Data reported herein are claimed to show that in *Nicotiana* self-sterility is due to the presence of the allelomorph of a dominant fertility factor, *f*. When a population is homozygous for this factor, *ff*, it is self-sterile. The factors which control the peculiar and systematic behavior of self-sterile plants when intercrossed among themselves are wholly independent of this factor, and the latter does not need to be considered in an interpretation of their expression.

The manifestation of self-sterility, as evinced by the degree to which pseudo-fertility shows, is considered due to a subsidiary inherited factor (or factors), but without the presence of the principal factor *ff* there is no evidence that it functions.

IV. *Selective fertilization* (pp. 346-355).—In this work, designed to test the possibility of the occurrence of selective fertilization in self-sterile *Nicotianas*, comparisons were made between the pollen tube frequency distributions of highly heterozygous and of comparatively homozygous plants. The influence of compatible matings on incompatible matings was also investigated, and in neither case was there any indication of selective fertilization. The evidence obtained is discussed.

V. *A family of self-sterile plants wholly cross-sterile inter se* (pp. 356-363).—This is a study of questions arising from data obtained in the course of work previously noted as referred to above.

Hybridization as a cause of apogamy in plants, A. ERNST (*Bastardierung als Ursache der Apogamie im Pflanzenreich*. Jena: Gustav Fischer, 1918, pp. XIV+666, figs. 172, pls. 2).—This is a monograph giving an extended account of studies involving hybridization, apogamy, the species concept, and the origin of species.

On chlorophyll, carotin, and xanthophyll, and on the production of sugar from formaldehyde, A. J. EWART (*Proc. Roy. Soc. Victoria*, n. ser., 30 (1918),

No. 2, pp. 178-209).—Extended investigations are reported and discussed on sugar formation in plants, from which the following conclusions are drawn:

“In the assimilation of carbon dioxide, chlorophyll acts as a light energizing enzyme, and takes direct part in the cycle of chemical changes, which probably have carotin, xanthophyll, phytyl, and glaucophyllins as intermediate products and glucose, levulose, formaldehyde, and oxygen as end products. The sugar may be formed directly as well as through the polymerization of formaldehyde. A large part of the energy represented by the carbohydrate products is absorbed during the reconstruction of the chlorophyll molecule. Carbon dioxide decomposes extracted chlorophyll both in light and in darkness, removing its magnesium and producing phaeophytin. The earlier supposition that xanthophyll is one of the products has not been sustained. In the presence of zinc dust, the zinc takes the place of the magnesium, and the chlorophyll remains green as a stable zinc chlorophyll.

“Apart from its protective function, carotin seems to be especially important, as providing during its photo-oxidation or partial disintegration the massive hydrocarbon combination in the phytyl radical of chlorophyll, whose addition is necessary to convert the dicarboxylic glaucophyllin into the tricarboxyll. Xanthophyll can be reduced to carotin by the aid of metallic reductases, but no oxidases have been found capable of converting carotin into xanthophyll. The oxidation of these substances in darkness or in feeble light differs in certain respects from that taking place in intense light.

“The oxidation of rhodophyllin, chlorophyll, xanthophyll, and carotin is more rapid at high temperatures than at low ones, and the rates of oxidation are in the order given, carotin being most readily oxidized. A rapid method is described of polymerizing formaldehyde to sugar, which has a definite end reaction, and yields calcium and sodium tartrates as by-products.”

The author gives equations, not as representing established facts, but to indicate graphically how chlorophyll could act as a photic or lytase enzyme for the conversion of carbon dioxide and water into carbohydrates. The chief difficulty in regard to them, as he notes, is the very large mass reactions which they represent. The first stage shows how amorphous chlorophyll+carbon dioxide and water would form xanthophyll (or carotin) oxygen and glaucophyllin. The second stage shows that carotin (or xanthophyll)+water+oxygen would equal phytyl+levulose+glucose+formaldehyde. This reaction would take place in light with the aid of an oxidase enzyme, and the excess oxygen from the first stage of the reaction escapes. In the third stage phytyl, glaucophyllin, and carbon dioxide form amorphous chlorophyll and oxygen.

“This change would take place in the living plant with the aid of light energy. It makes the total volume of oxygen exhaled equal to the volume of carbon dioxide absorbed.

“This suggested cycle would indicate the enzymatic action of chlorophyll in the presence of water, carbon dioxide, and light, and might serve as a basis for further investigation . . . With an excess of carbon dioxide and a deficiency of light, stage 1 would preponderate. With stronger illumination stages 2 and 3 would balance 1. With excessive illumination and a deficiency of carbon dioxide, disintegratory photo-oxidation would take place, and the amount of chlorophyll would be reduced.”

The recovery of vegetation at Kodiak, R. F. GRIGGS (*Ohio Jour. Sci.*, 19 (1918), No. 1, pp. 1-57, figs. 32).—This is an account of conditions and processes in the region affected by the eruption of Mt. Katmai, Alaska (E. S. R., 40, p. 812), as regards vegetation, and the revegetation of this area. Comparisons are made with other volcanic outbursts there and elsewhere.

It is stated that the damage to vegetation by an eruption is not likely to be so great as at first appears, no permanent injury to agricultural interests being probable in cases where the ash fall is not greater than 12 inches.

Hydrogen cyanid fumigation, E. E. CLAYTON (*Bot. Gaz.*, 67 (1919), No. 6, pp. 483-500, figs. 2).—A study has been made of normal green plants, chiefly tomatoes, growing under normal greenhouse conditions until exposed to hydrocyanic acid gas.

It has been found that different concentrations of HCN give effects ranging from stimulation to depression. The maximum of beneficial results occurred at a point fatal to insect life, but just below that of first injury to the plant. External factors increasing resistance are wetting the leaves, reduction of temperature, and reduction of light intensity during the day preceding fumigation. Injury closely paralleled amount of stomatal opening. Soil water supply influenced resistance by affecting growth rate, rapidly growing plants being more susceptible. Sugar content showed a positive correlation with resistance.

A modification of the Wright-Buchner anaerobic tube, R. R. MELLON (*Jour. Bact.*, 4 (1919), No. 3, pp. 295-297, fig. 1).—The author explains the advantages and employment of the method involved.

FIELD CROPS.

The words "productivity," or "productiveness," and "fertility" as applied to agriculture, C. V. PIPER (*Jour. Amer. Soc. Agron.*, 11 (1919), No. 9, pp. 342, 343).—This paper, which is the fifth of a series of contributions to agronomic terminology, previously noted (E. S. R., 36, p. 827), comprises a brief discussion of the derivation and present generally accepted meanings of the words "fertility" and "productivity" or "productiveness as applied to agriculture." It is concluded that "in view of the fact that the word 'fertility' is often used in agriculture in the narrow sense of soil fertility or even of one of the theories of soil fertility as well as in its broader original meaning, it is an unsatisfactory and often ambiguous term to use in technical publications. 'Productivity' or 'productiveness,' both in their potential and actual applications, are words whose clearness has not been impaired by the evolution of ideas, and therefore they should be employed in preference to the word 'fertility' as used in its broad application."

Report of committee [of the American Society of Agronomy] on standardization of field experiments (*Jour. Amer. Soc. Agron.*, 11 (1919), No. 9, pp. 350, 351).—Supplementing a previous report (E. S. R., 40, p. 823), the committee states that "to what extent it may be desirable to unify methods is still an open question. The best information we have suggests that complete standardization will not be practicable nor desirable." They suggest that experimentation in methods be undertaken wherever possible in order to accumulate a mass of data from which a few fundamental standards may be derived.

Additions to the bibliography previously noted include eight titles.

Report of the committee [of the American Society of Agronomy] on varietal nomenclature (*Jour. Amer. Soc. Agron.*, 11 (1919), No. 9, pp. 349, 350).—This is a further report (E. S. R., 39, p. 833) on the standardization of varietal names and on the classification and registering of new introductions.

It is suggested that a new committee on the standardization of varieties be appointed, this committee to formulate a plan for testing and comparing standard types and new introductions. The functions of the committee would include the examination of proposed systems of classification and the adoption of a satisfactory system, the suggestion of necessary changes or modifications

in classification, the testing of all standard types whenever practical in order to determine their relative adaptations, the appointment of a subcommittee to identify and properly classify for seedsmen or agronomists either old varieties or new introductions, and the providing of means for the proper registration and publication of new introductions.

Official field crop inspection, F. A. SPRAGG (*Science, n. ser.*, 51 (1920), No. 1309, pp. 113, 114).—In a discussion of a paper on the subject by Bolley (E. S. R., 41, p. 536), the author maintains that a State-controlled seed inspection under the direction of the agricultural college, as advocated by Bolley, will in most cases be preceded by a cooperative seed growers' association. This is said to be due to the fact that after a superior variety has been developed a producing and selling agency must be formed in order to maintain a supply of the improved seed, and that the commercial aspect of such an organization bars it from direct association with the agricultural college. It is thought, however, that the college may legitimately aid in the inspection of pedigreed seed, both in the field and after it has been re-cleaned.

The conversion of winter into spring grain, C. FRUWIRTH (*Ztschr. Pflanzenzücht.*, 6 (1918), No. 1, pp. 1-46).—The author describes rather extensive observations with wheat, rye, and barley in an effort to determine whether typical winter varieties could be changed over into spring sorts, either through adaptation to modified cultural practices or through breeding and selection.

Potash fertilization and lodging in cereals, C. KRAUS (*Landw. Jahrb. Bayern*, 5 (1915), No. 5, pp. 259-305, figs. 2).—Rather extensive experiments are described in which observations were made upon the effect of potash upon lodging cereals. It was concluded that potash aided in the development of stiff straw. See also a previous note (E. S. R., 41, p. 733).

Varieties of corn grown in Argentina: Native and acclimated varieties, C. D. GIOIA (*Varietades de Maiz Cultivadas en Argentina: Maices Argentinos y Aclimatados. Buenos Aires: J. Weiss y Preusche, 1919, pp. 165, figs. 68*).—The principal native and introduced varieties of corn grown in Argentina are briefly described and illustrated. Information relative to the cultural practices employed in growing the crop and to diseases affecting corn is included.

The chemical composition of the cotton plant, G. S. FRAPS (*Texas Sta. Bul.* 247 (1919), pp. 5-17).—Considerable tabulated data are presented showing the chemical composition of the cotton plant and its parts, based largely on analyses of four representative plants selected by the superintendents of the various substations and forwarded to the chemical laboratory of the State station. The results secured may be summarized as follows:

The average amounts of different parts of the plant which accompany 300 lbs. of seed cotton were found to be 588 lbs. of stalk, 446 lbs. of leaves, 313 lbs. of bolls, and 162 lbs. of burs, although there were large variations in individual cases. It is stated that larger yields of cotton would have been produced with practically the same amount of parts of the plant if seasonal conditions had been more favorable. Where yields of from 1,000 to 1,200 lbs. seed cotton per acre were obtained, the amount of stalk per 300 lbs. of seed cotton was about 350 lbs., of leaves 150 lbs., of bolls 50 lbs., and of burs 160 lbs.

The phosphoric acid used per 300 lbs. seed cotton varied from 3.1 to 18.1 lbs., with an average of 8 lbs.; potash from 9.4 to 72.6 lbs., with an average of 27 lbs.; and nitrogen from 14.6 to 78.8 lbs., with an average of 32.3 lbs. With yields of from 1,000 to 1,200 lbs. of seed cotton, about 5 lbs. of phosphoric acid, from 9 to 18 lbs. of potash, and from 15 to 25 lbs. of nitrogen were used per 300 lbs. of cotton seed. With a yield of less than 1,000 lbs. seed cotton per

acre, the amount of mineral taken from the soil per 300 lbs. seed cotton was proportionately greater, while the plant was larger in proportion to the yield and sometimes formed bolls which did not produce cotton. An excess of potash may be taken up by the cotton plant.

The probable needs of cotton per 300 lbs. seed cotton or 100 lbs. lint are estimated to be 7 lbs. phosphoric acid, 25 lbs. nitrogen, and 15 lbs. potash. The draft on the soil was not found to be in direct proportion to the size of the crop, but was somewhat larger for small crops and somewhat less for large crops.

Cotton leaves were moderately high in protein (15.58 per cent), high in ether extract (7.44 per cent), and moderate in crude fiber (9.93 per cent), and are regarded as having a good feeding value. Empty burs, which are found around gins, are said to contain some seed, and to have a feeding value probably a little higher than that of cottonseed hulls.

The Bourbon palm of South Annam and its fiber, M. P. BUSSY (*Bul. Agr. Inst. Sci. Saigon [Cochin China]*, 1 (1919), No. 12, pp. 377-380).—This comprises a brief discussion of the fiber obtained from the petioles and leaves of the so-called Bourbon palm (*Corypha lævis*).

[Paper-making materials] (*Bul. Imp. Inst. [So. Kensington]*, 17 (1919), No. 2, pp. 141-159).—Supplementing similar work previously noted (E. S. R., 40, p. 823), this comprises an account of investigations made by the Imperial Institute of a number of materials from South Africa, Rhodesia, Egypt, Papua, and St. Helena in an effort to ascertain their suitability for the manufacture of paper. The materials include *Cymbopogon* spp., *Trachypogon polymorphus*, *Themeda forskalii mollissima*, *Tristachya rehmanni*, and *Panicum obscurens* from South Africa; muguguboya bark and mungongo wood (*Ricinodendron rautanenii*) from Rhodesia; stems of *Cyperus alopecuroides* and *C. papyrus* from Egypt; lalang grass (*Imperata arundinacea*) from Papua; and so-called thatching grass from St. Helena.

[Potato experiments in Bavaria], L. KIESSLING (*Landw. Jahrb. Bayern*, 7 (1917), No. 10, pp. 739-754).—This describes work conducted during 1914-1916, inclusive, embracing observations on the influence of size of seed tuber on yield, the effect of cutting the tuber, tests of early varieties, and selection experiments with potatoes.

A study of the rice of the Kamerun, F. HEIM (*Bul. Agence Gén. Colon. [France]*, 12 (1919), No. 142, pp. 569-574).—This reports the analysis of three varieties of rice from the Kamerun, and presents a tabular statement showing the composition of 15 other sorts from different sources.

Effect of inoculation and lime on the yield and on the amount of nitrogen in soy beans on acid soil, E. B. FRED and E. J. GRAUL (*Soil Sci.*, 7 (1919), No. 6, pp. 455-467, fig. 1).—In this paper, a contribution from the Wisconsin Experiment Station, the authors describe pot and field experiments carried out with soy beans on Plainfield sand from Sparta and Hancock and on Colby silt loam from Marshfield and Curtiss in a study of the influence of additions of limestone and of inoculation with nodule bacteria upon the yield and composition of soy beans. Observations were also made on changes in the nitrogen supply of the soil. The results secured may be summarized as follows:

In every test the percentage of protein in the tops was higher in the nodule-bearing plants than in the plants free of nodules. Although the absence of the nodule bacteria renders it impossible for the soy bean plant to utilize the nitrogen of the air the effect is not always apparent, and in parts of Wisconsin soy beans will produce large crops in the absence of the nodule bacteria. In such cases the entire nitrogen supply of the plant is taken from the soil.

Inoculation of soy beans grown on sand from Sparta increased the yield of dry matter, while the yield was further increased when inoculation was supplemented by an application of lime. Sufficient lime to neutralize one-half of the active soil acidity produced maximum yields. The percentage of nitrogen in the crop and the total amount was also increased by inoculation.

Crops grown on sand from Hancock yielded better when inoculated than when uninoculated, inoculation being more effective in increasing the yield than lime. Small amounts of lime and inoculation together produced the best yields. The nitrogen content of the inoculated crop was considerable higher than that of the uninoculated crop.

It is stated that when the entire crop is removed from the soil, leaving only the roots and stubble, there will be less nitrogen in the soil than before the crop was grown, but if a properly inoculated crop is turned under as a green manure it will add large quantities of nitrogen to the soil.

Inoculation was not found to be as effective in increasing yields on Colby silt loam as on the sandy soils, although it influenced the percentage of nitrogen and consequently the total amount in the crop.

"Soy beans if properly inoculated will utilize nitrogen from the air and thus enrich the soil, provided the crop residue is returned to the soil. It is not necessary to plow the crop under if the crop is fed on the farm. The manure can be returned to the soil, and in this way be utilized in the improvement of the land. Small additions of limestone to acid soils render the inoculated soy bean plant more active in absorbing air nitrogen."

Report on the condition of the European beet sugar industry, H. J. DE MESA (*La. Planter*, 64 (1920), No. 1, pp. 12, 13).—This describes the present condition and future prospects of the industry in Poland, Russia, Czechoslovakia, Germany, Austria, Hungary, and France, with particular reference to its bearing on the cane sugar industry of Cuba. It is concluded that European sugar beets will not seriously compete with Cuban sugar cane for some time to come.

Manurial experiments with sugar cane, H. A. TEMPANY (*Dept. Agr. Mauritius, Gen. Ser., Bul. 14* (1918), [English Ed.], pp. 28).—This describes fertilizer experiments with sugar cane conducted during the period of 1913–1918 at various experimental centers in Mauritius. In summarizing the results, the author states that the fundamental basis in maintaining the fertility of sugar-cane land is the application of pen manure in sufficient quantity to supply an adequate amount of organic matter in addition to plant food constituents. The economical use of commercial fertilizers under conditions where a large amount of pen manure is available is said to depend largely upon local conditions.

In these experiments increased yields followed the application of commercial fertilizers when they were used in addition to pen manure, although some of the increases were within the mean probable error. Sulphate of ammonia appeared to give the best results, on the whole, although nitrate of soda also showed satisfactory increases, while dried blood was less satisfactory. The addition of potash and phosphate usually increased the yield, but when these were used alone the results were generally disappointing. The effects of the fertilizers were about equally marked on ratoon cane as on plant cane, and on low lands as on high land. The application of molasses resulted in an appreciable increase in yield in most cases, while the effect of lime was less regular. The systematic irrigation of plats treated with nitrogenous fertilizers led to marked increases in yield.

Fertilizer experiments with sugar cane [at Tucumán], W. E. CROSS (*Rev. Indus. y Agr. Tucumán*, 9 (1919), No. 11–12, pp. 170–178, fig. 1; trans. in *Sugar*

[*New York*], 21 (1919), No. 12, pp. 633, 634, 651).—This describes the continuation during 1918 and 1919 of work previously noted (*E. S. R.*, 41, p. 533).

The application of stable manure resulted in increased yields of cane in the case of P. O. J. 36, but so delayed the maturity of the cane that the yield of sugar from the fertilized plot exceeded that of the unfertilized plot by only a small margin. Sulphate of ammonia again gave very satisfactory results. Increased yields of cane and of sugar were obtained from the use of cowpeas as a green manure crop. Observations on the value of nitrogenous fertilizers in combating a root disease of sugar cane indicated that considerable improvement followed the use of sodium nitrate and sulphate of ammonia, while stable manure also gave beneficial results, although to a less marked degree.

Tucumán sugar canes in 1919, W. E. CROSS (*Rev. Indus. y Agr. Tucumán*, 9 (1919), No. 11-12, pp. 161-167, fig. 1; *abs. in La. Planter*, 63 (1919), No. 22, pp. 349, 350, fig. 1).—Observations on cane varieties grown from seedlings produced in Tucumán during 1917 and 1918 are briefly noted. It is stated that a number of nurseries have been established in frost-free sections of northern Argentina, where it is hoped to procure seedling canes from seed produced in Argentina by specially selected canes.

Further trials with the cultivation of Réunion tobacco, H. A. TEMPANY and G. G. AUCHINLECK (*Dept. Agr. Mauritius, Gen. Ser., Bul. 15* (1919), [*English Ed.*], pp. 20).—Experimental and large-scale tests of growing Réunion tobacco in Mauritius, supplementing work previously noted (*E. S. R.*, 40, p. 442), are said to prove definitely that this type of tobacco can be successfully grown in the island, and that it yields a product well suited to local requirements.

Wheat growing in Wisconsin, E. J. DELWICHE and B. D. LEITH (*Wisconsin Sta. Bul. 305* (1919), pp. 18, figs. 7).—The adaptation of the crop to various types of soil in the State is indicated, and cultural methods and field practices deemed best for growing wheat in Wisconsin are described. Based on variety tests reported, covering a number of years and conducted in different parts of the State, Turkey Red (Pedigree No. 2), winter wheat, and Marquis (Wisconsin No. 50), spring wheat, are recommended for the southern part of the State; and Turkey Red and Bacska (Pedigree No. 408), winter varieties, and Red Fife and Marquis, spring varieties, for the northern section.

Wheat in East Africa, W. J. DOWSON (*Dept. Agr. Brit. East Africa Bul. 4* (1919), pp. 16).—This is a rather popular account of the cultural methods and field practices employed in growing the crop in British East Africa.

HORTICULTURE.

Manual of gardening in New Zealand, D. TANNOCK (*Christchurch, New Zealand, and London: Whitcombe & Tombs, Ltd., pp. 298, pl. 1, figs. 106*).—A manual of information relative to the planting, culture, and care of all kinds of ornamentals, vegetables, fruits, and nuts in New Zealand, including special chapters on Hardy Bulbs and Garden Foes, by A. E. Lowe; on Vegetable and Fruit Growing, by W. Sinclair; and on Rose Growing for Exhibition, by R. Nicoll.

A little garden the year round, G. TEALL (*New York: E. P. Dutton & Co., 1919, XV+227, pls. 17*).—A popular treatise on ornamental and vegetable gardening, including chapters on the culture and care of indoor plants.

Forcing vegetables in hotbeds, J. BÖTTNER (*Die Frühbeetreiberei der Gemüse. Frankfurt on the Oder: Trowitzsch & Son, 1917 pp. 119, figs. 92*).—A treatise on hotbed practices, including specific directions for growing the more important vegetables.

Mushroom culture (*Champignon Culture Rationelle*. Paris: Libr. Larousse, pp. 32, figs. 15).—This pamphlet contains practical instruction for commercial mushroom culture, including chapters on diseases and other enemies, poisonous mushrooms, and methods of cooking and conserving.

Growing tomato seed, W. W. TRACY (*Seed World*, 7 (1920), No. 3, pp. 18, 19, fig. 1).—A paper on this subject delivered before the National Cannery Association, Cleveland, on January 29, 1920.

Seed farming in Britain, A. J. MACSELF (*Burnley, England: Hortus Printing Co., Ltd., 1919, pp. 32*).—A small practical treatise on the cultivation of vegetables for the production of seeds.

The nursery-manual, L. H. BAILEY (*New York: The Macmillan Co., 1920, pp. XI+456, pls. 12, figs. 226*).—A new edition of the author's Nursery-Book (E. S. R., 8, p. 602) completely revised and reset.

The recognition of fruit: Graphic records, H. E. DURHAM (*Jour. Pomol., vol. 1, No. 1, pp. 28-36, figs. 3*).—The author calls attention to the faulty illustrations and drawings which frequently accompany the descriptions of fruits, and presents details for making simple graphic records with special reference to apples and pears.

Timely measures for grafting old fruit trees, F. SCHÖNBERG (*Zeitgemässe Massnahmen beim Umpfropfen Älterer Obstbäume*. Stuttgart: Eugen Ulmer, 1917, pp. 41, figs. 45).—In this small work the author describes and illustrates proper and improper methods of shaping and top-working old fruit trees, with special reference to the apple and pear.

Pruning trees to bearing age, W. P. TUFTS (*Blue Ribbon Peach News*, 1 (1920), No. 1, pp. 5, 26, 27, figs. 10).—Practical observations on the pruning and shaping of young fruit trees, based on pruning studies conducted by the author at the California Experiment Station (E. S. R., 42, p. 138).

The bush fruit: Quickly remunerative fruit-growing by simplified methods, J. BÖTTNER (*Das Buschobst: Schnell Lohnende Obstzucht nach Vereinfachtem Verfahren*. Frankfort on the Oder: Trowitzsch & Son, 1918, pp. 5+112, figs. 75).—A treatise on the culture of orchard fruit trees in the form of bushes.

A possible method of retarding the flowering of fruit trees, F. DIÉNER (Rev. Vitic., 51 (1919), No. 1328, pp. 379, 380).—Chlorin gas was liberated in the vicinity of a cherry tree and a peach tree. The gas attacked the trees and they appeared to be completely scorched and destroyed. However, the trees came into bloom late in the season and set fruit, hence the author suggests the possible utilization of chlorin and other asphyxiating gases for retarding the blooming period of fruit trees, with the view of producing fruit after the normal season.

Report on tests of self-sterility in plums, cherries, and apples at the John Innes Horticultural Institution, I. SURTON (*Jour. Pomol., Vol. 1, No. 1, pp. 1-19*).—A reprint of the investigations previously noted (E. S. R., 40, p. 148).

A study of sterility in the plum, M. J. DORSEY (*Genetics*, 4 (1919), No. 5, pp. 417-488, pls. 5).—A contribution from the Minnesota Experiment Station continuing previous work relative to unfruitfulness in the plum (E. S. R., 41, p. 445). Cytological studies were made of pollen and pistil development in a representative group of plum varieties and hybrids. The various stages of development are described and discussed with the view of throwing some light on inherent causes of the self-sterility, which occurs uniformly among the varieties of American species of plum. A bibliography of cited literature is given.

The author found that pollen development under Minnesota conditions proceeded no farther in the fall than the archesporial-cell stage, and growth in the spring began about April 1. The tissues of the mature anther developed and functioned normally so that there appeared to be influences from this source which would contribute to pollen abortion. Normal pollen development was typical in the group of plums studied. While many aborted grains were found in all varieties studied, and in some supposedly pure species, pollen abortion was not a cause of sterility except in rare instances where suppression was complete. The percentage of aborted pollen was higher in hybrids than in species supposed to be pure. In many of the hybrids pollen was found to break up into yellowish, oily globules, thus accounting for the fact that pollen of some varieties is "sticky" at dehiscence and is not readily blown away by the wind. Stamens may metamorphose into either petals or pistils, but in the anthers affected new types of aborted pollen were not found. In general neither self- nor cross-sterility could be explained upon the basis of pollen abortion.

Pistil development in the fall showed no evidence of the growing point from which the ovule is formed. At bloom the ovary may contain two ovules in each of which there are four to eight nuclei. Typically, either before or soon after bloom one of the ovules was suppressed, but many variations were found in the degree of growth before suppression. Pistils were found to drop in three waves, separate and distinct in point of time and size. The first drop, in which all of the pistils were aborted, occurred immediately after bloom. Flowers bearing aborted pistils generally bore normal pollen. The second drop occurred two to four weeks after bloom, and included all pistils in which, for any reason, fertilization had not taken place. In pistils which fell at this time the ovaries had attained a size of 2 to 5 mm. The third or "June drop" followed the second by an interval of about two weeks. The plums were larger than in the second drop and fertilization had taken place, but embryo development had stopped.

Controlled plum crosses of different combinations were found to set different percentages of fruit. In some crosses no fertilization took place and all pistils fell in the second drop, in other crosses fertilization occurred but either a part or all of the pistils dropped. In general, all varieties studied were found to be self-sterile, some cross-sterile, and others cross-fertile. The type of sterility, either self or cross, was found to be that termed incompatibility, in which gametic fusion is prevented by slow tube growth. Some pollen grains, apparently normal, failed to germinate under the conditions of the stigmatic fluid, while others developed pollen tubes under similar conditions. These differences are attributed to something inherent in the grains rather than in their substratum, which either in the case of another sap or stigmatic fluid may be regarded as homogeneous throughout. This condition can be explained by differences in genetic constitution.

A study of the formation and development of the flower buds of Jonathan and Grimes Golden in relation to different types (clover sod, blue grass sod, cover crop, and clean tillage) of soil management, R. S. KIRBY (Proc. Iowa Acad. Sci., 25 (1918), pp. 265-289, figs. 12).—A progress report of studies being conducted at the Iowa Experiment Station (E. S. R., 40, p. 148). A bibliography of related literature is included.

The data here presented show that the formation and development of flower buds of the Jonathan and Grimes Golden varieties subjected to four types of soil management were associated with a number of factors, of which the most important appeared to be the amount of soil moisture. This also affects the

growth of the trees and probably the size of the crop at the same time as it affects the formation and development of flower buds.

"Flower buds were formed, that is, differentiated from leaf buds, earlier on sod plats than on plats receiving some cultivation each year. The earliest time at which flower buds were formed occurred on clover sod with a low percentage of soil moisture. Flower buds formed earlier on a clover sod than on a blue-grass sod having slightly less soil moisture. On the other hand, flower buds formed earlier on a blue-grass sod than on a clover sod having about 2.5 per cent more soil moisture. These facts indicate two things, first, that the addition of nitrates in the clover sod causes the flower buds to form earlier; and second, that the amount of soil moisture is a very important if not the chief external factor in determining the time at which flower buds form.

"The formation of flower buds began about the first of July on the plats where it occurred earliest and extended until the middle of September on the plats where it occurred latest, thus occupying a period of about 2.5 months. The time occupied by each tree in forming flower buds was about four weeks. Trees in sod produced the largest proportion of flower buds, and those in clover sod, which supposedly contained the most nitrates, produced a much larger proportion of flower buds than those in blue-grass sod. The period covering the time during which the different trees formed and developed their flowers extended from about July 1, 1916, to May 17, 1917, thus being about 10 months in length.

"Apple flowers have two periods of rapid growth. The first one immediately follows the differentiation of the flower bud from the leaf bud, and during this period, which is about 6 weeks in length, the floral organs are differentiated. During the second period, which begins about 6 weeks previous to the opening and ends with the full expansion of the flower, the floral organs increase their size many times. During the time intervening between the two periods of rapid growth, growth continues but is slow."

Some promising new pear stock, B. T. GALLOWAY (*Jour. Heredity*, 11 (1920), No. 1, pp. 25-32, figs. 8).—Notes on some of the more promising oriental pear stocks introduced and now being tested by the Office of Foreign Seed and Plant Introduction of the U. S. Department of Agriculture.

The length of stem in pears and apples, E. A. BUNYARD (*Jour. Pomol.*, vol. 1, No. 1, pp. 20-22, fig. 1).—The author presents some evidence to show that the length of stem can not be accepted as a very constant character, and is of little value in diagnosing varieties of pears and apples.

The strawberry and its cultivation in Canada, W. T. MACOUN (*Canada Expt. Farms Bul.* 92 (1919), pp. 39, figs. 11).—In the present revised edition of Bulletin 62 (E. S. R., 22, p. 733) sections on Insects Affecting the Strawberry, by the Entomological Branch (pp. 31-35), and Common Strawberry Diseases, by W. A. McCubbin (pp. 35-39), have been added.

Loganberries and Evergreen blackberries, J. L. STAHL (*Washington Sta., West. Wash. Sta. Mo. Bul.*, 7 (1920), No. 10, pp. 154-157).—Concise directions are given for the culture and care of Logan and Evergreen blackberries.

Specialized mulberry culture, F. ZAGO (*Italia Agr.*, 56 (1919), No. 12, pp. 371-373, pl. 1).—A discussion of methods of growing mulberries with reference to maximum leaf production for silkworm culture.

The fertilizing action of sulphur on grapevines, J. CHAUZIT (*Bul. Agr. Algérie, Tunisie, Maroc.*, 2. ser., 25 (1919), No. 12, pp. 295, 296).—Continuing investigations previously reported (E. S. R., 31, p. 442), experiments were conducted to verify the effect of sulphur on vines which had received no fertilizer for two years, to compare the effects of sulphur and horse manure, and to determine the effect of sulphur mixed with horse manure.

The data secured confirm the author's earlier conclusion as to the general beneficial effect of sulphur on the yield of grapes. In view of the dry conditions subsequent to the various applications, a plat receiving horse manure at the rate of about 14 tons per acre yielded somewhat less than the check plat, whereas a plat receiving the same amount of stable manure plus 175 lbs. of sulphur per acre yielded much higher than the check plat. It appeared that the sulphur exerted a decomposing action on the stable manure, although no conclusion is thus far drawn as to the exact cause of the beneficial action produced by the sulphur. The experiments are to be continued.

Possible uses for wine-grape vineyards, F. T. BIOLETTI and W. V. CRUESS (*Cal. State Bd. Vitic. Commrs. Bul. 14* (1919), pp. 18).—The methods proposed and listed here are of four types, shipping the fresh grapes to countries which do not prohibit wine making, utilization of grapes for other purposes, such as raisins, for home wine making; grape juice, grape sirup, vinegar, grape sugar, cream of tartar, etc.; grafting the vines with raisins and other table varieties; and replacing the vines with other crops.

On the chinin or coyo (*Persea schiedeana*), G. ITIÉ (*Agron. Colon., 4* (1919), No. 27, pp. 78-82, fig. 1).—The author concludes that the chinin previously described by him as a peculiar form of avocado obtained from the State of Tabasco, Mexico (E. S. R., 40, p. 151) is synonymous with the coyo described by Popenoe in his report on the avocado in Guatemala (E. S. R., 41, p. 45).

Cinchona culture in Java, LOBLE (*Bul. Écon. Indochine, n. ser., 22* (1919), No. 138, pp. 761-764).—A concise statement of the adaptation of different varieties of cinchona to Java conditions, methods of propagation, planting, and care of plantations.

Selection of stocks in citrus propagation, H. J. WEBBER (*California Sta., Bul. 317* (1920), pp. 269-301, figs. 14).—This bulletin presents in detail the results secured in comparative tests with large, intermediate, and small nursery trees used as stocks for oranges and grapefruit. The results of these tests have been summarized in a previous paper by the author (E. S. R., 42, p. 140).

Strains of Satsuma oranges in the United States, L. B. SCOTT (*Proc. Gulf Coast Hort. Soc., 4* (1918), pp. 3-8).—A discussion of variation in the Satsuma orange based upon observations of the author and Tanaka previously noted (E. S. R., 40, p. 342). Instructions are given for keeping tree performance records similar to those used in Chamel's work with citrus fruits in California (E. S. R., 37, p. 144), with the view of eliminating worthless variations from the groves.

Rate of increase in temperature with altitude during frosty nights in orange groves in southern California, F. D. YOUNG (*Cal. Citrogr., 5* (1920), No. 5, pp. 136, 160, 161, figs. 3).—A discussion of the factors which cause stratification of the lower air on cool, calm nights, including data showing what the actual extent of this stratification was found to be on certain representative nights in the Pomona Valley.

The data given show the minimum temperatures registered at 5-ft. levels on a 40-ft. tower on 44 cool nights during 1919 and 1920. The average temperature for the 44 nights at the 5-ft. level was 32.8° F. and at the 40-ft. level was 40.4°. This data was secured over relatively level ground. The author points out that on steep hillsides and at the bases of steep hills other factors enter into the problem, and the increase in temperature with altitude may be much more pronounced.

In view of the fact that efforts are being made to perfect some method whereby the warmer air of the upper stratas may be mixed with the cool air

of the lower stratas, the author points out that if such a machine could be devised the effect on the temperature near the ground would be much less on a night with long continued extremely low temperature than on a night when the temperature fell steadily all night and a dangerous temperature was not reached until after midnight.

The coco palm or coconut tree, L. T. MAIJER (*De Kokospalm of Klapperboom. Batavia: G. Kolff & Co., 1917, pp. 7+71, figs. 24*).—A monograph on the coco palm (*Cocos nucifera*), with reference to its botany, history, East Indian names of the various parts and products of the palm, varieties, soil requirements, details of culture, harvesting, preparation of copra, oil, fiber, and other products, the traditions of the Javanese relating to the coconut tree, the coconut tree and its products in the language of the people, and the importance of palm culture to the natives of Java.

Curing of vanilla beans (*Vanilla planifolia*) (*Imp. Dept. Agr. West Indies, Rpt. Agr. Dept. St. Kitts-Nevis, 1917-18, pp. 28-31; also in Trop. Agr. [Ceylon], 53 (1919), No. 5, pp. 312-314*).—Experiments conducted at the St. Kitts-Nevis Botanic Station indicate that the practice of dipping the beans of *V. planifolia* in hot water prior to the sweating process can not be dispensed with. If hot water is not used the beans turn brown after some time, then black, and finally burst, the pleasant odor of cured vanilla being entirely absent.

The water should have a temperature of from 80 to 90° C. (176 to 194° F.) for the development of good aroma. Boiling water seems to destroy to some extent the action of the oxidase. Sweating the beans in glass-topped boxes, in which a temperature of 50° was maintained, gave good results. After sweating, the beans are allowed to dry slowly at room temperature, which takes about two weeks. They should then be packed in air-tight tins as soon as possible, otherwise much of the aroma is lost and they become somewhat hard.

The culture of medicinal plants, A. GORIS and J. DEMILLY (*La Culture des Plantes Médicinales. Paris: Vigot Bros., 1919, pp. XI+143, figs. 29*).—The introductory chapter of this manual contains some general notes on the culture of medicinal plants and methods of preparing them for market. Each plant is then considered with reference to its distinguishing characteristics, uses, cultural requirements, and harvesting period.

Notes on the early history of the pecan in America, R. H. TRUE (*Ann. Rpt. Smithsn. Inst., 1917, pp. 435-448*).—A contribution to the history of the pecan, gleaned largely from unpublished manuscripts and from old or rare works not easy of access. A reference list of cited literature is included.

Pecans, other than those of the well-known sections, J. F. JONES (*Amer. Nut Jour., 12 (1920), No. 2, pp. 25, 30*).—In this paper the author points out the unreliability of many southern varieties of the pecan when grown in the North, and suggests the utilization of Iowa-grown varieties for northern planting.

Diversification in orchards, W. C. GRIFFING (*Proc. Gulf Coast Hort. Soc., 1 (1915), pp. 25-34*).—The author suggests several fruit crops suitable for interplanting in pecan groves, and also gives a descriptive list of special varieties and classes of trees suitable for ornamental planting in the Gulf Coast region of the United States.

Street trees, F. L. MULFORD (*U. S. Dept. Agr. Bul. 816 (1920), pp. 58, figs. 37*).—A treatise on street trees, their selection, culture, and care. Introductory considerations deal with the importance of shade trees, public control of street trees, planning for trees on city streets, spacing trees, conditions for tree growth, and kinds of trees suitable for city streets.

The United States is arbitrarily divided into 13 regions, and a list is given of trees of desirable varieties for street planting in each region. A descriptive list of the more important street trees is also given, together with details relative to the culture and care of trees. A list of publications of this Department relating to diseases and insects affecting shade and ornamental trees is appended.

Systematic tree planting in country planning, W. W. ANDREWS (*Canad. Forestry Jour.*, 16 (1920), No. 1, pp. 24, 25).—A concise enumeration of the benefits to be derived by general traffic and by the farmer through the systematic protection of prairie roads and farms by tree planting.

Parks and gardens, G. and P. ADOLPHE-BELLAIR (*Parcs et Jardins. Paris: J. B. Baillière & Sons, 1919, pp. 382, figs. 227*).—A treatise on landscape gardening issued as one of the volumes of the *Encyclopédie Agricole*, published under the direction of G. Wery. Part 1 deals with the elements and materials of the landscape garden, and part 2 with the principles and practice of landscape gardening.

FORESTRY.

Forests, woods, and trees, A. HENRY (*London: Constable & Co., Ltd., 1919, pp. XII+314, pls. 21, figs. 21*).—In the introductory chapters of this book the author considers the influence of forests on climate, stream flow, soil erosion, wind, and purity of air and water. The value of forest districts as sites for sanatoria, and the history and utility of parks, open spaces, and trees in towns are then discussed. The concluding chapters of the book are devoted to a study of the afforestation of the important water catchment areas in Great Britain and Ireland, including a descriptive list of trees suitable for planting in these areas and for general planting.

Report of the director of the National Park Service to the Secretary of the Interior for the fiscal year ended June 30, 1919, S. T. MATHER (*U. S. Dept. Int., Rpt. Div. Natl. Park Serv., 1919, pp. 384, pls. 35, figs. 6*).—A report on the administration, protection, improvement, public use, and revenues of the U. S. National Park system for the year ended June 30, 1919, including a summary of conditions in each park and monument, their important needs, plans for future development, and recent and pending legislation relating to the park system. The report is accompanied by several appendixes containing the reports of officers in charge of each park, as well as maps, statistics, legislation, bibliographies, and miscellaneous information relative to the parks.

Annual report of the director of forestry of the Philippine Islands for the fiscal year ended December 31, 1918, A. F. FISCHER (*Ann. Rpt. Dir. Forestry P. I., 1918, pp. 83, pls. 5*).—A report for the year on activities of the divisions of forest management, investigation, sawmills and utilization, forest lands and maps, and administration, the office of the wood expert, and the forest school, including recommendations relative to needed legislation. Statistical data relative to land applications, timber licenses, yield of major and minor forest products, revenues, and expenditures for the year are appended.

Report on forest administration in Burma for the year ended June 30, 1918, H. CARTER (*Rpt. Forest Admin. Burma, 1918, pp. III+5+114, pl. 1*).—A report on the administration and management of the State forests in Burma for the year ended June 30, 1918. Important data relative to alterations in forest areas, forest surveys, working plans, production, grazing operations, yields in major and minor forest products, revenues, expenditures, etc., are appended in tabular form. A glossary of vernacular or local names and expressions used in the report is included.

National forest range improvement and development, J. H. HATTON (*Producer*, 1 (1920), No. 9, pp. 9-12, figs. 3).—This paper gives a brief résumé of the activities of the Forest Service of the U. S. Department of Agriculture, with reference to the regulation of grazing, the construction of range improvements, and the artificial reseeding of ranges.

Economy and efficiency in handling forest products a national necessity, A. P. NELSON (*Cong. Rec.*, 59 (1920), No. 63, pp. 3626-3828).—A résumé of the scope of the work of the Forest Products Laboratory at Madison, Wis., with special emphasis on the national importance of this work.

What our forests support, F. H. SMITH (*Amer. Forestry*, 26 (1920), No. 313, pp. 16, 17).—A brief survey as to the nature and extent of the various industries dependent upon the forest resources of the country.

The forest resources of Virginia, R. C. JONES (*Va. Geol. Comm., Off. State Forester Bul.* 19 (1919), pp. 11).—A brief general statement as to the character, amount, value, and condition of the forest resources of Virginia, with a warning as to the destructiveness of present forest practices and the necessity of rational forest management both by the State and by private owners.

Plain statements on Canada's forests, F. J. D. BAERNJUM (*Canad. Forestry Jour.*, 16 (1920), No. 1, pp. 27-31, figs. 3).—A discussion of the limitations of Canada's wood supply, together with suggested remedies.

Forestry legislation in Canada during 1919, F. W. H. JACOMBE (*Canad. Forestry Jour.*, 16 (1920), No. 1, pp. 33, 34).—A résumé of forestry legislation concerning Dominion and Provincial forest lands in 1919.

Forestry and rural policy, J. S. MAXWELL (*Trans. Highland and Agr. Soc. Scot.*, 5. ser., 31 (1919), pp. 67-93, figs. 6).—In this paper the author discusses the factors that have led to the neglect of forestry in the British Isles and particularly in Scotland, and points out the effect of the war in depleting the timber reserves of Scotland. He then presents the essential factors of the forest policy for the United Kingdom as developed by the Reconstruction Committee, and discusses these factors with special reference to their application to Scottish conditions.

The forest policy of France, W. B. GREELEY (*Amer. Forestry*, 26 (1920), No. 313, pp. 3-9, figs. 7).—This article deals particularly with the control of sand dunes and mountain torrents in France. It is based upon material taken largely from Cours de Droit Forestier, by C. Gugot, and from data prepared by G. Garbe.

The forest situation in modern Greece, C. G. SKLAWUNOS (*Forstwiss. Centbl.*, 41 (1919), Nos. 3, pp. 81-90; 5, pp. 173-184; 7, pp. 249-264).—An account of the forests of Greece with reference to their extent, distribution, ownership, and component species; forest policy, protection, the timber industry; and exports and imports.

Note on the vegetation of Cyrenaica and on its agricultural utilization, A. MAUGINI (*Agr. Colon. [Italy]*, 13 (1919), No. 12, pp. 515-546, figs. 8).—A descriptive account of the physical features and vegetation of the territory of Cyrenaica, in northern Africa, with special reference to the pastures and woods. A list of collected plants is included.

Rate of growth of indigenous and exotic trees in New Zealand, E. MAXWELL (*New Zeal. Jour. Sci. and Technol.*, 2 (1919), No. 6, pp. 371-376, fig. 1).—Data are given showing the rate of growth in New Zealand of indigenous trees as compared with the rate of growth of exotic trees there and with the rate of growth of foreign trees in foreign countries. Data are also given showing the rate of growth of 34 specimens of Eucalyptus of value for timber.

In view of the fact that several of the commercially important foreign species attain marketable size in a much shorter time than the important native species,

the author concludes that it would be a hopeless undertaking to attempt to provide even a small portion of the future timber needs of the country by growing native trees.

The germination of some trees and shrubs and their juvenile forms, L. H. PAMMEL and C. M. KING (*Proc. Iowa Acad. Sci.*, 25 (1918), pp. 291-340, figs. 76).—In continuation of a similar study of oaks (E. S. R., 40, p. 47), data are given on germination tests on a number of trees and shrubs, together with descriptions and illustrations of their seedling forms.

The reproductive organs of *Hevea brasiliensis*, C. HEUSSER (*Arch. Rubbercult. Nederland. Indië*, 3 (1919), No. 11, pp. 455-514, figs. 15).—Results are presented of a morphological and cytological study of the reproductive organs of *Hevea brasiliensis*. In addition to the descriptive text various phases of the study are presented in a series of plates. A bibliography of cited literature is included.

DISEASES OF PLANTS.

Recent literature on fungus diseases of plants, L. H. PAMMEL (*Trans. Iowa Hort. Soc.*, 53 (1918), pp. 185-225).—A condensed account is given of the literature relating to plant diseases as noted by the author during the year. The several sections include information relating to diseases of apple, pear, quince, potato, tomato, root crops, vegetables, fruit and forest trees, cereals, and forage crops, also miscellaneous diseases and other forms of injury. An account is also given of remedial measures.

A discussion of systematic papers is followed by a short sketch history of phytopathology.

Botany and plant diseases, F. C. STEWART (*N. Y. State Hort. Soc. Proc.*, 1 (1919), pp. 19-24).—Winter injury is briefly discussed as noted following the severe conditions of 1917-18.

The unusually succulent condition of peach twigs in the fall may, it is thought, have had something to do with what is termed spray injury following fall application of soluble sulphur and the use of lime sulphur at a strength suitable for scale. Recent literature on fruit diseases is indicated and briefly discussed.

[Experimental work with plant diseases, Ontario], W. H. HEARST (*Rpt. Min. Agr. Ontario, 1917*, pp. 60-62).—Bordeaux mixture appears to be of little utility as against onion blight. Combined with Black Leaf 40, it gives hope of controlling celery black heart through its destructive effects on the tarnished plant bug, which is believed to be responsible for injury leading to infection resulting in this disease.

Lime sulphur dust and lead arsenate in dust form applied over a limited potato area gave an increased yield of cleaner and larger tubers. The use of dust mixtures is recommended for celery blight, but formalin was not successful after this disease was once well started.

Experiments with soil treatment practically amounting to partial sterilization are being tested out in various greenhouses in the Province.

Botany [Ontario, 1917] (*Ann. Rpt. Ontario Agr. Col. and Expt. Farm*, 43 (1917), pp. 24-31).—Attention is given in this report mainly to such diseases of potato as late blight, leaf roll, mosaic, and curly dwarf; to celery late blight; to seed oats treatment with formalin; to snapdragon rust; to white pine blister rust; and to a peculiar disease of winter tomatoes.

Report of the mycologist, R. H. BUNTING (*Govt. Gold Coast, Rpt. Agr. Dept.*, 1917, pp. 19-21).—Cacao brown pod showed an increase at Aburi. Spraying results were not decisive. White thread was particularly prevalent on cacao growing in clay soil and under forest shade.

The Liberian coffee fruit disease, which advances rapidly in the wet season, does not attack other species of coffee growing near infected *C. liberica*. Bordeaux mixture checks the disease, but its use is not economical. The causal organism has been determined as a new species of *Muratella*, and is to be described later under the name *M. coffea*.

Para rubber shows a disease resembling that described usually as stripe canker, and associated with the same fungus (*Phytophthora faberi*). The latex yield is considerably affected. Treatments with solutions of creosote and with lysol were too expensive for practical purposes. A 20 per cent carbolineum treatment is recommended. Leaf disease (*Helminthosporium heveæ*) caused much damage in one place by defoliation.

The peanut crop was practically destroyed at Aburi and Peki by *Cercospora personata* and by bunching disease, the cause of which is not yet known. Sweet potato was seriously attacked by a fungus corresponding mainly to *Lasiodiplodia tubericola*. *Hymenochaete noxia* fatally attacked *Cedrela odorata*, *Coffea robusta*, *Anona muricata*, and *Persca gratissima*. *Polyporus lignosus* caused the death of a specimen of *Melia azadirachta*. *Hemileia* n. sp. caused damage to *Strophanthus hispidus* at Aburi. A description will be published later. A brief account is given of the facts ascertained in connection with the general sanitation of cacao as related to protection from diseases and to yield from recovered plants.

The present state of grain treatment for cereal diseases, L. HILTNER (*Landw. Jahrb. Bayern*, 8 (1918), No. 4-5, pp. 173-206).—A report is made regarding the various plans, methods, and practices designed to minimize the injurious effects of seed-borne cereal diseases.

[Fungicidal treatment of cereal seed], G. IRLBACH (*Landw. Jahrb. Bayern*, 8 (1918), No. 4-5, pp. 206-210).—This is a more condensed account than that of Hiltner above noted of the treatments for seed-borne cereal diseases.

The extermination of the common barberry to prevent crop leakage due to stem rust, L. H. PAMMEL (*Trans. Iowa Hort. Soc.*, 53 (1918), pp. 401-408).—An account is given of the relation of barberry to stem rust of wheat and oats and of the measures during and since 1917 to eradicate the barberry hosts.

Formaldehyde treatment of seed corn, F. D. RICHEY (*Jour. Amer. Soc. Agron.*, 12 (1920), No. 1, pp. 39-43).—This paper, a contribution from the U. S. Department of Agriculture, describes observations on the effect upon germination of treating seed corn with formaldehyde solutions of different strengths and for different periods in an effort to prevent the growth of fungi on the seedlings grown in water cultures. Germination tests were made both in water cultures and in sand.

"Treatment of seed corn with solutions of 5, 15, and 25 cc. of formaldehyde per liter materially reduced the development of fungi on the plants grown in water culture. The vitality of the seed, as evidenced by the development of the seedlings in either water culture or sand, was not affected by treatment with the solution of 5 cc. of formaldehyde per liter. Treatment with the solution of 15 cc. of formaldehyde per liter did not materially affect the seedlings grown in water culture, but nevertheless was injurious, as evidenced by the germination and development in sand. Treatment with 25 cc. per liter was markedly deleterious . . . Soaking seed corn for two hours in a solution of 5 cc. liquor formaldehyde in 995 cc. of water, followed by a fuming period of from 2 to 24 hours, can therefore be recommended as checking fungus development without interfering with the normal development of corn seedlings in water culture."

A preliminary study of the inheritance of rust resistance in oats, J. H. PARKER (*Jour. Amer. Soc. Agron.*, 12 (1920), No. 1, pp. 23-38, pls. 2).—This paper, a contribution from the U. S. Department of Agriculture, describes work conducted at Cornell University in a study of the genetic behavior of rust resistance in pedigree lines and in a large number of F_2 generation hybrids of Burt and Sixty-Day oats. The methods of seeding, inoculating, and recording the observations were the same as those previously noted (E. S. R., 38, p. 849). Most of the inoculations were made on seedlings, although a sufficient number were made at time of heading to demonstrate that the results were similar. The rusts employed included the crown or leaf rust of oats (*Puccinia lolii avenæ*) and the stem rust of oats (*P. graminis avenæ*). The results secured may be summarized as follows:

Burt and Sixty-Day and all hybrids of these varieties so far tested were found to be entirely susceptible to stem rust. All plants of Sixty-Day also were uniformly susceptible to crown rust, while of 223 inoculated plants of Burt, 48 were classified as resistant, 152 as intermediate, and 23 as susceptible.

Each of five hybrid families contained, in the F_2 generation, some plants showing a high degree of resistance to crown rust and others which were as susceptible as plants of the Sixty-Day parent, while a rather large number was classified as intermediate, showing varying degrees of resistance. The numerical results of inoculations of 468 seedlings made in the F_2 hybrids were as follows: Classified as resistant, 81; classified as intermediate, 61; and classified as susceptible, 326. These results are held to indicate that susceptibility to crown rust in this cross is partially dominant, while resistance is recessive. This behavior is not thought to be due to environmental conditions or to differences in the metabolism of the host but to definite genetic factors, although nonhereditary factors may influence or modify it.

It is stated that rust resistance and susceptibility can hardly be considered as simple characters or as being determined by a single factor difference, the F_2 results favoring the view that several factors are involved, i. e., the multiple factor hypothesis. No attempt has been made to construct a definite factorial hypothesis to explain the results obtained.

This preliminary work has proved the possibility of transferring resistance to crown rust from the Burt variety to plants of the F_2 generation of a Burt \times Sixty-Day cross, suggesting a further use of the method of hybridization in the effort to produce rust-resistant varieties of oats.

A list of 19 references, comprising the literature cited, is appended.

Potato diseases in Hawaii and their control, C. W. CARPENTER (*Hawaii Sta. Bul.* 45 (1920), pp. 42, pls. 15, figs. 7).—A study has been made of some of the causes of potato crop failures in Hawaii, and the author states that they are due largely to the use of poor seed, continuous cropping, diseases and insect pests, and unsatisfactory soil conditions. The following diseases and insect pests of the Irish potato are reported as present in Hawaii: Fusarium wilt (*Fusarium oxysporum*), late blight (*Phytophthora infestans*), early blight (*Alternaria solani*), black scurf and rosette (*Rhizoctonia solani*), Sclerotium wilt (*Sclerotium rolfsii*), common or corky scab (*Actinomyces chromogenus*), tuber rots (*P. infestans*, *F. oxysporum*, *F. radicicola*, and *F. cæruleum*), tuber moth (*Phthorimæa operculella*), cutworms, mite disease, and nematodes (*Heterodera* sp.); and the nonparasitic troubles sunscald, sunburn of tubers, leaf tipburn, hollow potato, pronged potatoes, and arsenical injury. For the improvement of the potato industry the author recommends the universal adoption of the practices of seed selection and disinfection, crop rotation, and spraying with Bordeaux mixture.

A further report on the value of dusting v. spraying to control fruit tree insects and fungus diseases, L. CAESAR (*Ann. Rpt. Ent. Soc. Ontario*, 48 (1917), pp. 79-85).—A series of experiments carried out in 1917 similar to that noted for the previous year (*E. S. R.*, 37, p. 832) is reported.

There was little difference as to cost of dusting as opposed to spraying in case of large trees, but the spray is the cheaper with small trees. The liquid spray is preferred until such time as improved dust substitutes or dusting machinery or both are available.

Field and investigation work [on fruit diseases and insects in Ontario] (*Ann. Rpt. Ontario Agr. Col. and Expt. Farm*, 43 (1917), pp. 20-24).—In this report it is stated that a second year's test of the dust method of spraying for fruit insects and plant diseases has been made. The liquid appeared to be the better form for apple scab. It is thought that spraying may be better for the average fruit grower.

Brown rot of sweet cherry is satisfactorily controlled with a series of four treatments. The trees are sprayed a day or two before the buds open with lime sulphur of specific gravity 1.035; again after the blossoms fall with lime sulphur of specific gravity 1.008; with the same just as the cherries begin to color; and finally, they are dusted with finely-ground sulphur and talc two or three days before picking begins.

Pear blight control has passed its fifth-year test, showing satisfactory success at low expense where the care and management are adequate. The raspberry variety Herbert appears to be immune to raspberry yellows. Accounts are given of operations against insect pests. A list of publications issued is also given.

[**Fruit and berry diseases in Ontario**], W. H. HEARST (*Rpt. Min. Agr. Ontario*, 1917, pp. 42-45).—A substantially identical report is noted above.

The spike disease of peach trees: An example of unbalanced sap circulation, A. and G. L. C. HOWARD (*Indian Forester*, 45 (1919), No. 12, pp. 611-617, pt. 1).—The authors deal with a pathological condition of peach trees closely resembling spike of sandalwood and supposedly due to the same general cause, which is asserted by Hole to be prolonged unbalanced sap circulation (*E. S. R.*, 39, p. 255).

The trouble is described as it occurs, generally on peach budded on almond in certain localities. The principal direct cause appears to be interruption at the union of graft and stock. The idea of an ultramicroscopic parasite is rejected.

Spike disease of sandal, R. S. HOLE (*Ann. Rpt. Bd. Sci. Advice India*, 1917-18, pp. 33, 34).—A field study of spiked sandal is briefly noted.

One of the most characteristic symptoms of this disease is the accumulation of carbohydrates (usually starch) in the leaves and twigs. The disease appears also to be associated with factors decreasing water supply or translocation of organic food, such as injury by fire or attacks by fungi, killing the twigs and injuring the cortex. It may be the result of prolonged action of such factors, and appropriate experiments have been initiated. It is thought that the transport of organic food in the cortex may be hindered in some such way as that suggested by Brierley (*E. S. R.*, 41, p. 453).

A possible cause of spike in sandal, A. B. JACKSON (*Indian Forester*, 45 (1919), No. 12, p. 635).—It is stated that the symptoms of spike are such as might be brought about by a prolonged unbalanced circulation of sap. No fungus or insect has been shown to cause the trouble. Spike usually occurs where the growth of sandal is densest, often at great distances from the nearest spiked area. Sandal is a root parasite and is parasitic on a large number of

trees, including those of its own species. The question is raised whether a prolonged unbalanced circulation of sap and consequent spike disease might not be produced by excessive parasitism of sandal on sandal.

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Whitetail deer in New York.—A study of the operations of the buck law, W. S. CARPENTER (*Albany: N. Y. Conserv. Comm.* [1919], pp. 31, figs. 6).—The study of the habits of the whitetail deer here reported led to the conclusion that the deer law should be amended to admit of the killing of only one buck and the season should be shortened by cutting out the first two weeks in October.

The gray wolf of South Dakota, B. DALRYMPLE (*Altoona, Pa.: Altoona Tribune Co.*, 1919, pp. 31, pls. 21).—This account of the gray wolf deals particularly with its habits as related to means for its destruction. The equipment required in combating the pest is considered.

Spirochaeta icterohæmorrhagiæ in the common rat in England, with remarks on the minute structure of these Leptospira, A. C. COLES (*Parasitology*, 11 (1918), No. 1, pp. 1-9, pls. 2).—Previously noted from another source (*E. S. R.*, 39, p. 759).

The bioclimatic law, A. D. HOPKINS (*Jour. Wash. Acad. Sci.*, 10 (1920), No. 2, pp. 34-40).

The collection and preservation of insects, E. G. SMYTH (*Rev. Agr. Puerto Rico*, 3 (1919), Nos. 2, pp. 17-33, pl. 1, figs. 2; 3, pp. 28-43, figs. 11).—A brief popular account.

Twelfth report of the State entomologist and plant pathologist, 1918-19, W. J. SCHOENE (*Quart. Bul. Va. State Crop Pest Comm.*, 1 (1920), No. 4, pp. 28, figs. 4).—This, the usual report (*E. S. R.*, 40, p. 647), covers the work for the biennial period ended September 30, 1919. Brief accounts are included on the sweet potato weevil (*Cylas formicarius*) and the oriental peach moth (*Laspeyresia molesta*), and reference is made to insect outbreaks during the period and the status of investigational work.

[**Leaflets on economic insects in Canada**] (*Canada Dept. Agr., Ent. Branch, Crop Protec. Leaflet* 11, pp. 2, figs. 5; 12, pp. 3, figs. 4).—These deal, respectively, with The Date on which It Is Safe to Reseed Fields in the Prairie Provinces after They Have Been Devastated by Cutworms, by E. H. Strickland, and The Beet Webworm (*Loxostege sticticalis*), by E. H. Strickland and N. Criddle.

Second hundred notes on Indian insects, T. B. FLETCHER (*Agr. Research Inst. Pusa Bul.* 89 (1919), pp. VII+102, pls. 32).—These notes, in continuation of the one hundred previously noted (*E. S. R.*, 36, p. 653), deal with insects of India of more or less economic importance.

Preliminary list of insects associated with cotton in Egypt, E. W. ADAIR (*Agr. Jour. Egypt*, 8 (1918), pp. 80-88).—This is an annotated list arranged by orders.

Report to the War Committee of the Royal Society on the work of the Grain Pests (War) Committee, W. A. HERDMAN (*Roy. Soc. [London], War Com. Memo.* 3 (1918), pp. 3).—A brief report of the work of the committee.

Monthly notes on grubs and other cane pests, II, J. F. ILLINGWORTH (*Bur. Sugar Expt. Stas. Queensland, Div. Ent. Bul.* 8 (1919), pp. 51, pls. 2).—This report, in continuation of that previously noted (*E. S. R.*, 41, p. 354), covers the year from July, 1918, to June, 1919.

Insect pests and plant diseases in the vegetable and fruit garden, F. M. DUNCAN (*London: Constable & Co., Ltd., 1919, pp. 95, pls. 12*).—A popular work.

Insects affecting the avocado in Trinidad and Tobago, F. W. URICH (*Bul. Dept. Agr. Trinidad and Tobago, 18 (1919), No. 3, pp. 129-131, pls. 2*).—The insects mentioned as attacking the avocado include *Solenopsis geminata*, which not only attends mealy bugs and scale insects but also bites off young bark from shoots and stems of the trees; scale insects, including *Pulvinaria pyri-formis*, *Aspidiotus destructor*, *Saissetia nigra*, *Pseudococcus nipæ*, and the citrus mealy bug; the webbing caterpillar (*Stericta albifasciata*, which sporadically attacks and devours young leaves and blossoms of tall trees; and several minor pests, namely, *Selenothrips rubrocinctus*, greenhouse thrips, and *Aleurodicus neglectus*.

Grasshopper control in Montana, J. R. PARKER (*Bien. Rpt. Mont. Bd. Hort., 10 (1917-18), pp. 80-85, figs. 4*).—The data here presented have been previously noted (*E. S. R.*, 39, p. 763).

The Blattidæ of Panama, M. HEBARD (*Mem. Amer. Ent. Soc. No. 4 (1919), pp. 148+VI, pls. 6*).—In the course of his study of 894 specimens from Panama the author has recognized 47 genera and 93 species and races, of which 10 genera and 37 species are described as new.

The native host plant of the camphor thrips (*Cryptothrips floridensis*), J. R. WATSON (*Fla. Buggist, 3 (1919), No. 2, pp. 25-27*).—The author finds that the native bays of the genus *Tamala* are the hosts of the camphor thrips, a native insect which has spread to the camphor wherever opportunity offered. The uneven distribution of this thrips in Florida and its absence from many camphor hedges and trees is thought to be explained by the remoteness of the uninfested trees from bays and lack of transportation facilities. This thrips seems to have no choice whatever as between camphor and bay, provided the leaves or twigs are of an equal age.

The bionomics of *Aphis grossulariæ* and *A. viburni*, M. D. HAVILAND (*Proc. Cambridge Phil. Soc., 19 (1919), No. 5, pp. 266-269; abs. in Rev. Appl. Ent., Ser. A, 7 (1919), No. 8, pp. 322, 323*).—The author's observations indicate that *A. grossulariæ*, which is a serious pest of currant and gooseberry bushes in Great Britain, is probably identical with *A. viburni*, a common species which is found on guelder rose (*Viburnum opulus*) in spring and summer.

A contribution to our knowledge of South Indian Coccidæ, T. V. RAMAKRISHNA AYYAR (*Agr. Research Inst. Pusa Bul. 87 (1919), pp. 50, pls. 16, figs. 5*).—One hundred and twenty-nine species of Coccidæ occurring in South India are here considered.

Sericulture, J. VIEL (*Sériciculture. Paris: J. B. Baillière & Sons, 1920, rev. and enl. ed., pp. 403, figs. 71*).—This is a small handbook, which is one of the volumes of the *Encyclopédie Agricole*, published under the direction of G. Wery.

A study of tobacco worms and methods of control, L. B. EDROZO (*Trop. Agr. [Ceylon], 50 (1918), No. 6, pp. 331-336; 51 (1918), No. 1, pp. 53-58*).—The data presented, which relate to Philippine insects, have been noted from another source (*E. S. R.*, 40, p. 62.)

The aquatic adaptations of *Pyrausta penitalis* (Lepidoptera), P. S. WELCH (*Ann. Ent. Soc. Amer., 12 (1919), No. 3, pp. 213-226*).—This is a report of studies made on Sandusky Bay, Ohio, where *Nelumbo lutea*, the plant food of this species, occurs abundantly. While its life cycle is imperfectly known, there appear to be at least two generations per year. The older larvæ possess a well-developed efficient form of surface swimming and can withstand constant submergence for a period of 1.5 hours. Two well-defined periods are recognized in the feeding activities of the larvæ, (1) an early one, the leaf-feeding

period, and (2) a later period, the petiole period. After the caterpillar has attained the length of about 14 mm. the surface feeding under webbings is abandoned and it begins to tunnel lengthwise into the upper end of the petiole, boring through from the upper surface.

"After a burrow long enough to contain the whole larvæ is constructed, the caterpillar turns about and feeds mostly on the upper surface of the leaf just outside the entrance. Larvæ are frequently observed on the upper leaf surface with only one or two posterior body segments remaining in the burrow. . . . Since the work of a single larva may lead to leaf deterioration and since it is known that, when present, the buds and seed-capsules are also attacked, it is evident that *P. penitalis* is a serious enemy of *Nelumbo*. The ability of the older larvæ to migrate from leaf to leaf also increases their menace to the food plant. . . .

"Pupation occurs in the petiole burrow below the water level outside and, since submergence is fatal, protection is provided not only by the walls of the petiole and the formation of a firm, silken cocoon but also by the construction of a special closing device—a cream colored, circular, concavo-convex cap—at the top of the tunnel, excluding the water but providing for the ultimate emergence of the adult."

Worms in walnuts, C. P. LOUNSBURY (*So. African Fruit Grower and Small-hold.*, 6 (1919), No. 11, pp. 307, 309).—This is a discussion of the codling moth as an enemy of walnuts, both in South Africa and in California. It has spread since first recorded as a walnut pest, and is now a formidable walnut pest on farms in the Oudtshoorn district and in the east of the Free State. The loss in the season of 1914-15 in some parts of Oudtshoorn was from 50 to 60 per cent of the crop. Notes on control work in South Africa and correspondence with H. J. Quayle and R. E. Smith relating to its control in California are presented. Reference is also made to a paper by Mackie (*E. S. R.*, 41, p. 665). Papers by Foster (*E. S. R.*, 23, p. 760) and by Smith (*E. S. R.*, 40, p. 456) have been previously noted.

The false codling moth (*Argyroplote leucotreta*), a native insect known as a citrus pest, is said to have been reared from walnut in Pretoria a number of times. A third lepidopteran (*Myelois ceratonia*) has also been reared repeatedly from walnuts, having been collected in Oudtshoorn, Bloemfontein, and Pretoria.

Cotton and the pink bollworm in Egypt, H. A. BALLOU (*West Indian Bul.*, 17 (1919), No. 4, pp. 237-292, pls. 5, figs. 9).—This is a review of a report on investigations presented to the Egyptian Government which will appear later. It is based upon personal investigations of control measures conducted in Egypt from September, 1916, to February, 1918. The first part (pp. 237-255) treats of the industry's development and falling rate of yield, and the second part (pp. 256-292) of the bionomics of *Pectinophora (Gelechia) gossypiella*, the extent of its injury, its control, etc. An annotated bibliography of 41 titles is included.

Treatment of cotton in the field as a combative measure against *Gelechia* attacks, G. C. DUDGEON and W. CARTWRIGHT (*Agr. Jour. Egypt*, 7 (1917), pp. 120-133).—The authors conclude from experiments conducted that the reduction of water does not result in a diminution of yield nor damage to the fiber, and that the crop matures earlier and more thoroughly, thereby lessening residues for boll picking—thus reducing the bollworm damage. It is also concluded that topping and stripping the leaves does not result in a diminution of yield, does not damage the fiber, and reduces the bollworm attack. While the best conditions of watering must depend on climate and soil, the tendency of the experiments is to show that the water should be reduced after June to the minimum

consistent with the health of the plant and entirely withheld after the first week in August.

Treatment of cotton in the field as a combative measure against *Gelechia* attacks.—Experiments in 1917, W. CARTWRIGHT (*Agr. Jour. Egypt*, 8 (1918), pp. 43-53).—This paper, which reports upon experiments conducted in continuation of those noted above, relates particularly to the application of water and topping of the plants.

It was demonstrated that the reduction of water and the complete stoppage after the first week in August increases the yield of cotton, does not damage the fiber, and ripens the crop earlier; and that topping in addition on well-developed cotton further increases the yield and does not damage the fiber. The results of treatment in the field on the quality of the fiber are reported upon in an appendix by S. R. P. Carver (pp. 52-53).

The pink bollworm, W. W. EVANS (*Bul. Agr. and Mech. Col. Tex.*, 3. ser., 4 (1918), No. 21, pp. 34-37).

The Angoumois grain moth, J. L. KING (*Penn. Dept. Agr., Bur. Plant Indus. Circ.* 1 (1920), pp. 14, figs. 3).—This is a popular summary of information on the Angoumois grain moth, based upon studies by the author previously noted (*E. S. R.*, 38, p. 862).

Occurrence of malaria and anopheline mosquitoes in middle and southern California, W. B. HERMS (*Pub. Health Rpts. [U. S.]*, 35 (1920), No. 6, pp. 275-281).—This paper is based upon a State-wide malaria-mosquito survey begun in the spring of 1916, carried on during the summer of 1916 and a portion of the summer of 1917, and completed during the summer of 1919.

Mosquito work of the Bureau of Entomology, D. L. VAN DINE (*Amer. Jour. Pub. Health*, 10 (1920), No. 2, pp. 116-119).

Tarred felt disks for protecting cabbages and related vegetables from attacks of the root fly, A. D. IMMS (*Jour. Bd. Agr. [London]*, 23 (1917), No. 12, pp. 1222-1224, pl. 1; 25 (1918), No. 1, pp. 59-61).—These data are based upon the work previously noted (*E. S. R.*, 37, p. 764).

Notes on the lunate onion fly, *Eumerus strigatus* (Syrphidae), F. R. COLE (*Ent. News*, 31 (1920), No. 2, pp. 31-35, fig. 1).—The author describes and figures this European species and records observations on its habits. In North America the species was first captured in Ottawa in 1904 and in this country in 1910, but now occurs from Quebec and Maine south to Pennsylvania and in Ottawa, Quebec, Ohio, and Colorado, and along the Pacific coast from California to British Columbia.

The broad-bean weevil, R. E. CAMPBELL (*U. S. Dept. Agr. Bul.* 807 (1920), pp. 22, pl. 1, figs. 6).—Infestation of the broad or horse bean in California by *Bruchus rufimanus* has resulted in a reduction of dry beans for market from 200,000 bags to the present production of about 50,000 bags. It is pointed out that only about 30 or 40 per cent of the crop is used as stock feed, the larger portion being shipped to New York and other eastern cities, where it is used for food by Italians and Portuguese and is known as fava. The principal broad-bean sections in California are around San Francisco Bay and down along the coast to a little below San Luis Obispo. Farmers' Bulletin 969 on this bean, by McKee, has been previously noted (*E. S. R.*, 39, p. 837). This weevil was first recorded as established in the United States in September, 1909, having been found by I. J. Condit at San Luis Obispo.

Life history studies show that there is but one generation of the weevil each year, and that it does not breed in dry beans. The eggs are laid on the green pods in the field from the middle of March to the middle of May. The larvæ reach maturity from August to October, while adults can be found from

August to the following June. The egg stage is from 9 to 18 days; the larval stage, 10 to 15 weeks; the pupal stage, 7 to 16 days; and the adult stage, 1 to 8 months. Germination of infested beans was found to be from 20 to 40 per cent less than that of uninfested beans. Germination of seed a year or more old is only slightly less than that of new seed.

"There are no natural enemies of the broad-bean weevil of any consequence in America. It requires 170 to 180° F. for over half an hour to kill all of the weevils in broad beans. Sulphur is unsatisfactory as a fumigant. Carbon disulphid at the rate of 7 lbs. per 1,000 cu. ft. in a tight box for 24 hours kills all the weevils. In seed held over until the second year all the weevils are dead. Beans from crops planted late, after March 1, are much less infested than those planted earlier, from November to March." The value of late planting as a control measure is emphasized in a paper by the author previously noted (E. S. R., 41, p. 759).

A list of nine references to the literature cited is included.

The fern weevil menace, D. T. FULLAWAY (*Hawaii. Forester and Agr.*, 17 (1920), No. 1, pp. 3, 4, pl. 1).—The Australian fern weevil (*Syagrius fulvitaris*), a serious infestation of which on *Sadleria* ferns in the neighborhood of Kilauea as previously noted,¹ is found to have escaped from one or two greenhouses in Hilo and spread all over the city, from Wainaku to Waiakea, on the fish-tail fern. It is said to have been present for 15 years on *Sadleria* ferns in the mountains back of Honolulu, and it is now impossible to find a single plant that has not suffered severely from its ravages.

Why young queens may fail, F. W. L. SLADEN (*Gleanings Bee Cult.*, 48 (1920), No. 2, pp. 80-82, figs. 2).—This is a report of experiments in which 16 queens were taken to Duck Island located at the eastern end of Lake Ontario, about seven miles from the nearest colonies, to be mated with drones of selected parentage.

"Only 3 out of the 16 queens were lost, not a large proportion considering the wind blew fresh nearly every day from July 23, the day the bees were brought, until August 4. Of the 13 queens surviving, 12 had started laying. Eleven of these had commenced to lay between July 28 and August 1, at the age of 12 to 16 days, and the remaining one on August 4 when 19 days old. All turned out to be drone-breeders, but 6 of them produced some workers. . . .

"Assuming that laying begins 2 days after mating, which the writer has always found to be true during the active season, none of the drones flying at the time the first queens were mated were less than 5 days old or over 16 days old, and all the drones flying at the time the last queen that began to lay was mated were at least 13 days old, probably many of them were a few days older." The results indicate that in order to function properly the drones should be much older than has previously been thought to be the case.

Contributions to a knowledge of the natural enemies of Phyllophaga, J. J. DAVIS (*Ill. Dept. Registr. and Ed., Div. Nat. Hist. Survey Bul.*, 13 (1919), Art. 5, pp. IV+53-138, pls. 13, figs. 48).—This preliminary paper on the natural enemies of white grubs deals first with the parasites of the larva, which include the black digger wasps of the genus *Tiphia*, namely, *T. punctata*, *T. transversa*, *T. inornata*, and *T. vulgaris* and their enemies; the banded digger wasps of the genus *Elis*, including *E. 5-cincta*, *E. atriventris*, *E. interrupta*, *E. obscura*, and *E. illinoisensis*; tachinid and dextiid parasites (*Microphthalma disjuncta*, *M. pruinosa*, *Ptilodexia harpasa*, *P. abdominalis*, *Myocera cremides*, and *Prosenia (Mochlosoma) lacertosa*); two hymenopterous enemies, *Ophion bifoveolatum* and *Pelecimus polyturator*; the tawny bee fly (*Sparnopolius*

¹Hawaii. Forester and Agr., 16 (1919), No. 10, p. 259.

fulvus); hairworms of the family Mermithidæ; and a West Indian grub parasite (*Campsomeris dorsata*). The predacious insect enemies of the larva next considered include the robber flies, particularly *Promachus vertebratus*, *P. fitchii*, *Erax maculatus*, and ten other species; *Coenomyia pallida*; two tabanids, the autumn horsefly (*Tabanus sulcifrons*) and the black horsefly (*T. atratus*), etc. Mites as enemies of Phyllophaga larvæ are briefly noted. The parasites of the adult beetle considered include the ortalid flies *Pyrgota undata* and *P. valida*; tachinid flies (*Cryptomeigenia theutis*, *C. aurifacies*, *Eutrixoides jonesii*, *Eutrixa exile*, and *Biomyia lachnosternæ*; and sarcophagids (*Sarcophaga prohibita*, *S. tuberosa sarracenioides*, *S. cimbicis*, *Sarcophaga* n. sp., *S. helicis*, *S. utilis*, *S. falculata*, and *Fannia canicularis*. Mention is also made of spiders as enemies of Phyllophaga. The affections of the larva considered, including nematode, protozoan, bacterial, and fungus diseases, are followed by accounts of the miscellaneous predacious enemies, including birds, wild mammals, and amphibians, and domestic animals.

Of the many parasites of Phyllophaga the *Tiphia* species are the most efficient and abundant, one or another of the species being found in greater or less abundance in every section of the United States east of the Rocky Mountains. The life histories of the four common species studied by the author at Lafayette, Ind. (*T. punctata*, *T. transversa*, *T. inornata*, and *T. vulgaris*), are similar in many respects. "The black digger wasps, *T. punctata* and *T. transversa*, and probably *T. vulgaris* also, issue from the cocoons during the summer, more often during June and July (*T. inornata* earlier), feed on the flowers of such weeds as asters and parsnips or the honeydew of plant lice (especially that of *Aphis maidis*), mate, and reenter the ground to parasitize the common white grub. The grub is first paralyzed, the wasp stinging it on the underside of the first or second thoracic segment, and an egg is then laid on the dorsum of the thorax, the underside of the abdomen, or elsewhere, according to the species of *Tiphia*." The egg hatches in four or five days, and the larva immediately pierces the integument and begins to suck the body fluid. About two weeks are required for the development of the larva up to the time the cocoon is commenced. Most species appear to remain in the cocoon over winter as larvæ, pupation taking place and the adults emerging the following spring and summer. In the latitudes of Lafayette all species of *Tiphia* have normally one annual generation.

The life history of only one species of *Elis*, *E. 5-cincta*, has been studied. Notes on the bionomics of other of the natural enemies are presented.

A bibliography of six pages is included.

Philippine wasp studies (*Hawaiian Sugar Planters' Sta., Ent. Bul. 14* (1919), pp. 186, figs. 106).—This bulletin consists of two parts:

I. *Descriptions of Philippine wasps*, S. A. Rohwer (pp. 5-18).—Descriptions are given of 7 species of Sphecidae, 5 species of Psammocharidae, and 3 species and 1 variety of Vespidae new to science.

II. *Descriptions of new species and life history studies*, F. X. Williams (pp. 19-186).—A general account is first given of the bionomics of wasps and their economic status, followed by descriptions of 12 new species and a new genus (*Hyloliris*), one of which species is from Formosa. In his investigations for the Hawaiian Sugar Planters' Association the author was stationed at Los Baños, about 40 miles by rail south of Manila. During the course of his studies from June, 1916, to September, 1917, 182 species of aculeate wasps, including a few Bethyridæ, were collected in the Philippines, of which 52 are treated biologically in this paper. The species *Scolia manila* of the Scollidæ is considered at some length. An account of the species of *Tiphia* includes keys

for the separation of the males and females of three species, prepared by P. H. Timberlake.

A bibliography of six pages is appended.

The importation of *Tiphia pallela* from Barbados to Mauritius, D. d'EMMERZ DE CHARMOY (*Dept. Agr. Mauritius, Sci. Ser. Bul. 6 (1918)*, [*English Ed.*], pp. 89-103, pl. 1).—Previously noted from another source (E. S. R., 38, p. 467).

The digger chalcid parasite (*Dirrhinus sarcophagæ* n. sp. on *Sarcophaga aurifrons*), W. W. FROGGATT (*Agr. Gaz. N. S. Wales, 30 (1919)*, No. 12, pp. 853-855, figs. 4).—During the course of investigations at the Government Sheep Fly Experiment Station a small chalcid wasp which burrows into the loose soil and deposits eggs in the pupæ of the flesh fly (*S. aurifrons*) was met with, and is here described as new.

The red spiders of America and a few European species likely to be introduced, E. A. MCGREGOR (*Proc. U. S. Natl. Mus., 56 (1919)*, pp. 641-679, pls. 6, figs. 11).—Thirty-one species of spider mites are recognized, of which one (*Tetranychus pacificus*) is described as new. The genus *Anychus* is erected for *T. banksi* and *T. rusti* and *Septanychus* for *T. tumidus*.

A list of 23 references to the literature is included.

The dust method for controlling rust mite on citrus trees, W. W. YOTHERS (*Fla. Grower, 20 (1919)*, No. 23, pp. 8, 9, fig. 1).—This is a paper read before the Florida Citrus Seminar, in which attention is called to the value of sulphur applied as a dust in the control of the rust mite.

Several experiments conducted by the author in 1918 corroborate earlier work, and show that the effect of the sulphur upon the mite is practically instantaneous. "Since the incubation period of the rust mite egg is about five days, the mortality will be complete if the interval between the dust application and the first rain is an equally great length of time."

Experiments on a fairly large scale in two fields are reported upon. Examinations made after application of dust consisting of 20 per cent hydrated lime and 80 per cent sulphur showed practically all mites to have been killed within one hour. The results show flowers of sulphur to be as effective as the finely ground mixture of sulphur and lime. So long as the sulphur was present it killed the young mites as soon as they hatched out. While one dusting was not enough to produce bright fruit, it is thought that two will be. It is concluded that dusting done during the hottest and driest part of the day is in all probability equally as effective as when done while the foliage is wet with dew. It is said to be reasonably certain that a pound of sulphur is sufficient for a tree, and that a team and two men can dust 40 acres in a day. The approximate cost of treating 40 acres is placed at 4.7 cts. per tree.

Memorandum on acarids (mites) occurring in stored grain and flour, H. M. DUVAL (*Roy. Soc. [London], War Com. Memo. 2 (1917)*, pp. 3).—It is pointed out that flour suffers more deterioration than wheat when attacked by mites, that the effects of such attack are less readily combated, and that moisture content is, at the temperatures at which wheat is stored in England, the primary factor determining the presence of mites in harmful numbers.

FOODS—HUMAN NUTRITION.

Life and its maintenance (*London: Blackie & Son, Ltd., 1919*, pp. VIII+297, pls. 5, figs. 5).—This volume consists of public lectures on certain war problems delivered at University College, London, during the first half of 1918. These include among others: The Problem of Food, by W. M. Bayliss; War

Bread and its Constituents, by F. G. Hopkins; Accessory Food Factors (Vitamins) in Wartime Diets, by E. M. Hume; Alcoholic and Other Beverages in Wartime, by A. R. Cushny; and Cooperation in Food Supply, by A. G. Tansley.

Fat production and economy during the war, R. COHN (*Ztschr. Angew. Chem.*, 32 (1919), No. 50, *Aufsatz.*, pp. 193-198).—A discussion of the fat situation in Germany during the war.

The author states that the army ration, particularly in the first two or three years of the war, was much higher than the civilian ration. During the winter of 1917-18 the army ration on the East front included 55 gm. of butter or butter substitute for two days in the month only. This, together with the small amount of fat in the meat ration, gave a daily average of about 10 gm. of fat, which was also the civilian ration in the large cities. The fat ration for the armies on the western front was about 25 gm. per day. In discussing the effect of this low consumption of fat the author points out that it should have been accompanied by a corresponding increase in carbohydrate, but that the calorific value of a day's ration was sometimes as low as 2,300 to 2,600 calories in the army, and from 1,200 to 1,400 calories for the civilian population of the large cities.

Various unusual sources of fat utilized to supplement the diminished supply are discussed briefly, including dish water, sewage sludge, oil-bearing seeds, bones, and oils such as fish oil which can be converted into edible products by hydrogenation. In conclusion the author states that it is doubtful if Germany can at present increase the domestic production of fat so that even an average ration of 25 gm. of fat per day can be assured without importation from other countries.

Digestibility of certain miscellaneous vegetable fats, A. D. HOLMES and H. J. DEUEL, JR. (*Jour. Biol. Chem.*, 41 (1920), No. 2, pp. 227-235).—This paper from the Office of Home Economics, U. S. Department of Agriculture, reports the results of an investigation of the digestibility of avocado and cupuassú bean fats, and cohune, hempseed, palm-kernel, and poppy-seed oils. The methods followed were essentially the same as those followed in the previous digestion experiments conducted by this Office (*E. S. R.*, 41, p. 170).

The digestibility coefficients obtained were as follows: Avocado fat 87.9 per cent, cohune oil 99.1, cupuassú fat 94.1, hempseed oil 98.5, palm-kernel oil 98.0, and poppy-seed oil 96.3 per cent. "The digestibility of the protein and carbohydrate of the entire ration was essentially the same as that in other experiments of a similar nature, indicating that the fats exercised no unusual effect on the utilization of these constituents. These fats and oils, with the possible exception of cupuassú fat, which caused slight disturbances, produced no abnormal physiological effects and may be regarded as satisfactory for food purposes. Cohune, hempseed, palm-kernel, and poppy-seed oils especially are very highly utilized by the human body."

The composition of sausage substitutes, particularly those made from goat meat, H. LÜHRIG (*Pharm. Zentralthalle*, 60 (1919), No. 42, pp. 471-473).—Analyses are reported of different varieties of sausage made from goat meat. The samples examined contained, on the whole, less water and more fat than the corresponding war sausages made from beef and pork.

Fish pudding, fish dumplings, fish sausage, and similar preparations, P. BUTTENBERG, J. ANGERHAUSEN, and L. V. NOEL (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 38 (1919), No. 5-6, pp. 145-153).—Descriptions and analyses are given of various canned fish preparations imported into Germany from Norway and Denmark, and of fish and seal sausages.

Honey powder, honey aroma, and similar war concoctions, A. BEYTHIEN (*Ztschr. Untersuch. Nahr. u. Genussmtl.*, 38 (1919), No. 5-6, pp. 159-165).—

The author describes many varieties of artificial honey manufactured in Germany during the war. He points out that the preparation of such substances is not as simple as might appear, and that consequently it is inadvisable to attempt their preparation in the home.

Studies on the secretion of gastric juice, S. J. COHEN (*Jour. Biol. Chem.*, 41 (1920), No. 2, pp. 257-261, figs. 7).—The author reports that in 175 samples of gastric juice from 17 dogs the free hydrochloric acidity varied from 0 to 0.48 per cent, while the total chlorids varied from 0.39 to 0.54 per cent. This is thought to corroborate Pavlov's view that gastric juice is secreted with a constant acidity, and that variations are due to secondary neutralization.

The neutrality of the blood, W. M. BAYLISS (*Jour. Physiol.*, 53 (1919), No. 3-4, pp. 162-180).—For determining the H-ion concentration of arterial blood the author has devised an indicator method which is said to be capable, with practice, of as accurate results as the electrical method.

Blood to the extent of about 10 cc. is led directly into conical centrifuge tubes supplied with a small amount of powdered potassium oxalate and 3 or 4 cc. of liquid paraffin. After the blood has been collected, more liquid paraffin is added until the tube is nearly full. The tube is shaken to dissolve the oxalate and centrifuged, after which one drop of 0.1 per cent neutral red solution is added to the upper part of the plasma by means of a fine pipette, which is also used to mix the indicator with the plasma. The color is then noted and compared either with that of neutral red in a series of phosphate solutions of known H-ion concentration, if the exact H-ion concentration is to be determined, or with the other samples of blood taken after various treatments of the animal.

In the present series of experiments, the H-ion concentration of cat's blood was determined before and after the intravenous injection of sufficient acid to reduce the bicarbonate to one-third its normal value, and similarly after the injection of sufficient sodium bicarbonate to increase its concentration by one-fourth. The results obtained are summarized and discussed as follows:

"Intravenous injection of acid in sufficient quantity to neutralize half the bicarbonate in the blood does not increase the H-ion concentration of the plasma. The chief mode of compensation is by increase in pulmonary ventilation and consequent decrease of the carbon dioxide in the blood. Renal excretion of acid, and ammonia production in the liver do not appreciably come into play in short experiments. Injection of alkali is not so readily neutralized. The chief agent in this case appears to be excretion of alkaline urine.

"The proteins of the plasma play no perceptible part in the maintenance of neutrality between the limits of H-ion concentration possible in the living organism, namely, below 10^{-4} or above 10^{-10} normal. No evidence was obtained that either sodium bicarbonate, serum proteins, or both together convey carbon dioxide from the tissues to the lungs. Thus the only function of the sodium bicarbonate in the blood is to regulate the H-ion concentration, while, under normal conditions, the only function of the proteins is to give a colloidal osmotic pressure and a moderate degree of viscosity to the plasma."

Note on the hydrogen-ion concentration of the human duodenum, F. J. MYERS and J. F. McCLENDON (*Jour. Biol. Chem.*, 41 (1920), No. 2, pp. 187-190, fig. 1).—Determinations are reported of the H-ion concentration of the duodenum of a human subject three or four hours after ordinary rather varied meals. The pH values varied from 3.2 to 7.82, but showed a tendency to fluctuate around the neutral point, pH 6.3. The fact that the extreme range on the acid side was greater than on the alkaline side was considered to be due possibly to the spurting of gastric contents into the duodenum.

Changes in the hydrogen-ion concentration of the urine, as result of work and heat, G. A. TALBERT (*Amer. Jour. Physiol.*, 50 (1920), No. 4, pp. 579-588, figs. 2).—This paper reports the results of determinations of the H-ion concentration of the urine of the subjects in the investigation previously noted (*E. S. R.*, 42, p. 465) after intense exercise and after subjection to heat.

The average results of 37 observations of the pH values of the urine immediately before and immediately after intense muscular exercise of from 15 to 20 minutes' duration were pH 6.57 and 6.11, respectively. The results of 31 observations of the pH value of the urine before and after exposure to the heat of a sweat-cabinet for 15 or 20 minutes were pH 6.23 and 6.12, respectively.

These results indicate that both exercise and heat have a tendency to cause increased acidity of the urine. In commenting upon the possible causes of this increase in acidity the author reviews briefly the results and conclusions of other investigators, indicating that the exact changes brought about in the urine constitute a question that only further research can settle.

The metabolism of white races living in the Tropics.—II, The composition of the urine, W. J. YOUNG (*Ann. Trop. Med. and Parasitol.*, 13 (1919), No. 3, pp. 215-231).—In the present study, which is in continuation of the investigation previously noted (*E. S. R.*, 33, p. 366), the main object has been to compare the concentration of the urine of white subjects in Australia with that of European subjects.

The average composition of 24-hour samples of urine from 25 subjects of various occupations and on their ordinary diet was as follows: Volume 782 cc., specific gravity 1.0254, total nitrogen 10.4 gm., total sodium 7 gm., chlorids per 100 cc. 1.13 gm., and P_2O_5 1.73 gm. Compared with the accepted European standards these results show a much smaller volume, higher specific gravity, and lower content in sodium chlorid, which may be explained from excessive perspiration tending to increase the concentration of the urine but at the same time to remove the salt along with the water. The total nitrogen was considerably lower than that reported in European analyses, a result which, it is thought, can not be accounted for by loss of nitrogen from the skin but indicates rather a low nitrogen metabolism.

To test the theory that the higher concentration of the urine in the Tropics causes a greater amount of kidney disease than is found in temperate climates, an examination for albumin was made of the urine of persons not showing any other symptoms of kidney disease. An examination of the urine of 633 patients, including 330 men and 303 women, gave positive reactions in 57 cases, 42 of them men, thus indicating a comparatively high percentage of albuminuria and that it was more marked in men than in women.

Phosphorus requirement of maintenance in man, H. C. SHERMAN (*Jour. Biol. Chem.*, 41 (1920), No. 2, pp. 173-179).—In this contribution, in which the author has had the cooperation of A. R. Rose, M. Koch, F. Mathews, and E. Osterberg, the question of phosphorus requirement for maintenance in man has been treated in a similar manner to that of the protein requirement previously noted (*E. S. R.*, 42, p. 459). The indicated phosphorus requirements for maintenance per 70 kg. of body weight per day have been calculated from all available published experiments which have been considered quantitatively comparable, and from six series of experiments the data for which are reported in this paper for the first time.

The 95 experiments reported include 34 upon men and 61 upon women. The phosphorus requirement ranged from a minimum of 0.52 to a maximum of 1.2 gm., with an average of 0.88 gm. per 70 kg. of body weight per day. The

experiments upon men averaged 0.87 gm., and those upon women 0.89 gm. per 70 kg. per day. The range of variation was quite similar to that in the compilation of experimental data upon the protein requirement. Suggested reasons for variations in the phosphorus output are the function of phosphates in the maintenance of neutrality in the body, and possible differences in the quantitative efficiency in nutrition of different forms of phosphorus.

The author concludes that "while several of the factors determining the phosphorus output remain for further quantitative investigation, we are probably justified in concluding that we now know the phosphorus requirement with about the same probable accuracy that the protein requirement is known, and that about one-fortieth to one-fiftieth as much phosphorus (reckoned as element) as of protein is required in the maintenance metabolism of man."

In comparing this maintenance requirement with the amount furnished in the food supplies of 224 families or groups of people selected as typical of the population of different parts of the United States, only 8 dietaries showed less than 0.88 gm. of phosphorus per man per day, and of these only 2 would have been below the average requirement if the food had been sufficient in amount to cover the energy requirement amply. It is pointed out that these two cases were both reported from the Southern States, a fact thought to confirm the opinion of McCollum et al. (*E. S. R.*, 41, p. 469) that the pellagra-producing diets of the South are low in their phosphorus content. With this exception the author is of the opinion that "the danger that a freely chosen American dietary will be deficient in either protein or phosphorus does not appear serious, in the light of our present evidence, so far as the requirements of maintenance are concerned. What quantities of phosphorus in the food will best meet the requirements of growth, pregnancy, and lactation remains to be determined."

The feeding of normal infants during the second year, J. L. MORSE (*Jour. Amer. Med. Assoc.*, 74 (1920), No. 9, pp. 577-580).—This is a general discussion of the selection of food for infants from one to two years of age. The author advocates a simple diet consisting of milk, selected cereals, broth, beef juice, fruit juices, and small amounts of toast, stale bread, or crackers. The use of meat and green vegetables during this period is discouraged.

Calcium metabolism of infants and young children, and the relation of calcium to fat excretion in the stools, L. E. HOLT, A. M. COURTNEY, and H. L. FALES (*Amer. Jour. Diseases Children*, 19 (1920), No. 2, pp. 97-113).—From calcium determinations on the stools collected in the study of fat metabolism previously noted (*E. S. R.*, 42, p. 60), certain problems regarding calcium metabolism, especially in its relation to fat metabolism, have been studied. In this paper are presented the findings for infants taking modifications of cow's milk. The results of these observations are summarized as follows:

The average absorption of calcium oxid by healthy infants taking modifications of cow's milk was 0.09 gm. per kilogram of body weight as compared with 0.06 gm. for breast-fed infants. The daily total excretion of calcium oxid in the stools varied from 0.34 to 1.06 gm., averaging 0.7 gm. The excretion and absorption of calcium were in general dependent on the calcium intake, the absorption being from 35 to 55 per cent of the intake. This would indicate that to insure an absorption equal to the average found for breast-fed infants the intake of calcium oxid should be at least 0.13 gm. per kilogram, and to insure the average absorption of 0.09 gm. the intake of calcium oxid should be at least 0.19 gm. per kilogram. The best absorption of calcium was obtained when the food contained from 0.045 to 0.06 gm. of calcium oxid for every gram of fat and when the fat intake was not less than 4 gm. per kilogram.

An excessive calcium intake did not increase the calcium absorption, and a very low intake decreased the absorption. The total absorption of calcium varied with the weight of the child, while the per kilogram absorption did not vary regularly with either the age or the weight.

The relation of calcium excretion to soap excretion was not constant. The calcium that could be lost as soap was never a large proportion of the calcium intake. The calcium percentage of the total solids varied as a rule with the water content, diminishing as the water increased.

The calcium absorption was much lower in infants with diarrhea and with rickets than in healthy infants. The administration of cod-liver oil regularly increased the absorption of calcium unless diarrhea was present.

Fat-soluble vitamin.—IV, The fat-soluble vitamin content of green plant tissues together with some observations on their water-soluble vitamin content, H. STEENBOCK and E. G. GROSS (*Jour. Biol. Chem.*, 41 (1920), No. 2, pp. 149-162, figs. 17).—In continuation of the studies on fat-soluble vitamin previously noted (E. S. R., 42, p. 460) the authors, with the cooperation of M. T. Sell, present data on the fat-soluble vitamin content of certain leafy vegetables. In the experiments reported the material was air-dried at room temperature, ground to a meal, and incorporated in varying amounts in basal rations deficient in fat-soluble vitamin and in some cases in water-soluble vitamin. In some instances water-soluble vitamin was included in the form of ether-extracted wheat embryo.

The data, presented in the form of charts, indicate that 5 per cent of clover or alfalfa as the sole source of fat-soluble vitamin in a ration otherwise satisfactory allows normal growth and rearing of some young. The same amount of lettuce, spinach, and chard was found to furnish enough fat-soluble vitamin for long continued though somewhat subnormal growth. Few young were produced and none reared, but in no case was there evidence of xerophthalmia. Of the three, spinach appeared to be the richest and lettuce the poorest in fat-soluble vitamin. With cabbage poor results were obtained even when fed at a 15 per cent level. These results are thought to be in harmony with the theory proposed in the preceding paper of a correlation between fat-soluble vitamin distribution and the occurrence of certain yellow plant pigments.

The data also showed that, while 10 per cent of alfalfa and of clover was inefficient in respect to water-soluble vitamin, 15 per cent of either furnished enough of that vitamin for normal growth. Cabbage also furnished enough water-soluble vitamin when fed at a 15 per cent level.

Fat-soluble vitamin.—V, Thermostability of the fat-soluble vitamin in plant materials, H. STEENBOCK and P. W. BOUTWELL (*Jour. Biol. Chem.*, 41 (1920), No. 2, pp. 163-171, figs. 3).—Continuing the investigation noted above the authors, with the cooperation of M. T. Sell and E. G. Gross, have determined the stability of the fat-soluble vitamin in plant materials by means of feeding experiments in which the air-dried material furnishing the fat-soluble vitamin was soaked in water, autoclaved for three hours at approximately 15 lbs. pressure, and again air-dried before being incorporated into the ration.

The data obtained indicate that this treatment did not cause noticeable destruction of the fat-soluble vitamin of yellow maize, chard, carrots, and sweet potatoes. Hubbard squash was found to contain a considerable amount of fat-soluble vitamin which was not destroyed by the autoclaving process. The data on alfalfa are considered to be inconclusive, although all of the four rats fed on the ration containing autoclaved alfalfa declined after three or four weeks and died, two showing signs of xerophthalmia.

The general conclusion drawn is that "the fat-soluble vitamin as found in the plant kingdom in a grain, in leaf and stem tissue, in fleshy roots, and in a cucurbitous vegetable is comparatively stable at a high temperature."

Action of substances influencing the carbohydrate metabolism in experimental beriberi. C. FUNK (*Jour. Physiol.*, 53 (1919), No. 3-4, pp. 247-256).—The author summarizes and discusses previous investigations dealing with the physiology of the antiberiberi vitamin, and reports a continuation of his own studies of the rôle of this vitamin in carbohydrate metabolism (E. S. R., 32, p. 257). In the first series of experiments described, a number of substances known to affect carbohydrate metabolism were injected into normal pigeons and into pigeons fed on polished rice, and the effect on the sugar and the amino nitrogen of the blood and on the glycogen of the liver noted. The substances tested were glucose, phlorizin, adrenalin, pituitrin, and thyroid and parathyroid glands. In the second series the same substances, with the exception of glucose, were fed to pigeons on a polished rice diet, and their effect on the time of beriberi onset, loss in weight, and death observed.

In the first study glucose, which was given per os, caused a disappearance of glycogen from the liver and a diminution of blood sugar in both the pigeons fed a normal diet and those fed on polished rice, and a diminution of amino nitrogen on the polished rice diet only. Phlorizin increased slightly the glycogen and the blood sugar in the controls, and decreased the glycogen and slightly increased the sugar in the rice series. Adrenalin and pituitrin had no marked effect on carbohydrate metabolism. Desiccated thyroid gland produced a considerable sugar increase in the rice series and a disappearance of glycogen and increase of amino nitrogen in both series. Parathyroids produced in both series an increase of glycogen and blood sugar, and a decrease of amino nitrogen.

In the feeding experiments phlorizin appeared to hasten the onset of the disease and to increase the loss in weight, adrenalin to hasten death, pituitrin to have no effect, the thyroid gland to hasten death with great loss in weight but with evidence of beriberi in only one case out of six, and the parathyroid gland to hasten the development of beriberi symptoms but not to shorten the period before death.

The author is of the opinion that, with the exception of pituitrin, the action of the substances studied "has produced interesting results which might become more clearly defined on further investigation."

The experimental production of edema as related to protein deficiency. E. A. KOHMAN (*Amer. Jour. Physiol.*, 51 (1920), No. 1, pp. 185-187).—This is a brief report of a study of the etiology of the edema noted by Denton and Kohman (E. S. R., 40, p. 267) as occurring in a large percentage of rats fed on a low-protein carrot diet. Rats were fed diets deficient, respectively, in protein, calories, and fat, and in fat-soluble A and water-soluble B except as furnished by the carrots. Some of the diets were also of high and low water content, of an increased acid content, and of high and low salt content.

It was found that, while excessive water intake and an increase in the acid content of the diet both tended to increase edema, the primary cause of the edema was lack of protein. Edema was produced and cured three times in one rat by alternating a low protein diet with an adequate protein diet.

"These findings warrant the general conclusion that, if it is necessary to limit the amount of protein in a diseased condition or in a period of national economic stress (as was necessary in some of the European countries during the recent war), it is advisable to administer the low-protein diet in a form free from excess of water and any acid-producing foods. Symptoms of de-

veloping edema must be looked for and adequate protein supplied immediately to effect a cure."

Protein diets and undernutrition in treatment of diabetes, F. M. ALLEN (*Jour. Amer. Med. Assoc.*, 74 (1920), No. 9, pp. 571-577).—This is a brief discussion, illustrated by case reports, of the author's practice in the arrangement of the diet for diabetic patients following the period of fasting. Five facts which may serve in the planning of such diets are given as follows:

"(1) The total calories at first should be very low and increased gradually; (2) protein is the most important food; (3) the tolerance for protein is highest when other foods are excluded or closely restricted; (4) the caloric requirement falls with the body weight and may reach a very low minimum; and (5) the tolerance rises as the weight falls, and with exceedingly few exceptions the two curves intersect at some level on which life can be supported."

Boiled vegetables for the use of diabetics, P. J. CAMMIDGE (*Lancet [London]*, 1919, II, No. 26, pp. 1192, 1193).—For the purpose of determining which are the best vegetables to use in the preparation of the thrice-boiled vegetables for use in diabetes, an examination was made of the content in total carbohydrates and reducing sugars of 16 varieties of commonly used vegetables after three successive treatments with boiling water for 15 minutes.

The data reported indicate that the number of boilings required to secure a carbohydrate-free residue varies considerably with different vegetables, and is not directly related to the amount of carbohydrates originally present. Comparatively few of the vegetables investigated were entirely freed by three boilings. Celery, rhubarb, and spinach were freed from carbohydrate after the second boiling, and sliced turnip and sliced carrot after the third boiling, while all the other vegetables retained more or less carbohydrate even after three boilings. These were, in the order of increasing amounts of total carbohydrate retained, Spanish onion, beet root, cauliflower stalk, cabbage, [Brussels] sprouts, parsnips, sea kale, cauliflower flower, artichoke, potato, and swedes.

Reference is also made to the experiments of Wardall (*E. S. R.*, 39, p. 571) on the extraction of vegetables at a low temperature (60° C.) as offering possibilities of an extension of the limited range of vegetables open to severe cases of diabetes.

Botulism, W. L. DODD (*Amer. Food Jour.*, 15 (1920), No. 2, pp. 12-14).—A nontechnical discussion of the history, source, and means of prevention of botulinus poisoning.

An outbreak of botulism, D. L. SISCO (*Jour. Amer. Med. Assoc.*, 74 (1920), No. 8, pp. 516-521).—A report is given of an outbreak of botulism occurring in New York City in January, 1920, and resulting in the deaths of 6 out of the 7 members of the family.

The outbreak, like the ones previously noted by Jennings et al. (*E. S. R.*, 42, p. 262) and by Armstrong et al. (*E. S. R.*, 42, p. 261), was traced to factory-canned ripe olives, and resembled these outbreaks in every way. Antitoxin (Graham) obtained from the University of Illinois was administered to one patient 48 hours after the onset of symptoms with no beneficial results. The serum administered was later proved to be from a nonhomologous strain, which would probably have rendered it ineffective even if applied earlier. Serum from another strain of *Bacillus botulinus*, probably homologous with that of the olives, was obtained from the Bureau of Animal Industry, U. S. Department of Agriculture, and administered to a child of the family who had eaten one olive but had not developed definite and clear-cut symptoms. "Such symptoms never did develop, but to what degree the antitoxin was responsible for their failure to develop will probably never be known."

ANIMAL PRODUCTION.

An Introduction to Biology and other papers, A. D. DARBISHIRE (*New York: Funk & Wagnalls Co., 1917, pp. XVIII+291, pl. 1, figs. 18*).—The title essay is a study of the philosophical basis of biological thought, which the author did not live to complete. The rest of the volume consists of reprints of published papers, including *The Supposed Antagonism of Mendelian to Biometric Theories of Heredity* (1905), *The Difference between Physiological and Statistical Laws of Heredity* (1906), and *Some Tables for Illustrating Statistical Correlation* (1907). A list of the author's publications is appended.

The morphology of the mammalian seminiferous tubule, G. M. CURTIS (*Amer. Jour. Anat., 24 (1918), No. 3, pp. 339-394, figs. 24*).—The form of the seminiferous tubule in the testes of the mouse, rabbit, and dog was studied by means of wax reconstructions and by the histological examination of isolated specimens.

The process of spermatogenesis was found to occur along the tubule in a wave-like manner. The waves varied in length, uniformity, and direction of course and in some cases reversed their course. A region was discovered in the mouse tubule where embryonic structure was retained. It is suggested that this may be a reserve for growth or regeneration.

The relation of the embryo to the principal axis of symmetry in the bird's egg, G. W. BARTELMIZ (*Biol. Bul. Mar. Biol. Lab. Woods Hole, 35 (1918), No. 6, pp. 319-361, figs. 4*).—The author extends his previous study of pigeon eggs (*E. S. R., 28, p. 668*) and summarizes some of the neglected work of the pioneer embryologists who without modern appliances described the structure of the bird's egg "in a manner that must arouse the wonder and admiration of any embryologist to-day."

Two main axes are recognized, the principal (end to end) egg axis and the axis of the early embryo. These usually form an angle of from 45 to 90°, but there is considerable variation, more in the hen's egg than in the pigeon's. "Extreme variations of the axis angle are probably due to imperfect orientation of the ovum in the oviduct, to abnormalities in its action, or to irregularities during the final growth period of the oöcyte." Narrower variations are attributed to chance.

The yolk is not a sphere and has one axis longer than the others. "The long axis can be indentified in all ovarian oöcytes, and at the time of ovulation the ovum is oriented in the oviduct with reference to its long axis. The long axis accordingly determines the principal axis as we see it in the laid egg. . . . The right side of the embryo is nearer that end of the principal egg axis which is predetermined in the ovary to pass first down the oviduct."

Summarizing all available evidence the author concludes that it is invariably the pointed end of the egg which in the oviduct is directed toward the cloaca. In many cases the blunt edge emerges first when the egg is laid, but this is due to chance turnings during the complicated process by which the egg is delivered to the exterior through the prolapsed uterus without touching the walls of either vagina or cloaca.

On the weight of the epididymis, pancreas, stomach, and of the submaxillary glands of the albino rat (*Mus norvegicus albinus*) according to body weight, S. HATAI (*Amer. Jour. Anat., 24 (1918), No. 1, pp. 71-89, figs. 4*).—The growth in weight of the epididymis, pancreas, stomach, and submaxillary glands was determined on the basis of post mortem data from 259 rats. The weight of each organ is expressed mathematically as a function of body weight.

The physical basis of heredity, T. H. MORGAN (*Philadelphia and London: J. B. Lippincott Co., 1919, pp. 305, pls. 10, figs. 107*).—This is a summary of experimental and cytological evidence in favor of the view that the chromosomes are the bearers of hereditary factors. Six concepts are considered to be sufficiently well established to be designated laws of heredity, viz, segregation, linkage of genes, independent assortment outside of linkage groups, lineal arrangement of genes, interference with crossing over, and the limitation of the number of linkage groups to the number of pairs of chromosomes. There is a bibliography of over 500 titles.

Ensilage, A. W. OLDERSHAW (*Jour. Bath and West and South. Counties Soc., 5. ser., 13 (1918-19), pp. 54-86, pls. 2*).—This is an account of methods of making and utilizing different kinds of silage, particularly in the British Isles, with a bibliography. Chemical analyses made by G. S. Robertson are reported of samples of the following types of silage (from cylindrical silos unless otherwise designated): (1) Oats and vetches, (2) mustard, vetches, and chopped oat straw, ensiled in a gravel pit, (3) vetches, oats, rye, and wheat, (4) corn, (5) corn ensiled in a cart shed, (6) alfalfa, (7) alfalfa from a trench silo, (8) clover and rye grass, (9) meadow hay, and (10) crimson clover from a trench silo.

The composition of "sharps" and bran, and the effect thereon of the food controller's orders, H. E. COX (*Analyst, 43 (1918), No. 503, pp. 53-58*).—It is stated that the British Food Controller's orders requiring a higher extraction of flour during the war has resulted in reducing the starch content of middlings (sharps) and the inclusion in the middlings of the finer particles of bran. The author reports the results of physical and chemical examinations of samples of middlings and bran with particular reference to the relative proportion of starches and pentosans. This proportion is considered a good index of changes in composition.

[Feeding stuffs inspection 1917-18], W. H. STROWD (*Wis. Dept. Agr. Bul. 20 (1918), pp. 103-118 figs. 3*).—These pages contain a report on the inspection of feeding stuffs in Wisconsin from July 1, 1917, to October 31, 1918, the control service having been transferred from the station to the State Department of Agriculture on the former date. Included are tables giving average, maximum, and minimum percentages of protein, fat, and crude fiber found in samples of cotton meal, linseed meal, corn gluten feed, hominy feed, corn feed meal, wheat bran, wheat middlings, red dog, barley feed, brewers' dried grains, alfalfa meal, malt sprouts, vinegar grains, meat scrap, and various mixed and proprietary feeds.

Feed inspection for 1919, W. H. STROWD (*Wis. Dept. Agr. Bul. 25 (1919), pp. 54*).—The protein, fat, and fiber content, and in most cases the prices, of samples of feeding stuffs collected during the year ended October 31, 1919, are reported. These include corn bran, corn oil meal, distillers' grains, wheat shorts, rye feed, buckwheat shorts, and bone meal, as well as additional samples of the materials listed in the preceding note except malt sprouts and vinegar grains.

The breeding industry in North Africa, H. GEOFFROY SAINT-HILAIRE (*L'Élevage dans l'Afrique du Nord. Paris: Augustin Challamel, 1919, pp. XI+530, pls. 33*).—This is an elaborate treatise on the live stock and live-stock industries of Morocco, Algeria, and Tunis, based, it is stated, upon more than 20 years' study. Horses, asses, mules, cattle, sheep, goats, swine, camels, ostriches, and poultry are considered. Much bibliographical material is included.

Suggestions for the winter feeding of steers, E. S. GOOD (*Ky. Agr. Col. Ext. Circ. 75 (1919), pp. 16, figs. 2*).—Directions are given for fattening steers

during the winter, particularly when corn silage or sorghum silage is to form an important part of the ration. "The methods outlined have been found efficient and economical from experiments conducted at the Kentucky Experiment Station."

Note on cattle in the Bombay Presidency, G. F. KEATINGE (*Dept. Agr. Bombay Bul. 85 (1917), pp. 39, pls. 3*).—The author provides statistics as to the numbers of cattle in the Bombay Presidency in the years from 1886 to 1916, lists the native breeds of cattle and buffalo, and describes the breeding grounds and conditions of the range. Three maps show the distribution of grazing areas.

On abnormal sexual characters in twin goats, E. RICKARDS and F. W. JONES (*Jour. Anat. [London], 52 (1918), No. 3, pp. 265-275, figs. 8*).—The authors describe the anatomy (gross and microscopic) of the genital organs of a pair of twin goats. At birth they were considered females, but within a few days they began to develop male characters. The genital tubercle elongated so that the "vulva" became a narrow orifice on the under surface of the penis-like clitoris. The nipples and mammary glands continued like those of normal females of the same age. Both were killed when young, but not before it was noted that they behaved like males when in the presence of female goats.

The gonads were typical testes, "absolutely normal in character," each with a typical epididymis. The seminiferous tubules were solid, but this is attributed to the young age of the goats. A vas deferens extended from each testis, but there was also a pair of Müllerian ducts which united distally and formed a typical uterus. The uterus, vasa deferentia, and urethra opened into a common urogenital sinus. The whole internal anatomy resembled greatly that of the anomalous triplet goat described by A. Keith and reported by Davies (*E. S. R., 28, p. 770*).

The authors believe that the two kids were identical twins, but it is pointed out that even if this view were false Lillie's hormone theory (*E. S. R., 40, p. 466*) can not be invoked to explain the condition since the two individuals were obviously alike as to sex.

Goat keeping on money making lines, W. POWELL-OWEN (*London: George Newnes, Ltd., 1918, pp. 160, figs. 8*).—The author considers the breeding and housing of goats. He devotes a chapter to the goat as a draft animal, and another to the utilization of goat's milk, goat's meat, and goatskins.

The pig, S. SPENCER (*London: C. Arthur Pearson, Ltd., 1919, pp. 184, pls. 15*).—A treatise on the breeding, rearing, and marketing of swine in England. Particular attention is devoted to the description of breeds.

British pigs, J. LONG (*London: Chapman and Hall, Ltd., 1918, pp. VII+133, pls. 10*).—A manual particularly designed for "the small pig keeper."

Success with hogs, C. DAWSON (*Chicago: Forbes & Co., 1919, pp. 268, figs. 18*).—A book on swine husbandry devoting considerable attention to breeds and types and to feeding methods.

Third annual report Oklahoma State Live Stock Registry Board for the year 1918 (*Oklahoma Sta. Circ. 45 (1919), pp. 120, figs. 10*).—This report contains lists of stallions and jacks licensed in 1918 and considerable miscellaneous material of the same kind as in the previous report (*E. S. R., 40, p. 76*). The following popular articles are included: Hereditary Unsoundness in Horses, by C. W. McCampbell; The Future of the Draft Horse, by W. Dinsmore; Navel Infection in Young Colts, by L. L. Lewis; The Type of Horse Needed in Oklahoma, by F. A. Heberling; State Aid to Draft Horse Breeding, by E. McFarland; and The Beginner in Raising Draft Horses, by W. L. Blizzard.

The stud stock interests of Great Britain, W. W. CHAPMAN (*Jour. Roy. Agr. Soc. England*, 79 (1918), pp. 192-200).—The author outlines the organization of the British stud stock interests, lists the breed societies, and summarizes statistics of the export of live stock from Great Britain from 1894 to 1918.

Preferential mating of fowls, A. G. PHILIPS (*Jour. Amer. Assoc. Instr. and Invest. Poultry Husb.*, 5 (1919), No. 4, pp. 28, 30-32, figs. 6).—The author presents records of the mating activity of individual hens and cocks secured at the Indiana Experiment Station. The plan was to keep a cock and a flock of hens under observation from 7 a. m. to 6 p. m. on two successive days.

In a pen of 10 White Leghorns, the cock in the two days mated 50 times, neglected none of the hens either day and mated with 1 of the hens 9 times. In a flock of 28 White Leghorns the cock mated 77 times (daily average of 1.37 times per hen), but failed to mate with 5 hens either day. During the two following days with half the flock, the same male mated 53 times (daily average of 1.9 times per hen) and served all hens at least once, including the 5 previously neglected. One hen was mated 15 times in the four days.

In a flock of 14 Rhode Island Red hens, the cock mated only 17 times in the two days and missed 5 hens each day. A Black Langshan cock with 8 hens mated 17 times, missing one hen each day. A White Plymouth cockerel with 15 hens mated 28 times and neglected 3 particular hens both days.

Most of the copulations took place toward the end of the day. "The tendency seemed to be for the hens to be mated several times per day or not at all. The observation records show that the males showed attentions to the missed hens but were repulsed."

It is concluded that Leghorn cocks are more active than males of the heavier breeds and that it would be economical to increase the number of hens served by one cock, since the recorded matings are much more numerous than are necessary for continuous fertility.

The development of the chick, F. R. LILLIE (*New York: Henry Holt & Co.*, 1919, 2. ed. rev., pp. XI+472, pls. 8, figs. 250).—This treatise on the embryology of the chick was first issued in 1908 (E. S. R., 22, p. 272). The first part includes a treatment of the origin of the germ cells and the physiology of egg production, besides tracing the early course of development, while the later chapters assemble much material not readily available elsewhere as to the growth and form of the internal organs and skeleton toward the end of incubation. There is a bibliography of 21 pages.

Care of baby chicks (*U. S. Dept. Agr., Dept. Circ. 14* [1919], pp. 7, figs. 2).—Designed for the use of boys' and girls' poultry clubs.

Acorns as food for poultry, H. T. CRANFIELD (*Jour. Bd. Agr.* [London], 25 (1918), No. 5, pp. 573-576).—An experiment is reported in which 17 hens were fed coarsely ground dried acorns in place of scratch feed for four weeks. The number of eggs produced per laying bird was not decreased below the records of the two previous weeks. The proximate composition of the acorn kernels is reported.

Cost of starting a commercial poultry business, Mr. and Mrs. G. R. SHOUP (*Washington Sta., West. Wash. Sta. Mo. Bul.*, 7 (1920), No. 10, pp. 163-165).—An estimate is given of the first year's expenses and receipts in connection with a flock of 400 pullets.

Runner ducks, E. A. TAYLOR (*New York: Charles Scribner's Sons*, 1918, pp. 62, pls. 10, figs. 5).—Directions are given for the breeding, management, and feeding of runner ducks, particularly as egg producers. The author states that he trap-nests his ducks.

Duck keeping on money making lines, W. POWELL-OWEN (*London: George Newnes, Ltd., 1918, pp. 220, figs. 19*).—This volume deals with the breeding and management of ducks and the rearing of ducklings for the table. There are brief sections on geese, turkeys, and guinea-fowl.

DAIRY FARMING—DAIRYING.

The seasonal cost of milk production, F. A. PEARSON (*Illinois Sta. Bul. 224 (1919) pp. 3-18, fig. 1*).—The author reports the month to month variation in the cost of producing whole milk for the Chicago market on 18 of the farms included in his study of the year cost presented in Bulletin 216 (E. S. R., 40, p. 878). On these farms during the period covered (fiscal years 1914-15 and 1915-16) were 407 cows, 19 bulls, and 234 young stock, and there were produced for sale 6,717 lbs. of milk per cow.

The data are treated according to two accounting systems, one based on the entire herd, the other on the milk-producing part (cows and the necessary bulls). By the latter system a cow is credited with the value of her calf when it is born, and the cost of replacing milking stock is covered by a debit item, live stock depreciation.

In the computations interest on stock was distributed uniformly throughout the year, but the other expenses and credits for which monthly estimates could not be secured were prorated according to the volume of milk produced. The tables give (1) itemized financial statements by months of expenses and returns not milk, and (2) the amounts of feed and man labor expended monthly per 100 lbs. of milk and the ratio of the cost of these two items to the net cost of production. The following tabulation summarizes the second series of data, the year being divided into two equal periods that roughly coincide with the winter season and the pasture season, respectively. During the winter season 57 per cent of the milk was produced.

Seasonal variation in labor and feed expended (and their combined cost as percentage of the net cost of production) per 100 lbs. of milk.

Period of year.	Herd basis.						Cow (and bull) basis.					
	Man labor.	Grain.	Hay.	Other forage.	Si-lage.	Portion of net cost.	Man labor.	Grain.	Hay.	Other forage.	Si-lage.	Portion of net cost.
	Hours.	Lbs.	Lbs.	Lbs.	Lbs.	P. ct.	Hours.	Lbs.	Lbs.	Lbs.	Lbs.	P. ct.
November to April..	2.78	53.9	67.8	60.5	233	106.0	2.41	43.9	53.0	42.1	183	86.3
May to October.....	2.38	22.8	18.8	6.1	149	81.1	2.15	17.6	14.2	4.3	115	61.9
Entire year.....	2.60	40.7	46.6	37.4	197	97.9	2.29	32.4	36.4	25.9	154	77.8

The method of using these figures to derive an estimate of costs under any particular schedule of prices is explained, and the value of pasture in reducing costs is discussed in some detail.

Establishment and management of the dairy farm, G. K. KELKAR (*Dept. Agr. Bombay Bul. 86 (1917), pp. 59, pl. 1*).—This is a much augmented edition of Bulletin 31 (E. S. R., 20, p. 476), and includes chapters on housing, managing, and feeding the dairy herd under Indian conditions, the making and disposal of dairy products including ghee (clarified butter), khawa (desiccated milk), and kharwas (a colostrum product), and the business aspects of dairy-

ing. Appendixes give sample record forms, dimensions of dairy buildings, an outline of soiling systems, names and analyses of feeding stuffs, equipment tables, etc.

British Friesian cattle, G. HOBSON (*Trans. Highland and Agr. Soc. Scot., 5. ser., 30 (1918), pp. 35-55, figs. 4*).—This is an account of early importations of Holstein-Friesian cattle into Great Britain, with notes on milk yields of British Holsteins.

The milk goat dairy, G. H. WICKERSHAM (*Wichita, Kans.: [Author, 1919], 3. ed., pp. 48, figs. 21*).—An enlarged edition of a pamphlet previously noted (*E. S. R., 21, p. 573*).

Milk, P. G. HEINEMAN (*Philadelphia and London: W. B. Saunders Co., 1919, pp. 684, figs. 250*).—This is a comprehensive treatise on milk with particular reference to its biological properties, and is an elaboration of a course on the sanitary aspects of milk supplies which the author formerly gave at the University of Chicago. The volume deals with the physiology of lactation, the physical and chemical properties of milk, adulteration of milk, enzymes, toxins and antibodies in milk, germicidal action of milk, the bacteriological examination of milk and the kinds of microorganisms present, milk-borne infections, fermented milks, certified milk, pasteurization and other methods of reducing the microflora, control of milk supplies, economic aspects of milk production, butter, cheese, ice cream and ices, condensed and desiccated milks, and milk from mammals other than the cow. I. A. Abt and A. Levinson contribute a chapter on Milk in its Relation to Infant Feeding. Each of the 24 chapters ends with a bibliography.

Should the short-time test be continued? R. R. GRAVES (*Hoard's Dairyman, 58 (1919), No. 18, pp. 824-826*).—The author answers this question definitely in the negative. The seven-day test as at present conducted is considered a misleading indication of a cow's ability to produce butter fat, and an almost worthless basis for purchasing breeding stock.

Importance of sterilization in the successful operation of milking machines, G. H. HART (*Pacific Dairy Rev., 23 (1919), No. 26, pp. 12-15*).—Two experiments are reported which indicate that one cause of failure to secure complete sterilization of milking machine parts by the use of disinfecting fluids is the fact that rubber or traces of milk cause rapid oxidation of the contained chlorin, the solutions thus becoming worthless as germicides. It is also noted that rubber tubing subjected to frequent boiling does not deteriorate as rapidly as is commonly assumed.

Dairy bacteriology.—II, Bacteriology of cream, butter, and cheese, W. STEVENSON (*Trans. Highland and Agr. Soc. Scot., 5. ser., 30 (1918), pp. 97-125*).—The author discusses the rôle of bacteria in butter making and in the manufacture of Cheddar and Dunlop cheese, and reports briefly a series of tests at the West of Scotland Agricultural College Experiment Station in which the use of *Bacillus bulgaricus* as a starter resulted in better flavored Dunlop cheese than the ordinary *Streptococcus lacticus* starter. The success with the former starter is attributed to the fact that *B. bulgaricus* fermentation develops a high acidity fatal to most of the putrefactive organisms.

The first installment of this paper has been noted (*E. S. R., 38, p. 781*).

The lecithin content of butter and its possible relationship to the fishy flavor, G. C. SUPPLEE (*New York Cornell Sta. Mem. 29 (1919), pp. 101-151 pl. 1*).—The author reports a wide variety of experiments to test the hypothesis that a fishy flavor in butter might be produced by the formation of trimethylamin (which has a characteristic fishy odor) as a result of the decomposition of any lecithin present. No statements as to lecithin in butter could be found

in the literature, but qualitative tests by the author revealed its presence, and J. T. Cusick furnished him with data from 12 samples showing a lecithin content ranging from 0.05 to 0.07 per cent (approximately).

Six lots of experimental butter samples (totaling 160) were prepared and submitted to from four to six competent butter judges for comments as to the presence of fishy or other foreign flavor. In making each sample there was added to the cream, the cream and unworked butter, or the unworked butter alone a definite amount of either trimethylamin or one of its fatty acid salts, or a fatty acid, or some combination of these.

"While there are several conflicting opinions as to the presence of the fishy flavor in any particular sample, it is nevertheless evident that the greatest number of positive comments is found in the samples containing trimethylamin in one form or another. . . . Usually the greatest uniformity of such comments is found in the samples containing trimethylamin in unstable form." The trimethylamin butyrate samples were judged fishy more frequently than the samples treated with any of the other substances.

In no case were the check samples fishy. Half of the samples were unsalted, and in each lot the unsalted butter was fishy less often than the salted.

The lot containing the largest number of fishy samples was made from raw sweet cream, the substances tested being added to the cream and also worked directly into the butter. Another lot from pasteurized sweet cream with the substances added only after churning contained almost as many fishy samples. The lots showing least fishiness were made from sour cream.

Six samples of fishy-flavored butter found on the market were examined for trimethylamin (by a special micro method) and this substance was found to be present in appreciable quantities. Trimethylamin was absent from two market samples originally judged fishy but which had lost this flavor at the time of analysis.

The acidity, trimethylamin content, and flavor of a number of butter samples held in storage for varying periods were also determined. In some cases the butter was made without experimental additions, in others the cream or the butter was inoculated with lactic acid bacteria, and in still others the cream was acidified with lactic acid. The results indicate that the presence of a certain amount of lactic acid is required for the development of fishy flavors. Allowing for uncertainties in the estimate of flavors, it is also concluded that a thoroughly typical fishy flavor is not developed unless trimethylamin is likewise present.

To discover what biological conditions produce a fishy flavor, cream samples were inoculated with bacteria isolated from fishy butter. Butters made from such cream were judged fishy in a number of cases, particularly where Hammer's *Bacterium ichthyosmius* (E. S. R., 37, p. 686) or another organism (unidentified) had been added. Further studies of the biochemical action of *B. ichthyosmius* indicated that it would decompose cholin (lecithin base) with the liberation of trimethylamin. It is concluded, therefore, that the action of specific bacteria is sufficient if not necessary for the production of trimethylamin in butter.

A list of literature references to lecithin in dairy products and to the fishy flavor of butter is appended.

Testing a new method of pasteurizing milk for cheese manufacturing (*Ann. Rpt. Ontario Agr. Col. and Expt. Farm*, 43 (1917), pp. 54-56).—Two lots of milk treated with hydrogen peroxid and then held at 125° F. for 30 minutes had a lower bacterial count than ordinary pasteurized milk. A lactic culture was added and the milk made into cheese in the ordinary way. After six weeks

in the curing room the cheeses were found to be of very poor quality, lacking body and cheese flavor. The cheese from one lot was gassy and possessed a hydrogen peroxid flavor. *Oidium lactis* and a mixed bacterial flora were present, with lactic acid bacteria predominating.

Experiments in the use of rennet substitutes for cheese making, T. J. MCKINNEY (*Ann. Rpts. Dairymen's Assocs. Ontario, 1916, pp. 111-114*).—Experiments at the Ontario Agricultural College in the use of homemade rennet and pepsin preparations in cheese making are reported.

A mixture of rennet and pepsin is recommended if a sufficient supply of rennet at a reasonable price can not be secured. If it is necessary to use pepsin alone, a slightly higher acidity in the milk is suggested.

The use of pepsin and other substitutes for rennet in cheese making, G. H. BARR (*Ann. Rpts. Dairymen's Assocs. Ontario, 1916, pp. 55-59*).—The author has tested the value of various proprietary coagulants containing pepsin for cheese making. With most of the preparations the cheeses were of good quality, but there was a greater loss of fat in the whey than when rennet was used.

Some further notes on the use of pepsin in the manufacture of cheese, G. H. BARR (*Ann. Rpts. Dairymen's Assocs. Ontario, 1917, pp. 112-114*).—Experiments made at the Finch Dairy Station on the influence of temperature and amount of pepsin on the fat content of the whey are reported. Data from 106 vats are held to indicate that settling the milk at a temperature under 86° F. and the use of enough pepsin to permit cutting the curd in less than 30 minutes results in a fat loss no greater than that found when rennet extract was used.

VETERINARY MEDICINE.

Digest of comments on the Pharmacopœia of the United States of America and on the National Formulary, M. I. WILBERT (*Pub. Health Serv. U. S., Hyg. Lab. Bul. 105 (1916), pp. 516*).—This bulletin consists of brief abstracts of articles of interest in connection with the U. S. Pharmacopœia and the National Formulary appearing in pharmaceutical, medical, and chemical literature during the year 1914. The preceding edition of this series has been previously noted (*E. S. R., 32, p. 875*).

Digest of comments on the Pharmacopœia of the United States of America and on the National Formulary, A. G. DUMÉZ (*Pub. Health Serv. U. S., Hyg. Lab., 1919, Buls. 118, pp. 455; 119, pp. 316*).—These bulletins continue the series noted above for 1915 and 1916, respectively.

Chronic phlegmon with sclerosis and its treatment with autogenous serum, R. MIDDELDORF (*Berlin. Tierärztl. Wchnschr., 34 (1918), No. 49, pp. 475-478*).—The successful treatment of ten cases of chronic ulcerous lymphangitis by injection of autogenous serum is reported.

Experiments on the production of specific antisera for infections of unknown cause.—III, **The effects of a serum precipitin on animals of the species furnishing the precipitinogen**, P. ROUS, G. W. WILSON, and J. OLIVER (*Jour. Expt. Med., 31 (1920), No. 3, pp. 253-265*).—In continuation of the studies previously noted (*E. S. R., 40, p. 678*), this paper reports an investigation of the possible dangers in therapeutic practice of the use of sera exhausted by the methods described, particularly as regards the precipitins present in such sera.

It was found that "there is present in serum of high precipitin titer, produced by the repeated injection of rabbits with the blood-free serum of guinea pigs or dogs, a principle highly toxic for animals of the species furnishing the antigen. Intravenously the serum causes severe shock, and even sudden death,

while locally it gives rise to acute inflammatory changes and profuse capillary hemorrhages. The complete removal of hemolysins and hemagglutinins from the serum by exposing it repeatedly to washed red cells lessens its toxicity to only a slight degree and one obviously dependent on these elements, while the further removal of precipitin by specific precipitation *in vitro* has no detoxifying effect whatever. Whether the toxic principle is a hitherto unrecognized antibody or perhaps a toxic product of the interaction of precipitin and precipitinogen, one formed as readily in the test tube as in the animal body, remains to be determined."

These results are considered to be of a discouraging nature from the point of view of the utilization of the serum of infected human individuals as antigen, unless some means can be found for nullifying the action of this toxic principle.

Serum sickness following injection of bovine serum, A. NETTER and COSMOVICI (*Compt. Rend. Soc. Biol. [Paris]*, 82 (1919), No. 28, pp. 1152, 1153).—The authors report that in their experience bovine serum has not shown the superiority attributed to it by Penna (E. S. R., 40, p. 582) for the treatment of various diseases. Several cases are reported in which severe serum sickness resulted from its use.

Pneumococcus cultures in whole fresh blood.—I, The retardative effect of the blood of immune animals and the mechanism of the phenomenon, C. G. BULL and L. BARTUAL (*Jour. Expt. Med.*, 31 (1920), No. 3, pp. 233-251).—This paper reports a study of the alleged pneumococidal property of the whole blood of normal and immune animals of different species with the technique described by Heist et al. (E. S. R., 40, p. 286.)

The observations noted indicate that the whole, uncoagulated blood of immune animals is not so highly pneumococidal *in vitro* as has been claimed by the above authors (E. S. R., 41, p. 577) and others, but that it merely retards the multiplication of pneumococci, the relative lengths of the latent periods of the cultures corresponding in a general way to the relative resistance of the animals to infection by these organisms. The blood of animals artificially immunized, both actively and passively, was found to have a similar retarding effect on the growth of pneumococci. On microscopic examination, cultures of pneumococci in immune blood showed chain formation, growth in clumps, and phagocytosis of the organisms by the polynuclear cells, the growth occurring first in the free serum and later in the clot.

"The retardation of multiplication depends on two factors, opsonization of the pneumococci by the immune serum and phagocytosis of the organisms by the polynuclear cells; growth readily occurs when either agent is absent. Pneumococci multiply in defibrinated immune blood because few phagocytes are present after defibrination. Pneumococci grow in the most potent immune blood after mechanical destruction of the white cells."

The cultural differentiation of beta hemolytic streptococci of human and bovine origin, J. H. BROWN (*Jour. Expt. Med.*, 31 (1920), No. 1, pp. 35-47).—The fact that hemolytic streptococci are common in good dairy products and are usually harmless to the consumer makes it desirable that such streptococci be distinguishable from the hemolytic streptococci pathogenic to man which are also at times found in dairy products. This has led to the studies here reported which were conducted by the Department of Animal Pathology of the Rockefeller Institute for Medical Research at Princeton, N. J. The details of the investigation are presented largely in tabular form.

None of the procedures described by the author serves by itself to differentiate streptococci of human and bovine origin with certainty, but each of them serves as a strong presumptive test. Most strains fall easily into the human or bovine group by all the tests.

Dairy infection with *Streptococcus epidemicus*, J. H. BROWN and M. L. ORCUTT (*Jour. Expt. Med.*, 31 (1920), No. 1, pp. 49-70, pl. 1).—“A streptococcus epidemic of moderate extent and severity was characterized by clinical symptoms different from the usual septic sore throat, though the organism found was culturally *S. epidemicus*. The infection was traced to the milk from a single quarter of the udder of a cow in a dairy of 112 cows producing an otherwise excellent grade of raw milk. A number of the milkers on the dairy farm [which produced a high grade of raw milk for sale in Boston] were found infected. It was impossible to trace the infection of the cow's udder to any one of the milkers, though such an infection seems probable since the streptococcus isolated from the cow was in every respect like streptococci isolated from patients and milkers, and different from those usually found in normal cows or cows with garget.

“Certain recommendations are made to safeguard producers of raw milk against the occurrence of such epidemics.”

Paratyphoid abortion in mares and its relation to abortion in cows, W. STICKDORN and O. ZEH (*Berlin: Tierärztl. Wchnschr.*, 35 (1919), Nos. 39, pp. 365-367; 40, pp. 377-379).—The authors report that of 73 cases of abortion in mares examined during the past 4 years 47 of the aborted fetuses were found on bacteriological examination to contain paratyphoid bacilli, and 3 both paratyphoid and streptococcus bacilli, thus indicating the paratyphoid bacillus to be the predominating cause of abortion in mares. Abortion due to this organism is further differentiated from that caused by the abortion bacillus of Bang through the acute course of the disease, which manifests itself particularly in the septic alterations of the fetus. Serological methods alone failed in a number of cases examined, indicating that only a positive finding is to be considered reliable.

Attention is called to the value as an immunizing agent against the paratyphoid bacillus of the preparation parabortion previously described by Zeh (*E. S. R.*, 42, p. 273).

The valuation of the new symptomatic anthrax vaccine (*Emphysarcol*), H. FOTH (*Berlin: Tierärztl. Wchnschr.*, 34 (1918), No. 18, pp. 171-175).—This article summarizes the investigations of the author concerning the standardization and proper use of the symptomatic anthrax (blackleg) vaccine previously noted (*E. S. R.*, 28, p. 376) and more fully described later.¹

The vaccine is prepared from highly virulent, spore-containing, blackleg cultures, and contains water-soluble proteins, killed bacilli, living spores, and the metabolism products of the bacilli. It is used in two forms, type A, a turbid solution containing numerous spores attenuated by heat, and type F, a filtered spore-free solution. The two types are used simultaneously, type A being injected into the tail, and type F into the front of the ear.

Epizootic lymphangitis, H. VELU (*Rev. Gén. Méd. Vet.*, 28 (1919), Nos. 331, pp. 349-368; 332, pp. 413-432; 333, pp. 491-504).—This is a summary of information on epizootic lymphangitis of the horse dealt with under the headings of history, epidemiology, etiology, symptomatology, pathological anatomy, diagnosis, prognosis, prophylaxis, and treatment. A bibliography of 63 titles is appended.

Vaccination experiments against rinderpest with the method of serum vaccination of Schein, P. CROVERI (*Bul. Soc. Path. Exot.*, 12 (1919), No. 8, pp. 487-489).—A comparative study of the method of immunization against rinderpest proposed by Schein (*E. S. R.*, 38, p. 484) and the method of Kolle and Turner is reported. The conclusion is drawn that the method of Schein is less

¹ Berlin. Tierärztl. Wchnschr., 32 (1916), No. 11, pp. 121-123.

reliable and does not confer so lasting an immunity as the original method of Kolle and Turner, of which it is a modification.

The significance of lipoids in resistance to tuberculosis, J. DE SEIXAS PALMA (*Centbl. Bakt. [etc.]*, 1. Abt. Orig., 83 (1919), No. 3, pp. 231-254, figs. 5).—An investigation of the possible influence of the lipoids of various organs on resistance to tuberculosis is reported and summarized as follows:

The lipoids of the lymph glands of tuberculous cows when dissolved in olive oil or emulsified in bile produced edema or necrosis and even death when injected into experimental animals. The same lipoids converted into soap and separated into their saturated and unsaturated fractions proved equally poisonous.

The iodine numbers of the lipoids of the mesenteric glands and of the pancreas showed a marked contrast in reference to tuberculosis. The free lipid acids of the mesenteric glands of tuberculous cows contained more unsaturated groups than the parent substance and than the analogous acids from healthy glands. The contrary was true of the pancreas, the healthy glands having a higher iodine number than the pancreas of tuberculous animals. These findings are thought to indicate that the mesenteric glands of tuberculous cows contain poisonous compounds of the tubercle bacilli, due theoretically to the lack of fat-splitting ferments which are found in large numbers in the pancreas. The saturated soap fractions from the pancreas of tuberculous cows were never poisonous and contained no substances giving a positive ninhydrin reaction. It is pointed out in this connection that the lymph glands in tuberculous herds have often been found to be tuberculous, while such is never the case with the pancreas.

A constant and marked difference between the lipoids of healthy and tuberculous animals was noted, the latter having a lower melting point and darker color, turning brown on warming. The activity of these preparations in tuberculosis was demonstrated through the phagocytosis and digestion of the soaps from tuberculous cows gave good results in the ophthalmic treatment of myelin figures and the heightened solubility of the isolated fat of the tubercle bacilli. In intraperitoneal experiments it was demonstrated that the pancreatic soaps incited the leucocytes to phagocytosis. The saturated pancreatic soaps from tuberculous cows gave good results in the ophthalmic treatment of dogs with tuberculous eye infection of the human type. Similar unsaturated soaps caused marked irritation when injected subcutaneously into guinea pigs.

The author concludes that the saturated pancreatic soaps of tuberculous cows form the best agent for the attenuation of tubercle bacilli of the human type.

Possible failure of tuberculin in cows during gestation and after calving, R. BISSAUGE (*Rev. Gén. Méd. Vét.*, 28 (1919), No. 356, pp. 679-681).—Evidence is given to indicate that the intradermal as well as the subcutaneous tuberculin test is likely to fail in tuberculous animals in the last two months of gestation and for about ten days after calving.

Tuberculosis in horses, M. SCHLEGEL (*Berlin. Tierärztl. Wchnschr.*, 34 (1918), No. 52, pp. 501-504).—This is a review of the literature of tuberculosis in horses, together with descriptions of four authentic cases of different types as follows: Primary tuberculosis of the lungs with tumor-like formation, primary tuberculosis with extensive nodule formation, primary skin and muscle tuberculosis originating in a shell wound in the left forearm, and intestinal tuberculosis. The danger is pointed out of confusing tuberculosis with glanders through similarity in nodule formation.

Tick fever in Palestine, F. D. NICHOLSON (*Brit. Med. Jour.*, No. 3077 (1919), p. 811).—The author reports finding recurrent fever in white troops stationed in Palestine to have been transmitted by *Argas persicus*.

Microbabesia divergens in Netherlands Indies, J. C. F. SOHNS (*Dept. Landb., Nijv. en Handel [Dutch East Indies], Veeartsenijk. Meded.*, No. 28 (1918), pp. 75, pls. 3).—The author reports on the discovery in 1917 of a small babesia in slaughtering cattle, recently brought from Australia to Java, which is distinctly smaller than *Babesia bigemina* and occurs in the peripheral blood, mostly in slender forms but in hitherto unknown periods. "It also appears in the spleen and liver but is most numerous in the kidneys, in which inner organs it assumes a shorter and plumper, often an almost round, shape, probably indicating a resting stadium. This rounded form also prevails in blood smears taken a certain time after death. . . ."

"For this parasite, already known by three names, *Babesia bovis*, *B. divergens*, and *Piroplasma argentium*, I propose the name *Microbabesia divergens*, giving better than others the characteristic peculiarities, i. e., the smallness and the divergence. The symptoms in the beginning are often indistinct [and do not] present any marked difference from that of Texas fever; redwater, however, is not constant, but icterus occurs more frequently, a symptom that Smith and Kilborne did not mention in their description of Texas fever."

This disease causes less severe losses than Texas fever. Inoculation with microbabesia causes a mild affection, which is followed by immunity. *Margaropus australis* is said to be the intermediate host in Java.

A list of 65 references to the literature is included.

Researches upon a spirillum associated with abortion in ewes, C. M. CARPENTER (*Cornell Vet.*, 9 (1919), No. 4, pp. 191-203, pls. 3).—The first part of this paper, consisting of a review of the literature and particularly the work of McFadyean and Stockman (*E. S. R.*, 30, p. 684) on the subject, is followed by an account of an outbreak of abortion in a flock of 235 yearling ewes in New York State. In a bacteriological examination of the affected animals there was recovered in cultures a spiral-shaped actively motile organism which in some cases was mixed with a streptococcus.

The purification and concentration of hog cholera serum, E. RECORDS (*Jour. Amer. Vet. Med. Assoc.*, 56 (1919), No. 3, pp. 291-302).—The investigation discussed in this article was undertaken at the Nevada Experiment Station for the purpose of determining the feasibility from a commercial and economic standpoint of subjecting hog cholera serum to a refining and concentrating process analogous to that used in making the globulin products from diphtheritic and tetanic serums.

The general procedure followed was to free the virulent blood from hemoglobin and cellular débris by the use of sodium citrate, sodium chlorid, or the sodium chlorid and navy bean extract method of Dorset and Henley (*E. S. R.*, 35, p. 488), and then to precipitate the diluted plasma with saturated ammonium sulphate by the method of Homer (*E. S. R.*, 35, p. 680), with slight modifications.

It was found possible to recover practically the entire antibody content of hog cholera serum in a single precipitation by the addition of 55 per cent of ammonium sulphate. The subsequent final clarification and sterilization of the solutions of such precipitates by passage through a bacteria-retaining filter was, however, found to be exceedingly difficult and almost impossible in practical amounts. "No attempt at chemical clarification of the final solutions before filtration was made, and there may still be possibilities along this line, or perhaps some modification or refinement of the precipitation method might overcome the difficulties of final filtration."

The author concludes that "the commercial production of such a globulin product is probably not justified at this time owing to the high cost as compared to the very satisfactory sterile, clear, antihog-cholera serum now on the market at a reasonable price."

Production and use of antihog-cholera serum, W. J. LOPP (*Amer. Jour. Vet. Med.*, 15 (1920), No. 1, pp. 13, 14).—Statistics are given of the amount of hog cholera serum produced yearly from 1915 to 1919, inclusive, in all United States' licensed establishments. From these figures and the estimated number of hogs in the United States during the same period the percentage of hogs vaccinated yearly has been calculated, the results being 6.45, 6.57, 7.41, 14.8, and 10.67 per cent, respectively. The decrease in 1919 over the preceding year is attributed to the rather indiscriminate use of hemorrhagic septicemia and mixed infection bacterins in place of hog cholera serum. The importance is emphasized of a differential diagnosis before using these bacterins.

The percentages of loss of hogs from hog cholera for the years 1913 to 1918, inclusive, are estimated as 9.91, 10.68, 8.57, 5.99, 4.38, and 3.78 per cent, respectively. The steady decrease in the loss of hogs from this disease is attributed largely to the increased use of the United States' released hog cholera serum.

Diseases of the horse's foot, H. C. REEKS (*Chicago: Alex. Eger, 1918, pp. XXI+458, figs. 165*).—The several chapters of this work deal with the subject as follows: Regional anatomy, general physiological and anatomical observations, method of examining the foot, general remarks on operations on the foot, faulty conformation, diseases arising from faulty conformation, wounds of the keratogenous membrane, inflammatory affections of the keratogenous apparatus, diseases of the lateral cartilages, diseases of the bones, and diseases of the joints.

Treatment of joint-ill with serum from the dam, JOHN (*Berlin. Tierärztl. Wchnschr.*, 34 (1918), No. 49, pp. 478, 479).—Attention is called to the possibility of treating advanced cases of joint-ill with serum from the dam. Two case reports are given of foals 9 and 10 weeks old which were cured of severe cases of joint-ill by the intravenous injection of 450 gm. of the serum warmed to 40° C. on a water bath.

The etiology of meningo-encephalitis enzootica (Borna disease) of equines, R. KRAUS (*An. Soc. Rural Argentina*, 53 (1919), No. 18, pp. 861-867, figs. 4).—The author's studies have led to the conclusion that Borna disease is caused by a definite diplococcus.

Roup in poultry, W. J. JOHNSON (*Washington Sta., West. Wash. Sta. Mo. Bul.*, 7 (1920), No. 10, pp. 166-170, figs. 7).—This is a popular descriptive account.

RURAL ENGINEERING.

Hydrology: The fundamental basis of hydraulic engineering, D. W. MEAD (*New York: McGraw-Hill Book Co., Inc., 1919, pp. XI+647, figs. 356; rev. in Engin. News-Rec.*, 83 (1919), No. 21, p. 1021).—This treatise, consisting of material brought together largely from the results of the author's own work, covers the occurrence of water—its distribution and fluctuations in quantity, special attention being given to rainfall phenomena and to observations of atmospheric conditions which control precipitation. Following this is a discussion of the influence of geology and topography upon the occurrence of ground water and surface run-off water, with a consideration of the causes

and effects of floods, the practicability of water storage, and other applications of engineering data. As a conclusion, the author has outlined briefly some of the applications of hydrology. Two general classes of engineering work in which it plays an important part are considered, (1) works for the utilization of water and (2) works for the control of water.

Abundant references to related works are included.

Hydraulics, R. L. DAUGHERTY (*New York: McGraw-Hill Book Co., Inc., 1919, 2. ed., rev. and enl., pp. XVI+267, figs. 252*).—In this, the second edition of this book (E. S. R., 35, p. 786), the new material consists principally of graphical methods of solving certain practical problems, the determining of the economic size of pipe, and problems of flow through compound pipes, branching pipes, pipes with laterals, and through rotating channels.

Second biennial report of the State Water Commission of California, 1917-18 (*Bien. Rpt. State Water Comm. Cal., 2 (1917-18), pp. 19*).—This pamphlet reports the activities of the commission for the years 1917 and 1918, dealing particularly with water rights and calling attention to cooperative work in irrigation investigations with the U. S. Department of Agriculture.

Second report of the State Engineer of New Mexico, J. A. FRENCH (*[Bien.] Rpt. State Engin. N. Mex., 2 (1914-1916), pp. 103+[V], pls. 30*).—This report is divided into two parts, one relating to the work and expenditures of the New Mexico State Highway Commission and the other covering the work of the State Engineer for the period from December 1, 1914, to November 30, 1916, and relating to irrigation, hydrographic surveys, stream gauging, protection from the Rio Grande River, and well-digging on State lands.

The value of a hydraulic horsepower at the wheel, E. W. RETTGER (*Cornell Civ. Engin., 28 (1919), No. 2, pp. 62-69, fig. 1*).—This is a mathematical analysis of the economic design of penstocks or pipes.

Experiments on the flow of water through contractions in an open channel, E. W. LANE (*Proc. Amer. Soc. Civ. Engin., 45 (1919), No. 8-10, pp. 715-774, pls. 8, figs. 20*).—Studies made in connection with the design of the flood prevention works of the Miami conservancy district, on the laws governing the flow of water through a contraction in an open channel, are reported.

The experiments consisted of measurements of flow through a contraction with rounded edges, 1 ft. wide; a sharp edge contraction, 1 ft. wide; a sharp edge contraction, 2 ft. wide; a short flume with rounded entrance; a short flume with sharp corner entrance; and an expanding or Venturi flume. The apparatus used is described in detail. The most important conclusions drawn from these experiments are as follows:

The manner in which the flow of water through a contraction takes place is entirely dependent on the conditions existing in that particular case. The two most common formulas are those of d'Aubuisson and Weisbach. Under certain conditions, one of these formulas may be applicable and, under another set of conditions, the other; while under still other conditions, neither should be used. The flow through a contraction is intimately connected with the phenomenon of "maximum flow." To explain the conditions of flow in the expanding flume, the theory of back-water curves was developed for a frictionless channel with a level bottom and variable width. Certain forms of contractions were found to possess considerable merit as instruments for the measurement of flowing water.

Appendixes are attached containing (1) a brief description of the application of the theory of flow through contracted openings to the design of the flood-

prevention works of the Miami conservancy district, and (2) a description of the unstable state of the stream below a sharp-edged contraction.

Verification of the Bazin weir formula by hydrochemical gaugings, F. A. NAGLER (*Proc. Amer. Soc. Civ. Engin.*, 44 (1918), No. 1, pp. 3-54, figs. 24).—This paper presents the results of 23 experiments on a standard Bazin weir 3.72 ft. high and 6.56 ft. wide, conducted at the University of Michigan. The water was measured hydrochemically, tests being made on heads as high as 4 ft. on the weir.

It was found that for heads of less than 2 ft. the discharges, as given by the salt solution gaugings, were higher than those computed by the Bazin weir formula. For heads greater than 2 ft., the Bazin formula gives discharges which are greater than those obtained in this set of experiments. This attains a maximum difference of 0.6 per cent at a head of 4 ft. The salt solution experiments which lie within the range of the Bazin experiments coincided with the Bazin formula and experimental curve more closely than the Bazin experiments themselves. The results of the high head experiments fitted the Bazin formula more closely than they would fit the probable extension of the Bazin experimental curve. "In claiming that the Bazin formula gives actual discharge within 1 per cent, within the range of his experiments, this formula is all that its author maintains. There is, however, further merit for the Bazin formula, in that this statement proves to be valid for heads as high as 4 ft. on a weir 3.72 ft. high. The Bazin weir formula is thus extended 100 per cent beyond its original legitimate field of application."

A comparison between the results of these experiments and the Bazin, Fteley and Stearns, Francis, and King formulas leads to the conclusion that "the agreement with the Bazin experimental curve is remarkably good, except for the low heads. The Bazin formula approximates these experiments within 1 per cent for all discharges listed. The Fteley and Stearns formula gives good results for the highest heads, but gives discharges too small for heads of less than 1 ft. The Francis formula does not agree with these experiments. The discharges vary from 1.4 to 4.75 per cent, and are lower than the hydrochemical experiments for both low and high heads on the weir. The King weir formula approximates these experiments very closely for nearly all heads; in fact, it seems to fit the data better than any of the existing formulas, except for a divergence of 1.25 per cent at the lowest head."

The methods of hydrochemical and weir gauging used are described.

Study of pressures in hydraulic dam cores (*Engin. News-Rec.*, 83 (1919), No. 22, pp. 1040-1041, figs. 7).—This report describes methods used by the engineers of the Miami conservancy district to obtain data on core consistency and action and on lateral and vertical pressures. The Goldbeck pressure cell apparatus is being used to obtain data on core consistency and action and lateral and vertical pressures. Resistance to penetration or supporting power of dam cores is being gauged by lowering a 6 in. cast-iron ball into the pool by a rope, its penetration under its weight being recorded.

River discharge, H. CHATLEY (*Engineering* [London], 108 (1919), No. 2801, p. 322; also in *Engin. and Contract.*, 52 (1919), No. 18, p. 493).—In the course of investigations made during the past three years as to the regulation of the Whangpoo and Yangtze Rivers, comparisons were made of the various discharge formulas on large streams with irregular flow.

It was found that all the standard formulas have no applicability whatever to natural sinuous and irregularly sectioned streams because of the dissipa-

tion losses at the bends and changes of section. The energy so lost may easily amount to as much as the friction head obtained from the formulas. In fairly straight and uniformly sectioned reaches when the flow is steady the exponential form

$$V=CR^{0.7}I^{0.5} \dots$$

gives consistent results, I being the local slope or tangent to the water surface at the measuring section. When the flow was unsteady in regular channels, the velocity followed this form:

$$V=CR^{0.7}\left(I-\frac{a}{g}\right)^{0.5} \dots$$

where a is the acceleration. In other words, the effective slope is equal to the algebraic difference between the actual slope and an acceleration slope determined by the ratio of the actual mean acceleration of the water to the gravitational acceleration.

Surface water supply of St. Lawrence River Basin, 1917 (*U. S. Geol. Survey, Water-Supply Paper 454 (1919), pp. 124+XXXIII, pls. 2*).—This report, prepared in cooperation with the States of Minnesota, Wisconsin, New York, and Vermont, presents the results of measurements of flow made on streams tributary to the Great Lakes and the St. Lawrence River during the year ended September 30, 1917.

Surface water supply of Hudson Bay and upper Mississippi River Basins, 1917 (*U. S. Geol. Survey, Water-Supply Paper 455 (1919), pp. 207+XXX, pls. 2*).—This report, prepared in cooperation with the States of Minnesota, Wisconsin, Iowa, and Illinois, presents the results of measurements of flow made on streams in the Hudson Bay and upper Mississippi River drainage basins during the year ended September 30, 1917.

The seasonal variation in the reaction and hardness of river water in India, W. C. ROSS and K. N. BAGCHI (*Indian Jour. Med. Research, 6 (1919), No. 4, pp. 423-429, figs. 4*).—Twenty-one months' studies on Ganges River waters and nine months' studies on Sone River waters showed that these waters become acid in reaction during the monsoon period. This change from alkaline to acid reaction was found to be a definite natural process of seasonal variation of alkalinity in river waters.

The effect of the acidity in reaction on sedimentation was to delay the formation of aluminum hydrate, to produce a less firm coagulum with diminished powers of sedimentation, and also to upset completely the calculation of the quantity of alum required. It was found by experiment that the addition of lime so as to render the water definitely alkaline, restored the conditions necessary for good sedimentation. The acidity was demonstrated to be due to the presence of free carbon dioxid in the water, boiling of which caused a temporary return to alkalinity in reaction, which again was followed by a gradual return to the previous condition of acidity. It was also found by experiment that the acidity could be greatly reduced by the use of an air pump to remove carbon dioxid from the water.

The theory is advanced that this change in reaction is due to catalytic action, decomposing the calcium bicarbonate and liberating carbon dioxid, and that the fine sediment which is present in these river waters after the strong west winds are established and when the rivers rise is the catalytic agent.

Classification of springs, K. BRYAN (*Jour. Geol., 27 (1919), No. 7, pp. 522-561, figs. 23*).—This is an extensive discussion of springs, made for the purpose of providing a series of terms expressive of genesis which will include all springs. Springs are divided into two main classes: Class 1, springs due

to deep-seated waters, include volcanic springs and fissure springs; class 2, springs due to meteoric and occasionally other waters moving as ground water under hydrostatic head, include depression springs, contact springs, artesian springs, and springs in impervious rock.

Farm water supply, F. H. PETERS (*Dept. Int. Canada, Irrig. Div. Bul. 5 (1919), pp. 27, figs. 11*).—This is a semitechnical bulletin, prepared for distribution among the farmers of the semiarid districts of Alberta and Saskatchewan, with a view to aiding them in procuring a domestic water supply. The bulletin discusses such subjects as earth reservoirs, dams, rain catchers or cisterns, and methods of purifying water.

It is to be noted that the greater part of the water supplies described in this bulletin are of the surface variety, in view of the semiarid conditions. The methods of purifying water are therefore considered of extreme importance. These include boiling, chemical treatment with chlorid of lime, filtration, and distillation. Sand filtration is apparently generally recommended. However, an illustration of a homemade filter, made out of two casks, is given, which, it is stated, is very efficient. The large cask contains a filter consisting, from the top, of 12 in. of fine sand, 3 in. of fine gravel, 6 in. of animal charcoal, and 3 in. of fine gravel. The water flows through this filter into the second cask, which is a storage chamber.

Chlorination and chloramin, J. RACE (*Jour. Amer. Water Works Assoc., 5 (1918), No. 1, pp. 63-82*).—This paper reports studies on the effect of acids, alkalis, and salts on chlorination of water supplies.

It was found that "the effect of small quantities of sodium chlorid (up to 10 parts per million) is apparently very limited, but larger amounts tend to increase the velocity of the germicidal action of the hypochlorite. Sodium chlorid itself has no effect on the viability of *Bacillus coli* during the period covered, viz, five hours. In quantities up to approximately 5 parts per million caustic potash has but little effect. At 5 to 10 parts per million the velocity of the germicidal action is materially reduced, but when higher amounts are present the germicidal action of the alkali itself begins to take effect and may entirely nullify the retarding effect on the hypochlorite. . . . Small amounts of acid, whether added as a strong mineral acid or a weak acid such as carbonic acid, increase the velocity of the action in a marked manner. Sulphuric acid alone has a germicidal effect, but insufficient to account for the observed effect of the addition of acid to hypochlorites."

A comparison of various sources of chlorin with bleach showed that chlorin gas and electrolyzed salt are slightly superior to bleach, but the difference has no practical significance. Abnormally high efficiency was obtained with ammonium hypochlorite. Data on practical use of chlorin disinfection for water supplies are also given.

Iron-depositing bacteria and their geologic relations, E. C. HARDER (*U. S. Geol. Survey Prof. Paper 113 (1919), pp. 89, pls. 12, figs. 14*).—This is a report of rather extensive investigations on the iron-depositing bacteria, with particular reference to their existence in soil and in water supplies. It was found that, in addition to the iron-depositing bacteria proper, probably many of the common bacteria of soil and water are active in precipitating iron compounds. A critical summary of the works of others bearing on the subject and a bibliography are included.

Duty of water in irrigation, W. L. POWERS (*Oregon Sta. Bul. 161 (1920), pp. 20, fig. 1*).—A summary is given of 12 years' irrigation experiments on brown silt loam soil of good fertility, conducted partly in cooperation with the U. S. Department of Agriculture.

The data reported are based on about 600 seasonal plat products and some 30,000 soil moisture determinations. Staple field crops were grown on duplicate one-tenth acre plats under field conditions and measured quantities of irrigation water pumped from a creek were used. A summary of the 12 years' experiments indicates that all crops gave an increase from the use of water, and in all cases the profits have been substantially larger where the crop was raised under irrigation. Except for corn, the water cost of dry matter has been distinctly less with irrigation, the difference being on the average 15 to 20 per cent less. The gain in net profit per acre for the irrigation treatment over the dry treatment ranged on the average from 87 cts. with corn to \$23.96 with potatoes.

It was found that alfalfa and other meadow crops required relatively large amounts of water, and without irrigation their growth is checked in June. Two irrigations gave better results than one in dry seasons, the water being applied for the third and fourth cuttings. With a good head of water the strip border method of irrigation was found to be adapted to this silt loam soil, while with a smaller head the use of the corrugation method was necessary.

"Potatoes, beans, and other cultivated crops require in this climate only a moderate amount of supplemental irrigation. With beans, one moderate soaking at the time they are coming into full bloom followed by thorough cultivation is generally the most profitable. With potatoes, a uniform moderate moisture content is the important factor in keeping them growing at an even rate. This is best maintained by moderate irrigation when the potatoes are coming into bloom and further irrigation when they have about finished blooming. Beets have been more profitable under irrigation than corn or kale. They make their growth late in the season and are somewhat benefited by a second irrigation. It may not be profitable, however, to apply late irrigation, or a second irrigation, to beets, except in dry seasons. Grain, when planted in the fall is not itself greatly benefited by irrigation, though some increase in yield has been obtained." Spring grain in dry seasons has been very substantially benefited by irrigation.

Data on the economic duty of water showed that the following average quantities of water gave the most profitable returns: Beets 11.38 in., beans 8.6, grass 21.28, alfalfa 20.64, clover 19.28, and potatoes 10.12 in. Data on the effects of rotation on the economical use of water showed a difference of \$6.63 net profit per acre in favor of the irrigated rotation. Rotation both with and without irrigation resulted in an increase in yield and profit and a decrease in water cost. With irrigation, increase in yield and profit was greater especially in the closing years of the period.

The factors affecting the economical use and duty of irrigation water are summarized in some detail.

Irrigation in the Fourteenth Census of the United States, R. P. TEELE (*Engin. News-Rec.*, 83 (1919), No. 20, pp. 926, 927).—This is a brief outline of the inquiries to be included in the fourteenth irrigation census.

Life of flume prolonged by roofing paper lining (*Engin. News-Rec.*, 84 (1920), No. 3, p. 131, figs. 2).—This is an account of experiments with a leaky wooden flume in an irrigation district in southern California. After other means of stopping a 50-per-cent leakage had failed, roofing paper was used and resulted in keeping the leakage below 10 per cent for five years. Three types of paper lining were experimented with, and the successful type was applied as follows:

The flume was first strengthened and plugged and the seams mopped with asphalt. The felt lining was applied while the asphalt was still hot, thus

forming a tight bond between the lining and the flume joint. Laps in the lining at joints were nailed with large flat-headed roofing nails. The roofing paper was placed on top of the lining and mopped with hot asphalt.

Self-cleaning screen for small canals (*Engin. News-Rec.*, 84 (1920), No. 3, p. 128, figs. 3).—A self-cleaning screen for excluding floating solids, leaves, and other débris from small canals is described and illustrated.

Tile drainage, J. A. KING (*Mason City, Iowa: Mason City Brick & Tile Co.*, 1918, pp. [VIII]+63, pls. 6, figs. 42).—This is a popular treatise on the subject of farm tile drainage, in which an explanation is given of how and why tile drainage will benefit the soil, together with instructions for the proper installation of tile drainage systems under different conditions. The author apparently favors the use of clay tile in this work, although he takes up briefly important points to be considered in the selection of cement tile.

Determination of Kutter's roughness in a drainage ditch, R. BOSARD (*Engin. News-Rec.*, 83 (1919), No. 20, pp. 921, 922, figs. 5).—Experiments on the value of n in Kutter's formula, made on ditches in the Grassy Lake and Tyrnza drainage district in Arkansas, are reported. The soil is a stiff, heavy gumbo and the plant growth is quite dense and profuse.

The average of eight values of n was found to be 0.0377. It is concluded that for ditches in soil of this kind the value of 0.03, which is commonly used, is not high enough, and that the value of 0.035 is the one more nearly correct.

The leveling of soils in Egypt, V. M. MOSSÉRI and C. AUDEBEAU BEY (*Bul. Union Agr. Égypte*, 16 (1918), No. 125, pp. 81-124, pls. 8, figs. 7).—This bulletin deals with types of apparatus used, the methods employed, and the cost of leveling agricultural soils in Egypt. Among the tools used for this purpose are plankers, plank drags and scrapers, and scrapers of the inverting type, corresponding to the usual metal scraper except that they are made of plank. This last tool seems to be the one most generally used with the most effective results. Considerable cost data are given in graphic form, showing the relation between cost, depth of scraping, and distance of haul.

Road laws of the State of Idaho, compiled by J. W. ARNEY and M. H. EUSTACE (*Boise, Idaho: State*, [1918], pp. 214).—The text of these laws is given as revised to February 1, 1918.

Country Roads Board: Fifth annual report, W. CALDER (*Ann. Rpt. Country Roads Bd. Victoria*, 5 (1918), pp. 54).—This is a report of the activities and expenditures of the Country Roads Board of Victoria for the year 1918. It is noted that loan expenditures on permanent works during the year amounted to about £226,600.

Classification and uses of highways and the influence of Federal-aid acts, T. H. MACDONALD (*Engin. News-Rec.*, 83 (1919), No. 21, pp. 985-988).—The uses of highways of the United States are classed as agricultural, recreational, commercial, and military, being placed in this order as an indication of the order of their importance as determined by their respective volumes. The important modifications considered necessary in order that the present Federal-aid law may satisfactorily meet the national need for improved roads and the economic needs of individual communities are discussed.

The present status of impact tests on roadway surfaces, A. T. GOLDBECK (*Engin. and Contract.*, 52 (1919), No. 23, pp. 651, 652).—The author describes the impact tests now being conducted by the Bureau of Public Roads of the U. S. Department of Agriculture, pointing out that their aim is to determine (1) the amount of impact delivered to road surfaces and (2) the effect of this impact on different types of surface.

Brick paving stands first—shows highest percentage in mileage under test (*Brick and Clay Rec.*, 56 (1920), No. 2, pp. 136, 137, figs. 2).—In experiments conducted by the Iowa Engineering Experiment Station on the relative tractive resistance of hard-surfaced roads, monolithic brick pavement gave the greatest actual mileage and also the largest ton-mileage per gallon of gasoline. Concrete in good condition was second, followed in order by bitulithic, gravel in excellent condition, and ordinary gravel.

The road-building sands and gravels of Washington, M. M. LEIGHTON (*Wash. Geol. Survey Bul.* 22 (1919), pp. 307, pl. 1, figs. 44).—This bulletin reports the results of field examinations showing the nature, extent, and manner of occurrence by counties of the gravel deposits of the State of Washington, and also reports laboratory tests to ascertain their probable quality for gravel macadam and the various forms of pavement in which sand and gravel are used.

Tests of road gravels for use in gravel macadam showed that practically all of the gravels in the State are firm, durable, and resistant to abrasion. There are few, if any, soft sandstones and shale rocks among them.

Sixty-nine samples of road gravel were tested for their resistance to abrasion. The maximum loss by abrasion on any one of these samples was 32.8 per cent, the minimum loss 2.2 per cent, and the average loss 10.9 per cent. Field tests showed that "most of the coarse aggregates thus far used in cement concrete pavements have a low percentage of wear. The minimum is 2.4 per cent, the maximum 14.8 per cent, and the average 5.2 per cent."

The chief points regarding the sands of the State are also summarized.

The development of concrete road construction, A. N. JOHNSON (*Reprint from The J. E. Aldred Lectures on Engineering Practice, 1917-18. Baltimore: Johns Hopkins Univ., 1918, pp. 79-111, figs. 4*).—This paper includes an outline of the development of the use of the concrete road, as well as the development of various features of construction. The practical application of the results of investigations and research are also pointed out.

With reference to the quality of materials, the conclusion is drawn that the presence of organic impurities in sand is responsible for most defective concrete sands, and that the colorimetric test furnishes a simple and inexpensive method for detecting the presence of such impurities. "It is recommended, in proportioning the materials, that where the coarse aggregate is 2 to 2½ in. in size, and the sand limit is assumed at ¼ in., that the proportions be 1 part cement, 2 parts sand, and 3 parts coarse aggregate. Where the coarse aggregate is limited in size from 1 to 1½ in., it is recommended that proportions be 1 part cement, 1½ parts sand, and 3 parts coarse aggregate. It will be found that the resulting concrete will be of approximately the same strength in each instance. . . .

"As a result of careful observation of something over 30,000,000 sq. yds. of concrete roads, some of which were reinforced and some were not, the conclusion is reached that the reinforcement that has been used, generally averaging about 28 lbs. of metal per 100 sq. ft. of pavement, has not lessened the number of cracks, but has had a marked influence on the width of the cracks that have formed. That is, in the nonreinforced roads a far larger proportion of the cracks have opened sufficiently to become noticeable and require filling with tar or asphalt for proper maintenance. On the reinforced roads a majority of the cracks have not opened up sufficiently to be casually noticeable and have not required any filling. The cracks which occur are usually transverse or longitudinal. Most transverse cracks are occasioned because of the shrinkage in the concrete due to setting. . . .

"The removing of the excess water makes the resulting concrete stronger . . . Laboratory tests made upon slabs of concrete, some of which were rolled and others wood-floated, but otherwise of identical workmanship and materials, showed that the rolled concrete had a cross breaking strength approximately 20 per cent greater than the wood-floated slab."

Reinforced concrete roads, their construction, maintenance, and life, W. M. JONES (*Engineering [London]*, 108 (1919), No. 2813, pp. 733-735).—This is a review of British practice in reinforced concrete road construction, in which the author reports certain special details of construction which he has found to be satisfactory.

He is of the opinion that drainage of the road bed is vital, and that the subsoil should be of uniform density and should be thoroughly consolidated. The aggregate used should be clean, hard and tough, and free from foreign matter, and the sand should be coarse and well-graded. A well-mixed, rich concrete, accurately proportioned, should be used and not sloppy concrete. Reinforcement is considered necessary in British practice, not only to strengthen the concrete but to prevent cracking. Rapid drying should be prevented. It is concluded that from the British viewpoint a reinforced concrete road properly made is to-day the most efficient and economical type.

Amendments to recommended practice for concrete roads and street construction, H. E. BREED (*Proc. Amer. Concrete Inst.*, 15 (1919), pp. 405-410, figs. 3).—Recommendations are made regarding mixing, consistency, construction and finishing apparatus, and reinforcing.

Cement-concrete pavements in New Zealand and the United States and Canada, W. E. BUSH (*Engineering [London]*, 108 (1919), No. 2813, pp. 735-737).—The author reviews his own experience in the design and construction of concrete roads and pavements in New Zealand and also reviews American and Canadian practices along this line. From his experience the adoption of the following precautions is recommended:

- (1) The thorough preparation of the subgrade or foundation, including the use of a suitable steel reinforcement over trenches or holes where subsidence may take place;
- (2) the use of the very best quality and uniformity of aggregate and cement, and their thorough mixing, with as small a quantity of water as is necessary to insure density of mass and smooth finish;
- (3) the utmost care in the tamping, screeding, and troweling of the pavement;
- (4) the keeping damp of the concrete during the process of setting and hardening; and
- (5) the allowance of ample time for setting, never less than three weeks in summer and four in winter or damp or cold weather, and preferably longer, before traffic is allowed to use the pavement.

Report of the committee on reinforced-concrete highway bridges and culverts, A. B. COHEN (*Proc. Amer. Concrete Inst.*, 15 (1919), pp. 360-372, figs. 7).—In this report recommendations are made relating to the important assumptions necessary for fixing the effective width carrying a concentrated load on a simple reinforced concrete slab superstructure, and to related items. The points relating to effective width of concrete slabs have, for the most part, been previously noted from reports issued by the Bureau of Public Roads of the U. S. Department of Agriculture. Other conclusions based on work performed at the Lewis Institute and the Highway Department of Ohio are included.

Load concentrations on steel floor-joists of wood floor highway bridges, T. R. AGG and C. S. NICHOLS (*Iowa Engin. Expt. Sta. Bul.* 53 (1919), pp. 31, figs. 24).—An investigation is reported which was undertaken to determine the manner in which heavy wheel loads, such as those of traction engines, are distributed to the various I-beams and channels in a highway bridge floor sys-

tem consisting of I-beam and channel joists and wood planking, such as is used on secondary roads. The investigation was confined to the determination of (1) the percentage of a wheel load carried by each I-beam and channel joist of a highway bridge carrying a wood floor, for various positions of a certain pair of tractor wheels, (2) the effect of using two layers of floor planks, the upper one being laid (a) lengthwise of the floor, (b) on a diagonal, (3) the effect upon distribution of load of loosening the planks from the nailing pieces, and (4) the effect of the wheel lugs upon the distribution of the load.

It was found that a concentration on a single floor joist equal to 55 per cent of one wheel load is possible where a single thickness of wood floor is laid on the steel floor joists. The concentration on the joists immediately under the wheels is generally increased slightly if the ends of the plank are loosened, but the additional concentration is small. The concentration on the joists immediately under the wheels is slightly reduced by a second layer of floor planks laid lengthwise of the bridge floor. The concentration on the outer I-beam or channel increases rapidly as the load approaches the side of the bridge. The outer joist should have a section modulus as great as that of any other joist in the floor system. The concentration on light I-beams used for joists and placed at intervals is much less than on the heavier I-beam joists with wider spacing, so they may be safely employed if enough are used to insure wheel bearing on two joists.

Developments in 1919 in the use of machinery for highway construction, C. S. HILL (*Engin. News-Rec.*, 84 (1920), No. 1, pp. 8-10).—A review is given of progress made in determining types of plant adapted to rapid and economical construction of highways. It is noted that the use of motor trucks and tractor-trailers for material haulage increased.

Southern yellow pine (*New Orleans, La.: Southern Pine Assoc.*, 1918, 6. ed., rev., pp. 136+X, pl. 1, figs. 33).—This is the sixth edition of this handbook, which contains tables and formulas for use in the design of structures of yellow pine.

The conservation of wood, T. WOLFF (*Forstwiss. Centbl.*, 40 (1918), No. 10, pp. 372-387).—This article deals with German practice in wood preservation, with particular reference to impregnation with metallic salts or antiseptic substances, such as creosotes and tar oils. Some recent American processes are also reviewed, including the sterilization of green timber with an alternating electrical current.

Concrete engineers' handbook, G. A. HOOL, N. C. JOHNSON ET AL. (*New York: McGraw-Hill Book Co., Inc.*, 1918, pp. XXIII+885, pls. 2, figs. 983).—The purpose of this handbook is "to make available in concise form the best of present day knowledge concerning concrete and reinforced concrete and to present complete data and details, as well as numerous tables and diagrams, for the design and construction of the principal types of concrete structures. Although intended as a working manual for the engineer, the first few sections of the book may be read with profit by any one engaged in concrete work. In these sections an effort has been made to present the latest authoritative knowledge in regard to the making and placing of concrete in such form that it may be applied in the field to the betterment of construction."

Principles of reinforced concrete construction, F. E. TURNEAURE and E. R. MAURER (*New York: John Wiley & Sons, Inc.*, 1919, 3. ed., rev. and enl., pp. VIII+485, pls. 2, figs. 208).—This is the third revised edition of this book. Separate chapters are devoted to the theory of flexure, bond and shear, and the design of beams, and a new chapter has been added covering the analysis of flat slabs, including slabs supported on beams as well as the so-called flat slab

system of floor construction. The chapter on building construction has been extended to include a more detailed treatment of continuous beams and girders.

Reinforced concrete design tables, M. E. THOMAS and C. E. NICHOLS (*New York: McGraw-Hill Book Co., Inc., 1917, pp. VIII+208, figs. 4*).—This is a handbook of formulas and tables to be used by the designer of reinforced concrete, and includes data for slabs, simple beams, tee beams, double reinforced beams, and square and hooped columns.

Tests of concrete in tension, T. H. CARVER and J. H. QUENSE (*Engin. News-Rec., 83 (1919), No. 21, pp. 1005, 1006, figs. 4*).—The apparatus used is described and tests of concrete briquettes 5 in. square, at ages of from 57 to 609 days, are reported. A mixture of 1:1.42:2.36 was used. The greatest tensile strength of 492 lbs. per square inch was obtained at 609 days, and the tensile strength varied from this amount to 268 lbs. per square inch at 58 days. An interesting development of the test was the fact that the permanent set became negative in some cases.

The solubility of Portland cement and its relation to theories of hydration, J. C. WITT and F. D. REYES (*Philippine Jour. Sci., Sect. A, 13 (1918), No. 4, pp. 147-163, fig. 1*).—Experiments are reported in which it was found that, when cement is shaken with water in a closed vessel, large amounts of calcium with relatively small amounts of most of the other elements present go into solution. The factors that affect the results have been found to be (1) absence of carbon dioxide, (2) method of agitation, (3) fineness of grain, (4) volume of water, and (5) time. Of these, volume of water is the most important. As the volume of water is increased, the amount of calcium going into solution in a given time increases rapidly. When cement is treated with approximately 8,000 times its weight of water, 90 per cent of the calcium present goes into solution in 24 hours, with indications that still more would dissolve in a greater volume. Though the work was not undertaken as a study of hydration, the results obtained are closely related to the theories of hydration that have been formulated from time to time.

“Since all the important compounds in cement contain calcium and 90 per cent of all calcium present goes into solution, it may be stated that under favorable conditions the hydration of all important compounds results in the formation of calcium hydroxid. It has not been found possible to obtain a saturated solution of calcium hydroxid by shaking cement in water. This may be due to the fact that presence of dissolved calcium hydroxid inhibits further hydration, or it may be that when the concentration of the calcium hydroxid solution reached a certain value a colloid is formed, according to Michaelis’ theory.”

Some generalizations on the influence of substances on cement and concrete, J. C. WITT (*Philippine Jour. Sci., Sect. A, 13 (1918) No. 1, pp. 29-48*).—A review of the work of others bearing on the subject is given, and experiments reported on the action of solutions of the chlorids and sulphates of sodium, zinc, and copper, the nitrates of sodium, potassium, and ammonium, and the bicarbonates of sodium and potassium on briquettes made from each of four brands of cement. Four concentrations of each of the solutions were used.

It was found that the general tendency of all the solutions is to decrease the tensile strength. Of the 352 results (which represent 1,056 briquettes), only 44 showed an increase in strength and, as a rule, this increase was small. The greatest number of such cases occurred with the sulphates. The increases occurred mostly with cements containing the most sulphates, and with the 1 and the 0.5 normal solutions.

The decreases in tensile strength were most prominent with the 7-day briquettes, and the principal ones were with the maximum concentration of each solution employed. Cement containing the most iron, lime, and magnesia and the least sulphates was the most sensitive to the effect of the solutions in lowering the tensile strength. With this cement, every solution used caused one or more series of briquettes to fall below the specified limits. Apparently there was no relation between the effect of the solutions on the set and on the tensile strength. On the basis of their effect on the set, the salts may be divided into two groups: (1) Sodium chlorid, sodium nitrate, potassium nitrate, ammonium nitrate, sodium sulphate, sodium bicarbonate, and potassium bicarbonate; and (2) zinc chlorid, copper chlorid, zinc sulphate, and copper sulphate.

When a member of the first group was added to a cement, a small amount of the salt caused a retardation of the set. After a maximum point was reached, the set was accelerated by further additions of the substance until the original setting time was reached or even passed. The second group showed a retardation with the lowest concentration of each solution employed, and this increased with increasing concentration. For the ranges studied the time-concentration curves of these salts rose indefinitely. This was contrary to the corresponding curves of group 1, which passed through maximum points. With the salts investigated, the positive ion was more important than the negative in determining the effect of an electrolyte on cement. There was no well-established relationship between this effect and the solubility of any calcium compounds that may be formed.

Concrete hardening accelerated by calcium chlorid (*Concrete* [Detroit, Mich.], 15 (1919), No. 3, pp. 125, 126).—The results of an investigation conducted by the U. S. Bureau of Standards on means of accelerating the rate of increase in the strength of concrete are reported.

It was found that the gauging of concrete with solutions containing small amounts of calcium chlorid gave the most efficient results. Several other chemicals were tried with no practical beneficial effect, namely, ammonium hydroxid, ammonium carbonate, sodium phosphate, sodium sulphate, sodium hydrate, sodium carbonate, oxalic acid, potassium sulphate, and sulphuric acid. In the mortar tests in mixtures of 1:3 Ottawa sand, the addition of from 1 to 5 per cent of commercial calcium chlorid to the mixing water did not materially affect the time of set of the cement. By using 2 to 4 per cent calcium chlorid the tensile strength of the mortars was increased from 155 to 230 per cent at an age of 24 hours, and from 173 to 190 per cent at an age of 48 hours. In the various mixtures of Potomac river gravel concrete, the addition of 4 per cent commercial calcium chlorid to the mixing water gave consistently the best strength increase; in some samples this was specially noticeable at early ages. The use of pure calcium chlorid gave strengths about 30 per cent above those attained with the use of commercial calcium chlorid.

Further experiments to determine the strength and durability of concrete containing small amounts of calcium chlorid under various curing conditions and to ascertain the effects of such additions on the corrosion of metal reinforcing are also reported. The effect of the addition of calcium chlorid on the compressive strength of 1:3 standard sand mortar was to give a marked percentage of increase. Under freezing conditions, the calcium chlorid treated concrete showed the same marked percentage of increase in strength as the specimen cured in the laboratory. Results of the corrosion tests showed that at the end of a year in both the 1:2 and 1:3 mortars gauged with 4 per cent calcium chlorid, both with the galvanized and the plain expanded metal lath,

that the metal had been attacked varying in amount from a few rust spots on the galvanized lath to complete rusting through in some cases of the plain lath. Lath embedded in 1:3 mortars not gauged with the calcium chlorid examined at the same time showed the metal absolutely clean, with no indications of corrosion. In the cases of the rods embedded in 1:2 and 1:3 mortars and concretes of mixes of 1:1½:3 and 1:2:4 proportions, gauged with 6 per cent solution of calcium chlorid, all the metal had been attacked, showing rust pits, while the rods in the mortars and concretes mixed with plain water were not corroded at all.

Effect of calcium sulphate on cement, J. C. WITT (*Engin. World*, 16 (1920), No. 2, pp. 83-87, figs. 2).—Experiments conducted by the Bureau of Science of Manila showed that if clinker is ground in a small laboratory mill, its average time of set is independent of the amount of calcium sulphate added. When ground in the regular way at the plant it must have a sulphuric anhydrid content of 1.8 per cent to insure a normal set. The effects of exposure to air and of additions of hydrated lime were found to be independent of the sulphuric anhydrid content. Soundness and normal consistency were independent of the sulphuric anhydrid content, except that the latter increased with the amount of hydrated lime present.

Pressing out mix water adds to cement mortar strength, C. T. WISKOCIL (*Engin. News-Rec.*, 83 (1919), No. 3, pp. 130-132, figs. 3).—Tests made with special apparatus at the University of California on the effect of expressing the water from cement mortar ranging from neat to 1:5 mix and a constant 1:4 mix on strength are reported.

It was found that using pressures up to 30,000 lbs. per square inch gave very high compressive values. "The greater percentage increase in the strength of the lean mixes was caused by the higher relative water content of the mortar as based on the amount of cement used. The stiffer consistency of the richer mixes produced relatively greater strengths in the controls and lower strengths in the pressure specimens. . . .

"This explanation was verified by making a special batch of neat cement mortar with 37.25 per cent water by weight of cement. Pressure specimens made from this mixture were 6¾ times stronger than the controls. The molding pressure, 30,000 lbs. per square inch, thus produced an increase of 575 per cent in the compressive strength. The average strength of the pressure specimens made from mortar mixed with 25 per cent water was 14,230 lbs. per square inch. Pressure specimens made from the wetter mortar averaged 17,080 lbs. per square inch. . . .

"Increasing the amount of water expressed has a decided effect on the strength, especially at the lower pressure. At 10,000 lbs. per square inch the percentage increase in strength is about 570 per cent, while the maximum pressure (30,000 lbs. per square inch) raises this percentage increase to 810."

Effect of vibration, jiggling, and pressure on concrete, D. A. ABRAMS (*Engin. and Contract.*, 52 (1919), No. 13, pp. 352-354, figs. 7).—The results of an experimental study conducted at Lewis Institute on the effect of vibration and pressure on the strength and other properties of fresh concrete are reported. The test series included 600 compression tests of 6 by 12 in. concrete cylinders at the age of 28 days.

It was found that varying the number of strokes from 12 to 50 on each 4-in. layer in the standard method of hand-puddling with a ½-in. bar had little influence on the compressive strength of ordinary plastic concrete. In general, the tamping methods used gave lower strengths than hand-puddling. A tamper of large diameter for a given weight was less effective than one of smaller

diameter. Increasing the thickness of the layer from 4 to 6 in. caused a falling off in strength of about 12 per cent for tamped concrete. Tamping or puddling the first 4-in. layer only, caused a falling off in strength of 10 to 13 per cent. Striking the metal form with a steel bar after the completion of molding by the standard method had no effect on the strength of concrete. The "standard" method of hand-puddling, using 25 strokes with a $\frac{5}{8}$ -in. steel bar for each 4-in. layer of concrete in a 6 by 12 in. cylinder, is recommended for laboratory tests of concrete.

Vibration of the specimen after molding by means of an electric hammer running at 1,000 r. p. m. had little influence on the strength of the puddled concrete up to a period of about 30 seconds. If continued, there was a steady falling off in strength; after 45 to 60 seconds the strength was only 90 per cent of that produced by the standard method of puddling.

In general, jiggling in any manner with the apparatus used reduced the compressive strength of the concrete regardless of the height of drop, rate, or duration of treatment. Exceptions were found in the dry mixes and those made of aggregates of the smaller sizes. There was little difference in the effect of jiggling due to the quantity of cement used. In the very dry mixes the strength, due to jiggling 20 seconds, was increased about 25 per cent. The wetter mixes (relative consistency 1.1 to 1.25) were reduced in strength 3 to 6 per cent by jiggling.

Pebbles and crushed limestone as coarse aggregate gave essentially the same results in the jiggling tests. The concretes for finer aggregates showed a material increase in strength with jiggling in both 1:5 and 1:3 mixes. For aggregate coarser than about $\frac{3}{8}$ in., jiggling reduced the strength from 3 to 10 per cent. The grading of the aggregates (for a given maximum size) had little influence on the effect of jiggling.

The greater the drop the greater the reduction in strength for 1:5 concrete. For a drop of $\frac{1}{2}$ in. the strength was reduced 12 per cent. The faster the rate of jiggling the lower the strength of 1:5 concrete. Using $1\frac{1}{2}$ -in. aggregate at 150 r. p. m. the strength was reduced about 13 per cent. The strength of 1:5 concrete fell off rapidly with the duration of jiggling. After 2 to 3 minutes jiggling the strength was reduced about 20 per cent as compared with the standard method of hand-puddling. Allowing the concrete to stand for a period of time before jiggling increased the strength to a slight extent. The maximum increase was found at 2 to 4 hours. The application of a pressure of 1 lb. per square inch during the jiggling process (equivalent to a head of 1 ft. of fresh concrete) gave the same strength as standard hand-puddling. Molding the cylinders by the standard method on the jiggling table while it was in motion gave the same strength as standard hand-puddling without jiggling.

The compressive strength of concrete was increased by pressure applied immediately after molding. For a pressure of 200 to 500 lbs. per square inch the increase was 20 to 35 per cent. The duration of pressure as between 15 minutes and 16 hours produced no difference in strength. There was a steady reduction in the water-ratio of the concrete with the application of pressure. The application of pressure increased the strength of concrete in accordance with the quantity of mixing water expelled. The tests of concrete subjected to pressure showed the usual relation between compressive strength and water-ratio.

Tests of eighteen concrete columns reinforced with cast-iron, J. TUCKER, JR. and J. G. BRAGG (*U. S. Dept. Com., Bur. Standards Technol. Paper 122 (1919), pp. 38, pls. 8, figs. 13*).—A description and discussion of tests of 18 reinforced concrete columns to determine the suitability of cast iron as a reinforcing ma-

terial when used with the usual spiral hoop and vertical steel rod reinforcing is given. The cast-iron reinforcing consisted in most cases of cast-iron cylinders of different diameters and wall thicknesses, which were placed in the center of the column. In two cases cast-iron I-beams with long oblong holes in the web were used for reinforcing.

The behavior of these columns tested to failure was similar to that of ordinary concrete columns reinforced with spiral and longitudinal steel rods. The concrete shell began to fail at the same strain at which cylinders of plain concrete failed, an average of about 0.00145 in. per inch. This type of column gave ample evidence of approaching failure. The economical limit of cast-iron reinforcement to be used is given by the formula

Per cent cast iron = $\frac{100fe}{fi+fe-fv}$, or 21 per cent using the values determined in this test. fe = maximum stress withstood by the hooped concrete: For 1 per cent spiral reinforcing and 1:1:2 concrete this value appeared to be 5,300 lbs., or 33 per cent increase above the unrestrained strength of concrete. fi = maximum stress withstood by cast iron: A fair value for this would be 60,000 lbs. fv = stress in the cast-iron reinforcement when the column is sustaining maximum load or about 40,000 lbs.

Eccentricity and variation in pitch of the spiral and variation in depth of the longitudinal steel rods of the column apparently did not affect its strength. The maximum strength of the columns was not quite equal to the strength of the cast-iron reinforcement tested independently, plus the strength of a spiral reinforced column. The columns commenced to scale at from 58.5 to 77.5 per cent of maximum load as against from 77.2 to 94.7 per cent for plain spiral reinforced columns. The average maximum total load withstood by the various cast-iron reinforced columns was 81.5 per cent greater than that withstood by plain spiral columns of the same length. From nine columns of the same cross-section and lengths of from 6 to 14 ft. with 12.5 per cent cast iron (that is, of total area of cast-iron, rods, and concrete within spiral), the formula $\frac{P}{A} = 12,500 - 20l$ is derived. In this, P = mean stress upon total area of column within spiral, A = total area as above, and l = length of column in inches.

Filling the hollow cast-iron core of the columns apparently added approximately 6,500 lbs. for each square inch of cross section of the concrete thus filled in. It also increased by 20 per cent the load withstood at the first signs of failure.

Varying the radius of gyration of the cast-iron-tube reinforcement, the cross section of the cast iron remaining constant and the tube hollow, appeared to have the following results: (1) A 10 per cent greater load in the columns with the smaller diameter pipe before the first spalling or indication of failure, (2) the same ultimate strength and the same total load, and (3) the same strain curve for all columns. The splicing of the columns evidently made the spliced sections stronger than the rest of the column section. The column did not buckle at these points. The columns were stiffer than any of the other columns, and failed at the average maximum of the other columns of the same length. The columns with I-sections were apparently exactly similar in their action to those of the same percentage of cast iron in the form of tubes and did not show any signs of bending until after the maximum load had been withstood.

Burnt earth concrete, with iron and wood reinforcement, L. P. HODGE (*Engineering [London], 108 (1919), No. 2801, pp. 302, 303, figs. 11*).—Experi-

ments and practice are reported from which the conclusions are drawn that well burnt earth can be safely substituted for stone in concrete when the cost of stone is prohibitive, and that hardwood can be substituted for iron or steel reinforcement with advantage in fairly large sections when the cost of iron is prohibitive. In sections of small depth, however, the cost of converting the wood into thin strips and the difficulty of so placing them as to get sufficient tension and sufficient surface protection outweigh the advantage.

The most suitable wood with reference to uniformity and ultimate resistance to tension was found to be greenheart.

Wind motors: Their possibilities and limitations, F. C. POULTON (*Jour. Roy. Soc. Arts*, 67 (1919), No. 3480, pp. 590-594; also in *Sci. Amer. Sup.*, 88 (1919), No. 2286, pp. 286, 287).—This article deals with the possibilities and limitations of wind motors for supplying power for corn grinding, pumping, general farm-machinery operation, workshops, and generation of electricity for light and power, with special reference to conditions in the United Kingdom.

Prime mover of high efficiency, F. E. D. ACLAND (*Sci. Amer. Sup.*, 88 (1919), Nos. 2282, pp. 204, 205; 2283, pp. 218, 219, 232, figs. 6).—A description is given of the general features of the so-called Still engine, which is a new type of internal-combustion engine utilizing the heat of radiation and exhaust for the generation of steam, which is used for increasing the general efficiency of the engine. The principles of the engine and the results of tests are also summarized.

Gas engine troubles, V. V. DETWILER (*Bien. Rpt. Kans. State Bd. Agr.*, 21 (1917-18), pp. 103-110, figs. 4).—The author briefly outlines farm gas engine troubles and remedies therefor.

Kerosene as a fuel in high-speed engines, L. F. SEATON (*Mech. Engin. [New York]*, 41 (1919), No. 11, pp. 881, 882, figs. 3).—A series of tests on a high-speed, heavy-duty type of engine, using kerosene as fuel, are reported.

A series of tests was first run with various temperatures in the vaporizer, air entering the carburetor at a constant temperature. The temperature of the intake air was maintained at 115° F., and the temperature around the vaporizer was increased from an initial 150° by 100° increments until a temperature of 650° was maintained on the bypass pyrometer. The loads carried under this condition were approximately 5, 10, 15, and 20 h. p. Tests were also made increasing the temperature of the intake air by increments of 10°.

It was found that the thermal efficiency of the engine was practically constant throughout all heat changes made. At low heats the motor would not idle down below 800 or 900 r. p. m. At the exceptionally high temperatures of the ingoing down gases (about 375°) the engine could be idled down to 150 r. p. m., would pick up almost as well as when burning gasoline, and could be started on kerosene. The only advantage in heating the ingoing air and gas was that it made the motor more flexible.

"It is the belief . . . that a motor designed as follows would handle kerosene at all loads successfully: The pistol displacement should be greater per horsepower than that commonly used, a higher compression pressure should be obtained, the intake passages should be large and short, and the intake gas should be heated to a temperature considerably above the boiling point of kerosene. This probably would be done with the exhaust gases, necessitating an automatic temperature control at all loads."

Weighting liquid fuel in engine test, J. S. A. JOHNSON (*Power*, 50 (1919), No. 18, p. 656, fig. 1).—In connection with a test of internal-combustion engines at the Virginia Polytechnic Institute, it was found that in the weighing of liquid fuel the actual weight of fuel used must be calculated by subtracting

from the difference recorded by the scales between the weights at the beginning and end of the test, the weight of a volume of the liquid equal to the volume of the dimensions of the suction pipe between the levels of the liquid at the beginning and end of the test.

Researches on the resistance to wear of parts of agricultural machines, M. RINGELMANN (*Compt. Rend. Acad. Sci. [Paris]*, 169 (1919), No. 18, pp. 807-809).—This is a brief outline of methods proposed by the Society for the Encouragement of National Industry of France for the testing of the wear of the metal parts employed in the construction of agricultural machines under varying conditions of use, the purpose being to develop questions relating to durability of the metal, heat treatment, etc.

Agricultural tractors, M. DE MAGALHÃES (*Escola Agr. "Luiz de Queiroz," Piracicaba, Brazil, Ser. Engen. Rural, Bol. 3* (1919), pp. 13, figs. 9).—This is a brief review of experimental work with tractors as conducted by the Texas Experiment Station, and a discussion thereof to show how the results may be adapted to conditions in Brazil.

American tractors in the English tests, J. E. MARTIN (*Farm Machinery, No. 1464-1465* (1919), pp. 13, 14, 58, 60, 62, 64, figs. 3).—This is a general report on the international field demonstration held at Lincoln, England, from an American viewpoint. Comparisons are drawn between this demonstration and similar events that have been held in America, and the opinion of the British farmer regarding modern methods is analyzed.

The soils on which the plowing demonstrations were conducted furnished two extremes, one being a lowland heavy clay and the other a light upland loam. On the lowland soil the resistance to traction offered by plowing varied from 592 lbs. with a 9-in. bottom at a 5½-in. depth to 810 lbs. with a 9-in. bottom at a 6-in. depth. On the light loam soil the resistance of plowing varied between 392 and 565 lbs. at the same width and depth of cut.

In the hauling trial each contesting tractor was required to draw a trailer wagon up a hill, loaded with pig-iron bars, until the limit of its power or its traction was reached. It was found that rubber tires or even smooth drive wheels had a very great advantage over ordinary cleat or spud drive wheels in this test.

The Lincoln tractor trials, T. CLOSE, B. J. OWEN, and H. G. RICHARDSON (*Jour. Bd. Agr. [London]*, 26 (1919), No. 7, pp. 686-690).—This is a preliminary report of a large tractor test conducted in England.

A noteworthy feature of the trials was the evidence that considerable attention is being paid to reduction in weight and to rendering vital parts of the machinery more accessible. Little difference was found between the comparative values of high-speed and low-speed machines. In comparing wheels with caterpillar tracks it was found that the advantages of the latter do not lie in their distinguishing feature. All the plows operated in the test turned narrow furrows and were fitted with general-purpose breasts. Another feature of the plowing was the general adoption of self-lift plows. Riding plows were in use with a few of the heavier tractors, but no advantage was evident. The majority of the tractors gave ample evidence of their suitability for providing power for thrashing.

Tests of work with tractors at Bourges, 1919, E. RABATÉ (*Prog. Agr. et Vitic. [Ed. l'Est-Centre]*, 40 (1919), No. 42, pp. 370-375).—Cultivation tests using 15 different tractors and motor plows of French, British, and American manufacture, and tests of plows, pulverizers, and other cultivating implements are briefly reported. The work was done on very tough, dry, siliceous clay soil, plowing to an average depth of about 15 cm. (5.9 in.).

