 粍	200 〃
第三種	板厚 13-15 粍	厚 13-15 粍 幅 30-45 粍	200 〃
第四種	板厚 6-8 粍	厚 6-8 粍 幅 35-50 粍	200 〃

鋼質ハ下記六種ニ區別ス（A ハ第一．第三種 B ハ第二．第四種ノ試驗片ニ依ルモノナリ）

鋼質	番號	抗張力 平方粍瓩	抗張力 平方吋噸	最低延伸 A	最低延伸 B	燒入	鍛合	屈曲	在庫別色

上記分析及試驗ハ當所ノ分析所ト試驗所ニテ試驗シタルモノナリ

寸法表　備考第一

形鋼及棒鋼(丸・角・平・半丸ノ類)

一 寸法ハ吋ニ依ルモ重量ハ瓩ニ依ルヲ當所ノ通則トスルガ故ニ表ニ記載セル形鋼及棒鋼ノ重量ハ長サ一呎ニ付听及瓩ノ二樣ニ現ハセリ

二 表ニ記セル重量ハ均一ナル鋼ノ比重ヲ七・八五トシテ計算シタルモノナリ即チ一平方粍ノ斷面積ヲ有スルモノ長サ一米ニ付〇・七八五瓩又ハ一平方吋ノ斷面積ヲ有スルモノ長サ一呎ノ重量三・四听ニ相當ス

三 故ニ表ニ記入セル重量ハ唯理論ニシテ假定ノ重量タルニ過ギズ實物ニ於テハ通常此重量ニ對シ一本毎ニ就テハ正負百分ノ六全重量ニ就テハ正負百分ノ三ノ公差ヲ要ス

四 表ニ示セル斷面ノ寸法ハ可成的精確ヲ保タシムベシト雖ドモ「ロール」ノ磨滅ヨリ生ズル少許ノ變動ハ免カルヽ能ハズ故ニ形鋼ノ「フランヂ」(山形ハ兩邊)ノ長サニ於テ正負二「パーセント」形鋼ノ高サハ正負二「パーセント」(山形ヲ除ク)丸角ノ徑邊平鋼ノ幅ハ正負二「パーセント」「ユニバーサル」平鋼ノ幅ハ正負一「パーセント」ノ公差ヲ要ス

