IV. Tributary states. These formerly ineluled Burma, Annam, Loochoo, liorea, ete. (see all these titles): but one by one they have slipped from China's grasp.

Chinese Language: the leating member of the group of monosyllabie languages which ocenpy toutheastern Isia, and constitute, with a posible exception or two, the whole of the monosylabic clas. This monosylabism is not, as a lew scholars have held. a state to which they have been reduced by a process of phonetic llecay, but manifestly a primitive condition. It represents a stage out of which all other languages, whe ther of the agglatinative or inflective type, have passed, while these, from arrested development, have remained behind. Thinese words are not only altogether destitute of inflection, but they are hardly parts of speech in the sense which we attach to the term, being to a great extent still in the root state. The same word may, according to its position in the sentence, be nom, adjective, adrerb, or verb: e. g. sin must be varions), translated "fidelity," " faithful," "taithfully," "believe." This indefiniteness, however, attaches to the words only when taken seprately, and disappears in the sentence. Chiefly by the value given to pusition, but partly also (especially in the spoken language) by the use of certain words as signs of grammatical relation, logical precision of statement is attained. Being eut off from the resources of derivation for the multiplication of forms, while the development of sigmifieation has gone on as in other languages the number of homophonous words is very great. The phonetie eombinat ions of which the language adimits are comparatively fer and simple. The number of distinct rocables differs considerably in the rarious dialects. the highest limit being not far from 1,000 and the lowest 500 . By the aid of tones, similar to thnse which we use for the purpose of emphasis and expression, this mumber is increazed two or three fold, being raised in the kwan-hwa to about t.goo. The same phonetic combination pronounced in different tones constitutes so many different words, and so essential a part of the fromuciation is the tone that a wrong tone will sooner occasion misunderstanding of a word than will the substitution of a wrong consonant. In the motern dialects the number of tones varies from four to eight, the smaller number being found in some of the districts of Central China; in the Kwan-hwa there are fire, in the Fuchow and Amor dialects seven, in the Canton eight. The number of works which coincide both in sonnd and tone being, however, still very large, other means are necessary to remove the ambiguity, and in the spoken language phrases composed of two or more words are largely used in the place of simple terms. Two synonyms are frequently this joined: e. g. shu-muh. "tree." Sht and muh have each varions significations besilles that of "tree." but there is no other in which they agree, and the combination thus hecomes definite. Other phrases are taken in a collective sense : e. or. hiung-ti, "older brother, sounger brother." for "brother "or "hrothers": or ins a derived sense: e. g. tung-si, "east-west." for "thing." These phrases, which often extend to four or five words, make a near approach to proper compronds, one of the words uniformly receiring a strongel accent. supported in the case of the loiger phrases by a secondary accent.
Spoken by a population varionsly estimated at from three to four hundred millions, the Clinese not unnaturally is dividen into strongly marked lialects. Of these the Kwanhwa, commonly called by baropeans the mamdatin or court dialent, has the widest eurrency, being poken with minor ditferences over the whole north and west of the empire, and on the east reachine as far south as the Yang-tseKiang. It is, further, the language of oflicial commanication throughout the empire and the only one of the popnlar dialect which has reecived any considenable literary rultivation. Phonctically, it is the porest of the dialects. The only consonant fimals of which it atmits are the nasals $n$ and $n g$, and the somat initinls $b, d, g$. $r, z$, fonm in some of the ather dialects, are wanting here. The southeastern diallects, in the provinces of canton and Fukien, on the other hand, are the mont arehaie, haring pressred the final mutes $p, k, t$. Differine largely in vocabulary, as well as in the form ind tome of the worls cmmon to them. these several diallets are not genemally understoon (exerpot the Kwin-hwa) heyond the himits of a single province. There are in aldition many local dialechs, les marked in charaeter and of a more limited correney. This diversity does not, however, extend to the written languare, which is uniform throughnt the cmpire, ame, to it therree nmap)bronched in any other literature, uniform also thronghout
the whole course of its history. Its development has been to some extent independent of the spoken language, ant forms one of the most interesting chapters in the history of writing.

The date of the invention of the present characters, commonly ascribed to T'sang-kié, about 2600 B. c.. can not be fixed eren approximately, but the history of the successive stages of the development of the system is written in the characters themselves. The first signs were purely ideographic. being rude representations of the objects named. A circle with a point in the center stood for the sun, a crescent for the moon, a three-pointed peak for a mountain. The changes of form which the $y$ hare undergone, arising in part from the ditferent materials nsed in writing. lave left in the present characters little resemblance to the objects pictured. The limits of this method of direet representation were soon reached. A few words denoting position and number were represented by points and strokes: thus a point alove or helow a horizontal line signified "above" or " below": a stroke through the center of a circle, "misdle." The enmbining of two or more signs to express a single idea, either by direct or symbolical representation. was another casy step: thus "water" and "eye" make up the sign for "tear ": "sun "and " moon " for "bright."

By far the greater number of characters, however, are formed on a new principle, the combination of an idengraphic and phonetic element in one sign. The number of homophonons words is, as we have seen, very large, and a sign having been found for one of these, it is used phonetically to represent the sound of the others, being differentiated in each case by an additional sign, which indicates in a general way the meaning. In this combination one of the parts, termed the phonetic or primitive, gives up, its meaning and retains only its sound: the other, the radical, gives up its sombl and retains only the meaning. For example the sylable tao has anong other significations the following : "sword," "anxions," "appetite," "heart of a tree."." long narrow boat." "a species of tish of a slender form." The first of these. "stord," heing represented ideugraphically. the others are written phonetically by the same sign. further defined by the radicals for "heart," " eat," "tree," " boat," "fish."
The number of different phoneties emploved in writing a single vocable is in some cases twenty or more and the aggregate number of characters thus forined may exeeed a hundred. Some characters are used both as phoneties and radicals: and a character composed of a matical and phonetie may itself be employed as a phonetic in forming new characters. The number of phonetics in common use is about 1,000. These phonetics represent the somm of the word as a whole, without analyzing it into its elements.

There is however, it kind of syltabic slelling called Fantsiel, introduced from lndia by Budlhist priests. and first currently used in dictionaries of the fifth and sixth centuries to mark the sound of charactars with more precinion. One series of characters is chosen to represent the initial sounds, another the final sounds. together with the tone ${ }_{+}$ the number of both varying acending to the dialect. Thus ling. "classie," in the dietionary of Kang-hi is suelled with the characters $k$-ien l-ing. thie first being simply the sign of the initial $k$, the second of the final ing.

In the armacment of the chameters Chineae dietionaries follow three ditferent methods. By the first the characters are distributed according to their meaning under a certain mumber of categories, such as heaven, carth, hody, cte. The sucond principle of arrangement is according to the radical part of the character. This appears first in the Shuoh-veen published A. 1), 100 , in which 10,000 characters are arranged under 540 radicals, a number slightly increased in subsequent dictionaries, but in the Tzu-Mrui, jublishell during the Ming dynasty, reduced to 214. This last number is retained in the two primeipal dictionaries of the present dynasty, the Ching-tzu-fung and the $h^{* \prime}$ (tny-hi-fzu-fien. In the last-mentioned work, with is tutal of about 44,000 characters, the number fomd under the different radieals varise from io to 1,300 , or combing duplicate forms, 1.900 , the folfowing radieals having each 1,000 and upward: month, heret, himd, tree woter, plant. luder eacla radical the characters are arranged in the orler of the nomber of strokes eontained in the phonetic. The third and hast method of arrangement is acmorting to the sound uf the characters. The nstal order in works of this class is the following: the characters are divided into four grait clases, accorling to the tone; each tone divided into smabler classes, aceorling to the final sound,
and these sometimes farthor sumbiderl, acemerng to the initials. To this chass helougs the Per-mineynefor, one of the most extensive lexicographical works in any language, It gives by momerous citations the fulles illistration of the usare of the language, and was puhlished in filt in 1 :3 thich volumes of the total number of chameters in the language extravaght statements have of ton been mate. The more complete dictionaries contain from for,000 to bo, (om) of which ohsolete and duplicate forms and proper names make up perhaps one-half. The number of rally litherent Whaters which have the sanction of goox usage is not fin
 fortion of the characters are of rave exempence. ant a
 all the needs of the seholar.

In no langnage are the differences leet wern the liturary and colloquial idioms so great as in Chinese Words aliki in sound hat distinet in meaning heing written with different characters, the precantions against ambiguity required in the poken language are to some extent mane ensary. In the elassical style conciseness is earried to the extremest limit. It is in general true of the classical books that, While to the eye they are definite, to the ear they conver mo meaning. In this ancient style formed kn-wôn, all histor ieal, philosophieal, and critioal warks are still written, and no aceomphishment is so highly watued anong seholars as the mastery of it. Novels and dramatic emmositions, which are regarded as quite inferior classes of literature
 Ghove the collomulal, and, like it, abounding in compound phrases. The Win-chans, the style of the literary eosays, which is also much cultivated, is of a more artificial chatracter than the Ku-wên, and less estermed.

- The relation of the kn-won to the ancient spoken langhaure whether and how far it represents it, and how far it is the prolnct of a merely literary devolophent, are goints unon which scholars ure not armed. Dombless the ("hinese written characters would long ago have given phace fo an aphater ic system had they not bern peouliarly sinited to the genins of the languare, which, being monosylabie, abounds in homophono words. still there are sorions drawheks not the least of which is this, that the lator involved in learning and holding in the memory in many arbitrary chatracters aborbs mo sthall portion of the intelleetual inergy of the people. Attempts hive been made, hot without success, to romanize some of the popular itlions, the tomes heing marken by diacritie signs. Books hawe bern published by miswionaries in this character in the Shanchai. Ningo, Fuchow, and Amoy dialects. To the concise clasical style, lowsere this method is quite inapplicable.

The chinese characters have undergone in the eomrse of their history great changes of form, ath six warition are now in use. These are the Chuenosho or seal chamemer. bisel in seals and ormamental inseriptions; the $L i$-shu, and, elosely relateel to it, the hial-shu, a patlera st yle emphoyed in carpful writing: the Sung-sher, the eommon book ehatracter; the Hiny-x/u, or ruming hatnd: and tle still more abbreviated "grass-character," Ts"en-Izŭ. lı no comatry is the art of calligraphy so highty esterned or so -whlutioly cultivated as in Chima, anl no written character is an welt Mapted to the rlisulay of it.

Of the Chinese languge in quomb we may suy, in conelusion, that, motwithstanding its poremy of forms, it has
 as an instrument of thought to matny. prehapk to most, in flected languages.

Smbson Vas Niste.

naliy $3 t 1$ ，but of six only the titles are preserverl），selected by Conturins as the most worlhy of preservation out of nearly 4．000．The poetical merit of these pieces is rery unequal． but is in general superior to that of later prosuctions．They belong，with few exceptions，to the Chow dynasty，and for the light which they throw on the history and customs of the time are of great value．The fourth place anong the claswies is ocenpied by the Rituals，three in number．The Li－ki，which is designated loy imperial authority as one of the Fiue Classics is a compilation mate in the first century B．c．ont of the oliter litunls．I＇lue last of the Five Classics is the（\％iun Tiviu（Spring and Antumn Amals），the only one of which the athorship can be properly ascribed to Confucius，his lahors upon the others heing merely those of an editor．It is a chronicle of events from 720 to 480 B ．c．． written in continuation of the Shu Fing．In it are recorled thirty－seven eclipses of the sun（the earliest 720 n ．c．），which， with few erceptions，have heen proved bip calculation cor－ rect．The Four Books are next in rank．Two of them，the Ta Mint and the Chiung Jung．formed parts of the Li－ki （Book of Rites），but were botacherl and arranged in the present order loy chu Mi．the great eritic of the twelfth cen－ tury．The Ta Mioh（Great Learning）is a disconrse on the principles of government．in eleven chapters，the first contaming the words of Confncins，and the remaining ten a commentary on them．commonly ascribed to his diseiple， Tsŭng T＇san．The Cthong Fieng（Invariable Mean）is a philowophical treatise，attributed to Kiung lieih，the grand－ son of C＇onfucius，in which the observance of the right mean is set forth as the lighest wisdom amd virtue．The Lun Iru（Miscellaneous Conrersations）of Conlucins and his disciples is a eollection of mostly disconnected sayings， embodying the substance of his teaching．which was alto－ gether of a practical character，on ethics，government， ceremonies，and the like．The last and most extensive of the Four Books contuins the works of Jlencius，who now ranks second only to Confucius in the general esteem． thongh not until the $t$ welfth century were his writ ings defi－ nitely almitted in a place among the classics．All of these are now accessible to the English reader in Dr．Legge＇s ex－ cellent translation．IIs edition of the Chinese classies， published at IIongkong， $186 \mathrm{t}-\mathrm{F}_{2}$ in the original text，with translation，elaborate introductions and notes，inclnded the Four Bowhs．Shu King．Shi Jing．and Chun Ts＇iu． The translations have also for the most part been separately pmblished，and the series has since been completed in the Shered Bools of the East，where his translation of the Fih King forms the sixteenth volume，and the Li－hi the twenty－seventh and twenty－eighth volumes．Many other works bear the title of king（elassic）；nor is it confined to the orthodox school，hut applied also to the eanonical books of the Troist and Buddhist faiths，and even to works of a more miscellaneons character，such as important teehnical writings．Thus we have the rlír Kigg（＇lea Classic），on the enltnre of the tea－plant，and the Shan－hai Fing（IItl）and River Classie），an aneient gengraphical work from which many poctical allusions are bortowed．

