GENERATION of Man. As 'tis in human Subjects, that the gradual Process of Generation has been principally inquired into; and the Structure, and Office of the Organs subservient thereto, chiefly examined: What the laic Naturalists, and Anatomists have settled with regard thereto, is referred for this Head.

The *Parts of Generation*, then, are different in the different Sexes.

Those, proper to the Male, are the *Penis*; the *Testicles*; the *Vesiculae Seminales*; the *Vasla deferentia*; the *Parafas-*

is, and the *Vulva preparantis*; which see described each under its proper Article, PENIS, TESTICLES, &c.

The *Parts of Generation proper to the Female*, are the *Pudendum, the Clitoris, Nymphae, Hymen, Uterus, Fallopiian Tubes, and Ovaries or Testes*. See PUDENDUM, CLITORIS, NYMPHAE, HYMEN, UTERUS, FALLOPIAN TUBES, and OVARIES.

The Process of *Generation*, so far as the Male contributes to it, is as follows: The Penis being erected by an Affusion of Blood; as shewn under ERECTION; the Glans, at the same time tumefied; and the nervous Papillae in the Glans much rubbed, and highly excited in Coitus; an ejaculatory Contraction follows, by which the Seed is press'd out of the Seminal Vesicles, and expell'd with some Force. See PAPILLAE, EJACULATION, &c.

The Process of *Generation* on the part of the Female, is thus: The Clitoris being erected, after the like manner as the Penis in Man; and the neighbouring Parts all distended with Blood, they more adequately embrace the Penis in Coitus; and by their Intumescence press out a Liquor from the Glands about the Neck of the Womb, to facilitate the Passage of the Penis.

At the same time, the Fibres of the Womb contracting, open its Mouth (which at other times is extremely close) for the Reception of the finer Part of the Seed.

Thus, the Seed, pregnant with Animalcules, is convey'd, with some Impetus, into the Uterus; where being retain'd by the convulsive Constriction of the inner Membrane thereof, and further heated and agitated therein; it is prepared to impregnate the Ovum.

During the Act of Coition, the Fallopiian Tubes growing stiff, embrace the Ovaries with their strong muscular Edges, like Fingers; and compress them; till, their Mouths being dilated, and expanded by this Embrace, force the Egg, now ripen'd, into their Cavities, and gradually drive it forwards by their Vermicular Motion, till at last they protrude it into the Cavity of the Womb, to meet the Seed, some of the Animalcules whereof entering the dilated Pores of the glandulous Membrane of the Egg, are there retain'd, nourish'd, grow to its Navels, and suffocate the rest of the less lively Animalcula. And thus is *Conception* performed. See CONCEPTION.

Others rather suppose the Seed convey'd from the Uterus thro' the Fallopiian Tubes to the Ova; and thus take the Impregnation to be first perform'd in the Ovaries; or even the Tube themselves, the Ova and Seed meeting by the way.

Others, considering the Closeness of the Mouth of the Womb, and the Thickness of the Membranes of the Ovaries, judge it impossible for the Seed to pass that way; and therefore suppose it taken up by the Veins, which open into the Cavity of the Vagina, or even Womb; where circulating, it ferments with the Mals of Blood; and hence all the Symptoms which appear in Conception. At length it coeters and impregnates the Egg by the small Twigs of Arteries, which are upon its Membranes. This Fermentation swelling the Membranes of the Tube, they open their Cavity, and make room for the Ova, to pass into the Womb.

The Egg impregnated, and close shut up in the Womb, swims in the Humors thereof; which growing more and more subtil, enter the patent Pores found on one Side the Ovum, distend, fill, and augment it; and there being still further attenuated, nourish the Embryo; thicken and expand the Membranes of the Ovum, especially in that Part by which it grew to the Ovary, and thus form the Rudiments of a *Placenta*. See PLACENTA.

The same Causes still continuing, and the Pores both of the Placenta, and the Membranes being enlarged; the Egg begins to fill the Capacity of the Womb; and at length its Stem or Calyx grows to the concave Surface thereof: And thus is the Navel-string, or Funiculus form'd. See FUNICULUS UMBILICALIS, &c. See also FETUS.

This System is founded on the Supposition of the *Animalcula* in the Male Seed.

They who for them aside as unconcern'd in *Generation*, account for it thus: The Seed, containing volatile, oily, and saline Parts, as appears from its fetid Smell, oleaginous Substance, &c. being lodg'd in the Womb, and there further digested and excited; grows yet more volatile, fetid, pungent, and stimulating; and thus, adding to the Heat occasioned by Coition, relaxates the nervous Fibres of that Part, and occasions a Fermentation, and gentle Inflammation; and by that means an extraordinary Flux of Humors to that, and the adjacent Parts.

By this means the Tube become rigid, and fit to grasp the Ovaries, which are also heated by the Effluvia of the Semen, and the Warmth of the Parts surrounding. Upon this, a greater Flux into the Ovaries; till at length, the Ova, some of them at least, by such greater Supply of Nourishment, increase in Bulk; and as those grasp'd by the Edges of the Tube, will be kept warmest, and the greatest Flux be made thereto, they will soonest be ripen'd, fall off,

and be received by the Tube, and convey'd to the Womb; Where, growing, after the manner of the Seeds of Plants, the Placenta at length takes hold of, and adheres to the Uterus; from which time the Embryo begins to be nourish'd after a different manner. See GESTATION; see also NUTRITION, CIRCULATION, &c.

GENERATION of *Insects*; see INSECT.

GENERATION of *Plants* bears an admirable Analogy to that of Animals: See the Process deliver'd at length under the Article *Generation of PLANTS*.

The *Parts of Generation of Plants*, are the *Flowers*; and particularly the *Stamina, Apices, Farina fecundans, and Pistils* thereof. See FLOWER; see also STAMINA, FARINA, and PISTIL.

GENERATION of *Mushrooms*, see MUSHROOM.

GENERATION of *Minerals*, or *Fossils*, see MINERAL, and FOSSIL.

GENERATION of *Stones*, see STONE; see also SPAR, TROCHITES, and CRYSTAL.

GENERATION of *Shells*, see SHELL.

GENERATION, in Theology. The Father is said to have produc'd his *Word, or Son*, from all Eternity, by way of *Generation*; on which occasion the Word *Generation* raises a peculiar Idea: That Procession, which is really effected in the way of Understanding, is called *Generation*, by reason the *Word*, in virtue thereof, becomes like to him from whom he takes his Original; or as St. Paul expresses it, the Figure, or Image of his Substance, i. e. of his Being and Nature. See TRINITY, PERSON, PROCESSION, &c.

And hence it is, that the Second Person in the Trinity is called the *Son*. See SON, &c.

GENERATION is also us'd, tho' somewhat improperly, for *Genealogy*; or the Series of Children, issued from the same Stock: Thus, the Gospel of St. Matthew commences with the *Book of the Generation of Jesus Christ*, &c.

The later, and more accurate Translations, instead of *Generation*, use the Word *Genealogy*. See GENEALOGY.

GENERATION is also us'd to signify a People, Race, or Nation; especially in the literal Translations of the Scripture: Where the Word generally occurs, wherever the Latin has *Generatio*; and the Greek, *γεννη*, or *γεννησις*.

Thus, *A wicked and perverse Generation seeketh a Sign, &c. One Generation passeth away, and another cometh, &c.*

GENERATION is also us'd in the Sense of an Age, or the ordinary Period of Man's Life.

Thus, we say, To the third and fourth *Generation*: In this Sense, Historians usually reckon a *Generation* the Space of thirty Years, or thereabouts. See SECVLUM.

Herodorus makes three *Generations* in an hundred Years; which Computation appears from the later Authors of political Arithmetic, to be pretty just. See ANNUITY, and POLITICAL ARITHMETICK.

GENEROUSA, Gentlewoman; see GENTLEMAN.

Generosa is a good Addition; and if a Gentlewoman be named *Spinster*, in any original Writ, Appeal, or Indictment, the may abate and quash the same. 2 *Inst. fol. 668*.

GENESIS, the first Book of Holy Scripture, or the Bible; containing the History of the Creation; and the Lives of the first Patriarchs. See BIBLE, and SCRIPTURE.

The Book of *Genesis* makes the Head of the *Pentateuch*. See PENTATEUCH.

Its Author is *Moses*: It contains the Relation of 2567 Years; viz. from the Beginning of the World, to the Death of *Joseph*.

The *Jews* are forbid to read the Beginning of *Genesis*, and the Beginning of *Ezekiel*, before 30 Years of Age.

The *Hebrews* call this Book *Bereshith*, in regard it begins with that Word, which in their Language signifies *in principio*, in the Beginning. 'Twas the *Greeks* gave it the Name *Genesis*, *γεννησις*, q. d. Production, Generation; by reason it begins with the History of the Production, or Generation of all Beings.—

Cebrenus makes mention of an Apocryphal Book, entitled *little Genesis*, *Genesis parva*, containing several Incidents, not in the other: Some of which he has preserv'd; particularly, that *Cain* was buried under the Ruins of a House: That an Angel taught *Abraham* the Hebrew Tongue; That *Methuselah*, Prince of the Devils, advised God to order *Adam* to sacrifice his Son, for a Trial of his Obedience: That the Children were only cast into the Nile for ten Months, &c.

GENESIS, in Geometry, the Formation of a Line, Plane, or Solid, by the Motion, or Flux of a Point, Line, or Surface. See LINE, and SURFACE; see also POINT, and FLUXION.

The *Genesis*, or Formation, e. gr. of a Globe, or Sphere, is conceived by supposing a Semi-circle to revolve upon a Right Line, drawn from one Extreme thereof to the other; call'd its *Axis*, or the Axis of Circumvolution: The Motion, or Revolution of that Semi-circle, is the *Genesis* of the Sphere, &c. See AXIS; see also SPHERE, GLOBE, &c.

In the *Genesis* of Figures, &c. the Line, or Surface that moves, is called the *Descriptens*; and the Line around which, or according to which the Revolution, or Motion is made, the *Dirigent*. See *DESCRIBENT*, and *DIRIGENT*.

GENET, in the *Manage*, &c. a small sized, well proportioned Spanish Horse.

Some also give the Term *Geneta* to well made Italian Horses.

To ride a la *Genette*, is to ride in the Spanish Fashion; i. e. with the Stirrups so short, that the Spurs bear upon the Flanks of the Horse. This is deem'd a Piece of Gallantry in Spain, but not among us.

GENETHLIACI, in Astrology, Persons who erect Horoscopes; or foretell what shall betide Men, by means of the Stars which presided at their Nativity. See *HOROSCOPE*, and *NAVITIVY*.

The Antients call'd them *Chaldei*, and by the general Name *Mathematici*: Accordingly, the several Civil, and Canon Laws, which we find made against the Mathematicians, only respect the *Genethliaci*, or Astrologers.

They were expell'd Rome by a formal Decree of the Senate; and yet found so much Protection from the Credulity of the People, that they remain'd therein unmolested.

Hence an antient Author speaks of them as *Hominum genus quod in evitate nostra semper est vetabitur, & retinebitur*. See *ASTROLOGY*.

Autipater, and *Abinapontus* have shewn that *Genethliology* should rather be founded on the Time of Conception, than that of the Birth. *Vitruvius*.

The Word is form'd of the Greek γενεθλια, Origin, Generation.

GENETHLIACUM, GENETHLIAC Poem, GENETHLIACUM Carmen, is a Composition in Verse, on the Birth of some Prince, or other Illustrious Person; wherein the Poet promises him great Honours, Advantages, Successes, Victories, &c. by a kind of Prophecy or Prediction.

Such is the *Elogue* of *Virgil* to *Pollio*, beginning,

Sicelides Muses paulo majora canamus.

There are also *Genethliac Speeches*, or *Orations*; made to celebrate a Person's Birth-day.

GENEVA, a popular Name for a distill'd Water; procur'd from the Seeds, or Berries of the Juniper Tree; which the French call *Genevier*, and the Berry *Genevre*: Whence the English Appellation *Geneva*.—See *WATER*, and *JUNIPER*.

GENEVIEVE, St. GENEVIEVE, or St. GENEVIEFVE. The *Fathers* or *Religions* of St. *Genevieve*, is a Congregation of Regular Canons of the Order of St. *Augustin*; established in France.

The Congregation of St. *Genevieve* is a Reform of the *Augustin* Canons, begun by St. *Charles Fauré*, in the Abby of St. *Vincent de Senlis*, whereof he was a Member, in the Year 1618. See *AUGUSTINES*.

The Reform soon spread into other Houses; particularly that of *Notre Dame d'Eu*, and the Abby of St. *Genevieve* at *Paris*, chiefly by the Interest of the Cardinal de la Roche-foucauld, who was chose Abbot thereof in 1619; and in 1621 propos'd the Reform to the Religious of his Abby.

In the Year 1634 the Abby was made elective; and a General Chapter, composed of the Superiors of 13 Houses who had now receiv'd the Reform, chose F. *Fauré* Co-adjutor of the Abby of St. *Genevieve*, and General of the whole Congregation. Such were its Beginnings.

It has since increas'd very much, and now consists of above an hundred Monasteries; in some whereof the Religious are employ'd in the Administration of the Parishes, and Hospitals; and in others, in the Celebration of Divine Service, and the Instruction of Ecclesiastics in Seminaries for the purpose.

The Congregation takes its Name from the Abby of St. *Genevieve*, which is the Chief of the Order; and whose Abbot is the General thereof. The Abby it self took its Name from St. *Genevieve*, the Patroness of the City of *Paris*; who died in the Year 515. Five Years after her Death, *Clovis* erected the Church of St. *Genevieve*, under the Name and Invocation of St. *Peter*; where her Relicks are still preserv'd; her Shrine visited, and her Image carried with great Processions and Ceremonies, upon extraordinary Occasions, as when some great Favour is to be intreated of Heaven.

GENIAL, GENIALIS, an Epithet, applied by the Antients to certain Deities, whom they suppos'd to preside over the Affair of Generation. See *GEN*.

Among the *Genial* Gods, *Dii Genesiales*, says *Festus*, were *Water*, *Earth*, *Fire*, and *Air*, which the Greeks call'd *Elementa*.

The twelve Signs were also rank'd in the Number; as also the Sun and Moon.

They were thus call'd a *Gerendo*, from Bearing; Or, according to the Correction of *Scaliger* and *Vossius*, a *genendo*, to yeare, produce.—

Yet *Festus* says, they were also call'd *Gennies*, or *Gennies* which seems to require the former Reading. M. *Dacier* in a Note, shews that *gerere* has the Sense of *gerere*.

GENICULI, in Botany, the Knots; which appear on Herbs: Whence Botanists call those mark'd therewith *Geniculate Plants*. See *PLANT*.

GENIOGLOSSI, in Anatomy, a Pair of Muscles, proceeding inwardly from the Fore-part of the lower Jaw, under another called *Geniohyoides*; and which, enlarging themselves, are fasten'd into the Basis of the Tongue. See *TONGUE*.

They serve to pull the Tongue forward; and to thrust it out of the Mouth; being thus call'd from γεννη, *Mentum*, the Chin, and γλωσσα, *Lingua*, the Tongue.

GENIOHYOIDEUS, in Anatomy, a Muscle of the Os Hyoides, which, with its Partner, is short, thick, and fleshy; arising from the internal Parts of the lower Jaw-bone, called the Chin; and dilating themselves, are soon loosn'd again; and inferred into the superior Part of the Fore-bone of the Os Hyoides. See *MUSCLE*.

These pull upwards and forwards the Os Hyoides; and assist the *Genioglossi* in thrusting the Tongue out of the Mouth. See *HYOIDES*.

They take their Name from γεννη, *Mentum*, the Chin; and ὀψος, *Hyoides*.

GENITAL, GENITALIS, in Medicinæ, something that relates to Generation. Thus we say, the *Genital Parts*, &c. the Parts employ'd in the Affair of Generation. See *PARTS* and *GENERATION*.

The *Genital* Gods, *Dii Genitales*, are sometimes us'd in the antient Roman Foes for those we otherwise call *Indigetes*. See *INDIGITES*.

Anonimus, in the Argument of the fourth Book of the *Eneid*, takes the Word in a different manner: The *Dii Genitales*, he observes, were not such as were born of human Parents, were not thus call'd *quasi geniti ex hominibus*; but rather because they themselves had begot human Children.

GENITALIA, or GENITORIES, in Anatomy, a Name sometimes given the Testes, or Testicles of Man; on account of their Office in Generation. See *TESTICLE*.

GENITES, or GENITES, among the Hebrews, were those who descended from *Abraham*, without any Mixture of foreign Blood.

The Greeks distinguish'd by the Name of *Genites* such of the *Israelites*, as were issu'd from Parents, who, during the *Babylonish* Captivity, had not allied with any Gentile Family.

The Word is form'd of the Greek γεννη.—

GENITIVE, the second Case of the Declension of Nouns. See *CASE*.

The Relation of one thing consider'd as belonging in some manner to another, has occasion'd a new Termination of Nouns, call'd the *Genitive Case*. See *NOUN*.

An English, the *Genitive Case* is made by prefixing the Participle of *to be*; in French, *de*, or *du*, &c. though, in Stricness, there are no Cases at all in either of those Languages, inasmuch as they do not express the different Relations of Things by different Terminations, but by additional Prepositions.

In the *Latin*, this Relation is express'd in divers manners: Thus we say, *Caput Hominis*, the Head of a Man; *Color Rose*, the Colour of a Rose; *Opus Dei*, the Work of God, &c.

As the *Genitive Case* serves to express very different, and even opposite Relations, there sometimes arises an Ambiguity therefrom: Thus in the Phrase *Vulnus Acbillis*, the Wound of *Acbillis*, the *Genitive Acbillis* may either signify the Relation of Subject, in which Sense it is taken passively for the Wound *Acbillis* has receiv'd; or the Relation of a Cause, in which Sense it is taken actively for the Wound *Acbillis* has given: Thus in that Passage of St. *Paul*, *Certum sum quod neque mors, neque vita, &c. nos poterit separare a charitate Dei in Christo*, &c. The *Genitive DEI*, has been taken by Interpreters in two different Senses; some giving it the Relation of Object, and understanding the Passage of the Love which the Elect bear to God in *Jesus Christ*, whereas others give it the Relation of Subject, and explain it of the Love which God bears the Elect in *Jesus Christ*.

In the Hebrew Tongue, the *Genitive Case* is marked after a manner very different from that of the *Greek*, and *Latin*; for whereas in those Languages the Noun Govern'd is varied; in Hebrew they change the Noun Governing.

GENITURA, or GENITURE, a Name some Authors give to the Seed; both that of the Male, and Female. See *SEED*.

GENIUS, a good, or evil Spirit; or a Demon, whom the Antients suppos'd set over each Person, to direct his Birth, accompany him in Life, and to be his Guard. See *DEMON*.

Among the *Remans*, *Festus* observes, the Name *Genius* was given to the God who had the Power of doing all things, *Deum qui vim obtineret rerum omnium gerendarum*; which *Vossius*, de *Idolol.* rather chooses to read *gerendarum*, who has the Power of producing all Things; by reason *Confortinus* frequently uses *genere* for *gignere*.

Accordingly, *St. Augustin de Civitat. Dei*, relates, from *Varro*, that the *Genius* was a God who had the Power of generating all things; and presided over them when produced.

Festus adds, that *Aufustinus* spake of the *Genius* as the Son of God, and the Father of Men, who gave them Life; others, however, represented the *Genius* as the peculiar or tutelary God of each Place; And 'tis certain, this last is the most usual Meaning of the Word.

They had their *Genius* of Nations, of Cities, of Provinces, &c. Nothing is more common than the following Inscription on Medals, *GENIUS POPULI ROM.* the *Genius* of the Roman People: Or, *GENIO POP. ROM.* to the *Genius* of the Roman People.—

In this Sense, *Genius* and *Lar* were the same thing; as, in effect, *Confortinus* and *Apuleius* affirm they were. See *LARES*, and *PENATES*.

The *Platonists*, and other Eastern Philosophers, supposed the *Genii* to inhabit the vast Region, or Extent of Air, between Earth and Heaven. They were a sort of intermediate Powers, who did the Office of Mediators between Gods and Men. They were the Interpreters, and Agents of the Gods; communicated the Wills of the Deities to Men; and the Prayers, and Vows of Men, to the Gods. As it was unbecoming the Majesty of the Gods to enter into such trifling Concerns; this became the Lot of the *Genii*, whose Nature was a Mean between the two; who derived Immortality from the one, and Passions from the other; and who had a Body framed of an aerial Matter.

Most of the Philosophers, however, held that the *Genii* were born, and died; and *Plutarch* attributes the ceasing of Oracles partly to the Death of the *Genii*. See *ORACLE*.

The Heathens who consider'd the *Genii* as the Guardian Spirits of particular Persons, believed that they joyc'd, and were afflicted at all the good, and ill Fortune that befel their Wards. They never, or very rarely appear'd to them; and then only in favour of some Person of extraordinary Virtue or Dignity.

They likewise held a great Difference between the *Genii* of different Men; and that some were much more powerful than others; on which Principle it was, that a Wizard in *Appian* bids *Anthony* keep at a distance from *Othavins*, by reason *Anthony's Genius* was inferior to, and stood in Awe of that of *Othavins*.

There were also *Evil Genii*, who took a pleasure in persecuting Men, and bringing them evil Tidings: Such was that in *Paterculus*, &c. which appear'd to *Brutus* the Night before the Battle of *Philippi*. These were also call'd *Larvæ*, and *Lemures*. See *LARVÆ*, and *LEMURES*.

GENIUS is more frequently us'd for the Force or Faculty of the Soul, consider'd as it thinks, or judges.

Thus we say, A happy *Genius*, a superior *Genius*, an elevated *Genius*, a narrow confin'd *Genius*, &c. In the like Sense we say, A Work of *Genius*; a Want of *Genius*, &c.

GENIUS is also us'd in a more restrain'd Sense for a natural Talent, or Disposition to one Thing more than another. In this Sense we say, A *Genius* for Verse; for the Sciences, &c.

GENS D'ARMES, see *GEND'ARMES*.

GENTIAN, a Medicinal Root, the Product of a Plant of the same Name; which the Antients, to render it the more considerable, denominated from *Genetius*, King of *Illyria*, who is suppos'd to have been the first that discover'd the admirable Virtues thereof.

The Root *Genetian* is of a yellowish Colour, and intolerably bitter; is sometimes as thick as the Arm, but more commonly divided into Branches no bigger than the Thumb: Its Stem is several Feet high, being very smooth and polish'd, the 'divided by Knots from Space to Space, out of which arise the Leaves, which resemble those of *Plantain*. Its Flowers, which likewise accompany the Knots, are yellow; and its Seed, flat, round, smooth, and light.

This Root is held excellent against Poxes, and even against the Plague. It stands at the Head of the Stomachicks, warming and strengthening the Stomach, and helping Digestion. It is sudorifick, and us'd with Success in intermitting Fevers, whence some call it the *European Quinquina*; and is also an Ingredient in Treacle. Externally, it is used for Wounds.

The Plant affects moist Places, and is found commonly enough in some Parts of *England*, *Burgundy*, the *Alps*, and *Pyreneans*: The Root is to be choic'd dry, new, of a moderate Thickness, free from Earth, and furnish'd with five little Branches or Fibres; and, if possible, that which is dry'd by the Air, which is distinguishable by the Colour, it being

blackish within Side, when dry'd in the Oven, and of a golden Yellow, when in the Air.

GENTILE, *GENTILIS*, a Pagan, or Person who adores Idols. See *IDOL*, *PAGAN*, &c.

This Name the Jews gave to all who were not of their Religion; as the Christians give that of *Infidel*. *St. Paul* is called the *Doctor*, or *Apostle* of the *Gentiles*, which Appellation he first gave himself. *Rom. xi. 13. As I am the Apostle of the Gentiles, I magnify mine Office.*

The Calling of the *Gentiles* to Christianity, had been predicted in the Old Testament, as it was accomplish'd in the New. See *Psal. ii. 8. xix. 28. Is. ii. 2. lxvi. 18. Joel ii. 29. Matth. viii. 11. xii. 17. Acts xi. 40. xiii. 47, 48. xviii. 8. Rom. i. 5. iii. 29. xi. 12, 13, 25. Eph. ii. 11. Revel. xi. 2. xxii. 2.*

In the Roman Law, and History, the Name *Gentile*, *Gentilis*, sometimes expresses those whom the Romans otherwise call'd *Barbarians*; whether they were Allies of Rome, or not: In this Sense the Word occurs in *Ammianns*, *Arrianus*, and the *Notitia Imperii*.

The same People us'd the Word *Gentilis* in a more peculiar Sense, for all Strangers, or Foreigners, not subject to their Empire; as we see in the *Theodosian Code*, in the Title *De Nuptiis Gentilium*, where the Word *Gentiles* stands opposed to *Provinciales*, or the Inhabitants of the Provinces of the Empire.

The Word is likewise us'd in the Greek; but was not introduced either into that, or the Latin Tongue, till after Christianity was establish'd; it being taken from Scripture.

The Hebrews apply the Name גוֹי, *Gentis*, to all the other People of the Earth, who were not *Israelites*, or *Hebrews*. Some will have it, that the *Gentiles* were thus call'd in Contradistinction to the Jews, and Christians; by reason these latter have a positive Law to observe in Matters of Religion, whereas the *Gentiles* have only the natural Law; hence they are call'd *Gentiles*, quia sunt uti genti fuerunt.

GENTLEMAN, a Person of noble Birth, or descended of an ancient Family, which has long bore Arms. See *NOBLE*, and *ARMS*.

In Strictness, *Chamberlain* observes, a *Gentleman* is one whose Ancestors have been Freemen, and have owed Obedience to none but their Prince: So that in Propriety of Speech, no Man is a *Gentleman* who is not born so.

But, in *England*, the King, being the Fountain of Honour, can make a *Gentleman* by Charter, or by bestowing an honourable Employment on him.—*Gallim* is even of Opinion, that if a *Gentleman* be bound Apprentice to a Merchant, or other Trade, he does not lose his Degree of *Gentility*.

By the Custom of *England*, Nobility is either greater, or less: The greater consists all from Barons upwards, inclusive: The lesser, all from Baronets downwards, consisting of Baronets, Knights, Bishops, and *Gentlemen*. See *NOBILITY*; see also *KNIGHT*, &c.

The Word is form'd of the French *Gentilhomme*, or rather of *Gentil*, fine, fashionable, or becoming; and the *Saxons*, *Man, q. d. bonus, or bonesto loco natus*.

The same Signification has the Italian *Gentil huomini*, and the Spanish *Hidalgo*, or *Hijo d'Algo*, that is, the Son of a Person of Note.

Among us, the Term is applicable to all above Yeomen; so that Noblemen may be properly call'd *Gentlemen*. See *YEOMAN*.

If we go further back, we shall find *Gentleman* originally derived from the Latin *Gentilis homo*, which was used among the Romans for a Race of noble Persons of the same Name, born of free or ingenious Parents, and whose Ancestors had never been Slaves, or put to death by Law.

Thus, *Cicero*, in his *Topicks*; *Gentiles sunt, qui inter se eodem sunt nomine ab Ingentis oriundi, quorum materum nemo servitutem servavit, qui capite non sunt damnati*, &c.

Some hold, that it was formed from *Gentile*, i. e. Pagan, and that the ancient *Franks*, who conquer'd *Gaul* which was then converted to Christianity, were call'd *Gentiles* by the Natives, as being yet Heathens.

Others relate, that towards the Declension of the Roman Empire, as recorded by *Ammianns Marcellinus*, there were two Companies of Brave Soldiers, the one call'd *Gentilium*, and the other *Scutariorum*; and that it was hence we derived the Names *Gentleman*, and *Esquire*. See *ESQUIRE*.

This Sentiment is confirmed by *Pasquier*, who supposes the Appellations *Gentis* and *Esquiers* to have been transmitted to us from the Roman Soldiers; it being to the *Gentiles* and *Scutarii*, who were the bravest of the Soldiery, that the principal Benefices and Portions of Lands were assigned. See *BENEFICE*.

The *Gauls* observing, that during the Empire of the Romans, the *Scutarii* and *Gentiles* had the best Tenements,

or Appointments of all the Soldiers on the Frontiers of the Provinces, became insensibly accustomed to apply the same Names *Gentilhomme*, and *Leuyers*, to such as they found their Kings gave the best Provisions or Appointments to. *Paq. Rech. L. II. C. 15.*

In our Statutes, *Gentilis homo* was adjudg'd a good Addition for a *Gentleman*. 27 *Edw. 3.* The Addition of Knights is very antient, but that of Esquire or *Gentleman*, rare, before 1 *Hen. 5.* See ADDITION.

GENTLEMEN of the Chapel, are Officers, whose Duty and Attendance is in the Royal Chapel; being in Number 22: Twelve whereof are Priests, and the other twenty called Clerks of the Chapel, who assist in the Performance of Divine Service. See CHAPEL.

One of the first twelve is chosen for Confessor of the Household, whose Office it is to read Prayers every Morning to the Household Servants; to visit the Sick; examine, and prepare Communicants, and administer the Sacraments.

Another, well versed in Musick, is chosen first Organist; who is Master of the Children to instruct them in Musick, and what is necessary for the Service of the Chapel: A second is likewise an Organist: A third a Lutanist; and a fourth a Violist.

There are likewise three *Vergers*, so called from the Silver Rods they usually carry in their Hands, being a Sergeant, Yeoman, and Groom of the Vestry: The first attends the Dean, and Sub-Dean, finds Surplices, and other Necessaries for the Chapel: The second has the whole Care of the Chapel, keeps the Pews, and seats the Nobility and Gentry: The Groom has his Attendance within the Chapel Door, and looks after it.

GENUFLEXION, the Act of bowing, or bending the Knee; or rather, of kneeling down. See KNEELING.

The Jesuit *Rosneyd*, in his *Onomasticon*, shews that *Genuflexion*, or Kneeling, was a very antient Custom in the Church; and even under the Old Testament Dispensation: And that this Practice was observ'd throughout all the Year, excepting on Sundays, and during the time from Easter to Whitfuntide, when kneeling was forbid by the Council of Nice.

Others have shewn, that the Custom of not kneeling on Sundays had obtain'd from the Time of the Apostles; as appears from St. *Ireneus* and *Tertullian*: And the *Astrosic* Church, scrupulously attach'd to the antient Ceremonies, still retains that of not kneeling at Divine Service. The *Russians* esteem it an indecent Posture, to worship God on the Knees. Add, that the *Jews* usually pray'd standing.

Rosneyd gives the Reasons of the Prohibition of *Genuflexion* on Sundays, &c. from St. *Basil*, *Anastasius*, St. *Justin*, &c.

Baronius is of opinion that *Genuflexion* was not establish'd before the Year of Christ 58, from that Passage in *Acts*, chap. xx. 26. where St. *Paul* is expressly mention'd to kneel down at Prayer; but *Saurin* shews that nothing can be thence concluded.

The same Father remarks, that the primitive Christians carried the Practice of *Genuflexion* so far, that some of them had wore Cavities in the Floor where they pray'd: And St. *Jerom* relates of St. *James*, that he had contracted a Hardness in his Knees, equal to that of Camels.

GENUS, *Kind*, in Logicks, and Metaphysics, is that which has Species under it: Or, it is the Origin, and Radix of divers Species, join'd together by some Affinity or common Relation between them. See SPECIES.

Or, *Genus* is a Nature, or Idea, so common and universal, that it extends to other general Ideas, and includes them under it. See GENERAL.

Thus, *Animal* is said to be a *Genus*, in respect of *Man*, and *Brute*; in regard *Man* and *Brute* agree in the common Nature and Character of *Animal*: So, a *right lined Figure of four Sides*, is a *Genus*, in respect of a *Parallelogram*, and a *Trapezium*, and so likewise is *Substance*, in respect of *Substance extended*, which is a *Body*; and *thinking Substance*, which is *Mind*. See SPECIES.

In the general, *Genus* may be said to be a Class of a greater Extent than *Species*; and which is not convertible therewith. For though we may say, that all *Body* is *Substance*; yet it cannot be said all *Substance* is *Body*.

Add, that whatever may be said of the *Genus*, may likewise be said of the *Species* under it; e. g. whatever is said of *Ens*, Being, will equally hold of *Body*.

The Schoolmen define the *Genus Logicum* to be a Universal which is predicable of several Things of different Species; and divide it into two kinds: The one, *simulacrum*, which is the highest or most general; and has nothing above it to respect as a *Genus*: The other *subaltern*, which they likewise call *Medium*.

The *Genus simumum* is that which holds the uppermost Place in its Class, or Predicament; or it is that which may be divided into several Species, each whereof is a *Genus* in respect of other Species plac'd below it. See PREDICAMENT.

Thus in the Predicament of things subsisting of themselves, *Substance* has the Place and Effect of *Genus simumum*, and is predicated of all the Things contain'd in that Class; for both *Plato*, and *Man*, and *Animal*, and even *Spirit*, are properly call'd *Substance*.

Accordingly there are so many *simma genera*, as there are Classes of Predicaments or Categories. See CATEGORY.

A *Subaltern Genus* is that which being a Medium between the highest *Genus*, and the lowest *Species*; is sometimes consider'd as a *Genus*, and sometimes as a *Species*.

Thus *Bird*, when compar'd with *Animal*, is a *Species*; when to a *Crow*, an *Eagle*, or the like, a *Genus*.

Genus, again, is divided into *Remotum*, remote, where, between it and its *Species*, there is another *Genus*; and *Proximum*, or next, where the *Species* is immediately under it; as *Man*, under *Animal*.

A good Definition, say the Schoolmen, consists of *Genus*, and Difference. See DEFINITION, and DIFFERENCE.

Genus is also us'd for a Character or Manner, applicable to every thing of a certain Nature: In which Sense it serves to make capital Divisions in divers Sciences; as Musick, Rhetorick, Botany, Anatomy, &c. See ART, and SCIENCE.

GENUS, GENDER, in Botany, a System, or Asssemblage of several Plants, agreeing in some one common Character, in respect of the Structure of certain Parts; whereby they are distinguish'd from all other Plants. See PLANT.

The Distribution of Plants into *Genera*, and *Species*, is absolutely necessary to ease the Memory, and prevent its being oppress'd, and overburthen'd with an Infinity of different Names.

The Knowledge of a *Genus*, comprehends, in a kind of Miniature, that of all the Plants belonging thereto; each being denominated from some Circumstance, common to the whole Kind, to save the Embarrass of so many particular Names.

Something like this, even the common People do, especially in the instance of *Ranunculus*; but in most other Plants the Difficulty is infinitely greater, as 'tis hard to find any thing in common among them, whereon to found their *Genera*.

Hence Botanists differ as to the Manner of regulating these *Genera*, and the Characters whereon they are to be establish'd: Mr. *Roy*'s Distribution, see under the Article PLANT.

One of the latest, and best Writers, *Monf. Tournefort*, after a long and accurate Discussion, has chose in Imitation of *Gesner*, and *Columna*, to regulate them by the Flowers, and Fruit consider'd together; so that all Plants, which bear a Resemblance in those two respects, are of the same *Genus*: After which the respective Differences as to Root, Stem, or Leaves, make the different *Species*, or Sub-divisions. See SPECIES.

Mr. *Roy* made some Objections to this Distribution; which grew into a considerable Controversy between the two Authors. The Question was, Whether the Flowers and Fruits were sufficient to establish *Genera*, and to determine whether a Plant was of this *Genus*, or that?

The same *M. Tournefort* introduces another higher kind of *Genus*, or Class, which is only regulated by the Flowers: He observes, that he has never hitherto met with above fourteen different Figures of Flowers; which, therefore, are all that are to be retain'd in the Memory; so that a Person who has a Plant in Flower, whose Name he does not know, will immediately see what Class it belongs to in the Elements of Botany: The Fruit appearing some Days afterwards, determines its *Genus*, in the same Book; and the other Parts give its *Species*.

It is a wonderful Ease to the Memory, to have only fourteen Figures of Flowers to retain, and by means hereof to be enabled to descend to 673 *Genera*, which comprehend 8846 *Species* of Plants; which is the Number of those yet known by Land and Sea.

GENUS, in Musick, by the Antients call'd *Genus Melodie*, is a certain manner of subdividing the Principles of Melody, i. e. the consonant Intervals, into their cocinuous Parts. See INTERVAL, CONCORD, and CONCURSUS.

The Moderns, considering the Octave, as the most perfect Interval, and that whereon all the other Concords depend in the present Theory of Musick; the Division of that Interval is consider'd as containing the true Division of the whole Scale. See OCTAVE, and SCALE.

But the Antients went to work somewhat differently: The Diatessaron, or Fourth, was the least Interval which they admitted as Concord; and therefore they sought first how that might be most concinnously divided; from which they constituted the Diapente, or Fifth; and Diapason, or Octave.

The Diatessaron being thus, as it were, the Root or Foundation of the Scale, what they call the *Genera*, *Kinds*, arise from its various Divisions; and hence they defined the *Genus modulandi*, the manner of dividing the Tetrachord, and disposing

disposing its four Sounds as to Succession. See TETRA-CHORD.

The *Genera* of Music were three, viz. the *Eubarmosick*, *Chromosick*, and *Diatosick*: The two last whereof were variously subdivided; and even the first, though 'tis commonly reckon'd to be without any Species, yet different Authors have propos'd different Divisions under that Name, tho' without giving particular Names to the Species as was done to the other two. See SPECIES.

For the *Character*, &c. of the several *Genera*, see ENHARMONICK, CHROMATICK, and DIATONICK.

The *Parts*, or *Divisions* of the Diatessaron they call'd the *Diastems* of the several *Genera*, upon which their Differences depend; and which in the *Enharmonic* are particularly call'd the *Diessis*, and *Ditonum*; in the *Chromatic*, the *Hemitonism*, and *Trienitonium*; and in the *Diatonic*, the *Hemitonism*, or *Linna*, and the *Tonus*.

But under these general Names, which distinguish the *Genera*, there are other different *Intervals*, or *Ratios* which constitute the *Colores Generum*, or Species of *Enharmonic*, *Chromatic*, and *Diatonic*. Add, that what is a *Diastem* in one *Genus*, is a *System* in another. See DIASTEM, SYSTEM, CHORD; see also DIAGRAMMA.

GENUS, in Rhetoric. Authors distinguish the Art of Rhetoric, as also *Orations*, or *Discourses* produced thereby, into three *Genera*, or *Kinds*, *Demonstrative*, *Deliberative*, and *Judiciary*.

To the *Demonstrative* Kind belong *Panegyrics*, *Genealogies*, *Epithalamiums*, *Funereral Harangues*, &c. See each under its Head, PANEGYRIC, EPITHALAMIUM, &c.

To the *Deliberative* Kind belong *Perjuasions*, *Diffusions*, *Commendations*, &c. See PERSUASION, &c.

To the *Judiciary* Kind belong *Defences*, and *Accusations*. See RHETORIC, ORATION, &c.

GENUS, in Algebra. The ancient Algebraists distributed that Art into two *Genera*, or *Kinds*; the *Logistic*, and *Specious*. See LOGISTIC, and SPECIOUS.

GENUS, in Anatomy. The *Genus nervosum*, or *nervous kind*, call'd also the *nervous System*, is an Expression, pretty frequent among Authors; signifying the *Nerves*, consider'd as an *Assemblage* or *System* of similar *Parts*, distributed throughout the *Body*. See NERVUS, and SIMILAR PART.

Tobacco contains a deal of sharp, caustic Salt, proper to cause Irritations in the nervous Kind: Vinegar, taken in too great Quantity, incommodes the nervous Kind.

GEOCENTRIC, in Astronomy, is applied to a Planet, or its Orbit, to denote it concentric with the Earth; or, as having the Earth for its Centre, or the same Centre with the Earth.

Thus we say, that all the Planets are not geocentric. See PLANET.

GEOCENTRIC Place of a Planet, is the Place wherein it appears to us, from the Earth; supposing the Eye there fix'd: Or, it is a Point in the *Ecliptick*, to which a Planet, seen from the Earth, is refer'd. See PLACE, and HELIOCENTRIC.

GEOCENTRIC Latitude of a Planet, is its Latitude seen from the Earth; or the Inclination of a Line connecting the Planet and the Earth, to the Plane of the Earth's (or true) *Ecliptick*.

Otherwise, it is the Angle, which the aforesaid Line (connecting the Planet, and the Earth) makes with the Line which is drawn perpendicular to the Plane of the *Ecliptick*. See LATITUDE.

Thus, in *Tab. Astronomy*, Fig. 40. the Angle $\angle T'e$ is the Measure of that Planet's *Geocentric Latitude*, when the Earth is in *T*, and the Angle $\angle T' \varphi$, the Measure of it when the Earth is in *s*. See LATITUDE.

GEODESIA, that Part of Geometry, which contains the Doctrine, or Art of measuring Surfaces; and finding the Contents of all kinds of plain Figures. See SURFACE; see also MEASURING.

It is usually call'd *Surveying*, when employ'd in measuring of Lands, Grounds, Roads, Countries, Provinces, &c. See SURVEYING.

The Word is *Greek*, $\gamma\epsilon\omicron\delta\alpha\iota\sigma\iota\alpha$, form'd of $\gamma\eta$, terra, Earth, and $\delta\iota\omicron\delta\iota\upsilon$, I divide.—

GEOGRAPHICAL Mile, is the Minute, or sixtieth Part of a Degree of a great Circle. See MILE, and DEGREE.

GEOGRAPHICAL Table, see MAP.

GEOGRAPHY, the Doctrine or Knowledge of the Earth, both as in itself, and as to its Affections; or a Description of the Terrestrial Globe, and particularly of the known inhabitable Part thereof, with all its Parts.

The Word is form'd of the *Greek* $\gamma\eta$, terra, Earth, and $\gamma\epsilon\omicron\gamma\alpha\phi\iota\alpha$, scribo, I write.

Geography makes a Branch of Mathematics, of the mix'd kind; in that it considers the Earth, and its Affections, as depending on Quantity, and consequently measurable, viz. its Figure, Place, Magnitude, Motion, celestial Appearances, &c. with the several Circles imagin'd on its Surface. See MATHEMATICKS.

Geography is distinguish'd from *Cosmography*, as a Part from the Whole: This latter considering the whole visible World, both Heaven, and Earth. See COSMOGRAPHY.

From *Topography*, and *Chorography*, it is distinguish'd as the whole from a Part. See TOPOGRAPHY, and CHOROGRAPHY.

Galaitius considers Geography as either *Exterior*, or *Interior*: But *Varenius* more justly divides it into *General*, and *Special*; or, *Universal*, and *Particular*.

General, or *Universal* GEOGRAPHY is that which considers the Earth in General, without any Regard to particular Countries; or the Affections, common to the whole Globe, as its Figure, Magnitude, Motion, Land, Sea, &c. See GLOBE.

Special, or *Particular* GEOGRAPHY is that which considers the Constitution of the several Regions, or Countries; their Bounds, Figure, &c. with the Mountains, Forests, Mines, Waters, Plants, Animals, &c. therein: As also their Climates, Seasons, Heat, Weather, Distance from the Equator, &c. And their Inhabitants, Arts, Foods, Commodities, Customs, Language, Religion, Policy, Cities, &c.

Geography is very ancient; at least the *Special* Part thereof: For the ancient Writers scarce went beyond the Description of Countries.

It was a Custom among the *Romans*, after they had conquer'd and subdued any Province, to have a Map, or painted Representation thereof carried in Triumph, and expos'd to the View of the Spectators. See MAP.

Historians relate that the *Roman* Senate, about a hundred Years before Christ, sent Geographers into divers Parts, to make an accurate Survey and Mensuration of the whole Globe; but they scarce ever saw the twentieth Part thereof.

Before them, *Neco*, King of *Egypt*, order'd the *Phoenicians* to make a Survey of the whole Coast of *Africa*, which they accomplish'd in three Years: *Darius* procur'd the *Ethiopic* Sea, and the Mouth of the *Indus* to be examin'd: And *Pliny* relates, that *Alexander*, in his Expedition into *Asia*, took two Geographers, *Diogenes*, and *Bete*, to measure and describe the Roads; and that from their Itineraries the Writers of the following Ages took many Particulars. Indeed, this may be observ'd, that whereas most other Arts are Sufferers by War, Geography and Fortification alone are improv'd thereby.

The Art, however, must need have been exceedingly defective; as a great Part of the Globe was then unknown; particularly all *America*, the *Northern* Parts of *Europe*, and *Asia*; with the *Terra Australis*, and *Mogellonica*: And as they were ignorant of the Earth's being capable of being sail'd round, of the *Torrid Zone*'s being habitable, &c.

The principal Writings on this Art, among the *Antients*, are *Protonius*'s eight Books: Among the *Moderns*, *Johannes de sacro Bosco*, *De Sphera*, with *Clavius*'s Comment; *Ricciolus*'s *Geographia*, and *Hydrographia Reformata*; *Wigelius*'s *Speculum Terra*; *De Chales*'s *Geography*, in his *Mundus Mathematicus*; and above all, *Varenius*'s *Geographia Generalis*, with *Jarrin*'s Additions: To which may be added *Liebknecht*'s *Elementa Geographiae Generalis*; *Sturmius*'s *Compendium Geographicum*; and *Wolffius*'s *Geographia*, in his *Elementa Mathematicae*.—

GEOMANCY, GEOMANTIA, a kind of Divination, perform'd by means of a Number of little Points, or Dots, made on Paper, at random; and considering the various Lines and Figures, which those Points present; and thence forming a Judgment of Futurity and deciding any Question propos'd. See DIVINATION.

The Word is form'd of the *Greek* $\gamma\eta$, terra, Earth; and $\mu\alpha\gamma\iota\sigma\iota\alpha$, Divination; it being the ancient Custom to cast little Pebbles on the Ground, and thence to form their Conjectures; instead of the Points now made use of.

Polydore Virgil defines *Geomancy* a kind of Divination perform'd by means of Clefts or Chinks made in the Ground; and takes the *Persian* Magi to have been the Inventors thereof. *De Inuent. Rer. L. 1. c. 25.*

GEOMETRY, the Science, or Doctrine of Extension, or extended things; that is, Lines, Surfaces, and Solids. See LINE, SURFACE, and SOLID.

The Word is form'd of the *Greek* $\gamma\eta$, terra, Earth, and $\mu\epsilon\tau\epsilon\omicron$, metiri, to measure; it being the Necessity of measuring the Earth, and the Parts and Places thereof that gave the first occasion to the Invention of the Principles and Rules of this Art, which has since been extended and applied to numerous other Things; inasmuch that *Geometry* with *Arithmetick*, are now the general Foundation of all *Mathematics*. See MATHEMATICKS.

Geometry is commonly divided into four Parts, or Branches, *Planimetry*, *Altimetry*, *Longimetry*, and *Stereometry*. See each under its proper Article, PLANIMETRY, ALTIMETRY, LONGIMETRY, and STEROMETRY.

Geometry, again, is distinguish'd into *Theoretical*, or *Speculative*, and *Practical*.

The first contemplates the Property of Continuity; and demonstrates the Truths of General Propositions, call'd *Theorems*. See THEOREM.

The second applies those Speculations and Theorems to particular Uses in the Solution of Problems. See **PROBLEM**. *Speculative Geometry*, again, may be distinguished into *Elementary*, and the *Sublimar*.

Elementary, or *Common GEOMETRY*, is that employed in the consideration of Right Lines, and plain Surfaces, and Solids generated therefrom. See **PLAIN**, &c.

The *Higher*, or *Sublimar GEOMETRY* is that employ'd in the consideration of Curve Lines, Conic Sections, and Bodies form'd thereof. See **CURVE**, &c.

Herodotus, lib. II. and *Strabo*, lib. XVII. assert the *Egyptians* to have been the first Inventors of *Geometry*; and the annual Inundations of the Nile to have been the Occasion: For that River bearing away all the Bounds and Landmarks of Mens Estates, and covering the whole Face of the Country, the People, say they, were obliged to distinguish their Lands by the consideration of their Figure, and Quantity; and thus by Experience and Habit, form'd themselves a Method, or Art, which was the Origin of *Geometry*.—A farther Contemplation of the Draughts or Figures of Fields thus laid down and plotted in Proportion, might naturally enough lead them to the Discovery of some of their excellent and wonderful Properties; which Speculation continually improving, the Art became gradually improved, as it continues to do to this Day. *Josephus*, however, seems to attribute the Invention to the *Hebrews*: And others among the Antients make *Mercury* the inventor. *Poind. Virgil. de Invent. Rer. L. I. C. 18.*

The Province of *Geometry* is almost infinite: Few of our Ideas, but may be represented to the Imagination by Lines, upon which they straight become of *Geometrical* Consideration; it being *Geometry* alone that makes Comparisons, and finds the Relations, of Lines. See **LINE**.

Astronomy, Music, Mechanics, and, in a Word, all the Sciences which consider Things susceptible of more, and less; *i. e.* all the precise and accurate Sciences, may be refer'd to *Geometry*: For all Speculative Truths only consisting in the Relations of Things, and in the Relations between those Relations, they may be all refer'd to Lines. Consequences may be drawn from them; and these Consequences, again, being render'd sensible by Lines, they become permanent Objects, constantly expos'd to a rigorous Attention and Examination: And thus we have infinite Opportunities both of enquiring into their Certainty, and pursuing them further. See **ART**, and **SCIENCE**.

The Reason, for instance, why we know so distinctly, and mark so precisely, the Concords call'd Octave, Fifth, Fourth, &c. is, that we have learnt to express Sounds by Lines, *i. e.* by Chords accurately divided; and that we know that the Chord, which sounds Octave, is double of that which it makes Octave withal; that the Fifth is in the sesquialterate Ratio, or as three to two; and so of the rest.

The Ear it self cannot judge of Sounds with such Precision; its Judgments are too faint, vague, and variable to form a Science. The finest, best tuned Ear, cannot distinguish many of the Differences of Sounds; whence many Musicians deny any such Differences; as making their Sense their Judge. Some, for instance, admit no Difference between an Octave and Three Ditones: And others, none between the greater and lesser Tone; so that the Comma, which is the real Difference, is insensible to them; and much more the Schisma, which is only half the Comma.

'Tis only by Reason, then, that we learn, that the Length of Chords which makes the Difference between certain Sounds, being divisible into several Parts, there may be a great Number of different Sounds contained therein, useful in Music, which yet the Ear cannot distinguish. Whence it follows, that had it not been for Arithmetic and *Geometry*, we had had no such thing as regular, fix'd Music; and that we could only have succeeded in that Science by good Luck, or Force of Imagination, *i. e.* Music would not have been any Science founded on incontestable Demonstrations: Tho' we allow that the Tunes compos'd by Force of Genius and Imagination, are usually more agreeable to the Ear, than those compos'd by Rule. See **SOUND**, **TUNE**, **GRAVITY**, **CONCORD**, &c.

So, in Mechanics, the Heaviness of a Weight, and the Distance of the Centre of that Weight from the Fulcrum, or Point it is sustained by, being susceptible of *plus*, and *minus*, they may both be express'd by Lines; whence *Geometry* becomes applicable hereto; in virtue whereof, infinite Discoveries have been made, of the utmost use in Life. See **BALANCE**, **STILYARD**, &c.

Geometrical Lines and Figures, are not only proper to represent to the Imagination the Relations between Magnitudes, or between Things susceptible of more and less; as Spaces, Times, Weights, Motions, &c. but they may even represent Things which the Mind can no otherwise conceive; *e. gr.* the Relations of incommensurable Magnitudes. See **INCOMMENSURABLE**.

We do not, however, pretend, that all Subjects Men may have occasion to inquire into, can be express'd by Lines.

There are many not reducible to any such Rule: Thus, the Knowledge of an infinitely powerful, infinitely just GOD; on whom all Things depend, and who would have all his Creatures execute his Orders to become capable of being happy, is the Principle of all Morality, from which a thousand undeniable Consequences may be drawn, and yet neither the Principle, nor the Consequences can be express'd by Lines, or Figures. *Mallebranche's Recherche de la Verite, T. II.*

Indeed, the antient *Egyptians*, we read, used to express all their Philosophical, and Theological Notions by *Geometrical* Lines. In their Researches into the Reason of Things; they observ'd, that GOD, and Nature us'd Perpendiculars, Parallels, Circles, Triangles, Squares, and harmonical Proportions; which engaged the Priests and Philosophers to represent the Divine and Natural Operations by such Figures: In which they were followed by *Pythagoras*, *Plato*, &c. Whence that Saying of *Boetius*, *Nullum Divinorum scientiam æquæqualem attingere posse*. See **PLATONIC**, **PYTHAGOREAN**, &c.

But it must be observ'd, that this Use of *Geometry* among the Antients was not strictly Scientific, as among us; but rather Symbolical: They did not argue, or deduce Things and Properties unknown from them; but represented or delineated Things that were known. In effect, they were not used as Means or Instruments of discovering, but Images of Characters, to preserve, or communicate the Discoveries made. See **SYMBOL**, and **HELEOGNETIC**.

"The *Egyptians*, (*Gale* observeth) us'd Geometrical Figures, not only to express the Generations, Mutations, and Deductions of Bodies; but the Manner, Attributes, &c. of the Spirit of the Universe, who diffusing himself "from the Centre of his Unity, thro' infinite concentric "Circles, pervades all Bodies, and fills all Space. But of "all other Figures they most affect'd the Circle, and Tri- "angle; the first, as being the most perfect, simple, capa- "cious, &c. of all Figures: Whence *Hermet* borrow'd it to "represent the Divine Nature; defining God to be an in- "tellectual Circle or Sphere; whose Centre is every where; "and Circumference no where." See *Kirch. Oedip. Ægyptiacæ*, and *Gale Phil. General. Lib. I. c. II.*

The Antient *Geometry* was confin'd to very narrow Bounds, in comparison of the Modern. It only extended to Right Lines and Curves of the first Order, or Conic Sections; whereas in the modern *Geometry* new Lines of infinitely more and higher Orders are introduced. See **CURVE**.

The Writers, who have cultivated and improved *Geometry*, may be distinguish'd into *Elementary*, *Practical*, and those of the *sublimar Geometry*.

The principal Writers of *Elements*, see enumerated under the Article **ELEMENTS**.

Those of the *Higher Geometry* are *Archimedes*, in his Books of *Sphæra*, *Cylindro*, and *Conicæ Dimensione*; as also of *Spiralibus*, *Conoidibus*, *Spheroidibus*, & *Quadraturæ Perabolæ*; and *Arenarius*; *Kepler*, in his *Stereometria Nova*; *Cavalieri*, in his *Geometria Indivisibilium*; and *Torricellius*, de Solidis Spheroidalibus; *Pappus Alexandrinus*, in *Collectionibus Mathematicis*; *Paulus Guldanus*, in his *Mechanicks* and *Statics*; *Barrow*, in his *Lectiones Geometricæ*; *Huygens*, de *Circuli Magnitudine*; *Walladius*, de *Lineis Spiralibus*; *Schooten*, in his *Exercitationes Mathematicæ*; de *Billy*, de *Proprietione Harmonica*; *Lalouze*, de *Cyclotide*; *Fer. Ernest. Com. ab Herbstenstein*; in *Diatome Circulorum*; *Viviani*, in *Esercit. Mathemat. de Formatione, and Mensura Formicæ*; *Boet. Palma*, in *Geomet. Exercitation. and Apoll. Pergæus*, de *Sectione Ratiotiva*.

The Writers on the Sections of the Cone, and Sphere; see under **CONES**, and **SPHERICES**.

For *Practical Geometry*, the fullest and completest Treatises are those of *Mallet*, written in French; but without the Demonstrations: And those of *Schweener*, and *Cantzerus*, both in High-Dutch.—In this Class are likewise to be rank'd *Clavius*'s, *Tacquet*'s, and *Ozanam*'s *Practical Geometries*; *De la Hire*'s *Ecole des Arpenteurs*; *Reinboldus*'s *Geodesia*; *Herrman Beyer*'s *Stereometria*; *Voigtel*'s *Geometria Subterranea*, all in High-Dutch; *Hoffius*, *Gallileus*, *Goldmannus*, *Sebeckell*, and *Ozanam*, on the Sector.—

GEOMETRICAL, something that has a relation to *Geometry*. See **GEOMETRY**.

Thus we say, a *Geometrical* Method, a *Geometrical* Genius, a *Geometrical* Strictures, a *Geometrical* Construction, and *Geometrical* Demonstration, &c. See **DEMONSTRATION**, &c.

Geometry it self leads us into Errors: After once reducing a thing to *Geometrical* Consideration, and finding that it answers pretty exactly, we pursue the View, are pleas'd with the Certainty and Agreeableness of the Demonstrations; and apply the *Geometry* further and further, till we out-run Nature. Hence it is, that all Machines do not succeed: That all Compositions of Music, wherein the Concords are the most rigidly observ'd, are not agreeable: That the most exact Astronomical Computations do not always foretel the precise Time and Quantity of an Eclipse.

The Reason is, that Nature is not abstracted; Mechanical Levers and Wheels are not Geometrical Lines and Circles, as they are supposed to be: Our Taste for Tunes is not the same in all Men; nor at all times in the same Man: And as to Astronomy, there is no perfect Regularity in the Motions of the Planets; their Orbits do not seem reducible to any fix'd known Law, &c.

The Errors, therefore, we fall into in Astronomy, Music, Mechanics, and the other Sciences to which Geometry is applied, do not properly arise from Geometry, which is an infallible Science; but from the false Misapplication of it. *Mallebranch, Recherche de la Ver.*

GEOMETRICAL LINE, or Curve, call'd also Algebraic Line, or Curve, is that wherein the Relation of the Abscisses to the Semi-ordinates may be express'd by an Algebraic Equation. See ALGEBRAIC CURVES.

Thus, suppose in a Circle, *Tab. Geometry, Fig. 51.* $AB = a$ $AP = x$ $PM = y$; then will $PB = a - x$, and consequently, since $PM^2 = AP \cdot PB$; $y^2 = x(a - x)$. Again, suppose in *Fig. 52.* $PC = x$, $AC = a$ $PM = y$, then will $MC^2 = PM^2$, that is $a^2 - x^2 = y^2$. See EQUATION.

Geometrical Lines are distinguish'd into Classes, Orders, or Genera, according to the Number of the Dimensions of the Equation that expresses the Relation between the Ordinates and the Abscisse; or which amounts to the same, according to the Number of Points in which they may be cut by a Right Line.

Thus, a Line of the first Order will be only a Right Line: Those of the second, or Quadratick Order, will be the Circle, and the Conick Sections; and those of the third, or Cubick Order, will be the Cubical and Nelian Parabolas, the Clissof of the Antients, &c. See CIRCLE, CONIC SECTION, PARABOLA, CLISSOID, &c.

But a Curve of the first Gender (because a Right Line can't be reckon'd among the Curves) is the same with a Line of the second Order; and a Curve of the second Gender, the same with a Line of the third Order; and a Line of an infinitesimal Order is that, which a Right Line may cut in infinite Points; as the Spiral, Cycloid, the Quadratrix, and every Line generated by the infinite Revolutions of a Radius. See LINE.

However, it is not the Equation, but the Description, that makes the Curve a Geometrical one: The Circle is a Geometrical Line, not because it may be express'd by an Equation; but because its Description is a Postulate: And it is not the Simplicity of the Equation, but the Exactness of the Description, which is to determine the Choice of the Lines for the Construction of a Problem. The Equation, that expresses a Parabola, is more simple than that which expresses a Circle; and yet the Circle, by reason of its more simple Construction, is admitted before it.

The Circle, and the Conick Sections, if you regard the Dimension of the Equations, are of the same Order; and yet the Circle is not numbered with them in the Construction of Problems, but by reason of its simple Description is prefer'd to a lower Order, viz. that of a Right Line; so that it is not improper to express that by a Circle, which may be express'd by a Right Line: But it is a Fault to construe that by the Conic Sections, which may be constructed by a Circle.

Either, therefore the Law must be taken from the Dimensions of Equations, as observed in a Circle, and so the Distinction be taken away between plane and solid Problems: Or the Law must be allow'd not to be strictly observed in Lines of superior Kinds; but that some, by reason of their more simple Description, may be prefer'd to others of the same Order, and be numbered with Lines of inferior Orders.

In Constructions that are equally Geometrical, the most simple are always to be prefer'd: This Law is so universal as to be without Exception. But Algebraic Expressions add nothing to the Simplicity of the Construction; the bare Description of the Lines here are only to be consider'd; and these alone were consider'd by those Geometricians, who joined a Circle with a Right Line. And as these are easy or hard, the Construction becomes easy, or hard: And therefore it is foreign to the Nature of the Thing, from any thing else to establish Laws about Constructions. See CONSTRUCTION.

Either, therefore with the Antients, we must exclude all Lines besides the Circle, and perhaps the Conic Sections, out of Geometry; or admit all according to the Simplicity of the Description: If the Trochoid were admitted into Geometry, we might, by its means, divide an Angle in any given Ratio: Would you therefore blame those, who would make use of this Line to divide an Angle in the Ratio of one Number to another, and contend that this Line was not defin'd by an Equation, but that you must make use of such Lines as are defin'd by Equations? See TRANSCENDENTAL.

If, when an Angle were to be divided, for instance, into 1001 Parts, we should be oblig'd to bring a Curve defin'd

by an Equation of above an hundred Dimensions to do the Business; which no body could describe, much less understand; and should prefer this to the Trochoid, which is a Line well known, and describ'd easily by the Motion of a Wheel, or Circle. Who would not see the Absurdity?

Either therefore the Trochoid is not to be admitted at all in Geometry, or else in the Construction of Problems, it is to be prefer'd to all Lines of a more difficult Description: And the Reason is the same for other Curves.

Hence, the Triflections of an Angle by a Conchoid, which Archimedes in his Lemma's, and Pappus in his Collections have prefer'd to the Invention of all others in this Case, must be allow'd good, since we must either exclude all Lines, beside the Circle, and Right Line, out of Geometry, or admit them according to the Simplicity of their Descriptions; in which Case, the Conchoid yields to none, except the Circle.

Equations are Expressions of arithmetical Computation, and properly have no Place in Geometry, except as far as Quantities truly Geometrical (that is, Lines, Surfaces, Solids, and Proportions) may be said, to be some equal to others: Multiplications, Divisions, and such sort of Computations are newly received into Geometry, and that apparently contrary to the first Design of this Science; for whoever considers the Construction of Problems by a Right Line, and a Circle found by the first Geometricians, will easily perceive, that Geometry was invented, that we might expeditiously avoid by drawing Lines the Tediousness of Computation.

It should seem therefore, that the two Sciences ought not to be confounded: The Antients so industriously distinguish'd them, that they never introduced arithmetical Terms into Geometry; and the Moderns by confounding both, have lost a deal of that Simplicity, in which the Elegancy of Geometry principally consists. Upon the whole, that is arithmetically more simple which is determined by more simple Equations; but that is geometrically more simple which is determined by the more simple drawing of Lines; and in Geometry, that ought to be reckon'd best, which is geometrically most simple.

GEOMETRICAL PLANE, see PLANE.

GEOMETRICAL SOLUTION of a Problem, is when the Problem is directly solv'd, according to the strict Principles and Rules of Geometry; and by Lines that are truly Geometrical. See PROBLEM, and SOLUTION.

In this Sense we say, Geometrical Solution, in Contradistinction to a Mechanical, or Instrumental Solution, where the Problem is only solv'd by Rules and Compasses. See MECHANICAL.

The same Term we likewise use in opposition to all indirect, and inadequate Solutions, as by infinite Series's, &c. See SERIES.

We have no Geometrical Way, of finding the Quadrature of the Circle; the Duplicate of the Cube, or finding of two mean Proportionals: Mechanical ways, and others, by infinite Series's, we have. See QUADRATURE, DUPLICATION, and PROPORTIONAL.

The Antients, Pappus informs us, in vain endeavour'd at the Triflection of an Angle, and the finding out of two mean Proportionals by a Right Line, and a Circle. Afterwards they began to consider the Properties of several other Lines, as the Conchoid, the Clissof, and the Conic Sections, and by some of these endeavour'd to solve those Problems. At length, having more thoroughly examined the Matter, and the Conic Sections being received into Geometry, they distinguish'd Geometrical Problems into three Kinds, viz.

1^o Into Plane ones, which deriving their Original from Lines on a Plane, may be solv'd by a Right Line, and a Circle. See PLANE.

2^o Solid ones, which were solv'd by Lines deriving their Original from the Consideration of a Solid, that is, of a Cone. See SOLID.

3^o Linear ones, to the Solution of which were required Lines more compounded. See LINEAR.

According to this Distinction, we are not to solve solid Problems by other Lines than the Conic Sections; especially if no other Lines but Right ones, a Circle, and the Conic Sections must be received into Geometry.

But the Moderns advancing much farther, have received into Geometry all Lines that can be express'd by Equations; and have distinguish'd according to the Dimensions of the Equations, those Lines into Kinds; and have made it a Law, not to construe a Problem by a Line of a Superior kind, that may be constructed by one of an inferior one. See GEOMETRICAL LINE.

GEOMETRICAL PROPORTION, call'd also absolutely and simply, Proportion, is a Similitude or Identity of Ratio's. See RATIO.

Thus, if A be to B, as C to D, they are in Geometrical Proportion: So 8, 4, 50 and 15 are Geometrical Proportionals. See PROPORTION.

GEOMETRICAL Progression is a Series of Quantities, in continued Geometrical Proportion, i. e. increasing or decreasing in the same Ratio. See RATIO.

Thus, *e. gr.* 1, 2, 4, 8, 16, 32, 64, and 128 : And 729, 243, 81, 27, 9, 3, 1, are Geometrical Progressions. See GEOMETRICAL PROGRESSION.

GEOMETRICAL Locus, or *Place*, called also simply *Locus*, is a Line whereby an indeterminate Problem is constructed. See LOCUS.

GEOMETRICAL Construction of an Equation, is the contriving and drawing of Lines and Figures, whereby to demonstrate the Equation, Theorem, or Canon to be geometrically true. See CONSTRUCTION of Equations.

GEOMETRICAL Osculum, see EVOLUTA, and OSCULUM.

GEOMETRICAL Scale, see DIAGONAL SCALE.

GEOMETRICAL Table, see PLAIN Table.

GEOMETRICAL Pace, is a Measure consisting of five Feet. See PACE, and FOOT.

GEOMETRICALLY Proportionals, are Quantities in continual Proportion; or which proceed in the same constant Ratio; as 6, 12, 24, 48, 96, 192, &c. See PROPORTIONALS.

They are thus called, in Contradistinction to equidifferent Quantities; which are called, tho' somewhat improperly, *Arithmetically Proportionals*. See ARITHMETICALLY PROPORTIONAL.

GEOPONIC, something relating to *Agriculture*.—Thus *Cato, Varro, Columella, Palladius, and Pliny* are sometimes called *Geoponic Writers*. See GEORGIC.

St. GEORGE, a Name whereby several Orders, both Military and Religious, are denominated. It has its Rise from a Saint, famous throughout all the East; and called by the *Greeks* Μεγαλειστος, *g. d. Great Martyr*.

On some Medals of the Emperors *John, and Mammel Comnenii*, we have the Figure of *St. George* arm'd, holding a Sword, or Javelin in one Hand, and in the other, a Buckler, with this Inscription, an O, and therein a little A, and

ΓΕ—ΠΙΟC, making O ΑΓΙΟΣ ΓΕΩΡΓΙΟΣ, *O Holy George*.

He is generally represented on Horseback, as being supposed to have frequently engaged in Combats in that manner.

He is adored throughout *Armenia, Missoy*, and all the Countries which adhere to the *Greek Rite*: From the *Greek*, his Worship has long ago been received into the *Latin Church*; and *England* and *Portugal* have both chose him for their Patron Saint. See PATRON.

St. GEORGE is particularly used for an *English Order of Knights*; more usually now called the *Order of the Garter*. See ORDER of the GARTER.

Our King *Edwards VI.* out of a Spirit of Reformation, made some Alterations in the Ceremonial, Laws, and Habit of the Order, that the *Romish Saint* might have less Share therein. 'Twas he first commanded that the Order should no longer be called the *Order of St. George*, but that of the *Garter*.

Knights of St. GEORGE. There have been various Orders under this Denomination, most of which are now extinct; particularly, one founded by the Emperor *Friedrich III.* in the Year 1470, to guard the Frontiers of *Bohemia* and *Hungary* against the *Turks*.—Another, called *St. George of Aflaima*, founded by the Kings of *Aragon*.—Another in *Austria* and *Corinthia*.—And another in the Republic of *Genoa*, still subsisting, &c.

Religious of the Order of St. GEORGE. Of these there are divers Orders, and Congregations; particularly *Canons Regular of St. George in Aiga*, at *Venice*, establish'd by two Noble *Venetians*, in the Year 1424.—Another Congregation of the same Institute in *Sicily*, &c.

GEORGICK; something that relates to the Culture or Tilling of the Ground. See AGRICULTURE.

The *Georgicks of Virgil*, are the 4 Books composed by that Poet on the Subject of *Agriculture*.

The Word is borrowed from the *Latin Georgicus*; and that of the *Greek γεωργικος*, of γῆ, terra, Earth, and ἔργον, opus, opus, I work, labour; or ἔργον, opus, Work.—

GEOSCOPY, a kind of Knowledge of the Nature, and Qualities of the Earth, or Soil, gain'd by viewing and considering it. See SOIL.

Geoscopy is only conjectural; but its Conjectures are very well grounded.

The Word is form'd of the *Greek γῆ*, Earth, and σκοπεῖν, I see, view.

GERESOL, in Music, one of the Clefs. See CLEF.

GERFALCON, or *GYRFALCON*, a Bird of Prey, of a Size between a Vulture and an Hawk; and of the greatest Strength next the Eagle. See FALCON, and HAWK.

GERMAN. A Brother *German* is a Brother both by the Father's and Mother's side; in Contradistinction to *Uterine Brothers*, &c. who are only so, by the Mother's side. See BROTHER.

So, likewise, *Cousins German* are those in the first, or

nearest Degree; being the Children of Brothers or Sisters *German*. See COUSIN, &c.

Among the *Romans* we have no Instance of Marriage between Cousins *German*, before the Time of the Emperor *Claudius*; when, they were very frequent. See MARRIAGE.

Theodosius prohibited them under very severe Penalties, even Fine, and Proscription. See CONSANGUINITY.

GERMAN Language, see TEUTONIC, and LANGOAGE.

GERMAN Empire, &c. SEE EMPIRE, &c.

GERMANICUS, an ancient Title of Honour, given to several Emperors, on account of the Victories obtain'd by them over the *Germans*, or in *Germany*.

Gallian bears this Title on Medals; and the Argument for its being on occasion of a Victory in *Germany*, is, that on the Reverse we find the Words, VICTORIA GERMANICA. VICTORIA GER. VICTORIA. G. M. that is, *Germanica maxima*.

Claudius Gothicus bore the same Title, *Germanicus*, and accordingly on the Reverse of his Medals we find *Victoria Germanica*; as on others of his Medals we read, *Victoria Gothicus*.

GERMEN, or *GERM*, or *GEM*, that Part of a Seed which germinates, i. e. sprouts or shoots out the first, for the Production of a new Plant. See SEED.

Botanists call it the *Plume*, see PLUME; see also PLANT, and SEED; see also GERMINATION.

GERMINATION, the Act of *Germinating*; that is, of a Plant's sprouting, or shooting in the Ground. See PLANT, and GERMEN.

Some use the Word in a more extensive Sense; so as likewise to include the shooting of Leaves, Blossoms, Branches, Flowers, Fruits, and Seeds. See SEED, LEAF, FLOWER, BRANCH, &c.

The Modern Philosophers have been very attentive to the *Germinations* of Plants, as well of the Formation of the Chick in the Egg. See PLANT.

The Progress of *Germination* has been very accurately observ'd by the Curious *Malpighi*, in the Seed of a Gourd. The Day after it was committed to the Ground, he found the Outer-coat or Integument a little tumid, and in its Tip there appear'd a small Gap or Aperture, thro' which the Plume or Gem was seen.

The second Day, the outward Coat, or Secundine was much softer, the inner torn and corrupted, the Plume, or Plantule somewhat longer and more tumid, and the Beginning of the Roots shew'd themselves.

The third Day, the outer Secundine was become dusky, and the Leaves of the Plantule inflated, and the Root or Radicle had made itself a Passage thro' the Secundines, near the former Aperture; the Plume, or Stem, as also the Seed Leaves being now grown much bigger.

On the sixth Day, more of the Seed Leaves had broke thro' the Secundines, and were found thicker and harder; the Root having now emitted a great Number of Fibres, and the Stem grown a Finger's Length.

The following Days, the Roots still shot further, other Roots arising from them, and others from these; and the Stem, in its Progress, grew hollow, or siliulous, and the Seed Leaves broader and greener.

About the twenty first Day, the Plant seem'd compleat; from which time the Seed Leaves began to droop, and at length died away. See PLANT.

GERON, *GERONTES*, in Antiquity, a kind of Magistracy in ancient *Greece*.

The *Gerontes* were at *Sparta*, what the *Areopagites* were at *Athens*. See AREOPAGITE.

The *Gerontes* were instituted by *Lycurgus*: Their Number, according to some, was twenty eight; and according to others, thirty two. They govern'd in Conjunction with the King, whose Authority they were intended to ballance, and to watch over the Interests of the People.

None were to be admitted into this Office under sixty Years of Age, and they held it for Life.

They were succeeded by the *Ephori*. See EPHOR.

The Word is form'd of the *Greek γῆρας*, which signifies old Man.

Whence also the Words *GERONIC*, something belonging to an old Man; and *GERONICON*, a famous Book among the Modern *Greeks*, containing the Lives of the ancient Monks.

The Senate of *Gerontes* was called *Gerusia*, that is Assembly or Council of old Men.

GERUND, in Grammar, a Tense, or Time of the Infinitive Mood; like to the Participle, but indeclinable. See MOOD, and INFINITIVE.

The *Gerund* expresses not only the Time, but also the Manner of an Action; as, He fell in running *Post*.

It differs from the Participle, in that it expresses the Time which the Participle does not. See PARTICIPLE.

And from the Tense properly so called, in that it expresses the Manner which the Tense does not. See TENSE.

The Grammarians are very much imbarra's'd to settle the Nature and Character of the *Gerunds*: 'Tis certain, they are no Verbs, nor distinct Moods of Verbs, in regard they do not mark any Judgment, or Affirmation of the Mind, which is the Nature of a Verb.—And besides, they have Cases, which Verbs have not. See *VERB*.

Some therefore will have them to be Adjectives passive, whose Substantive is the Infinitive of the Verb: On this footing they denominate them Verbal Nouns, or Names formed of Verbs and retaining the ordinary Regimen thereof. See *NOVN*.

Thus, say they, *tempus est legendi libros, et librarium*, is as much as to say, *tempus est re legere libros, vel librarium*. But others stand up against this Decision.

The Word is form'd of the Latin *Gerundium*, and that from the Verb *gerere*, to bear.

GESSES, in the Furniture belonging to an Hawk. See *JESSES*.

GESTATION, the Time of a Woman's going with Child; or the Interval between Conception, and Delivery. See *DELIVERY*; see also *FÆTUS*, and *CONCEPTION*.

GESTATION is also a Term in the ancient Medicine, used for a sort of Exercise. See *EXERCISE*.

Alepiades first brought Frictions, and *Gestation* into Practice.—The Design of *Gestation* was to recover Strength after a Fever, &c. was gone.

It consisted in making the Patient walk, or ride in a Chariot, or in a Boat; or even in rocking him in his Bed, if he could not endure a more violent Agitation.

GESTICULATION, the Act of making indecent or unsuitable Gestures, or in too great Number. See *GESTURE*.

Gesticulation is a grievous Fault in an Orator.

GESTURE, a Motion of the Body, intended to signify some Idea, or Passion of the Mind.

Quintilian defines *Gesture*, *totius corporis motus & conformatio*. *Gestures* are a kind of Natural Language which supplies the Use of Speech in those naturally dumb. The *Mimes* and *Pantomimes* were great Proficients in the Style of *Gesture*. See *MIME*, and *PANTOMIME*.

Gesture consists principally in the Actions of the Hands, and Face. See *ACTION*, and *PRONUNCIATION*.

GIAGH, or JEMACH, a Cycle of twelve Years, in use among the *Turks* and *Cathayans*. See *CYCLE*.

Each Year of the *Giagh* bears the Name of some Animal: The first, that of a Mouse; the second, that of a Bullock; the third, of a Lynx, or Leopard; the fourth, of a Hare; the fifth, of a Crocodile; the sixth, of a Serpent; the seventh, of a Horse; the eighth, of a Sheep; the ninth, of a Monkey; the tenth, of a Hen; the eleventh, of a Dog; and the twelfth, of a Hog.

They also divide the Day into twelve Parts, which they call *Giagh's*; and distinguish them by the Names of the same Animals.

Each *Giagh* contains two of our Hours, and is divided into eight *Keb*, as many there are Quarters of Hours in our Day.

GIANT, or GYANT, a Man of extraordinary, enormous Stature and Bulk. See *STATUERE*.

The Reality of *Giants*, and of Nations of *Giants*, is much controverted among the Learned. Travellers, Historians, and Relations both sacred and profane furnish various Instances thereof; a great Part of which, Naturalists and Antiquaries set aside.

Those among the Antients who speak of *Giants*, as Historians, and affirm there were such Things, are *Cæsar*, de *Bello Gallico*, L. I. *Tæitus*, de *Morib. Germanor.* & *Annal.* L. II. *Florus*, L. III. c. 3. *St. Augustin* de *Civir. Dei* L. XV. c. 9. and *Saxo Grammaticus*, at the End of his Preface: And among the Moderns, *Hieron. Magius*, *Miscellan. de Gigantibus, Obissognonis, de Gigantibus, Kiræber Mund. Subterræn.* L. VIII. S. II. c. 4. and to many others; that *Stephanus* in his Notes on *Saxo Grammaticus*, affirms nothing can be more extravagant than to deny, or allegorize the Authorities we have thereof.—

Mr. *Derham* observes that though we read of *Giants* before the Flood, *Gen.* vi. 4. and more plainly after it, *Numb.* xiii. 33; yet 'tis highly probable, the Size of Man has always been the same from the Creation; for as to the *Nephilim*, *Gen.* vi, the Antients vary about them; some taking them for Monsters of Impiety, Atheism, Rapine, Tyranny: And as to those *Nam.* xiii. which were evidently spoke of as Men of a Gigantic Size, 'tis probable the Fears of the Spies might add thereto.

But be this as it will, 'tis manifest that in both these Places *Giants* are spoken of as Rarities and Wonders of the Age, not of the common Stature: And such Instances we have had in all Ages; excepting some fabulous Relations; such as we take to be that of *Trembocebus*, who is said to be dug up Anno 1613, and to have been higher than the Trophies, and 26 Foot long: And no better we suppose the *Giants* to have been, which *Ol. Magnus* gives an Account of in his 5th Book, such as *Hartben* and *Starabator* among

the Men; and among the Women, *Reperta est* (saith he) *Puella—in capite univertata, normia induta ebliamye purpurea, longitudinis cubitarum 50, latitudinis inter humeros quatuor.* *Ol. Mag. Hist.* L. 5. c. 2.

But, as for the more credible Relations of *Goliath* (whose Height was six Cubits, and a Span, 1 *Sam.* xvii. 4. which, according to Bishop *Comberland*, is somewhat above eleven Feet English); of *Maximianus* the Emperor (who was nine Foot high); and others in *Augustus* and other Reigns, of about the same Height: To which might be added the Dimensions of a Skeleton, dug up lately in the Palace of a Roman Camp near St. Albans by an Urn inscribed *Marcus Antoninus*; of which an Account is given by Mr. *Chefeldon*, who judg'd by the Dimensions of the Bones, that the Person was eight Foot high. *Philos. Transact.* N^o 333. For these antique Examples and Relations, we say, they may be match'd, nay outdone, with modern Examples; of which we have divers in *J. Ludolph. Comment. in Hist. Artthrop.* L. 1. c. 2. & 12. *Magus, Conringius, D. Hackewill*, and others; which last relates from *Nannes*, of Porters and Archers belonging to the Emperor of China, of Fifteen Foot high; and others from *Purchas*, of ten and twelve Foot high, and more. See the Learned Author's *Apolog.* p. 208.

GIBBOUS, in Medicine, is us'd to denote a Person bunch'd or hump-back'd. See *VERTEBRA*.

That Part of the Liver out of which the *Vena Cava* arises, is also called the *gibbous* Part. See *LIVER*.

GIBBOUS is also us'd in reference to the enlightened Parts of the Moon, while she is moving from Full to the first Quarter, and from the last Quarter to Full again; for all that time the dark Part appears horned, and tilted, and the light one bunch'd out, Convex, or *Gibbous*. See *PHASES*, and *MOON*.

GIBELINS, GIBELLINS, or GIBELLING, a famous Faction in Italy, opposite to the *Guelphs*. See *GOELPH*.

The *Guelphs*, and *Gibellins* ravaged, and laid waste Italy for a long Series of Years; so that the History of the Country, for the space of two Centuries, is only a Detail of their mutual Violence, and mortal Wars.

We have but a very obscure Account, of their Origin, and the Reason of their Names: The Generality of Authors affirm, that they arose about the Year 1240, upon the Emperor *Frideric* the Second's being excommunicated by Pope *Gregory* the Ninth.

That Prince, say they, making a Tour among the Cities of Italy, gave the Name *Gibelins* to such as he found well affected to him; and that of *Guelphs* to those who adhered to the Pope.

But as to the Reason, and Signification of those Words, there is a deep Silence: *Gibelin* might possibly be form'd of *Ghebieder*, *Imperator*; whence *gæbiedolyken*, *imperiose*. Of *Ghebiedelin*, the *Italians* might make, by Corruption, *Gibelins*; so that *Gibelins*, in this Light, should be the same with *Imperialists*, or such as follow'd the Emperor's Party.

By the way, some Writers maintain, that the two Factions arose ten Years before; tho' still under the same Pope, and Emperor.

Other Historians relate, that *Conrad III*'s marching into Italy, in the Year 1159, against the *Neapolitans*, *Roger*, Count of *Naples* and *Sicily*, in order to defend his States, called to his Assistance *Guelph*, Duke of *Bavaria*; and that one Day when the two Armies were ready to join Battle, the *Bavarians* cried out in High-Dutch, *Hie Guelph*; or as others say in Flemish, *Hier Guelph*, that is, *Here Guelph*: And that the *Imperialists* answer'd, on their Side, with the Words *Hie*, or *Hier*, *Gibelin*, *vere Gibelin*; calling the Emperor by the Name of the Place where he had been bred.

Hornius refers the Names to the War in 1140, between *Henry* the Proud, Duke of *Bavaria*, and *Saxony*; and *Conrad* the Third, Duke of *Swabia*: The two Princes being preparing to engage near the Town of *Winsberg*, the *Bavarians* began to cry out, *Guelph*, which was the Name of Duke *Henry's* Brother, and the Partisans of the Emperor, *Weiblingen*, the Name of the Place where that Prince was born and bred in the Duchy of *Wirttemberg*, whose Surname he bore: From which *Weiblingen*, the *Italians* at length form'd *Gibelin*.

This Account is confirm'd by *Martin Crusius*: *Initium Gibelline* (*Wibeline* a *Patria Conradi Regis*) & *Wolfei concertationis*. *Conrad* being of *Weiblingen*, that Word, says *Crusius*, gave rise to *Gibellineque*, and that to *Gibeling*, *Gibelin*, *Gibellini*.

Platina, on the other Hand, assures us, that the Name *Gibelin* arose from that of a German at *Pilsboys*; whose Brother, named *Guelph*, gave likewise his Name to the opposite Faction; the two Brethren, it seems, bearing an irreconcilable Hatred.

Others maintain, that the Emperor gave the Appellation *Gibelin* to those of his Party, from the German Word *Giffel*, signifying Ridge, or Top; by reason the Empire rested on them, as the Rafters of a House lean on the Ridge, which joins them a-top.

Kraus, a learned Canon of *Strasbourg*, in the Lives of the Emperor of the House of *Brunswick*, is of the second Sentiment above related : In a Battle, says he, between *Welf*, or *Guelph*, and *Friderick*, the Army of the first crying out, *Die Welf ! He, Welf !* the second commanded his, to cry out *Die, Gibeling ! He, Gibeling*, the Name of his Birth Place; and the *French* and *Lombards* taking the Signification of those Words, they were answer'd, that by *Welf* was meant the Pope's Party; and by *Gibeling*, the Emperor's.

Yet others contend, that the Word *Gibelin* is only a softening of the Word *Gibertine*, or *Gubertine*; and that it arose from *Gubert*, an Anti-Pope, set up by the Emperor *Henry III.* in the Year 1080, *Alla Sancti Propyl. Mais*, p. 198.

Mainbourg, in his *Hist. de la Decad. de l'Emp.* advances another Opinion: The two Factions, and their Names, says he, arose from a Quarrel between two Antient and illustrious Houses, on the Confines of *Germany*, that of the *Henry's* of *Gibeling*, and that of the *Guelphes* of *Adorf*: Which Account appears the most probable of them all.

GIBET, a Machine, in manner of a Gallows, whereon notorious Criminals after Execution, are hung in Irons, or Chains; as *Spectacles*, in *terrorem*. See GALLOW.

The Word in French, *Gibet*, properly denotes what we call Gallows: It is supposed to come originally from the Arabic *Gibel*, Mount, Elevation of Ground; by reason they are usually made on Hills, or Eminences.

GIBLETS, the Offalls or Entrails of a Goose; including the Heart, and Liver, with the Feet, Gizzard, &c.

The Word is supposed to be form'd of *Goblets*, from the French *Gobeau*, mouth-full.

Giblets make a considerable Article in Cookery: They boil *Giblets*, stew *Giblets*, make Ragouts of *Giblets*, *Giblet* Pies, &c.

GIGANTIC, see GIANT.

F. Bonhours relates, that one of the Artifices of the *Indian Bramans* consists in persuading the simple People, that the Gods eat like us; and, that they may bring them Store of Victuals, they represent those Gods of a Gigantic Size, and above all, give them a huge Tun Belly.

GIGANTOMACHIA, the Battle of the Giants against the fabulous Gods of the antient Heathens.

Several of the Poets have compos'd *Gigantomachias*: That of *Scorron* is the finest of all his Pieces.

The Word is Greek, *γίγαντες*, form'd of *γίγας*, *γίγας* &c. Giant, and *μάχη*, Combat, of *μάχησις* *πρὸς*, I fight.

GIGG, GIGGLE, or JIG, in Music and Dancing, a gay, brisk, sprightly Composition, and yet in full Measure, as well as the *Allemand*, which is more serious. See DANCE.

Ménage takes the Word to arise from the Italian *Giga*, a musical instrument mentioned by *Dante*.

GILBERTINES, an Order of Religious, thus call'd from *St. Gilbert*, of *Simppringham*, in the County of *Lincoln*, who founded the same, about the Year 1148.

Antiently, none were received into it but married People: The Monks observ'd the Rule of *St. Augustin*; and were accounted Canons; and the Nuns that of *St. Benedict*.

The Founder erect'd a double Monastery, or rather, two different ones, contiguous to each other, the one for Men, the other for Women, but parted by a very high Wall.

The Order, afterwards, consist'd of ten such Monasteries: All which were suppress'd at the general Dissolution of Monastic Orders under King *Henry VIII.*

GILD, or GUILD, originally signify's a Fraternity, or Company; form'd from the *Saxon Gildan*, to pay, because every Man was *gildare*, i. e. to pay something towards the Charge and Support of the Company. See COMPANY, and FRATERNITY.

Thence comes our *Guild-hall*, q. d. the Hall of the Society or Fraternity, where they meet and make Orders and Laws among themselves. See GUILD-HALL.

The Original of *Gilds* is thus related: It being a Law amongst the *Saxons*, that every Freeman of fourteen Years old should find Sureties to keep the Peace, or be committed; certain Neighbours enter'd into an Association, and became bound for each other, either to produce him who committed an Offence, or to make Satisfaction to the injur'd Party: This, that they might the better do, they rais'd a Sum of Money among themselves, which they put into a common Stock; and when one of their Pledges had committed an Offence, and was fled, then the other nine made Satisfaction out of this Stock, by Payment of Money, according to the Offence. See *FRANK-PLEDGE*.

Because this Association consist'd of ten Families, it was call'd a *Decennary*: And from hence came our Fraternities. See DECENNA.

But, as to the direct Time when these *Gilds* had their Origin in *England*, there is nothing of Certainty to be found; since they were in use long before any formal Licence was granted to them for such Meetings.

Edward the third, in the fourteenth Year of his Reign, granted Licence to the Men of *Covestry*, to erect a Mer-

chants *Gild* and Fraternity, of Brethren and Sisters, with a Master, or Warden; and that they might make Casalties, bestow Alms, do other Works of Piety, and constitute Ordinances touching the same, &c.

So *Henry* the fourth, in his Reign, granted a Licence to found a *Gild* of the *Holy Cross*, at *Stratford* upon *Avon*.

In the Royal Boroughs of *Scotland*, a *Gild* is still us'd for a Company of Merchants, who are Freemen of the Borough. See BOROUGH.

Every Royal Borough has a *Dean* of *Gild*, who is the next Magistrate below the Bailiff. He judges of Controversies among Men concerning Trade; disputes between Inhabitants touching Buildings, Lights, Water-courses, and other Nuisance; calls Courts, at which his Brethren of the *Gild* are bound to attend; manages the common Stock of the *Gild*, and amerces and collects Fines.

GILD, or GELD, according to *Camden*, does also signify a Tribute, or Tax; and the Statutes of 27 *Edw.* 3. Stat. 2. cap. 13; and 11 *Hen.* 7. cap. 9. us'd *Gildable* in the same Sense with *Taxable*. See GELD.

GILD, according to *Crompton*, does also signify an Amercement: As in *Forsgeld*, which he interprets a Pledgation without the Forest, in these Words,—To be quit of all manner of *Gild*, is to be discharged of all manner of Pledgations to be made for gathering Sheafs of Corn, Lamb, and Wool, to the use of Foresters.

GILD, or GELD, is also us'd among our antient Writers for a Compensation, or Mulct for a Fault committed.—*Quicquid in amercio in alterum furatum habet in duos Geldos compensare faciat.*

Hence, *Weregild*, is the Price of a Man; *Orfgeld*, is the Price of Cattle; *Angild*, the single Value of a thing; *Tungild*, the double Value. See WERGILD, &c.

There are likewise many Words, which end with *Geld*, and that shew the several kinds of Payments; as *Danegeld*, *Padegeld*, *Soregeld*, *Hornegeld*, *Sorgeld*, *Peungeld*, &c. See DANEGELD, &c.

GILD, or GUILT Rents, are Rents payable to the Crown by any *Gild*, or Fraternity; or such Rents as formerly belonged to Religious *Gilds*, and came to the Crown at the general Dissolution, order'd by Stat. 12 *Car.* 2.

GILDABLE, or GELDABLE, denotes *Tributary*, that is, liable to Pay, Tax, or Tribute.

Camden, dividing *Suffolk* into three Parts, calls the first *Gildable*, because liable to Tax; from which the other two Parts were exempt, because *Ecclesie* *Donate*.

Gildable is also explain'd in an antient MS. to be that Land or Lordship which is *sub distributione Curie* *Vice-Com.*

GILGUL *Hammetbin*, a Hebrew Phrase, literally signifying the Rolling of the Dead.

To conceive the Use of this Diction, it is to be observ'd that the *Jews* have a Tradition, that at the coming of the *Messiah*, no *Israélite* shall rise any where but in the Holy Land. What, then, shall become of all the Faithful inter'd in other Parts? Shall they perish, and remain in the State of Death?

No, say the Jewish Doctors: But God will dig them subterraneous Canals, or Cavities, thro' which they shall roll from their Tombs to the Holy Land; and when arriv'd there, God will blow on them, and raise them again.

This imaginary Passage of the Carcases, or Ashes of the *Jews*, from their Tombs, to the Holy Land, by rolling under Ground, is what they call *Gilgul Hammetbin*, the rolling of the Dead.

GILHALDA *Tentonicorum*, was us'd for the Fraternity of Eastling Merchants in *London*; call'd the *Stillyard*. See STILLYARD.

GILD-Hall, q. d. *Gilde Aula*, the chief Hall in the City of *London*. See GUILD-HALL.

—*Gildarum nomine continentur non solum minores Fraternitates, & Sodales, sed ipse etiam civitatum Communitates*, says the learned *Spelman*. See GILD.

GILD-MERCHANT, *Gilda Mercatoria*, was a certain Privilege, or Liberty, granted to Merchants, whereby they were enabled among other Things to hold certain Pleas of Land within their own Precincts.

King *John* granted *Gildam Mercatoriam* to the Burgessees of *Nottingham*.

GILDING, or GUILDING, the Art, or Act of spreading or covering a Thing over with Gold, either in Leaf or Liquid. See GOLD.

The Art of *gilding* was not unknown among the Antients, tho' it never arriv'd among them at the Perfection to which the Moderns have carried it.

Pliny assures us, that the first *gilding*, seen at *Rome*, was after the Destruction of *Carthage*, under the Consonship of *Lucius Mummius*; when they began to *gild* the Ceilings of their Temples, and Palaces; the Capitol being the first Place on which the Enrichment was bestow'd. But he adds, that Luxury advanced on them so hastily, that in a little time you might see all, even private and poor Persons, *gild* the very Walls, Vaults, &c. of their Houses.

We need not doubt but they had the same Method with us, of bearing Gold, and reducing it into Leaves; though it should seem they did not carry it to the same Height; if it is true which *Pliny* relates, that they only made five-hundred Leaves four Fingers square of a whole Ounce. Indeed he adds that they could make more; that the thickest were called *Bractes Præstantes*, by reason of a Statue of that Goddess at *Prænestè* gilt with such Leaves; and that the thinner sort were called *Bractes Quæstioræ*.

The modern Gilders do also make use of Gold Leaves of divers Thicknesses; but there are some so fine, that a thousand don't weigh above four or five Drachms. The thickest are used for gilding on Iron, and other Metals; and the thinnest, on Wood.—

But we have another Advantage over the Ancients, in the manner of using, or applying the Gold: The Secret of painting in Oil, lately discover'd, furnishes us with means of gilding Works that shall endure all the Injuries of Time and Weather, which to the Ancients was impracticable. They had no way to lay the Gold on Bodies that would not endure the Fire but with Whites of Eggs, or Siz; neither of which will endure the Water: So that they could only gild such Places as were shelter'd from the Moisture of the Weather.—

The Greeks called the Composition which they used for gilding on Wood, *Leucophaemum*, or *Leucophaemum*; which is described as a sort of glutinous compound Earth, serving, in all Probability, to make the Gold stick, and bear polishing. But the Particulars of this Earth, its Colour, Ingredients, &c. the Antiquaries and Naturalists are not agreed upon.

There are several Methods of Gilding in use among us; viz. *Gilding in Oil*; *Water Gilding*; *Gilding by the Fire*, which is peculiar to Metals; *Gilding of Books*, &c.

Method of GILDING on Wood.

The Basis, or Matter whereon the Gold is applied, in this Method, is the Remains of Colours found settled to the Bottom of the Pots wherein the Painters wash their Pencils. This Matter, which is very viscid, they first grind; then pass it thro' a linnen Cloth; and thus lay it with a Pencil on the Matter to be gilt, after having first wash'd it once or twice over with Siz; and if it be Wood, with some white Paint.

When almost dry, but while yet unctuous enough to catch and retain the Gold, they spread their Gold Leaves thereon, either whole, or cut in pieces: To take up and apply the Leaves, they make use of a Piece of fine, soft, well carded Cotton; or of a Palet for the purpose; or barely the Knife, wherewith the Leaves were cut, according to the Parts of the Work they are to gild, or the Breadth of the Gold to be applied.

In proportion as the Gold is laid, they pass over it a coarse, stiff Pencil or Brush, to make it stick, and, as it were, incorporate with the Ground: With the same Pencil, or a smaller one, they mend any Cracks that may happen therein, after the same manner as will be hereafter shown in *Water Gilding*.

This sort of *Gilding* is chiefly used for Domes, and Roofs of Churches, Courts, Banqueting Houses, &c. and for Figures of Plaster, Lead, &c. that are to stand exposed to the Weather.

Method of GILDING in Water.

Water Gilding is not perform'd without more Apparatus; nor can it be used so ordinarily, nor on such large Works, as the former: Wooden Works, and those of Stucco, are almost the only ones gilt in this way: which, besides, must be shelter'd from the Weather.

The Siz made use of for gilding, is to be made of Shreds, &c. of Parchment, or Gloves, boil'd in Water, to the Consistence of a Jelly. See *GLUE*.

If it be Wood that is to be gilt, they first give it a Wash of this Siz, boiling hot; and when this is dry, another of white Paint, mix'd up with the same Siz. For this White, some use Plaster of Paris, well beaten and sifted; others Spanish White, &c. It is laid on with a stiff Brush, and oftener, or seldomer repeated, according to the Nature of the Work: For Pieces of Sculpture, seven or eight Lays suffice; for flat, or smooth Works, ten, or twelve. In the latter Case they are applied by drawing the Brush over the Work; in the former by dabbing it.

When the whole is dry, they moisten it with fair Water, and rub it over with several Pieces of coarse Linnen, if it be on flat; otherwise, they beat or switch it with several Slips of the same Linnen tied to little Sticks, to make it follow and enter all the Cavities and Depressures thereof.

The White thus finish'd, they proceed to yellow it; observing, that if it be a Piece of Sculpture in Relievo, they first touch up, and repair the several Parts which the white Ground may have disfigur'd, with little Iron Instruments, as Gouges, Chisels, &c.

The Yellow, which they use, is only common Oker well ground and sifted, and thus mix'd up with the Siz us'd for

the White, only weaker by one half. This Colour is laid on hot; and in Works of Sculpture supplies the Place of Gold, which frequently cannot be carried into all the Cavities and Denings of Follages and other Ornaments.

Over this yellow is applied a Lay, which is to serve for the Ground whereon the Gold is to be immediately laid: It is usually composed of the *Armenian Boile*, Blood-stone, Black Lead, and a little Fat, to which some add Soap and Oil of Olives; others, burnt Bread, Blütre, Antimony, Glais of Tin, Butter and Sugar Candy. These Ingredients being all ground together, with hot Siz, they apply three Lays of the Composition upon the Yellow, each after the other is dried; taking Care not to put any in the small Cavities of the Work, to hide the yellow. The Brush used in this Application, is to be soft; and when the Matter is well dried, they go over it with a stronger Brush, to rub it down, and take off the little prominent Grains, and thus facilitate the burnishing of the Gold.

In order to proceed to gild, they must have three sorts of Pencils; one, to wet; another to touch up, and amend; and a third to flatten: There is also required a Cushion, to spread the Gold Leaves on, when taken out of the Book; a Knife to cut them; and a Squirrel's Tail fitted with a Handle; or else a piece of fine Stuff on a Stick, to take them up, direct, and apply them.—

They begin with the wetting Pencils, by which they moisten the Lay last laid on with Water, that it may the better receive and retain the Gold: The Leaves are then laid on the Cushion; and taken up, if whole, with the Squirrel's Tail; if in pieces, with the other Instrument, or even the Knife they are cut withal, and laid, and spread gently on the Parts of the Work before moisten'd.

When the Leaves happen to crack, or break in laying on, they make up the Breaches with little Pieces of Leaf taken up on the repairing Pencil; and with the same Pencil, or another somewhat bigger, they smooch the whole; pressing the Gold into the Dents, where it could not so well be carried with the Squirrel's Tail.

The Work thus far gilt, when dry, remains either to be burnish'd, or flatten'd.—

To burnish it, is to smooch, and polish with a Burnisher, which is usually a Dog's, or Wolf's Tooth, or a Blood-stone fitted in a Handle for the purpose. See *BURNISHING*.

To flat, is to give it a light Lick in the Places not burnish'd, with a Pencil dip't in Siz, whereon a little Vermillion sometimes has been mix'd. This helps to preserve and prevent its flaking, when handled.

The last thing is to apply the Vermell in all the little Lines, and Cavities; and to stop and amend any little Faults with Shell Glue.

The Composition here call'd *Vermell*, is made of Gum Gutt, Vermillion, and a little of some ruddy, brown Colour, ground together, with Venice Varnish, and Oil of Turpentine. Some Gilders, in lieu hereof, content themselves with fine Lacca, or Dragons Blood, with Gum Water.

Sometimes, instead of burnishing the Gold, they burnish the Ground or Composition laid on last before it; and content themselves afterwards to wash the Part over with the Siz. This Method is chiefly practis'd for the Hands, Face, and other Nudities in Relievo; which, by this means, don't appear so very brilliant as the Parts burnish'd; though much more so than the Parts perfectly flat.

To gild a Work, and yet preserve white Grounds; they use to apply a Lay of Spanish White mix'd with a weak Fish Glue, on all the Parts of the Ground whereon the yellow, or the last Lay might run.—

Method of GILDING by the Fire.

There are two ways of *Gilding by Fire*, viz. that with Liquid Gold, and that with Leaf Gold.

The first is perform'd with Gold, reduc'd to a Calx, and amalgamated with Mercury, in the Proportion of about an Ounce of Mercury to a Drachm of Gold.

In order to the Operation, they heat a Crucible red hot, then put the Gold and Mercury in it, and stir them gently about, till the Gold be found melted and incorporated into a Mass with the Mercury. This done, they cast them into Water, to wash and purify; and thence into other Waters, where the Amalgama which is almost as liquid as if there were nothing but Quicksilver in it, may be preserved a long time for Use.

Before they proceed to apply this amalgamated Gold, they first roughen the Metal it is to be applied on; which is done by washing it over with *Aqua fortis*, or *Aqua fecunda*: Then rinsing the Metal in fair Water, and scouring it a little with small Sand, it is ready for the Gold.—

They now cover over the Metal with the Mixture of Gold, and Mercury, taking it up with a Slip of Copper, or a Brush made of brass Wire, and spreading it as equally thereon as possible; in order to which they wet the Brush from time to time in fair Water.—

Thus far advanc'd, the Metal is set to the Fire, upon a Grate, or in a sort of a Cage, under which is a Fan of Coals: In proportion as the Mercury evaporating and flying off discovers Places where Gold is wanting, they take Care to supply them, by adding new Pieces of Amalgam.—

The Work is then rubb'd over, with the Wire Brush dip't in Beer, or Vinegar, which leaves it in a Condition to be brought to Colour, which is the last Part of the Process, and which the Gilders keep to themselves as a mighty Secret; tho' we know it cannot differ much from what we shall hereafter shew of the manner of giving Gold Species their Colour, under the Article COINING.

GILDING by the Fire with Gold Leaves.

To prepare the Metal for this Gilding, it must be first well scratch'd, or raked; then polish'd, with a Polisher; and then set to the Fire to blue, *i. e.* to heat, till it appear of a blue Colour. This done, the first Lay of Gold is clapt thereon, and lightly rubb'd down with a Polisher; and thus exposed to a gentle Fire.

They usually only give it three such Lays, or four at most; each Lay consisting of a single Leaf for the common Works, and of two for the extraordinary ones: After each Lay they set it a-fresh to the Fire. After the last Lay, the Gold is in a Condition to be burnish'd.

GILDING of Books; see BOOK-BINDING.

GILL, or Ground-Ivy, a Medicinal Plant, which gives the Denomination to a sort of medicated Ale, or Drink, called Gill, or Gill Ale, made by infusing the dried Leaves of the Plant therein. See ALE.

Gill is held very absterive and vulnerary, and is prescribed in all Disorders of the Lungs, and Breast; and is also esteem'd good in Obstructions of the Viscera: Whence it also passes for Hepatic, Diuretic, Splenic, and Nephritic. It is said to do Wonders in Tubercles and various Indurations of the Lungs. Willis commends its Powder in obstinate Coughs; and Eramuller gives the History of a Scorbatic Consumption cured by a strong Decoction of this Herb after a Vomit.

GILLA, in Chymistry and Pharmacy, is an Arabic Term for Salt; peculiarly used among us for the Emetic Salt of Vitriol. See VITRIOL.

This Salt is prepared from that Mineral, by three, or four repeated Operations, *viz.* Dissolution, in May Dew; Filtration; and Crystallization. In default of May Dew, Rain Water may serve.

Gills is used in Tertian Agues, and all Fevers arising from a Corruption of the Humors of the first Region. It destroys Worms, and prevents Putrefaction. The Dose is from 20 Grains to half a Drachm, taken in Broth, or in Cordial Waters.—

GILLS, BRANCHES, in Natural History, those membranous, cartilaginous Parts in Fishes, whereby they respire, hear, &c. See FISH; see also BRANCHIA.

What we call Gills in Fishes, are properly their Lungs: Respiration of Air is as necessary to Fishes, as to terrestrial Animals: There is always a deal of Air inclosed among Water; and 'tis this Air that Fishes respire. The whole Mechanism of their Gills is contriv'd with this View, *viz.* to separate and imbibe this Air from the Water, and present it to the Blood, after the same manner as it is presented to the Lungs of other Animals. See LUNGS.

M. du Verney has unravel'd this infinitely complicated Piece of Mechanism, in the Gills of a Carp: The first thing that offers, is a sort of Timber-work, consisting of a great Number of bony Laminae, each subdivided into an Infinity of bony Fibres, whose Office is to sustain the innumerable Ramifications of an Artery dispatch'd hither from the Heart. The Use of these Ramifications is to prevent the Blood extremely subdivided, and, as it were, each Globule of Blood by it self, to the Water. Between these Laminae, and throughout the whole Contexture of the Gills, are an infinite Number of very narrow Passages, destined to receive and subdivide the Water which the Fish takes in by the Mouth, into little Parcels. In this State the Air, its Prison Doors being now in some measure open'd, makes its Escape, and joins it self with the Blood of all the little Arteries.—

These Gills have necessarily an alternate Motion of Dilatation and Compression, which is effected by another very curious Piece of Mechanism; when they dilate, the Water is taken in, and when they contract, it is expell'd again. Hence 'tis probable that it is in the very Instant of Contraction, that the Air expell'd from the Water is forc'd to enter the Pores of the little Blood Vessels, by reason the Force is then greater than at any other time; and this Action requires a considerable Force. The same Reason holds with respect to the Lungs of Men; accordingly M. du Verney maintains, that tho' the Air enter the Lungs in the time of Inspiration, it is only received into the Blood in that of Expiration, when the superfluous Air is carried off by the Trachea; so that the real Inspiration, *i. e.* the Entrance of

the Air into the Blood, should be the Expiration. See RESPIRATION.

The Water is taken by the Mouth, and carried off again, stirr'd of its Air, by the Gills; and the Air gain'd from it, is distributed first to the Arteries of the Gills, and thence by the Law of Circulation to all the little Veins inclosed therewith. See CIRCULATION, &c.

GINGER, GINGER, an Aromatic Root, of considerable Use both as a Spice, and a Medicine.—

It is brought chiefly from Calcutta, in the East Indies; tho' of late it has been cultivated with good Success in the Antilles Islands.

The Plant which affords it, resembles our Rush, both in respect of Stem, and Flower.—The Root goes no depth under Ground, but spreads itself near the Surface, in form not unlike a Man's Hand; but very knotty.

When arrived at Maturity, they dig it up, and dry it in Hurdles, either in the Sun, or Oven: The bait is that which is new, dry, well fed, hard to break, of a ruddy, brown Colour without, resinous within, and of a hot, pungent Taste.

They use to comfit the Root, when green, with Sugar; and Honey; having first steep'd it some time in Water, to take away part of its Acrimony, and dispose it to part with the Outer-skin. They also make a Marmelade of it, and dry Cakes.

The Northern People make great use of this Confection, as holding it sovereign against the Scurvy. The Indians eat the Root, when green, by way of Salade, first chipping it small, mixing it with other Herbs, and seasoning it with Oil and Vinegar.

As to its Medicinal Use, it is held good to strengthen the Stomach, and awaken Appetite. It promotes Digestion, prevents Putrefaction, &c.

GINGER-BREAD, a richer kind of Bread, the Flavour and Taste whereof are heighten'd and improv'd with Spices, and particularly Ginger; whence the Name. See BREAD.

There are various Forms and Preparations of Ginger-Bread: We shall content ourselves with the following one, which is well recommended.

Into a Pound of Almonds, grate a penny white Loaf, sift, and beat them together: To the Mixture add an Ounce of Ginger, scraped fine, and Liguorice and Anis Seed in Powder, of each a quarter of an Ounce: Pour in two or three Spoonfuls of Rose-water, and make the whole into a Paste, with half a Pound of Sugar: Mould, and roll it, print it, and dry it in a Stove.

Others make it of Treacle, Citrus, Lemon, and Orange Peel, with candied Ginger, Coriander, and Caraway Seeds, mix'd up with as much Flower as will make it into a Paste.

GINGIVA, in Anatomy, the Gums; a hard sort of Flesh, investing the Alveoli, or Sockets of the Teeth. See FLESH, and TEETH.

The Gingsivae are form'd by the Union of two Membranes one of which is a Production of the Periosteum, and the other of the Internal Membrane of the Mouth. See MOVEMENT.

GINGLYMUS, in Medicine, one of the Species of Articulation. See ARTICULATION.

The Ginglymus is that Jointure of the Bones, where each Bone mutually receives the other; so that each both receives, and is received. See BONE.

There are three Species of Ginglymus: The first, when the same Bone, at the same Extremity, receives and is reciprocally received by another Bone; after the manner of a Hinge: Such is that of the Cubitus and Humerus. See CUBITUS, and HUMERUS.

The second, when a Bone receives another at one of its Extremes, and is received into another, at the other: As the Vertebrae do. See VERTEBRAE.

The third is that where a Bone is received into another, after the manner of a Wheel, or Axis of a Wheel in a Box: Such is that of the second Vertebra of the Neck in the first. See AXIS.

GIN-SENG, or GIN-SEM, in Natural History, a very extraordinary and wonderful Plant, hitherto only found in Tartary.

The Gin-seng is one of the principal Curiosities of the Chinese, and Tartars: Their most eminent Physicians have wrote many a Volume of its Virtues.

It is known among them by divers other Names, as the only Spirituous; the pure Spirit of the Earth; the Plant that gives Immortality, &c. It makes, in effect, the whole Materia Medica, for the People of Concluid; being too precious for the Populace.

All the Writers of the Chinese Affairs make mention of the Gin-seng: As Marinus, in his Atlas; F. Kerber, in his China Illustrata; F. Tachard, in his Voyages; and F. de Comte, in his Memoirs.

And yet we knew but very little of this Plant, before P. Jartoux, a Jesuit, and Missionary in China; who being employ'd by Order of the Emperor, in making a Map of Tartary, in the Year 1709, had an Opportunity of seeing it growing.

growing in a Village about four Leagues from the Kingdom of *Coben*, inhabited by *Tartars*, call'd *Calca-Tatze*.

That Father took the occasion to design the Plant, and give an accurate Description thereof, with its Virtues, and the manner of preparing it; which, being a great Curiosity, we shall here gratefully the Reader withal.

The *Gin-feng*, represented *Tab. Nis. History, Fig. 10.* has a white Root, somewhat knotty, about thrice the Thickness of the Stem, and which goes tapering to the End: At a few Inches from the Head, it frequently parts into two Branches, which gives it some Resemblance of a Man, whose Thighs the Branches represent: And 'tis hence it takes the denomination *Gin-feng*.

From the Root rises a perfectly smooth, and tolerable round Stem: Its Colour is a pretty deep Red, except toward the Foot, where, by the Neighbourhood of the Earth, it turn'd somewhat whiter. At the Top of the Stem is a sort of Joint, or Knot, form'd by the shooting out of four Branches, which spread as from a Centre: The under Side of each Branch is green, mix'd with white; and the upper Part, much like the Stalk, of a deep Red: The two Colours gradually decrease, and at length unite on the Sides.

Each Branch has five Leaves, well enough represented in the Figure; and 'tis observable that the Branches divide equally from each other, both in respect of themselves, and of the Horizon; and with the Leaves make a circular Figure, nearly parallel to the Surface of the Ground.

The Fibres of the Leaves are very distinguishable, and on the upper Side are set with small whitish Hairs: The Membrane, or Pellicle between the Fibres, rises a little in the Middle, above the Level of the Fibres.

The Colour of the Leaf is a dark Green, above, and a shining, whitish Green underneath; and all the Leaves are finely jagged or indented.

On the Edges, from the Centre of the Branches, arises a second Stalk, D E, very straight, smooth, and whitish, from Bottom to Top, bearing a Bush of round Fruit, of a beautiful red Colour. This Bush, in the Plant viewed by our Missionary, was computed of twenty four Berries; two of which are here represented 9, 9.

The Red Skin, that covers the Berry, is very thin, and smooth, and contains within it a white Pulp: As these Berries were double (for they are sometimes single) each had two rough Stones, of the Size and Figure of our Lentils. The Pedicles, whereon the Berries were supported, all arose from the same Center; and spreading exactly like the Radius of a Sphere, made the Bush of Berries of a circular Form. The Fruit is not good to eat; and the Stone includes a Kernel: It has also a small Beard at the Top, diametrically opposite to the Pedicle.

The Plant dies away every Year; the Number of its Years may be known by the Number of Stalks it has forth; of which there always remains some Mark, as is shown in the Figure, by the Letters *b b b*, &c. From whence it appears, that the Root A was seven Years old; and the Root H fifteen.

As to the Flower, F. *Jartoux* owns he had never seen it; and therefore could not describe it: Some have assured him, that it is white, and very small; others, that there is no Flower at all, and that no body had ever seen it. He rather inclines to think it so small as to have escap'd Notice; and, what confirms him in the Opinion, is, that those who seek the *Gin-feng*, having nothing in view but its Root, overlook and despise the rest as useless.

As they have sowed the Seed in vain, without any Plant ever arising therefrom; 'tis probable this might give occasion to the Fable which is current among the *Tartars*:—They say, that a Bird eats it, as soon as it is in the Earth; and not being able to digest it, it purifies in its Stomach, and afterwards springs up in the Place where it was cast by the Bird with its Dung.—The Missionary rather believes that the Stone remains a long time in the Ground, before it takes root; which Opinion appears the more probable, as there are some Roots no longer or bigger than ones little Finger, which yet have shot forth at least ten Stalks.

Tho' the Plant, here described, had four Branches; yet there are some which have but two; others, three; and others, five, six, or seven: But each Branch has always five Leaves.

The Height of the Plant is proportionable to its Bigness, and the Number of Branches the Root has: The larger and more uniform it is, and the fewer small Strings or Fibres it has, the better it is accounted.

'Tis hard, to say, why the *Chinese* should call it *Gin-feng*, a Word which signifies *Form*, or *Representation*: Neither that Father, nor any he inquir'd of, could ever find that it bore more Resemblance to the Figure of a Man, than is ordinarily seen among other Roots. The *Tartars*, with more Reason, call it *Obvata*, that is, the *first of Plants*.

Those who gather the *Gin-feng*, preserve only the Root; and all they can get of it in ten, or fifteen Days time, they bury together in some Place under Ground. Then they take

care to wash it well, and scour it with a Brush: Then dip it in boiling Water, and prepare it in the Fume of a fart of yellow Millet, which gives it Part of its Colour.

The Milt is put in a Vessel, with a little Water, and boil'd over a gentle Fire; the Roots being laid over the Vessel upon small, transferable Pieces of Wood, being first cover'd with a linen Cloth, or some other Vessel, plac'd over them.

They may also be dried in the Sun, or by the Fire; but then, tho' they retain their Virtue well enough, they have not that yellow Colour, which the *Chinese* so much admire. When the Roots are dried, they must be kept close in some very dry Place; otherwise they are in danger of corrupting, or being eaten by Worms.

As to the Place where this Root grows, it is between the thirty ninth and forty seventh Degree of North Latitude, and between the tenth and twentieth Degree of East Longitude, reckoning from the Meridian of *Peking*. Here is found a long Tract of Mountains, which the thick Forests that cover and encompass them, render almost impassable. It is upon the Declivities of these Mountains, and in these thick Forests, upon the Banks of Torrents, or about the Roots of Trees, and amidst a thousand other different Sorts of Plants, that the *Gin-feng* is found. It is not to be met with in Plains, Vallies, Marshes, the Bottoms of Rivulets, or in Places too much exposed and open.

If the Forest take fire, and be consumed, this Plant does not appear till two or three Years after: It also lies hid from the Sun as much as possible, which shows that Heat is an Enemy to it.

The Places where the *Gin-feng* grows, are on every Side separated from the Province of *Quan-tong*, by a Barrier of wooden Stakes, which encompasses this whole Province, and about which Guards continually patrol, to hinder the *Chinese* from going out, and looking after this Root.

Yet, how vigilant soever they are, their Greediness after Gain incites the *Chinese* to lurk about privately in these Deserts, sometimes to the Number of two or three thousand; at the hazard of losing their Liberty, and all the Fruit of their Labour, if they are taken, either as they go out of, or come into the Province.

The Emperor having a mind that the *Tartars* should reap all the Advantage that is to be made of this Plant, rather than the *Chinese*, gave Orders, in 1709, to ten thousand *Tartars*, to go and gather all that they could of the *Gin-feng*, upon Condition that each Person should give him two Ounces of the best, and that the rest should be paid for Weight for Weight, in pure Silver.

It was computed that by this means the Emperor would get this Year about twenty thousand *Chinese* Pounds of it, which would not cost him above one fourth Part of its Value.

We met, by chance, with some of these *Tartars*, in the Midst of those frightful Deserts; and their Mandarins, who were not far out of our Way, came one after another, and offer'd us Oxen for our Subsistence, according to the Commands they had received from the Emperor.

This Army of Herbarists observed the following Order: After they had divided a certain Tract of Land among their several Companies, each to the Number of an hundred Persons, spread itself out in a Right Line, to a certain fix'd Place, every ten of them keeping at a distance from the rest.

Then they search'd carefully for the Plant, going on leisurely in the same Order; and in this manner, in a certain Number of Days, they run over the whole space of Ground appointed them.

When the Time is expired, the Mandarins, who are encamp'd with their Tents in such Places as are proper for the Subsistence of their Horses, send to view each Troop, to give them fresh Orders, and to inform themselves if their Number is complete.

If any one of them is wanting, as it often happens, either by wandering out of the way, or being attack'd by wild Beasts, they look for him a Day or two, and then return again to their Labour, as before.

The *Gin-feng*, we have observ'd, is an Ingredient in most of the Medicines which the *Chinese* Physicians prescribe to the better sort of Patients: They affirm that it is a sovereign Remedy for all Weaknesses occasion'd by excessive Fatigues, either of Body, or Mind; that it attenuates and carries off pituitous Humours; cures Weakness of the Lungs, and the Pleurisy; stops Vomiting; strengthens the Stomach, and helps the Appetite; disperses Fumes, or Vapours; fortifies the Breast; is a Remedy for short and weak Breathing; strengthens the vital Spirits, and is good against Dizziness of the Head, and Dimness of Sight, and that it prolongs Life to extreme old Age.

No body can imagine, that the *Chinese* and *Tartars* would set so high a Value upon this Root, if it did not constantly produce a good Effect: Those that are in Health, often make use of it to render themselves more vigorous and strong; and I am persuaded it would prove an excellent

Medicine in the Hands of any *European* who understands Pharmacy, if he had but a sufficient Quantity of it to make such Trials as are necessary to examine the Nature of it chymically, and to apply it in a proper Quantity, according to the Nature of the Disease for which it may be beneficial.

It is certain that it subtilises, increases the Motion of, and warms, the Blood; that it helps Digestion, and invigorates in a very sensible manner.

After I had designed the Root, I observed the State of my Pulse, and then took half of the Root, raw as it was, and unprepared; in an Hour after, I found my Pulse much fuller and quicker; I had an Appetite, and found myself much more vigorous, and could bear Labour better and easier than before. Four Days after, finding myself fatigued and weary, that I could scarce sit on Horseback, a Mandarin who was in Company with us, perceiving it, gave me one of these Roots: I took half of it immediately, and an Hour after I was not in the least sensible of any Weariness. I have often made use of it since, and always with the same Success: I have observ'd also, that the green Leaves, and especially the fibrous Part of them, chewed, would produce nearly the same Effect. The *Tartars* often bring us the Leaves of *Giu-feng*, instead of Tea; and I always find myself so well afterwards, that I should readily prefer them before the best Tea. Their Decoction is of a grateful Colour; and when one has taken it twice, or thrice, its Taste and Smell become very agreeable.

As for the Root, it is necessary to boil it a little more than Tea, to allow time for extracting its Virtue; as is practis'd by the *Chinese*, when they give it to sick Persons; on which occasion they seldom use more than the fifth Part of an Ounce of the dried Root.

To prepare the Root for Exhibition, cut it into thin Slices, and put it into an earthen Pot well glazed, with about half a Pint of Water; the Pot to be well cover'd, and set to boil over a gentle Fire; and when the Water is consumed to the Quantity of a Cup full, a little Sugar to be mix'd with it, and to be drank: Immediately after this as much more Water to be put on the Remainder, and to be boiled as before, to extract all the Juice, and what remains of the fibrous Part of the Root. These two Doses to be taken, the one in the Morning, and the other in the Evening.

GIRDERS, in Architecture, the largest Pieces of Timber in a Floor—Their Ends are usually fasten'd into the Summers, or Breit-Summers, and the Joists are framed in at one End to the *Girders*. See **JOIST**.

By the Statute for rebuilding London, no Girder is to lie less than ten Inches into the Wall; and their Ends to be always laid in Lome, &c.

Girders and Summers in Length.	From		to		must be in

	24	0	26	0	17	14

GIRDING-Beams, in Building, the same as *Girders*. See **GIRDER**.

GIRDLE, CINCULUS, or ZONA, a Belt, or Band, of Leather, or other Matter, tied about the Reins; to keep the Part more firm, and tight.

It was antiently the Custom for Bankrupts, and other Confessors, to put off, and surrender their *Girdle*, in open Court—The Reason hereof, was, that our Ancestors used to carry all their necessary Utensils, as Parle, Keys, &c. tied to the *Girdle*; whence the *Girdle* became a Symbol of the Estate. History relates, that the Widow of *Philip I.* Duke of *Burgundy*, renounced her Right of Succession, and put off her *Girdle* on the Duke's Tomb. See **INVESTITURE**.

The *Romans* always wore a *Girdle*, to tuck up the Gown when they had occasion to do any thing. This Custom was so general, that such as went without *Girdles*, and let their Gowns hang loose, were reputed idle, dissolute Persons.

Maidens or Virgins GIRDLE—It was the Custom among the *Greeks*, and *Romans*, for the Husband to untie his Bride's *Girdle*.

Homer, lib. 11. of the *Odyssey*, calls this *Girdle* *μαρτίριον* *ζώνη*. *Maid's Girdle*. *Festus* relates, that this *Girdle* was made of Sheep's Wool; and that the Husband untied it in Bed. He adds, that it was tied in the *Herodian* Knot; and that the Husband untied it, as a happy Prefage of his having as many Children as *Hercules*, who at his Death left seventy behind him.

The Poets attribute to *Venus* a particular kind of *Girdle*, called *Cestus*; to which they annex a Faculty of inspiring the Passion of Love. See **CESTUS**.

Quicksilver GIRDLE, in Medicine, is a sort of *Girdle* smother'd over with Mercury, or having Mercury inclosed within it. See **MERCURY**.

It is made of Leather, Linen, Cloth, Cotton, Stuff, or the like, and the Mercury prepared or killed various ways, as with fasting Spittle, Fat, or the like.

It is applied as a Topical Medicine about the Wastle, sometimes with good Effect, but frequently proves dangerous, principally in weak Constitutions, and those subject to Convulsions.

Its Intention is, the Cure of the Itch, driving away Vermin, killing Lice, &c.

QUEENS GIRDLE, is an ancient Duty, or Tax, rais'd at *Paris* every three Years, at the rate of three Deniers upon each Muid of Wine, and six for each Queue. It was intended for the Maintenance of the Queen's Household: Afterwards they augmented and extended it to other Commodities, as Coals, &c.

Vigenere supposes it to have been originally thus called, by reason the *Girdle* antiently served for a Purse; but he adds, that a like Tax had been rais'd in *Persia*, and under the same Name, above two thousand Years ago; as appears from *Plato*, in his *Alcibiades*, *Cicero*, *Athenaeus*, &c.

CHRISTIANS OF THE GIRDLE, *Moscovickes*, tenth Call of the Family of the *Abassides*, enjoy'd the Christians, and *Jews* in the Year of the Hégira, 253; of *Jesus Christ*, 836, to wear a large leathern *Girdle*, as a Badge of their Profession; which they bear to this Day throughout the East: From which time the Christians of *Asia*, and particularly those of *Syria* and *Mesopotamia*, who are almost all *Nestorians*, or *Jacobites*, have been called *Christians of the Girdle*.

ORDER OF THE GIRDLE, the Order of *Cordeliers*; see **CORN**, and **CORDELIERS**.

GIRDLE, in Architecture; see **CINETURE**.

GIRLE, among Hunters, is a Roe back of two Years.

GIRON, or **GIROIN**, in Heraldry, a Gore, or triangular Figure, having a long, sharp Point, like the Step of a spiral Stair Case, and ending in the Centre of the Escutcheon.

When a Coat has six, eight, or ten of these *Girons*, meeting or centring in the Middle of the Coat, it is said to be *Gironne*, or *Gironny*. See **GIRONNE**.

The Word is *French*, and literally signifies the *Gremium*, or Lap; by reason, in sitting, the Knees being suppos'd somewhat asunder, the two Thighs, together with a Line imagin'd to pass from one Knee to the other, forms a Figure somewhat simular hereto.

GIRONNE, **GIRONNY**, in Heraldry, is when a Shield or Coat is divided into several *Girons*, which are alternately Colour and Metal; as in the adjoining Figure, which is Blazon, *Gironne* of six Argent and Sable.

When there are eight pieces or *Girons*, it is absolutely said to be *Gironne*; when there are more, or fewer, the Number is to be express'd—*Gironne* of four, or

fourteen, &c.

Some, instead of *Gironne*, say, *Parti*, *Couppé*, *Troischi*, and *Failli*, by reason the *Girons* are form'd by such Divisions of the Field.

Four *Girons* form a *Salteer*, and eight, a *Cross*; See **SALTEER**, &c.

GIVEN, *Datus*, a Term frequently used in Mathematics, signifying something which is suppos'd to be known. See **DATA**.

Thus, if a Magnitude be known, or we can find another equal to it, we say, it is a *given Magnitude*, or that such a Thing is *given* in Magnitude. See **MAGNITUDE**.

If the Position of any thing be suppos'd as known, we say, *Given in Position*. See **POSITION**.

Thus, if a Circle be actually described on a Plain, its Centre is *Given in Position*; its Circumference *Given in Magnitude*; and the Circle is *Given* both in *Position*, and *Magnitude*.

A Circle may be *given* in Magnitude only, as when only its Diameter is *given*, and the Circle not actually described.

If the Kind, or Species of any Figure be *given*, they say, *given in Species*—If the Ratio between any two Quantities is known, they are said to be *given in Proportion*.

GLACIALIS, *Ice*, something relating to Ice; and particularly, a Place that abounds in Ice.

Thus, we say, the *Mare Glaciale*, or *Congelatum*, that is, the *Ice*, or *Frozen Sea*; call'd also *Chronian Sea*, or *Sarmatian Sea*. See **SEA**.

The Word is form'd of the Latin *Glacies*, *Ice*. See **ICE**.

GLACIS, in Building, &c. is an easy, insensible Slope, or Declivity. See **DECLIVITY**.

The Declent, or Inclination of the *Glacis* is less steep than that of the *Talut*. See **TALUT**.

In Gardening, a Defect sometimes begins in *Talus*, and ends in *Glacis*.

The *GLACIS* of the *Cornich* is an easy, imperceptible Slope in the Cymaïc of a Cornich, to promote the Defect and draining off of the Rain-Water. See *CYMAISE*.

GLACIS, in Fortification, is particularly us'd for that of the Counterescarp.

The *Glacis* of the Counterescarp, or cover'd Way, is the Sloping Bank that reaches from the Parapet of the Corridor, or Counterescarp, to the level Side of the Field. See *COUNTERESCARP*.

The *Glacis* is about six Foot high, and loses itself by an insensible Diminution in the space of ten Fathoms. See *ESPLANADE*.

GLADE, in Agriculture, Gardening, &c. a *Vista*, or open, and light Passage, made thro' a thick Wood, Grove, or the like, by lopping off the Branches of Trees along the Way. See *VISTA*, &c.

GLADIATOR, in Antiquity, a Person who fought with naked Swords in the *Arena*, at *Rome*, to entertain the People. See *ARENA*, *SPECTACLE*, &c.

The *Gladiators* were usually Slaves, and fought out of Necessity; tho', sometimes, Freemen made Profession thereof, like our *Slave-fighters*, for a Livelihood.

After a Slave had serv'd on the *Arena* three Years, he was dismiss'd. See *SLAVE*.

The *Romans* borrow'd this cruel Diversion from the *Astiatiks*: Some suppose that there was Policy herein; the frequent Combats of *Gladiators* tending to accustom the People to despise Dangers, and Death.

The Origin of such Combats seems to be as follows: From the earliest Times, we have any Acquaintance withal in profane History, it had been the Custom to sacrifice Captives, or Prisoners of War, to the Manes of the Great Men who had died in the Engagement: Thus *Achilles*, in the *Iliad*, L. XXXIII. sacrifices twelve young *Trojans*, to the Manes of *Patroclus*; and in *Virgil*, L. XI. v. 81. *Aeneas* sends Captives to *Evander*, to be sacrificed at the Funeral of his Son *Pallas*.

In length of Time they came to sacrifice Slaves at the Funerals of all Persons of Condition: This was even esteem'd a necessary Part of the Ceremony; but as it would have appear'd barbarous to have massacred them like Beasts, they were appointed to fight with each other, and do their best to save their own Lives, by killing their Adversary. This seem'd somewhat less inhuman, by reason there was a Possibility of avoiding Death; and it only lay on themselves, if they did not do it. See *FUNERAL*.

This occasion'd the Profession of *Gladiator* to become an Art: Hence arose Masters of Arms; and Men learn'd to fight, and exercise therein.

These Masters, whom the *Latins* call'd *Lauiste*, bought their Slaves, to train up to this cruel Trade; whom they afterwards sold to such as had occasion to present the People with so horrible a Show.

Junius Brutus, who expell'd the Kings, is said to have been the first who honour'd the Funeral of his Father with these inhuman Diversions—They were at first perform'd near the Sepulchre of the Deceased, or about the Funeral Pile; but were afterwards removed to the Circus and Amphitheatres, and became ordinary Amusements. See *CIRCUS*, *AMPHITHEATRE*, &c.

The Emperor *Claudius* restrain'd them to certain times, but he soon afterwards allow'd what he decreed, and private Persons began to exhibit them at Pleasure, as usual; and some carried the brutal Satisfaction so far as to have them at their ordinary Feasts. See *FEAST*.

And not Slaves only, but other Persons would hire themselves to this infamous Office.

The Master of the *Gladiators* made them all first swear, that they would fight to death; and if they fail'd therein, they were put to death, either by Fire, or Swords, Clubs, Whips, or the like.

It was a Crime for the Wretches to complain when they were wounded; or to ask for Death; or seek to avoid it, when overcome: But it was usual for the Prince, or the People to grant them Life, when they gave no Signs of Fear, but waited the fatal Stroke with Courage and Intrepidity. *Augustus* even decreed, that it should always be granted them.

From Slaves, and free'd Men, the wanton Sport spread to People of Rank and Condition; and *Nero* is related to have brought upwards of 400 Senators, and 600 *Romans* Knights upon the Scene; yet *Domitian*, that other Monster of Cruelty, refin'd upon him, exhibiting Combats of Women in the night-time.

Cassianus the Great is said to have first prohibited the Combats of *Gladiators*, in the East; at least, he forbid those condemn'd to death for their Crimes, to be employ'd herein: There being an Order still extant to the *Prefectus Praetorii*, rather to send them to work in the Mines in lieu thereof: It is dated at *Beryta* in *Phoenicia*, the first of *October* 325.

The Emperor *Honorius* first forbid them at *Rome*, on occasion of the Death of *St. Telemachus*, who, coming out of the East into *Rome*, at the time of one of these Spectacles, went down into the *Arena*, and us'd all his Endeavours to prevent the *Gladiators* from continuing the Sport: Upon which the Spectators of that Carnage, fired with Anger, stoned him to death. *Theodoret. Hist. Eccles. L. V. c. 26.*

It must be observ'd, however, that the Practice was not entirely abolish'd in the West before *Theodoric*, King of the *Ostrogoths*.—*Honorius*, on the occasion first mentioned, had prohibited them; but the Prohibition does not seem to have been executed. *Theodoric*, in the Year 1500 abolish'd them finally.

Some time before the Day of Battle, the Person who presented the People with the Shews, gave them Notice thereof, by Programmas, or Bills, containing the Names of the *Gladiators*, and the Marks whereby they were to be distinguish'd; for each had his several Badge, which was most commonly a Peacock's Feather, as appears from the *Scholiast of Juvenal*, on the 138th Verse of the III^d *Satyr*; and *Turnebus Advers. L. III. c. 8.*

They also gave notice what time the Shews would last, and how many Couples of *Gladiators* there were: And it even appears from the 52^d Verse of the 7th *Satyr* of the II^d Book of *Horace*, that they sometimes made Representations of these Things in Painting; as is practic'd among us, by those who have any thing to shew at Fairs.

The Day being come, they began the Entertainment by bringing two kinds of Weapons; the first were Staves, or wooden Files, call'd *Rudes*; and the second, effective Weapons, as Swords, Poniards, &c.

The first were call'd *Arms Inferior*, or *Exercitoria*; the second, *Decoratoria*, as being given by Decree, or Sentence of the *Praetor*; or of him at whose Expence the Spectacle was given.

They began to fence, or skirmish with the first, which was to be the Prelude to the Battle: From these, when well warm'd, they advanc'd to the second, with which they fought naked.

The first Part of the Engagement was called *ventilare, preludere*; and the second, *dimicare ad certum, or versis armis pugnare*: And some Authors think with much Probability, that it is to these two kinds of Combat that *St. Paul* alludes in the Passage 1 Cor. ix. 26, 27. *I fight, not as one that beatech the Air; but I keep under my Body, and bring it into Subjection.*

If the Vanquish'd gave up his Arms, it was not in the Victor's Power, to grant him Life: It was the People, during the time of the Republic; and the Prince, or People, during the time of the Empire, that were alone impowr'd to grant the Boot.

The Reward of the Conqueror was a Crown, or a Branch of the *Leutisk Tree*: Sometimes they gave them his Conque, or dismiss'd him, by putting one of the wooden Files, or *Rudes* in his Hand; and sometimes they even gave him his Freedom.

The Sign, or Indication whereby the Spectators shew'd that they granted the Favour, was to fall the Thumb; or clench it between the other Fingers: And when they would have the Combat finish'd, and the Vanquish'd slain, they rais'd the Thumb, and directed it towards the Combatants: Which we learn from *Juvenal, Sat. III. v. 36.*

The *Gladiators* challeng'd, or defied each other, by shewing the little Finger; which fame, during the Combat, was to own themselves overcome. *Pliny, L. XXVIII. c. 2. Prudentius, L. II. contra Symm. v. 1098. Horace, L. I. Ep. 18. v. 66. Politian. Miscell. c. 42. Turneb. Advers. L. XI. c. 6. Lips. Satum. L. II. c. 22.*

There were divers kinds of *Gladiators*, distinguish'd by their Weapons, Manner, and Time of fighting, &c. as

The *Andabata*, of whom we have already given an account under the Article *ANDABATA*.

The *Caterarii*, who fought in Troops, or Companies; Number, against Number. *Lipf. Lib. II. c. 16.*

The *Conjuncti*, whom Authors mention as a Species of *Gladiators*, the same with the *Rudarii* and *Veterani*; founding the Opinion on a Passage in *Pliny, L. VIII. c. 7.* But *Lipfius* shews, that they have mistaken *Pliny, Saturn. Lib. II. c. 16.* and *Turneb. Advers. L. XXX. c. 6.*

The *Cubicularii*, which are a little peculiar, being chiefly founded on a Passage in *Lampridius*, in the Life of the Emperor *Commodus*: *Inter haec habitu Vicinarius, vicinarius inmolavit, in arena rudibus, inter Cubicularios Gladiatores pugnavit lucentibus aliqua modo mucronibus.*

Turnebus reads *Rudarii*, in lieu of *Cubicularios*, and understands it of those who had been dismiss'd, and could no longer be oblig'd to fight, except with Files.

Salmustius reads *Gladiator*, and refers it to the Emperor, who fought not only on the *Arena*, and with Files, or blunted Instruments; but at home, with his Servants, and Valets de Chamber, and with Sharps.

Lippus will have nothing alter'd in the Text: The *Gladiatores Cubicularii*, he observes, were those who fought at private Houles, during Feasts, &c. Accordingly, *Dion* says expressly, that *Commodus* sometimes fought at home, and even kill'd some Person on such a Rencontre; but that in public he only fought with blunted Weapons.

The *Dimache*, or *Dimacheres*, who fought arm'd with two Poniards, or Swords; or with Sword and Dagger. *Lipf. Saturn. L. II. c. 13.*

The *Effedarii*, who fought in Cars; call'd also, in an inscription lately discover'd at *Lyons*, *Affedarii*. *Saturn. Serm. L. II. c. 13.*

The *Fiscales*, or *Casariani*, who belong'd to the Emperor's Company, and who being more robust and dexterous than the rest, were frequently call'd for; and therefore nam'd *Postulatii*. *Saturn. L. II. c. 15.*

The other Kinds were, the *Hepptomachi*, *Meridiani*, *Mermillones*, *Ordinarij*, *Provocatores*, *Retiarii*, *Rudiarum*, *Secutores*, *Spehatores*, and *Tiraces*: Which see describ'd under their several Articles *MERIDIANI*, *RETIARIJ*, *SECTORES*, &c.

Some Authors, and particularly *Viguere* on *Livy*, rank the *Obsequentes*, mention'd by *Spartan* in his Life of *Marcus Anrelin*, among the Number of *Gladiators*. *Lippus* laughs at him, *Saturn. L. II. c. 16.* and with some Reason: The *Obsequentes* properly were the Troops which that Emperor rais'd among the *Gladiators*, or whom of *Gladiators* he made Soldiers.

The War of the *GLADIATORS*, *Bellum Gladiatorum*, or *Spartacum*, call'd also the *Servile War*, was a War which the *Romans* sustain'd about the Year of their City 680.

Spartacus, *Crispus*, and *Oenonius*, having escap'd with thirty *Gladiators* more, out of the Place where they had been kept, at *Capua*, gather'd together a Body of Slaves, put themselves at their Head, render'd themselves Masters of all *Companis*, and gain'd several Victories over the *Roman* Praetors.

At length they were defeated, in the Year 682, at the Extremity of *Italy*, having in vain attempted to pass over into *Sicily*.

This War proved very formidable to the *Roman*. *Craesus* was not able to finish it: The Great *Pompey* was forc'd to be sent as General.—

GLADIUS, SWORD, or *Jus GLADIJ*, *q. d. Right of the Sword*, is us'd in our ancient *Latin* Authors, and in the *Norman* Laws, for a supreme Jurisdiction.

Cambden, in *Britannia*, writes, *Comitatus Fines pertinet ad Gladium Cestrie*. And in *Selden*, *Tit. of Honour*, p. 640. *Curiam suam liberam de omnibus placitis, &c. exceptis ad Gladium ejus pertinetibus*.

And it is probably from hence, that at the Creation of an *Earl*, he is *Gladio Juecinctus*, to signify that he had a Jurisdiction over the County. See *EARL*, *COUNT*, &c.

GLAND, GLANDULA, in *Anatomy*, a soft, spongy, lax kind of Body; serving to separate some particular Humor from the Mass of Blood. See *BLOOD*, and *HUMOR*.

The Antients took the *Glands* to be nothing more than a kind of *Pillows*, or *Cushions*, for the neighbouring Parts to rest on—Some of them, at length, began to fancy them *Sponges*; to receive and imbibe the superfluous Moisture of the other Parts.

Later Physicians came to assign them the nobler, and more important Uses—They consider'd them as *Cisterns*, which contain'd proper Ferments, whereby the Blood, upon its mixing therewith, was put into a Fermentation, in the Progress whereof it work'd, or threw off certain of its Parts, and sent them away by their excretory Ducts.

The Moderns, who allow'd them the Organs whereby the vital Fluids are separated for the Uses of the Body, consider'd them as *Filters*, the Pores whereof being all of different Figures, would only admit of similarly figur'd Particles, to pass thro' them.

But the latest Authors rather conceive the *Glands* as *Sieves*, whose Perforations being of different Sizes, tho' of the same Figure, only separate such Particles whose Diameters are less than their own.

The *Glands*, to the Eye, appear a sort of whitish, membranous Masses, compos'd of an outer Cover, or Integument, within which a vascular plexus Matter is contain'd. They are denominat'd from their Resemblance in-form, to *Acorns*, which the *Latin*s call *Glandes*.

By Dissection, and the Microscope, they are found to be real *Plexus*, or Pelotons of Vessels, variously wound, and implicat'd among themselves. But the modern Anatomists, *Malpighi*, *Bellini*, *Wharton*, *Noch*, *Peyser*, &c. have gone farther, and discover'd them to be no more than continued Convolutions of the capillary Arteries. See *ARTERY*.

Their Formation appears to be thus—An Artery arriving at a certain Part, is divided into an infinite Number of exceedingly fine Branches, or Ramifications: These capillary Branches are laid in various Bends and Circumvolutions; and from the Reversus thereof, arise new Branches, or Vessels,

for Veins; which, a little further, unite, or terminate in some larger Branch.

All these Ramifications, both Veins and Arteries, are roll'd up in a Bundle; making numerous Gyres, and Circumvolutions: And from the various Bends and Angles form'd by both Kinds, arise numerous other minute Vessels, which make the principal and most essential Part of the *Gland*.

The Blood brought from the heart-ward, by the Artery, into the glandular Plexus, pursues all the Turns, and meanders in the arterial Part thereof, till arriving at the venal Part, it is brought back again to the Heart. In the mean time, during its Progress thro' the Arterial and Venal Folds, some Part of it is absorb'd, or drain'd off, at the Orifices of the Tubules arising from the Flexures thereof.

What is thus received into these, which we may call the *Secretory Ducts*, is commonly taken up by other Tubules; springing out of them: These, joining together, form a single Canal, call'd the *Excretory Duct*; which, passing out of the Body of the *Gland*, carries off the secreted Matter into some proper Receptacle destin'd to retain, or receive it.

Tho', sometimes, the *Secretory Vessels* themselves terminate in a Basin, or Reservoir; and deposit their Contents therein.

Such is the general Structure, and Office of the *Glands*; which we shall further illustrate under the Article *SECRETION*.

A *Gland*, then, is a Composition of divers kinds of Vessels; viz. an Artery, and a Vein; *Secretory*, and *Excretory Ducts*: To which may be added a *Nerve*, which is found in every *Gland*, diffus'd thro' the whole Substance thereof, to furnish Spirits for the promoting the Secretion; and a *Membrane*, which supports the Convolutions of the Vein and Artery, accompanying them thro' all their minutest Divisions; and *Lymphaticks*, which have been discover'd in several *Glands*. See *VEIN*, *ARTERY*, *NERVE*, *SECRETORY*; *EXCRETORY*, and *LYMPHATIC*.

The *Secretory Tubes*, however, are what we principally consider as the Organ of the *Gland*. These alone do sometimes form the greatest Part of what is call'd a *Gland*, or glandular Body.

M. Wuyflew has discover'd a kind of *Tomentum*, or Down within their Cavity; which he supposes to do the Office of a *Filter*, and to be that whereby such a certain Humor is separated from the common Mass of Blood.—His System will be explain'd when we come to treat of *SECRETION*.

The *Down-Vessel* being the grand Organ of Secretions; its Structure and Application is diversified according to the different Purposes Nature has in view. Sometimes the Liqueur filtrated thro' it, trickles out, Drop by Drop, upon a Membrane, to which one Extremity of the Vessel is fasten'd; as where the Filtration is only intended for moistening and lubricating the Part, with that Liqueur: In which case the *Down-Vessel* is both *Secretory*, and *Excretory*; which is the most simple Case.—Such are those innumerable *Glands* spread thro' the greatest Part of the *Viscera*.

Sometimes a great Number of these *Down-Vessels* is spread over the inner Surface of a little, membranous Cell into which they pour their Liqueur, which is discharged hence at a little Aperture in the Cell: Such are the solitary *Glands* of the Intestines, which appear like so many little separate Grains.

Sometimes a Vessel is bent, and has only Down in the first Part thereof, which alone is *Secretory*, and the rest excretory, pouring the Liqueur into some other common Cavity.—Such are the *Glands* that compose a *Caeca* *Kidney*.

The *Secretory Vessels* are sometimes of a very great Length, notwithstanding that they take up but little room; being wound over themselves again and again; sometimes in a single Peloton, or Knot, and sometimes in several, inclosed in a common Membrane.—Whence the Distinction of *Glands* into *Conglobate*, and *Conglomerate*.

The *Glands* are of several Kinds, in respect of their Form, Structure, Office, and Use: Authors usually divide them into *Conglobate*, and *Conglomerate*.

Conglobate, or *Simple GLANDS*, are those consisting of one continuous Mass, with an uniform Surface.—Such are the *Subcutaneous GLANDS*.

A *Conglobate Gland*, is, more strictly, a little, smooth Body, wrap'd up in a fine, double Skin, by which it is separated from all the other Parts; only admitting an Artery, and Nerve to pass in, and a Vein and excretory Duct to go out.—These *Glands* either discharge their secreted Humor into the Chyle, or venous Blood; or else it transpires thro' the Pores of the Skin, or the Coats of the looser Membranes found in most Parts of the Body.

Of the *Conglobate* Kind are the *Glands* in the cortical Part of the Brain, where the animal Spirits are supposed to be secreted. See *CORTEX*, *BRAIN*, and *SPIRITS*.

Such also are the *Labial Glands*, and the *Testes*. See *TESTICLE*.

Conglomerate, or *Compound GLAND*, is an irregular Assemblage of several simple *Glands*, tied together, and wrap'd

wrap'd up under one common Membrane—Such are the *Mucillary Glands*, &c.

The Humors secreted in these *Glands*, are sometimes discharged at a common excretory Duct, form'd of an Union of the excretory Ducts of all the particular ones; as the *Pancreas* and *Carotides* do. See *PANCREAS* and *CAROTIDES*.

Sometimes, the Ducts uniting form several Tubes, only communicating with each other by cross Canals; as in those of the Breasts. See *MAMMÆ*.

Some, again, have several excretory Tubes, without any Communication together; as the *Glandule lachrymales*, and *prostatæ*. See *PROSTATÆ*, &c.

Others, have their several excretory Ducts inserted into a common Canal, which opens at last into some of the greater Cavities; as the *Salivary Glands*, *Intestinal Glands*, &c. See *SALIVA*, *INTESTINES*, &c.

Lastly, in others, each *Gland* has its own excretory Duct, thro' which it transmits its Liguor to a common Basin; such are those of the Kidneys. See *KIDNEY*, *PALVIS*, &c.

The *Glands* are again divided into *Vascular*, and *Vesicular*. *Vascular Glands* are only Clusters of little Vessels, which uniting together, form the Canal or excretory Duct through which their secreted Juice is discharged.

Vesicular Glands are Assemblages of Vesiculae communicating with each other, and all terminating in two or three larger Vessels; by a Prolongation whereof the excretory Duct is form'd.

The *Glands*, again, are divided into *Adventitious*; and *Perpetual*, or *Natural*.

Adventitious Glands are those Kernels arising occasionally under the Arms-pits, on the Neck, &c. Such are the *Strumæ*, and the Tumors sometimes found on the Larynx, and Middle of the Trachea.

Perpetual, or *Natural Glands* are of two Kinds, *Conglobate*, and *Conglomerate*. See *CONGLOBATE*, and *CONGLOMERATE*.

A List of the divers Sorts of Glands in the human Body, each whereof filtrates a different Humor.

Lumbal Glands, or *GLANDULÆ Lumbares*, are three *Glands*, thus called by *Barbolineus*, as lying on the Loins. See *LOINS*.

The two largest lie upon one another betwixt the descending Cava and Aorta, in the Angle made by the Emulgents with the Cava; The third and smallest stands over the former under the Appendices of the Diaphragm. They communicate, and are connected together by small lacteal Vessels. *Barbolineus* had concluded them to serve as a common Receptacle of the Chyle; but *Dr. Wharton's* Opinion is more probable, viz. that they supply the Place of those larger *Glands* found in the Melancheries of Brutes.

Miliary Glands, *GLANDULÆ Miliæres*. See *MILIARY Glands*.

Mucilaginous Glands are a kind of *Glands* first described by *Dr. Havers*. See *MUCILAGINOUS Glands*.

Mucous Glands, *GLANDULÆ Mucosæ*; see *MUCOUS Glands*.

Myrtiform Glands, are Contractions of the Hymen, broke by the first Act of Venery. See *MYRTIFORMES Glandule*; see also *HYMEN*.

Oderiferous Glands, *GLANDULÆ Oderifera*, are certain small *Glands* discover'd by *Dr. Tyson*, in that Part of the Penis, where the Prepuce is contiguous to the Balanus. See *PAPERYTIUM*.

He gave them this Name from the brisk Scent which their separated Liguor emits. In such Persons as have the Prepuce longer than ordinary, they are not only more in Number, but larger, and separate a greater Quantity of Juice; which, lodging there, often grows rancid, and corrupts the

Glands. These *Glands* are very conspicuous in most Quadrupeds, especially Dogs, and Boars.

Pineal Gland, *GLANDULA Pinealis*. See *PINEAL Gland*, and *CONARIUM*.

Pituitary Gland, *GLANDULA Pituitaria*. See *PITUITARY Gland*.

Renal Glands, *GLANDULÆ Renales*; call'd also *Capsule atrabillares*, are two *Glands*, first discover'd by *Eustachius*, between the Aorta, and the Kidneys, a little above the emulgent Vessels; tho' their Situation and Figure is varied: In some they are round; in others square, triangular, &c. The right is usually bigger than the left, and each about the Size of a *Nux Vomica*: They are inclin'd in Fat.

Their Use is not certainly known: 'Tis suppos'd to be to separate a Liguor from the Arterial Blood, before it go to the Kidneys.—See *ATRABILARES*.

GLANDERS, a filthy Disease in a Horse, consisting in a running of corrupt Matter from the Nose, of a different Colour, according to the Degree of the Malignity, or as the Infection has been of shorter or longer Continuance; being white, yellow, green, or black.—

Authors ascribe it to various Causes; some to Infection; some, to a Disorder of the Lungs; others, to the Spleen; some, to the Liver; and others, to the Brain—After it has been of so long standing, that the Matter is become of a blackish Colour, which is usually in its last Stage, they suppose it to come from the Spine; and hence call it the *Mourning of the Chine*.

Kernels and Knots are usually felt under the Caul in this Disorder: And as these grow bigger and more inflamed, so the *Glanders* increase more under the Horse's Body.

A late Author is of opinion, that the chief Seat of this Distemper is in a little, soft, spongy Flesh, which is easily dilated by the least Influx of the Blood: And thence it is that some Horses have a running at the Nose from a very slight Cold; but when this spongy Substance happens to be very much relaxed, the Running is increased in Proportion.

GLANDULA, in Anatomy, the same as *Gland*. See *Gland*.

The Word is a Diminutive of the Latin *Glans*, Acorn; and is here us'd on account of some external Resemblance between the *Glands* of the Body, and the Fruit of the Oak.

GLANDULÆ Sebaceæ, are a Number of *Glands* under the Skin of the Auricle of the Ear, first discover'd by *Valsalva*, and thus denominated, by reason they separate a greasy Matter, like *Sebum*, or Tallow. See *AVARICES*.

This *Sebum*, he asserts, being carried to the Surface of the Skin, turns into a scaly Substance, not unlike that of *Brus*.

GLANDULA Gnidionis, among Surgeons, is a Tumor resembling a *Gland*, soft, single, moveable, without Roots, and separated from the adjacent Parts.—

GLANDULÆ, in Anatomy, &c. a Diminutive of the Word *Gland*, signifying a little *Gland*.

Thus, the *Amygdales*, or Almonds of the Ears are called *Glandules*. See *TONSIL*.

GLANDULOUS, or *GLANDULAR*, something composed of *Glands*; or that abounds with *Glands*. See *GLAND*.

Thus, the Breasts are said to be *Glandulous Bodies*. See *BREASTS*.

The Cortical Substance of the Brain is commonly reputed to be *glandulous*: Tho' the Excellent *Ruyssch*, from the Discoveries made by his admirable Injections, holds that there is no such thing therein. See *BRAIN*.

The Antients distinguish'd a particular kind of Flesh, which they call'd *Caro glandulosa*, or *glandulous* Flesh. See *FLESH*.

GLANDULOUS Body, *GLANDULOSUS Corpus*, the same with *Prostata*. See *PROSTATÆ*.

GLANS, *Acorn*, in Natural History, a Fruit contain'd within a smooth, but hard Bark, including a single Seed; its Hind-part being cover'd with a kind of Cap, and the Fore-part bare. See *FRUIT*, and *SEED*; see also *TIMBER*, &c.

GLANS, in Anatomy, is the Tip, or Button of the Penis; or that Part cover'd with the Prepuce; call'd also *Balanus*. See *BALANUS*, and *PENIS*.

The *Glans* is only a Dilatation of the Extremity of the spongy Substance of the Urethra, bunch'd and turn'd back on the two conical Tips of the *Corpora cavernosa*, which terminate therein. See *URETHRA*, and *CAVERNOSEA Corpora*.

The Extremity of the Prepuce is apt to grow so straight in old Men, that it cannot bear the *Glans*; perhaps thro' the Defect of frequent Erections. See *PAPERYTIUM*; see also *ERECTION*.

GLANS is also us'd for the Tip, or Extremity of the Clitoris, from its Resemblance both in Form and Use, to that of the Penis. See *CLITORIS*.

The principal Difference consists in this, that it is not perforated: This *Glans* is also cover'd with a Prepuce, form'd of the inner Membrane of the Labia. See *PAPERYTIUM*.

GLASS, *Vitrum*, a transparent; brittle, facitious Body, produc'd of Salt and Sand, by the Action of Fire. See VITRIFICATION.

The Word *Glass* is form'd of the Latin *Glastum*, a Plant call'd by the Greeks *Ipsaris*, by others, *Aggicume*, by the Romans, frequently, *Arsifon*, sometimes *Vitrum*, by the ancient Britains, *Guadam*, and the English, *Wood*.

We find frequent Mention of this Plant in ancient Writers, particularly *Cesar*, *Vitruvius*, *Pliny*, &c. who relate, that the ancient Britains painted, or died their Bodies with *Glass*, *Glastum*, *Guadam*, *Vitrum*, &c. i. e. with the Blue Colour procur'd from this Plant.

And hence, the facitious Matter we are speaking of, came to be call'd *Glass*; as having always somewhat of this Blackness in it. See *WOOL*.

The Chymists hold that there is no Body but may be vitrified, i. e. converted into *Glass*—By intense Heat even Gold it self gives way to the Sun's Rays collect'd in a Burning-Glass, and becomes *Glass*. See *GOLD*, and *BURNING-Glass*.

Add, that as *Glass* is the Effect, or Fruit of Fire, so 'tis the last Effect: All the Chymists Art, and all the Force of Fire not being able to carry the Change of any natural Body beyond its Vitrification. Whence *Dr. Merret* mentions it as a merry Saying of a very great Artist in the Business of *Glass*, That their Profession would be the last in the World: For that when God should consume the Universe with Fire, all things therein should be turn'd to *Glass*. See VITRIFICATION.

Nature, Character, and Properties of GLASS.

Naturalists are divided, in what Class of Bodies to rank *Glass*—*Agricola* makes it a concrete Juice: *Belencensis*, a Stone: *Plinius* ranks it among the Media mineralia; and the Workmen, when in Fusion, call it *Metal*. But *Dr. Merret* with Reason sets aside all these Opinions, from this Consideration, that all the forementioned Bodies are natural Concretes; whereas *Glass* is a Compound made by Art, and never found in the Earth, as the others are.

Fallopius, indeed, contends, that *Glass* is no more artificial than a Metal; and that they are both equally extract'd, or educ'd from other Bodies: The one from Sand; the other from its Ore.—He adds, that tho' Ashes be added to Sand, for the making of *Glass*, yet it is false that they contribute to the Composition of *Glass*; their Use, according to him, being only for the better extracting of the *Glass* from the mineral Stone.

This, *Dr. Merret* easily confutes: For if *Glass* were extract'd from the Stones, or Sand only, the Weight of the Metal must be much less than that of the Stones alone; whereas, it is much greater, an hundred Weight of Sand, sufficing for 50 of *Glass*.

In effect, the Ashes contribute a deal of Salt to the Composition of *Glass*—Accordingly, in Pieces of old *Glass*, one may sometimes pick out Grains of Salt, easily discoverable to the Taste; beside that the finest *Glass*, standing long in a subterranean Place, will moulder or resolve into its first Ingredients, Salt and Sand, by the Decay of the Union thereof. Whence it appears that the Salt remains in the *Glass*, in Specie: To which may be added that Experiment of *Van Helmont*. "Melt *Glass*-Dust with Sandever, and "set them in a moist Place; and the *Glass* will resolve into "Water. Pour on *Aqua regia*, enough to saturate the "Sandever; and the Sand will precipitate to the Bottom "in the same Quantity, and Weight, as was first used." *Helm. Cap. De Terra*.

Here, then, is a true Analysis of *Glass*; or a Solution into its first Principles, or Ingredients: The Salt being imbib'd by the Sandever, and *Aqua Regia*. *Merret. in Ant. Neri De Art. Vitrar.*

The learned, and curious Author just mentioned, gives us the following Characters, or Properties of *Glass*; whereby it is distinguish'd from all other Bodies; viz. 1° That it is an Artificial Concrete of Salt, and Sand, or Stones: 2° Fusible, by a strong Fire. 3° When fused, tenacious, and coherent. 4° It does not waste, or consume in the Fire. 5° When melted, it cleaves to Iron. 6° Ductile, when red hot, and fashionable into any Form; but not malleable: And capable of being blown into a Hollowness; which no Mineral is. 7° Frangible, when thin, without annealing. 8° Friable, when cold. 9° Always diaphanous, whether hot, or cold. 10° Flexible, and Elastic. 11° Dissoluble by Cold and Moisture. 12° Only capable of being green, or cut with Diamond, and Emery. 13° Receives any Colour, or Dye, both externally, and internally. 14° Not dissoluble by *Aqua fortis*, *Aqua regia*, or *Mercury*. 15° Neither Acid Juices, nor any other Matter extract'd either Colour, Taste, nor any other Quality from it. 16° It admits of polishing. 17° Neither loses of Weight, nor Substance by the longest, and most frequent Use. 18° Gives Fusions to other Metals, and softens them. 19° The most

pliable thing in the World, and that which best retains the Fashion given it. 20° Not capable of being calcined. 21° An open *Glass*, fill'd with Water in the Summer-time; will gather Drops of Water on the Out-side so far as the Water on the Inside reaches; and a Man's Breath blown upon it will manifestly moisten it. 22° Little *Glass* Balls fill'd with Water, Mercury, or other Liqueur, and thrown into the Fire; as also Drops of Green *Glass* broken, fly asunder with a loud Noise. 23° Neither Wine, Beer, nor any other Liqueur will make it mussy, nor change its Colour, nor rust it. 24° It may be cemented as Stones, and Metals. 25° A Drinking *Glass*, partly fill'd with Water, and rubb'd on the Brim with a wet Finger, yields musical Notes, higher, or lower, as the *Glass* is more or less full, and makes the Liqueur stir and leap.—

For the Flexibility of *GLASS*, see further under FLEXIBILITY of *Glass*.

For the Malleability of *GLASS*, see MALLEABILITY, &c.

History, and Antiquity of GLASS.

De Neri will have *Glass* as ancient as *Job*: For that Writer, c. XXVIII. v. 17. speaking of Wisdom, says, *Gold and Glass shall not be equal'd to it*.

This, we are to observe, is the Reading of the *Septuagint*, Vulgate Latin, *St. Jerom*, *Pineda*, &c. For in the English Version, instead of *Glass*, we read *Crystal*; and the sense is done in the *Chaldee*, *Arius Montanus*, and the King of Spain's Edition: In other Versions, &c. it is read a Stone; in others, a Beryl: In the Italian; Spanish, French; High and Low Dutch, &c. a Diamond; in others, a Carbuncle; and in the *Thurgom*, a Looking *Glass*.

In effect, the Original Word is *Zachachab*, from the Root *Zaac*, to purify, cleanse, refine, be white, transparent: And the same Word, *Exod. XXX. 34*, is applied to *Frankincense*, and render'd in the *Septuagint*, *pellucid*.—Hence the Reason of so many different Renderings: For the Word signifying beautiful, and transparent in the general, the Translators were at liberty to apply it to whatever was valuable and transparent.

Most Authors will have *Aristophanes* to be the first Author who mentions *Glass*: That Poet, in his Comedy call'd *the Clouds*; *Scen. I. Act 2*, uses the Word *Hyalos*, *vazos*, which is now ordinarily render'd *Glass*. He there introduces *Strepsiades*, teaching *Socrates* a new way to pay old Debts, viz. "by placing a fair transparent Stone sold by the Druggists, "from which Fire is struck, between the Sun and the Writ- "ing; and so melting away the Letters thereof." This Stone *Socrates* calls *vazos*; which the *Sevotiast* on *Aristophanes* derives from *vaz*, to rain, from the Likeness it bears to Ice, which is Rain, or Water congeal'd; tho' it must be own'd the Word *vazos* is ambiguous, and signifies *Crystal* as well as *Glass*: And *Gorrens* relates that they had a kind of yellow Amber, transparent as *Glass*, call'd by some, *vazos*.

Aristotle has two Problems upon *Glass*; the first, *Why we see through it?* The second, *Why it cannot be beaten?* If these Problems be *Aristotle's*, which the Learned doubt very much; this would probably be the earliest Piece of Antiquity of *Glass*: But the first Author, who makes unqueint'd Mention of this Matter, is *Alexander Aphrodisiensis*, who uses it in a Simile: "As the Floridness of a Colour is seen thro' "Glass," &c.

After him the Word occurs constantly enough: *Lucius* mentions large Drinking *Glasses*; and *Plutarch*, in his *Symposiaco*, says that the Fire of *Tamarisk* Wood is fittest for the making of *Glass*.

Among the Latin Writers, *Lucretius* is the first that takes notice of *Glass*.—*Nisi recta foramina traxant—Qualia sunt Vitri*—

Dr. Merret, however, adds, that *Glass* could not be as unknown to the Ancients; but that it must needs be as ancient as Pottery itself, or the Art of making Bricks: For scarcely can a Kiln of Bricks be burnt; or a Batch of Pottery Ware be made, but some of the Bricks, and Ware, will be at least superficially turn'd to *Glass*: And therefore, without doubt it was known at the Building of *Babel*.

Hence, *Ferrant Imperatus*, lib. 25. c. 7. "Gloss, like tho' artificial Kind, is found under Ground, in Places where "great Fires have been.—Other *Glasses* are found in round "Clods, like Firestone, some brittle, others firm, &c. This "Fossil *Glass* is wrought by the Americans, and used in "stead of Iron." lib. XXI. c. 7. And no doubt, but Vitrifications were more common in the ancient Bricks than ours: as they temper'd their Earth two Years together, and burnt them better. See *BARICA*.

Pliny relates the manner of the Discovery of *Glass*—It was found, according to that Author, by accident, in *Syria*, at the Mouth of the River *Belus*, by certain Merchants driven thither by the Fortune of the Sea. Being obliged to live there, and dress their Victuals, by making a Fire on the Ground; and there being Store of the Plant *Kali* upon the Spot; this Herb being burnt to Ashes, and the Sand or

Stones of the Place, accidentally mix'd with it, a Vitrification was undesignedly made. From whence the Hint was taken, and easily improved.

Indeed, how old soever *Glass* may be; the Art of making, and working it, appears of no great Antiquity.—The first Place mention'd for the making hereof, is *Sidon* in *Syria*, which was famous for *Glass* and *Glass-houses*, as observ'd by *Pliny*, *L. XXXVI. c. 26.*—The first Time we hear of *Glass* made among the *Romans*, was in the Time of *Tiberius*; when *Pliny* relates that an Artificer was put to death for making *Glass* Malleable. See *MALLEABILITY.*

Venice, for many Years, excell'd all *Europe* for the Fineness of its *Glasses*. The great *Glass-works* were at *Muran*, or *Murau*, a Village near the City, which furnish'd all *Europe* with the finest and largest *Glasses*. But within this fifty Years the *French* and *English*, have not only come up to, but even surpass'd the *Venetians*; so that we are now no longer supplied from abroad.

The *French* made a considerable Improvement in the Art of *Glass*, by the Invention of a Method to cast very large Plates; till then unknown; and scarce practic'd yet, by any but themselves, and the *English*.

That Court applied itself with a laudable Industry to cultivate and improve the *Glass* Manufacture.—A Company of *Glass-men* was establish'd by Letters Patents; and it was provided by an Act, not only that the working in *Glass* should not derogate any thing from Nobility, but even, that none but Nobles should be allowed to work therein.

Ingredients of GLASS, with the Method of preparing them.

The Materials used in the Composition of *Glass*, we have observ'd, are *Salt*; and *Sand*, or *Stone*. See *SALT*, and *SAND*.

The *Salt* is of the fix'd Kind; such as will not evaporate with the most intense Heat.—The *Sand*, or *Stone* must be such as will melt easily: This is what gives Firmness and Consistence to the *Glass*.

1^o This *Salt* is procur'd chiefly from a kind of *Ashes*, call'd *Polverine*, or *Rochetta*, brought from the *Levant*, and particularly from *Alexandria* and *Tripoli*.—The *Ashes* are those of a Vegetable, frequent in the Country, commonly call'd *Kali*; sometimes *Kalli*; *Kallu*; *Cali*; by *Gesner*, *Alkali*; by *Lobel*, *Soda*; by *Dodonæus*, *Salsola*; and by *Camer. Cordus*, *Fuchsius*, &c. *Ambyllis*. *Dr. Merret* calls it *English Salt-sour*, from its Saline Taste; and *Glass-wood*, from the Use made of its *Ashes* in making of *Glass*. See *KALI* and *POLVERINE*.

Bauhin mentions ten Species of this Plant; whereof there are four used by the *Alexandrians*, &c. for the making of *Polverine*, and *Soap*; viz. *Kali geniculatum*; *Kali ferunda species*; *Kali Egyptianum*; and *Kali Spinosum*.

The first and last, our own Coasts affords, where they are call'd by the People *Frog-grass*, and *Sea-grass*; but they are of no use for making of *Glass*: Being laid on a hot Iron, they fly off almost wholly in Pumes, leaving no *Ashes* at all; whereas the *Kalies* brought from the *Levant*, applied on the same Iron, are soon converted almost wholly into *Polverine*, i. e. very saline *Ashes*, of a dark Colour. See *SOAP*.

To get the *Salt* from this *Polverine*, they pulverize, and sift it very fine; then boil it in a Brass Copper, with fair Water and Tarter, till a third Part of the Water is consumed; taking care to stir it from time to time. Then, filling up the Copper with fresh Water, they boil it a second time, till half be consumed: This done, they have a Lee impregnated with *Salt*. To get the *Salt* from the Lees, they boil them, till the *Salt* shoots at the Top; which they scum off as it rises. An hundred Pounds of *Ashes*, this way, usually yields eighty or ninety of *Salt*.

When the *Salt* is dry, they beat it grossly, and put it into a Furnace, to dry it further with a gentle Heat. When sufficiently dry, they pound and sift it very fine, and lay it by to make *Frit*. See *Frit*.

Note. Instead of the *Ashes* of the Plant *Kali*, those of *Fern* will also yield a *Salt*, which makes excellent *Glass*; nothing inferior to that of *Polverine*. The Method of Preparation is the same. Add, that the *Ashes* of the Cods, and Stalks of Beans; as also those of Coleworts, Beambic Bush, Millet Stalks, Rushes, Fern Rushes, and many other Plants may be us'd for the like Purpose, and after the same manner.

2^o For *Sand*, the second Ingredient in *Glass*.—The best, we have observ'd, is that which will melt, is white, and transparent. This is found principally in *Italy*, called a sort of Marble, call'd *Tarso*: The next is *Quartz*, or *Quartz*, a sort of Pebbles found at the Bottoms of Rivers.

Indeed, nothing makes finer and clearer *Glass* than *Flint*, but the Charge of preparing it, deters the *Glass-men* from using it. The Preparation necessary for *Stone*, is to calcine, powder, and sieve it.

Aut. Neri observes, that all white, transparent Stones, which will not burn to Lime, are fit to make *Glass*; and

that all Stones which will strike Fire with Steel, are capable of being employ'd in making of *Glass*. But this latter Rule, *Dr. Merret* observes, does not hold universally.

Where proper *Stone* cannot be had, *Sand* is us'd: The best for the purpose is that which is white and small; for green *Glass*, that which is harder, and more gritty: It is to be well wash'd; which is all the Preparation it needs.—Our *Glass-houses* are furnish'd with white Sand for their Crystal *Glasses* from *Maldstone*; and with the coarser, for green *Glass*, from *Maldstone*.

Some mention a third Ingredient in *Glass*, viz. *Manganese*, or *Sydera*, a kind of *Pfunds* Leadstone, dug up in *Germany*, *Italy*, and even in *Mendip Hills* in *Somersetshire*. But the Proportion hercof to the rest, is very inconsiderable; besides, that it is not used in all *Glass*. Its Office is to purge off the natural greenish Colour, and give it some other Tincture requir'd.

Method of making White, and Crystal GLASS.

There are three sorts of Furnaces us'd in the *Glass-works*: One to prepare the *Frit*, call'd the *Calcar*: A second to work the *Glass*; and a third, call'd the *Leer*, to anneal it. See them all describ'd under the Article *FURNACE*.

To make *Crystal Glass*, take of the whitest *Tarso* pounded small, and sieved as fine as Flower, two hundred Pounds; and *Salt of Polverine*, an hundred and thirty Pounds. Mix them together, and put them into the Furnace call'd *Calcar*, first beating it. For an Hour keep a moderate Fire, and keep stirring the Materials, that they may incorporate and calcine together. Then increase the Fire for five Hours: After which take out the Matter; which being now sufficiently calcined, is call'd *Frit*.—From the *Calcar* put the *Frit* in a dry Place, and cover it up from the Dust, for three or four Months. See *Frit*.

Now, to make the *Glass*, or *Crystal*: Take of this *Crystal Frit*, call'd also *Bollito*; set it in Pots in the Furnace, adding to it a due Quantity of *Manganese*: When the two are fused, cast the Fluor into fair Water, to clear it of the *Salt*, call'd *Sandever*; which would otherwise make the *Crystal* obscure, and cloudy. This Lotion must be repeated again, and again, as oft as needful, till the *Crystal* be fully purged. Then set it to boil four, five, or six Days; which done, see whether it have *Manganese* enough; and if it be yet greenish, add more *Manganese*, at Discretion, by little and little at a time; taking care not to overdose it, by reason the *Manganese* inclines it to a blackish Hue. Then let the Metal clarify, till it become of a clear, and shining Colour: Which done, it is fit to be blown, or form'd into Vessels at pleasure.

There are three principal Kinds of *Glasses*, distinguish'd by the Form, or manner of working them; viz. *Round Glass*, as these of our Vessels, Phials, Drinking Glasses, &c. *Table or Window Glass*, of which there are divers Kinds, viz. *Crown Glass*, *Jealous Glass*, &c. and *Plate Glass*, or *Looking Glass*.

Method of Working or Blowing Round GLASS.

The Working Furnace, we have observ'd, is round, and has six *Bocces*, or Apertures: At one of these, call'd the *great Bocca*, the Furnace is heated, and the Pots of *Frit* set in the Furnace: Two other, smaller Holes, call'd *Boccellas*, serve to lade or take out the melted Metal, at the End of an Iron, to work the *Glass*. At the other Holes, they put in Pots of other fusible Ingredients, to be prepared, and at last emptied into the Lading Pot.

There are six Pots in each Furnace, all made of Tobacco-Pipe Clay, proper to sustain not only the Heat of the Fire, but also the Effect of the *Polverine*, which penetrates every thing else. There are only two of these Pots that work: The rest serve to prepare the Matter for them. The Fire of the Furnace is made and kept up with dry, hard Wood, cast in, without Intermission, at the six Apertures. This they never omit, not even on the most solemn Festivals.

When the Matter contain'd in the two Pots is sufficiently vitrified, they proceed to blow, or fashion it: The Process whereof we shall here deliver from *Agricola*, *Dr. Merret*, the *French Diction. de Commerce*, &c.

The Operator, or *Servitor* (the Metal being now sufficiently refined) takes his Blowing Iron, which is a hollow Tube, about two Foot and a half long; and dipping it in the Melting-pot, there turns it about: The Metal sticks to the Iron, like some glutinous, or clammy Juice, much like but more firmly, than *Turpentine*, or *Venice Treacle*.

For each *Glass* he dips four times, and at each Dip rolls the End of his Instrument, with the *Glass* thereon, on a piece of Iron, over which is a Vessel of Water; the Coolness whereof helps to consolidate the *Glass* more readily, and disposes it the better to bind with the next to be taken out of the Pot.

After they have dip'd the fourth time, and there is now Matter enough on the Instrument, the Operator begins to blow gently thro' the Iron; by which he raises or lengthens it nearly a Foot; much as we do by blowing in a Bladder, or Globe: And to give it a Polish, he rolls it to and fro on a Stone, or Marble.

This done, he blows a second time, and thus forms the Bunch, or Belly of the *Glass*. The Matter by this second Blast assumes the Figure of a Gourd, or Calicab, eighteen or twenty Inches in Diameter. As often as the Operator blows into the Iron (which must be very often) he removes it hastily from his Mouth to his Cheek, lest he should draw the Flame into his Mouth, when he re-applies it to the Iron.

