THE FRUIT SITUATION

Summary

Fruit supplies in the 1941-42 season are indicated to be slightly larger than in the preceding year. The increase in the total supply of fruit available for domestic consumption probably will be about as great as the increase in production since no appreciable change in the fruit export situation is in prospect during this period. Increased consumer purchasing power and demand for fruits will at least partly offset the effect on prices of these increased supplies, and returns to growers generally will be larger than in the 1940-41 fruit season.

Production of peaches, California dried prunes, apricots, strawberries, citrus, California grapes, and California plums is indicated to be greater than a year ago. Production of pears and cherries is indicated to be smaller, and the condition of commercial apples on June 1 was slightly below that of a year earlier.

The Agricultural Marketing Service estimated, as of June 1, that the peach crop this summer would total 66.1 million bushels compared with 54.4 million in the summer of 1940. The crop in California is indicated to be smaller this year, but that in the rest of the country is indicated to be considerably greater. If the peach marketing season is normal this year, increased consumer purchasing power probably will more than offset the adverse effect on prices of increased supplies.

Total production of cherries in 12 States this season is indicated by the Agricultural Marketing Service, as of June 1, to total 148,390 tons compared with 178,310 tons in 1940. Sweet cherry production is indicated to be larger this year, whereas that of sour varieties is indicated to be smaller.

In view of the small prospective carry-overs of sour and sweet cherries, and the prospective increase in consumer purchasing power, the demand for cherries for canning is likely to be greater this year than last. An unfavorable factor, however, is the prospect of increased costs of canning operations.

Total pear production in the 1941-42 pear season is indicated, as of June 1, to total 30.3 million bushels compared with 31.6 million last year. Production of Bartlett pears in the Pacific Coast States is indicated to be about the same as in the 1940-41 season. The carry-over of Pacific Coast canned pears probably will be the largest on record. This larger than normal carry-over will tend to restrict the amount of pears canned this season, especially in view of the fact that export prospects are very unfavorable. Increased consumer purchasing power and a shorter peach crop for canning probably will not offset the loss of expert outlets for pears. The total amount of pears available for the fresh market may be roughly 600,000 bushels more than was made available in 1940.

Early in June the Agricultural Marketing Service reported that the June 1 condition of apples in commercial areas was 65 percent compared with 69 percent on June 1, 1940. Last year the condition of commercial apples on August 1 was 58 and the commercial crop totaled 115.5 million bushels.

Despite a smaller California Valencia crop this year and increased consumer purchasing power, prices of California Valencias are currently running below those of a year ago. This is largely due to increased competition of mid-season oranges this year. It is probable that prices of California Valencias will increase relative to those of a year earlier as soon as the remaining mid-season oranges have been marketed.

PEACHES

BACKGROUND. The increase in peach production from 1933-40 took place largely in the late peach-producing States, and in California. Production in the early States fluctuated about a constant level. Growers in the areas that produce peaches for market as fresh fruit have been generally optimistic, and a large number of trees have been planted in recent years.

From June to early August, 10 Southern States 1/ are the principal source of market supplies of fresh peaches. In the 5-year period 1936-40, approximately 45 percent of the United States peach crop, excluding production in California, was produced in these States. In 1940 the peach crop in these 10 Southern States was 8 percent smaller than in 1939, production in competing areas was smaller, and consumer purchasing power was greater.

Despite these relatively favorable factors, the average price received by southern peach growers for their 1940 crop was 8 percent below that received for the 1939 crop. Indications are that the major portion of the 1940 crop was marketed in a much shorter period of time than was the major part of the 1939 crop. Considerable quantities of late crop peaches came onto the market in 1940 while large marketings of early peaches were still being made. The year before only a small quantity of early peaches remained to be marketed when the late peach season got into full swing. Thus, it appears that the shorter marketing season in 1940 for the major portion of the crop, coupled with increased competition from the late crop States, resulted in prices in 1940 averaging below those in 1939.

