# WYATT'S DEPENDABLE CORN HYBRIDS

**F-27 N. C. 27 (Yellow)** The most widely planted yellow corn in North Carolina and widely adapted and popular in South Carolina, Georgia, Alabama and Tennessee. While it is not the highest yielding yellow corn in every test, other qualities have won for it by far the greatest planter acceptance. Grain quality, shuck coverage, insect resistance and general good appearance and performance are some of these qualities. N. C. 27 averaged 71.6 bushels per acre in 2 tests in the Piedmont and 92.3 in 4 tests in the Coastal Plain regions during 1949. All tests were official. Root and stalk strength are very good and the plants average 179 ears per 100 stalks. Medium maturity. N. C. 27 at its very best, treated, tested and graded is sealed in the Wyatt bags. Buy it with confidence at your regular seed suppliers store or order it direct from us. Prices: 7 lbs. (½ Peck) \$2.05; 14 lbs. (Pk.) \$3.60; 28 lbs. (½ Bu.) \$6.45; 56 lbs. (Bu.) \$11.70 postpaid.\* Not prepaid, 7 lbs. \$1.65; 14 lbs. \$2.95; 28 lbs. \$5.35; 56 lbs. \$9.75.

**F-26 Dixie 17 (White)** Currently the most popular white hybrid corn for the South. Dixie 17 made the highest average yield (111.7 bu. per acre) and highest individual yield (120.4 bu. per acre) in all 1949 N. C. official trials in competition with 36 hybrids and open pollinated varieties in both the Piedmont and Coastal Plain areas. It is widely adapted, yielding 111.7 bushels per acre in Camden County; 120.4 in Halifax; 115.1 in Robeson; 99.6 in Lenoir; 93.8 in Catawba and 65.4 in Rockingham. As the picture on this page indicates, the plants average 202 ears per 100 stalks as compared with 115 ears per 100 stalks of Weekley's, one of the better open pollinated varieties. Grain quality is good, kernels large and of uniform hard texture. Insect resistance is good except where rice weevils are severe. Husk coverage is good. Plants may stalk-break after maturity in closely spaced plantings and where high yields are produced. Medium maturity. Prices: 7 lbs. (½ Peck) \$2.05; 14 lbs. (Pk.) \$3.60; 28 lbs. (½ Bu.) \$6.45; 56 lbs. (Bu.) \$11.70 postpaid.\* Not prepaid 7 lbs. \$1.65; 14 lbs. \$2.95; 28 lbs. \$5.35; 56 lbs. \$9.75.

**F-4 N. C. 1032 (Yellow)** A widely adapted yellow hybrid recommended especially in the Piedmont and Northern Coastal Plain areas of North Carolina, Piedmont South Carolina and Central and Northern portions of Georgia and Alabama. Yield and grain quality are good, sucker habit light and stalk strength best of all hybrids tried in official North Carolina field tests. Plants average 150 ears per 100 stalks. Shucks coverage is good and weevil resistance fair. The golden yellow kernels are deep, wide and of good quality. Medium maturity. Prices: 7 lbs. (½ Peck) \$2.05; 14 lbs. (Pk.) \$3.60; 28 lbs. (½ Bu.) \$6.45; 56 lbs. (Bu.) \$11.70 postpaid.\* Not prepaid 7 lbs. \$1.65; 14 lbs. \$2.95; 28 lbs. \$5.35; 56 lbs. \$9.75.

## N. C. Agricultural Extension Service Recommendations for Increasing Corn Yields

1. Have the soil tested and apply lime as recommended.
2. Prepare a good seedbed and plant level with the ground except where drainage is poor.
3. Use 300-500 lbs. of 6-8-6 or 4-8-8 at planting. Use the higher rates following crops receiving low amount of fertilizer and the 4-8-8 on potash deficient soils or following legumes for hay.
4. Avoid late, deep cultivation but control weeds early. Use a weeder where available until corn is six inches high. Cultivate shallow until the corn is 2½ feet high, and then stop cultivation. Do not use turning plow or bull tongue. Do not injure corn roots.
5. Place rows about 3½ feet apart.
6. Space plants about 16-20 inches apart within the row, using wider spacing for less fertile soils.
7. Sidedress with adequate nitrogen (potash where needed) when corn is 6-8 weeks old or about 2½ feet high. Yield increases of 25-45 bushels per acre may be expected by use of 500 lbs. of Nitrate of Soda, or 400 lbs. of Calnitro or ANL, or from 250 lbs. per acre of Ammonium Nitrate. One-fourth of this rate of application should give yield increases of 10-12 bushels per acre above similar corn receiving no sidedressing.