The historical works，which are very voluminons，fall mostly into three classes．First in importance are the his－ tories of the several dynasties，the work of official histori－ ographers，and construeted mostly on a miform plan．The variety of subjects treated of．each in a distinct section． gives them an cheyclopatie eharacter．The ordor．varying sunewhat in the suarate works．is in general the followines： First．The personal history of the successive emperors of the dynasty，followed by a series of memoirs on chronology． rites，music，jurisprudance，political eononny．state saeri－ fice，astronomy intlume of the five elements．geography． and literature closing with biographers of the eminent men of the dymsty，and historical and erographieal notices of foreion inations．The series as at presint nstublished con－ sists of twent y－four historiss，compriving 3．364 books．They are of very unerplat merit：some of them the work of single nuthors，ethers prepared by a homid of schohars．The secoma class of histories follows a elronologieal order．The most celebrated creneral history on this plan is the Tan－chik－f ung－ kien of S九ur－ma－下゙wang，a writor of the elowenth century．It was revisal in the next conthry under the direction of（＂hu Ifi，ant pulblisherl with the title Thug－kien－krug－muh．C＇on－ tinuations were adhed in the following dynusties．Ibe Nailla translated it into French（Paris， $17 \div 7-\infty 3,12$ vols．， 4to）．The ubridement of the above work，entitlerk fiang－ Kien－i－chi－luh（History Male liasy），is ome of the most nse－ fnl compendinms．Another chas of works，ealled Complete

Pecords，follows neither the one nor the other of the abore methods，but gives with more freedom of arrangement a general surveg of the subject treated．

In liographies the literature is unusually rich．Besiries the space accorded to them in the dynastic histories and in statistical works，separate biographies，many of them of a collective character．abound．
The geographical works are hardly surpassed in extent by those of any country．There are works on the gengra－ phy of the whole empire．such as the Ta－tsing－yith－c ung－rhi， published anter the present dynasty，which give nnder eneh， province the topograplay，popuation，taxes，ete．：under each prefecture and department．the antiquities，public works，eminent and notorious characters born there，pro－ ductions of the soil，and a varicty of other details．In ad－ dition，every province，every prefecture，every department． neanly every district，and frequently a town or famons locality within a dislrict，has its separate description， amonnting in all to thonsands of volumes．Some of these works are of considerable antiquity，and in succesaire edi－ tions have been gradually enlarged．Of the listory and gengraphy of Eastern Asia，beyond the limits of the empire， Chinese jiterature contains many valuable notices．The accomnts of the journers of Budahist pilgrims to India be－ tween the fondth and the tenth eenturies are the most im－ portant sonrees of information for the history of Buddhism in India drring that nerior that we possess．

The three principal philosophical and religions sects．the Confuchanists．Taoists，and Buddhists，have each an exten－ sive literature．Of the orthodox school the most celtbrated among the near successurs of Confucius and Mencius was Sun－tzu．who held，in ojprosition to Nencius，to the original depravity of human nature．In the eleventh and twelfth eenturies，under the Sung dynasty，Chow－tzŭ，and especialf Chu IIi，gave a new impulse，and in some particular＇s a new direction．to philosophical speculation．The authority of Chu Hi．who was equally eminent as a commentator of the classices and in other flepartments of literature，has remained paramount to the present day，though under the present dymasty there is some disposition to rebel against it．Lao－ tzŭ，the founder of the Taoist school，was a eontemporary of Confueins．The prineipal texts of Taoism，trunslated by Dr．Legge，are contained in The Sacred Books of the East， rols．xxxix．，x．，Oxfort，1891．Taoism has long since degenerated into superstitious practices，its followers being devoted to magie，aldchemy，and the like．Bnddhism was introuluced from India in the first century of our era．The earliest translation from the Sanskrit．the Sutru of Forty－ turo bections，was marle A．D．67，and for several centuries there was constant aetivity in this work．The catalogue of Chi－shing，published in 730 ，gives a list of 2,278 separate Works which had been translated up to that date．These constitute the more important part of the literatme of Chi－ nese Budahism，though in the fifth and sixth centuries original works began to appear．and have since greatly mul－ tiplied．
In the history of Chinese poetry there are two distinetly marked periods．In the earlis，previons to the T＇ang dy－ nastr，the st ructure was less artificial and the rhythm freer． In the Shi King the verses are mostly of four syllahles； the thrme is often imperfect，and sometimes altogether wanting．In the $T$ ang period a more rigid consecntion of tones was introduced．and verses of five and seven syllables betame the favorites．The tones for rhythmical purposes are divided into two classes－the ping or＂＂even＂tone con－ stituting one．while the other three tones are considered ＂nneven．＂In every verse the first，thirl．and fifth sylables are indifferent with repeet to tone：the second，fourth， and sixth must alternate，so that the orter is either＂even，＂ ＂nneven，＂＂even＂；or＂uneren，＂＂even，＂＂nneren．＂
The weakest siok of Chinese literature is the scientific． It lits a tolembly complete system of arithmetic，nlder than the Christian era，a system of algebra which dates from the thirteenth century，but no theoretical astronomy worthy of the name，exeept what is borrowed from the West．For the reculation of the ealendar，and for astrologieal purposes， observations of a simple character were very early made， and numerons eclipses recorled．Wuring the Ming dynasty mathematical knowledge hat greatly declined，and the first desuit missionaries recommended themselves to the impe－ rial faror chietly by their aequirements in this science． The mathematical works since pulblished are mainly based on Enropean methods．Medical writers are numerous，and some of them very aneient，but the science，notwithstand－
ing its long history，has male little progers．The che fork on materia mediea in the／＂m－Ts＇rm，in tifty－t wo hot com－ piled by Li shi－chin of the Ming dynasty．He made extracts from more than sim marlier writers，and gives sum medica－ ments，selected and orimimal．

（＇hinookin Indians：This linguivice family of Imtians inchules a number of triber whose former homese extendend along the＇olumbia river．chiefly man the northera hank， from its month to the balles athont ？ut miles．＇Their vil－ lages also extended along the Pacitic const from and inelnd－ ine honer lamel，in Shalwater bay，on the N．．．to about Tillamerk Weat，some 20 miles S．of the mouth of the Co－ lumbia．Fohlowing are the most important Chinowkan tribs： Louer Chimut，Chinuk ant Chatsop：I＇pper Chinck，Cath－ lanut，C＇athlapotle，Chiluckquittoguaw，Clakuma，Kıniak， Wehnelont，Ahltnoma，Wihkiakum，Wasere
The Chinookan may he regarded as typical representa－ tives of the fishing tribes of the morthwist contat，deriving their subsistence from the salmon－fisheries，and，to a wery slight extent，from berries am rents．The remaining neces－ sitios and luxuries of savage life，above those ohtanable by their own efforts such ass skins for dothing，ormaments， efe．，they tormerly procured by barter chaifly for dried sal－ mon and ronts．Their trade was extensive，mot only among tribes of their own language lut also with inland ludians of the shahap，ian，Kalapooian，Salishan，and other stocks． and eviduce is mot wanting to show that this early intertri－ bal trate had received monch impeths from the preseme of white traders at the mouth of the Columbia．firm their proximity to Astoria，the Chinuk proper early became well known，and their language formed the hasis of the widely spmand trade jargon which is still used as a methom of com－ manieation hetween the whites and the varions lotian tribes of this region．
Whe hand of the Cbinuk only was found by Tewis and 1 larke in possersion of horses，the Weocksocwillacum ahove the（foseades，and most of the down or more owned by them lad recently been taken from the methboring shoshonean tribes．Dis remarked hy lewis and（larke most of the（lhimak country was so densedy womded as to fortrid the mase of horxes．

Thungh hardly to le callod warlike，the Chimk were fuarresome，and maintained a petty warfare among them－ selves anid with the shoshonj and other tribes．
Though conforming in apparance and in their generald hathits，the Chinookan tribes premented the the arly（ol）－ verwormy minor wints of ditierence．＇Thas it is stated by Lewis and Clarke that on tha lower part of the Colum－ that the practice of head－flattening was universal．while on the unger pant the practive was limited to a few of the women．
sharery largely prevaled anong the（＇himak．They ob－ （ainal blives ly（a）ature or hy purchase．
hittle 1 s known of the ir tribal lawsor of their soeial and phlitical usates．There apears to have been no such thing as a pulitical union of the（＇hinowkn tribes as a whob，of imend of any eonsiderable pat of them．They serm to have lived a nerally in small commonities，the size and lu－ cation of which were determinet ly the sensem and by the
 rathons were alwas sitmet at falls or ragids．＂lowe were monemally recardid as indolent，thievish，and ireacherous．
 promal populaty or uther canse，sems to have bera able （le extend at hast a monimal antherity over comtignons vil－ lay．．．suraking closely atherd diabects．
The thimk were in the main a sedentary people，themerh frophent changre of residence from one fishing－point to an－ other were common，as from a sumber to a winher location－

 fiftern to f wentr indivilmate to ench lomse．
 Charke for the lodian pughation were estimates，made with all the atre powible under the circumstames．They paned thrensh the ereater part of tho＇lhinowan temitury i wice． brabubly visited al great many of their settlements，and in
 tatement of the Chinakan gepplation is probably to be act

excessive when the extent of comutry inhalited and the ahundant fool-supply are eonsidered. Evidence is given by Lewis and Clarke that some four years previons to their visit, or abont lson, a reduction which had ocenred in the mumlee of the (latwo tribe at the month of the Columbia was attributed to smalipox. Practimally, howerer. the Indian tribes along the river were found by the travelers in their pristine condition.
There are and Wase on the W:um Spring reservation, Gregon. and 1.50 on the Yakama reservation, Washingtorn. On the cirande lionde reservation, Oregon, there are 59 Clakama. It is learned that there still remain three or four lamilie: probably belonging to one of the down-river tribes, about $f$ iniles abme the month of the Columbia. Two of these speak the chimuk proper, and three have an imperfeet command of Clatson). There are eight or ten families, probably also of one of the lower river tribes, living near Freeport, Wiash.

Some of the Wathata, or Cpper Chinuk, live near the Caventes abont in miles holow the Dalles. There thes remain probably het ween aut and 600 of the lutians of this family.

 ters, late productions, unter the name of Chon, are eelited

Chipman, Hiviel, Lis, 1): h, in Salishmpy (omm., Nov. 15, linä; graduated at bartmonth in liser; became distimpuithed as a lawyer ant an anthor. Ile was a member
 politics of that state. Ife pulainhed is valuable work on
 preme ('surt of l'ermont ( $1 \times 24$ ) ; and other works. D. in Ripitm, Vit., Ipr. 23, 1世.ju.
Chipman. Nathasela, ILa. D: : shlifer ant jurist ; brother of Dani-l ('hipman: b, in Salishury conn.. Now, 15, 125? grachated at Yate in 1 :is. He was an ollicer of the Revo-
lutionary army : was admitted to the har in 1779; chief justice of Terimont ror several vears: julge of the U. S. district court for Termont (1791-93) ; and [. S. Senator 179-180\%. His work on the laws of Vermont are highly commented. He published Principles of Gorermment ( 1733 ) and other works. D. in Tinmonth. Vt., Fels. 15, 1843. See his Life by his brother Diniel (1846).

Chipman. Warn, LL. 1): a jurist of New Brunswick; son of a Tory refugee trom Missaehusetts to that province; 1) in St. Jolin. July 10, 17~T: graduated at llarvard in 1804. He succeetled his father as jutge in 1824, and as boundary commissinner : became chief justice of the supreme Court of the province in 1834 , and was proninent in its legislature. D. in St. John, Dec. 2th, 18.51.

Chipmonk : a popular name in the U . S. for tarions small sround sifuirrels of the genus Tamias, more particularly for the common Tramiras striatus. This little striped

sipuirrel is about 10 inches in total length, reddish brown above. white below, marked with two white and five black longitudinal stripes. It is abundaut throughout the Eastem U. S., N. of the lowlants of the southern States. It feeds on nuts, seeds, and grain. laying up a store for winter's use; as muel as two pecks of jrorision have been taken from a single burrow. see also Siduride. F. A. Lucas.
Chip'pawa: a pmet-vilage and port of entry of Ontario, Dominion of Canala, Weltand County; on the Niagara river: about 3 mites above Niagata Fills (for location, see map of Ontario, ref. 5-E). This village is memorable as the scene of an important victory of a portion of the $\mathrm{U}^{\top}$. S. army under Maj-Aten. Joseph Brown (mat see Scotr, WinFIELD) over a superior Britisl force under Maj-Gen. Jial, July $\bar{i}, 1814$. The number actually engagen on the $\mathbb{V}$. S. wide was 1.100 : the British force numbered 2,100 . The T . S . luss in killed and womded was 328 : the British loss was reported at 50.5 .