It was found that soil deep plowed with a tractor was better pulverized and not so dry as other soils. The work was, in general, done with greater ease, and the soil was more completely inverted and in a condition to make better use of atmospheric moisture. The soil on which the tests were conducted had been deep plowed the previous year, and it was noted that it had retained more water and was easier to plow than soil which had been shallow plowed. The tests indicated the advisability of having an ample factor of safety in the rated power of the tractor motor, in view of the sudden and large overloads to which this type of soil subjected the tractor during plowing. It was found that the tractive effort increased in this soil and under the conditions of the test with the square of the depth of the plowing.

The detailed data of the tests are reported in tables.

Farming by motor (*London: Temple Press, Ltd., pp. 95, figs. 60*).—This pamphlet gives considerable popular information regarding farm tractors and motor plowing from the English viewpoint. It includes illustrated examples of the work that can be done with motor tractors, and information for guidance in the selection of machinery for motor tillage.

Mechanical cultivation and its use on a small scale on small farms, HOTTENGER (*Cong. Gén. Génie Civ. Sess. Natl., 1918, Trav. Préparatoires, Sect. VII, Génie Rural et Indus. Agr., pp. 179-192*).—This is mainly an economic consideration of the use of tractors, motor plows, and other mechanically propelled cultivating apparatus on small farms in France.

Actual motor cultivation, P. LECLER (*La Motoculture Actuelle. Paris: Soc. Agr. France, pp. 28, figs. 23*).—This pamphlet gives an analysis of tractors, tractor plows, and cultivating apparatus, with particular reference to the construction of their characteristic working parts and their mechanical operation. Tractors are divided into four categories, as (1) tractors, properly speaking, which draw cultivating implements and can be detached therefrom, (2) automobile plows, (3) cable tractors, which draw cultivating apparatus by means of cables, and (4) so-called haulers, which haul themselves and cultivating apparatus by means of anchored cables. The general construction of these types is described, with particular reference to the number, distribution, and operation of the wheels. A summary of recent experiments is also given, most of the data from which have been noted from other sources. An appendix is included which gives graphic data on factors influencing the mechanical operation of the tractor, including such matters as volume of soil removed per horse-power-hour, increase of consumption of fuel per horse-power with decreasing charge, relation between the volume and weight of fuel consumption, consumption of fuel per acre plowed at different depths, and fuel consumption in gallons per acre under different conditions.

The week of motor cultivation in autumn, G. COUPAN (*Vie Agr. et Rurale, 9 (1919), No. 45, pp. 321-330, figs. 12*).—This is a report on tractors, tractor plows, and other motor-propelled cultivation apparatus as tested in France during the past fall. These included a number of tractors of American manufacture. No specific test results are given other than general results of performance.

Plows for mechanical cultivation, G. DUVAL (*Vie Agr. et Rurale, 9 (1919), No. 45, pp. 331-334, figs. 5*).—This article deals with the mechanical details of French and American plows for use with tractors.

The economic limit to motor truck weights, R. C. BARNETT (*Engin. and Contract., 51 (1919), No. 1, pp. 6, 7; 52 (1919), No. 14, pp. 374-380, figs. 6*).—An extensive mathematical analysis is given of annual cost of roadbed, annual cost of motive power, and annual cost of vehicles, as functions of total annual

cost of motor-truck transportation, with a view to determining minimum cost per ton-mile as a basis for road and truck selection and design.

The first general conclusion is drawn that an increase in the size and weight of a motor truck tends to increase the annual cost of pavement and to decrease the annual cost of power and of the vehicle. The cost per ton-mile, which is to be made a minimum, is expressed as the total annual cost indicated above divided by the annual ton-mileage. The total annual cost is expressed in terms of truck capacity and speed in miles per hour by the following formula:

$$C_a = 27368K^{2/3} + 48.6K^{1/8}S^2 + \frac{2,752,000}{SK^{1/3}} + \frac{8,880,000}{SK} \\ + \frac{122,400}{K^{1/4}} (.0447K^{3/8}S^2 + 77) \frac{2,000}{K^{1/4}}$$

in which C_a = the total annual cost or the sum of total roadbed cost and total operating cost, K = the capacity of the truck, and S = the speed in miles per hour.

Elevators and transporters of hay, M. RINGELMANN (*Jour. Agr. Prat.*, n. ser., 32 (1919), No. 18, pp. 368-371, figs. 8).—This article gives a mechanical analysis of several different types of hay-unloading apparatus, including rope slings, forks, and single and double hooks, as used in France.

On the design of railway wagons for the carriage of perishable foods, A. R. T. WOODS ET AL. (*Dept. Sci. and Indus. Research [Gt. Brit.] Spec. Rpt. 1 (1919), pp. 8*).—This report deals with the features and design of refrigerator and fruit cars from the English viewpoint.

Tests of two refrigerator cars were made in which the cars were charged with ice and salt and allowed to stand on a siding. Observations of the atmospheric temperatures and the temperatures at the top and bottom, taken every 2 hours over a period of 48 hours, showed that the temperatures in each of the cars were very nearly the same during the test. It was noticed throughout that the upper thermometers showed nearly constantly temperatures, which were from 5 to 7° F. higher than those at the bottom. It was also found that after the first 24 hours a rise which occurred in the outside atmospheric temperature was accompanied by an almost similar rise in the temperature inside the car. During the experiment the atmospheric temperature ranged from 87 to 57.5°, with an average of 65.25°. The lowest average temperature reached in the car was 46°, the outside temperature at the time being 62°. At the termination of the experiment the mean temperature in the car was 56°, the mean atmospheric temperature being then 74.25°. It was noted that although the car temperature had increased by 10° from the minimum obtained, there was still a considerable quantity of ice remaining in the tanks at the conclusion of the tests.

It is generally concluded that "(1) the insulation of none of the cars is as effective as is desirable, and improvement can be made both in existing cars and especially in cars which have to be constructed in future, (2) the deficiency in the air-tightness of the cars is a serious matter, especially as regards the fitting of the doors. This should be remedied in the existing cars, and proper provision for air-tightness should be made in all those which will be constructed in future, (3) the provision of ice-tanks in the cars may be considered large enough, but the practice of icing them is altogether inefficient, and steps should be taken to insure improvements on these points."

The literature of refrigeration, G. C. HODSDON and C. H. LEES (*Dept. Sci. and Indus. Research [Gt. Brit.] Spec. Rpt. 2 (1919), pp. 8*).—A list of 170 refer-

ences to English, American, French, Italian, and German literature on refrigeration is given.

Buildings for farm animals, M. RINGELMANN (*Logements des Animaux Principes Généraux. Paris: Libr. Agr. Maison Rustique, 1918, pp. 160, figs. 199*).—This book deals first with the general principles involved in the design and construction of living quarters for animals, including barns, sheep folds, stables, hog pens and houses, poultry houses, and dog kennels as used in France. The second part of the book deals more specifically with the design of stalls and stables, taking into consideration factors relating to size and type of animal and general characteristics of the animal; also questions relating to lots and pastures with their necessary equipment are discussed. All important points of design and construction are illustrated. A final section includes illustrations of sample buildings and structures.

The storing of roots, H. A. CRAIG and S. G. CARLYLE (*Edmonton, Canada: Govt., pp. 10, figs. 9*).—Brief instructions for the planning and construction of root storage cellars are given, together with sample drawings.

Limiting the fuel for domestic heating, K. MEIER (*Jour. Amer. Soc. Heating and Ventilating Engin., 25 (1919), No. 1, pp. 43-48*).—This is a comparison of methods and efficiency of domestic heating in Switzerland and in this country.

From records and personal experience the author states that the legitimate normal consumption of coal for residences in Switzerland averages about $\frac{3}{4}$ ton per 1,000 cu. ft. of actually heated space, or $\frac{2}{3}$ ton per room of 2,000-cu.-ft. capacity. In comparing these conditions with conditions in the United States, he is of the opinion that the same normal consumption of coal should in general prevail in this country, but gives data to show that the consumption here is considerably greater. He attributes this waste of fuel in house heating to building construction, ventilation, differences of temperature actually maintained, types of heating system used, and the low efficiency of boilers and furnaces. With reference to temperature actually maintained, it is shown that for the same temperature difference and nearly equal fuel consumption it should be possible to maintain higher indoor temperatures in climates similar to that in New York than in Switzerland.

How to figure coil sizes for hot water services, M. W. EHRLICH (*Dom. Engin., 90 (1920), No. 3, pp. 122-124, figs. 5*).—A simple graphic method is given for finding the number of feet of pipe required for heating water to any temperature by the use of live or exhaust steam, with particular reference to domestic practice.

A test of the conductivity of window shades, J. R. ALLEN (*Jour. Amer. Soc. Heating and Ventilating Engin., 25 (1919), No. 1, pp. 65, 66*).—Tests conducted for the purpose of determining the relative amounts of heat transmission through a single-strength glass window, close fitting with stops on both sides, first without window shades and second with window shades pulled down in front of the window, are reported.

It was found that the saving in heat transmitted by the use of the single inside curtain was 19.2 per cent, by the outside curtain 28.7 per cent, and by both curtains 42.7 per cent. The marked difference in heat transmission between the tests of the inner curtain and the outer curtain was without doubt due to the fact that the inner curtain did not fit its opening tightly. This allowed currents of warm air to enter at the top and, being cooled between the curtain and the window, to fall and go out through the clearances at the sides and bottom. The outer curtain fitted over the smooth sides of the box about 1.5 in. and permitted very little movement of air between it and the window.

Rural home sanitation, V. M. EHLERS and L. G. LENERT (*Tex. State Bd. Health Pub. No. 2 (1919), pp. 39, figs. 36*).—This is a popular bulletin dealing with all phases of rural sanitation, including location of buildings, water supply, sewage disposal, sanitary building construction, and the destruction of flies, mosquitoes, and vermin.

Treatment of canning-plant wastes in Wisconsin, E. J. TULLY (*Engin. News-Rec., 83 (1919), No. 21, pp. 1017, 1018, figs. 3*).—This is a general statement of plans for the treatment of plant washings, silage juices, and combined wastes by the Wisconsin State Board of Health.

Briefly stated, treatment of these wastes involves reduction of the concentration of the organic matter, in suspension and in solution, to conform to local sanitary requirements. The plan indicated to accomplish this end includes diversion of all cooling water around the treatment system to be used to dilute the effluent; coarse screening of the waste products prior to discharge into the system, if it is desired to recover peas, etc., to be used for cattle-feeding purposes; discharge of domestic sewage into public sewer systems, when such facilities are afforded; conveying pea, corn, and plant washings and silage juice effluent, and sewage if necessary, to a common point, and subjecting wastes to treatment in a combination unit comprising a sedimentation or retention unit of three sections and a crushed stone gravity or contact filter, depending on topographical conditions; and preliminary treatment of silage juice, using lime or soda-ash to neutralize partly the acidity and reduce the organic concentration, and subjection of the chemically treated liquor to sedimentation, coke contact, or gravity straining and gravel-sand filtration, depending on the degree of treatment required prior to the discharge of the effluent into the unit used to treat the washings.

Use of paint on the farm, H. H. KING (*Bien. Rpt. Kans. State Bd. Agr., 21 (1917-18), pp. 126-135, figs. 6*).—Information on the proper use of paint on Kansas farms is given, which is based largely on the results of experiments conducted at the Kansas Agricultural College.

In tests of the drying tendencies of sunflower, soy bean, and menhaden fish oils, it was found that when mixed with linseed oil in half-and-half proportions these oils did not show any inferior qualities to linseed oil alone, and indicated the possibility of their partial substitution for linseed oil. In experiments on the use of lead and zinc as pigments, it was found that mixtures containing both of these pigments possessed better covering and lasting qualities than either alone. It has also been found that varying proportions of so-called reinforcing or inert pigments in ready mixed paints may be employed with no noticeably serious effects. It is noted that for Kansas conditions a southern exposure destroys paints much more rapidly than a northern exposure. Experiments with a paint tinted yellow with a very small quantity of chrome yellow showed the effect of this color in lengthening the life of the paint, and in most cases the panels painted with the tinted paints stood up better than those painted with a white paint.

Electricity on Kansas farms, C. M. HARGER (*Bien. Rpt. Kans. State Bd. Agr., 21 (1917-18), pp. 95-102, figs. 3*).—This article describes briefly a rural electrical system in Kansas, reaching into 10 counties, and utilizing transmission lines supplied by two central stations. It is noted that the first cost of installation to the average farmer is about \$380, which includes also the first year's expense for power up to 5-h. p. connected load. The annual minimum rate for power is \$30 a year or \$2.50 per month.

The development of the application of electricity to agriculture, P. LECLEZ (*Cong. Gén. Génie Civ., Sess. Natl., 1918, Trav. Préparatoires, Sect.*

VII, *Génie Rural et Indus. Agr.*, pp. 82-139).—This is a rather extensive discussion of the important factors in the promotion of the use of electricity in the agricultural districts of France, with particular reference to matters interesting the farmer, the producer of electricity, the distributor of electrical current, and the manufacturer of electrical apparatus.

RURAL ECONOMICS.

Royal Commission of Agriculture.—Interim report of His Majesty's commissioners appointed to inquire into the economic prospects of the agricultural industry in Great Britain, W. B. PEAT ET AL. (*London: Govt.*, 1919, pp. 21).—It is recommended in this report by the Royal Commission of Agriculture that (1) minimum prices for wheat, barley, and oats grown in Great Britain be guaranteed by the State on the same principle and conditions as are laid down in part 1 of the Corn Production Act, 1917, the producer being allowed unrestricted market for his produce, but the State retaining the right to control prices in case of national emergency, (2) that barley should be dealt with in the same manner as wheat under section 1 of the Corn Production Act, (3) that for the grain crops of 1920 and subsequent years the guarantees be calculated on a sliding scale, based on average bare costs of production of the preceding year, (4) that the guarantees be continued until Parliament otherwise decides, not less than four years' notice of withdrawal being required, (5) that the boards of agriculture or county committees be empowered to take action against any landowner or farmer guilty of neglectful cultivation, (6) and that a certificate be required to the effect that the holding has been well cultivated, and that either one-eighth part of the holding or one-fourth part of the arable land is under cereal crop.

The minority report recommends that farmers be left free to cultivate their land as they deem best; that the boards of agriculture organize a system of distribution of information relating to agriculture; and that so long as prices of cereals are controlled by the Government, the farmers be paid prices not less than those at which the commodities can be imported. In making reservations to all but the first of the recommendations of the majority report, H. S. Cautley contends that average bare costs of production are impossible of determination.

Royal Commission of Agriculture.—Minutes of evidence (*London: Govt.*, 1919, vols. 1, pp. 189, App., pp. 20+V; 2, pp. 128, App., pp. 32+III; 3, pp. 119, App., pp. 103+III; 4, pp. 92, App., pp. 41+III; Minutes Nov. 4-5, pp. 539-589).—This gives the evidence heard at intervals between August 5 and November 5, 1919, by the commission appointed "to inquire into the economic prospects of the agricultural industry in Great Britain, with special reference to the adjustment of a balance between the prices of agricultural commodities, the costs of production, the remuneration of labor, and hours of employment."

The German agricultural problem during and after the war, DE GUICHEN (*Jour. Économistes [Paris]*, 1919, Nov., pp. 248-261).—This sets forth German difficulties with regard to food supply during the war, the concern of that nation in controlling the grain-growing regions of eastern Europe, and its purchases of Roumanian grain, and discusses the probability of emigration by the German agricultural population.

Government regulation and vegetable growing, A. BOVENSCHEN (*Kriegswirtschaft und Genüßbau. Berlin: Deutscher Schriftenverlag*, 1918, pp. 36).—A defense is made of the German food administration against charges of being socialistic, and a high protective tariff for German agricultural products after the war is urged.

Some directions in which Victorian agriculture may be developed, A. E. V. RICHARDSON (*Jour. Dept. Agr. Victoria, 17 (1919), No. 11, pp. 641-650*).—A further development of the wheat, wool, dairying, and meat industries and of diversified agriculture and systems of marketing is urged.

The farmers' platform.—A new national policy for Canada as adopted by the Canadian Council of Agriculture at Winnipeg, on November 29, 1918 ([*Winnipeg*]: *Canad. Council Agr.*, pp. 8).—The official draft of the revised and extended platform adopted by the Canadian Council of Agriculture in November, 1918, includes a reduction of the customs tariff leading to complete free trade with Great Britain in five years, direct taxation, and other planks relating to demobilization, land settlement, public ownership of systems of communication and transportation, and minor reforms.

The Argentine grain grower's grievances, G. HOLM ([*Buenos Aires: Author*], 1919, pp. 228, pl. 1).—The methods of grain marketing existing at present in Argentina are criticized from the standpoint of profits to the farmer and waste due to incorrect grading and storing. Arguments are presented in favor of State intervention in the construction of elevators and establishing uniform grades as the solution of difficulties of the grain farmers. In this connection, also such questions of rural credit as mortgages, harvesting loans, and warrants on grain stored, and of future grain trade possibilities are discussed.

Where opportunity knocks twice, F. CRISSEY (*Chicago: Reilly & Britton Co.*, [1914], pp. 207, pls. 63).—Methods of cultivation and marketing fruit and truck crops, as practiced by foreigners and a few native American small farmers in California, are described.

The determination of farm costs, J. KEANE (*Jour. Bd. Agr. [London]*, 26 (1919), No. 9, pp. 891-906).—Actual farm accounts kept from 1914 to 1918 on the author's home farm, Waterford, Ireland, along lines suggested by an investigation by Orwin previously noted (*E. S. R.*, 40, p. 192), are given. Under the system noted here no charges are made for interest on capital because it is regarded as a charge on profits rather than on production, nor are the services and expenses of the proprietor charged to farm costs since these are variable quantities. Total pasture charges are distributed at the end of the accounting year in proportion to the capital value of the various classes of stock. Overhead charges are included in the cost of crops or pasture.

The net income on certain crops, L. MALPEAUX (*Vie Agr. et Rurale, 9 (1920), No. 2, pp. 25-28*).—Comparative estimates, reporting the relative cost of production of wheat, oats, sugar beets, fodder beets, and potatoes in France before the war and in 1919, are given and discussed to show the complexity of determining accurate net income.

Ouyen farm competition, H. A. MULLETT (*Jour. Dept. Agr. Victoria, 17 (1919), No. 12, pp. 705-721, figs. 12*).—This article describes details of farm management found on a farm in the Mallee Settlement of northwest Victoria receiving the prize award in a farm competition held by a local agricultural society.

Profit and loss sharing on the farm, J. WYLLIE (*Jour. Bd. Agr. [London]*, 26 (1919), No. 9, pp. 910-913).—This outline of a profit-sharing scheme, intended primarily for tenant farmers and their employees, was awarded the prize offered recently for the best scheme submitted through certain British agricultural papers.

Housing of the agricultural laborer, J. C. THRESH (*London: Rural Housing and Sanit. Assoc.*, 1919, pp. [II]+81, pl. 1).—This pamphlet treats the subject from the point of view of public health administration in small districts, with particular reference to the county of Essex, England, and emphasizes the

need for new cottages. The principal defects of housing facilities are discussed, and details are given of the sanitary condition of rural cottages in several typical districts of the county.

Jewish colonization in Palestine.—Methods, plans, and capital, J. OETTINGER ([*The Hague*]: *Head Off., Jewish Natl. Fund*, pp. 110+[II], figs. 3).—This briefly describes the agricultural colonization of Palestine which has taken place under philanthropic organizations, individual private initiative, organized settlement companies, cooperative methods, and national programs, and notes colonization methods current in European countries. It discusses more in detail farming plans and estimates for the foundation and working capital required, annual outlay, and gross and net income on colonists' holdings of different sizes and types. Estimates are also given of the capital necessary for establishing and maintaining colonies of 100 families and more.

Cooperation in Geneva and in Switzerland, J. RENAUD (*La Coopération à Genève et en Suisse. Geneva: Soc. Coop. Suisse Consommation*, 1918, pp. VII+158+[I], pls. 12, figs. 3).—The author traces the workings of the Swiss Cooperative Consumers' Society of Geneva through the 50 years of its existence and the rôle of cooperation in Switzerland during and since the war.

Report on the working of cooperative societies in Bihar and Orissa for the year 1918-19 (*Rpt. Work. Coop. Soc. Bihar and Orissa, 1918-19*, pp. [II]+42+8+2, pt. 1).—This report continues information previously noted (E. S. R., 40, p. 893).

Farmers' Market Bulletin (*North Carolina Sta., Farmers' Market Bul.*, 6 (1919), No. 31, pp. 19, fig. 1).—This number contains the usual list of products which farmers have for sale, together with brief live-stock notes by C. S. Jones.

Monthly Crop Reporter (*U. S. Dept. Agr., Mo. Crop Rptr.*, 6 (1920), No. 1, pp. 8).—The usual monthly estimates of acreage and production, and brief articles, notes, and tabular data as to stocks, the farm and market prices, and marketing of important agricultural products are given. Official reports of area and production of important world crops in 1917, 1918, and 1919 are summarized.

[Annual agricultural statistics of France, 1917] (*Statist. Agr. Ann. [Paris]*, 1917, pp. 219-414).—These pages continue information previously noted (E. S. R., 40, p. 793).

[Agricultural statistics of Algeria for 1913 and 1914] (*Statist. Gén. Algérie*, 1913, pp. 233-280; 1914, pp. 233-280).—Statistics are continued from those previously noted (E. S. R., 33, p. 395).

AGRICULTURAL EDUCATION.

The Federal executive departments as sources of information for libraries, E. GUERRIER (*U. S. Bur. Ed. Bul.* 74 (1919), pp. 204).—This bulletin contains brief statements of the functions and, in some instances, of the accomplishments of the various offices of the Federal executive departments which have printed matter of interest to libraries.

The next organization step in southern agriculture, S. G. RUBINOW (*School and Soc.*, 10 (1919), No. 252, pp. 479-485).—This is a review of the development of agricultural extension work begun in 1904 as farm demonstration work. The method of demonstration work having passed from the stage of individual instruction to that of group or organized instruction, the author holds that the next step in southern agriculture must be represented by county organizations, either in the form of boards of agriculture, advisory councils, or agricultural bureaus. He offers suggestions with reference to the organiza-

tion of such county boards of agriculture, points out their advantages, and states concretely what they should accomplish.

Agricultural education (*Natl. Soc. Vocat. Ed. Bul. 31 (1919), pp. 29*).—This bulletin contains the following three articles relating to agricultural education, and the report of the committee on resolutions of the agricultural education section of the National Society for Vocational Education.

Purpose and Methods of Supervision in a State System of Agricultural Education, Z. M. Smith, (pp. 7-12).—The author briefly outlines some of the fundamental principles underlying the problems of supervision of vocational agricultural education.

Two Important Current Problems of Agricultural Education, D. Snedden (pp. 13-19).—In the author's estimation the problem of finding a type of school that should primarily give basic, instead of extension, vocational education for specific farming callings, that would be adapted primarily to boys of secondary school age, that would be inexpensive, that would not be chiefly a feeder to the agricultural college, etc., was largely solved when the home project type of training and instruction was evolved. Two problems further extending and defining the home project method are suggested.

In the first of these the author contends that "vocational education can never be really effective unless administered in the light of reasonably probable assurance as to what will be the career of the person trained during (a) the first five years, and (b) the second five years, etc., after the close of such training. . . . Findings, under this problem will vary from community to community, perhaps from decade to decade, as social conditions change. Expected results will not always follow in the individual cases, but they must for model numbers, otherwise our findings are unscientific and misleading, and our procedures based on them, wasteful, perhaps valueless, conceivably harmful."

The second problem deals with the general problem of defining optimum quantitative measures for projects which the author considers now one of the most important in sound vocational agricultural education. He has come to the conclusion that projects now prevailing are too small. As a means of initiating discussion he proposes standards for boys free to devote their full time to getting a vocational agricultural education. The difficulties sometimes claimed in standardizing improvement projects are considered only those inherent in bookkeeping and proper inventorying.

Present and Future Relations of Vocational Agricultural Education and Agricultural Extension, W. G. Hummel (pp. 20-27).—The author discusses the nature and purposes of the Smith-Lever and Smith-Hughes Acts, and briefly defines the relationships under the two acts in accordance with an agreement approved February 15, 1918, by a joint committee of the U. S. Department of Agriculture and the Federal Board for Vocational Education.

[**Report of**] committee on relationships of vocational schools to the extension division and the teaching staff of the college, R. W. STIMSON, A. VIVIAN, and K. L. HATCH (*Fed. Bd. Vocat. Ed., Vocat. Summary, 2 (1920), No. 9, pp. 153, 162, 163*).—This is the report of a committee of the American Association for the Advancement of Agricultural Teaching submitted at its meeting November 11, 1919. It is based on replies to inquiries addressed to the presidents of the State boards for vocational education, the deans or presidents and extension service directors of the State colleges of agriculture, and the State supervisors of vocational agricultural education in all States.

The returns indicate that harmony prevails among these agencies in most of the States, and that at least 15 States have provided for teamwork in writ-

ten agreements, while in 17 States informal agreements are reported to be operating satisfactorily. The committee briefly gives its views regarding a well-balanced State plan of agricultural education, and submits condensed recommendations for the discussion of possible policies and plans in the preparation of a sound and workable program.

Plan for vocational education in the State of Louisiana (*Baton Rouge, La.: State Dept. Ed., 1919, pp. 40*).—The requirements for vocational education in the State of Louisiana are outlined. It is intended to use 40 per cent of the teacher-training funds for agricultural subjects and 30 per cent for home economics subjects. The Louisiana State University and Agricultural and Mechanical College has been designated for the training of white teachers of vocational agriculture and home economics, and the Southern University and Agricultural and Mechanical College for the training of negro teachers in these subjects. Outlines of 4-year type courses in vocational agriculture and home economics and 4-year teacher-training courses in vocational agriculture and home economics are included.

Vocational education in Maryland, 1919, L. A. EMERSON (*Baltimore, Md.: State Dept. Ed., 1919, pp. 63*).—This publication contains a report on the progress of vocational education in Maryland in 1918-19, including war training courses, and an outline of the State plans for the administration of vocational education in 1919-20. Outlines of 2- and 4-year type courses in vocational agriculture, type courses in vocational home economics, and 4-year teacher-training courses in vocational agriculture and home economics are included.

In vocational agriculture a great deal of emphasis was placed on the project work and its correlation with classroom instruction. During the first year of the inauguration of the teacher-training work it was organized as a division of vocational education of the Maryland State College of Agriculture, but as a result of the recent reorganization of the college the vocational work is now a part of the school of education, which includes a department of agricultural education.

Vocational agricultural education in Mississippi (*Miss. Dept. Pub. Ed. Bul. 13 (1919), pp. 111*).—This bulletin outlines the requirements in equipment, instruction, supervision, etc., that must be met by Mississippi schools giving courses in vocational agriculture in order to be eligible to receive Federal aid under the provisions of the Smith-Hughes Act. Definite suggestions are offered for conducting supervised practice work and the three general forms or ways of securing such work, viz, the home or school project, practical work on school grounds, and community or agricultural extension work, are compared on the basis of the educational aims served. Project study outlines for gardening, growing Irish potatoes, cotton, corn, and peanuts, and raising poultry and pigs; an outline guide to better teaching; an outline of the organization and policies for county agricultural high schools formulated and agreed upon in a series of district conferences; important summer activities of the agricultural teacher, and record and report blanks are included.

Report on the Agricultural Instruction Act, 1918-19, J. H. GRISDALE (*Canada Dept. Agr. Sess. Paper 15a (1920), pp. 48*).—This report deals with the work carried on in 1918-19 under the Agricultural Instruction Act in Canada.

The amounts actually expended during the year included \$282,851 for agricultural colleges and schools; \$621,450 for instruction and demonstration including the whole or the larger proportion of the cost of maintenance of the agricultural representatives and their offices, agricultural credit courses, cooperation and marketing, live stock, dairying, poultry husbandry, and fruit and

vegetables; \$27,047 for women's work; \$163,647 for elementary agricultural education in public, high, and normal schools, teacher training, school gardens, nature study, domestic science, and school fairs in part; \$15,556 for boys' and girls' clubs; and \$25,000 for veterinary colleges. The colleges and schools benefiting from the grant are the Ontario Agricultural College at Guelph and the Agricultural School at Kemptville, Ont.; the Macdonald College and the schools of agriculture at Oka and Ste. Anne de la Pocatière in Quebec; the College of Agriculture of the University of Saskatchewan; the agricultural schools at Claresholm, Olds, and Vermilion in Alberta; and the College of Agriculture in British Columbia.

It is held that the agricultural club work, as the logical outcome of nature study and elementary agriculture, should be developed as an integral part of the school system or in very close alliance with it. In Manitoba 10-day short courses in woodworking were held during July and August to meet an insistent demand by the senior members of the boys' and girls' clubs. In Saskatchewan the rural education association movement has developed so rapidly that a director was appointed in 1918.

The Ohio plan for the training of teachers and the improvement of teachers in service. W. F. STEWART (*U. S. Bur. Ed., Higher Ed. Circ. 18 (1919), pp. 7*).—This paper was presented at the meeting of the American Association for the Advancement of Agricultural Teaching on November 11, 1919. It describes the plan for teacher training adopted by the Ohio State University, which provides for observation and practice work in five rural high schools that are so accessible by interurban and automobile service as to make unnecessary an absence for more than one-half day from the campus. The vocational agricultural departments in these high schools are in charge of well-qualified teachers who are ranked as instructors in the department of agricultural education of the university. Teacher-training students taking the observation work leave open for it at least one afternoon each week, and are required to visit each of the five training schools three times during the semester and to make two additional visits to two schools other than the training schools which are maintaining departments, making a total of 17 visits. Upon the submission of satisfactory reports on these visits, credit in the course is granted. The local teacher serves as the critic teacher.

In the plan for the improvement of teachers in service the following five agencies are employed and are briefly discussed: Sectional meetings at State teachers' associations, district conferences of vocational teachers, the services of a utility instructor, assistance from supervisors, and news letters and personal letters. The teachers assisted under this plan are all agricultural college graduates.

Agricultural botany in secondary education. H. F. ROBERTS (*Science, n. ser., 50 (1919), No. 1303, pp. 549-559*).—The author concludes that a course in agricultural botany for secondary schools should differ from the ordinary academic course in the same subject in the following respects: (1) In the aim of the course, which is the economic advantage of the pupil rather than the professional array of the subject from the standpoint of discipline; (2) in the means used for botanical instruction, the seed plants being largely employed as teaching material for practical purposes; (3) in the extensive use of plants of economic value as the means through which to study plant structure and functions." Suggestions are offered for following this method.

In his opinion a course in botany in all communities and especially in rural communities "should have three fundamental objects—to stimulate observation,

to give such botanical knowledge and training as will be most useful, and to impart culture." These three leading motives are briefly considered.

How to raise standards in veterinary education, W. N. BERG (*Jour. Amer. Vet. Med. Assoc.*, 56 (1919), Nos. 2, pp. 125-139; 3, pp. 270-278).—The author calls attention to the lower standards in veterinary education as compared with those in human medicine, and reviews the progress of medical education since 1904 brought about by the American Medical Association through a determination of the medical needs of the country, the classification of medical schools, publicity, etc. In his opinion the same should be done by the American Veterinary Medical Association for veterinary education. In a comparison of the minimal requirements in the selection of the student body and of the teaching body, as defined by the Council of Medical Education for medical schools and the Bureau of Animal Industry, U. S. Department of Agriculture, for veterinary colleges, it is shown that for the medical schools and the veterinary colleges, respectively, the admission requirements are 4 years' high school work and 2 years' college work, and 2 years' high school work; the teaching weeks per college year 32 and 28; the total hours in the 4-year course 3,840 and 3,380; full-time instructors on the faculty 8 and 0; part-time instructors on faculty 0 and 5. Statistical tables are included as an example of the numerous publicity activities of the Council of Medical Education in its desire to inform prospective students of the relative merits of the various schools.

Home economics, H. W. CALVIN and C. A. LYFORD (*U. S. Bur. Ed. Bul.* 50 (1918), pp. 38).—This is a survey of the progress in the years 1916-1918 in home economics education. It deals with the development of this subject in public, normal, and colored schools, and in colleges and universities; State and county supervision; the effect of war on college courses; practical application of food courses in the management of lunch rooms and cafeterias and in cooperating with fraternities, dormitories, and boarding houses; Smith-Lever extension work; new phases of home economics including nurses' courses, experiment station work in home economics, at the University of Nebraska the cadetting in the city schools of students in the special methods course under the joint supervision of a member of the university home economics staff and the city supervisor, itinerant teacher training, commercial clothing manufacture, etc.; child welfare courses; newly established and reorganized departments, and departments in which there has been unusual growth; etc.

Illustrated lessons in agriculture, G. A. BRICKER (*Columbus, Ohio: Kauffman-Lattimer Co.*, 1919, pp. 185+[2], figs. 86).—This manual is intended as an instruction book for teachers to accompany the author's agricultural charts and apparatus. It comprises a lesson on each of the 12 charts, including the walking plow, wheat, corn, spraying for the codling moth, grafting, the dairy cow, the beef animal, the farm horse, the hog and the sheep, the chicken, clover, and soil fertility; also exercises in soils and drainage in connection with the drainage apparatus. Each lesson consists of subject matter, practical exercises, and references to literature.

How teachers may use Farmers' Bulletin 602, Clean Milk: Production and Handling, A. DILLE (*U. S. Dept. Agr., Dept. Circ.* 67 (1920), pp. 6).—Suggestions are offered to teachers, especially in rural elementary schools, on the method of using the information contained in Farmers' Bulletin 602 (E. S. R., 31, p. 771) on the production and handling of clean milk.

Organization and results of boys' and girls' club work (Northern and Western States), 1918, O. H. BENSON and G. WARREN (*U. S. Dept. Agr., Dept. Circ.* 66 (1920), pp. 38, figs. 14).—This circular gives an account of how

boys' and girls' club work has been organized and conducted in different stages of its development in the Northern and Western States and some of the results achieved during 1918.

School fairs in 1919 (*Agr. Gaz. Canada*, 6 (1919), No. 12, pp. 1058-1065, figs. 4).—Notes are given on methods of organizing and conducting school fairs in 1919 in Prince Edward Island, Nova Scotia, Quebec, Manitoba, and Saskatchewan.

MISCELLANEOUS.

Monthly bulletin of the Western Washington Substation (*Washington Sta., West. Wash. Sta. Mo. Bul.*, 7 (1920), No. 10, pp. 153-176, figs. 8).—In addition to articles abstracted elsewhere in this issue, this number contains brief articles on the following subjects: Raising the Dairy Calf, by L. E. Carter; The Disease Factor in Fruit Growing, by A. Frank; and Report of Western Washington Egg-laying Contest for the Month of November, 1919, by G. R. Shoup.

Transactions of the Third International Congress of Tropical Agriculture (*Trans. 3. Internatl., Cong. Trop. Agr. 1914*, vols. 1, pp. XI+728, pls. 2, figs. 8; 2, pp. X+710, pls. 4, figs. 39).—Volume 1 contains the papers presented to this Congress held at London, June 23-30, 1914, on technical education in tropical agriculture, the organization of agricultural departments in relation to research, sanitation and hygiene on tropical estates, agricultural credit banks and cooperative societies, legislation against plant diseases and pests, cotton, fibers, and rubber. Volume 2 contains the remaining papers (except those presented by the Portuguese section, which have been printed separately), and deals with cereals, sugar, cocoa, tobacco, oils and oil seeds, the fertility of soils in the Tropics, and miscellaneous subjects.

Modern progress in agriculture, D. HERMENEGILDO GORRÍA Y ROYÁN (*Mem. R. Acad. Cien. y Artes Barcelona*, 3. ser., 14 (1918), No. 9, pp. 47).—This is an inaugural dissertation reviewing recent progress in agriculture, notably in agricultural instruction and extension work, agricultural organizations, Government protection of agriculture, radioculture, electricity as applied to agriculture, mechanical cultivation and agricultural machinery, special crops, nutrition of plants, agricultural bacteriology, plant pathology, dry farming, and farm management, with special reference to prevailing conditions in Spain.

Farm memorandum book (*Agenda Aide-Mémoire Agricole. Paris: J. B. Baillière & Sons*, 1918, pp. XII+246+[76]+148+[20], pl. 1, figs. 32).—This is a pocket manual of agricultural information published under the direction of G. Wery, including many useful tables and other data, forms for farm records, a farm calendar and diary, data as to French laws and regulations, an extensive bibliography of French books on agriculture, etc.

NOTES.

Purdue University and Station.—O. E. Reed, head of the department of dairying, has resigned to become superintendent of production for a large stock-breeding corporation. J. Howard Roop, deputy State chemist in the feeding stuffs control work, has resigned to engage in commercial work.

Kansas College and Station.—Since 1900, when the first strictly agricultural class was graduated, a total of 819 students have completed the 4-year course in agriculture. According to the latest information at hand, 50 per cent of these graduates are engaged in farming; 36 per cent are engaged in investigation, teaching, extension, or other professional agricultural work; and 14 per cent are engaged in nonagricultural occupations.

The students in the farmers' short course, which closed February 28, aggregated about 125 and represented 5 States and 59 Kansas counties. Ninety-eight per cent of these students live on farms; 50 per cent are working for their parents; 20 per cent are farm owners; 18 per cent are tenants; 6 per cent are farm managers; and 6 per cent are hired farm laborers. With reference to education, 92 per cent had finished the eighth grade, 52 per cent had had some high-school training, and 14 per cent had had some college training. The number of students registered in each of the 27 subjects offered varied from 5 to 106. The most popular courses as indicated by the registration were soil management, live stock production, live stock sanitation, grain crops, forage crops, farm management, and field machinery.

The eighth annual convention of Kansas live stock feeders was held at the college on March 20. The attendance exceeded 1,000, and represented about 80 counties of the State. The principal feature of the convention was a report on the results secured during the past winter in the station's feeding experiments with 100 steers, 240 hogs, and 445 lambs.

N. E. Olson, in charge of dairy manufacturers, resigned April 1 to engage in commercial work.

Louisiana Stations.—Seth S. Walker, soil chemist at Baton Rouge, has resigned to engage in commercial work in Florida.

Minnesota University.—According to a note in *Minnesota Farm Review*, W. W. Guosseff, in charge of dairy and animal husbandry work at Crookston, has resigned to become secretary of the Illinois Duroc-Jersey Breeders' Association.

Mississippi Station.—The State legislature has made its initial appropriation for the support of the main station, allotting \$46,300 for the ensuing biennium as well as doubling the appropriation for the substations. The State appropriations for this period for experimental work will aggregate \$176,300.

New Hampshire College.—A \$10,000 stock barn authorized by the 1919 legislature is nearing completion. It is a 2-story structure 40 by 65 feet with a 1-story ell 32 by 60 feet, and is thoroughly equipped with modern appliances. Provision is made for 30 head of sheep, 18 of cattle, and 4 horses. An appropriation of \$5,000 is also available for the purchase of pure-bred live stock, and is being expended for Herefords, milking Shorthorns, and Percheron horses.

EXPERIMENT STATION RECORD.

VOL. 42.

MAY, 1920.

No. 7.

With the development of the system of agricultural extension in the past few years, the class of workers known as "specialists" has come into increasing prominence and has already assumed an important rôle. The necessity for their provision as a part of the extension forces was for a time overlooked, because of the prominence given to the activities of the county agents, home demonstration agents, and boys' and girls' club agents. These carried the work so much more directly and intimately to the farmers and their families than had ever been done before that for a time the system seemed adequate in itself, with the aid of such specialists as already existed in the colleges and experiment stations.

It is now becoming more evident, however, that the provision of this group is a logical development, and contributes not only a material element of strength but provision for steady growth in extension teaching. The subject matter with which extension deals is in large measure of quite technical nature, originating outside the forces and calling for considerable of interpretation and guidance in its introduction. The various groups of agents are required to cover such broad fields and deal with so many subjects that they can not be expected to function as specialists, and are often in need of guidance in technical matters. Where such guidance and assistance is not provided in the extension organization, they must needs depend on the experts in the college teaching departments and the experiment stations, all busy men and engrossed in their particular duties.

Hence the extension specialist meets a real need and fills an important place in the general scheme. His activities have not always been fully formulated, and have varied considerably in different localities. To some extent his work has been of miscellaneous and propaganda character rather than directed specifically to definite functions, and this has tended to make the necessity for his services less clear in the minds of some people.

The particular field and function of extension specialists is becoming increasingly apparent as their activities assume more definite form, but there is still some lack of understanding of their work and

its distinctive features as well as of the need of it in the extension system. The following observations are offered as a contribution to the subject, without attempt to cover it completely, but with a view to making this feature of the work better understood. It is based on a study of the evolution of the specialist and the experience which has been had in the working out of his particular field and function.

The county extension agents, who are nearest the farmer and on whom the call comes first for information and help on practically every phase of agriculture and rural life, are the first to realize how relatively meager their own information on technical agriculture really is. This is so even though they have lived on a farm all their lives and been trained in our best colleges of agriculture. Like the country doctor, they may be good general practitioners but are constantly running across cases requiring the increased technical knowledge of a specialist for successful handling. Hence the need for extension specialists who can aid the county agents on matters of this kind; and it is from these agents that the call for the assistance of such specialists is particularly strong.

Again, the county agents are extremely busy men and women. Calls for their services cover all the working hours of the day, running more frequently than not into the late night, and involving winter and summer demonstrations, field meetings, consultations, lectures, committee meetings, campaigns, publicity and all such matters in which a rural community may be interested. Not only are all the week days filled, but the holidays and Sundays are broken into because of emergencies that come up on one farm or in one community or another throughout the county. This makes it difficult, if not impossible, for the county agent to find sufficient time to read and keep up with the progress in all the different lines upon which he is called to advise; and since he lives among his clients, and a whole year's plans, involving frequently considerable investments, are contingent upon his counsel being sound and up to date, he is keenly alive to the responsibility of his position and to the need of having someone on whom he may call for information and counsel from time to time.

The main reason for having extension specialists, however, is that the research departments of the agricultural colleges and the United States Department of Agriculture through their investigations and inquiries are constantly adding to or correcting our fund of agricultural information. The results of these investigations are frequently quite technical in character, and if they were simply reported in the ordinary way farmers and their advisers might fail to get

their full significance or to understand the exact technique of procedure in applying them. Personal explanation and visual demonstrations of the results are often absolutely essential if farmers are to grasp their meaning and get the full benefit of them, and this applies likewise to the various classes of extension agents.

The specialist is thus a link in the present system. In a sense, he is continuing what was done by the research specialists before the present extension organization was provided, although he deals mainly with a different group through whom he works. It will be recalled that before the advent of the present county extension system, with its paid county agent, home demonstration agent and boys' and girls' club agent, specialists from the college and station were accustomed to carry on their work with the farmers through lectures, bulletins, circulars, press notices, and direct dealing with individuals or associations. These specialists were therefore the forerunners of the more recent groups of agents in matters of publicity and popular teaching. Their activities in this respect were not very definitely organized or directed, and dealt mainly with groups of farmers rather than with individuals. They were in considerable degree free lances, and an individual in his work usually covered an entire State; hence they were able to do little more than scatter the seed without much opportunity for follow-up work to see that it took root and grew.

With the coming of the county agents, however, and the development of county extension organizations, an opportunity was afforded the specialists for planning a system of instruction which should reach all the farmers who could be interested, by means of local agents working under his guidance. With this was coupled the possibility of close and regular follow up, to see that his teachings were understood and applied, and that the expected beneficial results accrued.

The county agent system has developed very rapidly, so much so that the specialist is often just beginning to see clearly this new channel through which he may work, and the big opportunity it offers him for rapidly and effectively extending his message. The use of this system calls for a considerable modification of his previous method of work, so as to provide a well thought out, definitely planned program in which to a considerable degree he will be a teacher of leaders. With the county agricultural agencies, including the farm bureaus and community organizations, now available through which extension specialists may work, the need of such definite program on his part is important. Scattered, unorganized, disconnected efforts which mark no substantial advance should not form a part of the present day extension program, but the work of each

group should be systematized and made to supplement and strengthen that of the others.

Stated briefly, the extension specialist in the present extension system is the agent whose duty it is to see that the practical results of research along his particular line, as they are developed by the experiment stations, the Federal Department of Agriculture and other institutions, are put in usable form and brought to the attention of rural communities in a way that will benefit the maximum number of people. He heads up, from the extension standpoint, his line of work in the State, and imbues the various groups of extension agents and the county and community committeemen with what is right and sound to be done; and through these his influence reaches to the ultimate demonstrators. It rests largely with him in the first instance to determine what should be taught and how it should be presented; and beyond this he assists the other agencies in the development of the best kind of organization for accomplishing their purposes. In addition he may work through the various farmers' organizations and farmers' clubs in promoting his work.

A State dairy extension specialist, for example, would first consider what information along dairy lines the colleges had that would be helpful to dairy farmers and the dairy industry of that State; he would chart and map the dairy situation in the different sections of the State so that he could see at a glance what kind of dairy extension work each section was in most need of; and he would consider the agencies through which he might best work to reach the maximum of people interested in each of the different phases represented. Among these agencies the farm bureau or county organization with its complement of agents and of county and community committeemen, would appeal to him first, since extension work is their business and they are a part of the State and national system. He might also consider the possibilities of extending his message through the various dairy associations of the State, breeders' associations, etc.

In considering the county extension agencies, the dairy specialist would concern himself with the problems of each of the counties in which there were such agents and the training in dairying which each agent had received. If these agents were not already meeting the dairy needs of the county, the dairy specialist would aim to present the situation to them and the improvements possible, in such a way as to arouse their interest and secure their support in bringing the matter to the attention of the farmers. In this way the wishes of the farmers in regard to dairy extension work would be ascertained, and if they decided they would like to try out some of the

matters suggested, it would be the business of the extension specialist to see that the county agents, county committeemen, etc., were properly instructed. If necessary he would conduct three or four meetings with farmers in such county, to show not only the farmer but especially those responsible, just what the new phase of work was, and just how it should be handled in order to teach the thing desired for the improvement of the dairy industry in that community.

The aim of the successful extension specialist is therefore to go far enough to assure himself that the local agencies through whom he is working thoroughly understand the message, are competent to present it effectively, and will continue to carry forward and organize the work with farmers in additional communities. In this effort the extension specialist finds his most effective method of teaching is the actual showing of these various agents just how to conduct the demonstration on a farmer's farm, in the farmer's barns, or feed lot, or in the farmer's home. He then goes on to another county to teach the county extension agents there, and after convincing himself that the agents there have his message and can extend it, he will go to the third and fourth counties, and so on to all the county agents of the State needing his help.

Particular attention may be called to the growing practice among extension specialists of so organizing their work that it may be extended through the home demonstration agents and boys' and girls' club agents, as well as through the county agricultural agents. Not only is it desirable to interest the farmer in what the specialist has to extend, but also the farmer's wife if the matter is at all suitable, and especially the farm boy and girl. Indeed, the extension specialist who fails to plan his work so that farm boys and girls may take part in it fails to utilize one of the most efficient agencies available for teaching better agricultural and home practices both to present and future farmers.

It may be set down, therefore, that the first business of an extension specialist in getting his subject before the farmers of the State is to interest and instruct particularly the county agents, the home demonstration agents, and the boys' and girls' club agents in the subject which he represents. He is essentially the teacher of these leaders. The better he teaches these leaders and the more thoroughly they are made to understand the subject, the more certain they are to teach and extend the message the specialist desires.

All do first and most eagerly the things they know best. A county agent or club agent or local committeeman will be lukewarm in pushing a subject he does not understand. It is not enough, therefore, for a specialist to visit a county agent or boys' and girls' club agent once, but

he must repeat his visits and instructions until such agents are thoroughly grounded in the subject. Then he must maintain the continued interest of each agent with whom he works by keeping closely in touch with him by correspondence and otherwise. He will furnish them with new charts, new lantern slides, and literature which can be used in presenting his subject. The specialist must constantly be studying, planning, and developing new ways, new material, and publicity matter for presenting and sustaining interest in his subject, and must furnish this material freely and fully to the agents in the field if he expects their support in fullest measure.

It will thus be seen that the aim of the present day extension specialist should be to tie to him first of all the county agent, the home demonstration agent and the county club agents, by keeping them fully informed as to the whole philosophy and plan as well as the details of his work, since these forces remain permanently in the county and are in constant touch with the farmer. The extension specialist may not be able to return to the county more than once or twice a year, and with only such occasional visits he can not hope to reach the farmers or their families in any intimate instructional way except the few he may work with as a means of teaching the local agents and committeemen. Nor is this necessary. But he can teach and leave his message with the local forces and the men cooperating with them in forwarding it, and he needs to make his work with this limited group so effective that they can represent him in carrying it on directly with the farmers. In this way he can reach thousands where by the old method he reached but tens.

The extension specialist usually finds that after he has given his message to a certain number of agents, and the agents begin to put the material out, some of them will do it much more effectively than others. Indeed, there are likely to be some agents who will do the work along some one line or other more effectively than the specialist himself, while others may fall far below the desired accomplishment. The specialist therefore has an important function in helping the agent below par to become more efficient. He becomes a common carrier from agent to agent of the best methods as developed by the agents themselves, and these best methods will relate for the most part to means or organizations to effectively reach the maximum number of farmers. In his subject therefore the extension specialist is not only a teacher of subject matter, but he is also an adviser on the best methods of organizing his particular line of work.

In counties without farm bureaus or county agents, the specialists have another task in getting their information to the farmers. But it is not the purpose to take up that phase of the work at this time. That is another story, but a minor one.

From the above discussion it may be concluded that the function of the extension specialist has come to be a very important one in extension work. These specialists are in considerable degree dealing with leaders and trained men, and consequently their technical training in their respective subjects must be such as will command the respect and meet the needs of the agents and the best farmers with whom they will do most of their work. Furthermore, since they are working through others in an advisory way rather than as administrators, they must be broad minded, forward looking and inspiring men, and possessed of both tact and judgment in dealing with others.

While, as stated at the outset, the demand for extension specialists now comes largely from the county agents and most advanced farmers, it should be understood that this demand is for specialists thoroughly trained in their subjects and willing to work with others cooperatively. The character of the service and its particular requirements call for the careful selection and proper training of persons for it. This training needs to take account not only of technical knowledge and its application in practice, but the qualities and ability to develop successfully the teaching attitude. There is believed to be opportunity for a larger number of extension specialists whose training meets the high standard set for this responsible type of service.

RECENT WORK IN AGRICULTURAL SCIENCE.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

The cause of deterioration and spoiling of corn and corn meal, J. S. McHARGUE (*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, pp. 257-262, fig. 1).—This contribution from the Kentucky Experiment Station reports the results of an extensive investigation of the underlying causes of the deterioration and spoiling of corn and corn meal during storage or while in transportation.

The fundamental cause of deterioration was found to be excessive moisture. The laboratory experiments reported indicate that sound corn containing 12 per cent of moisture can be kept in good condition in storage for at least 12 months, provided it is not exposed to conditions in which moisture can be absorbed. Corn containing 15 per cent of moisture will mold if confined in airtight vessels at ordinary temperature, and if the moisture content reaches 20 per cent alcoholic and acid fermentations will result.

Similar experiments with meal ground from whole grains of sound corn containing 12 per cent of moisture indicate that, while more susceptible to hydrolytic changes resulting in an increase in acidity, such meal can be kept for a period of 12 months when air and moisture are excluded without acquiring any musty or sour odor. "How seriously this increase in the acidity of the oil affects the palatableness and wholesomeness of bread made from such meal remains to be determined in future experiments. Except from the standpoint of acidity, the meal is apparently in a perfectly sound condition and has even retained a nutty odor." By still further lowering the moisture content of the meal the development of acidity may be reduced to a negligible quantity. By storing at a lower temperature the development of acidity may also be retarded.

The different species of molds which developed in some of the samples of corn and corn meal under unfavorable conditions were isolated, grown in pure cultures, and identified. These include *Penicillium expansum*, which was observed only on the germ of the corn and which made the most prolific growth of any of the species; *Aspergillus glaucus* and *A. albus*, which developed in isolated clusters on the germ; and *Citromyces* sp., which grew vigorously on the degerminated part of the corn.

In applying the results of this investigation to problems of commercial handling of corn the author states that "apparently the reabsorption of moisture is a very important cause of the spoiling of large quantities of export corn while in transit to European ports. If corn containing no more than 12 per cent of moisture were stored in perfectly dry holds and so protected that moisture could not enter, there appears to be no reason why such corn should not keep in a sound condition during transportation on the ocean." Similar protection of corn meal is thought to be sufficient to insure its preservation for comparatively long periods of time, and to obviate the necessity of degerminating the corn previous to grinding, a practice which is considered by the author not only to be unnecessary but to be harmful from the standpoint of nutrition.

The quantities of preservatives necessary to inhibit and prevent alcoholic fermentation and the growth of molds, M. C. PERRY and G. D. BEAL

(*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, pp. 253-255, figs. 2).—This paper reports a study of the amount of various food preservatives required to check alcoholic fermentation, to inhibit decomposition by yeasts and molds, and to destroy all living organisms in standard 1 per cent dextrose broth.

The medium was prepared by sterilizing a known volume of 2 per cent dextrose broth and adding sterile water and preservative to double the original volume. After inoculation the tubes were allowed to stand at room temperature for from four to eight days according to the time required to produce visible growth in check tubes containing no preservative. The organisms studied were pure cultures of *Saccharomyces cerevisiæ* and *Penicillium glaucum*, and the preservatives selected were absolute alcohol, sodium salicylate, sodium benzoate, sodium sulphite, sodium hydrogen sulphite, and formaldehyde. The results obtained, which are presented in both graphic and tabular form, may be summarized as follows:

The inhibitive effect toward *S. cerevisiæ* was noted at 0.25 per cent concentration of formaldehyde and sodium hydrogen sulphite, 0.5 per cent sodium benzoate, 0.6 per cent sodium sulphite, 1 per cent sodium salicylate, and 11 per cent alcohol. For complete sterilization the order was slightly different, both sodium benzoate and salicylate being more effective than the sulphites.

The inhibitive effect upon *P. glaucum* was noted at the following concentrations of preservatives: 0.25 per cent of formaldehyde, sodium hydrogen sulphite, and sodium benzoate, 3 per cent of sodium salicylate, and 8 per cent of alcohol. No inhibitive effect was observed at 12 per cent concentration of sodium sulphite. The same relative order held for complete sterilization.

A method of testing the amylolytic action of the diastase of *Aspergillus oryzae*. S. A. WAKSMAN (*Jour. Amer. Chem. Soc.*, 42 (1920), No. 2, pp. 293-299).—Attention is called to the distinction between the amylolytic (amylolytic, liquefying) power and the saccharogenic (saccharifying) power of diastatic enzymes for starch, and it is pointed out that in the majority of investigations on the action of diastase the saccharogenic rather than the amylolytic power has been measured. The investigations reported in this paper were undertaken with a view to finding the best methods for the measurement of the amylolytic power of diastatic enzymes with reference to their suitability in the textile industry for the desizing of fabrics.

The method adopted is based upon the disappearance of raw starch in a solution without considering how much has been hydrolyzed to dextrans and how much to sugars. Dry potato starch was first treated with a 0.5 per cent solution of neutral red until the color was absorbed, and then washed repeatedly with water until the supernatant liquid became almost perfectly clear. The colored starch was then dried and a 2 per cent solution prepared in the usual manner. In making the test, this paste was introduced in 10 cc. portions into large test tubes which were placed in a thermostat at 40° C. until this temperature had been reached, when the enzyme was added and the tubes shaken and placed back in the thermostat. As soon as the starch had hydrolyzed, the solution lost its opacity and became clear, this end-point being more easily recognizable by the color imparted to the starch by the neutral red.

The amylolytic power can be calculated from these determinations by making use of the fact that the product of concentration of the enzyme by the time of action is constant within certain limits. A unit of enzyme is taken as the amount of enzyme which will liquefy 10 cc. of 2 per cent raw potato starch in 30 minutes at 40°.

Data presented on the starch liquefying powers of malt enzymes and enzymes obtained from *A. oryzae* (commercial name Polyzime) and on the corresponding

Lintner values show that the first give a higher Lintner value while the second give a higher liquefying value, the latter being from four to six times as great as that of the malt preparations. It is pointed out that this confirms the results of Sherman and his associates (*E. S. R.*, 36, p. 315) on the relative amylolytic and saccharogenic powers of these diastases.

Contribution to the chemical investigation of hardened fats, with special regard to their content in nickel and arsenic, G. RIESS (*Arb. Reichsgesundtsamt.*, 51 (1919), No. 3, pp. 521-531).—An investigation of hardened vegetable and fish oils is reported, which included determinations of their physical and chemical constants and of their content in nickel and arsenic. The materials examined included hardened cottonseed, peanut, and linseed oils, and hardened whale oil. Determinations of arsenic were made by the method of Beck and Merres previously noted (*E. S. R.*, 36, p. 806). Nickel was determined by a shaking-out method, the technique for which is as follows:

About 200 gm. of the hardened fat was melted in a long-necked flask, and about 100 cc. of 12.5 per cent hydrochloric acid and a small amount of potassium chlorid were added. The flask, the neck of which was covered with a watch glass, was heated for an hour on a water bath with frequent shaking. After cooling to solidify the fat, the solution was filtered and an aliquot part of the filtrate evaporated to dryness in a porcelain dish. The residue was dissolved in water, heated with excess of ammonia, filtered, and the filtrate tested for nickel with dimethylglyoxime solution.

The experimental data reported indicate that the hardened oils examined showed no marked differences in physical and chemical properties from the ordinary edible fats, and contained practically negligible quantities of nickel and arsenic.

Cyanogenesis in Sudan grass: A modification of the Francis-Connell method of determining hydrocyanic acid, P. MENAUL and C. T. DOWELL (*Jour. Agr. Research [U. S.]*, 18 (1920), No. 8, pp. 447-450).—Determinations of the hydrocyanic acid in Sudan grass are reported from the Oklahoma Experiment Station. Some of the analyses were made by the method previously described by Dowell (*E. S. R.*, 40, p. 804) and one or two by a modification of the Francis-Connell method (*E. S. R.*, 30, p. 709). This modification, which is described in detail, consists essentially in removing the colloidal sulphur formed in the Francis-Connell method by evaporating the solution to dryness on a water bath at 70° C. and heating the residue to 130° for 5 minutes, after which the solution, slightly acidified with hydrochloric acid, is treated with cadmium chlorid until the sulphur is entirely precipitated. The maximum intensity of color in the final reaction was found to occur when 5 cc. of a 10 per cent ferric chlorid solution was used in 100 cc. of the solution, the standard solution for comparison containing 5 mg. of HCN as KCN.

A table is given of the percentage of hydrocyanic acid in Sudan grass at different stages of growth. This shows that the Sudan grass contains about one-third as much hydrocyanic acid as do the grain sorghums. As has been found with other sorghums, there is a decrease of hydrocyanic acid with growth, and more of the acid is present in the leaves than in the remainder of the plant. A number of determinations indicate that there is more hydrocyanic acid in the plant in the morning than in the afternoon, the amount decreasing in the one case reported in the table from 0.0052 per cent (in the whole plant calculated on fresh basis) for grass cut in the morning to 0.0035 for grass cut in the afternoon of the same day.

Purification of compressed gases in testing catalysts for ammonia synthesis, R. O. E. DAVIS (*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, pp. 289, 290, figs. 3).—The method of purification of gases used in testing catalysts

at the Arlington, Va., plant in work on the synthesis of ammonia carried on in cooperation between the Bureau of Soils, U. S. Department of Agriculture, and the Nitrate Division of the War Department is described. Illustrations are given of two of the purification chambers employed and of the assembled apparatus used for analyzing gases for oxygen and moisture.

Purification of benzoic acid by fractional condensation, M. PHILLIPS and H. D. GIBBS (*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, pp. 277-279, fig. 1).—The authors at the Bureau of Chemistry, U. S. Department of Agriculture, describe a method of purifying benzoic acid or other volatile solids based on the principle of fractional condensation.

The apparatus used consists of a kettle filled with lubricating oil, in which is immersed a pot provided with a 1-in. iron pipe extending into the first condensing chamber and surrounded by a copper coil terminating inside the pot. The condensing chambers consist of cylindrical wire screens, 0.25 in. mesh, of different diameters placed concentrically on a thick reinforced glass plate, which is further insulated from the heat of the oil bath by two sheets of asbestos. Another glass plate provided with openings for thermometers in each chamber is placed over the chambers.

In operation the pot is about three-fourths filled with the crude benzoic acid and the oil bath and chambers are heated, the latter by passing in a stream of hot air. When the temperature in the first chamber is about 50 or 60° C. and that of the oil bath about 120°, the air flow in the chamber is discontinued and the air passed at a definite rate through the copper coil and into the pot. The acid volatilizes and passes through the iron pipe into the first chamber. On passing through the successive screens the moving stream of vapor loses its heat gradually and condenses on the surface of the screen.

Indicators and their industrial application, H. A. LUBS (*Jour. Indus. and Engin. Chem.*, 2 (1920), No. 3, pp. 273, 274, fig. 1).—The author reviews recent developments in the field of indicators, and discusses briefly the application in some of the chemical manipulations of the dye industry of the series of indicators developed by Clark and Lubs at the Bureau of Chemistry, U. S. Department of Agriculture (E. S. R., 37, p. 506).

For general laboratory use methyl red and thymolsulphophthalein are recommended if only two indicators are to be selected, but the whole series is considered desirable for very accurate work.

Further work on acid potassium phthalate as a standard in volumetric analysis, W. S. HENDRIXSON (*Proc. Iowa Acad. Sci.*, 25 (1918), pp. 501-504; also in *Jour. Amer. Chem. Soc.*, 42 (1920), No. 4, pp. 724-727).—The author reports a further study of the properties of acid potassium phthalate and its value as a standard in volumetric analysis as recommended previously (E. S. R., 34, p. 408). The laboratory work, which was performed by S. G. Norton under the direction of the author, included determinations of the number of crystallizations of the salt necessary to secure a sufficiently pure product, of the yield on the basis of the phthalic anhydrid used, and of the hygroscopic properties of the salt.

Three crystallizations in all of the salt were found to give a product of the necessary purity. A yield of about 50 per cent of the theoretical was obtained after four crystallizations from hot water. The hygroscopicity of the salt was practically nil, and its solubility at 25° C. was 10.23 per cent and at 35°, 10.25 per cent.

The determination of chlorin with the nephelometer, A. B. LAMB, P. W. CARLETON, and W. B. MELDRUM (*Jour. Amer. Chem. Soc.*, 42 (1920), No. 2, pp. 251-259).—A study is reported of the suitability of the nephelometric method

for determining minute amounts of chlorin in alcoholic solutions. The results obtained are summarized as follows:

"In a 50 per cent alcohol-water solution, heating silver chlorid suspensions of widely differing concentrations to 40° C. for 30 minutes after precipitation produces a more intense and constant opalescence than can be attained at room temperature; further heating for 30 minutes at 40°, or standing at room temperature for an hour, produces no perceptible change in this opalescence.

"Using this technique, chlorids in such solutions can be estimated with an average deviation of about 3 to 4 per cent over concentrations ranging between 4 and 300×10⁻³ M. Opalescence in such solutions decays more rapidly in diffuse daylight than in the dark. The opalescence of the same quantity of silver chlorid in water is about 15 per cent greater than in 50 per cent alcohol or 50 per cent acetic acid."

A study of the determination of amino acids by means of the hydrogen electrode, E. L. TAGUE (*Jour. Amer. Chem. Soc.*, 42 (1920), No. 2, pp. 173-184, figs. 2).—A method for the electrometric titration of amino acids in solution is described which takes into account the fact that such substances require the presence of an excess of OH-ions before they will show their maximum acid characteristics, or an excess of H-ions before they will show their maximum basic nature. In neutralization a certain proportion of the added OH-ions is consequently used up in bringing the solvent to the OH-ion concentration required for complete neutralization of the amino acid. To make the proper corrections for this factor the titration is carried out as follows:

"Sufficient standard alkali is added to a definite volume of the aqueous solution of the amino acid under investigation to give it a pH value of about 12.5. Then to an equal volume of water the same standard alkali is added in an amount sufficient to give it the same pH value, care being taken to add sufficient water to give the blank the same volume as that of the original at the pH value compared. Subtracting the cubic centimeters used in the blank from that required in the original gives the cubic centimeters of standard alkali necessary to neutralize the amino acid alone."

The neutralization curves for several amino acids determined in this way are given. These indicate in a striking manner the influence of the different groups in the molecule and bring to light certain inaccuracies in the formol titration method of Sørensen.

A new type of condenser for the determination of crude fiber, C. A. CLEMENS (*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, pp. 288, 289, figs. 2).—The condenser described consists of a glass bulb one side of which is blown in such a manner as to fit inside a lipless beaker. The lower surface of this projection is concave, thus offering a large surface for the condensation of the vapors in the beaker. In the top part of the bulb are sealed two glass tubes bent at right angles, one of them extending nearly to the bottom of the bulb. These serve as inlet and outlet tubes for a stream of cold water, several condensers being usually arranged in series.

The condenser, which may be used with lipless beakers ranging in size from 500 cc. to 1,000 cc., either tall or wide form, is said to offer even more advantages than the apparatus devised by Spears (*E. S. R.*, 40, p. 410).

The acidimetry of red wines and fruit juices, A. M. MACMILLAN and A. TINGLE (*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, pp. 274-276).—The conditions under which red wines and fruit juices may be titrated by the spectroscopic method previously noted (*E. S. R.*, 39, p. 503) are described, and the principles underlying spectroscopic titration and their application are discussed. Phenolphthalein in 1 per cent solution and methyl red in 0.05 per cent solution are recommended as suitable indicators for the spectroscopic

method, the amount required varying with the color, depth, and total volume of the liquid.

The detection of methyl alcohol, H. WOLFF (*Chem. Ztg.*, 43 (1919), No. 104, p. 555).—Apomorphin in concentrated sulphuric acid is suggested as giving a more reliable and delicate test for methyl alcohol after oxidation than the reagents commonly used for color tests with formaldehyde. The blue-violet color produced is not formed by the aldehydes of the higher alcohols.

Methods for the quantitative determination of saccharin, O. BEYER (*Chem. Ztg.*, 43 (1919), No. 101, pp. 537, 538).—This is a review, with references to the literature, of various methods of determining saccharin. The method of Richmond and Hill, previously noted (E. S. R., 41, p. 115), is recommended as accurate and time-saving.

The sanitary quality of milk as judged by the colorimetric hydrogen-ion determination, L. H. COOLEGE and R. W. WYANT (*Michigan Sta. Quart. Bul.*, 2 (1920), No. 3, pp. 145, 146; also in *Creamery and Milk Plant Mo.*, 9 (1920), No. 3, p. 38).—A method of grading milk by means of colorimetric H-ion determinations is outlined briefly as follows: One-tenth cc. of the milk to be tested is placed in a tube of neutral broth containing bromthymol blue as an indicator and incubated at 37° C. Colorimetric readings are taken at one-hour intervals and the condition of the milk is judged by the rate at which the reaction changes.

It is stated that the poorest samples of milk may be picked out at the end of one hour and the best samples given their proper rating at the end of eight hours. Various advantages in the use of this method are pointed out and it is recommended as a valuable aid to city milk plants, condenseries, ice-cream factories, etc.

A similar method for testing milk has been previously described by Baker and Van Slyke (E. S. R., 42, p. 209).

Notes on double polarization methods for the determination of sucrose and a suggested new method, G. W. ROLFE and L. F. HOYT (*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, pp. 250-253).—An investigation is reported of the possibility of using in the double polarization method for determining sucrose a substitute for hydrochloric acid which would invert so slowly at ordinary temperatures as to permit direct readings without error and yet be sufficiently acid to effect complete inversion on heating. Monochloroacetic acid proved a satisfactory reagent, and the method developed involving its use is described as follows:

"Dissolve the normal weight of sample in a 100-cc. flask, clarify with an appropriate amount of lead acetate, make up to volume, and filter. Transfer 50 cc. of filtrate to a 100 cc. flask, add 15 cc. of a 20 per cent solution of monochloroacetic acid, make up to volume with water, and polarize within 15 minutes after adding the acid. To invert, transfer about 50 cc. of the solution to a 50 cc. flask, stopper tightly by tying down the cork, and immerse flask in boiling water, maintaining active ebullition for 30 minutes, or for 60 minutes for low-grade products clarified with a large amount of lead acetate. Remove flask, and cool quickly to room temperature. Allow to stand at least 2 hours and polarize in a 200 mm. tube with thermometer."

The percentage of sucrose is calculated from the following formula:

$$S = \frac{2(a-b)}{141 - \frac{t}{2}} \times 100$$

In this formula S=percentage of sugar, a=direct reading, b=invert reading and t=temperature. The solutions should be made and polarized at as nearly 20° C. as possible.

The principal advantages of this method are considered to be that both direct and invert readings are made on a solution of unchanged acidity and sugar concentration, a slight excess of basic lead acetate does not affect the inversion or produce troublesome precipitates, no error is introduced by making up to volume after inversion, and inverted solutions of low-grade products are lighter in color and easier to polarize than those inverted by the Herzfeld method. Comparative tests indicated that the method gives more accurate results than the Herzfeld method. The chief disadvantage is thought to be in the time required, but it is pointed out that the actual time required in manipulation is little if any more than that of the usual methods.

Contribution to the study of the titration method for determining blood alkalinity.—Action of acids on protein solutions, R. CLOGNE (*Compt. Rend. Soc. Biol. [Paris]*, 82 (1919), No. 29, pp. 1192, 1193).—Determinations by titration of the alkalinity of egg albumin, beef blood, and beef serum after the addition of varying amounts of a standard acid, both in the cold and after heating on a water bath, are reported for the purpose of pointing out the influence of the protein content of such solutions on the alkalinity determinations. It is shown that the added acid combines not only with the alkali in the blood but also with the proteins, thus introducing a modifying factor in such determinations of blood alkalinity.

Determination of ammonia in blood by a volumetric method, P. GÉRARD (*Compt. Rend. Soc. Biol. [Paris]*, 82 (1919), No. 29, pp. 1186–1189).—The method consists essentially in bubbling about 200 liters of air through a 10 cc. sample of oxalated blood treated with an equal volume of a 20 per cent solution of sodium or potassium carbonate, collecting the liberated ammonia in 2 cc. of $N/100$ H_2SO_4 diluted with about 5 cc. of distilled water, and titrating the excess of acid with $N/100$ base.

The method is said to require not longer than 1.5 hours for completion and to give results of a precision comparable with the methods commonly used, while being much simpler in material and technique.

Some observations on E. C. Kendall's method of estimating iodine in thyroid preparations, S. B. KUZIRIAN (*Proc. Iowa Acad. Sci.*, 25 (1918), pp. 495, 496).—The author, at the Iowa Experiment Station, reviews Kendall's method of estimating iodine in thyroid preparations, and discusses briefly certain details that must be followed to obtain satisfactory results in the determination of iodine in tankage, roughage, and other organic substances with a high percentage of ash. These include the use of more sodium hydroxide and less potassium nitrate in destroying the organic matter; the elimination of iron and other interfering elements by adding to the solution of the fused mass a few grams of sodium carbonate and some talc, boiling for a few minutes, setting aside for two hours, and filtering; and the complete elimination of bromine by the addition of a considerable excess of phosphoric acid and a prolonged boiling of the diluted filtrate.

The determination of cellulose in woods, W. H. DORE (*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, pp. 264–269, fig. 1).—This contribution from the California Experiment Station reports a study of the effect of alkaline and of acid hydrolysis of wood previous to chlorination in the cellulose determination. The data reported indicate that all processes involving hydrolysis result in a diminished yield of both α -cellulose and total cellulose in practically the same ratio. It was found that the hemicelluloses, for the removal of which the preliminary hydrolytic treatment had been recommended, were hydrolyzed during the chlorination treatment and dissolved in the filtrates and washings. A part of the furfural-yielding material (probably xylan) was also hydrolyzed and dissolved during chlorination, while a considerable proportion (probably

oxycellulose) was unaffected by any of the hydrolytic treatments and remained in the residue.

These findings have led to a modification of the methods previously described by the author in connection with the proximate analysis of wood (E. S. R., 41, p. 14). The preliminary hydrolytic process is now considered unnecessary and objectionable in that it has been found to involve a slight destruction of the cellulose.

Utilization of waste sulphite liquor, compiled by B. JOHNSEN and R. W. HOVEY (*Dept. Int. Canada, Forestry Branch Bul. 66 (1919), pp. 195*).—This is a review of the literature on the commercial utilization of waste sulphite liquor. The material has been arranged in chapters according to the nature of the recovered products, and each of the more important chapters is prefaced by a brief discussion of the subject treated. The products include binding materials, gums, adhesives and sizing materials, tanning materials, alcohol, fuel, feeding stuffs, fertilizers, dyes, sulphur, and miscellaneous substances.

Industries for the conservation of fruits.—**Apples**, C. ARNOU (*Les Industries de la Conservation des Fruits. La Pomme. Paris: Author, [1919], pp. 122, figs. 42*).—This volume, which is one of a series on the commercial utilization and conservation of fruits, includes chapters on the manufacture of various products from apples, the preservation of the fruit by refrigeration and desiccation, and the utilization of by-products. Illustrations are given of the machinery employed in the various processes described.

Making grape juice, P. THAYER (*Mo. Bul. Ohio Sta., 4 (1919), No. 8, pp. 249-252*).—The hot-pressed and cold-pressed processes described were adapted from methods outlined in Farmers' Bulletins 175 (E. S. R., 15, p. 154) and 644 (E. S. R., 32, p. 809) of the U. S. Department of Agriculture. In one case the grapes were crushed and heated to 65° C. (149° F.) before pressing and in the other they were simply crushed and pressed. The juice in both cases was heated to 80° before bottling and was then filtered through conical felt filters, bottled, and heated at 75°. By thus heating the juice before filtering to a higher degree than after bottling, the production of sediment in the bottles is said to be avoided.

As a rule the hot-pressed juice resembled the fresh fruit in color while in most cases the cold-pressed juice was of a lighter or different color, that from blue grapes being usually red, and that from red grapes pink or even colorless. The cold-pressed juice was always as sweet and in some cases sweeter than the hot-pressed juice.

Notes on the results with various varieties are tabulated.

Varieties of grapes for juice, P. THAYER (*Mo. Bul. Ohio Sta., 4 (1919), No. 8, pp. 253-260*).—A study is reported of the value for juice production of the more important varieties of grapes grown in the station variety vineyard. In 1917, 66 lots of grape juice totaling 262 bottles were made from 33 different varieties of grapes, and in 1918, 76 lots totaling 248 bottles from 34 varieties. The juices were prepared without the addition of sugar or water by both the methods outlined in the above article, and were tested both alone and in various combinations for attractiveness of appearance and flavor, and for the percentage dilution and amount of sugar required per 100 cc. of the undiluted juice to secure the greatest palatability. The results are reported in a table in which are included the Brix readings for the specific gravity of the juice.

In general the juices made from blue grapes by either process were attractive, those prepared from red grapes by the hot process were more attractive than the cold pressed juices, and the juices of white varieties were, with few exceptions, unattractive by themselves. By combining different juices

It was found possible to overcome the individual faults of the separate juices and to make an almost endless variety of juices of different colors and flavors. The principal possibilities in blending are considered to be the creation of new flavors, the correction of acidity or poor color, the amelioration of acidity, and the utilization of unattractive juices. Suggestions are given for such combinations among the juices tested.

Every step in canning, G. V. GRAY (*Chicago: Forbes & Co., 1919, pp. 253*).—This volume contains detailed directions for canning fruits, vegetables, meat, and fish by the cold-pack method; making jellies and fruit preserves; drying fruits and vegetables; curing, smoking, and preserving meat; preserving eggs; storing vegetables in the home; and marketing home-canned produce. A chapter entitled Why Canned Goods Spoil explains the causes of unfavorable results sometimes experienced by the beginner in using the cold-pack method, and gives directions for avoiding such failures.

Temperature-time relations in canned foods during sterilization, G. E. THOMPSON (*Proc. Iowa Acad. Sci., 25 (1918), pp. 39-48, figs. 6*).—Essentially noted from another source (*E. S. R., 41, p. 209*).

METEOROLOGY.

A statistical study of weather factors affecting the yield of winter wheat in Ohio, T. A. BLAIR (*U. S. Mo. Weather Rev., 47 (1919), No. 12, pp. 841-847, figs. 2*).—In this paper "the statistical method is applied to the problem of determining what are the important weather factors affecting the growth of winter wheat in Ohio, and their relative importance. The results are expressed as partial correlation coefficients and in linear regression equations of the form,

$$Y = a + b_1x_1 + b_2x_2 + b_3x_3 + b_4x_4 + \dots,$$

in which the coefficients are evaluated by least square methods." In this equation "Y is the yield; $x_1, x_2, x_3, x_4, \dots$ are the various weather elements, such as mean temperature, total precipitation, percentage of sunshine, expressed numerically; $a, b_1, b_2, b_3, b_4, \dots$ are numerical quantities having a constant value for a given equation, to be determined from the data. . . .

"Because of the difficulty of securing extensive data for other weather elements, it is necessary to deal chiefly with temperature and precipitation values. In general, it is to be expected, because of the relatively large and well-distributed rainfall of Ohio, that temperature variations will have more influence than precipitation variations upon the yield. For the State as a whole, correlations of monthly weather values with the 'condition' reports of the Bureau of Crop Estimates and with the reported yields show no very close relationships. The correlations with condition give a general indication that a wet autumn, a warm and dry winter and spring, especially a warm March, and a cool and wet May are the most favorable weather conditions. Yield correlations suggest a warm March and June and a cool and dry May as the only important requisites for a good yield. In Fulton County in northwestern Ohio, and in three counties in the central part of the State, certain 10-day periods in April, May, and June are found to exert a more effective influence on the yield than all other weather conditions combined, except that in Fulton County the March snowfall is also an important factor. It is weather conditions during these 10-day periods, especially temperature conditions, that largely determine yield. These periods are connected especially with the jointing, heading, and filling stages in the growth of the plant. . . . Because of the large influence of late May and June temperatures, earlier forecasts of yield can be of little value."

Relation of the weather to the yield of wheat in Manitoba, A. J. CONNOR (*Canada Census and Statis. Off., Mo. Bul. Agr. Statis., 11 (1918), No. 116, pp. 115-125, fig. 1; extract in U. S. Mo. Weather Rev., 47 (1919), No. 12, p. 848*).—This article is based on simultaneous observations at various experiment stations, on temperature, precipitation, and other meteorological conditions, and on dates of sowing, appearance above ground, stooling, stem roots, heading, flowering, milk-stage, maturity, and harvesting of wheat, as well as on the average height of the plants every seven days.

"There appeared to be a relation between the length of the period from sowing to heading, or from the appearance of the plants to heading, and the subsequent yield, the longer periods being positively related to the greater yields. . . .

"From the results so far attained it is not educible that there is a critical period of short duration." During the latter part of the 90-day period after sowing, however, there will ordinarily be increased probability of heat and drought in Manitoba, and if during this period "the weather be warm, dry, with great temperature range, the wheat plants will head early and the harvest will be light; but if the cool and moist conditions continue, heading will be postponed and the yield increased. . . . The variability of early July weather may be regarded as the critical factor in wheat production in Manitoba."

It was found that the rainfall, mean daily minimum temperature, and mean daily range of temperature during the third 30 days after sowing are to some extent intercorrelated. "The minimum is slightly and the rainfall to a much greater degree correlated with the range, both negatively, while there is no relation between the minimum and the rain. Since the rainfall is related positively and the other factors negatively to the yield of wheat, the quotient

$\frac{\text{Rain}}{\text{Range} \times \text{minimum}}$ should be related positively. The plotting of these quotients against the yields led to the following equation: If Y be the yield in bushels per acre, m the mean minimum temperature, p the total precipitation for 30 days, r the mean daily range m^1-40 , then

$$Y = 0.434 \left(m - \frac{r}{2} \right) \log \frac{1000p}{rm'}$$

If the mean daily temperature be denoted by t , then the quantity $\left(m - \frac{r}{2} \right)$ may be written $(t - r)$."

The dependence of the chemical composition, especially the starch content, of the wheat upon weather changes has also been studied with a view to proving or disproving the hypothesis "that the total starch content of the grain varies directly as the amount of water transpired by the plant from heading to maturity . . . [and] that the factors favorable to starchy grain are a moist soil with bright sunshine, low humidity, high temperature, and drying winds." The study has not proceeded far enough to warrant conclusions.

Cultivation does not increase the rainfall, J. W. SMITH (*U. S. Mo. Weather Rev., 47 (1919), No. 12, pp. 858-860, figs. 2*).—This is a paper presented at a joint meeting of the American Meteorological Society and Association of American Geographers, St. Louis, Mo., December 31, 1919.

Data are presented from which the conclusion is drawn that "cultivation does not increase the rainfall in the semiarid region. There are well-defined sequences of increasing and decreasing annual rainfall amounts, but there has been no progressive increase or decrease during the past 50 years. It is not possible to predict the approximate precipitation for any year from past records."

Australian droughts, C. RICHARDSON (*U. S. Mo. Weather Rev.*, 47 (1919), No. 12, p. 860).—The relation of air currents to these droughts is discussed.

The distribution of maximum floods, A. J. HENRY (*U. S. Mo. Weather Rev.*, 47 (1919), No. 12, pp. 861-866).—This is a paper read before the American Meteorological Society at New York, January 3, 1920. The conclusions reached are summarized as follows:

"The records of both American and European rivers show an average of 7 to 10 great floods per century. Great floods are primarily due to precipitation, and that precipitation, in the form of rain, which produces floods may be of two distinct types, (1) so intense and widely distributed as to produce flooding regardless of antecedent conditions, (2) moderate rains continued intermittently for 8 to 10 days or more with antecedent conditions favorable to a high run-off. There does not appear to be an orderly progression in the magnitude of floods with the lapse of years; that is to say, the absolute maximum flood of any 100-year period is not necessarily greater than the absolute maximum flood for the preceding 100 years. The magnitude of great floods with respect to the average annual flood seems to increase in a geometrical progression, but apparently wholly regardless of the flow of time. Great floods, like great rainfalls, are essentially a local phenomenon even for the same stream."

Evaporative capacity, R. E. HORTON (*Abs. in U. S. Mo. Weather Rev.*, 47 (1919), No. 12, p. 856).—This is an abstract of a paper presented before the American Meteorological Society at New York, January 3, 1920.

"The object of this paper is to furnish data showing the relative evaporation rates under standard conditions at different localities throughout the United States. The term 'evaporative capacity' is defined by the author as: 'The maximum rate of evaporation which can be produced by a given atmospheric environment from a unit area of wet surface exposed parallel with the wind, the surface having at all times a temperature exactly equal to that of the surrounding air.'

"The evaporative capacity of 112 U. S. Weather Bureau stations has been determined from the meteorological normals of temperature, wind velocity, and humidity, by means of the author's evaporation formula. The coefficients in the evaporation formula were determined by experiments covering two years on a standard Weather Bureau evaporation pan. Maps are given showing evaporative capacities for day and night and summer and winter conditions, and tables are given showing monthly evaporative capacities and day and night time temperatures for each of the 112 stations. The application of the maps and data to problems in hydrology, water consumption by plants, and agriculture is discussed."

Variations in the total and luminous solar radiation with geographical position in the United States, H. H. KIMBALL (*U. S. Mo. Weather Rev.*, 47 (1919), No. 11, pp. 769-793, pl. 1, figs. 22).—This is a rather exhaustive summary of investigations carried on by the author for a number of years, the purpose of which is "to determine as accurately as possible with the data available, (1) the variation in direct solar radiation intensities with latitude, (2) the increase in intensity as we go westward from the Atlantic coast districts to the drier and more elevated central plains, (3) the total radiation received on a horizontal surface (direct solar, plus diffuse radiation from the sky), and (4) to reduce the total, or heat radiation as thus determined along certain parallels of latitude to luminous, or daylight intensity. There have been utilized in this investigation the radiation measurements made at Washington, D. C., since 1905; at Madison, Wis., since 1910; at Santa Fe, N. Mex., since 1912; and at Lincoln, Nebr., since 1915; and the measurements of the total

solar, or heat radiation, and of luminous solar radiation or daylight illumination, made at Mount Weather, Va., during 1913 and 1914."

"Most of the results are shown in both tables and charts, the latter consisting of isopleths of heat or of luminous solar radiation, with hour angles of the sun as ordinates and days of the successive months as abscissas, except that the daily totals of radiation on a horizontal surface on the twenty-first of each month are shown by means of radiation isograms on outline maps of the United States. The effect of surface slope on solar radiation intensities is briefly considered."

Thermal belts and inversions of temperature in the North Carolina mountain region, H. J. Cox (*Abs. in U. S. Mo. Weather Rev.*, 47 (1919), No. 12, pp. 879, 880).—This is the author's abstract of a paper presented at a joint meeting of the American Meteorological Society and Association of American Geographers, St. Louis, Mo., December 31, 1919. The paper is based upon observations at 16 places in the mountain region of North Carolina, from 1912 to 1916, inclusive.

The observations were made at the different places under varying conditions of topography, on valley floor, slope, and summit, for the purpose of more clearly defining, if possible, the so-called thermal belts. The results throw light on the location, cause, and extent of these thermal belts. The results indicate that cold valley bottoms as well as cold mountain tops are normal. The warmest thermal belts between these two extremes are found where the mountain mass is small, the slope steep, and the opposite valley wall not close. "The higher temperatures on the slopes and certain summits in the Carolina mountain region are favorable for fruit growing in so far as the absence of frost is concerned, as compared with the valley floors, but considerable injury often occurs from freezes in the winter and early spring in the upper and middle levels after protracted heated periods and growing weather which had served to swell the buds."

Predicting minimum temperatures, J. W. SMITH (*Abs. in U. S. Mo. Weather Rev.*, 47 (1919), No. 12, pp. 848, 849).—This is "a mathematical discussion of the relation between the relative humidity in the late afternoon and the variation of the minimum temperature during the coming night from the afternoon dewpoint temperature, when radiation conditions prevail.

"The study shows that there is a well-defined relation which can be expressed by the curve for a parabola. . . . The equation used is written $v = x + by + cz$, in which v is the variation of the minimum temperature from the evening dewpoint; b is the evening relative humidity, and c is the square of the relative humidity; x , y , and z are the three unknowns, which are evaluated from three normal equations which are readily written by the star point method after the data have been properly charted. The results are remarkably accurate. The studies show that the minimum temperature can be closely predicted in the orchard at considerable distance from the observing station; that the hygrometric observations made at noon may be used quite as well in some instances as those made in the evening, and that the equation will sometimes apply as well to cloudy as to clear nights."

Evidence of climatic effect in the annual rings of trees, A. E. DOUGLASS (*Abs. in U. S. Mo. Weather Rev.*, 47 (1919), No. 12, p. 881).—This is the author's abstract of a paper presented before the American Meteorological Society at St. Louis, Mo., December 30, 1919. A more detailed account of the same study has been noted (*E. S. R.*, 42, p. 417).

Monthly Weather Review (*U. S. Mo. Weather Rev.*, 47 (1919), Nos. 11, pp. 769-840, pls. 15, figs. 37; 12, pp. 841-911, pls. 17, figs. 10).—In addition to de-

tailed summaries of meteorological, climatological, and seismological data and weather conditions for November and December, 1919, and bibliographical information, reprints, reviews, abstracts, and minor notes, these numbers contain the following contributions:

No. 11.—Variations in the Total and Luminous Solar Radiation with Geographical Position in the United States (illus.), by H. H. Kimball (see p. 618); Bibliographic Note on Sunshine in the United States, by R. DeC. Ward; A New Instrument for Measuring Sky Radiation (illus.), by A. Ångström; Some Problems Relating to the Scattered Radiation from the Sky (illus.), by A. Ångström; Note on Comparisons Between Pyrheliometers and on the Difference Between the Ångström Standard and the Smithsonian Standard, by A. Ångström; Parade-ground Temperatures at College Station, Tex., by C. F. Brooks; Temperatures in New York Subways (illus.); Forecasting Tide Stages in the Harbor at Portland, Oreg. (illus.), by E. L. Wells; and The Virginia Earthquake of September 5, 1919, by E. W. Woolard.

No. 12.—A Statistical Study of Weather Factors Affecting the Yield of Winter Wheat in Ohio (illus.), by T. A. Blair (see p. 616); Predicting Minimum Temperatures, by J. W. Smith (see p. 619); The Work of the U. S. Weather Bureau in the West Indies, by O. L. Fassig; Aerological Work in the U. S. Navy, by C. N. Keyser; New Form of British Daily Weather Report; International Meteorological Committee Meeting in London, July, 1919; Note on High Free-air Wind Velocities Observed December 16 and 17, 1919 (illus.), by W. R. Gregg; Evaporative Capacity, by R. E. Horton (see p. 618); Device for Obtaining Maximum and Minimum Water Surface Temperatures (illus.), by R. E. Horton; Cultivation Does Not Increase the Rainfall (illus.), by J. W. Smith (see p. 617); Australian Droughts, by C. Richardson (see p. 618); The Distribution of Maximum Floods, by A. J. Henry (see p. 618); and Determination of Meteorological Corrections on the Ranges of Guns (illus.), by W. Noll.

Climatological data for the United States by sections (*U. S. Dept. Agr., Weather Bur. Climat. Data, 6 (1919), Nos. 9, pp. [204], pls. 4, figs. 2; 10, pp. [202], pls. 4, figs. 2.*)—These volumes contain brief summaries and detailed tabular statements of climatological data for each State for September and October, 1919, respectively.

SOILS—FERTILIZERS.

Relation of the moisture equivalent of soils to the moisture properties under field conditions of irrigation, S. T. HARDING (*Soil Sci., 8 (1919), No. 4, pp. 303-312, figs. 6.*)—Attention is called to the need for some criterion which will furnish an index of the soil moisture properties in studies of the water requirements of soils under irrigation. In this connection, a comparison of the moisture equivalent with the critical moisture points of soils under the actual field conditions of irrigation practice, is reported. This is based on data secured by the author in the course of various field investigations of the water requirements of soils and their irrigation practice, conducted under the supervision of the Irrigation Investigations of the Bureau of Public Roads, U. S. Department of Agriculture, and the University of California.

The general field method used was to take soil moisture samples before and after irrigation in order to determine the amount of water retained by the soils. The data were secured from a wide range of soils under varying conditions of practice, including about 9,200 individual moisture determinations from soils in Montana, Idaho, Washington, Nevada, and California, and about 300

moisture equivalent determinations made from 1913 to 1918, inclusive. Comparisons of four moisture conditions were made for the surface foot of soil and for the average of the upper 5 ft. of soil, these corresponding to the maximum field capacities, the normal field capacity, the usual moisture before irrigation, and the wilting of the crop.

The data presented are thought to warrant the general conclusion that there is a fairly consistent relationship between the moisture equivalent and the various moisture properties of soils, which appears to offer promise of usefulness in determining moisture properties and probable irrigation practice of soils whose irrigation is contemplated, particularly as to the probable depth of water which will be retained from an irrigation with its effect on the depth to be applied and the necessary frequency of application. The data presented, while indicating the general nature of the relationship of soil moisture capacity and soil texture, are not sufficient to fix the numerical values of such relationships except in a very general way. The relationship of the soil-moisture properties to the moisture equivalent does not appear to be linear except in the case of the wilting of the crop. The maximum depth of water per foot depth of soil which can be retained under favorable conditions for the upper 5 ft. of soil is about 1.25 in., which indicates that depths of a single irrigation in excess of 6 to 8 in., even under favorable soil conditions, will not be retained in the upper 5 or 6 ft. of soil. This conclusion is in accord with the results of general field observations from many sources.

Experiments on soil moisture, G. M. GRANTHAM and M. M. McCool (*Michigan Sta. Quart. Bul.*, 2 (1920), No. 3, pp. 142-144).—The results of experiments covering a period of three years on tillage and moisture control on a deep, medium sandy soil, growing potatoes, corn, and radishes with and without a soil mulch, are reported.

The portions of the field that were not mulched were scraped with a hoe to eradicate the weeds. The mulched portions were cultivated 3 in. deep. It was found that the differences in the amount of water lost from the unmulched plot and the one mulched with 3 in. of soil were negligible, while changes in the water content of the soil beneath a layer of muck were appreciably less than in the others. The results on the whole suggested that tillage conserves moisture mainly by the eradication of weeds and grass, and that the importance of the soil mulch in this connection has been somewhat overemphasized.

Adsorptive unsaturated soils, D. J. HISSINK (*Adsorptief Onverzadigde Gronden. Delft, Netherlands: Technol. Gezelschap*, [1918], pp. [I]+129-148).—The author discusses the so-called adsorptively unsaturated soils occurring in humid climates, which are apparently the result of constant cropping and the leaching effect of rain followed by drying. Basic material must be supplied to and retained by such soils, and it is thought that liming is the best treatment. It is considered that the influence of liming on the adsorptive power of soils for basic material is one of the chief causes of its importance.

Calcium and magnesium content of virgin and cultivated soils, J. W. AMES and C. J. SCHOLLENBERGER (*Soil Sci.*, 8 (1919), No. 4, pp. 323-335).—The results of determinations of the contents of and relationships existing between total and fifth-normal nitric acid soluble calcium and magnesium, carbonate, and the reaction of both virgin and cultivated soils from 23 locations in Ohio, are reported, as conducted by the Ohio Experiment Station. The soils were sampled from two depths, 0 to 7 in. and 7 to 15 in.

The data indicate that in most virgin soils there is a concentration of readily soluble calcium and magnesium at the surface. With cultivated soils, however, the subsoil is usually better supplied with these elements than the surface soil. Certain interesting relationships between the proportion of the total calcium

and magnesium which are soluble and the carbonate content and reaction are pointed out. These are summarized in the statement that when the proportion of the total bases (calcium and magnesium together) which are soluble is high, the soil is very likely to contain more carbonate or to be more basic to tests than is the case with similar soils having a less proportion of these bases soluble. Moreover, this is true for soils containing very small amounts, as well as those better supplied with carbonates.

A list of references to literature bearing on the subject is included.

The mixing of mineral soils and moor soils, G. RITTER (*Fühling's Landw. Ztg.*, 67 (1918), No. 1-2, pp. 16-31).—Vegetation experiments and studies of nitrification and nitrogen fixation in mixtures of loamy sand soils and moor soils are reported. The purpose is to show the advantages to either soil of such a mixture with reference to physical and chemical condition.

It was found that the addition of virgin moor soil or peat litter to a light mineral soil increased the nitrate content, also the nitrate content of an upland moor soil was increased following an intermixture of lime and good mineral soil. It is concluded that the physical, chemical, and biological properties of an upland moor soil or a light mineral soil may be improved by mixing these two soil types.

Sugar-cane soils in the division of Demak, C. J. VAN LOOKEREN CAMPAGNE (*Arch. Suikerindus. Nederland. Indië*, 1918, *Jubileumnum*, pp. 34-39).—The sugar-cane soils of the division of Demak in the Samarang residency in central Java are discussed with reference to their origin and physical and chemical composition. These soils have been formed from weathered products of andesite and basalt in connection with lava and ashes of recent volcanic origin. Mechanical analyses show that the greatest part of the soil particles are smaller than $\frac{1}{20}$ mm.

Bacteriological effects of green manure, II, C. F. BRISCOE and H. H. HARNED (*Mississippi Sta. Bul.* 185 (1918), pp. 3-18, figs. 8).—This is a progress report on experiments begun in 1913 (*E. S. R.*, 32, p. 721), to determine the effect of microorganisms in the fermenting of green manures and particularly the advantage of a light dressing of stable manure as compared with that of a bacterial culture in the utilization of these green manures for plant food. The work included bacteriological and vegetative tests. The soil used was a mixture of sandy silt and sandy loam soil and was deficient in plant nutrients. The green manures added were alfalfa, oats, and cowpeas.

It was found that there was a direct relation between the bacterial count and the amount of organic matter added. The results of the vegetative tests and the bacteriological tests agreed closely. A light dressing of stable manure or the addition of a bacterial culture with a green manure gave a marked increase in the crop when 4 tons of the green manure were added. When 8 tons were added the effect was practically neutral, and when 16 tons were added a depressing effect was noted from the addition of the organisms contained either in the manure or in the bacterial culture. This phase of the work is to receive further attention.

The nitrogen content of the oat crop varied with the amount of crop produced, but not in direct proportion. The accumulative effect of green manure was marked, showing a uniform increase through the various treatments and continued effect in the following years. Where dry oats and vetch straw was turned under it was found that amounts as large as 16 tons were readily utilized and produced a crop 3.2 times that from untreated soil. Eight tons of the straw produced a larger crop than 20 tons of horse manure. The proportions were about one part oats and two parts vetch straw, and the horse manure was applied with and without lime. It was also noted that where large amounts

of the oats straw were used together with horse manure or with a bacterial culture, or both, a depressing effect was brought about.

Studies on the synthesis of nitrogenous fertilizers (on the reactions $N+O$, $N+H$, NH^3+O , and on the transformation of cyanamid into ammonium sulphate), H. ALBRAND (*Rev. Prod. Chim. [Paris]*, 22 (1919), Nos. 14, pp. 367-371; 15, pp. 395-398, figs. 7; *abs. in Chem. Abs.*, 13 (1919), No. 21, pp. 2721, 2722).—A review is given of the various methods of fixing nitrogen. The processes discussed are the Birkeland and Eyde, Hausser, Kilburn-Scott, Schonherr, Haber, cyanamid, ammonia by the cyanamid process, nitric acid by the Oswald reaction, transformation of the cyanamid into ammonium sulphate, and the arc process. Details of the methods are given, as well as the production by various countries.

The relation of certain acidic to basic constituents of the soil affected by ammonium sulphate and nitrate of soda, L. P. HOWARD (*Soil Sci.*, 8 (1919), No. 4, pp. 313-321).—A study of the relation of acids to bases in soils to a depth of from 7 to 8 in., as conducted at the Rhode Island Experiment Station, are reported. The soils had received like treatment for the past 25 years, except that one series was supplied with nitrogen in the form of sodium nitrate while the other was supplied with nitrogen in the form of ammonium sulphate.

It was found that great variations in acidity existed between the soils receiving sodium nitrate, as compared with those receiving ammonium sulphate. The soil acidity could not be correctly measured by reagents which reacted only with the acidic ingredients. Digestion with hydrochloric acid showed that great variations existed between the quotient obtained by dividing the oxids of aluminum and iron by those of calcium and magnesium. It ranged from 85, in the case of the unlimed soil receiving ammonium sulphate, to 10 where lime and nitrate of soda were employed.

A subsequent extract with ammonium hydroxid showed no great variation in this ratio of weak to strong bases. An exchange of bases, produced by treatment of the soil with a solution of potassium chlorid, showed a marked degree of reserve acidity from the unlimed soil receiving ammonium sulphate. The acidity so developed showed a correlation to the acidity of an aluminum salt equivalent in amount to the weight of aluminum which was contained in the solution obtained by shaking with potassium chlorid. In the acid unlimed soils, iron, and aluminum partially took the places occupied by calcium and magnesium in the limed soils. The soil solution acted as a buffer solution containing phosphates and carbonates. The concentration of hydrogen ions in the soil solution from the unlimed plot receiving ammonium sulphate was very similar to that produced by the addition of even quite large amounts of aluminum salts to buffer solutions.

It is concluded that "the 'acidity' in a soil caused by long-continued use of ammonium sulphate is the result of a change in the ratio of acids to bases. The position normally occupied by the stronger bases, such as calcium and magnesium, has been taken by weaker bases, such as iron and aluminum. The neutrality of the soil solution can no longer be maintained, since salts of these weak bases dissociate. Free acid resulting from this dissociation is accompanied by a definite concentration of hydrogen ions."

A list of 12 references to literature bearing on the subject is included.

Upland moor cultivation without sodium nitrate, E. GULLY (*Landw. Jahrb. Bayern*, 8 (1918), No. 3, pp. 126-154).—Three years' experiments with potatoes on upland moor soils, using sodium nitrate with each of calcium carbonate and two different types of by-product lime, are reported. The lime was applied in amounts of 890, 1,780, and 3,560 lbs. per acre.

It was found that potatoes are able to withdraw considerable quantities of soil nitrogen from upland moor soils over 2 and 3 year periods. The use of calcium carbonate on this soil hindered the assimilation of nitrate nitrogen somewhat. This was more marked in the third year than in the second. It is concluded that where nitrate nitrogen is used on upland moor soils it is not advisable to make the heavy applications of lime which are customary on German soils. The by-product limes gave better results in this respect, however, than the pure calcium carbonate. It is concluded further that such lime should not be applied in amounts exceeding the equivalent of 1,780 lbs. of calcium oxid per acre.

Three years' experiments with ammonium sulphate and liming, using the same types of lime on upland moor soils, gave very poor results with potatoes. It is recommended that where ammonia nitrogen is used, in order to insure a profit with potatoes, additions of phonolite or calcium carbonate be made at the beginning of cultivation. Neither on newly broken upland moor soil nor on second-year soil was fertilization with ammonium sulphate satisfactory, it being found that the ammonia nitrogen was not completely utilized. It was also found that calcium carbonate and phonolite gave about equal results in increasing the yield of potatoes where ammonium sulphate was used. Lime nitrogen gave better results on newly broken upland moor soils without liming than ammonium sulphate. In dry years, however, lime nitrogen alone and in combination with calcium carbonate gave unsatisfactory results. Ammonium sulphate on the other hand gave satisfactory results when accompanied by calcium carbonate. The action of lime nitrogen was improved where by-product lime was applied previous to cultivation in amounts equivalent to 1,068 lbs. of calcium oxid per acre.

Results of further nitrogen experiments, SCHNEIDEWIND (*Landw. Wchnschr. Sachsen, 20 (1918), Nos. 16, pp. 153-155; 17, pp. 161-163*).—Experiments with various crops on different soils are reported.

It was found that potash ammonium nitrate gave as good results as sodium nitrate when used as a top-dressing. Similar results were obtained with sod-ammonium nitrate, and it is concluded that both of these forms of nitrogen may be used as a substitute for sodium nitrate. Ammonium chlorid, urea, and urea nitrate gave as good results as ammonium sulphate, and lime nitrogen almost as good. None of these forms of nitrogen were as successful as sodium nitrate. Urea gave poorer results as a top-dressing than any of the other types. Ammonium chlorid depressed the starch content of potatoes.

The best results were obtained with beets and other summer crops when all the forms of nitrogen used were added before planting. It was further found that on deep rich soils nitrogenous fertilizers can be safely applied in the fall, but that on light permeable soils the least loss results and the best results are obtained when they are applied as top-dressings in the spring. Lime nitrogen gave the best results with summer crops when added before planting. The use of lime nitrogen in grain form is not recommended.

Potassium-bearing minerals as a source of potassium for plant growth, E. DE TURK (*Soil Sci., 8 (1919), No. 4, pp. 269-301*).—It is pointed out that there are quite large areas of soils in Illinois and other States which are markedly deficient in potassium. These consist mainly of muck and deep peat soils, and light sandy soils. Attention is called to the abundance of potash-bearing minerals in the United States, and experiments are reported which were conducted at the Illinois Experiment Station (1) to determine to what extent the potassium in certain minerals will become available when mixed with peat soil, using both the growth of a crop and chemical analysis as a measure of the amount of soluble potassium, and (2) to determine the effect of certain more active organic materials and soluble salts upon the solubility of the potas-

sium in those minerals. A review of previous investigations by others, bearing on the subject, is given, and the nature and significance of the silicate minerals are considered with reference to their formation, composition, and structure.

In the experiments, the soil used was a very loose peat, quite free from sand and plant residues. The minerals selected for study were orthoclase feldspar, microcline, leucite rock, alunite, muscovite, and lepidolite. The organic materials used were bright clean alfalfa hay, finely ground; clean prairie hay, consisting mainly of blades, finely ground; and fresh cow manure, without litter, carefully dried at low temperature and ground.

It was found that the use of finely ground potassium-bearing minerals increased the yield of buckwheat in peat soil from 21 to 34.8 per cent. Lepidolite was detrimental to the growth of buckwheat, especially if present in large amounts. The addition of crop residues, manure, or soluble sodium or magnesium salts to peat soil, together with the minerals used in this experiment, did not increase the yield of crop or the availability of the mineral potassium. The so-called feeding power of the plant itself, through the activities of the root system, was an important factor in the utilization of relatively insoluble potassium.

The solubility of the minerals used, as determined by extraction with water, was very low, except that of lepidolite. It was increased by ammonium chlorid and also by the decomposition of alfalfa. The result in the latter case may be due to ammonification of the nitrogenous compounds in the alfalfa.

All the minerals used have the ability to absorb considerable amounts of potassium from solution. The absorption is probably physical to a large extent.

The low availability of the potassium of dune sand was due to the fact that most of the potassium is contained in the larger particles. The relatively small surface of the particles is considered sufficient explanation of the low solubility of the potassium contained in them. The increase in solubility of the potassium in such sands produced by grinding, however, was not sufficient to be of practical value.

It is stated that the results of the crop culture work should not be considered conclusive, but that they should be verified by repetition for several seasons with various other farm crops. A list of 69 references to the works of others, bearing on the subject, is included.

A field comparison of hydrated lime with limestone of different degrees of fineness, B. L. HARTWELL and S. C. DAMON (*Rhode Island Sta. Bul. 180 (1919), pp. 4-18, figs. 4*).—Six years' experiments made to compare a high magnesium slaked or hydrated lime and a 10-mesh ground limestone from the same original rock are reported. The following siftings from the limestone also entered into the comparison: Ten to 20 mesh, 20 to 40, 40 to 80, and all finer than 80 mesh. The crops grown each year were mangels, carrots, alfalfa, and barley. The additions were made on the basis of equivalent acid neutralizing value. During the first season the 80-mesh limestone had the same effect on growth as the hydrated lime, and the percentage of this grade in the 10-mesh limestone was a measure of the efficiency of the calcium oxid equivalent of the unsifted limestone for the crop immediately following its application.

It was found that where lime is much needed, about two and one-half times as much ground limestone by weight, depending upon its fineness, was required to exert the same effect as hydrated lime. The effect of the 10-mesh limestone during the third, fourth, and fifth year after application was greater than the equivalent amount of hydrated lime, but the greater activity of the latter in the first years placed the average slightly in favor of the hydrated lime. It is stated that a selection from these two kinds of lime should depend mainly on the relative cost per calcium oxid equivalent, delivered on the land. Increasing

costs of transportation and containers tend to place the advantage with the material having the higher analysis.

[Fertilizers], F. A. LÓPEZ DOMÍNGUEZ (*Ann. Rpt. Insular Expt. Sta., Dept. Agr. and Labor, Porto Rico, 1919, pp. 21-23*).—It is stated that a total of 131 samples of mixed fertilizers and fertilizing materials, representing every brand offered for sale in Porto Rico during the fiscal year 1918-19, were analyzed, of which 104 were taken officially. Of the official samples, 20 per cent were found to be below the guaranty, which was a decided improvement over the previous year.

Analyses of 25 samples of guanos showed the maximum content of nitrogen as ammonia to be 4.76 per cent and the minimum 0.1 per cent. The percentages of potash were still lower, the maximum being 1.11 per cent and the average 0.46 per cent. One sample contained no potash. These guanos are said to be chiefly valuable for the phosphoric acid content. The highest phosphoric acid content found was 21.6 per cent, the lowest 2 per cent, and the average 9.4 per cent.

AGRICULTURAL BOTANY.

Plant physiology, H. MOLISCH (*Pflanzenphysiologie. Leipzig and Berlin: B. G. Teubner, 1917, pp. [4]+102, figs. 63*).—This is No. 569 of the *Aus Natur und Geisteswelt* series.

Relation of moisture in solid substrata to physiological salt balance for plants and to the relative plant-producing value of various salt proportions, J. W. SHIVE (*Jour. Agr. Research [U. S.], 18 (1920), No. 7, pp. 357-378, figs. 7*).—This is a report of studies carried on at the New Jersey Experiment Stations on the influence of different degrees of moisture in solid substrata upon the physiological salt balance for young wheat plants and upon the relative plant-producing value of various salt proportions. Tests were made in sand cultures with 36 sets of salt proportions of the three salts monobasic potassium phosphate, calcium nitrate, and magnesium sulphate, and with three different degrees of moisture.

It was found, under the conditions of the experiment, that the physiological balance of the nutrient solutions producing the best yields of wheat tops and roots was not altered by variations in the moisture content of the solid substratum to which the solutions were applied. The physiological balance of salt proportions which was best with the lowest moisture content was also best with the medium and the highest degree of moisture. It is claimed that good physiological balance and optimum total concentration of a nutrient solution for plants is not alone sufficient to produce the best growth of which the solution is capable when it is diffused as a film on the particles of a solid substratum. A medium degree of moisture which was approximately optimum for the substratum used was found to be correlated with the highest yields of tops and roots, high transpiration rates, and medium water requirement ratios.

Effect of lime upon the sodium chlorid tolerance of wheat seedlings, J. A. LECLEERC and J. F. BREAZEALE (*Jour. Agr. Research [U. S.], 18 (1920), No. 7, pp. 347-356, pls. 10*).—In continuation of work previously reported (*E. S. R., 27, p. 130*), an account is given of investigations carried on cooperatively between the Bureau of Chemistry and the Bureau of Plant Industry of this Department, to determine the effect of lime upon some of the common salts occurring in alkali soils.

In these experiments, wheat seedlings were grown in solutions containing varying proportions of sodium chlorid, and it was found that the higher tolerance to alkali salts shown by plants in soil and sand than by those grown in water cultures is not due entirely to the physical effect of the presence of

solid particles of different degrees of fineness, but also to certain soluble substances which are sometimes present in very small quantities. Calcium oxid and calcium sulphate were found to overcome the toxic effects of sodium chlorid and sodium sulphate. Magnesium sulphate and barium chlorid were slightly antagonistic to sodium chlorid, while potassium chlorid, sodium nitrate, sodium phosphate, ferric chlorid, and alum had no effect on the toxicity of sodium chlorid. Under the circumstances of the experiments, the presence of lime did not prevent the entrance of sodium chlorid and sodium sulphate into the plant cells. The antagonistic effects of lime are considered to be due not to its effect on the permeability of the cells but to some other cause.

On chlorophyll, carotin, and xanthophyll, and on the production of sugar from formaldehyde, A. J. EWART (*Proc. Roy. Soc. Victoria, n. ser., 30 (1918), No. 2, pp. 178-209*).—Giving an account of work subsequent to that previously noted (E. S. R., 34, p. 30), the author states that in the assimilation of carbon dioxid chlorophyll acts as a light energizing enzym and takes direct part in the cycle of chemical changes. These changes probably have carotin, xanthophyll, phytyl, and glaucophyllins as intermediate products and glucose, levulose, formaldehyde, and oxygen as end products, the sugar being formed directly as well as through the polymerization of formaldehyde. A large part of the energy represented by the carbohydrate products is absorbed during the reconstruction of the chlorophyll molecule. Carbon dioxid decomposes extracted chlorophyll both in light and in darkness, removing its magnesium and producing phæophytin. The earlier supposition that xanthophyll is one of the products has not been sustained. In the presence of zinc dust, the zinc takes the place of magnesium and the chlorophyll remains green as a stable zinc chlorophyll.

Apart from its protective function, carotin seems to be specially important as providing, during its photo-oxidation or partial disintegration, the massive hydrocarbon combination in the phytyl radicle of chlorophyll whose addition is necessary to convert the dicarboxylic glaucophyllin into the tricarboxylic chlorophyll. Xanthophyll can be reduced to carotin by the aid of metallic reductases, but no oxidases have been found capable of converting carotin into xanthophyll. The oxidation of these substances in darkness or in feeble light differs in certain respects from that taking place in intense light. The oxidation of carotin, xanthophyll, chlorophyll, and rhodophyllin, is more rapid at high temperatures than at low ones, and decreases in the order in which they are here named.

A rapid method is described of polymerizing formaldehyde to sugar, which has a definite end reaction and yields calcium and sodium tartrates as by-products.

The influence of concentration of sugar solutions upon the growth of microorganisms, O. GROVE (*Univ. Bristol, Ann. Rpt. Agr. and Hort. Research Sta., 1918, pp. 34-38; Jour. Bath and West and South. Counties Soc., 5. ser., 13 (1918-19), pp. 127-131*).—The results are here detailed in tabular form, with discussion, of experiments made to ascertain the percentage of sugar needed to prevent development of certain microorganisms.

Yeasts and bacteria do not develop under the conditions here noted in a sugar solution of 50 per cent or more. The influence of concentrations and acidity is noted, as are also other characters. *Penicillium* is checked at 65 per cent, but even at 70 per cent feeble growth is noted after one month.

The growth of Aspergillaceæ and other fungi on strongly saccharin substrata, N. BEZSSONOF (*Ber. Deut. Bot. Gesell., 36 (1918), No. 10, pp. 646-648*).—Data are given regarding the growth of several *Aspergillaceæ* on substrata containing high percentages of saccharose.

The formation of soluble starch by mold fungi with particular reference to their synthesis of nitrogenous compounds, F. BOAS (*Biochem. Ztschr.*, 86 (1918), No. 1-2, pp. 110-124).—*Aspergillus niger* is able to produce easily soluble substances from quinic acid, more particularly from certain of its compounds. The comparative values of different carbon sources investigated are discussed.

Tyrosin in the fungi: Chemistry and methods of studying the tyrosinase reaction, C. W. DODGE (*Ann. Missouri Bot. Gard.*, 6 (1919), No. 1, pp. 71-92, fig. 1).—The author has attempted to determine some of the chemical processes taking place in the reaction associated with the change to blue or black observed when certain fungi are exposed to the air. He concludes that the tyrosinase reaction is not deamination, although deaminases may exist in the same organism with tyrosinase, and that the tyrosin molecule is synthesized into a larger, more complex molecule, in which part of the carboxyl groups are either split off as carbon dioxid, or more probably bound in the molecule so that it will not react with alkali.

Importance of epidermal coverings, R. B. HARVEY (*Bot. Gaz.*, 67 (1919), No. 5, pp. 441-444, figs. 2).—It has been shown that undercooling of the tissues occurs to a greater degree in such herbaceous plants as possess protective epidermal coverings than in plants not so protected. Undercooling in such plants is due, not to substances in the cell sap, but mainly to the prevention of inoculation from ice formed on the surface of the tissue. A method is given for determining electrically the temperatures within leaf tissues.

The habitats of halophytes.—II, *Plantago maritima*, R. KOLKOWITZ (*Ber. Deut. Bot. Gesell.*, 36 (1918), No. 10, pp. 636-645, fig. 1).—This is an account of the occurrence of *P. maritima* as regards geological regions and chemical content of the soil.

Water requirement and adaptation in *Equisetum*, L. DOSDALL (*Plant World*, 22 (1919), Nos. 1, pp. 1-13, fig. 1; 2, pp. 29-44, figs. 4).—From a study of the water relations of *Equisetum*, undertaken to throw light upon the nature of bog xerophytes and the successional relations of *Equisetum* in the hydrosere and paleosere, as described with discussion, the author states that *E. fluviatile* requires a higher concentration of water in soil to maintain its normal functions and its life than does *Ranunculus sceleratus*, and probably higher than do *Helianthus annuus* and *Phaseolus vulgaris*.

Transpirational water loss is much greater from *E. fluviatile* than from the mesophytes and the xerophytes with which it was compared, from which fact it is concluded that this form is a true hydrophyte. This high transpiration is correlated with low photosynthetic efficiency as compared with the two plants above named. The fact that *Equisetum* can adjust itself to physical changes in the habitat by marked physiological responses, although it gives negative results as to adaptation, is considered to indicate that the xeromorphic features are extremely stable structures, and that adaptation to hydrophytic conditions has come about through the development of air-spaces, diaphragms, and permanently open stomata. The great amount of water lost through transpiration and guttation indicates that this species does not grow in the xerophytic regions of bogs because of its low absorptive powers, and that it can not be considered an actual xerophyte at all, its xerophily being only superficial and probably due to the persistence of ancestral structures now compensated by adjustment and by adaptation in the aerenchym. The apparent xerophily is not considered an indication of a dry climate or a physiologically arid habitat, because the water lost by the plants is great and means of checking it are absent. It is thought probable that the superficial xeromorphy of *Equisetum* was acquired in a cold arid period, such as the Permian.

E. fluviatile usually plays a secondary part in the various kinds of swamps. *E. hyemale* and *E. arvense* are found in much drier areas than is *E. fluviatile*. A comparison of the transpiration per unit area shows that the former are more mesophytic, which accounts for the fact that these two species are capable of invading grassland.

Studies on transpiration in high-moor plants, P. B. JENSEN (*Bot. Tidsskr.*, 36 (1917), No. 2, pp. 144-154, fig. 1).—In a study of transpiration employing *Empetrum* sp., *Vaccinium vitis idæa*, *V. uliginosum*, and *Betula* sp., it was found that the transpiration in high-moor plants is less than in plants growing on hard soil. The differences among the moor plants are rather small. It is thought that the diminution in the rate of transpiration produced by xeromorphy is compensated for by the stomata, which are more open in the xeromorphic plants. It is deemed possible that a difference in the transpiration in the two groups of plants may be found in years with greater rainfall.

The absorption of nutrients and allied phenomena in the pitchers of the Sarraceniaceæ, J. S. HEPBURN, E. Q. ST. JOHN, and F. M. JONES (*Jour. Franklin Inst.*, 189 (1920), No. 2, pp. 147-184, figs. 7).—In this report, the authors enumerate the species of Sarraceniaceæ, giving their geographical distribution, and noting their own observations on the nectar and on the wetting and the digestive power of the pitcher liquids. An account is also given of their studies on absorption by the pitchers of introduced liquids and on increased secretion by the pitchers of liquids in response to the introduction of such substances as acids and alkalis.

Water underwent absorption in the pitchers of *Darlingtonia californica* and the Sarracenias, as did also the solvent and (more rapidly) the solute in case of a nitrogenous compound dissolved in water. When a phosphate buffer was added, the nitrogenous component was still absorbed, though the pitcher contents increased in volume. Absorption of phosphate was less rapid than was that of water in case of a neutral phosphate solution. The percentage of the introduced nitrogenous compound or phosphate absorbed usually increased with the period of absorption. The lithium ion was absorbed from a solution of neutral lithium citrate. Absorption by the pitchers of substances introduced into their cavities was demonstrated by the decrease of the content of such substances in the solution, also by the appearance in the pitcher tissues of the element dissolved, as in case of lithium.

These results are held to indicate that the proteolytic products formed in the pitcher cavity by the digestion of the prey are absorbed by the pitchers, and utilized for the nutrition of the plant; also that phosphates and probably other mineral foods derived from the prey are absorbed and utilized in like manner.

The magnitudes and variations of osmotic values, G. BLUM (*Zur Kenntnis der Grösse und Schwankung des Osmotischen Wertes. Inaug. Diss., Univ. Freiburg (Switzerland)*, 1916, pp. 113).—The author reports the results of studies carried out on the osmotic values in different cells of given tissues and in different tissues of several plants; daily and annual variations in osmotic values; values on different sides of the same organ; and the influence of external factors. Particulars are given as noted in *Urtica dioica*, *Fagus silvatica*, *Helleborus fatidus*, *Sedum acre*, and *Funaria hygrometrica*. The results are detailed in their connections.

While at a given height above the ground the osmotic pressures tend to approximate the same values, those of different layers may differ greatly; but the differences corresponding to height greatly outweigh those of different layers at a given height. The highest values, taking the plant as a whole or the leaf only, were found in the palisade, the lowest in the epidermal cells. Periodic variations, both daily and yearly, were noticed in the different tissues.

Light sources in phytophysiological studies, H. SIERP (*Biol. Zentbl.*, 38 (1918), No. 6, pp. 221-257, figs. 10).—Numerical and graphical data are discussed as obtained with sources of light differing in regard to intensity and character (wave length) as related to the requirements of studies in the physiology of plants. A bibliography is appended.

Inheritance of certain flower characteristics in *Papaver rhœas*, J. BECKER (*Ztschr. Pflanzenzücht.*, 6 (1918), No. 3-4, pp. 215-221, figs. 3).—This account of an examination by the author of a vast number of flowers of *P. rhœas*, with regard to the possible and actual appearances of certain petal color markings, brings out the fact that these characters are affected by a very unfavorable situation (the influence of external conditions) as regards morphological characters.

Finland varieties of field peas, K. TERÄSVUORI (*Acta Soc. Fauna et Flora Fennica*, 40 (1915), No. 9, pp. 1-142, figs. 2).—This is the author's account of a study with particular reference to the number of seed fundaments and seed produced per pod, as noted in tests with peas of field varieties.

It was found that the number of seed fundaments per pod is influenced by the number and the position of the pods on the peduncle, this being greater in the single pod or in the older of a pair. The ordinal number of the node is not significant in this connection. As regards the number of seed fundaments, an individual has usually two or three kinds of pods which, for the greater part, belong to one or two neighboring classes. In case of individuals of a pure line grown under like conditions, most of the pods fall in one to three neighboring classes, of which one, or less often two, will include more than half of the variants. The number of seed fundaments in the pure line is in a certain degree dependent upon external conditions during the growth period, but it remains fairly constant from year to year.

As regards the number of seed fundaments, genotypic differences exist according to the tabular figures. A high or a low number of seed fundaments is not linked (genetically) with any given color in blooms, cotyledons, seed coats, or hilum, nor is it linked with size or fertility of seed.

Practically never do all the seed fundaments of a plant develop into seeds; the number of the latter being affected by the number and the position of the pod. Seed number per pod is more sensitive to external living conditions than is the number of seed fundaments. All gradations up to complete development of all the fundaments may be found in different pods of the same individual. Weather, but not earliness of a variety, appeared also to be significant. A negative correlation appears between number and weight of seed.

The morphological basis of some experimental work with maize, P. WEATHERWAX (*Amer. Nat.*, 53 (1919), No. 626, pp. 269-272).—Employing certain characters of Indian corn as illustrative material, and reviewing work done recently by various authors, with their views, the author claims that many of the organisms most useful for establishing and testing the principles of heredity have an external appearance that may be very deceptive as indicating their true structure. This alone, he claims, is the key to the deeper significance of their genetic behavior.

Species placed by Saccardo in the genus *Phoma*, I-II, W. B. GROVE (*Roy. Bot. Gard. Kew, Bul. Misc. Inform.*, 1919, Nos. 4, pp. 177-201, figs. 23; 10, pp. 425-445, figs. 6).—These notes are said to contain the results of studies on specimens placed by Saccardo in the Kew Herbarium, and to result from a continuation of studies previously noted (*E. S. R.*, 38, p. 752) on the genus *Phomopsis*.

FIELD CROPS.

Methods of plant breeding, F. W. HILGENDORF (*New Zeal. Jour. Agr.*, 19 (1919), No. 6, pp. 354-358).—This comprises a review of a paper, read before the New Zealand Institute Science Congress, dealing with the methods employed and some of the results secured in plant-breeding work, with particular reference to close pollinated plants such as the cereals. The author maintains that a study of fertilization in self-fertilized plants shows that variations in the offspring are rare, and that in the light of carefully conducted experiments they would seem to be entirely absent.

Sectional variety tests [in 1919] with corn, oats, barley, and soy beans, J. F. COX and E. K. CHAMBERLIN (*Michigan Sta. Quart. Bul.* 2 (1920), No. 3, pp. 126-128).—The tests with corn included 32 varieties grown in 24 localities. In lower Michigan, Golden Glow, Early Silver King, Folk White Cap, and Duncan; in central Michigan, Golden Glow, Pickett, and Early Silver King; and in the northern part of the State, Putnam Golden Glow, Nelson Golden Glow, and Ogemaw White Cap gave the highest yields. It is pointed out that a great improvement would result through the adoption of one or two of the best varieties and strains for widespread local distribution in the different corn-growing sections of the State.

Sixteen varieties of oats were tested in 12 well-distributed counties. The results of the experiments indicated that Wolverine, College Success, College Wonder, Worthy, White Bonanza, New Victory, Johnson, and Strube are superior in yield and quality.

The season was not favorable to the growth of barley. While all yields were low, Black Barbless, developed at the station, gave the highest yield, which is attributed as possibly due to superior drought resistance. Other varieties giving good yields were Michigan-2-row and Wisconsin Pedigree.

Soy bean varieties grown in six widely separated localities resulted in the best yields from Ito San, Black Eyebrow, Mongol, Hollybrook, and Early Brown.

Short season hay crops experiments, C. R. MEGEE (*Michigan Sta. Quart. Bul.*, 2 (1920), No. 3, pp. 125, 126, fig. 1).—Experiments were made with spring sown and early summer sown crops.

Of the spring sown crops a mixture of 1½ bu. of oats and 1 bu. of peas per acre yielded 1.7 tons, and one of 2 bu. of oats and 20 lbs. of hairy vetch, 2 tons of air dry hay per acre, while oats alone gave 1.1 tons. Of the early summer sown crops corn gave the highest yield as well as the largest amount of total digestible nutrients.

Soy beans sown May 20 and June 7 yielded about 3 tons of air dry hay per acre. Certain varieties yielded about five times as much hay as others. The Ito San, Black Eyebrow, and Early Brown were quite reliable, while Mammoth Yellow and Ogemaw were quite inferior.

Of the millets Golden outyielded Hungarian, and Common ranked third. Japanese millet when allowed to become quite mature gave a good yield of hay of inferior quality. Sudan grass sown at the rate of 25 lbs. per acre gave a slightly larger yield than Golden millet, but was 10 to 14 days later in maturing.

Grain crop variety tests, E. B. SPOOKEY (*Washington Sta., West. Wash. Sta. Mo. Bul.*, 7 (1920), No. 11, pp. 179, 180).—The leading varieties in the test here reported were Blue Bell field peas; Minnesota No. 281, Banner, Sparrowbill, and Swedish Select oats; Hannchen and Blue barley; and Mexican Bluestem, Red Fife, Red Chaff, and Marquis wheat. Seeding from 3 to 3.5 bu. per acre of Blue Bell field peas gave the best results and the use of 60 to 80 lbs. of oats with

80 to 90 lbs. of peas proved most satisfactory for hay or silage. Seeding 140 lbs. of oats per acre gave higher yields than were secured from 100 and 120 lbs. per acre. In a 1-year test there was no gain from seeding more than 2 bu. of barley per acre.

Eight-inch v. four-inch drilling of grain, F. A. WELTON (*Mo. Bul. Ohio Sta.*, 4 (1919), No. 8, pp. 246-248).—Fourteen drilling tests with wheat, in progress for three years and including the rates of 4.5, 6.5, and 9 pk. per acre, showed an average gain of 0.75 bu. of grain and 16 lbs. of straw per acre in favor of the drills 8 in. apart. In a similar manner 30 tests with oats, conducted for four years and including rates of drilling at 5, 6, 6.5, and 8 pk. per acre, gave an average gain of 4.2 bu. of grain and 51 lbs. of straw per acre in favor of the 8-in. drilling.

Alfalfa in Wisconsin, R. A. MOORE and L. F. GRABER (*Wisconsin Sta. Bul.* 308 (1919), pp. 34, figs. 21).—This bulletin presents popular directions for the culture of alfalfa in the State, and reports briefly the results of several experiments conducted by the station at different times.

A comparison of the hay and protein production per acre of alfalfa, clover, and timothy showed that alfalfa yielded practically twice as much hay as was secured from clover and three times as much as was obtained from timothy. Alfalfa produced in a single season three times and nine times the quantity of protein produced by clover and timothy, respectively.

Alfalfa seedlings made August 4 and 25, and September 15 and 25, 1914, and examined on May 12, 1915, showed a length of roots of 20, 13, 10, and 8 in., and a length of stems of 20, 17, 13, and 8 in. for the different dates of seeding, respectively.

It was found further that a mixture of 15 lbs. of alfalfa seed and 5 lbs. of timothy seed per acre makes a valuable combination. On a plat of alfalfa and timothy at the station, on which over 50 per cent of the alfalfa was killed out the second winter, the hardier timothy took the place of the dead alfalfa plants, and the average yield for the third and fourth years was 6,850 lbs. of hay per acre in two cuttings.

In studying the effect of late fall cutting it was noted that alfalfa cut September 2, 1914, had reached a height of 22 in. on May 12, 1915, as compared with 17 in. for alfalfa cut September 26.

The results of tests of seed from different sources showed variations in hardiness in some instances even between seed secured from different growers in the same State, and indicated that for Wisconsin the most winter resistant alfalfas are Grimm, Baltic, and Cossack.

In another test a plat was seeded June 27, 1914, with Montana grown seed and a similar plat from the same lot of seed on June 23, 1915. Both plats had excellent stands in the fall of 1915, but in the spring of 1916 about 76 per cent of the two-year-old plat and only about 9 per cent of the new seeding had winter-killed. This result is taken as indicating that the new seedings of common alfalfa are the hardier, and this conclusion was borne out by reports from growers over the State received at that time.

Alfalfa seed production, F. A. SPRAGG and E. E. DOWN (*Michigan Sta. Quart. Bul.* 2 (1920) No. 3, pp. 130-132, figs. 2).—The production of alfalfa seed in Michigan is briefly noted, and the results in this line secured at the station are reported as indicating that alfalfa is a satisfactory seed-producing crop when properly handled.

Planting rates and spacing for corn under southern conditions, C. A. MOOERS (*Jour. Amer. Soc. Agron.*, 12 (1920), No. 1, pp. 1-22, figs. 3).—In this paper, a contribution from the Tennessee Experiment Station, the author sum-

marizes data secured in variety tests conducted in various parts of the State in an effort to formulate an accurate method for determining the proper stand of corn with regard both to the productivity of the soil and to the variety. Observations were also made on the best rate of planting corn for silage, and on the effect of variations in the grouping and spacing of a given number of plants. Various planting rates were employed, ranging from 6,000 to 10,000 plants per acre on rich bottom land, and from 4,200 to 6,600 plants on good upland soil at Knoxville, while in western and central Tennessee the rates varied from 3,000 to 5,400 plants per acre. In general, the yields ranged from 30 to 80 bu. per acre, although some experiments were made on soil which under average conditions produced less than 30 bu. Data have been assembled which are held to indicate the proper stand for each of a number of varieties of corn grown on soils of different degrees of productiveness. The conclusions reached may be summarized as follows:

The rate of planting corn is of much practical importance in the South, but a definite rule is needed, as too thick planting is of common occurrence. Different varieties require appreciably different rates of planting, the small and short-season varieties, in general, requiring thicker planting than the large, long-season sorts.

The experimental results indicated a close relationship between the best rate of planting for grain production and a definite yield of grain per plant. To approximate the proper stand of corn, the following equation is suggested: $N = \frac{56 Y}{F}$, when N represents the number of stalks per acre, Y the expectancy, or approximate production in bushels per acre of the field in question under average seasonal conditions, and F the standard varietal factor, or average weight of grain per plant at the best rate of planting, as determined experimentally for the variety in question. On land of high productiveness the average weight of grain per plant at the best rate of planting was found to vary from year to year with the nature of the season, the more favorable the season the greater being the weight. The standard varietal factor is, therefore, practically the average result obtained for all seasons.

It is stated that the data obtained may be interpreted as indicating that a varietal factor is practically a constant between the 36- and 65-bu. limits of productivity, although the evidence indicates that as the productiveness of the soil changes a change should be made in the varietal factor. Based on the average for 15 varieties, this change was calculated to be 0.0014 per bushel change in expected yield. A table of standard factors for 24 varieties is given, and the following formula is developed for use in connection with the table:

For land producing on the average more than 64 bu. per acre,

$$N = \frac{56 Y}{F + (Y - 64)0.0014}$$

For land producing on the average less than 64 bu. per acre

$$N = \frac{56 Y}{F - (64 - Y)0.0014}$$

In addition the suggestion is made that no rate of planting should be less than that calculated for a 25-bu. crop. The margin of safety seemed to go with a too high rather than a too low rate of planting.

The results of three series of experiments agree in showing that the best rate of planting silage corn was little different from that which gave the highest yield of grain, although in practice a material increase seems warranted. In the spacing experiments the conclusion was reached that the best results in practice will probably be obtained with a width of row which permits the satis-

factory use of tillage implements, but allows the determined number of stalks to be as widely spaced as possible.

The improvement of the yield of Sea Island cotton in the West Indies by the isolation of pure strains, II, S. C. HARLAND (*West Indian Bul.*, 17 (1919), No. 4, pp. 210-236).—Supplementing work previously noted (E. S. R., 41, p. 531), the author presents a detailed discussion of further observations made by him at St. Vincent and of date secured by W. Robson in breeding work conducted in Montserrat during the period 1916-1918, inclusive.

Both the St. Vincent and Montserrat strains were grown from self-fertilized seed derived from single-plant selections. The characters studied in the Montserrat strains included the mean maximum lint length in millimeters, the weigh of lint per seed in milligram, the mean seed weight in milligrams, and the number of bolls per pound of seed-cotton. The St. Vincent strains were examined for weight of lint per seed, mean seed weight, and mean maximum lint length. Information is also given on correlations between lint weight of the parent strain and the mean lint weight of the progeny, lint weight and lint length, lint weight and seed weight, lint weight and lint per boll, lint weight and lint per acre, lint length of parent strain and mean lint length of progeny, seed weight of parent strain and mean seed weight of progeny and lint per acre of parental strain and lint per acre of progeny. A method of improving Sea Ialsnd cotton is outlined, which is said to give practical results in a comparatively short time.

Summerizing the results secured, it is stated that "short-linted plants can be eliminated easily and rapidly from the commercial crop by the adoption of the pedigree culture method. Slight differences in lint, length, weight of lint per seed, seed weight, and weight of lint per boll are hereditary, and are maintained from season to season. The yield of Sea Island cotton can be increased by selecting plants possessing certain combinations of morphological characters. Particular attention should be paid to weight of lint per seed and seed weight. Weight of lint per seed is correlated with weight of lint per boll and with weight of lint per acre. Types of high seed weight must be grown, because the maximum weight of lint per seed can only occur if the seed weight is also at the maximum. There is a strong correlation between parent and mean of progeny in respect of the characters lint length, lint weight, and seed weight. The character of a plant, therefore, affords some guide to the kind of progeny it will produce, but in general the inherent worth of a plant can only be judged in terms of the average behavior of its progeny. Lint length and lint weight are possibly negatively correlated, but there is a need for further investigation of the subject. No strain exists at the present time possessing the combination of long lint (above 55 mm.) and high lint weight (above 55 mg.)."

"The chief danger of pure strain work with Sea Island cotton is that valuable combinations of Mendelian factors may be permanently lost, unless full attention be given throughout the period of selection to all the morphological and physiological characters bearing on yields. The particular combination of Mendelian factors which has given rise to the Montserrat strain of lint weight 60 mg. appears to have been eliminated from the St. Vincent and St. Kitts commercial cottons. The yield of St. Vincent and St. Kitts cottons can undoubtedly be increased by crossing them with the heaviest yield Montserrat strain, and the whole question of artificial hybridization in relation to cotton breeding is discussed at length."

Northern Ontario as a source of seed potatoes, J. MILLER (*Ontario Dept. Agr., Ann. Rpt. Agr. and Expt. Union*, 39 (1917), pp. 17-23).—This report with discussion brings out the fact that in northern Ontario the conditions are preva-

lent under which the potato thrives best, a prominent factor being the immaturity of the seed there produced, which greatly increases the yield from such seed potatoes. Other factors discussed are the long days of sunshine, cool nights, abundant moisture, absence of drought periods, and comparative freedom from physiological diseases.

Spring planting of Rosen rye proves unsatisfactory, F. A. SPRAGG and E. E. DOWN (*Michigan Sta. Quart. Bul.* 2 (1920), No. 3, pp. 132, 133, fig. 1).—Plantings of Rosen rye were made at different dates. The planting made September 25 yielded at the rate of 46.8 bu. per acre. A number of check plats planted October 10 averaged 44.6 bu. per acre. The planting made November 21 gave 5.4 bu. per acre, and two plantings made on April 9 were total failures.

Sugar cane experiments in the Leeward Islands, 1916-17 and 1917-18, A. E. COLLENS ET AL. (*Imp. Dept. Agr. West Indies, Sugar-Cane Expts. Leeward Isl., 1917-18, pt. 1, pp. 87*).—This describes variety tests with sugar cane conducted in Antigua, St. Kitts, and Nevis in continuation of similar work previously noted (E. S. R., 38, p. 437). A report of the fertilizer experiments is to appear later. Data are given showing the rainfall at the various experimental centers during the seasons indicated.

In Antigua, the two leading plant canes for the season of 1916-17 were B. 6308 with 26.3 tons of cane per acre and 5,240 lbs. sucrose, and Sealy Seedling with 29.1 tons of cane and 4,700 lbs. sucrose. The highest yields for the season of 1917-18 were secured from B. 3922 with 23.75 tons of cane and 4,370 lbs. sucrose, and B. 6308 with 22.33 tons of cane and 3,910 lbs. sucrose. Sealy Seedling with an average yield of 6,330 lbs. sucrose per acre was first of 10 varieties grown for the past 17 years. Uba with 22 tons of cane and 3,170 lbs. sucrose, and B. 3922 with 14.9 tons of cane and 2,760 lbs. sucrose were the highest yielding ratoon canes tested during 1916-17. The best sorts tested during the season of 1917-18 were B. 109 with 13.75 tons of cane and 2,000 lbs. sucrose, and B. 3922 with 10.85 tons of cane and 1,820 lbs. sucrose. Of 12 varieties of ratoon cane grown during the past 16 years, Sealy Seedling was first with 3,570 lbs. sucrose per acre.

B. 6308 with 33.2 tons of cane and 7,820 lbs. sucrose, and B. 6388 with 30.8 tons of cane and 7,670 lbs. sucrose were the best plant canes grown in St. Kitts during the season of 1916-17, while Ba. 6032 with 33.4 tons of cane and 7,080 lbs. sucrose, and B. 6308 with 32.3 tons of cane and 7,030 lbs. sucrose were best during the 1917-18 season. The highest-yielding ratoon canes for the 1916-17 season were A. 2 with 27.4 tons of cane and 5,850 lbs. sucrose, and B. 254 with 24.9 tons of cane and 5,800 lbs. sucrose. During the 1917-18 season the best results were obtained from B. 1528 with 21.8 tons of cane and 4,120 lbs. sucrose, and B. 6346 with 17.7 tons of cane and 4,000 lbs. sucrose. Observations on a number of seedlings are also noted.

In Nevis the highest-yielding plant canes for the 1916-17 season were B. 6308 with 51 tons of cane and 11,480 lbs. sucrose, and B. 1528 with 36.9 tons of cane and 8,590 lbs. sucrose. The best sorts grown during the 1917-18 season were B. 4596 with 20.1 tons of cane and 4,600 lbs. sucrose, and B. 254 with 18.8 tons of cane and 4,100 lbs. sucrose. No ratoon canes were harvested in the experiment.

The sugar cane industry of Brazil (*Industria Assucareira no Brazil. Rio de Janeiro: Min. Agr., Indus., e Com., Dir. Geral Estatist., 1919, pp. 102, pls. 2*).—Statistical information is given relative to the production and exportation of sugar.

Rust-resisting sunflowers, F. A. SPRAGG and E. E. DOWN (*Michigan Sta. Quart. Bul.* 2 (1920), No. 3, pp. 128, 129, fig. 1).—Four varieties, Mantica, Kaeurpher from South America, Mammoth Russian, and Dubble Mixed, were com-

pared, with the result that the South American variety was outstanding in rust resistance. It is stated that this variety is composed of many types, and that from these selections may be made to meet the needs of varied conditions.

[Tobacco] (*Bol. Tec. [R. Ist. Sci. Sper. Tabacco, Scafati]*, 16 (1919), No. 1, pp. 5-48, pls. 3).—This publication includes a description of *Nicotiana chinensis* and brief reviews of numerous technical and popular articles from different sources dealing with the production of tobacco.

[Wheat-crossing], J. JELINEK (*Ztschr. Pflanzenzücht.*, 6 (1918), No. 1, pp. 55-57).—The author describes a method of crossing wheat which is said to result in a marked increase in the number of seeds set by the hybrid.

The essential points of the method include the planting of the parent strains side by side, the emasculation of the spike of the female parent, and the binding together of the emasculated spike and a spike of the male parent. The spikes are then wrapped with paper, which is removed after about 14 days. In the case of an attempted cross of sorts maturing at different times, it is suggested that the early maturing kind be planted later, or that it be planted somewhat deeper than the late maturing strain so that the spikes will ripen at the same time.

Fertilizing the wheat crop of 1920, C. E. THORNE (*Mo. Bul. Ohio Sta.*, 4 (1919), No. 8, pp. 235-240, fig. 1).—This article considers the use of fertilizers, drainage, crop rotations, and liming as related to wheat production and points out briefly some of the results secured in the station experiments.

In a 25-year experiment wheat was grown continuously and in rotation without fertilizer treatment, with applications of commercial fertilizers consisting of 160 lbs. each of nitrate of soda and acid phosphate and 100 lbs. of muriate of potash per acre, and with the use of 5 tons per acre of barnyard manure under continuous culture and of 4 tons under crop rotation. Under continuous culture the average yield per acre for the first five years without fertilizer treatment was 10.1 bu., and for the last 5 years it was 8.4 bu. as compared with 9.3 and 19.3 bu., respectively, where the crop was grown in rotation. On the plats receiving commercial fertilizers the yields were 19.8, 22.3, 20.5, and 33.1 bu., and on those treated with barnyard manure 15.8, 23.5, 11.6, and 32.5 bu. per acre, respectively.

In a 5-year rotation of corn, oats, wheat, clover, and timothy the equivalent of 2 tons of ground limestone per acre was applied after the land had been plowed for corn, and during each 5-year period for 25 years two dressings of barnyard manure were applied at the rate of 8 tons per acre each on corn and wheat. As compared with unlimed land otherwise similarly treated the average yields for the last 5-year period showed the following gains per acre in favor of liming: Corn 11.9, oats 3.2, and wheat 4.4 bu., clover 930 lbs., and timothy 2,600 lbs. On lands similarly limed but receiving no fertilizer treatment during the 25 years the increases for the last 5-year period due to liming were as follows: Corn 10, oats 15, and wheat 8.8 bu., clover 1,310 lbs., and timothy 1,660 lbs. per acre.

The results of 26 experiments with acid phosphate, in progress in 13 counties for 25 years, are reported as indicating that in the rotations followed the crops other than wheat paid for the acid phosphate applied, and that the average increase or gain was 5 bu. of wheat for every 100 lbs. of acid phosphate used.

Wheat in a 5-year rotation followed at Wooster for 25 years on land receiving each 5-year period 320 lbs. of acid phosphate together with nitrogen and potassium costing \$21 on a prewar basis yielded an average of 28.42 bu. per acre. On the same farm wheat grown for 21 years in a 3-year rotation of corn,

wheat, and clover, the corn receiving 8 tons of fresh barnyard manure and 320 pounds of acid phosphate per acre, gave an average acre yield of 28.79 bu. It is pointed out that while these experiments are not exactly comparable the results would seem to indicate that manure may be substituted for nitrogen and potash.

HORTICULTURE.

Vegetable culture, J. VERCIER (*Culture Potagère. Paris: Hachette & Co., 1919, 4. ed., pp. VI+402, figs. 269*).—A treatise on vegetable growing in France, issued as one of the volumes of the *Encyclopédie des Connaissances Agricole*, under the direction of M. E. Chancrin.

Methods for marketing vegetables in California, S. S. ROGERS (*California Sta. Circ. 217 (1920), pp. 19*).—A detailed discussion of market methods and the formation and management of vegetable marketing organizations, including other data of value to the vegetable grower, such as a list of the leading varieties of vegetables for California, seasons in which various vegetables are in most demand, marketing requirements of vegetables, and the production of vegetables for the cannery and drier.

Fruits for Minnesota planting (*Minn. Hort., 48 (1920), No. 2, p. 45*).—A list of orchard and small fruits, including ornamental fruiting shrubs and nuts, adopted by the Minnesota State Horticultural Society.

Minnesota State Fruit-Breeding Farm in 1919, C. HARALSON (*Minn. Hort., 48 (1920), No. 2, pp. 34, 35*).—A brief progress report on breeding and selection work with orchard and small fruits.

Among recent fruits of special promise resulting from the work are several seedling apples; the No. 70 plum, a cross of Burbank with a native variety, which is a clingstone of the very best quality not subject thus far to plum rot or any other diseases; hardy crosses of *Prunus nigra* and *P. triflora*; several seedling annual and everbearing strawberries; seedling gooseberries; the Minnesota No. 4 raspberry; and a hybrid black cherry of good quality and size.

Report of committee examining Minnesota State Fruit-Breeding Farm, W. H. EDDY, H. LAKE, and A. B. LYMAN (*Minn. Hort., 48 (1920), No. 2, pp. 36, 37*).—A brief résumé of the work noted above.

Varieties of fruit for Wyoming, M. D. HARRIS (*Bien. Rpt. Wyo. Bd. Hort., 7 (1916-18), pp. 17-22*).—Suggestions on varieties of fruit suitable for the home orchard in Wyoming.

Spraying and dusting experiments, 1918, W. H. BRITTAIN (*Ann. Rpt. Fruit Growers' Assoc. Nova Scotia, 55 (1919), pp. 102-110*).—Experiments conducted in 1918 indicate that the major part of spray injury from lime-sulphur can be attributed to the final or fourth spray. Injury was invariably greater where the lime-sulphur was sprayed up from below the tree than when sprayed from above the tree. Apple scab was, generally speaking, controlled best by spraying downward. There was no abnormal leaf drop when 7:7:100 Bordeaux was substituted for the fourth lime-sulphur spray. Plats dusted with lime-sulphur showed no abnormal leaf drop. Scab was efficiently controlled by lime-sulphur, soluble sulphur, and Bordeaux. Lead arsenate also appeared to have a decided fungicidal value.

Relative to the value of dusting as compared with spraying, the author concludes from two seasons' tests that dusted arsenicals and sprayed arsenicals are both efficient, if properly applied. Under certain conditions, dusting with lime-sulphur may give as good scab control as spraying. At other times, and especially against a severe outbreak, it is somewhat inferior. Although having great advantages in rapidity and ease of application, the practicability of displacing spraying with dusting is still unproved.

The propagation of apple trees on their own roots, J. K. SHAW (*Massachusetts Sta. Bul. 190 (1919), pp. 73-96, pls. 4*).—In connection with a general study of the interrelation of stocks and scion among apples, work was undertaken to produce stocks of known parentage by inducing root formation from the stems of selected varieties. The methods used and the results obtained are here discussed in detail, together with a discussion of the histology of the twig in relation to root formation, which is based on work conducted by R. P. Armstrong, a graduate assistant.

In the trials reported stem cuttings of apples failed to grow, though callus formation in some varieties was good. Root cuttings grew well, though growth was slow the first season. Limited tests indicated that most varieties may be propagated by mound layers. The nurse-root method gave the best results. The scion was whip-grafted on a short piece of root and planted deeply. Rooting from the scion took place at the end of one or two seasons' growth, after which the nurse root was removed and the tree replanted. Neither dwarf apple nor pear roots were of value as nurse roots.

There was a great variation between and within varieties as to the readiness with which they sent out roots from the scion. Of 14 varieties propagated in considerable numbers in successive years and under different conditions Tolman only produced 3 per cent of rooted trees, whereas Sweet Bough produced 98 per cent.

Generally speaking, the softer the wood the higher was the proportion rooting from the scion. There was apparently a relation between the varietal ability to produce roots from the scion and the thickness of the cambium layer at the dormant season. A fertile, well-drained, sandy loam probably offers the best conditions for securing a high percentage of rooting trees. Once trees are established on known roots they may be reproduced true to type either by the root cuttings or by grafting on the known roots.

Ohio apple orchard fertilization, I, F. H. BALLOU (*Rural New Yorker, 79 (1920), No. 4576, p. 456, figs. 2*).—The author cites evidence based on fertilizer investigations conducted by the Ohio Experiment Station to show that it is not safe to depend on single unfertilized rows of trees as checks for more than a very brief term of years. After a few years the roots of the check trees may reach over into the fertilized plats and render the results of the experiment inaccurate.

During the course of the station's fertilizer studies there has not been a single instance in which fertilization with quickly available nitrogenous plant food has failed to increase greatly the vigor, fruitfulness, and cash returns of the trees thus treated as compared with the unfertilized or check trees. Three upland orchards in which fertilization tests were first established returned a clear gain of \$125.75 an acre per year from the sections where nitrate of soda was used.

Manuring experiments, 1917-18, J. M. WARD and P. H. THOMAS (*Agr. and Stock Dept. Tasmania, Bul. 75 (1918), pp. 3*).—The results to date are given of a series of fertilizer experiments that are being conducted in a run-down apple orchard. Thus far nitrogen appears to be the limiting factor.

Apple spraying in 1919, G. E. SANDERS (*Ann. Rpt. Fruit Growers' Assoc. Nova Scotia, 1919, pp. 110-118*).—Summing up the evidence from tests conducted during 1918, the author recommended the following formula for 1919: First spray, 3:10:40 Bordeaux, 1:40 arsenate of lime; second spray, 2:10:40 Bordeaux, 1:40 arsenate of lime; third spray, soluble sulphur 1 lb. or sulfocide 1 qt. to 40 gal. water, 5.40 lime, 0.5:40 arsenate of lime; fourth spray, 2:10:40 Bordeaux, 1:40 arsenate of lime.

It is believed that under usual conditions this program will enable the control of insect pests and fungus diseases, without reducing the crop and without causing fruit russet and foliage injury. When cankerworm is prevalent, it is advisable to use 6 lbs. of paste arsenate of lead or 3 lbs. of dry arsenate of lead to 40 gal. of water plus 5:40 hydrated lime immediately before the blossoms open in place of the regular formula. When tussock moth is serious, the above treatment for cankerworm should be used in place of the regular formula for the third or calyx spray.

Costs and profits in the Minnesota apple orchard, W. G. BRIERLEY (*Minn. Hort.*, 48 (1920), No. 2, pp. 46-51).—A contribution from the University of Minnesota, presenting data on an orchard survey conducted in 1918-19 by W. J. Koppen under the direction of the author.

Summarized data for 30 orchards averaging 15 years of age, aggregating 159 acres and with an average yield of 133 bu. per acre, showed the average labor costs per acre to be \$47.25, materials cost \$20.06, fixed costs \$37.65, and overhead cost \$3.14, or a total of \$108.10 per acre. The net profit per acre was \$30.68, and the net profit per bushel, \$0.23.

In four well-handled orchards, aggregating 25 acres, the receipts per acre were \$410.48 and the costs per acre \$184.17, as compared with receipts per acre of \$15.15 and costs of \$30.99 in four poorly handled orchards aggregating 27.5 acres.

Pears: Production estimates and important commercial districts and varieties, H. P. GOULD and F. ANDREWS (*U. S. Dept. Agr. Bul.* 822 (1920), pp. 16, figs. 3).—A joint contribution from the Bureau of Plant Industry and the Bureau of Crop Estimates of this Department. It discusses the relative importance and extent of the pear industry in the United States, presents statistical estimates of the annual production of pears for the years 1909-1919, inclusive, and gives an account of the important commercial districts and varieties by States.

The floral biology of the peach, I-II, A. MANARESI (*Staz. Sper. Agr. Ital.*, 44 (1911), No. 3-4, pp. 175-209; 52 (1919), No. 1-2, pp. 42-68).—A contribution from the Royal Agricultural High School, Bologna, discussing factors affecting fruitfulness of the peach and continuing previous studies of the effect of annular decortication or ringing (*E. S. R.*, 21, p. 439). A bibliography of related literature is given.

Relative to the effects of ringing the branches, the author concludes that this process notably increases production in addition to yielding larger and earlier maturing fruit without materially injuring the tree. The thickness of the foliage and the fruit stock is increased on ringed branches.

A test made to determine the value of sulphuring during the flowering period indicated that sulphuring during this time was of little value and tended to reduce the crop.

In the second part the author presents results of pollen germination studies of a large number of varieties of peaches. A bibliography of related literature is appended.

The new hybrid plums, D. C. WEBSTER (*Minn. Hort.*, 48 (1920), No. 2, pp. 43, 44).—Brief notes on several hybrid plums originating at the Minnesota State Breeding Farm and under test by the author.

Making graft-unions, L. RAVAZ (*Prog. Agr. et Vitic. (Ed. VEst-Centre)*, 41 (1920), No. 8, pp. 173-182, figs. 14).—A detailed illustrated account of methods employed in preparing scion and stock cuttings of grapes, making the union, and rooting the grafted cuttings.

China mulberry and sericultural work (*Amer. Silk Jour.*, 39 (1920), No. 3, pp. 64-66, pl. 1, figs. 5).—A report of the University of Nanking on progress made in the establishment of mulberry plantations and the production of silk-worm eggs.

The budding and grafting of cacao, R. O. WILLIAMS (*Proc. Agr. Soc. Trinidad and Tobago*, 19 (1919), No. 12, pp. 294-301).—A paper on the propagation of cacao, with special reference to the importance of propagating from selected seed, buds, and scions, as determined in the cacao experiments of the Trinidad and Tobago Department of Agriculture in their natural-yield tests of cacao (*E. S. R.*, 39, p. 143).

The future of cacao, P. DE MORAES (*Brasil Agr.*, 4 (1919), No. 10, pp. 271-278, figs. 8).—A statistical review of the cacao industry, with special reference to the future of the industry in Brazil.

Variation in coconuts, T. PETCH (*Trop. Agr. [Ceylon]*, 54 (1920), No. 1, p. 1, pl. 1).—Of 5 nuts on a bunch of coconuts, 3 were green and 2 yellow in color. One nut of each color was planted side by side. The plant from the yellow nut has a distinctly yellow tinge with a yellow or bronze midrib to the leaves, and is making less vigorous growth than the plant grown from the green nut. This fact indicates that yellow varieties may have originated as sports from the normal green varieties, and unless desirable on account of other qualities they should not be planted because of their slower growth, owing to their chlorotic condition.

The effects of alkali on citrus trees, W. P. KELLEY and E. E. THOMAS (*California Sta. Bul.* 318 (1920), pp. 305-337, figs. 2).—The authors made a survey of several citrus groves in different localities of southern California to determine the effects of alkali, preliminary to a study of methods of combating alkali. The results of this survey are discussed and related studies briefly reviewed. In lieu of more definite information some general suggestions are given for the treatment of injured groves. Several analyses of soils and irrigation waters are appended.

Severe alkali injury was observed in a number of citrus groves in several districts, and a large percentage of this injury was due to irrigation water. Chlorids were the most injurious constituents of the waters, although in certain localities some of the waters also contained injurious amounts of sulphates and carbonates. The irrigation supplies rarely contained enough alkali to harm citrus trees directly, but the injury was due to the concentration of salts after a variable period of years, depending on the nature of the soil, the amounts of alkali in the water and soil, rate of evaporation, etc. Alkali injury was also brought about in an experimental plat at the Citrus substation by repeated large applications of nitrate of soda.

Examination of the nature of alkali injury showed that an excess of chlorids causes the tips and margins of citrus leaves to become yellow or brown, followed by defoliation. Sometimes a large portion of the leaves fall, and the young, tender shoots may be killed. An excess of sulphates and bicarbonates, on the other hand, is more likely to stunt the growth of the trees and cause the leaves to become chlorotic. More or less mottle leaf may also occur. Lemon trees are apparently injured by lesser amounts of alkali than oranges.

The effects of alkali are intensified by the puddling effect of continued irrigation with waters containing sodium salts, particularly those containing sodium carbonate and sodium bicarbonate. Under such conditions the alkali can not leach down beyond the citrus roots. It is especially important to keep the soil open and porous where nitrate of soda or saline irrigation water is used in regions of light rainfall. To accomplish this, the use of deep-rooted

cover crops and plowing under organic materials such as manure or bean straw is recommended. When saline water is the only source of irrigation, the use of the basin or flooding systems instead of the furrow system of irrigating may afford temporary relief from alkali injury in case the subsoil drainage is satisfactory. By increasing the alkaline content of the drainage water, however, the ground water may ultimately become heavily charged with salts. Observations made in one district showed the most effective treatment for injured groves to consist of thorough tillage, plowing down manure, and the application of irrigation water free from alkali.

Pruning the navel orange, R. W. HODGSON (*Cal. Citrogr.*, 5 (1920), No. 5, pp. 138, 169).—A contribution from the University of California discussing the pruning of both young and bearing navel orange trees.

Control of humidity conditions in lemon storage rooms, A. D. SHAMEL (*Cal. Citrogr.*, 5 (1920), No. 5, pp. 137, 170, 171, figs. 3).—A popular summary of work previously reported (*E. S. R.*, 36, p. 842), with illustrations of the humidifier designed by the author.

Report on the production of tea in India in the calendar year 1917, G. F. SHIRRAS (*Dept. Statist., India, Rpt. Prod. Tea, 1917*, pp. [4]+29, pl. 1).—A statistical report on the area and production of tea, number and area of plantations, and number of persons employed in each district in India in 1917, including summaries of area and production since 1885, as well as other comparative data. A chart is given illustrating the growth of production and exports and the variations in price of tea during the previous 15 years.

Importance of the Spanish nut trade, C. J. JONES (*U. S. Dept. Com., Bur. Foreign and Dom. Com., Com. Rpts. No. 55 (1920)*, pp. 1314-1320).—A consular report on the nut industry in Spain, consisting mainly of production and export statistics.

Teas' hybrid catalpa, D. F. JONES and W. O. FILLEY (*Jour. Heredity*, 11 (1920), No. 1, pp. 16-24, figs. 6).—A contribution from the Connecticut State Experiment Station. The authors first discuss the origin and characteristics of the Teas natural hybrid catalpa. An account is then given of a cross made by H. K. Hayes in 1911 between the supposed parents, *Catalpa bignonioides* and *C. kaempferi*, of the Teas hybrid.

Observations were made by the authors relative to the growth and character of the parent species and the hybrid. The data secured show that the resulting form coincides with the Teas hybrid in all its characters, including its greater vigor of growth and hardiness and more showy inflorescence than the parent forms, thereby confirming the supposed parentage of the Teas hybrid.

The best of our newer and rarer foliage trees, P. KACHE (*Mitt. Deut. Dendrol. Gesell.*, 28 (1919), pp. 213-254).—Notes on new or little known ornamental trees and shrubs.

Notes on the genus Dahlia, with descriptions of two new species from Guatemala, W. E. SAFFORD (*Jour. Wash. Acad. Sci.*, 9 (1919), No. 13, pp. 364-373, figs. 4; *abs. in Jour. Heredity*, 11 (1920), No. 1, p. 48).—A contribution from the Bureau of Plant Industry of the U. S. Department of Agriculture.

The author points out the inadequate botanical classification of our garden forms of dahlias, and suggests a revision of the genus based on the study of material collected in the elevated regions of Mexico and Central America, where the plants are endemic, rather than upon garden-grown specimens. Two new ornamental species, *Dahlia popenovii* and *D. maxonii*, collected in Guatemala by W. Popenoe and W. R. Maxon, respectively, are described. Plants of the latter species, which is known as the tree dahlia, grow to the height of from 8 to 15 ft. This tree dahlia is extensively used in Guatemala for hedges, and the buds and young shoots eaten as greens.

FORESTRY.

Forestry and a forest policy for New York, H. P. BAKER (*N. Y. Forestry*, 7 (1920), No. 1, pp. 24-31).—A discussion of the importance of forestry to New York, including a résumé of the points that should be included in the development of a forestry policy for the State.

Notable things accomplished by the Pennsylvania Department of Forestry since its establishment, to date (*Forest Leaves*, 17 (1920), No. 7, pp. 99-101).—A concise enumeration of the more important achievements in Pennsylvania along the lines of general forest administration, silviculture, forest legislation, and forest education.

Forest legislation in the returned territory, R. TRIFONE (*R. Ist. Super. Forestate Naz. Firenze* [Pub.], 3 (1919), pp. 87).—A contribution from the Superior Institute of Forestry at Florence, Italy. It comprises a study of forest legislation under Austrian rule in the territory returned by Austria to Italy, with special reference to its application to this region as an Italian province.

The forest experiment station's thinning areas, G. SCHOTTE (*Statens Skogs-förs. Anst.* [Sweden], *Flygbl.* 11 (1918), pp. 7, figs. 7).—Instructions are given for the use of the forest staff in making timber surveys.

Influence of the forests upon the climate, J. HANN (*Mitt. Deut. Dendrol. Gesell.*, 28 (1919), pp. 110-116).—A partial review of the literature on the subject.

The forests of Buchanan County, Va., W. G. SCHWAB (*Va. Geol. Survey Bul.* 18 (1918), pp. 251-270, pls. 7).—An account of the forests of Buchanan County, Va., discussing forest types, distribution and classes, commercial species, past and present methods of lumbering, lumber and other products, stumpage values, reproduction and rate of growth of young stands, forest fires, and the future of the forests and lumber industry.

The application, adaptation, and usefulness of exotic trees in Westphalia, H. GRAF ZU STOLBERG (*Mitt. Deut. Dendrol. Gesell.*, 28 (1919), pp. 100-106).—Notes on the adaptation of a large number of exotic coniferous and deciduous trees to Westphalian conditions.

First inventory of the woods and other forest products of Tonkin, A. CHEVALIER (*Bul. Écon. Indochine, n. ser.*, 21 (1918), Nos. 131, pp. 497-524; 132, pp. 742-884, pl. 1; 22 (1919), No. 137, pp. 495-535).—The inventory is based on missions to Tonkin undertaken by the author in 1913 and again in 1917 and 1918, as well as on available literature.

Part 1 contains a general account of the existing forests and forest types, examines the causes leading to the devastation of the forests, and suggests the organization of a forest service for the development of adequate administration, rational exploitation, and forest research, with the view of insuring a future supply of forest products for local needs and for export trade. Part 2 comprises an inventory of the forest species by families, information being given when known relative to the scientific and native nomenclature, distinguishing characteristics, dimensions, and geographic distribution of the species, as well as the properties, uses, and market value of the wood. Part 3 deals with minor forest products and also contains a density table for the woods of Tonkin, together with an index of the woods included in the inventory.

The Venezuelan mahogany, a hitherto undescribed species of the genus Swietenia, H. PITTIER (*Jour. Wash. Acad. Sci.*, 10 (1920), No. 2, pp. 32-34).—An account is given of study by the author of a tree which has been considered as identical with *S. mahogoni*, but which he describes as a new species and to which the name *S. candollei* is given. It is found in Venezuelan forests, and was formerly planted extensively in hedges and in parks and along streets.

Rubber research in the Dutch East Indies, T. PETCH (*Trop. Agr. [Ceylon]*, 54 (1920), No. 1, pp. 6-9).—A list, compiled from the *Nederlandsch-Indisch Rubber Jaarboek*, is given of experiment stations and estates now engaged in rubber research in the Dutch East Indies.

Note on the mechanical strength and seasoning properties of Shorea robusta (sal) timber, R. S. PEARSON (*Indian Forest Rec.*, 7 (1919), No. 6, pp. 26).—In continuation of a previous memoir (*E. S. R.*, 30, p. 239) the results are given of hardness, toughness, and seasoning tests conducted with various samples of sal timber grown in different localities in the Central and United Provinces of India.

How lumber is graded, H. S. BETTS (*U. S. Dept. Agr., Dept. Circ.* 64 (1920), pp. 39, figs. 10).—A summary and discussion of the grading rules adopted for various hardwood products by the National Hardwood Lumber Association, together with the grades adopted for the various softwood lumber products by the principal lumber associations and descriptions of typical grading rules of several of the most important commercial species.

DISEASES OF PLANTS.

Report of [New York] bureau of plant industry, G. G. ATWOOD (*N. Y. State Dept. Farms and Markets, Ann. Rpt.*, 1 (1918), pt. 1, pp. 114-130).—Portions of this report relate to inspection of shipments and orchards; to measures for preventing the spread of the white-pine blister rust and the alternate currant rust; and to the control of apple scab. A summary is given of work undertaken by the plant pathologist, and an account of new insects and diseases appearing during the year.

Report of the division of plant pathology and botany, J. MATZ (*Ann. Rpt. Insular Expt. Sta., Dept. Agr. and Labor, Porto Rico, 1919, pp. 33-36*).—Brief notes are given on the occurrence of a large number of diseases.

Preliminary to more extended studies of some of them, an investigation has been conducted on the root diseases of sugar cane which showed that *Rhizoctonia* and *Pythium* may produce decay of roots in a few days, while *Marasmius* did not appear to produce any appreciable change in growing roots. A species of *Sclerotium* was also studied and found capable of infecting leaf tissue and to cause decay of rootlets. Some attention was paid to means of transmission of yellow stripe disease, and of 35 plants inoculated by injecting juice from diseased plants, all but 4 remained free from infection.

The author reports the presence of a black spot of grapefruit which is due to a slow-growing fungus, and that *Phytophthora terrestris* was found in association with foot rot of citrus trees. Studies are also reported of the rots of coconut, avocado, and cacao, which are apparently due to a species of *Diplodia*.

Mycologist's report on a visit to Trinidad, W. NOWELL (*Proc. Agr. Soc. Trinidad and Tobago, 19 (1919), No. 6, pp. 141-159*).—This is an account of a study during the period December, 1918, to February, 1919, of conditions in Trinidad as regards matters connected with diseases of economic plants, such as blight of sugar cane and root disease of coconuts, the latter of which he believes to be caused by fungi closely allied to *Marasmius* or *Odontia*. Factors named and discussed as locally influencing disease include cultural and soil conditions, climate, froghopper insect attack, rotation, sanitation, and marring.

North American rusts on Cyperus and Eleocharis, F. D. KERN (*Mycologia, 11 (1919), No. 3, pp. 134-147*).—In addition to lists of known hosts, descriptions are given of *Puccinia canaliculata*, *P. antioquiensis*, *P. cyperi*, *P. eleocharidis*, and *Uromyces eleocharidis*; of the new combination *P. cyperi-*

tagetiformis; and of the new species *P. abrepta*, *P. liberta*, and *Uredo incomposita*. Five names are excluded for reasons given.

Treatment of cereal seeds by dry heat, D. ATANASOFF and A. G. JOHNSON (*Jour. Agr. Research [U. S.]*, 18 (1920), No. 7, pp. 379-390, pls. 2).—In investigations carried on at the Wisconsin Experiment Station for the control of certain seed-borne diseases of cereals, the authors conducted a series of experiments in which barley, wheat, rye, and oats were subjected to high temperatures.

It was found that seed of these cereals, especially of good quality and well dried, was able to withstand protracted exposures to dry heat at comparatively high temperatures. It was shown that the bacterial blight of barley due to *Bacterium translucens* and the bacterial blight of oats caused by *Pseudomonas avenæ* may both be eliminated by exposing the infected seed to dry heat at temperatures which will still leave the seed viable. Experiments also indicated that a number of seed-borne diseases, such as wheat scab (*Gibberella saubinetii* and *Fusarium* spp.) and spot blotch of barley (*Helminthosporium sativum*), may be practically eliminated by the dry heat treatment, while net blotch of barley due to *H. teres* and the stripe disease (*H. gramineum*) and *Helminthosporium* blotch of oats caused by *H. avenæ sativæ*, as well as loose smut of barley and smuts of oats, are markedly reduced by the dry heat treatment without materially injuring the germination of the seed.

Broken stem disease of rye, F. DETMERS (*Mo. Bul. Ohio Sta.*, 4 (1919), No. 8, pp. 262, 263, figs. 2).—The author describes a disease of rye which has heretofore not been reported in Ohio. The disease is said to be due to a species of *Mycosphaerella*, and is characterized by a uniformly grayish-brown discoloration of the lower internodes of the rye stalk. When split open, the stalk shows that the infection causes a brown dry rot appearance of the inside, and the cells are packed with the threads of the fungus. Stalks which do not break, bend and lie almost flat. The heads are not directly affected, but fail to develop to normal size, some of them producing no normal kernels while others may produce a few plump ones. Attention is called to this disease in order that additional information may be obtained regarding it.

"Take-all" disease of wheat in Virginia, W. J. SCHOENE (*Quart. Bul. Va. State Crop Pest Comm.*, 1 (1920), No. 4, pp. 22, 23).—An account is given of the discovery, in September, 1919, of wheat take-all in a field in Roanoke County. A brief note relates also to the introduction of this disease into this country, supposedly from Australia, as flag smut was found in the same field in Illinois.

Studies on the winterkilling of wheat, R. SCHANDER and E. SCHAFFNIT (*Landw. Jahrb.*, 52 (1918), No. 1, pp. 1-66, fig. 1, pls. 4).—This is a report of investigations bearing upon the freezing and frost-killing of plants; chemical-physiological processes, and physical changes in the cell contents under low temperatures; the cold resistance of certain wheat varieties; and predisposing factors in winterkilling.

The new sugar cane disease, J. A. STEVENSON (*Rev. Agr. Puerto Rico*, 1 (1918), No. 1-2, pp. 18-25, figs. 2).—A mosaic disease of sugar cane is described as showing a whitish-yellow mottling or variegation, the appearance and progress of which may cause it to be confused with other diseases or anomalies of the sugar cane plant, such as chlorosis. The variety Otaheite is specially susceptible to this disease. No causal parasite has been demonstrated. The disease is propagated in cuttings. Selection of uninfected stock for planting is of prime importance. Resistance to the disease is also important.

[The yellow stripe or sugar cane disease], F. S. EARLE (*Ann. Rpt. Insular Expt. Sta., Dept. Agr. and Labor, Porto Rico, 1919, p. 18*).—The author reports

that the yellow stripe or sugar cane mosaic disease, which was only recently discovered (E. S. R., 38, p. 150), has spread throughout Porto Rico so that probably four-fifths of the cane fields are now more or less invaded by it. Directions for the control of the disease have been given (E. S. R., 41, p. 347), and it is said that these recommendations are being adopted by many plantations with gratifying results.

Root disease in sugar cane (*Roy. Bot. Gard. Kew, Bul. Misc. Inform., No. 10 (1919), p. 452*).—This is a brief discussion of the report by Nowell noted on page 643.

Diseases [and other injuries in Montana orchards], A. L. STRAUZ (*Bien. Rpt. Mont. Bd. Hort., 10 (1917-18), pp. 11-16, figs. 2*).—In a report including important insect pests and diseases of plants, it is stated that apple leaf scab (*Venturia pomii*) is prevalent throughout the western portion of Montana, causing losses annually amounting to thousands of dollars. It is said to be the most destructive plant disease in the State.

Fire blight (*Bacillus amylovorus*) was more prevalent in 1918 than in 1917, but does not now seriously injure the fruit industry. Root gall and crown gall (*Pseudomonas tumefaciens*) are present in some degree in all orchards, dwarfing and stunting the trees affected. Silver leaf does comparatively little damage. Root rot or crown rot (cause not definitely known) is showing its effects in many orchards, but generally on few trees.

Physiological troubles, as briefly discussed, include winter injury, malnutrition, and brown bark spot.

Spraying experiments for black spot and powdery mildew, J. M. WARD and P. H. THOMAS (*Agr. and Stock Dept. Tasmania, Bul. 74 (1918), pp. 10*).—As a result of a series of experiments rather preliminary in character, it was found that the best results as regards control of apple black spot came from the use of Bordeaux mixture at the 4:4:40 strength if applied when most of the bloom buds were well open, earlier or later sprays being much less effective.

Powdery mildew was controlled more effectively by using commercial atomic sulphur than by the use of lime sulphur. There is no resulting injury to the foliage, if applied in proper strength, when the bud scales are first released and again when the trees are in leaf; that is, 1 lb. for 10 gal. water for the first spray, and 1 lb. for from 10 to 16 gal. for the second, according to the condition of the trees following the first spraying.

Cedar rust and cedar eradication, W. J. SCHOENE (*Quart. Bul. Va. State Crop Pest Comm., 1 (1920), No. 4, pp. 15-18*).—An outline is given of progress in the removal of cedars from the vicinity of orchards, and in general of co-operation for protection against infection of apple by the rust fungus in the counties of Augusta, Albemarle, Botetourt, Clarke, Frederick, Rockingham, and Shenandoah.

Diseases and insect troubles of raspberries and their control, A. FRANK (*Washington Sta., West. Wash. Sta. Mo. Bul., 7 (1920), No. 11, pp. 188-192, figs. 6*).—A popular description is given of a number of the more common diseases and insect pests of the raspberry, and suggested methods are given for their control so far as definite means are known.

Treatment for Cycloconium of olive, A. ROLET (*Jour. Agr. Prat., n. ser., 32 (1919), No. 20, pp. 413-415*).—This is a review of work by several authors on treatment for black scale (*Lecanium oleæ*), fumagine (*Fumago vagans*, *F. salicina*, *Capnodium oleophilum*) and Cycloconium (*C. oleaginum*) of olive.

The fungus diseases of the avocado, J. B. RORER (*Bul. Dept. Agr. Trinidad and Tobago, 18 [1919], No. 3, pp. 132, 133, pls. 2*).—The only serious disease attacking the fruit of the avocado up to this time is the so-called anthracnose.

This is said to be caused by a fungus closely related to or identical with the organism previously noted as causing anthracnose of mango (E. S. R., 35, p. 153).

Avocado die-back is of frequent occurrence throughout the Colony. This is due to *Diplodia cacaoicola*, which also causes die-back of cacao and of rubber. It is thought to enter by way of very young tissues through wounds made by the anthracnose fungus, growing then rapidly down the tree and killing back the shoots for a distance of two or three feet from the tip. The same fungus also attacks budded avocados.

A summary of the citrus canker investigation in south Alabama, G. L. PELTIER (*Proc. Gulf Coast Hort. Soc.*, 4 (1918), pp. 21, 22).—Having contributed articles (E. S. R., 39, pp. 757, 857) regarding the susceptibility and resistance of citrus to canker and the overwintering of the canker organism, the author states that during the past two years an attempt has been made to perfect a method for the consistent isolation of the canker organism from the soil, in order to determine whether it will live in the soil, and if so, under what conditions. Studies are in progress on the life history and other matters regarding the organism.

Pink disease of citrus, H. A. LEE and H. S. YATES (*Philippine Jour. Sci.*, 14 (1919), No. 6, pp. 657-673, pls. 7, figs. 2).—This is an account of the discovery (in 1917) and investigation of an apparently serious stem and branch disease of citrus trees in three localities in the Philippines. The name pink disease, employed elsewhere to indicate the result of infection by *Corticium salmonicolor*, is accepted here also.

Local investigation and trial of control measures have given almost complete control of the disease at Lamao. Copper sprays, though effective against the disease, kill also the fungus parasites which keep down the scale insects. Lime sulphur, which is efficacious against both this disease and the scale insect, is recommended. It is effective at a strength of 1:40, but at 1:35 causes no injury to the foliage. The time for spraying varies with the season. Removal of affected portions is effective when combined with the spraying treatment, and the treatments are simple and comparatively inexpensive, supposedly combining readily with other methods in a general plan against other diseases on other plants.

Fungus diseases [in Ceylon, 1918] (*Year Book Planters' Assoc. Ceylon*, 1918, pp. 79-81).—Brown bast of rubber trees is thought to be present throughout the rubber-producing area, though still most abundant in the drier regions. This trouble is thought to be identical with the disease of the same name in the Federated Malay States and in Java. The treatment recommended is to scrape the diseased bark until the latex begins to flow, and then apply Brunolinum at full or half strength in order to kill the portions of the cortex in which the nodules develop. Around abnormal streaks and patches such a nodule-producing center or abnormal region is usually a group of altered latex vessels. It is stated that though nodules follow brown bast, altered particles may be produced without the previous existence of brown bast.

The root disease caused by *Poria hypobrunnea* is still comparatively rare, most cases of root trouble being due to brown root disease (*Fomes semitostus*, *F. lignosus*), and *Ustulina zonata*. It is now said that the disease attributed to a *Poria* in the Federated Malay States is really due to a *Fomes*, which has been named *F. pseudoferrens*. This has not been found in Ceylon. An extensive outbreak of *F. lignosus* occurred on stumps and logs of *Erythrina umbrosa*. *Botryodiplodia theobromae* causes the death of large numbers of tea bushes near decaying *Hevea* stumps.

Moldy rot on the tapped surface of rubber trees may be due locally to *Phytophthora faberi*, differing from the disease given the same name in the Federated Malay States. The bark decay now most prevalent in some rubber districts is that caused by the claret colored canker. A new root disease of tea (*F. applanatus*) has been noted on one estate. The fungus is said to be a common saprophyte in Ceylon, but to have been found to cause root disease of *Acacia decurrens* and *Casuarina montana*, and in South India, of coffee.

P. hypolateritia, the common root disease fungus of tea in up- and mid-country districts, has been found to spread to tea from stumps of Albizzia.

A leaf disease of coconut is briefly described as occurring in one district.

Inspection for pine blister rust, W. J. SCHOENE (*Quart. Bul. Va. State Crop Pest Comm.*, 1 (1920), No. 4, pp. 14, 15).—White pine blister rust inspection, which was continued during the summer months of 1918-19, is here briefly discussed with its bearings upon the production of white pines within the State of Virginia, which are estimated to be worth about \$10,000,000.

Treatment for chlorosis, G. ARNAUD (*Rev. Vitic.*, 51 (1919), No. 1325, pp. 325-330, figs. 2).—A treatment for chlorosis in trees of different kinds consists in piercing the trunk or larger branches with a specially adapted form of punch which removes the portion cut out, and then filling the orifice so made with a mixture of powdered iron sulphate and oil. The restorative effect is said to continue for several years.

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Specific, subspecific, and varietal categories of insects and the naming of them, W. L. MCATEE (*Ent. News*, 31 (1920), Nos. 2, pp. 46-55; 3, pp. 61-65).

On the insecticidal principle of *Chrysanthemum cinerariifolium* (insect powder), I. R. YAMAMOTO (*Ber. Ōhara Inst. Landw. Forsch.*, 1 (1918), No. 3, pp. 389-398).—The author has "isolated a yellow, transparent, neutral sirup named pyrethron as an insecticidal principle which has the saponification value 216 and iodine value 116. Pyrethron is easily saponified with alcoholic potash and loses its insecticidal power after saponification. The power of this pyrethron is reduced by heating or when exposed to the air for a long time. Pyrethron has the power to control the germination of bacteria in addition to a strong insecticidal power. In the saponification product, I have isolated higher alcohols having the formulas $C_{21}H_{44}O$ (M. P. 199° C.) and $C_{27}H_{56}O$ (M. P. 175-179°) and fatty acids, liquid and solid, having the formulas $C_{16}H_{32}O_2$ and $C_{18}H_{36}O_2$ (palmitic). Judging from these results, it is probably true that the insecticidal principle of the insect powder is ester."

Report of the entomologist, H. T. FERNALD (*Agr. of Mass.*, 1918, pp. 87-94).—This report deals with the occurrence of the more important insects of the year. Mention is made of serious injury in several places by red bugs (*Heterocordylus malinus* and *Lygidea mendax*), which have gradually increased during the last five years. The saddled prominent (*Heterocampa guttivitta*) defoliated beech, maple, and other trees, being limited almost exclusively to the hilltops in western Massachusetts, and extending from about as far north as Brattleboro, Vt., southward as far as Chester and Becket. The squash borer was unusually abundant, in one field observed all but 4 of 400 plants having been destroyed by it.

Report of the imperial entomologist, T. B. FLETCHER (*Sci. Rpts. Agr. Research Inst. Pusa*, 1918-19, pp. 86-103, pls. 3).—This report deals with the work of the year, including the occurrence of the more important insect pests, that with bees, lac, silk, etc. Among the important enemies mentioned are a

gracilariid (*Acrocercops* sp.), the larvæ of which mine under the bark of cotton at Pusa, causing the layer of bark to peel off the entire stem and even from the leaf stalks.

[**Economic insects in Tasmania**], H. M. NICHOLLS (*Agr. and Stock Dept. Tasmania, 1918, Buls. 77, pp. 9, figs. 4; 78, pp. 12, figs. 8; 1919, Bul. 83, pp. 6*).—These bulletins relate to The Codling Moth and the Powdery Mildew, Scale Insects, and the Woolly Aphis (*Eriosoma lanigera*), respectively.

Wheat insect survey for 1919, E. C. COTTON (*Mo. Bul. Ohio Sta., 4 (1919), No. 8, pp. 241-245, fig. 1*).—This is a report upon the wheat insect survey made during 1919 in continuation of that of the previous year (E. S. R., 39, p. 863), in order to obtain definite data on which to base sowing dates for the fall seeding.

The survey showed the jointworm to have been the most important insect damaging wheat, as was the case the previous year. Wheat fields in but three of the counties visited were free from the ravages of this pest, the damage varying from 1 per cent or less in some counties in the eastern part of the State to a maximum of 89 per cent in Miami County, with an average of 31.4 per cent for the 39 counties reported. No cultural or other method of control for the jointworm has been devised, since early and late planting do not yield consistent results either in nearby fields the same year nor in consecutive years in the same field.

The Hessian fly situation changed somewhat from the previous year, the greatest damage occurring farther east, particularly in the counties of Lorain, Medina, Wayne, Ashland, Richland, Knox, Huron, Erie, and Sandusky. The highest infestation was in Ashland, where counts showed an infestation of 37.9 per cent of the straws, the average for the State being 14.4 per cent. The importance of closely observing fly-free dates in seeding is emphasized, it being pointed out that the Hessian fly is very delicate in structure and a very large proportion of the flies appear and disappear within a week. Examinations of "dates of sowing" plats made during the fall of 1918 showed a decrease in the percentage of plants infested from 76 on September 2 to none on September 30 or later in Miami, from 100 per cent on September 1 to none on October 1 in Lorain and the southern part of Erie County, and a reduction to none on September 28 in Sandusky County.

The imperative necessity for cooperation in control work is called to attention, and also the fact that Miami County after suffering very severe losses from the fly for five or six successive seasons was ridded of the insect in a single season by cooperative procedure. As a control measure for the jointworm it is recommended that all wheat fields should be carefully raked while damp with dew or rain and the rakings together with down straw should be run through the separator or thrown out to the pigs or chickens.

Insects attacking squash, cucumber, and allied plants in Connecticut, W. E. BRITTON (*Connecticut State Sta. Bul. 216 (1919), pp. 33-51, pls. 8, figs. 9*).—This popular summary of information follows the plan of the account given in an earlier paper (E. S. R., 20, p. 1048) but has been revised, enlarged, and wholly rewritten.

Two new termites from Arizona, T. E. SNYDER (*Proc. Ent. Soc. Wash., 22 (1920), No. 2, pp. 38-40*).

Brief descriptions of new Thysanoptera, X, R. S. BAGNALL (*Ann. and Mag. Nat. Hist., 9. ser., 4 (1919), No. 22, pp. 253-277; abs. in Rev. Appl. Ent., Ser. A, 7 (1919), No. 12, p. 543*).—Among the 25 species here described as new are *Frankliniella varicornis* collected on *Petalostemon purpureum*, and *Euthrips cameroni* from injured wheat stems, both in Saskatchewan, Canada. The genus *Limphysothrips* is erected.

Sulphur fumigation for the control of mealy bug (*Pseudococcus bakeri*) on grapevines in the vineyard, R. L. NOUGARET (*Mo. Bul. Dept. Agr. Cal.*, 9 (1920), No. 1-2, pp. 26-31; also in *Cal. Cult.*, 54 (1920), No. 6, pp. 191, 198).—This is a summary of information on the control of *P. bakeri* by burning sulphur under the tent.

An account of this pest by the author has been previously noted (E. S. R., 40, p. 650). It is pointed out that on grape it has two distinct broods which do not overlap as when it lives on citrus and pear. "One brood, the first of the year, hatches in June and is the progeny of the overwintering larvæ; the other, the second brood of the year, hatches during September and October. After hatching, the larvæ remain in the ovisac until the following spring. . . . Therefore, it is only necessary to conduct the fumigation with the object of destroying the larvæ without taking the eggs into consideration."

The author has found that where sulphur wicks are used approximately 5 oz. are required for 100 cu. ft., and if the tent volume is 250 cu. ft., covering 4 vines and making 3 fumigations per hour per tent, the cost is 8½ cts. per vine. When refined lump sulphur is used approximately 6 oz. are required for 100 cu. ft., and for a tent of 250 cu. ft., covering 4 vines and making 2.5 fumigations per hour per tent, the cost would be 5.7 cts. per vine. Since this method of control is practically an eradication it is thought to be the most economical.

The fumigator is warned against fumigating with sulphur while the vines are in an active growing state or during the daytime. Care should be taken that the temperature does not reach too high a point, etc.

A new species of Matsucoccus from pines in California, F. B. HERBERT (*Proc. Ent. Soc. Wash.*, 21 (1919), No. 7, pp. 157-161, figs. 14).—*Matsucoccus fasciculensis*, taken from within the fascicles of digger pine (*Pinus sabiniana*) and yellow pine (*P. ponderosa*) needles in California, is described as new.

A new genus and species of coccid from Loranthus, H. MORRISON (*Proc. Ent. Soc. Wash.*, 21 (1919), No. 9, pp. 197-202, pl. 1).—Under the name *Macrocepicoccus loranthi* n. g. and n. sp. the author describes a form collected on *Loranthus* sp. at Georgetown, British Guiana.

The peach tip moth (*Laspeyresia molesta*), W. W. FROGGATT (*Agr. Gaz. N. S. Wales*, 30 (1919), No. 12, pp. 891, 892).—This pest, which first appeared in suburban gardens in New South Wales in 1909 and was thought to be the peach twig moth, has been definitely determined to be the oriental peach moth (*L. molesta*). It has spread rapidly and is now one of the important pests in the Gosford and Newcastle areas, and the author considers it only a matter of time before it will become established throughout the orchard districts of Australia. The pupa is said to be parasitized by *Gambrus stokesi*.

The green clover worm a pest of soy beans (*Plathypena scabra*), L. B. SMITH (*Quart. Bul. Va. State Crop Pest Comm.*, 1 (1919), No. 3, pp. 8, figs. 4).—This is a brief report of observations by the author, together with a review of the literature. This worm is said to have caused serious injury to soy beans throughout eastern Virginia during the season of 1919, and other legumes, including Lima and snap beans, alfalfa, and clover, were injured to some extent. Reports from other States indicate that the outbreak of this pest extended over the greater portion of the Atlantic coastal plain from Maine to Florida.

The injury is caused by the worms eating the leaves and occasionally the blossoms, usually only the softer tissues of the leaves being destroyed. The injured blossoms become brown in color and later drop off the plant.

In controlling the pest, soy beans when grown in rows for seed purposes may be sprayed with 1.25 lbs. of arsenate of lead and 2 lbs. of lime to 50 gal.

of water at any time without danger of injuring the plants. If preferred, a dusting mixture consisting of 5 lbs. of powdered arsenate of lead and 50 lbs. of land plaster or air-slaked lime may be used. It is pointed out that it is unnecessary that the sprays reach the underside of the leaves, and the ordinary potato sprayer will serve the purpose if the spray boom is raised several inches above the tops of the plants.

There is no practical method for protecting soy beans which have been sown broadcast to be used for forage. If the pest becomes abundant on clover and alfalfa, the crop should be cut at once. On snap beans the pest may be controlled in the same way as on soy beans grown in rows, the arsenical to be applied just previous to the opening of the blossoms.

Reference is made to the accounts of this pest by Chittenden (E. S. R., 13, p. 665), Britton (E. S. R., 20, p. 1048), and Hill (E. S. R., 39, p. 865).

On the life history and habits of a peach leaf miner (*Ornix* sp.), C. HARUKAWA and N. YAGI (*Ber. Ōhara Inst. Landw. Forsch.*, 1 (1918), No. 3, pp. 325-333, pl. 1).—The authors deal with a leaf miner of the peach in Japan which somewhat resembles *Ornix geminatella*, a leaf miner of the apple in the United States reported upon by Haseman (E. S. R., 35, p. 359).

This peach leaf miner has not as yet caused any great damage in Japan, but the authors are of the opinion that under favorable conditions it might become a source of severe injury, since there are four complete and one partial generation each year. While its distribution in Japan has not as yet been determined, it is known to occur in Tokyo and Okayama Prefectures.

The eggs are laid singly on the underside of the leaf, largely close to the midrib. They hatch in from three days to about two weeks, and the larva immediately begins mining the epidermis on the underside of the leaf at the point where the egg is cemented to it. At about the middle of the fourth stage the larva leaves its original mine and builds a new completely closed cell with the leaf, in which it conceals itself and continues feeding on the epidermis. When full grown the larva either spins a yellowish cocoon at one end of the mine, or it leaves the mine, folds over the edge of the leaf, and fastens the edge to the leaf surface and builds its cocoon in the recess thus made. In addition to the peach, its favorite host, the species attacks plum, cherry, Japanese flowering cherry, apple, and apricot.

Control measures include the burning of all fallen leaves to which the cocoons of the last brood may be attached and other rubbish in the orchard, stripping off the rough outer bark of the tree trunks, and the application of pyrethrum decoction oil emulsion for the adults.

The serpentine leaf miner of the peach, a species of *Lyonetia*, C. HARUKAWA and N. YAGI (*Ber. Ōhara Inst. Landw. Forsch.*, 1 (1918), No. 3, pp. 335-348, pl. 1).—The authors here report studies of the life history, habits, and natural enemies of a species of *Lyonetia* that is an important enemy of the peach in Japan. The species is thought to be distinct from the European pest, *L. clerkella*, under which name it was considered in an account of its life history by Kuwana and Takachiho in 1911.¹

This leaf miner is widely distributed in Japan, feeding exclusively on the leaf tissue of the peach. There are seven broods each year, the adults of the last brood wintering over. There are three larval instars. Several undetermined hymenopterous parasites have been reared by the authors.

Lepidoptera at light traps, W. B. TURNER (*Jour. Agr. Research [U. S.]*, 18 (1920), No. 9, pp. 475-481, fig. 1).—This is a report of observations by the Bureau of Entomology of the U. S. Department of Agriculture made at Hagerstown,

¹ Rpt. Imp. Agr. Expt. Sta. Tokyo, 38 (1911), pp. 99-102.

Md., during 1918, in continuation of work in 1916, an account of which has been previously noted (E. S. R., 39, p. 560).

The collections were made on 28 full nights between May 14 and September 13. "The total of 3,152 moths recorded for that period embraces 60 odd species. Of this total, 2,200 or 69.8 per cent are males, and 952 or 30.2 per cent are females. Tabular data give an itemized account of the species, the numbers taken of each sex, and the percentage of males and females. In two species, *Noctua c-nigrum* and *Euparthenos nubilis*, the two sexes are equally represented; and of those species of which at least five individuals were taken three show a preponderance of females." A table giving the percentage of gravid females shows that of 952 moths dissected, 736 or 77.3 per cent, were gravid, these constituting 23.35 per cent of all moths captured. Of the 11 genera of arctiids represented, all the females of 9 genera were gravid. Among the noctuids, gravid females made up 100 per cent in 8 genera.

Records of temperature and humidity presented in tabular form have led the author to conclude that the night-flying habits of the moths are but little influenced by these factors. On the other hand, such meteorological conditions as strong winds, rain, or fog materially restrict flight.

Data as to the total collection of moths, arranged by hours of collection, are presented. In the first three periods, ending at 10 p. m., there were taken 325 females, or 35 per cent of the total of 952 females and 40 per cent of the total of gravid females. In the same period, 424 males, or 19 per cent of the total males, were killed. From 10 p. m. to 4 a. m. the percentage of gravid females declined, while that of the males and spent females increased.

Some 60 odd species, representing 10 families, were taken in collections at Hagerstown in the summer of 1918. Of these at least 20 are of economic importance, and several others are likely to prove serious pests if circumstances favor them.

Further studies of *Sorosporella uvella*, a fungus parasite of noctuid larvæ, A. T. SPEARE (*Jour. Agr. Research [U. S.]*, 18 (1920), No. 8, pp. 399-439, pls. 6).—This is a detailed report of investigations conducted by the author, of the Bureau of Entomology of the U. S. Department of Agriculture, a preliminary account of which has been previously noted (E. S. R., 36, p. 757). The work has been summarized by the author as follows:

"The presence of *S. uvella*, an entomogenous fungus, is recorded for the first time in America. The previous association of *Sorosporella* with the Entomophthorales is shown to be erroneous, and the proper position of the organism, among the verticilliacious Hyphomycetes, is designated.

"The reproductive bodies are thick-walled resting spores or chlamydospores and thin-walled conidia, the latter being herein definitely associated with the life history of the organism for the first time. It is shown that yeastlike vegetative cells, existing within the blood of infected insects, are ontogenetically related to other phases in the development of the organism. There is an ingestion of these vegetative cells by certain of the blood corpuscles (phagocytosis), the process being apparently followed by the destruction of the phagocytes. This phenomenon has, up to the present time, been overlooked by those investigators who have studied the fungus diseases of insects.

"The organism is readily cultivated on artificial nutrients and exhibits two quite different types of growth when grown on favorable media. In certain cases, both when the fungus was grown on media and when the resting spores were placed in a moist chamber, fruiting structures of the *Isaria* type developed. No perfect or ascigerous condition has been observed. The disease caused by the organism is readily transmitted to healthy insects, and in labo-

ratory experiments a mortality of from 60 to 90 per cent may be readily obtained."

District of Columbia Diptera: Asilidæ, W. L. MCATEE and N. BANKS (*Proc. Ent. Soc. Wash.*, 22 (1920), Nos. 1, pp. 13-20; 2, pp. 21-33, figs. 2).

Life history of Eubiomyia calosomæ, a tachinid parasite of Calosoma beetles, C. W. COLLINS and C. E. HOOD (*Jour. Agr. Research [U. S.]*, 18 (1920), No. 9, pp. 483-497, pls. 2).—This is a report of biological studies by the Bureau of Entomology of the U. S. Department of Agriculture of *E. calosomæ*, a native tachinid parasite, which is known to occur in New England as far north as York County, Me., and Merrimack County, N. H.; as far west as Worcester County, Mass.; and as far south as Plymouth County, Mass., and Providence County, R. I. Since first reared from *Calosoma calidum* by Burgess in 1896, it has been reared from adults of *C. sycophanta*, *C. frigidum*, and *C. calidum* collected in the field. Larvæ of *C. sycophanta*, *C. frigidum*, and *C. scrutator* have been exposed to the flies in breeding experiments, but without results.

There are two full generations per year and a partial third under favorable conditions. The eggs hatch in from 3 to 24 hours, the larvæ develop in from 9 to 12 days, and the pupæ in from 9 to 18 days, making it possible for a generation to develop fully in from 20 to 25 days. It hibernates in the second larval instar within the body cavity of *Calosoma* adults, in the soil.

During the seasons from 1915 to 1918, over which period a study was made of its life history, the highest parasitism upon *C. sycophanta* was 3.4 per cent in 1916 and an average of 4.4 per cent upon *C. calidum* for a period of years. "The abundance of the parasite of the summer generations occurs at a time when adults of *C. sycophanta* and other species of *Calosoma* are beginning to enter the earth for a period of dormancy followed by hibernation. This doubtless tends to limit the opportunity for increase under present conditions. The data thus far accumulated show that the parasite has not yet caused a serious handicap to the abundance and usefulness of *C. sycophanta* in New England."

A list of 8 references to the literature is included.

Studies on the fruit flies of Japan.—I, Japanese orange fly, T. MIYAKE (*Bul. Imp. Cent. Agr. Expt. Sta. Japan*, 2 (1919), No. 2, pp. 85-165, pls. 9, figs. 5).—Reports of the presence of an orange-infesting fruit fly in the orchards of

Kiushu led to investigations by the Department of Agriculture and Commerce in 1914. Two species of fruit flies were found to occur in the orange groves of the invaded districts of Kiushu. The first of these, a species known as very injurious and identified by Kuwana in 1911¹ as *Dacus ferrugineus*, has been found by the author to represent a new species to which he gives the name *D. tsuneonis*; the other, a hitherto undescribed species, the author describes as new under the name *D. (Chaetodacus) bezzii*. *D. tsuneonis* was found by the author to be a formidable pest to the orange, but no positive proof was found that *D. bezzii*, which occurs abundantly, was a source of injury. Mention is made of the occurrence of *D. (Chaetodacus) ferrugineus dorsalis* of Hendel, a very injurious orange-infesting species, in Formosa.

The studies reported relate particularly to *D. tsuneonis* (pp. 92-146), its internal and external anatomy, life history, habits, etc. This is followed by descriptions of *D. bezzii* and four other new species which were discovered in the course of the study, namely, *Hyphenidium polyfasciatum*, *Acidia kagoshimensis*, *A. marumoi*, and *Gastrozona japonica*. The author's studies show *D. tsuneonis* to occur in at least five of the Prefectures of Kiushu, to which island it is strictly limited. Its injury usually amounts to from 10 to 20 per cent of the whole crop, and where it is severe it reaches 50 per cent. The fly usually appears at the end of June, accelerating in emergence during July and diminishing at the end of August, but its appearance is met with until September, rarely to October.