The Operator whirls his Iron many times round his Head, to lengthen and cool the *Glass*; sometimes the *Glass* thus blown round, is return'd to the Fire, where it flattens a little of itself: When flattened, it is taken out, and cooled; and if needful for the Design, the Workman flats its Bottom, by pressing it on the Marble; or moulds it in the *Stamp-iron*: And thus delivers it to the Master Workman, to break off the Collect.

The Collect, or Neck, is the narrow Part which clove to the Iron: To for the *Glass* at liberty, they lay a Drop of cold Water on the Collect; which by its Coldness, cuts, or cracks about a Quarter of an Inch: After which, giving it a slight Blow, the Fracture is communicated all round the Collect. The wast Piece to be thrown by to make green *Glass*.

This done, they dip an Iron Rod, or *Pontego* in the Melting Pots, and with the Manner that sticks thereto, they apply and fasten it to the Bottom of the Vessel, opposite to the Collect.—The Vessel thus sustained by the Iron Rod, is carried to the great Bocca to be heated, and scalded; and while another Person takes care thereof, the former Operator rests and prepares himself for the *Bronching*.

To *branch*, or make the Bowl, they thrust in an Iron Instrument, call'd *Passage*; and the Aperture, open'd thereby, they further augment, and widen with the *Procello*: In turning this Instrument about, to form the Bowl, the Edge becomes thick'd; the *Glass* being, as it were, doubled in that Part: Whence the Hem observed on the Circumference of our *Glasses*.—What is superfluous, they cut off with the Shears.

The Vessel thus open'd, is return'd to the great Bocca; where, being sufficiently heated a second time, the Workman gives the Bowl its finishing, by turning it about with a circular Motion; which it increases, in proportion as the Bowl opens, and enlarges by means of the Heat and Agitation.

The *Glass* thus finish'd, they carry it from the Bocca, still turning it round, to a kind of earthen Bench, cover'd with Brands, or Coals extinguish'd: Here they let it cool a little, and come to its Consistence, having first detach'd it from the Iron Rod, by a Stroke or two with the Hand.

Thus, with blowing, pressing, scalding, amplifying, and cutting, the *Glass* is framed into the Shape preconceived in the Workman's Mind. If need be, he proceeds to put on a *Foot* and *Handle*; and with the *Spici* puts on *Rogaries*, and *Marblings*.

When the Master has finish'd a Number of them, another Servitor takes them with an Iron Fork, and speedily places them in the Tower, or *Leer* to anneal and harden. See FURNACE, ANNEALING, &c.

What has been here said of White, or Crystal *Glass*, holds equally of common, or Green *Glass*; the working being the same in all; and the Difference only in the Salt, or Pulverine made use of.

So many Masters as there are, so many Pots, at the least, and so many Bocca's there must be; each Man having his proper Station; where, says Dr. Merret, they receive those scorching Heats falling directly into their Faces, Mouths, and Lungs; whence they are forc'd to work in their Shirts, like the *Cyclopes*, and *Nudi-membra Pyrraemones*, with a Straw broad-brim'd Hat on their Heads, to defend their Eyes from the excessive Heat and Light.—They sit in large, wide, wooden Chairs, with two long Elbows, to which their Instruments are hung. They work six Hours at a time, measur'd by a single *Glass*; after which they are relieved by others, for the like Times: So that the Furnaces are never idle.

Method of working, or blowing WINDOW, or TABLE GLASS.

The Method of making Crown Window *Glass*, now practis'd in England, is said to have been borrow'd from the French.—An English *Glass*-maker went over, to work in France, on purpose to get into the Secret; which, when he had attain'd to, he return'd, and set up a *Glass*-work, where-in he far outdid the French, his Teachers.

This *Glass* is blown much after the manner of Looking *Glass*. Some Writers, from wrong Intelligence, have said that it was run, or cast in Sand: But the real Process is as follows.—

The Furnace, Melting-pots, Materials, and Fire are the same for Window, or Table *Glass*; as for Round *Glass*; and the Difference in the Operation only commences after the Servitor has dip'd his Blowing-iron the fourth time in the melted Metal.

The *Glass*, then, being in this Condition, they blow it; but instead of rounding, or forming it into a Bunch; the particular Motion the Workman gives it in the directing and managing the Wind, and the way of rolling it on the Iron; make it extend in length two or three Feet, and form a Cylinder, which at first is but two Inches in Diameter; but which, by being re-committed to the Fire, and blown a-fresh when taken out, becomes of the Extent required for the Table of *Glass* to be form'd. With this Circumstance however, that the Side which is fasten'd to the Iron, goes gradually diminishing, and ends in a kind of Cone, or Pyramid.

To render the two Ends nearly of the same Diameter, after adding a little *Glass* to that opposite to the Iron, they draw it out with a Pair of Iron Pinchers. Then they incide, or cut off the same End with a little Water; and carrying the Cylinder back to the Bocca, they incide it likewise with Water in two other Places; one, eight, or ten Inches from the Iron; and the other, the whole Length.

The *Glass* Cylinder thus abridg'd of both its Extremities, is, next, heated on a kind of earthen Table, somewhat rais'd in the Middle, in order to promote its Opening at the Place incided longitudinally. The Workman, here, makes use of an Iron, wherewith he alternately lowers and raises the two Sides, or Halves of the Cylinder, which now begin to open, and unfold like a Sheet of Paper, and at length grow perfectly flat.—The Table of *Glass* is now in its last Perfection, and needs nothing farther but to be heated over again: When taken out, they lay it on a Table of Copper; whence, after it has cool'd and come to its Consistence, they carry it on Forks to the Tower of the Furnace, where they leave it to anneal for 24 Hours.

The Number of Tables anneal'd at a time, which sometimes amount to an hundred, with the perpendicular Situation they are set in, occasion'd, antiently, that those set in first, sustaining in some measure, the Pressure of all the last, were bent; and thus render'd inconvenient for Use: But this Inconvenience is now remedied, by separating them into Tens, with an Iron Shiver; which diminishing the Weight, by dividing it, keeps the Tables as flat, and even as they were put in.

Kinds of Table, or Window GLASS.

There are divers Sorts of this *Glass*, made in divers Places, for the use of Building: Those most known among us, are given us, by the Author of the *Builders Dictionary*, as follows:

Crown-Glass, of which, says that Author, there are two Kinds; distinguish'd by the Places where they are wrought, viz. 1^o *Ratcliff Crown Glass*, which is the best and clearest; and was first made at the Bear Garden, on the Bank-side, *Southward*; but since at *Ratcliff*: Of this there are 24 Tables to the Cafe, the Tables being of a circular Form, about three Foot six Inches in Diameter. See TABLE, and CASE. 2^o *Lambeth Crown Glass*, which is of a darker Colour than the former, and more inclining to green.

French Glass, also call'd *Normandy Glass*, and formerly *Lorraine Glass*, because made in those Provinces. At present it is made wholly in the *Nine Glass Works*; five whereof are in the Forest of *Lyon*; four in the County of *Eu*; the last, at *Beausant*, near *Rouen*.—It is of a thinner Kind than our *Crown Glass*; and when laid on a Piece of white Paper, appears of a dirtyish green Colour. There are but 25 Tables to the Cafe.

German Glass, is of two Kinds, White, and Green: The first is of a whitish Colour, but subject to those small, curved Streaks, observed in our *New-Castle Glass*; tho' free from the Spots and Blemishes thereof. The Green, beside its Colour, is liable to the same Streaks as the White: But both of them are straighter, and less warped than our *New-Castle Glass*.

Dutch Glass, is not much unlike our *New-Castle Glass*, either in Colour, or Price. 'Tis frequently much warped, like that, and the Tables are but small.—

New-Castle Glass, is that most used in England. 'Tis of an Ash Colour, and subject to Specks, Streaks, and other Blemishes; and beside is frequently warp'd. *Lezyburn* says, there are 45 Tables to the Cafe, each containing five superficial Feet: Some say there are but 35 Tables, and six Foot in each Table.

Method of working PLATE-OR LOOKING GLASS.

The Materials wherof *Looking Glass* is made, are much the same as those of other Works of *Glass*; viz. an Alkali Salt, and Sand.

The Salt, however, it is to be observ'd, should not be that extracted from *Potverine*, or the Ashes of the *Syrian Kali*; but that from *Barillia*, or the Ashes of a Plant of that Name, of the Genus of *Kalics*, but growing about *Alicant* in *Spain*.—'Tis very rare that we can have the *Barillia* pure; the *Spaniards*, in burning the Herb, make a Practice of mixing another Herb along with it, which alters its Quality; or of adding Sand to it, to increase the Weight: Which is easily discover'd, if the Addition be only made after the boiling of the Ashes, but next to impossible, if made in the boiling. It is from this Adulteration that those Threads and other Defects in *Plate Glass* arise.—To prepare the Salt, they clean it well of all foreign Matters; pound or grind it with a kind of Mill, and sift it pretty fine.

As to the Sand, 'tis to be sifted, and wash'd, till such time as the Water cometh off very clear; and when it is well dried again, they mix it with the Salt, passing the Mixture thro' another Sieve. This done, they lay them in the annealing Furnace for about two Hours; in which time the Matter becomes very light, and white: In which State they are called *Frit*, or *Fritta*, and are to be laid up in a dry, clean Place, to give them time to incorporate, for at least a Year. See *Frit*.

When they would employ this *Frit*, they lay it for some Hours in the Furnace, adding to some, the Fragments, or Shards of old, and ill made *Glasses*; taking care first to calcine the Shards, by heating them red hot in the Furnace, and thus casting them into cold Water. To the Mixture must likewise be added *Manganese*, to promote the Fusion, and Purification.

The Matter thus far prepared, is equally fit for *Plate Glass* to be form'd either by *Blowing*, or *Casting*.—

Method of blowing LOOKING-GLASS-PLATES.

The Work-houses, Furnaces, &c. used in the making of this kind of *Plate Glass*, are the same as those in the following Article, to which the Reader is refer'd.

The Melting-pots, wherein the Materials to be blown, are fused, are 38 Inches in Diameter, and 35 high. After those Materials are vitrified by the Heat of the Fire; and the *Glass* is sufficiently refined; the Master Workman dips in his *Blowing-iron*, once, and again, till he has got Matter enough thereon.

This done, he mounts on a kind of Block, or Stool, five Foot high, to be more at liberty to balance it, as it lengthens in the blowing. If the Work be too heavy for the Workman to sustain on his *Blowing-iron*, two or more Attendants assist him, by holding Pieces of Wood under the *Glass*, in proportion as it stretches, for fear it should fall off the Iron by its own Weight.

When, after several repeated Heatings, and Blowings, the *Glass* is at length brought to the Compass, proper for its Thickness, and the Quantity of Metal taken out; they cut it off with Forces, at the Extremity opposite to the Iron, in order to point it with the *Pointil*.

The *Pointil* is a long, firm Piece of Iron, having a Piece going a-cross one of its Ends, in manner of a T: To point the *Glass*, they plunge the Head of the T into the Melting-pot; and with the Liquid *Glass* sticking thereto, they fasten it to the Extremity of the *Glass* before cut off. When it is sufficiently fasten'd, they separate the other Extremity of the *Glass* from the *Blowing-iron*; and instead thereof, make use of the *Pointil* to carry it to the Furnaces appointed for that end; where, by several repeated Heatings, they continue to enlarge it, till it be equally thick in every Part.

This done, they cut it open with the Forces; not only on the Side by which it stuck to the *Blowing-iron*, but likewise the whole Length of the Cylinder: After which, giving it a sufficient Heating, it is in a condition to be entirely open'd, extended, and flatten'd. The manner of doing which is much the same as for *Table Glass*, and need not be here repeated.

Lastly, the *Glass* being sufficiently flatten'd, is laid to anneal, for ten, or fifteen Days, according to the Size and Thickness.

It may be observ'd, that *Looking Glasses* thus blown, should never be above 45, or at most 50 Inches long, and of a Breadth proportionable. Those exceeding these Dimensions, as we frequently find among the *Venice Glasses*, cannot have the Thickness sufficient to bear the Grinding; and beside are subject to warp, which prevents them from regularly reflecting Objects.

Method of casting, or running large LOOKING-GLASS-PLATES.

This Art is of *French* Invention; and not above fifty Years old. 'Tis owing to the Sieur *Abraham Thevenot*, who first propos'd it to the Court of *France*, in 1688.

It is perform'd much like the casting of *Sheer Lead*, among the *Plumbers*: By means hereof we are not only enabled to

make *Glasses* of more than double the Dimensions of any made the *Venetian* way of blowing; but also to cast all kinds of Borders, Mouldings, &c.

The Furnaces for melting the Materials of this Manufacture, are of enormous Size; and those for annealing the *Glasses* when form'd, are much more so. Round a Melting-Furnace, there are at least twenty four Annealing Furnaces; each from 20 to 25 Foot long: They are called *Carquasses*: Each *Carquasse* has two *Tyfferts*, or Apertures, to put in Wood, and two Chimnies. Add, that beside the Annealing Furnaces, &c. there are others for the making of *Frit*, and calcining old Pieces of *Glass*.

All these Furnaces are cover'd over with a large Shed; under which are likewise Forges, and Work-houses for Smiths, Carpenters, &c. continually employ'd in repairing, and keeping up the Machines, Furnaces, &c. As also Lodges, and Apartments, for these, and the other Workmen employ'd about the *Glass*; and in keeping up a perpetual Fire in the great Furnace: So that the *Glass*-house, as that in the Castle of *St. Gooen*, in the Forest of *Fore*, in the *Styffenois*, appears more like a little City, than a Manufactory.

The Inside of the Furnaces are form'd of a sort of Earth, proper to sustain the Action of the Fire; and the same Earth serves for Melting-pots, Cisterns, &c. The Furnaces seldom last above three Years; after which they are to be rebuilt, from Bottom to Top: And to keep them good even for that Time, the Inside must be refitted every six Months. The Melting-pots are as big as Hogheads, and contain above two thousand Weight of Metal. The Cisterns are much smaller, and serve for the Conveyance of the liquid *Glass*, which is drawn out of the Pots, to the Casting Tables.

When the Furnace is in a condition to receive the Pots, and Cisterns, they heat it red hot: This done, they fill the Pots with Materials; which is done at three times, to facilitate the Fusion. When the Matter is sufficiently vitrified, refined, and settled, which usually happens in twenty four Hours; they fill the Cisterns, which are in the same Furnace, and which are left there about six Hours longer, till such time as they appear all white, through the excessive Heat.

To get the Cisterns with the Metal out of the Furnace; they make use of a large Iron Chain, which opens and shuts with Hooks, and Eyes. From the Middle hereof, on each Side, arise two massive iron Pins, whereby, with the Assistance of Palles, the Cisterns are rais'd on a kind of Carriage of a proper Height; and thus conducted to the Table where the *Glass* is to be run. Here, slipping off the Bottom of the Cistern, there rushes out a Torrent of Matter, all in Fire, wherewith the Table, prepared for that purpose, is presently cover'd.

The Table, whereon the *Glass* is to be run, is of Pot Metal, about nine Foot long, and broad in proportion. It is supported on a wooden Frame, with Trucks, for the Convenience of removing from one *Carquasse*, or Annealing Furnace to another, in proportion as they are fill'd.—

To form the Thickness of a *Glass*, there are two Iron Rulers, or Rims, placed a-round the Edge of the Table; and on these, rest the two Extremes of a kind of Roller, which serves to drive the liquid Matter before it to the End of the Table, or Mould. The iron Rulers, being moveable, and capable of being set closer, or further a-part at pleasure, determine the Width of the *Glasses*, and retain the Matter, that it does not run off at the Edges.

As soon as the Matter is arriv'd at the End of the Table, and the *Glass* is come to a Consistence, which is in about a Minute; they shove it off into the Annealing Furnace, where it slides with ease enough, by reason of the Sand strew'd thereon.

What is most surprizing throughout the whole Operation, is the Quickness, and Adrefs, wherewith such massy Cisterns, fill'd with so flaming a Matter, are taken out of the Furnace, convey'd to the Table, pour'd therein, the *Glass* spread, &c. The whole is inconceivable to such as have not been Eye witnesses of that surprizing Manufacture.

As fast as the Cisterns are emptied, they carry them back to the Furnace, and take fresh ones, which they empty as before. This they continue to do, so long as there are any fall Cisterns; laying as many Plates in each *Carquasse* as it will hold, and stopping them up as soon as they are full; to let them anneal, and cool again, which requires at least ten Days.

The first Running being dispatch'd, they prepare another, by filling the Cisterns a-new, from the Matter in the Pots: And after the second, a third; and even a fourth time, till the Melting-pots are quite empty.

The Cisterns, at each Running, should remain at least six Hours in the Furnace, to whiten; and when the first Annealing Furnace is full, the Casting-table is to be carried to another. It need not here be observ'd, that the *Carquasses*, or Annealing Furnaces must first have been heated to the Degree proper for them. When the Pots are emptied, they take them out, as well as the Cisterns, to scrape off what

what *Glass* remains, which otherwise would grow green by Continuance of Fire, and spoil the *Glasses*.

The manner of heating the large Furnaces, is singular enough: The *Tisfor*, or Person employ'd for that purpose, quite naked to his Shirt, runs round the Furnace without making the least Stop, with a Speed faras inferior to that of the lightest Courier: As he goes along, he takes two Billets, or pieces of Wood, cut for the purpose; which he throws into the first Tisfart; and continuing his Course, does the same for the second. This he holds on without Interruption for six Hours, successively; after which he is reliev'd by another, &c. It is surprizing that two such small pieces of Wood, and which are consumed in an instant, should keep the Furnace to the proper degree of Heat; which is such, that a large Bar of Iron, laid at one of the Mouths of the Furnace, becomes red hot in less than half a Minute.

'Tis computed that a Furnace, before it be fit to run *Glass*, costs above three thousand five hundred Pounds: That at least six Months are requir'd for the building it a-new; and three Months for the refitting it: And that when a Pot of Matter burlis in the Furnace, the Loss of Matter and Time amounts to above 250 Pounds.

The *Glass*, when taken out of the Melting Furnace, needs nothing further but to be ground, *polish'd*, and *foliated*.

For the Grinding of *GLASS*, see GRINDING of *Glass*.

For the Polishing of *GLASS*, see POLISHING of *Glass*.

For the Foliating of *GLASS*, see FOLIATING.

Painting on *GLASS*.

The primitive manner of painting on *Glass* was very simple, and of consequence very easy: It consisted in the mere Arrangement of pieces of *Glass* of different Colours, in some sort of Symmetry; and constituted a kind of what we call *Mosaic Work*. See MOSAIC WORK.

Afterwards, when they came to attempt more regular Designs, and even to represent Figures rais'd with all their Shades, their whole Address went no farther than to the drawing the Contours of the Figures in Black, with Water-colours, and hatching the Draperies, after the same manner, on *Glasses* of the Colour of the Object intended to be painted. For the Carnations, they chose *Glass* of a bright Red; upon which they design'd the principal Lineaments of the Face, &c. with Black.

At last, the Taste for this sort of Painting being considerably improv'd, and the Art being found applicable to the adorning of Churches, Basilicks, &c. they found means of incorporating the Colours with the *Glass* itself, by exposing them to a proper Degree of Fire, after the Colours had been laid on.

A French Painter of *Marfilles* is said to have given the first Notion hereof, upon going to *Rome*, under the Pontificate of *Julius II.* *Albert Durer*, and *Lucas of Leyden* were the first that carried it to any Height.

The Colours used in painting on *Glass*, are very different from those used either in painting in Oil, or Water. See PAINTING.

The Black is made of two Thirds of Flakes, or Scales of Iron, beaten up, and mix'd with another Third of Rocaille, or little *Glass*-beads.—White, with Sand, or little white Pebbles, calcined, pounded in a Mortar, and afterwards ground on a Marble; with one fourth Part of Salt-peter added thereto, and the Mixture calcined and pulveris'd over again: To which, when they are ready to use it, is added a little *Gypsum*, or Plaster of Paris well ground, &c.—For Yellow, they use Leaf-silver-ground, mix'd up in a Crucible with Sulphur, or Salt-peter; then well beaten and ground on a Porphyry Stone; and, at length, ground over again with nine times as much red Oker.—Red is made of Litharge of Silver, and Scales of Iron, Gum Arabic, Harderia, *Glass*-beads, and Blood-stone, nearly in equal Quantities. This is one of the most difficult Colours; and the Preparation only to be learnt by Experience.—Green, is made of *As Uftum*, one Ounce; as much black Lead, and four Ounces of white Sand, incorporated by the Fire. After Calcination, they add a fourth Part of Salt-peter; after a second Calcination, a sixth Part more: After which they make a third Coction before it is used.—Azure, Purple, and Violet, are prepared like Green, only leaving out the *As Uftum*, and in lieu thereof using Sulphur, for Azure; Perigueux, for Purple; and both the Drugs for Violet.—Carnations are made of Ferretta and Rocaille: And lastly, Colours for the Hair, Trunks of Trees, &c. are made of Ferretta, Rocaille, &c.

This Account of the Colours we have from *Monf. Freblien's* Excellent Work *des Principes d'Architecture*, &c. Tho' it must be own'd that all the Painters on *Glass* don't use them; there being few Artists of that kind but have invented their own particular ones, whereof they make great Secrets. But this is certain, that these above described are sufficient for the best Paintings of all sorts; provided a Person has but the Skill to manage them.

In the Windows of divers ancient Churches, Chapels,

Colleges, &c. we meet with the most beautiful, and vivid Colours imaginable; such as far exceed any used among us: Not that the Secret of making those Colours is lost; but that the Moderns won't go to the Expence of them; nor take all the necessary Pains; by reason this sort of Painting is not now so much esteem'd as formerly.

Those beautiful Works, which were made in the *Glass*-houses, were of two kinds: In some, the Colour was diffused thro' the whole Body of *Glass*; in others, which were the more common, the Colour was only on one Side, scarce penetrating within the Substance above one third of a Line; tho' more, or less, according to the Nature of the Colour; the Yellow being always found to enter the deepest.

These last, tho' not so strong and beautiful as the former, were of more Advantage to the Workmen; by reason, on the same *Glass*, tho' already colour'd, they could show other kind of Colours, where there was occasion to embroider Draperies, enrich them with Follages, or represent other Ornaments of Gold, Silver, &c.

In order to this they made use of Emery; grinding; or wearing down the Surface of the *Glass*, till such time as they were got thro' the Colour, to the clear *Glass*: This done, they applied the proper Colours on the other Side of the *Glass*.—By this means the new Colours were prevented from running, and mixing among the former, when the *Glasses* came to be expos'd to the Fire, as will be hereafter shewn.

When the intended Ornaments were to appear white, or silver'd, they contented themselves to bare the *Glass* of its Colour with Emery, without applying any new Colour at all; and it was in this manner, that they wrought their Lights and Heightenings on all kinds of Colours.—

The first thing to be done, in order to paint on *Glass*, in the modern way, is to design, and even colour the whole Subject on Paper. Then they make choice of pieces of *Glass* proper to receive the several Parts; and proceed to divide; or distribute the Design itself, or the Paper it is drawn on, into Pieces suitable to those of *Glass*: Having always a view that the *Glasses* may join in the Contours of the Figures, and the Folds of the Draperies; that the Carnations, and other finer Parts may not be damaged by the Lead wherewith the Pieces are to be join'd together.

The Distribution made, they mark all the *Glasses*, as well as Papers, with Letters, or Numbers; that they may be known again.

This done, applying each Part of the Design on a *Glass* intended for it, they copy, or transfer the Design upon this *Glass*, with the black Colour, diluted in Gum-water; by tracing and following all the Lines, and Strokes, as they appear thro' the *Glass*, with the Point of a Pencil.

When these first Strokes are well dried, which happens in about two Days, the Work being only in black and white, they give it a slight Wash over, with Urine, Gum Arabic, and a little black; and this several times repeated, according as the Shades are desir'd to be heighten'd: With this Precaution, never to apply a new Wash, till the former is sufficiently dried. This done, the Lights, and Risings are given, by rubbing off the Colour in the respective Places, with a wooden Point, or the Handle of the Pencil.

As to the other Colours above-mention'd, they are used with Gum-water, much as in Painting in Miniature; taking care to apply them lightly, for fear of effacing the Our-lines of the Design; or even for the greater Security, to apply them on the other Side, especially the yellow, which is very pernicious to the other Colours, by blending therewith.

And here, too, as in pieces of black and white, particular regard must be had, not to lay Colour on Colour, or Lay on Lay, till such time as the former are well dried. It may be added, that the Yellow is the only Colour that penetrates thro' the *Glass*, and incorporates therewith by the Fire: The rest, and particularly the Blue, which is very difficult to use, remaining on the Surface, or at least entering very little.

When the Painting of all the Pieces is finish'd, they are carried to the Furnace, to *anneal*, or bake the Colours.

The Furnace, here us'd, is small, built of Brick, from 18 to 30 Inches square: At six Inches from the Bottom is an Aperture, to put in the Fuel, and maintain the Fire: Over this Aperture is a Grate, made of three square Bars of Iron, which travell'd the Furnace, and divide it into two Parts: Two Inches above this Partition, is another little Aperture, thro' which they take out Pieces, to examine how the Coction goes forwards.

On the Grate is plac'd a square earthen Pan, six or seven Inches deep; and five or six Inches less, each way, than the Perimeter of the Furnace. On one Side hereof is a little Aperture, thro' which to make the Trials, plac'd directly opposite to that of the Furnace destined for the same end.

In this Pan are the Pieces of *Glass* to be plac'd, in the following manner: First, the Bottom of the Pan is cover'd with three Strata, or Layers of Plaster, or Lime, pulverized, those Strata being separated by two others, of old, broken *Glass*: The Design whereof is to secure the painted *Glass* from the too intense Heat of the Fire: This done, the

Glasses are laid horizontally on the last, or uppermost Layer of Plaster, or Lime.

This first Row of *Glass* they cover over with a Layer of the same Powder, an Inch deep; and over this lay another Range of *Glasses*: And thus alternately, till the Pan is quite full; taking care that the whole Heap always end with a Layer of Plaster.

The Pan thus prepared, they cover up the Furnace with Tiles, or a square Table of earthen Ware, closely luted all round; only having five little Apertures, one at each Corner, and another in the Middle, to serve as Chimneys.

Things thus disposed, there remains nothing but to give the Fire to the Work.—The Fire for the two first Hours, must be very moderate; and to be increas'd, in proportion as the Coffin advances, for the space of ten, or twelve Hours; in which Time it is usually completed. At last, the Fire, which at first was only of Charcoal, is of dry Wood: So that the Flame covers the whole Pan, and even issues out at the Chimneys.

During the last Hours, they make Essays from time to time; by taking out Pieces laid for the purpose, thro' the little Aperture of the Furnace, and Pan, to see whether the Yellow be perfect, and the other Colours in good Order. When the Annealing is thought sufficient, they proceed with great Hast to extinguish the Fire, which otherwise would soon burn the Colours, and break the *Glasses*.—

GLASSES are distinguish'd with regard to their Form, Use, &c. into various Kinds; as,
Drinking Glasses, Optic Glasses, Looking Glasses, Burning Glasses, &c.

Drinking GLASSES are simple Vessels, of common *Glass* or Crystal, usually in form of an inverted Cone.—

Each *Glass* consists of three Parts, viz. the Calix, or Bowl; the Bottom; and Foot; which are all wrought, or blown separately.

Nothing can be more dexterous, and expeditious than the manner wherein these Parts are all blown; two of them open'd, and all three join'd together. An Idea is only to be had thereof, by seeing them actually at work.

The *Glasses* chiefly used in *England*, are made of the Ashes of *Fern*; *Crystall Glasses*, being grown into Disks. The exceeding Brittleness of this Commodity, notwithstanding the easy Rate of each *Glass*, renders the Consumption hereof very considerable.

Optic GLASSES, are those made of use to strengthen, improve, or preserve the Sight. See *OPTIC GLASS*.

To this Class belong,

Convex GLASSES	} sec	CONVEX.
Concave GLASSES		CONCAVE.
Lenticular GLASSES		LENS.
Meniscus GLASSES, &c.		MENISCUS, &c.
Plain GLASSES		PLAIN GLASS.

To find the Foci of *Optic GLASSES*, see *FOCUS*.

Burning GLASS		BURNING GLASS; see also MIRROR.
Weather GLASS		WEATHER GLASS.
Cupping GLASS		CUPPING GLASS.
GLASS WINDOW	} sec	WINDOW.
GLASS DROP		DROP.
GLASS BODY		BODY.

GLAUCOMA, in Medicine, a Disease of the Eye, wherein the crystalline Humour is turn'd of a greenish, or Azure Colour, and its Transparency thus diminish'd. See *EYE*, and *CRYSTALLINE*.

Those in whom this Disorder is forming, discover it hence that all Objects appear to them as thro' a Cloud or Mist: When entirely form'd, the visual Rays are all intercepted, and they see nothing at all.

It is reckon'd incurable, when inveterate, and in aged Persons: And even under other Circumstances, is very difficult of Cure; External proving of little Service.

The Internals best suited to it, are those used in the *Gutta Serena*. See *GUTTA SERENA*.

Jul. Cesar Claudinus, Consul. 74. gives a Remedy for the *Glaucoma*.

The Word comes from the *Greek* γλαυκός, *glauus*, *caesus*, sea-green.

The *Glaucoma* is usually distinguish'd from the *Cataract* or Saffusion, in this, that in the *Cataract* the Whiteness appears in the Pupil, very near the Cornea, but shows deeper in the *Glaucoma*.

Some late *French* Authors, however, maintain the *Cataract* and *Glaucoma* to be one and the same Disease.—According to them, the *Cataract* is not a Film, or Pellicle form'd before the Pupil, as had always been imagin'd; but an Al-

teration of the Humour itself, whereby its transparency is prevented; which brings the *Cataract* to the *Glaucoma*. See *CATARACT*.

GLEAM, is popularly used for a Ray, or Beam of Light. See *RAY*.

Among *Falconers*, a Hawk is said to *gleam*, when she casts or throws up Filth from her Gorge.

GLEANNING, or **GLEANNING**, the Act of gathering, or picking up the Ears of Corn, left behind after the Field has been reap'd, and the Crop carried home.

By the Customs of some Countries, particularly those of *Melton*, and *Essex*, all Farmers, and others, are forbid either by themselves, or Servants to put any Cattle into the Fields, or prevent the *gleanning* in any manner whatever, for the space of 24 Hours, after the carrying off of the Corn; on Penalty of Confiscation, &c.

GLEBE, **GLEBA**, in Natural History, Chymistry, &c. a Clod, or Piece of Earth, containing some Metal, or Mineral. See *ORE*; see also *MARCHASITE*, *METAL*, &c.

The *Glebes* are carried to the Forges to be wash'd, purify'd, melted, &c. See *GOLD*, *SILVER*, *IRON*, &c.

GLEBE, or **GLEBAN**, is properly us'd for Church-land. *Dos vel Terra ad Ecclesiam pertinens*.— See *CHURCH*.

Glebe-land is most commonly us'd for that Land belonging to the Parish Church, beside the Tithes; tho' in the more general, and extensive Use of the Word, *Glebe* is applicable to any Land, or Ground belonging to a Benefice, Fee, Manor, Inheritance, or the like.

Thus, *Laudædæ, Gleba est terra in qua consistit dos Ecclesiæ; generaliter tamen sumitur pro solo, vel pro terra culta*.—

That, in the Civil Law, Slaves were said to be affected to the *Glebe*, i. e. went with it, were fold with it, &c. The Right of Patronage should be annex'd to a *Glebe*. See *PATRONAGE*.

GLEET, in Medicine, a Flux of thin Humor from the Urethra. See *FLUX*, *URETHRA*, &c.

This, or a *Gonorrhæa Simplex*, often succeed the Cure of a *Gonorrhæa Virulenta*, and sometimes remain oblitiate, even after the Use of a Salvation. See *GONORRHEA*.

The *Gleet* may happen either from too great Relaxation of the Glands in the Urethra, or from a Corrosion or Exulceration of them. It appears most frequently after a *Gonorrhæa* has been of long standing, or ill managed in the Cure; as by the Use of acid or corroding Injections, and the like.

The Glands may here also happen to be ulcerated by the Matter of the Running, which is often sharp enough for that purpose.

A *Gleet* is distinguish'd from a *Gonorrhæa simplex*, nor only by the Colour, and Consistence of the Matter evacuated, but also by the manner wherein it comes away: The Matter of a *Gleet* comes away as well at one time as at another; but that of a *Gonorrhæa simplex* chiefly in Erections, and when the Patient goes to stool. The Matter of a *Gleet* is commonly brownish, but that of a *Gonorrhæa simplex* white. And the Continuance of a true *Gleet* is unattended with Weakness, or other ill Consequences, and dangerous Symptoms; nor does it unfit Men for Procreation, as *Gonorrhæa simplex* will.

An astringent Regimen is the most proper in both; Coffee and Claret are supposed proper Liquors in these Cases: So are those made acid with Juice of Lemmons, Vinegar, &c.

GLENE, **GLENA**, **GLENOIDES**, in Anatomy, a Name given to those Cavities in Bones, which are of a middle kind, that is, neither of the deepest, nor shallowest, but in a mean between the two. See *BONE*.

Thus, the Cavity of the Omoplate, wherein the Humerus is received, is a *Glene*, or *Glenuides*. See *OMOPLATE*.

GLENOIDES, or **GLENE**, according to *Blanchard*, &c. is peculiarly attributed to two Cavities in the lower Part of the first Vertebra of the Neck.

The Word is *Greek*, composed of γλῆν, *Eyelid*; and ὠδῶ, *Form*.

GLICYRRHIZZA, or **GLYCYRRHIZA**, call'd also *Radic dulcis*, *Liquorizia*, and *Liquorice*, a sweet-tasted Root, of considerable Use in Medicine, against Coughs, and other Disorders of the Breast and Lungs.

The Shrub which bears it, is cultivated in divers Parts of *England*, particularly about *Pontefract* in *Yorkshire*; in some Provinces of *France*, *Spain*, *Germany*, and *Muscovy*; and especially in *Persia*, where it thrives better than any where else; there being some on the Banks of the *Carafu*, *Kenki*, and *Kermi-arpa*, whose Roots are thicker than the *Arm*; and whose Juice, in respect of Strength, Virtue, &c. are preferable to others.

The Root of the *Liquorice* Plant runs, or spreads a great way in the Ground, and emerging into Air from Place to Place, produces for many new Stems, or Plants, few of which rise above five Foot high. Its Leaves are thick, green, shining, half-round, and glutinous: Its Flower red, like the *Hyacinth*; and its Seed contain'd in roundish Pods.

In the Culture, care must be taken to have a warm, light, rich Soil, or to amend it with Manure: They plant it in Trenches, three Spits deep, in February and March; usually in Rows, at a Foot distance from each other. The Parts chose for this purpose, are Sets from the Top of the Plant, or the very Top of the Root; or else the Runners that spread from the Master-root.—In moist Weather, the Branches may also be slip'd and planted.

They are taken about November, or December, after they have stood three Summers in the Ground; for then the *Liquorice* weighs most, and will keep with least Loss: Not but that there is a continual Diminution in this respect from the first taking it.

New, green *Liquorice* should be chose smooth and even, about the Thickness of the middle Finger, ruddy without, yellowish within, easy to cut, and of an agreeable Smell.

This Root being boil'd a long time in Water, till the Fluid has got a deep, yellow Tincture; and the Water, at length evaporated over a moderate Fire; there remains a black, solid Sediment, which is what we call *Liquorice*, or *Liquorice Juice*, or sometimes *Spanish Juice*.

Chuse it black without side, and of a shining Black within, easy to break, and of an agreeable Taste. The whitish, and yellowish *Liquorice Juices* are good for nought; being usually no other than Compositions of Sugar, Starch, a little Gum Tragacanth, and *Liquorice Powder*.

The native *Liquorice Juice* is very sweet upon the Palate, even more than Sugar, or Honey; and is yet accounted a great Quencher of thirst; on which account *Galen* prescribes it in Dropsies. It is very balsamic, and detergent; insomuch that there is scarce any medicinal Composition for Diseases of the Breast, but it is an Ingredient in.—

GLOBE, in Geometry, a round or spherical Body; more usually called a *Sphere*. See *SPHERE*.

The Earth, and Water, together, are supposed to form a *Globe*, hence call'd the *Terraqueous Globe*. See *TERRAQUEOUS*.

The Planets, both Primary, and Secondary, are supposed, as well as our Earth, to be solid *Globes*. See *PLANET*.

The Earth, is, in a peculiar Sense call'd the *Globe*, or *Globe of the Earth*. See *EARTH*.

GLOBE is particularly used for an artificial Sphere of Metal, Plaster, Paper, or other Matter; on whose convex Surface is drawn a Map, or Representation, either of the Earth, or Heavens, with the several Circles conceived thereon. See *MAP*.

In this Sense, *Globes* are of two kinds, *Terrestrial*, and *Celestial*; each of very considerable Use: The one, in Astronomy, and the other in Geography; to perform many of the Operations thereof, in an easy, sensible manner, so as to be conceived without any Knowledge of the mathematical Grounds of those Arts.

The fundamental Parts, common to both *Globes*, are an *Axis*, representing that of the World; and a spherical Shell, or Cover, which makes the Body of the *Globe*, on whose external Surface the Representation is made. See *AXIS*, *POLE*, &c.

Globes, we have observed, are made of divers Materials, viz. Silver, Brass, Paper, Plaster, &c. Those commonly used, are of Plaster, and Paper: The Construction whereof is as follows:

Construction of Globes.

A wooden *Axis* is provided, somewhat less than the intended Diameter of the *Globe*; and into the Extremes hereof two Iron Wires are driven, for Poles: This *Axis* is to be the Beam, or Basis of the whole Structure.

On the *Axis* are applied two spherical, or rather hemispherical Caps, form'd on a kind of wooden Mould, or Block.—These Caps consist of Pasteboard, or Paper, laid, one Lay after another, on the Mould, to the Thickness of a Crown-piece; after which, having stood to dry, and imbody; making an Incision along the Middle, the two Caps thus parted, are slip'd off the Mould.

They remain now to be applied on the Poles of the *Axis*, as before they were on those of the Mould: And to fix them in their new Place, the two Edges are sown together with Packthread, &c.

The Rudiments of the *Globe* thus laid, they proceed to strengthen, and make it smooth and regular.—In order to this, the two Poles are half'd in a metaline Semicircle, of the Size intended; and a kind of Plaster, made of Whiting, Water, and Glue heated, melted, and incorporated together, is dubb'd all over the Paper-Surface. In proportion as the Plaster is applied, the Ball is turn'd round in the Semicircle, the Edge whereof, pares off whatever is superfluous, and beyond the due Dimension; leaving the rest adhering in Places that are short of it.

After such Application of Plaster, the Ball stands to dry; which done, it is put again in the Semicircle, and fresh Matter applied: Thus they continue alternately to apply the

Composition, and dry it, till such time as the Ball every where accurately touches the Semicircle; in which State it is perfectly smooth, regular, firm, &c.

The Ball thus finish'd, it remains to paste the Map, or Description thereon: In order to this, that Map is projected in several Gores, or Guffets; all which join accurately on the spherical Surface, and cover the whole Ball. To direct the Application of these Gores, Lines are drawn by a Semicircle on the Surface of the Ball, dividing it into a Number of equal Parts corresponding to those of the Gores, and subdividing those again answerably to the Lines and Divisions of the Gores.

The Papers thus pasted on, there remains nothing but to colour and illuminate the *Globe*; and to varnish it, the better to resist Dust, Moisture, &c.

The *Globe* itself, thus finish'd, they hang it in a Brass Meridian, with an Hour Circle, and Quadrant of Altitude; and thus fit it into a wooden Horizon.

Description of the Globes.

The Things common to both *Globes*, are either delineated on the Surface; or added as Appendages, without it.

Without the Surface, are 1^o The two *Poles*, whereon the *Globe* is turn'd, representing those of the World.—See *POLE*. 2^o The *Brazen Meridian*, which is divided into Degrees, and passes thro' the Poles. See *MERIDIAN*.—3^o The *Wooden Horizon*, whose Upper side represents the Horizon; and is divided into several Circles: The innermost whereof contains the twelve Signs of the Zodiac, subdivided into their Degrees; the next, the *Julian*; and the third, the *Gregorian Calendars*. Without-side of all these, are drawn the Points of the Winds. See *COMPASS*, and *WIND*.—4^o A *Brass Quadrant of Altitude*, divided into 90 Degrees, to be fasten'd on the Meridian at the Distance of 50 Degrees from the Horizon. See *QUADRANT of Altitude*.—5^o The *Hour Circle*, divided into twelve Hours, and fitted on the Meridian, round the Pole, which carries an Index pointing to the Hour.—A *Mariner's Compass* is sometimes added on the Bottom of the Frame; and sometimes, a *Semicircle of Position*. See *COMPASS*, and *POSITION*.

On the Surface are delineated, 1^o The *Equinoctial Line*, divided into 360 Degrees; commencing from the Vernal Intersection. See *EQUINOCTIAL*.—2^o The *Ecliptic*, divided into 12 Signs, and these subdivided into Degrees. See *ECLIPTIC*.—3^o The *Zodiac*. See *ZODIAC*.—4^o The two *Tropics*. See *TROPIC*; and 5^o The *Polar Circles*. See *POLAR CIRCLE*.

What else belongs to *Globes*, either as to Construction, or Description, is different, as the *Globe* is either Celestial, or Terrestrial. See *Celestial*, and *Terrestrial GLOBE*.

Celestial GLOBE, is an artificial Sphere, on whose convex Surface the fix'd Stars are laid down, at proportionable Distances, together with the principal Circles of the Sphere. See *STAR*, *CONSTELLATION*, *CIRCLE*, &c.

The Use of these *Globes*, is to exhibit the Phenomena of the Motions of the Sun, and Stars, in an easy, and obvious manner; which, tho' somewhat unaccurate, is yet exact enough for the common Uses of Life, and may save the Trouble of Trigonometrical Calculation.—See *ASTRONOMY*.

To exhibit the Stars, Circles, &c. on the Surface of a given Sphere, or Ball, and fit it for the Uses of Astronomy.

1^o Assume any two Points diametrically opposite to each other, as P, and Q; (*Tab. Astronomy*, Fig. 58.) And in these, fix up Axes, P A, and Q C, for the Ball to turn round on. The Points P and Q; or A and C, will exhibit the *Poles of the World*. 2^o Divide a Brazen Circle A B C D into four Quadrants, A E, E C, C F, and F D; and subdivide each Quadrant into 90 Degrees, number'd from the Points E, and F towards the Poles A, and C. 3^o Close the *Globe* in this Circle, as in a *Meridian*, at the Points A, and C, so as it may freely turn therein.

4^o Apply a Style, or Pin to the Surface of the *Globe* in the first Degree of the Meridian, and turn the Ball round; by this means will a Circle be described on the Surface, representing the *Equator*, to be divided into Degrees. 5^o From the Pole of the World P, towards M; and from the other Pole C, towards N. Number 23 $\frac{1}{2}$ Degree; the Points M and N will be the *Poles of the Ecliptic*.

6^o Apply a Style to the Meridian, in the Point M, and turn the *Globe* round; by this Rotation will the Arctic Polar Circle be described: And after the same manner is the Antarctic Polar to be described about the Point O.

7^o Number 23 $\frac{1}{2}$ Deg. from the *Equator* towards the Poles P, and Q; and note the Points H, and I. Then, applying a Style to the Meridian, as before, two Circles will be described parallel to the *Equator*; whereof that drawn thro' H, will be the *Tropic of Cancer*, and the other thro' I, the *Tropic of Capricorn*.

8^o Hang the *Globe* within the Meridian, in the Poles of the Ecliptic, as before in the Poles of the World; and applying a Style to E, turn it round: By this means will the *Ecliptic* be delineated; which remains to be divided into 12 Signs; and each of these into 30 Degrees.

9^o While the *Globe* remains thus suspended, bring the Degree of Longitude of any Star under the Meridian; and in the Meridian, number as many Degrees towards the Pole as is the Degree of Latitude of the Place: The Point of Intersection is the Place of that Star on the Surface of the *Globe*. After the like manner is the Place of the Star determined from the right Ascension and Declination given; the *Globe* being supposed suspended from the Poles of the World, or the Equator.

10^o All the Stars of a Constellation thus laid down; the Figure of the Constellation is to be design'd; after which it may either be colour'd, or engraven.

11^o Place the *Globe* with the Meridian, in a wooden Frame or Horizon D B L, supported on four Feet; in such manner, as to be divided thereby into two Hemispheres; and that the Pole A may be rais'd or depress'd at pleasure.

12^o On the Limb, or Edge of the Horizon describe a Circle, which divide into 360 Degrees, and insert the Calendars, and Winds.—

13^o Lastly, to the Pole A, fit a Brazen Semicircle, divided into 24 horary Parts, and number'd twice twelve, so that the Lines or Divisions of XII, may be in the Plane of the Meridian, on either Side the Pole. And on the Pole itself apply an Index, to turn round with the *Globe*.—Thus is the *Globe* compleat.

It may be here observ'd, that as the Longitude of the Stars is continually growing, a *Globe* does not remain of perpetual Use: But the Increase in 72 Years only amounting to a Degree, it will make no considerable Error in an hundred Years; the Design of a *Globe* being only to represent things something near the Truth.

To make a Celestial Globe the usual way.

This Method is that the most frequently us'd; and we only premis'd the former as being the most easily conceived, and leading more naturally to this.—

1^o From the given Diameter of the *Globe*, find a Right Line A B, Fig. 59. equal to the Circumference of a great Circle; and divide it into twelve equal Parts.

2^o Thro' the several Points of Division, 1, 2, 3, 4, &c. with the Interval of 10 of them, describe Arches mutually, intersecting each other in D and E.—These Figures, or Pieces duly pasted or join'd together, will make the whole Surface of the *Globe*.

3^o Divide each Part of the Right Line A B, into 30 equal Parts; so that the whole Line A B, representing the Periphery of the Equator, may be divided into 360 Degrees.

4^o From the Poles D, and E, with the Interval of 23 $\frac{1}{2}$ Deg. describe Arches a b; these will be twelfth Parts of the Polar Circles.

5^o After the like manner, from the same Poles D, and E, Fig. 59, 60, with the Interval of 66 $\frac{2}{3}$ Deg. reckon'd from the Equator, describe Arches c d; these will be twelfth Parts of the Tropicks.

6^o Thro' the Degree of the Equator e corresponding to the right Ascension of any given Star, and the Poles D and E, draw an Arch of a Circle; and taking in the Compasses the Complement of the Declination from the Pole D, describe an Arch, intersecting it in i; this Point i will be the Place of the Star.

7^o All the Stars of a Constellation thus laid down, the Figure of the Constellation is to be drawn according to Bayer, Hevelius, or Flamsteed.

8^o Lastly, after the same manner, are the Declinations, and Right Ascensions of each Degree of the Ecliptic a g determined.

9^o The Surface of the *Globe* thus projected on a Plane, is to be engraven on Copper, to save the Trouble of doing this over again for each *Globe*.

10^o A Ball, in the mean time, is to be prepar'd of Paper, Plaster, &c. after the manner above directed, and of the intended Diameter of the *Globe*. On this, by means of a Semicircle, and Style, is the Equator to be drawn; and thro' every 30th Degree, a Meridian. The Ball thus divided into twelve Parts, corresponding to the Segments before projected; they are to be cut out from the printed Paper, and pasted on the Ball.

11^o Nothing now remains but to hang the *Globe* as before in a Brazen Meridian, and Wooden Horizon. To which may be added a Quadrant of Altitude H I, Fig. 61. made of Brass, and divided in the same manner, as the Ecliptic and Equator.—

If the Declinations, and Right Ascensions of the Stars be not given; but their Longitudes, and Latitudes, in lieu thereof; the Surface of the *Globe* is to be projected after the same manner as before; except that in this case D, and

E, Fig. 59. are the Poles of the Ecliptic, and f b the Ecliptic itself; and that the Polar Circles, and Tropicks, with the Equator g d, and the Parallels thereof, are to be determin'd from their Declinations.

The latest Catalogue of the Stars is that of Mr. Flamsteed, wherein the Right Ascensions and Declinations, as well as the Longitudes, Latitudes, &c. are every where express'd. See CATALOGUE.

Use of the Celestial Globe.

The Use of this Instrument is very extensive: Scarce any thing in the spherical Astronomy but may be exhibited thereby. See ASTRONOMY.

The principal Points are contain'd in the following Problems, with their Solutions; which will let the Reader enough into the Nature and Reason of this noble Instrument to apply it, of his own Accord, in any other Cases.—

Problem I. To find the Right Ascension, and Declination of a Star, represented on the Surface of the Globe.

Bring the Star to the graduated Side of the Brazen Meridian; Then, the Number of Degrees intercepted between the Equator, and the Point of the Meridian cut by the Star, gives its Declination; and the Degree of the Equator, which comes under the Meridian together with the Star, is its Right Ascension. See ASCENSION, and DECLINATION.

II. To find the Longitude and Latitude of a Star.

Apply the Centre of the Quadrant of Altitude over the Pole of the Ecliptic in the same Hemisphere with the Star; and bring its graduated Edge to the Star: The Degree on the Quadrant cut by the Star is its Latitude, reckon'd from the Ecliptic; and the Degree of the Ecliptic cut by the Quadrant, its Longitude. See LONGITUDE, and LATITUDE.

III. To find the Sun's Place in the Ecliptic.

Seek the Day of the Month in the proper Calendar on the Horizon; and against the Day in the Circle of Signs is the Sign and Degree the Sun is in for that Day. This done, find the same Sign upon the Ecliptic, on the Surface of the *Globe*: This is the Sun's Place for that Day.—See PLACE.

IV. To find the Declination of the Sun.

The Sun's Place for the Day being brought to the Meridian; the Degree of the Meridian intercepted between the Equinoctial and that Place, is the Sun's Declination for that Day, at Noon.

V. To find the Place of a Planet, with its Right Ascension and Declination; its Longitude, and Latitude, for the Time being given.

Apply the Centre of the Quadrant of Altitudes on the Pole of the Ecliptic (the Pole, we mean, of the same Denomination with the Latitude); and bring it to the given Longitude, in the Ecliptic: This Point is the Planet's Place: And bringing it to the Meridian, its Right Ascension, and Declination will be found as already shewn of a Star.

VI. To rectify the Globe, or adjust it to the Place, &c. so as it may represent the present State, or Situation of the Heavens.

1^o If the Place be in North Latitude, raise the North Pole above the Horizon, if in South, the South Pole; till the Arch intercepted between the Pole and Horizon be equal to the given Elevation of the Pole. 2^o Fix the Quadrant of Altitude on the Zenith, i. e. on the Latitude of the Place. 3^o By means of a Compass or Meridian Line-place the *Globe* in such manner as that the Brazen Meridian may be in the Plane of the Meridian. 4^o Bring the Degree of the Ecliptic the Sun is in, to the Meridian, and set the horary Index to XII: Thus will the *Globe* exhibit the Face of the Heavens for the Noon of that Day. 5^o Turn the *Globe* till the Index come to any other given Hour: Thus will the *Globe* shew the Face of the Heaven for that time. See RECTIFYING.

VII. To know all the Stars and Planets by means of the Globe.

1^o Adjust the *Globe* to the State of the Heavens, for that Time. 2^o Look on the *Globe* for some one Star, which you know; e. gr. the middlemost Star in the Tail of the Great Bear. 3^o Observe the Positions of the other more conspicuous Stars in the same Constellation; and by transferring the Eye from the *Globe* to the Heavens, you will easily

easily note the same, there. 4° After the same manner may you proceed from this to the neighbouring Constellations; till you have learnt them all. See STAR.

If the Planets be represented on the *Globe*, after the manner above described, by comparing them with the neighbouring Stars, you will likewise know the *Planets*. See PLANET.

VIII. To find the Sun's oblique Ascension, his Eastern Amplitude, and Azimuth, with the Time of Rising.—

1° Rectify the *Globe* for the Hour of XII; and bring the Sun's Place to the Eastern Side of the Horizon: Then, the Number of Degrees intercepted between that Degree of the Equator now come to the Horizon, and the Beginning of Aries, is the Sun's *Oblique Ascension*. 2° The Degrees on the Horizon intercepted between the East Point thereof, and the Point wherein the Sun is, is the *Ortive, or rising Amplitude*. 3° The Hour pointed to by the Index, is the Time of the Sun's Rising. 4° Turning the *Globe*, till the Index points to the present Hour; lay the Quadrant to the Sun's Place; the Degree cut by the Quadrant, in the Horizon, is the Sun's *Azimuth*. See AZIMUTH, OBLIQUE, &c.

IX. To find the Sun's Oblique Descension, Western Amplitude, and Azimuth, with the Time of Setting.

The Solution of this Problem is the same as that of the former; excepting that the Sun's Place must be here brought to the Western Side of the Horizon; as, in the former, it was to the Eastern. See DESCENSION.

X. To find the Length of Day and Night.

1° Find the Time of the Sun's rising; which being number'd from Midnight, the Double thereof gives the *Length of the Night*. 2° Subtract the Length of the Night from the whole Day, or 24 Hours; the Remainder is the *Length of the Day*. See DAY, and NIGHT.

XI. To find the Rising, Setting, and Culminating of a Star, its Continuance above the Horizon, for any Place and Day; together with its oblique Ascension, and Descension; and its Eastern and Western Amplitude and Azimuth.

1° Adjust the *Globe* to the State of the Heavens, at 11 a-Clock, that Day. 2° Bring the Star to the Eastern Side of the Horizon: Thus will its *Eastern Amplitude, and Azimuth*, and the Time of rising be found; as already taught of the Sun. 3° Bring the same Star to the Western Side of the Horizon: Thus will the *Western Amplitude and Azimuth*, and the Time of setting be found. 4° The Time of Rising subtracted from that of Setting, leaves the *Continuance* of the Star above the Horizon.—5° This Continuance above the Horizon subtracted from 24 Hours, leaves the Time of its Continuance below the Horizon. 6° Lastly, the Hour to which the Index points, when the Star is brought to the Meridian; gives the Time of Culmination. See RISING, SETTING, CULMINATING, &c.

XII. To find the Altitude of the Sun, or a Star, for any given Hour of the Day or Night.

1° Adjust the *Globe* to the Position of the Heavens; and turn it till the Index point at the given Hour. 2° Fix on the Quadrant of Altitude, at 90 Degrees from the Horizon, and bring it to the Sun's or Star's Place. The Degrees of the Quadrant intercepted between the Horizon, and the Sun or Star is the *Altitude* required. See ALTITUDE.

XIII. The Altitude of the Sun by Day, or of a Star by Night being given, to find the Time of that Day, or Night.

1° Rectify the *Globe* as in the preceding Problem. 2° Turn the *Globe*, and Quadrant till such Time as the Star, or Degree of the Ecliptic the Sun is in; cut the Quadrant in the given Degree of Altitude; then does the Index point at the Hour sought. See TIME, HOUR, &c.

XIV. The Azimuth of the Sun, or a Star, given; to find the Time of Day, or Night.

Rectify the *Globe*; and bring the Quadrant to the given Azimuth in the Horizon: Turn the *Globe*, till the Star come to the same: Then will the Index shew the Time.

XV. To find the Interval of Time between the Risings of two Stars; or their Culminations.

1° Raise the Pole of the *Globe* so many Degrees above the Horizon, as is the Elevation of the Pole of the Place.

2° Bring the first Star to the Horizon; and observe the Time the Index points to. 3° The same do by the other Star. Then subtracting the former Time from the latter; the Remainder is the Interval between the Risings.

After the like manner is the Interval between two Culminations found; by bringing both Stars to the Meridian.

XVI. To find the Beginning and Ending of the Crepusculum, or Twilight.

1° Rectify the *Globe*; and set the Index to the XIIth Hour; the Sun's Place being in the Meridian. 2° Take the Sun's Place, and turn the *Globe* Westward, as also the Quadrant of Altitude, till the Point opposite to the Sun's Place cut the Quadrant of Altitude in the 18th Degree above the Horizon. The Index will shew the Time when the Twilight commences in the Morning. 3° Taking the Point opposite to the Sun; bring it to the Eastern Hemisphere, and turn it, till it meet with the Quadrant of Altitude in the 18th Degree: Then will the Index shew the Time when Twilight ends. See CREPUSCULUM.

Terrestrial GLOBE, is an artificial Sphere, on whose Surface are delineated the principal Places of the Earth, in their proper Situations, Distances, &c. together with the Circles imagin'd on the Surface of the terrestrial Sphere. See EARTH.

The Use of the *Terrestrial Globe*, is to exhibit the several Affections, and Phenomena of the different Places of the Earth, depending on Magnitude, &c. in an easy, obvious manner, without the Trouble of Trigonometrical Calculation. See GEOGRAPHY.

To construct a Terrestrial GLOBE.

The Construction of a *Terrestrial Globe*, whether of Metal, or Plaster, Paper, &c. is the same as that of a Celestial. The same *Circles* are delineated on both: And as for the *Places, viz. Cities, Towns, &c.* they are laid down from the Longitudes, and Latitudes given; as the Stars are from their right Ascensions and Declinations.

Hence, all Problems depending on the Circles, may be equally wrought on either *Globe*; as the Ascensions, Descensions, Amplitudes, Azimuths, Risings, Settings, Altitudes, &c. of the Sun; the Lengths of Day and Night; Hours of the Day and Night; Crepuscula, &c.

We shall here, therefore, only give what is peculiar to the *Terrestrial Globe*.

Use of the Terrestrial GLOBE.

Problem. I. To find the Longitude and Latitude of any Place delineated on the Globe.

Bring the Place to the graduated Side of the Brass Meridian: The Degree of the Meridian it cuts, is the *Latitude* required; and the Degree of the Equator at the same time under the Meridian, is the *Longitude* required.

II. The Longitude and Latitude given, to find the Place on the GLOBE.

Seek, in the Equator, the given Degree of Longitude; and bring it to the Meridian: Then count from the Equator on the Meridian the Degree of Latitude given towards this or that Pole, as the Latitude is either North, or South. The Point under this is the *Place* requir'd.

III. To find the Antoci, Periaci, and Antipodes of any Place.

1° The given Place being brought to the Meridian; count as many Degrees on the Meridian from the Equator towards the other Pole. The Point thus arriv'd at; is the Place of the *Antoci*. See ANTOCI. 2° Note the Degrees of the Meridian over the given Place and its *Antoci*; and turn the *Globe* till the opposite Degree of the Equator, come under the Meridian; or, which amounts to the same, till the Index, which before stood at XII, come to the other XII: Then will the Place corresponding to the former Degree, be the *Periaci*; and the latter, that of *Antipodes*. See PERIACI, and ANTIPODES.

IV. To find what Place of the Earth the Sun is Vertical to at any Time assigned.

1° Bring the Sun's Place found in the Ecliptic to the Meridian; and the Index to the Hour of XII: Noting what Point of the Meridian corresponds thereto. 2° If the given Hour be before Noon; subtract it from twelve Hours; and turn the *Globe* towards the West, till the Index point at the Hours remaining. Thus will the Place requir'd be under the Point of the Meridian before not'd. 3° If the Hour be Afternoon, turn the *Globe* in the same manner towards the

West, till the Index point at the given Hour: Thus again will the Place requir'd be found under the Point of the Meridian before noted.—

If, at the same time, you note all the Places which are under the same Half of the Meridian with the Place found; you will have all the Places to which the Sun is then in the Meridian: And the opposite Half of the Meridian will shew all the Places, in which it is then Midnight.

V. *A Place being given in the torrid Zone, to find the raw Days in the Year wherein the Sun is vertical to the same.*

1° Bring the given Place to the Meridian; and note the Degree of the Meridian corresponding thereto. 2° Turn the Globe about, and note the two Points of the Ecliptic passing thro' that Degree. 3° Find what Days the Sun is in those Points of the Ecliptic: For on those Days he is vertical to the given Place.

VI. *To find those Places in the Torrid Zone to which the Sun is Vertical on a given Day.—*

Bring the Sun's Place in the Ecliptic to the Meridian: Then turning the Globe round, note all the Places which pass thro' that Point of the Meridian. Those are the Places required.

After the same manner are found what People are *Astic*, for any given Day. See *Asc 11*.

VII. *A Place being given in the Frigid Zone, to find on what Days of the Year the Sun does not rise; and on what Days he does not set to the same.*

1° Count as many Degrees in the Meridian from the Equator towards the Pole, as is the Distance of the given Place from the Pole. 2° Turning the Globe round, note all the Points of the Ecliptic passing thro' each Point noted in the Ecliptic: By this means you will have the Arches which the Sun describes while he neither rises, nor sets; and the Points themselves give the Places of the Sun, when he neither rises nor sets, at the Beginning and Ending. 3° Find what Days of the Year the Sun is in those Places: These are the Answer to the Question.

VIII. *To find the Latitude of the Places wherein any given Day it is of any given Length.*

1° Bring the Sun's Place for the given Day to the Ecliptic, and set the Index to the Hour of twelve. 2° Turn the Globe, till the Index point at the Hour of rising or setting. 3° Raise and depress the Pole till the Sun's Place appear in the Eastern or Western Side of the Horizon. Then will the Pole be duly elevated, and consequently the Latitude given.

IX. *To find the Latitude of those Places in the Frigid Zone, where the Sun does not set for a given Number of Days.*

1° Count for many Degrees from the next Tropic, towards the Equinoctial Point, as there are Units in half the Number of the given Days; by reason, the Sun in his proper Motion, goes nearly a Degree every Day. 2° Bring the Point of the Ecliptic, thus found, to the Meridian: Its Distance from the Pole will be equal to the Elevation of the Pole, or Latitude of the Places requir'd.

X. *Any Hour of the Day, or Night being given, to shew all those Places to which the Sun rises, and sets; where it is Noon, or Midnight; and where Day, or Night.*

1° Find what Place the Sun is at that time vertical to, as already taught. 2° Let this Place be brought to the Zenith of the wooden Horizon, i. e. elevate the Pole as the Latitude of that Place requires. Then, will the Places on the Eastern Side of the Horizon, be those the Sun is setting to; and on the Western Side, those he rises to: Those under the upper Semicircle of the Meridian, have it Noon; and those under the lower, Midnight. Lastly, to those in the upper Hemisphere it is Day; and to those in the lower, Night.—

Hence, as, in the Middle of an Eclipse, the Moon is in the Degree of the Ecliptic opposite to the Sun's Place; by the present Problem it may be shewn what Places of the Earth then see the Middle of the Eclipse; and what, the Beginning, or Ending.—

XI. *To find what Places of the Earth a Planet, e. gr. the Moon, is vertical to, any Day of the Year.*

1° Mark the Planet's Place on the Globe, as above taught. 2° Bring this Place to the Meridian; and note the Degree

over it. 3° Turn the Globe round; the Places which pass under the Point, are those required.—

XII. *The Declination of a Star, or any other Phenomenon given; to find what Parts of the Earth the same is vertical to.*

Count as many Degrees in the Meridian, from the Equator towards one Pole, as are equal to the given Declination; viz. towards the North, if the Declination be Northward; and towards the South, if the Declination be South. Then, turning it round, the Places that pass thro' the Extremity of this Arch in the Meridian, are the Places required.—

XIII. *To determine the Place of the Earth where any Star, or other Celestial Phenomenon will be Vertical at a given Hour.*

1° Elevate the Pole according to the Latitude of the Place, from whose Noon or Midnight the Hours are number'd. 2° Bring the Sun's Place for that Day to the Meridian, and set the Index to Twelve a-Clock. 3° Determine the Place of the Star on the Surface of the Globe, and bring it to the Meridian: The Index will shew the Difference of Time between the Appulse of the Sun and Star to the Meridian of the Place: Note the Point of the Meridian over the Place of the Star. 4° Find in what Places of the Earth it is then Noon, and set the Index to Twelve a-Clock. 5° Turn the Globe towards the West, till the Index have pass'd over the Interval of Time between the Calmination of the Sun and Star. Then, under the Point of the Meridian before observed, will the Place required be found.

And hence may be found what Place a Star, or other Phenomenon rises or sets to at any given time.—

XIV. *To place the Globe in such manner, under any given Latitude, as that the Sun shall illumine all those Regions, which be actually illumined on Earth.*

1° Rectify the Globe, i. e. Elevate the Pole according to the Latitude of the Place: Bring the Place to the Meridian; and set the Globe North, and South by the Compass: Thus, the Globe having the same Situation to the Sun, as the Earth has; that Part thereof will be illumined, which is illumined on Earth.

Hence, the Globe being situate in the same manner, when the Moon shines, it will shew what Parts are then illumined by the Moon.

And, in the same manner, may we find where the Sun and Moon rise and set at any given Time.

XV. *To find the Distance of two Places on the Globe.*

Take the given Places in the Compasses; and apply them to the Equator. The Degrees they there subtend, being reduc'd into Miles, Leagues, or the like, give the Distances required. See *DEGREES, MILES, &c.*

The same may be done, and more commodiously, by laying the graduated Edge of the Quadrant of Altitude over the two Places; and noting the Degrees intercepted.—

GLOBULAR CHART, a Representation of the Surface, or some Part of the Surface, of the Terraqueous Globe, upon a Plane; wherein the Parallels of Latitude are Circles nearly Concentric; the Meridian's, Curves bending towards the Poles; and the Rhumb-lines also Curves. See *CHART, and PROJECTION.*

The Merits of this Chart consist in this, that the Distances between Places upon the same Rhumb, are all measur'd by the same Scale of equal Parts, and the Distances of any two Places in the Arch of a great Circle, is nearly represented in this Chart by a Straight Line.—Hence, Land Maps made according to this Projection, would indubitably have great Advantages above those made any other way. See *MAP.*

But for Sea Charts, and the Ules of Navigation, 'tis yet controverted, whether the Globular Chart be preferable to Mercator's, where the Meridians, Parallels, and particularly the Rhumb-lines, are all straight Lines; inasmuch as straight Lines are found more easy to draw, and manage than Curves, especially such as the Rhumb-lines on the Globular Chart are. See *MERCATOR, RHUMB, &c.*

This Projection is not new, tho' not much taken notice of till of late. It is mention'd by Ptolomy, in his Geography; as also by Blundevill in his Exercises.

GLOBULAR SAILING, see *Great Circle SAILING.*

GLOBULE, GLOBULUS, a little Globe; call'd also a Spherule. See *GLOBE.*

Thus the Cruor, or red Particles of the Blood are call'd Globules of the Blood, on account of their Redness, and Smallness. See *CRUOR.*

The Microscope discovers the Blood to consist of red, globular Particles, swimming in a limpid, transparent Water, or

or Scram; and these, when at a due Distance, may be discern'd to attract each other, and unite into larger Globules, like the Spheres of Quicksilver. See BLOOD.

The *Cartesians* call the Particles broke off of the Matter of the first Element *Globules of the second Element*. See ELEMENT, *CARTESIANS*, &c.

GLOBULUS NAFI, is us'd for the lower cartilaginous moveable Part of the Nose. See NOSE.

GLORIA PATRI, in the Liturgy, a Formula, or Verse, repeated at the End of each Psalm, and on other Occasions, to give Glory to the Holy Trinity; call'd also *Doxology*. See DOXOLOGY.

It is thus called, because beginning in the Latin Office with these Words, *Gloria Patri*, q. d. *Glory be to the Father*, &c.

Pope *Damasus* is commonly held to have first order'd the Recital, or rather the singing the *Gloria Patri* at the End of Psalms. *Baronius*, indeed, will have it to have been us'd in the times of the Apostles: But his use, then, he allows to have been more obscure; and that it did not become popular till after the Rise of *Arianism*, when it was made a kind of Symbol of Orthodoxy.

The fifth Canon of the Council of *Vaison*, held in 529, decrees, "That the Name of the Pope shall always be rec'd hears'd in the Churches of France; and after the *Gloria Patri*, shall be added *Sicut erat in Principio*, as is done at Rome, in Africa, &c. On account of the Hereticks, who say that the Son of God had his Beginning in time." *Fleury*.

GLORIA IN EXCELSIS, a kind of Hymn also recited in the Divine Office; beginning with the Words *Gloria in Excelsis Deo*, & in terra pax hominibus, &c. *Glory be to God on High, on Earth Peace*, &c.

GLOSS, or **GLOSSA**, a Comment made on the Text of any Author, to explain his Sense more fully, and at large; whether in the same Language, or another.

Nic. de Lira has composed a *Gloss* of the Bible in six Volumes, Folio.—The *French* say proverbially of an ill Comment, that it is *Gloss à Orleans, plus obscure que le Texte*.

The Word *Gloss*, according to some, comes from the Greek γλωσσα, Tongue; the Office of a *Gloss* being to explain the Text; as that of the Tongue is to discover the Mind.

Others derive it from the Latin *Gloss*, a Sister-in-Law, which among the Lawyers sometimes stands for Sister; the *Gloss* being, as it were, Sister to the Text.—

GLOSS is also us'd for a literal Translation; or an Interpretation of an Author in another Language, Word for Word. See TRANSLATION.

Young Scholars need an Interlineary *Gloss* for the understanding of *Juvenal*, *Horace*, *Salust*, &c.

GLOSS is also us'd in Matters of Commerce, &c. for the Lure of a Silk, Stuff, or the like. See LUSTRE.

GLOSSARY, a kind of Dictionary, for explaining the obscure, antient, and barbarous Words, and Phrases of an alter'd, corrupted, or refined Language. See DICTIONARY, &c.

Speiman's Glossary, intitled *Latino-Barbarum*, is an excellent Work; tho' that Author did not begin to study in this way till 50 Years of Age.

M. du Cange's Latin Glossary in three Volumes, and his *Greek Glossary* in two Volumes Folio, are wonderful Performances, full of uncommon Erudition.

Lindembrok has a *Glossary* on the Laws of *Charlemain*, &c.

GLOSSOCOMON, a Chirurgeons Instrument, us'd in setting broken and dislocated Thighs and Legs; as also in extending those which remain too short after setting. See DISLOCATION, &c.

It consists of a hollow Trunk, wherein the Thigh, or Leg is laid: At the Bottom hereof is a kind of Wheel; and towards the Top are two Pulleys, one on each Side. Several Thongs of Leather are tied both above and below the fracture'd Place. Those below, are fasten'd to the Axis of the Wheel, which they are near: Those above, go over the Pulleys to come to the Axis, which they are likewise fasten'd to; so that the same Turning of the Wheel, both draws the Part of the Leg, or Thigh, which is above the Fracture, upwards; and that below, downwards.

The Word is form'd of the Greek γλωσσα, Tongue, and κωμῶν, to have care; and was properly and primarily given by the Antients to a little Box, wherein they kept the Records of their Hautbois, &c.

GLOSSOCOMON, in Mechanics, is a Name given by *Genon* to a Machine composed of divers dented Wheels, with Pinions; serving to raise huge Burthenes.—

GLOSSOPETRA, or **GLOTTOPETRA**, in Natural History, a kind of Stone, in form of a Tongue; commonly found in the Island of *Malta*, and divers other Parts. See STONE.

Naturalists are divided as to the Nature, and Origin of these Stones.—*Steno*, de Corpore solido intra solidum contento: *Ol. Wormius*, *Duffert*, de *Glossopetra*; and *Reychebus* de *Glossopetris Lunenburgensibus*, treat of them at large.

The vulgar Notion is that they are the Tongues of Serpents petrify'd; and hence their Name, which is a Compound of γλωσσα, Tongue, and πέτρα, Stone.—Hence also their traditionary Virtue in curing the Bites of Serpents.

The People relate, that since the Viper which bit *St. Paul* without doing him any Harm; all the Serpents of that Island have had the same Virtue; and that the *Glossopetra* are the Tongues of those formerly dead.—But this is palpable Fable, which the sole Figure of the *Glossopetra* refutes; they having nothing of the Figure of a Serpent; beside that they are too big. See PETRIFICATION.

The common Opinion of Naturalists is that they are the Tongues of Fishes, left at Land by the Waters of the Deluge; and since petrify'd. See DELUGE.

Some specify the very kind of Fish; and take it to be that which *Theophrastus*, and the Greek Writers call *μαρμαρις*, and the Moderns, the *Sea-dog*.

Camerarius cannot persuade himself that the *Glossopetra* found in *England*, *Malta*, and a round *Montpelier* were ever the Teeth of a Sea-dog, or any other Fish.—The chief Difficulty, he suggests, is the small Quantity of volatile Salt and Oil they afford by Distillation. To which *Dr. Woodward* answers, in defence of the common System, that having laid so long buried under Ground, 'tis no wonder they should have lost the best Part of their volatile Principles.—'Tis certain that human Bones, and Skulls long interr'd don't afford near the Quantity of those Principles, as they would have done immediately after the Person's Death.

Another Scruple proposed by *Camerarius*, is, that the *Glossopetra*, when expos'd to the naked Fire, turn to a Coal, and not a Calx; contrary to what is asserted by *Fabius Colonna*—*Dr. Woodward* answers, that 'tis likely enough the *Glossopetra*, in burning, may assume the Form of Coal, before it arrive at that of a Calx.

GLOTTIS, in Anatomy, a Cleft, or Chink in the Larynx, serving for the Formation of the Voice. See LARYNX.

The *Glottis* is in form of a little Tongue; whence its Name, from γλωσσα, Tongue: For the same reason the *Latins* call it *Lingula*, i. e. little Tongue.

Thro' this Chink the Air descends, and ascends in respiring, speaking, singing, &c. It has an Apparatus of Muscles, whereby we contract and enlarge it; and hence all the Variety of Tones of the Voice. See VOICE.

The *Glottis* is cover'd and defended with a thin, soft Cartilage call'd the *Epiglottis*. See EPIGLOTTIS.

GLOVE, **ΧΑΙΡΟΤΗΡΕΑ**, a Habit or covering for the Hand and Wrist; us'd both for Warmth, Decency, and to shelter from the Weather.

Gloves, are distinguish'd, with respect to Commerce, into *Leather Gloves*, *Silk Gloves*, *Thread Gloves*, *Cotton Gloves*, worsted *Gloves*, &c.

There are also *Gloves* of Velvet, Satin, Taffary, &c. *Leather Gloves* are made of Shamy, Kid, Lamb, Doe, Elk, Buff, &c. See LEATHER.

There are Perfum'd *Gloves*; Wash'd, Glazed, Wax'd, White, Black, Stauf-colour, &c. Single, lin'd, top'd, lac'd, fring'd with Gold, Silver, Silk, Fur, &c.

'Tis a Proverb, that for a *Glove* to be good, and well made, three Kingdoms must contribute to it; *Spain*, to dress the Leather; *France*, to cut it; and *England*, to sew it: But, of late, the *French* seem to have appropriated the Functions of the other two; the *Gloves* of the *French* Manufacture having now the Advantage in point of dressing and sewing; as much as cutting.—

To throw the *Glove*, was a Practice, or Ceremony very usual among our Forefathers; being the Challenge, whereby another was desired to single Combat.—It is still retain'd at the Coronation of our Kings; when the King's Champion casts his *Glove* in *Westminster-Hall*. See CHAMPION.

Foyn supposes the Custom to have arose from the Eastern Nations, who in all their Sales, and Deliveries of Lands, Goods, &c. give the Purchaser their *Glove* by way of Delivery, or Investiture. To this effect he quotes *Ruth* iv. 7. where the *Chaldee* Paraphrase calls *Glove*, what the common Version renders by *Sheep*. He adds, that the Rabbin's interpret by *Glove*, that Passage in the CVIIIth Psalm, *In Idumeam extendam calcamentum meum*, Over *Edom* will I cast out my Shoe.—Accordingly, among us, he who took up the *Glove*, declared thereby his Acceptance of the Challenge; and as a Part of the Ceremony, continues *Foyn*, took the *Glove* off his own right Hand, and cast it upon the Ground, to be taken up by the Challenger. This had the Force of a mutual Engagement on each Side, to meet at the Time and Place which should be appointed by the King, Parliament, or Judges.—See *AGE*, &c.

The same Author asserts, that the Custom which still obtains of blessing *Gloves* in the Coronation of the Kings of *France*, is a Remain of the Eastern Practice of giving Possession with the *Glove*. *L. XVI. p. 1017. &c.*

Antiently it was prohibited the Judges to wear *Gloves* on the Bench. And at present in the Equeries of most Princes, 'tis not safe going in without pulling off the *Gloves*.—

GLUE, **GLUTEN**, a viscid, tenacious Matter serving as a Cement to bind, or connect divers Things together. See **CEMENT**.

There are divers Kinds of *Glues* made use of in the divers Arts; as the Common *Glue*; *Glue* *Glue*; Parchment *Glue*—But the two last are more properly call'd *Sizes*.

The Common, or *Strong Glue* is a Commodity used by numerous kinds of Artificers; as Joiners, Cabinet-makers, Case-makers, Hatters, Bookbinders, &c. And the Consumption thereof is very considerable. The best is that made in *England*, in square Pieces, of a ruddy, brown Colour. *Flanders Glue* is held the next after the *English*.

Glue is made of the Skins of all kinds of Beasts, as Oxen, Cows, Calves, Sheep, &c. The older the Beast is, the better is the *Glue*, made of its Hide. Indeed, 'tis rare they use whole Skins for this purpose; those being capable of being applied to better purpose: But they make use of the Shavings, Parings, or Scraps thereof: Sometimes they make it of the Feet, Sinews, Nerves, &c. of Beasts.

That made of whole Skins, is the best; and that of Sinews, &c. the worst: And hence chiefly arises the Difference of *Glues*; and the Advantages of the *English* and *Flemish Glues*: For, as our Tanners generally make the *Glue* themselves; they are not sparing of the Parings of the Skins, which they never sell: Whereas, in *France*, &c. the *Glue-makers* being a peculiar kind of Manufacturers, and having no Parings, &c. but what they buy, make use chiefly of Sinews, Feet, &c.

Method of making **GLUE**.

To make *Glue* of Parings; they first sleep them two, or three Days in Water; then washing them well out, they boil them to the consistence of a thick Gelly. This done, they pass the Gelly, while yet hot, thro' Oiler Baskets, to separate from it any Impurities; and in order to purify it still further, they let it rest some time. When the Ordures, or foreign Matters are precipitated to the Bottom of the Vessel; they melt and boil it a second time.

This done, they pour it into flat Frames, or Moulds; whence it is taken out, when pretty hard and solid, and cut into square Pieces, or Cakes. Nothing now remains, but to dry it in the Wind, on a sort of coarse Net, and afterwards to bring it, to finish the Drying.

The *Glue* made of Feet, Sinews, &c. is manag'd after the same manner; with this only Difference, that they bone, and scour the Feet, and don't lay them to steep.

The best *Glue* is that which is oldest: The surest Test of Goodness is to lay a Piece to steep three, or four Days in Water; if it swell considerably without melting, and when taken out resume its former Dryness, it is excellent.

Fish Glue, is a sort of *Glue* made of the nervous and mucilaginous Parts of a large Fish, found chiefly in the *Russian Seas*.

These Parts being boil'd, bear a near Resemblance to that viscid Matter found on the Skins of Cod Fish. When boil'd to the consistence of a Gelly, they spread it on a Leaf of Paper, and form it into Cakes; in which State it is sent to us.

Fish Glue is of considerable use in Medicine, and divers other Arts; where it is better known under the Names of *Issing Glass* and *Icthyocola*. See *ISSING GLASS*, &c.

GLUTEUS, in Anatomy, from *γλυφω*, *Nates*, a Buttock; a Name common to three Muscles, whose Office is to extend the Thigh—The first

The *Gluteus Major*, or the greater, arises semicircularly from the Os Coccygis, the Spines of the Sacrum, the Spine of the Ilium, and a strong Ligament which runs between the Sacrum, and Tubercle of the Ilium; and descending, is inserted into the *Linea aspera*, four Fingers Breadth below the great Trochanter.

The *Gluteus Medius*, or the middle one, call'd also *minor*, or *less*, arises from the Spine of the Ilium under the former, and is inserted into the superior and external Part of the great Trochanter.

The *Gluteus minimus*, or *least*, arises from the lower Part of the external Side of the Ilium, under the former, and is inserted at the superior Part of the great Trochanter.

GLUTINATIVE, **AGGLUTINATIVE**, or **CONGLUTINATIVE**, in Medicine, and Pharmacy. See **CONGLUTINATIVE**.

GLYCONIAN, or **GLYCONIC**, in the *Greek* and *Latin* Poetry.—A *Glyconian Verse* is that consisting of two Feet, and a Syllable. See **VERSE**, and **FOOT**.

This is *Scaliger's* Sentiment, who adds, that the *Glyconian Verse* was also call'd *Eurypidean*.

Others hold that the *Glyconian Verse* consisted of three Feet; a Spondee, and two Dactils; or rather, a Spondee, Choriambos, and a Pyrrhic; which Opinion is the most followed.

See *de dicta poetici Cyprici*, is a *Glyconian Verse*.
GLYCYRRHIZA, or **GLYCYRRHIZA**, in Medicine, *Liquorice*. See **GLYCYRRHIZA**.

GLYPHE, or **GLYPHIS**, in Architecture, a general Name for any Cavity, or Canal, whether round, or terminating in an Angle; us'd as an Ornament, in any Part.

The Word is *Greek*, *γλυφω*, which literally signifies *graving*.

Augis is properly a Nitch, or Indenture made in *graving*; or, more properly, the Notch in the Head of an Arrow, over which the String goes. See **TRIGLYPH**.

GLYSTER, see **CELYSTER**.

GNOME, a Name which the Cabalists give to certain invisible People, whom they suppose to inhabit the Inner Parts of the Earth, and to fill it to the Centre.

They are represented as very small of Stature, tractable, and friendly to Men; and are made the Guardians of Mines, Quarries, hidden Treasures, &c.

Vigener calls them *Gnomoni*—The Females of this Species are call'd *Gnomides*.

Vigneuil de Morville in his *Melange d'Histoire & de Littérature*, T. I. p. 100. gives a Relation of a Conference with a Philosopher of this Class, who held that an Infinity of Spirits inhabited each of the four Elements, Fire, Air, Water, and Earth, under the Denomination of *Salamanders*, *Sylphs*, *Oudins*, and *Gnomes*; that the *Gnomes* are employ'd in working, or actuating the Machines of Brutes upon the Earth.

He added that some Philosophers of that Sect, held that these Spirits were of two Sexes, for the two Sexes of Beasts, or moving Machines; that they were even more or less perfect as the Brutes were; and that there was an infinite Number of exceedingly small ones, to aduate the infinite Number of Insects, and Animalcula, both those that are visible, and those which are too small to come under our Senses; that all these Spirits in general govern their respective Machines according to the Disposition of the Parts, or Organs, the Humors, Temperaments, &c. that they do not lay hold of all Machines indifferently, but of those suited to their own Character, Element, &c. That a haughty one, for instance, seizes a *Spanish Gennet*; a cruel one, a *Tyger*, &c. See **SILPH**, &c.

GNOME, or **CERIA**, is also us'd for a short, pithy, useful, and sententious Observation, Reflexion, or the like; worthy to be treasur'd up, and remembered. See **SENTENCE**, **APOTHEOSIS**, &c.

Such is that of *Juvenal*,

Orandum est ut sit mens sana in corpore sano.

The Writers of Rhetoricks distinguish several kinds of *Gnomes*, according as they turn on Words, on Actions, or both; denominating them *Verbal*, *Active*, and *Mix'd Gnomes* or *Chitiz*.

GNOMON, in Geometry.—If a Parallelogram be divided into four lesser ones, by two Lines intersecting each other; and one of these Parallelograms be retrench'd, or taken away; the other three will make a *Gnomon*, ordinarily call'd a *Synare*. See **SQUARE**.

Or, a *Gnomon* in a Parallelogram, may be said to be a Figure form'd of the two Complements, together with either of the Parallelograms about the Diameter. Thus, in the Parallelogram A B Tab. *Geometry*, Fig. 5. the *Gnomon* is M + x + o + N; or M + N + x + z.

GNOMON, in Astronomy, an Instrument, or Apparatus for measuring the Meridian Altitudes of the Sun, and Stars. See **MERIDIAN ALTITUDE**.

Those conversant in Observations, prefer the *Gnomon* to the smaller Quadrants, both as more accurate, easier made, and more easily applied. See **QUADRANT**, and **OBSERVATION**.

Accordingly, both Antients, and Moderns have made use of *Gnomons*, for the making of their more considerable Observations: *Ungb Beigh*, King of *Parthia*, &c. us'd a *Gnomon*, in the Year 1227. which was 180 *Roman Feet* high: That erected by *Ignatius Dantes* in the Church of St. *Petrinus* at *Boulogne*, in the Year 1576, was 67 Feet high; *M. Cassini* erected another 20 Feet high, in the same Church, in the Year 1653. See **SOLSTICE**.

To erect an *Astronomical Gnomon*, and observe the Meridian Altitude of the Sun by the same.

Erect a perpendicular Style, of a considerable Height, on the Meridian Line: Note the Point where the Shadow of the *Gnomon* terminates when projected along the Meridian Line: Measure the Distance of that Extreme from the *Gnomon*, i. e. the Length of the Shadow.—Thus, having the Height of the *Gnomon*, and the Length of the Shadow, the Meridian Altitude of the Sun is easily found.

Suppose, e. gr. T S (Tab. *Opticks*, Fig. 13.) the *Gnomon*, and T V the Length of the Shadow. Here, on the right-angled Triangle S T V, having the two Sides T V and T S, the Angle V which is the Quantity of the Sun's Altitude, is found out by this Analogy: As the Length of the Shadow T V, is to the Altitude of the *Gnomon* T S; so is the whole

whole Sine : to the Tangent of the Sun's Altitude above the Horizon.

Or, more accurately, thus ;

Make a Circular Perforation in a Brass Plate, to transmit enough of the Sun's Rays to exhibit his Image on the Floor: Fix it parallel to the Horizon in a high Place, proper for Observation: Let fall a Line, and Plummet, wherewith to measure the Height of the Perforation from the Floor. Take care the Floor be perfectly level, and exactly horizontal: and let it be whiten'd over, to exhibit the Sun more distinctly. Draw a Meridian Line thereon, passing thro' the Foot of the *Gnomon*, i. e. thro' the Point the Plummet points out: Note the extreme Points of the Sun's Diameter on the Meridian Line K and I, and from each subtract a Right Line equal to the Semi-diameter of the Aperture, viz. K H, *Tab. Astron. Fig. 57.* on one Side, and L I on the other.—Then will H L be the Image of the Sun's Diameter, which bisected in B, gives the Point on which the Rays fall from the Centre of the Sun.

Now, having given the Right Line A B, and the Altitude of the *Gnomon*, with the Angle A, which is Right; the Angle A B G, or the apparent Altitude of the Sun's Centre, is easily found: For, assuming one of the given Sides A B for Radius; A G will be the Tangent of the opposite Angle, B. Then say, As one Leg, A B, is to the other A G; So is the whole Sine, to the Tangent of the Angle B.

GNOMON, in Dialling, is the *Style*, Pin, or Cock of a Dial; the Shadow whereof pointeth out the Hours. See *STYLE*, and *DIAL*.

The *Gnomon* of every Dial is suppos'd to represent the Axis of the World; and therefore the two Ends or Extremities thereof must directly answer to the North, and South Poles. See *MERIDIAN*.

The Word is *Greek*, γνομων; which literally imports somewhat that makes a thing known; by reason the *Style*, or Pin makes the Hour, &c. known.

GNOMONICA, or GNOMONICES, GNOMONICES, the Art of *Dialling*; or of drawing Sun and Moon Dials, &c. on any given Plane. See *DIAL*, and *DIALLING*.

'Tis thus call'd, as it shows how to find the Hour of the Day, &c. by the Shadow of a *Gnomon*, or *Style*.

GNOSIMACHI, an ancient Sect in Religion, whose distinguishing Character was that they were profess'd Enemies of all studied Knowledge in Divinity.

Damascenus says that they were perfectly averse to all the *Gnostics* of Christianity, i. e. to all the Science, or Knowledge therein. They held it an useless Labour to seek for *Gnosis* in the Holy Scriptures; that God requires nothing of Men but good Works; that it were, therefore, much better to walk with more Simplicity, and not to be so solicitous about the Dogmata of the *Gnostic* Life.

This *Gnosis* which they decried, is commonly understood of Science; and *Damascenus's* Interpreters translate the Word *fo*.

Some Authors take the Word *Gnosis* to have a farther Meaning, and that in the first Ages of Christianity, it signified much the same with what we call *Spirituality*, and the *Gnostic* Life, Γνωσις αγγελικη. In which Sense the *Gnosimachi* must have been such as were Enemies of the Spiritual Life; who contended for the doing of good Works in all Simplicity; and blamed such as aim'd to render them more perfect by Meditation, a deeper Knowledge and Insight into the Doctrines and Mytherics of Religion, and the sublimer, and more abstracted Exercises. See *GNOSTIC*.

The Word is *Greek*, γνωσιμη, q. d. an Enemy of Wisdom.—

GNOSTICKS, ancient Hereticks, famous from the first Rise of Christianity; principally in the East. See *HERETICKS*.

The Name *Gnostic*, which properly signifies *learned*, was adopted by those of this Sect, as if they were the only Persons who had the true Knowledge of Christianity: Accordingly, they look'd on all the other Christians as simple, ignorant, and barbarous Persons, who explain'd, and interpreted the Sacred Writings in too low, and literal a Signification.

At first, they were no more than the Philosophers, and Wits of those Times, who form'd themselves a peculiar System of Theology, agreeable to the Philosophy of *Pythagoras*, and *Plato*; to which they accommodated all their Interpretations of Scripture.

But the Word *Gnostic* afterwards became a general Name, comprehending divers particular Sects, and Parties of Hereticks, who rose in the first Centuries; and who, tho' they differ'd among themselves as to Circumstances, yet all agreed in some common Principles: Such were the *Valentinians*, *Simonians*, *Carpocratians*, *Niclatians*, &c. See *VALENTINIANS*, *SIMONIAN*, &c.

Sometimes, the Word *Gnostic* is us'd as a proper Name,

and peculiarly attributed to the Successors of the first *Niclatians*, and *Carpocratians* in the second Century, upon their laying aside the Names of the first Authors. See *CARPOCRATIAN*, *NICLATIAN*, &c.

Such as would be thoroughly acquainted with all their Doctrines, Reveries, and Visions, may consult *St. Irenaeus*, *Tertullian*, *Clement Alexandrinus*, *Origen*, and *St. Epiphanius*; particularly the first of these Writers, who related their Sentiments at large, and confutes them at the same time: Indeed, he dwells more expressly on the *Valentinians*, than on any other Sort of *Gnosticks*; but he shows the General Principles whereon all their mistaken Opinions were founded, and the Method they followed in explaining Scripture.

He accuses them with introducing into Religion certain vain and ridiculous Genealogies, i. e. a kind of divine Procreations, or Emanations; which had no other Foundation but in their own Imaginations. See *EON*, *AERA*, *CADABRA*, &c.

In effect, the *Gnosticks* confess'd that these Emanations were no where expressly deliver'd in the sacred Writings; but insist'd at the same time, that Jesus Christ had intimated them in Parables, to such as could understand him.

They built their Theology not only on the Gospels, and the Epistles of *St. Paul*; but also on the Law of *Moses*, and the Prophets. These last were peculiarly serviceable to them, on account of the Allegories, and Allusions they abound withal; which are capable of different Interpretations.

They for a great Value on the Beginning of the Gospel of *St. John*; where they fancied they saw a great deal of their Emanations, under the Word, the Life, the Light, &c.

They divided all Nature into three kinds of Beings; viz. *Hylic*, or Material; *Psychic*, or Animal; and *Pneumatic*, or Spiritual.

On the like Principle they also distinguish'd three Sorts of Men; *Material*, *Animal*, and *Spiritual*: The first, who were Material, and incapable of Knowledge, inevitably perish'd both Soul and Body: The third, such as the *Gnosticks* themselves pretended to be, were all certainly saved: The *Psychic*, or Animal, who were the middle between the other two, were capable either of being saved, or damn'd, according to their good, or evil Actions.

The Word *Gnostic* is form'd of the Latin *Gnosticus*, and that of the *Greek* γνωσις, knowing, learned, witty, enlighten'd, spiritual; of γινωσκω, I know.

The Name *Gnostic* sometimes occurs in a good Sense, in the ancient Ecclesiastical Writers, and particularly *Clement Alexandrinus*, who, in the Person of his *Gnostic*, describes the Characters and Qualities of a perfect Christian. This Point he labours in the seventh Book of his *Stromata*, where he shows that none but the *Gnostic*, or learned Person has any true Religion. He affirms, that were it possible for the Knowledge of God to be separated from eternal Salvation; the *Gnostic* would make no Scruple to chuse the Knowledge: And that if God should promise him Impunity in doing of any thing he has once spoke against, or offer him Heaven on those Terms, he would never alter a Whit of his Measures. See *GNOSIMACHI*.

In this Sense that Father uses *Gnostic*, in opposition to the Hereticks of the same Name; affirming that the true *Gnostic* is grown old in the Study of the Holy Scripture; and that he preserves the Orthodox Doctrine of the Apostles, and the Church: Whereas the false *Gnostic* abandons all the Apostolical Traditions, as imagining himself wiser than the Apostles.

At length the Name *Gnostic*, which originally was the most glorious, became infamous, by the idle Opinions, and dissolute Lives of the Persons who bore it; much, as in the present Age, has faded with the Names *Quietist*, *Pietist*, &c. See *QUIETISM*, &c.

GO, is sometimes us'd in Law, in a special Signification: Thus, to go *without Day*; and, to go to God, is as much as to be dismiss'd the Court; to be acquitted.

GOAD, STIMULUS, a Stick arm'd at one End with a pointed Iron, to prick, and urge on a Horse, Ox, or the like.

In speaking of Horses, we more commonly use the French Name *Valet*; reserving *Goad* for Oxen.—

GOAL, a Prison, or Place of legal Confinement. See *PRISON*.

The Word is form'd of the French *Geole*; and that of the Barbarous Latin *Geola*, *Geola*, *Gayola*, a Cage: Whence the *Picards* still call a Bird-cage, *Gayolle*.

The *Gosler*, *Geolier*, was call'd *Gastarius*, and *Cojularius*. *Scaliger* derives the Word *Gosler* from *Juscularius*. Some Latin Authors call him *Commentariensis*, by reason he keeps a Register, or List of all those under his Custody.

GOBLET, or GOBLET, a kind of Drinking-cup, or Bowl, ordinarily of a round Figure, and without either Foot, or Handle.

Goblets, made of the Wood *Tamarin*, are rank'd among the Medicinal Drugs; in regard the Liquors infus'd a while therein, are suppos'd to acquire a Quality which renders them good in Dificases of the Spleen.

The Word is French, *Goblets*; which *Salmafius*, and others derive from the Barbarous Latin, *Cupa*: *Budeus* derives it from the Greek *κρητάνη*.

GOBELINS, a celebrated Manufactory, establish'd at *Paris*, in the Faubourg *St. Marcel*, or *St. Marceau*; for the making of *Tapistry*, and other Furniture, for the use of the Crown. See *TAPISTRY*.

The House where this Manufactory is carried on, was built by two Brothers, *Giles*, and *John Gobelin*, both excellent Dyers, and the first who brought to *Paris* the Secret of dying that beautiful Scarlet Colour still known by their Name; as well as the little River *Bievre*, on whose Banks they fix'd their Dye-house; and which is now known by no other Name than that of the River of the *Gobelins*.

It was in the Year 1667, that this Place, till then call'd *Gobelin's Poly*, chang'd its Name into that of *Hotel Royal des Gobelins*, in consequence of an Edit of *Louis XIV*.

Monf. *Colbert*, having re-establish'd, and with new Magnificence enrich'd and compleated the King's Palaces, particularly the *Leuere*, and *Tuilleries*, began to think of making Furniture, suitable to the Grandeur of those Buildings: With this View he call'd together all the ablest Workmen in the divers Arts and Manufactures throughout the Kingdom; particularly Painters, *Tapistry-makers*, Sculptors, Goldsmiths, *Ebenists*, &c. and by splendid Offers, Pensions, Privileges, &c. call'd others from foreign Nations.

And to render the intended Establishment more firm and lasting, brought the King to purchase the *Gobelins*, for them to work in; and drew up a System of Laws, or Policy, in XVII Articles.

By these it is provided that the new Manufactory shall be under the Administration of the Superintendent of the King's Buildings, Arts, &c. That the ordinary Masters thereof shall take Cognizance of all Actions, or Processes brought against any of the Persons in the said Manufactory, their Servants, and Dependants: That no other *Tapistry Work* shall be imported from any other Country, &c.

The *Gobelins* has ever since remain'd the first Manufactory of this kind, in the World. The Quantity of the finest, and noblest Works, that have been produc'd by it; and the Number of the best Workmen bred up therein, are incredible. In effect, the present flourishing Condition of the Arts, and Manufactories of *France* is in a great measure owing thereto.

Tapistry Work, in particular, is their Glory. During the Superintendance of *M. Colbert*, and his Successor *M. de Louvois*, the making of *Tapistry* is said to have been practis'd to a Degree of Perfection, scarce inferior to what was anciently done by the *English*, and *Flemish*.

The Battles of *Alexander*; the Four Seasons; the Four Elements; the King's Palaces, and a Series of the principal Actions of the Life of *Louis XIV*. from the time of his Marriage to the first Conquest of *France* Comte, done from the Designs of *M. le Brun*, Director of the Manufactory of the *Gobelins*, are Master-pieces in their kind.

GOBONE, GONONATED, in Heraldry, the same as *Compone*. See *COMPONE*.

GOD.—No just Definition can be given of the Thing signified by this Name, as being infinite, and incomprehensible. See *DEFINITION*.

In Scripture, he is defined by, I am that I am: Alpha and Omega; the Beginning and End of all Things.

Among Philosophers, he is defined a Being of infinite Perfection; or in whom there is no Defect of any thing which we conceive might raise, improve, or exalt his Nature. See *PERFECTION*.

Among Men, he is chiefly consider'd as the first Cause, the first Being, who has exist'd from the Beginning, has created the World, and who subsists necessarily, or of himself. See *CAUSE*, &c.

Sir *Isaac Newton* chuses to consider, and define *GOD* not as is usually done, from his Perfection, his Nature, Existence, or the like; but from his Dominion. 'The Word *GOD*,' according to him, 'is a relative Term, and has a Regard to Servants: 'Tis true, it denotes a Being eternal, infinite, and absolutely perfect; but a Being, however eternal, infinite, and absolutely perfect, without Dominion, would not be *GOD*.'

'The Word *GOD* frequently signifies *LORD*; but every Lord is not *GOD*: The Dominion of a spiritual Being or Lord, constitutes *GOD*; true Dominion, true *GOD*; the supreme, the Supreme; feign'd, the feign'd.

'From such true Dominion it follows that the true *GOD* is living, intelligent, and powerful; and from his other Perfections, that he is supreme, or supremely perfect: He is eternal, and infinite, omnipotent, and omniscient; that is, he endures from Eternity to Eternity, and is present from Infinity, to Infinity.

'He governs all Things that exist, and knows all Things

that are to be known: He is not Eternity, or Infinity, but eternal and infinite: He is not Duration, or Space, but he endures, and is present: He endures always, and is present every where; and by existing always and every where, constitutes the very Things Duration and Space, Eternity and Infinity. See *ETERNITY*, *DURATION*, *SPACE*, &c.

'Since every Particle of Space is always, and every indivisible Moment of Duration, every where, the Creator and Lord of all Things can never be *unquam usquam*. See *UNQUAM*, &c.

'He is omnipresent, not only virtually, but also substantially; for Power without Substance cannot subsist. See *POWER*, &c.

'All Things are contain'd, and move in him; but without any mutual Passion: He suffers nothing from the Motions of Bodies; nor do they undergo any Resistance from his Omnipresence.

'It is confess'd that *GOD* exists necessarily; and by the same Necessity he exists always, and every where. Here also he must be perfectly similar; all Eye, all Ear, all Brain, all Arm, all the Power of perceiving, understanding and acting; but after a manner not at all corporal, after a manner not like that of Men, after a manner wholly to us unknown. See *ΑΝΥΠΟΘΕΤΟΝ ΕΙΝΑΙ*.

'He is destitute of all Body, and all bodily Shape; and therefore cannot be seen, heard, nor touch'd; nor ought to be worship'd under the Representation of any thing corporal. See *IMAGI*, &c.

'We have Ideas of the Attributes of *GOD*, but do not know the Substance even of any Thing: We see only the Figures, and Colours of Bodies; hear only Sounds, touch only the outward Surfaces, smell only Odours, and taste Tasts; and do not, cannot, by any Sense, or any reflex Act know their inward Substances, and much less can we have any Notion of the Substance of *GOD*. See *BODY*, *SUBSTANCE*, &c.

'We know him by his Properties, and Attributes; by the most wise, and excellent Structure of Things, and by final Causes; but we adore, and worship him only on account of his Dominion: For *GOD*, setting aside Dominion, Providence, and final Causes, is nothing else but Fate, and Nature. *Philos. Nat. Princip. Math. in Calc.* See *FATE*, *NATURE*, &c.

A late ingenious Divine has wrought these Thoughts of that admirable Philosopher into Form, and ripen'd them into a more express System; in a Discourse upon this Occasion.

The great Principle or Proposition he lays down, is that *GOD* is not rightly defined a Being absolutely perfect, but a spiritual Being endued with absolute Dominion—Not that he denies the self-existent Being to be infinitely perfect; but only that it is his Dominion, not his Perfection, that is intended by the Word *GOD*.

The self-existent Being, he observes, may be consider'd either absolutely, or relatively: Absolutely, as he is in his own Nature, and as he is consider'd by the Metaphysicians: Relatively, as he stands related to his Creatures, and as he is consider'd by the Religionist, his Worshipper. Now, in treating of the Definition of *GOD*, he intends a nominal, not a real Definition; not what the Nature of that self-existent Being is, which we call *GOD*; but what it is we mean by the Word *GOD*: Which, on this System, is that self-existent Being, consider'd not absolutely, but relatively; not as he is abstractedly in his own Nature, but as he stands related to the Universe, whose Sovereign Lord he is. See *UNIVERSE*.

'Tis added, that the Names given him in most Languages, denote, not his abstract, metaphysical, and absolute Idea, but his religious, popular, and relative one.

Indeed, every Worshipper of *GOD* will allow that he worships that self-existent Being for no other Reason, but because he is *GOD*; that is, because he is *LORD* and Sovereign; for one would be under no Obligation to worship a Being, tho' absolutely perfect, that had no Dominion over him.—A perfect Being without Dominion, would be only an Object of Contemplation, and Admiration; not of Worship: For Worship is only a Payment of Homage, an Acknowledgment of Subjection; which, where there is no Dominion, cannot be due, and is therefore always due in proportion to the Degree of Dominion.

The Word *GOD* signifies *LORD*, and not a Being absolutely perfect: Thus when I say, my *GOD*, the *GOD* of the Universe, it seems plain, that the Notion of *GOD* is relative, not absolute, that is, includes Dominion, not absolute Perfection; and if I were to express the same in any other Words, could I do it otherwise than thus, My *LORD*, the *LORD* of the Universe; and not thus, my perfect Being, the perfect Being of the Universe?

Indeed, it seems impossible to prove the Existence of a *GOD*, in the Sense affix'd to that Name, a priori, or any otherwise than from his Dominion; that is by arguing from the Effect to the Cause. The following Propositions, 'tis true, are undeniably demonstrable a priori. 1^o That there is a self-existent, i. e. necessarily existent Being; because the

Universe could not produce itself. 2° That a necessarily existent Being must be eternal, and omnipresent, that is co-existent with infinite Duration, and infinite Space, because whatever exists in an absolute Necessity of Nature, has no Relation to Difference of Time, Place, &c. and consequently must exist always and every where. 3° This Being must be perfectly similar, simple, and uncompounded, without the least Variety, or Difference imaginable, or possible, because absolute Necessity is every where and always the same. From which Proposition it also follows, as a Corollary, that this Being is immutable.

It is apparent therefore, *a priori*, that there is a self-existent Being, which is not Matter; and that this Being is eternal, omnipresent, similar, and unchangeable, by necessary Connexion between self-Existence, and these Attributes: but it is impossible to shew any necessary Connexion between self-Existence and Understanding; and if so, it is impossible to prove that the self-existent Being is intelligent *a priori*, or any otherwise than by arguing from the Effect to the Cause; that is, from the Consideration of the Frame of the Universe, the Laws of Nature, and final Causes. *Maxwell's Diss. concern. GOD.*

The Hebrews call the Name of God יהוה, as consisting of four Letters, which it is observ'd to do in most Languages: Thus, in the Hebrew, God is called יהוה, *Yehovah*; in Greek, Θεός; in Latin, *Deus*; in Spanish, *Dios*; in Italian, *Mio*; in French, *Dieu*; in the ancient Gaulish, *Diox*; in ancient German, *Diet*; in the Slavonic, *Duch*; in Arabic, *Alla*; in the Polish, *Bóg*; in the Pannonian, *Istn*; in the Egyptian, *Teny*; in the Persian, *Sire*; in the Language of the Magi, *Orsi*.

The Rabbins, and Hebraists, particularly St. *Jerom*, and the Interpreters, reckon up ten different Names of God in Scripture; which are, אלהים, *Elohim*, אלה, *Elohe*, אלהים, *Elohim*, אלהים, *Elohim*, אלהים, *Elohim*, אלהים, *Elohim*, אלהים, *Elohim*, אלהים, *Elohim*. The others are only Names of Attributes. St. *Jerom* gives a particular Explanation of the ten Names, in his Epistle to *Marcella*: And *Bunorf* the younger has an express Dissertation on the same; *Dissertatio de nominibus Dei*. The Jesuit *Societ* has three several ones on the three Names *El*, *Shaddai*, and *Yehovah*, printed at Paris in 1735.

Cicero in his Treatise of *Nat. Deorum* puts this ridiculous Argument against the Existence of a God in the Mouth of *Cotta*: 'How shall we conceive any thing of a God, when we cannot possibly attribute any Virtue to him? Shall we say he has Prudence? No, for Prudence consisting in making a Choice between good and evil, what need has God of such Choice, when he is by his own Nature incapable of any evil? Shall we say he has Understanding and Reason? No, for Understanding and Reason only serve to discover Things unknown to us, by Things that are known; but there can be nothing unknown to God. Nor can we attribute Justice to God; that being a Thing which only relates to human Society: Nor Temperance; since he has no Pleasure to refrain: Nor Courage, in regard he is not susceptible of any Pain, Labour, or Fatigue; nor exposed to any Danger. How then can a Thing be God, which has neither Virtue, nor Understanding?' See *ARTIBUS, DIVINITAT, &c.*

God is also used in speaking of the false Deities of the Heathens; many of which were only Creatures, to which divine Honours and Worship were paid. See *Idol*.

The Greeks and Latins, it is observable, did not mean by the Name God an all-perfect Being, whereof Eternity, Infinity, Omnipresence, &c. were essential Attributes: With them, the Word only implied an excellent and superior Nature; and accordingly they give the Appellation Gods to all Beings of a Rank, or Class higher and more perfect than Men.

Nay, Men themselves, according to their System, might become Gods, after Death; inasmuch as their Souls might attain to a Degree of Excellence superior to what they were capable of in Life. See *DEIFICATION*.

The first Divines, Father *Bossu* observes, were the Poets: The two Functions, tho' now separated, were originally combined, or rather one and the same Thing. See *POETRY*.

Now the great Variety of Attributes in God, that is the Number of Relations, Capacities, and Circumstances wherein they had occasion to consider him; put these Poets, &c. under a Necessity of making a Partition, and to separate the divine Attributes into several Persons; by reason the Weakness of the human Mind could not conceive so much Power and Action in the Simplicity of one single divino Nature.

Thus the Omnipotence of God came to be represented under the Person and Appellation of *Jupiter*; the Wisdom of God, under that of *Minerva*; the Justice of God, under that of *Juno*. See *EPICUR, FABLE, &c.*

The first Idols, or false Gods that are said to have been adored, were the Stars, Sun, Moon, &c. in regard of the Light, Heat, and other Benefits we derive from them. See *ASTRONOMY, STAR, SUN, &c.*

Afterwards, the Earth came to be deified for furnishing Fruits necessary for the Subsistence of Men and Animals: Then Fire and Water became Objects of divine Worship, for their Usefulness to human Life. See *FIRE, and WATER*.

When Things were thus got in the Train, Gods, by degrees, became multiplied to Infinity; and scarce any thing but the Weakness, or Caprice of some Devotee or other, elevated into the Rank; Things useless, or even destructive not excepted.

To authorize their own Crimes, and justify their Vices and Debaucheries, they constituted criminal, vicious, and licentious Gods, unjust, rapacious, and tyrannical Gods, covetous and thievish Gods, Drunken Gods, impudent Gods, cruel and bloody Gods.

The principal of the ancient Gods, whom the Romans call'd *Di majorem Gentium*, and which *Cicero* calls *Celestial Gods*; *Varro*, Select Gods; *Ovid*, *Nobiles Deos*, others, *Consentes Deos*; were *Jupiter*, *Juno*, *Vesta*, *Minerva*, *Ceres*, *Diana*, *Venus*, *Mars*, *Mercury*, *Neptune*, *Vulcan*, *Apollo*.

Jupiter is consider'd as the God of Heaven; *Neptune* as God of the Sea; *Mars* as the God of War; *Apollo* of Eloquence, Poetry, and Physick; *Mercury* of Trades; *Bacchus* of Wine; *Cupid* of Love, &c.

A second Sort of Gods, call'd *Demi Gods*, *Semi-Dii*, *Dii minorum Gentium*, *Lodigites*, or Gods adopted, were Men canonized, and deified.—As the greater Gods had Possession of Heaven by their own Right, so these secondary Deities had it by Right of Donation; being translated into Heaven for that they liv'd as Gods upon Earth. See *INDICITS, HERO, and APOTHEOSIS*.

The Heathen Gods may be all reduced to the following Classes. 1° Created Spirits, Angels, or Demons; whence good and evil Gods; *Genii*, *Lares*, *Lemures*, *Typhones*, *Protecting Gods*, *Infernal Gods*, &c. See *DEMON, GENIUS, LARES, &c.*

2° Heavenly Bodies, as the Sun, Moon, and other Planets, fixed Stars, *Constellations*, &c. See *SUN, MOON, STAR, CONSTELLATION, &c.*

3° Elements, as Air, Earth, Ocean, Ops, *Vesta*; the Rivers, Fountains, &c. See *NALIAS, POUNTAINS, &c.*

4° Meteors; thus the Persians adored the Wind; *Thunder*, and *Lightning*, were honour'd under the Name of *Geryon*. See *THUNDERBOLT*. And several Nations of India and America have made themselves Gods of the same. *Caster*, *Pollux*, *Helena*, and *Iris* have also been prefer'd from Meteors to be Gods; and the like has been practic'd in regard to Comets: Witness that which appear'd at the Murder of *Cesar*. *Socrates* deified the Clouds, if we may give Credit to *Aristophanes*; and the primitive Christians, *Tertullian* assures us, were reproach'd with the same Thing.

5° They erected Minerals, or Fossils into Deities; such was *Beylus*; the *Finnlanders* ador'd *Stones*; the *Scythians* *Iron*; and many Nations *Silver*, and *Gold*.

6° Plants have been made Gods; thus *Leeks* and *Onions* were Deities in Egypt: The *Slavos*, *Lithuanians*, *Celts*, *Vandals*, and *Peruvians* ador'd *Trees* and *Forests*: The ancient *Gauls*, *Britons*, *Druids*, bore a particular Devotion to the Oak; and it was no other than *Wheat*, *Corns*, *Seeds*, &c. that the Ancients adored under the Names of *Ceres* and *Proserpina*. See *PANES, SYLVANS, DRUIDS, &c.*

7° They took themselves Gods from among the Waters: The *Syrians*, and *Egyptians* ador'd *Fishes*, the *Oxyrinchites*, *Laopolitans*, *Sentens*, and the Inhabitants of the *Eliphantide* had each a Fish for their God; and the *Tritons*, *Nereids*, *Syrens*, &c. what were they but Fishes? Several Nations have ador'd *Serpents*, particularly the *Egyptians*, *Prussians*, *Lithuanians*, *Somogians*, &c. See *TRITONS, NEREID, SYREN, &c.*

8° Insects, as *Flies* and *Ants* have had their Sacrificers; these among the *Thebaitians*, and those in *Acanthia*, where *Bullocks* were offer'd to them.

9° Among Birds, the *Stork*, *Crow*, *Sparrowhawk*, *Igls*, *Eagle*, *Griffon*, and *Lapwing* have had Divine Honours; the last in *Mexico*, the Rest in *Egypt*, and at *Tebes*.

10° Four-footed Beasts have had their Altars, as the *Bull*, *Dog*, *Cat*, *Wolf*, *Baboon*, *Lion*, and *Crocodile* in *Egypt* and elsewhere; the *Hox* in the Island of *Creta*; *Rats* and *Mice* in the *Troas*, and at *Venedos*; *Weasels* at *Tibes*; and the *Porcupin* throughout all *Zoroaster's* School.

11° Nothing was more common than to place Men among the Number of Deities, and from *Belus*, or *Baal* to the *Roman* Emperors before *Constantine*; the Instances of this kind are innumerable. Frequently they did not wait for long

long as their Deaths for the Apotheosis. *Nebuchadnezzar* provided to have his Statue worshipp'd while living; and *Virgil* shews that *Augustus* had Altars, and Sacrifices offer'd to him. *Ecolg.* 1. v. 6, 7. As we learn from other Hands, that he had Priests call'd *Augustales*; and *Temples*, at *Lyons*, *Narbona*, and several other Places; and he must be allowed the first of the *Romans*, in whose behalf Idolatry was carried to such a Pitch. The *Aethiopians* deem'd all their Kings, Gods: The *Vellada* of the *Germans*; the *Janus* of the *Hungarians*; and the *Tvas*, *Orbin*, and *Assa* of the Northern Nations were also Men.

15^o Not Men only, but every thing that relates to Man has also been deified; as *Labour*, *Rest*, *Sleep*, *Youth*, *Age*, *Death*, *Virtues*, *Vices*, *Occasion*, *Time*, *Place*, *Numbers* among the *Pythagorians*; the *Generative Power*, under the Name of *Protopus*: *Infancy* alone had a Cloud of Deities; as *Vogelants*, *Levana*, *Rumina*, *Edofo*, *Posina*, *Cubo*, *Cumina*, *Corax*, *Ovisago*, *Statulimus*, *Fabulinus*, &c.

They also ador'd the Gods *Health*, *Fever*, *Fear*, *Love*, *Pain*, *Indignation*, *Shame*, *Impudence*, *Opinion*, *Renown*, *Prudence*, *Science*, *Art*, *Fidelity*, *Felicity*, *Calumny*, *Liberty*, *Money*, *War*, *Peace*, *Victory*, *Triumph*, &c.

Lastly, *Nature*, or the *Universe*, was reputed a God. See *NATURE*, and *UNIVERSE*.

Hesiod has a Poem under the Title of *Θεογονία*, i. e. the Generation of the Gods; wherein he explains their Genealogy and Descent, sets forth who was the first, and principal of all the others, who first descended from him and what Issue each had; the whole making a sort of System of Heathen Theology. See *THEOGONY*.

Beside this popular Theology, each Philosopher had his separate System; as may be seen from the *Timæus* of *Plato*, and *Cicero De Natura Deorum*.

Justin Martyr, *Tertullian* in his *Apologeticks* and his Books *contra Gentes*; *Ambrosius*, *Minucius Felix*, *Lactantius*, *Eusebius*, *Prepar.* & *Demon. Evangel.* *St. Augustin De Civit. Dei*, and *Theodoret advers. Gentes*, shew the Vanity of these Gods.

'Tis very difficult to discover the real Sentiments of the Heathens, with respect to their Gods: They are exceedingly intricate and confused, and even frequently contradictory. They admitted for many superior and inferior Gods, who shared the Empire, that all was full of Gods. *Varro* reckons up no less than thirty thousand ador'd within a small Extent of Ground, and yet their Number was every Day growing. The Way to Heaven was so easy for the Great Men of those Days, that *Juvenal* beings in *Atias* complaining he was ready to sink under the Load of such a Number of new Gods as were daily placed in the Heavens: Yet *Pa. Mourges* seems to have proved, that all the Philosophers of Antiquity have acknowledg'd that there was but one God—*Plan Theol. des Sells. Savants. de Grece*. See *GODNESS*.

GOD-BOTE, in our ancient Saxon Customs. *Missa eo delictis in Deum admittis obventionis*.—A Fine, or Amercement for Crimes and Offences against God: An Ecclesiastical, or Church Fine.

GOD-FATHERS, and *GOD-MOTHERS*, Persons who direct, and attend at the Baptism of Infants, or other Persons; and give the Name. See *BAPTISM*, and *NAME*.

The Number of *God-fathers*, and *God-mothers* is now reduc'd to three in the Church of *England*, and to two in that of *Rome*: Antiently, they had as many as they pleas'd.—

The *Romanists* have also *God-fathers*, and *God-mothers* at their Confirmation. See *CONFIRMATION*.

They also give *God-fathers*, &c. to Bells, at their Baptism. See *BELL*.

Among the Antients it was the Custom for Persons of Quality to have others of like Quality cut their Childrens Hair, the first time; by which they became reputed a sort of *God-fathers*. And the like was practis'd with regard to the Hair of the Beard. See *ADOPTION*, *FATHER*, *HAIR*, &c.

The Name *God-father* was also antiently given to a kind of Seconds, who attended and assisted the Knights in Tournaments, or single Combats.

The *God-fathers* of Duels were a kind of Advocates, chosen by the two Parties, to represent the Reasons of their Combat to the Judges. See *COMBAT*, *DUEL*, *CHAMPION*, &c. Something of this kind is still retain'd at solemn Carousals: There are two, or more in each Quadrille. See *QUADRILL*.

The Infinitive of *God-fathers* and *God-mothers*, *Patris* and *Marris* is originally *Roman*: They were young People, who in the Games of the Circus had the Direction of the Chariots, Shews, and Images of the Gods. *Cicero* makes mention of them in his Oration *de Haruspicio respici.*

Their Office was much like that of the Children in some Romish Ceremonies, who are dress'd in the Habit of Angels, to throw Flowers, bear Incense-Pots, Lights, &c. and accompany the Relicks, and Images of Saints.—

GODDESS, *Dea*, *Diva*, a Heathen Deity, of the female Sex. See *GOD*.

The Antients had almost as many *Goddeses*, as Gods:

Such were *Juno*, the *Goddes* of Air; *Diana*, the *Goddes* of Woods, and Chastity; *Proserpina*, the *Goddes* of Hell; *Venus*, of Beauty; *Tethis*, of the Sea: Such also were *Victory*, *Fortune*, &c. See *FOR TUNE*.

Nay, they were not contented to make Women Gods, and admit both Sexes into the Roll; but they had also Hermaphrodite Gods: Thus *Minerva*, according to several of the Learned, was both Man and Woman, and worshipp'd both under the Appellation of *Lunus*, and *Luna*. *Mitra*, the *Persian* Deity, was both God and *Goddes*; and the Sexes of *Venus* and *Vulcan* are very dubious: Whence, in the Invocations of those Deities, they us'd this Formula, *Ze thos God, or Goddes*; as we learn from *A. Gellius*.

It was a Privilege peculiar to *Goddeses*, that they might be represented on Medals, naked: The Imagination, it was suppos'd, must be aw'd, and kept from taking Liberties, by the Consideration of the Divine Character.

GOD-GILD, in our antient Customs, that which is offer'd to God. See *GILD*.

GOLD, *AURUM*, a yellow Metal; the heaviest, purest, most ductile, and shining, and on those accounts the most valuable, of all Metals. See *METAL*.

The Chymists call *Gold Sol*, the *Sun*, to denote its Pre-eminence over the other Metals, which are call'd by the Names of the Planets: Its Symbol, or Character is ☉, which in their Hieroglyphical way of writing, denotes Perfection, Simplicity, Solidity, &c.—See *CHARACTER*.

The Weight of *Gold* is to that of *Silver* as 19 to 10.—A Cubic Inch of pure *Gold* weighs 12 Ounces, 2 Drachms, 52 Grains; and the Cubic Inch of *Silver* 6 Ounces, 5 Drachms, 28 Gr.—The Pound Weight, or twelve Ounces Troy of *Gold* is divid'd into 14 Carats. See *CARACT*, *WEIGHT*, and *SPECIFIC GRAVITY*.

The Value of *Gold* is to that of *Silver* as 14 to 13; antiently, it was only as 12 to 1. Indeed, this Proportion varies as *Gold* is more or less plentiful: For *Suetonius* relates, that *Cæsar* brought such a Quantity of *Gold* from *Italy*, that the Pound of *Gold* was only worth seven Pound and half of *Silver*. Standard *Gold* is worth 44 lib. 10 s. Sterling the Pound-weight: Standard *Silver*, is worth 3 l. the Pound; or 5 s. the Ounce. See *STANDARD*; see also *SILVER*, and *MONEY*.

The first Characteristic, or Property of *Gold* is that it is the heaviest of all Bodies—So that whoever would make *Gold*, must be able to add to the Weight of other Matters, and make them equiponderate with *Gold*.

In every Mels of Matter, therefore, heavier than Mercury, there must of necessity be a Share of *Gold*; there being no Body in Nature of intermediate Gravity; i. e. no Body whose Gravity is to that of *Gold*, more than as 14 to 19. See *MERCURY*.

Its second Character is, that of all known Bodies it is the most ductile, and malleable, and of all Bodies its Parts have the greatest Degree of Attraction, i. e. cohere with the greatest Force.—Our *Gold-beaters*, and *Wier-drawers* furnish us with Proof of this Property. They every Day reduce *Gold* into Leaves, or Lamellæ, unconceivably thin; yet without leaving the least Aperture, or Chasm visible to the best Microscope, or even pervious to the Light. See this Property consider'd more at large under the Article *DUCTILITY*.

This Tenacity, or cohesive Force of *Gold* depends altogether on its being free from Sulphur: For mix but a single Grain of Sulphur with 1000 times the Weight of *Gold*, and the Mass ceases to be malleable. See *SULPHUR*.

The third Character of *Gold* is its Fixedness in the Fire; in which it exceeds all other Bodies.—This Property seems to result from the Homogeneity, and Equality of its Parts, which equally aid, and support each other, and have equal Pores, or Interstices thro' which the fiery Corpuscles find an easy Passage.—The Prince of *Mirandola*, *Mr. Boyle*, and other Chymists furnish divers Experiments to illustrate this wonderful Fixity. After laying a Quantity of *Gold* two Months in the intensest Heat imaginable, it is taken out without any sensible Diminution of Weight. See *FIXITY*.

It must be added, however, that in the Foci of the large Burning Glasses of Mess. *Leibniz*, *Bayen*, and *Villette*, even *Gold* itself volatilizes and evaporates. After this manner, we are told from the Royal Academy at *Paris*, a Quantity of pure *Gold* was vitrified; being first fused into a sort of Calx, which emitted Fumes, and lost of its Weight. But the same Calx fused again with a Quantity of Greese was restor'd into *Gold*. See *VOLATILITY*, *VITRIFICATION*, *BURNING GLASS*, &c.

Its fourth Character is, not to be dissoluble by any Menstruum in Nature, except *Aqua Regia*, and Mercury. See *MENSTRUUM*.

The Basis of *Aqua Regia* is Sea Salt, which is the only Salt in Nature that has any Effect on *Gold*. But this Salt has its Effect in what Form or Manner never applied, whether as a Fluid, or a Solid; in Substance, or in Spirit. See *AQUA REGIA*, and *SALT*.

Mr. Boyle made a Menstruum of Butter of Antimony, which dissolved Gold with great Facility; and hence concluded that Gold might be dissolv'd without Sea Salt: But by Mistake, the effective Part even of this Menstruum being Hill Sea Salt, which is an Ingredient in Sublimate of Mercury wherewith Butter of Antimony is made. See SALT, SUBLIMATE, &c.

The seventh Character is that it readily and spontaneously, as by some Magnetic Virtue, attracts, and absorbs Mercury; tho' what My Lord Bacon writes, viz. that Gold, in imbibing Mercury, increases in Weight, we doubt, is but ill warranted. For 'tis certain it must be increas'd in Bulk, more than in Weight, and consequently must be specifically lighter. See MERCURY.

It may be added, that as soon as the Mercury enters the Gold, the Metal becomes soft, like a Paste. See AMALGAMATION.

The eighth Character is, that it withstands the Violence both of Lead, and Antimony, i. e. being fused in the Coppel along with either of those Matters, it does not dissipate and fly off with them in Fume, but remains fix'd, and unchanged.

All other Metals, except Gold, and Silver melted with Lead, perish with it, and evaporate by Fire; and in Antimony, all other Metals except Gold, and even Silver itself, undergo the same Fate.—Thus, if a Mafs consisting of Gold, Silver, Stones, Copper, &c. be fused together with Antimony, the several Matters become separated, and all but the Gold rises to the Surface in form of a Scoria, and is blown off with Bellows: But the Gold remains behind, much purified, as having lost all its heterogeneous Parts along with the other Metals. And hence Antimony is used as the Test of Gold. See TEST, COPPEL, REFINING, &c.

The ninth Character is that of all Bodies it is the simplest (the primary Elements being excepted).—By simple we here mean that whose minutest Part has all the Physical Properties of the whole Mafs. Thus, if a Grain of Gold be dissolv'd in *Aqua Regia*; and a single Drop of the Solution be taken, a Quantity of Gold may be separated therefrom, which shall only be the Millionth Part of the Grain, and yet have all the Characters of Gold. Or, if you fuse a Grain of Gold with a large Mafs of Silver, and mix the two together, so that the Gold becomes equally diffused thro' the whole Mafs; you will have in every Particle of the Mafs a Particle of perfect Gold. Accordingly, dissolve any Part of the Mixture in *Aqua fortis*, and a Quantity of Gold will precipitate to the Bottom, bearing the same Proportion to the Grain that the Part dissolved did to the whole Mafs. On which Principle depends the Art of Essayng. See ESSAYNG.

All the known Parts of the Earth afford this precious Metal; tho' with a deal of Difference, in point of Purity, and Abundance: *Europe*, so fertile in other respects, comes short of all the other Quarters, in Gold. *America* furnishes the most; and particularly the Mines of *Peru*, and *Chilly*. That of *Asia* is esteem'd the finest, particularly that of *Manaricabo* in the *East Indies*: The *Spaniards* assure us that they get Gold out of some of their *Peruvian* Mines, 25 Carats fine before it be purified. Add, that the Gold of *Acima* on the Coast of *Africa* is found from 22 to 23 Carats.

Glauber, an eminent Chymist, holds that there is not any Sand, or Stone, but Gold may be procured from; Limestone only excepted: Only that the Expence of separating it, much surmounts the Profit.

Gold is chiefly found in Mines: Tho' there is some also found in the Sand and Mud of Rivers, and Torrents; particularly in *Guinea*. This last is in form of a fine Powder, and call'd *aqueus* & *Gold dust*. *Glauber* holds that there is a third sort of Gold, scarce found any where but in the Drains of the Mountains of *Chilly*, which they separate from the Earth by washing; whence the Places where it is found, or separated, are call'd *Lavadero's*.

This Earth is usually reddish, and very fine: At about six Foot deep it is mix'd with Grains of large Dust; and from hence commences the Stratum, or Bed of Gold. Between are Banks of soft bluish Stone, mix'd with yellow Threads, which yet are not Gold, but only Pyrites, or Marcassites of Gold.

When they have discover'd any of this Earth, they endeavour to bring Rivelets to it (which in those Mountains are very frequent) in order, by force thereof, to rear off the upper Earth, and lay the Golden Stratum bare. This they forward by digging with Spades, &c. As soon as the Golden Earth is uncover'd, they turn off the Water; and dig up the Soil by Force of Arm; and loading it on Mules, carry it to the *Lavadero's*, i. e. a sort of Basins of Water, where the Earth undergoing divers repeated Lotions, in different Waters, the earthy, and impure Part is all separated and carried off by the Stream, and the Gold left at Bottom. See LAVATORY.

This Method of getting Gold is immensely gainful; the Expences being but trifling, compar'd with thole accruing in the common way by Machines, Fire, and Quicksilver:

The richest of these *Lavadero's* is that of *Vfplancia del Rey*, twelve Leagues from the *Concepcion*, a Part of the South Sea—*Thuringia*, and some other Places along the *Rhine*, are the only Places in *Europe*, where Gold is got in this manner.

The Gold of Mines is of two kinds; the one in small Peces, or Grains of various Forms, and Weights. Of this sort, among the Specimens sent by *Columbus* into *Spain*, to let them see the Richness of his Discovery, there were some of 18 Ounces Weight; and the Relations of those Days assure us, that in 1502 there were others found of thirty two Pounds Weight.

The other kind of Gold is dug up in Stony Glebes, which is what they call the *Mineral*, or *Ore of Gold*: These Glebes are of various Colours, and usually 150 or 160 Fathom deep. Along with the Gold they usually contain some other Mineral Matter, as Antimony, Vitriol, Sulphur, Copper, or Silver; particularly the last; without some Share of which it is scarce ever found.

Manner of separating GOLD.

They first break the Metalline Stone with Iron Mallets; pretty small; then carry it to the Mills, where it is ground into a very fine Powder; and lastly pass it thro' several Brass Sieves one after another, the last as fine as any of our Silk Sieves.

The Powder thus prepar'd, is laid in wooden Troughs with a proper Quantity of Mercury and Water, and there left to knead and saturate in the Sun and Air for twice twenty four Hours. After this the Water, with the recrementsitious Earth is drove out of the Tubs by means of other hot Waters, pour'd thereon. This done, there remains nothing but a Mafs of Mercury with all the Gold that was in the Ore. The Mercury they separate from it by Distillation in large Alembicks. The Gold, in this State, is call'd *Virgin Gold*; as well as that found in the Sand of Rivers, or that in Grains in the Mines; in regard none of them have pass'd the Fire. After this, they usually fuse them in Crucibles, and cast them into Plates, or Ingots. See FUSION.

Manner of Refining GOLD.

There are three principal Manners of refining Gold; the first with Antimony; the second with Sublimate; and the third with *Aqua fortis*. This last, which is call'd *Departing*, or Parting, is already describ'd under the Article DEPART; and the two former under those of Refining. See REFINING.

Beside these three, there are other Methods of Refining Gold; particularly that call'd the *Coppel*, which is perform'd with Lead and Althes; and that call'd *Cementation*, by means of a Composition of Brick Dust, common Salt, Sal Ammoniac, Sal Gemma, and Urine. See COPPEL, and CEMENTATION.

The Essayng of GOLD, is perform'd with the Touchstone, but more securely by Fire. See TOUCHSTONE, and ESSAYNG.

For the Making of GOLD, see PHILOSOPHER STONE, and TRANSMUTATION.

GOLD WIRE, is a Cylindrical Ingot of Silver, superficially gilt, or cover'd with Gold, at the Fire; and afterwards drawn successively thro' an infinite Number of little round Holes of a Wire-drawing Iron, each less than the other, till it be no bigger than a Hair of the Head. See WIRE.

It may be observ'd, that before the Wire be reduc'd to this excessive Fineness, it is drawn thro' above an hundred and forty different Holes; and that each time they draw it, it is rubb'd fresh over with new Wax, both to facilitate its Passage, and to prevent the Silver's appearing thro'.

It is amazing to what Degree of Fineness the Gold is here drawn; and yet it still keeps firm together, and never shews the least Signs of the Silver underneath it. The Reader may see a Computation hereof, as also a more particular Account of the manner of proceeding, under the Article DUEVILITY of Gold.

GOLD WIRE FLATTED, is the former Wire flattened between two Rollers of polish'd Steel, to fit it to be spun on Silk, or to be used flat as it is, without spinning, in certain Stuffs, Laces, Embroideries, &c.

GOLD THREAD, or SPUN GOLD, is the flatted Gold wrapp'd, or laid over a Thread of Silk, by twisting it with a Wheel, and Iron Bobbin.

The Methods of managing and drawing Gold and Silver both real and seeming in all these Kinds, are very curious, and of great Use in Commerce.

Manner of forming GOLD WIRE, and GOLD THREAD both round, and flat.

First, An Ingot of Silver of 24 Pound is forged into a Cylinder about an Inch in Diameter: Then 'tis drawn thro' eight or ten Holes of a large, coarse Drawing Iron, both to finish the

Roundness, and to reduce it to about three Fourths of its former Diameter. This done, they file it very carefully all over, to take off any Filth remaining of the Forge: Then they cut it in the Middle, and thus make two equal Ingots thereof; each about 26 Inches long; which they draw thro' several new Holes to take off any Inequalities the File may have left, and to render it as smooth, and equable as possible.

The Ingot thus far prepar'd, they heat it in a Coal Fire: Then, taking some Gold Leaves, each of about four Inches square, and weighing 12 Grains; they join four, eight, twelve, or sixteen of these together, as the Wire is intended to be more, or less gilt; and when they are so join'd as only to form a single Leaf, they rub the Ingots, recking hot, with a Batnisher.

These Leaves, thus prepar'd, they apply over the whole Surface of the Ingot to the Number of six, over each other; burnishing or rubbing them well down with the Blood-stone, to close, and smoothen them.

When gilt, the Ingots are laid a-new in a Coal Fire; and when rais'd to a certain Degree of Heat, they go over them a second time with the Blood-stone, both to solder the Gold more perfectly, and to finish the Polishing.—

The Gilding finish'd, it remains to draw the Ingot into Wire. In order to this, they pass it thro' twenty Holes of a moderate Drawing-iron, by which it is brought to the Thickness of the Tag of a Lace: From this time, the Ingot loses its Name, and commences *Gold Wire*. Twenty Holes more of a lesser Iron, leave it small enough for the least Iron; the finest Holes of which last, scarce exceeding a Hair of the Head, finish the Work.

To dispose the Wire to be spun on Silk, they pass it between two Rollers of a little Mill: These Rollers are of polished Steel, and about three Inches Diameter. They are set very close to each other, and turn'd by means of a Handle fasten'd to one of them, which gives Motion to the other. The Gold Wire in passing between the two, is render'd quite flat; but without losing any thing of its Gilding; and is render'd so exceedingly thin, and flexible, that it is easily spun on Silk Thread, by means of a Hand Wheel; and so wound on a Spool, or Bobin. See FLEXIBILITY.

GOLD LEAF, or Beaten Gold, is Gold beaten with a Hammer, into exceedingly thin Leaves.

'Tis prodigious to consider the Fineness they will thus reduce a Body of Gold to: 'Tis computed, that an Ounce may be beaten into 1600 Leaves, each three Inches square; in which State, it takes up more 159092 times its former Space. See DUCTILITY.

This Gold they beat on a Block of Marble, commonly black Marble, about a Foot square, and usual rais'd three Foot high: They make use of three sorts of Hammers, form'd like Mallets, of polish'd Iron. The first, which weighs three, or four Pounds, serves to chafe, or drive; the second, of eleven or twelve Pounds, to close; and the third, which weighs fourteen or fifteen Pounds, to stretch, and finish.

They also make use of four Moulds, of different Sizes; viz. two of Vellum, the smallest whereof consists of 40 or 50 Leaves, and the larger, of two hundred: The other two, consisting each of 500 Leaves, are made of Bullocks Gut, well four'd and prepared. See MOULD.

The Method of preparing, and beating Gold, is as follows.

They first melt a Quantity of pure Gold, and form it into an Ingot: This they reduce, by forging, into a Plate about the Thickness of a Sheet of Paper: Which done, they cut the Plate into little Pieces about an Inch square, and lay them in the first, or smallest Mould, to begin to stretch them. After they have been hammer'd here a while with the smallest Hammer, they cut each of them into four; and put them in the second Mould to be extended further.

Upon taking them hence, they cut them again into four, and put them into the third Mould; out of which they are taken, divided into four, as before, and laid in the last, or finishing Mould; where they are beaten to the Degree of 'Thinness required.—

The Leaves thus finish'd, they take them out of the Mould, and dispose them in little Paper Books prepar'd with red Bole, for the Gold to stick to: Each Book ordinarily contains 25 Gold Leaves.

There are two Sizes of these Books: Twenty five Leaves of the smallest only weigh five or six Grains; and the same Number of the largest nine, or ten Grains.

It must be observ'd that Gold is beaten more, or less, according to the Kind, or Quality of the Work it is intended for: That for the Gold-wire Drawers to gilt their Ingots withal, is less made thicker, than that for gilding the Frames of Pictures, &c. withal.

SHEET GOLD is that us'd by the Illuminators; and where-withall we write Gold Letters.—It is made of the Portions of Leaf Gold, and even of the Leaves themselves, reduc'd into an insensible Powder, by grinding on a Marble, with Ho-

ncy. After leaving it to infuse some time in *Aqua fortis*, they put it in Shells, where it sticks. To use it, they dilute it with Gum Water, or Soap Water.

Burnish'd GOLD, is that smoothen'd, or polish'd with a Steel Instrument, call'd the *Burnisher*, if it be wrought Gold, or Gilding on Metal; or with a Wolf's Tooth, if it be gilding in Water. See BURNISHING, and GILDING.

MILLION of GOLD, is a Phrase us'd to signify a Million of Crowns. See CROWNS.

TIME of GOLD, is a kind of Money of Account, us'd by the Dutch, and in some other Countries; containing a hundred thousand Florins. See FLORIN.

GOLD COIN, or Species of GOLD; see COIN.

A hundred Pounds of, or in, Gold, is found to weigh two Pound, ten Ounces: The same Sum in Silver, weighs 26 Pound, 4 Ounces. Twenty two Pence, in Copper Farthings and Half-pence, weigh one Pound Avoirdupois.—

A Tun of Gold at 4 Pounds the Ounce amounts to 96000 l. A Tun of Silver at 5 s. 2 d. the Ounce, to 62000 l. A Pound Sterling Gold, to 48 l. An Ounce is worth 4 l. The Penny, weight, 4 s. One Grain, 2 d. A Pound of Sterling Silver amounts to 3 l. 2 s. An Ounce is worth 5 s. 2 d. The Penny, weight, 3 d. and something more; one Grain, a half-penny. A Pound of Silver Avoirdupois comes to 3 l. 5 s. 3 d. half-penny.

Mosaic GOLD, is Gold applied in Panels on a proper Ground, distributed into Squares, Lozanges, and other Compartments, part whereof is shadow'd to raise, or heighten the relief. See MOSAIC.

Virgin GOLD, is Gold, just as it is taken out of the Mines before it have undergone any Action, or Preparation of Fire: Whence the Greeks call it *αυρηον*. Such is the *αυρηον* of the *Chilly*: 'Tis added, that there are Masses, or Lumps of pure Gold found in the Mines, particularly those of Hungary. Accordingly, in the Emperor's Collection are still preserved several Plates of Gold, said to have been thus found.

Virgin Gold is said to be very pale, and so soft that it may be moulded into any Figure, with the Hand: It even takes an Impression from a Seal, like the softest Wax. To harden it, as also to brighten its Colour, they mix Emery with it.

FINE, or PURE GOLD, is that purged by Fire of all its Impurities, and all Alloy.—The Latins call it *Aurum purum*, *Aurum primum*, *Aurum obtutum*, *Aurum colatum*.

The Moderns frequently call it *Gold of 24 Carats*; but, in Reality, there is no such thing as Gold so very pure; and there is always wanting at least a Quarter of a Carat. Gold of 22 Carats has one Part of Silver, and another of Copper: That of 23 Carats has half a Part, i. e. half a twenty-fourth of each. See CARAT, and ALLOY.

Bontevone maintains, that the *Electrum* of the Antients was Gold of 19 Carats; or four Parts Gold, and a fifth Silver.—From an Ordinance of King *John of France*, it appears that the Gold then struck at *Paris* was of 19 Carats; and yet 'tis added that it was the best and finest Gold then known on Earth.

In *England*, at this time, the Standard of Crown Gold is 22 Carats. See GUINEA.

Cloth of GOLD, } see } CLOTH of GOLD.
Gold Money, } } MONEY.
Potable GOLD, *Aurum potabile*, see POTABLE Gold.

Fulminating GOLD, Aurum fulminans, see FULMINATING GOLD, in Medicine, and Chymistry.—The Chemists make several Preparations of Gold for Medicinal Uses; as Salts, Mercuries, and Tinctures of Gold; but 'tis a Point not yet well agreed on whether Gold have any real Property whereby it may be of Use of Medicine.—

The most ancient Physicians are all silent on the Matter: The *Arabs* are the first who mention it in this Quality.—*Avicenna* attributes extraordinary Virtues to it; but he speaks on Conjecture more than Experiment. And yet it is pretty certain Gold must have an Effect: A Quantity of Gold Filings being taken by a Person in a Bolus, he was very well purg'd thereby: But this might well be owing to the great Weight of its Particles, which impinging violently against the Glands of the Intestines, promoted their Vibrations, and thus express'd the Humor secreted therein. *Boreau*, in a Letter to *Barbolin* relates, that having heated an Ingot of fine Gold several times red hot, and extinguish'd it as often in Water, he found the Weight of the Ingot considerably diminish'd; upon which, proceeding to evaporate the Water, he drew a little Quantity of Gold from it. Hence it appears, that the subtle Parts of the Gold pass into the Liquors it is extinguish'd in; and hence, 'tis argued, it may have considerable Effects.

Notwithstanding the small Number of Experiments whereon the Medicinal Efficacy of Gold is founded; the Alchymists will have it contain the Radical Balm of Life, for the retrieving of Health and Youth, and the Removal of all Diseases. Gold, according to them, contains a Sulphur friendly to Nature, like that of the Sun, which animates the whole Universe; And on this Principle they have form'd a thou-

a thousand airy Projects for an Universal Remedy. See ELIXIR.

In effect, 'tis probable the *Arabs* and Alchemists were only brought to attribute all these Virtues to *Gold*, from their perceiving certain Qualities therein, which they supposed it must communicate to other Bodies. Thus, *e. gr.* *Gold* being commonly said to be incapable of being destroyed; 'tis hence concluded to be proper to preserve animal Matters, and defend them from Putrifaction: Which is just as reasonable as some Physicians prescribing the Blood of an Ass's Ear as an appeasing Remedy, by reason the Ass is a very peaceable Animal. See POTABLE Gold.

GOLD, in Heraldry, is one of the Metals; more properly call'd by the *French Name Or*. See METAL, and OR.

GOLDEN, something that has a relation to *Gold*, or consists of *Gold*, is valuable like *Gold*, or the like. See GOLD.

GOLDEN BULL, *Bulla Aurea*, see explain'd under the Article BULL.

GOLDEN FLEECE, in the ancient Mythology, was the Skin, or Fleece of the Ram, upon which *Phryxus* and *Helle* are supposed to have swam over the Sea to *Colchis*; and which being sacrific'd to *Jupiter*, was hung upon a Tree in the Grove of *Mars*, guarded by two Brazen-hoof'd Bulls, and a monstrous Dragon that never slept; but taken, and carried off by *Jafon*, and the *Argonauts*. See ARGONAUT.

Many Authors have endeavour'd to shew that this Fable is an Allegorical Representation of some real History.

Order of the *GOLDEN FLEECE*, is a Military Order instituted by *Philip the Good*, Duke of *Burgundy*, in 1429. See MILITARY Order.

It took its Denomination from a Representation of the *Golden Fleece*, bore by the Knights on their Collars, which consisted of *Flints*, and *Steels*. The King of *Spain* is now Grand Master of the Order, in Quality of Duke of *Burgundy*: The Number of Knights is fix'd to 31.

'Tis usually said to have been instituted on occasion of an immense Profit which that Prince made by *Wool*: Tho', others will have a Chymical Mystery couch'd under it, as under that famous one of the Antients, which the Adepts contend to be no other than the Secret of the Elixir, wrote on the Fleece of a Sheep.

Olivier de la Marche writes that he had suggest'd to *Philip I.* Archduke of *Austria*, that the Order was instituted by his Grand-father *Philip the Good*, Duke of *Burgundy*, with a View to that of *Jafon*; and that *John Germain*, Bishop of *Chalons*, Chancellor of the Order, upon this occasion made him change his Opinion, and assur'd the young Prince that the Order had been instituted with a View to the Fleece of *Gideon*.

William Bishop of *Tournaay*, Chancellor likewise of the Order, pretends that the Duke of *Burgundy* had in View the *Golden Fleece* of *Jafon*, and *Jacob's Fleece*, *i. e.* the speckled Sheep belonging to this Patriarch, according to the Agreement made with his Father-in-Law *Laban*. Which Sentiment gave Birth to a great Work of this Prelate in two Parts: In the first, under the Symbol of the Fleece of *Jafon* is represented the Virtue of Magnanimity, which a Knight ought to possess; and under the Symbol of the Fleece of *Jacob*, he represents the Virtue of Justice.

Paradis is of the same Mind, and tells us that the Duke design'd to insinuate that the fabulous Conquest which *Jafon* is said to have made of the *Golden Fleece* in *Colchis*, was nothing else but the Conquest of Virtue, which requires a Victory over those horrible Monsters Vice, and our evil Inclinations.

GOLDEN NUMBER, in Chronology, a Number shewing what Year of the Moon's Cycle, any given Year is. See CYCLE of the Moon.

To find the Golden Number of any Year since Christ.

Since the Lunar Cycle commences with the Year before our Saviour's Birth; to the given Year add 1: Then, dividing the Sum by 19; the Sum remaining after the Division, is the *Golden Number* required: If there be nothing remaining, the *Golden Number* is 19.

Suppose, *e. gr.* the *Golden Number* of the present Year 1725 were required: $1725 + 1 = 1726$. And 1726 divided by 19, gives a Quotient 9, and leaves a Remainder of 16, the *Golden Number* of this Year.

The *Golden Number* is used in the *Julian Calendar*, to shew on what Days the New Moons fall. In Succession of Time, however, it must be observ'd, that the *Golden Numbers*, thro' the Defect of the Lunar Cycle, recede, and do no longer shew the true Time of New Moons, &c. See CALENDAR.

Hence, in the *Gregorian Reformation* of the Calendar the *Golden Number* is thrown out; and the *Epaet* introduced in lieu thereof. See EPIAET.

GOLDEN RULE, in Arithmetick, a Rule, or Praxis, of great Use, and Extent in the Art of Numbers; whereby we find a fourth Proportional to three Quantities given. See PROPORTION.

The *Golden Rule* is also call'd the *Rule of Three*, and *Rule of Proportion*. See its Nature and Use under the Article RULE of Three.

GOLDEN CALF, was a Figure of a Calf, which the *Israelites* cast in that Metal, and set up in the Wilderness, to worship, during *Moses's* Absence in the Mount; and which that Legislator, at his Return, burnt, ground to Powder, and mix'd with the Water the People were to drink of; as related *Exodus xxxiii*.

The Commentators have been divided on this Article: The pulverizing of *Gold*, and rendering it potable, is an Operation in Chymistry, of the last Difficulty; and 'tis hard to conceive how it should be done at that Time, before Chymistry was ever heard of, and in a Wilderness too. Many therefore, suppose it done by a Miracle: And the rest, who allow of nothing supernatural in it, advance nothing but Conjectures, as to the Manner of the Process.

He could not have used simple Calcination, nor Amalgamation, nor Antimony, nor Calcination; nor is there one of those Operations, that quadrates with the Text.

M. Stobell has endeavour'd to remove this Difficulty. The Method *Moses* made Use of, in making his *Aurum potable*, according to this Author, was the same with that which now obtains; only that instead of Tartar, he made use of the *Egyptian Natron*, which is common enough throughout the East. See POTABLE Gold.

GOLOPS, in Heraldry, are Roundies of a Purple Colour. See ROSENELL.

GOMPHOSIS, in Anatomy, a kind of Articulation of the Bones, wherein the one is chafed, or fitted immovably into the other, after the manner of a Peg, or Nail. See ARTICULATION.

The Teeth are set in the Jaws by *Gomphosis*. See TEETH, and MAXILLÆ.

The Word is *Greek*, γομφωσις, form'd of γομφος, clavus, a Nail.

GONAGRA, in Medicine, the Goat in the Knee. See GOAT.

The Word is compos'd of γόνυ, Knee, and ἀγρως, captura, Seizing.

GONARCHA, a Term in the ancient Dialling—*Mr. Perant*, in his Notes on *Vitruvius*, lib. IX. c. 9. takes the *Gonarcha* to have been a Dial drawn on divers Surfaces, or Planes; some of which being Horizontal, others Vertical, others Oblique, &c. form'd divers Angles. Whence the Appellation; from γόνυ, Knee, or γωνία, Angle. See DIAL.

GONDOLA, a little flat Boat, very long, and narrow; chiefly used at *Venice*, to row on the Canals. See BOAT.

The middle-fix'd *Gondola's* are upwards of 30 Foot long, and four broad: They always terminate, at each End, in a very sharp Point, which is rais'd perpendicularly the full Height of a Man.

The Word is Italian, *Gondola*. *Du Cange* derives it from the vulgar *Greek γωνυριος*, a Bark, or little Ship. *Lancelot* deduces it from γόνυ, a Term in *Athenensis* for a sort of Vase.

The Address of the *Venetian Gondoliers*, in passing their narrow Canals, is very remarkable: There are usually two to each *Gondola*; and they row by pushing before them. The Fore-man rests his Oar on the left Side of the *Gondola*: The Hind-man is placed on the Stern, that he may feel the Head or the Tilt, or covering of the *Gondola*; and rests his Oar, which is very long, on the right side of the *Gondola*.

GONFALCON, or *GONFANON* a kind of round Tent, bore as a Canopy, at the Head of the Processions of the principal Churches at *Rome*, in Case of Rain; its Verge, or Banner serving for a Shelter, where there is not a great deal of Attendance.

GONORRHÆA, or rather *GONORRHEA* in Medicine, an involuntary Flux, or Dripping of Seed, or other Humor, by the Penis; without Erection, or Titillation. See SEED. The Word is form'd of the *Greek γόνιον*, genitura, Seed, and ἵα, flux, I flow.

The *Gonorrhæa* is of two kinds: The one Simple, the other Virulent.

The Simple *Gonorrhæa*, or that without Virus, or Malignity, takes its rise from violent Exercises, and Strainings; the immoderate Use of hot Foods, and particularly, fermented Liquors, as Wine, Beer, Cyder, &c. It is cured by indulging Rest, nourishing Foods, Broths, &c.

This Species is again divided into two; the one True, *Gonorrhæa vera*, wherein the Humor discharged is real Seed: The other Spurious, *Gonorrhæa Nativa*, wherein the dripping Humor is not Seed, but a Matter from the Glands about the Prostates. See PROSTATES.

This latter Kind bears some Resemblance to the *Flour Albus*, or Whites in Women; and frequently remains a long time, without much Diminution of the Patient's Strength. Some call it a *Catarrhal Gonorrhæa*. Its Seat is in the Glands of the Prostates, which are either too much relax'd, or ulcerated.

The *Virulent Gonorrhœa*, *Gonorrhœa Virulenta*, arises from some impure Commerce, and is the first Stage of the Venereal Disease; being what we popularly call a *Clap*. See *VENEREAL Disease*, and *CLAP*.

The Parts here primarily affected are the *Prostates* in Men, and *Lacine* in Women, which being ulcerated by some contagious Matter received in Coition, emit, first, a whitish, watery Liqueur, with an acute Pain: This afterwards grows yellowish, then sharper, and at length greenish, or bluish, and frequently fœtid.

It is attended with a Tension and Inflammation of the Yard, and an *Ardor Urine*, or Sharpness of Urine, which gives a painful Sensation in the Emission; the urinary Passage being torn and excoriated by the Acrimony of the Humor.

Hence arise Tumors of the Prepuce, and Glands, with Ulcers on the Linc; and sometimes Caruncles in the Urethra.

The Cause of the *Virulent Gonorrhœa*, according to M. *Littre*, is some acid Humor, heated, rarified, and rais'd at the time of Coition, from the internal Parts of the Pudendum of a Woman infected, and lodg'd in the Urethra of the Man. It has different Seats in the Body: Sometimes it only fixes on *Cowper's* mucous Glands; sometimes on the *Prostates*; and sometimes on the Vesiculae Seminales: Sometimes it possesses two; and sometimes all three of the Places at once.

From this Diversity of Seat of the *Gonorrhœa Virulenta*, M. *Littre* makes two Sorts; *Simple*, which only affects one of the three Parts; and *Compound*, or *Complicated*, where several are affected.

That seated in the mucous Glands, he observes, may remain *Simple*, thro' the whole Course of the Disease, by reason the Mouths of those Glands open into the Urethra an Inch and half on this Side the *Prostates*, and also look down towards the Glands; so that their Liqueur is easily discharged. The other two Sorts mutually produce each other; by reason the Ducts of the Vesiculae Seminales terminate in the Urethra in the Middle of those of the *Prostates*: So that there is an easy Communication between them.

That seated in the mucous Glands, is much the rarest Case; and the easiest cured. The Cure is effected by emollient Cataplasms, and Fomentations upon the Part, and a Half-bath. *Mém. de Acad. An. 1711.*

For the other Species, more powerful Means are to be used.—The principal Remedies are *Mercurial Purges*, an *Emulsion of green Hempseed*, *Cattle-spleen*, *Turpentine*, *Sacch. Saturni*, &c. We have likewise great Commendations of *Green Precipitate of Mercury*, and *Mercur. dulcis*. *Bolus Saturni Teresbinatum*, prepared with a gentle Fire of *Sacch. Saturni*, and *Oil of Turpentine*, is much applauded where the Heat is great about the Reins and Genitals; as also *Campbor*. An *Infusion of Combarides* in Wine, is the *Nestrum* of a noted *Dutch* Physician. *Resin of the Wood Guaiacum* is also recommended; and *Balsom of Capiba* is held a sort of Specific: To which must be added *Antimonial Diaphoreticum*, *Bezoardicum Minerale*, Water where-in Mercury has been boiled; *Injections of Linus-water*, *Mercurius dulcis*, *Saccharum Saturni*, &c.

Piccain's Method of curing the *Gonorrhœa Virulenta*, is as follows: In the Beginning of the Disease, he purges with a laxative Pils of *Senna*, *Salt of Tartar*, and *Mellilot* Flowers; and gives the Patient *Whey* for his Drink. After three, or four Days spent in purging, if the Scalding of the Urine, and the Flux, be abated, and the Colour and Consistence of the Matter improved; he administers *Bolus's* of *Turpentine*, and *Rheum* for six or seven Days; and if they keep the Body loose, so much the better. By all means, Astringents to be avoided; the *Gonorrhœa* being scarce ever known to degenerate into a *Pox*, unless too hastily stop'd. *Piccain in MS.*

Du Blegny directs the Cure of the *Gonorrhœa*, to begin with a gentle Cathartic of *Cassia*, *Senna*, *Crysal Mineral*, *Tamarinds*, *Althæa*, and *Rhubarb*, administer'd every other Day: Then, *Diureticks*, particularly those of *Turpentine*; and lastly, gentle Astringents; as *Mineral Waters*, *Crocus Martis Astringens*, *Tincture of Roses*, *Tincture of Coral* in *Cochineal*.

A *Ptyalism*, or *Salivation* never cures a *Gonorrhœa*. See *SALIVATION*.

GOOD or GOODNESS, in the general, is whatever tends, or conduces to preserve, or improve Nature, or Society; in opposition to *Evil*, which tends to destroy or impair the same. See *EVIL*.

Hence *Good* is divided by the Philosophers into 1^o *Bonum sui*, *Private Good*; which is that whereby a thing tends to preserve *Êc*, itself; under which comes that popular Division of *Goods* of Body, Mind, and Fortune: And 2^o *Bonum Communium*, whatever promotes the Interest, and Welfare of Society; as all the *Civil Offices* &c.

Good, in *Metaphysics*, or *Metaphysical Good*, call'd also *Absolute*, or *Real Good*, and *Good pro se*, is the essential Perfection or Integrity of a thing, whereby it has every thing that belongs to its Nature. See *PERFECTION*.

In this Sense all things that are, are *Good*; in as much as they have the Perfections naturally belonging to things of their Kind. Thus, a thinking Substance is *good*, or perfect, as it has all the essential Attributes of Thought: So an extended Substance is *good*, as it possesses all the Parts necessary to constitute it such.

In effect, as it is absurd to imagine a Being without its Essence; so is it, to imagine a Being without the Requisites of its Essence: So that it appears an Error in some Philosophers who divide Beings into *Good*, or Perfect; and *Evil*, or Imperfect. See *ESSENCE*.

Others define *Metaphysical*, or *Transcendental Goodness*, by Congruency with the *Divine Will*; as making that the Measure of all real *Goodness*.

Physical, or *Natural Good*, is that whereby a thing possesses all things necessary to its *Bene esse*, i. e. to its well-Being, or second Perfection; and to the Performance of its Functions, and Uses.

In this Sense *Physical Goodness* coincides with *Physical Perfection*. See *PERFECTION*.

To this are required the several Powers, and Faculties in their proper Degree; a due Situation, Figure, Proportion, &c. of Parts.

Note, beside absolute *Physical Goodness*, there may be a *Relative one*; as in Foods, which to one Man are *Salutary*, to another *Poison*, &c. To this Head also belong Things *Good pro tempore*, or according to Circumstances; as the Amputation of a mortified Limb, &c.

Moral, or *Ethical Good*, is the Agreement of a Thinking, reasonable Being, and of the Habits, *AGAs*, and Inclinations thereof, with the Dictates of right Reason, and the Will of the Creator, as discover'd by natural Light.

In order to this, it is not enough that a thing done, said, thought, desir'd, be just, and good; but it must be done thought, &c. well, i. e. from good Principles, and to good Ends.

Others define *Moral Good* more largely. *Moral*, which they also call *Relative Good* according to them, is something that is good to another, or that tends someway to the Perfection thereof. In this Sense they divide it into three Kinds, *Honestum*, *Jucundum*, and *Utile*.

The first, *Bonum honestum*, is what agrees with right Reason; and is desirable for itself; as all things virtuous; as to love God, respect our Parents, &c. It is consider'd without any regard to Pleasure; not but that there is a fincœ Pleasure annex'd to it. *Zeno*, and the *Stoicks* allow of no other *Goods*; the *Goods* of Body, &c. they call *Commoda*, *Conveniences*, not *Goods*. See *STOICKS*.

Bonum jucundum, is that which is good, as it tends to give us Pleasure, and is desired for that reason; but without any Repugnancy to Virtue, or right Reason: As Music, to the Ears; Painting, to the Eyes, &c.

Bonum utile, or *commodum*, is that which is good on account of something else for which it is desired; as Money, Riches, &c.

Chief, or *Supreme Good*, *Summum Bonum*; see *SUMMUM Bonum*.

The Philosophers are divided as to what the *Chief Good* of Man consists in; whether in the *Goods* of Fortune, of Body, or Mind. Some, hold *Riches*, and *Honors*, the *Supreme Good*; others, as *Aristippus*, and the *Cyrenaic School*, bodily Pleasures; and others, as *Zeno*, and the *Stoicks*, Virtue. See *CYRENAIC*, *STOICKS*, &c.

Good Works } see } MERIT, and SUPEREROGATION.

Good Will } see } COMMON Place.

Good Bearing, *Bonus Gestus*, in a Law Sense, is particularly used for an exact Carriage, or Behaviour of a Subject towards the King, and his liege People; to which some Men, upon their Misbehaviour, are bound.

He that is bound to this, *Lambard* says, is more strictly bound than to the Peace; because whereas the Peace is not broken without an *Affray*, *Battery*, or such like, this *Surety De bono gestu* may be forfeited by the Number of a Man's Company, or by his, or their Weapons, or Arms. See *PEACE*.

Good-Behaviour; see *GOOD Bearing*.

Goods, *Bona*, in Law, and particularly the *Civil Law*, include all kinds of Effects, Riches, Possessions.

There are two Kinds of *Goods*; *Movæbles*, *res moventes*, *mobiles*; and *Immovæbles*, *res non moventes*. See *MOVABLES*, and *IMMOVABLES*.

It is a Maxim in the *Civil Jurisprudence*, that he who confiscates the Body, confiscates the *Goods*; meaning that all the Effects of a Person condemn'd to a capital Punishment, or perpetual Banishment, are forfeited to the King. See *CONFISCATION*.

A Man is said to bind himself *Body and Goods*; meaning, that beside his *Goods* he obliges his Person, and submits to remain in Prison, provided he don't execute his Promise.

Goods, again, are divided into *Proper*, *Avitia*, *Paterna*, *Hereditaria*; *Acquired*, or *Acquests*, *Alio quam hereditatis jure*

jure acquisita: And *Conquests*; *Viro & Uxori flante societate acquisita*.

And again, into *real and personal Goods*; see *REAL*, and *PERSONAL*.

And lastly, into *Noble, or Free*; and *Servile, or Base*. Goods belonging to the Domain of the Crown, and *Fisum spectantia*, cannot be alienated for ever; unless by way of Exchange: They may be sold under the Faculty of perpetual Redemption.—See *REDEMPTION*.

Dotal Goods, Dotalia, are those accruing from a Dowry, and which the Husband is not allowed to alienate. See *DOWER*.

Vacant Goods, Vacantia, are those abandoned, or left at large, either by reason the Heir renounces them, or that the Defunct has no Heir. See *VAGANT*.

Paraphernal Goods, Paraphernalia, are those which the Wife gives her Husband to enjoy, on condition of withdrawing them when she pleases. See *PARAPHERNALIA*.

Adventitious Goods, Adventitia, are those which arise otherwise than by Succession from Father, or Mother; or from direct Ancestor to Descendant. See *ADVENTITIOUS*.

Provelitious Goods, Provelitia, are those arising by direct Succession. See *PROVELITIOUS*.

Receptitious Goods were those which the Wife might reserve the full Property of to her self, and enjoy them independently of her Husband; in distinction from *Dotal* and *Paraphernal Goods*.

GORDIAN, a Term in History.—The *GORDIAN Knot* was a Knot made in the Leathers, or Harness of the Chariot of *Gordius*, Father of *Midas*; so very intricate, that there was no feign where it began, or ended.

The Inhabitants had a Tradition, that the Oracle declared that he should be Master of *Asia* who could untie this Knot. *Alexander* having undertaken it, and fearing that if he should not be able to effect it, it would be deem'd an ill Augury, and prove a Check in the way of his Conquests; cut it asunder with his Sword; and thus, says *Quintus Curtius*, either accomplish'd, or eluded the Oracle.

Some will have the Phrase derived from *Gordius*, King of *Phrygia*, who tied the fatal Knot; others, from *Gordium*, a City in *Phrygia*, where the Knot was made.—

GORE, in Heraldry, one of the regular Abatements, used, according to *Greilinn*, to denote a Coward. See *ABATEMENT*.

It consists of two Arches, or Curve Lines, drawn, one from the Sinister Chief, the other from the Sinister Base, and meeting in an acute Angle in the middle of the Feet-Point; as in the Figure adjoining.

GOREL, the Name, or Title given to the Prince of *Georgia*.—The *Gorel* is always a *Mahometan*: The *Sophi* of *Perfia* obliges him to observe the Religion of the *Alcoran*, to preserve the Dignity of *Gorel* in his Family.

GORGE, a French Term, used for what in *English* we call the *Throat*, and the *Latinus Fauces*. See *THROAT*.

GORGE, in Falconry, is the uppermost Bag, or Stomach of a Hawk, or Falcon; being that which receives the Food the first. See *HAWK*.

The *Gorge, Ingulvis*, is the same in Birds of Prey with what we call the *Crow*, or *Crop*.

When the Bird is fed, he is said to be *gorged*. See *HAWKING*.

GORGE, in Architecture, a set of concave Moulding, wider, but not so deep as a *Scotia*; used chiefly in Frames, Chambranes, &c. See *SCOTIA*.

GORGE of a Chimney, is the Part between the Chambrane, and the Crowning of the Mantle.—Of this there are divers Forms, straight, perpendicular, in form of a Bell, &c.

GORGE is sometimes also used for a Moulding that is concave in the upper Part, and convex at Bottom; more properly called *Gala*, and *Cymatium*. See *GULA*, and *CYMATIUM*.

GORGE is also used for the Neck of a Column; more properly called *Collarino*, and *Gorgerin*. See *GORGERIN*, &c.

GORGE, in Fortification, the Entrance of a Bastion; or of a Ravelin, or other Out-work. See *BASTION*, *RAVELIN*, &c.

The *Gorge* is what remains of the Sides of the Polygon of a Place, after retrenching the Curtains: In which case it makes an Angle in the Centre of the Bastion—Such is *A H D Tab. Fortification*, Fig. 1.

In flat Bastions, it is a Right Line on the Curtain by which we enter either the Bastion, or the Out-works. It is also the Aperture thro' which we enter, or the Interval between, the two Wings, or Flanks on the Side of the Ditch.

All the *Gorges* are to be delicate of Parapets; otherwise, the Besiegers having taken possession of a Work, might make use thereof to defend themselves from the Shot of the Place: So that they are only fortified with Palisado's, to prevent a Surprise.

lyon between the Flank, and the Centre of the Bastion, as *A H*, is call'd the *Demi Gorge*. See *DEMI GORGE*.

GORGED, in Heraldry, is when a Crown, Coronet, or the like thing is bore about the Neck of a Lion, a Swan, &c. In that case they say, the Lion, or Cygnet is *gorged* with a Ducal Coronet, &c.

Gorged is also used when the Gorge, or Neck of a Peacock, Swan, or the like Bird is of a different Colour, or Metal from the rest.—

GORGED, among Farriers, &c. signifies as much as *swelled*.

In this Sense they say, the Legs of a Horse are *gorged*; the palfren Joint is *gorged*.

GORGERIN, a Part of the ancient Armour; being that which cover'd the Throat, or Neck of a Person arm'd at all Points.—

GORGERIN, or **GORGE**, in Architecture, is the little Frieze in the Doric Capital, between the Astragal at the Top of the Shaft of the Column, and the Annulets. See *DORIC CAPITAL*.

Some call it *Colarino*.—*Vitruius* gives it the Name *Hypotrachelium*. See *HYPOTRACHELIUM*.

GOTHIC, or **GOTTHIC**, something that has a relation to the *Goths*, an ancient People, originally inhabiting that Part of *Sweden* call'd *Gothland*; whence they spread themselves over *Greece*, *Dalmatia*, *Bulgaria*, *Italy*, *Spain*, &c.

Thus we say, *Gothic Manner*, *Gothic Ignorance*: The Tyrant *Maximian* was of *Gothic Race*, &c.

GOTHIC Character, or **Gothic Writing**, is a Character, or manner of Writing, which, in the main, is the same with the *Roman*, only full of Angles, Turns, and Bendings; especially at the Beginning and Ending of each Letter. See *CHARACTER*, and *LETTER*.

The Manuscripts in *Gothic Characters* are not very ancient.—*Uphlar*, Bishop of the *Goths*, was the first Inventor of the *Gothic Characters*; and the first that translated the Bible into the *Gothic Tongue*.

The *Runic Characters* are also frequently call'd *Gothic Characters*: *Fa. Mabillon, De re Diplomat. L. I. C. II.* But they who take the *Gothic Characters* to be the same with the *Runic*, are mistaken; as is shewn by *Ol. Wormius, Junius* in his Preface to the Gospels writ in *Runic Letters*, and *Dr. Hecks* on the *Runic Tongue*. See *RUNIC*.

GOTHIC Architecture, is that which deviates from the Proportions, Characters, &c. of the *Antique*. See *ARCHITECTURE*.

The *Gothic Architecture* is frequently very solid, heavy, and massive; and sometimes, on the contrary, exceedingly light, delicate, and rich. The Abundance of little, whimsical, impertinent Ornaments, are its most usual Character.

Authors distinguish two Kinds of *Gothic Architecture*; the one ancient, the other Modern.—The *Antient*, is that which the *Goths* brought with them from the North, in the 5th Century: The Edifices built in this manner, were exceeding massive, heavy, and coarse.

Those of the *Modern Gothic* run into the other Extreme, being light, delicate, and rich to a Fault: Witness *Westminster Abby*, the Cathedral of *Lichfield*, the Cross of *Conventry*, &c.

The last kind continued long in use, especially in *Italy*, viz. from the 13th Century, to the Restauration of the antique Building in the XVth. All the ancient Cathedrals are in this kind. See *ARCHITECTURE*.

The Inventors of the *Gothic Architecture* thought, no doubt, they had far surpass'd the *Greek Architects*: A *Greek Building* has not a single Ornament but what adds a Beauty to the Whole. The Parts necessary to sustain, or shelter it, as the Columns, Corniches, &c. derive all their Beauty from their Proportions: Every thing is simple, measure'd, and restrain'd to the Use it is intended for. No daring, out of the way Strokes; nothing quaint to impose on the Eye: The Proportions are so just, that nothing appears very grand of itself, tho' the whole be grand. On the contrary; in the *Gothic Architecture*, we see huge Vaults rais'd on slender Pillars, which one would expect every Minute to tumble down, tho' they will stand for many Ages. Every thing is cramm'd with Windows, Roses, Crosses, Figures, &c.

GOTHIC Column, is any round Pillar, in a *Gothic Building*, either too thick, or too small for its Height. See *COLUMN*.

There are some found even of 20 Diameters high; without either Diminution, or Swelling. See *PILLAR*, *DIMINUTION*, *SWELLING*, &c.

GOUD, or **GAUD**, or **Woad**, a Plant used by the Dyers, to give a yellow Colour; and for this reason call'd in Latin, *Luceola, of luteus*, yellow. See *YELLOW*.

This Plant is sown in a light Ground, in the Months of *March*, or *September*; and is ripe in *June*, or *July*. In hot Countries it is frequently dry enough when gather'd; but in the colder, care must be taken to dry it. Great Circumspection to be used, that it be not gather'd before thorough ripe; as also to prevent its getting wet, when gather'd. See *WOAD*.

GOVERNMENT, or **GOVERNMENT**, a Quality, or Office, which gives a Man Power, or Right, to command, or rule over a Place, a City, a Province, a Kingdom, or the like; either supremely, or by Deputation.

Government is either *General*, and *Supreme*, as that of a whole Kingdom, Empire, Sovereign State, &c. See **KINGDOM**, **EMPIRE**, **STATE**, &c. or *Particular*, and *Subordinate*, which again is subdivided into *Civil*, *Military*, or *Ecclesiastical*. See **CIVIL**, **MILITARY**, and **ECCLESIASTICAL**.

The *Government* of the King's Household belongs to the *Lord Steward*. See **STEWARD**, and **HOUSEHOLD**.

Our *Cities*, *Corporations*, and *Boroughs* are usually *govern'd* by *Mayors*, and *Aldermen*, and *Common Council-Men*. See **MAYOR**, **ALDERMAN**, &c. See also **CITY**, &c.

The *King* was called to the *Government* of *England*, by the free Voices of the *Parliament*, and the *People*—Such a *Lord* bought the *Government* of such a *Province*, *Island*, &c. The *East India Company* nominate to the *Government* of *Fort St. George*, &c.

GOVERNMENT is also us'd for the *City*, *Country*, or *Place* to which the *Power* of *governing* or *commanding*, is extended.

Sansou has given us *Maps of France*, divided into its *Governments*. There are 38 *Governments*, or *Provinces* in that Kingdom, independent of each other. Beside these, there is another Division into *Governments*, called *Grand Governments*, whereof there are twelve, *vis.* those of the *Isle of France*, *Burgundy*, *Normandy*, *Brittany*, *Picardy*, *Dauphiny*, &c. which are not proper *Provinces*, commanded each by its several *Governor*, but rather so many *Classes* of *Governors*, or *Governments*, contriv'd for the better, and easier regulating the *Seats*, &c. of so many *Governors*, *Bailiages*, *Prevosts*, &c. as were obliged to assist at the holding of the *General Estates*.—

GOVERNMENT, again, is us'd for the *manner*, or *Form* of *governing*, *i. e.* for the *Policy* of a *Country*, *State*, &c. See **LAW**, and **POLICY**.

In this *Sense*, *Governments* are divided into *Monarchies*, *Aristocracies*, and *Democracies*. See **MONARCHY**, **ARISTOCRACY**, **DEMOCRACY**.

The *Government* of *France* is *Monarchic*; that of *Venice*, *Aristocratic*; and that of the *United Provinces*, *Democratic*: The *Government* of *England* is both *Monarchic*, *Aristocratic*, and *Democratic* all in one.

GOVERNMENT, in *Grammar*, is understood of that *Construction* of *Nouns*, and *Verbs*, wherein they require some *Alteration* to be made in others, join'd or *contracted* with them. See **CONSTRUCTION**, **NOUN**, and **VERB**.

Construction is divided into two *Parts*, that of *Concord*; and that of *Government*, call'd also *Regimen*. See **CONCORD**.

The *Rules*, or *Measures* of *Government*, or *Regimen*, see under the *Article* **REGIMEN**.

GOVERNOUR, or **GOVERNOR**, an *Officer* vest'd by a *King* or *Sovereign Prince*, with the *Command* and *Administration* of a *Province*, *Place*, &c. See **GOVERNMENT**.

Such a *Governour* being charg'd with *Mal-administration*, was recalled, and brought to his *Trial*.

A *Governour* represents the *King*, and not only commands the *Garrison*, *Troops*, &c. but the *Citizens*, &c. A *Governour* of a *fortified Place* was antiently required to hold out three *Attacks*, before he *surrender'd*.—

GOVERNOUR is also frequently us'd for a *Superintendent*. Thus we say, The *Governour* of the *Bank*; the *Governour* and *Directors* of the *South Sea Company*; the *Governour* of a *Hospital*, &c. See **BANK**, **COMPANY**, **HOSPITAL**, &c.

GOUGE, an *Instrument* us'd by *divers Artificers*; being a sort of round, hollow *Chissel*; serving to cut *Holes*, *Channels*, *Grooves*, &c. in *Wood*, *Stone*, &c. See **CHISSEL**.

GOUST, *Godr*, a *French Term*, for what the *Italians* call *Gusto*, and we, *Taste*. See **TASTE**.

GOUT, **ARTHRITIS**, in *Medicine*, a *painful Disease*, occasion'd by a *Flux* of *sharp Humor*, upon the *Joints* of the *Body*. See **DISEASE**.

Some *Physicians* define the *Gout*, an *Inflammation*, *Swelling*, and *Painfulness* of the *Joints*. Its *prime Cause* is usually attributed to *Wine*, *Vecey*, *Gluttony*, and *Idleness*.

