CORNER NASSAU AND SPRUCE STREETS.

1853.

Advertisement.

MESSRS. G. H. BARR & Co. beg leave to offer to their friends and the public, the following Catalogue of Agricultural and Horticultural articles which they have for sale, and which they offer to such as may favor them with their patronage, at as low rates, quality considered, as they can be obtained for at any other establishment in this city.

The descriptive catalogue of Agricultural Implements does not, of course, include all which we have for sale; but whilst we do not pretend to say that we will keep every thing which may be brought to the notice of the agricultural public, yet we would announce our intention of keeping for sale a full assortment of articles of established merit, or which, if novelties, may appear to be deserving of the public patronage; and we trust that we will not be considered egotistic in saying that our past experience in the business will, we think, enable us to select such, and such only, as we can recommend with the utmost confidence to our customers.

It is usual, in Agricultural catalogues, to give descriptions, etc., of Steam Engines, Bark and Sugar Mills, and machinery of that description; but not considering these matters as coming strictly in the line of our business, we have refrained from inserting them in this catalogue; but we offer our services to planters and farmers in procuring for them all such articles, or any others that can by any possibility be needed upon either a plantation or a farm. We will give every attention to such commands; and if the articles have to be made to order, will personally superintend their construction, and in all cases attend to their shipment, etc., only charging therefor the usual per centage, as allowed by mercantile usage.

One prominent branch of our business will be the dealing in artificial Manures and Fertilizers, of which we will keep a large assortment; and our customers may depend upon having them exactly as represented.

Much care is necessary in purchasing these articles, as it is easy to deceive a purchaser who may be wanting in a knowledge of chemistry or chemical manipulations. Many articles are thrown upon the market by persons who, without any positive intention to deceive, yet from their want of knowledge or skill in making the necessary chemical combinations required in their manufacture, produce articles which are almost effete, or but of little value to the purchaser. In all cases where we are likely to be deceived, the articles are submitted to a chemical analysis, by an eminent chemist, so that we may be enabled to guard the purchaser from deception.

It will be observed that the Horticultural department of our business occupies a more prominent position than is generally allotted to it by parties usually engaged therein.

There is a general prejudice against buying Garden Seeds at Agricul-

tural Warehouses ; but as it is our intention to make our establishment as complete as possible, we have engaged in it determined if possible to do away with such prejudice, by keeping such articles as we can with confidence recommend ; for every attention has been paid in selecting such sorts as are of established reputation, and no pains have been spared in procuring such stock as we are confident will be found to be of the highest quality. We respectfully solicit a trial of our seeds, feeling assured that they will give the fullest satisfaction.

In addition to the standard and approved varieties, every novelty worthy of note will be added from time to time. A large number appear in this present catalogue, indicated by a different type. They are all of high reputation in the respective localities from whence they were obtained, and of such merit as to render them well worthy of a trial here. We shall be happy to give packets of them gratuitously to such gardeners, especially market gardeners, as will give them a fair trial.

Of Flower Seeds it will be seen, upon reference to the catalogue, that we have a very extensive assortment, embracing more choice articles and novelties, than perhaps can be found at any other establishment. Our large assortment of Greenhouse Flower Seeds, is particularly a novelty in this country, and we trust that we will meet with a large share of the public patronage in disposing of them. The attention of amateurs is particularly called to our selection of Asters, Balsams, Hollyhocks, Larkspurs, Stocks, etc., especially those in the original sealed packages.

We are also agents for the sale of Professor J. J. MARES's assortments of Garden Seeds, raised with the greatest possible care, by himself. They are sold in the original packages as put up by him, and at his prices. In many parts of the country they have obtained a very high reputation, and they are recommended as well worthy of trial.

In conclusion, we would beg leave to assure those who may favor us with their patronage, that no effort shall be wanting on our part to please our customers and to give general satisfaction.

Agricultural and Horticultural Implements.

PLOUGH.