五 各形鋼及平鋼類ノ厚サハ第三項ノ重量制限ヲ脫セザル範圍ニテ於テ正負十「パーセント」ノ公差ヲ要スルモノトス

六 形鋼棒鋼等ノ長サニ付テハ正五吋ノ公差ヲ要ス

七 以上三乃至六項ノ公差ヲ更ニ制限セントスルニハ其都度特別ノ協定ヲ要ス

寸法表　備考第二

板類ノ備考

一 厚ハ通常吋又ハ一平方呎ノ重量ニテ定ム幅及長サハ呎トス　薄板亞鉛引平板同波形鐵板ハ B. G. 番號ヲ用ユ

二 板ノ重量ハ厚サ八分ノ一吋ノモノ一平方呎ノ重量ヲ五・一听又ハ二・三二瓩トシテ計算シタルモノナリ

三 實際重量ハ十枚以上ヲ平均シテ正負三「パーセント」ノ公差ヲ要ス但シ一枚毎ニ於テハ八分三吋以上ノ板ニテハ正

貮五%八分三吋及其以下ノモノニテハ正貮八%十六分三吋及以下ノ板ニ以テハ十「パーセント」ノ公差ヲ許容スルヲ要ス

四　板ノ幅ニ於テ幅三呎未滿ノモノハ正八分五吋幅三呎以上五呎未滿ノモノニ在リテハ正四分三吋幅五呎以上ノモノニ在リテハ正一吋ノ公差ヲ要ス

五　板ノ長サニ於テ長サ十五呎未滿ノモノハ正貮四分三吋十五呎以上三十呎未滿ノモノハ正貮一吋三十呎及以上ノモノニハ正貮一吋二分一ノ公差ヲ要ス

六　薄板ハ幅三呎未滿ノモノハ幅ニ於テ四分一吋幅三呎及以上ノモノハ幅ニ於テ八分五吋ノ公差ヲ要ス

七　板ノ厚サハ可成的均一ニ保タシムベシト雖實際製作上部分ニ依リ厚サヲ異ニスルコトヲ免レズ通常最厚部分ト最薄部分トノ差ヲ下表ノ範圍内ニ於テ製作スベシ

厚サ		吋	$\frac{3}{16}$—$\frac{17}{64}$	$\frac{9}{32}$—$\frac{25}{64}$	$\frac{13}{32}$—$\frac{3}{4}$	$\frac{25}{32}$以上
		粍	5—6·9	7—9·9	10·0—19·9	20·0以上
重量		粍	8—11	11—16	16·1—32·0	32·1以上
幅	3′—3′-11″		1·0粍	1·0粍	0·9粍	0·8粍
	4′—4′-11″		1·2 〃	1·1 〃	1·0 〃	0·9 〃
	5′—5′-11″			1·8 〃	1·7 〃	1·6 〃
	6′以上			2·4 〃	2·2 〃	2·2 〃

八　以上三乃至七項ノ公差ヲ更ニ制限セントスルトキハ其ノ都度特別ノ協定ヲ要ス

寸法表　備考第三

軌條附屬品（繼目板ヲ除ク）鑛山用軌條附屬品及一般用「リベット」、「ボルト」類ノ如キ小形ノモノニテ多數ヲ集メテ取扱フモノハ重量ニ依テ注文スベシ然シテ抽出標本ニ依テ平均單重ヲ測リ全量ノ個數ヲ算出ス但シ重量公差ヲ全體ニ對シ正貮百分ノ五トス

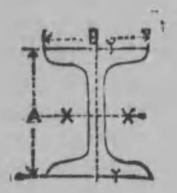
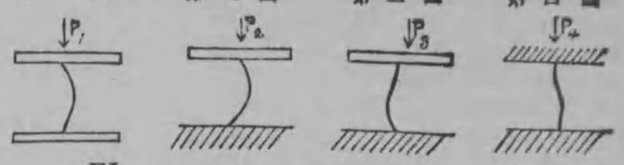
工形鋼支柱ノ強度表



E＝彈性係數29,000,000
I＝物量力率(吋⁴)
l＝長サ(吋)
C＝安全係數＝5

第一圖　第二圖　第三圖　第四圖



$P_1=\pi^2\frac{EI}{Cl^2}$　$P_2=\frac{1}{4}P_1$　$P_3=2P_1$　$P_4=4P_1$

第一圖　柱ノ兩端ヲ固定セズシテ荷重ノ方向ヲ柱軸ノ方向ニ制限シタル場合
第二圖　柱ノ一端ヲ固定シ他端ヲ固定セズシテ之ニ荷重ヲ加ヘタル場合
第三圖　ハ柱ノ一端ヲ固定シ他端ヲ固定セズシテ荷重ノ方向ヲ柱軸ノ方向ニ制限シタル場合
第四圖　ハ柱ノ兩端固ヲ定シ荷重ノ方向ヲ柱軸ノ方向ニ制限シタル場合

備考　本表ハ兩端固定セズシテ荷重ヲ柱軸ノ方向ニ加ヘタル場合(第一圖)
最大荷重ハ材料ノ强サ(實用抗壓力)ヲ斷面一平方吋ニ付15,000听トシテ計算シタルモノナリ
最大荷重＝斷面積×15,000
最大荷重ニ於ケル長サトハ此最大荷重ヲ加ヘ得ベキトキノ柱ノ最大長サヲ云フ
最大荷重ニ於ケル長サハ第二圖ノ場合ニハ上表ノ½倍
第三圖ノ場合ニハ上表ノ$\sqrt{2}$倍.　第四圖ノ場合ニハ上表ノ2倍トス

STRENGTH AND STIFFNESS OF BEAMS.

Let M = the greatest bending moment.