F-26 Corn, Dixie 17

**F-3 Tennessee 10 (White)** A consistently good white hybrid for Coastal Plain, Piedmont and Mountain regions in North Carolina and extensively used in South Carolina, Georgia, Alabama and Tennessee. In the 1949 official tests Tennessee 10 averaged 90.5 bushels per acre in 4 tests in the Coastal Plain and 69 in 2 tests in the Piedmont. Its 6 year average 1944-49 in the Mountains is 85.8 bushels per acre. Medium maturity. Prices: 7 lbs. (½ Peck) \$2.05; 14 lbs. (Pk.) \$3.60; 28 lbs. (½ Bu.) \$6.45; 56 lbs. (Bu.) \$11.70; postpaid.\* Not prepaid 7 lbs. \$1.65; 14 lbs. \$2.95; 28 lbs. \$5.35; 56 lbs. \$9.75.

## Chemical Weed Control

Planters of large corn acreages should contact us for information on Chemical weed control. No obligation. A large Eastern grower wrote us May 26, 1949, "I treated around 80 acres of corn with the best results. Hardly a weed left and did not hurt any corn in any way."

## 40,000 Plants of 300 African Violet Varieties Have Proved HYPONEX Value Here

Thousands of African Violet plants are commercially grown in the greenhouses of Hugh Eyerdorn & Son, R.D. 1, Wadsworth, Ohio, with HYPONEX providing the only food from the time they are started until they are sold. The above picture shows a part of one house in which many thousands of violets reveal the healthy condition resulting from balanced feeding . . . Plants are better in color, heavier stemmed and flowers are larger, more prolific. Eyerdorns say: "HYPONEX gives exactly the right food for the best culture of African Violets. It produces better plants faster and saves time, trouble and expense in plant care. We feed our growing plants every two weeks with the proportion of about 1 teaspoonful HYPONEX to 1 gallon of water with water temperature 70° to 90°."

## African Violets Can Be Grown in Any Soil, Even in Sand or Water (Hydroponic culture) With HYPONEX

What growing medium to use for African Violets is a matter of choice when HYPONEX is fed . . . Soil, sand or even water alone has produced outstanding plants. Flower Grower published the results of tests in July, 1949, of water culture for African Violets. Recommended proportions of HYPONEX in luke warm water were used and this solution changed to fresh solution every week or ten days. This picture was furnished through courtesy of Flower Grower and shows plant growing in water (variety: Blue Boy). It produced blossoms profusely . . . Some as large as 1-7/8 inches across.

# HYPONEX Grows Sturdier Plants Quicker with Better Color, Heavier Foliage and More Bloom . . .

Thousands of tests in African Violet culture prove the value of HYPONEX feeding. Its balanced nutrients are always exactly proportioned to assure correct growth of all the plant . . . roots, stems, foliage and flowers. Many growers have reported results that show sturdier plant growth quicker with better coloring, heavier foliage and more bloom. Swinford's Greenhouse, R.D. 3, Anderson, Indiana, have specialized in African Violets for many years and report they have followed the schedule of feeding with HYPONEX — 1 teaspoonful to a gallon of water — every two weeks with the result their plants have a healthier green, leaves larger, stems sturdier — and always in bloom.

## HYPONEX is Clean, Odorless, Immediately Soluble in Water, SAFE and Easy to Use . . .

HYPONEX is instantly available to plant roots as a food when it is dissolved in water and applied . . . It is clean to use and odorless. It is always safe and sure in results when used in the recommended proportions. It is economical and never deteriorates. It can be used on all plants, indoors or outdoors, with the assurance of quicker, healthier growth, larger flowers and more of them.

## Excellent for Starting Slips . . . Faster Growth

Many growers of African Violets develop their plants from leaves, as shown in this illustration. Starting medium is sand, vermiculite or other inert material. HYPONEX is used for feeding when roots first begin to show. Plant develops quickly as roots rapidly respond to balanced nutrient.

## Showing 12-week Plant Growth Cycle with HYPONEX Feeding . . .

1. 3 weeks in damp sand or vermiculite, HYPONEX feeding has just been started.
  2. In 5 weeks root system is developing.
  3. In 8 weeks budding has started.
  4. At 12 weeks the plant is well started.

410 Cantaloupe, Gold Lined Rockyford

# WYATT'S *Western* Grown Muskmelons

**CULTURE:** The Melon delights in warm rich soil with good drainage. Good Melons, however, can be grown on almost any land if the trouble is taken to dig holes 2 feet square, filling them with a rich compost of woodsmold and cow-pen manure. Plant three-fourths to one inch deep April or May in rows 6 feet apart, leaving not less than 4 feet between the hills, putting about 10 seeds to the hill. As insects are often very destructive, it is best not to thin at all until the plants are well started. When they are large enough to be safe, thin to two in a hill, and keep the ground mellow and free from weeds. Those who make a speciality of Muskmelons will find it advantageous to start the seed under protection of glass, so as to have the plants ready by the time seeds could be usually planted in the open ground.