PROUTY AND MEARS' CELEBRATED CENTER DRAUGHT PLOUGHS.—These Ploughs are recommended with the greatest confidence to the favorable notice of the public, as combining more of the essential qualities of a good plough, than any other which has yet been brought out. By having adapted to them, the admirable principle of Center Draught, whereby the line of draught is through the center of the plough, it receives the resistance of the furrow slice equally on both sides, causing it to land properly and keep its true position with a straight, regular and steady motion.

These qualities enable it to be managed with such ease, that one man and a yoke of oxen are quite equal to the task of breaking up new land of any ordinary soil.

The materials and workmanship of these ploughs are of the very best quality; the wings, landsides and points, being chill-hardened; the points are also on the self-sharpening principle.

These ploughs have received a greater number of valuable premiums than any other yet offered in this country, and are of deservedly high reputation.

SELF-SHARPENING PLOUGH.—These ploughs have a reversing, self-sharpening, double point and share; turn a furrow about twelve inches deep by sixteen inches wide; are not liable to choke; and are equal the culture of the strongest soil, at an expense for repairs scarcely amounting to one cent per acre.

SWARD PLOUGH—for breaking up grass lands. These ploughs have a peculiar structure of the mould-board, or ground wrest, whereby the cohesion of the furrow slice is completely destroyed, and turned over or inverted in a light and friable condition.

IMPROVED LOCK-COULTER MEADOW PLOUGH—for swampy or rough land. These are very heavy, strong ploughs, with steel-edged shares or points, a wrought iron lock coulter, and a reverse or drag cutter for the purpose of cutting the surface of wet meadows; they are also provided with crane clevis, so that the team can travel on the unbroken ground, and thereby keep clear of the miry furrow.

These ploughs are very strong, and admirably adapted for ploughing newly cleared land, among roots, &c., &c.

IMPROVED SIDE-HILL PLOUGH.—These ploughs are so constructed that the mould-board can be readily shifted from one side of the beam to the other, so that the ploughman can work horizontally on side hills, turning all the furrows one way; they also have many advantages for level ploughing, and are becoming much used for that purpose also.

PREMIUM SUB-SOIL PLOUGH.—These ploughs are light and simple in construction, easy of draught and management, and are used for following the common plough, to stir up the sub-soil, which it does without mixing it with the incumbent strata. They are admirably adapted for loosening ground in road-making. No farmer should be without one of these ploughs.

DOUBLE MOULD BOARD OR RIDGING PLOUGH.—These ploughs are used for ridging out land, ploughing among corn, potatoes, &c., as they throw the earth both ways. They are a very useful and desirable implement, being eminently labor-saving.

SMITH'S PATENT MICHIGAN PLOUGH.—This consists of two ploughs, one small and one large, attached to the same beam. The smaller, a forward one, turns a furrow from four to six inches deep; throwing all the surface grass, or vegetable matter, into the bottom of the adjoining deep furrow. This plough differs from the sub-soil plough in this, that it turns the top soil and brings the sub-soil to the surface. It is of very light draught, compared with the work which it accomplishes, and is an implement of very great merit; it has already received a number of valuable premiums,

THE GEDDES HARROW.—The cut, it is presumed, will sufficiently explain the merits of this implement. As the draught is from the center, the uneasy struggling motion of the square harrow is got rid of, and it is consequently easier for the team; it is provided with hinges, and can be readily lifted when in motion.

THE SQUARE HARROW.—The cut represents a very good form of square harrow, with folding joints, suitable for rough, heavy work.

THE SCOTCH HARROW is, as can be seen from the cut, an improvement upon the common square form, the dotted lines are the lines of pulverization which it makes, and are so arranged as to be at equal distances apart.

CULTIVATORS.—Of this class of implements there are several kinds; some being adapted for hand use and some for animal draught.

The hand cultivator expands from ten to eighteen inches, and is generally used for stirring the soil between rows of vegetables, as beets, carrots, &c.; it is a very useful and desirable implement.

The larger cultivators for field culture expand from two to five feet; they are made both with wood and iron frames, with shares of different patterns, according to the work to be done, or the fancy of the purchaser.