In California the production of both freestone and clingstone varieties increased from 1933-40. The clingstone variety is used primarily for canning, and the freestone variety for drying and for sale in the fresh form. The demand for canned freestones has been increasing in recent years, and last year about 14 percent of the freestone crop was canned. The disposition of the total California crop depends on the size of the crop, the carry-over of canned and dried peaches, the demand for fresh peaches, and the market prospect for canned and dried packs.

In the 5-year period 1934-38, 20 percent of the dried peach pack and 15 percent of the canned peach pack were exported. Hostilities in Europe did not materially reduce dried and canned peach exports until May 1940. It is estimated that less than 4 percent of the 1940 dried peach pack, and less than 1 percent of the canned pack, were exported during the 1940-41 marketing season.

^{1/} North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas.

Outlook for 1941

Early peach crop estimated to be largest since 1931

On June 1 the Agricultural Marketing Service estimated that the 1941 peach crop in the 10 Southern peach States would total 20.8 million bushels. If a crop this size materializes it would be 50 percent greater than that of last year, and the largest since 1931. Peach production in the late States, excluding California, is estimated to total 24.1 million bushels compared with 17.0 million in 1940.

The price of southern peaches this year will depend upon a number of factors. The most important of these are the size of the southern crop, the purchasing power of consumers, and supplies in competing areas. Other factors normally influencing price are the length of the marketing season and the quality of the crop.

If the marketing season is normal this year, increased consumer purchasing power probably will more than offset the adverse effect on southern prices of increased supplies in the Southern and late States. The purchasing power of consumers is considerably improved over a year ago because of the national defense program.

The first peaches were shipped out of Georgia in the last week in May, and up to June 7 fewer cars had been shipped by rail and boat than were shipped in the comparable period a year ago.

California crop estimated to be smaller this year

It is probable that there will be fewer clingstones and freestones produced in California this year than last. On June 1 the Agricultural Marketing Service estimated that the clingstone crop this year would total 13.2 million bushels compared with 14.7 million in 1940, and that the freestone crop would total 8.0 million bushels compared with 8.9 million a year ago.

Clingstones: The disposition of the clingstone crop this season depends largely upon what canners think the demand for canned peaches will be during the coming marketing season, and upon the demand for fresh peaches. It is estimated that the carry-over of canned clingstone and freestone peaches on June 1 was roughly 1.6 million cases, the smallest since 1937.

Table 1 shows the estimated probable disposition of the California clingstone crop this year, the disposition in 1940, and the average disposition in the 5-year period 1935-39. The estimates for 1941 and 1940 have been revised in line with the latest estimates of production, and, therefore, do not coincide with those published a month ago. Any further change in the crop prospect would alter the situation.

Table 1.- Estimated probable disposition of 1911 California clingstone crop, fresh equivalent weight, 1940 disposition, and average disposition 1935-39

Year beginning June 1	Total	Production: Unharvest- : ed	Harvested	Cenned	Dried	Used fresh
	:Short to	ns Short tons	Short tons	Short tons	Short tons	Short tons
1941 1940	317,0 353.0		317,000 338,000	285,000	22,000	10,000 16,000
Average 1935-39	336,0	- /	329,000	27,4,000	35,000	20,000

The smaller prospective crop this year as compared with last, and the improved demand situation will favorably effect the price paid by canners for clingstone peaches.

Freestones: The outlook for freestone peaches is comparatively favorable. The relatively small crop of clingstones will result in an increased demand for freestones for canning. Also, the demand for dried peaches will be increased over a year ago as a result of increased consumer purchasing power. It is anticipated that the amount of freestones canned from the 1941 crop will be considerably greater this year than last. Table 2 shows the estimated probable disposition of the 1941 crop, the disposition in 1940, and the average disposition in the 5-year period 1935-39. The estimates have been revised in line with recent changes in production estimates.