Chipprwa [native. Ojiburay or ofitheme]: a river of Wisconsin: rises in Jham Comery Jlows nearly southwestward throngh Chipuewa ant other counties; enters The Mississippi river at the foot of Lake Pepin: length about $2 \geqslant 0$ miles. It traverses extensive forests of pine.

Chinpowa Falls: city and railroal junction; capital of Chippewa co., W'is. (for focation of comnty, see map of W is(cunsin, ref. 3- $\boldsymbol{c}^{\prime}$ ) : on Chipuewa river. It has gas and eleetrie light, complete system of watr-works, graded schools, ample water-power. several mills, aml extensive manufactures of lumber. Pop. (1880) 3.982; (1890) 8,6.0; (1890) ?, 196.

Editor of " Independext."
Chippewas: Sce Algonquian Indmas.
Chipping Barnet: town, Englaml. Se Baraet.
Chipping Bird, or Chippine Nbarow: a common little North Ameriean bim (spizelle socialis, Bonap.). It is between 5 and 6 inches long, whitish muterneath, crown chestnut. hack and sides ashen, with streaks of white and hack. Its song comsists of six or seven motes rapidly repeaterl.

Chituidi'gui Palm, or Piassa'la Palu: the Leopoldima pinsselia: a tree of the Palm family, found in the tropical portions of south America, from whieh much of the piassahat fiber of commeree is derivet. It bears large pinate leares. Which, after lying, remain hanging from the trunks until they finally split up intu tungled masses of fibers, giving them an unsighty apmearance. The fiber is
collected and sent to bitope amel Amerben，where it is mate into brooms，cordage，ete．This tree is neatly velated to the
 name of pasiaba jralm，since it yichls a similar filuer．

Revised by F．Stcrges Alles．
Chinsi．kereonsee：a town of Italy；province of siena in the Val di Chiana（sce map of Italy，ref．4－I＇）：the resi－ dence of a bishop；has a large cathertral．It was the Clu－ sium of the ancients，one of the twelvecilies of the Birns－ can confederation，and the headquarters of Porsena．Its museum contains a very interesting collection of Etruscan bronzes．mirrors，vases．fnneral nins，etc．，foum in the riein－ ity．In Dinte＂s time the district was a＂prestilential pool．＂ but the drainage of the Chima in 1816 has brought fertility to the valley and prosperity to the town．Pop． $5,005$.

Chivalry［from O．Fr．cheralerie：Ital．camalleria（whenee Fr．caralerie．Eng．cavalry）．from deriv，of Lat．caballa－ rius．horsman，hostler］：the system or dignitr of knight－ hood；originally a body or assembly of knights or horse－ men．The word has the same etrinology as coralry．and in the Italian and Spanish langnages the same term is used for both．Chivalr？was an institulion originating in the Middle Ages．Its origin is to be traced to the costoms and sentiments of＇Teutonic nations．especially remarkable for the respect which they evinced for the female sex，and for their develofment of the feudil srstem．It was essentially aristouratic，and included military accomplishments，the relation of vassal to his lorl．the defense of women and derotion to their honor and persons．The moral and social standard of the justitution were high，and the manuers in－ culcated heroic and elevated．The ceremonial relation as－ sumed by the Church to Kisighthoon（q．$\ell_{\text {．}}$ ）enhanced these ideals．and tended to make them the common rule of life for lersons of gentle hirth，althongh in conduct individuals fregnently fill far below them．Withont chivalry the cou－ sades could mot have taken the form or proportions which they did．The appearance of chivaly marks the transition of fendalism from riolence to culture．It gave rise to the literature of chroniclers，like Villehardouin and Froissart，of troubadours and troureres and other medineval singers．Its extravagances were ridiculed by Cervantes，but it created traditions of manners．peetry，and art which still have force in society．In English law chivalry denotes a land－temure conditioned on the perfomance of kight－sertice．It wasa service the the crown．aml was ordinarily of a military na－ ture for forty dars annualle，but by commntations it was vale to risappear．

The Conrl of Chimlry was instituted hy Edward 111. requlated hy litchard II．in 1090．and of it the earl marshal and the lurd high constable were joint juders．When both bere present the comt hat summary juristiction in erimi－ nal cases ：the earl－marshal sitting alone constituted a conrt of honor．It is represented now only ty the earl marshal of the lleralds College，a sinecure heveditary in the dukedom of Norfolk．

Chivasso．kee－raas sio：a town of Italy：provinee of Tu－ rin：on the left bank of the l？o，near the intlux of the Oreo （sce map）of Italy，ref．3－13）．It was at one time considered the key to Piedinont，hut its fortifications were lestroyed in 1804 he the French，and it now has no military inmortance． It carries on some trate in grain and wool．Pop， $4,350$.

Chiforiy．Phimpe lltraidt，Comede：memoir－writer： b．at（hiverny，in liftany，Nar，25，152s．He reccived it Government whice in 150 ？throngh the inthence of Marie de
 accessim of llenry IV．．．he was received into favor with that monarch．Whioln lasted until his death at Chiverny，July 2 ？ 150！9．His work．Mimoires d＇listat de 1hessire lhilippe Ilurrult．etc．．was first pmintel in Paris in 16：36．

Chives．or Cives：a garden name for Allium seloneno－ prosum，a small onion－like plant，which is wikd in Europe and the northern parts of Xorth America．It is grown in gardens for the shenter hollow leaves，which are nsed for flavoring in soupsor sows．it is a peremial phat，grow－ ing in tonch champs and bearing rose－purple flowers in derne erect umbels or hearls．The plant grows to a hight of of to 10 inches．It is propagater lyy dividing the clumps． Chives is little grown in the U． $\begin{aligned} & \text { ．}\end{aligned}$
 publie: in the provinee of limems A yors and almut 100 miles mest of the city of Themes Ayme with which it is enosnected by rail. It is sithated in the center of a rech gra\%ing ragion, settled principally by Italiam, Batsige, and lierman inmigrants. The town is well built, with wide strects. excellent sharis, a theater, frea library, cluth-houses. cte. P'o. ( 1850 ) 11,000 , and rapidly growins.

('hlaroal [from firet sylable of chlorime and the tits

 stored to itcoriginal form by lomat. With wator it imme at ablibl harlrate known as chlural hyalrate on lighate of chmo
ral, which is now mach used in medicine as a hymotic. Liebreich introluced chlotal as a hypnotic, thinking that it would be broken up into chloroform and formic acid in the animal bouly. This is, howerer, not the casc. Chloral acts ate chloral and is eliminated from the bode as uroelaloralic accic?. The dose is from 10 to 20 grains to an adult. Much harger doses have been given with no bad results, but well-authenticated fatal cases of chloral poisoning indicate the necessity of cantion in its nse. The sleep pronduced by hydrate of chloral is wonderinlly sweet and refreshing to most patients. Hydrate of chloral sometimes increases hysterical symptons, and moless well diluted is irritant to the stomach. It is peenliarly valuable in tetams. (tiven in large doses, it powerfully diminishes reflex action, and is a physiological antidote in jrisoning ly strychnia. Croton chloral is a by-product in the manufacture of chloral. It possenses similit properties in less degree, unites with water to form a hyedrate, and is used in medicine as a hymotic. It is chiefly userl as a memely for neuralgia, in which chloral itself is not as efficacious. See Ilydrate of Crotox Chloral. lievised by 1l. A. Hare.
Chlo'rate : a compond formel by the replacement of the hydrogen of choric acid hy a metallic element. The best known of these salts is potassiam chlorate ( $\mathrm{KClO}_{3}$ ), which, mixed witl combustibles, such is sulphur and chareoal, forms highly explosive compunds, which ignite by a blow or friction. It is also a useful medicine. See culoric Acid.
Chlorhydrie Acid: See Ilybrochloric Aim.
Chloric Icid ( $\mathrm{HClO}_{3}$ ): forms with potash the white erystalline salt ealled potassium chlorate, or chlorate of potasl. ( See Chlorate.) 'lhis acid is a simpy licuid, setfing fire to dry organic sulstances with which it comes in contact.
Chlo'rine [from Gr. $\chi \lambda \omega \rho \delta s$, green + suffix -ine]: one of the seventy chemical elements. It occurs in nature in very large quantitics hut alyays in combination. The most widely distributed ind abundant compound containing it is common salt, or sodium chloride. It was carly fombd that when this compound is treated with sulphuric aciel an acid is formed. This is now called hydrochlorie acid, but it was once called muriatic acich. In 1 irt Scheele, in the course of an inrestigation on black oxide of minganese, or pyrolusite, treated this compound with muriatic acid and obtained chlorine, whel he studied very thoronghly. It was smposer] to contain oxygen. It forms an acid without the addition of oxygen. but at that time it was regarted as necessary that all acils should contain oxyen. It has been prover. however, berond a donbt that notling simpler can be ohtained from chlorine than chlorine itself. and so it is regariled as an element. It belongs to the family of the halogens, of which thumine, homine, and ionline are the other members. It is formed most easily by the method used by scheele-that is, hy treating black oxide of manganese with hydrochloric acill. It is mate also hy passing hydrodhloric acid gats mised with air orer clay balls saturated with a solution of blue vitriol and heateil to a rather high temperature. Chlorine is a greenish-yellow gas of extremely disagreable whor. It acts with great energy upon most substances. Ilisintegrating them and forming new compounds, amone which are chlorides, by a process analogons to ordinary Combestion (q. $r^{\circ}$ ). When imhaled it teanses most nememfortale sensations in the fhroat, and in large quantitics it is very dangerous. Its chief use is for beaching. It is passed into lime, and thus a compound of lime and chlorine, known as haching-powder or "chloride of lime" is formed. When this is dissolved in water in contact with the air, the sohution is an excellent bleacher. The chemical symbol of chomine is ('l, its atomice weight 35.4 . Binary emmponels of chorice acid athl an element or radical are chlorides.
lra liemen.
Chlorrite |from (ir. $x$ 入apos, green, with suffix -ite]: the name of a group of minerals emmpoed of varions propertions of hydrous silicates of aluminimm, magresinm, and ferrons iron. They are genorally of various shade of gren in color, and in structure resemibe mice, bat some are granular. They are soft and yield minsly to the knife. I chlorite in chemintry is a satt formed by chlorous acid.

Chlorroform from the dirst syllable of chlorime the first syllable of formyl, of which it was comsidered to he a trichloridel: a heary coloness, and very volatile liquid, which is mot inflammahle, and possesses a sweet tasto amb it neutral reaction. It is soluble in about 200 parts of water
and in all proportions in alcohol and ether. Becanse of its power as a solvent it is sometimes used by chemists and phamacists for other than medicinal purposes. The only chloroform which should be used in medicine is known as Choroformum purificutum. It has a formula of $\mathrm{CHCl}_{s}$ and a molecular weight of 11908 , and shouhd contain, according to the L. S. Phamacopreia, 49 per cent. by weight of pure ehtoroform and only 1 per cent. of alcohol. It should he kept in a dark-glasis stoppered bottle and in a cool dark place. Jocally applied to the skin chloroform is capable of prolucing very considerable irritation and even blisters if evaporation is prevented. When inhaled it rery speedily procluces a condition of anasithesia and unconscionsness during which any major surgical operation may be performed without pain to the patient. It was first introluced into medicine as a general anasthetic by simpson, of Edinburgh. The substance itself was originally discovered by Guthrie, of sackett's Harbor. N. Y., and also almost simultaneously by Snubeiran, of France. Githrie, however, failed to recognize it as chloroform, and called it chloric ether.

Much diseussion has arisen in the medical profession as to the safety of this inarethetic. The enormons amount of statistics that has been collected proves that the death-rate all over the world from the alministration of chloroform is about 1 to 3.000 administrations, while that of ether varies from 1 in 6.000 to $1 \mathrm{im} 13,000$ administrations. It is evident, therefore that chloroform is meln the more dangerous drug. The advantages which it possesses are its rapidity of action, the fact that only a small quantity is required to anasthetize the patient, and again that its inhalation, to most patients, is not very disagreeable. On the other hant, there is no doult that it possesses very powerfu] depressing influences which are chiclly exercised upon the two vital functions of respisation and the heart.
Chloroform is sonetimes used internally, generally in the form of the "spirit of chloroform." in the dose of 1 to 5 drops for the relief of ahdominal pain and for the removal of tapeworm, when used by inhalation. In such cases it should always be diluted with water.
H. A. Hare.