SEED SOWERS AND CORN PLANTERS.—These machines are used for drill-sowing corn, beans, peas, turnips, mangel wurtzel, beets, carrots, &c., &c. They can be had of many various kinds, both for hand use and draught. Wherever they have been used, they have given great satisfaction; and they soon save their cost in the diminished quantity of

seed required per acre, when compared with that required when seed is sown broadcast; in many cases the saving will amount to one-half, and the work is infinitely better done, as the machine opens the drill, deposits the seed, covers it and rolls it down, at the one operation.

HORSE RAKE.—These implements are almost indispensable to the farmer, particularly in localities where laborers are not readily procurable. With one of them a single horse and driver can rake into winnows from two to three acres of hay in the course of one hour, an advantage strikingly appreciable when securing a crop of hay from an approaching storm.

FANNING MILL.—Of these there are several different kinds; the best will clean at the rate of a bushel of wheat per minute, taking out all the chaff, cockle, ches, or other extraneous matter at one operation, and yet working so easily, as to only require the strength of a stout lad in turning them.

CORN SHELLERS.—Of these implements there are also many kinds; some will shell from one hundred and fifty to two hundred bushels of ears per day, with the labor of two men; and some are arranged to do twice that amount of work with the labor of three men.

VEGETABLE CUTTERS.—These instruments are so improved as to cut the roots into small square pieces, and not into slices as heretofore, thus doing away with the danger of the animal choking, and also enabling it to take up its food readily and without inconvenience.

These machines can be had, capable of cutting fifty bushels of turnips, carrots, etc., per hour.

STRAW CUTTERS.—Of these there are a great variety; some adapted for cutting hay and straw, and others for corn stalks; and some combining the necessary requisites for doing both. They are adapted for hand use or horse power, as may be required. The latter are very powerful machines, and will readily cut a ton of hay in an hour and a half.

HAND AND POWER GRAIN MILLS—Adapted for grinding grain, coffee, or spices, as may be desired. They grind from one to two bushels per hour, but can be so constructed as to run by other power, giving, of course, a proportionably increased amount of flour or meal per hour.

REAPING MACHINES.—These machines, of such incalculable benefit to the farmer, can be had of the most approved construction, capable, with the labor of four horses, a driver, tender, and eight binders, of reaping twenty acres per day, cutting in one minute four hundred square yards of grain, clover, or grass. Any farmer will save the cost of one of these machines in one or two seasons.

HORSE POWERS.—These machines can be had in all the different styles made. The Endless Chain Horse Powers, which are most in vogue at the present time, have attached to them grain threshers and separators, and with one horse, aided by two men and a boy, will thresh from seventy-five to one hundred bushels of wheat per day, and, of oats, nearly double the quantity. These powers can also be applied to any other machines, such as Straw-cutters, Fanning-mills, Corn-shellers, Grain-mills, etc., ordinarily used on a farm.

THERMOMETER CHURNS.—These are recommended as the simplest and best Churn in use; and having a thermometer attached to them, no difficulty is experienced in keeping the cream at the exact temperature necessary to produce the finest butter with the least expenditure of labor and time.

CORN CRACKER.—This valuable machine is used for cracking corn and cobs, previous to grinding them for provender, or for cracking the corn alone, as for hominy, or stable use. It grinds the corn and cobs to the *same degree* of fineness, even when the corn is damp or green, without clogging, which no other mill will do. It combines the essential requisites of compactness, durability, uniformity of work, and economy of power.

MOTT'S AGRICULTURAL FURNACE.—This is the most approved form of Agricultural Furnace, or Boiler, now before the public. They boil the water very quickly, and entirely dispense with the expense of masonry and brickwork. They can be had of all sizes, from 10 to 120 gallons.

WHEELBARROWS—of different kinds, either for garden, canal, or railroad work, of the very best workmanship.

ROAD SCRAPER.—The best of these are now made with cast iron bottoms, sides, and edges. They are very useful in road-making, leveling, ditch-making, etc., and would be found to be a useful and convenient article on every farm.

ROOT AND BUSH PULLER.—This is a very effective implement, and is used for tearing out stools, or clumps of small bushes, in wet or boggy land.