**CULTURE:** 1 ounce is enough for 100 feet of drill; 4 to 6 pounds will sow an acre. Sow very thickly from January to March ¼ of an inch deep in drills 18 inches apart in deep, rich, sandy loam, which has been well manured for a previous crop. When the plants are 2 to 3 inches high, thin out to 4 inches apart and cultivate frequently to keep down weeds. The roots which are excellent for stock as well as for the table, are much improved in flavor by being left in the ground during the winter. As the seeds do not germinate well in hot weather, sowing should be done as early as possible.

## Ten Steps in Lawn Building

- 2—Apply the equivalent of 3 heavy, green cover crops or 3 inches weed free manure or both if available.
- 3—Apply lime as needed up to 50 lbs. per 1,000 sq. ft. and fertilizer 40 lbs. per 1,000 sq. ft.
- 4—Pulverize and smooth surface.
- 5—Seed 6 lbs. Carolina, Sunny South or Shady Nook, mixture per 1,000 sq. ft., between September 1 and March 1.
- 6—Soak thoroughly but slowly to avoid moving seeds. Keep moist until grass is up. Soak occasionally during dry periods.
- 7—Mow Bermuda and rye grasses close and often; Blue grasses and fescues no closer than 2 inches nor more often than necessary, particularly during hot, dry seasons.
- 8—Compost clippings with liberal amount of sand and return to lawn in light applications as mulching during summer.
- 9—Feed at 8 weeks intervals, year 'round, with 20 to 40 lbs. per 1,000 sq. ft., high grade fertilizer or 50 to 100 lbs. per 1,000 sq. ft. sheep manure, or both. Always sprinkle after feeding.

### MORNING GLORIES

IPOMEAS. In growing Ipomeas (Morning Glories and Moonflowers), never plant until the soil is thoroughly warm. To aid germination of particularly hard-seeded varieties, filing a small notch at the top of the seed will help considerably. Always select the driest, sandiest part of the garden and sow where the plants are to flower as the Ipomeas resent transplanting. Plants should be kept on the dry side in order to induce early and abundant flowering with a rather sparse growth of foliage. Heavy watering will stimulate foliage growth at the expense of flowers. A poor soil is preferable to a rich one and fertilizer should not be used as this will promote heavy foliage which will hide the flowers.

1804 Blue Star This new morning glory won the ALL AMERICA SELECTION 1949. The flowers are light blue with dark blue ribs to form a star. Very early. Pkt. 10c; 3 pkts. 25c; ¼ oz. 50c.

1808 Scarlett O'Hara This introduction brings us an entirely new color in the popular garden flower, rich dark wine red or deep rosy crimson. The dark green foliage does not make a heavy growth, leaving the plants graceful in appearance. Pkt. 10c; ¼ oz. 50c

1809 HEAVENLY BLUE. A graceful vine of extremely quick growth producing a great number of exquisitely formed deep clear blue petunia-like flowers. Ideal for covering stumps or other unsightly objects. Pkt. 10c; ¼ oz. 35c; oz. \$1.00.

# Wyatt's Superb Petunias

Sow the small seeds in a warm, sunny, open place outdoors, thinning to 15 inches apart, or in frames for transplanting. Scatter seeds thinly, barely cover and firm soil over them; water seedlings with a fine spray to prevent drying out. The weakest looking seedlings usually produce the finest flowers, so save the weak plants for transplanting. Seed of the double and fringed sorts should be pressed into a shallow pot of sifted soil and covered with only a sprinkling of sand. The pot should be watered from below by placing it in water. Never allow to become too dry nor too moist.

1909 Petunia Burgundy

# CLOVER SEEDS

F97 Alfalfa

**F87 White Blossom Sweet Clover** Adapted to a wide variety of soils; is used for pasture, for forage, for ensilage, for bees, for soil improvement. Especially good as a manure crop and to inoculate the soil in preparation for a crop of alfalfa. The roots break up, aerate and drain stiff subsoils and add humus. Spring sowings will yield a crop the following fall and two crops the following year. The first season it grows 1½ to 2½ feet high, but if cut when 6 inches high it stools out and makes a more tender growth for grazing. Sow 15 pounds per acre July to October or February, March. Prices: lb. 60c; 2 lbs. \$1.00; 5 lbs. \$2.00; 10 lbs. \$3.85, postpaid. Not prepaid 10 lbs. \$3.40; 25 lbs. \$8.25; 100 lbs. or more at 32c lb.