I = the geometrical moment of inertia of a section of the beam about a horizontal axis in the plane of the section, through the centre of figure,

y_0 = the distance of the centre of figure of the section to the tension or compression skin,

f = the intensity of stress induced in the tension or compression skin,

ρ = the radius of curvature of the gravity-axis (or neutral axis for ordiary beams) of the beam originally straight,

E = the coefficient of direct elasticity,

W = the total load on the beam; in the case of uniformly distributed load $W = wl$, w units of weight being the intensity of load per unit length of the span.

l = the length of the beam,

x, y = the coordinates of any point in the elastic curve which the gravity axis assumes after bending, the axis of x being the originally straight axis of the beam,

F = the greatest shearing force,

δ = the maximum deflection (except in the cases marked (1) and (2) in the Table I.) of the beam when uniform in section,

$m, n, p,$ = constants for greatest bending moment, maximum deflection and greatest shearing force; Table I gives the values of these constants.

Then the general formula for strength is

$$M = f\frac{I}{y_0} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (A)$$

and that for stiffness is

$$\frac{1}{\rho} = \frac{M}{EI}$$
$$\text{or } \frac{d^2y}{dx^2} = \frac{M}{EI} \text{ very nearly.} \quad \Big\} \ldots\ldots\ldots (B)$$

We have so

$$M = mWl \quad \ldots\ldots (1)$$

$$\delta = n\frac{Wl^3}{EI} \quad \ldots\ldots (2)$$

$$F = pW \quad \ldots\ldots\ldots (3)$$

(1) Here the maximum deflection occurs at $\frac{1}{\sqrt{5}}l = 0.4472\,l$ from the supported end & is $\frac{Wl^3}{48\sqrt{5}EI} = 1.022 \times \left(\frac{7}{16} \times \frac{Wl^3}{48\,IE}\right)$.

(2) Here the maximum deflection occurs at $\frac{1}{16}(1+\sqrt{33})l = 0.4216\,l$ from the supported end & is $1.040 \times \left(\frac{1}{4} \times \frac{Wl^3}{48\,EI}\right)$.

TABLE 1.

Giving the values of m, n and p in the Formulæ (1), (2), and (3).

Max. B.M.	Max. Def.	Manner of Loading.	m	n	p	Remarks.
Wl	$\frac{Wl^3}{3EI}$	 $W'l = W_1 l_1$	1	$16 \times \frac{1}{48}$	1	Greatest bending moment occurs at the fixed end and at the support in the first and second figures respectively; shearing force is constant.
$\frac{Wl}{2}$	$\frac{Wl^3}{8EI}$	*w lbs. per ft.*  *w lbs. per ft.* w, $w_1 l_1^2 = w l^2$	$\frac{1}{2}$	$6 \times \frac{1}{48}$	1	Greatest bending moment at fixed end or at support; greatest shearing force at fixed end or at support.

502

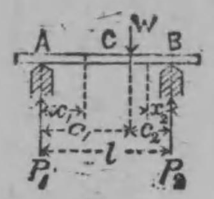
Max. B.M.	Max. Def.	Manner of Loading.	m	n	p	Remarks.
$\frac{Wl}{4}$	$\frac{Wl^3}{48EI}$		$\frac{1}{4}$	$\frac{1}{48}$	$\frac{1}{2}$	Greatest B. M. at the centre; shearing force constant for each half of the span.
$\frac{Wl}{8}$	$\frac{5Wl^3}{384EI}$	*W lbs per ft.* 	$\frac{1}{8}$	$\frac{5}{5} \times \frac{1}{48}$	$\frac{1}{2}$	Greatest B M. at the centre; greatest shearing force at the ends.
$\frac{Wl}{8}$	$\frac{Wl}{192EI}$		$\frac{1}{8}$	$\frac{1}{4} \times \frac{1}{48}$	$\frac{1}{2}$	Greatest bending moment at centre and ends, or at centre and supports; shearing force constant for each half of the span. Points of contrary flexure at $\frac{1}{4}l$ from centre.