By experiments conducted in which marked flies were liberated the maximum distance traveled was 720 yds. within three days, the minimum being 360 yds. within six days.

Since the eggs are deposited in the juice sacks or between them or between the pulp and the rind, thick-skinned oranges (navel oranges, pomeloes, etc.) are usually exempt from the attack of the fly, the ovipositor possibly being unable to reach the pulp. In nature, infested oranges with a single puncture are most abundant, those with two punctures are not extremely rare, but with three punctures they are very rare. The author's observations indicate that there are from two to six eggs laid in each puncture. The period of incubation of the egg has not been determined, though in one case they did not hatch until the eighth day after deposition. The maggots usually appear at the beginning of October and by the end of the month or at the beginning of November become full grown.

"When the larva has nearly eaten up the contents of the originally infested carpel, it enters the adjoining carpel and then to the next, according to the size of the fruit, activity of the larva, and the duration of the larval period. From two to ten carpels are infested by a single maggot. In kumquats the boring is irregular, and usually the seeds are eaten." The oranges begin to fall in October and continue until November. The larvæ soon leave the fruit and enter the ground to a depth of 1 or 2 in. and pupate.

No parasites of importance have as yet been found. Capturing the adult flies by a special apparatus, collecting and treating infested fruit, and picking up the pupæ are practiced in infested localities. The author's recommendations are as follows: "Adults should be captured as early as possible in the season of their appearance; infested fruits should be picked up as quickly as possible; infested oranges should be utilized as raw material for the preparation of citric acid; the construction of storehouses for oranges should be improved; and a full knowledge of the present species should be diffused among local orchardists."

A bibliography of 32 titles is appended.

¹ Rpt. Imp. Agr. Expt. Sta. Tokyo, 38 (1911), pp. 109-112.

Work and parasitism of the Mediterranean fruit fly in Hawaii during 1918, H. F. WILLARD (*Jour. Agr. Research [U. S.]*, 18 (1920), No. 8, pp. 441-446).—This is a report by the Bureau of Entomology of the U. S. Department of Agriculture on the status of the parasitism of *Ceratitis capitata* in Hawaii by *Opius humilis*, *Diachasma tryoni*, *D. fullawayi*, and *Tetrastichus giffardianus* in continuation of the yearly records (E. S. R., 40, p. 62). It shows the extent of parasitism during 1918, the amount of infestation by *C. capitata* for the same period, and, for the purpose of comparison, gives general summaries of parasitism and infestation during 1916 and 1917.

While the parasitism by both *D. fullawayi* and *T. giffardianus* was less in 1918 than in 1917, the total percentage of parasitism for the last year, on account of the increased effectiveness of *D. tryoni*, had increased 8.3, making the total parasitism for 1918, 55.8 per cent of all the fruit-fly larvæ under observation. The data recorded show that the value of these parasites as destroyers of fruit flies has consistently increased each year since their introduction, until in 1918 they caused the destruction of considerably more than half of all the fruit flies developing in fruits about Honolulu. "This great decrease in the numbers of this pest has been of direct benefit to the people of Hawaii by greatly decreasing the infestation of the fruits less susceptible to fruit-fly attack, since this class contains the majority of fruits of commercial value. It has been of value also to the fruit growers of the mainland United States by greatly decreasing the danger of the introduction of the fruit fly there."

European fruit fly in North America, J. M. ALDRICH (*Jour. Agr. Research [U. S.]*, 18 (1920), No. 9, pp. 451-473, pl. 1, figs. 7).—This is a detailed report of biological investigations during the years 1914 to 1916 by the Bureau of Entomology of the U. S. Department of Agriculture at Lafayette, Ind., of *Oscinis frit*, an insect which attacks both winter and spring wheat every year over the whole geographical range of the crop and at times has done considerable damage. A summary of the present status of knowledge of this pest abroad by Collin has been previously noted (E. S. R., 40, p. 860). In this country biological observations of it were first made by Garman in Kentucky in 1889, when he found the stems of young wheat infested, and a similar observation was made by Fletcher at Ottawa, Canada, about the same time.

The author's studies have led to the conclusion that the forms recorded from this country under the names *O. pusilla*, *O. nitidissima*, *O. carbonaria*, *O. variabilis*, *O. nigra*, and *O. soror* are all synonyms of *O. frit*.

"In the commonest form of injury minute maggots occur in young stems of wheat close to the ground. They are easily distinguished from the larvæ of the Hessian fly . . . from the fact that the larva is in the center of the stem and crawls actively when removed, whereas the Hessian fly larva is between the bases of the leaves and is extremely inactive. The *O. frit* larva often causes the central leaf to die and turn brown, those about it remaining green; this the Hessian fly larva never does."

The region of greatest abundance in this country corresponds closely with that in which winter wheat is grown, from the Great Lakes to the Ohio River and westward about as far as the Missouri. At Lafayette it winters in the larval stage in winter wheat.

Following the emergence of this brood as adults in the spring there are normally four summer broods. The data presented show an average period from adult to adult in the first summer brood of 49.7 days for 35 individuals; for the second brood, 30.3 days for 41 individuals; for the third brood, 28.5 days for 21 individuals; and for the fourth brood 45.5 days for 2 individuals.

From the records obtained the author finds the division of the entire period in its life cycle by percentage to be as follows: Preoviposition 14, egg 11, larva 50, and pupa 25. The fly deposits its eggs on the grains and grass, usually on the very young tender shoots, in which case the larva enters the shoot and feeds downward in the middle, but sometimes upon or within the glumes just after heading, in which case it eats out the soft young kernel. A very characteristic symptom of infestation in young shoots of all kinds is the dying of the central leaf while the others around it remain green. Cereals, including wheat, rye, emmer, barley, and oats, sowed in rows in the garden in late spring were infested in the order given, the wheat being much the worst infested, and oats hardly at all. The author's investigations have led to the conclusion that *O. frit* as it occurs in this country does not normally feed upon the oat at all, but that occasional individuals, when compelled, are able to do so. Sweepings show that from early summer onward the fly is much more abundant on blue grass lawns than anywhere else, but sweepings on blue grass that has begun to head, or is in a later stage, yield very few specimens, indicating that the presence of young shoots is the attraction. Sweepings on timothy in un-mixed stand yield almost no specimens at any time, indicating that it is a plant unattractive to *O. frit*. A list of the known food plants includes 20 species, on 7 of which it has been reared by the author.

Due to the difficulty in identifying it, the most that can be said of *O. frit* is that it appears to be highly parasitized by minute Hymenoptera. In regard to remedies, it is stated that the similarity of frit fly attack on wheat to that of the Hessian fly indicates that a solution of the one trouble may carry the other with it. "Wheat sown early in the fall is more infested than that sown later, so the recommendation of late sowing to escape the Hessian fly will be equally applicable for *O. frit*, but with this difference, that with the Hessian fly the possibility of infestation entirely ceases at a certain date, but with *O. frit* the chances decrease regularly until cold weather. Wheat sown in the late spring is more infested than that sown early. Continuous cropping in wheat appears to make no difference with the fly, which migrates freely for considerable distances."

A list of 24 references to the literature is included.

Biology of some Coleoptera of the families Colydiidæ and Bothrideridæ, F. C. CRAIGHEAD (*Proc. Ent. Soc. Wash.*, 22 (1920), No. 1, pp. 1-13, figs. 32).

Descriptions of new North American ichneumon flies, R. A. CUSHMAN (*Proc. U. S. Natl. Mus.*, 55 (1919), pp. 517-543, fig. 1).—The genera *Chrysopoctonus* and *Cryptohelcostizus* are erected and 14 species described as new. The species of economic importance are *Habrobracon politiventris*, *Ænoplex polychrosidis*, *Spilocryptus exannulatus*, and *Glypta mutica* from the grape berry moth at North East, Pa.; *Chrysopoctonus patruelis* from *Chrysopa* sp. at Alhambra, Cal.; *Helcostizus rufiscutum* from *Phlæsinus* sp. at Cypress Point, Monterey, Cal.; *Cryptohelcostizus rufigaster* from *Chrysobothris mali* and *Agrilus angelicus* at Harold, Cal.; and *Mesoleius balteatus* from *Ametastegia glabrata*, at Wenatchee, Wash.

Descriptions of seven new species of Opus (Hymenoptera-Braconidæ), A. B. GAHAN (*Proc. Ent. Soc. Wash.*, 21 (1919), No. 7, pp. 161-170).—The species here described as new are *Opus cupidus*, thought to parasitize *Pegomyia hyoscyami* at Brooklyn, N. Y.; *O. turneri*, reared from dipterous leaf miners on cowpeas at Greenwood, Miss.; *O. downesi*, from the apple maggot at Victoria, B. C.; *O. richmondi* and *O. lectus*, collected on blueberry "barrens" at Cherryfield, Me., and may be parasitic on the apple maggot; and *O. trinidadensis* and *O. cereus* from *Anastrepha* spp., Trinidad, British West Indies.

Revision of the parasitic chalcidoid flies of the genera *Homalotylus* Mayr and *Isodromus* Howard, with descriptions of two closely related genera, P. H. TIMBERLAKE (*Proc. U. S. Natl. Mus.*, 56 (1919), pp. 133-194, pls. 4).—The genera *Anisotylus* and *Brethesia* are erected, and 11 species and 2 subspecies are described as new. The species of economic importance described as new include *Homalotylus mexicanus*, reared from material of *Ceroputo yuccæ* on agave, Guadalajara, Mex.; *H. quaylei*, reared from citrus mealy bug material from Sicily, Italy, probably from a coccinellid host; *H. africanus*, reared from *Pseudococcus* material, undoubtedly from a coccinellid larva, Cape Town, South Africa; *H. cockerelli*, reared from larvæ of *Hyperaspis trimaculata* associated with *Dactylopius confusus* on *Opuntia* or collected at *Dactylopius* colonies on *Opuntia* at Brownsville, Tex., etc.; *H. affinis*, reared from larvæ of *Hyperaspis osculans* in colonies of *D. confusus*, at Uplands, Cal.; *H. brevicauda*, reared from a scymnine larva associated with *Orthezia* sp. on *Hymenoclea monogyra*, Durango, Mex.; *H. hyperaspidis*, reared from larvæ and pupæ of *Hyperaspis undulata*, Utah and California; *Anisotylus similis texanus*, collected on sorghum heads at San Antonio, reared from a pupa of *Hyperaspis bigeminata* at Austin, and from an undetermined coccinellid larva at Brownsville, Tex.; *A. similis utahensis*, reared from larvæ of *Scymnus americanus* and *S. lacustris* at Murray and Salt Lake City, Utah; and *Brethesia latifrons*, reared from material of the cottony cushion scale, Mendoza, Argentina.

Polyembryony and sex, J. T. PATTERSON (*Jour. Heredity*, 10 (1919), No. 8, pp. 344-352, figs. 10).—The author reports studies of the polyembryonic broods of three species of parasitic Hymenoptera, namely, *Copidosoma gelechiæ*, which is found in the larvæ of the Solidago gall moth (*Gnorimoschema salinaris*); *Paracopidosomopsis floridanus*, which oviposits in the egg of the cabbage looper; and *Platygaster* sp., which is found in the larvæ of two dipterous gall makers of the mountain cedar (*Sabina sabinoides*), namely, *Walshomyia texana* and *Rhopalomyia sabinæ*. Much of the data on the sex ratios of the three species is presented in tabular form.

Preliminary note on the life period of the bulb mite (*Rhizoglyphus echinopus*), N. YAGI (*Ber. Ôhara Inst. Landw. Forsch.*, 1 (1918), No. 3, pp. 349-360, pl. 1, figs. 8).—In this paper the author deals principally with the anatomy of the species. It molts twice in both sexes, the external sexual differences appearing in the adult. "The span of one generation is about 10 days in August, 15 days in July, and 20 days in June. Difference of the length of life depends chiefly upon temperature, which remarkably affects the embryonic development. Both canna and tree peony (*Pæonia moután*) are found to be the host of this mite."

Tropical fowl mite in the United States, with notes on life history and control, H. P. WOOD (*U. S. Dept. Agr., Dept. Circ.* 79 (1920), pp. 8, figs. 2).—This is a report of studies of *Liponyssus bursa* Berlese, two outbreaks of which have occurred in the United States, one at Beltsville, Md., and the other at Raymond, Ill. At both of these places measures were taken to eradicate the pest, which, it is thought, if once established would prove to be as serious a menace to the poultry industry as is the roost mite, and possibly more so. This species is reported to occur in Africa, China, India, Mauritius, Comoro Islands, Bahamas, and South America. It was first reported in this country from Beltsville, Md., on April 2, 1917, and at Raymond, Ill., January 24, 1919. The source of the infestation could not be determined in either case.

"*L. bursa*, the tropical fowl mite, is considerably smaller than *Dermanyssus gallinæ*, the roost mite, and it moves about much faster. The posterior end of the abdomen in the female is bilobed in most specimens. The hairs on the

dorsum are longer and more prominent than in *D. gallinæ*, and the legs are smaller. *L. bursa* is found in the nests and on the fowls. *D. gallinæ* is found in cracks of the roost and building, in nests, and only sparsely on fowls. *D. gallinæ* does not deposit eggs and molt on its host; *L. bursa* does. *D. gallinæ* feeds at night; *L. bursa* may feed both night and day."

The eggs, which are laid either on the host or in the nest, hatch, off the host, in three days. Upon hatching out the larva does not feed but molts in about 17 hours, whereupon it is ready to feed. The first stage nymphs molt in from 1 to 2 days. The molting period of the second stage nymphs was not determined.

In addition to the domestic fowl it is reported to occur upon the starling, the sparrow, and one or two other hosts, and to attack man. In examinations by the author the mite was found on English sparrows on one farm adjoining the original infestation in Illinois, and in the locality studied another mite was more or less abundant in some of the English sparrow nests examined.

It is said that continuous heavy infestation of the tropical fowl mite often results in death of the fowl, and that setting hens will leave their nests if not relieved of the infestation.

"Since this mite feeds and breeds on poultry, it could be introduced readily into the country and disseminated through the shipment of infested stock. It may be stamped out either by dipping fowls in sulphur, soap, and water, or by giving them a heavy dusting with sulphur. At the same time the houses, especially the nests, floors, and dropping boards, must be treated with carbolineum. A continuous war against the English sparrow should be instituted in a locality where the mite is discovered. Nests should be robbed and destroyed by fire and the nesting places eliminated."

FOODS—HUMAN NUTRITION.

Report on food conditions in Germany, E. H. STARLING (*London: Govt. 1919, pp. 48, pls. 4*).—This report is based on observations made during two visits to Germany shortly after the armistice, the first confined to four cities in the occupied territories and the second to Berlin and Kattowitz in Upper Silesia. Data are included on the prewar food conditions in Germany, the effect of war on these conditions, the actual food supplied to the population during the war, illicit food trading, the effects of the war on the health of the working classes, the middle class and children, the effects of food shortage on efficiency and output, the mental condition of the population, and the outlook as regards food for the year 1919-20.

It is shown that, while before the war Germany produced 85 per cent of the total food consumed by her inhabitants, the cutting-off of the importation of feeding stuffs and the application of home-produced artificial manures to the manufacture of explosives resulted in a reduction of the effective quantity of live stock by 55 per cent and a diminution of the soil productivity by 40 per cent. These factors are considered largely responsible for the serious shortage of food in Germany.

"The effects of these conditions, deficient production and defective distribution, have been felt by the consuming classes, forming two-thirds of the population, and this chronic starvation has caused a great loss of body weight and diminished resistance to disease. The death rate has increased and the birth rate diminished, so that the number of deaths now considerably exceeds the number of births, and the population is diminishing in numbers. Underfeeding has caused not only inefficiency in work and a diminution of national output, but has also had a marked effect on the mentality of the people, who are

listless, apathetic, and hopeless. . . . There is a widespread increase of tuberculosis, the deaths from this disease having increased, according to the locality, from 2.5 to 6 times. The lack of milk has seriously affected the health of the children. In all classes rickets and associated diseases are of common and increasing occurrence."

The immediate needs of Germany are summarized as food for her workers, concentrated feeding stuffs and manures for her agriculture, and raw materials for her manufacturers. Of the first, the estimated need for importation in 1920 is to the value of at least 8,000,000,000 calories.

Statistical material on which this report is based is presented in a series of appendixes including, in addition to statistical tables and charts, memoranda on Agricultural Conditions in Germany, by A. P. McDougall, and on Agricultural Statistics, by C. W. Guilleband.

The food ration of the adult man, L. BINET (*Presse Méd. [Paris]*, No. 29 (1919), pp. 281, 282).—This is a résumé of a report made by J. P. Langlois at a conference of the Society of Food Hygiene (France) on the food requirements of man, as based on observations during the war and on laboratory researches.

Mess officers' manual (*Philadelphia: Lea & Febiger, 1919, pp. 192, pls. 2, figs. 3*).—This manual was prepared by officers of the Division of Food and Nutrition of the Medical Department, U. S. Army, to facilitate the work of camp nutrition officers, but is considered to be for the most part equally useful for stewards and dietitians of civil institutions. It consists of chapters on the composition of foods, selection and inspection of foods, storage of foods, digestion and absorption of foods, nutritive value of foods and their use in the diet, kitchen economy and mess management, the duties of mess officers, and a glossary.

Nutrition during childhood, P. NOBÉCOURT (*Presse Méd. [Paris]*, No. 65 (1919), pp. 653-655).—This is a general discussion of the food requirements of children from 2.5 to 15.5 years of age. The ill effects of undernutrition are illustrated by the condition of the children of Lille after three years of inferior rations during the war. The rations were said to be of low calorific value, rarely exceeding 1,600 calories, and to be deficient in assimilable protein and fat. The result was an almost universal retardation of growth and development, not only physical but psychic. A large percentage of the population from 10 to 20 years of age showed tuberculosis lesions.

Principles of general physiology, W. M. BAYLISS (*London and New York: Longmans, Green & Co., 1918, 2. ed., rev., pp. XXIV+858, figs. 263*).—In this revision of the volume previously noted (*E. S. R.*, 34, p. 777) a few changes have been made, the bibliography has been brought up to date, and a new section on the transport of carbon dioxide in the blood has been added.

The food industry, K. VON BUCHKA (*Das Lebensmittelgewerbe. Leipzig: Akad. Verlagsgesell., 1918, vol. 3, pp. XL+678, figs. 60; 1919, vol. 4, pp. XI+412, figs. 22*).—In these volumes of the treatise on the food industry, the first volume of which has been previously noted (*E. S. R.*, 32, p. 854), the subjects and contributing authors are as follows:

Vol. 3, Introduction on The Importance of Chemical Research in the Food Industry, by T. Paul (pp. XVII-XL); Grains, Milling Products, Starches, Bread and Pastry Materials, and Legumes, by R. Fritzweiler (pp. 5-306); Spices, by E. Küster (pp. 311-362); and Drinking and Mineral Waters, by L. Grünhut (pp. 367-678).

Vol. 4, Milk and Milk Products, by Teichert (pp. 1-134); Sweetening Agents, by W. Lange (pp. 139-228); and Beer, by G. Bode (pp. 233-412).

Food chemistry in 1917, J. RÜHLE (*Ztschr. Angew. Chem.*, 32 (1919), Nos. 4, Aufsatz., pp. 9-14; 6, pp. 17-21; 8, Aufsatz., pp. 27-31; 10, Aufsatz., pp. 36, 37).—This is an extensive survey of the literature of 1917 on food chemistry. Following a review of special legislation in Germany regarding substitutes, adulterants, etc., necessitated by war conditions, the literature is reviewed under the headings of general chemistry of foods; apparatus and methods; milk and cheese; butter, edible fats, and oils; flour and flour substitutes; sugar and confections; fruits; spices; coffee, cocoa, tea, and tobacco; wine; beer; preservatives; and fermentation chemistry.

The food value of milk, E. L. FERRY (*Connecticut State Sta. Bul.* 215 (1919), pp. 30, figs. 14).—This bulletin is essentially a transcript of an address delivered by the author at the annual meeting of the Connecticut Dairymen's Association in January, 1919. The material consists largely of a survey of the work of the station during the past few years on the constitution of the proteins, and the constitution and nutritive value of milk. Many charts and tables from the contributions which have been noted previously are here reproduced.

Milk: Its importance as food, J. F. LYMAN (*Ohio Agr. Col. Ext. Bul.*, 15 (1919-20), No. 3, pp. 2-20).—"In this bulletin an attempt is made to set forth the superior quality of milk as a food, and to emphasize its great importance as a factor of safety in the diets of all human beings, infants, children, and adults, whether sick or well."

Utilization of the shark for food and leather, A. ROGERS (*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, p. 293).—The author outlines the possibilities in the utilization of sharks—the skins to be used in the manufacture of leather, the livers rendered for their oil, and the flesh used as food and fertilizer stock. About 50 per cent of the weight of the shark is said to be edible, the fresh meat when boiled, broiled, or baked closely resembling halibut or sword fish.

Experiments with soy bean meal as a substitute in the Army ration, A. W. DOX (*Proc. Iowa Acad. Sci.*, 25 (1918), pp. 517-519).—Two tests of the suitability of soy bean meal as a substitute in the Army ration are reported.

In one case soy bean meal was used in making soup in the proportion of 1.5 oz. to a pint of boiling water. By adding beef stock and proper seasoning a very palatable soup resulted. A soy bean flour of practically the same composition as the meal was used in bread making in the proportion of 20 per cent soy bean flour and 80 per cent wheat flour. The product was darker and smaller than the corresponding wheat bread, but was of excellent flavor.

The energy content of extra foods, II, C. G. and F. G. BENEDICT (*Boston Med. and Surg. Jour.*, 181 (1919), No. 14, pp. 415-427).—Continuing the investigation previously noted (E. S. R., 40, p. 269), determinations are reported of the energy content of food materials often eaten between meals, at incidental light meals, picnics, spreads, etc. The data presented include the calorific value, as measured with the bomb calorimeter, of olives and olive products, sardines, nuts, potato chips, doughnuts, and confectionery (such as caramels, nougatines, chocolate almonds, peppermints, and a large number of candies popularly sold in portions costing one cent each). Partial reports are given on cream cheeses, popcorn, crackers, and pretzels. Weights and sizes are given of various lump sugars, and the weights of average helpings of granulated sugar.

The conclusion of the authors in the previous communication, that the energy value of the ordinary portions of the so-called extra foods is not without significance and should not be disregarded, is confirmed by the additional data here presented as shown by the following examples.

An average sized olive furnished from 8 to 10 calories, extra large olives from 14 to 15 calories, and small olives, including stuffed varieties, 4 or 5 calories. An average sized can of American sardines furnished about 500 calories, with from 15 to 26 gm. of protein. About 150 calories were furnished by 10 half-walnuts and 60 calories by 10 peanut kernels. Doughnuts averaged about 200, educator wafers 11, and pretzels 19 calories apiece. Individual caramels averaged over 45, chocolate almonds about 13, and large nougatines 83 calories. The penny candies, popular with children, furnished on the average from 50 to 60 calories each, the average teaspoonful of sugar from 29 to 35 calories, and an ordinary lump of sugar about 29 calories.

In conclusion emphasis is laid upon the necessity of not underestimating the energy needs of the growing boy and girl as reflected in their seemingly insatiable appetites.

Diseases of nutrition and infant feeding, J. L. MORSE and F. B. TALBOT (*New York: Macmillan Co., 1920, 2. ed., rev., pp. X+384*).—In this second revised edition of this volume, the aim of which has been to present a detailed description of the scientific basis of rational infant feeding and of its application in the method of infant feeding taught in the Harvard Medical School, new data have been added bringing the literature up to April 1, 1918. The subject matter is treated under the sections of physiology and metabolism, breast feeding, artificial feeding, diseases of the gastrointestinal canal, and diseases of nutrition. In the last-named section the diseases discussed include rickets, infantile scurvy, spasmophilia, and acidosis.

Treatment of the intolerance of infants for milk by the subcutaneous injection of milk, E. WEILL (*Presse Méd. [Paris], No. 60 (1919), pp. 601-604*).—The author is of the opinion that the ordinary digestive disturbances of infants, not traceable to specific organic lesions or authentic infections of the gastrointestinal tract, are due to an intolerance for milk. This intolerance is of the nature of a slight specific anaphylaxis toward the milk of the particular species employed. While it may often be avoided by substituting cow's milk for breast feeding or vice-versa, it has been found possible to overcome it entirely by injections of the milk in question.

In the author's practice the injections are made subcutaneously in the abdominal region in progressively increasing doses, starting with 0.5 cc. of the milk followed in an hour by 2 cc. and three hours later by from 5 to 10 cc. Rigorous aseptic conditions should be practiced in the preparation of the milk, which may be boiled or heated for 20 minutes to 110° F. The reaction is accompanied by slight local disturbances and often by a slight lowering of the temperature in the case of human milk and a slight elevation of the temperature with cow's milk.

Reports are given showing the results of this treatment in 8 cases selected from a much larger number, all of which responded to the treatment. The effects are said to be lasting, no return of the trouble having been noted during six months of observation.

Studies in the adaptation of an artificial food to human milk.—II, A report of three years' clinical experience with the feeding of S. M. A. (synthetic milk adapted), H. J. GERSTENBERGER and H. O. RUH (*Amer. Jour. Diseases Children, 17 (1919), No. 1, pp. 1-37, pl. 1, figs. 24*).—This paper supplements the one previously noted (*E. S. R., 34, p. 558*) by further details and slight modifications in the preparation of the artificial milk now called S. M. A., and by chemical observations made on 311 infants fed with this milk. From these observations the following general conclusions are drawn:

“It is possible to obtain an excellent nutritional result, according to our present standards, without the aid of butter fat in the food, if the food is

similar to breast milk in its protein, carbohydrate, salt, and water content, if the substituting fat contains an adequate amount of fat-soluble growth factor, and if the fat is similar to breast milk fat in other respects, namely, saponification number, iodine number, Reichert-Meissl number, and melting point, and if, further, an antiscorbutic is given with S. M. A., so long as it is manufactured as at present; that is, over the route of pasteurization or sterilization. The feeding of S. M. A. was not accompanied by the development of rickets, spasmophilia, or anemia in full-term normal infants.

"It is possible to feed, with excellent nutritional results, a large group of full-term, normal infants with S. M. A. without any qualitative change for as long a time as it is customary to keep infants at the breast. This accomplishment represents a distinct advance in practical infant feeding, inasmuch as it establishes a marked simplification of feeding, especially from the standpoint of the general practitioner and the general welfare station, and as a result of the good nutritional results obtained it represents further a substantial means for the lessening of sickness among infants, and, indirectly, of improving the health and strength of the nation."

Calcium metabolism of infants and young children and the relation of calcium to fat excretion in the stools.—II, Children taking a mixed diet, L. E. HOLT, A. M. COURTNEY, and H. L. FALES (*Amer. Jour. Diseases Children*, 19 (1920), No. 3, pp. 201-222).—In this continuation of the investigation previously noted (*E. S. R.*, 42, p. 555), the calcium metabolism of older children taking a mixed diet was investigated along similar lines with the following results:

The average absorption of calcium oxid by children on a mixed diet with adequate calcium intake was 0.055 gm. per kilogram of body weight, an amount somewhat lower than that of infants taking modifications of cow's milk. The daily excretion was correspondingly higher, averaging 0.87 gm. The average intake of calcium was lower than that in infants, the average in 79 cases being 0.108 gm. per kilogram. When the intake was 0.09 gm. per kilogram or less the percentage of the calcium intake absorbed averaged only 20.3, while when the intake exceeded 0.09 gm. per kilogram the percentage absorbed averaged 40.4. This is thought to indicate that an intake of at least 0.09 gm. of calcium oxid per kilogram is necessary to insure a good absorption by children taking a mixed diet. The best absorption of calcium occurred when the food contained from 0.03 to 0.05 gm. of calcium oxid for every gram of fat and when the fat intake exceeded 3 gm. per kilogram. The absorption of calcium was greatly increased by the addition of chalk mixture to the diet, but not by the addition of calcium acetate or phosphate.

A very small intake of calcium decreased the absorption to the point of a negative balance in some cases. The age of the child irrespective of the weight had no relation to the calcium absorption. The excretion of calcium in the stools bore some relation to the excretion of fat as soap, but none at all to the excretion of total fat. The calcium percentage of total solids in the stools was less than that of infants on modified milk and was lower in acid than in normal or constipated stools. The soap percentage of total solids followed on the average the variation in the calcium percentage of total solids.

Calcium absorption and excretion in chronic intestinal digestion, rickets, and recovery from rickets followed the same lines as in the preceding study, a low absorption and high excretion being the rule until recovery, when the reverse took place. Cod liver oil again increased the calcium absorption. The substitution of vegetable fats for milk fat had no effect upon the calcium metabolism.

The effects of a diet of polished and of unpolished rice upon the metabolic activity of *Paramecium*, M. D. FLATHER (*Biol. Bul. Mar. Biol. Lab. Woods Hole, 36 (1919), No. 1, pp. 54-61, fig. 1*).—The investigation reported in this paper was undertaken to discover the effects of the presence and absence of the vitamin contained in rice upon the metabolic activity of *Paramecium*, with a view to determining whether this vitamin is so far-reaching in its effects as to alter the metabolism of unicellular organisms.

Comparisons were made of the division rate of single individuals of pure strains of *Paramecium* for 11 days in media consisting, respectively, of 3 drops of distilled water with 1 drop of 1 per cent malted milk solution, 2 drops of distilled water with 2 drops of 1 per cent rice water made from polished rice, and 2 drops of distilled water with 2 drops of 1 per cent unpolished-rice water. It was found that the division rate with polished rice was broken and irregular, with unpolished rice fairly regular, and with malted milk very regular in daily increase in the number of divisions. "From these results it is evident that unpolished rice is much less favorable than malted milk as a culture medium for *Paramecium*, and that polished rice is quite inadequate for maintaining the vitality of the organisms. It seems probable that the essential factor lacking in the diet of polished rice is the vitamin removed in the process of polishing."

Further experiments conducted along similar lines to determine the effect of orange juice upon the metabolic activities of the *Paramecium* in the same media are reported. The orange juice was found to stimulate slightly the metabolic activities of the organism in polished rice, but to have absolutely no effect upon the division rate of those in unpolished rice. From these results it may be concluded that orange juice has not a powerful influence upon the metabolic activities of *Paramecium*.

Botulism: Preliminary report of a study of the antitoxin of *Bacillus botulinus*, E. C. DICKSON and B. M. HOWITT (*Jour. Amer. Med. Assoc., 74 (1920), No. 11, pp. 718-722*).—The experiments recorded, which were performed during the year 1917-18, are presented as a preliminary report in order to call attention to certain facts established in regard to the production and value of *botulinus* antitoxin.

The literature on the production of *botulinus* antitoxin is reviewed, and the method employed by the authors is outlined briefly. This consisted of inoculating 3 goats over a period of several months with three virulent strains of *B. botulinus*. Two of these strains, strains III and IV, were recovered from chickens poisoned with home-canned string beans (California) and with home-canned corn (Oregon), and the third strain, strain VI, from cheese (the Nevin strain). The potency of the antitoxins obtained was defined as approximately 3,000, 5,000, and 600, respectively, the number indicating the respective antitoxic equivalent in 1 cc. of serum as tested against one test dose of its homologous serum. In all the experiments the toxins and antitoxins were mixed in vitro before being injected, and all inoculations were given subcutaneously, guinea pigs being used for the standardization.

On testing these antitoxins against the action of the toxins of seven strains of *B. botulinus*, including the three from which the antitoxins were prepared, it was found that the antitoxins of strains III and IV were alike in their action and showed a protective power against three other toxins as well as their own. The antitoxin of strain VI, while not protecting against that of III, and IV, protected against its own toxin and two others. From these results the authors conclude that there are at least two types of *B. botulinus* which are distinct so far as their toxin-antitoxin relationships are concerned, as has been previously noted by Burke (*E. S. R., 42, p. 260*).

Experiments to test the effect of the administration of specific antitoxin at varying intervals after the injection of toxin were conducted upon guinea pigs. It was found that it requires at least four times as much antitoxin to neutralize one test dose of toxin *in vivo* as *in vitro*, thus necessitating the use in experiments *in vivo* of four or five times the antitoxin equivalent of one test dose of toxin calculated from experiments *in vitro*. When slightly more than one test dose of toxin was injected into guinea pigs, the lives of the animals were saved when the antitoxin was given within 18 hours after the toxin, although the onset of symptoms was not prevented even when given 12 hours after. An excess of antitoxin beyond that required to neutralize the amount of toxin administered was found to afford no greater protection than amounts just sufficient for neutralization. When a smaller amount of toxin was injected, the length of time during which the antitoxin might exert its influence was lengthened. When the toxin was administered by feeding as well as by subcutaneous injection, the administration of antitoxin was of value if given within 24 hours.

In discussing the therapeutic value of botulinus antitoxin it is pointed out that, as it is impossible to determine quickly what type of toxin is responsible for the poisoning in a given outbreak, it will be necessary to have a polyvalent antitoxin if satisfactory results are to be obtained. Since the amount of toxin ingested is unknown, large doses of the antitoxin should be given intravenously following the usual precautions for the administration of serum.

Epidemic gastroenteritis due to food poisoning, J. D. COMRIE and G. A. BIRD (*Jour. Roy. Army Med. Corps*, 33 (1919), No. 5, pp. 374-390, figs. 6).—A brief account is given of an epidemic of severe gastroenteritis occurring in one of the convalescent depots of the British Expeditionary Forces in France in July, 1918, affecting from 300 to 400 men and causing 7 deaths.

A bacillus showing the reactions of *Bacillus aertrycke* was recovered from the spleen in all the fatal cases, as well as from the feces of 6 other patients. The source of this bacillus was thought to be some meat pies made of meat cooked on the previous day and warmed up before serving, the heat of cooking probably not being sufficient to sterilize the meat and to prevent the multiplication of the bacteria with which it was infected.

The first symptoms of the disease were of violent gastrointestinal irritation followed by cardiac failure. The temperature rose at once to about 102° F., remained high for two or three days, and then fell to normal or subnormal. In the fatal cases death followed in less than ten days. Recovery in the remaining cases was extremely slow, some of the subjects being incapacitated for several months.

ANIMAL PRODUCTION.

Quantitative studies on the growth of the skeleton of the albino rat, H. H. DONALDSON (*Amer. Jour. Anat.*, 26 (1919), No. 2, pp. 237-314, figs. 24).—To study the absolute and relative growth of the separate bones or natural group of bones of albino rats and to provide norms or reference values for the skeletal parts of experimental rats, the skeletons of 106 normal individuals, ranging in age from birth to 500 days, were macerated, cleaned, disarticulated, and dried. The data are intended to supplement and in part to replace the data on the rat skeleton given in the author's memoir (*E. S. R.*, 40, p. 546).

It was found that the appendicular and the axial skeletons maintained a fairly constant ratio of weights from about the time of weaning (body weight of 15 gm.) until the end of the record. The rate of growth of the cranium

is only about 40 per cent of that of the entire skeleton. The hind limbs grow very rapidly from birth to weaning, but after that point the growth of the appendages is so closely correlated with body growth that it was found possible to compute the body weight accurately from the weight of one of the long bones, and to determine the body length by multiplying the sum of the length of two long bones by a constant factor.

Contrary to what is considered to be common opinion, it was found that the long bones are relatively more slender at maturity than at birth.

Changes in the weights of the various parts, systems and organs in albino rats kept at birth weight by underfeeding for various periods, C. A. STEWART (*Amer. Jour. Physiol.*, 48 (1919), No. 1, pp. 67-78).—The author reports data as to body development and weights of internal organs and body parts of 8 albino rats killed at birth and of 15 rats kept strictly at birth weight (by reduction in the opportunities for suckling) and killed at an average age of 16 days. Under normal feeding the body weight would have trebled in this period.

During maintenance the head increased about 45 per cent in weight, with a compensating decrease in the trunk and extremities. The body length increased 11 per cent and the tail became much elongated. The viscera increased 46 per cent, the integument 25 per cent, and the musculature and skeleton (together) 6 per cent. The rest of the body (mainly fat, body fluids, and some small glands) decreased 59 per cent. The testes made the greatest relative increase of any organ (374 per cent) while the ovaries remained practically constant (increase of 5 per cent). In these rats the testes, epididymides, eyeballs, brain, kidneys, spleen, and heart increased more markedly at the expense of the rest of the body than in the case of the rats in the author's previous experiment (*E. S. R.*, 42, p. 468), which were held less rigorously at maintenance for 3 weeks.

Recovery of normal weight in the various organs of albino rats on re-feeding after underfeeding from birth for various periods, C. M. JACKSON and C. A. STEWART (*Amer. Jour. Diseases Children*, 17 (1919), No. 5, pp. 329-352).—Data are presented as to the development of the body parts and internal organs of 31 rats maintained at nearly constant weight from birth until the age of 21, 45, or 66 days, then given ample feed for several weeks, and finally autopsied at body weights of 25 to 75 gm. The controls were normally grown individuals of the same body weights.

In general, the body parts and organs recovered their normal size particularly in the groups re-fed to the higher body weights. In the 25 gm. group the body (nose to anus) length was somewhat above and the integument below normal, while the intestines were longer than in the controls. In all groups the skeleton, brain, spinal cord, and thymus were somewhat subnormal in weight, but the empty stomach and intestines were heavier than in the controls in most cases.

The spleen and particularly the testes showed a tendency to overcompensatory growth in the earlier stages of refeeding and a retardation later. Results from the ovaries were irregular.

The effects of inanition in the young upon the ultimate size of the body and of the various organs in the albino rat, C. M. JACKSON and C. A. STEWART (*Jour. Expt. Zool.*, 30 (1920), No. 1, pp. 97-128, figs. 5).—The authors report the results of additional inanition and refeeding experiments, which differ from the series noted above in that the re-fed animals were not killed until they had attained their maximum body development. Besides groups of rats underfed from birth until the ages of 3, 6, or 10 weeks, data are included from other groups in which reduced feeding began at weaning (3 weeks) and continued in some individuals for nearly a year, and in most cases for upward

of 20 weeks. The treatment was made as severe as was experimentally possible, and over half the rats perished from starvation, 70 surviving to adult life.

The re-fed rats that survived grew variably, but failed to reach the adult size of controls from the same litters. The authors, therefore, take issue with Osborne, Mendel, et al. (*E. S. R.*, 32, p. 165; 34, p. 562) as to the possibility of permanent loss of growth capacity through quantitative reduction in diet, and point out that the Osborne and Mendel rats were put on restricted diet at a relatively late age and were allowed to increase in weight somewhat during underfeeding.

Autopsies were made on 28 of the test rats and 17 normal animals of corresponding body weight. The test animals were slightly subnormal in body length, tail length, and in weights of skeleton, integument, and musculature. The viscera weighed slightly above the normal. In general the bodies of these permanently stunted rats were normally proportioned.

The ovaries were distinctly subnormal in size, and this fact is suggested as the cause of a marked loss of fertility noted in the females when mated to normal males. On the other hand, the testes and epididymides were definitely above normal in size. Males on the average were more stunted than the females.

Effects of inanition and refeeding upon the growth of the kidney of the albino rat, J. A. KITTELSON (*Anat. Rec.*, 17 (1920), No. 5, pp. 281-297).—The author reports a quantitative study of the structure of the kidney in several young normal white rats, and in 8 individuals (from one of Stewart's inanition experiments) stunted from birth to the age of 3 or 6 weeks and then killed or re-fed.

During underfeeding, particularly when severe (maintenance at birth weight), the cortex grew much less rapidly than the medulla, but the normal proportions were restored upon refeeding. During the shorter inanition period the formation of new renal (malpighian) corpuscles apparently ceased, although rudimentary corpuscles already present continued to grow and attained a size distinctly above the normal, thereby more than compensating for the deficiency in number. However, between the third and sixth week of underfeeding the formation of new corpuscles was resumed. The corpuscles in the re-fed individuals were larger and more numerous than in the controls.

The author suggests that the disproportionate size of the corpuscles of underfed rats is to be explained by the fact that the blood which is furnished the renal tubules of both cortex and medulla passes first through the corpuscles. The latter thus have a good opportunity to secure nutritive material despite the limited supply.

The relative volumes of the cortex and medulla of the adrenal gland in the albino rat, J. C. DONALDSON (*Amer. Jour. Anat.*, 25 (1919), No. 3, pp. 291-298, figs. 4).—The body weights and the amounts of cortical and medullary tissue in the adrenal glands of 17 albino rats killed at varying ages are recorded. The volumes of the cortex and medulla were determined by reconstruction from sections of the fixed gland.

The relative volume of medullary tissue was found to decrease from birth to puberty, and then remain approximately constant. It was higher throughout life in males than in females.

The adrenalin content of the suprarenals of the female white rat, and the changes brought about by thyroid feeding and other conditions, P. T. HERRING (*Quart. Jour. Expt. Physiol.*, 12 (1919), No. 2, pp. 115-123).—Observations on 12 thyroid-fed rats and 12 controls are reported.

In normal adult female rats the adrenal glands were 40 per cent heavier than in males of the same body weight, and the adrenalin content was more than twice as great. The adrenalin content was increased during pregnancy.

The feeding of fresh ox-thyroid caused a rapid increase in the weight of the adrenals, due mainly to a hypertrophy of the cortex. Females were less tolerant to thyroid administrations than males, and the increase in the size of the gland was less marked. It is held that the maintenance of health under thyroid feeding is conditioned upon an abundant adrenalin secretion.

The postnatal development of the suprarenal gland and the effects of inanition upon its growth and structure in the albino rat, C. M. JACKSON (*Amer. Jour. Anat.*, 25 (1919), No. 3, pp. 221-289, figs. 10).—The material for this investigation consisted of the adrenal glands of 56 underfed and 52 control white rats. The rats had all been fed on graham bread soaked in whole milk, the rations being reduced in a series of maintenance and chronic inanition experiments and cut off entirely during acute inanition. The paper includes an account of the organogenesis and histogenesis of the gland and a study of the volumes of cortex and medulla, of parenchyma and vascular stroma, and of cytoplasm and nuclei.

The ratio of cortex and medulla was not materially changed in young rats stunted by underfeeding nor in adults subjected to acute or chronic inanitions, but stunted young rats showed increased vascularization in the inner cortex.

Except in the inner cortical zone the cell nuclei were found to increase only slightly in size in the course of normal growth, but the cytoplasm showed considerable growth. These relations were varied somewhat by underfeeding, the cytoplasm but not the nuclei being reduced in size.

In young rats stunted by underfeeding mitosis was almost completely suppressed. After a week's refeeding cell division had begun again, and in two weeks the normal rate was reestablished.

In stunted young rats the differentiation of liposomes (lipoidal granules or droplets) continued, and the lipochrome pigment was laid down at the normal age. Under extreme inanition the liposomes disappeared from the inner cortical layers of adult rats, but persisted in the outer cortex.

Studies on the mammary gland.—IV, The histology of the mammary gland in male and female albino rats from birth to ten weeks of age, J. A. MYERS (*Amer. Jour. Anat.*, 25 (1919), No. 4, pp. 395-435, figs. 19).—The author reports histological studies of the mammary glands of young rats from birth until after puberty, in continuation of his previous papers on the gross anatomy (*E. S. R.*, 40, p. 467).

Near the highest part of the nipple there appears a few days after birth a slight excavation, the developing milk-pore, communicating with the intra-epidermal part of the primary duct. Complete connection with the primary duct is not established until the sixth week. In later stages the milk-pore occurs near the apex of the cone-shaped nipple.

The milk ducts are for the most part lined with a two-layer epithelium, the outer layer of irregular cells and the inner (glandular) layer of cuboidal or low columnar cells. At 9 or 10 weeks some of the terminal processes show indications of developing into alveoli. The walls of the intra-epidermal part of the primary duct are lined with stratified epithelium similar to that covering the surface of the nipple.

Masses of subcutaneous fat develop soon after birth and increase in size with age. Many of the milk ducts ramify in this fat. The stroma in later stages shows a marked infiltration of fat, but specific stains failed to reveal fat in either the secretions of the milk ducts at the beginning of their normal glandular activity at the 10-week stage or in the epithelial walls.

A slight secretion was noted in the lumina of the milk ducts soon after birth, and in this connection the literature on new-born or witches' milk is reviewed.

Studies on the mammary gland.—V, The effects of inanition on the developing mammary glands in male and female albino rats from birth to ten weeks of age, J. A. MYERS (*Amer. Jour. Diseases Children*, 17 (1919), No. 5, pp. 311–328, figs. 16).—The author has examined the mammary glands of a number of Stewart's rats underfed from birth.

In animals held at birth weight and killed at various ages up to 3 weeks, the milk ducts grew very little during the first week and afterwards growth seemed completely inhibited. In animals allowed to reach the normal weight of a week-old rat (about double the birth weight) in from 33 to 65 days, the milk ducts were not so well developed as in normal individuals of the same weight. This was particularly noticeable in the case of a female killed at 65 days (normally the time of puberty and a period of very active proliferation of mammary tissue); her mammary glands differed from those of a new-born rat only in having somewhat more elongated ducts. Approximately the same development of the ducts was shown by another female allowed to reach the normal 2 weeks' weight in 70 days.

The lumen of the primary duct in the underfed rats did not communicate with the milk pore until the tenth week. The nipple grew very little during inanition, being elevated above the surface only slightly in young rats starved for 8 to 10 weeks. The epithelial processes failed to develop much beyond the stage reached at birth, and the sulcus around the base of the nipple remained shallow. The subcutaneous fat in the neighborhood of the milk ducts soon decreased after severe underfeeding.

The oestrous cycle in rats, J. A. LONG (*Abs. in Anat. Rec.*, 15 (1919), No. 6, p. 352).—The author recognizes four stages, numbered from 0 to 3, in the estrual cycle of rats. In stage 0 the uterine mucosa is greatly thickened as the result of mitoses, in stage 1 the dry cornified layer is exposed by the stripping off of the outer cells, in stage 2 there is a loosening of the cornified cells with the formation of a cheesy secretion, and in stage 3 an invasion by leucocytes, disappearance of the cornified cells, and desquamation of the deeper noncornified layers. The uterus in stages 0 and 1 is distended by a clear fluid that apparently increases the activity of spermatozoa. Copulation takes place during stage 1, and ovulation at the end of 2 or somewhat later.

Five days is considered the normal length of the estrual cycle, but during the first few weeks after puberty and following infertile copulations the cycles are longer, while suckling was found to delay the second post partum ovulation for upward of 40 days.

Stimulation of the cervix of the uterus by inserting a glass rod during stage 1 was found to prolong the following cycle, and it is suggested that the vaginal plug may act in this mechanical way.

See also a previous note (E. S. R., 40, p. 663).

Studies on the ovary of the spermophile (*Spermophilus citellus tri-decemlineatus*) with special reference to the corpus luteum, D. DRIPS (*Amer. Jour. Anat.*, 25 (1919), No. 2, pp. 117–184, figs. 29).—The cycle of changes occurring annually in the ovaries of the spermophile, which ovulates but once a year, are presented with detailed histological descriptions of the corpus luteum. Three stages in the development of the latter are recognized (1) extending throughout most of the gestation period and characterized by a granular secretion in the protoplasm of the luteal cells, (2) from shortly before parturition until about six weeks afterward, in which the luteal cells are filled with lipid droplets, and (3) the regression phase. The luteal cells are considered to be transformed granulosa cells, the cells of the internal theca contributing only to the connective tissue and vascular network. Ovulation

does not take place without coitus, but fertilization is not necessary for the normal development of corpora lutea after ovulation.

Several series of surgical operations on female spermophiles were carried out. Removal of the uterus after conception produced no change in the corpus luteum cycle, but the mammary glands did not enlarge. The removal of both ovaries during early pregnancy caused degeneration of the placentas and fetuses, and abnormal involution of the uterus. During the last half of pregnancy it induced abortion, but involution was normal. That these results were not due to operative trauma is shown by the fact that removal of a single ovary interfered in no way with gestation. Double ovariectomy in nonpregnant animals caused a very gradual functional atrophy of the uterus.

It is concluded that the corpora lutea produce two secretions that influence the changes occurring in the uterus during pregnancy. The early secretion effects the normal implantation and development of the embryo, and the late lipid secretion helps to bring about normal involution of the uterus.

On the origin of the corpus luteum of the sow from both granulosa and theca interna, G. W. CORNER (*Amer. Jour. Anat.*, 26 (1919), No. 1, pp. 117-183, figs. 27).—The author presents a detailed histological study of the changes occurring in the ovary of the sow after ovulation, based upon a large amount of carefully timed material.

The membrana granulosa was found to remain intact after rupture of the Graafian follicles. Its cells increase in size without division, and their cytoplasm becomes filled with lipid substances. The author's previous suggestion (*E. S. R.*, 40, p. 663) that the granulosa cells become the larger elements (lutein cells) of the fully formed corpus luteum was confirmed. It was also found that the large lipid-laden cells of the theca interna, after being increased in number by mitosis and losing many or all of their fatty inclusions, pass into the new formed corpus luteum and become lodged between the granulosa cells throughout the whole structure.

The vaginal closure membrane, copulation, and the vaginal plug in the guinea pig, with further considerations of the oestrous rhythm, C. R. STOCKARD and G. N. PAPANICOLAOU (*Biol. Bul. Mar. Biol. Lab. Woods Hole*, 37 (1919), No. 4, pp. 222-245).—The authors record observations on the estrual cycle of the guinea pig made since their earlier communication on the subject (*E. S. R.*, 40, p. 467), including the discovery of an epithelial overgrowth ("vaginal closure membrane") which covers the orifice of the vagina during pregnancy and between periods of heat.

Ovulation was found to occur every 15 to 17 days in young females and at slightly longer intervals in older individuals. Copulation takes place at a particular stage prior to ovulation when the vagina is filled with a foamy mucous secretion and before the advent of leucocytes. The vaginal plug which forms a few moments after copulation was found to remain in the vagina only a few hours, and to be composed of desquamated epithelial cells and coagulated semen.

Interstitial cells in the gonads of domestic fowl, H. D. GOODALE (*Anat. Rec.*, 16 (1919), No. 4, pp. 247-250, figs. 4).—In the thymus and blood of several drakes and in degenerating (cystic) tubules of the testis of a Hamburg cock the author found an abundant supply of cells having the appearance, size, shape, and staining reactions of the granule-laden cells in the hen's ovary to which Boring and Pearl (*E. S. R.*, 39, p. 177) restrict the term "interstitial cells." The cells observed had all the characteristics of eosinophile leucocytes, and the author suggests that the so-called interstitial cells are also such leucocytes, an hypothesis which would explain their sporadic occurrence in the ovary. As to the clear cells of the ovary, which the author identifies with the luteal

cells of Pearl and Boring (E. S. R., 40, p. 665), "although no granules have been demonstrated the possibility must be recognized that these cells may be true interstitial cells, at least from the physiological standpoint, i. e., they may furnish an internal secretion such as is demanded of the ovary."

Glycogen in the chick embryo, H. J. ALLEN (*Biol. Bul. Mar. Biol. Lab. Woods Hole*, 36 (1919), No. 1, pp. 63-70, pls. 2).—Microchemical tests on sections of chick embryos in the early stages of incubation (up to the tenth day) revealed glycogen in small amounts and rather sporadically distributed in the body tissues, but present in the yolk-sac at all stages. It is suggested that the large reserve of energy in the yolk makes extensive storage of glycogen in early embryonic stages unnecessary.

The effect of abnormal temperatures upon the developing nervous system in the chick embryos, F. M. ALSOP (*Anat. Rec.*, 15 (1919), No. 6, pp. 307-331, figs. 13).—The author reports on the nature and extent of abnormalities developed in chick embryos (up to the age of 3 days) incubated at low (94 to 102° F.) or at high (104 to 108°) temperatures. A total of 303 eggs were used in the experiments, and there were 168 control eggs incubated normally.

Abnormalities were noted in 90 per cent of the high temperature and 67 per cent of the low temperature embryos. The high temperatures caused a rapid development of the optic vesicles and mid-brain, thus producing a large proportion of abnormalities in the brain region. Low temperatures interfered mostly with the formation of the neural tube.

Computing rations for farm animals, E. S. SAVAGE (*Cornell Reading Course for the Farm*, No. 117, rev. (1919), pp. 51-118, figs. 5).—This constitutes a second revision of Bulletin 321 of the New York Cornell Experiment Station (E. S. R., 39, p. 167), the only change noted being modifications of the table giving fertilizing constituents recovered from feeds consumed.

Stock breeding in Madagascar, G. CARLE (*Internatl. Inst. Agr. [Rome]*, *Internatl. Rev. Sci. and Pract. Agr.*, 10 (1919), No. 1, pp. 1-11).—The author discusses cattle raising in Madagascar and the possibility of a more efficient utilization of the extensive grasslands, cattle grazing being the chief industry of the island. Aside from work animals on estates and a few head kept on smaller farms to provide manure, all the cattle (estimated at 7,000,000 head) roam without shelter, receiving a minimum of care from the native herders.

The Madagascar breed is considered a zebu, as it has a hump of variable size on the withers. The cow averages 47 in. in height, the bull 49. The forequarters are well developed, but the trunk is short and the hindquarters defective, the pelvis being narrow and shorter than in any European breed. "Their facility for fattening is astonishing, as is their resistance to bad weather and drought."

General census of cattle in Mauritius, 1918, H. ROBERT (*Dept. Agr. Mauritius, Statis. Ser., Bul. 4* (1918), [English Ed.], pp. 15).—This bulletin gives the results of a census of cattle in Mauritius in August, 1918.

A slight decrease in working cattle and a large decrease (amounting to a third of the 1914 total) in dairy cattle was noted. The European war having interfered with the normal supply of cattle for slaughter from Madagascar and work animals having increased greatly in value, the demand for meat was satisfied by the slaughter of dairy stock.

The gestation of the carabao, B. M. GONZALEZ (*Jour. Heredity*, 10 (1919), No. 8, pp. 374, 375, fig. 1).—Observations made on the herd of Philippine carabao (a variety of the water buffalo, *Bos bubalus* of India and China) owned by the College of Agriculture, University of the Philippines, are recorded.

The gestation period in three cases varied from 318 to 324 days. In two of these cases the cows came in heat again 54 days after parturition. The mani-

festations of heat are obscure, and the time of estrus was determined by attempting to breed the cows every two days. No previous data on gestation in this form were found in the literature.

Simple rations v. complex rations for poultry, C. H. BURGESS and M. E. DICKSON (*Michigan Sta. Quart. Bul.*, 2 (1920), No. 3, pp. 139-141, figs. 4).—It is recorded that during the four months, November, 1916, to February, 1917, a pen (size not stated) of Single Comb White Leghorn pullets fed a scratch feed of corn and wheat and a mash of bran, oats, and meat scrap laid 97 more eggs than a similar pen fed a more complicated ration in which Kafir corn, barley, buckwheat, and sunflower seed was added to the scratch, and cornmeal, middlings, and gluten feed replaced the oats of the mash. Charts are used to compare the daily production of the two groups and to show the relation between production and temperature.

Meat scraps v. soy bean proteins as a supplement to corn for growing chicks, A. G. PHILIPS, R. H. CARR, and D. C. KENNARD (*Jour. Agr. Research [U. S.]*, 18 (1920), No. 7, pp. 391-398, pl. 1, fig. 1).—The authors report investigations at the Indiana Experiment Station as to the influence of source and proportion of protein in the feed on the growth and nitrogen metabolism of young White Leghorn chicks. The chicks were 4 weeks old when the experiment began and 30 weeks old when it terminated. Each lot, consisting of 15 chicks, was confined in a pen 4 by 6 ft. A ration composed of ground corn, cornmeal, and corn bran (10:7:3), sprouted oats, charcoal, grit, oyster shell, and a complex salt mixture was fed to one lot (control), while 12 other lots received this basal ration plus a protein supplement. The amounts of the latter were so adjusted that the added crude protein formed a definite percentage of the basal ration. Four lots derived their supplemental protein from meat scrap, 4 from soy bean meal, and 4 from both sources in equal amounts.

The control lot, which was on a protein plane averaging about 9 per cent, made an average individual gain of 47.9 gm. per period (14 days) or 1.44 gm. per gram of protein consumed. The nitrogen content of the excreta was 2.24 per cent. Similar data for the other 12 lots are assembled in the following table:

Growth and nitrogen elimination of chicks fed varying amounts of meat scrap or soy bean meal or both, in addition to a corn ration.

Protein added to basal ration.	Protein in feed (approximate).	Individual gain per fortnight.			Gain per gram of protein fed.			Nitrogen in excreta. ¹				Nitrogen waste above control lot.
		Meat scrap lots.	Soy bean lots.	Mixed protein lots.	Meat scrap lots.	Soy bean lots.	Mixed protein lots.	Meat scrap lots.	Soy bean lots.	Mixed protein lots.	Average all lots.	
P. ct.	P. ct.	Gm.	Gm.	Gm.	Gm.	Gm.	Gm.	P. ct.	P. ct.	P. ct.	P. ct.	P. ct.
5	13	87.0	89.8	90.9	1.31	1.35	1.37	2.73	2.74	2.91	2.79	24.5
10	16	85.3	104.3	101.2	.89	1.08	1.05	3.56	3.62	3.52	3.57	59.4
15	18	80.6	97.3	99.8	.85	1.03	.88	3.35	4.49	4.00	3.95	76.3
20	20	87.2	90.2	98.0	.76	.83	.83	4.44	4.42	4.92	4.59	105.0
Average	84.5	95.3	97.5	.95	1.07	1.03	3.52	3.82	3.84

¹ Average of determinations at the ages of 4, 8, 16, and 20 weeks.

The amount of feed consumed varied but little from lot to lot. It is concluded that the supplemental protein was most effective when 10 per cent was added to the basal ration, and that the meat scrap alone was inferior to the soy bean meal either alone or mixed. The authors also suggest that chicks are capable of utilizing soy bean protein to a greater extent than mammals.

The uniformity in nitrogen excretion of lots on the same protein plane despite the diverse sources of the protein is noted. "It would appear that there was no economy in nitrogen excretion at the point where the gain was most efficient . . . though such an economy might have been expected." For two of the periods separate nitrogen determinations are reported on two portions of the excreta, the portion dissolved in $N/10$ hydrochloric acid and the portion not dissolved. The nitrogen in the former is considered to represent ammonia, urea, and amino acid nitrogen, and that in the latter mainly uric acid nitrogen. On this assumption the increase in nitrogen excretion (shown in the table) that is associated with increased protein intake consists almost entirely of uric acid.

Data are also tabulated as to the proportion of ash in the excreta, and some information is given concerning an additional lot of chicks fed like one of the meat scrap lots but with the omission of the extra mineral matter. It is stated that this omission made no appreciable difference in the results.

The breed in poultry, and pure breeding, W. A. LIPPINCOTT (*Jour. Heredity*, 10 (1919), No. 2, pp. 71-79, figs. 7).—As an illustration of the point that body-shape and not pedigree is the chief criterion of breed in poultry, the case is reported of a standard-bred White Wyandotte hen. In a breeding test at the Kansas Experiment Station, this hen was found to carry the barring factor (sex-linked), and to be heterozygous for the factor (or pair of closely linked factors) which, as the author has shown (E. S. R., 39, p. 877), makes the Blue Andalusian fowl "blue." Since neither of these factors is common in White Wyandottes, it is suggested that the bird in question acquired them through breed crosses several generations back.

The relation of plumage to ovarian condition in a Barred Plymouth Rock pullet, L. J. COLE and W. A. LIPPINCOTT (*Biol. Bul. Mar. Biol. Lab. Woods Hole*, 36 (1919), No. 3, pp. 167-182, pls. 2).—The authors report the case of a Barred Plymouth Rock female that was normally feathered in early life but which during a spring molt in the pullet year developed feathers like those of a male in form and structure.

Diagnosis of ovarian tumor was confirmed by an abdominal incision made when the hen was two years old. At the time of incision the authors implanted in the body cavity a piece of the ovary of a freshly killed actively laying pullet, and also plucked the feathers from the left side of the body. The new feathers grown on the denuded area were of typical female structure, so that the bird was cock-feathered on one side and hen-feathered on the other, but the feathers on both sides were alike as to the relative widths of the white and black bars. "Although the failure of the ovary to function properly gave rise to a condition of internal secretion which led to the assumption of male plumage with respect to shape and structure of feathers, the soma was still heterozygous for the barring factor and consequently the white bars in the 'cock' feathers remained narrow as in the normal female."

The paper is a joint contribution from the Wisconsin and Kansas Experiment Stations.

Preparation of eggs for market, E. W. BENJAMIN (*Cornell Reading Course for the Farm*, No. 133 (1918), pp. 217-247, pls. 7, figs. 22).—The author discusses in considerable detail the candling, grading, and packing of eggs, and the farm conditions likely to affect the quality of eggs. Colored plates and a colored wall chart illustrate the appearance before the candle and when opened of eggs showing various defects.

Poultry in Mauritius, D. D'EMMEREZ DE CHARMOY (*Dept. Agr. Mauritius, Gen. Ser., Bul. 12* (1918), [English Ed.], pp. 39, pls. 2).—Information is assem-

bled on the anatomy, breeding, feeding, housing, diseases, and parasites of the domestic fowl, as a step toward getting the poultry industry established on the Island of Mauritius on a commercial scale.

"Attempts have often been made to introduce good breeds of poultry into Mauritius from other countries, and much money has been expended in this way, but no one has hitherto succeeded in acclimatizing any of the breeds so introduced or in obtaining cross-bred fowls suitable to local conditions.

DAIRY FARMING—DAIRYING.

Researches on the influence of the nucleoproteins of the udder on the milk secretion of the cow, R. GIULIANI (*Clin. Vet. [Milan], Rass. Poliza Sanit e Ig., 41 (1918), No. 18, pp. 453-477*).—The author reports an experiment indicating a slight transitory increase in the milk and fat production of cows following injections into the udder of small quantities of nucleoprotein derived from the udders of lactating cows.

The nucleoprotein was prepared from a potassium hydroxid extract of the udder tissue by precipitation with acetic acid, and an injection consisted of 10 cc. of a saturated solution of the precipitate in a weak aqueous solution of sodium carbonate. The injections were made on 10 successive days shortly before the evening milking.

Compared with their average records for the 10 days before and the 10 days after the experimental period, the 4 cows in the experiment showed a respective average increase of 345, 325, 260, and 240 gm. of evening milk per day. The average increase in fat percentage were 0.335, 0.2, 0.39, and 0.29, respectively. No change was observed in the percentages of protein, lactose, and ash, and the next day's morning milk of each animal was normal as to amount and composition.

Production and distribution of milk, W. ASTOR ET AL. (*[Bd. Agr. and Fisheries London], Final Rpt. Com. Prod. and Distrib. Milk, 1919, pp. 77, pls. 12*).—The committee on the production and distribution of milk, having issued three interim reports (*E. S. R., 41, p. 184*) on the war-time problems of the milk industry in Great Britain, devotes its final report mainly to questions likely to arise in the future, both during the reconstruction period and later. After considering the present state of the milk supply as to production, consumption and hygiene, and pointing out the relation between price and consumption and the necessity of reducing the cost of production, the committee discusses the means that might be taken to increase production, decrease production costs, and improve the sanitary quality of milk. Among the specific recommendations are the development of dairy research and education, formation of milk record societies and the keeping of private records, wider use of milking machines, introduction of the accredited (tuberculosis-free) herd system, a system of grading milk similar to that used in New York and other American cities, more satisfactory methods of pasteurization, delivery of milk to the consumer in bottles, increase of the area of farms under cultivation, the growing of alfalfa, increased importation of Holstein cattle, the keeping of goats by small holders, and government aid to dairy farmers in erecting suitable buildings.

The report proper is followed by a series of appendixes, mainly reports of various subcommittees. Matters discussed include the improvement of dairy stock, the handling of milk, labor problems on dairy farms, dairy education, use of milking machines, and the pasteurization of milk in Scotland. The milk regulations of various European countries and the British Colonies are summarized, and data on the cost of milk production in the United States are cited. A number of maps show the density of the human and cow populations

in England and Scotland, the distribution of creameries, cheese factories, and condenseries, and the sources of the milk supply of London.

Calculating the cost of milk production, E. G. MISNER (*Cornell Reading Course for the Farm, No. 142 (1919), pp. 199-224, fig. 1*).—The author outlines a rather complete cost accounting system "for farmers who desire to calculate and study the cost of producing milk on their own farms." The record blanks presented were not designed primarily for the use of investigators, although it is suggested that cost records be kept on the cow basis so as to facilitate comparisons between different farms. The cost data collected by the U. S. Food Administration (E. S. R., 40, p. 280) are summarized in a table.

Laws relating to milk and milk products (*Boston: Mass. State Dept. Health, 1919, pp. 26*).—This is a compilation of Massachusetts laws pertaining to the control of milk, milk products, and oleomargarin.

Municipal milk control, E. KELLY (*Milk Dealer, 9 (1919), No. 3, pp. 20, 22, 24*).—In this address, delivered at a meeting of the Association of American Dairy, Food, and Drug Officials, the author advocates standardization of municipal legislation regarding milk control, the vesting of power in the local health authorities to formulate minor regulations, and more rigorous qualifications for milk inspectors. It is held that bacteriological analysis of milk can not attain its full usefulness without farm inspection.

[Milk inspection and milk prices in Chicago] (*Rpt. and Handb. Dept. Health Chicago, 1911-1918, pp. 823-834, 890-919, 924-952, 1023-1047, figs. 13*).—These pages include (1) an account of the methods adopted by the Chicago health authorities in inspecting milk supplies and dairy farms, (2) monthly summaries from 1911 to 1918 of bacterial counts, and determinations of fat and solids-not-fat of the market milk delivered, (3) tabulations showing producers' and consumers' milk prices by months from 1907 to 1918, and (4) a short account of the Federal Milk Commission's investigation of the cost of milk production in the Chicago district (E. S. R., 41, p. 573), together with three briefs presented by the Commissioner of Health in January, 1918, on behalf of the consumers.

The movement for cooperative delivery of milk, D. W. HYDE, JR. (*Natl. Munic. Rev., 8 (1919), No. 2, pp. 195, 196*).—The author cites several cases where the dealers supplying milk to a city have adopted or at least formed plans for adopting the zone system of delivery. It is also noted that dealers have combined to organize cooperative pasteurizing plants at Riverside, Cal., and Utica, N. Y.

Milk bottle losses (*U. S. Dept. Agr., Bur. Anim. Indus., Milk-Plant Letters, 60 (1919), pp. 2; 61 (1919), pp. 2; also in Creamery and Milk Plant Mo., 8 (1919), No. 4, pp. 38, 39; and N. Y. Produce Rev. and Amer. Cream., 47 (1919), No. 24, pp. 946, 948*).—Replies are summarized from milk dealers and health officers in 86 cities (33 States) to a questionnaire sent out by the Dairy Division regarding local milk-bottle problems. Data from 50 of the dealers as to losses of milk bottles are tabulated.

Use of other dealers' bottles was reported in 72 cities and traffic in milk bottles by junk dealers in 27. Milk-bottle exchanges were operated in 33 cities. On the average the dealers purchased 1.2 bottles a month for each bottle of milk filled daily. The replacement of bottles was greater proportionally in the larger establishments, despite the fact that such concerns had relatively smaller breakage in the plant. The difference is attributed to the greater effort made by small dealers to secure the return of bottles from customers.

Systems of pasteurization (*U. S. Dept. Agr., Bur. Anim. Indus., Milk-Plant Letter 62 (1919), pp. 2; also in N. Y. Produce Rev. and Amer. Cream., 47*

(1919), No. 23, p. 888).—The results are tabulated of a survey by the Dairy Division of the pasteurization systems in use in 237 milk plants located in the larger cities of the United States. The vat system was used by 88 plants, the in-bottle system by 16, machines of the tubular type by 44, film or drum pasteurizers by 48, and kettle pasteurizers by 37, while 4 immersed the milk cans in vats of water heated by live steam. The vat and in-bottle systems were favored especially by the smaller plants. In 15 cases the flash method was used.

Remade milk and cream, H. W. REDFIELD (*N. Y. Produce Rev. and Amer. Cream.*, 48 (1919), Nos. 3, pp. 114, 116-120; 4, pp. 170, 172-175; also in *Creamery and Milk Plant Mo.*, 8 (1919), Nos. 6, pp. 50, 52, 54, 56, 58; 7, pp. 43, 44, 46, 48, 50).—The material in this paper has been noted from another source (*E. S. R.*, 40, p. 802).

Yeasts and molds in butter and cream, T. H. LUND (*Rpt. Proc. Dominion Dairy Conf. Ottawa, 1918*, pp. 59-63; also in *N. Y. Produce Rev. and Amer. Cream.*, 48 (1919), No. 6, pp. 282, 284, 286).—Results of studies on the influence of pasteurization of cream on the nonbacterial flora of butter are briefly reported.

Seven commercial samples of creamery butter from raw cream and four from cream imperfectly pasteurized by the flash method (at temperatures of 120 to 130° F.) gave an average mold count of 2,039 per cubic centimeter, and an average yeast count of 1,700. The highest mold count occurred among the samples from heated cream. Ten samples from pasteurized cream gave an average mold count of 15 (with a maximum of 110), and an average yeast count (excluding one abnormally high count) of 1,182.

In tests under experimental conditions, *Oidium lactis* spores in sour cream were completely destroyed by holding at 130° for 30 minutes or at 135° for 10 minutes. The yeast cells were less readily killed, a temperature of 145° for 30 minutes being found necessary.

The author suggests the use of mold and yeast counts as official tests for determining whether butter has been made from raw or pasteurized cream.

The deterioration of butter through the agency of *Oidium lactis*, H. M. NICHOLLS (*Agr. and Stock Dept. Tasmania, Bul. 86* (1919), pp. 4).—It is stated that *Oidium* is widely prevalent in Tasmania and is the cause of much loss to creameries. Pasteurization by the holding rather than the flash method is advocated as a control measure, for the author found that the mold survives brief exposure to temperatures of 170° F. and higher. He also found that the mold would grow in soft butter (butter with high moisture content or improperly refrigerated), and suggests that the nondevelopment of spores in butter observed by Combs and Eckles (*E. S. R.*, 39, p. 785) was due to the hardness of the medium.

VETERINARY MEDICINE.

Report of practitioners' short course in veterinary medicine (*Off. Pub. Iowa State Col. Agr.*, 16 (1919), Nos. 38, pp. 53, pls. 13; 39, pp. 95).—In continuation of the report on the short course in veterinary medicine previously noted (*E. S. R.*, 39, p. 582), lectures are presented in No. 38 on Ascariasis and Oesophagostomiasis, by W. W. Dimock (pp. 6-29) and Therapeutic Measures in the Eradication of Certain Animal Parasites, by H. D. Bergman (pp. 30-53). No. 39 includes lectures on contagious abortion and tuberculosis, as follows: The *Bacillus abortus* and Tests for the Detection of Abortion in Cattle, by C. Murray and L. E. Willey (pp. 22-25); Contagious Abortion: Its Complications and Their Treatment, by H. E. Bemis (pp. 25-28); Abortion from the Practitioner's Standpoint, by C. E. Cotton (pp. 29-43); Correlation of Our Present

Knowledge Regarding Infectious Abortion in Cattle, by V. A. MOORE (pp. 44-62); Tuberculin Tests for Tuberculosis, by R. R. BOLTON (pp. 63-69); and Tuberculosis: Its Prevalence, Lesions, and Interpretation of Tests, by V. A. MOORE (pp. 69-84).

Annual report of the Bengal Veterinary College and of the civil veterinary department for the year 1918-19, A. SMITH (*Ann. Rpt. Bengal Vet. Col. and Civ. Vet. Dept., 1918-19*, pp. [30]).—The usual annual report (E. S. R., 41, p. 680).

Annual report of the civil veterinary department Bihar and Orissa for the year 1918-19, D. QUINLAN (*Ann. Rpt. Civ. Vet. Dept. Bihar and Orissa, 1918-19*, pp. [VI]+8+XVI, pl. 1).—The usual report (E. S. R., 40, p. 183).

Report on the civil veterinary department (including the Insein Veterinary School), Burma, for the year ended March 31, 1918, G. H. EVANS (*Rpt. Civ. Vet. Dept. Burma, 1918*, pp. [6]+13, pl. 1).—The usual annual report (E. S. R., 38, p. 180).

Annual report of the Imperial Bacteriological Laboratory, Muktesar, A. L. SHEATHER (*Ann. Rpt. Imp. Bact. Lab., Muktesar, [India], 1919*, pp. 19).—This annual report for the year ended March 31, 1919, includes data on the amount of rinderpest and anthrax serums, hemorrhagic septicemia and strangles serum, and vaccines, black quarter vaccine, mallein, tuberculin, and miscellaneous vaccines manufactured and issued, and on the examination of specimens and inoculation work during the year.

Immunization of cattle against rinderpest was carried out by the serum simultaneous method on a total of 1,509 animals. Of 40 pure-bred imported animals thus treated 6 died, 4 from pneumonia and the other 2 as a result of impaction of the stomach. These experiences are thought to indicate the advisability of allowing imported animals sufficient time for acclimatization before subjecting them to simultaneous inoculation. Excluding the pure-bred stock treated, the percentage mortality of the animals thus immunized was only 0.47.

Studies on anthelmintics.—VII, A comparison of castor oil and other purgatives in connection with the administration of some anthelmintics, M. C. HALL and M. WIGDOR (*Jour. Amer. Vet. Med. Assoc., 56 (1920), No. 4*, pp. 394-399).—This is in continuation of the work previously noted (E. S. R., 42, p. 379).

"Experiments published in this paper and elsewhere show that castor oil is highly satisfactory as a purgative after oil of chenopodium, not only by virtue of its purgative properties but by virtue of a protective action aside from this. It will save the lives of animals receiving lethal doses of oil of chenopodium, when administered with the drug or an hour later, and will save animals given lethal doses of oleoresin of male fern when given with the drug.

"Calomel will also save animals when given with lethal doses of male fern. Liquid petrolatum affords but little protection against lethal doses of chenopodium and diminishes the anthelmintic efficacy. Olive oil retards the passage of chenopodium from the stomach and increases gastric absorption; it does not protect against lethal doses. Some medical men prefer magnesium sulphate to castor oil; our data on this point are inadequate. Magnesium sulphate is not well suited to dog practice."

Cresols and substitutes for cresol soaps.—I, Alkaline cresol solutions and their disinfecting power, E. HALLER (*Arb. Reichsgesundheitsamt., 51 (1919), No. 3*, pp. 556-576).—An investigation is reported of the value of preparations of cresol with sodium hydroxid as substitutes for cresol soaps as disinfectants.

It was found that by mixing certain definite proportions of sodium hydroxid solutions and cresol, cresol lyes could be obtained forming clear solutions on diluting with water. The rapidity with which the clear solution forms and the percentage of cresol in such a solution depend upon the alkali content of the cresol lye, 30 per cent of sodium hydroxid forming the clearest solution.

The high content of free alkali in such a solution is said to disqualify it from being used as a skin or wound disinfectant, but it has been found to be an excellent disinfectant for stools and other infectious waste products. For such purposes the author recommends a preparation of equal parts of a 25 per cent sodium hydroxid solution and pure cresol diluted 1:20 with water. The solution thus prepared contains 2.5 per cent cresol.

Mutual precipitation of toxins and their antitoxins: Application to the standardization of antidiphtheritic and antitetanic serums, M. NICOLLE, E. DEBAINS, and E. CÉSARI (*Compt. Rend. Acad. Sci. [Paris]*, 169 (1919), No. 26, pp. 1433, 1434).—The principle that various antitoxic serums form specific precipitates when mixed with the corresponding toxins has been applied to the standardization of antidiphtheritic and antitetanic serums as follows:

The filtrates from cultures of the organisms are saturated with anhydrous sodium sulphate, the precipitates obtained are vacuum-dried over sulphuric acid and reduced to a homologous powder, and the powder is dissolved in distilled water in the proportion of 0.8 gm. of the powder to 10 cc. of water. The toxic solution is then mixed with an equal volume of a 10 per cent solution of gelatin in physiological solution and placed in 1 cc. quantities in separate tubes, which are then placed in the refrigerator until the gelatin has solidified.

In testing the antitoxic serums, 1 cc. of the serum at varying dilutions is added to the tubes containing the gelatin-toxin mixture, and the tubes are kept at room temperature for two hours. At the end of this time, the appearance of a white ring at the juncture of the two liquids denotes a positive result. The standard values of antidiphtheritic and antitetanic serums of the Pasteur Institute (Paris) correspond in the above technique to the formation of the ring with 1 cc. of the serum diluted 1:50.

It is stated that this standardization in vitro has proved to be in absolute concordance with the usual standardization in vivo. The advantages which the new method offers are considered to be in simplicity and in economy of time, labor, and expense. It further permits studies of the progress of the antitoxic property at the beginning of the immunization, thus making possible the early elimination of horses unsuited to the production of antitoxins.

Protein fever.—The effect of egg white injection on the dog, S. J. COHEN (*Jour. Lab. and Clin. Med.*, 5 (1920), No. 5, pp. 285-294, figs. 4).—"Repeated subcutaneous injections of egg white in guinea pigs produce a constant fever, associated with most of the signs of infection. . . . Repeated subcutaneous injections of egg white in dogs do not affect the temperature curve and do not produce fever. The author is unable to explain the difference of reactions."

Contagious abortion of cattle, C. P. FITCH and W. L. BOYD (*Minn. Agr. Ext. Spec. Bul.* 28, rev. (1919), pp. 14, pls. 5).—This is a summary of information on the nature of contagious abortion, means of prevention, and treatment.

"Owing to the prevalence of abortion and the extensive distribution of the germs, together with the rarity of abortion from other causes, one is usually safe in deciding on the nature of the disease from the history and symptoms of the affected animals. A laboratory examination of the blood of heifers or cows in the light of our present knowledge seems to be of little practical value in the control of this disease. White scours and calf pneumonia are often found to coexist in herds affected with abortion, and are thought to be closely related.

"No drugs have yet been found that will cure or prevent this insidious disease, although much can be accomplished in the way of control and eradication by the proper treatment and by practicing rigid sanitary measures. As the treatment of abortion is mainly through prevention, strict hygienic measures, such as irrigating the vagina of the heifer or cow before breeding and irrigating the sheath of the bull both before and after service, should be practiced in all herds. The use of vaccines in the control of this disease is still in its experimental stage. The treatment of sterile or nonbreeding cows requires surgical knowledge, and should be attempted only by competent and skilled veterinarians. The use of white scours serum is indicated in all cases where scours of pneumonia of calves is present.

"Breeders, when purchasing animals, should inquire carefully concerning the breeding history of the particular individuals to be bought and also of the entire herd in which these animals are located."

Diagnosis of bovine contagious abortion, C. P. FITCH (*Jour. Amer. Vet. Med. Assoc.*, 56 (1920), No. 5, pp. 459-467).—The conclusions drawn by the author are as follows:

"Abortions due to other than specific biological agents are rare. The history or physical examination of cases of abortion does not in all cases furnish definite grounds for a diagnosis. They are always, however, valuable adjuncts. Abortion or the precipitation tests are of little if any value. The cultural method is an exceedingly valuable aid in determining the cause of the particular case studied. Negative results from cultures can not exclude the presence of some infective agent. The agglutination test is the most reliable of the serological methods of diagnosis. It will indicate the amount of herd infection. It will not pick individual aborters. A positive reaction to this test means past or present infection. Guinea pig inoculation is a valuable method of determining the presence or absence of *B. abortus*. Many inoculated pigs, however, die of sepsis."

The etiology of so-called infectious abortion disease of cattle, E. C. SCHROEDER (*Jour. Amer. Vet. Med. Assoc.*, 56 (1920), No. 4, pp. 369-377).—A paper presented at the twenty-third annual meeting of the U. S. Live Stock Sanitary Association in Chicago, December, 1919.

Relationship of equine and human glanders, C. D. MCGILVRAY (*Jour. Amer. Vet. Med. Assoc.*, 55 (1919), No. 6, pp. 627-634).—The author describes the clinical aspects of glanders in man and in horses, the diagnosis of the disease by outward symptoms and by the allergic reactions with mallein, and the means employed in Canada for the suppression of equine glanders.

Statistics are given showing the progress made and the compensating cost of suppressing glanders in Canada from 1905 to 1917. The number of horses examined dropped from 1,777 in 1905 to 40 in 1917, and the reactors found from 40 to none. It is stated that the complete eradication of the disease has already been accomplished in several of the Provinces.

Louping-ill: Duration of the infectivity of the ticks, S. STOCKMAN (*Jour. Compar. Path. and Ther.*, 32 (1919), No. 4, pp. 283-285).—Continuing previous work (E. S. R., 40, p. 383), experiments are reported which supply direct evidence that if the tick is the carrier the duration of infectivity is probably as long as the life of the tick in the stage of its life cycle in which it is infective. The experiments show that measures of eradication based upon the starvation of the tick are impractical on account of the long period during which pastures would have to be left idle.

Observations on recurrent ophthalmia at the veterinary bacteriological laboratory, B. E. F., Italy, and at the Central Veterinary Research Labora-

tory, Aldershot, R. H. KNOWLES (*Jour. Compar. Path. and Ther.*, 32 (1919), No. 3, pp. 192-196).—The author first reports on the symptoms of two typical severe cases of recurrent ophthalmia selected from 25 cases of the disease, one of which was thought to be suffering from a primary attack, and the other, from a second or third attack. This is followed by a report upon agglutination tests at the Central Veterinary Laboratory, with the view of determining whether a specific agglutinin for the nerve bacillus was present in the blood of horses either suffering from recurrent ophthalmia in the acute stage or in which the active symptoms of the disease had subsided.

The results show (1) that a nonspecific agglutinin for the nerve bacillus is present in the blood of almost all horses, acting in dilutions of 1 in 10, and sometimes in 1 in 20, but not in higher dilutions; and (2) that the sera of horses either in the acute stage or the quiescent stage of recurrent ophthalmia do not contain agglutinin for the nerve bacillus in excess of the amount present in sera from normal horses; or, in other words, no specific agglutinin for the nerve bacillus is produced in cases of recurrent ophthalmia.

The author concludes that "if the presence of a microorganism in the eye is the cause of recurrent ophthalmia, special technique or culture media will be necessary for its isolation. It is doubtful if the so-called nerve bacillus plays any rôle in the etiology of recurrent ophthalmia."

Rinderpest in the New Langenberg Province of German East Africa during 1917-18, H. H. CURSON (*Jour. Compar. Path. and Ther.*, 32 (1919), No. 3, pp. 197-210).—A report of observations on the nature, occurrence, etc., of this disease.

Experimental transmission of swamp fever or infectious anemia by means of insects, J. W. SCOTT (*Jour. Amer. Vet. Med. Assoc.*, 56 (1920), No. 5, pp. 448-454).—This paper, read before the fifty-sixth annual meeting of the American Veterinary Medical Association at New Orleans in November, 1919, is based upon investigations, a report of which in part has been previously noted from another source (*E. S. R.*, 41, p. 478). The author considers his experiments to furnish conclusive evidence that certain bloodsucking flies, particularly the stable fly and *Tabanus septentrionalis*, may transmit infectious anemia of the horse.

Notes on swamp fever, S. HADWEN (*Jour. Amer. Vet. Med. Assoc.*, 56 (1920), No. 5, pp. 439-443).—This paper relates to the occurrence of intestinal worms, particularly *Triodontophorus tenuicollis*, in cases of swamp fever. Thus far, however, the author has found no evidence of a definite relation between parasitic worms and swamp fever.

Trematodes produced in South African snails: Encysting cercariæ, F. G. CAWSTON (*Jour. Compar. Path. and Ther.*, 32 (1919), No. 3, pp. 210-212).—Of the various cercariæ that infest fresh-water snails of Natal and the Transvaal, the author has observed two encysting forms.

The use of carbon bisulphid in infestations with bots, *Gastrophilus* spp., M. C. HALL and L. AVERY (*Jour. Compar. Path. and Ther.*, 32 (1919), No. 4, pp. 286-290).—Previously noted from another source (*E. S. R.*, 42, p. 381).

Control of the cattle tick, T. H. JOHNSTON (*Sci. and Indus. [Aust.]*, 1 (1919), No. 7, pp. 419-425, figs. 2).—The author reports upon life history investigations of *Margaropus annulatus*. The data presented by months in tabular form show the minimum periods elapsing between the dropping or removal of the engorged female, and the earliest hatching of the eggs, and the maximum period between the dropping or removal of the engorged female and the death of all the larvæ which hatch from its eggs, no food being supplied. The data are based upon observations by trained observers stationed at Brisbane, Woolooga, Toowoomba, and West Burleigh.

A malarial parasite in the blood of a buffalo, A. L. SHEATHER (*Jour. Compar. Path. and Ther.*, 32 (1919), No. 4, pp. 223-229, pls. 2).—Previously noted from another source (E. S. R., 42, p. 381).

Potassium iodid in malnutrition of pigs, J. J. FREY (*Jour. Amer. Vet. Med. Assoc.*, 56 (1920), No. 5, p. 508).—Reference is here made to an affection among suckling pigs in the foothill district of the Sacramento Valley, in which scalded-like areas appeared around the mouth and on the face and ears when the pigs were about three days old. While retaining a good appetite they become emaciated, the skin developed a scurvy-like surface, was wrinkled all over the body, and was hard to the touch. These symptoms progressed with increasing weakness until the pigs finally lay on their sides, unable to rise, and died in the course of two days or more.

The addition of about 2 gm. of potassium iodid dissolved in water and mixed with mash fed to the sows and litters daily resulted in almost immediate improvement. This corroborates the results obtained by Hart and Steenbock, and by Welch (E. S. R., 39, p. 187).

Progress in hog cholera control, U. G. HOUCK (*Jour. Amer. Vet. Med. Assoc.*, 56 (1920), No. 4, pp. 359-368).—A paper presented at the twenty-third annual meeting of the U. S. Live Stock Sanitary Association in Chicago on December 1, 1919.

Study of the swine erysipelas bacillus, L. COTONI (*Ann. Inst. Pasteur*, 33 (1919), No. 9, pp. 634-644, pl. 1; *abs. in Rev. Bact.*, 9 (1919), No. 4, p. 89).—The author records the results of a comparative study of the morphology, cultural characteristics, and pathogenicity of 11 strains of *Bacillus erysipelatis suis*.

Joint-ill in foals: Etiology, H. MAGNUSSON (*Jour. Compar. Path. and Ther.*, 32 (1919), No. 3, pp. 143-182, figs. 9).—The author reports upon investigations conducted during the years 1915-1918 at the Bacteriological Laboratory of the Agricultural Society, Malmö, Sweden. The results of the trials with serum and vaccine treatment of joint-ill are summarized as follows:

"The prospect of successfully treating foals already infected, and showing such highly developed lesions as severe arthritis with outward fistulas, numerous intramuscular abscesses, etc., is practically nil. Foals which fall ill immediately after birth should be treated with mixed streptococci and coli serum, or coli serum alone, 50 to 100 gm. Foals older than 8 days should be given large doses (100 to 200) of streptococcus serum alone. The injections should be made intravenously.

"Preventive inoculation with a mixture of coli serum and streptococcic serum and simultaneous vaccination with streptococcic vaccines gives good results, and should be used in stables where joint-ill generally appears. Further, in cases of navel abscess, or where the navel wound has been much dirtied at birth and the navel stump shows an inflamed appearance, vaccination ought not to be neglected as, especially in streptococcic infection, the disease shows itself so late that an eventual injection with serum made immediately after birth has had time to be eliminated. Passive immunity, as is well known, seldom lasts more than three or four weeks after the injection.

"The fact, however, that the *Bacterium viscosum equi* and some other bacteria occur in foals suffering from joint-ill will reduce the chances of always getting positive results by serum treatment. One has, therefore, to reckon with a certain death rate among the foals treated with colon and streptococcus sera. We must, however, do something against such a redoubtable disease, and it is indicated to make use of what our etiological researches have disclosed and try the specific action of serum and vaccine against infection with colon bacilli and streptococci."

The findings in 73 cases of joint-ill, septicemic or pyemic, in foals caused by *B. viscosum equi* are given in an appended table, as is a 3-page bibliography.

Joint-ill in foals: Etiology and serum treatment, J. M. McFADYNEAN and J. T. EDWARDS (*Jour. Compar. Path. and Ther.*, 32 (1919), No. 4, pp. 229-283, fig. 1).—This is a report upon bacteriological examinations of the diseased joints and other parts from 35 foals that died from joint-ill in 1919, in continuation of investigations of 1918 in which 37 foals were reported upon (E. S. R., 41, p. 480).

"In 22 of the cases the liquid in the diseased joints or pus from abscesses contained abundant streptococci, occurring in a state of purity in 13 cases, and containing only a small proportion of other organisms, presumably accidental contaminations, in the remaining 9 cases. In six cases coliform bacilli were present, either in a state of purity, or so greatly outnumbering other organisms present as to indicate that they were responsible for the lesions. In one of these the other organism included a small number of streptococci. The *Bacillus nephritidis* Meyer (or *Bacterium viscosum equi* Magnusson) was found in one case, accompanied by a few impurities. In four cases organisms which could not with certainty be identified with any named species were present in a state of purity in the joints. The most interesting of these was a streptothrix, which was abundantly present unmixed with any other organisms, in the diseased joint. . . . In two cases it was found impossible to come to any conclusion regarding the nature of the infection, but in neither of these were streptococci detected.

"The number of cases examined in the two years was 72, and in 45 of these, or 62.5 per cent, streptococci appeared to be the cause of the disease, leaving 27 or 37.5 per cent caused by other organisms. This gives a much larger proportion of streptococcus infections than Magnusson [see above abstract] found in 236 cases in Sweden (36.9 per cent), but that author considered that in his series the proportion of streptococcus cases was depressed owing to the fact that fewer of the older foals were sent to him for examination, and, perhaps, also by a lowering of the mortality in cases of that kind by the antistreptococcus serum and vaccines with which the foals had been treated. It is probable that in our series the percentage of cases caused by the *B. nephritidis equi* is too low, owing to the fact that in almost all our cases the joints or other parts were forwarded because the foals had died after treatment with serum. As a rule, the foals infected with that organism die sooner than those infected with streptococci, and a smaller proportion of them would, therefore, survive until a veterinary surgeon was called in and applied serum treatment.

"Having regard to the facts, it would appear that the actual proportion of cases of joint-ill caused by streptococci is somewhere between Magnusson's figures and our own, or probably about 50 per cent."

During 1919 a specific antistreptococcus serum, using for the purpose strains of streptococci isolated from the diseased joints of foals put up in doses of 25 cc., was supplied gratis and detailed reports were received of 253 cases thus treated. In 130 of the cases the disease terminated fatally or the foal was destroyed on humane grounds when recovery appeared to be impossible. In the remaining 123 cases the foals were reported some months after treatment to have recovered, but in 7 of them the recovery was then not complete. A brief report on each of the 253 cases treated with antistreptococci serum is appended.

Of 172 cases treated with *B. abortivo equinus* in 1917, 104 died, while in 1918, 250 foals were treated with this serum and 127 died.

Diseases of domesticated birds, A. R. WARD and B. A. GALLAGHER (*New York: Macmillan Co., 1920, pp. XII+333, figs. 69*).—Following an introduction

by V. A. Moore, the successive chapters with references to the literature included take up the diseases and parasites of domestic fowl (pp. 28-225), diseases of the ostrich and canary birds (pp. 226-241, 252-260), caponizing, (pp. 302-313), killing poultry (pp. 314-322), etc. Author and subject indexes are appended.

RURAL ENGINEERING.

The elements of hydrology, A. F. MEYER (*New York: John Wiley & Sons, Inc., 1917, pp. XII+487, pls. 7, figs. 283*).—It is the purpose of this book to set forth fundamental data and considerations underlying the science of hydrology, and it is intended for the use of professional men, teachers, and students of engineering. It contains the following chapters: The atmosphere—its temperature, pressure, and circulation; water—its various states and their properties; precipitation—its occurrence and distribution; evaporation from water surfaces; evaporation from land areas; transpiration; deep seepage; run-off; stream-flow data; supplementing stream-flow data; modification of stream flow by storage; and note to teachers of hydrology.

National Forests and the water supply, S. T. DANA (*Amer. Forestry, 25 (1919), No. 312, pp. 1507-1522, figs. 32*).—A popular and well illustrated discussion is given of the relation of the National Forests to water supplies for irrigation, power development, and domestic use.

An improved weir for gauging in open channels, C. HERSCHEL (*Mech. Engin. [New York], 42 (1920), No. 2, Sect. 1, pp. 83-88*).—The results of a series of investigations on weirs, conducted at the Massachusetts Institute of Technology, are reported, during which the author devised an entirely new weir.

The tests revealed that for discharges of from 0 to 9.55 cu. ft. per second per foot of weir length, the limits covered by the experiment, the quantity of water flowing, Q , was directly proportional to the difference, d , in two pressures, one measured just upstream of the weir and corrected automatically for the velocity of approach, and the other measured at the crest. The formula for this weir is $Q=5.5 d$.

The weir, which bears no resemblance to the sharp-edged weir now in use, has a 2:1 slope of approach to the crest. The crest is made in the form of an arc of a circle, and is hollow for observing the pressure at that point. The nappe of the stream is supported for a short distance beyond the crest by another 2:1 slope. Descriptions and diagrams of the apparatus and tests, together with tabular and graphic reports of the data obtained, are included.

The discharge of smooth wood-stave pipes and wood channels, A. A. BARNES (*Engin. News-Rec., 84 (1920), No. 5, pp. 228-230*).—This is a comparison of observed and calculated velocities in large and small pipes and open conduits of different shapes, particular reference being made to the work of Scobey (*E. S. R., 36, p. 281*). The author regards the results obtained by Scobey with some suspicion, in view of discrepancies of about 17 per cent in individual tests. A warning is given regarding the difference in the conditions of flow in an unplanned wood pipe and a smooth-planned wood pipe, which is considered to be of much importance in determining discharge.

Great new irrigation and power developments, C. H. LEE (*Jour. Electricity, 44 (1920), No. 3, pp. 119, 120, fig. 1*).—Statistical data, compiled by the State Water Commission of California, are briefly reported on the resumption of activity in agricultural and hydroelectric power development during the past year. These indicate not only a return of normal activities but an increase of nearly 40 per cent over the average for the past five years, and show that in

the past six months applications have been filed contemplating active development of 26 per cent of the maximum ultimate hydroelectric power resources of the State.

Water cost of irrigation, Truckee Valley, Nev., C. A. NORCROSS (*Nev. Agr. Col. Ext. Bul. 25 (1919), pp. 31*).—This bulletin presents a study of the irrigation situation in the Truckee Valley, Nev., on a crop producing area of 33,500 acres in relation to the quantity of water applied, evaporation and transpiration loss, seepage return to the Truckee River Channel, irrigation methods practiced, and the duty of water for the general area.

From a consideration of a large number of evaporation, transpiration, and duty of water measurements, it is deduced that the minimum seasonal depth of water necessary to be applied to the area to cover evapo-transpiration and seepage is 33.39 vertical in., 77.6 per cent of which would be evapo-transpiration loss and 22.4 per cent return seepage. This would be the condition were the sloughs and water surfaces eliminated. Under existing conditions, however, the evaporation loss is subtracted from the surplus or economic head applied in irrigation while such waters are retarded in the slough and water-surface areas in transit to the river outlet. Charging such evaporation to the irrigated area, the evaporation and evapo-transpiration loss plus seepage would require a minimum application, without additional correction for economic head, of 35.1 vertical in., 77 per cent of which would represent evaporation and evapo-transpiration, and 23 per cent return seepage.

An economic head equivalent to 6.385 vertical in. of applied water in irrigation may be supplied with a net increase of 8,665 acre-ft. to the 98,006 acre-ft. minimum, representing a total diversion from the river and creeks of 106,671 acre-ft. Such 8,665 acre-ft. for the season is represented by a constant retardation of 619 acre-ft. of water during the irrigation season, returning to the river at the close thereof. Inclusive of such economic head, the average duty of water in the Truckee Valley is 38.2 vertical in. Of such applied quantity, 25.85 vertical in., or 67.6 per cent, is lost by evapo-transpiration from the irrigated area; 1.72 vertical in., or 4.5 per cent, is lost by evaporation from slough and water surfaces; 7.49 vertical in., or 19.6 per cent, returns to the river as retarded seepage; and 3.14 vertical in., or 8.2 per cent, is returned as waste water. The actual loss from evaporation and transpiration is 27.57 vertical in., the remaining 10.63 in. returning as retarded seepage and waste water to the river channel.

Relief from floods, J. W. ALVORD and C. B. BURDICK (*New York: McGraw-Hill Book Co., Inc., 1918, pp. VIII+175, pls. 2, figs. 52*).—This is a semitechnical book, the purpose of which is to outline briefly the general flood problem in all its many phases, to show what remedies can be applied, and to point out the way to the selection of the proper works. The following chapters are included: The flood problem, various means for relief, flood investigations, fundamental data, future floods, flood protection by channel improvement, and flood prevention by water storage.

The progress of the purification of water with chlorin, A. MOREAU (*Bul. Soc. Encour. Indus. Nat. [Paris], 131 (1919), No. 6, pp. 416-423, figs. 4*).—This is a review of recent developments in the methods and apparatus for the purification of water by means of chlorin.

The conclusion is drawn that treatment of water with chlorin is now a practical process, which causes a marked reduction in the number of organisms and totally destroys the coli bacilli, particularly when the water has been previously filtered for the removal of suspended matter. One of the difficulties remaining is the fact that traces of the chlorin sometimes remain in the treated

water. The use of sodium bisulphite or sodium hyposulphite has been found to successfully remove such traces of chlorine, the latter being preferred on account of its availability and low price.

The American highway problem, A. R. HIRST (*Good Roads, n. ser., 19 (1920), No. 1, pp. 1-5*).—This article deals in a rather general way with problems relating to the securing of materials, construction, labor, efficient construction organizations, and fair prices, and improved location and alignment. Particular reference is made to the work of the Bureau of Public Roads of the U. S. Department of Agriculture, and to the fixing of salaries for highway engineers, it being argued that salaries should be paid highway engineers commensurate with the type and expense of the work of which they have charge.

State highway construction in 1919 and 1920 (*Engin. and Contract., 53 (1920), No. 5, pp. 119-124*).—Data are summarized from the different States as to the nature and cost of highway construction during 1919 and the probable nature, extent, and cost of construction during 1920.

Third biennial report of the Oregon State Highway Commission, S. BENSON ET AL. (*Bien. Rpt. Oreg. State Highway Comm., 3 (1916-18), pp. 154, pls. 2, figs. 30*).—This report deals with the activities and expenditures of the Oregon State Highway Commission for the biennium ended November 30, 1918, and includes the State highway engineer's report, tabulated statements of expenditures and costs, general tabulated information and maps, and a general description of work in various counties.

It is noted that up to November 30, 1918, 15 post road projects had been submitted to the Bureau of Public Roads of the U. S. Department of Agriculture for approval. An agreement has been reached upon cooperation on 14 forest road projects. It is also noted that during the 2-year period the actual construction work undertaken and completed consisted of 50 miles of paving, 111.8 miles of macadamizing, 134.5 miles of grading, and 40 bridges and large culverts. In addition, surveys of 902 miles of State roads have been made and designs for 42 bridges prepared for county authorities. The total amount expended on road work during the period was \$3,597,982.47.

Constitution and statutes of the State of Oregon relating to roads, highways, bridges, and ferries, compiled by B. W. OLCOTT (*Salem, Oreg.: State, 1917, pp. 216*).—This is a compilation of the road laws of the State of Oregon, containing all of the general laws of the State relating to roads, highways, bridges, and ferries, which are to be found in Lord's Oregon Laws in so far as the same have not been repealed, and also all acts relating to roads, highways, bridges, and ferries which were enacted by the Legislative Assembly of the State at its twenty-sixth, twenty-seventh, twenty-eighth, and twenty-ninth biennial sessions.

Developments in New York State highway maintenance (*Engin. News-Rec., 84 (1920), No. 6, pp. 265, 266, figs. 5*).—It is stated that maintenance equipment to be employed by the New York State Highway Department will include equipment storehouses of permanent construction, converted army motor trucks, and two-wheeled coal carts for cold patching.

Two-wheeled material carriers for maintaining bituminous macadam surfaces have been found to be specially useful. The cart is used with the small concrete mixer for hauling cold patch bituminous mixtures for repairing small holes. The advantages of the device are that it is low, so that the mixer can dump directly into it, and that it is easily propelled by two men. Cold patching has been found to be very successful and is quite extensively used. Cold patch material is also being used in the State for extensive resurfacing and widening.

It is stated that conspicuous success has been attained in converting fixed-body army motor trucks into vehicles adapted to special maintenance operations.

Variable designs for county highway systems (*Engin. News-Rec.*, 84 (1920), No. 5, pp. 243, 244).—Experience with macadam roads in Monroe County, N. Y., is summarized. The county has an area of 62 square miles and approximately 1,360 miles of rural highways.

The conclusion from this experience is drawn that the original construction of crossroads in the State-county system should be of water-bound macadam, utilizing local materials to their fullest extent, maintained by surface oiling. The original construction of secondary radial roads in the State-county system should be of penetration bituminous macadam, utilizing local materials, maintained by surface oiling. The construction of main trunk line, State route, heavy hauling roads should be of rigid pavements, using the best materials that can be obtained, but varying the type to secure in each case the cheapest first-cost pavement. For these roads no choice is made between concrete, brick, sheet asphalt, asphalt block, or stone block on concrete bases.

The gradual resurfacing of the heavier traffic macadam roads with topeka mix or small brick cubes is advocated. This method was successfully utilized in the county in reducing high-surface maintenance cost where the macadam foundation was solid enough for the traffic. It is believed that the county has been better served in the past and will be best served in the future by variable road designs, using for the majority of the mileage modern macadam for the original construction, later modified, if necessary, by recapping with a lower maintenance-cost surface.

Inclined planes instead of curve suggested for highway surfaces (*Engin. News-Rec.*, 84 (1920), No. 5, p. 227, fig. 1).—A study of field conditions has shown that on nearly every road whose cross section is that of a parabolic curve the central portion is too flat, and during the rainy season water often stands along the center portion. In addition, the parabolic camber gives a constantly increasing steepness to the outer edge of the pavement. It is suggested that two plane surfaces meeting at the center would take care of drainage more effectively, since the central portion would be as well drained as that closer to the edges. The cross section could be made of two plane surfaces sloping away from the center line at the rate of $\frac{1}{4}$ in. per foot, the peak being rounded by a curve tangent a foot or two on either side of the center.

Under this plan it is noted also that when a vehicle keeps to one side of the road broad tires would be given a bearing for their full width, which is not the case with the curved surface. It was found that when 12 to 15 ton loads were hauled on a truck with 18-in. iron wheels the wheels cut into the surface of a curved concrete paving and damaged it seriously, because only the inner edges of each tire secured a bearing on the curved surface of the road.

Instructions and table for reducing labor in curve computation, J. A. LILLY (*Engin. and Contract.*, 53 (1920), No. 5, pp. 137, 138, fig. 1).—A brief mathematical analysis of vertical curves for highway purposes, from which a table for use in selecting curves is given.

Fast road-building with concrete hauled four miles (*Engin. News-Rec.*, 84 (1920), No. 6, pp. 280, 281, figs. 5).—Experience is related on the concreting of a 6-mile road under the supervision of the Illinois Division of Highways, the concrete being hauled from a central mixing plant, a distance of 2 miles.

It is stated that wet-batch haulage on this work has demonstrated the practicability of making a round trip of 4 miles in 30 minutes. While hauling

causes no segregation of the ingredients in concrete of the stiff consistency specified, a tendency of the coarse aggregate to settle is noticeable in any batch that chances to be too wet. A thorough remixing, however, is effected by the process of dumping, spreading, and tamping. It is stated that a speed of construction is being obtained with this long-distance wet haulage which compares well with the average shown by more common methods of placing concrete directly from the mixer, and the concrete is passing with no difficulty the most rigid inspection.

Charts tell cost of concrete paving, F. J. HERLIHY (*Engin. News-Rec.*, 84 (1920), No. 6, pp. 261-264, figs. 5).—Graphic data are given from which bidding prices on concrete paving contracts may be determined, covering a wide range of physical conditions and variations in wages of labor and prices of equipment.

Reinforced concrete construction.—I, Fundamental principles, G. A. HOOL (*New York: McGraw-Hill Book Co., Inc.*, 1917, 2. ed., rev., pp. X+254, figs. 111).—This is the second revised edition of this book (E. S. R., 31, p. 186), in which all references to the recommendations contained in the First Progress Report of the Joint Committee on Concrete and Reinforced Concrete have been so changed as to apply to the final recommendations of this committee. Changes have also been made in the illustrative problems which are based on these recommendations. The principal changes occur in the articles on the design of web reinforcement in beams and in the treatment of columns.

Permeability of concrete, S. BOWMAN (*Jour. Soc. Chem. Indus.*, 38 (1919), No. 17, pp. 325R-327R, fig. 1).—This article describes in outline a method of investigating (1) the comparative merits of various concrete waterproofing agents, (2) the effect of such compounds on the chemical and physical properties of Portland cement and reinforced concrete, and (3) the economic aspect of the use of such compounds. The following tests are recommended: (1) Porosity, (2) tensile strength, (3) compressive strength, (4) setting time and soundness, (5) chemical composition, (6) corrosion of reinforcement, and (7) adhesion of reinforcement.

Recent experiments with straw gas, A. R. GREIG (*Jour. Engin. Inst. Canada*, 3 (1920), No. 1, pp. 10-12, figs. 4).—This report describes experiments and apparatus used in the distillation of gas straw as done by the agricultural engineering department of the Saskatchewan University.

An average of 500 cu. ft. of gas was obtained from 100 lbs. of wheat straw. This gas has a heat value of nearly 400 B. T. U. per cubic foot. In trials with a 4-h. p. gas engine it was found that straw gas is considerably different to deal with from ordinary gasoline. A compression ratio of 5.3 was established. The indicator cards showed an explosive pressure of 260 to 290 lbs. Five b.h.p. were obtained at 500 r. p. m. with a fuel consumption of 37.5 cu. ft. per horsepower hour. Five hundred cu. ft. ran a 5-h. p. engine for 2 hours and 40 minutes. Trials with an automobile fitted with a 300-cu.-ft. bag of straw gas showed that the car could be run only a short distance without stalling. The 300 cu. ft. of gas had less heat value than 1 gal. of gasoline, and it is considered that it does not give promise of becoming a substitute for gasoline. It was further found that 450 lbs. of straw will give an amount of heat about equal to one good shovelful of coal.

Data on house heating with straw gas are also given.

A practical brake horsepower formula for internal combustion engines, H. LEMP (*Gen. Elect. Rev.*, 22 (1919), No. 10, pp. 808, 809, fig. 1; also in *Mech. Engin.* [New York], 41 (1919), No. 12, Sect. 1, pp. 959, 960, fig. 1).—The author derives a simple and practical formula for the brake horsepower of internal

combustion engines, in which all of the numerical coefficients have been combined into the single round number, 1,000,000. The formula is as follows:

For a single-acting multi-cylinder engine of the 4-stroke cycle type:

$$\frac{s \times d^2 \times n \times N \times MP}{1,000,000} = \text{BHP}$$

For a single-acting multi-cylinder engine of the 2-stroke cycle type:

$$\frac{s \times d^2 \times 2 \times n \times N \times MP}{1,000,000} = \text{BHP}$$

In these formulas s stands for stroke of piston in inches, d for diameter of piston in inches, n for number of revolutions per minute, N for number of pistons (not cylinders), and MP for mean effective pressure (MEP) in pounds per square inch of piston area multiplied by mechanical efficiency.

A specially useful form of the formula is the one which shows that the ratio of brake horsepower to the product of the mean effective pressure and mechanical efficiency is constant.

Things to consider in radiator fan design, G. W. HOYT (*Agrimotor*, 3 (1920), No. 3, pp. 45-48, figs. 5).—The author summarizes the important factors in the design of radiator fans for tractors, basing his statements on experimental results, which are graphically reported. The close relation between the water jacket, pump, radiator, and fan are pointed out.

Multiple horse hitches, W. DINSMORE (*Bien. Rpt. Kans. Bd. Agr.*, 21 (1917-1918), pp. 141-154, figs. 14).—Considerable information on the design of multiple horse hitches, based in part on work conducted at the Illinois Experiment Station, is given. Hitches designed as a result of this work are briefly described and illustrated. It is noted that in designing any hitch, due consideration must be given to the following points: (1) Number of horses required for good work, (2) equalizing the pull between the horses, (3) method of driving the horses, (4) securing favorable conditions for the horses to work under, and (5) elimination of side-draft.

The influence of speed on the draft of a plow, J. B. DAVIDSON (*Agrimotor*, 3 (1920), No. 3, pp. 13-16, figs. 5).—Tests conducted at the Iowa State College and at the University of California on the influence of speed on the draft of a plow, in which an effort was made to keep all conditions except speed constant, are reported.

It was found that an increase in the field speed from 2 to 3 miles per hour, with a general-purpose moldboard, resulted in an increase of the draft of from 8 to 12 per cent, varying with the soil, and with an increase in the amount of work of 50 per cent. Doubling the speed resulted in an increase of draft of from 16 to 25 per cent, with an increase in the amount of work of 100 per cent. The furrows were laid more smoothly and the furrow slices better pulverized at the higher speeds. It is concluded that there are no inherent difficulties in plowing stubble ground in good condition at a speed of 4 miles per hour, and that plows can be operated at even higher speeds if specially designed for such speeds.

Harvesting machines, G. COUPAN (*Machines de Récolte. Paris: J. B. Baillière & Sons, 1919, 2. ed., rev. and enl., pp. 510, figs. 359*).—This book describes the mechanical details of harvesting machines in general. It is divided into three parts. Part 1 deals with machines for the harvesting of forage and cereal crops; part 2, with machines for the harvesting of root crops; and part 3, with machines for the preparing of crops for use after harvesting, including thrashers, hullers, shellers, grinders, etc.

Economic farm buildings, C. P. LAWRENCE (*London: The Library Press, Ltd., 1919, pp. XXII+180, pls. 4, figs. 82*).—This book deals with both the design and construction of farm buildings, the former subject being treated as clearly and concisely as possible and the latter in detail, with special tabulated information for ready reference. The economic aspect in its various phases has been especially considered, as being one of the essentials of good and careful farm management. The following chapters are included: Economic principles; local conditions, customs, and variations; development of homesteads; additions and alterations; hill farm homesteads; cattle sheds; stables; piggeries; boiler house; slaughterhouse; poultry houses; food stores, barns, etc.; shedding, etc.; lighting; ventilation; water supplies; drainage; walls; paved floors, etc.; slating, etc.; carpentry; joinery; plastering and cement work; ironwork; plumbing; glazing; painting; light structures; repairs; dwelling houses; and mechanical power. It is to be noted that this book has been prepared primarily from the British viewpoint.

Poultry houses for Oklahoma, M. R. BENTLEY and C. M. SMITH (*Okla. Agr. Col. Ext. Circ. 112 (1919), pp. [7], figs. 19*).—This is a popular bulletin giving working plans and brief specifications for poultry and brooder houses considered to be best adapted for Oklahoma conditions.

Hatching eggs electrically, P. J. DENNINGER (*Jour. Electricity, 44 (1920), No. 2, pp. 73, 74, figs. 2*).—A brief description of apparatus used for the electrical hatching of eggs is given.

RURAL ECONOMICS.

Social and economic fundamentals of agriculture (In *Arbeitsziele der Deutschen Landwirtschaft nach dem Kriege*, edited by F. E. von Braun and H. Dade. Berlin: Paul Parey, 1918, pp. 23-192, 973-986).—Contributions are published here under the editorship of F. E. von Braun and H. Dade on the subjects of the Evolution of Relationships between City and Country, and of Population Policy and Military Preparation, both by C. Ballod; Property Inheritance, Transfer and Purchase, and Colonization, by H. Dade; The Agricultural Labor Situation, by A. Hoffmeister; The Importance of Agricultural Statistics, by F. Zahn; The Food Supply of the German People, I by M. Rubner, II by Backhaus; Cooperation in Agriculture Before and During the War and Its Future, by Johannssen, previously noted (*E. S. R.*, 42, p. 392); Acquiring and Administering of Cooperative Working Credit, by O. Rabe; and The Socializing Influences of Cooperation upon Rural Districts, by Rang.

Agriculture of tomorrow, FERNAND-LAURENT (*L'Agriculture de Demain. Paris: Libr. Dalloz, 1919, pp. 113+[1]*).—The author outlines the differences between the views of the French Chamber of Deputies and Senate on the question of whether compensation from the State for war losses in agricultural industries should be administered from the point of view of the social and economic interests of the State by paying the loss at its value on the eve of demobilization plus expenses of reconstruction, on condition that the beneficiary rebuild his agricultural enterprise; or from that of the individual by paying damages on either of two conditions, one that the recipient invest in agriculture, in which case he should be reimbursed for expenses incurred, the other that he should receive the amount of the loss suffered in 1914 and remain free to reinvest at will.

Other needed legislation to encourage or compel the assembling of parceled holdings and the return of farming land to cultivation, to guarantee to tenants the increase in value for which they may be responsible, to reform

laws of inheritance, holding, and transfer, and to aid the development of agricultural cooperation is made the subject of critical study.

Possibilities of increased production in our rural industries, A. J. PERKINS (*Jour. Dept. Agr. So. Aust.*, 23 (1919), No. 5, pp. 396-425).—The pre-war agricultural and pastoral revenue of the State is reviewed, and such means of increasing rural production as increasing the mean returns of existing industries and the adoption of new forms of rural enterprise are discussed, emphasizing the importance of the question of markets.

Government experimental scheme of land settlement under a colony system (*London: Bd. Agr. and Fisheries* [1919], pp. 4, figs. 2).—This pamphlet describes the small holding and profit-sharing colony systems proposed by the British Board of Agriculture and Fisheries and being tried out on three estates in England and one in Wales.

Land for settlers (*So. African Jour. Indus.*, 2 (1919), No. 11, pp. 1061-1069).—Notes are given on the Crown lands available in the Transvaal and Cape Province for stock farms and small holdings for irrigation and dry farming. Methods of tenure and purchase and the financial assistance and training offered are also noted.

Land values in France, P. CAZIOT (*Vie Agr. et Rurale*, 9 (1919), Nos. 47, pp. 337-375; 51, pp. 453-457; 52, pp. 472-475).—The author attempts to show that the apparent rise in land values has not kept pace with the changes in the purchasing power of money and that landed proprietors are bearing the burden. The facts that land sells more readily than before the war and that operators are buyers and are displacing large proprietors are pointed out. Details of the situation in various regions of France are given.

War prices and the French farmer income, J. J. NEWLIN (*Wallaces' Farmer*, 45 (1920), No. 7, pp. 534, 536, fig. 1).—The author's observations of agricultural prices in France are recorded here. He notes an average 15 per cent increase in price of land, accompanied by a 200 to 600 per cent advance in prices of farm products, particularly of live stock and oats, and a conservative attitude of the prospective French farm land buyer.

Investigations relative to agricultural profits, 1917-18 (*Ann. Agr. Suisse*, 20 (1919), No. 2, pp. [III]+66-249).—This continues statistical reports previously noted (*E. S. R.*, 38, p. 596).

The dairy farming business in western Ontario, A. LEITCH and J. C. NEALE (*Ontario Dept. Agr. Bul.* 275 (1920), pp. 24).—This bulletin sets forth the conclusions from a farm survey of the dairy farm business conditions in western Ontario during the 12-month period ended February 28, 1919, following an investigation previously noted (*E. S. R.*, 42, p. 290).

It is indicated that it is possible by employing better farming methods to raise the labor income from the small farms considerably above the average, and that for dairying purposes farms of from 61 to 75 tillable acres and 111 to 135 tillable acres are odd-sized farms requiring greater managerial ability than do farms of any other size. The labor income advances steadily with increased crop yields per acre if all other factors remain constant.

The quality of live stock is the greatest single factor in determining profit or loss in the dairy farming business, and the use of a grade or scrub sire can not be tolerated. All-year dairying has proved a most profitable feature of farm organization in this locality. It is concluded that the average man should not specialize in dairying to a greater degree than the receiving of 70 per cent of his gross revenue from the dairy herd, and that the majority of farmers in Oxford County may add to their profits by maintaining larger herds of milch cows on their present acreages. A liberal expenditure for labor and feed is advocated.

Despite the increased prices of farm products during the past few years 6 per cent of these farmers had labor incomes of less than nothing in the period covered. The average cost of production of milk on 139 Oxford County farms was \$2.64 per hundredweight, and the average selling price was \$2.36 per hundredweight. Breeding is a slower but much more profitable method of increasing milk yield per cow than is feeding, and there is danger of feeding beyond the producing capacity of cows.

Share leases for dairy farms, J. D. BLACK (*Hoard's Dairyman*, 59 (1920), No. 3, pp. 108, 109).—Some special technical features of dairy leases of various types are discussed and a form of lease is given.

The landlord's and the tenant's share, J. D. BLACK (*Hoard's Dairyman*, 59 (1920), No. 3, pp. 105, 124, 125, 132, fig. 1).—Rent is regarded as the price paid in the case of farm land for a year's use of land and improvement, determined by demand and supply and based on each year's prospective income rather than on land values. The landlord occupies the place of middleman and requires an income. It is shown that on 1,185 cash-rented farms in Wisconsin, the landlord's average net income was 2.45 per cent of the market value, or according to another study in Minnesota 2.5 per cent, and in Iowa 2.3 per cent, which figures are low considering that increase in value and interest on investment are included in the figuring. The tenant's net incomes are similar to those made by owner operators.

Some problems of share rental are briefly discussed.

Compensation for farm managers, A. BOSS (*Hoard's Dairyman*, 59 (1920), No. 3, pp. 110, 111).—A profit-sharing contract is presented as having proved effective in instances where it was tried. The terms are illustrated with a case wherein A provides a farm of 320 acres fully stocked and equipped and valued at \$50,000; B and his wife agree to work for \$55 a month and board, and 25 per cent of the difference between the receipts and expenses at the end of the year. Under this proposal if the undivided profits were \$2,800, the hired manager would receive a total of \$1,300 in cash and board for himself and wife for a year. The farm owner would receive as his return \$2,100, or a little over 4.2 per cent on the investment.

Where the farmer touches city labor, J. A. STEVENSON ([*Winnipeg*]: *Canad. Council Agr.*, pp. 4).—The author emphasizes what he asserts to be the common economic interests of urban working classes and rural producers in the defeat of the protective tariff in Canada.

The Federal farm loan act, W. G. McADOO (*Successful Farming*, 19 (1920), No. 3, pp. 11, 62-65, fig. 1).—Attacks upon the tax exemption feature of the Federal farm loan system are refuted. Amendments to the act are suggested, limiting loans by joint stock land banks to farmers who will actually engage in the cultivation of the land and for live-stock equipment and improvement, and confining the amount of loans by those banks to a single borrower to not more than \$50,000.

Future of the Federal land bank bonds, W. H. JOYCE (*Univ. Cal. Jour. Agr.*, 6 (1920), No. 2, p. 11).—Some precautions to be considered in recommending loans for increasing and promoting agricultural development in California are given. Among those mentioned are that trees and vines can not be considered permanent security, that loans can not be made on land impregnated with excessive alkali or unproved lands underlaid with hard pan, and that there must be the assurance of a permanent and adequate water supply and drainage systems providing for a rising water table.

Suggestions for a State law providing for the organization of farmers' mutual fire insurance companies, V. N. VALGREN (*U. S. Dept. Agr.*, Dept.

Circ. 77 (1920), pp. 8.—A draft prepared at the special request of, and in cooperation with, a committee of the National Association of Mutual Insurance Companies is published here.

Importance of Bavarian cooperative societies, K. F. VON FRENBERG-JETZENDORF (*Landw. Jahrb. Bayern, 5 (1915), No. 1, pp. 1-12*).—In this article are discussed the origin and development of cooperative organizations, particularly agricultural societies in Bavaria. It gives, also, details of the business transacted for several years showing the increase, with figures for Germany for the sake of comparison.

The social survey, its history and methods, C. C. TAYLOR (*Univ. Missouri Bul., 20 (1919), No. 28, pp. 91, fig. 1*).—This is a key to the purposes and origin, technique, technology, possibilities, and limitations of the social survey. Among the sample schedules and questionnaires included in the appendix, a questionnaire for a rural church survey is given, and the bibliography comprises references to rural, urban, and general studies made on the survey basis.

The Market Reporter (*U. S. Dept. Agr., Market Rptr., 1 (1920), Nos. 5, pp. 65-80; 6, pp. 81-96, fig. 1; 7, pp. 97-112, fig. 1; 8, pp. 113-128; 9, pp. 129-144*).—Current market reviews for live stock and live-stock products, fruit and vegetables, seeds, grain, hay and feed, and cotton, and information on foreign markets, are continued in these numbers. The leading articles are on the subjects, respectively, of marketing agencies for cotton seed for planting and the British market for American pork; the importance of advertising in the marketing of farm products and why standard grading pays; Canada and Argentina as competitors with America's dairy products trade and the low available supply of red clover seed; market conditions in Great Britain and celery movement and markets; and the fundamental problems before investigators in marketing, the last being an address by G. Livingston, read before the American Farm Economic Association, Chicago, November 30, 1919.

Third national census (*Tercer Censo Nac. [Argentina], 5 (1919), pp. XIII+978*).—Data in this volume comprise statistics by provinces and territorial subdivisions of agriculture and live-stock farms, classified by area, main project or crop grown, nationality of managers, invested capital, number of persons living or employed on them, and machinery and equipment; of purely agricultural projects by area, time and terms of leasing, and nationality of managers; also of the area sown to cereals, fiber plants, legumes, and vegetables.

AGRICULTURAL EDUCATION.

The agricultural college in the new era (*Agr. Gaz. Canada, 7 (1920), No. 1, pp. 19-29, figs. 8*).—This is a symposium, by the presidents, principals, and deans of the agricultural colleges in Canada, on the functions of the agricultural college in the period following the world war. It comprises the following brief articles: Agricultural Colleges Must Assume New Responsibilities, by M. Cumming; The Agricultural College a Luminous Beacon, by Pere Jean de la Croix; The Agricultural College Must Lead in the Agricultural Era, by F. C. Harrison; Demonstrations Rather Than Lectures, by G. C. Creelman; Training for Good Citizenship, by J. B. Reynolds; Training Needed for Rural Leadership, by W. J. Rutherford; The Dignity of the Profession Must be Promoted, by E. A. Howes; and The Obligation to Prepare Leaders, by F. M. Clement.

The leading thoughts throughout these articles seem to be that the colleges should not only further stimulate and lower the cost of production through their research departments and an increased number of specialists' courses, but

through more extended courses in applied economics and social science should also teach students how to live in the country and how to make the country better to live in. They should train students for rural leadership and intelligent citizenship to meet the political and social upheaval following the war. It is suggested that the new farm leaders should promote the advancement of agricultural colleges and of agricultural instruction in the schools, and that the agricultural college staffs should exert themselves to keep ahead of this great agrarian movement and so retain their positions as leaders in that education which will give the power which rightly belongs to those whose activities constitute the foundation of the country's development and the basis of national prosperity.

Training teachers of agriculture (*U. S. Bur. Ed. Bul. 66 (1919), pp. 44*).—This bulletin contains the following papers and committee report on the Relation of General Science to Agricultural Instruction, presented at the ninth annual meeting of the American Association for the Advancement of Agricultural Teaching, held in Baltimore January 7, 1919, which have been previously noted (*E. S. R.*, 40, p. 398): Training Teachers After Employment, by R. W. Stimson; Improvement of Teachers in Service, by J. T. Wheeler; Organization for Teacher Training in Agriculture, by C. D. Jarvis; An Emergency Course for the Preparation of Teachers of Vocational Agriculture, by W. F. Lusk; and Emergency Course for Training Agricultural Teachers in South Carolina, by V. Peterson.

The association adopted resolutions heartily approving of the practice of training teachers while in service, strongly emphasizing the need in the teacher-training institutions for adequate facilities for practice teaching in agriculture, and recommending, as one of the suitable methods, the plan which provides for the actual employment of prospective teachers as apprentices as a part of their collegiate training.

General science in the agricultural high school, F. E. HEALD (*Gen. Sci. Quart.*, 3 (1919), No. 3, pp. 160-165).—The author suggests the following three ways of viewing the relationships between general science and elementary agriculture:

"(1) They may be more or less interchangeable, one being a reasonably good substitute for the other. (2) There may be no possible relationship between them, any more than between two isolated subjects of the curriculum. (3) They may be equally necessary courses for some schools, and the correlation or coordination of the two subjects the only rational arrangement."

The specific aims of the course in introductory or general science are stated, including that of making the transition from the nature study methods of the grades to the real scientific attitude and method. This need not be done by following the usual methods in high-school science, but rather by developing the scientific spirit of open-mindedness, willingness to investigate, the habit of observing closely, recording accurately, searching authorities, and verifying conclusions by further observation. It is found that so many of these aims would apply as well as aims for the course in elementary agriculture of a general nature, that the latter might be accepted in a community where only one year of agriculture is given or where the agriculture is for academic rather than vocational purposes. A list of suggested practicums for gaining skill is included.

The author holds that if a course in general science is so organized as to take cognizance of local problems and at the same time to correlate with other subjects in the first year program, the teacher in general science and the teacher of agriculture will be able to unify the items of interest and prevent much of each subject from being over the heads of the students. From his observation

of several hundred schools, he is convinced that where the teachers are well informed and have in mind the proper aims both as to their own subjects and as to correlating with their colleagues, this method of two parallel courses is by far the best.

Vocational education: Teacher-training course in home economics for experienced home makers, 1919 (*Cal. State Bd. Ed. Bul. 23-A, Sup. (1919), pp. 8*).—The minimum requirements for this 2-year course, including 10 basic units of work, are given, and a suggested type of examination is outlined.

Documents relating to vocational education (*Cal. State Bd. Ed. Bul. 23-A (1919), pp. 80*).—This bulletin, which is a revision of one previously noted (*E. S. R., 40, p. 394*), contains the regulations and requirements relating to the administration of the Federal and State vocational education acts in California for 1919–20. Under this plan the California State Board of Education will cooperate with the University of California in the training of vocational teachers of agriculture, and with the Southern California Branch of the University of California and the State normal schools authorized to train high-school teachers in household arts subjects in the training of women who have had practical experience in household duties and home management as vocational teachers of home economics. The University will maintain, in connection with and under the direct supervision of the school of education, training classes for teachers of vocational agriculture, each in charge of a supervisor, at one or more of the following places: The Kearney Farm in Fresno County, the Citrus Experiment Station in Riverside County, and the Davis Farm in Yolo County.

Progress in elementary agricultural education (*Agr. Gaz. Canada, 7 (1920), Nos. 1, pp. 46–54, figs. 3; 2, pp. 150, 151*).—This is a series of brief articles by education officials on progress in elementary agricultural education in the Provinces of Nova Scotia, Quebec, Ontario, Saskatchewan, Alberta, and British Columbia.

In Nova Scotia, 10 traveling teachers for doing rural science work are employed instead of paying grants to regular teachers for such work, the change having been found an improvement. Rural science has expanded from school gardening to include all phases of homemaking.

In Quebec, agriculture is taught regularly in all primary schools beginning with the third year of the course, and is also included in the course of the normal schools. In the first and second years of the primary schools elementary principles under the heading of object lessons are given on plants, animals, and the farm in general. School gardens and school fairs are found in a large number of districts. In 1917–18 there were 52 domestic science schools attended by 7,469 pupils. In rural domestic science schools, which are in a majority, the course includes fairly complete principles of agriculture, including the care of the garden, poultry, dairying, spinning and weaving wool, etc.

In Ontario, the laboratory method in agricultural instruction is employed as far as possible. The subject of agriculture is optional in the high schools, 33 of which are conducting such work in spite of the heavy course of obligatory subjects. In 1919 some 1,500 public and separate schools, both rural and urban, conducted classes in agriculture and qualified for grants. The work was begun in 1903 with 4 schools. Nature study is an obligatory subject in the public and separate schools.

In the Saskatchewan course of study, nature study is taught from grades 1 to 6, inclusive, and agriculture in grades 7 and 8. A type of short course in agriculture for farm boys is being developed successfully. A definite course in agriculture for the high schools is in preparation for the fall session of 1920.

In Alberta, instruction in agriculture is given in grade 11 of the high schools and in grades 7 and 8 in the elementary schools. Nature study is given in grades 1 to 6. Teachers receive instruction in agriculture in the normal schools, and may obtain an elementary certificate in this work after two seasons' study at the summer school.

It is stated that better methods of instruction in nature study and elementary agriculture are becoming more evident in the schools of British Columbia.

How to feed for bigger live-stock profits (*Pleasant Hill, Ohio: Live Stock Feeding Assoc., 1919, Lessons 1, pp. 38, figs. 34; 2, pp. 36, figs. 21; 3, pp. 38, figs. 23; 4, pp. 47, figs. 33; 5, pp. 37, figs. 16; 6, pp. 43, figs. 26; 7, pp. 48, figs. 25; 8, pp. 62, figs. 42; 9, pp. 69, figs. 78; 10, pp. 67, figs. 57*).—This course of 10 illustrated lessons, prepared by the Live Stock Feeding Association of Pleasant Hill, Ohio, and intended to cover the entire science of correct animal feeding, deals with the relation of feeds and feeding to raising live stock for profit; the fundamentals of feeding roughages; raising horses, beef cattle, sheep, swine, and poultry for profit; and dairy farming.

Nature study in the grades, G. B. GOLDSMITH (*Gen. Sci. Quart., 3 (1919), No. 3, pp. 167-185*).—The author briefly discusses the aims, method, and correlation of nature study, and outlines suggestive nature studies in plant and animal life, arranged by seasons, through grades 1 to 8, inclusive.

How the Cornell Rural School Leaflet hopes to teach conservation through nature study, E. L. PALMER (*Nature-Study Rev., 16 (1920), No. 2, pp. 65-72, figs. 2*).—The policy to be followed in the publication in teaching conservation and patriotism, namely, by organizing nature study material in an attractive and logical manner, is outlined.

Conventions of the Ontario Women's Institutes and Federated Women's Institutes of Canada, 1919 (*Ontario Dept. Agr. Circ. 25 (1919), pp. 40*).—This circular contains a summarized report of the Eastern, Western, and Central Ontario 1919 conventions of the Women's Institutes Branch of the Ontario Department of Agriculture, including resolutions passed, officers and board of directors of the provincial federation, etc.

School fairs in 1919 (*Agr. Gaz. Canada, 7 (1920), Nos. 1, pp. 55-56, figs. 2; 2, pp. 156-158*).—A series of reports on the school fair work in 1919 in Quebec, Ontario, Saskatchewan, Alberta, and British Columbia. A brief description is given of a county product map competition, a new feature in the school fair work of Middlesex County, Ontario.

MISCELLANEOUS.

Work and expenditures of the agricultural experiment stations, 1918, E. W. ALLEN, E. R. FLINT, and J. I. SCHULTE (*U. S. Dept. Agr. [Rpt.] Work and Expenditures Agr. Expt. Stas., 1918, pp. 80*).—This report consists mainly of a discussion of the activities of the stations and the use made by them of the funds granted by the Federal Government under the Hatch and Adams Acts, including the usual detailed statistics compiled from official sources as to the organization, revenues, additions to equipment, and expenditures of the stations.

During the fiscal year ended June 30, 1918, the total income of the stations, including those in Alaska, Hawaii, Porto Rico, and Guam, was \$6,215,681.65. Of this amount \$719,896.54 was derived under the Hatch Act, \$719,999.84 under the Adams Act, \$155,000 from the Federal appropriations for the insular stations, \$2,716,205.36 from State appropriations, \$17,815.40 from individuals and communities, \$216,686.47 from fees, \$918,466.34 from the sale of products, and \$751,508.08 from miscellaneous sources.

The value of additions to the equipment of the stations during the year is estimated as \$906,552.38, of which \$417,053.24 was for buildings.

The stations employed 1,684 persons in the work of administration and inquiry. Of this number, 897 were also members of the teaching staff of the colleges, and 449 assisted in the various lines of extension work. During the year the stations published 796 annual reports, bulletins, and circulars, aggregating 21,954 pages, and these were distributed to 1,030,105 addresses on the regular mailing list.

Report of the Porto Rico Insular Station, 1919 (*Ann. Rpt. Insular Expt. Sta., Dept. Agr. and Labor, Porto Rico, 1919, pp. 38*).—This contains the organization list, a report by the director for the fiscal year ended June 30, 1919, and departmental reports, the experimental features of which are for the most part abstracted elsewhere in this issue.

Quarterly bulletin of the Michigan Experiment Station, edited by R. S. SHAW and H. W. NORTON, JR. (*Michigan Sta. Quart. Bul., 2 (1920), No. 3, pp. 105-153, figs. 16*).—In addition to articles abstracted elsewhere in this issue, this number contains the following: Farm Accounting; Produce Better Wool, Cooperative Marketing of Wool—Other States Have Saved Thousands of Dollars,—Why Can't Michigan? and Dipping Sheep, all by G. A. Brown; Suggestions on Winter and Spring Care of the Brood Sow, by W. E. J. Edwards; Inoculation of Legumes, by R. L. Snyder; Oat Smut Again Makes Treatment Necessary, and Treatment for Barley Diseases, both by G. H. Coons; The Brown Swiss Herd of the Michigan Agricultural College, by J. E. Burnett; Termites in Buildings (*Leucotermes flavipes*), by E. McDaniel; Tree Planting Along Highways; Care and Repair of the Farm Tractor, by E. C. Sauve; The Seed Plot as a Factor in the Improvement of the Potato Crop, by H. C. Moore; Navel Ill in Colts, by E. T. Hallman; and The English Sparrow in Michigan, by A. C. Conger.

Monthly Bulletin of the Ohio Experiment Station (*Mo. Bul. Ohio Sta., 4 (1919), No. 8, pp. 235-263, figs. 5*).—This number contains, in addition to several articles abstracted elsewhere in this issue and miscellaneous notes, the following: Wheat Scab Serious in 1919, by A. D. Selby.

Monthly bulletin of the Western Washington Substation (*Washington Sta., West. Wash. Sta. Mo. Bul., 7 (1920), No. 11, pp. 177-192, figs. 6*).—In addition to articles abstracted elsewhere in this issue, this number contains brief articles on the following subjects: Help Beautify Western Washington, by J. L. Stahl; Maintaining the Winter Milk Flow, by L. E. Carter; and Baby Chicks (including feeding charts and other suggestions), by Mrs. G. R. Shoup.

NOTES.

California University and Station.—What is known as the Deciduous Fruit Station has recently been established as a part of the field activities of the division of pomology. A tract of 2.4 acres, with a house and outbuildings, has been leased for five years at Mountain View in the Santa Clara Valley, about 50 miles south from Berkeley. Among the immediate problems under consideration are the control of apricot brown rot, a disease that has been playing havoc in recent years; the brown apricot scale, which has been a serious pest on prune and apricot trees; the red spider on prune and cherry trees; thrips on prunes; *Armillaria* or oak fungus, a disease of the soil which is killing large numbers of fruit trees in many of the fruit sections of the State; root stocks for deciduous trees; pruning for early and heavy fruiting of all deciduous fruits; rejuvenation of old fruit trees by special pruning methods, and the improvement of fruit varieties by selection. Some notable results have already been secured this winter in the control of the brown rot of the apricot and brown apricot scale, and the control of thrips in prune and other trees. These studies constitute a part of the station's work with deciduous fruits, for which \$100,000 was appropriated by the last legislature for the ensuing biennium.

A tract of land has also been leased near Placerville for experimental work in cattle ranging.

Florida Station.—*Science* notes that Philip A. Macy, assistant chemist, has resigned to engage in commercial work.

Hawaii College.—J. H. Midkiff, assistant professor of agriculture, resigned February 1 to engage in field work for the Hawaiian Sugar Planters' Station.

Illinois University and Station.—Dr. William L. Burlison, professor and chief of crop production, has been appointed head of the department of agronomy to fill the vacancy caused by the death of Dr. Cyril G. Hopkins.

Kansas College and Station.—The college department of physics is furnishing weather forecasts by wireless each weekday. It is thought that many farmers and others will avail themselves of this service by the installation of receiving apparatus at a cost of about \$35.

Harry L. Kent, principal of the school of agriculture, has been appointed chief of the Fort Hays substation, vice Charles R. Weeks, who has become head of the Kansas State Farm Bureau. Herschel Scott, instructor in soils, has resigned to engage in commercial work. Dr. Roger C. Smith has accepted an appointment as assistant professor of entomology.

Minnesota University and Station.—H. W. Vaughan, professor of animal husbandry and animal husbandman, has resigned to become one of the editors of the *Duroc Digest*, the resignation becoming effective at the end of the college year. Otto Kinneberg, clinical assistant in veterinary medicine, resigned April 1 to engage in veterinary practice.

Montana College and Station.—O. B. Whipple, professor of horticulture and horticulturist, has resigned to engage in farming in Colorado.

Nebraska University and Station.—The new agricultural engineering building was formally dedicated April 14. Construction was originally started in 1916 and it was utilized for war training work while incomplete, becoming available for regular class work last spring.

The building is a 2-story and basement fireproof structure, costing with equipment about \$240,000. The main portion is 180 by 76 ft. with a 1-story annex 84 by 140 ft. The basement floor is devoted mainly to testing laboratories and storage purposes. On the first floor of the main building are the farm machinery and carpentry laboratories, and in the annex the forge shop, a large lecture room, and laboratories for farm motors and automobiles, farm grain handling, farm lighting, and farm hydraulics. The second floor is utilized chiefly for offices and classrooms and an agricultural physics laboratory.

New Mexico College.—R. W. Clothier, formerly of the Arizona University and Station and later with the Office of Farm Management, U. S. Department of Agriculture, has been appointed president and has entered upon his duties.

New Jersey Stations.—A tuberculosis-free accredited herd certificate has been awarded the college farm dairy herd by the Bureau of Animal Industry, U. S. Department of Agriculture.

Under the auspices of the Somerset-Hunterdon Holstein-Friesian Association, the local county agent, and the college authorities, an auction sale of 65 head of registered Holstein cattle was held in the sales pavilion of the college farm March 19. This sale proved to be very successful.

The agricultural students of the college are planning to hold a fair some time in May for the purpose of bringing the activities of the college before the people of the State.

H. R. Cox has been appointed extension specialist in soils and farm crops, vice J. B. R. Dickey, beginning April 1.

Cornell University.—John C. Maddy, extension instructor in animal husbandry, and Mark J. Smith, assistant extension professor of animal husbandry, have resigned to engage in farming. Walter G. Krum, extension instructor in poultry husbandry, resigned April 1 to take charge of a country estate in Westchester County, N. Y.

Pennsylvania College.—A department of poultry husbandry is to be established July 1, in charge of H. C. Knandel, at present assistant professor of poultry husbandry extension.

Virginia College and Station.—The State Legislature has made substantial increases in the appropriations for the college and extension division, but no change in the appropriation for the station.

Hampton Institute.—In common with other negro agricultural schools the curriculum of this institution has hitherto been mainly of secondary grade. Since the passage of the Smith-Lever and Smith-Hughes Acts, however, the demand for county agents and teachers of agriculture has increased greatly, and with the hope of thoroughly equipping men to fill these positions announcement is now made that beginning in September an agricultural course of college grade will be offered. Fifteen units of secondary work and two years of actual farm life and experience are to be required for entrance. Instead of four years of 9 months each, the new course will require three years of 12 months each, thereby making it possible to give the necessary field practice in the summer months. Warren K. Blodgett, extension assistant professor of rural engineering at Cornell University, has been appointed director of agricultural work.

Ohio C. Barber Agricultural and Industrial School.—Under the will of the late Ohio C. Barber, the bulk of his estate is bequeathed to five trustees, with instructions to found and incorporate as soon as possible the Ohio C. Barber Agricultural and Industrial School. This school is to be located on Mr. Barber's 2,000-acre farm at Barberton in Summit County, Ohio, known as the Anna Dean Farm. The farm is said to possess one of the most elaborate and imposing sets of permanent farm buildings to be found in this country, and is valued at approximately \$4,000,000.

The school is expected to become affiliated with Western Reserve University, its president, Dr. C. F. Thwing, being named as one of its trustees. The will provides "for education along agricultural and industrial lines and all things pertaining thereto, for the benefit of men and women of this and all succeeding generations, to aid them in becoming industrious and useful citizens, and especially looking to the development and proper treatment of the soil as well as to the development of manufacturing industries connected or affiliated therewith."

Provision is made for the location on the grounds of other schools or institutions of kindred purpose.

Cinchona Tropical Botanical Station.—The Smithsonian Institution has resumed its lease of this station, which is located on the southern slope of the Blue Mountains of Jamaica, and it announces that the privileges of the garden will again be available for American botanists. The laboratory includes a well kept botanical garden of 10 acres containing scores of exotic trees, shrubs, etc., and a plantation of 6,000 acres containing cinchona, tea, coffee, and rubber trees, Eucalyptus, and many other species. Nearby is an undisturbed montane rain forest, with an almost impenetrable jungle of tropical vegetation.

Research Institute for New Zealand.—Under a bequest of the late Thomas Cawthorn, of Nelson, New Zealand, about \$1,200,000 is available for the founding of Cawthorn Institute. A site of about 20 acres, near Nelson and overlooking Tasmania Bay, has been secured, and building will be commenced at an early date. T. H. Easterfield, professor of chemistry in the University of New Zealand, has been appointed director and T. Rigg, of the Cambridge University School of Agriculture, agricultural chemist. The chief work of the institution is to be "instruction in and performance of scientific research; such research to be definitely related to the industries of Nelson and of the Dominion."

Reorganization of British Board of Agriculture and Fisheries.—Under an act recently passed by Parliament the Board of Agriculture and Fisheries has been replaced by a Minister of Agriculture and Fisheries. Councils of agriculture are also provided for England and Wales, and an agricultural advisory committee for both countries. The official organ, *Journal of the Board of Agriculture*, has been rechristened the *Journal of the Ministry of Agriculture*. Lord Lee has been appointed Minister of Agriculture and Fisheries.

The councils of agriculture provided are to include representatives of local agricultural committees and nominees of the ministry itself. Labor, women, horticulture, agricultural education and research, and the Agricultural Wages Board are to be represented on these councils, which will meet twice a year. The advisory committee is a smaller body, meeting quarterly or oftener and consisting of 12 members nominated in part by the English and Welsh councils and in part by the ministry. There will also be a local agricultural committee for each county, partly nominated by the ministry.

Agricultural Education and Research in Great Britain.—The Seale Hayne Agricultural College at Newton Abbot in Devon resumed regular courses of instruction in agriculture in January. A 3-year diploma course in agriculture, a 2-year certificate course in agriculture and horticulture, and short courses in poultry husbandry, dairying, and similar subjects are being offered.

Lord Iveagh has purchased an estate of about 500 acres at Chadacre Hall, Suffolk, and is equipping it as a farm school for about 40 or 50 boys. The school is intended primarily for sons of poor parents, particularly farm laborers, but provision is also made for sons of small holders and others. Board, lodging, and instruction are to be entirely free.

The Institute of Research in Animal Nutrition at Aberdeen has been given \$50,000 by J. Q. Rowett toward its goal of \$125,000.

Training Returned Soldiers in Canada.—At Kentville, N. S., about 30 men received training during the past year. One hour daily was devoted to lectures on agriculture and three hours to live stock work, and the remainder of the time to practical handling of farm crops.

Two 12-weeks' courses were given at Fredericton, N. B., to 35 men. Several lectures a week were offered, as well as live stock judging, spraying, and other demonstrations and a large amount of practical field work.

A completely equipped farm of 150 acres, belonging to the experimental farm at Lennoxville, Quebec, was taken over temporarily by the Soldier Settlement Board for use in training work. About 70 men received instruction on this farm.

Italian Forestry Instruction.—In a recent issue of the *Journal of Forestry* a description is given by N. C. Brown of the organization and work of the Royal Italian Forestry College, together with information regarding the reorganization of technical education in forestry in Italy, which has been entirely rearranged in accordance with important reforms in the laws of 1910, 1911, and 1912.

It appears that in Italy forestry education is entirely in the hands of the central government at Rome, is supported by funds from the general forestry appropriation, and is supervised by the Director General of Forests under the Minister of Agriculture. It dates back to 1869, when the old Benedictine monastery at Vallombrosa was given over to the Royal Forestry Institute which, in spite of limited funds for educational purposes, flourished, and has turned out an excellent type of technical forester.

Under the laws of 1911 the school was moved to the Cascine Gardens in the outskirts of Florence, and its official name was changed to "Reale Istituto Superiore Forestale Nazionale," or the Royal Forestry College. Since its permanent establishment there in 1913 it has received an annual appropriation of about \$40,000. In accordance with later legislation, the college has two essential functions, viz, didactics, and study and experimentation. It provides a two-year graduate course in professional forestry for graduates of recognized engineering and agricultural schools, and also confers diplomas of professional efficiency upon those who have attained particular proficiency in the technical work of the State administration.

The students in the regular course are officially a part of the royal corps of foresters and are admitted to this school only as such. On the successful completion of competitive examinations they are given the title of adjutant assistant inspector of forestry in the Royal Forestry Corps and receive a yearly stipend of about \$500 for maintenance.

Each of the two years of the course of study is divided into the scholastic period in Florence from October 15 to June 15, and the period for field activity and inspection work from July 1 to September 30, the remaining time being available for vacations. At least one-half of the time and efforts of the faculty are expected to be devoted to scientific investigation and experimentation, the character of which is determined and supervised by an academic board under the general direction of the Director General of Forestry at Rome.

There are also two ranger schools located, respectively, at Citta Ducali, in the Abruzzi, near Aquila, and at Vallombrosa. Both offer one-year courses. There are three degrees, viz, forest guard, forest brigadier, and forest marshal. When ranger students have completed the course at the Citta Ducali school they enter the forest service as guards. After a period of three years in the forest, selected competent students are sent to the Vallombrosa school, and on completion of the one-year course receive the degree of forest brigadier. A few of the most proficient men receive the degree of forest marshal. Students at the

Citta Ducali school receive about \$320 a year and those at the Vallombrosa school approximately \$360 a year upon graduation as brigadiers, while those who receive the degree of forest marshal are given about \$480 a year and 40 cents extra per day for subsistence.

Extension of Agricultural Home Economics Instruction in Belgium.—The Minister of Agriculture in Belgium has appointed in each Province a woman State adviser of agricultural home economics instruction, chosen from among the instructors of itinerant agricultural home economics schools. The duties of these advisers will be to promote economic and social progress in rural districts, and to aid farm women in the better fulfillment of their duties as the mothers of families, housekeepers, and collaborators of the farmers in the field and in agricultural social work. This will be done principally by means of lectures and demonstrations, verbal and written advice, efforts to promote the success of the temporary agricultural home economics schools, the organization of professional agricultural unions for farm women, visits to markets, etc.

As the result of a study in foreign countries last summer by the inspectors of agricultural home economics instruction in Belgium, there will be opened in October, 1920, a State higher normal institute of agricultural home economics. The object of this institute will be not only the training of teachers of agricultural home economics but also of giving farmers' daughters an opportunity to receive instruction in this subject and of developing in them a love for country life. It will comprise Flemish and French sections, and applicants for admission must possess a teacher's diploma or certificate of secondary studies or their equivalent. The instruction, which will be theoretical and practical, will be distributed over five semesters, and will include religion; psychology; pedagogy; applied natural sciences, anatomy, biology, physiology, and hygiene; domestic economy, nutrition, sewing, home management, and rural esthetics; gardening, poultry raising, care of domestic animals, dairying, and cheese making; small rural industries; elements of social economy, law, commerce, and accounts; literature and languages; and arts.

Proposed Home Economics Work in the American College for Girls at Constantinople.—The international committee on teaching home economics of the American Home Economics Association is formulating plans for a department of home economics in the American College for Girls at Constantinople. This institution is the only one in the Near East offering vocational work to women, and has at present 560 students of 18 nationalities. Several courses in agriculture and home economics are already being offered. The association has voted to raise a fund of \$6,000, and to send out an American professor for three years.

Southwestern Division of the American Association for the Advancement of Science.—A southwestern division of the American Association has recently been formed, and among other activities is arranging to have lectures given from time to time in at least four localities, Tucson, Ariz., Albuquerque, N. Mex., Mesilla Park, N. Mex., and El Paso, Tex. It is hoped to utilize in part the services of scientific men who may be passing through the vicinity. Dr. Elliott C. Prentiss, 1515 Roberts-Banner Building, El Paso, Tex., is in charge of the matter at present.

Necrology.—Dr. Charles Gordon Hewitt, Dominion entomologist and consulting zoologist, died in Ottawa February 29 at the age of 35 years. Dr. Hewitt was a native of England, receiving the degree of D. Sc. from the University of Manchester. He came to Canada in 1909 as Dominion entomologist, and had been largely responsible for the notable progress made in developing a complete Federal entomological service.

Dr. Hewitt was widely known among entomologists, being president of the American Association of Economic Entomologists in 1913 and a fellow of several entomological and ornithological societies. The gold medal of the Royal Society for the Protection of Birds was awarded to him for his efforts in connection with the treaty between Canada and the United States for the protection of migratory birds. He was the author of two well-known books on the house fly and many reports and bulletins, and had just completed an important work on the Conservation of the Wild Life of Canada.

The recent death of Dr. John Wilson, lecturer in agriculture and rural economy in the University of St. Andrews, Scotland, in the words of *Nature* "robs the university and science of a keen and brilliant agricultural biologist. Dr. Wilson was one of the few who regarded agriculture as a sister science of biology rather than as a branch of chemistry, and his work on the improvement of farm crops has borne excellent fruit." He had worked particularly with potatoes, turnips, and oats, developing a very large number of new varieties.

William Hill, organizer and director of the agricultural department of Bethany College, West Virginia, died February 29 at the age of 55 years.

New Journals.—The Ecological Society of America has taken over *Plant World*, which is to be rechristened *Ecology*, issued as the official organ of the society, and published in cooperation with the Brooklyn Botanic Garden. It is to be a quarterly journal for the presentation of original articles, the first number being that for March, 1920, with Barrington Moore as editor in chief.

The *North American Veterinarian* is being issued monthly, and comprises editorial discussions, leading articles, reviews, case reports and other articles, notes, etc. The initial number contained as leading articles Traumatic Pericarditis of the Ox, by T. H. Ferguson; A Plea for Standard Methods of Estimating the Number of Killed Bacteria in Suspension, by W. E. King and R. E. Vories; Handling of Stock Hogs, by A. T. Kinsley; and Sterility of Cows and its Treatment, by H. Lothe.

The *Journal of the Museum of Comparative Oology* is being published by this museum, located at Santa Barbara, Cal. The initial number is devoted mainly to a description of the museum and its work, which is stated to be that of "accumulating the phylogenetic evidences offered by the eggs of the birds of the world."

The *Oregon Grower* is being issued monthly as the house organ of the Oregon Growers' Cooperative Association in the interests of the commercial fruit and nut growers of the State. C. I. Lewis, formerly of the Oregon College and Station and now organization manager of the association, is editor.

1920 Convention of Association of Land-Grant Colleges.—Announcement is made that the thirty-fourth annual convention of this association, formerly the Association of American Agricultural Colleges and Experiment Stations, will meet at Springfield, Mass., October 20-22, with headquarters at the Hotel Kimball.

EXPERIMENT STATION RECORD.

VOL. 42.

JUNE, 1920.

No. 8.

Many months have now gone by since the cessation of hostilities, and the return of the American Expeditionary Forces from Western Europe, yet interest is still keen in this country in the tremendous problems involved in the reconstruction of France and Belgium. Most of the territory actually laid waste on the Western Front was primarily devoted to agriculture, and the physical restoration for farm purposes of this great area constitutes in itself a most extensive reclamation enterprise. Of even greater magnitude, however, and in several ways more complicated and farreaching, is the adjustment of agriculture and rural life in the remainder of France and Belgium to postwar conditions.

The need of a comprehensive rehabilitation program has been quite generally recognized in these countries, and plans were under way before the signing of the Armistice for a bringing together of the various agricultural agencies. Eventually two notable agricultural congresses were held, the printed proceedings of which have recently been issued. The first of these was the French Agricultural Congress, which met in Paris from June 30 to July 3, 1919. This was followed by the National Congress for the Agricultural Restoration and Betterment of Rural Life in Belgium, which met from September 28 to October 1, 1919, at Brussels. These two congresses were distinct, each working along national lines, but naturally they had many things in common and can conveniently be discussed together.

The French congress was sponsored by the National Society for the Encouragement of Agriculture, whose executive council adopted on October 24, 1918, a resolution advocating "a grand agricultural congress of the principal agricultural societies and associations of France to determine the objectives of a campaign to restore the agriculture of the nation, particularly in the devastated regions." An announcement sent out by the society a few weeks later drew attention to the advisability of a comprehensive survey of the situation, and suggested the assembling of representatives of these bodies as a sort of legislature of agriculture to coordinate the efforts of the various agricultural agencies of the nation.

The congress was participated in by over five hundred delegates, representing mainly the national and local societies and similar bodies, the agricultural and viticultural "syndicates," and the rural cooperative, credit, and insurance organizations. Prominent among the participants were the representatives from the Provinces of Alsace and Lorraine. A delegation was also in attendance from the Grand Duchy of Luxemburg, and Belgium was represented by M. Paul de Vuyst, Director General of Agriculture. The presiding officer was M. Émile Loubet, former President of the French Republic and head of the National Society for the Encouragement of Agriculture, who had already served for several months as chairman of the organization committee. The first speaker was M. Victor Boret, Minister of Agriculture and Food Supply, and many other agricultural leaders shared in the deliberations, making the assembly unusually representative and influential.

The Belgian congress was organized under the auspices of the National Commission for the Betterment of Rural Life. This body, it may be recalled, was established in 1913 following the development of the "Village Moderne," or Model Rural Community, at the Ghent Exposition.¹ Its fundamental purpose was to foster on a permanent basis the improvement of rural and village life, and at the outbreak of the war it had completed preliminary arrangements for a congress on this subject to be held in the fall of 1914. After the invasion of Belgium, however, it resolved itself into the Central Commission for the Study of Rural Reconstruction, cooperating with the agricultural section of the National Committee of Assistance and Food Supply. Its initial meeting was held in January, 1915, and this was followed by others at regular intervals and the steady prosecution of surveys and studies of reconstruction problems. In cooperation with other bodies, among them the Central Society of Architects of Belgium and local reconstruction committees, plans were developed in considerable detail for rebuilding farm structures, rural churches, schools, and other public buildings, and efforts were made to be as well prepared as possible to resume the national life when the invaders' armies should be withdrawn. The holding of the congress here discussed was a logical step in this carefully considered national program.

The aggregate attendance at Brussels was approximately the same as at the French congress, but the basis of organization differed considerably. Although all individuals and institutions interested were eligible to membership, most of the delegates were from the several branches of the national, provincial, and local governments, the village burgomasters being quite commonly selected. The various

¹ E. S. R., 30, p. 301.

agricultural federations, official agricultural societies, and related bodies constituted another important group, and special provision was made for the educational and research institutions. About thirty-five of these institutions were represented, headed by the Institute of Chemistry and Agricultural Physics of Gembloux, and including the State Botanic Garden at Brussels, agricultural and horticultural schools, normal schools, and the agricultural house-keeping schools so typical of Belgium. A wide range of agricultural interests was thus assembled, and the congress vied with the French congress in the representative character and renown of its personnel.

The broad scope of the two congresses is indicated by their sectional organization. Each congress had a section on the restoration of the devastated regions, and this subject was obviously one of the most urgent and important under consideration. The remaining sections of the French congress dealt with the national livestock situation, the relations of farmers to governmental agencies, farm labor, colonial agriculture, and miscellaneous questions. There was also a section for general questions in the Belgian congress, but its distinctive trend toward rural sociological questions is shown by its provision of sections on the improvement of rural public services, the beautification of villages, and the betterment of rural life.

The principal conclusions of the congresses were embodied in very extensive resolutions, which constitute in effect bases for the elaboration of a national agricultural reconstruction program. Those of the Belgian congress embraced no fewer than one hundred and thirty-six separate items, and those from the French congress are nearly as numerous. Many of the subjects covered were of course primarily of local interest, but not a few dealt with principles and policies of much wider application.

Thus, in regard to the restoration of the devastated territory the French congress laid much stress on the importance of expert assistance. It favored the unification of the administrative forces of the government into a single reclamation service, with a specialist in charge of agricultural reconstruction and a competent staff of employees. In addition the formation of central and national advisory councils was advocated to represent the farmers and their problems, and also the provision of committees of experts to assist farmers in their purchases of livestock and in other ways.

Similarly the Belgian congress, after a special excursion to the battlefields of Roulers, Ypres, and elsewhere, laid down the principle that the vast problems of rural reconstruction could not be left to private endeavor but that there must be adequate and systematic assistance from governmental and other sources. The fact was brought out that experimental fields had already been established

in the shelled areas, and that tests had indicated that many of these fields could not be restored to their normal productivity in less than five or six years. Detailed suggestions were worked out for both the temporary and permanent rebuilding of farm structures, the reclamation of the devastated lands, and the reconstruction of rural roads, telephones, and other public services. Systematic instruction by lectures and short courses for farmers in these regions was urged, as well as demonstrations and exhibits of building plans, improved farm equipment, and household conveniences. A special rural exhibit was held in Brussels during the congress, consisting largely of models and farm plans worked out for the various provinces, and attracted much favorable comment as a concrete illustration of the kind of assistance available.

The livestock situation was considered by both congresses, but in most detail by the French, who gave it the status of a distinct section. Here again much emphasis was put on the desirability of expert assistance. A commission of farmers, teachers, and veterinarians was proposed to indicate the breeds of cattle and sheep necessary to replace the animals removed by the Germans, and the government was asked to assist in the keeping of the various herd books, to give increased attention to the combating of contagious diseases, to endeavor to develop improved strains of goats, and to establish a special livestock section in the National Council of Agriculture.

Considerable importance was attached by both congresses to the development of agricultural education. At Paris, the subject was considered chiefly in the section of farm labor, the view being expressed that better education and training would reduce the amount of hand labor necessary on the farm. More winter courses, both in fixed and traveling schools, the establishment of farm apprentice schools, and a general redirection of rural education toward the farm were also suggested.

The Belgian attitude is well expressed in the following resolution: "Since moral restoration of the country is even more vital than economic restoration and the perfection of family education is the greatest factor in moral progress, it is of first importance from the standpoint of national welfare to provide for the education of the rural population, assuring everywhere the means for parents and future parents to receive expert preparation." It was further specifically urged that in the interests of efficiency the sons of farmers and farm laborers take courses in professional agriculture and farm mechanics, and that landowners select their managers and directors from graduates of the agricultural colleges. In order to foster market gardening, the organization of "a thorough and regular system

of professional education through series of lectures to fourth grade schools, maintenance of demonstration gardens, and similar ways" was favored. The agricultural preparation of teachers in primary schools was indorsed, and a general improvement and modernizing of methods of agriculture was recommended.

The strengthening of agricultural research was only incidentally touched upon in the Belgian program, but at Paris advanced ground was taken in connection with the fostering of colonial agriculture. The congress recommended as a minimum program the establishment of at least one permanent agricultural station for each distinct agricultural region in the colonies. These stations would each include sections of economic botany and plant introduction, plant propagation and distribution, plant diseases, and meteorological observations, a research section, and a section for field testing and demonstrations. Particular insistence was expressed on the necessity of adequate facilities, including laboratories, a library, a museum, and a competent and well-paid personnel, the opinion being expressed that in the past insufficient support had been the most serious handicap to full efficiency.

In addition, it was proposed to supplement these general stations by a series of special research stations for the study of each of the principal colonial products, such as cotton, vanilla, rubber, sugar, coconuts, tea, silk, and livestock. All these stations would be under the immediate supervision of a Bureau of Colonial Agriculture in the Ministry for the Colonies, which would act as a central clearing house of information on colonial agriculture.

Extension work was tacitly accepted by both congresses as an urgent need. One of the Belgian resolutions advocated a system of counsellors for small farmers, with duties somewhat analogous to those of the county agents in this country. Unusual emphasis was put on the need of activities to improve living conditions on the farm and to add to the attractiveness of country life through the provision of home economics and hygiene instruction and the installation of farm conveniences, libraries, and better mail, telephone, and telegraph service, and fire protection. Studies of farmers' dietaries by the experiment stations were suggested as a basis for more precise data for instruction in nutrition. Perhaps most novel of all was the prominence given to what is termed rural esthetics, including a plea for expert instruction in the esthetics of rural buildings, roads, public places, furniture, clothing, and the like.

One outstanding result of the French congress was the immediate formation of a National Federation of Agricultural Associations, with an enrollment of over thirty national and regional bodies. This federation is to be a permanent and active organization, with head-

quarters in Paris, to serve as a central clearing house for the various agricultural systems in the coordination of their activities and policies and to constitute a single spokesman for their interests. One of its specific duties is to hold annually a French congress of agriculture.

Presumably somewhat similar functions will be performed in Belgium by the National Commission for the Betterment of Rural Life, which is also organized as a continuing body. In that case, means will be available in each country for perpetuating and developing the elaborate programs so carefully formulated. This would seem to be very desirable. A most useful service has already been rendered in assembling the agricultural leaders of the two nations in these congresses, and there will be widespread and sympathetic interest in the working out of the comprehensive policies which were there agreed upon.

RECENT WORK IN AGRICULTURAL SCIENCE.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

Distribution of the basic nitrogen in phaseolin, A. J. FINKS and C. O. JOHNS (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 375-377).—An analysis of phaseolin by the Van Slyke method is reported from the Bureau of Chemistry, U. S. Department of Agriculture. The nitrogen distribution corrected for solubility of bases was as follows: Amid N 10.89 per cent, humin N adsorbed by lime 1.72, humin N in amyl alcohol extract 0.31, cystin N 0.61, arginin N 12.31, histidin N 5.62, lysin N 9.49, amino N of filtrate 54.94, and nonamino N of filtrate 3.9 per cent. The percentage of basic amino acids was cystin 0.84, arginin 6.11, histidin 3.32, and lysin 7.88. It is pointed out that these results for the basic amino acids were higher, particularly the lysin value, than the results obtained by Osborne and Clapp¹ by the direct method of Kossel and Patten (*E. S. R.*, 15, p. 748).

The constitution of capsaicin, the pungent principle of Capsicum, II, E. K. NELSON (*Jour. Amer. Chem. Soc.*, 42 (1920), No. 3, pp. 597-599).—This is a continuation of the study previously noted (*E. S. R.*, 41, p. 310).

The lipolytic activity of the castor and soy bean, A. W. BARTON (*Jour. Amer. Chem. Soc.*, 42 (1920), No. 3, pp. 620-631).—The lipases of the castor and soy beans have been studied with respect to their ranges and amounts of activity in an aqueous solution and to their action on lard, olive oil, and ethyl butyrate. It was concluded that with lard or olive oil as a substrate the liberated acids can not be titrated in a water mixture with an aqueous standard solution. This difficulty was overcome by adding, before titration, sufficient ether and alcohol to dissolve all of the fat.

The castor bean lipase was found to be more intense in its action than the soy bean lipase, but both reacted within the same ranges of acidity. Lard and olive oil behaved similarly with respect to enzym activity in the different degrees of acidity. With ethyl butyrate as a substrate, the degree of activity was smaller and the range of acidity higher and shorter than with lard and olive oil.

From these observations the author concludes that both soy and castor beans contain the same lipase or lipases but in different quantity.

An electrically heated bomb for ammonia synthesis, R. O. E. DAVIS and H. BRYAN (*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, pp. 287, 288, figs. 3).

The sterilization of oils by means of ultra-violet rays, L. T. FAIRHALL and P. M. BATES (*Jour. Bact.*, 5 (1920), No. 1, pp. 49-66, figs. 4).—A study is reported of the adequacy of ultra-violet rays for the sterilization of oils to be used in the preparation of lipovaccines. The oils used in the experiments were sweet almond, cottonseed, and olive oil. These were first dried with anhydrous

¹ *Amer. Jour. Physiol.*, 18 (1907), No. 3, p. 295.

sodium sulphate, filtered, and then inoculated with various spore-forming bacteria or molds and exposed in petri dishes at various distances from the source of the radiation for different lengths of time. The oil was chilled during the exposure by floating the petri dish on ice water. It was found that with this arrangement the oil could be completely sterilized by an exposure of from 3 to 5 minutes at a distance of 10 cm.

The method of exposure finally adopted was that of flowing the oil through a spiral tube of transparent quartz having a bore of from 3 to 3.5 mm. and extending the length of the mercury vapor lamp. The spiral tube was inclosed in a gauze jacket over which ice water was allowed to flow from a number of fine jets. The oil was fed into the spiral by gravity and collected in sterile flasks. With this apparatus an exposure of 8 minutes at a voltage of 48, or 3.5 minutes at a voltage of 60, gave effective sterilization. By increasing the voltage to 150, a 4-minute exposure was sufficient. About 1.5 liters of oil could be sterilized in one hour in this way.

Further experiments indicated that the action of lipolytic enzymes in oil is inhibited by exposure to ultra-violet rays. Except for slight bleaching, the oil is in general unchanged physically and chemically by exposure, although in tests with olive oil it was found that exposure for long periods of time increased the acidity of the oil proportionally to the length of exposure.

Effect of the chlorin substitution products of methane, acetaldehyde, and of sodium acetate on catalase production, W. E. and E. L. BURGE (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 307-314, figs. 2).—The introduction of increasing amounts of chlorin into the methane molecule has been found to increase the destructive effect on catalase and its output from the liver as previously noted in the case of chloroform (E. S. R., 42, p. 259). Similarly chloral (trichloroacetaldehyde) decreased catalase more than did acetaldehyde, and the introduction of increasing amounts of chlorin into the sodium acetate molecule rendered it less effective in increasing catalase.

“The increase in oxidation following the ingestion of glycocholl, or a closely related compound acetic acid (sodium salt), is attributed to the increase in catalase. The decrease in oxidation arising during chloroform and chloral anesthesia and assumed by some to be the cause of the narcosis is attributed to the decrease in catalase.”

Extracts of pure dry yeast for culture media, S. H. AYERS and P. RUPP (*Jour. Bact.*, 5 (1920), No. 1, pp. 89-98).—Some of the ways in which extracts from dry yeast have been used in bacteriological work in the research laboratories of the Dairy Division, U. S. Department of Agriculture, are described briefly. These include the use of fresh yeast extracts for replacing meat extract in the preparation of peptone broths, and of autolyzed yeast extracts as media for fermentation tests and for the growth of pathogenic types of streptococci which do not grow in other sugar-free media. Extracts of yeast digested with hydrochloric acid or with pepsin are thought to offer possibilities in many lines of bacteriological work where the presence of fermentable material is not undesirable.

Biochemistry of the acetone and butyl alcohol fermentation of starch by *Bacillus granulobacter pectinovorum*, H. B. SPEAKMAN (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 319-343, figs. 4).—This is a study of the intermediate changes taking place during the fermentation of starch by *B. granulobacter pectinovorum* with the final production of acetone and butyl alcohol as previously noted (E. S. R., 41, p. 415). From the results obtained in the investigation, the details of which are presented and described, the chemical changes taking place during the fermentation are summarized as follows:

"*B. granulabacter pectinovorum* growing in a medium rich in starch changes the latter into glucose by exoenzym activity. Glucose passes into the cell and is oxidized to acetic and butyric acids. These acids are in part reduced to the corresponding alcohols."

Fermentation of fructose by *Lactobacillus pentoaceticus* n. sp., W. H. PETERSON and E. B. FRED (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 431-450, figs. 2).—The authors have continued their study of the pentose-fermenting bacteria (*L. pentoaceticus* n. sp.) found in silage (E. S. R., 42, p. 502) by an investigation of the fermentation of fructose by these organisms with particular reference to their ability to form mannitol. On the basis of the experimental data reported and those of other investigators, the general line of reaction by which fructose is broken down and mannitol is formed is thought to be as follows:

Some of the fructose is first hydrolyzed to acetic and malic acids with the production also of hydrogen. This in turn reacts with more of the fructose to form mannitol, while some of the malic acid formed in the first reaction breaks down into lactic acid and carbon dioxid. If the fructose solution is allowed to ferment for a long time, the manitol formed undergoes slow fermentation with the production of acetic and lactic acids. Some evidence was also obtained indicating that in a prolonged fermentation lactic acid itself may be broken down to acetic acid by the pentose-fermenting bacteria. The conversion of fructose into mannitol is much more rapid than the breaking up of mannitol into acetic and lactic acids, as shown by the fact that in the early stages of the fermentation mannitol accumulates to the extent of from 30 to 40 per cent of the original fructose but is eventually entirely destroyed.

Some aspects of the behavior of charcoal with respect to chlorin, G. S. BOHART and E. Q. ADAMS (*Jour. Amer. Chem. Soc.*, 42 (1920), No. 3, pp. 523-548, figs. 16).—A study is reported from the Bureau of Chemistry, U. S. Department of Agriculture, on the absorption of chlorin by charcoal as affected by variations of temperature, the velocity of gases through the charcoal, the thickness of the charcoal, and the gas pressure on the surface of the charcoal.

The De Roode-perchloric acid method for determining potash, T. E. KEITT (*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, pp. 276, 277).—The author, at the Georgia Experiment Station, presents a preliminary report of the use of perchloric acid as a substitute for potassium platinic chlorid in the modified De Roode method for the determination of potash previously described by Keitt and Shiver (E. S. R., 42, p. 109). The technique of the procedure, which it is hoped will be tested by other workers, is as follows:

"Place 2.5 gm. of the sample on a 12.5 cm. filter paper and wash successively with portions of boiling water into a 250 cc. flask until the washings amount to about 200 cc. Acidify the solution with 5 cc. of concentrated HCl while hot, precipitate the sulphates by adding drop by drop, in slight excess, normal BaCl₂ solution acidified with HCl (10 cc. usually suffices). Cool, make to mark, and shake. Allow the precipitate to settle. Transfer a 50 cc. aliquot part, corresponding to 0.5 gm., to a 175 cc. porcelain evaporating dish, add 30 cc. of aqua regia, and evaporate to dryness on hot plate; add a second portion of 30 cc. of aqua regia and evaporate to dryness; then add about 10 cc. of concentrated HCl and 20 cc. of distilled water and evaporate to dryness.

"Dissolve in 20 cc. of hot water and add 5 cc. of perchloric acid, 1.12 sp. gr.; evaporate on hot plate or steam bath until copious fumes come off, remove and run the liquid around the bottom of the dish, and if it does not solidify on cooling, evaporate more and cool again. It can be rapidly cooled by floating the dish on cold water. Take up the residue with 5 cc. of cold water and add

a second portion of 5 cc. of perchloric acid; evaporate the solution until dense fumes of perchloric acid appear. In case the residue appears baked, repeat the last operation.

"After cooling, add 20 cc. of 95 per cent alcohol, stir, and allow to stand 30 minutes. The precipitate may be collected either on a Gooch crucible carrying a pad of asbestos $\frac{1}{2}$ in. thick or on a tared filter paper. When the latter is used, a good quality 7 cm. filter suffices. The collection of the precipitate on a tared filter is generally more rapid. In either case wash the precipitate twice with 95 per cent alcohol containing 0.2 per cent perchloric acid, transfer the precipitate using the same wash, and wash until the filtrate and washings amount to about 75 cc. Finally, wash twice with alcohol-ether (1:1), using 3 to 5 cc. each time, to remove all of the perchloric acid. Dry for 30 minutes at 120° C.

"Weigh and dissolve the potassium perchlorate from the Gooch with about 200 cc. of hot water. Use another receiver and wash the pad with alcohol or ether to facilitate drying, dry 30 minutes, and weigh. The loss is potassium perchlorate, and potassium oxid is calculated using factor 0.34. Where the tared paper is used, no reweighing is necessary."

A table is given of the comparative results obtained on 7 samples analyzed for potash by the Lindo-Gladding, De Roode, and the proposed De Roode-perchloric acid methods. The results by the new method were with one or two exceptions slightly lower than by the De Roode, and higher than by the Lindo-Gladding method.

The determination of calcium and magnesium in different saline media, E. CANALS (*Bul. Soc. Chim. France, 4. ser., 23 (1918), No. 10, pp. 422-430; 25 (1919), Nos. 2, pp. 90-94; 12, pp. 655-658*).—A critical study is reported of the degree of precision of various methods for the quantitative determination of calcium and magnesium in saline media.

The method for calcium recommended as furnishing the greatest precision is its precipitation as oxalate and calculation either as CaCO_3 or CaO , although with certain precautions the determination as CaSO_4 is considered to be satisfactory. If the calcium is precipitated as CaCO_3 the subsequent oxidation to CaO is advised.

For magnesium the author recommends its precipitation as magnesium ammonium phosphate and calculation as pyrophosphate, or its volumetric determination by dissolving the precipitated magnesium ammonium phosphate in HCl and estimating the ammonia colorimetrically with Nessler's solution.

Contribution to the determination of zinc in organic materials—urine, feces, foods, etc.—with remarks on the zinc content of reagents and apparatus, A. WEITZEL (*Arb. Reichsgesundheitsamt., 51 (1919), No. 3, pp. 476-493*).—Two methods of determining the presence of zinc in small amounts in organic and other materials were examined, (1) its precipitation from acid solutions of the ash of the material by means of potassium ferrocyanid, and (2) its precipitation as sulphid after treatment of the ash solution with sodium hydroxid and acetic acid. In both methods the zinc is finally converted into the oxid and determined as such.

Both wet and dry methods of oxidizing the original material were found to give equally satisfactory results, and no difference was noted in the accuracy of the final results with either of the above methods of precipitation. The second method is, however, recommended in preference to the potassium ferrocyanid method as being more rapid and requiring fewer reagents.

It was found that zinc-containing apparatus such as Jena glass could be used with safety in zinc determinations except in the presence of phosphoric

acid or fluorids, both of which brought about an appreciable solution of the zinc from the glass. The necessity is consequently pointed out of using zinc-free glassware in the determination of zinc in organic materials likely to contain phosphates or fluorids.

A simple, rapid method for the determination of halogen in organic substances, W. A. VAN WINKLE and G. MCP. SMITH (*Jour. Amer. Chem. Soc.*, 42 (1920), No. 3, pp. 333-347, figs. 3).—The method described is said to be applicable to the determination of chlorin, bromin, or iodin in volatile substances. The material, volatilized with air, is drawn through a heated quartz tube, the combustion products are absorbed in alkaline sodium sulphite solution, the excess of sulphite is oxidized, and the halogen is finally determined by the Volhard volumetric method. The method is said to be simple, rapid, and accurate and, with certain modifications, to be equally applicable to non-volatile organic materials.

A modification of the apparatus for the determination of arginin nitrogen by Van Slyke's method, G. E. HOLM (*Jour. Amer. Chem. Soc.*, 42 (1920), No. 3, pp. 611, 612, fig. 1).—The essential feature of the apparatus, which has been devised at the Minnesota Experiment Station, is a straight piece of glass tubing 10 cm. in length and 3.3 cm. in diameter in which the stem of the Kjeldahl trap is fitted by means of rubber stoppers, which also contain inlet and outlet tubes for water. The tube thus serves as a condenser for the vapors passing up into the trap from the Kjeldahl flask to which it is attached. The neck of the flask is cut off to a length of about 10 cm. so that the apparatus may be used in the ordinary Kjeldahl rack. To eliminate the necessity of opening the flask when the water is added before the final distillation of ammonia, a separatory funnel is also inserted in the stopper of the flask.

In using the apparatus a stream of water is sent through the condenser during the six hours' digestion with potassium hydroxid, after which the condenser is drained and the system allowed to cool before the final distillation takes place. The advantages of the apparatus are said to be that there is no danger of loss through bumping, no transfer of material is necessary, and the expensive Folin bulb is eliminated.

The determination of small amounts of nitrites, particularly in corned beef, F. AUERBACH and G. RIESS (*Arb. Reichsgsndhtsamt.*, 51 (1919), No. 3, pp. 532-555).—An investigation of possible methods of determining nitrites when present in small amounts in meat was undertaken on account of the fact that the addition of nitrous acid or nitrites to meat as preservatives was forbidden by law in Germany. The possible reduction of nitrates to nitrites in meat cured with saltpeter was also investigated.

It was found that errors in the colorimetric determination of nitrates by *m*-phenylenediamin could be avoided by the addition of sodium acetate and acetic acid, and that the interfering soluble proteins and colored substances in the extracted meat samples could be removed by precipitation with a colloidal iron hydroxid solution. By following these precautions, the technique for which is described in detail, it was found possible to recover 95 per cent of added nitrites in meat samples.

An examination for nitrites of meat cured with known amounts of saltpeter showed that there was no appreciable reduction of nitrates to nitrites on standing. Synthetic sodium nitrate was found to contain as a rule less than 0.5 per cent of sodium nitrite.

In conclusion, the authors state that cured meat which is found to contain more than 15 mg. of sodium nitrite to 100 gm. of the meat must be considered to have been treated with nitrites.

Determination of magnesium in blood, W. DENIS (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 363-365).—A method of determining magnesium in small amounts of blood plasma is described, which consists essentially in the precipitation of the calcium in the plasma by Lyman's method (E. S. R., 37, p. 207), the removal of organic matter from the filtrate by oxidation with sulphuric acid, the precipitation of magnesium as magnesium ammonium phosphate, and the nephelometric determination of the phosphate by the reagent of Pouget and Chouchak (E. S. R., 20, p. 703).

The procedure, as carried out by the technique which is described in detail, has given an average magnesium recovery of 94 per cent in pure solutions containing from 0.02 to 0.1 mg. of magnesium. In more than 100 determinations on blood serum in both normal and pathological cases, the magnesium has varied from 0.8 to 3.8 mg. per 100 cc. of plasma. Excluding the pathological material, values from 1.6 to 3.5 mg. have been obtained.

Determination of chlorids in whole blood, J. H. AUSTIN and D. D. VAN SLYKE (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 345-348).—An investigation of the applicability of the Van Slyke-Donleavy method for plasma chlorids (E. S. R., 40, p. 714) to the determination of the chlorid content of whole blood is reported.

It was found that the direct application of the method to whole blood gives readings too high by 30 or 40 per cent, owing to the property of binding silver possessed by some component of the laked cells other than the chlorid, but that by precipitating the protein with picric acid alone or with picric and nitric acids after laking, and then treating the protein-free filtrate with silver nitrate and conducting the titration as in the Van Slyke-Donleavy method, accurate results may be obtained. The technique of the modification is described in detail.

A system of blood analysis.—I, A simplified and improved method for determination of sugar, O. FOLIN and H. WU (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 367-374, fig. 1).—Certain modifications have been made in the method of determining sugar in blood described in the system of blood analysis previously noted (E. S. R., 41, p. 13).

In the modified procedure reoxidations of the cuprous compounds, found to be a source of error when tubes of varying sizes are used, are excluded by the adoption of blood sugar tubes of definite size and shape, the specifications for which are given. The blank due to the blue alkaline copper tartrate is eliminated, and the error due to the so-called phenols in blood filtrates is removed by replacing the regular phenol reagent of Folin and Denis by a reagent which reacts with cuprous copper in acid solution without producing a color with phenols. The reagent is prepared by transferring to a liter beaker 35 gm. of molybdic acid and 5 gm. of sodium tungstate, and adding 200 cc. of 10 per cent sodium hydroxid and 200 cc. of water. The mixture is boiled vigorously for from 20 to 40 minutes to remove the ammonia present in the molybdic acid, cooled, diluted to about 350 cc., 125 cc. of concentrated (85 per cent) phosphoric acid added, and the whole diluted to 500 cc.

A comparison of blood sugar values per 100 cc. obtained by the original and the revised methods indicates that the new process tends to give slightly lower values than the original method.

Tables of refractive indices.—I, Essential oils, R. KANTHACK; edited by J. N. GOLDSMITH (*London: Adam Hilger, Ltd., 1918, vol. 1, pp. 151*).—In this volume, which is the first of a series of tables of the refractive indices of technical products, 1,500 measurements on over 500 distinct essential oils, compiled from various sources, are recorded. The author emphasizes in his preface the necessity of clearly stating the temperature of observation of

refractive indices under all circumstances. A list of 282 references to the literature is included.

A preliminary note on some new factors affecting the hardness of gur or crude sugar, T. S. SWADI (*Agr. Jour. India*, 14 (1919), No. 3, pp. 431-439).—Preliminary data on the composition of samples of gur, and of the soils and waters in the localities growing the sugar cane from which the gur samples were prepared, are presented. From these the author draws the tentative conclusion that soil and water have an important bearing on the hardness and keeping quality of the gur, the greater the alkalinity of the soil and water the softer being the gur.

Maple sugar sand (*Jour. Agr. and Hort. [Quebec]*, 23 (1920), No. 9 [*English Ed.*], pp. 163, 164).—Attention is called to sugar sand as a valuable by-product of the maple sugar industry, and a brief method is outlined for its preparation for market.

The sugar sand, largely composed of calcium malate, separates from the sap during its concentration to sirup, some of it depositing in the evaporator. The rest can be removed from the sirup either by settling or by filtering through flannel or felt. It is then washed with hot water to remove adhering sugar and dried on cotton or paper. If properly washed, the dry sugar sand will be powdery or lumpy and will vary in color from white to dark brown, depending upon the quality of the sirup.

[Manufacture of sorghum sirup], J. J. WILLAMAN, R. M. WEST, and C. P. BULL (*Minnesota Sta. Bul.* 187 (1919), pp. 32-55, figs. 8).—The manufacture of sorghum sirup on a large scale is discussed in detail. Descriptions are given of suitable factory buildings, evaporators, filter presses, and miscellaneous equipment, and the various processes involved in the manufacture of the sirup are explained and their relative merits discussed. These include the extraction of the juice; defecation by heat, by heat and lime, and by other means; evaporation of the juice in direct fire and steam coil evaporators and vacuum pans; and clarification, cooling, and packing of the sirup.

Analyses compiled from different sources are reported of sorghum sirups from various localities and produced by various methods. These figures indicate that there is a direct relation between the amount of lime used in the defecation and the acidity of the sirup. The proportion of sucrose to dextrose in the sirup depends mainly on the maturity of the cane and the acidity during defecation and evaporation. The amount of mineral matter is proportional to the lime used. The standard density for sorghum sirup is such that there is about 75 per cent of total solids.

In discussing the economic considerations of sorghum sirup manufacture, it is shown that as a rule the small-scale manufacture is not an economic procedure, and that factories at present operating on such a basis can as a rule profitably install additional equipment. Estimates are given showing that the total cost of producing sorghum sirup per season in 1918 in mills of a capacity of 1,000, 20,000, and 70,000 gal., respectively, was about 75, 51, and 46 cents per gallon. Tables are also given for computing the amount of available sugar contained in one ton of cane by means of the Baumé hydrometer reading of the juice, and of the composition and relative values of three grades of sorghum cane.

METEOROLOGY.

Factors of climatic control, W. J. HUMPHREYS (*Jour. Franklin Inst.*, 188 (1919), No. 6, pp. 775-810; 189 (1920), No. 1, pp. 63-98, pl. 1, figs. 11).—The chief factors of climatic control enumerated in this article are latitude, brightness of moon and planets, solar "constant" at a fixed distance, solar distance,

obliquity of ecliptic, perihelion phase, extent and composition of the atmosphere, vulcanism, sun spots, land elevation, land and water distribution, atmospheric circulation, ocean circulation, and surface covering. The article deals especially with the relation to climate of vulcanism, land elevation, atmospheric and ocean currents, sun spots, carbon dioxide content of the atmosphere, and surface covering.

"It appears from various considerations that, with a constant or nearly constant output of solar energy, the earth itself possesses the inherent ability to profoundly modify its own climates, whether only local or world-wide. Thus, a mere change in land elevation, whether of plateau or of mountain range, a thing that appears often to have happened, must alter both the local and the leeward climates, and, by reducing the general humidity, somewhat lower the average temperature. Besides, a change in land elevation of any considerable extent is pretty certain to be accompanied by a somewhat corresponding variation in continental area and such modification of shore lines and ocean beds that greater or less changes must follow in the directions, temperatures, and magnitudes of ocean currents, in the location and intensity of permanent 'highs' and permanent 'lows,' in the direction, force, and temperature of local winds, in the amount and kind of local precipitation, and in a host of other meteorological phenomena.

"Again, as the laws of radiation indicate must be true, and as observations, at least back to 1750, the date of the earliest reliable records, show, the temperature of the lower atmosphere depends in part upon the amount of dust in the upper air, in the sense that when this amount is great the average temperature at the surface of the earth is below normal, and when the dust is absent this temperature is comparatively high. Hence, as there appear to have been several periods of great volcanic activity in the past with intervening periods of volcanic quiescence, it is inferred that volcanic dust in the upper atmosphere was at least one important factor in some, if not all, of the great and universal climatic changes that have left their records in abandoned beaches and forsaken moraines."

It is suggested that the greatest of our past climatic changes may have been caused "by the roughly synchronous variations in continental level and volcanic activity; universal cold periods coming with increase in vulcanism, increase in elevation, and the obstruction of interzonal oceanic circulation; universal mild periods when volcanic dust seldom veiled the skies, when the continents had sunk or been eroded to low levels, and when there was great freedom of oceanic circulation from equatorial to polar regions; mild universal climatic oscillations with temporary changes in vulcanism; and mere local climatic changes with variations in such local climatic controls as near-by elevations and neighboring ocean currents. . . . It is but reasonable to suppose that the world is yet to know many another climatic change, in an irregular but well-nigh endless series, often local and usually slight, though always important, but occasionally, it may be, as in the ages gone, . . . universal, profound, and momentous."

The variability of corresponding seasons in different years, F. STUPART (*Jour. Roy. Astrom. Soc. Canada*, 13 (1919), No. 6, pp. 259-263; *abs. in Sci. Abs., Sect. A-Phys.*, 22 (1919), No. 264, p. 544).—Discussing this subject particularly with reference to the winters of 1917-18 and 1918-19 in Canada, the former being phenomenally cold and the latter phenomenally mild, it is shown that in the first case "the North Pacific low pressure was situated much farther south than usual, and its offshoots, in the form of traveling low areas, passed into Canada over southern British Columbia and thence kept away to the southward, and the result was a prevalence of northerly winds, not only in the western provinces but also in eastern Canada." During the winter of 1918-19 "the

North Pacific low was extremely energetic and in a stream of offshoot cyclonic areas, which impinged on the northern Alaskan coast, prevented the formation of anticyclonic conditions, and passing first southeastward, finally moved eastward as dispersing areas across the western provinces, there giving most persistent gradients for southerly and southwesterly winds with unseasonably high temperature." The author suggests further investigations regarding the control of the great centers of action in the North Pacific and North Atlantic, particularly the effect of changes both in position and temperature of the great ocean currents.

The book of normals of meteorological elements for the British Isles (*Met. Off. [Gt. Brit.], Book of Normals, Sect. I, 1919, pp. 94*).—This document gives monthly and annual averages of temperature, rainfall, and sunshine for the period of 35 years, 1881–1915.

Predicting stream flow in the Sierras, J. N. LE CONTE (*Jour. Electricity, 41 (1918), No. 6, pp. 248–251, figs. 21*).—Data on snowfall and also on the rate of melting of snow on the ground at Summit, Cal., at an elevation of 7,000 ft., for 20 years are reported and discussed, the purpose being to show the relation between the individual seasons and the average for the entire period.

While the results are considered rather unreliable, it is stated that "enough is brought out to show a definite law." By imposing the mean curve of snowfall for 20 years on the curves for each year probable curves of melting are deduced, which indicate that "if on the first of April the actual curve falls below the mean, the season will probably be a dry one so far as snow-fed streams are concerned. If, on the contrary, the actual curve of melting falls far above the mean, the snow will lie long in the mountains, and floods will come late."

Determination of water supply from snow fields (*Engin. News-Rec., 83 (1919), No. 17, pp. 766–768, fig. 1*).—This article describes and illustrates Church's snow sampler; gives tables prepared by Church and Smith, showing the relation between depth and water content of snow, based on several years' studies and snow surveys in the Sierra Nevada Mountains in Nevada, previous accounts of which have been noted (*E. S. R., 38, p. 416; 41, p. 211*); and discusses the use and value of the sampler and tables in estimating in advance the amount of water available for irrigation and power purposes.

Meteorological observations at the Massachusetts Agricultural Experiment Station, J. E. OSTRANDER and G. S. SMITH (*Massachusetts Sta. Met. Buls. 373–374 (1920), pp. 4 each*).—Summaries of observations at Amherst, Mass., on pressure, temperature, humidity, precipitation, wind, sunshine, cloudiness, and casual phenomena during January and February, 1920, are presented. The data are briefly discussed in general notes on the weather of each month.

Meteorological observations of the College of Belen, Habana, 1918, L. GANGOITI (*Observ. Met., Magnet., y Seismico Col. Belen [Habana, Reseña Met.], 1918, pp. 11+[77]*).—Detailed daily and monthly summaries of observations on pressure, temperature, precipitation, evaporation, humidity, wind, and cloudiness are given, and the characteristic meteorological features of each month are described in notes.

British rainfall, 1918, H. R. MILL and M. DE C. S. SALTER (*London: Edward Stanford, Ltd., 1919, pp. 68+[242], pls. 4, figs. 30; abs. in Nature [London], 104 (1919), No. 2617, p. 411*).—This is the fifty-eighth report of the British Rainfall Organization and its last as an independent organization, the control of the work having passed to the British Meteorological Office. The report contains, as usual, tabular summaries of data recorded by about 5,000 voluntary observers. It also contains special articles on The Development of the British Rainfall Organization Since 1910, by H. R. Mill, and on The Relation of Rainfall to

Configuration, by M. de C. S. Salter, the latter of which has been noted previously (E. S. R., 41, p. 510).

Rainfall maps are given which show for each month the actual rainfall in inches and the percentage of the average. A colored map is given which shows the relation of rainfall in 1918 to the average of 1875-1909. Evaporation and percolation data from several stations are also included.

Meteorology and agriculture, T. B. FRANKLIN (*Jour. Scot. Met. Soc.*, 3. ser., 18 (1919), No. 36, pp. 76-83; *abs. in Scot. Jour. Agr.*, 3 (1920), No. 1, pp. 90-93).—This paper discusses briefly and in a nontechnical way the relation of meteorological conditions to the soil supply of heat, water, and air required in plant growth, and also reports results of experiments by the author showing the action of soil mulches (surface tillage) and protection from the wind in conserving soil moisture and increasing the yield of potatoes.

SOILS—FERTILIZERS.

Soil survey of Linn County, Iowa, F. B. HOWE, T. H. BENTON, M. Y. LONG-ACRE, and A. H. MEYER (*U. S. Dept. Agr., Adv. Sheets Field Oper. Bur. Soils*, 1917, pp. 44, fig. 1, map 1).—This survey, made in cooperation with the Iowa Experiment Station, deals with the soils of an area of 453,760 acres in east-central Iowa, which lies within the glaciated portion of the State. The topography of the greater part of the area is that of a partially eroded drift plain, a feature of which is the occurrence of lenticular hills and ridges. Apparently every part of the area is reached by tributaries and minor drainage ways.

The soils of the county are derived mainly from loess, glacial till, and alluvial deposits. The glacial soils occupy the largest area. Including muck, 27 soil types of 12 series are mapped, of which the Carrington silt loam covers 49.7 per cent and the Carrington loam 10 per cent of the area.

Agricultural study of the soils of Cochin China, P. BUSSY (*Bul. Agr. Inst. Sci. Saigon [Cochin China]*, 2 (1920), No. 1, pp. 1-11).—The soils of Cochin China are divided into soils of recent alluvial origin, soils of ancient alluvial origin, and red soils of volcanic origin. Physical and chemical analyses of the different phases of each division are reported and discussed.

The soils of recent alluvial origin are generally very fertile, but require cultivation with high-powered machinery during a time of the year when the moisture content is at the optimum. They respond particularly to additions of phosphatic and calcareous fertilizers. The most recent alluvial deposits contain a considerable proportion of clay, which is thought to explain the great tenacity of these soils. These soils contain a considerable quantity of humus and an important reserve of organic matter, and are well supplied with nitrogen. It is noted that both the soil and the subsoil contain more magnesium than lime.

The older alluvial soils have about the same characteristics as those of more recent origin, except that the proportion of clay is somewhat lower. The soils of recent alluvial origin also contain certain areas of a highly acid nature, due to the presence of the sulphates of iron and aluminum. The valley alluvial soils are characterized by considerable gravel and mixtures of sand and organic débris. These soils are generally easy to cultivate.

The soils of ancient alluvial origin are easy to cultivate, but require abundant applications of fertilizers, particularly stable manure and other materials to increase the humus content. Additions of phosphatic and potassic fertilizers are also considered advisable. These soils are very permeable and are usually siliceous clays. They are generally deficient in fertilizing constituents.

The red soils are siliceous clays to their total depth, with the clay fraction predominating. They have a high capacity for retaining moisture, and contain a varying proportion of siliceous and strongly ferruginous gravel. The red soils are generally deficient in potash and lime, and are generally well supplied with nitrogen and phosphoric acid. When properly treated it is considered possible to conduct general agriculture in the red soils.

The movement of moisture in soil by capillarity, W. GARDNER (*Soil Sci.*, 7 (1919), No. 4, pp. 313-317, figs. 3).—In a contribution from the Utah Experiment Station, the author presents a mathematical analysis of the subject to show that the density or mass of moisture per unit volume in soil may be expressed in the formula $p = (Ax + B)^{3/2}$. In this p is the density, A and B are integration constants, and x apparently denotes distribution.

In the station laboratory several preliminary observations were made as to the moisture distribution at the steady state. The moisture was allowed to penetrate by capillarity into horizontal tubes of about 4 cm. diameter containing fine sand, and was evaporated from the remote end. The tubes, about 6 ft. in length, were mounted in such a way as to rotate about an axis perpendicular to the tube, and a record of the changing moment due to the moisture as it crept forward was kept as a guide to the degree to which a steady state was approached. The results are graphically reported, and it is the opinion that the assumptions which have been made in the theoretical considerations may affect the magnitude of the exponent in the equation, but the experimental data would seem to indicate that the equation is not far from correct. The experimental errors were rather large, owing to the fact that slight irregularities in the manner of packing the soil and other attendant experimental difficulties tended to modify the results obtained.

Three references to literature bearing on the subject are appended.

Adsorption phenomena in soils, D. J. HISSINK (*Chem. Weekbl.*, 16 (1919), No. 35, pp. 1128-1146; *abs. in Chem. Abs.*, 13 (1919), No. 23, p. 3266; *Jour. Soc. Chem. Indus.*, 38 (1919), No. 23, p. 918A).—The author calls attention to what he considers to be the erroneous interpretation of experiments by others, notably those of Van Bemmelen, on the relative adsorptive power of different soils for the cations sodium, ammonium, potassium, calcium, and magnesium. It is believed that the amount of a cation adsorbed from a solution depends on the amount already adsorbed in the soil, and that in order to ascertain the relative adsorption affinities of cations it is necessary to treat soil containing only one adsorbed cation with solutions of the others.

Experiments with clay containing only ammonium as the adsorbed cation gave the following descending order of adsorptive affinity: Magnesium, calcium, ammonium, potassium, and sodium. From experiments with permutit it is concluded that the ferric ion is not contained in it in such a way that it can enter into adsorption equilibrium with other cations in solution.

Disinfection of soil, E. MIÈGE (*Prog. Agr. et Vitic. (Ed. VEst-Centre)*, 41 (1920), No. 6, pp. 133-140).—A review is given of the work of others bearing on the subject, and the results of two series of experiments are reported. Field and garden experiments were conducted on a heavy siliceous clay soil at the National School of Agriculture at Rennes. The crops were potatoes, buckwheat, tomatoes, carrots, beans, and leeks. Several different substances, including sulphur, copper sulphate, potassium permanganate, calcium hypochlorite, charcoal, toluene, formal, lysol, carbon disulphid, and oxygenated water, were used.

In the field the action of the different substances was clearly manifest. Potatoes matured earlier and the quality was improved. Sulphur gave the best results, and copper sulphate showed some increase in yield. Toluene also gave good results. Calcium hypochlorite gave the best results with buckwheat.

In the garden experiments the materials added gave good results with all the crops, not only in increased yields but also by improvement in quality and condition. The bean crop was increased 120 per cent with calcium hypochlorite and 70 per cent by a simple application of charcoal. The yield of tomatoes was increased 45 per cent by the use of antiseptics and the carrot crop 200 per cent, the quality of the latter being also considerably improved. The use of antiseptics was markedly effective in protecting the crops against parasites.