The *Gout* is supposed to arise from two *Causes*: A *Redundancy* of *Humors*, and a *Weakeness* of the *Joints*. Its *proper Seat* is in the *Limbs*; not in the *Trunk* of the *Body*: In the latter *Case* it frequently proves *mortal*, not in the former.

Migraine makes the *Apoplexy* a *Gout*, because arising from the *Abundance* of *Pituits*, or *Phlegm*. According as this redundant *Pituita* throws itself on the *Lungs*, the *Liver*, or any other *Part*, it makes, according to him, an *Apoplexy*, a *Gout* of the *Liver*, of the *Lung*, of the *Spleen*, &c.

The *Gout* is a *Painful*, *Periodical*, and *Critical Paroxysm*, tending to free the *Body* of an *effluvie*, or *corrosive Matter*, by throwing it upon the *Extremities*; breath'g it out insensibly; or continuing it so as to render it *harmless*, or capable of circulating freely along with the *Juices*, till by col-

lecting again, gradually increasing, or separating from the *Blood*, it causes another *Paroxysm*.

The *Gout* is either *Regular*, or *Irregular*.

Regular, when it appears to be feasted in the *Extremities* of the *Body*, returns at *stated Periods*, and with a *gradual Increase* and *Decline* of the *Symptoms*: *Irregular*, when the *Paroxysms* are *frequent*, and *uncertain*; when the *Symptoms* vary, or happen *promiscuously*, and the *Disease* appears to be feasted in the *internal Parts* of the *Body*; as the *Stomach*, *Brain*, &c. leaving the *extreme Parts*, as the *Hands*, *Feet*, &c. free from *Pain*.

According as different *Parts* are affected by this *Dilemper*, it goes by different *Names*: When it seizes the *Feet*, it is call'd *Podagra*; when the *Knees*, *Gonagra*; when the *Hands*, *Chiroagra*; and when the *Hip Joint*, *Sciatica*, &c. See **PODAGRA**, **CHIROAGRA**, **SCIATICA**, &c.

Sometimes it attacks the whole *Body* at the same time, and then it is call'd the *General*, or *Universal Gout*.

The *Gout* may be *Hereditary*, or *Natural* to the *Constitution*, proceeding from a too great *Constitution* of the *Capillary Vessels*, whence the *gouty Humor* is more easily lodged, or detained in them. It may also proceed from *High-living*, *Crapsula's*, and eating such things as are hard of *Digestion*; a *sedentary Life*, drinking too freely of *raritartarus Wines*; *Irregular living*, *Excess* in *Vecey*; an obstructed *Perspiration*, and a *Suppression* of the *natural Evacuations*.

The *immediate Cause* of the *Gout* appears to be an *Alkaline*, or *acrimonious Matter* in the *Blood*; which being separated from it at particular times, falls upon the *Joints*, but most frequently upon the *Feet*, and *Hands*; which, if it be repelled, or if the *Blood* be overcharged therewith, so that a *Crisis* cannot be procured in the *Extremities* (as generally happens in *old Age*) it falls upon the *nobler Parts*; and then produces the *Irregular Gout*.

The *Regular*, chiefly and immediately affects the *Tendons*, *Nerves*, *Membranes*, and *Ligaments* of the *Body*, about the *Joints*—Sometimes a *cold shivering Fit* precedes, and generally a *Fever* accompanies, its first *Appearance*, which soon goes off, and returns by *Intervals*. A *light Pain* is felt in the *Joints*, where the *Crisis* is *perform'd*, which increases gradually; and in the *Podagra* generally fixes first on the *great Toe*, thence proceeding to the *Tarsum* and *Metatarsus*; sometimes, especially in *old Age*, it attacks the *Knees* and *Hands*; and wherever it is, by distending and irritating the *Parts*, causes a *violent Pain*, not unlike to that of a *dislocated Bone*. When the *Pain* is at its *State*, there appears an *Inflammation*, and a *Swelling*; both which increase as the *Pain* increases; and upon their *Remission*, the *Paroxysm* is ended: Tho' the *Tenderness* and *Swelling* in *fevere Fits*, will sometimes remain a longer *Time*, and cause an *Uncasiness* upon *Motion*.

It is observed, that *Women*, *Children*, and *young Men*, are seldom troubled with the *Gout*, unless it be *hereditary*; that it rarely attacks, before the *Patient* is 35, or 40 *Years* old, and sometimes not till the *Decline* of *Life*; that the *Corpulent* are more subject to it, than those who are *spare*, and *lean*; that the *Pain* increases towards *Night*, and decreases towards the *Mornings*; that the longer the *Interval* between the *Paroxysms*, the more *severe* they prove, and the longer they generally continue.

The *Disease* usually returns twice a *Year*, *vis.* in the *Spring*, and *Autumn*; and in the latter the *Paroxysm* is sometimes two, or three *Months*, before it comes to a *Period*; tho' its *Duration* is sometimes not above three, or four *Weeks*.

These are call'd *Cardinal Paroxysms*, to distinguish them from others of less *Duration*, which happen between the *Spring* and *Autumn*. The more *high-colour'd* the *Urine*, and the less *Sediment* it deposits; the further is the *Disease* from the *State* of *Concoction*, as 'tis termed. According to the *Violence* and *Continuance* of the *Fever*, the *Paroxysm* proves more or less *severe*.

In *Constitutions* much broke or shatter'd with the *Gout*, there are usually *stony*, or *chalky Concretions* form'd in the *Joints* of the *Fingers*, or *Toes*, and thence translated to the *Viscera*; which case is often attended with *irregular*, *frequent*, and short *Paroxysms* in the *Extremities*. In the *Decline* of *Life*, when the usual *Fits* do not happen; or if the *gouty Matter* be suddenly repelled from the *Extremities* by an *improper Regimen*, or *Medicines*; it usually seizes the *internal Parts*, and frequently the *Stomach*, *Head*, *Intestines*, &c. Causing *Want* of *Appetite*, *Reaching* to *vomit*, *Indigestion*, a *Cachexis*, the *Jaundice*, *Asthma*, *Diarrhea*; and at last, so obstructs the *fine capillary, nervous Tubes* (especially those of the *Stomach*, and *Brain*) as possibly to hinder the *Flux* of the *Animal Spirits*: Upon which *Death* suddenly ensues.

Sydenham gives us an accurate *History* of a *Fit* of the *Gout* in the *Feet*: It begins towards the *Cloze* of *January*, or *Beginning* of *February*, without the least previous *Notice*; except, perhaps, a *Crudity*, or *Apepy* for some *Weeks* before-hand; with a sort of *windy Intumescence*, and a *Heaviness* of

of the Body, which continually increases, till at last, a Paroxysm breaks out; being preceded, some Days, with a sort of Torpor, and a sensible Defect of the Functions thro' the Flesh of the Thighs, with some spasmodic Symptoms. The Day before the Paroxysm, his Appetite is very greedy; an Hour or two after Midnight, he is waked by a Pain, commonly in his great Toe, sometimes in the Heel, Ankle, or the Calf of the Leg, not unlike the Pain felt upon a Dislocation of the said Bones; with a Sento as if Water were sprinkled on the Part affected. This is succeeded by a Chilliness, and some Approach to a Fever: The Pain in the mean time, which at first was more remiss, gradually increases; in proportion to which the Chilliness abates. By Night, it is arrived at its Height, and settled about the Ligaments of the Bones of the Tarsus, and Metatarsus; where it sometimes resembles a violent Tendrion; and sometimes a Laceration of these Ligaments; sometimes the Biting, or Gnawing of a Dog; a Squeezing, or Coarctation. Thus far the Part affected has such an exquisite Sense, that it cannot bear the Weight of the Linen, nor even the Shaking of the Room occasion'd by a Person's Stepping. Hence, a thousand vain Endeavours to get Ease, by changing the Posture of the Body, the Position of the Foot, &c. till about two or three a-Clock in the Morning (the Space of a Nychthemeron from its Access), when a Remission is first perceived; the morbid Matter being by this time tolerably digested, or even dissipated. The Patient, hereupon, drops a-sleep, and at his Waking finds his Pains much abated, but the Part newly swell'd. A few Days hence, the other Foot undergoes the same Fate: Sometimes, both are attack'd from the first. From the Time it has seiz'd on both Legs, the Symptoms become more irregular, and precarious, both as to the Time of Invasion, and the Duration thereof. But this still holds, that the Pain recurs in the Night, and remits again in the Morning. A Series of these little, alternate Accesses, &c. constitutes a *Pir*, or *Paroxysm of the Gout*, which holds longer, or less, according to the Age, &c. of the Patient. In strong People, and those who have not had it often, fourteen Days is a moderate Paroxysm: In old People, and those long used to it, it will hold two Months.

For the first fourteen Days the Patient is usually bound: A Loss of Appetite, Chilliness towards Evening, and a Heaviness, and Uneasiness even of the Parts not affected, attend the whole Paroxysm. As it goes off, he is seiz'd with an intolerable Itching, especially between the Fingers; the Furrow falls, and his Toes scale, as if he had drank Poison.

Such is the Course of a *Regular Gout*; but when thro' improper Treatment it is disturbed, or prolonged, it seizes the Hands, Wrists, Elbows, Knees, and other Parts: Sometimes distorting the Fingers, and taking away their Use; sometimes generating tophaceous Concretions, or Knots about the Ligaments of the Joints, resembling Chalk, or Crabs Eyes; sometimes raising a whitish, inflammable Tumor, almost as big as an Egg, about the Elbows, &c.

It may be added, that where a Person has labour'd under the *Gout* for many Years; the Pain is sensibly less'n'd each Paroxysm, till at length it becomes rather an Uneasiness than a Pain: Hence that Reflexion of the Great *Sydenham*, *DOLOR IN HOC MORBO AMARISSIMUM EST NATURÆ PHARMACUM*.

The *Gout* is rank'd among the Number of incurable Difficulties: In effect, we have no thoro', and assured Remedy yet discovered for it; these that now obtain are little more than Palliatives: They tend to alluage the Pain, to diminish it for a time; but not to extirpate it.

Bleeding, and Purging are found absolutely prejudicial; and Diaphoreticks of no Service. Emetics, according to *Priestner*, and *Ermuller*, may do good in the Beginning of the Disease. But, upon the whole, nothing, in *Sydenham's* Opinion, proves of more Service than Digestives, or Medicines which strengthen the Stomach, and promote Digestion: As, Angelica Root, *Enul. Campan.* The *Theriac. Andromach.* the *Jesuit's Bark*; and Antiscurbuticks: These chiefly to be administer'd in the Intervals between the Paroxysms. *Maffgrave*, however, recommends internally Repellents, and principally Cardiacks; externally, Emplastors of *Gum. Canran.* or *Oxyroce*, or Cephalic, with *Burgundy Pitch*, or green Sea-cloth, commonly called *Hat-cast*, &c. Yet *Doleius* affirms, that Repellents do more harm than good; and gives us the following Recipe, as more than equal to all others.

R. *Conseil. bamecb.* ʒj. *Pulv. Jalap.* ʒi. *extract.* *Tripl. fibrin.* ʒij. *Litharg. aur.* ʒvj. *Sapo Animom.* ʒi. *Sacchar. Cantb.* ʒvj. *Ol. Olivær.* q. s. *Cera & Piceis parum* f. s. An Emplaster to be laid on the Joint affected, till the Pain, and the morbid Matter be driven away.

GRABATARI, or GRABATARI, in Church Antiquity, were such Persons as deserv'd the receiving of Baptism, to the Hour of Death; or, who did not receive it till they were dangerously ill, and out of Hopes of Life: From an Opinion, that Baptism absolutely wash'd away all former Sins. See BAPTISM.

The Word is form'd of the Latin *Grabatum*, Bed; and

that from the Greek *γρεβάριον*, a Hanging-bed, of *apud*, to suspend: Such was the Bed of Slaves, poor People, *Cynic* Philosophers, &c. who were Enemies of Luxury and Ease.

GRACE, in Theology, any Gift which God makes to Man, of his own free Liberality, and without their having deserv'd it at his Hands; whether such Gift regard the present, or a future Life.—

Grace is usually divided into *Natural*, and *Supernatural*. By *Natural Grace* is understood the Gift of Being, of Life, of such and such Faculties, of Preservation, &c. *St. Jerom.* Epist. 139. allows it a *Grace of God*, that Man was created: *Gratia Dei est quod homo creatus est*. So, also, it is by the *Grace of God*, that Angels, and human Souls are immortal; that Man has free Will, &c.

Supernatural Grace, is a Gift from above confer'd on intelligent Beings, in order to their Salvation.—'Tis these, only, are called *Graces* in the Riger of Theology; and 'tis for the Conveyance, Improvement, and Strengthening of these that the Sacraments are confer'd; the Ministry of the Word instituted, &c. See SACRAMENT, &c.

The Divines distinguish this *Grace* into *Habitual*, and *Actual*; *Justifying*, and *Sanctifying*.—

Habitual GRACE, is that which resides stably in us; is fix'd in the Soul, and remains till some grievous, wilful Sin expunge it.

This is also called *Justifying Grace*, as it makes us appear righteous and innocent before God: And *Sanctifying Grace*, as it makes us holy, and devoted to God. See JUSTIFICATION, and SANCTIFICATION.

Actual GRACE, is that which God gives us for the special Performance of some particular Good thing; as to convert us, enable us to resist a Temptation, &c.—

This, the Divines subdivide into divers Kinds: *Preventing*, *Concomitant*, and *Subsequent Grace*.

It is an Article of Faith, 1^o That *Actual Grace* is necessary for the beginning, carrying on, and finishing every good Work. 2^o That the Will is able to resist this *Grace*, and reject it. See WILL.

And hence this *Grace* becomes further divided into *Efficacious*, and *Sufficient*.—It is *Efficacious*, or *Efficient*, when it has the Effect; and *Sufficient*, when it has it not, tho' it might have had it. See EFFICACIOUS, and SUFFICIENT.

Some of the more rigid Calvinists, &c. admit a *Necessitating Grace*. See CALVINIST, PREDESTINATION, REGENERATION, &c.

We also say, the *Law of Grace*; the *Covenant of Grace*, in opposition to the *Mosaic Law*, &c. See LAW; see also REVELATION, &c.

Days of Grace, or Favour, are a certain Number of Days, allow'd for the Payment of a Bill of Exchange, after the same becomes due. See DAY of GRACE.

The *Days of Grace in England* are 3; at *Rome* 5; at *Rotterdam*, 6; at *Paris*, 10; at *Hamburg*, 12; at *Antwerp*, 14.

Act of GRACE, is an Act of Parliament for the Relief of insolvent Debtors in the several Parliaments; by clearing such as are qualified, or come within the Terms of the same, from all their former Debts, &c.

GRACES, Gratia, in the Canon Law, are the same with what we otherwise call *Provisions*, See PROVISION.

Expectative Graces, Gratia Expectative, are a sort of reversionary Benefices, disposed before the Time, or before they become vacant. See EXPECTATIVE.

GRACE is also a Term in the Formula of all Patents, &c. which begin, *George, by the Grace of God King of Great Britain, &c.*—The *Romish* Bishops frequently begin their Mandates in the like manner. Such-a-one, by the *Grace of God*, and the Holy See, Bishop of, &c.

The *English* Archbishops say, *By Divine Grace*, or *Divine Providence*. See ARCHBISHOP, &c.

All Sovereigns now use the Phrase *Grace of God*; Emperors, Kings, Princes, &c. Antiently Dukes, Counts, and even Lords talk'd in the same Style: In the new Collection of *Fa. Martene* we meet with a mere Seigneur qualified by the *Grace of God, Seigneur de Comborn*. *Louis XI.* forbad the Duke of *Brittany* to entitle himself by the *Grace of God*.

GRACE is also a Title of Dignity, attributed to Princes of inferior Rank, and who are not qualified for that of *Hightness*. See TITLE.

Till the Time of King *James I.* the Kings of *England* were address'd to under the Title of *Grace*, as they now are under that of *Majesty*. See MAJESTY, KING, &c.

Our *English* Dukes and Archbishops are address'd to under the Title of *Grace*. But that Title is most frequent in *Upper Germany*, and particularly *Austria*; where it is bore by the Barons, as being inferior to that of Excellence. See QUALITY, EXCELLENCE, &c.

GRACES, Gratia, Charities, in the Heathen Theology, were a Set of fabulous Deities, three in Number, who attended on *Venus*. See GOD.

Their Names are, *Aglia, Thalia, and Euphrosyne*; and they are supposed to be the Daughters of *Jupiter*. *Vossius de Idolol. L. XIII. c. XV.*

Some will have the *Graces* to have been four, and make them the same with the *Horse, Hours, or rather with the four Seasons of the Year*. See *HOURS, &c.*

A Marble in the King of *Prussia's* Cabinet represents the three *Graces* in the usual manner, with a fourth, seated, and cover'd with a large Veil, with the Words underneath, *AD SORORES IIII*. Yet *Moos. Zeger* will not allow the *Graces* to have been four: The Company there present, he understands to be the three *Graces, and Venus, who was their Sister, as being Daughter of Jupiter and Dione.*

They were always supposed to have hold of each other's Hands, and never parted. They were painted naked, to shew that the *Graces* borrow nothing from Art, and that they have no other Beauties but what are natural.

Yet, in the first Ages, they were not represented naked, as appears from *Pausanias L. VI. and L. IX.* who describes their Temple, and Statues. They were of Wood, all but their Head, Feet, and Hands, which were white Marble. Their Robe, or Gown was gilt: One of them held in her Hand a Rose, another a Dye, and the other a Sprig of Myrtle.

The Poets feign the *Graces* to have been very small of Stature; to intimate that the Things which charm, and delight us, are frequently little Matters; as, a Gesture, a Laugh, a careless Air, or the like.

GRACILIS, in Anatomy, a Muscle of the Leg, thus called from its slender Shape. See *LEGS*.

It arises partly tendinous, and partly fleshy, from the Os Pubis internally, between the first and second Heads of the Triceps; and in its Descent in the Inside of the Thigh, grows narrow, and becomes tendinous a little below the Sartorius, and is thus inserted into the Tibia. It assisteth in bringing the Thigh and Leg inwards.

GRADATION, the Act of ascending, Step by Step, to any Pitch, or Eminence: From the Latin *Gradius*, Degree Step.—See *DEGREE*.

GRADATION, in Rhetoric, is when a Series of Proofs is brought, rising by degrees, and improving each on the other. See *CLIMAX*.

GRADATION, in Logic, is an Argumentation consisting of four, or more Propositions, so disposed, as that the Attribute of the first is the Subject of the second; and the Attribute of the second, the Subject of the third; and so on, till the last Attribute come to be predicated of the Subject of the first Proposition.

As, in *Porphyry's* Tree: Man is an Animal; an Animal is a living Thing; a living Thing is a Body; a Body is a Substance: Therefore Man is a Substance.

An Argument of this kind is liable to a world of Fallacies; both from the Ambiguity of Words, and Things: *E. gr. Peter is a Man; Man is an Animal; Animal is a Genus; Genus is a Universal; therefore Peter is a Universal.*

GRADATION, in Chymistry, is a kind of Process belonging to Metals.—It consists in raising, or exalting them to a higher Degree of Purity, and Goodness, so as both to increase their Weight, Colour, Consistence, &c. See *METAL, TRANSMUTATION, &c.*

GRADATION, in Architecture, signifies an artful Disposition of several Parts, as it were, by Steps, or Degrees, after the manner of an Amphitheater; so that those placed before, do no Disservice, but rather Service to those behind.

The Painters also use the Word *Gradation* for an insensible Change of Colour, by the Diminution of the Tints, and Shades. See *DEGRADATION*.

GRADUAL, GRADUALE, was antiently a Church-book, containing divers Prayers, rehearsed, or sung after the Epistle.

In some of our antient Writers 'tis read *Graite, Graduale, &c.*

After reading the Epistle, the Chantor ascended the Ambo with his *Gradual*, and rehears'd the Prayers, &c. therein; being answer'd by the Choir: Whence the Name *Gradual*, on account of the Steps, or Degrees of the Ambo. See *AMBO*.

In the *Romish* Church, the Name *Gradual* is still retain'd to a Verse which they sing after the Epistle, and which antiently rehears'd on the Steps of the Altar: Tho' *Ugazio* gives another Account, and says it took its Denomination *Gradual*, because sung in a gradual Ascent from Note to Note. *Mogri* speaks differently still, and will have it to have took this Name, because sung while the Deacon went up the Steps to the Pulpit, to sing the Gospel.

GRADUALS, GRADUALES, is also applied to the fifteen Psalms sung, among the *Hebrews*, on the fifteen Steps of the Temple.—Others are of Opinion they were thus denominated, because the Singers rais'd their Voice by degrees, from the first to the last.

Cardinal *Bona*, in his Treatise of Divine Psalmody, says, The fifteen gradual Psalms are intended to represent to the Mind, that we only arrive at the Perfection of Goodness or Holiness, by degrees: He goes on to lay down, the fifteen

Degrees of Virtue, corresponding to the 15 Psalms; five of them are for Beginners; five for Proficients; and the rest for the Perfect.

GRADUATE, a Person who has the Degrees in any Faculty. See *DEGREE, &c.*

A *Graduate* in Physic, in Divinity, &c. See *FACULTY, DOCTOR, &c.*

In France, one Third of the Benefices of the Kingdom are affected to *Graduates*, viz. all that become vacant in the Months of *January, and July, April, and October.*

This Privilege of *Graduates* is no older than the sixteenth Century: It being observ'd that Men of Learning were much neglected by the Collators, and Patrons of Churches, Complaint therefore was made to the Council of *Vassy*, where this Decree was made; which was afterwards confirm'd by the *Pragmatic Sanction*, and again by the Concordat. See *PRAGMATIC, &c.*

GRADUATION, is used in Mathematics, for the Act of *Graduating*, or dividing any thing into Degrees. See *DEGREE*.

Graduation of this Quadrant, Theodolite, or the like, is very just, and clean. See *QUADRANT, THEODOLITE, &c.*

GRAFT, in Agriculture and Gardening, a little Shoot, Cyon, Bud, or Eye of a Tree, inserted into another Tree, to make it yield Fruit of the same Nature, and Kind as those of the Tree whence the *Graft* is taken. See *BUD, CYON, EYE, &c.*

Or, *Graft*, is a little Portion of a Tree, inclosed in a Cleft, or Incision made in another, in order to correct, qualify, or improve the Taste of its Fruit; or even to make it bear a different Sort of Fruit. See *ENGRAFTING; see also FRUIT, TREE, STOCK, &c.*

The Word is form'd of the French *Greffe*, which signifies the same thing; and *Greffe*, in this Sense, is supposed to have been derived from the Resemblance the Shoot bore to the Point of a Penknife, which was antiently called *Greffe*. *Du Cange* goes further, and derives the antient *Greffe* from *Graphium*, *Menage*, from *Graphium*, a Latin Word, signifying a little Stylus, or Iron Bodkin, one End whereof was pointed, and served to write withal on Waxen Tablets; and the other flat, serving to efface, or rub out what was wrote.

GRAFTING, OR GRAFTING, OR INGRAFTING, in Agriculture, and Gardening. See *ENGRAFTING*.

GRAFTING WAX. See *WAX, &c.*

GRAIN, a minute Body, or Parcel of a Body pulveriz'd. In this Sense we say, a *Grain* of Sand; a *Grain* of Salt; a *Grain* of Gunpowder, &c. See *PULVERIZATION, &c.*

GRAIN is also used for the Fruits, or Seeds of divers Plants; as, a *Grain*, or Corn of Pepper, of Filicia, &c. See *BERRY, SEED, KERNEL, &c.*

The Kingdom of Heaven is compared to a *Grain* of Mustard Seed.

GRAIN is more generally used for any Fruit, or Seed growing in a Spice, or Ear. See *SPICE*.

In this Sense, *Grain* comprehends all sorts of *Corn*; as Wheat, Rye, Barley, Oats, &c. See *CORN*.

GRAIN is also a small Weight, us'd in estimating divers Substances. See *WEIGHT*.

The *Grain* is the smallest of all the Weights known in England.—It is taken from the Weight of a *Grain* of Wheat, gather'd out of the Middle of the Ear, and well dried. 24 *Grains* make a Penny-weight, and 20 Penny-weight an Ounce. See *PENNY-WEIGHT, and OUNCE*.

The *Grain* is a Troy Weight, and used in the weighing of Gold, Silver, Jewels, Bread, and Liquors. See *TROY WEIGHT*.

Among the Antients, the *Grain* was the fourth Part of the *Siliqua*, or twelfth of the *Obolus*, and the 72^d of the *Drachma*. It comprehended a *Leus* and an half. See *SILIQUA, OBOLUS, &c.*

Fernelius L. IV. c. 6. Method. Medend. affirms it as a thing known and certain, that the *Grain* is of the same Weight, every where; but he is mistaken. Mr. *Greaves* in his Treatise of the *Roman Foot* has shewn, that 179 *Dutch Grains*, which *Stellius* had found to be the Weight of a *Philip* of Gold, only amount to 154½ *English Grains*. Add, that *Mont. Perrault* has computed the French *Grain* to be less than the *English*; and yet bigger than the *Dutch*: 'To the *English*, it is as 158 to 154½; and to that of *Holland*, as 158 to 179.

The *Grain* used by the Apothecaries, is the same with that of the Goldsmiths; tho' they make a Difference in the Weights rais'd therefrom. Thus, 20 *Grains*, with them, make a *Scruple*, 3; 3 *Scruples*, a *Drachm*, 3; 8 *Drachms*, an *Ounce*, 3, &c. See *DRACHM, SCRUPLE, &c.*

The Carat used in weighing Diamonds and precious Stones, is also divided into four *Grains*. See *CARAT*.

GRAIN is also used for the Figure, or Representation of *Grains* on Stones, Stuff, Leathers, &c. Thus we say, *Morocco* has a bolder *Grain* than *Shagreen*. See *MOROCCO, and SHAGREEN*.

In some Marble, the *Grain* is very fine; in others coarser. See *MARBLE, STONE, &c.* Steel

Steel is known by its *Grain*, which is much finer than that of Iron. See STEEL, and IRON.

GRAINING - BOARD, is a Board used by the Carriers, to give the Grain to their Leather. See CURRYING.

It is made with Teeth, or Nitches running quite across; into which, the soft, moisten'd, suppled Leather being press'd, its Surface readily takes the Impression.—See LEATHER.

GRAMINEUS, **GRAMINEA**, in Antiquity, a Crown form'd of Grass, *Gramen*, below'd, by the Romans, on certain of their Generals, in consideration of their having saved, or rescued an Army. See CROWN.

The *Grassy* Crown was but rarely confer'd; and for some signal Exploit; when, thro' the Courage, or Dexterity of a General, an Army reduc'd to the last Extremities had been saved, or deliver'd, and the Enemy put to flight.

GRAMINEOUS HERBS, among Botanists, are such as have a long, narrow Leaf, and no Foot-stalk. See PLANT.

GRAMMAR, the Art of speaking rightly; that is, of expressing one's Thoughts, by Signs mutually agreed on for that purpose. See SPEAKING.

The Signs, here found most convenient, are articulate Sounds; but, as these are transient, others have been invented more permanent, viz. *Grammata*, *γράμματα*, Letters, whence the Name *Grammar*. See VOICE, and LETTER.—

Grammar is more accurately defined, after Mr. *Jobnsen*, the Art of expressing the Relations of Things in Construction, with due Quantity in speaking, and Orthography in writing, according to the Custom of those whose Language we learn. See LANGUAGE.

Grammar is divided by some Authors, into four Parts, *Orthography*, *Prosody*, *Etymology*, and *Syntax*. See ORTHOGRAPHY, PROSODY, ETYMOLOGY, and SYNTAX.

Others chuse to divide it somewhat more obviously, into the Doctrine of *Letters*, or *Sounds*, which coincides with Orthography and Orthoepy; that of *Syllables*, their Accent, Time, &c. which falls in with Prosody; that of *Words*, their Kinds, Derivations, Changes, Analogy, &c. which amounts to Etymology; and that of *Sentences*, which considers the placing, or joining of Words together, called Syntax. See LETTER, WORD, SYLLABLE, and SENTENCE.—

The chief Business of *Grammar* is to decline, conjugate, construct, and spell Nouns, Verbs, and other Parts of Speech.

It teaches the Propriety, and natural Force of each Part of Discourse; and the Reason of all Expressions used therein. See DECLENSION, CONJUGATION, CONSTRUCTION, NOUN, VERB, SPEECH.

Some have called *Grammar* the Door, or Gate of the Arts and Sciences; by reason none of these are attainable, but by means hereof. *Grammar*, according to *Quintilian*, is that Eloquence, which the Foundation is to the Building: They who despise it, as only dealing in low, trivial Things, are exceedingly mistaken: It has, really, more Solidity than Show.

The Authors of the *Art of Thinking* consider *Grammar*, as not less necessary to try, and exercise the Abilities of the most Knowing, than to form the Minds of Beginners: The Advantages of *Grammar* are well set forth by *Perizonius*, in the Preface of his Edition of *Sanctius's Minerva*, *Amsterdam*, 1714. See GRAMMARIAN.

Diogenes Laertius relates, after one *Hermippus*, that *Epicurus* was the first that gave the Rules of *Grammar* for the Greek Tongue; but that *Plato* was the first who had taken the thing into Consideration, and even made some Discoveries on that Subject.

At Rome, *Crates of Mallantibus* in *Mysia*, cotemporary with *Aristarchus*, gave the first Lectures thereon to the Romans, during the Time of his being Ambassador for King *Attalus*, to the Commonwealth, between the second and third *Punic* Wars, soon after *Ennius's* Death. Before him, it was not known at Rome what *Grammar* meant. *Polydore Virgil De Invent. Rer. L. I. C. 7.*

Grammar is the same in all Languages, as to its general Principles, and Notions which it borrows from Philosophy to explain the Order and Manner wherein we express our Ideas by Words: But, as each Language has its particular Turns, its several Characters, and Genius, different from the Genius and Character of other Languages: Hence arise as many *Grammars*, as Languages.—An Example will suffice to shew this: We say in English, *Draw a straight Line*, not, a *Line* *straight*: In French, they say, *tirez ligne droite*, a *Line* *straight*, not *droite ligne*, a *straight Line*: And in *Latin* there is a Liberty to say it either the one way, or the other, *rectam lineam*, or *lineam rectam*, *ducere*. And if there be a Language which in the Phrase above-mentioned follows the same Analogy, as the English; it differs from it on a hundred other Occasions.—

Hence Dr. *Wallis* justly finds Fault with our English *Grammarians*, where he says, that all of them forcing our English Tongue too much to the Latin Method, have deliver'd many useless Things concerning Cases, Genders, and Declen-

sions of Nouns; Tenses, Moods, and Conjugations of Verbs; as also the Government of Nouns and Verbs, which our Language has nothing to do with. See ENGLISH, CASE, DECLENSION, GENDER, MOOD, &c.

GRAMMAR is also used for a Book containing the Rules of *Grammar* which obtain in any Language. See LANGUAGE.

The ancient *Grammars*, are; for the Hebrew, that of Rabbi *Judas Chigi*, which is commonly held the first Hebrew *Grammar* that appear'd; tho' it is certain, Rabbi *Saadias Hagggon*, who lived before Rabbi *Judas*, compos'd two Works in the same kind, one, expressly of *Grammar*; and the other, of the Elegances of the Hebrew Tongue. See HEBREW, &c.

For the Greek, the oldest *Grammar* is that of *Gaza*: The Latin ones, are the Works of *Martianus Capella*, *Priscian*, and *Antonius Pedianus*. See GREEK, &c.

The best of the modern *Grammars*, are 1^o For the Hebrew, that of *Pagninus*, the Edition of *Hen. Stevens*, or *le Preux* at Geneva, in 1592; that of *Petrus Martinius*, at *Roebel* 1592; that of *Buxtorf*; that of *Ludovicos Deus*, in three Languages; that of *Sixtinus Amama*, which is a Collection from *Martinius* and *Buxtorf*; that of *Bellarmino*, with the Notes of *Amis*; that of *Fa. Splanter* is useful for Beginners.

2^o For the Chaldee, the best are those of *Martinius*, *Buxtorf*, and *Lud. Deus*, in three Languages. See CHALDEE.

3^o For the Syriac, those of *Amira*, *Myricaeus*, *Waserus*, and *Beveridge*; with the Chaldee and Syriac ones of *Buxtorf*, of *Lud. Deus* in three Languages, and that of *Lambden*, 4^o For the Coptic, the *Prædromus Coptus*, and *Lingua Ægyptiaca Restituta* of *Kircher*. See COPTIC.

5^o For the Arabic, that of *Erpenius*, and that of *Galius*, which is only *Erpenius's* a little augmented. See ARABIC.

6^o For the Ethiopic, that of *J. Ludolphus*.

7^o For the Persian, that of *Lud. Deus*.

8^o For the Armenian, those of *Schroeder*, and *Galaanus*.

9^o For the Greek, those of *Mart. Rolandus*, *Silburgius*, *Fa. Moenquet*, *Vossius*, *Buxtorf*, and *Port Royal*.

10^o For the Latin, those of *Desauter*, the *Minervas* of *Sanctius*, those of *Vossius*, and that of *Port Royal*, which is only a Collection from the rest.

11^o For the Italian, those of *Berger*, *Lanfredini*, *Port Royal*, and *Veneroni*.

12^o For the Spanish, those of *Salazar*, *Port Royal*, the *Abbot de Verac*, &c.

13^o For the Portuguese, that of *Pereyra*.

14^o For the French, those of the *Abbe Regnier*, and *Fa. Buxtorf*.

15^o For the High-Dutch, those of *Heim*, *Clains*, *Hertz*, *ber*, and *Leopold*. Lastly,

16^o For the English, those of *Wallis*, *Brightjan*, and *Greenwood*.—

GRAMMARIAN, **GRAMMATICUS**, a Person well versed in *Grammar*; or who teaches *Grammar*. See GRAMMAR.

The Denomination *Grammatician*, is like that of *Critic*, now frequently used as a Term of Reproach: A mere *Grammatician*; A dry, plodding *Grammatician*, &c. The *Grammatician* is conceived as a Person wholly attentive to the Minute of Language; indifferently employ'd about Words, and Phrases; incapable of perceiving the Beauties, the Delicacy, Fineness, Extent, &c. of a Sentiment: See PREJUDICE. *Scaliger*, however, consider'd *Grammaticians* in another Light. *Utriusque essent*, says he, *boni Grammatici: Sufficit enim illi, qui omnes Aulicos probe vult intelligere, esse Grammaticum*.—

The Title *Grammatician*, 'tis certain, was antiently a Title of Honour; being given not only to such as applied themselves to *Grammar*, or excell'd in Philology; but to all who were reputed Learned in any Art, or Faculty whatever, as is shewn by *Ger. Vossius*, in his Book of *Grammar*.

The Word was properly a Title of Literature and Erudition, and frequently given to Persons who excell'd in all, or many Arts, call'd also *Polyhistores*. See POLYHISTOR.

Thus, *Plotinus*, a famous Philosopher in *Justinian's* Time, remarkable for the Except, and Variety of his Knowledge, was surnam'd *Grammaticus*, as appears from *Plotinus's* Library: So *Saxo*, the Danish Historian, in the XIIIth Century, got the Appellation *Grammaticus*: And as late as the Year 1580 *Thomas d'Acursius*, a celebrated Neapolitan Lawyer, was surnam'd the *Grammatician*.

The Title *Grammatician* was antiently below'd on those we now call *Criticks*, Men of Learning, Erudition, Letters, &c. and particularly such as wrote well, and politely in every kind. See CRITICISM.

'Tis in this Sense that *Suetonius* entitles his Book which he wrote on the best Latin Authors, *Of the Celebrated Grammaticians*; and that *Cornelius Nepos* calls the Commentators on the Orators, and Poets, *Grammaticians*; and lastly, 'tis in this Sense the Word is attributed by the Antients to *Apion*, *Philoponus*, and *Helinus*.

The most celebrated *Grammarians* of the II^d Century, were *Aper*, *Pollis*, *Eutyebius*, *Proculus*, *Albenus*, *Jnlius Pollux*, *Macrobis*, and *Aulus Gellius*: The Works of these last Authors, are an Assemblage of Abundance of very different Things, and Subjects, relating to the Criticism of the ancient Writers, and the polite Literature.

If the Name have lost its ancient Effect, 'tis thro' the Fault of those who have assumed it; by treating of Grammar in a low, Pedantic, Dogmatic manner; reducing it to Words and Syllables; and dwelling altogether on trifling, puerile Remarks, and Censures: Whereas its proper Office is to make an accurate, and thro' Examens of an Author; to enter into all his Views, to point out the Beauties, and the Defects thereof; to distinguish the true Beauties from the false; and the genuine Productions of an Author, from the Suppositions: That is, a *Grammatian* was then, what we call a *Critic*, now.

Those who only taught to read, understand, and explain Authors, were called *Grammatisti*, *Grammatistæ*; in Contradistinction from *Grammatici*: tho', in course of Time, the *Grammatistæ* have rose into the Place of *Grammatici*; who are prefer'd to that of *Critici*. See CRITICISM.

GRAMMATICAL, something relating to Grammar.— Thus we say, *Grammatical Construction*: *Grammatical Signification*, &c. Idioms, as Anglicisms, Latinisms, Grecisms, Gallicisms, &c. deviate from *Grammatical Strictness*. See ANGLICISMS, GALLICISMS, &c.

Such a Phrase is not *Grammatically* just; 'tis an Idiom. See IDIOM.

GRANADO, or GRANADA, or GRENADA, in the Military Art, a hollow Ball, or Shell, of Iron, Brass, or even Glass, or Pottery Earth, filled with Gunpowder, and fitted with a Fusee to give it Fire.

Of these there are two kinds; the one *large*, the other *small*: The first to be thrown at the Enemy by a Mortar, properly call'd *Bombs*. See BOMB.

The latter to be cast with the Hand; and thence denominated *Hand Granado's*.

Casimir, indeed, makes another Distinction; where the Ball, or Shell is round, whatever the Size be, he calls it a *Granado*; and where, Oval, or Cylindrical, a *Bomb*: But Custom allows only the former Division.

The best way, *Casimir* observes, to secure a Man's self from the Effect of a *Granada*, is, to lie flat down on the Ground, before it bursts.

Historians relate, that at the Siege of *Ostend* there were above fifty thousand *Granado's* thrown in one Month into the City; and that the Citizens threw above twenty thousand into the Works of the Besiegers.

The Common, or *Hand Granade* is a little, hollow Ball of Iron, Wood, Pastboard, &c. fill'd with strong Powder, lighted with a Fusee, and thus thrown with the Hand among the Enemy's Bastillions, Trenches, Posts, &c.

Their Composition is the same with that of *Bombs*; which see.—For Size, they are usually about the Bigness of an Iron Bullet, and weigh about three Pounds: As to Dimensions, they are common in Thickness one eighth, one ninth, or one tenth of their Diameter; their Aperture, or Orifice about $\frac{1}{2}$ wide, as prescribed by *Casimir*.

Thuanus observes that the first time *Granado's* were used, was at the Siege of *Wachtendonck*, a Town near *Guelderes*; and that the Inventor was an Inhabitant of *Vento*, who in making an Experiment of the Effect thereof, occasion'd two thirds of that City to be burnt; the Fire being kindled by the Fall of a *Granado*.

Bombs: were known long before the Invention of *Granado's*. See MORTAR.

The Antients had a sort of *Olle*, or Fire-pots, somewhat of the same Nature with our *Granado's*, but less perfect.

Casimir mentions a sort of Blind *Granado's*, without any Aperture, or Fusee, as not needing to be lighted; but being thrown with a Mortar, take Fire of themselves whenever they fall on any hard, solid Object.

The Name *Granada* takes its Rise hence, that they are fill'd with Grains of Powder, as a Pomgranate is with Kernels. See POMGRANATE.

GRANADIER, or GRENADIER, or GRANADEER, a Soldier who carries a Pouch full of *Hand Granado's* to be thrown among the Enemy. See GRANADO.

There are Companies of *Foot Granadiers*, and *Horse Granadiers*, or *Granadiers* of *Horse*, who march at the Head of the King's Guards.

To each Troop of *Horse Guards* there is added by Establishment a Troop of *Granadiers*, consisting of 64 Men, besides Officers commanded by the Captain of the Troop of Guards. See GUARDS.

One Division of *Granadiers* mounts with a Division of the Troop; go out on small Parties from the Guard; perform Centinels, Duty, &c.

The Pay of the private *Granadiers* is \pm s. 6 d. per Day. GRANARY, A Place to lay, or store Corn in, particularly for keeping. See CORN.

Sir Hen. Warton advises to make it look towards the North, as much as may be; because that Quarter is most cool and temperate.

Mr. Worlidge observes, that the best *Granaries* are built of Brick, with Quarters of Timber wrought in the Inside, whereto to nail the Boards, with which the Inside of the *Granary* must be lined to close to the Bricks, that there be no Room for Vermin to shelter themselves. There may be many Stories one above another, and let them be near the one to the other; for the shallower Corn lies, the better, and it is the easier turned.

Some have had two *Granaries*, the one above the other, and filled the upper with Wheat, or other Corn: This upper one had a small Hole in the Floor, by which the Corn descended into the lower one, like the Sand in an Hour-Glass; and when it was all come down into the lower *Granary*, it was then carried up again into the upper one; and so it was kept continually in Motion: Which is a great Preservation to the Corn. See further in the Article CORN.

A large *Granary*, full of square wooden Pipes, may keep Corn from heating.

GRANATE, a Gem, or pretious Stone, of a high, red Colour; thus called from the Resemblance it bears to that of the Kernel of a Pomgranate. See PRECIOUS STONE.

Granates are either *Oriental*, or *Occidental*: The first are brought from divers Parts of the East Indies; the second from *Spain*, *Bohemia*, and *Silesia*.—

These, from the East, are distinguish'd by their Colour into three Kinds: The first, of a deep, brownish Red, like black clotted Blood; of which Kind there are some as big as an Hen's Egg: The second, are nearly of the Colour of a Hyacinth, with which it were easy to confound them, but for their superior Redness. The last, having a Mixture of Violet with their Red, are called by the Italians, *Rubini della Rocha*. See RUBY.

The Occidental *Granates* are of divers Kinds, according to the Places they are found in. Those of *Spain*, imitate the Colour of the Kernel of a Pomgranate: Those of *Bohemia* have a golden Coat with their Red, glittering like a live Coal: Those of *Silesia* are the darkest of all, and seldom thoroughly transparent.

Of the Occidental *Granates*, those of *Bohemia* are the most valued: Some even give them the Preference over the Oriental Kind. They are found near *Prague*; not in any particular Mines, but are pick'd up by Peasants in the Fields, from among the Sands, and Pebbles.

The *Granate* is of some Use in Medicine: Its Powder is sometimes an Ingredient in the Cordial Elixirs. The Antients held it excellent against Heaviness and Melancholy.

GRAND, a Term rather *French*, than *English*, though used on many Occasions in our Language. It has the same Import with *Great*; being form'd of the Latin *Grandis*.— See GREAT.

In this Sense we say, The *Grand Master* of an Order; the *Grand Master* of *Malta*; of the *Free Masons*, &c. See MALTA, and MASON.

So also we say, the *Grand Visier*, the *Grand Signior*, &c. See VISIER, and SIGNIOR, &c.

Grand Father, *Grand Mother*, &c. See PARENTAGE, DESCENT, DEGREE, CONSANGUINITY, &c.

In the *French* Polity and Customs, are divers Officers thus denominated, which we frequently retain in *English*; as *Grand Amoner*, *Grand Ectoyer*, *Grand Chambellan*, *Grand Voyer*, &c.

We also say, the *Grand Gust*, *Grand Moude*, the *Grand Style*, &c. See SUBLIME, &c.

Grand Assize; see ASSIZE, and MAGNA ASSISA.

Grand Cape; see CAPE, and ATTACHMENT.

Grand Distress, *Districcio magna*, a Distress so called, not for the Quantity, for it is very short; but for the Quality, for the Extent is very great; for thereby the Sheriff is commanded, *Quod distringat teneant, ita quod ipse nec aliquis per ipsum ad ea manum apponant, donec habuerit aliud præceptum, & quod de exitibus coramdem nobis respondant, & quod habeat corpus eius*, &c. See DISTRESS.

This Writ lies in two Cases: Either when the Tenant, or Defendant is attach'd, and to returned, and appears not, but makes Default; or where the Tenant, or Defendant hath once appear'd, and after makes Default. On such Occasions, this Writ lies by Common Law, in lieu of a *Petis Cape*.

Grand Gusto, is a Term used by Painters, to express, that there is something in the Picture very great, and extraordinary, calculated to surprisè, please, and instruè.

Where this is found, they say, The Painter was a Man of the *Grand Gusto*: And they use the Word *Sublime*, and *Marvelous*, when they speak of a Picture in much the same Sense.

Grand Serjeanty; see CHIVALRY, and SERJEANTY. GRANDEL, is underitood of a Lord of the first Rank, or prime Quality.

In *Spain*, the Term *Grandor*, is spoken absolutely of the Prime Lords of the Court, to whom the King hath once given Leave to be cover'd in his Presence: There are some *Grandes*

des for life only; made by the King's laying, simply, *Be cover'd*. Others, are *Grandeets* by Defect; made by the King's laying, *Be cover'd for thy self, and Heirs*. These last, are reputed far above the former. There are some have three, or four *Grandeets*, or *Grandeets* in their Family.

GRANGE, an ancient Term for a *Baro*; or Place wherein to lay up and thresh Corn.

The Word is sometimes also used in a more extensive Sense, for the whole Farm; with all the Appendages of Stables for Horses, Stalls for Cattle, &c. See FARM.

It is form'd of the Latin *Grania*; or of *Grasmus*, Grain, Corn.—Hence also *Granger*, or *Grangier*, a Farmer.

GRANI, in our ancient Writers, Multichoos, or Whiskers of a Beard.—*Quia cum sit in fine rotundatis Granorum formam efficiunt.*

It is given for a Reason why the Cup is refused to the Laity, *Quia barbati, & prolixos habent Granos, dum poculum inter epulas sumunt, prius liquore pilos inficiunt quam ori infundunt.*

GRANIT, GRANITES, a sort of Marble, extremely hard, rough, and incapable of taking a thoro' Polish: Thus called, as being sprinkled over with a great Number little Stains, resembling Grains of Sand. See MARBLE.

There are three sorts of *Granit*; that of *Egypt*; that of *Italy*, and that of *Daubigny*.

The first has brownish, or greenish Spots, on a dirty, white Ground. It is found in very large Pieces; and is that chiefly used by the *Egyptians*, in their Obelisks, and Pyramids on the Tombs of their great Men. There are Columns of this Stone above 40 Foot high.

The *Granit* of *Italy* is softer than that of *Egypt*; especially in the Quarry, where it cuts with much more Ease. There is also a sort of *Green Granit*, which is a Species of Serpentine, spotted with green, and white Spots.

The *Granit* of *Daubigny*, a Quarry whereof has been found, is only a very hard sort of Flint.

GRANIVOROUS, an Epithet, or Denomination given to such Animals as feed upon Corn, or any other Grain or Seeds. See ANIMAL and SEED.

Granivorous Animals are chiefly of the Bird kind. See BIRD.

These have a peculiar Provision for the digesting of so dry and hard a Food. See DIGESTION, GIZZARD, &c.

GRANT, in Law, a Gift in Writing, of something which cannot aptly be pass'd, or convey'd by Word only; as Rents, Reversions, Services, Advowsons in Gross, Tithes, &c.

Or, it is a Gift made by such Persons as cannot give but by Deed; as the King and all Bodies Politick. See DONATION. This Difference is often, in Speech, neglected; and the Word *Grant* taken generally for every Gift whatsoever, made of any thing, by any Person. In this Sense he that granteth is named *Grantor*, and he to whom it is made, the *Grantee*.—A Thing is said to *lie in Grant*, which cannot be assign'd without Deed. See DEED.

GRANULATION, in Chymistry, an Operation perform'd on Metals, whereby they are reduc'd into small *Grains*, or Globules.

It is done by melting them; and when in Fusion, casting them into cold Water; in which they congeal into *Gravels*, as required: And are hereby render'd more easy to be dissolved. See DISSOLUTION.

The best way is to pour the fluid Metal thro' a Calender, or a new Birchen Broom.—

We also say, the *Granulation* of Gun-powder. See GUN-POWDER.

GRAPPE, see VINE, RAISIN, and WINE.

GRAPPLE, in the Managoe—A Horse is said to *grapple* with one, or both Legs, when he catches, or raises 'em more hastily, and higher than ordinarily, as if he were curvetting.

GRAPHOIDES, in Anatomy, an Appendage of the Bones of the Temples, long, small, sharp, and a little crooked, like a Cock's Spur. See OS TEMPORALIS.

The same Name is sometimes also applied to the *Musculus Digastricus*. See DIGASTRICUS.

Likewise, to an Extension of the Brain, resembling a Writing-pen. See BRAIN.

GRAPHOMETER, a Name which some Authors, particularly the *French*, give to a Surveying Instrument, by us commonly called a *Semicircle*. See SEMICIRCLE.

GRASS-Plots, and Walks, make a considerable Article in Gardening, &c. See WALK, &c.

Grass, or *Green Plots* are had either by sowing of Hay-Seed, or laying of Turf: For the first, which is the cheapest way, the Seed of the finest Upland Pastures is to be choic'd, well sifted and cleans'd.

For the second, the Turf should be cut on a Down, or Green, or Common, or Sheep-walk, where the *Grass* is short and fine; if there be any Knots, or Roughnesses, the Place must be cleans'd and roll'd after a Shower, before it be cut up. The Turf is cut in Squares, mark'd out with Lines, rais'd with a Knife, and roll'd up; about three Inches thick.

The *Quarter*, or *Verges* are to be prepar'd with a free Coat of poor Earth to lay the Turf on; and after laying, the Turf must be well water'd, roll'd, &c.

Small Pieces of *Grass*-work, as Knots, Stieck-work, and Volutes of Parterres, Cut-work, *Verges* about Balcons, &c. must always be laid with Turf.—

To sow *Grass* for Plots, &c. the Ground must first be dug or broke with a Spade, then dress'd, laid even, raked fine, and cover'd an Inch thick with good Mould to facilitate the Growth of the Seed. Then the Seed to be sown pretty thick, that it may come up close and short; and lightly, to be raked up, and cover'd. The best Season is the latter End of *August*: When it is well come up, it must be mow'd, and this often repeated; since the sower 'tis mow'd, the thicker and handfomer it grows. It must also be roll'd from time to time.

GRATICULATION, a Term some Writers use for the dividing a Draught, or Design into Squares, in order to the reducing it thereby. See REDUCTION.

GRATIOLA, a Medicinal Plant, of considerable Virtues; tho' little known in the ordinary Practice; as being suppos'd dangerous of Application.

Its most noted Effects are to evacuate hydropic Waters, both upwards and downwards, taken either in Infusion, or Decoction; to cleanse Wounds, and to kill Worms.

Its Bark, taken in Powder, is said to be scarce inferior in Virtue to *Ipecacuanha* for Dysenteries.

It is of a very bitter Taste; whence, probably its vermifugous Power; and its Root astringent, whence its Use in the Dysentery.

M. *Bomblac* made an Extract of this Plant, which purged gently, and was very Diuretic: Another Extract made of the Feces or Refuse, proved much more efficacious. *Hist. de l'Acad. An. 1705.*

GRAVE, in Music, is applied to a Sound, which is in a low, or deep Tone. See SOUND, and TUNE.

The thicker the Chord, or String, the more *grave* the Tone, or Note: And the smaller, the acuter. See CHORD.

Notes are suppos'd to be the more *grave*, in proportion as the Vibrations of a Chord, are less quick. See GRAVITY.

GRAVE, in Grammar, an Accent opposite to *Acute*. See ACCENT.

The *Grave* Accent is express'd thus: (`) and shows that the Voice is to be depress'd, and the Syllable over which it is plac'd, pronounced in a low, deep Tone.

GRAVE is also an Ingredient in the Composition of divers Terms in History, and Poetry. Thus we say, *Landgrave*, *Burggrave*, *Markgrave*, *Pallgrave*, &c. See PALS-GRAVE, &c.

The Word, in this Sense, is form'd of the German *Graef*, signifying *Comes*, Count; and in the Barbarous Latin *Gravio*, *Gravio*.—See COURT.

GRAVE is also used for a Tomb, wherein a Defunct is interr'd. See TOMB, and SEPULCHRE.

GRAVELLO, a Heaviness, or Littlefiness, which accompanies a lessened Transpiration, or taking Cold as it is commonly call'd. Hence also, the Cafe being frequently accompanied with a Ranning of the Nose and Eyes.

The *Gravellos* and *Coryza* are sometimes a sed promiscuously. See CORYZA.

GRAVEL, in Natural History, coarse Sand, found at the Bottom, and the Sides of Rivers. See SAND.

Monf. *Perrault* lays down the Difference between *Sand*, and *Gravel*.—The first, according to him, is small, and consists of fine, even Grains: The latter is bigger, and consists of little Pebbles, mix'd with the finer Fragments of Stones. *Gravel* is chiefly used in laying Yards, Courts, and Walks in Gardens.—

The Word is form'd of the French *Gravier*; which *du Cange* derives from the Barbarous Latin *Graveria*, signifying the same thing.—

GRAVEL, in Medicine, a Disease of the Bladder, and Kidneys, occasion'd by a sandy, or gritty Matter gather'd therein, which cohering into a stony Mass, prevents the due Secretion, and Excretion of the Urine. See URINE.

The *Gravel* is generally consider'd as the same Disease with the Calculus, or Stone. See STONE.

GRAVEL Soil, see SOIL.

GRAVEL Walk, in Gardening.—To lay, or form a Walk with *Gravel*, all the good Soil is to be pared away, below the Roots of any *Grass*, or Woods; then the Place to be fill'd two or three Inches with coarse *Gravel* unscarf'd, laying it highest in the Middle: Then rolling it; a new Stratum of finer *Gravel* to be thrown on, two, or three Inches thick: And the Rolling to be repeated again and again.

Note, the Sides next the Beds should be laid a Foot and an half, or two Foot with Turf from whence the Heat of the Sun cannot be reflect'd as from *Gravel*, to the Prejudice of the neighbouring Flowers.

GRAVELLING, among Farriers, a Disorder incident to Travelling-horses, occasion'd by little *Gravel*-stones getting in between the Hoof and the Shoe, which settling to the Quick, frets, and fetters the Part. ²Ts

'Tis cured by pulling off the Shoe, drawing the Place to the Quick, picking out all the Gravel, and flopping up the Foot with Horse-grease, and Turpentine pour'd in hot.

GRAVER, a Steel Instrument, serving to engrave on Metals. See ENGRAVING.

The *Graver* consists of four Sides, or Faces; and the Point usually terminates in a Lozange. The other End is fitted into a Wooden Handle. See STEEL, TEMPER, &c.

Beside Engravers, the Seal-cutters, Locksmiths, Gunsmiths, Goldsmiths, Armourers, Spurmakers, &c. likewise make use of *Gravers*.

GRAVING, the Art, or Art of cutting Lines, Figures, and other Designs on Metals; more properly called *Engraving*. See ENGRAVING.

GRAVITATION, the Exercise of *Gravity*, or the Pressure a Body exerts on another Body underneath it by the Power of *Gravity*. See GRAVITY.

'Tis one of the Laws of Nature, discover'd by Sir Isaac Newton, and now received by most Philosophers, that every Particle of Matter in Nature *gravitates* towards every other Particle; which Law is the Hinge whereon the whole *Newtonian* Philosophy turns. See *NEWTONIAN Philosophy*.

What we call *Gravitation*, with respect to the *Gravitating* Body, is call'd *Attraction* with respect to the Body *gravitated* to. See ATTRACTION.

The Planets, both primary and secondary, as also the Comets, all *gravitate* toward the Sun, and toward each other; and the Sun toward them; and that in proportion to the Quantity of Matter in each. See PLANET, COMET, SUN, EARTH, MOON, &c.

The Peripateticks, &c. hold that Bodies only *gravitate* when out of their Natural Places; and that *Gravitation* ceases when they are restored to the same; the Intention of Nature being then fulfill'd. The final Cause of this Faculty, they hold, is only to bring Elementary Bodies to their proper Places where they may rest. But the Moderns shew that Bodies exercise *Gravity* even when at rest, and in their proper Places.

This is particularly shewn of Fluids; and it is one of the Laws of Hydrostatics, demonstrated by Mr. Boyle, and others, that Fluids *gravitate in proprio loco*, the upper Parts pressing on the lower, &c. See FLUID.

For the Laws of Gravitation of Bodies in Fluids, specifically lighter or heavier, than themselves; see SPECIFIC GRAVITY.

GRAVITY, in Physics, the natural Tendency, or Inclination of Bodies towards a Centre. See CENTRE.

In this Sense *Gravity* coincides with *Centripetal Force*. See CENTRIFUGAL FORCE.

Gravity is defined by others, more generally, to be the Natural Tendency of one Body towards another; and by other more generally still, the mutual Tendency of each Body, and each Particle of a Body towards all others: In which Sense the Word coincides with what we more usually call *Attraction*. See ATTRACTION.

The Terms *Gravity*, *Centripetal Force*, *Weight*, and *Attraction*, do, in effect, all denote the same thing; only in different Views, and Relations: Which different Relations, however, Authors are apt to confound; and accordingly, the four, are frequently used promiscuously.

In Propriety, when we consider a Body as tending towards the Earth, the Force wherewith it tends we call *Gravity*, Force of *Gravity*, or *Gravitating Force*: The same Force, when we consider it as immediately tending to the Centre of the Earth, we call *Centripetal Force*: The same, when we consider the Earth, or Body toward which it tends, we call *Attraction*, or *Attractive Force*; and when we consider it, in respect of an Obstacle, or a Body in the way of its Tendency, upon which it acts, we call it *Weight*. See WEIGHT, &c.

Philosophers conceive very differently of *Gravity*: Its Nature, Use, Phenomena, Cause, Effects, and Extent have afforded various Speculations in all Ages.

Some consider it as an active Property, or innate *Vis* in Bodies, whereby they endeavour to join their Centre. Others hold *Gravity* in this Sense, to be an occult Quality, and as such to be exploded out of all sound Philosophy. See OCCULT QUALITY.

Sir Is. Newton, tho' he frequently calls it a *Vis*, Power, or Property in Bodies; yet explains himself, that all he intends by the Word, is the Effect, or the Phenomenon. He does not consider the Principle, the Cause whereby Bodies tend downwards, but the Tendency itself, which is no occult Quality, but a sensible Phenomenon, be its Cause what it will, whether a Property essential to Body, as some make it; or superadded to it, as others; or even an Impulse of some Body from without, as others. See *NEWTONIAN Philosophy*.

'Tis a Law of Nature long observ'd, that all Bodies near the Earth, have a *Gravity*, or Tendency towards the Centre of the Earth; which Law, the Moderns, and particularly the immortal Sir Is. Newton, have found, from certain

Observation, to be much more Extensive; and to hold universally with respect to all the known Bodies in Nature. See NATURE.

'Tis now, therefore acknowledg'd a Principle or Law of Nature, that all Bodies, and all the Particles of all Bodies *gravitate towards each other*, mutually: From which single Principle, Sir Is. Newton has happily deduc'd all the great Phenomena of Nature. See *NEWTONIAN Philosophy*.

Hence *Gravity* may be distinguish'd into Particular, and General.

Particular Gravity is that whereby heavy Bodies descend towards the Earth. See EARTH.

Phenomena, or Properties of Particular GRAVITY.

1^o All Circumterrestrial Bodies do hereby tend towards a Point which is either accurately, or very nearly the Centre of Magnitude of the terraqueous Globe. See TERRAQUEOUS GLOBE.

2^o This Point, or Centre is fix'd within the Earth; or at least hath been so ever since we have had any authentick History:

For a Consequence of its shifting, tho' ever so little, would be the overflowing of the low Lands, on that Side of the Globe towards which it approached. Dr. Halley suggests, it would well account for the universal Deluge, to have the Centre of Gravitation removed for a Time towards the Middle of the then inhabited World: For the Change of Place but the 2000th Part of the Radius of our Earth would be sufficient to lay the Tops of the highest Hills under Water. See DELUGE.

3^o In all Places equi-distant from the Centre of the Earth, the Force of *Gravity* is nearly equal.

Indeed all Places of the Earth's Surface are not at equal Distances from the Centre; because the Equatorial Parts are something higher than the Polar Parts: The Difference between the Earth's Diameter and Axis being about 34 English Miles, which hath been proved by the Necessity of making the Pendulum shorter in those Places, before it will swing Seconds. See PENDULUM.

4^o *Gravity* equally affects all Bodies, without regard either to their Bulk, Figure, or Matter: So that abstracting from the Resistance of the Medium, the most compact and loose, the greatest and smallest Bodies would descend equal Spaces in equal Times; as appears from the quick Descent of very light Bodies in the exhausted Receiver. See VACUUM.

Hence, a very great Difference may be observ'd betwixt *Gravity* and Magnetism; the latter affecting only Iron, and that towards its Poles; the former, all Bodies alike, in every Part. See MAGNETISM.

Hence, it follows that *Gravity*, in all Bodies, is proportionable to their Quantity of Matter; so that all Bodies consist of Matters equally heavy. See BODY, MATTER, &c.

Hence also may be concluded that there is no such thing as positive Levity, those Things which appear light, being only comparatively so. See LEVITY.

If several things ascend, and swim in Fluids, it is only because they are not Bulk for Bulk, so heavy as those Fluids; Nor is there any Reason, why Cork, for instance, should be said to be light, because it swims on Water, any more than Iron, because it will swim on Mercury. See SPECIFIC GRAVITY, &c.

5^o This Power increases as we descend, and decreases as we ascend from the Centre of the Earth, and that in the proportion of the Squares of the Distances therefrom reciprocally; so as, for instance, at a double Distance, to have but a Quarter of the Force, &c.

6^o As all Bodies *gravitate* towards the Earth; so, does the Earth equally *gravitate* towards all Bodies, i. e. The Action of *Gravity* is mutual on each Side, and equal. See REACTION.

Hence also the attractive Powers of Bodies, at equal Distances from the Centre, are as the Quantities of Matter in the Bodies.

Hence also the attractive Force of the entire Bodies, consists of the attractive Force of the Parts: For by the adding, or taking away any Part of the Matter of a Body, its *Gravity* is increased, or diminish'd in the Proportion of the Quantity of such Particle to the entire Mass.—

General, or Universal GRAVITY.

The Existence of the same Principle of *Gravity* in the great Regions of the Heavens, as well as on Earth, is easily proved.

That all Motion is naturally rectilinear, is allow'd by all; those Bodies, therefore, which move in Curves, must be retain'd therein by some Power continually acting on them. Hence, the Planets being found to revolve in curvilinear Orbits, we infer that there is some Power, by whose constant Influence, they are prevented from flying off in Tangents.

Again, it is proved by Mathematicians, that all Bodies moving in any Curve Line described in a Plane, and which by Radii drawn to any certain Point, describe Arcs about the Point proportionable to the Times; are impell'd, or acted on by some Power tending to that Point: Now it is shewn by the Astronomers that the Primary Planets, round the Sun; and the Secondary Planets, round the Primary ones, do describe Arcs proportionable to the Times. Consequently, the Power whereby they are retain'd in their Orbits, is directed towards the Bodies placed in the Centres thereof.

Lastly, it is demonstrated, that if several Bodies revolve with an equable Motion in Concentric Circles, and the Squares of their Periodical Times be as the Cubes of the Distances from the Common Centre; the Centripetal Forces of the revolving Bodies, will be reciprocally as the Squares of the Distances. Or, if Bodies revolve in Orbits approaching to Circles, and the Apfides of those Orbits be at rest; the Centripetal Forces of the revolving Bodies, will be reciprocally as the Squares of the Distances.

Now, the Astronomers all agree, that both these Cases obtain in all the Planets: Whence it follows, that the Centripetal Powers of all the Planets are reciprocally as the Squares of the Distances from the Centres of the Orbits.

Upon the whole, it appears, that the Planets are retain'd in their Orbits by some Power which is continually acting on them: That this Power is directed toward the Centre of their Orbits: That the Intensity, or Efficacy of this Power increases upon an Approach toward the Centre, and diminishes at its Recede from the same; and that it increases in the same Proportion as the Distance diminishes; and diminishes in the same as the Distance increases—Now, by comparing this Centripetal Force of the Planets, with the Force of Gravity on Earth, they will be found perfectly alike.

This we shall illustrate in the Case of the Moon, the nearest to us of all the Planets—The Rectilinear Spaces describ'd in any given Time by a falling Body urged by any Powers, reckoning from the Beginning of its Descent, are proportionable to those Powers. Consequently, the Centripetal Force of the Moon revolving in its Orbit, will be to the Force of Gravity on the Surface of the Earth; as the Space which the Moon would describe in falling, any little Time, by her Centripetal Force towards the Earth, had she no circular Motion at all, to the Space, a Body near the Earth would describe in falling by its Gravity towards the same.

Now, by an actual Calculus of those two Spaces, it appears, that the first of them is to the second, *i. e.* the Centripetal Force of the Moon revolving in her Orbit, is to the Force of Gravity on the Surface of the Earth, as the Square of the Earth's Semidiameter, to the Square of the Semidiameter of her Orbit: Which is the same Ratio, as that of the Moon's Centripetal Force in her Orbit, to the same Force near the Surface of the Earth.

The Moon's Centripetal Force, therefore, is equal to the Force of Gravity. These Forces, consequently, are not different, but one and the same: For, were they different, Bodies acted on by the two Powers conjointly, would fall towards the Earth, with a Velocity double to that arising from the sole Power of Gravity.

It is evident, therefore, that the Moon's Centripetal Force, whereby she is retain'd in her Orbit, and prevented from running off in Tangents; is the very Power of Gravity of the Earth, extended thither.

The Moon, therefore, gravitates towards the Earth; and the Earth reciprocally towards the Moon: which is further confirm'd by the Phenomena of the Tides. See TIDES.

The like Reasoning might be applied to the other Planets—For, as the Revolutions of the Primary Planets round the Sun, and those of the Satellites of Jupiter and Saturn round their Primaries, are Phenomena of the same Kind as the Revolution of the Moon round the Earth; as the Centripetal Powers of the Primary are directed towards the Centre of the Sun; and those of the Satellites, towards the Centre of their Primaries; and lastly, as all these Powers are reciprocally as the Squares of the Distances from the Centres: it may safely be concluded that the Power and Cause is the same in all.

Therefore, as the Moon gravitates towards the Earth, and the Earth towards the Moon; so do all the Secondaries to their Primary ones, the Primary to their Secondary ones; so, also, the Primary ones to the Sun, and the Sun to the Primary ones. See PLANET, COMET, SYSTEM, &c.

Phænomena, or Properties of Universal GRAVITY.

1. All the several Particles of all Bodies in Nature gravitate to all the Particles of all other Bodies.

To what has been urged in Proof hereof, from the Analogy between the Motions of the several Bodies in our System; it may be added, that Saturn is actually observed by Astronomers to change its Course when nearest to Jupiter; and Jupiter, also, is found to disturb the Motion of the Sa-

tellices of Saturn. So that the Gravitation of those Bodies is Matter of actual Observation. See JUPITER, SATURN, and SATELLITES; see also DISTURBING Force.

2. The Quantity of this Gravity at equal Distances, is always proportional to the Quantity of Matter in the gravitating Bodies.

For, the Powers of Gravity, are as the Quantities of Motion they generate; which Quantities, in unequal Bodies, equally swift, are to each other as the Quantities of Matter. Consequently, since unequal Bodies, which are equally swift, are to each other as the Quantities of Matter; therefore, in regard unequal Bodies at the same Distance from the attracting Body are found to move equally swift, by Gravity: It is evident, the Forces of Gravity are proportionable to the Quantities of Matter.

3. The Proportion of the Increase, or Decrease of Gravity in the Approach, or Removal of Bodies from each other, is this; that the Force is reciprocally in a Duplicate Ratio; *i. e.* As the Squares of the Distances.

Thus, suppose a Body of an hundred Pounds, at the Distance of ten Diameters from the Earth; the same Body, if its Distance were but half so great, would have quadruple the Weight: If its Distance were but one third of the former, its Weight would be nine times as great, &c.

Hence, we gather the following Corollaries. 1^o That at equal Distances from the Centre of Homogeneous Bodies, the Gravity is directly as the Quantity of Matter, and inversely as the Square of the Diameter. 2^o That on the Surfaces of equal, spherical, and homogeneous Bodies, the Gravities are as the Densities. 3^o That on the Surfaces of spherical, homogeneous, equally dense, but unequal Bodies, the Gravities are inversely as the Squares of the Diameters. 4^o That if both the Densities and Diameters differ, the Gravities on the Surfaces will be in a Ratio compounded of the Densities, and the Diameters. Lastly, that a Body placed any where, within a hollow Sphere, which is homogeneous, and every where of the same Thickness, will have no Gravity, wheresoever it be placed; the opposite Gravities always precisely destroying each other.

For the Particular Laws of the Descent of Bodies, by the Force of Gravity, see DESCENT of Bodies; and CENTRIFUGAL Force.

Cause of GRAVITY.

We have various Theories advanced by the Philosophers of various Ages to account for this Grand Principle of Gravitation. The ancients, who were only acquainted with particular Gravity, or the Tendency of sublunar Bodies towards the Earth, aim'd no further than at a System which should answer the more obvious Phenomena of the same; But the Moderns, as their Principle is higher and more extensive, so should their Theory be.

Aristotle, and the Peripateticks, content themselves to refer Gravity or Weight to a native Inclination in heavy Bodies to be in their proper Place or Sphere, the Centre of the Earth. See SPHERE and ELEMENT.

Copernicus ascribes it to an innate Principle in all Parts of Matter, whereby when separated from their Wholes, they endeavour to return to them again, the nearest way.

But neither of these Systems assigns any Physical Cause of this great Effect: They only amount to this, that Bodies descend, because they descend.—

Gassendus, Kepler, Gilbert, and others ascribe Gravity to a certain Magnetic Attraction of the Earth.

These Authors conceive the Earth to be one great Magnet continually emitting Effluvia, which lay hold on all Bodies, and draw them toward the Earth.—But this, we have observ'd, is inconsistent with the Phenomena. See MAGNETISM.

Des Cartes, and his Followers, Robaut, &c. attribute Gravity to an external Impulse, or Trusion of some subtile Matter. See CARTESIANISM.

By the Rotation of the Earth, say they, all the Parts and Appendages thereof necessarily endeavour to recede from the Centre of Rotation: But they cannot, all, actually recede, as there is no Vacuum or Space to receive them.

If now, we suppose the Earth A B C D, *Tab. Mechanics*, Fig. 8. and L a Terrestrial Body placed in the Pyramidal Space, A E B: It follows, that the Matter in this Pyramid, will have so much less Endeavour to recede from the Centre, as the Body L has a less Endeavour than the fluid Matter whose Place it possesses. Hence it will follow, that the Matter of the adjacent Pyramids receding with more Force; that in the Pyramid A E B, and particularly the Body L will be thereby driven toward the Centre; for the same Reason, as Cork, tho' a heavy Body, ascends in Water.

This Hypothesis, tho' ingenious enough, yet, as it is founded on the Supposition of a Plenum, it is overthrown by what we shall prove of the Existence of a Vacuum.

Dr. Hook inclines to an Opinion much like that of *Zes Cartes*: Gravity, he thinks, deducible from the Action of a most subtle Medium, which easily pervades, and penetrates the most solid Bodies; and which by some Motion it has, detaches all earthly Bodies from it, toward the Centre of the Earth.

Voffen, and many others give partly into the *Cartesian* Notion, and suppose Gravity to arise from the Diurnal Rotation of the Earth round its Axis.

Dr. Halley, despairing of any satisfactory Theory, chuses to have immediate Recourse to the Agency of the Almighty.

So, Dr. Clark, from a View of several Properties of Gravity, concludes, that it is no adventitious Effect of any Motion, or subtle Matter, but an Original, and General Law impress'd by the Almighty on all Matter, and preserv'd therein by some efficient Power penetrating the very solid, and intimate Substance thereof; as being found always proportionable, not to the Surfaces of Bodies or Corpuscles, but to their solid Quantity and Contents.

It should, therefore, says he, be no more enquired, why Bodies gravitate, than how they came to be first put in Motion.—*Annos. in Rohaulti Phys. P. c. 28.*

Dr. S. Gravesande, in his *Introduct. ad Philosoph. Newton.* contends, that the Cause of Gravity is utterly unknown; and that we are to look on it no otherwise than as a Law of Nature, originally and immediately impress'd by the Creator, without any Dependence on any second Law or Cause at all. Of this he thinks, the three following Considerations, sufficient Proof.

1st. That Gravity requires the Presence of the gravitating or attracting Body: So the Satellites of *Jupiter*, e. g. gravitate towards *Jupiter* wherever he be.

2^d. That the Distance being supposed the same, the Velocity wherewith Bodies are moved, by the Force of Gravity, depends on the Quantity of Matter in the attracting Body: And that the Velocity is not changed, let the Mass of the gravitating Body be what it will.

Lastly, That if Gravity do depend on any known Law of Motion, it must be some Impulse from an Extraneous Body; whence, as Gravity is continual, a continual Stroke would be required.

Now, if there be any such Matter continually striking on Bodies, it must be fluid, and subtle enough to penetrate the Substance of all Bodies: But how shall a Body subtle enough to penetrate the Substance of the hardest Bodies, and so rare as not sensibly to hinder the Motion of Bodies, be able to impel vast Bodies towards each other with such Force? How does this Force increase in a Ratio of the Mass of the Body toward which the other Body is moved? whence is it that all Bodies, supposing the same Distance, and the same Body gravitated to, move with the same Velocity? Can a Fluid, which only acts on the Surface, either of the Bodies themselves, or of their internal Particles, communicate such a Quantity of Motion to Bodies, which in all Bodies fall exactly follow the proportion of the Quantity of Matter in them?

Mr. Cotes, goes yet further; giving a View of Sir *Is. Newton's* Philosophy, he asserts that Gravity is to be rank'd among the primary Qualities of all Bodies; and deem'd as essential to Matter, as Extension, Mobility, or Impenetrability. *Prefat. ad Newton. Princip.*

But this Author seems to have overshot the Mark. His great Master, Sir *I. Newton* himself, disclaims the Notion; and to show that he does not take Gravity to be essential to Bodies, gives us his Opinion about the Cause; chusing to propose it by way of Query, as not being yet sufficiently satisfied about it by Experiments.

This Query we shall subjoin at large—After having shewn that there is a Medium in Nature vastly more subtle than Air, by whose Vibrations Light communicates Heat to Bodies, and is itself put into alternate Flux of easy Reflexion and easy Transmission, and Sound propagated; and by the different Densities wherof the Refraction and Reflexion of Light is perform'd. See MEDIUM, HEAT, REFRACTION, &c. He proceeds to enquire,

Is not this Medium much rarer within the dense Bodies of the Sun, Stars, Planets, and Comets, than in the empty celestial Spaces between them? And in passing from them to great Distances, doth it not grow denser and denser perpetually, and thereby cause the Gravity of those great Bodies towards one another, and of their Parts towards the Bodies; every Body endeavouring to go from the denser Parts of the Medium towards the rarer?

For if this Medium be supposed rarer within the Sun's Body than at its Surface, and rarer there than at the hundredth Part of an Inch from its Body, and rarer than at the fiftieth Part of an Inch from its Body, and rarer there than at the Orb of Saturn; I see no Reason why the increase of Density should stop any where, and not rather be continued thro' all Distances from the Sun to Saturn, and beyond.

And tho' this Increase of Density may at great Distances be exceeding slow, yet if the Elastic Force of this Medium be exceeding great, it may suffice to impel Bodies from the denser Parts of the Medium towards the rarer with all that Power which we call Gravity.

And that the Elastic Force of this Medium is exceeding great, may be gather'd from the Swiftness of its Vibrations. Sounds move about 1140 English Feet in a second Minute of Time, and in seven or eight Minutes of Time they move about one hundred English Miles: Light moves from the Sun to us in about seven, or eight Minutes of Time, which Distance is about 70000000 English Miles, supposing the Horizontal Parallax of the Sun to be about 12; and the Vibrations or Pulses of this Medium, that they may cause the alternate Fits of easy Transmission, and easy Reflexion, must be swifter than Light, and consequently, above 700000 swifter than Sounds; and therefore the Elastic Force of this Medium, in Proportion to its Density, must be above 700000 x 700000 (that is above 490000000000) times greater than the Elastic Force of the Air, is in Proportion to its Density: For the Velocities of the Pulses of Elastic Mediums, are in a subduplicate Ratio of the Elasticities and the Rareities of the Mediums taken together.

As Magnetism is stronger in small Lossitudes than in great ones, in proportion to their Bulk; and Gravity is stronger in the Surface of small Planets, than in those of great ones, in proportion to their Bulk; and small Bodies are agitated much more by Electric Attraction, than great ones: So the Smallness of the Rays of Light, may contribute very much to the Power of the Agent by which they are refracted. And if any one should suppose that Aether (like our Air) may contain Particles which endeavour to recede from one another (for I do not know what this Aether is) and that its Particles are exceedingly smaller than those of Air, or even than those of Light; the exceeding Smallness of such Particles may contribute to the Greatness of the Force by which they recede from one another, and thereby make that Medium exceedingly more rare and elastic than Air, and of consequence exceedingly less able to resist the Motions of Projectiles, and exceedingly more able to press upon gross Bodies, by endeavouring to expend it self. *Opticks*, p. 325, &c. See LIGHT, ELASTICITY, &c.

GRAVITY in *Mechanicks*, is the Conatus, or Tendency of Bodies toward the Centre of the Earth. See CENTRE.

That part of *Mechanicks* which considers the Motion of Bodies arising from Gravity, is peculiarly called *Statics*. See STATICS.

GRAVITY is distinguish'd into *Absolute* and *Relative*. *Absolute* GRAVITY, is that wherewith a Body descends freely thro' another resisting Medium. See RESISTANCE.

The *Laws of Absolute* GRAVITY, see under the Article DESCENT of Bodies.

Relative GRAVITY, is that wherewith a Body descends after having spent part of its Weight in overcoming some Resistance. See RESISTANCE.

Such is that wherewith a Body descends along an inclined Plane, where some part is employ'd in overcoming the Resistance, or Friction of the Plane. See FRICTION.

The *Laws of Relative* GRAVITY; see under the Article *Inclined* PLANE.

Centre of GRAVITY, Diameter of GRAVITY, Plane of GRAVITY, } See CENTRE of Gravity, DIAMETER of Gravity, PLANE of Gravity.

GRAVITY in *Hydrostatics*—the Laws of Bodies gravitating in Fluids, make the Business of *Hydrostatics*. See HYDROSTATICS.

GRAVITY is here divided into *Absolute* and *Specific*. *Absolute* or *true* GRAVITY, is the whole Force wherewith the Body tends downward. See GRAVITATION.

Specific GRAVITY, call'd also *Relative*, *Comparative*, and *Apparent* GRAVITY, is the Excess of Gravity in any Body, above that of an equal Quantity or Bulk of another.

For the *Laws of Specific* GRAVITY: with the Methods of determining it both in Solids and Fluids. See SPECIFIC Gravity, and HYDROSTATICAL Balance.

GRAVITY of the Air. See WEIGHT of the Air. See also AIR and PRESSURE.

GRAVITY, in *Music*, an Affection of Sound, whereby it becomes denominated *grave*, *low*, or *flat*. See SOUND.

Gravity stands in Opposition to *Acuteness*, which is that Affection of Sound, whereby it is denominated *Acute*, Sharp, or high. See ACUTENESS.

The Relation of Gravity, and Acuteness, is the principal thing concern'd in Music; the Distinctness, and Determinateness of which Relation, gives Sound the Denomination of *Harmonical*, or *Musical*. See MUSIC and HARMONY.

The Degrees of Gravity, &c. depend on the Nature of the Sonorous Body itself, and the particular Figure and Quantity thereof: Tho, in some Cases, they likewise depend on the Part of the Body where it is struck. Thus, *e. gr.* the Sounds of two Bells of different Metals, and the same Shape and Dimensions, being struck in the same Place, will differ as to Acuteness and Gravity; and two Bells of the same Metal will differ in Acuteness, if they differ in Shape or Magnitude, or be struck in different Parts. See BELL.

So in Chords, all other things being equal, if they differ either in Matter, or Dimensions, or Tension; they will also differ in Gravity. See CHORD.

Thus again, the Sound of a Piece of Gold is much graver than that of a Piece of Silver of the same Shape and Dimensions; and in this Case, the Tones are, *ceteris paribus*, proportional to the Specific Gravities; so a solid Sphere of Brass, two Foot diameter, will sound graver than another of one Foot diameter; and here the Tones are proportional to the Quantities of Matter, or the Absolute Weights.

But it must be observed, that Acuteness and Gravity, as also Loudness and Lowness, are but relative Things. We commonly call a Sound acute and loud, in respect to another which is grave, or low with respect to the former: So that the same Sound may be both grave and acute, and also loud and low, in different Comparisons.

The Degrees of Acuteness, and Gravity, make the different Tones, or Tunes of a Voice, or Sound: So we say one Sound is in Tune with another, when they are in the same Degree of Gravity. See TUNE.

The immediate Cause, or Means of this Diversity of Tones lies deep. The modern Musicians fix it on the different Velocity of the Vibrations of the Sonorous Body: In which Sense Gravity may be defined, a relative Property of Sound, which, with respect to some other, is the Effect of a lesser Number of Vibrations accomplish'd in the same Time, or of Vibrations of a longer Duration: In which Sense also, Acuteness is the Effect of a greater Number of Vibrations, or Vibrations of a shorter Duration.

If two, or more Sounds be compared in the Relation of Gravity, &c. they are either Equal, or Unequal, in the Degree of Tune.

Such as are equal, are call'd Unisons. See UNISON.

The Unequal including, as it were, at a Distance between each other, constitute which we call an Interval in Music, which is properly the Difference in Point of Gravity, between the two Sounds. See INTERVAL.

Upon this Unequality, or Difference, does the whole Effect depend; and in respect herof, these Intervals are divided into *Concords* and *Discords*. See CONCORD and DISCORD. See also SCALE.

GRAVY, in Cookery, &c. the Juice of Flesh or Fish, obtained therefrom by Coction, Election, Frixion, or the like. See JUICE.

The procuring of Gravies is no inconsiderable part of Cookery, inasmuch as these are required to heighten the Gusto, and Relish of most Dishes. There are divers Processes of Beef Gravy; one of the shortest and simplest, is to cut a Pound or two of lean Beef-Stakes into Slices, beat 'em well, fry them till brown, and then add a Pint of strong Broth, and an Onion; letting the whole boil a little, and then straining it for Use.

To make Mutton Gravy, they roast a Shoulder of Mutton a little more than half, cut it with a Knife, squeeze out the Gravy with a Press; then moisten the Meat again with Broth, and press it a second time: Add a little Salt, and keep it for Use.

Veal Gravy is chiefly had by cutting Steaks off a Fiellet, beating them, and stewing them with sliced Onions, Carrots, and Parsnips; and at last adding strong Broth, Parsley, &c. letting them stew afresh, and straining them for Use.

To make Fish Gravy, Carps and Tenches are slit lengthways, and stewed with Butter, Onions, Carrots, &c. till brown; then a little Flower put in, and stew'd till brown. Lastly, Some Fish-Broth is strained thro' a Cloth, and the whole season'd with Salt, Lemon, Cloves, and savoury Herbs.

GRAY, a mix'd Colour, partaking of the two Extremes Black and White. See BLACK, WHITE, &c.

In the Manage they make several Sorts of Grays, as the *Branded* or *blacken'd Gray*, which has Spots quite black, dispersed here and there. The *dappled Gray*, which has Spots of a darker Colour than the rest of the Body. The *light or silver Gray*, wherein there is but a small Mixture of black Hairs. The *fad* or *powder'd Gray*, which has but a small Mixture of white: And the *brownish* or *sandy-colour'd Gray*, where there are *bay-colour'd* Hairs mix'd with the Black. See HORSE.

GREASE. See FAT.

GREASE, among Farriers, &c. a Swelling and Gourdness of the Legs of a Horse, generally happening after a Journey.

If the *Grease* be an Attendant of some other Disease, it

will be in vain to attempt the Cure before the Disease be removed that is the original Cause of it: And therefore, if it be a Hæctick, the *Wounds*, or the *Farcin*, &c. the Directions given for those Diseases are to be followed, and in the mean Time proper Applications to be us'd outwardly for the *Grease*.

If the *Grease* proceeds from common and ordinary Accidents, and the Horse has no other Distemper upon him; then, Applications that are peculiar to that Distemper are to be followed: If the Horse has been well fed and pamper'd, begin the Cure with Bleeding and Purgings, so as to diminish the Redundance of the Humours; but these ought to be us'd with Moderation, and it may be better to effect it with spare Diet and daily Labour.

After moderate Evacuations, it may be proper to make a Rowel on the Inside of the Thigh, or on the Belly; and to keep it open for a Month, or longer, as there shall be occasion; and in the mean time to give the Horse the Cinabar or Antimonial Balls. See ROWEL.

GREAT, a Term of Comparison, denoting a thing to have more Extension than some other to which it is refer'd. See COMPARISON.

Thus we say a *great Space*: A *great Distance*: A *great Figure*, a *great Body*, &c. See GRAND.

The Term is likewise us'd figuratively, and in Matters of Morality, &c. to signify Ample, Noble, Elevated, Extraordinary, Important, &c.

Thus we say, *Shakspear* was a *great Genius*: *Quæci Elizabeth* had a *great Soul*: *Cromwell* was a Man of *great Designs*: *Da Vinci*, a *great Painter*: *Galileo* a *great Philosopher*: *Besse* a *great Critick*, &c.

GREAT is also a Title or Quality ascribed to certain Princes, and other illustrious Personages. See TITLE and QUALITY.

Thus we say the *great Turk*: The *great Mogul*: The *great Chæm of Tartary*: The *great Duke of Florence*, &c. See MOGUL, CHAM, &c.

GREAT is also a Surname bestowed on several Kings and Emperors. See SURNAME.

Thus we say *Alexander the Great*: *Cyrus the Great*: *Charles the Great*, or *Charlemaign*: *Henry the Great of France*, &c. So the English frequently say, *Edward the Great*, or the *Great Edward*; *William the Great*, meaning King *William III.* or the *Great William*. And the French, *Louis the Great*, *le Grand*, speaking of the late *Louis XIV.*

Gyles of Paris, says *Charlemaign* first got the Surname *Great* from the Tallness and Eminence of his Stature. *Helgan* adds that *Hugue*, *Hugh* the *Great of France* was thus denominat on account of his great Piety, Goodness, &c.

GREAT is also applied to several Officers, who have Preeminence over others. See GRAND.

Thus we say, the Lord *Great Chamberlain*: The *Great Marshal of Poland*, &c. See CHAMBERLAIN, &c.

GREAT Circles of the Sphere, are particularly such as divide the Sphere into two equal Parts or Hemispheres; or whose Planes pass thro' the Centre of the Sphere: In Contradistinction from the *lesser Circles*, which cut the Sphere into unequal Parts, &c. See CIRCLE, SPHERE, CIRCLE, LESSER, &c.

The Equator, Meridian, Ecliptic, Vertical, &c. are *great* or *greater Circles* of the Sphere; and the *Parallels*, *Tropicks*, &c. *lesser Circles*. See EQUATOR, MERIDIAN, &c.

GREAT <i>Tithes</i> ,	} 000	TITH,
GREAT <i>Gm</i> ,		CANON,
GREAT <i>Letters</i> ,		CAPITAL;
GREAT <i>Bear</i> ,		URSA major.

GREE, in our Law-Books, from the French *Gre*; *i. e.* *Will*, *Allowance*, or *liking*; signifies Agreement, Contentment, or Good-liking.—Thus to make *Gre* to the Parties, is to satisfy them for an Offence done. 'Judgement shall be put in Suspence, till the *Gre* be made to the King of his Debt, *Stat. 25. Edw. 3.* See AGREEMENT.

GREEK, GRECIAN, something belonging to the People of Greece.

GREEK, absolutely so called, or *Greek Language*, or *antient GREEK*, is the Language spoke by the antient Greeks, and still preserv'd in the Works of their Authors, as *Plato*, *Aristotle*, *Isocrates*, *Demosthenes*, *Thucydides*, *Xenophon*, *Homer*, *Hesiod*, *Sophocles*, *Euripides*, &c. See LANGUAGE.

The *Greek* has been preserv'd entire longer than any other Language known, maugre all the Revolutions that have happened in the Country where it was spoke. See ENGLISH.

Yet, from the Time of the Removal of the Seat of Empire to *Constantinople*, in the 13th Century, it has been gradually altering: The Alterations at first did not consist in the Analogy of the Tongue, the Construction, Inflections, &c. There were only new Words, new Riches acquired, by taking in the Names of new Dignities and Offices, and the Terms of Art

Art it was before unacquainted with: But, at length, the Incursions of the Barbarians, and especially the Invasion of the *Turks*, wrought much more considerable Alterations. See *Moderns GREEN*.

The *Greek* has a great Copia or Stock of Words: Its Inflections are so remarkable for their Variety, as those of most of the other European Tongues, for their Simplicity. See *INFLXION*.

It has three Numbers, Singular, Dual, and Plural. See *NUMBERS*; and abundance of Tenses in its Verbs, which makes a Variety in Discourse, prevents a certain Driness which always accompanies a too great Uniformity, and renders the Language peculiarly fit for all Kinds of Verse. See *TENSE*, &c.

The Use of the Participles of the Aorist, and Preterit, together with the compound Words, wherein it abounds; give it a peculiar Force and Brevity, without taking any thing from its Perspicuity.

The proper Names, in the *Greek* Language, are significative, as in the Oriental, as well as in most of the modern Languages, where the Learned still find some, tho' remote, Character of their Origin. See *NAME*.

The *Greek* was the Language of a polite People, who had a Taste for Arts and Sciences, which they cultivated with Success. In the living Tongues, are still preserved a vast Number of *Greek* Terms of Arts: Some descended to us from the *Greeks*, and others form'd a-new. When a new Invention, Machine, Rite, Order, Instrument, &c. has been discovered, Recourse has commonly been had to the *Greek* for a Name; The Facility wherewith Words are there compounded, readily affording as Names expressive of the Use, Effect, &c. of such Instruments. Hence *Areometer*, *Thermometer*, *Barometer*, *Micrometer*, *Logarithm*, *Telescope*, *Microscope*, *Lexodromy*, &c.

Modern or Vulgar GREEN, is the Language now spok'd in *Greece*.

There have been few Books writ in this Language, from the taking of *Constantinople* by the *Turks*; scarce any thing but some Catechisms, and the like Pieces, compos'd or translated into the *Vulgar Greek*, by the *Latin* Missionaries.

The native *Greeks* are contented to speak the Language without cultivating it. The Misery they are reduced to under the Dominion of the *Turks*, renders them ignorant, of necessity; the Turkish Politicks not allowing any of the Subjects of their Estates, to apply themselves to the Arts and Sciences.

Whether it be out of a Principle of Religion, or Politicks, or Barbarism, they have indolently destroy'd all the Monuments of ancient *Rome*; despising the Study of a Language which might have render'd them polite, their Empire happy and flourishing, and have made the People forget their former Masters, and their ancient Liberty.

In this, widely different from the *Romans*, those ancient Conquerors of *Greece*, who after they had subdued the Country, applied themselves to learn the Language; in order to imbibe their Politicness, Delicacy, and Taste for Arts and Sciences.

'Tis not easy to assign the precise Difference between the vulgar, and the ancient *Greek*: It consists in the Terminations of Nouns, Pronouns, Verbs, and other Parts of Speech, which make a Difference between those two Languages much like that observed between some of the Dialects of the *Italian* or *Spanish*: We instance in those Languages, as being the most known, but we ought to have said the same of the *Hebrew*, *Sclavonic*, &c. Dialects.

Beside, the modern *Greeks* have divers new Words not in the ancient; particularly several Particles which appear as Expletives, and which were introduced to characterize certain Tenses of Verbs, and certain Distions, which would have the same Meaning without such Particles, had Custom dispensed with them; Divers Names of Dignities and Offices, unknown to the ancient *Greeks*; and abundance of Words borrowed from the vulgar Tongues of the neighbouring Nations.

Accordingly, one may distinguish three Ages of the *Greek* Tongue: The first ends at the Time when *Constantinople* became the Capital of the *Roman* Empire; Not but there were several Books, especially of the Fathers of the Church, writ with great Purity after that Time; but, as Religion, Law, and Policy, both civil and military, began then to introduce new Words into the Language, it seems necessary to begin the second Age of the *Greek* Tongue from that Epoch; which lasted to the taking of *Constantinople* by the *Turks*, where the last Age commences.

GREEN Wine. See *WINE*.

GREEN Orders in Architecture, are the *Doric*, *Ionic*, and *Corinthian*; in Contra-distinction to the two *Latin* Orders, the *Tuscan* and *Composite*. See *ORDER*; see also *DORIC*, *IONIC*, and *CORINTHIAN*.

GREEN Rite, or *RITUAL*, is distinguished from the *Latin*. See *RITE* and *RITUAL*.

GREEN Church, is that part of the Christian Church which is established in *Greece*; extending likewise to some other Parts of *Turky*. See *CHURCH*.

It is thus call'd in *Europe*, *Asia*, and *Africa*, in Contra-distinction from the *Latin*, or *Romish* Church; as also the *Eastern* Church, in Distinction from the *Western*. See *LATIN*.

The Romanists call the *Greek Church*, the *Greek Sobisja*, because the *Greeks* don't allow the Authority of the Pope, but depend wholly, as to Matters of Religion, on their own Patriarchs. They have treated them as Schismatics, ever since the Revolt, as they call it, of the Patriarch *Photius*. See *PATRIARCH*.

The Learned are divided as to the peculiar Doctrines and Sentiments of the *Greek Church*. 'Tis certain many Errors are usually charged on them, which they are free of. The Point has been warmly contested between *Caucus* Archbishop of *Corfu*, and the *Seur de Mont*, on the one Side; and *Lucas Hoffarius*, and *Leo Allatus*, a *Greek*, on the other; the two first accusing, the last excusing them. *Caucus*, &c. will have them agree with the Protestants, in rejecting abundance of the Rules and Observances establish'd in the *Romish* Church; while *Allatus*, &c. endeavours to find the same Observances among the *Greeks*, as among the *Latins*, only under other Forms, and with other Circumstances.

Of the Seven *Latin* Sacraments, says *Caucus*, the *Greeks* only admit five: Confirmation and Extreme Unction, they set aside. *Allatus*, on the contrary, insists, that they don't properly set them aside, but only differ as to the manner of administering them. Instead of conferring long after Baptism, they always join Baptism and Confirmation together: Beside that Confirmation, among them, is confer'd by the ordinary Priests. The like Error is charged on *Caucus*, with regard to Extreme Unction. See *SACRAMENT* and *EXTREME UNCTION*.

But it is to be here added, that from the Answer of *Jeremy*, Patriarch of *Constantinople*, to the Divines of *Wirttemberg*, it appears, that the *Greeks*, like the Reformed, do really own no more than two Sacraments instituted by Christ, viz. Baptism and the Eucharist. See *EUCCHARIST*, &c.

The *Greeks*, says the same *Caucus*, offer no Worship to the Eucharist: *Allatus* replies, it is true, they don't adore it, as the Romanists do, immediately after the speaking those Words, *This is my Body*: Yet do they really adore it after the Words wherein Consecration consists, viz. after the Prayer call'd *The Invocation of the Holy Spirit*. See *ADORATION*.

As to Confession, *Caucus* is certainly in the right, that they don't hold it of divine Appointment, but only of positive, or ecclesiastical Right; which they likewise affirm of all the other Sacraments, except the two above-mentioned: yet have they the Use of Auricular Confession. See *CONFESSION*.

As to Marriage, *Caucus* is just to them, in saying, that they do not esteem it an indissoluble Band; they maintain with great Zeal, the Necessity and Validity of Divorce. See *DIVORCE*.

As to the Primacy of the Pope, *Caucus* does them Justice in saying they deny it. 'Tis certain the *Greeks*, *Melchites*, and other Orientals, do not allow the Primacy of the Pope over the other Patriarchs, in the Sense it is allowed of among the *Latins*. See *POPE*, *PRIMACY*, &c.

Nor do they allow of more than Seven General Councils. All those held by the *Latins* since *Photius*, they set aside. See *COUNCIL*.

GREEN Grammar, }
GREEN Testament, } see } *GRAMMAR*,
GREEN Lexicon, } } *BIBLE*,
} } *LEXICON*, &c.

GREEN, one of the original Colours of the Rays of Light. See *COLOUR*, *RAY*, and *LIGHT*.

If Urine, Citron-Juice, or Spirit of Vitriol, be cast on a *green* Ribbon, it becomes blew; by reason the yellow of the Greening-wick is thereby exhald and consum'd, so that nothing but blue remains behind. See *BLUE*, &c.

Grass and Herbs, and even all Vegetables in Places exposed to the open Air, are *Green*; and those in subterraneous Places, or Places inaccessible to the Air, White and Yellow. Thus when Wheat, or the like, germinates under Ground, 'tis White or Yellow; and what is in the open Air, *Green*: Tho' this too is Yellow before it be *Green*.

Artificial Greens are rarely simple Colours, but produced by the Mixture of Yellow and Blue. See *BLUE* and *YELLOW*.

Two Powders, the one Blue, and the other Yellow, well mixed, appear perfectly *Green*; tho' when viewed with a Microscope, we observe a Chequer of Blue and Yellow.

The Dyers make divers Shades, or Casts of *Green*, as *Light-Green*, *Yellow-Green*, *Grass-Green*, *Lawel-Green*, *Sea-Green*, *Dark-Green*, *Parrot-Green*, and *Celadon-Green*.

All the *Greens* are first dy'd in Blue, then taken down with Wood, Verdigrise, &c. and then *green'd* with the Weed, there

here being no one Ingredient that will give *Green* alone.

Mountain-Green, or *Hungary-Green*, is a sort of greenish Powder found in little Grains, like Sand, among the Mountains of *Kernausfut* in *Hungary*, and those of *Maldavia*.

The' some hold that this *Mountain-Green* is salitious, and the same with what the Ancients called *Flos Aeris*, prepared by casting Water, or rather Wine, on Copper red-hot from the Furnace, and catching the Fumes thereof on Copper-Plates laid over for the Purpose; or by dissolving Copper-Plates in Wine, much as in making *Verdegrease*. The Painters make use of this Colour for a *Grass-Green*. It is sometimes counterfeited, by grinding *Verdegrease* with *Cerule*.

Earth GREEN. See VERDITER.

Calcined GREEN, and *DiBilled GREEN*. See VERDEGREASE.

GREEN COPPERAS. See COPPERAS.

GREEN Fish. See FISH.

GREEN Glass. See GLASS.

GREEN Cap. See CAP.

GREEN Hide, is that not yet curried, but such as taken off from the Carcase. See HIDE, LEATHER, and CURRYING.

GREEN Cloth, a Board, or Court, of Justice, hold in the Compting-House of the King's Household, for the taking Cognizance of all Matters of Government and Justice within the King's Court Royal; and for correcting all the Servants therein, that shall in any way offend. See HOUSEHOLD, and COMPTING-HOUSE.

To this Court also belongs the Authority of maintaining the Peace for twelve Miles round the King's Court, wherever it shall be, excepting at *London*. See PEACE and PAX.

The Judge of this Court, is the Lord Steward, assisted by the Treasurer, Comptroller, Cofferer, Clerks of the *Green Cloth*, &c. See STEWARD; see also VERGE.

It takes its Name *Green-Cloth*, from a *Green-Cloth* spread over the Board where they sit, whereon are the Arms of the Compting-House.

Clerks of the *Green-Cloth*, are two Officers of the Board of *Green-Cloth*, who attend there, and have Business assign'd them by the Board. All Bills of Comptrolments relating to the Office, are sum'd up, and allowed by the Clerks Comptrollers, and audited by the Clerks of the *Green-Cloth*.

They also appoint the King's, Queen's, and Household's Dice, keep all Records, Leijgers, and Papers relating thereto; make up Bills, Parcels, and Debentures for Salaries, &c. And Provisions and Necessaries for the Offices of the Pantry, Buttery, Cellar, &c.

GREEN-House, or *Conservatory*; a House, or Building, in a Garden; contriv'd for preserving of the more tender and curious Exotic Plants, which will not bear the Winter's Cold abroad in our Climate. See EXOTIC.

Green-Houses, as now built, serve not only as *Conservatories*, but likewise as Ornaments of Gardens; being usually large and beautiful Structures, in Form of Galleries, where in the Plants are handsomely ranged in Cases for the purpose. See GARDEN.

The *Green-House*, Mr. *Mortimer* directs to be open to the South, or very little declining therefrom: The Height and Breadth to be about 11 Foot, and Length according to the Number of Plants intended to be kept therein. It should be situate on the driest Ground, and so contriv'd, as that nothing may obstruct the Sun's Rays in Winter. In the building it, Care must be taken, not to plaster it on the Inside with Lime and Hair; Dampness being observed to continue longer on such Plaster, than on Bricks or Wainscote. To preserve it the more from Moisture and Colds, an artificial Heat is to be used: In order to this, some hang up Fires, and others place Pans of Coals in Holes in the Ground. The better way is, to have a Stove behind the *Green-House*, and to convey the Heat thereof thro' Trills made under the Floor for that Purpose. The best Method of all, according to *Bradley*, is the new Stove invented by M. *Goussier*, and published in *English* by Dr. *Fogolieri*. See FIRE.

Some have Sashes, Casements, and Doors of Glass; others prefer moveable Canvas Doors, to be taken off, and put on at pleasure.

The Pots and Cases are to be ranged in the *Green-House* so, as not to incommode one another, or hinder any from readily receiving both Sun, Air, &c. As to the Management of the Plants herein, *Mortimer* recommends the opening of the Mould about them, from time to time, and sprinkling a little fresh Mould in them, and a little warm Dung on that; as also to water them when the Leaves begin to wither and curl, and not often, which would make them sive and be sickly; and to take off such Leaves as wither and grow dry.

Bradley advises, that in the colder Parts of *England*, the Front of the *Green-House* be built in a Sweep, or Semicir-

cle, to receive the Sun's Rays, one part or other of it, all Day: That all the Windows, &c. in the Front, have close, thick, wooden Shutters, to be shut every Night in Winter, for fear of Frosts, Nipping Winds, &c.—*Dutch* Tiles he thinks the best Lining for the Walls, as being dry, and reflecting a deal of Heat; and square Tiles for the Pavement, which readily imbibe the Wet, and never wear, as Marble and the harder Stones do.—The Plants in the *Green-House* are not to fill above a $\frac{1}{2}$ Part of the Space thereof; the rest being left vacant for the Air to circulate about the Plants. If the *Houses* be crowded with Plants, the Effluvia they are continually emitting by Perspiration, and the Vapours from the Mould, will condense the Air, and cause Dampness. The Plants to be disposed, as much as possible, about the middle Parts of the *Green-House*, where they will be safer from the Cold, which is usually greatest near the Glasses and Walls: The tenderest Plants to be disposed nearest to where the Heat comes in.

'Tis a general Rule among Gardeners, to set Exotic Plants into the *Green-House*, about the second Week in *September*, and to take them out again about the middle of *May*; tho' there should be some Distinction made herein; the tenderest Sorts from Places near the Line, as the *Aloes*, &c. being to be confined more to the *Green-House*, than *Oranges*, *Myrtles*, &c.

GREEN PLOTS, *Walks*, &c. See GRASS PLOTS, &c.

GREENLAND FISHERY. See WHALE FISHERY.

GREENWICH HOSPITAL. See HOSPITAL.

GREGORIAN Calendar, is that which shows the new and full Moon, with the Time of *Easter*, and the movable Feasts depending thereon, by Means of Epochs disposed thro' the several Months of the *Gregorian* Year. See CALENDAR, EASTER, &c.

The *Gregorian Calendar*, therefore, differs from the *Julian*, both in the Form of the Year; and in that it uses Epochs, instead of Golden Numbers. See EPOCH, and GOLDEN NUMBER.

This Reformation of the Calendar, was made in 1582, by Order of Pope *Gregory XIII.* and with the Advice of *Aloysius Lilius*, and other Mathematicians: At the same Time, ten Days were cut off from that Year, and cast away, to bring the Equinoxes to their ancient Seat, viz. the 21st of *March*. And to keep them constantly there, the same Pope introduced the *Gregorian* Year. See the Article following.

GREGORIAN Year, is the *Julian* Year corrected, or modelld, in such manner, as that the three secular Years, which in the *Julian* Account are Bissextile, are here common Years, and only every fourth secular Year, a Bissextile Year. See BISSEXTILE.

The *Gregorian* Year, tho' it comes nearer to Nature and Truth, than the *Julian*'s, is not strictly just: In 400 Years it gets 1 Hour 20; and consequently in 7200, a whole Day. See YEAR.

The *Gregorian* Year, is that now used in most Countries of *Europe*; *England*, most of the *United Provinces*, *Sweden*, and *Denmark*, excepted; where the *Julian* Year still obtains. See JULIAN Year.

From this Difference, arises the Distinction of *Old* or *Julian*, and *New* or *Gregorian* Style. See STYLE.

The *Old Style* is now 11 Days behind the *New*: So that the same Day which in the *Gregorian* Account is the 11th Day of any Month, in the *Julian* is only the 1st.

GREGORIAN Epochs, is the Epoch, or Time whence the *Gregorian* Calendar, or Computation, took Place. See EPOCH.

The present Year 1726, is the 144th Year of the *Gregorian* Epoch.

GREENADA, }

GRANATE,
GRANADIER.

GRESHAM-College. See COLLEGE.

GREVE, among our ancient Writers, is a Denomination of Power and Authority; signifying as much as a *Census*, or *Viccomes*; and hence our *Slyzeve*, *Portgreve*, &c. See PORTGREVE, &c.

According to *Hotelden*, *Greve dicitur, ides quod jure delevit Crith, i. e. pacem ex illis facere, qui Patria infernus est, i. e. miseriam vel malum*.

Hence, but with less Power and Dignity, is derived the Word *Reve*, a Bailiff, or Under-Officer of the Lord of a Manor. See REVE.

GRIFFON, *Gryffulus*, 2404, in *Natural History*, a Bird of Prey, of the Eagle Kind. See EAGLE.

The Antients speak fabulosity of the *Griffon*; they represent it with four Legs, Wings, and a Beak; the upper Part representing an Eagle, and the lower a Lion: They supposed it to watch over Gold Mines, hidden Treasures, &c. The Animal was consecrated to the Sun; and the ancient Painters represented the Chariot of the Sun as drawn by *Griffons*. M. *Spanheim* observes the same of those of *Jupiter* and *Nemesis*.

We find mention of the *Griffon* in Holy Scripture; but are not to understand the Text of that chimerical Animal just described, which no Body ever saw but in Painting and Armories, notwithstanding what *Serrius*, in his Comment on the 8th Eclogue of *Virgil* and *Idore*, say of it.—The *Griffon* in Scripture, is that Species of Eagle, called in Latin *Offifraga*, and in Hebrew פֶּרֶס, *Peres*, of the Verb פֶּרַס, *Peres*, to break.

God prohibited the *Jews* to eat divers Kinds of Birds of Prey, as the *Kite*, *Vulture*, &c. And the divers Species of Eagles, which are distinguished in Latin by the Names of *Aquila*, *Gryps*, *Habennus*.—*Panfanus*, in *Arcaidius*, says the *Griffon* has his Skin spotted like a Leopard.

The *Griffon*, we mean the fabulous one, is frequently seen on ancient Medals; and is still bore in Coat-Armour. Or, a *Griffon Rampant*, with Wings display'd, Sable, is born by the Family of *Morgan* in *Monmouthshire*, &c. *Gul-lam* blazons it *Rampant*; alledging that any very fierce Animal may be so blazoned, as well as a *Lion*.

Sytleter, *Morgan*, and others, use the Term *Segreiant* instead of *Rampant*. See *RAMPANT* and *SEGREIANT*. **GRILLADE**, in Cookery, a Dish of Meat broiled on the Grid-Iron; thus called from the *French* *Griller*, to broil.

The Word is also used for the browning of any Dish, by rubbing a hot Iron over it.

To *Grill Oysters*, is to put them into Scollop Shells, season them with Salt, Pepper, and Parsley shred, and pour their own Liqueur to them; covering them with grated Bread; stewing them half an Hour on the Fire, and browning them with a red-hot Iron.

Shrimps are *grill'd* after the same Manner.

GRINDING, *Trituration*, the Act of breaking, or comminuting a solid Body, and reducing it into a Powder, Dust, Flower, Farina, or the like; particularly, by means of a Mill. See *MILL*.

Grinding is one of the Species of Dissolving. See *DISSOLUTION*.

The Painters Colours are ground on a Marble, or Porphyry, either with Oil or Gum Water; see *PAINTING* and *COLOUR*.

Some late Physicians have contended, that Digestion is perform'd by *grinding* the Food in the Stomach: Some even maintain that every Part in the Body, is a Vessel or Vessels; that all the Vessels have a Motion of Syctole and Diastole; and that all the Operations of the Body consist in the Attrition or *grinding* of the Humours or Matters contained in such Vessels. See *DIGESTION* and *TRITURATION*.

GRINDING is also used for the rubbing or wearing off, the irregular or otherwise redundant Parts of the Surface of a Body, and of reducing it to the destined Figure, whether that be flat, concave, or the like. See *FIGURE*.

The *grinding of Glasses* is a considerable Art, and as such, necessarily requires to be here insisted on; especially that of Optic Glasses. See *GLASS*, *OPTIC GLASS*, &c.

Method of GRINDING Optic Glasses.

For Convex-Glasses, the first Step is to provide a Dish or Basin, within whose Cavity the Glass is to be form'd.

In order to this, they take a piece of Brass, Copper, Iron, or Wood, and form it into a Segment of a Circle, with the Radius of the Basin or Dish intended. This done, a Basin is made by a Smith, either of Iron or Copper; having its Cavity exactly fitting or corresponding to the Segment above mentioned: tho' sometimes they chuse to have the Basin cast; in which Case, the Rules above delivered for concave Mirrors, are to be here observed. See *MIRROR*.

The Figure of the Basin thus roughly formed, is to be finished in the Pewterers Lathe; or on a Stone Mould A. *Tab. Miscellaneous*, Fig. 12. fixed to an Iron Axis, with a Pinion B C, moveable by a Wheel D E, and that by a Winch or Handle F. The Basin being ground on the Mould, till it exactly fit in all Parts; they take it off, and cementing it to a wooden Block (loosen, if need be, with Lead) strew it over with fine sifted Sand, and thus *grind* it over again on the Mould, till all the Furrows or Scratches be quite taken away.

Lastly, They *grind* large Pieces of Glass in a Basin, with fine Sand between; till such Time as its Surface being well smoothed, there is no longer any Opposition to the Motion.

Note, the Dish is known to be perfectly finished, when a Hair being stretched over it, its Shadow projected in the Cavity, particularly in a Camera obscura, does not appear distorted.

The Basin finish'd, proceed to chuse Glasses for the Purpose: In order to this, lay 'em on clean Paper, and observe what Colours are projected thereon; for the same are the Colours of the Glasses. Always fixe aside those of the darker Colours, and chuse the brighter: But as the whitest and brightest have usually Veins; and beside, in Tract of Time, by the Humidity of the Air, are apt to rust, and lose their

Polish; for this Reason *Huygen* recommends those a little yellowish, reddish, or greenish; *Hewellius* the bluish. A Glass is found to be free from Bubbles, Sands, Veins; Knobs, and Spires, by holding it to the Sun, and receiving the Rays through it on a white Paper; for the Flaws above-mentioned, will each project a Shadow thereon.

If instead of Lenticular, or at least Spherical Glasses, you make use of Plane Glass; it must be divided, and cut with a Diamond, into Squares; and if it be too thick to break otherwise, you may do it by laying it on a Table covered with a Cloth, in such manner, as that the Side or Part to be sever'd, hang over the Edge; for being struck with an Iron Instrument, in this Situation it easily breaks in the Direction of the Line drawn by the Diamond. Having thus got a square Piece, describe two concentric Circles thereon, with a Pair of Compasses, one of whose Legs carries a Diamond; the Diameter of the inner Circle, to be equal to the Breadth of the intended Lens, and that of the outer somewhat more; and break off the Corners, as above directed; and the lesser Inequalities take off on a Grind-Stone, or the like. Examine now whether the Piece of Glass be every where equally thick; if it be not, reduce it to such Equality by *grinding* it on an Iron Plate with Sand and Water. Lastly, glue or cement the Glass thus prepared to a wooden Handle N M O, *Fig. 31.* with a Cement made of Pitch, with a fourth part of Rosin; or one Part of Wax, and eleven of Colophony. Care to be taken that the Base, or bottom of the Handle N O, be equal to the Glass; and that the Centre of the Glass and Handle meet together. Smaller Lens's, as those used for Microscopes, are fix'd on with Sealing-Wax.

Now, to grind the Glass, and bring it to the Convexity required; smear over the Dish equally with fine sifted Sand moisten'd with Water: Then taking the Handle with the Glass thereon, work the Basin sometimes this way, and sometimes that, to prevent the Form of the Basin from being disturb'd; never leaning too hard thereon. When the Glass has got the Figure of the Basin, clean it well of all the Sand, and Filth adhering; and sprinkle the Basin over with Emery moisten'd in Water; *grinding* the Glass thereon, till all the Roughness and Inequalities are taken away. After this, the fine Sand used in Hour-Glasses may be of Service, applied and used as before; remembering to take out the Sand when too much worn, and substitute new in its stead. Some in lieu hereof, chuse several Sorts of Emery, each finer than other, or even the Powder of Flints calcined and pounded. Lastly, *grind* the same Glass in another Basin, or Dish which is a Segment of a lesser Sphere, making use of the like Sand as before; till it have got a pretty high Rim or Margin all around.

In regard the Pressure is not here determined accurately enough upon the Middle of the Glass, by the mere Guidance of the Hand; some have chuse to make Use of the following Machine, especially for *grinding* of Object-Glasses.

Fix the Dish H I, *Fig. 14.* on a horizontal Table: exactly over its Centre let the Aperture D be, through which pass an Iron Arm five or six Inches long, fasten'd to the Staff A B. Let the other Extreme of the Staff be fitted into a Hole cut in the Dish, and fasten'd therein. Now to *grind* the Glass, instead of the Dish, take hold of the said Staff, and work with Sand, &c. as before.

Huygen tells us, that he first used coarse Emery, then a finer Powder of the same, which would be 30 Seconds in sinking to the bottom of a Vessel of Water, putting in fresh every half or quarter of an Hour. Sometimes too, he used Emery of 30 Seconds, for $\frac{1}{2}$ of an Hour; then Emery of 400 Seconds, for $\frac{1}{2}$ of an Hour; and lastly, Emery of 45 Minutes for $\frac{1}{2}$ of an Hour. The same Effect is had from Powder of Flints, broke in an Iron Mortar, mix'd with Water, and stirred sometime with a wooden Spatula, taking the Powder as it precipitates in some certain Time to the bottom of the Vessel, by decanting the Water.

What remains is, to polish the Glass; which see under the Article *POLISHING*.

GRINDING is also used for a coarser, and less accurate Method of smoothing or polishing the Surface of a Body; particularly Glass for Looking-Glasses, &c. See *LOOKING-GLASS*, &c.

In the new Method of working large Plates of Glass for Looking Glasses, Coach-Glasses, &c. by moulding, and, as it were, casting them somewhat after the manner of Metals; described under the Article *GLASS*: The Surface being left uneven, it remains to be ground and polished.

In order to this, the Plate of Glass is laid horizontal, on a Stone in Manner of a Table; and to secure it the better, plac'd down with Mortar, or Stucco, that the Effort of the Workman, or of the Machine used therein, may not shake or displace it. To sustain it, there is a strong wooden Frame that furrounds it an Inch or two higher than the Glass.

The Bottom or Base of the *grinding* Engine, is another rough Glass, about half the Dimensions of the former: On this

this is a wooden Plank, cemented thereto; and upon this are proper Weights applied to promote the Titure: The Plank or Table, being fasten'd to a Wheel, which gives it a Motion.—This Wheel, which is at least 5 or 6 Inches Diameter, is made of very hard but light Wood, and is wrought by two Workmen placed against each other, who push and pull it alternately; and sometimes, when the Work requires it, turn it round. By such means, a constant mutual Attrition is produced between the two Glasses, which is favour'd by Water and Sands of several Kinds bestow'd between; Sand still finer and finer being applied, as the grinding is more advanced: At last Emery is used. We need not add, that as the upper or incumbent Glass polishes and grows smoother, it must be shifted from time to time, and others put in its place.

It is to be noted, that only the largest Size Glasses are thus ground with a Mill; for the middling and smaller Sorts are wrought by the Hand, to which End there are four wooden Handies at the four Corners of the upper Stone, or Carriage, for the Workmen to take hold of, and give it Motion.

What remains to the Perfection of Glass, comes under the Denomination of Polishing. See POLISHING.

GRIP, or GRIFE, is a small Ditch cut a-cross a Meadow, or ploughed Land; in order to drain it: It also signifies an Handful; as, a *Gripe of Corn*.

GRIP of a Ship, is the Compass or Sharpness of her Stem under Water; chiefly towards the bottom of her Stem. See SHIP.

The Design of sharpening her so, is to make her *gripe* the more, or keep a good Wind; for which purpose sometimes a false Stem is put on upon the true one.

GRIP is also a Sea-Phrase for a Ship's being apt to run her Head or Nose too much into the Wind: In such Case they say, she *gripes*; of which there are two Causes, either over-loading her a-head, the Weight of which presses her Head so down, that it is not apt to fall off from the Wind; or the staying or setting her Masts too much aft; which will always be a Fault in a small Ship that draws much Water, and will cause her to be continually running into the Wind.

In floozy-Ships, if the Masts be not stayed very far aft, they will not keep a good Wind.

GRIPES, *tormenta Ventris*, in Medicine, a sort of Colic, or painful Disorder of the Lower Belly, occasioned by some sharp pungent Matters velleicating the Parts, or by Winds put up in the Intestines. See COLIC.

The Gripes are a very common Symptom in young Children, and may be caused by the Aliment they use, which is considerably different from what they had been accusom'd to in the Uterus. See CHILDREN.

The Retention of a Part of the Meconium may also give occasion hereto, as being somewhat acrimonious. See MECONIUM.

This Disorder sometimes proves so violent, as to throw the Child into universal Convulsions, or to cause what is vulgarly called Convulsions of the Bowels.

GRIST is Corn ground, or fit for grinding. See FLOWER, MEAL.

GROANING, in Heraldry, a Term used for the Cry or Noise of a Buck. See HUNTING.

GROAT, an English Money of Account, equal to Four-Pence. See PENNY.

Other Nations, as the *Dutch, Polanders, Saxons, Bohemians, French*, &c. have likewise their *Groats, Groots, Grächts, Gros*, &c. See MONEY and COIN.

We had no Silver Money in the *Saxon Times* bigger than a Penny; nor after the Conquest, till Edward III. who about the Year 1351, coin'd *Grotes*, i. e. *Groats*, or *great Pieces*, which went for 4 d. a-piece; and so the Matter stood till the Reign of Henry VII. who, in 1504, first coin'd Shillings. See SHILLING.

GROCERS, by the Stat. 37 Edw. II. cap. 5. were used for those who engross'd Merchandize. See ENGROSSING.

GRAM, in the Manufactories, a sort of Stuff, all Silk; being in Reality no more than a Taffety, coarser and thicker than ordinary. See TAFFETY.

GROOM, properly denotes a Servant appointed to attend on Horses; the Word being formed of the German *Grom*, Boy, Youth. See EQUESTRY.

GROOM is also the Denomination of several Officers and Servants in the King's Household. See HOUSEHOLD.

There are *Grooms* of the Almonry, *Grooms* in the Computing-House, *Grooms* of the Chamber, the Privy-Chamber, *Grooms* of the Robes, of the Wardrobe, &c. See ALMONRY, CHAMBER, WARDROBE, &c.

GROOM of the Stole. See STOLE.

GROOM-Porter is an Officer of the Household, whose Business is to see the King's Lodging furnished with Tables, Chairs, Stools, and Firing; to provide Cards, Dice, &c. and to decide Disputes arising at Cards, Dice, Bowling, &c.

GROS, a foreign Money, in divers Countries, answering to our *Groat*. See Groat.

A Pound Gros, *Liore de Gros*. See POUND and LIURE.

GROSS is the Quantity of twelve Dozen. See DOZEN.
GROSSA, a *Groat—Concessa est Regi una Grossa que continet quatuor denarios de quolibet viro & muliere*. Knighton. Anno 1378.

GROSSE-BOIS, in our ancient Law-Books, signifies such Wood as hath been, or is, either by the Common Law, or Custom of the Country, reputed Timber. See TIMBER.

GROSSUS, in our ancient Writers, denotes a thing entire, and not depending on another.

Thus, *Villains in Gross*, was a Servant, who did not belong to the Land, but immediately to the Person of the Lord; So, an Advowson in *Gross*, is a Right of Patronage not annexed to the Fee or Manor, but belonging to the Patron himself, distinct from the Manor. See ADVOWSON, VILLAIN, &c.

GROSS-WEIGHT is the Weight of Merchandizes, and Goods with their Dutt and Dross, as also of the Bag, Cask, Chest, &c. wherein they are contained; out of which *Gross-Weight*, Allowance is to be made for Tare and Tret. See TARE and TRET.

GROTESQUE, or GROTESK, or GROTTESQUE, a wild whimsical Figure of a Painter, or Engraver; having something ridiculous, extravagant, and even monstrous in it.

The Name arises hence, that Figures of this Kind were antiently much used to adorn the Grotes's wherein the Tombs of eminent Persons, or Families were inclosed. Such was that of *Ovid*, whose Grotes was discover'd near *Rome* about 50 Years ago. See GROTES.

Calot a celebrated Engraver of *Lorraine*, had a wonderful Genius for designing *Grotesques*: the like *aid of Leonardus da Vinci*.

We also extend the Word to any thing whimsical, or wildly pleasant, in a Person's Dress, Discourse, &c.—*Maquerade Habits* are the more valued, the more *Grotesque* they are: Our Theatres present us with Entertainments in *Grotesque Characters*, i. e. Persons quaintly dress'd; as *Harlequins, Scaramouches*, &c.

Plaudes has given us a very *Grotesk Picture of Æsop: Ariosto and the Italian Poets* are full of *Grotesque Descriptions*.

GROTESQUE-Work, GROTESK-Work, or *Grottesco*, is a Work or Composition in Painting, and Sculpture, in the *Grotesque Manner* or Taste; consisting either of Things which are merely imaginary, and have no Existence in Nature, or of Things turn'd and distorted out of the way of Nature, so as to raise Surprise and Ridicule.

Grotesque-Work is the same with what we sometimes call *Antique*. See ANTIQUE. See also MORESQUE.

GROTESQUES, or GROTESKS, are particularly used for little fanciful Ornaments, of Animals, compounded with Follages, Fruit, &c.

Such are those painted by *Raphael* in the Apartments of the Vatican; and those carved by *Michael Angelo* in the Ceilings of the Portico of the Capitol.

Vitruvius calls Compartments of this kind *Harpagenituli*. GROTTO, or GROTTA, in natural History, a large deep Cavern or Den in a Mountain or Rock. See STONE.

The ancient *Anchorites* retired into Dens, and *Grotto's*, to apply themselves the more attentively to Meditation, &c. See ANCHORITE, HERMIT, &c.

In *Grotto's* are frequently found Crystals of the Rock, *Stalactites*, and other natural Conglaciations; see CRYSTAL, STALACTITES, PETRIFICATION, &c.

The Word is *Italian*, *Grotta*, form'd according to *Mendage*, &c. from the Latin *Crypta*. *Du Gange* observes, that *Grotta* was used in the corrupt Latin.

M. *Hombert* conjectures, from several Circumstances; that the Marble Pillars in the *Grotto of Antiparos*, vegetate or grow.

That Author looks on this *Grotto* as a Garden, whereof the Pieces of Marble are the Plants; and endeavours to show that they could only be produced by some vegetative Principles. *Mendel. Acad. Anno 1702.*

At *Foligno* in *Italy*, is another *Grotto*, consisting of Pillars and Orders of Architecture of Marble, with their Ornaments, &c. scarce inferior to those of Art; but they all grow downwards: So that if this too be a Garden, the Plants are turn'd upside down. *Mendel. Acad. Anno 1711.*

The *Zirebitzner-See*, or Lake, in *Carniola*, famous for being full of Water, Fish, &c. the best part of the Year; and quite dry, and bearing Grass, Corn, &c. the rest; proceeds from some subterraneous *Grotto* or Lake; as is made highly probable by Mr. *Falcoffer*; *Philosoph. Trans. N^o 191.*

We have several *Grotto's* famous in Natural History; as, *Grotta del Cane*, a little Cavern near *Pizzosoli*, four Leagues from *Naples*, the Steams whereof are of a melancholic or noxious Quality; whence also it is called *Bocca Venenosa*, the poisonous Mouth. See MEFITES.

Two Miles from *Naples*, *Eys Dr. Mead*, just by the *Lago d'Agnano* is a celebrated *Mofeta*, commonly called *La Grotta* do

de Cami, equally destructive to all within the Reach of its Vapours.

'Tis a small *Grotto* about 8 Foot high, 12 long, and 6 broad; from the Ground arises a thin, subtle, warm Fume, visible enough to a discerning Eye, which does not spring up in little Parcels here and there, but in one continued Stream, covering the whole Surface of the bottom of the Cave; having this remarkable Difference from common Vapours, that it does not, like Smoke, disperse it self into the Air, but quickly after its Rise, falls back again, and returns to the Earth; the Colour of the Sides of the *Grotto* being the Measure of its Ascend; for so far it is of a darkish green, but higher only common Earth. And as I my self found no Inconveniency by standing in it, so no Animal, if its Head be above this Mark, is the least injured. But when, as the manner is, a Dog, or any other Creature, is forcibly kept below it; or by reason of its Smallness, can't hold its Head above it; it presently, loses all Motion, falls down as dead, or in a Swoon, the Limbs convulsed and trembling, till at last no more Signs of Life appear, than a very weak and almost insensible beating of the Head and Arteries; which if the Animal be left a little longer, quickly ceases too, and then the Case is irrecoverable; but if snatched out, and hid in the open Air, soon comes to life again, and sooner if thrown into the adjacent Lake.

The Fumes of the *Grotto*, the same Author argues, are no real Poison, but act chiefly by their Gravity; else the Creatures could not recover so soon; or if they did, some Symptoms, as Faintness, &c. would be the Consequence of it. He adds, that in Creatures killed therewith, when dissected, no Marks of infection appear; and that the Attack proceeds from a want of Air, which the Circulation tends to an entire Stoppage, and this so much the more, as the Animal inspires a Fluid of a quite different Nature from the Air, and so no ways fit to supply its Place.

Taking the Animal out while alive, and throwing it into the neighbouring Lake, it recovers: This is owing to the Coldness of the Water, which promotes the Contraction of the Fibres, and so assists the retarded Circulation; the small Portion of the Air which remains in the Vesiculae, after every Expiration, may be sufficient to drive out the noxious Fluid. After the same manner, cold Water acts in a *deliquium Animæ*: The Lake of *Agnano* has no other Virtue in it more than others.

Grotta della Serpi, is a subterraneous Cavern near the Village of *Saffa*, eight Miles from the City of *Braccano* in Italy; described by *Kircher* thus:

The *Grotta della Serpi*, is big enough to hold two Persons; it is perforated with several fistular Apertures, somewhat in manner of a Sieve; out of which, at the beginning of the Spring Season, issues a numerous Brood of young Snakes of divers Colours, but all free of any particular poisonous Quality.

In this Cave they expose their Lepers, Paralyticks, Arthriticks, and Elephantiac Patients naked; where, the Warmth of the subterraneous Steams resolving them into Sweat, and the Serpents clinging variously all around, licking and sucking them, they become so thoroughly freed of all their vicious Humours, that upon repeating the Operation for some Time, they became perfectly restored.

This Cave *Kircher* visited himself, and found it warm, and every way agreeable to the Description given of it. He saw the Holes, and heard a murmuring, hissing Noise in them. Tho' he mis'd seeing the Serpents, it being not the Season of their creeping out; yet he saw a great Number of their Exuvie, or Sloughs, and an Elm growing hard by laden with them.

The Discovery of this Cave, was by the Cure of a Leper going from *Rome* to some Baths near this Place; who, losing his way, and being benighted, happen'd upon this Cave, and finding it very warm, pulled off his Cloaths, and being weary and sleepy, had the good Fortune not to feel the Serpents about him till they had wrought his Cure. *Museum Wormian.*

We also read of the *Milky Grotto*, or *Crypta Lactea*, a Mile distant from the ancient Village of *Berlebhem*.

It is said to be thus denominatèd, on occasion of the blessed Virgin, who let fall some Drops of Milk in giving Suck to the little Jesus in this *Grotto*. And hence it has been commonly supposed, that the Earth of this Cavern has the Virtue of restoring Milk to Women that are grown dry, and even of curing Fevers.

Accordingly, they are always a-digging in it, and the Earth is sold at a good Rate to such as have Faith enough to give Credit to the Fable—An Altar has been built on the Place, and a Church just by it.

Grotto is also used for a little artificial Edifice made in a Garden, in Imitation of a natural *Grotto*.

The Outfides of these *Grottos* are usually adorn'd with Rustic Architecture, and their Infide with Shell-work, furnish'd likewise with various Jet d'Esus, or Fountains, &c. See SHELL-WORK, &c.

The *Grotto* at *Verfailles*, is an excellent Piece of Building.—*Solomon de Caux* has an express Treatise of *Grottos* and Fountains.

GROVE, in Agriculture, &c. a little thick Wood. See Wood.

The ancient Romans had a sort of Groves near several of their Temples, which were consecrated to some God, and called *Laci*, by *Antiphrasti*, a *non luceudo*, as being shady and dark. See Locus.

In very large and magnificent Gardens, a Grove is usually a Plot of Trees, inclosed with Pallisades, consisting of tall Trees, as Elms, Horse Chestnuts, &c. the Tops whereof make a Tuft or Flame, and shade the Ground below.

At the Foot of the tall Trees, which generally run all along the Pallisades at equal Distance, other lesser Trees are often planted, whole Tufts form a Resemblance of a sort of Copse within the former.

GROUND, in Agriculture, a Piece of Land, or Soil; or a Portion of Earth, whether fit or unfit to be tilled and cultivated. See EARTH and SOIL. See also ORCHARD, GARDEN, &c.

All Sorts of Land may be reduced to *boggy* or *marshy*, *ebalky*, *gravelly*, and *stony*. See Bog, MARSH, CHALK, SAND, GRAVEL, &c.

GROUND, in Painting, is the Surface, upon which the Figures, and other Objects, are raised or represented. See PAINTING.

The *Ground* is properly understood of such Parts of the Piece as have nothing painted on them, but retain the original Colour upon which the other Colours are applied to make the Representations. See COLOURING.

A Drapery, Piece of Building, the like, are said to serve as a *Ground* to a Figure, when the Figure is painted on the Drapery or Building.

In the like Sense, we also say the *Ground* of a Piece of Tapistry, of an Embroidery, of a Medal, Coin, &c. See TAPISTRY, EMBROIDERY, BROCADE, MEDAL, COIN, &c.

The *Ground* of a Shield or Escutcheon in Heraldry, is properly called the *Field*. See FIELD.

GROUND, in Etching, is a gummos Composition, smeared over the Surface of the Metal to be etch'd; to prevent the *Aqua Fortis* from eating, or having effect, except in Places where this *Ground* is cut thro', or pared off, with the Points of Needles. See ETCHING.

GROUND-Work, in Building. See FOUNDATION.

GROUND-Sell, or GROUND-Plate. See SELL.

GROUND-Tackle, a Sea-Term denoting a Ship's Anchor, Cables, &c. with whatever is necessary to make her ride safe at Anchor in a proper *Ground*. See TACKLE, ANCHOR, &c.

GROUNDING of a Ship, is the bringing her on *Ground*, to be trimmed, made clean, or to have some Leak stopp'd in her.

GROUPADES is corruptly used, in the Manage for *Groupades*. See GROUPADE.

GROUP, or GROUPE, in Painting and Sculpture, an Assemblage or Knot of two or more Figures of Men, Beasts, Fruits, or the like, which have some apparent relation to each other.

In a good Painting, it is necessary that all the Figures be divided into 2 or 3 *Groups*, or separate Collections—Such and such a Thing make a *Group* with such and such others of a different Nature and Kind. The antique *Laomedon* is a fine *Group* of three beautiful Figures.

A *Group* has somewhat in it of the Nature of a Symphony or Concert of Voices: As, in the one the Voices must sustain each other, in order to fill the Ear with an agreeable Harmony from the whole; whence if any part were to cease, something would necessarily be mis'd: So, in the *Group*, if the Parts or Figures be not well balanced, something will be found disagreeable.

There are two Sorts of *Groups*, or two manners of considering *Groups*; with regard to the Design, and to the Clair obscure. The first is common both to Works of Painting, and those of Sculpture; the latter peculiar to Painting.

Groups, with regard to the Design, are Combinations of divers Figures, which have relation to each other, either on account of the Action, or of their Proximity, or of the Effect they have. These we conceive, in some measure, as representing so many different Subjects, or at least so many distinct Parts or Members of one greater Subject. See DESIGN.

Groups, with regard to the Clair obscure, are Bodies of Figures wherein the Lights and Shadows are diffus'd in such manner that they strike the Eye together, and naturally lead it to consider them in one View. See CLAIR obscure.

The Word *Grouppe* is French, form'd of the *Italian Gruppo*, a Knot.

In Architecture we say a *Group* of Columns, speaking of three or four Columns join'd together on the same Pedestal. See COLUMN.

When there are but two together, we say a *couple*, not a *Group* of Columns. See COUPLE.

In Music, a *Group* is one of the Kinds of Diminutions of

of long Notes, which in the Working, forms a sort of Group, Knot, Bush, or the like.

The *Group* usually consists of four Crochets, Quavers, or Semiquavers tied together, at the Discretion of the Composer.

GRABATARI, GRABATARI, in Antiquity, were such Persons as deferr'd the receiving of Baptism to the Hour of Death; or, who did not receive it till they were dangerously ill, and out of Hopes of Life; from an Opinion, that Baptism absolutely wash'd away all antecedent Guilt. See **BAPTISM**.

The Word is form'd of the Latin *Grabatum*, Bed; and that from the Greek *γρεβατες*, a Hanging-Bed, of *αρενας*, to suspend; such being the Bed of Slaves, poor People, Cynic Philosophers, &c. who were Enemies of Luxury and Ease.

GRUBBING a Cock, a Term us'd by Cock-fighters, for the cutting off the Feathers under the Wings.—It is a thing not allowed by Cock pit Law, nor to cut off his Feathers in any handling Place. See **COCK-PIT LAW**.

GRUBBS, in Medicine, a white, unctuous kind of Pimples or little Tumors, arising upon the Face, chiefly the Ale of the Nose. See **TUMOR**, &c.

They are usually owing to hard Drinking, and an obstru'd Perspiration; though natural in some Constitutions.—They begin with a small black Point, which gradually spreads; and sometimes the Matter tends to Suppuration, upon which the Heads of the Eruptions grow white or yellow.—They are usually reputed salutary; whence to check their Growth suddenly, has proved of ill Consequence. They are cured by Evacuation, and acrimonious Lotions.

GRUME, GRUMUS, in Medicine, &c. A Particle of Blood, Milk, or other Fluid, which is coagulated, thick'n'd, hard'n'd, or not sufficiently thin, and diluted. See **BLOOD**, see also **COAGULATION**, &c.

Phthical People frequently spit up *Grumes*, i. e. Clots of Blood. See **PHTHISIS**.

Grumes of Milk, are what we popularly call *Curds*. See **MILK**, **CHEESE**, &c.

GRUMOUS Blood, is that State or Consistence of the Blood, wherein it is too viscid, and thick, for a due brisk Circulation: The Effects whereof are, that it stagnates in the Capillary Vessels, and produces divers Diforders. See **LENTOR**; see also **DISEASE**, &c.

GRUS, in Antiquity, a Dance perform'd yearly by the young *Abenians*, around the Temple of *Apollo*, on the Day of the Delia. See **DELIA**.

The Motions and Figures of this Dance were very intricate, and variously interwove, some of them being intended to express the Windings of the Labyrinth, wherein the Minotaur was kill'd by *Theseus*. See **LABYRINTH**.

GRY, a Measure containing $\frac{1}{2}$ of a Line. See **LINE**.

A Line is $\frac{1}{2}$ of a Digit; and a Digit $\frac{1}{2}$ of a Foot; and a Philosophical Foot $\frac{1}{2}$ of a Pendulum, whose Diastromes, or Vibrations, in the Latitude of 45 Degrees, are each equal to one Second of Time, or $\frac{1}{2}$ of a Minute. See **INCH**, **FOOT**, **PENDULUM**, &c.

GRYPHUS, a kind of Enigma; or an artful obscure Description of a Thing. See **ENIGMA**.

GUADAGE, or GUIDAGE, among our ancient Writers, (*est quod datur alieni, ut tuto conducatur per terram alterius*;) that which is given for safe Conduct through unknown Ways, or a strange Territory.

GUADUM, **GUODAN**, in Natural History, an Herb by the ancient *Romans* called *Glastum* and *Vitrum*; by the *Greeks* *Isatis*; by the *Britains* *Guadum*; and by us now, *Wood*.

The ancient *Britains*, *Cesar* informs us, painted their Faces with this Herb, to appear the more terrible to their Enemies. And *Pliny* relates, that the same was practiced by the Women in divers Sacrifices. See **GLASS**.

GUANNAGIUM. See **WANNAGE**.

GUARANTEE, or WARRANTY, a Term relative to *Warrant*, or *Warranter*; properly signifying him whom the *Warranter* undertakes to indemnify, or secure from Damage. See **WARRANTER**.

GUARANTEE, or Guaranty, is more frequently us'd for a *Warranter*, or a Person who undertakes and obliges himself to see a second Person perform, what he has stipulated to a third.

The *Guarantee of a Treaty*, is a Prince, or Power, pitched on by the treating Parties, to see, or engage that each Side shall perform the Articles. The *Guarantees of the Treaty of Oliva*, of *Westphalia*, &c. See **TREATY**.

The ancient Lords were oblig'd to *Guaranty* the Lands of their Vassals, i. e. to defend them against their Enemies; otherwise they lost their Fee, and their Vassals were no longer bound to do them Homage and Service.—Kings alone did not forfeit their Fiefs by not *Guarantying* them; and yet we read that *Borel*, Count of *Barcelona*, threaten'd the King of *France*, *Hayb Capet*, to swear Fealty to the *Saracens*, in case he did not *guaranty* him; and under *Leewis* the Young, the Count of *Champagne* did Homage to the Emperor, on the like Account. See **FEU**.

To *Guaranty a Fee*, had likewise another Meaning, being us'd to denote, that where a *Fee* was divided between the

eldest Son, and the younger, the eldest did Homage to the Lord both for himself and all the rest; and by that Homage *guarant*'d the whole.

GUARD, or GARD, in its general Sense, implies Defence, Custody, or Conservation of any Thing; the Act of observing what passes, to prevent Surprize; or the Care and Precaution taken to hinder any Thing's being done contrary to the Intention and Desire of another.

The Word is both us'd in a proper and a figurative Sense; for the Act or Service of *Guarding*, and the Persons appointed for that Purpose: Thus we say, to be upon *Guard*, to set the *Guard*, mount the *Guard*, &c. So also we say a strong *Guard*, an Attempt on the *Guard*; 2000 Men are necessary for the *Guard* of the City, &c.—So, again, those to whom the King commits the Safety of his Person, are called his *Guard*, *Life-Guard*, *Body-Guard*.

And so, those who have the Education and Guardianship of Infants, or Idiots, are called their *Guards*, or *Wards*. See **WARD**.

The same Term is also applied to a *Writ* relating to the Office of *Ward*, whereof there are three Kinds; one called *droit de Garde*; the second *Escheat de Garde*; the third *Roulement de Garde*. See **WARD** and **GUARDIAN**.

The Word is form'd of the *French Garde*, and that of the corrupt Latin *Warda*; and that of the *German Wabrew* to keep.

GUARD, in the military Sense, is properly the Duty or Service done by the Soldiers, to secure the Army or Place from the Surprizes and Efforts of an Enemy.—Of this there are divers Kinds, as

Main-Guard, is that from whence all the other *Guards* are detach'd. Those who are to mount the *Guard*, meet at the respective Captain's Quarters, and from thence go to the Parade; where, after the whole *Guard* is drawn up the *main Guards* are detach'd for the Posts and Magazines; and then the subaltern Officers throw Lots for their *Guards*, and are commanded by the Captain of the *Main-Guard*.

Grand-Guard, consists of three or four Squadrons of Horse, commanded by a Field-Officer, and posted before the Camp on the Right and Left Wing, towards the Enemy; for the Security of the Camp.

In a Camp every Battalion puts a small *Guard*, commanded by a subaltern Officer, about 100 Yards before its Front. This is called the *Quarter-Guard*. As

That small *Guard* of Foot, which a Regiment of Horse mounts in their Front under a Corporal, is called the *Standard-Guard*.

Advance-Guard, is a Party of Horse or Foot which marches before a Body to give Notice of approaching Danger. When an Army is upon the March, the *Grand Guards*, which should serve that Day, are as *Advance-Guards* to the Army.—That small Body also of 12 or 16 Horse, which are posted under a Corporal, or Quarter-Master, before the *Grand-Guard* of a Camp, are called the *Advance-Guard*.

There is also the *Piquet-Guard*, which is a Number of Horse and Foot, who keep themselves always in a Readiness in case of an Alarm; the Horses are saddled, and the Riders boot'd all the while, and the Foot draw up at the Head of the Battalion at the beating of the Tattou, but afterwards return to their Tents, where they are in a Readiness to march upon any sudden Alarm.—This *Guard* is to make Resistance in case of an Attack, till the Army can get ready.

GUARD is particularly understood of a Soldier, as a Musketeer, Archer, or the like, detach'd from a Company or Corps, to protect, detain, or secure any Person, or survey his Actions.

A *Guard* was set over each Party, to prevent the Duel's taking Place.

The Term is also us'd for the Troops or Companies kept up to guard the King: As in the following Articles—

Royal Guards, are Forces rais'd and maintained to guard his Majesty's Person. See **KING**.

There are also Bodies of *Guards* to wait on the Princes of the Blood, in the same Capacity.

The *Guards* are distinguish'd into *Horse*, *Foot*, *Granadiers*, and *Promen*.

The *Horse-Guards* are distinguish'd by Troops: First, second, third, and fourth Troop of *Horse-Guards*. See **TROOP**.

The *Foot-Guards* are distinguish'd by Regiments: First Regiment, Cold-Stream Regiment, Royal Regiment of *Foot-Guards*. See **REGIMENT**.

Guards, no doubt, are as ancient as Monarchy. The remotest Antiquity asserts Instances hereof; the Scripture mentions those of *Saul* the first King of the People of God, 1 *King*. xix. 11. and those of *Achis* King of the *Philistines*, 1 *King*. xxvii. The *Grecian Kings* had also their *Guards*: *Justin* mentions those of *Pissistratus*, Tyrant of *Athen*, lib. 11. c. 8. those of the Tyrans of the same City, established by *Lysander*, lib. v. c. 8. those of *Ages* King of *Sparta*, lib. xii. c. 1. those of *Alexander*, lib. xii. c. 8. those of the *Ptolemies* Kings of *Agypt*, lib. xvi. c. 2; &c. *Tarquin* the Proud, is said

said to have been the first who took *Guards* at Rome. *Diogenes Halicarnassensis*, lib. iv. and yet we find that *Romulus* form'd himself a *Guard*, consisting at first of 12 Lictors, and afterwards of 300 Soldiers, whom he called *Celeres*. See *CELERES*.

The Roman Emperors had, for their *Guard*, the *Pre-torian* Cohorts, established by *Augustus*, as *Dion* and *Suetonius* relate: Those of the Emperors of *Constantinople*, were called *Buccellarii*. See *BUCCELLARII*; see also *DOMESTICI* and *PROTECTORES*.

Captain of the *Guards*, Colonel of the *Guards*, Brigadier of the *Guards*, Exempt of the *Guards*, &c. See *CAPTAIN*, *COLONEL*, *BRIGADIER*, *EXEMPT*, &c.

Yeomen of the *Guards*. See *YEOMEN of the Guards*.

The *French Guards* are divided into thole *within*, and thole *without* the Palace: The first consists of the *Gardes du Corps*, q. d. Body-Guard; part whereof are *Gardes de la Manche*, q. d. of the Elbow: The hundred *Swisses*; and the *Guards* of the Gate.

The *Guards without*, are *Gen's d'Armes*, Light-Horse, Musketeers, and two Regiments of *Guards*, the one of *French*, the other *Swiss*. See *GENS' d'ARMES*.

The *Garde du Corps*, or *Life-Guard*, consists of four Companies of Horse: The first was antiently *Scottish*, and still retains the Name; tho' it now consists wholly of *French* Men. Not only the Name, but they also retain the antient Phrase or Formula of answering when called upon, *I am here*. The *Scottish Guard* was first established in *France* by *Charles VII.* who chose himself a *Guard* out of such *Scots* as were sent by the Earls of *Buccan*, *Douglas*, and other *Scottish* Lords, to drive out the *English*.

Pre-torian Guards, } see } *PRE-TORIAN*,
White Guards, } } *SCHOLARAE*.

GUARD, in Fencing, an Action or Posture proper to defend or screen the Body from the Efforts, or Attacks of an Enemies Sword—See *FENCING* and *DEFENCE*.

There are four general *Guards* of the Sword; to conceive which, it will be necessary to imagine a Circle drawn on an upright Wall, and divided into four Cardinal Points, *viz.* top, bottom, right, and left.

Now, when the Point of the Sword is directed to the bottom Point of the Circle, and consequently the Head of the Sword tilted up to the top Point, with the Body inclining forwards; this is called *Prime*, or the *first Guard*—The *second Guard*, which some improperly call the *third*, is when the Point of the Sword is directed to the right or second Point of the same Circle, a Quadrant distant from the *first*; with the Point of the Sword turn'd to the right, and the Body rais'd proportionably—*Tierce*, or the *third Guard*, is perform'd by directing the Sword's Point to the uppermost Point of the same Circle diametrically opposite to that of *Prime*: In which Case the Body, Arm, and Sword, are in their natural Disposition, being the Mean between the Extremes of their Motion—*Quart*, or the *fourth Guard*, is when the Point of the Sword is directed to the fourth Point of the Circle, descending to the right as far as one fourth of *Tierce*, with the external Side of the Arm and the Flat of the Sword turn'd towards the Ground; and the Body out of the Line to the right, and the Point of the Sword towards the Line to the left—There is also *Quint*, or a kind of *fifth Guard*, being the return of the Point of the Sword on the right, after traversing the Circle, to the Point of the *Prime* whence it had departed; and yet with a different Disposition of the Body, Arm, and Sword.

These *Guards* are also called *Figures* and *Postures*; and the common Centre of all their Motions is to be in the Shoulder.

In all these Kinds of *Guards*, there are high *advanced*, high *retired*, and high *intermediate* *Guards*, when disposed before the upper part of the Body, either with the Arm quite extended, quite withdrawn, or in a mean State—*Mean advanced Guard*, or *Empty mean Guard*, is when the Sword is disposed before the middle part of the Body—*Low advanced*, *retired*, or *intermediate* *Guards*, are thole where the Arm and Sword are advanced, withdrawn, or between the two Extremes, before the lower part of the Body.

Some will have *Prime* the principal *Guard*; others *Quint*; others, with better Reason, *Tierce*, in regard it consists of right Lines, which are more easily defended than oblique ones, such as thole of *Prime*, *Second*, *Quart*, and *Quint*. See *SWORD*.

GUARDS, in Astronomy, is a Name sometimes applied to the two Stars nearest the Pole, being in the hind part of the Chariot, at the Tail of the little Bear. See *CENOSURA*.

Their Longitude, Latitude, &c. see among thole of the other Stars in the Constellation *Ursa minor*.

One of them is the Pole Star. See *POLE STAR*.

GUARDANT, or *GARDANT*, in Heraldry, a Term applied to a Lion or other Beast when born in a Coat of Arms, full faced, or with his Face turned towards the Spectator, and thus appearing in a Posture of Guard, and Defence.—The Heraldry says a Lion is never to be represented, but a Leopard always.

GUARDIAN, or *GARDIAN*, he to whom the Charge or Custody of any Person or Thing is committed. See *WARD*.

The Notion of *Guardian* Angels, is very antient in the East. See *DEMON*.

In the Convent of *Franciscans*, the Officer is called *Guardian* who in the rest is called *Superior*. See *SUPERIOR*.

In the Order of the Garter, the Officer who in other military Orders is called *Grand-Master*, is called the *Sovereign Guardian* of the Order. See *GARTER*.

GUARDIAN, in Law, is a Person intrusted with the Education, Tuition, &c. of such as are not of sufficient Discretion to guide themselves, and their own Affairs; as Children, and Idiots.

The Word *Guardian*, with us, includes the Offices both of the *Tutor* and *Curator* of the *Civilians*: The *Tutor*, for instance, had the Government of a Youth, till he arrived at 14 Years of Age. See *TUTOR*. And the *Curator* had the Disposition and ordering of his Effects thence forward, till 25 Years of Age; or the Charge of a Lunatick, during his Lunacy. See *CURATOR*; all which Purposes, our *Guardians* alone answer.

We have three Kinds of *Guardians*: One appointed by the Father in his Will; another by the Judge afterwards; and a third cast upon a Minor by the Custom of the Land: But the antient Law relating to *Guardians*, is much alter'd by *Stat. 12. Car. II.* which ordains that, 'Where any Person has a Child under the Age of 21 Years, and unmarried at the Time of his Death, it shall be lawful for the Father of the Child, whether born at the Time of his Decease, or yet in *ventre sa mere*, either by Deed or Will, to dispose of the Custody and Tuition of such Child while under Age, or for any lesser Time, to any Person, Popish Recusants excepted: Which Disposition shall be good against all Persons claiming such Child as *Guardian in Seque*, or otherwise. And in Case the Father appoint no *Guardian*, the Ordinary may appoint one to look to his Goods and Chattels till the Age of fourteen, at which Time the Child may chuse a *Guardian* himself. And for his Lands, the next of kin on that side by which the Lands descend, shall not be *Guardian*, as heretofore in Case of a Tenure in *Seque*. See *SEQUE*.

GUARDIAN of the Spiritualities, is he to whom the spiritual Jurisdiction of a Diocese is committed, during the Vacancy of the See. See *VACANCY*.

This *Guardian* may be either such in Law, i. e. *Jure Mogistratus*, as the Archbishop is of any Diocese within his Province; or by *Delegation*, as he whom the Archbishop or Vicar-General, does for the Time depute. See *VICAR*, &c.

The *Dean* and *Chapter of Canterbury*, are *Guardians* both for the Diocese, and the whole Province, during a Vacancy of the Archbishop.

GUARDIAN, or Warden, of the Cinque-Ports, is an Officer who has the Jurisdiction of the Cinque-Ports, with all the Power that the Admiral of England has in other Places. See *CINQUE-PORTS*, and *ADMIRAL*.

Cambdesa relates, that the *Romans*, after they had settled themselves, and their Empire in our Island, appointed a Magistrate or Governour over the East Parts where the Cinque-Ports lie, with the Title of *Comes Littoris Saxonici per Britanniam*; having another that bore the like Title, on the opposite Side of the Sea. Their Business was to strengthen the Sea Coast with Munition against the Outrages and Robberies of the Barbarians. And that Antiquary takes our Warden of the Cinque-Ports to have been erected in Imitation hereof. *Britannia*, p. 228.

GUARDIAN of the Peace. See *CONSERVATOR of the Peace*.

GUELPHS, or *GUELFs*, a celebrated Faction in Italy, antagonists of the *Gibellins*. See *GIBELIN*.

The *Guelphs* and *Gibellins* fill'd Italy with Blood and Carnage for many Years. The *Guelphs* stood for the Pope, against the Emperor. Their Rise is refer'd by some to be the Time of *Conrad III.* in the 12th Century; by others to that of *Frederic I.* and by others, to that of his Successor *Frederic II.* in the 13th Century.

The Name *Gueff* is commonly said to have been form'd from that of *Welfe*, *Welfo*, on the following Occasion: The Emperor *Conrad III.* having taken the Duchy of *Bavaria* from *Welfe VI.* Brother of *Henry Duke of Saxonia*, *Welfe*, assisted by the Forces of *Roger King of Sicily*, made War on *Conrad*, and thus gave Birth to the Faction of the *Guelphs*.

Others chuse rather to derive the Name *Welfe* from that of *Gulfona*. Others, again, derive the Name *Gueff* from the *German Welf*, on account of the grievous Evils committed by that cruel Faction. Lastly, others derive the Denomination from that of a *German* called *Gueffe*, who lived at *Pifney*; adding, that his Brother, named *Gibel*, gave the Name to the *Gibellins*: Under which Head, the Reader will find a more ample Account of the Origin and History of thole celebrated Factions.

GUERTE, in Fortification, a small Tower of Wood or Stone, placed usually on the Point of a Bastion, or on the Angles of the Shoulder; to hold a Centinel, who is to take care of the Ditch, and watch out against a Surprise—

GUEST-TAKERS, or *GIST-TAKERS*. See *AGISTORS*.
GUET,

GUET, a French Term of War, signifying *Watch*; particularly used for a Person posted as a *Spy* in any Place, to have an Eye thereon, and give Notice of what passes. See **CENTINEL**, **SENTRY**, &c.

GUET is also used for a *Corps de Garde* posted at any Passage; or Company of Guards who go on the Patrol. See **WATCH**.

Some Officers are exempted from *Guet* and Guard, i. e. Watch and Ward.

In the same Sense they say *Guet de Nuit*, Night Watch: *Mot de Guet*, Watch-Word: *Guet Royal*: *Guet Bourgeois*, &c. The *Chevalier de Guet*, is the Officer who commands the *Guet Royal*, or Royal Watch.

GUEULE, in Architecture. See **GULA**.
GUIDON, a sort of Flag, or Standard bore by the King's Life-Guard; being broad at one Extreme, and almost pointed at the other, and slit or divided into two. See **FLAG**, **STANDARD**, &c.

The *Guidon* is the Ensign or Flag of a Troop of Horse-Guards. See **GUARD**.

GUIDON is also the Officer who bears the *Guidon*.
The *Guidon* is that in the Horse-Guards, which the Ensign is in the Foot. See **ENSIGN**.

The *Guidon* of a Troop of Horse takes place next below the *Corset*.

GUIDONS, or *Sebota Guidonum*, was a Company of Priests, established by *Charlemagne* at Rome, to conduct and guide Pilgrims to *Jerusalem*, to visit the holy Places; to assist them in case they fell sick, and to perform the last Offices to them in case they died.

GUIDRIGILD. See **WEREGILD**.

GUILD, **GELD**, or **GILD**. See **GILD**.

GUILD HALL, or **GILD-HALL**, the great Court of Judicature for the City of London. See **HALL**.
In it are kept the Mayor's Court, the Sheriffs Court, the Court of Huttings, Court of Conscience, Court of Common-Council, Chamberlain's Court, &c. See **MAYOR'S COURT**, **COMMON-COUNCIL**, **CHAMBERLAIN**, &c.

Here also the Judges sit upon *Nisi prius*, &c.

GUINEA, a Gold Coin struck, and current in England. See **COIN**.

The Value or Rate of *Guineas* has varied: It was first struck on the Footing of 20 Shillings; by the Scarcity of Gold it has since advanced to 21 Shillings and 6 Pence; but is now sunk to 21 Shillings.

The Pound Weight Troy of Gold is cut into Forty-four Parts and an half; each Part makes a *Guinea*. See **GOLD**.

This Coin took its Denomination *Guinea*, by reason the Gold whereof the first were struck, was brought from that Part of Africa called *Guinea*; for which Reason it likewise bore the Impression of an Elephant.

GUINEA-PEPPER. See **PEPPER**.

GULA, in Anatomy, the *Gullet*; or that Conduit by which Animals take down Food into the Stomach. See **DIGLUTITION**.

GULE, **GURULE**, or **GOLA**, in Architecture, a wavy Member, whose Contour resembles the Letter S; called by the Greeks *Cymatium*, q. d. a little Wave, and by our Workmen an *Ogee*. See **CYMATIUM** and **OEGE**.

This Member is of two Kinds, *recta* and *inversa*:

The *first*, and principal, has its Cavity above, and Convexity below. This always makes the Top of the Corona of the Cornice, jetting over the Drip of the Cornice like a Wave ready to fall.

It is called *Gula recta*, and by the French *Doucine*. Sometimes it is absolutely called the *Establature*, as being the first or uppermost Member thereof. See **DOUCINE**, **CORONA**, **CORNICE**, &c.

The *second* is just the reverse of the former, its Cavity being at the Bottom; so that it appears inverted, with regard to the former. This is used in the Architrave, and sometimes in the Cornice, along with the former, only separated by a Reglet.

Some derive the Word from the Resemblance these Members bear to the *Gula*, or Throat of a Man: Others from the Herald's Term *Gules*; as supposing the Moulding furnished from the ancient manner of wearing their Garments, which consisted of Slips or Swaths, alternately Fur and Stuff of various Colours; the Intervals between which, were called *Gules* or *Guales*.

GULES, in Heraldry, signifies the Colour *Red*. See **COLOUR** and **RED**.

The same Colour, in the Coats of Noblemen, is, by some, called *Ruby*; and in those of sovereign Princes *Mars*; but this is no standing Practice. See **METAL**, **PREVIOUS STONE**, &c.

In Engraving, *Gules* is expressed by perpendicular Strokes drawn from the Top of the Escutcheon to the Bottom, with the Letter G.

This Colour is reputed a Symbol of Charity, Valour, Hardiness, Generosity; and represents Blood Colour, Cinnamon and true Scarlet. It is the first of all Colours used in Armory; and is of that account, that anciently it was prohibited any Person to wear *Gules* in his Coat Armour, unless he were a Prince, or had Permission from the Prince. *Spelman* in his

Afflogia, says this Colour was particularly honour'd by the Romans, as it had been before by the Trojans; and that they painted the Bodies of their Gods, and of their Generals that triumph'd, with Vermillion—Under the Consuls, the Roman Soldiers wore *Red*; whence they were denominated *Ruffati*. *John de Bado Anvo* adds, that the *Red* Garment, which the Greeks call *Pheonicus*, and we *Scarlet*, was first used by the Romans, to prevent seeing of the Blood issue from Wounds in Fight.

In effect, *Gules* has always been esteem'd an Imperial Colour; the Emperors were clothed, shod, and had their Apartments furnish'd with *Red*: Their Edicts, Dispatches, Signatures, and Seals, were of *Red-ink*, and *Red Wax*; whence the Name *Rubricæ*. See **RUBRIC**.

Fa. Monet derives the Word *Gules*, *Guelles*, from the Hebrew *Gulud*, and *Guludit*, a reddish Pellicle or Skin appearing on a Wound when it begins to heal: But *F. Menestrier* reproaches him, that there were no such Words in the Hebrew Tongue. This, however, is not true: All the Eastern Languages, the Hebrew, Chaldean, Syriac, and Arab, say גולד, *Gbled*, for *Curtis*, *Peltis*; when the Arabic *Gulud*. And in the general, the Word *Gules* signifies *Red* among most of the oriental Nations: The Arabs and Persians give the Name to the Rose.

Others, with *Nicod*, derive the Name *Gules* from *Gulz*, the Throats of Animals, being generally *Red*; whence the Latin *Cuspidium*, of the Greek *κακκας*, Scarlet Grain.

GULLET. See **OSORHAGUS**.

GULPH, or **GULF**, in Geography, an Arm or Part of the Ocean running up within the Land.—Such is the *Gulph of Venice*, called also the *Adriatic Sea*; the *Gulph of Lyons*, the *Gulph of Mexico*, of *Florida*, &c. See **OCEAN**.

A *Gulph* is strictly distinguished from a *Sea*, in that that the latter is larger. See **SEA**. From a *Bay*, or *Sinus*, it is again distinguished by its being greater than the same. See **BAY**.

Some will have it essential to a *Gulph*, to run into the Land thro' a Strait or narrow Passage. See **STRAIGHT**.

The *Sea* is always most dangerous near *Gulphs*, by reason of the Currents being pent'd up by the Shoars. The Word is form'd of the Greek *αδωκω*; which *Guichart* again derives from the Hebrew *גול*, *Gob*. *Du Cange* derives it from the barbarous Latin *Gulfum* or *Gulfus*, which signifies the same Thing.

GUM, **GUMMI**, a vegetable Juice exuding thro' the Pores of certain Plants, and there hardening into a tenacious transparent Mass. See **PLANT**.

Gum is properly one of the Juices of the Bark: It is drawn thence by the Sun's Warmth, in Form of a glutinous Humour; and by the same Cause [is afterwards inspissated, concocted, and render'd tenacious

The Character of *Gums*, whereby they are distinguished from Resins and other vegetable Juices, is, that they are dissoluble in Water, and at the same Time inflammable by Fire. See **MINSTRUUM**, **WATER**, and **FIRE**.

In the general they are more viscid, and less friable, and generally dissoluble in any aqueous Menstruum; whereas Resins are more sulphurous, and require a spirituous Dissolvent. *Boerhaave* considers a *Gum* as a sort of saponaceous Fat; which beside its oily Principle in common with a Resin, has some other Ingredient that renders it miscible with Water. See **RESIN**.

Gums are different, according to the different Trees, Roots, &c. they issue from: Some Authors distinguish them into *Aqueous*, and *Resinous Gums*: The first, those dissoluble in Water, Wine, and the like Fluids; The second, those only dissoluble in Oil.

To these two some add a third anomalous Kind, viz. those soluble with much Difficulty either in Water or Oil.

Among the Class of *Gums* are usually ranked, *Gum-Anima*, *Arabic*, *Gutta*, *Adragant*, *Ammoniac*, *Asa Fetida*, *Bdelium*, *Balm*, *Benjoin*, *Campbor*, *Copal*, *Elaeag*, *Frankincense*, *Esperbium*, *Galbanum*, *Lacca*, *Manna*, *Myrrh*, *Olibanum*, *Sagapenum*, *Sanguis Draconis*, *Sarcocolla*, *Stacte*, *Storax*, *Tacamabacha*, *Turpentine*. See each described under its proper Article.

Theophrastus speaks of a way of multiplying Plants, perform'd per *Lachrymas*, by means of the Gum or Resin; but *Agricola* takes this to be only practicable where there are Seeds in the Gum.

Gum-Anima, or *Animi*, is a resinous Juice oozing from a Tree by the Portuguese called *Courbari*, growing in diverse Parts of America.

This *Gum* is very hard and transparent, of an agreeable Smell, not unlike Amber: It neither dissolves in Water nor Oil, and consequently is not properly accounted a *Gum*. In lieu of this, they frequently substitute *Copal*.

Gum-Arabic, call'd also *Thebaic*, *Sarracenic*, *Babylonish*, and *Achabitic*, from the Places or the Tree which produce it, is the Juice of a little Tree growing in Egypt, of the *Cassia* Kind, called in Latin *Acacia foliis Scorpioides Leguminosa*. 'Tis very transparent, glutinous upon the Tongue, almost insipid to the Taste, and twisted somewhat in form near of a Worm.

It is esteem'd good to incrassate, to stop the Pores, blunt the Points of too pungent Medicines, and temper the Acrimony of the Trachea in Coughs, &c.

Gum-Gutta, or *Gutta-Gamba*, or *Gutta-Gemon*, or *Gambandra*, popularly *Gambocbe*, is a resinous Gum brought from the Kingdom of *Stam*, &c. in large Pieces fashion not unlike Saucigees, hard, brittle, and very yellow.

It oozes from Incisions made in a kind of prickly Shrub, which climbs up the neighbouring Trees. It purges violently both upwards and downwards; and is particularly used in Dropsies, the Ich, &c. but it is dangerous.

It serves also to make a yellow Colour, for painting in Miniature. See *MINIATURE*.

Gum-Senegal, is the Gum ordinarily sold by the Druggists for *Gum-Arabic*, which it resembles very nearly both as to Form and Virtue: It is either white bordering on the yellow, or of a deep Amber Colour, transparent, &c. It oozes out of a prickly Shrub common enough in *Africa*. The Gum is brought as from *Senegal*, whence its Name.—

Gummo-Rofin, or *Gum-Rofin*, is a harden'd Juice of a middle Nature between a Gum and a Resin, being both dissoluble in aqueous Menstruums like a Gum; and in oleaginous ones like a Resin.

Such are *Mastic*, *Campior*, *Storax*, &c. Some Naturalists make a Class of *Irregular Gummo Resins*, being such as dissolve, tho' with Difficulty, and not perfectly, both in aqueous and oleaginous Liquors; as *Zedaium*, *Myrrh*, &c.

Gum, among Gardeners, is a Disease incident to Fruit Trees, of the Stone kind, as Peaches, Plumbs, Apricots, Cherries, &c. See *DISEASE*, &c.

The Gum is a kind of Gangrene, arising from a Corruption of the Sap, which extrivates and hardens. It usually begins on some naked or broken Part, and spreads it self to the rest. To avoid its spreading, *M. Quintaine* directs to cut off the morbid Branch two or three Inches below the Part affected.

This Gum is no more than a thick, distemper'd, viscid Juice, which not being able to make its way through the Fibres of the Body of the Tree, to feed and supply them, is obliged, by the Prorusion of other succeeding Juice, to burst its Vessels, which lie between the Wood and Bark, and to ooze out upon the Bark.

When the Distemper ferrounds the Graft, it admits of no Remedy: When it is only on one Side of a Bough, the Gum must be taken off to the Quick of it; some Cow-dung clap'd on the Wound, and cover'd over with a linnen Cloth, and tied down.—

GUN, a Fire-Arm, or Weapon of Offence, which forcibly discharges a Ball, Shot, or other offensive Matter, thro' a Cylindrical Barrel, by means of Gun-powder. See *BALL*, *GUN-POWDER*, *ARM*, &c.

GUN is a general Name, under which are included divers, or even most Species of Fire-Arms: They may be divided into *great* and *small*.

Great-Guns, called by the general Name *Cannon*, make what we call *Ordinance*, or *Artillery*; under which come the several Sorts of *Cannon*, as *Cannon-Royal*, *Demi-Cannon*, &c. *Culverins*, *Demi-Culvers*, *Sakers*, *Minions*, *Falcons*, &c. See *ORDNANCE*; see also *CANNON*, *CULVERIN*, &c. *Small Arms* include

Muskets, *Musketoons*, *Carabines*, *Blunderbusses*, *Fowling-Pieces*, &c. See *CARABINE*, *MUSKET*, *FOWLING-PIECE*, &c.

Pistols and *Mortars* are almost the only Kinds of regular Weapons charg'd with Gun-powder, that are excepted from the Denomination of *Guns*. See *MORTAR* and *PISTOL*.

For the History and Invention of *Guns*, } see } *CANNON* and *GUN-POWDER*.
For the Use and Application of *Guns*, } see } *GUNNERY*.

GUNNERS, Officers of the Tower, and other Garrisons, whose Business is to manage and look after the Ordnance mounted on the Lines and Batteries, which are all fix'd and ready with Carouches and Ball, for Service, on the shortest Warning.—One or more of them are on Duty Day and Night. See *ORDNANCE* and *TOWER*.

Master-GUNNER of England, is an Officer appointed to teach and instruct all such as desire to learn the Art of Gunnery, and to admit to every Scholar an Oath; which, beside the Duty of Allegiance, obliges him not to serve any foreign Prince or State without Leave; nor to teach the Art of Gunnery to any, but such as have taken the said Oath; and to certify to the Master of the Ordnance, the Sufficiency of any Person recommended to be one of his Majesty's *Gunnery*.

The *Gunner*, Sir *J. Moor* observes, should know his Pieces, and their Names, which are taken from the Height of the Bore, the Names of the several Parts of a Piece of Ordnance, how to terriate his Gun, and how to dispart it. See *ORDNANCE*, *TERTIATE*, *DISPART*, &c.

GUNNERY, the Art of shooting with Guns and Mortars, i. e. of charging, directing, and exploding thofe Fire-

Arms to the best Advantage. See *GUN* and *MORTAR*.

GUNNERY is sometimes considered as a part of the military Art, and sometimes of Pyrotechny. See *WAR* and *PYROTECHNY*.

To the Art of *Gunnery* belongs the Knowledge of the Force, and Effect of Gun-powder, the Dimensions of Pieces, and the Proportions of Powder and Ball they carry; with the Methods of Managing, Charging, Pointing, Spunging, &c. See *GUN-POWDER*, *CHARGE*, *POINTING*, *SPUNGE*, &c.

Some Parts of *Gunnery* are brought under mathematical Consideration, which among Mathematicians are called absolutely by the Name *Gunnery*, viz. the Method of elevating or raising the Piece to any given Angle, and of computing its Range; or of raising and directing it so, as it may hit a Mark or Object propos'd.

The Instruments chiefly used in this Part of *Gunnery*, are the Callipers or Gunners Compasses, Quadrant, and Level; and the Methods of applying which see under the Articles *CALLIPER*, *LEVEL*, and *QUADRANT*.

The Line or Path in which the Bullet flies, whatever Direction or Elevation the Piece is in, is found to be the same with that of all other Projectiles, viz. a Parabola. See *PARABOLA*.

Hence, the particular Laws observed in the Motion or Flight of the Ball, its Velocity, Extent, &c. with the Rules for hitting Objects, are delivered under the Article *PROJECTILE*.

Matus, an *English Engineer*, is mentioned as the Person who first taught any regular Use of Mortars, in the Year 1634; but all his Knowledge was experimental and tentative; he knew nothing of the Curve the Shot describes in its Passage, nor of the Difference of Range at different Elevations. And most of the Gunners and Engineers employ'd about Batteries, &c. to this Day go by no better Rules: If the Range does not hit right, they raise or lower the Piece, till they bring it to a Truth: And yet there are certain Rules, founded on Geometry, for all these Things; most of which we owe to *Galles Engineer* to the Grand Duke of *Tuscany*, and his Disciple *Toricellini*.

A Ball or Bomb going out of a Piece, we find, never proceeds in a straight Line towards the Piece it is levelled at, but begins to rise from its Line of Direction the Moment it is out of the Mouth of the Piece.—This some account for thus: The Grains of Powder nearest the Breech, taking Fire first, press forward, by their precipitated Motion, not only the Ball, but likewise those Grains which follow the Ball along the Bottom of the Piece; where successively taking Fire, they strike, as it were, the Ball underneath, which because of a necessary Vent, has not the same Diameter, as the Diameter of the Bore; and so insensibly raise the Ball towards the upper Edge of the Mouth of the Piece, against which it so rubs in going out, that Pieces very much used, and whose Metal is soft, are observ'd to have a considerable Canal there, gradually dug by the Friction of Balls. Thus the Ball going from the Cannon, as from the Point of the Parabola E, Tab. Fortification, Fig. 12. raises it self, in its Progress, to the Vertex G; after which it descends by mix'd Motion.

Ranges made from the Elevation of 45 Deg. are the greatest; and those made from Elevations equally distant from 45 Deg. are equal; that is, a Piece of Cannon, or a Mortar, level'd to the 42th Deg. will throw a Ball, or Bomb, the same Distance, as when they are elevated to the 50th Deg. and as many at 50 as 60, and 60 of others.

It has been shewn, that to find the different Ranges of a Piece of Artillery in all Elevations, we must, 1st. Make a very exact Experiment by firing off a Piece of Cannon, or Mortar, at an Angle well known, and measuring the Range made, with all the Exactness possible; for by one Experiment well made, we may come at the Knowledge of all others, in the following Manner.

To find the Range of a Piece, at any other Elevation required, say, as the Sine of double the Angle under which the Experiment is made, is to the Sine of double the Angle of an Elevation propos'd, so is the Range known by the Experiment, to the other required.

GUN-POWDER, a Composition of Salt-Peter, Sulphur, and Charcoal, mix'd together, and usually granulated; which easily takes Fire, and rarifies or expands with great Vehemence, by means of its Elastic Force. See *ELASTICITY*, *RAREFACTION*, &c.

"Is to this Powder we owe all the Action, and Effect of Guns, Ordnance, &c. so that the modern military Art, Fortification, &c. depend wholly thereon. See *GUN*, *ORDNANCE*, *FORTIFICATION*, &c.

The Invention of *Gun-powder* is ascribed, by *Polydore Virgil*, to a Chymist, who having accidentally put some of this Composition in a Mortar, and cover'd it with a Stone; it happen'd to take Fire, and blew up the Stone.

Thevet says, the Person here spoke of, was a Monk of *Frybourg*, named *Constantine Anselm*: But *Belleforest* and other Authors, with more Probability, hold it to be *Zariboldus Schwarz*, or the Black: At least it is affirm'd, he

he first taught the Use of it to the *Venetians*, in the Year 1380, during the War with the *Genovesi*; and that it was first employed in a Place antiently called *Fissa Candeeana*, now *Choggia*, against *Laurence de Medicis*; and that all *Italy* made Complaints against it, as a manifest Contravention of a fair Warfare.

But what contradicts this Account, and shows *Gun-powder* of an older *Age*, is, that *Peter Messius*, in his various Readings, mentions, that the *Moor* being besieged in 1343, by *Alphonfus XI. King of Castile*, discharged a sort of Iron Mortars upon them, which made a Noise like Thunder: which is seconded by what *Dou Pedro Bishop of Leon* relates in his Chronicle of King *Alphonfus* who reduced *Tolosa*, viz. that in a Sea Combat between the King of *Tunis*, and the *Moorish King of Sevil*, above 400 Years ago, those of *Tunis* had certain Iron Tans or Barrels, wherewith they threw Thunder-boits of Fire.