503

Manner of Loading.	m	n	p	Remarks.
Max. B.M. Max. Def. $\frac{Wl}{12}$ $\frac{Wl^3}{384EI}$  	$\frac{1}{12}$	$\frac{1}{8}\times\frac{1}{48}$	$\frac{1}{2}$	Greatest bending moment at fixed ends or at support; greatest shearing force at fixed ends or at supports. Points of contrary flexure at $\frac{l}{2\sqrt{3}}=0.2887l$ from centre. $\frac{1}{2}\left(1-\frac{1}{\sqrt{3}}\right)l=0.211l$
	$\frac{3}{16}$	$\frac{7}{16}\times\frac{1}{48}$	$\frac{11}{16}$	Greatest bending moment at fixed end or at middle support or at right hand support. Greatest shearing force between W and fixed end, or between W and middle support, or between W and right hand support. Pressure at A_1, A_2, and A_3 $\frac{5}{16}$ W.

Manner of Loading.	m	n	p	Remarks.
				The deflection given is that at the centre. Pressure at B_2 $\frac{11}{8}$W; pressure at B_3 $\frac{23}{16}$ W.
	$\frac{1}{8}$	$\frac{1}{4}\times\frac{1}{48}$	$\frac{5}{8}$	Greatest bending moment at fixed end or at middle support or at right hand support; greatest shearing force at fixed end, or at middle support or at right hand support. Pressures at supports A_1A_2 and A_3 $\frac{3}{8}$ W. The deflection given is that at centre. Pressures at B_2 and B_3 $1\frac{1}{4}wl$.

SPECIAL CASE 1.



Beam supported at the ends and loaded with a concentrated weight at an intermediate point.

Hence $P_1=\frac{c_2}{l}W$ and $P_2=\frac{c_1}{l}W$;

the greatest bending moment occurs at the loaded section and its value is

$$M=\frac{c_1c_2}{l}W.$$

The equation to the elastic curve between A and C is

$$y_1=\frac{W}{EI}\frac{c_1^2c_2^2}{6l}\left\{\frac{2x_1}{c_1}+\frac{x_2}{c_2}-\frac{x_1^3}{c_1^2c_2}\right\}$$

and that between C and B is

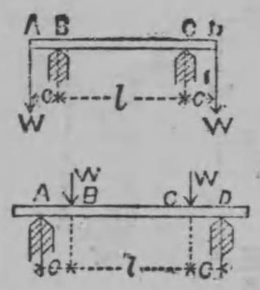
$$y_2=\frac{W}{EI}\frac{c_1^2c_2^2}{6l}\left\{\frac{2x_2}{c_2}+\frac{x_2}{c_1}-\frac{x_2^3}{c_1^2c_1}\right\}.$$

The deflection at the scetion C is

$$y_e=\frac{c_1^2c_2^2}{3l^4}\times\frac{Wl^3}{EI}.$$

The maximum deflection occurs at a point distant $x=c_1\sqrt{\frac{1}{3}+\frac{2c_2}{3c_1}}$ from the left hand end, c_1 being supposed greater than c_2, and $Y_{max.}=\frac{c_1}{c_2}\left(\frac{1}{3}+\frac{2c_2}{3c_1}\right)^{\frac{3}{2}}\times\frac{c_1^2c_2^2}{3l^4}.\frac{Wl^3}{EI}$.

SPECIAL CASE 2.

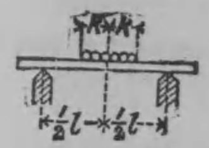


Beam under the action of two equal and opposite couples.

Here the supporting forces are each equal to W and the bending moment is constant between the points B and C at which the two inner equal forces act. The elastic curve between these points is, therefore, an arc of a circle. The shearing force is zero between these points and is equal to W between each W and nearest support. The maximum deflection occuring at the centre is, above or below BC.

$$Y_{max.}=\frac{c}{8l}.\frac{Wl^3}{EI}.$$

SPECIAL CASE 3.



Beam supported at the ends and loaded uniformly over a central portion of the span with w units of weight per units of weight per unit of length.

Here the supporting forces are each equal to wk and the greatest bending moment occuring at the centre is

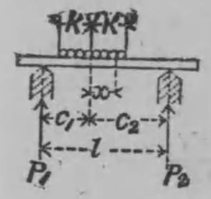
$$M_{max.}=\frac{1}{4}lW.\left(1-\frac{k}{l}\right).$$

The greatest deflection occuring at the centre is

$$Y_{max.}=\left(1-\frac{k}{l}\right)\left(1+\frac{k}{l}-\frac{k^2}{l^2}\right).\frac{1}{48}\frac{Wl^3}{EI}.$$

where W the total load is $2wk$.