Greenhouse and plat experiments with tomatoes, cucumbers, and carnations, on a clay soil rich in iron oxid and deficient in lime, are also reported. The best results in these experiments were apparently obtained with toluene and carbon disulphid. It is noted that different results were obtained with different materials added, the specific result depending upon the chemical composition of the material and the species of plant on which it was used. For instance, in a comparison of the two sets of experiments it is noted that sulphur and copper sulphate gave better average results on potatoes and tomatoes than on any of the other crops, and lysol and formol gave better results on carrots. Tomatoes were benefited more by toluene and carbon bisulphid than by any other material. The use of lysol and formol together diminished their effectiveness, while the addition of calcium hypochlorite and charcoal to sulphur increased its effectiveness.

Attention is drawn to the difficulty of distinguishing between the fertilizing action of the materials used and their antiparasitic action, and it is concluded that more research is necessary to place soil sterilization on a practical working basis.

The disinfection of soil and its partial sterilization, L. MALPEAUX (*Vie Agr. et Rurale*, [10] (1920), No. 6, pp. 94-97, figs. 3).—A review is given of a number of experiments by others on the partial sterilization of soils, with particular reference to the use of sulphur compounds.

Research on soil reaction, E. RABATÉ (*Prog. Agr. et Vitic. (Ed. l'Est-Centre)*, 41 (1920), No. 7, pp. 161-165).—Different methods of determining and studying soil reaction are reviewed, and the interpretation of the results of such studies from the soil fertility standpoint is discussed. The use of organic nitrogenous fertilizers is advised on strongly basic soils, and it is stated that numerous tests have shown that soils of acid reaction are almost always deficient in available phosphoric acid. Natural phosphates are recommended for such soils and superphosphate for strongly alkaline soils. It is concluded that a study of soil reaction should always be conducted in soil surveys, and that data regarding reaction should always accompany soil analyses.

A study of methods of determining soil alkali, D. W. PITTMAN (*Utah Sta. Bul.* 170 (1919), pp. 3-21, figs. 8).—This bulletin reports comparisons of different methods of testing alkali soils, both as to results and relative variability, a study of some of the irregularities in the water extraction method of testing for sodium carbonate, and a study of crop germination as an indication of alkalinity.

It was found that the many different methods of determining and expressing the alkali content of a soil give widely varying results, especially with reference to the sodium carbonate content. The amount of basic carbonate determined in a soil by water extraction was found to vary with the organic content of the soil, the time allowed for equilibrium, and the proportion of soil to water used.

Studies of the absorption of sodium carbonate by synthetic soils showed a large but widely varying absorption of the carbonate which was in general, however, proportional to the organic matter content of the soil. The stage of equilibrium was also very largely dependent on the amount of water used, and ex-

traction was relatively less where a small amount of the salt was added originally.

The toxic limits of alkali salts in a soil were found to differ with the different methods of determining the salt in the soil. Data are given showing the degree of toxicity of the three most important alkali salts—sodium chlorid, sodium carbonate, and sodium sulphate—as indicated by germinating wheat kernels in soils to which these salts were added in different amounts. Graphic data are also given showing the relationship between the toxicity of these salts and different methods of determining the salt content of soil.

The tolerable limits of the contamination of the Weser River water by wastes from the potash industry, KERP (*Arb. Reichsgesundheitsamt.*, 51 (1919), No. 2, pp. 239-389).—A rather extensive study of the contamination of the water of the Weser River in Germany from the waste products of potash industries is reported.

It was found that fish life was not materially injured until a hardness degree of 110 was reached in a concentration of chlorin of 2,000 mg. per liter. The injury to agricultural lands overflowed by the river waters, while not very marked, was found to be mainly due to the influence of the potash by-products on the physical condition of the soil. It is concluded, however, that the potash industry should continue to take steps toward the safe disposal of the waste products without permitting them to flow into the river water, and extensive recommendations as to the permissible limits governing such practice and methods of disposal are given.

The doctrine of fertilizers, E. PFYFFER VON ALTISHOFEN (*Die Düngerlehre. Berlin: Hugo Steinitz, 1917, 2. ed., pp. IX+292, figs. 106*).—This is a text-book giving information on fertilizers and fertilizing materials, and their rational use in German agriculture. It is the purpose to cover all types of different fertilizers and soil amendments, including natural and artificial complete fertilizers, green manures, and general commercial fertilizers.

The determination of the fertilizer requirements of soils, E. HASELHOFF (*Fühling's Landw. Ztg.*, 67 (1918), No. 11-12, pp. 193-204).—A summary is given of studies bearing on the subject by a number of different experimenters, from which the conclusion is drawn that plant analysis may assist in determining the fertilizer requirements of soils, but that it is not an absolutely certain basis for such determination. The results of long-time pot experiments are considered to be a better basis, especially when all growth factors, particularly moisture content, are considered.

In this connection experiments with rye, beans, wheat, beets, and oats, on three different soils, extending over a period of five years, are reported, the purpose being to show the variations in results which may occur under variable conditions. Several different schemes of fertilization were employed, and a large variation in yield of crops was noted. Variations in yield were noted with individual fertilizers in the same year, from which it is concluded that the application of such experimental data to other soils is not feasible. The results are also taken to indicate the vast possibilities for error in 1-year experiments. It is concluded that fertilizer experiments can give a correct indication of the fertilizer requirements of the soil when the experiments are conducted for several years with different crops under conditions of soil, weather, and other factors which are of particular significance to a particular crop.

The influence of two different fertilizers on plant yield, E. A. MITSCHERLICH (*Landw. Jahrb.*, 52 (1918), No. 2, pp. 279-296, pls. 3, fig. 1; *abs. in Chem. Zentbl.*, 1918, II, No. 19-20, pp. 854-856).—Experiments are reported on the influence on the yield of oats of two fertilizers which had no influence on each

other. Potash was used as potassium sulphate and nitrogen as ammonium nitrate. It was found, when both fertilizers were present in the same available form and were not influenced by any other substances, that to obtain the highest yield of oats 2.18 times as much nitrogen was necessary as potash, indicating that the potash was better utilized by the plant than the nitrogen. This experiment again confirmed the correctness of the law of physiological relations, and the author is of the opinion that the Baule formula is practical, since it was mathematically possible to express the crop yield in terms of the many variables.

A second experiment on the influence of two fertilizers having an influence upon each other is reported. In the first part of the experiment, calcium carbonate was used in connection with phosphatic fertilizers. Raw phosphate did not give so high results with reference to crop yield as a more soluble fertilizer. It was also found that the highest yield which could be obtained with phosphatic fertilization was depreciated by the addition of calcium carbonate, gradually at first and later more rapidly. It is concluded, on the basis of an experiment with a phosphorite meal, that an increased yield through phosphatic fertilization with calcium carbonate is almost impossible. The value of Thomas meal, however, was considerably greater than that of tricalcium phosphate in the presence of calcium carbonate. It is further concluded that phosphoric acid fertilization on soil recently treated with lime or marl is ineffective, and also that it is ineffective on soils rich in lime unless the injurious action of the lime is counteracted by other salts, such as ammonium sulphate.

In the second part of this experiment, potash and ammonium chlorid were used together. It was found that the ammonium chlorid depreciated the action of the potash, and it was considered probable that the ammonium chlorid under the given conditions was physiologically acid and had a poisonous effect.

Some factors which influence the yield of paddy in comparative manurial experiments at the Manganallur Agricultural Station, H. C. SAMPSON (*Agr. Jour. India*, 14 (1919), No. 5, pp. 739-746).—A review of these factors is given, which indicates the importance of maintaining careful notes of experiments and the danger which lies in merely judging the results of different plats by the figures of yields recorded.

Long-time fertilizer experiments on the same soil, from 1905 to 1918, F. VON LOCHOW (*Fühling's Landw. Ztg.*, 67 (1918), No. 23-24, pp. 442-448).—Cropping experiments, using complete and individual fertilizers on a loamy sand soil with a loamy sand to a sandy loam subsoil, are reported, extending from 1905 to 1918, inclusive. It is concluded from the results of these experiments that long-time experiments on the same soil, using fertilizers in general, are not productive of profitable information, and that better results can be obtained by conducting experiments to determine what particular fertilizers can be most profitably used on a particular soil.

Manuring for milk, J. M. ADAMS (*Dept. Agr. and Tech. Instr. Ireland Jour.*, 20 (1919), No. 1, pp. 45-61, figs. 2).—Experiments extending over several years, conducted at the Clonakilty Agricultural School in Ireland, in which cows were tested on manured and unmanured pastures, are reported.

The experiment consisted in the estimation of the improvement in pasture following the application of basic slag and other fertilizers, in terms of milk yield, the results being obtained by grazing milch cows and comparing the yield of milk produced with that of similar cows grazed on an equal area of the same pasture unmanured. The results of these experiments demonstrated that manuring for milk is profitable, and that the carrying capacity for cows of a poor pasture can be considerably increased by manuring. It was found that on

the poor pastures tested it was possible for cows in milk to more than pay the cost of the basic slag in the first season after application by reason of the greater number of cows carried. Particular attention is drawn to the fact that the advantage gained by manuring poor pastures lies not so much in the individual increase in milk yield per cow as in the additional carrying capacity of the pasture.

Investigations on the conservation of liquid manure by the addition of different materials, O. LEMMERMANN and H. WIESSMANN (*Landw. Jahrb.*, 52 (1918), No. 3, pp. 297-341).—Investigations on the conservation of liquid manure by the addition of different materials, especially brown coal, peat, sulphuric acid, sodium bisulphate, superphosphate, kainit, gypsum, and formalin, are reported.

The brown coal used was able to combine with 5.122 per cent of ammonia. The compound formed was very stable at ordinary temperatures, but released a part of the ammonia at 100° C. The addition of from 50 to 60 per cent of air-dry brown coal containing 80 per cent dry matter was sufficient to preserve perfectly the liquid manure used. Fertilizer experiments with liquid manure conserved with brown coal gave good results, and the nitrogen in the so-treated liquid manure was more active than an equal amount of nitrogen in the form of ammonium sulphate. The addition of 20 per cent of peat to liquid manure resulted in a loss of 51.03 per cent of the nitrogen after 62 days, in spite of the fact that the peat possessed the power to form a very stable chemical compound with ammonia.

The addition of from 1.5 to 2 per cent of sulphuric acid of 66° B. protected liquid manure from nitrogen losses. The addition of 7 per cent sodium bisulphate of an acidity equivalent to 0.3501 gm. of sulphuric acid per gram of the substance was sufficient to conserve the liquid manure used. The nitrogen loss after 62 days, by the addition of 10 per cent superphosphate, was 27.48 per cent. The use of kainit did not conserve liquid manure. An addition of 15 per cent resulted in a loss of 70.18 per cent of the nitrogen within 62 days. Gypsum gave somewhat better results than kainit, although by an equal addition the nitrogen loss was 63.86 per cent within 62 days. The addition of 0.25 per cent of formalin to fresh urine depressed fermentation of the urea. An addition of 6 per cent formalin to liquid manure was equally effective and the nitrogen loss after 62 days was only 1.7 per cent. Experiments with numerous other materials showed that small quantities of zinc chlorid and copper sulphate sufficed to prevent urea fermentation, while other salts, such as sodium chlorid and sodium sulphate, when used in the same quantities, were unable to do so. It was found that in studies on the conservation of liquid manure it is of the greatest importance to know the exact characteristics of the liquid manure used.

Fertilizer mixtures and composts, G. R. P. D'UTRA (*Estrumes Mistos e "Compostos."* Sao Paulo: Sec. Agr., Com. e Obras Pub. Estado Sao Paulo, 1919, pp. 103).—This pamphlet summarizes considerable data from different sources on the preparation and use of barnyard manures and composts in agriculture, with particular reference to the application of the methods outlined to conditions in Brazil. Special attention is given to the composition of different barnyard manures and composts, the conservation of such manures, and the amounts to be used on different soils for different crops.

Artificial nitrogenous fertilizers, E. J. RUSSELL (*Jour. Soc. Chem. Indus.*, 39 (1920), No. 1, pp. 5R, 6R).—Experiments on the value of ammonium nitrate, calcium nitrate, and cyanamid as sources of nitrogen, as compared with other well known nitrogenous fertilizers, are reviewed.

It is noted that in most cases ammonium nitrate gave better results than either sodium nitrate or ammonium sulphate when used in amounts giving

equal amounts of nitrogen. "On the other hand, nitrate of ammonia has some disadvantages in comparison with nitrate of soda; it is not so easily handled by the farmer, it has to be stored in casks, not in bags, and it is not readily applied by the ordinary drill. These are essentially minor disadvantages, but they offset any slight advantage the nitrate of ammonia may possess over nitrate of soda."

A comparison of calcium nitrate with sodium nitrate indicates no important difference. "Nitrate of lime has the advantage that the calcium is never hurtful in the soil, while the sodium sometimes is, though also the sodium is sometimes an advantage."

It is stated that the whole value of cyanamid depends upon the rate at which ammonia is formed, this depending largely upon the soil to which it is added. "There is reason to suppose that the production of ammonia takes place in two stages, the first of which is purely chemical and the second bacterial; further, that the agent producing the chemical change is not always present in sufficient quantity in the soil. It would be an obvious advantage if a chemist could say beforehand of a given class of soil whether or not it were likely to decompose cyanamid. Work with this purpose has been carried out at Rothamsted, and the results are very promising.

"The results of all published field trials show that the three fertilizers—nitrate of soda, sulphate of ammonia, and cyanamid—when compared on the basis of equal nitrogen content have the following values: Nitric nitrogen 100, ammoniacal nitrogen 97, cyanamid nitrogen 90. But these include cases where the cyanamid nitrogen could have had no proper chance of acting. Under better advice, the farmer could have been warned beforehand and the use of the cyanamid kept to those numerous cases where it can decompose rapidly and act well. In these circumstances the value of the cyanamid nitrogen might rise well above 90, and, what is more important, the risk of failure might be considerably reduced."

Some aspects of cheap cyanid processes, H. PHILIPP (*Chem. and Metal. Engin.*, 22 (1920), No. 7, pp. 313-317).—A review is given of the developments in cyanid synthesis and improvements made in the ferrocyanid processes. A discussion is given of reactions between nitrogen, carbon, and the alkaline bases, nitrogen fixation by the electric arc, and the cyanamid process. It is stated that the disadvantages offered by the Bucher process are the number of steps involved, the short life of the retorts, the inability to use the finely divided iron many times owing to the accumulation of impurities, and the difficulty and losses in separating the sodium cyanid from the aqueous solution.

The synthesis of ammonia, I-III, E. B. MAXTED (*Chem. Age* [London], 1 (1919), Nos. 19, pp. 514, 515; 20, pp. 540-542; 22, pp. 590-592, fig. 1).—This paper is in three parts.

Part I deals with the present position of ammonia synthesis in Great Britain. The author draws attention to the vague nature of the international position with regard to the Badische patents, and states that the possibility of having to defend an action for infringement may have prevented the erection of synthetic plants in Great Britain. Part II deals with the technology of the process of ammonia synthesis. Part III takes up the relation between the direct synthesis of ammonia and the alternative methods of nitrogen fixation from an economic standpoint, with special reference to their applicability in Great Britain.

The advantages of the synthesis of ammonia under very high pressures, G. CLAUDE (*Compt. Rend. Acad. Sci.* [Paris], 170 (1920), No. 3, pp. 174-177).—In a discussion of the German process of ammonia synthesis using pressures around 200 atmospheres, it is pointed out that the use of pressures around

1,000 atmospheres has the advantage that the combination of the ammonia is hastened and the catalyzer may be reduced in size, even in excess of an inverse ratio to the pressure. The recovery of the ammonia is facilitated also, and by use of cooling water it may be recovered as liquid ammonia with high pressures without the necessity of recovering it as an aqueous solution.

Reversible oxidation of sodium nitrite, C. MATIGNON and E. MONNET (*Compt. Rend. Acad. Sci. [Paris]*, 170 (1920), No. 3, pp. 180-182).—Experiments are reported from which it is concluded that the passage of sodium nitrite to sodium nitrate by direct oxidation is a reversible reaction that requires a good catalyzer which will permit active operation under atmospheric or reduced pressures.

Phosphate demonstrations in Stevens County in 1918, P. R. McMILLER, P. E. MILLER, and G. H. NESOM (*Minnesota Sta., Rpt. Morris Substa., 1918*, pp. 47-54, figs. 2).—This has already been noted from another source (E. S. R., 41, p. 425).

The potash of Alsace and potash of Germany, A. ARNAL (*Vie Agr. et Rurale*, [10] (1920), No. 6, pp. 98-100).—A comparison is given of the value of the potash resources of Alsace and of Germany. It is the opinion that the German potash is inferior in grade and purity to that of Alsatian potash, and that the process of extraction is more difficult. Other factors of advantage of the Alsatian potash are discussed.

Sources of industrial potash in Western Australia, E. S. SIMPSON (*West. Aust. Geol. Survey Bul. 77* (1919), pp. 46, pls. 2, figs. 4).—This report deals with the sources of industrial potash in Western Australia and includes descriptions of the uses, manufacture, foreign supplies, and local occurrences throughout the State as far as they have been examined. The local sources of potash in Western Australia are wood, seaweed, and coal ashes; feldspar; glauconite; jarosite; and alunite. Chemical analyses of samples of these materials are reported and discussed, with a view to local development.

Two appendices, on Examination of Western Australian Seaweeds for Potash and Iodin, by I. H. Boas; and The Alunite Deposits at Kanowna, by T. Blatchford, are also included.

The practice of liming, P. DIFFLOTH (*Vie Agr. et Rurale*, [10] (1920), No. 6, pp. 89-93, figs. 3).—A summary is given of French practice in liming agricultural soils, in which different types of lime used and the action of lime in soils are discussed. Lime spreading and the burning of lime are also described.

The rôle and use of magnesium in fertilizers, J. LEFÈVRE (*Vie Agr. et Rurale*, [10] (1920), No. 6, pp. 105-107).—A review of the results of different experiments on the value of magnesium as an element in fertilizers is given. Analyses of different crops are given showing an appreciable percentage of magnesium. It is the opinion that the use of magnesium in the form of dolomite is advisable, particularly for viticulture.

Limekiln gases for carbon dioxide fertilization, F. RIEDEL (*Tonindus. Ztg.*, 43 [1919], pp. 607-610, 619, 620; *abs. in Chem. Zentbl.*, 1919, III, No. 18, p. 737).—Experiments are reported indicating that successful results in promoting crop growth were obtained in hothouses through the use of carbon dioxide gas obtained from a limekiln. It was found that the yield was in some cases doubled and in others quadrupled, and these results are attributed to the use of the gas.

Increasing the production of irrigated wheat and jowar (*Dept. Agr. Bombay Leaflet 6* (1918), pp. 2).—Brief data are given to show the increase in yield of irrigated wheat and sorghum resulting from the use of oil cakes as manure on Bombay soils.

Progress of the inorganic chemical industries in the principal provinces [of Germany] during 1917, V. HÖBLING (*Chem. Indus. [Berlin]*, 41 (1918), Nos. 17-18, pp. 177-188; 19-20, pp. 202-215).—This is a summary of reports of progress along inorganic chemical lines in Germany during 1917, including sections on sewage, sulphur, nitrogen, and nitric acid, potash, and ammonia.

Fertilizers for 1917, A. MCGILL (*Lab. Inland Rev. Dept. Canada Bul.* 378 [1917], pp. 37).—Analyses of 349 samples of fertilizers and fertilizing materials offered for sale in Canada and collected for inspection during March, April, and May, 1917, are reported. It was found that six samples were low in phosphoric acid, four in ammonia, and one in both ammonia and phosphoric acid.

AGRICULTURAL BOTANY.

Cooperation and individualism in scientific investigation, C. L. SHEAR (*Sci. Mo.*, 9 (1919), No. 4, pp. 342-348).—This is a brief discussion of needs and possibilities in regard to cooperation and individualism in scientific work under the conditions of the present and the probable near future.

Directions for collecting flowering plants and ferns, S. F. BLAKE (*U. S. Dept. Agr., Dept. Circ.* 76 (1920), pp. 8, figs. 3).—This circular replaces a portion of circular 126 of the Bureau of Plant Industry (E. S. R., 29, p. 327). Instructions are given for collecting and preserving flowering plants and ferns.

Natural history of Paradise Key and the near-by Everglades of Florida, W. E. SAFFORD (*Ann. Rpt. Smithsn. Inst.*, 1917, pp. 377-434, pls. 66, figs. 32).—This is a report of a survey begun by the author in September, 1917, and resulting in the collection of specimens representing many branches of natural history (both animal and plant life), which have been deposited in different institutions which are named.

This island, situated in the heart of the Florida Everglades, is said to present a remarkable example of a subtropical jungle in which primeval conditions of animal and plant life have remained unchanged by man. It is said to be remarkable also as being the meeting place for many temperate and tropical types. Discussion is given of the climate, physical geography, and history of this and neighboring regions.

The consideration of life as regards plants includes discussion of marsh and slough plants; forest trees and their epiphytes; climbing lianas; native palms; and plants peculiar to the pineland region, especially the saw palmetto and the cycad *Zamia floridana*.

Floral aspects of the Hawaiian Islands, A. S. HITCHCOCK (*Ann. Rpt. Smithsn. Inst.*, 1917, pp. 449-462, pls. 25).—The author, having in the summer of 1916 studied with the aid of A. E. Hitchcock the flora of this area, describes the various aspects of plant life of the Hawaiian Islands in connection with the bearings thereon of the situation, climate, and history of the Islands.

The flora of Stewart Island (New Zealand): A study in taxonomic distribution, J. C. WILLIS (*Ann. Bot. [London]*, 33 (1919), No. 129, pp. 23-46, figs. 2).—The flora of Stewart Island is dealt with in the light of the age and area theory as regards its taxonomic distribution. It is claimed that all the general predictions made have proved correct.

The relationship of Stewart Island to the two great invasions of plants into New Zealand is considered. It is claimed that the northern invasion was perhaps the earlier. It is thought that Stewart Island did not lie in the track of the southern invasion, but that it received plants thereof from the northern side of Foveaux Strait. In each invasion the plants which occur in Stewart Island are selected from the largest families and genera. It is claimed that, as many predictions may be successfully based upon age and area alone, the

operation of this factor must be the principal positive determining cause in geographical distribution, while the operation of barriers is the principal negative cause. Some difficulties are discussed.

Observations on the anatomy of teratological seedlings.—I, On the anatomy of some polycotylous seedlings of *Cheiranthus cheiri*, H. S. HOLDEN and D. BEXON (*Ann. Bot. [London]*, 32 (1918), No. 128, pp. 513-530, figs. 17).—The authors describe the vascular anatomy of a series of seedlings of *C. cheiri*, showing cotyledonary abnormality ranging from hemitricotily to tetracotily. This is believed to indicate at least two methods of cotyledonary increase, namely, cotyledonary fission and dichotomy of the growing point of the cotyledon. To these may possibly be added the downward displacement of one or more epicotyledonary leaves. The relation of these facts to the interpretation of other results observed is discussed.

Observations on the anatomy of teratological seedlings.—II, On the anatomy of some polycotylous seedlings of *Centranthus ruber*, D. BEXON (*Ann. Bot. [London]*, 34 (1920), No. 133, pp. 81-94, figs. 9).—A study was carried out with polycotylous seedlings of *C. ruber* in the hope of discovering, among the abundant material by this species, evidence corroborative and supplemental as related to that obtained in the investigation of *Cheiranthus cheiri*, above noted, as to the origin of polycotily. The vascular anatomy of a number of *C. ruber* seedlings showing all stages of polycotily from hemitricotily to tetracotily is described. These, though they agree in broad outline with the types of structure found in *C. cheiri*, differ as to frequency of fusions between cotyledons and as to the presence noted in some seedlings of a cotyledon the median bundle of which retains its collateral structure. The significance of these features is discussed. The vascular anatomy of a twinned seedling is described, the twinning being due to the fusion of distinct embryos, or to the partial separation of the daughter cells resulting from the quantitative division of the embryo initial.

Some anomalies in monocotyledonous roots, A. V. SPRATT (*Ann. Bot. [London]*, 34 (1920), No. 133, pp. 99-105, pl. 1, fig. 1).—The results of the present studies show that a large proportion of monocotyledonous natural orders contain members which have somewhat abnormal root structures. The anomaly consists in the filling of the pith of the stele, which is rather larger than usual, with scattered vascular elements. These are formed by secondary thickening or are differentiated at the growing point, and later in some cases coalesce to form a solid stele. Discussion is given of the roots of *Dracæna*, *Pandanus*, *Yucca*, and other plants.

Variation in *Eranthis hyemalis*, *Ficaria verna*, and other members of the Ranunculaceæ, with special reference to trimery and the origin of the perianth, E. J. SALISBURY (*Ann. Bot. [London]*, 33 (1919), No. 129, pp. 47-79, figs. 20).—From an examination of variations, both meristic and substantive, in flowers of *E. hyemalis*, *F. verna*, and other members of the Ranunculaceæ, the author claims to have shown that meristic variation is exhibited in all the floral regions, involving a corresponding variation in the total number of parts present. Correlation is usually present between variations in the different parts of a flower, increase or decrease usually being exhibited simultaneously by the perianth, androecium, and gynæceum. Branched stamens are not infrequently present, and bifurcated petals have been observed in several members of the group. Increase in any one region is usually accompanied by an increase in the adjacent regions, so that transformation can not be assumed. Substantive variations of the nature of transitions are not infrequent, and emphasize such features as the foliar nature of the calyx or the staminodal character of the honey leaves. From the facts adduced, the author concludes that meristic

variation is mainly the outcome of two tendencies, namely, fission and fusion, the causation of which is discussed.

Variation in *Anemone apennina* and *Clematis vitalba*, with special reference to trimery and abortion, E. J. SALISBURY (*Ann. Bot. [London]*, 34 (1920), No. 133, pp. 107-116, figs. 9).—In the present paper, further data are furnished in support of views set forward in the communication noted above, relative to the essential trimery of the Ranunculaceæ and the variation of the number of constituents of the flower through fusion or fission.

A corn pollinator, M. C. COULTER (*Bot. Gaz.*, 68 (1919), No. 1, pp. 63, 64, fig. 1).—The construction and use of this pollinator, which is described and discussed, are said to be as simple as can be required, even in case of unskilled assistants. A dense cloud of pollen is blown over the silks with comparatively little waste. Pollination can readily be repeated if desired. The expense is slight. A certain difficulty in filling the pollinator, introduced by the height of the corn, appears to be unavoidable.

Some concepts in mycology.—An attempt at synthesis, W. B. BRIERLEY (*Brit. Mycol. Soc. Trans.*, 6 (1918), pt. 2, pp. 204-235, fig. 1).—This paper is a tentative essay toward synthesis in mycology. The author has followed out two of the possible lines of construction, namely, the species concept and the educability of fungi.

The preservation of artificial cultures of molds, H. F. TAGG (*Trans. and Proc. Bot. Soc. Edinb.*, 27 (1919), pt. 4, pp. 335-337).—A satisfactory culture of a nonliquefying fungus on nutrient gelatin or agar-agar may be prepared for keeping and handling indefinitely if killed with formalin vapor in the Petri dish and sealed while in a sterile condition. The organism and culture may be cut out, dried, and mounted on glass or cardboard. Other methods and modifications for different purposes are discussed.

On the alga-flora of some desiccated English soils: An important factor in soil biology, B.-M. BRISTOL (*Ann. Bot. [London]*, 34 (1920), No. 133, pp. 35-80, pl. 1, figs. 12).—The investigation by means of water cultures of 44 samples of soil from widely separated localities is said to have shown that there is a widely distributed ecological plant formation in cultivated soils consisting of moss protonemata and algæ, some of the most important of which are indicated. It is thought likely that the extensive algal formation must be of considerable economic importance in the biology of the soil. Six new species or varieties are described, 16 species already described are newly recorded for the British Islands, and a number of stages are depicted in the life histories of certain species already known.

Notes on some saprophytic species of fungi associated with diseased potato plants and tubers, G. H. PETHYBRIDGE (*Brit. Mycol. Soc. Trans.*, 6 (1918), pt. 2, pp. 104-120, pls. 2).—The author, in the course of work previously noted (*E. S. R.*, 41, p. 748) bearing more particularly on other subjects, gave attention to a number of saprophytic species, some of which had not been adequately described. A few of these are dealt with in these notes as studied in pure cultures.

A biological and systematic study of Swedish Gymnosporangiums, J. ERIKSSON (*Compt. Rend. Acad. Sci. [Paris]*, 168 (1919), No. 9, pp. 470-473).—*Juniper communis* in Sweden is attacked by *Gymnosporangium clavariæforme* and *G. tremelloides*. An account is given of the alternate or related forms and their hosts.

Merulius in North America, E. A. BURT (*Ann. Missouri Bot. Gard.*, 4 (1917), No. 4, pp. 305-362, pls. 3, figs. 39).—This contains descriptions of a large number of species of *Merulius*, with a key and index.

Cold resistance in marine algæ, H. KYLIN (*Ber. Deut. Bot. Gesell.*, 35 (1917), No. 4, pp. 370-384).—The author concludes from this study that death from cold in case of the plants herein employed is conditional upon the actual formation of ice, and that such death is due primarily to the withdrawal of water from the cell.

Production of citric acid by Sterigmatocystis nigra, M. MOLLIARD (*Compt. Rend. Acad. Sci. [Paris]*, 168 (1919), No. 7, pp. 360-363).—As a result of this work, the author corroborates certain statements of Wehmer (E. S. R., 5, pp. 127, 435, 1030) regarding the production of citric acid by fungi other than *Citromyces*, *S. nigra* producing citric acid under certain conditions.

Amygdalin as nutriment for Aspergillus niger, [I], II, H. J. WATERMAN (*K. Akad. Wetensch. Amsterdam, Verslag. Wis en Natuurk. Afd.*, 25 (1916-17), pt. 2, pp. 1033-1037, 1143-1145; also in [*English Ed.*], *Proc. Sect. Sci.*, 19 (1916-17), pt. 2, pp. 922-927, 987-989).

In the first of these papers, a study of the behavior of *A. niger* grown from spores inoculated at 33° into solutions containing 2 per cent amygdalin plus the necessary inorganic nutrients is said to have shown that amygdalin is assimilated by the living mycelium, also that the production of young mycelium occurs at the expense of the assimilated amygdalin. The data as tabulated also show that amygdalin is a better nutrient for this fungus than is glucose as regards at least the dry weight produced. This conclusion is said to agree with results previously obtained (E. S. R., 31, p. 225), showing that the presence of a benzol nucleus in the assimilated organic chemical compound increases the quantity of mold formed at the cost of this nutrient.

The author claims to have shown that, generally speaking, it is rather the quantity than the substance absorbed that causes overburdening of cells and accompanying retardation of growth; so that narcotic substances can be introduced into an organism without injury thereto. For this purpose the narcotic substance should be combined with one or more chemical compounds. A complex chemical compound then results, which can not overburden cells but from which the desired active substance may be formed within the cell.

The fact noted above, that amygdalin gives a greater weight increment of *A. niger* than does glucose, was confirmed in another way by a new series of experiments, reported in the second paper. From these it is concluded that amygdalin, without any preceding conversion into glucose, benzaldehyde, and hydrogen cyanid, is absorbed by the cells.

It is inferred that the addition of amygdalin diminishes the noxious influence of benzaldehyde.

The biological significance of nucleoli, A. MEYER (*Ber. Deut. Bot. Gesell.*, 35 (1917), No. 3, pp. 333-338).—This is largely a discussion of the findings and views of others regarding the nature and functions of nucleoli, chiefly as exemplified in a few plants which are named.

Colloidal studies on plasma in plants, T. TADOKORO (*Jour. Col. Agr. Hokkaido Imp. Univ.*, 8 (1919), No. 5, pp. 143-182, figs. 13).—Sap expressed from pounded wheat seedlings was tested with different solutions of several salts for degree of alteration. The results as presented graphically show that different neutral salts produce greater or lesser changes in emulsive plasma colloids. Concentrations lethal for living cells cause notable alterations in their plasma colloids. The antagonisms observed are noted and discussed with their implications.

Hydrogen-ion concentration of plant juices, I, II, C. B. CLEVINGER (*Soil Sci.*, 8 (1919), No. 3, pp. 217-226, fig. 1; 227-242, fig. 1).—This paper is in two parts.

I. *The accurate determination of the hydrogen-ion concentration of plant juices by means of the hydrogen electrode* (pp. 217-226). Employing in the study of acidity or H-ion concentration of plant juices a modification of the electrode vessel developed by Clark (E. S. R., 34, p. 804), and used by him with Lubs (E. S. R., 35, p. 801), the author obtained results believed to be more accurate than any previously reported on the study of plants in this regard. Duplicate measurements usually agree within 0.1 millivolt and constant potentials are maintained for some minutes at least. A table showing the possible accuracy is given.

II. *Factors affecting the acidity of hydrogen-ion concentration of plant juices* (pp. 227-242). Among the factors influencing acidity in plant juices are the time of standing, time of day (or night), stage of growth, portion of plant tested, and soil, illumination and temperature being probably also involved. Acidity measurements were made of oats, buckwheat, soy beans, and cowpeas. Acids accumulate during the night and are destroyed in the daytime. Diurnal changes in plant processes are also believed to be factors. The investigation reported has been largely on methods, and is regarded as preliminary.

Application of biochemical method to the study of indigenous orchids—Discovery of a new glucosid, E. BOURQUELOT and M. BRIDEL (*Compt. Rend. Acad. Sci. [Paris]*, 168 (1919), No. 13, pp. 701-703).—Results are given of biochemical studies on several orchids named, with an account of the preparation and properties of a glucosid claimed to be new and named loroglossin.

Utilization of glucose and of levulose by higher plants, H. COLIN (*Compt. Rend. Acad. Sci. [Paris]*, 168 (1919), No. 13, pp. 697-699).—Referring to the varying ratios of dextrose to levulose in different portions of the plant, the author gives the results of analysis of different parts of beet, chicory, and Jerusalem artichoke. He states that any hypothesis of isomerism in this connection is insufficiently supported and prefers the view that dextrose and levulose migrate at different rates or else are unequally utilized by the plant. Differences in concentrations and viscosities are discussed in connection with views of other authors named.

The geotropic behavior of starch-free seedlings and the removal of starch from coleoptiles of the Gramineæ, C. ZOLLIKOFER (*Ber. Deut. Bot. Gesell.*, 36 (1918), No. 1, pp. 30-38).—A detailed account is given of studies on *Tagetes erecta* and various other plants regarding the assumed connection between geotropic and phototropic responsiveness and the presence of starch.

The relation of aeration to the growth and activity of roots and its influence on the ecesis of plants in swamps, H. F. BERGMAN (*Ann. Bot. [London]*, 34 (1920), No. 133, pp. 13-33, figs. 3).—The author gives an account of the development, conduct, and results of experimentation with several plants named in regard to their behavior when the roots were in abnormal relations as regards air supply.

Roots of land plants do not live under prolonged submergence. The submerged roots die, and new ones form at or near the water surface. In peat or sphagnum, land plants show a reduction of the entire plant in a way not evident in plants grown in soil with submerged roots. A number of observations and deductions are given with discussion.

Development of root systems under dune conditions, W. G. WATERMAN (*Bot. Gaz.*, 68 (1919), No. 1, pp. 22-53, figs. 17).—This account emphasizes the necessity of interpreting the extension of root systems not only in regard to structure and function but also in regard to the causes of such extension. The study is said to have shown that dune sand as a substratum for plant growth is remarkable for the uniformity of its texture and for the absence

of mineral salts required by plants. It is homogeneous chemically, but it contains old soil layers and minute streaks and patches, apparently of carbonaceous and organic origin, also dead plants, all these being very irregularly distributed.

Roots of dune species react differently to the elements of this structure, these reactions being specific and hereditary and reflecting possibly some growth conditions of the ancestral plants. They are regarded as of great importance in the choosing of species for introduction into conditions where the humus content is uneven. After making due allowance for such influencing factors as moisture, oxygen, and penetrability, the evidence indicates nutrient or at least chemical influence as the cause of variability in symmetry in the extension of roots under dune conditions.

Under certain conditions, the root apparently utilizes organic matter directly, at the expense of its shoots. Extreme lengthening and thickening of roots occurring under these conditions call into question the value of the common method of estimating plant growth by measuring the length and weight of roots.

The mechanics of water provision [in plants], O. RENNER (*Ber. Deut. Bot. Gesell.*, 36 (1918), No. 3, pp. 172-179; *abs. in Bot. Gaz.*, 68 (1919), No. 1, p. 72).—In an account of studies pursuing phases related to those previously investigated (E. S. R., 28, pp. 729, 822; 35, p. 432), the author presents data with a discussion regarding the forces, energy, and processes involved.

The influence of contact stimulus and mechanical rubbing on the growth and on the turgescence of seedlings, P. STARK (*Ber. Deut. Bot. Gesell.*, 35 (1917), No. 3, pp. 266-291, figs. 3).—The data herein presented lead the author to the conclusion that the stems of young seedlings curve in response to contact stimulus in either of two ways, according as the plant is kept in a dry or in a damp atmosphere.

Influence of light on absorption by plants of organic matters from the soil, D. C. DE BESTEIRO and MICHEL-DURAND (*Compt. Rend. Acad. Sci. [Paris]*, 168 (1919), No. 9, pp. 467-470).—A study carried out with the heliophilous plant *Pisum sativum* (to be followed by a study of a heliophobic plant) is said to have shown a greater augmentation of dry weight corresponding to the greater intensity of illumination, the greater development being apparent in underground as well as in aerial parts.

The individual plants took more glucose from the nutritive medium under the greater illumination.

A given weight of roots absorbed more glucose in weak than in strong illumination. A given weight of a plant as a whole absorbed from the medium sensibly the same amount of glucose in different intensities of illumination.

These results as a whole with their implications are considered to show that the pea, a heliophilous plant, is not able to adapt its chlorophyll assimilation to weak illumination intensities, and that it is incapable of augmenting the absorptive power of its roots so as to take from the soil a large quantity of organic carbon. There is, then, in case of this plant, neither parallel nor compensation between absorption of carbon by the green leaves in the carbon dioxide of ordinary air and the absorption of organic carbon by the roots in the soil.

The influence of light- and gravitational stimuli on the seedlings of *Avena sativa*, when free oxygen is wholly or partially removed, U. P. VAN AMELJDEN (*K. Akad. Wetensch. Amsterdam, Verslag. Wis en Natuurk. Afd.*, 25 (1916-17), pt. 2, pp. 1135-1143; also in [*English Ed.*], *Proc. Sect. Sci.*, 19 (1916-17), pt. 2, pp. 1165-1173).—Experiments were carried on with *A. sativa* seedlings under a total pressure of one atmosphere maintained by replacing removed oxygen with nitrogen.

Geotropic response was diminished by a fore period of 5 hours in nitrogen, and was absent after a fore period of 6 hours. Phototropic response was apparently unchanged after 3 hours in nitrogen. It was still perceptible after a 6-hour immersion, but after 8 hours in nitrogen it was entirely absent. When nitrogen was replaced by air after 65 or 75 minutes, a slight after effect began to be apparent about 1 hour later, showing that so-called perception had occurred but that oxygen was required to show a reaction. After a fore period of 24 hours in 4 to 5 per cent oxygen, the plants in ordinary air showed an influence on perception, the seedlings remaining able for a long time to perceive a geotropic or a phototropic stimulus in an atmosphere containing a relatively low percentage of oxygen.

The minimum illumination period causing germination in seeds of *Lythrum salicaria*, E. LEHMANN (*Ber. Deut. Bot. Gesell.*, 36 (1918), No. 3, pp. 157-163).—Strong illumination produced much earlier and more abundant germination in seeds of *L. salicaria* than was obtained in seed not so exposed.

Energy curves of light absorption by the colorants of green leaves, A. URSPRUNG (*Ber. Deut. Bot. Gesell.*, 36 (1918), No. 3, pp. 111-121, figs. 4).—This is largely a discussion of data and views contributed by other authors on the relations between sunlight (direct or diffused, high or low) incident upon plant surfaces, and the processes and in general the phenomena related thereto, with more particular reference to the chlorophyll grains, the red coloring material in the cell sap, and the protection supposedly afforded thereby against incident solar energy.

Apparatus for the study of photosynthesis and respiration, W. J. V. OSTERHOUT (*Bot. Gaz.*, 68 (1919), No. 1, pp. 60-62, fig. 1).—The author, having sought to combine the two methods formerly noted (*E. S. R.*, 39, p. 432), dealing with measurement of photosynthesis in land plants and in aquatics respectively, has carried on experiments to this end and presents herein a simple method for the study of photosynthesis and respiration.

The method, which is said to be so simple and convenient as to be adapted to classroom demonstration as well as to investigation, consists essentially in placing the plants in a chamber in which the gas is made to bubble through an indicator, the color indicating alterations in the carbon dioxide tension.

Photochemical extinction during the process of assimilation, A. URSPRUNG (*Ber. Deut. Bot. Gesell.*, 36 (1918), No. 3, pp. 122-135, figs. 2).—The author reports with discussion a study and resulting data regarding the absorption of solar energy in different portions of the solar spectrum by leaves of different plants.

The injurious effects of ultra-violet rays, A. URSPRUNG and G. BLUM (*Ber. Deut. Bot. Gesell.*, 35 (1917), No. 4, pp. 385-402).—A comparative study of the influence of ultra-violet rays on plants of several species is followed by a discussion of their relative resistances to the injurious effects of these rays, and the basis of such resistance, such as absorption of the rays by the epidermis.

Effect of illuminating gas on plants, C. WEHMER (*Ber. Deut. Bot. Gesell.*, 36 (1918), No. 3, pp. 140-150, pl. 1, figs. 5; *abs. in Bot. Gaz.*, 67 (1919), No. 6, p. 517).—In the production of injury by illuminating gas to the root systems of woody plants, the author states that within the age limits of the plants employed (less than seven years) the stage of development was an important factor. Resistance was at a maximum during the winter, but was much less during late summer and fall, and least during the spring; the gas exercising apparently a positively poisonous influence. The trouble is due primarily to root injury. A more specialized report on the toxic constituents is promised.

A biological and systematic study of Philippine plant galls, L. B. UICHANCO (*Philippine Jour. Sci.*, 14 (1919), No. 5, pp. 527-554, pls. 15).—This is,

in the main, an account of galls due to different species of insects. It is stated that galls can be produced only when the tissue of the plant is interfered with during or prior to the actual development of the tissue, no stimulus, whether physical or chemical producing galls after full maturity of the tissue has been attained.

FIELD CROPS.

Safe farming in the Southern States in 1920, B. KNAPP (*U. S. Dept. Agr., Dept. Circ. 85 (1920), pp. 19*).—This comprises a discussion of economic factors affecting farming in the South, and outlines as a safe farm system one which will maintain soil fertility; furnish a sufficient supply of both food and feed to insure a surplus; and provide for the production of cotton, tobacco, rice, or sugar cane as strictly cash crops, depending on the locality. Tabulated statistics are appended showing the acreage and yield by States, for the Southern States, of cotton, corn, wheat, oats, hay, Irish potatoes, sweet potatoes, and rice, for the period of 1909–1919, inclusive, and of peanuts, grain sorghums, and velvet beans for shorter periods of time.

[**Report of field crops work at the Morris substation, 1918**], P. E. MILLER (*Minnesota Sta., Rpt. Morris Substa., 1918, pp. 5–38, figs. 9*).—A report is presented on the progress of work along the same general lines as that heretofore noted (*E. S. R., 39, p. 436*), including meteorological data. The results for the 4 years 1915–1918 are given in tables.

In the fertilizer experiments with crops in rotation corn and oats were replaced in 1918 by wheat. This arrangement placed wheat on fall-plowed clover sod, fall-plowed wheat stubble, and on corn stubble disked in the spring. The average yield of 3 plats showed that in each series the plats with no treatment gave the lowest and the plats receiving acid phosphate and manure the highest production of grain. The ranges in yield were as follows: Clover sod 17.2 to 22.1 bu., wheat stubble 26.1 to 30.1 bu., and corn stubble 29.7 to 39.1 bu. per acre.

The results of fertilizer experiments with alfalfa in progress since 1915 showed that acid phosphate, used at the rate of 480 lbs. per acre annually, was the only fertilizer application that has thus far given a distinct benefit. The results of manuring clover and timothy sod at the rate of 32, 16, 8, and 4 tons per acre in a rotation of corn, wheat, barley, and clover and timothy, as shown by the yields of wheat and barley, were generally in favor of the smallest application and of no treatment. In tests of wheat straw and corn stover at the rates of 1 and 2 tons per acre as fertilizers for wheat and corn the better response was secured from corn, while wheat showed but little improvement. The results indicated that the cumulative effect of such crop residues may be highly beneficial though not apparent in the first crop.

The yields of corn and wheat secured in a series of rotations, including alfalfa, were best when corn followed alfalfa and wheat followed corn. The clover utilization test led to the conclusion that on the soil under experiment, which is rich in organic matter, plowing under clover is wasteful when it can be used as hay or pasture.

The highest yielding varieties of different crops tested in 1918 were as follows: Mindum, a durum wheat, 23.3 bu.; Marquis wheat 21.6 bu.; Kherson oats 53.1 bu.; Minnesota Manchuria barley, a 6-rowed variety, 36.1 bu.; Wisconsin Pedigreed rye 29.8 bu.; White spring emmer 30.9 bu.; Northwestern Dent corn 42.2 bu.; Green Mountain potatoes 149.9 bu.; and Minnsoja soy beans 12.4 bu. per acre. Among alfalfa varieties Grimm and Baltic proved the best yielders and the hardiest varieties. Breeding work carried on with Minnesota No. 13 corn is reported as resulting in earlier maturity without reduction in the

yield. In seeding experiments with oats the use of 80 lbs. per acre gave the highest average yield of grain. It was observed during the season that the height of grain on the different plats was in direct relation to the thickness of seeding, which ranged from 48 to 112 lbs. per acre, the thinnest seeding producing the tallest plants with the largest heads.

[Report of field crops work at the Dickinson substation, 1914-1918], L. R. WALDRON and J. C. THYSELL (*North Dakota Sta. Bul. 131 (1919), pp. 3-50, 63-79, 80-82, fig. 1*).—The work with field crops for each of the 5 years, 1914-1918, is described in the seventh to the eleventh annual reports of the substation, continuing previous work (E. S. R., 35, p. 228). The weather conditions for each year are noted and the experimental results are briefly discussed. The work was along the same general lines from year to year, and had reference mainly to variety and cultural tests with cereal and forage crops, flax, and potatoes.

As in the preceding years, the work with cereal crops in 1918 included principally testing and improving varieties and comparing different dates and rates of seeding. In 1918 D-5 ranked first in yield among the durum varieties of wheat with 20.2 bu. per acre, while in the five group Ghirka No. 5 led with 17.6 bu., in the bearded group of common wheats Kubanka Bluestem with 17.4 bu., and in the bluestem group Haynes or Minnesota 169 with 14.3 bu. For the 5 years, 1914-1918, the leading varieties and their average yields for the respective groups were as follows: Monad 24.9, Marquis 18.3, Preston 14.8, and Crossbred 12.9 bu. per acre.

In 1918 seeding Kubanka No. 8 wheat at the rates of 3, 4, 5, and 6 pk. per acre on April 5 and 22 and May 1 gave an average yield of 17.3, 20.1, 19.2, and 18 bu. per acre respectively, while the average yields for the different dates of seeding at the various rates were 21.4, 17.9, and 16.6 bu. per acre, respectively. Of winter rye, spring rye, Beloglina winter wheat, and Kubanka spring wheat, sown November 3, 1917, only winter rye survived the winter.

In 1918 the leading variety of oats, Golden Rain, yielded 49.5 bu. per acre, and this variety also stood first in average yield for the 6 years, 1913-1918, with 59.1 bu. per acre. Among 5 varieties of 2-rowed hulled barley Steigum produced the highest yield, 23.6 bu. per acre, and among 4 varieties of 6-rowed hulled barley Mariout led with 22.8 bu. per acre, being closely followed by Gatami with 22.2 bu. Of four varieties of 2-rowed barley, not including Steigum, which were grown from 1914-1918, Swan Neck ranked first with an average yield of 30.9 bu., and of 3 varieties of 6-rowed barley Gatami led with 25.3 bu. per acre for the period. Hannchen, a 2-rowed barley, sown at different rates from 1913-1918, inclusive, gave the best average yield from the use of 6 pk. of seed per acre.

The results of a flax variety test showed the best yields of linseed from Select Russian and N. D. R. 52. Flax grown in a mixture with each of the grains, wheat, oats, and barley, in 1917 and 1918 did not succeed.

Tests with grain sorghum indicated that the crop is not adapted to the climate. Wheat grown after various crops and after fallow gave the following average results for 10 years: After corn 23, fallow 25.7, peas 21, sweet clover 20.4, winter rye 2.17, oats 18.2, and wheat 15.1 bu. per acre. In a test of corn varieties in 1918 Mercer Flint gave the best results, yielding in one instance 6,940 lbs. of green substance per acre. The highest yield of potatoes for the year, 135 bu. per acre, was secured from Burbank. A test of silage crops resulted in a yield of green fodder of 12,260 lbs. from corn, 21,029 lbs. from sunflowers, and 40,824 lbs. per acre from mangels.

Annual report of chief soil and crop instructor, H. O. ENGLISH (*Brit. Columbia Dept. Agr. Ann. Rpt., 11 (1916), pp. 75-78*).—The work with field

crops at demonstration stations located at Armstrong, Chilliwick, Edgewood, Errington, Grand Forks, Rock Creek, Rose Hill, and Pitt Meadows, is briefly noted. The crops tested were mainly wheat, corn, oats, peas, clover, alfalfa, vetch, and mangels.

Annual report of district agriculturist, Fort George district, H. E. WALKER (*Brit. Columbia Dept. Agr. Ann. Rpt., 11 (1916), pp. 89-91*).—A brief report is given on the general agricultural conditions of the district, and the results of growing crops on demonstration plats at Fort George are briefly noted. The following varieties are mentioned as suitable for the region: Abundance and Banner oats; O. A. C. No. 21 and Wisconsin 55 barley; Red Wave and Dawson Golden Chaff winter wheat; Marquis and Bluestem spring wheat; Red, Early Rose, Gold Coin, and Reliance potatoes; and Grimm alfalfa. Good results were secured with redtop, timothy, rye grass, and brome grass.

[**Grass mixtures for meadows and pastures on peaty soils**], H. OSVALD (*Svenska Mosskulturför. Tidskr., 34 (1920), No. 1, pp. 1-16, fig. 1*).—In a paper presented at a meeting of the Swedish Moor Culture Association in 1919, the author summarizes in tables and discusses the results of experiments with different grass mixtures for meadows and pastures on peaty soil, conducted mainly at Flahult and Torestorp.

At Flahult the growth of a seed mixture consisting of 20 per cent alsike clover, 10 per cent white clover, 35 per cent timothy, 10 per cent meadow foxtail, 20 per cent meadow fescue, and 5 per cent blue grass was studied for the 5 years 1914-1918. Alsike clover produced the largest percentage of total forage, over 21 per cent, the first 2 years, and timothy gave the best results the second and third years when it constituted, respectively, 68.1 and 61 per cent of the yield. It was further observed that the third year the grasses began to produce plants that did not develop stems but remained of a leafy character and the percentage of such leafy plants showed a tendency to increase during the following years.

In a similar study at Torestorp for the 3 years, 1916-1918, with a mixture of 5 per cent red clover, 20 per cent alsike clover, 50 per cent timothy, 5 per cent meadow foxtail, 10 per cent meadow fescue, and 10 per cent orchard grass, plants of a leafy character appeared the first year in all the grasses, but they showed marked increases only in timothy and meadow fescue. The first year timothy constituted 88.2 per cent, the second year 80.2 per cent, and the third year 57.6 per cent of the yield. The third year meadow fescue made up 26 per cent of the crop, and 51.6 per cent of the forage produced consisted of leafy plants of timothy and 21.5 per cent of leafy plants of meadow fescue.

A botanical analysis made at Flahult in 1917-18 of the hay grown from the mixture given above, but including *Poa trivialis* and sown at different dates in May, June, July, and August, showed that timothy and meadow foxtail produced the largest percentage of plants developing stems during the first year of their growth, while the second year the relationship between the number of such plants and of those producing only foliage and incompletely developed stems was practically reversed. Meadow fescue did not show this tendency very definitely, and *P. trivialis* produced practically no plants with undeveloped stems.

Observations made from 1910 to 1918, inclusive, on the behavior of clover and grasses sown as a mixture for meadow purposes indicated that alsike clover produced its best growth the first year, timothy the second, meadow foxtail the sixth, and blue grass the ninth year. It is pointed out from this result that by the proper selection of species in the seed mixture it is possible to maintain the productive capacity during the period the meadow is to remain.

Similar studies of 25-year and 8-year old meadows showed that white clover and blue grass made up the principal part of the forage produced.

[**Grassland in the United Kingdom and its improvement and maintenance**], W. SOMERVILLE (*Nature [London]*, 104 (1919), No. 2617, pp. 421-425).—This article reproduces in abridged form the address of the president of the section on agriculture of the British Association, previously noted editorially (E. S. R., 42, p. 106).

Investigation of blossoming and fertilization in winter rye and winter wheat, E. OBERMAYER (*Ztschr. Pflanzenzücht.*, 4 (1916), No. 4, pp. 347-403).—These studies, conducted at Magyaróvár in Hungary, indicated that the manner and duration of blossoming in winter rye and winter wheat shows wider variations there than was observed by investigators in other countries.

The greatest variation occurred in the time required for the closing of the glumes after the flower was fertilized. The general manner of blossoming in rye was in some instances sudden and rapid and in others slow or sporadic and fluctuating. Wheat differed from rye in that the manner of blossoming was usually irregular and very seldom sudden and rapid. The individual selections of rye blossomed with greater uniformity than was observed in similar wheat selections.

The blossoming of rye flowers without opening was observed as being only exceptional, while single wheat flowers blossoming unopened could be found at all times during the blossoming period and under certain conditions the phenomenon became more or less general. A somewhat similar process of blossoming was observed in rye and wheat flowers that had only partly opened. When sudden and intense blossoming of rye was imminent it was noted that some time before the opening of the flowers the anthers pushed against the glumes and spread them apart, but this was never observed in wheat.

The simultaneous opening of a sufficient number of wheat and rye flowers was attended by a crackling noise. Spikes with sterile anthers were observed to be quite frequent in both rye and wheat.

Weather conditions influenced the process of blossoming in the individual flower as well as over the field. Cloudiness, low morning temperatures, and warm winds were not unfavorable, but a low temperature associated with rainy, windy weather interfered with the normal progress of blossoming in both crops.

The condition of the floral organs, especially of the male parts, exerted a marked influence on fertilization. Differences in the structure of these organs were studied, and it was found that while such differences occur in healthy material they are much more marked in sterile pollen grains, immature pollen, pollen gathered and kept near its limit of time, and in spikes with sterile anthers. It was noted that a healthy pollen of high vitality contains, as a rule, but few sterile grains. The shriveling of pollen grains due to the loss of moisture within certain time limits did not in itself reduce viability. Rye pollen when gathered remained viable only from 2½ to 3 hours, and immature pollen was incapable of effecting fertilization. A study of the size of rye and wheat pollen indicated that the pollen of the Hungarian wheat studied was larger than the pollen of *Triticum dicoccoides*, which in turn was larger than that of *T. turgidum mirabile*. In laboratory germination tests with rye pollen grains the optimum cane sugar concentration used in an agar-agar cell was a little above 30 per cent. Keeping rye pollen exposed to the air but in the dark showed no advantage over keeping it similarly exposed in the shade, and placing it into a desiccator proved injurious.

The condition of the female flower organs was found to influence fertilization mainly through the supply of nutrition available to each fertilized flower for

the development of the young fruit. Fertilization seemed quite generally brought about, but the inner or secondary flowers in the spike apparently were not always vigorous enough to obtain the necessary nutrition for which they had to compete with the usually stronger outer blossoms. The variation in strength or vigor of the inner flowers is regarded as a heritable character.

Studies were made also to determine the degree of self and cross fertilization in rye and wheat. Cross fertilization was found to be the more general method of fertilization in rye, although self fertilization also occurred, especially in the beginning of the blossoming season, at times of sporadic flowering, and in closed or only partly opened blossoms. Wheat was observed to be generally self fertilized, but under certain conditions cross fertilization also took place.

[**The sorghum sirup industry and the sorghum plant**], J. J. WILLAMAN, R. M. WEST, and C. P. BULL (*Minnesota Sta. Bul. 187 (1919), pp. 7-31, figs. 13*).—The history and present status of the sorghum sirup industry in Minnesota is briefly reviewed, while the botany and the culture of the sorghum plant are treated at greater length.

The results of testing seven varieties of strains of saccharin sorghums in 1900 and 1901 showed that Folgers led with a yield of 12.67 tons of green cane per acre, being followed by Amber with 11.66 tons and Collier with 11.22 tons. The sugar content ranged from 12.28 per cent in Colman to 14.46 per cent in a strain of Minnesota Early Amber. The Minnesota Amber strains being of early maturity gave the smaller yields of green cane per acre, but gave indications of a high sugar content.

Varieties and strains tested in 1912 and 1913 showed great variation in all the characters observed. South Dakota ranked first in maturity although Early Rose, a strain selected in Minnesota, showed practically the same earliness. The highest average yield, 19.1 tons of green cane per acre, was obtained from S. P. I. 17,566 Orange, being followed by Amber with 17.9 tons, S. P. I. 17,548 Red Amber with 15.3 tons, and Orange with 15.2 tons.

The culture of sweet sorghum for forage is discussed, and the results of growing Early Amber for this purpose are compared in general with the similar use of Minnesota No. 13 corn. The results of analyses of sweet sorghum fodder and corn fodder are given in a table. Directions are given for the improvement of the crop by seed selection.

The results of field experiments with sugar cane in the years 1917-18, J. KULJPER (*Arch. Suikerindus. Nederland. Indië, 27 (1919), No. 51, pp. 2245-2320; also in Meded. Proefsta. Java-Suikerindus., Landbouwk. Ser., No. 5 (1919), pp. 2245-2320*).—The sugar experiment station at Pasoeroean in 1917-18 made about 1,000 plat tests on different soil types with sugar cane varieties, including a number of new strains originated at the station. On nearly all soil types the best results were secured with the variety EK 28, but on rather wet soils an older variety, 247 B, proved most satisfactory. A study of the comparative yielding capacity of different varieties showed that varieties EK 28 and EK 2 stood distinctly above 247 B in this regard. The varieties now considered best for Java are EK 28, EK 2, 247 B, DI 52, 100 POJ, SW 3, and 90 F. The older Black Cheribon cane is reported as having almost disappeared from cultivation.

The results of fertilizer experiments indicated that among different sources of nitrogen ammonium sulphate, as compared with nitrate of potash, cyanamid, peanut cake, dried blood, meat meal, filter presscake, and stable manure, gave the best returns. Stable manure and filter presscake had no value as sources of nitrogen, but stable manure was apparently a good source of phosphoric acid.

Bagasse ashes had some fertilizing value on the different soil types, and molasses as a fertilizer is reported as giving good results on coarse sandy soils.

A study was made also of the use of seed cane grown at high altitudes in relation to the control of sereh disease. It was found that tops of full-grown cane and cuttings from planting cane from higher altitudes, when healthy, were of equal value for planting, but that under unfavorable soil conditions the tops as compared with the cuttings were more readily attacked by the disease. Cuttings infected with yellow stripe disease, as a rule, showed a reduced sugar yield in the crop.

Binding the stalks together to prevent the cane from falling down did not prove of advantage, and no profitable increases in yield were secured from minor changes in the culture and the planting of cane.

HORTICULTURE.

[Report on fruits, ornamentals, and vegetables], P. E. MILLER (*Minnesota Sta., Rpt. Morris Substa., 1918, pp. 38-44, figs. 2*).—A statement of varieties of fruit, ornamentals, and vegetables under trial at the West Central substation at Morris, Minn., in 1918, including tabular data on tests of ornamental shrubs and annuals. The varieties of vegetables listed are recommended for general planting in the region of the substation.

[Report on fruit investigations], W. BURNS (*Ann. Rpt. Dept. Agr. Bombay, 1916-17, pp. 55, 56*).—Brief notes are given on experimental work conducted during the year 1916-17 with the mango, citrus fruits, guava, papaya, grape, fig, and banana.

Experiments in budding the mango have shown that the mango scion will not flower until it is sufficiently mature, even if it is grafted on a mature stock. Mango flies have been successfully trapped by using a distillate of the Tulsi (*Ocimum sanctum*) plant, a method devised by R. Rao Karsagode. Spraying mango trees with water during the flowering period interfered with the setting of fruit, and confirmed the belief in the detrimental effect of rain at this period.

Incosopol, a cotton oil product, has proved an effective remedy for aphid on citrus. The sucking moth (*Ophideris fullonica*) has been traced as the cause of considerable falling of citrus fruits, and measures are being devised against it.

An attempt to reduce seeds in guavas by selection and vegetative propagation has not given promising results thus far. The sugar content of guavas was found to increase as the trees became mature. Guava stocks have exerted no influence on the color of the scion fruit.

Crosses made with papayas have shown that the production of pure male plants can be eliminated by the use of hermaphrodite plants as pollen plants. Propagation of papayas by cuttings in the field was not successful, as the cuttings were apt to rot at the base. The artificial branching of the papaya by removing the top resulted in low stocky trees and an increased number of fruits.

Spray calendar (*Arkansas Sta. Circ. 48 (1920), pp. 4*).—A spray calendar for apples, pears, peaches, plums, cherries, and grapes, with directions for preparing spray mixtures.

Orchard spray calendar, C. E. SANBORN and D. C. MOORING (*Okla. Agr. Col. Ext. Circ. 109 (1919), pp. 8, figs. 7*).—A spray calendar for the control of the more important pests and diseases of orchard and small fruits, including directions for making spray solutions.

More about rootstocks, W. L. HOWARD (*Mo. Bul. Dept. Agr. Cal., 9 (1920), No. 3, pp. 93-95, fig. 1*).—In continuation of a previous report on rootstock ex-

periments at the California Experiment Station (E. S. R., 40, p. 444), the author presents some additional notes on the value of different roots as stocks for prunes and pears.

[**Note on raising seedling apples**], E. LAXTON (*Jour. Pomol.*, Vol. 1, No. 2, pp. 104-109).—Notes are given on methods used by the author and W. Laxton in breeding apple seedlings, together with tabular data showing the crosses made and the principal characteristics of the progeny.

Peach growing in Florida, W. L. FLOYD (*Fla. Univ. Ext. Bul.* 27 (1920), pp. 15, figs. 8).—This bulletin deals with the culture and care of peaches, particularly in the home orchard.

Magnesia and the manuring of vines, J. LEFÈVRE (*Rev. Vitic.*, 51 (1919), No. 1329, pp. 394-398, figs. 2).—A brief summary of the knowledge relative to the use of magnesium as a fertilizer, with special reference to its use for grapes.

Special attention is called to the combination of magnesium and calcium oxids which is manufactured by several factories in France and sold under the name of dolomagnesium. When the magnesium is administered in this form, either alone or in combination with other fertilizers, it has none of the toxic effects of magnesium sulphate and chlorid. In addition to its value as a direct nutrient and in amending acid soils it has also an antichloritic action. A number of experiments conducted under varying conditions indicate that a normal dose of dolomagnesium is from 500 to 1,000 kg. per hectare; 2,000 kg. per hectare (1,780 lbs. per acre) may be used without injury in making an initial application. Dolomagnesium may be mixed with other fertilizers except nitrogenous fertilizers.

Conservation of fresh grapes, J. FIGUEROA (*Dir. Jen. Serv. Agr. [Chile] Bol.* 52 (1919), pp. 27, figs. 18).—An account of the principal processes by which grapes are preserved in the fresh state.

Statistics in the production of grapes and wine in 1919 (*Estadís. Prod. Vitic. [Spain]*, 1919, pp. 7).—A statistical report on the production of grapes and wines in various regions and Provinces of Spain during the year 1919.

The propagation of some tropical fruits, R. S. CUNLIFFE (*Agr. News [Barbados]*, 19 (1920), No. 465, pp. 52, 53, fig. 1).—The present paper discusses the propagation of avocados. Subsequent notes are to deal with other tropical fruits.

The mango in Florida, E. D. VOSBURY (*Fla. Grower*, 21 (1920), No. 10, pp. 8, 9, 35, 37).—Practical suggestions are given for growing mangos, including information relative to soil requirements, varieties, method of propagation, grove management, the control of pests and diseases, harvesting and marketing the crop, yields, and profits.

The dwarf coconut, W. P. HANDOVER (*Agr. Bul. Fed. Malay States*, 7 (1919), No. 5, pp. 295-297).—An account of a dwarf form of coconut growing in the Federated Malay States, with reference to its distinguishing characteristics, history, growth, and yield.

The status of the American nut industry, C. A. REED (*Amer. Nut Jour.*, 12 (1920), No. 3, p. 41).—A brief discussion of the present status of the various nut industries in the United States.

Top-working the pecan, E. J. KYLE (*Proc. Natl. Nut Growers' Assoc.*, 14 (1915), pp. 93-96).—A contribution from the Texas College, discussing conditions under which top-working is advantageous and methods of budding that may be employed.

Control of the sap flow in stocks to be grafted, J. F. JONES (*Proc. Natl. Nut Growers' Assoc.*, 14 (1915), pp. 96, 97).—The author's experience in grafting the English walnut, shagbark hickory, and pecan under northern conditions

has shown that to secure uniformly good results the scions must be vigorous, well-matured, and perfectly dormant; the stocks must be vigorous and the sap active, but not excessively so. To control the flow of sap the stocks are repeatedly cut back as growth starts, cutting off only sufficient of the previous season's wood to remove all buds that have started to grow. This operation is repeated every week or 10 days, thereby not only prolonging the grafting season but insuring better stands of grafts than on unmanipulated stocks.

[Report on trees, shrubs, and hedges], J. C. THYSELL (*North Dakota Sta. Bul. 131 (1919), p. 79*).—A brief note on the condition of demonstration plantings of trees, shrubs, and hedges.

Report on the treatment of the surroundings of the small home, H. B. and L. A. DUNINGTON GRUBB (*Toronto: Ontario Housing Com., 1919, pp. 35, figs. 20*).—This report was prepared at the request of the Ontario Housing Committee, with the view of suggesting means of beautifying the individual lot and of outlining the general principles which govern the attractive and economical development of any new area.

Part 1 of the report deals with the general development of land for industrial housing. It discusses the subdivision of land with reference to efficiency, beauty, and economy. Part 2 deals with the layout of the individual lot and contains several plans, together with a list of trees, shrubs, flowers, and vegetables suitable for community and industrial gardens.

FORESTRY.

Making woodlands profitable in the Southern States, W. R. MATTOON (*U. S. Dept. Agr., Farmers' Bul. 1071 (1920), pp. 38, figs. 55*).—A contribution from the Forest Service of this Department discussing how farm forestry pays, marketing timber profitably, supplying timber for farm needs, utilizing farm timber rightly, profitable employment for winter, protecting woodland from injury, improving woodland by cutting, making waste land profitable, increasing the sale value of the farm, and forestry demonstrations in progress. The various topics are well illustrated, and a reference list is given of related literature published by this Department and by various Southern States.

The new Grand Canyon National Park, R. S. YARD (*Natl. Parks Assoc. Pub. 1 (1919), pp. 24, figs. 13*).—An analysis of the scenic features of this park, with suggestions for its better comprehension and enjoyment.

The new Zion National Park, R. S. YARD (*Natl. Parks Assoc. Pub. 2 (1920), pp. 31, figs. 16*).—A descriptive account of the scenic features of the Zion National Park and the relation of this park, together with the Grand Canyon and Bryce Canyon, to the brilliantly colored plateau country of southern Utah.

Annual return of statistics relating to forest administration in British India for the year 1917-18 (*Ann. Return Statis. Forest Admin. Brit. India, 1917-18, pp. 25, pl. 1*).—A statistical review showing alterations in forest areas and progress made in forest settlements, surveys, working plans, forest protection, etc., including also yields in major and minor forest products, revenues and expenditures, with comparative data showing the annual forest revenue, expenditure, etc., for the last 10 years.

The forest policy of France: Its vindication, W. B. GREELEY (*Amer. Forestry, 25 (1919), No. 310, pp. 1379-1385, 1424, figs. 8*).—A general account of the history, development, and accomplishments of organized forestry in France, in which the author points out how thoroughly the long established French forest policy was vindicated during the great war.

Conservation: The form or the substance: Which? W. COMPTON (*Chicago: Natl. Lumber Manfrs. Assoc., 1919, pp. 24*).—In this paper the author presents

and discusses a number of principles which it is believed should underlie a national policy of forest protection and replacement.

Some problems of reafforestation, W. SOMERVILLE (*London: John Murray, 1919, pp. 13*).—This paper is primarily a discussion of species and mixtures of species suitable for reafforesting British woodlands.

On the growth, treatment, and structure of some common hardwoods, R. T. PATTON (*Proc. Roy. Soc. Victoria, n. ser., 31 (1919), No. 2, pp. 394-411, pl. 1, figs. 7*).—This paper deals chiefly with a study of the growth of the mountain ash (*Eucalyptus regnans*).

Trial of an experimental dendrometrical table for chestnut coppice, G. DI TELLA (*Ann. R. Ist. Super. Forestale Naz. Firenze, 4 (1918-19), pp. 105-156, figs. 8*).—The table here presented and discussed in detail was constructed from measurements made of 475 felled trees. The steps used in constructing the table are given in detail.

The koa tree, C. S. JUDD (*Hawaii. Forester and Agr., 17 (1920), No. 2, pp. 30-35, pls. 3*).—A descriptive account of the koa tree (*Acacia koa*) of Hawaii, including information relative to uses of the wood. Attention is also called to the value of this tree for reforesting denuded areas where good drainage and favorable soil and moisture conditions obtain.

A contribution to the knowledge of the wood of the bravo pine, J. G. A. CARDOSO (*Bol. Assoc. Cent. Agr. Portuguesa, 20 (1918), Nos. 9, pp. 296-305; 10, pp. 325-333; 12, pp. 391-402, figs. 6*).—The author presents the results of a micrographical study of the wood structure of the bravo pine (*Pinus pinaster*).

The origin, extraction, and value of coniferous seeds, I, L. PICCIOLI (*Ann. R. Ist. Super. Forestale Naz. Firenze, 4 (1918-19), pp. 1-93, figs. 57*).—This is part 1 of an exposition on the coniferous seed industry. Its successive chapters discuss the importance of the inheritance of mutations; influence of place of origin on seed; a defense of importation; private, commercial, and State seed production; the influence of tree selection on the quality of the seed; periodicity of abundant harvests, and causes which determine them; harvesting the fruit; methods and equipment for seed extraction; diswinging and cleaning; the relation between volume and weight of whole fruits and of seed in different species; cost of production and market value of seeds; and germination, longevity, and storage of seeds.

DISEASES OF PLANTS.

Annual report of provincial plant pathologist, J. W. EASTHAM (*Brit. Columbia Dept. Agr. Ann. Rpt., 12 (1917), pp. 51-56*).—In this report it is stated that a fairly comprehensive plant disease survey with record of results has now been made of the fruit-growing districts of British Columbia.

A case of mushroom apple-root rot was noted in the Shuswap district, the whole orchard being reported as being in a dying condition. A fungus appears to pass from the remains of old natural trees and shrubs to the apple roots, and probably to other trees.

Apple tree anthracnose control tests resulted decisively in favor of early sprayings. In case of apples placed in cellar storage until after Christmas it was found that the Bordeaux mixture had disappeared, supposedly due to the sweating of the fruit. The experiment was continued as possibly having an important bearing on the value of early spraying. An apple scab control test employing on one tree as a spray lime sulphur at the three periods, pink, calyx, and two weeks later, showed a high degree of protection by the treatment; also an increased set of fruit on the sprayed tree.

At Creston the value of spraying was demonstrated.

Fire blight, though prevalent in the Okangan during 1917, did not become epidemic, though the sporadic and somewhat later primary appearances led to numerous secondary infections subsequently. The trouble is largely explained by the absence of skilled labor to remove the early dormant cankers. At Grand Forks the injury was greater.

Potato late blight, certain *Fusarium* rots, and other internal diseases caused much loss to potato growers in certain regions during the previous two seasons. Silver scurf (*Spondylocladium altrovirens*), while frequent in the coast and inland sections, is controllable only by seed selection.

Report of [the] provincial plant pathologist, J. W. EASTHAM (*Brit. Columbia Dept. Agr. Ann. Rpt., 13 (1918), pp. 32-36, pl. 1*).—Potato leaf roll appeared in 1918 in the vicinity of Vancouver. White pine blister rust has not yet been found in British Columbia, though it is thought that the western pine, *Pinus monticola*, might prove more susceptible than the eastern species, *P. strobus*, if the disease were once introduced. Apple anthracnose control was studied in experiments which are described. The effects of the previous year's spraying were of practical value in 1917.

Apple scab data obtained from tests during three years have offered a basis for successful work in the direction of control. Late rains (about the middle of August) introduced a new factor during 1917, and the late spray that year appeared valuable, whereas in previous years it had appeared superfluous.

Potato disease was made the subject of organized study, including different localities. Late blight did not appear until August. The single spraying afforded a considerable degree of protection. Proper dates for spraying can not be determined in advance.

Weather conditions were important as regards diseases of other plants besides potato. The heavy rains about the middle of August, following a hot, dry season, resulted in much apple scab, fruit pit, and a very general condition of premature breakdown in the tissue of apples. Peculiar cases of rotting are noted.

[**Plant diseases, British Columbia**], M. S. MIDDLETON (*Brit. Columbia Dept. Agr. Ann. Rpt., 12 (1917), pp. 20, 21*).—In this portion of a report including insect pests, it is stated that in the main the fire blight situation was improved during 1917, and the same is true regarding apple and pear scab. Apple anthracnose has become serious in the moist, coast sections. Peach mildew and leaf curl were not serious. Late blight of potatoes was extremely prevalent in 1917. Other common diseases were scab, *Rhizoctonia*, and *Fusarium* wilt. Among other diseases giving more or less trouble in certain sections were raspberry anthracnose, strawberry-leaf spot, and mildew.

Experimental work [on plant disease and insect control], B. HOY (*Brit. Columbia Dept. Agr. Ann. Rpt., 12 (1917), pp. 29, 30*).—This is an account dealing with experimental spraying for apple scab and woolly aphid at Kelowna, and peach mildew, leaf curl, and twig borer at Summerland.

Apple scab spraying resulted in clean fruit when lime sulphur was used at 1:30 for the pink spray, 1:35 just after the fall of the petals, and 1:35 2 weeks later. From these and other experiments outlined, it is concluded that the pink, calyx, and one later spray thoroughly applied will control apple scab in any normal season.

Peach mildew and leaf curl were not sufficiently tested, owing to their comparatively slight severity this season. Fire blight inspection showed considerable blossom blight in early spring, but only a few cases of severe infection.

Work connected with insect and fungus pests and their control, F. WATTS (*Imp. Dept. Agr. West Indies, Rpt. Agr. Dept. Dominica, 1918-19, pp.*

13-15).—In addition to a discussion of insects, it is stated that one of the most common and destructive diseases of lime trees in Trinidad is a wither tip due to *Glæosporium limetticolum*. This disease has caused the death of many young nursery plants during the past two years at the St. Clair Station. It attacks limes of all ages and has become epidemic. It is successfully controlled by the use of a 4:4:50 Bordeaux mixture containing a sticker made up for each gallon of water by adding 2 lbs. resin and 1 lb. washing soda crystals. This is mixed and boiled (about one hour) until the preparation is of a clear brown color, spreading and adhering to the glossy leaf surfaces.

Efforts made to prevent the introduction of serious plant pests and diseases into St. Lucia, and the spreading therein, A. J. BROOKS ([*Imp. Dept. Agr. West Indies*], *Agr. Dept. St. Lucia Leaflet 17* (1919), pp. 12).—The plant protective measures here outlined with discussion include efforts to prevent the introduction and spreading of plant diseases and pests and to eradicate them when once introduced into the island of St. Lucia.

Mycology [and plant diseases, Madras, India, 1918-19], R. C. WOOD (*Rpt. Dept. Agr. Madras, 1918-19, pp. 8, 9*).—Information is given regarding the paddy disease (*Piricularia oryzae*) noted previously by McRae (E. S. R., 41, p. 749), whose continued investigations are said to have shown that a fungus, apparently similar, attacks *Panicum repens*, a grass which is common among the rice fields; also that this fungus inoculated into wheat and barley produces the disease.

Phytophthora meadii caused less disease of rubber trees than previously, owing supposedly to unusual monsoon conditions. Another rubber disease has appeared, resembling brown bast as known elsewhere. No causative organism has been discovered.

Bud rot of palmyras (*Pythium palmivorum*) has been reduced, supposedly to the lowest possible point. Inoculation experiments with bleeding disease of the palm (*Thielaviopsis ethacetica*), show that the attack occurs only at wounds, and that cauterizing and disinfecting an affected area offers good hope for a permanent cure.

Mildew (*Oidium tuckeri*) and bird's-eye disease (*Glæosporium ampelophagum*) of grape were reduced by spraying. The Mahali disease of areca nuts was not so extensively treated, the season being unfavorable to the development of this disease. The advantage of treating cereal seed for smut was not very marked.

Mycology [Ceylon, 1918], T. PETCH (*Ceylon Admin. Rpts. Sect. IV, Rpt. Dir. Agr., 1918, pp. 10, 11*).—In a report on the work of the botanical and mycological division, it is stated that the consignments of diseased plants sent in for examination included Hevea, tea, coconut, and certain food and miscellaneous plants.

Vegetable pathology [Queensland], H. TRYON (*Ann. Rpt. Dept. Agr. and Stock [Queensland], 1915-16, pp. 51-55*).—This report includes brief notes on diseases affecting a wide range of economic plants.

Vegetable pathology [agricultural crops, Queensland], H. TRYON (*Ann. Rpt. Dept. Agr. and Stock [Queensland], 1917-18, pp. 45-47*).—This report is of the same general character as that noted above and previously (E. S. R., 39, p. 850).

Annual report of the government microbiologist, H. M. NICHOLLS (*Tasmania Agr. and Stock Dept. Rpt. 1917-18, pp. 13-16*).—Black spot of apple caused much less injury on the whole than during the preceding season. It is concluded that the best results as regards control are obtained by applying Bordeaux mixture thoroughly, first in the spring as the flower buds begin to

unfold and lime sulphur after the first fruit has set. Powdery mildew in most places stands next to black spot as regards orchard injury. These two diseases are often complicated by the presence of the red spider. Leaf spot (*Sphaeropsis malorum*) has increased very materially during recent years. The Irish blight of potato was materially checked by the dry summer. The fungus is carried over in the seed potatoes. Potato wilt (*Fusarium solani*) is very common in Tasmania, causing considerable loss during some seasons. Crown gall exists in the State, having been introduced supposedly on trees from Victoria.

Proclamation regarding control of grain smut (*Prakt. Bl. Pflanzenbau u. Schutz, n. ser., 17 (1919), No. 7-8, pp. 77-81, figs. 5*).—This information was embodied in a poster and deals with smuts of wheat, barley, and oats.

Treatment of wheat rust, E. FOEX (*Bul. Agr. Algérie, Tunisie, Maroc, 2. ser., 25 (1919), No. 12, pp. 292-294*).—This gives the substance of a leaflet of information bearing upon two methods (which are outlined) for the treatment of seed wheat grain to prevent smut.

A practical method of fighting wheat rust, D. B. SWINGLE (*Bien. Rpt. Mont. Bd. Hort., 10 (1917-18), pp. 74-79, figs. 4*).—A brief statement of the history of wheat rust, its practical control in Denmark, and the difficulty of its control by eradication of barberry, especially in the southern parts of the United States, is followed by an account of the establishment of a barberry eradication district extending from Michigan to Montana, inclusive, and from Minnesota to Illinois, inclusive. In Montana this rust attacks both purple and green-leaved barberry, though the Japanese species is immune there as elsewhere.

Studies on stem rust in Wisconsin, 1918, J. G. DICKSON and A. G. JOHNSON (*Wis. Dept. Agr. Bul. 20 (1918), pp. 56-60, fig. 1*).—During the spring and summer of 1918, an intensive study was made of the stem rust problem in Wisconsin, the chief object being to accumulate more detailed and definite information on the rôle of the barberry (*Berberis vulgaris*) in the spread of the stem rust of grain (*Puccinia graminis*). A brief account is here given of this work, which was carried on in cooperation with the Bureau of Plant Industry, U. S. Department of Agriculture.

The urediniospores which had formed on the new fall shoots of perennial grasses and winter grains retained their ability to grow until the winter covering of snow had disappeared, about March 5, after which time their viability rapidly decreased, no viable spores being found after March 30. Germination in February averaged less than 3 per cent, and in March less than 1 per cent.

An account with graphical illustration shows that degree of infection decreased rather uniformly with distance measured northeast from a barberry hedge, ranging from 100 per cent at 15 ft. to 10 per cent at 200 ft., 1 per cent at 300 ft., and 0.5 per cent at 400 ft. It is stated that the three strains of grain stem rust in Wisconsin go also to such grasses as wild barley, quack grass, orchard grass and wild rye. All these strains will rust the barberry, which however is able thereafter to rust only the appropriate special hosts. New grain stem rust development was not found in advance of the time when the infection could not have come from infections on barberry.

The eradication of barberry in Wisconsin, C. P. NORGDORF (*Wis. Dept. Agr. Bul. 20 (1918), pp. 44-56, figs. 5*).—This is a general account of barberry as a host of the wheat black stem rust fungus, and of its early and recent history in Wisconsin as regards location and attempts to eradicate the fungus, particularly in relation with barberry growing wild.

A preliminary note concerning a serious nematode disease of red clover in the Northwestern States, R. H. SMITH (*Jour. Econ. Ent., 12 (1919), No. 6, pp. 460-462*).—The widespread destructiveness of an affection of red clover in

Idaho during the autumn and early winter led to an investigation by the author in which the well-known stem and bulb nematode of Europe (*Tylenchus dipsaci* [*devastatrix*]) was found responsible.

The indications are that it has been present in southern Idaho for several years, and that it is rapidly increasing in its destructiveness. During the spring of 1919 several hundred acres of red clover had to be plowed up, while a large percentage of the fields left was quite badly affected. This nematode was first recorded from North America by Bessey, who found it damaging a field of rye at Edgerton, Kans., in 1907. It was next discovered in 1913 at Bellingham, Wash., where it caused serious injury to hyacinths, and in 1915 it was found injuring red clover at Redmond, Oreg.

"The nematodes appear to enter the clover plants at the surface of the ground, first working into the stipules of the leaves which surround the developing stems and later entering the stems. The infested parts near the ground become enlarged, spongy, and finally turn brown and rot off. The worms also occur higher up in the stems and in the leaves and branches, where they cause distortions and enlargements. The malforming of plants is most pronounced in autumn and early winter. During the summer the foliage of affected plants usually has an unhealthy, striped-yellow appearance, and the plants as a whole are more or less stunted.

"The death of diseased plants is hastened in the greater number of cases by the work of secondary agents, the most important of which seem to be the root mite (*Rhizoglyphus rhizophagus*), the larvæ of the mycetophilid (*Sciara trifolii*), and the larvæ of *Sitones hispidulus*, a snout beetle that is common in clover fields in the Northwest. The greater injury results to clover fields the second year or longer after seeding, when both the nematodes and the insects are found to be more abundant. Several fields have been observed, however, which had to be plowed up the first year after seeding."

The potato disease problem, C. R. ORTON (*Potato Mag.*, 2 (1920), No. 7, pp. 10-14, 36, figs. 9).—Methods and means of control are pointed out for the several potato diseases named as important.

The ring or bangadi disease of potato (*Dept. Agr. Bombay Leaflet 8 (1918), pp. 3*).—It is stated that in nearly all of the potato growing tracts of the Deccan and the Bombay Karnatak one of the most important diseases is the ring disease known as bangadi or chakri. This leaflet describes the symptoms of the disease and preventive methods.

The disease is recognized by the sudden wilting of some part, extending later to the whole plant. Dead plants or patches are common. The cut potato shows a brown ring from which may be squeezed a creamy, yellow liquid, containing the causal bacteria.

The disease is carried by the seed tubers, which if badly infected may rot without sprouting, or may produce plants which will probably wither sooner or later, and by which the disease may be propagated. Diseased tubers may rot in storage and extend the disease to others.

Prevention requires the use of only disease-free seed, obtained by disinfection of knives for cutting up the seed tubers, draining the low places in the field, proper storage, and adequate inspection.

Fusarium blight of the soy bean and the relation of various factors to infection, R. O. CROMWELL (*Nebraska Sta. Research Bul. 14 (1919), pp. 5-43, figs. 5*).—In a previous publication (*E. S. R.*, 37, p. 50), the author described the disease of soy beans due to *Fusarium tracheiphilum*. In the present publication, an account is given of additional studies on the soy bean blight to determine the effect of various factors on the amount and severity of the disease.

morphological and cultural characters of the organism, an account is given of experiments on the relation of various soil factors to infection of soy beans, including the influence of soil types, acidity and alkalinity, nematodes, soil temperature, and influence of other organisms. The physical structure and acidity of soils under natural conditions were not limiting factors in infection, but acidity under certain conditions was found to have some influence. Infection is said to occur through the roots, but nematodes did not increase the percentage of blight materially. Other organisms, such as *Rhizoctonia* and *Sclerotium rolfsii*, and other root injuries are believed to increase materially the percentage of diseased plants in the field.

An investigation was made on the susceptibility of different varieties of soy beans, and the Black Eyebrow variety was found to show some evidence of resistance. The Brown variety, while not resistant, appeared tolerant and developed remarkably in spite of numerous fungus filaments and nematodes within the roots. Fifteen other varieties tested were found to be similarly affected. Velvet beans were not found subject to attack of this organism.

The mottling or yellow stripe disease of sugar cane, J. A. STEVENSON (*Jour. Dept. Agr. and Labor Porto Rico, 3 (1919), No. 3, pp. 3-76, pls. 3, figs. 7*).—Earlier reports (E. S. R., 39, p. 53; 42, p. 644) regarding the disease of sugar cane which has been raging in Porto Rico unchecked for several years are followed up with a systematic account of studies on this trouble, for which the descriptive name mottling disease is preferred.

The mottling disease first appeared in the northwest section of the island, and spread rapidly eastward until only a portion of the east and southeast coast regions remain uninfected. Indications point to a continued progress by the disease. Upland fields have as a rule been most severely attacked. Losses to date are estimated at \$2,500,000. These appear chiefly in tonnage, though diseased canes introduce also difficulties in manipulation at the mill. Apparently the trouble spreads by other means than by infected planting material. The disease has been found on several varieties in Santo Domingo, though it is not yet epidemic there. One infested area is reported from St. Croix.

Though Otaheite was the variety first seriously attacked, Rayada and other native types have succumbed in succeeding seasons. The numerous foreign varieties (mostly seedlings) vary greatly in this respect, ranging from great susceptibility to very promising resistance. Some station seedlings are also quite promising.

The disease is characterized by a mottling of the leaves, followed in advanced stages by a stunting of the entire stool and the presence of gray, sunken lesions on the stalks. The appearance of the mottling varies greatly with the variety. Approximately a three years' progressive course is followed, ending in the death of the stool.

No other hosts are yet known. No direct relation has been established between the disease and nature of soils, years in cane, methods of preparing the land, drainage, or other cultural features. No direct influence was demonstrated in case of fertilizers, liming, seed treatment, manner of disposing of trash, or moisture content of the soil. An accumulative effect in successive ratoon crops is apparent. The disease has not been transmitted artificially. Chemical tests of the juice do not show any abnormal glucose ration or any constant difference between the juice of normal and that of diseased canes.

Fungi and bacteria are not known to be associated in any way as causal agents, either on leaves or stalks. The cankers appear to be a result of the general weakening of the plant, though fungi may invade them later. The infectious principle is present in all parts of the diseased plants. The disease is

transmitted by seed pieces, and also apparently by some other means. Infection appears to be aerial, and not to persist in the soil. Certain insects may be carriers. The disease is considered to be an infectious chlorosis due to a virus or ultramicroscopic organism. The disease and its manifestations are discussed in view of what is known regarding related phenomena.

Report on an investigation of frog hopper pest and diseases of sugar cane in Trinidad. W. NOWELL (*Bul. Dept. Agr. Trinidad and Tobago*, 18 [1919], No. 2, pp. 57-69).—The main object of the present report is to contribute to the understanding of the cane trouble now widely known as blight and correlated with root disease and with widely varying degrees of injury to standing canes. Both the attack and its persistence are said to depend upon a condition of weakness or debility in the cane, that is, root disease presupposes unfavorable conditions.

Fungi related to root disease are mainly two, belonging to the *Marasmius* group (usually *M. sacchari*), and to the *Odontia* group (*O. sacchari* and *O. saccharicola*). The disease is apparently much more common in association with the latter type. The parasitism of both requires investigation. Depressed vitality on the part of the cane favors injurious development by the root fungus, which enters the root tips, distorting, checking, and finally killing them. It also envelops the young leaf shoots at various stages, cementing the sheaths and in severe cases infesting internally the buds, shoots, and underground connections of the stock, and to some extent the leaves of the developed canes. The general effect is that of water shortage. This is due to interference with absorption and conduction, and such interference is delayed or decreased in situations favoring good root development and deep penetration by the roots. The planting and cultivation customary in these regions are frequently such as to favor access of the fungi left by the old canes. Climatic conditions in Trinidad, however, are so favorable to cane as partly to offset cultural disadvantages.

Frog hopper infestation may be connected with the trouble above discussed through the reduction of vigor in plants, but in many examples seen it is considered as possible that no effective part was taken by the frog hopper insects.

Remedial plans suggested include treatment of sets with Bordeaux mixture.

The relation of root fungus to frog hopper blight of sugar cane in Trinidad. C. B. WILLIAMS (*Bul. Dept. Agr. Trinidad and Tobago*, 18 [1919], No. 2, pp. 52-56).—In connection with the above report by Nowell, the present author gives a provisional and incomplete account of his own experiences and observations of frog hopper blight of sugar cane, following a summary of the history of the blight and a view of its connection with the presence of frog hopper and the root fungus (*Marasmius*).

The general conclusions of the present author agree with those of Nowell. The view is expressed that 50 per cent of the damage at present caused by blight could be prevented without any decrease in the number of frog hoppers.

Sugar cane varieties and frog hopper blight in Trinidad. C. B. WILLIAMS (*Bul. Dept. Agr. Trinidad and Tobago*, 18 [1919], No. 2, pp. 70-83).—The question of varieties resistant to frog hopper blight having come into prominence in the course of the observations and work above noted, the author has collected notes and observations which are here particularized as covering more than 50 cane varieties. From this work he concludes that no variety of cane at present grown in Trinidad is immune to the blight, though Uba and Badilla are measurably resistant, and recently introduced varieties seem to justify further experimentation.

Field diseases of the sweet potato in Texas. J. J. TAUBENHAUS (*Texas Sta. Bul.* 249 (1919), pp. 3-22, figs. 34).—After giving directions for treatment of

sweet potatoes intended for seed purposes, the author describes the more common field diseases of sweet potatoes in Texas, and suggests methods for their control.

Experimental work [with apple scab and with fire blight of apple], P. E. FRENCH (*Brit. Columbia Dept. Agr. Ann. Rpt.*, 12 (1917), pp. 24-28).—Spraying tests showed that apples can be produced commercially free from scab. At Salmon Arm, the best results for the money expended were obtained from three applications with lime sulphur, the pink and the calyx spray and another 4 weeks later. In the Vernon district two sprays were sufficient, these being the calyx (the more important) and the one 4 weeks later.

To the above locality tests were added material tests, the average results of the 2 years showing clearly the superiority of lime sulphur over atomic sulphur and Bordeaux. The latter caused much russeting of the fruit, but the former showed a 20 per cent decrease in yield attributed to scab.

Experiments testing the value of lime sulphur against apple scab at different strengths (1:30 to 1:50), showed the weaker strengths to give practically the same results as the stronger ones which have been usually applied.

On the whole, apple scab caused less damage in 1917 than in the previous year, owing to the season and to the more efficient methods employed.

Fire blight, which is scattered sparsely throughout the Vernon and Armstrong districts, occurring mostly on old limbs of such varieties as Spitzenberg, has been located for the most part, and the situation offers promise of early control.

Red cedar trees and cedar rust, R. E. MARSHALL and F. D. FROMME (*Va. Polytech. Inst. Ext. Bul.* 39 (1920), pp. 8, fig. 1).—The results are given of a cedar rust survey of Augusta County, Va., in which 113 orchards containing a total of 72,235 apple trees of the York Imperial variety were examined for severity of rust infection on the foliage, amount of defoliation, size of fruits, vigor of trees, and number and location of cedars. The relation between cedar trees and cedar rust in the orchards is shown in a very conclusive way, proximity to cedar trees being reflected in the greatly increased number of infections on this susceptible variety of apple.

Treatment for anthracnose, L. RAVAZ (*Prog. Agr. et Vitic. (Ed. l'Est-Centre)*, 41 (1920), No. 5, pp. 103-104).—Treatments locally effective against grape anthracnose are given. The first of these is made up of iron sulphate 30 to 40 kg. and sulphuric acid 1 to 2 kg. in 100 liters of water; the second of 10 kg. sulphuric acid in 100 liters of water.

Treatment of chlorosis [in vines] in full vegetation, L. DEGRULLY (*Prog. Agr. et Vitic. (Ed. l'Est-Centre)*, 40 (1919), No. 22, pp. 506, 507).—A report from Donnadieu is quoted, stating that iron sulphate at 0.1 per cent strength is a certain preventive of chlorosis, and that it is advisable to add iron sulphate in all spraying operations where an acid spray is applied to grapevines.

Autumnal treatment for chlorosis, L. RAVAZ (*Prog. Agr. et Vitic. (Ed. l'Est-Centre)*, 40 (1919), No. 42, pp. 361-363).—Discussion is given of the prevalence during 1918 of conditions favorable to the development of chlorosis in grapevines, and of measures taken to prevent or forestall this trouble by applications, mainly of iron compounds, capable of utilization by the plant.

Red ring disease of coconuts, W. NOWELL (*Agr. News [Barbados]*, 18 (1919), No. 460, p. 398).—In a report read before the Board of Agriculture of Trinidad, in October, 1919, the author states that the connection of the so-called root disease of coconut with the presence of a nematode has been abundantly confirmed. A description of this nematode, said to be a new species, under the name *Aphelenchus cocophila*, is expected to be given by Cobb in a forthcoming number of this publication. It is now known that the presence of this

organism in the roots is secondary, and that the red zone of the stem is a breeding ground for the nematode, which thence extends to roots and to leaves, both mature and semimature, and even to the youngest rudimentary leaves in the bud centers. No alternate host of the nematode is yet known. The disease appears typically first in widely separated cases as the trees approach the bearing age, and extends from these centers until infestation may approach 30 per cent. Injury does not appear to be a prerequisite to infection by the organism.

The fungus diseases of the tea leaf, A. C. TUNSTALL and S. C. BOSE (*Indian Tea Assoc., Sci. Dept. Quart. Jour.*, No. 3 (1919), pp. 82-89, pls. 3, figs. 4).—These investigations on fungus diseases of tea leaves are still in progress, and are to be published in pamphlet form when completed. The present contribution is confined to characters of the normal tea leaf.

Red rust, A. C. TUNSTALL (*Indian Tea Assoc., Sci. Dept. Quart. Jour.*, No. 3 (1919), pp. 90-94).—This is a brief account of tea red rust (*Cephaleuros virescens*, *C. mycoidea*), its forms, conditions of attack, and control measures.

Black canker or rot of chestnut, B. PEYRONEL (*Staz. Sper. Agr. Ital.*, 52 (1919), No. 1-2, pp. 21-41, pls. 4).—Reporting further on a study previously noted (*E. S. R.*, 37, p. 657), the author notes a fungus found in connection with black canker of chestnut. This is considered a species of a new genus. Both are technically described. The new form is named *Rhacodiella castaneæ*.

The occurrence of oak mildew on beech in Britain, A. D. COTTON (*Brit. Mycol. Soc. Trans.*, 6 (1918), pt. 2, pp. 198-200).—This was observed by the author near Sevenoaks, Kent, in July, 1918. It occurred on shoots springing from stumps of old trees which had been cut down, the beech being infected in some instances directly from spores produced by the oak. Apparently in such cases, only very young leaves are susceptible.

The present status of the white pine blister rust control in Montana, 1918, G. A. ROOT (*Bien. Rpt. Mont. Bd. Hort.*, 10 (1917-18), pp. 69-73, figs. 3).—A brief account is given of the white-pine blister rust, though it is stated that no record has yet been made of its presence in Montana.

The white pine blister rust (Concord, N. H.; Forestry Dept., 1919, pp. 4, figs. 11).—This pamphlet, giving a popularized account of the white pine blister rust in its two stages, its dissemination, and results, sketches also the development and work of the New Hampshire Forestry Commission since the inception of it work in 1917 in connection with the Bureau of Plant Industry, U. S. Department of Agriculture.

White pine blister rust [in Wisconsin], C. P. NORGORD (*Wis. Dept. Agr. Bul.* 20 (1918), pp. 16-17, 40-43, figs. 2).—Active work on white pine blister rust in cooperation with the U. S. Department of Agriculture has shown that this disease reached Wisconsin earlier than was formerly thought, as what appeared to be a small infection in Polk County proved to be really a very wide infection, extending to nine additional counties. The most dangerous centers are three in number, namely, Falun (Burnett County), Lewis (Polk County), and Rice Lake (Barron County), in all of which pines are seriously attacked.

An account is given of inspection and other work during 1917 and 1918, with discussion of measures in force or in prospect.

ECONOMIC ZOOLOGY—ENTOMOLOGY.

An apparent effect of winter inactivity upon distribution of mammals, H. H. T. JACKSON (*Jour. Mammalogy*, 1 (1920), No. 2, pp. 58-64, fig. 1).

Rodent mountaineers, W. P. TAYLOR (*Jour. Mammalogy*, 1 (1920), No. 2, pp. 93, 94).

A new subspecies of beaver from North Dakota, V. BAILEY (*Jour. Mammalogy*, 1 (1919), No. 1, pp. 31, 32).

Notes on the fox squirrels of southeastern United States, with description of a new form from Florida, A. H. HOWELL (*Jour. Mammalogy*, 1 (1919), No. 1, pp. 36-38).

The Florida spotted skunk as an acrobat, A. H. HOWELL (*Jour. Mammalogy*, 1 (1920), No. 2, p. 88).

The wood rat as a collector, W. P. TAYLOR (*Jour. Mammalogy*, 1 (1920), No. 2, pp. 91, 92).

The Florida water rat (*Neofiber alleni*) in Okefinokee Swamp, Ga., F. HARPER (*Jour. Mammalogy*, 1 (1920), No. 2, pp. 65, 66, pl. 1).

Description of a new race of the Florida water rat (*Neofiber alleni*), A. H. HOWELL (*Jour. Mammalogy*, 1 (1920), No. 2, pp. 79, 80).

Identity of the bean mouse of Lewis and Clark, V. BAILEY (*Jour. Mammalogy*, 1 (1920), No. 2, pp. 70-72).

The Georgian bat, *Pipistrellus subflavus*, in Wisconsin, H. H. T. JACKSON (*Jour. Mammalogy*, 1 (1919), No. 1, p. 38).

Birds and the war, H. S. GLADSTONE ([London]: Skeffington & Son, Ltd., 1919, pp. XVIII+169, pls. 17).—The several chapters of this work deal with the utility and economy of birds in the war, sufferings of birds in the war, behavior of birds in the war zones, and the effect of the war on birds. It concludes with a list of the ornithologists killed in the war.

Insects attacking sugar cane in the United States, T. E. HOLLOWAY and U. C. LOFTIN (*Jour. Econ. Ent.*, 12 (1919), No. 6, pp. 448-450).—This is an annotated list of 18 important enemies of sugar cane.

Common orchard and nursery pests and their control, G. C. STARCHER, W. E. HINDS, and G. L. PELTIER (*Ann. Rpt. Commr. Agr. and Indus. [Ala.]*, 1918, pp. 97-129, figs. 8).—A popular summary of information.

Principal insects and plant diseases attacking the stems of currants and gooseberry plants, H. C. SEVERIN (*Ann. Rpt. State Ent. S. Dak.*, 10 (1919), pp. 16-36, pl. 1, figs. 11).—The insects here noted are the American currant borer (*Psenocerus supernotatus*), imported currant borer (*Sesia tipuliformis*), European fruit tree lecanium (*Lecanium corni*), oyster-shell scale, Putnam's scale, currant aphid, imported currant worm, oblique-banded leaf roller (*Archips rosaceana*), red spider (*Tetranychus telarius*), and span worm (*Cymatophora ribearia*).

Eleventh annual report of the Quebec Society for the Protection of Plants from Insects and Fungus Diseases, 1918-19 (*Ann. Rpt. Quebec Soc. Protect. Plants [etc.]*, 11 (1918-19), pp. 84, pls. 11).—Among the papers here presented are the following: Methods of Studying Economical Insects, by W. Lochhead (pp. 12-17); The Sparrow Question, by P. Fontanel (pp. 20-24); The Pepper and Salt Moth (*Amphidasis cognataria*), by J. C. Chapais (pp. 25, 26); Dusting and Spraying Suggestions for Quebec, by C. E. Petch (pp. 27, 28); The Present Situation of the Brown-tail Moth in Eastern Canada, by L. S. McLaine (pp. 29-32); Some Problems in Botany and Entomology, by V. A. Huard (pp. 33, 34); The Imported Alder Leaf Miner [*Kaliosysphinga dohrnii*], by C. B. Hutchings (pp. 35-37); A Canadian Bee, *Colletes inaequalis*, by L. M. Stöhr (pp. 38-45); Some Insect Injuries in Woodlots [*Pityokteines sparsus*, *Pissodes dubius*], by J. M. Swaine (pp. 46-48); Efficiency Factors in Potato Spraying, by W. H. Rankin (pp. 49-55); How the Protection of Plants has Progressed in Quebec, by G. Maheux (pp. 56-58); and Insect Carriers of Plant Diseases, by E. M. DuPorte (pp. 59-65).

The beneficial action of lime in lime-sulphur and lead arsenate combination spray, R. H. ROBINSON (*Jour. Econ. Ent.*, 12 (1919), No. 6, pp. 429-

433).—This is a report of investigations by the associate chemist of the Oregon Experiment Station.

The data presented indicate that there is a pronounced detrimental chemical reaction between lime-sulphur and lead hydrogen arsenate when mixed for a combination spray. By the addition of lime at the rate of about 10 lbs. to 100 gal. of lime-sulphur previous to adding the lead arsenate, this reaction can be prevented to a certain extent.

Lace bug on hawthorn, *Corythucha bellula* (Tingitidæ, Hemiptera), W. H. WELLHOUSE (*Jour. Econ. Ent.*, 12 (1919), No. 6, pp. 441-446, figs. 2).—This tingitid, originally found to occur in abundance in 1917 on several *Cratægus* trees near Tiffin, Ohio, has been observed during the past year in several localities about Ithaca, N. Y. It appears to confine its attack to those species of *Cratægus* which have an abundance of pubescence along the veins on the lower sides of the leaves, having been found in great abundance on *C. neofluvialis* and to some extent on *C. albicans* and *C. punctata*. The leaves of *C. neofluvialis* were so discolored by its attack that by the end of July they attracted attention several hundred yards away. By the middle of August the leaves were falling and by September 1 the branches were bare, with the result that no fruit matured on the infested trees. The injury is caused by the nymphs and adults puncturing the undersurface of the leaf and sucking the sap, causing at first a mottled effect due to the pale areas around the feeding punctures while later the leaf turns brown and falls to the ground.

There are two generations of the insect a year at Ithaca. The first brood hatched out in July from eggs laid in late May and June, the nymphs becoming mature in from 20 to 25 days. The second brood eggs are laid in late July and August, and the adults appear in late August and September. The winter is passed by the adults of the second brood among the fallen leaves and in crevices of the bark. The eggs are laid on the undersurface of the leaf in the axils formed by the midrib and its lateral branches. Eggs laid June 2 hatched in 37 and 38 days, while eggs of the second brood laid July 29 and 30 hatched 17 and 18 days later. Upon hatching out, the nymphs feed in colonies near the eggshells. They molt five times, feeding from 3 to 6 days between molts, the earlier stages requiring 3 or 4 days and the later ones 5 or 6 days. During the fifth stage the nymphs wander about more freely over the leaf and sometimes go to adjoining leaves. Descriptions are given of the five stages.

As regards control measures, it is pointed out that should the second brood nymphs become too numerous on ornamental plantings, they may be controlled by using one of the nicotin sprays commonly used against leaf bugs on apple.

The life history and early stages of *Macropsis virescens graminea*, a poplar leaf-hopper in New Jersey, H. B. WEISS and E. L. DICKERSON (*Jour. Econ. Ent.*, 12 (1919), No. 6, pp. 437-440).—This is a report of observations covering a period of several years upon *M. virescens graminea*, a European insect which was fairly abundant on Lombardy poplars in a nursery at Irvington, N. J.

The winter is passed in the egg stage, the eggs being found in 2-year-old wood, usually in the neighborhood of the buds near the end of the growth, although some are found in the twig tissue between the sets of buds. They are inserted singly on their sides just beneath the bark tissue, and the bark over the egg is raised, showing the contour in a somewhat irregular fashion. Hatching takes place during the first week in May at a time when the leaves are small, and by the last few days in May and the first part of June the first adults appear. The greater part of the adults, however, appear about the middle of June, and from then on until the middle of July and later they can be found scattered over the trees.

Oviposition takes place during the last of June and first part of July. There are five nymphal stages, and the combined time necessary for them to mature is about one month. The early stages are found on the young unfolding leaves and leaf petioles, usually at the bases. As they become older they disperse and move to the stems where they rest in the axils of the leaves or occasionally on the petioles. Technical descriptions are given of the egg, five nymphal stages, and the adult.

The species is said to have been recorded by Osborn as occurring at Salem, N. Y., and at Orono, Me. Specimens on elm in a nursery at Rutherford, N. J., were also examined by the author.

The Houghton gooseberry aphid, A. C. BAKER (*Jour. Econ. Ent.*, 12 (1919), No. 6, pp. 433-437).—*Aphis houghtonensis*, described by Troop in 1906 from specimens attacking the gooseberry at Indianapolis, has been studied by the author, specimens having been received from Benton Harbor, Mich., in 1916, where it was injurious to the Houghton gooseberries.

Rearings were made and descriptions are given of alate viviparous, intermediate, and summer apterous forms and of the sexes. The eggs, which apparently are deposited upon the bark under the loose folds that extend down the twigs, about the bases of the buds, and occasionally upon the thorns, hatch the middle of April. As soon as the young stem mothers are hatched, they wander to the young opening leaves to feed and place themselves either on the undersurface of the leaves or upon the petioles. Thus attacked, the leaves immediately begin to curl and soon inclose the stem mothers and the young they may have produced. The alate viviparous form was found to occur in every generation in which specimens were reared from the second onward. All specimens of the alate viviparous form were placed upon gooseberry died without reproducing, indicating that an alternate host is necessary, at least to certain individuals. The first summer apterous form appeared on May 9, when young were produced by adult stem mothers. They attacked the leaves in the same manner as did the stem mothers, causing many of them to roll very tightly so that great difficulty was experienced in examining the insects. The sexes appear upon the bushes in September and October, and eggs are laid as early as the first week in October.

Lucerne aphid (*Dept. Agr. Bombay Leaflet 4* (1919), pp. 3, pl. 1).—A brief account of this plant louse, which is a source of considerable injury.

Experiments with steam disinfectors in destroying lice in clothing, R. H. HUTCHISON (*Jour. Parasitol.*, 6 (1919), No. 2, pp. 65-78, fig. 1).—"If the penetration of steam is sufficient to produce a temperature of 75° C. (167° F.) in the center of a barracks bag (or other load of infected goods) all eggs and active stages of body lice will be destroyed. This conclusion, based on the above practical tests, agrees very well with laboratory experiments on fatal temperatures. Nuttall [*E. S. R.*, 39, p. 864] has shown that nits are killed in one minute at 70° in dry heat, and in 10 seconds at 70° moist heat.

"If the disinfectors are operated efficiently on the time schedule now employed (viz., a 10-inch preliminary vacuum; 15 lbs. steam pressure for 15 minutes, reckoned from the time the steam is turned on; followed by a 10-inch drying vacuum), the requisite temperature (75°) is attained in every case. By efficient operation is meant (1) the maintenance of a full head of steam so that the 15 lbs. pressure in the disinfecter is produced within 5 minutes, thus allowing at least 10 minutes for exposure; (2) overloading must be guarded against; (3) the individual bundles must not be rolled too tightly.

"Little, if any, shrinkage of woolen goods is caused by this treatment. There is, of course, some wrinkling, but these wrinkles are not permanent but may be remedied by pressing."

The coconut butterfly (*Brassolis isthmia*) on banana, J. ZETEK (*Jour. Econ. Ent.*, 12 (1919), No. 6, p. 465).—The author reports upon the occurrence of the larvæ of *B. isthmia* on banana trees at Panama City. An account of this pest upon coconut palms by Dunn has previously been noted (*E. S. R.*, 38, p. 58).

Some lepidopterous pests new to sugar cane in Queensland, E. JARVIS (*Bur. Sugar Expt. Stas. Queensland, Div. Ent. Bul.* 9 (1920), pp. 16, pl. 1).—The author records the presence in north Queensland cane fields of Lepidoptera not included in the bulletin previously noted (*E. S. R.*, 36, p. 654). The species considered are *Cirphis loreyi*, *Mocis frugalis*, *Melanitis leda*, *Padraona hypomoloma*, an undetermined bag moth, *Anthela acuta*, and *Ophiusa melicerte*. The author lists the species of Noctuidæ, 27 in number, recorded from various parts of the world as being more or less injurious to sugar cane.

A new genus and species of oecophorid moths from Japan, C. HEINRICH (*Proc. Ent. Soc. Wash.*, 22 (1920), No. 3, pp. 43-50, figs. 14).—A species reared from stored grain at Yokohama, Japan, is described as *Santuzza kuwanii* n. g. and n. sp.

Experimental transfer of Weil's disease by the stable fly, P. UHLENHUTH and P. KUHN (*Ztschr. Hyg. u. Infektionskrank.*, 84 (1917), pp. 517-540; *abs. in Abs. Bact.*, 2 (1918), No. 5, p. 283).—The authors have succeeded in transmitting infectious jaundice in guinea pigs through the bites of stable flies. Of 9 attempts, 4 were certain, 3 doubtful, and 2 clearly negative.

The swarming of anopheline mosquitoes, C. S. BANKS (*Philippine Jour. Sci.*, 15 (1919), No. 3, pp. 283-288).—This paper relates to observations of *Myzomyia rossii*.

Investigation of control measures for white grubs affecting sugar cane in Queensland, J. F. ILLINGWORTH (*Jour. Econ. Ent.*, 12 (1919), No. 6, pp. 451-455).—This report of investigations of control measures conducted by the author in Queensland is based upon work previously noted (*E. S. R.*, 42, p. 545).

New American Cleridae, with note on the synonymy of *Micropterus* Chev. (Coleoptera), E. A. CHAPIN (*Proc. Ent. Soc. Wash.*, 22 (1920), No. 3, pp. 50-54).

A parasite of dermestid beetles in entomological collections, T. D. A. COCKERELL (*Canad. Ent.*, 52 (1920), No. 2, p. 34).—Under the name *Laelius utilis* the author describes a new bethylid parasite reared from anthrenid larvæ.

A weevil attacking agave, H. A. BALLOU (*Agr. News [Barbados]*, 19 (1920), No. 462, p. 10).—A weevil which attacks agave in Curaçao has been identified as *Scyphophorus acupunctatus*, an insect which is native of and abundant in Mexico. While originating in Mexico and Central America, it now occurs in Curaçao, Haiti, and Cuba in the western Tropics and in East Africa and Java in the East. This weevil occurs in the "bull end" of the flower pole in *Agave vivipara*, but does not appear to attack *A. sisalana*. The larvæ and adults occur in great numbers in the stem and leaf bases of plants of *A. frankeera* that have not yet formed a pole.

Notes on the bronze apple-tree weevil, G. F. MOZNETTE (*Jour. Econ. Ent.*, 12 (1919), No. 5, pp. 426-429, pl. 1).—The bronze apple-tree weevil (*Magdalis ænescens*), first described in 1876 by LeConte from specimens collected in Oregon, occurs in British Columbia, Washington, and Oregon and is prevalent throughout the Willamette Valley in Oregon, where observations of the species were made by the author.

It is said to attack trees which have been weakened from some other cause, never having been observed to attack healthy trees. It was observed by the author at McMinnville, Oreg., in 1916 in Italian prune wood sawed from

orchard trees, killed apparently through the attacks of the peach and prune root borer (*Aegeria opalescens*).

The eggs are deposited in the bark, eggs laid April 26 having hatched by May 14 and 15. The larvæ live over winter feeding on the bark and on the surface of the wood next to the bark, transforming again in the early part of April. They bore beneath the bark, forming channels that run in every direction. The length of the larval stage is approximately 10 to 11 months, depending on the weather conditions in the spring. Pupation takes place in an oval cell excavated between the wood and bark at the end of the burrow, the pupal stage lasting for 5 days.

Reference is made to its parasitism by *Tetrastichus* sp. and a braconid (*Calyptus* sp.), the parasitism of individuals in limbs examined averaging 50 per cent.

A proctotrypid inquiline with *Formica exsectoides*, W. M. MANN (*Proc. Ent. Soc. Wash.*, 22 (1920), No. 3, pp. 59, 60).

Descriptions of six new wasps, S. A. ROHWER (*Proc. Ent. Soc. Wash.*, 22 (1920), No. 3, pp. 54-59).

Studies on the life history and habits of the jointworm flies of the genus *Harmolita* (*Isosoma*), with recommendations for control, W. J. PHILLIPS (*U. S. Dept. Bul.* 808 (1920), pp. 27, pls. 6, figs. 8).—This is a report of biological studies and observations of the jointworm flies of the genus *Harmolita*, formerly known as *Isosoma*, a revision of which genus by the author and Emery has been previously noted (*E. S. R.*, 41, p. 667).

Six species are classed as attacking grain crops, namely, the wheat jointworm (*H. tritici*), wheat straw worm (*H. grandis*), wheat sheath-gall jointworm (*H. vaginicola*), barley jointworm (*H. hordei*), rye jointworm (*H. secalis*), and rye straw worm (*H. websteri*). Five species are classed as infesting the cultivated grasses, namely, the timothy straw worm (*H. albomaculata*), orchard grass straw worm (*H. dactylicola*), blue-grass jointworm (*H. captiva*), blue-grass straw worm (*H. poae*), and festuca jointworm (*H. festucæ*). Ten species are classed as infesting wild grasses, namely, *H. maculata*, *H. atlantica*, *H. agropyrophila*, *H. elymi*, *H. elymicola*, *H. elymivora*, *H. rufipes*, *H. hesperus*, *H. elymophthora*, and *H. ovata*. All of the above-mentioned species have been reared repeatedly in cages under artificial conditions with the exception of *H. captiva*, *H. rufipes*, *H. hesperus*, *H. elymophthora*, and *H. ovata*. The habits of the remaining eight species recognized by Phillips and Emery are practically unknown. So far as known there is but a single generation each year, with the exception of *H. grandis* and *H. agropyrophila*, which have two.

The adults of *H. tritici*, which is probably the most important species of the genus, emerge in May and oviposit in the stems of growing wheat just about the time the heads begin to appear, the eggs hatching in 10 days. The larvæ mature in about three weeks or a month from date of oviposition, during which time they molt at least three times and possibly four times. The majority of the larvæ pupate in the fall and the remainder in the spring. "A plant infested by the wheat jointworm may not show any external signs of infestation whatever, or the stems may be distorted and have wartlike elevations on them. In any case the stem at the point infested is hard and woody, and where there is no distortion the point of infestation may be readily detected by pinching the stem between the thumb and forefinger. These infested places usually occur above the second or third joint from the root, but may occur above any joint. In badly infested fields several joints may be affected and a large number of plants may fall, thus greatly reducing the yield. It is not necessary, however, that the plants fall or lodge to reduce the yield greatly." It causes serious

losses in nearly all the wheat-producing States east of the Mississippi River and in a large part of Missouri, but for some unexplained reason has not as yet invaded the States farther west. It will not develop in any plant other than wheat. A recent Farmers' Bulletin on this species by the author has been noted (E. S. R., 40, p. 170).

H. grandis ranks next to *H. tritici* in importance as an enemy of wheat, and is at present the most important jointworm west of the Mississippi, where it often causes widespread injury. It appears to be the most widely distributed species in the United States, occurring usually in greater or less numbers wherever wheat is grown. It is one of the two species of the genus that has two generations a year, and is the only one known to be dimorphic. The spring form attacks the wheat plants when they are small, the eggs being deposited in the base of the young plant. The affected tiller is totally destroyed by the developing larva and if the plant has not tillered it kills the entire plant. The larva develops within and right at the base of the plant, usually causing the plant to become somewhat bulblike at this point. This generation, which is usually wingless, emerges during March and April in the Eastern and Central States, while in Washington and probably in other Pacific States it emerges in April. The summer form emerges in May and deposits its eggs in the growing wheat plant slightly above the joints, the eggs hatching in about 5 days. The larva rasps the inner walls of the stem, sucks the juices, and subsequently forms a little cell within the joint. "In all the winter wheat areas the effect upon the plant is to cut down the yield of grain, while in places where both spring and winter wheat are sown, often in adjoining fields, the summer form turns its attention to the spring wheat in preference to the older and tougher plants of the winter wheat. Spring wheat is affected very much in the same manner as winter wheat is injured by the first generation (form *minuta*). The summer generation remains in old wheat stubble, pupating in the fall." This species has only been reared from wheat.

H. vaginicola deposits eggs in the tender wheat leaf sheath surrounding the embryonic head, causing the leaf sheath to become fleshy and thick and later hard and woody, thus compressing the stem to such an extent that little or no sap reaches the developing head. As a result the head usually protrudes only one or two inches beyond the leaf sheet. The larvæ remain in the wheat stubble until the following spring and then pupate and emerge as adults in May. The species has refused to develop in any plant other than wheat.

H. hordei, which for many years has been a source of serious injury in all the barley-growing sections in the Eastern United States, has not as yet been introduced into Wisconsin, Minnesota, and the Dakotas. Its injury to barley is exactly the same as that caused to wheat plants by *H. tritici*. The larvæ remain in the old barley stubble until the following spring, when they pupate and emerge as adults. This in the vicinity of Charlottesville, Va., occurs during May. It develops in barley only.

H. secalis, which has not as yet become of much economic importance, remains in old rye stubble throughout the summer, fall, and winter, pupates in the spring, and emerges as an adult about the middle of May. *H. websteri*, which is of little economic importance, remains in the old rye stubble until spring, when the larvæ change to pupæ, the adults emerging about the middle of May.

The parasites of *H. tritici* have held it in check. Experiments covering a period of three years in which infested stubble was plowed soon after harvest and disked and peas or soy beans sown show this to be a very effective control measure for *H. tritici*, the infestation in these trials being reduced from 8 to 1

per cent. from 32 to 3 per cent, and from 19 to 2 per cent. The barley jointworm, the rye jointworm, and the rye straw worm can undoubtedly be controlled in the same manner if the necessity arises. The wheat straw worm is very easily controlled, and since one generation is wingless it is only necessary to keep down all volunteer wheat and never plant wheat nearer than 40 to 50 yds. from infested stubble. See following article.

The migration of *Harmolita grandis* form *minutum*: An important factor in its control, W. H. LARRIMER and A. L. FORD (*Jour. Econ. Ent.*, 12 (1919), No. 6, pp. 417-425, pl. 1, figs. 3).—The authors report the results of studies by the Bureau of Entomology of the U. S. Department of Agriculture made at West La Fayette, Ind. The purpose was to determine the distance the first or spring generation of the wheat straw worm (*H. grandis minutum*), which is largely wingless and which hibernates largely in the stubble, can migrate, thus determining the distance that wheat can be sown from stubble of the previous year's crop without danger of infestation.

In examinations of eight fields the greater part of the infestation occurred within 10 yds. of the standing stubble, and beyond 30 yds. the infestation became practically negligible. "The amount of infestation varied markedly in the eight fields, ranging from 20.1 to 6.2 per cent at the stubble, but in every case it decreased in practically the same ratio as the distance from the stubble increased. These data show that under ordinary conditions very few of the wingless adults of this species will migrate farther than 30 yds. from the stubble which marked their emerging place." In examinations made of several fields which were in wheat the previous year only a trace of the spring generation of this species was found, and that only where the stubble of the previous year's crop had been improperly plowed.

Examinations were also made in the same eight fields for the second or summer generation infestation, four counts being made, namely, next to stubble, and at 50, 100, and 150 yds. The counts showed that while the heaviest infestation remained in those parts of the fields nearest the standing stubble, comparatively high infestations were found even at 150 yds., or approximately in the middle of most of the fields used in the count. The studies made of second generation individuals, which are winged, show them to be strong fliers, and that they infest all wheat fields over the whole general neighborhood fairly uniformly. Thus control measures should be directed against the first generation. "By planting wheat not closer than 30 yds. to standing stubble, one is fairly safe from infestation. Where the stubble can be thrown under without plowing up a hay crop, it should be, but where the hay crop is to be left with the stubble, the following year's wheat should not be sown within 30 yds. of it. If it should be, it will act merely as a breeding place for the first generation, and the resulting winged second generation will then infest the whole field and near-by fields as well." The importance of keeping down all volunteer wheat in or near stubble is emphasized.

The sugar cane beetle borer parasite (*Ceromasia sphenophori*) in Queensland, J. F. ILLINGWORTH (*Jour. Econ. Ent.*, 12 (1919), No. 6, pp. 457-459).—This is a report of the present status of a tachinid parasite of the sugar cane beetle borer (*Rhabdocnemis obscura*), which was introduced into North Queensland in 1914 from Fiji, where it had been established by the author in 1913 (*E. S. R.*, 32, p. 350).

As a result of parasitism by *C. sphenophori*, the beetle borer is no longer a serious pest in the Mossman district. The ant *Pheidole megagephala*, which was present in the cane fields of North Queensland, as was found to be the case in Fiji, is an important enemy of this parasite.

A successful method of breeding parasites of white grubs, J. F. ILLINGWORTH (*Jour. Econ. Ent.*, 12 (1919), No. 6, pp. 455-457, pl. 1).—This is a description of a method devised by the author in North Queensland in the course of breeding work with two abundant species, namely, *Campsomeris tasmaniensis* and *C. formosus*.

A migrating army of millepedes, F. E. BROOKS (*Jour. Econ. Ent.*, 12 (1919), No. 6, pp. 462-464).—This paper relates to the migration of *Fontaria brunnea* and *F. virginicensis* in West Virginia.

FOODS—HUMAN NUTRITION.

The feeding of nations, E. H. STARLING (*London: Longmans, Green, & Co.*, 1919, pp. IX+146).—This book consists of the Oliver-Sharpey lectures delivered at the Royal College of Physicians, London, on June 3 and 5, 1919, on the general principles which must be followed in any successful attempt to secure an equitable division of the entire food resources of a nation among the individuals belonging to that nation.

Following an historical review of the method of attacking this problem in Germany at the beginning of the war, in England by the Physiological War Committee of the Royal Society and various Government agencies, and for the allied nations by the Interallied Scientific Food Commission, the food problem in its broadest aspects is discussed "as it appeared to the Interallied Scientific Commission, and as it must present itself in the future to any Government which is charged with the responsibility of controlling the whole question of production, supply, and distribution of food to its armies, militant and industrial."

The subject matter includes a discussion of the methods involved in the calculation of the energy requirement in calories of the total population of a nation, the influence of a restricted food supply upon a nation, the limits within which the ordinarily accepted quantities of the various foodstuffs can be varied without detriment to health and efficiency, the different policies in regard to the provisions of food as illustrated by Germany and by the United Kingdom, and the policy adopted by the latter for the distribution of food.

Food for the family, M. H. HIGGINS, I. ALDERSON, and E. TAYLOR (*Tex. Agr. Col. Ext. Bul. B-53* (1920), pp. 44, fig. 1).—This bulletin consists of a series of lessons dealing in a definite sequence with the principles underlying the cooking of different types of food and with some of the more important problems of dietetics. The lessons, which are designed to serve as programs for women's clubs, contain references to Farmers' Bulletins and U. S. Food Leaflets, suggested outlines for papers to be prepared from these references, and brief notes and recipes bearing upon the particular subject of the lesson.

Increase or decrease in the average retail prices of staple foods in July, 1914, and February, 1920 (*Natl. Food Jour.* [London], 3 (1920), No. 50, pp. 31, 32).—This is a table giving the average retail prices of staple foods in Great Britain, France, Italy, Norway, Sweden, Denmark, Holland, Switzerland, the United States, Belgium, and Germany in July, 1914, and the prices in February, 1920, of the same foods calculated as percentage increases over the 1914 values.

Nutritive value of the proteins of the barley, oat, rye, and wheat kernels, T. B. OSBORNE and L. B. MENDEL (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 275-303, figs. 13).—The comparative nutritive values of the proteins of barley, oats, rye, and wheat have been determined by a series of experiments in which growing rats were fed the finely-ground seed mixed with 3 per cent of a suit-

able salt mixture, 5 per cent of butter fat, and, where necessary, enough corn starch to make the total protein of the ration approximately 5, 8, and 10 per cent. The growth results obtained were calculated in gains in body weight per gram of protein eaten according to the method previously noted (E. S. R., 40, p. 765), beginning at a body weight of from 70 to 80 gm. and including the subsequent first 4 weeks, and also the first 10 weeks.

With all of the cereal grains used, poor growth resulted at the 5 per cent protein level, but satisfactory growth at the 8 and 10 per cent level with the exception of the rye. With this cereal satisfactory growth was obtained for a few weeks at the 8 and 10 per cent levels, after which nearly all the rats declined and died from some unknown cause.

The growth results obtained for the first 4 weeks showed a slight advantage for the barley proteins over the other three, but this was scarcely apparent over the longer period, thus indicating comparative equality. The data also indicate that the efficiency of the cereal proteins is somewhat less than that of lactalbumin and casein. This is thought to emphasize the advantage of the addition of more efficient supplementary protein to the cereal protein, as has been pointed out elsewhere (E. S. R., 41, p. 261). The efficiency of the proteins of the whole cereals was found to be much higher than that of wheat endosperm.

It is pointed out that the unexpected availability for growth of the proteins of these whole cereals is in harmony with the recent findings of Sherman and his collaborators with regard to the efficiency of oat and maize proteins (E. S. R., 41, p. 763).

Studies in nutrition, II, III (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 379-399, figs. 8).—In continuation of the nutrition investigation previously noted (E. S. R., 41, p. 262), two papers are presented.

II. *The rôle of cystin in nutrition as exemplified by nutrition experiments with the proteins of the navy bean, Phaseolus vulgaris*, C. O. Johns and A. J. Finks (pp. 379-389).—In this paper the literature on the nutritive value of phaseolin is reviewed, and an investigation of the cause of its failure to promote growth is reported.

From data obtained by the authors at the Bureau of Chemistry, U. S. Department of Agriculture, and hitherto unpublished data contributed by Osborne and Mendel, the conclusion is drawn that the failure of phaseolin to promote growth is due partly to its low content of cystin, and partly to some as yet unexplained factor, possibly a toxin, associated with the material in its raw state. By boiling the phaseolin with water and adding 2 per cent of cystin, the resulting material furnished adequate protein for normal growth in young rats. Similarly cooked navy bean meal supplemented with cystin proved much more efficient than the raw meal without the cystin.

III. *The nutritive value of commercial corn gluten meal*, C. O. Johns, A. J. Finks, and M. B. Paul (pp. 391-399).—The purpose of the experiments reported in this paper was to determine the nutritive value of commercial gluten meal, and to find some cheap concentrate to supplement the deficiencies in lysin and tryptophan of the zein composing about one-half of the proteins of the gluten meal.

A diet containing 53 per cent of gluten meal, equivalent to 19.4 per cent of protein, together with a suitable salt mixture, starch, butter fat, and lard, proved to be inadequate for the growth of young rats, but by the addition of 3 per cent of dried brewers' yeast satisfactory growth was obtained, indicating that the corn gluten contains a mixture of proteins adequate for normal growth if taken in sufficient quantity.

Rats fed on a diet in which the sole protein and the water-soluble vitamin were furnished by 25 per cent of corn gluten (equivalent to 9 per cent of protein) and 25 per cent of coconut press cake (equivalent to 5 per cent of protein) grew normally. Good results were also obtained with 30 per cent of corn gluten and 31 per cent of coconut press cake. "Hence, it seems practical and economical to supplement gluten meal with coconut press cake, both for the purpose of supplementing the proteins of gluten meal and adding the water-soluble vitamin which gluten meal lacks."

Is fat indispensable for well being? (*Jour. Amer. Med. Assoc.*, 74 (1920), No. 11, pp. 737, 738).—This is an editorial discussion based primarily upon the report of Hindhede regarding the effects of food restrictions in Denmark during the war (*E. S. R.*, 42, p. 459). It is suggested that the success of the ration used in Denmark, which did not make special provision for fat, points to the possibility that fat may not be an indispensable constituent of the diet, and that the seeming necessity for it may be due to the fat-soluble vitamin. The Danish ration, which was preponderatingly vegetarian and contained large amounts of bran, probably supplied sufficient amounts of this vitamin.

The direct replacement of glycerol in fats by higher polyhydric alcohols, I, II (*Biochem. Jour.*, 13 (1919), No. 3, pp. 296-305).—Two papers are presented.

I. *The interaction of olein and stearin with mannitol*, A. Lapworth and L. K. Pearson (pp. 296-300).—With a view to obtaining glycerol from fats by a process which would leave the by-products of the reaction in a form suitable for edible purposes, olive oil was distilled under reduced pressure with the polyhydric alcohol mannitol in the presence of sodium ethoxid as a catalyst. Similar experiments were also performed with stearin in place of olive oil.

In both cases nearly the whole of the glycerol present in the original fat was recovered in the distillate, the maximum yield of glycerol being reached when the proportion of fat to mannitol corresponded with two molecules of fat to three of mannitol. The other products were water with a little alcohol and a substance resembling in many respects the original fat. A study of the percentage composition of the purified fat has led to the conclusion that it consists mainly of the dioleates and distearates, respectively, of mannitan and isomannid, although direct evidence has not been obtained of the presence of mannitan and isomannid residues in either product.

II. *The value of synthetic mannitol olive oil as a food*, W. D. Halliburton, J. C. Drummond, and R. K. Cannan (pp. 301-305).—This paper presents the results of an investigation of the digestibility and nutritive value of the mannitol oil noted above. The oil is described as having a light greenish-brown color and a taste and odor reminiscent of but less pleasant than that of olive oil. The iodine number of the oil was 82.4 and the saponification number 159, and it contained 4 per cent of free fatty acids calculated as oleic acid.

In the first feeding experiments nearly mature rats were used, and all of the fat of the diet was supplied by the mannitol oil. On this ration the rats tended to lose weight, and the food consumption was not good. In all cases, however, the absorption of the oil was good, as shown by a percentage utilization of 95.8 as compared with 96.6 for olive oil and 97.8 for butter fat and olive oil. Young rats on a diet in which the fat was supplied by a mixture of mannitol oil and butter did not grow quite so well as those fed olive oil and butter, but were in as satisfactory a condition at the end of the experiment. This is thought to indicate that there was no toxic factor present in the oil, but that it was slightly less palatable than the olive oil.

Effects of feeding with calcium salts on the calcium content of the blood, W. DENIS and A. S. MINOT (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 357-361).—The possibility of increasing the concentration of calcium in the blood by ingestion of calcium salts was studied on 5 human subjects and on cats and rabbits. In the human subjects the ingestion thrice daily of 2 gm. of calcium lactate did not alter the calcium content of the blood plasma. In cats and rabbits, when the initial calcium concentration was low, it was sometimes possible to increase greatly the amount of calcium in the plasma by feeding calcium lactate.

The occurrence of zinc (and copper) in human organs and excretions and in food materials, E. ROST and A. WEITZEL (*Arb. Reichsgsundhtsamt.*, 51 (1919), No. 3, pp. 494-520).—Determinations by the method noted on page 710 of this issue are reported of the content of zinc in feces, urine, various organs, and tissues of man and of animals, and in food materials. The copper content of the same materials was also determined in a number of cases.

The maximum zinc content of various foods, arranged in order of decreasing magnitude in milligrams of zinc per kilogram of food material, is reported as follows: Liver 339, meat 50.4, dark bread 7.8, brain 6, cow's blood 5.6, and potatoes 2.3 mg. Goat's and cow's milk, milked into glass receptacles, was found to contain from 2.3 to 3.9 mg. zinc per liter, and market milk no larger amounts. The storage of food material in zinc-containing receptacles did not appear to increase their zinc content.

In the organs of human bodies zinc was found to the extent of 145.5 mg. per kilogram in the liver, 51.5 mg. in the muscles, and 12.5 in the brain. The amount of zinc found in human feces varied from 2.7 to 18.9 mg. per day, as much as 39.3 mg. being occasionally found. Slight traces only of zinc were found in the urine.

The addition of zinc-containing beef liver to the diet of persons excreting normal amounts of zinc did not greatly increase the output of zinc in feces or urine, thus indicating that the greater part of the zinc must have been absorbed by the body. Small amounts of copper were regularly found in the food materials and organs containing zinc.

The conclusion is drawn that zinc can no longer be considered as of accidental occurrence in the human body, but on the contrary is one of its normal constituents. A list of 30 references to the literature is appended.

The function of vitamins in the metabolism of *Sclerotinia cinerea*, J. J. WILLAMAN (*Jour. Amer. Chem. Soc.*, 42 (1920), No. 3, pp. 549-585, figs. 8).—This contribution from the Minnesota Experiment Station consists of an extensive study of the vitamin requirements of *S. cinerea*, the brown rot fungus of peaches and plums. In connection with this study the existing literature on vitamins has been reviewed and discussed.

The author defines vitamins as follows: "Vitamins constitute a class of substances, the individuals of which are necessary for the normal metabolism of certain living organisms, but which do not contribute to the mineral, nitrogen, or energy factors of the nutrition of those organisms." It is pointed out that this definition does not assign any specific function to the vitamins, does not limit them to either plant or animal organisms, does not imply anything as to the nature, properties, composition, or number of the vitamins, and does not claim that a given metabolic activity will not take place at all in the absence of the vitamins but only that it will not take place normally.

It was found that while *S. cinerea* can not grow on a medium composed of sucrose, salts, and asparagin, it grows readily on such a medium when small amounts of plant decoctions, particularly of the fruits of plums and peaches,

are added. The factor furnished by such decoctions was found to be of the nature of a vitamin.

By adsorption on fuller's earth vitamin preparations were made from a large number of plant and animal materials, including the leaves and buds of plants, seeds, seed sprouts, tuber sprouts, rice polish, sporophores and mycelia of fungi, the mycelium of *Sclerotinia* itself, pollen of maize, fruit juices, wort, autolyzed yeast, milk, and pancreatin. All of these preparations promoted growth in the *Sclerotinia*, and a few promoted reproduction as well. The amount of reproduction in any given case was not necessarily proportional to the amount of vegetation. The materials which brought about the highest degree of reproduction were pollen, fungus, sporophores, yeast, peach juice, and the terminal buds of *Phaseolus multiflorus*.

These results are discussed on the hypotheses (1) that two vitamins are involved, and (2) that only one vitamin is concerned. While considerable evidence in support of the first hypothesis is advanced, the author considers the hypothesis of the existence of a single vitamin for *Sclerotinia* to be more plausible.

"It is very probable that reproduction in *Sclerotinia* is simply a different manifestation of the same activities as characterize vegetation. The single activity that is apparently most dependent on a vitamin supply is respiration. Respiration is common to all the materials which have yielded the vitamin; and the degree of metabolic, and hence respiratory, activity in these materials is proportional to the activity of the vitamin prepared from them. Thus the evidence is accumulating in favor of the view that there is a close connection between respiration in a cell and its vitamin content, and also its vitamin requirement. Just which cells in the plant world can synthesize this vitamin is still an open question. The *Sclerotinia* vitamin is possibly identical with the water-soluble B of the higher animals; and since the latter can not synthesize this vitamin, it becomes an important point to know which plant organs can."

Nutritive factors in plant tissues.—III, Further observation on the distribution of water-soluble vitamin. T. B. OSBORNE and L. B. MENDEL (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 451-468, figs. 10).—In continuation of the studies previously noted (E. S. R., 41, p. 762), the examination by the same methods is reported of the water-soluble vitamin content of alfalfa, cabbage, clover, spinach, and timothy dried as previously described; of beet, carrot, and turnip root washed, cut into thin slices, air dried at 50 to 60° C., and ground; of commercially canned tomatoes dried at 60 to 70° and ground; and of whole and pared potatoes and potato peel boiled and dried at 60 to 70°. The experiment with each dried food extended over eight weeks, starting with healthy growing rats weighing about 90 gm. each. The daily doses of the dried food consisted in most cases of 1 and 0.5 gm. portions with occasionally 0.2 and 2 gm. doses.

The results as indicated by the growth charts may be summarized as follows: Alfalfa and clover proved richest in the water-soluble vitamin, better results being secured with 1 gm. doses than have ever been obtained in the same laboratory with 16 cc. of milk as the source of the water-soluble vitamin. Timothy hay did not prove a satisfactory source of the vitamin. With tomatoes 1 gm. doses promoted very good growth, and amounts as low as 0.2 gm. limited growth or at least maintenance. Spinach, cabbage, turnip, and carrot proved less potent than tomato, 1 gm. doses being about equivalent to 0.5 gm. of the dried tomato. The beet root did not equal the other roots tested, a result in harmony with the observations of Steenbock and Gross (E. S. R., 42, p. 460). The potato was as rich in water-soluble vitamin as some of the roots. Potato peel showed

no advantage over the rest of the potato, and new potatoes no marked superiority to old.

It is pointed out that, inasmuch as the daily allowance of water-soluble vitamin was fixed while the food intake varied, the ratio of the dried product to the total food varied in the different experiments. When 1 gm. portions of the dried product were used these ranged from 10 per cent or less of the food intake in the animals which grew best to 15 per cent or more at the other extreme of the series, while in the 5 gm. experiments the content of plant food in relation to the total food ranged from 5 to 9 per cent.

Experiments on the utilization of the calcium of carrots by man, M. S. ROSE (*Jour. Biol. Chem.*, 41 (1920), No. 3, pp. 349-355).—The extent of utilization of the calcium of carrots by the human body was determined by digestion experiments carried out on four young women, the calcium balance being determined for a period in which the calcium intake, supplied by freshly boiled carrots, was close to the estimated minimum for equilibrium.

"In all cases but one there was a positive calcium balance on the carrot diet, and in this case the loss was small. When approximately 55 per cent of the calcium was derived from carrots, one subject had practically the same retention as on a diet in which 70 per cent of the calcium was derived from milk. It seems possible, therefore, to meet the requirement of the adult human organism for calcium largely, if not wholly, from carrots."

It is pointed out that these results are strikingly different from those obtained by McClugage and Mendel (*E. S. R.*, 39, p. 876) with dogs, their experiments indicating that calcium is poorly utilized when derived from carrots.

Relative antiscorbutic value of fresh, dried, and heated cow's milk, R. E. BARNES and E. M. HUME (*Biochem. Jour.*, 13 (1919), No. 3, pp. 306-328, figs. 3).—This is the complete report of an investigation the results of which have been previously noted from another source (*E. S. R.*, 42, p. 162).

The antiscorbutic property of dehydrated meat, M. H. GIVENS and H. B. McCLUGAGE (*Science, n. ser.*, 51 (1920), No. 1315, pp. 273-275, fig. 1).—The literature on the antiscorbutic properties of meat is reviewed, and experiments are reported in which meat dehydrated by the vacuum process described by Falk et al. (*E. S. R.*, 41, p. 807) and subsequently air-dried for several days was used as the only source of antiscorbutic vitamin in feeding experiments with guinea pigs. The dried meat was fed both uncooked and cooked for 15 minutes at 100° C., about 1.5 gm., representing approximately 15 per cent of the total solids ingested, being eaten daily by each guinea pig. In no case did the meat afford any protection against scurvy.

It is pointed out that these findings are in accord with those in the literature reviewed with the exception of the results of Pitz (*E. S. R.*, 40, p. 272), which indicated that dried meat to the extent of 10 per cent of the diet delayed the onset of scurvy and prolonged the life of the animals. The authors agree with Dutcher and associates (*E. S. R.*, 41, p. 861) that the favorable results obtained by Pitz were due to the amount of milk consumed by the guinea pigs and not to antiscorbutic properties in the meat.

Edema as a symptom in so-called food-deficiency diseases, A. D. BIGLAND (*Lancet [London]*, 1920, I, No. 5, pp. 243-247).—The author has attempted to correlate various epidemics of edema or dropsy with a view to determining a common etiological factor. The epidemics discussed include an outbreak of edema occurring in Turkish prisoners of war in Egypt in 1916, edema in Europe during the recent war, epidemic dropsy occurring in India at various times, ship beriberi and scurvy, and an outbreak of edema in East Africa.

A discussion of possible causative factors and of the mechanism of edema production has led the author to conclude that "epidemic dropsy is a condition due to affection of the suprarenal glands as a result of inanition arising from starvation, complete or partial. It may be that the suprarenals hypertrophy at the expense of the other endocrine organs and by their increased function give rise to dropsy. Possibly, also, this hyperactivity may in time give place to a suprarenal insufficiency as exophthalmic goiter gives place to myxedema. This second condition may be pellagra. Whatever the true explanation may be, it is extremely probable that food deficiency, together with disordered function of certain endocrine organs, plays a large part in the causation of epidemic dropsy and pellagra."

A list of 22 references to the literature is appended.

Pellagra, H. F. HARRIS (*New York: The Macmillan Co., 1919, pp. X+421, pls. 7*).—This monograph contains a very complete résumé and discussion of foreign literature on pellagra, together with brief references to some of the investigations on this subject in the United States. The subject matter is treated under the following chapter headings: Synonyms and history and brief résumé of more important early papers, causation, pathological anatomy, symptomatology, diagnosis, prognosis, prophylaxis, treatment, and relationship of pellagra to life insurance.

An appendix contains a paper on "Run-out" Condition, Poor Germination, and Rotting of Indian Corn, by P. O. Vanatter, and copies of the Austrian and Italian laws on bad maize and pellagra. An extensive bibliography and a series of illustrative plates are included.

In the chapter on causation of pellagra, the author offers the following tentative explanation of the etiology of the disease:

"Pellagra is an extremely chronic endemic affection of temperate and sub-tropical countries, i. e., where Indian corn is grown and much eaten. While the malady has been generally thought in the past to be the consequence of inanition, the result of an inadequate diet, it has been more recently regarded as the effect of the habitual consumption of Indian corn, and possibly in rare instances of eating other starchy foods that have been acted upon by low vegetable forms; if this theory should be found to be correct the disease is probably more directly the result of the action of certain phenol poisons, produced by molds while growing in these cereals, and possibly of albuminous and ferment toxins contained in sound maize, all of which together, acting from one generation to another, and not unlikely intensified by bad hygienic conditions and insufficient and imperfect food, ultimately culminate in a frank outbreak of the classical symptoms of this disease. Finally, it can not be too strongly urged that the malady is probably always hereditary, no person ever in his lifetime eating enough maize to produce the disease."

Botulism (*Pub. Health Rpts. [U. S.], 35 (1920), No. 7, pp. 327-330*).—This article describes the protective measures taken by the Bureau of Chemistry, U. S. Department of Agriculture, in regard to botulism from ripe olives. The batches of olives found responsible for the recent outbreaks of botulism (E. S. R., 42, p. 261) have been removed from the market, and an investigation of the olive-packing plants in California has been conducted. This has shown that the process of sterilization employed in the case of olives packed in glass is usually inadequate. The jars are usually heated for about one-half hour at the temperature of boiling water, a temperature too low to kill the botulinus bacilli present in the olives.

According to these investigations "it would appear that the public may protect itself by refraining for the present from the consumption of ripe olives

packed in glass. As a further measure of precaution, no food of any description showing even the slightest unnatural odor, unnatural color, swelling of the container, signs of gas, or any evidence of decomposition whatever should be used for food purposes. In practically every case of botulism the food was shown to have had an offensive or abnormal odor. While all spoiled food may not contain *Bacillus botulinus*, any spoiled food, even though the spoilage be slight, may contain it, and, in view of the fatal effect of very small amounts of the toxin which this organism generates, the only safe rule is to examine carefully all food products before they are served and to discard those which are even slightly suspicious."

ANIMAL PRODUCTION.

Studies of heredity in rabbits, rats, and mice [I-III], W. E. CASTLE (*Carnegie Inst. Wash. Pub. 288 (1919), pp. 56, pls. 3, figs. 5*).—The following three papers are presented. Page references cover only the descriptive text as the tabular matter is segregated in an appendix.

I. *Further experiments upon the modifiability of the hooded character of rats* (pp. 1-3).—The continuation of selection experiments with piebald rats (E. S. R., 39, p. 377) is reported. Because of the results secured when the selected individuals were crossed with wild rats, the author withdraws his previous contention that genes can be modified by selection. The wild race, "when its residual heredity is made fully effective by repeated crosses, brings both the plus-selected and the minus-selected hooded lines to a phenotype of common grade."

II. *The inheritance of white-spotting in rabbits, with special reference to gametic contamination* (pp. 4-28).—The author reports breeding experiments with rabbits involving a study of the amount of spotting shown by descendants of matings between self and Dutch pattern rabbits and between self and English pattern. The Dutch pattern is recessive to self, and occurs in several typical varieties which were found to form with self a set of at least four multiple allelomorphs. The English pattern was found to be the heterozygous expression of a dominant white-spotting.

III. *Observations on the occurrence of linkage in rats and mice* (pp. 29-36).—In breeding experiments with rats in which nearly 5,000 young were secured, a crossover percentage of 18 was observed between the allelomorphs for pink-eyed yellow and red-eyed yellow. Crossing over seemed to occur with equal facility in both sexes. Albinism was found to be completely linked to red-eye, and to be as closely linked to pink-eye as pink-eye is to red-eye.

In mice pink-eye and albinism were found to be partially linked, the percentage of crossovers being about 14.

Linkage in rats, H. L. IBSEN (*Amer. Nat.*, 54 (1920), No. 630, pp. 61-67).—The author presents results of breeding experiments with rats at the Wisconsin Experiment Station and reports lack of linkage (1) between the red-eye allelomorphs and the self-Irish-hooded set of allelomorphs, (2) between red-eye and agouti, and (3) between agouti and self. Since red-eye was shown by Castle (E. S. R., 39, p. 877) to be linked both to pink-eye and to the set of allelomorphs comprising intense pigmentation, nonyellow, and albinism, the author's data indicate that the five known sets of allelomorphs concerned with coat color in rats belong in three linkage groups.

The conclusion of Castle (noted above) that red-eye is completely linked with albinism is also confirmed.

Anomalous ratios in a family of yellow mice suggesting linkage between the genes for yellow and for black, L. C. DUNN (*Amer. Nat.*, 53 (1919), No.

629, pp. 558-560).—A limited amount of data is presented, but sufficient in the author's opinion to indicate some linkage between yellow and black in mice.

Genetic studies in rabbits.—I, **On the inheritance of weight**, R. C. PUNNETT and P. G. BAILEY (*Jour. Genetics*, 8 (1918), No. 1, pp. 1-25, figs. 12).—The authors record some data as to the body weights and rates of growth of F_1 and F_2 individuals from two rabbit crosses, (1) between the Flemish, one of the heaviest breeds, and a small-sized mixed strain, and (2) between Flemish and Polish, the latter the lightest-weight breed known. Only tentative conclusions are drawn, but it is suggested that "early maturity may depend upon some factor or factors independent of size, though probably a larger rabbit would mature later than a smaller one where both were similarly constituted with regard to the specific genetic factors upon which onset of maturity depended."

Color inheritance in cats, with special reference to the colors black, yellow, and tortoise-shell, C. C. LITTLE (*Jour. Genetics*, 8 (1919), No. 4, pp. 279-290).—This paper is a critical analysis of proposed solutions of the problem of the inheritance of tortoise-shell and related colors in cats. The author follows Whiting (E. S. R., 42, p. 376) in regarding yellow (Y) as a sex-linked dominant to black (y). Tortoise-shell females are considered heterozygous for Y. The anomalous occurrence of black females from the matings yellow $\delta \times$ black η and yellow $\delta \times$ tortoise-shell η and of tortoise-shell females and black males from matings of yellow \times yellow are explained by a new hypothesis, viz, that some (perhaps 50 per cent) of the Y genes in certain yellow individuals are transformed into y 's. The occurrence of tortoise-shell males, which as Wright pointed out (E. S. R., 40, p. 869) is a much rarer event, is considered an entirely distinct phenomenon and capable of explanation as a case of non-disjunction (E. S. R., 35, p. 272).

Inheritance of white-spotting and other color characters in cats, P. W. WHITING (*Amer. Nat.*, 53 (1919), No. 629, pp. 473-482).—The author reports a continuation of work previously noted (E. S. R., 42, p. 376), and includes a general summary of known facts about inheritance of coat color in cats.

A note on the fate of individuals homozygous for certain color factors in mice, C. C. LITTLE (*Amer. Nat.*, 53 (1919), No. 625, pp. 185-187).—The author examined 16 gravid uteri of yellow female mice that had been mated to yellow males and found 91 normal and 21 (18.7 per cent) degenerating embryos, thus confirming the observations of Ibsen and Steigleder (E. S. R., 38, p. 573) that in such matings a high proportion of the embryos die in utero. In 2 matings of yellow $\delta \times$ nonyellow η and 3 of nonyellow $\delta \times$ yellow η there was a total of 35 normal embryos and one "small apparently embryonic mass" interpreted as a possible degenerating embryo.

It is also noted that similar degenerating embryos (27.2 per cent out of a total of 22) were found in matings of black-eyed white \times black-eyed white mice. The author had previously found that the black-eyed white character resembles yellow in that homozygotes have not been found (E. S. R., 40, p. 275).

The fate of homozygous yellow mice, W. B. KIRKHAM (*Jour. Expt. Zool.*, 28 (1919), No. 2, pp. 125-135, figs. 2).—A detailed report of work previously noted from a preliminary paper (E. S. R., 38, p. 573). It is stated that the albino mice used as controls were of a stock known by breeding tests not to carry yellow. Phagocytes were found to aid in the destruction of the abnormal blastulae shortly after their implantation.

Uterine, tubal and ovarian lysis and resorption of conceptuses, A. W. MEYER (*Biol. Bul. Mar. Biol. Lab. Woods Hole*, 36 (1919), No. 4, pp. 283-308, figs. 10).—The author calls attention to the retrogression of ova and early

conceptuses in various mammals reported by previous workers, including himself (E. S. R., 40, p. 663), describes some new cases found in collections of human embryological material, and discusses the possible enzymes concerned in the early degeneration and absorption of embryos.

Synthetic pink-eyed self white guinea pigs, H. L. IBSEN (*Amer. Nat.*, 53 (1919), No. 625, pp. 120-130, figs. 5).—In this paper from the Wisconsin Experiment Station the author records the formation, by a suitable combination of known hereditary characters, of a race of guinea pigs genetically not albino but having the appearance of extreme albinos, including the white ears hitherto unobtainable by fanciers except as an accident. The genetic factors concerned in the production of color in guinea pigs are described.

Tricolor inheritance.—IV, **The triple allelomorphic series in guinea pigs**, H. L. IBSEN (*Genetics*, 4 (1919), No. 6, pp. 597-606).—The author presents the evidence, promised in the first paper of this series (E. S. R., 35, p. 770), showing that the genes for complete extension, partial extension, and nonextension of black (or chocolate) pigment in the guinea pig form a set of multiple allelomorphs. The results of all the author's breeding experiments that bear on this matter are tabulated, over 4,100 guinea pigs being involved. A few aberrant ratios were secured, and some individuals when classified on the basis of external appearance seemed to be exceptions, but in all cases where such animals lived long enough to be subjected to a critical breeding test it was found that they belonged in the genotypic class called for by the hypothesis.

Inheritance of congenital palsy in guinea pigs, L. J. COLE and H. L. IBSEN (*Amer. Nat.*, 54 (1920), No. 631, pp. 130-151, figs. 3).—The inheritance of a neurosis in guinea pigs characterized by clonic spasms of the legs was studied, and found to be a simple Mendelian recessive to normality. The heterozygous animals were entirely normal in their reactions.

Studies on inheritance in pigeons.—III, **Description and linkage relations of two sex-linked characters**, L. J. COLE and F. J. KELLEY (*Genetics*, 4 (1919), No. 2, pp. 183-203).—This paper continues a series of reports on pigeon breeding at the Wisconsin Experiment Station (E. S. R., 33, p. 371). The factors dealt with are those for intensity of pigmentation, previously studied by Cole (E. S. R., 27, p. 573), and for a variously manifested color condition called for convenience dominant red. The latter character shows only in the presence of the factor for black, and is entirely distinct in appearance and inheritance from the recessive red of Cole's earlier report (E. S. R., 31, p. 572). Its identification is held to clear up confusion in the literature as to inheritance of red in pigeons. Nuttall (E. S. R., 40, p. 275) has discussed one aspect of this character but without recognizing its sex-linked transmission.

Intensity and dominant red were found to be only loosely linked to each other, the rather meager data (73 offspring from critical matings) indicating crossing over of 40 per cent in the male. Among the 988 offspring in the intensity matings and the 366 in the dominant red matings no aberrant cases occurred which could be attributed to failure of sex-linkage. The few recorded cases of such among doves (which Little discusses in the following paper) are examined and dismissed as probable mistakes in the breeders' records.

A marked excess of males was observed in some of the matings involving intensity, and a sex-linked lethal gene closely linked to the dilute gene is suggested as a possible explanation. It was also noted that newly-hatched squabs destined to show intense color are often more abundantly provided with down than are "dilute" squabs, and the possibility that this correlation might be due to another unidentified sex-linked factor is considered.

Alternative explanations for exceptional color classes in doves and canaries. C. C. LITTLE (*Amer. Nat.*, 54 (1920), No. 631, pp. 162-175).—The hypothesis of the altered gene developed by the author to explain the occurrence of aberrant color classes in cat breeding experiments (noted on p. 763) is invoked as an explanation of somewhat similar cases recorded for ring doves by Staples-Browne (*E. S. R.*, 28, p. 270) and by Strong (*E. S. R.*, 28, p. 270), and for canaries by Durham and Marryat (*E. S. R.*, 20, p. 1168). The change in these cases, however, would be from the recessive to the dominant allelomorph.

The developmental relations of brachydactyly in the domestic fowl. C. H. DANFORTH (*Amer. Jour. Anat.*, 25 (1919), No. 2, pp. 97-115, figs. 5).—The author describes the anatomical and embryological features of the shortened outer toe (digit IV) that commonly occurs in feather-legged chickens, and concludes on the basis of these observations and the results of the breeding experiments noted below that brachydactyly and feathering on the tarsi are manifestations of a single set of hereditary conditions. A preliminary report has been noted (*E. S. R.*, 42, p. 68).

When the outer toe is of normal proportions it is longer than the inner toe (digit II), and the author proposes as an index of brachydactyly the ratio of 100 times the length of digit IV to the length of digit II, an individual's index being the average of the indices of its two feet. In the brachydactyl individuals examined the index ranged from 100 (all five phalanges present, the fourth being somewhat reduced) to 70 (second, third, and fourth phalanges shortened and fused, fifth or terminal phalanx absent).

The condition was recognized with certainty in embryos on the tenth day of incubation. "The fact that brachydactyly is apparent at the time when cartilages are formed, if not actually before then, would seem to indicate that the reduction of the skeleton takes place in response to conditions already manifest in the toe, and not as a result of any factor acting specifically on cartilage or bone formation. In other words, the cartilage anlagen form while subjected to a kind of compression resulting from the shortening of the toe."

Since feather-legged pigeons are often web-footed as well as brachydactylous, it is suggested that syndactyly belongs in the same hereditary complex as the other two characters. The author's breeding experiments demonstrated that polydactyly is transmitted independently of brachydactyly in the fowl.

An hereditary complex in the domestic fowl. C. H. DANFORTH (*Genetics*, 4 (1919), No. 6, pp. 587-596, figs. 5).—The author presents the results of his studies on the inheritance of brachydactyly, ptilopody (a term proposed as a precise designation for booting or leg-feathering), and syndactyly in the domestic fowl, including some critical evidence, secured since the preceding paper was written, in support of the theory that these three characteristics are the product of a single factor or group of factors.

The experiments began with a booted brachydactyl male, one of whose parents was clean-legged and normal-toed. His offspring from White Leghorn females were crossed with Black Minorcas and also mated inter se. The Leghorns and Minorcas were all normal-toed and clean-legged. Records of over 550 descendants of the original booted specimen were secured.

The back crosses of brachydactyl ptilopod F₁'s on normal-toed aptilopod birds produced 255 normal-toed aptilopod chicks, 138 brachydactyl ptilopod, 40 brachydactyl aptilopod, and 8 normal-toed ptilopod. That the latter two classes were not crossover classes produced by partial linkage between two distinct factors, one for brachydactyly and the other for ptilopody, is shown by the fact that similar arrays were secured where either normal-toed ptilopod or short-toed aptilopod individuals were mated to Minorcas. Four web-footed

offspring were also produced in the course of the experiments, although none of the breeding stock was syndactyl. Since syndactyly is normally a dominant trait in poultry, and since in each case one parent at least was brachydactyl or ptilopod, syndactyly is included provisionally in the hereditary complex.

The theory of the interchangeability of these characters is used to explain aberrant results obtained by Davenport (E. S. R., 23, p. 75) and Punnett and Bailey (E. S. R., 41, p. 472). The author holds that the ptilopod condition consists primarily of modifications in size, form, and distribution of the scales on the tarsi. "In its mildest manifestation only the scales are involved. In slightly more pronounced instances there appears in addition a modified quill or rudimentary feather, generally on the basal phalanx of the fourth toe. Further intensities of manifestation may be traced through the ten stages recognized by Davenport." Adoption of this view would necessitate the revision of much past work on the inheritance of booting.

It is pointed out that differences in the time at which a disturbing factor becomes effective in embryonic life would explain the variable manifestations of the three characters in question. Coming into play on the seventh or eighth day of incubation it might produce permanent webbing since all chicks are web-footed at this stage; two days later the critical period for syndactyly might be passed, but the cartilages of the toe would be in their formative stage and might be susceptible to change; and finally by the twelfth day, although too late for changes in toe proportions, the disturbing conditions might still be able to modify the scales and feather germs.

Evidence that germ cells are subject to selection on the basis of their genetic potentialities, C. H. DANFORTH (*Jour. Expt. Zool.*, 28 (1919), No. 3, pp. 385-412).—The heterozygous brachydactyl birds used as breeders in four of the experiments noted above were exposed to alcohol (inhalation method) two hours or more daily for six weeks to two months following (in one experiment preceding) the period in which the data on "normal" inheritance were collected. The latter data furnished a complete control, as the unalcoholized mates were the same in both cases.

The purpose was to determine whether alcohol treatment would alter the relative proportions of gametes produced by heterozygotes. Since the alcoholized individuals in three experiments were also heterozygous for white color and for polydactyly, it was possible to study the distribution of color and extra toes in addition to brachydactyly. The main results are given in the subjoined table. In experiment 4 the alcoholized subjects were hens; in the other experiments cocks.

Distribution of characters among offspring of alcoholized and normal fowl heterozygous for brachydactyly, polydactyly, and white color, when mated to triple recessives.

Stock.	Number of offspring.	Brachydactyl.					Polydactyl.				White.
		Expt. 1.	Expt. 2.	Expt. 3.	Expt. 4.	Total.	Expt. 1.	Expt. 2.	Expt. 3.	Total.	Total.
Alcoholized.	386	<i>P. ct.</i> 46.7	<i>P. ct.</i> 43.3	<i>P. ct.</i> 53.6	<i>P. ct.</i> 56.3	<i>P. ct.</i> 48.2	<i>P. ct.</i> 29.4	<i>P. ct.</i> 37.9	<i>P. ct.</i> 52.0	<i>P. ct.</i> 36.0	<i>P. ct.</i> 52.7
Control.....	520	39.2	35.1	42.7	38.4	39.0	33.2	39.0	40.1	36.0	53.9

It is concluded that the alcohol treatment had no influence on the distribution of color, a possible tendency (in view of experiment 3 where the treat-

ment was unusually severe) to increase the proportion of polydactyl individuals, and a distinct tendency to increase brachydactyly.

On the physiological properties of the gonads as controllers of somatic and psychical characteristics, I, II, C. R. MOORE (*Jour. Expt. Zool.*, 28 (1919), Nos. 2, pp. 137-160, figs. 5; 3, pp. 459-467, fig. 1).—These two papers are the first of a contemplated series dealing with the effects on rats, guinea pigs, and perhaps other forms of such operations as the removal of gonads and the implantation of germinal tissue from the opposite sex. The experiments were intended in part to duplicate those of Steinach (*E. S. R.*, 27, p. 275; 28, p. 173).

I. *The rat.*—Observations are reported on a single litter of white rats composed of 4 males and 5 females. The gonads were completely removed from 3 males and 3 females at the age of 25 to 35 days, and pieces of ovary from the females were implanted in the abdominal musculature of the castrated males. Pieces of testis were inserted similarly in the spayed females.

There were no differences in body development between the animals operated on and the normal controls that the author is willing to attribute to the transplantations, but Steinach's conclusion that the experimental subjects tend to assume the instincts and behavior of the sex furnishing the transplant was confirmed. Histological examinations indicated that the ovarian grafts remained functional, but the implanted testicular tissue underwent marked degeneration, the seminiferous tubules being more or less isolated and consisting only of large irregular cells, interpreted as Sertoli cells, with no trace of spermatozoa.

II. *Growth of gonadectomized male and female rats.*—The gonads were removed from 18 male and 22 female white rats at ages varying from 23 to 51 days. The castrated males of a given litter in all cases became heavier than their spayed sisters, and the author concludes that the similar weight difference found in normal rats is due to a specific sex difference and not to the secondary influence of the sex glands.

The relation between the number of chromosomes of a species and the rate of elimination of mongrel blood by the pure-sire method, H. H. LAUGHLIN (*Proc. Soc. Expt. Biol. and Med.*, 16 (1919), No. 8, pp. 132-134).—Given a 24-chromosome species in which no exchange of segments (crossing-over) between homologous chromosomes occurs, the probabilities are computed that 1, 2, . . . , 10 top-crosses with pure bred sires will eliminate all or all but one of the chromosomes of the original unimproved stock. After 5 generations the grades are essentially "pure" for chromosomes, and further grading up is considered to be of no practical use, granting the initial assumptions.

Analysis of the effects of selection, A. H. STURTEVANT (*Carnegie Inst. Wash. Pub.* 264 (1918), pp. 68, pl. 1, figs. 14).—The author reports experiments with an inbred stock of *Drosophila melanogaster* (of the mutant race called dichæt), which manifested variability in the number of thoracic bristles. Strains were developed by selection having both increased and decreased numbers of bristles, but this apparent success of selection is attributed to the presence of modifying factors some of which were made evident by their linkage relations with known factors.

Following the report of experimental work there is a rather extended discussion of cases cited in the literature as examples of contamination of allelomorphs and factor variability. It is concluded that "modification of factors by selection, crossing, fractionation, or similar means is undemonstrated in any given case, and has been shown not to occur in other cases that are typical of the results usually obtained."

Parthenogenesis and crossing-over in the grouse locust *Apotettix*, R. K. NABOURS (*Amer. Nat.*, 53 (1919), No. 625, pp. 131-142).—In extending his breeding experiments with Orthoptera at the Kansas Experiment Station (E. S. R., 40, p. 367) to other genera of grouse locusts, the author found that females of at least one species of *Apotettix* are capable of laying either parthenogenetic or fertilized eggs, the former developing only into females. The parthenogenetic offspring of females heterozygous for several hereditary factors determining pattern were not of a uniform type, but showed various different pattern combinations in proportions which are believed to indicate normal segregation and crossing-over. The chromosomal relations have not been worked out completely as yet, but some evidence was found that the parthenogenetically produced female has fewer than the diploid number of chromosomes.

The author also cites data believed to indicate a certain amount of crossing-over in the male *Apotettix*.

On the part which the lime in the shell of the hen's egg takes in the formation of the chick's skeleton during incubation, C. DELEZENNE and E. FOURNEAU (*Ann. Inst. Pasteur*, 32 (1918), No. 9 pp. 413-429, fig. 1).—In a study of 50 fertile eggs (mostly from hens of the Faverolle breed) opened at various stages of incubation, the authors found that the calcium oxid content of the interior (white, yolk, and embryo combined) remained about 0.06 per cent of the initial egg weight during the first 10 days of incubation (i. e., before the beginning of skeleton formation), and thereafter increased rapidly, particularly after the sixteenth day, reaching 0.34 per cent at hatching. Similar increases were shown by eggs of the pea fowl and the duck examined at the beginning and the end of incubation. Two infertile hen's eggs incubated 14 and 21 days, and 2 eggs held 34 days without incubation, were the same as fresh eggs with respect to calcium content. The phosphorus (P_2O_5) content, recorded for 11 eggs, showed at least no increase and perhaps a slight decrease toward the end of incubation.

It is suggested that the lime of the shell is dissolved in some constituent of the amniotic fluid and passes through the vitellin membrane to supply the embryo with the calcium necessary for the skeleton.

See also the earlier researches of Carpioux (E. S. R., 20, p. 472), which the authors do not include in their literature review.

On the bacterial and catalase content of hens' eggs, W. RULLMANN (*Centbl. Bakt. [etc.]*, 2. Abt., 45 (1916), No. 6-12, pp. 219-230).—The author made observations on 21 eggs and found as much catalase present in newly laid eggs as in older eggs that had not decomposed and were still practically sterile. In general, slightly less catalase occurred in the yolk than in the white.

The colors of colloids.—VII, Blue feathers, W. D. BANCROFT (*Jour. Phys. Chem.*, 23 (1919), No. 6, pp. 365-414).—This paper consists mostly of extensive quotations from the publications of H. Gadow, V. Haecker, M. I. Newbigin, R. M. Strong, and other naturalists who have discussed the optical properties of feather structure, together with a table summarizing Lord Rayleigh's researches on the amount of light of different wave lengths reflected by blue feathers.

It is concluded that blue color in feathers is generally due to the presence of minute air bubbles in a colorless medium, and that the addition of a yellow pigment produces a structural green. It is pointed out, however, that failure to isolate a blue pigment from feathers does not prove that blue color may not in some cases be due to a pigment having a blue surface color but showing some other color on extraction.

Forage substitutes, A. LHOSTE (*Les Succédanés des Fourrages*. Paris: J. B. Baillière & Sons, 1918, pp. 96).—The author discusses the feeding value of a large number of little-used plant products and waste materials (algae, leaves, twigs, heather, prickly broom, reeds, horse chestnuts, acorns, pomace, spoiled fruits, sugar beet tops, sugar beet pulp, potato pulp, walnut, rape, and olive-residue after oil extraction, legume pods, corn stalks, dried blood, by-products of tanning industry, etc.), citing the known or probable chemical composition of each and using good meadow hay as the basis of comparison.

Commercial feeding stuffs, quarterly report, April 1 to June 30, 1919, E. G. PROULX ET AL. (*Indiana Sta. Bul. 231 (1919)*, pp. 3-219).—This bulletin tabulates the chemical and microscopic analyses of 819 samples of feeding stuffs collected during the second quarter of 1919, including alfalfa meal, tankage, meat scrap, corn feed meal, corn germ meal, hominy feed, cottonseed meal, cottonseed hulls, linseed meal, wheat bran, wheat middlings, red dog, oat flour, oat middlings, rye middlings, rye red dog, velvet bean feed, and a variety of proprietary mixed, calf, and poultry feeds. There is also a list of the brands on sale in the State, together with the manufacturer's guaranty as to the composition of each.

Inspection of commercial feeding stuffs, T. O. SMITH (*New Hampshire Sta. Bul. 191 (1919)*, pp. 42).—The proximate composition is recorded of samples of alfalfa meal, barley feed, beet pulp, cottonseed meal, distillers' dried grains, linseed meal, linseed cake, gluten feed, hominy feed, velvet bean feed, peanut oil feed, rye middlings, wheat bran, wheat middlings, red dog, and a variety of compounded feeds, calf meals, and poultry feeds.

Commercial feeding stuffs, F. D. FULLER (*Texas Sta. Bul. 251 (1919)*, pp. 5-241).—This publication tabulates the proximate analyses of samples of feeding stuffs made during the year ended August 31, 1919. The materials are alfalfa meal, barley chop, barley middlings, dried beet pulp, brewer's dried grains, coconut-oil meal, coconut meal (new process), corn bran, corn chop, ground corn cob, corn feed meal, corn flour, corn gluten feed, corn meal, cold pressed cottonseed, cottonseed feed (cracked and ground), cottonseed cake (ordinary, prime, and choice), cottonseed meal (ordinary, prime, and choice), graham flour, hominy feed, Japanese bean meal, kafir corn chop, linseed meal (old process), meat scrap, milo maize chop, milo maize feed meal, milo maize head chop, ground oats, ground oat hulls, oat meal, cold pressed peanuts, whole pressed peanuts (cracked and ground), peanut feed, peanut oil cake, peanut oil meal, ground peanut hulls, rice bran, rice hulls, rice polish, rough rice, rye bran, rye flour, rye middlings, tankage, velvet bean feed, whole pressed velvet bean, wheat bran (with and without screenings), brown and gray shorts (with and without screenings), wheat mixed feed, white shorts, and a variety of proprietary mixtures. A table showing the average composition of each kind of feed analyzed and introductory matter dealing with the administration of the State feed law are also included.

Commercial feeding stuffs registered for sale in Texas, October 1, 1919, F. D. FULLER (*Texas Sta. Bul. 252 (1919)*, pp. 5-304, figs. 2).—This bulletin consists mainly of a list of manufacturers and dealers (classified by city and State) registered to sell feeding stuff in Texas, together with the names of the brands offered for sale and the manufacturer's guaranty as to the composition of each.

Feeding stuffs, H. T. CRANFIELD (*Midland Agr. and Dairy Col., Rpt. Feeding Stuffs and Fert., 1914-1918*, pp. 5-25, pl. 1).—The author reports proximate analyses of bran, shorts, middlings, wheat germ meal, rolled oats, corn meal, corn germ meal, corn gluten feed, rice meal, and the following "cakes": Lin-

seed, cottonseed (Egyptian and Bombay), hempseed, palm kernel, rape, coconut, peanut and soy bean.

A number of compounded cakes and meals classified according to purpose as designated by the manufacturer are entered on a two-dimensional chart, protein percentages being used as abscissa and the fat percentage, as ordinates. As mapped out the areas of the different classes overlapped markedly.

Merino history and Merino breeding, S. M. CLEAVER (*Delaware, Ohio: Author, 1918, pp. 48, figs. 36*).—The author gives a short account of early importations of Merino sheep into the United States and a history of the development of the three types.

Annual wool review for 1916, 1917, and 1918, W. J. BATTISON (*Bul. Natl. Assoc. Wool Manfrs., 47 (1917), No. 1, pp. 1-61, pl. 1; 48 (1918), No. 1, pp. 1-63, pl. 1; 49 (1919), No. 1, pp. 1-67, pl. 1*).—These are the customary yearly reports giving statistics of domestic wool production, importations of wool, and wool prices in the United States, together with comprehensive summaries of the wool trade in other countries.

The Australasian wool trade: Annual review and statistics, season 1918-19, DALGETY & Co. LTD. (*Dalgety's Ann. Wool Rev. Australasia, 25 (1919), pp. 60*).—This is a statistical review of the wool markets of Australasia, with notes on the international wool trade. The topics discussed include the character of the Australian and New Zealand clips, the wool exports of the Australian Commonwealth, a comparison of record prices, Great Britain's wool position, the wool industry of the United States following the armistice, the wool markets of South Africa, and suggestions for preparing the clip.

Egg-weight as a criterion of numerical production in the domestic fowl, P. HADLEY (*Amer. Nat., 53 (1919), No. 628, pp. 377-393, fig. 1*).—This is a more extended discussion of material already noted from a preliminary paper (*E. S. R., 41, p. 274*). It is stated that the complete data will be published later. The records are those of 38 White Plymouth Rocks hatched in 1909.

The cost of producing eggs on a one-man poultry farm in New Jersey for 1919, V. G. AUBRY (*New Jersey Stas., Hints to Poultrymen, 8 (1920), No. 4, pp. 4*).—The author tabulates by months the average records of egg production, feed consumption, cost items, and financial returns on several (apparently about 10) one-man poultry farms in New Jersey for the year ended October 31, 1919. A summary for the year of the results on the most successful farm and the average farm are also given. The present report is more detailed than that for 1917-18 (*E. S. R., 41, p. 77*) and includes all laying birds on the farms considered, whereas the previous year's records, it is now stated, were from selected pens.

The average farm flock consisted of 970 birds with a mean production of 126 eggs (percentage production 34.4). During the year the average consumption of mash was 41.5 lbs. and of scratch feed 37.3 lbs. Allowing 5 per cent for depreciation and 4 per cent interest on investment the average labor income per bird was \$3.50.

How to break eggs for freezing (*U. S. Dept. Agr., Dept. Circ. 74 (1920), pp. 12, figs. 10*).—A series of simple illustrated directions for the use of egg breakers in a frozen-egg plant.

Belgian hares as meat producers, F. L. WASHBURN (*Minn. Agr. Ext. Spec. Bul. 37 (1919), pp. 12, figs. 5*).—Directions are given for keeping Belgian hares or other breeds of large-sized rabbits as a family source of meat, together with notes on killing, dressing, and cooking.

Cavy culture, E. MICHAELS (*Philadelphia: Author, 1920, pp. 72, figs. 32*).—This pamphlet gives practical instructions for raising and marketing guinea pigs, with notes on the guinea pig as a source of food and fur.

DAIRY FARMING—DAIRYING.

Inheritance of quantity and quality of milk production in dairy cattle, W. E. CASTLE (*Proc. Natl. Acad. Sci.*, 5 (1919), No. 10, pp. 428-434).—The author tabulates the first and in some cases the second lactation records of 31 Holstein×Guernsey F₁ heifers, and of 24 registered Holstein and 7 registered Guernsey dams of these cross-breeds. The crossing was begun in 1911 by the late T. J. Bowlker on his farm at Framingham, Mass., as a definite experimental attempt to combine high milk production and high percentage of butter fat. It is stated that the project has been taken over by the University of Illinois.

During their first lactations (365 days or less) the cross-breeds averaged 6,612 lbs. of milk, the Holsteins 7,673, and the Guernseys 4,617. The corresponding records during the second lactation were 8,663, 9,475, and 5,593. Butter fat tests were not taken systematically except in the case of the first lactations of the cross-breeds, where the average fat percentage was 4.08 and the average yield 270 lbs. Eight of the Holsteins averaged 267 lbs. of fat during their first lactations. To provide a comparable figure for the Guernseys it is assumed that the fat test was 5 per cent, and on this basis the fat production was 231 lbs.

Milk produced in southern China, C. O. LEVINE (*Philippine Jour. Sci.*, 15 (1919), No. 1, pp. 91-105, pl. 1).—The author presents some notes concerning the character of the dairy industry in southern China (vicinity of Canton and Hongkong), reports analyses of the milk of the water buffalo (*Bubalus bubalis*), the Chinese "yellow cow" (a variety of the zebu, *Bos indicus*), and descendants of improved European cattle, and describes the physical appearance of the native cattle, giving some body measurements of buffalo cows.

The ten samples of buffalo milk that were completely analyzed averaged 12.5 per cent of fat, 6.04 protein, 3.7 sugar, and 0.88 per cent ash. Monthly summaries of the milk and fat produced by buffaloes during four complete and a number of partial lactations are included.

"Buffalo milk is pure white, with absolutely no tint of yellow. Cream and butter made from it are rather oily and have but a faint tint of yellow. By mixing European cows' cream with the buffalo cream and using vegetable butter color the color and the texture can be greatly improved."

Dairy industry around Coimbatore, D. ANANDA RAO (*Agr. Jour. India*, 14 (1919), No. 2, pp. 265-274, pls. 2, fig. 1).—The author gives a brief account of the native trade in curds and ghee in the Kangayam region of Madras, and a more extended treatment of the creamery business which is a recent development and somewhat speculative in nature. The dairy animals are practically all buffaloes. There is a local breed of zebu-like cattle excellent for draught purposes but giving very little milk.

Statistics relative to the dairy industry in New York State (*N. Y. State Dept. Farms and Markets, Agr. Bul. No. 118* (1919), pp. 32, pl. 1).—This publication is a report of a census by the State Department of Farms and Markets, and gives for each city or other community of over 200 inhabitants an estimate of the amount of fluid milk consumed in 1918, the number of concerns engaged in distributing this milk, and the number of cows from which it was derived. The total amounts of each kind of dairy products manufactured in the State in 1918 are also tabulated from the records of the Bureau of Markets of the U. S. Department of Agriculture.

The total number of milk-producing cows was found to be 1,023,034 and the average production 4,337 lbs. of milk per head per year. Slightly more than half the milk was marketed for direct consumption. There were 1,742 estab-

lishments engaged in shipping milk or manufacturing milk products, and a map showing their distribution throughout the State is included.

Preliminary report of the Council of Farms and Markets of its investigation of the cost of production and distribution of milk in New York State. W. E. DANA [N. Y. State] *Council Farms and Markets Invest. Cost Prod. and Distrib. Milk, Prelim. Rpt. 1919, pp. 29; also in N. Y. [State] Dept. Farms and Markets, Foods and Markets, 2 (1919), No. 13, pp. 3-18.*—This preliminary report to the legislature consists of a summary of cost data collected by the Committee on Milk of the New York State Council of Farms and Markets, and two appendixes giving further details of the investigation, one dealing with production and the other with distribution.

The production costs were secured from 30 herds furnishing milk for sale in seven eastern New York cities (excluding New York City but including Poughkeepsie) and covered the year ended September 30, 1918. The average number of cows on a farm was 17.5 and the average production per cow 6,628 lbs. To produce 100 lbs. of milk required 35 lbs. of grain, 53.4 lbs. of hay, 4.7 lbs. of other dry forage, 105.8 lbs. of silage, 2.8 lbs. of other succulence, and 2.6 hours of man labor. The cost of these items was \$2.82. The miscellaneous costs totaled \$1.10 and the returns other than milk 48 cts. The net cost was thus \$3.44. A managerial charge was not included. Similar computations of the costs per cow are also given.

The data as to distribution costs were furnished by 26 retailers in 10 of the up-State cities and in general covered the month of January [1919?]. The average amount of milk handled daily per plant was 2,731 qt. The distributors received 12.7 cts. per quart and paid producers 8.9 cts. Marketing costs averaged 2.8 cts. and the profit was approximately 1 ct. a quart. The distributing costs of 12 concerns, mainly occupied with retail trade, was 4.94 cts. per quart. It is held that more efficient management would reduce the costs of retailing milk.

A study of the New York City milk problem. I. G. JENNINGS (*New York: The Natl. Civic Federation, 1919, pp. 58*).—This pamphlet, accepted by Columbia University as a dissertation for the doctorate, deals with inefficiencies or supposed inefficiencies in the production, distribution, and sanitary control of milk destined for domestic consumption in New York City, and discusses possible remedies for the conditions asserted to exist.

Information as to conditions in the producing centers was derived mainly from 25 replies (duly tabulated) by superintendents of creameries or shipping stations to a questionnaire calling for data on the size of each patron's farm, and, for a given day, the number of cows he milked, the amount of milk he sent to the station, and the means employed to get it there. Data as to 32 milk routes secured from distributors' records and by interviews with drivers are also tabulated, and the points of conflict between dealers and the board of health are outlined. That the consumers themselves are responsible for some inefficiencies, particularly in delivery, is recognized, but it is argued they should not be expected to pay a price for milk high enough to include a profit on the unbusiness-like producing and distributing methods which the author believes he has demonstrated.

As remedial measures, the possibilities of regulation by a State commission and of public ownership of the milk industry are both discussed, and court decisions are cited to show that few legal difficulties stand in the way of either. However, the author is plainly distrustful of such devices, since "the function of government is not business," and puts his faith in what he calls natural cooperation between the parties concerned, with a minimum of interference from governmental agencies.

Milk cost survey for the week November 26 to December 2, 1917 (*Baltimore: Md. Council Defense, 1917, pp. 42, figs. 2*).—Detailed data are presented showing the cost of producing milk in ten Maryland counties during the week specified. Ten herds in each county were selected and the county agents cooperated in securing accurate records. Distribution costs of 29 retailers in Baltimore and other cities are also summarized. The record forms used in the survey are reproduced.

Milk cost survey for the week August 19, 1918, to August 25, 1918 (*Md. Agr. Col. Ext. Bul. 15 (1918), pp. 10*).—This second survey was undertaken to secure data as to summer costs of milk production for comparison with the preceding. The same herds were covered, with the addition of 10 from another county.

Is milk distribution a municipal function? D. W. HYDE, JR. (*Natl. Munic. Rev., 8 (1912), No. 8, pp. 532-534; also in Milk Dealer, 9 (1920), No. 5, pp. 10, 12, 14*).—Cases are cited of rigorous control and even operation of the retail milk business by English municipalities during the war with results satisfactory to consumers and producers. An important purpose of the control was to secure equitable distribution in times of shortage. The author would like to see similar schemes tested in this country.

Surplus milk (*U. S. Dept. Agr., Bur. Anim. Indus., Milk-Plant Letter 64 (1919), pp. 2; also in N. Y. Prod. Rev. and Amer. Creamery, 48 (1919), No. 11, p. 546*).—Replies are summarized to a questionnaire sent by the Dairy Division to milk dealers in four cities requesting data as to the relation of amount of milk received to volume of sales during each month of 1918. Throughout the year Boston dealers sold 64 per cent of their receipts as market milk, Philadelphia dealers 83 per cent, Pittsburgh dealers (where much condensed milk was manufactured) 44 per cent, and Detroit dealers 82 per cent.

Milking machines and the production of clean milk, T. ORR (*Pub. Health [London], 33 (1920), No. 6, pp. 85-92*).—The author describes the mechanical parts and method of operation of several types of milking machines used in Great Britain, discusses the associated bacteriological problems, and gives a list of 34 bibliographical references.

Reports on the keeping and carriage of milk in ventilated and unventilated churns, respectively, J. GOLDING, E. C. V. CORNISH, and R. S. WILLIAMS (*Jour. Bd. Agr. [London], Sup. 19 (1919), pp. IV+32*).—Bacteriological studies are reported showing insanitary conditions in milk transported in the antiquated milk can—still used to some extent in England—that is provided with ventilating holes in the lid. A special type of ventilated "churn" admitting filtered air was also tested, and it was found that such air was without beneficial influence on either the acidity or the bacterial content of the milk. It is concluded that the remedy for so-called cow smell is not ventilation in transit but the introduction of clean milking methods and modern cooling devices.

Some characters which differentiate the lactic acid streptococcus from streptococci of the pyogenes type occurring in milk, J. M. SHERMAN and W. R. ALBUS (*Jour. Bact., 3 (1918), No. 2, pp. 153-173, figs. 4*).—A study is reported from the Pennsylvania Experiment Station of 50 cultures of the true lactic-acid streptococcus and 50 of the pyogenes group of streptococcus isolated from milk in order to discover, if possible, easily recognized diagnostic differences between the two groups.

Differences were noted in chain formation and in ability to coagulate milk and to produce fermentation, but what is considered the most useful test is based upon marked differences in capacity to reduce stains. *Streptococcus lacticus* reduced methylene blue, litmus, and indigo carmine very promptly,

while the pyogenes group had no effect on the first named and decolorized the others very slowly and incompletely and only after curdling had taken place. It was also observed that all the cultures of lactic-acid bacteria grew at 10° C., while none of the other group developed at this temperature.

A lactose-fermenting yeast producing foamy cream, O. W. HUNTER (*Jour. Bact.*, 3 (1918), No. 3, pp. 293-300, fig. 1).—The author reports work at the Kansas Experiment Station leading to the isolation of a lactose-fermenting yeast which produces the hot-weather defect known as foamy cream.

The optimum temperature for growth was found to be about 37° C., and the thermal death point 55° for ten minutes. The organism is resistant to desiccation, but is killed readily by calcium hypochlorite, lime, or cresol, though not by washing soda or boric acid.

Quantity and quality of New South Wales butter, 1917-1919, L. T. MACINNIS (*Agr. Gaz. N. S. Wales*, 30 (1919), No. 11, pp. 791-795, pl. 1, fig. 1).—Statistics and graphs are presented showing the monthly amounts of butter manufactured in New South Wales during the two years ended June 30, 1919. Improved quality, particularly of export butter, is noted. Droughty conditions prevailing during the summer of 1918-19 caused a marked decrease in the output.

Investigations on Swedish Emmental cheese and large-holed Swedish farm cheese, L. F. ROSENGREN and E. HAGLUND (*Centbl. Bakt. [etc.]*, 2. *Abt.*, 45 (1916), No. 6-12, pp. 156-186).—Previously noted from a Swedish source (*E. S. R.*, 35, p. 483).

Review of the imported dairy produce trade for the year ended June 30, 1919, W. WEDDEL & Co., LTD. (*Weddel's Ann. Rev. Imported Dairy Prod. Trade*, 25 (1919), pp. 7).—A statistical summary of imports of butter, cheese, and margarin into the United Kingdom.

VETERINARY MEDICINE.

Pathogenic microorganisms, W. H. PARK and A. W. WILLIAMS (*Philadelphia: Lea & Febiger*, 1920, 7. ed., rev. and enl., pp. X, 17-786, pls. 9, figs. 214).—The principal revisions and additions in the seventh edition of this well-known text book (*E. S. R.*, 38, p. 480) are as follows:

The whole subject of immunity has been rewritten, the revision of the chapter on complement fixation being contributed by M. A. Wilson and W. C. Noble. The chapter on media has been rewritten by B. v. H. Anthony to include the recent work on H-ion concentration. Extensive revisions have been made in the sections on streptococci, yeasts, and influenza bacilli. New material has been added on the bacteria pathogenic for the respiratory tract, and on preventive measures against typhoid and paratyphoid fevers and wound infections due to anaerobes.

Chemical structure and antigenic specificity.—A comparison of the crystalline egg-albumins of the hen and the duck, H. D. DAKIN and H. H. DALE (*Biochem. Jour.*, 13 (1919), No. 3, pp. 248-257, figs. 4).—The authors have found that the purified crystalline albumins from the eggs of the domestic fowl and duck behave as distinct antigens for the anaphylactic reactions in guinea pigs. Corresponding with this difference has been noted a distinct difference in the structure of the proteins, as shown by the fact that when the proteins are racemised the amino acids escaping racemisation are not identical in the two proteins.

“So far as they go, the results support the conception that the stereochemical structure of the protein molecule is at least an important factor in antigenic

specificity. Without the information given by the racemisation method these two proteins would have been indistinguishable, except by an immunological test. The racemisation having shown a structural difference, the presumption that structure and antigenic specificity are related seems to be warranted. This conclusion, however, provides only a first step toward a conception of the relation between antigen and antibody. In due course it will be of interest to discover whether that protein of an immune serum which carries the specific 'antibody' action shows any difference of molecular pattern from the corresponding protein of a normal serum. Meanwhile the only kind of relation which seems to provide even a distant analogy is that of enzyme and substrate; but the discrimination of the antibody is far more delicately specific."

A comparison between the precipitation of antitoxic sera by sodium sulphate and by ammonium sulphate, A. HOMER (*Biochem. Jour.*, 13 (1919), No. 2, pp. 278-295, figs. 8).—A further contribution to the method of concentrating antitoxic sera previously noted (*E. S. R.*, 40, p. 288) is given in a comparison between anhydrous sodium sulphate and ammonium sulphate as precipitating agents, and in a study of the conditions regulating the preparation of satisfactory end products from the ammonium sulphate or from the sodium sulphate fractionation of unheated and of heat-denatured plasma.

In the precipitation of the serum proteins by sodium sulphate there were found to be no critical points marking the limits for the precipitation of the individual proteins. The percentage precipitation of the antitoxin at various concentrations of sodium sulphate was a linear measure of the percentage precipitation of the antitoxin-bearing proteins, and was undisturbed by the heat-denaturation of the serum proteins occurring during the heating of the adjusted plasma at 58° C. for four or five hours.

The concentration of either ammonium sulphate or sodium sulphate required for the precipitation was affected by the reaction and dilution of the plasma and by the addition of cresylic acid. Within the limits of error, the decreases in molecular concentration caused by these factors were practically identical for both substances.

By suitable fractionation of the unheated plasma, results were obtained similar to those with heated plasma. The exception was that the preliminary addition of cresylic acid proved disadvantageous, in that it reduced the proportion of antitoxin associated with the second fraction precipitates and led to the production of less readily filterable end products.

Sodium sulphate is considered a rather more satisfactory reagent than ammonium sulphate, in that the agglutination of the particles of precipitated protein in the euglobulin and pseudoglobulin zone is apparently more satisfactory. Since the sodium sulphate does not hydrolyze in solution, the first fraction mixtures can be heated for four or five hours at 58° without loss of antitoxin, resulting in the production of clearer end products than those obtained by heating in two stages as is necessary with ammonium sulphate.

A simple new method for the cultivation of anaerobic organisms.—Semi-liquid media in bacteriology, J. LIGNIÈRES (*Compt. Rend. Soc. Biol. [Paris]*, 82 (1919), No. 26, pp. 1091-1094).—This supplements the report previously noted (*E. S. R.*, 42, p. 379).

On methods of isolation and identification of the members of the colony-typhoid group of bacteria: Study of the bacteriological action of CR indicator, J. BRONFENBRENNER, M. J. SCHLESINGER, and D. SOLETSKY (*Jour. Bact.*, 5 (1920), No. 1, pp. 79-87).—A study of the bactericidal action of China blue and rosolic acid, a mixture of which is known as the CR indicator, is reported. The results indicate that China blue is inert toward both Gram-positive and Gram-negative organisms, while rosolic acid inhibits the growth of Gram-

positive organisms only. The bactericidal power of CR is thus shown to be due entirely to the action of rosolic acid.

It is pointed out that the bactericidal properties of CR agree quite closely with those of various dyes of the triphenylmethane series as observed by Kligler (E. S. R., 39, p. 412) and others. Rosolic acid, however, differs from these dyes in that it alone does not inhibit the growth of *Bacillus dysenteriae*. This difference is thought to render the CR indicator particularly suitable for the preparation of selective media to be used for the isolation of intestinal bacteria.

On the resistance to desiccation of the intermediate host of *Schistosoma japonicum*, W. W. CORT (*Jour. Parasitol.*, 6 (1919), No. 2, pp. 84-88).—"The resistance to desiccation of *Blanfordia nosophora*, the intermediate host of the Japanese blood fluke (*S. japonicum*), is limited to about three months. Desiccation unfavorably affects the cercariæ within the snails, and infected snails succumb more quickly than uninfected. Individuals of *B. nosophora* will voluntarily leave the water and become dry under unfavorable conditions. Measures for the control of Japanese schistosomiasis by draining the breeding places of *B. nosophora* would be fully effective only if these places were kept dry at least three months."

Sclerostomes of the donkey in Zanzibar and East Africa, C. L. BOULENGER (*Parasitology*, 12 (1920), No. 1, pp. 27-32, figs. 5).—Studies of collections of nematodes from the donkey have led to the identification of nine species, namely, *Strongylus vulgaris*, *S. edentatus*, *S. asini* n. sp., *Triodontophorus intermedius*, *Cylicostomum auriculatum*, *C. coronatum*, *C. bicoronatum*, *C. alveatum*, and *C. adersi* n. sp.

Weeds poisonous to live stock, P. R. TALBOT and J. C. COOPER (*Alberta Dept. Agr., Prov. Schools Agr. Bul. 1* (1919), pp. 40, pls. 4, figs. 15).—This descriptive account gives the information required for the identification of the most injurious and poisonous weeds found in Alberta, which cause heavy losses of live stock annually, methods of handling to prevent stock from eating these weeds, and the symptoms and treatment of animals affected. Colored plates of tall larkspur (*Delphinium glaucum* or *D. brownii*), death camas (*Zygadenus venenosus*), water hemlock (*Cicuta maculata*), and white loco weed (*Oxytropis lamberti*) are by N. Criddle.

Live stock sanitary department of Alabama, C. A. CARY (*Ann. Rpt. Commr. Agr. and Indus. [Ala.]*, 1918, pp. 62-70).—This is the report of the State veterinarian and secretary of the Live Stock Sanitary Board on the work with eradication cattle ticks, work with tuberculosis, hog cholera, blackleg, and hemorrhagic septicemia, and the control of the hog louse.

Report of the bureau of animal industry, D. W. McLAURY, J. G. WILLS, and C. LINCH (*N. Y. State Dept. Farms and Markets, Ann. Rpt.*, 1 (1918), pt. 1, pp. 72-104, pls. 8).—This report includes accounts of work with infectious diseases of animals, and contains maps showing the extent for the fiscal year ended June 30, 1918, of tuberculosis, glanders, rabies, hog cholera, anthrax, blackleg, actinomycosis and hemorrhagic septicemia, infectious anemia, and mange.

Deficiency diseases, C. A. CARY (*Jour. Amer. Vet. Med. Assoc.*, 56 (1920), No. 6, pp. 609-614).—In this paper, presented at the annual meeting of the American Veterinary Medical Association at New Orleans in November, 1919, the author discusses the similarity between the deficiency diseases of human beings and certain animal diseases.

The clinical symptoms of polyneuritis gallinarum and infantile beriberi are shown to follow closely posterior limb paresis of swine, a disease occurring in

swine fed on corn or peanuts alone. Sore mouth or black tongue in dogs is considered suggestive of acute pellagra in man. Osteomalacia or creeping sickness of cattle, which occurs along the coastal plain region during the dry season, is compared with rickets, and it is shown that the disease occurs during a time when the cattle, owing to the lack of young grass, are suffering for fat-soluble A, lime, and phosphates. It is pointed out that pigs, dogs, cows, and horses may have scurvy, which is probably associated at times with rickets in pigs and pups and with osteomalacia and osteoporosis in mature cattle and horses.

Attention is called to the fact that in some southern States where hogs are fed largely on velvet beans there are many cases of abortion. It is suggested that many cases of so-called contagious abortion may be due to over-feeding cottonseed meal or some other unbalanced feed.

A note on sodium morrhuate in tuberculosis, L. ROGERS (*Brit. Med. Jour.*, No. 3032 (1919), pp. 147, 148).—The author reports that the sodium salts of the fatty acids of cod liver oil, termed sodium morrhuate, have been used with considerable success in the treatment of tuberculosis in the same way that the sodium salts of chaulmoogra oil have been used in the treatment of leprosy.

The chemotherapeutics of the chaulmoogric acid series and other fatty acids in leprosy and tuberculosis.—I, Bactericidal action; active principle; specificity, E. L. WALKER and M. A. SWEENEY (*Jour. Infect. Diseases*, 26 (1920), No. 3, pp. 238-264).—This investigation, which was undertaken partly to confirm the therapeutic claims for chaulmoogrates and morrhuates noted by Rogers in the above article, includes a study in vitro "of the antiseptic and bactericidal actions of chaulmoogra oil and its constituents, the identification and isolation of the bactericidally active substance of chaulmoogra oil, the determination of the specificity of its bactericidal action for acid-fast bacilli, and an investigation of the presence or absence of this bactericidal substance in cod liver and other oils."

The fatty acids of the chaulmoogric series, chaulmoogric and hydnocarpic acids and possibly lower isomers of this series, were found to possess a specific bactericidal activity toward the acid-fast bacteria one hundred times greater than phenol, but to be inactive against all other bacteria tested. This specific activity appeared to be a function of the carbon ring structure of the molecules of the chaulmoogric series. The fatty acids of cod liver oil, the salts of which constitute Rogers' sodium morrhuate, did not possess the specific bactericidal activity of the chaulmoogric acid series.

"Experiments on animals are now in progress to determine whether or not the chaulmoogric acid series have any practical value in the chemotherapy of tuberculosis."

Vaccination against anthrax virus with nonspecific substances, R. TURRÓ (*Compt. Rend. Soc. Biol. [Paris]*, 82 (1919), No. 26, pp. 1085, 1086; *abs. in Vet. Rev.*, 4 (1920), No. 1, p. 58).—The author reports that beaten egg forms an excellent medium for the growth of the anthrax bacillus, but that if 0.5 per cent ammonia be added to the egg and evaporation prevented the material has a strong bacteriolytic power for the organism. The name oviserum has been given to the bacteriolytic substance. Experiments are cited which show that rabbits strongly immunized with oviserum are immune to anthrax virus, and that the serum of such animals has a much higher bacteriolytic power than normal serum.