Choke-cherry: the common name of Prmus rirginiana and its fruit: a suecies of biml-cherry; a native of North America; the fruit is very astringent.

Chokedamp: See Carbonic Acid.
Chok'ing: the ohstruction of the pharynx or asophagus, or more rarely of the larynx or trachea, by masses of food or other foreign bodies. Choking by olistruction of the pharynx or asophagus is sometimes relieved by the operation of an emetic, sometimes by the use of gullet-forceps, of which there are many varieties or by other appropriate instrmments. (Esophagotomy, or chtting, has heen resorted to, but this is one of the most formidable operations of surgery, ant is not often necessary. When forelisn bodies lodige in the larynx, aphonia, or loss of voice, is one of the symptoms. If the substance is in the windpipe or bronchi, the smraeon may otten detect its presence by auseultation. The symptoms cansed by foreign bodies in the asoplagus are often surpasimgly like those which occur when similar bolles lolge in the atir-prassages. These symptoms are various: there may te spasmodie eonghing, redness of the fucr. ineffectual attempts to swallow, unnsmal discharge of saliva. aml generally groat liftieulty of breathing. There is also a great tembiney on the part of the patient to liend the head back, and thus to increase the diticulty in breathing by bressing the foreign borly against the trachea.

## Revised by William Pepper.

Cholera, kol'e-ra [Gr. xoдє́pa, used by Ilippoerates as name for cholera nostras, from $\chi$ o入ń, bile]: an acute infections disease in which purging and vomiting are prominent symptoms. The home of genuine Asiatie cholera is in Indii, whence all its great epidenics have taken origin. The first outbreak of which we have aecurate recorl oceurred in 1817, and the disease first appeared in Europe in notable legree in 18:30-39, sinee which time a number of çidemies have occirral, the one in 1866 being noteworthy, that of 1892 in Russia, France, Italy, and JIamburg also being sever". The disease has appeared in epidemic proportions in Amprica a mumber of times, the outbreaks of 1832,1849 . 1854, and 1866 being motable examples. The nature and history of the disease hat long made it clear to the minds of the medionl profossion that an infections ageney is operative in the profluction of cholefil : but the actual demonstration of the specifie germ remained for the genims of Koch, who discovered the "bacillus of cholera" in Egypt in 188", a year after communication of his still more important iniscovery of the ranse of thberenlosis. The bacilus of cholera is a short rorl-slaped orgimsm generally presenting a slight earve, whence tha mame hy which it is often known, "comman hacillus": but nobler certain eiremmstances it is seen as lonir spiral threarls, amb is therefore, strictly speaking, a spirillum. This organism ocenrs only in the intestinal canal ant contents, never in the blood or distant organs. There is 1 un longer much question as to the method of infertion. I'ure contagiousnews, that is, infection by association with a patimet hy emanations, an the like, probahly never orrurs. The dejecta being cast ont are preservel in the snil, the grrms enter water which is afterward drank, ame the disense so producoll. Other methods may ocemr, but this is wouhtless the mont eommon. The bacilli have bren athatly discovered in water supplied for drinking in cisfoms. The nature of the soi] has some part in the propagation of the disease, but this is certainly of less importance than was formerly helieved. The fact that the poison dows mot heorme disisinimated by the air and wimd is well proved by the ubservition that choblera proceeds from plaee to place afonge the heaten lines uf travel. and no more rapitlly than the means of laman imeremmmanisation rember it. possihle.

Ephinemicos of clonerit are apt to oreme during the summer montho, like cloolera morbus. a similar but entimely distinct diseave. In the carly part of an ephamic, and to an extent dhring its conser, casis of cholera. presenting nosymploms hegome at milel wiatmath, are ipt to oocur. These rases, colleal cholorine, are as infectious os the sevore attakes,
 Womal forms ary also nshereal in with slight diarthoan, attemeleal with malaise and aneral dabersions. Later the de-
 "onsisting of large guthtities of watry flaid contaming lowsende epithelimm from the bewel-wald ("rice-water discharges"). At tha same time romiting begins and grows in
intensity and the patient's general condition grows more and more profoumbly depressed, until in the last or " algin stage" he lies collapset, with cold exterior, pinched features, whisnering or alsent roice, and finally death. There is rarely much abomminal pain, but there is eommonly mueh cramplike pain and tenderness in the limbs. It is at tinses diftieult to distinguish violent cases of cholera morbus from true Asiafic cholera; but the presence of the comma bacillus, which is not ditlientt to demonstrite, is an infallible test. Cholera infanlum, also similar in its clinical manifestations, is an entirely distinct disease, and clistinguisherl by the ahsence of Koch's bacillus.
-The treatment of the disease is of little importance compared with the prevention. The dejections of each case must be rigiclly guarded, being receired at once into strong solutions of carbolie acil. The patient slould, as far as possihle, be isolated in a healthful locality. Lvery person in the aftected locality must exereise the most scrupulous premonal cleanliness and attention to his general health. Fspecially must any tendency to diarhou or disturbance of the stomich be righted at once. Sinitary corrons have been found of much less value than was expected, and are looked upon by many as useless and unjustifithle. Water. millk, and foots in general should be boiled or heated before being usch. The treatment of the disease consists largely in palliation of the symptoms, with supporting measures. During the early stage of diarrhai it is necessary to check this, to which end some adrise opimm, others more simple remerlies, as bismuth. During the stage of collapse it is necessury to supply the finids wasted by the enormons discharges, and this is best done by injecting large quantities of weak salt solution under the skin or into the rectum. Further, it will be necessary in this stage to supply extermal heat. stimulants, und supporting measures, but generally they prove of little avail. The mortality is sometimes frighttully ligh ( 50 to 70 per cent.), but generally is considerably less than this.

William Pepper.
Cholroa Infan'tnm, or Acute Intestinal Cafarrh: a severe and flangerons form of infantile diarrhas, seen prinripally during the first two vears of life, and more commonly amonir the poor, hut not confined to them. It is most frefuently ohserved in hot elimates, amd furing the hot season in inore temperate zones, not alone in the E. S. but in Europe as well, occurbug just as frequently during the first as the second summer. It has 10 direct relation to dentition, which is illogieally aconsed of being the cimse of many infantile diseases: it also is but rarely due to exprosure, or to mental emotions of infant, mother, or wet-nurse. Usually the eatuse is found in improper feeding, especially during lont weather ; the former does direct injury, and the latter; by dehilitating the nerrous system and lowering the fumetions of all the digestive organs, dimibishes the general strengtls and power of endurance. Thus murslings ire but seldom affected, and many infants will reenvel from an athack by beiug returned to the mother's breast. It may be noted, howerer, that an inproper condition of the breast-milk-i. に. umdue proportion of water, fat, or eascin, admixture of medicinal agents taken by mother or nurse, or a change probluced by mental emotions in the latter-are known to be injurious. Artificially fed bubies and thoso ahraty weaned are mostly attacked. Artificial food is selflom identical in mutritive value with mother's milk: cow's milk contains more butter and rasein than the former, and requires builing, skimming, and subseguent dilution with water, preferably barley water. Vegetable food is clangerous, moness carefully selected and prepareal.

Onset of the lisease is eharacterized hy womiting, oftentimes incossant, and frequent protuse diarlocal passiges. very oftomsive. hoth contabing varicties of undigested fond, particularly large curds of milk; later, the stouls are more watery, with an arjul or fetid olorr, and more ur less vomit. ing contimus. These passages eontain many bacteria, mone of which is consildew characteristic of the attection; they concouragy the formation of poisomons products of deeompoition, whill att on the system. Joaning. erving, and
 rapidly daprivel of atherertion of the water entained in it, ematianos; the cyes lie derp in the orthits; sutures and fontane Jles of the skall sink; the skin beomes dry am ashy;
 while tha bouly temperature rises; the palke becomes rapid and wemk: the voice is feehlo. and the exprexsion listless.

Chop＇tank：a river which rises in kent co．．Itel．．and flows sonthwestward into Maryland．It expands into an estuary．forming the boundary between Talhot and Ior－ chester Counties，and conumunicates with Cherapeake Bay． Length nearly 100 miles．Slons can ascend it abont $\dot{3} 0$ miles．

## Chopmuish Imdians：See Shafaptias lsdass，

Choragus，kō－riy＇gŭs，or Choregus（in Attic Gr．xopnyos）： originally an Athenian citizen appointed by the state to be the leader and trainer of a chorus in dramatic contests in Athens．Later the functions of the choragus was to supply the money necessary for living and feeding the coach and the chorentie．for the purchase of costumes，and the rent of training quarters．Il is prize consisted of a crown and tri－ pod；he might build a monmment and on it expose his tripod．
Chu＇ral，or Cliora＇le［Fr，choral．Med．Lat．chorälis； deriv．of chorus］：a tune written or arranged for a hymmor psalm to be sung by a congregation in public worship．This style of music has its origin in the Enchiridion of Luther and Walther（ 1594 ），and the Lutheran Chureh produced many subsequent collections．The melody was given in then to the tenor．and there were at times even five and sis parts．The greatest composer of such music was Johann Crüger（ $152 \mathrm{~S}-166 \%$ ），whose Praxis Pietatis Melica（ 1649 ）pre－ serves much of his work．Sebastian Bach．a hundred rears later，applied counterpoint to many of these themes，and from his time the old chorales have had great influence on the development of I＇rotestant chureh music in Great Brit－ ain and on the European continent．In Germany they are still sung in unison，and slowly and strongly with orgain ac－ companiment ：but much Enclish choral music is in parts． It involres a development of harmony．is stately，devont， and excellently adapted to congregational singing．In the Roman Catholic Churcla a choral is any part of the service which is sung by the whole choir．

Chord［a spelling of cord to adapt it to etymol．：Lat． chorld，Gr，xop $\delta$ 斤，a string of gut ］：in geometry，the straight lite which joins the two extremities of the are of a curve；so called because while the are resembles the how （arcus），the chord may be likened to the bowstring．The chord of a circular are may be found by multiplying the radius by twice the sine of half the angle which the are subtends．The use of chords in trigonometry is motly supersetied by the use of sines．

Since two circles can ent each other in only two pints． ther can have only one common chord．But by Poncelet＇s ＂principle of continuity．＂to which modern geometry owes so much．the circle may be considered as a curve of the second order，and as such two circles may be said to have four points of intersection，two of which are，however， alrays imaginary．These imaginary points are called＂cir－ cular points at infinity．＂This riew also gives the two cir－ cles sis common chords instead of one．Four of these chords are imaginary，and the fifth is infinitely distant； while the sixth（and most obvious）chord may or may not cut the two circles in real prints．Thi，last chord is often called the ratical axis，and has many remarkable proper－ ties．See Geomptry．

## Chom，in masic：Sce Coxsonamef．

Chom＇ua dorsa＇lis：See Notochord．
Cloorda＇ta［from lat．chorda，a cord］：Since the term rertebrata implies the existence of a back bone nade up of separate vertebra，it has been foum necessary to make a new term to include not only the true vertelrates but sev－ eral other forms tlosely allied to them．yet which lack the separate vertebral elements．All of these forms agree in having the nerous system unperforated by the alimentary canal，in the possession in either embrro or alult of gill slits connecting the throat with the exterion．and in the pros－ ses－ion of a cartilaginonsaxis，the notochord produced from the intetinal wall and lying betwen the alimentary canal and the nerwous system．The body is mate up of a series of similar joints or inetameres and the principal circulatory organ eomsists of a tulve，uffent wisted，tring upno the side of the boly opposite to the mervons system．The chorlata are dividital into（1）the Trochorda．or Tramita：（2）the Memishordia，or Exy：ropselst1：（3）the Cephalorlardia， or heptocarmir（with the single genns Anphoxus．q．$\imath^{\circ}$ ）；