**F80 White Dutch Clover** Because of its spreading habit and persistent year 'round growth White Dutch is invaluable for lawn and pasture use. It grows in all soils and will grow both in the shade and open areas responding to lime and fertilizers recommended for other clovers. Like other clovers White Dutch enriches the soil while furnishing nutritious grazing. Sow 6 to 8 pounds per acre alone or 2 to 3 pounds with other clovers or grasses. Prices: lb. \$1.40; 5 lbs. \$6.40; 10 lbs. \$11.95, postpaid. Not prepaid 10 lbs. \$11.50; 25 lbs. \$28.00; 100 lbs. or more at \$1.10 lb.

**F89 Ladino Clover—More Popular Every Year** A perennial clover of exceptional merit for pastures, especially on moist, fertile land. Recovers rapidly from grazing or clipping and is leafy and succulent. A complete recovery after grazing often takes place in two weeks. Its growing season is as long as that of any other legume. Like all clovers, Ladino succeeds best on well limed land. Sow 5 to 6 pounds per acre alone or 1 to 3 pounds in mixtures. Prices: lb. \$2.45; 5 lbs. \$11.25; 10 lbs. \$21.75, postpaid. Not prepaid 10 lbs. \$21.00; 25 lbs. \$51.25; 100 lbs. or more at \$2.00 lb.

F89 Ladino Clover and Orchard Grass

**F97 Alfalfa (Oklahoma Approved)** While Alfalfa is a relatively expensive crop, the first cutting usually returns about double the cost of seeds, lime, fertilizer and planting. A good method is to lime the land and plant an annual legume crop that can be thoroughly disked, not turned, in preparing the alfalfa seed bed. Use 20 to 35 pounds (not more) borax per acre and drill August 20 to October 1, or February 15 to March 25, 25 to 40 pounds of thoroughly inoculated seeds per acre. Roll or cultipack after seeding. At seeding time use 1,200 pounds 2-12-12 and 8-10 tons barnyard manure if available and not weed infested. Apply 400 pounds 0-12-12 annually thereafter. Cut before ¼ flowers open. Always leave the alfalfa stand 6 inches tall or more for winter since any closer cutting invariably results in severe damage. If your stand of alfalfa becomes thin or weak sow 3 to 5 lbs. Orchard grass per acre to help control weeds and increase production. We handle only premium quality seeds. Supplies of good seeds will be limited. Prices: lb. \$1.00; 5 lbs. \$4.25; 10 lbs. \$8.00, postpaid. Not prepaid 10 lbs. \$7.40; 25 lbs. \$18.00; 100 lbs. or more at 70c lb.

**BORAX.** Prices: 25 lb. bag \$2.00; 100 lb. bag \$6.00. f.o.b. Raleigh, N. C.

**F86 Alsike Clover** We offer only premium quality northern grown seeds of hardy strains. Used mostly in mixtures but when properly handled produces heavy tonnage of highly nutritious hay or grazing. Sow 2 to 5 pounds per acre in mixtures or 12 to 15 pounds alone, early spring or fall. Prices: lb. 90c; 5 lbs. \$3.75; 10 lbs. \$7.00, postpaid. Not prepaid 10 lbs. \$6.40; 25 lbs. \$15.50; 100 lbs. or more at 60c lb.

**F82 Red Clover (N. C. Grown)** One of the most productive of the clovers. Well adapted to our piedmont soils. Especially valuable in pasture mixtures. Sow early spring or fall 20 pounds per acre. Lime and fertilizer as for other clovers. Prices: lb. 90c; 5 lbs. \$3.75; 10 lbs. \$7.00, postpaid. Not prepaid 10 lbs. \$6.40; 25 lbs. \$15.50; 100 lbs. or more at 60c lb.

**F83 Crimson Clover** Should be sown from August to October. When sown by itself, 25 to 30 pounds are required to the acre; sown with grain or vetches, 15 pounds would be sufficient. Prices: lb. 55c; 5 lbs. \$2.00; 10 lbs. \$3.60, postpaid. Not prepaid 10 lbs. \$3.00; 25 lbs. \$7.00; 100 lbs. or more at 26c lb.

**F95 Sericea Lespedeza** Scarified and re-cleaned. This is the perennial lespedeza being grown so largely over the south. Its greatest asset is that it grows on the poorest soils without fertilizer or lime and while it steadily improves the land, it produces an abundance of nutritious hay if cut when tender. Prices: lb. 55c; 5 lbs. \$2.00; 10 lbs. \$3.60, postpaid. Not prepaid 10 lbs. \$3.00; 25 lbs. \$7.00; 100 lbs. or more at 26c lb.