CHERRIES

BACKGROUND. - Cherry production in the 12 major cherry producing States has increased moderately since 1930. The upward trend in production has been more pronounced in the sweet cherry than in the sour cherry areas. In 1938 and 1939 unusually favorable growing conditions actuated the upward trend in sweet cherry production. In the sour cherry States the wide fluctuations in

production have been more noticeable than the slight upward trend in production. Sweet cherry prices have recovered from the low level prevailing in 1932. Prices of sour cherries, which followed an upward trend from 1932-37, declined during 1938-39, and were relatively low in 1940.

The canning and frozen food industries have furnished important outlets for the sweet and sour cherry crops (see tables 3 and 4). In recent years approximately 69 percent of the sour cherry crop has been placed in cans or frozen and about 45 percent of the sweet cherry crop has been canned or barreled. Insignificant quantities of sweet cherries have been frozen in the last few years.

The European war has not had a direct effect on cherry producers in this country. United States exports of cherries have been negligible. In past years small quantities have been imported from Italy and what was formerly Yugoslavia, but the elimination of these imports due to hostilities abroad has had little effect on the domestic cherry industry. Indirectly the war has affected the canned cherry situation in that competition from canned fruits formerly exported has been increased since the canned packs of these fruits have not been reduced in line with the sharp curtailment of export outlets.

Outlook for 1941

Cherry crop likely to be considerably smaller this year

Total production of cherries in 12 States this season is indicated by the Agricultural Marketing Service, as of June 1, to total 146,390 tons compared with 178,310 tons in 1940, and the 10-year 1930-39 average of 138,234 tons. Sweet cherry production is indicated to be 5 percent greater this year than last, whereas production of sour varieties is indicated to be 30 percent smaller. Sweet cherries are produced largely in the West, whereas the sour varieties are produced mainly in the North Central and Middle Atlantic States.

Demand by canneries will be active

The demand for sour cherries for canning will be quite active this season. In 1940 about 3.5 million cases of sour cherries were canned from a little over 57,000 tons of the fresh fruit. Stocks of red pitted cherries in canners' hands on June 1 totaled about 166,000 cases (24 No. 2's), an indication that the carry-over on July 1 (the beginning of the new marketing season) will be negligible.

The canned and frozen packs of red pitted cherries will be smaller than in 1940 because of the smaller prospective crop of 79,150 tons. Last year roughly 75,000 tons of fresh fruit were canned and frozen, and 35,000 tons were consumed fresh. Of the amount consumed fresh, approximately 16,000 tons were consumed on the farms. Unless the total quantity consumed on farms

TTS-54 - 9 -

this year is negligible the pack of canned and frozen sour cherries will be reduced materially from that in 1940.

In the case of sweet cherries in the Pacific Coast States, the crop is expected to be slightly greater than in 1940. It is likely that the carry-overs of canned and brined cherries into the new crop season will be small relative to the carry-overs into the 1940 season. Trade reports indicate that in California prices slightly higher than a year ago are being paid for sweet cherries for canning.

In view of the small prospective carry-overs of sour and sweet cherries, and the prospective increase in consumer purchasing power, the demand for cherries for canning is likely to be greater this year than last. An unfavorable factor, however, is the prospect of increased costs of canning operations.

Table 3.- Sour cherries: Production and utilization, 11 States, 1937-40, and production 1941 1/

Year	: :Production :	: :Unharvested :	Estimated quantity canned	: :	Estimated quantity frozen	:	Estimated consumed fresh

Production estimates after 1937 obtained from reports of Agricultural Marketing Service. Utilization estimates based on trade reports of canned, barreled, and frozen sweet cherry packs.

2/ Indicated June 1.

PEARS

BACKGROUND. - Pear production has about doubled in the last 20 years. The increase occurred largely in the Pacific Coast States, where during the 5-year period 1936-40 two-thirds of the total United States pear crop was produced. Farm prices of pears tended to decline with increased production.