Chore＇a（in（ir．Xopeía，a dance），or St．Yitus＇s Dance：a disease characterized by irregular，imwoluntary，atud often srotespue muscular action，without appreciable organic change in any tissue，and generally without pain or any known deringement of mental action or of seusation．It is most common in chiddren atter the second dentition and be－ fore puberty；much more common in girls than in bors； sometimes attacks pregnant women and other adults，though some cases once called adult chorea would now be recog－ nized as locomotor atasia，a very different disease．Cliorea is sometimes hereditary，sometimes epidemic．Many writers have elassed the lancing mania（the original＂sí．Vitus＂s dance＂），tarantism，and the strange excesses of certain reli－ ginnists（dervishes，French prophets，＂jumpers，＂and＂con－ iulsionists＂）all as varieties of chorea．Stammering has been called a chorea of the wocal organs．The disease is sometimes associated with rheumatism and generally with anamia．Snch complications should receive special treat－ ment．The metallic tonics are generally useful，and so are systematic gymnastics，life in the open air，and a kind and unobtrusive discipline，which shall teach the yonng patient the power of the will over the morements of the limely．
Chorepis＇copms（in Late Gr．хшрєтiбкотоs）：country bislop， vicarme episcopi，or villanus episcopus，as upposed to the ca－ thedralis episcopus；to be distingnished，as being stationary， from the disilator．Who itinerated；a class of bishops called into existence in the lafter part of the thirl century，and first in Asia Minor，in order to meet the want of episcopal super－ vision in the conntry parts of the then enlarged dioceses，ant to aroid the necessity for the subdirision of these sees of vast territorial extent．The functions of the chorepiscopi were episcopal，though the exercise of their powers was limited to minor oftices．Ther gave a measure of supervision to the country of which they were assigned the charge．In loco episcopi they ordained readers，exorcists，subleacons，but，as a rule，not pricsts or deacons（and of course not bishops）．un－ less hy express permission of their diocesan．They adminis－ tered confirmation in their own districts and（in Gaul）conse－ crated churches．They were held therefore to have＂mis－ sion，＂that is，the power of ordination，but to lack jurisdiction save subordinately and as expressly assigned．Ameng the Eastern sects the chorepiscopi were presbuters，mul，in at least one ritual．their setting apart for their office is preseribed to be without the laying on of hands．English writers，such as Beveridge．Haminond．Cave．Bingham，aud Routh，assert the true episcopal character and consectation of the chorppis－ copi．Van Espen takes the same view．Morinus and Du finge，with others，allege them to have been presbyters only．The weight of evidence would prove that at first they were duly consecrated to the episcopal office，but that in later years they became simple presibters with no claim to＂mission＂and powessing such＂juristiction＂only as might be exereised by an archdeacon． W．S．Perry．
（＇horiam＇lons（in Gr．xoplaußos）：a classic measure com－ pounded of a choree（trochec）and iambus，thus：dimorens． But the choriambi that oceur most trequently are now meas－ ured as irrational dactyls．See Metres．
Chor＇ley ：a town of England，in Lancashire；on a hill and on the river Chor ： 20 miles N．W\％．of Manchester， 8 miles S．E，of Preston（see map of England，ref．F－F）．It has an ancient parish chureh in the Sorman style，and a handsome（onthic churel．The place owes ite prosprity to various manafactures of cotton yarn，muslin．jaconet．calico． ginghan，and railway cars．Mines of enal ind lead and Yuarries of slate are worked．and bleaching is carried on in the vicinity．Pop．（1891） 23,08 ？

Chorley．Hexry Fothergill ：journalist，author，and mu－ sie＂ritie＂；b．in Blackley Ilurst，Lancashire．Enclamd．Dec． 1．\％． 1 sin；educated in lecal schools，hut mustly self－tanght； hegran to write for the London Athencum in 18．30，and con－ timued till his death．Feb．16， 1802 ．Ile wrote revjews of liturature，and and masic．obitnary notices，ate．．but his most enduring work was his volumes on Motern fierman Music （1sī）：Thirty Yerns：1／usical Recollections（1862）；and Ta－ fional Ilusic of the Hord，published pothumously．Ite Wrote the librefos of many operas and cantatas，worts for many songs，aml translated many foreign librettos into Eng－ lish．He also wrote novels，dramas，and poems．He was honest and conscientions as at critic，but wery stubbom and velf－willed．

and Alsace. Ite was the chief poetic exponent of the ideals of courtes, chivalric love, and mystical devotion, which, coming perhaps originally fron l'ruvence with the famons Eleanor of Poitiens, Queen of France and then of England, were taken up by her daughter, Narie of Champegne, and made the tests of virtue at her court. To Chrestien is due in latitienlar the identification of the legends of Celtic origin, just then beenming popular in Furope, with these ideals. Geodroy of Mommonth had indeed planly allowed chivalric chements to intrule themselves in his Lat in version of tine legends: but Chrestien first made the identification complete, and after his time the Artharian and other Celtic heroes and heromes were everywhere thunght of as peculiarly representative of the dreams and aspirations of chivalric soctety. Chestien's Arthurian poems and their approximate dates are the following: Triston (1160); now lost); Éref et linuide ( $110 \mathrm{i} . \mathrm{i}$ ) ; Le Conte de la Charrette, or Lancelot (1170): Le chemtier (th lion, or Icain (11i2); Percevt, or Le Conte de Crrant (1175). Besides these poems Chrestien imitated at last two episodes in Ovid's Mefamorphoses, that of P'hilomela being preserved to us; and he translated into French Ovid's Ins amatoria, and perhaps his Remedia amoris. He also composed one of the earliest romums d"uremtures, his Cligès ( 116 im ), based upon an Oriental legemi of a wite of Solomon stolen by a ruse in which she has a part herself. For analyses of the French romances of Celtic origin. with full bibliographical information, see l"ITistoire littermive de la France, t. Xxx. (Paris, 1888). For Chrétien, see C. Paris, Le Conte de the Charrette in Romania, vol. sii., 1. 409 (1683): W. Förster, Christian ion Troyes sammtliche erheltene Herke (Halle, 1884, seq.). A. R. Marsh.
 choice passages from authors, as of things worthy to be
 is useful to learn. The Greeks frequently formed commonplace books by collecting the various passages to which in the course of reading they had affised the mark $\chi$ (хpqoros). Hence hooks of extracts chosen with a view to utility have received this name.
Clures'tus of Byzan'tium: one of the most distinguished pupils of Heronles Atticus, a contemporary of the Emperor Aurelius. He was celebrated for bis eloqinence, and taught rhetoric with great success, having many distinguished men among his hearers. Of his writings nothing is preserved. Philostratus has given notices of him in his lives of the sophists.

Chrism, krizm, or Chrisom, kriz'ün [from Gr. хpî $\mu \alpha$, an anointing ; leriv. of xpleav, anoint. Doublet of cream]: an ointment or oil, eonsecrated by a bishop, and nsed in the Roman Catholie, Greek, and Oriental Churches in the consecration of chalices, altar-stones, and churches, in the blessing of the water for baptism, and in the ceremonies of baptism, confirmation, ordination, and extreme unction. In the R.C. Church it is a mixture of nil and balsam, but in the Eastern it contains over forty ingredients.

Christ [0. Eng. crist, from Lat. Christus, Gr, xpiatos, anointed ; derive of xplew, imoint; a translation of Heb. mūshicu. messiah]: a word which was at first a title of our Saviour, now in general use as part of his name. As kings were anointed on being called to their offices, so the Savinar was anointerd (Arts x. \%8)" with the loly Ghost and with power." This anminting signifies a consecration or setting apart for a peculiar work. For the historical account of Christ, see Jesus: for an accomot of the doctrines held with rearall to ('lirist's nature, se C'mbistology.

Chrisi, krist, Whinel, y, von: Greek seholar: b. in Geissonheim, (remany, Ang. 2, 1831 ; professor in the University of Mmich since 1861. Among his best-known works are Metrik der Griechen und Piomer (18:!, 刃d edit.); text alitions of Aristotle's Popties and Metaphysics: Homer's Tliud, with prolegomena (3 vols., Leipzig, 1s84); History of (irat: Liternture (vol. vii. of 1. Minler's Ilendbuch der clussischert 1 lterthumsmissensechuft, ©d edit. 1801). Auther of a grat number of valuable articles in the publications of the Munich Acalemy.

Alfred Gudemin.
('hristadel'bhians (liter., brothers of Christ): a religious hooly erriminating in the U.S. about 1855, with John I'homas, ll. D, a man of English birth, after whom the sect is somet ines called Thomasites. They attach equal importonee to the Old and Now Testaments, and believe that the intention of the Crator is to recall to immortal life all who love him in this life, and with them to people this
world. All who have not caught the immortal principle perish in teath. They reject the doctrine of a personal devil. Christ, they believe, is the Son of God, leriving from the leity moral perfection. but from his mother the common natire of Alam. They ascribe to him the threefokl character of prophet. priest, and king. The first office he fulfilled by his life and death on carth; as priest he now mediates before the Deity: and as king he will return to earth and reign from the throne of Davil over the glorified word. "phis denomination is small in numbers; its monthly organ, The Christadetphen, is pmblished in Birminghan, England; the exposition of its vicws may be found in the publications of Thomas and of Robert Ruberts.

Christehureh: a borough and seaport of Mampshire, Englanl; on the English Channel and at the head of the estuary formed by the rivers Avon and Stour ; 33 miles by rail S. W. of Southampton (sce map of England, ref. 14-1H). Here is a priory church, founded as an Angustinian priory by Flanbard, ean of Christchurch, early in the twelfth century. It is over 300 feet long by 100 across the transept. Christclurch has several breweries, but the former noted mannfacture of fusce-chains for watchex is no longer carried on. The borough, which includes Boursemoutn (q. z.), returns one member to Parliament. l'op. of parliamentary borough (1891), 53,300 ; of municipality, 3,994 .

Christchurch: a town of New Zealand: capital of the province of (anterbury; on the banks of the river Avon, 7 miles from the sea. It is connected by railway with Lyttelton, which is its port, and by telegraph with nearly all the leading towns. It is the seat of in Anglican bishop, and has a college. Pop. (1881) 15,213; with Sydenham and suburbs, $30,9 \pi 0$; ( 1806 ) with suburbs, $51,330$.

Clurist. Pictures of: The New Testament contains no hiut at the personal appearance of Christ, and the douhle tradition which soon began to form was evidently based, not on actual knowledge, bat on the prophetic descriptions of the old Testament, the persecuted Church imagining Christ as the suffering Messiah, in accordance with Ps. xxii. and Isa. liii. : the yictorious Church as the glorified Messiah, in arcordance with P's. slv, anel the Song of Songs. Of formal descriptions three have come down to us, but none of them has any real value. The first is found in a Latin letter which pretends to have been written by Publius Lentulus, "president of the people of Jernsalem" and a contemporary of Pilate. It was first discovered in a manuscript copy of the works of Anselm, and is certainly not older thai the fourth century. A second description is founl in the works of John of Damaseus (Ep. ad. Thenph. Imp. de renerandis imaginibus) from the eighth century, and a third in the ecelesiastical history of Nicephorus (i. 40) from the fourteenth century. All those descriptions agree in depicting christ as having florid or reddish hair parted down the middle of the crown, hlue eyes, and forked beard. Finally, two portraits of Christ are spoken of. Ensebius tells us (llist. Lect. i. 13) of a correspondence between Christ and King Abgimus of Osroene, and when repeating this story Moses Choronensis adle (IIist. Arm. ii. 80-3:3) that Christ sent his portrait to Abgarns. Both Rome and Genoa claim to be in possession of the genuine portrait. Another portrait of Christ became imprinted on the silken handkerchief of Veronica when she wiped the sweat from his face while he was carrying his cross to Golgotha. That portrait, too, has multiplied, and several cities chaim to have the genuine one. Sce Mrs. Jameson and Lady Eastlake, The Mistory of our Lorl in Works of Arl (London, 186: 5 ).

Christian II.: King of Denmark; b. in Nyborg, Finen, July $\stackrel{2}{2}, 1481$. He begran to reign in 1513, and married 1sifulla, is sister of the Emperor Charles V., in 1515. In 1520 he in vaded sweden, which he partially conquered. He usurped the throne of Swerlen, and abused his power with cruelty, but he was expelled by Gustavus Vasa in 1522. His Damish suljects also revolted, deposed him, and elected his uncle, Frederiels $I_{\text {. }}$, king in 1523. Christian retired to Flanders, athl redurned with an army in 153 I , but was defeaterl and kept in prison until his death, Jan. 25, 1559. See Behrmann, Kony Christiern II., IIistorie (1815).
Christian IV.: King of Denmark; h. in Fremprikshorg, Zedland, Apr: 19, 157T; the son and successor of lrederick In., who died in 15s8. IIe became in $16: 5$ the commander of the Protestant armies in the Thirty Years' war against the Emperor of Austria, but his campaigns were nufortunate

Christianity: the religion of those who accept . Tesus of Nazareth as thie Messiah. that is the Christ, promised of old to lerael. It is now the dominant religion in Emope (Turker execpted), in North and Sonth Imerical, and in Australia, zouthern A frien, amd mony islands, and is making stealy progress in the other parto of the earth. It exists in the form of a large number of particular churches. sects. tlenominations, which may be classified in three large gromps: the Romim Catholic Chmech: the Oriental Churehes, Enchoding the (ireek Chureh; and other Churehes. mamly those gronged under the mane Protestant. The aggregate nominally Christiau population of the earth exceeds 400 , 000.000. Of thris. somewhat more than half are Roman Catholics, more than one-fourth l'rotestants, mul hess than me-fonth comected with the Oriental Churches. There is no room in this article to disenss the characteristies of those Claristian bolliso or opinions that may le regarded as exceptional, nor even to discuss the differential characteristics of the various churches. For these, see Eastern C'uurfaes,
 Reforyations, and the names of the varions denominations and mownents. Thure are certain things which most (Christians of different names have in common, and to these we must now contine our attention.