**F93 Kobe Lespedeza** A variety particularly adapted to lowlands and lighter soils. The leaves and stems are slightly coarser making a heavier hay crop. This variety is recommended by the N. C. Experiment Stations for all but the mountainous regions of North Carolina, South Carolina and Virginia. Sow 30 to 40 lbs. per acre. Responds to liming and fertilizing. Prices: 10 lbs. \$2.50; 25 lbs. \$5.75, postpaid. Not prepaid 25 lbs. \$4.75; 100 lbs. or more at 18c lb.

**F92 Korean Lespedeza** Korean Lespedeza will grow on any soil, wet or dry, rich or poor, sour or sweet. Unexcelled for hay crop since it will produce from 2 to 4 tons of good hay per acre on a good thick even stand. It is almost equal to alfalfa in feeding value, and compares favorably in fineness, palatability and protein content. A good stand will make one ton of hay per acre for each 4 to 5 inches above cutter bar. Korean Lespedeza is earlier than other lespedezas, this insures harvest before fall rains and early frost and gives time for seed bed preparation for small grain that fall. Sow 30 pounds of seed per acre February to April. Prices: 10 lbs. \$2.00; 25 lbs. \$4.25, postpaid. Not prepaid 25 lbs. \$3.25; 100 lbs. or more at 12c lb.

# Grasses

for Pasture and Hay

Alta and F53 Kentucky 31 Fescues. Soil Conservation Service Photo.

**F57 Alta Fescue** A tall or giant Fescue adapted to a wide variety of soils and uses. Like most long lived grasses, growth is slow after germination and should not be grazed until 6 inches high. Once established Alta Fescue promises to be the most versatile and valuable grass in a generation. It is the highest yielding grass in virtually every experiment station where it has been tried; is palatable and grows over a longer period each year than other grasses. Alta has a remarkable resistance to drought and its dense, deep roots make it ideal for erosion control, soil building, weed control, roadside planting, athletic fields, parks, airports, etc. In combination with suitable legumes it produces an excellent almost year 'round pasture. Because it has no underground root stocks it cannot become a pest and is readily killed by plowing. Continued high yields will require feeding, especially nitrogen which may be supplied partly by seeding with clover. Seed in a prepared, firm seed bed fall or early spring 20 to 25 lbs. per acre alone; 10 to 15 lbs. with 3 lbs. Ladino, White or Sub Clover, or 15 lbs. Lespedeza. Prices: lb. \$1.10; 5 lbs. \$4.75; 10 lbs. \$9.00, postpaid. Not prepaid 10 lbs. \$8.40; 25 lbs. \$20.50; 100 lbs. or more at 80c lb.

**F53 Kentucky 31 Fescue** A tall Fescue very similar to Alta. This strain was developed in Kentucky from whence its fame as a pasture grass has spread over the South. Because of its close kinship to Alta we recommend the same practices listed above for Alta. Prices: lb. \$1.10; 5 lbs. \$4.75; 10 lbs. \$9.00, postpaid. Not prepaid 10 lbs. \$8.40; 25 lbs. \$20.50; 100 lbs. or more at 80c lb.

**F48 Bermuda Grass** Makes a vigorous and persistent growth in every part of the South; lasts for years; stands heat without injury; grows well in any soil that is not too wet. Sow at the rate of 10 to 20 lbs. to the acre for pasture; 60 to 80 lbs. for lawns and golf courses. Plant from March until June. Seed will not germinate when ground is cold, and under favorable conditions, takes 30 to 40 days to germinate. Prices: lb. 75c; 5 lbs. \$2.90; 10 lbs. \$5.30, postpaid. Not prepaid 10 lbs. \$4.70; 25 lbs. \$11.25; 100 lbs. or more at 42½c lb.

**F57 Dallis Grass (Imported)** In the cotton belt it furnishes two or more hay cuttings of fine quality. It stands light frosts and does well on most any soil with ample moisture. It stands close grazing remarkably well and grows from early spring until killing frost. Sow February to April. Plant 8 pounds per acre. Prices: lb. \$1.05; 5 lbs. \$4.50; 10 lbs. \$8.60, postpaid. Not prepaid 10 lbs. \$8.00; 25 lbs. \$19.25; 100 lbs. or more at 75c lb.

# SORGHUM - MILLET

for grain and foliage

**F73 Sudan Grass** A quick growing heavy yielding summer hay crop well liked by stock. Strongly drought-resistant. Sow it after the ground becomes thoroughly warm, either broadcast or in rows two feet apart. Sudan grass may be profitably grown with cowpeas and soybeans. Almost any soil, from heavy clay to light sand, will grow Sudan grass. Sow 10 lbs. to the acre in 2-foot rows; 25 lbs. broadcast. Prices: lb. 45c; 5 lbs. \$1.40; 10 lbs. \$2.40, postpaid. Not prepaid 10 lbs. \$1.80; 25 lbs. \$4.25; 100 lbs. or more at 16c lb.