The nature of the mallein reaction and the hereditary transmission of glanders antibodies, E. BERTETTI and G. FINZI (*Atti R. Accad. Lincei*, 5. ser., *Rend. Cl. Sci. Fis., Mat. e Nat.*, 27 (1918), II, No. 11-12, pp. 372-379).—In con-

tinuation of the study of glanders immunization and the mallein reaction (E. S. R., 38, p. 379), the authors report a study of the hereditary transmission of glanders antibodies. Nine foals born of dams affected with glanders, two in the course of hyperimmunization, one showing specific signs of nasal glanders, and three controls born of healthy dams were tested by the agglutination, complement deviation, and mallein tests. The controls gave negative results in every case, while the others gave positive agglutination and complement deviation tests and negative mallein tests.

These results are considered not only to indicate that glanders antibodies pass through the placental membrane, but also to confirm the authors' theory that the existence of antibodies does not suffice to explain the reaction to mallein.

A contribution to the study of the heredity of rabies, P. REMLINGER (*Ann. Inst. Pasteur*, 33 (1919), No. 5, pp. 375-388).—A review of the subject in which reference is made to the studies of Konradi (E. S. R., 17, p. 408; 36, p. 383).

Experimental streptococcus empyema: Attempts at prevention and therapy by means of vaccines and serum, F. P. GAY and R. L. STONE (*Jour. Infect. Diseases*, 26 (1920), No. 3, pp. 265-284).—This investigation, while undertaken chiefly from the point of view of human streptococcus empyema, is considered to have some bearing "on the general question of streptococcus immunity, and particularly as indicating the possibilities of specific prevention or therapy of localized streptococcus infections of the empyema type."

It was found possible to produce a characteristic and fatal empyema in rabbits by the direct injection into the pleural cavity of from 0.1 to 0.2 cc. of a passage culture of a human strain of streptococcus carried through the pleural cavity of several animals. The experimental empyema produced is said to resemble the human form except that initial bronchopneumonia was not produced. The infection, while rarely becoming generalized, was invariably fatal in about five days.

"Experimental streptococcus empyema in rabbits may be prevented by previous immunization with killed, followed by living, cultures of the same strain of streptococcus, but only when repeated vaccinations have been practiced and in a total amount which would seem to preclude the practicability of such a preventive inoculation in human beings, provided the conditions are similar.

"The serum of rabbits that have been successfully immunized against subsequent intrapleural infection with the streptococcus contains potent antibodies, particularly agglutinins, opsonins, and precipitins. . . . The more potent of these antisera from rabbits when injected simultaneously with the culture into the pleural cavity may prevent the evolution of the otherwise invariable and fatal empyema. In a few instances subsequent injection of serum into the pleural cavity, or even intravenously, has cured the empyema. No very optimistic conclusion on the practical use of an antistreptococcus serum in this type of localized infection can be drawn from our experiments as hitherto conducted. Attempted vaccine therapy of the localized empyema has given consistently negative results."

Mycosis of the bovine fetal membranes due to a mold of the genus Mucor, T. SMITH (*Jour. Expt. Med.*, 31 (1920), No. 2, pp. 115-122).—"A mucor, closely resembling Lichtheim's *Mucor rhizopodiformis*, was isolated from the diseased chorion of a cow and from the lungs and digestive tracts of the fetus. No other microorganisms were detected. The mucor was demonstrated in teased preparations from the fresh cotyledons as well as in sections of tissues suitably hardened. It produced focal lesions in rabbits following the intravenous injection of spores. The condition of the amniotic fluid and the contents

of the rumen of the fetus justify the inference that premature expulsion was impending."

Eradication of the cattle tick, J. BAGUÉ (*Porto Rico Dept. Agr. and Labor Sta. Circ. 18 (1919)*, [*Spanish Ed.*], pp. 12, pl. 1, figs. 2).—This is a popular account of Texas fever and the cattle tick and methods of eradication in Porto Rico, including plans for a concrete dipping vat taken from Farmers' Bulletin 498 previously noted (E. S. R., 27, p. 579).

Bacterium anatum n. sp., the etiologic factor in a widespread disease of young ducklings known in some places as "keel," L. F. RETTGER and M. M. SCOVILLE (*Jour. Infect. Diseases*, 26 (1920), No. 3, pp. 217-229).—The authors describe a disease first noted in young ducklings in the spring of 1918. The disease, which is of wide distribution and high mortality, resembles bacillary white diarrhea of chicks. The symptoms are noticeable soon after hatching. The affected individuals appear weak and sluggish and have an intense thirst. The name "keel" has been given to the disease from the fact that, after drinking, some of the ducklings drew themselves to full height, staggered for a few seconds, keeled over, and died. The infection causes no lesions or any other pathologic condition with the exception of paleness of the tissues and light body weight.

From the internal organs of the dead ducklings there has been isolated an organism which has been given the name *B. anatum* n. sp. "While *B. anatum* resembles *B. pullorum* in several particulars, it is more closely related, in so far as morphological, cultural, and fermentation properties are concerned, to *B. paratyphosus* A and B, and to *B. enteritidis*. Its agglutination reactions link it most closely with *B. paratyphosus* B; also its alkalinizing action in milk. Of the different organisms which have been used in the comparative study, namely, *B. typhosus*, *B. paratyphosus* A and B, *B. enteritidis*, *B. pullorum*, and *B. sanguinarium*, *B. anatum* resembles *B. typhosus* least and *B. paratyphosus* B most.

"The organism was obtained in pure culture also from ovarian cysts and from an abdominal cyst of breeding ducks on a large commercial duck farm which was very seriously affected by the duckling disease. It appears quite probable, therefore, that the disease is transmitted from the breeders through infected eggs in the same way as bacillary white diarrhea has been demonstrated by Rettger et al. [E. S. R., 41, p. 880] to have its source in the ovaries of infected hens. Proof of such relationship in the duckling disease is, however, still lacking, owing to our inability to procure the necessary materials for a more extensive study of this point. It is planned to resume this phase of the investigation with the appearance of the next breeding season."

Pigeon diseases and feeding management, E. J. W. DIETZ (*Chicago: Author, 1919*, pp. 78, pl. 1, figs. 17).—A popular account.

RURAL ENGINEERING.

Philippine water supplies, G. W. HEISE and A. S. BEHRMAN [*Philippine Bur. Sci., Dept. Agr. and Nat. Resources, Pub. 11 (1918)*, pp. 218, pls. 19, figs. 2].—This report deals with the water supplies of the Philippine Islands for domestic and industrial use.

It is noted that the surface wells of the Philippines are generally very near to human habitations, and are for the most part constructed in an insanitary manner. Practically every open surface well examined was found to be dangerously polluted. Spring waters were usually found to be bacteriologically pure at the point of emergence, and are, on the whole, considered to be excellent sources for household use. The deep well waters were found, as a rule, to be more highly mineralized than the spring waters, but biologically they were

found to be very satisfactory, and are considered to be the most desirable sources of drinking water available in the Philippines for general use at the present time.

Further sections of the report deal with methods of storage and distribution, methods of purification of domestic supplies, waters for industrial use, and methods of water examination, including interpretation of analyses.

Report of the water conservation and irrigation commission for the year ended June 30, 1917 (*N. S. Wales, Rpt. Water Conserv. and Irrig. Comm., 1917, pp. 74, pls. 3*).—This is a report of the activities of the commission for water conservation and irrigation in New South Wales for the year ended June 30, 1917. Data are given on irrigation areas established and controlled by the State, irrigation schemes under consideration, water conservation works, artesian and shallow boring, and water conservation and irrigation works constructed by private parties.

Method of replacing old wooden flume with metal structure (*Engin. and Contract., 53 (1920), No. 6, pp. 164-165, figs. 4*).—The replacement of wooden flumes on an irrigation ditch in California with metal flumes is described and illustrated, showing progressive steps in the flume installation.

River protective work, M. PAULSEN (*New Zeal. Jour. Agr., 19 (1919), No. 5, pp. 271-276, figs. 3*).—Operations for the successful protection of farm land against a small river, by the use of groynes and the planting of willows in the river bed, are described.

Note on land drainage in irrigated tracts of the Bombay Deccan, C. C. INGLIS (*Agr. Jour. India, 14 (1919), No. 5, pp. 781-786, pl. 1*).—Information on drainage practice is given indicating that conditions in the Deccan are excessively complicated, but that the problem is mainly one of preventive drainage. The damage is considered to be entirely due to the opening of canals. Sodium carbonate is almost entirely absent from the soils, while sodium sulphate and, to a less extent, sodium chlorid are present in great excess. In experiments to ascertain the permeability of soils and subsoils, the "posthole auger" method is advocated, in which permeability is measured by the rate of recuperation of subsoil water. The coefficient of recuperation is measured by the formula: $\frac{K}{A} = \frac{1}{T} \log. \frac{H}{h}$, where K=coefficient, T=time in hours, H=full head of depression, h=head of depression after T hours, and A=area of bore hole.

Public Roads (*U. S. Dept. Agr., Public Roads, 2 (1919), No. 18-19, pp. 43, figs. 27*).—This number of this periodical contains the following articles: Asphalt in Road Construction, by J. L. Goldberg; Some Points in Handling Materials; Material Must Be Moved Early; The Present Status of Impact Tests on Roadway Surfaces, by A. T. Goldbeck (see below); Growth of Federal Aid Work, by A. C. Bruce; Nearly \$25,000,000 Allowed in Federal Aid in Two Months; Roads for Motor Truck Traffic, by C. J. Bennett; Motor Vehicles and the Highways, by W. D. Schier; and Traffic Census Shows Value of Paved Roads to Los Angeles, by J. C. Veenhuysen.

The present status of impact tests on roadway surfaces, A. T. GOLDBECK (*U. S. Dept. Agr., Public Roads, 2 (1919), No. 18-19, pp. 19-24, 25, figs. 15*).—A progress report indicating the status of impact tests on roadway surfaces, being conducted by the Bureau of Public Roads, is given (*E. S. R., 41, p. 689*).

Considerable data and a number of curves are given showing test results obtained from a class B, 3 to 5 ton standard army truck, a 5½ ton truck, and a 1½-ton truck. These results in general show the maximum impacts that have been measured. They indicate that under certain conditions the impact pressure produced by heavy motor trucks is very large. The highest pressure thus

far measured was in the neighborhood of 42,000 lbs. when the weight on the rear wheel causing this pressure was only 7,750 lbs., and the unsprung weight on one rear wheel was 1,837 lbs. With the 5½-ton truck, which has an unsprung weight of 1,000 lbs., it was shown that the impact pressures produced were very much smaller than in the case of the class B army truck. When the latter, with a total weight of 7,750 lbs. on one rear wheel, fell through a height of 2 in. at a speed of 15 miles per hour, the impact pressure produced was about 34,500 lbs. With the 5½-ton truck, loaded with 8,060 lbs. on one wheel and under corresponding conditions of speed and height of fall, the impact pressure produced was only 23,500 lbs., or 68 per cent of the impact pressure of the army truck. The unsprung weight of the 5½-ton truck was only 56 per cent of that of the army truck, but the gross load carried on the rear wheel was slightly larger. The indications are therefore that a light unsprung weight tends to lessen the impact of a truck on the road surface.

With the 1½-ton truck having a total weight of 3,470 lbs. on one rear wheel and 1,065 lbs. unsprung weight on one rear wheel, the impact pressure at a speed of 15 miles per hour and a height of fall of 2 in., was about 14,000 lbs. It is noted that the unsprung weight of this truck is practically the same as that of the 5½-ton truck, and the impact pressure produced is very much lower. This is taken to indicate that unsprung weight does not alone influence the impact pressure produced on the road. When questions of road design are to be considered, it is concluded that the actual wheel pressure on the road is the all-important factor rather than the gross load of the truck.

In the results obtained thus far the impact on the road varied with some power of the speed, this power being less than 2 and extending down as low as 1. The tests indicate that impact does not vary directly as the height of fall, the reason being that the action of the springs of the vehicles gives the unsprung weight an acceleration above that due to gravity. The amount of spring deflection at the instant the impact occurs is another factor influencing the amount of impact. Further tests are in progress, particularly tests to determine the effect of impact on road surfaces.

1920 program shows New York highways 67 1/2 per cent concrete (*Engin. News-Rec.*, 84 (1920), No. 6, p. 290).—Data issued by the New York State Highway Department are reported, showing that out of a total of 725 miles of highway to be constructed during 1920, approximately 500 miles, or 67.5 per cent of the total, are listed as concrete highways. Bituminous macadam is second with 139 miles, and 38 miles of highway are to be constructed of one or both of the foregoing types.

Should "binding steel" be used in concrete highway? W. C. CONGER (*Concrete [Detroit, Mich.]*, 16 (1920), No. 2, pp. 77-79).—A brief analysis is given indicating the important factors in the use of reinforcing in concrete roads, in which the author apparently advocates the use of mesh reinforcing. It is recommended that every State construct a section of unreinforced and a section of reinforced concrete road, side by side, for comparative test.

Use of slag as coarse aggregate on Elkhart-Osceola road, C. GRAY and F. KELLAM (*Concrete Highway Mag.*, 4 (1920), No. 2, pp. 27-29).—Experiments on the use of slag in concrete for road construction are reported, including especially compression and wear tests. The results are taken to indicate that the resistance to wear and the compression strength are unusually high for field concrete made under the conditions of the test, and constitute a distinct recommendation for slag as a concrete highway material when properly selected and used.

Effect of fineness of cement on quality of concrete, D. A. ABRAMS (*Concrete [Detroit, Mich.]*, 15 (1919), No. 5, pp. 189-196, figs. 12).—Four years'

studies on the subject are reported as conducted at the Lewis Institute, in which 51 different samples of Portland cement were ground to different degrees of fineness, giving residues ranging from 2 to 43 per cent on the standard 200-mesh sieve. In general, the aggregate consisted of sand and pebbles, although in one series blast furnace slag and burnt shale were used. The results of compression tests on 6,125 6 by 12 in. cylinders, of 9,000 compression and tension tests of mortar, and of several thousand miscellaneous tests made at ages of from seven days to one year are reported.

No necessary relation between the strength of concrete and the fineness of the cement was established, if different cements are considered. In general, the strength of concrete increased with the fineness of a given lot of cement, for all mixes, consistencies, gradings of the aggregates, and ages of concrete. For cements with residues higher than 10 per cent the strength of concrete varied approximately inversely as the residue on the 200-mesh sieve. Fineness of cement was more effective in increasing the strength of lean mixtures than rich ones, and in increasing the 7-day strength of concrete than at ages of 28 days to one year.

For the usual range of consistencies the effect of fineness was independent of the consistency of the concrete. The rate of increase in strength with fineness was lowered for very wet mixtures. The principal result of finer grinding was to hasten the early hardening of the concrete. The normal consistency of cement increased with fineness, but the time of setting and the unit weight of cement decreased. The fineness of cement had no appreciable effect on the yield or density of concrete. The change in length of concrete specimens stored in air or water was independent of the fineness of the cement and the consistency of the concrete. The lean concretes were slightly less affected than the rich mixtures. The type of aggregate had little or no influence on the relative effect of fineness of cement on the strength of concrete, but there was an intimate relation between the strength of the concrete and the water-ratio of the mixture. The lower the water-ratio, the higher was the strength, and vice versa.

The preservation of wood (*Pittsburgh: The Rodd Co., [1919], pp. 48, pls. 10*).—This is a compilation of information in popular form on methods and materials for the preservation of wood.

The mechanical properties of Philippine bast-fiber ropes, A. E. W. KING (*Philippine Jour. Sci., 14 (1919), No. 6, pp. 561-655, pls. 5, figs. 2*).—Investigations primarily undertaken for the purpose of securing quantitative results on the mechanical properties of bast ropes, conducted by the Bureau of Science of Manila, are reported. It is noted that while these fibers have no great commercial significance, in the rural districts they constitute a cheap material for the manufacture of cordage that is sufficiently resistant and durable for agricultural and animal husbandary purposes. The averages of two series of tests are given, the one on air-dry specimens and the other on specimens that had been immersed in fresh tap water for 24 hours. The results are compared with tests with standard fiber cordage. A few results of tests of miscellaneous ropes made of material not coming under the classification of either bast or standard cordage fiber are also included. A primitive wooden rope-laying apparatus is described and illustrated.

It was found that dry rope made of *Gnetum* sp. bast, having a mean circumference of 18 mm., showed the highest maximum mean tensile strength of 11,100 lbs. per square inch. This value compares favorably with the values for F and G grades of abaca rope. Rope made of coir fiber, ranging in strength from 2,420 to 2,640 lbs. per square inch, gave the poorest results. Rope made

of *Gnetum* sp., which had been immersed in fresh tap water for 24 hours, was the strongest of the immersed specimens. It is noted that wetting generally caused a slight decrease in the tensile strength of most bast ropes. The *Gnetum* sp. rope showed the greatest breaking length of the bast ropes, of 27,700 ft., which closely approaches the value of the various abacá ropes tested. Rope made of coconut fiber showed a breaking length inferior to most of the bast fiber ropes tested. The elongation of bast fiber ropes was generally less than that of most standard cordage fibers, and wetting increased the mean elongation of nearly all of them. The minimum and maximum average average elongations for dry and wet specimens were 6 and 16 per cent and 9 and 25 per cent, respectively.

How to remove keyed pulleys from a shaft, G. H. RADEBAUGH (*Power Farming*, 29 (1920), No. 2, pp. 14, 15, figs. 15).—Drawings and information are given showing the common styles of keys or methods of fastening pulleys to shafts in farm machinery, and information is given regarding practical methods of removing the pulleys.

Gasoline tractors, C. B. HAYWARD (*Chicago: Amer. Tech. Soc., 1919, pp. [V]+169+6, pls. 8, figs. 87*).—This is a semitechnical treatise on gasoline tractors and problems relating to their mechanism and operation. The following subjects are discussed: Classes of tractors, selecting a tractor, tractor motors, valves and valve timing, fuel supply system, lubricating system, cooling system, ignition system, types of ignition systems, types of motors, engine governors, tractor clutches, tractor transmissions, lubrication, and engine parts.

Some practical points in farm tractor design, J. C. WESTMONT (*Agrimotor*, 3 (1919), No. 2, pp. 24, 25, fig. 1).—The author summarizes his personal past experience with different designs of farm tractors. He concludes that the ultimate type of tractor will be the 4-wheel, 4-cylinder type with the motor set lengthwise of the frame and all gears operating in oil in dust-proof cases in both frame and frameless types.

Manganese steel in farm tractor manufacture, E. C. BAUER (*Agrimotor*, 3 (1919), No. 2, pp. 27, 28).—The progress of the use of manganese steel in the manufacture of farm tractor parts is summarized and its working qualities discussed. Comparative service tests from different sources are summarized, which were made on manganese steel, carbon steel, and forged steel tracks for crawler tractors. It is stated that the results of these tests have almost invariably shown the superiority of manganese steel.

Laboratory tests of the physical characteristics of manganese steel indicate a tensile strength of from 90,000 to 110,000 lbs. per square inch, an elastic limit of about 50,000 lbs. per square inch, an elongation in 2 in. or about 33 per cent, and a reduction of area of 35 per cent. It is stated that the metal does not become austenitic until about 6 per cent manganese and 8 per cent carbon are introduced. The price of manganese steel is said to be greater than that of carbon steel.

Wrought steel gear blanks for farm tractors, R. B. WOODWORTH (*Agrimotor*, 3 (1919), No. 2, pp. 22, 23, figs. 5).—The progress in the construction of tractor gears is reviewed, attention being called to the change from cast iron and steel to forgings. Data on the materials used for gears in some 150 different tractors manufactured in 1917 and 1918 showed an increase of from 24 to 42 per cent for carbon steel, a decrease of from 40 to 28 per cent for cast steel, and a decrease of from 23 to 13 per cent for semisteel.

What impulse starters have done for tractors, P. A. TANNER (*Agrimotor*, 3 (1919), No. 2, pp. 20, 21, figs. 5).—A description is given of the construction and operation of impulse starters, with particular reference to their use on

farm tractor engines. It is stated that the impulse starter on the tractor makes starting of even the largest engines safe, sure, and easy.

The Nebraska tractor law and rules for official tractor tests, L. W. CHASE, E. E. BRACKETT, O. W. SJOGREN, and G. K. SHEDD (*Nebraska Sta. Circ. 10 (1919)*, pp. 3-14, fig. 1).—The text of the Nebraska tractor law is given, together with details of rules for official tractor tests, and the testing equipment at the University of Nebraska is described. The provisions of the law are as follows:

(1) A stock tractor of each model sold in the State must be tested and passed upon by a board of three engineers under State university management. (2) Each company, dealer, or individual who offers a tractor for sale in Nebraska must have a permit from the State Railway Commission, issued after a stock tractor of that model has been tested at the university and its performance compared with the claims made for it by the manufacturer. Temporary permits are provided before tractors are tested, good until the tests are made. (3) A service station with full supply of replacement parts for each model of tractor must be maintained within the State and within reasonable shipping distance of customers.

The complete test consists of the following parts: (1) Drawbar work at from one-third load to full load for 12 hours: This test gives opportunity for the tractor to "limber up." (2) Brake-horsepower test at rated load and rated speed for two hours: This test will show whether or not the tractor will carry its rated load on the belt; also show fuel consumption at rated load. (3) Brake-horsepower test at load varying from maximum to no load with all engine adjustments as in test (2) for one hour: This will show fuel consumption and speed control on varying load. (4) Brake-horsepower test at maximum load for one hour with governor set as in test (2) and carburetor adjusted to give maximum power: This will show the maximum horsepower of the tractor on the belt. (5) Brake-horsepower test at one-half load for one hour with governor set as in test (2) and carburetor adjusted for most economical operation at one-half load: This test will show fuel consumption at one-half load. (6) Drawbar horsepower test at rated load for 10 hours: This test will be made on a half-mile cinder track and will show whether or not the tractor will carry its rated drawbar load continuously; also show fuel consumption on drawbar work. (7) Maximum drawbar horsepower test: This test will be a series of short runs with an increase of load for each run until the engine is overloaded or the drive wheels slip excessively. (8) Miscellaneous: This may include investigation of work on inclines, turning radius, effectiveness of brakes, or any other feature of the tractor which may seem to require special observation. (9) Tractors will be under observation for endurance throughout the complete test as outlined above.

Report of tractor belt tests in Ohio, J. B. GREEN (*Farm Impl. News*, 41 (1920), No. 7, pp. 26, 27, 41, fig. 1).—Belt tests of 33 tractors, conducted by the department of agricultural engineering of Ohio State University, are reported.

It was found that the average amount of fuel used by all the kerosene-burning machines was 0.854 lbs. per horsepower-hour when pulling their rated load. On the same rated load tractors burning gasoline used 0.833 lbs. of fuel per horsepower-hour. The fuel consumed per horsepower-hour when developing the maximum horsepower was somewhat higher with gasoline than with kerosene.

An outstanding feature of the tests was the influence of the temperature of the cooling water upon fuel economy. The five tractors using the most fuel had an average radiator temperature of 160° F., while the five machines using the least fuel per horsepower-hour had a temperature of the cooling medium 19° higher, or 179°. The data sheets showing fuel used and temperatures for

10-minute intervals nearly always showed that a rise in the temperature of the cooling medium was accompanied by a corresponding decrease in fuel consumption.

All the tractors tested showed an average overload in their maximum tests of 18 per cent. The five tractors showing the greatest percentage of overload had an average of 55 per cent. The five tractors which tested in their maximum tests below their rating fell below less than 5 per cent. It is stated that, in general, all tractors performed well when on test.

Logging with belt tread tractors, C. D. METCALF (*Sci. Amer. Mo.*, 1 (1920), No. 1, pp. 42-44, figs. 5).—Experience with the use of caterpillar tractors and trailers for use in logging operations in the Northwest is reviewed.

Motor tractor trials at Pusa, W. SAYER (*Agr. Jour. India*, 14 (1919), No. 5, pp. 710-714, pls. 5).—Tests of a 22-h. p. tractor with a drawbar pull of from 1,800 to 2,500 lbs. on typical oat stubble soil are briefly reported. The tractor was able to pull a double-furrow disc plow, which is pulled as a rule by three pairs of big bullocks, the engine running with a good reserve on second speed. Other results are reported in more or less detail.

The motor tractor in Great Britain (*Agr. Gaz. N. S. Wales*, 31 (1920), No. 1, pp. 1-5).—A summary of the results of an investigation of the working costs of farm tractors in Great Britain is given. It is stated that in estimating the running cost of a tractor, high-speed light tractors may be given a life of two years, while a 20-per cent depreciation may be allowed for low-speed heavy tractors.

Data on the approximate cost of plowing by tractor showed that the consumption of paraffin varies according to the resistance of the soil to draft. It has been found that spring connections between the plow and the tractor have proved unsatisfactory in England, and that hilly ground is unsuitable for tractor plowing. The speed at which the tractor travels has been found to influence the quality of the plowing, and for good work a speed of from 2½ to 3 miles an hour should not be exceeded. The farm tractor is unsuited for road haulage in England owing to the prevalent type of roads.

The economies of high speed tractor plowing, C. H. SPRAGUE (*Agrimotor*, 3 (1919), No. 2, pp. 14, 15, figs. 3).—The author briefly reports data from experience indicating the advantage of higher speed tractor plowing over low speed plowing.

It is noted that when plowing at a speed of from 3 to 3½ miles per hour, the soil is thrown over well pulverized and in a level condition. Fast plowing is more successful in completely turning under trash and weeds than slow plowing. In a clay loam soil with weeds from 2 to 3 ft. tall, fast plowing left the field level and well pulverized with weeds covered, while in slow plowing the pulverization was poor and the weeds were not covered.

Review of mechanical cultivation, M. RINGELMANN (*Bul. Soc. Encour. Indus. Natl. [Paris]*, 117 (1918), II, No. 5, pp. 275-297, figs. 14).—A review is given of different experiments, conducted in France during 1917, on various aspects of mechanical cultivation.

Attention is particularly called to experiments on vineyard cultivation in different localities, in one case using a 10-20 h. p. tractor. On grapes and cereal crops it was found that the tractor with two men and a 3-furrow plow did as much work as five teams and five drivers in the same time. The conclusion is drawn that any tractor having an axle length equal to the distance between the vines minus 50 cm. (18.7 in.) can be used. It was found that the machine used turned easily on a headland from 4½ to 5 meters wide. Special attention is called to the importance, in purchasing a tractor, of seeing that

any accessories projecting beyond the line of the wheels will allow the tractor to pass between the vines.

Further experiments on the estimation of the work of a power-farming machine lead to the deduction of the formula: $s=Klc$, in which s is the surface plowed, l is the width of plowing, and c , the distance traveled per unit of time. K is a coefficient covering losses in time, and varies from 0.64 to 0.71, with respective speeds forward during work of 1.5 and 0.8 meters per second.

Further experiments on reddish sand and silt soils almost entirely lacking in lime showed that where the soil conditions were good a cylindrical mold-board plow required an average traction of 6.4 lbs. per square inch, while a disc plow required an average traction of but 4.2 lbs. per square inch, giving an economy over the mold-board plow of about 38 per cent. In dry weather it was found that ordinary plows will penetrate these pebbly heavy soils with difficulty and that the shares are quickly ruined, but if sufficiently heavy a disc plow will always penetrate. If the soil is wet, the share penetrates easily, whereas the disc plow kneads the soil like mortar, doing damage. The disc plow, however, is considered generally preferable to the mold-board plow.

Experiments with planting cane sets by hand v. machine planting of same (*Ann. Rpt. Bur. Sugar Expt. Stas. [Queensland], 19 (1919), pp. 14, 15*).—These experiments showed that crop results from the machine method of planting were better than hand planting, both in manured and unmanured plats. The experiment is being continued.

Dusting machinery for cotton boll weevil control, E. JOHNSON and B. R. COAD (*U. S. Dept. Agr., Farmers' Bul. 1098 (1920), pp. 31, figs. 5*).—This publication is intended to aid the prospective purchaser of dusting machinery for cotton boll weevil control in selecting a satisfactory model and one adapted to the needs of his particular farming conditions. It also reports the progress of investigations being conducted in the design and development of dusting machinery, by the Bureau of Public Roads, as a guide to manufacturers.

In dealing with factors affecting machine construction, it is pointed out that every step toward simplifying the operation and maintenance of the dusting machine is a tremendous advance toward making it satisfactory and efficient, when the character of available labor is considered. It is particularly desirable that the operator be exposed to a minimum amount of dust. It is noted that in first tests of power dusters, from 15 to 20 lbs. of calcium arsenate per acre were required to treat cotton satisfactorily, but by improving the machinery so that the dust was broken up better and thus distributed over a larger area, it has been possible to reduce this dosage to about 5 lbs. per acre and secure the same satisfactory results.

With hand operated machines a considerable number of observations based on small areas have shown an average speed of operation of about 1 acre per hour per machine. Experiments to date have indicated, however, that the hand machine has a decidedly limited use. The treatment of areas over 50 acres with a number of hand machines has not proved practicable under most conditions, and it is concluded that the use of the hand machine will be limited to exceedingly small areas of cotton and as an adjunct to large machinery.

The power machines have proved fairly satisfactory, but the desirability of eliminating the engine has become so pronounced that the present tendency is to favor the wheel traction machines. These types are described in some detail. It is pointed out that dusting machinery for cotton poisoning is strictly in an experimental stage, and that it is to be expected that improvements will be developed from time to time for some years.

Plan and details for concrete cattle-dipping vat (*Nat. Builder, 63 (1920), No. 2, p. 59*).—These are working drawings.

Plans of grain elevators. C. S. CLARK (*Chicago: Grain Dealers Jour.*, [1918], 4. ed., pp. [IV]+XLVIII+426, pls. 2. figs. 906).—This is the fourth edition of this book, containing what are considered to be the latest and best arrangements and construction for terminal storage, transfer, and cleaning elevators, together with plans of several hundred country elevators. Grain elevators of varying capacities and of many different types of materials and designs are included.

Loading test of 18-ft. circular concrete grain bin, P. J. HANSEN (*Engin. News-Rec.*, 84 (1920), No. 7, pp. 316, 317, figs. 3).—Experiments are reported on the behavior of grain bins, separated by tie walls, under outside pressure from grain in the interstices. The conclusion is drawn that a circular bin designed for grain pressure will safely stand the same pressure on the convex side, as on the concave side, but that the pressure per square foot should not exceed the pressure on the concave side.

Protection of potatoes from cold in transit—Lining and loading cars (*U. S. Dept. Agr., Farmers' Bul. 1091* (1920), pp. 27, figs. 24).—This bulletin is a revision of Bureau of Markets Document 17 (E. S. R., 40, p. 138), and explains successful methods of lining and loading potatoes in box cars, produce cars, refrigerator cars, and heater cars, based upon commercial practices and the results of tests and inspections. The specific lining and loading directions are designed primarily for cars with a heater in the doorway, unless otherwise specified.

It is stated that of 400 cars of northern potatoes examined during the winter of 1917-18, approximately one-fourth were lined and loaded correctly, while in the remaining three-fourths there was always the danger of overheating the potatoes at the top of the load and at the same time allowing the potatoes on the floor to freeze. It is also stated that it is comparatively simple for a heater to furnish enough warm air to protect a car of potatoes from freezing, even in severe weather. To accomplish this a complete air passage the full width of the car must be kept open around the load. In this connection attention is drawn to the following points: (1) The potatoes must not be loaded close enough to the ceiling to block any part of this circulation, (2) there must be a large, unobstructed opening for the warm air to pass down to the floor after it has spread the length of the ceiling from the heater, and (3) the false floor must be so constructed that this warm air can pass under it at all points back to the heater again. This circulation is slow and labored and is limited by the smallest opening in the space provided around the load, just as the effectiveness of a chimney is limited by the narrowest place in the flue. If the space around the load is partially blocked by the potatoes themselves, or by boards, shavings, or straw, the warm air will not circulate as it should.

Storage and diseases of the sweet potato in Texas (*Texas Sta. Bul. 250* (1919), pp. 41, figs. 39).—This bulletin discusses potato storage, harvesting, management of the potato house, curing and care of sweet potatoes in storage, storage period after curing, and diseases of sweet potatoes in storage, and, as a result of extensive studies made in sweet potato storage, by a committee consisting of J. J. Taubenhaus, E. A. Miller, H. M. Eliot, B. F. Brown, and A. K. Short, presents the details of the Texas A. and M. storage houses.

It is stated that this type of house has been given a severe test under adverse conditions and has proved very satisfactory. It is relatively low in cost of construction, is cheaply and simply operated, keeps potatoes with a minimum loss from rots, and gives them good shipping qualities. The house described is a 5,000-bu. house and is designed as a unit system. This unit

house is advocated because in that unit of bulk it is possible to make use of all the natural conditions of ventilation, and, with proper management, to reduce the losses from rots to a minimum.

The dimensions of the 5,000-bu. house are 59 ft., 10 in., by 26 ft. by 11 ft., 4 in. The preponderance of length is designed to secure the maximum amount of ventilation. The house is built of lumber, this material having been thoroughly tested and found to give satisfaction. It is constructed on piers which extend about 2 ft. above ground, thus allowing the necessary floor ventilation. To protect the house against severe cold spells, outer drop-doors on the north and west sides reaching from the baseboard to the ground are considered desirable. Floor ventilators, windows, doors, and ceiling ventilators, any or all of which may be opened or closed when it is necessary to admit or exclude air currents, are distinct features of the house. A cupola is used for roof ventilation.

Another distinct and important feature of the house is the method of heating and air circulation, which is accomplished by means of a stove and flue. "The features of this system of heating is an opening under the stove, through which the out-door air enters from under the house. The air then passes around a jacketed stove, where it becomes heated and dried in contact with the stove. Since warm air is lighter, it will naturally rise to the ceiling and spread to all parts of the house. As it absorbs moisture from the inside air, it becomes cooler and heavier and falls to the floor, whence it escapes by suction through the bottom openings of the flue. By this method a constant and strong circulation of warm dry air may be maintained whenever damp or cold weather makes it necessary to keep windows and ventilators closed."

The bins are divided into four quarters, two above and two below, thus causing the potatoes to be in small bulk and facilitating the curing process. The bins are also raised above the floor to allow circulation of air from underneath. Provision is also made for storage in hampers, baskets, or crates, where it is not desired to store in bins. A loading platform is provided on the outside.

Thirty-two drawings showing the details of the house are included.

Harvesting and storing ice on the farm, J. T. BOWEN (*U. S. Dept. Agr., Farmers' Bul. 1078 (1920), pp. 31, figs. 30*).—This is a revision of Farmers' Bulletin 623 (E. S. R., 32, p. 591). It discusses sources of ice and methods of harvesting ice, and gives practical working data on the capacity, location, and construction of ice pits and ice houses. General specifications for various types of ice houses are included.

Rural plumbing, G. C. WHIPPLE (*Public Health Rpts. [U. S.], 35 (1920), No. 3, pp. 131-135*). This is a brief outline of rural sewage disposal problems.

Practical types of sanitary privies, C. W. STILES (*Amer. Jour. Pub. Health, 10 (1920), No. 1, pp. 48-52*).—The author concludes that the best kinds of privies for general use are the LRS and the chemical types. The advantage of the LRS type over the chemical lies in the lower cost as averaged over a period of from 5 to 10 years. Its disadvantages are that it requires the addition of water once a week and occasionally produces abnormal odors. The chemical system over the LRS is seemingly better suited for use inside the house, but when emptied there is sometimes a delay in recharging the vat with the proper chemical. It is stated that the chemical generally used has caustic soda as its chief ingredient.

Experiments showed that a 3-per-cent chemical killed the *Bacillus coli* content within 24 hours, and killed the eggs of hookworms and of *Ascaris* and the spores of *Endameoba* and *Lambliia* within a practical period of time. Further

experiments with sodium dichromate in a strength of 4 gm. per liter of excreta showed this chemical to be a practical disinfectant in some chemical closets in warm weather. The adoption of sodium dichromate is not advised until experiments in cold weather have been performed. It is concluded that inspection, follow-up work, and better mechanical construction are factors of supreme importance in a sanitary-privy system.

Treatment and disposal of sewage, H. B. HOMMON, J. K. HOSKINS, H. W. STREETER, R. E. TARBETT, and H. H. WAGENIALS (*Pub. Health Rpts. [U. S.], 35 (1920), No. 3, pp. 101-131*).—Brief descriptions are given of methods, processes, and structures used in the treatment and disposal of sewage in the United States. A bibliography is included.

Fire control on the farm, H. A. VON NIEDA (*Power Farming, 29 (1920), No. 2, pp. 10, 11, 20, figs. 2*).—This is a popular report on methods and means of fire prevention on the farm. Fire extinguishing apparatus is described and its principles and operation explained.

RURAL ECONOMICS.

Agricultural economics, H. C. TAYLOR (*New York: The Macmillan Co., 1919, pp. X+439, figs. 24*).—This, one of the series of social science text-books edited by R. T. Ely, covers the economics of production and of marketing, and the problem of maintaining and improving the economic and social position of the farmer. Problems of land and land tenure, farm credits, equipment, management, labor, and wages, and the grades and proportions of these factors of production are discussed. That portion of the book relating to marketing is devoted mainly to the relations between the farmer and middleman and the difficulties of price fixing on the basis of cost of farm products. Social needs of farm life are outlined, and a survey of the importance of farm accounts and the historical, geographical, statistical, and experimental methods necessary in the investigation of agricultural problems concludes the volume. Much of the material included here has been noted from other sources (E. S. R., 17, pp. 95, 302; 37, p. 290; 39, p. 687).

What is rural economics? J. ISE (*Quart. Jour. Econ., 34 (1920), No. 2, pp. 300-312*).—The author sets forth his view of the fallacy of combining rural economics and farm management. For the sake of academic standards he advocates the strict definition of the subject matter of the two, and the subdivision of the former into subjects such as land problems, marketing of farm products, rural credits, cooperation, and others.

The work of the Office of Farm Management and its relation to the agricultural experiment stations, H. C. TAYLOR (*Jour. Farm Econ., 2 (1920), No. 1, pp. 45-55*).—In this article the outline of research work in farm management and farm economics and of methods of study, previously noted (E. S. R., 40, p. 890), is enlarged upon with the end in view of enlisting State aid in economic investigations.

The application of investigational data to the reorganization of the farm, A. BOSS (*Jour. Farm Econ., 2 (1920), No. 1, pp. 36-44*).—Certain questions most often asked by farmers in regard to farm organization and live stock problems, those of farm equipment, organization and utilization of farm labor, and of marketing are cited, and it is shown how the data for answering them were reached and where they are available. The importance of careful long-time investigation and the easy availability of accurate farm organization information is urged.

Determination of the profits of peasant agriculture, E. LAUR (*Landw. Jahrb. Bayern*, 5 (1915), No. 2, pp. 95-113).—Some simple accounting practices for determining the gross and net profits of the year's business on peasant farms are set forth here. The author, however, favors a double entry system of bookkeeping, and gives several formulas illustrating the distribution of costs among the separate branches of the business, and the determination of relative profitableness. He discusses, also, the relation of size of holdings, diversified and intensified systems of farming, the management of the business, and land classification to net profits.

Scottish agriculture during the war, C. DOUGLAS (*Trans. Highland and Agr. Soc. Scot.*, 5. ser., 31 (1919), pp. 1-66, figs. 3).—This article gives an outline of the organization and activities of the Board of Agriculture for Scotland during the war. Tables given as the appendix, comprising statistics of acreage under crops and grass, numbers of various classes of live stock, and average prices of agricultural products, 1914-1918, with comparisons, were prepared by J. Wyllie from official and private sources.

Proceedings of the French Agricultural Congress (*Cong. Agr. Franç.*, 1919, *Compt. Rend. Trav.*, pp. 65-120, 171-446).—In these resolutions passed by this congress, held at Paris between June 30 and July 3, 1919, are outlined a plan of organization by which farmers in the devastated areas may quickly and efficiently be helped by the State to restore their agriculture, and also for a national federation of agricultural associations. Measures considered necessary for stabilizing the situation existing in regard to agricultural labor, including improvements in rural housing and living conditions, professional training for farm labor, encouraging disabled men to go back to the land, and developing suitable immigration, as well as for improving the agriculture of the French colonies, are presented.

Report of the fifth agricultural and cooperative conference, Burma (*Dept. Agr. Burma, Rpt. Agr. and Coop. Conf.*, 5 (1919), pp. 40).—This report embodies general addresses on the economics of Indian agricultural production heard at the conference held at Mandalay, September 1-5, 1919. Accounts of the progress of cooperative agricultural enterprises, and resolutions of sub-committees on rural finance, insurance, and related matters are also given.

The salvation of the land, J. MÉLINE (*Le Salut par la Terre. Paris: Hachette & Co.*, 1919, pp. 272).—This is a general discussion of land values, means of intensifying French agriculture, agricultural labor, insurance, and cooperation.

The world's food resources, J. R. SMITH (*New York: Henry Holt & Co.*, 1919, pp. [3]+634, figs. 144).—This presents a study of physical, geographic, and economic facts of the world's food supply, also the possibilities of new areas or of those capable of more intensive cultivation, and discusses the adaptation of human consumption to new conditions of world production and trade.

The Illinois Agricultural Association and its job, E. DAVENPORT ([*Chicago*]: *Ill. Agr. Assoc.*, 1920, pp. 18, fig. 1).—It is said that the aim before the association must be that of following, without making entangling alliances, a program covering the larger issues of agricultural development, such as better marketing facilities, credit systems available to all farmers, and more modern living conditions, while at the same time including the development of such local affairs profiting its individual membership as shipping associations, car facilities, improved retail service for farmers, and advice in methods of investment.

Farm bureaus and their job, E. DAVENPORT (*Successful Farming*, 19 (1920), No. 3, pp. 10, 42, 182, 183, figs. 2).—This has been essentially noted in the above.

New Town, edited by W. R. HUGHES (*London and Toronto: J. M. Dent & Sons, Ltd., 1919, pp. 141*).—A chapter on Agriculture in New Town in this "proposal in agricultural, industrial, educational, civic, and social reconstruction" advocates farming on the cooperative colony plan, also on small holdings and allotments, and discusses the educational and financial aspects of the development of agriculture for the good of the community.

Report of the Belgian Peasants' League, C. LUYTGAERENS (*Boerenbond Belge Exercise, 1918, pp. 102*).—Reports of the project previously noted (E. S. R., 42, p. 89) are continued for the year 1918.

Report on the working of the cooperative societies in the Punjab, M. L. DARLING (*Rpt. Work. Coop. Soc. Punjab, 1919, pp. [5]+5+23+II+4*).—This continues reports previously noted (E. S. R., 41, p. 94).

The cooperative grain industry in Russia, B. KOMAR (*Russ. Coop. News, 1-2 (1919-20), No. 7-1, pp. 11-14*).—This is the first of a series of articles intended to illustrate the cooperative hold on raw materials in Russia. The course of the development of cooperative marketing of grain is traced from the early form in local credit associations to the central coordinating organization of the grain trade in the "Southern Russian Cooperative Grain" and the "All-Russian Central Union of Consumers' Societies." General information regarding cooperative flour mills is also given. It is held that cooperatives have obtained a firm foothold in the grain trade of Russia so far as the domestic market is concerned, and we are sure to acquire a lasting hold in the export grain trade with the termination of the blockade and the opportunity to sell abroad.

Farmers' Market Bulletin (*North Carolina Sta., Farmers' Market Bul., 7 (1920), No. 32, pp. 24, fig. 1*).—This number contains an article on The Farmers' Interest in Good Seed, by J. L. Burgess, covering the importance of a perfect stand, relation of vitality to development and maturity, importance of clean seed, and cost of weed seeds, in addition to the usual partial list of field crops, fruits and vegetables, live stock, and miscellaneous produce which farmers have for sale or want to buy.

[**Land tenure and agriculture in the Union of South Africa**] (*Union So. Africa, Off. Year Book, No. 1 (1917), pp. 357-409, figs. 2*).—These pages give statistics and general information relating to the tenure and occupation of Crown lands, land settlement, registration of deeds, and extent of the irrigated area, also to live stock and pastoral production, including dairying and ostrich farming, agricultural production, agricultural cooperation, and the export and import trade in agricultural and pastoral products, mainly for the period 1910-16.

AGRICULTURAL EDUCATION.

Third annual report of the Federal Board for Vocational Education, 1919.—I, Vocational education; II, Vocational rehabilitation (*Fed. Bd. Vocat. Ed. Ann. Rpt., 3 (1919), vols. 1, pp. 256; 2, pp. 56, figs. 12*).—Volume 1 of this report for the year ended June 30, 1919, consists of three parts, viz, the progress and needs of vocational education, a summary of progress by States, and a statistical report.

It is shown that for 1919-20, 35 States have State funds for vocational education equal to or greater than the maximum allotment from Federal funds. Of the total fund allotted to the States for vocational agricultural instruction for 1917-18 approximately 50 per cent was expended, and for 1918-19 approximately 75 per cent. In 1918-19, 30 States employed full-time supervisors of

vocational agriculture and 18 States part-time supervisors. In several States two or more supervisors of agriculture have been provided.

Attention is called to the need for a careful study of the method by which the best use can be made of the land and equipment of special or separate schools of agriculture; also of the best means of providing opportunities for supervised practical work in schools organized for pupils living in sparsely settled sections of the country where it is impossible to establish schools which will provide instruction to the pupils while they are still living at home. The problem of reaching the large group of boys who are engaged in the business of farming but who have not received instruction in technical agriculture is also considered.

Many of the agricultural colleges have already made provision for the recognition of high school agriculture for entrance credit. They also show a tendency so to organize the instruction of the first and second years of the regular college course as to permit the graduate of a high school vocational department of agriculture to elect advanced courses rather than to take the elementary courses which repeat much of the instruction which he has received in high school. There is a tendency to adapt the instruction in a given school to the agricultural needs of the community, and to limit the instruction to the well-established practices which are based upon experience as well as upon the results of college and experiment station work. Science teachers in the rural high schools are relating their instruction more definitely to the fields of agriculture and home economics.

The success of the training of teachers of agriculture is found to be largely dependent upon the meeting of the following conditions by the teacher-training institution: It should be in touch with the latest developments in the field of scientific and practical agriculture in so far as they relate directly to the agriculture of the State, and it should give the instruction in classes in technical agriculture from the standpoint of the use of the results of this instruction in the field of practical agriculture. Further, it should be in constant touch with the farmers of the State in order that there may be direct contact with the condition and development of agriculture in the State. The equipment of the institution should be the equal of any in the State in so far as instructors, laboratories, farm machinery and buildings, farm animals, etc., needed for instruction in subject matter of agriculture are concerned.

In 1918-19 courses for training vocational teachers of agriculture were given in 60 institutions reimbursed from Federal funds, as compared with 40 in the preceding year. During the war many of the States put into operation short intensive emergency courses through which men experienced in farming, trained in science, and with experience in teaching, were given instruction in technical agriculture. These classes have now been discontinued except in some cases where those who have already had one summer of instruction are being given an opportunity to complete a course already begun.

As regards the relationship between cooperative agricultural extension work and vocational agricultural instruction, general policies or principles are stated, upon which it is suggested that the State director of the agricultural extension service and the executive officer of the State board for vocational education should base a plan of cooperation for the State.

Marked progress during 1918-19 in the development of vocational home economics education is indicated both by an increase in the number of schools offering this subject, and the number of women and girls reached by such classes. Only 3 States in 1918-19 did not use Federal funds for instruction in this subject as compared with 10 in 1917-18. While in 1917-18 thirty-one

States made provision for the supervision of home economics instruction, in 1918-19 every State provided some supervision and also certification for its home economics teachers. There has been an improvement in the type of teaching and in the teacher-training courses offered. Plans and methods of supervision and types of vocational home economics schools developed are discussed.

The number of vocational home economics evening schools increased from 123 in 1917-18 to 127 in 1918-19, and the number of teachers from 688 to 758. The short unit course, varying in length from 8 to 36 lessons, has been found most effective in these evening schools. Only 6 States report part-time classes, a total of 27 such classes having been reimbursed from Federal funds in 1918-19.

The number of day schools, organized in most States as a part of the regular high school course, receiving Federal funds in 1918-19 was 309, with 604 teachers, as compared with 200 such schools and 398 teachers in 1917-18. Home project work has been developed in connection with the day schools. Five States have required home work to supplement the classroom instruction, and 2 States have outlined very satisfactory projects which are required of all students taking the vocational courses, and have provided for a system of supervision and reports on such subjects.

The home economics teacher is being employed for 12 months in several of the States. The effort to offer instruction under as nearly normal home conditions as the limitations of the school permit has led in some schools to the substitution of a school kitchen, in which the student works in quantities and uses utensils of average family size, for the individual unit equipment so commonly found in the average home economics laboratory. A number of schools have been equipped with housekeeping apartments, and in one State a practice cottage, fitted up as an average home, is required. Good results have been obtained from the insistence upon the use of the combination lecture and laboratory period. The demand in a number of schools for the production of a product that can be sold has raised the standard of work required of the students.

In 3 States the teacher training in home economics is conducted directly by the State Board for Vocational Education at established centers within the States. In 1918-19 forty-eight States used Federal funds to train teachers of home economics and 67 institutions were designated, with an enrollment of 3,098 and a teacher-training staff of 366. The length of the teacher-training course is 4 years in all States but four, and in two of the latter it is being developed into a 4-year course. More time is being devoted to methods and there has been a decided increase in the amount of practice teaching required. This now varies from 25 to 54 lessons, with a minimum requirement of a course of 3 credit hours or about 36 lessons, actually taught by each student. The improvement of teachers in service has been provided for in only a few States. Suggestions for further progress are made.

Volume 2 of the report deals with vocational rehabilitation. The statistics show that of a total enrollment of 5,650 disabled soldiers 626 were enrolled in agricultural courses June 30, 1919.

Department of rural and agricultural education (*Addresses and Proc. Natl. Ed. Assoc.*, 56 (1918), pp. 271-293).—These proceedings include the following papers presented at the sessions of the department of rural and agricultural education of the National Education Association at its annual meeting in Pittsburgh, July 2-4, 1918: The Relationship Between Teacher-Training Departments Under the Provisions of the Smith-Hughes Act and State Supervisors

of Agriculture for the State Boards for Vocational Education, by G. A. Works, and Sectional Conferences and Periods of Professional Improvement Work for Teachers of High School Agriculture, by R. W. Stimson, which have been previously noted (E. S. R., 40, p. 691); and Project Methods in Teacher-Training in Vocational Agriculture, by A. W. Nolan; Project Methods in Teacher-Training Courses, by W. S. Taylor; Home Project Work Too Small—Something Bigger Needed—A Substitute in Operation, by W. S. Welles; The Birth and Childhood of Vocational Education, with a Forecast of Its Development During Adolescence, by D. Snedden; The New Education in Agriculture Based on Sound Pedagogy, by W. R. Hart; and Effect of Rural Continuation School on Agricultural Efficiency, by R. W. Stimson.

First biennial report and recommendations of the [Mississippi] State Board for Vocational Education (*State Bd. Ed. Miss. Bul. 16 (1919), pp. 21*).—According to this report, the passage of the Smith-Hughes law marks the beginning of systematic work in vocational education in Mississippi. In 1919, 36 schools with an enrollment of 978 boys in vocational agricultural courses were approved, as compared with 30 schools with an attendance of 713 boys in 1918. Practically twice as many boys began projects in 1919 as in 1918, and more than three times as many completed their projects. In 1919 the total amount of profit made by the boys from their projects was approximately \$6,000, more than the total amount paid from Federal funds for agricultural instruction and State supervision for the year. Each vocational agricultural school is required to do some community or agricultural extension work for farmers, which included the setting out, pruning, and spraying of fruit trees, vaccination of hogs against cholera, and of cows and mules against blackleg and anthrax, the terracing of land, the dehorning of cattle, the testing of milk, etc.

Only \$1,000 of Federal funds was available for each of the past 2 years for promotion of vocational home economics, hence only 3 county training schools for negroes and 1 school for white students received Federal aid for this subject. Three State colleges received Federal aid for the training of teachers of vocational subjects. Summaries of expenditures for vocational education are included, as well as brief statements of what other Southern States have done recently to promote vocational education.

Ohio State plan for vocational education (*Columbus: Ohio State Bd. Ed., 1920, pp. 50*).—This is an outline of the plan for the administration and supervision of vocational education in Ohio for 1919–20 under the Smith-Hughes Act.

Approval has been given to the College of Agriculture of the Ohio State University for teacher training in vocational agriculture, and to the Ohio State University, the University of Cincinnati, and Miami University for teacher training in vocational home economics. Of the Federal funds available for teacher training, it is proposed to expend approximately 25 per cent each on agricultural and home economics subjects, respectively.

The teacher-training curriculum in agriculture will be 4 years in length, comprising 136 unit hours, and will include at least 40 per cent of scientific agricultural work, 18 semester hours of professional work in education, which must include a course in special methods in vocational agriculture, and at least 4 semester hours of supervised practice teaching. It has been arranged to offer the latter in the agricultural department of 5 rural and village high schools located within easy distance of the Ohio State University.

The teacher-training course in home economics extends through 4 years and consists of from 30 to 40 per cent of vocational home economics subjects, 20 to 25 per cent of related technical subjects, 12 to 15 per cent of professional subjects, and 15 to 25 per cent of academic subjects. It has been arranged to use a typical high school in Columbus, 2 village high schools, a typical high

school in Cincinnati, and the practice school on the campus of Miami University for observation and practice work.

The relation of nature study to boys' and girls' club work, T. HADLEY (*Nature-Study Rev.*, 16 (1920), No. 2, pp. 54-61).—The author believes that "the close relation of the school and the home will Americanize our foreign population and assist in relieving the present unrest more quickly than teaching English in night schools." It is suggested that nature study and boys' and girls' club work would produce that bond between teacher, school, pupil, and parents as no other subject taught. The ideals of nature study and the advantages that it will bring, if properly taught, to the community and the individual child are briefly reviewed.

The ideals of boys' and girls' club work are divided between two groups of instructors, viz, the far-seeing idealist group that is gradually learning the nature study point of view, and the group which is largely the product of the agricultural college, and who are largely interested in the economic value of the work. In the author's opinion, the ideals which are the background of nature study teaching and those of club work should be the same, as the same results can be obtained. The most advantageous kind of club work is a division of nature study.

Nature study teachers and club leaders should have a knowledge of the scientific subject matter necessary for such instruction, and should be given the nature study point of view. In each normal school there should be a required course in nature study, including the material and the method; also a required course in club work that will furnish the material of club projects and the broad point of view that will give the child all the benefits of club work. Further, no one should be permitted to teach nature study or be a club leader without the above training.

The principles of agriculture for high schools, J. H. GEHRS (*New York: The Macmillan Co.*, 1919, pp. X+[2]+594, pl. 1, figs. 203).—This book consists of five sections dealing with the history, importance, geographical distribution, economic aspects, and factors influencing production, uses, etc., of (1) farm crops, (2) farm animals, (3) soils, (4) horticulture, and (5) farm management. Each chapter is followed by review questions, problems, and references to literature. This book and Gehrs and James's laboratory manual entitled *One Hundred Exercises in Agriculture* (E. S. R., 36, p. 596) are designed for a one-year course in high school agriculture.

Laboratory, field, and project guide in elementary agriculture, G. A. SCHMIDT (*New York: D. Appleton & Co.*, 1920, pp. XVII+226, pl. 1, figs. 75).—This practical guide for teachers of elementary agriculture comprises exercises, projects, exhibits, and things to observe, arranged by months, relating to field crops, seeds and weeds, soils and soil fertility, farm animals, gardening, plant diseases and pests, and horticulture and propagation. It is intended to be used in connection with an elementary agricultural text and to cover two years' work, but is equally adaptable to courses of shorter length in which more time is given per week to the subject. An appendix contains tables showing the digestible nutrients in feeds, elements of plant food in crops and feeds, plant food in commercial fertilizing materials, a gardener's planting table, score cards, etc.

An outline for seasonal presentation of farm crops and horticulture, E. F. JOHNSON (*Ohio State Bd. Ed. Vocat. Agr. Bul.* 2 (1919), pp. 44, figs. 5).—In this seasonal presentation outline of farm crops and horticulture the author suggests subject matter, literature, and references; subjects for class reports; illustrative and laboratory materials; field trip exercises; and laboratory work. Suggestions on preparing laboratory and illustrative material are added.

[**Instruction in gardening**] (*Nature-Study Rev.*, 16 (1920), No. 3, pp. 89-106, 113-122, 124-129, figs. 9).—This number is devoted largely to gardening work and includes the following articles:

Efficiency Aids to Garden Work, by E. E. Shaw (pp. 89-94).—This is a discussion, by the curator of elementary instruction, of aids given in her garden work with children at the Brooklyn Botanic Gardens, including the preliminary work in familiarizing pupils with the materials to be used and the method employed in the use of such materials, begun six weeks before the garden is actually planted.

Gardening as a Part of City Education, by J. L. Randall (pp. 95-97).—The author calls attention to the need of subjects allied to biology for the education of the city child and for the introduction of which, as school and continuation school activities, gardening is paving the way.

A Garden Health Drive, by A. Walker (pp. 98-101).—This is a revision of a play dealing with the classes of garden pests and methods of combating them, which was first published in the *National Service Bulletin* of March 15, 1919.

Some Enemies of the Garden, by G. W. Herrick (pp. 113-122).—This article describes the enemies of the cabbage family, cucumbers and squashes, the Irish potato, the tomato, and radishes, and their habits and methods of control.

Reports from Garden Supervisors (pp. 124-129).—Brief reports are given on the garden work in Waltham, Mass., Louisville, Ky., Philadelphia, Pa., Washington, D. C., Grand Rapids, Mich., and Richmond, Va.

The remaining articles deal with Costumes and Scenery for the Garden Health Drive, by D. Kalb (pp. 101-103); Bits of Interesting School Garden History (p. 104); and Are Exhibits and Prizes of Value? by A. N. Roberts (pp. 105, 106).

Syllabus of The Horace Plunkett Foundation lectures on rural sociology, A. W. ASHEY (*Oxford, Eng.: Inst. Research Agr. Econ.*, [1919], pp. 10).—This is a syllabus of six lectures, given at the University of Oxford in 1919, dealing with the economic foundations of rural society, rural population and its physical conditions, mental condition of the rural population, voluntary associations, constitutional aspects of village society, and social relations between town and country. It indicates the subjects dealt with rather than the conclusions reached. The course is intended to provide an introduction to the study of rural society and to general social conditions in agricultural districts. Aspects of the history of rural life in England and Wales during the nineteenth century are included in order to provide a historical background and avoid generalization without direct reference to concrete facts. A few selected readings and a series of books of reference on the subject dealt with are appended to the summary of each lecture.

MISCELLANEOUS.

Report of West Central Experiment Station, Morris, 1918 (*Minnesota Sta., Rpt. Morris Substa.*, 1918, pp. 54, figs. 14).—The experimental work reported is for the most part abstracted elsewhere in this issue.

Report of the Dickinson substation for the years 1914 to 1918, inclusive (*North Dakota Sta. Bul. 131* (1919), pp. 83, figs. 20).—This report consists of the seventh to eleventh annual reports of this substation. The experimental work recorded is for the most part abstracted elsewhere in this issue.

NOTES.

Delaware College and Station.—George L. Schuster, assistant agronomist of the West Virginia Station, has been appointed professor of agronomy and agronomist, beginning April 1. Louis R. Detjen, assistant horticulturist of the North Carolina Station, has been appointed associate horticulturist in the college and station.

Florida Station.—Dr. R. W. Ruprecht, formerly of the Massachusetts Station, has been appointed plant physiologist beginning May 1.

Idaho University.—Claude Wakeland, deputy State entomologist of Colorado and in charge of alfalfa weevil investigations from 1917 to 1919, has accepted a position as State extension entomologist with headquarters at Boise.

Kansas College.—The second annual students' grain judging contest was held at the college April 10 with 116 students competing. The principal prize was offered by the Kansas Crop Improvement Association.

Kentucky University and Station.—The resignations are noted of Geoffrey Morgan, assistant director of extension, on March 31; Ralph Morgan as district agent in the extension division on April 30; D. D. Slade as extension poultryman on March 15; and O. F. Floyd, extension market specialist, on March 31. Charles A. Mahan has been appointed State agent in the extension division and A. C. Burnette in charge of negro extension work.

Minnesota University.—The honorary degree of Doctor of Agriculture was conferred on Dean R. W. Thatcher April 14 by the University of Nebraska. J. S. Montgomery, formerly connected with the university, has returned as extension specialist in beef cattle, hogs, and horses, beginning May 1.

Nevada Station.—Some interesting results have recently been obtained in a preliminary test of souring sunflower silage by means of lactic acid bacteria. Dr. Lewis H. Wright, assistant veterinarian, has resigned.

New Mexico Station.—Some very encouraging results of pasturing range cows on the native shadscale (*Atriplex canescens*) are reported. Ten range cows, four of them with calves, which were turned out on this native brush about the first of the year have kept in unexpectedly good condition and without loss of weight. This plant gives promise of being an excellent emergency feed, especially during periods of drought and very cold winters. Work on methods for its propagation is now being planned.

Results from the new project for the improvement of the native New Mexico goat by crossing with the Toggenburg breed for milk production are also encouraging. One of the ten does bought out of a common herd from a native goat raiser is now giving 5 lbs. of milk a day.

Ohio State University.—E. F. Johnson, assistant professor of agricultural education, resigned April 15 to engage in farming.

Oklahoma College and Station.—M. A. Beeson, head of the department of agronomy, has resigned to take effect July 1 to engage in commercial work. Frank B. Cross, assistant in horticulture, resigned May 1 to become a county agent in New Jersey.

Pennsylvania College and Station.—The resignations are noted of W. H. Darst as associate professor of farm crops, P. E. Dougherty as assistant professor of animal husbandry extension, C. M. Cummings as instructor in dairy husbandry, and J. S. Owens as instructor in agricultural extension. Recent appointments include the following: Ward C. Pelton, specialist in vegetable gardening at the Connecticut State Station, as professor of vegetable gardening, beginning June 1; Ross M. Gridley, field agent in animal husbandry in the Georgia College, as assistant professor of animal husbandry extension; Henry W. Thurston, jr., formerly associate plant physiologist at the Nebraska Station, as assistant professor of plant pathology; C. R. Mason, instructor in horticulture at Purdue University, as instructor in vegetable gardening, beginning June 1; Allen L. Baker as instructor in agricultural extension; and Frank G. Bamer, B. B. Mason, Paul S. Williams, and Lawrence W. Smith as assistants, respectively, in agronomy, rural organization extension, dairy husbandry extension, and forestry, beginning June 1.

Virginia Truck Station.—John T. Griffin, a member of the governing board since the organization of the station in 1907 and its president since 1913, died April 14. He was largely responsible for the establishment of the station and also for the organization of the Southern Produce Company, which now handles as a cooperative exchange about 75 per cent of the truck farm and market garden products of southeastern Virginia.

Agricultural Education and Research in Latin America.—The Government of Argentina has recently offered additional scholarships in the agricultural schools of Casilda, Tucuman, Cordoba, and Mendoza to young men of Peru desiring to follow up their studies in Argentina. The municipal council of Buenos Aires, on December 22, 1919, passed an ordinance providing for the establishment of a practical school of aviculture in connection with the zoological garden. During the apprentice period pupils will be required to give their services to the school gratuitously. On the completion of the course a diploma as practical aviculturist will be given.

In the Colombian Ministry of Agriculture a department of cattle and meat inspection has been established to study contagious cattle diseases and their remedies, and to inspect cattle and meat products intended for export to countries which demand certificates of inspection. A law of November 5, 1919, grants a subsidy of about \$10,000 for the establishment of a course in agriculture and industries in the University of Nariño.

The Department of Agriculture of Cuba has decided to establish a bureau of commercial information in European and American countries for the purpose of establishing cordial commercial relations between Cuba and the other countries. The first bureau will be established in France.

Organization of Research Department by the Olympia Agricultural Company, Ltd., of Great Britain.—The Olympia Agricultural Company, Ltd., is a British syndicate which has purchased agricultural estates aggregating 20,000 acres in the counties of Yorkshire, Northamptonshire, Cambridgeshire, Suffolk, Warwickshire, and Wiltshire. A research department has recently been organized under the direction of Dr. Charles Crowther, professor of agricultural chemistry in the University of Leeds and director of the institute for research in animal nutrition in that university. This department will exercise advisory functions in connection with the large scale farming operations of the company, and for some time its activities will consist mainly of experiments essential to the establishment of a sound basis for this advisory work, but it is announced that its primary object will be to conduct research in various branches of agricultural science and practice for the general welfare of British agriculture.

The headquarters of the department have been located on the company's estate of about 2,700 acres at Offchurch, near Leamington, in Warwickshire, where the ancient mansion of Offchurch Bury is being adapted to provide the necessary laboratories and other improvements which are now approaching completion. From this center, experimental work with crops and live stock on all the company's estates will be carried out under the general supervision of Capt. F. H. Billington, formerly of the staff of the Irish Department of Agriculture and Technical Instruction.

Under the plans announced, Dr. Crowther will continue and extend his present studies in agricultural chemistry and animal nutrition in addition to his administrative duties. Plant breeding research is expected to be a further prominent feature of the department's activities, under the direction of Capt. Hunter, lately in charge of the plant breeding work conducted in Ireland by the Department of Agriculture and Technical Instruction. Provision has also been made for research on soil problems and plant nutrition, under the direction of Capt. C. T. Gimmingham, formerly chemist of the agricultural research institute of the University of Bristol.

It is stated that liberal financial provision for the research department has been made by the company. *Nature* regards the inauguration of this work as a very important event, concluding its account of the enterprise as follows: "The enhanced appreciation of the importance of research to British industries is one of the most significant effects of the war, and it is gratifying to find that British agriculture, despite its traditional conservatism and suspicion of academic 'theory,' is not to lag behind other industries, and a good omen that it should contain in its ranks men so alive to the value of research as to provide for it within the industry without the stimulus of subvention from the public purse."

Agricultural Instruction and Experiments at the University of Nanking.—

The latest annual report of the College of Agriculture and Forestry of the University of Nanking, China, indicates that noteworthy progress has been made at this institution in the development and extension of its agricultural work. One of the most striking events was the organization, late in 1918, of an agricultural experiment station. This action followed a recommendation by Prof. C. W. Woodworth of the California University and Station, who was then temporarily serving at the college as special investigator and lecturer on entomology. Subsequently, several tracts of land, aggregating about 21 acres, were purchased at a cost of \$9,000. About 5 acres have already been planted to mulberries for sericultural work, and the remainder is under general cultivation. The college also has the use of about 36 acres of vacant university land, though the small size and scattered nature of the various holdings constitute a serious handicap to experimental work. It is estimated that eventually at least 160 acres of adjacent land will be needed for the college farm and station.

Much of the principal work so far under way has dealt with sericulture. About \$5,000 has been provided for this by the International Committee for the Improvement of Sericulture in China. The chief undertaking of the committee is to produce certified silk worm eggs by the Pasteur process and distribute them to farmers, studies at the college indicating an average incidence of disease of 66 per cent for uncertified stock. This work was temporarily interrupted by fire, which destroyed the entire product for the year. The college is also grafting 100,000 mulberry trees for sale at cost in 1921 and 150,000 for 1922, and is carrying on experiments in the production of mulberry cuttings and studies in pruning, fertilization, culture, etc. Tests are being made on

the utilization of the autumn crop of mulberry leaves, as well as breeding and selection work with silk worms. A three-month course in sericulture has been instituted, and extension work through lectures and demonstrations is contemplated.

Cotton experiments have already shown that certain foreign varieties can be successfully grown in China, though careful tests are necessary to determine the adaptability of varieties to diverse conditions. A cooperative test was organized in 1918 in eight provinces with pure seed of the standard test sets of the U. S. Department of Agriculture. The cotton improvement work is being supported by two Chinese cotton mill owners' associations and the Shanghai Anti-Adulteration Association.

Improvement of native corn by pedigree selection has been carried on for four years, and seed distribution to farmers is to be begun this spring. There has also been selection work with about 75 strains of lowland rice, 100 native and foreign strains of wheat, and about 100 varieties of fruits.

There is much interest in forestry, and about 7 acres of land are devoted to forest nurseries. A colonization project on Purple Mountain has largely developed into a reforestation demonstration.

The student enrollment has numbered about 100, of whom 42 were regular students in agriculture, 30 in forestry, and 26 in the short course in sericulture. The demand for trained graduates has exceeded the supply, notably for assistants for agricultural missionary work. There has been a marked increase in interest on the part of missionary organizations and also by a number of influential government officials.

Shakespearean Garden at Stratford-on-Avon.—*Nature* announces that the trustees and guardians of Shakespeare's birthplace at Stratford-on-Avon are laying out the "Great Garden" as an Elizabethan garden. Old-fashioned flowers, such as are mentioned in his writings or are otherwise known to have been then in cultivation will be utilized, thus restoring the garden so far as possible to its original aspect.

Soldier Settlement in Italy.—What is known as the Opera Nazionale per i Combattenti (National Assistance of Soldiers and Sailors) was established toward the close of 1918, primarily to take charge of certain annuities granted to service men on engaging in farming or certain other productive occupations. This organization is empowered to acquire lands from both public and private sources and to improve these properties for eventual sale or lease to ex-service men. It also promotes the formation of farming colonies, cooperative agricultural associations and societies, and affords certain credit facilities.

Miscellaneous.—The legislature of the State of Bahia, Brazil, has recently authorized the department of agriculture to institute a series of agricultural experiment stations throughout the State. A unique feature of the legislation is that the service authorized is to be made self-supporting by the collection of a one per cent export duty on all agricultural products.

Dr. John W. Macfarlane, professor of botany and director of the Botanical Laboratory and Botanic Garden of the University of Pennsylvania, **retires** June 30 after twenty-eight years' service.

EXPERIMENT STATION RECORD.

VOL. 42.

ABSTRACT NUMBER.

No. 9.

RECENT WORK IN AGRICULTURAL SCIENCE.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

Proso millet investigations.—Analysis of the oil.—A characteristic alcohol, B. A. DUNBAR and E. R. BINNEWIES (*Jour. Amer. Chem. Soc.*, 42 (1920), No. 3, pp. 658-666).—In connection with an investigation of the grain of the proso millet, with a view to its employment as a commercial food source, the authors have analyzed the oil which can be obtained by extraction from the grains to the extent of about 5 per cent.

The oil was found to be a semidrying oil, having a specific gravity of 0.9228 at 22.5° C. and a refractive index (Abbé) of 1.4745. The chemical constants were as follows: Saponification number 181.5, iodine number (Hübl) 92.3, free fatty acids calculated as oleic 11.9 per cent, acetyl value 39.23, Reichert-Meißl number 2.5, and unsaponifiable matter 2.52 per cent. The volatile acids constituted 0.36 per cent calculated as formic acid, and the insoluble fatty acids 89.8 per cent of the oil. Of the latter 85.3 per cent were unsaturated and 14.7 per cent saturated. The saturated acids appeared to be composed of a comparatively large amount of palmitic acid with smaller quantities of carnaubic and daturic acids. The unsaturated acids were composed largely of oleic and linolic acids and an isoform of linolic acid.

It was found that the oil on standing for several hours deposited a mass of white crystals, which on purification yielded six-sided crystals resembling those of phytosterol, but differing from the latter in certain respects, particularly the melting point, which was 279°. An examination of this substance has led to the conclusion that it is a ketone-alcohol of a tentative molecular formula of $C_{24}H_{36}O_2$. To this compound, pending its further examination, the name of prosol has been given.

[**Composition of the velvet bean**], E. R. MILLER (*Alabama Col. Sta. Rpt.* 1919, p. 34).—Data are reported on the composition of the velvet bean (Early Speckled variety) as follows: Ash 2.8 to 2.9 per cent, calcium 0.13 to 0.15, magnesium 0.14 to 0.16, phosphorus 0.4, sulphur 0.31, chlorine 0.021, ether extract 6.5, protein 20, carbohydrate (principally starch) 30, and alcoholic extract 12 to 13 per cent.

The ash content of the stems and leaves of the plants collected when the fruit was mature was 2.96 and 11.9 per cent, respectively, and the corresponding figures for the plant in full bloom were 4.37 and 5.85 per cent. The stems of plants in bloom contained 0.71 per cent calcium and 0.319 per cent magnesium, and the leaves 1.433 per cent calcium, 0.214 per cent magnesium, and 0.187 per cent phosphorus.

The results obtained from other varieties of velvet beans did not differ greatly from those of the Early Speckled variety.

Catalysis in theory and practice, E. K. RIDEAL and H. S. TAYLOR (*London: Macmillan & Co., Ltd., 1919, pp. XV+496, pls. 2, figs. 35; rev. in Nature [London], 104 (1920), No. 2619, pp. 463, 464*).—This volume treats of the fundamental principles involved in catalysis and their application in modern chemical processes. The subject matter is considered under the following headings: Early history, theoretical introduction, the measurement of reaction velocity in catalytic processes, oxidation processes, hydrogen and hydrogenation, dehydrogenation, the fixation of nitrogen, hydration and hydrolysis, dehydration, applications of catalysis to organic chemistry, ferments and enzymes, catalysis in electrochemistry, catalysis by radiant energy, and catalysis in analytical chemistry.

An effective connecting bulb, C. M. CLARK (*Jour. Indus. and Engin. Chem., 12 (1920), No. 4, p. 366, fig. 1*).—The essential feature of the bulb described is a baffle plate in the form of a deep watch glass, which is fastened to the exit tube and reaches to within about 5 mm. of the side of the bulb. Any spray entering the bulb from the distilling flask strikes against the concave side of the plate and is prevented from reaching the small holes in the exit tube through which the vapor passes to the condenser. A small hole near the lower extremity of the inlet tube and a slight narrowing of the end of the tube are other features which, although not considered essential, assist in holding back the spray. A diagram is given of the bulb.

The use of cupferron in quantitative analysis, G. E. F. LUNDELL and H. B. KNOWLES (*Jour. Indus. and Engin. Chem., 12 (1920), No. 4, pp. 344-350*).—This paper consists chiefly of a review of the literature on the use of cupferron ($C_6H_6 N. NO. ONH_4$) as a quantitative precipitant, together with the results obtained at the U. S. Bureau of Standards in an attempt to adopt the cupferron method to the determination of zirconium.

The conclusion is drawn that while cupferron has been successfully used for the quantitative determination of copper, iron, titanium, zirconium, thorium, and vanadium, so many elements interfere with the determinations that the method should not be employed unless the qualitative composition of the substance is known, or a qualitative examination of the ignited and weighed cupferron precipitate is made. It is thought that cupferron can be used to good advantage in certain separations, such as iron from manganese and iron and titanium from aluminum and manganese.

Boric acid modification of the Kjeldahl method for crop and soil analysis, F. M. SCALES and A. P. HARRISON (*Jour. Indus. and Engin. Chem., 12 (1920), No. 4, pp. 350-352*).—An investigation of the possibility of using boric acid in place of sulphuric acid for the absorption of ammonia in the Kjeldahl nitrogen method as suggested by Winkler (*E. S. R., 31, p. 108*) is reported from the Bureau of Plant Industry, U. S. Department of Agriculture.

The boric acid solution was prepared by dissolving the pure crystallized acid in distilled water at room temperature in the proportion of 4 gm. of the acid to 100 cc. of the water. It was found that 50 cc. of this solution was sufficient to absorb 95 mg. of nitrogen as ammonia. Methyl orange, congo red, and bromthymol blue were used as indicators in titrating the excess of boric acid with standard H_2SO_4 . With the first two the end-point was determined by matching against a standard. With bromphenol, the end-point was observed by arranging an electric bulb a few inches from the reflecting surface of the burette stand in such a way that the flask was between the bulb and reflecting surface, the end-point being the disappearance of the purple color. This indicator proved more satisfactory than the other two.

Comparative tests with sulphuric and boric acids as absorbing solutions for the ammonia set free from ammonium sulphate and from various crops and soils in the usual Kjeldahl procedure are reported, which indicate that the boric acid method gives as accurate results as does the sulphuric acid. It is recommended as of special value in laboratories where many nitrogen determinations are made, as it requires only one standard solution and is time saving in that the boric acid solution can be measured without special accuracy. If the acid solution is made of such strength that 1 cc. equals 1 mg. of nitrogen or some whole number multiple, further time may be saved on calculations.

Colorimetric determination of glycogen, R. THIEULIN (*Jour. Pharm. et Chim.*, 7. ser., 21 (1920), No. 3, pp. 91-93).—For the quantitative determination of glycogen in small fragments of liver, the author recommends a colorimetric procedure depending upon the reaction of glycogen with iodine. A series of standards is made up containing known amounts of glycogen in solution and a fixed amount of iodine, and these are matched against a solution of the sample prepared by treating the liver with concentrated KOH, precipitating the glycogen with an equal volume of alcohol, centrifuging, dissolving the precipitate in distilled water, and neutralizing it with acetic acid.

Invertase activity of mold spores as affected by concentration and amount of inoculum, N. KOPELOFF and S. BYALL (*Jour. Agr. Research [U. S.]*, 18 (1920), No. 10, pp. 537-542).—This contribution from the Louisiana Sugar Experiment Station consists of a study of the limits of concentration of cane sugar solutions at which the invertase of mold spores is active, together with a study of the influence of the numbers of mold spores upon their invertase activity in sugar solutions at the saturation point. The spore suspensions were prepared according to the methods previously described (*E. S. R.*, 42, p. 336).

The invertase activity of the spores of blue aspergillus (*Aspergillus sydowi*), *A. niger*, and *Penicillium expansum* was exhibited at concentrations of sugar varying from 10 to 70 per cent, the maximum activity occurring between 50 and 60 per cent concentration. The spores of the blue aspergillus appeared to be relatively more active in inverting power than the other two molds.

Invertase activity in a saturated sugar solution was found to increase with the number of spores. The least number of spores required to produce inversion in such a solution was about 5,000 for *A. sydowi*, and between 50,000 and 110,000 for the other two species.

These results are considered suggestive in their bearing upon the practical problem of sugar deterioration. "A certain correlation to be emphasized is that the blue aspergillus, which was found to have the greatest capacity for deteriorating sugar (besides occurring with greatest frequency), has spores which appear to exhibit the most intense invertase activity in saturated sugar solutions. Since we have pointed out that sugar inoculated with spores of this mold deteriorated without the development of mycelia, the conclusion would appear to be substantiated that mold spores alone, if present in sufficient number, are capable of deteriorating sugar."

The effect of concentration on the deteriorative activity of mold spores in sugar, N. and L. KOPELOFF and B. BYALL (*Jour. Indus. and Engin. Chem.*, 12 (1920), No. 3, pp. 256, 257).—The results of the above study are corroborated by an investigation of the deteriorative activity of mold spores in sugars of known composition. A series of sugars with films of known composition were prepared by coating large crystals of sterilized sugar with sterilized black strap molasses and 60° Brix sugar sirup in definite proportions and purging in the centrifuge. The sugars were aseptically inoculated with mold spores

by adding 15 gm. of sugar, containing approximately 1,000 spores per gram, to 135 gm. of sugar in Erlenmeyer flasks, which were then tightly corked and paraffined. The corresponding molasses was inoculated with a single scoopful of mold. All of the flasks were incubated at from 28 to 30° C. The results obtained are tabulated and summarized as follows:

"A decrease in concentration of molasses inoculated with molds is responsible for a progressive increase in reducing sugars and a decrease in sucrose Clerget when incubated at 30° for 4 months. A decrease in the concentration of films in inoculated laboratory-made sugars having films of unknown concentration, and moisture ratios of 0.08 to 0.2 caused an increase in reducing sugars (and a decrease in sucrose Clerget) which gave evidence of active deterioration. These sugars were incubated at 30° for 1 month, and similar results followed a like incubation of 4 months. *Aspergillus sydowi*, followed by *A. niger* and *Penicillium expansum* in the order named, effected the greatest deterioration in both molasses and sugar."

Food preserves, L. LAVOINE (*Les Conserves Alimentaires*. Paris: Libr. Hachette & Co., 1917, 6. ed., pp. VIII+156, figs. 99).—This is the sixth edition of a manual of food preserving designed for both the town and country housewife, and also the farmer or producer. It contains brief general directions for the preservation of foods by heat sterilization, refrigeration, desiccation, antiseptics, and surface coating, and special directions for the treatment of specific materials under each general process. The subject matter is supplemented by illustrations and diagrams.

Process of treating dried fruit, S. KATZPROWSKY (*U. S. Patent, No. 1,253,045, January 8, 1919*).—This patent (No. 1,253,045) covers a process of treating dried fruits with a dextrin-containing solution, preferably commercial glucose, which prevents sugaring of the fruit and at the same time improves the appearance of the dried product.

The process, as applied to raisins, consists of heating nearly to the boiling point a commercial glucose solution of from 36 to 46° Balling and immersing the raisins in the solution for from 10 to 20 seconds, after which the raisins are heated to 200° F. for a short time to evaporate the water of solution. When dried the glucose forms a glossy tough coat which prevents the cracking of the raisins and the consequent sugaring of the pulp. The amount of glucose which is required to thoroughly seal the fruit adds from 2 to 3.5 per cent to the weight of the fruit.

[Fruit drying] (*California Sta. Rpt. 1919, pp. 31, 33, 34*).—The summary of research work of the station along this line during the past three years includes a brief report of a survey of the State covering drying practices, conducted by W. L. Sweet.

About 8 lbs. of sulphur per green ton of fruit is used in drying fruit. The average exposure to the sulphur dioxid fumes varies from 4 hours to over night, after which the fruit is exposed to the sun for 2 or 3 days and then stacked for the same length of time. Peaches are dried for 3.5 days in the sun and about 6 days in the shade. With pears, from 15 to 20 lbs. of sulphur per green ton is used with an average exposure to the sulphur dioxid fumes of from 12 to 48 hours, exposure to the sun for 1 or 2 days, and stacking for from 10 to 28 days. Prunes are first dipped in a solution of 4.6 lbs. of lye to 100 gal. of water just below the boiling temperature, and are then sun-dried on trays for about 5 days and stacked for the same length of time. Data are given on the drying rate of different varieties of peaches and prunes.

In experiments on drying fruits without sulphurous acid, W. V. Cruess has found that the color of most fruits is satisfactorily retained if the fruits are

cooked in a 40 per cent glucose solution for from 3 to 30 minutes (depending upon the fruit) before drying. A study is being made by E. L. Overholser and Cruess of the chemical processes involved in the sulphuring of fruits and their effect upon the fruit tissues, and upon the palatability of the product. The possibility of salvaging rain-damaged prunes by sulphuring has been previously reported by Cruess (E. S. R., 41, p. 117).

Fruit-drying investigations during the summer of 1918 with several varieties of peaches indicate that some of the white-fleshed varieties may prove as useful for drying purposes as the yellow varieties now handled. A comparison of the dried products of fully ripe with partially ripe peaches showed an 11 per cent gain in weight of the ripe over the partially ripe fruit.

The process of treating dried fruits with a dextrin solution, developed and patented by S. Katzprowsky as noted above, has been found to consistently prevent sugaring in experimental tests.

[Grape juice and sirup] (*California Sta. Rpt. 1919, pp. 40, 41*).—The preliminary report by F. T. Bioletti and W. V. Cruess on grape sirup, previously noted (E. S. R., 40, p. 414), is supplemented by the statement that "a sirup of fresh grape flavor and of either deep red or white color has been made by a combination of the freezing and the vacuum evaporation processes. This sirup is excellent for table use, water ices, ice cream, and for a beverage when diluted with carbonated water. It may be made from wine grapes or sound second crop and cull table or raisin grapes."

It is also stated that satisfactory grape juices of a red color and considerable acidity or tartness can be made by combining slightly under-ripe red wine grapes with ripe Muscat or highly flavored wine grapes, such as Semillon or Riesling.

[Olive investigations] (*California Sta. Rpt. 1919, pp. 41, 42*).—A study by W. V. Cruess and J. R. Zion of the control of color in ripe olives is reported.

The darkest and best color was obtained when the lye used did not exceed 3 per cent or fall below 1 per cent, and when the first treatment barely penetrated the skin. Exposure after the second lye treatment did not increase the color. Slight alkalinity of the brine in the cans (not over 0.01 per cent) increased the color, while acidity bleached it. The use of enameled cans was found to be favorable to the stability of the color, while plain tin injured the color and clouded the brine. A study by Cruess of the functions of lye during the various stages of olive processing has been previously noted from another source (E. S. R., 42, p. 113), as has also the description of a new process of olive pickling by the use of heated, aerated, and circulating liquids (E. S. R., 38, p. 617).

A process by which the disagreeable odors and flavors of inferior olive oil can be removed has been developed by Cruess and C. C. Scalione. The process consists of treating the oil at from 185 to 190° F. with about 0.1 per cent of soda ash, from 2 to 5 per cent of fine bone-black, and a stream of carbon dioxide, after which the oil is cooled and filtered.

In cooperation with A. W. Christie it has been found that olive pomace contains from 6 to 14 per cent of oil, which may be recovered by means of solvents such as gasoline, and used in soap making.

METEOROLOGY.

Determination of normal temperatures by means of the equation of the seasonal temperature variation and a modified thermograph record, F. L. WEST, N. E. EDLEFSEN, and S. EWING (*Jour. Agr. Research [U. S.], 18 (1920), No. 10, pp. 499-510, figs. 6*).—This paper, which is a contribution from the Utah

Experiment Station, "gives an approximate solution of the problem of the determination of the normal temperature at a certain place at an assigned hour of the day on a particular day of the year.

"An equation that shows the seasonal change in temperature is presented and gives the mean daily temperature in terms of the time of year. Another equation gives the percentage of the mean temperature that the temperature of a particular hour of the day is in terms of the time of day. The product of the results of the solution of the equations gives the temperature sought. The equation is of general application, inasmuch as the first term is the mean annual temperature and the value for the location considered is to be inserted in the equation before using it.

"An arithmetical solution is also presented. The hourly temperatures, expressed as percentages of the mean daily temperatures, are given. The mean monthly temperature for each of the 12 months must be known for the location considered. The mean daily temperature changes approximately one-third of 1° F. a day, except from December 15 to January 15 and from July 15 to August 15, when the mean temperature for any day is approximately equal to the mean temperature for the month. With this information, the mean daily temperature is readily calculated, and by multiplying this value by the percentage found in the table for the particular hour considered, the desired probable temperature is obtained.

"In the arid West the mean error of the method of determining the normal temperature is very small, but the mean error in predicting the actual temperature is 7°, with 60 per cent of the errors less than this amount. These errors are due largely to the abnormal temperatures produced by rain and snowstorms."

Alfalfa seed growing and the weather, with particular reference to conditions in Utah, J. C. ALTER (*Utah Sta. Bul. 171 (1920), pp. 3-31, figs. 9*).—This bulletin is based upon the results of a study of climatic conditions in the older alfalfa growing regions, e. g., Persia and Turkestan, and in the humid as well as the drier portions of the United States where alfalfa seed production has been attempted, especially in Utah.

It is shown that "seed crops are matured occasionally in nearly all parts of the United States, but the certainty of the crop and the security of the industry are greatest in the Plateau States, where the yields per acre are much the greatest. A crop is grown in the Central States in those seasons when the corn crop fails because of drought; the yields here run from 2 to 3 bu. per acre; but over the more arid West, crops of from 4 to 6 bu. are grown about four years out of five. The failures of the western crops are due principally to such causes as temporary shortage of irrigation water; excessive wet from inopportune rains, perhaps on a recent watering; desiccating winds at blossom time; untimely spring or autumn frosts; grasshoppers; and weevils."

In humid regions the seed crop "is strictly limited to the thinnest stands on the driest lands, and even there the seed sets in fair quantities only in the occasional extremely droughty years. . . . Even in the more favorable arid regions the seed crop is very exacting in its current meteorological requirements, from the first spring growth, through early summer maturity, to late summer or autumn harvests. . . . The seed crop is a more or less direct result of the meteorological conditions which produce the preceding crop of hay."

The main meteorological requirements appear to be "a rapid and early rise of springtime temperatures, without setbacks or lack of moisture, to get the first or hay crop off the field, also to place the right amount of moisture in the

soil for producing a vigorous and thrifty root system, and get the seed crop started off in time to mature before autumn frosts. The summer must be quite dry to produce seed rather than stem and leaf growth, and yet moisture must be ample and timely for filling the seed. Heavy rains must not wash away the pollen. If dependent on natural precipitation, 2 or 3 in. a month from March until June in Utah, with from $\frac{1}{2}$ to 1 in. a month in light showers from July to September, are desirable. The summer must not be too warm, particularly at blossom time, as the wilting and blighting of the bloom occurs readily when moisture is deficient and winds and temperature excessive. The optimum mean temperatures in western Utah are about as follows: March, when the hay crop begins growth, 40° F.; April, 48° for rapid development; May, 56°; and June, 65° . . .

"The seed crops should have a July mean temperature of about 70° and August 75° for the blooming and seed setting periods. If the average September temperature is 60° or lower it appears that there is a strong probability of frost before harvesting is completed. . . . Seed yields greater than average in Utah seem to require an abnormally warm spring, the temperatures from 3 to 5° above normal, at least during March and April. Such a spring should be followed by a summer from 2 to 4° cooler than usual to give a slow and gradual growth and a consequent better and more extensive setting of seed. Mean monthly maximum temperatures above 90° in the blooming months are unfavorable, and short periods with temperatures above 100° when moisture is deficient, cause light yields. The seasons are somewhat longer and freer from frosts on the gently sloping lands near the mountains than far out on the flat lands, the season being lengthened from two to three weeks." "An excess of cold cloudy weather at blossom time is unfavorable, an optimum being about 30 to 35 per cent cloudiness. . . .

"The average maturing season for the principal seed regions of Utah is about 80 days, the first cutting coming about June 15 to 20. Forty days are then required to reach the early blossom stage, or cutting time for hay, being July 25 to 30. Forty additional days necessary for maturing the seed bring the harvest about September 4 to 9, one or two weeks before the average date of first killing frost in autumn. The extent of frost injury is greatly lessened by cutting the partly ripened seed just prior to a frost, as the seed is much better protected in the bunch or windrow. A light frost is warded off by irrigating the land just prior to the frost. Weevil depredations are greater in cold, wet spring seasons, and dry, hot weather in summer favors weevil extermination by dust mulching. After a late spring heavy pasturing and spraying are recommended for weevil extermination."

"There is usually little winterkilling of ordinary alfalfa in any of the better seed growing States, and the plant is accredited with the ability to withstand great extremes of heat in summer and cold in winter without especial injury to its root system, though the Grimm, Baltic, and sand lucern varieties and other hardy strains do best in Montana and adjacent regions, while the Peruvian variety does best in the warmer regions of California and Arizona. . . . The Baltic, Grimm, sand lucern, and some others [do best] where the general average winter temperatures are from 20 to 25° and summer temperatures 70 to 75°, but the Peruvian variety does best where the winter mean temperature is above freezing and the summer means 85 to 95°."

A considerable bibliography of the subject is appended.

A further report on Montana climate, E. BURKE and R. M. PINCKNEY (*Montana Sta. Circ. 87 (1919), pp. 15, figs. 4*).—The available data on precipi-

tation and temperature as recorded at 30 selected places in the State are summarized and discussed, with the particular purpose of giving a comprehensive idea of precipitation conditions in the past and their probable recurrence in the future.

The rainfall data are classified with reference to three natural rainfall districts, namely, eastern mountain, western mountain, and plains districts. "The mountain district west of the main range shows an annual rainfall of 15.75 in., with extremes ranging from 11.65 in. to 22.13 in. The average rainfall for the growing season of April, May, June, and July is 6.23 in., or but 40 per cent of the annual. In the northwestern corner of the State the seasonal rainfall is even a smaller proportion. Only 26 per cent of the rain of the year comes in May and June. This district must make a special effort to conserve the fall and winter precipitation. In the mountain district east of the main range the average yearly rainfall is 16.22 in., varying from 11.09 in. to 23.53 in. The rainfall for April, May, June, and July is 53 per cent of the annual, and that for May and June is 35 per cent of the annual.

"The plains area of the State is drier than either of the mountain areas. The average yearly precipitation is 13.63 in., with a range from 12.06 in. to 15.51 in. The rainfall for the growing season is about 55 per cent of the annual, and that for May and June is 37 per cent of the annual. Contrasting the districts east of the Continental Divide, it is noted that while the plains district has over 2.5 in. less annual rainfall it has only 1.2 in. less during the growing season and about 0.7 in. less in May and June.

"Considering next the dry year of 1904 and also those of 1917, 1918, and 1919, we find not alone a low annual rainfall, particularly east of the Continental Divide, but a rainfall during the growing season that shows a lower percentage of the total than is normal, while May and June show a very low percentage of the total precipitation. This is particularly true of this year, 1919. We had thus two adverse conditions during the past three seasons; first, a low annual rainfall; and, second, a lower percentage of that which did come fall in the growing season." The rainfall records at the majority of the points of observation agree with the general average, although there are purely local differences in rainfall quite aside from the characteristics of the large surrounding areas.

In addition to the tables, four charts are given, showing the rainfall for the growing season, April to July, inclusive, at Helena, Havre, Miles City, and Bozeman. The records available lend no support to the belief that the plowing up and cropping of the soil causes an increase in rainfall. "No human activities have been able to bring about any perceptible change in either rainfall or temperature. There is no argument whatever for this in Montana when we consider that not over 10 to 12 per cent of the land area of this State is plowed or cropped each year, and probably not over 25 to 30 per cent will ever be plowed. It is true, however, that the extremes of wet and drought which recur in all localities are most severely felt where from inexperience or lack of means the settlers have not arrived at a permanently satisfactory method of planning and operating their farms so as to meet these adverse conditions with least loss."

Data are given which show that the monthly mean temperature during the growing season of 1919 was higher than that of any preceding year recorded. Limited observations on humidity indicate that dry periods are apt to be windy, and that periods of little rainfall and high temperature are times of low humidity of the air.

[Weather at Crookston, Minn., seasons of 1917 and 1918], C. G. SELVIG (*Minnesota Sta., Rpt. Crookston Substa., 1917-18, pp. 11-15, figs. 3*).—Observations at the substation at Crookston, Minn., on precipitation and killing frosts, 1897-1918, and on temperature, 1916-1918, are reported, and the general weather conditions of the seasons of 1917 and 1918 are briefly described.

The season of 1917 was as a whole the driest on record, the precipitation being 10.79 in. as compared with an average of 21.1 in. for the 21 years, 1897-1918. "The growing season was 35 days less than the average. The latest frost was recorded on June 1 and the earliest killing frost in the fall on September 2. Corn failed to mature. Grass crops were short. Grain crops were of excellent quality and on carefully tilled soil gave an average yield. . . .

"The precipitation in 1918 was 18.07 in. The season was one of the earliest on record, the first seeding being done April 2. While 3.06 in. of rain fell during April and 2.96 during May, it came at intervals which did not prevent spring seeding. Corn, however, received an unfavorable start. The season was 14 days shorter than the average. As a result very little corn matured. The latest frost in the spring was recorded on May 21, and the earliest in the fall on September 8. . . . The season was very favorable for grain crops, the station fields and plats yielding above the average."

Meteorological data, R. W. EDWARDS (*Texas Sta. Bul. 253 (1919), pp. 8-10*).—Tables are given which show monthly and annual precipitation at the Chillicothe substation, Texas, from 1906 to 1917, inclusive, with monthly and yearly averages and monthly maximum, minimum, and mean temperatures at the same place from 1913 to 1917, inclusive.

The average annual rainfall for the 12 years 1906 to 1917 was 24.09 in., varying from 12.59 in. in 1917 to 34.81 in. in 1915. The temperature records show that "the winter temperatures do not usually fall below zero. Summer temperatures are relatively high, and thus plants requiring much heat, as, for instance, cotton and certain sorghums, which are more or less subtropical in their nature, reach maturity with certainty. These high temperatures are moderated somewhat by the dryness of the air. Rather dry atmosphere is not detrimental to such crops as sorghum and cotton, but it does have an adverse effect on corn, soy beans, and other crops which require a more humid atmosphere for their maximum production."

SOILS—FERTILIZERS.

Parallelism of the soils developed on the gray drifts of Minnesota, C. O. ROST (*Thesis, Univ. Minn., 1918, pp. 68, pls. 12*).—A study of the relation of the chemical composition and the physical properties of certain glacial soils of Minnesota to the age of the drift upon which they have been developed is reported.

Ten virgin fields were sampled on each of three types, the loam and silt loam of the Carrington series and the silt loam of the Fargo series, representing, respectively, forest, upland grassland, and lowland grassland. The samples were taken to a depth of 3 ft. in four separate sections, the first 6 in., the second 6 in., and the second and third feet. Five fields on a fourth soil type, Marshall silt loam, developed only upon the loess overlying the Kansan till, were included in the study and treated similarly in so far as part of the determinations are concerned. Three of these were still in virgin forest and two were adjacent to land that had been cleared and given over to farming.

It was found that the texture of the fine earth of each type, as indicated by the moisture equivalent, is very similar on both drifts, but the proportion of coarser fragments is lower in the soils on the Kansan than in those on

the Late Wisconsin. On the older formation, the original fragments of the softer rock (limestones, shales, and cherts) have almost entirely given way to the processes of weathering throughout a depth greater than 3 ft. A general relation was found to exist between the calcareousness and the texture, the finest textured soils retaining the most carbonate and the coarsest the least.

With the two soils of the Carrington series the degree of acidity, as indicated by the litmus, the Truog, and the ammonia methods, is the more pronounced on the Kansan. With the loam the carbon dioxide content is alike on both drifts, carbonates having been removed to a depth in excess of 3 ft., but with the silt loam (although on the Kansan the leaching has been as extensive as on the preceding type) considerable amounts of carbonate still remain in the third foot on the Late Wisconsin. On the fields of the Fargo type much less carbonate has been removed in the case of either drift, and the reaction is less frequently acid on the Kansan than on the younger drift. On the Kansan the calcium carbonate has been leached out to a depth greater than 3 ft. on both the Carrington types, while on the Late Wisconsin the same is true for the Carrington loam, but there is still an appreciable quantity in the third foot-section of the Carrington silt loam. The lime, other than that in the form of carbonate, is similar both in amount and distribution on the two Carrington types, but in the first 2 ft. in the Fargo silt loam it is considerably higher on the Kansan. The magnesia in each type is very similar from drift to drift, but is considerably higher in the Fargo silt loam than in the other types. The ratio of total lime to magnesia is slightly higher on the Late Wisconsin. The ratio of lime in the form of silicate to magnesia is very similar for each type from drift to drift, except with the Fargo silt loam, where it is lower on the younger formation.

The phosphoric acid is higher on the Kansan; this being true for each of the three types. On the two prairie types it shows a decrease from the surface downward, but with the forest type the vertical distribution is irregular. Both potash and soda are very similar in corresponding sections from the two drifts, except that with the Carrington loam the potash is slightly higher and soda distinctly lower on the later glaciation.

In volatile matter the corresponding sections from the two drifts are very similar, except that the Fargo silt loam in the surface 6-in. section shows nearly twice as much on the Kansan as on the Late Wisconsin. The organic carbon, both in amount and distribution, is very similar from drift to drift with both of the Carrington types, but in the first two sections of the Fargo silt loam it is higher on the Kansan, in this resembling the volatile matter. The forested fields show lower percentages than those on the grassland. The distribution of nitrogen resembles that of organic carbon and volatile matter. In relative darkness of color there is no difference between the drifts in the case of any of the soil types, except in the surface 6-in. section on the Carrington loam and the second and third foot-sections on the Fargo silt loam. With these the soil on the Late Wisconsin is somewhat darker.

"If the three types of soils, studied in detail, were to be classified according to the Russian system, the Fargo silt loam would be considered a true chernozem, the Carrington silt loam a chernozem in the early stages of degradation, and the Carrington loam a degraded chernozem. In general, the first 3 ft. of soil on the well-drained areas, originally similar in topography and profile and later covered by the same type of vegetation, are almost identical on the two drifts, which would suggest that the age of the most recent glaciation is so great as to have permitted the uniformity in climate and in vegetative

cover, which has prevailed on the two sides of the dividing line in any locality, to almost completely obliterate the effects of the great difference in age."

The soils of Jackson County, H. V. TARTAR and F. C. REIMER (*Oregon Sta. Bul.* 164 (1920), pp. 62, pl. 1).—This bulletin is intended to supplement a previous report on a soil survey of the Medford area, as conducted by the Bureau of Soils of the U. S. Department of Agriculture (E. S. R., 31, p. 513), and reports the results of chemical analyses of samples of the representative soils of Jackson County in southern Oregon, together with some of the progress results of fertilizer experiments. The area discussed covers about 348,160 acres of valley and adjacent hill and mountain land which are mainly of residual and alluvial origin. The average texture of these soils is a clay loam. The drainage conditions are in general good.

The chemical analyses show (1) that there is an abundant supply of potassium, calcium, and magnesium, (2) that none of the soils are acid, some of them containing considerable amounts of limestone, (3) that the phosphorus supply is only fair in some types and low in others, (4) that the nitrogen content (also organic matter) is prevailingly low, in some cases being already deficient for the maximum growth of nonleguminous crops, and (5) that sulphur is present in most of the soils in very limited quantities, and its supply is one of the most limiting factors in the growth of crops, making large demands for this plant food.

"The soils of Jackson County can be made far more productive by liberating the latent plant food in them. This can be done by deeper plowing, fall plowing, increasing the humus content, proper handling and application of all the stable manure, rotation of crops, the growing of legumes, and irrigation and drainage wherever needed.

"The only fertilizers that have produced marked increases in yield are sulphur fertilizers for the legumes, nitrogen for fruit trees and grains, especially in the lighter soils, phosphorus when used in conjunction with sulphur on alfalfa on some of the poorer soils. Potash has been of value on only one ranch, where the soil is an old swamp bed largely composed of vegetable matter."

Soil investigations (*California Sta. Rpt.* 1919, pp. 59-65).—The results of a number of studies on the physics, chemistry, and bacteriology of California soils are summarized.

Experiments on nitrification indicate that while nitrogen is the limiting plant food element in California soils, the limiting factor in crop production is not the incapacity of the soil to effect nitrification. Studies on the effect of soluble salts on soil by W. P. Kelley indicate that sodium salts set calcium free from the soil silicates, equivalent amounts of sodium becoming insoluble. The extent of the replacement is proportional to the concentration, and the reaction conforms to the mass action formula and is reversible. The degree of replacement is widely variable in different soils, being greatest in heavy and least in sandy soils. Potassium and ammonium salts produce similar effects. Calcium salts replace magnesium. Chlorids, sulphates, and nitrates are only slightly absorbed by soils, and phosphates are absorbed to some extent. Neutral soils have the power of neutralizing considerable amounts of sodium carbonate, this being more marked in heavy soils than in light soils.

Studies by D. D. Waynick demonstrated that soils may vary strikingly within the smallest distances at which they can be sampled practicably. Greenhouse experiments on the relative availabilities of nitrogenous fertilizers in California soils deficient in nitrogen, using barley as a crop, showed that ammonium sulphate is superior to all other nitrogenous fertilizers, followed in

order by sodium nitrate, calcium nitrate, dried blood, high-grade tankage, and steamed bone meal. In connection with these experiments, C. B. Lipman and W. F. Gericke found that the addition of sulphur to fertilizers resulted in as good yields with sodium nitrate as with ammonium sulphate, which is taken to indicate the need of these soils for sulphur. Greenhouse studies by Lipman with barley on the availability of peat nitrogen in sand soil, in which the peat was used untreated, treated with steam under pressure for three hours, and treated with weak sulphuric acid and then with steam under pressure, showed that no significant differences were obtained between controls and the peat-treated cultures. This is taken to indicate that peat is practically useless as a source of available nitrogen to crops in California soils. Experiments by Wright on the decomposition of soil minerals by bacteria indicate that the acid produced by bacteria, chiefly carbonic acid, is responsible for the solvent effects on minerals, and it is the opinion that bacteria are, therefore, concerned in the supply of available minerals to plants.

Studies on the fixation of nitrogen by *Azotobacter* by Waynick and Woodhouse indicate that a very large percentage of the total nitrogen fixed in the first studies of growth of *Azotobacter* in culture consists of amino-acid nitrogen. This is taken to indicate that the elementary nitrogen passes through the simple organic forms before it is made into protein forms, and that the nitrogen is fixed by combination with hydrogen and not with oxygen. Studies by D. R. Hoagland and A. W. Christie on the effect of irrigation waters on the osmotic pressure and reaction of various soils led to the conclusion that an irrigation water may produce a much more injurious effect on a sandy soil than on a heavy one.

[**Work in soil chemistry and bacteriology at the New Jersey Stations, 1918**], J. G. LIPMAN and A. W. BLAIR (*New Jersey Stas. Rpt. 1918, pp. 181-184*).—This report notes the progress in experiments on the availability of nitrogen and on the accumulation and utilization of nitrogen in field and cylinder experiments during 1918 (*E. S. R.*, 40, p. 125), and reports a reorganization of the gypsum and iron sulphate experiments. A partial summary of the nitrogen availability experiments has been previously noted (*E. S. R.*, 39, p. 817).

The results so far secured on the gypsum and iron sulphate experiments do not seem to justify the continuation of the experiment in accordance with the original plan, and it has been decided to make a change in both the rotation and fertilizer treatment. The eight plats have been divided into two sections, four plats constituting a nonlegume and four plats a legume section. Two plats in each section will receive potassium chlorid at the rate of 50 lbs. per acre annually. The other two plats in each section will receive no potash. The rotation is to be as follows: 1918, all plats in corn (winter vetch on legume section); 1919, all plats in oats, followed by buckwheat on nonlegume section and soy beans on legume section, as green manure crops; 1920, all plats in wheat; 1921 and 1922, two plats in each section in timothy, and two plats in each section in timothy and clover.

Soil moisture studies on heavy soils (*California Sta. Rpt. 1919, pp. 13, 14*).—Moisture studies in citrus groves on heavy types of soil by E. E. Thomas have shown that irrigation furrows should not exceed 250 or 300 ft. in length in such soil, and that much better results are obtained by the use of a 45 or 60-day interval between irrigations. Less frequent and more thorough cultivations are also considered necessary on such soils.

Improved hydraulic agriculture in swamps, sand wastes, and arable soils, B. PETROCCHI (*Atti R. Accad. Geogr. [Florence], 5. ser., 16 (1919), No. 4*,

pp. 201-227, pl. 1, fig. 1).—A plan is outlined, based on preliminary studies for the reclamation of swamps and sand waste soils, and for the improvement of the arable soils of an area of about 40,000 acres in the neighborhood of the cities of Pisa and Livorno, in Italy.

Alkali investigations (*California Sta. Rpt. 1919*, pp. 65-67).—A survey by W. P. Kelley et al. of the irrigation water supplies in use throughout the citrus and walnut belt of California indicates that the major portion is of excellent quality but that a considerable portion contains alkali. The poorer water usually comes from wells. In a few cases as much as 2 tons, and in a still greater number of cases from $\frac{1}{2}$ to 1 ton, of alkali is being added to the soil per acre per annum.

Studies by C. B. Lipman and L. T. Sharp on the chemical treatment of alkali land showed that where about 50 tons of strong sulphuric acid were sprayed on 40 acres of alkali soil there was a clear improvement in the productive power of the soil, but not great enough to justify the sulphuric acid treatment in practice. The effect of the treatment seemed to decrease the second year and showed a tendency to disappear. Treatment with sulphur gave no results.

A greenhouse experiment by Lipman and W. F. Gericke on the effect of barnyard manure on alkali showed that applications at the rate of 20 or more tons per acre prevented partly or wholly the injurious effects of excessive amounts of alkali salts in the soil growing barley. This treatment seemed almost without effect in the fifth season. Experiments on the influence of heavy metals on alkali salts showed that with barley the sulphates of copper, lead, zinc, iron, and manganese may prevent any considerable injury by common salt, sodium sulphate, or sodium carbonate when present in the soil in toxic concentrations.

Soil alkali, F. S. HARRIS (*Utah Sta. Circ. 41 (1920)*, pp. 3-7, fig. 1).—Popular information is given regarding alkali in semiarid soils, its action toward crops, and methods of reclamation of alkali land. It is stated that the native vegetation and a chemical analysis of the soil to a depth of at least 6 ft. make an excellent combination in determining the degree of contamination of alkali land. If sagebrush is growing vigorously it may be assumed that the alkali content is not excessive. On the other hand shadescale, greasewood, saltweed, and salt grass all indicate the presence of dangerous quantities of alkali. Drainage and the proper use of irrigation water are considered the quickest and most effective means of reclaiming alkali land.

Crop yields on the Golden Valley peat experimental fields in 1918, F. J. ALWAY and C. G. SELVIG (*Minnesota Sta., Rpt. Crookston Substa., 1917-18*, pp. 90-93, fig. 1).—Experiments with 16 different grain, hay, and root crops on a peat soil from 12 to 36 in. deep, underlaid by black muck and yellowish gray clay loam, are reported, the treatments being manure, phosphate, and potash, and burning. With one or two exceptions there were marked crop increases resulting from manure, phosphate, and burning. It is considered evident that these soils need available phosphoric acid, and the benefit of burning is ascribed to the fact that the peat ash is regarded as a low-grade phosphatic fertilizer. It is considered probable also that potash will be required within a few years on part of these peat soils.

"As most of the grass-covered peat lands of Marshall, Pennington, Clearwater, Polk, Kittson, and Roseau Counties, and the western part of Beltrami County appear similar in origin and composition to those at Golden Valley, it is not improbable that most of them will behave similarly with phosphate, manure, and burning. Peat landowners in these districts are advised to experiment on their own fields with acid phosphate on a small scale."

The effects of nitrate of soda on soils (*California Sta. Rpt. 1919, p. 14*).—Experiments by W. P. Kelley showed that after sodium nitrate was used annually for a period of 11 years on citrus trees the trees became wholly unprofitable and showed the most extreme symptoms of mottle-leaf. Soil studies showed that at first calcium was set free by sodium nitrate, producing beneficial effects. In course of time the available calcium became reduced to a low point, and further applications of sodium nitrate brought about excessive concentrations of soluble sodium in the soil solution. Concurrently, the soil became greatly deflocculated and impervious.

British synthetic ammonia developments (*Amer. Fert., 52 (1920), No. 6, pp. 80, 97, 100, 104*).—Attention is drawn to the proposed establishment in Great Britain of the so-called Claude synthetic ammonia process which increases the pressure of combination from 200 atmospheres, as used by the Germans, to 1,000 atmospheres without reducing the temperature at which the combination is effected. "By increasing the pressure of reaction to 1,000 atmospheres the yield of ammonia is increased fourfold, up to 50 per cent, while the speed of reaction is commensurately increased. The power required to compress to 1,000 atmospheres is admittedly greater than to 200 atmospheres, but there are some essential advantages secured, which in the final result makes the total power expended per ton of synthetic ammonia produced no larger than what is required for compression at 200 atmospheres."

The report of the British Nitrogen Products Committee is also summarized.

The utilization of dead animals and organic wastes, in the manufacture of superphosphates containing nitrogen, A. MORVILLEZ (*Indus. Chim. [Paris], 5 (1918), p. 150; abs. in Chem. Zentbl., 1919, IV, No. 6, p. 181*).—The manufacture of a nitrogen superphosphate from 100 kg. of flesh, 90 kg. of sulphuric acid, and 200 kg. of raw phosphate is described. It was found that 350 kg. of superphosphate was obtained, containing from 1.5 to 2 per cent of organic nitrogen and 18 to 20 per cent of citrate-soluble phosphoric acid.

Barium phosphate experiments, A. W. BLAIR (*Amer. Fert., 52 (1920), No. 7, pp. 142, 144*).—Experiments conducted at the New Jersey Experiment Stations with barium phosphate in comparison with barium sulphid, basic slag, raw rock phosphate, and acid phosphate, are reported. The soil used was a sassafras loam and the crops grown were soy beans and corn. The barium phosphate was added at the rate of 600 lbs. per acre and the other phosphates at the rate of 300 lbs. per acre.

There was little difference between the check plats and those treated with phosphates. The opinion is expressed that barium phosphate should not be condemned without further trial, but "farmers should note that it is a low-grade, slowly available material and that the price which is now being asked for it is only a little below the price of acid phosphate, which is a thoroughly tried and readily available material."

Conditions in the European phosphate market, W. C. PHALEN (*Amer. Fert., 52 (1920), No. 5, pp. 138, 140, 142, 144*).—It is stated that indications in the European fertilizer market point to a prosperous condition caused chiefly by the growing demand for all classes of fertilizer material in spite of a shortage of supplies. It is reported that phosphate rock has been found in Drenthe and Overijssel Provinces in northeastern Holland. Analyses show the material to be of a low grade, containing only 25 to 30 per cent of calcium phosphate, but it is considered to be of great value as a fertilizer. Low grade phosphate rock deposits are also reported as existing in the Twente District in eastern Holland. While difficult and expensive to mine, about 30 tons of from 15 to 20 per cent material are being produced daily.

Data on the consumption of phosphates in France are reported, and it is stated that the future policy of the French Government will be to regulate the exportation of African phosphate rock for many years to insure an adequate home supply. The estimated needs for France in 1919 are given as 1,100,000 tons of phosphate. It is estimated that approximately 2,000,000 tons of superphosphate can be used annually to great advantage in Spain. Brief data are also given on the phosphate situation in Italy.

Potash recovery at cement plants, A. W. G. WILSON (*Canada Dept. Mines, Mines Branch Bul. 29 (1919), pp. 34, pls. 6*).—Investigations on progress in the development of successful processes for recovering potash from flue dust in a form suitable for industrial purposes are reported and summarized.

A list of 50 references to literature bearing on the subject is appended.

German potash production and prices (*Amer. Fert., 52 (1920), No. 5, pp. 67-69*).—Data on the production, use, and export of potash in Germany are reported. It is stated that the total production of actual potash for 1919 was 946,000 short tons, of which 264,000 tons were sold abroad, the remainder meeting about 41 per cent of home requirements. A further increase in the schedule of prices of potash for domestic consumption is announced, amounting to about 45 per cent.

It is noted that the new prices are about six times as high as the prices in force at the beginning of the war. Expressed in terms of marks per American unit, or 1 per cent of actual potash per short ton, the new price of potash for domestic consumption are as follows: Crushed carnalite, containing from 9 to 12 per cent actual potash (K_2O), 4.64; crushed crude salts, containing 12 to 15 per cent actual potash, 5.45; manure salts, containing 20 to 22 per cent actual potash, 6.73; manure salts, containing 30 to 32 per cent actual potash, 7.55; manure salts, containing 40 to 42 per cent actual potash, 8.82; muriate, containing 50 to 60 per cent actual potash, 10.46; muriate, containing 61 per cent K_2O , 11.46; and sulphate of potash, containing 42 per cent K_2O , 13.82.

Production problems are also discussed.

Spanish potash: Good prospects but Government inactivity (*Amer. Fert., 52 (1920), No. 6, pp. 57, 58*).—It is stated that in the area that has been investigated in Spain in the neighborhood of Suria there are approximately 10,000,000 tons of anhydrous potassium oxid worth about \$731,000,000 on a prewar basis. Other less important areas are briefly described. A complaint is voiced against Government inactivity with reference to the Spanish potash deposits.

The limestone deposits of New South Wales, J. E. CARNE and L. J. JONES (*N. S. Wales Geol. Survey, Min. Resources Ser. No. 25 (1919), pp. XII+411, pls. 91, figs. 11*).—This report deals in considerable detail with the distribution, nature of occurrence, composition, and characteristics of all the known limestone deposits of New South Wales, and describes the present condition of the lime, cement, and marble industries and the possibilities of their further development. It is stated that limestone is widely distributed in New South Wales, the more important deposits occurring within the central and eastern portions of the State.

"The great bulk of the limestones of New South Wales are remarkably low in magnesia contents, and though the occurrence of dolomite as a mineral in veins and ore channels has frequently been noted, the workable deposits of high-magnesian limestones are few."

Numerous analyses of samples of limestones are included.

[Soils], M. J. FUNCHES (*Alabama Col. Sta. Rpt. 1919, p. 19*).—Further studies at the station on the toxicity of soluble manganese in acid soils (E. S. R., 39, p. 627) showed that manganese may be regarded as a very good

indicator of an acid condition, but that of itself it is not likely to produce harmful effects unless present in very large amounts. The toxicity of certain soil extracts was apparently due more to the acidity of the solution, or to the combined effect of acid and aluminum, than to the manganese, which was frequently found. The results obtained by means of seedling cultures in soil extracts indicated that manganese carbonate may lower the acidity of such extracts and thus render the solutions better mediums for growth.

Efforts to determine whether salts of aluminum were toxic, more because of the acidity of such salts than because of the direct effect of the aluminum, gave disappointing results, since the aluminum could not be kept in solution when the acidity was destroyed. Certain plants, like velvet beans and peanuts, appeared to be more able to throw the aluminum out of solution by neutralizing the acid than other plants, such as clover or Melilotus seedlings.

In recent work several soils from north Alabama gave very acid extracts after incubation with dried blood. It was shown that each of these soils from which very acid extracts were obtained supported nitrification of dried blood, and that soluble manganese was present in large quantities in most cases.

This work is to be continued.

The large-scale use of carbon-dioxid fertilization, F. RIEDEL (*Mitt. Deut. Landw. Gesell.*, 1919, pp. 427, 451, 467; *abs. in Chem. Ztg.*, 43 (1919), No. 121-123, *Beilage*, p. 245).—Experiments on the use of carbon-dioxid gas from blast furnaces in hotbeds and in open fields are reported. The gas was conducted from the blast furnaces through pipes. In the hotbed experiments it was found that the yield of tomatoes in the gassed soils was 2.75 times that in the un-gassed soils, and the yield of cucumbers 1.7 times that in the un-gassed soils.

Experiments on open plats with a number of crops, including beets, potatoes, barley, and lupines showed large increases in all cases in favor of the gassed soils. The method of securing and applying the gas is described.

The use of cane molasses as a fertilizer, LINDET (*Compt. Rend. Acad. Agr. France*, 5 (1919), No. 28, pp. 737, 738).—A brief summary of information relative to the cause of the crop increases from the use of molasses on soils leads to the conclusion that this is due not to the potash in the molasses, but either to a favorable influence on the nitrogen-fixing bacteria or to an increase in the solubility of soil elements.

Crop injury by borax in fertilizers, O. SCHREINER, B. E. BROWN, J. J. SKINNER, and M. SHAPOVALOV (*U. S. Dept. Agr., Dept. Circ. 84* (1920), pp. 35, *figs. 25*).—Earlier experiments and observations by others bearing on the subject are reviewed, and preliminary field experiments on the influence of a Searles Lake potash salt containing 6.25 per cent borax ($\text{Na}_2\text{B}_4\text{O}_7$) when used in complete fertilizers having from 2 to 8 per cent potash on potatoes and cotton are reported, which were carried out in cooperation with farmers in the States of Maine, New York, New Jersey, Virginia, North Carolina, South Carolina, and Georgia.

Investigation of cases in certain sections growing potatoes and cotton indicated the use in fertilizers of potash salts containing borax in what proved in practice to be excessive quantities. The higher the potash content of such mixed fertilizers the higher was also the borax content and the greater the damage to the crop. This damage was greatest when the fertilizer had been drilled in with the seed, and was more severe where the soil and climatic conditions were such as to leave the fertilizer and seed, or the sprouting seed, too long in contact with the borax-containing salts. The greatest damage was done to germination, which was either entirely prevented or much delayed,

sometimes many weeks. This showed itself in many missing hills, producing a poor stand and consequently a reduced yield.

It is not thought likely that damage of a permanent character has resulted this year on the fields subjected to this borax trouble. This is indicated by the fact that rainfall immediately following the application of the fertilizer, a moister condition of the soil when applied, a slightly reduced quantity used, owing to the improper regulation of the drill, or a better distribution in the soil, especially when broadcasted, all tend toward a marked reduction, even to the vanishing point, in the harmful effect of the borax.

Analyses showed that the borax content in many commercial mixtures found on affected farms was rather high, varying from 0.73 to 2.3 per cent. An examination of the potash salts occurring in commerce showed that some contained as much as 12, 20, and even 30 per cent of borax.

In the field experiments no such serious injury has resulted as occurred in commercial fields, but even here the yields were materially affected.

In addition, greenhouse studies with pots to obtain data on the limits of toxicity of borax are reported. A large number of fertilizer mixtures were used with wheat and cotton as the plant indicators of toxicity, and with a much wider range of borax content than was feasible in the field experiments. This indicated for wheat plants a toxic limit of 2 to 3 lbs. of borax per acre, while with cotton this toxic limit appeared to be higher, between 8 and 9 lbs. per acre. The reactions were in all cases decisive and left no doubt as to the poisonous action of the borax on the plants.

Inspection of commercial fertilizers for the season of 1919, H. D. HASKINS ET AL. (*Massachusetts Sta. Control Ser. Bul. 12 (1919), pp. 3-77*).—This bulletin contains the results of actual and guaranteed analyses of 615 samples of fertilizers and fertilizing materials collected for inspection in Massachusetts during 1919, together with a list of manufacturers and brands, and data on composition, cost, and valuation of crude stock materials.

A study of the nitrogen used in the mixed complete fertilizers for 1919 showed that the average total nitrogen found was 2.65 per cent, made up of nitrates and ammoniates 1.35 per cent and organic nitrogen 1.3 per cent. The average total nitrogen found in ammoniated superphosphate was 3.5 per cent, of which nitrates and ammoniates made up 1.56 per cent and organic nitrogen 1.94 per cent. Of the total phosphoric acid found in the complete mixed fertilizers, 85.5 per cent was present in available form and 66.4 per cent of the available phosphoric acid was in water-soluble form. In the case of the ammoniated superphosphates, 87.9 per cent of the total phosphoric acid was in available form and 61.2 per cent of the available phosphoric acid was in water-soluble form.

The average complete fertilizer contained 1.88 per cent of water-soluble potash. Out of a total of 119 brands analyzed, 47 failed to meet the minimum potash guaranty and 64 fell below the minimum guaranty in one or more elements. Out of the 159 brands of ammoniated superphosphates analyzed, 34 fell below the minimum guaranty in one element, but none of the brands were deficient in both elements. Other valuation data are included.

[**Fertilizer analyses**], R. E. ROSE and F. T. WILSON (*Fla. Quart. Bul. Dept. Agr., 30 (1920), No. 1, pp. 42-64*).—Special analyses of 284 samples of fertilizers and fertilizing materials taken by purchasers in Florida during 1919 are reported, together with actual and guaranteed analyses of 4 samples of fertilizing materials termed illegal and collected for official inspection.

Analyses of fertilizer by the Department of Agriculture for 1919 (*Va. Dept. Agr. and Immigr. Buls. 145 (1919), pp. 10-30; 146 (1919), pp. 11-25; 147*

(1919), pp. 9-24).—Actual and guaranteed analyses of 513, 335, and 370 samples of fertilizers and fertilizing materials, and 5, 8, and 11 samples of lime, respectively, as made by the Virginia Department of Agriculture during 1919, are reported in these publications.

Analysis of fertilizer by the Department of Agriculture for 1919 (*Va. Dept. Agr. and Immigr. Bul. 149* (1920), pp. 8-11).—Analyses are reported of 56 samples of fertilizers and fertilizer materials, 8 samples of lime, and 2 samples of lime and potash, offered for sale in Virginia during the fall of 1919 and found to be deficient within the terms of the fertilizer inspection law.

AGRICULTURAL BOTANY.

Effect of the relative length of day and night and other factors of the environment on growth and reproduction in plants, W. W. GARNER and H. A. ALLARD (*Jour. Agr. Research [U. S.]*, 18 (1920), No. 11, pp. 553-606, pls. 16, figs. 3).—The results are given of investigations carried on by the authors in the Bureau of Plant Industry, U. S. Department of Agriculture, in which a dark chamber was used for growing plants, by which the number of hours of exposure to sunlight could be controlled. As a part of the investigation, a series of plantings of soy beans was made in the field at intervals of three days throughout the season, in order that the effects produced by different dates of planting could be compared with those produced by artificial shortening of the daily exposure to light.

Tobacco, soy beans, and a large number of other plants were experimented with, and it was found that the relative length of the day was an important factor in the growth and development of the plants, particularly with respect to sexual reproduction. In some species it was found that the normal plant could attain flowering and fruiting stages only when the length of day falls within certain limits. Consequently, these stages of development are ordinarily reached only in certain seasons of the year. In the absence of favorable length of day for bringing into expression the reproductive processes in certain species, vegetative development was said to continue more or less indefinitely, thus leading to the phenomenon of gigantism. On the other hand, under the influence of a suitable length of day, precocious flowering and fruiting may be induced. In this way certain varieties or species may act as early or late maturing, depending on the length of day to which they happen to be exposed. The species exposed to a length of day favorable to growth and sexual reproduction have shown a tendency to assume an ever-blooming or ever-bearing type of development.

The relationship between annuals, biennials, and perennials was studied, and under artificial conditions it was found possible to change the nature of the plants materially. In all species studied the rate of growth was found directly proportional to the length of the daily exposure to light, but within the limits of the experiment light intensity was not found a factor of importance. With soy beans, limiting water, inducing temporarily wilting daily, was without effect on the date of flowering, although the drought hastened the final maturing of the seed. Interrelationships between length of day and prevailing temperatures of the winter season are said to control successful reproduction largely in many species and their ability to survive in certain regions. The authors point out that the relation between the length of the day and the time of flowering is of great importance in crop yields, and indicates the necessity for seeding at the proper time.

[**Botanical studies by the California Station**] (*California Sta. Rpt. 1919*, pp. 14, 15, 67, 68).—The effects of alkali on citrus have been found by W. P.

Kelley to vary widely for different localities. They are usually marked by chlorosis, mottling, yellowing, or burning of the leaf margins or tips, perhaps also premature defoliation. In all these cases, fruit yield and quality are usually impaired, and in extreme cases the trees become unprofitable. Lemons are more sensitive than oranges to alkali. Suitable manuring, watering, and drainage offer promise of success in restoring normal conditions.

The composition of normal citrus trees is said to alter rapidly as growth proceeds. The young leaves contain relatively high percentages of nitrogen, phosphorus, and potassium, which attain their maximum during the first 6 or 8 weeks of growth and decrease considerably just before the leaves fall normally. Calcium exceeds potassium after the first week, and attains to 5 per cent or more of the dry weight of the leaf at maturity.

Mottled as compared with normal leaves contain less calcium and more potassium, phosphorus, and nitrogen. Trees showing mottled leaf are abnormal in not securing the requisite calcium and in absorbing excessive amounts of potassium. This tendency, though most marked in the leaves, is evident in other portions of the tree.

The casual variability in the yields of orange, lemon, walnut, and apple orchards has been determined by L. D. Batchelor and H. S. Reed with special reference to its bearing on the value of small plot trials as compared with larger, continuous plots, knowledge of the normal yield of a plot often being important in comparisons.

Critical studies on culture solutions for plant growth have been made by D. D. Waynick, the object being to eliminate errors in method and to appraise past work in the light of knowledge of such errors. Briefly stated, it has been shown that the sizes of containers for culture solutions have been too small in the past, and that difference between so-called good and poor solutions almost disappear or lose significance when studied on a statistical basis. It is found, also, that the season is an important factor as to differences between good and poor solutions, the differences being much greater between the two in the late spring than in the winter under greenhouse conditions at Berkeley. The variability in the growth of the plants in the poor solution is much greater than that of the plants in the good solution.

A new method of obtaining the soil solution has been devised by C. B. Lipman, which is said to be simple, direct, and efficacious.

The rôle of the tapetum, M. MASCÉ (Compt. Rend. Acad. Sci. [Paris], 168 (1919), No. 22, pp. 1120-1122, figs. 4).—The author gives an account of studies intended to furnish precise information regarding the nature, behavior, function, and fate of the tapetum, chiefly in *Datura arborea* (*Brugmansia candida*), and as confirmed by observations on other species.

This layer is said to accumulate nutritive materials in a dissolved condition in the cellular vacuoles. These materials are afterwards transformed, resulting in the elaboration of starch, fats, and other bodies, which are delivered to the pollen. This activity is followed by the degeneration of the tapetal cells and the nuclear multiplication and other modifications which are in close relation with their functions and alterations thereof. The tapetal layer is, therefore, clearly defined by its functions, which are nutritive and secretory, conforming in the course of their evolution to the general laws of cellular biology.

The absorbent power of root tips, H. COUPIN (Compt. Rend. Acad. Sci. [Paris], 168 (1919), No. 10, pp. 519-522).—Experimentation with peas as here outlined has led the author to the conclusion that root tips possess absorbent power as regards water, and that this power permits the plant to attain the

maximum growth consistent with the available quantity of nutritive substances and with other conditions.

The transformation of the plant ovule into an ovary, J. A. HARRIS (*Proc. Soc. Expt. Biol. and Med.*, 16 (1919), No. 8, pp. 134-136).—In a study of basal and of placental proliferation in fruits of *Passiflora gracilis* it was found that the former occurred in about 3.33 per cent and the latter in 0.039 per cent of the cases. Both occurred at the same time in 18 individuals out of the 568,098 fruits examined. Basal proliferation, while presenting morphological problems, is considered for reasons stated as not having the physiological significance attaching to placental proliferation.

Germination of barley pollen, S. ANTHONY and H. V. HARLAN (*Jour. Agr. Research* [U. S.], 18 (1920), No. 10, pp. 525-536, pls. 2, figs. 2).—Experiments were conducted by the Bureau of Plant Industry, U. S. Department of Agriculture, to determine the viability of barley pollen in various solutions and in different moist chambers. Extensive studies were also made of fertilization under field conditions, using pollen in eight successive stages of development.

The artificial germination of the pollen was found very difficult, but under properly controlled moist chamber conditions a certain degree of success was attained. It was found that a proper range of humidity must coincide with a certain range of temperature. The retention of viability by barley pollen when stored under various conditions was studied, but no satisfactory results were obtained. A study of the conditions governing fertilization in nature is said to show that conditions unfavorable to fertilization are also unfavorable to progress in the development of pollen and vice versa. In this way natural fertilization is assured.

Diœciousness in *Thalictrum dasycarpum*, J. H. SCHAFFNER (*Ohio Jour. Sci.*, 20 (1919), No. 2, pp. 25-34).—The author contributes to the general problem of the nature of diœciousness a number of observations made on *T. dasycarpum* as representing a genus of plants quite low in the evolutionary scale yet showing considerable specialization. This species presents no important sexual dimorphism as between staminate and carpellate plants except in the sporophylls themselves, and but little between stamens and carpels before the final elongation of the filaments.

A considerable percentage of the individuals are apparently strictly staminate or carpellate, and from these extremes, intermediates grade up through all degrees to individuals which produce nearly an equal number of stamens and carpels. The intergradation as regards sexual characters is illustrated by examples, and it is thought that almost any degree of expression of maleness or femaleness could be found. Great diversity of sexual expression can be found on different branches of the same inflorescence. In *T. dasycarpum* and some other plants maleness or femaleness may not be expressed until a late stage has been reached in the vegetative growth of the annual shoot. The facts noted in this connection are discussed in their supposed bearings, more particularly on the question of the nature of sex and its developmental history.

Amygdalopersica formonti, G. RIVIÈRE and G. BAILHACHE (*Compt. Rend. Acad. Sci. [Paris]*, 161 (1915), No. 17, pp. 497-499; 168 (1919), No. 10, p. 525).—In the first of these two articles, an account is given of the spontaneous development in 1908 of almond shoots on the trunk and branches of old peach trees originally grafted on almond stocks, these shoots being situated as much as 2 meters from the graft union. This phenomenon was examined in 1910 by a Commission of the French National Society of Horticulture and studied by other botanists. The name *A. formonti* was given to this production, which was considered as a graft hybrid by L. Daniel.

Blooms perfectly typical of almond appeared on these shoots each year, 8 to 10 days earlier than on the peach trees (trunk and branches) bearing them. The resulting fruits were typical and during 1915 attained sufficient growth to display characters of bitter and not of sweet almonds. Plantings were made testing fertility and heredity.

Record is also made of the development at other places named, apparently spontaneous, of almond branches on peach trees.

As set forth in the second article, the seed from one of the almond fruits, referred to in the above note, was planted April 25, 1916, and demonstrated fertility in this strain by producing a tree. This has, during three years, displayed only characters which are appropriate to the almond, and which are particularly pronounced as regards the leaves.

It is further stated that in 1917 the original almond shoot produced three more fruits, the seeds of which were planted in 1918 and produced each a vigorous young almond tree. This is regarded as evidencing the normal fertility of *A. formonti*.

Production of glycocoll by *Isaria densa*, M. MOLLIARD (*Compt. Rend. Acad. Sci. [Paris]*, 167 (1918), No. 22, pp. 786-788).—On various protein substrata with certain additions, *I. densa* effects a notable production of glycocoll.

Egg albumin as a complete food for *Isaria densa*, M. MOLLIARD (*Compt. Rend. Acad. Sci. [Paris]*, 168 (1919), No. 10, pp. 523, 524).—Further work with *I. densa* has shown that the utilization of albumin as substratum is more rapid than when this is impregnated with a saccharine solution, and that in the former case a more considerable oxidation also occurs. Other observations are noted. Egg albumin prepared as indicated is said to satisfy all the nutritive requirements of *I. densa*. The phenomena of intense oxidation of egg albumin are thought to be correlated with a very weak respiratory quotient and the formation of oxalic acid.

The relation between the number of chromosomes of a species and the rate of elimination of mongrel blood by the pure-sire method, H. H. LAUGHLIN (*Proc. Soc. Expt. Biol. and Med.*, 16 (1919), No. 8, pp. 132-134).—Results with discussion are given of calculations said to show that in breeding as far as the F_2 generation by means of pure male parents in a 12-chromosome species (as illustrated by man) the probability that a given species carries absolutely no mongrel descended chromosome is 1:0.205. From this it is concluded that beyond the F_2 generation selection for mass improvement by the pure male method in a 12-chromosome species is practically ineffective.

A Darwinian statement of the Mendelian theory, H. F. ROBERTS (*Nature [London]*, 103 (1919), No. 2598, pp. 463, 464).—The author notes, with discussion, a number of statements by Darwin in his *Animals and Plants under Domestication*, which he believes constitute virtually a statement of the Mendelian theory of the distribution and recombination of factors in hybrid offspring.

FIELD CROPS.

Report of agriculturist, E. F. CAUTHEN (*Alabama Col. Sta. Rpt. 1919*, pp. 15-18).—The work in 1919 with cotton, corn, oats, wheat, soy beans, rye, and vetch and other forage crops is briefly noted.

The results of a breeding test with Cook 588 cotton indicated that the appearance of black and green seed, which is an undesirable character, is capable of elimination. Cook No. 1110 cotton surpassed the next most productive variety in the regular variety test by 62 lbs. of lint cotton per acre. Hybrid oat No. 651 is reported as showing resistance to winterkilling. Alabama Bluestem

wheat gave a marked increase in yield over Fulcaster and other widely-grown varieties, and matured about 10 days earlier than these. Among varieties of vetch under test Oregon No. 13420 did not lodge badly, remained green to the ground, and showed but little stem disease, while a strain of *Angustifolia* did not shatter the seed badly when ripe.

In fertilizer experiments on coastal plain soil nitrate of soda and calcium cyanamid, applied under corn at the time of planting and as a side dressing at different stages of growth, gave an increase in yield of 150 per cent and 50 per cent, respectively, but when similarly applied to cotton the yield increases were nearly equal. In a 12-year test with different sources of nitrogen the continuous use of sulphate of ammonia reacted injuriously upon the growth of sorghum and oats. Experiments with different sources of potash as fertilizers for wheat, corn, and cotton on coastal plain soil did not show marked differences in yield.

[Work with] farm crops (*California Sta. Rpt. 1919, pp. 44-52, 70*).—Preliminary studies by J. W. Gilmore and W. W. Mackie are reported as showing that a properly cultivated fallow contains at the close of the season about three times as much soluble nitrogen in the upper 2 ft. as on uncultivated fallow. On a series of plats of the cultivated fallow 44 bu. of wheat and 76 bu. of barley per acre were produced during the somewhat unfavorable season of 1919.

In a series of trials by Gilmore the yield of wheat on plats continuously cropped for 5 years declined from 48.2 bu. to 11 bu. per acre. As compared with these results it is noted that the average yields of 3 plats alternately in wheat and fallow were 15.8 bu., 48.44 bu., and 44.61 bu. per acre in 1914, 1916, and 1918, respectively.

The results of a rotation experiment by Gilmore and B. A. Madson in which wheat was alternated with peas or vetch, and these crops turned under, furnishing about 1,000 lbs. of dry matter per acre, brought out the value of maintaining a favorable amount of organic matter in the soil. The use of sulphate of ammonia and nitrate of soda in growing wheat in different parts of the State on soils insufficiently supplied with available nitrogen was found by C. B. Lipman to be of decided advantage.

Variety tests with barley, conducted for 9 years, are reported by Madson and G. W. Hendry as demonstrating the superiority of Mariout over Coast barley in yielding capacity, drought-resistance, and earliness. Mariout also shattered less than Coast barley. An irrigation study with barley by S. H. Beckett, covering 8 years, indicated that in seasons of deficient rainfall the application of irrigation water produced a material increase in yields up to a total of 22 acre inches of rainfall plus irrigation water. It is concluded from the results that in wet years with a normal distribution of the rainfall the application of irrigation water is not warranted.

A rotation of grain, sugar beets, corn, and potatoes was tested by Beckett 4 years in different combinations under varying irrigation treatment, but no particular rotation of these crops was indicated as being preferable. During the succeeding 4 years the same area was cropped exclusively to grain and beans. The results in general showed a decline in yield, which is attributed to the increasingly poor physical condition of the soil resulting from continuous irrigation without the addition of organic matter.

In work with grain sorghums by Madson and Hendry the selection of the superior heads for seed resulted in yields ranging from 2,500 to 5,000 lbs. per acre as contrasted with less than one-half those yields by ordinary methods. At the University farm on land previously cropped to cereals, Madson and

P. B. Kennedy found that Sudan grass produced 3,554 lbs. of hay per acre with only 8.84 in. of rainfall. Yields of 5 tons of hay per acre were secured in years of normal rainfall, and of 5 to 6 tons per acre with irrigation.

According to studies by Hendry made on alkali tolerance of beans the varieties observed were grouped as follows: Most tolerant—Blackeye, Horse bean, Garbanzo; moderately tolerant—Lima, Tepary; and least tolerant—Small white, Red Kidney, large white, Pink, Red Mexican, Bayo. In this connection a table is given showing the percentage acreage distribution of the several leading varieties for the northern and southern counties, the Sacramento and San Joaquin Valleys, and the Central Coast region. Data presented with reference to the composition of California bean varieties have been previously noted (E. S. R., 39, p. 266).

Notes are given on work by Gilmore and W. S. Wilkinson on the irrigation of cotton in the Imperial Valley and on cotton production in the Sacramento and San Joaquin Valleys. Tests at Kearney Ranch are reported as showing that both the short staple or upland type and the long staple, or Egyptian type, can be grown successfully. Yields of over 2,000 lbs. of seed cotton per acre are recorded for Durango, Yuma, and Pima cotton with a variation of lint from 28 to 32 per cent.

A study by W. E. Packard and Wilkinson of the influence of irrigation in the Imperial Valley on the prevalence of alfalfa roots in different types of soil is reported. It was found that in sandy loam soils where water was applied frequently and in small amounts 54.82 per cent of the roots were in the first foot of soil. Where an optimum amount of water was applied at frequent intervals the percentage of roots for each foot from the first to the sixth was as follows: First, 9.51 per cent; second, 18.1; third, 14.15; fourth, 16.74; fifth, 12.48; and sixth, 8.92 per cent, or a total of 79.9 per cent in the upper 6 ft. of soil. In soils with the water table within 4½ ft. of the surface 70.43 per cent of the roots were in the upper 2 ft. of the soil. A study by T. F. Tavernetti of the labor required to harvest alfalfa, conducted at University farm while harvesting the first crop for the season of 1918, showed that the labor expenditure could be reduced from 6.8 to 5 hours per ton.

Notes by Kennedy on the culture and value of Harding grass (*Phalaris stenoptera*), Smilo grass (*Oryzopsis miliacea*), and Napier fodder (*Pennisetum purpureum*) are presented. The results of analyses by F. W. Albro of ripe and green castor beans, showing that there is practically no difference between the oil content of the ripe and the green beans, are tabulated.

Experiments by G. P. Gray on the chemical control of the morning glory by means of arsenic as a spray on the foliage indicated that a sufficiently high humidity at the time of application to permit the absorption of the poison before the spray dries, and a degree of maturity of the plant permitting a downward movement of the poison to the roots, are absolutely necessary conditions for success.

The growth of sunflowers was studied by H. S. Reed to determine the relative superiority of good plants for plant-breeding purposes. It was found that variations in size were not necessarily due to variations in the soil, moisture, or other external conditions. Plants small at maturity were generally small at the beginning, and those large at maturity showed a well-marked superiority from the start. There was evidence that height is determined by factors distributed at random through the population, and it was found that the distribution of the relative height of the plants was fairly equal. The tallest and the shortest plants were observed as less variable in regard to their mean relative height than plants more nearly of average height.

[Report of field crops work in Minnesota, 1918], A. Boss (*Minnesota Sta. Rpt. 1919, pp. 38-41, 52*).—Descriptions are given of variety, culture, and breeding experiments with cereal, forage, and other field crops for the year ended June 30, 1919. Earlier work along the same lines has been previously noted (E. S. R., 40, p. 731).

In the cereal breeding work two winter wheat varieties of particular value and named Minturki and Minhardi have been developed from crosses between Turkey and Odessa. A new promising barley variety named Minsturdi is reported as produced from a cross between South African and Manchuria. A durum wheat named Mindum, which is a good yielder, is described as a selection of the Arnautka group. First generation crosses between high protein self-fertilized strains of Minnesota No. 13 corn gave somewhat better yields and produced 2.5 per cent more protein than was secured from ordinary Minnesota No. 13 corn normally pollinated.

In grain variety trials Mindum, Marquis, and Preston wheat proved of equal value. Lincoln, Silvermine, Victory, Improved Ligowo, O. A. C. 72, and Minota oats gave practically equal yields and outranked other varieties in production. Two crosses between Lion and Manchuria barley gave the highest yield of the varieties tested. Grimm alfalfa sown in 1914 yielded three crops in 1918, while common alfalfa on adjacent plats was entirely killed out. Cooperative production and distribution of seeds of various field crops, including sugar beets, are briefly noted.

The results of studies in the division of horticulture on degeneracy in the potato showed that straw mulch and shading had no material effect on tubers already running out, but gave marked results in maintaining the productiveness and vigor of new stock.

[Report of field crops work at the Crookston substation, Minn., 1918], C. G. SELVIG (*Minnesota Sta. Rpt. 1919, pp. 66-68, 70-73*).—Variety, culture, and fertilizer trials with various field crops conducted during the year in continuation of similar work already reported (E. S. R., 40, p. 732) are described. The season of 1918 is noted as one of the most favorable on record.

The leading varieties and their yields per acre were as follows: Mindum wheat, 43.3 bu.; Marquis wheat, 37.8 bu.; Svanhals barley, 57 bu.; Iowa No. 105 oats, 88.6 bu.; Iowa No. 103 oats, 88 bu.; Minnesota No. 2 rye, 33 bu.; Bangolia field peas, 25.5 bu.; Minnesota No. 19 flax, a wilt-resistant variety, 13.5 bu.; Semipalatinsk No. 2445 alfalfa, 6,177 lbs., in two cuttings; Giant Sugar Feeding mangels, 23.8 tons; Prizewinner rutabagas, 500 bu.; and Mastodon stock carrots, 10.6 tons. Brome grass yielded 4,300 lbs. per acre, timothy 2,600 lbs., and sweet clover 2,500 lbs. The highest yield of hay, 4,800 lbs. per acre, was secured from a mixture of brome grass 10 lbs., tall meadow oat grass 6 lbs., white clover 2 lbs., and alfalfa 4 lbs. per acre.

In 1918 under favorable seasonal conditions oats sown at the rate of 8 pk. per acre gave the best yield, while for the 6-year period the use of 13 pk. per acre has given the highest average yield. Sowing on plowed land, corn stubble, or on corn land, with part or all of the stalks standing did not give sufficient protection to winter wheat to make its culture profitable. In the different crop-rotation tests in progress, wheat produced 24.7 bu. per acre in the 7-year rotation, 19.8 in the 5-year rotation, 18.4 in the 4-year rotation, 19.1 in the 3-year rotation, 17.2 in continuous cropping with clover, and 17.4 bu. in continuous cropping. Oats yielded 42 bu. in the 7-year rotation and 55.7 bu. in the 5-year rotation. Barley yielded 16.8 bu. in the 7-year rotation and 30.6 in the 3-year rotation.

Wheat showed a much more marked benefit from acid phosphate in 1918 than it did in earlier years. Barnyard manure when used alone gave as high yields

as when reinforced by acid phosphate or rock phosphate. In general the increase in yields from acid phosphate has not been sufficient to make its use clearly profitable on the soil under test.

In variety tests with potatoes Green Mountain and its seedling, the Kremer seedling, gave the best yields of the late varieties, yielding 126 and 128.6 bu. per acre, respectively, while Early Ohio produced 128.6 bu. per acre. In an 8-year test the standard varieties produced the following average yields: Green Mountain 128.56, Rural New Yorker 119.23, Early Ohio 113.78, Irish Cobbler 106.48, Burbank 94.7, and Triumph 79.04 bu. per acre. Seed tubers of Early Ohio grown at the four substations in 1917 were compared at Crookston in 1918. The highest yield, 239.4 bu. per acre, was secured from the seed grown at Crookston, while the seed from Duluth gave 236.48, that from Grand Rapids 156.75, and that grown at University Farm 129.24 bu. per acre. Green Mountain grown in ten check rows gave an average yield of 234.1 bu. per acre.

The experiment with different-sized seed pieces this year resulted in the highest yield, 207.7 bu. per acre, from 4-oz. tubers when cut in half. In comparing different quantities of seed per acre the highest net yields were obtained from 16, 18, and 20 bu., the respective yields being 150, 155, and 154.5 bu. per acre. Sixteen bu. per acre gave the highest net yields through the 4-year period. Commercial fertilizers on potatoes in a 3-year rotation showed no marked increase in yield in 5 years. Potato seed selection experiments with Early Ohio resulted in yields of 128.6 bu. from hill-selected seed, 104.1 bu. from bin-selected, 65 bu. from field-run, and 58.3 bu. per acre from run-out seed. The results of growing potatoes in rotation showed that the largest yields were produced in the short-term rotations. It was noted that tuber diseases were more common in the second crop in a 3-year rotation than on new or clean soil.

[Report of field crops work at the Crookston substation, Minn., 1917-18], C. G. SELVIG (*Minnesota Sta. Rpt. Crookston Substa., 1917-18, pp. 16-47, 48-51, 57-65, 93-97, figs. 12*).—This work, which is in continuation of previously reported activities of the same nature, has been noted above or previously (E. S. R., 40, p. 732).

[Report of field crops work at the Duluth substation, Minn., 1918], M. J. THOMPSON (*Minnesota Sta. Rpt. 1919, pp. 87, 88, 89*).—The climatic conditions of the season and the results of culture and variety tests are briefly noted.

Six-rowed varieties of barley, Minnesota No. 281 oats, and Alaska peas maintained their lead in the test. Millets did not set seed, but the following yields of forage per acre were secured: Japanese 3.6 tons, German 3.8 tons, Siberian 4.2 tons, Hungarian 4.3 tons, and Proso 4.7 tons. Sunflowers grown for silage produced 13.56 tons of green feed per acre. Among eight standard varieties of potatoes Burbank Russet ranked first with 199.5 bu. per acre, followed by King with 198.5 bu., and Burbank with 198 bu. Early Ohio potatoes from northern-grown seed tubers as a rule gave the better yields and the more uniform tubers. Twelve seedlings, averaging more than 200 bu. per acre at University Farm in 1917, showed a distinct decrease at this station in 1918. An average gain of 29 bu. per acre was secured from spraying.

In the fertilizer trials potatoes on unlimed soil produced 10 bu. more per acre than were secured from those grown on limed soil. The average yield per acre on acid phosphate plats was 191 bu., on rock phosphate plats 196 bu., on manure plats 202 bu., as compared with 169 bu. on the check plats. In a fertilizer test with oats the highest yield, 63.09 bu. per acre, was obtained on the acid phosphate plat, while the rock phosphate plat yielded 56.22 bu., the

manure plat 59.79 bu., and the check plats 49.38 bu. Lime increased the yield of hay on all plats nearly 18 per cent. This year plats on which clover was plowed under yielded 156.7 bu. of potatoes as compared with 134.9 bu. on plats that had been pastured and 106.1 bu. on plats that had been harvested. In an experiment in which duplicate plats in 3-year rotation received 5, 10, and 20 tons of manure per acre, respectively, the 5-ton rate yielded an average of 133 bu. of potatoes, the 10-ton rate 145 bu., and the 20-ton rate 139 bu. per acre, while for oats the respective yields were 30.7, 33.1, and 36.5 bu. per acre.

[Report of field crops work at the Grand Rapids substation, Minn., 1918], O. I. BERGH (*Minnesota Sta. Rpt. 1919, pp. 83-85*).—A brief description is given of climatic conditions for the year ended June 30, 1919, and of the progress of work along lines similar to those previously noted (E. S. R., 40, p. 734).

Maximum yields per acre in variety tests with field crops are reported as follows: Red Chaff, five wheat, 38.35 bu.; Prelude, an early bearded five, 35.8 bu.; Marquis 35.4 bu.; Minnesota No. 951, a durum wheat, 47.5 bu.; Odessa, 6-rowed barley, 52.8 bu.; Austrian Hannah, 2-rowed barley, 55.7 bu.; Silvermine No. 506 oats 130.3 bu.; emmer 54.4 bu.; winter rye 44 bu.; Turkey Red winter wheat 24.9 bu.; Burbank potato 415.3 bu.; and Minnesota Grimm alfalfa 4,660 lbs. Different meadows of timothy and clover ranged in yield from 2,260 to 3,550 lbs. of hay per acre, while broom corn gave 1,320 lbs.; English rye grass 1,280 lbs.; meadow fescue 1,280 lbs.; western rye grass 1,160 lbs.; and orchard grass 760 lbs. per acre. A yield of 6,800 lbs. of hay per acre was secured from oats and peas.

Grimm alfalfa seeded at the rate of 3 to 4 pk. per acre early in April with wheat as a nurse crop, and the soil manured and inoculated, gave a very successful stand. Minnesota No. 2 winter rye and Turkey Red winter wheat gave the best yields from seedings made on August 15 as compared with those made on later dates. Winter rye cut for hay June 17 yielded 2.6 tons per acre. Improvement work with Minnesota No. 13 Yellow Dent corn was continued, and the development of a strain somewhat smaller than the ordinary Minnesota No. 13, but of earlier maturity, is reported.

The results of experiments on muskeg soil indicated that upland soil requires manure and lime and that rye for grain, timothy and clover, oats and peas for hay, Kentucky blue grass, redtop, timothy, and clover for pasture, Russian sunflower for silage, rutabagas for forage purposes, and rape for soiling and pasture may be grown successfully with this treatment. The use of peat on unlimed soils showed a beneficial effect on all crops of the rotation, but much less so than stable manure.

[Report of field crops work at the Morris substation, Minn., 1918], P. E. MILLER (*Minnesota Sta. Rpt. 1919, pp. 74-81*).—This work has been noted from another source (E. S. R., 42, p. 731).

[Experiments with field crops at the New Jersey Station], J. G. LIPMAN and A. W. BLAIR (*New Jersey Stas. Rpt. 1918, pp. 184-193*).—These experiments were largely in continuation of work previously noted (E. S. R., 41, p. 35). The fifth year's yield from the first cutting on four alfalfa plats was largest on the plat which had received 4,000 lbs. of ground limestone per acre, and lowest on the plat receiving no limestone. In average yield for the 5 years these plats stood in the same relationship.

Experiments to study the influence of bacteria carried in manure on the decomposition of leguminous and nonleguminous green manures are described. Cow manure at the rates of 50, 100, and 200 lbs. per $\frac{1}{10}$ acre plat was spread before a green manure crop of vetch and crimson clover or of rye was plowed

under. A study of the corn grown after this treatment showed that the total nitrogen recovered in the crop from the manure plats exceeded the total nitrogen recovered on the check plats. It did not appear that the increase could be attributed entirely to the manure, and it is believed that the organisms introduced in the manure furthered the decomposition of the green manure material and thus provided more nitrogen for the following crop than was furnished where no manure was given. The average yield of corn where the leguminous crops were plowed under was 2,300 lbs., and where rye was used as a green manure 1,760 lbs. per acre. The corresponding average quantities of nitrogen recovered were 54.5 lbs. and 41.3 lbs., respectively.

A study of the influence of lime on the yield of dry matter and nitrogen from different varieties of soy beans has been previously described (E. S. R., 34, p. 632). In 1917, a study made of the influence of lime on the number of nodules and the percentage of nitrogen when soy beans are harvested for hay showed that the average yield of dry matter from 12 plants from the limed plats was 84.4 gm. and from the unlimed plats 46.5 gm. The percentage of nitrogen in the dry matter was 0.25 per cent higher for the limed than for the unlimed plats. On the limed plats an average of 85 nodules, and on the unlimed plats of 37 nodules per plant, was found. Of six varieties grown to maturity on both series of plats all gave the higher yield of beans and straw on the limed plats, the average increase being 5.5 bu. of beans and 800 lbs. of straw per acre. Of the varieties grown Austin stood first in yield with 20 bu. per acre. The percentage of nitrogen in different varieties grown from 1914 to 1917, inclusive, is shown in a table.

[Report of work by the department of agronomy of the New Jersey Stations], F. APP (*New Jersey Stat. Rpt. 1918, pp. 171-173*).—The activities of the department for the year are briefly stated and results from alfalfa and sweet clover seedings are noted. Alfalfa seeded in August without a nurse crop and during the latter part of March with wheat as a nurse crop produced good stands, while alfalfa seeded April 11 and June 7 without a nurse crop was a failure. Observations made at the station and over the State brought out the fact that a successful stand of alfalfa depends largely upon the proper source of seed.

Sweet clover seeded with wheat as a nurse crop in 1916 gave a very rank growth in 1917, when it was allowed to go to seed to reseed itself. Reseeding by this method, however, was not successful, although in practice it is frequently accomplished in this way.

[Report of the] department of agronomy, A. N. HUME (*South Dakota Sta. Rpt. 1919, pp. 6-11*).—The progress and status of work on the influence of rotation upon the maintenance of soil fertility, correlations between certain physical characters of plants and their capacity for yield, and water as a limiting factor in the growth of sweet clover are briefly described, and variety, culture, breeding, and fertilizer experiments with cereals are noted. Some of the work with cereals referred to has been reported in bulletin form (E. S. R., 39, p. 739; 40, p. 34).

New [field crop] plant introductions, N. E. HANSEN (*South Dakota Sta. Rpt. 1919, pp. 29-33*).—Plant introductions, including durum wheat, alfalfa, proso, sweet clover, and Chee grass (*Lasogrostis splendens*), made by the author a number of years ago from Russia and Siberia, are enumerated and the more important species and varieties are described, mainly as to their cold and drought resistant characters. It is pointed out how new strains have been developed from the original material and what progress has been made in testing and distributing varieties of value under South Dakota

conditions. A hybrid alfalfa known as Cossack and marked by a very light-colored variegation, including many white flowers, is reported as successfully grown on an extensive scale in the western part of the State. A selection from Cossack alfalfa made to develop a white-flowered variety came about 70 per cent true to white color two years ago, and was about 97 per cent white during the past season. Semipalatinsk alfalfa, it is stated, has proved thoroughly hardy in Saskatchewan.

Selection work with Hansen White Siberian proso was conducted to develop a pure line and a select variety, and efforts were put forth to establish the use of proso as a new cereal for table use. Hansen White Siberian sweet clover and Chee grass are reported as giving good results as far North as Saskatoon, Sask. Chee grass is described as growing up to 16 ft. or more in height on pure alkali soils on the dry steppes of the Semipalatinsk Province of western Siberia.

Report of experiments at substation No. 12, Chillicothe, Texas, R. W. EDWARDS (*Texas Sta. Bul.* 253 (1919), pp. 5-8, 10-28, figs. 11).—Brief descriptions are given of 17 varieties of grain sorghums and 10 varieties of forage sorghums tested at the station. The average grain yields of 10 varieties grown for the 5 years, 1913-1917, ranged from 11 bu. per acre for Dwarf Kafir to 23.3 bu. for feterita. Dwarf hegari and Dwarf milo gave an average yield per acre of 21.2 and 21.8 bu. per acre, respectively. In average forage yields for the same years Orange and Sumac of the forage sorghums ranked first with 8,580 lbs. and 8,040 lbs. per acre, respectively. Blackhull Kafir, a grain sorghum, in this test ranked next in average yield per acre with 5,040 lbs. In experiments on the rate of planting sorghums in rows the best yields in general were secured from the thickest plantings. In the average of 4 years' results of experiments on the rate of seeding forage sorghums in close drills or broadcast, the best yields were obtained from the use of 45 lbs. of seed per acre sown in close drills. A test of different dates of seeding resulted in the best yields of forage from seedings made June 2 and 15. Other results indicated that the highest grain yields are secured when seedings are made from 2 to 4 weeks earlier.

Sudan grass gave much better yields of seed and hay when grown in rows 40 in. apart than were secured from rows 24 in. apart or from close drills. The results of seeding Sudan grass at rates varying from 10 to 35 lbs. of seed per acre indicated that from 15 to 20 lbs. of seed is likely to give the best results. Soy beans did not prove a satisfactory crop at the station, but cowpeas proved the most successful annual leguminous crop grown. The varieties found most valuable are briefly described. Brief notes are also given on Kulthi beans, moth beans, and mung beans.

Previous work was summarized in Bulletin 202 (E. S. R., 37, p. 331).

The genera of grasses of the United States, with special reference to the economic species, A. S. HITCHCOCK (*U. S. Dept. Agr. Bul.* 772 (1920), pp. 307, pls. 20, figs. 174).—This bulletin describes all the genera of grasses which include species native, introduced, or cultivated in the United States. Under each genus the useful and the harmful species are pointed out. Descriptions are given of the subfamilies and keys to the tribes, of the tribes and keys to the genera, and of the genera as grouped under 14 tribes.

Silage crops, E. B. STOOKEY (*Washington Sta., West Wash. Sta. Mo. Bul.*, 7 (1920), No. 12, pp. 198, 199).—Brief notes are given on the culture of corn, clover, and grass, spring oats and peas or vetch, and sunflowers for silage. Minnesota No. 13 corn planted in hills 18 in. apart or drilled 8 or 9 in. apart with a distance of 3 ft. between the rows gave generally the best results. Of

the different cereals grown with peas or vetch oats proved most satisfactory. The use per acre of 60 to 90 lbs. of oats with 40 to 50 lbs. of spring vetch or 60 to 90 lbs. of White Canadian or McAdoo field peas is recommended. Mammoth Russian sunflowers planted at the distances given for corn produced a much heavier crop, especially on light soil, than was secured with corn, but the silage produced was distinctly inferior to corn silage.

Alsike more reliable than the red clover (*Mo. Bul. Ohio Sta., 4 (1919), No. 12, p. 368*).—Alsike clover is reported as being substituted increasingly in Ohio for common red clover, especially on soils deficient in lime and drainage. The resistance of alsike clover to anthracnose and root rot diseases, the cheaper seed, and the smaller quantity required of it, are pointed out as favorable factors in this connection.

Cotton growing, R. L. STEWART (*New Mexico Sta. Bul. 120 (1919), pp. 16, figs. 5*).—Experiments in cotton growing conducted in 1891 are briefly reviewed, and the results of experiments carried on from 1916-1919, inclusive, are reported.

In 1916 the best stand was secured from plantings made April 21 and 24. A planting made June 16 resulted in a good stand, but the larger part of the bolls produced did not mature before frost. Of 8 varieties tested Burnett, the leading variety, produced 1.47 bales per acre, being followed by Durango with 1.46 bales, and Allen Improved Triumph with 1.37 bales. In 1917 two mesa plats about 40 ft. higher than the valley were planted to Durango cotton on May 28. The first picking was made October 1, and although a large number of bolls did not mature before frost a yield of 0.82 bale of lint cotton per acre was secured.

A piece of valley land containing 1.3 acres, planted to cotton April 22, 1918, yielded at the rate of 1.35 bales of lint per acre. The first picking was made September 28, the second October 18, and the third and last November 19. Several plats of cotton grown on mesa soil in 1918 gave an average yield of 1.25 bales per acre, the leading plat yielding at the rate of 1.9 bales. The work of 1918 was repeated in 1919 on the same piece of ground and with the same kind of treatment. The cotton was planted April 23, chopped June 4, given two other hoeings, together with two cultivations, and was irrigated 5 times. The entire field yielded at the rate of 1.25 bales per acre. This year 8 plats of the same variety planted on the mesa land gave an average yield per acre for the entire area of 0.7 bale.

The use of manure, sulphur, lime, acid phosphate, and cottonseed meal, each applied alone in the two years, 1918 and 1919, did not show any marked increases in yield due to the fertilizer treatment. Cotton on alkali land with the water table within a short distance of the surface produced plants of good size and gave a fairly good yield.

A note is given on the value of Durango cotton for the irrigated valleys of southern New Mexico.

Fertilizers profitable for potato growing (*Mo. Bul. Ohio Sta., 4 (1919), No. 12, p. 368*).—Experiments at the station are noted as showing that from 10 to 16 tons of manure, and from 300 to 500 lbs. of acid phosphate per acre may be used with profit in fertilizing potatoes. The 24-year average yield of potatoes, grown in rotation with wheat and clover and fertilized with 8 tons of manure alone, was 173 bu. per acre.

Prussic acid in sorghum, S. E. COLLISON (*Florida Sta. Bul. 155 (1919), pp. 51-54*).—This bulletin discusses the economic importance of prussic acid in sorghum, reviews some of the experiments by other investigators with reference to the poisoning properties when sorghum containing the substance is eaten by

stock, and reports the results of an examination of 17 varieties of sorghum and related plants for the purpose of determining their prussic acid content. A table is given showing the moisture and dry matter content of the plants, together with the percentage of prussic acid found in the fresh material. The plants were examined when they varied from 12 to 24 in. in height, and the amount of prussic acid found ranged from 0.0007 per cent in Orange sorghum up to 0.0037 per cent in Dwarf hegari. Samples of mature Dwarf hegari contained 0.0038 per cent and similar samples of feterita 0.0036 per cent.

Spring wheat uncertain.—Fly may injure crop (*Mo. Bul. Ohio Sta.*, 5 (1920), No. 1, p. 25).—In culture experiments at the station spring wheat gave an average of 18 bu. per acre for 6 years, while winter wheat averaged 34 bu. per acre over a period of 25 years. On account of a heavy infestation of Hessian fly throughout the State spring wheat is considered one of the more doubtful crops for the year.

Clipping tests of oats and wheat, C. G. WILLIAMS (*Mo. Bul. Ohio Sta.*, 5 (1920), No. 1, pp. 20-23).—Clipping tests of oats made in 1906-7, and of wheat made in 1907 and 1919, are described, and the effect of the treatment is indicated in tables setting forth the yields of the clipped and unclipped crops. The results in some instances showed a marked reduction in yield due to clipping, while in others they indicated apparently a somewhat beneficial effect with reference to yield and the prevention of lodging. The data are considered insufficient to warrant recommending the practice.

Report of the department of seed analysis, J. P. HELYAR (*New Jersey Stat. Rpt. 1918*, pp. 93-96).—Summaries of tests of field crop and vegetable seeds made during the year are given in tabular form, with notes on the seed situation of the year and the inspection and analysis of official samples.

HORTICULTURE.

[Recent results of horticultural investigations] (*California Sta. Rpt. 1919*, pp. 11-13, 16, 24-31, 32, 38-40, 41).—A summary is given of horticultural research during the 3 years ended June 30, 1919.

The fertilizer experiments with citrus fruits begun in 1907 have been continued by H. J. Webber and his associates at the Citrus substation. Uniform treatments have now been under way 12 years. The results thus far secured continue to emphasize the great importance of organic matter and nitrogen and the comparative slight importance, on the soils included at least, of phosphoric acid and potash. The plats treated with stable manure and raw rock phosphate on which a leguminous winter cover crop is each year grown and plowed under in early spring continue to be superior to those otherwise treated. Plats treated with chemicals, such as nitrate of soda alone or in conjunction with sulphate of potash, superphosphate, and dried blood have gradually deteriorated, showing increased quantities of mottle leaf, and are now much inferior to plats that have received organic matter. In an experiment conducted to determine the best methods of rejuvenating an old citrus grove the trees on two plats receiving manure and summer cover crops seemed to have improved more in general appearance than the trees on any other plat, although other methods of treatment here noted resulted in larger yields of fruit.

Further studies on the use of green manures in citrus groves continue to emphasize the importance of this practice, bitter clover (*Melilotus indica*) and purple vetch (*Vicia atropurpurea*) giving the most satisfactory results when used as winter cover crops. Preliminary trials of another vetch, *V. dasycarpa*, have also given excellent results. The purple vetch is proving very desirable

for use, especially on light sandy soils where in some cases it has been found difficult to get a good stand of bitter clover. A feature that has been brought out in the recent experiments is the importance of using green manures in young groves to improve the soils while the grove is developing. In a 70-acre grove planted at the Citrus substation in the spring of 1917, Blackeye beans have been grown between the trees each summer and bitter clover sowed broadcast over the entire area in the winter. The beans have more than paid for the cultivation of the grove, and the bean straw and clover has been returned to the land. Under this treatment the grove has made a remarkable growth with no other fertilizer.

Recent developments in citrus stock experiments have been noted from another source (E. S. R., 42, p. 537).

The value of severe pruning as a means of rejuvenating nonproductive orange trees has been investigated by H. S. Reed with the result that moderate pruning has been found to be fully as beneficial as severe pruning and to give much larger yields of fruit. Reed and F. F. Halma have found strong evidence for the presence of a factor which controls the branching habit in the lemon, pear, and other trees. The apical portion of the shoot appears to produce a substance which travels downward in the phloem layer and prevents the development of subapical buds. If the apical portion of a young shoot be cut off the lateral buds just below the point of amputation will grow out to form shoots, because they are thereby freed from the inhibiting substance. When they begin to grow, however, they form a renewed supply of the inhibiting substance and perpetuate a dormant condition in the buds below them. When an unbranched shoot is held in the horizontal position the buds on the upper side of the shoot develop but the lower buds do not, the inhibiting substance appearing to flow along the ventral side of the shoot. Observations made by Reed on the fruit growth of Lisbon lemons show that the fruit requires 7 to 14 months to come to maturity. Fruit which was set in May, June, and July came soonest to maturity. Fruit set in the spring months has the best chance of survival. As the season advances the chances for advancement of juvenile fruit diminishes.

Cold-storage work conducted by I. J. Condit with several varieties of persimmons shows that the fruit can be kept satisfactorily for several months, although market demands probably do not justify storage much after January 15. Avocados of the Mexican type kept fairly well for about one month, after which shriveling and decay ensued. Freezing at 30° F. darkens the flesh of the avocado and renders it unfit for eating, whereas persimmon flesh is not injured at this temperature. Fuerte avocados held at 32° temperature were found to lose their normal green appearance and to assume a brown, dirty color. On the other hand, fruit of the Challenge held for 6 weeks at 32° kept its firmness and appearance remarkably well. Both persimmons and avocados soften much more rapidly at 36° than at 32° or 30°.

Studies on caprification of figs conducted by Condit show that the number of female Blastophagas entering a Smyrna fig in the process of caprification depends largely upon the numbers of Capri figs and insects in the tree. A great majority of the insects issue from the mature Capri figs during the first day after distribution, very few after the third day. The female Blastophagas hover closely around the Capri or Smyrna tree, and are found at distances away from the tree only when carried by wind. Caprification exercises marked changes in the color and appearance of certain figs, such as the Brown Turkey and particularly the Kadota. Caprifigged Adriatic figs show more interior than exterior differences. Generally speaking, caprification increases the number of seeds and sugar content of the figs.

Several fruit pollination studies are briefly noted. Continued studies by G. L. Philp have confirmed previous observations by Tufts (E. S. R., 41, p. 148) that all almond varieties are self-sterile and a few are inter-sterile. The apricot, on the other hand, appears to be sufficiently self-fertile to make inter-planting for purposes of cross-pollination unnecessary. Further studies with cherries confirm previous results that the leading varieties of sweet cherries are self-sterile under California conditions. Several of these varieties have also proved inter-sterile. Results of pollen studies with Bartlett pears have been noted in Bulletin 307 of the station (E. S. R., 41, p. 240). During the season of 1919 13 varieties of pears, including the Bartlett, were tested for self-sterility. All varieties tested were benefited by cross-pollination. Observations made by A. H. Hendrickson relative to the pollen of plums and prunes covering a period of 5 years indicate, as noted in a previous report (E. S. R., 36, p. 139), that practically all the Japanese plums are self-sterile but will cross-pollinate readily when the blooming periods occur approximately at the same period. The same is generally true for European plums. The French (Agen) and Sugar prunes are undoubtedly self-fertile.

Pollination work with Yellow Newtown and Yellow Bellflower apples was conducted by E. L. Oberholser in 1919. The results indicate that the Yellow Newtown is sufficiently self-fertile to set a fair crop of fruit through the agency of its own pollen, but that its fruitfulness is greatly increased when pollinated with Yellow Bellflower. Yellow Bellflower is not sufficiently self-fertile to set paying crops of fruit without cross-pollination, and did not set a full crop when pollinated with Yellow Newtown. The apples were found to set fruit much more abundantly where hives of honeybees were placed in the orchard to supplement natural pollinating agencies.

M. N. Wood studied the causes of self-sterility in certain fruit, particularly the almond. A well-known self-sterile variety of almond, the Ne Plus Ultra, was made to set 30 per cent of fruit from its own pollen by previously applying to the pistils a 3 per cent sugar solution. This set of fruit is as good or better than the number set by this variety under first-class conditions for cross-pollination.

The results of pruning investigations of deciduous trees conducted by Tufts indicate, in general, that light and thin pruning is superior to heavy pruning and thinning. The results in detail secured with young trees are given (E. S. R., 42, p. 534).

Experiments conducted by R. H. Taylor indicate that the optimum temperature for the most rapid ripening of Bartlett pears is between 70 and 80°. The ripening process of pears at higher temperatures was delayed in a similar way but to a less degree than when pears were held at a temperature of 32°. Pears of the same lot which ripened fully in one week when held at a temperature of 70 to 80° kept well for a period of from 4 to 6 weeks when held in a temperature of from 100 to 110°. These results suggest that during an abnormally warm season the pears should not be picked early as has been the custom, but should be allowed to remain on the trees, thereby securing better development of the fruit with the moderation of temperature later on. It also suggests the possibility of holding pears in a warm room rather than making an effort to store them in slightly cooler temperatures. Different varieties of pears differ considerably in the stage of maturity at which they should be picked for market. The Bartlett was found to be greatly improved in quality if picked in the earlier stages of its maturity, whereas the Bosc has failed to reach good quality when ripened in storage unless it reached a higher stage of maturity on the tree than required for the Bartlett.

Tests were made to determine whether dried fruits are in danger of being injured by freezing under conditions of usual shipment to eastern markets. Commercially processed and packed fruits containing approximately 22 per cent of moisture were not frozen or injured when subjected to a temperature of -25° . The results of a survey of fruit drying practices in the State made by W. L. Sweet are noted on page 804.

Various materials have been tested for covering pruning wounds on fruit trees. Cement paint seemed to stick longer and tighter than any other material, but was the most expensive paint tried. Hard asphaltum proved quite satisfactory in its sticking qualities, but was troublesome to apply as it had to be painted on while warm. A roofing paint called Oronite served all purposes and was easy of application.

A test of root stocks for some of the common deciduous fruits was started in 1915. After 4 years, Royal Ann cherries on Mazzard and Mahaleb stocks have made about the same growth. Bartlett pear on quince root has made very poor growth, while adjacent trees on French pear stock have made very satisfactory growth. Bartlett on Japanese pear root has done well for two years and promises to be highly satisfactory. Bartlett top-worked on Surprise pear, which in turn was grafted on Japanese pear root for the past two years, has made good unions. Prunes on almond and myrobalan stock so far have shown no differences in growth. Peaches and almonds on the different root stocks mentioned for stone fruits have shown no special differences in growth.

Studies made to determine uses for wine grapes have been elsewhere reported (E. S. R., 42, p. 537). Observations on the Black Corinth or true currant grape indicated that it must be grafted on resistant stocks. The best stock at the Davis farm has been *Riparia gloire*, on which it has yielded 1.75 tons of dried fruit per acre. At the Kearney vineyard the best stock has been Chasselas \times Berlandieri 41-B, on which it has yielded about 2 tons. Increase of bearing by girdling is being tested and has given very promising results. Among the promising table grapes under observation during the last three years are the Kurtelaska, a grape of Malaga type, and the Marvel of Malaga, a grape somewhat resembling the Tokay, which is believed to be specially promising for districts and soils where the Tokay fails to color well. A large amount of data has been accumulated by F. T. Bioletti and his associates on the complex question of the relative phylloxera-resistant value of various grape stocks. On the basis of the results at Davis and Kearney recommendations are given regarding suitable stocks for the principal varieties of table, raisin, and wine grapes. One of the remarkable results of the work is the indication that the Rupestris St. George, which is used almost exclusively in California, is inferior in value to nearly all of the other stocks tested.

Observations and experiments conducted by Bioletti and F. C. H. Flossfeder indicate that the pruning of young olive trees should be limited to the minimum necessary to give them the proper form of framework, and that the pruning of old trees should be limited to the annual thinning out of young branches and twigs. In all cases thinning out is emphasized rather than cutting back.

[Report of the] division of horticulture, W. G. BRIERLEY (*Minnesota Sta. Rpt. 1919, pp. 49-54*).—Brief statements are given of progress made in various lines of work.

Studies relative to the healing of pruning wounds on apple trees have shown that 6.3 per cent of all wounds from 0.25 in. to 4 in. in diameter fail to heal, and that the failures are practically all due to poorly made wounds. It is concluded that if the tree is kept growing vigorously and the wounds are carefully made, sterilized, and covered with grafting wax or gas tar to hinder the entrance of disease, there should be few wound failures.

Blueberry experiments are being conducted at Cloquet in cooperation with the Bureau of Plant Industry of the U. S. Department of Agriculture. The results already secured with plants of *Vaccinium pennsylvanicum* indicate that this low-bush type can be readily propagated and grown, and the station is to test several hundred high-bush×low-bush hybrids received from the U. S. Department of Agriculture. Young plantings of black walnut, chestnut, shag-bark hickory, and filbert were not injured in the comparatively mild winter of 1918-19, but pecan and English walnut trees showed a high percentage of winterkilling.

Work in fruit breeding was continued and extended. The results thus far secured in the sterility study with plums have been recently noted (E. S. R., 42, p. 534).

In the breeding work with vegetables, improved strains of the Alaska pea, Refugee bean, and Hubbard squash have been isolated. The crossing and selection of cucumbers and tomatoes was also continued. Work with potatoes is noted on page 825.

Progress made in variety tests of fruits, cooperative orchard management, and in landscape gardening and floriculture is briefly reported.

[Report on horticultural investigations at the Crookston Substation, 1917 and 1918], C. G. SELVIG (*Minnesota Sta., Rpt. Crookston Substa., 1917-18, pp. 65-80, figs. 2*).—Data are given on the condition of hardy apples and crab apples planted at the Crookston substation during the period 1910-1918.

The results to date indicate that only the hardiest varieties of apples, such as Hiberna, Duchess, and possibly Pattens Greening and Charlamoff, can be expected to survive any considerable time. Virginia and Transcendent crabs are apparently more hardy than the above named apples. Even these varieties show more or less heart-killing each year, but under favorable cultural conditions may continue their growth for 10 or 15 years and produce a few crops before dying. Observations conducted for three seasons show that trees growing in sweet clover sod were less subject to heart-killing, sun scald, and alkali injury than similar trees growing under clean cultivation. The growth of trees on the sweet clover plat was more mature in the fall. Tree and bush fruits do best when planted in the shelter of effective windbreaks, where they are protected from the drying winds of summer and where the snow cover is abundant in winter.

Forty-two different trees of Minnesota seedling plums have been planted during the last 5 years. Of these, only one tree, Minnesota No. 7, has survived. Standard varieties of plums planted in a similar situation have quite largely failed. On the other hand, both seedlings and standard varieties when planted in or near the windbreak have made good growth and yielded fair to good crops. The varieties of gooseberries and currants under test are apparently very hardy. All of the Minnesota seedling raspberries were severely winterkilled during the winter of 1917-18, most of the standard varieties also showing great injury. The variety which survived the winter best was the Sunbeam. Seedling grapes were also seriously injured, but the Beta variety and plants of what were supposedly Campbell's Early survived the winter as in former years and made a vigorous growth.

A list is given of varieties of fruit recommended for northern Minnesota, based both on the work at the substation and the results obtained by growers in that section.

Tabular data are given showing the number of windbreak and ornamental trees and shrubs planted each year since 1912 and the number now growing, together with a list of desirable windbreak trees and ornamental trees, shrubs, and vines.

The variety testing of vegetables was continued during the year. Data are given and discussed showing the yields for 1918 for different varieties of beans, beets, cabbage, carrots, cauliflower, sweet corn, cucumbers, lettuce, onions, parsnips, peas, radishes, squash, tomatoes, and other vegetables.

[**Report on horticultural investigations at the Crookston substation, 1918-19**], C. G. SELVIG (*Minnesota Sta. Rpt. 1919, pp. 69, 70*).—The results with apples at the Crookston substation continued to look unpromising for apple culture in that section, but in view of the comparatively favorable condition of trees growing in sweet clover sod as noted above, new plantings of varieties of apples and crab apples of the first degree of hardiness have been made on plats receiving the following cultural treatments: Bare fallow, fallow with fall cover crop, grass, hay to be removed, sod mulch, and sweet clover, with one hay crop and one seed crop each year. Variety tests of garden vegetables are briefly noted.

[**Studies on heredity and environment at the New Jersey Station**], B. D. HALSTED (*New Jersey Stas. Rpt. 1918, pp. 197-199*).—A brief progress report on heredity and environment studies with vegetables and other plants (E. S. R., 41, p. 42). Among the desirable strains of vegetables resulting from the breeding work to date are a wax-podded pole bean, resulting from a cross between Hodson Wax and Kentucky Wonder, a green-podded pole bean from the same cross, a crystal wax type larger than the crystal parent, a hybrid wax bean, and a "Giant Plum" tomato of commercial size.

Report of the specialist in market gardening, C. H. NISSLEY (*New Jersey Stas. Rpt. 1918, pp. 150-154*).—A report similar to the above on several demonstration projects relating to market gardening conducted by growers in co-operation with the specialist and the county agents.

Report of the specialist in vegetable growing, R. W. DE BAUN (*New Jersey Stas. Rpt. 1918, pp. 145-149*).—A report on extension activities in the State during 1918, with special reference to increasing vegetable production for war-time needs.

Report of the department of horticulture, M. A. BLAKE and C. H. CONNORS (*New Jersey Stas. Rpt. 1918, pp. 41-64, fig. 1*).—The report contains observations on winter injuries to fruit trees during the severe winter of 1917-18, a statement of progress made in peach investigations (E. S. R., 41, p. 41) during 1918, and considerable tabular data showing the blooming dates of apples and pears for 1918 and picking date records in the strawberry variety tests for the years 1911-1918, inclusive, together with the usual weather observations for the year. Observations made on peach borers at Vineland are also noted.

The fertilizer experiment that has been conducted for several years in one of the peach orchards at Vineland has been discontinued, and the results are to appear in bulletin form. The orchard will now be given good general treatment with the view of demonstrating that a peach orchard can be maintained in profitable bearing beyond its tenth year of growth.

Some experiments were started to determine the rate of growth of the fruits of several varieties of peaches as affected by thinning the fruits at different stages. Special measurements were also being made during 1918 to determine the relation between the system of pruning peaches and the growth of twigs and fruit. The seedlings secured from peach crosses made in 1916 were set in orchard form. During the season of 1917 a bud sport was found at Vineland on the peach variety Burke, in which the leaves were variegated, white, and green. It is to be propagated as a horticultural variety.

[Report on orchard trials at the Duluth substation], M. J. THOMPSON (*Minnesota Sta. Rpt. 1919, p. 88*).—A note on the losses by varieties of apple trees from winterkilling during the winter of 1918–19. The average of all varieties was 13.5 per cent.

[Report of the] fruit-breeding farm, Zumbra Heights, C. HARALSON (*Minnesota Sta. Rpt. 1919, pp. 93–95*).—This report, together with the accompanying report of the committee examining the fruit-breeding farm, was noted from another source (*E. S. R., 42, p. 637*).

[Report on fruit breeding], N. E. HANSEN (*South Dakota Sta. Rpt. 1919, pp. 18–29*).—Work in the breeding and selection of hardy and blight-resistant fruits was continued (*E. S. R., 41 p. 238*). Descriptions are given of the following varieties sent out for trial in the spring of 1919: The Beauty, Olga, Izo, Sugar, Alexis, Cathay, and Red Tip crabs; also three selected American wild crab seedlings, the Giant Wild, Missouri Wild, and Mercer Wild; the Caramel, Sasha, and Chance apples; and the South Dakota Usuri, Tolstoy, Pushkin, and Gogol pears, together with several varieties of apples on Siberian crab roots.

Japan pear seedlings are apparently too tender as stocks for the blight-resistant hybrid pears as they winter-killed during the winter of 1918–19, thereby preventing the distribution of these hybrids. The author is of the opinion that the Siberian pear, *Pyrus ussuriensis*, and the Chinese pear, *P. ovoidea*, will probably be the hardy blight-proof pear stocks for the North.

In the work with grapes, only one of the standard varieties, the Beta, has proved to be hardy without winter protection. Three other seedlings of the same pedigree as the Beta (the Dakota, Monitor, and Suelter) are being tested, and efforts are being made to improve the native grapes. A seedling of the Wilder crossed with pollen of a wild grape from Bismarck, North Dakota, fruited in 1918. While the berry is small, it is remarkable for the improvement in flavor and for the ease with which the fruits separate from the pulp.

The breeding of hardy roses was continued.

Spring spraying program for 1920, A. FRANK (*Washington Sta., West. Wash. Sta. Mo. Bul., 7 (1920), No. 12, pp. 204–208*).—A spraying schedule is given for the control of the common diseases and pests of apples, pears, cherries, prunes, plums, and peaches.

Bearing habits of the Delicious apple, C. W. ELLENWOOD (*Mo. Bul. Ohio Sta., 5 (1920), No. 1, pp. 27, 28*).—Notes are given on the production records of this variety in the station orchards.

As observed at the station, the Delicious is an annual bearer, but alternates with rather heavy and medium light crops. It compares favorably in yield with other commercial varieties, and seems to reach a profitable bearing age about 10 years after planting. The range of picking dates of Delicious for a 10-year period was from October 3 to October 21.

Fertilizers for peach orchards, P. THAYER (*Mo. Bul. Ohio Sta., 4 (1919), No. 12, pp. 380–385*).—The station started a fertilizer test in a peach orchard in 1915. Although the test has run for five seasons, seasonal conditions have been unfavorable, and the trees have borne only one full crop (1915) and one light crop (1916). Taking the partial data secured in this work in connection with the results secured at other stations the author offers some tentative suggestions for fertilizing peaches.

An abundant supply of nitrogen is favorable to the development of strong new shoots, upon which the fruit buds are formed and an abundance of foliage to nourish the fruit crop. In the absence of nitrogen it is doubtful whether

applications of phosphoric acid or potash are justifiable. In the presence of a sufficient quantity of nitrogen, the application of phosphoric acid is beneficial, especially on clay soils. Where both nitrogen and phosphoric acid are supplied there is probably some benefit from potash, especially on sandy soils. On clay soils in the absence of nitrogen, potash is of no value and may be injurious.

The Bartlett plum, P. THAYER (*Mo. Bul. Ohio Sta.*, 5 (1920), No. 1, p. 26, fig. 1).—An account of the tree and fruit of this variety, which is recommended more for its ornamental features than as a fruit, although the fruit possesses a fair quality.

[**Report on cranberry investigations at Whitesbog, N. J.**], C. S. BECKWITH (*New Jersey Stas. Rpt. 1918*, pp. 222-230).—As the result of a conference between station officials, interested cranberry growers, and a representative of the U. S. Department of Agriculture, the station's cranberry investigations were replanned in 1918. Broadly stated, the purpose of these investigations is to make a search for the general principles upon which successful cranberry growing depends. During 1918, attention was given to the problems of plant-food, soil acidity, soil water, and insects. The present report reviews previous work with plant foods (*E. S. R.*, 42, p. 441) and for correction of soil acidity (*E. S. R.*, 39, p. 748), and outlines new experiments along these lines. Work to be conducted in the study of soil moisture and in the control of insect enemies is also briefly noted.

Citrus fertilizer experiments, S. E. COLLISON (*Florida Sta. Bul. 154* (1919), pp. 3-48, figs. 11).—A detailed account is given of experiments started in 1909 to determine the effects of various fertilizers upon the chemical composition of the soil, upon the growth and composition of the trees, and upon the fruit. The effects of lime and other alkaline materials and of various cultural treatments upon the soil and the trees were also studied. The experiment was conducted in a grove of young trees all of the same variety, specially selected with regard to uniformity of size. The grove was divided into 48 plats and an application of 2 lbs. per tree of ammonia 5 per cent, from sulphate of ammonia; phosphoric acid, 6 per cent, from acid phosphate; and potash, 6 per cent, from high-grade sulphate of potash was used as the standard formula. Several variations from this standard were included in the experiment, and nitrogen, phosphoric acid, and potash from different sources were compared. In order to supplement the work with fertilizers in the field, soil tank experiments were begun on the station grounds with the view of determining losses of fertilizing material in the drainage water under different systems of fertilizing and the effects of long-continued use of fertilizers on the soil.

Summing up the results of the field work, sulphate of ammonia, acid phosphate, and high-grade sulphate of potash has given somewhat better results as measured by the increase in growth than any other mixture. Good results were obtained from the use of nitrate of soda as a source of ammonia, from steamed bone and oats as sources of phosphoric acid, and from low-grade sulphate, hardwood ashes and the muriate as sources of potash. Lime and other alkaline materials, notably ground limestone and basic slag, have proved distinctly injurious to growth. This injury consisted, in its mildest form, of a light attack of frenching; in the severest type, of chronic, severe frenching, partial defoliation, and a permanent retarding of growth, resulting in stunted, undersized, and unhealthy trees. See also a previous note by Floyd (*E. S. R.*, 37, p. 656).

In July, 1910, 18 months after the trees had been planted, they exhibited the early stages of the disease known as dieback. The disease continued to gain headway, and a thorough examination was made of the entire grove with the view of determining whether any relation existed between the disease and the

fertilizer treatment. No such relation could be established, the disease appearing to be entirely independent of the fertilizers used. Spraying with Bordeaux appeared to be quite effective in controlling the dieback, and from the end of the year 1915 on and until the close of the experiment no further trouble was experienced with the disease.

Following the freeze of February, 1917, a careful examination was made with the view of finding out what effect, if any, the various fertilizer treatments had in making the trees more or less resistant to cold injury. No conclusive evidence could be obtained indicating that any special fertilizer treatment among those used on the better plats was more effective than another in making the trees resistant to frost. Generally speaking, the trees in those plats which were in a weakened and unhealthy condition owing to various causes, such as overfertilization and the effect of alkaline materials, suffered more seriously from the cold. Trees in a good healthy condition not only withstood the frost better, but made a quicker recovery.

Clean cultivation throughout the year was of considerable benefit to young trees, but after a few years leads to a loss of soil organic matter and should not be practiced with trees over 5 or 6 years old.

Data secured in the soil tank experiment showed that nitrogen, both in the organic and inorganic form, is lost in large quantity by leaching. For the period from July 13, 1911, to July 17, 1913, 72.5 per cent of the nitrate of soda applied to the soil leached through the soil, which was about 4 ft. in depth, and was lost in the drainage water. During the same period 41 per cent of the sulphate of ammonia and 38.3 per cent of dried blood were lost. Losses in potash for the first two years were small, but at the end of 4 years about 30 per cent of the potash applied had leached out. The loss of phosphoric acid was extremely small, amounting to only 0.05 of one per cent of the amount applied for the 4-year period. A large proportion of the phosphoric acid applied was retained in the upper 9 in. of soil, and much of the potash in the water-soluble form was also retained by the soil. There was a slight increase in nitrogen in all of the plats excepting the clean culture and the unfertilized ones.

Roses for the home garden, J. L. STAHL (*Washington Sta., West. Wash. Sta. Mo. Bul.*, 7 (1920), No. 12, pp. 196, 197).—This comprises concise suggestions on the culture and care of roses, including a list of desirable varieties tested at the western Washington substation.

Beautifying the farmstead, F. L. MULFORD (*U. S. Dept. Agr., Farmers' Bul.* 1087 (1920), pp. 65, figs. 66).—The author discusses the need of beautifying the farmstead, desirability of making plans for improvement in advance, styles of design, location of the buildings, walks and drives, service features, lawns, arrangement of plantings, use of trees, shrubs, vines, and herbaceous plants, and selection of plant material. The text is accompanied by several farmstead plans. A chart is given showing the appropriate color combinations for highly colored flowers.

FORESTRY.

[**Report of forestry investigations at the California Station**] (*California Sta. Rpt.* 1919, pp. 53-56).—A survey was made by W. Metcalf of eucalyptus groves of various species in California. The average growth measurements obtained are here presented in tabular form. Several trees from central China have proved to be well suited to central California conditions. Among these are *Populus tomentosa*, *P. simonii*, *P. sinensis*, and *Ulmus pumila*, all of which give promise of making excellent windbreak trees; and *Zelkova serrata*, a fine

street tree resembling the elms. Experiments with the seed of Bishop pine (*Pinus muricata*) to determine the vitality in seeds of the closed-cone group of pines indicated that seed just matured shows the highest germination percentage and produces the most vigorous trees and most rapid growth. Seed which had remained in the closed cones for from 3 to 15 years showed a remarkable uniformity of vitality and rate of growth.

Damping off in the nursery seed-beds has been effectively prevented by the use of 0.2 fluid ounce of sulphuric acid per square foot of seed-bed. In the case of fall-sown beds of Douglas fir a better stand was obtained where treatment was given one week before sowing. Based on measurements and observations made at the Chico and Santa Monica Forestry Stations lists are given of species suited for windbreak, ornamental, and woodlot plantings in the Sacramento Valley and in southern California. Notes are given on the principal uses of several California species.

[**Note on forestry experiments at the Grand Rapids substation, Minn.**], O. I. BERGH (*Minnesota Sta. Rpt. 1919, p. 85*).—In tree planting experiments being conducted at the Grand Rapids substation the effect of intertillage on the growth of different kinds of pine trees as compared with no tillage was very marked, trees receiving intertillage having grown more than twice as much as those receiving no tillage.

The administrative report of the Virginia State forester for the calendar years 1918 and 1919, with suggestions for extensions of State forestry work, and recommendations for amendments to the present forestry laws, R. C. JONES (*Va. State Forester Rpt. 1918-19, pp. 62*).—A report of forest activities with a special bearing on the war, forest-fire protection, educational and demonstration work, nursery operations, etc., including recommendations for a future forestry program and new legislation. The forestry laws of Virginia are appended.

Report of the forestry commission for the year ended June 30, 1919, R. DALRYMPLE HAY ET AL. (*Rpt. Forestry Comm. N. S. Wales, 1919, pp. 38, pls. 9*).—A report on operations on the State forests of New South Wales for the year ended June 30, 1919, including also notes on research work with forest products and data on the organization of the State forests, imports and exports of timber, revenues and expenditures, yields in major and minor forest products, etc.

Salient features of a forestry policy for Ohio, E. SECREST (*Mo. Bul. Ohio Sta., 5 (1920), No. 1, pp. 15-19*).—The author briefly considers some of the more essential features of a joint program of State, municipal, and private forestry.

Cooperation between National Forests and adjacent private lands, B. P. KIRKLAND (*Jour. Forestry, 18 (1920), No. 2, pp. 120-130*).—A contribution from the University of Washington, in which the author submits the outline of a program for the immediate introduction of forestry on private lands adjacent to National Forest boundaries.

Private forestry in France, W. B. GREELEY (*Amer. Forestry, 26 (1920), No. 315, pp. 139-143, figs. 2*).—An analysis of private forestry in France, in which consideration is given to the source of private forests, economic conditions favoring private forestry, and the public policy of France toward her private forests.

Great profits from forests in the French Jura, T. S. WOOLSEY, JR. (*Canad. Forestry Jour., 16 (1920), No. 3, pp. 116-118, figs. 2*).—Summarized growth and yield statistics are given for four 100-year-old fir-spruce stands in the Jura that are somewhat comparable to spruce-fir stands of northern New England or southern Canada. These four stands averages 71,000 ft. b. m. per acre as

compared with a yield of from 5,000 to 10,000 ft. b. m. per acre for natural balsam fir and spruce in eastern Canada.

Natural regeneration of French forests, T. S. WOOLSEY, JR. (*Amer. Forestry*, 26 (1920), No. 314, pp. 77-81, figs. 10).—An account of methods employed in different types of French forests to secure adequate natural regeneration.

Transcaucasian forests, E. C. MEARS (*U. S. Dept. Com., Bur. Foreign and Dom. Com., Com. Rpts. No. 75* (1920), pp. 1794-1797).—A consular report in which information is given relative to the principal forest species in Transcaucasia, location of forests, the forests now in process of exploitation, forest products available, obstacles to early exploitation, and accessibility of the principal forests. A list is also given of unexploited areas.

The tropical acacias of Queensland, J. H. MAIDEN (*Proc. Roy. Soc. Queensland*, 30 (1918), pp. 18-51, pls. 7).—In this paper the author presents a tentative descriptive list of tropical Queensland species of acacia. A select bibliography of related literature is included.

Note on Hollong timber (*Dipterocarpus pilosus*), R. S. PEARSON ([*Indian*] *Forest Bul.* 39 (1919), pp. 8, pl. 1).—An account of this Indian timber species, with reference to its general distribution; locality and habit; natural reproduction and rate of growth; characteristics of the tree; characteristics, properties, and uses of the timber; method of extraction; and yields and returns.

The identification of mahogany, A. KOEHLER (*Jour. Forestry*, 18 (1920), No. 2, pp. 154-156).—A contribution from the Forest Service of the U. S. Department of Agriculture, comprising a brief critical review of H. H. Dixon's article on Mahogany, and the Recognition of Some of the Different Kinds by Their Microscopic Characteristics (E. S. R., 41, p. 541).

[Experiments in rubber culture] (*Fiji Dept. Agr. Ann. Rpt.* 1918, pp. 3, 4).—Data are given showing the average annual increase in girth for several years of the trees in five Hevea rubber plats, together with brief notes on other rubber plants and some tapping experiments.

The use of wood.—**Wood in agricultural implements**, H. MAXWELL (*Amer. Forestry*, 26 (1920), No. 315, pp. 148-155, figs. 14).—This article deals with the uses of wood in the production of various agricultural implements.

Raw material for the paper industry, A. F. HAWES (*Amer. Forestry*, 26 (1920), No. 315, pp. 134-138, figs. 5).—A description of the several processes for making wood pulp, together with a statistical survey of the present production and consumption of pulpwood and suggestions relative to means of perpetuating the national pulp supplies.

Some information about Chinese wood oil, D. Y. LIN (*Far East. Rev.*, 15 (1919), No. 9, pp. 598-601, figs. 4).—In this article the author briefly considers the distribution of the wood oil trees (*Aleurites montana* and *A. fordii*), the method of cultivation, the oil extraction process, the composition and properties of the oil, the uses of wood oil, the regions of production, the extent of the industry, and the foreign consumption of wood oil. In conclusion, he presents some brief suggestions relative to the cultivation, manufacture, and marketing of wood oil.

The Burmese atha system of measuring timber, A. W. MOODIE (*Indian Forester*, 46 (1920), No. 3, pp. 132-140, figs. 2).—A native system of measuring timber used uniformly throughout Upper Burma is described.

Rating scale for foresters, C. M. STEVENS (*Jour. Forestry*, 18 (1920), No. 2, pp. 143-150).—The author here presents and discusses the application of a rating scale, which in its present stage of development covers broad basic administrative positions in the Forest Service of the U. S. Department of Agriculture, such as forest ranger and forest supervisor.

DISEASES OF PLANTS.