Its. Relution twother Religioms.-Christianity is monotheistic, in distinction from all polytheistic, pantheistic, naturewoshiping. or agnosite religions. It clams to be of divine origin. and that not morely in the semse of it having come into existence throngh the provilential guiding of the ordinary forces of hature and the hman spirit. hat also in the semse of its being the product of divine spiritual operations that transceml what we commonly call nature. In other words. it clams to be a supernatural religion. Prolessing thas to be no product of the human intellect, aml acknowlerlging no anthor but the being whom it sets before ns as the olject of worship, it elams to be the only trme religion, and is consequently exchsive: that is to say, it admits of no eompromise with any other religions system. That it does not clatim that there is nothing time or good in ather systems, or that no adherents of other systems are true worshipers of the one true (forl.

To the ancient religion of harach it tands in peenliar rebations, claming for ite own the Ohl Testanent as well its the New. Thoonly logical position for Christianity to take here, thmoh mot all 'hristims take it, is that christiamity is itself tha ane int religion of Istael, in a changen diopencition. adapting it to new comditions: aml that the present religion of the Jows is a less conreet hranch of the same ancient religion. llistorically, Dohammedanism is a shootfrom the Claristian point of view a corrapt shoot-from the same rout.
''hristiunityas Rerectrol Refigion.-Christians hold that forl, in addition to his providential manifestation of himself in nature and in haman history, makes a spiritual revelation of himself to men in three different forms: in the Scriptures of the Ohl and Now Testamente, in the pirithal illumination amil guilance of imdividuals, aml in spiritual sumprision of the arts ame trabitions of the 'harch in its orgmie chatracter. Protestants regard the first of these three as supurme: the hierarchical chmehes exalt the thim: ammon men of certan types of thinking, or mong bury difformt men of certain types of feeling, the secomi is maile prominent.
Sulvetion in the Christion System.-For the varions doetrines of the Cluristian religion. see such articles ats thase on

 wrus. ote. so far as men are concerned, its central idea is that men are lose ath meed to be saved.

Man is representel as involved in misery, incapacitated for the surver of fient, and hable to pomishinent tor sion in a fulume state. In its teachings concerning a momely for this state of things the don trine of the athment clati-s sectial attentim-a dondrine tinght in all the sacrifices of the pat
 of the Bible: Man being utterly inenpable of cifterting lis awn delivermece fimb somt his son to sase simers, to make them holy and partakers of atemal lite. By Thitarians :mal whers who do not ateept har abow view, atonement or rect onriliation with fand is made to depmid on repontance. while the life and hath of thiso are represented as ane ex-
 buthe most trying eimematame: in which siew the dortrines of a propitiatory sacritiece and imputel righteonshese
fill to the gronnd. These doctrines, however, are held by most of those who receive the deetrine of the Trinity and the genemally received doctrine as to the incarnation of the son of Grmb.

The doctrine of divine grace is a part of the system of Christianity on which rery important differences of opmion suhsist, especially as to the relation of grace to individual men. Such are the differences conceming clection, and euncerning man's ability or imbility to excreise saving faith of himself. But by Christians generally the relation of the believer to Christ and his faith in Christ are aseribed to the Moly Ghost or Spirit of God, the third person of the (fombent. Sice Calimism and Armaviaxism.
salvation is viewed as beginning in regencration, and as carried on in sanctification, and all its joys as connected with the progress of sanctification in this lifo or in that which is to come. Faith in (lhrist fan not in maccompanied with repentance; though believers are holy in confrast io what they onee were, yet there is none in this life free from sin, the lempter of our first parents heing still the ative chemy of men. Responsibility belongs to human nature: and the doctrine of a judgment to come may be comsidered as to a certain extent a doctrine of natural religion. as may also that of the immortality of the soul: but the clear anil distinct ennaciation of these doctrines belongs to the Christian religion.

Of the moral element of christianity it is sulficient here to state that it is hamonions with the doctrinal part and insenarable from it: that it is fommel 1 pon the teachings of the Bible with regard to the mural attrilutes of (ion, aml is exmplified in the character of Jesus Christ : and that it is divisible into two great parts-one of the love of God, and the other of the love of man.

Among what are temest the means of grace, which form so important a part of the system, the doetrine contained in the bible first clams attention as the means of conversion ani of edification, the instrument ly which salvation is begum ant carried on. The ordinances of worship, praver, and atraments are means of grace, concerning the relative imburtance of which, as comparted with the other means, considerable differeme of upinion prevails. The same remark applies also to the combination of Christians into an organzed budy with its own system of ('hurel gevermment and liscipline.

The truth of Christianity is supported ly many difforent evibures, impependent, but muthally corrobrative. It appeals to reason, and demands to have its clams examined. Xor is there ams fiath where there is not a montal comvetions arrivel at by reasoning, ditect or midirect. See Arologetis and buidences of Curistlinity.

Christmas, Fexpal of [so called becanse an especial mass, the "mass of C'hrisi," was celebrated on that day; Fr. Sorit: "acr. Wrimuchtsfest (from the solemm vigils whict preerted the feast isseli): Ital. Natale i. e. birthay ]: the day om which the birth of Jesus Christ is celebraterl thronglaont the Christian world. This event was, in the East during the third eentury. set on the same day of the year with lis laptism and the two commemorated on Jan. 6, which in the Whest is the fanst of Eiphany. The liomans hald, like other bagan nations, a natare festival, ealow hy then saturmalia, and the nuthem peoplas hal lule: both celebrated the 1 morn of the yar fron the death of winter to the life of spring-the wintur solstier. As this was an auspicions change the festiral was a vary joyous one. It hegan with the Lomanse en Bre tional hasted seven hass. The giving of presents ath the burning of cambles charatorized it.

Among the northern people the lighting of a huge log in the houses of the great and with appropriate ceremonies was a feature. The Roman Church, finding this festival decply intrenehed in popular enteem, wisely atopted it, and at the same time altered it in intention and olservance. It wats no longer natural delight at the prospect of spring. the conquest of the sun over cold and barrenness, but peculiarly Christian joy in the rise of the sun of Righteonsness with universal life and warmth which the feast set forth. The day was put just at the close of the heathen festival, and the presents and the cercmonies were meant to srmbolize the unspeakable gift of Got- the saviour, Like many other popwhar usages the exact course of Christmas can not be traced. The authority and example of the lioman C"mreh, and perbaps the inconvenience of celebrating two such different events as the birth aml, the manitestation of C'larist nnon the same hay, caused the Fastern Chureh as early as the latter part of the fourth century to separate the events and keep the hirth of Christ on Dee. 25.
Christmas has always been the most popular of festivals. It is in Christendom the time of gift-giving and merry-making. Even the Jews keep it in this way, and multitules of Christians as little think of or care for its special significance. The ceremonies of the day are a mixture of pagan aut Christian elements, and formerly were conducive to disorder ant immorality. Thus in England there was a Lord of Misrule, and in Sentland an Thbot of Tureason, appointed to superintend and coneoct the Christmas revels. The sports were buisterons and coarse, and extended from All-1hallow eve (Nor. 1) to Candlemas (Feb. 2). The fivorite dish for breakfast and smpper during this period was a boar's heal with an apple stuek in its month: and by way of pastry there were plum-puddings and minee-pies. Evergreens and the sacred mistictue decorated honse and chmech -plainy a borrowing from the Innidie worship. In Germany and France and in other comntries during the Middle Ages, from the eleventh century on, there were sacred plars at C'hristmas in which the scenes attendint upon the birth of Christ were enactent. At first they were in Latin, and followed the seriptural story as amplified by legend: later a comic element was introlnced. and this part was in the vernacular: later, the entire play was in the vemacular. The earliest performers were the elergy and the place was the church or churchyam. But as a vernacular play it was more under purely secular control, if not entirely in lay hands, and given in a pmblic square.
The christmas mass. celebraten by the pope in person, is rery elaborate. Formerly he sald thre masses-one in the Liberians hasilica at midnight Christmas ese, one in the Chmreh of St. Anastasia al dawn Christmaxday, and the third in the Vatican chureh in the eourse of the day. Ordinary priests are allowed to celebrate three masses that lay, incause in a seuse there were three births of Christ-first, the eternal generation ; second, the earthly birth from a woman: and third, the birth in the believer's heart. The pope was in the habit of calling unou any sovereigu who might be present in the papal clapel on Christmas night to read the fifth tesson in the office, sword in hand, and the pope wouth bless a dueal eap and sword, which he presented in person or sent to some prince.
Christmas has always had its appropriate songe commonly called carols: many are most beantiful. (see next anticle.) It has been the theme of innmmerable eloquent sermons. It is the great sumday-sehool festival of the year. In liturgical ehurches it has its special services. But j'uritanism took offense at its association with what is called " popery" and refused to observe the day.
S. II. J.

Cluristmas Carols [carol, from O. Fr. carole: Provenc. corolla, ring-dance < Lat, corol'fa, dimin. of coro'na, erown]: songs or hyms sung, generally in the open air, in celebration of Chistmas. These were not always of a sacred character, and thuse of a jovial kind were sonetimes smmg at the Christmas bard. The enstom of singing Christmas carols dates from a very early priokl, and in the Midale Ages became very popmlar, when the clergy ant pemple oftem joined in the singing, which was accompanied with dances and the musie of varions instruments. Those with which the dawn of Christmas is mow nshered in in Great Tritain and the $\mathrm{I}^{\top}$. S. are generally religious; ther are sometimes sung in churehes. A collection of early Ennlish carols was print da by Wykyn de Worde in 1521. The most complete collection is by Sandys (London. 1893). Thre is a collection of German carols by Karl Wcimholil (Gratz, 185) : new ed. Vienna, 18\%),
and umong the miny editions of Frembearols, called nofls facre was one publishad at l'vitiers in I-2.

('ibristoloniy, Ihereticil and Uxiccepted Theorifs of. -The ortholox doetrine of the person of Christ set forth in the preceling article is the resultant of many torces. It will he convenient to state in chronological sequence the varions "hersies" which comlitioned its development.

1. From the 1 prostoli: Age to the Fourth ('entury.-1. Ebionism in thereromd centary, which attirmed the humanity to the exclusion of the divinity of Cluist.
2. (rausficism, which came ny about the same time and resolved ("hrist's humanity into a delusive appearance.
B. Rutimulistic l゙nituriumism, second and third centuries. which denied his divinity or clamed that it was a mere power, whife sencrally atmitting his supermatural hirth.
3. Patripussimmism, third century, whith attirmed that the distimetions of Father, Son, and Holy spirit were only verbal.
4. Subollimisism, thim century. which affirmen that the Fother, som, and ifuly spirit were omly three rolations in which the ane Gexl stond toward the work. Wrer against such more or lese prevalant opinions the Church taghth the full divinity of Chris, his full humanity, and his imfepentant premmaility.
B. From the Conncil of Vican. 355 to 3S1--Atrius a probbyter of Aleximblia (i. (e.), taupht that Christ was mot co-ergal with the Father, but was a smbordinate divinity, different in tsence from (iond. not eternal. though existrit betore the worll, a creature of Gonl, although the ereatur of the worth amb its incomate sivibur. As a variant from his riew: the Semi-1rims tanglat that Christ was similar in his esentus tor (ind. Hence came the two terms, the orthodux homo-avaa, onemess of essmen between Christ and God, and the heterodox homoi-ousin, sinilarity of essence. The great oflument of Arins was Athanasius. The first
 verse on the urthodox side, and the secomt actumenical combicil, that of comstantimple, 381, reaffirmed its decision, and since then the ('hurch has newor receded from its welief in the essential meness of the Son with the Father, which carries with it his etemal deity: Arianism was not killed by thes- (onnurils. It contimed to flonrish for centurips amone the harbarims. Vifilas, the aposile of the fothes, whe an Alian, and su were the confuerors of the Roman (mblife in the fith century.
llaving settled the 'quesiom of Christ's theity, the -lund was igitatod by questions as to the proper constitution of his theathopic persom. There were there primeipal heresies:
5. I/willimerienism. i. © the doctrine of Apollinaris the
 human benly and a human sumb, but not a haman spirit or reamin, Ia flate of the hatter, he thatht, was the Logens, which was therefore orgameally united with the man desus.
6. Sestorinaism, i.e the doctrime atributed io Nestorins.
 This was that the two natures, althongh sulusiting in mity se that chrive is hotblivine ant humat, are not so mated

 at lwaloll jurson.
 abot of a monasiom nowr comstanimople esommaniceterl ly the conmeil of constantinople the. He taught the dipertly oppesite vinw tor Nestorius, viz., that in the incanntion there is an anorption of the laman mane live the divibe. Ilmman mature, wern the human body. is deitied. Hente the butyonms emsinered it altowable to saly "God is burn," "(iot was crucilied," " Goul alied."