**F74 Tift Sudan** Tift Sudan grows 4 to 8 feet, branches or leaves out to a greater degree, and is much more resistant to the many leaf and stem diseases than the common variety. F47 Orchard Grass Seed Production

## COMBINE MILO FOR GRAIN

**F296 Plainsman (Combine) Milo** A superior plant for growing with peas for hay because of its low habit of growth. For grain it out yields corn and brings a higher price. Dry grain is ready in 110 to 120 days. Ready to cut for hay in 60 days. Plant 10 lbs. per acre in rows; broadcast 25 lbs. with peas or 50 lbs. alone. Prices: lb. 35c; 5 lbs. \$1.00; 10 lbs. \$1.60, postpaid. Not prepaid 10 lbs. \$1.00; 25 lbs. \$2.25; 100 lbs. or more at 8c lb.

F197 Hegari

## HEGARI

**F197 Hegari** Recognized as the most valuable and widely adapted member of the sorghum family, and well suited to conditions in the Southern states. Hegari has great forage value for two reasons. First because its high sugar content makes stalks and leaves highly palatable to livestock, and second, it yields heavily with its many broad leaves and substantial stalks. As an ensilage crop many acres are planted to Hegari every year in the South. As a pasture crop, in thickly seeded plantings it pastures well and also makes good hay. Its largest use is in bundle feeding and it can be left shocked in the field until fed, or as is coming into more general practice, it is ground head, stalks and leaves through a hammer mill. Hegari makes a good substitute crop for corn, which it out yields on light soils, and it can be planted much later. Prices: lb. 35c; 5 lbs. \$1.00; 10 lbs. \$1.60, postpaid. Not prepaid 10 lbs. \$1.00; 25 lbs. \$2.25; 100 lbs. or more at 8c lb.

## WYATT'S RECLEANED MILLETS

**F185 Golden Millet** German or Golden Millet makes a quickly grown, easily cured and large yielding, nutritious hay crop. Seed thickly, not less than 50 lbs. to the acre, from the middle of April until the end of July. It's a quick crop, maturing in six to eight weeks. Cut while in bloom, before the seed hardens in the head. Prices: lb. 40c; 5 lbs. \$1.25; 10 lbs. \$2.00, postpaid. Not prepaid 10 lbs. \$1.40; 25 lbs. \$3.25; 100 lbs. or more at 12c lb.

**F186 Pearl, or Cat-Tail Millet** One of the best and most nutritious of the continuous cutting green forage plants. Grows 8 to 10 feet high, but cutting can commence when it has attained the height of 3 to 4 feet, when it will stool out enormously and make rapid growth; can be cut in this way three to four times during the season. It does well even on poor land, and surprisingly well in dry seasons. Plant April to August, 6 to 8 lbs. to the acre in rows 3 feet apart. Prices: lb. 45c; 5 lbs. \$1.40; 10 lbs. \$2.40, postpaid. Not prepaid 10 lbs. \$1.80; 25 lbs. \$4.25; 100 lbs. or more at 16c lb.

## TEOSINTE

**F289 Teosinte** Cut when 4 or 5 feet high, it makes an excellent fodder, starts immediately into growth again, and will give several more cuttings. If sufficient quantity is planted a continuous supply of nutritious green feed can be had daily right up to frost. Plant in May or June in drills 3½ to 4 feet apart; 3 to 4 lbs. plants an acre. Prices: lb. \$1.50; 2 lbs. \$2.75, postpaid. Write for prices on larger lots.

F296 Combine Milo

F146 Soy Bean, Ogden

**F146 Ogden** Ogden is considerably earlier than most beans and is consequently better adapted to rotations with small grains. Seedings as late as June in the Wake County trials made a substantial production of hay. Average bean yield for 6 tests at scattered points in the state during 1943 was 27.8 bushels per acre. Plants are nicely branched and for that reason are more desirable for hay than the coarser growing types. Write for prices.

**F150 Volstate** A yellow seeded variety producing high yields of good oil beans. Plants are somewhat taller than Ogden and slightly less branched. For a hay crop or a crop that might be optional we would recommend Ogdens, but for a crop planted on light land and for combining we would recommend the Volstate owing to the height of the plant and the fact that the beans are somewhat bunched on the plant. Write for prices.