Du Cange adds, that there is mention made of it in the Registers of the Chambers of Accounts in *France* as early as the Year 1338. See CANNON.

To say no more, it appears that our *Roger Bacon* knew of *Gun-powder* 150 Years before *Sebwarts* was born: That excellent Friar mentions the Composition in express Terms, in his Treatise of *Nobilitate Magie*, publish'd at *Oxford* in 1216. 'You may raise Thunder and Lightning at pleasure,' says he, by only taking Sulphur, Nitre, and Charcoal, which singly have no Effect, but mix'd together, and confin'd in a close Place, cause a Noise and Explosion greater than that of a Clap of Thunder.'

There are divers Compositions of *Gun-powder*, with respect to the Proportions of the three Ingredients; to be met with in Pyrotechnical Writers: But the Process is much the same in all.

The Sulphur and Salt-peter being purified, and reduced to Powder, are put, with the Charcoal-Dust, in a Mortar, moisten'd with Water or Spirits of Wine, or the like, and pounded 24 Hours together; taking Care to wet the Mass from time to time, to prevent its taking Fire: Lastly, squeezing it through a Sieve, it is formed into little Grains, or Globules; which being dried, the Powder is complet; and the least Spark being struck thereon from a Steel and Flint, the whole will be immediately inflam'd, and burst out with extreme Violence.

The Effect is not hard to account for: The Charcoal part of the Grain whereon the Spark falls, catching Fire like Tinder, the Sulphur and Nitre are readily melted, and the former also breaks into Flame; and at the same time the contiguous Grains undergo the same Fate. Now 'tis known that Salt-peter, when ignited, rarifies to a prodigious Degree. See SALT-PETER, and RARIFICATION.

Sir J. Newton reasons thus on the Point: The Charcoal and Sulphur in *Gun-powder*, easily take fire, and kindle the Nitre; and the Spirit of the Nitre being thereby rarified into Vapour, rushes out with an Explosion much after the manner that the Vapour of Water rushes out of an *Aeolipile*; the Sulphur also being volatile, is converted into Vapour, and augments the Explosion: Add that the acid Vapour of the Sulphur, namely, that which distils under a Bell into Oil of Sulphur, entering violently into the fix'd Body of the Nitre, lets loose the Spirit of the Nitre, and excites a greater Fermentation, whereby the Heat is further augmented, and the fix'd Body of the Nitre is also rarified into Fume, and the Explosion thereby made more vehement and quick.

For if Salt of Tartar be mixed with *Gun-powder*, and that Mixture be warmed till it takes Fire, the Explosion will be more violent and quick than that of *Gun-powder* alone, which cannot proceed from any other Cause than the Action of the Vapour of the *Gun-powder* upon the Salt of Tartar, whereby that Salt is rarified. See PULVIS FULMINANS.

The Explosion of *Gun-powder* arises, therefore, from the violent Action whereby all the Mixture being quickly and vehemently heated, is rarified and converted into Fume and Vapour; which Vapour, by the Violence of that Action, becoming so hot as to shine, appears in the Form of Fume. See FIRE.

M. de la Hire ascribes all the Force and Effect of *Gun-powder*, to the Spring or Elasticity of the Air, inclosed in the several Grains thereof, and in the Intervals or Spaces between the Grains: The Powder being kindled, sets the Springs of so many little Parcels of Air a-playing, and dilates them all at once; whence all the Effect; the Powder itself only serving to light a Fire which may put the Air in Action; after which the whole is done by the Air alone. See AIR.

Gun-powder is a Commodity of such Consequence, both in respect of Speculation, of War, and of Commerce; (the Consumption thereof being incredible,) that it will deserve a more particular Detail—To make *Gun-powder* ducly, then, Regard is to be had, that the *Salt-Peter* be pure, and in fine large Crystals or Shootings: Otherwise, it is to be purified, by taking away its fix'd or common Salt, and earthy Parts, thus: Dissolve 10 Pounds of Nitre, in a sufficient Quantity of fair

Water, settle, filtrate, and evaporate it in a glazed Vessel, to the Diminution of half, or till a Pellicle appear on it: The Vessel may then be taken off from the Fire, and set in a Cellar: In twenty-four Hours the Crystals will shoot, which separate from the Liquor; and after the like manner may the Liquor be crystalliz'd several Times, till all the Salt be drawn forth: This done, put it into a Kettle, and that on a Furnace with a moderate Fire, which gradually encrease till it begins to smoke, evaporate, loest its Humidity, and grow very white: It must be kept continually stirring with a Ladle, for fear it should return to its former Figure, whereby its Greatness will be taken away; after that, so much Water is to be poured into the Kettle, as will cover the Nitre, and when 'tis dissolv'd and reduc'd to the Consistency of a thick Liquor, it must be stirred with a Ladle, without Intermission, till all the Moisture is again evaporated, and it be reduced to a dry and white Meal.

The like Regard is to be had to the Sulphur, chusing that which is in huge Lumps, clear and perfectly yellow, not very hard nor compact, but porous; nor yet too much shining; and if when set on the Fire, it freely burns away all, leaving little or no residant Matter, 'tis a sign of its Goodness; so likewise if it be pressed between two Iron Plates that are hot enough to make it run, and in the running appear yellow, and that which remains of a reddish Colour, it may be concluded to be fit for the purpose—But, in case the same be soal and impure, it may be prepared in this manner: Melt the Sulphur in a large Iron-Ladle or Pot over a very gentle Coal-fire well kindled, but not flaming; then scum off all that rises on the Top, and swims upon the Sulphur; take it presently after from the Fire, and strain it through a double Linnen-Cloth, letting it pass at leisure; so will it be pure, the gross filthy Matter remaining behind in the Cloth.

For the Charcoal, the third Ingredient, such should be choicn as is large, clear, free from Knots, well burnt, and cleaving.

There are three Kinds of Powder, viz. *Cannon-Powder*, *Musket-Powder*, and *Pistol-Powder*, of each of these again there are two Sorts, a *stronger* and a *weaker*; all which Differences arise only from the various Proportions.

The Proportions are thus: In the stronger *Cannon-Powder*, to every hundred Pounds of Salt-Peter, 25 Pounds of Sulphur are generally allowed, with the same Quantity of Charcoal; and in the weaker *Cannon-Powder*, to every hundred Pounds of Salt-Peter, 20 Pounds of Sulphur, and 24 of Charcoal. As for the stronger *Musket-Powder*, 20 hundred Pounds of Salt-Peter require 18 Pounds of Sulphur; and 20 of Charcoal; and in the weaker there go to an hundred Pounds of Salt-Peter, 15 of Sulphur, and 18 of Charcoal. In the stronger *Pistol-Powder*, an hundred Pounds of Salt-Peter require 12 of Sulphur, and 15 of Coal; whereas the weaker has an hundred Pounds of Salt-Peter, only 10 of Sulphur, and but 18 of Charcoal.

Other Authors prescribe other Proportions: *Semiencantz*, for Mortars, directs an hundred Pounds of Salt-Peter, 25 of Sulphur, and as many of Charcoal: For great Guns, an hundred Pounds of Salt-Peter, 15 of Sulphur, and 18 of Salt-Peter: For *Muskets* and *Pistols*, an hundred Pounds of Salt-Peter, 8 of Sulphur, and 10 of Charcoal.

Methius extols the Proportion of one Pound of Salt-Peter to three Ounces of Charcoal; and two, or two and a quarter of Sulphur: than which, he affirms, no *Gun-powder* can possibly be stronger.

He adds, that the usual Practice of making the *Gun-powder* weaker for Mortars, than Guns, as in the Example above, is without any Foundation, and renders the Expence needlessly much greater: For, whereas to load a large Mortar, 24 Pounds of common Powder is required, and consequently to load it ten times 240 Pounds; he shews, by Calculation, that the same Effect would be had by 180 Pounds of the strong Powder.

As to the Process of making the *Gun-powder*: All the Ingredients are first to be finely powder'd, then moisten'd with fair Water, or Vinegar, or Spirit of Wine, or with Water and Spirit of Wine mixed together, or Urine, which is usual; afterwards all must be well beat for the Space of 24 Hours at least, and then granulated after the following manner: A Sieve is to be prepared with a Bottom of thick Parchment made full of round Holes, and the former beaten Mass moisten'd before-hand, with 20 Ounces of Spirit of Wine, 12 of Spirit of Wine-Vinegar, 12 of Spirit of Nitre, 2 of Spirit of Sal Armoniack, and 1 Ounce of Camphire dissolved in Spirit of Wine, and let all these be mingled together. Otherwise, take 40 Ounces of Brandy, and one of Camphire, and let them be mixt and dissolved for the said Purpose: When the whole Compound is made up into Balls as big as Eggs, put them into the Sieve, and with them a wooden Ball; which move up and down about the Sieve, so that it may break the Balls of Powder, and make it pass thro' the little Holes in Coats.

For greater Quantities, Mills are usually provided, by means of which, more Work may be perform'd in one Day, than a Man can do in an hundred. See MILL.

Gun-Powder may also be made of several Colours, but the Black is the most serviceable of any. To make *White-Powder*, proceed thus:

Take ten Pounds of Salt-Peter, one of Sulphur, and two of the Saw-dust of Elder or the like Wood powder'd fine; mix them together, and use the former Method—Or thus, with ten Pounds of Nitre, and a Pound and a half of Sulphur dried and finely powder'd, mix two Pounds of Saw-dust, &c. or instead of that, rotten Wood dried and powder'd, with two Pounds and three Ounces of Salt of Tartar; whereof make *Powder* to be kept close from the Air.

'Tis also to be noted, that in making *Pistol-Powder*, if you would have it stronger, it should be stirred up several Times while in the Mortar, and moisten'd with Water distilled from Orange or Lemmon-peels in an Alembick, and then beat for 24 Hours, as aforesaid.

Corn-Powder is of so much greater Force than when in Dust or Meal, that 'tis concluded, the larger Grains are stronger than the smaller; for which Reason *Cannon-Powder* is granulated larger than other *Powders*; and therefore *Powder* in loading should not be beat home into the Piece, so as to bruise the Grains.

There are three Ways to prove the Goodness of *Gun-powder*. 1. By Sight, for if it be too black, it is too moist, or has too much Charcoal in it; so also if rubbed upon white Paper, it blackens it more than good *Powder* does; but if it be a kind of Azure Colour, somewhat inclining to Red, 'tis a sign of good *Powder*. 2. By Touching, for if in crushing it with your Fingers-Ends, the Grains break easily and turn into Dust without feeling hard, it has too much Coal in it, or if in pressing under your Fingers upon a smooth hard Board, some Grains feel harder than the rest, or as it were dent your Fingers-Ends, the Sulphur is not well mixed with the Nitre, and the *Powder* is naught. 3. By Burning, wherein little Heaps of *Powder* are laid upon White Paper three Inches or more asunder, and one of them fired; which if it only fires all away, and that suddenly and almost imperceptibly, without firing the rest, and make a small thundering Noise, and a white Smoke rises in the Air almost like a Circle, the *Powder* is good; if it leaves black Marks, it has too much Coal, or is not well burnt: If it leaves a Greenness, the Sulphur or Nitre are not well cleaned or ordered. Again, if two or three Corns be laid on Paper an Inch distant, and Fire be put to one of them, and they all fire at once, leaving no Sign behind, but a white smoky Colour in the Place, and the Paper not touched; and the *Powder* is good. So also if fired in a Man's Hand; and it burns not; but if black Knots appear which burn downwards in the Place where Proof was made after firing, 'tis not strong enough, but was Nitre.

To recover damaged *Powder*, the Method of the *Powder-Merchants* is to put part of the *Powder* on a Sailcloth, to which they add an equal Weight of what is equally good; and with a Shovel mingle it well together, dry it in the Sun, and barrel it up, keeping it in a dry and proper Place.

Others again, if it be very bad, restore it by moistning it with Vinegar, Water, Urine, or Brandy; then they beat it fine, scarce it, and to every Pound of *Powder*, add an Ounce, an Ounce and half, or two Ounces (according as 'tis decay'd) of melted Salt-Peter; afterwards these Ingredients are to be moisten'd and mixed well, so that nothing can be discern'd in the Composition; which may be known by cutting the Mass, and then they granulate as aforesaid.

In Calc the *Powder* be in a manner quite spoiled, the only way is to extract the Salt-Peter with Water according to the usual manner, by boiling, filtering, evaporating, and crystallizing; and then with fresh Sulphur and Charcoal, to make it up a new again.

GUNTERS-LINE, call'd also *Line of Lines*, and *Line of Numbers*, is a graduated *Line* usually placed on Scales, Rules, Sectors, &c. See SCALE, RULE, &c.

This *Line* is only the Logarithms transfer'd upon a Ruler, from the Tables, so as to answer much the same Purposes instrumentally, as the Logarithms themselves do arithmetically.—What the Logarithms do by Addition and Subtraction, is done in this *Line* by turning a Pair of Compasses this way and that. See LOGARITHM.

This *Line* has been contriv'd various Ways, for the Advantage of having it as long as possible.—As, first, on the two-foot Ruler, contriv'd by *Edm. Gunter*, and call'd *Gunter's Scale*; whence also the *Line* itself took its popular Denomination *Gunter's Line*. See *GUNTER'S SCALE*.

After this, *Wingate* doubled the *Line*, or laid it together, so as one might either work right on, or a-cross. Then it was project'd in a Circle, by *Oughtred*, and made to slide by the same Author: And lastly, project'd in a kind of Spiral, by *Brown*.

The Method of using or applying it, is much the same in all; except that in *Gunter's* and *Wingate's* way; common

Compasses are us'd: In *Oughtred's* and *Brown's*, flat Compasses, or an opening Index; and in the Sliding Rules no Compasses at all. See SLIDING-RULE.

Description of Gunter's-Line, or the Line of Numbers.

The *Lines* represented, is usually divided into an hundred Parts, whereof every Tenth is number'd, beginning with 1 and ending with 10: So that if the first great Division 1, signify one tenth of any whole Number or Integer, the next will signify 2, two tenths; 3, three tenths, &c. and the intermediate Divisions to many 100 Parts of the same Integer, or Tenths of one of the former Tenths. For Numbers greater than 10, the Sub-divisions must signify Integers, and the greater Divisions 10 Integers, so that the whole *Line* will express 100 Integers; and if you would have it still more, then the Sub-divisions to be each 10 Integers, and each great Division 100, so that the whole be 10000; and after the same Manner, may it be extended to 10000, by making each Sub-division 100.

A whole Number under four Figures being given, to find the Point on the Line of Numbers that represents the same.

Look for the first Figure of the Number among the large figured Divisions; this leads you to the first Figure of your Number. For the second, count so many Tenths from that Division forwards, as that second Figure amounts to. For the third Figure, count from the last Tenth so many Centesims as the third Figure contains: And so for the fourth Figure, count from the last Centesim so many Millions as the fourth Figure has Units, or is in Value; that will be the Point where the Number propounded is, on the *Line* of Numbers.

For an Example—To find the Point representing the Number 1728—for 1000 take the first great Division marked 1 on the *Line*; then for 7 reckon seven Tenths forwards, this is 700; for 2, reckon two Centesims from the seventh Tenth; and for 8, estimate the following Centesim to be divided into 10 Parts, if it be not expressed, which in *Lines* of ordinary Length cannot be done; and 8 of that supposed 10 Parts, is the precise Point for 1728, the Number propounded to be found; and the like of any other Number.

To find a Fraction, consider that the *Line* properly only expresses decimal Fractions, as thus, $\frac{1}{10}$, or $\frac{1}{100}$, or $\frac{1}{1000}$; and nearer the Rule cannot well come than as one Inch, one Tenth, one Hundred, or one Thousand Part of an Inch: So that for other Fractions, as Quarters, Half-Quarters, &c. you must either estimate them as near as you can reasonably, or else reduce them into Decimals.

Use of Gunter's-Line, or the Line of Numbers.

1^o Two Numbers being given, to find a third geometrically proportional to them; and to three a fourth Number, to four a fifth, &c.—Extend the Compasses on the *Line* from one Number to another; then that Extent applied upwards or downwards, as you would either increase or diminish the Number from either of the Numbers, the moveable Point will fall on the third proportional Number required. Again, the same Extent applied the same way from the third, will give a fourth; and from the fourth a fifth, &c.

For Example—Let the two Numbers 2 and 4 be propounded to find a third Proportional, &c. to them; extend the Compasses on the first Part of the *Line* of Numbers, from 2 to 4; which done, and the same Extent being applied upwards from 4, the moveable Point will fall on 8, the third Proportional required; and from 8 it will reach to 16, the fourth Proportional; and from 16 to 32 the fifth, &c. Contrariwise, if you would diminish, as from 4 to 2, the moveable Point will fall on 1, and from 1 to $\frac{1}{2}$; and from $\frac{1}{2}$ to $\frac{1}{4}$, &c.

But, generally, in this, and most other Works, make use of the small Divisions in the middle of the *Line*; that you may the better estimate the Fractions of the Numbers you make use of; for how much you miss in setting the Compasses to the first and second Term, so much the more you will err in the fourth; therefore the middle Part will be most useful. For Example; as 8 to 11, so is 12 to 16.50, if you imagine one Integer to be divided but into 10 Parts, as they are on the *Line* on a two foot Rule.

2^o One Number being given to be multiplied by another, to find the Product—Extend the Compasses from 1 to the Multiplier; and the same Extent applied the same way from the Multiplicand, will make the moveable Point fall on the Product: Thus, if 6 be given to be multiplied by 5; extending the Compasses from 1 to 5, the same Extent will reach from 6 to 30, the Product sought.

³⁰ One Number being given to be divided by another, to find the Quotient—Extend the Compasses from the Divisor *E. gr.* 25 to 1, and the same Extent will reach from the Dividend *E. gr.* 750, to the Quotient 30; or, extend the Compasses from the Divisor to the Dividend, the same Extent will reach the same way from 1 to the Quotient.

⁴⁰ Three Numbers being given, to find a fourth in direct Proportion—Extend the Compasses from the first Number, suppose 7, to the second, *v. g.* 14; that done, the same Extent applied the same way from the third, 22, will reach to the fourth Proportional sought, *viz.* 44.

⁵⁰ Three Numbers being given, to find a fourth in Inverse Proportion—Extend the Compasses from the first of the given Numbers, suppose 60, to the second of the same Denomination, *viz.* 30; if the Distance be applied from the third Number backwards, 5, it will reach to the fourth Number sought, 25.

⁶⁰ Three Numbers being given, to find a fourth in duplicate Proportion—If the Denominations of the first and second Terms be Lines, extend the Compasses from the first Term to the second, of the same Denomination; This done, that Extent being applied twice the same way from the third Term, the moveable Point will fall on the fourth Term required. *E. gr.* the Area of a Circle, whose Diameter is 14, being 154, what will the Content of a Circle be, whose Diameter is 28; applying that Extent the same way from 154 twice, the moveable Point will fall on 616, the fourth Proportional or Area sought.

⁷⁰ To find a mean Proportional between two given Numbers—Bisect the Distance between the given Numbers, the Point of Bisection will fall on the mean Proportional sought. Thus the Quotient of the two Extremes divided by one another. Extremes being 8 and 32, the middle Point between them will be found 16.

⁸⁰ To find two mean Proportionals between two given Lines—Trisect the Space between the two given Extremes; the two Points of Trisection will give the two Means required—Thus if 8 and 27 be the two given Extremes, the two Means will be found 12 and 18.

⁹⁰ To find the Square Root of any Number under 100000—The Square Root of a Number is always a mean Proportion between 1, and the Number whose Root is required; yet with this general Caution, that if the Figures of the Number be even, that is, 2, 4, 6, 8, 10, &c. then you must look for the Unit at the beginning of the Line, and the Number in the second Part or Radius, and the Root in the first Part; or rather reckon 10 at the End to be Unity; and then both Root and Square will fall backwards towards the Middle in the second Length or Part of the Line—If they be odd, the Middle 1 will be most convenient to be counted Unity, and both Root and Square will be found from thence forwards towards 10—On this Principle the Square Root of 9 will be found to be 3; the Square Root of 64, to be 8, &c.

¹⁰⁰ To find the Cube Root of any Number under 1000000000—The Cube Root is always the first of two mean Proportionals between 1 and the Number given, and therefore to be found by trifling the Space between them. Thus the Cube Root of 1728 will be found 12; the Root of 17280, nearly 26; the Root of 172800 almost 56.

Though the Point on the Line representing all the square Numbers is in one Place, yet by altering the Unit, it produces various Points and Numbers for their respective Roots.—The Rule to find this, is to put Dots, or suppose them put over the first Figure to the Left-hand, the fourth Figure, the seventh, and the tenth; If then the last Dot on the Left-hand falls on the last Figure, as it does in 1728, the Unit must be placed at 1 in the Middle of the Line, and the Root, the Square, and the Cube, will all fall forwards toward the End of the Line.

If it fall on the last but 1, as in 17280, the Unit must be placed at 1 in the beginning of the Line, and the Cube in the second Length; or the Unit may be placed at 10 at the End of the Line; and then the Root, the Square, and Cube, will all fall backwards, and be found in the second Part, between the middle and the End of the Line.—Thus will the Cube Root of 8 be found 2; that of 27 3; that of 64, 4; that of 125, 5; that of 216, 6, &c.

For particular Uses of GUNTER'S Line in the Measuring of Timber, Gauging of Vessels, &c. See SLIDING-RULE.

For other Uses in Geometry, Trigonometry, &c. See SECTOR and GUNTER'S SCALE.

GUNTER'S QUADRANT, is a Quadrant made of Wood, Brass, or the like; being partly a Stereographic Projection on the Plane of the Equinoctial, the Eye supposed in one of the Poles: So that the Tropick, Ecliptick, and Horizon,

are Arches of Circles, but the Hour-Circles all Curves, drawn by means of several Altitudes of the Sun for some particular Latitude every Day in the Year. See STEREOGRAPHIC and PROJECTION.

The Use of this Instrument is to find the Hour of the Day, the Sun's Azimuths, &c. and other common Problems of the Globe; as also to take the Altitude of an Object in Degrees.

See its Description and Use more at large under the Article GUNTER'S QUADRANT.

GUNTER'S SCALE, called also by Navigators absolutely the Gunter, is a large Plain Scale, with divers Lines thereon; of great Use in working Questions in Navigation, &c. See SCALE and SAILING.

On one Side the Scale represented Tab. Trigonometry, Fig. 35. are the Line of Numbers, marked Numbers; the Line of artificial Sines, marked Sines; the Line of artificial Tangents, marked Tangents; the Line of artificial versed Sines, marked V. S. the artificial Sines of the Rhumbs, marked S. R. the artificial Tangents of the Rhumbs, marked T. R. the Meridian Line in Mercator's Chart, mark'd Merid. and equal Parts marked E. P.—To which, on the shorter Scales, of a Foot long, are usually added Lines of Latitudes, Hours, and Inclinations of Meridians.

On the Backside of the Scale are the Lines usually found on a Plain Scale. See PLAIN SCALE.

The Lines of artificial Sines, Tangents, and Numbers are so fitted on this Scale, that by means of a Pair of Compasses, any Problem, whether in right-lined or spherical Trigonometry, may be solved very expeditiously, and with tolerable Exactness; whence the Instrument becomes extremely useful in all Parts of Mathematics where Trigonometry is concerned; as Navigation, Dialling, Astronomy. See TRIGONOMETRY, &c.

The same Lines are also occasionally laid down on Rulers to slide by each other; hence called Sliding Gunter; So as to be used without Compasses; but he that understands how to use them with, may, by what we have said of Everard's and Coggehall's Sliding-Ruler, use them without. See SLIDING-RULE.

Use of GUNTER'S Scale.

¹⁰ The Base of a right-lined right-angled Triangle being given, 30 Miles, and the opposite Angle thereto 26 Degrees; to find the Length of the Hypotenuse.

The trigonometrical Canon or Proportion is thus—As the Sine of the Angle, 26 Deg. is to the Base 30 Miles, so is Radius to the Length of the Hypotenuse—Set one Foot of the Compasses, therefore, on the 26th Deg. of the Line of Sines; and extend the other to 30 on the Line of Numbers, and the Compasses remaining thus opened, set one Foot on 90 Deg. on the End of the Line of Sines, and extend the other on the Line of Numbers: This will give 68 Miles and a half, for the Length of the Hypotenuse sought.

²⁰ The Base of a right-angled Triangle being given, 25 Miles, and the Perpendicular 23; to find the Angle opposite to the Perpendicular.

As the Base 25 Miles is to the Perpendicular 15 Miles, so is Radius to the Tangent of the Angle sought.—Extend the Compasses, then, on the Line of Numbers, from 25 the Perpendicular given, to 25 the Base given; and the same Extent will reach the contrary way, on the Line of Tangents, from 45 Deg. to 57 Deg. the Angle sought.

³⁰ The Base of a right-angled Triangle being given, suppose 20 Miles, and the Angle opposite to the Perpendicular 50 Deg. to find the Perpendicular.

As Radius is to the Tangent of the given Angle 50 Deg. so is the Base 20 Miles to the Perpendicular sought.—Extend the Compasses then on the Line of Tangents, from the Tangent of 45 Deg. to the Tangent of 50 Deg. and the same Extent will reach on the Line of Numbers the contrary way, from the given Base 20 Miles, to the required Perpendicular 25 1/2 Miles.

Note, The Extent on the Line of Numbers is here taken from 20 to 25 1/2 forwards; that the Tangent of 50 Deg. may be as far beyond the Tangent of 45 Deg. as its Complement 40 Deg. wants of 45 Deg.

⁴⁰ The Base of a right-angled Triangle being given, suppose 35 Miles, and the Perpendicular 48 Miles; to find the Angle opposite to the Perpendicular.

As the Base 35 Miles is to the Perpendicular 48 Miles, so is Radius to the Tangent of the Angle sought.—Extend the Compasses from 35, on the Line of Numbers, to 48; the same Extent will reach the contrary way on the Line of Tangents, from the Tangent of 45 Deg. to the Tangent of 56 Deg. 5 Min. or 53 Deg. 55 Min.—To know which of those Angles the Angle sought is equal to, consider that the Perpendicular of the Triangle being greater than the Base, and both the Angles opposite to the Perpendicular, and the

Base, making 90 Deg. the Angle opposite to the Perpendicular will be greater than the Angle opposite to the Base; and consequently the Angle 53 Deg. 55 Min. will be the Angle sought.

5^o The Hypothesis of a right-angled Spherical Triangle being given, suppose 60 Degrees, and one of the Sides 20 Degrees, to find the Angle opposite to that Side.

As the Sine of the Hypotenuse 60 Deg. is to Radius, so is the Sine of the given Side 20 Deg. to the Sine of the Angle sought—Extend the Compasses on the Line of Sines, from 60 Deg. to the Radius or 90 Deg. and the same Extent will reach on the Line of Sines the same Way, from 20 Deg. the given Side, to 23 Deg. 10 Min. the Quantity of the Angle sought.

6^o The Course and Distance of a Ship being given, to find the Difference of Latitude and Departure.

Suppose a Ship sails from the Latitude of 50 Deg. 10 Min. North, S. S. W. 48. 5 Miles: As Radius is to the Distance sailed 48. 5 Miles, so is the Sine of the Course, which is two Points, or the second Rhumb, from the Meridian, to the Departure—Extend the Compasses from 8 on the artificial Sine Rhumb-Line, to 48. 5 on the Line of Numbers; the same Extent will reach the same way from the second Rhumb, on the Line of artificial Sines of the Rhumbs, to the Departure: Writing 18.6 Miles.

Again, As Radius is to the Distance sailed 48. 5 Miles, so is the Cosine of the Course 67 Deg. 30 Min. to the Difference of Latitude—Extend your Compasses from the Radius, on the Line of Sines, to 48. 5 Miles on the Line of Numbers; the same Extent will reach the same way, from 67 Deg. 30 Min. on the Line of Sines, to 44.8 on the Line of Numbers; which converted into Degrees, by allowing 60 Miles to a Degree, and subtracted from the given North-Latitude 50 Deg. 10 Min. leaves the Remainder 49 Deg. 25 Min. the precise Latitude.

7^o The Difference of Latitude and Departure from the Meridian being given; to find the Course and Distance.

A Ship from the Latitude of 59 Deg. North, sails North-Eastward till she has altered her Latitude 1 Deg. 10 Min. or 70 Miles, and is departed from the Meridian 57. 5 Miles, to find the Course and Distance—As the Difference of Latitude 70 Miles is to Radius, so is the Departure 57. 5 Miles to the Tangent of the Course 39 Deg. 20 Min. or three Points and a half from the Meridian—Extend the Compasses from the fourth Rhumb, on the Line of artificial Tangents of the Rhumbs, to 70 Miles on the Line of Numbers, the same Extent will reach from 57. 5 on the Line of Numbers to the third Rhumb and a half on the Line of artificial Tangents of the Rhumbs, to 70 Miles on the Line of Numbers.

Again; as the Sine of the Course 39 Deg. 20 Min. is to the Departure 57. 5 Miles, so is the Radius to the Distance 90.6 Miles—Extend the Compasses from the third Rhumb and a half, on the artificial Sines of the Rhumbs, to 57. 5 Miles on the Line of Numbers; that Extent will reach from the Sine of the eighth Rhumb, on the Sines of the Rhumbs, to 90.6 Miles on the Line of Numbers.

8^o Three Sides of an oblique Spherical Triangle being given, to find the Angle opposite to the greatest.

Suppose the Side A B, Fig. 36. be 40 Deg. the Side B C 60 Deg. and the Side A C 96 Deg. to find the Angle ABC. Add the three Sides together, and from half the Sum subtract the greater Side A C, and note the Remainder: Thus, *c. gr.* the Sum will be 196 Deg. half of which is 98 Deg. from which subtracting 96 Deg. the Remainder is 2 Deg.

Then extend the Compasses from the Sine of 90 Deg. to that of the Side A B 40 Deg. and applying this Extent to the Sine of the other Side B C 60 Deg. you will find it reach to a fourth Sine 54 Deg.

Again; from this fourth Sine extend the Compasses to the Sine of half the Sum, *i. e.* the Sine of 73 Deg. the Complement of 98 Deg. to 180; this second Extent will reach from the Sine of the Difference 2 Deg. to the Sine of 3 Deg. 24 Min. against which, on the versed Sines, stands 151 Deg. 50 Min. the Quantity of the Angle sought.

GUN-SHOT WOUNDS. See WOUND.

GUSSET, in Heraldry, one of the Abatements of Honour. See ABATEMENT.

The *Gullet* is said to be appropriated to lascivious, effeminate, or wanton Persons. It is form'd of a Line drawn from the Dexter, of lesser Angle of the Chief, and descending diagonally to the chief Point; from whence another Line falls perpendicularly upon the Base: as in the Figure adjoining.

GUST, GUSTATION; } see { TASTE and GODY,
TASTING.

GUST-HOPES, is used by *Braslon* and other ancient Writers, for a Stranger, or *Guch*, who lodges with a Person the second Night.

In the Laws of St. Edward, published by *Lambard*, it is written *Gest*. See UNCOUTH.

GUTTA, a Latin Term for what in *Englisch* we call Drop. See DROX.

GUTTA *Anglicana*, the *Englisch Drops*, or the *Volatile Englisch Drops*, or *Goddard's Drops*, is a medicinal Liqueur prepared from divers Ingredients; of sovereign Efficacy against Coagulations of the Blood, malignant Fevers, and particularly the Small-Pox, Obstructions, Epilepsies, drousy Diseases, Vapours, &c.

The Inventor of these celebrated Drops, was *Dr. Goddard*, a Physician of *London*. The Secret of their Composition was purchased by *King Charles II.* at the Price of 6000 Pounds Sterling; whence the Denomination *Gutta Anglicana*.

This costly Receipt, we shall here gratify the Reader withal, a *Meillere Marche*: 'Take five Pounds of human Cranium of a Person hand'd, or dead of some violent Death, two Pounds of dried Vipers, two Pounds of Hart's-Horn, and two of Ivory; mince the whole small, put it in two or three Retorts, and distill it in a reverberatory Furnace, with the same Precautions as are ordinarily used in distilling Hart's-Horn and Vipers, to extract their volatile Salt. When the Vessels or Receivers are cold, unlute 'em, and shake them well, in order to loosen the volatile Salt from the Sides of the Vessels. Pour the whole into a large Glass Cucurbit, and filtrate it through a Brown Paper, in order to separate the Oil, which is here useless: Put the filtrated Liqueur in a Glass Retort, with a Sand Heat, and fit a Glass Retort thereto, as a Recipient: Take care all Things be well luted, and make a Cohobation of the said Matters at three Times. But, by the way, add all the Salt before separated from the Receivers; and after the said three Cohobations, unlute the Retorts, and pour the whole into a Matrass with a long Neck, to which fit a suitable Capital, and a Receiver; lute all the Joinings on each Side with a wet Bladder, and set the Vessel in a Sand Heat: By this means, the volatile Salt will be sublimed, and stick to the Capital, and upper Part of the Matrass. Continue the Fire till Spirit enough have rose to fuse and dissolve the Salt which arose first: Then take all the Fire out of the Furnace, that the Distillation may proceed no further; which is a Circumstance of the last Importance; without which the Medicine would be weaken'd by too much Phlegm. *Biet*, in the *Mem. de Trev. An. 1715*.

As to the Dose of this Remedy, they begin with 7 or 8 Drops, increasing, by Degrees, to 40 or 50, on pressing Occasions, as in Apoplexies, Lethargies, Weaknesses, &c.

The real Composition of the *Gutta*, however, is somewhat controverted. *M. Fourquet* assures us, that he had the Secret communicated to him by *Dr. Lister*; and that it is no other than the volatile Spirit of Raw-Silk rectified with Oil of Cinnamon, or other essential Oil. See *SILE*.

The same Author assures us, he had found by Experience that the *Gutta Anglicana* were not in any respect preferable to the common volatile Spirits of Hart's-Horn and Ammoniac, except that the Smell is more supportable.—*Mem. de l'Acad. An. 1700*.

GUTTA, in Architecture, are Ornaments in form of little Cones, used in the Plafond of the Doric Cornice, or on the Architrave, underneath the Triglyphs; representing a sort of Drops, or Bells; usually six in Number. See TRIGLYPH.

They are sometimes also called *Lachryme*, Tears; and *Campane* or *Compaunie*, Bells. *Leon. Baptista Alberti* calls them *Nails*.

GUTTA Serena, is a Disease of the Eyes, consisting in an entire Prevention of Sight, without any apparent Fault or Disorder of the Eyes, excepting that the Pupil looks somewhat larger and blacker than before. See EYES, &c.

Its Cause is supposed to be a Compression or Obstruction of the Optic Nerves, which prevents the due Flux of the animal Spirits into the Retina. *Pitcairn* ascribes it to an Indispotion of the Retina, occasioned by the Vessels thereof being too much distended with Blood.

The *Gutta Serena* is one of the most dangerous and untractable of all the Diseases of the Eyes. The Cure, according to *Pitcairn*, must be attempted with Mercurials and even Salivation, and with Decoctions of Galicum.

The *Musca Volitantes* are a pathognomic Sign of a growing *Gutta Serena*. The Greeks call it *Ananrosta*. See AMAUROSI.

GUTTERS, in Building, are a kind of Valleys in the Roofs of Buildings, serving to drain and receive the Rain-Waters. See ROOF.

GUTTURAL Letters, are those pronounced, or form'd as were in the Throat. See LETTER.

Dr. Wallis distinguishes the Vowels in our Language into Labial, Palatine, and *Guttural*; according to the three several Degrees of opening of the Mouth to pronounce them, larger, middle, and less. On this Footing he makes three *Guttural* Vowels, and three Labial, and as many Palatines. See VOWEL.

GUTTUS, a Latin Term used among Antiquaries, for a sort of Vase used in the Roman Sacrifices; to take the Wine and sprinkle it, *Guttatus*, Drop by Drop, upon the Victim. See SACRIFICE.

Vigenero on *T. Lily*, gives the Figure of the *Guttus*, as represented on divers Medals and other ancient Monuments.

GUTTY, or **GUTTE**, in Heraldry, is when a thing is represented as charged or sprinkled with Drops.

In Blazon, the Colour of the Drops is to be named: Thus, *Gutty* of Sable, of Gules, &c.

Some Authors will have red Drops called, *Gutty de Sang*, or Drops of Blood; black ones, *Gutty de Poix*, of Pitch; white, *Gutty d'Eau*, of Water, &c.

GUZES, in Heraldry, Roundies of a sanguin or murrey Colour. See **ROUNDLE**.

GWABR-MERCHER, a *British* Word, signifying a Payment or Fine made to the Lords of some Manors, upon the Marriage of their Tenants Daughters; as also upon their committing Incontinency. See **MAARHET** and **LAIRWITE**.

GYMNASIARCH, **GYMNASIARCHIA**, in Antiquity, the Master, or chief of a *Gymnasium*. See **GYMNASIUM**.

The Greeks did not rank the *Gymnasiarcha* among the Number of Magistrates; tho' his Office was of great Consideration, as having the Care of all their Youth, who were trusted to him to be form'd to Exercises of the Body.

He had two Offices under him, to assist him in the Government of the *Gymnasium*: The first named *Xystarch*, and the second *Gynastes*. The former was Master of the *Athleta*, and presided over the Wrestling. See **XYSTARCH**, **ATHLETA**, &c.

The latter had the Direction of all the other Exercises; taking Care they were performed in due Time and Manner; that they were not too severe; that the Youth attempted nothing beyond their Strength; and that nothing were done that might be injurious to their Health.

They had several subaltern Officers or Servants under them, for the Service and Instruction of the Youth committed to them.

The Word is compounded of *gymnasion*, and *archa*. Government.

GYMNASIUM, a Place of Exercise; or a Place fitted for performing Exercises of the Body. See **EXERCISE**.

Among the Antients, the *Gymnasium* was a Place destined for this very Purpose, and where People were even taught and regularly disciplin'd therein. See **XYSTES**.

If we may credit *Solon* in *Lucian's Anachars*, and *Cicero de Orat.* lib. 2. the Greeks were the first who had *Gymnasia*; and among the Greeks, the *Lacedaemonians*; after them, the *Athenians*.

Vitruvius describes the Structure and Form of the antient *Gymnasium* at length, lib. 5. c. 11.—The Word is Greek, *gymnasium*, form'd of *gymnos*. Naked; by reason they put off their Clothes, to practise with the more Freedom.

GYMNASITICE, **GYMNASITICA**, the *Gymnastic Art*; or the Art of performing the Exercises of the Body. See **EXERCISE**.

The *Gymnastica* comprehended all the Exercises, as Wrestling; Running, both on Foot and on Horseback; Fencing; the Discus, or Quoits; the Use of the Lance, &c. *Hoffman* reckons no less than 55 *Gymnastic Exercises*. See **WRESTLING**, **DISCUS**, &c.

It appears that they did not perform their Exercises quite naked so early as the Time of *Homer*, but always in Drawers; which they did not lay aside before the 32d Olympiad. One *Oxyppus* is said to have been the first that introduced the Practice; for having been worried by means of his Drawers undoing, and entangling him; he threw them quite aside, and the rest afterwards came to imitate him.

GYMNIC, **GYMNETUS**, something belonging to the Exercises of the Body.

The *Gymnic Games* are those wherein the Body is exercised; such as Wrestling, Running, Dancing, the Use of the Lance, and Quoit-Playing. See **GAME**.

It was those made the chief Divisions of the *Olympic*, *Neuean*, *Pythian*, and *Isthmian* Solemnities; being called by the Greeks *Pythianus*, and the Latins *Pythagorism*. See **OLYMPIC**, **NEUEAN**, **PYTHIAN**, and **ISTHMIAN**, &c.

GYMNOPEEDIA, a kind of Dance, in Use among the antient *Lacedaemonians*. It was performed during their Sacrifices, by young Persons who danced naked, singing at the same Time a Song in Honour of *Apollo*. See **DANCE**.

One *Terpander* is recorded as the Inventor of the *Gymnopedic*.

GYMNOPEIDICE, a kind of Dance, in Use among the Antients.

Athenens describes it as a *Bacchic* Dance, perform'd by Youths strip'd quite naked, with certain interrupted, tho' agreeable Motions, and Gestures of the Body, the Arms and

Legs being flourish'd and directed after a peculiar Manner, representing a sort of real Wrestling.

The Word is compounded of *gymnos*, naked, and *paida*, Child.

GYMNOSOPHISTS, a Set of *Indian* Philosophers, famous in Antiquity; denominated from their going barefooted. See **PHILOSOPHER**.

The Word *Gymnosophist* is form'd of the Greek *gymnosophistes*, *g. d.* a Sophist, or Philosopher, who goes naked.

This Name was given to the *Indian* Philosophers, whom the excessive Heat of the Country obliged to go naked; so that of *Peripateticks* was given those who philosophiz'd Walking. See **PERIPATETICKS**, &c.

Laertius, *Traces*, &c. will not have *Gymnosophist* to be the Name of any particular Sect, but a common Name of all the Philosophers in the *Indies*; And hence divides them into *Brachmans* and *Germans*. See **BRACHMANS**.

Among the *Germans*, called also by *Clement Alexand. Sarmatae*, some were called *Hylotii*; by *Clement Alexand. Alotii*, as inhabiting the Woods; which last seem to come nearest to the Notion of *Gymnosophisti*. *Clement* relates, that they neither inhabit Cities nor Towns, are clothed mostly with the Leaves of Trees, eat Acorns and Berries, and drink Water out of their Hands, abstaining from all Marriage and Procreation.

Apuleius Florid. lib. 1. describes the *Gymnosophisti* thus: 'They are all devoted to the Study of Wisdom, both the elder Masters, and the younger Pupils; and what to me appears the most amiable thing in their Character, is, that they have an Aversion to Idleness and Indolence: Accordingly, as soon as the Table is spread, ere a Bit of Victuals be brought, the Youth are all called together from their several Places and Offices, and the Masters examine them what good they have done since the Sunrise. Here one relates something he has discovered by Meditation; another has learn'd something by Demonstration: And as for those who have nothing to alledge why they should dine, they are turn'd out to Work fasting.'

The great Leader of the *Gymnosophisti*, according to *Jerom*, was one *Buddas*, call'd by *Clement* *Butta*; who is rank'd by *Suidas* among the *Brachmans*. That last Author makes *Buddas* the Preceptor of *Muses* the *Persian*, the Founder of the *Gymnosophisti*.

GYNECEUM, among the Antients, the Apartment of the Women; or a separate Place, where the Women kept themselves retired, and out of the Sight of the Men.

The Word is compounded of the Greek *gynai*, a Woman, and *ceon*, an House.

Under the *Roman Emperors* there was a particular Establishment of *Gynaecea*; being a kind of Manufactories managed chiefly by Women, for the making of Clothes, Furniture, &c. for the Emperor's Household. Mention is made of these *Gynaecea* in the *Theodosian Code*, *Justinian's Code*, and divers other Authors.

In Imitation hereof, divers of the modern Manufactories, particularly those of Silk, where a Number of Women and Maids, associated and form'd into a Body, are called *Gynaecea*.

GYNECIARIUS, a Workman employ'd in a *Gynaeceum*.

In the antient *Gynaecea* there were Men to weave and shape; the rest, as Spinning, &c. being performed by Women.

Criminals were sometimes condemned to serve in the *Gynaecea*, much as now in the Gallies. Frequently, too, this was a kind of Service which Princes exacted of their Subjects, or Vassals, both Men and Women, whom they made to work for them in their *Gynaecea*.

GYNECOCRATUMENIANS, **GYNECOCRATUMENI**, an antient People of *Sarmatia Europea*, inhabiting the Eastern Banks of the River *Tanais*, near its Opening into the *Palus Meotis*; thus called, as Authors relate, because they had no Women among them.

The Word is form'd of *gynai*, a Woman; and *cratistes*, vanquish'd; of *agros*, I overcome; *g. d.* overcome by a Woman.

Fa. *Harduin*, in his Notes on *Pliny*, says they were thus called, by reason, after a Battle which they lost against the *Amazons* on the Banks of the *Thermodoon*, they were obliged to have a venereal Commerce with them, in order to get them Children: *Et quod Virtricibus objepantur ad procreandum eis Soboles*.

Fa. *Harduin* calls them the Husbands of the *Amazons*; *Amazorum Conubia*. For, as that Author observes, the Word *Unde* must be retrench'd from *Pliny*; having been soiled into the Text by People who were not Masters of the Author's Meaning, *Unde Amazorum Conubia*.

They who take the *Amazons* for a fibulous People, will imagine the same of the *Gynecocratumenians*. See **AMAZONS**.

GYNÆCONOMUS, the Name of a Magistrate of *Athens*, who had the Censure and Inspection of the Women.

There were ten *Gynæcomi*: Their Business was to inform themselves of the Lives and Manners of the Ladies of that City, and to punish such as misbehaved themselves, or transgressed the common Bounds of Modesty and Decency.

They had a List hanging out, of the Names of all those whom they had censured, or condemned to any Mulct, Forfeiture, Penance, or other Penalty.

The Word is compounded of the Greek *Γυνή*, *Γυνή*, a Woman; and *νομός*, *Law*.

GYNÆOCRACY, **GYNÆOCRATIA**, a State where Women have, or may have, the supreme Command.

In this Sense, *England* and *Spain* are *Gynæocracies*: The *French* value themselves, and think they are greatly happy that their Monarchy is not *Gynæocratic*. See **SALIC LAW**.

The Word is form'd of *Γυνή*, *Γυνή*, a Woman, and *αρχή*, *Authority*, *Power*, *Government*.

GYNGLIMUS, in Anatomy, &c. See **GINGLYMUS**.

GYP SUM, in natural History, a Stone found in Quar-

ries, which being burnt, and diluted, or wrought up with Water, serves to make the fine Plaster of *Paris*. See **PLASTER**.

GYPSE, **GYPSE**, or **GYP SUM**, is also used for a counterfeit of Talk; or a shining transparent Stone chiefly found in the Quarries of *Montmartre* near *Paris*, among other Plaster Stones.

Some confound this with the former, on account of the Conformity of its Name with the Latin *Gypsum*; but unhappily enough; as the *Gypse* is not fit for the making of Plaster.

This Stone being calcined in a Kiln, beaten in a Mortar, and sifted, and mix'd up with Gum, or fine Water and Colours, serves to counterfeit Marble, which it does to that Perfection, that both the Eye and Touch may be deceived. See **MARBLE**.

The Method of preparing it, will be shewn under the Article **MO SAIC WORK**.

GYROMANCY, or **GYROMANTIA**, a kind of Divination, performed by walking round, or in a Circle. See **DIVINATION**.

The Word is compounded of the Greek *γύρω*, a Circle; and *μαντεία*, *Divination*.

H is the 8th Letter of the Alphabet, and the 6th Consonant. See LETTER and ALPHABET.

Varro, *de Re Rustica*, L. III. C. 1. calls the *H effluvis*. And *Martianus Capella* says it is pronounced by a gentle Contraction of the *Trachea*. — Hence it has been disputed, whether or no the *h* be a real Letter.

Some will only have it an Aspiration, or Spirit, in Regard its Sound is so weak. And accordingly the *Greeks*, now a-days at least, do not place it in the Line of the other Letters, but put it over the Head of the following Letter: Tho' it should seem they antiently wrote it in the same Line with the rest.

The *Latin* Grammarians, as they were religious Imitators of the *Greeks*, have on their Authority generally rejected the *h*; and the Moderns have herein followed the *Latins*.

But we have already shewn that the *h*, like all the other Aspirates, from the Time it is aspirated, and for this very Reason that it is aspirated, is not only a Letter, but a real Consonant; it being a Motion, or Effort, of the *Larynx*, to modify the Sound of the Vowel that follows; as is evident in the Words *Hallebard*, *Hero*, *Holland*, &c. where the Vowel *e*, is apparently differently modified from what it is in the Words *Endive*, *Eating*, *Elect*, &c. and such Modification is all that is essential to a Consonant. See CONSONANT.

Upon the whole, the *H* is either a Letter, or *S* and *Z* are none; those being no more than hissing Aspirations: And they who exclude the *h* from among the Letters, as conceiving it only a Mark of Aspiration, might as well exclude the Labial Consonants *b* and *p*, and say they are only Marks of certain Motions of the Lips, &c. See ASPIRATION.

The *H*, then, is a Letter and a Consonant, of the Guttural Kind, i. e. a Consonant, to the Pronunciation whereof, the Throat concurs in a particular Manner, more than any other of the Organs of Voice. See GUTTERAL.

'Tis true, in many Words beginning with *h*, the Aspiration is very weak, and almost insensible; the *h* in those Cases, not doing its Office: But it does not cease to be a Consonant on that Score, more than various other Consonants, which we write, but do not pronounce; as the *k* in *Physick*, &c. and several other Letters, particularly in the *Hebrew*, *French*, &c.

Nor does it cease to be a Consonant, because it does not hinder the Elision of the foregoing Vowel, when another Vowel follows in the subsequent Word; for then *us* would undergo the same Disqualification.

Monf. *Ménage* distinguishes two Kinds of *h*; the one an Aspirate, which he allows a Consonant; the other a Mute, which he considers as a Vowel. — Now, 'tis certain, the aspirated *h* is a Consonant; but the Mute *h* is no Vowel, as having no peculiar or proper Sound distinct from that of the Vowel, or Diphthong, immediately following it. See VOWEL.

When the *h* is preceded by a *c*, the two Letters together have the Sound of the *Hebrew* *Ch*, with a Point over the right Horn; as in *Charity*, *Chyle*, &c.

In most Words derived from the *Greek*, and beginning in that Language with the Letter *χ*, the *ch* which begins them in *English*, has generally the Sound of a *k*, as in *Echo*, *Chorus*, &c. tho' it is sometimes softened a little, as in *Cheerfulness*, &c.

After a *p*, the *h* is always pronounced together with the *p*, like an *f*; as in Phrases, *Philistins*, *Phlegm*, *Phlebotomy*, *Philosophy*, *Phoenicians*, &c. — Most Words of this Class, are either proper Names, or Terms of Art, borrow'd from the *Greek*, or the *Oriental* Languages; and wrote in *Greek* with a *p*, and with a *h* in the others. — In ancient Authors we frequently meet with *h* put instead of *f*; as *habeo*, for *fabo*; but this is principally observable in the *Spanish* Tongue, where, most of the Words borrow'd from the *Latin*, beginning with an *f*, take the *h* in lieu of it: As *hablar* for *fabulari*; *habeo* for *fabus*; *habeo* for *fatum*.

The *Aspera*, or sharp Accent of the *Greeks*, which is the same with our *h*, is also frequently changed for an *s*; as, *ἄσπερος*, *Sul*; *ἄσπερος*, *Seprem*; *ἄσπερος*, *Sex*; *ἄσπερος*, *Serpo*; *ἄσπερος*, *Semis*; *ἄσπερος*, *Sus*, &c. — The *h* is also used for some other Letters enumerated at large by *Passerat*, *de Litterarum inter se cognatione & permutationibus*.

Antiently, the *H* was put for *Ch*; thus, of *Cylovidius* was form'd *Hindovius*, as 'tis read in all the Coins of the IXth and Xth Centuries; and it was on this Account, that they wrote *Hindovius* with an *H*. — In Course of Time, the Sound of the *h* being much weaken'd, or

entirely suppress'd, the *H* was dropt, and the Word was wrote *Ludovius*. In like Manner we read *Histoire*, *Hionis*, &c.

Fa. Lobineau, will have this Difference to have arose from the Differences in the Pronunciation. — Such, says he, as could not pronounce the Guttural, wherewith those two Words begin, substituted a *c* for it; and they who pronounced it so, wrote it after the same Manner: But such as were accustomed to pronounce it, wrote it likewise. — He might have added, that such as could not pronounce the Guttural, at length absolutely rejected it, and both wrote and spoke *Louis*, *Loisire*, &c.

Some learned Men have conjectured that the *H* should have been detach'd from the Name; and that it signified Lord, from the Latin *Herus*, or the German *Herr*. Much as the *D*, which the *Spaniards* prefix to their proper Names, as *D. Philippe* for *Don Philip*. — But as it is likewise found before the Names of several Cities, 'tis more probable the Letter was there used to denote the rough harsh Pronunciation of the antient *Franks*.

The *H* is sometimes also found prefix'd to the *C*; as *Heorolus*, *Healende*, &c. for *Carolus*, *Calende*, &c.

Among the Antients, the *H* was also a Numeral Letter, signifying 400, according to the Verse.

H quoque ducentos per se designat habentos.

When a Dash was added a Top, *H̄*, it signified two hundred Thousand. — See what has been observed on this Subject, under the Letter *E*.

HABAKKUK, or **HABAKUK**, one of the twelve lesser Prophets whose Prophecies are taken into the Canon of the Old Testament. See PROPHET and PROPHECY.

The precise Time is not known when *Habakkuk* prophesied; but from his predicting the Ruin of the *Jews*, by the *Chaldeans*, it may be concluded he prophesied before *Zedekiah*, or about the Time of *Manasses*. — His Prophecy only consists of three Chapters.

The Name is wrote in the *Hebrew* with *ח*, *heth*; and signifies a Wrestler, or Grappler. The *Greek* Translators call him *Ambakoma*.

HABDALA, or **HABDALAH**, a Jewish Ceremony, practis'd among the People, every Sabbath-Day Evening.

Towards the Close of the Sabbath, when the Stars begin to appear, each Master of a Family lights a Torch, or Flambeau, or, at least, a Lamp with two Wicks. — A little Box of Spices is prepared, or a Glass of Wine taken; then singing, or rehearsing a Prayer, and blessing the Wine and the Spices, they all smell them, and after a few Ceremonies perform'd about the Torch, or Lamp, they cast a little of the consecrated Wine into the Flame; every Body tastes; and thus they break up, wishing each other not good Night, but good Week.

The Word is *Hebrew*, and literally signifies Separation: It is form'd of *בדל*, *badal*, to separate, divide; the Ceremony being look'd upon, as the Division or parting of the Sabbath from the rest of the Week. It was establish'd to prevent their being too hasty in ending the Sabbath.

HABEAS Corpus, in Law, a Writ, which a Man indited for a Trespass before the Justices of Peace, or in a Court of Franchise, and imprisoned for it, may have out of the King's Bench, thereby to remove himself thither, at his own Costs, to answer the Cause at the Bar thereof.

The Order in this Case, is, first to procure a *Certiorari*, out of the Chancery, directed to the said Justices, for removing the Indictment into the King's Bench; and upon that to procure this Writ to the Sheriff, for causing his Body to be brought at a certain Day.

HABEAS Corpora, is also a Writ, that lays for bringing in a Jury, or for many of them, as refuse to come upon the *venne facias*, for the Trial of a Cause brought to Issue. See JURY, &c.

HABENDUM, a Word of Course in a Conveyance. — In every Conveyance are two principal Parts, the *Premises*, and the *Habendum*: The Office of the first is to express the Name of the Grantor, the Grantee, and the Thing granted.

The *Habendum* is to limit the Estate, so that the general Implication, which, by Construction of Law, passeth in the *Premises*, is by the *Habendum* controlled and qualified. — As in a Lease to two Persons; the *Habendum* to one for Life, alters the general Implication of the Jointenancy in Free-hold, which should pass by the *Premises*, if the *Habendum* were not. See CONVEYANCE.

HABERE facias Seisnam, a Writ Judicial, which lies where a Man hath recovered Lands in the King's-Court; directed to the Sheriff, commanding him to give him the Seisin thereof. See SEISIN.

This Writ issues sometimes out of the Records of a Fine executory, directed to the Sheriff of the County, where the Lands lye; commanding him to give to the Cognizee, or his Heirs, Seign of the Land, whereof the Fine is levied.

The Writ lieth within the Year after the Fine, or Judgment, upon the *Scire facias*; and may be made in divers Forms.

There is also a Writ called *Habere facias Seisnam*, *ubi Rex habuit assensum, diem & vestium*; which is for the Delivery of Lands to the Lord of the Fee, after the King had taken his Due of his Lands who was convict of Felony.

HABERE FACIAS VIFUM, is a Writ that lies in divers Cases, as in Dower, Formedon, &c. where a View is to be taken of the Land, or Tenements, in Question. See VIEW.

HABERGE, or **HAUBERGE**, or **HAUBERRE**, or **HAUZERT**, in the ancient Customs, the same with *Habergeon*, viz. a Coat of Mail. See **HABERGEON**.

HABERGEON, or **HAUBERGEON**, or **HABERGETUM**, a Coat of Mail; or an ancient Piece of defensive Armour, in Form of a Coat, defending from the Neck to the Middle; form'd of little Iron Rings, or Masles, link'd into each other. See MAIL.

Varro makes the *Gauls* the first Inventors of the *Habergeon*.

The Antiquaries and Criticks are divided as to the Etymology of the Word. — *Speelman* derives it from *hame, ham, or hamecon*, Hook; and *berg, Menage*, &c. derive from *al, or alba*, all; and *bergen*, to cover. — *Fasciob* derives it from *albus*, by Reason the Masles, or Links, were white, polish'd, and shining.

Some of our Writers, and particularly *Du Cange*, make the *Habergeon*, a Head-piece, or Helmet, covering the Head and Shoulders; and derive the Word from the German *Hals*, Neck, and *bergen*, to cover. He adds, that in the Age of corrupt *Latin*, they wrote it *Halsberga, Albergellum, Ausbergatum*, &c.

HABILLMENTS of War, in our ancient Statutes, signify Armour, Harness, Utensils, or other Provisions, for War; without which there is supposed no Ability to maintain War. 3d Part. *Instit.* fol. 97.

HABIT, or **HABITUDE**, in Philosophy, an Aptitude, or Disposition, either of the Mind, or Body, acquired by a frequent Repetition of the same Act. See **HABITUDE**.

Some of the Schoolmen call it *Qualitative Habit, Habitus Qualitativus*; and define it a Quality adventitious to a Thing, fitting and disposing it either to act, or suffer: Others define it an Affection of Mind, or Body, persisting by long Use and Continuance.

Habits may be distinguish'd into those of the Mind, and of the Body. — Thus Virtue is call'd a *Habit* of the Mind: Strength a *Habit* of the Body.

All natural *Habits*, whether of Body or Mind, are no other than the Body and Mind themselves, consider'd as either acting or suffering; or they are Modes of the Body or Mind, wherein it perseveres till effaced by some contrary Mode. See **MODE**.

Aristotle enumerates six *Habits* of the Mind, viz. Understanding, Knowledge, Wisdom, Prudence and Art: Which Division the later Writers set aside, and only admit of three Intellectual *Habits*, viz. *Science, Prudence, and Art*; agreeable to the three Kinds of Objects, about which the Mind has occasion to be facilitated; which are either *Theoretical, Practical, or Effective*. See **ART, SCIENCE, &c.**

HABIT, in Medicine, is what we otherwise call the *Temperament, or Constitution* of the Body, whether obtain'd by Birth, or Manner of Living. See **TEMPERAMENT and CONSTITUTION**.

An ill temper'd *Habit*, without any particular apparent Disease, the Physicians usually call a *Cachexia, or Cacochymia*. See **CACHEXIA and CACOCHYMIA**.

A Thing is said to *enter the Habit*, when it becomes intimately diffus'd throughout the Body; and is convey'd to the remotest Stages of Circulation.

HABIT is also used for a *Dress, or Gorb*; or the Assemblage, or Composition of Garments, wherewith a Person is cover'd. See **GARMENT**.

In this Sense we say, the *Habit* of an Ecclesiastic; of a Religious, &c. The military *Habit*, &c.

The Ecclesiastical *Habit* only commenced about the Time of *Gregory the Great*, i. e. it only began at that Time to be distinguish'd from the *Lay Habit*, viz. in the Vith Century. — The Establishment of the barbarous Nations was the Occasion thereof: For the Laymen took the *Habit* of the Nations they had submitted to; but the Priests kept to the *Roman Dress*.

The Abbot *Boileau* has an express Treatise on the Ecclesiastical *Habit*, wherein he maintains, contrary to the

common Opinion and Custom, that the Ecclesiastical *Habit* should be a short one, and that a short *Habit* is more decent than a long one.

HABIT, is particularly used for the uniform Garments of Religious, conformable to the Order whereof they make Profession. See **RELIGIOUS and ORDER**.

The *Habit* of *St. Benedict*, of *St. Augustine*, &c. In this Sense, we say absolutely such a Person has taken the *Habit*, meaning he has enter'd upon a Novitiate in a certain Order. — So he is said to quit the *Habit*, when he renounces the Order. See **NOVITIATE, VOWS, &c.**

The *Habits* of the several Religious, were not supposed to be calculated for Singularity or Novelty: The Founders of the Orders, who were at first chiefly Inhabitants of Deserts and Solitudes, gave their Monks the *Habit* usual among the Country People. Accordingly the Primitive *Habits* of *S. Anthony*, *S. Hilarion*, *S. Benedict*, &c. are described, by the ancient Writers, as consisting chiefly of Sheep's Skins, the common Dress of the Peasants, Shepherds, and Mountaineers of that Time: And the same they gave their Disciples.

The Orders establish'd in and about Cities, and inhabited Places, took the *Habit* wore by the Ecclesiastics at the Time of their Institution. — Thus *S. Dominic* gave his Disciples the *Habit* of regular Canons, which he himself had always bore to that Time. And the like may be said of the *Jesuits, Barnabites, Theatines, Oratorians*, &c. who took the common *Habit* of the Ecclesiastics at the Time of their Foundation. And what makes them differ so much from each other, as well as from the Ecclesiastical *Habit* of the present Times, is, that they have always kept invariably to the same Form; whereas the Ecclesiastical *Habits* have been changing their Mode at every Turn.

HABITATION, a Dwelling-Place, or House. See **HOUSE, EDIFICE, BUILDING, &c.**

HABITATION, is sometimes also used for *Cobabitation*. See **COHABITATION**.

HABITUAL, something that is become, or turn'd into a *Habit*, or *Habitude*. See **HABITUDE, &c.**

Thus, we say, a *Habitual*, or inveterate Disease: *Habitual Sin*, &c. An *Habitual Disposition* is the same Thing with a *Habitude* it self.

Habitual Grace, is that convey'd to us by Baptism, and afterwards augmented and improved by the Eucharist, and other appointed Means. See **GRACE**.

The *Romish Divines* hold *Habitual Grace* necessary in Order to be saved; and *Actual Grace*, to the doing any Thing meritorious.

HABITUDE, HABITUDO, in the Schools, signifies the Respect, or Relation, which one Thing bears to another. See **RELATION**.

In this Sense, *Habitude* is one of *Aristotle's* Categories. See **CATEGORY**.

Some of the more precise, and accurate Schoolmen, consider *Habitude* as a Genus; and sub-divide it into two Species. Where it is consider'd as Quiescent, they call it *Respect*; where, as moved, *Relation*: To which some add a third Species, consider'd with Respect of Figure, which they call *Mode*.

HABITUDE, is also used in Philosophy, for what we popularly call *Habit*, viz. a certain Disposition, or Aptitude, for the performing, or suffering, of certain Things; contracted by reiterated Acts of the same Kind. See **HABIT**.

Habitudes are distinguish'd into those of the *Body* and the *Mind*.

Among those of the *Mind*, call'd also intellectual *Habitudes*, are frequently number'd Memory, Knowledge, Prudence and Art. But others deny there are any such Thing as proper intellectual *Habits*; and fix them all in the Brain.

Bodily *Habitudes* are innumerable: To these we refer all our *Art*. See **ART**.

Virtues, and Vices, are consider'd by the Philosophers under the Notion of good and bad *Habitudes*. See **VIRTUE and VICE**.

The Archbishop of *Cambray* defines *Habitudes*, in the general, to be certain Impressions left in the Mind; by Means whereof, we find a greater Ease, Readiness, and Inclination to do any Thing formerly done, by having the Idea ready at hand to direct us how it was done before. — Thus, *E. g.* we form a *Habitude* of Sobriety, by having always before us the Inconveniences of Excess; the Reflections whereof, being often repeated, render the Exercise of that Virtue more and more easy.

Fa. Mallebranch gives a more artful, and mechanical Theory of the *Habitudes*. — His Principle is, that they consist in a Faculty, which the Spirits have acquired, of passing easily from one Part of the Body to another. He argues thus: If the Mind set on, and move the Body, 'tis, in all Probability, by Means of a stock of animal

animal Spirits, lodg'd in the Brain, ready to be sent at the Motion of the Will, by means of the Nerves which open or terminate in the Brain, into the Muscles of the Body. See BRAIN and NERVE.

Now, an Influx of Spirits into a Muscle, occasions a Swelling; and, of Consequence, a shortening of the Muscle; and consequently a Motion of the Part that Muscle is fix'd to. See MUSCULAR AORTIO.

Further, the Spirits do not always find all the Roads open and free, which they are to pass thro'; whence that Difficulty we perceive of moving the Fingers with that Quickness necessary to play on a Musical Instrument; or of moving the Muscles necessary to pronounce the Words of a foreign Language. But, by Degrees, the Spirits, by their continual Flux, smoothen the Ways; so that at length they meet with no Resistance at all. Now, 'tis this Facility the Spirits find of passing, when directed into the Members of the Body, that *Habitudes* consist. See SPIRIT.

On this Hypothesis, 'tis easy accounting for an Infinity of Phenomena relating to the *Habitudes*. — Why, for Instance, Children acquire new Habits with more Ease than grown Persons: Why, 'tis difficult getting rid of inveterate Habits: Whence that incredible Quickness in the Pronunciation of Words, even without thinking of them, as is particularly observable in those long accus'd to Formalists, &c.

On this footing, the Faculty of Memory appears to have very much the Nature of a *Habitudo*; inasmuch that in one Sense it may pass for a *Habitudo*. See MEMORY. See also PASSION, NATURAL Inclination, &c.

HACHES, and HACHING. See HATCHES and HATCHING.

HACKNEY. See HAQUENY.

HACKNEY Coach. See HACKNEY COACH.

HADRIANE, or HADRIANALIA, in Antiquity, Games instituted in Honour of the Emperor *Hadrian*, or *Adrian*. See GAMES.

There were two Sorts of *Hadriana*, the one held every Year, and the other every five Years.

HÆMATITES, or HÆMATITES *Lapis*, in Natural History, the *Blood-Stone*; a ruddy Mineral in Form of a Stone; thus call'd, either on Account of its resembling dry, curdled Blood, or of the Faculty it has of staining Blood; from the Greek, *ἷμα*, *Sanguis*, Blood.

'Tis reckoned five Kinds, viz. the *Ethiopic*, the *Andronian*, or black, the *Arabie*, the *Elalites*, or *Milites*, and the *Chifos*; beside that commonly call'd the *Magnes Hæmatites*; from the Property it has of attracting Iron.

The five Sorts differ chiefly in point of Hardness: The best, according to *Dioscorides*, is that which is friable, hard, black, and smooth, without either gritty Parts, or Veins.

That commonly us'd by the Painters is fastitious; being made of *Armenian Bole*, and other Drugs.

The Native, or Fossil Kind, comes from *Egypt*, *Bohemia*, &c. It has divers Uses in Medicine; being held cooling and astringent, and in that Quality prescribed in Hemorrhages. — It is given, in Sublance, in Form of a fine Powder.

The Gilders use it for Barnishers, to polish their Gold withal. *Bauschius* has an express Treatise on this Stone. See GILDING.

HÆMATOSIS, in Medicine, the Action whereby the Chyle is converted into Blood; call'd also *Sanguification*. See SANGUIFICATION.

The Word is form'd of the Greek, *ἷμα*, *Sanguis*, Blood.

The chief of the vital Actions, are the *Chylific*, and *Hæmatific*. See CHYLOSIS, BLOOD, &c.

HÆMOPTYSIS, or HÆMOPYON, in Medicine, a spitting of Blood; occasion'd by the Rupture, or Erosion of some Vessel of the Lungs; and accompanied, usually, with a Cough, and a Sense of Pressure on the Breast. See BLOOD.

The *Hæmoptyis* differs from a Vomiting of Blood, in that in the *Hæmoptyis*, the Blood comes from the Lungs, and for that Reason is florid and frothy; whereas in the Vomiting of Blood, it comes from the Stomach, and is blackish.

The *Hæmoptyis* is occasioned by violent Shouts, or Cries; by Strains, Falls, vehement Coughs; by the Suppression of some ordinary Evacuation, or by the Abundance of some sharp corrosive Humor.

The *Hæmoptyis* is either accidental, or habitual — The latter is a Symptom of the *Pneumia*. It is best cured, according to *Morron*, by the *Cortex*: It is stopp'd by Astringents, as *Armen. Bol. Sang. Dracon. Lapis Hæmat.* &c. See PHTHISIS.

The Word comes from *ἷμα*, Blood; and *πύον*, to spit. HÆMORRHAGE, in Medicine, a Flux of Blood, at any Part of the Body; arising either from a Rupture of

the Vessels, as when they are too full, or too much press'd; or from an Erosion of the same, as when the Blood is too sharp and corrosive. See FLUX and BLOOD.

The *Hæmorrhage*, properly speaking, as understood by the Greeks, was only a Flux of Blood at the Nose; but the Moderns extend the Name to any Kind of Flux of Blood, whether by the Nose, Mouth, Lungs, Stomach, Intestines, Fundament, Matrix, or the like.

Hypochondriac, Scorbutic, and Cachectic Persons, are liable to various and immoderate *Hæmorrhages*. — The Cure of *Hæmorrhages* arising from a Plethora, is by Evacuants, and particularly Phlebotomy, to cause a Revulsion. — That from an increas'd Velocity of a thin acrimonious Blood, is to be attack'd with Coolers, and Agglutinants.

The principal simple Remedies in *Hæmorrhages*, are *Album Græcum*, Spirit or Oil of Vitriol, *Calceantibus* rubified, Colophony pulverized, Oil of Turpentine, Decoction of *Catechu*, *Cortex Peruv.* &c. See STYPTICS.

A Ligature on the Limb has frequently a good Effect: So *Elect. Boylean. Pulvis Galeni*; *Elect. Symplic. Tinctur. Rosar. Epithem. de Sacchar. Saturni*, &c.

An *Hæmorrhage* at the *Anus*, is more usually call'd a *Dysentery*. See DYSENTERY.

The Word is compounded of the Greek, *ἷμα*, *Sanguis*; Blood; and *ρῆμα*, or *ρῆμα*, *frango*, *rumpo*, *crumpo*, I break, burst forth, &c.

HÆMORRHOIDAL, an Epithet given to the Veins and Arteries of the *Intestinum Rectum*, and the Fundament; as being the Seat of the *Hæmorrhoids*. See HÆMORRHOIDS.

The *Hæmorrhoidal Arteries* are two; the one internal, the other external.

The internal is a Branch of the lower Mesenteric, which running along the *Rectum*, terminates at the Fundament; the external springs from the Hypogastric Artery.

The *Hæmorrhoidal Veins* are also internal and external.

The internal carries back the Blood of the *Rectum* and Fundament, which it embraces regularly; and is inserted sometimes into the spicic Branch of the *Porta*, and sometimes into the Mesenteric: The external beings back the Blood from the muscular Parts about the Fundament, and terminates in the Hypogastric Vein.

HÆMORRHOIDS, in Medicine, a Disease of the Fundament, popularly call'd the *Piles*.

The *Hæmorrhoids* are a painful, periodical Tumor, in the lower Part of the *Intestinum Rectum*; usually appearing externally in the *Anus*. — They may be consider'd as a Sort of various Tumors in the *Hæmorrhoidal Veins*; arising from the too great Abundance of morbid Blood therein. See HÆMORRHOIDAL VESSELS.

The Disease is either simple, as when the Veins alone are tumefied; or compound, as when the neighbouring Parts become infected, or an Excrescence arises therefrom, as a *Ficus*, *Crista Galli*, *Codyloma*, or the like.

Hæmorrhoids are either open, *fluentes*, that is, yield Blood; or blind, *cæcæ*, where the Parts are only tumid. — In the first, the Vessels of the *Rectum* are open; in the latter, there is some Obstruction, which occasions them to swell.

The *Hæmorrhoids* sometimes are internal, and cause great Pain in going to Stool; especially if the *Fæces* be indurated: After which they often appear externally, and Blood is seen upon the Excrements.

Emulus is careful in distinguishing the genuine, hæmorrhoidal Flux, from a bloody Diarrhea, frequent in scorbutic Cases. — The *Hæmorrhoids* are usually open'd by the Attrition of the Excrements in a Stool, so that the Blood flows at the same Time with the Excrements; but if it flow promiscuously before, as well as after the Excrements, and without Pain, 'tis a scorbutic Flux.

Where the Flux is excessive, Phlebotomy, and Capping, are good, by way of Revulsion; and internally, Astringents and Opiales. — Upon a Suppression of the usual Flux, without removing the Cause, the open *Hæmorrhoids* degenerate into the blind; in which Case they must be open'd again with Aloetics, &c. Tamarinds are held excellent to assuage the Flux. Chalybeats strike at the Cause of the Evil. Scrophulary, Onion, and Leek, are much commended.

The Word is form'd of the Greek, *ἡμῆσις*, *Sanguinis profusivum*, Flux of Blood; which is compounded of *ἷμα*, Blood, and *ῥέω*, I flow.

HEREDE *abducto*, is a Writ that lay for the Lord, who, having by Right the Wardship of his Tenant under Age, could not come by his Body, as being conveyed away by another. See RAVISHMENT *de Gard*.

HEREDE *deliberando alii qui habet custodiam terre*, a Writ directed to the Sheriff, willing him to command one that had the Body of him who was ward to another,

to deliver him to him, whose Ward he was on Account of his Land. See **WARD** and **GUARDIAN**.

HÆREDIPETA, in our ancient Law-Books, the next heir. *Et nullus Hæredipeta suo propinquos vel extraneos periculoſa ſane cuſtodia committatur.* Leg. H. Cap. 70.

HÆRESARCH, *Hærefarcha*, of the Greek, Ἀρχιερεὺς, an Arch-Heretic. See **HERETIC**.

HÆRESIS, *Heresy*, } See **HERESY**.
HÆRETICUS, *Heretic*, } See **HERETIC**.

HÆRETICO *Contumendo*, is a Writ that lies againſt one who is an *Heretic*, viz. who having once been convicted of *Heresy* by his Biſhop, and having abjured it, afterwards falling into it again, or ſome other, is thereupon committed to the ſecular Power. See **HERETIC**, &c.

Sir Edward Coke was of Opinion, that this Writ did not lie in his Time: But it is now formally taken away by Statute, Car. II.

HAGARD, in Falconry, a Hawk, or Falcon, not taken in the Net; but after he had been inured to Liberty, and preying for herſelf. See **FALCONRY**.

Hagard Hawks, are hard to tame, and bring under Diſcipline. See **HAWK** and **FALCON**.

The Word is French, and ſignifies *ſierce*; ſome derive it from the Latin *agreste*, wild: Others, from the German *bag*, Inſolare, fortified Place. — Whence, Monſ. *Huet* obſerves, the Word *Hagard* is ſometimes applied to a Man who becomes hardy and proud, in Confidence of the Strength of the Place he is in.

HAGIOGRAPHIA, a Name given to Part of the Books of Scripture, call'd by the Jews *Chevroim*. See **SCRIPTURE**, **BIBLE**, &c.

The Jews divide the Sacred Writings into three Claſſes: The *Law*, which comprehends the five Books of *Moses*: The *Prophets*, which they call *Neviim*; and the *Chevroim*, q. d. *Writings*, call'd by the Greeks, *Cheviographia*, comprehending the Book of *Pſalms*, *Proverbs*, *Job*, *Daniel*, *Eſſays*, *Chronicles*, *Canticles*, *Ruth*, the *Lamentations*, *Eccleſiaſtes* and *Eſther*.

The Jews call theſe Books the *Writings*, by way of Eminence, as being wrote by immediate Inſpiration of the Holy Spirit. — Thus ſay *Kimbbi*, in his Preface to the *Pſalms*; *Maimonides*, in *More Neb.* and *Elias Levita*, in his *Tsibbi*, under the Word כְּתוּבִים.

They diſtinguiſh them, however, from the *Prophets*; in that their Authors did not receive the Matters contain'd in them, by the Way call'd *Prophecy*, which conſiſts in Dreams, Viſions, Whiſpers, Extaſies, &c. but by mere ſimple Inſpiration, and Direction of the Spirit. See **INSPIRATION**.

The Word is compounded of ἅγιος, *holy*; and γράφω, *I write*.

The Name is very antient: St. *Jerom* makes frequent Mention of it. — Before him, St. *Epiphanius* call'd theſe Books ſimply *Γραφά*.

HAGIOSIDERE, or **HAGIOSIDIRE**. — The Greeks, who are under the Dominion of the *Turks*, being prohibited the Uſe of Bells, make uſe of an Iron to call People to Church, call'd *Hagiosidere*. See **BELL**.

Magnus gives us the Deſcription of a *Hagiosidere* he had ſeen. — 'Tis a Plate of Iron, about 3 Inches broad, and ſixteen long, faſten'd by the middle to a Chain, or Cord, whereby it is ſuſpended at the Church-Door. On this they ſtrike with an Iron Hammer, with ſome Meaſure and Cadence, ſo as to make no diſagreeable Noiſe.

They alſo carry a *Hagiosidere* before the *Prieſt* in a Proceſſion of the Sacrament to any ſick Perſon, bearing on it from Time to Time, to advertiſe the People to adore it; much as in the *Romiſh* Church they do with a *Bell*.

The Word is compounded of ἅγιος, *holy*; and ἰδερν, *Iron*.

HAIL, *Grando*, in Phyſiology, an aqueous Concretion, in Form of white, or pellucid Spherules, deſcending out of the Atmosphere. See **METEOR** and **ATMOSPHERE**.

Hail, is conceiv'd to be form'd of Drops of Rain, frozen in their Paſſage thro' the middle Region. See **RAIN** and **FREEZING**.

Others, take it for the Fragments of a frozen Cloud, half melted, and thus precipitated and congel'd again. See **CLOUD** and **BAROMETR**.

Accordingly, the *Cæreſſians* deſine *Hail* to be a Cloud, either wholly, or in Part liquified; which tending downward by its own Gravity, is, in its Paſſage, froze by the Impreſſion of ſome very cold Wind; and thus precipitated, for the moſt Part, in round transparent Globes. — They add, that if the Cloud have been totally liquified, the *Hailſtones* are pellucid; or otherwiſe, only partly ſo. See **SNOW**.

Hail aſſumes various Figures, according to the Degrees of Heat or Cold of the Air, which the Parts of the liquified Clouds paſſ thro': Sometimes 'tis round, ſometimes

Angular, Triangular, Pyramidal, &c. ſometimes thin and flat, ſtar-like, with fix equal Points, &c.

Hail is obſerved frequently to attend Thunder and Lightning; the Nitre that contributes to the one, having likewiſe a large Share in the Production of the other. See **THUNDER**, **NITRE**, &c.

Natural Hiſtories furniſh us with various Inſtances of extraordinary Showers of *Hail*. — In the *Philoph. Tranſactions*, Dr. *Halley*, and others relate, that in *Cockſhire*, *Lancashire*, &c. April 29. 1697, a thick, black Cloud, coming from *Carnarvonſhire*, diſpoſed the Vapours to congel in ſuch Manner, that for about the Breadth of two Miles, which was the Limit of the Cloud, in its Progreſs for the Space of 60 Miles, it did inconceivable Damage: Not only killing all Sorts of Fowls, and other ſmall Animals, but ſplitting Trees, knocking down Horſes and Men, and even ploughing up the Earth, ſo that the *Hailſtones* haried themſelves under Ground, an Inch, or an Inch and a half deep. — The *Hailſtones*, many of which weigh'd five Ounces, and ſome half a Pound, and were five or fix Inches about, were of various Figures, ſome round, others half round; ſome ſmooth, others emboid'd and crenelated: The icy Subſtance of them was very transparent and hard; but there was a ſnowy Kernel in the middle of them.

In *Hertfordſhire*, May 4. the ſame Year, after a ſevere Fit of Thunder and Lightning, a Shower of *Hail* ſucceeded, which far exceeded the former: Some Perſons were kill'd by it, their Bodies beat all black and blue: Vaſt Oaks were ſplit, and Fields of Rye cut down as with a Scythe. The *Stones* were meaſur'd from ten to thirteen or fourteen Inches about. Their Figures were various, ſome oval, others pick'd, ſome flat. *Philoph. Tranſact.* N^o. 229.

At *Liſſe* in *Flanders*, 1686, fell *Hailſtones* of a very large Size; ſome of which contain'd in the middle a dark brown Matter, which thrown on the Fire, gave a very great Report. *Phil. Tranſact.* N^o. 203.

Mozerty, ſpeaking of the War of *Loius XII.* in *Italy*, in the Year 1510, relates, that there was for ſome Time, a horrible Darkneſs, thicker than that of Night; after which the Clouds broke into Thunder and Lightning, and there fell a Shower of *Hailſtones*, or rather as he calls them *Pebbleſtones*, which deſtroys'd all the Fiſh, Birds, and Beaſts of the Country. — It was attended with a ſtrong Smell of Sulphur; and the *Stones* were of a bliſtiſh Colour: Some of them weighing an hundred Pounds. *Hiſt. de France*, T. II. p. 339.

HAILE, a Sea Term, uſed either to call to a Ship to know from whence ſhe comes, and whether ſhe is bound; or elſe to ſalute her, and wiſh her well. — To hale a Ship, is alſo the ſame Thing as what we call pulling a-ſhore.

HAIR, little ſlender Threads, iſſuing out of the Pores of the Skins of Animals; and ſerving moſt of them as a Tegment, or Covering. See **SKIN** and **PORE**.

In Lieu of *Hair*, the Nakedneſs of ſome Animals is cover'd with Feathers, Wool, Skins, &c. See **FEATHER**, **WOOL**, &c.

The *Hair* is found on all Parts of the Body, except the Soles of the Feet, and the Palms of the Hands. — But it grows longeſt on the Head, Beard, in the Arm-Pits, and about the Privities. See **PUDES**, &c.

The *Physicians* diſtinguiſh it into Kinds, and give it divers Denominations; but this only in *Greek* and *Latin*. — The *Hair* of the Head they call *Capillus*: That of Women particularly, *Coma*, from *καμν*, to dreſs and adjuſt; and that of Men *Cæſaries*, from *caſendo*, becauſe often cut: That of the Back of the Head, *Juba* and *Crines*: That hanging behind the Ears, *Cucini*; q. d. curled and buckled.

The *Antients* held the *Hair* a *Soet* of Excrement, fed only with excrementitious Matters, and no proper Part of a living Body. — They ſuppoſed them generated of the fuliginous Parts of the Blood, exhaly'd by the Heat of the Body to the Surface, and there condenſed in paſſing thro' the Pores. — Their chief Reaſons were, that the *Hair* being cut, will grow again apace, even in extreme old Age, and when Life is very low: That in *Hæctic*, and *Conſumptive* People, where the reſt of the Body is continually emaciating and attenuating, the *Hair* ſhall thrive: Nay, and that it will grow again in dead Carcaſes. — They added, that *Hair* did not feed and grow like the other Parts, by Introſpection, i. e. by a Juice circulating within 'em; but, like the Nails, by Juxta-poſition, each Part next the Root thruſting forward that immediately before it.

But the *Moderns* are all agreed that every *Hair* does properly and truly live, and receive Nourishment to fill and diſtend it like the other Parts; which they argue hence, that the Roots do not grow grey in aged Perſons, ſooner than the Extremities, but the whole changes Colour at once: And the like is obſerved in Boys, &c. which ſhews

shews that there is a direct Communication; and that all the Parts are affected alike. — To which it may be added, that there are Instances of Persons, who by intense Grief, or Fear, have been known to grow grey in a Night's Time.

It may be observed, however, that, in Propriety, the Life and Growth of *Hairs*, is of a different Kind from that of the rest of the Body; and is not immediately derived therefrom, or reciprocated therewith. — 'Tis rather of the Nature of Vegetation. They grow as Plants do out of the Earth; or as some Plants shoot from the Parts of others; from which tho' they draw their Nourishment, yet each has, as it were, its several Life, and a distinct Economy. — They derive their Food from some Juices in the Body, but not from the nutritious Juices of the Body; whence they may live, tho' the Body be starv'd. See VEGETATION, PLANT, &c.

The *Hairs*, examined by the Microscope, appear to be fistulous Bodies like Horns. Their tubulous Structure is confirm'd from the Disease call'd *Plica Polonica*, wherein the Blood oozes out at their Extremities. See PLECA.

Each *Hair* is found to consist of five or six other lesser ones, all wrapp'd up in one common Tegument: They are knotted like some Sorts of Grass, and send out Branches at the Joints. — They have each a round bulbous Root, which lies pretty deep in the Skin, being implanted in the pyramidal *Papillæ*; and by this they imbibe, or secrete, their proper Food from the adjacent Humours. Their Extremities split or divide into two or three Branches, especially when kept dry, and left to grow too long; so that what to the naked Eye appears only a single *Hair*, to the Microscope seems a Broom.

They turn grey on the fore-part of the Head, and particularly about the Temples, sooner than behind; the back-part affording them the proper Juice longer than the rest. See TEMPLES.

For the like Reason they fall soonest on the Crown of the Head. See HEAD.

Their Size, or Thickness, depends on the Magnitude of the Pores they issue from: — If those be small, these are fine: If the Pores be straight, the *Hairs* are straight: If those be oblique or sinuous, the *Hair* is curl'd.

They ordinarily appear round, or cylindrical; but the Microscope also discovers triangular, and square ones; which Diversity of Figures arises from that of the Pores; to which the *Hairs* always accommodate themselves. Their Length depends on the Quantity of the proper Humor to feed them; and their Colour on the Quality of that Humor; Whence, at different Stages of Life the Colour usually differs.

The *Hair* of a Mouse, view'd by Mr. *Derham* with a Microscope, seem'd to be one single transparent Tube, with a Pith made up of fibrous Substance, running in dark Lines, in some *Hairs* transversely, in others spirally. The darker medullary Parts, or Lines, he observes, were no other than small Fibres convolved round, and lying close together, than in the other Parts of the *Hair*. They run from the Bottom to the Top of the *Hair*; and, he imagines, may serve to make a gentle Evacuation of some Humor out of the Body. Hence, the *Hair* of hairy Animals, this Author suggests, may not only serve as a Fence against Cold, &c. but as an Organ of insensible Perpiration.

It was esteem'd a notable Honour among the ancient *Gauls*, to have long *Hair*; and hence came the Appellation *Gallia Comata*. For this Reason *Julius Cæsar*, upon subduing the *Gauls*, made them cut off their *Hair*, as a Token of Submission. — It was with a View to this, that such as afterwards quitted the World, no go and live in Cloisters, procur'd their *Hair* to be shaven off; to shew that they bid Adieu to all earthly Ornaments, and made a Vow of perpetual Subjection to their Superiors. See TONSURE.

Greg. de Tours assures us, that in the Royal Family of France, it was a long Time the peculiar Mark and Privilege of the Kings and Princes of the Blood, to wear long *Hair*, artfully dress'd and curl'd: Every body else were obliged to be cut round, in Sign of Inferiority and Obedience. Some Writers assure us, that there were different Cuts for all the different Qualities and Conditions, from the Prince, who wore it at full Length; to the Slave, or Villain, who was quite cropt. *Horstomann* treats at large of this Privilege of the Kings of France. *Franco Gallia*, C. 11.

To cut off the *Hair* of a Son of France, under the first Race of Kings, was to declare him excluded from the Right of succeeding to the Crown, and reduced to the Condition of a Subject. *Fa. Daniel*, Hist. de France, T. 1.

In the 8th Century, it was the Custom for People of Quality, to have their Childrens *Hair* cut the first Time, by

Persons they had a particular Honour and Esteem for; who, in virtue of this Ceremony, were reputed a Sort of spiritual Parents, or God-fathers thereof. — Tho' this Practice appears to have been more ancient, inasmuch as we read that *Constance* sent the Pope, the *Hair* of his Son *Heracles*, as a Token that he desired him to be his adoptive Father. See GODFATHER, ADOPTION, &c.

The Parade of long *Hair* became still more and more obnoxious in the Progress of Christianity; as something utterly inconsistent with the Profession of Persons who bore the Cross. Hence numerous Injunctions and Canons to the contrary. — Pope *Anicetus* is commonly supposed to have been the first who forbid the Clergy to wear long *Hair*; but the Prohibition is of an older Standing in the Churches of the East; and the Letter wherein that Decree is wrote, is of a much later Date than that Pope. — The Clerical Tonsure is related by *Astoria Hippolensis*, as of Apostolical Institution. See CLERIC.

Long *Hair* was anciently held so odious, that there is a Canon still extant of the Year 1096, importing, that such as wore long *Hair*, should be excluded coming into Church while living; and not be pray'd for when dead.

We have a furious Declamation of *Luitprand* against the Emperor *Pheocas*, for wearing long *Hair*, after the Manner of the other Emperors of the East; all except *Theophilus*, who being bald, enjoy'd all his Subjects to shave their Heads.

The French Historians and Antiquaries, have been very exact in recording the Head of *Hair* of their several Kings. — *Charlemaign* wore it very short, his Son *luther*, *Charles the Bald* had none at all. Under *Hugh Capet*, it began to appear again: This the Ecclesiasticks took in Dudgeon, and excommunicated all who let their *Hair* grow. *Peter Lombard* expostulated the Matter so warmly with *Charles the Young*, that he cut off his *Hair*; and his Successors for some Generations wore it very short.

A Professor of *Utrecht*, in 1650, wrote expressly on the Question, whether it be lawful for Men to wear long *Hair*? and concluded for the Negative. — Another Divine, named *Reves*, who had wrote for the Affirmative, replied to him.

The *Greeks*, and after their Example, the *Romans*, wore false *Hair*. See PERRUKE.

Wulferus, in the Philosophical Collections, gives an Account of a Woman buried at *Norimberg*, whose Grave being open'd 43 Years after her Death, there was *Hair* found issuing forth plentifully thro' the Clefts of the Coffin; inasmuch that there was Reason to imagine, the Coffin had some Time been cover'd all over with *Hair*. — The Cover being removed, the whole Corps appeared in its perfect Shape; but from the Crown of the Head to the Sole of the Foot, cover'd over with a thick set *Hair*, long and curl'd. — The Sexton going to handle the upper Part of the Head with his Fingers, the whole Structure fell at once; leaving nothing in his Hand but a Hand full of *Hair*: There was neither Skull, nor any other Bone left; yet the *Hair* was solid, and strong enough.

Mr. *Arnold*, in the same Collection, gives a Relation of a Man hang'd for Theft, who in a little Time, while he yet hung upon the Gallows, had his Body strangely cover'd over with *Hair*.

Dr. *Tyson* adds, that tho' the outward Surface of the Body, be the usual Place where the *Hair* grows; yet it has been sometimes found on the Tongue, in the Heart, the Breasts, Kidneys, &c. but that there is scarce any inward Part more subject to it, than the Ovary, or Testicles of Females. *Phil. Collect.* N^o. 2.

HAIR, makes a very considerable Article in Commerce; especially since the Mode of Perrukes has obtain'd. See PERRUKE.

The *Hair* of the Growth of the Northern Countries, as England, &c. is valued much beyond that of the more Southern ones, as Italy, Spain, the South Parts of France, &c.

The Merits of a good *Hair* consist in its being well set, and neither too coarse nor too slender; the Rigidity rendering it less susceptible of the artificial Curl, and disposing it rather to tangle; and the Smallness making its Curl of too short Duration. — Its Length should be about 25 Inches; the more it falls short of this, the less Value it bears.

There is no certain Price for *Hair*, but it is sold from Five Shillings to Five Pound an Ounce, according to its Quality. — The grey is the most coveted, then the white, &c.

The Scurfiness of grey and white *Hair* has put the Dealers in that Commodity upon Methods of redacting other Colours thiereto. — This is done by spreading the *Hair* to bleach on the Grass, like Linen; after first washing it out in a lissivous Water. See BLEACHING.

This Lye, with the Force of the Sun and Air, brings the Hair to so perfect a Whiteness, that the most experienced Person may be deceived therein; there being scarce any Way of detecting the Artifice but by boiling and drying it; which leaves the Hair of the Colour of a dead Walnut-Tree Leaf.

There is also a Method of dying Hair with Bismuth; which renders such white Hair, as borders too much upon the yellow, of a bright Silver Colour. — Boiling is the Proof of this too; the Bismuth not being able to stand it.

Hair which does not curl or buckle naturally, is brought to it by Art; by first boiling, and then baking it in the following Manner: — After having pick'd and sorted the Hair, and disposed it in Parcels, according to the Lengths; they roll them up, and tie them tight down, upon little cylindrical Instruments, either of Wood or Pottery, a Quarter of an Inch thick, and hollow'd a little in the middle; in which State they are put in a Pot over the Fire, there to boil for about two Hours. — When taken out they let them dry; and when dried, spread them on a Sheet of brown Paper, cover them with another, and thus send them to the Pasty Cook; who making a Crust or Coffin around them of common Paſt, sets them in the Oven, till the Crust is about three fourths baked.

The End by which a Hair grew to the Head, is called the *Heels of the Hair*; and the other, with which they begin to give the Buckle, the *Point*. — Formerly the Perruque-Makers made no Difference between the two Ends, but curled and wove them by either indifferently; which made them unable to give a fine Buckle: Hair wove by the Point never taking the right Curl. — Foreigners own themselves obliged to the *English* for this Discovery; which was first carried abroad by a Perruque-Maker of our Country. *Diff. de Commerce.*

HAIR is also used in divers Arts and Manufactures. The Hair of Beavers, Hares, Conics, &c. is the principal Matter whereof Hats are made. See HAT.

Spread on the Ground, and left to putrify on Corn Lands, Hair, as all other animal Substances, *vis.* Horns, Hoofs, Blood, Garbage, &c. proves a good Manure. See MANURE.

Hair also makes an Ingredient in the Composition of Plaster. See PLASTER.

Hair, in the Manage, and among Farriers, is popularly call'd the *Coat*, and makes a Point of principal Consideration in Respect of Horses, &c. See HORSE.

If the Hair of a Horse, especially about the Neck, and Parts uncover'd, be sleek, and smooth, and close; 'tis an Indication of his being in Health and good Case: If rough and flaring, or any Way discolour'd, it denotes a Coldness, Poverty, or some inward Defect. — To make the Hair smooth, sleek, and soft, he must be kept warm, sweat'd often, and when sweat'd, the Coat well scrup'd and rubb'd down.

The Hair growing on the Fetlock, serves as a Defence to the prominent Part thereof, in travelling on stony Ways, or in frosty Weather.

If a Place be bare, or thin of Hair, or the Hair be too short; the ancient Farriers used to wash it with the Urine of a young Boy; and after that with a Lye of unslaked Lime, Ceruse, and Litharge. — The Moderns have various other Ways: Some wash the Parts with a Decoction of the Roots of *Althea*; others with Goats Milk, wherein Agrimony has been pounded; others rub the Part with Nettle Seed, bruis'd with Honey Water, and Salt: Others anoint it with the Juice of an Onion, or Radish; others with a Mixture of Alum, Honey, Goats Dung, and Swines Blood: Others with the Root of the white Lilly, boil'd in Oil; Others with Tar, Oil of Olives, and Honey: And others, with green Walnut Shells powder'd, and mix'd with Honey, Oil, and Wine.

To take off Hair in any Part, they apply a Plaster, made of unslack'd Lime, boil'd in Water, with Orpiment added. See MARK, STARS, &c.

HAIRS-Breadth, is accounted the forty eighth Part of an Inch. See MEASURE, INCH, &c.

HALBARD, or HALBERD, an offensive Weapon, consisting of a long Shaft, five Foot long, with a Steel Head, somewhat in manner of a Crescent. See ARMS and ARMOUR.

The Halbard was antiently a common Weapon in the Army; where, there were Companies of Halbardeers: It is still retain'd by the Sergeants and Corporals on divers Occasions. — It was call'd the *Danish Ax*, because first bore by the *Danes*; and on the left Shoulder. From the *Danes* it was deriv'd to the *Scots*; from the *Scots* to the *English-Saxons*; and from them to the *French*.

The Word is form'd of the German *Hal*, Hall, and *bars*, a Hatchet. *Vossius* derives it from the German *hellebaer*, of *hel*, clarum, splendens, and *baer*, bipennis.

Others bring it from *ala*, by Reason the Halbaras were ranged in the Wings of the Army, *quasi aliparatus*.

HALBERT, among Farriers, &c. is a Piece of Iron, an Inch broad, and three or four Inches long, folder'd to the Toe of a Horse's Shoe, that sets out before; to hinder a lame Horse from resting or treading upon his Toe.

Halbert Shoes do of Necessity constrain a lame Horse to tread or rest on his Heel, when he goes a moderate Pace; which lengthens and draws out the back Sinew, that was somewhat shrunk before.

HALCYON-DAYS, *Dies Alcyonis*, a Phrase, that frequently occurs among Writers, to denote a Time of Peace and Tranquillity.

The Diction takes its Rise from a Sea-Fowl, call'd among Naturalists *Halcyon*, or *Alcyon*, which builds its Nest about the Winter's Solstice, when the Weather is usually observ'd to be still and calm.

The antient Tradition was, that it built its Nest, and laid its Eggs in the Sea; chusing for that Purpose a Sea-fon when the Waves were quite still.

HALF-BLOOM, a round Mass of Metal, which comes out of the Finery of an Iron-Work. See BLOOMERY and IRON-WORK.

HALF-MARK, *Dimidia Marka*, is a Noble. See NOBLE. *Fitz-herbert* says, that in Case a Writ be brought, and the Seisin of the Demouandant, or his Ancestor alledged; the Seisin is not traversable by the Defendant, but he may tender the half Mark for the Enquiry of this Seisin: Which is, in plainer Terms, that the Defoudate shall not be admitted to deny, that the Possessor, or his Ancestors, was seised of the Land in Question, and to prove his Denial; but that he shall be admitted to tender half a Mark in Money, to have an Enquiry made, whether the Demouandant, &c. were seised or not?

HALF-MOON, *Demi Lune*, in Fortification, is an Out-work, that hath only two Faces, forming together a salient Angle, which is flank'd by some Part of the Place, and of the other Bastions. See OUT-WORK, DEMI-LUNE, &c.

These Half-Moons are sometimes raised before the Curtain, when the Ditch is a little wider than it ought to be; in which Sense it is much the same with a Ravelin, only that the Gorge of an Half-Moon is made bending in like a Bow, or a Crescent, and is most Times us'd to cover the Point of a Bastion; whereas Ravelins are placed before the Curtain. — But they are defective, as being ill flank'd. See RAVELIN.

HALF-PENNY, a Copper Coin, whose Value is express'd by its Name. See PENNY. See also OBOLUS.

HALF-SEAL, is us'd in Chancery, for the Sealing of Commissions to Delegates appointed upon any Appeal in Ecclesiastical or Marine Causes. See DELEGATE.

HALF-TONGUE, *Medietas Linguae*, is a Jury impannell'd in a Cause, where a Stranger, or Foreigner, is a Party. See MEDIETAS Linguae.

HALIBUTICKS, *Haliuticas*, of the Greek, *'Almutes*, Books treating of Fishes, or the Art of Fishing. See FISH and FISHING.

HALIGAMOT. See HALIMOTE.

HALL, was antiently us'd for a Mansion-House, or Habitation. See MANSION.

HALL, *Salle*, in Architecture, is a large Room, at the Entrance of a fine House, Palace, or the like. See PALACE, &c.

Vitruvius mentions three Sorts of Halls: The *Tetrapyle*, which has four Columns supporting the Plafond, or Ceiling: The *Corinthian*, which has Columns all around, let into the Wall, and is vaulted over: And the *Egyptian*, which had a Peristyle of isolated *Corinthian* Columns, bearing a second Order, with a Ceiling. These were call'd *Oeci*.

The Hall is properly the first, and finest Partition, or Member of an Apartment; and, in the Houses of Ministers of State, public Magistrates, &c. is that wherein they dispatch Business, and give Audience.

In very magnificent Buildings, where the Hall is larger and loftier than ordinary, and placed in the middle of the House, it is call'd a *Saloon*. See SALOON.

A Royal Apartment is said to consist of a Hall, or Chamber of Guards, *Aula Pretoriana*; an Anti-chamber, *Procurera*; a Chamber, *Camera*; a Cabinet, *Conclave*; and a Gallery, *Porticus*. See APARTMENT.

HALL is also a public Building, erected for the Administration of the Policy and Justice of a City, or Corporation. — In this Sense we say the *Town-Hall*, a *Company's Hall*, &c.

Guild-Hall, is a stately Building in the City of London, and the great Court of Judicature for that City. See COURT and GUILD-HALL.

Here, Meetings of the Citizens are held, for the Election of Officers, solemn Entertainments, &c.

HALL, is also particularly used for a Court of Justice; or an Edifice wherein there is one or more Tribunals. See COURT, JUSTICE, and TRIBUNAL.

In *Westminster Hall* are held the great Courts of this Kingdom, viz. the King's-Bench, Chancery, Common-Pleas, and Eschequer. See KING'S-BENCH, COMMON-PLEAS, and ESCHERQUER.

Above STAIRS, is likewise held the High Court of Parliament. See PARLIAMENT.

Westminster-Hall was the Royal Palace, or Place of Residence of our ancient Kings; who ordinarily held their Parliaments, and Courts of Judicature, in their Dwelling-Houses, (as is still done by the Kings of Spain) and frequently fat the said Courts of Judicature, as they still do in Parliament.

A great Part of this Palace was burnt under Henry VIII. what remains is still referred for the said Judicatories. — The great *Hall*, wherein the Courts of *Kings-Bench*, &c. are kept, is said to have been built by *William Rufus*; others say by *Richard I.* or *II.* 'Tis reckon'd superior, in Point of Dimensions, to any *Hall* in *Europe*, being 500 Foot long, and 100 broad.

HALLAGE, a Fee due for Cloth brought for Sale to *Blackwell-Hall* in *London*.

The Word is also used for Toll paid to the Lord of a Fair, or Market, for Commodities sold in the common *Hall* of the Place.

HALLELUJAH, a Term of Rejoicing, sometimes sung or rehears'd, at the End of Verses on that Occasion.

St. *Jerom* first introduced the Word *Hallelujah* into the Church Service: For a considerable Time it was only used once a Year, in the *Latin Church*, viz. at *Easter*: But in the *Greek Church* it was much more frequent. St. *Jerom* mentions its being sung at the Interments of the Dead, which it still continues to be in that Church; also on some Occasions in *Leuis*.

In the Time of *Gregory the Great*, it was appointed to be sung all the Year round in the *Latin Church*, which rais'd some Complaints against that Pope, as giving too much into the *Greek Way*, and introducing the Ceremonies of the Church of *Constantinople* into that of *Rome*. But he excus'd himself by alledging that this had been the ancient Usage at *Rome*; and that it had been brought from *Constantinople* at the Time when the Word *Hallelujah* was first introduced under Pope *Damasus*.

The Word is *Hebrew*; or rather, it is two *Hebrew* Words join'd together; one of them *הללו*, *hallelu*, and the other *יהוה*, *ja*, an Abridgment of the Name of God, *יהוהיהוה*, *Jehova*. The first signifies *Laudate*, praise ye; and the other *Dominus*, the Lord.

HALLIARDS, or HALYARDS, in a Ship, are Ropes which serve for hoisting up all the Yards, except the Cross Jack, and the Sprit-sail Yards. See YARD.

HALMOTE, or HALIMOTE, from the *Saxon* heale, i. e. *Aula*, Hall, and *heimot*, conventus, Meeting; is the same with what we now call a *Court-Baron*; the Word implying a Meeting of the Tenants of the same Hall or Manor. See BARON.

Omnis causa terminatur, vel Hundredo, vel Comitatu, vel Halimote, solum habentium vel dominorum curia. L. L. Hen. I. Cap. 10.

The Name is still retained at *Langton*, and other Places in *Heresfordshire*. See MOTTE.

It is sometimes also taken for a Convention of Citizens in their public *Hall*; which was also call'd *Folkmoet* and *Halmote*. See FOLMOTTE, HALL, &c.

This *Halmote* and *Halimote*, are often confounded with the *Folknote*, though originally they were two distinct Courts. In Effect, the *Halimote* properly signifies the Lord's Court, or a Court Baron held in the Manor, in which Differences between the Tenants were determined. See MANOR, COURT, TENANT, LORD, &c.

HALO, in Physiology, a Meteor, in Form of a luminous Ring, or Circle, of various Colours, appearing round the Bodies of the Sun, Moon, and Stars. See METEOR.

That around the Moon is the most usual; and is also call'd *Corona*, *Crown*. See CORONA.

That about the Sun is peculiarly call'd *Parhelia*. See PARHELIA.

The Word is form'd of the *Greek*, *αλος*, or *αλον*, *Alea*. Naturalists conceive the *Halo* to arise from a Refraction of the Rays of Light in their passing thro' the fine, rare *Vesicula* of a thin *Nubecula*, or Vapour, toward the Top of our Atmosphere; which Account they confirm hence; that a Quantity of Water being thrown up against the Sun, as it breaks and disperses into Drops; it forms a Kind of *Halo*, or Iris, exhibiting the Colours of the Natural ones. See RAINBOW.

Mr. *Huygens* supposes *Halo's*, or Circles round the Sun, to be form'd by small round Grains of a Kind of *Hail*, made up of two different Parts; one of which is opaque, an inclosed in the other which is transparent: Which is the Structure really observed in *Hail*. See HAIL.

After the same Manner he accounts for the *Parhelia*; only that there he imagines the icy Grains of an oblong Figure, and rounding at the Ends; like Cylinders, with round Convex Tops. — Where some of these Cylinders are in an erect Position, the Circle they form will be white, by Reason of the Reflection of the Rays of the Sun on the Surface of these Cylinders.

He proceeds to account for the colored *Halo's*, and *Parhelia*, from the same Hypothesis; and produces an Experiment of a glass Cylinder, a Foot long, having within it an opaque Kernel, (which was a Cylinder of Wood) and the ambient Space filled with Water: This Cylinder being expos'd to the Sun, and the Eye dispos'd in a proper Place; the several successive Reflections and Refractions necessary to produce such an Effect did plainly appear.

The Light which comes through Drops of Rain by two Refractions, without any Reflection, Sir *J. Newton* observes, ought to appear strongest at the Distance of about 26 Degrees from the Sun, and to decay gradually both Ways, as the Distance from him increases and decreases: And the same is to be understood of Light, transmitted through spherical *Hail-stones*. — Add, that if the *Hail* be a little flattened, as is often the Case, the Light transmitted may grow so strong at a little less Distance than that of 26 Degrees, as to form a *Halo* about the Sun or Moon; which *Halo*, as often as the *Hail-stones* are duly figur'd, may be colored; and then it must be red within by the least refrangible Rays, and blue without by the most refrangible ones; especially if the *Hail-stones* have opaque Globules of Snow in their Centre, to intercept the Light within the *Halo*, as *Huygens* has observ'd, and make the inside thereof more distinctly defined than it would otherwise be.

Such *Hail-stones*, though spherical, by terminating the Light by the Snow, may make a *Halo* red within, and colour'd without, and darker in the red than without, as *Halo's* use to be: For of those Rays which pass close by the Snow, the Rubrifirm will be least reflected, and so come to the Eye in the directest Lines. *Optice*.

HALSFANG. See HALFPANG and PILLORY.

HALT, in War, a Pause, or Stop, in the March of a military Body. See PAUSE.

In Places full of Defiles, frequent *Halts* must be made: The Army made a *Halt* to rest themselves.

Some derive the Word from the *Latin Halitus*, Breath; it being a frequent Occasion of *halting*, to take Breath: Others from *aito*, by Reason in *Halts* they raise their Pikes, &c. an End.

HALTERISTÆ, HALTERISTS, in Antiquity, a Sort of Players at *Discois*; denominated from a peculiar Kind of *Discus*, by the *Greeks* call'd *σάρις*, and by the *Latins* *Halter*. See DISCUS.

Budeus, and others, take the *Halter* to have been a leaden Weight, or Club, which the Vaulters bore in their Hands, to secure and keep themselves the more steady in their Leaping. — Nor will these Authors allow of any Sort of *Halter* besides this Weight; nor other *Halterists* but these Vaulters. — But *Cornarius*, in his Comments on *Galen*, refutes the Opinion.

Others, as *Cornarius*, *Constantine*, and *Portus*, will have the *Halter* to be a Lump, or Massive of Lead, or Stone, with a Hold, or Handle, fix'd to it, by which it might be carried; and that the *Halteristæ* were those who exercised themselves in removing these Massives from Place to Place. — These Authors add, that the Weight, or Ball mention'd by *Budeus*, was not call'd *σάρις*, *Halter*, but *σάρις*, *Aliter*, which signifies *Assistance*, *Help*.

Hier. Mercurialis, in his Treatise *de Arte Gymnastica*; L. II. C. 12. distinguishes two Kinds of *Halteristæ*; for tho' there was but one *Halter*, there were two Ways of applying it. — The one was to throw or pitch it in a certain Manner, or only to hold it out at Arm's End; and in this Posture to give themselves divers Motions, swinging the Hands backwards and forwards, &c. according to the engraven Figures thereof given us by *Mercurialis*.

The *Halter* was of a cylindrical Figure, less in the middle, where it was held, by one Diameter, than at the two Ends. It was above a Foot long; and there was one for each Hand: It was either of Iron, Stone, or Lead.

Galen, *De tuenda Valetud.* Lib. I. Lib. V. and Lib. VI. speaks of this Exercise, and shews of what Use it is in purging the Body of peccant Humors; making it equivalent both to Purgation and Phlebotomy. See EXERCISE and GYMNASIUM.

HALTING, among Farriers, &c. an Irregularity in the Motion of a Horse, arising from a Lameness, or other Injury in the Shoulder, Leg, or Foot; which leads him to spare the Part, or use it too timorously.

An Acquaintance with this Disorder, in its several Circumstances, is a Thing of great Extent in the Affairs of the Manage; for which Reason we shall add the principal Points relating thereto. — If a Horse *halts*, 'tis either before; in which Case his Grief lies either in the Shoulder, the Legs, or Feet: Or *behind*, where it must lye in the Hip, Ham, or the like.

1°. The Signs which indicate it in the *Shoulder*, are his not lifting up his Leg, but trailing it on the Ground; or his casting out one Leg more than the other, and with his Knee, in a Manner, unbecom. — Add that in turning short he will visibly favour the Leg on the lame Side. Again, if the Ailment be found in the Shoulder, it must either be in the Top of the Shoulder Blade, call'd the *Withers*, which is known by his *Halting* most when a Person is on his Back, his shrinking much, and offering to bite when gripp'd, and handled about the Top of the Shoulder Blade: Or in the Bottom of the Shoulder Blade, joyning to the Marrow Bone, which is the fore Pitch of the Breast; which is known by his treading his Steps thick, and shrinking, ready to fall down, when press'd in that Part: Or in the Elbow, which joys the Marrow Bone to the Leg; which is known by wincing, and taking up his Foot when pinch'd there.

2°. If the Grievance be in the *Legs*, it either lies in the Knee, or Pastern Joint, which he discovers by refusing to bow the one or the other, and going stiffly on it: Or in the *Shank*, which is discovered by some Splint, Screw, Wind-gall, or other visible Malady thereon.

3°. If it be in the *Foot*; it is either in the Coronet, and owing to some Strain, to be distinguish'd by some Tumor, or breaking thereon, or its appearing hot and burning to the Touch: Or in the *Heel*, owing to an Over-reach or the like, and visible to the Eye, as also by his treading altogether on his Toe: Or in the *Quarters*, between the middle of the Hoof and the Heel, which is known by his *Halting* more when on the Edge of a Bank than when on plain Ground. — This is sometimes occasion'd by being pricked with a Nail in the Shoeing; and the faulty Nail is distinguish'd by pinching the Head of each Nail, and the Hoof together with a Pair of Pinchers.

If a Horse halt *behind*, from a Disorder in the Hip, or Huckle Bone, he will go sidelong, and not follow so well with that Leg as the others; nor will he turn on that Side without labouring the Leg; add, that he shows it still most, in walking on the Side of a Bank with the worst Leg highest.

If a Horse has any hidden Infirmary, that will bring him to halt when he comes to Travel, it may be discover'd by running him in the Hand on smooth Way, at the Length of the Halt; and observing how he sets down his Legs: If he favour none of them, he is to be further prov'd, by riding him roundly till well heated; then letting him stand still an Hour, and after that running him in the Hand at Haltes length as before.

HALYMOTE, properly signifies an Holy, or Ecclesiastical Court. See HALMOTE.

There is a Court held in London by this Name, before the Lord Mayor and Sheriffs, for regulating the Bakers. — It was antiently held on *Sunday* next before *St. Thomas's Day*, and for this Reason call'd the *Halymote*, or Holy-Court. — The Title thereof runs thus: *Coram sancti-motis tenens in Guiltaldis Civitatis London. Coram Majori & Vicecom. &c.*

HALYWERCPOLE, antiently signified such Persons of the Province of *Durham*, as held Lands, on Condition of defending the Corps of *St. Cuthbert*; and who hereupon claimed the Privilege not to be forced to go out of the Bishoprick either by King or Bishop. *Hijf. Dunelm.*

Hence *Durham* in our Year Books is call'd *Francheife de Werk*. Selden.

HAM, a Saxon Word, properly signifying a House, or Dwelling-Place. — Sometimes it also signifies a Street, or Village.

Hence it is that the Name of many of our Towns end with it; as *Nottingham*, *Buckingham*, *Walsingham*, &c.

HAM, is also a Part of the Leg of an Animal; being the inner, or hind-Part of the Knee; or the Ply, or Angle, in which the Leg and Thigh, when bent, incline to each other. See *LEO*, *THIGH* and *KNEE*.

HAM, in Commerce, &c. is used for a Thigh or Shoulder of Pork, dried, season'd, and prepar'd to make it keep, and give it a brisk agreeable Flavour. See *GAMMON*.

Woffphalia-Hams, so much in Vogue, are prepar'd by Salting them with Sale-Petre, pressing them in a Press

eight or ten Days, steeping them in *Juniper Water*, and drying them by the Smoak of *Juniper Woods*.

HAMADRYADES, in Antiquity, fabulous Deities, revered among the ancient Heathens, and believ'd to preside over Woods and Forests, and to be inclos'd under the Bark of Oaks. See *COPE*.

The Word is compounded of *hama*, *simul*, together; and *dryas*, *Dryad*, of *drye*, *Oak*. See *DRYADES*.

The *Hamadryades*, *amaplyades*, were supposed to live and dye with the Trees they were attach'd to; as is observed by *Servius* on *Virgil*, *Ecol. X. v. 62.* after *Monsieur de la Motte*, the Scholiast of *Apollonius*, &c. who mention other Traditions relating thereto.

The Poets, however, frequently confound the *Hamadryades*, with the *Naiads* and *Nepæes*; witness *Catullus Carm. LXIII. v. 23.* *Ovid. Fast. IV. 229. Propert. Eleg. XX. 32.* See *NAIADS*.

Festus calls them *Quercustulane*, as being issued, or sprung from Oaks. An ancient Poet, one *Pherenicus*, in *Athenæus*, L. III. calls the Vine, Fig-Tree, and other Fruit-Trees, *Hamadryades*, from their Mother's Name.

HAMAXOBII, **HAMANOBIIANS**, in the ancient Geography, a Nation of People who lived wholly in Chariots; whence their Appellation, from *amaça*, a *Car*, or *Chariot*, and *biis*, *Life*.

The *Hamaxobii*, or *Hamanobite*, were an ancient People of *Sarmatia Europæa*, inhabiting the Southern Part of *Moscovy*. — They had no Houses, but Tents made of Leather, and fix'd on Chariots, to be ready for shifting and Travel.

HAMBROUGH Company. See *COMPANY*.

HAMMELING, or *HAM-fringing*, the Act of cutting off the *Hem*.

Hawmeling, or *Hawmbling* of Dogs, is the same with *Expeditating*, or *Lawing*. See *EXPEDITATING*.

HAMLET, **HAMEL**, or **HAMPSEL**, from the Saxon, *Ham*, *House*, and the German, *Ham*, *Member*; are Diminutives of *Ham*; and signify a little Village; or rather, a Part of a Village. See *VILLAGE*.

The learned *Spelman* upon these Words, shewing the Difference between *Villa integra*, *Villa dominica*, & *Hamleta*, says, *Hamleta vera, que mediæstantis sriborgi non obtinuit, hoc est ubi quinque capitales plebei non adprehensit sunt.* — The Statute of *Econ. 14. Edw. I.* mentions this Word thus, *Les nuyes de toutes les Villes & Hamlets que sont en son Wapentake.* In an ancient MS. it is expounded the *Seat of a Free-holder*.

HAMMER, an Instrument of Iron, with a Handle of Wood; used in most mechanic Arts, to beat, stretch, drive, &c. See *BEATING*, &c.

Bodies capable of being stretch'd, or extended, under the *Hammer*, are said to be *malleable*. See *MALLEABILITY*.

The *Larins* call it *Mallens*, of *Morrellus*, by which Name *Pliny* calls it, when he says, that *Cypria*, Daughter of *Agriopis*, invented the *Hammer* and *Pinchers*. *Menege* derives the Latin Name a *Marte*, & *Martius*.

The *Hammers* of Forges, are moved or worked by a Water-Mill. See *FORGE*.

HAMMER HARDENING. See *HARDENING*.

HAMMER of a Clock. See *CLOCK* and *CLOCK-WORK*.

HAMMER, in Anatomy. See *MALLEUS*.

HAMMERING, the Act of beating, or extending, and fashioning a Body under the *Hammer*. See *HAMMER*.

When it is perform'd on Iron heated for the Purpose, the Smiths usually call it *Forging*. See *FORGING*.

HAMMERING, in Coining. — A Piece of Money, or a Medal, is said to be *Hammer'd*, when struck, and the Impression given, with a *Hammer*, and not with a Mill. See *COIN* and *MEDAL*.

For the Method of Coining with the Hammer, See *COINING*.

HAMMOCK, or **HAMAC**, a Kind of hanging-Bed; suspended between two Trees, Posts, Hooks, or the like; much used throughout the *West Indies*, as also on Board of Ships.

The *Indians* hang their *Hammacs* to Trees, and thus secure themselves from wild Beasts and Insects, which render lying on the Ground dangerous.

The People of the *Caribbee* Islands are wonderfully superstitious in the Point of their *Hammacs*; and do not make them without a deal of Ceremonies. — At each End of the Room, they put Bags of *Alices*, without which, it is the Opinion, that the *Hammock* won't last. If they were to eat Figs on a *Hammock*, they believe it would rot: Nor dare they eat any Fish that has good Teeth, as believing that would make their *Hammock* soon wear thro'.

According

According to *Fa. Plumier*, who has often made use of the *Hannac* in the *Indies*, it consists of a large, strong Coverlet, or Sheet of coarse Cotton, about six Foot Square: On two opposite Sides, are Loops of the same Stuff, thro' which a String is run, and thereof other Loops are form'd, all which are tied together with a Cord; and thus is the whole fasten'd to two neighbouring Trees, in the Field; or two Hooks, in Houses.

This Kind of Bed serves, at the same Time, for Bed, Quilts, Sheets, Pillow, &c.

HAMUS, or HAMULUS, is an Hook. See *HOOK*.

Surgeons also make Use of an Instrument thus called, to extract the Child in difficult Labours.

HANAPER, or HAMPER, an Office in Chancery. See *CHANCERY*.

The Clerk of the *Hanaper*, sometimes styled *Warden of the Hanaper*, receives all Money due to the King for Seals of Charters, Patents, Commissions, and Writs; and attends the Keeper of the Seal daily in Term-Time, and all Times of Sealing; and takes into his Custody all sealed Charters, Patents, and the like, which he receives into Bags; but anciently, it is supposed, into *Hampers*, which gave Denomination to the Office.

There is also an Officer, who is Comptroller of the *Hanper*. See *COMPTROLLER*.

HANCES, in a Ship, are Falls, or Descents of the Five-Rails, which are placed as Banisters in the Poop, &c. and down to the Gang-way.

HANCES, or HANSES, in Architecture, are the Ends of Elliptical Arches; which are Arcs of smaller Circles than the Scheme, or middle Part of the Arch. See *ARCH*.

HAND, *Manus*, a Part, or Member of the Body of Man; making the Extremity of the Arm. See *ARM*.

The Mechanism of the *Hand* is very curious, excellently contrived to fit it for the various Uses and Occasions we have for it, and the great Number of Arts and Manufactures it is to be employ'd in. It consists of a Compagae of Nerves, and little Bones, jointed into each other, which give it a great Degree of Strength, and at the same Time an unusual Flexibility, to enable it to handle adjacent Bodies, lay hold of them, and grasp them, in order either to draw them towards us, or thrust them off.

Axaxogoras is represented by ancient Authors, as maintaining, that Man owes all his Wisdom, Knowledge, and Superiority over other Animals, to the Use of his *Hand*. — *Galen* puts the Thing another Way: Man, according to him, is not the wisest Creature, because he has *Hands*; but he had *Hands* given him because he was the wisest Creature. For it was not our *Hands* that taught us Arts, but Reason. The *Hands* are the Organs of Reason, &c. *De usu part. Lib. I. C. 3.*

HAND, in Medicine: — The *Hand*, among Anatomists, extends from the Shoulder to the Fingers Ends; call'd also the *greater Hand*.

It is divided into three Parts: — The first reaching from the Shoulder to the Elbow; properly call'd the *Arm*, *Brachium*. See *ARM*.

The second reaches from the Elbow to the Wrist. — The third, the *Hand*, *Manus*, properly so call'd; call'd also the *lesser Hand*, or *extrema Manus*. — This is subdivided into three other Parts; the *Carpus*, which is the Wrist: — The *Metacarpus*, which is the Body of the *Hand*, including the *Dorsum* and *Vola*: — And the Fingers, *Digiti*. See each described under its proper Article, *CARPUS*, *METACARPUS*, and *FINGERS*.

The Muscles whereby the *Hand* is moved and directed, are the *Palmares*; the *Flexor* and *Extensor*, *Carpi Ulnaris*, and *Radialis*; *Perforatus*; *Perforans*; *Lumbricales*; *Interossei*; *Extensori*, *Abductori*, and *Flexori* of the Fingers. See each in its Place, *PALMARIS*, *FLEXOR*, *EXTENSOR*, &c.

The *Hand* makes the Subject-Matter of the Art of Palmistry, which is employ'd in considering the several Lines and Eminencies of the Palm of the *Hand*, their Significations, &c. See *PALMISTRY*.

Among the *Egyptians*, the *Hand* was used as a Symbol of Strength: — Among the *Romans*, it was held a Symbol of Fidelity; and accordingly was consecrated to that God, by *Numa*, with great Solemnity.

In Chirurgery, they use an *Iron Hand*, which is a Kind of Artificial, or Subsidiary *Hand*, to be applied, and fitted on the Stump of an Arm, after the *Hand* has been cut off.

It has most of the Motions of the natural *Hand*, which are effected by Means of Springs, Pulleys, Pinions, Buttons, &c. *Aut. Pare* gives us its Structure at large.

HAND, in Falconry, is used for the Foot of the Hawk: — To have a clean, strong, slender, glutinous *Hand*, well clawed, are some of the good Qualities of a Hawk or Falcon. See *HAWK* and *FALCON*.

HAND, in the Masnage, is a Term variously used. — Sometimes it stands for the Fore-foot of a Horse.

Hand is also used, for a Division of the Horse into two Parts, with Respect to the Rider's *Hand*. — The *Fore-hand* includes the Head, Neck, and fore-Quarters. — The *Hind-hand* is all the rest of the Horse.

Spear-Hand, or *Sword-Hand*, is used for a Horseman's Right-*Hand*.

Bridle-Hand, is his Left-*Hand*. — Your regular Cavalier holds his *Bridle-Hand* 2 or 3 Inches above the Pommel of the Saddle.

A Horseman is said to have no *Hand*, when he only makes Use of the *Bridle* unreasonably; not knowing how to give the Aids or Helps of the *Hand* with Discretion.

To keep a Horse upon the *Hand*, signifies to feel him in the Stay upon the *Hand*, and to be always prepared to avoid any Surprise from him. — When the Horse obeys and answers the Effects of the *Hand*, he is said to *rest well upon the Hand*.

A Horse-man ought to have a *light Hand*, i. e. he ought only to feel the Horse upon his *Hand*, so as to resist him whenever he attempts to slip from it; and as soon as he has made his Resistance, ought to lower the *Bridle*, instead of cleaving to it.

If a Horse, by a too great Eagerness to go forward, presses too much upon the *Hand*, it ought to be slacken'd at certain Times, and at other Times to be kept hard, in order to disappoint him from continually preying upon the Bit. This Facility, or Liberty of the Horseman, of slackening or stiffening the *Hand*, makes what they call a *good Hand*.

A Horse is said to force the *Hand*, when he does not fear the *Bridle*, but runs away in Spite of the Rider.

To work a Horse upon the *Hand*, is to manage him by the Effects of the *Bridle*, without any other Helps, except the Calves of the Legs.

To be heavy upon the *Hand*, is understood of a Horse, which by Reason of the Softness of his Neck, the Weakness of his Back, the Largeness of his Head, and the Weight of his Fore-quarters; or his Weariness; throws himself upon the *Bridle*, without making any Resistance, or Effort, to force the Horseman's *Hand*.

Harmonical *HAND*, in Music, is used by some Writers for the ancient Diagramma, or Scale of Music, upon which they learn'd to sing. See *GAMMUT*, *SCALE*, *DIAGRAM*, &c.

The Reason of the Appellation was, that *Guido Aretinus*, upon inventing the Notes, *ut, re, mi, fa, sol, la*, disposed them on the Fingers of the Figure of a *Hand* stretch'd out. See *NOTE*.

He changed the Letters of the Alphabet, used till that Time to express the Notes, for these six Syllables, which he took out of the first Strophe of the Hymn of St. *Johna Baptist*, composed by *Paulus Diaconus*.

Ut queant Laxis resonare fibris
Mi-ra Ge-fo-rum fa-mu-li to-rum
Sol-ve pol-lu-ti la-bii re-atum.
Sancte Joanne.

Imposition of HANDS, or Laying on of Hands, signifies the conferring of Holy Orders; a Ceremony wherein the *Hands* are laid on the Head of another, as a Sign of a Mission, or of a Power given him to exercise the Functions of the Ministry belonging to the Order. See *ORDINATION*, &c.

The Apostles began to appoint Missionaries by the Imposition of *Hands*. See *IMPOSITION*.

Washing one's HANDS of a Thing, signifies the witnessing that a Person has no Part or Concern in an Affair; and that he will not be answerable for it: As *Pilate* did in Respect of our Saviour's Death. — In this Sense a Man is said to have clean *Hands*; and particularly a Judge, to denote that he has not been corrupted by Bribes or Presents.

Left-HAND, — To marry with the *Left Hand*, is to espouse a Woman of inferior Degree, whose Children, in virtue of such Marriage, are not to succeed to the Father, nor share with the other Children; but be contented with what Fortune the Husband shall appoint them the next Day after Marriage.

This Method of taking *Left-handed Wives* obtains in *Germany*. See *MARRIAGE*.

HAND, is also used for the Index of a Clock, Watch, or the like, serving to point the Hour, &c. See *INDEX*.

HAND of Justice, is a Scepter, or Baton, a Cubit long, having an Ivory Hand at the Extremity thereof; used as an Attribute of Kings, wherewith they are painted in their Royal Robes; as on the Coronation Day.

Authors usually call it *Virga*. — *Louis X. of France*, first took the *Hand* of Justice for his Device.

Long-Hand, Longimans. — A Kind of Title, or Surname, assumed by certain Princes. *Artaxerxes*, the Son of *Xerxes*, and his Successor in the *Persian Empire*, were thus denominated; as having one *Hand* longer than the other.

Short Hand. See *TACHOGRAPHY*.

Bloody Hand. See *BLOODY-HAND*.

HAND is also figuratively used in Painting, Sculpture, &c. for the Manner or Style of this or that Master. See *MANNER, STYLE, &c.*

HANDS, are born in Coat Armour, *dexter* and *sinister*; that is, right and left; expanded or open, and after other Manners.

Azure, a *dexter Hand* couped at the Wrist, and extended in pale Argent; is born by the Name of *Browe*. — Argent, three *sinister Hands*, couped at the Wrist, Gules, by the Name of *Meynard*.

The Knights Barons, are to bear in a Canton, or in an Escutcheon, which they please, the Arms of *Uffter*, viz. in a Field Argent, a *sinister Hand* couped at the Wrist, Gules. See *BARONET*.

HAND-BOROW, from the *Saxon*, *Bony-hand*, a *Surety*; *est quasi vas, aut fidei jussor manusculis, hoc est, minor, seu inferior; nam Head-borow, vas est Capitalis, vel superior.* Spelman. See *HEAD BOROW*.

HAND-BREADTH, is sometimes used for a Measure of three Inches. See *INCH* and *MEASURE*.

HAND, or *HANDFUL*, is also a Measure of four Inches, by the Standard; according to the Stat. 33 H. 8. Cap. 5. See *MEASURE*.

The *Hand*, among Jockeys, is four Fingers Breadth, and is the Measure of a Fift clenched; by which the Height of Horses is measured.

A Horse for War should be 16 or 18 *Hands* high.

HAND-HABEND, in our ancient Customs, denotes a Thief taken in the very Fact. See *HOND-HABEND*.

Si quis hominem liberum introcinimus, seu rem faratam seu muleriam (quem hebbempe hanoa vocant) comprehenderit, &c. Concil. Berghemise, Anno 697.

HANDLING, a Term used in Respect of fighting Cocks, signifying the measuring the Girth of them, by gripping one's Hands and Fingers about the Cock's Body.

HANGINGS, Linings for Rooms, made of Arras, Tapestry, &c. See *TAPESTRY*.

HANGS-Over, in Building. See *BATTER*.

HANSE, or *ANSE*, an ancient Name, for a Society or Company of Merchants, particularly those of certain Cities in *Germany*, &c. hence call'd *Hanse Towns*. See *COMPANY* and *HANSE TOWN*.

HANSE TOWNS, certain Free Towns of *Germany*, and the *North*, united in strict League, under Laws and Magistrates of their own appointing, for the better carrying on of Commerce, and their mutual Safety and Assistance. See *COMPANY*.

This celebrated Association, which makes so great a Figure in the History of Commerce, is commonly supposed to have commenced at *Bremen* on the *Weser*, in the Year 1164; others say in 1260, immediately after the Incursions and Piracies of the *Danes*, *Normans*, &c. others in 1206; and others in 920: But be its Origin when it will, it was confirm'd and re-establish'd in 1270. See *COMMERCE*.

At first it only consisted of Towns situate on the Coasts of the *Baltic Sea*, or not far from it. — But its Strength and Reputation increasing, scarce any Trading City in *Europe* but desired to be admitted into it.

Under our King *Henry III.* the *Hanse* consisted of no less than 62 Cities; to which were afterwards added 4 more.

France furnished to the Confederacy, *Rouen*, *St. Malo*, *Bordeaux*, *Bayonne*, and *Marseilles*: *Spain*, *Barcelona*, *Sevil*, and *Cadix*: *England*, *London*: *Portugal*, *Lisbon*: — The *Low-Countries*, *Antwerp*, *Dort*, *Amsterdam*, *Bruges*, *Rotterdam*, *Ostend*, and *Dunkirk*: And *Italy* and *Sicily*, *Messina*, *Leghorn*, and *Naples*.

The *Hanse* was divided into 4 Classes, or Members, which were those of *Lubeck*, *Cologne*, *Brumswick*, and *Prussia*, or *Danzic*. — Those four Cities were the Heads of the four Members; and *Lubeck* that of the whole *Hanse*.

Beside this, the *Hanse* had four principal Factories, or Staples, at *London*, *Bruges*, *Novogrod*, and *Berg*; that of *Bruges* was afterwards removed to *Antwerp*. But the first and principal was that of *Lubeck*, which still remains the Head of the Association. That of *London* was call'd *Guildballa Teutonorum*, or the *Stillyard*. See *STILLYARD*.

The Government of the *Hanse* was at first Aristocratical: Then it came under the sole Direction of the Grand Master of the *Teutonic Order*; and, at length, diverse Princes and Lords made Interest for it.

The End of the *XIVth* Century, and the Beginning of the *XVth*, were the most flourishing Times of this Alliance. — They were then in a Condition to proclaim War against Kings: History is not silent, as to that they waged against *Waldemar King of Denmark*, about the Year 1348; and against *Eric*, in 1478; particularly this last, where the *Hanseatic Fleet* consisted of Forty Ships, containing above 12,000 Regular Troops, beside the Seamen.

But the several Princes, whose principal Cities were enter'd into the Association, began to think it Policy to put some Bounds to a Power, which, in Time, might have proved formidable to themselves. — The Means were easy, and short: Each withdrew the Merchants of his Country from the Association; which, in a little Time, from the great Number of Cities it had comprehended, found it self sunk to those few which had begun the Confederacy; which henceforth was call'd the *Teutonic Hanse*. Tho' these are still so considerable in Point of Commerce, that they are admitted to make Treaties with the greatest Kings.

The Divisions that were got among them, contributed greatly to their Fall: Nor must it be forgot, that the Establishment of the Republic and Commerce of *Holland* had its Share therein.

The four first Cities which form'd the League, were *Lubeck*, *Cologn*, *Brumswick*, and *Danzwick*, which were call'd *Mother-Towns*; as those afterwards added thereto, were call'd *Daughters* thereof.

A great Number of Towns in *Germany*, still retain the Title of *Hanse Towns*; but this is rather an empty Title which they affect, than any Argument of their continuing to trade under the Laws and Protection of the ancient Alliance; there being scarce any but *Lubeck*, *Hamburg*, *Bremen*, *Rostock*, *Brumswick*, and *Cologn*, that are truly *Hanseatic*, and that have Deputies at the Assemblies held on the common Occasions thereof.

The great Trade the *Dutch* maintain with the *Hanse Towns*, contributes not a little towards maintaining some Part of them in their ancient Reputation; and 'tis principally to their Alliance with that flourishing Republic, that they owe the Preservation of their Liberties: The Success some of them have received from the *Dutch*, having sav'd them more than once from the Enterprizes of the Neighbouring Princes. See *COMMERCE*.

The Word *Hanse*, is obsolete *High-Dutch*, or *Teutonic*, and signifies Alliance, Confederacy, Association, &c.

Others derive it from the two *German* Words, *An-see*, that is, on the Sea; by Reason the first *Hanse Towns* were all situate on the Sea-Coast: Whence, the Society is said to have been first call'd, *sea see seden*, that is, Cities on the Sea; and afterwards, by Abbreviation, *Hanse*, and *Hanse*.

HANSEATIC, something belonging to the Alliance, or Company of the *Hanse*.

Thus we say, The *Hanseatic Body*: The *Hanseatic Towns*, &c. See *HANSE*.

HANSGRABE, the Title of an Officer in *Germany*. — The *Hansgrabe* is the chief of a Company, or Society.

The Word is a Compound of the *German*, *Hant*, and *Graf*, Count. See *GRAVE*.

HAP, in Law, from the *French*, *Happer*, to catch, or snatch; signifies the same with us: — Thus we say, to *Hap* the Possession of a deed Poll, *Littleton*, Fol. 8. to *Hap* the Rent.

If Partition be made between two Partners, and more Land be allowed the one than the other; and she that hath most of the Land, charges her Land to the other, and *happeth* the Rent; she shall maintain Affire without Speciality. *Term. ley*.

HAQUENY, *Hackney*, an old *French* Word for an ambling Horse. See *AMELING*.

HAQUEBUT, a Kind of Gun, or Caliver, otherwise call'd an *Harquebuss*, or *Arquebuss*. See *HARQUEBUT*.

It is also call'd a *Hagbut*. — The *Haquebut* is a bigger Sort of Hand-Gun; thus call'd from the *Teutonic*, *Hack Butte*.

HARANGUE, a Modern *French* Name for a Speech, or Oration; i. e. a Discourse made by an Orator in public. See *ORATION*.

Menage derives the Word from the *German* *haborung*, or the *English* hearing. Others derive it from the *Latin*, *Ara*, Altar, by Reason the first *Harangues* were made before Altars: Whence the Verse of *Jowenal*,

Aut Lugdunensem Rhetor dicturus ad Aram.

The Word is also frequently used in an ill Sense, viz. For a too pompous, prolix, or unseasonable Speech, or Declaration. — In *Horace*, the Poets generally *Harangue* etc

ere they come to fight; as in *England*, Criminals *Harsaque* on the Scaffold before they die. *St. Eprem.*

HARBINGER, an Officer of the King's Household, having four Yeomen under him, who ride a Day's Journey before the Court when they travel, to provide Lodgings, &c.

HARBOUR, a *Sea-Port*; or a Station where Ships may ride safe at Anchor. See *PORT*.

The Word is chiefly applied to those clofed, or secured with a Bomb, or Chain; and that are furnished with a Mole, &c. See *MOLLS*, &c.

To *Harbour*, is to lodge, receive, or entertain; to find a retiring Place. — Among Hunters, an Hart is said to *Harbour* when he goes to Rest; whence to *unharbour* a Deer, is to dislodge him. See *HUNTING*.

HARDENING, the Art of communicating a greater Degree of *Hardness* to a Body, than it already has. See *HARDNESS*.

The *Harden*ing and Tempering of Iron and Steel, makes a considerable Article in the mechanical Arts. See *IRON*, *STEEL*, *TEMPERING*, &c.

There are divers Ways of effecting it; as by the Hammer; quenching it, when hot, in cold Water; Case hardening, &c.

To *harden* and temper *English*, *Flemish*, and *Swedish* Steel, they give it a pretty high Heat, then suddenly quench it in Water, to make it very hard: *Spanish* and *Venice* Steel only need a blood red Heat, and then quench'd. See *HEAT*.

The Workmen sometimes grind Indigo, and Sallad Oyl together, and rub the Mixture upon it with a Woollen Rag while it is heating, and let it cool of itself.

If the Steel be too *hard* or brittle for an Edge, Spring, or pointed Instrument, it may be let down, or made softer, thus: Take a Piece of Grind-stone, or Whet-stone, and rub hard on the Work, to take the black Scurf off it, and brighten it; then let it heat in the Fire, and as it grows hotter, the Colour will change by degrees, coming first to a light Goldish Colour, then to a darker Goldish Colour, and at last to a blue Colour: Chafe which of these Colours the Work requires, and quench it suddenly in the Water.

Hammer HARDENING, is mostly used on Iron and Steel Plates, for Saws, Springs, Rules, &c. See *SPRING*, &c.

Case HARDENING is thus perform'd: — Take Cow-horn, or hoof, dry it well in an Oven, and beat it to Powder; put as much Bay-Salt as Powder into stale Urine; or White-wine Vinegar, and mix them well together, cover the Iron, or Steel, all over with this Mixture, and wrap it up in Loom, or Plate Iron, so as the Mixture touch every Part of the Work; then put it in the Fire, and blow the Coals to it, till the whole Lump have a blood-red Heat, but no higher; lastly, take it out and quench it.

HARDNESS, *Durities*, in Philosophy, that Quality in Bodies, whereby their Parts cohere firmly together, so as to resist the Touch. See *COHESION*.

In this Sense *Hardness* coincides with what on other Occasions we call *Firmness*, and sometimes *Solidity*, in Opposition to Fluidity. See *FIRMNESS*, *SOLIDITY*, and *FLUIDITY*.

More strictly speaking, a Body is said to be *hard*, when its Parts mutually cohere, so as not to yield inwards, or give Way to an external Impulse; and therefore not subject to any Motion in Respect of each other, without breaking the Body. — In which Sense, *Hardness* stands opposed to *Softness*, where the Parts do readily give Way.

The Peripateticks make *Hardness* a secondary Quality; as supposing it to arise from *Dryness*, which is a primary one, and to be in Proportion thereto. See *QUALITY*.

Its remote Causes, according to them, are either Heat or Cold, according to the Diversity of the Subject: Heat producing *Dryness*, and by that Means *Hardness* in Clay; and Cold, doing the like in Wax.

The *Epicurean* and *Corpufcular* Philosophers, account for *Hardness*, from the Figure of the component Parts, and their Union together. — Accordingly, some ascribe it to the Atoms, or Particles of the Body, being hooked, and thus mutually catching and hanging upon one another: But this is directly bringing that for an Answer, which was the Question. For how do those hooked Parts hang on? See *PARTICLE*.

Again: The *Cartesians* will have the Cohesion of hard Bodies, effected by Rest; that is, by nothing at all. See *REST*.

Sir *Is. Newton* shews, that the primary Particles of all Bodies, whether solid or fluid, are *hard*, perfectly *hard*; and not capable of being broke or divided by any Power in Nature. — See *MATTER*, *BODY*, *ELEMENT*, &c.

These Particles he maintains to be connected together

by an attractive Power; and according to the Circumstances of this Attraction, is the Body either *hard*, or soft, or even fluid. See *ATTRACTION*.

If the Particles be so disposed or fitted for each other, as to touch in large Surfaces, such Body will be *hard*; and the more so, as those Surfaces are the larger. If, on the contrary, they only touch in small Surfaces, the Body, by the Weakness of the Attraction, will remain soft. See *PARTICLE*.

HARDS, or **HURNS**, of Flax, or Hemp, are the coarser Parts, separated in the dressing of it, from the Tear, or fine Stuff. See *HEMP*.

HARE-HUNTING. See *HARE-HUNTING*.

HARIOT, or **HERIOT**, a Duc, or Service, belonging to the Lord at the Death of his Tenant; consisting of the best Beast the Tenant had at the Time of his Death. See *SERVICE*.

Coke on *Littleton* observes, that *Heriot* in *Saxon* is called *hepegat*, *q. d.* the Lord's Beast: *hepe*, signifying Lord, and *geat*, *Beast*; from which others dissent, urging that *hepe*, in *Saxon*, signifies an Army, and *geoc*, *spjus*: And that the *Saxon* *hepegat*, whence we derive our *Heriot*, signified Provision for War, or a Tribute, or Relief, given to the Lord of a Manor, for his better Preparation towards War. — *Erst enim Heciorum militaris suppellectilis prebatio, quum absente cassalle, Dominus reperisset in sui ipsius amissionem*, says *Speelman*.

By the Laws of *Conutus*, Tit. de *Herioris*, it appears, that at the Death of the great Men of this Nation, so many Horses and Arms were to be paid, as they were in their respective Life obliged to keep for the King's Service. See *RELIEF*.

But *Heriot* is now wholly taken for a Beast, which the Lord by Custom, chafes out of all the Store of his deceased Tenant, be it Horse, Ox, &c. and in some Mannors, the best Piece of Plate, Jewel, or the best Moveable.

Heriot is of two Sorts: 1^o. *Heriot Custom*, where *Heriots* have been paid Time out of Mind by Custom, after the Death of a Tenant for Life. 2^o. *Heriot Service*, when a Tenant holds by such Service to pay *Heriot* at the Time of his Death; which Service is expressed in the Deed of Feoffment. See *SERVICE*.

For this the Lord shall distrain; and for the other he shall seize and not distrain. — If the Lord purchase he of the Tenancy, *Heriot Service* is extinguished; but not so of *Heriot Custom*. See *FARLEY* and *SOLE TENANT*.

HARLEQUIN, a *Buffoon*. — In the *Italian* Comedy, the *Harlequin* is the same with a Merry Andrew, or Jack Pudding in our Drolls, on Mountebanks Stages, &c. — We have also introduced the *Harlequin* upon our Theatres; and this is one of the standing Characters in our Grotesque Entertainments.

The Term took its Rise from a famous *Italian* Comedian, or rather Buffoon, who came to Paris under Henry III. and who frequenting the House of M. de *Harlay*; his Companions used to call him *Harlequin*, *q. d.* little *Harlay*, a Name which has descended to all those of the same Rank, and Profession.

HARLOT, a Woman given to Incontinency; or that makes a *Habit* or a Trade of prostituting her Body.

The Word is supposed to be used for *Whore*, of a little Whore. — Others derive it from *Arietta*, Miss to *Roberts* Duke of *Normandy*, and Mother to *William the Conquerour*: *Cambden* derives it from one *Ariotha*, Concubine to *William the Conquerour*. — Others from the *Italian Ariotta*, a proud Whore.

HARMONIA, in Music, &c. See *HARMONY*.

HARMONIA, in Anatomy, a Sort of Jointure, or Articulation of the Bones. See *ARTICULATION*.

Harmonia is a Species of the *Symphysis*, or Juncture, intended for absolute Rest. See *SYMPHYSIS*.

Two Bones are said to be joyn'd *per Harmoniam*, by *Harmonia*, when the Jointure is in one uniform, right, or circular Line; or when the Bones meet with even Margins: In Contradistinction from *Sutura*, where they are indented. See *SUTURA*.

The Bones of the upper Jaw are joyn'd *per Harmoniam*. See *MAXILLA Superior*.

HARMONICA, **HARMONICES**, a Branch, or Division of the ancient Music. See *MUSIC*.

The *Harmonica* is that Part which considers the Differences, and Proportion of Sounds, with Respect to acute and grave: In Contradistinction from *Rythmica* and *Metrica*. See *RYTHMICA* and *METRICA*.

The only Part of their Music the Antients have left as any tolerable Account of, is the *Harmonica*; which it self is but very general and theoretical.

Mr. *Malcolm* has made a very industrious, and learned Inquiry into the *Harmonica*, or Harmonic Principles of the Antients. — They reduced their Doctrines into seven Parts, *viz.* of *Sounds*; of *Intervals*; of *Systems*; of the *Genera*; of the *Tones*, or *Modes*; of *Mutations*; and of the *Melodia*. See each consider'd under its proper Article **SOUND**, **INTERVAL**, **SYSTEM**, **GENERA**, **MODE**, **MUTATION** and **MELODIA**.

HARMONICAL Arithmetic, is so much of the Theory and Doctrine of Numbers, as relates to making the Comparisons, Reductions, &c. of Musical Intervals, which are express'd by Numbers, in order to our finding their mutual Relations, Compositions and Resolutions. See **INTERVAL**, &c.

HARMONICAL Composition, in its general Sense, includes the Composition both of *Harmony* and *Melody*, i. e. of Music, or Songs, both in a single Part, and in several Parts. See **COMPOSITION**.

In its more proper and limited Sense, *Harmonical Composition* is restrain'd to that of Harmony. In which Sense it may be defined the Art of disposing and concerting several single Parts together, in such Manner, as to make one agreeable whole. See **SONG**, &c.

The Art of Harmony has been long known under the Name of *Counterpoint*. See **COUNTERPOINT**.

At the Time when Parts were first introduced, Music being then very simple, there were no different Notes of Time; and the Parts were in every Note made Concord.

This they afterwards call'd *simple*, or *plain Counterpoint*, to distinguish it from another Kind, then introduced, wherein Notes of different Value were introduced, and Discords brought in between the Parts. See **DISCORD**.

This they call'd *Figurative Counterpoint*. See **FIGURATIVE Counterpoint**.

HARMONICAL Interval, is an Interval, or Difference of two Sounds which are agreeable to the Ear, whether in Consonance or Succession. See **INTERVAL**.

Harmonical Intervals, therefore, are the same with **Concords**. See **CONCORD**.

They are thus call'd, as being the only essential Ingredients of Harmony. See **HARMONY**.

HARMONICAL Proportion, is a Sort of Proportion between three Quantities, wherein the Difference of the first and second, is to the Difference of the second and third; as the first is to the third.

Thus, 2 : 3 : 6 are *Harmonical*, because 2 : 6 :: 1 : 3 are Geometrical.

So four Numbers are *Harmonical*, when the first is to the fourth, as the Difference of the first and second, to the Difference of the third and fourth.

Thus, 24 : 16 : 12 : 9 are *Harmonical*; because 24 : 12 :: 8 : 3 are Geometrical.

For the *Loves and Rules of HARMONICAL Proportion*. See **HARMONICAL PROPORTION**.

HARMONICAL Series, is a Series of many Numbers in continual *Harmonical* Proportion. See **SERIES**.

If there be four or more Numbers, whereof, every three immediate Terms are *Harmonical*; the whole makes an *Harmonical Series*, of continual *Harmonical* Proportions: As 30 : 20 : 15 : 12 : 10.

Of if every 4 immediately next each other are *Harmonical*, 'tis also a continual *Harmonical Series*; but of another Species; as 5 : 4 : 6 : 9 : 18 : 36, &c.

HARMONICAL Sounds, is an Appellation given by M. *Sauveur* to such Sounds as always make a certain determinate Number of Vibrations in the Time that some other fundamental Sound, to which they are refer'd, makes one Vibration. See **SOUND** and **VIBRATION**.

Harmonical Sounds, are produced by the Parts of Chords, &c. which vibrate a certain Number of Times while the whole Chord vibrates once. See **CHORD**.

By this they are distinguished from the third, fifth, &c. where the Relations of the Vibrations is 4 to 5, or 5 to 6, or 2 to 3. See **THIRD**, &c.

The Relations of Sounds, had only been consider'd in the Series of Numbers 1 : 2, 2 : 3, 3 : 4, 4 : 5, &c. which produced the Intervals call'd *Octave*, *Fifth*, *Fourth*, *Third*, &c. Mr. *Sauveur* first consider'd them in the natural Series, 1, 2, 3, 4, &c. and examined the Relations of the Sounds arising therefrom. — The Result is, that the first Interval 1 : 2, is an Octave; the second 1 : 3, a twelfth; the third 1 : 4, a fifteenth, or double Octave; the fourth 1 : 5, a seventeenth; the fifth 1 : 6, a nineteenth, &c.

This new Consideration of the Relations of Sounds, is more natural than the old one; and does express and represent the whole of Music, and is in Effect all the Music that Nature gives without the Assistance of Art. — The String of a Harpichord, or a Bell, beside their general Sound, which is proportionate to their Length, Tension, &c. do

also at the same Time yield other subordinate and acuter Sounds, which a nice Ear, with a good Attention, clearly distinguishes.

These subordinate Sounds arise from the particular Vibrations of some of the Parts of the String, or Bell, which are, as it were, detach'd from the rest, and make separate Vibrations: In Effect, every half, every third, every fourth, &c. of the Chord performs its Vibrations apart, while a general Vibration is made of the whole Chord. — Now all these subordinate Sounds are *Harmonical* with Regard to the whole Sound: The least acute, which we hear, is Octave with the whole Sound; the least acute that follows, makes a twelfth with the whole Sound; the next a seventeenth, &c. till they grow too acute for the Ear to perceive them. Now throughout the whole, we hear no such Thing as a Sound that makes a fifth, or a third, &c. with the whole Sound; none in short, but what are compriz'd in the Series of *Harmonical* Sounds.

Add, that if the Breath, or Bellows that blow a Wind Instrument, be play'd stronger and stronger, the Tone will be continually rais'd, but this only in the Ratio of the *Harmonical Sounds*. — So that it appears that Nature, when she makes as it were a System of Music her self, uses no other but this Kind of Sounds; and yet they had hitherto remained unknown to the Musicians: Not but that they frequently fall into 'em, but it was inadvertently, and without knowing what they did. — M. *Sauveur* shews that the Structure of the Organ depends entirely on this unknown Principle. See **ORGAN**.

HARMONY, in Music, the agreeable Result of an Union of several Musical Sounds, heard at one and the same Time; or, the Mixture of divers Sounds, which together have an Effect agreeable to the Ear. See **SOUND**.

As a continued Succession of Musical Sounds produces *Melody*; so does a continued Combination of those produce *Harmony*. See **MELODY**.

Among the Antients, however, as sometimes also among the Moderns, *Harmony* is us'd in the strict Sense of *Consonance*; and so is equivalent to the *Symphony*. See **CONSONANCE** and **SYMPHONY**.

The Words *Concord*, and *Harmony*, do really signify the same Thing; tho' Custom has made a little Difference between them. Concord is the agreeable Effect of two Sounds in Consonance: And *Harmony*, the Effect of any greater Number of agreeable Sounds in Consonance. See **CONCORD**.

Again, *Harmony* always implies *Consonance*: But *Concord* is also applied to Sounds in *Succession*; tho' never but where the Terms can stand agreeably in Consonance: The Effect of an agreeable Succession of several Sounds, is call'd *Melody*; as that of an agreeable Consonance, *Harmony*.

The Antients seem to have been entirely unacquainted with *Harmony*; the Soul of the modern Music. — In all their Explications of the *Melodia*, they say not one Word of the Concert, or *Harmony* of Parts. We have Instances, indeed, of their joining several Voices, or Instruments, in Consonance: But then those Voices, &c. were not so join'd, as that each had a distinct and proper Melody, so making a Succession of various Concords; but were either Unisons, or Octaves, in every Note; and so all perform'd the same individual Melody, and constituted one Song. See **SONG**, **SYNAEVA**, &c.

When the Parts differ, not in the Tension of the whole, but in the different Relations of the successive Notes; 'tis thus that constitutes the modern Art of *Harmony*. See **MUSIC** and **MELODIA**.

Harmony is well defined the Sum of Concords, arising from the Combination of two or more Concords, i. e. of three or more simple Sounds, striking the Ear all together: And different Compositions of Concords make different *Harmony*.

To understand the Nature, and determine the Number, and Preference of *Harmonies*; it is to be consider'd, that in every compound Sound, where there are no more than three simple ones, there are three Kinds of Relations, *viz.* the primary Relation of every simple Sound to the fundamental, or gravel, whereby they make different Degrees of Concord with it: The mutual Relations of the Acute sounds each with other, whereby they mix either Concord or Discord into the Compound: And the secondary Relation of the whole, whereby all the Terms unite their Vibrations, or coincide more or less frequently.

Suppose, e. gr. four Sounds, A, B, C and D, whereof A is the gravel; B next; then C; and D the acutest. — Here, A is the fundamental; and the Relations of B, C, and D, to A are primary Relations: So, if B be a 3d g above A, that primary Relation is 4 to 5; and if C be 5th to A, that primary Relation is 2 to 3; and if D be

Sve to A, that is 1 to 2. For the mutual Relations of the acute Terms, B, C, D, they are had by taking their primary Relations to the fundamental, and subtracting each letter from each greater: Thus, B to C is 5 to 6, a 3d I; B to D is 5 to 8, a 6th I, &c. — Lastly, to find the secondary Relation of the whole, seek the least common Dividend to all the lesser Terms or Numbers of the primary Relations, i. e. the least Number that will be divided by each of them exactly: This is the Thing sought; and shews that all the simple Sounds coincide after so many Vibrations of the Fundamental as the Number expresses.

So in the preceding Example, the lesser Terms of the three primary Relations are 4, 2, 1, whose least common Dividend is 4. Consequently, at every 4th Vibration of the fundamental, the whole will coincide.

Now *Harmony*, we have observed, is a compound Sound, consisting of three, or more, simple Sounds. — Its proper Ingredients are Concords; and all Discords, at least in the primary and mutual Relations, are absolutely forbidden. 'Tis true Discords are used in Music; but not for themselves simply, but to set off the Concords by their Contrast and Opposition. See *Discord*.

Hence, any Number of Concords being proposed to stand in primary Relation with a common Fundamental; we discover whether or no they constitute a perfect *Harmony* by finding their mutual Relations. — Thus, suppose the following Concords, or primary Relations, viz. the greater 3d, 5th, and Octave given; their mutual Relations are all Concord, and therefore may stand in *Harmony*. For the greater 3d and 5th are to one another, as 5:6, a lesser 6th. The greater 3d and Octave, are as 5:8 a lesser 6th. And the 5th and Octave are as 3:4 a lesser fourth. But if 4th, 5th, and 8ve, be proposed, 'tis evident they cannot stand in *Harmony*; by Reason betwixt the 4th and 5th there is a Discord, viz. the Ratio 8:9. Again, supposing any Number of Sounds which are Concord, each to the next, from the lowest to the highest; to know if they can stand in *Harmony*, we must find the primary, and all the mutual Relations, which must be all Concord. So let any Number of Sounds be as 4:5:6:8; they may stand in *Harmony* by Reason each to each is Concord: But the following ones cannot, viz. 4, 6, 9, because 4:9 is Discord.

The necessary Conditions of all *Harmony*, then, are Concords in the primary and mutual Relations; on which Footing, a Table is easily form'd of all the possible Varieties: But to determine the Preference of *Harmonies*, the secondary Relations are likewise to be consider'd. — The Perfection of *Harmonies* depends on all the three Relations: It is not the best primary Relations that make best *Harmony*: For then a 4th and 5th must be better than a 4th and 6th. Whereas the first two cannot stand together, because of the Discord in the mutual Relation: Nor does the best secondary Relation carry it; for then would a 4th and 5th, whose secondary Relation with a common Fundamental is 6, be better than a lesser 3d and 5th, whose secondary Relation is 10: But here also the Preference is due to the better mutual Relation. — Indeed, the mutual Relations depend on the primary; tho' not so, as that the best primary shall always produce the best mutual Relation: However, the primary Relations are of the most Importance; and together with the secondary, afford us the following Rule for determining the Preference of *Harmonies*.

Viz. Comparing two *Harmonies*, which have an equal Number of Terms, that which has the best primary and secondary Relations, is most perfect. — But in Cases, where the Advantage is in the primary Relation of the one, and the secondary of the other, we have no certain Rule: The primary are certainly the most considerable; but how the Advantage in these ought to be proportion'd to the Disadvantage in the other, or *vice versa*, we know not. So that a well turned Ear must be the last Resort in these Cases.

Harmony is divided into Simple and Compound.

Simple *HARMONY*, is that where there is no Concord to the fundamental above an Octave.

The Ingredients of simple *Harmony*, are the seven simple original Concords, of which there can be but 18 different Combinations, that are *Harmony*; which we give in the following Table from Mr. Malcolm.

Table of simple HARMONIES.

	2 ⁴²⁷⁵ Rel.		2 ⁴²⁷⁵ Rel.		
5th	8ve	2	3d g	5th	4
4th	8ve	3	3d l	5th	10
6th g	8ve	3	4th, 6th, g	3	4th, 6th, g 8ve
3d g	8ve	4	5d g, 6th g	12	3d g, 6th g 8ve
3d l	8ve	5	3d l, 6th l	5	5d l, 6th l, 8ve
6th l	8ve	5	4th, 6th l	15	4th, 6th l, 8ve

These are all the possible Combinations of the Concords that make *Harmony*: For the Sve is compounded of a 5th and 4th, or a 6th and 3d; which have a Variety of greater and lesser; out of these are the first six *Harmonies* composed: Then, the 5th being composed of the greater 3d, and lesser 3d, and the 6th of 4th and 3d; from these proceed the next six of the Table: Then an Sve join'd to each of these 6, make the last six.

The Perfection of the first twelve is according to the Order of the Table: Of the first six each has an Octave, and their Preference is according to the Perfection of the other lesser Concord join'd to the Octave. — For the next six, the Preference is given to the two Combinations with the 5th, whereof that which has the 3d g is best; then to these two Combinations with the 6th g, of which that which has the 4th is best. — For the last six, they are not placed last, as being the least perfect, but because they are the most complex, and are the Mixtures of the other 12 with each other. In Point of Perfection they are plainly preferable to the preceding six, as having the very same Ingredients, and an Octave more.

Compound *HARMONY*, is that which to the simple *Harmony* of one Octave, adds that of another Octave.

For the Compound *Harmonies*, their Variety is easily found out of the Combinations of the simple *Harmonies* of several Octaves.

Harmony, again, may be divided into that of *Concords*, and that of *Discords*.

The first is that we have hitherto consider'd, and wherein nothing but Concords are admitted.

The second is that wherein Discords are used, intermix'd with the Concords. See *HARMONICAL Composition*.

Composition of *HARMONY*. See *HARMONIC Composition*.

HARMONY, is sometimes also used in a laxer Sense, to denote an Agreement, Suitableness, Union, Conformity, &c.

The Word is form'd of the Greek *ἁρμονία*, of the Verb *ἁρμόζω*, *convenire*, *congruere*, to agree, match, &c.

In Music, we sometimes apply it to a single Voice, when sonorous, clear, and soft; or to a single Instrument, when it yields a very agreeable Sound. — Thus, we say, the *Harmony* of her Voice: of his Lute, &c.

In Matters of Learning, we use *Harmony* for a certain Agreement between the several Parts of a Discourse, which renders the reading thereof agreeable. — In this Sense we say *Harmonious* Periods, &c. See *PERIOD*, *NUMBERS*, &c.

In Architecture, *Harmony* denotes an agreeable Relation between the Parts of a Building. See *SYMMETRY*.

In Painting, they speak of a *Harmony*, both in the Ordinance and Composition, and in the Colours of a Picture. — In the Ordinance, it signifies the Union, or Connection between the Figures, with Respect to the Subject of the Piece. See *ORDONNANCE*.

In the Colouring it denotes the Union, or agreeable Mixture of different Colours. See *COLOURING*.

M. de la *Chambre* derives the *Harmony* of Colours from the same Proportions, as the *Harmony* of Sounds. — This he insists on at large, in his Treatise of the Colours of the Iris. On this Principle, he lays down green, as the most agreeable of Colours, corresponding to the Octave in Music; red, to a fifth; yellow, to a fourth, &c.

The Name *Harmony*, or *Evangelical Harmony*, is used as the Title of divers Books, composed to shew the Uniformity and Agreement of the four Evangelists. See *EVANGELIST*.

The first Attempt of this Kind is attributed to *Tatian*, or *Theophilus of Antioch*, in the II^d Century. — After his Example, divers other *Harmonies* have been composed, by *Ammonius of Alexandria*, *Eusebius of Cesarea*, *Jansenius Bishop of Gant*, *Monf. Toimard*, *Mr. Whiston*, &c.

HARMONY of the Spheres, or *Celestial HARMONY*, is a Sort of Music, much spoke of by many of the Philosophers and Fathers; supposed to be produced by the regular, sweetly tuned Motions of the Stars and Planets. See *SYSTEM*.

Plato, *Philo Judaeus*, *St. Augustine*, *St. Ambrose*, *St. Isidore*, *Boetius*, and many others, are strongly possess'd with the Opinion of this *Harmony*, which they attribute to the various and proportionate Impressions of the heavenly Globes upon one another; which acting under proper intervals, form a *Harmony*.

It is impossible, according to them, that such spacious Bodies, moving with so much Rapidity, should be silent; on the contrary, the Atmosphere, continually impell'd by them, must yield a Set of Sounds, proportionate to the Impulsions it receives: Consequently, as they do not all run the same Circuit, nor with one and the same Velocity, the different Tones arising from the Diversity of Motions, directed by the Hand of the Almighty, form an admirable Symphony, or Concert. See *MUSIC*.

St. Irenæus, St. Basil, and St. Epiphanius, have appeared against the Notion.

Pre-established HARMONY, a celebrated System of *M. Leibnitz*, by Means whereof he accounts for the Union or Communication between the Soul and Body. See *SOUL, &c.*

The Philosophers had universally held that the Soul and Body act really and physically on each other. — *Des Cartes* first appear'd, and thenc'd that the Heterogeneity of their Nature did not allow of such real Union; and that they could only have an apparent one, whereof God is the Mediator. See *CAUSE*.

Mr. Leibnitz, unsatisfied with either of these Hypotheses, establishes a third. — A Soul, or Spirit, he observes, is to have a certain Series of Thoughts, desires and wills: A Body, which is only a Machine, is to have a certain Series of Motions, to be determined by the Combination of its mechanical Disposition, with the Impressions of external Objects.

If, now, there be found a Soul and a Body so framed, that the whole Series of Wills of the Soul, and the whole Series of Motions of the Body, exactly correspond; and that at the same Time, for Instance, when the Soul desires to go to any Place, the two Feet move mechanically that Way: This Soul and Body will have a Relation to one another, nor by any actual Union between them, but by the constant and perpetual Correspondence of the several Actions of both. — Now, God puts together this Soul and Body, which had such a Correspondence antecedent to their Union; such a *pre-established Harmony*. — And the same is to be understood of all the other Souls and Bodies, that have been or ever will be join'd.

In Effect, the LAWS of Motion in the Body, succeeding in the Order of Efficient Causes, do also agree and correspond with the Ideas of the Soul; so that the Body is determined to act at the Time when the Soul wills.

The same Principle he extends farther, and makes a *pre-established Harmony* between the Kingdoms of Nature and Grace; to account for the apparent Communication between them, and make physical and moral Evil correspond. See *GRACE, EVIL, &c.*

Such is the System of pre-established Harmony, *Harmone pre-establi*. — The Author's Way of stating and inferring it, may be seen in his *Essais de Theodicee*.

HARMONY, in Anatomy. See HARMONIA.

HARMOSTES, in Antiquity, a Sort of Magistrate among the *Spartans*; whereof there were several in Number. — Their Business was to look to the Building of Cities, and repairing the Forts, and Fortifications of the Cities.

The Word is Greek, *ἁρμόστης*, form'd of *ἁρμόσιον*, *armonicon*.

HARNESSE, a compleat Armour; or, the whole Equipage and Accoutrements of a Cavalier, heavily arm'd; as Calk, Cuirass, &c. See ARMOUR. See also CASE, CURRASS, &c.

The Word is form'd of the French, *Harnois*; which some derive from the Greek, *ἀρνώσις*, a Lamb's Skin; by Reason they anciently cover'd themselves herewith. — *Du Cange* observes, that the Word *Harnois* is used in the corrupt Latin, in the same Sense; and that it comes from the High-Dutch, *Harnas*, or *Harnisch*. Others derive it from the Italian, *arnese*. Others from the Celtic, *Harnas*, a Cuirass.

HARNESSE, is also used for the Furniture put on a Horse, to draw in a Coach, Waggon, or other Carriage; as Collars, Leathers, Traces, &c.

HARO, in the Customs of Normandy, a Cry whereby to invoke the Help and Assistance of the Officers of Justice, &c. See CRY.

When any Person finds his Man, and would carry him before the Judge: Upon hearing the *Haro*, he is obliged to follow the Person who has cried it on him; and both of them either remain in Prison, or put in Bail.

The Letters of the French Chancery have usually this Clause, *Non obstant Clameur de Haro, &c.*

The *Haro* had anciently such vast Power, that a poor Man of the City of *Caen*, named *Affelin*, in virtue hereof, arrested the Corps of *William the Conqueror*, in the middle of the Funeral Procession, till such Time as his Son *Henry* had paid the Value of the Land in Question; which was that whereon the Chapel was built, where he was interred.

The Word is commonly derived of *Ho* and *Roal*, as being supposed an Invocation of the Sovereign Power, to assist the Weak against the Strong, on Occasion of *Raoul*'s first Duke of Normandy, about the Year 912; who render'd himself venerable to his Subjects, by the Severity of his Justice: So that they call'd on him even after his Death, when they suffer'd any Oppression.

Guill. Guiart speaks of the *ba Roal*, (i. e. *ba Roal*) as a Military Cry brought into *Neustria* by the Normans, under the Conduct of *Raoul*. Others say, that during his Life-time, they used to cry a *Raoul*, I cite you to appear before *Raoul*, by Reason he administer'd Justice to his Subjects in Person. But others, as *M. Caseneuve*, take all these Etymologies to be false; and suppose the Word *Haro*, to have been a Cry long before *Duke Raoul*. Some derive it from *Harola* King of Denmark, who in the Year 826, was made Grand Conservator of Justice at *Meuz*. Others, lastly, derive it from the *Danish* *ha roal*, signifying *help me*; a Cry rais'd by the Normans, in flying from a King of Denmark, named *Roxa*, who made himself Duke of Normandy.

HARP, a Musical Instrument, of the String Kind; being of a triangular Figure, and placed an End between the Legs to be play'd on. See INSTRUMENT.

There is some Diversity in the Structure of Harps. — That call'd the *Triple Harp*, has 78 Strings, or Chords, in three Rows, 49 in each, which make four Octaves: The first Row is for the Semitones; and the third is in Unison with the first. There are two Rows of Pins, or Screws, on the right Side, serving to keep the Strings tight in their Holes, which are fasten'd at the other End to three Rows of Pins on the upper Side.

This Instrument is struck with the Finger and Thumb of both Hands. Its Music is much like that of the Spinnet; all its Strings going from Semitone to Semitone: Whence some call it an *inverted Spinnet*. See SPINETT. It is capable of a much greater Degree of Perfection than the Lute. See LUTE.

King *David* is usually painted with a Harp in his Hands; but we have no Testimony in all Antiquity, that the Hebrew Harp, which they call *Cinnor*, was any Thing like ours. — On a Hebrew Medal of *Simon Machabæus* we see two Sorts of Musical Instruments; but they are both of them very different from our Harp, and only consist of three or four Strings.

Papias, and *du Cange* after him, will have the Harp to have took its Name from the *Arpi*, a People of Italy, who were the first that invented it; and from whom it was borrowed by other Nations.

All Authors agree, that it is very different from the *Lira*, *Cytara*, or *Barbiton*, used among the Romans. See LYRA.

Fortunatus, L. VII. *Carm.* 8. witnesses, that it was an Instrument of the Barbarians.

Romanusq; Lira, plaudes tibi Barbarus Harpa
Graecus Achillicæ, Crassa Britannia casat.

Mevius, &c. derive the Word from the Latin, *Harpa*; and that from the German, *herp*, or *harff*. Others bring it from the Latin *Carpa*, because touch'd, or thrum'd with the Fingers. *Dr. Hick* derives it from *Harpa*, or *Harpo*, which signify the same Thing; the first in the Language of the *Cimbri*, the second in that of the *Anglo Saxons*.

The English Priest who wrote the Life of *St. Dunstan*, and who lived with him in the Xth Century, says, C. 2. N. 12. *Sumpsit secum ex More Citharæ suam, quam paterni lingua Harpam vocamus*; which intimates the Word to be Anglo-Saxon.

HARPIES, *ἁρπυιæ*, in Antiquity, a Sort of fabulous Monsters, of the Bird-Kind, mention'd among the Poets.

They are represent'd with Wings, Ears like Bears, Bodies like Vultures, Faces like Women, and Feet and Hands hooked like the Talons of Birds of Prey. See *Virgil. Æneid.* L. III. who gives a Description of them.

The Ancients look'd on the Harpies, as a Sort of Gnomi, or Demons. — Some make them the Daughters of *Tellus* and *Oceanus*, the Earth and Ocean; whence, says *Servius*, it is, that they inhabit an Island, half on Land, and half in Water. *Valerius Flaccus* makes them the Daughters of *Typhon*.

There were three Harpies, *Aello*, *Ocyrops*, and *Celano*, which last *Homer* calls *Podarge*. — *Hesiod*, in his Theogony, v. 267. only reckons two, *Aello* and *Ocyrops*; and makes them the Daughters of *Tethys* and *Electra*; affirming, that they had Wings, and went with the Rapidity of the Wind. *Zephrus* begot of them *Balus* and *Xanthus*, *Achilles*'s Horfes. *Pherecydes* relates, that the *Boræades* expell'd them from the *Egean* and *Sicilian* Seas, and pursued them as far as the Islands, which he calls *Plotæ*; and *Homer*, *Calyne*; and which have since been call'd *Strophades*.

Vossius, de *Idolol.* L. III. C. 99. p. 63. thinks, that what the Ancients have related of the Harpies, agrees to no other Birds so well as the *Bats*, found in the Territories of *Darien* in *South America*. — These Animals kill not only Birds, but Dogs and Cats; and prove very troublesome

some to Men by their Peckings. But the Ancients, as the same *Vossius* observes, knew nothing of these Birds. By the *Harpies*, therefore, he thinks, they could mean nothing else but the Winds; and that it was on this Account they were made Daughters of *Elephas*, the Daughter of *Oceanus*. Such is the Sentiment of the Scholastic of *Apollonius*, *Hesiod*, and *Eufrastius*. — Their Names *Aelle*, *Ocyropsis*, and *Celeus*, are supposed to be a further Argument.

HARPINEER, the Engineer, or Fisherman, who manages, and throws the *Harpyng Iron*. See **HARPYNG IRON**.

The *Harpineers*, are the most robust and dexterous Persons in the Crew of Ships sent on Whale Fishing. — Their Place is at the End of the Pinnace, and they direct the Pilot as well as the Rowers. When they come within Reach of the Whale, they dart their Iron with great Violence into his Head, so as to penetrate the Skin and Fat, and enter deep into the Flesh. Immediately upon this, the Whale dives to the Bottom, and when he returns to the Air again to fetch Breath, the *Harpineer* takes Occasion to strike him afresh; tho' he would have died of the former Wound; it being a Circumstance well assured, that Blood never stanches, nor Wounds ever heal in the Whale.

This done, the other Fishers approach a Side of him, and run a long Spear shod with Iron, under the Fins, thro' the Intestines, into his Breast. The Blood now spouts out, and the Carcase welters in its own Fat. It remains to tow him to Shore, there to cut off the Blubber, &c. See **WHALE FISHERY**.

— *African* as the *Harpineer* perceives the Sturgeon's Belly, which is frequently turning, now on this Side, and then on that, he darts his Iron into the same, as being destitute of Scales. *Denis Hist. de l'Amérique*. See **STURGEON FISHERY**.

HARPYNG-IRON, *Harpygo*, a Sort of Dart, or Spear, fasten'd to a Line, wherewith they catch Whales, and other large Fish, as *Sturgeons*, &c. See **HARPINEER**.

This *Harpyng-Iron* is a large Javelin of forged Iron, five or six Foot long, with a sharp, cutting, triangular Point, barbed like that of an Arrow. At the upper End is engraven the *Harpineer's* Name, near a Ring, to which the Line is fasten'd, which they let down, as soon as the Beast is struck, to give him Room to dive, &c. See **WHALE FISHERY**.

HARPINGS, in a Ship, is properly her Breadth at the Bow; tho' some call the Ends of the Bends, which are fasten'd into the Stem, by the same Name.

HARPOCRATIANS, a Sect of Hereticks, mention'd by *Celsus*; the same with *Carpocratians*. See **CARPOCRATIANS**.

HARPSICHOORD, or **HARPSICHOLO**, a Musical Instrument of the Wind-Kind; play'd after the Manner of an Organ. See **ORGAN**.

The *Italians* call it *Clave Cimbaia*, and the *French Clavecin*. In *Latin* it is usually call'd *Grave Cymbalum*, q. d. a large or deep Cymbal. See **CYMBAL**.