SPECIAL CASE 4.



Beam supported at the ends and loaded uniformly over a portion of the span with w units of weight per unit of length.

Here the supporting forces are $P_1=\frac{c_2}{l}W$ and $P_2=\frac{c_1}{l}W$, where W the total load, is $2wk$.

The bending moment at any section situated within the loaded portion is

$$M_x=2wk\frac{c_1}{l}(c_2-x)-\tfrac{1}{2}w(k-x)^2.$$

The greatest bending moment occurs at a point distant $x=k\left(1-\frac{2c_1}{l}\right)=k\left(\frac{2c_2}{l}-1\right)$ from the centre of the load toward the larger segment of the span, and

$$M_{max.}=\frac{c_1c_2}{l}W\left(1-\frac{k_1}{l}\right).$$

MOMENT OF INERTIA.

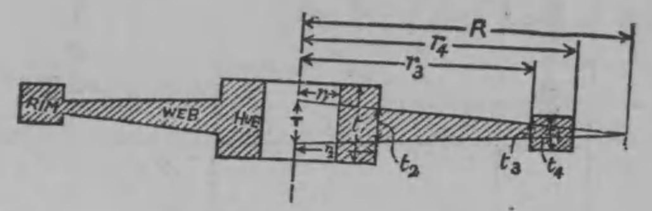
Fly Wheels.



Webbed Wheels.

$I = I_{Hub} + I_{Web} + I_{Rim}$

$$I_{Hub} = \frac{w\pi t_1}{2g}(r_2^4 - r_1^4) \quad \ldots \quad \ldots \quad \ldots \quad \ldots \quad \ldots \quad \ldots \quad (1)$$

$$I_{Web} = \frac{2\pi w t}{g}\left\{\frac{r_3^4 - r_2^4}{4} - \frac{r_3^5 - r_2^5}{5R}\right\} \quad \ldots \quad \ldots \quad \ldots \quad (2)$$

$$I_{Rim} = \frac{w\pi t_4}{2g}(r_4^4 - r_3^4) \quad \ldots \quad \ldots \quad \ldots \quad \ldots \quad \ldots \quad \ldots \quad (3)$$

g = Acceleration of Gravity = 32·2 Ft. Per Sec^2.

w = Weight of Material, Lbs. Per Cu. Ft.

Wheels with Arms.

Approximate Method of reducing arms to an Equivalent web.

A_2 = Total sheared area of inner ends of arms.

A_3 = " " " " outer " " "

t_2 = Thickness of inner edge of an equivalent web having the same area as the sheared area of all the inner ends of the arms.

t_3 = Thickness of outer edge of equivalent web.

$t_2 = \frac{A_2}{2\pi r_2}$ $\qquad$ $t_3 = \frac{A_3}{2\pi r_3}$ $\qquad$ Find R and **7**.

Apply Formulae 1, 2, & 3.

MOMENTS OF INERTIA.

Solids.

Solid.	Moment of Inertia.	Solid.	Moment of Inertia.
Rectangular Parallelopiped. 	$\frac{1}{12}Md^2$	Rt. Circular Cone. 	$\frac{3}{10}Mr^2$
Rt. Circular Cylinder. 	$\frac{1}{2}Mr^2$	Rt. Circular Cone. 	$\frac{3}{20}M(r^2+\frac{1}{4}h^2)$

Rt. Circular Cylinder. 	$M(\frac{1}{4}r^2+\frac{1}{2}h^2)$	Rt. Circular Cone. 	$\frac{3}{20}M(r^2+4h^2)$
Rt. Circular Cylinder. 	$M(\frac{1}{4}r^2+\frac{1}{3}h^2)$	Sq. Pyramid. 	$\frac{1}{20}Md^2$
Hollow Rt. Circular Cylinder. 	$\frac{1}{2}M(r_2^2+r_1^2)$	Sphere. 	$\frac{2}{5}Mr^2$