The biochemistry of resistance to disease in plants, R. A. GORTNER (*Minnesota Sta. Rpt. 1919, pp. 34, 35*).—A brief report is given of investigations on the resistance of diseases in plants, the chemical composition of plums resistant and nonresistant to the brown rot organism being studied. In addition, culture experiments with the brown rot fungus (*Sclerotinia cinerea*) were made on prune and apple juice media, and the experiments have shown an active pectase is elaborated by the hyphæ which causes the coagulation of soluble pectins into calcium pectate. If sufficient pectin is present, a fairly firm gel is produced upon which the fungus develops. It is claimed that when the fungus penetrates a host tissue, it dissolves out the middle lamella, but instead of assimilating it for food, the material is precipitated into a compound of calcium pectate. This fills the intercellular spaces, and by preventing the collapse of the tissue, the infected fruit remains firm and retains its form. Through the presence of the calcium pectate in the dried mummies on the trees, water is imbibed freely, and this provides the dormant mycelium with a source of moisture that permits growth and formation of spores during the blossoming time of the trees.

Considerable culture work was done with this fungus to determine its fundamental nutrition, but all attempts to compound a synthetic medium that would support it have failed. It is believed that the juice of the host plant is necessary for the development of the fungus, and this suggests the existence of some accessory food substance which is present in natural hosts.

Malignancy of the crown gall and its analogy to animal cancer, I. LEVIN and M. LEVINE (*Proc. Soc. Expt. Biol. and Med.*, 16 (1918), No. 2, pp. 21, 22).—The object of this investigation was to repeat from a different standpoint some of the various studies reported by Smith (E. S. R., 38, p. 752). The authors inoculated plants in considerable number and variety with *Bacterium tumefaciens* and made a gross and microscopical study of the resulting crown galls.

Analysis of the material showed that a certain number of these plant tumors behave morphologically and biologically as do benign growths (growing very slowly and interfering not at all with the development of the inoculated plant, and while compressing, not injuring, the neighboring normal tissues); but that other crown galls appear to be true malignant tumors, dwarfing the inoculated plant and inducing the necrosis above and even below the point of inoculation on the stem. Microscopically, the galls show invasion and destruction of the neighboring normal tissues.

A number of crown galls were obtained containing leafy shoots. Close study revealed characters differing materially from conditions obtaining in animal cancer. In most specimens the gall presents throughout only small, young, undifferentiated cells, but in some the central growing part resembled crown gall, the periphery showing the development of adult differentiated tissue or parenchyma, which is claimed to be a part of the new growth and not of the normal tissues of the inoculated plant. The same is said to be true of rudimentary organs (conducting system), or even of a whole rudimentary organism (leafy shoot), which may appear at the periphery or in some other portion of the ordinary crown gall. This appearance of highly differentiated tissues subsequent to and participating in the development of a malignant tumor is, it is claimed, unknown in animal cancer.

The conclusion arrived at is that a fast developing simple crown gall presents much analogy to animal cancer and offers ideal material for the cellular study thereof. The structure of the growing central part is identical in practically all crown galls thus far investigated. This structure, therefore, represents only one type among the large number of pathological processes grouped under

the name of cancer. The study of crown gall, however, affords no secure ground for a claim that all human cancers are formed through the activity of an identical organism.

[Plant diseases studied at the California Station] (*California Sta. Rpt. 1919, pp. 17-20, 32, 33, 34, 35, 42, 43, 46*).—The citrus nematode (*Tylenchus semipenetrans*) is said to be found in all of the principal citrus districts of the State, attacking 12 citrus varieties (but no other plants so far as known), including sour and sweet orange and pomelo, all three of which are used extensively as root stocks. The attack on the feeding rootlets (piercing the cell wall and breaking down the tissues) gives ready entrance to *Fusarium* and other fungi. The nematodes are found on roots, ranging from within an inch of the surface to 12 ft. below, and being associated invariably with a poor condition of the trees. No completely successful method of protection has been found.

Studies by J. T. Barrett and H. S. Fawcett on citrus fruit spots, stains, and blemishes are noted. Some of these troubles have been traced to definite causes, several stains and spots being caused by the wither-tip fungus (*Colletotrichum glaucosporioides*), which is discussed in connection with its adaptation and its supposed continued production of new types under natural conditions. A new lemon spot, designated as green pit, has been found in three sections of the State, always in connection with a *Septoria*. A storage scald has become important this season.

Citrus gummosis (*Pythiacystis citrophthora*) has been shown by Fawcett to be preventable, and curable when taken in time. A study of the causal organism as regards its growth relations has aided in the explanation of differences in seasonal occurrences and in rate of enlargement of disease areas. Temperature relations of growth have been studied in this fungus, also in *Phytophthora terrestria*, *Phomopsis citri*, and *Diplodia natalensis*. The results, besides bearing upon the relations between temperature and growth, aid also in explanation of the occurrence and geographical distribution of some of the diseases produced by these fungi.

Citrus psorosis, or scaly bark, is found to be transmissible under certain conditions, but the time required for the development of lesions, even when small, is long, usually months or even years. In early stages only, the disease may be practically controlled. Internal decline of lemons has been studied further by Barrett and Fawcett in a limited way. The typical trouble shows maximum occurrence in July-September. It may occur on trees of any age or condition. No parasitic organism has been found in this connection. Citrus root rots appear to be more prevalent than when first reported. Two types were found by Barrett to occur, one of these, a dry rot, attacking at the crown, penetrating into and through the heartwood, and causing sudden wilting and death of the tree; another, more difficult to detect, causing a decay of the tap and lateral roots from their extremities toward the trunk, which may cause a decline continuing for years. A *Fusarium* has been isolated from both types. Citrus chlorosis, when severe, is found to be connected with a limy subsoil. A basal hypothesis is offered to explain experiments by C. B. Lipman which are described, in which iron sulphate sprayed on the leaves restored the normal green color.

June drop of the Washington navel orange, a cause of great losses in California, was shown by J. E. Coit and R. W. Hodgson to be due in part to *Alternaria citri* (which was but little affected by spraying), but in the main to a stimulus to abscission arising from daily water deficits in the developing fruits, arising from climatic conditions. Citrus blast, though easily killed by drying on exposure, was found by H. A. Lee to live in cuttings for more than

four months, sufficiently long to carry through the summer. It occurs in all the citrus districts of northern California, particularly among oranges.

Fruit-tree spraying experiments showed that dry lime-sulphur used with dormant peach and apricot trees in fall and winter is fully as effective as is liquid lime-sulphur or Bordeaux mixture in protecting trees against leaf curl, twig blight, and shot-hole fungus. As a summer (full leaf) spray, dry lime-sulphur produced the same foliage effect as did the other sprays.

Shot-hole and twig blight of stone fruits were studied during 1916 and 1917 in an extensive cooperative experiment carried out in several counties. Shot-hole of almond is controlled by the spring spray only, while the December spray is the most effective with peaches. Apricot shot-hole was not controlled by the usual sulphur preparations and Bordeaux mixture, but thinning out the tops reduced the disease somewhat. Twig blight was not reduced by the dormant spray nor by spraying after the fruit had set. Apricot limb gall, studied by Khazanoff, appears to be due to a *Monochaetia*, probably a new species. The galls are due to increase in thickness of the bark mainly. The disease is prevalent in Alameda, Santa Clara, and San Benito Counties, attacking trees over 15 years old and spreading until the tree is practically destroyed.

Apricot bacterial gummosis, rather serious in character, has been studied by Barrett since 1916. It is believed to be caused by *Pseudomonas cerasus*. Activity of the organism seems to be confined largely to the dormant period, being checked by the growth activities of spring. The killing of large areas of bark in a short time may girdle and destroy large branches or even trees. Infection occurs in the fruit spurs. The disease is now known to occur in 8 counties, including the best apricot regions of the State. Control measures found effective are almost exclusively surgical.

Crown gall resistance in plums, studied by C. O. Smith, shows great variability as regards varieties, some of the more promising of which are to be tested under different climatic and soil conditions.

Walnut dieback, or winter killing, may, it is found by L. D. Batchelor and H. S. Reed, prevail even in the absence of temperature extremes. This injury may prove to be the result of one condition or several resulting in the desiccation of the twig. Probable causes are indicated in some detail. A new walnut variety named Ehrhardt, supposedly resistant to walnut blight, has been taken under observation. Walnut blight resistance has been studied by C. O. Smith in commercial varieties and found to behave in artificial much as in natural inoculation, though certain of the varieties more resistant under natural conditions showed much greater susceptibility under conditions of artificial inoculation. It has been shown that the blight organism can live for at least 2.5 months in sterilized soil, dying out in 10 days or less in unsterilized soil. This is thought to be due to competitive conditions among the soil organisms.

Walnut blight control experiments, involving removal of all possible sources of infectious materials and spraying pruned and unpruned plats with Bordeaux mixture or lime-sulphur, were carried out by Fawcett and Batchelor during 1916 in Orange and Ventura Counties. The results agreed with those previously obtained in showing little, if any, reduction of the blight.

Cereal smuts have been studied by W. W. Mackie since 1917 in cooperation with the U. S. Department of Agriculture and the College of Agriculture. The reduction of smut due to cooperative effort during 1917 was exceeded by that of 1918, following which considerable areas were found to be smut free.

Phytopathology [Mauritius, 1918], D. D'EMMEREZ DE CHARMOY (Ann. Rpt. Dept. Agr. Mauritius, 1918, pp. 10, 11).—This account as given includes insect pests and other parasites of plants.

Pigeon pea showed for the first time a root disease which is ascribed to a fungus not yet identified. Sugar cane root disease appeared to have been much more prevalent than formerly, cases being reported in five districts, and affecting both virgin canes and ratoons. More than eight different fungi have been isolated, but none of these has been shown to cause the disease. Bacterial heart rot of sugar cane was reported from various districts. Bacterial wilt of potato and tobacco is more serious on the latter.

Treating oats for smut, W. L. BURLISON and R. W. STARK (*Illinois Sta. Circ. 240 (1920), pp. 4*).—The authors recommend the use of formaldehyde solution for control of oat smut by sprinkling a solution of 1 pt. of formalin in 10 gal. water at the rate of 1 pt. of solution per bushel of oats. The oats should be thoroughly mixed, covered, and allowed to remain covered for about 2 hours, after which they are uncovered and the gas allowed to escape.

Basal glumerot of wheat, L. McCULLOUGH (*Jour. Agr. Research [U. S.], 18 (1920), No. 10, pp. 543-551, pls. 2*).—In the course of a study made in the Bureau of Plant Industry, U. S. Department of Agriculture, on wheat samples, a bacterial disease unlike the black chaff was discovered. This disease is due to a hitherto undescribed organism, and was found on heads of wheat collected in widely separated localities in the United States and Canada. The most noticeable external character of the disease is a brown to black discoloration on the lower part of the glumes and of the adjacent rachis. The grains inclosed in the diseased glumes were found to have bacteria in their tissues at the germ end. In advanced cases this end of the grain is black and charred in appearance. The organism causing the disease has been isolated, not only from freshly collected material but also from grain kept in the laboratory for 17 months. The author describes the organism as *Bacterium atrofaciens* n. sp.

Fusarium wilt of chile pepper, L. H. LEONIAN (*New Mexico Sta. Bul. 121 (1919), pp. 32, figs. 7*).—A wilt of chile pepper, known to have existed on the station farm since 1908 and to have been serious or destructive since 1911, was studied after the latter date, principally during 1918-19.

The causal organism, which is regarded as belonging to the section *Martiella* of the genus *Fusarium*, has been named *F. annuum* n. sp. It attacks some or all of the underground parts and often the lower aerial stem. The development of the characteristic dark brown sunken lesions is attended by wilting (usually sudden), total disintegration of the root hairs, breakdown of the cork cambium, disintegration of the cortical cells, and development of white or bluish sporodochia on the underground parts.

The fungus grows saprophytically in soils of ordinary fertility, and the infective material is carried by means of diseased plant remains, possibly by seed bed plants, also by air and water.

The wilting is probably due not to a mechanical stoppage of water movement by the growth of hyphae in the passages, nor to the production of toxic substances, but to a general failure and breakdown of the tissues invaded.

The severest outbreaks occur in August or September, a certain relation existing between temperature and the occurrence and severity of the attack. The optimum temperature appears to be near 31° C., the highest actual temperature in the fields being about 25° and the minimum temperature permitting infection about 17°.

Soil moisture appears to be the chief controlling factor, an 85 per cent wilting occurring when the capillary moisture much exceeds 12 per cent, as against 2 per cent at a content below that point. Intelligent and careful irrigation is, therefore, a principal control measure. Heavy soils should be avoided. Ridging and the use of windbreaks are also recommended.

A new lettuce disease, R. C. THOMAS (*Mo. Bul. Ohio Sta.*, 5 (1920), No. 1, pp. 24, 25, fig. 1).—The occurrence of a new lettuce disease in greenhouses is reported. Preliminary investigations are said to indicate that the disease is identical with that recently described by Brown as due to *Bacterium vitians* (E. S. R., 39, p. 455).

Temperature relations of certain potato-rot and wilt-producing fungi, H. A. EDSON and M. SHAPOVALOV (*Jour. Agr. Research [U. S.]*, 18 (1920), No. 10, pp. 511-524, figs. 9).—In a contribution from the Bureau of Plant Industry, U. S. Department of Agriculture, the authors give an account of experiments of pure cultures of six species of *Fusarium* and two strains of *Verticillium alboatrum*.

The two strains of *Verticillium*, one from the South and the other from the North, showed distinctly different thermal behavior. As a result of their investigations, a certain degree of correlation was found by the authors to exist between the temperature relations of some potato fungi in pure cultures and their geographical distribution and seasonal occurrence. This correlation is said to be particularly striking in *F. oxysporum* and *V. alboatrum*.

From the results obtained, they believe that a temperature of about 40° F. should hold *Fusarium* tuber rots in check during storage. The susceptibility of *V. alboatrum* to high temperatures is believed to suggest the possibility of a heat treatment for infected seed tubers. The use of temperature tests in certain cases is deemed by the authors to offer a useful supplementary method for the identification of fungi exhibiting contrasting thermal relationships.

Potato disease treatment [at Crookston, Minn.], C. G. SELVIG (*Minnesota Sta., Rpt. Crookston Substa., 1917-18, pp. 51-55, fig. 1*).—Tests were made of seed potatoes noticeably affected with such common tuber diseases as *Rhizoctonia* and scab. The tubers were treated with formalin, corrosive sublimate, or copper sulphate, or else the cut seed tubers were dusted until supplied with a good adherent coating of air-slaked lime or powdered sulphur. Despite variability in the results through a period of years, the increased yields and cleaner product are considered to justify seed treatment, as well as rotation.

Formalin applied to cut seed has retarded germination a few days, but the plants as a rule appeared normal by midsummer, and the treatment was followed by an increased yield of tubers. Uncut seed were not retarded by the application of formalin. Corrosive sublimate, whether applied before or after cutting the seed, was more efficient in controlling disease, but there was only a slight increase of tubers. The application of air-slaked lime appeared of value only for its fertilizing effects, and sulphur as here used had little or no effect as a fungicide.

Tests were made on leaf diseases with Bordeaux mixture of 5:5:50 strength before 1917, and of 4:4:50 afterward. Spraying was begun in June when the plants were from 6 to 8 in. high and was repeated at intervals of two weeks. It was found that the largest average yield and the greatest net return were obtained from plants which had received three sprayings. The fourth application did not pay for its employment. General spraying appeared to be successful for the Red River Valley even in years of but little early blight. Late blight has not yet been recorded for this region.

Commercial lime-sulphur appeared to be detrimental in 1916, but in 1917 there was a slight increase in yield. Self-boiled lime-sulphur is considered as offering promise on account of its low cost and results obtained.

Silver-leaf disease (including observations upon the injection of trees with antiseptics), F. T. BROOKS and M. A. BAILEY (*Jour. Pomol., Vol. 1, No. 2, pp. 81-103*).—In order to duplicate as far as possible in different localities work

previously noted (E. S. R., 30, p. 451; 38, p. 50), the authors carried out experiments at Cambridge and at the John Innes Horticultural Institution.

As regards the physical factors in silvering, the authors still consider that by far the greater part of the peculiar appearance of plum leaves in the earlier stages of silvering is due to the formation of abnormal air spaces below the upper epidermis, whereby the character of the light normally reflected is changed.

Further observations upon the occurrence and incidence of silver leaf are noted and discussed. Inoculation experiments were carried out with the plum, apple, and other plants. It appears that this disease is not inseparably connected with inoculation by *Stereum purpureum*. Following experiments on the curative treatment of silver-leaf disease, it is admitted that there is at present no known curative treatment that can be applied on a commercial scale with prospect of success, but it is considered probable that any measures conducive to the general well-being of the trees would tend to reduce the danger.

Shot-hole fungus (*Bd. Agr. and Fisheries [London], Leaflet 247 (1911), pp. 4, figs. 3*).—This gives a brief account of the manner and results of attacks by *Cercospora circumscissa*, which are common on leaves of the peach, almond, cherry, apricot, and nectarine, and less so on those of the plum and other rosaceous trees. Remedial measures exclude Bordeaux mixture on account of foliage injury, but prominence is given to self-boiled lime-sulphur in this connection.

Red root disease [of Hevea], T. PETCH (*Trop. Agr. [Ceylon], 52 (1919), No. 1, pp. 27-34*).—This disease, first seen in Ceylon in 1905, occurred rather commonly in 1914 on Hevea and *Tephrosia candida* at Peradeniya. It has since been recorded from several estates in the low country, being still ranked among the less common of the root diseases of Hevea in Ceylon. The disease (ascribed to *Poria hypobrunnea*) is discussed in regard to its occurrence, spread, symptoms, and relation to other root diseases, and in regard to control measures including prevention, tree surgery, and chemical fungicides. Attention is also directed to white stem blight and top canker of Hevea.

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Forced movements, tropisms, and animal conduct, J. LOEB (*Philadelphia and London: J. B. Lippincott Co. [1918], pp. 209, pls. 4, figs. 38*).—In this volume, which is the first of a series of monographs on experimental biology, the author discusses the symmetry relations of the animal body as the starting point for the theory of animal conduct, forced movements, galvanotropism, heliotropism (the influence of one source of light), an artificial heliotropic machine, asymmetrical animals, two sources of light of different intensity, the validity of the Bunsen-Roscoe law for the heliotropic reactions of animals and plants, the effect of rapid changes in intensity of light, the relative heliotropic efficiency of light of different wave lengths, change in the sense of heliotropism, geotropism, forced movements caused by moving retina images (rheotropism and amerotropism), stereotropism, chemotropism, thermotropism, instincts, and memory images and tropisms.

A bibliography of 554 titles is included.

The rat as a carrier of diseases transmissible to man and to other lower animals, A. G. R. FOULERTON (*Jour. Compar. Path. and Ther., 32 (1919), No. 3, pp. 182-191*).—Noted from another source (E. S. R., 42, p. 355).

Rat bite fever.—Report of a case, A. ARKIN (*Arch. Int. Med., 25 (1920), No. 1, pp. 94-111*).—A summary of information on this disease, caused by

Spirochaeta morsus muris, followed by a report of a case in a boy of 9 years bit by a rat. References are given to the more important literature on the subject.

On a coenurus in the rat, M. TURNER (*Ann. Appl. Biol.*, 6 (1919), No. 2-3, pp. 136-141, fig. 1).—This is a report of studies of tapeworm cysts found in the rat in London which represent either a new species or a very atypical form of a known species.

A mouse oxyurid, *Syphacia obvelata*, as a parasite of man, W. A. RILEY (*Jour. Parasitol.*, 6 (1919), No. 2, pp. 89-93, pl. 1).—This records the infestation of a family of five in the Philippine Islands by *S. obvelata*.

Report on a collection of Copepoda made in Honduras by F. J. DYER, C. D. MARSH (*Proc. U. S. Natl. Mus.*, 55 (1920), pp. 545-548, pl. 1).

Catalogue of birds of the Americas, C. B. CORY (*Field Mus. Nat. Hist. [Chicago] Pub. Zool. Ser.*, 13 (1919), pt. 2, No. 2, pp. 317-607, pl. 1).—This part of the work previously noted (E. S. R., 39, p. 759) deals with the families Trogonidæ, Cuculidæ, Capitonidæ, Ramphastidæ, Galbulidæ, Bucconidæ, and Picidæ. An index to the volume is appended.

Third and fourth annual lists of proposed changes in the A. O. U. Check List of North American birds, H. C. OBERHOLSER (*Auk*, 35 (1918), No. 2, pp. 200-217; 36 (1919), No. 2, pp. 266-273).—These lists are in continuation of those previously noted (E. S. R., 39, p. 154).

Birds of North Carolina, T. G. PEARSON and C. S. and H. H. BRIMLEY (*N. C. Geol. and Econ. Survey [Rpt.] 4* (1919), pp. XXIII+380, pls. 30, figs. 275).—Sketches on North Carolina ornithology and life zones and bird distribution and an explanation of keys and descriptions are followed by a descriptive list of North Carolina birds containing 341 species and varieties (pp. 17-335). A bibliography of eight pages on North Carolina birds, tables on fall and spring migration of birds at Raleigh, 1895-1911, data on song period of birds at Raleigh, and a brief glossary are appended. A subject index and indexes to the common and scientific names are also appended.

The 24 colored plates with one exception are by R. B. Horsfall.

Birds in town and village, W. H. HUDSON (*New York: E. P. Dutton & Co. [1920]*, pp. X+323, pls. 8).—This is a popular account based upon English conditions.

British birds, their nests and eggs, and how to name them, W. M. GALLICHAHAN (*London: Holden & Hardingham, Ltd.*, 3. ed., pp. 152, figs. 84).—A small handbook.

The birds of the Tambelan Islands, South China. H. C. OBERHOLSER (*Proc. U. S. Natl. Mus.*, 55 (1920), pp. 129-143).

Notes on birds collected by Dr. W. L. Abbott on Pulo Taya, Berhala Strait, southeastern Sumatra, H. C. OBERHOLSER (*Proc. U. S. Natl. Mus.*, 55 (1920), pp. 267-274).

Notes on Dr. W. L. Abbott's second collection of birds from Simalur Island, western Sumatra, H. C. OBERHOLSER (*Proc. U. S. Natl. Mus.*, 55 (1920), pp. 473-498, fig. 1).

A revision of the subspecies of the white-collared kingfisher (*Sauroptatis chloris*), H. C. OBERHOLSER (*Proc. U. S. Natl. Mus.*, 55 (1920), pp. 351-395).

The races of the Nicobar megapode (*Megapodius nicobariensis*), H. C. OBERHOLSER (*Proc. U. S. Natl. Mus.*, 55 (1920), pp. 399-402).

Notes on the wrens of the genus *Nannus*, H. C. OBERHOLSER (*Proc. U. S. Natl. Mus.*, 55 (1920), pp. 223-236).

Report of entomologist, W. E. HINDS (*Alabama Col. Sta. Rpt. 1919*, pp. 26, 27).—In this brief report of the work of the year, it is pointed out in connection

with the work with *Calandra oryza* that the selection of a weevil-resistant type of seed ear is the first important step to be taken in control work. Next in importance is the utilization of the trap plat method of concentrating the first generation of rice weevils in the field so that they may be controlled economically by proper handling of the small amount of corn that is grown on this trap area.

Reference is also made to soil fumigation work with sodium cyanid now under way.

Entomological investigations (*California Sta. Rpt. 1919, pp. 68-70*).—Investigations made by C. W. Woodworth while in China confirm the view that with the present cost of labor sericulture can not be commercially profitable in California.

In a special study by Woodworth of the problem of mosquito control in the lowlands of Yangtze Valley in China the practical use of the ordinary inspection net as a means of control was demonstrated. In sanitary work at Newport News, Va., W. B. Herms demonstrated the practicability of drainage for mosquito control under conditions of scarcely any fall, in which drainage canals serve as a means for concentrating water rather than carrying it off the land. Since the mosquitoes thrive only in small pools this drainage work was almost as effective as that which would have occurred had the water been drained off.

In fumigation work in which carbon bisulphid was used, E. R. de Ong found the effect of gas on the germination of the seeds to be quite negligible even with excessive treatment (E. S. R., 41, p. 754). In cold storage work with insects he obtained considerable data on the length of time the various insects are able to survive exposure to different degrees of refrigeration. All of the rice weevils, with one exception, were killed in one month. The Indian meal moths were all dead in two months, but larvæ of the yellow meal worm can live over three months.

Extensive studies of the chemical and physical properties of liquid cyanid were made by G. P. Gray and E. R. Hulbrit (E. S. R., 41, p. 502), who originated a method for determining the concentration by the use of the thermometer and specific gravity spindle. They also investigated the action of cyanid upon metals.

Reference is made to insecticide statistics compiled by Gray, an article relating to which has been previously noted (E. S. R., 40, p. 59). Of \$3,000,000 spent annually in California for insecticides, one-third is spent for cyanid and about one-sixth for sulphur.

A survey of the forest areas of Santa Cruz County and a partial survey of the National Forests of Monterey and Santa Barbara Counties, made by G. A. Coleman with the view to increasing the output of honey, resulted in finding some 47 suitable locations for new apiaries, about 25 of which are now occupied or are about to be occupied.

Reference is made to a study of the natural breeding areas of the beet leaf-hopper by H. H. Severin, accounts of which have been previously noted (E. S. R., 41, pp. 456, 755).

Division of entomology and economic zoology, W. A. RILEY (*Minnesota Sta. Rpt. 1919, pp. 45-47*).—Field experiments are said to show that under ordinary conditions Nicofume and soap will kill 65 per cent of the potato-leaf hoppers, whereas under laboratory conditions 99 to 100 per cent were killed. Life history studies were made of the oak twig girdler with the view to finding a satisfactory method of control. It appears that the only possible method is to trim all dead branches from the trees and burn them with their insect contents. *Camponotus pennsylvanicus* was a serious enemy of cedar

in the State, the average infestation running from 15 to 25 per cent in the swamps and from 40 to 70 per cent on higher land. Brief reference is made to other work under way. A nematode hitherto unknown as a parasite of man has been discovered and evidence adduced to show that it is transmitted through food contaminated by rodents.

Report of the department of entomology, T. J. HEADLEE (*New Jersey Stat. Rpt. 1918, pp. 205-295*).—The author first presents a tabular list of insects and other animals received and identified during the year, 82 in number. Brief reference is then made to the occurrence of and work during the year with plant lice, the potato flea-beetle, tomato flea-beetle (*Epitrix fuscula*), the oriental peach moth, horse-radish flea-beetle (*Phyllotreta armoraciæ*), and the seed-corn maggot (*Pegomyia fusiceps*).

Investigations of the pear psylla led to the conclusion that the recommendations as to control measures made in the report of 1916 (E. S. R., 39, p. 761) should be followed in their entirety. The least important of three treatments is the scraping of the rough bark from the trees in late fall or early winter. The faithful annual practice of the winter and spring spraying, accompanied by as much scraping as may be necessary to keep the trees clean, will bring the pear psylla under reasonably satisfactory control. Thoroughness of coating coupled with the proper time of application is absolutely essential to success. Particular attention was given during the year to control work with the plum curculio. The schedule for the application of lime-sulphur and arsenate of lead recommended in 1917, namely, (1) before the buds swell, (2) as the blossoms first show color, (3) directly after the petals fall, (4) 10 days after the blossoms fall, and (5) June 20 to 30 for all fall and winter varieties, was modified in 1918, so that the fourth application was made 7 days after the petals fell and an additional application made 17 days after the blossoms fell. Those who applied the extra spray with sufficient thoroughness eliminated the normal curculio injury. Particular mention is made of two parties, one at Allaire and the other near Clementon, who succeeded in eliminating serious curculio damage by closing up the gap between the blossom-fall and the 10-days-after-blossom-fall spray by the introduction of another spray as outlined in the new schedule. Better results are secured with a mixture of lime-sulphur and lead arsenate than with lead arsenate alone, the lime-sulphur appearing to have a repellent action.

An account is next given of the sprinkling sewage filter fly (*Psychoda alternata*), by T. J. Headle and C. S. Beckwith (pp. 214-221), accounts of which from other sources have been noted (E. S. R., 40, p. 356; 41, p. 165). The cranberry investigations were taken over by the department of entomology during the year and work was carried on by C. S. Beckwith, the data presented relating particularly to fertilizer experiments (pp. 222-230) and being abstracted on page 837. A report is made of studies of eggs of apple aphids by A. Peterson (pp. 231-234), a bulletin relating to which has been previously noted (E. S. R., 41, p. 253).

Experiments with tarred paper collars and other substances for protection against the peach tree borer are reported by A. Peterson (pp. 234-243), in continuation of the work of the previous year (E. S. R., 41, p. 58). The report relates particularly to extensive experiments made with tarred paper collars commercially known as Scott's tree protectors. Details relating to the application of these protectors are presented. The results obtained from those placed about the base of 75 or more of 8 to 10 year old trees in three distinct portions of the peach orchard at Clementon are reported upon in tabular form. While no conclusion can be drawn as to the value of the tarred paper disks the results are indicative of what may be expected in another year. Only a few large

larvæ were found at the end of the season in November when the trees were bored. The protectors in the southeast and northeast parts of the orchard are said to have reduced the infestation 90 per cent and 75 per cent in the southwest portion.

Experiments were also tried with various chemicals or common spray materials sprayed on the trunks at intervals of 10 days to 2 weeks. In all cases the number of small larvæ present in the spring of the year apparently indicates their ineffectiveness. Applications of nicotin resinate, 1 part to 100 parts of water, from one to three times failed to reduce the number of larvæ. Applications of Scalecide 1:15 on July 25, August 6, and August 18 did not injure the trunks, but the number of larvæ was not materially reduced. Applications of Scalecide 1:20 plus crude carbolic acid 1 per cent and applications of fish-oil soap 1 lb. to 25 gal. of water plus crude carbolic acid 1 per cent applied on the same dates also failed to reduce the number of larvæ materially.

A detailed report is given of the mosquito work carried on during the period from November 1, 1917, to June 30, 1918 (pp. 243-295).

[Report of the] department of entomology, H. C. SEVERIN (*South Dakota Sta. Rpt. 1919, pp. 14-18*).—This report deals briefly with the results of studies of the web-spinning sawfly of plum and cherry (*Neurotoma inconspicua*) and the common field cricket (*Gryllus abbreviatus*).

N. inconspicua is generally distributed in South Dakota, but the greatest amount of damage is done in the eastern third of the State. It attacks principally wild plums (*Prunus americana*), the common garden plums (*P. domestica*), Canada plums (*P. nigra*), western sand cherry (*P. besseyi*), the compass cherry (*P. besseyi*×*americana*), and the hybrid plums *P. besseyi*×*P. triflora*, *P. americana*×*P. simonii*, and *P. americana*×*P. triflora*. The injury consists of the destruction of the foliage by the gregarious web-spinning larvæ, the entire foliage of the tree being devoured and an unsightly web covering the branches and uneaten midribs of the leaves, where the pest is at all abundant.

The first sawflies are found in the first or second week of June. Egg mass averaging 46 eggs is laid by each female upon the undersurface of the midrib of the leaves of plum, sand cherry, etc. These hatch in a period of 4 to 8 days. The larvæ feed for 2 or 3 weeks upon the leaves, whereupon they drop to the ground, enter it to a depth of 1.5 to 10.5 in. and hollow out a chamber. Here they remain inactive throughout the remainder of the summer, fall, winter, and early spring, and pupate the latter part of May and early June. The adults emerge in from 1 to 2 weeks later.

A tachinid fly (*Eubrachymera debilis*) at times destroys as high as 50 per cent of the sawfly larvæ, but the host is killed only after it has reached its full growth and entered the ground. Larvæ of *Chrysopa* and nymphs and adults of *Podisus maculiventris* are important predacious enemies. The application of arsenate of lead, 2 lbs. of paste or 1 lb. of powder, to 50 gal. of water when the larvæ are small, is the most satisfactory artificial control measure. The use of other arsenical compounds is advised against because of danger of burning the foliage.

G. abbreviatus is the source of considerable injury to alfalfa seed and seed pods, shocked grains, and binder twine. Two parasites attack the eggs, namely, *Ceratoteleia marlatti*, which is very common and is quite a factor in keeping down the numbers of this pest, and *Paridris* n. sp., which is not so common. The control measures recommended include the renovation of alfalfa fields in the fall to destroy the cricket eggs, plowing or disking and harrowing in the fall the fields containing the eggs, and burning cocks or stacks of old hay or thrashed alfalfa.

[Special entomological investigations in St. Vincent] (*Imp. Dept. Agr. West Indies, Rpt. Agr. Dept. St. Vincent, 1918-19, pp. 13-18*).—The investigations reported relate to the life histories and control of the cotton stainer (*Dysdercus delauneyi*), the green bug (*Nezara viridula*), and the pea chink (*Edessa meditabunda*).

[Entomological notes], J. C. F. FRYER (*Ann. Appl. Biol., 6 (1919), No. 2-3, pp. 207-209*).—These notes relate to *Charaëas graminis*, the Angoumois grain moth, *Anthonomus pomorum*, *Phyllobius urticae*, and *P. oblongus*.

Insect pests in 1918, R. S. MACDOUGALL (*Trans. Highland and Agr. Soc. Scot., 5. ser., 31 (1919), pp. 152-188, figs. 24*).—This paper, which deals with the occurrence of and work with the more important insects of the year, concludes with an introduction to the life histories of the Chermes.

Notes on certain parasites, food, and capture by birds of the common earwig (*Forficula auricularia*), H. H. BRINDLEY (*Proc. Cambridge Phil. Soc., 19 (1918), No. 4, pp. 167-177*).—A contribution to the knowledge of *F. auricularia*, in which the author gives the results of investigations of the effects of parasitism by the gregarine *Clepsydrina ovata* and of the nature of the food consumed. In a careful examination made of the alimentary canal of 46 males from the Isles of Sicily it was found that about half were infested by *C. ovata*, the average number of gregarines per individual being about 25. In food tests decided preference was shown for the leaves of vegetable marrow, beet, and cabbage, the blossoms of *Anchusa* and *Oenothera*, and unskinned plum fruit. A brief summary is given of the present knowledge of the capture of earwigs by birds.

Accounts of this pest in the United States by Jones (*E. S. R., 38, p. 56*) and Essig (*E. S. R., 39, p. 464*) have been noted.

"White ants" as pests in the United States and methods of preventing damage, T. E. SNYDER (*Mo. Bul. Dept. Agr. Cal., 9 (1920), No. 1-2, pp. 7-20, figs. 11*).—Noted from another source (*E. S. R., 41, p. 355*).

Formosan termites and methods of preventing their damage, M. OSHIMA (*Philippine Jour. Sci., 15 (1919), No. 4, pp. 319-383, pls. 13, figs. 5*).—"In Formosa three species of termite, namely, *Leucotermes flaviceps*, *Coptotermes formosanus*, and *Odontotermes formosanus*, are injurious to wooden structures. A pair of mature individuals of *C. formosanus* is able to start a new colony. In a newly established colony of *C. formosanus* egg laying begins 5 to 13 days after swarming. *C. formosanus* lays from 1 to 4 eggs a day. Eggs of *C. formosanus* hatch in from 24 to 32 days after they are laid. The soldier of *C. formosanus* develops from the egg laid by the queen. *C. formosanus* attacks lime mortar. The principal food of *C. formosanus* is cellulose."

The termite-proof concrete layer is deemed entirely satisfactory in preventing the entrance of termites from the ground. Teak and cypress pine are immune from the attack of Formosan termites. The resistance of timber is not due to its hardness or weight, or to the inorganic compounds contained in it, but to sesquiterpene alcohols that can be extracted by benzene or alcohol. Cypress pine contains "gua-jol," and Fochow cedar and Randai cedar contain "cedrol." Camphor green oil contains 25 per cent of sesquiterpene alcohol and is entirely satisfactory as a preventive for buildings. The anthracene oil fractionated from coal tar is also effective in preventing the damage of *O. formosanus*.

The outbreak of locusts in western Canada in 1919 (*Agr. Gaz. Canada, 7 (1920), No. 3, pp. 218-220, figs. 2*).—The outbreak of locusts which occurred in certain sections of Manitoba, Saskatchewan, Alberta, and British Columbia in 1919 is said to be the most important from an economic viewpoint that has been experienced since the West was developed as an agricultural region.

Harlequin cabbage bug and its control, F. H. CHITTENDEN (*U. S. Dept. Agr., Farmers' Bul. 1061 (1920), pp. 13, figs. 5*).—A popular summary of information on the life history and habits and methods of control of this enemy of cole crops.

[**Walnut aphid studies**] (*California Sta. Rpt. 1919, pp. 43, 44*).—A new species of fungus, found by O. F. Burger and A. F. Swain in 1917 to be an important factor in controlling the walnut aphid in Southern California, has been given the name *Entomophthora chromaphidis* (E. S. R., 39, p. 464).

A brief account is given of the work of R. E. Smith with nicotin dust applied by large power-driven blowing machines. This has proved to be a very effective means of control, the walnut aphid being almost completely destroyed when the dust was applied with reasonable thoroughness. The original method of preparation of the dust consisted in diluting blackleaf 40 with considerable water, mixing with the desired proportion of kaolin from Ione, Cal., into a stiff mud, and then drying in air or with a little heat and repulverizing, several days at least being required to complete the process. At the present time a mixture of 75 per cent kaolin and 25 per cent hydrated lime is made in a mechanical mixer, and during the mixing process the desired amount of blackleaf 40 is blown into the mass in a fine spray, without any dilution. The lime dries out the moisture and also has a chemical effect, freeing the nicotin from the sulphate and rendering it much more active and effective, though less permanent, nicotin being more volatile than its sulphate. By the use of other machinery the material is further mixed and pulverized and the finished product delivered into sacks, 12 minutes being required to complete the whole process for each 400-lb. charge of material.

A mixture containing 2.5 per cent blackleaf 40 (1 per cent nicotin) is being used for the walnut aphid, from 1 to 4 lbs. of material being applied per tree, according to size. Two men with a team and a blower can thoroughly dust from 2 to 4 acres per hour. The total cost is from \$3 to \$5 per acre. Thus far, more than 5,000 acres have been dusted and it has not been necessary to dust more than once during the season. An account by Hodgson has been noted (E. S. R., 41, p. 457).

A reference to the use of this dust against *Psylla mali* in Nova Scotia by Britain has been noted (E. S. R., 41, p. 755).

Injury to silkworms by caterpillars of the brown-tail moth, Y. ABE (*Abstr. in Rev. Appl. Ent., Ser. A, 6 (1918), No. 11, pp. 501, 502*).—Irritation by the hairs from brown-tail moth caterpillars caused a sudden loss of appetite of silkworms followed by inactivity and emesis of green fluid.

Insects resembling European corn borer, H. A. GOSSARD (*Mo. Bul. Ohio Sta., 4 (1919), No. 12, pp. 372-379, figs. 8*).—Brief descriptions and accounts of the habits are given of insects resembling the European corn borer (*Pyrausta nubilalis*), including the bollworm, the lined stalk borer (*Hadena fractilinea*), corn stalk maggot (*Chatopsis aenea*), sod webworms (*Crambus* spp.), a native pyraustid caterpillar (*P. ainsliei*), the parsnip webworm (*Depressaria heracliana*), etc.

The lined stalk borer (*H. fractilinea*) was frequently received during the summer, having caused serious local damage in eight different counties in the northeastern part of the State. This caterpillar, which resembles the stalk borer (*Papaipema nitela*), becomes active in June and enters the stems of corn at the tips and bores downward. Irregular holes appear in the growing tip very much as if the work were done by the common stalk borer. As much as one-third of the stand in fields of 10 acres was reported destroyed. A closely related species, *Luperina stipata*, works in much the same way as *H. fractilinea*, but enters the corn plant lower down and burrows upward instead of down-

ward. The life history is not completely known, but since the larvæ occur from May to July and the adults have been captured from July to September it is thought there is but one brood a year. The eggs are laid in the fall, and timothy sod appears to be a favorite place for oviposition. Nearly all the severe damage to corn thus far reported has been on timothy sod plowed in the spring and sometimes late in fall. The eggs are supposed to hatch in the fall and the caterpillars probably hibernate as partially-grown cutworms. It is thought that early fall plowing of timothy sod will control this pest as well as related cutworms.

The corn stalk maggot (*C. ænea*) is often found in the stalks and under the leaf sheaths of a number of valuable crops, such as corn, sorghum, onions, sugar cane, broom corn, wheat, oats, rushes, and wild grasses. While they are generally scavengers aggravating a previous injury, it appears that healthy plants may also be attacked by them. The damage caused is quite similar in general outward appearance to the breaking over of the tassels by the European corn borer. The eggs are inserted beneath the leaf sheaths, and the maggots either feed near where they hatch or seek out some bruised spot where entrance to the interior of the plant is easy. The larvæ, if immature when winter arrives, hibernate at least in many cases. There appear to be three or four broods per year. Control in corn is practically accomplished by removing and feeding the stalks as fodder or by converting them into silage.

California oak worm (*Phryganidia californica*), H. E. BURKE and F. B. HERBERT (*U. S. Dept. Agr., Farmers' Bul. 1076 (1920), pp. 11, figs. 9*).—This lepidopteran of the family Diopitidæ appears in enormous numbers every few years and strips the live oak (*Quercus agrifolia*) and the white or valley oak (*Q. lobata*) of their leaves in the valleys of central California. In addition it becomes a general nuisance by crawling on lawns, walks, fences, and into houses, swimming pools, etc. It is a native California insect which, though occurring most abundantly in the San Francisco Bay region, is found in most of the coast region where the live oak grows from Sonoma County to southern California. In addition to the live oak and valley oak, it feeds on various other species of native and introduced oaks, the American chestnut (*Castanea dentata*, and in some cases on the blue gum (*Eucalyptus globulus*).

The young worms eat the pulp from the surface of the leaf between the netted veins, feeding on either surface, but more often on the upper. The older worms feed on the edges of the leaves, eating everything down to the main ribs. There are two generations of the species during the year, the worms being most noticeable during April and May and again in August and September; the moths during June and July and again in October and November. The eggs are laid on the leaves of the oaks and many other trees, on the bark of the trunks, on the grass under the trees, etc. Those placed on the leaves are laid in more or less regular rows in groups of from 2 to 40 on the under-surface of the leaf. They hatch in from 10 to 15 days in the summer time and from that to 4 months in the winter time. The larvæ molt from 3 to 6 times, 5 being the normal number. About 2 weeks are passed in the pupal stage.

The eggs, larvæ, and chrysalids are destroyed by the spined soldier bug (*Podisus maculiventris*). The larger larvæ are destroyed by a small grayish tachinid, *Thryptocera flavipes*, and the pupæ are parasitized by *Chalcis abiesia* and *Itoplectis behrensi*. A bacterial disease is said to destroy large numbers of the larvæ. As a control measure the author recommends the use of from 3 to 5 lbs. of arsenate of lead paste, or 1.5 to 2.5 lbs. of the dry powder, dissolved in 50 gal. of water and applied by means of a power sprayer. This should be applied in April, and again if necessary about August 1, while the worms are

in the younger stages and are more easily killed and have done very little damage.

The western oak looper (*Therina somniaria*) which defoliates oaks in Oregon and Washington in a similar manner should not be confused with *P. californica*.

Notes on the life history of *Ephestia kuehniella*, R. V. WADSWORTH (*Ann. Appl. Biol.*, 6 (1919), No. 2-3, pp. 203-206).—Brief notes are given on the biology of the Mediterranean flour moth.

The life history of the toon shoot and fruit borer, *Hysipyla robusta* (Lepidoptera; Pyralidæ; Phycitinæ) with suggestions for its control, C. F. C. BEESON (*Indian Forest Rec.*, 7 (1919), No. 7, pp. [IV]+71, pls. 13, figs. 2).—This is a monographic account of *H. robusta*, which attacks the young shoots of the toon tree, boring its way along the pith. It attacks trees both in plantations and in the forests, preferring those about 3 ft. in height and of strong growth. The species occurs in India, Burma, Ceylon, Perak, British New Guinea, and Australia. Studies of its seasonal history and life history are presented in detail, much of the data being given in tabular and chart form. A bibliography of 29 titles is included.

The ultimate seasonal infection of malarial fever, with the mosquito carrier as the indicator, B. MAYNE (*Pub. Health Rpts. [U. S.]*, 34 (1919), No. 35, pp. 1969-1972).—The author, having considered it practicable to develop a sanitary indicator for malaria prophylaxis in the determination of the initial and terminal infection found existing among mosquitoes collected in districts where malaria thrives, presents some information pertaining to ultimate infection. It is pointed out that the date up to which time mosquitoes are infective and beyond which time they are not differs with the place and year. At Lenoir, in northern Louisiana, the date was between October 20 and November 1 in 1917.

The ox warble or ox bot flies (*Hypoderma bovis* and *H. lineatum*), R. S. MACDOUGALL (*Trans. Highland and Agr. Soc. Scot.*, 5. ser., 31 (1919), pp. 94-121, figs. 8).—This is a review of the present status of knowledge of the life history and habits and means of prevention and remedial measures for the ox warbles, which are dealt with in connection with a bibliography of 33 titles.

Observations on the more common aphidophagous syrphid flies, C. H. CURRAN (*Canad. Ent.*, 52 (1920), No. 3, pp. 53-55).—The author's observations relate to *Allograpta obliqua*, *Sphaerophoria cylindrica*, *Syrphus americanus*, *S. ribesii*, *S. torvus*, *Paragus tibialis*, and *P. bicolor*.

On a new saccharomycete, *Monosporella unicuspidata* n. g. and n. sp., parasitic in the body cavity of a dipterous larva (*Dasyhelea obscura*), D. KEILIN (*Parasitology*, 12 (1920), No. 1, pp. 89-91, figs. 3).—The saccharomycete here described as new was found in a ceratopogonid larva (*D. obscura*), which usually lives in the thick brown sap that fills the infected wounds of elm or horse chestnut trees. A list is given of 16 references to the literature.

Calwer's beetle book.—Introduction to the knowledge of the beetles of Europe, C. SCHAUFUSS (*Calwer's Käferbuch. Einführung in die Kenntnis der Käfer Europas. Stuttgart: E. Schweizerbart'sche Verlagsbuchhdlg.*, 1916, 6. ed., vols. 1, pp. 88+709, pls. 20, figs. 250; 2, pp. 709-1390, pls. 28, figs. 4).—In the introductory part of this work a general account is given of the beetles, their structure, development, life history, collection and rearing, preservation and mounting, determination and classification, sale and exchange, a table for the identification of the common ants of Germany (pp. 66-68), and a table for the separation of the families of beetles occurring in the Palearctic region (pp. 69-88). The main part of the work takes up the various families of beetles, commencing with the Cicindelidæ, giving descriptions of the genera

and species. Illustration of the beetles are in colors, as many as 36 being given on a single plate and a total of 1,400 being illustrated.

Two Philippine leaf-mining buprestids, one being new, C. S. BANKS (*Philippine Jour. Sci.*, 15 (1919), No. 3, pp. 289-299, pls. 3).—A descriptive and biological account is given of *Endelus bakeri* found in blotch mines, singly, on the leaves of the bird's nest fern (*Asplenium nidus*). *E. calligraphus*, which forms galleries in the leaves of *Asplenium* sp., is described as new.

Notes on the biology of *Necrobia ruficollis* (Coleoptera, Cleridæ), H. SCOTT (*Ann. Appl. Biol.*, 6 (1919), No. 2-3, pp. 101-115, figs. 2).—This is a report of studies of a clerid beetle, the larvæ of which are usually saprophagous, but which sometimes return to the predacious habits characteristic of the family and kill and devour other larvæ. They have been observed to eat the soft parts of dead adult flies and to kill and eat fly maggots.

A list of 28 references to the literature is appended.

Some insect relations of *Bacillus tracheiphilus*, F. V. RAND and L. C. CASH (*Phytopathology*, 10 (1920), No. 3, pp. 133-140, fig. 1).—The investigations here reported have been summarized as follows:

"It is clear that a small percentage of striped cucumber beetles harbor the wilt organism internally when they enter the cucurbit fields in the spring, and there appears to be no other source for their infection than the cucurbit crop of the preceding autumn. Infections may take place from the mouth parts, at least for a limited time after feeding upon wilted plants, and infections are shown to occur when the feces of some beetles, but not all, come into contact with fresh injuries to the leaves. Infections take place only through injuries involving the vascular system. *B. tracheiphilus* has been isolated directly from the viscera of wilt-fed striped cucumber beetles. Beetles of the genus *Diabrotica* (proved for two species) are the only carriers of the disease so far known in nature."

On the life history of "wireworms" of the genus *Agriotes*, with some notes on that of *Athous hæmorrhoidalis*, I. A. W. RYMER ROBERTS (*Ann. Appl. Biol.*, 6 (1919), No. 2-3, pp. 116-135, pl. 1, figs. 5).—This is a report of biological studies by the author, together with a review of the literature, a list of 25 references to which is included.

Notes on the apple root weevil (*Leptops hopei*), W. W. FROGGATT (*Agr. Gaz. N. S. Wales*, 31 (1920), No. 1, pp. 56-60, figs. 7).—Injury is caused by the larvæ of *S. hopei*, which do not bore into the roots but after working their way down the trunk eat away the bark and gouge a regular furrow along the outer surface, following around until all the bark of the main roots and the surface wood are devoured and the damaged root rots. There is said to be but one previous record of its root injury in New South Wales, but it has been found on various occasions doing considerable damage to the opening buds of vines and fruit trees.

The maize billbug or elephant bug (*Sphenophorus maidis*), W. P. HAYES (*Kansas Sta. Tech. Bul.* 6 (1920), pp. 5-27, figs. 12).—This is a report of studies conducted in southern Kansas in 1914 and 1915, an account of which work by the author has been previously noted (E. S. R., 35, p. 760). Studies of this species by Kelly have also been noted (E. S. R., 25, p. 159), as have studies of the southern corn billbug by Webster (E. S. R., 27, p. 162), Smith (E. S. R., 29, p. 56), and Metcalf (E. S. R., 37, p. 666).

Since the studies of this beetle commenced, in 1914, it has been a source of damage to planted corn in Cowley, Butler, Marion, and Greenwood Counties and is known to occur in four other counties. It is found principally along river valleys of the southern part of the State, and does slight injury on second-

bottom land, but only rarely on the higher land. Dispersion takes place almost entirely through the ability of the adult to walk from field to field, it never having been observed to fly.

The injury is caused both by the adult beetle and the larva, each being of a distinct type. Punctures made by the adult while feeding kill a large number of plants soon after they break through the ground and during their early stages of growth. The plants that survive or escape injury from the feeding of the adult beetles are subject to a more severe type of damage from the feeding of the larvæ. Large cavities are dug out of the plant by the adults in which to lay their eggs, from which the larvæ hatch and at once begin feeding and burrowing into the heart of the plant. The burrows increase in size and eventually extend from the taproot to several inches above the surface of the soil. This does not always kill the plant, but causes the upper leaves to assume a pale, wilted appearance and the whole plant to become gnarled and distorted. The stalks grow slowly, sucker profusely, and seldom produce ears.

In addition to corn, rosin plants and swamp grass have been recorded as food plants. While field corn is the principal crop injured by the beetle, it at times thrives on sweet corn, cane, Kafir corn, and feterita.

The eggs are laid in slits made by the female in the plant at or near the surface of the soil and sometimes in the soil near the corn plant. The incubation period of the egg varied from 4 to 25 days, with an average of 8.2, in 1914, and from 5 to 39 days, with an average of 12.26, in 1915. The length of the larval stage ranged from 40 to 60 days, with an average of 52.5, in 1914, and from 32 to 69 days, with an average of 42.83, in 1915, when reared on corn. The period on kafir corn was from 32 to 68 days, with an average of 47.5; on cane, 39 to 75 days, with an average of 54.83; on feterita, 38 to 52 days, with an average of 44.42; and on sweet corn, 43 to 56 days, with an average of 48. Pupæ are found in the field during late summer and early autumn in pupal cells in or near the taproot of the infested plant. The pupal period varied from 10 to 13 days, with an average of 11.4, in 1914, and from 9 to 30 days, with an average of 13.84, in 1915. The majority of the beetles pass the winter in their pupal cells within the cornstalks.

"Summing up the seasonal appearance of this billbug, we find the adults present in the fields throughout the fall, winter, spring, and larger part of summer; eggs may be found in May, June, and sometimes in July; larvæ from the first part of June to the middle of September; pupæ are present from the latter half of July to the last of September. There is but one generation annually, though adults that have lived through the winter will sometimes be abroad after their progeny have matured."

The species has few natural enemies, none having been recorded. Fall plowing is said to be a fairly effective control measure, since it breaks up the winter quarters of those beetles hibernating within the cornstalk and disturbs all others more or less. The cheapest, most satisfactory, and most practicable method of control is the use of a cropping system in which corn does not follow corn.

The four-spotted cowpea weevil (*Bruchus quadrimaculatus*), O. WADE (*Oklahoma Sta. Bul. 129 (1919), pp. 3-14, figs. 6*).—The damage caused to the cowpea by the four-spotted cowpea or bean weevil in Oklahoma is said to have increased at an alarming rate in recent years. In the present paper the author presents a summary of information on its life history and habits and control measures.

During the year 1918-19 seven generations and a partial eighth were reared by the author under conditions simulating those of the ordinary storage house. Eggs are deposited on the green pods in the field or on the seed through vents

in the pods, the average number deposited per female varying from 11 to more than 100, 75 being about the average under favorable conditions. The larvæ, which hatch out in from 5 to 20 days (average 6 to 8), bore directly down through the pod into the seed. From 17 to 40 days are passed in the larval stage and from 7 to 19 (average 8 to 10) in transformation of the larvæ to adults. Thus the life cycle varies from 30 to 35 days in the summer up to 82 days under lower temperature conditions.

Bruchobius laticeps was found to be a common parasite of this weevil in Oklahoma, making its appearance in late June and early July and again in late September and October. During 1918 it was present in considerable numbers, and in several quantities of stored cowpeas being used for breeding purposes it was effective enough finally to rid the peas of the weevil completely. Tests made demonstrate that the weevil can be effectively controlled and stored cowpeas protected from damage by either of two methods, which are both practicable for common use. The first consists of storing cowpeas in ordinary bins or common sacks after having mixed the seed with air-slaked lime, using 1 part of the lime to 8 parts peas by weight. The other consists in the fumigation of cowpeas with carbon bisulphid, using not less than 5 lbs. carbon bisulphid to 1,000 cu. ft. of space, dosing three times at intervals of one week, then sacking in bags of close weave and tight seams, and tying the tops securely.

Observations at the station failed to show the presence of *B. chinensis* in as great numbers as *B. quadrimaculatus*, or that it causes as much damage.

Hypera nigrirostris in the Pacific Northwest, L. P. ROCKWOOD (*Canad. Ent.*, 52 (1920), No. 2, pp. 38, 39).—The author records the occurrence of *H. nigrirostris* from Vancouver, B. C., southward through Washington to its southern limits in Oregon at Garden Home in the Willamette Valley, Forest Grove in Tualatin Valley, and Nehalem on the coast.

Bathyplectes exigua, a European species hitherto not recorded in the United States and apparently without host record in Europe, was found to parasitize about 50 per cent of the early cocoons of *H. nigrirostris* at Puyallup, Wash. In 1919, adults of this parasite were swept from clover at Forest Grove and were present at Nehalem on the ocean front. A species identified as *B. exigua* has been reared from a larva of *H. punctata* at Mechanicsburg, Pa. *Dibrachoides dynastes*, a pteromalid parasite attacking the pupæ within the lacy cocoons, was found in some numbers during the seasons of 1918 and 1919 at Puyallup and Auburn, Wash.

The black banana stem weevil (*Cosmopolites sordidus*), W. W. FROGGATT (*Agr. Gaz. N. S. Wales*, 30 (1919), No. 11, pp. 815-818, figs. 6).—This weevil, originally described from Java, was first recorded on the Tweed River from a banana plantation near Stoker's Siding, where the bananas have since been dug out. At the present time the infested district appears to be the Condong Range, where there are a number of plantations more or less badly attacked. It has previously been recorded as a pest of banana at Redland Bay, Queensland.

A brief account is given of its life history and habits.

American foulbrood, G. F. WHITE (*U. S. Dept. Agr. Bul.* 809 (1920), pp. 46, pls. 8, figs. 9).—This monographic account is similar in nature to the works of the author on sacbrood (E. S. R., 36, p. 659) and on Nosema disease (E. S. R., 41, p. 359). The work has been summarized by him as follows:

"American foulbrood is an infectious disease of the brood of bees caused by *Bacillus larvæ*. All larvæ, worker, drone, and queen are susceptible to the infection; adult bees are not. Man evidently is not susceptible to infection with the organism nor are the experimental animals. So far the disease has not been encountered or produced in other insects than honeybees. The brood of bees can be infected through feeding the spores of the bacillus to a colony.

The spores contained in a single scale are more than enough to produce considerable disease in the colony. The portal of entry of the infecting agent is somewhere along the alimentary tract of the larva, most likely the stomach (midintestine). Practically speaking there are no secondary invaders either during the life of the infected larva or during the decay of the remains. The incubation period is approximately 7 days. The brood is susceptible to infection at all seasons of the year. More brood dies of the disease during the second half of the brood-rearing season than during the first half.

"The disease is present at least in Australia, New Zealand, Denmark, England, Ireland, Germany, France, Switzerland, Canada, Cuba, and the United States. The rosy foulbrood of all these countries is one and the same disease. Occurring as it does in such a wide range of climatic conditions, it is evident that the presence of the disease can not be attributed alone to any particular climate.

"The course of the disease in the colony is not affected greatly, if at all, by the quality of food used by the bees, or by the quantity present. Colonies in which the disease has been produced through artificial inoculation can be kept in the experimental apiary without transmitting the disease to others. This fact is of special importance not only in the technique of making studies, but also in the control of the malady.

"The spores of American foulbrood remain alive and virulent for years in the dry remains (scales) of larvæ and pupæ dead of the disease and in cultures that have become and remain dry. The spores are very resistant to most destructive agencies. A variation in resistance is noted both as to the individual spores of a sample and as to the spores contained in different samples. Many of the spores are killed within 1 minute at 100° C., and all of them from some samples are killed in less than 5 minutes. In some instances 96° maintained for 10 minutes will destroy all of the spores, while 98° will often do it. The most resistant of the spores studied when suspended in water have not withstood 100° for 11 minutes. The spores withstand more heating when they are suspended in honey or honey diluted with water than when suspended in water. The spores suspended in honey or diluted honey can be destroyed by 100°, but it may require half an hour or more to do so.

"American foulbrood spores when dry were destroyed by the direct rays of the sun in from 28 to 41 hours. The spores when suspended in honey and exposed to the direct rays of the sun were destroyed in from 4 to 6 weeks. The spores when suspended in honey and shielded from direct sunlight remained alive and virulent for more than a year. It is very likely that they are capable of remaining so for a very much longer period.

"The spores resisted the destructive effects of fermentation for more than 7 weeks at incubator and outdoor temperatures, respectively, and probably are able to withstand these agencies for a very much longer period. The spores resist carbolic acid at room temperature in strengths ordinarily used as a disinfectant for periods of months; 1 to 1,000 mercuric chlorid for days; 10 per cent formalin for hours. Experiments recorded in the present paper indicate that drugs do not materially affect the course of the disease.

"American foulbrood infection is transmitted primarily through the food of bees; possibly at times to some extent through their water supply. Robbing from the diseased colonies of the apiary, or from neighboring apiaries, is the most likely mode by which the disease is transmitted in nature. The placing of brood combs containing diseased brood with healthy colonies will result in the transmission of the disease. Flowers should not be considered as a likely medium through which infection may take place. Whether the disease is ever transmitted by queens or drones has not been determined. That they have

been overestimated at times as possible sources of infection seems likely. It is quite probable that in many cases hives which have housed colonies infected with American foulbrood will not transmit the disease to healthy colonies transferred to them. Results from the present studies confirm the observation made by beekeepers that danger from this source may be removed by properly flaming such hives inside. The clothing of those about an apiary, and the hands of the apiarist are not fruitful sources for the transmission of the disease. Tools and bee supplies generally about an infected apiary will not transmit the infection in the absence of robbing from those sources.

"American foulbrood usually can be diagnosed from the symptoms alone. A definite diagnosis can always be made from suitable samples by bacteriological methods. The prognosis in the disease in the absence of treatment is decidedly grave, but with proper treatment it is favorable. From the technical viewpoint many of the problems considered in these studies have been solved only partially; from the practical point of view, however, the results are sufficient to make a logical, efficient, and economic treatment of American foulbrood possible."

A list of 29 references to the literature is appended.

Control of American foulbrood, E. F. PHILLIPS (*U. S. Dept. Agr., Farmers' Bul. 1084* (1920), pp. 15, figs. 5).—This publication, based upon the work above noted, gives a popular account of preventive and remedial measures for American foulbrood. In controlling this disease it is necessary that all combs, honey, and other materials from the inside of the hive be taken from the bees, and that a chance be given them to establish themselves again on new combs. Several methods are given in this publication, but the underlying principle is the same in all cases.

A study of the behavior of bees in colonies affected by European foulbrood, A. P. STURTEVANT (*U. S. Dept. Agr. Bul. 804* (1920), pp. 28, figs. 6).—This report of a series of investigations started at Cornell University in 1918 has been summarized as follows:

"European foulbrood is an infectious disease. *Bacillus pluton* was found to be the primary invader, appearing in the intestinal tract of larvæ before death, contemporary with the first slightly apparent symptoms. The variation in the appearance of the diseased larvæ after death is due to the presence or absence of secondary invaders.

"The period of incubation for European foulbrood was found to be from 36 to 48 hours, although the gross symptoms usually do not become apparent in less than 3 or 4 days, varying with conditions of honey flow and strength of colony. It has been noted in apiary practice that the first brood of the year usually escapes with little loss. During the first 5 to 7 days the spread of the disease in the colony after infection is slow, after which the increase is rapid under favorable conditions. The critical time, therefore, to detect the disease and start treatment is early in its course, thus making conditions unfavorable.

"The evidence tends to confirm the theory that one of the ways the disease is spread in the colony is by the house-cleaning bees, and from colony to colony by their drifting. It is quite probable that the infective organisms are carried on the mouth parts and pedal appendages. The question of infection from intestinal contents or from the source of larval food at various stages needs further substantiation.

"Irrespective of strength of colony, the Italian bees were found to resist infection much better than hybrids and showed more ability to overcome the disease. This apparent resistance of the Italian bees was observed to be largely due to the more vigorous house-cleaning characteristics rather than to a natural resistance or immunity to the disease. There was very little difference in the

apparent period of incubation between the Italian and hybrid colonies, possibly a slight difference in favor of the Italians. Furthermore, it was noted that often there may be a slight recurrence of disease in the brood of the new Italian queen until a sufficient number of her bees have emerged to eliminate the infection by house cleaning. Apparently, infection is not always entirely removed by a period of queenlessness.

"As a rule, requeening is necessary in the treatment of European foulbrood, except possibly in the strongest Italian colonies, which show only slight infection. Where a considerable quantity of disease is present, sufficient to require treatment, it was found unsafe to use a period of less than 10 days' queenlessness, due to the infectious condition of the diseased material remaining and the accompanying behavior of the colony. The stronger the colony in Italian bees, the more rapid was the recovery.

"A heavy honey flow tends to prevent infection from gaining a foothold. It also tends to eliminate the disease if present before the start of the heavy honey flow. This was found to be due to the effect of dilution on the infection because of the influx and direct feeding of the fresh nectar to the larvæ.

"European foulbrood is a disease of weak colonies. It was found to be difficult effectually to infect any but the very weak colonies during the heavy honey flow. Therefore, colonies kept strong up to the time of the honey flow run very little danger of contracting European foulbrood. This and others of the facts observed are in exact harmony with facts already observed in apiary practice."

Determination of age in honeybees, H. L. M. PIXELL-GOODRICH (*Quart. Jour. Micros. Sci. [London], n. ser., 64 (1920), No. 254, pp. 191-206, pl. 1*).—"For the study of those bee diseases with which no specific organisms have so far been identified it is important to be able to eliminate bees dying of old age, and this can not be done with certainty by observing outward symptoms. However, the age of bees, which normally work almost incessantly for about six weeks and then die, may be determined with some accuracy from a study of the brain cells. With advancing age the cytoplasm of these cells undergoes gradual reduction peripherally, until in senescence only a vestige is left surrounding the nucleus.

"The condition of the head glands, including a pair of esophageal glands which do not appear to have been previously recorded, gives some indication of age in normal healthy bees."

A list is given of 20 references to the literature.

A remarkable case of homing instinct, C. N. AINSLIE (*Canad. Ent., 52 (1920), No. 3, pp. 50-52*).—This relates to *Sphex vulgaris*.

FOODS—HUMAN NUTRITION.

A pink yeast causing spoilage in oysters, A. C. HUNTER (*U. S. Dept. Agr. Bul. 819 (1920), pp. 24*).—The investigation reported in this bulletin includes a study of the distribution of the pink yeast which has been found to be the cause of the development of a pink color in New England oysters shipped for some distance, of possible methods of controlling or preventing its development, and of the morphological, cultural, and biochemical properties of the organism.

The pink yeast, which belongs to the group of *Torulæ*, was found in largest numbers in the houses where the oysters were shucked and packed, to a considerable extent on the decks of the boats bringing in the oysters, to a much less extent (26.3 per cent of the samples examined) in the oysters before they were brought to the oyster house, occasionally in deep surface water samples from the oyster beds, and not at all in mud samples from the bottom of the

bay. The principal source of contamination of the oysters is considered to be the process of handling in the oyster house.

The study of the yeast itself showed that it reproduces by budding, does not form spores, grows at room temperature but not at 37° C., and is killed at 64°. It does not produce acid, gas, nor alcohol in carbohydrate media, and does not produce indol or phenol. It reduces nitrates to nitrites and ammonia. The pink pigment produced by the yeast is insoluble in water, slightly soluble in alcohol and carbon disulphid, somewhat more soluble in chloroform, and very soluble in ether. The yeast resists drying for at least 100 days and is not affected by chemicals commonly employed in the disinfection of water, but is destroyed by a 0.04 per cent solution of formaldehyde (formalin 1:1,000).

It is thought that the pink yeast may be eliminated by systematic disinfection of oyster houses, utensils, etc., by thorough washing several times during the season with a formaldehyde solution of the above strength. The occasional appearance of the yeast in the water of the bay and in the oysters when taken from the water is considered traceable in large measure to the oyster shells, which after contamination with the yeast in the oyster houses are subsequently planted in the oyster beds.

[**Whale meat**] (*California Sta. Rpt. 1919, p. 58*).—As the result of artificial digestion experiments, conducted by H. A. Mattill, it is reported that whale meat is as easily digested as any other meat. Raw whale meat was not so completely digested at the end of 2.5 hours as raw beef, but more completely digested than the beef in 4 hours. In the cooked condition it was rather more quickly and completely digested than beef. The composition of whale meat is reported as follows: Water 71.22 per cent, ash 1.2, protein 23.13, fat 4.24, and undetermined 0.21 per cent.

[**Control of mills by means of laboratory data**], R. R. JACOBS and O. S. RASK (*Jour. Amer. Assoc. Cereal Chem., 4 (1919), No. 1, pp. 16-18*).—On the basis of data presented, the authors discuss the possibility of determining the quality of flour by laboratory mill control. The results of analyses of some flour and other milling products are given. The following conclusions are drawn:

“Wheat is composed of three parts, the endosperm or flour-producing portion, the bran tissue, and the embryo or germ. The flour-producing portion contains practically all the starch and only very small quantities of pentosans and fats, the pentosans forming in part the framework of the cellular structure of the endosperm.

“The bran tissue contains practically all of the pentosan, with small amounts of fat and no starch; the pentosan content of this bran tissue is constant. . . . The embryo or germ contains practically all of the fat, inappreciable quantities of pentosan, and no starch. Therefore, the amount of fat and pentosans in any grade of flour is a measure of the amount of offal (germ and bran) contained in that flour; conversely, the amount of starch contained in wheat or any mill product is a measure of the amount of endosperm and, therefore, of the amount of flour contained in that product.

“The accuracy of the flour yield determination of wheat as made by the ordinary experimental mill is dependent on two very important factors, the skill of the operator and the completeness of the equipment.”

The determination of pentosans or starch may be used as a check on the miller's yield reports by the application of a formula which is given. The determinations and formulas may be used for obtaining the milling efficiency on a percentage basis.

The gastric response to foods.—VII, The response of the normal human stomach to vegetables prepared in different ways, R. J. MILLER, H. L.

FOWLER, O. BERGEIM, M. E. REHFUSS, and P. B. HAWK (*Amer. Jour. Physiol.*, 51 (1920), No. 2, pp. 332-349, figs. 32).—In this continuation of the investigation previously noted (E. S. R., 41, p. 857), a study was made of the response of the normal human subject to 30 different kinds of vegetables prepared in various ways in a total of 124 experiments made on 25 normal men.

The average evacuation time of all subjects of the rapid-emptying type was 2 hours, and of the slow-emptying type 2.5 hours. The averages of the highest acidities developed (expressed in cubic centimeters of $N/10$ alkali required to neutralize 100 cc.) were 70 to 77, respectively, for the two types.

"In general, raw vegetables low in protein, as carrots, celery, tomatoes, cabbage, lettuce, and cucumbers, leave the stomach rapidly, develop moderately high free acidities but little combined acidity, and leave the stomach without great change. Boiled vegetables show much more rapid and complete disintegration. Vegetables high in starch, such as potatoes, show very considerable starch digestion before leaving the stomach. In certain cases hardly any starch reaction could be obtained toward the end of digestion."

It is pointed out that the results obtained differ in many points from the results recorded by Beaumont in his well-known experiments on Alexis St. Martin.

[Chemical analyses of prunes, dried apricots, and almonds] (*California Sta. Rpt. 1919*, pp. 35-38).—Analyses by the nutrition laboratory of the station of samples of prunes and dried apricots from different localities for water and total sugar are reported, together with calculations of the sugar to a 25 per cent basis.

The percentage of water in prunes varied from 14.4 to 31.66 and in apricots from 11.5 to 38.4, the average of 14 samples of the latter being 26.9 per cent. The percentage of total sugar in the prunes ranged from 41.3 to 56.19 and in the apricots from 39.28 to 56.4, with an average of 47.19 for the latter.

Proximate analyses are reported of 14 varieties of domestic almonds and of 5 imported varieties. The average values for the domestic varieties were as follows: Water 5.74 per cent, ash 3.31, protein 23.72, fat 53.49, fiber 2.56, and nitrogen-free extract 11.38 per cent. The protein content of the imported varieties was lower than that of the domestic and the nitrogen-free extract proportionally higher.

The macroscopic and bacteriological investigation and valuation of canned meat, W. FREI and A. KRUPSKI (*Schweiz. Arch. Tierheilk.*, 60 (1918), No. 10, pp. 445-470; *abs. in Vet. Rev.*, 3 (1919), No. 1, pp. 25, 26).—The authors discuss the macroscopic examination of tinned meat for the detection of bacteriological infection. The different conditions which may be met with are summarized as follows: If the tin is of normal appearance, impervious, and without bulging the contents may be macroscopically normal and bacteriologically sterile, or macroscopically normal and bacteriologically infected, or macroscopically abnormal and either sterile or infected. If the tin leaks it is to be considered infected in all cases whether macroscopically normal or spoiled. If the tin is swelled there is a possibility of the contents being macroscopically normal and sterile from reaction with the metal of the container, or the contents may be infected and be either macroscopically normal or altered.

Further remarks on the examination of canned meat, X. SEEBERGER (*Schweiz. Arch. Tierheilk.*, 61 (1919), No. 11-12, pp. 367-377).—Attention is called to the paper of Frei and Krupski noted above, and a different scheme is proposed for the examination of canned meats, depending upon the characteristic sound produced by the shaking of the cans under certain conditions.

Absence of this sound on shaking the can may be taken to indicate the absence of gas, with the exception of special cases where a thick layer of fat

prevents the breaking of the gas against the tin. If the sound is produced the presence of gas is indicated. In cans containing no gas the contents may be liquid or solid or both, macroscopically normal and unchanged or decayed, and sterile or infected. In cans containing gas the contents may be macroscopically normal and unchanged, in which case the gas is either air due to incomplete filling of the can, or hydrogen formed by the reaction of the acid of the material on the metal of the container. If the contents are spoiled the gas contains, in addition to the above gases, decomposition products of the material.

The cans should be properly cooled before shaking.

Bacillus botulinus (*California Sta. Rpt. 1919, p. 58*).—Canned peas, corn, and fish, containing lemon juice as recommended by W. V. Cruess in Circular 158 (E. S. R., 36, p. 509), and control cans without lemon juice were inoculated by him with spores of *B. botulinus* and heated in boiling water for three hours. No bacterial growth or toxin was produced in the cans containing lemon juice, while those without lemon juice developed typical bacterial growth and sufficient toxin to kill guinea pigs.

A pictorial history of tea (*Tea and Coffee Trade Jour., 36 (1919), Nos. 5, pp. 417, 418, figs. 5; 6, pp. 512-515, figs. 7; 37 (1919), Nos. 1, pp. 30-32, figs. 4; 3, pp. 250-253, figs. 3; 38 (1920), No. 1, pp. 34-37, figs. 4*).—A large amount of historical information is brought together and summarized. The illustrations are reproductions of rare and unusual Oriental and other prints or drawings.

The history of food adulteration and its control, E. L. REDFERN (*Chem. Age [New York], 2 (1920), No. 3, pp. 439-441*).—This is a brief historical sketch of food adulteration from the middle ages to the present time.

The health officer, F. OVERTON and W. J. DENNO (*Philadelphia: W. B. Saunders Co., 1919, pp. 512, figs. 51*).—This volume contains chapters on milk, food sanitation, food values, disposal of household waste, water supplies, ventilation, camp sanitation, and child hygiene, as well as a long list of others dealing with organization (personnel), rural health work, management of epidemics, and related questions of interest in connection with the general subject of public health.

Emergency cooking for large groups of people (*Washington: American Red Cross, 1918, pp. 16*).—An instructor's manual prepared by the Bureau of Dietitian Service, American Red Cross. Suggestions are given for the organization and instruction of a class in the preparation of foods in quantity for war emergency purposes, including outlines for 15 lessons for class instruction in quantity cooking.

Government residence halls, Washington, D. C., M. CONYNGTON and L. MAGNUSSON (*U. S. Dept. Labor, Bur. Labor Statis., Mo. Labor Rev., 9 (1919), No. 4, pp. 9-15, figs. 4*).—Information is summarized in this account of the provision made during the war emergency situation for suitable accommodations at reasonable cost for the largely augmented number of Government women employees. Data are included regarding the kitchen and dining room equipment, cost of meals, and also concerning food and dietary problems.

[Attention to feeding employees in the] hygienic control of the anilin dye industry in Europe, A. HAMILTON (*U. S. Dept. Labor, Bur. Labor Statis., Mo. Labor Rev., 9 (1919), No. 6, pp. 1-21*).—The importance of proper feeding of men in dangerous trades is insisted upon, and information is summarized with regard to the anilin dye industry.

The diets of laboring-class families during the course of the war, M. FERGUSON (*Jour. Hyg. [Cambridge], 18 (1920), No. 4, pp. 409-416*).—The dietary studies of laboring-class families in Glasgow previously noted (E. S. R., 38, p. 267) have been supplemented by further studies of a few of the same families during later periods of the war. The present report summarizes the data ob-

tained from five families including 3 men, 5 women, 12 children over 10 years, and 14 under 10 years of age in a series of four investigations as follows: (1) A part of the study previously noted, which was made in 1915-16 when there were no dietary restrictions; (2) in February, 1917, when, although prices were high, all foodstuffs except potatoes were still plentiful; (3) in November, 1917, after voluntary rationing had been urged by the Food Ministry; and (4) in December, 1918, during the period of compulsory rationing of meat, sugar, and fats.

The summarized data of these four studies indicate that rationing had little effect upon the energy value or the protein content of the diets, but tended to decrease the amount of fat consumed. This reduction in fat was attributed to the fact that where strict economy is necessary the housewife of the class studied generally relies upon margarin as her chief source of fat. Although there was a weekly ration of lard, none of the five families purchased it. The one family whose diet showed an increase of fat had had an advance of income during the war, and purchased considerable unrationed bacon and sausage during this period. Slightly more meat and sugar were eaten during the period of compulsory rationing than in the preceding two periods.

In general the food consumed during the different periods was determined much more by the income and dietary habits of the families than by the restrictions of rationing. This is brought out forcibly by the fluctuations in the energy value of the dietaries of one of the families following changes in income.

With the exception of the family with fluctuating income, the energy available in the food of all families studied furnished the children of these families only 40 per cent above their basal requirement. This energy came chiefly from bread and potatoes, the diets including almost no milk, no eggs, and but little meat, fish, and fat. These children were markedly below the average in height and weight. This interruption in growth is considered to be due to the insufficient supply of food, particularly of that containing the accessory growth-promoting factors.

Japan's food scarcity, F. MIYAMOTO (*Japan Mag.*, 10 (1920), No. 9, pp. 354, 355).—The food situation and food needs in Japan are discussed.

Malnutrition (*Pub. Health Serv. U. S., Keep Well Ser.*, No. 11 (1920), pp. 12).—This leaflet discusses in simple terms the symptoms, causes, and treatment of malnutrition in children, and offers suggestions for their proper feeding. Tables are included of the standard weight and height for boys and girls from 5 to 18 years of age.

Nutritional edema and "war dropsy," M. B. MAVER (*Jour. Amer. Med. Assoc.*, 74 (1920), No. 14, pp. 934-941).—An extensive review is given of the literature on war edema and its relation to deficiency diseases and also on experimental edema, and the results obtained in a study of experimental edema in dogs, rats, and guinea pigs are reported briefly.

Most of the instances of distinct edema were observed in animals living on a diet poor in protein and fat and containing much fluid. It is pointed out that these results agree fully with those reported by Kohman (*E. S. R.*, 42, p. 557) and also with the clinical evidence.

"This condition does not seem to be a typical 'deficiency disease' in the sense of being the result of a deficiency in one or more specific unknown constituents (vitamins) in the diet. In a broader sense it is, however, a deficiency disease, and is the result of a protracted existence on a diet deficient in total calories, especially in protein. Undoubtedly, a high fluid intake, and possibly a high salt intake, are important accessory features."

Fifty-six references to the literature are included.

The experimental production of edema as related to protein deficiency, E. A. KOHMAN (*Amer. Jour. Physiol.*, 51 (1920), No. 2, pp. 378-405, figs. 5).—This is the complete report of the investigation previously noted (*E. S. R.*, 42, p. 557).

The nature and function of the antineuritic vitamin, R. A. DUTCHER (*Proc. Natl. Acad. Sci.*, 6 (1920), No. 1, pp. 10-14).—The literature concerning the chemical characteristics and metabolic functions of the antineuritic vitamin is reviewed, and studies at the Minnesota Experiment Station supplementing those previously noted (*E. S. R.*, 41, p. 766) are reported briefly.

An experiment conducted by S. D. Wilkins has shown that a diet of polished rice causes extreme atrophy of the testicles of cockerels. That this was due to the lack of vitamin in the rice has also been shown in experiments in which one testicle only was removed from the rice-fed bird and green alfalfa then added to the rice diet. On removing the remaining testicle at a later period it was found to have grown to a much larger size than the one first removed. It has been found possible to obtain decided atrophy of the testes in cockerels without any loss in body weight, thus eliminating the starvation or inanition hypothesis.

Attention is called in this connection to the conflicting conclusions of Jackson and Stewart (*E. S. R.*, 42, p. 664) and of Osborne and Mendel (*E. S. R.*, 34, p. 562) on the capacity to grow after prolonged undernutrition. It is suggested that the failure to produce normal growth on refeeding noted by the first authors was due to too extensive pathological changes (atrophy) caused by a quantitatively inadequate diet, while the remarkable growth on refeeding of the animals in the latter case was probably due to the fact that the diets were adequate with respect to vitamins, so that in consequence the organs and ductless glands had received sufficient nourishment to prevent decided atrophy.

"The hormones from the ductless glands undoubtedly influence to a marked degree the activity, health, growth, and well-being of animals. May it not be possible that the hormone supply is dependent upon the vitamin content of the food? As a result of our observations, we wish to suggest tentatively that the activity of the organs of internal secretion is dependent upon the stimulatory action of the vitamin. Whether this is in the nature of a nerve stimulant, nuclear nutrient, or the chemical nucleus of a hormone is, of course, a matter of speculation."

The metabolism of carbohydrates, J. A. HEWITT and J. PRYDE (*Jour. Physiol.*, 53 (1920), No. 5, p. LXV).—This is a preliminary contribution on the stereochemistry of certain carbohydrates in the alimentary canal. A determination of the percentage absorption of glucose indicated that the relative proportion of the α and β forms in the intestine is not that of an equilibrated aqueous solution, but it has not yet been determined whether this may be attributed to preferential absorption of one form, or to a change in stereoisomerism, or to the formation of another variety of glucose.

ANIMAL PRODUCTION.

Inbreeding and outbreeding: Their genetic and sociological significance, E. M. EAST and D. F. JONES (*Philadelphia and London: J. B. Lippincott Co.*, 1919, pp. 285, pls. 13, figs. 31).—In this monograph the authors expound the problems of inbreeding and cross-breeding from the point of view of current research in genetics, and review a large number of published observations on self-fertilized and cross-fertilized plants and inbred and out-crossed animals.

It is concluded that inbreeding and outbreeding have no influence on the size, vigor, or fertility of the progeny apart from the influence which the

method of breeding necessarily exerts on the distribution of Mendelian characters. In the chapter on the cause of hybrid vigor the authors discard the idea that this phenomenon is due to the stimulus of heterozygosis, as suggested by East and Shull independently in 1911, and adopt Jones' theory (E. S. R., 38, p. 367) of dominant linked genes. However, the original explanation is employed in other chapters for expository purposes, and the term heterosis is retained. Pearl's definition of inbreeding is adopted, and his scheme of measuring inbreeding is explained but not made use of.

Four introductory chapters on reproduction and the chromosome theory of heredity are inserted for the benefit of nontechnical readers. There are two chapters on the rôle of inbreeding and outbreeding in evolution and in the improvement of animals and plants under domestication, and two on inbreeding in man and the question of race mixtures. The bibliography includes 225 titles.

Partial and complete duplicity in chick embryos, G. W. TANNREUTHER (*Anat. Rec.*, 16 (1919), No. 6, pp. 355-367, figs. 6).—Four whole mounts of double or nearly double chick embryos and an early blastoderm with four primitive streaks are figured and described. Poor heat regulation during incubation is assigned as the cause of the abnormalities.

Relative abundance of serum proteins in albino rats at different ages, I. TOYAMA (*Jour. Biol. Chem.*, 38 (1919), No. 1, pp. 161-166, fig. 1).—The author reports that the percentage of total protein in the blood serum of white rats increases rapidly during the suckling period, decreases slightly at puberty, and then increases slowly. The changes in general parallel the changes in retractive index of the serum studied by Hatai (E. S. R., 42, p. 262). A sharp temporary drop in the globulin content at the end of the suckling period is attributed to the change from a milk to a solid diet.

The feeding value of Sudan grass, G. G. ST. CLAIR POTTS (*Agr. Gaz. N. S. Wales*, 30 (1919), No. 9, pp. 657, 658).—The author gives chemical analyses of Sudan grass (at four stages of maturity) and Japanese millet made by F. B. Guthrie, and cites a practical test indicating the superiority of Sudan grass over *Paspalum dilatatum* as a pasture grass for milch cows.

Inspection of commercial feedstuffs, P. H. SMITH and E. S. MIXER (*Massachusetts Sta. Control Ser. Bul.* 11 (1919), pp. 3-32).—The proximate composition of 1,084 samples of feeding stuffs collected during the year ended August 31, 1919, are tabulated. These include cottonseed meal and feed, linseed meal, corn germ meal, corn gluten meal and feed, hominy feed, corn meal, corn feed meal, coconut oil meal, peanut oil meal, brewers' dried grains, yeast and vinegar grains, wheat bran, middlings, shorts, red dog, wheat mixed feed, durum wheat bran and shorts, rye "feed," oat "feed," barley feed, barley middlings, barley mixed feed, velvet bean feed, dried beet pulp, alfalfa meal, meat scrap, meat-and-bone scrap, tankage, fish meal, bone meal, and a variety of mixed and proprietary stock and poultry feeds and calf meals.

The bulletin also includes tables giving (1) the fertilizer constituents of 18 unmixed feeds and 22 compounded proprietary feeds, based on analyses by H. D. Haskins and L. S. Walker, (2) the prices and protein-fat-and-fiber-content of 14 unmixed feeds during the years 1916 to 1919, and (3) the monthly fluctuations in wholesale prices of 20 feeding stuffs from September, 1918, to August, 1919. There are two brief notes by J. B. Lindsey entitled: What Kind of Grain Shall I Purchase? (pp. 27, 28), and Low-grade Feeds (p. 29).

Better sires.—Better stock (*U. S. Dept. Agr., Bur. Anim. Indus.*, 1919, pp. 16).—This pamphlet outlines the plan of a "crusade" on the part of the Bureau

of Animal Industry to increase the number of good pure-bred sires in use in the United States. Any breeder of cattle, horses, asses, swine, sheep, goats, or poultry who agrees to employ only pure-bred sires of good quality may be enrolled and is then given an official emblem which he is at liberty to display. The enrollment campaign began October 1, 1919.

Fifty-fourth annual live stock report, 1919 (*Union Stock Yard and Transit Co., Chicago, Ann. Live Stock Rpt., 54 (1919), pp. 53*).—Daily receipts and shipments of adult cattle, calves, hogs, sheep, and horses during 1919 are tabulated and totaled by months. Annual receipts and shipments from 1865 to 1919 are also given.

Review of the frozen meat trade, 1919, W. WEDDEL & Co., LTD. (*Weddel's Ann. Rev. Frozen Meat Trade, 32 (1919), pp. 26, pl. 1*).—A statistical summary of the British import trade in beef, mutton, and lamb carcasses during 1919, with comparative data for previous years and other countries.

The frozen meat industry of New Zealand, M. A. ELIOTT (*New Zeal. Jour. Sci. and Technol., 1 (1918), Nos. 3, pp. 157-166, figs. 2; 4, pp. 193-200, figs. 2*).—An account of the development and extent of the frozen meat industry of New Zealand, with statistics of the export trade in beef and mutton.

Beef production, K. J. J. MACKENZIE and F. H. A. MARSHALL (*Jour. Bd. Agr. [London], 25 (1918), No. 6, pp. 623-640*).—This is a summary of a report to the Board of Agriculture and Fisheries of the authors' investigations of the dressing percentage of various types of beef animals, and its relation to the amount of fat wasted, the edible quality of the meat, and the general question of the most economical condition for slaughter.

A total of 92 animals were slaughtered in the course of the work, and all the butchering was done by one man. Particular attention was given to the proportion of bone, cartilage, lean, and gross fat of the seventh rib "joint." To get a measure of the degree of marbling in the muscle, "the central portion of the iliospinalis muscle (which extends from the neck back to the hindquarters, often called the 'eye' of the joint by butchers), was carefully dissected out from the surrounding fascia and interstitial fat; the substance of the muscle was dried, and the intermuscular fat extracted. A portion of the same muscle from the wing rib and first cut of loin was treated similarly."

The following table summarizes these data:

Influence of finish of steers on proportions of fat and other tissues in rib cuts of beef.

Dressing percentage. ¹ Class range.	Number of steers.	Tissues in butcher's cut of seventh rib.				Fat in iliospinalis muscle.	
		Cartilage.	Bone.	Extra- muscular fat.	Muscle and included fat.	Seventh rib.	Thir- teenth rib.
		<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
50-52.....	10	3.7	18.4	15.5	62.1	11.8	6.4
53-54.....	28	3.3	17.3	18.4	60.6	12.9	8.6
55-56.....	26	2.6	16.9	21.5	58.4	17.3	12.5
57-62.....	20	2.4	16.0	24.4	56.9	20.4	13.9

¹ Based on fasted liveweight.

The authors hold that, largely through the teachings of J. B. Lawes, an undue importance has been attached to degree of fatness in estimating the yield of carcass. "The error tends to leave a very large proportion of our cattle feeding too long because the estimator believes them to be low in yield

of carcass, since the percentage of fat is only normal or 'useful.' He is, in other words, waiting till he feels fat on the animal, which will most likely produce a high percentage of dripping but need not necessarily give the nation a large amount of useful meat."

Cooking trials at King's College for Women and at a munition workers' hostel showed little discrimination on the part of patrons between animals of different dressing percentage. "The two series of trials demonstrate clearly that meat obtained from beasts of comparatively low percentage can be satisfactorily cooked, served, and eaten (and without giving rise to any complaints), and with a minimal quantity of waste. In the case of young animals which are moderately well bred, the meat from a carcass even as low as 51 per cent can be eaten by the public without hardship, but it is no doubt easier to spoil a bad joint in the cooking than it is to spoil a good one."

Cattle and the future of beef production in England, K. J. J. MACKENZIE (*Cambridge, Eng.: Univ. Press, 1919, pp. X+[1]+168*).—This book is primarily a detailed inquiry into the economic basis of beef raising in Great Britain to which is appended a series of chapters devoted to the merits of individual breeds.

Estimates are given showing the poor returns in human food per acre from the prevalent practice of keeping "stores" for three years or more until they are mature enough to utilize large quantities of cake and roots to make prime beef. It is held that there are other ways of maintaining soil fertility besides "supplying plant food through the excreta of overfed bullocks," and that the beef needs of England can be met to a great extent by fattening baby beef. The author deplores a recent effort on the part of the British Government to popularize the Holstein as a dual purpose breed, and holds that the Shorthorn and similar breeds are best adapted for the ordinary farm where both beef and milk must be produced.

F. H. A. Marshall provides a chapter on the physiological aspects of beef fattening which is mainly an account of the investigation noted above. It is stated that publication of the complete report has been postponed, perhaps indefinitely.

[**Sheep feeding experiments at the California Station**] (*California Sta. Rpt. 1919, pp. 78, 79*).—Conclusions drawn from experiments by R. F. Miller are noted.

A comparison of three kinds of sorghum silage fed with alfalfa hay for fattening lambs showed that feterita silage ranked first in economy of gain, sweet sorghum second, and milo maize third. The addition of barley improved these rations. Coconut meal and cottonseed meal were found to be desirable supplements to barley and alfalfa. Alfalfa hay as sole feed was very unsatisfactory. Ordinary barley stubble was worth about 75 cts. an acre when lambs were selling at 7 cts. a pound. At the same selling price of lamb, alfalfa meal and molasses feed was found to be worth \$10 a ton and was thus an expensive producer of gains. Spineless cactus was found unpalatable and produced slower gains than corn silage.

The addition of beet pulp to silage and alfalfa was found valuable in fattening old ewes for the market.

Bureau of Animal Industry range sheep experiment, F. R. MARSHALL (*Natl. Wool Grower, 7 (1917), No. 1, pp. 35, 36*).—This is a brief summary of some records of the experimental work with range sheep conducted by the U. S. Department of Agriculture at Laramie, Wyo.

During the years 1910 to 1915, 72.8 per cent of the yearling ewes lambed, and of these 86.5 lambed again as two-year-olds. Of the ewes which did not lamb as yearlings 88.8 per cent had lambs the following year.

For three successive years a lot of 17 ewes were hand-shorn and a similar lot machine-shorn, and for two years another lot of 12 were hand-shorn and a similar lot machine-shorn. The records indicated that after two years fleeces of sheep shorn by machines had increased in weight over the hand-shorn fleeces to an extent, which in the author's opinion, can not be attributed entirely to closer shearing. Two years' records also showed heavier fleeces from folded than from plain-wool sheep, but the wool was longer in the latter fleeces.

A short statement of one year's results in raising Corriedales on the range is included.

Some experiences in breeding range sheep, F. R. MARSHALL (*Natl. Wool Grower*, 8 (1918), No. 1, pp. 35-37; also in *Amer. Sheep Breeder*, 38 (1918), No. 2, pp. 92, 93).—Tables are presented showing the relation of fineness of wool in Rambouillet ewes to grease weight of fleece and length of wool, based on records secured by the Bureau of Animal Industry of the U. S. Department of Agriculture at Laramie, Wyo., in 1915 and 1916. It is also noted that the percentage of lambs produced was higher and the proportion stillborn or dead within a week lower in the case of the Lincoln×Merino crossbreds than in the case of pure bred Rambouillets and Corriedales.

Results of experiments with crossbred range sheep, F. R. MARSHALL (*Natl. Wool Grower*, 10 (1920), No. 1, pp. 17-19).—Results secured by the Bureau of Animal Industry of the U. S. Department of Agriculture since the transfer of the sheep experiments to Dubois, Idaho, in 1917, are summarized.

The F₂ generation of the Lincoln×Rambouillet cross form a desirable and fairly uniform strain for which the name Columbia is proposed. Each generation is mated inter se. It is thought that after a few more generations the Columbias will be entitled to consideration as a distinct breed.

Sheep and wool for farmers.—Cross-breeding experiments.—The wool and mutton type, J. W. MATHEWS (*Agr. Gaz. N. S. Wales*, 29 (1918), No. 7, pp. 480-490, figs. 3; 30 (1919), Nos. 2, pp. 99-110, figs. 3; 3, pp. 169-175, fig. 1; 6, pp. 406-421, pls. 4; 12, pp. 837-847).—These articles are the final installments of a report on crossing experiments between imported British long wool rams and Australian Merino ewes. The data secured at the Bathurst Experiment Farm are given in detail and the previously reported results at the Wagga Farm¹ and the Cowra Farm (*E. S. R.*, 37, p. 770) are summarized, some additional observations being recorded.

The experiments were begun in 1909 and 1910 and the actual crossing lasted five years on each farm. It was planned to keep as many as possible of the ewe lambs under observation for at least five years. The rams used were Lincolns, Leicesters, and Border Leicesters. A large number of tables are included showing the weight of fleece, fineness of wool, body weight, girth (in some cases), carcass weight and other slaughtering data, etc., of the three classes of crossbreds at different ages.

"The Lincoln furnished, on the whole, the cross most regular in outline—a character that became more marked as the sheep advanced with age. The progeny of the Leicester, though square, was fairly short of body, but with particularly well-rounded hindquarters; a marked deficiency, however, was the comparative narrowness of the forequarters, and the shortness of the brisket. The Border Leicester produced a broad, long-bodied sheep, fairly equal in conformation, high on the leg, and with full hams, deep shoulders, broad loins, well-rounded girth, prominent brisket, and capacious chest, as the dimensions

¹ *Gaz. N. S. Wales*, 25 (1914), Nos. 2, pp. 93-105; 6, pp. 461-469; 7, pp. 553-569, pls. 3; 8, pp. 645-651, pl. 1.

given in tables showing waist girth measurements indicate. So far as first crosses go, the Border Leicester undeniably furnished the most suitable class of carcass for export." This cross was also distinctly heavier than the others at practically all ages. The Lincoln crosses produced the heaviest fleeces, but they were coarser and more variable in quality than the others and sold for less money than those of the Border Leicester cross.

The empire's trade in wool in its relation to the wool trade of the world, A. S. JUDGE (*Bul. Imp. Inst. [London], 16 (1918), No. 4, pp. 476-515*).—This article presents estimates of the amount of wool produced by each of the important sheep-raising countries of the world, and statistical summaries of the international trade in wool and woollen manufacture, with particular regard to the trade of the British Empire.

[**Hog feeding experiments**], G. S. TEMPLETON (*Alabama Col. Sta. Rpt. 1919, pp. 28-30*).—Brief notes on three hog feeding trials are presented.

To study the influence of peanuts in the ration on the quality of the lard, 5 lots of 5 hogs each and 1 of 3 hogs were fed for 107 days beginning December 28, 1918. Three rations produced firm carcasses, viz, the check ration corn and tannage (8:1); corn and peanut meal (7:1); and corn and oil-free peanut meal (2:1). The average melting points of the lard were, respectively, 40.3, 39.9, and 42.4° C. Some of the carcasses of the lot fed corn and ordinary peanut meal (2:1) dressed out firm and the others were medium soft; the average melting point of the lard was 40.5°. The carcasses of the lot fed corn and peanut meal (1:1) were classified as medium soft (lard melting at 39.7°), while the sixth lot (3 hogs) fed exclusively on whole peanuts were very oily, the lard being semifluid.

An acre of peanuts was hogged-down by 5 hogs in 38 days. The hogs were then put in dry lot and finished on corn and tannage. An acre of corn and soy beans (alternate rows) furnished grazing for a comparable group of 7 hogs for 64 days. Both lots were marketed at the same time and were satisfactory to the packer, bringing top prices. The hogs finished in the dry lot were somewhat firmer.

A fish meal containing 56.56 per cent protein and 6.89 per cent oil made from menhaden, was fed with corn in the proportion 1:6 to four 63.5-lb. Poland China gilts for 127 days. Four litter mates (gilts) were fed tannage (protein 36.19, fat 21.68 per cent) and corn 1:6, for the same period. The fish meal lot made an average daily gain of 1.37 lbs. per head and required 3.73 lbs. of feed per pound of gain. The check lot gained at the rate of 1.27 lbs. per day and consumed 4.04 lbs. of feed per pound of gain. The menhaden meal, which was furnished by the U. S. Department of Agriculture, proved to be a palatable feed.

[**Swine feeding experiments at the California Station**] (*California Sta. Rpt. 1919, pp. 77, 78-80*).—Conclusions drawn from swine feeding tests conducted by J. T. Thompson, E. C. Voorhies, and C. M. Vestal are stated but no details of the experimental procedure are given.

A lot of pigs fed grain on alfalfa pasture from weaning were compared with another lot on alfalfa pasture without grain throughout the grazing season and then finished on grain. "The first lot reached market weight in approximately one-half the time required by the others. They were on pasture only 42 days, compared with 258 days for the second lot, and when ready for market had consumed less grain." Alfalfa cut green and fed in the dry lot produced slower gains than alfalfa pasture, but not as large an area of alfalfa was required. With the cut alfalfa more grain was used per unit of gain.

As to concentrates for fattening pigs, milo maize in one trial was found about 10 per cent more efficient than barley, but in a second trial the latter

was 10 per cent the more efficient. Two trials are held to indicate that unskimmed whey has about 60 per cent of the feeding value of skim milk. Another trial seemed to show that 16 lbs. of skim milk was equal to a pound of tankage or fish meal.

Household garbage collected in Oakland during the last half of 1917 was fed to hogs and a gain of 75.6 lbs. per ton of garbage was secured.

Swine feeding experiment, W. DIETRICH (*Minnesota Sta., Rpt. Crookston Substa., 1917-18, pp. 83, 84*).—Inconclusive results are reported from an experimental attempt to induce changes in the offspring by excessive protein feeding. A group of pigs receiving a normal protein ration (0.5 lb. per day) were fed corn, oats, and tankage, while another group on a high protein plane (0.9 lb.) had skim milk in addition. In the first year the offspring of matings high×high averaged about the same weight at the age of ten months as those of normal×normal but in the second year they were lighter.

Winter rations for brood sows, W. L. ROBISON (*Mo. Bul. Ohio Sta., 4 (1919), No. 12, pp. 363-368, figs. 2*).—Three experiments are reported involving comparisons of supplements to corn and legume hay as winter rations for pregnant sows. They were begun in December, 1915, January, 1918, and January, 1919, respectively, and each sow was continued on the experimental rations until she farrowed. The combined results (including those from two lots, one fed tankage, the other skim milk, not reported in detail) are summarized as follows:

Comparison of supplements to rations for brood sows.

Supplement.	Number of sows.	Daily ration.			Weight per sow.		Daily gain per sow.	Pig per litter.	Average birth weight per pig.	Daily cost of ration.	
		Ground corn.	Supplement.	Legume hay.	Initial.	Final.				Gross.	Net. ¹
		Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Cts.	Cts.	
None.....	11	4.02		2.55	398.7	450.0	0.60	12.6	2.27	12.6	9.2
Tankage.....	37	3.75	0.31	2.55	391.9	457.4	.84	11.9	2.24	13.6	7.3
Linseed meal.....	7	5.24	.37	1.53	398.9	479.8	.87	10.2	2.45	16.1	8.4
Skim milk.....	15	4.23	10.14	1.87	405.6	496.2	1.22	11.0	2.31	18.5	7.3
Oats.....	7	2.47	2.47	1.54	437.7	504.7	.85	11.6	2.29	13.3	7.0

¹ Gross cost less value of daily gains at 12 cts. a pound.

Corn was charged at 2.5 and oats at 2.25 cts. a pound, skim milk at 60 cts. per 100 lbs., and linseed meal at \$80, tankage at \$110, and hay at \$20 a ton.

The author holds that sows should gain in body weight during gestation, and points out that seemingly expensive rations may in reality be cheap if credit is given for gains. It is also noted that oats when low in price with respect to corn may be used as a partial substitute for the latter.

Poultry [experiments at the California Station] (*California Sta. Rpt. 1919, pp. 80-82*).—In connection with a brief mention of an investigation by J. E. Dougherty of the influence of artificial lighting on egg production during winter months, it is noted that birds in pens lighted both before sunrise and after sunset each day went through a heavy molt in the spring, and that those illuminated only at the end of the day molted lightly, while those exposed in the morning hours alone did not undergo a molt.

Feeding tests by W. E. Lloyd, not reported in detail, are held to indicate that rice bran when sweet and free from hulls is a satisfactory partial substitute for wheat bran in the mash. Paddy rice may be used as one-third of the grain

ration of adult fowls without injurious effect from the gritty hulls. Rice polish makes a satisfactory substitute for ground barley.

It is also reported that wheat infected with stinking smut is not injurious to hens when fed with a good mash.

Poultry rations and methods of feeding, H. R. LEWIS (*New Jersey Stas., Hints to Poultrymen*, 8 (1920), No. 5, pp. 4).—The feeding of brooder chicks, range chicks, and laying hens, the finishing of pullets for slaughter, and the place of Epsom salts in the poultry ration are treated briefly.

Methods of feeding laying hens, W. J. BUSS (*Mo. Bul. Ohio Sta.*, 5 (1920), No. 1, pp. 29-32).—The experimental data recorded were reported in greater detail in Ohio Station Bulletin 322 (E. S. R., 39, p. 275).

“Contrary to general opinion, the failure to induce exercise by feeding the grain in the litter did not seem to have a detrimental effect upon the health of the fowls. In matter of cleanliness, feeding in the trough has much to commend it. There is always more or less filth in the litter, even though the litter is changed frequently, and some of this is picked up with the grain when fed in the litter.”

The bearing of ratios on theories of the inheritance of winter egg production, H. D. GOODALE and G. MACMULLEN (*Jour. Expt. Zool.*, 28 (1919), No. 1, pp. 83-124).—Winter egg records of Rhode Island Red pullets and their parents at the Massachusetts Experiment Station are tabulated in two ways, (1) by a scheme—requiring three classes of birds, high (30 or more eggs before March 1), medium (1 to 29 eggs), and zero producers—to test Pearl's theory (E. S. R., 28, p. 576) that egg production is determined by two hereditary factors, one sex-linked and the other not, and (2) on the basis of a simpler theory—requiring two classes, high (30 or more eggs) and low (0 to 29 eggs) producers—that two ordinary (not sex-linked) factors are concerned, two dominant genes being necessary for high production. The observed ratios agreed fairly well with those expected by both theories, but it is thought that the “fit” was better in the case of the second. Similar results were obtained from some records of Cornish Indian Game crosses, and it was found that Pearl's data could be adequately described by the ratios called for on the second theory.

It is concluded, therefore, that a sex-linked factor concerned with the number of eggs laid in the winter has not been demonstrated, and that the “too great ease” with which observations can be fitted to theory renders unprofitable any further study of the inheritance of egg production by classifying pullets according to egg records alone. The study of the rate of production and the conditions modifying it, as outlined by Goodale in a paper previously noted (E. S. R., 41, p. 179), is deemed a more promising method of approaching the problem.

Practical results from studies on egg production, H. D. GOODALE (*Massachusetts Sta. Bul.* 191 (1919), pp. 97-104, fig. 1).—This bulletin consists of three short notes, the first of a projected series dealing with practical results of the poultry breeding experiments conducted at the station.

I. *Inbreeding* (pp. 97-102).—Cases are cited of high and of low egg records of inbred pullets, and the conclusion is drawn that inbreeding must be used with caution. “Very likely the best way to renew the commercial egg flock is through the crossing of strong, high-producing, inbred lines, which will, of course, be maintained intact by inbreeding, and making the cross anew each season.”

II. *Is the influence of the male or of the female the more important?* (pp. 102, 103).—In view of the doubtful foundation for the theory of the sex-linked inheritance of egg-laying capacities (as noted in the preceding abstract), it is pointed out that the dam is as important as the sire in determining the egg records of offspring.

III. *The exclusion of parasites* (pp. 103, 104).—The quarantine methods in use at the station's poultry plant are outlined.

Is the inheritance of egg production an insoluble problem? H. D. GOODALE (*Jour. Amer. Assoc. Instr. and Invest. Poultry Husbandry*, 5 (1919), No. 10, pp. 73, 74).—Five difficulties encountered in the experimental study of egg production are briefly discussed, namely, securing stock of requisite purity, getting sufficient progeny from particular mated pairs, determining the productivity of males, maintaining uniformity in details of management, and keeping out disease. It is thought that an investigator can overcome the first four by patience and adequate facilities, but the author sees no hope of excluding obscure and unrecognized diseases, although rigorous quarantine may help.

"Unless the investigator can show that disease can be neglected, all supposed solutions of the problem must receive the closest scrutiny."

Improving mongrel farm flocks through selected standard-bred cockerels, W. A. LIPPINCOTT (*Kansas Sta. Bul. 223* (1920), pp. 3-48, figs. 30).—The author reports on the egg records secured in a three-generation grading experiment with poultry.

The original stock of 40 mongrel pullets, purchased from a local firm of poultry packers, was divided into 4 equal-sized pens as nearly alike as possible in type, weight, and development, but without regard to color. The cockerels mated to the respective pens were a White Orpington, a Barred Plymouth Rock, a Single Comb White Leghorn—all three standard-bred—and a mongrel secured from the packing house. Laying records began November 1, 1913, and at the end of each year the pullets in a pen were replaced by 10 of their daughters, one from each dam as far as possible. "In the cases where there were no daughters, pullets from other females in the same pen were used. The basis of choice in such cases was vigor and similarity to the breed of their sires. The egg records of their dams were not consulted." Each pen of daughters were mated to a purchased cockerel of the same breed as their sires. "The standard-bred cockerels used throughout the experiment were purchased solely upon the representation of their breeders. In so far as could be ascertained by correspondence the birds chosen were as desirable from an egg-production standpoint as any to be secured at the time. They were purchased without previous inspection, and no means beyond the reach of any interested person was used in locating them."

The following table summarizes the egg records:

Egg production of mongrel pullets and of their descendants by standard-bred and mongrel cocks.

Pullet stock.	Eggs laid per pullet.				Relative egg production.			
	Leghorn crosses.	Ply-mouth Rock crosses.	Orpington crosses.	Ungraded mongrels.	Leghorn crosses.	Ply-mouth Rock crosses.	Orpington crosses.	Ungraded mongrels.
Mongrels.....	72.3	98.5	84.8	95.8	100	100	100	100
First generation.....	155.9	132.5	126.8	104.0	216	135	150	109
Second generation.....	188.6	149.6	105.8	145.2	261	152	125	152
Third generation.....	192.6	155.6	79.6	129.6	266	158	94	135

The relatively poor showing of the second and third Orpington crosses is attributed to the chance selection of poor sires. One of the first Orpington male's daughters was the only first-generation grade to lay more than 200 eggs.

[**Hens as egg producers**] (*Minnesota Sta. Rpt. 1919, p. 74*).—A three years' experiment at the Crookston substation to determine the value of retaining

hens as layers beyond their pullet year is summarized. As pullets 25 birds averaged 114 eggs and as hens 107 eggs per year. Although the hens consumed somewhat less feed than the pullets they yielded a slightly lower profit.

Egg-laying tests at Hawkesbury Agricultural College, seventeenth year's results, 1918-19, E. F. WHITBREAD and J. HADLINGTON (*Agr. Gaz. N. S. Wales*, 30 (1919), No. 5, pp. 337-360, figs. 11; also in *Dept. Agr. N. S. Wales, Farmers' Bul. 123* (1919), pp. 26, figs. 11).—This is a discussion of the New South Wales contest concluded March 31, 1919. Monthly individual egg records are tabulated of 420 pullets and 120 second-year hens. The production of the latter as pullets is also given. The report of the previous contest has been noted (*E. S. R.*, 41, p. 370).

Report on the eighth Victorian egg-laying competitions, 1918-19, A. HART (*Jour. Dept. Agr. Victoria*, 17 (1919), No. 6, pp. 341-359, figs. 11).—This is a report of the egg-laying contest held at Burnley, Victoria, during the year ended March 31, 1919. Individual records by months are tabulated for 82 White Leghorn, 40 Black Orpington, and 20 Rhode Island Red pullets, and group records by months for 100 pens of 6 birds each. Reports of preceding contests have been noted (*E. S. R.*, 41, p. 371).

DAIRY FARMING—DAIRYING.

Dairy cattle [feeding experiments] (California Sta. Rpt. 1919, pp. 72-76).—Brief summaries of several feeding tests conducted by F. W. Woll and E. C. Voorhies are presented on these pages. Those not reported in previous publications are as follows:

In continuation of previous investigations of alfalfa hay as a sole feed for milch cows (*E. S. R.*, 41, p. 371), it is noted that 3 third lactation records of alfalfa-fed cows have been secured and that the butter fat production was again lower than that of 3 corresponding lactations of the mixed-feed group used as controls. In a similar study of alfalfa *v.* alfalfa plus other succulent feeds, it was found that 8 heifers fed the latter averaged 14 per cent more milk and 15 per cent more fat than 6 heifers of similar type fed alfalfa alone.

In a comparison between whole and ground grain (oats and milo maize) as feed for young calves receiving in addition skim milk and alfalfa hay, the group given the ground mixture made the less rapid gain, but in a repetition with somewhat older calves the results were reversed. It is estimated that with ground grain 3.2 feed units and with whole grain 3.5 units produced a pound of gain (both tests combined). "Considering the cost of grinding small grains like milo [maize] and oats, it would appear, therefore, that there was no appreciable advantage found in grinding the grain for young dairy calves."

Oat hay and alfalfa hay were compared as feed for young calves in a test by the reversal method with 2 groups of skim milk calves whose grain ration consisted of dried beet pulp, barley, wheat bran, and coconut meal (3:2:2:1). The greater gains were made during alfalfa feeding.

A group of heifers and dry cows, receiving throughout limited amounts of alfalfa hay, were fed barley straw for 50 days and then changed to milo maize stalks. Although more of the latter was consumed per day, the gains of both cows and heifers were larger during the first period.

Cost of producing dairy products (Minnesota Sta. Rpt. 1919, p. 42).—Cost data for six cow test associations (1,635 cows) for the year ended July, 1918, are summarized. To produce 100 lbs. of milk required 17.3 lbs. of grain, 41.5 lbs. of roughage, 89 lbs. of silage, and 27 days of pasture. The average annual production was 6,517 lbs. of milk and 251 lbs. of fat.

The variability of cows' milk, H. S. H. WARDLAW (*Proc. Linn. Soc. N. S. Wales*, 42 (1917), pt. 4, pp. 815-865, figs. 6).—The freezing-point depression, density, electrical conductivity, and chemical composition of samples of afternoon milk from 109 normal cows were studied.

Using the ratio of range to mean as the measure of variability, the author finds that depression of the freezing point and density were the least variable quantities measured. Of the chemical constituents, lactose was the least and fat the most variable. The percentages of fat and ash were greater in the milk of older cows, and that of protein less. The other determinations (physical and chemical) were not effected by age. As lactation progressed the percentage of lactose became slightly lower, but the electrical conductivity and the percentages of fat and of protein increased.

Protein in milk (*California Sta. Rpt. 1919*, p. 76).—It is reported that 60 samples of cows' milk from the San Francisco district, analyzed by M. E. Jaffa, averaged 3.26 per cent protein, and that 40 samples of goats' milk averaged 3.58 per cent.

The relation between the fat-content and the electrical conductivity of milk, H. S. H. WARDLAW (*Proc. Linn. Soc. N. S. Wales*, 43 (1918), pt. 3, pp. 613-625).—The author reports that the removal of fat from milk increases the electrical conductivity, the increase being directly proportional to the volume of fat removed.

A study of the electro-pure process of treating milk, A. K. ANDERSON and R. FINKELSTEIN (*Jour. Dairy Sci.*, 2 (1919), No. 5, pp. 374-406, figs. 2).—Extensive bacteriological and chemical observations are recorded of milk subjected to an alternating current of 2,300 volts in a patented electric pasteurizing device installed at Camp Meade, Md. In operating the machine the milk, previously heated to 40° C. (104° F.), passes in rapid succession through four porcelain cups of 200 cc. capacity, in each of which it comes in contact with two electrodes and completes the circuit. The high resistance of the milk generates heat, so that at the end of the (approximately) 20 seconds required for the passage of a given particle of milk through the machine the temperature has been raised to 70° (158° F.).

When the preliminary heating of the milk was properly carried out, the machine was found to effect a satisfactory reduction in the bacterial count. The final product was at least equal to that designated grade B pasteurized milk by the New York city standard, and was often equal to grade A. Practically all the lactose-fermenting, endo-positive organisms were destroyed. The treated milk kept well at 5 to 10° for 5 days. The machine elevates the temperature of the milk about 30° irrespective of the initial temperature, and since in experimental runs the bacterial content was not reduced when the initial temperature was 25° it is concluded that the heat and not the electric current is the effective killing agent.

Treatment of milk at 70° did not interfere with the cream line but the time required for coagulation by rennin was decidedly increased. Little or no albumin was precipitated by the electrical treatment. Peroxidase was not destroyed, but the reductase of the milk was weakened.

A report from E. V. McCollum is included as to the vitamin content of the processed milk. Since the milk cured polyneuritis in the young rat and butter fat from the milk cured xerophthalmia in the same animal, it is concluded that the electrical treatment has no effect on the vitamins present.

Observations on the toxic properties of heated and decomposed milk and of milk cultures of *Bacterium welchii* (*Bacillus ærogenes capsulatus*), W. W. FORD (*Amer. Jour. Diseases Children*, 18 (1919), No. 3, pp. 199-206).—Milk heated to 80 or 85° C. (176 to 185° F.) for 20 to 30 minutes and then

allowed to decompose at 37° was found to contain bacteria and bacterial products which caused acute death in guinea pigs and rabbits inoculated subcutaneously. Berkefeld filtrates were also toxic. The same or at least similar products were secured from milk cultures of the common gas gangrene organism (*B. welchii*), which the author and his collaborator Pryor (E. S. R., 32, pp. 268, 269) have found of constant occurrence in market milk.

"The demonstration of such materials in heated milk should be kept clearly in mind in the consideration of the problem of milk pasteurization; and, under all circumstances, milk heated to temperatures sufficient to destroy vegetative bacteria but not their spores should be kept at a low temperature to prevent the development of these spores and should be used within a brief interval after the heating."

Sterilization of bottles for pasteurized milk, M. B. HOPKINS and M. L. KELLY (*Amer. Jour. Pub. Health*, 9 (1919), No. 3, pp. 183, 184).—Counts of bacteria in supposedly sterilized milk bottles from 23 milk plants are reported to show both the difficulties and the importance of enforcing a municipal ordinance requiring that all containers used for milk in Baltimore be sterilized.

Keeping quality [and flavor] of butter (*Minnesota Sta. Rpt. 1919*, pp. 44, 45).—It is stated that experimental work has been carried out which indicates (1) that butter made from cream pasteurized at 175° F. (enzymes destroyed) keeps better than butter made from the same cream heated to the usual temperature of 145° (enzymes still active), and (2) that working a small amount of starter into the butter in the churn produces a better flavor than the old practice of ripening the cream in the vat.

Pickling of butter (*California Sta. Rpt. 1919*, p. 77).—It is stated that S. L. Denning found butter in good condition after eight months' storage in a 20 per cent solution of sodium chlorid at 50° F. The butter had been cut into 2-lb. "squares" and wrapped in parchment paper before the brine was added.

[Cheese making experiments at the California Station] (*California Sta. Rpt. 1919*, pp. 76, 77).—The following statements concerning the use and bacterial composition of starters are made, based mainly on observations by H. S. Baird: (1) The use of a lactic starter containing *Bacillus bulgaricus* produces a buttermilk cheese of good quality, (2) pasteurized milk ripened with *B. bulgaricus* yields a "fairly satisfactory" Cheddar cheese, and (3) a pure culture of *B. bulgaricus* used as a starter is more effective than a *Streptococcus lacticus* (*B. lactis acidi*) culture in controlling gassy fermentations in California (granular curd) cheese, but the cheese is not uniform in flavor.

In a note on rennet substitutes in making California cheese it is stated that the use of pepsin and curdalac causes corkiness. The cheese "contains about the same percentage of moisture as rennet cheese, but has a dry appearance and feeling. This defect seems to be caused by a lack of acid. Pepsin requires the presence of acid, and since California (granular) cheese is a sweet-curd cheese, the necessary acid is not developed. Pepsin is more dependent upon the presence of acid for coagulating milk than rennet. A mixture of one-half rennet and one-half pepsin gives satisfactory results."

The mold of the blue-veined cheeses, D. W. STEUART (*Jour. Dairy Sci.*, 2 (1919), No. 5, pp. 407-414, figs. 4).—Using Thom's cultural methods (E. S. R., 22, p. 531) the author found that *Penicillium roqueforti* is the characteristic *Penicillium* in typically-veined Roquefort, Gorgonzola, Stilton, and blue Caerphilly cheeses made in Wales, and reports a very successful use of pure cultures of this mold at University College, Cardiff, in the manufacture of Stilton, Wensleydale, imitation Roquefort, and single-curd blue Caerphilly cheeses. The degree of acidity developed in the curd appeared to be without influence on the success of the inoculation.

It is suggested that *Oidium lactis* plays an important part in the formation of the crinkled coat of Stilton cheeses.

On the fungus flora of Brie cheese, A. LOUBIÈRE (*Compt. Rend. Acad. Sci. [Paris]*, 170 (1920), No. 6, pp. 336-339, figs. 2).—The author records the occurrence of *Fusarium sarcochroum*, *Geotrichum candidum*, and *Trichosporium* sp. on ordinary specimens of Brie cheese, in addition to the familiar *Penicillium*. On specimens that had become dried in the curing cellar he found *Hormodendron cladosporioides*, *Gymnoascus luteus*, and *Lasiobotrys* sp. Developmental stages of *Trichosporium* and *Hormodendron* are described and illustrated.

Camembert cheese, G. FILAUDEAU (*Ann. Falsif.*, 11 (1918), No. 113-114, pp. 71-76).—The moisture, fat, and salt contents of 40 Camembert cheeses are tabulated, together with the dimensions and prices.

The book of ice cream, W. W. FISK (*New York: The Macmillan Co.*, 1919, pp. XVIII+302, figs. 88).—The manufacture of ice cream on a commercial scale is the subject of this manual. The topics discussed include the classification of ice cream, the milk products and other ingredients of the mix, the equipment used, refrigerating systems, the freezing and hardening processes, judging and testing the finished product (including the use of the Mojonier testers), bacteria in relation to ice cream, marketing problems, arrangement of the factory, and history of the ice cream industry.

VETERINARY MEDICINE.

Report of the twenty-first annual meeting of the United States Live Stock Sanitary Association, 1917 (*Rpt. U. S. Live Stock Sanit. Assoc.*, 21 (1917), pp. VIII+158).—Among the papers presented at the twenty-first annual meeting of the association held in Chicago, December 3-5, 1917, are the following: The Eradication of Tuberculosis from Cattle and Swine, by J. A. Kiernan (pp. 10-20) (*E. S. R.*, 38, p. 686); Bovine Tuberculosis, by E. Z. Russell (pp. 20-26); Plan for Branding Accredited Herds, by W. J. Fritz (pp. 26-55); Report on Contagious Abortion Disease, W. L. Giltner, B. B. Flowe, and G. M. Potter (pp. 56-77); *Necrobacillosis*, by W. L. Boyd (pp. 78-83); Recent Studies on the Modes of Transmission of Hog Cholera, by M. Dorset (pp. 84-91); Hog Cholera Control, by J. W. Connaway (pp. 91-108); Blackleg and Its Prevention, by G. A. Johnson (pp. 110-120) (*E. S. R.*, 39, p. 188); Cleaning and Disinfection of Stock Cars, by J. H. Mercer (pp. 122-128); etc.

The report of the twenty-second annual meeting of the association has been noted (*E. S. R.*, 41, p. 777).

Report of the twenty-third annual meeting of the United States Live Stock Sanitary Association, 1919 (*Rpt. U. S. Live Stock Sanit. Assoc.*, 23 (1919), pp. 292, figs. 2).—The papers presented at the twenty-third annual meeting of the association, held in Chicago, December 1-3, 1919, are as follows: Tuberculosis and the Beef Industry, F. W. Harding (pp. 31-37); Tuberculosis and the Dairy Industry, by J. M. Hackney (pp. 38-44); Report of Progress in Tuberculosis Control, by J. A. Kiernan (pp. 44-55) (*E. S. R.*, 42, p. 477); Safe and Practical Regulations for Handling Feeder Hogs, by W. W. Wright (pp. 55-66); Regulations for Interstate Shipment of Swine in Crates, by W. J. Carmichael (pp. 67-74); Report of Progress in Hog Cholera Control, by U. G. Houck (pp. 74-84) (*E. S. R.*, 42, p. 679); Differential Diagnosis of Infectious Swine Diseases, by A. T. Kinsley, W. W. Dimock, and W. E. King (pp. 84-88) (*E. S. R.*, 42, p. 381); *Bacillus coli communis*, by W. W. Dimock (pp. 88-93); Comparing Swine Plague to Hog Cholera, by R. Jay (pp. 97-102); State Laws Affecting the Serum Industry, by E. M. Boddington (pp. 103-109); How Shall We Name Bovine Abortion Disease, including a report of a committee on in-

fectious abortion, by W. Giltner (pp. 115-124); Memorandum Relative to the Etiology of So-called Infectious Abortion Disease of Cattle, by E. C. Schroeder (pp. 125-132) (E. S. R., 42, p. 677); The Nature of Abortion, by W. L. Williams (pp. 133-156); Sequelæ of Abortion Bacilli Infection of the Bovine Uterus, by E. T. Hallman (pp. 156-160); Abortion Disease and Its Control, by J. F. DeVine (pp. 160-182), noted on page 881; Changes in the Live Stock Industry, by F. R. Marshall (pp. 195-202); Hemorrhagic Septicemia in Sheep, by I. E. Newsom (pp. 203-222); Sanitation and Live Stock Transportation, by A. F. Stryker (pp. 222-237); etc.

Proceedings of the Wisconsin Veterinary Medical Association, 1919, edited by F. B. HADLEY (*Proc. Wis. Vet. Med. Assoc.*, 4 (1919), pp. 128, pl. 1, figs. 14).—Among the papers presented at the fourth annual meeting of the association, held at Madison, January 14-16, 1919, are the following: Hairless Pigs, by E. B. Hart (pp. 32-36); Swine Plague, by L. G. Hart, jr. (pp. 36-39); The Hog Cholera Situation in Wisconsin, by J. T. Purcell (pp. 47-49); The Outlook for the Veterinarian in the Philippines, by G. Van Agustin (pp. 50-54); Hemorrhagic Septicemia, by W. L. Richards (pp. 54-57); A New Vaccine against Contagious Abortion, by F. B. Hadley (pp. 57-61); Report of the State Detention Farm for Tuberculous Cattle, by O. H. Eliason and J. P. West (pp. 61-68); Bots in Horses, by S. B. Fracker (pp. 69-72); Necrobacillosis in Pigs, by J. B. Collins (pp. 72-74); and A Few Cases of Traumatic Pericarditis in Cows, by H. Lothe (pp. 75-81).

A text-book upon the pathogenic bacteria and protozoa, J. MCFARLAND (*Philadelphia and London: W. B. Saunders Co., 1919, 9. ed., rev., pp. 858, pls. 3, figs. 330*).—This is a revised edition of the work previously noted (E. S. R., 36, p. 177).

Source and significance of streptococci in market milk, F. S. JONES (*Jour. Expt. Med.*, 31 (1920), No. 4, pp. 347-361).—"The principal source of streptococci in milk is the cow's udder. The udder streptococci fall into two broad groups; those of the larger group agree in cultural characters and agglutination affinities with mastitis streptococci; the smaller group is composed of low acid-producing streptococci. The streptococci of the latter group produce clear zones of hemolysis about surface and deep colonies in horse blood agar plates. They attack dextrose, lactose, saccharose, and maltose, but do not ferment raffinose, inulin, mannite, or salicin. Acid production in dextrose by the members of this group is about the same as that produced by human streptococci under the same conditions. The limiting hydrogen-ion concentration for these pleomorphic udder streptococci in dextrose serum bouillon is within the limits of the limiting hydrogen-ion concentration observed by Avery and Cullen for human streptococci.

"All the streptococci from the vagina, saliva, skin, and feces have been non-hemolytic. Those from the saliva form a heterogeneous aggregation in which individuals fermenting raffinose, inulin, and mannite predominate. From the skin a characteristic streptococcus has been found. It produces acid in dextrose, lactose, saccharose, maltose, raffinose, mannite, and salicin, but fails to acidulate media containing inulin. The fecal streptococci are characterized by the formation of large amounts of acid in dextrose, lactose, saccharose, maltose, raffinose, inulin, and salicin. Mannite is not fermented. Neither the fecal nor the skin streptococci have been isolated from the bottled milk with any great frequency."

Tumors: Their nature and causation, W. D'ESTE EMERY (*New York: Paul B. Hoeber, 1918, pp. XX+146*).—The several chapters of this work discuss the primary postulates for the parasitic hypothesis and their justification, the natural history of tumors considered in the light of these hypotheses, some

histological considerations, further considerations derived from the life history of tumors, the experimental grafting of tumors and its bearing on the question, difficulties (real and imaginary), some other theories, and some analogies from plant pathology.

Surgical and obstetrical operations, W. L. WILLIAMS (*Ithaca, N. Y.: Author, 1919, 4. ed., rev., pp. X+196, figs. 74*).—This fourth edition, prepared with the collaboration of J. N. Frost, of the work previously noted (*E. S. R., 27, p. 475*) is designed primarily for the use of students in laboratory surgery and embryotomy, but will be found of value to the practitioner.

Poisonous plants, O. A. BEATH (*Proc. Soc. Prom. Agr. Sci., 39 (1919), pp. 39-47*).—Brief accounts are included on loco, larkspurs, lupines, death camus, water hemlock, aconites, vetches, laurels, woody aster, western sneezeweed, wild cherry, milkweed, oak, and ferns. Methods of control and economic considerations are briefly dealt with.

A new sheep poisoning plant of the Southern States, C. D. MARSH (*U. S. Dept. Agr., Dept. Circ. 82 (1920), pp. 3, fig. 1*).—*Daubentonia longifolia*, in some sections popularly known as coffee bean, has been called to the attention of this Department within the last two years as likely to be of great importance as a cause of stock poisoning. It is a shrub or small tree belonging to the pea family which grows in the Gulf region and in Texas, extending as far north as the northeastern border of that State. While all the known cases of poisoning have been of sheep and goats, it is thought probable that under suitable conditions cattle also would be affected.

In light cases the main symptom is depression, generally accompanied with diarrhea. When animals are fatally poisoned there are no pronounced symptoms, but the animals become weak, the breathing is labored, and they die with very little struggling. So far as known the danger from the plants is entirely from the seeds, and the cases of poisoning occur in the winter in areas where feed is scanty. A little more than 1 oz. of seeds may poison a sheep, and it may be killed by less than 2 ozs. It is said that little can be done in the way of remedies, and that the main reliance must be in prevention.

An inquiry into the causes for variation in determinations of disinfecting value, B. FANTUS and F. RUMRY (*Jour. Infect. Diseases, 26 (1920), No. 4, pp. 351-354*).—In an attempt to find out the reason for discrepancies in the results of experiments for determining the disinfecting value of chemicals by the growth of bacteria in solutions containing the disinfectant, a study was made of the effect of variations in the number of organisms added to the solution and of the presence of clumps of the bacteria on the resulting values. A 24-hour typhoid culture was used as the source of the bacteria and π citric acid solution as the disinfectant.

"Within the limits of the observations made, neither variations in the numbers of bacteria nor the presence of clumps are the determining factors for variations in results in observations on disinfecting time. . . .

"To command confidence in results in experiments of this kind, a much larger number of observations is required than are usually made; the average might then be noted, and only large differences in disinfection time considered conclusive evidence of difference between different agents."

The influence of thorium X on antibody formation, L. HEKTOEN and H. J. CORPER (*Jour. Infect. Diseases, 26 (1920), No. 4, pp. 330-335*).—Observations on the liberation of antibodies in rabbits under the influence of varying doses of thorium X are reported in a series of experiments in which thorium X was injected before, at the same time, and after the injection of the antigen, and the lysin, precipitin, and leucocyte content of the blood subsequently measured.

The antigen used was sheep's blood injected intraperitoneally in one dose of 25 cc.

It was found that in rabbits treated with thorium X in the early stages of antibody production the amount of precipitin in the blood might be reduced even when there was no definite reduction in the leucocytes in the peripheral blood. When the precipitin production was well under way, thorium X appeared to have no effect on the amount of precipitin in the blood. This is thought to indicate that thorium X may act on the mechanism of production rather than on the precipitin itself. It was uncertain whether any definite effect was exercised on the formation of lysin. It is pointed out that in this respect thorium X differs from benzene, which has been found by Hektoen (E. S. R., 35, p. 781) to restrain the output of lysin as well as precipitin.

"It is noteworthy also that thorium X, like benzene and the Roentgen rays, seems to be without effect on the antibody content of the blood when introduced near the height of the curve; but that unlike the other two agents, it causes leucopenia as promptly at this time as earlier. Further and more diversified experiments are required to determine whether these are constant and fundamental differences in the actions of agents which disturb in some way the production of antibodies at the same time they destroy leucocytes, marrow, and lymphoid cells."

Streptolysin, P. H. DE KRUIF and P. M. IRELAND (*Jour. Infect. Diseases*, 26 (1920), No. 4, pp. 285-329, figs. 10).—The first part of this work consists of an investigation of hemolysin production by several strains of beta streptococcus in a standard broth to which various concentrations of blood sera of different species were added.

The data obtained in this study were used in the synthesis of a new blood-agar plate of maximal differentiating power. The amount of free hemolysin present at different periods of incubation was determined by the titration against constant quantities of washed blood cells of the supernatant fluid obtained by centrifuging the serum broth cultures at high speed (8,000 r. p. m.).

Lysin production was found to reach its maximum for the strains studied in from 7 to 8 hours when young (8 to 12 hour) cultures were used, and in a somewhat longer time with older cultures. When the logarithmic growth period of the culture ceased the free lysin began to decrease rapidly, often disappearing completely in 14 hours. Whole cultures were hemolytically active in low titer after the streptolysin had disappeared completely from the supernatant liquid.

Heated sera were in general superior to unheated for hemolysin production. Sheep and horse serum were superior in all concentrations to human, and decidedly superior to rabbit serum broth. All of the sera rose sharply from comparatively low titers in 5 per cent concentration to maximum values at 20 per cent for horse, sheep, and human serum to 25 per cent for rabbit.

The new blood-agar plate devised as a result of this study is made by combining 4 parts of heated sheep blood serum with one part of red blood cells. One part of this mixture is then combined with 3 parts of liquid agar, which makes the final concentration 20 per cent of serum, 5 of cells, and 75 of agar.

"The proposed medium is not only a very suitable one for demonstration of the hemolytic zones of beta streptococcus, but is in addition very efficient in the demonstration of multiple concentric zones of green production and hemolysis for alpha streptococcus and pneumococcus."

Chemotherapeutic studies with ethylhydrocuprein and mercurופן in experimental pneumococcus meningitis in rabbits, J. A. KOLMER and G. IDZUMI (*Jour. Infect. Diseases*, 26 (1920), No. 4, pp. 355-372, figs. 4).—This paper records the results of experiments in which the toxicity of ethylhydro-

cuprein hydrochlorid and mercuriophen was determined by subthecal injection in rabbits, and the influence was studied of various dosages of these substances on the course of infections produced by the subthecal injection of virulent pneumococci.

"The subthecal injection of single doses of ethylhydrocuprein in amounts of 0.5 cc. of 1:500 and 1:1,000 solutions per kilogram of body weight had a distinct beneficial effect on the course of experimental meningitis in rabbits produced by a type 1 pneumococcus of moderate virulence, when administered not later than 4 to 6 hours after the injection of organisms; when given 24 hours after the pneumococci this effect was not apparent. With a meningitis produced by a more virulent culture of type 2 pneumococci, single doses of this drug had but slight or no effect on the duration of the lives of the experimental animals."

Mixtures of specific antipneumococcus serum and ethylhydrocuprein and of sodium oleate and ethylhydrocuprein gave no better results than the drug alone.

Single doses of mercuriophen in amounts as large as 0.5 cc. of 1:1,000 solution per kilogram of body weight had no appreciable effect on the course of experimental meningitis.

The authors conclude that ethylhydrocuprein offers promising possibilities in the treatment of human pneumococcus meningitis, provided it can be injected subthecally early in the disease. The method of procedure in such cases is outlined briefly.

Abortion disease and its control, J. F. DEVINE (*Rpt. U. S. Live Stock Sanit. Assoc.*, 23 (1919), pp. 160-182).—In the course of this discussion, the author states that in work with 1,110 animals in 37 herds in which abortion first ran in some herds as high as 47 per cent he has kept down re-abortion to as low as no per cent in some herds and in no herd to exceed 7+ per cent. This has been accomplished through sanitation and the proper cleansing of the uterus after abortion and subsequent attention to the vagina.

"In one herd 47 per cent of the herd aborted in 1917, in 1918 there was 100 per cent conception, the carrying of calves to full term, and the physiological expulsion of the membranes after dropping normal living calves; while in several herds in the immediate neighborhood re-abortion would run from 11 to 33 per cent." The author has no evidence that the udders were not in all these cases free from *Bacillus abortus*, but concludes that they must have contained the organism, thus indicating that second abortions may not be due to re-infection of the uterus from the udder, as has been reported to be the case by some investigators.

[Blackleg culture filtrate] (*California Sta. Rpt. 1919*, pp. 86, 87).—Of 14 young cattle vaccinated by G. H. Hart with blackleg culture filtrate, 2 developed the disease after one vaccination. Both of these were under 6 months of age at the time of vaccination, while most of the animals were over 6 months of age. As in many parts of the State vaccination under 6 months of age is necessary to prevent losses, it is recommended that when blackleg culture filtrate is used all animals of susceptible age be vaccinated twice yearly, as has been the general practice with the old muscle vaccine.

Blackleg, H. WELCH (*Montana Sta. Circ. 86* (1919), pp. 8, figs. 8).—A popular summary of information.

Report on Johne's disease, B. B. JOSHI (*Poona Agr. Col. Mag.*, 11 (1919-20), No. 2-3, pp. 85-89).—This is a report of the occurrence of Johne's disease in buffaloes kept for dairy purposes and in dairy cows.

Observations on paratyphoid bacilli recently isolated from animals, R. S. SPRAY (*Jour. Infect. Diseases*, 26 (1920), No. 4, pp. 340-346).—This is a report of work at the Purdue Experiment Station. "An intimate study of the tissues

of carcasses of several hundred swine dying of enteric disease has shown the predominating bacterial flora to be members of the paratyphoid-enteritidis group. Thirty-four out of 40 strains studied in detail were typical *B. suispestifer*; two were identical with human *B. paratyphosus* A; two were identical with human *B. paratyphosus* B; two were intermediate between *B. suispestifer* and *B. paratyphosus* B. *B. enteritidis* was not encountered at any time.

"No true representative of the paratyphoid-enteritidis group has been isolated from feces nor from the lumen of the intestine in a large number of attempts. This fact is very striking in view of the predominance of this group in the tissues.

"It has been possible in this work to confirm in all respects the reports of other workers on the value of arabinose, xylose, dulcitol, inositol, lead acetate, agar, and glucose serum water as diagnostic media for the differentiation of the members of the paratyphoid-enteritidis group."

[Tuberculosis investigations] (*California Sta. Rpt. 1919, pp. 82-85*).—The progress report on tuberculosis investigations contains in addition to the previously noted reports by Hart and Traum on combined tuberculin tests (E. S. R., 36, p. 383), and by Traum on making cattle environments free from infective tuberculous material (E. S. R., 38, p. 380), brief summaries of work on the intradermal and complement fixation tests for tuberculosis.

The observation that the intradermal injection of tuberculin in doses commonly used in official testing gives rise to a thermal reaction similar to the one obtained by the subcutaneous method is thought to have practical application in that by one injection both a local reaction and a general reaction as indicated by rise in temperature are produced. It is stated that the San Francisco County Medical Milk Commission has adopted this method in place of the subcutaneous test for testing dairy cows to be used for producing certified milk. Attention is called to the fact that in some instances the local reaction following intradermal injection of tuberculin does not appear until after 48 hours. It is recommended that two observations be made, the first at 48 or 60 hours, and the second at 96 or 120 hours, or if only one observation can be made that it be made at 72 hours.

The complement fixation test has been applied by J. V. Cook and J. Traum to 244 cattle sera with the following results: "Of 46 cases of severe tuberculosis 43, or 93.5 per cent, gave positive results and 3, or 6.5 per cent, gave no fixation. Of 55 cattle with slight or moderately severe localized lesions, 10, or 18.18 per cent, gave positive results while 45, or 81.81 per cent, gave negative results. The sera from 129 cattle showing no tuberculous lesions on postmortem showed 12, or 9.3 per cent, positive, while 117 were negative. Seven of the tuberculous and 7 of the nontuberculous sera were anticomplementary and were not included in the above figures."

Serological studies on tuberculosis.—Second contribution: Further observations on complement fixation, S. A. PETROFF (*Amer. Rev. Tuberculosis, 3 (1920), No. 11, pp. 683-697*).—This paper supplements an earlier contribution¹ by a further discussion of the different phases of the complement fixation reaction for tuberculosis and by a comparative study of different antigens for the reaction.

The antigens used are classified into four groups: (1) Tubercle bacilli, dead or living, intact or pulverized, suspended in saline solution; (2) filtrates of broth cultures of tubercle bacilli; (3) ether-alcohol extracts of tubercle bacilli or their derivatives; and (4) a group of minor importance, including those antigens which are extracts of various tuberculous organs. Chemically these

¹ Amer. Rev. Tuberculosis, 1 (1917), No. 1, p. 33.

may contain a large amount of lipins, or combinations of lipins and proteins; or may possibly be free from lipins.

To determine what fraction of the tubercle bacilli contains the necessary antigenic properties, preparations from tubercle bacilli were made which were considered to be apparently pure lipins, lecithin, kephalin, and sphingomyelin; a mixture of proteins and phosphates, cuorin, and carnithin; and other antigens rich in tubercle bacillus proteins. When compared for antigenic value the lipins gave no reactions, the mixtures of lipo-proteins weak reactions, and the protein fractions good reactions, although not equivalent to the control consisting of the glycerin extract of the whole tubercle bacilli.

In conducting the reaction the primary incubation period of antigen-antibody-complement is considered to be of the utmost importance, the optimum time being two hours, after which further incubation is said to impair the reaction. The optimum temperature of the final reaction is placed at between 35 and 40° C. The mechanism of the reaction is discussed, but no new theory is advanced to explain the phenomenon.

In conclusion the author confirms his earlier statement that an absolute diagnosis of tuberculosis can not be made by complement fixation alone but that it is "only one of the many links in the tuberculosis diagnostic chain." In order to obtain reliable results the technique must be standardized and the test performed only by well-trained workers.

Sodium morrhuate in the treatment of tuberculosis, L. ROGERS (*Indian Jour. Med. Research, Spec. Indian Sci. Cong. No., 1919, pp. 236-256*).—This is a more detailed description of the treatment previously noted (E. S. R., 42, p. 777), with clinical reports from a number of physicians.

Contribution to the study of bovine anaplasmosis, J. LIGNIÈRES (*Bul. Soc. Path. Exot., 12 (1919), No. 9, pp. 641-651*).—The author gives a detailed report upon the experimental inoculation of several species of animals with *Anaplasma argentinum*. The investigations led him to conclude that the guinea pig, rabbit, pig, and horse are not susceptible to *A. argentinum*, but that the sheep and goat are receptive to it and remain infected for years. The passages from sheep to sheep and from goat to goat can be continued indefinitely. No symptoms of the affection appeared in the sheep or goat aside from an occasional rise of temperature of 1° C. lasting for a day or two about the thirtieth day, but the virus was active when injected into the bovine.

Malignant catarrhal fever, C. J. MARSHALL, T. E. MUNCE, M. F. BARNES, and F. BOERNER (*Jour. Amer. Vet. Med. Assoc., 56 (1920), No. 6, pp. 570-580, fig. 1*).—This is a detailed report of an outbreak of this highly fatal disease that occurred in Chester County, Pa., and in which 31 of 61 animals in a herd succumbed.

Both medicinal and biological treatment failed to check or alter its course, although the premises were frequently cleaned and disinfected. It is thought that the disease is more prevalent than is generally supposed, and that had this outbreak occurred in a small herd with but few deaths the diagnosis would probably have been overlooked. Up to the present time there appears to be no known cause and no prevention or cure for the disease.

The Federal quarantine and the rising cost of conducting the cattle business in the tick-infested area, E. M. NIGHBERT (*Fla. Univ. Ext. Bul. 23 (1920), pp. 5-7*).

Diseases of sheep (*California Sta. Rpt. 1919, pp. 88-90*).—Investigations were made of preparturient paralysis, which attacks fat ewes several days before they are due to lamb. While the cause of the disease has not been definitely determined, lack of exercise and overfeeding of such animals are thought to be primarily responsible for the trouble. The affected ewes are dull, listless, and

aimless in their movements, and in advanced stages there is loss of vision, staggering gait, or inability to rise. After 5 to 8 days of illness the animal usually dies. Prevention by avoiding conditions that make for the excessive deposition of fat is said to have been successful.

An investigation was made of an infection in bucks in which marked changes were found in the genito-urinary organs, the infection progressing to the point of pus formation and necrosis of soft tissues. In some cases the entire testicle, which is primarily affected, was destroyed. Cultures from the affected areas on blood agar developed an organism which proved to be *Bacillus pyogenes*. Upon injection into the testicle of a healthy animal it produced a slowly progressing inflammation accompanied by pus formation similar to the naturally infected cases. The treatment of affected animals is unsatisfactory.

Two serious outbreaks of necrobacillosis in baby lambs which caused the lambing percentage to drop to about 75 were investigated during the year. The infection which presumably enters through the navel caused death in from 24 to 72 hours after birth. It is characterized by the formation in the liver of multiple necrotic areas of a grayish-yellow color, varying in size from a match head to a pea. Some cases also showed gastric infection. Cleaner lambing quarters with disinfection of the navel at birth with iodine were recommended and resulted in an appreciable cessation of deaths.

Field investigations of hemorrhagic septicemia in sheep, together with specimens and letters received, are said to indicate that this disease is much more prevalent than has been commonly supposed. It occurs in acute and chronic forms and is characterized by occurring sporadically and with a variable mortality in different flocks. In the acute form there is high temperature, loss of appetite, shivering, prostration, and early death, while in the chronic form the symptoms are milder, with little elevation of temperature. In two of the three outbreaks investigated during the year a vaccine made from *B. ovissepticus* and administered subcutaneously gave excellent results. In one herd of 300 out of which 15 head had died over a period of three weeks no further loss was sustained at four weeks.

[**Hog cholera immunization**] (*California Sta. Rpt. 1919, pp. 87, 88*).—Garbage-fed pigs aged 6 to 7 months, which had been vaccinated by the simultaneous method just before weaning, were subjected by P. T. Petersen to severe infection by injection with large amounts of virus. Absolute immunity was shown in 985 out of the 1,000 pigs tested. No losses from hog cholera occurred in 15,000 garbage-fed pigs, offsprings of immune sows which were vaccinated just after weaning and observed until sent to market. Unvaccinated check pigs under the same conditions contracted cholera. The successful immunization of garbage-fed hogs is thought to make possible the improvement of garbage-fed strains by the use of purebred boars, a practice hitherto impracticable on account of the susceptibility of the better type of hogs to cholera.

The desirability of a cell-free hog cholera serum is pointed out, and a centrifuge which has been found to clear the serum in a satisfactory manner is described. "This is called a vertical, direct-connected, bucket-type centrifuge. The motor is 10 h. p. and gives a speed of 3,600 r. p. m. to 4 steel cups having a capacity of 800 cc. each. The precipitating force is 3,000 lbs. Full speed for 10 minutes will throw down the red cells and other débris in the form of a clot, leaving the serum a semitransparent pink fluid."

The loss in volume of the serum due to the removal of the red corpuscles is replaced by the addition of physiological salt solution containing 0.5 per cent of phenol.

Bacteriologic studies of a peracute disease of horses and mules, R. GRAMHAM, F. H. K. REYNOLDS, and J. F. HILL (*Jour. Amer. Vet. Med. Assoc.*, 56

(1920), Nos. 4, pp. 378-393; 5, pp. 489-507; 6, pp. 586-599, fig. 1).—This is a detailed report of a preliminary bacteriological study of a fatal equine disease, which has led to the following conclusions:

"In the absence of more conclusive evidence it can not be claimed that *Bacillus enteritidis* is the prime and specific cause of the disease in question. Yet it appears that this organism and possibly certain strains of *B. paratyphoid B* are closely related to the bacteriology of this disease. The symptoms-complex of the animals experimentally fed *B. enteritidis* isolated from the spontaneous cases are identical with those displayed by animals suffering from a spontaneous attack. *B. enteritidis* was isolated from approximately 22 per cent of the spontaneous cases under observation.

"Experimental animals not fasted to induce fatigue were not susceptible to *B. enteritidis* infection by feeding. *B. enteritidis* proved fatal to experimental mules which were fasted and subjected to conditions inducing fatigue, as incurred incident to shipment. *B. enteritidis* could not always be demonstrated in the heart blood, even following death in experimental animals by artificial infection, suggesting that the type of the disease induced is probably a toxemia per se. Complement-fixing bodies or agglutinins could not be demonstrated in the blood of all sporadic cases, and negative results to the above serological tests were likewise obtained in experimental mules artificially infected. Feeding avirulent cultures, as well as inoculating killed cultures subcutaneously and intravenously and live cultures subcutaneously, appeared to have produced a degree of immunity. Yet the value of immune serum, as well as bacterins, in establishing an artificial immunity was not satisfactorily or completely demonstrated. Some limited experimental evidence is indicative of their value.

"*B. enteritidis* appears to lead a somewhat saprophytic existence and to possess a capricious pathogenesis. It is possible that some animals possess a degree of immunity or resistance against this organism.

"Paratyphoid organisms were encountered in cultures from extraneous sources, though their pathogenic significance was not completely determined. The isolation of *B. enteritidis* from equine feces of a healthy animal is suggestive of the relation which this organism might play in the development of an acute toxic gastro-enteritis, exclusive of outside sources of infection. The sterile filtrate of *B. enteritidis* experimentally fed was not sufficient to induce death in healthy mules, and it appears that the live organisms in the digestive tube are essential for the elaboration of additional poison.

"The relation of *B. coli*-like organisms constantly encountered in the internal organs of animals suffering from acute toxic gastro-enteritis could not be determined experimentally. It is believed, however, that a colon bacillosis is a common secondary invader. *B. enteritidis*, *B. paratyphoid B*, and *B. paracolon* appear closely related morphologically and culturally, and certain strains of the former and latter were identical serologically."

[**Detection and control of avian diseases**] (*California Sta. Rpt. 1919, p. 86*).—A study of the relative value of the intradermal and agglutination tests for the detection of *Bacterium pullorum* infection in mature fowls indicates that the intradermal test is unreliable. The intradermal tuberculin test was found to be fairly reliable for detecting tuberculosis infection in fowls.

Autogenous bacterins have proved to have neither curative nor immunizing value in the control of fowl cholera in turkeys.

"**Safety first**," in the poultry yard, W. C. THOMPSON (*New Jersey Stas., Hints to Poultrymen, 8 (1920), No. 6, pp. 4*).—The author discusses briefly the care of young chicks to secure adequate growth and the management of cases of constipation and prolapsed uterus among laying birds.

Artificial v. natural incubation: [Influence on bacillary white diarrhea of chicks], C. E. BROWN (*Minnesota Sta., Rpt. Crookston Substa., 1917-18, pp. 84-86*).—The author reports the results of experiments conducted from 1912 to 1917 with a view to determining the influence of natural and artificial incubation upon white diarrhea in chicks. In 1912, 600 Barred Rock eggs laid by a flock affected with white diarrhea were secured. One half of these eggs were hatched artificially and the other half were hatched with hens. Enough of the more vigorous pullets of each flock were saved to produce eggs for the following year, and each year the eggs used were from the succeeding generation. The two flocks were always penned together, and the males mated with them each year were hen hatched.

The percentage of loss each year from white diarrhea in the artificially hatched lots has shown no indication of diminishing, amounting to 23.75, 38.5, 26.75, 30.75, 44.44, and 69.48 per cent, respectively, thus showing a material increase in 1917. Each season since 1913, 150 eggs from the naturally hatched line have been incubated artificially, with the result that with the exception of the first and second generation no traces of white diarrhea have been found. The percentage of loss from white diarrhea up to the age of 21 days, for the seasons of 1913 to 1917 from eggs artificially hatched, from the second, third, fourth, fifth, and sixth generations, respectively, of the naturally hatched line is as follows: 1913 chicks, 25 per cent; 1914, 4; and none for 1915, 1916, and 1917.

Chicken pox (epithelioma contagiosum) (*California Sta. Rpt. 1919, p. 85*).—It is reported that losses from this disease have been greatly reduced by the use of the vaccine described by Beach (E. S. R., 34, p. 784). It has been found that one injection usually produces sufficient immunity to protect fowls against natural infection for a year, although occasionally a second injection is necessary to stop the spread of the disease. Complete immunity does not result for from three to six weeks after vaccination. The immunizing value of the vaccine varies in direct proportion to the virulence of the virus contained therein. When properly administered the vaccine is said to be harmless to healthy fowls and also to have considerable therapeutic value for infected fowls.

In the preparation of the vaccine about 4 gm. of dried scab per bird can be produced on the Leghorn cockerels inoculated for the production of the virus. The mortality of the birds is about 50 per cent, the percentage of mortality being less and the amount of scabs produced per bird greater during warm weather or when the birds are kept in a warm room.

Turkey pox and chicken pox have been found to be mutually transmissible.

Chicken pox or contagious epithelioma, W. T. JOHNSON (*Washington Sta., West. Wash. Sta. Mo. Bul., 7 (1920), No. 12, pp. 199-204, figs. 5*).—The cause and symptoms of chicken pox are described, and detailed directions with illustrations are given for the vaccine treatment of affected flocks.

Intestinal roundworms expelled by tobacco dust (*California Sta. Rpt. 1919, p. 86*).—In cooperative investigations with J. E. Dougherty it was found that tobacco dust added to dry mash in the proportion of 1 lb. tobacco to 50 lbs. mash and fed daily for two or three weeks is an effective means of expelling intestinal roundworms from poultry. Good results were also obtained when tobacco dust was given in a single dose in dry mash, using 1 lb. for each 100 birds. The experiments indicate that it can be safely fed daily in the proportion of 1 lb. of tobacco to 50 lbs. of mash from the time the chicks are 70 days old and for periods of 20 days, with an interval of 20 or 30 days.

Oil of chenopodium also proved effective for expelling these parasites, when used at the rate of 1 teaspoonful for each 12 birds, mixed with moist mash.

As a single dose method of treatment the use of oil of chenopodium seemed to be more desirable than tobacco dust.

Sour milk treatment for poultry diseases (*California Sta. Rpt. 1919, pp. 85, 86*).—Observations extending over a period of three years show that coccidiosis in chicks and entero-hepatitis in turkeys have been promptly checked and birds successfully matured in infected yards when fed liberal amounts of sour milk with a restricted grain and mash ration.

RURAL ENGINEERING.

Agricultural surveying laboratory manual, D. SCOATES (*Agricultural College, Miss.: Author, 1918, 2. ed., pp. 99, figs. 15*).—This is the second edition of this manual (E. S. R., 30, p. 888), which is written primarily for students attending agricultural colleges.

Analysis of statically indeterminate structures by the slope deflection method, W. M. WILSON, F. E. RICHART, and C. WEISS (*Univ. Ill., Engin. Expt. Sta. Bul. 108 (1918), pp. 218, figs. 131*).—A very technical exposition of the subject is given.

Inspections and costs of run-off records, C. H. PIERCE (*Cornell Civ. Engin., 28 (1920), No. 4, pp. 164-169*).—The fundamental factors in determining the accuracy of stream-flow data are discussed. It is pointed out that in the final analysis the seasonal distribution of run-off and the effect of snow, ground, surface, and artificial storage introduce so many complications that exact comparisons of run-off can not be made, and that the discharge of each stream obeys a law peculiar to itself.

The coefficient of run-off of water courses in the interior [of France], P. MORIN (*Compt. Rend. Acad. Sci. [Paris], 169 (1919), No. 21, pp. 983-985*).—Studies on the relation between run-off and rainfall in the upper Cher River Basin are reported, covering the period from 1909 to 1918, inclusive.

It was found that this relation, called the coefficient of annual run-off, varied from 0.64 in 1910 to 0.39 in 1918. The deep subsoil of the basin is impervious, and the water which does not run off is evaporated. It is concluded that the coefficient of run-off depends directly on the amount of rainfall. Under conditions of equal rainfall, it was found that the coefficient of run-off is smaller when the rainfall is relatively heavier during the hot season.

Surface water supply of Colorado River Basin, 1916 (*U. S. Geol. Survey, Water-Supply Paper 439 (1919), pp. 198+XXXIV, pls. 2*).—This report, prepared in cooperation with the States of Arizona, Nevada, Utah, and Wyoming, presents results of measurements of flow made on streams of the Colorado River Basin during the year ended September 30, 1916.

Surface water supply of lower Columbia River Basin and Pacific Slope Drainage Basins in Oregon, 1916 (*U. S. Geol. Survey, Water-Supply Paper 444 (1919), pp. 190+LI, pls. 2*).—This report, prepared in cooperation with the States of Oregon and Washington, contains the results of measurements of flow made on streams in the lower Columbia River Basin and the Pacific Slope Drainage Basins in Oregon during the year ended September 30, 1916.

Gazetteer of streams of Texas (*U. S. Geol. Survey, Water-Supply Paper 448 (1919), pp. 267*).—This is a gazetteer of streams, lakes, and ponds as shown by the topographic maps of Texas.

Elements of western water law, A. E. CHANDLER (*San Francisco: Technical Pub. Co., 1918, rev. ed., pp. [4]+158+[6]*).—This is the second revised edition of this book (E. S. R., 31, p. 587), the purpose being to incorporate changes due to new legislation and judicial opinions.

Land clearing, M. J. THOMPSON (*Minnesota Sta. Rpt. 1919, p. 90*).—In a land-clearing project at the Duluth substation, begun in 1913, a 5-acre tract was cut off in 1913, sown to grass in 1914, pastured in 1915, 1916, 1917, and 1918, and almost entirely stumped in 1919. Two-thirds of the stumps were pulled by direct hitch with a team of horses, the other third being removed by dynamite or the stump puller. The cost per stump was 13.5 cts. for 20 per cent dynamite, 17.2 cts. for 30 per cent, and 16.7 cts. for 40 per cent. There was a saving in total cost of about 33 per cent over green clearing.

Terracing in Texas, J. C. OLSEN (*Tex. Agr. Col. Ext. Bul. B-51 (1919), pp. 27, figs. 18*).—This bulletin gives general information on methods of terracing best adapted to Texas soils.

It is stated that the level-bench terrace is adapted to Texas conditions to only a limited extent, and can be recommended only for deep, porous soils which are too steep to permit the use of a cultivated terrace. The broad-base terrace, contouring a field with a light grade to conduct the surplus water away slowly, is the type best adapted to most parts of Texas. The best time to do terracing work in the State is in the late summer and fall after harvesting. A terracing table showing vertical fall between terraces, distance between terraces, and fall along terraces for different soils is given as follows:

Terracing table for Texas soils.

Item.	Vertical fall between terraces in feet.												
	1	1½	2	2½	3	3½	4	4½	5	5½	6	6½	7
Distance between terraces for heavy black land and soils with a large percentage of clay...feet..	200	165	135	115	100	94	88	83	78	74	70	67	65
Distance between terraces for sandy soils that wash easily, feet.....	185	140	115	95	89	84	80	76	72	68	65	62	60
Fall per 100 feet along the terrace, inches.....	0-3	1-4	4	3-4 (4-5)	(1) (3)	(1) (3)	(1) (3)	4 (5)	(2)	(2)	(2)	(2)	(2)
Base width to build terraces first year.....feet.....	22	22	22	21	21	20	20	19	19	18	18	17	16
Height, in inches, to build terraces above the watercourse when dirt is loose. Settles 25 per cent.	15	16	18	20	21	21	22	22	23	23	23	24	24
Minimum top width of water in watercourse when water is 9 inches deep.....feet.....	11	10	9	9	8	8	8	7	7	7	7
Linear feet of terrace per acre for distance between terraces given on line A.....	218	264	323	380	435	462	495	526	559	588	620	650	672

¹ Sandy loose soil.

² For sandy and loose soil.

³ For heavy soils.

The use of a soil-saving dam and homemade equipment for terracing is also discussed.

Some theoretical studies on proportioning concrete by the method of surface area of aggregates, R. B. YOUNG (*Amer. Soc. Testing Materials Proc., 19 (1919), pt. 2, pp. 444-457, figs. 6*).—Theoretical studies on the surface area method of proportioning concrete are reported, giving evidence to prove that the fineness modulus of an aggregate varies approximately as its surface area, although the former bears no mathematical relation to the latter. A formula is derived for the quantity of water required to gauge a mortar or concrete, from which a graph giving the relation between the compressive strength and cement content of a mortar or concrete is obtained. This is shown to be identical in form with the curves already obtained experimentally. It is shown

further that if this formula for the water content of a mix is based on correct premises, the cement content of a mortar or concrete must vary with the surface area of the aggregate used if a constant water-cement ratio, and therefore a constant compressive strength, is to be maintained.

Cements producing quick-hardening concrete, P. H. BATES (*Amer. Soc. Testing Materials Proc.*, 19 (1919), pt. 2, pp. 425-438).—Certain cements are described which have been prepared by the U. S. Bureau of Standards and which have the property of hardening very rapidly. These were made in a manner no different from that used in making Portland cement, but their composition differed very materially in that they were composed very largely of lime and alumina. These calcium aluminates, when they are very high in alumina, do not have a very rapid initial set but do harden very quickly and therefore produce early high strengths. Some of the maximum strengths were 3,145 lbs. per square inch for 1:6 gravel concrete at the end of 24 hours, 6,010 lbs. per square inch at the end of seven days, and 8,220 lbs. per square inch at the end of one year. Experiments with a similar cement are reported. It is the opinion that both of these cements commend themselves for certain special uses where quick-hardening concrete of high strength is desired, but that neither would be desirable where subjected to the continued action of water.

Relation between methods of curing standard concrete test specimens and their compressive strength at 28 days, H. W. GREEN (*Amer. Soc. Testing Materials Proc.*, 19 (1919), pt. 2, pp. 607-618, figs. 2).—Investigations to determine what effect exposure to the drying properties of the air would have upon the compressive strength of concrete test specimens that had been buried in moist sand for different periods of time are reported. It was found that (1) the careful curing of concrete test specimens is as important an item, when uniform results are desired, as proportioning the aggregate or mixing the batch, (2) the variation between specimens cured properly and improperly is often over 100 per cent, (3) the longer concrete remains moist the higher will be its compressive strength, and (4) the compressive strength of test specimens buried in moist sand may be increased by exposing them to the drying effects of the air.

Modulus of elasticity of concrete, S. WALKER (*Amer. Soc. Testing Materials Proc.*, 19 (1919), pt. 2, pp. 510-585, figs. 37).—Compression tests on about 3,500 6 by 12-in. concrete cylinders are summarized. The relation between the modulus of elasticity and strength of concrete was studied for the following variables: Size and grading of aggregate, kind of aggregate, quantity of cement, consistency of concrete, age at test, time of mixing, and curing conditions of concrete. The tests show that the modulus of elasticity is affected by these variables in a similar manner to the strength.

Tests are also reported which show that the gauge length over which the deformations are measured do not appreciably affect the determination of modulus of elasticity. A study of the stress-deformation data for the tests shows that the relation may be represented by the equation, $s=Kdn$, where s =unit stress of concrete, d =unit deformation of concrete, K =a constant depending on the strength of the concrete, and n =an exponent, approximately constant. This equation applies for stresses below 50 to 90 per cent of the ultimate strength.

Tests on concrete of a number of different consistencies, sizes, and gradings of aggregate, mixes ranging from 1:15 to about 1:3, and ages ranging from seven days to one year show that there is a general relation between modulus of elasticity and strength of concrete, but that this relation is not linear. The relation may be represented by an equation of the form, $E=CS^m$, where

E =modulus of elasticity of concrete, C =a constant depending on the conditions of the test, S =compressive strength of concrete, and m =an exponent.

The initial tangent modulus for usual concrete mixtures is represented by the equation, $E_t=33,000 S^{\frac{5}{8}}$. For the tangent modulus at 25 per cent of the compressive strength the equation becomes $E_{t25}=66,000=S^{\frac{5}{4}}$.

A nomographic chart showing the interrelation of mix, consistency, size, and grading of aggregate, strength, and modulus of elasticity is presented.

A study of data from other sources shows that the stress-deformation relation of a great number of other materials, including various woods, metals, stone, brick, brick piers, rubber, rope, and concrete of many kinds, may be represented by a relation of the same form as that given for concrete.

Pressure of concrete in forms, G. PAASWELL (*Engin. and Contract.*, 53 (1920), No. 8, pp. 208, 209).—Experimental data on the subject are summarized, and an empiric formula, together with a table of data to show the pressure of concrete in forms, is given. The final formula arrived at is as follows:

$$P=A \frac{wh^2}{2}, \text{ where } A=\frac{1-e^{-kt^2}}{kt^2}$$

In this formula P is the unit pressure on a vertical surface at a given point below the top of the concrete in pounds per square foot; h is the head of concrete in feet; w is the weight of concrete; e is the base of natural logarithms; k is a parameter; and t is the time elapsed since the point at h was poured, in hours; A is a coefficient. The parameter k is determined by the following formula:

$$k=\frac{1}{t_0^2} \log_e (20/19)$$

More light on protecting concrete against fire (*Engin. News-Rec.*, 84 (1920), No. 10, pp. 469, 470).—Tests are reported which show that limestone aggregate is highly fire resistant, and is preferable in this respect to highly siliceous gravels. Where highly siliceous aggregate is to be used, the use of high-weight, large-mesh reinforcement in the outer concrete is recommended.

Paint, a plastic material and not a viscous liquid: The measurement of its mobility and yield value, E. C. BINGHAM and H. GREEN (*Amer. Soc. Testing Materials Proc.*, 19 (1919), pt. 2, pp. 640-664, figs. 8).—In this paper the differences between the viscous and plastic substances are pointed out, and paint is shown to be a plastic material and not a viscous liquid. It is thus classified as a solid and is referred to as being rigid or mobile. The plastometer, an instrument designed to determine the mobility and yield values of plastic substances, is described and its method of use discussed. Formulas for calculating these properties from laboratory measurements are derived.

Experimental data from the use of the apparatus are presented and discussed.

First biennial report of the California Highway Commission, N. D. DARLINGTON ET AL. (*Bien. Rpt. Cal. Highway Comm.*, 1 [1917-18], pp. 142, pls. 30, figs. 4).—This is a report of the work and expenditures of the California Highway Commission for the biennial period ended December 31, 1918. It deals with highway legislation in the State, includes data on the design and construction of highways, and reports the results of laboratory tests of construction materials, including especially concrete and road oil.

Highway inspectors' handbook, P. HUBBARD (*New York: John Wiley & Sons, Inc.*, 1919, pp. XXVI+372, figs. 56).—This is a handbook for inspectors, engineers, and contractors, in which the author has presented briefly most of

the important details of highway construction and maintenance in such form as to be quickly available. Use is made of a large number of diagrams in place of the customary tables. Each general subject is divided into articles, the following subjects being included: Highway inspection; broken stone; gravel, sand, and clay; hydraulic cement; bituminous materials; laboratory tests of bituminous materials; inspection of sand-clay, gravel, shell, and shovel-run or crusher-run slag roads; inspection of broken stone and broken slag roads; inspection of bituminous surface treatments; inspection of bituminous macadam pavements; inspection of concrete foundations and pavements; bituminous paving plant inspection; inspection of bituminous concrete and sheet asphalt pavements; inspection of brick and block pavements; inspection of miscellaneous work and materials; measurements; miscellaneous field testing and sampling equipment; records and reports; and typical material requirements.

The turnpikes of New England, F. J. WOOD (*Boston: Marshall Jones Co., 1919, pp. XVII+461, pls. 102, figs. 16*).—This book deals with the engineering, economic, and archaeological aspects of the turnpikes and toll bridges of New England.

The proper width of a permanently paved highway, M. L. PATZIG (*Munic. and County Engin., 58 (1920), No. 2, pp. 66, 67*).—Data on highway widths for different purposes are reported, and it is concluded that 20 ft. is not an unreasonable minimum width.

Standard specifications for brick pavements, M. B. GREENOUGH (*Munic. and County Engin., 58 (1920), No. 2, pp. 57-61*).—The history of brick pavements is briefly reviewed and the new standard and alternate specifications are discussed. The author points out the value of thorough subsoil drainage for the base of brick pavements, and of the use of a variety of kinds of bases to meet different subsoil, traffic, and economic conditions. Experience indicates that tendency of design is away from the slab type of brick pavements and toward the types that depend upon the high quality of the individual unit. The use of the cement grout filler is being discontinued, and the adoption of the standard brick is becoming widespread.

Fundamental considerations affecting concrete pavement design, S. T. MORSE (*Munic. and County Engin., 58 (1920), No. 2, pp. 62-66*).—Data on the design of concrete pavements from different sources are summarized, and a mathematical analysis is made of different design factors. Tabular data are given showing the required thickness and relative cost per square yard of wide and narrow pavements.

Utilizing old macadam to increase width of concrete road (*Engin. News-Rec., 84 (1920), No. 10, pp. 461-463, figs. 3*).—Reconstruction of old macadam roads by building a concrete surface in two strips with the old surface left in the middle, is described, as done by the New York State Highway Department. After the concrete has been constructed the macadam receives a bituminous surface. By this design the old surface is utilized for foundation where it is in the best condition, an extra wide road is obtained, and it is easy to keep roads open to traffic during construction.

Cost data are included.

Service the final test of quality of road stone, H. E. BREED (*Munic. and County Engin., 58 (1920), No. 2, pp. 51, 52*).—The author reviews a number of different tests of road stone and points out the value of the impact test. He concludes that road stone must be considered in relation to its particular function in a specified type of pavement. The concrete type is better built with stone the wearing quality of which is most nearly commensurate with that of the matrix, or a stone with a French coefficient of from seven to nine.

Bituminous surface treating work, D. O. STONE (*Cornell Civ. Engin.*, 28 (1920), No. 4, pp. 170-178, fig. 1).—The organization and forms used by the Ohio State Highway Department are described and illustrated.

Field manual: Instructions for making bridge and culvert surveys [*Des Moines*]: *Iowa Highway Comm.*, 1919, pp. 25).—This outline of instructions for making bridge and culvert surveys is based on recent practice of the Iowa Highway Commission.

Proposed farm power studies (*U. S. Dept. Agr., Off. Sec. Circ. 149* (1920), pp. 8).—This circular reports the proceedings of a conference on farm power problems held in Chicago on October 6 and 7, 1919, by representatives of the U. S. Department of Agriculture and of State colleges and various agricultural and trade organizations, in which it was recommended that Congress be asked to make adequate appropriation for fundamental studies of farm power problems to be undertaken by the Department in cooperation with the colleges. Pursuant to this recommendation a Departmental committee was appointed by the Secretary of Agriculture to take charge of farm power projects, which suggested the following seven projects: (1) The testing and rating of farm tractors, (2) the determining of the working rating of horses, (3) the measurement of power requirements of machines and implements, (4) the development of practical methods of expanding the power of farm horses, (5) the determination by field studies of the mechanical efficiency of horses as power units, (6) the increasing of the economic efficiency of horse and tractor power by the readjustment of the size of the farm and the combination of enterprises, and (7) the compiling of accurate data concerning farm power demands and the relative cost of meeting these demands by the various kinds of power on farms.

Efficiency in the use of oil fuel, J. M. WADSWORTH (*Washington: U. S. Dept. Int., Bur. Mines*, 1919, rev. ed., pp. 86, pls. 3, figs. 18).—This is a handbook of information for boiler-plant and locomotive engineers who are intimately associated with the use of oil fuel.

Theory and practice of plantation transportation, L. W. ALWYN-SCHMIDT (*Sugar [New York]*, 22 (1920), No. 2, pp. 70-73, figs. 2).—This is a discussion of the use of motor trucks and tractors for sugar-plantation transportation.

Tractor activities throughout Nation (*Farm Machinery*, No. 1466-67 (1920), pp. 11-17).—Replies from 44 agricultural colleges and experiment stations to a questionnaire relating to the status of the tractor industry are reported. The questionnaire includes for the respective States an estimate of farm tractors in use, a statement of the economic advantage of power farming as compared with horse power, the principal objections in the State against tractors, plans for the education of farmers in the operation of power machinery, and the best size of tractor for use in the State.

Directory and specifications of farm tractors (*Farm Machinery* No. 1472-73 (1920), pp. 13-31, figs. 125).—This directory includes specifications with illustrations for 314 tractors of 222 different makes.

Analytical dynamometer tests of agricultural machinery, M. CONTI (*Univ. Nac. Buenos Aires, Rev. Facult. Agron. y Vet.*, 2 (1919), No. 3, pp. 343-348, figs. 2).—Tests of different agricultural machines as conducted in Argentina are discussed.

Power-distribution tests of a grain binder showed that 16.5 per cent of the power was utilized by the sickle, 7.1 per cent by the reel, 22.9 per cent by the canvas platform, 42.2 per cent by the canvas elevator, and 9.3 per cent by the binder proper. Tests of a grain separator operated by electric motor showed that 22.22 per cent of the power was utilized by the cylinder, 13.89 per cent by the extractor, ventilator, and sifter, 5.56 per cent by the grain and

chaff elevator, 22.22 per cent by the automatic feeder, and 36.11 per cent by the blowing stacker. A brief test of a corn sheller showed that it required about five times as much power to operate the sheller when shelling corn as when running empty.

Care and operation of farm machinery, E. MORANDI (*La Mano d'Opera e le Macchine Agrarie. Piacenza: Fed. Ital. Consorzi Agr., 1916, pp. 73, figs. 45*).—This pamphlet deals especially with tillage machinery, and contains an appendix by P. Ceresta-Costa on the use of tractors and motor plows in Italian agriculture.

Stone roller for thrashing jowar (*Dept. Agr. Bombay Leaflet 6 (1917), pp. 2 pl. 1*).—A stone roller for thrashing sorghum is described and illustrated. The roller is 32 in. long and 22 in. in diameter. The axles are set in lead at the two ends of the roller and revolve in iron bearings. The whole rests in a wooden frame. With one man and two cattle drawing the roller the same amount was thrashed in $3\frac{1}{2}$ hours as in 8 hours by the old method of treading by cattle and at one-seventh of the cost. The thrashed grain was undamaged.

Booms for spraying truck crops, L. B. SMITH and H. H. ZIMMERLEY (*Virginia Truck Sta. Bul. 28 (1919), pp. 83-98, figs. 6*).—This bulletin describes the construction of booms or structures for conducting spray material to and supporting the nozzles, which have been found best adapted for the spraying of potatoes, tomatoes, spinach, and kale in eastern Virginia.

The potato boom is arranged to spray four rows. There are three straight nozzles to each row, one of which is vertical and the other two lateral. Under eastern Virginia conditions the spring crop of potatoes should receive the first spray when the plants are about 8 in. tall. For this application it is best to regulate the height of the boom to bring the lateral nozzles about 6 in. above the ground. This height may be maintained for the second spraying. For the third and succeeding applications, the height should be regulated to bring the vertical nozzles not less than 12 in. or more than 15 in. above the top of the plants. Among the crops, other than potatoes, which may be sprayed with this boom, are bush beans, soy beans, cabbage, sweet corn, and peas.

The tomato boom is an adaptation of the potato boom, and is designed to spray tomatoes and eggplants, grown in rows 5 ft. apart. It has been found impractical to attempt spraying tomatoes with a traction or power outfit when the rows are closer together. There are three nozzles to each row, arranged in a manner similar to those on the potato boom. The arms are curved to give the lower nozzles a slight upward angle, and are fitted with a double elbow at the point of attachment to the secondary supply pipe. This permits them to be adjusted to conform to the size of the plants.

The spinach boom is designed for spraying four rows of spinach, each 10 in. apart, on a bed 5 ft. wide. The nozzles are pointed in a forward direction and are supported on U-systems. This arrangement was devised during recent experiments in spraying spinach for the control of aphids. Each U-system is composed of one tee No. 6, two elbows No. 7, two elbows No. 9, two close nipples E, two nipples F, two nipples G, and two nozzles No. 8. Elbows Nos. 7 and 9 permit the nozzles to be adjusted in vertical and horizontal planes, respectively. During the operation of spraying the U-systems pass between and not over the rows. There are two nozzles pointed at angles of about 20° toward the rows or so arranged that the center of the cone of spray strikes the plants about 24 in. in front of the nozzles. Experience has shown that the spinach boom equipped with this arrangement of nozzles is an exceedingly satisfactory outfit for spraying large acreages of cucumbers and cantaloups.

The kale boom is constructed on the same principle as the spinach boom. It is designed for spraying six rows 20 in. to 30 in. apart. The U-systems are carried between the rows and the nozzles are directed at angles of about 30° toward the plants.

Farm buildings and tools (*California Sta. Rpt. 1919, pp. 90-93*).—Miscellaneous studies of farm buildings and farm tools are reported. A list of plans of farm buildings prepared by the agricultural engineering division and available for distribution is given. The results of a study of dairy buildings resulted in the design of an experimental milk house, the significant features of which are a smooth washable interior, well insulated walls of tile, and an insulated ceiling.

Tests of the usual forms of spark arresters for tractors showed that the centrifugal type is more efficient than any of the screen types. Tests to determine the relative merit of several standard and commercial wood preservatives for silos indicated that heavy creosote oil is as satisfactory as others and cheaper.

Data as to the tractive resistance of farm wagons on different road surfaces are summarized.

RURAL ECONOMICS.

The influence of wheat and cotton on Anglo-American relations during the Civil War, L. B. SCHMIDT (*Iowa Jour. Hist. and Politics, 16 (1918), No. 3, pp. 400-439*).—This paper analyzes the balance between Great Britain's economic dependence upon the United States for cotton and for wheat, indicating that the maintenance of England's neutrality during the Civil War depended upon the more serious consequences anticipated from the food famine which would have resulted from the cutting off of the supply of northern wheat rather than upon the risk of a cotton famine. Statistics of the production of the two commodities in the United States immediately preceding and during the Civil War, the production in the United Kingdom, and the importation by the latter from her colonies and from foreign countries, are reviewed; and the development of England's final policy is illustrated by quotations from contemporary debates.

The farmer and foreign exchange, S. SOSLAND (*Mich. Farmer, 154 (1920), No. 11, p. 395, fig. 1*).—This article sketches the effect of the foreign exchange situation as tending to reduce foreign trade in farm products and to increase the sale of European food products in this country.

Why the price of farm land varies, G. W. NORRIS (*Farm Jour., 44 (1920), No. 4, pp. 26, 102*).—The suggestion is made that the generally lower farm land values in the eastern industrial States are due to the drain of city industry upon farm labor supply and managerial ability.

Information on land values, L. A. EVANS (*Tasmania Agr. and Stock Dept. Rpt. 1918-19, pp. 20-24*).—This gives notes on land values in the rural districts of Tasmania where the land has been partially improved by the clearing of the timber and the sowing of artificial grasses.

[Land tenure and settlement and agriculture in Australia], G. H. KNIBBS (*Off. Yearbook Aust., 12 (1901-1918), pp. 237-402, figs. 6*).—Information previously noted (*E. S. R., 41, p. 493*) is continued for the latter year.

Russian agrarian reform, W. D. PREYER (*Die Russische Agrarreform. Jena: Gustave Fischer, 1914, pp. XIV+415, pls. 10*).—A detailed survey of the history of Russian peasant unrest from its early manifestations to the revolution of 1905 and 1906, difficulties both to peasants and large landholders arising out of concessions in the way of allowing peasants to acquire land, the gradual dissolution of the common field system and the assembling of peasant holdings,

the encouragement of free colonization of Siberia, and the organization and activities of agrarian commissions and of the peasant bank are noted. The author urges the importance to a nation's agrarian development of a conservative land-holding middle class, and also of adequate statistical information. Further reforms recommended for individual and group organization and for interior colonization are outlined, and a bibliography of German and Russian sources is appended.

The employment of women in agriculture in England and Wales (*Wages Bd. Gaz.*, 2 (1920), No. 37, pp. 83-90).—Statistics are given which were obtained from answers to an inquiry form sent quarterly to a number of farmers in England and Wales since April, 1915.

On the basis of answers of about 7,000 farmers this report is made, dealing first with the numbers of women engaged in agriculture in each division of the country and the proportion which they bear to the number of men employed both regularly and casually, and in the second place with conditions which lead to the employment of women or the reverse. England and Wales were divided into ten groups of counties classified according to the number of women employed regularly in agriculture in 1914 in proportion to the number of men so employed. The counties were arranged into groups, including first all those where the proportion in 1914 was as one woman to four men or less, others in which the number of men employed regularly was, respectively, 5 to 10, 11 to 20, and 21 to 30 times the number of women so employed, and one in which very few women were employed regularly in 1914. Changes brought about in this respect during the war are noted, and a table is given showing the number of men to each woman regularly employed in agriculture in each division of England and Wales in July, 1914 to 1919, inclusive. It is noted that the counties where the proportion of women regularly employed to men so employed is the lowest were practically the same in 1918 as in 1914.

How Denmark has prospered, W. R. BIRKS (*Sci. and Indus. [Aust.]*, 2 (1920), No. 1, pp. 52-59).—This is an account of the visit of a group of men selected from the Australian army to study the agricultural methods of certain countries to farms and other typical agricultural enterprises in Denmark.

Testing farms in the South for efficiency in management, C. L. GOODRICH (*U. S. Dept. Agr., Dept. Circ. 83* (1920), pp. 27).—This has been essentially noted in another form (*E. S. R.*, 40, p. 789).

The results of double entry bookkeeping in an agricultural enterprise (*Ann. Agr. Suisse*, 19 (1918), No. 1, pp. 41-114; 20 (1919), No. 3, pp. 295-316).—The principal results obtained on an institutional farm under the supervision of the Swiss Peasants' Union are reproduced and interpreted in order to illustrate the value and practicability of double-entry bookkeeping for farm accounts. The data cover the fiscal years ended April 30, 1916-17, and 1918-19.

Home supplies furnished by the farm, W. C. FUNK (*U. S. Dept. Agr., Farmers' Bul. 1082* (1920), pp. 19, figs. 28).—This gives graphic illustrations suggesting the utilization of farm supplies in the family living. The discussion is based on data previously noted (*E. S. R.*, 32, p. 487; 36, p. 289).

The necessity for the organization of agricultural interests, T. N. CARVER (*Ann. Rpt. Conn. Sta. Bd. Agr.*, 50 (1918), pp. 60-72, pl. 1).—A discussion of the advantages of standardization and advertisement in the marketing of farm products.

Report of the State Bureau of Markets and Marketing, V. H. DAVIS (*[Ohio Dept. Agr.]*, *State Bur. Markets and Marketing Rpt. 1917-1919*, pp. 18).—This outlines the investigational activities, organization, and demonstration and other extension-service work of the Ohio Bureau of Markets and Marketing, also legislation relating thereto.

Farmers' Market Bulletin (*North Carolina Sta., Farmers' Market Bul., 7 (1920), No. 33, pp. 23, figs. 3*).—This number contains a brief article on spring measures for sweet-potato disease control, the usual partial list of products which farmers have for sale, notes of public sales of purebred live stock, and a spraying calendar for apples in North Carolina.

The Market Reporter (*U. S. Dept. Agr., Market Rptr., 1 (1920), Nos. 10, pp. 145-160, fig. 1; 11, pp. 161-176, fig. 1; 12, pp. 177-192, fig. 1; 13, pp. 193-208, fig. 1*).—This continues weekly and monthly summaries of the movement, marketing, and prices of specified commodities, and tabulated statistics with interpretative text in regard to important classes of agricultural products.

Leading articles appearing in No. 10 briefly describe the manner and importance of gathering market information, especially with reference to fruit and vegetables, and present a discussion of the February meat trade; No. 11 takes up the onion market season and the movement to eliminate many of the sizes of standard containers. The latter numbers shows also the receipts and disposition of the principal classes of live stock at public stockyards February, 1919 and 1920. No. 12 contains leading articles, one outlining the dairy and market news service of the Bureau of Markets, the other discussing the subject of farmers and foreign exchange, also a monthly cold storage report showing holdings on March 1, 1920, and February 1, 1918, 1919, and 1920. No. 13 gives an analysis of the hay market situation and of price ranges of honey during the past three seasons.

Monthly Crop Reporter (*U. S. Dept. Agr., Mo. Crop Rptr., 6 (1920), No. 2, pp. 9-20*).—The usual monthly estimates of acreage and production of specified crops, and data as to the farm and market prices for various agricultural products, are continued. This number relates mainly, however, to the number and value on farms, average prices by age, class or selling unit, and marketing, trade, and aggregate value comparisons of the principal classes of live stock. Estimates are given of the number of cattle, swine, and sheep in leading countries of the world before and after the war.

Monthly Crop Reporter (*U. S. Dept. Agr., Mo. Crop Rptr., 6 (1920), No. 3, pp. 21-32, figs. 3*).—This number contains the usual estimates of acreage and production and data relating to farm and market value of important products, a crop summary for March, and many other statistics of farm stocks, crop acreages, production, exports, and prices. A comparison is made of the prices of 88 articles bought by farmers in the years 1909, 1914, 1918, and 1919, and of the average value of plow lands in 1918, 1919, and 1920 by States. Trends in agricultural statistical data by index numbers and by percentage changes yearly are shown.

What Brazil buys and sells, L. DE AFFONSECA, JR. (*Rio de Janeiro, Brazil: Min. Agr., Indus., and Com., 1918, pp. XXIX+101+[1]*).—In this are given statistics of the numbers of live stock in Brazil and of the approximate output of various agricultural products and their exportation during the last five years.

Acreage and live stock returns of Scotland (*Agr. Statis. Scot., 7 (1918), pt. 1, pp. 57*).—Information previously noted (*E. S. R., 41, p. 594*) is continued for 1918.

The products of French East Africa, G. FRANÇOIS (*Les Productions de l'Afrique Occidentale Française. [Paris]: Min. Colon., 1918, pp. 156+[3]*).—This gives a detailed report on the agricultural resources of the region, covering descriptive and statistical information as to oil-producing and textile and fiber plants, cereals, legumes, root crops, forest products, fruits, live stock, and fish.

Agricultural conditions in South Africa, F. D. FISHER (*U. S. Dept. Com., Bur. Foreign and Dom. Com., Com. Rpts., No. 63 (1920), pp. 1499-1501*).—This article notes briefly climatic conditions, characteristics of the rural population

of the Johannesburg consular district, the topography of the region and its effect on temperature, precipitation in various parts of the Union, and physical features and fertility of Rhodesia.

AGRICULTURAL EDUCATION.

The field in farm management demonstrations, H. C. M. CASE (*Jour. Farm Econ.*, 2 (1920), No. 1, pp. 9-22).—The history of farm management demonstration work, which had its origin in farm surveys conducted in 1912 and 1913, is briefly reviewed. This is followed by a consideration of the various agencies, e. g., the county agent, agricultural high-school teachers, and bankers with whom the farm management demonstrator may cooperate, and the assistance that the people representing these agencies can be expected to give, judging from their past training and experience; an analysis of the methods used in the past, viz, work with individual farmers, with small community groups of farmers, and with large extension school groups in giving instruction in farm accounting and problems in farm organization and management; and suggestions for the advancement of farm management demonstration work.

[**Report on the work of the extension service**] (*California Sta. Rpt. 1919*, pp. 101-108).—This is a report on the progress in the organization and work of farm advisor work in organized counties in cooperation with county farm bureaus; home demonstration work in organized counties through the county farm bureaus; agricultural club work through the county farm bureaus and the public schools; extension schools and demonstrations, correspondence courses in agriculture, vocational teachers' training classes, and rehabilitation courses at the university farm school; fair exhibits, etc.

Report of the division of extension in agriculture and home economics for the period of eight months ending June 30, 1918, A. AGEE ET AL. (*New Jersey Stas. Rpt. 1918*, pp. 99-144, fig. 1).—This includes the administrative report of the director of the extension division and the reports of the leaders of farm demonstration, home demonstration, and boys' and girls' club work.

Definite results are reported concerning the organization and relationship of the county boards of agriculture to women's work. With regard to boys' and girls' club work the conclusions have been reached that club work is essential and should form a definite part in the scheme for the education of boys and girls, particularly those who live in rural communities. The school is deemed the main institution through which these activities should be promoted, but all other public and semipublic institutions should be coordinated with it in the work. The understanding with the State Department of Public Instruction is fundamentally sound, and the relations should be even closer than they are at the present time. Not only would the interests of club work, but those of extension and general education work as well, be more efficiently served if a somewhat closer relation could be established between club leaders and the county farm bureaus. Paid county leadership is necessary to the performance of satisfactory club work, and ultimately there should be county leaders on full time in all organized counties.

The extension of education to the American farmer, J. G. MERRISON (*Jour. Bd. Agr. [London]*, 26 (1916), No. 9, pp. 881-891, pl. 1, figs. 4).—The author describes the organization, objects, and methods pursued by the extension department of the International Harvester Company in its educational and propaganda work, by means of demonstration trucks and farms, the distribution of literature, the visual method, and the "Safe Farming" newspaper service.

The school and the soil, and the soil and the farmer, H. DÖRFLER (*Landw. Jahrb. Bayern*, 8 (1918), No. 3, pp. 155-171).—The author discusses means of developing the agricultural instruction for the farming population of Germany, and of fostering a greater personal responsibility on the part of the farmer in his sphere of work and toward the public.

He recommends that the present system of agricultural instruction for farmers, consisting of instruction for adults by means of demonstrations and farm papers, and of instruction for farm boys in winter schools, which is deemed of only sporadic value, be reorganized, and suggests that in order to reach the rural masses the teaching of the spirit of the soil should be begun in the rural school as soon as the technical difficulties of reading and writing have been overcome, by giving the regular school subjects an agricultural trend. Further, Sunday and evening classes in theoretical instruction should be held for farm boys who have completed the rural school course and are beginning work on the farm. This instruction should be adapted to local conditions and work seasons, and should be supplemented by exhibitions and a study of farm machinery and implements. These classes should not be conducted in the usual question-and-answer school system, but in a more informal manner, and will be possible only where the services of the regular school teacher can be utilized for the agricultural instruction. This would necessitate training courses for teacher-students and teachers in service, which could be given by the agricultural instructor during vacations or at the usual teachers' meetings.

It is further recommended that agricultural illustrative material be extended and studied more intensively, and that the school garden be used for variety tests, fertilizer experiments, etc., as an introduction to practical work. The plan outlined is considered only a necessary preparatory step toward the ideal, namely, the expansion of these evening classes and the public continuation school into public obligatory vocational agricultural schools. With the introduction of the latter, the instruction in the agricultural winter schools would need to be reorganized to meet the needs of the more promising or efficient agricultural students, and to train managers, cooperative officials, subordinate State officials, etc. The preparatory training they are at present obliged to give could be discontinued and its course reduced from two winter half years to one.

A textbook of commercial geography, C. C. ADAMS (*New York: D. Appleton & Co., 1918, rev. ed., pp. XVI+508, pls. 18, figs. 156*).—The contents of this text have been limited to the commodities entering most extensively into trade because of their greater educational value in any attempt to elucidate for the classroom the nature of commerce and its underlying principles. Chapters are included for the United States on the climate, natural features, and distribution of leading products; vegetable food products, beverages, tobacco, and the trade in them; animal food products and the trade in them, and the horse, whales, sponges, and furs; vegetable and animal fibers—oils from the seed of fiber plants; and wood crops, the commodities they yield, and the trade in them. The agricultural products of foreign countries are also dealt with.

Selection and care of clothing, L. I. BALDT (*U. S. Dept. Agr., Farmers' Bul. 1089* (1920), pp. 32, figs. 10).—Practical suggestions are offered with reference to a spending plan for clothing, including the freshening and remaking of old garments; the selection of clothing as regards suitability of material, design, and color, and including general facts about textiles; and simple home testing of textile goods; and the care of clothing.

MISCELLANEOUS.

Thirty-second Annual Report of Alabama College Station, 1919 (*Alabama Col. Sta. Rpt. 1919, pp. 35*).—This contains the organization list, a finan-

cial statement for the Federal funds for the fiscal year ended June 30, 1919, and reports of the director and heads of departments on the work of the station during the year. The experimental work reported is for the most part abstracted elsewhere in this issue.

Annual Report of California Station, 1919 (*California Sta. Rpt. 1919, pp. 163, pl. 1*).—This contains the organization list; a report of the director consisting mainly of a summary of the research work of the station during the three years ended June 30, 1919, an account of other activities of the station, and a brief note on the new plan of administration; and an appendix containing lists of the various station projects and publications of the year and a report of the reconstruction committee of the College of Agriculture as to post-war activities. The experimental data reported are for the most part abstracted elsewhere in this issue.

Twenty-seventh Annual Report of Minnesota Station, 1919 (*Minnesota Sta. Rpt. 1919, pp. 95*).—This contains the organization list, a financial statement for the fiscal year ended June 30, 1919, and reports of the director, heads of divisions, and the various substations. The experimental work recorded is for the most part abstracted elsewhere in this issue.

Report of the superintendent, Northwest Experiment Station, 1917 and 1918 (*Minnesota Sta., Rpt. Crookston Substa., 1917-18, pp. 99, figs. 25*).—This contains the organization list and a report of the superintendent of the substation in 1917 and 1918, including several special articles by members of the staff. The experimental work reported is for the most part abstracted elsewhere in this issue.

Annual Report of New Jersey Stations, 1918 (*New Jersey Stas. Rpt. 1918, pp. XXIV+302, figs. 2*).—This contains the organization list of the stations, a financial statement for the College Station for the fiscal year ended June 30, 1918, and for the State Station for the period from November 1, 1917, to June 30, 1918, a report by the director (E. S. R., 40, p. 797), and departmental reports, the experimental features of which are for the most part abstracted elsewhere in this issue.

Annual Report of South Dakota Station, 1919 (*South Dakota Sta. Rpt. 1919, pp. 35*).—This contains a report by the director on the organization, work, and publications of the station, and departmental reports, of which that of the agronomist and entomologist and portions of that of the horticulturist are abstracted elsewhere in this issue.

Monthly Bulletin of the Ohio Experiment Station (*Mo. Bul. Ohio Sta., 4 (1919), No. 12, pp. 363-391, figs. 10; 5 (1920), No. 1, pp. 3-32, figs. 4*).—These numbers contain, in addition to several articles abstracted elsewhere in this issue and miscellaneous notes, the following:

No. 12.—Usefulness of Production Records in Dairy Management, by A. E. Perkins, and Index.

No. 1.—The Ohio Agricultural Experiment Station, Its Government and Work, this being the reply of the station to an inquiry by the State Joint Legislative Committee on Administrative Reorganization as to the Government and work of the station and its relations with other State institutions.

Monthly bulletin of the Western Washington Substation (*Washington Sta., West. Wash. Sta. Mo. Bul., 7 (1920), No. 12, pp. 193-208, figs. 5*).—In addition to articles abstracted elsewhere in this issue, this number contains a brief article entitled: Winter Management of Sheep in Western Washington, by C. M. Hubbard.

NOTES.

Cornell University and Station.—The largest appropriations ever granted any State college of agriculture have just been approved by the governor. The college receives an increase of almost \$300,000 over the previous year for salaries and running expenses. In addition \$500,000 is made immediately available for new buildings, with \$2,500,000 more authorized under the building plan. The total State appropriations for the college for the year will aggregate about \$1,800,000.

It is expected that the enlarged maintenance grant will afford opportunity for considerable increases in salary. More discretion is afforded the executive staff in this matter than under the former "segregated budget" system. Two new executive positions are established, one that of vice-dean of resident instruction, and the other that of vice-director of the station. Further extension of the rural marketing and finance work was also authorized.

The old insectary built in 1886 by Prof. Comstock has been razed to make room for the new chemistry building.

G. W. Tailby, sr., superintendent of the horse barn, has retired after 44 years' service.

American Association of Soil Survey Workers.—This organization was formed at a conference of representatives of soil survey work in the Upper Mississippi Valley States, held in Chicago, February 6 and 7. This conference was held to consider ways and means of establishing closer cooperation between the State and Federal soil surveys. Among the subjects taken up were the extent to which new soil types should be established, the basis of mapping and classifying soils, methods of soil mapping, nomenclature, the uses of the soil survey and its relation to other activities and industries, soil survey reports and joint publications, supervision of field work, inspection, etc., mechanical analyses, and correlative laboratory work, using the soil type as a basis and taking up such studies as adsorption, colloids, water holding capacity, etc.

The objects of the new association as outlined in the constitution are to establish a closer relationship among the soil survey workers of the various States, to provide a medium through where there may be a free discussion of problems arising in soil survey work, and to aid in developing a closer cooperative relationship between the States and the Bureau of Soils of the U. S. Department of Agriculture, to the end that greater uniformity may be secured in the work. Membership is open to all persons in the United States and Canada engaged in soil survey work. Meetings are to be held annually, with additional sectional meetings at various experiment stations during the summer.

Officers elected for the ensuing year include A. R. Whitson, University of Wisconsin, president, M. F. Miller, University of Missouri, vice-president, and W. J. Geib, University of Wisconsin, secretary-treasurer. Provision has also been made for standing committees on soil classification and nomenclature, utilization, field methods, correlative laboratory work, and legislation.

American Association of Agricultural College Editors.—This association will hold its eighth annual meeting at the Massachusetts Agricultural College, Amherst, Mass., from June 30 to July 2.

INDEX OF SUBJECTS.

- Abortion—**
 bacilli infection of bovine uterus, sequelæ of, 878.
 bovine, name for, paper on, 877.
 bull as carrier, Mich., 397.
 contagious—
 bovine, diagnosis, 677.
 etiology of, 677, 878.
 in cattle, 676, 878.
 in sheep, pathology, 273.
 lecture on, 674.
 new vaccine for, 878.
 paper on, 877.
 so-called, possible cause, 777.
 (See also *Bacillus abortus*.)
 control, 878, 881.
 in ewes, studies, 570.
 paratyphoid, in mares, 273, 568.
Acacia koa, description and uses, 739.
 Acacias, tropical, of Queensland, 840.
Acanthopsyche spp., notes, 361.
 Acarids, of stored grain and flour, 551.
 Accessory food factors, experimental work on, 58.
 (See also Vitamins.)
 Accounting, farm. (See Farm accounting, Farm cost system.)
 Acetaldehyde, effect on catalase production, 708.
 Acetanilid, effect on catalase production, 259.
 Acetic acid, effect on swine, 266.
 Acetone, production, process, 708.
Achorutes viaticus, use on sewage filters, 188.
 Acid number of crude fat, determination, 111.
 Acid phosphate. (See Superphosphate.)
Acidia n. spp., description, 653.
 Acidimetry of colored solutions, 612.
 Acidosis—
 and creatinuria, 367.
 and rickets, 367.
Acids—
 amino. (See Amino acids.)
 effect on swine, 266.
 fatty. (See Fatty acids.)
 Aconite, poisonous to stock, control, 879.
Acorn—
 hulls, composition, Tex., 369.
 kernels, composition, Tex., 369.
- Acorns—**
 analyses, 562.
 as food for poultry, 562.
 feeding value, 769; Tex., 369.
 Acridin compounds, antiseptic potency, 272.
Acrocercops sp. on cotton, 648.
Acrolepia assectella, notes, 152.
Actinomyces—
 chromogenus on potato, Hawaii, 543.
 spp., culture and key, 434.
 Actinomycetes, metabolism, studies, 434.
 Aculeata, parasitic, studies, 159.
 Adhesives, preparation from waste sulphite liquor, 615.
Adrenal—
 glands, effect of scorbutic diet on, 464.
 glands, ratio of cortex and medulla in rats, 665.
Adrenalin—
 effect on carbohydrate metabolism, 557.
 effect on catalase production, 258, 259.
 in suprarenals of albino rats, 665.
 Advitant, use of term, 164.
Æcidium grossulariæ, studies, Conn.State, 247.
Ædes calopus. (See Stegomyia.)
Enoplex polychrosidis n. sp., description, 655.
Aerological—
 observations, U.S.D.A., 14.
 work in United States Navy, U.S.D.A., 620.
 Afforestation. (See Forestation.)
 Agaves, weevil attacking, 751.
Agglutination—
 test for diagnosis of contagious abortion, 677.
 test for recurrent ophthalmia, 678.
Agricultural—
 chemistry. (See Chemistry.)
 colleges—
 functions, symposium, 690.
 improvement of instruction, 393.
 laws concerning, U.S.D.A., 496.
 (See also Alabama, Arizona, etc.)
 colonization—
 in Japanese Sakhalin, 393.
 in Palestine, plans, 594.
 (See also Land settlement.)