The *Harpisichord* is furnish'd with a Set of Keys; sometimes two Sets: — The touching, or striking of these Keys, moves a Kind of little Jacks, which move a double Row of Chords, or Strings of Brass and Iron, stretch'd on the Table of the Instrument over four Bridges. See **MUSIC**.

HARQUEBUS, or **HARQUERUS**, in our ancient Statutes, call'd also *ARQUEBUSE*, *HAQUERUT*, or *HAQUET*; is a *Hand-Gun*; or a Fire-Arm of a proper Length, &c. to be bore in the Arm. See **GUN**.

The *Harquebus* is properly a Fire-Arm, of the ordinary Length of a *Musquet*, or *Fowling-Piece*; cock'd, usually, with a Wheel. — *Hauveler* prescribes its Legitimate Length to be 40 Calibers; and the Weight of its Ball one Ounce, seven eights; its Charge of Powder as much.

There is also a larger Kind, call'd *Harquebuss a Croc*, much of the Nature of our *Blanderbusses*, us'd in War, for the Defence of Places; being usually rest'd on something when discharg'd.

The first Time these Instruments were seen, was in the *Imperial Army of Bourbon*, who drove *Bonivives* out of the State of *Milan*. — They were so big and heavy, that there were two Men to carry them.

The Word *Harquebus*, is form'd of the *French*, *Arquebuse*; and that from the *Italian*, *Arcofusio*, or *Arco Abuso*, of *Arco*, a Bow, and *Buso*, a Hole; on Account of the Touch-Hole, at which the Powder is put to prime it; and that it succeeded to the Bows of the Ancients.

HARRIER, a Kind of Hound, call'd in *Latin*, *Senecæ*, from his tracing, or chasing by Foot. — Being endow'd with an admirable Gift of Smelling, and also very bold in the Pursuit of his Game. See **HOUND**.

There are several Kinds; all differing in their Services; some are for the Hare, Fox, Wolf, Hart, Buck, Badger,

Otter, Pole-Cat, Weasel, Coney, and some for one Game, some for another, &c. See **HUNTING**.

HARROW, in Husbandry, a Drag made in a Square Form, to break the Clods of Earth after Ploughing. See **PLOUGHING**, **TRELLING**, **SEEDING**, &c.

It consists of three Parts; 1^o. The *Harrows-Bulls*, which are the Holes where the Nails go in; 2^o. The Slots, which are the Cross-Pins; 3^o. The *Harrows-Tines*, Pins, or Tusks, which are Iron Nails; 4^o. The Hook, being that which fastens the Horse to them; 5^o. The Couplings, when two *Harrows* are tied together.

HART, in the Forest Law, a Stag of five Years old complete. See **GAME**.

If the King or Queen hunt him, and he escape, he is called an *Hart Royal*. See **HUNTING**.

And if by such Hunting he be chased out of the Forest, Proclamation is commonly made in the Places adjacent, that in Regard of the Pastime the Beast has afforded the King or Queen, none shall hurt, or hinder him from returning to the Forest; upon which he is call'd an *Hart Royal proclaimed*. See **PUBLICUS**, &c.

HARTS-HORN, *Cornu Cervi*. See **HARTS-HORN**.

HART-HUNTING. See **HART-HUNTING**.

HARTH-PENY, and *Harth-Silver*, (*Sax. heopþpening*) See **CHIMNEY-MONEY**, and **PETER-PENNY**.

HARUSPEX, or **ARUSPEX**, in Antiquity, a Sort of Priest, or Diviner, who inspects and considers the Entrails of Beasts, particularly those of Victims; to find Signs, or Indications of something he wants to know. See **DIVINATION**.

Cicero de Divinat. L. II. explains the Difference between *Aruspe* and *Haruspe*. See **ARUSPEX**.

The Word is *Latin*, form'd of *Hars*, an Augur's Bird; or *Haruga*, *Viscera*, Entrails; and *ispicio*, I look into.

In *Festus* we meet with *Haruga*, or *Haruiga*, which he defines to be a Victim, whose *Viscera* are consider'd while yet remaining together. Upon which *M. Dacier* observes, that *Haruga* is form'd from *deus*, *Aries*, by inserting the *Eolic Digamma*, before the *s*, thus, *deus*. It was properly, therefore, a Ram they sacrificed; but afterwards the Name became common to all Victims. See **VICTIM**.

HASSOCK, or **HASKEK**, probably of the *Teutonic Hase*, *Hare*, and *Soeks*, because *Hare-Skins* are sometimes worn instead thereof to keep the Feet warm in the Winter; denotes a Bass, or Cushion made of Rushes, to kneel upon in Churches.

HASTA, among Antiquaries and Medallists, signifies a Kind of Javelin, not sho'd or headed with Iron; or rather, an ancient Scepter, somewhat longer than ordinary, occasionally given to all the Gods. See **SCYPTER**.

The *Hasta* is supposed a Symbol of the Goodness of the Gods, and of the Conduct of Providence, which is equally mild and forcible.

The *Hasta pura* on Medals, is that unadorn'd with any Ferris, &c.

In some Countries, *Hasta* is a Measure, or Quantity of Ground, amounting to 30 Paces; thus call'd, according to *M. du Cange*, from the *Hasta*, Pole, or Rod, wherewith it was measured.

HASTIVE, or **HASTING**, a *French* Term sometimes us'd in *English*, for *hasty*, *forward*, or something that comes before the ordinary Time or Season.

The **HASTIVE** Fruits are *Straw-berries* and *Cherries*. — We have also *Hastive Peas*, &c.

HAT, a Covering for the Head, wore by the Men throughout the Western Part of *Europe*. See **HEAD**.

Hats are chiefly made of Hair, Wool, &c. work'd, full'd, and fashion'd to the Figure of the Head. See **HAIR** and **WOOL**.

Hats are said to have been first seen about the Year 1400; at which Time they became of Use for Country Wear, Riding, &c. — Father *Daniel* relates, that when *Charles II.* made his Publick Entry into *Rouen* in 1449, he had on a *Hat*, lined with red Velvet, and surmount'd with a Plume, or Tuft of Feathers. — He adds, that it is from this Entry, at least under this Reign, that the Use of *Hats* and Caps is to be dated, which heretofore began to take Place of the *Chaperons* and *Hoods*, that had been wore before.

In Progress of Time, from the Laity, the Clergy likewise took the Habit; but it was look'd on as a crying Abuse, and several Regulations were publish'd, forbidding any Priest, or Religious, to appear Abroad in a *Hat* without Corners; and enjoying them to keep to the Use of *Chaperons*, made of black Cloth, with decent Corners: If they were Poor, they were at least to have Corners fasten'd to their *Hats*, and this upon Penalty of Suspension and Excommunication. — Indeed, the Use of *Hats* is said to have been of a longer Standing among the Ecclesiastics of *Brittany*, by two hundred Years; and principally among the

the Canons: But these were no other than a Kind of Caps; and thus from hence arose the square Caps wear in Colleges, &c. See CAP.

Lobineau observes, that a Bishop of *Dol*, in the XIIth Century, zealous for good Order, allow'd the Canons alone to wear such Hats; enjoining, that if any other Person should come with them to Church, Divine Service should immediately stand still. *T. l. p. 845.*

Hats make a very considerable Article in Commerce. — The finest, and those most valued, are made of the pure Hair of an amphibious Animal, call'd *Castor*, or *Beaver*, frequent in *Canada*, and other Provinces of *North America*. See CASTOR.

Method of making Hats.

Hats, we have observed, are made either of Wool, or of Hair of divers Animals, particularly the *Castor*, *Hare*, *Concy*, *Camel*, &c. The Process is much the same in all; for which Reason we shall content our selves to instance in that of *Castors*.

The Skin of this Animal is set with two Kinds of Hair; the one long, stiff, glossy, and pretty scarce; this being what renders the Skin, or Fur, of so much Value. See FUR. The other short, thick, and soft; which alone is used in Hats.

To tear off one of these Kinds of Hair, and cut the other, the *Hatters*, or rather the Women employ'd for that Purpose, make Use of two Knives, a large one like a Shoemaker's Knife, for the long Hair; and a smaller, not unlike a Vine-Knife, wherewith they shave, or scrape off the shorter Hair.

When the Hair is off, they mix the Stuff; to one third of dry *Castor*, putting two thirds of Old *Cast*; i. e. Hair which has been some Time by the Savages; and card the whole with Cards, like those used in the Woolen Manufactory, only finer. This done, they weigh it, and take more or less, according to the Size or Thickness of the Hat intended. — The Stuff is now laid on the *Hurdle*, which is a Square Table, parallel to the Horizon, having longitudinal Chicks cut thro' it. On this Hurdle, with an Instrument call'd a *Bow*, much resembling that of a Violin, but larger; whose String is work'd with a little Bow-stick, and thus made to play on the Furs; they fly and mix them together, the Dust and Filth at the same Time passing thro' the Chinks. This they reckon one of the most difficult Operations in the whole; by Reason of the Justice required in the Hand to make the Stuff fall precisely together, and that it may be every where of the same Thickness. — In Lieu of a Bow, some *Hatters* make use of a Sieve, or Searce of Hair, thro' which they pass the Stuff.

After this Manner they form Gores or two Capades, of an Oval Form, ending in an acute Angle a-top. — And with what Stuff remains, they supply and strengthen them in Places where they happen to be slender than ordinary. — Tho' it is to be remember'd, that they design'dly make them thicker in the Brim, near the Crown, than towards the Circumference, or in the Crown it self.

The Capades thus finish'd, they go on to harden them into closter, more consistent Flakes, by pressing down a *hardening Skin*, or Leather thereon. — This done, they are carried to the *Bason*, which is a Sort of Bench with an Iron Plate fitted therein, and a little Fire underneath it; upon which laying one of the harden'd Capades, sprinkled over with Water; and a Sort of Mould applied thereon; the Heat of the Fire, with the Water and pressing, embody the Stuff into a slight hairy Sort of Stuff, or Felt: After which, turning up the Edges all around over the Mould, they lay it by; and thus proceed to the other. — This finish'd, the two are next join'd together, so as to meet in an Angle a-top, and only form one Conical Cap, after the Manner of a *Monicus Hippocrates*.

The Hat thus bason'd, they remove it to a large Kind of Receiver, or Trough, resembling a Mill-hopper, going sloping, or narrowing down from the Edge, or Rim, to the Bottom, which is a Copper Kettle, fill'd with Water and Grounds, kept hot for the Purpose. — On the Descend, or sloping Side, call'd the *Plank*, the Bason'd Hat, being first dip't in the Kettle, is laid. — And here they proceed to work it, by rolling and unrolling it again and again, one Part after another, first with the Hand, and then with a little wooden Roller; taking Care to dip it from Time to Time; till at length by thus falling and thickening it, four or five Hours, it is reduced to the Extent, or Dimensions of the Hat intended. — To secure the Hands from being injured by this frequent Rolling, &c. they usually guard them with a Sort of thick Gloves.

The Hat thus wrought, they proceed to give it the proper Form; which is done by laying the conical Cap on a Wooden Block, of the intended Size of the Crown of the

Hat; and thus tying it round with a Pack-Thread, call'd a *Commander*: After which, with a Piece of Iron, or Copper, bent for the Purpose, and call'd a *Stramper*, they gradually beat or drive down the *Commander* all around, till it has reach'd the Bottom of the Block; and thus is the Crown form'd; what remains at Bottom below the String, being the Brim.

The Hat being now set to dry; they proceed to *finish* it, by holding it over a *Flair of Straw*, or the like; then it is *postwood* or rubbed with *Pumice*, to take off the coarser Nap; then rubbed over afresh with *Seal-Skin*, to lay the Nap still finer; and lastly, carded with a fine Card, to raise the fine Cotton, with which the Hat is afterwards to appear.

Things thus far advanced, the Hat is sent, upon its Block, and tyed about with Pack-Thread as before, to be dyed. — The Dyer's Copper is usually very large, holding 10 or 12 Dozen Hats. The Dye, or Tincture, is made of *Logwood*, *Verdegreen*, *Copperas*, and *Alder Bark*; to which some add *Galls* and *Somma*. See DYEING.

Here the Hat is kept boiling for about three Quarters of an Hour; then taken out and set to cool, and then return'd to the Dye; and this for 10 or 12 Times successively.

The Dye being compleat, the Hat is return'd to the *Hatter*, who proceeds to dry it, by hanging it in the Top, or Roof, or a Stove or Oven; at the Bottom of which is a Charcoal Fire. — When dry, it is to be stiff'd, which is done with melted glue, or *Gum Senek*, apply'd thereon by first smearing it, and beating it over with a Brush, and then rubbing it with the Hand. — The next Thing is to steam it, on the *Steaming Bason*, which is a little Hearth, or Fire Place, rais'd three Foot high, with an Iron Plate laid over it, exactly covering the Hearth. On this Plate they first spread Cloths, which being sprinkled over with Water to secure the Hat from Burning, the Hat is placed, Brim downwards, thereon. When moderately hot, the Workman strikes gently on the Brim, with the Flat of his Hand, to make the Jointings incorporate and bind, so as not to appear; turning it from Time to Time, this Way and that Way, and at last overturning and setting it on the Crown.

When steam'd sufficiently, and dried, they put it again on the Block, brush and iron it on a Table, or Bench for the Purpose, call'd the *Stall-board*. This they perform with a Sort of Iron like those commonly used in Ironing Linen, and heated like them; which being rubb'd over and over each Part of the Hat, with the Assistance of the Brush, smoothens and gives it a Gloss, which is the last Operation; nothing now remaining but to clip the Edges even with Scissors, and sew a Lining into the Crown.

HAT, is also figuratively used for the Dignity of a Cardinal, or a Promotion to the Dignity. See CARDINAL.

In this Sense they say, To expect the Hat; claim, or have Pretensions to the Hat, &c.

Pope *Innocent IV.* first made the Hat the Symbol, or Cognizance of the Cardinals; injuncting them to wear a *Red Hat*, at all Ceremonies and Processions, as a Token of their being ready to spill their Blood for Jesus Christ.

HAT, in Heraldry. See CHAPEAU.

HATCHES, in a Ship, are Doors in the Mid-ship, or between the Main-mast, or Fore-mast; by which any Goods of Bulk are let down into the Hold.

Hence, the *Hatch-Way* is that Place directly over the *Hatches*; so that to lay a Thing into the *Hatch-Way*, is to put it so that the *Hatches* cannot be come at, or open'd.

HATCHES, are also Flood-Gates, set in a River, &c. to stop the Current of the Water.

The Word is particularly used for certain Dams, or Mounds, made of Rubbish, Clay, or Earth, to prevent the Water that issues from the Stream-Works, and Tin-Walvers in *Carweel*, from running into the fresh Rivers. See TIN.

The Tenants of *Zulyfoke*, and other Mannors, are bound to do certain Days Work to the *Hatches*.

HATCHING, the Act whereby fecundated Eggs, after seasonable incubation, exclude their young. See EGG and INCUBATION.

Hatching, with Respect to the Oviparous Tribe, amounts to the same as Parturition, or Delivery, in the Viviparous. See DELIVERY, &c.

The Ostrich is said to lay her Eggs in the Sand; and that the Heat of the Sun does the Office of a parent Animal, and *hatches* them.

In *Egypt*, they hatch their Chickens by the Heat of an Oven: The Method whereof is given us by *Mr. Greaves*, in the *Philosophical Transactions*, N^o. 117.

They have Houses, it seems, built for the Purpose; having a long Entrance, on each Side whereof are 12 or 14 Ovens, whose Bottoms and Sides are form'd of Sun dried

dried Bricks, lined with Mats, for the Eggs to lye on; and the Tops cover'd with Sticks, except two Spaces, which are Brick, and serve as Hearths to build the Fires on wherewith the Eggs are to be heated. — Over these, is another Story of Ovens; having Holes, which are either stop'd with Tow or left open at Pleasure, to govern the Heat of the Ovens below.

They begin to heat the Ovens in the middle of *January*; spending every Morning about an hundred Pound Weight of Camel's or Buffalo's Dung, and the like Quantity at Night; till the middle of *February*; by which Time the Ovens are too hot for the Hand to be held upon the Walls. — After this they put in the Eggs to hatch; which they continue successively till the End of *May*.

The Eggs are first put upon Mats in the lower Ovens, upon the Ground, 7 or 8000 Eggs in Number, and laid only double, one upon another; in the Ovens over these, the Fire is made in the little Channels, from whence the Heat is conveyed into the lower: The Eggs directly under these Hearths lie threefold.

At Night, when they new-make their Fires in the Hearths, they remove the Eggs that were directly underneath, lying three one upon another, in the Place of those which lay on the Sides only double; and these being now removed, they lie treble under the Hearth, because the Heat is greater there, than on the Sides.

These Eggs continue in the lower Ovens fourteen Days and Nights; after which they remove them into the upper. And in these, there being now no more Fire used, they turn the Eggs four Times every twenty four Hours.

The 21st, or 22d Day, the Chickens are hatched; which, the first Day eat not: The second, they are fed with away by Women who give them Corn, &c. The Master of the Ovens hath a third Part of the Eggs for his Cost and Pains; out of which he is to make good to the Owners, who have two thirds in Chicken for their Eggs, if any happen to be spoil'd, or miscarry.

The Fire in the upper Ovens, when the Eggs are placed in the lower, is thus proportioned. — The first Day the greatest Fire, the second less than the first; the fourth more than the third, the fifth less, the sixth more than the fifth, the seventh less, the eighth more, the ninth without Fire, the tenth a little Fire in the Morning, the eleventh they shut all the Holes with Flax, &c. making no more Fire; for if they should, the Eggs would break. They take Care that the Eggs be no hotter than the Eye of a Man, when they are all laid upon it can well endure. When the Chickens are hatch'd, they put them into the lower Ovens, &c.

HATCHING, or HACHING, in Designing, Engraving, &c. signifies the making of Lines with a Pen, Pencil, Graver, or the like; and the intersecting, or going a-cross those Lines, with others drawn over them another Way. See ENGRAVING, DESIGN, &c.

The Depths and Shadows of Draughts are usually form'd by *Hatching*, or *Hatch-Work*.

What is surprising in the Gravings of *Mellan* and *Sabelers*, is, that they express the Shadows exceeding well, without any *Hatches*, or *Hatchings*. See SHADOW.

These *Hatchings* are of great Use in Heraldry, to distinguish the several Colours of an Escutcheon, without its being illuminated. See COLOUR.

The first Kind of *Hatching* in Pale, or from Top to Bottom, signifies *Gules*, or *Red*. — The second in Fess, a-cross the Coat, *Azure* or *Blue*.

Hatching in Pale, counter-hatch'd in Fess, signifies *Sable*, or *Black*. — *Hatching* in Bend, proceeding from right to left, signifies *Green*: And that in Bars, from left to right, *Purple*.

When the Coat is only dotted, it is supposed to be *Or*. And when quite bare, or void, *Argent*, or *White*. See ARGENT, &c.

The Invention is, commonly, ascribed to *Fa. Pietra Sancta*. — Tho' the *Sieur de la Colombe*, has disputed his Title to it.

HATCHMENT, in Heraldry, the Marshalling of several Coats of Arms in an Escutcheon. See MARSHALLING.

HATCHMENT, is also a popular Name for an *Archivement*. See ARCHIVEMENT.

HATTOCK, a Shock of Corn, containing twelve Sheaves. — Others make it only three Sheaves laid together.

HAVEN, a *Sea-Port*, or Harbour for Ships. See PORT and HARBOUR.

The Word is derived from the Saxon *Hafene*; or the German *hasen*, or the French *havre*, which all signify the same Thing.

HAUNCH, or *HANCH*, the *Hip*; or that Part of the Body between the last Ribs, and the Thigh.

The *Haunches* consist of three Bones, join'd together by Cartilages; which, in Course of Time, grow dry, hard, and bony; so that in Adults, the three only seem to constitute one continued Bone. See SACRAM.

The *Haunches*, or *Hips*, of a Horse, are those Parts of the hind Quarters, which extend from the Reins or Back, to the Hoot or Ham; See HOARSE.

One of the most necessary Lessons in managing the great Horse, is that of putting him upon his *Haunches*; which in other Terms is called to couple him well, or to put him well together or compact.

A Horse that does not bend, or lower his *Haunches*, throws himself too much upon his Shoulders, and is heavy upon the Bridle. — To drag the *Haunches*, is to change the leading Foot in Galloping.

HAUNT, among Hunters, the Walk of a Deer, or the Place of his ordinary Passage. See HUNTING.

HAVRE, in Geography, &c. a French Term; signifying the same with *Haven*, or *Harbour*. See HARBOUR.

HAUTOBOY, or *HONOY*, a Sort of Musical Instrument, of the Wind-kind, with a Reed to blow or play it withal. See INSTRUMENT.

The *Hautboy* is shaped much like the Flute, only that it spreads, or widens, more toward the Bottom. The Treble is two Foot long: The Tenor goes a fifth lower, when blown, or sounded open. It has only seven Holes: The Bass is five Foot long, and has eleven Holes.

The Word is French, *Haut-bois*, q. d. *High-wood*; and is given to this Instrument, by Reason its Tone is higher than that of the Viola.

HAW, among Farriers, &c. a Gristle growing between the nether Eye-lid and the Eye of a Horse, and which will put it quite out, if not timely taken away.

It comes by gross, tough, and stigmatic Humours, falling from the Head, and knitting together, which in the end grow to this Infirmary, the Signs whereof are the watering of the Eye, and the involuntary opening of the nether Side.

Every Smith can cut it out: The affected Beast is to be held fast by the Head, and with a strong double Thread, a Needle to be put in the mid'd of the upper Eye-lid, and tied to his Horn: Then taking the Needle again, with a long Thread, and putting it through the Gristle of the Haw; with a sharp Knife cut the Skin finely round, and so pluck out the *Haw*. — That done, lay about his Eye, take out the Blood, wash it with Beer, or Ale, and cast in a good deal of Salt; wash it again afterwards, stroking it down with your Hands, and so let him go. — To cure a Sheep of this Malady, drop into the Eye the Juice of Camomile, or Crows-foot.

HAWK, *Accipiter*, a Bird of Prey, of a bold and generous Nature; whereof there are several Species. See BIRD.

The *Hawk* makes the Subject of a particular Art, call'd *Hawking*, or *Falconry*. See HAWKING and FALCONRY.

Naturalists distinguish about the Number and Division of the *Hawk-kind*. — The most commodious Distribution is into *Long-winged* and *Short-winged Hawks*.

To the *Long-winged*, which may be also call'd the *Falcon-Tribe*, belong the *Falcon*, *Haggard Falcon*, *Gerfalcon*, *Lanner*, *Hobby*, *Saker*, *Merrin* and *Bawler*; all which are reclaim'd, mane'd, fed and mused, much after the same Manner. — Of the *Short-winged Species*, or *Hawks* properly so call'd, are the *Gos-Hawk*, and *Sparrow-Hawk*.

The former are generally brought to the Lure; and seize their Prey with the Foot; beaking the Neck Bone with their Beak, ere they proceed to plume or tire it: The latter are brought to the Fist; and kill their Game by Strength, and force of Wing, at Random; and proceed immediately to plume them. See LURE, PLUME, &c.

It is to be noted, that the Female of all Birds of Prey is much larger, stronger, and more courageous than the Male; which is distinguished therefrom by some diminutive Name. — Those of the *Falcon* and *Gos-Hawk*, are call'd *Tiercel*, or *Tiercelet*; that of the *Gerfalcon*, *Terkin*; that of the *Merrin*, *Jack*; that of the *Hobby*, *Robin*; that of the *Sparrow-Hawk*, *Masket*; and that of the *Lanner*, *Lanneret*.

Hawks also have different Names, according to their different Ages. — The first Year she is call'd a *Sotrage*. — The second an *Estervien*. — The third a *white Hawk*. — The fourth a *Hawk of the first Coat*.

Add, that they have different Denominations according to the different Seasons when they are taken. — Those taken in the Spring, are call'd *Eyesses*, or *Nyesses*. — Those which had forsaken it, and were fed in some Place, not far off, by the old ones, *Branchers*. — Those which had begun to prey for themselves, *Snar-Hawks*. — Those which have chang'd their Feathers once or more, *Mow'd Hawks*. — And those which lived at large, and prey'd for themselves about the Woods, *Hogards*.

We shall here, according to our Method in other Things, give the Reader what relates to the several Species of *Hawks*; referring for what is common to 'em all, to the Article HAWKING.

1^o. Of the *Falcon*, or *Falcon Gentle*, her Nature and Qualities; with the Manner of Rearing and reclaiming, and bringing her up to the Sport, we have elsewhere spoke under the Article *FALCON*.

2^o. The *Hagard Falcon*, call'd also *Peregrine Falcon*, *Passenger*, and *Traveller*, because no Native of our Island; or rather, by Reason of its Roving, and Wandering more than any other Sort; is not inferior to the best of the Tribe, for Strength, Courage, Hardiness, and Perseverance. She is distinguished from the Common Falcon, as being larger, longer arm'd, with a longer Beak and Talons, a higher Neck, &c. She will lie longer on the Wing; and is more deliberate and advised in her swooping, &c.

The *Hagard Falcon*, when wild and unreclaim'd, takes the greatest Liberty of all Birds; living either by Land or Sea: And is of such absolute Power, that wherever she comes, all flying Fowl stoop under her Subjection: Even the Tiercelet, tho' her natural Companion, dares not fit by her, or approach her Residence, except in Cawking Time; when, for Procreation Sake, she admits him in a submissive Manner to come near and woo her.

When very young, she is apt to attack Birds too strong for her; which she persists in, till a sound Beating have brought her to a better Understanding. — She is an incessant Pains Taker; no Weather discouraging her from her Game. — When unreclaim'd, she has seiz'd her Prey, and broke the Ink or Neck, she falls on the Crop, and feeds first on what is contain'd there; then on the other Parts. When she has fill'd her Gorge, she flies to some solitary Place, near the Water, where she sits all Day, and at Night takes Wing to some convenient Place, where she had before purpos'd, to perch till Morning.

For the Method of Reclaiming, Muzzling, Entering, &c. a *Hagard Falcon*, or other Sort of Hawk, with the Terms of Art us'd in Respect thereof. See the Article *HAWKING*:

3^o. The *Gerfalcon*, or *Gyrfalcon*, is the largest Bird of the *Falcon* Kind; coming next to the Size of a Vulture; and of the greatest Strength next an Eagle: She is stoutly arm'd; and in all Respects a lovely Bird to the Eye.

Her Head and Eyes are like the *Hagard*; her Back great and bending, her Nares large: — Her Sails long and sharp pointed, and her Train and Mail much like the *Lanners*, having a large Marble feared Foot; and plumed black, brown, and russet. — She may also be call'd a *Passenger*, her Eyrie being in *Prussia*, *Aiscovy*, and the Mountains of *Norway*.

The *Gerfalcon* is of a fierce and fiery Nature, very hardly managed and reclaimed; but being once overcome, proves an excellent *Hawk*, scarce refusing to strike at any Thing. She does not naturally fly the River; but always pursues the Herons, Shovelers, &c. In going up to their Gate, they do not hold the Course, or Way, which others use to do; but climb up upon the Train, when they find any Fowl, and as soon as they have reach'd her, pluck her down, if not at the first, yet at the second or third Encounter.

4^o. The *Saker*, or *Sacra*, is the third in Esteem, next the *Falcon*, and *Gerfalcon*, but difficult to be managed, being a *Passenger*, or *Peregrine Hawk*, whose Eyrie has not yet been discovered, but chiefly found in the Islands of the *Levant*.

She is somewhat longer than the *Hagard Falcon*; her Plumage rusty and ragged; the Scar of her Foot and Beak like the *Lanner*; her Pounces short, and her Train the longest of all Birds of Prey.

She is very strong and hardy to all Kind of Fowl, being more disposed to the Field a great deal than the *Brook*, and delighting to prey on great Fowl, as the *Heron*, *Goose*, &c. but for the Crane she is not so free as the *Hagard Falcon*. — She also excels for the lesser Fowl, as *Pheasants*, *Partridges*, &c. and is much less dainty in her Diet, as long-winged *Hawks* usually are.

The *Saker* makes excellent Sport with a *Kite*; who, as soon as he sees cast off, immediately betakes her self to, and trusts in the Goodness of her Wings, and gets to her Pitch, as high as possibly she can, by making many Towers and Wrenches in the Air; which together with the Variety of Conests and Bickering between them, affords a curious Spectacle.

5^o. The *Lanner*, or *Lanar*, is a *Hawk* common in most Countries, especially *France*; making her Eyrie on lofty Trees in Forests, or on high Cliffs near the Sea-side.

She is less than the *Falcon Gentle*, fair plumed, and of shorter Talons than any other *Falcon*. — Such as have the largest and best feated'd Heads, are esteem'd the best.

Mew'd *Lanners* are not easily known from *Gos-Hawks*, or *Sakers*; the chief Marks and Characteristicks are, That they are blacker, have less Beaks, and are less arm'd and pounc'd than any other *Hawks*.

Of the whole *Hawk* Tribe, there is none so fit for a young Falconer as this, because she is not inclined to Sur-

feits, and seldom melts Grease by being overflow'd.

There is another Sort of *Lanners*, whose Eyrie is in the *Alps*, having their Heads white, and flat aloft, large and black Eyes, slender Nares, short and thick Beaks; being less than the *Hagard*, and *Falcon Gentle*, tho' there are different Sizes of them; their Tail Marble, or Russet: Breast Feathers white and full of Russet Spots, and the Points and Extremities of their Feathers full of white Drops; their Sails and Traits long; short legged, with a Foot less than that of a *Falcon*, marble-feared.

This *Hawk* never lies upon the Wing, after she has flown to a Mark; but after once swooping, makes a Point; and like the *Gos-Hawk*, waits the *Powl*. — She is more valuable abroad than in *England*; we looking on her as foolish, and hard mettled. The Truth is, a very strict Hand must be kept over her; as being of an ungrateful Disposition. — She is flown at Field, or Brook, and will maintain long Flights; by which Means much Fowl is killed. To fly them, they must be kept very sharp; and because they keep their Cattings long, they must have hard Cattings made of Tow, and Knots of Hemp.

6^o. The *Merlin* is the smallest of all Birds of Prey; and bears a Resemblance to a *Hagard Falcon* in Plumage, as also in the Scar of the Foot, Beak, and Talons, and not unlike her in Conditions.

When well managed, bred, and carefully looked after, she proves an excellent *Hawk*; especially at Partridge, Thrush, and Lark. — But she is very baucy, and unruly, and special Care must be had lest she unaturally eat off her own Feet and Talons, as she has often been known to do.

She is wonderfully venturesome; and will fly at Birds bigger than her self, with such Eagerness, as to pursue them even into a Town or Village.

Tho' the *Merlin* be accounted an *Hawk* of the *Fist*, she may be brought to take delight in the Lure; when you have made her come to the Lure, so as she will patiently endure the Hood, you should make her a Train with a Partridge; if the foot and kill it, reward her well: Then fly her at the wild Partridge, and if she take or make it at first or second Flight, being retrieved by the Spaniels, feed her upon it with a reasonable Gorge; cheating her in such Manner with the Voice, that she may know it another Time: If she do not prove hardy at the first or second Time, she will be good for nothing.

7^o. The *Hobby*, is a Sort of *Hawk* that naturally preys on Doves, Larks, and other small Game.

She has a blue Beak, but the Spar thereof and Legs are yellow; the Crinels, or little Feathers under the Eye, very black, the Top of the Head between black and yellow.

She has also two white Scams on her Neck: The Plumage under the Gorge, and about the Brows, are reddish, without Spot or Drop; the Breast Feathers for the most Part brown, yet interspersed with white Spots; her Back, Train and Wings, are black aloft, having no great Scales upon the Legs, unless a few behind; the great Stretchers and Pounces are very large, with Respect to her short Legs; her brail Feathers are tinged between red and black; the pendant ones, or those behind the Thigh, of a rusty, smoaky Hue.

She is a *Hawk* of the Lure, and not of the *Fist*; and is an higher Flyer, being in every Respect like the *Saker*, but she is of a much less Size; for she is not only nimble and light of Wings, but dares encounter *Kites*, *Buzzards*, or *Crows*, and will give Soule for Soule, Blow for Blow, till sometimes they surge and come tumbling down to the Ground both together. — But she is chiefly for the Lark, which poor little Creature does so dread the Sight of her, soaring in the Air over her, that she will rather choose to commit her self to the Mercy of Men or Dogs, or to be trampled on by Horses, than venture into the Element, when she sees her mortal Enemy soaring there.

The *Hobby* also makes excellent Sport with Nets and Spaniels; for when the Dogs range the Field, to spring the Fowl, and the *Hobby* flairs aloft over them, the silly Birds, apprehensive of a Conspiracy among the *Hawks* and Dogs to their utter Ruin, dare not commit themselves to their Wings, but think it safer to lie close on the Ground, and so are taken in the Nets. — This Sport is call'd *Daring*.

8^o. The *Goshawk*, or *Gos-Hawk*, q. d. *Gros Hawk*, is a large, short-winged *Hawk*, of which there are several Sorts, differing in Goodness, Force, and Hardiness, according to the Diversity of their Choice in Cawking; at which Time the several Sorts of Birds of Prey assemble themselves with the *Goshawk*, and gallant it together.

There are *Gos-Hawks* from most Countries, but none better than those bred in the North of *Ireland*. — She ought to have a small Head, a long and straight Face, a large Throat, great Eyes, deep set; the Apple of the Eye black; Nares, Ears, Back and Feet large and black; a black

black long Beak, long Neck, big Breast, hard Flesh, long fleshy Thighs, the Bone of the Leg and Knee short, long large Pounces and Talons; and to grow round from the Stern, or Train, to the Breast forward. — The Feathers of the Thighs, towards the Train, should be large, and the Train Feathers short and soft, somewhat tending to an Iron Mail. The Baril Feathers ought to be like those of the Breast; and the Covert Feathers of the Train, spotted and full of black Rundles, but the Extremity of every Train Feather black streaked.

To distinguish the Strength of the Bird, the divers of them in several Places of one Chamber, or Mew; and that Hawk that flies and mates highest and farthest off, may be concluded to be strongest.

The *Goat-Hawk* flies at the Pheasant, Mallard, wild Goose, Hare, and Coney; nay she will venture to seize a Kid, or Goat. — She is to be kept with Care, as being very choice and dainty in Eating, &c.

9. *Sparrow-Hawk*, is also a Kind of short-winged Hawk; whereof there are several Sorts, different in Plumes; Some small plumed and black; others of a larger Feather; some plumed like the Quail; some brown or Canvas-Mail, &c.

The *Sparrow-Hawk*, so far as her Strength will give her Leave, is a good Hawk; and he that knows how to man, reclaim, and fly with a *Sparrow-Hawk*, may easily attain to the keeping and managing of all others. — In this Respect she really excels, that she serves both for Winter and Summer, with great Pleasure, and will fly at all Kind of Game, more than the Falcon.

HAWKERS, antiently, were fraudulent Persons; who went from Place to Place, buying and selling Beasts, Pewter, and other Merchandize, which ought to be uttered in open Market.

In this Sense, the Word is mention'd, *Anno 25 Hen. VIII. Cap. 6. and 33 ejusdem, Cap. 4.*

We now call those *Hawkers*, who go up and down London Streets, crying News Books, and selling them by Retail. — The Women who furnish the *Hawkers*, i. e. sell the Papers by Wholesale from the Press, are call'd *Mercuries*.

The Appellation of *Hawkers* seems to grow from their uncertain Wandering, like those who, with *Hawks*, seek their Game where they can find it.

HAWKING, the Art, or Exercise of Chasing and taking Wild-Fowl, by Means of *Hawks*, or Birds of Prey. See *HAWK*.

Hawking is the same Thing with what we otherwise call *Falconry*. See *FALCONRY*.

The Word *Hawking*, in its Latitude, does also include the taming and disciplining of *Hawks*, and fitting them for the Sport.

Hawking, tho' an Exercise now much disused among us, in Comparison of what it antiently was, does yet furnish a great Variety of significant Terms, which still obtain in our Language.

Thus, the Parts of a *Hawk* have their proper Names. — The Legs, from the Thigh to the Foot, are call'd the *Arms*; the Toes, the *Petty-fingers*; the Claws, the *Pounces*. — The Wings are call'd the *Sells*; the long Feathers thereof the *Benons*; the two longest, the *principal Feathers*; those next thereto, the *Flags*. — The Tail the *Train*. — The Breast Feathers, the *Mails*: — Those behind the Thigh, the *Pendants Feathers*: When the Feathers are not yet full grown, she is said to be *unfeather'd*; when they are complete, she is *feather'd*: — The Claw, or Crop, is call'd the *Gorge*: — The Pipe next the Fundament, where the Faeces are drawn, down, is call'd the *Pannel*: — The slimy Subtance, lying in the Pannel, is call'd the *Gins*: — The upper and crooked Part of the Bill, is call'd the *Beak*; the nether Part the *Clap*: The yellow Part between the Beak and the Eyes, the *Scar* or *Sere*; the two small Holes therein, the *Nares*.

As to her Furniture: — The Leathers, with Bells button'd on her Legs, are call'd *Bowits*. — The Leathern Thong, whereby the Falconer holds the *Hawk*, is call'd the *Lease*, or *Leash*; the little Straps, by which the Lease is fasten'd to the Legs, *Jesses*; and a Linc or Pack-thread fasten'd to the Lease, in disciplining her, a *Creance*. — A Cover for her Head, to keep her in the Dark, is call'd a *Hood*; a large wide Hood, open behind, to be wore at first, is call'd a *ruster Hood*: To draw the Strings, that the Hood may be in Readiness to be pull'd off, is call'd *unstrucking the Hood*. — The blinding a *Hawk* just taken, by running a Thread thro' her Eye-lids, and thus drawing them over the Eyes, to prepare her for being hooded, is call'd *Seeling*. — A Figure, or Resemblance of a Fowl, made of Leather and Feathers, is call'd a *Lure*. — Her resting Place, when off the Falconer's Fist, is call'd the *Perch*. — The Place where her Meat is laid, is call'd the *Hack*. — And that whereto she is set, while her Feathers fall and come again, the *Mew*.

Something given a *Hawk*, to cleanse and purge her Gorge, is call'd *Castig*: — Small Feathers given to make her Cast, are call'd *Plumage*: — Gravel given her to help bring down her Stomach, is call'd *Rangle*: — Her throwing up Filth from the Gorge after *Castig*, is call'd *Gleaming*. — The Purging of her Gorge, &c. *Eyscaming*. — A being stuffed is call'd *Gorgiting*. — The inserting a Feather in her Wing, in lieu of a broken one, is call'd *Jessing*. — The giving her a Leg, Wing, or Pinion of a Fowl to pull at, is call'd *Tying*: — The Neck of a Bird the *Hawk* preys on, is call'd the *Lake*: — What the *Hawk* leaves of her Prey, is call'd the *Pill*, or *Pelf*.

There are also proper Terms for her several Actions: — When she flutters with her Wings, as if striving to get away, either from Perch or Fil, she is said to *Bare*. — When standing too near, they fight with each other, it is call'd *Crabbing*: — When the young ones quiver, and shake their Wings in Obedience to the elder, it is call'd *Cowering*: — When she wipes her Beak after feeding, she is said to *Feak*: — When she sleeps, she is said to *Yolk*: — From the Time of exchanging her Coat, till she turn white again, is call'd her *Interseasoning*: — Treading is call'd *Cawking*. — When she stretches one of her Wings after her Legs, and then the other, it is call'd *Mantling*: — Her Dung is call'd *Mating*; when she mutes a good Way from her, she is said to *face*; when she does it directly down, instead of yerking backwards, she is said to *face*; and if it be in Drops, it is call'd *Dropping*. — When she as it were sneezes, it is call'd *Saiting*. — When she raises and shakes her self, she is said to *Rowse*; when after Mantling, she crosses her Wings together over her Back, she is said to *Warble*.

When a *Hawk* seizes, she is said to *Bind*. — When after seizing she pulls off the Feathers, she is said to *Plume*. — When she raises a Fowl aloft, and at length defends with it to the Ground, it is call'd *Trussing*. — When being aloft, she defends to strike her Prey, it is call'd *Stooping*. — When she flies out too far from the Game, she is said to *Rake*. — When forsaking her proper Game, she flies at Pycs, Crows, &c. that chance to cross her, it is call'd *Chack*. — When missing the Fowl, she betakes her self to the next Check, she is said to *fly on Head*. — The Fowl or Game she flies at is call'd the *Quarry*. — The dead Body of a Fowl, kill'd by the *Hawk*, is call'd a *Petr*. — When she flies away with the *Quarry*, she is said to *carry*. — When in stooping, she turns two or three Times on the Wing, to recover her self ere she seizes, it is call'd *Cancelseering*. — When she hits the Prey, yet does not truss it, it is call'd *Ruff*.

The making a *Hawk* tame and gentle, is call'd *Reclaiming*. — The bringing her to endure Company, *Manning* her. — An old staunch *Hawk* used to fly and set Example to a young one, is call'd a *Make-Hawk*.

The Reclaiming, Manning, and bringing up a *Hawk* to the Sport, is not easy to be brought to any precise Set of Rules. — It consists in a Number of little Practices, and Observances, calculated to familiarize the Falconer to his Bird, to procure the Love thereof, &c. — The principal Hold and Foundation which the Falconer has to work upon, is the Bird's Stomach. — The great Principle of Appetite he is to make use of an hundred Ways, to lead the Bird obliquely to what he would have from him: All he can do is, to divert Nature, and make her subservient to his Purposes, to make it the Interest of the Bird, either real or apparent, to do what the Falconer requires of her.

The Course, 'tis evident, will be different, according to the State and Condition of the Bird to be managed. — An *Eyese*, e. g. needs no reclaiming; she is to be carefully nursed, and brought up in their natural Tameness.

A *Brancher*, *Scar-Hawk*, or *Rouage-Hawk*, needs no Nursing; she is to be brought down from her Wildness, and habituated to another Course of Life; and in Pursuance of her own Views, and Interests, to be made subject to those of her Master.

To *Reclaim*, e. g. a *Hogard* Falcon; they begin with shutting her up from the Light, by pulling a Hood over her Eyes; and fixing her by a *Creance*, which makes her more accessible. — The next Thing is to handle her frequently, taking her up, often stroaking her, sitting her on the Hand, and carrying her about; unhooding, and presently hooding her again; and this for eight or nine Days, without ever suffering her to sleep. — All the while she is to be kept sharp set, but to be frequently fed, with a little at a Time; unhooding her for the Purpose, and when unhooded, the Voice to be continually used to her, that she may learn it; and that the hearing of the Voice may naturally put her in Hopes of being fed. — This done she is to be invited to come from the Perch to the Fist, by unstrucking her Hood, shewing her some Meat, using the Voice, and calling her till she come to it, and feed thereon. — If she still refuse, keep her sharp set

till she do. — Proceed then to bring her to the Lure, by giving her to some Person to hold, and calling her with a Lure, well garnished with Meat on both Sides, and give her a Bit: Use her to this for six or seven Days; after which tempt her to come gradually further and further off, to the Lure, waving it and calling it round your Head, &c. and if she come to it soundly, reward her. In three or four Days more call her to your Lure, well garnished as above, as far as 'tis possible for her to see or hear you; and set her loose from all her Furniture.

The Hawk thus mann'd, reclaim'd and lured, you may go with her into the Fields; and whistle her off your Fist, to see whether she will take out or no. If she mount and fly round you in Circles, as a good Hawk ought to do; after two or three Turns call to her with your Voice, and fling out the Lure about your Head, and upon her stooping, or coming to it, give her a Chicken, or Pidgeon, and let her kill and feed thereon. — Being thus far initiated, give her first Stones, every Evening, to prepare her Body for Castings; and then Castings to cleanse and scour her Body, and make her eager. — This Course continue till she have had endued and mewed enough to enter upon Business.

If the Hawk be intended for some particular Sort of Game, let her Lure be a Resemblance of that Sort of Game; and make a Practice of frequently feeding and rewarding her thereon; or on a Train of the same Kind; calling her when feeding, as if she were call'd to the Lure. Add, that it may be proper to feed her in such like Places as those her Game is chiefly to be found in.

To enter a Hawk, it may be convenient to take a well qualified Henck, and let her stoop a Fowl, on Brook or Plash; this done, reward, hood and set her; and taking the young Hawk, go half a Bow-shot up the Wind, loose her Hood, and softly whistle her off the Fist, till she have reared or mewed; then let her fly with her Head into the Wind; and when she is at a proper Height, let go a Fowl for her to stoop and traik. See further under the Article FALCON.

HANKWIT, or HANGWIT, from the Saxon hangan, i. e. suspendere, to hang, and wite, Multa, Punishment, is a Liberty granted to a Man, whereby he is quit of a Feign, or Thief, hanged without a Judgment, or escaped out of Custody. — We also read it interpreted to be *Quir de lerois pendu sans Serjeant le Roy*, i. e. without a legal Trial. — And elsewhere, *Nultra pro latrone preter juris exigentiam suspensio vel elapsio*.

Some suspect that the Word may also signify a Liberty, whereby a Lord challengeth the Forfeiture due for him who hangs himself within the Lord's Fee. See BLOODWIT.

It seems to be so in *Consuetud. ex Domestay*, by Dr. Gale, viz. *Haugewitibus facies in Civitate to S. Arbit*.

HAWSER, or HALSER, belonging to a Ship, is a Rope consisting of three Strands; being a Kind of little Cable, serving for many Uses on Board, as to fasten the Main and Fore-foresails, to warp a Ship over a Bar, &c. See ROPE, CABLE.

HAWSES, in a Ship, are two round Holes under her Head, through which the Cables pass, when she is at Anchor. See CABLE and ANCHOR.

A *Bold Hawse*, is when the Hole is high above the Water. A *Fresh Hawse*, when there is Reason to suspect the Cable may be fretted in these Holes.

Burning in the Hawse, is when the Cable endures an extraordinary Strain.

Clearing the Hawse, is the untwisting of two Cables, which being let out at different *Hawses*, are twisted about one another.

Freshing the Hawse, is when new Pieces are laid upon the Cable in the *Hawse*.

Riding upon the Hawse, is when any weighty Substance lies across, or falls directly before the *Hawse*.

HAY, HAYA, or HAYE, a Fence or Inclosure, form'd of Rails; wherewith some Forests, Parks, &c. were antiently surrounded.

Sometimes the Word is used for the Park it self: And sometimes for an Hedge, or hedged Ground. — *Univerfis Capitulum B. Petri Ebor. concessisse ad firmam totam Hayam nostram de Langerath, cum solo eiusdem Haye, Bruneta, Marfio, & omnibus aliis pertinentiis. Reddendo inde annuatim nobis tempore pinguedinis unum samonem, & ferriunam tempore siccitatis unum samonem, &c.*

HAYBOOT, in our antient Customs, from the Saxon HAY, Hedge, and Boot; a Mould or Recompence for a Hedge-breaking; or rather, a Right to take Wood necessary for making Hedges, either by Tenant for Life, or for Years, though not expressed in the Grant or Lease. — This mention'd in the *Mss. 2 Tom. pag. 134, & concordo ei ut de bosco suo Heyboot, &c.* — In the same Place, *Husbote* signifies a right to take Timber to repair the House.

HAYS, a particular Kind of Nets for the taking of Rabbits, Hares, &c.

HAYWARD, or HAWARD, a Keeper of the common Herd of Cattle of a Town; who is to look that they neither break nor crop the Hedges of inclosed Grounds; and is sworn in the Lord's Court, for the due Performance of his Office. See HAY.

HAZARD. See CHANCE and GAMING.

HEAD, *Caput*, the uppermost, or foremost Part of the Body of an Animal. See BODY and ANIMAL.

Phylog, and other of the antient Naturalists, speak of a Nation of People without Heads, call'd *Blemmyes*. See BLEMMYES.

We have Accounts in modern Geographers and Travellers, of People whose Heads are as flat as the Hand; it being the Custom among them to flatten their Children's Heads, when new Born, by passing them thro' a Press, or laying them between two Planks with a considerable Weight thereon. — They are said to be the Inhabitants of the Province *Cofaguas*, on the great River of the *Ausazons*, in South America.

Anatomists account the Head of Man, the first or uppermost Venter; being that which comes last in Order of Dissection, by Reason its Contents are not so subject to Corruption. See VENTER.

The Head is divided into two Parts: The *1st*, the *Calvaria*, or Scalp, being that Part cover'd with Hair. See HAIR.

The *2d*, smooth, or without Hair, call'd the *Face*, or *Village*; by the Latins *Vultus*, and by the Greeks *Prosopon*, q. d. *looking forward*. See FACE.

The former is subdivided into four; viz. the *Front*, or Forehead, which is reputed the most humid, call'd by Physicians the *Sinciput*, q. d. *summus Caput*. See FRONT and SINCIPUT.

The hind, or Back Part, call'd *Occiput*; by the Greeks *Inion*, by Reason all the Nerves, which among them are call'd *taei*, arise herefrom. See OCCIPUT and NERVE.

The middle, or Top-part, call'd the *Crown* of the Head, and by Anatomists *Vertex*, a *Vertendo*, by reason the Hair turns round there. See VERTEX.

Lastly, the Sides are call'd the *Temples*, *Tempora*, as being the Places where the Hair first begins to turn grey, and discover the Age. See TEMPLE.

The Bone, or Bones of the Head, is call'd by one general Name *Skull*, or *Cranium*; consisting of several Parts, or lesser Bones. See CRANIUM.

The Bone of the Fore-head, is call'd *Oss frontis*, or *Puppis*, or *Coronale*, or *Verecundum*, whence impudent Persons are said to be *frontless*. See OSS FRONTIS, &c.

The Bone of the Scalp is call'd *Oss scapitis*, or *Bregma*. See BREGMA, &c.

The Bone of the Back of the Head is call'd *Oss Occipitis*, or *Prona*. See OSS OCCIPITIS, &c.

And those of the Temples, *Temporalia*, or *Ossa Temporis*. See OSS TEMPORIS.

These Bones are connected or join'd together by Sutures. See SUTURE.

In the Head are seated the principal Organs of Sense; viz. the *Eye*, *Ear*, &c. And in it is likewise the *Brain*, invested with its Meninges; the supposed Seat of the Soul. See SENSE, BRAIN, &c.

The Head is moved by ten Pair of Muscles, viz. the *Per Spiculum*, *Complexum*, *Rectum majus externum*, *Rectum minus externum*, *Obliguum Superius*, *Obliguum Inferius*, *Mastoiideum*, *Rectum internum majus*, *Rectum internum minus*, and *Rectum Laterale*. See each described under its respective Article.

The Orbitals cover the Head with a *Turban*, or a *Cap*. — The Occidentals with a *Hat*, &c. See TURBAN, HAT and CAP.

Kings, on solemn Occasions, wear the Crown on the Head; Bishops the Mitre, &c. See CROWN, MITRE, &c.

The antient Cavaliers wore *Helmers*. — The Soldiers, *Casks*. See HELMET and CASK.

HEAD, is also used for the Top of a Tree, or other Plant. See TREE and PRUNING.

HEAD, is also applied to the Extremity of a Bone. See BONE.

When a Bone has a round Tip, or End, which advances, or projects forward, whether in the Way of an Apophysis or Epiphysis; it is call'd the *Head* of the Bone. See APOPHYSIS, &c.

If its Rise, or Origin, be slender, and it enlarge by Degrees, it is call'd the *Neck*. See NECK.

If it terminate in a Point, it is call'd *Corone*, *Corvus*, or *Coracoides*, as resembling a Crow's Bill. See CORONE, CORACOIDES, &c.

When the Head is flat, they call it *Condylus*, or *double Head*; as in the Extremities of the Bones of the Fingers. See CONDYLUS.

HEAD, is also us'd for the Extreme of a Muscle, which is fasten'd or inserted into the Stable-Bone, or the

the Part not intended for Motion. See MUSCLE, &c.
The *Head* of a Muscle is a Tendon. See TENDON and TAIL.

HEAD, again, is applied in the Mechanic Arts, to the Parts of Inanimate and Artificial Bodies. See CAPITAL.

In this Sense we say, that some Nails have *Heads*; others *Hooks*; others, as Brads, neither. See NAIL.

So also we say the *Head* of a Pin, &c. See PIN.

HEAD, is also used in Painting, Sculpture, &c. for a Picture, or Representation of that Part of the human Body; whether in Colours, Draught, Relief, or Creux. See SCULPTURE, BUSTO, &c.

Those in Painting, taken from the Life, or supposed to bear a just Resemblance to the Person; are more properly call'd *Portraits*. See PORTRAIT.

HEAD, in Architecture, &c. an Ornament of Sculpture, or carved Work, frequently serving as the Key of an Arch, Plat-band, and on other Occasions. See KEY and ARCH.

These Sort of *Heads* usually represent some of the Heav'n Divinities, Virtues, Seasons, Ages, &c. with their Attributes. — As a Trident for *Neptunus*, a Helmet for *Mars*, a Crown of Ears of Corn for *Ceres*, a Caduceus for *Mercury*, a Diadem for *Juno*. See ATTRIBUTES, &c.

The *Heads* of Beasts are also used in Places suitable thereto: As a Bullock's, or Sheep's *Head*, for a Shambles, or Market-house; a Dog's, for a Kennel; a Deer's, or Boar's, for a Park or Forest; a Horse's, for an Equerry, &c.

In the Metopes of the Friezes, and other Parts of certain *Antique, Doric* Temples, we meet with Representations of Bullocks, or Rams *Heads* flaid; as a Symbol of the Sacrifices offer'd there.

In Heraldry, the *Heads* of Men, Beasts, Birds, &c. are bore in Armoury, either full-faced and in *front*, or side-faced and in *profile*; which must be distinguish'd in Blazoning. — *Vers a Chequeron Gules, between three Turke Heads, Couped, Side-faced, proper*: By the Name of *Smith*.

Among Medallists, the different *Heads* on ancient Coins, are distinguish'd by the different Dresses thereof. See MEDAL.

In the *Imperial* Medals, where the *Head* is quite bare, 'tis usually a Sign the Person was not an Emperor, but one of the Children thereof, or the presumptive Heir of the Empire. Tho' we have Instances of those who were only *Cæsars*, and never reign'd, being crown'd with Laurel, or adorn'd with a Diadem: As, on the contrary, we have Emperors *Heads* entirely bare.

The *Heads* which are cover'd, are either cover'd with a Diadem, or a Crown, or a simple Case, or a Veil, or some other foreign Covering; whereof the Diadem is the most antique. — The Senate first granted it to *Julius Cæsar*, to wear the Laurel Crown, which his Successors took after him. See CROWN, DIADEM, &c.

The *Heads* of Deities are frequently distinguish'd by some special Symbol thereof.

HEAD, is also applied to Monsters; supposed most of them fabulously to have many *Heads*. See MONSTER, &c.

The Serpent *Ambrosiana*, or *Cecilia*, is said by Naturalists to have two *Heads*. — The Poets attribute three *Heads* to *Hecate*, *Geryon*, and *Cerberus*: *Typhon* and *Hydra* are said to have an hundred *Heads*.

The *Head* of the Gorgon *Medusa*, is said to have struck People dead with the very Sight. — It has been since translated into Heaven, and made a Constellation; where it still shines as a Part or Appendage of the Constellation *Perseus*; continuing still to dispense its malefic Influences, as the Astrologers suppose, upon our Earth. See CONSTELLATION.

The Stars, &c. in *Medusa's* *Head*, which is also call'd *off* from the Arabs, *Ras Algol*; See among the rest of *PERSEUS*.

HEAD, is also used for the Horns of a Deer; as a Hart, Buck, &c. See HORN.

Hart's *mew*, or cast their *Heads* every Year; and get new ones. See MOULTING.

The old Hart, or Buck, casts his Head sooner than the young; and the Time is about the Months of *February* and *March*. — Having cast their *Heads*, they instantly withdraw into the Thickets; hiding themselves in convenient Places near good Water, &c. far from the Annoyance of Flies.

After they have mewed, they begin to *button* again in *March*, or *April*, i. e. to shoot out new Horns; which at first appear like little Bunches.

Note, if a Hart be gelt before he have a *Head*, he will never bear any; and if he be gelt when he has a *Head*, he will never after mew or cast it. — If only one of his Testicles be taken out, he will want the Horn of that Side; if one of the Testicles be only tyed up, he will want the Horn of the opposite Side. See CASTRATION and GELDING.

The Age of a Hart, or Deer, is usually reckon'd by the Number of *Heads*. — A Deer of the first *Head*, the second *Head*, &c.

At one Year they have nothing but Bunches, call'd *Synsignificators* of Horns to come. The 2d Year they appear more perfectly, but still and simple: This makes the first *Head*, properly call'd *Broches*, and in a Fallow-Deer, *Pricks*. The 3d Year they grow into two *Speers*, or four, six, or eight small Branches. At the 4th, they bear eight or ten: At the 5th, ten or twelve: At the 6th, fourteen or sixteen: At the 7th Year they bear their *Heads* beamed, branched and furred as much as they will bear; never multiplying further, but only growing in Magnitude.

The Names and Diversities of Heads in the hunting Language, are as follow:

The Thing that beareth the Antlers, Royals, and Tops, is call'd the *Beam*; and the little Streaks therein are *Glitters*. — That which is about the Crust of the Beam, is term'd *Pearls*; and that which is about the Bar it self, formed like little Pearls, is call'd *Pearls bigger than the rest*. — The Bar is next the *Head*; and that which is about the Bar, is call'd *Pearls*. — The first is call'd *Antler*, the second *Sur-antler*; all the rest which grow afterwards, till you come to the Crown, Palm, or Croche, are call'd *Royals* and *Sur-royals*; the little Buds or Broches about the Tops, are call'd *Croches*.

Their *Heads* go by several Names; The first *Head* is call'd a *Crown-top*, because the Croches are ranged in Form of a Crown. — The second is call'd a *Palmed-top*, because the Croches are formed like a Man's Hand. — All *Heads* which bear not above three or four, the Croches being placed aloft, all of one Height, in Form of a Cluster of Nuts, are call'd *Heads of so many Croches*: All *Heads* which bear two on the Top, or having their Croches doubling, are call'd *Forked-Heads*. — All *Heads* which have double Burs, or the Antlers, Royals, and Croches turned downwards, contrary to other *Heads*, are call'd simple *Heads*. See HUNTING.

HEAD, is sometimes also used for the whole Man.
In this Sense we say, to offer a Reward for a Man's *Head*. — In Proscriptions a Price is set on a Man's *Head*. See PROSCRIPTION.

Capitation is a Tax laid upon each *Head*; call'd also *Poll* and *Head-money*. See CAPITATION and POLL.

HEAD, again, is used figuratively in speaking of Communities and Bodies politic, for the principal or leading Member thereof. See PRINCIPAL.

Thus, we say, a President, or Master, is at the *Head* of his Company. — A Dean is the *Head* of his Chapter. — The Ministers are at the *Head* of Affairs. See PRESIDENT, DEAN, MINISTER, &c.

The King of Great Britain is at the *Head* of the Protestant World, &c.

HEAD, is also used to denote the Relation of Priority; or that which comes first in any Thing. See PRIORITY.

In this Sense, we say, the Names of Authors should always appear at the *Head* of their Books. — Prefaces, and Epitaph Dedicatory, come at the *Head*. — The Governour marches out at the *Head* of the Garrison.

HEAD, in the military Art. — The *Head of the Camp*, is the front, or fore-most Part of the Ground, an Army is incamped on; or that which advances most towards the Campaign, Field, or the Enemy. — The *Head of the Camp* is always to be the best fortified. See CAMP, &c.

In the like Sense we say, the *Head of the Trenches*. — The *Head of the Sap*: — *Of the Works*, &c. meaning those Parts advanced the furthest towards the Enemy. See WORKS, SAP, &c.

Such a Night the *Head* of the Trenches was carried further by an hundred Paces. — There are two *Heads* of a Trench; that is, two Attacks. See TRENCH and ATTACK.

The *Head of a Horn-Work*, is that Part contain'd between two Demi-Bastions. See HORN-Work.

HEAD of a Ship, or other Vessel, is the *Prow*, or Part that goes foremost. See PROW. See also SHIP.

HEAD, in the Manage. The Perfections required to the *Head of Horse*, are that it be small, narrow, lean and dry. — Horses with a big gross *Head*, are apt, by their Weight, to rest and loll upon the Bridle; and so incommode the Rider's Hand. — A Horse with a large *Head* can never look stately, unless he have a long and very well turned Neck, and place his *Head* well. — Horses with gross fat *Heads*, much charged with Flesh, are subject to Infirmities of the Eye.

But the chief Thing in a Horse's *Head* is a good *Oset*, so as he may be able to bring his *Head* into his natural Situation; which is, that all the fore Part, from the Brow to the Nose, be perpendicular to the Ground; so that if a Plummet were applied thereto, it would but just raze or shave it. See HORSE.

The *Head* of a Horse is also used to import the Action of his Neck, and the Effect of the Bridle and Wrist.

Moors Head, is understood of a Horse with a black Head and Feet; the Body being usually of a Roan Colour. See HORSE.

Moors Head, is also used by Engineers, for a Kind of Bomb or Grenado, shot out of a Cannon. See BOMB and GRANADO.

Moors Head, is also used in Heraldry, for a Representation, usually in Profile, of a *Black-moors Head*, swath'd or roll'd about with a Bandage; frequently bore as a Crest. See CREST.

Moors Head, in Chymistry, is a Cover, or Capital, of an Alembic, having a long Neck, to convey the Vapours rais'd by the Fire, into a Vessel, which serves as a Refrigeratory. See ALEMBIC.

In Music, the **HEAD** of a Lute, Theorbo, or the like, is the Place where the Pins or Pegs are screw'd, to stretch or slacken the Strings. See LUTE, &c.

The **Dragons Head**, in Astronomy, &c. is the ascending Node of the Moon, or other Planet. See NODE, DRAGON, &c.

HEAD-ACH, a painful Sensation in the Muscles, Membranes, Nerves, or other Parts of the **Head**. See CEPHALALGIA.

It is supposed to arise from an extraordinary Distention of those Parts, either by the Fluids therein being rarified, or their Quantity and Motion increas'd.

When attended with a Vomiting, Deafness, and Watching, it pretends Madnes; with a Noise in the Ear, Dulcins of Feeling in the Hands, &c. an Apoplexy or Epilepsy. See MADNESS, APOPLEXY, &c.

The Cure is by Bleeding in the Jugular; Cupping, or applying Leeches to the Temples, and behind the Ears and Neck. — Iffices, Emetics, and Diaphoreticks are also occasionally used; with Anti-epilepticks and Apoplecticks. — A Vesicatory applied to the whole Scalp, is the last Remedy.

M. **Hornberg** gives us an extraordinary Instance of the Cure of a most violent and inveterate **Head-Ach**, by an accidental Burn of the **Head**. See BURN.

HEAD-BOROW, signifies the Person who is chief of the Frank-Pledge; and had antiently the principal Direction of those within his own Pledge. See FRANK-PLEDGE.

He was also called **Burrow-Head**, **Burholder**, now **Bopolder**, **Third-Borow**, **Tything-Man**, Chief-Pledge, and **Borow-Elder**, according to the Diversity of Speech in divers Places. See TYTHING-MAN, &c.

This Officer is now usually call'd a **High-Constable**. See CONSTABLE.

The **Head-Borow** was the chief of ten Pledges; the other nine were call'd **Hand-Borows**, or **Plogii Manuales**. See FRIBOURG.

HEAD FARCIN. See FARCIN.

HEAD-LAND, in Husbandry, is that Part which is plough'd across, at the Ends of other Lands.

HEAD MOUND-SHOT, a Disease in Children, wherein the Sutures of the Skull, generally the Coronar, *rise*; that is, have their Edges shot over one another; and so close lock'd together, *s. gr.* as to compress the internal Parts, the Meninges, or even the Brain it self. See SUTURE.

The Disease usually occasions Convulsions; and is supposed to admit of no Cure from Medicines; unless Room could be given, by manual Operation, or a Division of the Sutures.

The **Head Mound-Shot**, is the Disorder opposite to the Horse-Shoe Head. See HORSE-SHOE HEAD.

HEAD-PENCE, and **HEAD-SILVER**. See COMMON FINE.

HEAD-SEA, is when a great Wave, or Billow of the **Sea**, comes right a-head of the Ship, as she is in her Course.

HEAD-STRAK, in the Manage. See CAVESON.

HEALFANG, or **HALSFANG**, in our antient Customs, *Collistrigium*, or the Punishment of the Pillory. See PILLORY.

The Word is compounded of two Saxon Words, *Haly*, i. e. *Collum*, and *fang*, *Captura*; *pæna scilicet qua alicui Collum fringatur*. See COLLISTRIGIUM.

Healfang, however, cannot signify a Pillory in the Charter of *Canons de Forestis*, Cap. 14. *Et pro culpa solvat Regi duos solidos quos Dani vocant Halfrang.*

Sometimes it is taken for a pecuniary Punishment, or Mulct, to commute for standing in the Pillory; and is to be paid either to the King, or to their chief Lord. — *Qui falsum Testimonium dedit, reddat Regi vel Terræ Dominio Halfrang.* Leg. H. 1.

HEALING, in its general Sense, includes the whole Process of curing or removing a Disorder, and restoring Health. See CURE and DISEASE.

In this Sense, **Medicine** is defined the Art of **Healing**. See MEDICINE, &c.

In its more restrained Sense, as used in Chirurgery, &c. **Healing** denotes the uniting or consolidating the Lips of

a Wound or Ulcer. See WOUND and ULCER.

The Medicines, proper for this Intention, are call'd Incarnatives, Agglutinatives, Vulneraries, &c. See INCARNATIVE, AGGLUTINANT, VULNERARY, &c.

Dr. **Beale** has a Discourse of **Healing Springs** and **Waters** in the *Philosoph. Transact.* N°. — See WATER and SPRING.

HEALING, in Architecture, denotes the Covering the Roof of a Building. See ROOF and COVERING.

The **Healing** is various; as of *Lead*, *Tyles*, *Slate*, *Horbam Stone*, *Shingles*, *Reed* and *Straw*. See LEAD, TYLES, STONES, SHINGLES, &c.

HEALTH, *Valētudo*, *Sauetas*, a due Temperament, or Constitution, of the several Parts whereof an Animal is composed, both in Respect of Quantity and Quality. — Or it is that State of the Body, wherein it is fitted to discharge the natural Functions perfectly, easily, and durably. See BODY, LIFE, FUNCTION, &c.

Health, is the State or Condition, opposite to *Distast*. See DIZZAS.

The Preservation, and Restoration of **Health**, makes the Object of the Art of Medicine. See MEDICINE.

The Condition, or Continuance of **Health**, depends principally on the six Non-Naturals, viz. *Air*, *Food*, *Exercise*, the *Passions*, *Evacuation* and *Retention*, and *Sleep* and *Waking*. See each in its Place, FOOD, EXERCISE, PASSION, &c.

The Antients personified and even deified **Health**; or rather, erected a Goddess to whom they supposed the Care of **Health** to belong. — The *Greeks* worshipp'd her under the Name *Hygeia*, and the *Latins* under that of *Sanitas*. — The Place of her Worship at *Rome* was on the *Montes Quirinalis*, where she had a Temple; and a Statue crown'd with Medicinal Herbs.

We frequently find the Goddess **Health** on the Reverse of Medals. — She is represented with a Serpent stretch'd on her left Arm, and holding a Patera to it with the left. Sometimes she has an Altar before her, with a Serpent twisted round the same, and raising its Head to take something out of the same. The Inscription is SAL. AUG.

HOUSE OF HEALTH, a Kind of Hospital, or public Building, for the Reception and Entertainment of Persons infected with the Plague, or coming from Places infected therewith. See PEST-HOUSE, QUARANTINE, &c.

In the like Sense we say, Officers of **Health**, Certificate of **Health**, &c.

HEAM, among Farriers, the same with the After-birth in Women. See SECUNDINE.

Thyme, **Penny-Royal**, **Winter Succory**, or common **Horse-hound**, boil'd in white Wine, and given a Mare, are esteem'd good to expel the **Heam**. — Ditany given in a Pessary, expels the **Heam**, as well as the dead Foie: So do Fennel, Hops, Savin, Angelica, &c.

HEARING, *Auditus*, the Act, or Faculty of perceiving Sounds. See SOUND and PERCEPTION.

Hearing is reckon'd among our external Senses. — Its Organ is the **Ear**, and particularly the auditory Nerve diffus'd thro' the same: And its Object certain Motions, or Vibrations of the Air. See SENSE, EAR, and AIR.

Hence, **Hearing** may be more scientifically defined a Sensation, whereby from a due Motion impress'd on the Fibrillæ of the auditory Nerve, and communicated thence to the Sensory; the Mind perceives, or gets the Idea of Sounds. See SENSATION.

Philosophers have diffus'd as to the immediate Organ of **Hearing**. — *Aristotle* will have it the *Cochlea* and *Tympanum*, and takes the Sense of **Hearing** to be seated therein. *Hist. Animal*, Cap. 10. in which he is followed by *Galen*, Lib. 8. *de usu par.* See TYMPANUM, &c.

The Moderns speak of the Point on much better Ground. — The **Ear**, and the several Parts thereof, Membranes, Canals, Labyrinth, Nerves, &c. are only Means, Vehicles, for the Reception, Modification, and Transmission of the sonorous Matter to the Brain; which is the Seat of the Sense. See BRAIN and SENSORY.

A Sound, in Effect, is nothing but a certain Refraction, or Modulation of the external Air, which being gathered by the external **Ear**, passes through the *Membrana Auditoria*, and beats upon the *Membrana Tympani*, which moves the four little Bones in the *Tympanum*. See AVICICLE and TYMPANUM.

In like Manner, as it is beat by the external Air, these little Bones move the internal Air, which is in the *Tympanum* and *Vestibulum*; which internal Air makes an Impression upon the auditory Nerve in the Labyrinth, and *Cochlea*, according as it is moved by the little Bones in the *Tympanum*; so that according to the various Refractions of the external Air, the internal Air makes various Impressions upon the auditory Nerve, the immediate Organ of **Hearing**; which different Impressions represent different Sounds.

Sir Isaac Newton carries the Thing somewhat farther, and supposes *Hearing*, like Seeing, to be perform'd, not immediately by the Vibrations of the Air, but by those of some other more subtle Medium, excited in the auditory Nerves by the Tremors of the Air, and propagated thro' the solid Capillaments of the Nerve to the Place of Sensation. See MEDIUM, VISION, &c.

The curious Structure of the Labyrinth, and Cochlea, tend to make the weakest Sounds audible; for the whole Organ of *Hearing* being included in a small Space, had the auditory Nerve run in a strait Line, the Impression would only have been made on a very small Part of it; and the Strength of the Impression being, *Ceteris paribus*, always as the Number of Parts upon which the Impression is made, Sounds which are now low, could not have been heard at all. — If the auditory Nerve had, like the *Retina*, been expanded into a large Web, which had covered or lined some wide Cavity, the Impression of Sounds even in this Case had been much weaker, than they are now: For this large Cavity had given Room for the Sounds to dilate; and all Sounds grow weaker, as they dilate.

Both of these Inconveniencies are prevented by the present Structure of the Labyrinth and Cochlea, whose Canals, by their winding, contain large Portions of the auditory Nerve, upon every Point of which the smallest Sound being at once impressed becomes audible; and by their Narrowness, the Sounds are hindered from dilating: And the Impressions made upon the Nerves by the first Dilatations are always the strongest.

The Strength of the Impression in narrow Canals, is likewise increased on Account of the Elasticity of the Sides of the bony Canal; which receiving the first and strongest Impulses of the Air, do reprobate them more strongly upon the auditory Nerve.

It may be observed, that tho' Air be the usual Matter of Sounds; so that a Bell rung in *Vacuo* is not heard at all: Yet will most other Bodies, properly disposed, do the like Office; only some more faintly than others. See MEDIUM.

Thus may a Sound be heard thro' Water, or even thro' Earth; of which we have various Instances. See SOUND. Add, that tho' the Ear be the ordinary Organ of *Hearing*; yet *Hagerup*, a Danish Physician, maintains, that one may hear with the Teeth. — Thus, if one End of a Knife, or the like, be applied on a Harpsichord, and the other held between the Teeth; the Music thereof will be plainly heard, tho' the Ears be ever so closely stopp'd. — But this, perhaps, may as well be refer'd to the Sense of Feeling. See FEELING.

Such as Want the Sense of *Hearing* are said to be *Mute* or *Deaf*. See DEAFNESS. * The Sense of *Hearing*, says *Cicero*, is always open; * for this we have Need of even when asleep. The * Passage to it is full of Turns, and Membrs; that * nothing hurtful may enter or find its Way in. If any * little Vermine does endeavour to pass; it must stick and * be bemired in the *Cerumen*, or Ear-Wax, laid for that * Purpose near the Entrance. *De Nat. Doct. L. 2. Cap. 57.*

HEARING, is particularly us'd in Civil and Judicial Concerns, for a Cause, being brought before the Judge and Jury, and the Parties being heard as to the Merits thereof. See CAUSE, JUDGE, &c.

Such a Cause was kept off eight Months, ere it was brought to a *Hearing*. — We are to have our *Hearing* the last Day of the Term. See ISSUE.

The *Hearing* of Embassadors at the Courts of Princes is usually call'd *Audience*. See AUDIENCE and EMBASSADOR.

HEARSE, among Hunters, an Hind in the second Year of her Age. See HUNTING.

HEART, *Cor*, in Anatomy, a musculous Part, in the animal Body, situate in the *Thorax*; wherein the Veins all terminate, and from which all the Arteries arise; and which, by its alternate Contraction and Dilatation, is the chief Instrument of the Circulation of the Blood, and the Principle of vital Action. See ARTERY, VEIN, BLOOD, LIFE, &c.

This noble Part is included in a Capsula, or Pouch, call'd the *Pericardium*; whose Structure and Office will be explain'd under the Article PERICARDIUM.

The Figure of the *Heart* is a Cone, or Pyramid reversed; the upper, and broader Part whereof, is call'd the *Basis*; and the lower, the *Cone*, *Apex*, or *Point*; which is turn'd a little towards the left Side.

Its Magnitude is indeterminate, and different in several Subjects, according to their respective Dimensions. — Its ordinary Length is about six Inches, its Breadth at the Basis four or five; and the whole Circumference fourteen. Its Place is in the middle of the *Thorax*, between the two Lobes of the Lungs; and it is fasten'd to the *Mediastinum* and *Pericardium*, and supported by the great

Blood-Vessels, to which alone it is immediately connect'd; being, for the Conveniency of its Motion, disengaged from any other Impediments. — It is cover'd with a thin Membrane, which, about the Basis, is guarded with fat; and which is no other than the common Membrane of the Muscles. See MEMBRANE.

It has two great Cavities, call'd *Ventricles*, somewhat unequal; the right being larger, capable of containing between two and three Ounces of Blood. — They are divided by a fleshy Partition, consisting of the same muscular Fibres with the *Parietes* themselves, and call'd the *Septum*; the Figure whereof is Concave towards the left Ventricle, and Convex towards the right. — There is no immediate Communication between the Ventricles; but for the Blood to pass out of one into the other, it must first pass thro' the Lungs. See SEPTUM, &c.

The *Parietes*, or Sides of these Ventricles, are of a Thickness and Strength very unequal; the left much exceeding the right, because of its Office, which is to force the Blood thro' all the Parts of the Body; whereas the right drives it through the Lungs only, and is therein greatly assisted by other Parts. — The right Ventricle, in Effect, seems only intended with a View to the Lungs; whence, in such Animals as have no Lungs, we only find one Ventricle, which is the left. See LUNGS.

In the Ventricles are little Muscles, call'd *Columnae Carnea*, or *Laeruli*, derived from the *Parietes*, and connect'd, by tendinous Extremities, to the *Valves* of the *Heart* hereafter mention'd. See COLUMNAE.

The Ventricles are capped each with an *Auricle*, or little Muscle, consisting, like the Ventricles themselves, of a double Order of fleshy Fibres. See AURICLE.

The Vessels, either arising from, or terminating in the *Heart*, and its *Auricles* are two *Arteries*, viz. the *Aorta*, and the *Pulmonary Artery*, which have their Origin from the two Ventricles, viz. the *Aorta* from the left, and the *Pulmonary* from the right: And two *Veins*, which terminate in the *Auricles*, viz. the *Cava Vein* in the right, and *Pulmonary Vein* in the right. See AORTA, CAVA, PULMONARY, &c.

At the respective Orifices of these Vessels are plac'd *Valves*. See VALVE.

Particularly, at the Orifice of the Arteries, within each of them, are three semi-lunar Valves, or Membranes, of a semi-lunar Figure, which close the Orifice of the Artery, and hinder the Relapse of the Blood into the *Heart* at the Time of its Dilatation. — At the Mouth of the right Ventricle, just at its Junction with the *Auricle*, are three others call'd *Tricuspid*, from their three Points being fasten'd by tendinous Fibres to the *Columnae Carnea*; so that upon the Contraction, or Systole of the *Heart*, they close the Orifice, and hinder the Blood from recurring into the great Vein. — The same Office do the two *Mitral Valves*, at the Exit of the left Ventricle, stopping the Return of the Blood into the *Pulmonary Vein*. See SEMI-LUNAR, TRICUSPID, and MITRAL.

The Substance of the *Heart* is entirely fleshy, or musculous. — The Antients, indeed, generally took it for a *Parenchyma*; but *Hippocrates* had a juster Sentiment; and after him *Steno* and the Moderns, have evidently found it to consist of a continued Series of proper musculous Fibres, variously contorted, or wound up, and ending at the Orifices of the respective Ventricles, where they form their Tendons.

In dissecting the *Heart*, after taking off the proper Membrane, there appear, on the outer Surface of the right Ventricles, some slender strait Fibres tending to and ending in the Basis. — Immediately under these is a double Order of spiral Fibres, the exterior whereof ascend obliquely from the Septum to the Basis, and form a Sort of *Helix*, or *Cochlea*: The interior take a contrary Course; winding obliquely from the right Side towards the left, so as to encompass both Ventricles, and ending in the Basis on the left Side, form likewise an *Helix* of an inverse Order. — Under these appear the Fibres of the left Ventricle; and first, a spiral Series running to the left, under which, as in the other Ventricle, lie another Order running the contrary Way, which not only extend to the outward *Paries*, but encompassing the whole Ventricle, make the Septum more immediately appertain to, and be a Part of, the left Ventricle. Some of them, instead of terminating, as the rest do, in the Tendons of the *Heart*, run inwards, and form the *Columnae Carnea*; while others, reaching down to the Cone, are wound about it, and form the Circle call'd the *Centre* of the *Heart*. See CENTRE.

The Fibres of the *Heart* appear to be the same with those of the other Muscles; whence the Part now generally pass'd for a real Muscle; tho' some think the Inference not over just, inasmuch as the *Aorta* has the same Claim to be reputed a Muscle. See MUSCLE and AORTA.

Some late Authors, upon considering the Structure and Disposition of the spiral Fibres, chuse rather to make the Heart a double Muscle, or two Muscles tyed together. — In Effect, the two Ventricles, with their respective Auricles, are found two distinct Bodies, two Vessels, or Cavities, which may be separated, and yet still remain Vessels; the Septum, which was supposed to belong only to the left, being now found to consist of Fibres derived from them both. — To say no more, the two Ventricles, according to *M. Winslow*, are two several Muscles united together, not only by the Septum, but by several Plans of Fibres arising from the exterior Base of the Heart, and meeting at the Apex, which entering the left Ventricle, lines the Parietes, &c.

The Heart has also its proper Blood Vessels, viz. two Arteries springing from the Entrance of the Aorta; and one larger Vein, with one or two lesser; all which, from their encompassing the Heart, are called Coronarie. See CORONARY.

The Nerves of the Heart and its Auricles, come from a Plexus of the *Par Vagum*, called by *Willis*, *Plexus Cardiacus*. See NERVE and PLEXUS.

It has also *Lympheducts*, which carry the Lymph from the Heart to the Thoracic Duct. See LYMPHEDUCT.

The Use of the Heart, and its appendant Auricles, is to circulate the Blood through the whole Body: In Order to which, they have an alternate Motion of Contraction and Dilatation. — By the Dilatation, call'd the *Diastole*, their Cavity is open'd, and their internal Dimensions enlarged to receive the refract Blood from the Veins; and by their Contraction, call'd the *Systole*, their Cavity is shrunk, and their Dimensions less'n'd, to expel the Blood again into the Arteries. See SYSTOLE and DIASTOLE.

It must be added, that these alternate Motions of the Heart and Auricles, are opposite in Time to each other; the Auricles being dilated whilst the Heart is contracted again; and contracted whilst it is dilated, to drive the Blood into it. See AURICLE.

By Means of the right Ventricle, the Blood is driven through the Pulmonary Vein, from which being received into the Pulmonary Artery, it is returned to the left Ventricle; from which by the Aorta, it is distributed all over the rest of the Body, and thence returned to the right Ventricle by the *Vena Cava*; so making an entire Circulation through the whole Body. See CIRCULATION.

Sennebusch speaks of a Man who had no Heart; but *Molinetti* denies it: As also that there ever were two Hearts found in any Man, tho' the Case be common in divers Insects, which have naturally several Hearts; witness Silk-Worms, which have a Chain of Hearts running the whole length of their Bodies. But we have incontestable Instances of two Hearts, even in the same Man. — There have been Hearts found all gnawed and devoured with Worms: *Morretus* open'd the Hearts of some *Banditti*, which were all Hairy, or at least incited with a *Tomentous*, or Down. — And what is still more extraordinary, we have Accounts of Persons in whom the Heart has been found inverted, or turned upside down; particularly in a Woman hang'd some Time ago in *Saxony*, and a Man hang'd at *Paris*. *Journ. des Sav.*

Timorous Animals have always larger Hearts than courageous ones; as we see in Deer, Hares, Afes, &c. — There is a Bone found in the Basjs of the Hearts of certain Animals, particularly Deer; which seems to be no other than the Tendons of the Fibres of the Heart indurated and ossified.

Historians relate, that Pope *Urban VIII* being open'd after his Death, was found to have such a Bone in his Heart. The Case is very usual in the Trunk of the Aorta, which springs from the Heart. See AORTA.

Many amphibious Creatures, as the Frogs, &c. have but one Ventricle in the Heart. — The Tortoise is said by the *French Academics* to have three Ventricles: *M. Buffone* charges this on them as a Mistake; and maintains it has but one. The Point is scarce yet ascertain'd. *Mem. de l'Acad. An. and Philosoph. Transact.* N^o. 328.

Theory of the Motion of the HEART.

The Principle of Motion in the Heart, or the Power from which its alternate Contraction and Dilatation arises, has been greatly controverted among the late Physicians and Anatomists.

The Expulsion of the Blood out of the Ventricles, argues a very considerable Motion in the Part. — The motive Power 'tis certain, must surmount the Resistance made to it; and according to *Borelli's* Computation, the Resistance made to the Motion of the Blood thro' the Arteries, is equal to 180000 Pounds, which therefore are to be removed by the Heart; or else the Circulation must cease. Now, whence comes the Machine of the Heart to have such a Power? And after the Expulsion, what other Power

is it that firmounts the former, and restores the Part to its State of Dilatation, to produce a reciprocal *Æstus*?

The whole Affair remain'd in the utmost Darknes and Uncertainty, till *Dr. Lower's* excellent Treatise *De Cordis*, where the Mechanism, whereby the Contraction, or Systole, is effected, was admirably explain'd. — The Cause of the Dilatation, or Diastole, which *Dr. Lower* had in great Measure over-look'd, has since been happily supplied by *Dr. Drake*.

That the Heart is a Muscle, furnish'd and instructed for Motion like other Muscles, is abundantly demonstrated by *Dr. Lower* and others; and as it is a solitary Muscle, without any proper Antagonist, and not directly under the Power of the Will, nor exercising voluntary Motion, it approaches nearest to the sphincter Kind, which has these Conditions in common with it. See SPHINCTER.

But in constant, and regular Alterations of Contraction and Dilatation, the Heart differs exceedingly from all the other Muscles of the Body. See MUSCLE.

This Alteration has given the Learned Abundance of Trouble, who finding nothing peculiar in the Structure, which should necessarily occasion it; nor any Antagonist, whose Re-action should produce it; have been extremely perplexed to find out the Cause.

That, Contraction is the proper Action and State of all Muscles, is evident both from Reason and Experience. For if any Muscle be freed from the Power of its Antagonist, it immediately contracts, and is not by any Action of the Will or Spirits, to be reduced to a State of Dilatation. — Thus, if the Flexors of any Joint be divided; the Extensors of that Joint being by that Means freed from the contrary Action of their Antagonists, the Joint is immediately extended, without any Consent of the Will, and in that State remains; and so *vice versa*, if the Extensors be divided.

Hence it appears, that the ordinary Muscles have no resistive Motion, but what they derive from the Action of their Antagonists, by which they are ballanced. — Thus the Sphincters of the *Anus*, *Vesica*, &c. having no proper Antagonists, are always in a State of Contraction, and suffer nothing to pass them, but what is forced through them by the contrary Action of some stronger Muscles, which, tho' not properly called Antagonists, yet on all necessary Occasions, perform the Office of such. See ANUS, VESICA, &c.

We have here, then, an adequate Cause of the Contraction of the Heart, viz. the natural *Vis Motrix* of muscular Fibres, who's proper Nisus, or Tendency, is to contract themselves. See MUSCULAR and FIBRE.

It may be added, however, that tho' the muscular Fibres of the Heart, acted by the Nerves, be the immediate Instrument of its Constriction, or Systole, as is shewn by *Dr. Lower*, yet is there another Cause which contributes not a little thereto, and which *Dr. Lower* over-look'd, viz. the intercostal Muscles and Diaphragm, which aid and facilitate this Contraction, by opening a Passage for the Blood through the Lungs, which denied, would be an invincible Obstacle. — Add, that the pulmonary Artery and Vein, spreading themselves throughout all the Divisions and Sub-divisions of the *Bronchia* of the Lungs, and being as it were co-extended therewith, must suffer the like Alteration of superficial Dimensions, as the *Bronchia* do in the Elevation and Depression of the *Coffæ*. So that while the Ribs are in a State of Depression, whether before Commerce with the external Air, or after, the annular Cartilages of the *Bronchia* shrink one into another, and by that Means their Dimensions are exceedingly contracted: In Conformity to which Condition of the *Bronchia*, the pulmonary Artery and Vein must likewise, either by Means of their muscular Coats, contract themselves to the same Dimensions, or lie in Folds or Corrugations; which is less probable. — On the other Hand, when the Ribs are elevated, and the Diaphragm bears downwards, the Air rushing into the Lungs, shoots out the cartilaginous Rings, and divaricates the Branches of the *Ysæbes*, and by them extends the several Divisions of the pulmonary Artery and Vein, and thereby lengthens and enlarges their Cavities: And this their alternate Action, will be continued, and imparted to the Heart; from which they arise.

Thus is a Passage open'd to the Blood from the light Ventricle of the Heart, to the left, through the Lungs, to which it could not otherwise pass; and the Opposition which the Blood, contained in that Ventricle, must otherwise necessarily have made to its Constriction, is taken off; and the Systole thereby facilitated. See SYSTOLE.

For the Diastole, or Dilatation of the Heart, *Dr. Lower* contents himself to ascribe it to a Motion or Restitution of the over-strained Fibres. — His Words are, 'Since all its Motion consists in its Contraction; and the Fibres of the Heart are made for Constriction only; 'tis evident, all the Motion of the Heart is in its Systole: But,

as the Fibres are stretch'd beyond their Tone in every Constriction; for this Reason, after that *Nyxus* is over, the *Heart* relaxes again by a natural Motion of Restitution, and is distended by the Influx of new Blood from the Veins. The Diastole, then, is not effected by any further Action of the *Heart* beside a Remission of its former Tension, and the Influx of the Blood.

Now, if Contraction be the sole Action of those Fibres, as it certainly is, and as the Author here confesses; how can their Distention, vulgarly tho' improperly, call'd their Relaxation, be a Motion of Restitution? For, from the Nature of those Fibres, and their Disposition; the Structure of the *Heart* manifestly appears tonical, and its Dilatation a State of Violence. So that the Constriction is the true Motion of Restitution, and the only State to which it will spontaneously return when the Force is taken off; and thus we are left still to seek for the true Cause of the Diastole, which appears the most difficult Phenomenon relating to the *Heart*.

Mr. *Cowper*, in his Introduction to his *Anatomy*, improves on the Share Dr. *Lower* hints the Blood to have in that Action, and makes it the main Instrument of the Dilatation of the *Heart*; in which he is followed by Dr. *Drake*; who, however, differs from him as to the Manner, and Reasons of its being so.

'The *Heart* of an Animal,' says Mr. *Cowper*, 'bears a great Analogy to the Pendulums of those artificial Automata, Clocks and Watches, while its Motion is performed like that of other Muscles; the Blood doing the Office of a *Pendulum*.' — If he means that the Blood, in its Reflux, by gravitating on the Auricles and Ventricles, dilates and expands them; acting therein as a Counterpoize to its Contraction as a Muscle; 'tis pity he had not given an Explication at large of so abstruse and important a Phenomenon: The specific Gravity of the Blood, not seeming a Cause adequate to the Effect it is here supposed to produce. — For if the Blood act only as a Weight, by meer Gravitation; so much of it only as descends from above the *Heart*, can be employed in that Action; which, at the largest Computation, does not amount to above five Pound Weight, and must be able, according to the Computation of *Borellus*, to overcome a Resistance of 155,000 Pound.

Whatever, therefore, the Force that dilates the *Heart* and is the Cause of the Diastole, be, it must be equal to that of the *Heart*, the intercostal Muscles and Diaphragm; to all which it acts as an Antagonist.

Such a Power is hard, perhaps impossible, to be found in the Machine of an animal Body; and yet without some such Antagonist, it is as impossible the Circulation of the Blood should be maintained. — All the Engines yet discovered within the Body, conspire towards the Constriction of the *Heart*, which is the State of Quiescence, to which it naturally tends; yet we find it alternately in a State of Violence, or Dilatation: And on this Alternation does all animal Life depend.

Some external Cause, therefore, must be found to produce this Phenomenon; which Cause must be either in some Quality of the Air, or the Pressure of the Atmosphere, because we have no constant and immediate Commerce, with any other Media.

Some Physicians observing this, and that deprived by whatsoever Means of Communication with the external Air, we became instantly extinct; have imagined, that in the Air of Inspiration, certain purer Parts of the Air were mixed with the Blood in the Lungs, and conveyed along with it to the *Heart*, where they nourished a Sort of vital Flame, which was the Cause of this reciprocal *Æfius* of the *Heart*. See *FLAME*.

Others, rejecting an actual Flame, have fancied that these fine Parts of Air, mixing with the Blood in the Ventricles of the *Heart*, produced an Effervescence which dilated it. See *EFFERVESCENCE*.

But these Notions have been long exploded, upon ample Conviction; and 'tis a Point yet undetermined, whether any Air does mix with the Blood at all in the Lungs or not. See *LUNGS*, &c.

But, supposing some Air do insinuate it self into the pulmonary Vein, it can no other Way dilate the *Heart*, than by an Effervescence in the left Ventricle, which would not dilate the right. — But even this Opinion is contradicted by Autopsy, and abundantly confuted by divers Authors. See *RESPIRATION*.

Upon the whole, the gross Body of the Atmosphere appears to be the true Antagonist to all the Muscles serving for ordinary Inspiration, and the Constriction of the *Heart*; which is confirmed not only from its sufficient Power, but the Necessity of its Action upon animal Bodies. See *ATMOSPHERE*.

The *Heart*, we have observ'd, is a solitary Muscle, of very great Strength; and the intercostal Muscles and

Diaphragm, which likewise have no Antagonists, are a vast additional Force, which must be balanced by the contrary Action of some equivalent Power, or other. For tho' the Action of the intercostal Muscles be voluntary, it does not exempt them from the Condition of all other Muscles serving for voluntary Motion, which would be in a State of perpetual Contraction, notwithstanding any Influence of the Will, were it not for the Liberation of antagonist Muscles. This Liberation, between other Muscles, is answer'd by the Weight of the incumbent Atmosphere, which presses upon the *Thorax*, and other Parts of the Body. And as in all other voluntary Motions, the Influence of the Will only gives a Prevalence to one, of two Powers before equilibrated; so here it serves to enable those Muscles to lift a Weight too ponderous for their Strength not so assisted: So that as soon as that Assistance is withdrawn, the Ribs are again depressed by the mere Gravitation of the Atmosphere, which would otherwise remain elevated thro' the natural Tendency of those Muscles to Contraction.

This is evidently proved from the *Toricellian* Experiment, and those made upon Animals in *Vacuo*; where, as soon as the Air is withdrawn, and the Pressure thereby taken off, the intercostal Muscles and Diaphragm are contracted, and the Ribs elevated in an Instant, and cannot by any Power of the Will be made to subside, till the Air is again let in to bear them forcibly down. See *VACUUM*.

As in the Elevation of the Ribs, the Blood, by the Passage open'd for it, is in a Manner solicited into the Lungs; so in their Depression, by the Subsidence of the Lungs, and Contraction of the Blood Vessels consequent thereof, the Blood is forcibly driven thro' the pulmonary Vein into the left Ventricle of the *Heart*. And this, together with the general Compression of the Body by the Weight of the Atmosphere which surrounds and presses on its whole Surface, is that Power which causes the Blood to mount in the Veins, after the Force impress'd upon it by the *Heart* is broken and spent, and which suffices to force the *Heart* from its natural State to Dilatation.

Upon computing the Weight of a Column of Air equal to the Surface of the Body, it appears a Power sufficient for the Effects here ascribed to it: And considering that the Bodies of Animals are compressible Machines, it appears that it must of Necessity affect them in the Manner here laid down. — And yet, tho' our Bodies be entirely composed of *Tubuli*, or Vessels filled with Fluids, this Pressure, how great soever, being equal every Way, could not affect them, were it not that the superficial Dimensions are easily variable; because, being compress'd on all Parts with the same Degree of Force, the contained Fluids could not any where begin to recede, and make Way for the rest to follow, but would remain as fix'd and immovable, as if they were actually solid. See *FLUID*. — But, by the Dilatation of the *Thorax*, Room is made for the Fluids to move; and by the Coarctation of it, fresh Motion is impress'd; which is the great Spring whereby the Circulation is set and kept going.

This reciprocal Dilatation and Contraction of the superficial Dimensions of the Body, seems so necessary to animal Life, that there is not any Animal so imperfect as to want it, at least none to which our anatomical Enquiries have yet reach'd. — For tho' most Kinds of Fish, and Insects, want both moveable Ribs and Lungs, and consequently have no dilatable *Thorax*; yet that Defect is supplied by an analogous Mechanism, answering sufficiently the Necessities of their Life. — Thus, Fishes, which have no Lungs, have Gills to do the Office of Lungs, receiving and expelling alternately the Water, whereby the Blood-Vessels suffer the same Alteration of Dimensions, as in the Lungs of more perfect Animals. See *GILLS*.

Add, that the Lungs, or Air-Vessels of Insects, are much more different from those of perfect Animals, than those of Fishes are; and yet in their Action and Use, agree perfectly with both; that is, removing and expelling the Air, and varying the Dimensions and Capacities of the Blood Vessels. Having no *Thorax*, or separate Cavity for the *Heart* and Air-Vessels, the latter are distributed thro' the whole Trunk; by which they communicate with the external Air through several Spiracles or vent Holes, to which are fitted so many little *Tracheae* or Wind-Pipes, which thence send their Branches to all the Muscles and *Viscera*, and seem to accompany the Blood-Vessels all over the Body, as they do in the Lungs of perfect Animals. By this Disposition, in every Inspiration, the whole Body is inflated, and in every Expiration compressed; and consequently the Blood-Vessels must suffer a Vicissitude of Extension and Contraction, and a greater Motion be thereby impress'd on the contained Fluids, than the *Heart*, which in these Creatures does not appear to be muscular, would be capable of giving. — The only Animal, exempted from this necessary Condition of receiving and expelling alternately some Fluid in and out of the Body, is a *Fœtus*:
* K k k

But this, while included in the Womb, seems to have little more than a vegetative Life; and ought scarce to be reckon'd among the Number of Animals: And were it not for that small Share of muscular Motion which it exerts in the Womb, it might, without Absurdity, be accounted a Graft upon, or Branch of the Mother. See *Foetus, Embryo, &c.*

One Difficulty we must not here conceal, which will lie against the whole Doctrine, viz. That the *Hearts* of several Animals have been found to beat regularly and strongly, even in *Vacuo*; not less so than in the Air. Witness the *Hearts* of Frogs, tried by Mr. Boyle. *Philosoph. Transact.* N^o. 62.

Estimate of the Force of the Heart.

The Quantity of the Force of the *Heart* has been variously estimated, and on various Principles; by various Authors, particularly *Borelli, Morland, Keil, Jurin, &c.*

The Force of the *Heart* may be defined by the Motion wherewith the *Heart* contracts; or by the Motion of a Weight which being opposed to the Blood at its Exit out of the *Heart*, will just balance and stop the same.—This we have no Way of coming at *a priori*; the internal Structure of the Part, and the Nature and Power of the contracting Cause being but imperfectly known: So that the only Means remaining, is to estimate it by the Effects.

All the Action of the *Heart* consists in the Contraction of its Ventricles: The Ventricles contracting, strike or press upon the Blood, and communicating Part of their Motion thereto, drive it out with Vehemence where the Passage is open.—The Blood thus protruded into the *Aorta*, and pulmonary Artery, presses every Way; partly against the Coats of the Arteries, which by the last Diastole had been left in a collapsed, flaccid State; and partly against the anterior Blood moving on too slowly before it. By such Means the Coats of the Arteries are gradually distended, and the antecedent Blood has its Motion accelerated.—By the Way it may be observed, that the more flaccid the Arteries are, the less Resistance will they make to a Dilatation; and the more they are dilated, the more strongly will they resist a further Distraction; so that the Force of the Blood, at its Egress out of the *Heart*, is at first spent in distending the Arteries, more than protruding the antecedent Blood; but afterwards more in protruding the Blood, than in distending the Arteries.

Borelli, we have already observed, in his *Oecoon. Animal.* makes the Obstacles to the Motion of the Blood thro' the Arteries, equivalent to 180,000 Pounds; and the Force of the *Heart* it self, only equal to 3,000 Pound, which is only $\frac{1}{60}$ of the Opposition it has to overcome. Then, deducting 45,000 Pound for the adventitious Help of the muscular Elastic Coat of the Arteries; he leaves the *Heart* with a Force of 3,000 Pound, to overcome a Resistance of 135,000 Pound; that is, with 1 to remove 45; which he supposes it enabled to do by Virtue of Percussion.

But had he proceeded in his Calculation to the Veins, which he allows to contain Quadruple the Quantity of Blood as the Arteries do, and to which this Energy of Percussion either does not reach at all, or very languidly; he would readily have seen the System of Percussion to be insufficient.

But his Calculus it self is also found to be faulty; the Force ascribed by him to the *Heart* being immensely too great.—*Dr. Jurin* shews, that had he not made a Mistake in the Computation, the Resistance which the *Heart* has to overcome, must have come out, on his own Principles, much greater; and instead of 135,000 Pound, would have been 1,076,000 Pound, which transcends all Probability.

The great Faults in his Solution consist, according to *Dr. Jurin*, in his estimating the motive Force of the *Heart* by a Ponderus at rest; in supposing the whole Weight sustain'd by a Muscle, in one of his Experiments, to be sustain'd wholly by the contracting Force thereof; in assuming Muscles, equally heavy, to be of equal Force: In supposing the utmost Force of the *Heart* exerted at every Systole, &c.

Dr. Keil, in his *Essays of the Anim. Oecon.* first ventured to set aside *Borelli's* Calculus; and substituted another, almost infinitely smaller, in its Stead. His Method of estimating the Force of the *Heart* is as follows:—Having the Velocity wherewith a Fluid flows out at an Orifice, without meeting any Resistance from an anterior Fluid; the Force which produces that Motion is thus determined. Let the Line *AB* be the height from which a falling Body will acquire a Velocity equal to that wherewith the Fluid flows out at the Orifice; then is the Force which produces the Motion of this Fluid, equal to the Weight of a Cylinder of the same Fluid, whose Base is equal to the Orifice, and Weight equal to

a *AB*: *Coroll. 2. Prop. 36. Lib. II. Newton Princip.*

Now, the Blood flowing out of the *Heart*, is resisted in its Motion by the anterior Blood in the Arteries and Veins, and therefore cannot flow with all the Velocity the Force of the *Heart* will give it; part of that Force being spent in overcoming the Resistance of the Mass of Blood. If therefore we knew how much the Velocity of the Blood is diminished by this Resistance, or what Proportion the Velocity of the Blood resisted, has to the Blood driven out, and not resisted; having already determin'd the Velocity of the Blood as it is resisted, we might easily recollect the Velocity, by which the Blood would flow were it not resisted; and from thence, the absolute Force of the *Heart*.

To find this, the Author made the following Experiment.—Having uncover'd the *Black Artery* and Vein in the Thigh of a Dog, near his Body; and pass'd convenient Ligatures under them; he open'd the whole Diameter of the Vessels, and received the Blood which ran from it in the Space of ten Seconds: The same was afterwards done by the Artery, for the same Space of Time; and both the Quantities of the Blood were exactly weighed. The Experiment was repeated for the greater Security: Till, the Quantity of Blood from the Artery, was found at a Medium, to that from the Vein in the same Space of Time, nearly as $7\frac{1}{2}$ to 3.

Now, the Velocity of the Blood in the *Black Artery*, so near the *Aorta*, must be nearly the same with that in the *Aorta* it self; and consequently the Velocity with which it flows out of the *Black Artery* cut asunder, is the same with which it would flow out of the *Heart* unresisted: Or, the Blood runs thro' a Wound in the *Black Artery*, with all the Velocity it received from the *Heart*. Now all the Blood which runs along the *Black Artery*, returns again by the *Black Vein*; and consequently, the Quantities of Blood which pass thro' both in the same Space of Time, are equal. The Quantity of Blood, therefore, which runs out of the *Black Vein* cut asunder, is the same which ran thro' the *Black Artery*, before it was cut, in that Space of Time. Having, therefore, the Quantity which runs thro' the *Black Artery* when it is cut, and when it is not cut, we have their Velocities; for the Velocity of a Fluid, running thro' the same Canal, in equal Spaces of Time, is directly as their Quantities: But the Velocity of the Blood, when the Artery is cut, is equal to that it receives by the full Force of the *Heart*; and the Velocity when it is not cut, is that Velocity with which the Blood moves thro' the *Aorta*, resisted by the anterior Blood: And therefore these two Velocities are to one another as $7\frac{1}{2}$ to 3.

If now the *Heart* throws out two Ounces of Blood every Systole, which is a probable Assumption, then the Blood moves thro' the *Aorta* at the Rate of 156 Feet in a Minute; and therefore the absolute Velocity, wherewith the Blood would be forced into the *Aorta*, did it find no Resistance, is such as would make it move 390 Feet in a Minute, or 6 $\frac{1}{2}$ Feet in a Second.

We now proceed to enquire, what is the Height from which a falling Body will acquire this given Velocity; for this Height doubled, gives the Length of the Cylinder whose Base is equal to the Orifice of the *Aorta*, and Weight equal to the absolute Force of the *Heart*.

It is known by Experiment, that the Force of Gravity will make a Body move 30 Feet in a Second, which is the Velocity it acquires in falling thro' 15 Feet; and therefore this Velocity is to the Velocity of the Blood flowing without Resistance into the *Aorta*, as 30 to 6.5: But because the Heights from which Bodies acquire given Velocities, are as the Squares of the Velocities, that is, as 900 to 42.25; therefore, as 900 to 42.25, so is 15 to 0.74.—This Height doubled, gives 1.48, or in Inches 17.76, which is the Height of a Cylinder of Blood, whose Base is equal to the *Aorta*, which we have supposed to be equal to 0.4187; and therefore the solid Content is 7.456112, the Weight of which is equal to the absolute Force of the *Heart*.

This Weight is five Ounces, whence the Force of the *Heart* is found equal to the Weight of five Ounces.

The same Author, by another Method of Calculating, from the Laws of Projectiles, finds the Force of the *Heart* almost equal to 8 Ounces, which tho' somewhat more than was before determin'd, yet the Difference is of no small Moment in Respect of *Borelli's* Account; the great Failing in whose Calculation *Dr. Keil* takes to arise from his not distinguishing between the Blood at rest, and already in Motion.—The Force of the *Heart*, 'tis certain, is not employ'd in giving Motion to any Quantity of Blood at rest, but only to continue it in Motion; how that Motion first arose, seems out of human Capacity to determine. 'Tis demonstrable, that if the Resistance of the Blood always bore the same Proportion to the Force of the *Heart*

it does now, the Blood never could at first be put in Motion by the *Heart*. If the Blood constantly moved forwards, with the Motion first communicated to it; and did the Coats of the Vessels make no Resistance; the posterior Blood would not be retarded by the anterior, and the Force of the Blood would equal the entire Force of the Mover. But because of the Resistance made by the Coats of the Blood-Vessels, and the Force which is spent in diffusing them, the Blood is continually retarded in its Motion as it circulates, and would in a short Time stop, were not the Motion lost made up again by a fresh Impulse from the *Heart*; and therefore the Force of the *Heart* must be equal to the Resistances the Blood meets with in its Motion: If it were more, the Velocity of the Blood would be continually increasing; if less, it would continually decrease; and at last stop: And hence it is evident, that if the Circulation of the Blood was once stopped, all the Force of the *Heart* could never set it moving again.

Thus much for Dr. Keill's System: — Dr. Jurin charges even this with its Defects; and particularly in that it supposes the Weight, whereby the Motion of Water running out at a Vessel may be generated, to be what generates that Motion: Which, this last Author takes for a Misapprehension of Sir Isaac Newton's Corollary; urging, that the Water falling by the Power of Gravity, acquires its Motion of it self; and that the Weight falling the same Time, only receives a Motion equal to that of the Water out of the Vessel. — There are some other Points which he objects against; and of which the learned Author, has an express Vindication in the *Philosoph. Transactions*; to which his Antagonist has since reply'd: But the Author dying in the mean Time prevented any Reply.

Dr. Jurin, however, proceeds to give another Computation, on more unexceptionable Principles; tho' his Adversary has found occasion therein for Recrimination.

He considers one of the Ventricles of the *Heart* impelling the Blood, as a given Body impelling another at Rest, with a given Velocity; and after communicating Part of its Motion thereto, proceeding with the same common Velocity. On which Principle the Force of the *Heart* will either be equal to the Factum of the Weight of the Ventricle, and its initial Velocity ere it impels the Blood; or to the Sum of the Motions of the Ventricle and the Blood flowing out of the same, and the Motion communicated to the Coats of the Arteries and the antecedent Blood.

Now, it is demonstrable: 1°. That the Motion whereby a hollow Machine, unequally contractile, does act in Contraction, is equal to the Sum of the Factums of the several Particles of the Machine multiplied into their respective Velocities. Whence it follows, that the Motion of the Machine is equal to the Factum of its Weight into some mean Velocity between the Particles moved swiftest, and those moved slowest. — 2°. That if the Water be express'd out of the Orifice of such a Machine, the Motion of the Water, hursting out of the same, will be equal to the Sum of the Facta of any transverse Sections of all the Threads of Water, severally multiplied into their respective Lengths and Velocities: Whence it follows, that the Motion of the Water is equal to the Factum of the Water issuing out at the Orifice into some mean Length between that of the longest Thread and the shortest. Hence, also, if there be several such Machines full of Water, and contracted alike, whether equally or unequally, the Motion of the Water, hursting out at the Orifice of one of them, will be in a Ratio compounded of the Quadruple Ratio of any homologous Diameter of the Machine, and the reciprocal Ratio of the Time wherein the Contraction is effected.

From these Data is drawn a Solution of the Problem, *To find the Force of the Heart*: — For, calling the Weight of the left Ventricle, or the Quantity of Blood equal to the same, p ; the inner Surface of the Ventricle, S ; the mean length of the Filaments, or Threads of Blood expell'd from the same, l ; a Section of the *Aorta*, s ; the Quantity of Blood, contain'd in the left Ventricle, q ; the Time wherein the Blood would be thrown out of the *Heart*, were the Resistance of the Arteries and antecedent Blood removed, t ; the variable Velocity, wherewith the Blood would flow thro' the *Aorta*, if the Resistance were taken away, v ; the variable Length of the *Aorta*, pass'd over by the Blood, x ; and the Time wherein the length x is run, z . — The mean variable Velocity of the Blood contiguous to the Ventricle, or the mean Velocity of the Ventricle it self will be $= \frac{2v}{3}$; the Motion of the Ven-

tricle, $= p \times \frac{2v}{3}$; the Motion of the Blood issuing out, $= sv \times l + vx$; and their Sum, or the Force of the Ventricle, $= sv \times \frac{2}{3} + l + vx$. But, $v = \frac{x}{z}$ whence, by

the inverse Method of Fluxions, the Force of the Ventricle

is found $= \frac{2p}{z} \times \frac{l}{s} + \frac{x}{z} + l$. But since $v = \frac{x}{z}$; $sv = q$.

And hence, the Force of the Ventricle $= \frac{q}{s} \times \frac{l}{s} + l$.

After the like Manner the Force of the right Ventricle, (noting the same Things by Greek Letters, which in the left are denoted by *Italic ones*) is found $= \frac{\rho}{s} +$

$\frac{\sigma}{z} + \frac{\rho}{2s} + \lambda$. So that the whole Force of the *Heart* is

$= \frac{q}{s} \times \frac{l}{s} + \frac{\rho}{z} + \frac{\rho}{2s} + \frac{\rho}{2s} + l + \lambda$. Q. E. D.

If now we suppose $p = 8$ Ounces, and σ to 4 Ounces, avoid; $S = 10$ Square Inches, and $z = 2$ as much; $l = 2$, and $\lambda = 1\frac{1}{2}$ Inches; $q = 2$ Ounces, avoid; $s = 0,418$ Square Inches, $v = 0,583$; and $t = 0,1$: The Forces of the Ventricles will be equal to the Weights underwritten, viz.

Of the left Ventricle, —————	Lib. Oz.
Of the right Ventricle, —————	9 — 1
Force of the whole Heart, —————	6 — 3
	15 — 4

Which Weights have a Velocity, wherewith they would move an Inch each Second of a Minute.

Cor. Hence it is infer'd, that when the Pulse is quicker than ordinary, either the Resistance is less than ordinary, or the Force of the *Heart* is increas'd, or a less Quantity of Blood than usual is expell'd at each Contraction of the *Heart*; and vice versa. — As also, that if the Resistance be either increas'd or diminish'd; either the Pulse, or the Quantity of Blood expell'd at each Contraction, will be either increas'd or diminish'd respectively. — And that if the Force of the *Heart* be increas'd or diminish'd, either the Pulse must be accelerated, or the Resistance diminish'd. See PULSE.

On these Principles, Dr. Jurin proceeds to demonstrate the three following Theorems.

1°. That the whole Motion of Resistance made to the Blood, issuing out of the *Heart* in the Systole, or the whole Motion communicated to the antecedent Blood and the Coats of the Arteries, is equal to the whole Force of the *Heart*, *quasi proxime*.

2°. That the Motion communicated to the antecedent Blood in a Systole, is to the Motion communicated to the Coats of the Arteries, as the Time of the Systole is to the Time of Diastole. Whence if, with Dr. Keill, we suppose the Systole perform'd in one third of the Interval between two Pulses, the Motion communicated to the antecedent Blood will be $\frac{1}{3}$ of the whole Motion of the *Heart*; and that communicated to the Arteries $\frac{2}{3}$.

3°. In different Animals, the Force of the *Heart* is in a Ratio compounded of the Quadruple Ratio of the Diameter of any homologous Vessel, and the inverse Ratio of the Time wherein the *Heart* is contracted; or a Ratio compound of the Ratio of the Weight either of the *Heart*, or the whole Animal; the subduplicate Ratio of the same Weight, and the reciprocal Ratio of the Time.

HEART-BURN, a Disease, among Physicians usually call'd *Cardialgia*. See CARDIALGIA.

The Testaceous Powders, as Oyster-Shells, Crabs-Eyes, &c. are the usual Remedies. See TESTACEOUS.

HEART of a Tree, the middle Part thereof, taken longitudinally, is called so. See TREE and TIMBER.

HEART, in the Manage. — A Horse that works in the Manage, with Contraint and Irresolution, and can't be brought to consent to it, is said to be a Horse of *raw Heart*.

HEARTH, *Focis*. See FIRE, CHIMNEY, &c.

HEARTH-MONEY. See CHIMNEY-MONEY.

HEARTH-STONES. See FIRE-STONES.

HEAT, *Calor*, one of the primary Qualities of Bodies, opposed to Cold. See QUALITY and COLD.

Or, Heat may be defined a Physical Being, whose Presence is known, and its Degree measured, by the Expansion of the Air, or Spirit, in the Thermometer. See THERMOMETER.

Heat is properly a Sensation, excited in us by the Action of Fire: Or it is the Effect of Fire on our Organ of Feeling. See SENSATION and FIRE.

Hence it follows, that what we call Heat, is a particular Idea, or Modification of our own Mind; and not any Thing existing in that Form in the Body that occasions it. — Heat is no more in the Fire that burns the Finger, than Pain in the Needle that pricks it. — In Effect, Heat, in the Body that gives it, is only Motion; in the Mind, only a particular Idea, or Disposition of the Soul. See IDEA.

Heat,

Heat, with Respect to our Sensation, or the Effect produced on us by a *hot* Body, is estimated by its Relation to the Organ of Feeling; no Object appearing to be *hot*, unless its *Heat* exceed that of our Body: Whence, the same Thing to different Persons, or at different Times to the same Person, shall appear both *Hot* and *Cold*.

Heat, as it exists in the *hot* Body; or that which constitutes and denominates a Body *hot*; and enables it to produce such Effects on our Organ; is variously consider'd by the Philosophers.—Some will have it a Quality, others a Substance, and others only a Mechanical Affection, *vis*. Motion.

Aristotle, and the *Peripateticks*, define *Heat* a Quality, or Accident, whereby homogeneous Things, *i. e.* Things of the same Nature and Kind, are collected or gather'd together; and heterogeneous ones, or Things of different Nature, sever'd or dis-united.—Thus, says he, the same *Heat* which associates and brings into a Mass several Particles of Gold before separate, separates the Particles of two Metals before mix'd together.

But, not only the Doctrine, but the very Instance he produces, is faulty: For *Heat*, tho' continued to Eternity, will never separate a Mass, *e. gr.* of Gold, Silver, and Copper: And, on the contrary, if several Quantities of Gold, Silver, and Copper, be put separately in a Vessel over a Fire; notwithstanding all their Heterogeneity, they will be mix'd and congregate'd into a Mass thereby.

In Effect, *Heat* cannot be said to do either this Thing or that universally; but all its Effects depend on the Circumstances of Application.—Thus, to do the same Thing in different Bodies, different Degrees of *Heat* are requir'd; as, to mix Gold and Silver, the *Heat* must be in a moderate Degree, but to mix Mercury and Sulphur in the highest. See GOLD, SILVER, &c.

Add, that the same Degree of *Heat* shall have opposite Effects:—Thus a vehement Fire shall render Water, Oil, Salts, &c. volatile; and yet the same imbodies Sand and a fix'd alkaline Salt, into Glass. See GLASS.

The *Epicureans*, and other *Corpuscularians*, define *Heat* not as an Accident of Fire, but as an essential Power or Property thereof, the same, in Reality, with it, and only distinguish'd therefrom in the Manner of our Conception.

Heat, then, on their Principles, is no other than the volatile Substance of Fire it self, reduced into Atoms, and emitted in a continual Stream from ignited Bodies; so as not only to warm the Object within its reach, but also, if they be inflammable, to kindle them, turn them into Fire, and conspire with them to make *Flames*.

In Effect, these Corpuscles, say they, flying off from the ignited Body, while yet contain'd within the Sphere of its Flame, by their Motion constitute Fire; but when fix'd, or got beyond the flame, and dispers'd every Way, so as to escape the Apprehension of the Eye, and only to be perceivable by the feeling, they take the Denomination of *Heat*; inasmuch as they still excite in us that Sensation.

The *Cartesians*, improving on this Doctrine, assert *Heat* to consist in a certain Motion of the insensible Particles of a Body, resembling the Motion whereby the several Parts of our Body are agitated by the Motion of the Heart and Blood. See HEART and BLOOD.

Our latest, and best Writers of Mechanical, Experimental, and Chymical Philosophy, differ very considerably about *Heat*.—The fundamental Difference is, whether it be a peculiar Property of one certain immutable Body call'd *Fire*: Or whether it may be produced mechanically in other Bodies, by inducing an Alteration in the Particles thereof.

The former, which is as ancient as *Democritus*, and the System of Atoms; had given Way to that of the *Cartesians* and other Mechanists; but is now with great Address retriev'd and improved on by some of the latest Writers, particularly *Hombert*, the younger *Leuery*, *Gravesande*, and above all, the learned and industrious *Boerhaave*, in a Course of Lectures expressly on *Fire*; the Result whereof we have already laid down under the Article FIRE.

The Thing we call *Fire*, according to this Author, is a Body, *Sui generis*, created such *ab Origine*, unalterable in its Nature and Properties, and not either producible *de Novo*, from any other Body, nor capable of being reduced into any other Body, or of ceasing to be Fire.

This Fire, he contends, is diffus'd equally every where, and exists alike, or in equal Quantity, in all the Parts of Space, whether void, or possess'd by Bodies; but that naturally, and in it self, is perfectly latent and imperceptible; and is only discover'd by certain Effects; which it produces, and which are cognizable by our Senses.

These Effects are *Heat*, Light, Colour, Rarefaction and Burning; which are all Indications of Fire, as being none of them producible by any other Cause: So that wherever we observe any of these, we may safely infer the Action and Presence of Fire.

But, tho' the Effect cannot be without the Cause, yet the Fire may remain without any of these Effects; any, we mean, gross enough to affect our Senses, or become Objects thereof: And this, he adds, is the ordinary Case; there being a Concurrence of other Circumstances, which are often wanting, necessary to the Production of such sensible Effects.

Hence, particularly, it is, that we sometimes find several, and sometimes all of these Effects of Fire together, and sometimes one unaccompanied with any others; according as the Circumstances favour or disperse for the same.—Thus we find Light without *Heat*; as in rotten Wood, putrid Fishes, or the mercurial Phosphorus: Nay, and one of them may be in the highest Degree, and the other not sensible; as in the Focus of a large burning Glass expos'd to the Moon, where, tho' the Light, as *Dr. Hook* found, was sufficient to have instantly blinded the best Eye, yet no *Heat* was perceivable, nor was there the least Rarefaction occasion'd in an exquisite Thermometer. See LIGHT.

On the other Hand, there may be *Heat* without Light, as we find in solid Phosphorus; in Fluids, which emit no Light, even when they boil, and not only *heat* and rarify, but also burn or consume the Parts; and in Metals, Stones, &c. which conceive a vehement *Heat* ere they shine, or become ignited.—Nay, and there may be the most intense *Heat* in Nature without any Light: Thus in the Focus of a large burning concave, where Metals melt, and the hardest Gems vitrify, the Eye perceives no Light; so that should the Hand happen to be put there, it would be instantly turn'd into a Coal, or even a Calc.

So also Rarefactions are frequently observ'd by the Thermometer, in the Night Time, without either *Heat* or Light, &c.

Thus it appears, that the Effects of Fire have a Dependence on other concurring Circumstances; some more, and others less.—One Thing seems to be required in common to them all, *vis*. that the Fire be collected or brought into less Compass: Without this, as Fire is every where equally diffus'd, it could have no more Effect in one Place than another, but must either be dispos'd to warm, burn, and shine every where, or no where. Indeed such every where does amount to no where; for to have the same *Heat*, &c. in every Place, would be to have no *Heat*: 'Tis only the Changes that we perceive; those alone make the Mind distinguish in its State, and become conscious of the Things that diversify it. So our Bodies being equally press'd on all Sides by the ambient Air, we feel no Pressure at all; but if the Pressure be only taken off in any one Part, as by laying the Hand over an exhausted Receiver, we soon grow sensible of the Load.

This Collection is perform'd two Ways: The first, by directing and determining the fluctuating Corpuscles of Fire into Lines, or Trains, call'd Rays; and thus driving infinite Successions of the fiery Atoms, upon the same Place or Body, each to produce its several Effect, and second that of the preceding ones, till by a Series of Augmentations, the Effect is sensible.—This is the Office of those Bodies which we call *Luminaries*; such as the Sun, and other heavenly Bodies; and Calinary Fires, Lamps, &c. on Earth, which do not emit the Fire from their own Substance, as is commonly conceiv'd, but only by their rotatory Motion direct the undetermined Corpuscles into parallel Rays. And the Effect may be still further intended by a second Collection of these parallel, into converging Rays, by Means of a Concave Speculum, or a Convex Glass, which at length bring them all into a Point; whence those astonishing Effects of our large burning Glasses, &c. See RAY, PARALLEL, CONVEX, BURNING GLASS, &c.

The second Way wherein the Collection is made, is not by determining the vague Fire, or giving it any new Direction; but merely by assembling it; which is done by the Attrition, or rubbing of two Bodies swiftly against each other; so swiftly, in Effect, as that nothing in the Air, except the floating Fire, has Activity enough to move an equal Pace, or succeed fast enough into the Places continually relinquish'd by it: By which Means Fire, the most agile Body in Nature, slipping in, becomes collected in the Path of the moving Body; so that the moveable has, as it were, a fiery Atmosphere around it.—Thus it is the Axes of Chariot Wheels, Mill-stones, the Ropes of Ships, Cannon-Balls, &c. conceive *Heat*, and frequently kindle into Flame.

Thus much for the Circumstance in *Heat*, common to all the Effects of Fire, *vis*. Collection.—The particular Circumstances are various: Thus, for it to warm, or to *heat*, *i. e.* give the Sensation of it, 'tis necessary that there be more Fire in the *hot* Body, or Thing, than in the Organ whereby it is to be felt; otherwise the Mind will not be put into any new State upon its Approach, nor have any new Idea.—Whence, also, if the contrary to this obtains, *e. gr.* if there be less Fire in the external

Object than in the Organ, it will raise an Idea of Cold, or Chillsiness.

Thus it is that a Man coming out of a hot Bath, into a moderately warm Air, seems as if he were got into an excessively cold Place; and another entering a Room scarcely warm, in a very pinching Day, will at first fancy himself in a Stove. — Whence it appears, that the Sense of Heat does by no Means determine the Degree of Fire; the Heat being only the Ratio, or Difference, between the internal and external Fire.

As to the Circumstances necessary to the Fires producing Light, Burning, Rarefaction, &c. See LIGHT, BURNING, &c.

The mechanical Philosophers, particularly my Lord Bacon, Mr. Boyle, and Sir Isaac Newton, look on Heat in another Light. — They do not conceive it as an original inherent Property of any particular Sort of Body; but mechanically producible in any Body.

My Lord Bacon, in an express Treatise *de Forma Calidi*, deduces, from a particular Enumeration of the several Phenomena and Effects of Heat:

1^o. That Heat is Motion; Not, that Motion generates Heat, or Heat Motion; tho' in many Cases, this be true: But, that the very Thing Heat is very Motion, and nothing else. — But this Motion, he shews, has several peculiar Circumstances which constitute it Heat.

As, 2^o. That it is an expansive Motion, whereby a Body endeavours to dilate or stretch into a larger Dimension than it had before.

3^o. That this expansive Motion is directed towards the Circumference, and at the same Time upwards; which appears hence, that an Iron Rod being erected in the Fire, will burn the Hand that holds it, much sooner than if put in laterally.

4^o. That this expansive Motion is not equable, and of the whole, but only of the smaller Particles of the Body; as appears from the alternate Trepidation of the Particles of hot Liquors, ignited Iron, &c. — Lastly, that this Motion is very rapid.

Hence, he defines Heat an expansive, undulatory Motion, in the minute Particles of the Body; whereby they tend, with some Rapidity, towards the Circumference, and at the same Time incline a little upwards.

Hence, again, he adds, that if in any natural Body, you can excite a Motion whereby it shall expand or dilate it self; and can so represent and direct this Motion upon it self, as that the Dilatation shall not proceed uniformly, but obtain in some Parts, and be check'd in others, you will generate Heat.

This Doctrine, Des Cartes and his Sect adhere to with some little Variation. — According to them, Heat consists in a certain Motion, or Agitation of the Parts of a Body, like to that wherewith the several Parts of our Body are agitated by the Motion of the Heart and Blood. See CALIDUM.

Mr. Boyle, in a Treatise of the *Mechanical Origin of Heat and Cold*, strenuously supports the Doctrine of the Producibility of Heat, with new Observations and Experiments: As a Specimen, we shall here give one or two.

In the Production, says he, of Heat, there appears nothing, on the Part either of the Agent or Patient, but Motion and its natural Effects. — When a Smith briskly hammers a small Piece of Iron, the Metal thereby becomes exceedingly hot; yet there is nothing to make it so, except the forcible Motion of the Hammer, impressing a vehement and variously determined Agitation on the small Parts of the Iron, which being a cold Body before, grows, by that super-induced Commotion of its small Parts, hot: First, in a more loose Acceptation of the Word, with Regard to some other Bodies, compared with which it was Cold before: And then sensibly Hot, because this Agitation surpasses that of the Parts of our Fingers; and in this Instance, oftentimes, the Hammer and the Anvil continue cold, after the Operations; which shews that the Heat, acquir'd by the Iron, was not communicated by either of those Implements as Heat, but produced in it by Motion great enough strongly to agitate the Parts of so small a Body as the Piece of Iron, without being able to have the like Effect upon so much greater Masses of Metal, as the Hammer and the Anvil. Tho', if the Percussions were often, and briskly renew'd, and the Hammer were small; this also might be heated. — Whence it is not necessary that a Body it self should be hot to give Heat.

If a large Nail be driven by a Hammer into a Plank of Wood, it will receive several Strokes on its Head, etc. it grow hot; but when it is once driven to the Head, a few Strokes suffice to give it a considerable Heat: For while, at every Blow of the Hammer, the Nail enters further into the Wood, the Motion produced is chiefly progressive, and is of the whole Nail tending one Way; but when the Motion ceases, the Impulse given by the

Stroke, being unable to drive the Nail further on, or break it, must be spent in making a various, vehement, and intestine Commotion of the Parts among themselves, wherein the Nature of Heat consists. *Mech. Princ. of Heat and Cold.*

That Heat, says the same Author, is mechanically producible, appears probable from a Consideration of its Nature, which seems principally to consist in that mechanical Property of Matter called Motion; but which is here subject to three Conditions or Modifications.

First, the Agitation of the Parts of the Body must be vehement. — For this distinguishes the Bodies said to be hot, from those which are barely fluid. — Thus, the Particles of Water, in its natural State, move so calmly, that we do not feel it at all warm, tho' it could not be a Liquor, unless they were in a restless Motion; but when Water becomes actually hot, the Motion manifestly and proportionably appears vehement, since it does not only strike our Organs of Feeling briskly, but ordinarily produce numerous very small Bubbles, melts coagulated Oil cast upon it, and affords Vapours, which by their Agitation ascend into the Air. — And if the Degree of Heat be such as to make the Water boil, the Agitation becomes more manifest by the confused Motions, Waves, Noise, Bubbles, and other obvious Effects, excited therein. Thus, in a heated Iron, the vehement Agitation of its Parts may be easily inferred from the Motion, and the hissing Noise it makes with the Drops of Water that fall upon it. — But tho' the Agitation be various, as well as vehement, yet there is a third Condition required to make a Body hot; which is, that the agitated Particles, or at least the greatest Number of them, be so minute, as to be singly insensible. — Were an Heap of Sand to be vehemently agitated by a Whirl-wind, the Bulk of the Corpuscles would keep their Agitation from being properly Heat, tho' by their numerous Strokes upon a Man's Face, and the brisk Commotion of the Spirits, which may thence ensue, they may perhaps produce that Quality.

The second Condition is, that the Determination be very various, and tend all manner of Ways. — This Variety of Determinations appears to be in hot Bodies, both by some of the instances already mentioned, and especially that of Flame, which is a Body; by the Dilatations of Metals when melted; and by the Operations of Heat, exercised by hot Bodies upon others, in what Posture or Situation soever the Body to be heated thereby, be applied to them: Thus a Coal, thoroughly kindled, will appear on all Sides red, and melt Wax, and kindle Brimstone, whether the Body be applied to the upper, the lower, or any other Part of it. — Hence, if we daily attend to this Notion of the Nature of Heat, 'tis easy to discern how it may be mechanically produced several Ways; for, except in some few anomalous Cases, by whatever Means the insensible Parts of a Body can be put into a very confused and vehement Agitation, Heat will be introduced into that Body: And as there are several Agents and Operations, by which the heating Motion may be excited; so there must be several mechanical Ways of producing Heat: Various Experiments may be reduced to almost each of these Heads; Chance it self having, in the Laboratories of Chymists, afforded several Phenomena referable thereto. Boyle, *Ubi supra*.

This System is further supported by Sir Isaac Newton, who does not conceive Fire, as any particular Species of Body, originally endued with such and such Properties. — Fire, according to him, is only a Body much ignited, i. e. heated hot so as to emit Light copiously; what else, says he, is red hot Iron than Fire? and what else is a burning Coal than red hot Wood? or Flame it self than red hot Smoak? 'Tis certain, that Flame is only the volatile Part of the Fuel heated red hot, i. e. so hot as to shine; and hence only such Bodies as are volatile, i. e. such as emit a copious Flame will flame; nor will they flame larger than they have Fume to burn. — In distilling hot Spirits, if the Head of the Still be taken off, the ascending Vapours will catch Fire from a Candle, and turn into Flame. So several Bodies, much heated by Motion, Attrition, Fermentation, or the like, will emit lucid Fumes; which, if they be copious enough, and the Heat sufficiently great, will be Flame; and the Reason why fused Metals do not flame, is the Smallness of their Fume; for, that Spelter, which fumes more copiously, does likewise flame. — Add, that all flaming Bodies, as Oil, Tallow, Wax, Wood, Pitch, Sulphur, &c. by flaming waste, and vanish into burning Smoak. *Opticks.*

And do not all fixed Bodies, when heated beyond a certain Degree, emit Light and shine? And is not this Emission perform'd by the vibrating Motion of their Parts? And do not all Bodies, which abound with terrestrial and sulphureous Parts, emit Light as often as tho' the Parts are sufficiently agitated; whether that Agitation be made by external Fire, or by Friction, or Percussion, or Putrefaction,

or any other Cause? — Thus, Sea-Water, in a Storm; Quicksilver agitated in *Vacuo*; the Back of a Cat, or the Neck of a Horse, obliquely rubb'd in a dark Place, Wood, Flesh and Fish, while they putrefie, Vapours from putrifying Waters, usually call'd *ignes fatui*; Stacks of moist Hay or Corn, Glow-Worms, Amber and Diamonds, by rubbing; Scrapings of Steel, struck off with a Flint, &c. emit Light. *Id. Ibid.*

Are not gross Bodies and Light convertible into one another? And may not Bodies receive much of their Activity from the Particles of Light, which enter their Composition? I know no Body less apt to shine than Water; and yet Water, by frequent Distillations, changes into fix'd Earth; which, by a sufficient Heat, may be brought to shine like other Bodies. *Id. Ibid.*

Next, that the Sun and Stars, according to Sir *Isaac Newton's* Conjecture, are no other than great Earths vehemently heated: For large Bodies, he observes, preserve their Heat the longest, their Parts heating one another; and why may not great, dense, and fixed Bodies, when heated beyond a certain Degree, emit Light so copiously, as by the Emission and Re-action thereof, and the Reflections and Refractions of the Rays within the Pores, grow still hotter, till they arrive at such a Period of Heat as is that of the Sun? Their Parts may be further preferred from flaming away, not only by their Fixity, but by the vast Weight and Density of their Atmospheres incumbent on them, and strongly compressing them, and condensing the Vapours and Exhalations arising from them. Thus, we see, warm Water, in an exhausted Receiver, shall boil as vehemently as the hottest Water open to the Air; the Weight of the incumbent Atmosphere, in this latter Case, keeping down the Vapours, and hindering the Ebullition, till it has conceiv'd its utmost Degree of Heat. So, also, a Mixture of Tin and Lead, put on a red-hot Iron in *Vacuo*, emits a Flame and Flame: But the same Mixture, in the open Air, by Reason of the incumbent Atmosphere, does not emit the least sensible Flame. — Thus much for the System of the Producibility of Heat.

On the other Hand, *M. Hombert*, in his *Essai du Souffre Principe*, holds, that the Chymical Principle, or Element, Sulphur, which is supposed one of the simple, primary, pre-existent Ingredients of all natural Bodies, is real Fire; and consequently that Fire is co-eval with Body. *Mem. de l'Acad. An. 1705.* See SULPHUR.

Dr. S. Graves joins on much the same Principle: Fire, according to him, enters the Composition of all Bodies, is contained in all Bodies, and may be separated or procured from all Bodies, by rubbing them against each other, and thus putting their Fire in Motion. But Fire, he adds, is by no Means generated by such Motion. *Elem. Phys. T. II. C. 1.*

A Body is only sensibly hot, when the Degree of its Heat exceeds that of our Organs of Sense; so that there may be a lucid Body, without any sensible Heat; and consequently, as Heat is only a sensible Quantity, without any Heat at all.

Heat, in the hot Body, says the same Author, is an Agitation of the Parts of the Body, made by Means of the Fire contained in it; by such Agitation a Motion is produced in our Bodies, which excites the Idea of Heat in our Minds: So that Heat, in Respect of us, is nothing but that Idea, and in the hot Body nothing but Motion. — If such Motion expel the Fire, in right Lines, it may give us the Idea of Light; if in a various and irregular Motion, only Heat.

M. Lemery the younger, agrees with these two Authors in asserting this absolute, and ingenerable Nature of Fire; but he extends it farther. — Not contented to confine it as an Element to Bodies, he endeavours to shew that it is equally diffus'd thro' all Space, is present in all Places, in the void Spaces between Bodies, as well as in the insensible Interstices between their Parts. *Mem. de l'Acad. An. 1713.* See ÆTHÆR.

This last Sentiment falls in with that of *Boerhaave* above deliver'd: — It seems extravagant to talk of heating Cold Liquors with Ice; yet *Mr. Boyle* assures us, he has easily done it, by taking out of a Basin of cold Water, wherein several Fragments of Ice were swimming, one Piece or two which he perceived very well drenched with the Liquor, and suddenly immersing them into a wide mouthed Glass, of strong Oil of Vitriol: For the Menstruum presently mixing with the Water, which adhered to the Ice, produced in it a brisk Heat, sometimes with a manifest Smoke, and that suddenly dissolving the contiguous Parts of the Ice, and those the next, the whole Ice was soon reduced to Water; and the corrosive Menstruum being, by two or three Shakes, well dispersed thro' it, the whole Mixture would immediately grow to hot, that sometimes the containing Vial could not be endured in ones Hand. *Boyle, Ubi supra.*

There is a great Variety in the Heat of different Places, and Seasons. — Naturalists commonly lay it down, that the nearer the Centre of the Earth, the hotter it is found; but this does not hold strictly true. — In digging Mines, Wells, &c. they find that at a little Depth below the Surface, it feels cool; a little lower, and it is yet colder, as being now beyond any Reach, or Influence, of the Sun's Rays, inasmuch that Water will freeze almost instantaneously; and hence the Use of Ice-Houses, &c. but when a little lower, viz. about 40 or 50 Foot deep, it begins to grow warmer, so that no Ice can bear it; and then the deeper they go, still the greater the Heat: Till, at length, Respiration grows difficult, and the Candles go out.

Hence, some have Recourse to the Notion of a Fund of Fire lodg'd in the Centre of the Earth; which they consider as a central Sun, and the great Principle of the Generation, Vegetation, Nutrition, &c. of fœtal and vegetable Bodies. See CENTRAL FIRE. See also EARTH, EARTHQUAKE, &c.

But *Mr. Boyle*, who had been at the Bottom of some Mines himself, suspects that this Degree of Heat, at least in some of them, may arise from the peculiar Nature of the Minerals generated therein. To confirm this, he instances in a Kind of Mineral, of a Vitriolic Kind, dug up in large Quantities, in several Parts of *England*, which by the bare Effusion of common Water will grow to hot, as almost to take Fire.

On the other Hand, as you ascend high Mountains, the Air grows more and more piercing and Cold: Thus the Tops of the *Pico de Tebeis* in *Boboma*, the Pike of *Tenariff*, and several others, even in the most saltry Countries, are found eternally invested with Snow and Ice; the Heat never being sufficient to thaw the same.

In some of the Mountains of *Peru* there is no such Thing as running Water, but all Ice: Plants make a Shift to grow about the Feet of the Mountains, but near the Top no Vegetable can live, not for Want of Food, but thro' the Intensity of the Cold. — This Effect is attributed to the Thinness of the Air, and the little Surface of Earth there is to reflect the Rays. The Rays are here only determined into a Parallelism; but the Effect of direct parallel Rays is found, by Computation, to be very inconsiderable; this Effect being really greater in Winter than Summer.

HEAT, in Geography. — The Diversity of the Heat of Climes and Seasons, arises from the different Angles, under which the Sun's Rays strike upon the Earth's Surface. See CLIMATE, ANGLE, &c.

It is shewn in Mechanics, that a moving Body, striking perpendicularly on another, acts on it with all its Force; and that a Body striking obliquely, acts with the less Force, the more it deviates from the perpendicular. — Now, Fire, moving in right Lines, must observe the same Mechanical Law as other Bodies; and consequently its Action must be measured by the Sine of the Angle of Incidence: And hence Fire, striking on any Obstacle in a Direction parallel thereto, has no sensible Effect, by Reason the Ratio is almost infinite, i. e. nothing. Accordingly, the Sun, radiating on the Earth in the Morning, scarce produces any warmth at all. See PERCUSSION and COMPOUND MOTION.

Hence, *Dr. Halley* gives a mathematical Computation of the Effect of the Sun, under different Seasons and Climates; going on this Principle, that the simple Action of the Sun, as all other Impulses or Strokes, is more or less forcible, according to the Sines of the Angles of Incidence, or to the perpendicular let fall on the Plane: Whence, the vertical Ray (which is of the greatest Heat) being put for Radius, the Force of the Sun on the Horizontal Surface of the Earth will be to that, as the Sine of the Sun's Altitude at any other Time.

Hence it follows, that the Time of the Continuance of the Sun's shining, being taken for a Basis, and the Sines of the Sun's Altitudes erected thereon as Perpendiculars; and a Curve drawn through the Extremities of those Perpendiculars: The Area comprehended will be proportionate to the Collection of the Heat of all the Sun Beams in that Space of Time.

Hence it will follow likewise, that under the Pole the Collection of all the Heat of a tropical Day is proportionate to a Rectangle of the Sine of 23 Degrees and an half, into 24 Hours; or the Circumference of a Circle; that is, the Sine of 23 Degrees and an half, being nearly $\frac{1}{2}$ of Radius, as $\frac{1}{2}$ into 12 Hours; or, the Polar Heat is equal to that of the Sun continuing 12 Hours above the Horizon at 53 Degrees height; than which the Sun is not 5 Hours more elevated under the Equinoctial.

But whereas the Nature of Heat is to remain in the Subject, after the Laminary that occasion'd its being heated is removed, and particularly in the Air; by the Equinoctial the 12 Hours Absence of the Sun does but little

diminish the Motion imprud'd by the past Action of his Rays wherein Heat consists, before he rises again; but under the Pole, the long Absence of the Sun for six Months, wherein the Extremity of Cold does obtain, hath so chill'd the Air, that it is, as it were, frozen, and cannot, before the Sun has got far towards it, be any Ways sensible of his Presence, his Beams being obstructed by thick Clouds, and perpetual Fogs and Mists.

Add, that the differing Degrees of Heat and Cold in different Places, depend, in great Measure, upon the Accidents of Situation, with Regard to Mountains or Valleys, and the Soil.—The first greatly help to chill the Air by the Winds, which come over them, and which blow in Eddies through the Levels beyond. See WIND.

Mountains, sometimes, turning a Concave Side towards the Sun, have the Effect of a burning Mirror on the Subject plain; and the like Effect is sometimes had from the Concave or Convex Parts of Clouds, either by Refraction or Reflection. And some even take these to be sufficient to kindle the Exhalations lodg'd in the Air, and produce Thunder, Lightning, &c. See MOUNTAIN, MIRROR, &c.

As to Soils: A stony, sandy, or chalky Earth, 'tis known, reflects most of the Rays into the Air again, and retains but few; by which Means a considerable Accession of Heat is derived to the Air; as, on the contrary, black ones absorb most of the Rays, and return few into the Air, so that the Ground is so much the hotter. See BLACKNESS, WHITENESS, &c.

This the Peasants, who inhabit the *Morafs de Voerens*, where Turf is dug, are very sensible of; walking there but a little while, the Feet grow extremely hot, but the Face not at all: On the contrary, in a sandy Place, the Feet are scarce warm when the Face is scor'd by the great Reflection.

The following Table gives every tenth Degree of Latitude to the Equinoctial and Tropical Sun, by which an estimate may be made of the intermediate Degrees.

Lat.	Sun in V. ☉.	Sun in ☉	Sun in ☿
0	20000	18341	18341
11	19696	20290	18834
20	18797	21737	19166
30	17321	22691	10134
40	15321	23048	6944
50	12855	22991	3798
60	10000	22773	2075
70	6840	23543	000
80	3473	24673	000
90	0000	25055	000

Whence are deducible the following Corollaries:

1°. That the Equinoctial Heat, when the Sun becomes vertical, is as twice the Square of the Radius: Which may be propos'd as a Standard to be compar'd with, in all other Cases.

2°. That under the Equinoctial, the Heat is as the Sine of the Sun's Declination.

3°. That in the frigid Zones, when the Sun sets not, the Heat is as the Circumference of a Circle into the Sine of the Altitude at 6. And, consequently, that in the same Latitude, these Aggregates of Warmth, are as the Sines of the Sun's Declination; and at the same Declination of the Sun, they are as the Sines of the Latitudes into the Sines of the Declination.

4°. That the Equinoctial Days Heat, is every where as the Cosine of the Latitude.

5°. In all Places where the Sun sets, the Difference between the Summer and Winter Heats, when the Declinations are contrary, is equal to a Circle into the Sine of the Altitude at 6, in the Summer parallel; and consequently those Differences are as the Sines of Latitude into, or multiplied by, the Sines of Declination.

6°. From the foregoing Table it appears, that the Tropical Sun, under the Equinoctial, has of all others the least Force: Under the Pole it is greater than any other Days Heat whatever, being to that of the Equinoctial as 5 to 4.

From the Table, and these Corollaries, a general Idea may be conceived of the Sum of all the Actions of the Sun in the whole Year, and that that Part of Heat, which ariseth simply from the Presence of the Sun, may be brought to a Geometrical Certainty.—The Heat of the Sun, for any small Portion of Time, is always as a Rectangle, contain'd under the Sine of the Angle of Incidence of the Ray, producing Heat at that Time.

HEAT, is usually divided, by the School Philosopher, into *Actual* and *Potential*.

Actual HEAT, is that which we have been hitherto speaking of, and which is an Effect of real, elementary Fire.

Potential HEAT, is that which we find in Pepper, Wine, and certain chymical Preparations, as Oil of Turpentine, Brandy, Quick-lime, &c. See POTENTIAL.

The *Peripateticks* account for the Heat of Quick-lime from an *Antiperistasis*. See ANTIPERISTASIS.

The *Epicureans*, and other *Corpuscularians*, attribute even *potential* Heat, to Atoms or Particles of Fire detain'd and lock'd up in the Pores of those Bodies, and remaining at rest therein; which being excited to Action again by the Heat and Moisture of the Mouth, or by the Effusion of cold Water, or the like Cause, break their Inclosures, and discover what they are.

This Doctrine is well illustrated by M. *Lenery* the younger, in the Influences of Quick-lime, *Regulus* of Antimony, Tin, &c. in the Calcination whereof he observes, 1°. That the Fire, which they imbibe in the Operation, makes a sensible Addition to the Weight of the Body, amounting sometimes to one tenth of the whole; and, that during this Imprisonment, it still retains all the particular Properties or Characters of Fire; as appears hence, that when once set at Liberty again, it has all the Effects of other Fire.

Thus, a stony, or saline Body being calcined, and Water pour'd thereon, that Fluid is found sufficient, by its external Impression, to break up the Cells, and let the Fire out; and upon this the Water is rendered more or less warm, according to the Fire lodg'd therein.—Hence, also, it is, that some of these Bodies visibly contain a deal of actual Fire; and the slightest Occasion is capable of disengaging it: Upon applying them to the Skin, they burn and raise an Echar, not unlike the Top of a live Coal.

To this it is objected, that the Particles of Fire are only such in Virtue of the rapid Motion, wherewith they are agitated; so that to suppose them fixed in the Pores of a Body, is to divest them at once of that, which constituted them Fire; and, consequently, to disqualify them for producing the Effects attributed to them.—To which M. *Lenery* answers, that tho' the rapid Motion of Fire do contribute very greatly to its Effects, yet the particular Figure of its Particles is to be consider'd withal. And tho' Fire should be detain'd, and fixed in the Substance of Bodies, yet why should it fare worse than other Fluids in the same Circumstances? Water, for Instance, is a Fluid, whose Fluidity depends, as already observed, on Fire, and consequently is less fluid than Fire; and yet every Day, Water included in Bodies of all Sorts, without losing its Fluidity, or any of the Properties that characterize it.

Add, that when Water is froze, the Motion of its Parts is, doubtless, discontinued; and yet the Figure of the Particles remaining the same, it is ready to commence a Fluid, as before, upon the least warmth. See WATER.

Lastly, tho' Salt be allow'd to be the Matter of Tastes, and that it has certain Properties, arising chiefly from the Figure of its Parts; yet it only acts when dissolved; or, which amounts to the same, when it swims in a Fluid proper to keep its Parts in Motion: Yet it is not less Salt, or less the Matter of Taste, when not in a State of Dissolution: To dispose it of that Quality, the Figure of its Parts must be alter'd. See SALT.

As to what may be further objected of the Impossibility of fixing so fine, subtle, penetrative, and active a Matter as Fire, within the spongy Substance of a gross, porous Body; it will be of no great Weight, unless it can be proved, that the Pores of the Cells are bigger than the same.—If it be insisted, again, that a Body which could find its Way into a solid Body, might get out again the same Way; and that as it only penetrated the Body, by Reason its own Corpuscles were smaller than the Pores, the same Consideration must let it out again: It is answer'd, that the Pores are not now in the same Condition as before; the Fire, in calcining, open'd and dilated the Pores, which, upon the Fire's ceasing, must close and contract again. *Mem. de l'Acad. An. 1713.*

M. *Boyle* endeavours to set aside this Account, and substitute a mechanical Property, viz. a peculiar Texture of Parts, in lieu of Fire.—Tho' a great Likeness might be expected between the Particles of Fire adhering to the Quick-lime, and those of highly rectified Spirit of Wine; yet he has not found that the Effusion of the Spirit upon Quick-lime, produced any sensible Heat, or visible Dissolution of the Lime, tho' it seem'd to be greedily suck'd in, as common Water would have been. And, further, he found, that if cold Water were pour'd on the same Lime so drenched, there would ensue no manifest Heat; nor did the Lump appear swell'd or broken, till some Hours after; which seems to argue, that the Texture of the Lime admitted some Particles of the Spirit of Wine into some of its Pores, which were either larger, or more fit, without admitting it into

most numerous, wherinto the Liquor must be received, to be able suddenly to dissipate the Corpuscles of Lime into their minuter Particles.

These Phenomina, according to Mr. Boyle, seem to shew, that the Disposition which Lime has to grow hot with Water, greatly depends on some peculiar Texture; since the aqueous Parts, which one would think capable of quenching most of the fiery Atoms, supposed to adhere to Quick-lime, did not near so much weaken the Disposition of it to Heat, as that Access of the spirituous Corpuscles, and their Contexture with those of the Lime increas'd it.

Yet, in other Places, he appears rather to give into the Corpuscular Scheme: Urging, that if instead of cold Water, you quench the Lime with hot Water, the Ebullition will be, oftentimes, far greater than if the Liquor were cold; which indeed might well be expected, hot Water being much firmer than cold, suddenly to pervade the Body of the Lime, and hastily dissolve, and set at Liberty, the fiery and saline Parts, wherewith it abounds. And what a greater Interest Salts may have in producing such Heats than cold Water, he has also tried, by pouring acid Spirits, and particularly Spirit of Salt, upon good Quick-lime: For by this Means there would be a far greater Degree of Heat excited, than if he had used common Water; and this, whether he employed the Spirit cold or hot.

It is not easy, says the same Author, to apprehend how such light and minute Bodies, should be so long detained, as must by this Hypothesis be allowed, in Quick-lime especially, since no great Heat ensues the pouring of Water upon *Mintum*, or *Crocus Martis per se*, tho' they have been calcined by a violent Fire, the Effluvia whereof seem to adhere to them, by the Increase of the Weight the Lead and Iron manifestly receive from the Operation of it. *Mech. Orig. of Heat.*

HEAT, in the Animal Oeconomy, *Natural HEAT*, *Vital HEAT*. See *CALIDUM Innatum*. See also *HEART* and *BLOOD*.

HEAT, in Chymistry. See *FIRE* and *BATH*.

HEAT, in Smithery, &c. See *IRON*.

HEAT, is also used in Respect of Race-Horses, for the Exercises to be given them by Way of Preparation, &c. See *HORSE*.

Two *Heats* in a Week are reckon'd a just Measure for any Horse of what State or Constitution whatever. — The Jockies lay it down as a Rule, that one of the *Heats* be given on the same Day of the Week, whercon the Horse is to run his Match; and this to be the sharpest *Heat*.

HEATHEN, See *PAGAN*.

HEAVE, at Sea, signifies to throw away, or sling any Thing over-board. — When a Ship, being at Anchor, rises and falls by the Force of the Waves, she is also said to *Heave and set*.

To *HEAVE at the Captain*, signifies to turn it about. See *CAPTAIN*.

To *HEAVE a Flag aboard*, is to hang it out. See *FLAG*, *SIGNAL*.

To *HEAVE out the Top-sails*, is to put them abroad. See *TOP-SAIL*.

HEAVE-Offerings, under the Jewish-Law, were the first Fruits given to the Priest. See *FIRST-FRUIT*.

HEAVEN, *Calum*, an Azure, transparent Orb, investing our Earth; whercon the Celestial Bodies perform their Motions. See *EARTH*, &c.

This is the popular Notion of *Heaven*; for the Word, it must be observed, has various other Ideas, in the Language of Philosophers, Divines and Astronomers: Agreeably to which, we may lay down divers *Heavens*, as the *Highest*, or *Empyrean Heaven*; the *Ethereal*, or *Starry Heaven*; the *Planetary Heaven*, &c.

HEAVEN, among Divines, call'd also the *Empyrean HEAVEN*, is the Abode of God, and blessed Spirits; as Angels, and the Souls of the righteous deceas'd. See *GOD*, *ANGEL*, &c.

This is also frequently call'd in Scripture the *Kingdom of Heaven*; the *Heaven of Heavens*; and by St. Paul, the *third Heaven*; sometimes *Paradise*; the *New Jerusalem*, &c. See *EMPYREAN*, &c.

This *Heaven* is conceiv'd as a Place in some remote Part of infinite Space, whercon the Deity is pleas'd to afford a nearer, and more immediate View of himself; a more sensible Manifestation of his Glory; a more adequate Perception of his Attributes, than in the other Parts of the Universe, where he is likewise present. See *UNIVERSE*, *OMNIPRESENCE*, &c.

This makes what the Divines also call the *Beatifick Vision*. See *VISION*.

Authors are much divided as to the Reality of such *Local Heaven*. — In this Sense of the Word, *Heaven* stands opposed to *Hell*. See *HELL*.

The inspired Writers give us very magnificent Descriptions of *Heaven*, the Structure, Apparatus, and Attendance thereof; particularly *Isaiah*, and St. *John* the Divine. — The Philosopher *Plato*, in his *Dial. de Anim.* speaks of *Heaven* in Terms that bear so near a Resemblance to those of Scripture; that *Ensebius* charges him with borrowing his Account thence. *De Prepar. Evangel. L. XI. C. 37.*

The antient *Romans* had a Kind of *Heaven* in their System of Theology, call'd *Elysium*, or the *Elysian Fields*. See *ELYSIAN Fields*.

The *Mahometan Heaven*, or *Paradise*, is very gross, agreeably to the Genius of their Religion. See *MAHOMETANISM*, *ALCORAN*, &c.

HEAVEN, among Astronomers, call'd also the *Ethereal* and *Starry HEAVEN*, is that immense Region whercon the Stars, Planets and Comets are disposed. See *STAR*, *PLANET*, &c.

This is what *Moses* calls the *Firmament*, speaking of it as the Work of the second Days Creation; at least 'tis thus the Word *קִמְיָה* is usually render'd by his Interpreters; tho' this somewhat abusively, to countenance their own Notion of the *Heavens* being *Solid*. — The Word, 'tis certain, properly signifies no more than *Expanse*, or *Extension*; a Term very well adapted by the Prophet to the Impression which the *Heavens* make on our Senses: Whence, in other Parts of Scripture, the *Heaven* is compar'd to a *Curtain*, or a *Tent* stretch'd out to dwell in. — The *I.XX.* first added to this Idea of Expansion, that of *Firm* or *Solid*; rendering it by *systema*, according to the Philosophy of those Times; in which they have been follow'd by the Modern Translators.

The later Philosophers, as *Cartes*, *Kircher*, &c. have easily demonstrat'd this *Heaven* not to be *Solid*, but *Fluid*; but they still suppose it full, or perfectly dense, without any Vacuity, and contain'd out into so many Vortices. See *ÆTHER*, *CARTESIANISM*, &c.

But others carry the Thing much further, and overturn not only the Solidity, but the supposed Plenitude of the *Heavens*. — Sir *Isaac Newton* has abundantly shewn the *Heavens* void of almost all Resistance, and consequently of almost all Matter; from the Phenomina of the Celestial Bodies; from the Planets persisting in their Motions without any sensible Diminutions of their Velocity; and the Comets freely passing in all Directions towards all Parts of the *Heavens*. See *RESISTANCE*, *PLANET*, *COMET*, *VORTEX*, &c.

Heaven, taken in this general Sense, for the whole Expanse between our Earth and the remotest Regions of the fix'd Stars, may be divided into two very unequal Parts, according to the Matter found therein, *viz.* the Atmosphere, or *Aerial Heaven*, possess'd by Air; and the *Ethereal Heaven*, possess'd by a thin, unresisting Medium, call'd *Æther*. See *ATMOSPHERE*, *AIR*, *ÆTHER* and *MEDIUM*.

HEAVEN, is more particularly used in Astronomy, for an Orb, or Circular Region of the *Ethereal Heaven*. See *ORB*.

The antient Astronomers assum'd as many different *Heavens*, as they observed different Motions therein. — These they supposed all to be *Solid*, as thinking they could not otherwise sustain the Bodies fix'd in them; and *Spherical*, as being the most proper Form for Motion.

Thus they had seven *Heavens* for the seven Planets, *viz.* — The *Heavens of the Moon*, of *Mercury*, *Venus*, the *Sun*, *Mars*, *Jupiter* and *Saturn*. See *PLANET*, &c.

The eighth was for the fix'd Stars, which they particularly call'd the *Firmament*. See *FIRMAMENT*.

Ptolemy added a ninth *Heaven*, which he call'd the *Primum Mobile*. See *MOBILE*.

After him two *CrySTALLINE HEAVENS* were added, by King *Alphonfus*, &c. to account for some Irregularities in the Motions of the other *Heavens*: And, lastly, an *EMPYREAN HEAVEN* was drawn over the whole, for the Residence of the Deity; which made the Number twelve. See *EMPYREAN*, &c.

The *CrySTALLINE HEAVENS*, were not supposed to have any Stars fix'd in them: They incompass'd the inferior, *Starry* and *Planetary HEAVENS*; and communicated their Motion to them. — The first serv'd to account for that slow Motion of the fix'd Stars, whereby they advance a Degree Eastward in 70 Years; whence the Precession of the Equinox. The second was to solve the Motions of Libration, or Trepidation. See *PRECESSION*, *LIBRATION*, *TREPIDATION*, &c.

But others admitted many more *Heavens*, according as their different Views, and Hypotheses required. — *Endoxus* supposed 23, *Calippus* 30, *Reymonstanius* 33, *Aristotle* 47, and *Fracastor* 70.

We may add, that the Astronomers did not much concern themselves whether the *Heavens*, they thus allow'd of, were

were real or not, provided they served a Purpose in accounting for any of the Celestial Motions, and agreed with Phenomena. See HYPOTHESIS, SYSTEM, PHENOMENA, &c.

Among the other Reveries of the Rabbins, contained in the *Talmud*, we find it asserted, that there is a Place where the Heavens and Earth join together; that Rabbi *Narcobans* going thither, laid his Hat on the Window of Heaven; and that going to take it again immediately after, it was gone, the Heavens having carried it off; so that he must wait for a Revolution of the Orbs to bring it to its Place again.

HEAVINESS, See WEIGHT, GRAVITY, &c.

For the *Laws of the Descent of Heavy Bodies*. See DESCENT, &c.

In Strictness, Heavy Bodies do not tend precisely to the very Centre of the Earth, except at the Poles and the Equator; by Reason of the spheroidal Figure of the Earth.—Their Direction is every where perpendicular to the Surface of the Spheroid. See EARTH and SPHEROID.

HEAULME, or HEAUME, in Heraldry, an *Helmet*, or Head-piece. See HELMET.

HEWING of Timber. See TIMBER.

HEBERMAN, in our ancient Law-Books, a Fisherman below *London-Bridge*; thus call'd, because he commonly fishes at Ebb Water. See EBB.

HEBERTHET, in our ancient Customs, a Privilege of having the Goods of a Thief, and the Trial of him, within a particular District.

HEBDOMADIUS, antiently denoted a Canon, or Prebendary, in a Cathedral Church, who had the peculiar Care of the Choir, and the Inspection of Officers of it for his Week. See CANON, CATHEDRAL, and CHOIR.

HEBDOMADEER, HEBDOMADARY, HEBDOMADARIUS, a Member of a Chapter, or Convent, whose Week it is to perform the Office, rehearse the Anthems and Prayers, preside and perform the usual Functions which Superiors perform at solemn Feasts, and on other extraordinary Occasions.

The *Hebdomadeer* generally collates to the Benefices which become vacant during his Week: Tho' this is usually look'd on as an Abuse.

The Word is form'd of the Greek, ἑβδομα, which signifies the Number seven, of *εβδομα*, Seven. See WEEK.

In Monasteries, the *Hebdomadary* is he who waits at Table for a Week, or other stated Period; directs and assists the Cook, &c.

In Church Antiquity, we meet with nine different Sorts of *Hebdomadeers*, viz.—The *Hebdomadarius Cantor*, or *Hebdomadary Chantor*; *Hebdomadarius Chori*, *Hebdomadary of the Choir*; which two were really the same, viz. he who presided at the public Service: *Hebdomadary of the Kitchen*, *Hebdomadarius Coquinae*: *Hebdomadary of the Dead*, or the Dead, *Hebdomadarius Defunctorum*, he who took Care of the Office and Service of the Dead: *Hebdomadarius Invitatoris*, he who sang the Invitatory: *Hebdomadarius Lector ad Mensam*, he who read at Meal Time: *Hebdomadarius majoris Missæ*, he who read Mass: *Hebdomadarius Pfalterii*, which probably was the same with the *Hebdomadarius Chori*: And *Hebdomadarius sacri Altaris*, which might be the same with *Hebdomadeer* of the high Mass.

HEBRAISM, an Idiotism or Manner of Speaking peculiar to the Hebrew Tongue. See IDIOTISME.

There is no Understanding, even the Versions of the Old Testament, without some Acquaintance with the Hebrew; they are so full of *Hebraisms*.

We have Abundance of *Hebraisms* borrow'd from Scripture, and naturalized in our own Language; as, *Son of Perdition*: *To sleep in the Lord*, &c. See HEBREW.

HEBREW, something relating to the People of the Jews, i. e. to the twelve Tribes, descended from the twelve Patriarchs, the Sons of Jacob. See JEWS. Thus we say,

HEBREW Bible. See BIBLE.

HEBREW Character. See CHARACTER.

There are two Kinds of Hebrew Characters; the *Antient*, call'd also the *Square*; and the *Modern*, or *Rabbinical* Characters.

The *Square Hebrew*, takes its Denomination from the Figure of its Characters, which stand more *Square*, and have their Angles more exact and precise than the other.

This Character is used in the Text of Holy Scripture, and their other principal and most important Writings.—When both this, and the *Rabbinical Character*, are used in the same Work; the former is for the Text, or the fundamental Part; and the latter, for the accessory Part, as the Gloss, Notes, Commentaries, &c.

The best and beautifullest Characters of this Kind, are those imitated from the Characters in the *Spanish* Manu-

scripts; next, those from the *Italian* Manuscripts; then, those from the *French*; and lastly, those of the *Germans*, whose Characters are much the same, with Respect to the other genuine *Square Hebrew* Characters, that the *Gothic* or *Dutch* Characters are with Respect to the *Roman*.

Several Authors contend, that the *Square Character* is not the real, antient Hebrew Character, wrote from the Beginning of the Language to the Time of the *Babylonish* Captivity; but that it is the *Affyrin*, or *Chaldean* Character, which the Jews assumed, and accustom'd themselves to, during the Captivity, and retain'd afterwards.—These Authors add, that what we call the *Samaritan* Character, is the antient Hebrew.

The learned Jesuit *Soncier* maintains, with great Address, that the antient Hebrew Character, is that found on the Medals of *Simon*, and others, commonly call'd *Samaritan Medals*; but which, he asserts, were really Hebrew Medals, struck by the Jews, and not by the *Samaritans*. See SAMARITAN.

The *Modern*, or *Rabbinical Hebrew* Character, is a good neat Character, form'd of the *Square Hebrew* by rounding it, and retrenching most of the Angles, or Corners of the Letters, to make it the more easy and flowing.—Those used by the *Germans*, are very different from the *Rabbinical* Character us'd every where else, tho' all form'd alike from the *Square* Character, but the *Germans* more slovenly than the rest.

The *Rabbins* frequently make use either of their own, or the *Square Hebrew* Character, to write the modern Languages in.—There are even Books in the vulgar Tongues, printed in the Hebrew Characters: Instances whereof are seen in the *French King's Library*.

HEBREW Language, call'd absolutely HEBREW, is the Language spoke by the *Hebrews*, and wherein most of the Books of the Old Testament are wrote; whence it is also call'd the *Holy*, or *Sacred Language*. See LANGUAGE.

There is no Piece, in all Antiquity, wrote in pure Hebrew, beside the Books of the Old Testament; and even some Parts of those are in *Chaldee*. See CHALDEE.

The Hebrew, then, appears to be the most antient of all the Languages in the World; at least, 'tis so with Regard to us, who know of no older. Some learned Men will have it the Language spoke by *Adam* in Paradise; and that the Saints will speak it in Heaven.

Alberti, in his *Hebrew Dictionary*, endeavours to find in each Word, in its Root, in its Letters, and the Manner of pronouncing them, some natural Reason of the Signification of that Word. But he has carried Matters too far; and it has been shewn, in the *Memoirs de Trevoux*, that on his Principles, Words which really signify quite different Things, should signify the same.

Newman, and *Loeffer*, have profecuted *Alberti's* Scheme further, and with more Address than he has done: The first, in his *Genesis Lingue Sanctæ*, and *Exodus Lingue Sanctæ*; and the latter, in his *Treatise de Causis Lingue Hebrææ*.

Be this as it will, the Hebrew, such as we have it in the Holy Scripture, is a very regular, analogical Language, and particularly so in its Conjugations. Properly speaking, there is but one, simple Conjugation; but this is varied in each Verb seven or eight Ways, which has the Effect of so many different Conjugations, and affords a great Number of Expressions, whereby to represent, under one single Word, all the different Modifications of a Verb; and several Ideas at once, which in the modern, and most of the antient and learned Languages, are expressible only by Phrases.

The Original, or Primitive Words in this Language, which they call *Radices*, *Roots*, rarely consist of more than three Letters, or two Syllables, which are express'd by two Sounds, or by the same Sound redoubled, which is indicated by a Point. See ROOT, RADICAL, &c.

There are twenty two Letters in the Hebrew Language, which Gramarians divide into *Guttural*, *Palatal*, *Dental*, *Labial*, and *Lingual*.—This Division is taken from the several Organs of Speech; some whereof contribute more than others to the Pronunciation of certain Letters. See VOICE. See also GUTTURAL, PALATAL, &c.

Usually, they only reckon five Vowels in the Hebrew, which are the same with ours, viz. a, e, i, o, u; but then each Vowel is divided into two, a long, and a *breve*, or short: The Sound of the former is somewhat greater, and longer; and that of the latter shorter, and more acute.—It must be added, that the two last Vowels have quite different Sounds, different, we mean, in other Respects beside Quantity and Degree of Elevation.

To these ten or twelve Vowels must be added some others call'd *Semi-Vowels*, which are only slight Motions serving to connect the Consonants, and make the easier Transitions from one to another. See VOWEL.

The Number of Accents is prodigious in the *Hebrew*. — There are near forty different ones; and of these, there are several, whose Use is not well ascertain'd, notwithstanding all the Enquiries of the Learned into that Matter.

In the general, we know these three Things: 1°. That they serve to distinguish the Sentences, and the Members thereof, like the Points and Comma's, &c. in *English*. 2°. To determine the Quantity of the Syllables; and 3°. To mark the Tone wherewith they are to be spoke or sung. See ACCENT.

'Tis no Wonder, then, there should be more Accents in the *Hebrew* than in other Languages; as they do the Office of three different Things, which in other Languages are called by different Names. See PUNCTUATION, QUANTITY, &c.

As we have no *Hebrew*, but what is contain'd in the Scriptures; that Language wants a World of Words; not only by Reason, in those primitive Times, the Languages were not so copious as at present, but also on this Account that the inspired Writers had occasion to mention many of the Terms that might be in the Language.

The *Chaldee*, *Syriac*, *Ethiopic*, *Arabic*, &c. Languages, are all only Dialects of the *Hebrew*; as the *French*, *Italian*, *Spanish*, &c. are Dialects of the *Latin*. See CHALDEE, SYRIAC, ARABIC, &c.

Rabbinical *HEBREW*, or *HEBREW* of the *Rabbins*, or *modern HEBREW*, is the Language used by the *Rabbins*, in the Writings they have composed. See RABBIN.

The *Body*, or *Body* hereof, is the *Hebrew* and *Chaldee*, with divers Alterations in the Words of those two Languages, the Meanings wherof they have considerably enlarged and extended. Abundance of Things they have borrowed from the *Arabic*. — The rest is chiecy composed of Words, and Expressions, chiefly from the *Greek*; some from the *Latin*; and others, from the other modern Tongues; particularly that spoken in the Place where each *Rabbin* lived or wrote.

The *Rabbinical* *Hebrew*, must be allowed a very copious Language: — *M. Simon*, in his *Crit. de l'Antiquité Testam. I. III. C. 27.* observes, that there is scarce any Art, or Science; but the *Rabbins* have treated thereof in it. They have translated most of the ancient Philosophers, Mathematicians, Astronomers, and Physicians; and have wrote themselves on most Subjects: They do not want even Orators and Poets. Add, that this Language, notwithstanding 'tis so crowded with foreign Words, has its Beauties visible enough in the Works of those who have wrote well.

M. Simon says, 'tis impossible to reduce it into an Art, or System of Rules; tho' several learned Men are of another Sentiment; and it not only appears possible, but has actually been perform'd. *Genebrard* first attempted it in his *Isagoge Rabbinica*, which yet goes no further than to the learning to read it. *Buxtorf* seconded him, at the End of his *Hebrew Grammar*; where we have an additional Piece, under the Title *Lectioes Hebraeo-Germanice usus & Exercitatio*. Others have gone yet further: *Majus* has lately given us a *Rabbinical Grammar*, at *Gissen*, under the Title of *Johannis Maji Grammatica Rabbinica*: And before him *Sennert* had done the same; *Rabbinismus*, h. e. *Præcepta Targumico-Talmudico Rabbinica*. *Witemb. An. 1666.*

HECATOMB, **HECATOMBS**, in Antiquity, a Sacrifice of an hundred Beasts of the same Kind, at an hundred Altars, and by an hundred Priests, or Sacrificers. See SACRIFICE.

Pythagoras is said to have sacrificed a *Hecatomb* to the *Muses*, of an hundred Oxen, in Joy and Gratitude, for his discovering the Demonstration of the 47th Proposition of the First Book of *Euclid*, viz. that in a rectangled Triangle, the Square of the Hypotenuse is equal to the Squares of the two other Sides. See HYPOTHENUSE.

The Word is form'd of the *Greek*, *ἑκατόμβη*, which properly signifies a sumptuous, or magnificent Sacrifice. — Others derive it from the *Greek* *ἑκατόν*, *Centum*, a Hundred, and *βου*, *Bos*, Bullock, &c. On which Footing, the *Hecatomb* should be a Sacrifice of an hundred Bullocks.

For the Origin of *Hecatombs*. — *Strabo* relates, that there were an hundred Cities in *Laconia*; and that each City used to sacrifice a Bullock every Year, for the common Safety of the Country; whence the Institution of the celebrated Sacrifice of an hundred Victims, call'd *Hecatombs*. Others refer the Origin of *Hecatombs* to a Plague; wherewith the hundred Cities of *Peloponnesus* were afflicted; for the Removal wherof, they jointly contributed to so splendid a Sacrifice.

Some derive the Word from *ἑκατό*, and *πύς*, *Por*, Foot; and on that Principle hold, that the *Hecatomb* might consist of only twenty five four footed Beasts. They add, that

it did not matter what Kind of Beasts were choic'd for Victims, provided the Quota of Feet were but had.

Yet *Julius Capitolinus* relates, that for a *Hecatomb* they erected an hundred Altars of Turf, and on these sacrificed a hundred Sheep, and an hundred Hogs. He adds, that when the Emperors offered Sacrifices of this Kind, they sacrificed a hundred Lyons, a hundred Eagles, and a hundred other Beasts of the like Kind.

The Month whereto the annual, or ordinary *Hecatomb* was sacrificed, was hence call'd the *Hecatombrou*. See MONTH.

The *Armenians* had a Sacrifice of the same Kind, offered yearly to *Mars*, call'd *Hecatombrouenna*, of *ἑκατόν*, *Centum*, and *φόνου*, of *φόνου*, *occido*, I kill; and that of *κατὰ*, *Cades*.

HECATOMPHONIA, was an ancient Sacrifice among the *Messenians*; offer'd by such as had slain an hundred Enemies in Battle. See SACRIFICE.

Pausanias makes mention of one *Aristomenes* of *Corinth*, who offered no less than three *Hecatombonias*.

The Word comes from *ἑκατόν* and *φόνου*, I kill.

HECK, among Husbandmen, a Rack; at which Horses are fed with Hay.

It is also an Engine, wherewithal to take Fish in the River *Ouse*. — A *Salmon-Heck*, is a Grate for the catching of that Sort of Fish. See *Salmon* FISHING.

Hence, also, the Word *Heckagium*, or *Hecagium*, which occurs in ancient Records, for a Rent paid the Lord for the Liberty to use such Engines.

HECKLING of *Hemp*, See *Hemp*.

HECTIC, or **HECTIC** Fever, in Medicine, a Sort of slow habitual Fever, gradually preying on and consuming the Moisture of the Body, and ending in a *Tubercle*, or Consumption. See FEVER.

The *Hectic* is also an Attendant of a Consumption; and is reputed one of the Diagnostic Signs thereof. See CONSUMPTION and PHTHISIS.

The Word is *Greek*, *ἡκτικός*, form'd of *ἡκτός*, *Habitus*; a Quality hard to separate from its Subject.

The *Hectic*, *Dr. Quincy* observes, is the Reverse of those Fevers which arise from a *Plethora*, or too great a Fulness from Obstruction. This being attended with too lax a State of the excretory Passages, and particularly those of the Skin, whereby so much runs off, as leaves not Resistance enough in the contractile Vessels to keep them sufficiently distended, so that they vibrate oftener, agitate the Fluids more, and keep them thin and hot.

The Remedy consists in giving a firmer Tone to the Solids, and laying more Load upon the Fluids, and thus bringing them to a better Consistence; which is effected by Means of Balsamicks, Agglutinants, and Foods of the best Nourishment. — All Evacuation herein is bad.

A Milk Diet, is much recommended in *Hecticks*, and particularly *Affes-Milk*, as being the least viscid and heavy. *Dr. Boynard* proposes *Butter-Milk* as a Succedaneum to *Affes-Milk*. According to him, it answers most of the Indications in this Case, as it cools, moistens, nourishes, &c. He adds, that he has known many Persons cured of obstinate *Hecticks*, by a continued Use thereof. See ANTIBIETICKS.

HEDAGIUM, antiently signified a Toll, or Custom, paid at the Hyth, or Wharf, &c. for landing Merchandise, Goods, &c. See WHARF, HYTH, &c.

From such Toll, or customary Duty, Exemptions were sometimes granted by the Sovereign to particular Persons, and Societies.

The Word is form'd from *Heda*, a Hyth, Port or Wharf.

HEDGE, in Agriculture, &c. a Fence, inclosing a Field, Garden, or the like; made of Branches of Trees interwoven. See FENCE.

The Word is form'd of the *German* *hege*, or *haag*, or the *Anglo-Saxon* *hegge*, or *boog*; which signify simply Inclosure, Circumference.

Quick-set Hedge, is that made of quick, or live Trees, which have taken Root; in Contradistinction to that made of Faggots, Hurdles, or dry Boughs, &c.

To plant a *Quick-Hedge* of *Thorn*, or the like, *Mr. Mortimer* directs, that the Sets be about as big as the Thumb, and cut within four or five Inches off the Ground; That if the *Hedge* have a Ditch, it be three Foot wide a-top, and one at Bottom, and two deep: That if the *Hedge* be without a Bank, or Ditch, the Sets be in two Rows, almost perpendicular, and at a Foot Distance: That the Turf be laid with the Grass Side downwards: That at every 30 Foot Distance, a young *Oak*, *Elm*, *Crab*, or the like be placed: That Stakes be driven into the loose Earth, at about two Foot and a half Distance, so low as to reach the firm Ground.