**F143 Roanoke** A new bean developed in the N. C. Experiment Station, U.S.D.A. Cooperating. Bean yield is higher than other popular varieties and the oil content of the bean is higher. Write for prices.

Write for prices and list of other varieties available.

### STOCK PEAS

Owing to the present situation with respect to farm labor the supplies of peas especially pure varieties, are extremely short.

**F101 Brabham** The seeds are smaller and do not require to be seeded as thickly as other kinds. It is disease-resistant, vigorous in growth, holds its foliage well, valuable for hay. Write for prices.

**F109 Whippoorwill** More largely grown than any other cowpea, probably because of its long vine, usually six feet long, and its large yield of both hay and peas. Write for prices.

**F111 Black** Very prolific, early to mature, makes a fine growth. Write for prices.

**F106 Taylor or Gray Crowder** A large speckled pea that has a large, long pod. Matures early. Write for prices.

**CULTURE:** Soils: Well drained sandy loam, properly limed, is best. Varieties: Virginia Bunch and Jumbo Runners in the old belt of North Carolina and Virginia. Spanish, North Carolina Runner or Virginia Bunch in the Southern Coastal plains and counties bordering the Piedmont using Spanish, Tennessee Red, or North Carolina Runner if in doubt as to the ability of the soil to make the larger varieties. In the Piedmont the Spanish variety is recommended. Smaller varieties produce more oil per ton of nuts, however, on adapted soils the larger nuts produce more oil per acre. Use 35 lbs. small varieties; 45 lbs. large varieties (shelled) per acre. Buy 1-3 more nuts by weight in the shell for the desired amount of shelled nuts. Field tests show 27 per cent increase in yield when seeds are treated with Arasan. Average of 22 tests conducted in North Carolina showed \$16.43 per acre increase return where peanuts were dusted 4 times with sulphur-copper dust, after deducting the cost of dusting.

**F221 Valencia** Yields 600 to 700 pounds in shells. Adapted to a variety of soils and makes few "pops." Straight smooth pods contain 3 or 4 large kernels of finest quality. An early bunch variety. **F253 Bonanza** A high quality leaf noted for its bright lemon color. Leaves are broad and long, making good weight. Especially suited to heavier soil types. Prices: Oz. \$1.00; 3 ozs. \$2.65; lb. \$13.00, postpaid.

**F278 Yellow Special, Certified** A fine variety originating in Virginia and receiving much interest for poorer soils where it produces good crops and good quality. Very large leaves that ripen uniformly. Prices: Oz. \$1.00; 3 ozs. \$2.65; lb. \$13.00, postpaid.

**F266 Dixie Bright 101, Certified**

From information available, Dixie Bright 101 is the best in yield and value per acre of any variety having resistance to black shank or to Granville wilt. A few crops were criticised for being a little slick, a few crops showed a gray mottled appearance which was objected to, and some crops were criticised for being too white.

Slickness and immaturity can usually be corrected by allowing tobacco to become ripe. Much of the gray, mottled appearance resulted from too much water, a partially drowned condition, and poor curing techniques. Tobacco that tends to cure up too white can usually be corrected by allowing the leaf to become very ripe before harvest and quite yellow before drying.

Dixie Bright 101 has moderate resistance to black shank and high resistance to Granville wilt. Suitable throughout the state where growers are using a rotation to keep the degree of black shank infestation down to some extent, or where both black shank and Granville wilt are present, or where Granville wilt alone is present. Prices: Oz. \$3.00; 3 ozs. \$8.25; lb. \$39.00, postpaid.

**F261 Dixie Bright 102, Certified**

Probably the highest quality variety available today has high resistance to black shank and Granville wilt. A moderate yielder (about like Oxford 26 and Virginia Bright Leaf), usually produces cigarette tobacco nearly to the top of the plant, and can be cured to a rich lemon color. Dixie Bright 102 needs to be primed when mature and ripe, and the temperature needs to be advanced early and rapidly as the leaf approaches the yellow stage. Otherwise, the leaf sponges easily. With proper ventilation, the leaf will dry at a fairly low temperature and dries quickly. The variety is suitable throughout the state where black shank is severe and where both black shank and Granville wilt are present. We know of no instance where buyers have found any criticism of Dixie Bright 102. The variety did show considerable susceptibility to ring-spot in some cases where ring-spot is a problem. Prices: Oz. \$3.00; 3 ozs. \$8.25; lb. \$39.00, postpaid.

**BLACK ROOT—ROT RESISTANT**

**F273 400, Certified** Noted for production of high quality yields of thin bright tobacco on the more fertile soil types. Resistant to Black Root Rot, a disease that is common on the heavier soil types of the old and middle belts. Best cures are obtained where the leaves ripen thoroughly on the hill. Prices: Oz. \$1.00; 3 ozs. \$2.65; lb. \$13.00, postpaid.