The canning industry has provided an important outlet for pears. In the 5-year 1934-38 period approximately 22 percent of the pear crop was placed in cans. In the same period the drying industry took about 5 percent of the crop. Increasing quantities of pears have been canned and dried in recent years, but since these outlets have not absorbed all of the increased production the volume of pears for fresh consumption has been larger.

From 1934-38 approximately 18 percent of the total pear crop was marketed outside of this country. In this period about 30 percent of the canned pack and 76 percent of the dried pack were exported. Substantial quantities of fresh pears also were exported. Export markets provided important outlets for the late variety pears; prior to the present European war over 50 percent of total shipments of fresh Hardy, Comice and Winter Nelis pears (important late varieties) went to foreign markets.

1940 pear season in review

The 1940 pear crop totaled 31.6 million bushels compared with 31.0 million in 1939. Production of Bartlett pears in the Pacific Coast States

TFS-54 - 11 -

was 1.1 million bushels smaller than in 1939, and production of late variety pears was 534,000 bushels greater.

At the beginning of the 1940-41 pear season it was evident that exports would be extremely small compared with those of preceding years. This meant that the proportion of the pear crop marketed in this country would be large in comparison with other years.

In view of this unfavorable export situation the Surplus Marketing Administration set up a direct purchase program and a diversion program for fresh pears. Similar programs had been in operation on a much smaller scale in the 1937, 1938, and 1939 pear seasons.

The carry-over of canned pears into the 1940-41 season was about 280,000 cases, one of the smallest carry-overs in years. Despite the sharply reduced export demand for canned pears, a pack roughly 20 percent larger than that in 1939 was put up because of the prospective increase in domestic consumer purchasing power. The pack of dried pears was reduced sharply in line with reduced export prospects.

Despite the near complete loss of export outlets, and increased production in 1940 over that in 1939, prices received by farmers averaged only 2 cents per bushel lower than in 1939. Increased consumer purchasing power, increased demand by conners, and purchasing and diversion programs carried out by the Surplus Marketing Administration combined to nearly offset the price effects of reduced export outlets and increased production.

Outlook for 1941

Total pear production this year is indicated, as of June 1, to total 30.3 million bushels compared with 31.6 million last year, and the 10-year 1930-39 average of 27.3 million bushels. Production of Bartlett pears in the Pacific Coast States is indicated to be about the same as in 1940.

As regards the canned pear situation, the carry-over of Pacific Coast canned pears probably will be the largest on record, roughly 5 times as large as that of last year. This larger than normal carry-over will tend to restrict the amount of pears canned this season, especially in view of the fact that export prospects are very unfavorable. Prospects of increased consumer purchasing power and a shorter peach crop for canning probably will not offset the loss of export outlets.

The Bartlett pear tonnage on the Pacific Coast is indicated to total about 329,000 tons. If approximately 165,000 tons of Bartlett pears are canned, and possibly 17,000 tons are dried, there would remain 147,000 tons of Bartletts for the fresh market. This would be equivalent to about 5.9 million bushels, which would be available for the fresh market along with 5.5 million bushels of late pears produced in the Pacific Coast States and 11.3 million produced in all other States. The total available for the fresh market would then be about 22.7 million bushels, or roughly 600,000 bushels more than was made available in 1940.

APPLES

BACKGROUND. - Approximately 115.5 million bushels of apples were produced commercially in 1940. In 1939 the commercial crop totaled 143.1 million bushels, of which 127.9 million bushels were marketed, in one form or another, through regular domestic trade channels. Even though the 1940 crop was smaller than 128 million bushels, the virtual loss of export outlets made it difficult to market varieties formerly exported. To alleviate this situation, the Department of Agriculture has made large purchases of export varieties from the 1940 crop.

Auction and wholesale prices of apples from September through November averaged considerably above those of a year earlier as the result of smaller domestic marketings and increased consumer incomes this year.