When the *Hedge* is eight or nine Years growth, it may be *split*'d or laid down; by giving the Shoots, or Branches, a Cut with a Knife, or Bill, half thro'; and then weaving it about the Stakes, and trimming off the small superfluous Branches.

Instead of Building a Garden Wall facing the North East, Mr. Lawrence advises, that to save Charge, &c. a Crab-Tree *Hedge* of three Rows be planted; which will be a good Mound, and quickly grow up to be a better Fence than a Wall against the West and South-West Winds, which make the greatest Destruction in a Garden, and which blow two Parts in three of the whole Year: Beside the Stock of Fruit such a *Hedge*, grafted with Red Breck, or Genet Moyl, will yield.

Espalier HEDGES. See *ESPALIER*.

Transplanting of HEDGE-ROWS. See *TRANSPLANTING*.

HEEL, in Anatomy, the hind Part of the Foot. See *FOOT*.

In Winter, the *Heels* are liable to Kind of Chilblains, call'd *Kibes*, which tend to Mortification. See *CHILBLAIN*.

The Bone of the *Heel* is call'd *Calcaneum*. See *CALCANEUM*.

HEEL of a Horse. See *HORSE*.

The *Heel* should be high and large; and one Side not rise higher on the Pastern than the other.—The Distempers incident to this Part, are scabbed *Heels* and Scratches. See *SCRATCHES*.

The *Heel* is properly the hind Part of the Foot; and has two Sides, where the Quarters terminate; or, it is the lower hinder Part of the Foot, comprehended between the Quarters, and opposite to the Toe.—Some narrow *heel'd* Horses have high *Heels*, but so weak and tender, that by pressing the two Sides of the *Heel* one against another, they will sensibly yield. See *HOOF*.

To open the *Heels*, is to pare the Foot, and cut the *Heel* low, almost clost to the Frush; taking it down within a Finger's Breadth of the Coronet, or Top of the Hoof, so as to separate the Quarters, and by that Means weaken and take away the Substance of the Foot, and make it clost, and become narrow at the *Heels*.

The *Heel of the Horseman*, being the Part which is armed with a Spur; the Word is us'd for the Spur it self: As, this Horse understands the *Heels* well. See *AID* and *CORRECTION*.

To ride a *Horse from one Heel to another*, is to make him go Side-ways, sometimes to one *Heel*, and sometimes to another.

HEEL, in the Sea-Language. — If a Ship lye on one Side, whether a-ground or a-boat, they say the *heels* off-ward, or to the Shore, a-star-board, or a-port.

HEEL of a Mast, is that Part of the Foot thereof, which is pared away flanting, that the Mast may be stay'd afterword on. See *MAST*.

HEELER, or *Bloody-Heel Cock*, is a fighting Cock which strikes or wounds much with his Spurs:—Cock-Masters know such a Cock, even while a Chicken, by the striking of his two Heels together in his going.

HEGIRA, in Chronology, a celebrated Epocha, us'd by the *Arabs* and *Mahometans*, for the Computation of Time. See *EPOCHA*.

The Word *Hegira*, in its original *Arabic*, signifies *Flight*; the Event which gave Occasion to this Epocha, being *Mahomet's* Flight from *Mecca*.—The Magistrates of that City fearing his Impetuosity might raise a Sedition, resolv'd to expel him: This, accordingly, they effected in the Year of our Lord 622, on the Eveing of the 12th or 16th of *July*.

To render this Epocha more creditable, the *Mahometans* affect to use the Word *Hegira* in a peculiar Sense, for an Act of Religion, whereby a Man forsakes his Country, and gives Way to the Violence of Persecutors and Enemies of the Faith: They add, that the *Coraitchites* being then the strongest Party in the City, oblig'd their Prophet to fly, as not being able to endure his abolishing of Idolatry.

This Flight was not the first; but it was the most famous. It happen'd on the 12th Year from his assuming the Character of Prophet and Apostle, and promulgating his new Religion. See *MAHOMETANISM*.

The *Orientalists* do not agree with us, as to the Time of the *Hegira*. Among the *Mahometans*, *Anossi* fixes it to the Year of Christ 630; and from the Death of *Moses* 2347: And *Ben Cassen*, to the Year of the World 5800, according to the *Greek* Computation. Among the *Christians*, *Said Ebn Zairik* refers the *Hegira* to the Year of Christ 614, and of the Creation 6114.

Khondemir relates, that it was *Omar*, the second Caliph, that first establish'd the *Hegira* as an Epocha, and appointed the Years to be numbered from it: At the Time he made this Decree, there were already seven Years elapsed. This Establishment was made in Imitation of

the *Christians*; who, in those Times, reckon'd their Years from the Perfection of *Dioclesian*. See *DIOCLESIAN ERA*.

But there is another *Hegira*, and the earlier too, tho' of less Eminence:—*Mahomet*, in the 14th Year of his Mission, was oblig'd to relinquish *Medina*: The *Coraitchites* had all along oppos'd him very vigorously, as an Innovator, and Disturber of the public Peace. Many of his Disciples, not enduring to be reputed Followers of an Impostor, desir'd Leave of him to abandon the City, for Fear of being oblig'd to renounce their Religion. This Retreat makes the first *Hegira*.

These two *Hegira's*, the *Mahometans*, in their Language call *Hegiratan*.

The Word is *Arabic*, form'd of *هجرة*, *hagira*, Flight; of *يوم*, to fly, quit ones Country, Family, Friends, &c.

The Years of the *Hegira* consist only of 354 Days. To reduce these Years to the *Julian* Calendar, i. e. to find what *Julian* Year a given Year of the *Hegira* answers to; reduce the Year of the *Hegira* given, into Days, by multiplying by 354; divide the Product by 365, and from the Quotient substract the Intercalations, i. e. as many Days as there are four Years in the Quotient; and, lastly, to the Remainder add 622. See *YEAR*.

HEIGHT, the third Dimension of a Body, consider'd with Regard to its Elevation above the Ground. See *DIMENSION* and *ELEVATION*.

Altimetria teaches how to find, or measure all *Heights*, both accessible and inaccessible. See *ALTIMETRIA*.

The Instruments chiefly us'd to measure *Heights*, are the *Quadrat*, and the Geometrical *Quadrat*. See *QUADRANT* and *QUADRAT*. See also *SHADOW* and *MIRROR*.

To measure the *Height* of Mountains, and particularly those of the Moon. See *BAROMETR*, *MOON*, &c.

HEIGHT, is sometimes also us'd for *Depth*. See *DEPTH*. The Design of *Leveling*, is to find the different *Heights*, or *Depths*, of Places. See *LEVELLING*.

HEIGHT, in Astronomy, &c. is more properly call'd *Altitude*. See *ALTITUDE*.

The *Height*, or *Altitude*, of the Sun, &c. is an Arch of the Meridian, comprehended between the Sun, &c. and the Horizon. See *SUN*, &c.

To find the Meridian *Heights* of the Sun, Stars, &c. See *MERIDIAN ALTITUDE*.

The *Height* of a Star, is either true or apparent.—The apparent *Height* is its Distance from the rational Horizon; or, rather, it is the *Height* of a Star such as it appears: The true *Height* is, what remains after the Refraction has been substracted. See *REFRACTION*.

M. Parent suggests a new Method of taking *Heights* at Sea, by a common Watch.—'Tis obvious, that in an oblique Sphere, the Difference between the rising and setting of two Stars, on the same Meridian, is greater, as they are further distant from one another. See *RIGHT ASCENSION*.

Now, the Astronomical Tables furnishing us with Tables of the right Ascensions and Declinations of all the fix'd Stars; 'tis easy, after observing the Difference of Time between the rising of two Stars, to distinguish that Part of the Difference which accrues from their different Position, from that which arises from the Obliquity of the Sphere.—But such Difference is the precise *Height* of the Pole of the Place of Observation. See *POLE*.

Indeed, the Ship not being immovable, but changing Place between the two Observations; seems to lay the Method under some Difficulty; to which *M. Parent* answers, that a small Alteration either of the Ship's Longitude or Latitude, will make no sensible Error; and that if she have gone a large Distance between the two Observations, 'tis easy reckoning how much it is, and allowing for it. See *SAILING*, &c.

HEIGHT, in Geography, Navigation, &c. is properly call'd *Elevation*. See *ELEVATION*.

The *Height*, or Elevation of the Pole, is an Arch of the Meridian intercepted between the Horizon and the Pole. See *POLE*.

The *Height* of the Pole is always equal to the Latitude of the Place. See *LATITUDE*.

HEIGHT, in the Manage, &c. the Stature of a Horse, &c. See *STATURE* and *HORSE*.

It is a reputed Imperfection in a Horse, when set too high on his Legs, i. e. when the Legs are too long in Proportion to the Body.

Some Jockeys have determin'd a Measure for them thus:—Take a String, and measure from the Horse's Withers to his Elbow, and what Length that is, the same should he have betwixt the Elbow and the lower Part of the Heels.—Some measure their Colts after this Manner at a Year old; being of Opinion that the Legs of a Colt at this Age, are as long as they ever will be.

The Duke of Newcastle, and Sir W. Hope, allow this to hold generally, but not universally.

HEIGHTS, in the military Art, are the Eminences round a fortified Place, whereon the Armies usually post themselves.—The Enemy had seiz'd all the *Heights*: Appear'd on the *Heights*, &c.

HEIR, *Heres*, in the Civil Law, he who succeeds to the whole Estate and Effects of another, whether by Right of Blood, or of Testament. See **SUCCESSION**.

The Infriction of an *Heir*, is a Circumstance necessary to the Validity of a Testament. See **TESTAMENT**.

There are two principal Kinds of *Heirs*, *Apparent* and *Presumptive*.

An *Heir Apparent*, is he on whom the Succession is so settled, that he cannot be set aside, without altering the Laws of Succession.

Heir Presumptive, See **PRESUMPTIVE HEIR**.
The Word is form'd of the Latin *Heres*, of the Verb *herere*, to stick, remain fast, be near, follow immediately, &c.

HEIR, in Common Law, is he who succeeds, by Right of Blood, to any Man's Lands, or Tenements in Fee.

For, nothing passes in Common Law, *jure hereditatis*, by Right of Inheritance, but **FEU**. See **FEU**.

By Common Law, therefore, a Man cannot be *Heir* to Goods or Chattels; for *Heres dicitur ab hereditate*: 'Tis the Inheritance denominates the *Heir*. See **INHERITANCE**.

Every *Heir*, having Lands by Descent, is bound by the Acts of his Ancestors, if he be named; it being a Maxim, that *qui sentit Commodum sentire debet & Onus*.

Movables, or Chattels immovable, are given by Testament, to whom the Testator thinketh fit; otherwise they lie at the Disposition of the Ordinary, to be distributed as he in Conscience likes best.

HEIR HEIR, See **LAST HEIR**.

HEIR LOOM, in our Law-Books, signify such Household Furniture, as is not inventoried after the Owner's Decease; but necessarily comes to the *Heir* along with the House. See **HEIR**.

Heir Loom comprehends divers Implements; as Tables, Prefices, Cup-boards, Bed-heads, Furnaces, Waincoat, and such like, which, in some Countries, have belonged to a House for certain Descents, and are never inventoried after the Decease of the Owner as Chattels are, but accrue by Custom, not by common Law, to the *Heir*, with the House it self.

Confectuio Hundredi de Stretford, in *Com. Oxon. est quod heredes tenementorum infra Hundredum predict. existant. post mortem Antecessorum suorum habebunt*, &c. *Principalmo, Anglies an Heir-Loomo, wa. De quodam genere Catalano, optimissimo, &c. Optimum plantarum, optimam Carucam, optimum Cypsum, &c. Coke on Littleton.*

HELCSAITES, or **ELCESAITES**, a Sect of ancient Heretics, in the 11th Century; denominated from their Leader *Elxai*, or *Helxeni*.

The *Helcsaites* condemn'd Virginity, and held it a Duty of Religion to marry: They taught that Jesus Christ was a mere Creature, who appear'd at the Beginning of the World in the Figure of *Adam*, and afterwards under that of *Jesus Christ*. That the Holy Spirit, which they supposed of the Female Sex, was the Sister of Jesus, &c. They establish'd seven Wives of an Oath, *wa. Salt, Water, Earth, Bread, Heaven, Air and the Wind*.

HELPEPÖLIS, in Antiquity, a military Machine, for the battering down the Walls of a Place besieged.

The *Helpepolis*, as described by *Diod. Siculus*, &c. appears to have been no more than the *Aries*, or battering Ram, with a Roof, or Covering over it, to prevent its being set on Fire, as also to screen the Men who work'd it. See **ARIES**.

Some will have it a Combination of two or three battering Rams, moving on large strong Wheels, roofed over, and cover'd with raw or wet Skins. It had several Iron Points, or Heads, wherewith the Execution was done; form'd much like the Thunderbolts which Painters represent. Within, was a great Number of Soldiers, who drove it with Force of Arm and by Means of Ropes, violently against the Wall where the Breach was intended.

Others, will have *Helpepolis* a general Name, comprehending all the Machines used by the Antients in the besieging of Towns; as, among us, the Name *Artillery* includes all the Sorts of Fire Arms.—But this Opinion is chiefly founded on the Origin of the Name, and does by no Means suit with those minute Descriptions given of the *Helpepolis* in the ancient Writers.

The Word is *Greek*, *ἑλπεύω*, compounded of the Words *ἔλαβ*, to take, and *πόλις*, City.

The Invention of the *Helpepolis*, and divers other military Machines, is ascribed to *Demetrius*, which, with the great Number of Cities he took thereby, gave him the Denomination of *Poliorcetes*, or City Taker.

HELLACA, in Antiquity, Sacrifices, and other Solemnities, perform'd in Honour of the Sun; whom the *Greeks* call *Helios*, *ἥλιος*. See **SUN**, **CIRCUS**, &c.

HELLACAL, in Astronomy.—The *HELLACAL RISING* of a Star, Planet, &c. is its issuing, or emerging out of

the Rays and Laire of the Sun, whereto it was before hid; whether this be owing to the Recess of the Sun from the Star, or of the Star from the Sun. See **RISEING**.

HELLACAL SETTING, is its entering or immersing into the Sun's Rays, and so becoming inconspicuous by the superior Light of that Luminary. See **SETTING**.

Or, a Star rises *HELLACALLY*, when after it has been in Conjunction with the Sun, and on that Account invisible, it gets at such a Distance from him, as to be seen in the Morning before the Sun's Rising.—The same is said to set *HELLACALLY*, when it approaches so near the Sun, as to be hid therein. So that, in Strictness, the *HELLACAL RISING* and *SETTING*, are only an Apparition and Occultation. See **OCCULTATION**, &c.

The *HELLACAL RISING* of the Moon, happens when she arrives at the Distance of 17 Degrees from the Sun; for the other Planets, 20 Degrees Distance is required: And for the Stars more or less, as they are greater or smaller. See **MOON**, **PLANET** and **STAR**.

To find the *HELLACAL RISING* and *SETTING* by the *Globe*. See **GLOBE**.

The Antients computed that a Star, between the Tropicks, would be forty Days ere it got clear of the Sun's Rays, and become conspicuous again. *Hippof* first made this Computation; and the rest follow'd him.—The Period comes very near to the Computation of the Moderns: For the Sun advancing nearly a Degree every Day, it will be 20 Days approaching thereto, from the *HELLACAL SETTING* of the Star; and 30 Days more withdrawing, till the *HELLACAL RISING*.

The Word is derived from the *Greek*, *ἥλιος*, *Sol*, Sun.

HELLASTES, in Antiquity, Officers, or Magistrates of *Athens*, constituting a Court of 500 Persons, or Judges, who took Cognizance of Civil Matters.

The Court of *Heliastes* was one of the six Civil Jurisdiccions of *Athens*; and that to which Matters of the greatest Moment were usually brought: So that it was held the most considerable of all the Civil Tribunals. The Delinquencies of the military Men were also brought before the *Heliastes*.

Ulpian gives us two Etymologies of the Word: Some, says he, derive it from *ἥλιος*, *Helios*, Sun; and hold it thus call'd by Reason they sit in the open Air, in Sight of the Sun. *Ulpian* himself chuses rather to derive *Heliastes* from *ἡλιαια*, *Helicia*, the Place where this Court, or Council was held; and that from *ἄσπασα*, *I assemble*, of *ἄσπασα*, *saio*, enough.

HELICE, in Astronomy, the same with *Ursa*. See **URSA**.

HELICOID PARABOLA, or the *Parabolic Spiral*, a Curve arising upon a Supposition of the Axis of the common *Apollonian Parabola*'s, being bent round into the Periphery of a Circle. See **PARABOLA**.

The *Helicoid Parabola*, then, is a Line passing thro' the Extremities of the Ordinate, which now converge towards the Centre of the said Circle.

Suppose, e.g. the Axis of the common *Parabola* to be bent into the Periphery of the Circle *BDM*, *Tab. Conicks Fig. 11*; then, the Curve *BFCNA*, which passes thro' the Extremities of the Ordinates *CF*, and *DG*, which converge towards the Centre of the Circle *A*; constitutes what we call the *Helicoid*, or *Spiral Parabola*.

If the Arch *BC*, as an Abscissa, be called *x*, and the Part *CF* of the Radius, as an Ordinate to it, be call'd *y*; the Nature of this Curve will be express'd by the Equation $1x = yy$. See **CURVE** and **EQUATION**.

HELIOCENTRIC, in Astronomy, is applied to Things which would appear to be to the Eye, were it placed in the Centre of the Sun. See **SUN**.

The Word is compounded of *ἥλιος*, *Sun*, and *κέντρον*, *Centrum*.

HELIOCENTRIC LATITUDE of a Planet, is the Inclination of the Line drawn between the Centre of the Sun and the Centre of a Planet, to the Plane of the Ecliptic. See **LATITUDE**.

The *HELIOCENTRIC LATITUDE* of a Planet is thus determined.—If the Circle *KLM*, *Tab. Astronom. Fig. 62*. represent the Orbit of the Earth round the Sun, and the inner one *ANB* be placed so, as to be inclined to the Plane of the other (for which Reason it appears in the Form of an Ellipsis) when the Planet is in *N* or *n*, (which Points are call'd its Nodes) it will appear in the Ecliptic, and so have no Latitude; if it move to *P*, then, being seen by the Sun, it will appear to decline from the Ecliptic, or to have Latitude; and the Inclination of the Line *RP*, to the Plane of the Ecliptic, is call'd the *Planet's HELIOCENTRIC LATITUDE*, and the Measure of it is the Angle *PRQ*, supposing the Line *Pq*, to be perpendicular to the Plane of the Ecliptic.

This *HELIOCENTRIC LATITUDE* will be continually increasing, till it come to the Point *A*, which they call the Limit, or utmost Extent of it; and then it will decrease again, till

till it come to nothing in N; after which it will increase again till it come to B; and lastly, by decreasing again, till the Planet come to be in n, &c.

HELIOCENTRIC Place of a Planet, is the Place wherein the Planet would appear to be, if viewed from the Centre of the Sun: Or the Point of the Ecliptic, wherein a Planet view'd from the Sun, would appear to be. See PLACE.

The **Helio-centric Place**, therefore, coincides with the Longitude of a Planet view'd from the Sun. See LONGITUDE and PLANET.

HELIOCOMETES, a Phenomenon sometimes observ'd at the setting of the Sun.

It was denominated *Helio-cometes*, q. d. *Comet of the Sun*, by Struvinus, and Pnyen who had seen it. In regard it seems to make a Comet of the Sun, being a large Tail, or Column of Light fix'd, or hung to that Luminary, and dragging after it at his Setting, much in the Manner of the Tail of a Comet. See COMET.

In that observ'd by M. Pnyen at Gryffswald, March 15, 1702, at Five of the Clock in the Afternoon, the End which touch'd the Sun was only half the Sun's Diameter broad; but the other End, opposite to the Sun, much broader. Its Length was above ten Diameters of the Sun; and it mov'd in the same Track as the Sun. Its Colour was yellow next the Sun, and darker further off. It was only seen pointed on the thinner, higher Clouds: A little Telescope easily discover'd that there was nothing of it on the thicker, and lower Clouds; tho' the naked Eye could not discover so much. It lasted, in its full Vigour, the Space of an Hour, and then gradually diminish'd.

HELIOSCOPE, in Opticks, a Sort of Telescope, peculiarly fitted for viewing and observing the Sun, without doing Prejudice to the Eye. See TELESCOPE.

Helioscopes are necessary in viewing the Phenomena of the Sun; as his Spots, Eclipses, &c. See SUN, SPOT, ECLIPSE, &c.

There are various Apparatus's of this Kind. —

As colour'd Glasses are found to diminish the Force of the Sun's Rays; to make a *Helioscope*, 'tis enough that both the Object Glass, and the Eye Glass of the Telescope, be of colour'd Glass; the first, e. g. of Red, and the latter Green.

But, as there is a Necessity for the Glasses to be very transparent, and equally colour'd; which rarely happens: *Hovellius* chafes rather to use two plain colour'd Glasses, with a Piece of Paper between, either tied, or cemented together, and applied before the Eye Glass.

Dr. Hook, in an express Treatise on *Helioscopes*, recommends four reflecting Glasses placed in the Tube; by these, he observes, the Force of the Rays will be so weaken'd, as only to strike the Eye with a 256th Part of their Force: And this *Helioscope* he prefers to all others.

M. Huggen's Method is much easier: — He only blackens the inside of the Eye Glass of the Telescope, by holding it over the Flame, or Smoak of a Lamp or Candle. Or, which is yet more commodious, blackens a Piece of plain Glass, and holds it between the Eye and the Object Glass: Or, which is best of all, claps the smoak'd Glass to another, with a Rim of thick Paper between, to keep the black from rubbing off, and fits the two into a Cell, or Frame, to be applied between the Eye and the Eye Glass.

The Word is compounded of ἥλιος , and σκοπεῖν , *video, specio*, I see, view, consider.

HELIO-TROPE, **HELIO-TROPISM**, in Natural History, a Plant popularly call'd the *Sun-flower*; as also *Tournefol*, or *Tournefol*. See TOURNEFOL.

The Word is compounded of the Greek, ἥλιος , Sun, and τροπή , *verto*, I turn.

HELIO-TROPE, is also a precious Stone, of a green Colour, streak'd with red Veins. See PRECIOUS STONE.

Pliny says 'tis thus call'd, by Reason when cast into a Vessel of Water, the Sun's Rays falling thereon, seem to be of a Blood Colour; and that when out of the Water, it bears some Resemblance of the Figure of the Sun; and is proper to observe Eclipses of the Sun withal, as a *Helioscope*.

The *Heliotrope* is also call'd *Oriental Jasper*, on Account of its ruddy Spots. See JASPER.

It is found in the *East Indies*; as also in *Ethiopia*, *Germany*, *Bohemia*, &c. Some have ascribed to it the Faculty of rendering People invisible, like *Gyges's Ring*.

HELISPHERICAL Line, in Navigation, denotes the *Rumb Line*. See RHUMB LINE.

It is thus call'd, because, on the Globe, it winds round the Pole Helically, i. e. spirally, and still comes nearer and nearer to it.

HELIX, in Geometry, a *Spiral Line*. See SPIRAL. In Architecture, some Authors make a Difference between the *Helix* and *Spiral*.

A *Stair-Case*, according to *Deviser*, is in a *Helix*, or

is *Helical*, when the Stairs, or Steps, wind round a Cylindrical Newel; whereas the *Spiral* winds round a Cone, and is continually approaching nearer and nearer its Axis. See STAIR-CASE.

The Word is Greek, ἥλιος , and literally signifies a *Wreath*, or *Winding*, of ἄστρον , *astrolos*, I environ.

HELIX, in Anatomy, is the whole Circuit or Extent of the Auricle, outwards: In Opposition to which the inner Protuberance answering thereto is call'd *Auricula*. See AURICLE and EAR.

HELIX, is also us'd in Architecture, for the *Caulicoles*, or little Volutes, under the Flower of the *Corinthian Capital*; call'd also *Uvilla*. See CAULICOLES and ULLA.

HELL, *Tartarus*, *Infernus*, a Place of Punishment, wherein the Wicked are to receive the Reward of their Deeds, after this Life. — In this Sense, the Word *Hell* stands oppos'd to *Heaven*. See HEAVEN.

Among the Ancients, *Hell* was call'd *Tartarus*, *Tartarus*, *Tartara*; *Ach*, *Hades*, *Infernus*, *Inferna*, *Inferi*, &c. — The *Jews*, wanting a proper Name for it, call'd it *Geberna*, or *Gebinnun*, from a Valley near *Jerusalem*, wherein was a Tophet, or Place, where a Fire was perpetually kept. See GEHENNA.

Divines reduce the Torments of *Hell* to two Kinds; *Pains Dæmoni*, the Loss and Privation of the Beatific Vision; and *Pains Sensus*, the Horrors of Darkness, with the continual Pains of Fire inextinguishable.

Most Nations and Religions have their *Hell*. — The *Hell* of the Poets is terrible enough: Witness the Punishment of *Tityus*, *Prometheus*, the *Dæmons*, *Lepidus*, *Phlegyas*, &c. described by *Ovid* in his *Metamorphosis*. *Virgil*, after a Survey of *Hell*, *Æneid*, Lib. VI. declares, that had a hundred Mouths and Tongues, they would not suffice to recount all the Plagues of the tortured. — The New Testament represents *Hell* as a *Lake of Fire* and *Brimstone*; a *Worm* which dies not, &c. Rev. XX. 10, 14, &c. *Mark* IX. 43, &c. *Luke* XVI. 23, &c. — The *Caffres* are said to admit 15 *Hells*, and 27 *Paradises*, where every Person finds a Place of Recompence suited to the Degree of Good or Evil he has done.

There are two principal Points of Controversy among Writers touching *Hell*: The 1st, Whether there really be any *Local Hell*, any proper and specific Place of Torment and Fire: The 2^d, Whether the Torments of *Hell* are to be Eternal.

I. The Locality of *Hell*, and the Reality of the Fire thereof, has been controverted from the Time of *Origen*. — That Father, in his Treatise *de agone*, interpreting the Scripture Account metaphorically; makes *Hell* to consist not in external Punishments, but in the Conscience of Sinners, the Sense of their Guilt, and the Remembrance of their past Pleasures. — *St. Augustine* mentions several of the same Opinion in his Time; and *Calvin*, and many of his Followers, have embraced it in ours.

The Retainers to the contrary Opinion, much the greatest Part of Mankind, are divided as to the Situation, and other Circumstances of this horrible Scene. — The *Greeks* after *Homer*, *Hesiod*, &c. conceiv'd *Hell*, *Tartarus* was *ἄρα*, *Lucian*, *de Lucif.*, and *Eustath.* in *Homer*.

Some of the *Romans* lodg'd it in subterranean Regions, directly under the Lake *Avernus*, in *Campania*; which they were led to from the Consideration of the poisonous Vapours emitted by that Lake. See AVERNUS. — Thro' a dark Cave, near this Lake, *Virgil* makes *Æneas* descend to *Hell*. See ELYSIUM.

Others plac'd *Hell* under *Tenarus*, a Promontory of *Laconia*, as being a dark frightful Place, beset with thick Woods, out of which there was no finding a Passage. This Way, *Ovid* says, *Orpheus* descended to *Hell*. — Others fancied the River, or Fountain of *Styx* in *Arcadia*, the Spring-head of *Hell*, by Reason the Waters thereof were deadly.

But these are all to be consider'd as only Fables of Poets; who, according to the Genius of their Art, allegorizing and personifying every Thing, from the certain Death met withal in these Places, took Occasion to represent them as so many Gates, or entering Places, into the other World. See FABLE, PERSONIFYING, &c.

The Primitive Christians, conceiving the Earth a large extended Plane, and the Heavens an Arch drawn over the same; took *Hell* to be a Place in the Earth, the furthest distant from the Heavens; so that their *Hell* was our *Antipodes*. See ANTIPODES.

Tertullian, *De Anima*, represents the Christians of his Time, as believing *Hell* to be an Abyss in the Centre of the Earth; which Opinion was chiefly founded on the Belief of *Christ's* Descent into *Hades*, *Hell*, *Matt.* XII. 40. See the following Article HELLS.

The learned Mr. *Whiston* has lately advanced a New Opinion. — According to him, the Comets are to be conceived as so many *Hells*, appointed, in the Course of their Trajectories, or Orbits, alternately to carry the Damned into the Confines of the Sun, there to be scorched by his Flames; and then return 'em to starve in the cold, dreary; dark Regions, beyond the Orb of *Saturn*. See *COMET*.

The Reverend and Orthodox Mr. *T. Swinden*, in an express Inquiry into the *Nature and Place of Hell*, not contented with any of the Places hitherto assign'd; contends for a new one. — According to him, the Sun it self is the *Local Hell*. See *SUN*.

This does not seem to be his own Discovery: — 'Tis probable he was led into the Opinion by that Passage in *Rev. XVI. 8, 9.* — Tho' it must be added, that *Pythagoras* seems to have had the like View, in that he places *Hell* in the Sphere of Fire; and that Sphere, in the middle of the Universe. — Add, that *Aristotle* mentions some of the *Italic*, or *Pythagoric* Schools, who placed the Sphere of Fire in the Sun, and even called it *Jupiter's Prison*. See *De Caelo*, L. II. See *Pythagorean*.

To make Way for his own System, Mr. *Swinden* undertakes to remove *Hell* out of the Centre of the Earth, from these two Considerations: — 1^o. That a Fund of Fuel or Sulphur, sufficient to maintain so furious and constant a Fire, cannot be there supported: And 2^o. That it must wane the nitrous Particles in the Air, to sustain and keep it alive. — And how, says he, can such Fire be Eternal, when by Degrees the whole Substance of the Earth must be consumed thereby?

It must not be forgot, however, that *Tertullian* had long ago obviated the former of these Difficulties, by making a Distinction between *Arcaani*, and *Publicus Ignis*, secret and open Fire: The Nature of the first, according to him, is such, as that it not only consumes, but repairs what it preys upon. — The latter Difficulty is solved by *St. Augustine*, who alleges, that God supplies the Central Fire with Air, by a Miracle.

Mr. *Swinden*, however, proceeds to shew, that the Central Parts of the Earth are possess'd by Water, rather than Fire; which he confirms from what *Moses* says of *Water under the Earth*, *Exod. XX.* from *Plato's XXIV. 2.* and *Job XXXI. 8.* — As a further Proof, he alleges that there would want Room, in the Centre of the Earth, for such an infinite Host of Inhabitants, as the fallen Angels, and wicked Men.

Drexelius, we know, has fix'd the Dimensions of *Hell* to a German Cubic Mile, and the Number of the Damned to an hundred Thousand Millions: *De Damnatorum Carcer. §. Rogo*. But Mr. *Swinden* thinks he need not have been so sparing in his Number, for that there might be found an hundred Times as many; and that they must necessarily be unsufferably crowded in any Space we could allow 'em in our Earth. — 'Tis impossible, he concludes, to stow such a Multitude of Spirits in such a scanty Apartment, without a Penetration of Dimensions, which, he doubts, is not good Philosophy, even in Respect of Spirits: If it be, he adds, 'he does not see why God should prepare, i. e. make, a Prison for 'em, when they might have been all crowded together into a Baker's Oven.' p. 206.

His Arguments for the Sun's being the *Local Hell*, are,

1^o. Its Capacity: — No Body will deny the Sun spacious enough to receive all the damned conveniently; so that there will be no Want of Room. Nor will Fire be wanting, if we admit of Mr. *Swinden's* Argument against *Aristotle*, whereby he demonstrates that the Sun is hot, p. 208, and seq. — The Good Man is 'fill'd with Amazement to think what *Pyrenean* Mountains of Sulphur, how many *Atlantic* Oceans of scalding Bitumen, must go to maintain such mighty Flames as those of the Sun: Our *Aetna* and *Vesuvius* are mere Glow-Worms,' p. 237.

2^o. Its Distance and Opposition to the *Empyream*, which has usually been look'd upon as the *Local Heaven*; such Opposition is perfectly answerable to that Opposition in the Nature and Office of a Place of Angels and Devils, of Elect and Reprobate, of Glory and Horror; of Hallelujahs and Curings: And the Distance quadrates well with *Drives* seeing *Abraham afar off*, &c. *the great Gulf between them*; which this Author takes to be the Solar Vortex.

3^o. That the *Empyream* is the highest, and the Sun the lowest Place of the Creation; considering it as the Centre of our System: And that the Sun was the first Part of the visible World created; which agrees with the Notion of its being primarily intended or prepared to receive the Angels, whose Fall he supposes to have immediately preceded the Creation.

4^o. The early, and almost universal Idolatry paid the

Sun; which suits well with the great Subtlety of that Spirit to entice Mankind to worship his Throne.

II. As to the Eternity of *Hell Torments*, we have *Origen*, again, at the Head of those who deny it; it being the Doctrine of that Writer, that not only Men, but Devils themselves, after a suitable Course of Punishment, answerable to their respective Crimes, shall be pardoned and restored to Heaven. *Aug. de Civit. Dei*, L. XXI. C. 17. — The chief Principle *Origen* went upon was this, that all Punishments are emendatory; applied only as painful Medicines, for the Recovery of the Patient's Health. Other Objections insisted on by modern Authors, are the Disproportion between temporary Crimes, and eternal Punishments, &c.

The Scripture Phrases for Eternity, as is observed by Archbishop *Tillotson*, do not always import an infinite Duration: Thus, in the Old Testament, *For ever*, often signifies only a long Time; particularly till the End of the Jewish Dispensation: Thus in the Epistle of *Jude*, V. 7. the Cities of *Sodom* and *Gomorrab* are said to be 'set forth for an Example, suffering the Vengeance of Eternal Fire'; that is, of a Fire that was not extinguished till those Cities were utterly consumed. — So 'one Generation is said to come, &c. but the Earth endureth for ever.

In Effect, M. le Clerc notes, that there is no Hebrew Word which properly expresses Eternity: *עולם Olam*, only imports a Time whose Beginning or End is not known; and is accordingly used in a more or less extensive Sense, according to the Thing treated of.

Thus, when God says, concerning the Jewish Laws, that they shall be observed *עולם לעולם* *leholam*, for ever, we are to understand as long a Space as he should think fit; or a Space whose End was unknown to the Jews before the coming of the Messiah. — All general Laws, and such as do not regard particular Occasions, are made for ever, whether it be expressed in those Laws or not; which yet is not to be understood in such a Manner, as if the Sovereign Power could no Way change them.

Archbishop *Tillotson*, however, argues very strenuously, that where *Hell Torments* are spoke of, the Words are to be understood in the strict Sense of infinite Duration; and what he esteems a peremptory Decision of the Point is, that the Duration of the Punishment of the Wicked, is in the very same Sentence expressed by the very same Word which is used for the Duration of the Happiness of the righteous, which all agree to be Eternal. 'These,' speaking of the Wicked, 'shall go away, *eis katasenaidon*, into eternal Punishments, but the Righteous, *eis zoen aidion*, into Life eternal.'

The same great Author attempts to reconcile this Eternity with the Divine Justice, which had not been satisfactorily done before. — Some had urged that all Sin is infinite, in Respect of the Object it is committed against, viz. God, and therefore deserves infinite Punishment: But, that Crimes should be heightened by the Quality of the Object, to such Degree, is absurd; since the Evil and Demerit of all Sin must then be equal, inasmuch as none can be more than infinite; and consequently there can be no Foundation for Degrees of Punishment in the next Life. Add, that for the same Reason as the least Sin against God is infinite, in Respect of its Object; the least Punishment inflicted by God may be said to be infinite, because of its Author; and thus all Punishments from, as well as Sins against, God, would be equal.

Others have urged, that if the Wicked were to live for ever, they would sin for ever: But this, says the Author, is mere Presumption. Who can say, that if a Man lived ever so long, he would never repent? Besides, the Justice of God only punishes Sins Men have committed, not those they might possibly have done.

Others therefore urge, that God gives Men the Choice of everlasting Happiness and Misery; and that the Reward promised to Obedience, is equal to the Punishment threaten'd to Disobedience. — To which it is answer'd, that tho' it be not contrary to Justice to exceed in Rewards, that being Matter of mere Favour; it may be so to exceed in Punishments.

It may be added, that Man in this Case has nothing to complain of, since he has only his Election. — But tho' this may suffice to silence the Sinner, and make him acknowledge his Destruction to be of himself, yet does not satisfy the Objection from the Disproportion between the Crime and the Punishment. — All the Considerations, therefore, hitherto alleg'd, proving ineffectual; our great Author is left to solve the Difficulty himself.

In Order to this, he observes that the Measure of Penalties, with Respect to Crimes, is not only, nor always taken from the Quality and Degree of the Offence; much less from the Duration and Continuance of it; but from the Reasons of Government, which require such Penalties

as may secure the Observation of the Law, and deter Men from the Breach of it. — Among Men it is not reckon'd Injustice to punish Murder and many other Crimes which perhaps are committed in a Moment, with perpetual Loss of Estate, or Liberty, or Life. So that the Objection of temporary Crimes being punished with such long Sufferings, is of no Force.

In Effect, what Proportion Crimes and Penalties are to bear to each other, is not so properly a Consideration of Justice, as of Wisdom and Prudence in the Law-giver, who may enforce his Laws with what Penalties he pleases, without any Impediment of his Justice, which is out of the Question.

The primary End of all Threatning is not Punishment, but the Prevention of it: God does not threaten that Men may sin and be punished; but that they may not sin, and so escape: And therefore the higher the Threatning runs, the more Goodness there is in it.

After all, it is to be consider'd, says the good Archbishop, that he who threatens, has still the Power of Execution in his own Hands. — There is this Difference between Promises and Threatnings; that he who promises, passes over a Right to another, and thereby stands oblig'd to him in Justice, and Faithfulness to make good his Word; but it is otherwise in Threatnings; he that threatens, keeps the right of punishing still with him, and is not oblig'd to execute what he threatens, any further than the Reasons and Ends of Government require. — Thus, God absolutely threaten'd the Destruction of Nineveh; and his peevish Prophet understood the Threatning to be absolute, and was angry for being employ'd in a Message that was not made good: But God understood his own Right, and did what he pleas'd, notwithstanding the Threatning he denounc'd, and notwithstanding *Jonah* was so touch'd in Point of Honour, that he had rather have perished, than *Nineveh* should have escap'd.

HELL, *Hades*, is sometimes also used, in the Scripture-Style, for Death, or Burial; by Reason the Hebrew and Greek Names, signify sometimes the Place of the damn'd, and sometimes simply the Grave. See **TOMB**, **SERVANTS**, &c.

Divines are divided about the Sense of that Article in the Apostle's Creed, where our Saviour is said to have been crucified, dead and buried, and that he descended into *Hell*, &c. — Some understand this Descent into *Hell* as no other than a Descent into the Tomb, or Sepulchre; which others object against, in that his Burial is expressly mention'd before; and maintain, that our Saviour's Soul actually descended into the subterraneous, or Local *Hell*; where he triumph'd over the Devils, &c.

The *Romanists* add, that he there comforted the Souls in Purgatory; and brought away the Spirits of the Patriarchs, and other just Persons, departed till that Time, carrying them with them into Paradise. See **PURGATORY**, **PATRIARCHS**, &c.

In the *Romish* Church, that Part of *Hell*, wherein those were retain'd who died in the Mercy and Favour of God before our Saviour's Suffering, is call'd *Limbus*. See **LIMBUS**.

HELLEBORE, HELLEBORUS, HELLEBORUM, ELLEBORE, a medicinal Plant, reputed, among the Antients, a specific for the Cure of Folly, Melancholy, and Madnes.

There are two Sorts of *Hellebore*, the Black and White. The *Black Hellebore*, *Helleborus Niger*, call'd also *Melampodium*, has a dark-colour'd Root, furnished with Abundance of little Fibres; its Stem green, its Leaves dented, and its Flower of a Carnation Hue, not unlike the Rose.

The *White Hellebore*, *Helleborus Albus*, call'd also *Veratrum*, to distinguish it from the former, has a whitish Root, beset with Fibres of the same Colour, shooting out at a Sort of Bulb, not unlike the Head of an Onion. Its Leaves are broad; at first green, afterwards of a yellowish red. From the middle of the Leaves rises a Stem, two or three Foot high, which separates about the middle into Branches, each whereof bears a considerable Number of little Flowers like Stars, dispos'd in Manner of a *Spica*, or Ear.

'Tis only the Roots are used, in each Kind; which are to be chosen large and fair, furnish'd with big Filaments: Those of the White, tan colour'd without, and white within; and those of the Black, blackish without, and brownish within; dry, clean, and of a sharp disagreeable Taste.

The Antients, as already observ'd, had a great Opinion of their Efficacy in Distates of the Mind; whence various Phrases and Forms of speaking among Writers: As *Capsus Helleboro Dignum*. — He needs a double Dose of *Hellebore*. — The Island of *Anticyra*, situate against Mount *Oeta*, was famous for the Growth and Use of this Plant, it being here in its greatest Perfection, and used with the best Effect. — Whence the Proverb, *Navigat Anticyras*, send him a Voyage to *Anticyra*.

They act as Purgatives, but so very violently, both upwards and downwards, as frequently to cause Convulsions; whence the Use of them internally is now out of Doors, unless join'd with other Purgatives, and even Alterants to correct them; but are still retain'd with Success, for the Farcy in Horses, and the Scab in Sheep.

The chief Use wherein the present Practice acknowledges white *Hellebore*, is in Form of a stercoratory Powder, to clear and open the Head. See **STERCORATORY**.

The black *Hellebore* used among us, Dr. *Quincy* suggests to be much inferior in Virtue to that of the Antients; for that it will not operate much by Stool, but is only a powerful Alternative, getting far into the Habit, and so promoting Sweat. See **PURGATIVE**.

He adds, that he has known it do Wonders in the Gout and Rheumatism; and that it rarely fails in Obstructions of the Menstrues.

HELLENISM, a Genus of *Grecicis*; or a Phrase accommodated to the Sent and Construction of the *Greek* Tongue. See **GREEK**.

The Word *Hellenism*, is distinguish'd from a *Grecicis*, in that the former is not apply'd to Authors who have wrote in *Greek*: Their Language, it is evident, should be a continual *Hellenism*: But it is apply'd to Authors, who writing in some other Language, use Turns and Expressions peculiar to the *Greek*.

There are Abundance of *Hellenisms* in the Vulgate Version of the Scriptures. See **VULGATE**.

HELLENISTIC, or HELLENISTIC Language, that used among the *Hellenists*. See **HELLENISTS**.

The Critics are divided as to this Language. — Several of them, and among the rest *Drossius* and *Sealiger*, take it to be the Language used among the *Grecian Jews*. They add, that 'tis in this Language the *Greek* Translation of the Seventy was wrote; and even the Books of the New Testament compos'd. — M. *Simon* calls it the Language of the Synagogue.

It must not be imagin'd, that this was any peculiar Language distinct from all others; or even any peculiar Dialect of the *Greek*: 'Twas thus denominat'd, to shew that it was *Greek*, mix'd with *Hebraicisms*, and *Syriscisms*.

Salmassius has oppos'd the common Opinion of the Learned touching the *Hellenistic* Language; and has wrote two Volumes on the Subject. But his Disputation turns chiefly on Words.

HELLENISTS, HELLENISTE, a Term occurring in the *Greek* Text of the New Testament, and which in the *English* Version is render'd *Grecians*.

The Critics are divided as to the Signification of the Word. — *Oecumenius* in his *Scolia* on *Acti* VI. 1. observes, that it is not to be understood as signifying those of the Religion of the *Greeks*; but those who spoke *Greek*, τῶν ἑλληνιστῶν. The Authors of the Vulgate Version, indeed, render it, like ours, *Greci*; but the *Meditors du Port Royal*, more accurately, *Juifs Grecs*, *Greek* or *Grecian Jews*; it being the *Jews* who spoke *Greek* that are here spok'd of, and who are hereby distinguish'd from the *Jews* call'd *Hebrews*; that is, who spoke the *Hebrew* Tongue of that Time. See **HEBREW**.

The *Hellenists*, or *Grecian Jews*, were those who liv'd in *Egypt*, and other Parts, where the *Greek* Tongue prevail'd. 'Tis to them we owe the *Greek* Version of the Old Testament, commonly call'd the *Septuagint*, or *Seventy*. See **SEPTUAGINT**.

Salmassius, and *Vossius*, are of a different Sentiment with Regard to the *Hellenists*. The latter will only have them to be those who follow'd the *Greek* Party. — *Sealiger* is represent'd in the *Sealigeriana*, as asserting the *Hellenists* to be the *Jews* who liv'd in *Greece*, and who read the *Greek* Bible in their Synagogue.

HELM, in Navigation, a Horizontal Piece of Timber, serving to move another fitted into it at right Angles, call'd the *Rudder*. See **RUDDER**.

The *Helm*, or *Tiller of a Ship*, is a Beam, or Piece of Timber, fasten'd into the *Rudder*, and, in coming forward into the *Steeerage*; where he that stands at *Helm*, steers the Ship. See **STEEERAGE**, **SAILING**, &c.

To *A Lee the Helm*, signifies to put the *Helm* to the Lee-Side of the Ship. — To *Bear up the Helm*, is to let the Ship go before the Wind. — To *Port the Helm*, is to put the *Helm* over to the right Side of the Ship. — To *Right the Helm*, or *Helm the Mastship*, is to keep it even with the Middle of the Ship. — To *Starboard the Helm*, is to put it to the right Side of the Ship.

HELM, in Chymistry, is the Head of a Still, or Alembic; thus call'd, because its Figure of something resembles a *Helm*, or *Helmet*. See **ALEMBIC**.

Hence, to bring a Thing over the *Helm*, is the same as to force it by Fire up to the Top of the Vessel, that

it may distil down into the Receiver by the Beak of the Head. See DISTILLATION.

And when they say, such a Thing cannot be brought over the *Helms*, they mean, that it is of too fixed a Nature to be raised into Vapour, by the Force of Fire. See FIFTY and VOLATILITY.

HELMET, or HELM, an ancient Armour of Defence, wore by the Cavaliers, both in War, and in Tournaments, as a Cover and Defence of the Head; and still used by Way of Crest or Ornament, over the Shield or Coat of Arms. See CREST.

The *Helmet* is known by divers other Names, as the *Cask*, *Head-piece*, *Steel-Cap*, &c. See CASE.

The *Helmet* cover'd the Head and Face, only leaving an Aperture above the Eyes, secured by Bars, which served as a Visor.

The *Helmet* is bore in Armoury as a Mark of Nobility; and by the different Circumstances of the bearing of the *Helmet*, are the different Degrees of Nobility indicated. In *France*, whence all our *Heraldry* originally came, the following Rules obtain.

A Person newly ennobled, or made a Gentleman, bears over his Escutcheon a *Helmet* of bright Iron or Steel; in Profile, or standing sideways; the Visor quite close.

A Gentleman of three Descents bears it a little open, but still in Profile, shewing three Bars of the Visor.

Ancient Knights, &c. have it in Profile, but shewing five Bars; the Edges of Silver.

A Baron's *Helmet* is of Silver, the Edges gold; with seven Bars, neither quite in Profile, nor yet in Front; with a Coronet over it adorned with Pearls. See BARON.

Viscounts and Earls formerly bore a Silver *Helmet*, with gold Edges; its Position like the former: But now they bear it quite fronting, with a Coronet over it. See VISCOUNT and EARL.

Marquisses bear a Silver *Helmet*, damask'd, fronting; with eleven Bars, and their Coronet. See MARQUIS, &c.

Dukes and Princes have their *Helms*, damask'd, fronting, the Visor almost open, and without Bars; with their Coronets over them. See DUKE, &c.

Lastly, the *Helms* of Kings and Princes, are all of Gold, damask'd, full fronting, and the Visor quite open, and without Bars. See KING, &c.

The *Helms* of Bishops are to be turn'd to the left, to denote their Bishops. See BISHOP.

Among the *English Heraldry*, these LAWS are of late somewhat varied. — *Leigs* will have the *Helms* in Profile, and close, to belong to Knights: But all other Authors give it to Esquires and Gentlemen.

To a Knight they assign the *Helmet* standing right forward, and the Borer a little open. See KNIGHT.

The *Helmet* in Profile, or posited side-ways, and open, with Bars, belongs to a Nobleman under the Condition of a Duke.

The *Helmet* right forward, and open, with many Bars, is assigned to Dukes, Princes, and Kings.

Those turned sideways, are supposed to be giving Ear to the Commands of Superiors; and those right forwards to be giving Orders with absolute Authority.

Commonly there is but one *Helmet* in a Shield; but, sometimes, two or three; if there be two, they must be placed facing each other: If three, the two Extremes must be looking towards that in the middle.

HELMONTIAN Laudatum. See LAUDANUM.

HELPS, in the Mange. — To teach a Horse his Lessons, there are seven *Helps*, or Aids, to be known. — These are the *Voice*, *Rein*, *Bit*, or *Snaffle*; the *Cavos* of the Legs, the *Stirrups*, the *Spur*, and the *Ground*. See AID.

The *Helps* are occasionally turn'd into *Corrections*. See CORRECTION.

HELVETIC, something that has a Relation to the *Swissers*, or *Swiss* Cantons, who were anciently called *Helvetii*.

The *Helvetic* Body is the Republic of *Switzerland*, consisting of thirteen Cantons, which make so many particular Common-wealths. See CANTON.

By the LAWS, and Customs of the *Helvetic* Body, all Differences between the several States, and Republics are to be decided within themselves, without the Intervention of any foreign Power.

HELVIDIANS, a Sect of antient Hereticks, denominated from their Leader *Helvidius*.

Their distinguishing Principle was, that *Mary* the Mother of *Jesus* was not a Virgin; but had other Children by *Joseph*.

HEMEROBAPTISTS, a Sect among the antient *Jeews*, thus call'd from their washing and bathing every Day, in all Seasons. See BAPTISM.

Epiphanius, who mentions this as the fourth Herefy among the *Jeews*, observes, that in other Points they had much the same Opinions as the *Scribes* and *Pharisees*;

only they denied the Resurrection of the Dead, in common with the *Sadducees*, and retain'd a few other Impieties of these last.

D'Herbelot speaks of them as a Sect still subsisting: — The Disciples of St. *John Baptist*, says he, who in the first Ages of the Church were called *Hemerobaptistes*, have constituted a Sect, or rather a Religion a-part, under the Name of *Mendai Inbia*. These People, whom our Travellers call Christians of St. *John Baptist*, by Reason their Baptism is very different from ours, have been confounded with *Sabeans*, from whom, however, they are very different. See SABBANS.

HEMERODROMI, among the Antients, were Centinels, or Guards, appointed for the Security and Preservation of Cities, and other Places. See GUARD.

They went out of the City every Morning, as soon as the Gates were open'd, and kept all Day patrolling round the Place, sometimes making Excursions further into the Country, to see that there were no Enemies laying in wait to surprize them.

The Word is *Greek*, $\eta\mu\epsilon\rho\delta\rho\omicron\mu\omicron$, compounded of $\eta\mu\epsilon\rho$, Day, and $\delta\rho\omicron\mu\omicron$, Course, running about, &c.

HEMERODROMI, were also a Sort of *Couriers* among the Antients, who only travell'd one Day, and then deliver'd their Packets or Dispatches, to a fresh Man, who run his Day; and so on, to the End of the Journey. See COURIER.

The *Greeks* had of these Sort of Couriers, which they learnt from the *Persians*, the Inventors thereof, as appears from *Herodotus*. — *Augustus* had the same: At least, he established Couriers, who, if they did not relieve each other from Day to Day, yet did it from Space to Space, and that Space was not great.

HEMI, a Word used in the Composition of divers Terms, — It signifies the same with *Semi*, or *Demi*, viz. half; being an Abbreviature of $\eta\mu\epsilon\iota\sigma$, *hemisys*, which signifies the same. See SEMI and DEMI.

The *Greeks* retrench'd the last Syllable of the Word $\eta\mu\epsilon\iota\sigma$, in the Composition of Words; and after their Example we have done so too, in most of the Compound Words borrowed from them.

HEMICRANIA, in Medicine, a Species of *Cephalalgia*, or *Head-Ach*; wherein one Hemisphere, or half of the Head is affected. See CEPHALALGIA and HEAD-ACH.

HEMICYCLE, HEMICYCLUM, is a *Semicircle*. See SEMICIRCLE.

HEMICYCLE, is particularly applied in Architecture, to Vaults in the Cradle-Form; and Arches and Frames, or Sweeps of Vaults, constituting a perfect Semi-circle. See VAULT.

To construct an Arch of hewn Stone, they divide the *Hemicycle* into so many Voussiers; taking Care to make them an uneven Number, that there be no Joyn in the middle, where the Key-Stone should be. See KEY.

The *Hemicyclium* was also a Part of the *Orchestra* in the antient Theatre. — *Scaliger*, however, observes, it was no standing Part of the *Orchestra*; being only used in Dramatic Pieces, where some Person was supposed to be arrived from Sea, as in *Plautus*'s *Rudens*.

The Antient's had also a Sort of Sun-Dial, call'd *Hemicyclium*. — It was a concave Semicircle, the upper End or Cusp whereof look'd to the North.

There was a *Styl*, or *Gnomon*, rising from the middle of the *Hemicycle*, whereof that Point corresponding to the Centre of the *Hemicycle*, represented the Centre of the Earth: And its Shadow projected on the Concavity of the *Hemicycle* which represented the Space between one Tropic and another, the Sun's Declination, the Day of the Month, Hour of the Day, &c.

The Word is compounded of $\eta\mu\epsilon\iota\sigma$, *dimidius*, and $\kappa\omicron\upsilon\kappa\lambda\omicron$, *Circle*.

HEMINA, a Vessel used as a Measure among the antient *Romans*. See MEASURE.

The *Hemina* contain'd eight Ounces of Liquor; and was the 12th Part of the *Congius*. See CONGIUS.

The Word is form'd of the *Greek*, $\eta\mu\alpha$, *half*. Several Authors have wrote express Treatises on the *Roman Hemina*; particularly *McL. Arnaud* and *Pellerier*.

St. *Benedict* prescribes the *Hemina*, as the Portion or Quantity of Wine to be allowed the Religious of his Order at each Meal. *Fa. Mabillon*, who has wrote on the Subject, shews that this *Hemina* is a Measure peculiar to the *Benedictines*, as well as the Pound of Bread allowed the same Religious, which only consist'd of fifteen Ounces. *Fa. Lancaeus* has a Dissertation to prove that the *Hemina* of Wine, prescrib'd by St. *Benedict*, only amounts to a *Demi Septier* of *Paris* Measure; Others make it two *Septiers*; and others three.

HEMIOLUS, an ancient Mathematical Term, occurring chiefly in Medical Writers. — It signifies the Ratio of two Things, whereof the one contains the other once and an half; as 3 : 2, or 15 : 10. See **RATIO**.

Macrobins, on the *Somnium Scipionis*, L. II. C. 2. observes, that the Concord, call'd in the ancient Music *Diapente*, and in the Modern a *Fifth*, arises from this Proportion. See **FIFTH**.

The Word is compounded of *ἡμι*, *half*, and *ολος*, *whole*.

HEMIOPE, or **HEMIOPIUS**, a Musical Instrument in Use among the Antients. See **MUSIC**.

The *Hemiopeus* was a Flute with only three small Holes. See **FLUTE**.

The Word is compounded of *ἡμι*, and *οπίς*, *Hole*.

HEMIPLEGIA, or **HEMIPLEXIA**, in Medicine, a Palsy of one whole Side of the Body. See **PALSY** and **PARALYSIS**.

The Word is compounded of *ἡμι*, *half*, and *πλευρα*, *I strike*, or *seize*.

HEMISPHERE, **HEMISPHERIUM**, in Geometry, is one half of a Globe, or Sphere, when divided into two by a Plane passing thro' its Centre. See **SPHERE**.

If the Diameter of a Sphere be equal to the Distance of the two Eyes; and a right Line drawn from the Centre of the Sphere to the middle of that Distance, be perpendicular to the Line which joins the Eyes: The Eyes making a Rotation on the Axis, or middle Point between them, will see the whole Hemisphere. — If the Distance of the Eyes be either greater or lesser than the Diameter of the Sphere; in making such Rotation they will view respectively more or less than a Hemisphere. See **VISION**.

The Writers in Opticks demonstrate, that a Glass Hemisphere unites parallel Rays at the Distance of a Diameter, and one third of a Diameter from the Pole of the Glass. See **LEN**, **PARALLEL**, &c.

The Centre of Gravity of a Hemisphere is five Eighths of the Radius, distant from the Vertex. See **CENTRE**.

HEMISPHERE, in Astronomy, is particularly used for one half of the Mundane Sphere. See **WORLD**, **ASTRONOMY**, &c.

The Equator divides the Sphere into two equal Parts, call'd the *Northern* and *Southern Hemispheres*. See **EQUATOR**.

The *Northern Hemisphere*, is that half in whose Vertex is the North Pole. — Such is that represented by D P A, (*Tab. Astronomy Fig. 2*) terminated by the Equator D A, and having the Pole P in its Zenith. See **POLA** and **NORTH**.

The *Southern Hemisphere*, is that other half D Q A, terminated by the Equator D A; and having the South Pole Q in its Zenith. See **SOUTH**.

The Horizon also divides the Sphere into two Hemispheres, *upper* and *lower*. See **HORIZON**.

The *Upper Hemisphere* is that half of the Mundane Sphere H Z R, terminated by the Horizon H R, and having the Zenith Z in its Vertex. See **ZENITH**.

The *Lower Hemisphere*, is that other half H N R, terminated by the Horizon H R, and having the Nadir N in its Vertex. See **NADIR**.

HEMISPHERE, is also used for a Map, or Projection, of half the terrestrial Globe, or half the Celestial Sphere, on a Plane. See **MAP** and **PROJECTION**.

Hemispheres, are frequently called *Planispheres*. See **PLANISPHERE**.

The Word is compounded of *ἡμι*, *half*, and *σφαίρα*, *Sphere*, or *Globe*.

HEMISPHEROIDAL, in Geometry, something that approaches the Figure of a Hemisphere, but is not justly so. The Cacao opens when yellow and ripe, into two large Hemispheroids, three Foot in Diameter. *Freezier*.

HEMISTICH, in Poetry, half a Verse. See **VERSE**.

'Tis disputed, whether or no the *Hemistichs*, left in the *Aeneid*, were left with Design; or whether they are owing to the Work's being unfinished.

In *English*, &c. the Common and *Alexandrine Verses*, require a Rest at the End of each *Hemistich*: Common Verses at the End of four Syllables; and *Alexandrine* at the End of six. See **VERSE**, **PAUSE**, **REST**, **ALEXANDRINE**, &c. *Leonine Verses* rhyme both at the End and at the *Hemistich*. See **LEONINE**, **RHYME**.

The Word is compounded of *ἡμι*, *half*, and *ἄξον*, *Verse*. **HEMITONE**, in the ancient Music, was, what we now call an half Note or Tone. See **NOTE** and **TONE**.

HEMITRITEUS, in Medicine, an irregular, intermitting Fever, which returns twice every Day; by which it is distinguish'd from the *Quotidian*, which only returns once in the Day. See **FEVER**.

The Word is compounded of *ἡμι*, *half*, and *τριτῆρος*, *third*.

HEMLOCK, *Cicuta*, a Narcotic Plant; of some Use in Physic, in that Intention. See **NARCOTIC**.

There is a Plaster denominated from it in the College Dispensatory; consisting of the Juice of the Plant boiled up with Gums, &c.

The Common *Hemlock* is a Poison; tho' not of the violent Sort. — We have Instances of considerable Quantities being taken without the least Disorder. *Philosoph. Transact.* N^o. 251. See **POISON**.

The *Cicuta* so much celebrated among the Antients, was the Juice of a Species of this Plant, call'd *Oenanthe Aquatica*. See **CICUTA**.

HEMP, a Plant of great Use in the Arts and Manufactories; furnishing Thread, Cloth, Cordage, &c. See **THREAD**, &c.

Hemp, by Naturalists call'd *Cannabis*, bears a near Analogy to Flax, *Linum*; both in respect of Form, Culture and Use. See **FLAX**.

The Plant is annual; that is, must be sown a-fresh every Year. — It rises quick, into a tall, slender Sort of Shrub, whose Stem however is hollow, and big enough to be char'd, and thus used in the Composition of Gun-Powder. — Its Leaves arise by fives or sixes from the same Pedicle, and are a little jagged; yielding a strong Smell, which affects the Head. — Its Flowers grow grape-wise, opposite to each other, in Manner of a *St. Andrew's Cross*; each consisting of five yellowish Stamina, incompass'd with a like Number of Petals, purple without, and white within. — Its Fruit, or Seed, is small and round, fill'd with a white soft Pulp; and grows on the Top of the Stem; having its Pedicles distinct from those of the Flowers. — Lastly, its Bark is a Tissue of Fibres, join'd together by a soft Matter, which easily rots it.

Hemp is of two Kinds; Male, popularly call'd *Karl*; and Female, or *Fimble*. — 'Tis the Male alone that produces Seed, to perpetuate the Kind: From the Seed of the Male arises both Male and Female.

It does not appear, that the Antients were acquainted with the Use of *Hemp*, in respect of the Thread it affords. *Pliny*, who speaks of the Plant in his *Natural History*, L. XX. C. 25. says not a Word of it; contenting himself with extolling the Virtues of its Stem, Leaves and Root. In Effect, what some Writers of the *Roman Antiquities* remark, viz. that the *Hemp*, necessary for the Use of War, was all stored up in two Cities of the *Western Empire*, viz. at *Ravenna* and *Vienna*, under the Direction of two Procurators, call'd *Procuratores Liniarii*; must be understood of Flax.

The Seed is said to have the Faculty of abating Venereal Desires; and its Decoction in Milk, is recommended against the Jaundice, &c. — The Leaves are held good against Burns, and the Juice thereof against Distach's. — The Powder, or Flower, mix'd with any ordinary Liquor, is said to turn those who drink thereof, stupid.

The Culture and Management of *Hemp*, makes a considerable Article in Agriculture; there being divers Operations required therein, as *Pulling*, *Watering*, *Beating*, *Swinging*, &c.

The Plant is sown in *May*, in a warm, sandy, rich Soil; and is it self sufficient to destroy Weeds on any Ground. — About *Lammas* they begin to gather it; the Light or Female being first ripe. The Marks of its Maturity, are its Leaves turning yellow, and the Stalks white.

The Way of gathering, is to pull it up by the Roots; after which they bind it up in Handfuls or Bundles: The Male they let stand eight or ten Days in the Air, that the Seed may dry and ripen; after which they cut off the Heads, and beat or thrash them to get out the Seed. — They also beat the Female, to get out a thick ferid Sort of Dust, contain'd therein.

This done, they proceed to water or rate it, by laying it five or six Days in a Pool, or other stagnant Water, to rot the Bark. A Stream, or running Water, would do the Business much better, but that it infects the Water, and gives it a Quality very pernicious to the Health; for which Reason it is forbid to rate it in Waters used for domestic Purposes.

When rotted, and taken out again, they dry it; then Brake or beat out the dry Bark, or Hcx, which is the woody Part of the Stem, from the Rind or Bark which covers it, by crushing it in a tooth'd or nick'd instrument call'd a *Brake*, beginning with the Root End.

When the Bark is sufficiently broke, and hangs by small Shivers, they swingle or beat them out with a Piece of Wood, edged for the Purpose. — Note, the *Karl Hemp* they sometimes break with the Fingers, and strip off the Rind, without the Help of the *Brake*, or *Swingle*.

The next Thing is to beat the *Hemp*; which is done either on a Block, or in a Trough, with an Hammer, or with Beetles; till it feel sufficiently soft and pliable. — It remains now to be beekled, or passed thro' divers Tooth-Instruments, not unlike the Wool-dressers Combs, of different Fineness: This, separating the shorter Tow from it, the rest is fit to be spun, wove, &c. for Thread,

Cloth, Cordage, or the like. See SPINNING, COR-
DAGE, &c.

HENEDECAGON, in Geometry, a Figure which has
eleven Sides, and as many Angles. See FIGURE and
POLYGON.

In Fortification, it is taken for a Place defended by
eleven Bastions. See BASTION.

The Word is Greek, *ἑνδεκάγωνον*, compounded of *ἑνδεκά*,
eleven, and *γωνία*, *Angle*.

HENDECASYLLABUS, in the Greek and Latin
Poetry, a Verse of eleven Syllables. See VERSE.

Sapphic, and *Phalæce* Verses, are *Hendecasyllables*, or
Hendecasyllabic, E. gr.

Sap. *Jam satis terris nivis atque diræ, &c.*

Phal. *Paffer mortuus est mea Puella, &c.*

The Word is Greek, compounded of *ἑνδεκά*, *Eleven*,
and *σύνσλητος*, whence the Word Syllable is borrow'd.

HENOTICUM, in Church History, a famous Edict of
the Emperor Zeno, in the Vth Century, intended to
reconcile, and reunite the *Eutychians* with the *Catholics*.
See EUTYCHIAN.

It was procured of the Emperor, by Means of *Acacius*
Patriarch of *Constantinople*, with the Assistance of the Friends
of *Peter Mogza*.

The Sting of this Edict lies here, that it does not admit
the Council of *Chalcedon*, like the other three, but rather
seems to charge it with Errors. — It is in Form of a
Letter, address'd by Zeno to the Bishops, Priests, Monks,
and People of *Egypt* and *Iybia*. It was oppos'd by the
Catholics, and condemn'd in Form by Pope *Felix III.*

The Word is Greek, *ἑνωτική*, q. d. *unitiva*, *reconcilia-*
tive; of *ἑνω*, *I unite*.

HEPAR, in Anatomy, the Liver. See LIVER.

HEPAR Uterinum, the same with *Placenta*. See
PLACENTA.

HEPATIC, in Medicine and Anatomy, something that
relates to the Liver; which the Greeks call *ἥπαρ*, *Hepar*.
See LIVER.

HEPATIC Flux. See FLUXUS Hepaticus.

HEPATIC Vein, is that otherwise call'd *Basilica*.
See BASILICA.

HEPATIC Duct, is a Vessel more usually call'd *Porus*
Biliaris. See PORUS Biliaris.

HEPATIC-Cystic Duct. See CYST-HEPATIC Duct.

HEPATIC Aloet, is that otherwise call'd *Aloet Succo-*
trina. See ALOES.

HEPATIC Plexus. See PLEXUS Hepaticus.

HEPATITES, *Liver Stone*, in Natural History, a Sort
of Stone, thus denominat'd from its Liver-Colour. See
STONE.

HEPATITIS, in Medicine, an Inflammation of the
Liver, with an Abscess or Impothume thereof. See IN-
FLAMMATION and LIVER.

The *Hepatitis* bears a near Resemblance to the *Pleur-*
isy; only that its Symptoms are less intense. See PLEURISY.

It usually either kills the Patient, or diffuses, or suppu-
rates gradually, or degenerates into a *Schirrus*.

HEPATOSCOPIA, the Art of divining, or discover-
ing future, or hidden Things, by inspecting the Entrails
of Beasts. See DIVINATION.

The Word is compounded of the Greek *ἥπαρ*, the
Genitive of *ἥπαρ*, *Liver*, and *σκοπέω*, *I consider*; the
Liver being a Part principally regard'd.

The Romans call'd it *Extispicina*. See EXTISPICIN.

HEPTACHORD, in the antique Poetry. — *Heptachord*
Verses, were thosé sung or play'd on seven Chords; that
is, in seven different Notes, or Tones; and probably on an
Instrument with seven Strings.

The Word is compounded of *ἑπτά*, *septem*, and *χορδή*,
Chord, *String*.

HEPTAGON, in Geometry, a Figure consisting of
seven Sides and seven Angles. See FIGURE.

If the Sides be all equal, it is call'd a *Regular Hep-*
tagon. See REGULAR.

In Fortification, a Place strengthen'd with seven Bastions
for its Defence, is call'd a *Heptagon*. See BASTION.

The Word is compounded of *ἑπτά*, *septem*, seven, and
γωνία, *Angle*.

HEPTAGONAL Numbers, are a Sort of Polygonal
Numbers; wherein the Difference of the Terms of the
corresponding arithmetical Progression is five. See PO-
LYGONAL Number.

One Property, among others, of these Numbers, is, that
if they be multiplied by 40, and 9 added to the Product;
the Sum is a square Number. See NUMBER.

HEPTAMERIS, *EPTAMERIS*, literally signifies a seventh
Part; being form'd of the Greek, *ἑπτά*, *seven*, and *μέρις*,
Part or *Portion*.

The Word is used by M. *Savours*, in his *Principles of*
Aesthetics, for the seventh Part of a *Meris*; and in his
System, for the 43d Part of the *Octave*. See OCTAVE.

HEPTAMERON, a Term literally implying *seven*
Days; being compounded of *ἑπτά*, *seven*, and *ἡμέρα*, *Day*.
It is chiefly us'd as a Title of certain Books, con-
taining the Transactions of seven Days.

The *Heptameron* of *Margaret de Valois*, Sister to
Francis I. of France, and Queen of *Navarre*, is a very
ingenious Piece, in the Manner of *Boccace's Decameron*.

HEPTARCHY, a Government compos'd of seven Per-
sons: Or a Country govern'd by seven Persons; or divid'd
into seven Kingdoms. See GOVERNMENT.

The *Saxon Heptarchy*, included all the Southern Part
of *England*, which was canton'd out into seven petty
Kingdoms. It subsisted from the Year 428, to the Year
825, when King *Egbert* re-united them into one; and
made the *Heptarchy* into a Monarchy. See MONARCHY.

The Word is compounded of the Greek, *ἑπτά*, *seven*, and
ἀρχή, *Imperium*, *Command*, *Rule*.

HEPTATEUCH, in Matters of Literature, a Volume
consisting of seven Books: Or a Work in seven Books.

The Term is chiefly applied to the first seven Books of the
Old Testament, viz. *Genesis*, *Exodus*, *Leviticus*, *Numbers*,
Deuteronomy, *Joshua*, and *Judges*; that is, the five Books
of *Moses* call'd the *Pentateuch*; and the two following ones,
which are usually join'd therewith. See PENTATEUCH.

The Word is compos'd of *ἑπτά*, *seven*, and *τεχνη*,
I do, *I work*; whence *τεχνή*, a *Work*, *Book*, and
ἑπτάτευχος, *Heptateuch*, a *Work* of seven Parts; or seven
different Works join'd in one Volume.

HEPTHÉMIMÈRES, in the Greek and Latin Poetry,
a Sort of Verse consisting of three Feet, and a Syllable;
that is, of seven half Feet. See VERSE, FOOT, &c.

Such are most of the Verses in *Anacreon*.

Ἡπτά		λίγυρ		ἄρα		ἄρα,
Ἡπτά		οὐκ ἔστ'		μὲν δ'		Νῆρ, &c.

And that of *Aristophanes* in his *Plutus*:

Ἡ πέντε μὲν ἦν ἑπτά.

They are also call'd *Trimeter Catalectic*.

HEPTHÉMIMÈRES, or **HEPTHÉMIMÈRIDE**, is also a
Cesura, after the third Foot, that is, in the seventh half
Foot. See CESURA.

'Tis a Rule, that this Syllable, tho' it be short in it
self, must be made long, on Account of the *Cesura*, or
to make it an *Hepthemimeres*: As in that Verse
of *Virgil*.

Et furtilis agitatae Amor, & conscia Virtus.

It may be added, that the *Cesura* is not to be on the
fifth Foot, as it is in the Verse which *Dr. Harris* gives
us for an Example,

Ille latus niveum molli fultus Hyacintho.

This is not a *Hepthemimeres Cesura*, but a *Hemite-*
mimeret, i. e. of nine half Feet.

The Word is Greek, *ἑπταμήμερος*, compounded of *ἑπτά*,
seven, *ἡμέρα*, *half*, and *μέρις*, *Part*.

HERACLEONTES, antique Hereticks, of the Party
of the *Gnosticks*; thus call'd from their Leader, *Heracleon*.
See GNESTICUS.

S. Epiphanius, *Hæc. 36.* is very ample on this Heresy.
He represents *Heracleon* as one who had reform'd the
Theology of the *Gnosticks* in many Points; tho', at Bot-
tom, he had retain'd the principal Articles thereof. He
relin'd on the ordinary Interpretations of Abundance of
Texts of Scripture; and even alter'd the Words of some
to make them consist with his own Notions.

For Example, he maintain'd, that by those Words of
St. John, *all Things were made by him*, is not to be
understood the Universe, and all that is good therein: The
Universe, which he calls *ἔσθω*, was not made by the Word,
but was made before him. And to support this Construction,
he added to those Words of *St. John*, *without him nothing*
was made, those other Words of *Things in the World*.

He distinguish'd two Kinds of Worlds; the one Di-
vine, the other Corruptible; and restrain'd the Word
ἔσθω, *all Things*, to this last. He held that the Word
did not create the World immediately, and of himself, but
only gave Occasion to the *Demurgos* to do it.

The *Heracleontes*, after the Example of their Master,
annul'd all the antique Prophecies; holding, that *St. John*
was really the Voice that proclaimed and pointed out the
Messiah, but that the Prophecies were only empty Sounds, and
signified nothing. — They held themselves superior in Point
of Knowledge to the Apostles; and on that footing dared
to advance the most extravagant Paradoxes, on Pretence of
explain-

explaining Scripture in a sublime, elevated Manner. They were so fond of these Mystic Interpretations, that *Origen*, tho' a Stickler that Way himself, was obliged to reproach *Heraclion* with his abusing Scripture by that Means. See *PROPHETCY, ALLEGORY, &c.*

HERACLIDES, in Antiquity, the Descendants of *Hercules*; whom the Greeks called *Ἡρακλῆδες, Heracles*.

The *Heraclides* were expelled from *Peloponnesus*, by *Eurystheus* King of *Mycene*, after the Death of *Hercules*.

The Return of the *Heraclides* into *Peloponnesus*, is a celebrated Epocha in the ancient Chronology; tho' the Time when it happen'd is differently assign'd, by reason Authors mistake the divers Attempts which they made to return, for the Return it self. The first Attempt was 20 Years before the taking of *Troy*: The second, was 100 Years later, or 80 Years after the taking of *Troy*. This last is supposed to have succeeded; at least, according to *Petavius*, who mentions only these two. *Rat. Temp.* P. I. l. 1. C. 12. and *Doctr. Temp.* l. IX. and C. 30.

Scaliger distinguishes three Attempts; and fixes the first, 50 Years later than *Petavius*, viz. 30 Years after the taking of *Troy*. He says nothing of the second, which was unfortunate like the first; but places the third in the same Year with *Petavius*.—This Return occasion'd a World of Changes and Revolutions in the Affairs of *Greece*; scarce a State, or People, but were turn'd upside down thereby. See *EPOCHÆ*.

The Return of the *Heraclides* is the Epocha of the Beginning of profane History: All the Time that preceded it, is reputed fabulous. Accordingly, *Ephorus*, *Cumans*, *Callisthenes*, and *Theopompus*, only begin their Histories from hence. See *HISTORICAL*.

HERALD, an Officer of Arms, antiently in great Repute, and possess'd of several considerable Functions, Rights and Privileges. See *ARMS* and *ARMOURY*.

Their principal Employment was to compose, or make out Coats of Arms, Genealogies, and Titles of Nobility. They were the Superintendants of military Exploits, and the Conservators of the Honours of War. They had a Right to take away the Arms of such as for Cowardice, Treason, &c. deserv'd to be degraded. They had a Commission to examine, and correct the Vices and Disorders of the Nobles, and to exclude them from Juits, Tournaments, &c. To them belong'd the correcting of all Usurpations, and Abuses relating to Crowns, Coronets, Cafs, Crests, Supporters, &c. They took Cognizance of all Differences among the Nobles, with Respect to their Bearings, the Antiquity of their Families, Precedencies, &c. They went into the Countries to search into the Grounds and Pretensions of Nobility; and had a Right to open all Libraries, and to command all the ancient Charters and Instruments in the Archives to be shown them. They had Admission into all foreign Courts; where they were commission'd to proclaim War, and Peace; and their Persons were held sacred as those of Embassadors.

To them it belong'd to make Publication of Juits and Tournaments; to call the People to them; to signify the Cartels; to mark the Ground, List, or Place of Duel; to see fair play observ'd; and to divide the Sun between the two Parties. In the Army, they advertised the Cavaliers, and Captains, of the Day of Battle, and assisted therein, before the Standard, retiring, after the first Onset, to some Place of Eminence, there to observe who behaved best, and to give a faithful Report thereof to the King. They number'd the Dead, reliev'd the Ensigns, redemanded Prisoners, summon'd Places to surrender, and in Capitulations walk'd before the Governour of the Place, to secure and warrant his Person. They were the principal Arbitrators of the Distribution of the Spoils of the vanquish'd, and of military Rewards. They publish'd Victories; and gave Notifications thereof to foreign Courts. They convened the Estates of the Kingdom, assist'd at Royal Marriages, and frequently made the first Demand; officiated at solemn Feasts, &c.

The Origin of *Heralds* is very antient.—*Stentor* is represented by *Homer* as *Herald* of the Greeks, who had a Voice louder than fifty Men together. The Greeks call'd them *ἀγορεύς*, and *εὐαγγελιστάς*; and the Romans, *Feciales*. See *FECIALES*.

The Romans had a College of *Heralds*, appointed to decide whether a War were just or unjust; and to prevent its coming to open Hostilities, till all Means had been attempted for deciding the Difference in a pacific Way. See *COLLEGE*.

Heralds, or *Heralds at Arms*, have formerly been denominated *Dukes at Arms*, because properly belonging to *Dukes*; as *Kings at Arms*, to *Kings*. See *KING* at *Arms*.

In *England*, we have six *Heralds*, viz. 1^o. *Richmond*, 2^o. *Lancaster*, 3^o. *Chester*, 4^o. *Windſor*, 5^o. *Southerſet*, 6^o. *Tork*. Their Office is to wait at Court, to attend public Solemnities, proclaim War and Peace; to look to the Regu-

lation of the Bearings of Arms, search Pedigrees, &c.

They were formerly created and christen'd by the King, who slowly pouring a gold Cup of Wine on their Head, gave them their *Herald's* Name: Now 'tis done by the Earl Marshal.—They could not arrive at the Dignity of *Herald*, without having been seven Years Pursuivant: Nor could they quit the Function of *Herald*, but to be made King at Arms. See *POURSUIVANT*, &c.

The modern *Heralds*, i. e. those we properly call *Heralds*, have lost a good deal of the Distinction and Offices of the ancient ones. What relates to the making out Arms, the rectifying of Abuses therein, &c. is chiefly committed to the *Kings at Arms*.

And in the Army, Drums and Trumpets have succeeded to the Function of *Heralds*; being sent by the Generals on the same Errands; and on that Account enjoying the same Rights and Privileges. Their Persons are under the Protection of the Law of Nations, when they bear the Marks of their Office publicly, i. e. the Trumpeter his Trumpet, and the Drummer his Drum; in the same Manner as the *Herald* his Coat.

The six *Heralds*, with the three *Kings at Arms*, and the four *Poursuivants*, are a College, or Corporation; erected into such by Charter of *Richard III.* who granted them divers Privileges, as to be free from Subsidies, Tolls, and all troublesome Offices. See *COLLEGE of ARMS*.

Clarencieux, and *Norroy King at Arms*, are also call'd *Provincial Herald*s. See *CLARENCIEUX*, &c.

The Word *Herald*, according to *du Cange*, comes from the two German Words, *Here*, Army; and *helo*, or *held*, Servant; because chiefly serving in the Army: Others, will have the two Words signify *Champion of the Army*, in Allusion to their Office of denouncing War, proclaiming Peace, &c.—*Du Cange* adds, that they were call'd *Clavigarii* as well as *Heralds*.

Borel derives the Word from the Latin *Hermus*, Master; q. d. one coming from his Master. Others from *Herbus*, q. d. High-lord; others from *Herold*, which is the same with *Dominus Veteranus*: And others, lastly, from *beerbold*, q. d. faithful to his Lord, or the Army.

HERALDRY, the Art of Armoury, and Blazoning; or the Knowledge of what relates to the Bearing of Arms, and the Laws and Regulation thereof. See *ARMS*, *ARMOURY*, *BLAZON*, &c.

Heraldry likewise comprehends what relates to the Marshaling of solemn Cavalcades, Processions, and other Ceremonies at Coronations, Installments, Creations of Peers, Funerals, Nuptials, &c. See *HERALD*.

HERB, a Name common to all Plants whose Stalks, or Stems, die away every Year, after their Seed is become ripe. See *PLANT*.

There are some *Herbs* whose Root perishes with the Stem: And others, where the Root survives the Stem by several Years. See *ROOT* and *STEM*.

Of the former, those which come to Maturity the first Year, and after they have cast their Seed, die away; are call'd *Annuals*: Such are *Wheat*, *Rye*, &c. See *ANNUALS*.

Those which only bear Flowers and Fruit the second Year, or even the third Year, and then perish; are call'd *Biannuals*: Such are the *Garden Angelica*, and some others.

Herbs whose Root does not perish after they have shed their Seed, are call'd *Perennials*; such are *Mint*, *Fennel*, &c. See *PERENNIAL*.

Of the, some keep their Leaves all the Year round, and are call'd *Ever-green*s; as the *Azaraea*, *yellow Violet*, &c. See *EVER-GREEN*.

The rest lose their Leaves, and continue bare, part of the Year; as *Fern*, *Colts-foot*, &c.

Herbs are also distinguished into *Kitchen*, or *Sallet-Herbs*, and *Medicinal Herbs*.

Sallet-Herbs, } See *SALLET*.
Pos-Herbs, } See *POT-HERB*.

The Word *Herb* is form'd of the Latin *Herba*; which some derive from *Aronum*, Field: Others derive it from the Greek, *ἔρβη*, *pacere*, to feed; of *ἔρβη*, *Padulum*. Of the Greek *Forbe*, the *Latini* form'd *Herba*; and of *Forba*, *Herba*, after the Manner of the *Spaniards*, who always change the *f* at the Beginning of a Word into *b*. See *F* and *H*.

HERBAGE, a collective Name, comprehending all Kinds of *Herbs*. See *HENN*.

The antient Hermits liv'd altogether of *Herbage*. See *HERMIT*.

What makes the principal Difference in the Goodness of *Butters* and *Cheeses*, is the Difference of *Herbage*. See *BUTTER*, &c.

HERBAGE, in Law, signifies the Pasture, or Fruits of the Earth, provided by Nature for the Bite or Mouth of Cattle. See *PASTURE*, &c.

The Word is also used for a Liberty, that a Man hath to feed his Cattle in another Man's Ground; as, in the Forest.—*Oecurrit frequens* (says Spelman) *pro jure depascendi alienum solum, ut in forejis.*

HERBAL, a Book which treats of Plants; or describes the Figure, Genus, Species, Properties, Virtues, &c. of Herbs, Trees, Seeds, &c. See PLANT.

Such are *Gerard's Herbal*, *Parkinson's Herbal*, &c.

HERBAL, is also used for a Set or Collection of Specimens of the several Kinds of Plants, dried and preserved in the Leaves of a Book.

In the *Philosophical Transactions*, we have a Method described for preserving Specimens for such an Herbal.—The Flowers, Leaves, &c. gather'd perfectly ripe, and in their true Colours, are to be spread on brown Paper, with the Parts all display'd as distinctly as may be. If the Stem, or the Body of the Flower, &c. be thick, one half to be pared away to make it lye flat. Over them is to be spread another brown Paper; and the whole to be put between two Iron Plates, screw'd tight together, and thus baked in an Oven for two Hours. When taken out, wash them over with a Mixture of Brandy and *Aqua fortis*, and lay them on fresh Paper to dry. Lastly, lick over the Backsides with a Brush dipped in a Dissolution of *Gum Dragon*, to make them stick; and lay them in the Paper Book, where they will lye fast, and always look fresh.

HERBALIST, or HERBORIST, a Person knowing in Plants; the same with *Botanist*. See BOTANIST.

HERBE, in the Academies, a Reward, or some good Staff given to a Horse that has work'd well in the Manège. See HORSE, &c.

HERBENGER, or HARBINGER, an Officer of the King's Court, who allots the Noblemen, and those of the Household their Lodging. See HARBINGER.

HERCULES, in Astronomy, one of the Constellations of the Northern Hemisphere. See CONSTELLATION.

The Stars in the Constellation *Hercules*, in *Protonoy's* Catalogue are 29: In *Tycho's* 28: In the *Britannic* Catalogue 95. The Longitudes, Latitudes, Magnitudes, &c. whereof are as follow.

HERCULEUS *Morbis*, in Medicine, the Epilepsy; thus call'd, from the Terror of its Attacks, and the Difficulty of Cure. See EPILEPSY.

HERD, among Hunters, a Company, or Assemblage, of black or fallow Beasts; in Contradistinction to *Flock*. See FLOCK.

A *Herd* of Deer from such a Forest.—The Deer begin to *herd* in the Month of *December*. See GAME, HUNTING, &c.

In the Hunting Language, there are various Terms used for Companies of the divers Kinds of Game.—We say a *Herd* of Harts or Bucks; a *Bevy* of Roes; a *Rest* of Wolves; a *Richest* of Martens, &c. See HUNTING.

The Word is form'd of the ancient Gaulish *Hordage*, signifying the same Thing.

HERDEWICH, HERDEWIC, HERDEWYCH, in our ancient Law-Books, a Grange, or Place for Cattle and Husbandry. See GRANGE.

Es unum Herdewycham *apud* *Hesbecorum* in *Peco*, &c. Mon. Angl.

HEREBOTE, the King's Edict antiently issued to command his Subjects into the Field.

The Word is form'd of the Saxon *Here*, Exercitus, *Army*; and *Bode*, a *Messenger*.

HEREDITAMENTS, in Law, are such Things immovable, as a Man may have to himself and his Heirs, by Way of Inheritance; or which, not being otherwise bequeathed, do naturally, and of Course, descend to him, and

explaining Scripture in a sublime, elevated Manner. They were so fond of these Mytic Interpretations, that *Origen*, tho' a Stickler that Way himself, was obliged to reproach *Heraclides* with his abusing Scripture by that Means. See *PROPHETRY*, ALLEGORY, &c.

HERACLIDES, in Antiquity, the Descendants of *Heraclides*; whom the *Greeks* call'd *Ἡρακλίδαι*.

The *Heraclides* were expell'd from *Peloponnesus*, by *Euristheus* King of *Myceen*, after the Death of *Hercules*.

The Return of the *Heraclides* into *Peloponnesus*, is a celebrated Epoch'a in the ancient Chronology; tho' the Time when it happen'd is differently assign'd, by reason Authors mistake the divers Attempts which they made to return, for the Return it self. The first Attempt was 20 Years before the taking of *Troy*: The second, was 100 Years later, or 80 Years after the taking of *Troy*. This last is supposed to have succeed'd; at least, according to *Petavius*, who mentions only these two. *Rat. Temp.* P. I. l. 1. C. 12. and *Distr. Temp.* l. IX. and C. 30.

Scaliger distinguishes three Attempts; and fixes the first, 50 Years later than *Petavius*, viz. 30 Years after the taking of *Troy*. He says nothing of the second, which was unfortunate like the first; but places the third in the same Year with *Petavius*.—This Return occasion'd a World of Changes and Revolutions in the Affairs of *Greece*; scarce a State, or People, but were turn'd upside down thereby. See *EPOCHIA*.

The Return of the *Heraclides* is the Epoch'a of the Beginning of profane History: All the Time that preceded it, is reputed fabulous. Accordingly, *Ephorus*, *Cassius*, *Callisthenes*, and *Theopompus*, only begin their Histories from hence. See *HISTORICAL*.

HERALD, an Officer of Arms, antiently in great Repute, and possess'd of several considerable Functions, Rights and Privileges. See *ARMS* and *ARMOURY*.

Their principal Employment was to compose, or make out Coats of Arms, Genealogies, and Titles of Nobility. They were the Superintendants of military Exploits, and the Conservators of the Honours of War. They had a Right to take away the Arms of such as for Cowardice, Treason, &c. deserv'd to be degraded. They had a Commission to examine, and correct the Vices and Disorders of the Nobles, and to exclude them from Justs, Tournaments, &c. To them belong'd the correcting of all Usurpations, and Abuses relating to Crowns, Coronets, Castles, Crests, Supporters, &c. They took Cognizance of all Differences among the Nobles, with Respect to their Bearings, the Antiquity of their Families, Precedencies, &c. They went into the Countries to search into the Grounds and Pretensions of Nobility; and had a Right to open all Libraries, and to command all the ancient Charters and Instruments in the Archives to be shown them. They had Admission into all foreign Courts; where they were commission'd to proclaim War, and Peace; and their Persons were held sacred as those of Embassadors.

To them it belong'd to make Publication of Justs and Tournaments; to call the People to them; to signify the Carrels; to mark the Ground, Lift, or Place of Duell; to see fair play observ'd; and to divide the Sun between the two Parties. In the Army, they advertised the Cavaliers, and Captains, of the Day of Battle, and assisted therein, before the Standard, retiring, after the first Onset, to some Place of Eminence, there to observe who behaved best, and to give a faithful Report thereof to the King. They number'd the Dead, reliev'd the Ensigns, redemanded Prisoners, summon'd Places to surrender, and in Capitulations walk'd before the Governour of the Place, to secure and warrant his Person. They were the principal Arbitrators of the Distribution of the Spoils of the vanquish'd, and of military Rewards. They publish'd Victories; and gave Notifications thereof to foreign Courts. They convened the Estates of the Kingdom, assisted at Royal Marriages, and frequently made the first Demand; officiated at solemn Feasts, &c.

The Origin of *Heralds* is very antient.—*Stentor* is represented by *Homer* as *Herald* of the *Greeks*, who had a Voice louder than fifty Men together. The *Greeks* call'd them *κρηστῆς*, and *εὐφρονας*; and the *Romans*, *Feciales*. See *FECIALES*.

The *Romans* had a College of *Heralds*, appointed to decide whether a War were just or unjust; and to prevent its coming to open Hostilities, till all Means had been attempted for deciding the Difference in a pacific Way. See *COLLEGE*.

Heralds, or *Heralds at Arms*, have formerly been denominated *Dukes at Arms*, because properly belonging to Dukes; as Kings at Arms, to Kings. See *KING at Arms*.

In *England*, we have six *Heralds*, viz. 1.^o *Richmond*, 2.^o *Lancaster*, 3.^o *Chester*, 4.^o *Windsor*, 5.^o *Somerset*, 6.^o *York*. Their Office is to wait at Court, to attend public Solemnities, proclaim War and Peace; look to the Regu-

lation of the Bearings of Arms, search Pedigrees, &c.

They were formerly created and christen'd by the King, who slowly pouring a gold Cup of Wine on their Head, gave them their *Herald's* Name: Now 'tis done by the Earl Marshal.—They could not arrive at the Dignity of *Herald*, without having been seven Years Pursuivant: Nor could they quit the Function of *Herald*, but to be made King at Arms. See *POURSUIVANT*, &c.

The modern *Heralds*, i. e. those we properly call *Heralds*, have lost a good deal of the Distinction and Offices of the antient ones. What relates to the making out Arms, the rectifying of Abuses therein, &c. is chiefly committed to the *Kings at Arms*.

And in the Army, Drums and Trumpets have succeeded to the Function of *Heralds*; being sent by the Generals on the same Errands; and on that Account enjoying the same Rights and Privileges. Their Persons are under the Protection of the Law of Nations, when they bear the Marks of their Office publicly, i. e. the Trumpeter his Trumpet, and the Drummer his Drum; in the same Manner as the *Herald* his Coat.

The six *Heralds*, with the three Kings at Arms, and the four Pursuivants, are a College, or Corporation; created into such by Charter of *Richard III.* who granted them divers Privileges, as to be free from Subsidies, Tolls, and all troublesome Offices. See *COLLEGE of Arms*.

Clarencieux, and *Norroy King at Arms*, are also call'd *Provincial Herald*s. See *CLARENCEUX*, &c.

The Word *Herald*, according to *du Cange*, comes from the two *German* Words, *Here*, Army; and *bold*, or *held*, Servant; because chiefly serving in the Army: Others, will have the two Words signify *Champion of the Army*, in Allusion to their Office of denouncing War, proclaiming Peace, &c.—*Du Cange* adds, that they were call'd *Clavigeris* as well as *Heralds*.

Borel derives the Word from the Latin *Herus*, Master; q. d. one coming from his Master. Others from *Herbans*, q. d. High-lord; others from *Herold*, which is the same with *Dominus Veteranus*: And others, lastly, from *herbans*, q. d. faithful to his Lord, or the Army.

HERALDRY, the Art of Armoury, and Blazoning; or the Knowledge of what relates to the Bearing of Arms, and the Laws and Regulation thereof. See *ARMS*, *ARMOURY*, *BLAZON*, &c.

Heraldry likewise comprehends what relates to the Marshaling of solemn Cavalcades, Processions, and other Ceremonies at Coronations, Installments, Creations of Peers, Funerals, Nuptials, &c. See *HERALD*.

HERB, a Name common to all Plants whose Stalks, or Stems, die away every Year, after their Seed is become ripe. See *PLANT*.

There are some *Herbs* whose Root perishes with the Stem: And others, where the Root survives the Stem by several Years. See *ROOT* and *STEM*.

Of the former, those which come to Maturity the first Year, and after they have cast their Seed, die away; are call'd *Annuals*: Such are *Wheat*, *Rye*, &c. See *ANNUALS*. Those which only bear Flowers and Fruit the second Year, or even the third Year, and then perish; are call'd *Bisannuals*: Such are the Garden *Angelica*, and some others.

Herbs whose Root does not perish after they have shed their Seed, are call'd *Perennials*; such are *Mint*, *Fennel*, &c. See *PERENNIAL*.

Of the'se, some keep their Leaves all the Year round, and are call'd *Ever-green*s; as the *Asarabacca*, *yellow Violet*, &c. See *EVER-GREEN*.

The rest lose their Leaves, and continue bare, part of the Year; as *Fern*, *Colts-foot*, &c.

Herbs are also distinguish'd into *Kitobin*, or *Sallet*-*Herbs*, and *Medicinal Herbs*.

Sallet-*Herbs*, } See { *SALLET*.
Por-*Herbs*, } See { *POT-HERB*.

The Word *Herb* is form'd of the Latin *Herba*; which some derive from *Arvum*, Field: Others derive it from the *Greek*, *εἶσθαι*, *pasce*, to feed; or of *εἶσθαι*, *Pabulum*. Of the *Greek* *Ferbo*, the *Latins* form'd *Ferba*; and of *Ferba*, *Herba*, after the Manner of the *Spaniards*, who always change the *f* at the Beginning of a Word into *b*. See *F* and *H*.

HERBAGE, a collective Name, comprehending all Kinds of *Herbs*. See *HEAR*.

The antient *Hermits* liv'd altogether of *Herbage*. See *HERMIT*.

What makes the principal Difference in the Goodness of *Butters* and *Cheeses*, is the Difference of *Herbage*. See *BUTTER*, &c.

HERBAGE, in Law, signifies the Pasture, or Fruits of the Earth, provided by Nature for the Bite or Mouth of Cattle. See *PASTURE*, &c.

At *Athens*, and *Rome*, they look'd on *Hermaphroditus* as ominous Monsters, and precipitated them into the Sea; as we are inform'd by *Alexander ab Alexandro*.

S. de Rennefort relates, that at *Syrac* there are Abundance of *Hermaphroditus*; who, with Women's Cloaths, wear Men's Turbans, to distinguish them, and let all the World know they have two Sexes.

In 1576, *Albert*, Bishop of *Bremen*, and Brother of the Duke of *Brunsvic*, was accus'd by *John de Tostewaltes*, or *Cestrosel*, Dean of his Chapter, with being an *Hermaphroditus*; but he cleared himself.

J. Frederic Meyer, a Lutheran Divine, has an express Dissertation, to prove that an *Hermaphroditus* cannot be a Priest: It was printed at *Gryffwald* in 1705. And *Willenberg*, another Lutheran of *Danzwick*, has wrote to prove them excluded from all Civil Employments, like Women.

The Word is form'd of the Greek, *ἡρμαφροδιτ*, a Compound of *ἡρμα*, *Mercury*, and *αφροδιτ*, *Venus*, q. d. a Mixture of *Mercury* and *Venus*, i. e. of Male and Female.

For, it is to be observed, *Hermaphroditus* was originally a proper Name; applied, by the Heathen Mythologists; to a fabulous Deity, whom some represent as a Son of *Hermes*, *Mercury*, and *Aphroditus*, *Venus*; and who being desperately in Love with the Nymph *Salmacida*, obtain'd of the Gods to have his Body and hers united into one. Others say, that the God *Hermaphroditus* was conceiv'd as a Composition of *Mercury* and *Venus*, to exhibit the Union between Eloquence, or rather Commerce, whereof *Mercury* was God; with Pleasure, whereof *Venus* was the proper Deity. Lastly, others think this Junction intended to shew that *Venus*, Pleasure, was of both Sexes: As, in Effect, the Poet *Calvus* calls *Venus* a God.

Pollentemque Deum Venerem.

As also *Virgil*, *Æneid*. Lib. II.

*Difcedo ac ducento Deo flammam inter & hostes
Expeditur*

Helychius observes *M. Spon*, calls *Venus Aphroditus*; and *Theophrastus* affirms, that *Aphroditus*, or *Venus*, is *Hermaphroditus*; and that in the Island of *Cyprus* he has a Statue, which represents her with a Beard like a Man.

HERMAPHRODITE, is also applied, metaphorically, to divers other Things beside Men.

The latest Botanists and Florists, make a Division of Plants, which they call *Hermaphroditus*; as having both the Male and Female Parts of Generation, viz. the Stamina and Pistil in the same Flower. See *PLANT*, *FLOWER*, *GENERATION*, *PISTIL*, &c.

Divers of the Insect and Reptile Kind, are also *Hermaphroditus*; particularly Worms, Snails, &c. See *INSECT*, &c.

In the Memoirs of the French Academy, we have an Account of a very extraordinary Kind of *Hermaphroditus*, which not only have both Sexes, but do the Office of both at the same Time. — Such are Earth-Worms, the round tail'd Worms found in the Intestines of Men and Horses; Land-Snails, and those of fresh Waters; and all the Sorts of Leeches. And as all these are Reptiles, and without Bones, *M. Ponsart* concludes it probable, that all other Insects which have those two Characters, are also *Hermaphroditus*.

The Method of Coupling, practis'd in this Class of *Hermaphroditus*, may be illustrated in the Instance of Earth-Worms. These little Serpents creep, two by two, into Holes proper to receive them; where they dispose their Bodies in such Manner, as that the Head of the one is turn'd to the Tail of the other. Being thus stretch'd out length-wise, a little conical Buxon, or *Papilla*, is thrust forth by each, and received into an Aperture of the other.

These Animals, being Male at one End of the Body, and Female at the other; and the Body flexible withal; *M. Homberg* does not think it impossible but that an Earth-Worm may couple with it self; and be both the Father and Mother of its young.

HERMATHENA, in Antiquity, a Figure representing *Mercury* and *Minerva* both in one.

M. Spon gives divers Figures of *Hermathena*, in his *Rech. Cur. de l'Antiquité*, p. 98. They are a Sort of Statues rais'd on square Pedestals, after the Manner of *Hermes*; only that the Attributes of *Minerva* are added thereto. See *HERMES*.

The Word is a Compound of *Hermes*, *Mercury*; and *Athens*, a Greek Name of *Minerva*.

HERMERACLES, in Antiquity, a Figure compounded of *Mercury* and *Hercules*.

M. Spon gives us a Type of an *Hemeracles*, *Rech. Cur. de l'Antiq.* p. 96. fig. xlii. The Name *Hemeracles*, he observes, was given to a Divinity, represented after the Manner of *Hermes*, with the additional Attributes of *Hercules*, viz. a Lion's Skin and a Club. — This he ascribes to the Custom among the Greeks, of placing the Statues of *Mercury* and *Hercules* in the Academy, and *Gymnasiums*, as both the one and the other presided over the Exercises of the Youth.

HERMES, among Antiquaries, a Sort of Figure or Statue, of the God *Mercury*; usually made of Marble, tho' sometimes of Brass, without Arms or Legs; and planted by the Greeks and Romans in their Cross-ways.

Servius gives us the Origin hereof, in his Comment on the VIIIth Book of the *Æneid*. Some Shepherds, says he, having one Day caught *Mercury*, call'd by the Greeks *Hermes*, asleep, on a Mountain; they cut off his Hands; from which he, as well as the Mountain where the Action was done, became denominat'd *Cyllenius*, from *κύλλω*, *main'd*: And thence, adds *Servius*, it is, that certain Statues without Arms are denominat'd *Hermes's*, *Hermetes*.

But this Etymology of the Epithet *Cyllenius*, contradicts most of the other ancient Authors, who derive it hence, that *Mercury* was born at *Cyllenus*, a City of *Arcadia*, or even on the Mountain *Cyllenus* it self, which had been thus call'd before him.

Suidas gives a Moral Explication of this Custom of making the Statues of *Mercury* without Arms. The *Hermetes*, says he, were Statues of Stone placed at the Vestibles, or Porches of the Doors, and Temples at *Athens*; For this Reason, that as *Mercury* was held the God of Speech and of Truth, square and cubical Statues were peculiarly proper; having this in common with Truth, that on what Side soever they are view'd, they always appear the same.

It must be observed, that *Athens* abounded more than any other Place in *Hermes's*: There were Abundance of very signal ones in divers Parts of the City; and they were one of the principal Ornaments of the Place. They were also placed in the high Roads and Cross-ways, by Reason *Mercury*, who was the Conier of the Gods, presided over the High-ways: Whence his Surname of *Troicus*, from *Troicus*, and that of *Vicinus*, from *Via*.

From *Suidas's* Account above cited, it appears, that the Terms, *Ternini*, us'd among us in the Doors, Balconies, &c. of our Buildings, take their Origin from these *Athenian Hermes's*; and that it were more proper to call them *Hermetes* than *Ternini*; for that tho' the Roman *Ternini* were square Stones, whereon a Head was frequently placed, yet they were rather us'd as Land-Marks, and mere-Stones, than as Ornaments of Building. See *TERNINI*.

HERMETIC, or *HERMETICAL Art*, a Name given to Chymistry, on a Supposition that *Hermes Trifonius* was the Inventor thereof, or excell'd therein. See *CHEMISTRY*.

We know but little of this *Hermes*, only that he was an ancient King of *Egypt*, 1000 Years prior to *Æsculapius*. *Zosimus Pannopolitanus* mentions him as having wrote of *Natural Things*; and there are several Pieces still extant under his Name, but all supposititious. See *VOLUME*.

HERMETICAL Philoſophy, is that which undertakes to solve and explain all the Phenomena of Nature, from the three Chymical Principles, *Salt*, *Sulphur*, and *Mercury*. See *PHILOSOPHY*. See also *PRINCIPLE*, &c.

A considerable Augmentation was made to the ancient *Hermetical Philoſophy* by the modern Doctrine of Alkali and Acid. See *ALKALI* and *ACID*.

HERMETICAL Physic, or *Medicine*, is that System, or Hypothesis, in the Art of Healing, which explains the Causes of Diseases, and the Operations of Medicines on the Principles of the *Hermetical Philoſophy*; and particularly on the System of Alkali and Acid. See *MEDICINE* and *CHEMISTRY*.

HERMETICAL Seal, a Manner of stopping or closing Glass Vessels, for Chymical Operations, so very accurately, that nothing can exhale, or escape; not even the most subtle Spirits.

It is perform'd by heating the Neck of the Matrass, or other Vessel, in the Flame of a Lamp, till it be ready to melt; and then with a Pair of Pinchers twisting it close together. — This they call putting on *Hermes's Seal*. Tho', there are other Ways of sealing Vessels *Hermetically*, viz. by stopping them with a Plug, or Stopp of Glass, well luted into the Neck of the Vessel. — Or, by turning another *Ovum Philoſophicum* upon that whercin the Matter is contain'd.

HERMHPROCRATES, in Antiquity, a Deity, or Figure of a Deity, compos'd of *Mercury*, and *Harpocrates*, the God of Silence.

M. Spou gives us an *Hermakropocrates*, in his *Rech. Cur. de l'Antiquité*, p. 98. fig. xv. having Wings on his Feet, like *Mercury*; and laying his Finger on his Mouth, like *Hercules*. 'Tis probable they might mean by this Combination, that Silence is sometimes Eloquent.

HERMIANS, HERMIANI, or HERMIOTITE, a Sect of Hereticks, in the II^d Century; thus called from their Leader *Hermias*.

One of their distinguishing Tenets was, that God is Corporal. They are also call'd *Seleucians*. See **SELEUCIANS**.

HERMIT, or EREMIT, EREMITA, a devout Person, retir'd into a Solitude, to be more at Leisure for Contemplation, and to disengage himself of the Affairs of the World. See **ANCHOREY**.

The Word is form'd of the Greek, *ἔρημος*, *Eremus*, Wilderness; and, according to the Etymology, should rather be wrote *Eremis*, the Spirit being soft.

A *Hermit* is not reputed a Religious, unless he have made the Vows. See **MONK, Vow, &c.**

Paul, firamed the *Hermit*, *Pavlus Eremitanus*, is usually reckon'd the first *Hermit*; tho' *St. Jerom*, at the Beginning of the Life of that Saint, says, it is not known who was the first. — Some go back to *St. John the Baptist*, and others to *Elias*.

Others make *St. Anthony* the Founder of the *Hermiteical* Life: But others take him to have only rekindled and heighten'd the Fervour thereof; and hold, that the Disciples of that Saint own'd *St. Paul of Thebes* for the first that practis'd it. — The Persecutions of *Decius* and *Valerian* are supposed to have been the Occasion.

Several of the ancient *Hermits*, as *St. Anthony*, &c. tho' they lived in Deserts; had yet Numbers of Religious accompanying them. See **SOLITARY**.

There are also divers Orders and Congregations of Religious, distinguished by the Title of *Hermits*; as, *Hermit* of *St. Augustin*, of *St. John Baptist*, of *St. Jerom*, of *St. Paul*, &c.

HERMITS of St. Augustin, is a religious Order, more frequently call'd *Augustines*, or *Austin* Friars. See **AUGUSTIN**.

It is commonly pretended to have been instituted by that Father; but without much Ground. This is pretty certain, he laid the Foundations of a Monastic Order about the Year 388, and retired to his Father's Estate near *Tegula*, to lead a religious Life, with some Companions: But it does not at all appear, that this Order has subsisted ever since; nor that the *Hermits* of *St. Augustin* are descended without Interruption from them.

This Order, in Reality, only commenced under Pope *Alexander IV*, in the middle of the XIIIth Century; and was form'd gradually by the Union of divers Congregations, which had no Rule, or at least had not that of *St. Augustin*. — These Congregations were those of *John Bonites*, the most antient of all; that of the *Hermits of Tuscany*; that of the *Sackell*; those of *Vallerfusa*; of *St. Blaise*; of *St. Benedic de Monte Fabulo*; of the *Tecce* of *Palmas*; of *Sancta Maria de Marcesta*; of *St. James de Molino*, and *de Longfavo* near *Lucca*.

This Coalition was not made by *Innocent IV*, as most Historians of the Order contend: All that Pontiff did, was to unite some *Hermits* in *Tuscany*, to whom he gave the Rule of *St. Augustin*: But these were a distinct Body from those just mention'd. — It was *Alexander IV*, that made the grand Union; as appears from his Bull, published in the *Mare magnum* of the *Augustines*.

That Pontiff undertook this Union from the first Year of his Pontificate, viz. the Year 1254. It was the Year 1256, ere the Superiors of all the Congregations could be got together. In the general Chapter the Union was effected: *Loufrance Septala*, a *Milanese*, was chosen General; and the Order divided into four Provinces, viz. those of *France*, *Germany*, *Spain* and *Italy*.

Since that, other Orders have been united to the *Hermits* of *St. Augustin*; as, the poor Catholics, &c. and the Order now consists of 42 Provinces.

After so many Unions, the Order began to divide again into separate Congregations, according to the Relaxations, and Reformation that afterwards got footing. — Such, are the *Barefooted Hermits* of *St. Augustin*; the Congregation of *Censorbi*, or the *Sicilian Reform*; the Congregation of the *Coloris* in *Calabria*, &c.

There are also several Congregations of Nuns, under the Appellation of *Hermits* of *St. Augustin*.

As also a third Order of *Hermits* of *St. Augustin*. See **THIRD ORDER**.

HERMITS of Bristini, was a Congregation form'd under Pope *Gregory IX*, who gave them the Rule of *St. Augustin*.

Their first *Hermitage*, or Abode, was in a solitary Place, call'd *Bristini*, in the Marquisate of *Acona*;

whence their Name. — They led a very austere Life; never eat any Meat, and fasted much.

HERMITS of Camalduli. See **CAMALDULI**.

HERMITS of St. John Baptist, was a religious Order in *Nouarre*; whose principal Convent, or *Hermitage*, was seven Leagues from *Pampelona*.

Till the Time of *Gregory XIII*, they lived under the Obedience of the Bishop of that City; but the Pope confirm'd them a Religious Order, approved their Constitutions, and admitted 'em to make the Vows. — Their Way of Living was exceeding austere: They went bare-footed, wore no Linnen, lay on Boards, with a large Stone for a Pillow, and bore a large wooden Cross on their Breasts.

Their House was a Kind of *Laura*, rather than a Convent; canton'd out into Cells, in which they lived solitary, in the middle of a Wood. See **LAURA**.

HERMITS of St. Jerom. See **JEROMITES**.

HERMITS of St. Paul the first *Hermit*, is an Order form'd in the XIIIth Century, by the Union of two Bodies of *Hermits* in *Hungary*; viz. those of *St. James de Patech*, and those of *Pistia* near *Zante*.

Upon their being incorporated, they chose *St. Paul* the first *Hermit*, for the common Patron, and Protector of their Order; and assumed his Name. — They multiplied very considerably in *Hungary*, *Germany*, *Poland*, and other Provinces; and came to have twenty Monasteries in *Hungary* alone: But the Revolutions and Wars in that Kingdom reduced them again.

HERMITAGE, properly signifies a Convent of *Hermits*. See **HERMIT** and **CONVENT**.

The Name was also popularly attributed to any Religious Cell, built and endowed in a private and reclusé Place; and thus annexed to some large Abbey, of which the superior was call'd *Hermita*. See **SOLITARY, RECLUSE, &c.**

HERMITAN, in Physiology, a dry North, and North Easterly Wind, or Breeze, usually blowing on the Coasts of *Guinea* in *Africa*. See **WIND** and **BREEZE**.

The *Hermitan* sometimes also blows from other Points.

HERMODACTYL, in Medicine, a Drug used as a gentle Purgative, &c. See **PURGATIVE**.

Naturalists are not agreed as to the Origin of this Drug. — Some will have it the Root, and others the Fruit of a Plant. To reconcile them, one might probably allow two Kind of *Hermodyctyls*; the one a Root, the other a Fruit.

The Fruit is about the Size of a little Chestnut, in Figure resembling a Heart; ruddy without, very white within; of a light fungous Substance; without Fibres; easily broke, and reducible into a Powder like Flower, of a sweetish Taste, but somewhat viscid. It is brought to us dried from *Egypt* and *Syria*.

Authors differ as to the Plant which bears it. In the common Opinion it passes for a Sort of *Colchicum*: Others take it for a tuberosus *Iris*.

Hermodyctyls are chiefly used to purge pituitous Humours of the Brain and Joints. — They are so efficacious in flowering the mucilaginous Glands, and preserving them from the Lodgments of gritty Matters, which occasion the Gout and arthritic Complaint; that they are denominated, by some Writers, *Annus Articularum*. — They also promote Sweat.

HERMOGENIANS, a Sect of ancient Hereticks, denominated from their Leader *Hermogenes*; who lived towards the Close of the II^d Century. See **HERESY**.

Hermogenes establish'd *Matter* as his first Principle; and made *Idea* the Mother of all the Elements. See **IDEA, &c.**

The *Hermogenians* were divided into several Branches, under their respective Chiefs, viz. *Hermians*, *Seleucians*, *Materiaris*, &c. See **HERMIANS, SELEUCIANS, &c.**

The *Mauichees* sprang from the *Hermogenians*. See **MANICHEES**.

HERNIA, in Medicine, &c. a Defect of the Intestines, or *Omentum*, out of their natural Place; or, rather, the Tumour form'd by that Defect; popularly call'd a *Rupture*. See **DISEASE** and **RUPTURE**.

When the *Perroneum* happens to be broken, or extraordinarily dilated; the *Viscera*, and particularly the Canal and small Guts, are apt to fall out of their Place, and to form these Sorts of Tumours call'd *Hernia's*.

They happen most usually in the *Inguen*, or Groin; the Scrotum, and Navel: Tho, sometimes, in other Places; as above or below the Navel; in the Side, far above the *Inguen*, in the upper Part of the Thigh, near the Spine, &c.

Hernia's are occasion'd by Blows, violent Concussions, over-stretching in Vomiting, hard Labour, or Wind; from which last Cause it is, that they are so frequent in Children, and so easily help'd by timely Cure: In Adults they are generally incurable. From *Hernia's* frequently arise

the Illic Passion, and sometimes Inflammations, and even Gangrenas of the Intestines.

Hernia's are variously denominat'd, both according to the Parts displac'd, and to those whercon they fall.

A Deficnt of the Intestines into the Scrotum, which is the most usual Kind of Rupture, is call'd *Enterocoele*. See ENTEROCOELE.

If, instead of the Intestines, the *Omentum* be fallen; it is call'd *Epiploecoe*. See EPIPLOECOE.

A Deficnt of both, is call'd *Enteropiploecoe*. See ENTERO-EPIPLOECOE.

If the Intestines fall on the Navel, it is call'd *Omphalocoele*. See OMPHALOCOELE.

If they fall thro' the Perforation of the *Obliquus Descendens* into the Groin; it is call'd *Buboucoele*, or *Inguinalis*. See BUBOUCOELE.

There are also a spurious Sort of *Hernia's*, or Tumours of the Testes, &c. occasion'd, not by the Deficnt of any of the solid Parts, but by a Coagulation of some of the Fluids.

When the Testicles are swell'd, and distend'd with a watery Humour, it is call'd a *Hydrocoele*, or *Hernia Aquosa*. See HYDROCOELE.

When with Wind, *Pneumatocoele*, or *Hernia Ventosa*. See PNEUMATOCOELE.

When the Tumour is owing to a Mole, or Excrefcence of Flesh, it is call'd *Sarcocoele*, or *Hernia Caruosa*. See SARCOCOELE.

When to a Dilatation of the Vessels, in Manner of a Varix, *Circocoele*, or *Hernia Varicosa*. See VARIX, &c.

A Kind of prominent Tumour in the Throat, is frequently call'd *Bronchocoele*, or *Hernia Gutturalis*. See BRONCHOCOELE.

Some late Authors also speak of *Hernia's*, or Deficnts of the Bladder into the Scrotum; but these are rare. — *M. Merz* concludes, that they never arise from mere Accident; but when they do happen, it must be the Effect of an original ill Conformation. — His Reason is, that the Bladder of Urine is too big to pass thro' the *Annulli* or Rings, which the Intestines pass thro'; beside that it is fasten'd too strongly on all Sides to admit of a Deficnt.

M. Petit, however, is of a different Sentiment; and maintains that *Hernia's* of the Bladder may be produc'd after the ordinary Manner of others. See the *Memoires de l'Acad. An. 1717*.

The Word is Latin, *Hernia*, and originally signifies the fame with *Tumor Scrovi*; call'd also *Ranexa*.

Præficus observes, that the ancient *Marsi* gave the Appellation *Herna* to Rocks: Whence, some will have *Hernia's* thus call'd *propter duritiem*, on Account of their Hardness. — *Scaliger* chufes rather to derive the Word from the Greek, *ἥρως*, *Ramus*, Branch.

HERO, in the ancient Theology and Mythology, was a great and illustrious Person, of mortal Nature; tho', by the Populace, suppos'd to partake of Immortality; and, after his Death, plac'd by them in the Number of the Gods. See GOD.

Hero's were, properly, Persons partly of divine, and partly of human Extraction; being begot between a Deity and a Mortal: As *Achilles*, who was the Son of the Goddess *Thetis*, by *Peleus*; or *Hercules*, who was the Son of *Jupiter* and *Alcmena*.

A *Hero*, then, coincides with what we otherwife call a *Demi-God*: Accordingly, *Lucian* defines a *Hero* to be a Medium between God and Man; or, rather, a Composition of both. See DEMI-GOD.

The Word is form'd of the Latin *Heros*, and that of the Greek, *ἥρως*, *Semi-sens*, Demi-god.

St. Augustin, de *Civitate Dei*, Lib. X. observes, that it is highly probable, some one of *Juno's* Sons was originally call'd by this Name; that Goddess being call'd in Greek *ἥρως*: Or, it may be, that great Men have been distinguish'd by this Appellation, in Allusion to the Opinion of the Antients, that virtuous Persons, after their Deaths, inhabited the wide Expanse of Air, which is *Juno's* Province.

Isidore inclines to think, that *Hero's* were thus call'd, *quasi aëros, aëri*, Persons of superior Merit, and worthy of Heaven. — *Plato* derives the Word from the Greek, *ἥρως*, *Anor*, as intimating the *Hero's* to have arisen from the Copulation of a God with a mortal Woman; or of a Goddess with a Man. — Others derive the Name from the Greek, *ἥρως*, *dicere*, to speak; the *Heroes* being Persons who by their Eloquence led the People at their Pleasure: Others, lastly, derive the Word from the Greek, *ἥρως*, *Terra*, Earth; the *Heroes*, on their Principle, being the *Dii Terrestris*, or Gods of the Earth.

HERO, is also us'd, in a more extensive Sense, for a great, illustrious, and extraordinary Personage; particularly, in respect of Valour, Courage, Intrepidity, and other military Virtues.

Fa. Bouhours makes this Distinction between a *Great Man* and a *Hero*, that the latter is more daring, fiery, and enterprising; and the former, more prudent, thoughtful, and reserved: — In this Sense we properly say, *Alexander* was a *Hero*, *Julius Cæsar* a great Man.

HERO of a *Poem*, or *Romance*, is the principal Personage, or he who has the Top-Part therein. See POEM, ROMANCE, &c.

The *Hero* of the *Iliad* is *Achilles*; of the *Odyfsee*, *Ulyfsee*; of the *Æncid*, *Æneas*; of *Tasso's Jerusalem*, *Godfrey of Bruloign*; of *Milton's Paradise Lost*, *Adam*; tho' *Mr. Dryden* will have the *Devil* to be *Milton's Hero*; in Regard he gets the better of *Adam*, and drives him out of Paradise.

The Character of *Achilles*, is the inexorable Wrath of a haughty, valiant, unjust, revengeful Prince: That of *Ulyfsee*, is the wise and prudent Disimulation of a courageous King, whose Constancy nothing could shake: That of *Æneas*, is Piety, Gentleness, Good-Nature, and Humanity; sustain'd, like the others, with an invincible Courage. See CHARACTER.

Many of the Criticks find Fault with the *Hero* of the *Æncid*. — He is too sensible and delicate; and wants of the Fire, Firmness, and uncontrollable Spirit, remarkable in the *Hero* of the *Iliad*. — Piety, Tenderness, and Submission to the Gods, are the Virtues of the middle Class of Mankind: They do not strike and command enough for a *Hero*, who is to be the Instrument of such notable Exploits. — *St. Evremont* looks on *Æneas* as fitter to have been the Founder of a Religious Order, than of an Empire.

Fa. Bossu defends *Virgil's Hero*, or at least *Virgil*, with admirable Address. — *Æneas's* Character, he observes, was not to be form'd on the Model, either of *Achilles*, or *Ulyfsee*; nor to be of the same Kind with them; as the Fable, the Design of the *Æncid*, was very different from those of the *Iliad* and *Odyfsee*. See FABLE, ACTION, &c.

What *Virgil* had in View, was to make the *Romans* receive a new Kind of Government; and a new Master: This Master, then, must have all the Qualities requir'd for the Founder of a State, and all the Virtues which make a Prince beloved. — The Violence of *Achilles* was of Consequence precluded; so was the Disimulation of *Ulyfsee*; that being a Quality which renders a Man suspected, not beloved.

Virgil was restrain'd in his Choice; his *Hero* was to be of the Genius of *Augustus*: The Poet was in the Condition of a Painter, who is oblig'd to accommodate a Piece of History to the Model of a Face that is given him. — The Characters of *Homer's* two *Heroes*, as being directly opposite to his Design, he has thrown upon *Turnus* and *Alextentius*, who are the Counterparts to his *Hero*.

'Tis disput'd among the Criticks, whether it be necessarily requir'd, that the *Hero* of an Epic Poem be a good and virtuous Man? — *Fa. Bossu* maintains the Negative: Between a *Hero* in Morality, and a *Hero* in Poetry, the same Distinction is to be made as between Moral, and Poetical Goodness: — Hence, as the Manners of *Achilles*, and *Alextentius*, are poetically as Good as those of *Ulyfsee* and *Æneas*; so those two cruel and unjust Men, are as regular poetic *Heroes*, as these two just, wise, and good Men. See MANNERS.

Aristotle, indeed, represents the *Heroic* Virtue, as a Virtue more than human; and, of Consequence, *Heroes*, as divine Persons, whom the Excellency of their Nature raises above our Class: But this, he says in his Books of Morality; in his Poetics he speaks another Language. — The prime Person of a Poem, whom we call the *Hero*, he observes, must neither be good nor bad, but between both: He must not either be superior to the Generality of Mankind by his Virtue and Justice; nor inferior to them by his Crimes and Wickedness. The Moral, and Epic *Heroes*, therefore, even on *Aristotle's* Principles, have nothing in common with each other: The one must be rais'd above Mankind; and the other must not be on a Level with the most perfect of Men.

In Effect, both reason, the Nature of the Poem which is to be a Fable, the Practice of *Homer*, and the Rules of *Aristotle* and *Horace* agree, that so far is it from being necessary that the *Hero* of an *Epos* be a perfect, faultless Man; that it is not necessary he be an honest Man: And that 'tis no Ways irregular to make him as perfidious as *Evius*; as unnatural as *Melen*; or as brutal as *Achilles*. See MANNERS.

'Tis another Subject of Controversy among the Criticks, whether the Catastrophe, or Conclusion of the Action, is necessarily to leave the *Hero* happy, and at Ease; or whether it be allowable to leave him unhappy?

The general Practice of the *Heroic* Poets stands for the Affirmative: We have scarce one Example of a *Hero* who is overcome, and remains unhappy: Excepting *Adam* in *Milton*.

In Tragedy, the Cafe is different: Unhappy Cataftrophes, according to *Aristotle*, are preferable to happy ones; and were always much better received among the Antients. Indeed, one Reason may be, that in the popular States of Greece, Monarchs being odious, nothing pleas'd them better than to see the Misfortunes of Kings: And even among us, where that Consideration does not hold, yet the unhappy Conclusion has its Advantage. — The Tragic Scene is the Throne of the Passions; and Terror and Pity are there to rule in a peculiar Manner: Now those Passions arise the most naturally from unhappy Events; and the Audience, quitting the Theatre, fall of the Misfortunes wherewith it was closed, preserve their Concern much longer, and feel more forcible Effects from it, than if their Tears had been wiped away, and their Sighs smother'd in the Satisfaction of a more happy *Peripetia*. See TRAGEDY, CATASTROPHE, and PERIPETIA.

But these Reasons have no Place in the Epopea; which is not intended so much to purge the Passions, as to remove ill Habitudes. — But 'tis true wital, that the Epopea does not exclude all unhappy Conclusions: The Nature of Epic Fable, is such as admits equally of good and bad Persons for the prime Parts; the unhappy Adventure of a Lamb unjustly devour'd by a Wolf, is a Subject every Way as instructive, and as regular, as the Generosity of a Lyon, who lets himself be disfamed of his Rage by the Innocence of the same Lamb.

'Tis true, if the Poet propos'd his *Hero* as a Pattern of Perfection for Imitation, the Misfortunes falling on him would suit very ill with the Design: But this was doubtless the farthest Thing in the Intentions of the great Masters of the Epopea above-mentioned. — The only Reason, perhaps, that can be given for the uniform Practice of the Poets in this Respect, is, than an Epic Poem, containing an Action of much more Extent than that of a Tragic Poem, the Reader would not be so well satisfied, if, after so many Labours and Difficulties as the *Hero* is brought to struggle wital, he should not, at last, be brought off; but perish miserably. There is something, no doubt, great and good in the *Hero*, which, in the Course of the Poem, makes us concern'd for him; so, that after so long an Acquaintance, we cannot leave him miserable, without some Anxiety; which it is not the Business of the Poet to raise. See EPIC POEM.

HEROIC, something belonging to a *Hero*, or *Heroine*. See HERO.

Thus we say, *Heroic Actions*, *Heroic Virtues*, *Heroic Style*, *Heroic Verse*, *Heroic Poet*, *Heroic Age*, &c. *Heroic Poem*, is that which undertakes to describe some extraordinary Action, or Enterprise. See POEM.

Homer, *Virgil*, *Statius*, *Lucretius*, *Tasso*, and *Milton*, have compos'd *Heroic Poems*. See ILLIAD, AENEID, &c. In this Sense, *Heroic Poem* coincides with an *Epic Poem*. See EPIC.

Heroic Poetry. See EPIC POETRY.

Heroic Age, is that Age or Period of the World, wherein the *Heroes*, or those called by the Poets the *Children of the Gods*, are supposed to have lived.

The *Heroic Age* coincides with the fabulous Age. See FABULOUS.

Heroic Verse, is that wherein *Heroic Poems* are usually compos'd; or that proper for such Poems. See VERSE.

In the Greek and Latin, Hexameter Verses are peculiarly denominat'd *Heroic Verses*, as being alone us'd by *Homer*, *Virgil*, &c. See HEXAMETER.

Alexandrian Verses of twelve Syllables, were formerly call'd *Heroic Verses*; as being supposed the only Verse proper for *Heroic Poetry*; but the latter Writers use Verses of ten Syllables. See ALEXANDRIAN.

HEROINE, a Woman that has the Qualities and Virtues of a *Hero*; or that has done some *Heroic Action*. See HERO.

HERODIANS, a Sect among the *Jews*, at the Time of *Jesus Christ*; mention'd by St. Matthew XXII. 16. and St. Mark III. 6.

The Critics, and Commentators on the New Testament, are very much divided with regard to the *Herodians*. — St. *Jerom*, in his Dialogue against the *Luciferians*, takes the Name to have been given to such as own'd *Herod* for the Messiah: And *Tertullian* and St. *Epiphanius* are of the same Sentiment. — But the same *Jerom*, in his Comment on St. *Matthew*, treats the same Opinion as ridiculous; and maintains, that the *Pharisees* gave this Appellation, by Way of Derision, to *Herod's* Soldiers, who paid Tribute to the *Romans*: Agreeably to which, the *Syriac* Interpreters render the Word by the *Domesticks of Herod*, i. e. his Counters.

M. *Sizon*, in his Notes on the 23 d Chapter of *Matthew*, advances a more probable Opinion. — The Name *Herodian*, he imagines, to have been given to such as adhered to *Herod's* Party and Interest, and were for preserving

the Government in his Family; about which there were great Divisions among the *Jews*.

Pa. *Hardouin*, will have the *Herodians* and *Sadducees* to have been the same Thing. See SADDUCEES.

HERPES, in Medicine, a cutaneous Heat or Inflammation, occasioning a Roughness of the Skin, by Means of a Number of little Pustules spreading this Way and that.

The Word is form'd of the Greek, *ἕρπης*, *paulatim gradior*, *repto*, by Reason the Eruptions creep from Place to Place.

There are divers Kinds of this Disease:

The simple HERPES, is a single Pustule or two, rising chiefly on the Face, of a whitish or yellowish Colour, pointed, and with an inflamed Base. — These dry away of their own Accord, upon letting out the little Drop of Pus contain'd in them.

The second Species of *Herpes*, is what we otherwise call *Serpigo*; and in English, a *Tetter*, or *Ring-worm*. See SERPICO and TETTER.

Miliary HERPES, is an Assemblage of innumerable little Pustules, under the Cuticle, of the Size of Millet Seeds: Popularly call'd the *Sbivogles*. See SHINGLES.

The *Herpes Miliaris*, according to *Wiseman*, approaches very nearly to the Nature of the *Psoira*; and therefore to be cured with Mercurial Catharticks, &c. See PSOIRA.

HERPES Exedens, is of a more corrosive Kind; the Pustules are ruddy, and attended with an itching; and ulcerate the Parts they rise on.

HERRING, See FISH and FISHERY.

Herrings are sometimes prescribed in Medicine, by Way of Cataplasms to the Feet, in Fevers; as being supposed to draw the febrile Matter downwards. Tho', 'tis more probable, this Effect should be owing to the Salt us'd in the Pickle.

Pickled HERRING, } See { HERRING FISHERY.

Red HERRING, }
HERRING Buß, a Vessel proper for the Herring Fishery. See FISHERY.

HERRING Cob, is a young Herring. See HERRING FISHING.

HERRING Fishery, See HERRING FISHERY.

There are divers Names given to *Herrings*, according to the different Manners wherein they are order'd, as,
1°. *Sea-Sticks*, being such as are catch'd all the Fishing Season, and are but once pack'd. — A Barrel of these holds six or eight Hundred; eight Barrels to the Tun, by Law: An Hundred of *Herrings* is to be a Hundred and twenty; a Last ten Thousand; and they commonly reckon fourteen Barrels to the Last. See LAST, &c.

There are others reckon'd on Shore, call'd *repacked Herrings*: Seventeen Barrel of *Sea-Sticks* make from twelve to fourteen of *repacked ones*.

The Manner of *Repacking*, is to take the *Herrings*, wash them out in their own Pickle, and lay them orderly in a fresh Barrel. These have no Salt put to them, but are close pack'd, and headed up by a swom Cooper, with Pickle, when the Barrel is half full; the Pickle is Brine, so strong as that the *Herring* will swim in it.

2°. *Summers*, are such as the *Dutch Chafers*, or *Divers*, catch from *June* to the 15th of *July*. — These are sold away in *Sea-Sticks*, to be spent presently, in Regard of their Fatness; for that they will not endure *Repacking*: They go one with another, full and shotten; but the *repacked Herrings* are sort'd, the full *Herrings* by themselves.

3°. The *shotten and sick Herrings* by themselves; the Barrel whereof is to be mark'd distinctly.

4°. *Crus Herrings*, which are such as are caught after the 14th of *September*. — These are cured with Salt upon Salt, and are carefully sort'd out, all full *Herrings*, and us'd in the *Repacking*.

5°. *Corred Herrings*, serve to make *Red Herrings*, being such as are taken in the *Yarmouth* Seas, from the End of *August* to the middle of *October*, provided they can be carried ashore within a Week, more or less, after their taking. — These are never gipped, but row'd in Salt, for the better preserving of them, till they can be brought on Shore; and such as are kept to make *Red Herrings*, are wash'd in great Vats in fresh Water before they are hang'd up in the *Herring-Hangs*, or *Red Herring Houfes*.

As for the Manner of *salting Herrings*. — The Nets being haled on board, the Fishes are taken out, and put into the War-backs, which stand on one Side of the Vessels: — When all the Nets are thus unladen, one fills the Gippers Basket. — The Gippers cut their Throats, take out the Guts, and sling out the full *Herrings* into one Basket, and the shotten into another: — One Man takes the full Basket when they are gipt, and carries them to the Rower-back, wherein there is Salt. — One Boy rows and flirs them about in the Salt; another

them thus rowed, and carries them in Baskets to the Packers. — Four Men pack the *Herrings* into one Barrel, and lay them, one by one, straight and even; and another Man, when the Barrel is full, takes it from the Packer. — It is let stand a Day or more open to settle, that the Salt may melt and dissolve to Pickle; after which they are fill'd up, and the Barrel headed. — The Pickle to be strong enough to sustain a *Herring*; otherwise the Fish decay in it.

HERRING Silver, was Money formerly paid in lieu of a certain Quantity of *Herrings*, for a Religious House.

HERSE, in Fortification, a Lattice, or Portcullise, in Form of an *Harrow*; beset with Iron Spikes.

It is usually hung by a Cord fasten'd to a Moulinet; to be cut, in Case of Surprise, or when the first Gate is broken with a Petard; that the *Herse* may fall, and stop up the Passage of the Gate, or other Entrance of a Fortress.

These *Herse*s are also often laid in the Roads, to incommode the March as well of the Horse, as of the Infantry.

The *Herse* is otherwise call'd a *Sarrasin*, or *Cataract*; and when it consists of Strait Stakes, without any Cross-pieces, it is call'd *Orgues*. See *ORGUES*, &c.

The Word *Herse* is French, and literally signifies *Harrow*; being form'd of the Latin *Herpes*, or *Hirpes*; which denote the same Thing.

HERSILLON, or *HERISSON*, in the military Art, a Name given to a Sort of Planks, or Beams, ten or twelve Foot long, whose two Sides are drove full of Spikes, or Nails, to incommode the March of the Infantry, or Cavalry. See *HERISSON*.

HESPER, *HESPERUS*, in Astronomy, a Star call'd also *Vesper*, *Phosphor*, *Phosphorus*, *Lucifer*, and the *Morning Star*. See *PHOSPHORUS*, *VESPER*, &c.

The Word is form'd of the Greek, *Ἑσπέρης*, and supposed to have been originally the proper Name of a Man, Brother of *Atlas*, and Father of the *Hesperides*. See *HESPERIDES*.

Diodorus, L. III. relates, that *Hesperus* having ascended to the Top of Mount *Atlas*, the better to observe and contemplate the Stars, never return'd more; and that hence he was fabled to have been changed into a Star.

HESPERIDES, in the ancient Mythology, were the Daughters of *Hesper*, or *Hesperus* a Brother of *Atlas*.

The *Hesperides* were three in Number, *Egle*, *Aethusa*, and *Hesperetibus* — *Hesiod*, in his *Theogony*, makes them the Daughters of *Nox*, Night; and seats them in the same Place with the *Gorgones*, viz. at the Extremities of the West, near Mount *Atlas*: 'Tis on that Account he makes them the Daughters of *Night*, by reason the Sun sits there.

The *Hesperides* are represented by the Ancients, as having the keeping of certain golden Apples, on t'other side the Ocean. 'The Poets give them a Dragon to watch the Garden where the Fruit grows: This Dragon *Hercules* slew, and carried off the Apples.

Pliny and *Solinus* will have the Dragon to be an other than an Arm of the Sea, wherewith the Garden was encompass'd; and which descended the Entrance thereof. And *Varro* supposes that the Golden Apples were nothing but Sheep. Others, with more Probability, say they were Oranges.

The *Garden of the Hesperides*, *Hesperii Horti*, or *Horti Hesperidum*, are placed by some Authors at *Larache*, a City of Fez; by others, at *Bernicbe*, a City of *Barca*, which tallies better with the Fable. Others, take the Province of *Susa* in *Morocco*, for the Island wherein the Garden was seated. Lastly, *Rudbeck* places these fortunate Islands, and the Garden of *Hesperides*, in Sweden. See *FORTUNATE*.

HESYCHASTES, a Person who keeps himself vacant and at Leisure, to attend the better, and with the less Interruption, to the Contemplation of divine Things.

The Name was chiefly used by the Ancients for such among the Monks as did not employ themselves in any Labour of the Hands, but renounced all bodily Action, to resign themselves wholly to Prayer and Meditation.

The Word is Greek, form'd of *ἡσυχία*, *quiesco*, *quieti indulgeo*, a Derivative of *ἡσυχία*, *quietus*, quiet. *Hesy-chastes* in Greek, answers to the literal Sense of *Quietist* in English.

HETERIARCH, *HETERIARCHA*, in Antiquity, an Officer in the Greek Empire; wherof there were two Species: The one call'd simply *Heteriarcha*; and the other, *great Heteriarcha*, who had the Direction of the former.

Their principal Function was to command the Troops of the Allies; besides which, they had some other Duties in the Emperor's Court, described by *Codin*, *de Officiis*, C. 5. n. 30, 31, 32, 37.

The Word is form'd of the Greek, *ἑταίρος*, *Socius*, Companion, Ally, and *ἄρχη*, *Imperium*, Command.

HETEROCLITE, *HETEROCLITON*, in Grammar, an irregular, or anomalous Word, which either in Declension, Conjugation, or Regimen, deviates from the ordinary Rules of Grammar. See *ANOMALOUS*, *IRREGULAR*, &c.

The Word is peculiarly applic'd to Nouns, which vary, or are irregular, in Point of Declension; having fewer Cases, Numbers, &c. than ordinary; or are of one Declension in one Number, and another in another. See *NOUS*, *DECLENSION*, &c.

We have varying *Heteroclitites*, defective, and redundant *Heteroclitites*, &c.

Under the Class of *Heteroclitites*, come *Apoteles*, *Dispositives*, *Monapoteles*, *Triptotes*, *Tetrapoteles*, *Pentapoteles*, &c. See *APTOTES*, *DIPTOTES*, &c.

The Word is Greek, *ἑτεροκλίτης*, form'd of *ἕτερος*, *alter*, another, different, and *κλίσις*, *I decline*.

HETERODOX, in Polemical Theology, something that is contrary to the Faith or Doctrine establish'd in the true Church.

Thus, we say, a *Heterodox* Opinion, a *Heterodox* Divinity, &c.

The Word stands in Opposition to *Orthodox*. See *ORTHODOX*.

It is form'd of the Greek, *ἑτεροδοξία*, a Compound of *ἕτερος*, *alter*, and *δόξα*, *Opinion*.

HETERODROMUS *Vectis*, in Mechanics, a Lever wherein the Fulcrum, or Point of Suspension, is between the Weight and the Power. See *LEVER*.

This is what we otherwise call a *Lever of the first Kind*. — Such is that represented *Tab. Mechanicæ*, Fig. 1.

If either the Weight be in the middle between the Power and the Fulcrum; or the Power between the Weight and the Fulcrum, the Lever is denominat'd *Heterodromus*. — Such are those represented Fig. 2 and 3.

HETEROGENEITY, in Physics, the Quality, or Disposition, which denominates a Thing *Heterogeneous*.

The Word is also used for the *Heterogeneous* Parts themselves. — In this Sense, the *Heterogeneities* of a Body are the same Thing with the *Impurities* thereof.

Heterogeneity, is a Term of a very lax Signification, and brought by the Chymists to serve almost for any Thing they do not understand; so that all Disagreement, or Inaptitude to Mixture between any Bodies, is imputed to the *Heterogeneity* of their Parts.

But, so far as the Term may be made use of, to convey any distinct Signification, it must be by considering natural Bodies under different Sortments, according as they are diversified by Figure, Bulk, Motion, and their more sensible Properties: So that those of different Sortments are *Heterogeneous* to one another, and the Parts of the same Sortment, homogeneous. See *HOMOGENEOUS*.

Thus the Division Chymistry makes of Bodies into Oils, Salts, Spirits, &c. may be reckon'd, with Respect to one another, *Heterogeneous*; tho' the Parts of each Division are among themselves *Homogeneous*.

In Effect, they are two Terms, which serve frequently for a Releige to Ignorance; otherwise the common Terms of *like* and *unlike* might serve every whit as well. *Quincy*.

HETEROGENEOUS, or *HETEROGENEAL*, literally imports something of a different Nature, or that consists of Parts of different Kinds: In Opposition to *Homogeneous*. See *HOMOGENEOUS*.

Thus, we say, Milk is a *Heterogeneous* Body; composed of Butter, Cheese, and Whey. See *MILK*.

The Refining of a Metal, is the purging it of all its *Heterogeneous* Parts. See *REFINING*.

The Word is Greek, form'd of *ἕτερος*, *alter*, different, and *γενος*, *Genus*, Kind; *q. d.* composed of different Kinds of Parts.

HETEROGENEOUS, is particularly applied in Mechanics, to those Bodies whose Density is unequal in different Parts of their Bulk. See *DENSITY*.

Or, *Heterogeneous* Bodies are such, whose Gravities are not proportionable to their Bulks. See *GRAVITY*.

Bodies equally dense, or solid in every Part, or whose Gravity is proportionable to their Bulk, are said to be *Homogeneous*. See *BODY*, &c.

HETEROGENEOUS Light, is that which consists of Parts or Rays of different Refrangibility, Reflexibility, and Colour. See *LIGHT*, *RAY*, *REFRANGIBILITY*, &c.

HETEROGENEOUS Nouns, in Grammar, are such as have one Gender in the Singular Number, and another in the Plural. See *GENDER*, &c.

HETEROGENEOUS Numbers, are those refer'd to different Units, or Integers. See *NUMBER*.

HETEROGENEOUS Quantities, are those which are of such different Kind and Consideration, as that one of them taken

taken any Number of Times, never equals or exceeds the other. See QUANTITY.

HETEROGENEOUS *Surd*s, are such as have different radical Signs, as, $\sqrt{2} a$, and $\sqrt{3} b$; $\sqrt{3} 9$, and $\sqrt{7} 19$.

How to reduce *Heterogeneous Surds* to Homogeneous ones; see under the Article *SURDS*.

HETERORHYTHMUS, a Term used by some fanciful Writers, for a Course of Life unsuitable to the Age of those who live it.

The same is also applied to Puffs, when they beat variously or irregularly in Diseases. See PULS.

The Word is compounded of the *Greek*, ἑτεροῦς, and ῥυθμῶς. See RHYME.

HETEROSCI, in Geography, a Term vulgarly applied to those Inhabitants of the Earth, whose Shadow, at Noon-tide is always projected the same Way. See SHADOW.

In this Sense, the Inhabitants of the temperate Zones are denominated *Heterosci*. See ZONE.

HETEROSCI, however, in Strictness, and according to the Origin and Reason of the Word, is a Term of Relation; and denotes those Inhabitants, which, during the whole Year, have their Noon-tide Shadows projected different Ways from each other.

Thus, we who inhabit the Northern temperate Zone, are *Heterosci* with Regard to those who inhabit the Southern temperate Zone: And those are *Heterosci* with Respect to us.

From this Definition it follows, that only the Inhabitants of the two temperate Zones are *Heterosci*; nor is the Word ordinarily applied to any other. Tho', in Reality, there is always one Part of the torrid Zone, whose Inhabitants are *Heterosci* with Regard to those of the rest, and with Regard to those of one of the temperate Zones, except at the Time of the Solstices. And even at that Time all of the torrid Zone are *Heterosci* with Regard to those of one of the temperate Zones.

But as this is variable, and the People of the torrid Zone have their Shadow now on this, and then on that Side; the Custom is to call them *Amphisci*, and not *Heterosci*. See AMPHISCI.

The Word is *Greek*, form'd of ἕτερος, other, different; and σκία, Shadow.

HETEROUSII, HETEROUSIANS, a Sect, or Branch of *Arians*; the Followers of *Actius*, and from him also denominated *Actians*. See AETIANS.

They were called *Heterousiani*, by Reason they held, nor that the Son of God was of a Substance like, similar to that of the Father; which was the Doctrine of another Branch of *Arians*, thence called *Homousiani*, *Homousii*: But that he was of another Substance different from that of the Father. See ARIAN and HOMOUSIAN.

The Word is *Greek*, compounded of ἕτερος, alter, and οἰα, Substance.

HEXACHORD, in the ancient Music, a Concord commonly called by the Moderns, a *Sixth*. See CONCORD and SIXTH.

The *Hexachord* is two-fold, *Greater* and *Lesser*. — The *Greater Hexachord*, is composed of two greater Tones, two lesser Tones, and one greater Semitone; which make five Intervals. The *Lesser Hexachord* consists only of two greater Tones, one lesser Tone, and two greater Semitones. See TONE.

The Proportion of the former, in Numbers, is as 3 to 5; and that of the other, as 5 to 8.

The Word is *Greek*, compounded of ἕξ, Sex, Six; and χορδή, Cord, Chord, or String.

HEXAEDRON, or HEXAHEDRON, in Geometry, one of the five regular Bodies, popularly call'd a *Cube*. See CUBE and REGULAR BODY.

The Square of the Side of a *Hexaedron*, is in a sub-triple Ratio to the Square of the Diameter of the circumscribed Sphere. — Hence, the Side of the *Hexaedron* is to the Side of the Sphere it is inscribed in, as 1 to the $\sqrt{3}$; and consequently incommensurable thereto.

The Word is *Greek*, form'd of ἕξ, Sex, Six; and ἄεδρον, Sedes, Seat.

HEXAGON, in Geometry, a Figure of six Sides, and as many Angles. See FIGURE and POLYGON.

If these Sides and Angles be equal, it is call'd a *Regular Hexagon*. See REGULAR.

The Side of a *Hexagon* is demonstrated to be equal to the Radius of a Circle circumscribed about the same. See CIRCLE and RADIUS.

Hence, a regular *Hexagon* is inscribed in a Circle, by setting the Radius off six Times upon the Periphery. See INSCRIBED.

To describe a *Hexagon* on a given Line A B, (*Tab. Geometry, Fig. 84.*) draw an Equilateral Triangle A C B;

the Vertex C will be the Centre of a Circle, which will circumscribe the *Hexagon* required. See CIRCUMSCRIBING.

In Fortification, a *Hexagon* is a Fortress with six Bastions. See BASTION.

The Word is *Greek*, form'd of ἕξ, Sex, Six, and γωνία, Angulus, Angle.

HEXAMERON, a Name given to divers Writings both of ancient and modern Authors, containing Commentaries, or Discourses, on the first Chapter of *Genesis*; wherein is delivered the History of the Creation, or the first six Days of the World.

St. Basil, St. Ambrose, &c. have wrote *Hexamerons*.

The Word is *Greek*, ἑξήμερος, compounded of ἕξ, Sex, Six, and ἡμέρας, which in the *Doric* Dialect is wrote ἡμέρας, Day.

HEXAMETER, in the ancient Poetry, a Verse used by *Greek* and *Latin* Writers, consisting of six Feet. See FOOT and VERSE.

The first four Feet of a *Hexameter*, may be indifferently either *Dactyls* or *Spondees*; but the last Foot, in Strictness, is always to be a *Spondee*; and the last but one a *Dactyl*. Such is that of *Homer*,

Ἔσθ' ἄλλο μ' ἔπιφασε, ἔχεν ὄσθ' ἔκδεν ἄρμα.

And that of *Virgil*,

Dixisti Justitiam moniti & non temere Divos.

Hexameter Verses are divided into *Heroic*; which are to be grave and majestic, suitable to the Dignity of *Heroic* Poetry: And *Satyric*, which may be more loose and negligent, as those of *Horace*. See HEROIC, &c.

Epic Poems, as the *Iliad*, *Odyssæ*, *Æneid*, &c. consist of *Hexameter* Verses alone: Elegies and Epistles ordinarily consist alternately of *Hexameters* and *Pentameters*. See PENTAMETER.

Some of the *French* and *English* Poets have attempted to compose in *Hexameter* Verses, but without Success. *Jodelle* made the first Essay in 1555, with a *Distich* in Praise of *Olivier de Maugny*, which *Pasquier* represents as a *Mallev-piece*. 'Tis this,

*Phœbus, Amour, Cypris, veut Saver, nourrir & orner
Ton Vers, & ton Chef, d'Umbre, de Flamme, de Fleurs.*

But this Kind of Poetry pleases no Body. The Modern Languages are not at all fit for a Kind of Verse whose Cadence depends altogether on long and short Syllables. See QUANTITY, VERSE, &c.

The Word is *Greek*, compounded of ἕξ, Six, and μέτρον, Mensura, Measure, Foot.

HEXAMILLION, EXAMILLION, in Antiquity, a celebrated Wall built by the Emperor *Emmanuel*, over the *Isthmus of Corinth*.

It took its Name from ἕξ, Six, and μίλιον, which in the vulgar *Greek* signifies a Mile; as being six Miles long.

The Design of the *Hexamillion*, was to defend *Peloponnesus* from the Incursions of the *Barbarians*. — *Anurath II.* having rais'd the Siege of *Constantinople*, in the Year 1424; demolish'd the *Hexamillion*, tho' he had before concluded a Peace with the *Greek* Emperor.

The *Venetians* rais'd it in the Year 1663, by thirty Thousand Workmen, employ'd for sixteen Days, and cover'd by an Army commanded by *Berthold d'Ège*, General of the Land Forces, and *Louis Lorezano*, General of the Sea.

The Infidels made several Attempts upon it, but were repuls'd, and oblig'd to retire from the Neighbourhood thereof. But *Baribaldo* being kill'd at the Siege of *Corinth*, which was attempted soon after; *Bertino Calciano*, who took on him the Command of the Army, abandon'd, upon the Approach of the *Besjerberg*, both the Siege and the Defence of the Wall, which had cost them so dear: Upon which it was finally demolish'd.

HEXAPLA, or EXAPLA, in Church History, a Bible disposed in six Columns, containing the Text, and divers Versions thereof; compiled and published by *Origen*. See BIBLE.

Eusebius, Hist. Eccl. L. VI. C. 16. relates that *Origen*, after his Return from *Rome* under *Carscallia*, applied himself to learn *Hebrew*; and began to collect the several Versions that had been made of the sacred Writings, and of these to compose his *Tetrapla* and *Hexapla*: Others, however, will not allow him to have begun till the Time of *Alexander*, after he had retir'd into *Palestine*, about the Year 231.

To conceive what this *Hexapla* was, it must be observ'd, that beside the Translation of the sacred Writings, call'd the *Septuagint*, made under *Ptolemy Philadelphus*, above 270 Years before Christ; the Scripture had been since translated into *Greek* by other Interpreters. The first of these Versions, (or, reckoning the *Septuagint*, the second) was that of *Aquila*, about the Year of Christ 140: The third was that of *Symmachus*, published, as is commonly supposed,

supposed, under *Marcus Aurelius*: The fourth was that of *Theodosian*, under *Constantinus*: The fifth was found at *Jericho*, in the Reign of *Caracalla*, about the Year 217: And the sixth was discover'd at *Nicopolis*, about the Year 228. Lastly, *Origen* himself recover'd Part of a seventh, containing only the *Psalms*. See *VERSION*.

Now *Origen*, who had held frequent Disputations with the *Jews* in *Egypt* and *Palestine* observing that they always objected against those Passages of Scripture quoted against them; and appeal'd to the *Hebrew* Text; the better to vindicate those Passages, and confound the *Jews*, by shewing that the Seventy had given the Sense of the *Hebrew*; or rather to shew, by a Number of different Versions, what the real Sense of the *Hebrew* was: undertook to reduce all these several Versions into a Body, along with the *Hebrew* Text; so as they might be easily confronted, and afford a mutual Light to each other.

In Order to this, he made Choice of eight Columns: In the first he gave the *Hebrew* Text in *Hebrew* Characters: In the second, the same Text in *Greek* Characters. The rest were filled with the several Versions abovementioned; all the Columns answering Verse for Verse, and Phrase for Phrase. In the *Psalms* there was a ninth Column for the seventh Version.

This Work *Origen* call'd *Ἑξάπλα*, *Hexapla*, q. d. *Septuple*, or a Work of six Columns; as only regarding the first six *Greek* Versions.

Indeed, *S. Epiphanius*, taking in likewise the two Columns of the Text, calls the Work *Ὀκτάπλα*, as consisting of eight Columns. See *ΟΚΤΑΠΛΑ*.

This celebrated Work peritid' long ago: Tho' several of the ancient Writers have preferred as Pieces thereof; particularly *S. Chrysostom* on the *Psalms*, *Philoponus* in his *Hexameron*, &c. — Some modern Writers have endeavoured to collect Fragments of the *Hexapla*, particularly *Drahus*, and *Fa. Montfaucon*.

HEXASTYLE, *HEKASTYLOS*, in the ancient Architecture, a Building with six Columns in Front. See *COLOMN*. The Temple of Honour and Virtue at *Rome*, built by *Martin*, was a *Hexastyle*. See *TEMPLE*.

The Word is composed of *ἕξ*, Six, and *σῦλη*, Column.

HEYRS, in Husbandry, are young timber Trees, usually left for Standards in felling of Woods or Coppices. See *TIMBER*, *FELLING*, *STANDARD*, &c.

HIATUS, a *Latin* Term, properly signifying the Aperture of the Mouth; from the Verb *hiare*, to gape.

It is variously used in Works of Literature, &c. to denote a *Cæsura*, or *Gasp*. Particularly in Verses, where there is a clashing of Vowels, by some Words ending with a Vowel, and the following one beginning with another. — Tho' 'till the Ear the open Vowels tire.

This clashing of Vowels, so disagreeable to the Ear, is called a *Hiatus* in Prose as well as Verse. — The *Romans* were so very careful to avoid it, that they always suppress'd the preceding Vowel even in Prose; as is observed by *Cicero* in his *Orator*.

The Word *Hiatus* is also used for a Defect in a Manuscript Copy; where something is lost, or effaced, by the Injuries of Time, or otherwise.

In a theatrical Piece, there is said to be a *Hiatus*, when a Scene is not well connected to the next, but leaves the Action interrupted. See *SCENE*.

In Matters of Genealogy, *Hiatus* is an Interruption in a Line or Series of Descendants. — Those Proofs of eight Hundred Years are impossible, by Reason of the frequent *Hiatus*'s occasion'd by Civil Wars, *Gothic* Inundations, &c.

HICKUP, *Ἡσέκουσθ*, or *HICKEY*, *Singultus*, in Medicine, a sudden irregular Inspiration; wherein the Stomach, and the Parts contain'd in the lower Venter, are driven from below, upwards.

The *Hiccup* is not a Disorder of the Stomach, as is usually imagined, but a convulsive Motion of the *Diaphragm*; whereby that Muscle retiring impetuously downwards, impels the Parts beneath it.

It is occasion'd by sharp Humours; a too great Plenitude of the Stomach; a Bit of any Thing stopp'd at its upper Orifice; or, in the general, by any Thing capable of irritating the Nerves of the *Diaphragm*.

The Remedy for the *Hiccup*, according to *Hippocrates*, is to fetch the Breath very long, or even to stop the Breath for some Time. A Sneezing happening upon a *Hiccup* generally cures it; the *Diaphragm*, shook by the violent Expiration, being apt to throw off what before irritated it.

The Word is form'd of the *Flemish* *Hick*, which signifies the same Thing. Others derive it *ab* *hicendo*; others, a *difficili* *Autolitus*.

HIDAGE, or *HYDAGE*, was an extraordinary Tax; anciently payable to the King for every Hide of Land. See *HIDE*.

Sunt etiam quedam communes Prestationes, que Servitia non dicuntur, nec de Consuetudine veniunt, nisi cum necessitate intervenierit, vel cum Rex venerit; sicut sunt Hidagia, Cocagia, & Carvagia, & alia plura de necessitate & ex consensu communi totius regni introducta, & que ad dominum non pertinent, &c. *Bracon Lib. II. Cap. 6.*

King *Æthelred*, in the Year of Christ 994, upon the Landing of the *Danes* at *Sandwich*, taxed all his Lands by *Hides*. Every 320 *Hides* of Land found one Ship furnish'd; and every 8 *Hides* found one *Jeck*, and one Saddle for the Defence of the Realm.

Wilhelmus Conceptor *de unaqueque Hida per Angliam sex solidos accepit. Floren. Wigorn. in An. 1084.*

The Word *Hidage* is also us'd for a being quit of that Tax; which was also call'd *Hyde-Gild*.

HIDE, the Skin of a Beast; particularly that of a Bullock or Cow. See *SKIN* and *LEATHER*.

We have *Hides* of divers Denominations, according to their State, Quality, &c.

Raw HIDE, or *Green HIDE*, is that which has not undergone any Preparation; being in the same Condition as when taken off the Carcase.

Salted HIDE, is a green *Hide*, season'd with Sea-Salt and Alum, or Salt-Petre; to prevent its spoiling and corrupting, either by keeping it too long in Cellars, or in transporting it too far in a hot Season.

There are also *Hides dried in the Hair*, sent from *America*; particularly those of Buffalo's, &c. See *BUCANERA*.

Tann'd HIDE, is a *Hide* either green, salted or dried, further dress'd and prepared by the Tanner, by paring off the Hair, and steeping it in Pits of Lime and Tan. See *TANNING*.

Carried HIDE, is that which after tanning, has passed thro' the Curriers Hands, and has thus received its last Preparation, and is fitted for Use. See *CURRYING*.

HIDE, *HYDE*, or *HYDA*, in our ancient Customs, was a Measure, or Quantity of Land, containing so much as could be yearly till'd with a single Plough. See *PLOUGH Land*.

Bess calls the *Hide* of Land *Familia*, and defines it to be so much as was sufficient for the ordinary Maintenance of one Family. See *FAMILY*.

In other Authors it is called *Mansum*, *Mansus*, *Casata*, *Carucata*, *Sullinga*, &c. See *CARUCATA*.

Crompton, in his *Jurisdict.* Fol. 222, says a *Hide* of Land, contains one hundred Acres: He adds, that eight *Hides* make a *Knight's Fee*. In an ancient Manuscript the *Hide* is fix'd at 120 Acres.

But Sir *Edward Coke* adds, that a *Knight's Fee*, a *Hide*, or *Plough-Land*, a *Yard-Land*, and an Oxgang of Land do not contain any certain, determinate Number of Acres. See *KNIGHT'S Fee*, *YARD LAND*, &c.

The Distribution of *England* into *Hides* of Land is very ancient; there being mention made of it in the Laws of King *John*, Cap. 14. *Henricus I. Maritand, sibi sue gratia Imperatori, cepit ab unaqueque Hida Anglie tres Sol. Spelman.*

HIDE-BOUND, a Disorder of a Horse, or other Beast, wherein his Skin sticks so tight to his Ribs and Back, as not to be loosen'd from it with the Hand.

The Disorder is sometimes owing to Poverty and bad keeping; at other Times to over Riding or a Surfeit, the Horse being suffer'd when he is hot, to stand long in the wet; or to a morbid Dryness of the Blood, which not having its natural Course, causes the Skin to shrink up, and cleave to the Bones.

HIDE-BOUND, among Husbandmen, — Trees are said to be so when the Bark ticks too close. See *BARK*.

HIDEL, in our ancient Statutes, signifies a Place of Protection, or a Sanctuary. See *SANCTUARY*.

HIDGILD, in the Laws of King *Canute*, is explained by *Pretium redemptionis aut manusmissionis Servi*; from the *Saxon* *hild*, i. e. the Skin, and *gild*, *pretium*, i. e. the Price by which he redeemed his Skin from being whipp'd. See *GILD*.

Si liber fessis dicitur operetur, perdat libertatem; si servus, corvum perdat, vel Hidgildum, i. e. let him be whipp'd, which was the Punishment for Servants. Vel Hidgildum, i. e. let him pay for his Skin; by which Payment he is to be excus'd from Whipping.

HIDROTICKS, or rather *HYDROTICKS*, in Medicine, are the same with *Sudorificks*. See *SUDORIFICKS*. *Carduus Benedictus*, *Zedoary*, *Gayac*, *Angelica*, &c. are of the Number of *Hidroticks*, or *Hydrotic Medicines*.

The Word is composed of the *Greek*, *ἵδρις*, *Sweat*.

HIERACTES, *HIERACTE*, a Sort of ancient Hercticks; denominat'd from their Leader *Hieracas*.

This *Hierarch* was by Nation an *Egyptian*; and, beside his Mother-Tongue, was a Master of the *Greek*, and well vers'd in all the polite Parts of Learning. Being born a Christian, he had been brought up to the Study of the Holy Scriptures, whereof he had a more than ordinary Acquaintance; so that he wrote Commentaries on some of them: But, by an ill Use of his Knowledge, he fell into divers Errors, in which his Interest and Authority among the Monks of *Egypt* procur'd him Abundance of Followers.

He absolutely deny'd the Resurrection of the Body; maintaining that the Soul alone rose again; and that the Resurrection was altogether spiritual. — *Epiphanius* surmises that he might have imbib'd this Error from *Origen*.

The same *Hieracas*, and his Followers likewise condemn'd Marriage; being of Opinion that it was only allowed under the Old Testament, and till the Coming of Jesus Christ; but that under the New Law, all Marriage was prohibited, as incompatible with the Kingdom of God.

S. Epiphanius produces the Passages of Scripture whereon he founded this Doctrine. He adds, that *Hieracas* did not give into *Origen's* Error with Regard to the Mystery of the Trinity, but allow'd the Son to be really and truly begotten of the Father: He was also Orthodox with respect to the Holy Ghost; excepting for some Peculiarities received from the *Melchisedechians*, on which he had refin'd. He liv'd a very austere Life, and promoted the same among his Followers: But after his Death they degenerated a-piece.

HIERA PICCA, in Pharmacy, a Kind of Elixior, first describ'd by *Galen*; compos'd of Aloes, Cinnamon, Mace, Agarabacca, Spicanardi, Saffron, Mastic and Honey.

It is us'd to purge and cleanse the Stomach; remove Obstructions, promote the Menstrs and Hemorrhoids, and sweeten the Blood. Tho' its chief Use among us, is in making the *Tinctura sacra*. See **TINCTURA**.

It is denominat'd from the *Greek*, ἱερός, sacer, holy, by Reason of its rare Virtues; and αἰσθητός, amarum, bitter; Aloes, which is the Base thereof, rendering it extremely bitter. See **ALOES**.

There is another *Hiera*, call'd *Hiera Diacolocynthidis Pachii*, by Reason *Colocynthis* is the Base thereof, and that it was first us'd with good Success by *Pachius* of *Antioch*, in divers obstinate Diseases. — It is compos'd of *Colocynthis*, *Opopanax*, *Aristolochia rotunda*, *Agaric*, and other Ingredients.

It is us'd in Epilepsies, Apoplexies, Palfies, and Lethargies, to excite the Mentis, and promote the Expulsion of the After-birth.

There is also a third Sort of *Hiera*, call'd *Liberanus*; but rarely us'd. — *Dr. Quincy* says, 'tis one of the most ridiculous Medleys ever contriv'd. It passes for a Cordial, &c.

HIERARCHY, **HIERARCHIA**, in Theology, the Order, or Subordination, among the several Choirs, or Ranks of Angels. See **ANGEL**.

St. Dionysius, and other of the ancient Writers, establish nine Choirs, or Orders of celestial Spirits, viz. Seraphims, Cherubim, Thrones, Dominions, Principalities, Powers, Virtues, Angels and Archangels: And these he divides into three *Hierarchies*. See **SERAPHIM**, **CHERUBIM**, &c.

The Word is *Greek*, form'd of ἱερός, sacer, holy, and ἀρχή, Principatus, Principality, q. d. ἱερός ἀρχή, sacer Principatus, holy Principality or Command; and Principality in holy Things.

HIERARCHY, is also us'd on Earth, for the Subordination between Prelates and other Ecclesiasticks. See **ECCLESIASTICAL POLITY**.

Archbishops, Bishops, Priests, and Deacons, compose the *Hierarchy* of the Church of *England*. In that of *Rome*, the Pope has likewise a Place at the Head of the *Hierarchy*.

Fa. Cellot, a Jesuit of *Paris*, has publish'd a Volume express'd *de Hierarchia* and *Hierarchie*, L. IX, on the *Hierarchy*, and those who compose it. He there distinguishes a created, and an increat'd *Hierarchy*; a divine, and a human or ecclesiastical *Hierarchy*; and in this, a *Hierarchy* of Jurisdiction, a *Hierarchy* of Order, and a *Hierarchy* of Graces the most sublime of all. — He defines *Hierarchy*, in the general, a Principality, Command, or Superiority in holy Things: *Principatus*, or *Imperium in rebus Sacris*. He holds, that *Hierarchy* excludes all below Bishops; and that neither Priests nor Deacons can be reckon'd among the Number of *Hierarchy*. *Bellarmin*, *Hallier*, *Aurelin*, &c. he holds, were all mistaken, and did not distinguish between being of the *Hierarchy*, and being under it. According to him, to be of, or in the *Hierarchy*, are the same Thing; and are only applicable to those who govern the Church, or have some Part in the Administration thereof: On the contrary, to be under the *Hierarchy*, is to be ruled or governed by the *Hierarchy*.

Cellot will not admit of any Difference between these three Expressions. To prove that they all denote the same Thing, he instances in the Case of Monarchy, alleg'd for the same Purpose by *P. Aurelius*: Urging, that in a Monarchy, all, even the Subjects are in the Monarchy, of the Monarchy, or under the Monarchy; and that none are excluded but Foreigners: And that the Case is the same in the *Hierarchy*.

HIERATIC Paper, among the Antients, was the finest Sort of Paper; which was set apart only for sacred or religious Uses. See **PAPER**.

HIEROGLYPHIC, a Symbol, or Mytic Figure, us'd among the ancient *Egyptians*, to cover, or conceal the Secrets of their Theology. See **CHARACTER**.

Hieroglyphicks are properly Emblems, or Signs of divine, sacred, or supernatural Things; by which they are distinguished from common Symbols, which are Signs of sensible and natural Things. See **SYMBOL**.

Hermes Trismegistus, is commonly esteem'd the Inventor of *Hieroglyphicks*: He first introduced them into the Heathen Theology; from whence they have been transplanted into the Jewish and Christian.

The Word is compos'd of the *Greek*, ἱερός, sacer, holy, and γλύψω, sculpsere, to engrave; it being the Custom to have the Walls, Doors, &c. of their Temples, Obelisks, &c. engraven with such Figures.

Sacred Things, says *Hippocrates*, should only be communicated to sacred Persons. — Hence it was, that the ancient *Egyptians* communicated to none but their Kings and Priests, and those who were to succeed to the Priesthood and the Crown, the Secrets of Nature, and the Myteries of their Morality and History; and this, by a Kind of Cabbals, which at the same Time that it instructed them, only amus'd the rest of the People. — Hence the Use of *Hieroglyphicks*, or mytic Figures, to veil their Morality, Politicks, &c. from profane Eyes. *Spon*. This Author, it may be observ'd, and many others, do not keep to the precise Character of a *Hieroglyphic*, but apply it to prophane as well as divine Things.

Hieroglyphicks are a Kind of real Characters, which do not only denote, but in some Measure express the Things. — Thus, according to *Clement Alexandrin*. Strom. 5. A Lion is the *Hieroglyphic* of Strength and Fortitude; a Bullock, of Agriculture; a Horse, of Liberty; a Sphinx of Subdely, &c. See **HIEROGLYPICAL**.

HIEROGLYPICAL, something containing a *Hieroglyphic*. See **HIEROGLYPHIC**.

In *Egypt* are still found divers Obelisks, Figures, &c. full of *Hieroglyphical* Figures or Characters. See **HIEROGRAMMATEL**.

From the inmost recesses of the Dome, says *Apuleius*, he brings forth certain Books wrote in mytic, uninteligible Characters; consisting partly of Figures of Animals, apparently suggesting some compendious Sayings; and partly of Knots, and Flourishes; all abundantly secured from the too curious Eyes of profane Readers. The religious Rites of the *Egyptians*, are mostly involv'd in such Figures of Animals, which are hence call'd ἱερογράμματα, *Hieroglyphical letters*.

HIEROGRAMMATEL, among the ancient *Egyptians*, were the Priests appointed to explain the Myteries of Religion, and to direct the Performance of the Ceremonies thereof.

The *Hierogrammatei* invented and wrote *Hieroglyphicks*, and *Hieroglyphical* Books, and occasionally explain'd 'em, with other Matters relating to the Doctrines of Religion. If we may believe *Suidas*, they were also Prophets; at least, he relates, that a *Hierogrammateus* foretold to an ancient King of *Egypt*, that there would be an *Israelite* of great Wisdom, Virtue and Renown, who should humble *Egypt*.

The *Hierogrammatei* were always near the King, to assist him with their Informations and Councils: The better to fit them for this, they made use of the Skill and Knowledge they had acquired in the Stars, and the Motions of the heavenly Lights; and even of the Writings of their Predecessors, wherein their Functions and Duties were deliver'd. They were exempted from all civil Employments; were reput'd the first Persons in Dignity next the King; and bore a Kind of Scepter in form of a Plough-share.

After *Egypt* became a Province of the *Roman* Empire, the *Hierogrammatei* sunk into Neglect.

HIEROMNEMON, an Officer in the ancient *Greek* Church; whose principal Function was, to stand behind the Patriarch at the Sacraments, Ceremonies, &c. and hear him in the Prayers, Psalms, &c. he was to rehearse. — He also cloth'd the Patriarch in his pontifical Robes; and assign'd the Places of all those who had a Right to be around him, when seated on his Throne; as the Master of the Ceremonies now does to the Pope.

The *Hieromonachos* was commonly a Deacon; when he was in Priest's Orders, as it sometimes happen'd, he was excus'd from dressing the Pope in his pontifical Habits. Whether he were Deacon, or Priest, he had under him an Officer nam'd *Castrifus*. He had also the keeping of the Book entitul'd *Contonacio*, or Book of Ordination; and that call'd *Euthroniaustians*, which was a Sort of Ritual.

The Word is compos'd of the Greek, *hieros*, sacred, and *monachos*, one who advertises, or puts in Mind of.

HIERONYMITES, or *Hermit of St. Jerom.* See **JERONYMITES** and **HERMIT**.

The Word is compos'd of *hieros*, holy, and *epus*, Name. **HIEROPHANTES**, or **HIEROPHANTA**, in Antiquity, a Priest among the *Athenians*. See **PRIEST**.

The *Hierophantes* was properly the Priest of the God-dess *Heeste*: At least, the Title was only given to the Priests when they performed the Sacrifices of that God-dess, and in respect of her.

St. *Jerom* says, that the *Hierophantes* extinguish'd the Fire of Lust, by drinking *Cenusa*, or the Juice of Hemlock; or even by making themselves Eunuchs. — *Appollodorus* observes, that it was the *Hierophantes* who instructed Persons initiated into the Religion, in the Myteries and Duties thereof; and that it was hence he deriv'd his Name. For the same Reason he was also call'd *Prophetes*, Prophet. — He had Officers under him to do the same Thing, or to assist him therein, who were also call'd *Prophetes* and *Exegetes*, i. e. Explainers of divine Things.

To the *Hierophantes* it belonged to dress and adorn the Statues of the Gods, and to bear them in Processions and Ceremonies.

The Word comes from *hieros*, holy, sacred, and *epus*, I appear.

HIEROPHYLAX, an Officer in the Greek Church. — His Quality is that of Guardian, or Keeper of the holy Things, Utensils, Vestments, &c. answering to our *Sacristan*, or *Sexton*. See **SACRISTAN**.

The Word is compos'd of *hieros*, sacer, and *phylax*, Keeper, or *guardian*, I keep.

HIEROSCOPY, **HIEROSCOPIA**, a Kind of Divination, perform'd by considering the Victim, and every Thing that occurs during the Course of the Sacrifice. See **SACRIFICIUM** and **VICTIM**.

The Word is form'd of *hieros*, sacer, and *scopus*, I consider.

HIGH, *Alens*, a Term of Relation, apply'd to a Body, consider'd according to its third Dimension, or its Elevation above the Horizon, or even above the Ground. See **HIGHT**.

Thus, we say, the Pike of *Tenariff* is reputed the highest Mountain in the World. See **MOUNTAIN**.

The Monument is 202 Foot high from the Ground. See **MONUMENT**.

The Tower of *St. Pauls*, before its first burning down in 1686, was 520 Foot high; on this was a Pole of Copper, and on that a Cross 15 Foot and a half high. — The Towers of *Notre Dame* at *Paris*, so much talk'd of, are 212 Foot high, &c. See **ALTIUDE**.

HIGH, is also us'd to denote a Person in Power, Dignity, &c. See **TITLE** and **QUALITY**.

Thus God is frequently call'd in Scripture the most high. So on Earth we say, high and puissant Lord, Prince, &c.

— The States General of the United Provinces, are call'd their High *Mightnesses*. See **STATES**, &c.

So in *England* we say, High Court of Parliament. See **PARLIAMENT**.

Lord High Chancellor, } See { **CHANCELLOR**.
Lord High Treasurer, } See { **TREASURER**.

HIGH, in Music, is sometimes us'd in the same Sense with *loud*, in Opposition to *low*: And sometimes in the same Sense with *acute*, in Opposition to *grave*. See **SOUND**, **ACUTENESS**, **GRAVITY**, &c.

HIGH BEARING-COCK, is a Term us'd with Respect to Fighting Cocks; denoting one larger than the Cock he fights withal. — As a Low Bearing Cock is one over-matched for Height.

HIGH-DUTCH, is the German Tongue in its greatest Purity, &c. as spoken in *Mishia*, &c. See **LANGUAGE**. See also **GERMAN**, **DUTCH**, &c.

HIGH OPERATION, in Chirurgery, is a Method of extracting the Stone; thus call'd, by Reason the Stone is taken out at the upper Part of the Bladder. See **STONE**.

For the Method of performing the High Operation. See **LITHOTOMY**.

The High Operation is said to have been first practis'd by *Roffis*, others say by *Franco* a Chirurgeon of *Louison*. It has been lately retriev'd by Mr. *Douglas*, and now practis'd with good Success by Mr. *Chefelden*, and others.

HIGH RELIEVO, See **RELIEVO**.

HIGH SEA, or **OCEAN**, is that far from Land. See **SEA** and **OCEAN**.

HIGH WATER, is that State of the Tides when they cease to flow. See **TIDES**, **FLUX**, &c.

HIGHNESS, a Quality, or Title of Honour given to Princes. See **TITLE** and **QUALITY**.

The Kings of *England* and *Spain* had formerly no other Title but that of *Highness*; the first, till the Time of *James I.* and the second, till that of *Charles V.* See **MAJESTY**.

The petty Princes of *Italy* began first to be complemented with the Title of *Highness* in the Year 1630. — The Duke of *Orleans* assum'd the Title of *Royal Highness*, in the Year 1651; to distinguish himself from the other Princes of *France*.

The Duke of *Savoy*, now King of *Sardinia*, bore the Title of *Royal Highness*, on Account of his Pretensions to the Kingdom of *Cyprus*. — 'Tis said that Duke only took the Title of *Royal Highness*, to put himself above the Duke of *Florence*, who was call'd great Duke; but the great Duke has since assum'd the Title of *Royal Highness*, to put himself on a Level with the Dukes of *Savoy*.