OX BOWS.—A good yoke is absolutely necessary to secure a large amount of labor, as it conduces greatly to the ease of the cattle. Those which are not properly constructed, or which are poorly made, very often seriously injure or worry the animals, and thereby diminish the amount of their labor.

WATER RAM.—These are very useful machines for raising water wherever a fall of four or five feet can be obtained. In such cases they will raise, according to their size, from 5 to 50 gallons per minute, to a perpendicular height of 100 feet or more. These machines combine sim-

plicity of construction with great effective power, and are but very little liable to get out of order.

SAUSAGE CUTTERS AND STUFFERS.—By the aid of these machines several hundred pounds of meat per day can be prepared, and the skins stuffed as fast as six or eight persons could do it in any other way.

Fertilizers.

NITRATE OF SODA OR CUBICAL NITRE. We have made arrangements for a supply of this article at the lowest market rates. For weak soils, deficient of soda, and of the constituents of nitric acid, this is an admirable manure. It acts specifically upon the foliage, and is, consequently, well adapted for grass lands. It may be used as a top dressing or in compost; it is generally applied at the rate of from 100 to 200 pounds per acre.

SALTPETRE. This article may be used with profit, to give vigor to organic manures which have lost their force, or to peat-compost requiring energy. It is composed of those ultimates which give the chief value to barnyard manure beyond its ammonia. When mixed with headlands, ditch scrapings, &c., and supplied with a small amount of phosphate of lime in its soluble form, it adds greatly to the vigor of the mass. The quantity usually used is 150 pounds to the acre.

POTASH SCRAPINGS. In localities requiring potash, and where unleached ashes cannot be readily procured, this article, from its condensed shape and consequent easy transportation, is a desirable amendment. It may be added in very dilute shape to the soil, or by being used in compost, will assist in its decomposition, afterwards affording to plants that very necessary ingredient in their elements, potash.

SULPHURIC ACID, used for dissolving bones for making superphosphate of lime. This will be supplied at the manufacturers' prices, with some of the largest of whom we have made arrangements for the supply of an article especially adapted for agricultural purposes, but far more concentrated than that generally sold therefor.

PLASTER OF PARIS. This is a powerful agent in seizing and retaining the volatile ammonia in stable manure, guano, and compost heaps, and can scarcely be too freely employed in such cases. It is frequently sown broadcast upon grass or grain early in the spring, at the rate of two or three bushels per acre, but is far more efficient in the compost heap.

CHARCOAL DUST. This is also an admirable and almost indispensable ingredient in the compost heap, absorbing ammonia, water, and gases

from the atmosphere. It is sometimes applied alone, like ashes, at the rate of from twenty to two hundred bushels per acre.

BONE DUST, in all its various forms, as sawings, turnings, crushed bones, &c., &c. It is an admirable manure for grain, wheat, and root crops, and is generally applied in its crude state, at the rate of from ten to thirty bushels per acre; but it is far preferable to use it in compost, by dissolving it in sulphuric acid and mixing it with earth, charcoal dust, and other ammonia saving agents.

POUDRETTE, manufactured by the Lodi Manufacturing Company, put up in barrels dry and free from smell. This is an excellent stimulating manure, well adapted for starting corn and other articles, but it is not lasting in its effects, requiring to be applied at least once again to the growing crop. From two to five barrels are generally applied to the acre, or about one gill to a hill of corn and two gills to a hill of potatoes. It is also frequently used for soaking grain previous to sowing, in the proportion of about a quart of poudrette to a gallon of water. It requires to be used with great judgment.

GUANO. This very popular and highly efficient manure will be furnished at the regular market rates, and warranted as pure as imported. It ought always to be used in the form of compost, first breaking up all the lumps and passing it through a sieve, adding to it, and well mixing with it, from five to ten times its bulk of good loamy soil, also well pulverized; and then, after it has lain a few days, turning it over, care being taken that the mass is well incorporated together. On the score of economy and efficiency both, it is advisable to add from 30 to 50 pounds of plaster to the ton, and a liberal amount of charcoal dust, as they absorb the ammonia and change its form, whereby it loses its volatility. Lime and ashes should never be added, as they expel the ammonia.