Cold storage holdings of apples on December 1 were the largest since 1937, and except for 1931 and 1937 were the largest in the last 12 years. The factors contributing to these large storage holdings have been discussed in detail in previous issues of this report.

Domestic marketings of fresh apples from December through March were greater than in the same period a year earlier. As a result of this, the rise in wholesale and auction apple prices from December through March was less than the rise during the same period last season. However, because of increased consumer purchasing power, prices in this period were higher this year.

Condition of commercial apple crop on June 1 below that of last year

Early in June the Agricultural Marketing Service reported that the June 1 condition of apples in commercial areas was 55 percent compared with 69 percent on June 1, 1940. Condition was above the 5-year average in the Eastern and Central States and equal to the average in the Western group of States. Last year the condition of commercial apples was only 55 percent on August 1, and the commercial crop totaled 115.5 million bushels.

Sales in May large and prices decline

Approximately 3.7 million bushels of apples were withdrawn from cold storage in May compared with 2.5 million in May 1940. As a result of these heavier marketings, prices of apples averaged below those of a year earlier for the first time in the 1940-41 season.

Domestic supply will be large in June

There will be roughly 1.2 million bushels more apples to be marketed during the remainder of the season than there were in the same period last year.

In the week ended June 6 auction and wholesale prices averaged below comparable prices last year.

CITRUS

Estimate of production of oranges and grapefruit from bloom of 1940 increased

Total winter and mid-season orange production from the bloom of 1940 is now placed at 54.2 million boxes compared with 48.8 million boxes from the bloom of 1939. The California Valencia crop, which is marketed mainly during the summer months, is estimated to total 25.1 million boxes this summer compared with 26.9 million in the summer of 1940. The estimate of grapefruit production has been increased to 43.7 million boxes, a record crop.

Marketing prospects for California Valencias this summer are favorable

Despite a smaller California Valencia crop this year and increased consumer purchasing power, prices of California Valencias are currently running below those of a year ago. This is largely due to increased competition of mid-season oranges this year. It is probable that prices of California Valencias will increase relative to those of a year earlier as soon as the remaining mid-season oranges have been marketed.

Lemon crop in 1940-41 season largest on record

The production of lemons from the bloom of 1940 is indicated, as of June 1, to total 13.6 million boxes compared with 12.0 million from the bloom of 1939. The average production in the 10-year period 1929-38 was only 8.2 million boxes.

Prices of lemons to date this season have averaged below those in the same period last year. The increase in consumer purchasing power has not been great enough to offset the increase in production. Lemon prices usually experience a seasonal rise in July and August because of the increased demand for lemons in periods of warm weather.

Citrus production in 1941-42 marketing season likely to be large

Citrus production from the bloom of 1941 is likely to be as large as the estimated record production from the bloom of 1940, if not slightly larger, unless unfavorable weather conditions occur.

Compiled from reports of the Agricultural Marketing Service and Surplus Marketing Administration.

/ Purchases made by Surplus Marketing Administration.

^{1/} Rail, boat and truck. No truck shipments reported for Louisiana, Alabama, and
Mississippi; total truck shipments from Texas; interstate truck shipments from
California-Arizona; interstate and intrastate truck shipments (excluding trucked to
canners and to boats) from Florida. All data subject to revision.
2/ Excluding relief shipments.

^{3/} Includes shipments from all producing areas, and also tangerines.

^{1/} Relates to crop from bloom of year shown. In California the picking season usually extends from about Movember 1 to December 31 of the following year. In other States the season begins with September 1. For some States in certain years, production includes some quantities donated to charity and/or eliminated on account of market conditions. 2/ Short-time average. 3/ Failure reported.
4/ Net content of boxes varies. In California and Arizona the approximate average for oranges is 70 pounds net and grapefruit 60 pounds; in Florida and other States oranges 10 pounds and grapefruit 80 pounds; California lemons, about 76 pounds net. 5/ December 1 indicated production.