The third cecumeniral council, that of Ephesus, 431, and the fourth, that of Chalcedon, 4.5. combemed the opinions just cited, and atfirmed that the one and the same Christ is "to be acknowledged in two natures, ineonfusedty, nochangeably, imdivisibly, inseparably." symbul of (hatceton; cf. Schaff's ('reeds, ii., 62.
D. But Greek speculation was not yet exhansted and new heresies sprang up.

1. Monophysitism. or the dortrine that Christ had but one composite nature: bence his humanity is a mere accident of the immutable divine substance.
2. Monothelitism. or the doctrine that since Christ had only one person he had only one will.
These therries met their death-hlow at the sixth armenical conncil, that of Constantinople, GRO, which thus defined the relation between the two wills: "We likewise preach two natural wills [in Christ] and two matural operations undivilded, inconvertible, inscparable, ummixed, . . . and the two natural wills [are] not contrary, . . . but his human will follows the divine will, and is not rexisting or rehoctant, but rather subject to his divine and ommipotent will." See Schatl": ('reeds, ii., is, 73.
$\therefore$ Another heresy was $A$ doptionism, or the doctrine that Christ as man was the Son of God by adoplion, not by nature. This was a Western theory, and contemmed at the synoul of Frankfort-on-the-Main, Filt.
E. Thown to the Reformation the Chatcedonian Christology reimed mudisputed in the Clurch. East and IWest, and passed over practically unchanged into the Intheran and Reformed Churehes. There has been discussion, however, as to (1) the communicatio infiomatum, in the interest of the Latheran themy of the uhiquity (see Lutheran (hurab) of Chisit's body, which doctrine indeed is essential to their view of the Eucharist: (2) in relation to the twoloh state of Christ, viz, of hmmiliation and exaltation: and (?) in relation to the threefoll othice of Christ. siz., of prophet, prist, and king. In regard to (1) the Lmtherans claimed that the humion nature of ('hrist was in such a semse clothed with the attribules of the divine nature that the body of "lorist was ubiquitons. The Reformed Clurches, while willing to gramt the phrase, denied that there was any transormation of the hmman nature into the divine, or zier rerse, allirming that the two natures remain separate and distinct. Hence thure is no mbiquity. In regard to (2) the Lutherans deny and the Refomed (lhurches affirm that the states refer to both natures. Lpon (3) the confesions do not materially ditier.
$F$. lhodern Christologies.-The ontr one which has denominatimal importance is the Intarian, which is held by that haty in ill firms, from the oll Socinian thory, which attributes smi-llivinity to Christ, to the extreme hammitarian which sees in Clirist merely in man. The only reent discussion in or holox eireles which has attracted attention is in relation to the kenosis, the "emptying " of the divine attributes of christ spoken of in Phil. ii. 7. There was sneh a disenssion in fermany in the early part of the sevateenth century between the liatheran divines of Giessen and Tiibingen, the former holding that (hrist entirely abstained chuing his earthly life from the use of his divine attributes, while the 'libhingen divines maintained that he nsed them serretly: The Kenotic theory is a revival and molitiontion of the (fiesen view. It asserts that mu Lomblrom his incarnation to his resurrection "literally emphed himsolf not mony of his divine glory bat also of his divine mote of existbnce and assmod the human mole of cxistence, sulject to the himits of space and time and the laws of development and growth " (schatif).

 times. "Ther remabitur ehaplers (ont-i=1 of" selections or
ahridements of the matters containel in sammel and Kincs with a large amount of supplementary matter. Hence the siptuagint namel it паралеiтठцеva (Paraleipomena, sup)finments), and the Vulgate borrowed this name. The last two verses repeat the first remes of Ezra, the author apparently regarding his task as complete when he ham brought the carlier history up to the times treated of in Eara. The thok wa- componet at or ston atter the time of Nehemiah. Its peculiar charateristic is that it is writen from the stamelpint of interest in the Lavitioal and ritualistie institutims. Its anthority was assailed during the first half of the ninetereth century bey the rationalits, but no one doubts that it contains valuable contribut ins to our knowledge of the history of the liraclites. Bymm this the views of mon differ much actording to their different viows of the inepiration of the scriptures. lievised by W. J. Beecher.
Choonogram [from Gr. xpóvos, time + yópuд writing, deriv. of rpápecy, write]: an inseription in which a certain date is indicated by printing some af the letters in Jarger tye than the othero, and taking them as lioman mumerals, the date 1632 is the expresed in the inseription of a medal
 If it is a verse, it is called chronostiehon.

Chromograph [from Gr. xpovorpápos. recording time : रpóvos. time $+\gamma p \alpha \phi \in$, write] : an instrument used (chiefly in antronomy) fur recorling the exact instant of the occurrence of an event. such as the transit of a star over the spider-lines of at telescope. 'The reend is made by electro-magnetisin. A point or pen, governed by the clock. mark- nuifurmly the secoms. It can alon be brought into action at any desired instant by an eJectric key under the finger of the observer. The first chronograph was simply Morse's telegrophic instrument slightly molified. The metlod was originally suggested by Prof. Locke, of Cineimati, about 1s50. The chronographs now in use nsually employ a rotating eylinder covered with paper, and turning on a helical axis, each revolution occupying one minute. see C"hrowseope. Veloctmeter, and (RDšasce.

Revised by E. 1. Nimols.
Chronology [from Gr. xpóvos, time $+\lambda$ bjos ( $-\lambda$ ofía), word, reason]: the seinem that treats of the succession of events in time. As an escential part of the sciences of astronomy and geology in determining the order of natural events and the duration of perinds. it is discussed in those articles. The present article deals with the subject in its more limited sense as applying only to human events. IBefore the art of writing was known the dates of erents were matters of mere oral tralition, and even after the invention of letters a period was described as lasting so many " generations," and an event as oceurring in the reion or archonship of some king or magistrate. lefore the cighth century b. c. dates of events are largely conjectural. The attempts to assign a precise late to the creation of the world occasioned mich froitless lahor and left to the most diverse results, of whieh Arehhishop Uswhers astimate is the most familiar to English realers. From the time of domon to the birth of Christ he reckons 4.004 rears, a conclusion wholly at rariance with monern scienct. Of early chronolngical systum the most definite is the Bathlonian. sir llenry latwlinson's discovery of the Assyian canom, published in 1stiz, determines the chrmology of Issyria from $1: 30 \mathrm{n} . \mathrm{c}$. for the next $\mathbf{0} 00$ years. (Fen the artiches Babroovi, Bableos and Asprba.) The bint of time, however, from which Babyloninn history is reckoned is iti b. c. This is the so-called era of Nabonasisir, and curimsly enomeh lwoth the Roman and the Greek eras thate from nearly the same point, the former beginning with the year aiti n. $i$., when Curnbus was rietor at the Olympie ganes and the latter from $\pi=3$ в. c. the supposed date of the founding of Pame. 'llore unit of time' in the Greek chromelogy was the (blympiol (q. r.), a perion of four years, while the Romans derignated an event by naming the consuls in whase term it oechrrent. Ater 310 A. In. however, the anthorizel system throughnt the lionan empire was he the Inmotmos (q. P) a perion of fifteen vears, and its use can be traed in the Weot as late as the fifteenth century, though the (1)ympials were followed in the Fast till 140 i . D. The simple plan of counting ly years was first allophed in 150 B. C. By Fratosthemes. Whase works have perishatl. Dionysins Fxiguns in the sixth century A. D. was the tirst to pinploy the C"ristian erah begimninir with the bieth of Christ. which, howerer, prohably oceurred from two to four venrs later than the punt from which Dionsius rechoned. Wown to the midate of the cightenth centiry A. D. histarical records are often confused by the fact that at different perionls
and among different nations varions dates trere seleeted for the beginning of the year, e. g. March 25. Christmas Day, Easter, and Jinuarr 1. (see (allemdar.) The Christian era is attenterl by this inconvenience, that we must count backward for the dates of events prior to the birth of Christ, a difficulty obviated by the Julian system, proposed by Joseph scaliger in the sixteenth century. which selects the late 4 il B. c. as a startins-iwint. Other important eras are the era of Constautinople, which began with 5509 в. с. : that of the scleucidx, dating from the capture of Babylon by Selencus in $31 \mid$ b. $c$. the Mohammedan era from the 11 maira (q. $\cdot$.). $6 \geqslant 9$ A. D.: and the Persian era of Yezdegerd, 632 A. D. For the ancient chronologies, see Persia, Ixdia, Cuna. Eifypt, ete. See also Year. Mosta, Day, Cyele, Period, and Week. The most labrious work on ehromology is Lialrt de Térifier les Dates (1818-31). There are manuals by Iteler
 Woodward and Cates (18:~3); Brockmann (Berlin, 188:3) Haydn (New York, 1883).
F. M. C'olbs:

Cli ronometer [from Gr. xpóvos, time $+\mu$ 'fpov, measure]: a watch of peculiar construction and great perfection of workmanship, used where tine must be measured with extreme accuracy, as in the determination of geographical longitudes ly measuring the difference of time. The chronometer differs from the ordinary wateh in the principle of its excapement. which is so constrncted that the balance is entirely free from the wheels during the greater part of its vibration: and also in having the balance compensated for variations of temperature. Marine chronometers generally beat half-seconds, and are hung in gimbals in boses abmit 6 or 8 inches square. The pocket chronometer docs not differ in appearance from the ordinary watch, excepting that it is generally a little larger. Chronometers are of immense utilitr in navigation. and ships gning on distant rovages are usually furnisherl with several. Tor the purpose of checking one another, and also to guard against the effects of accidental derangement in any single one. The accuracy with which chmometers have been found to perform is trily astonishing, the departures from perfect uniformity of rate of rumning amounting only to small tractions of a seconl from day to day for long periods of time

Chronoscope [from Gr. xpóvos, time + akoáds, watching, watchunan: deriv, of aкuтeiv, olserve]: a kind of chrongraph invented in 1835 by Wheatstone for measuring the duration of the electrie spiark. It consisted essentially of a plane mirror revolving with a high but known velocity, the elongation of the image of the spark as seen in this mirror furnishing the measure of the duration. In 1858 Feddersen sulstituted a cuncare for the plane mirror, with better results. In ls6: lioon replaced the concare mirror hy a set of achromatic lenoes and a plane mirror. and succeeded in measuring intervals of time as small as 40 one-billionthe of a second. I chronoseopic apparatus was construeted by Fizean for measuring the velocity of light. In this there was employed a rotating circular disk with sectors alternately open and closel. A ray from a luminons suree transmitted through one of the open sectors, and reflected hack from a distant mirmor, is. with a certain velocity of rotation, intercepted by a chased sector, and with a higher relocity is transmitted through the next following open sertor. The distance traversed in Pizean's ex]eriment was $\$ 633$ meters (about $5 \frac{3}{8}$ miles). With this and the known velucity of rotation the velocity of light per secom is computed. Foncault, and later Michelson, and alsis Nirwcomb, used for the same determination a chronoscope with a concave revolving mirror. Chronosopes for measuring the time of flight of projectiles have been invented ly What otone. Hipp. Hemry, Nave\%, Benton. De linttec, (ilnesener, Sclmitz. Biahforth, and others. In these the leginning and chut of the interval meaturyl are marked by the passume of the induction spark, or mechanically by elect m-magnetism. generally upn a revolving eylinder. That insomb upon a fixel are hefore which a pendulum swinge. For mating rqual minute intervals -ted tumingforks are nocd in varimic ways

Revised ly F. I. Nichols.
Chrudian, hanolim: a town of luhemia: on the ChruJimkit, a small river: findes. F. of l'rague (see map of Iustria-1lungary, ref. 3-E). It has several churehes, a conrent, and a gymmasium : also manufactures of cloth, beer, anl sugar, ami a large market for horses. L'op. (1890) 12,128 .
('hrysalis [ Lat. from (irr. xpüadais. the wold-colored sheath of butterllies, derir. of xpuods, golli]: originally, the pupal stage of certain butterfies, as, for instance, the thistle but-
terfly, on arcount of their golderespote; hat the term has bene extended to the perpal condition of all Lepidoptere (butterthios and moths), and even of all inserts. While at a first glance a chrysalis hats bat litale remmbance to the profe insect, a litile csamimation will rewal all the parts. The wings are foded arouml the bexly, white betwen them enn be seen the kers and antemar, and twhind the ringe of the abrlumen, all inclowed in at hard, herny sint. In sume enses the ehryalis is without other protection, but in others the larva, befor bising into this stage, phins a silken coecon, inside of which the transformation is malergone.
Chrysamina: Sec lieszidlase Dyes.

 which has herome prpular in Europe and Ameriat. 'Ihere is muth emfusion reperting the oripinal operies on form of the chrysuthemm, hat recent anthorities holl that it is derived from ('hrysenthemum sinense, and that ('. Indiciom. which was formerly supposed to tee the orgimal form, las given compatately few samen types. The genas (hrysarthemum, us now iceppted by English botanizts, comprises a great variety of phats, inclating the prethrume or leverfews and the ox-eyed daisy. The ehrysunthemum has heen grown from the earliest the in lapan, and an open 16 forayed chrsanthemam is one of the imperial emblems. "The greatest diversity of forms has arisen in recent vats, largely beranse of the fres introdnction of the loose amb odf forms from Japan. which are much untike the char. stiff, and bellform (or "incurved") types which are known as chimese chrsanthemmas, In the U. S. the tendency is to breal the Japmese types to the exclusion of the formal kinds, while the npposite is still true in parts of Fiurope.