The quantity used per acre varies with the crop, the soil, and its condition; from two hundred to four hundred pounds per acre are commonly applied, but it is advisable to use it often and more sparingly. In the liquid form it is generally used at the rate of one pound of guano to ten or twenty gallons of water—the latter is generally the best proportion—it is then frequently used as a steep for seeds.

SALT. In sections of the country remote from the sea-shore or the influence of the landward winds, this is a very useful fertilizer, applied at the rate of from five to twenty bushels to the acre. It can be sown broadcast, but, like all other artificial manures, is far more efficient and economical applied through the medium of the compost heap. Mixed with limo or plaster, or both together, it forms a variety of new combinations, which generally have a strong attraction for moisture, among which are soda, sulphuric acid, and their compounds.

LIME acts as an admirable agent in the decomposition of vegetable matter and other crude materials in the soil, bringing them into a proper shape to assimilate with the juices of the plants. It is generally applied in quantities varying from twenty to two hundred bushels per acre, but it is far preferable to apply it in small quantities and more frequently: it must be borne in mind that land can be so impoverished by the continued application and operation of lime as to become almost worthless, as it acts far more as a solvent of what is already in the soil than as a direct manure.

NATIVE PHOSPHATE OF LIME. This article is found in its natural state in New Jersey and in the northern part of the State of New York. It sometimes contains as much as 40 per cent. of phosphoric acid, in which its chief value consists. It requires to be dissolved in sulphuric acid before it can be profitably used. Many samples thrown upon the market contain large quantities of iron, with which the sulphuric acid combines more readily than with the other elements, thereby producing sulphate of iron or coppers, than which scarcely anything can be more detrimental to the soil; great care is therefore necessary in purchasing it, in order to be sure of its containing nothing that is injurious.

TRUE SUPER-PHOSPHATE OF LIME. This is a true super-phosphate of lime, made by dissolving bones or their equivalent in sulphuric acid, and then combined with such a quantity of the super-phosphate of lime as will supply the necessary amount of ammonia to render it energetic. It is inferior in power to the Improved Super-Phosphate, but is very superior to the super-phosphate as made in England and elsewhere.

MAPES'S IMPROVED SUPER-PHOSPHATE OF LIME. We are now prepared to furnish this admirable manure in any quantity, and can guarantee its purity, as it is made under the immediate supervision of Professor Mapes. It is much superior to the super-phosphate, as, in addition to the sulphuric acid and phosphoric acid used or evolved in the manufacture of the super-phosphate, it contains as large a quantity of Peruvian Guano and sulphate of ammonia as are necessary to furnish the other constituents of the plants. It is admirably adapted for drilling in with seeds, as, unlike guano, it has no pernicious effects upon them, not destroying or impairing their vitality; it also appears to be particularly suitable for root crops, as the yield of vegetables where it has been applied has been enormous. Its superiority in these respects to guano renders it of great service to the horticulturist.

It is generally applied at the rate of from one hundred to five hundred pounds per acre; this latter quantity has been found, by frequent experiment, to be equal to fifteen cords of stable manure.

Bulbous Roots.

Imported direct from the best houses at Harlem, in Holland, selected with the greatest possible care, the roots being of the first or largest culling, being far different from those sold at auction, which are generally of the fourth or fifth, and never higher than the third culling.

It only needs an inspection to be satisfied of their great superiority to those sold at auction, while the prices are but slightly, if at all in advance of auction prices, and the purchaser does not need to buy bulbs which he does not want, as is the case when they are sold in lots.

Printed directions for their cultivation accompany, gratis, each package sold.

HYACINTHS.

The selection which follows, consists of such sorts as are of high reputation for blooming in Pots, especially for room culture, those marked with an asterisk, are more especially suitable for blooming in glasses.

PRICES.

Those marked	12½ cts. each,	\$1 50 per doz.
"	" 18¾ "	2 00 "