The Prince of *Conde* first took the Title of *Most serene Highness*, leaving that of simple *Highness* to the natural Princes.

HIS TESTIBUS, q. d. *These Witnesses*; was a Phrase antiently added in the end of a Deed that was written in the same Hand with the Deed; upon which the Witnesses were call'd, the Deed read, and then their Names entred. See **DEED** and **WITNESS**.

This Clause of *His testibus*, in Subjects Deeds, continued till, and in, the Reign of *Hen. VIII.* but is now wholly omitted. See *Coke* on *Littleton*.

HILARIA, in Antiquity, Feasts celebrated every Year, by the *Romans*, on the eighth of the Calends of *April*, in Honour of the Mother of the Gods. See **FEAST**.

The *Hilaria* were solemniz'd with great Pomp, and rejoicing. Every Person dress'd himself as he pleas'd, and took the Marks, or Badges, of whatever Dignity, or Quality, he had a Fancy for.

The *Romans* took this Feast originally from the *Greeks*; who call'd it *ANABAΞTIS*, q. d. *Ascensus*: The Eve of that Day they spent in Tears and Lamentations, and thence denominated it *KATABAΞTIS*, *Descensus*.

Afterwards, the *Greeks* took the Name *IAPIA*, from the *Romans*; as appears from *Ptolemy*, in his Extract of the Life of the Philosopher *Platon*.

Cassaubon maintains, that beside this particular Signification, the Word *Hilaria* was also a general Name for all Solemn, or Feast Days, whether public or private and domestic. But *Salmastus* does not allow of this.

Yrigan, T. I. p. 482. distinguishes between *Hilaria* and *Hilaria*. The former, according to him, were public rejoicings; and the latter, Prayers made in Consequence thereof; or even of any private Feast, or Rejoicing, as a Marriage, &c. The public lasted several Days; during which, all Mourning, and Funeral Ceremonies, were suspended.

The *Hilaria*, were first institut'd in Honour of the Mother of the Gods, as is observ'd by *Macrobius*, L. I. C. 10. and *Lampadius*, in his Life of *Alexander Severus*; being apparently intended to express the Joy conceiv'd at the Birth of the Gods.

HILARODE, or **HILARODUS**, in the antient Music and Poetry, a Sort of Poet among the *Greeks*, who went about singing little gay diverting Poems, or Songs; tho' somewhat graver than the *Ionic* Pieces. See **RHAPSODY**.

The *Hilarodes* appear'd dress'd in white, and were crown'd with Gold. At first they wore Shoes; but afterwards assum'd the *Crepida*, which was only a Soal, ric'd over the Foot with Straps.

They did not sing alone; but had always a little Boy, or Girl, to attend them, playing on some Instrument.

From the Streets, they were at length introduced into the Tragedy; as the *Magodes* were into Comedy. See **MAGODES**, **TRAGEDY**, &c.

The *Hilarodes* were afterwards call'd *Simodes*, from a Poet named *Simus*, who excell'd in this Kind of Poetry.

The Word is compos'd of *hilaris*, joyful, and *odos*, Singing, Song. See **HILARODIA**.

HILARODIA, a Poem, or Composition in Verse, made, or sung by a Sort of Rhapsodists call'd *Hilarodes*. See **HILARODE**.

Scaliger holds *Hilarodia*, *Hilaro-Tragedia*, *Pblycegraphia*, and the *Ribonotic* Fable, to be all Names for the same Thing. See **HILARO-TRAGEDIA**.

HILARO-TRAGEDIA, a dramatic Performance, partly tragic, or serious; and partly comic, or merry. See **DRAMA**.

Scaliger, *Post. L. I. C. 52.* holds, the *Hilaro-Tragedia* and *Hilarodia*, to be one and the same Thing. Others, rather take the *Hilaro-Tragedia* to have been pretty nearly what we call a *Tragi-Comedy*. Others, again, will have it to have been a pure Tragedy, only terminating with a happy Catastrophe, which brings the Hero out of a wretched into a fortunate State. — But the first Opinion seems the most probable, and the best warrant'd. See **TRAGEDY**.

Suidas mentions one *Rhinton*, as the Inventor of this Kind of Poem: Whence it was also called *Rhintonica fabula*.

HILARY Term. See **TERM**.

HILL. See **MOUNTAIN**.

HILLOCK. See **MOUNT**.

HIN, a Hebrew Measure, containing the sixth Part of an Eph; or one Wine Gallon and two Pints. See **MEASURE**, **EPHA**, &c.

HIND, a Female Stag of the third Year. See **HUNTING**.

HIND Calf, a Hart of the first Year. See **HUNTING**.

HIND Hawk, in the Manage. See **HAND**.

HINDENI Homines, antiently signified a Society of Men; from the Saxon *Dindene*, *Societas*.

In the Time of our Saxon Ancestors, all Men were ranked into three Classes; the *Lowest*, the *Middle*, and the *Highest*; and were valued according to the Class they were in; that in Case an Injury were done by any one, Satisfaction might be made according to the Value, or Worth of the Man it was done to.

The *Lowest* were those who were worth ten Pounds, or two hundred Shillings; call'd *Viri aucentini*, or *Teybindenau*, and their Wives *Teybinda's*.

The *Middle* were valued at six hundred Shillings; and were call'd *Sixbindemen*, and their Wives *Sixbinda's*.

The *Highest* were valued at twelve hundred Shillings; and were call'd *Twelvebindemen*, and their Wives the *Twelvebinda's*. See **TWINDING**, and **TWELVING**.

HINE, or **HIND**, in the Saxon Language, signifies a Servant, or one of the Family: But it is now taken in a more restrictive Sense, for a Servant at Husbandry; and the Master-*hine*, is he that oversees the rest.

HINGES, in Building, those necessary Irons, by Means whereof Doors, Lids, Folds of Tables, &c. make their Motion, whether of opening, shutting, or folding. See **DOOR**, &c.

The Species of *Hinges* are many, viz. Bed, Box, Butts, Casement; *Lancepire*, and smooth-filed; Casting, Chest-black, *Lancepire*, smooth-filed, Coach, Delk, Doretails, Eises, Folding, Garnets, Dozen-ware-long, Dozen-ware-short, Weighty-long, Weighty-short, Lamb-heads, Port, Side-*Lancepire*, Side smooth filed, Side with rising Joyns;

Lancepire, and smooth filed, Side with Squares, Screw, Scuttie, Shutter; *Lancepire*, and smooth filed, Stall, Trunk of sundry Sorts, Joyns; *Lancepire*, Dozen-ware with Hooks, Dozen-ware long, Dozen-ware short, Weighty long, Weighty-short.

HIP. See **HAUNCH**.

HIP-Shot, a Disorder of a Horse, when he has wrung or sprained his Haunches, or Hips, so as to relax the Ligaments, that keep the Bone in its due Place.

The Signs are, that the Horse will halt much, and go aside long, trailing his Leg after him; and the *Hip* which is hurt will be lower than the other; the Flesh falling away on the Side of his Buttock.

HIPS, in Building, are those Pieces of Timber, placed at the Corners of a Roof. See **ROOF**.

The *Hips* are much longer than the Rafters, by Reason of their oblique Position, and are placed not with a right or square Angle, but a very oblique one; and by Consequence are not, at least ought to be, square at any Angle, as Rafters are not at all, but Level at every one of 'em; and which is yet more, as Rafters have but four Plains, these commonly have five. See **RAPPER**.

They are commonly, by Country Workmen, call'd *Corners*: Some call them *principal Rafters*, and others *Sleepers*. Indeed, *Hips* and *Sleepers* are much the same; only the *Sleepers* lie in the Vallies, and joyn at Top with the *Hips*; but those Surfaces or Plains, which make the Back of the *Hip*, are the under Sides of the *Sleeper*.

The *Backs of a Hip*, are those two Superficies, or Plains, on the outside of the *Hip*, which lie parallel, both in Respect of their Length and Breadth, with the Superficies of the adjoining Side, and End of the Roof.

HIP-Mould, is by some used for the back of the *Hip*. — Others understand it of a Prototype, or Pattern, commonly made of a Piece of thin Wainfoot; by which the Back, and the Sides of the *Hip* are cut out.

HIP-Roof, among Builders, call'd also *Italian Roof*; is a Roof which has neither Gable Head, nor Shread Head, or Jerkin Head; which last, are both Gable and *Hip* at the same End. See **ROOF**.

A *Hip-Roof* has Rafters as long, and with the Angles at the Foot, &c. at the Ends of Building, as it has at the Sides; and the Feet of the Rafters on the Ends of such Buildings as have *Hip-Roofs*, stand on the same Plane, viz. parallel with the Horizon, and at the same Height from the Foundation, with Rafters on the Sides of the Roof.

HIP-Styles. See **TYLE**.

HIPPEUS, or **EQUINUS**, in Physiology, a Sort of Comet which some Writers suppose to bear a Resemblance to a Horse.

But the Shape of this Kind of Comet is not always alike; being sometimes oval, and sometimes imitating a Rhomboides. — So its Train is sometimes spread from the Front, or Fore-part, and sometimes from the hind Part.

Hence, this Class of Comets is distinguished into *Equinus Barbatus*, *Equinus Quadrangularis*, and *Equinus Ellipticus*. See **COMET**.

HIPPIATRICE, the Art of curing the Diseases of Brutes, and particularly Horses.

This we rather call the *Farrier's Art*. See **FARRIER**.

The Word is composed of *ἵππος*, Horse, and *ιατρική*, Physician.

HIPPOCENTAUR, in Antiquity, a fabulous Monster, supposed to be half Horse, and half Man.

What gave Occasion to the Fable, was, a People of *Trochaly*, inhabiting near Mount *Pelion*, who became thus denominated, by reason they were the first that taught the Art of Mounting on Horseback; which occasion'd some of their Neighbours to imagine that the Horse and Man made but one Animal. See **HORSEMANSHIP**.

The *Hippocentaur* differ'd from the Centaurs, in this, that the latter only rode Bullocks, and the former Horses, as the Names themselves intimate. See **CENTAUR**.

Pliny affirms, he had seen a real *Hippocentaur* at *Rome*. — On the Medals of *Gallian*, is represented a Centaur drawing a Bow, or holding a Globe in the right Hand, and the Helm of a Ship in the left; with this inscription, *APOLLINI CONS. AUG. To Apollo the Conservator of Augustus*. — *Trifon* considers both the one and the other, as a Symbol of the Protection *Gallian* had received from *Apollo* in his Wars against the *Perthians*.

The Word is part Greek, form'd of *ἵππος*, Equus, Horse, and *κέντρον*, *pungo*, I prick, spur, and *ταύρος*, Bull.

HIPPOCRAS, or **HYPOCRAS**. See **HYPOCRAS**.

HIPPOCRATES'S Sleeve, *Manica Hippocratis*, a Kind of Filter, or straining Bag, form'd by joining the opposite Angles of a square Piece of Flannel, in Form of a Pyramid; and used to percolate, or strain Syrups, Decoctions, &c. for Clarification. See **FILTER**, **FILTRATION**, &c.

HIPPOCRATICA Facies, See **FACIES Hippocratica**.

HIPPODROME, **HIPPONOMEUS**, in Antiquity, a List, or Course, wherein their Horse Races were perform'd; as also their Horses exercis'd.

The Word is Greek, composed of *ἵππος*, Equus, Horse, and *δρομή*, *Cursum*, of the Verb *ἵστρομαι*, *curro*, I run.

HIPPOLAPATHUM, in Natural History, a Species of Lapathum, call'd also *Monk's Rhubarb*. See **RHUBARB**.

HIPPOMANES, a Sort of Poison, famous among the Antients as an Ingredient in amorous Philters, or Charms. See **POISON**, **PHILTER**, and **CHARM**.

Naturalists are not agreed about the Nature of the *Hippomanes*. — *Pliny* describes it as a blackish Cancrum, found on the Head of a new born Colt; which the Dam bites off, and eats, as soon as she is delivered. He adds, that if she be prevented herein by any others cutting it off before, she will not take to, nor bring up, the young.

Servius and *Columella* describe it as a poisonous Matter, trickling from the *Pudendum* of a Mare, when proud, or longing for the Horse.

At the End of *Moif. Bayle's Dictionary*, is a very learned Dissertation on the *Hippomanes*; and all its Virtues both real and pretended.

The Word is Greek, *ἵππομανες*, compounded of *ἵππος*, Equus, Horse, and *μανία*, *Furo*, Fury, Madness.

HIPPOPODES, or **HIPPORODES**, in the ancient Geography, an Appellation given to certain People, situate on the Banks of the *Scythian Sea*; as being supposed to have Horse's Feet.

The *Hippopodes* are mention'd by *Dionysius*, Geogr. v. 310. *Meis*, L. III. C. 6. *Pliny*, L. IV. C. 3. And *Str. Angustinus*, de Civit. L. XVI. C. 8. But the Truth is, they had this Appellation given them on Occasion of their Swiftness, or Lightness of Foot.

The Word is composed of *ἵππος*, Horse, and *πόδι*, *Pes*, Foot.

HIPPUS, in Medicine, an Affection of the Eyes, wherein they continually shake and tremble; and thus represent Objects as if continually fluctuating. See **ERY**.

It is thus call'd from the Greek, *ἵππος*, Horse; in regard the Objects appear to shift as much as when we are riding. *Blanchard*.

HIRCUS, in Anatomy, a Part of the Auricle, or outer Ear. See **EAR**.

The *Hircus* is that Eminence next the Temple. See **AURICLE**.

The Word is Latin, and signifies Goat.

HIRCUS, in Astronomy, a fixed Star; the same with *Capella*. See **CAPELLA**.

HIERUS, is also used by some Writers for a Comet, encompassed as it were with a Main, seemingly rough and hairy. See **COMET**.

HISSING, an Appellation given by Grammarians to the three Consonants, S, X, and Z. See **CONSONANT**. See also S, X, and Z.

HISTERIC, See **HYSTERIC**.

HISTIODROMIA, or **HYSTIODROMIA**, the Art of Sailing, or of conducting Vessels on the Sea. See **SAILING**.
Histiodromia is the same with what we otherwise call **NAVIGATION**. See **NAVIGATION**.

Histiodromia turns on four Points, any two whereof being given, the other two are easily found from 'em by the LoXdromic Tables, Sines, Tangents, Secants, Mercator's Chart, &c.

These four Things are, the Difference of Latitude, Difference of Longitude, the Course, and the Distance ran. See **LONGITUDE**, **LATITUDE**, **RHUMB** and **DISTANCE**.

The Word is Greek, composed of *hispa*, a Sail, of *ros*, the Mast of a Ship, which comes from *rosus*, so, I stand; and *deispa*, Course, of *deispa*, I run.

HISTORICAL, something that relates to History. See **HISTORY**.

Thus, we say, *Historical Truth*, *Historical Style*, &c. The Donation of *Constantin*, the Reality of a Pope *Joan*, &c. are *Historical Points*, very much controverted.

Henry Stevens has published a *Historical and Poetical Dictionary*; since improved and augmented by *Morery*. Mr. *Bayle* has given us an *Historical and Critical Dictionary*: *Diodorus Siculus*, *Vgquier*, and Bishop *Nicolson*, *Historical Libraries*.

The *Historical Art* consists chiefly in the arranging and disposing of the various Incidents, so as to constitute one uniform, well connected whole. Fa. *Daniel*.

The principal Qualities of the *Historical Style*, are **PURITY** and **BREVITY**. See **STYLE**.

HISTORICAL COLUMN, is that whose Shaft is adorned with Bas-reliefs carved all around from Bottom to Top, representing the History and Actions of some illustrious Person. See **COLUMN**.

In *Historical Columns*, the Figures may be either disposed in a spiral Line, continued from one End to the other; as in the *Trajan Column* at *Rome*: Or in distinct Bands, or Circles, containing so many different Subjects.

HISTORIOGRAPHER, a profess'd Historian, or Writer of History; or a Person who applies himself peculiarly thereto. See **HISTORY**.

The Term is chiefly used for a Person who has a peculiar Charge and Commission to write the History of his Time.—The *Historiographer* to his Majesty is an Officer under the Lord Chamberlain: His Salary 200*l.* per An*no*.

The Word is composed of the Greek, *hispa*, History, and *gros*, scribo, I write.

HISTORY, a Recital, or Description of Things as they are, or have been; in a continued, orderly Narration of the principal Facts and Circumstances thereof. See **ANNALS**.

The Word is Greek, *hispa*, History, and literally denotes a Search of curious Things, or a Desire of knowing, or even a Research of Things we have seen; being form'd of the Verb *hispa*, which properly signifies to know a Thing by having seen it. Tho' the Idea affect'd to the Term *History*, is now much more extensive; and we apply it to a Narration of divers memorable Things, even tho' the Relator only takes them from the Report of others.

The Origin of the Word is from the Verb *hispa*, I know; and hence it is, that among the Antients several of their great Men were call'd *Polyhistores*, q. d. Persons of various, and general Knowledge. See **POLYHISTOR**.

History is divid'd, with Regard to its Subject, into the *History of Nature*, and the *History of Actions*.

History of Nature, or **NATURAL HISTORY**, is a Description of natural Bodies; whether terrestrial, as Animals, Vegetables, Fossils, Fire, Water, Air, Meteors, &c. or Celestial, as the Stars, Planets, Comets, &c. See **NATURE**, &c.

Such are *Aristotle's*, *Diophrisides's*, *Aldrovandus's*, &c. *Histories*: Such also are *Rey's* and *Gessners* *History of Quadrupeds*, *Willoughby's* *Histories of Birds*, *Fishes*, &c. Such, lastly, are Mr. *Flamsteed's* *Historia celestis*, or *History of the heavenly Bodies*.

Natural History is the same with what we otherwise call *Physiology*. See **PHYSIOLOGY**.

HISTORY, with Regard to Actions, is a continued Relation of a Series of memorable Events, in the Affairs, either of a single Person, a Nation, or several Persons and Nations; and whether included in a great, or a little Space of Time.

Thus, *Thucydides* has wrote the *History of Greece*; *Livy* of *Rome*; *Meyeray*, and Fa. *Daniel*, of *France*; *Tyrrhel*, and *Eckard*, the *History of England*; *Buchanan* of *Scotland*; *Clarendon*, the *History of the Rebellion*;

Youanus, Bishop *Burnet*, &c. the *History of their own Lives and Times*.

Eusebius, *Baronius*, &c. have wrote the *History of the Church*; Bishop *Burnet* that of the *Reformation*, &c.

Several Authors have wrote on the Method of Reading, and Studying *History*; and, among the rest *Lucian*, *Bodinus*, *Vossius* the elder, *Whear*, *Patrici*, *Beni*, *Mojcardi*, *de Silbon*, *F. le Moine*, *Fa. Rapin*, the Abbot *de St. Real*, *Fa. Thomassin*, &c.

History is divid'd into *Antient* and *Modern*, *Universal* and *Particular*, *Sacred* and *Profane*.

Fa. Meusebrier gives us the proper Characters of the diverse Kinds of *History*, with great Accuracy.—He distinguishes *History*, with Regard both to its Matter, and its Form; and gives curious Instances of each particular.

History, with Regard to its Matter, is either *Sacred*, or *Natural*, or *Civil*, or *Personal*, or *Singular*.

SACRED HISTORY, is that which lays before us the Myseries and Ceremonies of Religion, Visions or Appearances of the Deity, &c. Miracles, and other supernatural Things, whereof God alone is the Author.—Such are the Book of *Genesis*, the Gospels, *Apocalypse*, &c. See **MIRACLE**, **GOSPEL**, **REVELATION**.

NATURAL HISTORY, is a Description of the Singularities of Nature; its Irregularities and Prodiges; and the Alterations it undergoes in the Birth, Progress, End, and Use of Things.—Such is *Aristotle's* *History of Animals*; *Theophrastus's* *History of Plants*; and the entire Body of *Natural History*, by *Pliny*: Such also are *Aesop's* *Natural History of the Indies*; *Plott's* *History of Staffordshire*, &c. **CIVIL HISTORY**, is that of People, States, Republicks, Communities, Cities, &c.—Such are those of *Thucydides*, *Hecateus*, *Livy*, *Polybius*, *Meyeray*, *Fa. Daniel*, *Milton*, *Buchanan*, &c.

PERSONAL HISTORY, is that which gives the Portrait, or Life of some single Person.—Such are the Lives of *Plutarch*, *Corn. Nepos*, *Suetonius*, &c. The Lives of the Painters, Poets, Philosophers, Saints, &c.

Personal History, is the same with what we otherwise call *Biography*. See **BIOGRAPHY**.

SINGULAR HISTORY, is that which describes a single Action, Siege, Battel, or even War, Expedition, &c.

History, with Regard to its Form, is either *simple*, or *figurate*, or *mix'd*.

Simple History, is that deliver'd without any Art or foreign Ornament; being only a naked, and faithful Recital of Things, just in the Manner, and Order wherein they pass'd.—Such are the *Chronicles of the Eastern Empire*; the *Fasts*; *Chronological Tables*, *Journals*, &c. See **FAST**.

Figurate History, is that which is further enrich'd with Ornaments, by the Wit, Ingenuity, and Address of the Historian.—Such are the *Political*, and *Moral Histories of the Greeks*, *Romans*, and most of the *Moderns*.

This latter is a Kind of *rational History*; which, without stopping at the Shell or Outside, the Appearances of Things, discovers the Springs and Movements of the several Events; enters into the Thoughts, the Breasts of the Persons concern'd therein; discovers their Intentions and Views; and by the Result of enterprising Undertakings, discovers the Prudence or Weakness, wherewith they were laid, conducted, &c.

These are much the most useful, and entertaining *Histories*.—To this Class, may be peculiarly refer'd the *Histories and Annals of Tacitus*, among the *Antients*; and those of *Guiscardin*, *Petavins*, and Bishop *Burnet* among the *Moderns*.

Mix'd History, is that which, beside the Ornaments of *figured History*, calls in the Proofs and Authorities of *simple History*; furnishing authentic Memoirs, or original Letters, Manifestos, Declarations, &c. to vouch the Truth of what is said.—Such are the *Histories*, or Collections of *Rushworth*; *Monf. Rapin* *Toussy's* *History of England*; the *Genealogical Histories of Ducheſne*; *Monf. de Marca's* *History of Spain*, &c.

HISTORY, is also used for a Romance; or a fabulous, but probable Relation, of a Series of Actions or Adventures feign'd or invented by the Writer.—Such is the *History of the Civil Wars of Granada*; the *History of Don Quixot*; the *Ethiopic History of Heliopolis*, &c. See **ROMANCE**.

HISTORY, in Painting, is a Picture composed of divers Figures, or Persons, representing some Transaction, or Piece of *History*, either real or feign'd. See **PAINTING**.

Painters are distinguish'd into *Portrait Painters*, *Flower and Fruit Painters*, *Painters of Beasts and Land-ships*, and *History Painters*.—The first Piece is universally allow'd to *History Painters*, as the most difficult, masterly, and sublime Province. See **ORDONNANCE**.

HISTRIO, in the ancient Comedy, was a Buffoon, or Drull, who acted some humorous Part to excite Laughter and Mertainment. See **COMEDY**.

HOAR-Frost, *Pruiua*. See FROST and PRUIUA.

HOARSENESS, *Raucoas*, a Diminution of the Voice. See VOICE.

The Part here affected is the *Aspera Arteria*, and particularly its Head or the Larynx. See ASPERA and LARYNX.

The next Cause of *Hoariness* is a too plentiful Effusion of thin Lympha upon the Part.

Hoariness is a Sort of Catarrhal Indisposition, arising from a too great Acrimony or Saltness of the Lymph. See CATARRH.

Sperma Ceti, Decoct. Rapa. & Rob. Paffular, are approv'd Remedies herein. — Where the Disorder is inveterate, Incidents and Expectorants are frequently Service.

HOBLERS, in our ancient Customs, were Men, who, by their Tenure, were oblig'd to maintain a little light Nag, or Hobby, for the certifying any Invasion toward the Sea Side.

The Name was also used for certain Irish Knights, who used to serve as light Horsemen upon *Hobbies*.

HOBBY, a Sort of Hawk that preys upon small Game, as Doves, Larks, &c. See HAWK.

HOBBITS, a Sort of small Mortars, used for annoying the Enemy at a Distance with small Bombs. See MORTAR and BOMB.

HOC-Tuesday Money, or HOCK-DAY Money, a Tribute anciently paid the Lordlord, for giving his Tenants and Bondmen Leave to celebrate *Hock-day*, or *Hock-day*; in Memory of the Expulsion of the domineering *Danes*. See HOCK-DAY.

HOD, a Sort of Tray for carrying Mortar, in use among Bricklayers.

HODEGOS, a Term purely Greek, signifying Guide.

The Word is chiefly used as the Title of a Book compos'd by *Anastafius the Smaitis*, toward the Close of the Vth Century; being a Method of disputing against the Hereticks, particularly the *Accephali*.

Mr. Toland has also publish'd a Dissertation under the same Title. Its Subject is the Pillar of Fire, &c. which went before the *Israelites*, as a Guide in the Desert.

HODGE-podge, or HATCH-potch, a Dish of Meat cut to Pieces, and strew'd with several Sorts of Things together.

HODGE-podge, or HOYCH-por, in Law, is the putting together of Lands, of several Tenures, for the more equal dividing of them. See HORTU-POR.

HODMAN, a young Scholar admitted from *Weyminster* School to be Student in *Christ's Church* College in *Oxford*. See SCHOOL.

HOE, or How, a Husband-man's Tool, made like a Cooper's Adz, to cut up Weeds in Gardens, Fields, &c.

This Instrument is of great Use, and should be more employ'd than it is, in hacking and clearing the several Corners, Creeks, and Patches of Land, in spare Times of the Year, which would be no small Advantage thereto.

HOG-flyer, among Hunters, a wild Boar of three Years old. See HUNTING.

HOGGET, or HOGREL, is a young Sheep of the second Year.

HOGINHINE, or rather AGRINHINE, *q. d. servus proprius*, or third Night oven *Servant*; is he that comes Guest-wife to an Inn or House, and lies there the third Night: After this he was accounted of that Family; and if he offended the King's Peace, his Host was answerable for him. See THIRD NIGHT oven *Hine*.

HOGOE, properly, HAUT-GOUT, a Mess in Cookery, denominat'd from its high Savour or Relish.

Its Preparations, Ingredients, &c. are various. — Its Basis is usually fine Meat, *e. g.* Leg of Mutton, minc'd with Suet and savoury Herbs, as Shalot, Thyme, Spinage, &c. added thereto, with seasoning of Salt and Pepper, and Yolks of Eggs: The whole work'd up into a Ball, and thus ball'd; frequently, in the Body of a Cabbage, first fashion'd like a Duck, or other Fowl, with a Head stuck on. — It remains to be serv'd up with a proper Sauce, as Butter, Yolks of Eggs, Anchovies, &c.

HOGSHEAD, a Measure, or Vessel of Wine, or Oil; containing the fourth Part of a Tun; or 63 Gallons. See MEASURE, TUN, GALLON, &c.

Two of these *Hogsheads* make a Pipe or But. See PIPE. The Distillers weigh their Vessels when full, and for a *Hogshead* allow 4 hundred Weights, 2 Quarters, and 22 Pound, Cask and Liqueur.

HOCK-*day*, or HOCK-*day*, or HOCK-Tuesday, in our ancient Customs, *Dies Martis quem quindennam Pasche vocant*; the second Tuesday after *Easter* Week.

This Day was very remarkable in former Times, inasmuch as to be used on the same Footing with *Michaelmas*, for a general Term or Time of Account. — We find Leases without Date referring to much Rent payable *ad duas Anni terminos, scil. ad le Hock-day, & ad Festum Sancti Mich.* See HOCK-Tuesday Money.

In Accounts of *Magdalen* College in *Oxford*, there is yearly an Allowance, *pro mulieribus Hockantibus*, of some

Manors of theirs in *Hampshire*; where the Men lack the Women on *Mondays*, & contra on *Tuesdays*. — The Meaning of it is, that on that Day the Women in Marriage stop the Ways with Ropes, and pull Passengers to them, desiring something to be laid out in pious Uses.

HOLD of a Ship, the lowest Part of the Ship; including all that Part lying between the Keelson, and the lower Deck. See SHIP, &c.

In the *Hold* are the Steward's Room, the Powder Room, the Bread Room, and the Boatswain's Room; divided from each other by Bulk-Heads.

The *Hold* is the Store Room in a Merchant Ship, or the Place wherein the Goods, at least all the heavier and more cumbersome, are stow'd. The rest are dispos'd between the two Decks; at least in *Dutch* Ships, which have their *Holds* very shallow, and the Space between the Decks; high.

To find the Burthen of a Ship, the *Hold* is to be measur'd. See BURTHEN.

HOLD-fast, an Iron Hook in Shape of the Letter S, fix'd in a Wall to retain and support it.

HOLLAND, in the Commerce of Linnen, a fine, white; even, close kind of Linnen Cloth, chiefly used for Shirts, Sheets, &c. See LINNEN.

It is wrought in the Provinces of *Holland*, *Friesland*, and other Parts of the United Provinces; whence the Appellation.

The principal Mart or Staple of this Cloth is at *Haerlem*, whither it is sent from most other Parts as soon as wove; there to be whiten'd the ensuing Spring.

That manufactur'd in *Friesland* is the most esteem'd, and call'd *Fries* *Holland*. It is the strongest, and the best colour'd of any of that Fineness. — It is never callender'd, nor thicken'd with Wap, as the rest; but is imported just as it comes from the Whittler. — It is distinguish'd by its being Yard, Quarter, and half wide; which is half a Quarter more than those commonly call'd *Fries* *Hollands*, which are not right.

Gulze *Holland* is very white and fine, and is chiefly used for Shirts; being the strongest of any for its Fineness, except true *Fries*. 'Tis just Yard wide.

Meauwe *Holland*, is a very strong Cloth, and wears exceeding well. 'Tis about Yard, Quarter, and half wide.

HOLLOW, in Architecture, a Concave Moulding, about a Quadrant of a Circle; by some call'd *Casement*, by others an *Abacus*. See CASEMENT, &c.

HOLLOW Square, is a Body of Foot drawn up with an empty Space in the Middle, for the Colours, Drums, and Baggage; facing, and cover'd by the Pikes every Way to oppose the Horse. See SQUARE.

HOLLOW Tower, in Fortification, is a Rounding made of the Remainder of two Bristlers, to join the Curtain to the Orillon; where the small Shot are play'd, that they may not be so much expos'd to the View of the Enemy. See TOWER, &c.

HOLM, HOLMUS, signifies as much as *Insula arvensis*, a River Island, according to *Bedo*; or plain grassy Ground upon the Water-sides, or in the Water, according to *Cambden*. — *Civitas Anobis Holmis in Campis de Westonia*. Mon.

Hence, where any Place is call'd by that Name, or where this Syllable is join'd with any other in the Names of Places, it signifies a Place surrounded with Waters. — As the *Flat-bushes*, the *Stephobushes*, near *Bristol*. — If the Situation of the Place be not near the Water, it may signify a hilly Place; for *Halm* in *Saxony*, is in *English* an Hill, or Cliff.

HOLocaust, a kind of Sacrifice, wherein the whole Offering is burnt or consum'd by Fire; call'd also in the Scripture, *Burnt-offering*. See SACRIFICE and OFFERING.

The Word is Greek, *ἁλόγενον*, *ἁλογενον*, compounded of *αἶμα*, *ratum*, whole; and *κατα*, *Ura*, *lyce* *Alfama*, I consume with Fire.

HOLOGRAPH, in the Civil Law, something written wholly in the Hand-writing of the Person who signs it.

The Word is chiefly used in speaking of a Testament, written wholly in the Testator's own Hand. See TESTAMENT.

The *Romans* did not approve of *Holographic* Testaments; and tho' *Valentinian* authoriz'd them by a Novel, they are not us'd where the Civil Law is in full Force.

The Word is Greek, compos'd of *ἅμα*, all, and *γραφω*, I write.

HOLEMETER, a Mathematical Instrument, serving universally for the taking of all Sorts of Measures, both on the Earth, and in the Heavens.

The *Holemeter* is the same with *Pantometer*. See PANTOMETER.

The Word is Greek, compos'd of *ἅμα*, and *μετρο*, I measure.

HOLSOM. — A Ship is said to be *holsom* at Sea, when she will hull, try, and ride well without rolling or labouring.

HOLYNESS, or **HOLINESS**, *Sanctitas*; the Quality which constitutes or denominates a Person or Thing *holy*; i. e. free or exempt of Sin. See **SIN**.

HOLYNESS is also us'd in respect of Persons and Things that are *sanct*, i. e. set apart to the Service of God, and the Uses of Religion. See **SACRED** and **SACRILEGIOUS**.

In this Sense we say *holy Days*, *holy Ordinances*, the *holy Bible*, *holy Gospels*, *holy War*, &c. — The *Roman Catholics* call the Inquisition the *holy Tribunal*; the See of *Rome*, the *holy See*, &c. See **INQUISITION**, &c.

Holy Oil, *holy Water*, &c. See **OIL**, **WATER**, &c.

Palatine is particularly call'd the *holy Land*, and *Jerusalem* the *holy City*. — Princes formerly made a Practice of going to signalize their Religion in the *holy Land*; who, if they had had any Religion, would have staid at Home. See **CROISADE**.

In the *Romish Countries*, one Third of the Year is taken up in *holy Days*, *Saints Days*, &c. In *Scotland*, they observe no stated *holy Days*, beside *Sundays*.

Holy Week, is the last Week of Lent, call'd also *Passion Week*. See **LENT** and **PASSION**.

Holy Thursday, is what we otherwise call *Maundy Thursday*. See **MAUNDAY**.

Holy Year is sometimes us'd for the Year of Jubilee. See **JUBILEE**.

In the *Jewish* Tabernacle, and afterwards in the Temple, were two Places; the one call'd the *Holy Sanctuaries*; and the other, which was more retir'd, the *Holy of Holies*, *Sanctum Sanctuorum*, or the *Sacrosanctum*. See **SANCTUARY**.

The *Holy* was separated from the *Holy of Holies* by a Veil. — In this latter Place was the Ark of the Covenant kept. See **ARK**.

HOLYNESS is also a Title or Quality attributed to the Pope; as that of Majesty is to Kings. See **TITLE**, **QUALITY**, &c.

Even Kings writing to the Pope, address him under the venerable Appellation of your *Holiness*, or *Holy Father*; in *Latin Sanctissimo*, or *Beatissimo Pater*. See **POPE**.

Anciently the same Title, *Holiness*, was given to all Bishops; as appears in *St. Augustin*, *Fortunatus*, *Nicholas I. Cassiodore*, &c. — *St. Gregory* compliments some of his contemporary Bishops with *Your Beatitude*, *Your Holiness*.

The *Greek Emperors of Constantinople* were also address'd under the Title of *Holiness*, in regard of their being anointed with *holy Oil* at their Coronations. — *Du Gange* adds, that some of the Kings of *England* have had the same Title; and that the *Oriental* have frequently refus'd it to the Pope.

Order of the Holy Ghost, is a military Order in *France*, the principal, in Point of Dignity, in that Kingdom. See **ORDER** and **KNIGHT**.

It was instituted by King *Henry III.* in 1569, in Memory of three great Events happening on the same Day, viz. his Birth, Accession to the Crown of *France*, and Election to that of *Poland*; and is to consist of 100 Knights only; who, to be admitted, are to make Proof of their Nobility for three Descents.

The King is the Grand Master or Sovereign, and takes the Oath as such on his Coronation Day; whereby he solemnly vows to maintain for ever the Order of the *Holy Ghost*, without ever suffering it to shrink, fall, or diminish, so long as it is in his Power to hinder it; and never to attempt to alter or dispense with any of the irrevocable Statutes of the Order.

The Knights are all to wear a Gold Cross, hung about the Neck by a blue Silk Ribbon or Collar; and the Officers and Commanders are also to wear a Cross sewed on the left Side of their Cloaks, Robes, and other upper Garment.

Before they receive the Order of the *Holy Ghost*, that of *St. Michael* is conferr'd, as a necessary Degree; for which Reason their Arms are surrounded with a double Collar.

Cross of the Holy Ghost, in Heraldry. — A *Cross of the Holy Ghost* consists of a Circle in the Middle, and on it the *Holy Ghost* in Figure of a Dove: the four Arms are drawn narrow from the Centre, and widening to the Ends, where the returning Lines divide each of them into two sharp Points, upon each of which is a Pearl. See **CROSS**.

From the Intervals of the Circle between the Arms, issue four Flower-de-luces. — This is the Cross worn by the Knights of the Order of the *Holy Ghost* in *France*.

Holy-Rood Day, a Festival observ'd by the *Roman Catholics*, in Memory of the Exaltation of our Saviour's Cross. See **EXALTATION of the Cross**.

Holy-water Sprinkle, among Hunters, signifies the Tail of a Fox. See **TAIL**.

HOMAGE, or **HOMMAGE**, in its general and literal Sense, denotes the Reverence, Respect, and Submission which a Person yields his Master, Lord, Prince, or other Superior. See **LORD**, &c.

HOMAGE, **HOMAGIUM**, **HOMINIUM**, in Law, is an Engagement or Promise of Fidelity, which the Vassal or Te-

nant who holds a Fee, renders to the Lord when admitted thereto. See **FEU**, **VASSAL**, **LORD**, &c.

The Word is form'd of the *Latin*, *Homo*, Man; by reason when the Tenant takes this Oath, he says, *Ego servento homo vestro, I become your Man*: For the same Reason, *Homage* is call'd *Manhood*: So the *Homage* of his Tenant, and the *Manhood* of his Tenant, is all one. *Coke on Justit.* fol. 64.

In the original Grants of Lands and Tenements by Way of Fee, the Lord did not only use his Tenants to certain Services; but also took a Submission, with Promise and Oath to be true and loyal to him as their Lord and Benefactor.

This Submission, &c. is call'd *Homage*, the Form whereof, as appointed by Stat. 17 *Edw. II.* is in these Words: When a Free-man shall do *homage* to his Lord, of whom he holdeth in Chief, he shall hold his Hands together between the Hands of his Lord, and shall say thus: "I become your " Man from this Day forth for my Life, for Member, and " for worldly Honour; and shall owe you my Faith for the " Land I hold of you, saving the Faith that I owe unto " our Sovereign Lord the King, and to mine other Lords.

In this Manner the Lord of the Fee, for which *Homage* is due, takes *Homage* of every Tenant as he comes to the Land or Fee. *Glouvil*, indeed, excepts Women; who only perform *Homage* by their Husbands; in regard *Homage* is suppos'd to have a more immediate Relation to Service in War; but *Fitzherbert* denies the Exception, *Nat. Brev.* fol. 157.

He adds, that Bishops do no *Homage*, but only Fealty, and, probably, for the same Reason as Women. Yet do we read, that the Archbishop of *Canterbury* does *Homage* on his Knees to our Kings at their Coronation; and that the Bishop of *Mau* is *Homage* to the Earl of *Derby*.

Fulbe reconciles this: By our Law, says he, a religious Man may do *homage*; but may not say to the Lord, *Ego servento homo vestro*; because he has already profess'd himself to be only God's Man; but he may say to him, "I do unto " you *Homage*, and to you shall be faithful and loyal.

Homage and Fealty, or Faith, are two distinct Things, different Duties. See **FEALTY**.

Originally, *Homage* was perform'd by the Gentleman, and Fealty by the Peasant. Others say, that *Homage* was that perform'd to the Lord himself; and Fealty to his Beneficial or Steward, for his Lord. — 'Tis added, that he who holds Lands for Term of Life, owes *Homage*, but not Fealty.

Bishops take the Oath of Fealty and Loyalty to the King for the Temporality they hold of him; but without *Homage* or Vassalage. See **TEMPORALITY**.

HOMAGE-LIEGE was a more extensive Kind of *Homage*, whereby the Vassal held of the Lord, not only for his Lands, but for his Person. — So that the Lord might use him against all Mankind, whether within or without the Kingdom, excepting the King. See **LIEGE**.

This Kind of *Homage* was render'd bare-headed, with the Hands join'd on the Gospels, one Knee on the Ground, and without Sword, Girdle, or Spurs. — By which it was distinguish'd from *Frank Homage*. See **FRANK**.

There are also other Distinctions of *Homage*, as, *Plain Homage*, or *Homage of a Fee*, where no Oath of Fidelity is taken.

Homage of Devotion, which is a Donation made the Church, and does not import any Duty or Service at all.

Homage of Peace, which a Person makes to another after a Reconciliation, as an Assurance that he will no longer disturb his Peace, &c.

Homage, again, is divided into *serv*, i. e. that perform'd upon the Grant of the Fee; and *Ancestral*.

HOMAGE Ancestral, is where a Man, and his Ancestors, Time out of Mind, have held their Land of the Lord and his Ancestors by *Homage*.

If such Lord have receiv'd *Homage*, he is bound to acquit the Tenant against all other Lords above him, of every Manner of Service; And if the Tenant has done *Homage* to his Lord, and is impleaded, and vouches the Lord to warranty, the Lord is bound to warrant him; and if the Tenant lose, he shall recover in Value against the Lord, so much of the Lands as he had at that Time of the Voucher, or any Time after. See **VOUCHER**.

HOMAGE is also us'd for the Jury in a Court Baron; because commonly consisting of such as pay *Homage* to the Lord of the Fee. See **JURY** and **COURT-BARON**.

HOMAGE is also taken, in some Cases, for the particular Place or District where the Services are to be perform'd.

HOMAGER, a Person that does, or is bound to do, *Homage* to another. See **HOMAGE**.

This Lordship is so extensive, that there are above 120 Tenants or *Homagers* therein.

HOMAGIO respectuendo, is a Writ issu'd out to the Executor, commanding him to deliver Seisin of Lands to the Heir that is at full Age, notwithstanding his *Homage* not being done.

HOMESOKEN, or rather **HAMSOKE**, the Privilege or Freedom which every Man hath in his Houſe. — Hence he who invades that Freedom, is properly ſaid *facere Homeſoken*. See **HAMSOKE**.

This ſeems to be what we now call *Burglary*, which is a Crime of a very heinous Nature, as being not only a Breach of the King's Peace, but a Breach of that Liberty which a Man hath in his Houſe, which, as we commonly ſay, ſhould be his Caſtle, and therefore ought not to be invaded. *Braſton lib. 3.* See **BURGLARY**.

The Word is alſo uſed for an Impunity to thoſe who have committed this Crime. — *Hamſokne, hoc eſt quietus eſſe de amerciamenis pro ingreſſu hoſpitii violenter & ſine licentia contra pacem Regis, & quod tenentis placita de cuiusmodi tranſgreſſione in curia veſtra. W. T. Baro, 2030.*

HOMÉ-STALL, a Manſion Houſe or Seat in the Country. See **MANſION**.

HOMER, or **OMER**, a Jewiſh Measure, containing the tenth Part of the *Epha*. See **MEASURE** and **EPHA**.

HOMICIDE, in common Law, the killing of a Man.

It is divided into *voluntary* and *caſual*. *Voluntary Homicide*, is that which is deliberate, and committed with a ſet Purpoſe and Mind to kill; and is either with a precedent Malice, or without. — The former is Murder, and is a felonious killing, with Malice prepense, any Perſon in the Realm, living under the King's Protection. See **MURDER** and **MANSLAUGHTER**.

Caſual Homicide, is either merely caſual or mix'd. — Merely *caſual*, is when a Perſon kills another by pure Miſchance, being about his lawful Occaſions; as in the Caſe of an Ax ſlipping out of a Man's Hand, or falling off the Helve while he is ſelling a Tree. See **CHANCE** and **MEDLEY**.

It is accounted *mix'd*, when there is Negligence, or ſome other unwarrantable Circumſtance, attending the Action.

HOMILY, or **HOMELY**, originally ſignify'd a Conference or Meeting; but has ſince been apply'd to an Exhortation, or Sermon deliver'd to the People. See **SERMON**.

The Greek Word, *Homilia*, ſays M. Fleury, ſignifies a familiar Diſcourſe; like the *Latin, Sermo*: And Diſcourſes deliver'd in the Church took theſe Denominations, to intimate that they were not Harangues, or Matters of Ornament and Flourish, like thoſe of prophane Orators; but familiar Diſcourſes, as of a Maſter to his Diſciples, or a Father to his Children.

All the *Homilies* of the Greek and *Latin* Fathers are account'd by Biſhops. — We have none of *Tertullian, Clemens Alexandrianus*, and other learned Perſons; by reaſon, in the ſiſt Ages, none but Biſhops were admitted to preach.

The Privilege was not ordinarily allow'd to Priests till toward the Vth Century. — *St. Chryſoſtom* was the ſiſt Priest that preach'd ſtatedly: *Origen* and *St. Auguſtin* alſo preach'd, but it was by a peculiar Licenſe or Privilege.

Phoſtus diſtinguiſhes *Homily* from *Sermon*; in that the *Homily* was perform'd in a more familiar Manner; the Prelate interrogating and talking to the People; and they, in their Turn, answering and interrogating him: So that it was properly a Converſation; whereas the *Sermon* was deliver'd with more Form, and in the Pulpit, after the Manner of the Orators.

There are ſeveral fine *Homilies* of the Fathers ſtill extant; and particularly of *St. Chryſoſtom, St. Gregory*, &c.

The Word is Greek, *homilia*; form'd of *homos*, *Catus*, Aſſembly, Council.

HOMINE capto in Withernamium, a Writ for apprehending him that has taken any Bondman or Woman, and led him or her out of the County; ſo that he or ſhe cannot be repley'd according to Law. See **WITHERNAM**.

HOMINE Replegiando, a Writ for the Bailing of a Man out of Priſon. See **BAIL**, **REPLEY**, &c.

HOMINICOLE, **HOMINGOLE**, in Antiquity, a Name which the Apollinarists gave to the Orthodox, to denote them Worſhippers of a Man. See **APOLLINARISTS**.

As the Orthodox maintain'd that Jeſus Chriſt was God-man; the Apollinarists accus'd them of adoring a Man, and call'd them *Hominicoles*.

The Word is form'd of the *Latin, homo, hominis*, Man, and *colo*, I worſhip.

HOMOCENTRIC, in Astronomy, a Term of the ſame Import with *concentric*. See **CONCENTRIC**.

The Hypotheſis of *Ptolemy* is explain'd by means of divers *homocentric* and *excentric* Circles. See **EXCENTRIC**, &c.

The Word is Greek, compos'd of *homos*, alike, ſimilar, and *centros*, Centre.

HOMOEOPOTON, *ομοειπότης*, a Figure in Rhetoric, where ſeveral Members of a Sentence end in like Caſes.

HOMOEOTELEUTON, *ομοειτελευτος*, a Figure in Rhetoric, where ſeveral Members of a Sentence end alike.

HOMOGENEOUS, or **HOMOGENEAL**, is a Term apply'd to various Subjects, to denote, that they conſiſt of ſimilar Parts, or Parts of the ſame Nature and Kind. — In

contra-diſtinction to *Heterogeneous*, where the Parts are of different Natures, &c.

Natural Bodies, for the generality, are compos'd of *homogeneous* Parts; as a Diamond, a Metal, &c. — Artificial Bodies, on the contrary, are Aſſemblages of *heterogeneous* Parts, or Parts of different Qualities; as a Building, of Stone, Wood, &c. See **HETEROGENEAL**.

The Word is compos'd of the Greek, *homos, idem*, or *equalis*, and *potos, Genus*, Kind.

HOMOGENEAL Light, is that whoſe Rays are all of one and the ſame Colour, Degree of Refrangibility and Reflexibility. See **LIGHT** and **RAY**.

HOMOGENEAL Numbers, are thoſe of the ſame Kind and Nature. See **NUMBER**.

HOMOGENEAL Surds, are ſuch as have one common radical Sign; as $\sqrt{27}$, and $\sqrt[3]{5}$. See **SURD**.

HOMOGENEUM, *Comperationis*, in Algebra, the known Quantity in an Equation; call'd alſo *Absolute Number*. See **EQUATION**, &c.

It is call'd *Homogeneous Comperationis*, of *Comperationis*, to diſtinguiſh it from the other Terms; which tho' *homogeneous* as well as this, i. e. always rais'd to the ſame Degree of Power, are not the Quantities to which Things are here compar'd or refer'd.

HOMOIOMERICAL Principles, a peculiar Kind of Principles, ſuppos'd, by *Anaxagoras*, in all mix'd Bodies; being determinate Numbers of ſuch ſimilar Principles, as, when they came to become Parts, e. gr. of an Animal Body, would there make ſuch Maſſes and Combinations as their Nature requir'd, viz. the Sanguinary Particles would then meet all together and make Blood, the Urinous Particles conſtitute Urine, the Officious ones Bones, the Carneous Fleſh, &c. See **PRINCIPLE**.

HOMOLOGATION, in the Civil Law, the Act of confirming or rendering a Thing more valid and ſolemn, by a Publication, Repetition, or Recognition thereof.

The Creditors have ſign'd the Contract; there remains nothing but to get it *homologated*.

The Word comes from the Greek, *homologia*, Conſent, Aſſent, form'd of *homos, ſimilis*, alike, and *logos* of *λογος*, *dicere*, to ſay, q. d. to ſay the ſame thing, to conſent, agree.

HOMOLOGOUS, in Geometry, is apply'd to the Sides of ſimilar Figures; which are ſaid to be *homologous*, or in Proportion to each other. See **SIMILAR**.

Thus, the Baſe of one Triangle, is *homologous* to the Baſe of another ſimilar Triangle: So, in ſimilar Triangles, the Sides oppoſite to equal Angles, are ſaid to be *homologous*. See **TRIANGLE**.

Equiangular or ſimilar Triangles, have their *homologous* Sides proportional.

All ſimilar Rectangles are to each other, as the Squares of their *homologous* Sides. See **RECTANGLE**.

The Word is Greek, compos'd of *homos*, Similar, and *logos*, Ratio, Reaſon, q. d. Quantities alike to each other in Ratio. — So, if the Ratio of A to B, be the ſame as of C to D; here A is *homologous* to C, as B to D; by reaſon of the Similitude between the Antecedents and Conſequents. The two Antecedents, and the two Conſequents, then, in any continu'd Geometrical Proportion, are *homologous* Terms. See **PROPORTION**.

HOMOLOGOUS Things, in Logick, are ſuch as agree in Name, but are of different Natures. — Theſe coincide with what we otherwiſe call *Equivocal Terms*. See **EQUIVOCAL**.

HOMONYMIA, in Logic, an *Equivocation*. See **HOMONYMUS**, &c.

HOMONYMUS, or **HOMONYMUS**, in Logic, is apply'd to a Word which has two different Meanings; or expreſſes two Things of different Nature and Quality.

Homonymus is the ſame as *Equivocal*. See **EQUIVOCAL**.

The Word is compos'd of *homos, ſimilis*, and the Ionic *onymos* for *ωνος, nomen*, Name.

HOMOOSIOS, *ομοσιος*, among Divines, a Being of the ſame Subſtance or Eſſence. See **SUBSTANCE**. See alſo **PERSON**, &c.

HOMOOSIANS, **HOMOUSIANS**, **HOMOUSIONS**, **HOMODISIONISTS**, **HOMOUSIANTS**, are Names which the Arians anciently gave to the Orthodox, by reaſon they held that God the Son is *Homooſius*, i. e. conſubſtantial with the Father. See **HETEROUSIANS**.

Emeric, King of the *Fanſals*, publiſh'd a Reſcript, directed to all the *Homaniſten* Biſhops. See **PERSON**, &c.

The Word is Greek, *homoiotes*, or *ομοιότης*, ſignifying of the ſame Subſtance.

HOMOPHAGI, among the ancient Geographers, a Name given to certain Nations who fed on raw Fleſh; as the *Scythians*, &c.

The Word is form'd of *homos*, crude, raw; and *phagos*, I eat.

HOMUNCIONATES, a Name the Arians gave to the Orthodox, in the IVth Century; by reason they admitted two Substances and two Natures in Jesus Christ.

HOMUNCIONISTS, a Sect of Hereticks, the Followers of *Phoebus*; and from him also call'd *Phoebianus*. See **PROTINIANS**.

They had this Appellation in respect of their denying the two Natures in Jesus Christ, and holding that he was only mere Man.

The Word is form'd of the Latin, *Homuncio*, a Diminutive of *homo*, Man; *q. d.* little Man.

HOMUNCIONITES, were a Sect of ancient Hereticks, whose distinguishing Dogma it was, that the Image of God was impress'd on the Body, not on the Soul or Mind of Man.

HOND-habent, in our ancient Customs, from the *Saxon*, *Hand*, and *habent*, having; a Circumstance of a manifest Theft, when the Party is taken with the Mainor, or Mainover, *i. e.* the Thing stolen in his Hand.

Breton also uses *Hond-habent* in the same Sense. See *Latro manifestus*. See **HAND-habent**.

So in *Fleta*, *Ferrus manifestus est ubi aliquis latro deprehensus fuisse de aliquo latrocinio Hand-habund*, & Beckeringe, & *infectus fuerit per aliquem cuius res aliqua fuerit, que dicitur Sactorgh*, & *tunc licet infectori rem suam petere criminaliter sit furatus*.

It also signifies the Right which the Lord hath to judge and determine of this Offence in his Court.

HONE, a fine Sort of *Wet-stone*, whercon to fit a Razor or Penknife.

It is of a yellowish Colour, being Holly-wood petrify'd or chang'd into Stone, by lying in the Water for a certain Season. See **PETRIFFICATION**.

Of these there are said to be some in *Oxfordshire*, that will be thus petrify'd in a very short Time.

HONEY, *Mel*, a sweet sort of Juice suck'd from Vegetables by the Bees, and deposited in their Combs. See **WAX**.

Honey is properly one of the Juices afforded by the Flowers, and is found to exude from all Sorts thereof; the very bitterest, as *Aloes* and *Colocynth*, not excepted.

In all Male Flowers that have Utricles at the Bottom of the Petala, is found a viscid, raddy, sweet Juice in good Plenty; whence it is, that we see the Children gather *Cowslips*, *Fox-gloves*, *Honey-suckles*, &c. and suck the *Honey* from them. — The Bees too visit these Flowers; and putting in their Proboscides, or Trunks, suck out the *Honey-Juice*, and load their Stomachs therewith; to be afterwards discharge'd and laid up in their Combs: — So that *Honey* is a vegetable Substance.

In the Belly of the Bee is a small transparent Bladder, which is the proper Receptacle of the *Honey*: When the Animal finds this full, it returns, enters one of the Cells, and discharges it there by that Part of the Head situate between the two Jaws, which it extends wider than ordinary, moving its Head at the same time this way and that. — If a Drop happen to be ill plac'd, it sucks it up again by its Proboscis, and discharges it a-new. — When a Cell is fill'd with *Honey*, they stop it up with Wax for Winter Store. See **WAX**.

Honey was anciently taken for a Dew that fell or descended on the Flowers; but what proves this a Mistake, is, that the Bees only gather it after the Sun is up, when there is no Dew left: It must therefore be either a Liquor prepar'd in the Flower, and excreted by its proper Vessels, like *Manna*. See **MANNA**.

Or rather, it appears to be the fine Dust, or Farina Pecundans of the Apices. — For, according to the Observations of *M. du Verney*, the Bees, when in the Search of *Honey*, fix on one of their Parts but the Stamina and Apices, and not on such as yield any other Liquor. See **FARINA**.

What is very remarkable, is, that *Honey*, in Virtue of its vegetable Nature, is discover'd by *M. Lemery* to contain Iron; which Discovery may serve as an Answer to *M. Geoffroy's* Chymical Question, *viz.* Whether there is any Part of a Plant without Iron? For if so delicate an Extract from the finest Part of the Flower, and this further elaborated in the little Viscera of the Insect, be not void of Iron, we may despair of seeing any so. See **IRON**.

We have two Kinds of *Honey*, *white* and *yellow*. — The white, call'd also *Virgin Honey*, trickles out spontaneously from the Comb, by turning it up or breaking it.

The second is squeeze'd from the Combs in a Press, after having first soften'd them with a little Water over the Fire. — There is also an intermediate Sort, of a yellowish white Colour, drawn by Expression, without Fire.

The *Honey* left to stand two or three Days, purges itself; throwing up a Scum of Wax and other Drofs, which is to be taken off.

Some Naturalists will have the *Honey* to be of a different Quality, according to the Difference of the Flowers or Plants the Bees suck it from. — Accordingly *Strabo* relates,

that there is a Kind of *Honey* in *Pontus*, which is a strong Poison; being procur'd by Bees which feed upon *Aconite* and *Wormwood*.

F. Lamberri, in his Account of *Mingrelia*, assures us of the contrary; and affirms it the best *Honey* in the World, by reason of the great Quantity of *Bawm* growing there. — He adds, that there is another very white Kind of *Honey*, hard as Sugar, and which does not stick to the Hands.

The Ancients rank'd *Sugar* and *Manna* among the Species of *Honey*. See **SUGAR** and **MANNA**.

Honey has considerable medicinal Virtues; being reputed a good Desurgent and Cleanser; and in that Quality used both internally and externally, for the Viscera, Wounds, Ulcers, &c.

Honey is the Basis of several Compositions in Pharmacy. — Of *Honey*, with the Addition of *Rosés* or *Violets*, *Mercurials*, &c. is made *Mel Rosatum*, *Mercuriale*, &c.

There is also a *Mel Scilliticum*, or a Preparation of *Squill*: *Mel Pappulatum Violatum*, made with *Raisins* boil'd in hot Water; And *Mel Autobosum*, made of *Rosmary* Flowers.

The Chymists also draw a Water, a Spirit, an Oil, &c. from *Honey*.

Honey is also an Ingredient in several Drinks, as *Mum*, *Methegin*, &c. See **MUM**, **METHEGLIN**, &c.

Wild Honey. *S. Adamnan*, Abbot of *Hii*, in his Description of the holy Places, observes, that in the Place where *St. John Baptist* liv'd in the Desert, there are Locusts which the poor People boil with Oil, and a Sort of Herbs with large long Leaves, of a Milk Colour, and a Taste like that of *Honey*; and that this is what in Scripture is call'd *wild Honey*.

HONEY-Dew, is a sweet-tasted Dew, found early in the Morning on the Leaves of divers Sorts of Plants. See **DEW**.

Honey-Dews, or *Mildews*, are of a very different Nature from Blasting, being caus'd by the condensing of a fat moist Exhalation, rais'd in a hot dry Summer, from Plants and Bioffoms; as also from the Earth; which, by the Coolness and Serenity of the Air in the Night, or in the upper clear Region of the Air, is thicken'd into a fat glucky Matter, and falls to the Earth again; Part whereof rests upon Oak Leaves, and some other Trees, whose Leaves are smooth, and do not easily admit the Moisture into them.

Gassendus holds, that a viscid Juice transpiring out of the Leaves, helps to compose this *Honey*, or to convert the Dew falling on them into a *Honey* Substance, which before had nothing of it: And hence he accounts for the Reason why we find it on some Trees, and not on others.

This *Honey-Dew* falling on the Ears and Stalks of Wheat, besmears them with a different Colour from the natural; and being of a clammy Substance, so binds up the young, tender, and close Ears of the Wheat, by the Heat of the Sun, that it prevents the Growth and Completing of the perfect Grain therein.

A Shower of Rain succeeding presently after the Fall thereof, or the Wind blowing stiffly, are the only natural Remedies against it.

HONEY-COMB, a waxen Structure, full of Cells, form'd by the Bees to deposit their *Honey*, Eggs, &c. See **CELL**, **WAX**, **HONEY**, &c.

The great Sagacity and Contrivance of the Bees in making their Combs, have often been admir'd. — Their Labour is distributed regularly among them; sometimes those Bees that carry the Wax in their Jaws and Chaps, moisten and mollify it with some Liquor that they distil upon it: the same sometimes build the Walls of their hexagonal Cells; but sometimes others do it; but those that form the Cells never polish them. — Others come and make the Angles more exact, and close and smooth the Superficies. — And as in the doing of this, some small Bits of Wax are pared off, there are some whose Business is to take these, that they may not be lost.

M. Moraldi has also observ'd, that those Bees that polish the Walls, work longer than those that build them; as if Polishing were not so laborious as Building.

They begin their Work at the Top of the Hive, fastening it to the most solid Part thereof: Thence it descends downwards, being continu'd from Top to Bottom, and from one Side to another; and to make it the more Solid, they use a Sort of temper'd Wax that is pretty much like Glue. The Form of the Cells, of which the *Honey-Comb* is made, is hexagonal; a Figure that, besides what is common with a Square and equilateral Triangle, has the Advantage of including a greater Space within the same Surface.

HONEY-COMB, in Gunnery, is the Metal of a Piece of Ordnance when it is ill cast, and spongyous.

HONI *Sic* *Qui* *Mel* *y* *Pense*, *q. d.* Evil to him that thinks Evil; the Motto of the most noble Order of the Knights of the Garter. See **GARTER**.

HONOR }
 HONORABLE } Sec { HONOUR.
 HONORARY } { HONOURABLE.
 { HONOURARY.

HONORIFIACI, in Antiquity, a Species or Order of Soldiers, under the Eastern Empire. — It was the *Honorifici* that introduc'd the *Goths*, *Vandalis*, *Alani*, *Suevi*, &c. into Spain.

Dionysus and *Ferimius*, two Brothers, had, with great Vigilance and Valour, defended the Passages of the *Tyreneans* against the Barbarians for some time, at their own Expence; but being at length kill'd, the Emperor *Constantinus* appointed the *Honorifici* to defend those Passages, who, not contented to lay them open to all the Nations of the North then ravaging the *Gauls*, join'd themselves to 'em.

HONOUR, *HONOR*. — Beside its literal Sen^s, wherein it denotes a Testimony or Token of Esteem and Submission, *Honor* is particularly apply'd in our Customs to the more noble Kinds of Seignories or Lordships; whereof other inferior Lordships or Manors hold, or depend. See **SEIGNORY**.

As a Manor consists of several Tenements, Services, Customs, &c. (See **MANOR**, **SERVICE**, &c.) So an *Honor* contains divers Manors, Knights-Fees, &c.

It was also formerly call'd *Beneficium* or *Royal Fee*; being always held of the King in Capite. *Spelman*. Anciently, *Honor* signify'd the same as *Baronia*. See **BARONY**.

By Stat. 37. Hen. 8. cap. 18. The King is empower'd by Letters Patent to create four several Honours, viz. *Westminster*, *Kingston upon Hull*, *St. Oystre*, and *Downington*; and as many other Honours as he will. — The Manner of creating these Honours, may be gather'd from the Stat. 33 Hen. 8. cap. 37, &c.

Maid of Honour, are young Ladies, in the Queen's or Princess's Household, whose Office is to attend the Queen, &c. when she goes abroad, &c. They are six in Number, and their Salary 300*l.* per Annum each.

The French call *Chevaliers de Honneur*, *Knights*, or *Gentlemen of Honour*, the Gentlemen Ushers of Queens and Princesses, who attend them, give them their Hand, &c. See **USHER**.

Counsellors of Honour, or *Honorary Counsellors*, are such as have a Right to enter or sit in Assemblies, Courts, &c. to deliberate or give Judgment in the same, tho' they do not properly and ordinarily belong thereto.

The *Honours of the Lounge*, are certain Privileges affixed to divers Diarines or Offices, particularly those of Duke, Peer, Chancellor, &c. as, to enter the Lounge in a Coach; to have the Tabouret or Stool in the Queen's Presence, &c.

The *Honours of the House*, are certain Ceremonies observ'd either by receiving Visits, making Entertainments, &c. perform'd either by the Master himself, or by some Person appointed for that Purpose; as, to go and receive the Guests, to conduct them out again, to see they be well seated, help them to the choice Bits, &c. And all this in a polite agreeable Manner.

The *Honours of the City*, are the publick Offices or Employments thereof. — He has been Constable, Overseer of the Poor, and Church-warden, of his Parish; Common-Councilman, Alderman, and lastly Mayor: He has paid all the *Honours of the City*.

The *Honours of the Church*, are the Rights belonging to the Patron, &c. As a Seat and Sepulchre in the Chancel, to be first serv'd with the consecrated Bread and Wine, &c.

The *Honours* is also us'd for the principal Parts of the Apparatus of great Ceremonies; as Coronations, Consecrations, Christenings, &c. Such are the Oil, Tapers, &c. — Such Lords or Ladies bore the *Honours* at such a Ceremony. In Obsequies, they anciently presented the *Honours*, that is, the Shield, Crest, Sword, Gantlets, Spurs, Banner, Horse, &c.

Funeral Honours, are the Ceremonies perform'd at the Interments of great Men; as Hangings, Hearths, Funeral Rarriages, &c.

Honour Courts, are Courts held within the *Honours*, or Seignories above mention'd. See **COURT**.

Honour Point, in Heraldry, is that next above the Centre of the Escutcheon; dividing the upper Part into two equal Portions. See **ESCUcheon**.

HONOURABLE ANECDOTE, *ANECDEOTE HONORABLE*, an infamous Kind of Punishment, us'd in France, &c. on Treasurers, Parricides, Sacrilegious Persons, and other heinous Criminals.

It consists in this, that the Offender is deliver'd up to the common Hangman, who having strip him to his Shirt, and put a Rope about his Neck, and a Wax Taper in his Hand, leads him to the Court, where he is to beg Pardon of God, the King, the Court, and his Country.

Sometimes the Punishment ends here; and sometimes Death or the Gallies are added.

HONOURABLE, or **HONORABLE** *Ordinaries*, in Heraldry, are the principal Ordinaries or Bearings, which, when in their full Extent, may possess one Third of the Field. See **ORDINARY**.

Some only allow of nine, viz. the *Cross*, *Chief*, *Pale*, *Bend*, *Fess*, *Chevron*, *Saltire*, *Gules*, and *Escallop* — Others add more, viz. the *Bar*, *Bardure*, &c. See each under its proper Article, **CROSS**, **CHIEF**, **PALE**, &c.

HONOURARY, or **HONORARY**, is understood of a Person who bears or possesses some Quality or Title, only for the Name's Sake, without doing any of the Functions there-to belonging, or receiving any of the Advantages thereof.

Thus we say, *honorary Counsellors*. See *Counsellors of Honour*.

In the College of Physicians, *London*, are four *Honorary Fellows*. See **COLLEGE**.

The Royal Academy of Sciences at *Paris*, consists of four Classes of Members, viz. *Honorary*, Pensionary, Associates, and Adjuncts. See **ACADEMY**.

The *Honorary* are to be twelve in Number, and all Inhabitants of the Kingdom.

Honorary Services, are such as relate to the Tenure of grand Serjeanty, and are commonly join'd with some *Honour*. See **SERVICE**.

Honorary is also us'd for a Lawyer's Fee; or a Salary given to publick Professors of any Art or Science.

Honorary Tutor, is a Person of Quality appointed to have an Eye over the Administration of the Affairs of a Minor; while the Onerary Tutors have the real effective Management thereof. See **TUTOR**, &c.

HONTEFONGENTHEP, a Thief taken hood-haband, i. e. having the Thing stolen in his Hand. See **HONDI-band**.

HOOD. See **CNAPERON** and **CUCULLUS**.

HOOD, in Falconry, is a Piece of Leather, wherewith the Head of a Hawk, Falcon, or the like, is cover'd. See **HAWK**, **FALCON**, &c.

After feeling a young Hawk, she is to be fitted with a large easy Hood, which is to be taken off and put on very often, watching her two Nights; and handling her frequently and gently about the Head. When you perceive she has no Aversion to the Hood, unfast her in an Evening by Candle-light, continuing to handle, hood and unhood her, as before; till at last she takes no Offence, but will patiently endure handling. See **HAWKING**.

After unfeeling, anoint with the Finger and Spittle the Place where the feeling Thread was drawn through; then hood her, and hold her on your Fist all Night.

As soon as she is well reclaim'd, let her sit upon a Perch; but every Night keep her on the Fist three or four Hours, brooking, hooding, and unhooding, &c. And thus you may do in the Day-time, when she hath learn'd to feed eagerly, and without Fear.

HOOF, *Ungula*, the horny Part which covers the Feet of divers Animals, as Horses, Bulls, &c. See **HORN**.

The Hoof serves much the same Purposes as the Nails of some Animals, and the Claws of others. See **NAIL**.

The Hoof of a Horse surrounds the Sole and the Coffin Bone. — To be good, it should be of a dark Colour, somewhat shining, high, smooth, of a round Shape, but a little larger below than above; stout, that the Horse may tread more on the Toe than on the Heel; somewhat hollow within, having a narrow Frush, and broad Heels. See **HORSE**.

The Hoof should not have Circles, which are a Sign of its being brittle, and that that Horse, having been often shod, has had his Feet spoil'd by the many Pieces broke out of it. — A white Hoof is commonly brittle.

To judge whether the Hoof be good and stanch, lift up the Foot, and consider if it have a Shoe fang'd purposely for it, and be very much pierc'd, and the Holes made in unusual Parts, as wanting Horn enough to take hold by in those Places where the Nails are commonly driven.

Sometimes they are forc'd to pierce the Shoes nigh the Heels, because the fore-part is bad; it being otherwise un-usual to drive the Nails near the Heels, except the Toe be so much spli and broke as not to bear Nails.

If the Hoof be not round, but broad, and spreading out at the Sides and Quarters, the Horse commonly has narrow Heels, and, in Time, will be flat-footed; which Sort of Foot is weak, and will not long carry a Shoe, nor travel far, but furbate: And that treading more on his Heels than Toes, will cause him to go low on his Pasterns.

If the Hoof be long, it will make him tread altogether on his Heels. — If crooked, viz. broad without and narrow within, so that the Horse is splay-footed, it will cause him to tread too much inward, and cut or interfere. — If the Frush be broad, the Heels will be weak and soft. — If the Heels be narrow and tender, the Horse will in time grow Hoof-bound.

The Infirmities to which Hoofs are liable, are, the casting of the Hoof, Hoof-bound, Hoof-hard, Hoof-hurt, loose Hoof, false Quarter, &c.

Casting of the Hoof. — A Horse is said to cast his Hoof, when the whole Coffin of the Hoof becomes loosen'd, and falls

falls off from the Bone. — This may be remedy'd by Care and proper Application; a new Hoof being procurable, if the Coffin Bone, &c. be not hurt.

Horses sometimes cast their Hoofs by reason of some Prick, Stub, foundering, surbating, or other Accident, that causes an Imposthumation in the Foot; so that the Hoof, and sometimes the Coffin Bone, being spongy and easily broken, fall off in large Pieces. The last when it happens is desperate.

Hoof-bleeds, is a shrinking in of an Horse's Hoof on the Top, and at the Heel; which makes the Skin stare above the Hoof, and to grow over the same.

It befalls an Horse divers ways, either by keeping him too dry in the Stable, by strait shoeing, or by some unnatural Heat after foundering.

Hoof-burr. — In labouring Beasts, especially Oxen, if the Hoof be hurt with a Coulter or Share, it may be cur'd by a Salve of Pitch and Grease mix'd with Powder of Brimstone, dissolv'd together, and with an hot Iron melted in the sore Hoof or Clec.

Hoof-loosen'd, is a Dissolution or dividing of the Horn or Coffin of a Horse's Hoof from the Flech, at the setting on of the Coronet.

If the parting be round about the Coronet, it comes by means of foundering; if in part, then by a Prick of some Channel-nail, Quitter-bone, Retreat, Graveling, Cloying, or the like.

The Signs of being loosen'd by foundering, is its breaking first in the fore Part of the Coronet, right against the Toes; because the Humour always descends towards the Toe. — If it proceeds from pricking, graveling, or the like, the Hoof will loosen round about equally, even at first. — If occasion'd by a Quiter bone, or Hurt on the Coronet, it will break right above the griev'd Part, and rarely be seen to go any farther.

Hoof-swall'd, is an Infirmity that sometimes befalls young Horses, when they are over-rid, or wrought hard, which makes them swell in that Part, by reason of the Blood falling down and settling there; which if not speedily remedy'd will beget a wet Spavin.

HOOK in Angling, &c. See ANGLING, &c.

HOOKS, in Buildings, &c. are of various Sorts; some of Iron, and others of Brass.

1^o. Armour Hooks, which are generally of Brass, and are to lay up Arms upon, as Guns, Muskets, half Pikes, Pikes, Javelins, &c. 2^o. Casement Hooks. 3^o. Chimney Hooks, which are made both of Brass and Iron, and of different Fashions: Their Use is to set the Tongs and Fire-hoof against. 4^o. Curtain Hooks. 5^o. Hooks for Doors, Gates, &c. 6^o. Double Line Hooks, large and small. 7^o. Single Line Hooks, large and small. 8^o. Tester Hooks of various Sorts. See TESTER.

HOOK-pins, in Architecture, are taper Iron Pins, only with a Hook-head, to pin the Frame of a Roof or Floor together.

HOOP, a Measure of a Peck. See PECK.

HOOP, or Hops, a Plant of the reptile Kind, whose Flower is a principal Ingredient in Beer, and other Malt Liquors. See BREWING. See also BEER and MALT-Liquor.

The Hop creeps like Snake-weed, unless it find Poles or Shrubs to hang to; or unless they who cultivate it, plant Poles for the Purpose. — Its Stem is long, flexible, rough, and hairy. — Its Leaf indented like that of the Vine, and cover'd with a kind of prickly Down like that of the Cucumber. Its Flowers are of a greenish Yellow, resembling, both as to Form and Size, those of the Female Elm; and grow in a kind of Bunch or Cluster. In this Flower is a blackish bitter Grain contain'd, which is the Seed of the Hop.

In the Spring time, while the Bud is yet tender, the Tops of the Plant being cut off, and boil'd, are eat like Aparagas; and found effectual to loosen the Body: The Heads and Tendrils are good to purify the Blood in the Scorbutus, and most cutaneous Diseases: Decoctions of the Flowers, and Syrops thereof, are of use against peccidental Fevers: Juleps and Apozems are also prepar'd with Hops, for Hypochondriacal and Hysterical Affections, and to promote the Menstrua.

The Propagation and Culture of Hops, being a Point of some Nicety, as well as great Advantage, we shall lay down a little System thereof. — 'Tis certain there is nothing in all the rural Employments, that, under prudent Management, turns to more account; very large Estates having been rais'd by this Commodity in a few Years past. — *Switzer* tells us, he has known Ground yield *scilicet per Annum per Acre*, planted therewith: To say nothing of the great Number of Poor that are employ'd therein, *viz.* in the Planting, Soiling, Digging, Houghing, Poling, Tying, Picking, &c.

Culture of Hops, and Hop Gardens.

Hops are of divers Kinds: *Mortimer* reckons four, *viz.* the wild Garlic Hop, which is not worth propagating; the long and square Garlic Hop, which, tho' valuable, yet on account of the Redness towards the Stalk, does not bear the best Price; the long white Hop, which is the most beautiful and fertile; and the oval Hop. Another Author distinguishes the Hops to be cultivat'd into the white and grey kinds; the latter being a large square Hop, more hardy, and bearing a plentiful Crop than the former; tho' it does not ripen so early.

For the Soil of Hops. — There is scarce any but may serve, except stoney, rocky, and stiff Clay Ground: The best, however, is that which is light, deep, and rich; which will be the better if Sand be mix'd with it: A black Garden Mould is also excellent. If the Ground be cold, stiff, and sour, the best Means of Improvement is to burn-beat it. *Mortimer* adds, that in *Kent*, where they esteem new Land best for Hops, they plant their Hop Gardens with Cherry Trees and Apple Trees, at a good Distance; that when the Land is past the best for Hops, (which happens in about ten Years) the Cherry Trees may begin to bear; and 30 Years after, when the Cherry Trees are spent, the Apple Trees may be in Perfection.

For the planting of Hops. — The Ground is first to be prepar'd by sowing in the Beginning of the Winter, either with the Plough or Spade. In *October*, (and sometimes, tho' rarely, in *March*) they proceed to plant; marking out the Places where each Hillock or little Plantation is to be. Some plant in Squares, Chequer-wise, which is the most convenient Form, where they intend, in the Course of the Tillage, to plough with Horses between the Hills: But the best Form for the Hop, as well as the most pleasing to the Eye, is the *Quincunx*. See QUINCUNX.

If the Ground be poor, or stiff, 'tis necessary some good Mould, or else a Compost of Manure and Earth, be laid in Holes a Foot square, in the several Places where the Hills are to be. — The Distance of the Hills in dry hot Ground may be six Foot; but in moist and rich Ground, subject to bear large Hops, eight or nine.

For planting, the largest Sets are to be chosen, eight or ten Inches long, having each three or four Joints. These to be set in Holes, made for the Purpose, one at each Corner of a Hole, and a Fifth in the Middle, raising the Earth two or three Inches about.

For the dressing of Hops. — If the Hop Ground be old, and wore out of Heart, they find it convenient to dig about them, toward the Beginning of each Winter, and take away a Quantity of the old Earth; its Place to be supply'd with what is fatter and fresher. — If the Hops be in good Heart, Manuring and Pruning is most advisable. In order to this, they pull down the Hills, and undermine all about, till they come near the principal Roots. This done, taking off the Earth from the Roots, they find by the Colour, &c. which are new Shoots, and which old ones; and cut off all the new ones. — When the Roots are thus dress'd, the new Mould or Manure to be apply'd.

For the Poling. — The Time is when the Hops begin to appear above Ground: The Number and Dimensions of the Poles to be adjust'd to the Distance of the Hills, the Nature of the Soil, and Strength of the Hop. — To prevent Houghing, the Poles are to be made to lean outwards; and particularly toward the South, to receive more of the Sun's Beams; it being Matter of Observation, that a leaning Pole bears more Hops than an upright one.

As to tying. — When the Hops are got two or three Foot above Ground, the next Business is to conduct and tie them to such Poles as are empty, and at a proper Distance for them. — They are to be ty'd with wither'd Rushes, or Woollen Yarn; but not so close as to hinder their climbing up the Poles: Two or three Strings may suffice for a Pole. This Operation is to be attend'd to in *April* and *May*.

About Midsummer, when they cease to run in Length, and begin to branch, such of them as are not yet got up to the Tops of the Poles, should have their Heads nipp'd off, or else be divert'd from the Pole, that they may branch the better; which is more for the Increase of the Hop, than its extending in Length.

Sometimes in *May*, after Rain, the Hills are to be made up with a Hoe, or Spade, or by ploughing; which will be a Means to destroy the Weeds: And 'tis necessary, if the Spring or Summer prove dry, to water them twice or thrice in a Season.

Hops begin toward the latter End of *July*; and the forward ones are ripe by the Close of *August*. — Their Ripeness is discover'd by their fragrant Scent, their changing of Colour, being easily pull'd, and by the brownish Colour of the Seed.

Hops are to be gather'd when they look a little brownish, and that without delay: the most expeditious Way, is, to make a Frame with four short Poles or Sticks, laid on four Forks driven into the Ground, of such Breadth, as to contain either the Hair-Cloth of your Kilo, or a Blanket tacked round it about the Edges. — On this Device, the Poles, with the *Hops* on them, may be laid, being either supported by Forks, or the Edges of the Frame; at each Side whereof, the Pickers may stand, and pick the *Hops* into it. — When the Blanket or Hair-Cloth is full, untack it, carry it away, and place another, or the same empty'd, in the same Frame again; and this Frame may be daily remov'd, with little Trouble, to some new Place of the Garden near the Work.

Hops must not be gather'd while wet; but if the Dew be on them, or a Shower of Rain has taken them, the Pole may be shaken, and they'll dry the sooner: if they be over-ripe, they'll be apt to shed their Seed, wherein consists their chief Strength; neither will they look so green, but somewhat brown, which much lessens their Value; though some let them stand as long as they can, because they waste less in the dropping; for four Pounds of undry'd *Hops*, thorough ripe, will make one of dry; whereas five Pounds of those fearly ripe, yet in their Prime, make but one; so that 'tis judg'd the Proprietors get more in the thorough-ripe *Hop* by the Weight, than they lose in the Colour.

As fit as the *Hops* are pick'd, they must be dry'd: Some among us, especially the *Flemings* and *Hollanders*, make use of an *Off* or *Kilo* for this Purpose: Others dry them on the ordinary Malt Kiln in an Hair-Cloth: But the best Way, is to make a Bed of flat Ledges, about an Inch thick, and two or three Inches broad, sawn, and laid one across the other, checkerwise, the flat Way; the Distances about three Inches, or the like; the Ledges so enter'd, are put into another, that the Floor may be even and smooth: This Bed may rest on two or three Joynes set edgewise, to support it from sinking; then cover it with large double Tin solder'd together at each Joyn; and so order the Ledges before they are laid, that the Joynes of the Tin may always lie over the Middle of a Ledge; and when the Bed is wholly cover'd with Tin, fit Boards about the Edges of the Kiln to keep up the *Hops*, only let the one Side be to remove, that the *Hops* may be shov'd off as before. The *Hops* may be turn'd on this Tin-Bed or Floor with great Safety, and small Expence of Fuel; beside that, any manner of Fuel will serve for this Purpose as well as Charcoal, the Smoke not passing thro' the *Hops*: But it must not be forgot, to make Conveyances for it at the several Corners and Sides of the Kilo.

The turning of *Hops* after the easiest and most secure Manner, is found to be not only a Waste and Injury to the *Hop*, but also an Expence of Fuel and Time; yet it may be prevented, in Case the upper Bed, wherein the *Hops* lie, have a Cover that may be let down and rais'd at Pleasure; which Cover may be tinn'd over, by nailing single Tin Plates to the Face of it, that when the *Hops* begin to dry, and are ready to be burnt, you may let down this Cover within a Foot and less of the *Hops*, which will reflect the Heat upon them, that the uppermost *Hop* will be as soon dry as the lower, and every *Hop* equally dry'd.

The Method of bagging *Hops*, (after they have lain a Month more to cool and toughen) is to make a round or square Hole in an upper Floor, big enough for a Man with ease to go up and down, and turn and wind in it; then tack a Hoop about the Mouth of the Bag fast with Packthread, that it may bear the Weight of the *Hops* when full, and of the Man that treads them: That done, let the Bag down thro' the Hole, and the Hoop will rest above, so as to keep the Bag from sliding wholly thro'; into this Bag cast a few *Hops*, and before you go in to tread, let an handful of *Hops* be tyed at each lower Corner with a Piece of Packthread, so make, as it were, a Tassel, whereby the Bag, when full, may be conveniently lifed or remov'd; then go into the Bag, and tread the *Hops* on every Side, another still casting in as fast as you require, till it be full: When 'tis well trodden and fill'd, let the Bag down by unripping the Loop, and close the Mouth of the Bag, filling the two upper Corners as you did the lower: This Bag, if well pack'd and dry'd, will keep several Years in a dry Place; only Care must be taken, that Mice do not spoil or waste the *Hops*; nor that they'll eat them, but make their Nests therein.

HOPLITES, **HOPLITÆ**, in Antiquity, were such of the Candidates at the *Olympic* and other sacred Games, as ran Races in Armour. See **GAME**.

One of the finest Pieces of the famous *Parthians*, was a Painting which represented two *Hoplites*; the one running, and seeming to sweat large Drops; and the other laying his Arms down, as quite spent and out of Breath. *Pliny* l. xxxv. c. 10, and *Pausanias de Coronis*, l. vi. cap. 14.

The Word is Greek *ὀπλίτης*, form'd of *ὄπλις*, Armour.

HOPLOMACHI, in Antiquity, were a Species of Gladiators. See **GLADIATOR**.

The *Hoplomachi* were those who fought in Armour, either compleatly arm'd from Head to Foot, or only with a Cass and Cuirass.

The Word is compos'd of the Greek *ὄπλις*, Armour, and *μάχη*, I fight.

HOPPEK, a Vessel wherein Seed-Corn is carry'd at the Time of Sowing. See **SOWING**.

The Word is also us'd for that wooden Trough in a Mill, into which the Corn is put to be ground. See **MILL**.

HORARY, something relating to *Hors*, *Hour*. See **HOURLY**.

HORARY Circles of the Globe. See **GLOBE**.

HORARY Circles, or *Lines*, in Dialling, are the Lines or Circles which mark the Hours on Sun-dials. See **DIAL**.

The *Horary Motion of the Earth*, i. e. the Arch it describes in the Space of an Hour, is 15 Degrees; not accurately, (for the Earth moves with different Velocity, according to its greater or less Distance from the Sun) but near enough for ordinary Computations. See **EARTH**.

HORD, **HORDE**, **HORDA**, in Geography, is us'd for a Company or Body of wandering People which have no settled Abode or Habitation; but strolc about *Asia* and *Africa*, dwelling in Chariots, or under Tents, to be ready to shift as soon as Herbage, Fruits, and the present Province is eaten bare.

Hord is properly the Name which the *Tartars*, who inhabit beyond the *Volga*, in the Kingdoms of *Astracan* and *Bulgaria*, give to their Villages.

A *Hord* consists of 50 or 60 Tents rang'd in a Circle, leaving an open Place in the Middle. — The Inhabitants of each *Hord* usually form a military Company or Troop; the eldest whereof is commonly the Captain, and depends on the General, or Prince of the whole Nation.

The Term *Hord* is a *Tartarian* Word, and literally denotes a *Multitude*.

HORDEATUM, a liquid Medicine, made of Barley, beat and boil'd with other suitable Ingredients.

HORDEOLUM, in Medicine, a small Tubercle arising on the Palpebræ or Eye-lids. See **PALPEBRÆ**.

It is thus call'd from the *Latin*, *Hordeum*, Barley, as resembling a Barley Corn.

The Cure of the *Hordeolum* and *Grando*, is by Disiccants and Suppuratives.

HORDICALIA, or **HORDICIDIA**, in Antiquity, a religious Feast held among the *Romans*, wherein they sacrific'd Cattle big with young. See **FEAST**.

This Feast fell on the 15th of *April*; on which Day they sacrific'd thirty Cows big with Calf, to the Goddesses *Terribus*, or *Terras*, Earth: Part of them were sacrific'd in the Temple of *Jupiter*. — They were burnt, at first, by the Pontifices; afterwards, by the eldest of the Vestal Virgins.

Alexander ab Alexandro Genial. Dier. writes *Horialis dies*; and from him, some of the Moderns call the Feast *Horolis*; but *Varro* writes it *Hordicalia*, and *Festus*, *Hordicidia*.

The Word *Hordicidia* is form'd of *horda*; which *Festus* explains by *pregnans*, pregnant; and *caedo*, I sacrifice. *Ovid*, in his *Fasti*, l. iv. v. 651, describes *horda*, or *fortia*, to be *Boi pregnans*; or *ovæda, gravidæ*.

HORIZON, or **HORIZON**, in Astronomy, a great Circle of the Sphere, dividing the World into two Parts or Hemispheres; the one upper, and visible; the other lower, and hid. See **CIRCLE** and **HEMISPHERE**.

The Word is pure Greek, and literally signifies *terminating* or *terminating the Sight*; being form'd of *ὄραω*, *termino*, *definio*, I bound, I limit; whence it is also call'd *Finiter*, *Finisiter*.

The *Horizon* is either *Rational* or *Sensible*.

The *rational*, *true*, or *Astronomical* *HORIZON*, which is also call'd simply and absolutely the *Horizon*, is a great Circle, whose Plane passes thro' the Centre of the Earth, and whose Poles are the *Zenith* and *Nadir*.

Such is the Circle *HR* (Tab. Astronomy, Fig. 52.) whose Poles are the *Zenith* and *Nadir*: Whence it follows, that the several Points of the *Horizon* are a Quadrant distant from the *Zenith* and *Nadir*.

The Meridian and Vertical Circles, all cut the *rational* *Horizon* at right Angles, and into two equal Parts. See **MERIDIAN** and **VERTICAL** Circle.

The *sensible*, *visible*, or *apparent* *HORIZON*, is a lesser Circle of the Sphere, as *hr*, which divides the visible Part of the Sphere from the invisible.

Its Poles, too, are the *Zenith* and *Nadir*: And consequently the *sensible* *Horizon* is parallel to the *rational*; and it is cut at right Angles, and into two equal Parts by the Verticals.

The *sensible* *Horizon* is divided into Eastern and Western. The *Eastern* or *Ortive* *HORIZON*, is that Part of the *Horizon* wherein the heavenly Bodies rise. See **RISE**.

The *Western* or *Occidental* *HORIZON*, is that wherein the Stars set. See **SETTING**.

HORIZON,

HORIZON, in Geography, is a Circle passing over a given Part of the Earth, and dividing the visible Part of the Earth and Heavens, from that which is invisible. See **EARTH**.

The Altitude or Elevation of any Point of the Sphere, is an Arch of a Vertical Circle, intercepted between it and the sensible **Horizon**. See **ALTITUDE** and **ELEVATION**.

This is peculiarly denominated *sensible Horizon*, to distinguish it from the *rational* or *true*, which passes thro' the Centre of the Earth; as already observ'd.

By *sensible Horizon* is also frequently meant a Circle, which determines the Segment of the Surface of the Earth, over which the Eye can reach; call'd also the *Physical Horizon*.

In this Sense we say, a spacious *Horizon*, a narrow stony *Horizon*. To find the *Extent of the Horizon*, or how far a Man's Prospect reaches, by means of the Height of his Eye, supposing the Earth an uninterrupted Globe, is a common Case of right-angled plain Triangles, where two Sides and an opposite Angle are given. — Thus, suppose AHB (Tab. Geography, Fig. 8.) a great Circle of the terraqueous Globe, C the Centre, HC its Semi-diameter, and E the Height of the Eye; since HE is a Tangent, the Angle at H is a right Angle; so that there are given HC, 398,586 Miles, or 21,034,781 English Feet, CE the same Length as the Height of the Eye on the Mast of a Ship, or at only a Man's Height, &c. added to it, and EHC the opposite right Angle.

By these three Parts given, it is easy to find all the other Parts of the Triangle. — And first, for the Angle at C, in order to find the Side HE; the Proportion is, as the Side CE to the Angle at H, so is the Side HC to the Angle at E; which being subtracted from 90 Degrees, the Remainder is the Angle at C. Then, as the Angle at E is to its opposite Side HC; or else, as the Angle at H is to its opposite Side CE; so the Angle at C to its opposite Side EH, the visible *Horizon*.

Or the Labour may be shortend by adding together the Logarithm of the Sum of two given Sides, and the Logarithm of their Difference; the half of which two Logarithms, is the Logarithm of the Side requir'd, neatly. For an Example, we will take the two Sides in Yards, by reason scarce any Table of Logarithms will serve us any farther: the Semi-diameter of the Earth is 7,011,594 Yards; the Height of the Eye is two Yards more, the Sum of both Sides is 7,011,596 Yards.

Logar. of which Sum is	- - -	7,1468368
Logar. of two Yards, the Differ. is	- - -	0,5010500
Sum of both Logar.	- - -	7,4478868
The half Sum	- - -	3,7239434

is the Logarithm of 5296 Yards = three Miles, which is the Length of the Line EH, or Distance the Eye can reach at six Feet Height.

This, at least, would be the Distance on a perfect Globe, did the visual Rays come to the Eye in a straight Line; but by means of the Refractions of the Atmosphere, distant Objects on the *Horizon* appear higher than really they are, and may be seen at a greater Distance, especially on the Sea, which is a Matter of great Use, especially to discover the Land, Rocks, &c.

Father *Loual*, Professor of Hydrography at *Marseilles*, found that the *Horizon* of his Observatory to the Sea ward was never more than 15 Minutes, nor less than 25; that is, the Arch of the Circumference of the Earth, intercepted between the Observatory and the *Horizon*, fluctuated between those two Quantities; whence *M. Cassini* deduces, that the Extent of the *Horizon* is seven French Leagues of three Miles each; and that the Observatory is 175 Foot high.

The Extent of the *Horizon*, at the same Place, and the same Height, is very subject to vary, by means of Differences in the Atmosphere, which occasion others in the Refractions. See **REFRACTION**.

When the Sea was full, or the North-West or South-East Wind blew, and the Air hazy about the *Horizon*, *P. Loual* always found his *Horizon* the lower; i. e. the Refraction which should raise it in that Case was less than ordinary. — And yet on the common Principles, the Air being now much charged with Vapours, the very contrary were rather to be expected. — This makes *M. Cassini* suspect, that there is some other refractive Matter in the Atmosphere, beside the Air itself.

The same Author observes, that at a Height much greater than that of *P. Loual's* Observatory, he found the Arch terminated by the *Horizon* to the Seaward, 42', without any sensible Variation; whence he concludes, that the Variations are the greater, as the Height is the less; which may seem contrary to what he had asserted in another

Place, viz. that the Variations in the apparent Altitudes of Bodies are greater, as these Objects are more remote, by reason they are seen thro' the larger Quantity of Air, which is all liable to be vary'd. — But the Contradiction may be solv'd.

HORIZON of the Globe. See **GLOBE**.

HORIZONTAL, something that has a Regard to the *Horizon*, is taken in the *Horizon*, or on a Level with the *Horizon*. See **HORIZON**.

In this Sense we say, a *Horizontal Plane*, *Horizontal Line*, *Horizontal Distance*, &c.

HORIZONTAL Plane, is that which is parallel to the *Horizon* of the Place; or nothing inclin'd thereto. See **PLANE**.

The Business of Levelling, is to find whether two Points be in the *horizontal Plane*; or how much the Deviation is. See **LEVELLING**.

HORIZONTAL Plane, in Perspective, is a Plane parallel to the *Horizon*, passing thro' the Eye, and cutting the Perspective Plane at right Angles. See **PERSPECTIVE PLANE**.

HORIZONTAL Line, in Perspective, is a right Line drawn thro' the principal Point, parallel to the *Horizon*: Or, it is the Interfection of the *horizontal* and *perspective Plane*.

Such is the Line PQ (Tab. Perspective, Fig. 12.) passing thro' the principal Point P.

HORIZONTAL Dial, is that drawn on a Plane parallel to the *Horizon*; having its Gnomon, or Style elevated according to the Altitude of the Pole of the Place it is design'd for.

Horizontal Dials are, of all others, the most simple and easy. — The Manner of describing them, see under the Article **DIALLING**.

HORIZONTAL Range, or *Level Range* of a Piece of Ordnance, is the Line it describes, when directed parallel to the *Horizon*, or *horizontal Line*. See **RANGE**.

Dr. Halley gives two very ready Theorems, the one to find the greatest *horizontal Range* at 45 Degrees Elevation, in any Shot made upon any inclin'd Plane, with any Elevation of the Piece whatsoever; and the other to find Elevations proper to strike a given Object with any Force, greater than what sufficeth to reach it with the middle Elevation.

1^o. A Shot being made on an inclin'd Plane: having the *horizontal Distance* of the Object it strikes, with the Elevation of the Piece, and the Angle at the Gun between the Object and the Perpendicular; to find the greatest *horizontal Range* of that Piece laden with the same Charge; that is half the Latus Rectum of all the Parabolic made with the same Impetus. — Take half the Distance of the Object from the Nadir, and the Difference of the given Elevation from that half; subtract the versed Sine of that Difference from the versed Sine of the Distance of the Object from the Zenith: The Difference of those versed Sines, will be to the Sine of the Distance of the Object from the Zenith, as the *horizontal Distance* of the Object struck, to the greatest Range at 45 Degrees.

2^o. Having the greatest *horizontal Range* of a Gun, the *horizontal Distance* and Angle of Inclination of an Object to the Perpendicular; to find the two Elevations necessary to strike that Object. — Halve the Distance of the Object from the Nadir; this Half is equal to the half Sum of the two Elevations sought: Then say, As the greatest *horizontal Range* is to the *horizontal Distance* of the Object, so is the Sine of the Angle of inclination, or Distance of the Object from the Perpendicular, to a fourth Proportional; which fourth being subtracted from the versed Sine of the Distance of the Object from the Zenith, leaves the versed Sine of half the Difference of the Elevations sought; which Elevations are therefore had, by subtracting that half of the Difference to and from the aforesaid half Sum. See **PRACTICE**.

HORIZONTAL Shelters, among Gardeners, are Defences dispos'd parallel to the *Horizon* for tender Plants, Blossoms, and Fruits in the Spring, against Blasts and pinching Nights.

The usual Shelters that have obtain'd, are *Bass-mats*, and other warm Coverings, which are roll'd up in the Day-time, and let down in the Night. — In lieu of these, the *Revd. Mr. Lawrence* first propos'd *horizontal Shelters*, chiefly on this Principle, that most of our Frosts and Blasts fall perpendicularly; i. e. the condens'd Vapours falling from the upper Region, do, at Night, form themselves toward the Surface of the Earth, into Drops of Dew, subject to be frozen by the Coldness of the Air. See **Dew**, **FROST**, &c.

The *horizontal Shelters* are to be made by laying Rows of Tyles, at certain Distances one above another, in the Structure of the Wall, so as to project or hang over the Plane of the Wall, to carry off the Dew, Wet, &c. — 'Tis so Inconvenience objected to this Method, that it is difficult to lead a Tree rightly among the Tyles, or to keep its Figure duly fill'd up.

HORIZONTAL *Parallax*
HORIZONTAL *Refraction*
HORIZONTAL *Projection*
HORIZONTAL *Distance*

See { PARALLAX.
REFRACTION.
MAP.
DISTANCE.

HORN, Cornu, a hard callous Substance, growing on the Head of divers Animals. See ANIMAL and HEAD.

'Tis laid down as a Rule by some Naturalists, that no Animals have Horns but those that are cloven-footed.

The Horns are usually a double Part; inasmuch that there is but one Exception, and this too controverted. See UNICORN.

The Horns of a Deer are properly call'd his *Head*. See HEAD.

In the History of the *French Academy of Sciences*, we have an Account of a Ballock's Horn dug out of the Ground in ploughing, which had four fibrous Roots, and appear'd to have grown or vegetated after the Manner of a Plant.

Horns make a considerable Article in the Arts and Manufactures. — Bullocks Horns taken by the Fire, serve to make Lanthorns, Combs, Ink-horns, Tobacco-Boxes, &c.

Horns is sometimes also used for the Hoof of a Horse, &c. See HOOF.

Horn's Horn, Cornu Cervi. — The Scrapings or Raspings of the Horn of this Animal are medicinal, and used in Astringent Draughts, Pills, &c. with that Intention.

It yields by Distillation a very penetrative volatile Spirit. See SPIRIT, &c.

Anatomical Horn. See CORNU ANATOMICI.

HORN is also a Sort of musical Instrument, of the Wind Kind; chiefly used in Hunting, to animate and bring together the Dogs, and the Hunters. See HUNTING.

The Horn may have all the Extent of the Trumpet. See TRUMPET.

The Term anciently was, *Wind a Horn*; all Horns being in those Times compos'd: But since straight Horns are come in fashion, they say, *Blow a Horn*, and sometimes, *Sound a Horn*.

There are various Lessons on the Horn; as the *Recheat*, *Double Recheat*, *Royal Recheat*, *Running or Farwood Recheat*, &c. See RECHEAT.

The Hebrews made use of Horns form'd of Rams Horns, to proclaim the Jubilee; whence the Name *Jubilee*. See JUBILEE.

HORN, in Anatomy. See CORNU, MATRIX, &c.

HORN, in Architecture, is sometimes used for *Volute*, See VOLUTE.

Horn of Plenty. See CORNU COPIA.

Horn with Horn, or **Horn under Horn** (*cornutus cum cornuto*) when there is Common *per cause de vicinage*, Inter-commoning of horned Beasts. See COMMON and INTER-COMMON.

Horn Work, in Fortification, a Sort of Out-work advancing toward the Field, to cover and defend a Curtain, Bastion, or other Place suspected to be weaker than the rest; as also to possess a Height, &c. See OUT-WORK.

It consists of two Demi Bastions, as LMN and OPO, Tab. Fortification, Fig. 12. and a Curtain NO. — Its Sides or Wings are usually parallel; tho' sometimes they approach or contract toward the Place, forming what they call a *Queue d'Arche*, or *Swellings Tail*. See QUEUE d'ARCHE.

When the Wings are too long, they sometimes make Espacements to flank them. — The Parts of the *Horn-work* next the Country, are to be furnish'd with a Parapet.

Two *Horn-works* join'd together, make a *Crown-work*. See CROWN-WORK.

Horn Beam Pollengers, are Trees which have been lopp'd, and are of about twenty Years Growth. See TREE and LOPPING.

HORNELD and HORNETE, (from the *Saxon, Horn*, and *Gold*, *Payment*) signifies a Tax within the Forest, to be paid for the feeding of horned Beasts. See GELD.

To be free of this, is a Privilege granted by the King to such as he thinks good. — *Quintus esse omni collectione in Foresta de Bestiis cornutis assis. Et sui quiesi de omnibus Geldis, & Danegeldis, & Wadegeldis, & Senegeldis, & Horn-geldis, &c.* See SUBSIDY.

A Horse is said to be *Horn bipped*, when the Tops of the two Haunch Bones appear too high.

HORNAGIUM, HORNAGE, in our ancient Law Books, seems to import the fine with Horn-geld.

HORODICTIC Quadrant. See QUADRANT.

HOROGRAPHY, the Art of making or constructing Dials; call'd also *Horologigraphy, Gnomonica, Scientifica, Ptolemaica*, &c. See DIALLING.

The Word is compounded of *hora, hora*, Time, Hour, and *graphein, scribo*, I write.

HOROLOGIOGRAPHY, the Art of making or constructing Dials. See DIALLING.

HOROLOGIUM, a common Name among the *Latin* Writers, for any Instrument or Machine to measure the Hours withal. See CHRONOMETER.

Such are our Clocks, Watches, Sun-Dials, &c. See CLOCK, WATCH, DIAL, &c. See also CREEPYDRA.

The Word is originally *Greek, αἰμαίον*, compos'd of *αἰμα*, *hora*, Time, Hour, and *αἰμα*, Speech, Discourse.

HOROLOGIUM, HOROLOGION, is also a Name the *Greeks* give to their Liturgy or Breviary; by reason it contains the daily Hours, or the several Offices to be rehears'd each Day. See HOUR.

The *Greeks* call it *αἰμαίον*, which answers to what in *Latin* and *English* we call *Diaturnal*, or *Diurnal*.

The *Optimus* is the Breviary of the *Greeks*. See BREVIARY.

HOROPTER, in Opticks, is a right Line, drawn thro' the Point where the two Optic Axes meet, parallel to that which joins the Centres of the two Eyes, or the two Pupils.

Such is the Line AB (Tab. Opticks, Fig. 67.) drawn thro' the Point of Concourse C, of the Optic Axes of the Eyes D and E, parallel to HI, which joins the Centres of the Eyes H and I.

It is call'd *Horopter*, as being found by Experience to be the Limit of distinct Vision. See VISION.

Plane of the HOROPTER. See PLANE of the Horopter.

HOROSCOPE, in Astrology, is the Degree of the Ascendant, or Star rising above the Horizon, at any certain Time when a Prediction is to be made of a future Event; as, the Fortune of a Person then born, the Success of a Design then laid, the Weather, &c. See ASCENDANT.

Mercury and *Venus* were in the *Horoscope*, &c. They were anciently so intimated with *Horoscopes*, that *Albertus Magnus* is said to have had the Temerity to draw that of *Jesus Christ*.

The Word is *Greek*, compos'd of *hora, hora*, Hour, and the Verb *σκοπεω, speko, considero*, I consider. — The *Latin* call it *Cardo Orientalis*.

HOROSCOPE is also used for a Scheme or Figure of the twelve Houses, i. e. the twelve Signs of the Zodiac, wherein is mark'd the Disposition of the Heavens for the given Time. See HOUSE and FIGURE.

Thus we say, to draw a *Horoscope*, construct a *Horoscope*, &c. We call it more peculiarly *calculating a Nativity*, when the Life and Fortune of a Person are the Subject of the Prediction: For they draw *Horoscopes* of Cities, great Enterprises, &c.

Lower HOROSCOPE, is the Point which the Moon flits out of, when the Sun is in the ascending Point of the Earth.

This is also call'd the *Part of Fortune*. See PART.

HOROSCOPE, is also a Mathematical Instrument, in manner of a Planisphere; but now disused. See PLANISPHERE.

It was invented by *J. Paduanus*, who compos'd a special Treatise thereon.

HORROR, HORRORE, strictly signifies such an Excess of Fear, as makes a Person tremble. — In Physick it denotes such a Shuddering or Quivering as precedes an Ague Fit; and is often join'd with Rigores and Lumbagines. See AGUE, FEVER, &c.

Tho' Ignorance of this Acceptation, some have understood Fear to be accounted by Authors among the antecedent Symptoms of those Disorders.

HORS de son feu, &c. out of his Fire, is an Exception to avoid an Action brought for Rent issuing out of certain Land, by him that pretends to be the Lord, or for some Customs and Services. — For if the Defendant can prove the Land to be without the Compass of his Fee, the Action falls. See DISTRICT.

HORSE, a Domestic Quadruped, of great Use in the Affairs of Agriculture, Commerce, War, Sporting, &c.

The *Horse* makes the Subject of a very extensive Art, call'd *Horsemanship*, consisting of divers subordinate Arts or Branches. See HORSEMANSHIP.

From the same Beast arise the Professions of Chivalry, Knighthood, &c. See CHEVALIER, &c.

Authors are divided as to the Time when Men first began to mount *Horses*. — The Scholasts of *Euripides*, and *Epistatibus* on the 11d Book of the *Iliad*, speak as if the Ancients had been unacquainted with the Use of Saddle *Horses*, and had only used them to draw Chariots, &c. They add, that Courses on *Horse-back* were not introduc'd at the Olympic Games, before the 8th Olympiad. — But this can scarce be; in regard the Centaurs, to whom the Invention is attributed, liv'd long before that Time. See CENTAUR.

It appears likewise from *Pausanias*, that there were *Horse Courses* even in the Time of *Hercules*, the Inlustrator of the Olympic Games. See OLYMPIC.

The Parts of a *Horse's* Body furnish a great Variety of Terms, by no means to be overlook'd. — The Skin and Coat are call'd the *Hair*; the long Hair on the Neck the *Main*; the Fore-top the *Yelping* or *Tuke*; the Hair behind, on the Feet, the *Fetlock* or *Fetter-lock*; that growing over the Top of the Hoof, the *Crown* or *Crown*; that on the Eye-lids, the *Brills*. — The Ridge between the Main-grows, is call'd the *Crest* or *Griff*; the fore Part, from the Neck to the fore Legs, the *Brislet* or *Clopp*; the Mark frequently running down his Face, the *Rack*; and that in the Forehead, the *Star*. — The

Top of the Shoulder Blades, at the setting on of the Neck, is call'd the *Withers*; the Place where the Saddle is fit, the *Deck*; and a Bruise or Hurt thereon, a *Novel-gall*; the Middle of the Back, from the Main to the Hips, the *Reins*; the Extremity of the Reins above the Hips, the *Craze*; the Tail, the *Deck* or *Rum*; the hollow or sinking of the Back-bone, the *Sway*; the hind Part of the Belly, next the Genital, the *Flank*; that nearer the Thighs, the *Grains*; the loose Skin wherein the Yard is, the *Sheath*; and the fore Parts of the Shoulders, next the Breasts, the *Fillers*. — The uppermost Part of the hind Leg, next the Buttock, is call'd the *Stifle* or *Stifle Joint*; the *stier Joint*, or bending of the hind Leg, the *Chambrel* or *Elbow*; the inner, the *Ham* or *Hough*; the Joint at the Fetlock, the *Pastern, Ankle*, or *Fetlock Joint*; the Foot, above the Hoof of the Ankle Joint, the *Coronet*. — The Part from the Withers to the Top Joint of the Thigh, is call'd the *Shoulder*; the middle Joint of the fore Leg, the *Knee*; the right Leg before, the *farther Leg*; and the left, the *warer*. — The Hoof is call'd the *Horn*; the Hollow of the Hoof, the *Coffin*; the tender Part of the Hoof, next the Heel, the *Frog*; the Ball of the Foot, the *Frog*; the Part to be pared or cut off the Hoof when overgrown, the *Rift*; the fore Part of the Hoof the *Toes*; the hind Part, where there is a Rising in the Middle of the Sole, the *Heel*; and the Infides meeting on the Heel, the *Quarters*. — Of most of these a further Account will be found under their respective Articles.

The Matters in this Art lay it down, that a Horse to be good, and well made, must have three Parts like those of a Woman, viz. the Breast, which is to be broad, the Hips round, and the Main long; three of a Lion, viz. Countenance, Intrepidity, and Fire; three of a Bullock, viz. the Eye, Nostril, and Joint; three of a Sheep, viz. the Nose, Gentleness, and Patience; three of a Mule, Strength, Confidence, and Foot; three of a Deer, Head, Leg, and Hair short; three of a Wolf, Throat, Neck, and Hearing; three of a Fox, Ear, Tail, and Trot; three of a Serpent, Memory, Sight, and Turning; three of a Hare or Cat, Running, Walking, and Suppleness.

Horses are distinguish'd into divers Kinds, and differently denominat'd, with regard to their Strain or Country. — As the *Neapolitan*, known by his Hawk Nose. — The *Spanish Genet*, by his small Limbs. — The *Barb*, by his fine Head and deep Hoof. — The *Dutch*, by the Roughness of his Legs. — The *English* by his strong knitting together, &c. — The *Flemish*, &c. See *GENET*, *BARB*, &c.

Horses are also distinguish'd with regard to the Uses or Offices they are reserv'd for; as, the *Coach Horse*, *War Horse*, *Hunting Horse*, *Running Horse*, *Pack Horse*, &c. See *COACH*, *HUNTING*, &c.

Horses are also distinguish'd with regard to their Colours; as — A *Bay*, which admits of divers Shades or Casts, such as a black Bay, brown Bay, dapple Bay; all which have constantly black Mains and Tails. — *Dun* and *Mare's Dun*, having frequently a black List about the Neck, which denominates them Flea-back'd. — *Flea-bitten*, which is white spotted with red. — *Grey*, Dapple Grey, Silver Grey, Sad or Powder'd Grey, Black Grey, Sandy Grey, and Iron Grey. — *Griffel* or *Rombr*, a light Flesh Colour intermix'd with white. — *French Colour*, or *Blossom Colour*. — *Pye-bald*, which consists of two Colours, one of them white. — *Road*, a Bay, Black, or Sorrel, intermix'd with white Hairs. — *Rabouan*, Black or Sorrel, with white Hairs scatter'd about his Body. — *Sorrel*, Common Sorrel, Red or Cow-colour'd Sorrel, bright or light-colour'd Sorrel, burnt Sorrel; all chiefly distinguish'd by the Colour of their Manes. — *Starling Colour*, resembling a brownish or blackish Grey, only more freckled, or intermix'd with white. — *Tiger Colour*, much the same with the brandied Grey, only the Spots smaller. — *Wolf Colour*. — *Deer Colour*. — *Black*. — *White*, &c.

These Colours are generally consider'd as Symbolical of the Nature, Qualities, &c. of the Beasts; and accordingly their Value is much influenc'd hereby. — The dapple Grey is priz'd for Beauty; the brown Bay for Service; the Black with Silver Hair for Courage; the Roan for Countenance; the Sorrel, Black without white, and Iron Grey, are reputed hot and fiery; the bright Grey, Flea-bitten, and Black with white Spots, are sanguine; the White, Dun, and Pye-bald, phlegmatic and heavy; the Mouse Dun, red Bay, and blue Grey, are dull; the Patch Colour rarely prove obedient to the Spur; the Sorrel seldom fail of being good, especially if their Legs, Tails, and Manes be black; and the same may be said of the Flea-bitten, at least those so mark'd in the fore Parts, or over the whole Body; for when only behind 'tis an ill Sign.

Indeed 'tis hard laying down any universal Rules. — The White, which promise the least, prove good when black about the Eyes and Nostrils. And there are excellent Iron Greys, tho' they are not reputed a good Colour.

For the Age, Teeth, Mark, &c. of Horses. See *AGE*, *TEETH*, *MARE*, &c.

For the Furniture, &c. of a Horse. See *SADDLE*, *BRIDLE*, *BIT*, &c.

HORSE is also us'd, in the Military Language, to express the Cavalry. See *CAVALRY*.

The Army consist'd of 30000 Foot, and 10000 Horse. See *INFANTRY*.

The Horse includes Horse Guards, Horse Grenadiers, and Troopers. — Dragoons are also frequently comprehended under the Name, tho' they fight on Foot. See *HORSE GUARDS*, *GRANADIER*, *DRAGOON*, &c.

Horse Guards, by the Spaniards call'd *Guardas de a Cavallo*; by the French, *Gardes de Corps*; the Germans, *Leibgarde*; and by the English usually *Life Guards*; are the Guards of the King's Person and Body, consisting of 800 Men, well arm'd and equip'd. See *GUARD*.

They are divided into three Troops; and to each is now added, by Establishment, a Troop of Grenadiers, consisting of 64 Men; all under the Command of a Captain. See *TROOP*, *GRANADIER*, *CAPTAIN*, &c.

Each Troop of Horse Guards is divided into four Divisions or Squadrons; two of which, consisting of 100 Men, commanded by a principal commission'd Officer, two Brigadiers, and two Sub brigadiers, with two Trumpets, mount the Guard, one Day in six, and are reliev'd in their Turns.

Their Duty is, by Parties from the Guard, to attend the King's Person when he goes out near Home. — When he goes out of Town, he is attended by Detachments out of all the three Troops.

One of the three Captains of the Horse Guards attends on the King when he walks on foot, immediately next his Person; carrying in his Hand an Ebony Staff or Truncheon with a Gold Head.

One Division of Grenadiers mounts with a Division of the Troop to which they belong; and go out on small Parties from the Guard, perform Centinel Duty on foot, attend the King also on foot, &c.

MASTER OF THE HORSE. See *MASTER OF THE HORSE*.

LIGHT HORSE, includes all the Horse except those of the Life Guard.

The Term *Light Horse* is sometimes apply'd to an independent Troop; or a Troop not embody'd into a Regiment.

The Denomination arose hence, that anciently they were lightly arm'd, in Comparison of the Royal Guard, which were arm'd at all Points.

HORSE, is also a Term us'd in various of the Arts and Manufactories, for something that helps to sustain their Work from the Ground, for the more commodious working at it.

The Horse us'd by the Tanners, Skinners, call'd also the Leg, is a Piece of Wood cut hollow and roundish, four or five Foot long, and plac'd aloft; upon which they pare their Skins to get off the Dirt, Hair, Flesh, &c. See *TANNING*, *CURRYING*, *CHAMOISING*, &c.

Horse is also us'd in Carpentry for a Piece of Wood jointed across two other perpendicular ones, to sustain the Boards, Planks, &c. which make Bridges over small Rivers; and on divers other Occasions.

WOOLEN HORSE. See *EQUULEUS*.

HORSE is also a Rope in a Ship, made fast to one of the Fore-mast Shrouds; having a dead Man's Eye at its End, through which the Pendant of the Sprit-sail Sheets is receiv'd.

HORSE is also a Cant Name lately introduc'd into the Affair of Lotteries, for the Chance or Benefit of a Ticket or Number for one or more Days, upon Condition, if it be drawn a Prize within the Time covenant'd for, of returning to the Seller an undrawn Ticket. See *CHANCE* and *LOTTERY*.

To determine the Value of a Horse. — Multiply the Amount of the Prizes in the Lottery by the Time the Horse is hired for; and from the Product subtract the Amount of the Number of Prizes by the Value of an undrawn Ticket into the Time of the Horse; The Remainder being divided by the Number of Tickets into the whole Time of drawing, the Quotient is the Value of the Horse. See *GAMING*.

HORSEMANSHIP, the Art of breaking, disciplining, and managing Horses. See *HORSE*.

Horsefanship, in its Latitude, includes what relates to the Make, Colour, Age, Temper, and Qualities of Horses; their respective Countries and Climates, with the Manner of breeding, propagating, &c. the Discovery of the Uses or Services they are fit for, whether the Wars, the Race, the Saddle, or Labour; and forwarding and accommodating them thereto.

In this general Sense, it also includes the Knowledge of the Defects and Diseases of Horses, and the Remedies proper for the same; with the several Operations requisite thereto, as *Docking*, *Gelding*, *Shoeing*, &c. And thus takes in the Farrier's Province. See *FARRIER*. See also *DOCKING*, *GELDING*, *SHOEING*, &c.

Building, there are four Wings or Out-buildings; one for the *Infirmaries*, another for several Officers of the House, another for old main'd Officers of Horse and Foot; and the fourth for the Baker, Laurence, &c.

The Number of ordinary Penfioners is 476; befide the Officers and Servants of the Houfe: The out, or extraordinary Penfioners, are alfo very numerous; and thefe, upon Occafion, do Duty in the feveral Garrifons, from whence Draughts are made for the Army, &c. See *INVALIDS*.

The Penfioners are all provided with Cloaths, Diet, Washing, Lodging, Firing, and one Day's Pay in every Week for fpendng Money.

The Qualifications requir'd to be admitted of this Body, are, that each Perfon bring a Certificate from his fuperior Officer, that he has been main'd or difabled in the Service of the Crown; or that he has ferv'd the Crown 20 Years, which muft be made appear by Mufter-Rolls.

To defray the Charges of this *Hofpital*, there is a confiderable Sum paid yearly out of the Foundage of the Army; befide one Day's Pay of each Officer, and each common Soldier, every Year; which, in Time of War, amounts to 12 or 14000*l*.

For the Administration of this *Hofpital*, there is a Governor, Lieutenant-Governor, Major, Treasurer, &c.

Greenwich Hofpital, is a Retreat for Seamen, who, by Age, Wounds, or other Accidents, are difabled from Service; and for the Widows and Children of fuch as are slain in the Service.

This, in Point of Magnificence and Spaciousnefs, excels even *Chelfea Hofpital*. A good Part of it was built in K. Charles II's Time, at the Expence of 36000*l*. It was much promoted by King William; and finifh'd under Queen Anne and King George.

The Number of Penfioners entertain'd in this *Hofpital* is 300. To each hundred Men are allow'd fix Nurfes, being the Widows of Seamen.

The Victualling is according to the Allowance of *Chelfea Hofpital*, viz. four Men to a Mefs; and each Mefs to contain four Pound of Flefh, a Gallon of Beer, &c.

It is adminifter'd by a Governor, Lieutenant-Governor, Captain, Lieutenant, Chaplain, Steward, Phyfician, &c.

Chrift's Hofpital, popularly call'd the *Blue Coat Hofpital*, was anciently a Monaftery of Grey Friars, founded by *Rubers*, the firft Prior thereof, in the Time of Henry I. difolv'd by Henry VIII. and converted by Edward VI. into an *Hofpital* for poor Children, who are fupply'd with all Necessaries and Conveniencies, cloath'd, dieted, and taught.

Since its firft Endowment it has receiv'd abundance of new Donations. A great Part of it was burnt down by the great Fire; but is again rebuilt by the Care of the Governors, tho' not without incurring a great Debt, and anticipating the Revenues of the *Hofpital*.

Formerly, a thoufand poor Children, moft of them Orphans, were maintain'd on this Foundation; and fix or feven Score yearly put out Apprentices, and the Maids to Service; but the Number, thro' the Deficiency of the Funds, is now much lefs.

Here were two Mathematical Schools; the firft founded by King Charles II; but they are now united. Youths are there taught feveral Parts of practical Mathematicks, particularly Navigation, to fit them for Apprentices to Mafters of Ships: To fay nothing of the Grammar School, (whence the moft pregnant Boys are yearly fear to the Univerfity) Writing School, Drawing School, &c.

The Officers of this *Hofpital* are a Prefident, Treasurer, Governors, &c.

St. Bartholomew's Hofpital adjoins to *Chrift's Hofpital*, and formerly belong'd to the fame Grey Friars.

At the Diffolution of Monafteries, Henry VIII. left 500 Marks a Year to it for the Relief of poor People; but it was more largely endow'd for the Ufe of fick and lame Perfons only, by Edward VI.

It is govern'd by a Prefident, Treasurer, &c. with other Officers. It is furnifh'd with two Phyficians, and three Mafter Surgeons, befide as many Aftifant Surgeons.

In this *Hofpital*, with two others depending on it, the one at *Kingftons*, the other call'd the *Lack in Southwark*, are about 300 Patients, provided with Lodging, Diet, Phyfick, Chirurgery, &c.

St. Thomas's Hofpital, in *Southwark*, is for the fame Purpofes as that of *St. Bartholomew*.

It was originally founded an *Hofpital*, by Richard, Prior of *Bermondsey*, in 1213; furrender'd to King Henry VIII; and given by Edward VI. to the Citizens of *London*, for an *Hofpital* for infirm and lame People.

It confifts of four quadrangular Courts: In the firft are fix Wards for Women; in the fecond, two Chapels, the leffer for the private Ufe of the *Hofpital*, and the larger Parochial: In the fame Court are the Houfes of the Treasurer, and other Officers; In the third Court are fix or

feven Wards for Men. The fourth has alfo three Wards, Baths hot and cold, a Chirurgery, Apothecary's Shop, &c.

There are about 3000 Perfons taken in and difcharg'd out of this *Hofpital* yearly.

The Governors of this *Hofpital* are the Lord Mayor and Court of Aldermen, with about 260 other Citizens. Among which are a Prefident, Treasurer, &c. two Phyficians, and three Surgeons.

Guy's Hofpital, or the *Hofpital of the Incurables*, is the Foundation of that wealthy Citizen and Bookfeller, *Thomas Guy*, Efq;

It is chiefly intended for reputed incurable Perfons; and is even to take in yearly a certain Number of Patients turn'd out of the other *Hofpitals*, particularly *Bethlehem*, as incurable.

The Founder beftow'd 50000*l*. on the Building in his Life-time; and, by Will, endow'd it with 200000*l*. at his Death, in 1724: The greateft Benefaction, without Difpute, that ever was left by any one private Man.

His Officers are a Prefident and Governors, moft of which are the fame with thofe of *St. Thomas's Hofpital*, which is in the Neighbourhood thereof, with a Treasurer, two Phyficians, two Surgeons, &c.

BETHLEHEM *Hofpital* } See { BETHLEHEM.
BRIDEWELL *Hofpital* } BRIDEWELL.
SUTTON'S *Hofpital* } CHARTER-HOUSE.

HOSPITALER, one that entertains and provides for poor People, Travellers, &c.

The Name is chiefly apply'd to certain Communities of Religious. — As the *Hofpitalers of Elfeffor* in *Elfeffor*, instituted to take Care of Lepers; *Hofpitalers of St. John Baptist of Coventry*; *Hofpitalers of St. Julian*; *Hofpitalers of St. Leonard at York*, &c.

The Religious *Hofpitalers* generally follow the Rule of *St. Auguftin*. Moft of them pretend that *St. Maribus* was their firft Poundress, and chufe her for their Patron, by reafon the entertain'd Jefus Chrift at her Houfe. Some of them go back to the Patriarch *Arabaham*.

There are alfo *Hofpitalers* among the military Orders; fuch are the Knights of *St. Lazarus*, and *St. John of Jerufalem*.

HOSPITALERS, HOSPITALARII, were a certain Order of Religious Knights, fo call'd, becaufe they built an *Hofpital* at *Jerufalem*, wherein the Pilgrims were receiv'd. — To thefe Pope Clement the Fifth transfer'd the Effects and Revenues of the Templars; whom, by a Council held at *Vienna*, he fuppreff'd, for their many and great Mifdeemeanors. See *TEMPLAR*.

Thefe *Hofpitalers* were otherwife call'd Knights of *St. John of Jerufalem*, and are now the fame with thofe whom we call Knights of *St. John of Malta*. See *MALTA*.

HOSPITIUM, an Inn; a Term peculiarly us'd in our Law Books for an *Inn of Court*. See *INNS of Court*.

HOSPITIUM is alfo us'd for a little Coavent, which the Religious built for the Reception of Strangers and Travellers of the fame Order, who have occafion to ftay with them fome time.

Moft of the *Hofpitiis*, or *Inns*, in Time became fix'd Convents. See *CONVENT*.

HOSPODAR, the Title borne by the Princes of *Wallachia* and *Moldavia*. See *PRINCE*.

The *Hospodars of Wallachia* and *Moldavia*, receive the Investiture of thofe Principalities from the Grand Signor, by a Veft and a Standard, which he gives them.

They are fometimes depos'd by him; tho', in other Refpects, they have the Sovereign Power within their States.

HOST, HOSPIES, a Term of mutual Relation, apply'd both to a Perfon who lodges and entertains another, and to the Perfon thus lodg'd, &c.

Thas, the Inn-keeper fays, he has a good *Host*, in fpeaking of the Traveller who lodges with him: And the Traveller, again, fays, he has a kind *Host*, in fpeaking of his Landlord.

The Word is form'd of the *Latin*, *Hospes*, which fometimes will have thus call'd, *quafi loquium*, or *quafi pateris*; for *quifum* was anciently wrote with an *Aspirate*.

It muft be obferv'd, then, that it was the Cuftom among the Ancients, when any Stranger ask'd for Lodging, for the Mafter of the Houfe, and the Stranger, each of them to fet a Foot on their own Side of the Threfhold, and fwear they would neither of them do any Harm to the other. — It was this Ceremony that rais'd fo much Hoeror againft thofe who violated the Law, or Right of Hofpitality on either Side; inafmuch as they were look'd on as perjurd.

Inftead of *Hofpes*, the ancient *Latins* call'd it *Hofpis*; as *Cicero* himfelf informs us: Tho', in Courfe of Time, *Hofpis* came to fignify an Enemy; fo much was the Notion of *Hofpitality* alter'd.

Hofis is alfo us'd by Way of Abbreviation for *Hofpis*, a Victim or Sacrifice to the Deity. See *HOSTIA*.

In this Sense, *Hof* is more immediately understood of the Person of the Word incarnate, who was offer'd up a *Hof* or *Hofia* to the Father, on the Cross; for the Sins of Mankind.

Hof is peculiarly us'd in the *Romish* Church for the Body of Jesus Christ, contain'd under the Species of Bread and Wine, which is offer'd up every Day, a new *Hof* or Sacrifice in the Mass. See *MASS*.

Pope Gregory IX. first decreed a Bell to be rung, as the Signal for the People to betake themselves to the Adoration of the *Hof*.

The Vessel wherein the *Hofs* are kept, is call'd the *Cibory*.

HOSTAGE, a Person left as Surety for the Performance of the Articles of a Treaty. See *TREATY*.

When two Enemies are on the Point of concluding a Treaty or Capitulation, 'tis frequent for them to give *Hofages* on each Side, as Sureties for the Execution of what is contain'd therein.

The Garrison of such a Place has capitulated, and given *Hofages*. Such an Officer was given as an *Hofage*.—The Word is form'd of *Hof*, and that of *Hofes*. See *HOF*.

A *Hofage* is either a Principal or an Accessary, according to the State of the Case. He is only an Accessary, when, for Instance, a Prince promises Fidelity to another, and gives up his Son, or some other great Lord, to assure his Engagement, without any further Stipulation. For, here, if the Prince fail of his Word, the *Hofage* is no ways accountable for it.

But the *Hofage* becomes a Principal, when it is expressly stipulated, that he shall be answerable for the Event: For Instance, if a City engage to surrender, in Case it be not reliev'd in so many Days; and to secure the Engagement give *Hofages*; these *Hofages* are what a Surety is to a Creditor for Debt of his Principal. So that if the Relief do not come, and yet the Citizens refuse to surrender, the *Hofages* stand in their Place, become Principals, and liable to be punish'd for the Perjurication of those they have become Surety for.

A *Hofage* given for another Person, becomes free when the Person dies.

HOSTEL, or *HOVEL*, a *French* Term, anciently signifying a House, or Dwelling-place.

It is now more commonly us'd for the Palaces or Houses of the King, Princes, and great Lords. In this Sense they say, the *Hofel de Conde*, *Hofel de Comi*, *Hofel du Louvre*, &c.

The Grand *Prevost de l'Hotel* is the first Judge of the Officers of the King's Household. His Jurisdiction is much like that of the Lord Steward of the Household of the King of England. See *STEWARD*.

The *Hotel de Ville* is what we call a *Town-house*, or *Town-hall*. See *HALL*.

HOTEL-DIEU, is a common Name for the chief Hospital for the Reception of sick Persons, in most of the Cities of France. See *HOSPITAL*.

The *Hotel des Mars*, is an Hospital near Paris of the same Nature with *Cheltesa* Hospital.

HOSTIA, *HOF*, in Antiquity, a Victim offer'd in Sacrifice to a Deity. See *VICTIM*.

The Word *Hofia* is form'd *ab hostibus*, it being the Custom to offer one before they join'd Battel, to render the Gods propitious; or after the Battel was over, to give them Thanks.

Nidore, on this Word, remarks, that the Name *Hofia* was given to those Sacrifices which they offer'd before they march'd to attack the Enemy; *ante quam*, says he, *ad Hostem pergerent*; in Contra-distinction from *Victimas*, which were properly those offer'd after the Victory: However, *Ovid* confounds the two, when he says,

Victima que occidit dextra Victrice vocatur;
Hofibus a Dextris Hofia nomen habet.

Fronton makes another Distinction: According to him; *Victimas* was a grand Oblation, and *Hofia* a smaller and less considerable one.

But he the Custom in this respect what it will, 'tis generally allow'd that the Word *Hofia* comes from *Hofis*, Enemy: Tho' there are some who derive it from the *Latin* Verb *Hofio*, q. d. *ferio*, I strike, smite.

HOSTILITY, the Action of an Enemy.—During a Truce, all *Hostilities* are to cease on both Sides: Such a City stands neuter, and commits no *Hostilities* on either Side.

The Word is *Latin*, *Hostilitas*, form'd of the Primitive *Hofis*, which signifies Enemy; and which anciently signify'd *Stranger*, *Hofes*. See *HOF*.

HOT-BATH, See *BATH* and *THERMÆ*.

HOT-BED, a Piece of Earth or Soil plentifully enrich'd wth Manure, and defend'd from cold Winds, &c. to forward the Growth of Plants, and force Vegetation, when the

Season or the Climate of itself is not warm enough. See *SOIL*, *MANURE*, *VEGETATION*, &c.

By means of *hot Beds* skillfully manag'd, we can so nearly imitate the Temperature of other Climates, that Seeds of Plants brought from any Country between the Tropicks; may be made to flourish even under the Pole. See *EXOTIC*.

Heat and Humidity being the great Influencers of Vegetation; to promote the Growth of any Plants, these must be duly proportion'd, so as neither to exceed nor come short of the Bounds Nature has allotted for it.—Too much Heat we find rather scorches a Plant than makes it grow; and too much Moisture frequently chills it, unless quickly exhal'd from the Roots.—With us, a moderate Heat is found the most eligible; such as is rais'd by the Ferment of wet Straw and Horfe-litter, which, from the Earth lying thereon, will send forth, for some time, a gentle Steam, impregnated with vegetative Salts. See *PLANT*, *WATER*, &c.

The usual Way of making *hot Beds*, is of Horfe-litter and Grass mix'd together, and left on a Heap for eight or ten Days to putrefy; and then remov'd into a Bed, and cover'd up with Glasses or Frames.—Others chuse to take Horfe Dung a Month or six Weeks old, and make a Seed-Bed of it about four Foot high, and cover it up with Straw a Foot thick, which is to be remov'd in three or four Days, and its Place supply'd either with Cows Dung, or the last Years Ridges.

The Process of ordering a good serviceable *hot Bed*, for the customary raising of Culliflowers, Cucumbers, Melons, Radishes, and other tender Plants and Flowers in *January* or *February*, is directed by Mr. *Morimer* in *Manner* following:

Provide a warm Place defend'd from all Winds, by being inclos'd with a Pale or Hedge, made of Reeds or Straw; about six or seven Foot high, of such Distance or Capacity as Occasion requires.—Within this Inclosure raise a Bed two or three Foot high, and three Foot over, of fresh Horfe Dung, about six or eight Days old; then tread it down very hard on the Top, make it level, and if you think fit, edge it round with Boards or Bricks, laying fine rich Mould about three or four Inches thick on it: When the extrem Heat of the Bed is over, which you may perceive by thrusting in your Finger; plant your Seeds at pleasure; and set your Fooks four or five Inches above the Bed, to support a Frame made of Sticks, and cover'd with Straw or Bals-mat, in order to secure the Seeds and Plants from Cold and Wet; only the Covering may be open'd in a warm Day, for an Hour before Noon, and an Hour after.—But take Care to earth up your Plants as they shoot in Height; and when able to bear the Cold, they may be transplanted.

In *Holland* they make use of *hot Beds* made of Sand; which are not so apt to raise unwholesome Damps as those of Horfe Dung.—The *Dutch* likewise make *hot Beds* of Tanner's Bark, which, when once rightly prepar'd, will maintain an equable Heat for six Months.

Bradley, with very good Reason, proposes a Thermometer to be us'd to regulate the Heat of *hot Beds*.—For Plants that are either to be brought up in a colder Season, or a colder Climate than what they naturally require; you are to take the Height at which the Thermometer stands in their proper Season or Climate, as a Standard; and by applying a Thermometer to the *hot Bed*, judge whether the Heat is to be intended or remitted.—Thus a *hot Bed* for Cucumbers must be kept, to raise the Spirit in the Glass, to the same Height as the natural Temperature of the Weather will raise it to about the latter End of *May* and *June*, when Cucumbers will grow abroad without any artificial Heat or Shelter. See *HEAT* and *THERMOMETER*.

HOT-HOUSE. See *STOVE*, *SUNATORY*, *HYPOCAUSTUM*, &c.

HOT-SHOOTS, or *HOFVISES*, a Sort of factitious or compounded Fuel, made of a third Part of any Coal, Pit, Sea, or Charcoal, mix'd with Loam. See *FUEL*.

These Ingredients are to be made up into Balls, moisten'd with a little Urine, or in any other Form at Pleasure; and expos'd to the Air till thoroughly cry.—Then may they be built into the most orderly Fire imaginable, affording a glowing, solemn, and constant Heat for seven or eight Hours without stirring. This Mixture is frequently us'd in some Parts to slacken the impetuous devouring of the Fire, and keep Coal from consuming too fast.

HOTCH-POT, or *HONG-PONGE*. See *HONG-PONGE*.

A Man being seiz'd of thirty Acres of Land in Fee, hath two Daughters, and gives with one of them ten Acres in Frank-Marriage, and dies seiz'd of the other twenty. If now she that is thus marry'd will have any Part of the twenty Acres, she must put her Lands given in Frank-Marriage in *Hotch-pot*, that is, she must refuse to take the sole Profits of the ten Acres, but suffer them to be mingled with the other twenty, to the End an equal Division may be made of the whole thirty between her and her Sister.—Thus for her ten Acres she will be intitled to fifteen. *Coke on Littl.*

HOTTS, or **HURTS**, the Pounces and round Balls of Leather stuffed, or ty'd on the sharp End of fighting Cocks Spurs; to keep them from hurting one another in sparring or breathing themselves.

HOUGH, the Joint of the hind Leg of a Beast. See **HAM**.

To **Hoogh**, or **cut the Hoogh**, is to **ham-string**. See **HAM-STRING**.

Hough-bony, is a hard round Swelling or Tumor growing upon the Tip or Elbow of the Hoof or Hoogh.

It generally proceeds from some Stroke or Bruise; and if neglected till the Sublance of the Swelling becomes hard like Glue, proves difficult to cure.

ROUND, *Canis Venaticus*, a Hunting Dog. See **HUNTING**.

Hounds may be distinguish'd, with regard to the Manner of their Hunting, into such as find out and pursue the Game by Sight, and the Quickness and Swiftness of their Motion; of which Kind are the *Grey Hound*, *Agassus*; and *Grey Hound*, *Canis Grovus*; the *Zerrier*, &c. and those which find and pursue the Game by the Goodness of their Smell.

The Species of scented Dogs may be divided farther into *Hounds*, simply so call'd, and *Blood Hounds*, each whereof admits of some Diversities.

1^o. As to *Hounds*, simply thus call'd, in *Latin*, *Canes Venatici*, *Odonatores*, *Sagaces*, &c. — Those which are all of one Colour, as white, black, &c. are the most valu'd; then those spotted with red: Those spotted with dun are little priz'd, as wanting Courage and Hardiness. — *Fallow Hounds* are of good Scent, and hardy, not fearing the Water: They keep the Chase well without Change; but not so swift as the white: They love the Hart above any other Chase, having little Stomach for the Hare, &c. whence they are not so fit for private Gentlemen; beside that, they are apt to run at tame Beasts.

The *don Hounds* are of more general Use, being fit for all Chases. — Their Sagacity and Fidelity in knowing and sticking to their Master's Voice and Horn, and none else, are much admir'd: They also understand each other, and know which are Rabblers, which Lyers, &c. — They are of different Sizes and Qualities in the several Counties, &c. Mountainous and Woodland Parts breed a tall heavy Sort, call'd *slow Hounds*: Moderate Soils, where the Champaign and Covert share pretty equally, produce a middle-sized *Hound* of a nimble Make.

The Marks of a good and fair *Hound* are, to be of a middle Proportion, rather long than round; the Nostrils wide; Back, bowed; Fillets, great; Haunches, large; Ham, straight; Tail, big near the Reins, and the rest slender to the End; the Leg, big; the Sole, dry; and Claws, large.

For the Terms us'd in respect of Hounds, their Noises, &c. See **HUNTING**.

To enter a young *Hound*; after having taught him to know the Hollow and the Sound of the Horn, at about eighteen Months old he may be taken into the Field. The best Method to initiate him, is to take a live Hare, and trail her upon the Ground, this Way, then that; and, at length, hide her at a proper Distance. Then setting the *Hound* near the Trail, he will take Wind, and run to and fro about the Fields, Woods, Paths, &c. till he find which Way she had gone: As he approaches nearer the lodged Hare, he will mend his Pace, and at last leap on his Prey, which he must be suffer'd to kill, and bringing it to his Master with Triumph, must be rewarded and encourag'd. — This done, he may be let run in a Pack of old *Hounds* to confirm and perfect him.

It ought to be noted, that whatever young *Hounds* are first enter'd at and rewarded with, they will ever after covet most; so that if they be intended, e. g. for the Hart, they must not be enter'd at the Hind.

2. The *Grey-hound* might deserve the first Place, by reason of his Swiftness, Strength, and Sagacity in pursuing his Game; such being the Nature of this Dog, that he is well sented to find out, speedily and quick of Foot to follow, fierce and strong to overcome, yet silent, coming upon his Prey unawares.

The Make and Proportions requir'd in a good *Grey-hound*, are, that he have a long Body, strong, and pretty large, a neat sharp Head, sparkling Eyes, a long Mouth, and sharp Teeth, little Ears, with thin Gristles in them, a straight, broad, and strong Breast, his fore Legs straight and short, his hind Legs long and straight, broad Shoulders, round Ribs, fleshy Buttocks, but not fat, a long Tail strong and full of Sinews.

Of this Kind, those are always fittest to be chosen among the Whelps that weigh lightest; for they will be sooner at the Game, and so hang upon it, hindering its Swiftness, till the heavier and strong *Hounds* come in to offer their Assistance; whence, beside what has been already said, 'tis requisite for a *Grey-hound* to have large Sides, and a broad

Middriff, that he may take his Breath in and out the more easily; his Belly should also be small, which otherwise would obstruct the Swiftness of his Course; his Legs long, and his Hairs thin and soft.

The Huntsman is to lead these *Hounds* on his left Hand, if he be on Foot, and on the Right if on Horseback. — The best Time to try and train them to the Game, is at twelve Months old, tho' some begin sooner, with the Males at ten, and the Females at eight Months old, which last are generally more swift than the Dogs: They should be kept in a Slip, while abroad, till they see their Course; neither should you loosen a young Dog 'till the Game has been a considerable Time on Foot, being apt, by over Eagerness at the Prey, to strain his Limbs.

3^o. The *Grey-hound*, or *Beagle*, is a Dog more beholden to the Sharpness of Sight, than his Nose or Smelling; by Virtue whereof, he makes excellent Sport with the Fox and Hare. — He is also noted as exquisite in chusing of one that is not lank or lean, but full, fat and round, which, if it happen to return, and be mingled again with the Residue of the Herd, he will soon spy out, and leave the rest untouched, never ceasing, after he has separated it from its Company, till he has weary'd it to Death.

These Dogs are much us'd in the North of *England*, and on Champion Ground, rather than bushy and woody Places, and by Horsemen more than Footmen. — If at any time he happen to take a wrong Way, upon the usual Sign made by his Master, he immediately returns, takes the right and ready Course, beginning his Chase a fresh, with a clear Voice and swift Foot, following the Game with as much Courage as at first.

4^o. The *Blood-hound* differs nothing in Quality from the *Scottish Stir Hound*, saving that it is more longly fix'd, and not always of the same Colour; but sometimes red, fanded, black, white, and spotted, &c. tho' most commonly either brown or red.

Their Nature is, that being set on by the Voice and Words of their Leader, to cast about for the Setting of the present Game, and having found it, they will never cease pursuing it with full Cry till it is tir'd, without changing for any other.

They seldom bark, except in their Chase, and are very obedient and attentive to the Voice of their Leader. — Those that are really good, when they have found the Hare, make Shew thereof to the Huntsman by running more speedily, and with Gesture of Head, Eyes, Ears, and Tail, winding to the Form or Hare's Male, never giving over Prosecution, with a Gallant Noise.

They have good and hard Feet, and stately Stomachs; and are very properly denominated *sanguinary* or *Blood-hounds*, by reason of their extraordinary Scent; for if their Game be only wounded, so that it escapes the Huntsman's Hands, or if it be kill'd, and never so cleanly carry'd away, these Dogs, by their exquisite Smell, will betray it, and not be wanting, either by Nimbleness or Greediness, to come at it, provided there be any Stains of Blood. — Nay, tho' by all the Cunning and Foresight imaginable, a Beast be convey'd away without Spot or Blood, yet through the roughest and most crooked Ways and Meanders, will this Dog find out the Deer-bealer, and even in the thickest Throng, will, by his Smell, separate and pick him out. See **BLOOD-HOUND**.

5^o. The *Zerrier*, or *Harrier* only hunts the Fox or Badger; being thus call'd, because, after the Manner of a Ferret in searching for Conies, he leaps into the Ground, and springs or attacks the Beast, either tearing them in Pieces, or halting them out by Force; or, at least, driving them out of their Harbours, to be taken in a Net, or otherwise.

The Huntsmen have commonly a Couple of *Zerriers*; that they may put in a fresh one, as Occasion serves, to relieve the other.

The Time of entering the *Zerrier*, is when he is near a Twelve-Month old: If it be not done within that Time, they will hardly be brought to take the Earth. This entering and fleshing of them may be perform'd several Ways. — First, when the Foxes and Badgers have young Cubs, take an old *Zerrier*, set him into the Ground, and when he begins to bay, hold the young one at the Hole or Mouth of the Earth, that he may listen and hear the old ones Bay.

The old Fox or Badger being taken, so that nothing remains within but the Cubs, couple up the old ones, and put in the Young in their Stead, encouraging them by crying, To him, To him. — If they take any Cub within, let them do with it what they list; not forgetting to give the old *Zerriers* their Reward, which is Blood and Livers fry'd with Cheese and some of their Grease; shewing them Heads and Skins to encourage them.

HOUR, *Hora*, an aliquot Part of a natural Day, usually a 24th, sometimes a 12th. See **DAY**.

An *Hour*, with us, is a Measure or Quantity of Time, equal to a 24th Part of the natural Day, or Nycthemeron; or the Duration of $\frac{1}{24}$ Part of the Earth's diurnal Rotation. 15 Degrees of the Equator answer to an *Hour*; but not precisely, but near enough for common Use. See *TIME*.

It is divided into 60 Minutes; the Minute into 60 Seconds, &c. See *MINUTE*.

The Division of the Day into *Hours* is very ancient; as is shown by *Kircher, Oedip. Egypt.* T. II. P. II. Class VII. c. 8. Tho' the Passages he quotes from Scripture do not prove it. — The most ancient *Hour* is that of the 12th Part of the Day. *Herodotus*, lib. II. observes, that the *Greeks* learnt from the *Aegyptians*, among other Things, the Method of dividing the Day into twelve Parts.

The Astronomers of *Cathaya*, &c. Bishop *Beveridge* observes, still retain this Division. They call the *Hour Clock*; and to each *Clock* give a peculiar Name, taken from some Animal: The 1st is call'd *Zeth*, Mole; the 2d *Chin*, Bullock; the 3d *Zem*, Leopard; the 4th *Mau*, Hare; the 5th *Chin*, Crocodile, &c.

The Division of the Day into 24 *Hours*, was not known to the *Romans* before the first *Punic* War. — Till that Time they only regulated their Days by the Rising and Setting of the Sun.

They divided the twelve *Hours* of their Day into four, viz. *Prime*, which commenc'd at six o'Clock; *Third* at nine, *Sixth* at twelve, and *Ninth* at three. They also divided the Night into four Watches, each containing three *Hours*.

The Origin of the Word *Hour*, *hora*, comes, according to some Authors, from a Surname of the Sun, the Father of *Hours*, whom the *Aegyptians* call *Horus*. Others derive it from the *Greek*, *hōra*, to terminate, distinguish, &c.

Others, from the Word *Urina*, which the *Greeks* call *hōra*; holding, that *Urimessytus* was the first that settled the Division of *Hours*, which he did from Observation of an Animal consecrated to *Serpis*, nam'd *Cynocephalus*, which makes Water twelve Times a Day, and as often in the Night; at equal Intervals.

There are divers Kinds of *Hours*, us'd by Chronologers, Astronomers, Dialists, &c.

Hours are divided into *equal* and *unequal*. *Equal*, are the 24th Parts of a Day and Night precisely; that is, the Time wherein 15 Degrees of the Equator mount above the Horizon.

These are also call'd *Equinoctial Hours*, because measur'd on the Equinoctial; and *Astronomical*, because us'd by Astronomers.

They are also differently denominat'd, according to the Manner of accounting them.

Babylonish Hours are equal *Hours*, reckon'd from Sunrise in a continu'd Series of twenty-four. See *BABYLONISH HOUR*.

Italian Hours are equal *Hours*, reckon'd from Sunset, in a continu'd Series of twenty-four. See *ITALIAN HOUR*.

Astronomical Hours are equal *Hours*, reckon'd from Noon, or Mid-day, in a continu'd Series of twenty-four. See *ASTRONOMICAL*.

European Hours are equal *Hours*, reckon'd from Midnight; twelve from thence to Noon, and from Noon to Mid-night twelve more.

Unequal or *temporary Hours*, are 12th Parts of the artificial Day or Night. The Obliquity of the Sphære renders these more or less unequal at different Times; so that they only agree with the equal *Hours* at the Times of the Equinoxes.

Jewish, or *planetary*, or *ancient Hours*, are twelfth Parts of the artificial Day or Night.

Hence, as 'tis only in the Time of the Equinoxes that the artificial Day is equal to the Night; 'tis then only that the *Hours* of the Day are equal to those of the Night; At other Times they will be always either increasing or decreasing.

They are call'd *Ancient* or *Jewish Hours*, because us'd by the Ancients, and still among the *Jews*. They are call'd *Planetary Hours*, by reason the Astrologers pretend, that a new Planet comes to predominate every *Hour*; and that the Day takes its Denomination from that which predominates the first *Hour* thereof: As *Monday* from the Moon, &c.

HOURS, *Hore*, among the ancient Poets, were certain Goddesses, the Daughters of *Jupiter* and *Themis*: They were three in Number, *Ennomia*, *Dice*, and *Irene*. To which were afterwards added two more, *Carpo* and *Talote*.

Homer makes them the Door-keepers of Heaven. *Ovid* allots them the Employment of harnessing the Horfes of the Sun: *Jugosa Equis Titan velocibus imperat* Horia.

HOURS, *Hore*, in the *Romish* Church, are certain Prayers perform'd at stated Times of the Day; as *Mattins*, *Vespers*, *Lauds*. See *MATTINS*, &c.

The lesser *Hours*, are *Prime*, *Tierce*, *Sixth*, and *Nove*. — They are thus call'd, as being to be rehears'd at certain

Hours prescrib'd by the Canons of that Church, in Commemoration of the Mysteries accomplish'd at those *Hours*.

These *Hours* were anciently call'd *Course*, *Curfus*. *F. Mobilis* has a Dissertation on these *Hours*, intitled, *de Curfu Gallicano*. The first Constitution enjoining the Observation of these *Hours*, is of the IXth Century, being found in a Capitular of *Heinric*, Bishop of *Basil*, directed to his Curates, importing, that the Priests shall never be absent at the Canonical *Hours* either by Day or Night.

Prayers of forty Hours, are publick Prayers continu'd for the Space of three Days successively, and without Intermission, before the Holy Sacrament, to obtain the Assistance of Heaven on some important Occasion. — In these Days, Care is taken, that the Holy Sacrament be expos'd forty *Hours*, viz. 13 or 14 *Hours* each Day.

Hour-Circles, or *Horary-Circles*, in Astronomy, &c. are great Circles, meeting in the Poles of the World, and crossing the Equinoctial at Right Angles; the same as *Meridians*. See *MERIDIAN*.

They are suppos'd to be drawn through every 15th Degree of the Equinoctial and Equator, and on both Globes are supply'd by the *Metidian*, *Hour-Circle*, and *Index*. See *GLOBE*.

The Planes of the *Hour-Circles* are perpendicular to the Plane of the Equinoctial, which they divide into 24 equal Parts.

Hour-Glass, a popular Kind of Chronometer or Clepsidra, serving to measure the Flux of Time, by the Defect or Running of Sand out of one Glass Vessel into another. See *CHRONOMETER*.

The best *Hour-Glasses* are those, which, instead of Sand, have Egg-shells well dry'd in the Oven, then beaten fine and sifted.

Hour-Glasses are much us'd at Sea for Reckoning, &c. See *RECKONING*, *LOG*, &c.

There are also a Sort of *Hour-Glasses*, which depend on the Flux of Water or other Liquid, more properly call'd *Clepsydrae*. See *CLEPSYDRA*.

Hour-Lines, on a Dial, arise from the Intersections of the Plane of the Dial, with the several Planes of the *Hour-Circles* in the Sphere, and therefore must be all Right Lines. See *DIAL* and *DIALLING*.

HOUSAGE, a Fee which a Carrier or other Person pays for laying up Goods in a *House*.

HOUSE, a Habitation, or Place built with Conveniencies to live in; or a Building wherein to shelter a Man's Person and Goods from the Inclemencies of the Weather, and the Injuries of ill-dispos'd Persons. See *BUILDING*.

We say a Brick *House*, a Stone *House*, a *House* of two Stories, of three Stories, a Manor *House*, a Farm *House*, &c. See *BRICK*, *STONE*, *STORY*, *MANOR*, &c.

Ancient Rome consisted of 48000 insulated *Houses*. See *INSULATED*.

A Pleasure *House* or Country *House*, is that built for a Person to enjoy and divert himself occasionally in. This is the *Villa* of the ancient *Romans*; and what in *Spain* and *Portugal* they call *Quintas*; in *Provence*, *Casinos*; in some other Parts of *France*, *Closterie*; in *Italy*, *Vigna*.

In this Sense the Word *Vigna* is sometimes us'd in *English* to denote the Country Seats of the Noble *Romans*; as the *Vigna Farnese*, *Vigna Borghese*, &c. — The Citizens of *Paris* have also their *Maisons de Bouteilles*, *Bottle-houses*, to retire to, and entertain their Friends; which, in *Latin*, might be call'd *Mise*, the Emperor *Domitian* having a *House* built for the like Purpose, mention'd under this Name by *Marzial*, lib. II. *Epig.* 59.

'Tis a Thing principally to be aim'd at, in the Site or Situation of a Country *House* or Seat, that it have Wood and Water near it: If it cannot be conveniently built among Trees, yet there are few Places where Trees may not be speedily rais'd about it. See *TREE*, *PLANTING*, *TRANSPLANTING*, &c.

It is far better to have a *House* defended by Trees than Hills; for Trees yield a cooling, refreshing, sweet, and healthy Air, and Shade, during the Heat of the Summer, and very much break the cold Winds and Tempests from every Coast in the Winter. — The Hills, according as they are situated, defend only from some certain Winds; and if they are on the North Side of the *House*, as they defend from the cold Air in the Winter, so they also deprive you of the cool refreshing Breezes, which are commonly blown from thence in the Summer. — And if the Hills are situated on the South Side, it then proves also very inconvenient.

A *House* should not be too low seated, since this precludes the Convenience of Cellars. — If you cannot avoid building on low Grounds, let the first Floor above the Ground the higher, to supply what you want to sink in your Cellar in the Ground; for in such low and moist Grounds, it conduces much to the Dryness and Healthiness of the Air, to have Cellars under the *House*, so that the Floors be good, and ceiled underneath.

Houses built too high, in Places obvious to the Winds, and not well defended by Hills or Trees, require more Materials to build them, and more also of Reparations to maintain them; and are not so commodious to the Inhabitants as the lower built *Houses*, which may be at a much easier Rate, and also as complete and beautiful as the other.

In Buildings or *Houses* not above two Stories with the Ground Room, and not exceeding twenty Foot to the Raifon-Place, and upon a good Foundation; the Length of two Bricks, or eighteen Inches for the heading Course, will be sufficient for the Ground Work of any common Structure, and six or seven Courses above the Earth to a Water-Table, where the Thickness of the Walls are abated, or taken in, on either Side, the Thickness of a Brick, namely two Inches and a Quarter.

For large and high *Houses* or Buildings of three, four, or five Stories with the Garrets, the Walls of such Edifices ought to be from the Foundation to the first Water-Table, three heading Courses of Brick, or 28 Inches at least; and at every Story a Water-Table, or taken in on the Inside for the Summers, Girders, and Joists to rest upon, laid into the Middle, or one Quarter of the Wall at least, for the better Bond. — But as for the innermost or partition Wall, a half Brick will be sufficiently thick; and for the upper Stories, nine Inches, or a Brick length, will suffice.

The Parts, Proportions, &c. of the *Houses* in London, are regulated by a Statute made for Rebuilding the City after Fire. — By this it is enacted, That the *Houses* of the first and last Sort of Building, fronting By-Streets or Lanes, shall be two Stories high, beside Cellars and Garrets; the Cellars six Foot and an half high, if the Springs of Water hinder not; and the first Story nine Foot from the Floor to the Ceiling, and the second Story as much: That all the Walls in Front and Rear be, as high as the first Story, full the Thickness of the Length of two Bricks; and thence upwards to the Garrets, of the Thickness of one Brick and an half; and that the Thickness of the Garret Walls on the back Part, be left to the Discretion of the Builder, so that the same be not less than one Brick Length; and that the Thickness of the Party Wall in the Garret, be of the Thickness of the Length of one Brick at least.

That the *Houses* of the second Sort of Building, fronting Streets and Lanes of Note, and the River of Thames, consist of three Stories high, beside Cellars and Garrets; that the Cellars thereof be six Foot and an half high, if the Springs hinder not; and that the first Story contain full ten Feet in Height from the Floor to the Ceiling; the second ten Foot, the third nine Foot; that all the said Walls in the Front and Rear, as high as the first Story, be two Bricks and an half thick, and from thence upward to the Garret Floor of one Brick and an half thick; and the Thickness of the Garret Walls on the back Part, be left to the Discretion of the Builder, so that the same may not be less than one Brick thick: And also that the Thickness of the Party Walls between every *House* of this second and larger Sort of Building, be two Bricks thick, as high as the first Story, and thence upward to the Garrets of the Thickness of one Brick and an half.

Also that the *Houses* of the third Sort of Buildings, fronting the high and principal Streets, shall consist of four Stories high, beside Cellars and Garrets; that the first Story contain full ten Foot in Height from the Floor to the Ceiling, the second ten Foot and an half, and the third nine Foot, the fourth eight Foot and an half; that all the said Walls in the Front and Rear, as high as the first Story, be two Bricks and an half in Thickness, and from thence upwards to the Garret Floor, of the Thickness of one Brick and an half; and that the Thickness of the Garret Walls on the back Part, be not less than one Brick; and also that the Party Walls between every *House* of this third and larger Sort of Building, be two Bricks thick as high as the first Floor, and thence upwards to the Garret Floor one Brick and an half.

Also, that in all *Houses* of the fourth Sort of Buildings, being Mansion *Houses*, and of the greatest Bigness, not fronting any Streets or Lanes as aforesaid, the Number of Stories, and the Height thereof, shall be left to the Discretion of the Builder, so as he exceed not five Stories.

The same Act also enjoins, that no Timber be laid within twelve Inches of the fire Side of the Chimney Jaunts; and that all Joists on the Back of any Chimney, be laid with a Trimmer, at six Inches distant from the Back; as also, that no Timber be laid within the Tunnel of any Chimney, upon Penalty to the Workman for every Day's Default, of 10s. and 10s. every Week it continues unremov'd.

Add, That as the Buildings of London join one upon another, and almost every several *House* hath a distinct Proprietor, the Parliament hath decreed, that the Wall dividing the Proprietors Ground, shall be built at the equal Charge of both the Owners: Whence it will not be impertinent to shew how these Party Walls are valu'd.

Now, all Brick-works, whether one, two, three, four, or any other Number of Brick Lengths in Thickness, are all to be reduc'd to the Thickness of a Brick and a half.

It hath been observ'd, that about 4500 of Bricks, of about 164. per 1000; a hundred and a Quarter of Lime, at 10s. per Hundred; two Loads and a half of Sand, at 3s. per Load, will completely raise one Rod of Brick-work of a Brick and a half Thickness. See BRICK, &c.

And thus much will a Rod of Party Wall, the Materials only, reduc'd to a Brick and a half thick, amount to, at the former suppos'd Rates; to which may be added for Workmanship 1l. 8s.

So that for every Rod of Party Wall they allow 3l. a-piece; whence, if a Party Wall be measur'd, and the Measure when reduc'd to a Brick and a half, be found to contain sixteen Rods; that sixteen multiply'd by 3l. giveth 48l. and so much is the one Proprietor to allow the other. See MEASURING, &c.

House of Correction. See CORRECTION.
Work-House. See WORK-HOUSE and RASPHUYS. See also BAIDWELL.

Town-House, or Hall, is a Place where the Officers and Magistrates of a Town or City hold their Meetings, for the due Administration of their Laws and Policy. See HALL, GILD, &c.

House is also us'd for a Convent or Monastery. See CONVENT, &c.

The Chief of such an Order has for many *Houses* dependent on it. — There have been Reforms made of several religious *Houses*.

Regular Priests give the Name *Houses* to the Places they reside in, and not that of Convents or Monasteries, which properly belong to simple Friars. — Thus we say, the *Jesuits House*, the *Barnabites* or *Tercians House*.

The Jesuits have both profess'd *Houses* and Colleges for Novices, which they call *Houses* of Probation.

They have also *Houses* of Retreat for Spiritual Exercises, where they receive secular Persons and Ecclesiastics, dispos'd to practise the same with them, for eight or ten Days. See JESUITS.

House is also us'd for one of the Estates of the Kingdom assembled in Parliament. See PARLIAMENT.

Thus we say, the *House* of Lords, the *House* of Commons, &c. See COMMONS, &c.

House is also us'd for a Noble Family; or a Race of illustrious Persons issu'd from the same Stock.

In this Sense we say, the *House* or Family of the *Stewarts*, the *Bourbons*, the *House* of *Hanover*, of *Austria*, of *Lorraine*, of *Sevoy*, &c.

House, in Astrology, is a twelfth Part of the Heavens. See HEAVEN.

The Division of the Heavens into *Houses* is founded on this, that the Stars and Planets when found herein have certain Influences, either good or evil ones, upon substancy Bodies; and so that *House* is assign'd its particular Virtue or Influence; upon the Consideration whereof they draw Horoscopes. See INFLUENCE, HOROSCOPE, &c.

This Division is made by six great Circles, call'd *Circles* of *Position*, which cut each other in the common Interseccion of the Meridian and Horizon, in the common Way of Doubling, which is that of *Requiescences*; For the Ancients had three other Ways. See POSITION, DUMIFYING, &c.

These Circles divide the Equator into twelve equal Parts, without any regard to the Zodiac.

The Horizon and Meridian are two Circles of the Celestial *House*, which divide the Heavens into four equal Parts, each whereof comprehends four *Houses*. — There are six above the Horizon, and as many below it; six Eastern, and six Western ones.

The Theme or Figure of the Heavens also consists of twelve Triangles, which are likewise call'd *Houses*; wherein are laid down the Stars, Signs, and Planets, compris'd within the respective Spaces of the Circles of Position. See THEME.

Each Planet has two certain *Houses*, wherein it exerts its self with peculiar Vigour; *Les* is the Sun's *House*, and *Cancer* that of the Moon; *Capricorn* is Saturn's, &c.

Some call the *Houses* *Dodecatemories*, and *Angles*; but that Name is more immediately appropriated to the twelve Signs or Divisions of the Zodiac. See DODECATEMORY.

The Astrological *Houses* have their particular Names according to their Qualities. — The first is the *House* of *Life*; being the Ascendant, and containing five Degrees above the Horizon, the rest beneath it. The second is the *House* of *Riches*. The third the *House* of *Brothers*. The fourth, in the lowest Part of Heaven, the *House* of *Relations*, and Angle of the Earth. The fifth, the *House* of *Children*. The sixth, the *House* of *Health*. The seventh, the *House* of *Marriage*, and the Angle of the West. The eighth, the *House* of *Death*, and upper Gate. The ninth, the *House* of *Pity*. The tenth, the *House* of *Offices*. The eleventh, the *House*

House of Friends. And the twelfth, the *House of Enemies*.

It is popularly, and, as it were, poetically said, that the Sun has twelve *Houses*; by which are meant the twelve Signs; tho', in reality, it has only one Sign, *viz.* Leo: beside, the Division of *Houses* is made by the Equator, and not the Zodiac.

They begin numbering the *Houses* with the Ascendant, and pass thence to the Nadir, or *Fundus Cæli*; so as the Vertical Point makes the 10th.

House-bote, a Term compounded of *House* and *Bote*, Compensation; signifying *Elitovers*, or an Allowance of Timber out of the Lord's Wood, for the Repair and Up-holding a *House* or Tenement.

House-bote (says *Coke on Littl.* fol. 41. b.) is twofold, *viz.* *Eschorium ædificandi* & *ardendi.* See *ESTOVERS.*

House-robbing, or *House-breaking*, (from the Saxon *Houfe-brice*) the robbing or plundering a Man in some Part of his *House*, or Booth or Stall in a Fair or Market; the Owner, or his Wife, Children, or Servants, being within the same. See *ROBBERING.*

This was Felony by Stat. 23 *Hen.* 8. and 3 *Edw.* 6. But is since made Felony, though none be within the *House*, 39 *Edw.* See *BURGLARY.*

House-wife's Cloth, is a middle Sort of Linnen Cloth between fine and coarse, for Family Uses.

HOUSHOLD, the Family or Domesticks of a Prince or private Person. See *FAMILY* and *DOMESTICK.*

The Civil Government of the King's Court belongs chiefly to the *Lord Steward of the Household.* See *STEWARD.*—He has Authority over all Officers and Servants of the King's *House*, except those of the Chapel, Chamber, and Stable, who are under the Jurisdiction of the Lord Chamberlain, Master of the Horse, and Dean of the Chapel. See *CHAMBERLAIN,* *MASTER of the Horse,* and *CHAPEL.*

Under the Lord Steward is a Treasurer of the *Household*, Comptroller, Cofferer, Master of the *Household's* Clerks of the Green Cloth, &c. See *TREASURER,* *COMPTROLLER,* *COFFERER,* *GREEN Cloth,* &c.

The *Troops of the Household* are the Horse Guards, Horse Grenadiers, and Foot Guards. See *HOSE GUARD,* &c.—The *Household Troops of France* are call'd the *Gendarmerie.* See *GENDARMES.*

HOUSEHOLD DAYS, are four solemn Festivals in the Year, when the King, after divine Service, offers a Bezaunt of Gold to God on the Altar.—These *Household Days* are *Christmas, Easter, Whitsunday,* and *All-Saints.* See *BEZANT.*

The *Household Days* are part of the twelve Collar and Offering Days. See *COLLAR DAY.*

HOUSING, or *HOUSE,* a Cover laid over the Saddle of a Horse, in order to save it from the Weather, Dirt, &c.

The Cavaliers appear'd with their embroider'd *Housings.*—The Word is form'd of the French, *Houffle*, which signifies the same Thing, tho' it anciently signify'd a kind of Hood wore by Country People.

Sbox HOUSING, a Piece of Cloth border'd with a Fringe, ostentives put round the Saddle, to cover the Croupe, and hang down to the lower Part of the Belly, to save the Stockings of those that ride without Boots.

BOOT HOUSING, is a Piece of Stuff fasten'd to the hinder Part of the Saddle, that covers a Horse's Croupe, either for the Sake of Ornament, or to hide the Horse's Leanness, or to save the Cloaths of the Rider from being daub'd and soil'd by the Sweat of the Horse.

HOW, among Gardeners. See *HOW.*

HOWKER, or *HOUCRE,* a Vessel much us'd by the Dutch; built something like a Pink, but rigg'd and mast'd like an Hoy. See *FLOATING VESSEL.*

They carry from 50 to 200 Tons; and with a small Number of Hands will go to the *East-Indies.*

They tack fore and short, will sail well, and lie near the Wind; and live almost in any Sea.

HOZING of Dogs, the cutting the Balls of their Feet. See *EXPEDITATING.*

HOY, a small Vessel or Bark, whose Yards are not across, nor the Sails square, like those of Ships, but the Sails like a Mitten; so that she can lie nearer than a Vessel with cross Sails can do.

HOYSE, or *HOISE,* the Sea Word for haling up any thing into the Ship, for getting up a Yard, &c.—Thus they say, *Hoise up the Yard, Hoise the Water in,* &c.

HUCKLE Bone, the Hip Bone. See *HIP BONE.*

HUCKSTER, one that sells Provisions, or small Wares, by Retail. See *RETAIL.*

HUDSON'S-BAY Company. See *COMPANY.*

HUE and CRY, a Law Phrase.—*Hue* signifies the Complaint of the Party robb'd, &c. and *Cry* the Pursuit of the Felon on the Highway, by describing the Party, and giving Notice to several Constables from one Town to another,

who are oblig'd to call upon the Parish for Aid in seeking the Felon, till he be apprehended, or, at least, parri'd to the Sea-side.

The *Normans* had a Pursuit with a Cry after Offenders, not unlike this; which they call'd *Clamor de Hæro.* See *HARO.*

Hue is us'd alone, Anno I *Edw.* I. Stat. 2.—In ancient Records it is call'd *Hærefung & clamor.* See *VOCIFERATIO.*

HUERS. See *CONDERS.*

HUG, or *Cornish HUG,* a Term us'd in Wrestling, when one has an Adversary on his Brest, and holds him fast there.

HUGUENOTS, an Appellation given to the Calvinists of France. See *CALVINIST.*

The Name had its first Rise in 1560; but Authors are not agreed as to the Origin and Occasion thereof. *Pasquier, Meuzge,* &c. give us divers Etymologies, but none of them are true.

Du Verdier derives it from *John Hus*, whose Opinions the *Huguenots* chiefly receive, and *Guesnon, Ape, q. d. Hus's* Ape. See *HUSSITES.*

Coquille deduces the Name from *Hugues Capet*, whose Right of Succession to the Crown, the Calvinists maintain'd against those of the House of *Guise*, who pretended to be the Successors of *Charlemaign.*

Others derive it from one *Hughes, Hagh*, a Sacramentarian, who had asserted much the same Doctrines as the *Huguenots*, under *Charles VI.*

Others fetch it from the Swiss Word *Hersingame*, i. e. seditious People; or from *Fingesten*, i. e. Allies or Associates in Faith, which is the Opinion *Mainbourg* inclines to, who hence concludes, that *Huguenot* is originally no Term of Reproach.

Castellan Matussiere, in his Memoirs, maintains them to have been call'd by the Populace, as being of less Value than a little Piece of Money of the same Name, being a Maille or Farthing, which, in the Time of *Hugh Capet*, was call'd *Huguenot, q. d.* not worth a Farthing.

Others take the Name to have been first given by way of Derision to a certain German, who being taken and examin'd as to the Conspiracy of *Amboise*, before the Cardinal de Lorraine, was confounded, and stopp'd short in the Beginning of his Harangue, which began with *Hue not venimus.*

But the most plausible Opinion is that of *Pasquier*, who observes, that at *Tours* the Hogen have a Notion of a Spright or Goblin, call'd King *Hogen*, who strols about in the Night Time; whence, as those of the Religion met chiefly in the Night Time to pray, &c. they call'd 'em *Hoguenots, q. d.* Disciples of King *Hogen*: For it was at *Tours* they were first denominated.—This Opinion *F. Daniel* affents to.

HUISSIER, a French Name for *Usher, Sergeant,* and *Beadle.*

HULKS, are large Vessels, having their Gun Decks from 113 to 150 Foot long, and from 31 to 40 Foot broad.—They will carry from 400 to 1000 Tons.—But their chief Use is for setting in Masss into Ships, and the like: Though anciently the Word *Hulka* seems to signify a small Vessel.

HULL of a Ship, is her main Body, without any Masts, Yards, Sails, or Rigging. See *SHIP.*

To *haul,* or *lie a haul,* is underfoot of a Ship, when, either in a dead Calm, (to preserve her from beating her Sails against the Masts) or in a Storm, when she cannot carry all her Sails; they are taken in to preserve them; so that nothing but her Masts, Yards, and Riggings are abroad, and her Helen ty'd down to the Lee-Side of the Ship.—In this State she will lie easily under the Sea, if she be a good Sailor; and make her Way one Point before the Beam.

To *strike a HULL,* in the Sea Language, is to lie closely or obscurely in the Sea in a Storm, or to tarry for some Conser, bearing no Sail, with the Helm lash'd a Lee.

HUMAN, something that relates to Man, or the Nature of Man. See *MAN* and *NATURES.*

The *human* Body is the Subject of Medicine. See *BODY.*

Epicurus and his Followers deny that the Gods concern themselves with *human* Affairs. See *EPICUREANS.*

Faith is distinguish'd into Divine and *Human.* See *FAITH.*

HUMANITY, the Nature of Man, or that which denominates him *human.*

Nepotus would not allow the Infirmities of *Humanity* to be attributed to the Deity; nor the Attributes of the Deity to *Humanity.* See *NASTORIANS.*

HUMANITIES is also us'd, plurally, for the *Humaniores Literæ*, i. e. the Study of the Greek and Latin Tongues, Grammar, Rhetoric, Poetry, and the ancient Poets, Orators, and Historians. See *PHILOLOGY.*

Such a Student has gone thro' his *Humanities* with Applause: *Calven* perform'd his *Humanities* in the College de la *Alexandre* at *Paris*.

HUMECTATION, *Maisening*, in Pharmacy, the preparing of a Medicine, by steeping it a while in Water, in order to soften and moisten it when too dry, to cleanse it, or to prevent its subtle Parts from being dissipated in grinding it, or the like. See **HUMIDITY**.

The Term is also us'd for the Application of moistening or suppling Remedies. — In this Sense we say, Embrications, Emplastors, Unctions, *Humectations*, Fontentations, &c.

The Word is *Latin*, *Humectatio*, of *Humor*, Moisture.

HUMERUS, in Anatomy, or Of **HUMERT**, the uppermost Bone of the Arm, popularly call'd the *Shoulder Bone*; extending from the Scapula or Shoulder-blade, to the upper End of the Cubitus, or Elbow. See **ARM** and **SHOULDER**, &c.

The *Humerus*, is a large, long, round fistular Bone, of a pretty hard, compact Substance; and its inward Cavity, which contains the Marrow, pretty long and large.

At its upper End it has a large round Head, which is cover'd with a very smooth Cartilage, and receiv'd into the Cavity of the Scapula, which makes a Juncture per *Arthrodiad*. — This Head of the Bone being much larger than the Socket into which it is receiv'd, the Part extant is strictly embras'd by a Ligament, one Edge of which is fasten'd to the Margin of the Cartilaginous Socket of the Scapula, and the other to the lower Part of the Head of this Bone, thereby uniting them firmly together; yet so as to leave the Motion the freest of all the Articulations of the Body, and therefore liable to Dislocations. See **SCAPULA**.

At the lower End of the *Humerus* are two Processes, cover'd each with a Cartilage; the external and lesser receiving the Extremity of the Radius; and the internal, the Head of the Cubitus. See **RADIUS**.

On the Out-side of each of these Processes, is a small Eminence, to which are fasten'd the Ligaments and Heads of the Muscles that move the *Carpus* and *Fingers*. See **CARPUS**.

In this Bone are also three *Sinus's*; one on the fore Side of the large Process, receiving a Process of the Cubitus; another on the back Part which receives the *Olecranon*; and the third, a small femilinear one between the two Processes, answering to the Eminence of the *Sinus's* of the Cubitus. See **CUBITUS**.

The later Anatomists allow this Bone five different Motions, viz, upwards, downwards, forwards, backwards, and rotatory; and five Part of Muscles for Performance of the same, viz, the *Deltoideus*, *Teres*, *Pectoralis*, *Infra-spinatus*, *Sulscapularis*, &c. See each under its proper Article, **DELTOIDES**, **TRES**, &c.

HUMID, **HUMIDUM**, *moist*. See **HUMIDITY**.

The School Philosophers make Water the *primam Humiditatem*, the first of *humid* Bodies, and the Cause or Principle of *Humidity* in others, which are more or less moist, as they partake more or less of this Element. See **WATER** and **ELEMENT**.

HUMIDITY, or *Moisture*, the Quality or Power of wetting or moistening other Bodies. See **QUALITY**.

Aristotle defines *Humidity*, by a passive Quality which indisposes a Body from being retain'd in its own Bounds, but makes it easily retain'd in those of another: which amounts to the same as his Definition of *Fluidity*. See **FLUIDITY**.

Others of the Peripatetic School, make *Humidity* a Quality whereby a Body is *humid*, i. e. moistens other Bodies, and, in moistening, sustains and disposes them to receive any Figure or Impression.

The modern Writers consider *Humidity* as a particular Species of *Fluidity*; and define it a *Flux*, which being apply'd on a solid Body, adheres thereto, and communicates the Quality to other Bodies. — Others, somewhat more accurately, call *Humidity* the Power whereby a Body moistens another: But what that Power is, they do not shew.