NOTE.—The abbreviations "Ala. Col.," "Conn. State," "Mass.," etc., after entries refer to the publications of the respective State experiment stations; "Guam," "Hawaii," and "P.R.," to those of the experiment stations in Guam, Hawaii, and Porto Rico; "Can.," to those of the experiment stations in Canada; and "U.S.D.A.," to those of this Department.

Agricultural—Continued.

conditions—

- in Great Britain, 190.
- in Russia, 894.
- in South Africa, 896.
- in southern United States, 490.
- in United States, address, U.S. D.A., 286, 287.
- on Belle Fourche project in 1918, U.S.D.A., 392.

(See also Agriculture.)

cooperation—

- for small producers, 89.
- in Bavaria, 690.
- in Belgium, 89, 791.
- in Germany, 687.
- in Great Britain, 89.
- in India, 594, 790, 791.
- in Minnesota, Minn., 391.
- in Ontario, 289.
- in Russia, 89, 791.
- in South Africa, 89.
- in Switzerland, 594.
- in Tropics, 599.
- laws of New York, N.Y.Cornell. 442.

cooperative societies in Germany, 392.
credit—

- and cooperation in Tropics, 599.
- in Germany, 687.
- in South Africa, 88.
- in Spain, 490.
- in United States, 689.
- need in cattle industry, 290.
- system of rating, 87.

development in Denmark, 895.

economics. (See Rural economics.)

education—

- elementary, in Canada, 692.
 - higher and secondary, in Netherlands, 91.
 - home projects, 594.
 - in Algeria, 494.
 - in Argentina, 294.
 - in Canada, report, 596.
 - in China, 399, 799.
 - in Great Britain, 697.
 - in India, 90.
 - in Japan, 90.
 - in Kansas, 295.
 - in Latin America, 199, 798.
 - in Portugal, needs, 493.
 - significance of type activities, 192.
 - vocational, courses, 195.
 - vocational, in Arkansas, 192.
 - vocational, in California, 294.
 - vocational, in Mississippi, 596.
 - vocational, rooms for, 495.
 - vocational, secondary, in Virginia, 495.
 - vocational, supervision, 595.
- (See also Agricultural instruction and Vocational education.)

engineering—

- extension work in, 94.
 - guide, 274.
- (See also Engineering.)

Agricultural—Continued.

experiment stations. (See Experiment stations.)

exports, activities of Bureau of Markets, 287.

extension—

- and experimentation, boundaries, editorial, 401.
- and vocational education, relations of, 595.
- county farm bureau development, U.S.D.A., 289.
- cooperative, U.S.D.A., 396.
- in California, Calif., 897.
- in Chinese missions, 399.
- in New Jersey, N.J., 897.
- in North and West, U.S.D.A., 396.
- in South, 594; U.S.D.A., 396.
- in United States, 897.
- specialists, function, editorial, 601.
- war service of county agent, U.S.D.A., 299.

hydraulics, treatise, 274.

implements, new, for India, 283.

institute in West Africa, 200.

Institute, Ultuna, report, 394.

instruction—

- elementary, 298, 495.
- for disabled, in France, 493.
- for ex-service men, 198, 500, 698.
- for farmers in Germany, 898.
- improvement in agricultural colleges, 393.
- in France, 396, 495.
- in Norway, 91.
- laboratory exercises for, 195.
- papers on, 793.
- relation of general science to, 291.
- secondary, 195, 196.
- secondary, science in, 691.
- supervised practice in, manual, 195.

(See also Agricultural education and Agriculture.)

investigation, organization and coordination, editorial, 304.

journals, new, 200, 500, 700.

labor—

- by women in England and Wales, 895.
- conditions, studies, Wis., 391.
- hours and wages in England, 190.
- housing problems, 593.
- in France, 287, 288, 490.
- in Germany, 687.
- minimum wages in England and Wales, 491.
- profit sharing and copartnership in, 190.
- Scottish, 190.
- wages, 491; U. S. D. A., 492.

laws—

- in Maine, 88.
- in Nebraska, 390.
- in New York, 291.

Agricultural—Continued.
 legislation, international yearbook, 390.
 machinery—
 care and operation, 893.
 draft tests, 184.
 dynamometer tests, 892.
 equalizers and hitches, 186.
 for motor tillage, selection, 588.
 fuller utilization of, 83.
 resistance to wear of parts, 587.
 standardization, 83.
 tests, 587.
 (*See also* Harvesting and Thrashing machinery.)
 organization—
 advantages, 895.
 in New York State, 190.
 in the South, 594.
 policy, trend in New York, 286.
 production, assistance by industrial councils, 288.
 products—
 effect of foreign exchange on, 894.
 foreign demand for, 287.
 in Germany, protective tariff for, 592.
 marketing. (*See* Marketing.)
 of French Africa, 230.
 prices, balance of and cost of production, 592.
 prices during the war, 191.
 prices in Canada, 191.
 prices in France, 490, 688.
 program for Southern States, address, 302.
 reconstruction. (*See* Reconstruction.)
 research—
 better illustrative material for, 101.
 cooperation and individualism in, 724.
 in Argentina, 294.
 in British Colonies, 99.
 in China, 799.
 in East African Protectorate, 99.
 in France, 396.
 in Great Britain, 697, 798.
 in Latin America, 798.
 in Tropics, organization, 599.
 in West Indies, 198.
 problems and methods, 201.
 resources of French East Africa, 896.
 school established in Peru, 200.
 schools in Algeria, 494.
 schools, secondary, science in, 691.
 statistics—
 importance, 687.
 of Algeria, 594.
 of Argentina, 690.
 of Australia, 894.
 of Brazil, 896.
 of Egypt, 392.
 of France, 594.
 of Germany, 658.
 of Japan, 492.
 of Netherlands, 191.

Agricultural—Continued.
 statistics—continued.
 of New Zealand, 90.
 of Roumania, 90.
 of Scotland, 90, 790, 896.
 of Switzerland, 90.
 of Union of South Africa, 90, 791.
 of United Kingdom, 90.
 surveying, laboratory manual, 887.
 teachers, training, 292, 295, 296, 298, 394, 395, 495, 596, 597, 691, 792.
 tenancy. (*See* Land tenure.)
 Agriculture—
 activities of Bureau of Markets in export trade, 287.
 address to bankers on, 87.

Aleurodicus neglectus on avocados, 546.

Aleurodiscus, studies, 147.

Aleyrodes citri. (See White fly, citrus.)

Alfalfa—

acid content, relation to soil acidity, 424.

and timothy mixtures, Wis., 632.

aphis, notes, 750.

as pasture crop, U.S.D.A., 370.

bacteria, sensitivity to acid, Wis., 324.

black, feeding value, 469.

breeding experiments, 32.

brown and black, losses of organic matter, 469.

culture, Mich., 397; Wis., 632.

culture experiments, 229, 826; Md., 135; N. J., 827; Va., 436.

culture in British Columbia, 733.

culture in western Kansas, Kans., 32.

early growth in alkali soil, Utah, 28.

effect of drainage, Wis., 384.

effect on nitrogen content of soil, 426.

fat-soluble vitamin in, 556.

feeding rack, plans, Mont., 86.

feeding value, U.S.D.A., 374.

fertilizer experiments, 98, 430; Minn., 731; Oreg., 221; Va., 21, 436.

for young pigs, Mont., 67.

green manuring experiments, Miss., 622.

hay, cost of production, Mo., 188.

hay, feeding experiments for lambs, Calif., 868.

hay, feeding value, Guam, 64; Tex., 369.

hay, feeding value as corn supplement, Kans., 375.

hay for dairy cows, Calif., 874.

hay v. oat hay for calves, Calif., 874.

hay v. Russian thistle for cows, Kans., 264.

hopper on Arizona cotton, Ariz., 357.

irrigation experiments, 576.

liming experiments, 523; N. J., 826.

Alfalfa—Continued.

meal, analyses, 263, 560; Ind., 769; Mass., 866; Mich., 63; N.H., 769; Tex., 769.

meal for lambs, Calif., 868.

non-inoculation through manure, Wis., 325.

pasture, supplemental feeds, comparison, U.S.D.A., 374.

pasture with grain, feeding value for pigs, Calif., 870.

plant, analyses, Oreg., 222.

roots as affected by irrigation, Calif., 823.

rotation experiments, U.S.D.A., 336.

seed production, Mich., 632; U.S.D.A., 337.

seed production, meteorological requirements, Utah, 806.

supplements as hog pasture, U.S.D.A., 373.

varieties, new, for South Dakota, S. Dak., 827.

variety tests, 98; Minn., 731, 824, 826; Va., 436.

water-soluble vitamin in, 556, 759.

weevil, methods of control, 159.

winterkilling, Wis., 338.

Alga flora of desiccated English soils, 726.

Alga—

feeding value, 769.

marine, cold resistance in, 727.

marine, fertilizing value, 526.

marine, intracellular acidity, 25.

Alignment charts, use in forest mensuration, 239.

Alkali—

effect on citrus groves, Calif., 640, 818.

fusions, 503.

investigations, Calif., 813.

salts, tolerance by plants, 626.

(See also Sodium salts.)

soils as affected by sulphur and sulphuric acid, Calif., 813.

soils, methods of testing, Utah, 718.

soils, reclamation, Utah, 813.

solutions, effect on concrete, 386.

tolerance of citrus seedlings, 443.

Alkaline—

iodids, determination, 111.

reserve of blood, effect of hemorrhage, 368, 465.

Alkalinization of infants' food, deleterious effect, 256.

Allograpta obliqua, notes, 854.

Almond—

branches, development on peach trees, 821.

oil, sweet, sterilization for preparation of lipovaccines, 707.

shot-hole, control, Calif., 843.

Almonds—

analyses, Calif., 862.

pollination, Calif., 832.

pruning experiments, Calif., 139.

self-sterility in, Calif., 832.

stocks for, Calif., 833.

- Alternaria solani*, notes, 48, 149; Hawaii, 543.

Apples—Continued.

- graphic records for, 534.
- insects affecting, 153.
- pollination, Calif., 832.
- pollination tests, 534.
- preparation for market, U.S.D.A., 39.
- propagation, Mass., 638.
- pruning experiments, 440; Calif., 139.
- pruning wounds, Minn., 833.
- seedling, breeding, 737.
- spray formula, 638.
- spraying calendar, Ark., 736; N.C., 896.
- spraying experiments, 637, 645.
- stem, length in, 536.
- thinning experiments, 39.
- varieties for Ohio, Ohio, 496.
- varieties, hardy, Minn., 834, 835; S.Dak., 836.
- varieties injured by winterkilling, Minn., 836.
- varieties, new, 637.
- winter injury in 1917-1918, Mass., 343.

Apricot—

- bacterial gummosis, studies, Calif., 843.
- leaf miner, life history and control, 650.
- limb gall, notes, Calif., 843.
- shot-hole, control, Calif., 843.
- twig blight, control, Calif., 843.

Apricots—

- dried, analyses, Calif., 862.
- pollination, Calif., 832.
- pruning experiments, Calif., 139.
- spraying experiments, Calif., 843.

Arbor day, relation to civic betterment, U.S.D.A., 141.

Archips rosaceana, notes, 748.*Ardisia crispa*, bud symbiosis in, 333.

Areca—

- koleroga, 145, 146.
- palm, diseases, 46.

Argas—

- miniatus*, studies, U.S.D.A., 252.
- persicus*, cause of recurrent fever, 570.
- Arginin nitrogen, determination, modification of apparatus, 711.

Argyroploce leucotreta, notes, 547.

Arizona University and Station, notes, 197.

Army worm, control in Ohio, Ohio, 300.

Arpax ruby, new pavement material, 385.

Arrhenothrips, new genus, erection, 154.

Arricciamento of elm and hackberry, 450.

Arsenic—

- determination in vegetable oils, 610.
- microtitration, 206.

Arsenical dips—

- oxidation in, 76.
- reduction in, 77.

Arsenicals. (See Calcium arsenate, Lead arsenate, Sodium arsenate and arsenite.)

Artichoke, Jerusalem, inulin in, 226.

Arundo phragmites meal, feeding value, 369.

Asarcia, status of genus, 355.

Ascariasis, lecture on, 674.

Ascarid larvæ, migrating course in host, 75.

Ascariids, removal by anthelmintics, 379.

Ascaris suilla, studies, 333.

Ascochyta—

fagopyrum on buckwheat, studies, 242.*pisi* on beans, 351.

sp., notes, 150.

Ascochyta, North American, descriptive list, 434.

Ash, mountain, growth studies, 739.

Ash, mountain, log measurements, 142.

Ashes. (See Wood ashes.)

Asilidæ in District of Columbia, 652.

Asparagin, effect on amylase, 203.

Asparagus—

- canned, botulinus poisoning from, 57.
- irrigation experiments, 138.
- tops, dried, feeding value, 369.

Aspartic acid—

- effect on amylase, 203.
- yield from prolin, 201.

Aspergillaceæ, growth as affected by saccharose, 627.

Aspergillus—

- flavus*, studies, 336.
- niger*, studies, 246, 336, 628, 727, 803, 804.
- sp., studies, 162, 608.
- sydowi*, studies, 336, 803, 804.

Aspidiotus—

- ancylus*. (See Putnam's scale.)
- destructor* on avocados, 546.
- pernicius*. (See San José scale.)

Asses, breeding in North Africa, 560.

Association of—

- Land-Grant Colleges, notes, 700.
- Southern Agricultural Workers, 1920 meeting, 301, 400.

Aster, woody, poisonous to stock, control, 879.

Athous hæmorrhoidalis, notes, 855.

Atmosphere—

- characteristics, 317.
- (See also Air.)

Atmospheric pressure, periodicities in, 212.

Atriplex canescens as pasture, notes, 797.*Atrodictes* spp., studies, 454.

Atterberg Schlämm cylinder, 119.

Autointoxication symptoms, origin of, 465.

Automobile design and construction, 84.

Avian diseases, detection and control, Calif., 885.

Avitaminosis experiments, technique, 365.

Avocado—

- anthracnose, 645.
- die-back, 646.
- fat, digestibility, 552.
- rot, studies, 643.

Avocados—

- budding experiments, 443.
- cold-storage studies, Calif., 831.
- culture, 140, 737.
- culture and marketing in Mexico, 239.
- culture in West Indies, 442.

- Avocados—Continued.
insects affecting, 546.
varieties, notes, 238.
- Azotobacter chroococcum*, conditions affecting growth, 225.
- Azotobacter*, fixation of nitrogen by, studies, Calif., 812.
- Babesia bovis*, synonymy, 570.
- Bacillus**—
abortus, tests for detection of, 674.
(See also Abortion.)
aerogenes and *B. coli*, differentiation, 274, 275.
aerogenes capsulatus in milk, toxic properties, 875.
aerogenes, distribution in water, 275.
amarus, description, 174.
amylovorus, notes, 645.
avisepticus, immunization, R.I., 78.
botulinus—
antitoxin, 558, 662.
effect of lemon juice on, Calif., 862.
occurrence in nature, 260.
presence in factory-canned products, 261.
studies, 58, 262, 762.
types, description, 260.
bulgaricus, use as a cheese starter, 564; Calif., 876.
carotovorus, notes, N.Y.State, 350.
cereus, notes, N.Y.State, 325.
cloacæ as transformer of cyanamid, 428.
coli and *B. aerogenes*, differentiation, 274, 275.
coli, bacterial content in milk, 72.
coli communis, paper on, 877.
coli, distribution in water, 275.
coli in jellied meats, 254.
enteritidis, studies, 885.
erysipelatis suis, studies, 679.
granulobacter pectinovorum, studies, 708.
hoplosternus, insect susceptibility to, 153.
larvæ, notes, U.S.D.A., 857.
melitensis, pathogenicity of, 74.
mesentericus in jellied meats, 254.
necrophorus. (See *Necrobacillosis*.)
nephritidis equi, studies, 680.
ovisepticus, vaccine, for hemorrhagic septicemia, Calif., 884.
paratyphosus A in swine, studies, 882.
paratyphosus B in swine, studies, 882.
pfaffi n. sp., description, 478.
prodigiosus as transformer of cyanamid, 428.
proteus vulgaris in jellied meats, 254.
pyogenes, infection in bucks, Calif., 884.
radicicola, effect of low temperature on, N.Y.Cornell, 435.
(See also Nodule bacteria.)
Reading, and *B. sporogenes*, comparison, 271.
rettgeri n.sp., description, 478.
sporogenes and Reading bacillus, comparison, 271.
- Bacillus**—Continued.
subtilis as transformer of cyanamid, 428.
subtilis in jellied meats, 254.
swipestifer, studies, 882.
tracheiphilus, studies, 855.
- Backwater curves and hydraulic jump, theory, 181.
- Bacteria**—
acid-fast, studies, 177.
and Protozoa, pathogenic, textbook, 878.
as affected by concentration of sugar solutions, 627.
effect on perithecia formation, 131.
increasing etching effect of roots on marble, 25.
iron-depositing, studies, 575.
nitrate-reduction test, N.Y.State, 325.
nitrogen-fixing, nonsymbiotic, 18.
- Bacterial tumors and wound calluses, 435.

- Baking powders, preparation, 363.
- Balsam, determination of future yields in Canada, 445.
- Bamboos, method of working in India, 44.
- Banana—
disease in Cuba, 49.
disease in tropical America, 49.
stem weevil, life history, 857.
- Bananas**—
antiscorbutic value, 257.
coconut butterfly on, 751.
culture experiments, 736; Guam, 37.
fertilizer experiments in India, 517.
insects affecting, 451.
nutritive value, 457.
Philippine, studies, 443.
- Barber, Ohio C., Agricultural and Industrial School, notes, 696.

Barberry—
 eradication, 542.
 eradication in Wisconsin, 742.

Barium phosphate, fertilizing value, 814;
 R. I., 527.

Bark-louse, oyster-shell. (*See* Oyster-shell
 scale.)

Barley—
 absorption of soil constituents, 23.
 antiscorbutic value, 463.
 as supplement to alfalfa pasture,
 U.S.D.A., 374.
 bran, value for milk production, Wis.,
 376.
 breeding experiments, Minn., 824.
 characters, factor analysis, 32.
 chop, analyses, Tex., 769.
 continuous culture experiments, 98.
 culture experiments, 132; N.Dak., 732.
 culture experiments in China, 400.
 culture in British Columbia, 733.
 culture in California, Calif., 32.
 diseases, treatment, Mich., 694.
 early growth in alkali soil, Utah, 28.
 effect of carbon dioxide, 816.
 effect of drainage, Wis., 384.
 effect of soil acids, Wis., 324.
 feed, analyses, 263, 560; Mich., 63;
 N.H., 769.
 feed, value for milk production, Wis.,
 376.
 feeding experiments, Mont., 67.
 feeding experiments for lambs, Calif.,
 868.
 fertilizer experiments, 223, 327.
 foot-rot disease in Northwest, 351.
 for fattening pigs, Calif., 870; Wis.,
 373.
 for young pigs, Mont., 67.
 freshly harvested, germination tests,
 237.
 inheritance in, studies, 133.
 irrigation experiments, Calif., 822.
 jointworm, control, U.S.D.A., 753.
 liming experiments, 523.
 limits of toxicity of ammonium sul-
 phate for, 219.
 loose smut, remedies, 644.
 Mariout, Calif., 32.
 meal, analyses, Mich., 63.
 middlings, analyses, 263; Mass., 866;
 Tex., 769.
 mixed feed, analyses, Mass., 866.
 nomenclature among the ancients, 33.
 offals, feeding value, 369.
 pastures, Mont., 68.
 physiological characters, 128.
 pollen, germination of, 820.
 protein, nutritive value, 755.
 rotation experiments, 132; Minn., 731,
 824; U.S.D.A., 336.
 sand and solution culture experiments,
 24.
 seed treatment with dry heat, 644.
 seeding, experiments in methods, 230.
 seeding rates, Wash., 632.

Barley—Continued.
 smut, control, 742.
 smut, infection through flower, 244.
 statistical notes, 439.
 stripe disease, Wis., 350.
 variety tests, 530; Calif., 822; Mich.,
 631; Minn., 731, 824, 825, 826;
 N.Dak., 732; U.S.D.A., 337; Wash.,
 631.

Barns—
 dairy, construction and equipment,
 Nebr., 285.
 design and construction in France,
 590.
 plans, 285.
 roof design, 86.
 ventilation systems, 285.

Barnyard manure. (*See* Manure.)

Basic slag. (*See* Phosphatic slag.)

Basswood, wood analysis, 7.

Bat, Georgian, in Wisconsin, 748.

Bathyplectes exigua, parasitism by, 857.

Beal, F. E. L., life and writings, 151.

Bean—
 anthracnose, varietal susceptibility,
 245.
 bacterial blight, elimination by aged
 seed, 351.
 dry root rot, N.Y.Cornell, 147.
 ladybird, control, summary of informa-
 tion, U.S.D.A., 252.
 meal, Japanese, analyses, Tex., 769.
 meal, navy, nutritive value, 756.
 mosaic, varietal susceptibility, 245.
 spot disease, studies, 351.
 weevil, life history, U.S.D.A., 548.
 weevil, life history and control, Okla.,
 856.

Beans—
 adzuki, unifoliate mutation in, 224.
Bacterium solanacearum on, 351.
 blackeye, use in citrus groves, Calif.,
 831.
 breeding experiments, Minn., 834.
 broad, seed coats, feeding value, 369.
 culture experiments, Tex., 828.
 culture in Burma, 436.
 distribution of chemical components,
 229.
 early growth in alkali soil, Utah, 28.
 effect of soil disinfection, 717.
 enzyme content, 228.
 fertilizer experiments, 222, 223, 719.
 irrigation experiments, 576.
 Lima, effect of position in pod, 138.
 navy, proteins, nutritive value, 756.
 new strain, N.J., 835.
 physiological isolation, 435.
 production in Cuba, 31.
 varieties tolerant to alkali, Calif., 823.
 variety tests, Minn., 835.
 (*See also* Mungo beans, Phaseolus, Te-
 pary beans, and Velvet beans.)

Bear grass, feeding value, Tex., 369.

Beavers, new subspecies, 748.

- Bedbugs—
 control, paper on, 152.
 eradication by steam, 358.
 life history studies, 358.
- Bee—
 culture, paper on, 152.
 moth, control, paper on, 152.
- Beech, oak mildew on, in British Isles, 747.
- Beechnut—
 cake, feeding value, 369.
 germs, feeding value, 369.
- Beef—
 blood, alkalinity determination, 614.
 exports, of New Zealand, 867.
 fat *v.* lean, cooking tests, 868.
 imports, British, statistics, 867.
 production, Nebr., 168.
 production, future, in England, 868.
 retail prices in North Dakota, N.Dak., 363.
 serum, alkalinity determination, 614.
 serum, normal, effect on anthrax bacillus, 475.
 (See also Cattle, beef.)
- Beekeeping—
 extension, Calif., 848.
 in Oklahoma, 160.
 in Ontario, 160.
 industry, 647.
 on the farm, 51.
 papers on, 152.
 to conserve sugar, 252.
- Bees—
 affected by European foulbrood, behavior, U.S.D.A., 859.
 brood diseases, 362.
 determination of age in, 860.
 foulbrood. (See Foulbrood.)
 handbook for beginners, 56.
 life history, 51.
 photic reactions of, 160.
 queen, mating, 549.
 winter loss, 362.
 (See also Honey.)
- Beet—
 leaf-hopper, breeding areas, Calif., 848.
 pulp, dried, analyses, 263; Mass., 866; Mich., 63; N.H., 796; Tex., 769.
 pulp, dried, feeding value, Tex., 369.
 pulp, for ewes, Calif., 868.
 root scab, control, 147.
 seed, treatment, 147.
 top silage, feeding value, U.S.D.A., 370.
 webworm, paper on, 545.
- Beetles—
 dermestid, parasite of, 751.
 hard back, on sugar cane, 52.
 of Europe, book on, 854.
 prionine, notes, 454.
 treatise, 455.
- Beets—
 criteria of ripeness, 130.
 effect of carbon dioxide, 816.
 fertilizer experiments, 223, 330, 719.
 field or fodder. (See Mangels.)
 irrigation experiments, 138, 576.
- Beets—Continued.
 liming experiments, 523.
 relative cost before and after war in France, 593.
 sugar. (See Sugar beets.)
 variety tests, Minn., 835.
 vitamin content, 759.
- Belle Fourche project farm in 1918, U.S.D.A., 396.

agrarian reform, Russian, 894.
agricultural resources of French East Africa, 896.
agricultural surveying, 887.
agriculture—
American, economic history of, 286.
elementary, 195, 795.
for eighth grade, 298.
for high schools, 795.
for teachers, 396.
illustrated lessons in, 598.
in New Town, 791.
of to-morrow, 687.

Books on—Continued.

animal breeding in North Africa, 560.
 animals injurious and beneficial to agriculture, 451.
 bacteria, pathogenic, 878.
 bacteriology, 474.
 beef production in England, 868.
 bees, 56.
 beetles of Europe, 854.
 biotechnology of meat, fat, and milk production, 263.
 birds and the war, 748.
 birds, British, nests and eggs, 847.
 birds, domesticated, diseases of, 680.
 birds in town and village, 847.
 buildings for farm animals, 590.
 butter making, 269.
 calcium requirement for man and animals, 260.
 camp nutrition, mess officers' manual, 658.
 canning and preserving, 113.
 canning, cold-pack method, 616.
 canning, commercial, 113.
 catalysis in theory and practice, 802.
 cattle foods, microscopic analysis, 469.
 cavy culture, 770.
 cheese making, 269, 270.
 chemistry, 310.
 chemistry of starch and cellulose, 409.
 chemistry, organic, 310.
 chicks, development, 562.
 colloids, physics and chemistry of, 109.
 concrete construction, 580, 581, 685.
 cookery, 458.
 cooking in quantity, 863.
 cows in health and disease, 273.
 dairy cows, feeding, 269.
 dairying, 269, 496.
 drainage systems, tile, 577.
 drug plants, culture, 538.
 drug plants, nomenclature of, 43.
 dry farm crops, 437.
 ducks, raising, 563.
 ducks, runner, 562.
 economics of daily life, 91.
 economics, rural, 789.
 encouraging repopulation and combating high cost of living, 391.
 engineering, civil, 478.
 engineering, highway, 279.
 engineering, irrigation, 479.
 engineering, rural, 274.
 engineering, structural, 486.
 excavation, machinery and costs, 482.
 farm buildings, construction, 687.
 farm engines, 282.
 farmers' union and federation, 391.
 farming, profitable, 88.
 farms, State, 490.
 feeding of nations, 755.
 fertilization problems, 262.
 fertilizers, 20, 719.
 fevers in the Tropics, 174.
 floods, remedies, 682.
 flower culture, 43.
 flower gardens, making of, 43.

Books on—Continued.

food and nutrition, 56.
 food and public health, 253.
 food and the war, 551.
 food from grains, 456.
 food industry, 658.
 food preservation, 804.
 food supply, world, 790.
 forage substitutes, 769.
 forestry, 43.
 forests of France, colonial, 446.
 forests, woods, and trees, 539.
 fruit and truck crops, 593.
 fruit culture, 238, 440.
 fruit in the home, 255.
 fruit trees as bushes, culture, 534.
 fruits, industries for conservation of, 615.
 garden insects and plant diseases, 546.
 gardening in New Zealand, 533.
 gardening, rôle in land development, 444.
 gardening the year round, 533.
 geography, commercial, 898.
 glow worm and other beetles, 455.
 goats, milch, 564.
 goats, raising, 561.
 goats, use and management in England, 265.
 grafting old fruit trees, 534.
 grain elevators, plans, 787.
 grapes, 41.
 harvesting machines, 686.
 health, public, 863.
 heredity, 262, 560.
 hides of colonial cattle, 264.
 highway inspection, 890.
 home economics teaching, 92.
 home projects in agriculture, 91.
 horses, diseases of foot, 571.
 horticulture, 444.
 household appliances, 285.
 hybridization, cause of apogamy in plants, 527.
 hydraulics, 274, 572.
 hydraulics, agricultural, 274.
 hydrology, elements of, 571, 681.
 ice cream manufacture, 877.
 inbreeding and cross-breeding, 865.
 insect artisans and their work, 249.
 land improvement in France, 790.
 land question in England, 391.
 lime, use in soil improvement, 524.
 live-stock and dairy farming, 263.
 meadows and forage plants, 437.
 meadows and pastures in France, 437.
 medicine, tropical, laboratory studies, 174.
 microorganism, pathogenic, 774.
 milk, biological properties, 564.
 milk, clean, production on farm, 472.
 moor cultivation, 512.
 motor vehicle engineering, 486.
 nature study, 92.
 nature teaching, 92.
 nurseries, 534.

Books on—Continued.

- nutrition diseases and infant feeding, 660.
 - nutrition in France during the war, 456.
 - oils, essential, and perfumes, 8.
 - oils, essential, refractive indices, 712.
 - oils, hydrogenation of, 409.
 - parks and gardens, 539.
 - pellagra, 761.
 - perfume and aromatic plants, 43.
 - perfumes and essential oils, 8.
 - pharmacy, 379.
 - physiology, principles of, 658.
 - pigeons, diseases and feeding, 779.
 - pigs, raising, 268, 561.
 - pine, southern yellow, 580.
 - plant physiology, 626.
 - poultry raising, 268, 471.
 - poultry, rational feeding, 268.
 - protozoa, pathogenic, 878.
 - pumping machinery, 480.
 - rabbits, breeding and care, 268.
 - roads and pavements, 279.
 - roses, 239, 444.
 - seed farming in Britain, 534.
 - sericulture, 546.
 - sheep, merino, history and breeding, 770.
 - softwood industry, 349.
 - soils and manures in New Zealand, 511.
 - surgical and obstetrical operations, 879.
 - timber, strength, seasoning, and grading, 280.
 - timbers and their uses, 446.
 - traction farming and traction engineering, 282.
 - tractors, 282, 783.
 - trees, 44.
 - trees, mountain, of southern California, 348.
 - tropisms, animal, 846.
 - tumors, nature and cause, 878.
 - turnpikes of New England, 891.
 - vegetable culture, 38, 637.
 - water law, western, 887.
 - wood and other organic structural material, 280.
 - wood, preservation, 782.
- Booms for spraying truck crops, Va. Truck, 893.
- Borax—
- determination, methods, 313.
 - in fertilizers, crop injury from, U.S.D.A., 816.
 - limits of toxicity, studies, U.S.D.A., 817.
- Borbhetha soil, fertilizer experiments, 22.
- Bordeaux—
- and oil emulsion spray, 153.
 - dist on peach and apple orchards, Va., 345.
 - mixture and casein, tests, 353.
 - mixture, fungicidal value, 48.

Bordeaux—Continued.

- mixture, improved form, 353.
 - mixture, value against potato pests, Mass., 366.
- Boric acid, use in nitrogen determination, 802.

- Crambus* spp. on corn, notes, Ohio, 852.
- Cranberries—
 culture in Quebec, 238.
 fertilizer experiments, 441; N.J., 837.
 proposed investigations, N.J., 837.
- Crane flies of New York, N.Y.Cornell, 157.
- Crank, driving or driven elements, 83.
- Cream—
 contests, U.S.D.A., 377.
 foamy, caused by lactose-fermenting yeast, 774.
 pasteurization, effects on nonbacterial flora of butter, 674.
 preparation for market, 270.
 remade, 674.
 separators, mechanics of, 269.
 yeasts and molds in, 674.
- Creamery—
 broader field for, 270.
 by-products, utilization, 269.
- Creatin—
 ingestion, studies, 367.
 urinary, relation of protein intake to, 367.
- Creatinin, ingestion studies, 367.
- Creatinuria in infants, studies, 367.
- Creosote—
 for fence posts, S.C., 85.
 in wood-stave pipe, effect on potability of water, 481.
 oil, heavy, use as wood preservative for silos, Calif., 894.
 penetration in Douglas fir, 240.
- Cresols and substitutes for cresol soaps, 675.
- Cress seeds, limit of germination, 39.
- Cronartium ribicola*. (See White pine blister rust.)
- Crop—
 and live stock improvement, cooperative, organizing for, 291.
 incomes, net, before and after the war, in France, 593.
 reports, U.S.D.A., 89, 191, 492, 594, 896.
 rotations. (See Rotation of crops.)
 tests, error from competition, 27.
- Crops—
 and prices in Tunis, 191.
 as affected by weather in New Jersey, 116.
 as affected by weather in Sweden, 117.
 irrigated, use by live stock, U.S.D.A., 370.
 outline for seasonal instruction, 795.
 relative resistance to alkali, Utah, 28.
 (See also Field crops.)
- Crowberry, adulterant for marmalades, 415.
- Crown gall—
 malignancy and analogy to cancer, 841.
 notes, 742.
- Crows, control, Okla., 355.
- Cruciferous seedlings, failure of, 46.
- Crude fiber. (See Cellulose.)
- Cryphalus abietis*, studies, 158.
- Cryptohelcostizus rufigaster* n.g. and n.sp., description, 655.
- Cryptomeigenia* spp., parasites of white grubs, 550.
- Cryptorhynchus* spp., notes, 159.
- Cryptothrips floridensis*, studies, 546.
- Cucumber—
 beetle, striped, infection with wilt organisms, 855.
 mildew, control, Guam, 38.
 mosaic, "white pickle," occurrence, Mass., 349.
 wilting disease, 47.
- Cucumbers—
 digestibility in stomach, 862.
 effect of soil disinfection, 718.
 insects affecting, Conn. State, 648.
 variety tests, Minn., 835.
- Culex larvæ, new, 652.

- Cull-bean meal, analyses, Mich., 63.
- Cultivation—
 as affecting rainfall, U.S.D.A., 617.
 mechanical, in France, 588, 785.
 mechanical, in Tunis, 390.
 mechanical, soil grip attachments, 488.
- Cultivators—
 motor, construction and operation, 588.
 Widen type, description, 488.
- Culture media—
 adjustment of reaction, 72.
 diagnostic, for paratyphoid-enteritidis group, 882.
 dry yeast extracts for, 708.
 liquid, for wood-destroying fungi, 225.
 semiliquid, for anaerobic organisms, 379, 775.
 soy bean cake for, 334.
- Culverts, reinforced-concrete, specifications, 579.
- Cupferron, use in quantitative analysis, 802.
- Cuprammonium washes, studies, 350.
- Cupuassou fat, digestibility, 552.
- Curdalac as rennet substitute in cheese making, Calif., 876.
- Currant—
 aphis, notes, 748.
 big bud, notes, 151.
 borers, notes, 748.
 diseases, notes, 748; N.Y.State, 350.
 industry in California, 42.
 leaf spot, notes, N.Y.State, 350.
 root rot, notes, N.Y.State, 350.
 rust, prevention, 643.
 worm, imported, notes, 748.
- Currants—
 black, reversion and resistance to big bud, 150.
 insects affecting, 748.
 variety tests, Minn., 834.
 (See also Ribes.)
- Cutaneous hypersensitiveness, studies, 74.
- Cutworm devastation in Canada and date of reseedling, 545.
- Cyanamid—
 effect on corn growth, 429.
 fertilizing value, 721.
 transformation into ammonium sulphate, 623.
 transformation into urea, 428.
- Cyanic acid, formation and identification, 414.
- Cyanid—
 reactions, sensitiveness of, 206.
 synthesis for nitrogenous fertilizers, 722.
 (See also Hydrocyanic acid.)

 effect of soil moisture on, Wis., 384.
 for subsoiling, 183.
 use in land clearing, 183, 278.
v. horse power for land clearing, Minn., 888.
- Extension work. (See Agricultural extension.)
- Fabrics, water resistance of, 417.
- Fallowing, cultivated *v. uncultivated*, Calif., 822.
- False silver leaf, description, 150.
- Fannia canicularis*—
 Empusa disease in, 361.
 n.sp., parasite of white grubs, 550.
- Farcy. (See Glanders.)
- Farina, manufacture from potatoes, 211.

Farm—

- accounting, Mich., 694.
- accounting, model forms for, 491.
- accounting on peasant farms, 790.
- accounting, value of double-entry book-keeping, 895.
- animals. (*See* Live stock and Animals.)
- building ventilation, notes, 86.
- buildings, plans, 285, 687; Calif., 894.
- bureau, county, organization plan, U.S.D.A., 289.
- bureaus, function, 790.
- cost system, 290.
- costs in Ireland, determination, 593.
- credit. (*See* Agricultural credit.)
- engines, handbook, 282.
- gates, plans, 285.
- labor. (*See* Agricultural labor.)
- land, price variations, 894.
- leases, collective, in Italy, 491.
- lighting plants, storage batteries for, 86.
- loans, Federal, plans for use, 87.
- machinery. (*See* Agricultural machinery.)
- management—
 - distinction from rural economics, 789.
 - extension teaching in, 897.
 - in the South, testing efficiency, U.S.D.A., 895.
 - in Victoria, 593.
 - research projects, 789.
 - survey in New Jersey, 290.
 - survey in Ontario, 290, 688.
 - survey in Pennsylvania, Pa., 170.
- managers, compensation for, 689.
- mechanics, instruction in Argentina, 294.
- memorandum book, 599.
- organization, as affecting costs of production, 88.
- organization, use of investigational data, 789.
- power projects, proposed, U.S.D.A., 892.
- products—
 - cost data, Mich., 397.
 - grading in New Hampshire, notes, 289.
 - inspection, U.S.D.A., 191.
 - minimum price system, 391.
 - warehouses, operation, N.C., 392. (*See also* Agricultural products.)
- profits and losses, plan for sharing, 593.
- publicity, Wash., 397.
- State, outline of project, 490.
- tenancy, evils of in United States, 288.
- tenancy in Great Britain, 287. (*See also* Land tenure)
- timbers, methods of treatment, S.C., 85.
- wagons, tractive resistance, Calif., 894.
- water supply in Canada, 575.

Farmers—

- and city labor, common interests, 689.
- and finance, address, 87.
- and the new day, 286.
- credit rating, 87.
- fuller representation in politics, 286.
- Farmers'—
 - Bulletins adapted to use by teachers, U.S.D.A., 299, 396, 598.
 - Exchange, Eastern States, plan, 289.
 - Institutes in United States, U.S.D.A., 396.
- Farming—
 - by motor, 588.
 - by the State, proposed, 491.
 - dairy. (*See* Dairy farming.)
 - effect of foreign exchange on, 894.
 - in the South, economic factors affecting, U.S.D.A., 731. (*See also* Agriculture.)
- Farms—
 - family supplies furnished by, 895.
 - fire control on, 789.
- Farmsteads, beautifying, U.S.D.A., 838.
- Fasciation in plants, studies, 332.
- Fat—
 - analysis and chemistry, 7.
 - determination in feces, new method, 506.
 - extraction apparatus, 207.
 - in the diet, dispensability of, 757.
 - in the diet, minimum, 165.
 - metabolism of infants, 60, 555.
 - production, biotechnology, 263.
 - storing by evergreen foliage, 433.
- Fats—
 - catalytic reduction with palladium, 409.
 - glycerol from, 757.
 - hardened, nickel and arsenic content, 610.
 - in Germany before and during the war, 362.
 - in Germany in war time, 552.
 - method for detecting rancidity, modification, 505.
 - replacement of glycerol by higher alcohols, 757.
 - synthesis of, 409.
 - vegetable, digestibility, 552. (*See also* Oils.)
- Fat-soluble A. (*See* Vitamin.)
- Fatty acids—
 - nephelometric values of, 505.
 - of different molecular weight, identification, 416.
 - retarding action, 310.
- Favolus europarus*, description, 51.
- Feathers, blue color in, cause of, 768.
- Feces—
 - fat determination in, new method, 506.
 - floral content, of children, 260.
 - of imported dogs, 180.
 - of infants, fat content, 60.
 - zinc content, 758.
 - zinc determination in, 710.

Federal—

- departments as source of information for libraries, 594.
- farm loan act, suggested amendments, 689.
- farm loans, plans for use, 87.
- land bank bonds, future of, 689.

Feeding—

- experiments. (*See Cows, Pigs, etc.*)
- racks, plans, 285; Mont., 86.

Feeding stuffs—

- chart, 770.
- digestibility, Tex., 369.
- drying, 417.
- fertilizer constituents, Mass., 866.
- for dairy cows, Calif., 71; Ohio, 496.
- from waste sulphite liquor, 615.
- inspection and analyses, 263, 560, 769; Ind., 769; Mass., 866; Me., 63; Mich., 63; N.H., 769; Tex., 769.
- labeling as to nutritive value, 253.
- law in Texas, Tex., 370.
- low-grade, Mass., 866.
- microscopic analysis, 469.
- nonprotein nitrogen content, 469.
- protein analyses, 210.
- wartime, in Germany, 369. (*See also specific kinds.*)

Fence posts, methods of treatment, S.C., 85.

Fences—

- portable, plans, 285.
- wire, for pastures, 282.

Fermentation, alcoholic, inhibition by preservatives, 609.

Ferments. (*See Enzymes.*)

Fern weevil, Australian, notes, 549.

Ferns—

- collecting, U.S.D.A., 724.
- poisonous to stock, control, 879.
- Ferrie hydroxid, fertilizing value, 222. (*See also Iron.*)

Fertility, use of term, 529.

Fertilization, problems, 262.

Fertilizer—

- experiments—
 - conclusions, Ohio, 516; Wash., 517.
 - in Germany, 516.
 - in India, 218, 518.
 - in Iowa, 516.
 - in Netherlands, 123.
 - long-time, on same soil, value, 720.
 - on Borbhetta soil, 22.
 - on seed beds, 518. (*See also special crops.*)
- industry, survey, U.S.D.A., 19.
- law, Mass., 23.
- laws in Pennsylvania, 331.
- materials, retail prices, report, U.S.D.A., 331.
- mixtures and composts, 721.
- requirements of soil. (*See Soils.*)

Fertilizers—

- animal, use, 328.
- borax in, determination, 313.

Fertilizers—Continued.

- borax in, effect on crops, U.S.D.A., 816.
- combined, effect on yield of oats, 719.
- date of application to cotton, 438.
- from waste sulphite liquor, 615.
- inspection and analyses, Calif., 223; Mass., 817; Me., 223; N.J., 432; R.I., 526; S.C., 23; Tex., 527.
- inspection and analyses in Canada, 724.
- inspection and analyses in Florida, 817.
- inspection and analyses in Louisiana, 23.
- inspection and analyses in Maryland, 223.
- inspection and analyses in North Carolina, 223, 526.
- inspection and analyses in Pennsylvania, 331.
- inspection and analyses in Porto Rico, 626.
- inspection and analyses in Virginia, 817, 818.
- inspection and control, 526.
- inspection in Spain, 526.
- nitrogenous. (*See Nitrogenous fertilizers.*)
 - organic, bacterization, 520.
 - phosphatic. (*See Phosphates.*)
 - production and use in Egypt, 127.
 - production and use in Japan, 218.
 - production and use in South Africa, 21.
- potash. (*See Potash.*)
- purchasing suggestions, Wash., 397.
- raw materials in Southern States, 525.
- regulations, U.S.D.A., 128.
- relation to crop production, Va., 21.
- relation to food production, 20.
- relation to soil fertility, 515.
- textbook, 719.
- use in Germany, 515.
- use in India tea districts, 518.
- use in New Jersey, 291.
- use on pastures, 720.
- use on sandy soils, Wis., 327. (*See also specific materials.*)

Fertilizin, formation in egg, 262.

Fescue, meadow. (*See Meadow fescue.*)

Feterita—

- prussic acid content, Fla., 830.
- variety tests, Tex., 828.

Fevers in the Tropics, 174.

Fiber—

- crude. (*See Cellulose.*)
- from Bourbon palm, 531.
- manila, for hoisting cables, tests, 388.
- plants, legislation in Tropics, 599.
- plants, production in Cuba, 31.
- ropes, mechanical properties, 782.

Fibers—

- estimation in paper, 12.
- vegetable, use in paper making, 116. (*See also Hemp, Henequen, etc.*)

Fibrin, digestion by trypsin, 60.

Ficaria verna, variation in, 725.

- Field crops—
 cost of production, Mo., 188.
 inspection, official, 530.
 work in Assam, 132.
 work in Bengal, 132.
 work in British Virgin Islands, 230.
 work in Burma, 436.
 work in Cuba, 31.
 work in India, 132.
 work in Madras, 436.
 work in Minnesota, Minn., 825, 826.
 work in Nigeria, 436.
 work in Ontario, 229, 230.
 work in Rhodesia, 230.
 work in Uganda, 32.
 work on the Gold Coast, 230.
 (*See also* Crops, Forage crops, Root crops, etc.)
- Field experiments, standardization, 28, 529.
 Field layouts, diagrams, 184.
- Fig—
 borer, studies, 454.
 experiment station in California, 94.
 preparations, analyses, 162.
- Figs—
 caprification, studies, Calif., 831.
 culture experiments, 736.
 for Yuma Mesa, Ariz., 341.
- Filao tree diseases in Mauritius, 354.
Filaria gallinarum n.sp., description, 180.

- Man—
food requirements, 658.
infestation by mouse oxyurid, 847.
vitamin requirements, 366.
- Manatha* spp., notes, 361.
- Mandarin juice, bactericidal power of, 7.
- Manganese—
compounds, fertilizing value, 222.
effect on plant growth, 525.
steel, use in farm tractors, 783.
sulphate, effect on alkali salts, Calif., 813.
toxicity in acid soils, 431, 816.
- Mange, treatment, 272.
(See also Sheep scab.)
- Mangels—
culture experiments, N.Dak., 732; Wyo., 135.
culture in British Columbia, 733.
fertilizer requirements, 327.
rotation experiments, 230.
seed production in Denmark, 135.
variety tests, Minn., 824; N.Dak., 732.
- Mango—
flies, control, 736.
mildew, 46.
weevil in Bengal, life history, 159.

- Mangoes—
 antiscorbutic value, 163.
 budding experiments, 736.
 culture experiments, 736.
 culture in Florida, 737.
 culture in India, 442.
- Mangrove swamps in Philippines, 142.
- Manioc. (*See* Cassava.)
- Mannitol—
 formation, 709.
 oil, nutritive value, 757.
- Manure—
 ammonification in soil, studies, N.Y. State, 325.
 conservation, 19, 721.
 effect on green manure, N.J., 827.
 effect on toxicity of alkali salts, Calif., 813.
 fertilizing value, Guam, 37.
 fertilizing value in Bombay, 518.
 flies breeding in, 453.
 for Iowa soils, 516.
 from city stables, fertilizing value, 325.
 liquid—
 conservation of nitrogen in, 519.
 conservation, studies, 326, 721.
 effect on nitrogen content of soils, 425.
 nitrogen content, 427.
 tanks, plans, 86.
 nitrification, studies, 519, 524.
 noninoculation by alfalfa feeding, Wis., 325.
 spreader tests, 186.
 use in New Jersey, 291.
 v. commercial fertilizers, N.Y. State, 326.
 v. sodium nitrate, 124.
- Manuring and insect control, 152.

- Pegomyia*—
brassicæ. (See Cabbage-maggot.)
fusciceps, notes, N.J., 849.
- Pelecinus polyturator*, parasite of white grubs, 549.
- Pellagra—
among Turkish prisoners of war, 463.
and bad maize, 761.
monograph, 761.
pathology and origin, 462.
relation to maize consumption, 457.
- Penicillium*—
crustaceum, description, 162.
expansum, studies, 336, 608, 803, 804.
olivaceum, description, 162.
oraolicum, inoculation on potatoes, 246.
roqueforti, use in cheese making, 876.
- Pennsylvania—
College, notes, 198, 499, 696, 798.
Station, notes, 198, 499, 798.
- Penstocks, economic design, 572.
- Pentosans, determination, 112.
- Peperomia pellucida*, use for greens, 138.
- Pepper—
adulteration, detection, 112, 415.
blossom rot, 145.
die-back, 145.
Fusarium wilt, N.Mex., 844.
long, adulterant for black pepper, 415.
weevil notes, 159.
- Peppers—
fertilizer experiments in India, 517.
methods of cultivating, 444.
- Pepsin—
as rennet substitute in cheese making, Calif., 876.
determination, 204.
preparations for cheese making, 566.
- Peptone intoxication, studies, 271.
- Peregrinus maidis*, control in Hawaii, 249.
- Perfume and aromatic plants, 43.
- Perfumes, artificial, treatise, 8.
- Peridermium pini*, relation to *Cronartium*, 51.
(See also *Cronartium* and White pine blister rust.)
- Periodicity in nuclear and cell division, 131.
- Periplaneta*—
americana. (See Cockroach, American.)
australasiæ, control, Minn., 358.
- Periploca, new genus, erection, 157.
- Perisothrips, new genus, erection, 154.
- Permeability—
determination, 227.
of plasma membrane as affected by light, 227.
soil, measurement formula, 780.
- Peronospora—
control, 450.
on grapevines, fungicide tests, 353.
- Peronospora parasitica*, studies, 46.
- Peronosporaceæ, studies, 350.
- Persea schiedeana*, notes, 537.
- Persimmon—
diseases and insect pests, Calif., 346.
oriental, culture in United States, Calif., 346.
- Persimmons, cold-storage studies, Calif., 831.
- Pestalozzia*—
guepini on Liberia coffee, 145.
lignosus on Para rubber, 145.
truncata, studies, 51.
- Petroleum, crude, effect on soy beans, 435.
- Pharcidia lichenum*, lime-dissolving fungus, notes, 336.
- Pharmacopœia of United States, 566.
- Pharmacy, yearbook, 379.
- Phaseolin—
nitrogen distribution in, 707.
nutritive value, 756.
- Phaseolus*—
lunatus, hydrocyanic acid content, 7.
spp., studies, 435.
- Phaulothrips, new genus, erection, 154.
- Phcidole megalcephala*, notes, 754.
- Phenacetin, effect on catalase production, 259.
- Phenological—
conditions, relation to amount of seed, 511.
literature, recent, 511.
observations in Europe, 511.
- Phenolphthalein, substitutes for, 504.
- Phenolsulphonic acid reaction for nitrate determination, 414.
- Phenylhydrazin reaction, modification, 112.
- Phibalothrips, new genus, erection, 154.
- Philotrypsis javæ* n.sp., notes, 56.
- Phlegthontium quinque-maculatus*. (See Tobacco worm.)
- Phlegmon, treatment, 566.
- Phlorizin, effect on carbohydrate metabolism, 557.
- Phloroglucinol, method of preparation, 505.
- Phoma*—
betæ, notes, 46.
lingam on cabbage, N.Y.State, 350.
- Phomopsis*—
citri, studies, Calif., 842.
spp., notes, 630.
vevans, studies, 148.
- Phoradendron* spp., notes, 354.
- Phorbia (Pegomya) cepetorum*. (See Onion maggot.)
- Phormia azurea*, studies, 157.
- Phosphate—
deposits of Galicia and Palestine, analyses, 430.
deposits of South Australia, analyses, 430.
deposits of Switzerland, 220.
nodules as direct fertilizer, 125.
of lime. (See Calcium phosphate.)
rock, as affected by sulfonation, 125, 429.
rock, composting with sulphur, Va., 429.
rock, fertilizing value. (See Phosphates, comparison.)
rock in Morocco, 220.

Phosphate—Continued.

- rock industries in Southern States, 525.
- rock, production, 19.
- rock, solubility, studies, 125.
- rock, sources and use, 525.

Phosphates—

- absorption by soils, Calif., 811.
- comparison, 20, 107, 125, 218, 720, 814; Minn., 723.
- conditions in European market, 814.
- consumption in Europe, 815.
- fertilizing value, 107, 125, 218, 220, 328, 720, 721; Minn., 723; Wis., 327.
- market conditions in Europe, 814.
- solubility, studies, 125.
- Vivianite and Vesta, fertilizing value, 22.
- (See also Superphosphate.)

Phosphatic—

- fertilizer resources of Uruguay, 328.
- fertilizers, treatise, 220.
- manures, use on Indian soils, 429.
- slag, fertilizing value, 721.
- (See also Phosphates, comparison.)
- slag, use in concrete highways, 781.

Phosphoric—

- acid, determination in sewage, 12.
- acid, fixation in soils, Va., 424.
- acid in soil, effect of lime on, 524.
- acid, use in Germany, 516.
- oxid, relation to antineuritic vitamin in maize products, 256.

Phosphorite meal, as direct fertilizer, 125.

Phosphorus—

- availability of in marsh soils, Wis., 512.
- distribution in plants, 229.
- in typical diets, studies, 555.
- maintenance requirement in man, 554.
- new method for testing, Wis., 313.

Photosynthesis—

- and respiration, 730.
- method of study in land plants, 730.

Phototaxis, studies, 333.

Phototropism, explanation, 128.

Phragmites communis pseudodonax, studies, 332.*Phryganidia californica*, studies, U.S.D.A., 853.*Phrynetia spinator*, studies, 454.

Phthalic anhydrid—

- melting point, 205.
- papers on, 109.

Phthorimæa operculella on potato, Hawaii, 543.*Phyllobius* spp., notes, 851.

Phyllophaga, parasites of, 549.

Phyllosticta theobromicola on cacao, 46.*Phyllotreta armoraciæ*, notes, N.J., 849.

Physiology, principles of, 658.

Phytoccia cylindrica on carrots, 152.*Phytolacca rivinoides*, use for greens, 138.

Phytopathology, history of, 541.

Phytophthora—

- cactorum*, studies, 450.
- cryptogea*, notes, 46.

Phytophthora—Continued.

- hypolateritia* on tea, 647.
- infestans*. (See Potato late blight.)
- spp., on rubber, 145, 542, 741.
- syringæ*, notes, 46.

terrestris on citrus trees, 643.*terrestris*, studies, Calif., 842.

Phytophthora on cacao, 49.

Pigeon pea root disease, notes, 844.

Pigeons—

- color inheritance, 764.
- diseases and feeding, 779.
- involution of thymus in, 165.
- sex-linked characters, inheritance, 764.
- vitamin requirements, 366.

Pigmentation. (See Anthocyanin, Color inheritance and Plants, pigments.)

Pigs—

- as affected by acids in ration, 266.
- as affected by excessive protein feeding, Minn., 871.
- breeding in North Africa, 560.
- calcium compounds for, Ohio, 470.
- feeder, regulation for handling, 877.
- feeding experiments, Ala.Col., 870; Calif., 870; Guam, 64; Kans., 374; Minn., 871; Mont., 66, 67; U.S.D.A., 370, 373, Wis., 373.
- finishing for market, Oreg., 267.
- hairless, paper on, 878.
- houses for, plans, 285.
- housing in France, 590.
- malnutrition of, potassium iodid in, 679.
- nitrogen metabolism experiments, 265.
- pasturing experiments, Ala.Col., 870; U.S.D.A., 373.
- peanut-fed, hardening, Tex., 169.
- raising, handbook, 68, 268, 561.
- shipment in crates, 877.
- (See also Sows and Swine.)

Pine—

- blister rust, studies, 51.
- (See also White pine blister rust.)
- bravo, wood structure of, 739.
- cones, insect injurious to, 158.
- diseases in Switzerland, 50.
- intertillage experiments, Minn., 839.
- Jeffrey, hand-pollination experiments, 241.
- longleaf, effect of turpentine, 241.
- longleaf, wood analysis, 7.
- needle necrosis, 50.
- seed oil, analysis, 410.
- seedlings, parasites on, 248.
- seeds, germination, Calif., 839.
- slash, growth in the South, 349.
- Southern yellow, handbook, 580.
- (See also Pinus and White pine.)

Pineapple, Smooth Cayenne, culture, Guam, 37.

Pines—

- for windbreaks on sandy soil, Mich., 348.
- in California, matsucoccus on, 649.

Pink bollworm. (See Cotton bollworm, pink.)

Pinus—
caribea, growth in the South, 349.
pinca, seeds of, analysis, 410.

Pipe—
 wood-stave, discharge of, 681.
 wood-stave, studies, 481.

Pipes—
 flow of water through, 480.
 hot water, estimating coil sizes, 590.

Pipistrellus subflavus in Wisconsin, 748.

Piricularia oryzae, notes, 145, 741.

Piroplasma caballi—
 studies, 178.
 transmission by ticks, 382.

Piroplasmosis—
 bovine. (See Texas fever.)
 equine, studies, 178, 382.

Pisciculture in France, 396.

Pissodes dubius, notes, 748.

Pituitrin, effect on carbohydrate metabolism, 557.

Pityokteines sparsus, notes, 748.

Pityophthorus spp., notes, 158.

Plague, Pahvent Valley, studies, 476.

Plant—
 breeder's envelope, description, 229.
 breeding in Porto Rico, 30.
 breeding, methods, 631.
 breeding. (See also Heredity and Hybridization.)
 breeding experiments. (See Corn, Cotton, Peaches, Tomatoes, Wheat, etc.)
 buds, development and arrangement, 130.
 cells, fibrous protoplasmic structures in, 228.
 cells, vitamin content, relation to respiration, 759.
 chromosomes. (See Chromosomes.)
 disease—
 legislation in Tropics, 599.
 survey, S.C., 447; Wis., 350.
 survey in India, 146.

diseases—
 and pests in St. Lucia, control, 741.
 biochemistry of resistance to, Minn., 841.
 control, application of genetics, 144.
 dissemination by insects, 748.
 dissemination by seeds, 447.
 dissemination by wind, 215.
 in British Columbia, 739, 740.
 in Ceylon, 741.
 in Great Britain, 46.
 in India, 145, 146.
 in Mauritius, 843.
 in Ontario, 541.
 in Pennsylvania, 447.
 in Philippines, 242.
 in Queensland, 741.
 recent literature on, 541.
 (See also Fungi and different host plants.)
 distribution in District of Columbia, 223.

Plant—Continued.
 galls, Philippine, studies, 730.
 glucosids, physiological rôle, 226.
 growth—
 as affected by chlorids, 335.
 as affected by crude petroleum, 435.
 as affected by length of day, 818.
 as affected by chromium and manganese, 525.
 in heated soils, Wis., 350.
 in soda-containing soils, 436.
 in sterilized soil, 25.
 rôle of colloid reactions, 433.

inspection for insect pests, 152.
 (See also Nursery inspection.)
 juices, H-ion concentration, 727.
 juices, determination of acidity, 505.
 lice, N.J., 849.
 lice, transmission of mosaic by, 250.
 pathology in Japan, sketch, 242.
 physiology, 626.
 pigments, studies, 333.
 production, laboratory exercises, 298, 496.
 prophylaxis, measures, 45.
 quarantine act, Federal, 355.
 quarantine inspection in Porto Rico, 52.
 root diseases, relation to soil temperatures, Wis., 350.
 sections, technique of mounting, 229.
 societies, methods of study, 128.
 tissues, nutritive factors in, 759.

Plantago maritima, habitats of, 628.

Planting dates, relation to daily exposure to light, 818.

Plants—
 absorption and metabolism, 24.
 acidity of roots and tops, 424.
 alpine and plains, leaf anatomy, studies, 432.
 alternation of generations, 332.
 annuals, physiological characters, 128.
 as affected by illuminating gas, 730.
 as affected by ultraviolet rays, 730.
 assimilation in, 335.
 assimilation of carbon dioxide by, 226.
 betain in, 335.
 blooming dates in Iowa, 38.
 carbon nutrition of, 137.
 chemistry of, localization, 433.
 collecting, U.S.D.A., 724.
 colloidal studies, 727.
 culture solutions, studies, Calif., 819.
 declared public nuisances in Mississippi, 249.
 ecesis in swamps, 728.
 epidermal coverings, importance of, 628.
 effect of light on absorption of organic matter, 729.
 effect of nitrogen on geotropic and phototropic responsiveness, 730.
 effect of starch on geotropic and phototropic responsiveness, 728.

Plants—Continued.

- fasciation in, studies, 332.
- food producing, American, 432.
- forcing by electrical stimulus, 38.
- fumigation with hydrocyanic acid gas, 529.
- geotropic response, 728, 730.
- germination, phytochemical studies, 131.
- green, and fungi, parallels, 433.
- hardy perennial, autumn planting, Ohio, 397.
- high-moor, transpiration in, 629.
- hybridization, cause of apogamy in, 527.
- immunity to their own products, 227.
- imports, U.S.D.A., 336.
- indoor, culture and care, 533.
- littoral, of Madagascar, studies, 224.
- marine, cold resistance in, 727.
- medicinal. (*See* Drug plants.)
- movements in, irritable, 333.
- of British Guiana, botanical identifications, 348.
- of eastern Colorado, geographic description and distribution, 224.
- of South America, new species, 224.
- organic balance in, 433.
- organic carbon nutrition, 433.
- ornamental, manual, 43.
- ornamental, varieties for Minnesota, Minn., 736.
- osmotic values in, 49, 228, 629.
- ovule transformation into ovary, 820.
- perfume-yielding and aromatic, 43.
- permeability. (*See* Permeability.)
- photosynthesis. (*See* Photosynthesis.)
- phototropic response, 728, 730.
- physical characters and capacity for yield, S.Dak., 827.
- poisonous, methods of control, 176, 879.
- poisonous to live stock in Alberta, 776. (*See also specific plants.*)
- pollination. (*See* Pollination.)
- protection in Quebec, paper on, 748.
- relationship of annuals, biennials, and perennials, 818.
- respiration. (*See* Respiration.)
- selection in relation to meteorological conditions, 511.
- serratin in, 333.
- self-sterility in, 527, 534.
- stature, as affected by light, 333.
- succulence in, basis, 432.
- transpiration. (*See* Transpiration.)
- utilization of dextrose and levulose, 728.
- variation. (*See* Variation.)
- variegated, periodicity in, 332.
- water movement in, 334, 729.
- winter injury, 541.
- yield capacity, S.Dak., 827.
- Plasmodium bubalis*, description, 381.
- Plasmodium infection of *Anopheles crucians*, 652.
- Plasmopara viticola*, notes, 49.

- Plastometer, use with paint, 890.
- Plat competition, errors from, 27.
- Plathypena scabra*, studies, 649.
- Platyedema ellipticum* on *Polyporus gilvus*, 252.
- Platygyaster* sp., polyembryonic broods, studies, 656.
- Pleospora herbarum*, notes, 150.
- Pleurotus colæ*, notes, 145.
- Podia interpunctella*. (*See* Indiana meal moth.)
- Plow bottoms, studies, 84, 85.
- Plowing—
 - effect on crop yields, 132.
 - experiments, 283.
 - fall, *v.* subsoiling, Wis., 323.
 - mold-board *v.* disk, 786.
 - spring *v.* fall, Wis., 323.
 - tractor. (*See* Tractor plowing.)
- Plows—
 - effect of speed on draft, 95, 686.
 - for mechanical cultivation, 588.
 - motor, tests, 488, 587.
 - motor, use in France, 588.
 - motor, use in Italy, 893.
 - tractor, construction and operation, 588.
 - tractor, tests in France, 588.
- Plum—
 - black knot, control, 353.
 - crown gall, resistant varieties, Calif., 843.
 - curculio, control, N.J., 849.
 - diseases, spray schedule, Wash., 836.
 - leaf disease, 49.
 - leaf miner, life history and control, 650.
 - Monilia, 150.
 - sawfly in Japan, 159.
 - sawfly, studies, S.Dak., 850.
 - silver leaf, studies, 846.
- Plums—
 - Bartlett, as ornamental tree, Ohio, 837.
 - breeding experiments, Minn., 834.
 - disease resistant, chemical composition, Minn., 841.
 - hybrid, new, 639.
 - pollen development in Minnesota, 535.
 - pollination, Calif., 41, 832.
 - pollination tests, 534, 535.
 - pruning experiments, Calif., 139.
 - spray calendar, Ark., 736.
 - varieties for Minnesota, 637, 639; Minn., 834.
- Plutella maculipennis*. (*See* Diamond-back moth.)
- Pneumococcus—
 - as affected by antipneumococcal serum, 73.
 - meningitis in rabbits, experimental, 880.
 - retardative effect of blood of immune animals, 567.
- Poisonous plants. (*See* Forage poisoning, Plants, poisonous, and *specific plants.*)
- Polders of Holland, formation by silting, 420.

- Pollen—
barley, germination of, 820.
physiology of, 225.
- Pollination—
of rye and wheat, studies, 734.
rôle of climate in, Calif., 41.
(See also *specific plants*.)
- Pollinator, corn, construction and use, 726.
- Polyembryony and sex, studies, 656.
- Polyneuritis—
gallinarum, effect of feeding and starvation, 366.
gallinarum in pigeons fed deficient diet, 463.
nature of, 366.
relation to antineuritic value of diet, 365.
- Polyporus*—
lignosus, notes, 145, 542.
lignosus on cacao, 350.
schweinitzii, studies, U.S.D.A., 248.
sp., notes, 51.
- Pomace, feeding value, 769.
- Pontia*—
monuste, on cabbage, 52.
rapæ, notes, 156.
- Popcorn, growth in alkali soil, early, Utah, 28.
- Poplar—
leaf hopper, life history, 749.
leaf-mining beetles, 454.
- Poppies, fertilizer experiments, 223.
- Poppy-seed oil, digestibility, 552.
- Populus* spp., notes, Calif., 838.
- Portia hypobrunnea*—
notes, 646.
studies, 846.
- Pork—
home curing, 507; Iowa, 470; Kans., 113.
production and marketing, 268.
production, cost data, Mich., 397.
quality, effect of feeding peanuts, Okla., 267.
soft, changes during curing, Tex., 170.
- Porto Rico Insular Station, report, 92, 694.
- Portulaca oleracea*, use for greens, 138.
- Posidonia oceanica*, fertilizing value, 526.
- Potash—
American, sources, U.S.D.A., 329.
deposits, German, 523, 723.
deposits of Alsace, 23, 392, 430, 723.
deposits of South Africa, new, 430.
deposits of Spain, 815.
determination in fertilizer materials, 109.
determination, method, 709.
effect on lodging in cereals, 530.
extraction from silicate rocks, 624.
fertilizing value, 107, 221, 328, 430, 516, 625; N.J., 812; Wis., 327.
from blast furnaces, 522, 523.
from by-products, effect on soil and plants, 329.
from cement dust, 124, 221, 815.
from minerals, fertilizing value, 430, 625.
- Potash—Continued.
from wood ashes, 522.
industry in United States, 20, 220; U.S.D.A., 329.
industry, progress in 1917 and 1918, 329.
industry, waste products from, contamination of rivers, 719.
lime, fertilizing value, 221.
Nebraska, retail prices, U.S.D.A., 331.
production, 20.
production and prices in Germany, 815.
production and sale, 19.
rock, fertilizing value, 430.
salts of Punjab Salt Range, 430.
salts, production in 1919, 523.
soil, effect of lime on, 524; Mich., 330.
sources and use, 525.
sources in Western Australia, 723.
- Potassium—
ammonium nitrate, fertilizing value, 624.
determination in blood, 506.
iodid, fertilizing value, 222.
iodid for malnutrition in pigs, 679.
muriate, retail prices, U.S.D.A., 331.
nitrate in Cape Colony, analyses, 430.
nitrate in Guatemala, 219.
nitrate, manufacture, new method, 521.
phthalate, acid, use in volumetric analyses, 611.
salts, borax in, U.S.D.A., 816.
salts, effect on calcium, Calif., 811.
sulphate, fertilizing value, 720, 721.
sulphate, retail prices, U.S.D.A., 331.
- Potato—
bacterial wilt, 844.
blight, notes, 742.
bread, 255.
digger tests, 186.
diseases, control, 743; Hawaii, 543; Minn., 845.
diseases in Canada, 246.
diseases in Ontario, 352.
diseases, notes, 149, 541.
eelworm disease, 149.
farms in New Jersey, studies, 290.
flea-beetle, N.J., 849.
flea-beetle, control, Mass., 356.

- wrapping heads for market, U.S.D.A., 376.

(See also Chickens, Ducks, Fowls, Geese, Hens, Turkeys, etc.)

Prairie hay, feeding value, Tex., 369.

Precipitation—

- in forests, 117.
- in Japan, effect of topography on, 418.
- loss by rainfall interception, U.S.D.A., 317.
- normal, in Utah, U.S.D.A., 319.
- relation to run-off and evaporation, 419.
- relation to wheat yield, 617.
- relation to wind direction, U.S.D.A., 320.

Precipitation—Continued.

seasonal distribution, U.S.D.A., 318.
(See also Rainfall, Snowfall, etc.)

Preservatives, quantities necessary to inhibit fermentation, 608.

Preserves—

insoluble solids in, determination, 415.
Turkish, manufacture in Asia Minor, 417.

Pretzels, energy content, 660.

Price fixing in England, 592.

Prices and wages in India, statistics, 291.

Prickly broom, feeding value, 769.

Primost, use in candy making, Wis., 316.

Primula, breeding experiments, 432.

Prion vittatus, nomenclature, 355.

Prionini, life history, notes, 454.

Privies, sanitary, practical types, 788.

Privy system, can, disposal station, 481.

Proctotrypid inquiline with *Formica exsectoides*, 752.

Proctotrypidæ, parasites of flies, 361.

Production value of protein mixtures, discussion, 265.

Productiveness, use of term, 529.

Productivity, use of term, 529.

Prolin, determination, 201.

Promachus spp. attacking white grubs, 550.
Proprietary foods, analyses, 162.

Prosenia (Mochlosoma) lacertosa, parasite of white grubs, 549.

Proso, new varieties for South Dakota, S.Dak., 827.

Proso oil, composition, 801.

Prosol, use of term, 801.

Protein—

action of acids on, 614.

analysis in feeding stuffs, study, 210.

decomposition products, feeding value, 469.

deficiency cause of edema, 557, 865.

diets in treatment of diabetes, 558.

feeding, effect on offspring, Minn., 871.
fever, studies, 676.

hydrolysates, action of furfural and dextrose on, 210.

hydrolysis, 201.

intake, relation to creatin excretion, 367.

mixtures, metabolism experiments, 265.
requirements in man, 459.

Proteins—

digestion and absorption, 258.

digestion, effect of acids on, 165.

in vegetable juices, isoelectric points of, 202.

of blood at different ages, 866.

of cereals, nutritive value, 755.

of navy bean, nutritive value, 756.

(See also specific proteins.)

Protozoa and bacteria, pathogenic, textbook, 878.

Protozoa in soil, studies, 217.

Prune diseases, spray schedule, Wash., 836.

Prunes—

analyses, Calif., 862.

drying process, Calif., 804.

Prunes—Continued.

French, new variety, origin, 140.

pollination, Calif., 41, 832.

pruning experiments, Calif., 139.

stocks for, 737; Calif., 833.

hardy crosses, 637.

Psacaphora metalifera, notes, 157.

Psammocharide species, descriptions, 550.

Psenocerus supernotatus, notes, 748.

Pseudococcus—

bakeri, control, summary of information, 649.

citri. (See Citrus mealy bug.)

nipa on avocado, 546.

sentrifolii affecting peanuts, 358.

sp. on peanuts, 52.

Pseudomonas—

avenæ, remedies, 644.

caudatus, description, N.Y.State, 325.

cerasus, studies, Calif., 843.

citri. (See Citrus canker.)

fluorescens, description, N.Y.State, 325.

radicicola. (See *Bacillus radicicola*.)

tumefaciens, notes, 645.

Pseudopeziza spp., notes, N.Y.State, 350.

Psilogaster fasciventris n.sp., description, 159.

Psychoda alternata, notes, N.J., 849.

Psylla—

mali, anatomy of head and mouth, 452.

pyri. (See Pear psylla.)

Pteromalus puparum, studies, 156.

Pteronus ribesii. (See Currant worm, imported.)

Pterothrips, new genus, erection, 154.

Ptilodexia spp., parasites of white grubs, 549.

Ptinidæ, new North American, notes, 158.

Ptychopteridæ, studies, N.Y.Cornell, 157.

Public health, book on, 863.

Puccinia—

abrepta n.sp., description, 448, 644.

coronata on oats, Iowa, 448.

cyperi-tagetiformis, n.comb., description, 448, 643.

glumarum, notes, 46.

graminis, notes, 742.

graminis on wheat, Iowa, 448.

graminis, studies, 242.

graminis tritici, studies, 244.

graminis tritici-compacti, studies, 244.

liberta n.sp., description, 448, 644.

petasiti-pulchellæ n.sp., studies, 46.

ribis, studies, Conn.State, 247.

spp., descriptions, 643.

spp., notes, Iowa, 448.

Pullets, cock feathering and ovarian tumor in, 671.

(See also Hens.)

Pulleys, keyed, methods of removing from shaft, 783.

Pulp wood consumption, statistics, U.S.D.A., 144.

(See also Wood pulp and Paper-making materials.)

Pulse beetles, enemies and control, 158.

Pulvinaria pyriformis on avocado, 546.

- Pumping machinery, treatise, 480.
 Pumpkin mildews, control, Guam, 38.
 Pumps, electric, tests and operating records, 182.
 Purdue—
 Station, notes, 600.
 University, notes, 497, 600.
 Purgatives, use after anthelmintics, comparisons, 675.
 Putnam's scale, notes, 748.
Pyrausta—
 ainslicii n.sp., notes, 361.
 ainslicii on corn, notes, Ohio, 852.
 nubilalis, notes, 159, 250, 361.
 penitalis, notes, 250, 361, 546.
 Pyrethron, insecticidal principle, 647.
Pyrigota spp., parasites of white grubs, 550.
 Pyrhelometers, comparisons, U.S.D.A., 620.
 Pyrox, value against potato pests, Mass., 356.
Pythiacystis citrophthora, studies, Calif., 842.
Pythium—
 artotrogus on pine seedlings, 248.
 debaryanum, notes, 46.
 debaryanum on pine seedlings, 248.
 debaryanum on potato, 449.
 debaryanum on sugar cane, Hawaii, 353.
 palmivorum, notes, 741.
 Pythium—
 and Rhizoctonia in coniferous seed beds, relative importance, 248.
 on sugar cane, 643.
 Quarantine, Federal, in tick-infested area, 179.
 Quince diseases, 541.
 Quinin—
 effect on catalase production, 259.
 residue, effect on denitrifying bacteria, 19.
 Rabbits—
 as meat producers, 770.
 breeding and care, 268.
 effect of excessive sexual activity, 467.
 inheritance of color, 762.
 inheritance of weight, 763.
 Rabies, heredity of, 178, 778.
 Radiator fan, design, 686.
 Radishes—
 growth in alkali soil, early, Utah, 28.
 rotation experiments, 230.
 variety tests, Minn., 835.
 Radium emanation, effect on vitamins of yeast, 167.
 Ragi, culture in Federated Malay States, 35.
 Railroad ties—
 average life, 281.
 volume table, 240.
 Rainfall—
 distribution over Germany, 118.
 effect of cultivation on, U.S.D.A., 617, 620.
 observations in Great Britain, notes, 499.
 of British Isles, 715.
 of cotton belt, 14.
 Rainfall—Continued.
 of Dominica, 510.

- range, breeding experiments, 869.
- range, management, 868.
- scab, dips, and dipping, 174.
- shearing, machine *v.* hand, 869.
- stomach worms, control, U.S.D.A., 381.
- winter management, 899.

Sherbets, preparation in the home, 255.

Shorea robusta. (*See* Sal.)

Shorts—

- analyses, 769; Mass., 866; Tex., 769.
- as supplement to alfalfa pasture, U.S.D.A., 374.
- with screenings, analyses, Mich., 63.

Shot-hole fungus, injury by, 846.

Shrubs—

- demonstration plantings, notes, N.Dak., 738.
- germination tests, 541.

- Shrubs—Continued.
 ornamental, for Minnesota, Minn., 736, 834.
 ornamental, new, and rare, 641.
- Silage—
 alfalfa, analyses, 560.
 corn, analyses, 560.
 corn, feeding experiments, Nebr., 169.
 corn, for lambs, Calif., 868.
 corn, for winter feeding of steers, 561.
 corn, rôle of pentose-fermenting bacteria in, 502, 709.
 crimson clover, analyses, 560.
 crops, culture, Wash., 828.
 from clover and rye grass, analyses, 560.
 from mustard, vetch, and oat straw, analyses, 560.
 from oats and vetch, analyses, 560.
 from vetch, oats, rye, and wheat, analyses, 560.
 inoculation, Mich, 397.
 juice, disposal, methods, 591.
 making and use in British Isles, 560.
 meadow hay, analyses, 560.
 sorghum, for lambs, Calif., 868.
 sorghum, for winter feeding of steers, 561.
 sorghum, *v.* corn for steers, Kans., 371.
 sunflower, acid content, 469.
 weights of, Kans., 187.
- Silkworms—
 injury by brown-tail moth caterpillars, 852.
 (See also Sericulture.)
- Silky oaks, timbers, studies, 348.
- Silos—
 capacity, Kans., 187.
 construction, 187, 285, 286, 390.
 construction for Cuba, 390.
 wood preservatives for, Calif., 894.
- Silt—
 content of Deli River, 421.
 content of river waters of Java, analyses, 421.
- Silver leaf disease, 150, 645, 845.
- Singing, increase in metabolism during, 167.
- Sires, pure-bred, for live-stock improvement, U.S.D.A., 867.
- Sires, pure, relation to elimination of mongrel blood, 767, 821.
- Sirup—
 making from sugar beets, 507.
 making in the home, 255.
 maple, manufacture in Michigan, Mich., 397.
 sorghum, manufacture, Minn., 713.
- Sisal, production in French Africa, 230.
- Sitones hispidulus* on red clover, notes, 743.
- Sitotroga cerealella*. (See Angoumois grain-moth.)
- Skim milk, for pigs, Calif., 871; Ohio, 871.
- Skins and hides, Indian, statistics, 170.
- Skunk, spotted. Florida, notes, 748.
- Slag. (See Phosphatic slag.)
- Sludge, activated, experiments, 188.
 (See also Sewage.)
- Slugs—
 carnivorous, of South Africa, 451.
 garden, 52.
- S.M.A. (synthetic milk adapted), for infant feeding, 660.
- Small holdings. (See Land settlement.)
- Smokehouse, tile, specifications, Iowa, 470.
- Smuts. (See Barley smut, Corn smut, etc.)
- Snails, trematodes of, in South Africa, 678.
- Snapdragon rust, notes, 541.
- Sneezeweed, western, poisonous to stock, control, 879.
- Snow surveys in Nevada, 715.
- Snowfall—
 and rate of melting in the Sierras, 715.
 effect on winter wheat yield, U.S.D.A., 321.
 of United States, 117.
- Snuff, analyses, N.Dak., 315.
- Soap solution, use as egg preservative, 212.
- Soapweed stem, feeding value, Tex., 369.
- Soda—
 effect on plant growth, 436.
 origin in soils, 118.
- Sodammonium nitrate, fertilizing value, 624.
- Sodium—
 acetate, effect on catalase production, 708.
 arsenate, reduction of in dipping fluid, 77.
 arsenite as dipping fluid, 76.
 arsenite as hawkweed eradicator, 439.
 arsenite for poisoning green timber, 184.
 arsenite, oxidation of in dipping fluid, 76.
 aspartate, effect on amylase, 203.
 assimilation, decrease by potash waste liquors, 330.
 benzoate, inhibitive effect on fermentation, 609.
 bisulphate, use in conservation of liquid manure, 721.
 carbonate, determination, 504.
 carbonate, toxicity in soils, Utah, 719.
 chlorid—
 effect on catalase production, 258, 259.
 effect on conservation of liquid manure, 721.
 for pickling of butter, Calif., 876.
 for treatment of war wounds, 272.
 tolerance as affected by lime, 626.
 toxicity in soils, Utah, 719.
 (See also Salt.)
 determination in blood, 506.
 hydrogen sulphite, inhibitive effect on fermentation, 609.
 hypochlorite. (See Hypochlorite.)
 hyposulphite for water purification, 683.
 morrhuate, use in tuberculosis treatment, 777, 883.

Sodium—Continued.

nitrate—

- and calcium nitrate, comparison, 722.
- and manure, comparison, 124.
- as hawkweed eradicator, 439.
- effect on nitrogen content of soils, 425.
- effect on soil acidity, 623.
- effect on soils, Calif., 814.
- fertilizing value, 138, 521, 623, 721; Calif., 812; Guam, 37.
- industry, Chilean, 124, 520.
- retail prices, U.S.D.A., 219, 331.
- substitutes for, 624.

nitrite, reversible oxidation of, 723.
salicylate, inhibitive effect on fermentation, 609.

salts—

- as affected by various sulphates, Calif., 813.
- effect on calcium, Calif., 811.

sulphate—

- as reagent in antitoxic sera concentration, 775.
- toxicity in soils, Utah, 719.
- use in conservation of liquid manure, 721.

sulphite, inhibitive effect on fermentation, 609.

sulphocarbonate as insecticide, tests, 250.

Softwood industry, technique, handbook, 349.

Soil—

acidity—

- aluminum factor, 816.
- as affected by ammonium sulphate, 623.
- as affected by green manures, Va., 324.
- as affected by sodium nitrate, 623.
- as result of chemical phenomena, 216.
- determination, Va., 324.
- effect on acidity of plant juices, 424.
- effect on growth of legume bacteria, Wis., 324.
- effect on seeds, Wis., 324.
- nature of, Wis., 324.
- notes, 217.

(See also Lime, Limestone, and Liming.)

acids, activity of, studies, 423.

analysis, apparatus, 119.

analysis, effect of boiling and shaking, 423.

analysis, effect of drying, 422.

bacteria—

- as affected by low temperature, N.Y. Cornell, 435.
- distribution and activities, 424.
- effect on nutrition of plants, 25.
- effect on soil minerals, Calif., 812.
- oxidation of vanillin by, 425.

bacterial analysis in Ontario, 514.

Soil—Continued.

constituents, rate of absorption, 23.

cultivation, comparison of methods, 514.

cultivation, subsoiling *v.* ordinary, 514.

erosion—

and conservation in South Africa, 513.

and prevention in India, 513.

by river, prevention, 780.

in Iowa, 95.

in South Africa, observations, 122.

prevention by terracing, 278, 888.

 variety tests, Minn., 735; N.Dak., 732; N.Mex., 36; Tex., 828.
 statistics, U.S.D.A., 731.
 (See also Kafir, Milo, etc.)
- Sorosporella uvella*, studies, 651.
 South Carolina Station, report, 496.
 South Dakota Station, report, 899.
- Sows, brood—
 feeding experiments, U.S.D.A., 374.
 winter and spring care, Mich., 694.
 winter rations, Wis., 373.
 winter rations, supplements, Ohio, 871.
- Soy bean—
 bacteria, sensitivity to acid, Wis., 324.
 blight, bacterial, 352.
 blight, *Fusarium*, studies, Nebr., 743.
 cake, analyses, 770.
 cake as substitute for peptone, 334.
 germination, effect on growth of nodule bacteria, 25.
 leaves, ether extracts of, studies, 411.
 meal as wheat substitute, 659.
 meal, digestibility, N.Dak., 161.
 nutritive value in human diet, N.Dak., 160.
 oil, drying tendencies, tests, 591.
 tops, determination of acidity, 505.
 urease, use in urea determination, 204.
- Soy beans—
 acid content, relation to soil acidity, 424.
 as corn supplement for chicks, 670.
 as green manure, Guam, 31.
 as hay crop, Mich., 631.
Bacterium solanacearum on, 352.
 cost of production, Mo., 188.
 cross pollination, Wis., 338.
 culture experiments, Tex., 828.
 disease-resistant varieties, Nebr., 744.
 effect of crude petroleum on, 435.
 effect of inoculation and lime, 531.
 effect of lime on nitrogen content, N.J., 827.
 feeding value, 369.
 fertilizer experiments, Mass., 326.
 green clover worm on, control, 649.
 infection, relation to soil factors, Nebr., 744.
 lipolytic activity, 707.
 selection for oil, Wis., 338.
 variety tests, Mich., 631; Minn., 731.
- Sparnopolius fulvus*, parasite on white grubs, 549.
- Sparrows—
 English, in Michigan, Mich., 694.
 paper on, 748.
- Spectroscopic titration for colored solutions, 612.
- Spermatogenesis—
 in albino rats, 376.
 process of, studies, 559.
- Spermatophytes in South America, new, 224.

 necessity in Missouri orchards, 482.
 v. fall plowing, Wis., 323.
 with dynamite, 183.
- Succulence in plants, basis, 433.
- Sucrase, presence in potato juice, 502.
- Sucrose determination, 613.
- Sudan grass—
 analyses, 866.
 as hay and pasture crop in Kansas, 234.
 as hay crop, Mich., 631; Wis., 338.
 culture experiments, Calif., 823; Tex., 828.
 culture in Guam, Guam, 31.

Sudan grass—Continued.

culture in New South Wales, 439.
cyanogenesis in, 610.
description, U.S.D.A., 340.
growth in alkali soils, early, Utah, 28.
v. Paspalum dilatatum as pasture for cows, 866.

Sugar—

conserving our natural resources, 252.
crude, factors affecting hardness, 713.
crystallization, 211.
determination in blood, 712.
effect of mold spores in, 803.
effect on nitrogen content of soils, 425.
formation in drying potatoes, 211.
from whey, use in candy making, Wis., 316.

in sugar beet leaves, 334.

in Tropics, 599.

industry in British Virgin Islands, 230.

industry, use of labor-saving devices in, 284.

invert, determination, 416.

lump, energy content, 660.

maple. (*See* Maple.)

manufacturing machinery, 284.

minimum need, 165.

oxidation, notes, 503.

plantations, use of motor trucks and tractors, 892.

production in plants, 527, 627.

production, relation to rainfall and froghopper blight, 510.

refining, foaming in, 211.

retail prices in North Dakota, N.Dak., 363.

sirups, preparation in the home, 255.

solutions, effect of concentration on microorganisms, 114, 627.

solutions, effect of number of mold spores on invertase activity, 803.

solutions, raw, crystal formation, 211.
(*See also* Glucose, Sucrose, etc.)

Sugar beet—

by-products, feeding value, U.S.D.A., 370.

fodder, feeding value, 369.

industry in Europe, 532.

juices, foaming, 211.

leaves, sugars in, 334.

pulp, feeding value, 769.

seed production in Denmark in 1918, 135.

seeds, feeding value, 369.

tops, feeding value, 769.

(*See also* Beet.)

Sugar beets—

as affected by soil acids, Wis., 324.

cost before and after the war in France, 593.

culture in Wyoming, Wyo., 135.

feeding value, U.S.D.A., 374.

fertilizer experiments, 221, 327, 329.

growth in alkali soil, early, Utah, 28.

home-grown, sirup from, 507.

Sugar beets—Continued.

production in Prussia during the war, 234.

rotation experiments, U.S.D.A., 336.

Sugar cane—

aphis, yellow, notes, 52.

bacterial heart rot, 844.

beetle borer parasite, 754.

blight in Trinidad, 643.

borer, studies, 234.

branching, 235.

chlorosis, 150.

crushing, advantages of engine power, 184.

cultural methods, 514.

culture experiments, 132, 436.

culture in Porto Rico, 36.

culture in Uganda, 32.

disease, new, in Porto Rico, 644.

diseases in Hawaii, 149.

effect of subsoiling, 514.

eye spot disease, 149.

fertilizer experiments, 30, 132, 234, 436, 518, 519, 532, 735.

fertilizer experiments in India, 517.

froghopper blight, relation to root fungus, 356.

froghopper blight, treatment, 745.

fungi, control, 353.

grubs, 545.

Indian, varieties for different localities, 236.

Indian varieties, studies, 235.

industry of Brazil, 635.

insects affecting, 545, 748.

insects affecting in Queensland, 751.

juice, color changes of, 115.

Lahaina disease, studies, Hawaii, 352.

Lahaina, nematode injury, 150.

liming experiments, 524.

mosaic. (*See* Sugar cane mottling disease.)

mottling disease, 46, 644, 736, 744; U.S.D.A., 449.

mottling disease, resistant varieties, P.R., 150.

mottling disease, transmission, 643.

Pahala blight, 150.

production in Cuba, 31.

ratoon crops, value of subsoiling, 514.
relation of root fungus to froghopper blight, 745.

ring spot, notes, 150.

root disease in Trinidad, 745.

root diseases, 643, 645, 844.

seed from high altitudes, 736.

sereh disease, studies, 736.

sets, hand *v.* machine planting, 786.

tannin, nature of, 115.

varieties in Dutch East Indies, 235.

varieties resistant to froghopper blight, 745.

variety tests, 30, 132, 230, 234, 436, 533, 635, 735.

waste, fertilizing value, 518.

white grubs, control, 751.

- Sugar cane—Continued.
 yellow stripe. (*See* Sugar cane mottling disease.)
 yellow tip, 150.
- Sulphate—
 of ammonia. (*See* Ammonium sulphate.)
 of potash. (*See* Potassium sulphate.)
- Sulphates—
 absorption by soils, Calif., 811.
 determination, 207, 313, 413.
- Sulphite liquor, waste, utilization, 615.
- Sulphur—
 as soil disinfectant, 718.
 composting with phosphate rock, Va., 429.
 dust, effect on citrus rust mite, 551.
 effect on rock phosphate, 429.
 fertilizers, effect on root system, Oreg., 222.
 fertilizing action on grapes, 222.
 fertilizing value, 525, 536; Calif., 812; Oreg., 221.
 from waste sulphite liquor, 615.
 fumigation for mealy bug, 649.
 industries in Southern States, 525.
 mixtures. (*See* Lime-sulphur mixtures.)
 solutions, method of analysis, 110.
- Sulphuric acid—
 as preservative of liquid manure, 326, 721.
 effect on alkali soils, Calif., 813.
 effect on assimilation in plants, 335.
 effect on swine, 266.
- Sulphurous acid, utilization in superphosphates, 126.
- Sunflower—
 heads denuded of seed, feeding value, 369.
 oil, drying tendencies, tests, 591.
 seed cake, feeding value, 369.
 silage, acid content, 469.
- Sunflowers—
 as silage crop, Wash., 828.
 culture, Minn., 825.
 culture experiments, N.Dak., 732.
 fertilizer experiments, Minn., 826.
 growth studies, Calif., 823.
 rotation experiments, 230.
 rust-resisting, Mich., 635.
 varieties for silage, U.S.D.A., 337.
 variety tests, N.Dak., 732.

- Tinea cloacella* bred from fungi, 157.
- Tiphia*—
parallela, establishment in Mauritius, 551.
 spp., life history, 550.
 spp., parasites of white grubs, 549.
- Tiphia, key to species, 550.
- Tipulidæ, studies, N.Y.Cornell, 157.
- Tobacco—
 as snuff substitute, detection, N.Dak., 315.
 bacterial wilt, 844.
 culture and treatment in Great Britain, 439.
 culture experiments, Va., 436.
 culture in Porto Rico, 30.
 culture in Tropics, 599.
 culture in Uganda, 32.
 curing barns and packing houses, plans, 489.
 Deli, selection experiments, 237.
 disease resistant strains, Wis., 350.
 dust for intestinal roundworms in poultry, Calif., 886.
 effect of shade and fertilizers, Guam, 31.
 fertilizer experiments, 237; Va., 21, 436.
 fertilizer experiments in India, 517.
 Fusarium root-rot, studies, 247.
 industry in Great Britain, progress report, 439.
 industry, statistics, 237.
 insects affecting, 155; Guam, 53.
 leaf spot, 448.
 moth in Dutch East Indies, 53.
 production, 636.
 production in Cuba, 31.
 production in Porto Rico, 439.
 Réunion, culture in Mauritius, 533.
 seed beds, fertilizer experiments, 518.
 variety tests, Va., 436.
 worms, methods of control, 546.
- Toluene—
 sulphonamin, p-, action of, 174.
 use as soil disinfectant, 718.
- Tomato—
 diseases, 349, 541; U.S.D.A., 342.
 early blight, studies, 247.
 flea-beetle, N.J., 849.
 fruit, double, structure and relations, 130.
 Fusarium root-rot, 247.
 products, adulterations, 113.
 rot, control, 48.
 seed, commercial utilization, 212.
 seed growing, paper on, 534.
- Tomatoes—
 as affected by carbon dioxide, 816.
 as affected by soil disinfection, 717.
 boom for spraying, description, Va. Truck, 893.
 breeding experiment, 38.
 citric acid in, 315.
 culture in Guam, Guam, 37.

Tomatoes—Continued.

- digestibility in stomach, 862.
- insects affecting, control, U.S.D.A., 342.
- new strain, N.J., 835.
- preserving, in France, 113.
- spraying experiments in Maryland, 349.
- varieties susceptible to disease, 448.
- variety tests, Minn., 835.
- vitamin content, water-soluble, 759.
- winter disease of, 541.

Toon shoot and fruit borer, life history, 854.
Toumeyella parvicorne (?), production of melezitose by, 311.

Toroptera nigra n.sp., studies, 155.

Trachypogon polymorphus for paper making, 531.

Tractor—

- attachments, 488.
- belt tests in Ohio, 784.
- cultivation, summary of tests, 283.
- design, notes, 783.
- drawbar pull, formula, 283.
- engines, handbook, 282.
- engines, starter for, description, 282.
- engines, testing in Nebr., 197.
- gears, wrought steel for, 783.
- hauling tests, effect of rubber tires, 587.
- law in Nebraska, Nebr., 784.
- light, experience survey in Canada, 282.

plowing—

- cost data, 785.
- high speed, economies of, 785.
- in France, 588, 785.
- in India, tests, 785.
- in Tunis, tests, 390.
- tests, 389, 488, 587; Mich., 389.

plows. (*See* Plows, tractor.)

radiator fans, design, 686.

spark arresters, tests, Calif., 894.

weight, effect on drawbar pull, 283.

Tractors—

- agricultural, notes, 487.
- American, in English tests, 587.
- as an investment, 184.
- caterpillar, for logging, 785.
- chain drive, tests, 389.
- construction of parts and operation, 588.
- cost of operation, in Great Britain, 785.
- demonstrations, 84; Mich., 389.
- demonstrations, educational value, 95.
- directory and specifications, 892.
- farm, care and repair, Mich., 694.
- farm, handbook, 282.
- gasoline, treatise, 783.
- impulse starters for, 783.
- kerosene v. gasoline and steam, 184.
- spark arresters, tests, Calif., 894.
- status in England, 588.
- status in United States, 892.
- tests, 389, 487, 587, 588, 785; Nebr., 784.
- use in cultivating grapes and cereal crops, 785.

Tractors—Continued.

- use in Italy, 893.
- use of manganese steel in manufacture, 783.
- use on sugar plantations, 892.
- v. 8-mule outfit for road maintenance, 484.

Trametes pini—

- notes, 50.
- studies, U.S.D.A., 248.

Transpiration—

- from leaf-stomata, 129.
- in plants, negative pressure, 334.
- in plants, studies, 629.

Traumatic pericarditis in cows, 878.

Traumatropisms, studies, 229.

Tree—

- chlorosis, remedies, 647.
- diseases, notes, 354.
- leaf hay, composition, 63.
- seeds, germination tests, 541.

Trees—

- as affected by mistletoe in Mexico, 354.
- as windbreaks for California, Calif., 838.
- coniferous. (*See* Conifers.)
- deciduous, pruning, Calif., 832.
- demonstration plantings, notes, N.Dak., 738.
- exotic, adaptation in Westphalia, 642.
- forest, diseases, 541.
- forest, insects affecting, 252; Ohio, 54.
- for planting on Arbor Day, 141.
- growth in relation to climate, 417; U.S.D.A., 619.
- growth rate in New Zealand, 540.
- growth, vertical, 348.
- interception storage loss, U.S.D.A., 317.
- of British Guiana, botanical identifications, 348.
- of southern California, guidebook., 348.
- ornamental, for Minnesota, Minn., 834.
- ornamental, new and rare, 641.
- ornamental, tests, U.S.D.A., 343.
- planting along highways, Mich., 694.
- planting in the country, systematic, 539.
- shade, insects affecting, Ohio, 54.
- shade, tests, U.S.D.A., 343.
- shade, winter work in insect control, Ohio, 451.
- street, selection and care, U.S.D.A., 538.
- tan-yielding, cultural studies in India, 44.
- Trichloroacetaldehyde, effect on catalase production, 708.
- Trichosporium*—
 - sp. on Brie cheese, 877.
 - vesiculosum* on filao trees, 354.
- Trimethylamin content of butter, N.Y. Cornell, 565.
- Trinitrotoluene, use under water, 278.
- Triodontophorus*—
 - intermedius*, studies, 776.
 - tenuicollis*, notes, 678.
- Tristachya rehmanni* for paper making, 531.

- Truck—
 crops, booms for spraying, Va.Truck, 893.
 crops for small farmers in California, 593.
 farms in New Jersey, studies, 290.
- Trucks. (See Motor trucks.)
- Tsutsugamushi disease, carrier, 451.
- Tubercle bacilli—
 metabolism, 177.
 virulence in cheese, 179.
- Tuberculin—
 failure during and after gestation, 569.
 intradermal injection, 273; Calif., 882.
 preparation and distribution, 380.
 test in Mauritius, 273.
 test, retesting of reactors, 477.
 tests, lecture on, 675.
- Tuberculina maxima*, studies, 51.
- Tuberculosis—
 and beef industry, 877.
 and dairy industry, 877.
 bovine, diagnosis, 273.
 bovine, paper on, 877.
 bovine, treatment, 380.
 complement fixation tests for, 178; Calif., 882.
 control, 477, 877.
 control in Alabama, 776.
 eradication conference, 380.
 eradication from cattle and swine, 877.
 eradication, herd list, U.S.D.A., 380.
 in horses, review of literature, 569.
 in live stock, summary of information, U.S.D.A., 273.
 intradermal tuberculin tests, Calif., 882.
 lecture on, 675.
 resistance, rôle of lipoids in, 569.
 serological studies, 882.
 treatment with chaulmoogric acids, 777.
 treatment with sodium morrhuate, 777.
- Tuberculous cattle, State detention farm for, 878.
- Tubers—
 diseases, 242.
 vitamin content, 460.
- Tule land, improvement, 17.
- Tulip—
 bulbs, distribution, U.S.D.A., 346.
 bulbs, failure, 50.
 droppers, description, 43.
- Tulips, varieties, U.S.D.A., 346.
- Tumors, nature and cause, treatise, 878.
- Turkey—
 entero-hepatitis, remedies, Calif., 887.
 pox, transmissibility, Calif., 886.
- Turkeys—
 raising, 563.
 wrapping heads for market, U.S.D.A., 376.
- Turnips—
 carbohydrate content, 202.
 culture, Wyo., 135.
- Turnips—Continued.
 dried, feeding value, 369.
 fertilizer experiments, 223.
 growth in alkali soil, early, Utah, 28.
 seed production in Denmark in 1918, 135.
 vitamin content, water-soluble, 759.
- Turpentine orcharding, effect on timber, 241.
- Tussock moth, remedies, 639.
- Twigs, feeding value, 769.
- Tylenchus*—
angustus, notes, 145.
dipsaci [*devastatrix*] on red clover, 743.
semipenetrans, studies, Calif., 842.
tritici galls on wheat, 245.
tritici, remedies, 47.
tritici, studies, 448.
- Tylocladus fragariae*. (See Strawberry crown-borer.)
- Tyrosin in fungi, 628.
- Tyrosinase and deamination, studies, 628.
- Ulmus pumila*, notes, Calif., 838.
- Ultramarines, analysis, notes, 416.
- Ultraviolet rays—
 for sterilization of oils, 707.
 injurious effects on plants, 730.
- Uncinula necator*, notes, 49.
- United States Department of Agriculture—
 Bureau of Markets. (See Bureau of Markets.)
 Office of Farm Management. (See Office of Farm Management.)
 States Relations Service. (See States Relations Service.)
 Weather Bureau. (See Weather Bureau.)
- Uranium acetate, fertilizing value, 222.
- Urea—
 determination, 11.
 effect on catalase production, 258.
 fertilizing value, 624.
 nitrate, fertilizing value, 624.
- Urease, use in urea determination, 204.
- Uredinales attacking pines, notes, 248.
- Uredo*—
incomposita n. sp., description, 448, 644.
vitis, notes, 49.
- Urine—
 concentration, of white race in Australia, 554.
 determination of saccharin in, 316.
 H-ion concentration, changes in, 554.
 loss of nitrogen in, 427.
 pigmentation, effect of carotinoids, 257.
 zinc content, 758.
 zinc determination, 710.
 (See also Manure, liquid.)
- Urocystis cepulae*—
 notes, 46.
 studies, 47.
- Uromyces eleocharidis*, description, 643.
- Ustilago zeæ*, description, Ohio, 448.

- Ustulina*—
vulgaris, parasitism of, 51.
zonata, notes, 646.
 Vaccination with heated cowpox virus, 176.
 Vaccine—
 therapy, methods, comparative value, 270.
 tuberculosis, therapy, 380.
 Vaccines—
 fat-splitting enzym in, value of, 270.
 manufacture in India, 675.
 preparation and preservation, 73.
Vacuna californica n.sp., studies, 155.
 Vaginal closure membrane in guinea pigs, 668.
Valonia macrophysa, acidity of cell sap, 25.
 Valves—
 flow of water through, 480.
 hydraulic experiments with, 79.
 Vanilla—
 beans, curing, studies, 538.
 tincture, National Formulary, method of preparation, 11.
 Vanillin, oxidation to vanillic acid, 425.
 Variation—
 in *Ancmone* and *Clematis*, 726.
 in *Ranunculacæ*, 725, 726.
 (See also Mutation and Heredity.)
 Variety names, standardization, 529.
 Vegetable—
 by-products, experiments with, 137.
 driers, construction, U.S.D.A., 114.
 extracts, analyses, 162.
 fats. (See Fats, vegetable.)
 gardening, home, directions, U.S.D.A., 341.
 gardening, treatise, 637.
 (See also Gardening.)
 juices, bactericidal power, 7.
 juices, proteins, isoelectric points of, 202.
 oils. (See Oils.)
 proteins. (See Proteins.)
 saps, electrical conductivity, studies, 228.
 Vegetables—
 availability of carbohydrates in, 457.
 boiled for diabetics, 558.
 breeding experiments, 137.
 canned, antiscorbutic and growth-promoting value, 163.
 canned microorganisms in, 164.
 culture experiments, Guam, 37.
 culture in home and army gardens, 38.
 drying, 202, 211, 616.
 drying for home use, U.S.D.A., 114.
 forcing in hotbeds, 533.
 fresh and dehydrated, carbohydrates of, 202.
 garden, insect pests and diseases, U.S.D.A., 341.
 gastric response to, 861.
 increasing production for wartime needs, N.J., 835.
 insects affecting. (See Garden insects.)
 marketing in California, methods, Calif., 637.
 Vegetables—Continued.
 of Ontario, diseases of, 147.
 storing in the home, 616.
 varieties for Minnesota, Minn., 736.
 variety tests, Minn., 835.
 (See also specific kinds.)
 Vegetation—
 of Cyrenaica, notes, 540.
 recovery in area of Mt. Katmai, 528.
 (See also Flora.)
 Velvet bean—
 feed, analyses, Ind., 769; Mass., 866; N.H., 769; Tex., 769.
 whole pressed, analyses, Tex., 769.
 Velvet beans—
 as green manure, Guam, 31.
 Chinese, globulin of, 201.
 composition, Ala.Col., 801.
 rotation experiments, 230.
 statistics, U.S.D.A., 731.
Venturia pomi, notes, 645.
 Vermiform appendix, remnant of retrograding cecum, 179.
 Vermont University, notes, 94, 499.
Verticillium alboatrum, temperature relations, 845.
 Verticillium strains, thermal behavior, 845.
 Vespidae species, descriptions, 550.
 Vesta phosphate v. superphosphate, 22.
 Vetch—
 as green manure, Calif., 830; Va., 427.
 culture in British Columbia, 733.
 hairy, early growth in alkali soil, Utah, 28.
 poisonous to stock, control, 879.
 variety tests, Ala.Col., 822.
 Veterinary—
 education in India, 90.
 education, raising standards in, 598.
 high school in Dorpat, destiny of, 494.
 manual, Bengal, 174.
 medicine, lectures on, 674.
 science instruction in Argentina, 294.
 surgery and obstetrics, 879.
 Vinegar—
 dried grains, analyses, 263, 560; Mass., 866.
 manufacture from Minnesota apples, Minn., 316.
 Vines, ornamental, for Minnesota, Minn., 834.
 Vineyards. (See Grapes.)
 Virginia—
 College and Station, notes, 696.
 Station, report, 496.
 Truck Station, notes, 798.
 Virus—
 adsorption by normal euglobulin, 475.
 cowpox, heated, vaccination with, 177.
 Vitamin—
 antiberiberi, rôle in carbohydrate metabolism, 557.
 antineuritic and water-soluble, differentiation, 460.
 antineuritic, in infant feeding, rôle of, 256.
 antineuritic, nature and function, 865.

Vitamin—Continued.

- antineuritic, relation to phosphoric acid in maize products, 256.
- antiscorbutic: (*See* Antiscorbutic.)
- content of milk after electrical treatment, 875.
- deficiency disease in pigeons, pathogenesis, 166.
- fat-soluble, associated with yellow pigment in corn, 461.
- fat-soluble, clinical rôle, 461.
- fat-soluble, deficiency, cause of calculi, 462.
- fat-soluble, in green plants, 556.
- fat-soluble in roots, 460.
- fat-soluble, relation to carotinoids, 257.
- fat-soluble, relation to yellow plant pigment, 257, 556.
- fat-soluble, thermostability, 556.
- index, formula, 366.
- requirements of yeast, 58.
- water-soluble, distribution, 759.
- water-soluble, extraction from brewers' yeast, 314.
- water-soluble in green plants, 556.

Vitamin-free diet, preparation, 365.

Vitamins—

- absolute requirements and body reserve, 366.
- addition to lipid-free diet, 257.
- as affected by ultraviolet rays, 59.
- as complementary factors to diastatic action, 460.
- definition, 758.
- effects of deprivation of, 166.
- effect on metabolism in paramecium, 662.
- effect on metabolism in *Sclerotinia cinerea*, 433, 758.
- essential for life, 257.
- in human nutrition, Ohio, 460.
- in various foods, 463.
- in wartime diet, 552.
- in yeast, action of radium emanation on, 167.

Vocational education—

- home economics in Tennessee, 396.
- home economics, need for training, 292.
- in California, 192, 692.
- in Illinois, 294.
- in Iowa, 295.
- in Kansas, 494.
- in Kentucky, 193.
- in Louisiana, 596.
- in Maryland, 596.
- in Massachusetts, 394.
- in Michigan, 295.
- in Minnesota, 193.
- in Mississippi, 495, 794.
- in Missouri, 295.
- in Montana, 193.
- in Nebraska, 194.
- in New Jersey, 296.
- in New York, 296.
- in Ohio, 794.
- in Oklahoma, 296.
- in Oregon, 297.

Vocational education—Continued.

- in Pennsylvania, 297.
 - in South Dakota, 297.
 - in Utah, 194.
 - in Virginia, 194.
 - in West Virginia, 395.
 - relation to agricultural extension, 595.
 - report of Federal Board, 791.
 - (*See also* Agricultural education.)
- Vocational rehabilitation, report of Federal Board, 793.
- Volcanic ash, damage to vegetation, 528.
- Wafers, energy content, 660.
- Wages and prices in India, statistics, 291.
- Walnut—
- aphis, control, Calif., 852.
 - blight, control, Calif., 843.
 - blight-resistant varieties, Calif., 843.
 - codling moth, notes, 547.
 - die-back, probable causes, Calif., 843.
 - disease, 51.
 - oil, analysis, 410.
 - residue, feeding value, 369, 769.
 - winter injury or die-back, Calif., 354.
 - worm in California, 547.

Walnuts—

- black, propagation and culture in Ohio, Ohio, 446.
- English, grafting, 737.
- English, winterkilling, Minn., 834.
- Persian, industry in Oregon, 43.
- pruning experiments, Calif., 139.
- variability in yields, casual, Calif., 819.

Warehouse system in North Carolina, notes, N.C., 89.

Warehouses—

- cotton, construction and fire protection, U.S.D.A., 390.
- cotton, regulations, U.S.D.A., 34.
- farm products, operation, N.C., 392.

Washington—

- College and Station, notes, 198.
- Substation, Western, monthly bulletin, 397, 599, 694, 899.

Wasps—

- black digger, parasites of white grubs, 549.
- new, descriptions, 752.
- new species, descriptions, and life histories, 550.
- Philippine, descriptions, 550.

Water—

- alkali, use for irrigation, Utah, 276.
- Bacillus coli* and *B. aerogenes* in, relative prevalence, 275.
- Buffalo, gestation of, 669.
- buffalo, milk of, analyses, 363, 771.
- buffalo, milk of, food value, 363.
- canals, factors affecting efficiency, 384.
- conductivity, preparation of, 8.
- conservation, effect of cultivation, 514.
- (*See also* Soil moisture.)
- determination in agricultural products, S.C., 413.
- determination in cereals, 415.

Water—Continued.

- diffusion through colloidal membranes, 130.
- duty of. (*See Irrigation.*)
- filter, homemade, description, 575.
- filtration in soils, 119.
- flow, calculation in open channels, 180, 681.
- flow in pipes, 480.
- flow in wood channels, 681.
- flow measurements, 572.
- glass, increasing volume of, 507.
- ground, control in Iowa, 82.
- ground level of, control on meadows, 29.
- ground, movement, 422.
- hemlock, identification, 776.
- hemlock, poisonous to stock, control, 879.
- hct, for soil disinfection, 243, 450.
- irrigation. (*See Irrigation water.*)
- measurement, apparatus, 81.
- measurement, verification of Bazin formula, 573.
- movement in plants, 334, 729.
- occurrence and utilization, 571.
- potable, bacteriological *v.* chemical analysis, 384.
- potability in creosoted wood-stave pipe, 481.
- power, developments in California, 479, 681.
- power on the farm, 81.
- power, undeveloped, in Southwest, 479.
- purification methods in Canada, 575.
- rat, Florida, notes, 748.
- requirements of Equisetum, 628.
- resistance in fabrics, 417.
- resources of California, report, 478.
- rights in California, 572.
- rights law, treatise, 887.
- river, of India, seasonal variations in alkalinity, 574.
- river, of Java, composition, 421.
- river, pollution by waste from potash industry, 719.
- spring, classification, 574.
- still, Bourdillon, modification, 8.
- supply, chlorination of, 575, 682.
- supply from snow fields, determination, 715.
- supply, iron-depositing bacteria in, 575.
- supply, legislation in South Africa, 459.
- supply of Colorado River Basin, 887.
- supply of Columbia River and Pacific Slope Basins, 887.
- supply of Gila and San Carlos Valleys, 383.
- supply of Hudson Bay and upper Mississippi Basins, 574.
- supply of Missouri River Basin, 383.
- supply of New Mexico, 183.
- supply of New South Wales, 780.
- supply of Peru, 384.
- supply of Philippines, 779.
- supply of St. Lawrence Basin, 574.
- supply of United States, 81.

Water—Continued.

- supply of western Gulf of Mexico Basins, 383.
 - supply on the farm, 481, 575.
 - supply, relation to National Forests, 681.
 - supply, rural, clarification and purification, 187.
 - surface temperatures, device for obtaining, U.S.D.A., 620.
 - systems, country, studies, 95.
 - systems for farm homes, 282.
 - treatise, 274.
 - waste, from potato-starch factories, purification, 275.
- Water-soluble B. (*See Vitamins.*)
- Water-soluble C. (*See Antiscorbutic value.*)
- Weather—
- as affecting crops in New Jersey, 116.
 - as affecting wheat yield in Manitoba, 617.
 - as affecting winter wheat, U.S.D.A., 616, 620.
 - Bureau, work in West Indies, 620.
 - forecasting, use for agriculture, 212.
 - report, daily, British, new form, U.S. D.A., 620.
 - (*See also Meteorological observations and Meteorology.*)
- Webbing in stored grain, paper on, 153.
- Weed—
- laws, in different countries, 137.
 - seeds, use as wartime feeding stuff, 369.
- Weeds—
- control in Germany, 440.
 - control in Sweden, 137.
 - eradication, Va., 439.
 - eradication experiments, in Ontario, 230.
 - eradication in pastures, Va., 437.
 - of Kansas, 238.
 - of Morocco, 230.
 - of Ontario, 229.
 - poisonous to live stock in Alberta, 776.
 - (*See also specific plants.*)
- Weevil borer, black, paper on, 451.
- Weevils, pulse, enemies and control, 158.
- Weir, formulas, 274, 573, 681.
- Well-digging in New Mexico, 572.
- Whale—
- meat, composition and digestibility, Calif., 861.
 - oil, hardened, arsenic and nickel content, 610.
- Wheat—
- adaptation to meteorological environment, 511.
 - affected with black stem rust, time of cutting, 448.
 - anthracnose, studies, 351.
 - as affected by ammonium sulphate, limits of toxicity, 219.
 - as affected by iron compounds, 218.
 - bran, analyses, 263, 560; Ind., 769; Mass., 866; Mich., 63; N.H., 769; Tex., 769.

Wheat—Continued.

- bran, digestibility, 457.
 bran, food value, 459.
 breeding experiments, 636; Minn., 824.
 bulb fly, biology of, 152.
 bunt, dry method of treating seed for, 245.
 by-products, federal price control, 492.
 clipping tests, Ohio, 830.
 continuous culture experiments, 98.
 continuous culture *v.* fallowing, Calif., 822.
 cost before and after the war, in France, 593.
 cost of production in Minnesota, 36.
 cost of production, Mo., 188.
 culture, effect of meteorological phenomena, 511.
 culture experiments, 132; Minn., 824; N.Dak., 732; Ohio, 830.
 culture in British Columbia, 733.
 culture in Burma, 436.
 culture in East Africa, 533.
 culture in India, 480.
 culture in Uganda, 32.
 culture in Wisconsin, Wis., 533.
 drilling tests, Ohio, 632.
 durum, new varieties for South Dakota, S.Dak., 827.
 effect on England's neutrality during Civil War, 894.
 fertilizer experiments, 23, 132, 218, 330, 719, 723; Ala.Col., 822; Calif., 822; Minn., 731, 824; N.Y.State, 326; Ohio, 636; Va., 21.
 fertilizer experiments in India, 517.
 field damaged, for poultry, Md., 170.
 flour. (*See* Flour.)
 foot-rot disease, description, 244.
 foot-rot disease in Northwest, 351.
 germ meal, analyses, 769.
 germination as affected by resting period, Wis., 338.
 glumerot, basal, 844.
 growth in alkali soil, early, Utah, 28.
 handling and grading in America, 491.
 harvest and prices in France, 287.
 heating, prevention by airtight storage, 237.
 industry in Victoria, further development, 593.
 inheritance in, studies, 133.
 insect survey, Ohio, 648.
 irrigation experiments, Utah, 276.
 irrigation experiments in India, 183, 480.
 jointworm, control, Ohio, 648; U.S.D.A., 752.
 Kanred, establishing in Kansas, Kans., 36.
 liming experiments, 218.
 Marquis, improved strain, Wis., 337.
 middlings, analyses, 263, 560; Ind., 769; N.H., 769.
 middlings, chlorin determination, 506.
 mixed feed, analyses, Mass., 866; Tex., 769.

Wheat—Continued.

- nematode disease, 47, 448.
 nematode galls, recognition, 245.
 of ancient Egyptians, 36.
 of North Dakota, milling qualities, N.Dak., 492.
 of Ohio, milling and bread-baking values, Ohio, 340.
 plant, deficiencies, Wis., 371.
 planting dates, Minn., 826.
 production, future, in British Empire, 439.
 protein, nutritive value, 459, 755.
 rotation experiments, 132; Minn., 731, 824; Ohio, 636; U.S.D.A., 336.
 rust, control, 742.
 rust, history in Wisconsin, 742.
 rust, relation to barberry, 542.
 scabs as affected by rotation, 244.
 seed treatment with dry heat, 644.
 seedlings, sodium chlorid tolerance as affected by lime, 626.
 self- and cross-fertilization, 735.
 sheath-gall jointworm, control, 752.
 shorts, analyses, 560.
 smut, control, 742.
 smut infected, feeding value for fowls, Calif., 872.
 smut, infection through flower, 244.
 smut-resistant varieties, 47.
 statistics, U.S.D.A., 731.
 storage, air-tight, as preventive of heating, 237.
 straw, gas from, tests, 685.
 straw worm, control, U.S.D.A., 752.
 straw worm, migration of, 754.
 take-all, description, 244.
 take-all in Virginia, 644.
 varieties, new, 137.
 variety tests, 132, 229, 399, 530; Ala. Col., 822; Minn., 731, 824, 826; N.Dak., 732; U.S.D.A., 336, 337; Wash., 631; Wis., 533.
 winter, blossoming and fertilization, 734.
 winter, freshly harvested, germination tests, 237.
 winter, yellow-berry in, 340.
 winter, yield as affected by weather, U.S.D.A., 321, 616.
 winterkilling, studies, 644.
 world's production and consumption, 439.
 yield in Manitoba, relation to weather, 617.
- Whey—
 butter, 270.
 feeding value for pigs, Calif., 871.
 sugar, use in candy making, Wis., 316.
- Whippoorwill from Porto Rico, description, 249.
- White—
 ants. (*See* Termites.)
 fly, citrus, destruction by lady beetles, 455.
 grubs, breeding parasites of, 755.

- White pine—
 blister rust—
 control, Conn.State, 248.
 dissemination by insects, 153.
 dissemination by wind, 248.
 in Montana, 747.
 in New Hampshire, 747.
 in Wisconsin, 747.
 inspection in Virginia, 647.
 notes, 46, 541.
 prevention, 643.
 studies, 51; Conn.State, 247.
 infection experiments, Conn.State, 247.
 insects affecting, 158.
 western, rots of, U.S.D.A., 248.
- Willow borer, studies, 454.
- Willows—
 basket, culture in Maryland, treatise, 240.
 pests, 240.
- Wind—
 and distribution of pressure, 117.
 direction, relation to rainfall, U.S.D.A., 320.
 motors, possibilities and limitations, 586.
 rôle in dissemination of pathogenic organisms, 215.
 velocities, high free-air, notes, U.S.D.A., 620.
- Windbreak trees—
 for Minnesota, Minn., 834.
 planting, Mich., 347.
 variety tests, U.S.D.A., 343.
- Window shades, conductivity, tests, 590.
- Wine, production in Spain, 140, 737.
- Wines, red, spectroscopic titration, 612.
- Wire rope, tests, 387.
- Wireworms—
 control, studies, 455.
 life history, 855.
- Wisconsin Station, report, 397.
- Witches' brooms on pears, 49.
- Woburn Experimental Fruit Farm—
 editorial on, 104.
 notes, 98.
 progress reports, 238.
- Wolf, gray, of South Dakota, destruction, 545.
- Women—
 Government employees, provision for, 863.
 metabolism during light household work, 167.
 on the farm, 490.
 workers in agriculture in England and Wales, 895.
 workers in agriculture in Bavaria, 288.
- Women's—
 colleges, home economics instruction in, 293.
 institutes in Canada, 196, 693.
- Wood—
 ashes, analyses, R.I., 526.
 ashes, as source of potash, 522.
 "built-up," 241.
- Wood—Continued.
 cellulose determination in, 614.
 decay of, 224.
 infection, studies, 51.
 oil, production and manufacture, 840.
 pulp cellulose, nitrating, 116.
 pulp, production and consumption, survey, 840.
 pulp production, statistics, U.S.D.A., 144.
 pulp, use in war bread, 363.
 (See also Pulpwood.)
 preservation, 85, 782.
 preservation, methods, 580.
 rat, notes, 748.
 rats, bushy-tailed, of California, 355.
 strength, seasoning, and grading, 280.
 use as reinforcement for concrete, 586.
 use in agricultural implements, 840.
 using industries of Maryland, 242.
 (See also Lumber and Timber.)
- Woodlands—
 British, species for, 739.
 farm, in Southern States, U.S.D.A., 738.
- Woods—
 analysis, methods, 7.
 called cedar, 44.
 distillation of charcoal and tar, 44.
 mechanical tests for, 240.
 of Tonkin, inventory, 642.
- Wool—
 cooperative marketing, Mich., 694.
 industry in Victoria, further development, 593.
 production and trade, summaries, 770.
 trade of Australasia, statistics, 770.
 trade of British Empire, 870.
- Woolly aphid. (See Aphid, Woolly.)
- Wound—
 calluses and bacterial tumors, 435.
 reactions in plants, studies, 229.
- Wounds, treatment, 272.
- Wrens of genus *Nannus*, 847.
- Wyoming—
 Station, notes, 94, 499.
 University notes, 499.
- Xanthonia villosula* injurious to forest trees, 252.
- Xanthopastis timais*, studies, 652.
- Xanthophyll, rôle in sugar production in plants, 527, 627.
- Xanthosoma hastifolium*, use for greens, 137.
- Xerophthalmia, cause, 59.
- Xylaria* spp. studies, Va., 447.
- Xylarias*, comparative studies, 147.
- Xyleborus*—
destruens, studies, 56.
 sp. notes, 152.
- Yams—
 African, culture, 439.
 culture experiments, 436.
 fertilizer experiments, 436.
 lesser, yields in Singapore, 439.
 variety tests, 436.

Yeast—

- activity, as affected by concentration of sugar solutions, 627.
 analyses, 263.
 and vinegar dried grains, inspection and analyses, Mich., 63.
 cells, catalase action in, strengthening, 204.
 culture experiments, 204.
 feeding experiments with rats, 167.
 fresh, extracts for culture media, 708.
 grains, analyses, Mass., 866.
 lactose-fermenting, producing foamy cream, 774.
 pink, cause of spoilage in oysters, U.S.D.A., 860.
 rate of growth and fermentation, 204.
 sensitiveness to hydrogen and hydroxyl-ion concentration, 204.
 vitamin requirements, 59.
 water-soluble vitamin in, 314.
- Yemané, regeneration experiments, 142.
 Yerba maté, adulteration, detection, 112.
 Yew berry, adulterant for marmalades, 415.
 Yogurt, preparation, directions, U.S.D.A., 363.

- Yucca glauca*, feeding value, Tex., 369.
Zagryphus n.g. and n.spp., descriptions, 362.
 Zebra hybrids as domestic animals, 375.
 Zebus—
 disadvantages, 371.
 in Madagascar, 669.
Zelkova serrata, notes, Calif., 838.
Zeugophora spp. on cottonwood and poplars, 454.
 Zinc—
 and lead as pigments, tests, 591.
 chlorid, use in conservation of liquid manure, 721.
 determination in organic materials, 710.
 occurrence in food materials, 758
 occurrence in human organs, 758.
 sulphate, effect on alkali salts, Calif., 813.
 Zinc-free glassware, use in zinc determination, 711.
 Zoological laboratory, new, in Eberswalde, paper on, 152.
Zosbera marina meal, feeding value, 369.
Zygadenus venenosus, identification, 776.

CONTENTS OF VOL. 42, No. 1.

	Page.
Editorial notes:	
Memorial exercises for Dr. C. G. Hopkins.....	1
Changes in the <i>Record</i>	4
Back numbers available for distribution.....	5
Recent work in agricultural science.....	6
Notes.....	93

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

Notes on the composition of the sorghum plant, Willaman et al.....	6
A study of hydrocyanic acid in <i>Phaseolus lunatus</i> , Simpson.....	7
Contribution to the chemistry of American conifers, Schorger.....	7
The bactericidal power of some vegetable juices and essences, Sarti.....	7
Production of fats and oils in the United States, Bailey and Reuter.....	7
Fat analysis and fat chemistry in 1916, Fahrion.....	7
The chemistry of essential oils and artificial perfumes, Parry.....	8
Chloretone: A description of some of its properties, Hamilton.....	8
Preparation and testing of hydrogen of high purity, Edwards.....	8
Rapid method for preparation of conductivity water, Clevenger.....	8
The Bourdillon water still, Bennett and Dickson.....	8
Determination of bromid in mineral waters, Baughman and Skinner.....	8

	Page.
Improved method for carbon by wet combustion, Hibbard.....	9
New method for detection of sulphur-oxygen compounds, Sander.....	10
Simple method for acidity of cereals: Application to oats, Birckner.....	11
The tincture of vanilla of the National Formulary, Smith.....	11
An apparatus for rapid gastric analysis, Miller.....	11
The determination of urea, Philibert.....	11
The titrimetric determination of phosphoric acid in sewage, Marzahn.....	12
The estimation of fibers in paper, Griffin.....	12
Paper research literature, Matthews.....	12
Copra drying, Cox.....	12
Copra and coconut products, Eaton.....	12

METEOROLOGY.

Monthly Weather Review.....	12
The marine meteorological service of the United States.....	13
[Free-air data], Gregg, Chancellor, and Cole.....	14
Motion of the air in the lowest layers of the atmosphere, Hellmann.....	14
Climate of the cotton belt, Stine and Baker.....	14
Meteorological observations, 1918, Nelson.....	14

SOILS—FERTILIZERS.

Soil survey of Drew County, Ark., Tillman, Hayes, and Hutton.....	15
Soil survey of Blackhawk County, Iowa, Tharp and Harper.....	15
Soil survey of Baltimore County, Md., Carter, Snyder, and Bruce.....	15
Soil survey of Chase County, Nebr., Rogers and Wolfanger.....	16
Soil surveys of Schoharie and Cortland Counties, Maxon and Fuller.....	16
Soil survey of Canadian County, Okla., Smies.....	16
Soils, Briggs.....	16
Survey of the more important soil types of Wurttemberg, Plieninger.....	16
Peat in the Dismal Swamp, Virginia and North Carolina, Osbon.....	16
The improvement of wild meadow and tule land, Powers.....	17
Importance of nonsymbiotic nitrogen-fixing soil bacteria, Düggeli.....	18
Rate of nitrification of green manures and crop residues, Joshi.....	18
Denitrification on account of difficultly decomposable substances, Nolte.....	19
Fertilization and sterilization, Veauvy.....	19
The conservation of plant food, Woods.....	19
Experiments on water absorbing properties of peat moss litter, Viersen.....	19
Mineral resources of the United States in 1918, Bastin and Clark.....	19
A survey of the fertilizer industry, Goldenweiser.....	19
The 1919 yearbook of commercial fertilizer.....	20
The American fertilizer handbook, 1919.....	20
Fertilizers, [I]—VII, Marchand.....	21
Fertilizers and crop production in Virginia, Hutcheson, Wolfe et al.....	21
Some preliminary experiments with manures on Borbhetta soil.....	22
Views on the nitrogen question and related problems, Hamburger.....	22
Prevention of volatilization of ammonia nitrogen by Ca Cl ₂ , Stutzer.....	22
Comparison of two fertilizers according to Mitscherlich law, Gorski.....	22
Value of Vivianite and Vestra phosphate, Graftiau and Courtoy.....	22
The residual effect of superphosphate, Gordon.....	23
The potash fields of Alsace, Witz.....	23
Report of analyses of commercial fertilizers.....	23
Analyses of commercial fertilizers, Brackett and Stackhouse.....	23
An act relative to the sale of commercial fertilizers.....	23

AGRICULTURAL BOTANY.

Rate of absorption of soil constituents, Burd.....	23
Relation of the nutrient medium to growth and absorption, Hoagland.....	24
The growth of higher plants in soils free of microorganisms, Fred.....	25
The etching of marble by roots, Fred and Haas.....	25
Effect of soy bean germination on nodule forming, Haas and Fred.....	25
Intracellular acidity in Valonia, Crozier.....	25
Physiological basis of morphological polarity in regeneration, II, Loeb.....	26
Connection of oxidases with the improvement of cultivated plants, Atti.....	27

FIELD CROPS.

	Page.
Plat competition as a source of error in crop tests, Kiesselbach.....	27
Experimental error in field trials, Kiesselbach.....	28
Relative resistance of various crops to alkali, Harris and Pittman.....	28
[Ground water control on meadows as related to yield], Simola.....	29
Report of the division of agronomy and plant breeding, Cowgill.....	30
[Field crop production in Cuba], Calvino.....	31
[Report of agronomy work at the Guam Station, 1918], Briggs.....	31
[Report of field crops work in Uganda, 1918], Simpson and Morgan.....	32
[Production of oleaginous plants in French possessions], de Roux et al.....	32
Growing alfalfa in western Kansas, Weeks.....	32
Cross-fertilization in alfalfa, Waldron.....	32
A factor analysis of barley, II, von Ubisch.....	32
Mariout barley, with discussion of barley culture in California, Hendry.....	32
The hulled and hullless barley on the ancient Egyptians, Schulz.....	33
Climatic adaptations of the white tepary bean, Hendry.....	33
Two systems of corn breeding, Hume.....	33
The relation of certain ear characters to yield in corn, Biggar.....	34
Inheritance of fasciation in the maize spike, Lo Priore.....	34
Cotton culture in Peru, Marie.....	34
Revised regulations for cotton warehouses.....	34
Natural cross-pollination in milo, Kraper and Conner.....	34
Distribution of dry matter and nitrogen in potato, Glynne and Jackson.....	35
Marketing Nebraska potatoes, Rankin.....	35
Storage of potatoes, Butler.....	35
Report of the German Potato Culture Station, 1918, von Eckenbrecher.....	35
Notes on the cultivation of ragi (<i>Eleusine coracana</i>), Spring and Milsum.....	35
After-ripening and germination of rice at different stages, Kondō.....	35
Sorghums for silage and hay, Stewart.....	36
Sugar cane culture in Porto Rico, Earle.....	36
Establishing Kanred wheat in Kansas, Salmon.....	36
The naked wheats of the ancient Egyptians, Schulz.....	36
Important factors in the cost of producing wheat, Boss.....	36
The work of the committee on seed stocks, Oakley.....	36
Seed Reporter.....	36

HORTICULTURE.

[Report of the horticulturist], Briggs.....	37
Electroculture in horticulture, Blin.....	38
Blooming time of Iowa plants, 1918, King, Ringland, and Hemenway.....	38
Vegetable growing, Truffaut.....	38
[Report on tomato and melon breeding], Cowgill.....	38
Temperature in relation to quality of sweet corn, Stevens and Higgins.....	38
The limit of germination in seeds of <i>Lepidium sativum</i> , Lesage.....	39
Varieties of fruit, Mooring.....	39
New or noteworthy fruits, Hedrick.....	39
Is thinning fruit profitable? Alderman.....	39
Preparation of barreled apples for market, Scott et al.....	39
Pear harvesting and storage in Rogue River Valley, Lewis et al.....	40
Plum pollination, Hendrickson.....	41
The "yema" graft of the vine, Bonnet.....	41
Grapes and how to grow them, Lansdell, edited by Sanders.....	41
Developing new grape industries, Husmann.....	41
How about the cherimoya? Popenoe.....	42
Report of the division of chemistry, López Dominguez.....	42
Manurial experiments with limes.....	42
[Cocoa, palm products, and fruits in Gold Coast], Tudhope et al.....	43
History and development of French walnuts in Oregon, Dosch.....	43
Methodical nomenclature of drug plants, Bruntz and Jaloux.....	43
Perfume and aromatic plants, Rolet.....	43
The gladiolus, Boynton.....	43
Tulip droppers, Stout.....	43
The making of a flower garden, Bennett.....	43
Flower growing, Roda.....	43

FORESTRY.

	Page.
Manual of forestry, Romiti-----	43
Forestry.—I, Silviculture, Marsden-----	43
Forestry.—II, Economic forest products, Pearson-----	44
Forest products: Their manufacture and use, Brown-----	44
The tree book, McFee-----	44
Woods called cedar, Lamb-----	44
The culture and exploitation of oil palms, de Wildeman-----	44
Rubber, Henry-----	44
The contraction across the grain in teak while seasoning, Pearson-----	44
The returned soldier and forest jobs, Zon-----	44
The forest wealth of Mexico, de Quevedo-----	45
Annual report of the State forester for 1918, Elliott-----	45
Annual reports of the State forester for 1917, and 1918, Pape-----	45
Review of net revenues from Saxony State forests for 1915, Wapler-----	45
Annual report of the forest department for 1918, Legat-----	45
Annual report of the woods and forest department for 1917, Lane-Poole-----	45
Report of the woods and forests department for 1918, Lane-Poole-----	45

DISEASES OF PLANTS.

Plant prophylaxis, Martínez-----	45
The dissemination of parasitic fungi, [Butler]-----	45
Rusts in southern France, Arnaud-----	45
The forms of <i>Peronospora parasitica</i> , Gäumann-----	46
<i>Puccinia petasiti-pulchella</i> n. sp., Lüdi-----	46
The genus <i>Snychytrium</i> , Rytz-----	46
Report of the division of plant pathology and botany, Stevenson-----	46
Some diseases of cultivated plants at Para, Brazil, Vincens-----	46
Work on plant diseases at the Royal Botanic Gardens, Kew [1918]-----	46
Mycology [Mysore, India, 1916-17], Coleman-----	46
Mildew of lily and a cotyledon disease of maple, Arnaud-----	46
Failure of seedlings, particularly of crucifers, Kyropoulos-----	46
[Control of cruciferous club root], Hiltner and Korff-----	47
Control of cereal and grass smuts and stripe disease, Quanjer and Botjes-----	47
Seed treatment for the prevention of cereal smuts, Mackie-----	47
Susceptibilities of wheat varieties to stinking smut, von Kirchner-----	47
The nematode disease of wheat in Virginia, Fromme-----	47
A wilting disease of cucumber, Lindfors-----	47
Onion smut: A disease new to Britain, Cotton-----	47
Investigations on mosaic disease of Irish potato, Schultz et al-----	47
Potato-spraying experiments at Wye College, 1918, Salmon and Wormald-----	48
Sweet-potato diseases, Harter-----	48
Tomato rot and control measures, Bruner-----	48
July treatment for chlorosis in fruit trees, Vercier-----	48
Silver-leaf in fruit trees-----	48
Susceptibility to Gymnosporangium of the pome fruits, Sahli-----	48
Water core and bitter pit of apple, Bois-----	48
Witches' brooms on <i>Pyrus communis</i> , Lemée-----	49
[Permeability and osmotic phenomena in diseased plants], Heusser-----	49
Anaheim, or California [vine] disease, Pachano-----	49
Grape disease, Aversa-Saccà-----	49
A new method of defense against Oidium, de Mas Solanes-----	49
Grape diseases in Cuba, Bruner-----	49
The banana disease in tropical America, Johnston-----	49
The banana and its diseases, Johnston-----	49
A disease of cacao, Martínez-----	49
[Some coconut diseases], Briggs-----	49
[Coconut diseases], Wester-----	50
Black rot disease of tea, [India]-----	50
An outbreak of black rot in Upper Assam, Tunstall-----	50
Failure of flower bulbs, Sorauer-----	50
Rusts of important Swiss coniferous forest trees, Fischer-----	50
Pear rust and <i>Juniperus sabina</i> , Lemée-----	50
Diseases and enemies of <i>Picea omorica</i> , Geschwind-----	50
Needle necrosis of pine, Vincens-----	50
The relation of <i>Peridermium pini</i> to Cronartium, von Tubeuf-----	51

	Page.
A note on the canker on <i>Albizzia</i> spp., Tunstall	51
The parasitism of <i>Ustilina vulgaris</i> , Patouillard	51
A walnut tree disease, Capus and Feytaud	51
A disease of walnut, Paravicini	51
Wood infection studies with spores of dry rot, Wehmer	51

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Laws relating to fur-bearing animals, 1919, Lawyer et al	51
The birds of Desecheo Island, P. R., Wetmore	51
Sixth report of Kansas Entomological Commission 1917-18, Mohler et al	51
Forty-ninth annual report of the entomological society of Ontario, 1918	51
Report of the division of entomology, Smyth	52
Thrips, black ants and other pests of cacao in Grenada, Ulrich	52
[Report on economic insects in Hawaii], Svezey	53
[Economic insects in the Philippines], Hernandez	53
Four of the most injurious corn pests, Dudley	53
Insects injurious to rice [in Guam], Briggs	53
Insect enemies [of tobacco in Guam], Briggs	53
<i>Lasioderma serricorne</i> and the tobacco moth, Jensen	53
[Coconut insects in Saipan], Briggs	54
Destructive insects affecting Ohio shade and forest trees, Houser	54
The bloodsucking insects of the Philippines, Banks	54
Use of toxic gases as means of control of the peach-tree borer, Blakeslee	54
The rice stem borer, Shiraki, French trans. by Lan	55
Malaria and anophele mosquito in northern California, Hems	56
The Cicadellidæ or leaf hoppers of South Carolina, Lathrop	56
The flat-headed apple-tree borer, Brooks	56
<i>Xyleborus destruens</i> destructive to djati (<i>Tectona grandis</i>), Roepke	56
Beginner's bee book, Pellett	56
Japanese chalcid flies, Girault	56

FOODS—HUMAN NUTRITION.

How shall we be fed?	56
The potato, its food value and utilization in bread baking, Maurel	57
The constipating qualities of orange juice, Gerstenberger and Champion	57
The relative content of antiscorbutic principle in limes and lemons	57
The antiscorbutic value of dry and germinated seeds, Chick and Delf	57
Botulism from canned asparagus, Thom, Edmondson, and Giltner	57
Baking experiments with so-called egg substitutes	58
Artificial honey, Behre and Ehrecke	58
Maté, or Paraguay tea, or St. Bartholomew's tea	58
Importance of accurate measurements in nutrition, Chick and Hume	58
Vitamin requirements of certain yeasts, Bachmann	59
The action of ultra-violet rays on the accessory food factors, Zilva	59
Note on xerophthalmia in rats, Bulley	59
Effect of alcohol on digestion of fibrin and caseinogen by trypsin, Edie	60
The fat metabolism of infants and young children, I-IV, Holt et al	60
Vitality and efficiency under prolonged restricted diet, Benedict et al	62

ANIMAL PRODUCTION.

On the probable error of Mendelian class frequencies, Wright	63
Determination and measurement of degree of inbreeding, Kříženecký	63
On the composition and feeding value of tree-leaf hay, Mayr	63
Commercial feeding stuffs, 1918-19, Woods	63
Commercial feeding stuffs, Patten et al	63
Safeguarding feeders of cottonseed products, Fitz and Langworthy	64
Animal husbandry, Edwards	64
Composition of beef animal and energy of fattening, Trowbridge et al	65
Cost of raising beef cattle in New Hampshire, Ritzmann	65
Winter feeding of beef cattle, Arnett	66
Government sheep ranch in Idaho, Coffey	66
The sheep in Egypt, Dudgeon and Mohammed 'Askar	66
Forage crop experiments with swine, Arnett and Joseph	66

	Page.
The use of forage crops in pork production, Arnett and Joseph.....	67
Swine husbandry.....	68
Observations of brachydactylism in the fowl, Danforth.....	68
Concerning the summer plumage of the drake, Goodale.....	68
Appliances and methods for pedigree breeding at Maine Station, Gowen..	68
Back yard poultry keeping, Graham.....	69
Use of incubators in Egypt, Dudgeon and Mohammed Kamel.....	69

DAIRY FARMING—DAIRYING.

Variation of Ayrshires in quantity and fat of milk, Pearl and Miner....	69
Variation of Ayrshires in quantity and fat of milk, Pearl and Miner....	70
Pure-bred sires effect herd improvement, Lawritson et al.....	70
Breed and size of cows as factors affecting milk production, Nevens....	70
Some correlations in the cost of milk production, Hopkins.....	70
Feeding dairy cows in California, Woll.....	71
Investigations with milking machines, Woll.....	71
Increase in bacteria of milk from pasteurizing vat to consumer, Dearstyne.	72
The colon-aerogenes group of milk, Hunter.....	72

VETERINARY MEDICINE.

Annual report of chief veterinary officer for the year 1918, Stockman....	72
Adjustment of reaction of culture mediums, Fennel and Fisher.....	72
Preparation of serums and vaccines by desiccation in vacuum, Bordas....	73
Behavior of antibodies in diluted and mixed immune sera, von Eisler....	73
Influence of antipneumococccic serum on growth of pneumococcus, Barber.	73
Antiblastic phenomena in immunity to pneumococcus, Barber.....	73
Résumé of études on cutaneous hypersensitiveness, Fleischner et al....	74
Blackleg and its control, Goss.....	74
The occurrence of dourine (slapziekte) in South Africa, Walker.....	75
The differential diagnosis of glanders, Pfeiler.....	75
Note relative to treatment of lymphangitis, Delmer.....	75
The migrating course of ascarid larvæ in the body of the host, Yoshida....	75
Notes on the species of Gastrophilus in South Africa, Bedford.....	75
Notes on the intoxication by Gastrophilus larvæ, van de W. de Kock....	75
Effects of arsenite of soda dipping fluids on working oxen, Mitchell....	76
Isolation of bacterium causing oxidation in cattle dipping baths, Green..	76
Description of bacterium which reduces arsenate to arsenite, Green.....	77
Experiments with emulsions for protecting camels against flies, Cross....	78
Mexican red fever of swine and its preventive vaccination, López Vallejo.	78
Studies on fowl cholera, VI, Hadley and Caldwell.....	78
Poultry diseases, Bushnell and Jackley.....	78

RURAL ENGINEERING.

Winter irrigation for western Kansas, Knapp.....	79
Hydraulic experiments with valves, orifices, etc., Talbot et al.....	79
Surface water supply of the United States, 1916, parts X, XII A, XII B....	81
Water power on the farm, Fitz.....	81
Ice on the farm, Larsen.....	81
Spacing and depth of laterals in Iowa underdrainage systems, Schlick....	81
Public Roads.....	83
Instrument for measuring wear of concrete, Rosengarten.....	83
Method for adjusting excavation and haul, Ball and Shore.....	83
Standardization of farm machinery, Dinneen.....	83
Relation of large machine units to production, Yerkes.....	83
Analysis to distinguish between a crank and an eccentric, Dickinson....	83
The Wichita tractor demonstration.....	84
The gasoline automobile: Its design and construction, I-III, Heldt.....	84
Plow bottom design, Bacon.....	84
A study of the plow bottom and its action upon the furrow slice, White....	85
Work of cultivation, Ringelmann.....	85
Modern developments in the preservative treatment of wood, Barth.....	85
Creosoting fence posts, Barre.....	85
Some stock ranch accessories, Murdock and Welch.....	86

	Page.
Practical suggestions for the construction of liquid manure tanks.....	86
Barn roof design, Strahan.....	86
Rural housing, Grant.....	86
Sanitation of rural workmen's areas.....	86
Farm building ventilation, Clarkson.....	86
The care of lead storage batteries for farm lighting plant, Beck.....	86

RURAL ECONOMICS.

Forward in agriculture, Christie.....	87
The farmer and finance, Thompson.....	87
Agriculture and the banker, Houston.....	87
Farm plans for using borrowed capital.....	87
Credit rating the farmer, Wright.....	87
How to make an annual report for country grain elevators, Robotka.....	88
Land and agricultural bank of South Africa.....	88
Making the farm pay, Bowsfield.....	88
Influence of good farm organization in costs of production, Handschin.....	88
Problem of land valuation in connection with a property tax, von Bauer.....	88
Laws of Maine relating to agriculture.....	88
Disposition of the public lands of the United States, Magnusson.....	88
Homes for soldiers, Lane.....	88
Report of measures to be taken for settling ex-service men.....	88
Cooperation for small producers.....	89
Report of the Peasants' League, 1914, 1915, 1916, 1917, Luytgaerens.....	89
The consolidation of agricultural cooperation in Russia, Maslov.....	89
The cooperative movement in South Africa, Pizar.....	89
Farmers' Market Bulletin.....	89
Monthly Crop Reporter.....	89
[Agricultural statistics of the United Kingdom, 1902-1916].....	90
Returns of produce of crops in Scotland.....	90
[Returns of agricultural crops for 1917].....	90
Agricultural statistics of Roumania.....	90
[Agricultural statistics of the Union of South Africa].....	90
[Land tenure: Agriculture and live stock in New Zealand, 1918], Fraser.....	90

AGRICULTURAL EDUCATION.

[Progress in agricultural and veterinary education], Mackenna.....	90
Some observations on agricultural work, III, Japan, Roberts.....	90
Agricultural and horticultural officials, institutions, and organizations.....	91
Report on agricultural and housekeeping schools for 1916-17.....	91
Report of School Garden Association of New York, ed. by Kilpatrick.....	91
A year in agriculture, with plans for home projects, Nolan.....	91
A textbook in general science and the economics of daily life, Brownell.....	91
A source book of biological nature-study, Downing.....	92
Nature teaching, Watts.....	92
Teaching home economics, Cooley et al.....	92

MISCELLANEOUS.

Report of the Guam Station, 1918.....	92
Report of the Porto Rico Insular Station, 1918.....	92

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

<i>Stations in the United States.</i>	<i>Page.</i>	<i>Stations in the United States—Contd.</i>	<i>Page.</i>
California Station:		South Carolina Station:	
Bul. 310, July, 1919.....	41	Bul. 199, June, 1919.....	56
Bul. 311, Sept., 1919.....	71	Bul. 200, Sept., 1919.....	23
Bul. 312, Oct., 1919.....	32	Bul. 201, Sept., 1919.....	85
Circ. 214, Sept., 1919.....	47	South Dakota Station:	
Circ. 215, Sept., 1919.....	71	Bul. 184, Jan., 1919.....	33
Guam Station:		Bul. 185, Apr., 1919.....	81
Rpt. 1918.....	14,	Utah Station:	
16, 31, 37, 49, 53, 54, 64, 92		Bul. 168, July, 1919.....	28
Kansas Station:		Virginia Station:	
Circ. 70, Oct., 1918.....	78	Bul. 221, Mar., 1919.....	21
Circ. 71, Nov., 1918.....	64	Bul. 222, Aug., 1919.....	47
Circ. 72, Jan., 1919.....	79		
Circ. 73, July, 1919.....	32	<i>U. S. Department of Agriculture.</i>	
Circ. 74, Aug., 1919.....	36		
Circ. 75, Aug., 1919.....	74	Bul. 769 (Sup.), The Production and Conservation of Fats and Oils in the United States, H. S. Bailey and B. E. Reuter.....	7
Maine Station:		Bul. 796, Use of Toxic Gases as a Possible Means of Control of the Peach-Tree Borer, E. B. Blakeslee.....	54
Bul. 279, Apr., 1919.....	70	Bul. 798, A Survey of the Fertilizer Industry, E. A. Goldenweiser.....	19
Bul. 280, June, 1919.....	68	Farmers' Bul. 1059, Sweet Potato Diseases, L. L. Harter.....	48
Off. Insp. 92, Aug., 1919....	63	Farmers' Bul. 1065, The Flat-Headed Apple-Tree Borer, F. E. Brooks.....	56
Massachusetts Station:		Farmers' Bul. 1079, Laws Relating to Fur-Bearing Animals, 1919, G. A. Lawyer, F. L. Earnshaw, and N. Dearborn....	51
Circ. 32 A, July 1, 1918....	23	Farmers' Bul. 1080, Preparation of Barreled Apples for Market, W. M. Scott, H. C. Hetzel, H. W. Samson, and M. Stockton.....	39
Michigan Station:		Office of the Secretary:	
Bul. 285, Sept., 1919.....	63	Circ. 143, Regulations of the Secretary of Agriculture under the United States Warehouse Act of August 11, 1916, as Amended July 24, 1919.—Revised Regulations for Cotton Warehouses.....	34
Missouri Station:		Bureau of Crop Estimates:	
Research Bul. 30, Jan., 1919..	65	Mo. Crop Rptr., vol. 5, No. 10, Oct., 1919.....	89
Montana Station:			
Bul. 128, Feb., 1919.....	66		
Circ. 83, Jan., 1919.....	67		
Circ. 84, Feb., 1919.....	86		
Circ. 85, Aug., 1919.....	66		
Nebraska Station:			
Circ. 8, July, 1919.....	70		
Circ. 9, Oct., 1919.....	35		
New Hampshire Station:			
Bul. 182, Apr., 1919.....	65		
Circ. 20, June, 1919.....	35		
New Mexico Station:			
Bul. 119, Apr., 1919.....	36		
North Carolina Station:			
Farmers' Market Bul., vol. 6, No. 29, Sept. 24, 1919..	89		
Ohio Station:			
Bul. 332, Nov., 1918.....	54		
Oregon Station:			
Bul. 162, July, 1919.....	40		
Porto Rico Department of Agriculture and Labor Station:			
Circ. 17 (Spanish Ed.), 1919.....	36		
Ann. Rpt., 1918.....	30,		
	38, 42, 46, 52, 92		
Rhode Island Station:			
Bul. 179, June, 1919.....	78

CONTENTS OF VOL. 42, No. 2.

	Page.
Editorial notes:	
The need of better illustrative material relating to research.....	101
Governmental support for the Woburn Experimental Fruit Farm.....	104
Pasture experiments in Great Britain.....	106
Recent work in agricultural science.....	109
Notes.....	197

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

An introduction to the physics and chemistry of colloids, Hatschek.....	109
Phthalic anhydrid.—I, Introduction, Gibbs.....	109
A new gasometric burette, Nicolardot and Prevot.....	109
A further study of the De Roode method for potash, Keitt and Shiver.....	109
Determination of calcium oxid in lime and limestones, Little and Beisler.....	109
Analysis and composition of calcium phosphate, Grünhut.....	110
Method for bringing elementary sulphur into solution, Bjerregaard.....	110
Determination of small quantities of alkaline iodids, Lasausse.....	111
The proximate analysis of commercial casein, Browne.....	111
The determination of the saponification number, Fahrion.....	111
Determination of acid number of fat from oil seeds, Beneschovsky.....	111
Modification of phenylhydrazin method for pentosans, Menaul and Dowell.....	112
The analysis of lemon juice, Huerre.....	112
Contribution to the study of the adulteration of pepper, Lendner.....	112
Biological methods for detecting adulteration in yerba maté, Marchisotti.....	112
Milk.....	112
Oxidation of lactose and lactic acid by $K_2Cr_2O_7$, Marchadier and Goujon.....	112

	Page.
Home preparation of pork, Paterson.....	113
A complete course in canning, Judge.....	113
A manual of canning and preserving, Carrell.....	113
Canning of spinach.—Consideration of standards, Campbell.....	113
Tomato preserves, Carles.....	113
The functions of lye in olive processing, Cruess.....	113
Influence of concentration of sugar solutions on microorganisms, Grove.....	114
The preserving value of various spices and essential oils, Grove.....	114
Drying vegetables and fruits for home use, Lund.....	114
Fruit drying, Tribolet.....	115
The chemistry and industry of table mustard, Carles.....	115
Color changes of sugar cane juice and the nature of cane tannin, Zerban.....	115
Methods and machinery for the extraction of oil from seeds, etc., Eaton.....	115
Note on the oil of <i>Ceratotheca sesamoides</i> , Bolton.....	115
Horse chestnut oil, Heiduschka and Zeileis.....	115
Chemical study of the oil from Indo-Chinese "Mac-Ken" nuts, Heim.....	115
The lumbang oil industry in the Philippine Islands, Aguilar.....	115
Vegetable fibers used in paper making, Clark.....	116
Paper pulp: Possibilities of its manufacture in Australia, Lightfoot.....	116
Tearing resistance of paper, Wells.....	116
Nitrating of woodpulp cellulose, Wells and Edwardes.....	116

METEOROLOGY.

Weather and crops in New Jersey, Smith.....	116
Yield of crops and variations in temperature and precipitation, Wallén.....	117
Precipitation, evaporation, soil moisture, and snow in forests, Schubert.....	117
Relation between wind and distribution of pressure, Jeffreys.....	117
The snowfall of the United States, Ward.....	117
Climatological data for the United States by sections.....	117
Monthly weather report for the year, McCaig.....	118
Distribution of rainfall over Germany, Hellmann.....	118
International catalogue of scientific literature: F, Meteorology.....	118

SOILS—FERTILIZERS.

Soils and soil formation in the light of colloid chemistry, Wiegner.....	118
Salt soils and alkaline soils: Origin of soda in soils, de Dominicis.....	118
The filtration of water in agricultural soils, Hugues.....	119
Effect of types of irrigation water on soils, Hoagland and Christie.....	119
The Atterberg Schlamme cylinder, van Zyl.....	119
Soil survey of Wapello County, Iowa, Hall and Angell.....	119
Soil survey of Texas County, Mo., Watkins et al.....	120
Soil survey of Beaufort County, N. C., Cobb et al.....	120
Soil Survey of Marlboro County, S. C., van Duyne et al.....	120
Composition of soils of Archer, Franklin, and Harrison Counties, Fraps.....	121
The needs of Texas soils for lime, Fraps.....	121
Soil analyses.....	121
Provincial soil survey, Finlow.....	121
Soils, Harrison.....	122
Soil survey and forest physiography of Kuitpo, South Australia, Teale.....	122
Observations on soil erosion, Torrance.....	122
Chemical studies of soil cultivated in various ways, Kristensen.....	123
Experiments on the manuring of green crops carried out on tea estates.....	123
[Fertilizer experiments], Harlow.....	123
Fertilizer tests at Sappemeer 1881 to 1915, Mulder et al.....	123
An experiment in nitrogen losses, Harlow.....	124
Production costs of Chilean nitrate, Marco.....	124
Equilibrium studies upon the Bucher process, Ferguson and Manning.....	124
Potash recovery at cement plants, Wilson.....	124
Various potash fertilizers on corn, Harlow.....	125
Phosphate nodules of Overijssel as fertilizer, Knuttel and van't Kruijs.....	125
Speed of solubility of phosphoric acid of Thomas meal, Maschhaupt.....	125
Various phosphate fertilizers on clover, Harlow.....	125
An experiment on the solubility of rock phosphate, Harlow.....	125

	Page.
Experiments with sulphur and rock phosphate, Harlow.....	126
Phosphorites and superphosphates and the sulphur industry, Tirelli.....	126
The action of lime in the soil, Hughes.....	127
The carbonation of burnt lime in soils, MacIntire.....	127
Experiments with by-product lime and marls containing magnesia, Tacke.....	127
The mussel mud deposits along the north shore of Nova Scotia, Harlow.....	127
Fertilizers.....	127
General regulations governing fertilizers.....	128

AGRICULTURAL BOTANY.

Fundamental questions in the study of vegetations, Gams.....	128
Some western species of <i>Lathyrus</i> , Piper.....	128
Report of committee on generic types of Botanical Society, Hitchcock.....	128
Recent studies on <i>Oenothera</i> , Lehmann.....	128
Reciprocal hybrids of <i>Epilobium roseum</i> and <i>E. parviflorum</i> , Lehmann.....	128
The significance of foliar glands in peach, Campbell.....	128
Physiological characters of summer and winter annuals, Gassner.....	128
Light and growth.—III, The explanation of phototropism, Blaauw.....	128
The influence of light on growth in coleoptiles of <i>Avena sativa</i> , Sierp.....	129
Action of enzymes on organic substances, Ciamician and Ravenna.....	129
Etherization of tissues and its effect on enzym activity, Bonns.....	129
Studies on anthocyanin metabolism, Noack.....	129
Anthocyan and respiratory exchanges in leaves, Nicolas.....	129
On transpiration from leaf-stomata, Jeffreys.....	129
Developmental history of the leaf, Schüepp.....	130
The developmental history of budding, Schüepp.....	130
Minor teratological phenomena, Lakon.....	130
Anatomical and physiological study of leaf cast, Pujiula.....	130
Criteria of ripeness in beets, Bernatsky.....	130
The physiologically acid and alkaline salts and soil sickness, Aberson.....	130
The cause of soil sickness, Sjollem.....	130
Influence of electrolytes on diffusion of water through collodion, Loeb.....	130
Osmotic pressure of <i>Nereocystis</i> and salinity of water, Hurd.....	131
The evaluation of the nutritive solution of von der Crone, Appel.....	131
Daily periodicity in nuclear and cell division, Karsten.....	131
Phytochemical studies, Zlataroff.....	131
Sporulation by symbiosis in fungi, Sartory.....	131

FIELD CROPS.

Tillage: A review of the literature, Sewell.....	132
[Report of field crops work in Assam], McSwiney.....	132
[Report of field crops work in Bengal, 1917-18], Smith et al.....	132
[Field crops work in Central Provinces and Berar, 1918], Allan et al.....	132
[Rotation and culture experiments], Sjöström.....	132
[Experiments with wheat, oats, rye, and root crops], Torssell.....	132
Observations on inheritance in lupines, wheat, and barley, Vestergaard.....	133
Root crop seed production in 1918 and the root crop seed trade, Helwig.....	135
Root crops, Parsons.....	135
Growing alfalfa in Maryland, Schmitz.....	135
Experiments in spacing cotton, Cook.....	136
Meadow fescue, Vinall.....	136
"Shelled" grain in oats, Stapledon and Loveday.....	136
Percentage of husk in different [oat] varieties, Stapledon and Loveday.....	136
Electroculture experiments by the South Wales Power Co., Allan.....	136
Effect of wounds on loss of weight of potatoes, Butler.....	137
Some new varieties of wheat, Pridham.....	137
Agricultural seed inspected in the fall of 1918, Smith.....	137
Review of weed laws in [different] countries, Juhlin-Dannfelt.....	137

HORTICULTURE.

The carbon nutrition of cultivated plants, Fischer.....	137
Inspection and analyses of insecticides and fungicides, Smith et al.....	137
Report of the Horticultural Experiment Station, 1918.....	137
Possible correlations concerning position of seeds in the pod, Halsted.....	138

	Page.
Plants used as spinach.....	138
Varieties of fruit for the home fruit garden in eastern Montana, Strausz.....	138
Pruning young deciduous fruit trees, Tufts.....	138
Factors affecting hardiness in fruits, Hedrick.....	139
Origin of a new and improved French prune variety, Shamel.....	140
Observations on the inflorescence of the olive, Pirotta.....	140
Statistics on the production of grapes and wine in 1918.....	140
Observations and opinion on avocado culture, Spinks.....	140
Influence of character of stock on growth in citrus propagation, Webber.....	140
Automatic disbudding of citrus, Coit.....	140
[Notes on the culture of limes].....	140
A basis for tea selection, Cohen Stuart.....	141
A bud variation of the Le Grand Manitou dahlia, Shamel.....	141
Mutation in Matthiola, Frost.....	141
A remarkable bud sport of Pandanus, Schaffner.....	141

FORESTRY.

Reconstitution and exploitation of forests after the war, Demorlaine.....	141
Arbor Day, Everard.....	141
Vacation land.—The National Forests in Oregon.....	141
Out-of-door playgrounds of the San Isabel National Forest.....	141
A summer vacation in the Sopris National Forest.....	142
Report of the State firewarden, Wilber.....	142
Oregon forest fires laws, 1911-1919.....	142
Timber line studies in the northern part of Luleå-Lappmark, Frödin.....	142
Timber production and growth curves in the mountain ash, Patton.....	142
History of the Dunkeld hybrid larch (<i>Larix eurolepis</i>), Henry and Flood.....	142
Note on <i>Hopea canarensis</i> , Hole.....	142
Note on <i>Ixora butterwickii</i> , Hole.....	142
Yemané (<i>Gmelina arborea</i>) in upper Burma, Dawkins.....	142
Philippine mangrove swamps, Brown and Fischer.....	142
A rubber plant survey of western North America, Hall and Goodspeed.....	143
[Rubber in Gold Coast], Tudhope et al.....	144
Origin of latex vessels and latex in <i>Hevea brasiliensis</i> , Bobillioff.....	144
Does the tapping with driptins give any advantage? Arens.....	144
Pulpwood consumption and wood pulp production in 1918, Smith.....	144

DISEASES OF PLANTS.

The application of genetics to the control of plant disease.....	144
Presence of nitrites and ammonia in diseased plants, II, Boncquet.....	144
Report of the mycologist, Bunting.....	145
Mycology and plant pathology, Mackenna.....	145
Provincial disease survey.....	146
Diseases of planters' crops.....	146
[Combating plant diseases in India].....	146
Burgundy mixtures and other copper sprays, Spinks.....	146
Disinfection of seeds with bromin, Artsixovsky and Stom.....	146
Seed disinfection for pure culture work: Hypochlorites, Duggar and Davis.....	146
Seed disinfection for pure culture work, Young.....	147
The Thelephoraceæ of North America, VIII-X, Burt.....	147
Merulius in North American supplementary notes, Burt.....	147
Comparative studies on three Xylarias, von Bronsart.....	147
Basal rots of garden plants, Matz.....	147
Fungus and bacterial diseases of vegetables in Ontario, Howitt and Jones.....	147
The dry root rot of the bean, Burkholder.....	147
Treatment of beet seed for control of root scab, Krüger and Wimmer.....	147
Cotton boll disease, de Sousa.....	147
[A wilting disease of cotton in Colombia], Pestico.....	148
Diseases of eggplant, Bruner.....	148
A note on the dropping of flowers in the potato, Dorsey.....	148
Prematuring and wilting of potatoes, Clinton.....	148
Frost necrosis of potato tubers, Jones, Miller and Bailey.....	148
Potato diseases, Pachano.....	149

	Page.
Potato spraying trials, 1917, Spinks.....	149
The eelworm disease of potato, Byars.....	149
The skin spot disease of potato tubers, Owen.....	149
Ormskirk potato trials, 1919.....	149
Protect seed potatoes against disease, Orton.....	149
[Sugar cane diseases, Hawaii], Agee.....	150
[Lahaina cane attacked by nematodes], Agee.....	150
Resistance of cane varieties to yellow stripe or mosaic disease, Earle.....	150
The more important fruit tree diseases of Ontario, Howitt and Caesar.....	150
Monilia on [orchard] fruits, Appel.....	150
Silver leaf disease, Bintner.....	150
Diseases of apple, Saccá.....	150
Pear tree diseases, Saccá.....	150
Reversion and resistance to big bud in black currants, Lees.....	151
[Treatment of grape diseases, 1916], de Zúñiga.....	151
Grape downy mildew, Pachano.....	151
Gummosis in grape vines, de Arís.....	151
Citrus canker eradication in the State of Florida, Newell.....	151
Internal browning of lemons, Barrett.....	151
[Lemon stem-end rot in California].....	151
A parasite of the tree fern <i>Cyathea</i> , Stevens and Dalbey.....	151

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Life and writings of Professor F. E. L. Beal, McAtee.....	151
Annual report of the Government entomologist for 1918-19, Ritchie.....	151
[Economic insects in Dominica], Hutson.....	152
Annual report for 1918 of the zoologist, Warburton.....	152
[Economic insects in Sweden].....	152
[Contributions on economic insects].....	152
Report on the work of the entomological division, Speyer.....	152
Entomology, McSwiney.....	153
The pink bollworm, the boll weevil, and Lower California cotton, Pratt.....	153
Control of principal insects injurious to apple above ground, Headlee.....	153
Insects in their relation to forestry, Shufeldt.....	153
Relation of insects to dissemination of <i>Cronartium ribicola</i> , Snell.....	153
[Work with stored grain insects].....	153
The microbe parasites of insects.— <i>Bacillus hoplosternus</i> , Paillot.....	153
Combined Bordeaux oil emulsion spray, Macrum.....	153
Faunistic notes on Swedish Thysanoptera by late Dr. F. Trybom, Tullgren.....	154
New genera and species of Australian Thysanoptera, Hood.....	154
On some new Thysanoptera from southern India, Hood.....	154
On some new Idolothripidæ (Thysanoptera), Hood.....	154
Grasshoppers and control measures, Urbahns.....	154
Notes on two Miridæ, Camptobrochis and Paracalocoris, McAtee.....	154
The genus <i>Gargaphia</i> (Tingidæ; Heteroptera), Gibson.....	154
Internal parasites of Michigan Coccidæ, McDaniel.....	154
Natural control of the oyster-shell scale (<i>Lepidosaphes ulmi</i>), Tothill.....	154
New aphids from oaks, Davidson.....	155
Another Toxoptera feeding on sedge (Homoptera; Aphididæ), Baker.....	155
<i>Gallobellicus nicotianæ</i> of Koningsberger, den Doop.....	155
Anoplura from South African hosts, Bedford.....	155
A list of Coccidæ affecting various genera of plants, Green.....	155
The Coccidæ of South Africa, I-III, Brain.....	155
The olfactory sense of lepidopterous larvæ, McIndoo.....	155
Parthenogenesis in <i>Apanteles glomeratus</i> , Gautier.....	156
Some new tropical American moths, Dyar.....	156
The common cabbage worm in Wisconsin (<i>Pontia rapæ</i>), Wilson et al.....	156
Control work with grapevine cochylys in Vaudois vineyards in 1918, Faes.....	156
Notes on the larch case bearer (<i>Coleophora laricella</i>), Fernald.....	157
Notes on Cosmopterygidæ, with new genera and species, Braun.....	157
A new olethreutid from New York, Heinrich.....	157
<i>Tinea cloacella</i> bred from fungi, Weiss.....	157
A new genus in the dipterous family Cyrtidæ from South America, Cole.....	157
New genera and species of muscoid flies, Townsend.....	157
Facts concerning <i>Phormia azurea</i> , Roubaud.....	157

	Page.
The crane flies of New York.—I, Distribution and taxonomy, Alexander	157
The horn-fly in Porto Rico, Smyth	158
The lantana fly (<i>Agromyza lantana</i>), Froggatt	158
Activity of Tabanidæ in Florida, Mosier and Snyder	158
Structure, bionomics, and forest importance of <i>Oryhalus abietis</i> , Ritchie	158
Mosquitoes collected by the Canadian Arctic Expedition, 1913-1918, Dyar	158
Preliminary report of the Antimalarial Commission, Tottenham et al.	158
Notes on forest insects.—II, Pityophthorus in white pine, Blackman	158
Notes on North American species of Hippodamia (Coleoptera), Timberlake	158
Notes on <i>Eustrophus bicolor</i> , bred from fungi (Coleoptera), Weiss	158
Pulse beetles (store forms), Kunhi Kannan	158
Structure, bionomics, and forest importance of <i>Oryhalus abietis</i> , Ritchie	158
A cerambycid infesting pine cones in India, Champion	158
Descriptions of new North American Ptinidæ, Fisher	158
European corn-borer investigations, Woodbury et al.	159
<i>Pyrausta nubilalis</i> , de Crombrugge de Picquendaele	159
The alfalfa weevil and methods of controlling it, Reeves et al.	159
[The mango weevil in Bengal], Milligan	159
The pepper weevil (<i>Cryptorhynchus cubæ</i>), Hart	159
On the peach sawfly, Harukawa	159
Some chalcid wasps reared from cecidomyid galls, Gahan	159
A new chalcid fly parasitic on the Australian bulldog ant, Brues	159
The parasitic Aculeata, a study in evolution, Wheeler	159
On the hymenopterous parasites of Kermes, Howard	159
An economic study of <i>Nasonia brevicornis</i> , Froggatt	160
The progress of <i>Scolia manilæ</i> in Hawaii, Muir	160
The ants of the British Solomon Islands, Mann	160
Leaf-cutting ants and means of control, Barreto	160
Myrmecophilous insects from Cuba, Mann	160
The photic reactions of the honeybee, <i>Apis mellifera</i> , Minnich	160
Beekeeping in Oklahoma, Sanborn	160
Thirty-ninth report of Beekeepers' Association of Ontario, 1918	160
The common ticks of Nyasaland, de Meza	160

FOODS—HUMAN NUTRITION.

Nutritive value of the soy bean in the human diet, Bowers	160
Blood dried by the Krause process, Ströse	161
Acquisition and utilization of blood, Opel	161
Studies of mold in bread, Herter and Fornet	162
Gluten in Italian pastes, Cutolo	162
Some of the newer proprietary foods, Street	162
The household foam test for butter and oleomargarin, Sommer	162
Antiscorbutic properties of fresh, heated, and dried milk, Barnes and Hume	162
Antiscorbutic value of some Indian dried fruits, Chick et al.	163
Antiscorbutic value of canned vegetables, Campbell and Chick	163
Study of microorganisms found in merchantable canned foods, Cheyney	163
Note on soluble lead in the glaze of casseroles, Masters	164
Problems of food and our economical policy, Armstrong	164
Maintenance ration.—Minimum need of sugar and of fat, Bierry	165
Effect of aluminum compounds on metabolism, Schmidt and Hoagland	165
Effect of various acids on the digestion of proteins by pepsin, Northrop	165
Involution of the thymus in birds, McCarrison	165
Disorders of children and putrefactive intestinal flora, Porter et al.	165
The pathogenesis of deficiency disease, II, McCarrison	166
Action of radium emanation on yeast vitamin, Sugiura and Benedict	167
Biometric standards for energy requirements, Harris and Benedict	167
Energy loss of women during household work, Benedict and Johnson	167
Caloric requirements of normal infants and children, Talbot	167

ANIMAL PRODUCTION.

[Improvement of pasture], Somerville	167
Cottonseed meal, Fuller and Fraps	167
Purebred live stock of the United States	167

	Page.
Beef production, Gramlich.....	168
Hardening peanut-fed hogs, Burk and Ewing.....	169
Field damaged wheat for poultry, Waite.....	170
Hens <i>v.</i> pullets, Hannas.....	170
Culling for eggs and market.....	170
Management of growing chicks.....	170
Preserving eggs.....	170
Indian hides and skins.....	170

DAIRY FARMING—DAIRYING.

Dairy farming in southeastern Pennsylvania, Billings.....	170
Dairy-cattle industry in United States and other countries, Pirtle.....	171
A study of the birth weight of calves, Eckles.....	171
Appetite as a guide in feeding dairy calves, McCandlish.....	172
Cow-testing associations in California, Voorhies.....	172
The cost of milk production in New England, Gilbert.....	172
Corrosive sublimate as a preservative in composite samples, Jackson.....	173
Results with vat pasteurization and final package methods, Hammer.....	173
The cellular test for pasteurized milk, Frost and Moore.....	173
Fly pupæ in bottled milk, Riley.....	173
Suggestions for the marketing of cottage cheese, James.....	173
Studies on abnormal evaporated milk, Hammer.....	173
Dairy statistical references, Pirtle.....	174

VETERINARY MEDICINE.

Laboratory studies in tropical medicine, Daniels and Newham.....	174
Fevers in the Tropics, Rogers.....	174
The Bengal veterinary manual, 1918.....	174
Simple live stock remedies, Faville and Lehnert.....	174
Dips and dipping, Green.....	174
The germicidal activity of the eucalyptus oils, Greig-Smith.....	174
An experimental study of the action of chloramins, Fantus and Smith.....	174
Pharmacological action of cadmium, Alsberg and Schwartze.....	175
Pharmacological action of gossypol, Alsberg and Schwartze.....	175
Poisonous plants and means of combating them, Barnes.....	176
Ultraviolet studies on blood serum.....	176
The rôle of blood platelets in natural immunity, Govaerts.....	176
A contribution to the immunization process, von Eisler.....	176
Vaccination by injection of heated cowpox virus, Henseval.....	176
Studies in acid-fast bacteria, XI, XII, Kendall et al.....	177
Experimental studies on equine piroplasmiasis, du Toit.....	178
The heredity of rabies.....	178
Complement fixation in diagnosis of tuberculosis, Moursund.....	178
Complement fixation test for tuberculosis, Pritchard and Roderick.....	178
Public health studies concerning cheese, Schroeder and Brett.....	179
The development and histology of the cecum in the ox, Place.....	179
The Federal quarantine and the tick-infested area, Nighbert.....	179
Cholera of the sheep, McGowan.....	179
Occurrence of <i>Aleurobius farinæ</i> in skin scrapings of horses, Pillers.....	180
A study of the fecal examinations of 1,000 imported dogs, Wigdor.....	180
Studies on anthelmintics, V. Hall and Wigdor.....	180
New nematode in fowls having a termite as an intermediary host, Theiler.....	180
Common poultry diseases.....	180
Lice, mites, and cleanliness.....	180

RURAL ENGINEERING.

Calculation of flow in open channels, Houk.....	180
Theory of the hydraulic jump and backwater curves, Woodward.....	181
The hydraulic jump as a means of dissipating energy, Riegel and Beebe.....	181
Electric pumping with results of tests and operating records, Wagner.....	182
The influence of hydraulic works on Dutch agriculture.....	183
Irrigation in Sind, Main.....	183
Surface water supply of New Mexico, 1888-1917, French.....	183
Surface water supply of New Mexico, 1918, French.....	183

	Page.
Land clearing by explosives, Burrows.....	183
Explosives for subsoiling, McDonald.....	183
Poisoning green timber with sodium arsenite, Burrows.....	184
The arrangement of farm fields, Falconer.....	184
The oil engine and its application to Indian agriculture, Schutte.....	184
Kerosene as a fuel for farm tractors, Secor.....	184
The tractor as an investment, Davidson.....	184
Draft tests of farm machinery, Stirniman.....	184
Equalizers and hitches, White.....	186
Rural structures of reinforced concrete, Fanti.....	187
Notes on grain pressures in storage bins, Larkin.....	187
Capacity of silos and weights of silage, Eckles et al.....	187
Silo construction, Evans.....	187
A handy lick trough for sheep, Judd.....	187
Poultry houses.....	187
Brood coops and appliances.....	187
Poultry appliances and methods, Waite.....	187
A hot water circulation system of heating brooders, Hadlington.....	187
Water on the farm, Guthrie.....	187
A new process of sewage purification, Rolants.....	188
Activated sludge experiments at Sheffield, Haworth.....	188
Insect life on sewage filters, Parkinson.....	188
Fire prevention on the farm and elsewhere.....	188

RURAL ECONOMICS.

Cost of producing some Missouri farm crops, Johnson and Green.....	188
What cotton must bring, Wannamaker.....	189
A Government grain monopoly, von Bechtolsheim.....	189
Assurance of the food supply by means of supply contracts, Zitzen.....	189
The economic situation in Europe, Hoover.....	189
[Economic position of United Kingdom on foodstuffs, 1912-1918], Paton.....	189
Arable <i>v.</i> grass under the present conditions of agriculture, Kelly.....	190
The worker's share in agriculture, Rew.....	190
Scottish farm labor, Duncan.....	190
How the Government works with the farmer, Houston.....	190
List of organizations pertaining to agriculture in New York State.....	190
The public land system of Texas, 1823-1910, McKittrick.....	190
Regulations of Secretary of Agriculture under Products Inspection Law.....	190
The church in rural America, Bricker.....	191
Monthly Crop Reporter.....	191
History of prices during the war.....	191
Wholesale prices [of agricultural products] in Canada, 1916 and 1917.....	191
Agricultural statistics in the Netherlands.....	191
Crops and prices in Tunisia, Cookingham.....	191

AGRICULTURAL EDUCATION.

The significance of type activities in agricultural education, Eaton.....	192
General suggestions for vocational agricultural education.....	192
Vocational education.....	192
State Board for Vocational Education: Statement of plans and policies.....	193
Plans for vocational education in Minnesota.....	193
Plans for vocational education, 1919-20.....	193
Plans for vocational education in Nebraska.....	194
Plans for vocational education under Smith-Hughes Act in Utah, 1919-20.....	194
Vocational education: Plan of the State Board for Vocational Education.....	194
Methods in supervised practice under the Smith-Hughes law, Maltby.....	195
Manual and note book for supervised practice in agriculture, Nolan.....	195
Courses of study in vocational agriculture, Nolan.....	195
An introduction to agriculture, Upham and Schmidt.....	195
Exercises in plant life for vocational agricultural schools, Wheeler.....	195
Exercises in soils and fertilizers for schools, Wheeler.....	196
Course of study in home economics for schools of Louisiana, Helbing.....	196
Sewing for girls' club work, Powell.....	196
Bibliography of home economics, Lyford.....	196
Report of the women's institutes of the Province of Ontario, 1918.....	196

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

<i>Stations in the United States.</i>	Page.	<i>U. S. Department of Agriculture—Con.</i>	Page.
California Station:		Circ. 2, Sewing for Girls' Club Work, O. Powell	196
Bul. 313, Oct., 1919	138	Circ. 3, Drying Vegetables and Fruits for Home Use, F. P. Lund	114
Bul. 314, Oct., 1919	172	Circ. 4, Vacation Land.—The National Forests in Oregon	141
Iowa Station:		Circ. 5, Out-of-door Playgrounds of the San Isabel National Forest	141
Bul. 190, July, 1919	173	Circ. 6, A Summer Vacation in the Sopris National Forest	142
Research Bul. 51, Aug., 1919	172	Circ. 7, Trend of the Dairy-Cattle Industry in the United States and Other Countries, T. R. Pirtle	171
Research Bul. 52, Aug., 1919	173	Circ. 8, Arbor Day, L. C. Everard	141
Kansas Station:		Circ. 9, Meadow Fescue	136
Bul. 222, Oct., 1919	187	Circ. 13, Brood Coops and Appliances	187
Circ. 76, Sept., 1919	113	Circ. 15, Preserving Eggs	170
Maryland Station:		Circ. 16, Lice, Mites, and Cleanliness	180
Bul. 228, July, 1919	135	Circ. 17, Management of Growing Chicks	170
Bul. 229, July, 1919	137	Circ. 18, Culling for Eggs and Market	170
Bul. 230, Aug., 1919	187	Circ. 19, Poultry Houses	187
Bul. 231, Sept., 1919	170	Circ. 20, Common Poultry Diseases	180
Missouri Station:		Gado de Puro Sangre dos Estados Unidos	168
Bul. 165, Aug., 1919	188	Ganado de Pura Sangre de los Estados Unidos	168
Nebraska Station:		Office of the Secretary:	
Bul. 174, Sept., 1919	168	Circ. 144, Rules and Regulations of the Secretary of Agriculture under the Food Products Inspection Law of July 24, 1919	190
New Jersey Stations:		Circ. 145, General Regulations Governing the Importation, Manufacture, Storage, and Distribution of Fertilizers and Fertilizer Ingredients	128
Hints to Poultrymen, vol. 8, No. 1, Oct., [1919]	170	Bureau of Crop Estimates:	
New York Cornell Station:		Mo. Crop Rptr., vol. 5, No. 11, Nov., 1919	191
Mem. 25, June, 1919	157	Forest Service:	
Mem. 26, June, 1919	147	Pulpwood Consumption and Wood Pulp Production in 1918, F. H. Smith	144
North Dakota Station:			
Spec. Bul., vol. 5, No. 13, Aug., 1919	160		
Pennsylvania Station:			
Bul. 159, Sept., 1919	170		
Porto Rico Department of Agriculture and Labor Station:			
Bul. 19, Aug., 1919	150		
Texas Station:			
Bul. 241, Feb., 1919	168		
Bul. 242, Mar., 1919	169		
Bul. 243, Mar., 1919	121		
Bul. 244, Apr., 1919	121		
Wisconsin Station:			
Research Bul. 45, Aug., 1919	156		
Research Bul. 46, Oct., 1919	148		
Wyoming Station:			
Circ. 13, June, 1918	174		
Circ. 14, May, 1919	135

CONTENTS OF VOL. 42, No. 3.

	Page.
Recent work in agricultural science-----	201
Notes -----	300

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

Problems and methods in agricultural research, Wheeler-----	201
Examination of college trained chemist for Government service, Cotton--	201
The hydrolysis of stizolobin, Jones and Johns-----	201
Isoelectric points of proteins in certain vegetable juices, Cohn et al-----	202
The carbohydrates of fresh and dehydrated vegetables, Falk-----	202
Egyptian lettuce oil, Griffiths-Jones-----	202
Proteolytic activity of amylase preparations, Sherman and Neun-----	202
The chemical identification of thyroxin, II, Kendall and Osterberg-----	203
Influence of aspartic acid and asparagin on starch, Sherman and Walker--	203
Contribution to biochemistry of soy bean enzym (urease) Wester-----	204
The combination of enzym and substrate, I, II, Northrop-----	204
The sensitiveness of living yeast, von Euler and Emberg-----	204
Strengthening of catalase action in yeast cells, von Euler and Blix-----	204
Yeast growth and alcoholic fermentation by living yeast, Slator-----	204
Some experiments with pure cultures of bread yeast Henderson-----	204
Para cymene, II, III, Lubs and Young-----	205
Phthalic anhydrid, II, III, Monroe-----	205

	Page.
The chemistry of Burgundy mixtures, Mond and Heberlein.....	205
Chemicals received by the Bureau of Chemistry during the war, Buc.....	205
A nitrogen generator for laboratory use, Badger.....	205
Simple method for nitrogen in nitrates and nitrites, Arnd.....	205
Colorimetric and titrimetric procedures for nitrogen, Allen and Davisson.....	205
Estimation of cyanogen compounds.—II, Spielmann and Wood.....	206
The sensitiveness of some cyanid reactions, Ekeley and Macy.....	206
The microtitration of arsenic, Green.....	206
New titration method for hydrogen sulphid in sewage, Marzahn.....	207
The use of nickel crucibles in determining soil potassium, Walker.....	207
Determination of sulphate as BaSO ₄ , Kolthoff and Vogelenzang.....	207
Fat extraction apparatus, Pickel.....	207
Preservation of milk for chemical analysis, Palmer and Cooledge.....	207
The heat coagulation of milk, Sommer and Hart.....	208
Potential acidity of milk and method for its determination, Terry.....	208
Study of methods of determining added water in milk, Goldan.....	209
Method for preliminary detection of abnormal milk, Baker and Van Slyke.....	209
Determination of keeping quality of milk, Baker and Van Slyke.....	209
Some experiments on the differentiation of cow and buffalo milk, Todd.....	210
Rapid method for the determination of moisture in margarins, Frank.....	210
Determination of carbon monoxid in blood, Van Slyke and Salvesen.....	210
Determination of blood volume by carbon monoxid method, Salvesen.....	210
Action of furfural and dextrose on amino acids, Dowell and Menaul.....	210
A note on the determination of catalase in blood, Bodansky.....	211
A microsaccharimeter, Van Lutsenburg Maas and Van Iterson.....	211
Crystal formation in supersaturated raw sugar solutions, Van Ginneken.....	211
Crystallization of sugar from its aqueous solution, Prinsen-Geerligs.....	211
The foaming of raw and refinery beet sugar juices, Herzfeld.....	211
Manufacture of Farina from potatoes, Richards.....	211
Sucrose formation in the drying of potatoes, Waterman and Holleman.....	211
Dehydration of vegetables: Past, present, and future, Prescott.....	211
Commercial dehydration in the food problem, Prescott and Sweet.....	211
The ripe olive process as used in California factories.....	212
Researches on oil-producing fruits and seeds, Jumelle.....	212
Possibility of commercial utilization of tomato and grape seed, Shrader.....	212
Notes on the preservation of eggs, Macomber.....	212

METEOROLOGY.

Agriculture and weather forecasting, Lopez.....	212
Periodicities in atmospheric pressure, Lévine.....	212
A new general classification of climates, Köppen.....	212
The climate of South Africa, Wood.....	212
Amount and composition of rain at Rothamsted, Russell and Richards.....	213
Relation of irrigation to humidity in recently reclaimed desert, McGregor.....	214
The cooling of the soil at night and late spring frosts, Franklin.....	214
Wind, and the distribution of pathogenic soil organisms, MacMillan.....	215

SOILS—FERTILIZERS.

A quantitative relation between soil and the soil solution, Keen.....	215
A note on the capillary rise of water in soils, Keen.....	216
Soil acidity: The resultant of chemical phenomena, Noyes.....	216
A preliminary note on soil acidity, Winter.....	217
Intensive formation of nitrates by biochemical methods, Dubourg.....	217
Observations on soil protozoa, Cutler.....	217
Analyses of soils of Crisp County, Worsham et al.....	217
Manures and manuring, Harrison.....	218
Pot-culture experiments, 1918, Voelcker.....	218
Artificial manures.—Experiments in India, II, Mann and Paranjpe.....	218
Artificial fertilizers in Japan, Dickover.....	218
Limestone and phosphate.....	218
Retail prices of nitrate of soda and acid phosphate, May 1, 1919.....	219
Saltpeter in Guatemala, Gale.....	219
Fixation of atmospheric nitrogen and manufacture of synthetic products.....	219
Manufacture of nitrates by electrothermic oxidation of nitrogen, Vèzes.....	219

	Page.
Manufacture of nitrates by electrothermic oxidation of nitrogen, Richard	219
The synthesis of ammonia, Vèzes	219
Synthesis of ammonia and its transformation into nitric acid, Richard	219
The action of ammonium salts in plant physiology, Söderbaum	219
Phosphatic fertilizers, Nicola	220
Phosphate requirements of paddy soils, Warth and Maung Po Shin	220
Natural phosphate in Switzerland and its agricultural use, Truninger	220
Phosphate rock in Morocco	220
The potash industry of the United States and its possibilities, Wells	220
Potash recovery at cement plants, Wilson	221
Potash fertilizer experiments in 1916 and 1917	221
Fertilizer experiments with potash lime [kalikalk], Söderbaum	221
Gypsum, Stone	221
Sulphur as a fertilizer for alfalfa in southern Oregon, Reimer and Tartar	221
Fertilizing action of sulphur on grapes, Chauzit	222
Experiments with manganese and other stimulants, 1908-1917, Söderbaum	222
The action of fluorids on vegetation, Gautier and Clausmann	223
Engine wastes: The cachaza and cinders, Calvino	223
Commercial fertilizers, Hibbard	223
Commercial fertilizers, 1919, Woods	223
Fertilizer analyses	223
Analyses of fertilizers: Fall season, 1918	223
The National Fertilizer Association: Organization and growth, 1894-1918	223

AGRICULTURAL BOTANY.

Flora of the District of Columbia and vicinity, Hitchcock and Standley	223
Phytogeography of the eastern mountain-front in Colorado, I, Vestal	224
The genus <i>Homalium</i> in America, Blake	224
New South American spermatophytes collected by H. M. Curran, Blake	224
Anatomical studies on littoral plants of Madagascar, Denis	224
A unifoliolate mutation in the adzuki bean, Blakeslee	224
The problem of heterostyly, Tischler	224
A biochemic basis for the study of taxonomy, heredity, etc., Reichert	224
Studies in the physiology of the fungi, VI-X	224
Conditions affecting growth of <i>Azotobacter chroococcum</i> , Allen	225
The physiology of pollen, Bobiljoff-Preisser	225
The development and contents of conifer needles, Kracht	225
Direct assimilation of organic carbon by <i>Ceratodon purpureus</i> , Robbins	226
The reduction of carbon dioxid by hydrogen peroxid, Wislicenus	226
The assimilation of carbon dioxid, Stoll	226
Willstätter's investigations on carbon dioxid assimilation, Waterman	226
Inulin in plants, its origin and transformation, Colin	226
Variation of carbohydrates in leaves, Michel-Durand	226
Biochemical researches on rôle of glucosids in plants, Combes	226
Immunity of plants to their own products, Combes	227
The development of typical leaf glucosids in <i>Digitalis</i> , Straub	227
Relations between leaf anthocyanin and respiration, Nicolas	227
Respiration and germinability in seeds, Hausman and Ivanicof	227
Influence of illumination on glucose, de Besteiro and Michel-Durand	227
Influence on light on permeability of the plasma membrane, Tröndle	227
Isotonic coefficients and utilization in determining permeability, Fitting	227
[Osmotic values in plants], Ursprung and Blum	228
Electrical conductivity as a measure of vegetable saps, Haynes	228
Fibrous protoplasmic structures in plant cells, Åkerman	228
The significance of the chondriome, Guilliermond	228
The vegetable proteases: I, Introductory, Fisher	228
Diastase activity in <i>Solanum tuberosum</i> , McGinty	228
Distribution of mineral elements and nitrogen in etiolated plants, André	229
Studies on traumatropisms, Stark	229
Traumatropism, Stark	229
Colorimeter in indicator method, H-ion determination, Duggar and Dodge	229
The micro-colorimeter in the indicator method, Duggar	229
Anthocyanin as a microchemical reagent, Gertz	229
The mounting of microscopic preparations, Coupin	229
Plant breeder's envelope, Davis	229

FIELD CROPS.

	Page.
[Report of field crops work in Ontario, 1918]-----	229
[Report of the Ontario agricultural and experimental union]-----	230
[Report of field crops work in British Virgin Islands, 1918-19], Watts-----	230
[Report of field crops work on the Gold Coast, 1916, 1917, and 1918]-----	230
[Agricultural products of French Africa]-----	230
[Report of field crops work in Rhodesia, 1917-18], Nobbs-----	230
The improvement of pasture land in Morocco, Ducellier-----	230
Preparing land for grain crops on the prairies, compiled by Gridale-----	230
The Devaux method of cereal culture, Manvilli-----	230
Experiments in methods of sowing barley, 1909-1915, Iversen-----	230
Corn families of South Dakota, Hume-----	231
Synthetic production of high-protein corn, Hayes and Garber-----	231
Corn production in Kansas, Cunningham-----	232
Cotton experiments, 1918, Brown-----	232
[The improvement of Egyptian cotton], Bolland-----	232
American cotton in the last three crop years, Heizmann-----	232
Cotton growing in Australia-----	233
The flax industry in Australia, Ward-----	233
The industrial exploitation of jume [in Tucuman], Diaz-----	233
The history of the lupine, Michaelis-----	233
Sensitiveness of lupines to calcium, Pfeiffer and Simmermacher-----	233
Oat growing experiments in Scotland, Symon-----	233
Perennial rye grass (<i>Lolium perenne</i>), Carrier-----	233
The rejuvenation and improvement of potatoes, Aumiot-----	233
Fertilizer experiments with potatoes, Jenkins and Clinton-----	233
Missing hills in potato fields: Their effect upon the yield, Collison-----	234
Preliminary note on the manuring of rice [in Egypt], Cartwright-----	234
Sudan grass, Vinal and Getty-----	234
Sugar beet production in Prussia during the war, Bartens-----	234
Report on sugar-cane experiments 1917-1919, Bovell and d'Albuquerque-----	234
Sugar cane varieties, Jeswiet-----	235
Studies in Indian sugar canes, IV-V, Barber-----	235
The germination of hulled and hullless timothy seed, Heinrich-----	236
Fertilizer experiments with tobacco, Diem-----	237
Selection experiments with Deli tobacco, III, Honing-----	237
Stocks of leaf tobacco-----	237
Germinating freshly-harvested winter wheat, Harrington-----	237
Prevention of heating in wheat by means of air-tight storage, Dendy-----	237
Farm seeds and weeds, Roberts-----	238
Seed reports, 1916, 1917, 1918, Kellogg-----	238
[Seed testing in Wyoming], Vass-----	238

HORTICULTURE.

Science and fruit growing, Duke of Bedford and Pickering-----	238
Commerce and trade in Italian horticultural products, Mondini-----	238
The valuation of fruit trees, Lécolier-----	238
The culture of small fruits, Pétraz-----	238
Grape diseases and modern methods of controlling them, Müller-----	238
Six years' experience with budded avocados, Whedon-----	238
The avocados of Mexico: A preliminary report, Popenoe-----	239
Essays on tea plucking, Cohen Stuart, Hamakers, and Siahaja-----	239
Commercial rose culture, Holmes-----	239

FORESTRY.

A policy of forestry for the Nation, Graves-----	239
Annual report of the director of forests, 1918, Swain-----	239
A suggested departure in National Forest stumpage appraisals, Flint-----	239
Comments on a suggested departure in stumpage appraisals, Girard-----	239
Alignment charts in forest mensuration, Bruce-----	239
Analysis of logging costs in Ontario, compiled by Mullory and Robertson-----	239
A volume table for hewed railroad ties, Girard and Swartz-----	240
British Guiana timbers, Hohenkerk-----	240
Basket willow culture in Maryland, Pfeiffer-----	240

	Page.
Inflorescence and seed forming in <i>Cinchona ledgeriana</i> , Feenstra-Sluiser.....	240
Bordered pits in Douglas fir, Griffin.....	240
Causes of natural coagulation in the latex of <i>Hevea brasiliensis</i> , Vernet.....	240
Effect of fertilization on the seed of Jeffrey pine, Munns.....	241
The management of a teak forest, Walker.....	241
Turpentine orcharding effect on long-leaf timber, Drolet.....	241
"Built-up wood," Butler.....	241
The wood-using industries of Maryland, Besley and Dorrance.....	242

DISEASES OF PLANTS.

The first decade of the American Phytopathological Society, Shear.....	242
Plant pathology in Japan, Lee.....	242
Development of plant pathology in Japan: Historical sketch, Shirai.....	242
Philippine plant diseases, Reinking.....	242
[Important diseases of food plants], Behrens.....	242
Relation of temperature and humidity to infection by fungi, Lauritzen.....	242
Daylight fumigation with hydrocyanic acid, Quayle.....	242
Soil disinfection by hot water, Byars and Gilbert.....	243
Experiments on the control of the root-knot nematode, Byars.....	243
Rhizoctonia in lawns and pastures, Piper and Coe.....	243
Specialization of black cereal rust in Sweden and other lands, Eriksson.....	243
The grain of barley or wheat, infected by smut through the flower, Miura.....	244
<i>Puccinia graminis tritici</i> and <i>P. graminis tritici-compacti</i> , Leach.....	244
Foot-rot disease of wheat—historical and bibliographic, Stevens.....	244
Wheat scabs as affected by systems of rotation, Holbert et al.....	244
Distinguishing nematode galls of wheat from bunted kernels, Berg.....	245
A dry method of treating seed wheat for bunt, Darnell-Smith and Ross.....	245
Inheritance of anthracnose resistance, McRostie.....	245
Additional varieties of beans susceptible to mosaic, Reddick and Stewart.....	245
Hot-water seed treatment for blackleg of cabbage, Norton.....	245
Onion diseases and their control, Walker.....	246
Some constitutional diseases of the potato, Murphy.....	246
Some potential parasites of the potato tuber, Shapovalov.....	246
Potato wart: A dangerous new disease.....	246
Cooperative potato spraying in 1917, Clinton and Harvey.....	246
Sweet potato mosaic, Ensign.....	246
Rust resistance in timothy, Hayes and Stakman.....	247
Fusarium root-rot of tobacco, Johnson.....	247
<i>Macrosporium solani</i> on tomato fruit, Rosenbaum.....	247
Keeping quality of strawberries and temperature when picked, Stevens.....	247
Inspection of phænogamic herbaria for rusts on Ribes, Clinton.....	247
Infection of <i>Pinus strobus</i> with <i>C. ribicola</i> , Clinton and McCormick.....	247
Investigations of white pine blister rust, 1918, Spaulding.....	248
Oomycetes parasitic on pine seedlings, Hartley and Hahn.....	248
Notes on some Uredinales attacking pines, Hedgcock and Hunt.....	248
A study of the rots of western white pine, Weir and Hubert.....	248
Pythium and Rhizoctonia seedbeds, Pierce and Hartley.....	248
Fungi which decay weaved roofs, Blair.....	249

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Recollections of the early days of the Biological Society, Howard.....	249
Mutanda ornithologica, VIII, Oberholser.....	249
Description of a whippoorwill from Porto Rico, Wetmore.....	249
Insect artizans and their work, Step.....	249
Economic entomology, Cockayne.....	249
Rules and regulations of the State Plant Board of Mississippi.....	249
The corn leaf hopper (<i>Peregrinus maidis</i>), Fullaway.....	249
Response of eggs of <i>Aphis avenæ</i> and <i>A. pomi</i> to various sprays, Peterson.....	250
[Plant lice transmit mosaic], Stuart.....	250
Dosage schedule for fumigation with liquid hydrocyanic acid, Woglum.....	250
Notes on pupæ of <i>Pyrausta nubilalis</i> and <i>P. penitalis</i> , Mosher.....	250
An injurious leaf miner of the honeysuckle, Crosby and Leonard.....	250
Notes on the bionomics of <i>Stegomyia fasciata</i> , I, Fielding.....	251
The apple maggot, Caesar and Ross.....	251

	Page.
Naphthalene <i>v.</i> chicken lice, Abbott.....	252
The chicken sticktight flea (<i>Sarcopsylla gallinacea</i>), Sanborn.....	252
Hibernating habits of two species of ladybirds, Fink.....	252
The bean ladybird and its control, Chittenden.....	252
<i>Xanthonia villosula</i> injuring forest trees, Wellhouse.....	252
Notes on <i>Platydemia ellipticum</i> and its fungus host, Weiss.....	252
Conserving our natural resources of sugar, Phillips.....	252
The fowl tick and how premises may be freed from it, Bishopp.....	252
The depluming mite of chickens: Eradication by one treatment, Wood.....	253

FOODS—HUMAN NUTRITION.