**GRANVILLE WILT RESISTANT**

**F254 Oxford 26, Certified** Resistant to Granville wilt, and recommended only for fields known to be contaminated with Granville wilt. This strain is highly resistant, but for best results should be grown on soil rotated to other crops for 1 to 2 years.

It can be planted closer together in the row for increased yield and the quality compares favorably with other varieties. Our seeds are chemically treated. Prices: Oz. \$2.00; 3 ozs. \$5.25; lb. \$26.00, postpaid.

**F269 Dixie Bright 27, Certified** Has about the same degree of resistance to Granville wilt as Oxford 26. No Black Shank resistance. Yields 200 to 400 pounds more per acre than Oxford 26, but until its characteristics and qualities are better known and understood, it is recommended that each grower limit planting of this variety in 1951 to a barn sized crop. This variety should be allowed to become well mature and ripe before harvest. Prices: Oz. \$3.00; 3 ozs. \$8.25; lb. \$39.00, postpaid.

### HOW TO USE DILUTION TABLE

This Dilution Table indicates the quantities of any given spray material to add to a given quantity of water to give the desired dosage (strength) of spray.

All liquid or semi-liquid materials are proportioned directly on a liquid basis, i.e., 1 to 100 dilution indicates that one gallon of spray material should be diluted with water to make 100 gallons of diluted spray (or three tablespoonfuls to make one gallon of diluted spray).

Dry materials such as Lead Arsenate or "BORDO" are proportioned by mixing a given number of pounds of spray material with water to make each 100 gallons of diluted spray. To aid in mixing, the table shows the smaller quantities of dry materials in convenient household measuring units.

NOTE: When two or more spray materials are combined in one spray mixture the same water is used to dilute all the materials.

# Planet Jr. Tractors and Equipment

## Planet Jr.

The Planet Jr. trade mark has been known in the Implement field since 1871 and Planet Jr. machines and equipment have been sold by our company since 1881. More than three-quarters of a century of experience in design and manufacture is your recommendation to buy a Planet Jr. Garden Tractor.

Ranking above any tractors in their class are the efficient, sturdy and versatile 1½ h.p. and 2½ h.p. tractors shown at left of this page. These sizes are ideal for small farms, nurseries and home gardens. They have a variety of uses with attachments shown at right of page.

At the left below is shown the 3 h.p. and 5 h.p. tractors, which are designed for the farmer who has given up his horse and plans to use power equipment, or the commercial vegetable grower who wants ample power for plowing, harrowing, seeding, cultivating and mowing.

The illustration shows the many features of advantage to you—adjustable handles shaped for easy handling; sturdy construction, actually the frame is welded instead of bolted together; the motor is set well ahead of the wheels, balancing the weight, making it easier to turn at the ends of rows, and providing maximum traction and power beyond the rated horsepower of the motor.

The patented Planet Jr. Jiffy Hitch provides for quick-change of attachments without the use of tools.

You can use it in very narrow rows—as close as 9 inches. You can use it in 42 to 48-inch rows by closing off the flow in three spouts and distributing through the other three—either on the right or left hand side.

The No. 220 spreads fertilizer from 4 to 30 inches on the ground. The hopper capacity is one bushel and the weight of the load is placed over the wheel, making it easy to push. The No. 220 will distribute 100 to 2,000 pounds of commercial fertilizer to the acre. Quantity per acre is regulated by a notched index on the right hand handle. The shut-off rod is operated from the same point.

## NO. 9—PLANET JR. HORSE HOE AND CULTIVATOR

Weight 70 lbs.  
Price: \$26.95

These Planet Jr. Horse Hoes and Cultivators are stronger, better made and finished than any other one-horse cultivators, and enable you to increase your yield, because they do a greater variety of work in corn, potatoes, cotton, beans, tobacco and other crops requiring similar cultivation, and do it more thoroughly. Cultivate deep or shallow, in different width rows, and the extra long frames make them steady running. All Planet Jr. cultivator steels are made of beveled steel thickest down the center, making them self-sharpening, and the points retain their shape and strength. No. 9 has lever expander, allowing quick adjustment for different width rows. Used with or without a wheel.

NO. 9-D Without wheel. Price: \$23.95.

## NO. 4-D—PLANET JR. PLAIN CULTIVATOR

## NO. 100-D—PLANET JR. PLAIN CULTIVATOR

We offer this Cultivator with the object of filling a definite need where lands are light or where farming is done on a modest scale. It weighs but 42 pounds. It will stand hard usage and do excellent work. A steady running tool and easy to handle and adjust.