But of this we are certain, that *Humidity* is no more than a Sort of relative Mode. — So far as the component Particles of a Fluid, compar'd with respect to the Pores and Particles of other Bodies, or the Texture thereof, are apt and dispos'd to enter those Pores, or stick to those Particles; so far is that Fluid *humid*: On the contrary, so far as there is a Repugnance or Incongruity between the Particles, &c. in respect of such Bodies, the Fluid is not *humid*.

Thus Quicksilver is not moist in respect to our Hands or Cloaths, and other Things, which it will not stick to; but it may be call'd *humid* in reference to Gold, Tin, or Lead, to whose Surfaces it will presently adhere, and render them soft and moist.

Even Water itself, which wets almost every thing, and is the great Standard of Moisture and *Humidity*, is not capable of wetting all Things; for it stands, or runs off in globular Drops on the Leaves of Cabbages, and many other Plants; and it will not wet the Feathers of Ducks, Swans, and other Water-Fowl.

Add, that the Texture alone may cause the Fluid to be *humid*, as is plain, in that neither Quicksilver alone, Lead, or Bismuth, will stick upon Glass; yet being mix'd together, they will form a Mass that will do so; as appears from such a Composition being frequently us'd in foisting Looking-Glasses. See **FOLIATING**.

HUMIDIUM Radicale, or *Radical Moisture*. See **RADICAL**.

This, in reality, seems to amount to no more than the purest and most delicate Part of the nutritious Matter, in a Condition ready to be assimilated. See **NUTRITION**.

By too much Heat, as in Fevers, Hectics, &c. this *Humidity* is too hastily exhaulted and spent.

HUMILIATION, the Act of *humbling*, i. e. of abating a Person's Pride, and bringing him lower in his own Opinion.

In this Sense, *Humiliation* stands contra-distinguish'd from *Mortification*: *Humiliation* brings down the Mind; *Mortification* subdues the Flesh. See **MORTIFICATION**.

HUMILIS *Musculus*. See **EVN**.

HUMOR, or **HUMOUR**. See **HUMOUR**.

HUMORISTS, or *gli HUMORISTI*, **HUMORISTS**, **HUMORISTAE**, the Title of a celebrated Academy of learned Men at *Rome*. See **ACADEMY**.

The Academy of *Humorists* was establish'd by *Paul Mancini*, who made use of *Gaspard Silvius* to assemble together all the Men eminent for Learning about *Rome*, and form them into a Society; as is observ'd by *Jeanus Nicetus* in his *Elogy of Silvius*, Part I. p. 32.

The Devise of this Academy is a Cloud, which being rais'd from the Salt Water of the Sea, returns again in Fresh; with this *Epitaphick of Lucretius*, l. vi. *Redit equivoque dulci*. *Jerom Alexander*, a *Humorist*, has three express'd Discourses on this Devise.

The *Obsequies of M. Peyres* were celebrated in the Academy of the *Humorists*, whereof he was a Member, in above forty different Languages. *Gassendi de Vita Peyreskii*; l. vi. p. 399.

HUMOROSI, the Name of an Academy establish'd at *Corona* in *Italy*. See **ACADEMY**.

The *Humorosi of Corona* must not be confounded with the *gli Humoristi of Rome*. See **HUMORISTS**.

HUMOUR, or **HUMOR**, in its general Sense, signifies the same as *Liquor* or *Liquid*. See **LIQUID** and **FLUID**.

The Word is *Latin*, *Humor*, form'd of the Greek *ἕμα*, *Pluvia*, Rain, of *ἕω*, *Plus*.

HUMOUR, in Medicine, is apply'd to any Juice, or fluid Part of the Body, as the *Clyste*, *Blood*, *Lymph*, *Fat*, *Serum*, *Lymph*, *Spirits*, *Bile*, *Seed*, *Saliva* and *Pancreatic Juices*, &c. See each under its proper Head, **CYSTE**, **BLOOD**, **BILE**, &c.

The four *Humours* so much talk'd of by the ancient Physicians, are four liquid Substances, which they suppose to moisten the whole Body of all Animals, and to be the Cause of the divers Temperaments thereof. See **TEMPERAMENT**.

These are *Phlegma*, *Pituita*, *Blood*, *Bile*, and *Melanchole*. See **PHLEGM**, **PITUITA**, &c.

But the Moderns do not allow of these Divisions. The *Humours* they rather chuse to distinguish into *Nutritious*, or *Alimentary*, as *Clyste* and *Blood*; those separated from the Blood, as *Bile*, *Saliva*, *Urine*, &c. and those return'd into the Blood.

Humours, again, are distinguish'd into *natural* or *salutary*, and *morbid* or *corrupted*. — To the former Class belong all the Juices ordinarily secreted for the Uses of the Body.

To the latter belong those compound *Humours* which thicken, and grow putrid; causing Tumors, Abscesses, Obstructions, and most Diseases. See **DISEASE**.

These are distinguish'd by various Names, *Malignant*, *Acid*, *Aeruginous*, *Corrosive*, *Crude*, *Pecceant*, &c. See **MALIGNANT**, **ACID**, &c.

HUMOUR is also us'd for the particular Temperament or Constitution of a Person, consider'd as arising from the Prevalence of this or that *Humor*, or Juice of the Body. See **TEMPERAMENT**.

Thus we say, a *Bilious Coleric Humour*; a *Phlegmatic Humour*; a *Melanchole*, *Restless*, *Hypochondriac Humour*; a *Sanguine*, *Gay*, *Sprightly Humour*, &c. See **SANGUINE**, &c.

HUMOURS of the Eye. — Anatomists and Opticians distinguish three particular *Humours* in the Eye, which they call the *Aqueous*, *Crystallin*, and *Vitreous*. See **EVN**.

The *Aqueous*, or *Watery Humour*, is plac'd in the anterior or fore Part of the Eye, which it possesses; and is thus call'd, because clear and fluid like Water. See **AQUEOUS**.

The *Vitreous*, or *Glassy Humour*, fills the posterior Part of the Eye; and is denominat'd from its Resemblance of melted Glass. See **VITREOUS**.

The *Crystalline Humour* is plac'd between the other two; and is thus call'd from its Solidity and Transparency, resembling that of a Crystal. See **CRYSTALLINE**.

These three *Humours* have each their Share in the Refraction of the Rays of Light necessary to Vision. See VISION and REFRACTION.

Authors, both ancient and modern, speak of the Regeneration of the *Humours* of the Eye; and give us Instances of their Reproduction, when by any Accident they had been let out. But their Instances generally go no farther than to the Aqueous and Vitreous *Humours*.

Berly, only, in a Letter to *Bartolomeo*, says as much of the Crystalline. — He affirms, that he has fir'd the Pupil of the Eye of divers Animals, and squac'd out all the *Humours*, even the Crystalline, and has again perfectly restor'd them to Sight; and that the Eyes of the Birds, whereon the Operation had been perform'd, instead of being damag'd thereby, were render'd more lively and vigorous than usual. He adds, that he had perform'd the same Experiment on divers Persons, with so much Success, that there remain'd not the smallest Appearance of a Cicatrix in the Eye.

HUMOUR is also us'd in Dramatic Poetry, for a subordinate or weaker Species of what the Critics call *Manners*. See MANNERS.

Humour is usually look'd on as peculiar to the *English* Drama; at least, our Comic Poets have excell'd therein, and carry'd it beyond those of any other Nation: Ours is perhaps the only Language that has a Name for it.

Humour is usually consider'd by our Critics, as a fainter or weaker Passion peculiar to Comic Characters, as being found in Persons of a lower Degree than those proper for Tragedy. See CHARACTER and TRAGEDY.

Every Passion may be said to have two different Faces, one that is serious, great, formidable, and solemn, which is for Tragedy; and another that is low, ridiculous, and fit for Comedy; which last is what we call *Humour*. See PASSION and COMEDY.

Wit only becomes few Characters: 'Tis a Breach of Character to make one half the Persons in a Modern, or, indeed, in any Comedy, talk wittily and finely; at least at all Times and on all Occasions. — To entertain the Audience, therefore, and keep the Dramatic Persons from going into the common beaten familiar Ways and Forms of speaking and thinking, recourse is to be had to something to hold the Place of Wit, that shall serve in lieu thereof, and divert the Audience, without going out of Character: And this does *Humour*; which therefore is to be look'd on as the true Wit of Comedy.

A very great Judge, the Duke of *Buckingham*, makes *Humour* to be all: Wit, according to him, should never be us'd, but to add an Agreeableness to some proper and just Sentiment, which, without some such Turn, might pass without its Effect. See WIT.

HUNDRED, *Centus*, Cent. the Number of ten Times ten; or the Square of ten. See NUMBER.

The Place of *Hundreds* makes the third in Order in the Arabic Numeration. See NUMERATION.

We usually express the Quantity or Proportion of the Profits made in the Way of Commerce, &c. by the *Hundred*. — They ask two and a half *per Cent.* or in the *Hundred*, for remitting Money to such a City. The legal Interest of Money is 5 *per Cent.* or in the *Hundred*. See EXCHANGE, REMITTANCE, INTEREST, &c.

HUNDRED, is also us'd as a Measure to express a certain Quantity or Number of Things. — A *Hundred* of Salt at *Amsterdam* is 14 Tons.

Deal Boards are fix Score to the *Hundred*, call'd the *long Hundred*. — Piles and Laths are five Score to the *Hundred*, if five Foot long, and six Score of three Foot long.

Hundred Weight, or the *great Hundred*. See QUINTAL.

HUNDRED, *Hundredum*, *Centuria*, is also a Part or Division of a Shire or County. See SHIRE and COUNTY.

It was so call'd, either because of old each *Hundred* found 100 Fidejussors or Sureties of the King's Peace, or 100 able Men for his War. See DECENNA, FRANK-MORGES, &c.

Others rather think it so call'd, because originally compos'd of an *hundred* Families. — 'Tis true *Bronson* tells us, that an *Hundred* contains *centum Villas*; and *Giraldus Cambrensis* writes, that the *Isle of Man* hath 543 *Villas*: But in these Places the Word *Villa* must be taken for a Country Family; for it cannot mean a Village, because there are not above 40 Villages in that Island. See VILLAGE.

So, where *Lambard* tells us that an *Hundred* is so call'd, a *numero centum hominum*, it must be understood of an *hundred* Men, who are Heads and Chiefs of so many Families.

Hundreds were first ordain'd by King *Alfred*, the 5th King of the West Saxons: *Alfredus Rex* (*Saxo* *Lambard*, *ord. 9. centuria*) *ubi cum Guthwino Daco fadus inerat, prudentissimum sibi a Fethro Moxi darum secutus consilium, Angliam, prius in Septagias, Centurias, & decurias partitus est.* — *Sarapianus*, *Sbyre*, a Scyrian (*quod partiri significat*) *nominosus, Centuriam, Hundred* & *Decuriam, Toobing* *sive* *Tienmantale*, i. e. *Decuriorate Collegium, appellavit; atque istum nominibus uti hodie vocatur*, &c.

This dividing of Counties into *Hundreds*, for the better Government, King *Alfred* borrow'd from *Germany*; where *Centis* or *Centina* is a Jurisdiction over 100 Towns.

This is the Original of *Hundreds*, which still retain the Name; but their Jurisdiction is devolv'd to the County-Court, some few excepted, which have been by Privilege annex'd to the Crown, or granted to some great Subject, and so remain still in the Nature of a Franchise. See COURT.

This has been ever since the Stat. 12 *Edw.* III. whereby these *Hundred Courts*, formerly form'd out by the Sheriff to other Men, were all, or most Part, reduc'd to the County Court, and so remain at present: So that where we read now of *Hundred Courts*, they are to be understood of several Franchises, wherein the Sheriff has not to do by his ordinary Authority, except they of the *Hundred* refuse to do their Office.

The Word *Hundredum* is sometimes also us'd for an Immunity or Privilege, whereby a Man is quit of the *Hundred-penny*, or Custom due to the *Hundred*. See TURN and WARD.

HUNDRED-LEGG, from *Hundred*, and the *Saxon*, *Legs*, Law, signifies the *Hundred Court*; from which all the Officers of the King's Forest were freed by the Charter of *Canutus*. See WARSCOT.

HUNDRED SELLA, the Payment of personal Attendance ordering Suit and Service at the *Hundred Court*.

HUNDREDERS, *HUNDREDARI*, are Men impannell'd, or fit to be impannell'd, of a Jury, upon any Controversy, dwelling within the *Hundred* where the Land in Question lies. See JURY.

The Word *Hundreder* is also us'd for him who hath the Jurisdiction of an *Hundred*, and holds the *Hundred Court*. See HEAD-BOROUGH.

Sometimes it is also us'd for the Bailiff of an *Hundred*. See BAILIFF.

HUNGARY Water, *Aqua HUNGARICA*, a distilled Water, denominated from a Queen of *Hungary*, for whose Use it was first prepar'd. See WATER.

Hungary Water is one of the distilled Waters of the Shops; and is directed in the College Dispensatory, to be made of Rosemary Flowers infused some Days in rectify'd Spirit of Wine, and thus distilled. See DISTILLATION.

Its Virtues are much the same as those of the Simple it is drawn from. See ROSEMARY.

HUNGER, *Fomes*, a natural Appetite or Desire of Food. See APPETITE and FOOD.

Hunger is properly distinguish'd into Natural and Animal: *Natural Hunger* is an Irritation of the Stomach, occasion'd by Fasting; *Animal Hunger* is the Sensation or Perception of that Irritation, and the Desire of Food consequent thereon.

There are various Opinions as to the Nature, Cause, and Definition of *Hunger*; the Point having been controverted from *Aristotle* to our Time. — *Galen* defines it a painful Sensation, arising from a Division of the Stomach; The other Peripateticks call it an Appetite or Desire of Hot and Dry; but two Systems some Authors have endeavour'd to reconcile by taking them both in; and, accordingly define *Hunger* a natural Appetite or Desire of Hot and Dry, occasion'd by a painful Division of the Membranes of the Stomach, arising from an Empiricness thereof. See STOMACH.

The modern Philosophers speak more accurately and intelligibly on the Point — *Hunger* is generally consider'd by them as owing to the Sharpness or Acrimony of the Liqueur contain'd in the Stomach, which vellecating the Fibres thereof, occasions this uneasy Sensation. — They add, that the occasional Cause of this Vellecation, is the Emptiness of the Stomach, which not furnishing Food for the Stomach-Liquor to be employ'd on, exposes its inner Membrane to the Action thereof.

In effect, 'tis generally agreed, that there is some menstruous Juice or Humour continually discharg'd from the excretory Ducts of the neighbouring Glands into the Stomach, to assist in the Dissolution and Digestion of the Food; and that this same Liqueur, after the Food is gone, falls upon the Stomach itself, irritates its Nerves so strongly, as to propagate the Impression to the Brain, and thus produce the Perception of *Hunger*. See DIGESTION.

This Juice some will have to be acid, by reason Bodies of that Class are us'd to whet the Appetite and excite *Hunger*; and that fatty Bodies more readily remove it than others, by their adhering to the Acid Spicula, and blunting the Points thereof. See ACID.

Others denying the Existence of any such Stomach-Liquor, and accounting for Digestion without; it deny *Hunger* to have any Dependence thereon. — The dry Attrition of the Coats of the Stomach, according to them, is the only Cause.

Thus it is that the *Indians* clude their *Hunger*, by swallowing Pills made of Tobacco Leaves and calcin'd Shells: These Pills take away the Appetite, both as the Tobacco Leaves gradually diminish the Sensibility of the Stomach, and as the calcin'd Shells absorb the Salino-acid Menstruum.

Thus

Thus also it is, that poor People frequently smoke Tobacco to deceive their *Hunger*, not to satisfy it; for Tobacco affords no Nutriment; but it occasions a plentiful Spitting, and by this Means discharges the Body of the corrosive Humour which causes *Hunger*.

This System Dr. *Drake* thus lays down:—When all the Chyme and Chyle is press'd out, the Stomach, which follows the Motions of its Contents, is again, by means of its muscular Coat, reduc'd to a State of Contraction, and by that Means the Inner is brought to lay in Folds, which touching, and by means of the Peristaltick Motion, rubbing lightly, upon one another, produce that gentle Sense of fretting or Vellication, which we call *Hunger*, which being felt first in the upper Orifice, which is first evacuated, begins there to prompt us to replenish: But as by Degrees the Remainder of the Contents are expell'd, this Friction or Rubbing of the Membranes upon each other, spreads gradually over the whole Stomach, and renders our *Hunger* more urgent and impatient, till, by a new Repletion, we take away the Cause.

Others think the Blood, deriv'd from the adjacent Ramifications of Arteries into the Stomach, sufficient to account for *Hunger*, without the Mediation either of Attrition or the Menstruum.—The Mass of Blood itself, they observe, is render'd acid thro' Abstinence from Food; its soft balsamic Parts having been carry'd into all Parts of the Body, and lodg'd therein as Nutriment, to supply the Absence of those wore off and exhal'd: To which it may be added, that the Velocity of the Blood is considerably augmented a good while after eating, beyond what it was during the Action of Digestion.

Hence it is, that Persons of a bilious Constitution, young People, and those who labour hard, must sooner find themselves *hungry* than others. 2^o. That *Hunger*, if it hold long, occasions a violent Heat, and even sometimes a Fever. 3^o. That those whose Humours are crass and viscid, are less incommoded with *Hunger* than others.

In effect, we observe, that some Animals, whose Humours are found to have those Conditions, as Tortoises, &c. will live a long time without Food.—For Man, six or seven Days are commonly suppos'd the Limit within which, if he take no solid Food, he dies; tho' we have Instances of Abstinence which far surpass this. See ABSTINENCE and FASTING.

HUNGRY Evil, is an unnatural and over-hasty Greediness in a Horse, to devour his Meat faster than he can chew it; and may be known by his snatching at it as if he would devour it whole.

HUNTING, the Art or Act of pursuing and chasing Beasts of Game. See GAME.

In its general Sense *Hunting* includes the Pursuit both of hairy and feather'd Game; but in its more proper and restrain'd Signification, it is only applicable to Beasts of Venery and Chase. See BEAST. See also FOWLING.

F. de Lamoignon, Professor of the French Laws, has an express Treatise of *Hunting*.—From those Words of God to Adam, Gen. i. 26 and 28, and to Noah, Gen. ix. 2, 3. *Hunting* was consider'd as a Right devolv'd, or made over to Man; and the following Ages appear to have been of the same Sentiment. Accordingly we find that among the more civiliz'd Nations, as the *Persians*, *Greeks*, and *Romans*, it made one of their genetical Diversions; and as to the wilder and more barbarous, it serv'd them for Food and Necessaries.—The *Romans* Jurisprudence, which was form'd on the Manners of the first Ages, made a Law of it; and establish'd it as a Maxim, that as the natural Right of Things which have no Master, belongs to the first Possessor, wild Beasts, Birds, and Fishes, are the Property of whoever can take them first.

But the Northern Nations of Barbarians, who over-run the *Roman* Empire, bringing with them a stronger Taste for the Diversion; and the People being now possess'd of other, and more easy Means of Subsistence from the Lands and Possessions of those they had vanquish'd; their Chiefs and Leaders began to appropriate the Right of *Hunting*, and, instead of a natural Right, to make it a Royal one.—Thus it continues to this Day; the Right of *Hunting*, among us, belonging only to the King, and those who derive it from him. See KING, LORD, &c.

And hence all our Laws and Charters of the Forest, Laws and Regulations for Preservation of the Game, &c. See FOREST and GAME.

Hunting is practis'd in a different Manner, and with a different Apparatus, according to the Nature, Genius, and Address of the particular Beast which is the Subject thereof.—These Beasts are the Hart, Hind, Hare, Boar, Wolf, Buck, Doe, Fox, Marten, and Roe; the five first whereof are denominat'd Beasts of the Forest, or Venery, *Sylvestres*; and the five latter, Beasts of the Field, or of Chase, *Campêtres*.

The Gentlemen and Masters of the Sport have from'd a new Set of Terms, which may be call'd the *Hunting Lan-*

guage; a little View or Vocabulary whereof we shall here give the Reader.

The Terms, then, us'd for Beasts of Venery and Chase, as they are in Company, are these.—They say, A *Herd* of Harts, and all Manner of Deer.—A *Benny of Roeb.*—A *Sowder* of Swine.—A *Roat* of Wolves.—A *Rickst* of Martens.—A *Brace* or *Leash* of Bucks, Foxes, or Hares.—A *Couple* of Rabbits or Conies.

There are also Terms for their Lodging.—A Hart is said to *Harbour*.—A Buck *Lodges*.—A Roe *Beds*.—A Hare *Sons* or *Forms*.—A Coney *Sits*.—A Fox *Komels*.—A Marten *Trees*.—An Otter *Watches*.—A Badger *Eerths*.—A Boar *Conches*.

Hence, to express their dislodging, we say, *Unharbour* the Hart.—*Rouse* the Buck.—*Start* the Hare.—*Bolt* the Coney.—*Unkennel* the Fox.—*Tree* the Marten.—*Fest* the Otter.—*Dig* the Badger.—*Rear* the Boar.

The Terms for their Noise at Rutting Time are as follows:—A Hart *Belleth*.—A Buck *Groans* or *Treats*.—A Roe *Bellows*.—A Hare *Beats* or *Taps*.—An Otter *Whines*.—A Boar *Freems*.—A Fox *Barks*.—A Badger *Scrieks*.—A Wolf *Howls*.—A Goat *Rattles*.

Terms for their Copulation.—A Hart or Buck goes to *Rat*.—A Roe goes to *Turn*.—A Boar goes to *Brim*.—A Hare or Coney goes to *Buck*.—A Fox goes to *Clicketting*.—A Wolf goes to *Match* or *Make*.—An Otter *Hunteth* for his Kind.

Terms for the Footing and Treading.—Of a Hart we say the *Slet*.—Of a Buck, and all follow Deer, the *View*.—Of all Deer, if on the Grass, and scarce visible, the *Footing*.—Of a Fox the *Print*; and other the like Vermin the *Footing*.—Of an Otter the *Marks*.—Of a Boar the *Track*.—The Hare, when in open Field, is said to *Sore*; when she beats about to deceive the Hounds, she *Doobles*; when she beats on the hard Highway, and her Footing come to be perceiv'd, she *Pricketh*: In Snow, it is call'd the *Trace* of the Hare.

The Tail of a Hart, Buck, or other Deer, is call'd the *Single*.—That of a Boar, the *Wreath*.—Of a Fox, the *Brush* or *Drag*; and the Tip at the End, the *Chape*.—Of a Wolf, the *Stern*.—Of a Hare and Coney, the *Sent*.

The Odour or Excrement of a Hart, and all Deer, is call'd *Footments* or *Footings*.—Of a Hare, *Croakes* or *Cro-tifings*.—Of a Boar, *Liffes*.—Of a Fox, the *Billiting*; and of other the like Vermin, the *Fuants*.—Of an Otter, the *Sprints*.

As to the Heads of Deer, something has already been spoken under the Article HEAD.

For the Attire, or Parts thereof, those of a Stag, if perfect, are the *Bur*, the *Pearls*, the little *Knobs* on it, the *Beams*, the *Gutters*, the *Antler*, the *Star-Antler*, *Royal*, *Sur-Royal*, and all at Top the *Croches*.—Of the Buck, the *Bur*, *Beam*, *Brow-Antler*, *Black-Antler*, *Advoucer*, *Palm*, and *Spellers*.

If the Croches grow in the Form of a Man's Hand, it is call'd a *Palmed Head*.—Heads bearing not above three or four, and the Croches placed aloft, all of one Height, are call'd *Crowned Heads*.—Heads having doubling Croches, are call'd *Forked Heads*, because the Croches are planted on the Top of the Beam like Forks.

They say, a *Litter* of Cubs, a *Nest* of Rabbits, a *Squirrel's Drey*.

The Terms us'd in respect of the Dogs, &c. are as follow.—Of Greyhounds, two make a *Brace*; of Hounds, a *Couple*.—Of Greyhounds, three make a *Leash*; of Hounds, a *Couple* and *Half*.—They say, *let slip* a Greyhound; and *cast off* a Hound.—The String wherein a Greyhound is led, is call'd a *Leash*; and that of a Hound a *Lyone*.—The Greyhound has his *Collar*, and the Hound his *Cuplet*.—We say a *Kennel* of Hounds, and a *Pack* of Beagles.

Styles or Manners of HUNTING.

The Styles or Manners of *Hunting* are various, according to the Country, the Beast, and the Means whereby he is to be caught.

The *Hunting* us'd by the Ancients, was much like that now practis'd for the Rain Deer; which is seldom *hunted* at Force, or with Hounds; but only drawn with a Blood-hound, and forestall'd with Nets and Engines.—Thus did they with all Beasts; whence a Dog is never commended by them for O'cing, before he has discover'd where the Beast lies: Hence, they were not in any Manner curious as to the Musick of their Hounds, or the Composition of their Kennel or Pack, either for Deepness, Loudness, or Sweetness of Cry, which is a principal Point in the *Hunting* of our Days.

Their *Huntsmen*, indeed, were accus'd to shout and make a great Noise, as *Virgil* observes in the third of his *Georgicks*; *Ingentem clamore preme ad retia Cervum*. But that Confusion was only to bring the Deer to the Nets laid for him.

The *Stilian* Way of *Hunting* had something in it very extraordinary. — The Nobles or Gentry being inform'd which Way a Herd of Deer pass'd, gave Notice to one another, and appointed a Meeting; every one bringing with him a Cross bow or Long-bow, and a Bundle of Staves studd with Iron, the Heads bored, with a Cord passing thro' 'em all: Thus provided, they came to the Herd, and casting themselves about in a large Ring, surrounded the Deer. — Then each taking his Stand, unbound his Faggot, set up his Stake, and ty'd the End of the Cord to that of his next Neighbour, at the Distance of ten Fom from one another. — Then taking Feathers, dy'd in Crimfon, and fasten'd on a Thread, they ty'd them to the Cord; so that with the least Breath of Wind, they would whirl round. — Which done, the Persons who kept the Stands withdrew, and hid themselves in the next Covert.

Then the chief Ranger entering within the Line with Hounds to draw after the Herd, roas'd the Game with their Cry; which flying towards the Line, were turn'd off, and still gazing on the shaking and shining Feathers, wander'd about as if kept in with a real Wall or Pale.

The Ranger still pursued, and calling every Person by Name, as he pass'd by their Stand, commanded him to shoot the first, third, or sixth, as he pleas'd; and if any of them mis'd, or singled out another than that assign'd him, it was counted a grievous Offence.

By such Means, as they pass'd by the several Stations, the whole Herd was kill'd by the several Hands. *Pierus Hærologie*. lib. 7. cap. 6.

Hunting, as practis'd among us, is chiefly perform'd with Dogs; of which we have various Kinds, accommodated to the various Kinds of Game; as *Hounds*, *Grey-hounds*, *Stawbeck Hounds*, *Black-hounds*, *Terriers*, &c. See *HOUND*.

In the Kennels or Packs they generally rank themselves under the Heads of *Enterers*, *Drivers*, *Flyers*, *Lyers*, &c.

On some Occasions, Nets, Snyars, and Inframents for digging the Ground, are also requir'd: Nor is the *Hunting-Horn* to be omitted. See *HORN*.

The usual Chafes among us, are the *Hart*, *Buck*, *Roë*, *Hare*, *Fox*, *Badger*, and *Otter*. — We shall here give what relates to each thereof.

By the way let it be observ'd, with regard to the Seasons of Beasts, that *Hare* and *Buck Hunting* begins at the End of Fencer Month, which is a *Footnight* after *Midsummer*, and lasts till *Holy-Rood-Day*. — The *Hind* and *Doë* come in Course on *Holy-Rood-Day*, and last till *Condennat*. — *Fox Hunting* comes in at *Christmas*, and holds till the *Annunciation*. — *Roë Hunting* begins at *Michaelmas*, and ends at *Condennat*. — *Hare Hunting* commences at *Michaelmas*, and goes out at the End of *February*. — Where the *Wolf* and *Bear* are hunted, the Season for each begins at *Christmas*; the first ending at the *Annunciation*, the second at the *Purification*.

Here, too, is the Place for some general Terms and Phrases, more immediately us'd in the Progress of the Sport itself: What belong to the several Sorts of Game, in particular, being refer'd for the respective Articles.

When the Hounds, then, being cast off, and finding the Scent of some Game, begin to open and cry; they are said to *challenge*. — When they are too busy, e'er the Scent be good, they are said to *isbble*. — When too busy where the Scent is good, they *haul*. — When they run it end-ways orderly, holding in together merrily, and making it good, they are said to be in *full Cry*. — When they run along without Opening at all, it is call'd *running Mute*.

When Spaniels open in the String, or a Grey-hound in the Course, they are said to *lepp*.

When Beagles bark and cry at their Prey, they are said to *gear*.

When the Dogs hit the Scent the contrary Way, they are said to *draw amiss*.

When they take fresh Scent, and quit the former Chafe for a new one, it is call'd *Hunting Change*.

When they hunt the Game by the Hoel or Track, they are said to *hunt Counter*.

When the Chafe goes off, and returns again, traversing the same Ground, it is call'd *Hunting the Feil*.

When the Dogs run at a whole Herd of Deer, instead of a single one, it is call'd *Running Riot*.

Dogs set in readiness where the Game is expected to come by, and cast off after the other Hounds are pass'd, are call'd a *Relay*. — If they be cast off e'er the other Dogs be come up, it is call'd a *Faultlay*.

When finding where the Chafe has been, they make a Proffer to enter, but return, it is call'd a *Blenish*.

A Lesson on the Horn to encourage the Hounds, is nam'd a *Call*, or a *Reebnet*. — That blown at the Death of a Deer, is call'd the *Mart*. — The Part belonging to the Dogs of any Chafe they have kill'd, is the *Reward*. — They say, *take off* a Deer's Skin; *strip* or *case* a Hare, Roë, and all Sort of Vermin; which is done by beginning at the Snout, and turning the Skin over the Ears, down to the Tail.

Hart HUNTING, or HUNTING of *Red Deer*. — This Animal, the first Year is call'd a *Calf* or *Hind-Calf*. — The second Year, a *Koobler*. — The third, a *Breck*. — The fourth, a *Staggard*. — The fifth, a *Steg*. — The sixth, a *Hart*.

The Female is call'd a *Hind*. — The first Year she is a *Calf*. — The second, a *Harje*, and sometimes a *Brocks's Sister*. — The third, a *Hind*.

Terms occurring more especially in *Hunting* the *Hart*, and not yet explain'd, are as follow: — The Print or Impression where a Deer has lain, is call'd a *Lager*: If it be in Covert, or a Thicket, it is call'd his *Harbour*. — Where a Deer has pass'd into a Thicket, leaving Marks whereby his Bulk may be guess'd at, it is call'd an *Entry*. — When they cast their Heads, they are said to *stew*. — When they rub their Heads against Trees to bring off the Pills of their Horns, they are said to *frey*. — When a Deer hard hunted takes to Swimming in the Water, she is said to go to *Soil*. — When they turn Heid against the Hounds, they are said to *beg*. — When the Hounds touch the Scent, and draw on till they put up the *Hart*, they are said to *draw on the Slot*.

As to the Nature and Qualities of the *Hart*, it is to be observ'd that he is an excellent Swimmer; there being Instances, when fore hunted, of his plunging into the Sea, and being kill'd by Fishermen's Nets Miles from Land. — When in going to rut, they have occasion to cross a great River, or Arm of the Sea, 'tis said they assemble in great Herds; the strongest goes in first, and the next of Strength follows; and so one after the other, relieving themselves by flaying their Heads on the Buttocks of each other.

The *Hind* commonly carries her Calf eight or nine Months, which usually falls in *May*: Some have two at once; and they eat up the Skin wherein the Calf laid. — As the Young grows up, she reaches it to run, leap, and how to defend itself from the Hounds.

The *Hart* is amas'd at hearing any Call, or whistle in his Ears: If you cry *wore*, *wore*, or *take heed*, you will see him instantly turn back, and make some little Stand. — His Sense of Hearing is very perfect when his Head and Ears are erected; but very imperfect when he holds them down: Hence, when he prick up his Ears, he is known to be apprehensive of Danger. When he is on Foot, and not afraid, he wonders and takes Pleasure to gaze at every thing he sees.

The *Hart* is very long-liv'd, commonly reaching to an hundred Years, or upwards. — The principal Marks of his Age are taken from his Head; yet is this somewhat precarious, some having more Croches thereon at the same Age than others. — Those are accounted to excel in Beauty of Horns, which bear them high.

The Horns do not grow to the Bone or Sculp, but only to the Skin, branching into many Spers, and falling off once a Year, in the Spring. — Tho' solid throughout, as Stones, yet, if they remain awhile in the Air, they grow very light and friable, discovering themselves to be no other than an earthly Substance, concrete and harden'd with a strong Heat into the Form of Bones. See *HEAD*.

The Horns being fallen, they retire and hide themselves in the Shades, to avoid the Annoyance of Flies; and only come out to feed in the Night. — Their new Horns appear at first like Bunches, very soft and tender; but by the Increase of the Sun's Heat, at length grow harder, and are cover'd with a rough Skin, call'd a *Yooet Heat*. — As that Skin dries, they daily try the Strength of their new Heads upon Trees, which not only burnishes and scrapes off the Roughness, but, by the Pain they feel, hereby admonishes them how long to forbear the Company of their Fellows; for when the Horn grows insensible, they return to their former Condition.

The taking of this Beast requires a deal of Art and Attention. — "The deceitful and subtle *Hart*, says *Gessner*, by Windings and Turnings deceives its Hunters, no less than the *Harts* of *Metamora* flying from the terrible Cry "of *Diana's* Hounds: the prudent *Hunter*, therefore, must frame his Dogs, as *Pythagoras* did his Scholars, with "Words of Art, to set them on, and take them off at Pleasure. See *HOUND*."

When he goes for Sport, he is first to encompass the Beast, *en son gisse*, in her own Layer; and thus unharbour her in the View of the Dogs, that so they may never lose her Slot or Footing. — But Note, a deal of Choice and Discretion is here requir'd; for he may not set off upon every one, either of the Herd, or those which wander solitary: The young, the small, &c. are to be pass'd over; and partly by Sight, and partly by the Footing, *Fewnets*, the *larcenous* of the Layer, &c. he must make Judgment of the Game, singling out for that Purpose the largest Head in the whole Herd.

There are divers Means for knowing an old *Hart*, *viz.* by the *Slot*, the *Entries*, the *Abatures* and *Foils*, the *Fewnets*, *Gate* and *Wicks*, *Fraying-backs*, *Head* and *Branches*.

As to the *Slot* — The Treadings of the *Hart's* Foot are to be carefully noted: If you find the Treadings of two,

the one long, and the other round, yet equally big, the longest Slot declares the largest Hart; Add, that the old Hart's hind Foot never over-reaches the fore Foot, as that of the young ones does. — 2°. The Femurising is chiefly to be judg'd of in *April* or *May*: If it be large and thick, it signifies the Hart to be old. — 3°. To know the Height and Thickness of the Hart, observe his *Berries* and *Galleries* into the Thickets, and what Boughs he hath over-stridden; and mark from thence the Height of his Belly from the Ground; for a young Deer usually creeps low as he passes to his Harbour, and goes thro' Places which the old one, being stiff and flately, will not stoop to. — 4°. By his Gate it may be known whether the Hart be large, and whether he will stand long before the Hounds; If he have a long Step, he will stand long; being swift, light, and well-breath'd; If he have a great Slot, which is the Sign of an old Deer, he will be a Laister. — As to his *Fraying-Puff*, note, that the older the Hart is, the sooner he goeth to fray, and the greater is the Tree he chafes to fray upon; it being necessary it be such as may not bend.

Now, to seek or find out a Hart in his Haut, or Feeding-Place, it is to be observ'd, that he changes his manner of feeding every Month. — From the Conclusion of the Rutting time, which is in *November*, they feed in Heaths and broomy Places. — In *December* they herd together, and withdraw into the Strength of the Forests, to shelter themselves from the severer Weather, feeding on Holm Trees, Elder Trees, Brambles, &c. The three following Months they leave berking, but keep four or five in Company, and in the Corners of the Forest, will feed on the Winter Pasture, sometimes making their incursions into the neighbouring Corn Fields, if they can perceive the Blades of Wheat, Rye, &c. appear above Ground. — In *April* and *May* they rest in Thickets and shady Places, stirring very little till Rutting-time, unless disturb'd. — The three succeeding Months they are in their Pride of Grease, and resort to Spring Copes and Corn Fields. — In *September* and *October* they leave the Thicket, and go to Rut; during which Season, they have no certain Place either for Food or Harbour.

Having found out the Game, the *Hunters* discouple and cast off the Dogs; and, some on Horseback, others on Foot, follow the Cry with the utmost Art, Observation, and Speed; remembering and preventing the subtle Turnings and Headings of the Hart; standing with Dexterity and Intrepidity to leap Hedges, Pales, Ditch, &c.

The utmost Address and Circumspection is to be used to keep to the Beast first attempted, and prevent the Dogs from pursuing any other: This, in effect, makes one of the principal Difficulties and Glories of the Chase; the Beast having a hundred Devices to put off some other Head for his own: Sometimes he will fend forth some other little Deer in his stead into the Dogs Way, lying close the while himself; on which Occasion the *Huntmen* is so found a Retreat, and break off the Dogs, and take in Leam, till the Game be recover'd.

Sometimes he will purposely seek out for other Deer at Layer, and rouse them, to make the Hounds hunt change, himself lying down flat in some of their Layers upon his Belly, to make the Hounds over-shoot him: Add, that they may neither scent or vent him, he will gather up his fore Feet under his Belly, and blow or breathe on some moist Place of the Ground; so that the Hounds shall pass within a Yard, without apprehending him. — He will break into one Thicket after another to find Deer, rousing, gathering them together, and herding with them; and even bearing some of them into his Treasuries, that he may the more easily escape. — Finding himself spent, he will break herd, and fall a doubling and crossing in some hard beaten Highway; always running against the Wind, not only to cool himself, but the better to hear the Voice of the Pursuers.

The last Refuge of a Hart forely hunted, is the Soil; keeping the Middle, for fear, lest by touching a Bough, or the like, he may give Scent to the Hounds. He always swims against the Stream, whence the old Rule, *He that smells his Chase first, let him try up the River, and down the Wind*. In taking Soil, he will sometimes cover himself under Water, so as to smell nothing but his Nose.

Where Opportunity of Water fails, he will fly into Herds of Cattel, as Cows, Sheep, &c. and will sometimes leap on an Ox, Cow, or the like, laying the fore Part of his Body thereon, that so touching the Earth only with his hinder Feet, he may leave a smell, or no Scent behind. — What is further still, the chief *Huntman* to *Levis XII.* relates, that a Hart which they were in hard Chase of, leas'd into a great tall white Thorn, which grew in a shadowy Place, and there stood aloft, till he was thrust through by a *Huntman*, rather than he would stir.

This being done, the *Hunter* with his Horn windeth the Fall of the Beast; upon which every one approaches, the skill-fullest opens the Beast, rewarding the Hounds with what properly belongs to them; the *Huntman*, at the same time,

dipping Bread in the Skin and Blood of the Beast to give the Hounds their full Satisfaction.

The Hart is known to be spent by his running stiff, high, and lompert; by his Mouth being black and dry, without Foam on it, and his Tongue hanging out; tho' he will sometimes close his Mouth to deceive the Spectators: And by his Slot; for he will sometimes close his Claws together, as if he went at Leisure, and straight again open them wide, making great Glidings, and hitting his Dew Claws upon the Ground, &c.

When quite spent, and close beset, or intercepted on all Sides, the Hart usually takes to Bay, and makes Force with his Head against the first Man or Dog that closes in upon him, unless prevented with a Spear, Sword, or the like. — Hence 'tis very dangerous going in to a Hart at Bay, especially at Rutting-time, for then they are more fierce.

The Hart being kill'd, his Death is solemniz'd with great Ceremony. — The first Thing, when the *Huntmen* come in, is to cry *ware Hams*, that the Hounds may not break into the Deer: Having secur'd this, they cut his Throat, and blood the younger Hounds, to make them love a Deer, and learn to leap at his Throat. Then having blown the *Merr*, and all the Company being come in, the most distinguished Person, who has not taken *Say* before, takes up the Knife, and lays it cross the Belly of the Deer, (some of the Assistants holding by the fore Legs, and at the same Time the *Huntman* drawing down the Pizzle) and thus draws the Knife along the Middle of the Belly, beginning near the Brisket, cutting deep enough to discover how fat he is. Then the most skilful Person breaks up the Deer, by first flitting the Skin from the cutting of the Throat downward, making the Arber, that the Ordure may not break forth, and then punching him, and rewarding the Hounds therewith.

Lastly, the Person that took the *Say*, being presented with a drawn Hanger, he is to cut off the Head; which done, and the Hounds rewarded therewith, the concluding Ceremony, if a Buck, is a Double, if a Stag, a Treble, Most blown by one, and a Recheat in Confort by all that have Horns: The whole concluded with a general *Who, Whoop*.

Buck HUNTING, or HUNTING of Fallow Deer. — The Buck the first Year, is call'd a *Fawn*. — The second Year, a *Priester*. — The third, a *Sorel*. — The fourth, a *Sore*. — The fifth, a *Buck of the first Head*. — The sixth Year, a *Great Buck*.

The Female is call'd *Dee* or *Doe*. — The first Year, a *Fawn*. — The second, a *Fegg*. — The third, a *Doe*.

This Beast is common in most Countries, being as copuler as a Hart, but in most Things resembling more a Roe, except in Colour; which is various, but most commonly branded or sandy on the Buck, having a black Laid all along on the Ridge, and the Belly and Sides spotted with white.

The Male has Horns not much differing from a Hart, except in Largeness, and that they grow out of the Head like Fingers out of the Hand; whence it is call'd *Cervus Palmatus*. The Female is without Horns.

Less Art and Skill are requir'd in lodging a Buck, than in harbouring a Hart; nor does there need so much drawing after: 'Tis sufficient that you judge by the View, and mark what Grove or covert he enters; for he does not wander and rove so often as a Hart, nor so frequently change his Layer.

When hard hunted, he takes to some strong Hold or Covert he is acquainted with; not flying far before the Hounds, nor crossing nor doubling, norasing any of the Subtilties the Hart is accustomed to.

The Buck will beat a Brook, but seldom a great River, as the Hart; nor can he stay so long at Soil.

The greatest Subtlety a *Huntman* need use in Hunting the Buck, is to beware of *Hawking* Counter or Change, because of the Plenty of Fallow Deer, which use to come more directly upon the Hounds than the Red Deer do.

The Buck herds more than the Hart, and lieth in the dryest Places: But if he be at large, unconfin'd in a Park, he herds but little from *May* to *August*, because the Flies trouble him. He takes Delight in hilly Places, but chafes the Dales to feed in.

ROE HUNTING. — The Roe, the first Year, is call'd a *Kid*. — The second, a *Gyrle*. — The third, a *Hemysr*. — The fourth, a *Roe-Buck of the first Head*. — The fifth Year, a *Fair Roe Buck*.

We have no Roe Deer in *England*; but they abound in *Scotland, Germany, Africa, &c.* And it should seem they had been more common among us, our ancient *Huntmen* still retaining the proper Terms for the Chase.

They make good Chase, stand long, and fly end-way. — When a Roe crosses and doubles, it is call'd *Trooping*.

Their Swiftness appears not only on Earth, but in Waters, thro' which they cut their Way as with Oars; whence they love Lakes and Streams, breaking the Floods to come at fresh Pasture, feeding on Rushes, &c.

Hares only grow on the Male; being fet with six or seven Branches, not palm'd, but Branchy, yet shorter than Fallow Deer. After Rutting he casts his Head.

They are said never to wink, not even when asleep; for which Conceit their Blood is prescrib'd to Persons dim-sighted or pur-blind. — The Tail of this Beast is less and shorter than that of a Fallow Deer, inasmuch, that it is question'd whether it ought to have that Denomination.

They keep most in Mountains among the Rocks; and when hunted, *Martiall* tells us, will hang thereon with their Horns, to delude the Dogs. — They are often taken by counterfeiting of their Voice, which the *Huntsmen* do by the Assistance of a Leaf in his Mouth.

When hunted, they turn much, and often, and will come back on the Dogs directly, when they can no longer endure. They also take Soil, as the Hart; and will hang by a Bough in such a Manner, as that nothing shall appear but their Snout.

Hare HUNTING. — A Hare, the first Year, is call'd a *Leveret*. — The second Year, a *Hare*. — The third, a *Great Hare*.

A Hare is call'd in *Hebrew*, *Arnebet*; which being Feminine, possess'd a great many with the Notion that all Hares were Females. — He is call'd *Lagus* by the *Greeks*, for his immoderate Lust, and by the same Nation *Procor*, for his Fear; and by the *Latin*, *Lepus*, *quasi leci-pis*, to denote Swiftness of Feet.

There are four Sorts of Hares. — Some live in the Mountains, some in the Fields, some in the Marshes, and some any where indifferently.

Those of the Mountains are the most swift, and those of the Marshes the slowest: The wandering Hares are most difficult and dangerous to follow.

Each Part and Member of the Hare is form'd for Celebrity; the Head is round and short, of a convenient Length; the Ears long and lofty, to hear the Enemy at a Distance, and save itself in Time; the Lips continually move, sleeping and waking; and the Eye is too big and round for the Lid to cover it, even when asleep, so that the Creature sleeps as it were on the Watch. The Breast is capacious, and fit to take more Breath than any other Beast.

They feed abroad to conceal their Forms; and never drink, but content themselves with the Dew. Her Ears lead the Way in her Chase; for with one of them she hearkeneth to the Cry of the Dogs, the other being stretch'd forth like a Sail to promote her Course.

The Hares of the Mountains often exercise themselves in Vallies and Hains, and thro' Practice, grow acquainted with the nearest Ways to their Forms. Those which frequent Bushes and Brakes, are not able to endure Labour, nor very swift, as being tender footed, and growing fat thro' Discontinuance of Exercise.

When the Hare has left the Dogs far behind, she goes to some Hill or Rising Ground, where, raising on her hinder Legs, she observes at what Distance her Pursuers are.

The Scent is naturally stronger in Wood Hares than Field Hares; but in all Sorts it is strongest when they feed on Green Corn. — In Winter Mornings, the Scent does not lie till the Frost be a little thaw'd: And it may be added, that a Hare always leaves more Scent when she goes to Relief, than when she goes to Form.

Her Footsteps are more seen in Winter than Summer, because, as the Nights are longer, they travel farther. — Their Prints are very uncertain at the full Moon; at which Time they leap and play together. The Young, it is to be observ'd, tread heavier than the Old, by reason their Limbs are weaker.

A Buck, or Male Hare, is known by his beating the hard Highways, feeding farther out in the Plains, and making his Doublings of a greater Compass than the Female, who keeps close by some Coverd Side, turning, winding, and crossing in the Bushes like a Coney, and rarely running out an End; whereas the Buck, having once made a Turn or two about his Form, then farewell Hounds, for he will frequently lead them five or six Miles without once turning his Head: Add, that the Buck is known, at his rising out of Form, by his hinder Parts, which are more white, or his Shoulders redder than the Does.

The Hare regulates her Conduct according to the Weather. — In a moist Day, she holds the Highways more than at any other Time; by reason the Scent is then most apt to lie; and if she come at the Side of any young Grove or Spring, she forbears to enter, but squats down a-side thereof, till the Hounds have over-shot her; upon which she returns the same Way she came, without turning into any Covert, for Fear of the Wet and Dew hanging on the Boughs.

Regard is also to be had to the Place where the Hare sits, and upon what Wind; for if her Form be either upon the North or South Wind, she will not willingly run into the Wind, but stide, or down the Wind: On the contrary, if she Form in the Water, 'tis a Sign she is foul and muffled,

and in the Course will make all her Doublings and Crossings about Brook Sides, and near Plashtes; for her Scent, under this Condition, being very strong, she needs a Place that will take but little.

Sometimes, when hunted down, she will start a fresh Hare, and squat in the same Form: Other times, she will creep under the Door of a Sheep-Coar, and hide among the Sheep, or run among a Flock of Sheep; and not without the utmost Difficulty be taken from among them. — Add, that loose will take the Ground like a Coney; which is call'd going to *Ventis*.

Some Hares will go up one Side of the Hedge, and come down the other; and we have known a Hare, that being sorely hunted, has got upon a Quickset Hedge, and ran a good way on the Top thereof, and then leap'd off upon the Ground: And 'tis no unusual Thing for them to take themselves to Furz Bashes, and leap from one to another, where-by the Hounds are frequently in Default.

A Hare does not live above seven Years, at most, especially the Buck: And if he and the Doe keep one Quarter, they will not suffer any strange Hare to sit by them; whence the Proverb, *The more you hunt, the more Hares you shall have*; since, having kill'd one Hare, another comes and possesses his Form.

By the Way it is to be observ'd, that to enter a young Kennel of Hounds, regard must be had to the Nature of the Country, and of the Quarry; for, according to the Place wherein they are enter'd, and the Game first given them, will they afterwards prove. Thus, if they be enter'd in a Champion Country, they will ever after more delight to *Dawt* there than in any other Place, &c.

Having found where a Hare hath reliev'd in some Pasture or Corn Field; to find her Form, the Season of the Year, and the State of the Weather, are to be consider'd. — In the Spring or Summer, a Hare will not sit in the Bushes, because frequently offended with Pimices, Snakes, and Adders; but will sit in Corn Fields and open Places. — In Winter, they chuse to sit near Towns and Villages, in Tufts of Thorns and Brambles, especially when the Wind is Northerly or Southerly. — According to the Season and Nature of the Place where the Hare is accustom'd to sit, there beat with your Hounds and start her; which is better Sport than Trailing of her from her Relief to her Form. — Having started her, step in; and hollow in the Hounds till they have undertaken it, crying, *Thar, Thar, or Therr, Therr*, and go on with full Cry; then Recheat them, and follow at a Distance, taking Care not to forward them too much at first, as being apt, in the first Heat, to overshoot the Game. — Above all Things mind the first Doubling the Hare makes, which is to be a Key or Direction for the whole Day; all the other Doublings she afterwards makes being like the first. — According to the Policies you see her use, and the Place where you hunt, make your Compafts, to help the Defaults, great or little, long or short; always seeking the most still and most commodious Places for the Hounds to hunt in.

FOX HUNTING. — This Animal, the first Year, is call'd a *Cub*. — The second, a *Fox*. — The third, an *Old Fox*.

His Nature, in many Respects, is like that of a Wolf; and both bring the same Number of Cubs at a Litter; but the Fox litters deep under Ground, which the Wolf does not.

A Bitch Fox is hard to take, when bragged, and with Cub, in regard she lies near her Burrow, into which she runs upon Hearing the least Noise; indeed 'tis no easy Matter to take her at any Time, as being a Beast of exceeding Subtlety.

What makes *Fox Hunting* the more entertaining, is, the strong hot Scent he affords, which keeps up an excellent Cry; but as his Scent is hotter at Hand, so it dies sooner than that of a Hare, &c. Add, that he never flies far before the Hounds, as not trusting to his Legs, or the Champion Ground, but has Recourse to the strongest Coverts. — When he can no longer stand up before the Hounds, he takes Earth, and must be dug out. — When cour'd by Greyhounds on a plain, his last Refuge is usually to piss on his Tail, and flap it in their Faces as they come near him; sometimes squiring his thicker Excrement upon them, to make them give over the Course.

When a Bitch goes a Clicketing, and seeks the Dog, she cries with a hollow Voice, not unlike the howling of a mad Dog; and the like Noise she makes when she misses any of her Cubs; but never cries at all when she is killing, but defends herself in Silence to the last Gasp.

The Fox is taken with Hounds, Greyhounds, Terriers, Nets, and Gins. — Of Terriers there are two Sorts, the one crook-leg'd, and commonly short hair'd, which take Earth well, and lie long at Fox or Badger; the other shagged and straight-leg'd, which will not only hunt above Ground as others, but also enter the Earth with great Fury, tho' they cannot stay in so long, by reason of their Vehemence.

The Fox chafes to Earth in Ground hard to dig, as in Clay or Stoney Ground, or amongst the Roots of Trees; and his Earth is commonly but one Hole, which goes straight a long Way in, before it come at their Couch. He sometimes by Craft possesses himself of a Badger's old Burrow, which has Variety of Chambers, Holes, and Angles. *Gesner* relates, that he frequently cheats the Badger of his Habitation, by laying his Excrements at the Mouth of his Burrow: Add, that the Wolf being an Enemy to the Fox, this latter secures his Earth, by laying an Herb call'd *Sea-Oxley* in the Mouth thereof, which the Wolf has a natural Aversion to, so that he never comes near the Place where it either lies or grows.

Badger HUNTING. — A Badger is call'd by several Names, *viz.* a *Gray Brock*, *Borefon*, or *Bauson*. — The Male is a *Badger* or *Borepsig*, and the Female a *Sow*.

This Beast is very frequent in *Italy*, *Sicily*, the *Alpine* and *Helvetian* Coasts; and not uncommon in *France* and *England*.

There are two Kinds, the one resembling a Dog in his Feet, and the other a Hog by his cloven Hoof: They differ too in their Snout and Colour, the one resembling that of a Dog, the other of a Swine: The first has a greyer or whiter Coat than the other, and goes farther out to prey: They differ also in their Meat, the one eating Flesh and Carrion like a Dog, the other Roots and Fruit like a Hog.

A late Author likewise mentions two Sorts of Badgers, but in a different Manner; the one, according to him, calling his Fossils long, like a Fox, having his Residence in Rocks, and making his Burrow very deep; whereas the Burrows of the other are made in light Ground, and have more Variety of Cells and Chambers: The one is call'd the *Badger-sig*, and the other the *Badger-wesig*; or the one may be call'd *Canine*, and the other *Swinish*: The first hath his Nose, Throat, and Ears yellowish, and is much blacker and higher legg'd than the latter. Both live on Flesh, hating greedily after Carrion; and are pernicious to Warrens, especially when big with young.

When the Badger Earths; after they have dug a good Depth, they make use of an Expedient to carry off the Earth. — In order to which, one of them lies down on his Back, and on his Belly the rest lay the Earth; thus raking his hind Feet in his Mouth, they draw the Belly-laden Badger out of the Hole or Cave, and having disburden'd him, he re-enters, and repeats the Labour till the Work be compleated.

The Badger is a very sleepy Beast, especially in the Day-time, seldom stirring abroad but in the Night; whence the Denomination *Lucifera*, *q. d.* Avoider of the Light.

The Badger is a deep biting Beast, having very sharp Teeth; to guard against the Effects whereof, it is usual to put great broad Collars about the Dogs Necks. His Back is broad, and his Legs longer on the right Side than the left, whence he runs best on the Side of a Hill or Cart-Road Way. He fights on his Back, and by this means is at Liberty to use both his Teeth and Nails: He has a Faculty of blowing up his Skin after a strange Manner, by which he defends himself against any Blow or Bite of the Dogs; so that you may thrust your Heart out on his Back; but a small Stroke on the Nose dispatches him presently.

In *Italy* and *Germany* they eat the Flesh of Badgers, boiling it with Peas; but in *England* it is not liked, being of a sweet rankish Taste. The best in *September*; and of the two Kinds, the Swinish Badger is the best Meat.

They are long Liver'd, and generally grow blind by meer Age; from which Time they never stir out of their Holes, but are fed by the rest.

The Method of *Hunting* the Badger is thus: — Seek the Earths and Burrows where he lies, and in a clear Moon-shine Night go and stop all the Holes but one or two, and therein place Sacks, fasten'd with drawing Strings, which may shut him in as soon as he strains the Bag. — The Bags thus set, call off your Hounds, and beat all the Groves, Hedges, or Tufts within a Mile or two. What Badgers are abroad, being alarm'd by the Dogs, will straight repair to their Earths, and so be taken.

He that Davs to watch the Sacks, must stand close, and upon a clear Wind; else the Badger will find him, and fly some other Way for Safety. If the Hounds either encounter him, or undertake the Chase before he can get into his Earth, he will stand at Bay like a Boar, and make excellent Sport.

If the Badger be attack'd in his Earth, as soon as he perceives the Terriers yearn him, he will stop the Hole between the Dogs and himself; and if the Dog continues baying, he removes his Baggage with him, and goes into another Apartment or Chamber, of which he usually has half a Dozen in the Burrow; thus retreating from one to the other, till he can go no farther, and barricading the Way as he goes.

Otter HUNTING. — The Otter is suppos'd by some, of

the Castor or Beaver Kind, being, like it, an amphibious Creature, and living both in the Water and on Land; beside that, the Resemblance in Point of Shape is such, as, were his Tail off, he were in all Respects like the Beaver; differing in nothing but Habitation, the Beaver frequenting both the salt Water and the fresh, but the Otter only the fresh. See **CASTOR**.

Tho' the Otter live much in the Water, he does not breathe like Fishes, but after the Manner of Quadrupeds. — He is web-footed, like our Water Fowl, and can endure to be under Water a long Time without Respiration: And yet in Fishing he is frequently found to pop up his Nose for Breath. — He has an admirable Smell, whereby he will directly wind a Fish in the Water a Mile or two off; and is a most pernicious Beast to a Fish-pond, his Dexterity at diving, and hunting under Water being such, that scarce any Fish can escape him: If by painful *trawling* ashore he cannot fill his Belly, he will feed on Herbs, Snails, or Frogs: He will swim a fishing two Miles together, always against the Stream, that when his Belly is full, the Current may carry him down again to his Lodging, which is near the Water, artificially built with Boughs, Sprigs, and Sticks couch'd together in fine Order.

The Flesh of this Beast is cold and filthy, as feeding on stinking Fish; for which Reason it is not eaten among us: Tho' among the *Germans* it is a pretty common Food; and the *Caribbian* Fryars, who are forbidden to eat all Manner of Flesh, are allow'd this. Some in *England* have, of late, said much in Praise of Otter Pye.

The Otter is to be hunted by particular Dogs, call'd *Otter Hounds*; and also with special Instruments, call'd *Otter Spears*.

To find him out, some are to go on one Side the River, and some on the other; bearing all the Way on the Banks, with the Dogs following. — Thus it is soon found if there be an Otter in that Quarter; for the Otter cannot endure long in the Water, but must come forth to make his Sprains, and in the Night sometimes to feed on Grass and other Herbs. If the Hounds find an Otter, look in the first and moist Places, to learn by the Prints which Way he bent his Head: If these make no Discovery, it may be partly perceiv'd by the Sprains. — This done, follow the Hound, and lodge him as a Hart or Deer.

The Otter always endeavours to keep to the Water, where he is Master. — In *Limning* him therefore, you are to be ready with your Spears, to watch his Vents, for that is the chief Advantage: If you perceive where he swims under Water, strive to get a Stand before him, where you expect he will Vent, and there endeavour to strike him with the Spear: If you miss, pursue him with the Hounds; which, if they be good, and well enter'd, will come chaunting and trailing along by the River Side, and beat every Tree-Root, every Otter-Bed, and Tuft of Bull-Rushes; nay, sometimes, they will take the Water, and beat it like a Spaniel; by which Means the Otter can hardly escape.

If the Beast find himself wounded with a Spear, he makes to Land, where he will maintain a furious Battle with the Dogs.

HURDLES, in Fortification, Twigs of Willows or Osiers, interwoven close together, and usually laden with Earth. Their Use is to render Batteries firm, or to consolidate the Passages over muddy Ditches, or to cover Traverses and Lodgements for the Defence of the Workmen, against the artificial Fires or Stones that may be call'd upon them.

HURDLES, in Husbandry, are Frames made either of splited Timber, or of Hazle Rods, platted together; to serve for Gates in Enclosures, or to make Sheepfolds, &c.

HURDS, or **HARDS** of Flax or Hemp, the coarser Parts, separated in the Dressings from the Tear or fine Stuff. See **HEMP** and **FLAX**.

HURLE Bone, in an Horse, is a Bone near the Middle of the Buttock; very apt to go out of its Sockets with a Slip or Strain.

HURLERS, a Quart Set of Stones in *Cornewall*, so call'd from an odd Opinion advanc'd by the common People, that they are so many Men petrify'd or chang'd into Stones, for profaning the Sabbath-Day by *barling* the Ball, an Exercise for which the People of that Country have been always famous.

HURTS, in Heraldry, by some wrote **HEURTS**, and by others **HURRTS**, are azure or blue Roundles. See **ROUNDLE**. The *English* Heraldists distinguish between the Colours of Roundles, and give them different Names agreeable thereto: Those of other Nations content themselves to call these *Torreaux & Avores*; and in other Cases, only add the respective Colour to the Term *Torreaux*.

But these being blue, some will have them signify Bruises or Contusions in the Flesh, which oft turn to that Colour; others suppose them *Hartle Berries*.

HURRICANE, a *Whirlwind*; or a Storm of Wind arising from a Contrariety and Opposition of several Winds. See WIND and WHIRLWIND.

Hurricanes are frequent in the *East and West Indies*; making terrible Ravages in the Islands thereof; blowing down Houses, rooting up Trees, and even whole Woods, &c.

They begin in the North, but turn round; and in a little time veer thro' all the Points of the Compass.

'Tis the Custom for the *French and English* Inhabitants in the *Caribbean Islands*, to fend every Year about *June* to the *Native Caribbees* of *St. Domingo* and *St. Vincent*, to know whether there will be any *Hurricanes* that Year: And about ten or twelve Days e'er any *Hurricane* come, they constantly fend them Word.

The *Prognosticks* these *Barbarians* go by, are given us by *Capt. Langford*, who, in 1697, engag'd one of them, by *Civilities*, to reveal them to him.

'Tis one of their Principles, that all *Hurricanes* come either on the Day of the *Full, Change, or Quarter* of the Moon; each of which is discover'd by a Number of Phenomena the preceding Quarters, as, a turbulēt Sky, Sun red, universal Calm, the Stars appearing red, Noises in Hollows or Cavities of the Earth, strong Smell of the Sea, a settled westerly Wind, &c.

That Author assures us, he receiv'd this Benefit from the Information, that whereas *Hurricanes* are so dreadful, that all Ships are afraid to put out to Sea while they last, and chuse rather to perish at Anchor in the Roads; yet, with good Management, a Vessel may lie out at Sea in these, as safely as other Storms, by taking Care the Ports be well barr'd and calked, the Topmasts and Tops taken down, the Yards a port laced, and the Doors and Windows secur'd. — With these Precautions, that experienc'd Navigator preserv'd his Vessel in two great *Hurricanes*, and taught others how to do the same, by putting out from Port, where they would inevitably have perish'd. And from the *Prognosticks* above, he foretold several *Hurricanes* at Land.

He adds, that all *Hurricanes* begin from the North, and turn to the Westward, till arriving at the South-East, their Force is spent.

The Cause he suggests to be the Sun's leaving the Zenith of those Places, and going back towards the South; and the repelling or bounding back of the Wind, occasion'd by the calming of the general Trade Wind. *Philosophical Transactions*, No. 246.

HUSBAND, *Maritus*, a Man join'd or contracted with a Woman, in Marriage. See MARRIAGE.

By the Laws of *England*, the Wife is suppos'd wholly under the Dominion of her Husband, nor can act or will any thing of herself. See WIFE, FEME, &c.

In *Germany*, the Power of the Husband is not so extensive; even the Princes of the Empire have not a Sovereign and Despotie Power over their Wives and Children. — *Paggenbacher*, a *German Lawyer*, has a Dissertation to prove, that, by the Law of Nature, a Husband has not a despotie Power over his Wife; and that Marriage is not Monarchy. He struggles hard to explain that Passage of *St. Paul* to the *Ephesians*, cap. v. 22. consistently with his Scheme.

J. Philip Palten, Professor of Law at *Gryffnach*, gives us a very learned Dissertation on the *Husbands* of a Queen, who is not King, *De Marito Reginae*. He defines him a Man marry'd with a Princess that holds a Crown by Right of Inheritance, but who only contracted Marriage with him, on Condition that the Marriage should not change his Condition, nor give him any Command over his Wife, or joint Authority with her; nor intitle him to succeed to any of her Royalties after her Decease, without the Intervention of some further Act. Hence he concludes, that in such Case 'tis the Queen is really King. See QUEEN and KING.

This, however, does not hinder but the Husband may be a King elsewhere, and in that Quality superior to his Wife; for a Maiden Queen may either marry a Sovereign Prince, or a Subject, and this either of her own Realm, or another. Of all which Cases he gives Instances: As, that of *Ferdinand* and *Isabella*, whose Marriage did not give any Authority to the one over the Kingdom of *Aragon*, nor to the other over that of *Castile*; of *Jean*, Daughter of *Isabella*, and *Philip of Austria*; *Philip II. of Spain*, and *Mary Queen of England*; the two *Jeanes* Queens of *Neples*; *Mary Queen of Scots*, and the Dauphin of *France*; and lastly, *Queen Anne*, whose Husband was her Subject, yielded Homage to her as her Vassal, and took an Oath of Fidelity to her as her Minister. *M. Palten* proceeds to examine in what Kingdoms this may happen; and shews, that it cannot be in an elective Kingdom, nor an usufructuary one; whence he concludes, that we shall never see it in *Poland, France, or Germany*; but that there are Instances of it in all the other Monarchies, of any standing, in *Europe*. He goes on to shew, that a Queen ought not to marry a King; that it is no Violation of the Conjugal Society, for her Husband to

be subject to her; and answers all the Difficulties that may be started with regard thereto, particularly from Passages of Scripture, as *Is. iii. 11. Cor. xiv. 34. Gen. iii. 6. Eph. v. 22. Gal. iii. 18, &c.*

HUSK, among Botanists, the Part which a Flower grows out of. See FLOWER.

Of these there are several Kinds, as *bulbous* or round Husks, *Beetle Husks*, *middle Husks*, *Foot Husks*, *Hefe Husks*, &c. See HOSE-HUSK, &c.

HUSSARS, *Hussards*, or *Hussarts*, an Order or Species of Soldiery in *Poland* and *Hungary*, commonly oppos'd to the *Ottoman Cavalry*.

The *Hussars* are Horsemen, cloth'd in Tygers and other Skins, and garnish'd and set out with Plumes of Feathers. Their Arms are the Sabre and Bayonet.

They are very retolute; firm Partizans; and better in a hasty Expedition, than a set Battle.

The Emperor and King of *France* have of these *Hussars* in their Service.

HUSSITES, a Party of Reformers, the Followers of *John Huss*. See REFORMATION.

John Huss, from whom the *Hussites* take their Name, was born in a little Village of *Bohemia*, call'd *Hus*. — He fell into the Scandals of *Wicklif* and the *Waldenses*; and in the Year 1407, began openly to oppose and preach against divers Errors in Doctrine, as well as Corruptions in Point of Discipline, then reigning in the Church. See *WICKLIFFITE* and *WALDENSES*.

He was condemn'd, with *Jerom* of *Prague*, by the Council of *Constance*, and burnt, in the Year 1415: But his Disciples still stuck to his Doctrines. — *Joh. Zizka*, being put at their Head in *Bohemia*, maintain'd War a long Time against the Emperor *Sigismund*, with great Success. And *Procopius Holy*, another of their Leaders, conducted them with equal Courage.

The *Hussites* spread over all *Bohemia* and *Hungary*, and even *Silesia* and *Poland*; and there are some Remains of them still subsisting in all those Parts.

HUSTINGS, *Hustingum*, from the *Saxon, Hus*, House, and *Ting*, Cause; or *q. d. domus causarum*, a House where Causes are heard; or rather, from *Hustinga*, Court or Council: Is the principal and highest Court in *London*, held in *Guild-hall*. See COURT and GUILD HALL.

Of the great Antiquity of this Court, we find this Mention in the Laws of King *Edward* the Confessor. — *Debet etiam in London que est caput Regni & Legum, semper curia Domini Regis singularis septimanis, Licet Iama Huthingis federe & teneri fundata erat olim & edificata ad instar & ad modum & in necessarium veteris moque Troje, & usque in bodiernum diem, Leges, & Jura & Dignitates, & Libertates Regniq;que consuetudines suas una semper inviolabilitate conservet.* *Taylor's* Hist. of *Gavel-kind*.

This Court is held before the Mayor and Aldermen of *London*. — Error or Attaint lies there of a Judgment or false Verdict in the Sheriffs Courts.

Other Cities and Towns had also Courts of the same Name, as *Winchester, Lincoln, York, Shipley*, &c.

HUT, from the *Saxon, Hute*, a small Cottage or Hovel. See COVTAGE and HOVEL.

The Word is also us'd for the Soldiers Lodges in the Field. See BARBACK.

HUKING of the Pike, among Fishermen, a particular Method of catching that Fish; very diverting. See PIKE FISHING.

For this Purpose, they take thirty or forty as large Bladders as can be got; blow them up, and tye them close and strong; and at the Mouth of each, tye a Line, longer or shorter, according to the Depth of the Water. At the End of the Line is fasten'd an armed Hook, artificially baited; and thus they are put into the Water with the Advantage of the Wind, that they may gently move up and down the Pond.

Now, when a Master Pike has struck himself, it affords a deal of Entertainment to see him bounce it about in the Water with a Bladder at his Tail; at last, when they perceive him almost spent, they take him up.

HYACINTH, or *JACINTUS*, in Natural History, a precious Stone; thus call'd from its Resemblance of the Purple Flower nam'd *Hyacinth*. See PEARCEOUS STONE.

There are four Sorts of *Hyacints*: those intermix'd with a Vermillion Colour; those of a Saffron Colour; those of an Amber Colour; and, lastly, those of a white, intermix'd with a slight red.

Hyacints, again, are distinguish'd into *Oriental* and *Occidental*. The *Oriental* come from *Calicut* and *Cambaya*, and are equal in Hardness to the *Oriental Amethyst*. — The *Occidental* are found in *Bohemia* and *Portugal*, which are a Degree softer.

The Stone graves or cuts fine, and would be more us'd for Seals, &c. but that the Graving frequently costs more than the Stone.

The Antients us'd it for Amulets and Talismans; and bore it about their Neck, or set in Rings, &c. supposing it to have the Virtue of scouring them from the Plague, &c.

The *Hyacinth* us'd in Medicine, and whereof the Confection of *Hyacinth* is made, is a different Stone, of which there are three several Sorts: The first about the Bigness and Figure of a Grain of Salt, and pretty soft: The 2d ruddy, and shap'd like the Point of a Diamond, found in divers Parts of *Italy, Silesia, Babowia*, &c. The third is white, intermix'd with yellow, and some other Colours; being found in the same Places as the red.

In Strictness, only the first Kind should be us'd in the Confection of *Hyacinth*; but the Druggists and Apothecaries frequently substitute the other.

Confection of *HYACINTH*, is a thin cordial Electuary, compos'd of divers Kinds of precious Stones, particularly of that whose Denomination it bears, with certain Earthe, Seeds, Roots, Coral, Hartshorn, and divers other Ingredients, well mix'd, and ground together. See CONFECTION of *Hyacinth*.

HYACINTHIA, in Antiquity, Feasts held at *Sparta*, in Honour of *Apollo*, and in Commemoration of his Favourite *Hyacinth*.

This *Hyacinth* was the Son of *Amycus*, King of *Sparta*, and was belov'd both by *Apollo* and *Zephyrus*. The Youth shewing most Inclination to the former, his Rival grew Jealous; and, to be reveng'd, one Day, as *Apollo* was playing at the *Diceus*, i. e. Quoits with *Hyacinth*, *Zephyrus* turn'd the Direction of a Quoit which *Apollo* had pitch'd, full upon the Head of the unhappy *Hyacinth*, who fell down dead. *Apollo* transform'd him into a Flower of the same Name: And as a farther Token of Respect, instituted this Feast.

The *Hyacinthia* lasted three Days; the first and third whereof were employ'd in bewailing the Death of *Hyacinth*, and the second in Feasting and Rejoicing.

The People who assisted at the Ceremony were crown'd with Ivy; by reason, says *Vossius*, *de Isidol.* l. ii. c. 14. that *Bacchus* and *Apollo* were the same Person.

HYBISTRICA, in Antiquity, a solemn Feast, held among the *Greeks*, with Sacrifices and other Ceremonies; whereas the Men attended in the Apparel of Women, and the Women in that of Men, to do Honour to *Venus* in Quality either of a God, or a Goddess, or both.

Or, according to the Account given by others, the *Hybistrica* was a Feast celebrated at *Argos*, wherein the Women, being dress'd like Men, insulted their Husbands, and treated them with all Marks of Superiority, in Memory of the *Argian* Dames having anciently defended their Country with singular Courage against *Cleomenes* and *Demaratus*.

Plutarch speaks of this Feast in his Treatise of the great Actions of Women. — The Name, he observes, signifies *Infirmity*, which is well accommodated to the Occasion, wherein the Women strutted it about in Cloaks, while the Men were oblig'd to dangle in Petticoats.

HYADES, in Astronomy, are seven Stars, famous among the Poets for the bringing of Rain. — Whence their Name, from the *Greek*, *Hyas*, *Pluere*, to rain.

Their Place is in the Bull's Head; The Principal of them in the left Eye, by the *Arabs* call'd *Alchabran*. Their Longitudes, Latitudes, &c. see among those of the other Stars in the Constellation *TAURUS*.

The Poets feign them the Daughters of *Atlas* and *Ebra*. Their Brother *Hyas* being torn to Pieces by a Lioness, they wept his Death with such Vehemence, that the Gods, in Compassion to them, translated them into Heaven, and plac'd them in the Bull's Forehead, where they continue to weep; this Constellation being suppos'd to preface Rain.

The' others of the Poets represent the *Hyades* as *Bacchus's* Nurfes, and the same with the *Dolowides*, who fearing the Repentment of *Juno*, and flying from the Cruelty of King *Lycærgus*, were translated by *Jupiter* into Heaven.

HYDATIS, in Medicine, a Distate of the Eyes, consisting of a fatty Substance or Excreescence, growing under the Skin of the upper Eye-lid; by which the whole Eye-lid, in Children, is sometimes render'd Oedematous. See *EYE*.

HYDATIS is also us'd, among the modern Physicians, for a little Bladder of Water, occasionally found in divers Parts of the Body. See *HYDATIDES*.

HYDATIDES, in Medicine, are little transparent Bags or Bladders full of Water, frequently found in divers Parts of the Body.

Hydatides are most common in dropical Persons, and are suppos'd to arise from a Distention and Rupture of the Lymphæducts; being found chiefly in the Parts adjoining in those Vessels, as the Liver, Lungs, &c. — They are also sometimes found in Icteric Cases, See *JAUNDICE*, &c.

We have Influences of *Hydatides* voided both by Stool, by Urine, and by Vomiting. — They are of all Sizes, from a Pin's Head to a Pullet's Egg.

The Word is form'd of the *Greek*, *Hyas*, Water, which, in the genitive Case, gives *Hyades*, whence *Hyas*, *Hydatis*. See *HYDATIS*.

HYDATOIDES, a Name some Authors give to the Aqueous Humour of the Eye, inclos'd between the Cornea and Uvea. See *AQUEOUS Humour*.

The Word is compos'd of *Hyas*, *Hyades*, Water, and *Hyas*, Form, Resemblance.

HYDATOSCOPIA, call'd also *HYDROMANCY*, a kind of Divination, or Method of foretelling future Events, by means of Water. See *HYDROMANCY*.

There is a natural or allowable Kind of *Hydatoscopia*: It consists in foretelling Storms, Tempests, Hurricanes, &c. from natural Signs or Indications in the Sea, Air, Clouds, &c.

The Word is compounded of *Hyades*, the Genitive of *Hyas*, Water, and *scopia*, I view, I consider.

HYDE of *Laud*. See *HYDE*.

HYDE, *Hyda*, from the *Saxon*, *Hygdyl*, a Price or Ransom paid to save one's Skin from beating: Also the same with *Hidage*. See *HERGELD*.

HYDRA, a Southern Constellation, consisting of twenty-six Stars, and imagin'd to represent a Water-Serpent. See *CONSTELLATION* and *STAR*.

Stars in the Constellation HYDRA.

HYDRAGOGUES, a Species of purgative Medicines; being such as are suppos'd peculiarly fitted to discharge serous, or watery Humours. See PURGATIVES.

The strongest Catharticks, Dr. *Quincy* observes, chiefly answer to the Character of *Hydragogues*; in that by their forcible shaking and vellicating the Bowels and their Appendages, they squeeze out Water enough to make the Stools appear little else. See CATHARTIC.

The principal *Hydragogues*, on the common Opinion, are the Juices of Elder, of the Root of Iris, of Soldanella, Mechoacan, Jalap, &c.

In the general, all sudorific, aperitive, and diuretic Medicines, are *Hydragogues*.

The Word is form'd of *Hydr*, Water, and *agogos*, to draw, to lead.

HYDRARGYRUM, a Name the Chymists give to Mercury or Quicksilver. See MERCURY.

The Word is Greek, form'd of *Hydr*, aqua, Water, and *argyros*, argentum, Silver, q. d. Water of Silver, by reason of its resembling liquid or melted Silver.

HYDRAULICKS, that Part of Statics which considers the Motion of Fluids, and particularly Water; with the Application thereof in artificial Water-works. See WATER.

To *Hydraulicks* belong, not only the conducting and raising of Water, with the constructing of Engines for those Purposes; but also the Laws of the Motion of fluid Bodies. See MOTION.

Hydrostatics explain the Equilibrium of Fluids, or the Gravitation of Fluids at rest; Upon removing that Equilibrium, Motion ensues; and here *Hydraulicks* commence.

Hydraulicks, therefore, suppose Hydrostatics; and the generality of Writers, from the immediate Relation between the two, join them together, and call them both either *Hydraulicks* or Hydrostatics. See HYDROSTATICS.

The Laws of *Hydraulicks* the Reader will find under the Article FLUID.

And the Art of raising Water; with the several Machines employ'd for that Purpose, as *Siphons*, *Pumps*, *Syringes*, *Fountains*, *Jets d'Eau*, *Fire-Engines*, &c. are describ'd under their proper Articles, SIPHON, PUMP, SPRING, FOUNTAIN, FIRE-ENGINE, &c.

The Word is deriv'd from the Greek, *Hydro*, fluid, *Hydro*, Water, form'd of *Hydr*, aqua, Water, and *aulos*, Tibia, Pipe or Flute: The Reason whereof is this; that at the Time of the first Invention of Organs, being unacquainted with the Method of applying Bellows to blow them, they made use of a Carazet or Fall of Water to make a Wind, and found them. See ORGAN.

The principal Writers who have cultivated and improv'd the *Hydraulicks*, are *Jo. Ceva*, in his *Geometria Motus*; *Jo. Bapt. Balianus*, *De Motu Naturali Gravium, Solidorum & Liquidorum*; *Mariotte*, in his *Mouvements des Eaux & autres Fluides*; *Domin. Guglielmini*, in his *Memoria Aquarum Pluviarum*, where the higher Laws of *Hydraulicks* are reduc'd to Practice: *Sir Is. Newton*, in *Phil. Nat. Princ. Mathematicæ*. And *Varignon*, in the Memoirs of the Royal Academy of Sciences.

As to *Hydraulick* Machines, *Hero of Alexandria* is the first who has wrote thereon. Of the Moderns, the Principal are, *Solomon de Caus*, in a French Treatise of *Machines*, and chiefly of *Hydraulick art*; *Casp. Schottus* in his *Mechanica Hydraulico-Pneumatica*; *De Cales* in his *Mundus Mathematicus*; *Boecler* in his *Architectura Curiosa*; And *Luc. Antonius Porvius*.

HYDRAULO-PNEUMATICAL, a compound Term apply'd, by some Authors, to such Engines as raise Water by means of the Spring of the Air. See AIR, WATER, ENGINE.

Mr. *Boyle* mentions a very pretty Fountain, which he calls *Hydraulico-Pneumatical*; made by the Spring of the Air pressing up Water in a Pipe, upon the Air's being excluded out of a Receiver, and thus the Weight of the Atmosphere taken off. See FOUNTAIN, VACUUM, &c.

HYDRELÆON, or **HYDRELÆUM**, in Pharmacy, a Mixture of common Oil and Water. See OIL and WATER.

Hydrelæon taken internally, excites Vomiting; externally, it is Anodyne, and promotes Suppuration.

The Word is a Compound of the Greek, *Hydr*, aqua, Water, and *læon*, *Oleum*, Oil.

HYDRENTEROCELE, in Medicine, a Hernia, or Tumor occasion'd by a Defect of the Intestines, and Water along with them, into the Scrotum. See HERNIA.

The Word is compounded of *Hydr*, Water; *enteris*, Intestine; and *celæ*, Tumor.

HYDROCANISTERIUM, a *Fire-Engine*; or a Machine which spouts Water plentifully and with Force, to be apply'd to the extinguishing of Fires and Conflagrations of Houles, &c. See FIRE, SPOUTING, &c.

We have various Contrivances to this Effect. — The first, and which is, as it were, the Basis of the rest, is a Pump inclin'd in a Cistula or wooden Vehicle fill'd with Water, and mounted on Wheels; the Pump being wrought with long Levers which come out of the Cistula; and the Water it raises directed to the Place by means of a jointed Tube. See PUMP.

The Dutch and others use a long flexible Tube of Leather, Sail Cloth, or the like, which they carry or conduct in the Hand from one Room to another, as Occasion requires; so that the Engine may be apply'd where the Fire is only within-sight, and does not burst out to expose it to its external Action.

To improve on this original Fire-Engine, they have since contriv'd to make it yield a continu'd Stream; by substituting a forcing or pressing Pump in lieu of the sucking Pump. See FORCING PUMP.

HYDROCELE, in Medicine, a Swelling or Bloating of the outer Integument or Skin of the Scrotum, occasion'd by watery Humours cast or detain'd therein.

The Word is form'd of the Greek, *Hydr*, Water, and *celæ*, Tumor.

The *Hydrocele* is distinguish'd from a Hernia or Defect, in that the first is form'd by slow Degrees, and the latter all at once. See HERNIA.

Youth is most expos'd to the *Hydrocele*. — It is cur'd by drying Medicines; or by letting out the Water with a Lancet, a Seton, or the like. — But these only amount to a palliative Care: To go to the Bottom of the Disease, recourse must be had to Cauteris.

The Word is compounded of the Greek, *Hydr*, aqua, and *celæ*, Tumor.

HYDROCEPHALUS, or **HYDROCEPHALIA**, in Medicine, a watery Head, or Dropsy in the Head. See HEAD.

The *Hydrocephalus* is a Congestion of Water in the Head, so as to distend and render it soft. See DROPSY.

There are three Kinds of *Hydrocephali*. The first, when the Water is gather'd between the Skull and the Skin: The second, when between the Skull and the Brain: And the third, when the Water is collect'd in the Ventricles of the Brain.

Children are more liable to *Hydrocephali*, than Adults; by reason their Head is soft, and has been much compress'd in the Womb; or, perhaps, by their having been too roughly handled by the Midwife. — Add, that the Bones of Childrens Heads being very soft, and their Sutures not yet exactly clos'd; they castly open, and give Way to an Influx of Water from without; whereas in Adults, the Bones of the Cranium are very hard, and closely bound together. See CRANIUM.

The *Hydrocephalus* is a Disease very difficult to cure. — There is no Remedy but by severe blistering on the Sutures. — It sometimes ends in mortal Convulsions, and sometimes in Lethargies or Apoplexies.

The Head, in this Case, is sometimes extended to a prodigious Bulk; so that the Person cannot bear or sustain it. Of this we have an extraordinary Instance given us by Dr. *Freind*, of a Girl two Years old, whose Head was 26 Inches in Circumference. *Philosoph. Transact. N.º 318.*

The Word is Greek, form'd of *Hydr*, Water, and *cephal*, Caput, Head.

HYDROGRAPHICAL Maps, more usually call'd *Sea Charts*, are Projections of some Part of the Sea, in Plano; for the Use of Navigation. See MAP and NAVIGATION.

In these are laid down all the Rhumbs or Points of the Compass, the Meridians, Parallels, &c. with the Coasts, Capes, Islands, Rocks, Shoals, Shallows, &c. in their proper Places, Proportions, &c.

Christopher Columbus, the first great Discoverer of America, was a Man that earn'd his living by making and selling *Hydrographical Maps*. He happen'd to be Heir of the Memoirs or Journals of a noted Pilot, one *Alonso Sanchez de Huelva*, Captain of a Ship, who, by Chance, had been driven by a Storm to the Island of St. Domingo, and dy'd at *Columbus's* House soon after his Return. This gave *Columbus*

Indicus the first Hint to attempt a Discovery of the *West-Indies*, in which he succeeded.

For the Construction of the several Kinds of Hydrographical Maps; See CHART.

For their Uses; See SAILING.

HYDROGRAPHY, that Part of Geography which considers the *Sea*; principally, as it is navigable. See SEA and GEOGRAPHY.

Hydrography teaches how to describe, and measure the *Sea*; gives an Account of its Tides, Counter-tides, Currents, Soundings, Bays, Gulphs, &c. as also its Rocks, Shelves, Sands, Shallows, Promontories, Harbours, Distances, &c. from Port to Port, with all that is remarkable, either out at *Sea*, or on the Coast.

Some of the best Authors use the Term in a more extensive Sense; so as to denote the same with *Navigation*.

In this Sense *Hydrography* includes the Doctrine of Sailing; the Art of making Sea Charts, with the Uses thereof; and every thing necessary to be known, in order to the safe and most expeditious Performance of a Voyage. See NAVIGATION. See also SAILING, CHART, &c.

Hydrography is the most perfect of all the Mathematical Sciences; there being scarce any thing wanting to its Perfection, but the Discovery of the Longitude. See LONGITUDE.

The Jesuits *Riccius*, *Fournier*, and *De Chales*, are the principal Writers on the Subject of *Hydrography*.

In *France*, they have Professors of *Hydrography* establish'd in all their Sea Ports, who are to instruct the Youth intended for the *Sea*, in all the Parts of Navigation, Sailing, Steering, &c. with the several Branches of Mathematicks necessary thereto; as Arithmetick, the Doctrine of the Sphere, Trigonometry.

They are Royal Professors, and teach Gratis; having Salaries allow'd them by the King. They are also charg'd with the Examination of Pilots, &c.

The Word is compounded of the Greek, *Hydro*, *agua*, Water, and *grapho*, *scribo*, *describo*, I write, describe.

HYDROMANCY, **HYDROMANTIA**, the Act or Art of divining or foretelling future Events by means of Water. See DIVINATION.

Hydromancy is one of the four general Kinds of Divination; the other three, respecting the other Elements, *viz.* Fire, Air, and Earth, are denominated *Pyromancy*, *Aeromancy*, and *Geomancy*.

Varro mentions the *Pythians* as the first Inventors of *Hydromancy*; adding, that *Ninus Ponspilus* and *Pythagoras* made use thereof. See HYDATOSCOPY.

The Writers in Opticks, furnish us with divers *Hydromantic Machines*, Vessels, &c.

To Construct a Hydromantic Machine, by Means whereof an Image or Object shall be remov'd out of the Sight of the Spectator, and restor'd again at Pleasure; without altering the Position either of the one or the other.

Provide two Vessels ABF and CGLK (Tab. Hydraulicks, Fig. 31.) the uppermost fill'd with Water, and sustain'd by three little Pillars, one whereof, BC, is hollow, and furnish'd with a Cock B.

Let the lower Vessel CL be divided by a Partition HI, into two Parts; the lower whereof may be open'd or clos'd by means of the Cock P.

Upon the Partition place an Image, which the Spectator in O cannot see by a direct Ray GL.

If now the Cock B be open'd, the Water descending into the Cavity CI, the Ray GL will be refracted from the Perpendicular GR to O; so that the Spectator will now see the Image by the refracted Ray OG. — And again, shutting the Cock B, and opening the other P, the Water will descend into the lower Cavity HL; whence, the Refraction ceasing, no Rays will now come from the Object to the Eye. — But, shutting the Cock P again, and opening the other B, the Water will fill the Cavity again, and bring the Object in Sight of O afresh. See REFRACTION.

To make a Hydromantic Vessel, which shall exhibit the Images of external Objects, as if swimming in Water.

Provide a Cylindrical Vessel ABCD, (Tab. Hydraulicks, Fig. 32.) divided into two Cavities by a Glass EF, not perfectly polish'd: In G apply a Lens Convex on both Sides; and in H incline a plain Mirror of an Elliptic Figure under an Angle of 45°; and let JH and HG be something less than the Distance of the Focus of the Lens G; so that the Place of the Images of Objects radiating thro' the same, may fall within the Cavity of the upper Vessel. — Let the inner Cavity be blacken'd, and the upper fill'd with clear Water.

If now the Vessel be dispos'd in a dark Place, so as the Lens be turn'd toward an Object illumin'd by the Sun; its Image will be seen as swimming in the Water.

The Word is Greek, compos'd of *Hydro*, Water, and *μετρησις*, Divination.

HYDROMEL, a Drink made of Water and Honey; call'd by the Greeks *μελιζωμο*.

Hydromel is Honey diluted with a sufficient Quantity of Water, and fermented by a long and gentle Heat. See HONEY.

Under the Class of *Hydromels* come our Mead, and Metheglin. See MEAD and METHEGLIN.

Hydromel is either *Simple*, call'd also *aqueus*, where Honey and Water are the only Ingredients, which may be prepar'd at any Time; or *Compound*, when other Drugs are added, to improve and exalt the Flavour and Virtues.

'Tis particularly call'd *Vinous Hydromel*, when it equals the Strength of Wine; which it is brought to do, not only by the great Quantity of Honey us'd in it, but also by its long Coction, Infusion, &c. This is only made in the Heat of Summer.

Vinous Hydromel, (the same with what we otherwise call Mead, &c.) is made of Rain Water and the best Honey boil'd together, and skum'd from Time to Time till they become of a Consistence to sustain an Egg. This done, the Liqueur is expos'd to the Sun for 40 Days, to dispose it to ferment; then, adding some *Spanish Wine*, and keeping it two or three Months, it acquires a Flavour scarce inferior to Malmsey. — It fuddles readily; and the drunken Fit holds longer than that produc'd by Wines, by reason of its more viscid Consistence.

Hydromel is the common Drink of the *Poles* and *Russians*. *Diadorus Siculus*, lib. V. and *Aristotle*, relate, that the *Colchiberi* and *Tanlantii*, ancient People of *Illyria*, drank *Hydromel* instead of Wine.

The Word is compos'd of *Hydro*, Water, and *μελις*, *honey*, Honey.

HYDROMETER, an Instrument wherewith to measure the Gravity, Density, Velocity, Force, or other Property or Circumstance of Water. See WATER.

That wherewith the specific Gravity of Water is determin'd, is more usually call'd an *Aerometer* or *Water-poise*. See AEROMETER and WATER-POISE.

The Word is compounded of the Greek, *Hydro*, Water, and *μετρον*, Measure.

HYDROMETRIA, **HYDROMETRY**, the Mensuration of Waters, and other fluid Bodies, their Gravity, Force, Velocity, Quantity, &c. See WATER and FLUID.

Hydrometria includes both Hydraulicks and Hydraulicks. See HYDROSTATICKS and HYDRAULICKS.

The Term is modern, and very little in use. — The first Influx where we meet with it, is in the Year 1694, when a new Chair or Professorship of *Hydrometria* was founded in the University of *Beaugne*, in Favour of *S. Greshamini*, who had carry'd the Doctrine of Running Waters, with respect to Rivers, Canals, Dikes, Bridges, &c. to an unusual Length. See RIVER, WAVE, &c.

HYDROMPHALUS, in Medicine, a Tumor in the Navel, arising from a Collection of Water.

The *Hydromphalus* is distinguish'd from other Tumors of the Navel by its being very soft, and yet not tractable or obedient to the Touch, so as to diminish or enlarge by compressing it. When view'd, plac'd between the Eye and the Light, it is found transparent.

The *Hydromphalus* is diffus'd by emollient and resolutive Medicines. It is also also cur'd by a Puncture made in the Middle of the Navel.

The Word is form'd of the Greek, *Hydro*, Water, and *φωαλλος*, *umbilicus*, Navel.

HYDROMISTES, or **HYDROMYSTA**, a Name given to certain Officers in the Greek Church, whose Business was to make the holy Water, and sprinkle it on the People. See HOLY WATER.

The Word is compounded of *Hydro*, *agua*, Water, and *μυστα*, a Person set apart for the Offices of Religion.

HYDROPARASTATES, or **HYDROPARASTES**, a Sect of Heretics, the Followers of *Tatian*, call'd also *Encratites*, *Apotactites*, *Sacrophori*, *Severiani*, and *Aquarians*. See ENCRATITES and AQUARIANS, &c.

The *Hydroparastates* were a Branch of *Manichees*, whose distinguishing Tenet was, that Water should be us'd in the Eucharist instead of Wine.

The Word is form'd of the Greek, *Hydro*, Water, and *μεσενος*, I present, I offer.

HYDROPHOBIA, in Medicine, an Aversion or Dread of Water; a Symptom arising in Persons bitten by a mad Dog, or other Beast.

Tho' the Term *Hydrophobia* do, in Strictness, only denote this one Symptom; yet it is frequently apply'd to the whole Disease consequent on such Bite, with all its Symptoms.

The Word is Greek, compounded of *Hydro*, Water, and *φοβος*, *Terror*, Fear, of *αβυσσος*, *timor*, I fear.

The History of this horrible Disease, as given by *Calvus Aurelianus*, *Dr. Mead*, *Escheller*, *Lifter*, &c. is as follows:

† The

The Bite of a mad Dog is attended with this surprising Circumstance, that its Effects frequently do not discover themselves till after the Cause is forgot; the Wound itself closing and healing like any other common Wound. But, some time after, dreadful Symptoms ensue: Usually they commence in about forty Days; sometimes in six, sometimes not till six Months, and sometimes not till a Year, or even two. The first Thing observ'd, is a wandering Pain throughout the whole Body, but chiefly about the wounded Part: The Patient grows anxious and melancholy, and very prone to Anger; complaining of every Thing, as the ambient Air, the Heaviness of his Bed Cloaths, &c. He vomits; his Pulse intermits, and somewhat of a Tremor is observ'd, with Convulsions of the Nerves and Tendons: Along with these he feels an inward Heat and Thirst: At last the grand Symptom appears, which denominates the Disease, viz. the *Ague Pavor*, or Dread of Water, so that he cannot bear so much as the Sight of any Liquid, without the utmost Consternation; much less can he swallow the smallest Drop. This is the Pathognomic Sign of the Disease's being come to its Height; and never happens till two or three Days before the Patient's Death; the Disease being then, by the unanimous Consent both of ancient and modern Physicians, absolutely incurable.

With this there are other concomitant Symptoms. — He forms at the Mouth, his Eyes stare, he cannot swallow his Spitte without Pain, and his *Pennis* is constantly erected: Some bark and snarl like Dogs, and actually fancy themselves transform'd into those Creatures, and, in the Height of their Madness, are ready to fly upon and tear to Pieces the By-standers. — *Palmarius* observes, that the *Hydrophobus* Patient cannot bear to look in a Glass, or any transparent Body: And that he never recovers, unless he know himself in a Glass; this being a Sign that the Poison has not yet laid hold of the vital Parts.

It may be added, that the *Hydrophobia* is not only occasion'd by the Bite of a mad Dog, but also of other Brutes, as Cats, Foxes, Wolves, Horfes, Mules, Bullocks, and even Cocks, &c. or of a Man in the like Condition.

Nor is any Bite or Wound at all necessary; the Saliva of a mad Dog, &c. being apt to convey the Disease by mere Contact, or Application to the Skin. — Thus, we have an Instance in the *Philosophical Transactions*, of two Men catching the Disease by putting their Fingers in the Mouth of a Puppy that had been bit by its mad Dam, and feeling its Tongue and Throat: And the like Instance we have in the same Work, of two Children in *Ireland*, who, by touching and handling the Head of a Dog that had been bit by a mad Dog, and washing the Wound, cur'd the Dog, but caught the Disease themselves.

For the Nature and Cause of the *Hydrophobia*; — Dr. Mead, from several Histories of particular Cases, concludes, that the *Hydrophobia* is the Effect of a particular Kind of Inflammation of the Blood, accompany'd with so great a Tension and Dryness of the nervous Membranes, and such an Elasticity and Force of the Fluid with which they are fill'd, that the most common Representations are made to the Mind with too great Effect; so that the usual Impressions on the Organs cannot be suffer'd. — Hence that Timorosity, unaccountable Anxiety, and Disquietude, which are always the Forerunners of the *Dread of Liquids*; as also, the Pain often felt in making of Water, and the strange Aversions sometimes found in Patients at the Sight of any thing white, the Retina being hurt and griev'd by the lively Impressions of that Colour thereon. — Nor is it hard to conceive, that when the Saliva is hot, and the Throat inflam'd and dry, the Swallowing of Drink should cause such an intolerable Agony.

M. Zauvvy, from a nice Dissection and Examen of the Parts of a Person dead hereof, conjectures, that the Saliva and Bile are the Fluids first infect'd; and that the Patient vomiting a Mixture hereof, the Throat becomes excoriated thereby; and hence that Horror for all Foods, and particularly Water, in regard this dissolves those grievous Salts contain'd in the Saliva and Bile. He adds, That the Nature of the Poison is such, as dissolves the balsamic and nutritious Part of the Blood, whence the Veins are dry'd up, so as not to admit any Blood from the Arteries; and the Arterial Blood by this means sustaining the Action and Impression of its Vessels for so long a Time, is still further dissolv'd, attenuated, and spiritualiz'd, and thus sent, in too great Quantity, and with too great Rapidity, to the Brain; whence those Convulsions, Distractions, &c.

Dr. Lister, from the remarkable History of *J. Cotton*, whom he attended under this Disease, concludes, 2^o. That some of the organic Parts of his Body were actually transform'd into, or affected after the Nature of a Dog, especially the Gula, Tongue, &c. so that any Fluid offer'd him in the erect Posture of a Man, was frightful, as well as difficult to take, as much as it would be for us to get a Dog to drink

standing on his hind Legs. But this was not all; for when he was turn'd upon his Belly, and would have lick'd the Dog, he could not drink; tho' the Sight of the Liquor in that Posture gave him as much Pleasure, as in the other Posture it did Pain; and tho' he frequently put out his Tongue, and lapp'd, yet he could not endure to take any thing Liquid into his Mouth, as tho' something hinder'd him within. 2^o. That his Spitte was invertion'd; for as oft as he swallow'd it, his Stomach vehemently abhorring it, it went to his Heart, as he said, and was present Death to him: And so Liquid Things coming nearer to the Confidence of Spitte, might give him the greater Terror, as they tend to promote the Discharge of Saliva into his Mouth; and for the same Reason might be more difficult to swallow than solid Things.

As to the Cure of the *Hydrophobia*, Dr. Mead, after *Galen*, recommends it, in this as in other venomous Cases, to enlarge the Wound by a circular Incision, to apply a Caustery to it, and to keep it open for at least forty Days. But if this Method seem too cruel, it may suffice to extract the Poison by clapping a Cupping-glass on the Place, having first made a deep Scarification. The Doctor adds, he has known a Person fresh bitten, happily sav'd by the sole Application of the *Unguentum Aegyptiacum* exceedingly hot.

If these external Precautions have not been us'd, or not in Time, recourse must be had to internal Remedies: Alexipharmachicks must be drank; among which, the Ashes of River Lobsters, or Cray Fish, are principally extoll'd by all the ancient Physicians; so that *Galen* affirms, no Body had ever dy'd who used this Remedy. These Ashes to be taken to the Quantity of one or two Spoonfulls every Day for forty Days successively, either alone, or with Gentian Root and Frankincense in Wine.

But the frequent and sudden plunging of the Patient over Head and Ears in the Salt Sea Water, is the best and safest Preventative against this Disease.

Emulus recommends Cardiacks and Alexipharmachicks, but all in a double Dose, and long continu'd; and Garlic, Rue, and Salt to be beat together, and apply'd in form of a Cataplasm over the Wound. Purging with Hellebore and Mercurius Dulcis is also good; and Cantharides are a Sort of Specific. Scarifying is commended; and after the Scarification, an Onion roasted under the Ashes, to be apply'd. But the readiest Remedy, he adds, is burning the Place affected with a red hot Iron, which effectually removes all the Malignity. If the Physician be not call'd till late, a Cupping-glass is to be apply'd very hot: An Issue near the Place may likewise be of Service.

Sir *Theod. Mayerus* gives the following Prescriptions for the Bite of a mad Dog. Pluck the Feathers from the Breach of an old Cock, and apply it bare to the Bite: If the Dog were mad, the Cock will swell and die, and the Person bitten will do well: If the Cock dies not, the Dog was not mad. *Philosoph. Transact.* N^o. 191.

'Tis a common Notion, that a Hair of the same Dog apply'd on the Bite, attracts the Venom, and works a Cure: But a Physician of *Rosbeck*, in a formal Dissection some Years ago, prov'd this a popular Error; and that the Remedy was more like to do harm than good.

The Marks whereby to know that a Dog is mad, are, his neither eating nor drinking, fawning at the Mouth and Nostrils, looking sad and sullen, and running at any thing in his Way, whether Man or Beast, known or unknown, without barking. — *Baldus*, a famous Lawyer, dy'd of the *Hydrophobia* four Months after his being bit in the Lip by a little Dog. And the same is said of *Dingoes* the Cynic.

The Members of the Royal Academy of Sciences, furnish us with various Instances of Persons cur'd of the Disease by various Means. — M. *Ponspans* mentions a Woman perfectly recover'd by bleeding her to a Deliquium, binding her in a Chair for a Year, and feeding her all that Time with Bread and Water. — M. *Berger* relates, that several Persons bitten, two were cur'd by bleeding them in the Forehead. — M. *de Havel* adds, that he has known Salt Water apply'd on the Wound, effect a Cure. — Divers Cases are produc'd of those cur'd of the *Ague Pavor*, by being overwhelm'd with a great Quantity of Water; and one, by being only ty'd to a Tree, and 200 Pails of Water thrown on him. — But the best Instance is that of M. *Moris*. A Maid of twenty Years of Age having all the Symptoms, was bath'd in a Tub of River Water, wherein a Eufeth of Salt had been diffus'd. They plung'd her naked again and again, till harass'd almost to Death, they left her in it quite senseless. — When she came to herself, she was surpris'd to find herself looking at the Water without any Concern. *Histoire del Acad. An. 1709.*

HYDROPHORIA, in Antiquity, a Feast or Funeral Ceremony, held among the *Albanians* and People of *Aegina*, in Memory of those who perish'd in the Deluge. See DR. LUGA.

The Word is form'd of the *Greek*, *Hydro*, Water, and *phora*, I bear, or carry off.

HYDROPIC, a dropical Patient; or a Person swell'd and bloated with the Abundance of Water or Wind. See **Dropic**.

The Word is form'd of *Hydro*, Water, and *ops*, Facies, Face.

HYDROPS, in Medicine. See **Dropic**.
The Word is originally Greek, *Hydro*, of Water, and *ops*.

HYDROPS ad Matulas, a Term sometimes used for a **Diabetes**. See **DIABETES**.

HYDROPTOTES, in Medicine, are such as drink nothing but Water. See **Water**.

It has long been controverted among Physicians, whether or no the *Hydroptotes* live longer than other Persons. See **DRINK**.

The Word is Greek, *Hydro*, of Water, and *metes*, Meter, Drinker, of *metes*, *lolo*, I drink.

HYDROSCOPE, an Instrument anciently used for the measuring of Time. See **CHRONOMETER**.

The *Hydroscope* was a Kind of Water-clock; consisting of a cylindrical Tube, Conical at Bottom: The Cylinder was graduated, or mark'd out with Divisions, to which the Top of the Water becoming successively contiguous, as it trickled out of the Vertex of the Cone, pointed out the Hour.

Synepius describes the *Hydroscope* at large in one of his Letters. See **CLEPSYDRA**.

The Word is Greek, *Hydro*, of Water, and *skopeo*, I view, I consider.

HYDROSTATICAL Balance, a kind of Balance contriv'd for the easy and exact finding the Specific Gravities of Bodies both Liquid and Solid. See **SPECIFIC Gravity**.

The Instrument is of considerable Use in estimating the Degree of Purity of Bodies of all Kinds; the Quality and Richness of Metals, Ores, Minerals, &c. the Proportions in any Mixture, Adulteration, or the like: Of which, the Specific Weight is the only adequate Judge. See **WEIGHT**, **METAL**, **GOLD**, **MIXTURE**, &c.

The *Hydrostatical Balance* is founded on this Theorem of *Archimedes*, That a Body heavier than Water, weighs less in Water than in Air, by the Weight of as much Water as is equal to it in Bulk. — Whence, if we subtract the Weight of the Body in Water from its Weight in Air, the Difference gives the Weight of as much Water as is equal in Magnitude to the Solid propos'd.

Having, therefore, two Bodies, the one firm, the other fluid, together with the Weight of each apart; to find their Proportion, divide the greater by the lesser, the Quotient compar'd to one that is an Unite, will be the Antecedent of the Proportion desir'd.

The Instrument, with all its Apparatus, is represented Tab. **Hydrostatics**, Fig. 34. and needs little Description.

To use it, the Weights *E* are so adjusted, as to balance what is to be hung on the other End of the Beam; in which State the Instrument is ready for Application.

Now, to find the Specific Gravity of a Fluid. — Hang to the other End of the Beam the little Scale *E*, and to the Bottom of the Scale the Bubble *G*; then fill a Cylindrical Vessel *OP* about two Thirds with common Water; and when the Bubble is let into it, the Beam will remain in an horizontal Position, if the Water be of the same Specific Gravity as that in which the Bubble was adjust'd: If it be not, there will be a Variation; which is to be corrected by means of little Weights for that Purpose.

Having thus adjust'd the Bubble in that Water, the Specific Gravity of any other Fluid will be found by weighing the Bubble therein; and since you always weigh so much of the Liquid as is equal to the Bulk of the Bubble, if there be any Variation between such Quantities, and the like Quantity of Water, it will be discover'd by putting Weights into the ascending Scale.

2^o. To find the Specific Weight of a Solid. — Instead of the Bubble, hang on the Bucket *H*, *K*, and the Beam will be in Equilibrium: Put the Solid intended to be examin'd therein, and counter-poise it with Weights in the other Scale: This done, note the Weight, and disburthen the Scales of the Solid and its Counter-poise, and sink the Bucket into the Glass of Water. — Then, as the Bucket will lose as much of its Weight, as is the Weight of an equal Bulk of Water; add the Scale *R* upon the Part, which will bring all to an Equilibrium. — Lastly, Put the Solid into the Bucket, and counter-poise it again with Weights; and as it answers in its Proportion to Water, it may be judg'd either genuine or adulterate, by comparing it to a Standard of that Species of Bodies to which it is suppos'd to belong.

HYDROSTATICKS, the Doctrine of Gravitation in Fluids; or that Part of Mechanicks which considers the Weight or Gravity of fluid Bodies, particularly Water; and of solid Bodies immerg'd therein. See **GRAVITY** and **GRAVITATION**.

To *Hydrostatics* belong whatever relates to the Gravities and Equilibria of Liquors; with the Art of weighing Bodies in Water, in order to estimate their Specific Gravities. — Mr. *Boyle* has apply'd *Hydrostatics* to good Purpose, in exa-

mining and proving the Goodness and Purity of Metals, Minerals, and other Bodies, particularly Fluids, in an exact Treatise, entitled, *Medicina Hydrostatica*. See **HYDROSTATICAL Balance**.

The Word is Greek, compos'd of *Hydro*, Water, and *statikos*, Statics, of *statos*, stands, of *cratos*, *sta*, *stis*, I stand, I stop; *Hydrostatics*: being conceiv'd as the Doctrine of the Equilibrium of Liquors. See **EQUILIBRIUM** and **STATICS**.

The Laws of **HYDROSTATICKS**, with the Application thereof; see deliver'd at large under the Articles **FLUID** and **SPECIFIC Gravity**.

Hydrostatics are frequently confounded with *Hydraulicks*, by reason of the Affinity of the Subjects; and several Authors chuse to treat of the two promiscuously. See **HYDRAULICKS**.

The eldest Writer on *Hydrostatics* is *Archimedes*, who first deliver'd the Laws thereof in his Book *de insidensibus Tomodo. Marin. Giesadius* first brought his Doctrines to Experiment, in his *Archimedes practicus*: And from him Mr. *Onglynes* took the greatest Part of what he has given us on this Subject.

Mont. *Marrate*, in a French Treatise, publish'd at Paris in 1686, *Of the Motion of Water and other Fluids*, gives most of the Propositions of *Hydrostatics* and *Hydraulicks*, prov'd by Reason, and confirm'd by Experiments: Nor are Mr. *Boyle's Hydrostatical Experiments*, and *Medicina Hydrostatica*, to be overlook'd: The Jesuit *Fr. Tertius de Lanis*, in the Ill'd Tome of his *Algebra Nova & Artis*, lays down the Doctrines of *Hydrostatics* more amply than they are elsewhere found. *E. Lamy*, in the 2^d Part of his *Mechanicks*, entitled, *Traite de l'Equilibre des Liquours*, delivers the fundamental Laws of *Hydrostatics*, and *Hydraulicks*; and the like is done by *Dr. Wallis*, in his *Mechanica*. Lastly, Sir *J. Newton* gives some of the sublimer Matters in the 2^d Book of his *Philosoph. Nat. Princip. Mathematicas*.

HYDROTICKS, in Medicine, *Sudorifics*; or Remedies that promote Sweat. See **SUDORIFICKS**.

The Word is Greek, form'd of *Hydro*, of Water, and *tyctis*, I cure.

HYGIENA, that Branch of Medicine which considers Health; and discovers proper Means and Remedies, with their Use, in the Preservation and Recovery of that State. See **MEDICINE** and **HEALTH**.

The Objects of this Branch of Medicine are the Non-Naturals. See **NON-NATURALS**.

Hygiene may be divided into three Parts; *Prophylactice*, which foresees and prevents Diseases; *Syncretice*, employ'd in preserving Health; and *Analeptice*, whose Office is to cure Diseases, and restore Health. See **PROPHYLACTICE**, &c.

The Word is Greek, *Hygie*, of *Hygie*, found, healthy.

HYGROCROSOELE, in Medicine, a Branch of a Vein swell'd with ill Blood, or other Humours. See **VARRIX**.

The Word is compos'd of *Hygro*, humidus, and *crosoele*, or rather *crosoele*, *crasis*, *crosoele*.

HYGROMETER, a Machine or Instrument whereby to measure the Degrees of Dryness or Moisture of the Air. See **AIR**, **HUMIDITY**, &c.

The Word is compos'd of the Greek, *Hygro*, humidus, moist, and *metron*, *metron*, I measure. See **HYGROSCOPE**.

There are divers Kinds of *Hygrosopes*; for, whatever Body either swells or shrinks by Dryness or Moisture, is capable of being form'd into an *Hygrometer*. — Such are Woods of most Kinds, particularly Ash, Deal, Poplar, &c. Such also is a Cat-gut, the Beard of a wild Cat, &c. See **WOOD**, &c.

The best and most usual Contrivances for this Purpose, are as follow:

Construction of a HYGROSCOPE.

Stretch a hempen Cord, or a Fiddle-string, as *AB* (Tab. **Pneumatics**, Fig. 7.) along a Wall, bringing it over a Truckle or Pulley *B*; and to the other Extreme *D*, tie a Weight *E*; into which fit a Style or Index *FG*. — On the same Wall fit a Plate of Metal *HI*, divided into any Number of equal Parts: And the *Hygroscope* is compleat.

For it is Matter of undoubted Observation, that Moisture sensibly shortens the Length of Cords and Strings; and that, as the Moisture evaporates, they return to their former Length: And the like may be said of a Fiddle-string. — The Weight, therefore, in the present Case, upon an Increase of the Moisture of the Air, will ascend; and, upon a Diminution of the same, descend.

Hence, as the Index *FG* will show the Spaces of Ascend and Descend; and those Spaces are equal to the Increments and Decrements of the Length of the Cord or Gut *ABD*; the Instrument will discover, whether the Air be more or less humid now, than it was at another given Time.

Or thus:

If a more sensible and accurate *Hygroscope* be requir'd, stain a Whipcord or Fiddle-string over several Truckles or Pulleys *A, B, C, D, E, F*, and *G*, (Fig. 8.) and proceed with the rest as in the former Example. Nor does it matter whether the several Parts of the Cord *AB, BC, CD, DE,*

EF, and FG, be parallel to the Horizon, as express'd in the present Figure, or perpendicular to the former.

The Advantage of this, above the former *Hygrometer*, is, that we have a greater Length of Cord in the same Compass; the longer the Cord, the greater its Contraction and Dilatation.

Or thus :

Fasten a hempen Cord or Fiddle-string AB (Fig. 9.) to an Iron Hook, and let the other End, B, descend upon the Middle of a horizontal Board or Table EF. Near B hang a leaden Weight of a Pound, C, and fit an Index CG. Lastly, from the Center B describe a Circle; which divide into any Number of equal Parts.

Now, it is matter of Observation, that a Cord or Gut twirls itself as it moisten'd, and untwirls again as it dries. — Mr. *Molyneux*, Secretary of the *Dublin Society*, writes, that he could perceive this alternate Twisting and Untwisting in a Cord, by only breathing on it eight or ten times, and then applying a Candle toward it. Hence, upon an Increase or Decrease of the Humidity of the Air, the Index will shew the Quantity of Twisting or Untwisting; and, consequently, the Increment or Decrement of Humidity or Siccity.

Or thus :

Fasten one End of a Cord or Fiddle-string HI (Fig. 10.) to a Hook H; and to the other End fasten a Ball K, of a Pound Weight. Draw two concentric Circles on the Ball, and divide them into any Number of equal Parts. Fit a Style or Index NO into a proper Support N, so as the Extremity O may almost touch the Divisions of the Ball.

Here, the Cord or Gut twisting and untwisting, as in the former Case, will indicate the Change of Moisture, &c. by the successive Application of several Divisions of the Circles to the Index.

Or thus :

Provide two wooden Frames AB and CD, (Fig. 11.) with Grooves therein; and between those Grooves fit two thin Leaves of Ash AEFC, and GBDH, so as they may easily slide either Way. At the Extremes of the Frames A, B, C, D, confine the Leaves with Nails, leaving between them the Space EGHF, about an Inch wide. On I fasten a Slip of Brass dented, IK; and in L a little dented Wheel, upon whose Axis, on the other Side of the Machine, an Index is to be put. Lastly, from the Centre of the Axis, on the same Side, draw a Circle, and divide it into any Number of equal Parts.

Now, it being found by Experience, that Ashen Wood readily imbibes the Moisture of the Air, and swells therewith; and as that Moisture slackens, shrinks again; upon any Increase of the Moisture of the Air, the two Leaves AF and BH growing turpid, will approach nearer each other; And, again, as the Moisture abates, they will shrink, and again recede.—Hence, as the Distance of the Leaves can neither be increased nor diminish'd without turning the Wheel L, the Index will point out the Changes in respect of Humidity and Siccity.

Or thus :

It is to be noted, that all the *Hygrometers* above describ'd become sensibly less and less accurate; and, at length, undergo no sensible Alteration at all from the Humidity of the Air. The following one is much more lasting.

Take the *Mossescope*, describ'd under that Article, and, instead of the exhauited Ball E, (Fig. 12.) substitute a Sponge, or other Body, which easily imbibes Moisture. To prepare the Sponge, it may be necessary first to wash it in Water; and when dry again, in Water or Vinegar wherein Sal Ammoniac or Salt of Tartar has been dissolv'd, and let it dry again.

Now, if the Air become moist, the Sponge growing heavier, will preponderate; if dry, the Sponge will be hoisted up; and, consequently, the Index will shew the Increase or Decrease of Humidity of the Air.

In the last mention'd *Hygroscope*, Mr. *Gould*, in the *Philosophical Transactions*, instead of a Sponge, recommends Oil of Vitriol, which is found to grow insensibly lighter or heavier, in Proportion to the lesser or greater Quantity of Moisture it imbibes from the Air; so that being saturated in the moistest Weather, it afterwards retains or loses its acquir'd Weight, as the Air proves more or less moist. — The Alteration is so great, that in the Space of 57 Days, it has been known to change its Weight from three Drains to nine; and has shifted an Index or Tongue of a Balance 30 Degrees. — A single Grain, after its full Increase, has vary'd its Equilibrium so sensibly, that the Tongue of a Balance only an Inch and half long, describ'd in an Arch one Third of an Inch in Compass; which Arch would have been almost three Inches, if the Tongue had been one Foot, even with so small a Quantity of Liqueur; consequently, if more Liqueur expand'd under a large Surface were us'd, a Pair of Scales might afford as nice a *Hygroscope* as any yet invented. — The same Author suggests, that Oil of Sulphur per Campa-

nam, or Oil of Tartar per Deliquium, or the Liqueur of fix'd Nitre, might be substituted in lieu of the Oil of Vitriol.

This Balance may be contriv'd two Ways; by either having the Pin in the Middle of the Beam, with a slender Tongue a Foot and half long, pointing to the Divisions on an arched Plate; as represented in Fig. 12.

Or, the Scale with the Liqueur may be hung to the Point of the Beam near the Pin, and the other Extreme be made so long, as to describe a large Arch on a Board plac'd for the Purpose; as represented in Fig. 13.

From a Series of *Hygroskopical* Observations made with an Apparatus of Deal Wood, describ'd in the *Philosophical Transactions*, Mr. *Coviers* concludes; 1°. That the Wood shrinks most in Summer, and swells most in Winter; but is most liable to change at Spring and Fall. 2°. That this Motion happens chiefly in the Day-time; there being scarce any Variation in the Night. 3°. That there is a Motion even in dry Weather; the Wood swelling in the Forenoon, and shrinking in the Afternoon. 4°. The Wood, by Night as well as Day, usually shrinks when the Wind is in the North, North-East, and East, in Winter and Summer. 5°. By constant Observation of the Motion and Rest of the Wood, with the Help of a Thermometer, one may tell the Situation of the Wind without a Weather-cock. See WIND.

He adds, that the Time of the Year may be known by it; for in Spring it moves quicker, and more than in Winter; in Summer it is more shrunk than in Spring; and has less Motion in Autumn than in Summer. See SEASON, WEATHER, &c.

HYGROSCOPE, is commonly us'd in the same Sense with *Hygrometer*. See HYGROMETER.

Hylosis, however, regarding the Etymology of the Word, makes some Difference. According to him, the *Hygroscope* only shews the Alterations of the Air in respect of Humidity and Dryness; but the *Hygrometer* measures them. A *Hygroscope*, therefore, is a less accurate *Hygrometer*.

The Word is compounded of $\nu\gamma\lambda\omicron\varsigma$, moist, and $\sigma\kappa\omicron\pi\omicron\varsigma$, vision, *species*, I see, I consider.

HYLE, or HYLEC, among Alchymists, is their first Matter; or it is Matter consider'd as produc'd by Nature herself; call'd also *Chaos*. See MATTER, ALCHYMY, &c.

The Word is Greek, $\delta\alpha\lambda\alpha$, which signifies Matter.

HYLEG, or HYLEON, in Astrology, an Arabic Term for a Planet; which in a Man's Nativity becomes the Moderator and Significator of Life. See NATIVITY, SIGNIFICATOR, &c.

HYLEGAL Places, among Astrologers, are such, in which, when a Planet happens to be set, it may be said to be fit to have the Government of Life attributed thereto.

HYLOBII, or HYLONIANS, a Sect of Indian Philosophers, thus denominated by the Greeks, in regard they retir'd to Forests, to be more at Leisure for the Contemplation of Nature.

The Name is compounded of the Greek, $\delta\alpha\lambda\alpha$, which, beside MATTER, signifies also Wood, Forest; and $\alpha\epsilon\tau\epsilon\rho\varsigma$, Life.

HYMEN, in Poetry, a Term of Invocation.—*Hymen* or *Hymeneus*, is properly a fabulous Divinity, suppos'd by the Ancients to preside over Marriages; and who accordingly was invoc'd in Epithalamiums and other matrimonial Ceremonies, under this Formula, *Hymen* a *Hymenee*.

The Poets generally give this Deity a Chaperon of Roses; and represent him as it were dissolv'd and enervated with Pleasures; dress'd in a yellow Robe, and Shoes of the same Colour; with a Torch in his Hand.—*Callistus*, in one of his Epigrams, addresses him thus :

*Cinge tempora floribus,
Suaque oleatis Anarecci.*

It was for this Reason, that the new marry'd Couple bore Garlands of Flowers on the Wedding-Day: Which Custom also obtain'd among the Hebrews; and even among the Christians, during the first Ages of the Church, as appears from *Tertullian*, *de Corona Militaris*, where he says, *Coronatus est Nupte Sponsus*.—*S. Chryostom* likewise mentions these Crowns of Flowers; and to this Day the Greeks call Marriage *coronatus*, in respect of this Crown or Garland. See CROWN and GARLAND.

HYMEN, in Anatomy, is a thin Membrane or Skin, resembling a Piece of fine Parchment, suppos'd to be stretch'd in the Neck of the Womb of Virgins, below the Nymphae; and to be broke when they are deslower'd; an Effusion of Blood following the Breach. See DEFLORATION and VIRGIN.

The *Hymen* is generally look'd upon as the Test of Virginity; and when broke, or withdrawn, shews, that the Person is not in a State of Innocence.—This Notion is very ancient. Among the Hebrews, it was the Custom for the Parents to save the Blood shed on this Occasion, as a Token of the Virginity of their Daughter; and to send the Sheets, next Day, to the Husband's Relations. And the like is said to be still practis'd

practis'd in *Portugal*, and some other Countries. See VITAGINITY.

And yet Authors are not agreed as to the Existence of such *Hymens*. Nothing, Dr. *Drake* observes, has employ'd the Curiosity of Anatomists, in dissecting the Organs of Generation in Women, more than this Part: They differ not only as to its Figure, Substance, Place, Perforation, but even its Reality; some positively affirming, and others flatly denying it.

De *Graaf* himself, the most accurate Inquirer into the Structure of these Organs, confesses, he always sought it in vain, tho' in the most unselected Subjects and Ages: All he cou'd find, was a different Degree of Straightness or Wide-ness; and different Corrugations, which were greater or less according to the respective Ages; the Aperture being still the less, and the Rugosities the greater, as the Subject was younger, and more untaught.

Dr. *Drake*, on the other Hand, declares, that in all the Subjects he had had Opportunity to examine, he does not remember to have mis'd the *Hymen* so much as once, where he had reason to depend on finding it. The first View he ever had of it, was in a Maid who dy'd at 30 Years of Age: In this, he found it a Membrane of some Strength furnish'd with fleshy Fibres, in Figure round, and perforated in the Middle with a small Hole capable of admitting the End of a Woman's little Finger, situate a little above the Orifice of the urinary Passage, at the Entrance of the Vagina of the Womb.

In Infants, it is a fine thin Membrane, not very conspicuous, because of the natural Straightness of the Passage itself, which does not admit of any great Expansion in so little a Room; which might lead De *Graaf* into a Notion of its being no more than a Corrugation.

This Membrane, like most others, does probably grow more distinct, as well as firm, by Age. That it is sometimes very strong and impervious, may be collected from the History of a Case reported by Mr. *Coxeter*: In a marry'd Woman, 20 Years of Age, the *Hymen* was found altogether impervious, so as to detain the Menstrues, and to be driven out by the Pressure thereof, beyond the Labia of the Pudendum, not unlike a Prolapsus of the Uterus. On dividing it, at least a Gallon of grumous Blood came forth. It seems the Husband, being deny'd a Passage that Way, had found another thro' the Meatus Urinaris, which was found very open, and its Sides extruded like the Anus of a Cock. See MEATUS.

Upon a Rupture of the *Hymen*, its Parts shrinking up, are suppos'd to form those little fleshy Knobs, call'd *Carnuncula Myrtiformes*. See MYRTIFORMES *Carnunculae*.

HYMEN is also us'd by Botanists for a fine delicate Skin, wherewith Flowers are inclos'd while in the Bud, and which bursts as the Flower blows or opens. See BUD.

The *Hymen* is particularly us'd in speaking of Roses.

HYMN, a Song or Ode in Honour of God; or, a Poem proper to be sung, compos'd in Honour of some Deity. See SONG and ODE.

The *Hymns* or Odes of the Ancients generally consisted of three Stanzas or Couplets; the first call'd *Strophe*; the second, *Antistrophe*; and the last *Epele*. See STROPHE, ANTISTROPHE, and EPODE.

The Word is form'd of the Greek, *ἕωμαι*, *Hymen*, of the Verb *ἔωμαι*, *celebro*, I celebrate. — *Hyione*, on this Word, remarks, that *Hymen* is properly a Song of Joy, full of the Praises of God; by which, according to him, it is distinguish'd from *Threnon*, which is a mourning Song, full of Lamentation. See THRENA.

St. *Hilary*, Bishop of *Poitiers*, is said to have been the first that compos'd *Hymns* to be sung in Churches: He was follow'd by St. *Ambrose*. Most of those in the *Roman* Brevisary were compos'd by *Prudentius*. They have been translated into *French* Verse by the Messieurs de *Port Royal*. See PSALM.

The *Té Deum* is also commonly call'd a *Hymn*, tho' it be not in Verse; so is the *Gloria in excelsis*. See TE DEUM and GLORIA in excelsis.

In the Greek Liturgy, there are four Kinds of *Hymns*; but then the Word is not taken in the Sense of a Praise offer'd in Verse, but simply of Laud or Praise.—The Angelic *Hymn*, or *Gloria in excelsis*, makes the first Kind; the Trisagion the second; the Cherubic *Hymn* the third; and the *Hymn* of Victory and Triumph, call'd *ἕωμαι*, the last. See TRISAGION.

HYOIDES, in Anatomy.—The Os *Hyoides*, call'd also *Bicorne*, is a Bone situate at the Root of the Tongue, making, as it were, the Basis or Foundation thereof. See TONGUE.

It is thus call'd from its imperfect Resemblance of the Greek *ὑψος*; the Word being form'd of *ὑψομαι*, Form; for which Reason it is also call'd *Hypoloides* and *Hypoloides*.

It generally consists, in Adults, of three little Bones; and in Children of five or six. The middle Bone of the three, which is the thickest and broadest, is call'd the *Basis*, and the two Side Bones *Cornua* or *Horns*; whence also the Appellations *Bicorne* and *Ceratoides*.

The Basis of the *Hyoides* is about a Thumb's Breadth long on the outer Side, which is convex; the inner being concave. It is half a Finger broad, and has a small Prominence in the Middle. The *Cornua* are an Inch and half long, and broader at Bottom than at the Extremes, which are about two Inches asunder.

It has two cartilaginous Processes, call'd *Cornicula*, fasten'd about the Juncture of its *Cornua* with the Basis. They are ty'd to the Processus *Styloides* by long slender Ligaments; tho' sometimes between them and the *Styloides* there is found a small Muscle, beside the *Stylohyoideus*.

The Basis of this Bone lies, as it were, on the Head of the Larynx; and its Horns are fasten'd by Ligaments to the upper Processes of the Cartilago *Scutiformis*, and *Styloides*. See LARYNX, SCUTIFORMIS, &c.

It is mov'd by five Pair of Muscles, viz. the *Sternohyoideum*, the *Cornuohyoideus*, the *Mylohyoideum*, *Geniohyoideum*, and *Stylohyoideum*. See each under its proper Article *STERNOHYOIDEUM*, *CORNUOHYOIDES*, &c.

HYOTHYROIDES, in Anatomy, a Pair of Muscles of the Larynx. See LARYNX.

They rise from the anterior Part of the Os *Hyoides*, and are insert'd into the Cartilago *Thyroidea*.—They serve as Antagonists to the *Sternohyroides*; and lift up the *Thyroid Cartilage*.

The Word is compounded of *Hyoides* and *Zhyroides*. See THYROIDES, &c.

HYPALLAGE, or *Immutation*, a Grammatical Figure, whereby, of different Expressions which give the same Idea, we make Choice of that which is least us'd; or, when there is a mutual Permutation or Change of Cases, Moods, Regimens, &c. See FIGURE.

As, in this Instance, *Dare Classibus Austris*, instead of *Dare Classes Austris*.

The Word is Greek, *ὑπαλλαγή*, form'd of *ὑπαλλάττω*, I change; compos'd of *ὑπὸ* and *αλλάττω*, I change; of *αλλάω*, alter, another.

HYPAPANTE, or *HYPANTE*, a Name which the Greeks give to the Feast of the Purification of the Holy Virgin; or the Presentation of Jesus in the Temple. See PURIFICATION.

The Word literally expresses *meeting*; by reason of the Meeting of old *Simeon* and *Anna* the Prophets in the Temple, at the Time the Child Jesus was brought thither.

The Words *Hypante* and *Hypopante* are Greek, *ὑπᾶντι* and *ὑποπᾶντι*, which properly signify humble and lowly Meeting; being compounded of *ὑπὸ*, under, beneath, and *πᾶντι*, I meet, of *ἄντι*, contra, against.

HYPER, a Greek Word, us'd in the Composition of divers Terms deriv'd from that Language.

The Greek Preposition, *ὑπὲρ*, *hyper*, literally signifies above, beyond; and, in Composition, expresses some Excess, or something beyond the Signification of the simple Word it is join'd with.—Hence,

HYPERBATON, in Grammar and Rhetoric, a Transposition; or, a figurative Construction, inverting the natural and proper Order of the Terms of a Discourse. See TRANSPOSITION.

The *Hyperbaton*, *Longinus* observes, is no other than a Transposal of Sentiments or Words out of the natural Order and Method of Discourse; and always implies great Violence or Strength of Passion, which naturally hurries a Man out of himself, and distracts him variously.—*Terentianus* is most liberal in *Hyperbaton*.

Quintilian calls the *Hyperbaton*, *Verbi transgressio*.—It is of use to enliven and animate the Discourse: It is very proper to express a violent Passion, and represent an Agitation of Mind in the liveliest Manner.

The Word is deriv'd of the Greek, *ὑπερβαίνω*, *transgredior*, I go beyond; form'd of *ὑπὲρ*, ultra, beyond, and *βαίνω*, eo, I go.

HYPERBOLA, in Geometry, one of the Curve Lines, form'd by the Section of a Cone. See CONIC SECTION.

The *Hyperbola* arises when the Plane that cuts the Cone is not parallel to one of its Sides, as it is in the *Parabola*; but diverges from it outwards, not inward, as in the *Ellipsis*. See PARABOLA and ELLIPSIS.

Thus, if the Cone ABC (Tab. Conics, Fig. 27.) be so cut, as that the Axis of the Section DQ continu'd, concur with the Side of the Cone AC, continu'd to E; the Curve arising from this Section is a *Hyperbola*. See CONE.

Some Authors define the *Hyperbola* to be a Section of the Cone, by a Plane parallel to its Axis. But this Definition is faulty: For tho' it be true that such a Section really describes a *Hyperbola*; yet it is likewise true, that a thousand others may be describ'd where the Plane is not parallel to the Axis, and which of Consequence are not included in the Definition.

Authors sometimes call the Plane terminated by this Curve, by *Hyperbola*; and in respect hereof, call the Curve itself the *Hyperbolic Line*.

A *Hyperbola* may be describ'd, with respect to its Properties, to be a Curve Line, wherein the Square of the Semi-ordinate is to the Rectangle of the Abscissas into a right Line compounded

pounded of the same Abfciss, and a given right Line call'd the Transverse Axis, as another given right Line, call'd the Parameter of the Axis, is to the Transverse Axis: Or, it is a Curve Line, wherein $ay^2 = abx + bxx$, that is, $bix = y^2 : ax + x^2$.

In the *Hyperbola*, a mean Proportional between the transverse Axis and Parameter, is call'd the *Conjugate Axis*: And if the Transverse Axis AB (Tab. Conicks, Fig. 27.) be join'd directly to the Axis AX, and be bisected in C; the Point C is call'd the *Centre of the Hyperbola*. See Axis and CENTRE.

If a right Line DE pass thro' the Vertex A, (Fig. 20.) parallel to the Ordinates MM, it is a *Tangent to the Hyperbola* in A. See TANGENT.

If a right Line DE be drawn thro' the Vertex A of an *Hyperbola*, parallel to the Ordinates MM, and be equal to the Conjugate Axis, viz. the Lines DA and AE equal to the Semi-axis; and right Lines CF and CG be drawn from the Centre C thro' D and E; those Lines are call'd *Asymptotes of the Hyperbola*. See ASYMPTOTES.

The Square of the right Line CI or AI, is call'd the *Power of the Hyperbola*. See POWER.

Properties of the HYPERBOLA,

In the *Hyperbola*, the Squares of the Semi-ordinates are to each other, as Rectangles of the Abfciss into a certain right Line compos'd of the Abfciss and Transverse Axis. — Hence, as the Abfcisses x increase, the Rectangles $ax + x^2$, and, consequently, the Squares of the Semi-ordinates y^2 , and therefore the Semi-ordinates themselves, increase. The *Hyperbola*, therefore, continually recedes from its Axis.

2°. The Square of the Conjugate Axis, is to the Square of the Transverse, as the Parameter, to the Transverse Axis. — And hence, since $bix : PM^2 :: AP : PB$, the Square of the Conjugate Axis, is to the Square of the Transverse; as the Square of the Semi-ordinate is to the Rectangle of the Abfciss into a Line compos'd of the Abfciss and Transverse Axis.

3°. To describe an *Hyperbola*, in a continu'd Motion; the Transverse Axis, and the Distance from the Vertex being given. In the two Foci F and f, (Fig. 28.) fix two Nails or Pins; and to one of them, in F, tie a Thread FMC, fastening the other End C to the Ruler Cf, which exceeds the same by the Transverse Axis AB. The other End of the Ruler being perforated, put it on the Pin f, and fixing a Style to the Thread, move the Ruler. Thus will the Style trace out an *Hyperbola*.

Again, with the same Data, any Number of Points in an *Hyperbola* are easily found, which may be connect'd into an *Hyperbola*. Thus, from the Focus f, with any Interval greater than AB, describe an Arch am , and making $fb = AB$; with the remaining Interval bm , from the Point P, draw another Arch intersecting the former in m : For, as $fm - Pm = AB$; m is a Point in the *Hyperbola*. And so of the rest.

4°. If in an *Hyperbola*, the Semi-ordinate PM, Fig. 20. be produc'd till it meet the Asymptote in R; the Difference of the Squares of PM and PR is equal to the Square of the Conjugate Semi-axis DA. — Hence, as the Semi-ordinate PM increases, the right Line PR decreases, and consequently MR; and therefore the *Hyperbola* itself approaches nearer to the Asymptote; but it can never absolutely meet it, because, as $PR^2 - PM^2 = DA^2$; it is impossible $PR^2 - PM^2 = PM^2$ should ever become = 0.

5°. In an *Hyperbola*, the Rectangle of MR and Mr, is equal to the Difference of the Squares PR² and PM². — And hence, the same Rectangle is equal to the Square of the Conjugate Semi-axis DA; and consequently all Rectangles form'd in the same Manner are equal.

6°. If qm be parallel to the Asymptote CF, the Rectangle of qm into Cq is equal to the Power of the *Hyperbola*. — And hence, 1°. If we make $CI = AI = a$, $Cq = x$, and $qm = y$, we shall have $a^2 = xy$; which is the Equation expressing the Nature of the *Hyperbola* within its Asymptotes. 2°. The Asymptotes therefore being given in Position, and the Side of the Power of CI or AI; if in one of the Asymptotes CG, you take any Number of Abfcisses; so many Semi-ordinates will be found, and by them any Number of Points in an *Hyperbola* will be determin'd by finding third Proportionals to the Abfciss, and the Side of the Power CI. — 3°. If the Abfcisses be not computed from the Centre C, but from some other Point L; and CL be suppos'd = b ; we shall have $Cq = b + x$; and consequently $a^2 = by + xy$.

7°. In the *Hyperbola*, as the Transverse Axis is to the Parameter; so is the Aggregate of the Transverse Semi-axis and Abfciss, to the Subnormal: And as the Aggregate of the Transverse Semi-axis and Abfciss is to the Abfciss; so is the Aggregate of the entire Transverse Axis and Abfciss to the Subtangent. See SUBNORMAL and SUBTANGENT.

8°. If within the Asymptotes of an *Hyperbola*, from a Point thereof, m , (Fig. 29.) be drawn two right Lines Hm and mK , and other two LN and NO, parallel to the same; $Hm, mK = LN, NO$. And the same will hold, if you draw LN parallel to the right Line thus drawn HmK , viz. in this Case likewise $Hm, mK = LN, NO$. — Consequently, all Rectangles form'd after this Manner of right Lines drawn parallel either to the same Line HK, or to two, Hm and mK , are equal to each other.

9°. If a right Line HK, be drawn in any Manner between the Asymptotes of an *Hyperbola*; the Segments HE and mK intercepted on each Side between the *Hyperbola* and Asymptotes are equal. — And hence, if $Em = 0$; the right Line HK is a Tangent to the *Hyperbola*: Consequently, the Tangent FD intercepted between the Asymptotes, is bisected in the Point of Contact V. Lastly, the Rectangle of the Segments Hm and mK , parallel to the Tangent FD, is equal to the Square of half the Tangent DV.

10°. The Square of the Semi-ordinate in an *Hyperbola*, is to the Rectangle of the Abfciss, and Aggregate of the Transverse Diameter AB, (Fig. 30.) and Abfciss AP, as the Square of the Conjugate Semi-diameter AD, is to the Square of the Transverse Semi-diameter CA. — Hence, if you suppose APx , and $2x^2 = AB = a$, you will have $y^2 = ax + x^2$; consequently $y^2 = (c^2ax + c^2x^2) : a = \frac{4c^2x}{a} + \frac{4c^2x^2}{a^2}$. Make $4c^2 : a = b$; then will $y^2 = bx + b^2x^2 : a$. So that the same Equation defines the Nature of the *Hyperbola* in respect of its Diameter, as expresses it in respect of its Axis; and the Parameter is a third Proportional to the Conjugate Diameters DE and AB.

11°. If from the Vertex A, and any Point of a Parabola N, you draw AF and TN parallel to the Asymptote CR; the Rectangle of TN into TC, will be equal to the Rectangle of FA into FC. — Hence, if $TC = x$, $TN = y$; the Equation expressing the Nature of a *Hyperbola* within Asymptotes, in respect of its Diameter, will be $xy = ax + b$.

12°. An Asymptote being taken for a Diameter; divided into equal Parts, and thro' all the Divisions, which form to many Abfcisses continually increasing equally, Ordinates to the Curve being drawn, parallel to the other Asymptote; the Abfcisses will represent an infinite Series of natural Numbers; and the corresponding *Hyperbolic* or *Asymptotic* Spaces, will represent the Series of Logarithms of the same Numbers. See LOGARITHM and LOGARITHMIC CURVE.

Hence, different *Hyperbolas* will furnish different Series of Logarithms to the same Series of natural Numbers; so that to determine any particular Series of Logarithms, choice must be made of some particular *Hyperbola*. — Now, the most simple of all the *Hyperbolas* is the Equilateral one; i. e. whose Asymptotes make a right Angle between them. This, M. de L'Hôpital alleges in Favour of the Binary Arithmetic, as being the Result of such Equilateral *Hyperbola*. See BINARY ARITHMETIC.

For the Locus of an *HYPERBOLA*. See LOCUS.
For the Quadrature of an *HYPERBOLA*. See QUADRATURE.

Equilateral HYPERBOLA, is that wherein the Conjugate Axis AB (Fig. 20.) and DE are equal.

Properties of the Equilateral HYPERBOLA.

Since the Parameter is a third Proportional to the Conjugate Axis, it is also equal to the Axis.

Wherefore, if in the Equation $y^2 = bx + b^2x^2 : a$, you suppose $b = a$; the Equation $y^2 = ax + x^2$ will express the Nature of the Equilateral *Hyperbola*.

And hence, the Squares of the Ordinates y^2 and ax , are to each other as $ax + x^2$ and $ax + x^2$: That is, as the Rectangles of the Abfcisses into right Lines compos'd of the Abfciss and Parameter.

If you suppose $CP = x$, $CA = r$, and $AP = x - r$, and $PB = r + x$. Consequently $y^2 = x^2 - x^2$.

And since $AE = CA$; the Angle ACE will be half right; and consequently the Angle of the Asymptotes FCG a right Angle.

Infinite HYPERBOLA's, or *HYPERBOLA*'s of the higher Kinds, are thus defin'd by the Equation $ay^2 + b^2 = bx^2$, $(a + x)^2$. See HYPERBOLOIDES.

Hence, in infinite *Hyperbolas*'s $ay^2 + b^2 = bx^2$, $(a + x)^2 = b^2$, $(a + x)^2$: That is, $y^2 + b^2 = x^2 + ax^2$, $(a + x)^2 : a^2 (a + x)^2$.

As the *Hyperbola* of the first Kind or Order has two Asymptotes, that of the second Kind or Order has three, that of the third, four, &c. See ASYMPTOTES, CURVE, &c.

In respect of these, the *Hyperbola* of the first Kind, is call'd the *Apollonian* or *Conical Hyperbola*.

Apollonian HYPERBOLA is the common *Hyperbola*, or the *Hyperbola* of the first Kind: Thus call'd in Contradistinction to the *Hyperbola*'s of the higher Kinds.

HYPERBOLE, in Rhetoric, a Figure, whereby the Truth and Reality of Things is excessively either enlarg'd or diminish'd.

As, He ran swifter than the Wind; He went slower than a Tortoise, &c.

The Character of an *Hyperbole* is to exaggerate or extenuate the Idea of the Thing spoke of, beyond the Bounds of Truth, or even of Probability.

Hyperbole's, says *Seneca*, lye without deceiving; they lead the Mind to Truths by Fictions, they convey the Sentiment intended, by expressing it in Terms which render it incredible. — The *Hyperbole* promises too much, to make you conceive enough.

Aristotle observes, that *Hyperbole's* are the favourite Figures of young Authors, who love Excess and Exaggeration; so that Philosophers should not use them without a great deal of Reserve.

The Pitch to which an *Hyperbole* may be carry'd, is a Point of great Delicacy: To carry it too far, is to destroy it: It is of the Nature of a Bow-string, which, by immoderate Tension, slackens; and frequently has an Effect quite contrary to that intended. *Longinus*.

These *Hyperbole's* are best, which are latent, and are not taken for *Hyperbole's*. For this Reason, they should scarce ever be us'd but in a Passion, and in the Middle of some important Incident: Such is the *Hyperbole* of *Herodotus*, speaking of the *Lacedaemonians*, who fought at *Thermopylae*. "They defended themselves, for some time, with the Arms that were left them, and at last with their Hands and Teeth; till the Barbarians, continually shooting, buried them, as it were, with their Arrows." Now, what Likelihood is there that naked Men should defend themselves with their Hands and Teeth against armed Men; and that so many Persons should be buried under their Enemies Arrows? Yet does there appear some Probability in the Thing, by reason it is not sought for the Sake of the Figure; but the *Hyperbole* seems to arise out of the Subject itself. *Id.*

Of the like Kind is that Passage of a Comic Poet mention'd by *Longinus*: He had Lands in the Country no larger than a *Lacedaemonian* Epistle. See *LACONIC*.

There are certain Manners of tempering the Harshness of *Hyperbole's*, and giving them an Air of Probability. *Virgil* says, That to see the Fleets of *Anthony* and *Agrippa* at the Battel of *Actium*, one would have taken them for the *Cyclopes* floating on the Water: And *Florus* speaking of the Expedition wherewith the *Romans* built a Number of Vessels in the first *Punic* War, says, It seem'd, not that the Ships were built by Workmen, but that the Trees were transform'd into Ships by the Gods. They do not say that the Ships were floating Islands; nor that the Trees were metamorphos'd into Ships; but only that one might have taken them to be so. This Precaution serves as a Kind of Passport to the *Hyperbole*, if we may be allow'd the Phrase, and makes it go down even in Prose: For what is excus'd before 'tis said, is always heard favourably, how incredible forever it be. *Bonhours*.

The Word is Greek, ὑπερβολή, *superlatio*, form'd of the Verb ὑπερβαίνω, *exsuperare*, to exceed, surpass by far.

HYPERBOLIC, something relating either to an *Hyperbole*, or an *Hyperbola*. See *HYPERBOLA* and *HYPERBOLIC*.

Thus we say, an *Hyperbolic* Expression; an *Hyperbolic* Image, &c.

HYPERBOLIC Line is us'd by some Authors for what we call the *Hyperbola* itself.

In their Sense, the plane Surface terminated by the Curve Line, is call'd the *Hyperbola*; and the Curve Line that terminates it, the *Hyperbolic Line*.

HYPERBOLIC Log of a Curve, is that which approaches infinitely near to some Asymptote.

Sir J. Newton reduces all Curves, both of the first and of the higher Kinds, into those with *Hyperbolic Legs*, and those with Parabolic ones. See *CURVE*.

HYPERBOLIC Conoid. See *CONOID*.

HYPERBOLIC Solid. See *CURVATURE*.

HYPERBOLIC Mirror. See *MIRROR*.

HYPERBOLICAL Cylinder, is a solid Figure, whose Generation is given by *Sir Christopher Wren*, in the *Philosophical Transactions*.

Two opposite *Hyperbola's* being join'd by the Transverse Axis, and thro' the Centre a right Line being drawn at right Angles to that Axis; and about that, as an Axis, the *Hyperbola's* being suppos'd to revolve; by such Revolution, a Body will be generated, which is call'd the *Hyperbolic Cylinder*, whose Bases and all Sections parallel to them will be Circles. In a subsequent *Transaction*, the same Author applies the new Figure to the grinding of *Hyperbolic Glasses*; affirming, that they must be form'd this Way, or not at all. See *MIRROR*.

HYPERBOLIFORM Figures, are such Curves as approach, in their Properties, to the Nature of the *Hyperbola*; call'd also *Hyperboloids*.

HYPERBOLOIDES, are *Hyperbola's* of the highest Kind, wherin $ax > 1$ and $ay > 1$. e.g. $ay^2 = bx^2 (a+x)$.

HYPERBOREAN, in the ancient Geography. — The Ancients deominated those People and Places *Hyperborean*, which were to the Northward of the *Scythians*. They had but very little Acquaintance with these *Hyperborean* Regions; and all they tell us of them is very precarious, much of it false.

Diodorus Siculus says, the *Hyperboreans* were thus call'd by reason they dwell beyond the Wind *Boreas*; *amis* signifying above or beyond, and *boros*, *Boreas*, the North Wind. This Etymology is very natural and plausible; notwithstanding all that *Rudbecks* has said against it, who would have the Word to be originally *Gothic*, and to signify Nobility. See *BORRAS*.

Herodotus doubts, whether or no there were any such Thing as *Hyperborean* Nations. *Strabo*, who professes that he believes there are, does not take *Hyperborean* to signify beyond *Boreas* or the North, as *Herodotus* understood it: The Preposition *amis*, in this Case, he supposes only to help form a Superlative; so that *Hyperborean*, on his Principle, means no more than *most Northern*: So that it appears the Ancients scarce knew themselves what the Name meant.

HYPERCATALECTIC, in the Greek and Latin Poetry, is apply'd to Verses which have one or two Syllables too much; or beyond the Measure of regular Verse. See *VERSE*.

The Greek and Latin Verses are distinguish'd, with respect to their Measure, into four Kinds: Catalectic Verses, where nothing is wanting at the End; Catalectic, which want a Syllable at the End; Brachycatalectic, which want a whole Foot at the End; and, lastly, *Hypercatalectic*, which have one or two Syllables too many. — These last are also call'd *Hypermetres*. See *CATALECTIC*, *CATALECTIC*, &c.

The Word is Greek, compos'd of *amis*, over, beyond; and *κατάληξις*, I put to the Number, I add; so that *Hypercatalectic* denotes as much as *super-added*.

HYPERCATHARSIS, in Medicine, *Super-purgation*; a too violent and excessive Purgation. See *PURGE*, *PURGATION*, and *PERGATIVE*.

The Word is compounded of the Greek, *υπερ*, *supra*, and *καθάρσις*, I purge.

HYPERCRISIS, in Medicine, an immoderate critical Excretion. See *CRISIS*.

Thus, when a Fever terminates in a Looseness, the Humours sometimes flow off faster than the Strength can bear, and are therefore to be check'd. — This is a *Hypercrisis*.

The Word is compounded of *υπερ*, *supra*, and *κρίσις*, *Crisis*, Judgment.

HYPERCRITIC, an over-rigid Censor, or Critic; one who will let nothing pass, but animadvert severely on the slightest Fault. See *CRITICISM*.

The Word is compounded of *amis*, *super*, above, beyond, and *κρίσις*, *Judex*, *Judex*, of *κρίνω*, *Judico*, I judge.

HYPERDULIA, in the *Romish* Theology, is the Worship render'd to the Holy Virgin. See *VIRGIN*.

The Worship offer'd to Saints is call'd *Dulia*; and that to the Mother of God, *Hyperdulia*; as being superior to the former. See *WORSHIP*.

The Word is Greek, *ὑπερδουλίαν*, compos'd of *amis*, above, and *δουλίαν*, *Worship*, *Service*.

HYPERMETER, in the ancient Poetry, the same with *Hypercatalectic*. See *HYPERCATALECTIC*.

The Word is compos'd of *υπερ*, *super*, and *μετρον*, *Measure*.

HYPERTHYRON, in the ancient Architecture, a Sort of Table, us'd after the manner of a Frieze, over the Jambs of Doric Doors and Gates, and the Lintels of Windows. It lies immediately under the Corona; and is by our Workmen usually call'd the *King-piece*. See *DOOR*, *WINDOW*, &c.

The Word is form'd of *amis*, *super*, over, and *θυρον*, *Janus*, Gate.

HYPERSARCOSIS, in Medicine and Chirurgery, an Excess of Flesh; or rather, a fleshy Excellence, such as those generally arising on the Lips of Wounds, &c. See *EXCRESCENCE*, *WOUND*, *FUNGUS*, &c.

HYPETHROS, *HYPETHRON*, *HYETHRAL*, *HYETHROS*, in the ancient Architecture, a Kind of Temple, open at the top, and thereby expos'd to the Air. See *TEMPLE*.

The *Hypethron*, according to *Vitruvius*, is any open Building or Portico, such as anciently were certain Temples that had no Roof or Covering. — Of this we have an Instance in the Temple of *Jupiter Olympicus*, built by *Cassius*, a Roman Architect, at *Albent*.

Of *Hypethros*, some were Decastyle, others Picnostyle. But they had all Rows of Columns within-side, forming a kind of Peristyle; which was essential to this Sort of Temple. See *PERISTYLE*.

The Word is form'd of *υπερ*, *sub*, under, and *ἕδος*, *Air*.

HYPHEN, an Accent or Character in Grammar, which implies, that two Words are to be join'd or connected into one Compound Word. — As, Male-Sanus, Male-Administration. See ACCENT, CHARACTER, &c.

HYPNOTICK, in Medicine, a Remedy which promotes or induces Sleep; call'd also *Soporific*, *Opiate*, &c. See SOPORIFIC, OPIATES, &c.

The Word comes from the Greek *υπνω*, *semitis*, Sleep. **HYPO**, a Greek Particle, retain'd in the Composition of divers Words borrow'd from that Language.

The Greek Preposition *υπο*, *Hypo*, literally denotes *under*, *beneath*: In which Sense it stands oppos'd to *επι*, *super*, above.

HYPOBOLE, in Rhetoric, a Figure whereby we answer before-hand, to what we apprehend the Adversary will object.

The Word comes from the Greek, *υπο*, and *βολη*, *facio*, I eat.

HYPOCATHARSIS, in Medicine, a too faint or feeble Purgation. See PURGATION.

The Word is compounded of *υπο*, *sub*, under, and *καθαρσις*, I purge.

HYPOCAUSTUM, among the Greeks and Romans, was a subterraneous Place, wherein was a Furnace that serv'd to heat the Baths. — *Vitruvius* calls it *Calidarium*. See BATH, &c.

The Ancients had properly two Sorts of *Hypocaustia*; the one call'd by *Cicero* *Vaporarium*, and by others *Laconicum* or *Sudatio*; which was a large sweating Bath, in which were three brazen Vessels, call'd *Calidarium*, *Tepidarium*, and *Frigidarium*, according to the Water contain'd therein.

The other Sort of *Hypocaustum*, was a Sort of Furnace or Kiln to heat their Winter Parlours, *Caminumculae Hydrumae*.

The latter *Hypocaustum* was call'd *Avenus* and *Furnax*; and the Man that tended the Fire *Furnicator*.

The *Hypocaustum* among the Moderns, is that Part or Place where the Fire is kept that warms a Stove or Hot-house. See STOVE.

The Word is Greek, *υποκαυστω*, form'd of the Preposition *υπο*, *sub*, under, and the Verb *καω*, *incendo*, I burn.

HYPOCHYMA, or **HYPOCHYSIS**, in Medicine, a Disease of the Eyes, popularly call'd *Cataracti*. See CATARACT.

The Word is Greek, *υποχυμα*, which literally denotes shedding, Effusion, or pouring out; the Disease having formerly been suppos'd to arise from an Effusion of some viscid Humour upon the Pupil.

HYPOCHYSIS, in Medicine. See HYPOCHYMA.

HYPOCISTIS, in Medicine, a Juice, us'd in the Composition of Treacle, &c. See TREACLE, &c.

The *Hypocistis* is the Juice, of a Shoot of the same Name, sprouting out from the Foot of a kind of Citrus Tree, call'd *Laudanum*; common enough in the hot Countreys. See LAUDANUM.

The Shoot grows about a Foot high; and one, two, or three Inches thick; somewhat bigger at Top than at Bottom; soft, succulent, of a yellowish Colour, and surrounded from Space to Space with a Sort of Rings, or brownish Knots.

When gather'd, they pound it in a Mortar, and express the Juice: That done, they evaporate it on the Fire till it come to the Consistence of a hard blackish Extract, like *Spanish Liquorice*. Then they make it up into little Cakes for Carriage.

It is of a tart astringent Taste, and us'd to stop Fluxes of the Belly, Vomiting, and Hemorrhages; tho' anciently much more than at present. It is also an Ingredient in Treacle, and some Unguents.

It is sometimes us'd as a Substitute to ACACIA. — Dr. *Quincy* says, it is the more powerful of the two. See ACACIA.

The Word is Greek, form'd of *υπο*, *under*, and *κυστις*, *Cistis*.

HYPOCONDRIA, or **HYPOCONDRIA**, in Anatomy, a Space on each Side the Epigastric Region, or upper Part of the lower Belly. See ABDOMEN and EPIGASTRIC.

The *Hypochondria* compose the upper Part of the Epigastricum. They are situate on each Side, between the Cartilago Eosiformis, and the Cartilages of the Ribs, and the Tip of the Breast; and are divided, with respect to their Situation, into *Right* and *Left*.

In the *Right Hypochondrium* the Liver is found; and in the *Left* the Spleen, and a great Part of the Stomach. See LIVER, SPLEEN, &c.

Hypocrates sometimes uses the Word *Hypochondrium* for the whole lower Venter or Belly. See VENTER.

The *Hypochondria* are subject to divers Disorders. See HYPOCHONDRIAC DISEASE.

The Word is compos'd of the Preposition *υπο*, *sub*, under, and *κυστις*, *Cartilago*; *a. d. Cartilagini Subjacentis*, or under the Cartilages of the Ribs, &c. See CARTILAGE.

HYPOCHONDRIAC Disease, *Affection*, or *Passion*, is the same with what we popularly call the *Spleen*, *Vapours*, &c. See DISEASE.

The *Hypochondria* is a very comprehensive Disease: It is

variously denominat'd, according to the various Symptoms it is attend'd with, and the various Parts where it is suppos'd to be seated, or in which it arises.

When conceiv'd as situate in the *Hypochondriac Regions*, or arising from some Disorder of the *Parts* contain'd therein, viz. the Spleen, Liver, &c. it is properly call'd the *Hypochondriac Disease*, *Spleen*, &c.

When conceiv'd as owing to some Disorder of the Womb, it is call'd *Hysteric Affection*, &c. See HYSERIC.

And lastly, when the stultic Rumbblings in the Intestines, Belches, &c. are consider'd, it is call'd the *Vapours*. See VAPOURS.

The *Hypochondriac* is a very common and obstinate Disease: Few Men of a sedentary Life, and fewer Women, are free from it: Its Symptoms are very numerous; The most usual, are a Pain in the Stomach, Windiness, Vomiting, a Swelling or Distension of the *Hypochondriac* or upper Part of the Belly, Noises and Rumbblings in the lower Venter, wandering Pains, a Constriction of the Breast, Difficulty of Breathing, Palpitation of the Heart, Faintings, Vigils, Inquietudes, Swimming of the Head, Fear, Suspensions, Melancholy, Deliriums, &c. Not that all these Accidents befall every Person seiz'd with this Disease; but sometimes some of them, and at other Times others, according to the Constitution, &c. of the Patient.

In effect, the *Hypochondriac* is a very vague, indeterminate Sort of Disorder. Dr. *Sydenham* observes, that its Symptoms are or emulate those of most other Diseases; and that whatever Part it is in, it produces somewhat like the common Diseases of that Part. — Thus, in the Head, it produces a Sort of Apoplexy; Fits like the Epilepsy, call'd *Hysteric Fits*; insupportable Head-ach, &c. In Persons affect'd with the Cholera, it produces a Palpitation of the Heart; sometimes, tho' rarely, it seizes the Lungs, and causes a continual dry Cough; It also inflames the Cholice, and Iliac Passion, and sometimes the Stone, Jaundice, &c. In the Intestines it produces a Diarrhea; in the Stomach, Nauseas: Sometimes it seizes the external Parts, and particularly the Back, which it renders chilly and painful; and the Legs and Thighs, which it swells so as to resemble the Dropsy; Seizing the Teeth, it resembles the Scurvy (indeed, *Er-muller* makes the Scurvy itself to be only a great Degree of this Disease). Lastly, which is the most unhappy Circumstance of all, the Patient is more affect'd in Mind than in Body.

The Seat of this Disease is commonly suppos'd to be in the Animal Spirits, and the nervous System. Its Cause is refer'd to an acid Salt abounding in the Mass of Blood; to which the ill Disposition of the Stomach, and the other Parts contain'd in the Epigastricum, may greatly contribute. *Paracelsus* assigns Crudities and Indigestions as the prime Cause. According to *Sydenham*, vehement Motions of the Body, or more usually violent Perturbations of the Mind, as Grief, Anger, Fear, &c. are its procatartick Causes.

For the Cure, the principal Indication is to purify and strengthen the Blood, which is to be effected, after proper Evacuations, by Chalybeats, Bitters, Strengtheners, and Volatile Spirits. The Cortex has also notable Virtues in this Disease; as also a Milk Diet. Riding is admirable. *Sydenham*.

HYPOCHONDRIAC Medicines, are Remedies proper in the *Hypochondriac Disease*.

Such are all those which tend to purify the Blood, Humours, and Spirits; as Chervil, Balm, Agrimony, and the other Cephalic and Cardiac Herbs: Such also are those which purge Melancholy or Atrabilis, and those which dispel Wind and Vapours; and all Medicines good for Disorders of the Nerves, particularly *Verum* both Male and Female; but above all, frequent, gentle, Anodyne Purgas.

HYPOCHONDRIAC Regions. See HYPOCONDRIA.

HYPOCRAS, or rather **HYPOCRAS**, *Vinum Hippocraticum*, a kind of medicated Wine. See WINE.

Hypocras is a Drink or Beverage compos'd of Wine, with Spices and other Ingredients infus'd therein; much us'd among the *French* by Way of Dram after Meals.

There are various Kinds of *Hypocras*, according to the Kind of Wine, and the other additional Ingredients made use of; white *Hypocras*, red *Hypocras*, Claret *Hypocras*, Strawberry *Hypocras*, *Hypocras* without Wine, Cyder *Hypocras*, &c.

That directed in our College Dispensatory, is to be made of Cloves, Ginger, Cinnamon, and Nutmegs, beat, infus'd in Canary, with Sugar; to the Infusion, Milk, a Lemon, and some Sips of Rosemary to be put, and the whole strain'd thro' a Flannel.

It is recommend'd as a Cordial, good in Paralytic, Apoplectic, and all nervous Cases.

Mennag approves the Conjecture of those who derive *Hypocras* from *Hypocrates*, as supposing him the Inventor hereof. — Others derive the Word from the Greek *υπο* and *κρασιον*, to mix.

HYPODROME. See HYPODROME.

HYPOGEUM,

which subtends, or is opposite to, the right Angle. See TRIANGLE.

Thus, in the Triangle KML, (Tab. Geometry, Fig. 71.) the Side ML, opposite to the right Angle K, is call'd the *Hypotenuse*.

'Tis a celebrated Problem in Geometry, that in every rectilinear right-angled Triangle, as KML; the Square of the *Hypotenuse* ML, is equal to the Squares of both the other Sides, KL and KM.—This is particularly call'd the *Pythagorean Problem*, from its Inventor *Pythagoras*, who is said to have sacrific'd a Hecatomb to the Muses, in Gratitude for their assisting him therein. See PROBLEM, &c.

The Word is Greek, *υποθεσις*, *subtendens*, form'd of *υποτις*, *subtendo*, I subtend.

HYPOTHESIS, in Logic, is a Proposition or Principle which we suppose, or take for granted, in order to draw Conclusions therefrom, for the Proof of a Point in Question. See SUPPOSITION and PRINCIPLE.

In Disputation, they frequently make false *Hypotheses*, in order to draw their Antagonists into Absurdities; and even in Geometry, Truths are deducible from such false *Hypotheses*.—Thus, if the Sky should fall, we should catch Larks: The Consequence is good, tho' drawn from a false *Hypothesis*.

The Word is Greek, *υποθεσις*, form'd of *υπο*, *sub*, under, and *τις*, *positio*, I of *pono*, I put.

Every Conditional or Hypothetical Proposition, may be distinguish'd into *Hypothesis* and Thesis: The first rehearses the Conditions under which any Thing is affirm'd or deny'd; and the latter is the Thing itself affirm'd or deny'd. See HYPOTHETICAL.

Thus, in the Proposition, a Triangle is half of a Parallelogram, if the Bases and Altitudes of the two be equal: The latter Part is the *Hypothesis*, if the Bases, &c. and the former the Thesis, a Triangle is half a Parallelogram. See THESES.

In strict Logic, we are never to pass from the *Hypothesis* to the Thesis; that is, the Principle suppos'd must be prov'd to be true, e'er we require the Consequence to be allow'd.

HYPOTHESIS, in Physicks, &c. is a kind of System, laid down from our own Imagination, whereby to account for some Phenomenon or Appearance of Nature.—Thus we have *Hypotheses* to account for the Tides, for Gravity, for Magnetism, for the Deluge, &c. See TIDES, GRAVITY, MAGNETISM, DELUGE, &c.

The real and Scientific Causes of natural Things generally lie very deep: Observation and Experiment, the proper Means of arriving at them, are in most Cases extremely slow; and the human Mind impatient: Hence we are frequently driven to feign or invent something which may seem like the Cause, and which is calculated to answer the several Phenomena; so that it may possibly be the true Cause.

Philosophers are divided as to the Use of such Fictions or *Hypotheses*, which are much less current now than formerly.—The latest and best Writers are for excluding *Hypotheses*, and standing wholly on Observation and Experiment. See EXPERIMENTAL PHILOSOPHY.

Whatever is not deduc'd from Phenomena, says Sir I. Newton, is an *Hypothesis*; and *Hypotheses*, whether Metaphysical, or Physical, or Mechanical, or of occult Qualities, have no Place in Experimental Philosophy. *Phil. Nat. Prin. Math. in Calc.*

The *Cartesians* take upon them to suppose what Affections in the primary Particles of Matter they please; just what Figures, what Magnitudes, what Motions, and what Situations they find for their Purpose.—They also feign certain unseen, unknown Fluids, and endue them with the most arbitrary Properties; give them a Subtility which enables them to pervade the Pores of all Bodies, and make them agitated with the most unaccountable Motions. But is not this to set aside the real Constitution of Things, and to substitute Dreams in their Place! Truth is scarce attainable even by the surest Observations; and will fanciful Conjectures ever come at it? They who found their Speculations on *Hypotheses*; yea tho' they argue from them regularly according to the strictest Laws of Mechanicks, may be said to compose an elegant and artful Fable; but 'tis still only a Fable. *Cotes in prefat. ad Newton. Princip.*

HYPOTHESIS is particularly apply'd, in Astronomy, to the several Systems of the Heavens; Or the divers Manners wherein different Astronomers have suppos'd the heavenly Bodies to be rang'd, mov'd, &c. See SYSTEM.

The principal *Hypotheses*, are the *Ptolemaic*, *Copernican*, and *Tychonic*. See PTOLEMAIC, COPERNICAN, TYCHONIC, &c.

The *Copernican* is now become so current, and is so well warranted by Observation; that the Retainers thereto, hold it injurious to call it an *Hypothesis*.

HYPOTHETICAL Proposition, is a Combination of two Categorical Propositions, the latter whereof follows from the former, which is distinguish'd by the Particle *if*. See PROPOSITION.

If he be a Man, he is an Animal: If the *Turk* sleep, the *Cock* crows: If you repent, you shall be forgiven. See CONDITIONAL.

HYPOTRACHELION, in Medicine, is the lower Part of the Neck. See NECK.

It is thus call'd from *υπο*, *sub*, under, and *τραχηλις*, *Collum*, Neck.

In Architecture, *Hypotrachelion* is used for a little Freeze in the *Tuscan* and *Doric* Capital, between the Altragal and Annulets; call'd also *Colarum*, *Gorgerin*, &c. See COLARIN, &c.

It is also apply'd by some Authors in a more general Sense, for the Neck of any Column; or that Part of the Capital thereof below the Altragal. See COLUMN and ASTRAGAL.

HYPOTRAPHOSIS, in Rhetoric, a Figure whereby a Thing is so lively describ'd or painted, that it does not seem to be read or heard, but actually seen, or presented before the Eyes. See DESCRIPTION.

Such is that elegant one of *Cicero*, wherein he paints the Barbarity of *Verges*: *Ipsa Inflammatus sceleris & furoris in forum venit. Ardebat Oculis; toto ex ore crudelitas emanabat. Exspectabant omnes quo tandem progressurus, aut quid nam alturus esses; cum repente Hominem corripit, atque in foro medio urdari ac deligari; & Verges expetere jubet. Clamabat ille miser se Civem esse Romanum, &c.*

The *Hypotrapsis* is frequently used by the Poets, and particularly *Virgil*, who abounds in Paintings.

The Word is Greek, *υποτραψις*, form'd of the Verb *υποτραψω*, *per figuram demonstro*, I show, reprove, or make any Thing to be seen, of *τραψω*, *Verbero*.

HYPZOOMA, in Anatomy, a Name given to such Membranes as separate two Cavities. See MEMBRANE.

In this Sense, the Mediastinum is a *Hypozoma*.

HYSILOGLOSSUS, in Anatomy. See BASIOGLOSSUS.

HYSILOIDES, in Anatomy. See HYOIDES.

HYPISSTARII, HYPISSTARIIANS, a Sect of Hereticks in the 14th Century; thus call'd from the Profession they made of worshipping the most High God, in Greek call'd *Υψιστος*, *Hypsiotes*.

The Doctrine of the *Hypsiarians*, was an Assurb'd of Paganism, Judaism, and Christianity. They ador'd the most High God with the Christians; but they also rever'd Fire and Lamps with the Heathens; and observ'd the Sabbath, and the Distinction of clean and unclean Things, with the Jews.

The *Hypsiarii* bore a near Resemblance to the *Euphrasites* or *Maslians*. See MASSALIAN.

HYSSOP, HYSSOPUS, a medicinal Herb, of a deterring cleansing Quality, and chiefly used in Diseases of the Breast and Lungs. See DEVERGENT.

It is a standing Ingredient in pectoral Apocryms.—There is also a Syrop, and a simple distill'd Water from it, us'd in the Shops. See WATER, &c.

It has also a Faculty to comfort and strengthen; and is prevalent against Melancholy and Phlegm.—It is propagated only by Slips.

Its Tops and Flowers reduc'd to Powder, are by some refer'd to strew upon the colder Salad Herbs. See SALLAD.

HYSSOPIC Art, a Name which *Paracelsus* gave to Chymistry, consider'd as that Art purifies Metals, Minerals, &c. in Allusion to that Text in the Psalms, *Curge me with Hyssop*, and I shall be clean. See CHEMISTRY.

HYSTERALGY, in Medicine, a Pain in the Matrix or Womb, occasion'd by an Inflammation, or other Disorder therein.

The Word is compounded of the Greek, *υστερ*, *Matrix*, Womb; and *αλγος*, *dolor*, Pain.

HYSTERIC Affection or *Passion*, a Disease in Women, call'd also *Suffocation of the Womb*, and *Fits of the Mother*.

Hysteric Affection is generally used by Authors promiscuously with *Hypocondriac Affection*; the two Diseases being suppos'd to be, in reality, the same.—They only differ in Point of Relations and Circumstance.

The *Hysteric* is properly a Species or Branch of the *Hypocondriac*, peculiar to Women, and suppos'd to arise from some Disorder of the Womb. See HYPOCONDRIAC AFFECTION.

One of the Symptoms or Effects of *Hypocondriac* Diseases is Convulsions, and Fits not unlike those of the Epilepsy; these we call *Hysteric Fits*; and the Disease that produces them, the *Hysteric Affection*. *Sydenham.*

The Name *Hysteric* is form'd of the Greek, *υστερ*, *Uterus*, Womb; the Patient frequently fancying a Ball rolling in the Abdomen, and sometimes rising to the Throat, which some weakly enough have attributed to an Elevation of the Womb.

It is particularly denominated *Hysteric Suffocation*, from one of its principal Symptoms, which is a Contraction of the Breast, and a Difficulty of Breathing.

Some Women under this Disorder, fancy a Rope ty'd about their Necks, ready to strangle them; and others, a Piece got into their Throats, which they cannot swallow, but stops their Breath: Some will even remain a good while as if really strangled, without any Sense or Motion.

The more common Symptoms or Accidents of this Disease, are a Swimming of the Head, Dazzling of the Eyes, Inquietudes, Pains of the Abdomen, Belches, Nauseas, Vomiting, Deliriums, Convulsions. It is not always attended with all these Symptoms, but sometimes with more, and sometimes with less, and those more or less violent.

Dr. *Paracelsus* describes a *Hysterie Paroxysm*, as beginning with a Sense of Coldness creeping up the Back, and afterwards spreading over the whole Body; Then ensues a Head-ach, and sometimes a Palpitation of the Heart, with a fainting, from which the Patient soon recovers. Sometimes, after the Coldness, succeeds a remarkable Heat, which brings on the fore-mention'd Symptoms. *Baglivini* adds, that *Hysterie* Women feel a Sense of Cold in the Crown of the Head; and this he takes to be the chief Diagnostic of the Disease.

The ordinary Causes of this Disorder are violent Passions, Rage, Love, Grief, ill News, sweet Smells, &c. As for the popular Notion of malignant Vapours rising from the Womb, and occasioning all these Symptoms; the Learned all discard it, and hold Men as subject to the Disease as Women. The real Cause is in the Animal Spirits, and the nervous System; and the Affection does not differ from the Hypochondriac.

For the Cure; as many of the Symptoms are convulsive, Antispasmodicks are indicated. During the Paroxysm, scented Things, whether internally or externally apply'd, are of Advantage; particularly Castoreum, the Smoak of burnt Horn, or burnt Feathers held to the Nose. Volatile Spirits also help to wake the Patient out of the Paroxysm; as also tickling in the Soles of the Feet. Where 'tis severer than ordinary, recourse must be had to Punction, Scarification, Veficatories, Causticks, &c. See *HYSTERIC Medicines*.

HYSTERICKS, or *HYSTERIC Medicines*, are Remedies proper to remove *Hysterie Affections*; particularly Disorders of the Womb.

There are divers Species of *Hystericks*: Some evacuate or cleanse the Womb, by expelling any Impurities lodg'd therein: Others tend to stop immoderate Fluxes thereof: And others strengthen the Tone of the Womb.

According to Dr. *Quincy*, *Hysterie Affections* arise either from too titillating, or too uneasy Sensations: The former proceed from that Irritation of the Nerves, which the Make and Secretion of those Parts have naturally subjected them to, and which, in some Sorts of Constitutions, arise to that Degree, as to draw the whole System into Disorder, and occasion a surprizing Variety of Symptoms; *e. gr.* several Sorts of Convulsions, and Species of Madness; which therefore are by some termed *Furores Uterini*. See *UTERINE*.

These Disorders seem most effectually allay'd, by such Things as are in a Manner the Reverse of Cordials, and are both in Smell and Taste very offensive and disagreeable: They seem to answer this End by suffocating, as it were, the Spirits, and damping their inordinate Sallics, so that such Stimulation ceases, and the Fibres return to their natural Tone and Motions: For as what is grateful to the Senses, gives an inexpressible Emotion to the fine nervous Filaments; so does what is fetid and disagreeable quite destroy that Emotion, and deaden it: And as the former Kind consist chiefly of fine subtle volatile Parts, by which, as before explain'd under *CEPHALICKS*, they are fitter to enter the Nerves; so these are generally of a clammy viscidous Contexture, and thereby the fitter to envelope and entangle that subtle Juice; whereby its Motion is much retarded, and consequently the Fibres render'd less spongy.

HYSTEROLOGY, *HYSTEROLOGIA*, is Rhetoric, a vitious Manner of speaking, wherein the natural Order of Things is inverted; call'd by the *Greeks*, *ὀργη* and *πρόσθεσις*, *q. d.* to put the first Thing where the last should be.

The Word is *Greek*, *ὀργη*, signifying a Discourse inverted.

HYSTEROMATOCY, in Chirurgery, an Operation more usually call'd in our Language the *Cesarian Operation* or *Section*. See *CESARIAN*.

HYSTERON-PROTERON, *ὄπισθεν πρότερον*. See *HYSTEROLOGY*.

HYSTEROTOMIA, in Anatomy, an Anatomical Dissection of the Uterus, or Womb. See *MATRIX*.

The Word is form'd of the *Greek*, *ἕρως*, *Matrix*, Womb, and *τομή*, *seco*, I cut, I dissect.

HYTH, a Port, Wharf, or little Haven, to embark or land Wares at.—Such are *Queen-hyth*, now *Maidenhead*, &c. See *PORT, HAVEN*, &c.