Food and the public health, Savage.....	253
Progress in food chemistry, Beckurts, Beck, and Rüder.....	253
Food control, from the standpoint of nutrition, McCollum.....	253
Standards of living.....	253
The lowered nutritive value of the commonest food materials, Haupt.....	253
The utilization of blood protein and skim milk protein in food, Laehns.....	254
Condensed or evaporated milks, malted milks, and milk powders, Street.....	254
Delicious products of the dairy, McDowell.....	254
Use of poultry club products.....	254
Preliminary study in the bacteriology of jellied meat products, Allen.....	254
Effect of milling on digestibility of Graham flour, Langworthy and Deuel.....	254
Potato flour and potato bread, Le Clerc.....	255
[Kiln-dried green maize (<i>gaudes</i>) of Echenon], Granvigne.....	255
Lupine bread, Pohl-Breslau.....	255
Fruit in the home, Marescalchi-Baur.....	255
Hydrogenated oils in nutrition, Bordas.....	255
Infant feeding with melted butter flour, Türk.....	255
Deleterious effect of the alkalization of infants' food, Hess and Unger.....	256
Antineuritic vitamin in artificial feeding of infants, Daniels et al.....	256
The deficiency aspect of maize products, Green.....	256
Relation between fat-soluble vitamin and yellow pigments, Steenbock.....	257
Carotinoids as fat-soluble vitamin, Palmer.....	257
Carotinemia: A new clinical picture, Hess and Myers.....	257
The antiscorbutic value of the banana, Lewis.....	257
Experiments with rats and dogs on a lipid-free diet, Stepp.....	257
Cholesterin content of blood and bile on lipid-free diet, Stepp.....	258
The digestion and absorption of protein, Kugler.....	258
Effect of adrenalin, desiccated thyroid, etc., on catalase, Burge.....	258
The alleged relation of catalase to animal oxidations, Stehle.....	259
The catalases of the blood during anesthesia, Reimann and Becker.....	259
The effect of pyretics and antipyretics on catalase production, Burge.....	259
Animal calorimetry.—XVI, Influence of lactic acid, Atkinson and Lusk.....	259
The calcium requirement for man and animals, Loew.....	260
The bacteriologic analysis of the fecal flora of children, Morris et al.....	260
Notes on <i>Bacillus botulinus</i> , Burke.....	260
The occurrence of <i>Bacillus botulinus</i> in nature, Burke.....	260
Spoiled canned foods and botulism, Burke.....	261
"Spoiled canned foods and botulism," Weinzirol.....	261
Botulism, I, II.....	261
Botulism from eating canned ripe olives, Armstrong et al.....	261
An outbreak of botulism, Jennings, Haass, and Jennings.....	262

ANIMAL PRODUCTION.

Problems of fertilization, Lillie.....	262
Heredity, Thomson.....	262
Refractive index of blood serum of albino rat at different ages, Hatai.....	262
Composition and feeding value of waste offals, Honcamp and Blanck.....	263
Feeding stuffs report, 1917 and 1918, Kellogg.....	263
Live stock and dairy farming, Gardner et al.....	263
Biotechnology of meat, fat, and milk production, Ereky.....	263
Cooperative live stock marketing, Thomson.....	263
Results of live stock experiments.....	263
Results of 1918-19 live stock experiments.....	264

	Page.
Growing beef on the farm, Farley.....	264
Judging beef cattle, Thompson.....	264
The hides of colonial cattle, Boulanger.....	264
Comparative rations for wintering breeding ewes, Russell.....	264
The goat: Its use and management, Bird.....	265
Maintenance and production value of protein mixtures, Hart and Steenbock.....	265
The acid-base balance in animal nutrition, I, II, Lamb and Evvard.....	266
Effect of feeding peanuts on the quality of pork, Dowell and Friedemann.....	267
Finishing pigs for market, Fjeldsted and Potter.....	267
Pig keeping on money-making lines, Powell-Owen.....	268
The pig, Gouin.....	268
Commercial poultry raising, Roberts.....	268
Profitable poultry keeping, Brown.....	268
The hen at work, Cobb.....	268
Rational feeding of poultry, Chenevard.....	268
Originating and standardizing a new variety of Cornish, Card.....	268
Culling the poultry flock.....	268
Increase in egg production in the winter season, Graham.....	268
Points for egg buyers.....	268
Practical rabbit keeping, Farrington.....	268

DAIRY FARMING—DAIRYING.

Farm dairying, Larsen.....	269
Dairying, Fascetti.....	269
Reports of Bernese Dairy School at Rütli-Zollikofen, Peter et al.....	269
How to feed the dairy cow, van Pelt.....	269
The cost of milk production in the district of Montreal, Barton.....	269
The composition of Egyptian cow milk, Hogan and Azadian.....	269
The composition of Egyptian goat milk, Hogan and Azadian.....	269
Practical buttermaking, Walker-Tisdale and Robinson.....	269
Cheese making, Decker, rewritten by Sammis.....	269
Practical cheese making, Walker-Tisdale and Woodnutt.....	270
The practice of soft cheese making, Walker-Tisdale and Robinson.....	270
A broader field for the creamery, Rawl.....	270

VETERINARY MEDICINE.

On the mechanism of immunization, Shaw-Mackenzie.....	270
Methods of choice in immunity, Shera.....	270
Contributions to biochemistry of pathogenic anaerobes, VIII, Harris.....	271
Distribution of nonprotein nitrogen in anaphylaxis, Hisanobu.....	271
Hydrogen-ion concentration and antiseptic potency, Browning et al.....	271
Notes on Carrel-Dakin's method of treatment, Dunne.....	272
Use of "lysochlor" for wounds and parasitic conditions, Middeldorf.....	272
Shell wounds and treatment with 10 per cent sodium chlorid, Middeldorf.....	272
Glanders, Conn.....	272
The pathology and diagnosis of glanders, Pfeiler.....	272
Contribution to the complement deviation test for glanders, Rudolf.....	272
Importance of a physical examination for bovine tuberculosis, Panisset.....	273
The intradermal tuberculin test, Ackley.....	273
Tuberculosis in live stock, Kiernan and Wight.....	273
The tuberculin test on cattle in Mauritius, Lionnet.....	273
The cow in health and disease, Conn.....	273
Meat poisoning and its relation to diseases of men and animals, Spiecker.....	273
Meat poisoning epidemic and paratyphoid infection in sheep, Frickinger.....	273
The pathology of contagious abortion in sheep, Manninger.....	273
The specific prevention of paratyphoid abortion in mares, Zeh.....	273

RURAL ENGINEERING.

The rural efficiency guide.—II, Engineering, Yeoman.....	274
Agricultural hydraulics, Diéner.....	274
Handbook of hydraulics, King.....	274
Discharge coefficients for canal head gates, Longwell and Hinds.....	274

	Page.
Water storage and the water code, Smith.....	274
Viability of <i>Bacillus coli</i> and <i>B. aerogenes</i> in water, Winslow and Cohen.....	274
Distribution of <i>Bacillus coli</i> and <i>B. aerogenes</i> , Winslow and Cohen.....	275
Waste waters from potato-starch factories in Hungary, Halmi.....	275
Determination of the duty of water by analytical experiment, Hammatt.....	275
The use of alkali water for irrigation, Harris and Butt.....	276
Use and waste of irrigation water, Smith.....	276
Irrigation experiments on light and improved soils, Gerlach and Groppe.....	276
Irrigation.....	276
Irrigation, Wood.....	276
Tile drainage in South Carolina, Eason.....	277
Soil drainage, Allan.....	277
Drainage and crop production in India, Howard and Howard.....	277
Terracing in Oklahoma, Bentley.....	278
Forest clearing machines, Eberts.....	278
Tests of Grade-III TNT for clearing land, or similar uses, Montgomery.....	278
Report on shot of Grade-III TNT under water, Montgomery.....	278
Tests of Grade-III TNT for shooting oak stumps, Montgomery.....	278
"Adode" shot with Grade-III TNT on bowlder, Tiffany.....	278
American highway engineers' handbook, Blanchard et al.....	279
Handbook for highway engineers, Harger and Bonney.....	279
A treatise on roads and pavements, Baker.....	279
Fourth biennial report of the Wisconsin Highway Commission, 1916-1917.....	279
Wood and other organic structural materials, Snow.....	280
Timber: Its strength, seasoning, and grading, Betts.....	280
Relation between average life of ties and percentage of renewals, Thorne.....	281
Electrolysis in concrete, Rosa, McCollum, and Peters.....	281
The enclosing of pastures with wire, Brüne.....	282
Farm engines and how to run them, Stephenson et al.....	282
Traction farming and traction engineering, Stephenson.....	282
Starting the tractor engine at ten below zero, Farrington.....	282
The farm tractor handbook, Sherwood.....	282
Light tractor experience survey.....	282
Influence of tractor weight on drawbar pull, Farrington.....	283
Dynamometer for tractor and implement tests, McIntosh.....	283
Review of mechanical cultivation, Ringelmann.....	283
New agricultural implements for India, Henderson.....	283
Balances and hitches for agricultural machines, Conti.....	283
[Plowing] experiment.....	283
Milking machines, Burkitt.....	283
Report of committee on labor-saving devices, Hind.....	284
Report of the committee on manufacturing machinery, Williams et al.....	284
Cotton gin fires caused by static electricity.....	284
Grain dust explosions and fires, Price.....	284
Mechanics of the household, Keene.....	285
Modern homes, barns, garages, and farm buildings.....	285
Farm buildings.....	285
Dairy barn and milk house arrangement, Frandsen and Nevens.....	285
Barn ventilation, Smith.....	285
Poultry houses and fixtures.....	286
Silos, Wilson.....	286
Silos and silage, Figueroa.....	286
The fodder silo, Rodriguez.....	286
RURAL ECONOMICS.	
Topical studies and references on American agriculture, Schmidt.....	286
The farmer and the new day, Butterfield.....	286
Has New York an agricultural policy? Jordan.....	286
Address of D. F. Houston, Secretary of Agriculture, before the Association of American Agricultural Colleges and Experiment Stations.....	286
Address of D. F. Houston, Secretary of Agriculture, before the National Association of Commissioners of Agriculture.....	287
Mr. Lloyd George and agriculture.....	287
French agriculture and the war, Sagnier.....	287
The foreign demand for agricultural products, Hibbard.....	287

	Page.
The vital concern of agriculture in foreign trade, Brand.....	287
International phases of the land question, Carver.....	287
Public lands in Oregon and Washington.....	288
Farm tenancy, Taylor.....	288
The agricultural laborer, Valdour.....	288
Working and living conditions of women in Bavarian agriculture, Kempf.....	288
The industrial council as a means for increasing production, Warmbold.....	288
Organization for extension work: The farm-bureau plan, Simons.....	289
Solving the farmer's marketing problem, Geddes.....	289
Marketing opportunities for New Hampshire farms, Farmer.....	289
Eastern States exposition market plan, Selby.....	289
Marketing bureaus and cooperative laws, Thompson.....	289
Cooperation [in Ontario].....	289
Foods and markets department of Farms and Markets Council, Porter.....	289
The middleman a necessity, Weld.....	289
"Hedging" in the futures market, Smith.....	290
Relation of banking to the cattle industry, McClure.....	290
Cost of production in relation to profits, Boss.....	290
Farm costing, Park.....	290
Report of the farm survey in Oxford County, Leitch.....	290
Methods of maintaining fertility on successful New Jersey farms, App.....	290
Texas Farm Management and Experiment Associations.....	291
Manual of laws pertaining to the Department of Farms and Markets.....	291
Rural income-tax, Park.....	291
Agriculture and forestry in Austria-Hungary, 1916.....	291
Prices and wages in India.....	291

AGRICULTURAL EDUCATION.

Relation of general science to agricultural instruction, Hatch et al.....	291
Training teachers of agriculture, Bricker.....	292
Survey of the needs in vocational home economics education, Bigelow.....	292
Home economics in the woman's college, Wheeler.....	293
Agricultural home economics instruction for women, Echavarria.....	294
Experimental Institute of Agricultural Mechanics of Buenos Aires, Conti.....	294
The ideal university, Marotta.....	294
Agricultural education in the Republic of Argentina.....	294
Report of commissioner of vocational education for 1918, Snyder.....	294
Vocational education, Blair et al.....	294
First biennial report of the State Board for Vocational Education.....	295
Agricultural education.....	295
Report of State Board for Vocational Education for 1919.....	295
The Michigan plan for vocational education under the Smith-Hughes law.....	295
Plans for administration of Smith-Hughes Act in Missouri for 1919-20.....	295
Report on vocational education and manual training for 1918, O'Leary.....	296
State-aided evening vocational schools.....	296
Plans of the Oklahoma State Board of Vocational Education.....	296
Revised plans under the Smith-Hughes law [in Oregon].....	297
Annual report of the agricultural division for 1917-18, Dennis.....	297
Plans for cooperation for vocational education in South Dakota.....	297
Agriculture for eighth year, Tex.....	298
The teaching of corn and corn culture in elementary agriculture, Ullrich.....	298
A year's work in vocational agriculture: Plant production, Guilbeau.....	298
Laboratory exercises in plant production, Blanton et al.....	298
Laboratory exercises in animal production, Blanton et al.....	298
Use and preparation of food, compiled and edited by Windsor.....	298
How teachers may use Farmers' Bulletin 1044, Dille.....	299
Gardening instructions for club members.....	299
Boys' agricultural club work in the Southern States, Hill and Chambers.....	299
Status of county agent work. Northern and Western States. 1918, Lloyd.....	299

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

<i>Stations in the United States.</i>	Page.	<i>U. S. Department of Agriculture—Con.</i>	Page.
Arizona Station :		Farmers' Bul. 1070, The Fowl Tick and How Premises May be Freed From It, F. C. Bishopp-----	252
Bul. 88, May 15, 1919-----	276	Farmers' Bul. 1073, Growing Beef on the Farm, F. W. Farley-----	264
California Station :		Farmers' Bul. 1074, The Bean Ladybird and its Control, F. H. Chittenden-----	252
Bul. 315, Nov., 1919-----	223	Circ. 25, Points for Egg Buyers: What to Sell, What to Buy, How to Candle, Egg-candling Devices-----	268
Connecticut State Station :		Circ. 26, Delicious Products of the Dairy, J. C. McDowell____	254
Bul. 213, July, 1919-----	254	Circ. 27, Gardening Instructions for Club Members-----	299
Bul. 214, Sept., 1919-- 233, 246, 247	247	Circ. 28, Cotton Gin Fires Caused by Static Electricity--	284
Kansas Station :		Circ. 30, Organization of a County for Extension Work—The Farm-Bureau Plan, L. R. Simons-----	289
Ft. Hays [Circ. 1], Apr. 5, 1917-----	263	Circ. 31, Culling the Poultry Flock: Why, When, and How_	268
Ft. Hays Circ. 6, Apr. 12, 1919-----	264	Circ. 32, Potato Wart—A Dangerous New Disease-----	246
Maine Station :		Circ. 33, How Teachers May Use Farmers' Bulletin 1044, The City Home Garden, A. Dille-----	299
Off. Insp. 93, Oct., 1919____	223	Circ. 36, Use of Poultry Club Products-----	254
Mississippi Station :		Circ. 37, Status and Results of County-agent Work, Northern and Western States, 1918, Showing War Service of the County Agent, W. A. Lloyd____	299
Bul. 186, Mar., 1919-----	232	Circ. 38, Boys' Agriculture Club Work in the Southern States, I. W. Hill and C. L. Chambers-----	299
Missouri Station :		Circ. 39, A Report on the Retail Prices of Nitrate of Soda and Acid Phosphate as of May 1, 1919-----	219
Research Bul. 34, June, 1919-----	207	Circ. 42, Perennial Rye-Grass (<i>Lolium perenne</i>), L. Carrier_	233
Nebraska Station :			
Circ. 6, Oct., 1919-----	285		
New York State Station :			
Bul. 459 (Popular Ed.), May, 1919-----	234		
Oklahoma Station :			
Bul. 123, Feb., 1919-----	252		
Bul. 124, May, 1919-----	267		
Bul. 125, July, 1919-----	264, 267		
Oregon Station :			
Bul. 163, July, 1919-----	221		
Bul. 165, Oct., 1919-----	267		
South Dakota Station :			
Bul. 186, Aug., 1919-----	231		
Utah Station :			
Bul. 169, July, 1919-----	276		
<i>U. S. Department of Agriculture.</i>			
Bul. 799, A Study of the Rots of Western White Pine, J. R. Weir and E. E. Hubert-----	248		
Farmers' Bul. 1060, Onion Diseases and Their Control, J. C. Walker-----	246		
Farmers' Bul. 1068, Judging Beef Cattle, E. H. Thompson_	264		
Farmers' Bul. 1069, Tuberculosis in Live Stock: Detection, Control, and Eradication, J. A. Kiernan and A. E. Wight-----	273		

U. S. Department of Agriculture—Con.

Office of the Secretary :	Page.
Circ. 146, Address of D. F. Houston, Secretary of Agriculture, before the National Association of Commissioners of Agriculture, Chicago, Ill., November 11, 1919.....	287
Circ. 147, Address of D. F. Houston, Secretary of Agriculture, before the Association of American Agricultural Colleges and Experiment Stations, Chicago, Ill., November 12, 1919.....	286
Scientific Contributions: ¹	
The Examination of the College Trained Chemist for Government Service, W. J. Cotton.....	201
The Hydrolysis of Stizolobin, the Globulin of the Chinese Velvet Bean, <i>Stizolobium niveum</i> , D. B. Jones and C. O. Johns....	201
Para Cymene, II, III, H. A. Lubs and R. C. Young.....	205
Phthalic Anhydrid, II, III, K. P. Monroe.....	205
Chemicals Received by the Bureau of Chemistry During the War, H. E. Buc....	205
Dehydration of Vegetables: Past, Present, and Future, S. C. Prescott.....	211
Commercial Dehydration: A Factor in the Solution of the International Food Problem, S. C. Prescott and L. D. Sweet.....	211
Possibility of Commercial Utilization of Tomato Seed and Grape Seed, J. H. Shrader.....	212
Wind and the Distribution of Pathogenic Soil Organisms, H. G. MacMillan....	215
Flora of the District of Columbia and Vicinity, A. S. Hitchcock and P. C. Standley.....	223
The Genus <i>Homalium</i> in America, S. F. Blake.....	224
New South American Spermatophytes Collected by H. M. Curran, S. F. Blake..	224
Plant Breeder's Envelope, R. L. Davis.....	229
Sudan Grass, H. N. Vinall and R. E. Getty.....	234

U. S. Department of Agriculture—Con.

Scientific Contributions—Con.	Page.
Germinating Freshly Harvested Winter Wheat, G. T. Harrington.....	237
A Policy of Forestry for the Nation, H. S. Graves.....	239
A Suggested Departure in National Forest Stumpage Appraisals, H. R. Flint....	239
Comments on a Suggested Departure in National Forest Stumpage Appraisals, J. W. Girard....	239
A Volume Table for Hewed Railroad Ties, J. W. Girard and U. S. Swartz..	240
Bordered Pits in Douglas Fir: A Study of the Position of the Torus in Mountain and Lowland Specimens in Relation to Creosote Penetration, G. J. Griffin.....	240
Effect of Fertilization on the Seed of Jeffrey Pine, E. N. Munns.....	241
"Built-up Wood," O. M. Butler.....	241
The First Decade of the American Phytopathological Society, C. L. Shear.....	242
Plant Pathology in Japan, H. A. Lee.....	242
The Relation of Temperature and Humidity to Infection by Certain Fungi, J. I. Lauritzen.....	242
Soil Disinfection by Hot Water to Control the Root-knot Nematode and Parasitic Soil Fungi, L. P. Byars and W. W. Gilbert..	243
Experiments on the Control of the Root-knot Nematode, <i>Heterodera radicola</i> , L. P. Byars.....	243
Rhizoctonia in Lawns and Pastures, C. V. Piper and H. S. Coe.....	243
Wheat Scabs as Affected by Systems of Rotation, J. R. Holbert, J. F. Trost, and G. N. Hoffer.....	244
Some Potential Parasites of the Potato Tuber, M. Shapovalov.....	246
Keeping Quality of Strawberries in Relation to Their Temperature When Picked, N. E. Stevens....	247

¹ Printed in scientific and technical publications outside the Department.

⁴ Acting director.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Chief, Office of Experiment Stations.*
Associate Editor: H. L. KNIGHT.

EDITORIAL DEPARTMENTS.

- Agricultural Chemistry and Agrotechny—SYBIL L. SMITH.
Meteorology, Soils, and Fertilizers { W. H. BEAL.
R. W. TRULLINGER.
Agricultural Botany, Bacteriology, and Plant Pathology { W. H. EVANS, Ph. D.
W. E. BOYD.
Field Crops—J. D. LUCKETT.
Horticulture and Forestry—E. J. GLASSON.
Economic Zoology and Entomology—W. A. HOOKER, D. V. M.
Foods and Human Nutrition { C. F. LANGWORTHY, Ph. D., D. Sc.
SYBIL L. SMITH.
Animal Husbandry, Dairying, and Dairy Farming—F. J. KELLEY.
Veterinary Medicine { W. A. HOOKER.
SYBIL L. SMITH.
Rural Engineering—R. W. TRULLINGER.
Rural Economics { E. MERRITT.
LOUISE MARBUT.
Agricultural Education { A. DILLE.
MARIE T. SPETHMANN.
Indexes—AMELIA B. DEANS.

CONTENTS OF VOL. 42, No. 4.

Editorial notes:	Page.
Conference of Southern Agricultural Workers.....	301
The organization of investigation in agriculture.....	304
Recent work in agricultural science.....	310
Notes.....	398

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

Yearbook of chemistry, edited by Meyer.....	310
Yearly progress in animal chemistry, edited by Andreasch and Spiro.....	310
Handbook of organic chemistry, edited by Prager and Jacobson.....	310
Experiments on the action of unsaturated fatty acids and lipoids, Stocks.....	310
Okra seed oil, Jamieson and Baughman.....	311
The composition of Hubbard squash seed oil, Baughman and Jamieson.....	311
The crystallography of melezitose, Wherry.....	311
The occurrence of melezitose in honey, Hudson and Sherwood.....	311
Methyl and ethyl ammonium mercuric iodids, Jamieson and Wherry.....	312
Fixation of nitrogen as HCN by electric arc, Briner and Baerfuss.....	312
Study of the catalytic oxidation of ammonia, Pascal and Decarrière.....	312
An electrolytic hydrogen generator for the laboratory, Williams.....	312
A device for centrifugalization at low temperatures, Welker.....	312
A device for preventing overtitration, Hackl.....	313

	Page.
The copper flame test for halogens in air, Lamb et al.....	313
Continuous process for nitrogen according to Dumas, Dexheimer.....	313
Determination of sulphate as SrSO_4 , Kolthoff and Vogelenzang.....	313
A new method for testing for phosphorus.....	313
Determination of H-ion concentration in soil extracts, Hudig and Sturm.....	313
Methods for the determination of borax in fertilizers, Ross and Deemer.....	313
Extraction of water-soluble vitamin from yeast, Osborne and Wakeman.....	314
The amboceptor fixation reaction, Reeser.....	315
The identification of citric acid in the tomato, Kremers and Hall.....	315
Milk calculations: A reply, Harris.....	315
Formula for calculation of added water in milk, Harris.....	315
The Crismer number of butter, Vandam.....	315
Snuff and snuff substitutes, Hulbert.....	315
About a new stomach examiner, based on the hydraulic principle, Togami.....	316
The determination of saccharin in urine, Jamieson.....	316
Cider- and vinegar-making qualities of Minnesota apples, Brierley.....	316
Primost (whey sugar) as a substitute product.....	316

METEOROLOGY.

Comparison of methods for computing daily mean temperatures, Hartzell.....	316
The characteristics of the free atmosphere, Dines.....	317
Rainfall interception, Horton.....	317
Seasonal distribution of precipitation in the United States, Kincer.....	318
Normal precipitation in Utah, Alter.....	319
Historical data on the variation of rainfall in Chill, Brooks.....	320
Relation of wind direction to subsequent precipitation in Ohio, Martin.....	320
Relation of snowfall to the yield of winter wheat, Root.....	321
Effect of snow on winter wheat in Ohio, Smith.....	321
Monthly Weather Review.....	321
Observations at Massachusetts Station, Ostrander and Smith.....	322
[Climatic conditions on Belle Fourche reclamation project in 1918], Aune.....	322

SOILS—FERTILIZERS.

Soil survey of Burke County, Ga., Maxon et al.....	322
Soil survey of Washington County, Md., Burke and McCall.....	323
Management of sandy soils.....	323
Management of the Superior red clay.....	323
Effect of variation in moisture content on soils, Martin and Christie.....	323
Nature of soil acidity.....	324
Soil acidity and the seeds of plants.....	324
Methods for determining soil acidity and effects of green manures, Hill.....	324
Influence of acidity on growth of legume bacteria.....	324
Use of nitrate-reduction test in characterizing bacteria, Conn and Breed.....	325
Will alfalfa feeding inoculate manure?.....	325
Ammonification of manure in soil, Bright and Conn.....	325
Collection, handling, and sale of city stable manure, Hamilton and Dickey.....	325
Preservation of liquid manure, Kristensen.....	326
[Report of soil fertility work in Massachusetts], Gaskill.....	326
An experience in crop production, Jordan and Churchill.....	326
Fertilizers on sand.....	327
Fertility tests on Colby silt loams.....	327
Fertilizer experiments with cereals and root crops, Iversen.....	327
Economic use of fertilizers in the soils of Uruguay, Arregui.....	328
Organic fertilizers of animal origin and their use, Malpeaux.....	328
Quality and value of important types of peat material, Dachnowski.....	328
Nitrogen fixation furnaces, Scott.....	328
Influence of storage on nitrogen in lime nitrogen, Meyer and Gorkow.....	328
Experiments with lime nitrogen and superphosphate, Haselhoff.....	329
Ammonium phosphate, Gerlach.....	329
Progress of the potash industry in the years 1917 and 1918, Hof.....	329
Sources of American potash, Davis.....	329
The action of potash by-products on soil and plants, Nolte.....	329
Additional information concerning lime, McCool.....	330

	Page.
Carbonates of calcium and magnesium and acid soils, Conner and Noyes	330
Notes on the effect of calcium sulphate on soils, McCool	331
Report on retail prices of unmixed fertilizer material June 1, 1919	331
Fertilizer report, Kellogg	331

AGRICULTURAL BOTANY.

Monohybrid mutations, de Vries	332
Relation between stature and chromosome number in <i>Oenothera</i> , Stomps	332
Teratological phenomena in relation to evolution and heredity, II, White	332
Studies on the cane variety, <i>Phragmites communis pseudodonax</i> , Tischler	332
Alternation of generations in the plant kingdom, Buder	332
Annual periodicity in variegated plants, Lakon	332
The influence of light on the stature of plants, Schanz	333
Phototaxis, Oltmanns	333
Pigments of flowering plants, Wakeman	333
The microchemistry of plants: Serratulin, Molisch	333
Bud symbiosis in <i>Ardisia crispa</i> , Miehe	333
The irritable movements of plants, Macfarlane	333
Note on illuminating gas causing abscission of flowers, Goodspeed et al.	333
Leaf cast, Küster	334
Soy bean cake as substitute for peptone in media, Hori and Bokura	334
Simple method of demonstrating degree of opening of stomata, Weber	334
Demonstration of liquid cohesion, Ursprung	334
Method of measuring [water movement in plants], Ursprung and Blum	334
[A study of water movement in plants, I], II, Ursprung and Blum	334
Studies on root saps, Kappen	334
The acidity of cell membranes, Odén	334
Negative pressure in transpiring shoots, Nordhausen	334
Sugars in the leaves of the sugar beet plants, Potvliet	334
Migration of betain in plants, Staněk	335
Influence of chlorids on growth of plants, Tottingham	335
Relation between sulphuric acid and assimilation, Wieler	335
A growth-inhibiting substance in the Chinese lemon, Reed and Halma	335
Do mold spores contain enzymes? Kopeloff and Kopeloff	336
A lime-dissolving fungus, Bachmann	336
Inventory of seeds and plants imported from January to March, 1916	336

FIELD CROPS.

[Work with field crops on Belle Fourche experiment farm in 1918], Aune	336
[Report of field crops work in Wisconsin, 1917 and 1918]	337
First generation crosses between corn varieties, Hayes and Olson	338
Suggested improvements in selling cotton by farmers, McConnell	339
Italian rye-grass (<i>Lolium multiflorum</i>), Carrier	340
Para grass (<i>Panicum barbinode</i>), Tracy	340
Redtop (<i>Agrostis alba</i>), Carrier	340
Sudan grass (<i>Andropogon sorghum</i>)	340
Productiveness and bread-baking values of Ohio wheats, Corbould	340
Yellow-berry in hard winter wheat, Roberts	340
Seed tests made at the station during 1918, Munn	340

HORTICULTURE.

The Yuma Mesa, Vinson, Crider, and Thompson	341
The club member's home vegetable garden, Close	341
Diseases and insects of the home garden, Gilbert and Popenoe	341
Insecticides and fungicides, Colon	341
Homemade, steam boiled, lime-sulphur wash, Berly	341
Mushrooms, White	341
Insect enemies and diseases of the tomato, Powell	342
[Report of horticultural investigations]	342
[Horticultural work on Belle Fourche experiment farm in 1918], Aune	343
Fruit growing on the northern Great Plains, Pfaender	343
Winter injury to fruit trees, Henry	343

	Page.
[Notes on the winterkilling of fruit trees during 1917-18], Shaw.....	343
Nature and control of apple scald, Brooks, Cooley, and Fisher.....	343
Twenty years of fertilizers in an apple orchard, Hedrick and Anthony....	344
Dusting experiments in peach and apple orchards, Fromme and Ralston..	345
Peaches: Production, districts, and varieties, Gould and Andrews.....	345
The kaki or oriental persimmon, Condit.....	346
Dutch-bulb culture in United States, Griffiths and Juenemann.....	346
Distribution of tulip and narcissus bulbs in 1919, Oakley.....	346
Making and maintaining a lawn.....	346
Horticultural exhibitions and garden competitions, Mulford.....	346

FORESTRY.

A policy of forestry for the Nation, Graves.....	346
The waning timber supplies, Secret.....	347
Forest devastation: A plan to meet it, Pinchot et al.....	347
Climate and forest fires in northern California, Show.....	347
Airplane forest fire patrol in California, Hammatt.....	347
Windbreaks, Chittenden.....	347
National Forest areas, June 30, 1919.....	348
Outdoor life in the Colorado National Forest.....	348
Vacational trips in the Holy Cross National Forest.....	348
Mountain playgrounds of the Pike National Forest.....	348
The vertical growth of trees, Cambage.....	348
Botanical identifications of British Guiana trees and plants, Hohenkerk..	348
The mountain trees of southern California, Jaeger.....	348
Notes on Eucalyptus, VI, Maiden.....	348
Two new species of Eucalyptus, Cambage.....	348
On the technology and anatomy of some silky oak timbers, Baker.....	348
Slash pine growth in the South, Mattoon.....	349
Handbook of technique of softwood industry (spruce and fir), Abeles.....	349
Tight and slack coopeage stock production in 1918, Smith and Pierson....	349

DISEASES OF PLANTS.

Report of the [Maryland] State [plant] pathologist, Temple.....	349
[Report of the department] of botany, Osmun.....	349
Notes on New York plant diseases, II, Stewart.....	349
[Plant-disease investigations].....	350
Report of the mycologist, Bunting.....	350
Constitutional chlorosis, Savastano.....	350
[Scorching due to cuprammonium washes], Butler.....	350
A new case of symbiosis between a bacterium and a fungus, Bally.....	350
Notes on parasitic fungi in Wisconsin, IV-VI, Davis.....	350
A biological study of the Peronosporaceæ, Laubert.....	350
Recent studies on <i>Sclerotium rolfsii</i> , Taubenhaus.....	351
The transmission of [plant] diseases through the seed, Ravn.....	351
A preliminary note on foot-rot of cereals in the Northwest, Dana.....	351
The imperfect stage of <i>Leptosphaeria tritici</i> of wheat, Durrell.....	351
Aged bean seed, a control for bacterial blight of beans, Rapp.....	351
<i>Ascochyta pisi</i> , Scalia.....	351
<i>Bacterium solanacearum</i> in beans, Smith and McCulloch.....	351
Potato demonstrations [regarding diseases in Ontario], Henry.....	352
Bacterial blight of soy bean, Coerper.....	352
Preliminary report on root rot in Hawaii, Carpenter.....	352
The control of cane fungi.....	353
New fruit fungi found on the Chicago market, Turley.....	353
A case of cauliflory and its significance, Lakon.....	353
Black knot of plums and cherries, Ceasar.....	353
Court-noué, Paulsen.....	353
[Tests with fungicides against Peronospora on grapevines].....	353
[Casein in fungicidal sprays for grapevines], Vermorel and Dantony....	353
Notes on tree pathology, Savastano.....	354
Indigenous trees attacked by mistletoe in the Valley of Mexico, Roldan..	354
Memorandum concerning diseases of filao trees in Mauritius, Tempany....	354
Hevea diseases due to Diplodia, Vincens.....	354
Winter injury or die-back of the walnut, Batchelor and Reed.....	354

ECONOMIC ZOOLOGY—ENTOMOLOGY.

	Page.
Suggestions for field studies of mammalian life histories, Taylor	354
Officials concerned with protection of birds and game, 1919, Lawyer	354
Our national elk herds, Graves and Nelson	354
Natural history of the bushy-tailed wood rats of California, Dixon	355
[Rats and their relation to disease]	355
The crow (<i>Corvus brachyrhynchos</i>), Sanborn et al.	355
The status of the genus <i>Asarcia</i> Sharpe, Oberholser	355
Notes on names <i>Halobaena caerulea</i> and <i>Prion vittatus</i> , Oberholser	355
<i>Pagophila eburnea</i> v. <i>P. alba</i> , Oberholser	355
A note on the eye of the black skimmer (<i>Rynchops nigra</i>), Wetmore	355
The names of the subfamilies of Scolopacidae, Oberholser	355
The Federal plant quarantine act, Marlatt	355
Probable cause of injury from use of arsenates, Patten and O'Meara	355
[Report of the] department of entomology, Fernald and Bourne	356
Biennial report of the State entomologist, 1918, Rumsey	356
[Economic insects in Trinidad]	356
Economic zoology	357
Insect pests of interest to Arizona cotton growers, Morrill	357
Insects attacking peanuts in Queensland, Jarvis	358
Cockroach pests in Minnesota, Haber	358
New observations on the life history of the bedbug, Hase	358
Steam as a bedbug eradicator	358
Experiments in spraying for San José scale, 1919, Brock and Flint	358
Two leaf-hoppers injurious to apple nursery stock, Ackerman	358
Control of green apple aphid in bearing orchards, Hodgkiss	360
Controlling army worm outbreaks in Ohio, Parks	360
The pink bollworm, Marlatt	360
South African bagworm, I, II, Hardenberg	360
The European corn borer and its nearest American allies, Heinrich	361
Some practical notes on the prevention of mosquito breeding, Delmege	361
Malaria in the rice field districts of California, Geiger	361
Observations on habits and parasites of common flies, Graham-Smith	361
The oviposition of <i>Saperda populnea</i> , Scheidter	362
Biennial report of apiarist, 1918, Reese	362
The Texas foul brood law, Paddock	362
Notes on certain genera of ichneumon flies, Cushman	362
Report on a small collection of Indian parasitic Hymenoptera, Gahan	362
Additions to List of Families of Ichneumon Flies, Viereck	362

FOODS—HUMAN NUTRITION.

The fat situation in Germany before, during, and after the war, Thoms	362
Changes in composition of ingredients of bread during baking, Mohorčič	363
Use of wood in preparation of war bread, Mohorčič and Prausnitz	363
Literature on chemistry and physics of milk and meat, Wedemann	363
Good drinks made of milk	363
The food value of the milk of the water buffalo, Cadbury	363
A case of hypersensitiveness to cow's milk, Park	363
Baking powder, Pritzker	363
[Miscellaneous food and drug topics], Ladd and Johnson	363
Use and preparation of food	364
The food calendar, Crigler	364
Tested international recipes, Van Arsdale, Monroe, et al.	364
High standards of living at low cost, Matthews	364
The effect of the past year's events on dietetics, Graves	364
The dietitian in social life, Gillett	364
Relation of field dietetics to social service, Joseph	364
The management of the dietary department of the hospital, Graves	365
Maintenance ration.—Function of carbohydrates, Maignon	365
[Nutrition problems], McCollum	365
Technique of avitaminosis experiments, Portier and Randoin	365
Edema observed in a monkey, Harden and Zilva	365
Antineuritic value of a diet and onset of polyneuritis, Green	365
Influence of feeding on polyneuritis, Eijkman and van Hoogenhuyze	366
The causation and treatment of rickets, Pritchard et al.	367
A study of creatinuria in infants, Gamble and Goldschmidt	367
Studies of blood regeneration, Buell	367

ANIMAL PRODUCTION.

	Page.
Feeding values of certain feeding stuffs, Fraps.....	368
Noteworthy war-time feeding stuffs, [I]—III, Kling.....	369
Use of mill wastes, particularly weed seeds, as war-time feeds, Kling.....	369
Beet top silage and other by-products of the sugar beet, Jones.....	370
Rules and regulations Texas feed law.....	370
Utilization of [irrigated] crops with live stock, Aune.....	370
Introduction of breeding stock [into Brazil], Cavalcanti.....	370
Brazil as a market for pure-bred cattle, Mackenzie.....	370
Breeds of cattle and their improvement in Colombia, González Torres.....	371
Effect of organic nutrients on animal growth and reproduction.....	371
Cattle feeding investigations, 1918—19, McCampbell et al.....	371
Lamb feeding investigations, 1919, Paterson.....	372
Inheritance of characters in sheep, Russell.....	372
[Swine feeding and nutrition studies].....	372
[Feeding] experiments with hogs, Aune and Bober.....	373
Swine feeding investigations, 1918—19, McCampbell et al.....	374
Crushed <i>v.</i> whole oats for work horses.....	375
Horse breeding in France, Musset.....	375
Zebras and their hybrids as domestic animals, Fawcett.....	375
[Nutrition studies with poultry].....	375
Judging fowls for egg production, Lewis.....	376
Report of the first Texas national egg-laying contest, Kazmeier.....	376
How to load cars of eggs.....	376
How to wrap heads.....	376
Inheritance of coat color in cats, Whiting.....	376
Studies on cell division in albino rat.—III, Spermatogenesis, Allen.....	376

DAIRY FARMING—DAIRYING.

Value of barley feed and barley bran [for milk production].....	376
Cost of milk production in Livingston and Macomb Counties, Riddell.....	377
Milk and cream contests, Kelly and Taylor.....	377
Off flavors in dairy products.....	377
On the use of aluminum in dairy practice, Utz.....	377
Causes and prevention of "leaky" butter.....	377
Trend of butter industry in United States and other countries, Pirtle.....	377
Trend of cheese industry in United States and other countries, Pirtle.....	378
Recovering cottage cheese curd from buttermilk, Perkins.....	378

VETERINARY MEDICINE.

Instructions for veterinary meat and dairy inspections, Morse.....	378
Federal meat inspection as a safeguard to public health, Mohler.....	379
Reports of veterinary director general for 1917 and 1918, Torrance.....	379
Yearbook of pharmacy.....	379
Semiliquid media for culture of anaerobic organisms, Lignières.....	379
The loco weed and its eradication, Medley.....	379
Studies on anthelmintics.—VI, Administration in capsules, Hall.....	379
Nonspecific complement binding substances in horse blood, Marcis.....	379
Relation of gas gangrene in man and blackleg in animals, Steinbrück.....	380
Further experiments in active immunization against glanders, Marxer.....	380
Irregular results in complement deviation reaction for glanders, Pfeiler.....	380
Inoculation of cows with Friedmann's tuberculosis vaccine, Gutknecht.....	380
Distribution of tuberculin by the Bureau of Animal Industry, Dorset.....	380
Tuberculosis eradication under accredited-herd plan.—Herd list No. 2.....	380
Tuberculosis eradication conference shows interest in disease-free herds.....	380
Diseases prevalent among horses and cattle in Mississippi, Ranck.....	381
A malarial parasite in the blood of a buffalo, Sheather.....	381
An outbreak of blackleg in sheep, Marsh.....	381
Stomach worms in sheep: Prevention and treatment.....	381
Differential diagnosis of infectious swine diseases, Kinsley et al.....	381
The longevity of the virus of hog cholera, Kernkamp.....	381
Comparing swine plague to hog cholera, Jay.....	381
The use of carbon bisulphid in infestations with bots, Hall and Avery.....	381
Pathology of dourine, Formad.....	382

	Page.
Experimental studies on equine piroplasmosis, III, du Toit.....	382
A simplification of the method of treating joint-ill, Forssell.....	382
The treatment of tetanus in horses, Schock.....	383
Fowl plague in Argentina, Andrieu and Badano.....	383
On the life history of <i>Ascaris lumbricoides</i> , IV, Stewart.....	383

RURAL ENGINEERING.

Geology and water of Gila and San Carlos Valleys, Schwennesen.....	383
Surface water supply of western Gulf and Mexico Basins, 1917.....	383
Surface water supply of Missouri River Basin, 1916.....	383
Organization, methods, and work of the hydrologic service, Basadre.....	384
Bacteriological and chemical analyses of water, Brulé and Hazard.....	384
Irrigation in the United States, Whitbeck.....	384
Irrigation in India, Review for 1917-18.....	384
Factors affecting efficiency in use of canal water, Roberts and Faulkner.....	384
Construction methods used in dam of Balmorhea project, Sullivan.....	384
Earth pressures, Hudson.....	384
Colby silt loam needs drainage.....	384
Effect on soil moisture on efficiency of dynamite.....	384
Seventh biennial report of the State highway commissioner, Rogers.....	385
First report of Directors of Department of Highways, Alexander.....	385
Seventh biennial report of the State Highway Department, Everett.....	385
Report of the State Commissioner of Highways, Duffey.....	385
Fifth biennial report of the State Road Commission, Browning.....	385
Final report of committee on materials for road construction, Blanchard.....	385
Wear resisting pavements, Pérégrin.....	385
Concrete pavements, Stewart.....	385
Chemistry of concrete, Blackie.....	386
Some tests of Douglas fir after long use, Alvarez.....	386
Strength and other properties of wire rope, Griffith and Bragg.....	387
The Centerville tractor demonstration and test, Musselman.....	389
Official tractor tests made in Ohio.....	389
Agricultural tractor trials in France.....	389
Motor tractor trials.....	389
Winners in chain drive contest.....	389
The conservation of motor fuel as affected by lubricating oil, Lentz.....	389
Actual situation of mechanical cultivation.....	390
The hydraulic ram, Cleghorne.....	390
Silos, Fontana.....	390
Silo for ensilage or grain, Wilson.....	390
Construction and fire protection of cotton warehouses, Workman.....	390
How to make a hog crate.....	390

RURAL ECONOMICS.

International yearbook of agricultural legislation.....	390
American Association for Agricultural Legislation, Ely.....	390
[Laws relating to the Department of Agriculture in Nebraska].....	390
Land settlement.....	391
The land question solved! Day.....	391
Encouraging repopulation and combating the high cost of living, Krug.....	391
[Projects of department of agricultural economics of Wisconsin Station].....	391
Farmers' union and federation advocate and guide, Kerr.....	391
Farmers' cooperation in Minnesota, Black and Robotka.....	391
German agricultural cooperative societies during the war, Johannssen.....	392
Modern grain exchanges, McHugh.....	392
A system of bookkeeping for grain elevators, Mason et al.....	392
Farmers' Market Bulletin.....	392
[Conditions on Belle Fourche reclamation project in 1918], Aune.....	392
Agriculture in Alsace Lorraine, Hitier and Hitier.....	392
Agriculture in Cyrenaica, Monti.....	392
[Agricultural statistics of Egypt].....	392
Agriculture of Japanese Sakhalin and Dutch East Indies, Müller.....	393
Index numbers of Indian prices 1861-1918, Shirras.....	393

AGRICULTURAL EDUCATION.

	Page.
Improvement of instruction in colleges of agriculture, Works et al.....	393
The future of higher forestry instruction in Prussia, Möller.....	394
Report of the work of the Ultuna Agricultural Institute, 1918.....	394
High schools and trade areas closely related.....	394
Plans of Massachusetts for year 1919-20.....	394
Report of State Vocational Board of West Virginia for 1918.....	395
Teaching home economics in high schools of Mississippi, Teague.....	396
Home economics under the Smith-Hughes Act, Turner.....	396
Cooperative extension work in agriculture and home economics, 1918....	396
A compendium of agriculture, Seltensperger.....	396
How teachers may use publications on diseases and insect enemies, Dille..	396
How teachers may use Farmers' Bulletin 876, Shinn.....	396

MISCELLANEOUS.

Work of Belle Fourche experiment farm in 1918, Aune.....	396
Thirty-first Annual Report of Massachusetts Station, 1918.....	396
Service to Wisconsin for 1916-17 and 1917-18, Russell and Morrison.....	397
Quarterly bulletin of the Michigan Experiment Station.....	397
Monthly Bulletin of the Ohio Agricultural Experiment Station.....	397
Monthly bulletin of the Western Washington Substation.....	397

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

	Page.
Arizona Station:	
Bul. 87, Dec., 1918.....	357
Bul. 89, Aug. 15, 1919.....	341
California Station:	
Bul. 316, Dec., 1919.....	346
Circ. 216, Nov., 1919.....	354
Hawaii Station:	
Press Bul. 54, Dec. 9, 1919..	351
Illinois Station:	
Circ. 239, Dec., 1919.....	358
Kansas Station:	
Circ. 77, Oct., 1919.....	371
Circ. 78, Oct., 1919.....	374
Circ. 79, Oct., 1919.....	372
Maryland Station:	
Bul. 232, Sept., 1919.....	341
Massachusetts Station:	
Met. Buls. 371-372, Nov.-	
Dec., 1919.....	322
Thirty-first An. Rpt. 1918,	
pts. 1 and 2.....	326,
343, 349, 356, 396	
Michigan Station:	
Quart. Bul., vol. 2, No. 2,	
Nov., 1919.....	330,
331, 347, 355, 377, 389, 397	
Minnesota Station:	
Bul. 183, Aug., 1919.....	338
Bul. 184, Aug., 1919.....	391
Bul. 185, Aug., 1919.....	316
Bul. 186, Aug., 1919.....	358
New Jersey Stations:	
Hints to Poultrymen, vol. 8,	
No. 2, Nov., 1919.....	376
New York State Station:	
Bul. 460, May, 1919.....	344
Bul. 461, June, 1919.....	360
Bul. 462, June, 1919.....	340
Bul. 463, June, 1919.....	349
Bul. 465, June, 1919.....	326
Tech. Bul. 67, April, 1919....	325
Tech. Bul. 68, June, 1919....	316
Tech. Bul. 73, June, 1919....	325
North Carolina Station:	
Farmers' Market Bul., vol.	
6, No. 30, Nov. 22, 1919....	392
North Dakota Station:	
Spec. Bul., vol. 5, No. 14.	
Oct., 1919.....	315, 363
Ohio Station:	
Mo. Bul., vol. 4, No. 9, Sept.,	
1919.....	340,
347, 360, 378, 397	
Oklahoma Station:	
Bul. 126, July, 1919.....	372
Bul. 128, Oct., 1919.....	355

Stations in the United States—Contd.

Porto Rico Department of Agri-	
culture and Labor Station:	
Bul. 20 (Spanish Ed.), Sept.,	
1919.....	341
South Carolina Station:	
Circ. 30, Jan., 1918.....	341
Texas Station:	
Bul. 245, April, 1919.....	368
Bul. 246, June, 1919.....	376
Control Circ. C, Sept., 1918..	370
Control Circ. D, April, 1919..	362
Virginia Station:	
Bul. 223, Nov., 1919.....	345
Tech. Bul. 19, April, 1919....	324
Washington Station:	
West. Wash. Sta. Mo. Bul.,	
vol. 7, No. 9, Dec., 1919....	397
Wisconsin Station:	
Bul. 302 (An. Rpts. 1917 and	
1918), Aug., 1919..	313, 316, 323,
324, 325, 327, 337, 342,	
350, 371, 372, 375, 376,	
377, 384, 391, 394, 397	

U. S. Department of Agriculture.

Bul. 797, Commercial Dutch-bulb	
Culture in the United States,	
D. Griffiths and H. E. Juene-	
mann.....	346
Bul. 801, Construction and Fire	
Protection of Cotton Ware-	
houses, J. M. Workman.....	390
Bul. 802, Quality and Value of	
Important Types of Peat Ma-	
terial, A. P. Dachnowski.....	328
Bul. 805, Two Leaf-hoppers In-	
jurious to Apple Nursery Stock,	
A. J. Ackerman.....	358
Bul. 806, Peaches: Production	
Estimates and Important Com-	
mercial Districts and Variet-	
ies, H. P. Gould and F. And-	
rews.....	345
Bul. 811, A System of Bookkeep-	
ing for Grain Elevators, B. B.	
Mason, F. Robotka, and A. V.	
Swarthout.....	392
Farmers' Bul. 1095, Beet Top	
Silage and Other By-products	
of the Sugar Beet, J. W.	
Jones.....	370
Circ. 29, Vacation Trips in the	
Holy Cross National Forest..	348
Circ. 34, Out-door Life in the	
Colorado National Forest....	348

U. S. Department of Agriculture—Con.		U. S. Department of Agriculture—Con.	
	Page.		Page.
Circ. 35, Diseases and Insects of the Home Garden, W. W. Gilbert and C. H. Popenoe.....	341	Circ. 62, Horticultural Exhibitions and Garden Competitions, F. L. Mulford.....	346
Circ. 40, Insect Enemies and Diseases of the Tomato, O. Powell.....	342	Circ. 63, Directory of Officials and Organizations Concerned with the Protection of Birds and Game, 1919, G. A. Lawyer.....	354
Circ. 41, Mountain Playgrounds of the Pike National Forest.....	348	Circ. 65, Distribution of Tulip and Narcissus Bulbs in 1919, R. A. Oakley.....	346
Circ. 43, Redtop (<i>Agrostis alba</i>), L. Carrier.....	340	Circ. 68, How Teachers May Use Publications on the Control of Diseases and Insect Enemies of the Home Garden, A. Dille.....	396
Circ. 44, Italian Rye-grass (<i>Lolium multiflorum</i>), L. Carrier.....	340	Circ. 69, How Teachers May Use Farmers' Bulletin 876, Making Butter on the Farm, E. H. Shinn.....	396
Circ. 45, Para Grass (<i>Panicum barbinode</i>), S. M. Tracy.....	340	Circ. 70, Trend of the Butter Industry in the United States and Other Countries, T. R. Pirtle.....	377
Circ. 46, How to Make a Hog Crate.....	390	Circ. 71, Trend of the Cheese Industry in the United States and Other Countries, T. R. Pirtle.....	378
Circ. 47, Stomach Worms in Sheep: Prevention and Treatment.....	381	Circ. 72, Good Drinks Made of Milk.....	363
Circ. 48, The Club Member's Home Vegetable Garden, C. P. Close.....	341	Office of the Secretary: Circ. 148, A Policy of Forestry for the Nation, H. S. Graves.....	346
Circ. 49, Making and Maintaining a Lawn.....	346	Forest Service: National Forest Areas, June 30, 1919.....	348
Circ. 50, Sudan Grass (<i>Andropogon sorghum</i>).....	340	Tight and Slack Coopera-ge Stock Production in 1918, F. H. Smith and A. H. Pierson.....	349
Circ. 51, Our National Elk Herds: A Program for Conserving the Elk on National Forests about the Yellowstone National Park, H. S. Graves and E. W. Nelson.....	354	Bureau of Plant Industry: Inventory of Seeds and Plants Imported by the Office of Foreign Seed and Plant Introduction During the Period from Jan. 1 to March 31, 1916.....	336
Circ. 52, How to Wrap Heads.....	376	Bureau of Soils: Field Operations, 1917— Soil Survey of Burke County, Ga., E. T. Maxon, C. E. Dear-dorff, W. A. Rockie, and J. M. Snyder.....	322
Circ. 53, Milk and Cream Con- tests, E. Kelly and G. B. Taylor.....	377	Soil Survey of Wash- ington County, Md., R. T. A. Burke and H. F. McCall.....	323
Circ. 54, Tuberculosis Eradica- tion Under the Accredited- Herd Plan.—Herd List No. 2.....	380	States Relations Service: Cooperative Extension Work in Agriculture and Home Economics, 1918.....	396
Circ. 55, How to Load Cars of Eggs.....	376	Weather Bureau: Mo. Weather Rev., vol. 47, Nos. 9-10, Sept.-Oct., 1919.....	317, 318, 319, 320, 321
Circ. 56, Suggested Improvements in Methods of Selling Cotton by Farmers Based on a Com- parison of Cotton Producers' and Consumers' Prices, O. J. McConnell.....	339		
Circ. 57, A Report on the Retail Prices of Unmixed Fertilizer Material as of June 1, 1919, with Comparative Prices for May 1.....	331		
Circ. 58, Fruit Growing on the Northern Great Plains, M. Pfaender.....	343		
Circ. 59, Suggestions for Field Studies of Mammalian Life Histories, W. P. Taylor.....	354		
Circ. 60, The Work of the Belle Fourche Reclamation Project Experiment Farm in 1918, B. Aune.....	322, 336, 343, 370, 373, 392, 396		
Circ. 61, Sources of American Potash, R. O. E. Davis.....	329		

U. S. Department of Agriculture—Con.

Scientific Contributions: ¹	Page.
Okra Seed Oil, G. S. Jamieson and W. F. Baughman	311
The Composition of Hubbard Squash Seed Oil, W. F. Baughman and G. S. Jamieson	311
The Crystallography of Melezitose, E. T. Wherry	311
The Occurrence of Melezitose in Honey, C. S. Hudson and S. F. Sherwood	311
Methyl and Ethyl Ammonium Mercuric Iodids: Their Preparation, Crystallography, and Optical Properties, G. S. Jamieson and E. T. Wherry	312
Methods for the Determination of Borax in Fertilizers and Fertilizer Materials, W. H. Ross and R. B. Deemer	313
The Determination of Saccharin in Urine, G. S. Jamieson	316
Nature and Control of Apple Scald, C. Brooks, J. S. Cooley, and D. F. Fisher	343
Climate and Forest Fires in Northern California, S. B. Show	347
Airplane Forest Fire Patrol in California, R. F. Ham-matt	347
Slash Pine Growth in the South, W. R. Mattoon	349
New Fruit Fungi Found on the Chicago Market, H. E. Turley	353
The Status of the Genus <i>Asarcia</i> Sharpe, H. C. Oberholser	355
Notes on the Names of <i>Haio-baena caerulea</i> and <i>Prion vittatus</i> , H. C. Oberholser	355
<i>Pagophila eburnea</i> v. <i>P. alba</i> , H. C. Oberholser	355

U. S. Department of Agriculture—Con.

Scientific Contributions—Contd.	Page.
A Note on the Eye of the Black Skimmer (<i>Rynchops nigra</i>), A. Wetmore	355
The Names of the Sub-families of Scolopacidae, H. C. Oberholser	355
The Federal Plant Quarantine Act, C. L. Marlatt	355
The Pink Bollworm, C. L. Marlatt	360
Note on the European Corn Borer (<i>Pyrausta nubilalis</i>) and Its Nearest American Allies, with Descriptions of Larvæ, Pupæ, and One New Species, C. Heinrich	361
Notes on Certain Genera of Ichneumon Flies, with Descriptions of a New Genus and Four New Species, R. A. Cushman	362
Report on a Small Collection of Indian Parasitic Hymenoptera, A. B. Gahan	362
Additions to A List of Families and Subfamilies of Ichneumon Flies of the Superfamily Ichneumonoidæ (Hymenoptera), H. L. Viereck	362
Federal Meat Inspection as a Safeguard to Public Health, J. R. Mohler	379
The Preparation and Distribution of Tuberculin by the Bureau of Animal Industry, M. Dorset	380
The Use of Carbon Bisulphid in Infestations with Bots, <i>Gastrophilus</i> spp., M. C. Hall and L. Avery	381
Pathology of Dourine, with Special Reference to the Microscopic Changes in Nerve Tissues and Other Structures, R. J. Formad	382

Indexes—	AMELIA B. DEANS.

CONTENTS OF VOL. 42, No. 5.

Editorial notes:		Page.
The border line between extension and experimentation in agriculture	-----	401
Recent work in agricultural science	-----	409
Notes	-----	497

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

Modern chemistry and industry of starch and cellulose, Chaudhuri	-----	409
The synthesis of fats, Fahrion	-----	409
The catalytic reduction of fats with palladium, Nord	-----	409
The hydrogenation of oils, Ellis	-----	409
The change of refractive indices of fixed oils with temperature, Wright	-----	409
Oil of juniper berries, Matthes and Rossié	-----	410
Pine seeds and pine seed oil, Matthes and Rossié	-----	410
Walnut oil, Matthes and Rossié	-----	410
The effect of mold upon the oil in corn, Rabak	-----	411
A chemical study of the ether extracts of soy bean leaves, Nelson	-----	411
The identity of hordein and bynin, Lüers	-----	411
Chemical analyses with membrane filters, Zsigmondy and Jander	-----	411
Thermoregulator with characteristics of Beckmann thermometer, Harvey	-----	411
The determination of hydrogen-ion concentration, Bunker	-----	411
A simple hydrogen electrode, Bailey	-----	412
Apparatus for volumetric determination of carbon dioxide, Constantino	-----	412
Apparatus for measurement of oxidase and catalase activity, Harvey	-----	412
[Moisture determination], Lipscomb	-----	413

	Page.
The McCrudden calcium method modified, Halverson and Schulz.....	413
A method of estimating small amounts of calcium, Pern.....	413
Determination of sulphates by oxidation of benzidin sulphate, Hibbard.....	413
Estimation of nitrates in water with phenolsulphonic acid, Frederick.....	414
Determination of traces of hydrocyanic acid and thiocyanates, Chelle.....	414
Formation of cyanic acid by the oxidation of organic substances, Fosse.....	414
Quantitative estimation of indol in biological media, Zoller.....	414
Influence of hydrogen-ion concentration on volatility of indol, Zoller.....	415
The moisture content of cereals, Nelson and Hulett.....	415
Insoluble solids in jams, preserves, and marmalades, Clemens.....	415
Microscopic detection of plant adulterants in foods, Griebel.....	415
Wild thyme as an adulterant of marjoram, Griebel and Schäfer.....	415
Contribution to the examination of milk, Saloman and Diehl.....	416
Remarks on the analyses of hardened oils, Grün.....	416
Ost copper carbonate solution for determining invert sugar, Beyersdorfer.....	416
Ultramarine, and a proposal to simplify its analysis, Kalshoven.....	416
Manufacture of Chinese ang-khak in United States, Church.....	416
Determination of the water resistance of fabrics, Veitch and Jarrell.....	417
The chemical composition of flax and hemp chaff, Schwalbe and Becker.....	417
Drying potatoes and other materials for foods and feedstuffs, Mendler.....	417
Manufacture of grape juice preserves in Asia, Bredemann and Schätzlein.....	417

METEOROLOGY.

Climatic cycles and tree-growth, Douglass.....	417
The effect of weather upon the yield of potatoes, Smith.....	418
The effect of topography on the precipitation in Japan, Terada et al.....	418
Precipitation, run-off, evaporation, and drainage in Europe, Halbfass.....	419
Report of the Iowa Weather and Crop Service Bureau for 1918, Reed.....	419
Meteorological records for 1918, Linfield.....	419
Meteorological records for the years 1917 and 1918, Price.....	420

SOILS—FERTILIZERS.

The composition and origin of soils, Calhoun.....	420
Field operations of the Bureau of Soils, 1915, Whitney et al.....	420
Contribution regarding two black soil appearances in Germany, von See.....	420
Silting and the origin of Wad and Dollard polders, Mansholt.....	420
Note on the Nile deposits in Egypt, Mosséri.....	420
The silt content of the Deli River, Tijnstra.....	421
Water and silt studies of different rivers of Java, den Berger and Weber.....	421
Ground water movement, Krüger.....	422
Further studies on condition of soil structure, Ehrenberg and van Zyl.....	422
The influence of boiling and shaking on fine mineral particles, Nolte.....	423
Geologically important frost phenomena in temperate climates, Behr.....	423
Influence of stones in soil on the growth of plants, Pfeiffer and Rippel.....	423
The richness of cultivated soils in copper, Maquenne and Demoussy.....	423
Activity of soil acids, Stephenson.....	423
Soil acidity.—II, Relation to acidity of plant juice, Truog and Meacham.....	424
Fixation of phosphoric acid in soils.....	424
Distribution and activities of bacteria in California soil columns, Lipman.....	424
Oxidation of vanillin by soil bacteria, Robbins and Lathrop.....	425
Nitrogen of soils and straw and sugar, Lemmermann and Einecke.....	425
Effect of alfalfa on fertility elements of soil, Swanson and Latshaw.....	425
The effect of green manuring on soils.....	427
Studies on the nitrogen content of liquid manure, I, Blanck.....	427
Nitrogen losses in urine, Bear and Royston.....	427
Peat in 1918, Osbon.....	428
The synthesis of ammonia under very high pressures, Claude.....	428
Transformation of cyanamid into urea by microorganisms, Mazé et al.....	428
Action of cyanamid and dicyandiamid on corn, Mazé et al.....	428
Effect of oxidation of sulphur on rock phosphate and nitrification, Shedd.....	429
Composting sulphate rock and sulphur.....	429
The selection of phosphatic manures.....	429
Some phosphate beds of Galicia, Podolia, and Palestine, Simonelli.....	430
The phosphate deposits of South Australia, Jack.....	430

	Page.
Manurial value of a modification of orthoclase-bearing rock, Hartwell.....	430
The potash salts of the Punjab Salt Range and Kohat, Stuart.....	430
A new potash supply, Bryant.....	430
The mineral riches in Alsace-Lorraine, de Launay.....	430
Partial sterilization of soils by application of lime, Watts.....	431
Relation between liming and the acidity of moor soils, Densch.....	431
Acid soils and the toxicity of manganese, Funchess.....	431
Analyses of commercial fertilizers and home mixtures, Cathcart et al.....	432
Proceedings of twenty-sixth convention of National Fertilizer Association.....	432

AGRICULTURAL BOTANY.

American food plants, past and present, Harshberger.....	432
Development of pistillate spikelet and fertilization in <i>Zea mays</i> , Miller....	432
Studies on fruit and seed formation in crossings in <i>Primula</i> , de Vries....	432
After-ripening and germination of seeds, Rose.....	432
Studies on the leaf anatomy of alpine and of plains plants, Lohr.....	432
Basis of succulence in plants, MacDougal, Richards, and Spoehr.....	432
Colloidal reactions fundamental to growth, MacDougal.....	433
The localization of chemical work in the plant, Tschirch.....	433
Organic balance in plants, Nicolas.....	433
Organic carbon nutrition of fungi and green plants, Bokorny.....	433
The alleged storing of fat by evergreen foliage, Meyer.....	433
Function of vitamin in metabolism of <i>Sclerotinia cinerea</i> , Willaman.....	433
Studies in the metabolism of Actinomycetes, Waksman.....	434
Cultural studies of species of Actinomycetes, Waksman.....	434
North American Ascochyta, Davis.....	434
Note on flagellation of nodule organisms of Leguminosæ, Hansen.....	434
Wound calluses and bacterial tumors, Magnus.....	435
The influence of low temperature on soil bacteria, Vass.....	435
Physiological isolation by low temperature in plants, Child and Bellamy....	435
Vegetative growth in soils containing crude petroleum, Carr.....	435
Trees and shrubs in soda-containing soils of Hungary, Bernatsky.....	436
A new method of studying movement of organisms, Moreau.....	436
Effect of anesthetics upon respiration, Haas.....	436
Respiration after death, Haas.....	436

FIELD CROPS.

[Report of field crops work in Virginia, 1918].....	436
[Report of field crops work in Burma, 1919], Lowry.....	436
[Report of field crops work in Madras, 1918-19], Wood.....	436
[Report of field crops work in Nigeria, 1918], Johnson.....	436
How to grow profitable crops on the dry farm, Horn.....	437
Meadows and forage plants, Garola.....	437
Meadows and pastures: The production of grass, de Lapparent.....	437
Fertilization and management of pastures, Hutcheson and Wolfe.....	437
Freezing injury of seed corn, Kieselbach and Ratcliff.....	437
Corn culture in Brazil, Hunnicutt.....	438
Application of fertilizers to cotton before and after planting, Rast.....	438
The extension of cotton cultivation in Egypt, Dudgeon.....	438
The development of cotton growing in Nyasaland.....	438
The henequen industry of Yucatan, Marsh.....	438
<i>Molinia cærulea</i> as a forage plant, Honcamp and Nolte.....	438
Yields of varieties of oats [in New South Wales], Pridham.....	438
Industrial and nutritive value of potato in Ireland, Johnson and Boyle....	438
Sudan grass [in New South Wales], Breakwell and St. Clair Potts.....	439
Tobacco [in Porto Rico], Legrand.....	439
The development of the tobacco growing industry in Great Britain, Wood....	439
Cultivation and treatment of tobacco in Great Britain, Campbell.....	439
Future of wheat production with reference to [British] Empire, Judge....	439
Yields of the lesser yam and of some African yams, Burkill.....	439
The testing of seeds order, 1918.....	439
Eradication of field hawkweed, Hutcheson and Wolfe.....	439
The distribution and control of field weeds in Germany, I, Wehsarg.....	440

HORTICULTURE.

	Page.
Cooperative and other methods of marketing California products, Lloyd	440
The California fruits and how to grow them, Wickson	440
Frost control and related factors, Whitten	440
How to prune and why, Chandler	440
Report on cranberry investigations for the season of 1918, Beckwith	441
Loganberry culture, Munson and White	442
Cooperative marketing in the Chautauqua-Erie grape industry, Phillips	442
Fruit culture in Tharushah, Mahomed Umarmkhan F. Barakzai	442
The avocado in Trinidad and Tobago, Freeman	442
Budding the avocado, Williams	443
Studies of Philippine bananas, Quisumbing y Argüelles	443
Cacao cultivation, Brooks	443
Response of citrus seedlings to salts and organic extracts, Breazeale	443
Application of the principles of breeding to drug plants, Woodworth	443
The spice gardens of Sirsi in Kanara, Sahasrabudde	444
Garden first in land development, Webb	444
The small garden: A practical manual of horticulture, Bois	444
Roses for home and garden, Taylor	444

FORESTRY.

One aspect of the national program of forestry: Cost, Hosmer	444
Legislative machinery for enforcement of private forestry, Pettis	444
Inspection and control of private forestry measures, Recknagel	444
Approximate cost of private forestry measures in Adirondacks, Churchill	445
A decade of private forest planting in Pennsylvania, Illick	445
Measures to insure lands remaining productive, Baker and McCarthy	445
How shall we make our forests safe for trees? Howe	445
Disposal of infected slash on timber-sale areas in the Northwest, Hubert	445
The use of seaplanes in forest mapping, Wilson	445
[Report of] committee on forests, Leavitt	445
Quebec forest regeneration survey, Howe	445
[Report of the] mission for the study of forest conditions, III, Bertin	446
Progress report of Forest Research Institute for 1918-19, Perrée	446
Timbers and their uses, Winn	446
Growing black walnut on Ohio farms, Secrest	446
The growth of <i>Hevea brasiliensis</i> in the Philippine Islands, Yates	446
Aeroplane lumber production in British Columbia, Craig	447

DISEASES OF PLANTS.

Plant diseases in crop production, Orton	447
Seed as a carrier of plant diseases, Gentner	447
Report of the division of botany, Barre	447
[Report on] plant pathology and bacteriology departments	447
North American rusts on <i>Cyperus</i> and <i>Eleocharis</i> , Kern	448
Notes on some polemoniaceous rusts, Orton	448
Cereal rust of small grains, Melhus and Durrell	448
Stage of maturity of cutting wheat affected with black stem rust, Ellis	448
Corn smut in Ohio, Van Pelt	448
Cotton root rot spots, Scofield	449
Parasitism of <i>Pythium debaryanum</i> on potato, Hawkins and Harvey	449
Keeping seed potatoes from disease attacks, Thomas	449
The mosaic disease of sugar cane and other grasses, Brandes	449
Pests of apple trees.—American blight and canker, Mosley	450
Apple blotch control proves successful	450
A disease of pears new to the continent of America	450
Peronospora [and] Oidium	450
Arricciamiento of elm and hackberry, Pantanelli	450
Soil disinfection to control root-knot nematode, Byars and Gilbert	450

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Animals injurious and beneficial to agriculture, Guénaux	451
Birds of eastern Canada, Taverner	451
Studies on the carnivorous slugs of South Africa, Watson	451

	Page.
On the endemic tsutsugamushi disease of Formosa, Hatori.....	451
[Insects of economic importance in St. Lucia], Hutson.....	451
Reports of the entomologist, Patterson.....	451
Insect enemies of rice [in Portuguese East Indies], Correia Afonso.....	451
Winter work in shade tree insect control, Houser.....	451
Anatomy of the head and mouth parts of <i>Psylla mali</i> , Grove.....	452
Apple-grain aphid, Baker and Turner.....	452
Descriptive catalogue of the scale insects of Australia, I, Froggatt.....	453
An imported feeder on stored peanuts, de Ong.....	453
<i>Anopheles crucians</i> as an agent in malaria transmission, Metz.....	453
Observations on habits of flies, especially those in manure, Mellor.....	453
Life history and larval anatomy of <i>Melinda cognata</i> , Keilin.....	454
The cottonwood leaf-mining beetles in southern Alberta, Strickland.....	454
Notes on larvæ and life histories of prionine beetles, Beeson.....	454
The fig and willow borer (<i>Phrynetia spinator</i>), Gunn.....	454
Prevention of damage by wireworms, Gray and Wheldon.....	455
Cultivation for wireworm and leatherjacket attacks, Gray.....	455
The glow worm and other beetles, Fabre, trans. by Teixeira de Mattos.....	455
The white fly eating <i>Delphastus</i> , Watson.....	455
Notes on <i>Sphenophorus</i> (Coleoptera), Chittenden.....	456
A new parasitic cynipid reared from a clover aphid, Weld.....	456
Labenidæ, a new family in the Ichneumonoidea, Viereck.....	456
The imported red spider attacking apple foliage, Frost.....	456

FOODS—HUMAN NUTRITION.

Scientific problems of nutrition in France during the war, Legendre.....	456
Nutrition problems, Wolff.....	456
Judging food from a chemical and physical standpoint, Rubner.....	456
Food from grains, Maurizio.....	456
The digestibility of the branny coats of wheat, Briggs.....	457
Availability of carbohydrate in certain vegetables, Olmsted.....	457
The nutritive value of the banana, II, Sugiura and Benedict.....	457
A possible new source of food supply, Claassen.....	457
Ripe olives a safe food, Cruess.....	457
Spices and their substitutes during the war, Beythien.....	458
Bakery report, Himber.....	458
Manual of good cookery and good management, Montagne.....	458
Food for a family of five, Greig.....	458
Menus [of a recently opened hotel in New York City].....	458
Dietary studies made in Missouri State hospitals for insane, Findley.....	458
Food waste in hospitals, Pitcher.....	458
[Food problems in public health work in South Africa].....	458
Effect of food restriction on mortality in Copenhagen, Hindhede.....	459
Protein requirement in man and efficiency of bread protein, Sherman.....	459
Growth and equilibrium, and diastatic action, Thiébaud.....	460
Vitamins in human nutrition, Forbes.....	460
Identity of growth-promoting and antineuritic vitamin, Mitchell.....	460
Fat-soluble vitamin.—II. Content of roots, Steenbock and Gross.....	460
Fat-soluble vitamin.—III, Maizes, Steenbock and Boutwell.....	461
The clinical rôle of the fat-soluble vitamin, Hess and Unger.....	461
The causation and treatment of rickets, Pritchard.....	462
Cystolithiasis among Filipinos and dietetic deficiency, Padua.....	462
The dairy industry and human welfare, McCollum.....	462
Pathology, origin, and cause of pellagra, Lubarsch and von Ostertag.....	462
Effects of malt on scurvy and on blood, McClendon et al.....	463
Deficiency diseases.....	463
The pathogenesis of deficiency disease, III, IV, McCarrison.....	463
Food factors in gastroenterology, Mendel.....	465
Origin of the so-called autointoxication symptoms, Alvarez.....	465
Alkaline reserve capacity of blood in hemorrhage, Tatum.....	465
Effect of work and heat on hydrogen-ion concentration of sweat, Talbert.....	465

ANIMAL PRODUCTION.

	Page.
Genetic and operative evidence on secondary sexual characters, Morgan	466
Sex studies.—XI, Hermaphrodite birds, Boring and Pearl	466
Excessive sexual activity of male rabbits, I, Lloyd-Jones and Hays	467
Excessive sexual activity of male rabbits, II, Hays	467
Degeneration in the albino rat testis due to diet, Allen	468
Changes in relative weights of rats underfed for various periods, Stewart	468
Microscopic analysis of cattle foods, Morris	469
Significance of nonprotein nitrogen content of feeding stuffs, Zuntz	469
Losses of organic matter in brown and black alfalfa, Swanson et al	469
Sunflower silage, Neidig and Vance	469
Nitrogen metabolism of two-year-old steers, Bull and Grindley	470
Finishing heavy steers on pasture and cottonseed meal, Hunt	470
The utilization of calcium compounds by growing swine, Forbes et al	470
Selection, dressing, and curing pork on the farm, Helser	470
Report of third year of Vineland international contest, Hannas	470
Poultry raising, Voitellier	471

DAIRY FARMING—DAIRYLING.

Further study of milk substitutes in feeding dairy calves, Caldwell	471
Self feeders for dairy cows, Hunt	471
Inheritance of Jersey colors, Hooper	472
Farmers' clean milk book, North	472
Sampling freshly drawn milk for cow-testing work, Shaw and Deysher	472
Quantitative and qualitative bacteriological methods for milk, Hastings	472
What is condensery milk worth? Anderson	473
Thirteenth annual conference of the American Dairy Science Association	473

VETERINARY MEDICINE.

A text-book of general bacteriology, Jordan	474
Live stock sanitary laws of Montana	474
A serious forage poison, Elliott	474
Factors influencing final H-ion concentration in bacterial cultures, Jones	474
Specific substances in leucocytes of immunized animals, Bachmann	474
Some factors influencing potency of concentrated antitoxic serum, Hixson	474
The specific action of the euglobulin of vaccinal serum, Henseval	475
Concerning the mode of action of vaccinal euglobulin, Henseval	475
Influence of normal beef serum on the anthrax bacillus, Kolmer et al	475
Blackleg immunization, Eichhorn	476
Deer-fly fever or Pahvant Valley plague, Francis	476
The retest of reacting cattle, Wills	476
Progress in tuberculosis control, Kiernan	477
The midland cattle disease	477
Prevention of hog cholera, Hackett	477
Three new bacterial species pathogenic for the domestic birds, [Hadley]	478

RURAL ENGINEERING.

The civil engineer's pocket-book, Trautwine	478
Sixth biennial report of the Department of Engineering of California	478
Report of State Engineer to Governor of Colorado, 1917-18, McCune	478
Annual report of the Reclamation Service, 1917-18, Davis	479
Fourth biennial report of the Reclamation Board of California	479
Contract forms and specifications, Morgan and Paul	479
Graphical method for estimating storm-water run-off, Horner	479
Three major power possibilities in California, Fowler	479
Power possibilities in California, Fowler	479
Undeveloped water power in the Southwest, Fowler	479
Irrigation engineering, Davis and Wilson	479
Irrigation district laws of Oregon, 1919	479
Irrigation, Drake and Peters	479
Administration report of the Irrigation Branch, 1917-18	479
Factors determining the duty of water in irrigation, Robinson	480
Recent methods of measuring irrigation water, Trask	480

	Page.
The saving of irrigation water in wheat growing, Howard.....	480
The irrigation of the Konia plain, Money.....	480
Pumping machinery, Greene.....	480
Hexagonal chart for finding velocity of water in pipes, Anthony.....	480
Diagrams for excess loss of head in pipe-lines, Bailey.....	480
Flow of water through one and one-half inch pipe and valves, Greve.....	480
Diagram for computing band spacing for wood-stave pipe, Batcheller.....	481
Leakage test of wood-stave pipe-line, Crown.....	481
Creosoted wood stave pipe and its effect upon water.....	481
The farm water supply and sewage disposal, Day et al.....	481
A disposal station for a can privy system, Johnson.....	481
Drainage laws of Illinois, in force July 1, 1917, compiled by Emmerson.....	481
Drainage district laws of Oregon, 1919.....	481
Drainage in Michigan, Miller and Simons.....	481
Farm drainage, Shafer.....	482
Various benefits from tile drainage, Bear.....	482
Deep subsoiling of orchards in Lindsay district, Tulare County, Brann.....	482
Excavation: Machinery, methods, and costs, McDaniel.....	482
Highway laws, revision of 1918.....	482
Highway laws: Amendments of 1919.....	483
Laws relating to highways and bridges, compiled by Markham.....	483
Supplemental laws relating to highways and bridges.....	483
Important statutes relating to State Highway Department of Oregon.....	483
County road legislation, McLean.....	483
First annual report of the Highway Department of Georgia, Patterson.....	483
Report of the State Highway Commission, 1918, Beard.....	483
Report of Massachusetts Highway Commission for 1918, Sohler et al.....	483
Reports of road commissioners of Wayne County, Mich., Hines et al.....	483
Tests demonstrate value of hard, smooth-surfaced roads, Johnson.....	483
Good roads pay for themselves twice every year, Veenhuyzen.....	484
Tests of thin-base monolithic-brick road, Edwards.....	484
Comparison of road subgrade and air temperatures, Wiley.....	484
Capacity load and ruling grade in highway transportation, Barnett.....	484
Cost of maintaining roads with tractor and eight-mule outfit, Hughes.....	484
Maintenance costs of primary highways in Washington, Cotterill.....	484
Proportion and reasonable economy in rural road design, Harger.....	484
Road materials in the vicinity of Regina, Saskatchewan, Reinecke.....	485
General specifications for road work.....	485
Charted summary of State concrete road specification, Johnson.....	485
Concrete in roads, bridges, and culverts, Breed.....	485
Bond between steel and concrete, Fuller.....	486
Structural engineers' handbook: Steel bridges and buildings, Ketchum.....	486
Motor vehicle engineering: Engines, Favary.....	486
Relation of time of ignition to economy of engine, Calderwood and Mack.....	486
N. G. E. A. data sheets, compiled by Brate.....	487
Agricultural tractors, Tweedy.....	487
Notes on tractors, Ringelmann.....	487
The work of the motor tractor, Garrad.....	488
The problem of adherence in mechanical cultivation, de Poncins.....	488
The Widen type of cultivator, Wibeck.....	488
Haymaking machinery, Bond.....	489
Flue curing tobacco barns and packing house, Jennings.....	489
Hog houses for South Dakota, Patty.....	489
Suggestions for the improvement of Vermont dairy stables, Strahan.....	489
Milk houses for Vermont dairy farms, Strahan.....	489
Lightning protection, Harding et al.....	489

RURAL ECONOMICS.

Rural community buildings in the United States, Nason and Thompson.....	489
The rural community fair, Galpin and Hoag.....	490
The American farm woman as she sees herself, Mitchell.....	490
Report of the Mission to the United States, Barbedette.....	490
A contribution to the bibliography of agriculture in Virginia, Swem.....	490
Articles relating to agriculture, Ramos Bascuñana.....	490
Landholding wages, and prices of commodities from 1200-1800, d'Avenel.....	490

	Page.
Report on large landholdings in southern California.....	490
A large State farm, Weigall and Wrey.....	490
Collective leases in Parma, Bologna, and Ferrara and in Lombardy.....	491
The land tax in China, Huang.....	491
Minimum wages for agricultural labor in England and Wales.....	491
The wages of rural labor.....	491
The value of farm bookkeeping and cost accounting.....	491
Agricultural bookkeeping, Manrique.....	491
Wheat handling and grading in America, Harris.....	491
[Notes on grain elevator operations in North Dakota].....	492
The farmers' elevator movement in Ohio, Erdman.....	492
Flour and mill feed prices, Himber.....	492
Monthly Crop Reporter.....	492
The Market Reporter.....	492
[Agricultural statistics of Japan].....	492

AGRICULTURAL EDUCATION. *

Function of agricultural instruction in promotion of production, Coutinho.....	493
The duty of agriculture toward the war injured, Amar.....	493
The university school of forestry, Corbin.....	493
The destiny of the Veterinary High School in Dorpat, Zalewsky.....	494
Report of the Minister of Agriculture of Quebec, 1918-19, Caron.....	494
Agricultural services and the promotion of agriculture, Jonnart.....	494
Plan for cooperation of Kansas Board of Education with Federal Board.....	494
Plans under the Smith-Hughes Act in Mississippi, 1919-20.....	495
Vocational agriculture in the secondary schools of Virginia, Eason.....	495
Rooms for a department of vocational agriculture, Stewart and Johnson.....	495
Agricultural instruction and small farming at primary school, Arnould.....	495
Forty laboratory exercises in soils, Fattig.....	496
Seventy laboratory exercises in plant production, Fattig.....	496
Profitable dairying, Hatch and Benkendorf.....	496
School gardens, Barthe.....	496

MISCELLANEOUS.

Federal legislation, etc., affecting agricultural colleges and stations.....	496
Twenty-fifth Annual Report of Montana Station, 1918.....	496
Thirty-second Annual Report of South Carolina Station, 1919.....	496
Annual Report of Virginia Station, 1918.....	496
Monthly Bulletin of the Ohio Experiment Station.....	496

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

<i>Stations in the United States.</i>	<i>Page.</i>	<i>U. S. Department of Agriculture—</i>	<i>Page.</i>
Iowa Station :		Bureau of Crop Estimates :	
Circ. 61, Oct., 1919-----	470	Mo. Crop Rptr., vol. 5, No.	
Circ. 62, Nov., 1919-----	448	12, Dec., 1919-----	492
Montana Station :		Continued.	
Twenty-fifth An. Rpt. 1918_	419, 496	Bureau of Markets :	
Nebraska Station :		Market Rptr., vol 1—	
Bul. 163, Apr. 15, 1918-----	437	Nos. 1-4, Jan. 3, 10, 17,	
New Jersey Stations :		and 24, 1920-----	492

CONTENTS OF VOL. 42, No. 6.

	Page.
Recent work in agricultural science.....	501
Notes.....	600

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

The ripening and pickling of California olives, Hilts and Hollingshead.....	501
Lipolytic enzymes in olive oil, Rector.....	502
Studies on enzym action, XVIII, McGuire and Falk.....	502
Rôle of pentose-fermenting bacteria in corn silage, Peterson and Fred.....	502
Ester transposition and saponification numbers, Pardee and Reid.....	502
The heptoses from gulose and some of their derivatives, La Forge.....	503
Oxidation of sugars by mercuric acetate, Ingvaldsen and Bauman.....	503
Alkali fusions, I, Gibbs and Phillips.....	503
Melting point determination with electrical heating, Malowan.....	503
Effect of chlorids on the nitrometer determination of nitrates, Sanders.....	504
The formaldehyde method for determining ammonium nitrate, Grissom.....	504
On the distillation of ammonia, Davisson.....	504
The volumetric phosphoric acid determination of Pincus, Springer.....	504
Substitutes for phenolphthalein and methyl orange, Scales.....	504
Nephelometric values of cholesterol and higher fatty acids, II, Csonka.....	505
Method of preparing phloroglucinol reagent for the Kreis test, Dixon.....	505
The electrometric titration of plant juices, Haas.....	505
Detection of hydrogen peroxid in pasteurized milk, Fouassier.....	505
Direct determination of potassium and sodium in blood, Kramer.....	506
Short modification of official chlorin method, Halverson and Wells.....	506

	Page.
A new shaking-out method for the determination of fat in feces, Sonntag	506
Sugar sirup from home-grown sugar beets, Ort and Withrow	507
Home curing of meats: Pork	507
New methods of food dehydration, Falk	507
The use of casein in glue making, Butterman	507
Colloidal method for increasing volume of water-glass, Malcolmson	507
Testing the mildew resistance of textiles, Levine and Veitch	508
Use of hydrogenated oils in manufacture of tin plate, Collins and Clarke	508

METEOROLOGY.

The climate of Kansas, Flora	508
Ohio weather for 1918, Alexander and Patton	510
The weather of Scotland in 1918, Watt	510
[Rainfall of Dominica, 1893-1918], Watts	510
Rainfall, sugar production, and froghopper blight in Trinidad, Williams	510
Phenological observations, 1918	511
Recent phenological literature	511
Selection of plants with reference to meteorological conditions, Azzi	511
Phenological conditions a basis for determining amount of seed, Hiltner	511
Influence of meteorological phenomena on culture of wheat, Figueiredo	511
Correlation of wind flow and temperature with evaporation, Shull	511
Optics of the air, Humphreys	511

SOILS—FERTILIZERS.

Soils and manures in New Zealand, Wild	511
Farming marsh soils, Whitson and Ullsperger	512
Guide for moor cultivation, Paulig	512
A soil survey of the Kistna Delta, Harrison et al.	512
Papers on soil denudation	513
Soil erosion and conservation, I-IV, Sim	513
Experiments on evaporation from soils, de Angelis d'Ossat	513
Influence of cultivation on waters in soils, Mendes de Godoy	514
Experiments with ordinary cultivation <i>v.</i> no subsequent cultivation	514
Bacterial analysis of soil samples, Jones and Murdoch	514
Subsoiling <i>v.</i> ordinary cultivation	514
Tests to determine the value of subsoiling ratoon crops	514
Microorganisms in plant chemistry and nitrogen fixation, Hendrick	514
The sterilization of soil by steam, Polak	514
Lowland moor soil as fertilizer for sand, Jablonski	515
Green manuring, Scherffius	515
Soil fertility and fertilizers, Calvino	515
Production, consumption, and requirements of plant food, Honcamp	515
Practical fertilizing questions, von Seelhorst	516
Iowa soils: Their improvement, Stevenson	516
The maintenance of soil fertility	516
Report on fertilizer experiments, Stookey	517
Artificial manures: Experiments in western India, Mann and Paranjpe	517
Manurial studies, Knight	518
Use of artificial manures on tea estates of Assam and Bengal, Hope	518
Fertilizer tests on seed beds in the fall of 1917, Van Dijk	518
Tests to determine the action of fertilizers on plant crops of cane	519
Nitrification of stable manure nitrogen in cultivated soil, Barthel	519
Conservation of the nitrogen of liquid manure, Henkel	519
I, Conservation of liquid manure nitrogen.—II, Bacterization, Vogel	519
Poultry manure: Its nature, care, and use, Shutt	520
The sodium nitrate industry of Chili, Bertrand	520
Sodium nitrate in 1919, Irvin	520
Taxing the air for increased food production, Lipman	520
A new process for the synthesis of ammonia, Hampel and Steinau	521
Outlook for sulphate of ammonia, Atwater	521
Iron oxid or salt with lime nitrogen, etc., Lemmermann and Einecke	521
Manufacture of KNO ₃ and (NH ₄) ₂ SO ₄ from potassium salts, Hampel	521
The catalyst for the oxidation of ammonia, Perley	522
Leather meal as a source of nitrogen for plants, Pfeiffer et al.	522
The manufacture and distribution of acid phosphate, Carter	522

	Page.
Wood ashes and production of potash, Bateman.....	522
Aspects of potash industry in Great Britain, Rossiter and Dingley.....	522
Potash recovery from blast-furnace gases in England, Hibbert.....	523
Potash salts in 1919, Phalen.....	523
The origin of German potash beds, Jänecke.....	523
The necessity for a supply of pure agricultural lime, Robertson.....	523
Experiments on lime and marl, Christensen.....	523
Right use of lime in soil improvement, Agee.....	524
Objects of liming.....	524
Liming, cultivation, and manurial experiments.....	524
Influence of lime on nitrification of manure, Barthel and Bengtsson.....	524
Sulphur in relation to soil, Powers.....	525
The action of chromium and manganese on plant growth, Pfeiffer et al.....	525
Our mineral supplies, McCaskey, Burchard, et al.....	525
Mineral resources and chemical industries of Southern States, Fairlie.....	525
The manufacture and fertilizing action of guanol, Gehring.....	525
Marine alga and its utilization, Trotter.....	526

The Bourbon palm of South Annam and its fiber, Bussy.....	531
[Paper-making materials].....	531
[Potato experiments in Bavaria], Kiessling.....	531
A study of the rice of the Kamerun, Helm.....	531
Effect of inoculation and lime on soy beans on acid soil, Fred and Graul.....	531
Report on the condition of the European beet sugar industry, de Mesa.....	532
Manurial experiments with sugar cane, Tempany.....	532
Fertilizer experiments with sugar cane [at Tucumán], Cross.....	532
Tucumán sugar canes in 1919, Cross.....	533
Further trials with Réunion tobacco, Tempany and Auchinleck.....	533
Wheat growing in Wisconsin, Delwiche and Leith.....	533
Wheat in East Africa, Dowson.....	533

HORTICULTURE.

Manual of gardening in New Zealand, Tannock.....	533
A little garden the year round, Teall.....	533
Forcing vegetables in hotbeds, Böttner.....	533
Mushroom culture.....	534
Growing tomato seed, Tracy.....	534
Seed farming in Britain, Macself.....	534
The nursery-manual, Bailey.....	534
The recognition of fruit: Graphic records, Durham.....	534
Timely measures for grafting old fruit trees, Schönberg.....	534

	Page.
Pruning trees to bearing age, Tufts	534
The bush fruit: Quickly remunerative fruit-growing, Böttner	534
A possible method of retarding the flowering of fruit trees, Diéner	534
Report on tests of self-sterility in plums, cherries, and apples, Sutton	534
A study of sterility in the plum, Dorsey	534
Formation of flower buds of Jonathan and Grimes Golden, Kirby	535
Some promising new pear stocks, Galloway	536
The length of stem in pears and apples, Bunyard	536
The strawberry and its cultivation in Canada, Macoun	536
Loganberries and Evergreen blackberries, Stahl	536
Specialized mulberry culture, Zago	536
The fertilizing action of sulphur on grapevines, Chauzit	536
Possible uses for wine-grape vineyards, Bioletti and Cruess	537
On the chinin or coyo (<i>Persea schiedeana</i>), Itié	537
Cinchona culture in Java, Loble	537
Selection of stocks in citrus propagation, Webber	537
Strains of Satsuma oranges in the United States, Scott	537
Increase in temperature with altitude during frosty nights, Young	537
The coco palm or coconut tree, Maijer	538
Curing of vanilla beans (<i>Vanilla planifolia</i>)	538
The culture of medicinal plants, Goris and Demilly	538
Notes on the early history of the pecan in America, True	538
Pecans, other than those of the well-known sections, Jones	538
Diversification in orchards, Griffing	538
Street trees, Mulford	538
Systematic tree planting in country planning, Andrews	539
Parks and gardens, Adolphe-Bellair and Adolphe-Bellair	539

FORESTRY.

Forests, woods, and trees, Henry	539
Report of the director of the National Park Service, 1919, Mather	539
Report of director of forestry of Philippine Islands for 1918, Fischer	539
Report on forest administration in Burma for 1918, Carter	539
National forest range improvement and development, Hatton	540
Economy and efficiency in handling forest products, Nelson	540
What our forests support, Smith	540
The forest resources of Virginia, Jones	540
Plain statements on Canada's forests, Barnjum	540
Forestry legislation in Canada during 1919, Jacombe	540
Forestry and rural policy, Maxwell	540
The forest policy of France, Greeley	540
The forest situation in modern Greece, Sklawunos	540
The vegetation of Cyrenaica and its agricultural utilization, Maugini	540
Rate of growth of indigenous and exotic trees in New Zealand, Maxwell	540
Germination of trees and shrubs and juvenile forms, Pammel and King	541
The reproductive organs of <i>Hevea brasiliensis</i> , Heusser	541

DISEASES OF PLANTS.

Recent literature on fungus diseases of plants, Pammel	541
Botany and plant diseases, Stewart	541
[Experimental work with plant diseases, Ontario], Hearst	541
Botany [Ontario, 1917]	541
Report of the mycologist, Bunting	541
The present state of grain treatment for cereal diseases, Hiltner	542
[Fungicidal treatment of cereal seed], Irlbach	542
Extermination of barberry to prevent crop leakage by stem rust, Pammel	542
Formaldehyde treatment of seed corn, Richey	542
Preliminary study of inheritance of rust resistance in oats, Parker	543
Potato diseases in Hawaii and their control, Carpenter	543
A further report on the value of dusting <i>v.</i> spraying, Caesar	544
Field and investigation work [on fruit diseases and insects in Ontario]	544
[Fruit and berry diseases in Ontario], Hearst	544
The spike disease of peach trees, Howard	544
Spike disease of sandal, Hole	544
A possible cause of spike in sandal, Jackson	544

ECONOMIC ZOOLOGY—ENTOMOLOGY.

	Page.
Whitetail deer in New York.—Operations of the buck law, Carpenter	545
The gray wolf of South Dakota, Dalrymple	545
<i>Spirochaeta icterohæmorrhagæ</i> in the common rat in England, Coles	545
The bioclimatic law, Hopkins	545
The collection and preservation of insects, Smyth	545
Twelfth report of State entomologist and plant pathologist, Schoene	545
[Leaflets on economic insects in Canada]	545
Second hundred notes on Indian insects, Fletcher	545
Preliminary list of insects associated with cotton in Egypt, Adair	545
Report on the work of the Grain Pests (War) Committee, Herdman	545
Monthly notes on grubs and other cane pests, II, Illingworth	545
Insect pests and diseases in the vegetable and fruit garden, Duncan	546
Insects affecting the avocado in Trinidad and Tobago, Ulrich	546
Grasshopper control in Montana, Parker	546
The Blattidæ, Hebard	546
The native host plant of the camphor thrips, Watson	546
The bionomics of <i>Aphis grossulariæ</i> and <i>A. viburni</i> , Haviland	546
Contribution to knowledge of South Indian Coccidæ, Ramakrishna Ayyar	546
Sericulture, Viell	546
A study of tobacco worms and methods of control, Edirozo	546
The aquatic adaptations of <i>Pyrausta penitalis</i> (Lepidoptera), Welch	546
Worms in walnuts, Lounsbury	547
Cotton and the pink bollworm in Egypt, Ballou	547
Treatment of cotton against Gelechia attacks, Dudgeon and Cartwright	547
Treatment of cotton as combative measure against Gelechia, Cartwright	548
The pink bollworm, Evans	548
The Angoumois grain moth, King	548
Occurrence of malaria and anopheline mosquitoes in California, Herms	548
Mosquito work of the Bureau of Entomology, Van Dine	548
Tarred felt disks for protecting cabbages and related vegetables, Imms	548
Notes on the lunate onion fly, <i>Eumerus strigatus</i> (Syrphidæ), Cole	548
The broad-bean weevil, Campbell	548
The fern weevil menace, Fullaway	549
Why young queens may fail, Sladen	549
Contributions to a knowledge of natural enemies of Phyllophaga, Davis	549
Philippine wasp studies	550
Importation of <i>Tiphia parallela</i> to Mauritius, d'Emmerez de Charmoy	551
The digger chalcid parasite on <i>Sarcophaga aurifrons</i> , Froggatt	551
The red spiders of America and a few European species, McGregor	551
The dust method for controlling rust mite on citrus trees, Yothers	551
Acarids (mites) occurring in stored grain and flour, Duvall	551

FOODS—HUMAN NUTRITION.

Life and its maintenance	551
Fat production and economy during the war, Cohn	552
Digestibility of certain miscellaneous vegetable fats, Holmes and Deuel	552
Composition of sausage substitutes, particularly from goat meat, Lührig	552
Fish pudding, dumplings, sausage, etc., Buttenberg et al	552
Honey powder, honey aroma, and similar war concoctions, Beythien	552
Studies on the secretion of gastric juice, Cohen	553
The neutrality of the blood, Bayliss	553
Hydrogen-ion concentration of human duodenum, Myers and McClendon	553
Changes in the hydrogen-ion concentration of the urine, Talbert	554
Metabolism of white races in Tropics.—II, Composition of urine, Young	554
Phosphorus requirement of maintenance in man, Sherman	554
The feeding of normal infants during the second year, Morse	555
Calcium metabolism of infants and young children, Holt et al	555
Fat-soluble vitamin.—IV, Content of plant tissues, Steenbock and Gross	556
Fat-soluble vitamin.—V, Thermostability, Steenbock and Boutwell	556
Action of substances on carbohydrate metabolism in beriberi, Funk	557
Experimental production of edema and protein deficiency, Kohman	557
Protein diets and undernutrition in treatment of diabetes, Allen	558
Boiled vegetables for the use of diabetics, Cammidge	558
Botulism, Dodd	558
An outbreak of botulism, Sisco	558

ANIMAL PRODUCTION.

	Page.
An introduction to biology and other papers, Darbishire.....	559
The morphology of the mammalian seminiferous tubule, Curtis.....	559
Relation of embryo to principal axis of symmetry in bird's egg, Bartelmez.....	559
Weight of epididymis, pancreas, etc., of albino rat, Hatai.....	559
The physical basis of heredity, Morgan.....	560
Ensilage, Oldershaw.....	560
The composition of "sharps" and bran, Cox.....	560
[Feeding stuffs inspection 1917-18], Strowd.....	560
Feed inspection for 1919, Strowd.....	560
The breeding industry in North Africa, Geoffroy Saint-Hilaire.....	560
Suggestions for the winter feeding of steers, Good.....	560
Note on cattle in the Bombay Presidency, Keatinge.....	561
On abnormal sexual characters in twin goats, Rickards and Jones.....	561
Goat keeping on money making lines, Powell-Owen.....	561
The pig, Spencer.....	561
British pigs, Long.....	561
Success with hogs, Dawson.....	561
Third annual report Oklahoma State Live Stock Registry Board, 1918.....	561
The stud stock interests of Great Britain, Chapman.....	562
Preferential mating of fowls, Phillips.....	562
The development of the chick, Lillie.....	562
Care of baby chicks.....	562
Acorns as food for poultry, Cranfield.....	562
Cost of starting a commercial poultry business, Shoup.....	562
Runner ducks, Taylor.....	562
Duck keeping on money making lines, Powell-Owen.....	563

DAIRY FARMING—DAIRYING.

The seasonal cost of milk production, Pearson.....	563
Establishment and management of the dairy farm, Kelkar.....	563
British Friesian cattle, Hobson.....	564
The milk goat dairy, Wickersham.....	564
Milk, Heineman.....	564
Should the short-time test be continued? Graves.....	564
Importance of sterilization in operation of milking machines, Hart.....	564
Dairy bacteriology.—II, Cream, butter and cheese, Stevenson.....	564
Lecithin content of butter and its relationship to fishy flavor, Supplee.....	564
Testing a new method of pasteurizing milk for cheese manufacture.....	565
Experiments in use of rennet substitutes for cheese making, McKinney.....	566
Use of pepsin and other substitutes for rennet in cheese making, Barr.....	566
Further notes on use of pepsin in manufacture of cheese, Barr.....	566

VETERINARY MEDICINE.

Digest of comments on Pharmacopœia and National Formulary, Wilbert.....	566
Digest of comments on the Pharmacopœia, Dumez.....	566
Chronic phlegmon with sclerosis and its treatment, Middeldorf.....	566
Specific antisera for infections of unknown cause, III, Rous et al.....	566
Serum sickness following bovine serum, Netter and Cosmovici.....	567
Pneumococcus cultures in whole fresh blood, I, Bull and Bartual.....	567
The cultural differentiation of beta hemolytic streptococci, Brown.....	567
Dairy infection with <i>Streptococcus epidemicus</i> , Brown and Orcutt.....	568
Paratyphoid abortion in mares and relation to cows, Stickdorn and Zeh.....	568
Valuation of the new symptomatic anthrax vaccine (<i>Emphysarcol</i>), Foth.....	568
Epizootic lymphangitis, Velu.....	568
Vaccination experiments against rinderpest, Croveri.....	568
Significance of lipoids in resistance to tuberculosis, de Seixas Palma.....	569
Possible failure of tuberculin during and after gestation, Bissauge.....	569
Tuberculosis in horses, Schlegel.....	569
Tick fever in Palestine, Nicholson.....	570
<i>Microbæsia divergens</i> in Netherlands Indies, Sohns.....	570
Researches upon a spirillum associated with abortion in ewes, Carpenter.....	570
The purification and concentration of hog cholera serum, Records.....	570
Production and use of antihog-cholera serum, Lopp.....	571

	Page.
Diseases of the horse's foot, Reeks.....	571
Treatment of joint-ill with serum from the mother, John.....	571
Hydraulics, Daugherty.....	571
Roup in poultry, Johnson.....	571

RURAL ENGINEERING.

Hydrology: The fundamental basis of hydraulic engineering, Mead.....	571
Hydraulics, Daugherty.....	572
Second biennial report of State Water Commission of California, 1917-18.....	572
Second report of the State Engineer of New Mexico, French.....	572
The value of a hydraulic horsepower at the wheel, Reittger.....	572
Experiments on flow of water through contractions in open channel, Lane.....	572
Verification of Basin weir formula by hydrochemical gaugings, Nagler.....	573
Study of pressures in hydraulic dam cores.....	573
River discharge, Chatley.....	573
Surface water supply of St. Lawrence River Basin, 1917.....	574
Surface water supply of Hudson Bay and Mississippi River Basins, 1917.....	574
Seasonal variation in river water in India, Ross and Bagchi.....	574
Classification of springs, Bryan.....	574
Farm water supply, Peters.....	575
Chlorination and chloramin, Race.....	575
Iron-depositing bacteria and their geologic relations, Harder.....	575
Duty of water in irrigation, Powers.....	575
Irrigation in the Fourteenth Census of the United States, Teele.....	576
Life of flume prolonged by roofing paper lining.....	576
Self-cleaning screen for small canals.....	577
Tile drainage, King.....	577
Determination of Kutter's roughness in a drainage ditch, Bosard.....	577
The leveling of soils in Egypt, Mosséri and Audebeau Bey.....	577
Road laws of the State of Idaho, compiled by Arney and Eustace.....	577
Country Roads Board: Fifth annual report, Calder.....	577
Classification of highways and influence of Federal-aid acts, MacDonald.....	577
The present status of impact tests on roadway surfaces, Goldbeck.....	577
Brick paving stands first—shows highest percentage in mileage under test.....	578
The road-building sands and gravels of Washington, Leighton.....	578
The development of concrete road construction, Johnson.....	578
Reinforced concrete roads, construction, maintenance, and life, Jones.....	579
Amendments to recommend practice for concrete construction, Breed.....	579
Cement-concrete in New Zealand, United States, and Canada, Bush.....	579
Report of committee on reinforced-concrete bridges and culverts, Cohen.....	579
Load concentrations on wood floor highway bridges, Agg and Nichols.....	579
Developments in 1919 in use of machinery for highway construction, Hill.....	580
Southern yellow pine.....	580
The conservation of wood, Wolff.....	580
Concrete engineers' handbook, Hool, Johnson, et al.....	580
Principles of reinforced concrete construction, Turneure and Maurer.....	580
Reinforced concrete design tables, Thomas and Nichols.....	581
Tests of concrete in tension, Carver and Quense.....	581
Solubility of Portland cement and relation to hydration, Witt and Reyes.....	581
The influence of substances on cement and concrete, Witt.....	581
Concrete hardening accelerated by calcium chlorid.....	582
Effect of calcium sulphate on cement, Witt.....	583
Pressing out mix water adds to cement mortar strength, Wiskocil.....	583

Plows for mechanical cultivation, Duval.....	588
The economic limit to motor truck weights, Barnett.....	588
Elevators and transporters of hay, Ringelmann.....	589
Design of railway wagons for carriage of perishable foods, Woods et al.....	589
The literature of refrigeration, Hodsdon and Lees.....	589
Buildings for farm animals, Ringelmann.....	590
The storing of roots, Craig and Carlyle.....	590
Limiting the fuel for domestic heating, Meier.....	590
How to figure coil sizes for hot water services, Ehrlich.....	590
A test of the conductivity of window shades, Allen.....	590
Rural home sanitation, Ehlers and Lenert.....	591
Treatment of canning-plant wastes in Wisconsin, Tully.....	591
Use of paint on the farm, King.....	591
Electricity on Kansas farms, Harger.....	591
Development of the application of electricity to agriculture, Lecler.....	591

RURAL ECONOMICS.

Royal Commission of Agriculture.—Interim report, Peat et al.....	592
Royal Commission of Agriculture.—Minutes of evidence.....	592
The German agricultural problem during and after the war, de Guichen.....	592
Government regulation and vegetable growing, Bovenschen.....	592
Directions in which Victorian agriculture may be developed, Richardson.....	593
The farmers' platform.—A new national policy for Canada.....	593
The Argentine grain grower's grievances, Holm.....	593
Where opportunity knocks twice, Crissey.....	593
The determination of farm costs, Keane.....	593
The net income on certain crops, Malpeaux.....	593
Ouyen farm competition, Mullett.....	593
Profit and loss sharing on the farm, Wyllie.....	593
Housing of the agricultural laborer, Thresh.....	593
Jewish colonization in Palestine.—Methods, plans, and capital, Oettinger.....	594
Cooperation in Geneva and in Switzerland, Renaud.....	594
Report on cooperative societies in Bihar and Orissa, 1918-19.....	594
Farmers' Market Bulletin.....	594
Monthly Crop Reporter.....	594
[Annual agricultural statistics of France, 1917].....	594
[Agricultural statistics of Algeria for 1913 and 1914].....	594

AGRICULTURAL EDUCATION.

The Federal departments as sources of information, Guerrier.....	594
The next organization step in southern agriculture, Rubinow.....	594
Agricultural education.....	595
Relations of vocational schools to extension and teaching, Stimson et al.....	595
Plan for vocational education in the State of Louisiana.....	596
Vocational education in Maryland, 1919, Emerson.....	596
Vocational agricultural education in Mississippi.....	596
Report on the Agricultural Instruction Act, 1918-19, Grisdale.....	596
The Ohio plan for the training and improvement of teachers, Stewart.....	597
Agricultural botany in secondary education, Roberts.....	597
How to raise standards in veterinary education, Berg.....	598
Home economics, Calvin and Lyford.....	598
Illustrated lessons in agriculture, Bricker.....	598
How teachers may use Farmers' Bulletin 602, Dille.....	598
Organization and results of club work, 1918, Benson and Warren.....	598
School fairs in 1919.....	599

MISCELLANEOUS.

Monthly bulletin of the Western Washington Substation.....	599
Transactions of Third International Congress of Tropical Agriculture.....	599
Modern progress in agriculture, Hermenegildo Gorría y Royán.....	599
Farm memorandum book.....	599

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

<i>Stations in the United States.</i>	Page.	<i>U. S. Department of Agriculture—Con.</i>	Page.
California Station:		Circ 67, How Teachers May Use	
Bul. 317, Jan., 1920-----	537	Farmers' Bulletin 602, Clean	
Hawaii Station:		Milk: Production and Hand-	
Bul. 45, Jan. 24, 1920-----	543	ling, A. Dille	598
Hawaiian Sugar Planters' Sta-		Bureau of Crop Estimates:

CONTENTS OF VOL. 42, NO. 7.

Editorial notes:		Page.
Extension specialists in agriculture and home economics-----		601
Recent work in agricultural science-----		608
Notes -----		695

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

The cause of deterioration and spoiling of corn and corn meal, McHargue.....	608
Preservatives to inhibit fermentation and molds, Perry and Beal.....	608
Testing amylolytic action of diastase of <i>Aspergillus oryzae</i> , Waksman.....	609
Chemical investigation of hardened fats, Riess.....	610
Cyanogenesis in Sudan grass, Menaul and Dowell.....	610
Purification of compressed gases in ammonia synthesis, Davis.....	610
Purification of benzoic acid, Phillips and Gibbs.....	611
Indicators and their industrial application, Lubs.....	611
Further work on acid potassium phthalate as a standard, Hendrixson.....	611
Determination of chlorin with the nephelometer, Lamb et al.....	611
Determination of amino acids by the hydrogen electrode, Tague.....	612
A new type of condenser for the determination of crude fiber, Clemens.....	612
The acidimetry of red wines and fruit juices, Macmillan and Tingle.....	612
The detection of methyl alcohol, Wolff.....	613
Methods for the quantitative determination of saccharin, Beyer.....	613
The sanitary quality of milk, Cooledge and Wyant.....	613

	Page.
Notes on double polarization methods for sucrose, Rolfe and Hoyt-----	613
The titration method for determining blood alkalinity, Clogne-----	614
Determination of ammonia in blood by a volumetric method, Gérard-----	614
Some observations on Kendall's method of estimating iodine, Kuzirian-----	614
The determination of cellulose in woods, Dore-----	614
Utilization of waste sulphite liquor, compiled by Johnsen and Hovey-----	615
Industries for the conservation of fruits.—Apples, Arnou-----	615
Making grape juice, Thayer-----	615
Varieties of grapes for juice, Thayer-----	615
Every step in canning, Gray-----	616
Temperature-time relations in foods during sterilization, Thompson-----	616

METEOROLOGY.

Weather factors affecting yield of winter wheat in Ohio, Blair-----	616
Relation of the weather to the yield of wheat in Manitoba, Connor-----	617
Cultivation does not increase the rainfall, Smith-----	617
Australian droughts, Richardson-----	618
The distribution of maximum floods, Henry-----	618
Evaporative capacity, Horton-----	618
Variations in solar radiation in the United States, Kimball-----	618
Thermal belts and inversions of temperature in North Carolina, Cox-----	619
Predicting minimum temperatures, Smith-----	619
Evidence of climatic effect in the annual rings of trees, Douglass-----	619
Monthly Weather Review-----	619
Climatological data for the United States by sections-----	620

SOILS—FERTILIZERS.

Relation of the moisture equivalent of soils to irrigation, Harding-----	620
Experiments on soil moisture, Grantham and McCool-----	621
Adsorptive unsaturated soils, Hissink-----	621
Calcium and magnesium content of soils, Ames and Schollenberger-----	621
The mixing of mineral soils and moor soils, Ritter-----	622
Sugar-cane soils in the division of Demak, van Lookeren Campagne-----	622
Bacteriological effects of green manure, II, Briscoe and Harned-----	622
Studies on the synthesis of nitrogenous fertilizers, Albrand-----	623
Relation of certain acidic to basic constituents of the soil, Howard-----	623
Upland moor cultivation without sodium nitrate, Gully-----	623
Results of further nitrogen experiments, Schneidewind-----	624
Potassium-bearing minerals as a source of potassium, De Turk-----	624
Field comparison of hydrated lime with limestone, Hartwell and Damon-----	625
[Fertilizers], López Domínguez-----	626

AGRICULTURAL BOTANY.

Plant physiology, Molisch-----	626
Relation of moisture in solid substrata to salt balance, Shive-----	626
Effect of lime on sodium chlorid tolerance, LeClerc and Breazeale-----	626
Chlorophyll, carotin, xanthophyll, and sugar from formaldehyde, Ewart-----	627
Influence of concentration of sugar solutions on microorganisms, Grove-----	627
Growth of Aspergillaceae and other fungi, Bezssonof-----	627
The formation of soluble starch by mold fungi, Boas-----	628
Tyrosin in the fungi, Dodge-----	628
Importance of epidermal coverings, Harvey-----	628
The habitats of halophytes.—II, <i>Plantago maritima</i> , Kolkwitz-----	628
Water requirement and adaptation in Equisetum, Dossdall-----	628
Studies on transpiration in high-moor plants, Jensen-----	629
Absorption of nutrients in pitchers of Sarraceniaceae, Hepburn et al-----	629
The magnitudes and variations of osmotic values, Blum-----	629
Light sources in phytophysiological studies, Sierp-----	630
Inheritance of certain flower characteristics in <i>Papaver rhæas</i> , Becker-----	630
Finland varieties of field peas, Teräsvuori-----	630
Morphological basis of some experimental work with maize, Weatherwax-----	630
Species placed by Saccardo in the genus <i>Phoma</i> , I-II, Grove-----	630

FIELD CROPS.

	Page.
Methods of plant breeding, Hilgendorf.....	631
Sectional variety tests [in 1919], Cox and Chamberlin.....	631
Short season hay crops experiments, Megee.....	631
Grain crop variety tests, Stookey.....	631
Eight-inch v. four-inch drilling of grain, Welton.....	632
Alfalfa in Wisconsin, Moore and Graber.....	632
Alfalfa seed production, Spragg and Down.....	632
Planting rates and spacing for corn under southern conditions, Mooers.....	632
Improvement of yield of Sea Island cotton in West Indies, II, Harland.....	634
Northern Ontario as a source of seed potatoes, Miller.....	634
Spring planting of Rosen rye proves unsatisfactory, Spragg and Down.....	635
Sugar cane experiments in the Leeward Islands, Collens et al.....	635
The sugar cane industry of Brazil.....	635
Rust-resisting sunflowers, Spragg and Down.....	635
[Tobacco].....	636
[Wheat-crossing], Jelinek.....	636
Fertilizing the wheat crop of 1920, Thorne.....	636

HORTICULTURE.

Vegetable culture, Vercier.....	637
Methods for marketing vegetables in California, Rogers.....	637
Fruits for Minnesota planting.....	637
Minnesota State Fruit-Breeding Farm in 1919, Haralson.....	637
Report of committee on Minnesota Fruit-Breeding Farm, Eddy et al.....	637
Varieties of fruit for Wyoming, Harris.....	637
Spraying and dusting experiments, 1918, Brittain.....	637
The propagation of apple trees on their own roots, Shaw.....	638
Ohio apple orchard fertilization, I, Ballou.....	638
Manuring experiments, 1917-18, Ward and Thomas.....	638
Apple spraying in 1919, Sanders.....	638
Costs and profits in the Minnesota apple orchard, Brierly.....	639
Pears: Production estimates, districts, and varieties, Gould and Andrews.....	639
The floral biology of the peach, I, II, Manaresi.....	639
The new hybrid plums, Webster.....	639
Making graft-unions, Ravaz.....	639
China mulberry and sericultural work.....	640
The budding and grafting of cacao, Williams.....	640
The future of cacao, de Moraes.....	640
Variation in coconuts, Petch.....	640
The effects of alkali on citrus trees, Kelley and Thomas.....	640
Pruning the navel orange, Hodgson.....	641
Control of humidity conditions in lemon storage rooms, Shamel.....	641
Report on production of tea in India in 1917, Shirras.....	641
Importance of the Spanish nut trade, Jones.....	641
Teas' hybrid catalpa, Jones and Filley.....	641
The best of our newer and rarer foliage trees, Kache.....	641
Notes on Dahlia, with two new species from Guatemala, Safford.....	641

FORESTRY.

Forestry and a forest policy for New York, Baker.....	642
Notable things accomplished by Pennsylvania Department of Forestry.....	642
Forest legislation in the returned territory, Trifone.....	642
The forest experiment station's thinning areas, Schotte.....	642
Influence of the forests upon the climate, Ham.....	642
The forests of Buchanan County, Va., Schwab.....	642
Adaptation of exotic trees in Westphalia, Graf zu Stolberg.....	642
First inventory of woods and other forest products of Tonkin, Chevalier.....	642
Venezuelan mahogany, a hitherto undescribed species, Pittier.....	642
Rubber research in the Dutch East Indies, Petch.....	643
Mechanical strength and properties of <i>Shorea robusta</i> , Pearson.....	643
How lumber is graded, Betts.....	643

DISEASES OF PLANTS

	Page.
Report of [New York] bureau of plant industry, Atwood.....	643
Report of the division of plant pathology and botany, Matz.....	643
Mycologist's report on a visit to Trinidad, Nowell.....	643
North American rusts on <i>Cyperus</i> and <i>Eleocharis</i> , Kern.....	643
Treatment of cereal seeds by dry heat, Atanasoff and Johnson.....	644
Broken stem disease of rye, Detmers.....	644
"Take-all" disease of wheat in Virginia, Schoene.....	644
Studies on the winterkilling of wheat, Schander and Schaffnit.....	644
The new sugar cane disease, Stevenson.....	644
[The yellow stripe or sugar cane disease], Earle.....	644
Root disease in sugar cane.....	645
Diseases [and other injuries in Montana orchards], Strausz.....	645
Spraying for black spot and powdery mildew, Ward and Thomas.....	645
Cedar rust and cedar eradication, Schoene.....	645
Diseases and insect troubles of raspberries and their control, Frank.....	645
Treatment for <i>Cycloconium</i> of olive, Rolet.....	645
The fungus diseases of the avocado, Rorer.....	645
A summary of the citrus canker investigation in south Alabama, Peltier.....	646
Pink disease of citrus, Lee and Yates.....	646
Fungus diseases [in Ceylon, 1918].....	646
Inspection for pine blister rust, Schoene.....	647
Treatment for chlorosis, Arnaud.....	647

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Specific, subspecific, and varietal categories of insects, McAtee.....	647
Insecticidal principle of <i>Chrysanthemum cinerariifolium</i> , I, Yamamoto.....	647
Report of the entomologist, Fernald.....	647
Report of the imperial entomologist, Fletcher.....	647
[Economic insects in Tasmania], Nicholls.....	648
Wheat insect survey for 1919, Cotton.....	648
Insects attacking squash and allied plants in Connecticut, Britton.....	648
Two new termites from Arizona, Snyder.....	648
Brief descriptions of new Thysanoptera, X, Bagnall.....	648
Sulphur fumigation for control of mealy bug on grapevines, Nougaret.....	649
A new species of <i>Matsucoccus</i> from pines in California, Herbert.....	649
A new genus and species of coccid from <i>Loranthus</i> , Morrison.....	649
The peach tip moth (<i>Laspeyresia molesta</i>), Froggatt.....	649
The green clover worm a pest of soy beans (<i>Plathypena scabra</i>), Smith.....	649
Life history and habits of a peach leaf miner, Harukawa and Yagi.....	650
Serpentine leaf miner of peach, Harukawa and Yagi.....	650
Lepidoptera at light traps, Turner.....	650
Further studies of <i>Sorospora uvella</i> , Speare.....	651
A new noctuid from Arizona, Dyar.....	652
New moths from Mexico (Lepidoptera, Noctuidæ, Hadeninæ), Dyar.....	652
The larva of <i>Xanthopastis timais</i> again, Dyar.....	652
The occurrence of malaria parasites in Anopheles, Mayne.....	652
Descriptions of hitherto unknown larvæ of <i>Culex</i> , Dyar.....	652
A new subgenus of <i>Culex</i> , Dyar.....	652
Revision of American Sabethini of Sabethes group, Dyar.....	652
District of Columbia Diptera: Asilidæ, McAtee and Banks.....	652
Life history of <i>Eubiomyia calosomæ</i> , Collins and Hood.....	652
Studies on the fruit flies of Japan.—I. Japanese orange fly, Miyake.....	652
Parasitism of Mediterranean fruit fly in Hawaii during 1918, Willard.....	654
European frit fly in North America, Aldrich.....	654
Biology of some Coleoptera of Colydiidæ and Bothrideridæ, Craighead.....	655
Descriptions of new North American ichneumon flies, Cushman.....	655
Descriptions of 7 new species of <i>Opius</i> , Gahan.....	655
Revision of parasitic flies of <i>Homalotylus</i> and <i>Isodromus</i> , Timberlake.....	656
Polyembryony and sex, Patterson.....	656
Preliminary note on the life period of the bulb mite, Yagi.....	656
Tropical fowl mite in the United States, Wood.....	656

FOODS—HUMAN NUTRITION.

	Page.
Report on food conditions in Germany, Starling.....	657
The food ration of the adult man, Binet.....	658
Mess officers' manual.....	658
Nutrition during childhood, Nobécourt.....	658
Principles of general physiology, Bayliss.....	658
The food industry, von Buchka.....	658
Food chemistry in 1917, Rühle.....	659
The food value of milk, Ferry.....	659
Milk: Its importance as food, Lyman.....	659
Utilization of the shark for food and leather, Rogers.....	659
Experiments with soy-bean meal as a substitute in Army ration, Dox.....	659
The energy content of extra foods, II, Benedict and Benedict.....	659
Diseases of nutrition and infant feeding, Morse and Talbot.....	660
Treatment of the intolerance of infants for milk, Weill.....	660
Adaptation of artificial food to human milk, II, Gerstenberger and Ruh.....	660
Calcium metabolism of infants and young children, II, Holt et al.....	661
Effects of rice on metabolic activity of <i>Paramecium</i> , Flather.....	662
The antitoxin of <i>Bacillus botulinus</i> , Dickson and Howitt.....	662
Epidemic gastroenteritis due to food poisoning, Comrie and Bird.....	663

ANIMAL PRODUCTION.

Quantitative studies on growth of skeleton of albino rat, Donaldson.....	663
Changes in weights of albino rats in underfeeding, Stewart.....	664
Recovery of normal weight after underfeeding, Jackson and Stewart.....	664
Effects of inanition in young on ultimate size, Jackson and Stewart.....	664
Effects of inanition and refeeding on growth of kidney, Kittelson.....	665
Relative volumes of cortex and medulla of adrenal gland, Donaldson.....	665
Adrenalin content of the suprarenals of the female white rat, Herring.....	665
The postnatal development of the suprarenal gland, Jackson.....	666
Studies on the mammary gland, IV, Myers.....	666
Studies on the mammary gland, V, Myers.....	667
The oestrous cycle in rats, Long.....	667
Studies on the ovary of the spermophile, Drips.....	667
The origin of the corpus luteum of the sow, Corner.....	668
The vaginal closure membrane and plug, Stockard and Papanicolaou.....	668
Interstitial cells in the gonads of domestic fowl, Goodale.....	668
Glycogen in the chick embryo, Allen.....	669
Effect of abnormal temperatures on the nervous system, Alsop.....	669
Computing rations for farm animals, Savage.....	669
Stock breeding in Madagascar, Carle.....	669
General census of cattle in Mauritius, 1918, Robert.....	669
The gestation of the carabao, Gonzalez.....	669
Simple rations <i>v.</i> complex rations for poultry, Burgess and Dickson.....	670
Meat scraps <i>v.</i> soy bean proteins as supplement to corn, Philips et al.....	670
The breed in poultry, and pure breeding, Lippincott.....	671
The relation of plumage to ovarian condition, Cole and Lippincott.....	671
Preparation of eggs for market, Benjamin.....	671
Poultry in Mauritius, d'Emmerz de Charmoy.....	671

DAIRY FARMING—DAIRYING.

Influence of the nucleoproteins of the udder on milk secretion, Giuliani.....	672
Production and distribution of milk, Astor et al.....	672
Calculating the cost of milk production, Misner.....	673
Laws relating to milk and milk products.....	673
Municipal milk control, Kelly.....	673
[Milk inspection and milk prices in Chicago].....	673
The movement for cooperative delivery of milk, Hyde.....	673
Milk bottle losses.....	673
Systems of pasteurization.....	673
Remade milk and cream, Redfield.....	674
Yeasts and molds in butter and cream, Lund.....	674
Deterioration of butter through the agency of <i>Oidium lactis</i> , Nicholls.....	674

VETERINARY MEDICINE.

	Page.
Report of practitioners' short course in veterinary medicine.....	674
Report of Bengal Veterinary College and civil department, Smith.....	675
Report of civil veterinary department Bihar and Orissa, 1918-19, Quinlan.....	675
Report on the civil veterinary department Burma for 1918, Evans.....	675
Report of Imperial Bacteriological Laboratory, Muktesar, Sheather.....	675
Studies on anthelmintics, VII, Hall and Wigdor.....	675
Cresols and substitutes for cresol soaps, I, Hailer.....	675
Mutual precipitation of toxins and their antitoxins, Nicolle et al.....	676
Protein fever.—The effect of egg white injection on the dog, Cohen.....	676
Contagious abortion of cattle, Fitch and Boyd.....	676
Diagnosis of bovine contagious abortion, Fitch.....	677
Etiology of so-called infectious abortion disease of cattle, Schroeder.....	677
Relationship of equine and human glanders, McGilvray.....	677
Louping-ill: Duration of the infectivity of the ticks, Stockman.....	677
Observations on recurrent ophthalmia, Knowles.....	677
Rinderpest in German East Africa during 1917-18, Curson.....	678
Experimental transmission of swamp fever by insects, Scott.....	678
Notes on swamp fever, Hadwen.....	678
Trematodes produced in South African snails, Cawston.....	678
The use of carbon bisulphid in infestations with bots, Hall and Avery.....	678
Control of the cattle tick, Johnston.....	678
A malarial parasite in the blood of a buffalo, Sheather.....	679
Potassium iodid in malnutrition of pigs, Frey.....	679
Progress in hog cholera control, Houck.....	679
Study of the swine erysipelas bacillus, Cotoni.....	679
Joint-ill in foals: Etiology, Magnusson.....	679
Joint-ill in foals: Etiology and treatment, McFadyean and Edwards.....	680
Diseases of domesticated birds, Ward and Gallagher.....	680

RURAL ENGINEERING.

The elements of hydrology, Meyer.....	681
National Forests and the water supply, Dana.....	681
An improved weir for gauging in open channels, Herschel.....	681
The discharge of smooth wood-stave pipes and wood channels, Barnes.....	681
Great new irrigation and power developments, Lee.....	681
Water cost of irrigation, Truckee Valley, Nev., Norcross.....	682
Relief from floods, Alvord and Burdick.....	682
The progress of the purification of water with chlorin, Moreau.....	682
The American highway problem, Hirst.....	683
State highway construction in 1919 and 1920.....	683
Third biennial report of Oregon State Highway Commission, Benson et al.....	683
Constitution and statutes of Oregon relating to roads, compiled by Olcott.....	683
Developments in New York State highway maintenance.....	683
Variable designs for county highway systems.....	684
Inclined planes instead of curve suggested for highway surfaces.....	684
Instructions and table for reducing labor in curve computation, Lilly.....	684
Fast road-building with concrete hauled four miles.....	684
Charts tell cost of concrete paving, Herlihy.....	685
Reinforced concrete construction.—I, Fundamental principles, Hool.....	685
Permeability of concrete, Bowman.....	685
Recent experiments with straw gas, Greig.....	685
Brake horsepower formula for internal combustion engines, Lemp.....	685
Things to consider in radiator fan design, Hoyt.....	686
Multiple horse hitches, Dinsmore.....	686
The influence of speed on the draft of a plow, Davidson.....	686
Harvesting machines, Coupan.....	686
Economic farm buildings, Lawrence.....	687
Poultry houses for Oklahoma, Bentley and Smith.....	687
Hatching eggs electrically, Denninger.....	687

RURAL ECONOMICS.

Social and economic fundamentals of agriculture.....	687
Agriculture of tomorrow, Fernand-Laurent.....	687
Possibilities of increased production in our rural industries, Perkins.....	688

	Page.
Government experimental land settlement under a colony system.....	688
Land for settlers.....	688
Land values in France, Caziot.....	688
War prices and the French farmer income, Newlin.....	688
Investigations relative to agricultural profits, 1917-18.....	688
The dairy farming business in western Ontario, Leitch and Neale.....	688
Share leases for dairy farms, Black.....	689
The landlord's and the tenant's share, Black.....	689
Compensation for farm managers, Boss.....	689
Where the farmer touches city labor, Stevenson.....	689
The Federal farm loan act, McAdoo.....	689
Future of the Federal land bank bonds, Joyce.....	689
Suggestions for farmers' mutual fire insurance companies, Valgren.....	689
Importance of Bavarian cooperative societies, von Frenberg-Jetzendorf..	690
The social survey, its history and methods, Taylor.....	690
The Market Reporter.....	690
Third national census.....	690

AGRICULTURAL EDUCATION.

The agricultural college in the new era.....	690
Training teachers of agriculture.....	691
General science in the agricultural high school, Heald.....	691
Teacher-training course in home economics for experienced home makers..	692
Documents relating to vocational education.....	692
Progress in elementary agricultural education.....	692
How to feed for bigger live-stock profits.....	693
Nature study in the grades, Goldsmith.....	693
How Cornell Rural School Leaflet hopes to teach conservation, Palmer..	693
Conventions of Ontario Women's Institute and Federated Institutes....	693
School fairs in 1919.....	693

MISCELLANEOUS.

Work and expenditures of experiment stations, 1918, Allen et al.....	693
Report of the Porto Rico Insular Station, 1919.....	694
Quarterly bulletin of Michigan Station, edited by Shaw and Norton.....	694
Monthly Bulletin of the Ohio Experiment Station.....	694
Monthly bulletin of the Western Washington Substation.....	694

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

<i>Stations in the United States.</i>		<i>U. S. Department of Agriculture—Con.</i>	
<p>California Station: Page.</p> <p>Bul. 318, Jan., 1920----- 640</p> <p>Circ. 217, Jan., 1920----- 637</p> <p>Connecticut State Station:</p> <p>Bul. 215, Dec., 1919----- 659</p> <p>Bul. 216, Dec., 1919----- 648</p> <p>Massachusetts Station:</p> <p>Bul. 190, Sept., 1919----- 638</p> <p>Michigan Station:</p> <p>Quart. Bul., vol. 2, No. 3, Feb., 1920----- 613, 621, 631, 632, 635, 670, 694</p> <p>Mississippi Station:</p> <p>Bul. 185, July, 1918----- 622</p> <p>Ohio Station:</p> <p>Mo. Bul., vol. 4, No. 8, Aug., 1919----- 615, 632, 636, 644, 648, 694</p> <p>Porto Rico Department of Agriculture and Labor Station:</p> <p>Rpt. 1919----- 643, 644, 694</p> <p>Rhode Island Station:</p> <p>Bul. 180, Dec., 1919----- 625</p> <p>Washington Station:</p> <p>West. Wash. Sta. Mo. Bul., vol 7, No. 11, Feb., 1920-- 631, 645, 694</p> <p>Wisconsin Station:</p> <p>Bul. 308, Dec., 1919----- 632</p>		<p>Bureau of Animal Industry— Continued. Page.</p> <p>Milk-Plant Letter 62, Systems of Pasteurization--- 673</p> <p>Bureau of Markets:</p> <p>Market Rptr., vol. 1—</p> <p>No. 5, Jan. 31, 1920---- 690</p> <p>No. 6, Feb. 7, 1920---- 690</p> <p>No. 7, Feb. 14, 1920---- 690</p> <p>No. 8, Feb. 21, 1920---- 690</p> <p>No. 9, Feb. 28, 1920---- 690</p> <p>Weather Bureau:</p> <p>Mo. Weather Rev., vol. 47, Nos. 11-12, Nov.-Dec., 1919----- 616, 617, 618, 619</p> <p>Climat. Data, vol. 6, Nos. 9-10, Sept.-Oct., 1919---- 620</p> <p>Scientific Contributions:¹</p> <p>Purification of Compressed Gases in Testing Catalysts for Ammonia Synthesis, R. O. E. Davis----- 610</p> <p>Purification of Benzoic Acid by Fractional Condensation, M. Phillips and H. D. Gibbs----- 611</p> <p>Effect of Lime Upon the Sodium Chlorid Tolerance of Wheat Seedlings, J. A. LeClerc and J. F. Breazeale----- 626</p> <p>Importance of Epidermal Coverings, R. B. Harvey-- 628</p> <p>Control of Humidity Conditions in Lemon Storage Rooms, A. D. Shamel----- 641</p> <p>Notes on the Genus Dahlia, with Descriptions of Two New Species from Guatemala, W. E. Safford----- 641</p> <p>The Venezuelan Mahogany, a Hitherto Undescribed Species of the Genus Swietenia, H. Pittier---- 642</p> <p>Pink Disease of Citrus, H. A. Lee and H. S. Yates--- 646</p> <p>Specific, Subspecific, and Varietal Categories of Insects and the Naming of Them, W. L. McAtee----- 647</p> <p>Two New Termites from Arizona, T. E. Snyder----- 648</p> <p>A New Species of <i>Matsucoccus</i> from Pines in California, F. B. Herbert---- 649</p>	
<i>U. S. Department of Agriculture.</i>			
<p>Bul. 822, Pears: Production Estimates and Important Commercial Districts and Varieties, H. P. Gould and F. Andrews----- 639</p> <p>Circ. 64, How Lumber is Graded, H. S. Betts----- 643</p> <p>Circ. 77, Suggestions for a State Law Providing for the Organization of Farmers' Mutual Fire Insurance Companies, V. N. Valgren----- 689</p> <p>Circ. 79, Tropical Fowl Mite in the United States, With Notes on Life History and Control, H. P. Wood----- 656</p> <p>Work and Expenditures of the Agricultural Experiment Stations, 1918, E. W. Allen, E. R. Flint, and J. I. Schulte----- 693</p> <p>Bureau of Animal Industry:</p> <p>Milk-Plant Letters 60, 61, Milk Bottle Losses----- 673</p>			

¹ Printed in scientific and technical publications outside the Department.

U. S. Department of Agriculture—Con.

	Page.
Scientific Contributions—Con.	
A New Genus and Species of Coccid from Loranthus, H. Morrison-----	649
Lepidoptera at Light Traps, W. B. Turner-----	650
Further Studies of <i>Sorosporaella uvella</i> , a Fungus Parasite of Noctuid Larvæ, A. T. Speare-----	651
A New Noctuid from Arizona (Lepidoptera, Noctuidæ, Acronyctinæ), H. G. Dyar-----	652
New Moths from Mexico (Lepidoptera, Noctuidæ, Hadeninæ), H. G. Dyar---	652
The Larva of <i>Xanthopastis timais</i> Again, H. G. Dyar---	652
Descriptions of Hitherto Unknown Larvæ of Culex (Diptera, Culicidæ), H. G. Dyar-----	652
A New Subgenus of Culex, H. G. Dyar-----	652
A Revision of the American Sabethini of the Sabethes Group by the Male Genitalia, H. G. Dyar-----	652
District of Columbia Diptera: Asilidæ, W. L. McAtee and N. Banks-----	652
Life History of <i>Eubiotomyia calosomæ</i> , A Tachinid Parasite of Calosoma Beetles, C. W. Collins and C. E. Hood-----	652

U. S. Department of Agriculture—Con.

	Page.
Scientific Contributions—Con.	
Work and Parasitism of the Mediterranean Fruit Fly in Hawaii During 1918, H. F. Willard-----	654
European Frit Fly in North America, J. M. Aldrich---	654
Biology of Some Coleoptera of the Families Colydiidæ and Bothrideridæ, F. C. Craighead-----	655
Descriptions of New North American Ichneumon Flies, R. A. Cushman-----	655
Descriptions of Seven New Species of Opius (Hymenoptera-Braconidæ), A. B. Gahan-----	655
Municipal Milk Control, E. Kelly-----	673
Remade Milk and Cream, H. W. Redfield-----	674
The Etiology of So-called Infectious Abortion Disease of Cattle, E. C. Schroeder-----	677
The Use of Carbon Bisulphid in Infestations With Bots, <i>Gastrophilus</i> spp., M. C. Hall and L. Avery--	678
Progress in Hog Cholera Control, U. G. Houck-----	679
Diseases of Domesticated Birds, A. R. Ward and B. A. Gallagher-----	680
National Forests and the Water Supply, S. T. Dana--	681

CONTENTS OF VOL. 42, No. 8.

	Page.
Editorial notes:	
Two notable congresses on agricultural reconstruction in France and Belgium.....	701
Recent work in agricultural science.....	707
Notes.....	797

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

Distribution of the basic nitrogen in phaseolin, Finks and Johns.....	707
Constitution of capsaicin, the pungent principle of Capsicum, II, Nelson....	707
The lipolytic activity of the castor and soy bean, Barton.....	707
An electrically heated bomb for ammonia synthesis, Davis and Bryan....	707
Sterilization of oils by means of ultra-violet rays, Fairhall and Bates....	707
Effect of chlorin substitution products on catalase production, Burge.....	708
Extracts of pure dry yeast for culture media, Ayers and Rupp.....	708
Biochemistry of acetone and butyl fermentation of starch, Speakman.....	708
Fermentation of fructose by Lactobacillus, Peterson and Fred.....	709
The behavior of charcoal with respect to chlorin, Bohart and Adams.....	709
The De Roode-perchloric acid method for determining potash, Keitt.....	709
Determination of calcium and magnesium in different saline media, Canals	710
The determination of zinc in organic materials, Weitzel.....	710

	Page.
Determination of halogen in organic substances, Van Winkle and Smith	711
Modification of apparatus for determination of arginin nitrogen, Holm	711
The determination of small amounts of nitrites, Auerbach and Riess	711
Determination of magnesium in blood, Denis	712
Determination of chlorids in whole blood, Austin and Van Slyke	712
A system of blood analysis.—I, Method for sugar, Polin and Wu	712
Tables of refractive indices, I, Kanthack and Goldsmith	712
Some new factors affecting the hardness of gur or crude sugar, Swadi	713
Maple sugar sand	713
[Manufacture of sorghum sirup], Willaman, West, and Bull	713

METEOROLOGY.

Factors of climatic control, Humphreys	713
The variability of corresponding seasons in different years, Stupart	714
The book of normals of meteorological elements for the British Isles	715
Predicting stream flow in the Sierras, Le Conte	715
Determination of water supply from snow fields	715
Observations at Massachusetts Station, Ostrander and Smith	715
Meteorological observations of College of Belen, Habana, 1918, Gangoit	715
British rainfall, 1918, Mill and Salter	715
Meteorology and agriculture, Franklin	716

SOILS—FERTILIZERS.

Soil survey of Linn County, Iowa, Howe et al	716
Agricultural study of the soils of Cochin China, Bussy	716
The movement of moisture in soil by capillarity, Gardner	717
Adsorption phenomena in soils, Hissink	717
Disinfection of soil, Miège	717
The disinfection of soil and its partial sterilization, Malpeaux	718
Research on soil reaction, Rebaté	718
A study of methods of determining soil alkali, Pittman	718
Tolerable limits of contamination by wastes from potash industry, Kerp	719
The doctrine of fertilizers, Pfyffer von Altishofen	719
The determination of the fertilizer requirements of soil, Haselhoff	719
The influence of two different fertilizers on plant yield, Mitscherlich	719
Factors which influence yield of paddy at Manganallur, Sampson	720
Long-time fertilizer experiments on the same soil, von Lochow	720
Manuring for milk, Adams	720
Conservation of liquid manure, Lemmermann and Weissmann	721
Fertilizer mixtures and composts, d'Utra	721
Artificial nitrogenous fertilizers, Russell	721
Some aspects of cheap cyanid processes, Philipp	722
The synthesis of ammonia, I—III, Maxted	722
Advantages of synthesis of ammonia under very high pressures, Claude	722
Reversible oxidation of sodium nitrite, Matignon and Monnet	723
Phosphate demonstrations in Stevens County in 1918, McMiller et al	723
The potash of Alsace and potash of Germany, Arnal	723
Sources of industrial potash in Western Australia, Simpson	723
The practice of liming, Difflorh	723
The rôle and use of magnesium in fertilizers, Lefèvre	723
Limekiln gases for carbon dioxid fertilization, Riedel	723
Increasing the production of irrigated wheat and jowar	723
Progress of inorganic chemical industries in Germany in 1917, Hölbling	724
Fertilizers for 1917, McGill	724

AGRICULTURAL BOTANY.

Cooperation and individualism in scientific investigation, Shear	724
Directions for collecting flowering plants and ferns, Blake	724
Natural history of Paradise Key and nearby Everglades, Safford	724
Floral aspect of the Hawaiian Islands, Hitchcock	724
The flora of Stewart Island (New Zealand), Willis	724
Observations on anatomy of teratological seedlings, I, Holden and Bexon	725

	Page.
Observations on anatomy of teratological seedlings, II, Bexon.....	725
Some anomalies in monocotyledonous roots, Spratt.....	725
Variation in <i>Eranthis hyemalis</i> and other Ranunculaceae, Salisbury.....	725
Variation in <i>Anemone apennina</i> and <i>Clematis vitalba</i> , Salisbury.....	726
A corn pollinator, Coulter.....	726
Some concepts in mycology.—An attempt at synthesis, Brierley.....	726
The preservation of artificial culture of molds, Tagg.....	726
The alga-flora of some desiccated English soils, Bristol.....	726
Some saprophytic fungi associated with diseased potato, Pethybridge.....	726
Biological and systematic study of Swedish Gymnosporangiums, Eriksson.....	726
Merulius in North America, Burt.....	726
Cold resistance in marine algae, Kylin.....	727
Production of citric acid by <i>Sterigmatocystis nigra</i> , Molliard.....	727
Amygdalin as nutriment for <i>Aspergillus niger</i> , I, II, Waterman.....	727
The biological significance of nucleoli, Meyer.....	727
Colloidal studies on plasma in plants, Tadokoro.....	727
Hydrogen-ion concentration of plant juices, I, II, Clevenger.....	727
Application of biochemical method to orchids, Bourquelot and Bridel.....	728
Utilization of glucose and of levulose by higher plants, Colin.....	728
The geotropic behavior of starch-free seedlings, Zollikofer.....	728
The relation of aeration to the growth and activity of roots, Bergman.....	728
Development of root systems under dune conditions, Waterman.....	728
The mechanics of water provision [in plants], Renner.....	729
Influence of contact stimulus and mechanical rubbing on seedlings, Stark.....	729
Influence of light on absorption, de Besteiro and Michel-Durand.....	729
Influence of light- and gravitational stimuli on Avena, Van Ameijden.....	729
Minimum illumination period causing germination in Lythrum, Lehmann.....	730
Energy curves of light absorption by colorants of green leaves, Ursprung.....	730
Apparatus for the study of photosynthesis and respiration, Osterhout.....	730
Photochemical extinction during the process of assimilation, Ursprung.....	730
The injurious effects of ultra-violet rays, Ursprung and Blum.....	730
Effect of illuminating gas on plants, Wehmer.....	730
Biological and systematic study of Philippine plant galls, Uichanco.....	730

FIELD CROPS.

Safe farming in the Southern States in 1920, Knapp.....	731
[Report of field crops work at the Morris substation, 1918], Miller.....	731
[Field crops work at Dickinson, 1914-1918], Waldron and Thysell.....	732
Annual report of chief soil and crop instructor, English.....	732
Annual report of district agriculturist, Fort George district, Walker.....	733
[Grass mixtures for meadows and pastures on peaty soils], Osvald.....	733
[Grassland in the United Kingdom and its improvement], Somerville.....	734
Blossoming and fertilization in winter rye and winter wheat, Obermayer.....	734
[The sorghum sirup industry and the sorghum plant], Willaman et al.....	735
Results of field experiments with sugar cane in 1917-18, Kuijper.....	735

HORTICULTURE.

[Report on fruits, ornamentals, and vegetables], Miller.....	736
[Report on fruit investigations], Burns.....	736
Spray calendar.....	736
Orchard spray calendar, Sanborn and Mooring.....	736
More about rootstocks, Howard.....	736
[Note on raising seedling apples], Laxton.....	737
Peach growing in Florida, Floyd.....	737
Magnesia and the manuring of vines, Lefèvre.....	737
Conservation of fresh grapes, Figueroa.....	737
Statistics on the production of grapes and wine in 1919.....	737
The propagation of some tropical fruits, Cunliffe.....	737
The mango in Florida, Vosbury.....	737
The dwarf coconut, Handover.....	737
The status of the American nut industry, Reed.....	737
Top-working the pecan, Kyle.....	737
Control of the sap flow in stocks to be grafted, Jones.....	737
[Report on trees, shrubs, and hedges], Thysell.....	738
Treatment of the surroundings of the small home, Dunnington Grubb.....	738

FORESTRY.

	Page.
Making woodlands profitable in the Southern States, Mattoon.....	738
The new Grand Canyon National Park, Yard.....	738
The new Zion National Park, Yard.....	738
Forest administration in British India for the year 1917-18.....	738
The forest policy of France: Its vindication, Greeley.....	738
Conservation: The form or the substance: Which? Compton.....	738
Some problems of reafforestation, Somerville.....	739
Growth, treatment, and structure of some common hardwoods, Patton.....	739
An experimental dendrometrical table for chestnut coppice, Di Tella.....	739
The koa tree, Judd.....	739
A contribution to the knowledge of the wood of the bravo pine, Cardoso.....	739
The origin, extraction, and value of coniferous seeds, I, Piccioli.....	739

DISEASES OF PLANTS.

Annual report of provincial plant pathologist, Eastham.....	739
Report of [the] provincial plant pathologist, Eastham.....	740
[Plant diseases, British Columbia], Middleton.....	740
Experimental work [on plant disease and insect control], Hoy.....	740
Work connected with insect and fungus pests and their control, Watts.....	740
Efforts to prevent introduction of plant pests into St. Lucia, Brooks.....	741
Mycology [and plant diseases, Madras, India, 1918-19], Wood.....	741
Mycology [Ceylon, 1918], Petch.....	741
Vegetable pathology [Queensland], Tryon.....	741
Vegetable pathology [agricultural crops, Queensland], Tryon.....	741
Annual report of the government microbiologist, Nicholls.....	741
Proclamation regarding control of grain smut.....	742
Treatment of wheat rust, Foex.....	742
A practical method of fighting wheat rust, Swingle.....	742
Studies on stem rust in Wisconsin, 1918, Dickson and Johnson.....	742
The eradication of barberry in Wisconsin, Norgord.....	742
A serious nematode disease of red clover in Northwestern States, Smith.....	742
The potato disease problem, Orton.....	743
The ring or bangadi disease of potato.....	743
Fusarium blight of the soy bean, Cromwell.....	743
The mottling or yellow stripe disease of sugar cane, Stevenson.....	744
Froghopper pest and diseases of sugar cane in Trinidad, Nowell.....	745
Relation of root fungus to froghopper blight in Trinidad, Williams.....	745
Sugar cane varieties and froghopper blight in Trinidad, Williams.....	745
Field diseases of the sweet potato in Texas, Taubenhau.....	745
Experimental work [with apple scab and fire blight of apple], French.....	746
Red cedar trees and cedar rust, Marshall and Fromme.....	746
Treatment for anthracnose, Ravaz.....	746
Treatment of chlorosis [in vines] in full vegetation, Degrully.....	746
Autumnal treatment for chlorosis, Ravaz.....	746
Red ring disease of coconuts, Nowell.....	746
The fungus diseases of the tea leaf, Tunstall and Bose.....	747
Red rust, Tunstall.....	747
Black canker or rot of chestnut, Peyronel.....	747
The occurrence of oak mildew on beech in Britain, Cotton.....	747
Present status of white pine blister rust control in Montana, 1918, Root.....	747
The white pine blister rust.....	747
White pine blister rust [in Wisconsin], Norgord.....	747

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Apparent effect of winter inactivity on distribution of mammals, Jackson.....	747
Rodent mountaineers, Taylor.....	747
A new subspecies of beaver from North Dakota, Bailey.....	748
Notes on the fox squirrels of Southeastern United States, Howell.....	748
The Florida spotted skunk as an acrobat, Howell.....	748
The wood rat as a collector, Taylor.....	748
The Florida water rat in Okefinokee Swamp, Ga., Harper.....	748
A new race of the Florida water rat (<i>Neofiber alleni</i>), Howell.....	748
Identity of the bean mouse of Lewis and Clark, Bailey.....	748

	Page.
The Georgian bat, <i>Pipistrellus subflavus</i> , in Wisconsin, Jackson.....	748
Birds and the war, Gladstone.....	748
Insects attacking sugar cane in the United States, Holloway and Loftin....	748
Common orchard and nursery pests and their control, Starcher et al.....	748
Insects and diseases attacking stems of currants and gooseberry, Severin....	748
Eleventh report of Quebec Society for Protection of Plants, 1918-19.....	748
Beneficial action of lime in lime-sulphur and lead arsenate, Robinson....	748
Lace bug on hawthorn, <i>Corythucha bellula</i> , Wellhouse.....	749
Life history of <i>Macropsis virescens graminea</i> , Weiss and Dickerson.....	749
The Houghton gooseberry aphid, Baker.....	750
Lucerne aphid.....	750
Experiments with steam disinfectors in destroying lice, Hutchison.....	750
The coconut butterfly (<i>Brassolis isthmia</i>) on banana, Zetek.....	751
Some lepidopterous pests new to sugar cane in Queensland, Jarvis.....	751
A new genus and species of oecophorid moths from Japan, Heinrich.....	751
Experimental transfer of Weil's disease by fly, Uhlenhuth and Kuhn....	751
The swarming of anopheline mosquitoes, Banks.....	751
Control measures for white grubs affecting sugar cane, Illingworth.....	751
New American Cleridæ, with note on synonymy of <i>Micropterus</i> , Chapin....	751
A parasite of dermestid beetles in entomological collections, Cockerell....	751
A weevil attacking agave, Ballou.....	751
Notes on the bronze apple-tree weevil, Moznette.....	751
A proctotrypid inquiline with <i>Formica exsectoides</i> , Mann.....	752
Descriptions of six new wasps, Rohwer.....	752
Life history and habits of jointworm flies of genus <i>Harmolita</i> , Phillips....	752
The migration of <i>Harmolita grandis</i> form <i>minutum</i> , Larrimer and Ford....	754
The sugar cane beetle borer parasite in Queensland, Illingworth.....	754
A successful method of breeding parasites of white grubs, Illingworth....	755
A migrating army of millepedes, Brooks.....	755

FOODS—HUMAN NUTRITION.

The feeding of nations, Starling.....	755
Food for the family, Higgins, Alderson, and Taylor.....	755
Average retail prices of staple foods in July, 1914, and February, 1920....	755
Nutritive value of proteins of barley, etc., Osborne and Mendel.....	755
Studies in nutrition, II, III.....	756
Is fat indispensable for well being.....	757
Direct replacement of glycerol in fats by higher alcohols, I, II.....	757
Effects of feeding with calcium salts on the blood, Denis and Minot.....	758
The occurrence of zinc (and copper), Rost and Weitzel.....	758
Function of vitamins in the metabolism of <i>Sclerotinia cinerea</i> , Willaman....	758
Nutritive factors in plant tissues, III, Osborne and Mendel.....	759
Experiments on the utilization of the calcium of carrots by man, Rose....	760
Antiscorbutic value of fresh, dried, and heated milk, Barnes and Hume....	760
The antiscorbutic property of dehydrated meat, Givens and McClugage....	760
Edema as a symptom in so-called food-deficiency diseases, Bigland.....	760
Pellagra, Harris.....	761
Botulism.....	761

ANIMAL PRODUCTION.

Studies of heredity in rabbits, rats, and mice, I-III, Castle.....	762
Linkage in rats, Ibsen.....	762
Anomalous ratios in a family of yellow mice suggesting linkage, Dunn....	762
Genetic studies in rabbits.—I, inheritance of weight, Punnett and Bailey....	763
Color inheritance in cats, Little.....	763
Inheritance of white-spotting and other color characters in cats, Whiting....	763
Fate of individuals homozygous for certain color factors in mice, Little....	763
The fate of homozygous yellow mice, Kirkham.....	763
Uterine, tubal and ovarian lysis and resorption of conceptuses, Meyer....	763
Synthetic pink-eyed self white guinea pigs, Ibsen.....	764
Tricolor inheritance.—IV, Ibsen.....	764
Inheritance of congenital palsy in guinea pigs, Cole and Ibsen.....	764
Studies on inheritance in pigeons, III, Cole and Kelley.....	764
Alternative explanations for exceptional color classes, Little.....	765

	Page.
Developmental relations of brachydactyly in the domestic fowl, Danforth.....	765
An hereditary complex in the domestic fowl, Danforth.....	765
Evidence that germ cells are subject to selection, Danforth.....	766
On the physiological properties of the gonads, I, II, Moore.....	767
Chromosomes of a species and elimination of mongrel blood, Laughlin.....	767
Analysis of the effects of selection, Sturtevant.....	767
Parthenogenesis and crossing-over in grouse locust Apotettix, Nabours.....	768
Lime in shell of hen's egg during incubation, Delezenne and Fourneau.....	768
On the bacterial and catalase content of hens' eggs, Rullmann.....	768
The colors of colloids.—VII, Blue feathers, Bancroft.....	768
Forage substitutes, Lhoste.....	769
Commercial feeding stuffs, Proulx et al.....	769
Inspection of commercial feeding stuffs, Smith.....	769
Commercial feeding stuffs, Fuller.....	769
Feeding stuffs registered for sale in Texas, October 1, 1919, Fuller.....	769
Feeding stuffs, Cranfield.....	769
Merino history and Merino breeding, Cleaver.....	770
Annual wool review for 1916, 1917, and 1918, Battison.....	770
The Australasian wool trade, season 1918-19, Dalgety & Co., Ltd.....	770
Egg-weight as a criterion of numerical production, Hadley.....	770
Cost of producing eggs in New Jersey for 1919, Aubry.....	770
How to break eggs for freezing.....	770
Belgian hares as meat producers, Washburn.....	770
Cavy culture, Michaels.....	770

DAIRY FARMING—DAIRYING.

Inheritance of quantity and quality of milk production, Castle.....	771
Milk produced in southern China, Levine.....	771
Dairy industry around Coimbatore, Rao.....	771
Statistics relative to the dairy industry in New York State.....	771
The cost of production and distribution of milk in New York State, Dana.....	772
A study of the New York City milk problem, Jennings.....	772
Milk cost survey for the week November 26 to December 2, 1917.....	773
Milk cost survey for the week August 19, 1918, to August 25, 1918.....	773
Is milk distribution a municipal function? Hyde.....	773
Surplus milk.....	773
Milking machines and the production of clean milk, Orr.....	773
Keeping milk in ventilated and unventilated churns, Golding et al.....	773
Characters differentiating lactic acid streptococcus, Sherman and Albus.....	773
A lactose-fermenting yeast producing foamy cream, Hunter.....	774
Quantity and quality of New South Wales butter, 1917-1919, MacInnes.....	774
Swedish Emmental and large-holed cheese, Rosengren and Haglund.....	774
Review of imported dairy produce trade for 1919, W. Weddel & Co., Ltd.,	774

VETERINARY MEDICINE.

Pathogenic microorganisms, Park and Williams.....	774
Chemical structure and antigenic specificity, Dakin and Dale.....	774
Precipitation of antitoxic sera by Na ₂ SO ₄ and (NH ₄) ₂ SO ₄ , Homer.....	775
Simple new method for cultivation of anaerobic organisms, Lignières.....	775
Study of the bactericidal action of CR indicator, Bronfenbrenner et al.....	775
Resistance to desiccation of host of <i>Schistosoma japonicum</i> , Cort.....	776
Sclerostomes of the donkey in Zanzibar and East Africa, Boulenger.....	776
Weeds poisonous to live stock, Talbot and Cooper.....	776
Live stock sanitary department of Alabama, Cary.....	776
Report of the bureau of animal industry, McLaury et al.....	776
Deficiency diseases, Cary.....	776
A note on sodium morrhuate in tuberculosis, Rogers.....	777
Chemotherapeutics of leprosy and tuberculosis, I, Walker and Sweeney.....	777
Vaccination against anthrax virus with nonspecific substances, Turró.....	777
The nature of the mallein reaction, Bertetti and Finzi.....	777
A contribution to the study of the heredity of rabies, Remlinger.....	778
Experimental streptococcus empyema, Gay and Stone.....	778
Mycosis of bovine fetal membranes due to mold of genus <i>Mucor</i> , Smith.....	778
Eradication of the cattle tick, Bagué.....	779

	Page.
<i>Bacterium anatum</i> n. sp., etiologic factor in "keel," Rettger and Scoville.....	779
Pigeon diseases and feeding management, Dietz-----	779

RURAL ENGINEERING.

Philippine water supplies, Heise and Behrman-----	779
Report of the water conservation and irrigation commission for 1917-----	780
Method of replacing old wooden flume with metal structure-----	780
River protective work, Paulsen-----	780
Note on land drainage in irrigated tracts of the Bombay Deccan, Inglis-----	780
Public Roads-----	780
The present status of impact tests on roadway surfaces, Goldbeck-----	780
1920 program shows New York highways 67½ per cent concrete-----	781
Should "binding steel" be used in concrete highways? Conger-----	781
Slag as coarse aggregate on Elkhart-Osceola road, Gray and Keliham-----	781
Effect of fineness of cement on quality of concrete, Abrams-----	781
The preservation of wood-----	782
The mechanical properties of Philippine bast-fiber ropes, King-----	782
How to remove keyed pulleys from a shaft, Radebaugh-----	783
Gasoline tractors, Hayward-----	783
Some practical points in farm tractor design, Westmont-----	783
Manganese steel in farm tractor manufacture, Bauer-----	783
Wrought steel gear blanks for farm tractors, Woodworth-----	783
What impulse starters have done for tractors, Tanner-----	783
Nebraska tractor law and rules for official tractor tests, Chase et al.-----	784
Report of tractor belt tests in Ohio, Green-----	784
Logging with belt tread tractors, Metcalf-----	785
Motor tractor trials at Pusa, Sayer-----	785
The motor tractor in Great Britain-----	785
The economies of high speed tractor plowing, Sprague-----	785
Review of mechanical cultivation, Ringelmann-----	785
Experiments with planting cane sets by hand v. machine planting-----	786
Dusting machinery for cotton boll weevil control, Johnson and Coad-----	786
Plan and details for concrete cattle-dipping vat-----	786
Plans of grain elevators, Clark-----	787
Loading test of 18-ft. circular concrete grain bin, Hansen-----	787
Protection of potatoes from cold in transit—lining and loading cars-----	787
Storage and diseases of the sweet potato in Texas-----	787
Harvesting and storing ice on the farm, Bowen-----	788
Rural plumbing, Whipple-----	788
Practical types of sanitary privies, Stiles-----	788
Treatment and disposal of sewage, Hommon et al-----	789
Fire control on the farm, von Nieda-----	789

RURAL ECONOMICS.

Agricultural economics, Taylor-----	789
What is rural economics? Ise-----	789
The Office of Farm Management and its relation to stations, Taylor-----	789
Application of investigational data to reorganization of the farm, Ross-----	789
Determination of the profits of peasant agriculture, Laur-----	790
Scottish agriculture during the war, Douglas-----	790
Proceedings of the French Agricultural Congress-----	790
Report of the fifth agricultural and cooperative conference, Burma-----	790
The salvation of the land, Méline-----	790
The world's food resources, Smith-----	790
The Illinois Agricultural Association and its job, Davenport-----	790
Farm bureaus and their job, Davenport-----	790
New Town, edited by Hughes-----	791
Report of the Belgian Peasants' League, Luytgaerens-----	791
Report on the cooperative societies in the Punjab, Darling-----	791
The cooperative grain industry in Russia, Komar-----	791
Farmers' Market Bulletin-----	791
[Land tenure and agriculture in the Union of South Africa]-----	791

AGRICULTURAL EDUCATION.

	Page.
Third annual report of the Federal Board of Vocational Education, 1919_	791
Department of rural and agricultural education-----	793
First report of [Mississippi] State Board for Vocational Education-----	794
Ohio State plan for vocational education-----	794
The relation of nature study to boys' and girls' club work, Hadley-----	795
The principles of agriculture for high schools, Gehrs-----	795
Laboratory, field, and project guide in elementary agriculture, Schmidt--	795
Outline for seasonal presentation of farm crops and horticulture, Johnson_	795
[Instruction in gardening]-----	796
Syllabus of lectures on rural sociology, Ashby-----	796

MISCELLANEOUS.

Report of West Central Experiment Station, Morris, 1918-----	796
Report of the Dickinson substation for 1914 to 1918, inclusive-----	796

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

<i>Stations in the United States.</i>	Page.	<i>U. S. Department of Agriculture—Con.</i>	Page.
Arkansas Station:		Farmers' Bul. 1091, Protection of Potatoes from Cold in Transit—Lining and Loading Cars	787
Circ. 48, Feb., 1920	736		
Indiana Station:		Farmers' Bul. 1098, Dusting Machinery for Cotton Boll Weevil Control, E. Johnson and B. R. Coad	786
Bul. 231, Sept., 1919	769		
Massachusetts Station:		Circ. 74, How to Break Eggs for Freezing	770
Met. Buls. 373-374, Jan.-Feb., 1920	715		
Minnesota Station:		Circ. 76, Directions for Collecting Flowering Plants and Ferns, S. F. Blake	724
Bul. 187, Sept., 1919	713, 735		
Rpt. Morris Substation, 1918	723, 731, 736, 796	Circ. 85, Safe Farming in the Southern States in 1920, B. Knapp	731
Nebraska Station:		Bureau of Animal Industry:	
Research Bul. 14, Nov., 1919	743	Milk-Plant Letter 64, Surplus Milk	773
Circ. 10, Dec., 1919	784	Bureau of Public Roads:	
New Hampshire Station:		Public Roads, Vol. 2, Nos. 18-19, Oct.-Nov., 1919	780
Bul. 191, June, 1919	769	Bureau of Soils:	
New Jersey Stations:		Field Operations, 1917—	
Hints to Poultrymen, vol. 8, No. 4, Jan., 1920	770	Soil Survey of Linn County, Iowa, F. B. Howe, T. H. Benton, M. Y. Longacre, and A. H. Meyer	716
North Carolina Station:		Scientific Contributions: ¹	
Farmers' Market Bul., vol. 7, No. 32, Feb. 1, 1920	791	Distribution of the Basic Nitrogen in Phaseolin, A. J. Finks and C. O. Johns	707
North Dakota Station:		The Constitution of Capsaicin, the Pungent Principle of Capsicum, II, E. K. Nelson	707
Bul. 131 (Rpt. Dickinson Substa. 1914-1918), Oct., 1919	732, 738, 796	An Electrically Heated Bomb for Ammonia Synthesis, R. O. E. Davis and H. Bryan	707
Porto Rico Department of Agriculture and Labor Station:		Extracts of Pure Dry Yeast for Culture Media, S. H. Ayers and P. Rupp	708
Circ. 18 (Spanish Ed.), Aug., 1919	779	Some Aspects of the Behavior of Charcoal with Respect to Chlorin, G. S. Bohart and E. Q. Adams	709
Texas Station:		Factors of Climatic Control, W. J. Humphreys	713
Bul. 249, Sept., 1919	745	Cooperation and Individualism in Scientific Investigation, C. L. Shear	724
Bul. 250, Oct., 1919	787		
Bul. 251, Sept., 1919	769		
Bul. 252, Oct., 1919	769		
Utah Station:			
Bul. 170, Aug., 1919	718		
<i>U. S. Department of Agriculture.</i>			
Bul. 808, Studies on the Life History and Habits of the Jointworm Flies of the Genus Harmolita (I s o m a), with Recommendations for Control, W. J. Phillips	752		
Farmers' Bul. 1071, Making Woodlands Profitable in the Southern States, W. R. Mattoon	738		
Farmers' Bul. 1078, Harvesting and Storing Ice on the Farm, J. T. Bowen	788		

¹ Printed in scientific and technical publications outside the Department.

CONTENTS OF VOL. 42, No. 9.

Recent work in agricultural science	-----	Page.
Notes	-----	801
		900

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY—AGROTECHNY.

Proso millet investigations, Dunbar and Binnewies	-----	801
[Composition of the velvet bean], Miller	-----	801
Catalysis in theory and practice, Rideal and Taylor	-----	802
An effective connecting bulb, Clark	-----	802
The use of cupferron in quantitative analysis, Lundell and Knowles	-----	802
Boric acid modification of the Kjeldahl method, Scales and Harrison	-----	802
Colorimetric determination of glycogen, Thieulin	-----	803
Invertase activity of mold spores, Kopeloff and Byall	-----	803
Effect of concentration on mold spores in sugar, Kopeloff and Byall	-----	803
Food preserves, Lavoine	-----	804
Process of treating dried fruit, Katzprowsky	-----	804
[Fruit drying]	-----	804
[Grape juice and sirup]	-----	805
[Olive investigations]	-----	805

METEOROLOGY.

Determination of normal temperatures, West et al	-----	805
Alfalfa seed growing and the weather in Utah, Alter	-----	806
A further report on Montana climate, Burke and Pinckney	-----	807
[Weather at Crookston, Minn., seasons of 1917 and 1918], Selvig	-----	809
Meteorological data, Edwards	-----	809

SOILS—FERTILIZERS.

	Page.
Parallelism of the soils developed on gray drifts of Minnesota, Rost	809
The soils of Jackson County, Tartar and Reimer	811
Soil investigations	811
[Soil chemistry and bacteriology, New Jersey, 1918], Lipman and Blair	812
Soil moisture studies on heavy soils	812
Hydraulic agriculture in swamps, sand wastes, etc., Petrocchi	812
Alkali investigations	813
Soil alkali, Harris	813
Crop yields on peat experimental fields in 1918, Alway and Selvig	813
The effects of nitrate of soda on soils	814
British synthetic ammonia developments	814
Utilization of dead animals and organic wastes, Morvillez	814
Barium phosphate experiments, Blair	814
Conditions in the European phosphate market, Phalen	814
Potash recovery at cement plants, Wilson	815
German potash production and prices	815
Spanish potash: Good prospects but Government inactivity	815
The limestone deposits of New South Wales, Carne and Jones	815
[Soils], Funchess	815
The large-scale use of carbon-dioxid fertilization, Riedel	816
The use of cane molasses as a fertilizer, Lindet	816
Crop injury by borax in fertilizers, Schreiner et al	816
Inspection of commercial fertilizers for season of 1919, Haskins et al	817
[Fertilizer analyses], Rose and Wilson	817
Analyses of fertilizer by the Department of Agriculture for 1919	817
Analyses of fertilizer by the Department of Agriculture for 1919	818

AGRICULTURAL BOTANY.

Effect of relative length of day and night on plants, Garner and Allard	818
[Botanical studies by the California Station]	818
The rôle of the tapetum, Maseré	819
The absorbent power of root tips, Coupin	819
The transformation of the plant ovule into an ovary, Harris	820
Germination of barley pollen, Anthony and Harlan	820
Diœciousness in <i>Thalictrum dasycarpum</i> , Schaffner	820
<i>Amygdalopersica formonti</i> , Rivière and Bailhache	820
Production of glycooll by <i>Isaria densa</i> , Molliard	821
Egg albumin as a complete food for <i>Isaria densa</i> , Molliard	821
Number of chromosomes and elimination of mongrel blood, Laughlin	821
A Darwinian statement of the Mendelian theory, Roberts	821

FIELD CROPS.

Report of agriculturist, Cauthen	821
[Work with] farm crops	822
[Report of field crops work in Minnesota, 1918], Boss	824
[Field crops work at the Crookston substation, Minn., 1918], Selvig	824
[Field crops work at the Crookston substation, Minn., 1917-18], Selvig	825
[Field crops work at the Duluth substation, Minn., 1918], Thompson	825
[Field crops work at the Grand Rapids substation, Minn., 1918], Bergh	826
[Field crops work at the Morris substation, Minn., 1918], Miller	826
[Experiments with crops at New Jersey Stations], Lipman and Blair	826
[Report of department of agronomy of New Jersey Stations], App	827
[Report of the] department of agronomy, Hume	827
New [field crop] plant introductions, Hansen	827
Report of experiments at Chillicothe, Texas, Edwards	828
The genera of grasses of the United States, Hitchcock	828
Silage crops, Stookey	828
Alsike more reliable than the red clover	829
Cotton growing, Stewart	829
Fertilizers profitable for potato growing	829
Prussic acid in sorghum, Collison	829
Spring wheat uncertain.—Fly may injure crop	830
Clipping tests of oats and wheat, Williams	830
Report of the department of seed analysis, Helyar	830

HORTICULTURE.

	Page.
[Recent results of horticultural investigations].....	830
[Report of the] division of horticulture, Brierley.....	833
[Horticultural investigations at Crookston, 1917 and 1918], Selvig.....	834
[Horticultural investigations at Crookston substation, 1918-19], Selvig.....	835
[Studies on heredity and environment at New Jersey Stations], Halsted.....	835
Report of the specialist in market gardening, Nissley.....	835
Report of the specialist in vegetable growing, De Baun.....	835
Report of the department of horticulture, Blake and Connors.....	835
[Report on orchard trials at the Duluth substation], Thompson.....	836
[Report of the] fruit-breeding farm, Zumbra Heights, Haralson.....	836
[Report on fruit breeding], Hansen.....	836
Spring spraying program for 1920, Frank.....	836
Bearing habits of the Delicious apple, Ellenwood.....	836
Fertilizers for peach orchards, Thayer.....	836
The Bartlett plum, Thayer.....	837
[Report on cranberry investigations at Whitesbog, N. J.], Beckwith.....	837
Citrus fertilizer experiments, Collison.....	837
Roses for the home garden, Stahl.....	838
Beautifying the farmstead, Mulford.....	838

FORESTRY.

[Report of forestry investigations at the California Station].....	838
[Note on forestry experiments at Grand Rapids substation, Minn.], Bergh.....	839
Report of the Virginia State forester for 1918 and 1919, Jones.....	839
Report of the forestry commission for 1919, Dalrymple Hay et al.....	839
Salient features of a forestry policy for Ohio, Secrest.....	839
Cooperation between National Forests and private lands, Kirkland.....	839
Private forestry in France, Greeley.....	839
Great profits from forests in the French Jura, Woolsey.....	839
Natural regeneration of French forests, Woolsey.....	840
Transcaucasian forests, Mears.....	840
The tropical acacias of Queensland, Maiden.....	840
Note on Hollong timber (<i>Dipterocarpus pilosus</i>), Pearson.....	840
The identification of mahogany, Koehler.....	840
[Experiments in rubber culture].....	840
The uses of wood.—Wood in agricultural implements, Maxwell.....	840
Raw material for the paper industry, Hawes.....	840
Some information about Chinese wood oil, Lin.....	840
The Burmese atha system of measuring timber, Moodie.....	840
Rating scale for foresters, Stevens.....	840

DISEASES OF PLANTS.

The biochemistry of resistance to disease in plants, Gortner.....	841
Malignancy of crown gall and analogy to animal cancer, Levin and Levine.....	841
[Plant diseases studied at the California Station].....	842
Phytopathology [Mauritius, 1918], d'Emmerz de Charmoy.....	843
Treating oats for smut, Burlison and Stark.....	844
Basal glomerot of wheat, McCulloch.....	844
Fusarium wilt of chile pepper, Leolian.....	844
A new lettuce disease, Thomas.....	845
Temperature relations of certain fungi, Edson and Shapovalov.....	845
Potato disease treatment [at Crookston, Minn.], Selvig.....	845
Silver-leaf disease, Brooks and Bailey.....	845
Shot-hole fungus.....	846
Red root disease [of Hevea], Petch.....	846

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Forced movements, tropisms, and animal conduct, Loeb.....	846
The rat as a carrier of diseases, Foulerton.....	846
Rat bite fever.—Report of a case, Arkin.....	846
On a Coenurus in the rat, Turner.....	847
A mouse oxyurid, <i>Syphacia obvelata</i> , as a parasite of man, Riley.....	847

	Page.
Report on collection of Copepoda made in Honduras by Dyer, Marsh	847
Catalogue of birds of the Americas, Cory	847
Third and fourth lists of changes in A. O. U. Check List, Oberholser	847
Birds of North Carolina, Pearson and Brimley	847
Birds in town and village, Hudson	847
British birds, their nests and eggs, and how to name them, Gallichan	847
The birds of the Tambelan Islands, South China, Oberholser	847
Notes on birds collected by Dr. Abbott on Sumatra, Oberholser	847
Notes on Dr. Abbott's second collection of birds, Oberholser	847
Revision of subspecies of the white-collared kingfisher, Oberholser	847
Races of the Nicobar megapode (<i>Megapodius nicobariensis</i>), Oberholser	847
Notes on the wrens of the genus <i>Nannus</i> , Oberholser	847
Report of entomologist, Hinds	847
Entomological investigations	848
Division of entomology and economic zoology, Riley	848
Report of the department of entomology, Headlee	849
[Report of the] department of entomology, Severin	850
[Special entomological investigations in St. Vincent]	851
[Entomological notes], Fryer	851
Insect pests in 1918, MacDougall	851
Notes on parasites, food, and capture by birds of earwig, Brindley	851
"White ants" as pests in the United States, Snyder	851
Formosan termites and methods of preventing their damage, Oshima	851
The outbreak of locusts in western Canada in 1919	851
Harlequin cabbage bug and its control, Chittenden	852
[Walnut aphid studies]	852
Injury to silkworms by caterpillars of the brown-tail moth, Abe	852
Insects resembling European corn borer, Gossard	852
California oak worm (<i>Phryganidia californica</i>), Burke and Herbert	853
Notes on the life history of <i>Ephestia kuehniella</i> , Wadsworth	854
Life history of the toon shoot and fruit borer, Beeson	854
The ultimate seasonal infection of malarial fever, Mayne	854
Ox warble or ox bot flies, MacDougall	854
Observations on the more common aphidophagous syrphid flies, Curran	854
A new saccharomycete, <i>Monosporella unicuspidata</i> n. g. and n. sp., Keilin	854
Calwer's beetle book.—Introduction to the beetles of Europe, Schaufuss	854
Two Philippine leaf-mining buprestids, one being new, Banks	855
Notes on the biology of <i>Necrobia ruficollis</i> , Scott	855
Some insect relations of <i>Bacillus tracheiphilus</i> , Rand and Cash	855
Life history of "wireworms" of the genus <i>Agriotes</i> , I, Rymer Roberts	855
Notes on the apple root weevil (<i>Leptops hopeti</i>), Froggatt	855
The maize billbug or elephant bug (<i>Sphenophorus maidis</i>), Hayes	855
The four-spotted cowpea weevil (<i>Bruchus quadrimaculatus</i>), Wade	856
<i>Hypera nigrirostris</i> in the Pacific Northwest, Rockwood	857
The black banana stem weevil (<i>Cosmopolites sordidus</i>), Froggatt	857
American fowlbrood, White	857
Control of American fowlbrood, Phillips	859
Behavior of bees in colonies affected by European fowlbrood, Sturtevant	859
Determination of age in honeybees, Pixell-Goodrich	860
A remarkable case of homing instinct, Ainslie	860

FOODS—HUMAN NUTRITION.

A pink yeast causing spoilage in oysters, Hunter	860
[Whale meat]	861
[Control of mills by means of laboratory data], Jacobs and Rask	861
The gastric response to foods.—VII, Vegetables, Miller et al	861
[Chemical analyses of prunes, dried apricots, and almonds]	862
Investigation and valuation of canned meat, Frei and Krupski	862
Further remarks on the examination of canned meat, X, Seeberger	862
<i>Bacillus botulinus</i>	863
A pictorial history of tea	863
The history of food adulteration and its control, Redfern	863
The health officer, Overton and Denno	863
Emergency cooking for large groups of people	863
Government residence halls, D. C., Conyngton and Magnusson	863

	Page.
[Feeding employees in the anilin dye industry in Europe], Hamilton.....	863
Diets of laboring-class families during the war, Ferguson.....	863
Japan's food scarcity, Miyamoto.....	864
Malnutrition.....	864
Nutritional edema and "war dropsy," Maver.....	864
Experimental production of edema and protein deficiency, Kohman.....	865
The nature and function of the antineuritic vitamin, Dutcher.....	865
The metabolism of carbohydrates, Hewitt and Pryde.....	865

ANIMAL PRODUCTION.

Inbreeding and outbreeding: Their significance, East and Jones.....	865
Partial and complete duplicity in chick embryos, Tannreuther.....	866
Relative abundance of serum proteins in rats at different ages, Toyama.....	866
The feeding value of Sudan grass, St. Clair Potts.....	866
Inspection of commercial feedstuffs, Smith and Mixer.....	866
Better sires.—Better stock.....	866
Fifty-fourth annual live stock report, 1919.....	867
Review of the frozen meat trade, 1919, Weddel & Co., Ltd.....	867
The frozen meat industry of New Zealand, Elliott.....	867
Beef production, Mackenzie and Marshall.....	867
Cattle and the future of beef production in England, Mackenzie.....	868
[Sheep feeding experiments at the California Station].....	868
Bureau of Animal Industry range sheep experiment, Marshall.....	868
Some experiences in breeding range sheep, Marshall.....	869
Results of experiments with crossbred range sheep, Marshall.....	869
Sheep and wool for farmers.—Crossbreeding experiments, Mathews.....	869
The Empire's trade in wool in its relation to the world, Judge.....	870
[Hog feeding experiments], Templeton.....	870
[Swine breeding experiments at the California Station].....	870
Swine feeding experiment, Dietrich.....	871
Winter rations for brood sows, Robison.....	871
Poultry [experiments at the California Station].....	871
Poultry rations and methods of feeding, Lewis.....	872
Methods of feeding laying hens, Buss.....	872
The inheritance of winter egg production, Goodale and Macmullen.....	872
Practical results from studies on egg production, Goodale.....	872
Is the inheritance of egg production an insoluble problem? Goodale.....	873
Improving mongrel farm flocks through selected cockerels, Lippincott.....	873
[Hens as egg producers].....	873
Egg-laying tests at Hawkesbury, 1918-19, Whitbread and Hadlington.....	874
Report on the eighth Victorian egg-laying competitions, 1918-19, Hart.....	874

DAIRY FARMING—DAIRYING.

Dairy cattle [feeding experiments].....	874
Cost of producing dairy products.....	874
The variability of cows' milk, Wardlaw.....	875
Protein in milk.....	875
Relation between fat content and electrical conductivity, Wardlaw.....	875
The electro-pure process of treating milk, Anderson and Finkelstein.....	875
Observations on toxic properties of heated and decomposed milk, Ford.....	875
Sterilization of bottles for pasteurized milk, Hopkins and Kelly.....	876
Keeping quality [and flavor] of butter.....	876
Pickling of butter.....	876
[Cheese making experiments at the California Station].....	876
The mold of the blue-veined cheeses, Stuart.....	876
On the fungus flora of Brie cheese, Loubière.....	877
Camembert cheese, Filaudeau.....	877
The book of ice cream, Fisk.....	877

VETERINARY MEDICINE.

Twenty-first meeting of U. S. Live Stock Sanitary Association, 1917.....	877
Twenty-third meeting of U. S. Live Stock Sanitary Association, 1919.....	877
Proceedings of Wisconsin Veterinary Medical Association, ed. by Hadley.....	878
A text-book upon the pathogenic bacteria and protozoa, McFarland.....	878

	Page.
Source and significance of streptococci in market milk, Jones.....	878
Tumors: Their nature and causation, d'Este Emery.....	878
Surgical and obstetrical operations, Williams.....	879
Poisonous plants, Beath.....	879
A new sheep poisoning plant of the Southern States, Marsh.....	879
Variation in determinations of disinfecting value, Fantus and Rumry.....	879
The influence of thorium X on antibody formation, Hektoen and Corper.....	879
Streptolysin, de Kruif and Ireland.....	880
Studies with ethylhydrocuprein and mercuraphen, Kolmer and Idzumi.....	880
Abortion disease and its control, DeVine.....	881
[Blackleg culture filtrate].....	881
Blackleg, Welch.....	881
Report on Johne's disease, Joshi.....	881
Observations on paratyphoid bacilli recently isolated, Spray.....	881
[Tuberculosis investigations].....	882
Serological studies on tuberculosis, Petroff.....	882
Sodium morrhuate in the treatment of tuberculosis, Rogers.....	883
Contribution to the study of bovine anaplasmosis, Lignièrès.....	883
Malignant catarrhal fever, Marshall et al.....	883
The Federal quarantine and the rising cost of cattle, Nighbert.....	883
Diseases of sheep.....	883
[Hog cholera immunization].....	884
A peracute disease of horses and mules, Graham et al.....	884
[Detection and control of avian diseases].....	885
"Safety first" in the poultry yard, Thompson.....	885
Artificial <i>v.</i> natural incubation and bacillary white diarrhea, Brown.....	886
Chicken pox (epithelioma contagiosum).....	886
Chicken pox or contagious epithelioma, Johnson.....	886
Intestinal roundworms expelled by tobacco dust.....	886
Sour milk treatment for poultry diseases.....	887

RURAL ENGINEERING.

Agricultural surveying laboratory manual, Scoates.....	887
Analysis of statically indeterminate structures, Wilson et al.....	887
Inspections and tests of run-off records, Pierce.....	887
The coefficient of run-off of water courses in [France], Morin.....	887
Surface water supply of Colorado River Basin, 1916.....	887
Surface water supply in Oregon, 1916.....	887
Gazetteer of streams of Texas.....	887
Elements of western water law, Chandler.....	887
Land clearing, Thompson.....	888
Terracing in Texas, Olsen.....	888
Proportioning concrete by method of surface area of aggregates, Young.....	888
Cements producing quick-hardening concrete, Bates.....	889
Methods of curing standard concrete test specimens and strength, Green.....	889
Modulus of elasticity of concrete, Walker.....	889
Pressure of concrete in forms, Paaswell.....	890
More light on protecting concrete against fire.....	890
Paint, a plastic material and not a viscous liquid, Bingham and Green.....	890
First report of California Highway Commission, Darlington et al.....	890
Highway inspectors' handbook, Hubbard.....	890
The turnpikes of New England, Wood.....	891
The proper width of a permanently paved highway, Patzig.....	891
Standard specifications for brick pavements, Greenough.....	891
Fundamental considerations affecting concrete pavement design, Morse.....	891
Utilizing old macadam to increase width of concrete road.....	891
Service the final test of quality of road stone, Breed.....	891
Bituminous surface treating work, Stove.....	892
Field manual: Instructions for making bridge and culvert surveys.....	892
Proposed farm power studies.....	892
Efficiency in the use of oil fuel, Wadsworth.....	892
Theory and practice of plantation transportation, Alwyn-Schmidt.....	892
Tractor activities throughout Nation.....	892
Directory and specifications of farm tractors.....	892
Analytical dynamometer tests of agricultural machinery, Conti.....	892

	Page.
Care and operation of farm machinery, Morandi.....	893
Stone roller for thrashing jowar.....	893
Booms for spraying truck crops, Smith and Zimmerley.....	893
Farm buildings and tools.....	894

RURAL ECONOMICS.

The influence of wheat and cotton on Anglo-American relations, Schmidt.....	894
The farmer and foreign exchange, Sosland.....	894
Why the price of farm land varies, Norris.....	894
Information on land values, Evans.....	894
[Land tenure and settlement and agriculture in Australia], Knibbs.....	894
Russian agrarian reform, Preyer.....	894
The employment of women in agriculture in England and Wales.....	895
How Denmark has prospered, Birks.....	895
Testing farms in the South for efficiency in management, Goodrich.....	895
Double entry bookkeeping in an agricultural enterprise.....	895
Home supplies furnished by the farm, Funk.....	895
The necessity for the organization of agricultural interests, Carver.....	895
Report of the State Bureau of Markets and Marketing, Davis.....	895
Farmers' Market Bulletin.....	896
The Market Reporter.....	896
Monthly Crop Reporter.....	896
Monthly Crop Reporter.....	896
What Brazil buys and sells, de Affonseca.....	896
Acreage and live stock returns of Scotland.....	896
The products of French East Africa, François.....	896
Agricultural conditions in South Africa, Fisher.....	896

AGRICULTURAL EDUCATION.

The field in farm management demonstrations, Case.....	897
[Report on the work of the extension service].....	897
Report of extension in agriculture and home economics, Agee et al.....	897
The extension of education to the American farmer, Merrison.....	897
The school and the soil, and the soil and the farmer, Dörfler.....	898
A textbook of commercial geography, Adams.....	898
Selection and care of clothing, Baldt.....	898

MISCELLANEOUS.

Thirty-second Annual Report of Alabama College Station, 1919.....	898
Annual Report of California Station, 1919.....	899
Twenty-seventh Annual Report of Minnesota Station, 1919.....	899
Report of Superintendent, Northwest Experiment Station, 1917 and 1918.....	899
Annual Report of New Jersey Stations, 1918.....	899
Annual Report of South Dakota Station, 1919.....	899
Monthly Bulletin of the Ohio Experiment Station.....	899
Monthly Bulletin of the Western Washington Substation.....	899

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS ABSTRACTED.

Stations in the United States.

	Page.
Alabama College Station:	
Thirty-second An. Rpt.	
1919-- 801, 815, 821, 847, 870, 898	
California Station:	
An. Rpt. 1919-- 804, 805, 811, 812, 813, 814, 818, 822, 830, 838, 842, 848, 852, 861, 862, 863, 868, 870, 871, 874, 875, 876, 881, 882, 883, 884, 885, 886, 887, 894, 897, 898	
Florida Station:	
Bul. 154, Dec., 1919-----	837
Bul. 155, Dec., 1919-----	829
Illinois Station:	
Circ. 240, Feb., 1920-----	844
Kansas Station:	
Bul. 223, Jan., 1920-----	873
Tech. Bul. 6, Jan., 1920----	855
Massachusetts Station:	
Bul. 191, Oct., 1919-----	872
Control Ser. Bul. 11, Nov., 1919-----	866
Control Ser. Bul. 12, Oct., 1919-----	817
Minnesota Station:	
Twenty-seventh An. Rpt., 1919-----	824, 825, 826, 833, 835, 836, 839, 841, 848, 873, 874, 876, 888, 899
Rpt. Crookston Substa. 1917-18-----	809, 813, 825, 834, 845, 871, 886, 899
Montana Station:	
Circ. 86, Sept., 1919-----	881
Circ. 87, Sept., 1919-----	807
New Jersey Stations:	
Hints to Poultrymen, vol. 8—	
No. 5, Feb., 1920-----	872
No. 6, Mar., 1920-----	885
An. Rpt. 1918-- 812, 826, 827, 830, 835, 837, 849, 897, 899	
New Mexico Station:	
Bul. 120, Dec., 1919-----	829
Bul. 121, Dec., 1919-----	844
North Carolina Station:	
Farmers' Market Bul., vol. 7, No. 33, Mar. 1, 1920---	896
Ohio Station:	
Mo. Bul., vol. 4, No. 12, Dec., 1919-----	829, 836, 852, 871, 899
Mo. Bul., vol. 5, No. 1, Jan., 1920-----	830, 836, 837, 839, 845, 872, 899

Stations in the United States—Contd.

	Page.
Oklahoma Station:	
Bul. 129, Nov., 1919-----	856
Oregon Station:	
Bul. 164, Jan., 1920-----	811
South Dakota Station:	
An. Rpt. 1919-- 827, 836, 850, 899	
Texas Station:	
Bul. 253, Nov., 1919-----	809, 828
Utah Station:	
Bul. 171, Feb., 1920-----	806
Circ. 41, Jan., 1920-----	813
Virginia Truck Station:	
Bul. 28, July 1, 1919-----	893
Washington Station:	
West. Wash. Sta. Mo. Bul., vol. 7, No. 12, Mar., 1920--	828, 836, 838, 886, 899
 <i>U. S. Department of Agriculture.</i> 	
Bul. 772, The Genera of Grasses of the United States, with Special Reference to the Economic Species, A. S. Hitchcock-----	828
Bul. 804, A Study of the Behavior of Bees in Colonies Affected by European Foulbrood, A. P. Sturtevant-----	859
Bul. 809, American Foulbrood, G. F. White-----	857
Bul. 819, A Pink Yeast Causing Spoilage in Oysters, A. C. Hunter-----	860
Farmers' Bul. 1061, Harlequin Cabbage Bug and Its Control, F. H. Chittenden-----	852
Farmers' Bul. 1076, California Oak Worm, H. E. Burke and F. H. Herbert-----	853
Farmers' Bul. 1082, Home Supplies Furnished by the Farm, W. C. Funk-----	895
Farmers' Bul. 1084, Control of American Foulbrood, E. F. Phillips-----	859
Farmers' Bul. 1087, Beautifying the Farmstead, F. L. Mulford-----	838

U. S. Department of Agriculture—Con.

	Page.
Farmers' Bul. 1089, Selection and Care of Clothing, L. I. Baldt -----	898
Circ. 82, A new Sheep-poisoning Plant of the Southern States, C. D. Marsh -----	879
Circ. 83, Testing Farms in the South for Efficiency in Management, C. L. Goodrich -----	895
Circ. 84, Crop Injury by Borax in Fertilizers, O. Schreiner, B. E. Brown, J. J. Skinner, and M. Shapovalov -----	816
Office of the Secretary:	
Circ. 149, Proposed Farm Power Studies as Outlined by the Farm Power Conference and the Departmental Committee on Farm Power Projects ----	892
Bureau of Animal Industry:	
"Better Sires—Better Stock" -----	866
Bureau of Crop Estimates:	
Monthly Crop Rptr., Vol. 6—	
No. 2, Feb., 1920 -----	896
No. 3, Mar., 1920 -----	896
Bureau of Markets:	
Market Rptr., Vol. 1—	
No. 10, Mar. 6, 1920 ---	896
No. 11, Mar. 13, 1920 ---	896
No. 12, Mar. 20, 1920 ---	896
No. 13, Mar. 27, 1920 ---	896
Scientific Contributions: ¹	
Boric Acid Modification of the Kjeldahl Method for Crop and Soil Analysis, F. M. Scales and A. P. Harrison -----	802
Alfalfa Seed Growing and the Weather, with Particular Reference to Conditions in Utah, J. C. Alter -----	806
Effect of the Relative Length of Day and Night and Other Factors of the Environment on Growth and Reproduction in Plants, W. W. Garner and H. A. Allard -----	818
Germination of Barley Pollen, S. Anthony, and H. V. Harlan -----	820
Private Forestry in France, W. B. Greeley -----	839
The Identification of Mahogany, A. Koehler -----	840
Raw Material for the Paper Industry, A. F. Hawes ---	840
Basal Glumerot of Wheat, L. McCulloch -----	844

U. S. Department of Agriculture—Con.

	Page.
Scientific Contributions—Contd.	
Temperature Relations of Certain Potato-rot and Wilt-producing Fungi, H. A. Edson and M. Shapovalov -----	845
Report on a Collection of Copepoda Made in Honduras by F. J. Dyer, C. D. Marsh -----	847
Third and Fourth Annual Lists of Proposed Changes in the A. O. U. Check List of North American Birds, H. C. Oberholser -----	847
The Birds of the Tambelan Islands, South China, H. C. Oberholser -----	847
Notes on Birds Collected by Dr. W. L. Abbott on Pulo Taya, Berhala Strait, Southeastern Sumatra, H. C. Oberholser -----	847
Notes on Dr. W. L. Abbott's Second Collection of Birds from Simalur Island, Western Sumatra, H. C. Oberholser -----	847
A Revision of the Subspecies of the White-collared Kingfisher (<i>Sauropatis chloris</i>), H. C. Oberholser -----	847
The Races of the Nicobar Megapode (<i>Megapodius nicobariensis</i>), H. C. Oberholser -----	847
Notes on the Wrens of the Genus <i>Nannus</i> , H. C. Oberholser -----	847
"White Ants" as Pests in the United States and Methods of Preventing Damage, T. E. Snyder ---	851
Some Insect Relations of <i>Bacillus tracheiphilus</i> , F. V. Rand and L. C. Cash -----	855
<i>Hypera nigrirostris</i> in the Pacific Northwest, L. P. Rockwood -----	857
A Remarkable Case of Homing Instinct, C. N. Ainslie -----	860
Bureau of Animal Industry Range Sheep Experiment, F. R. Marshall -----	868
Some Experiences in Breeding Range Sheep, F. R. Marshall -----	869
Results of Experiments with Crossbred Range Sheep, F. R. Marshall -----	869

¹ Printed in scientific and technical publications outside the Department.

<i>U. S. Department of Agriculture—Con.</i>		<i>U. S. Department of Agriculture—Con.</i>	
Scientific Contributions—Contd.	Page.	Scientific Contributions—Contd.	Page.
The Eradication of Tuberculosis from Cattle and Swine, J. A. Kiernan-----	877	Memorandum Relative to the Etiology of So-called Infectious Abortion Disease of Cattle, E. C. Schroeder -----	878
Plan for Branding Accredited Herds, W. J. Fritz---	877	Changes in the Live Stock Industry, F. R. Marshall---	878
Recent Studies on the Modes of Transmission of Hog Cholera, M. Dorset-----	877	The Federal Quarantine and the Rising Cost of Conducting the Cattle Business in the Tick-infested Area, E. M. Nighbert----	883
Report of Progress in Tuberculosis Control, J. A. Kiernan -----	877	The Field in Farm Management Demonstrations, H. C. M. Case-----	897
Report of Progress in Hog Cholera Control, U. G. Houck -----	877

 College Station: *Auburn*; J. F. Duggar.¹
 Canebrake Station: *Uniontown*; J. M. Burgess.¹
 Tuskegee Station: *Tuskegee Institute*; G. W. Carver.¹
- ALASKA—*Sitka*: C. C. Georgeson.²
- ARIZONA—*Tucson*: D. W. Working.¹
- ARKANSAS—*Fayetteville*: Bradford Knapp.¹
- CALIFORNIA—*Berkeley*: C. M. Haring.¹
- COLORADO—*Fort Collins*: C. P. Gillette.¹
- CONNECTICUT—
 State Station: *New Haven*; } E. H. Jenkins.¹
 Storrs Station: *Storrs*; }
- DELAWARE—*Newark*: C. A. McCue.¹
- FLORIDA—*Gainesville*: W. Newell.¹
- GEORGIA—
Experiment: H. P. Stuckey.¹
Tifton: Central Plains Station; S. H. Starr.¹
- GUAM—*Island of Guam*: C. W. Edwards.²
- HAWAII—
 Federal Station: *Honolulu*; J. M. Westgate.²
 Sugar Planters' Station: *Honolulu*; H. P. Agee.¹
- IDAHO—*Moscow*: E. J. Iddings.¹
- ILLINOIS—*Urbana*: E. Davenport.¹
- INDIANA—*La Fayette*: G. I. Christie.¹
- IOWA—*Ames*: C. F. Curtiss.¹
- KANSAS—*Manhattan*: F. D. Farrell.¹
- KENTUCKY—*Lexington*: T. P. Cooper.¹
- LOUISIANA—
 State Station: *Baton Rouge*; }
 Sugar Station: *Audubon Park, New Orleans*; } W. H. Dalrymple.¹
 North La. Station: *Calhoun*; }
 Rice Station: *Crowley*; }
- MAINE—*Orono*: W. J. Morse.¹
- MARYLAND—*College Park*: H. J. Patterson.¹
- MASSACHUSETTS—*Amherst*: S. B. Haskell.¹
- MICHIGAN—*East Lansing*: R. S. Shaw.¹
- MINNESOTA—*University Farm, St. Paul*: R. W. Thatcher.¹
- MISSISSIPPI—*Agricultural College*: J. R. Ricks.¹
- MISSOURI—
 College Station: *Columbia*; F. B. Mumford.¹
 Fruit Station: *Mountain Grove*; F. W. Faurot.¹
- MONTANA—*Bozeman*: F. B. Linfield.¹
- NEBRASKA—*Lincoln*: E. A. Burnett.¹
- NEVADA—*Reno*: S. B. Doten.¹
- NEW HAMPSHIRE—*Durham*: J. C. Kendall.¹
- NEW JERSEY—*New Brunswick*: J. G. Lipman.¹
- NEW MEXICO—*State College*: Fabian Garcia.¹
- NEW YORK—
 State Station: *Geneva*; W. H. Jordan.¹
 Cornell Station: *Ithaca*; A. R. Mann.¹
- NORTH CAROLINA—*Raleigh and West Raleigh*: B. W. Kilgore.¹
- NORTH DAKOTA—*Agricultural College*: P. F. Trowbridge.¹
- OHIO—*Wooster*: C. G. Williams.¹
- OKLAHOMA—*Stillwater*: H. G. Knight.¹
- OREGON—*Corvallis*: J. T. Jardine.¹
- PENNSYLVANIA—
 State College: *R. L. Watts*.¹
 State College: *Institute of Animal Nutrition*; H. P. Armsby.¹
- PORTO RICO—
 Federal Station: *Mayaguez*; D. W. May.²
 Insular Station: *Rio Piedras*; E. D. Colón.¹
- RHODE ISLAND—*Kingston*: B. L. Hartwell.¹
- SOUTH CAROLINA—*Clemson College*: H. W. Barre.¹
- SOUTH DAKOTA—*Brookings*: J. W. Wilson.¹
- TENNESSEE—*Knoxville*: H. A. Morgan.¹
- TEXAS—*College Station*: B. Youngblood.¹
- UTAH—*Logan*: F. S. Harris.¹
- VERMONT—*Burlington*: J. L. Hills.¹
- VIRGINIA—
Blacksburg: A. W. Drinkard, jr.¹
Norfolk: Truck Station; T. C. Johnson.¹
- VIRGIN ISLANDS—*St. Croix*: Longfield Smith.²
- WASHINGTON—*Pullman*: E. C. Johnson.¹
- WEST VIRGINIA—*Morgantown*: J. L. Coulter.¹
- WISCONSIN—*Madison*: H. L. Russell.¹
- WYOMING—*Laramie*: A. D. Faville.¹

¹ Director. ² Agronomist in charge. ³ Animal husbandman in charge. ⁴ Acting director.