Clorysplephantine stalnes [chryselephantine is from
 pas. -avtos. elephant. irory]: stathes whose surface was of gold and ivory. These statacs were male by the firecks of Proples's time that later, and were of great celebrity in antignity, the must important leing the statue of Zens in the temple of that fond at olympia and that of A thena l'arthenos in the lathemon at Athens. The first mamed of these statues is stated to have heen seatemand 43 feet in hoight, with a pedestal about 20 by 30 fert in horizomal dimensions, so that the whole sempisition most have filled up the western ent of the nans or inclosed room of the fomple. ovenping all the space between the inner rows of columus. In later times chryselephantine statues were made as prortraits of kings and prinees.
(Chrysipo (in lir Xpúaratos): an eminent stome philosopher; b. at soli, in ('ilicia, Ev9 B. © : : son of Aprollonins of Tarsus. IIe was a pupil of (leanthes. and was elistinguisher for his skill in dialeetios and his subthety as a diepmant. 11 e unce sain to (leanthes. "Teath me mily your du-trimos. ant I will fint the argments to defemid them." "The surites is said to hase hedn inventm hy chrysippus. 11 e wrote a great number of works, none ot which is extant.

Church［O．Eng．circe（cirice）：Northern Eng．Fivke （whence kirk）：O．Sas．kirika（Dutch kerk）：O．11，Germ． chinthe（Mod．Germ．kirche），borrowed probably hy way of Constantinople from Christian Greek кupiakóv（on phier．кupıa－ $\kappa_{\alpha}$ ），of the Lort（se．$\delta \bar{\omega} \mu a$ ）Lord＇s house（Lat．dominicum）， deriv．of кúpos，master，hord］：primarily，a place of Christian Worship：hence the assemblage there worshiping：bence also the whole body of Christians，as in the phrase， ＂Christ，the Heal of the Church．＂In this sense the word enrresponds to the Greek ékк入noia as nsed in the New Testament（Lat．ecclevia，Span．iglesia，Fr，église，Ital． chiesat），though somewhat differently used by different com－ mumions．Thus Roman Catholics regard the Church as composed of those only who participate in the traditional ordinances administered by the hierarchy in regular suc－ cesion from the apostles down，and often restrict the term still further to the Roman Catholic hierarchy itself，whose ofticial action is regarded as divinely inspiret and infallible． Protestants，on the other hand，consider the＂Clanreh Cath－ olic＂（or universal）to include all true believers in Christ， who constitute the inrisible Church；while the collective huly of members of christian communions is designated the cisible Church．which thus includes the lioman Cath－ olic．the Greek，and the Armenian communions，as well as the l＇rotestant．In theological languge，the＂Church mili－ tant＂is the collective borly on earth of believers engraged in the batlle against sin and error：the＂Church triumphant＂ is the seneral assembly of the redsemed in Heaven．＊

Berides these broal applications of the term，it is also used to designate（a）the collective borly of members of a given commonion or believers in a given ereed of Chistian－ ity，as the Episcopal Church，the Roman Catholic Church． the Giret Church，the Church of England：（b）a sect or de－ nomination，as the alethodist Church，the Doravian Church； （c）a single parisla on the bodr of worshipers at a particular church，as＂the Central church．＂＂the Church of St．Agnes．＂

Church：as an architectural term，any edifice consecrated to Christian wurship；but it has become especially associ－ ated with eertain tres of religions architecture which have grown up with the develoment of Christian ritnal．The earliest form andopted was that of the Roman basilica，a purely civie struchure serving as a public hall，market－place． and court－room．It compmised an apse，within which was the tribme for the manistrate，a hroal，open space hefore this for the publie．and a long mave hanked by side aisles． separated from each uther by colums beariner walls piercel with windows above the sile－aish roots．These arrange－ ments were admirably suited to the development of anty Christian worship，and the fact that the basifiea was met like the temple anowiated with pagan worship made it the more acceptable to the＇hristians when．in the fourth century，they were fermittel throurlont the Koman empire to worship in puhlie and to himite new or oceupy ohd strme－ tures．From this groum phat chaged slightly her enlarg－ ing the central space laterally intu transpte，imblthes se－ curing a symbolie rrubiforni outhene，was developed the phan of the mediaral cathedral and of the great abbey
＊Roman Cnthnlies acknowledger a distinction between the body of the Church，which is the visible organization．and the sutul．Which is the ngeregate of all the just known to ford alone and united in the Holy Ghost throush grace：so that there may bat those in the body who are bot in the coul，and cice versa．They acknowlydre als a dis－ tinction in the boty of the Charch，viz，the hiernrelhy，or the Ecclesias tlorens，the tem－hing Chureh，ant the，faithful，or the Erele side discen the Church taught，or the hearing Church．
ehurehes of Europe．I fundamental structural change was effected hy substituting vanling in stone lor the timber ceiling of the oriminal type．This lell to the use of flying－ buttreses．pinnacles and clustered shatts．The narthix，or long transverse porch at the front，Was exchanged for triple doors；the side aisles wre continued around the castern portion of the buiding，with its apse or polygonal or semi－ circular termination，which was assigned to the clergy and singers and calhel the Choir（q．c．，also（havele）：aind in England a second or mind pair of transept－arms was some－ times added．Vestries for the clergy，a baptistery，a campa－ nile for the bells，or else one or two towers with spires at the western ent，and chapels with altars for particular saints．were adled to the original plan．

In the Eastern Church tif circular and inmical trpes of church were developed．the latter emploring fonr short amd equal arms like those of the Greek crose，with a dome on their intersection and sometimes one over each of the arms also．The lenaissance architects combined the two irleas in suchstrnctures as St．Peter＇s at Rome．St．Paul＇s at Lon－ don，and sit．lienéviève at Praris．Parish churches vary more widely in type than the cathedral and abbey churches on account of inore wilely varying requirements，and a similar reason aceounts for the liversity of trpe or absence of type among modern Protestant denominations．

Clurch lisciplime : the means employed by the Chureh in maintan hor standard of ficty and iblodience. From her urigin to 312 she was constantly expment to inronls from petended friends, who really desived to secure her confidene ath then betray her to the civil authority. and from enthusiats and falsic teichurs who honesily trien to adapt her to their strange beliefs. Iler memhership, being recruitur from the lower elawies predominantly. were the rietims of low tastes amel vitiatem appetites. To ketu hersolf pare she was obliged to excommunicate grave offentcrs, whed to enjuin more on lese protangat exthaion from her sorvices estecially from the sarmane of the Lord's
 the partiws repented they wore generally roxtured, and the ble sing of the Charch was soldom rethised those who on their death-hnd dedared the ir surrow. The sins mont commonly punished were then and are tu-lay sexalal and other irrequltitices, heresy and schism, sulition and irrevereme.
 Church was united to the Romm state, diseciplin" relaxed, and wherever chareh and rate arr united there the diffiewlty of maintaining it high standard in the (hurch is greatly increasel. The alsamtare of the mion was that noturions iffenders ermble be handerater hy the churd to the state for Immishnent. In al latee perime the Roman Thurch in this way nsed the secollar anthorty in the punishment of herecy, thereby securing its crum extermination in many quarters.

## 

Churell llisfory, or llistorian Theoloyy: one of the fomr divisions of theolugical science-viz, exegetical (nr himidical), historient, systemat ic (or philowophiral), and practieal (ha miletieal and patomal) thenlory. Of thene divisions the hienurical is the ment extensive in lalk, and furnishess maty rial to all the reat. In importmee it giedsemby to expget itell thenlogs: which has th do with the interiperation of the Holy seritumes. Historical theology hagins with the creation of man in the image, and for the Ehery of (iemb, am? comes down to the present as its relative crial, hut will wo on till the sencral judguent on the final settloment of atl Che anfars of men: It enilraces within these limits ath that fulongs to the religions idecelopment of the race within the lime of revelation-the orisin, Irequess, mal fupt mese of the kinghom of (somt, and jis relations to the kit chluns if this wirla. Since the fall of man is has aswumed the character
of a histery of redemption (and is so represented, for instance, by Jonathan Lidwats in his well-known populat book). In a narrower sense, Chureh history is the history of Christianity from the hirth of Christ, or according to others. from the day of Pentecost (A. D. 30), when Christianity first assumed an organized form distinct from Judaism, down to the present time.

Church Histury axd secclar History.-These differ as Charch and state. as Christianity ami hamanity, as the order of grace and the order of nature differ. Yet they are inseparably connected and interwow, and the one cain not be understood without the other. Among the Jews the spiritual and sceular histoty together form one history of a theocracy. Both currents interningle in the old Byzantine empire, in the European states and the Latin Church during the Middle Ages, in the perionl of the Reformation, ciuring the colonial fremod of America, and in all countries where Church and state are unitel. Gibhon's Ifistory of the Decline and Foll of the Romon Empire is in great part also a listory of the rise ant progress of Christianity, which survived the lall of Old and New Rome and went forth to conquer the lartharian conquerors by christianizing and civilizing them. A history of the papacy is also a history of the Holr limman empire, and rice cersir. No history of the sixteenth eentury can be written withont constant reference to the Protestant Reformation and the Roman Catholic reaction. (Compare e. g. Hume. Macaulay, and Burnet for England: Rankeand Janssen for Germany : Motley for IJolland.) The Puritan settlements of New England are the heginning alike of the ecelesiastical and secular history of North America. In modern times the tendency is more and more toward separation of the spinitual and fempmal, the ecclesiastical imil civil powers; nevertheless, the Church will ahways be more or hess influenced hy the surrounding state of civil society, and must adapt itself to the wants of the age and progress of events; while, on the other hand, the world will always feel the moral influence, the rest raining, ennobling, stimulating. purifying, and sanctifying power of Christianity, which works like a learen from within upm all ramifications of societ r .

I'ERIODS AND EPucus.- These represent the lifferent stages in the religions development of the race, and must not be arhitrarily made according to a mechanical scheme (such as the centurial division athered to hy Mosheim), hat taken from the actual stops or starting-points ( $e^{2} \pi \chi^{\prime} \mathfrak{h}^{\prime}$ ), and circuits ( $\pi$ eplodos) of the history itself. The following are the natural divisions:

1. Sucred or Biblicul Ilistory, the history of the Divine revelation from the cration to the chose of the apostolic age, running parallel with the Soriptures from (ienesis to Revelation. ITere we must distinguish the dispensation of the Law and the dispensation of the Gospel, or the history of the Old Testament religion and of that of the Sev Testament religion.
(a) Under the Oll Dispensution, from the creation down to John the Baptist. Subdivisions: The antedihurian neriod: the patriarchal perionl ; the Mosate perion (the establishment of the Jewish theoeracy) : the periml of the Jewish monarchy and prophecy; the period of the Batylonian exile; the period of the restoration, the Macrabsures the Roman rule till llerod the Great and down to the destruction of Jerusalem.
(b) Cuder the Neme Dispensatiom, A. D. [-100, Phrist and the apostles, or primitioe and nommative Christianity in its Tivine-human fomder and inspired organs. Sublivisions: The preparatury mision of John the Baptiat: the life of Christ : the founding of the "hurch by the apentles: the lit bors of Peter. Pank, and John. 'This period comnets liblicat history with erelesiastionl history and belonge as much to the hatier as to the fommer.
2. Christiun Mistory, or chureh Ihistory proper, from the clase of the apmetulice age to modern times. Sululivisions:
(a) Ifistory ul Anciont Christianity, (mblaseing the first six centuries to (iresory 1. (ato): (Brato-latin. patristic. Catholie, the common stock from which the Cireck, the Roman, and the Protwant (hurehes have sprung. sumbi-
 sue 1 b): (2) the Anto-Nicene arre on the are of percentime
 (3) the Post-Nicene age, or the age of patriards. Christian emprors, and aromumical councils (to Sion). some historlans "arry the age of anchnt Chrishanity down to Charlemagne, A. is. 800 (som as to inctule John of Dimatens the last of the (ireck Futhers), ind the beginning of the (ier-
man Roman empire and the temporal nower of the papacy. In this case we hase a form subdisision, from Gregory I. to ('harlemagne (A. D. 590 to S(00). The ancient Chureh history has its theater in the ohd Roman empire, around the Jediterramean. among Jews, Greeks, and Lomans to the borders of the barbarians.
(b) Ihistory of Mediural Christianity, from the close of the sixth to the hegimning of the sisteenth century, or from Gregory I. (A. D. 590), the first mediaval pope, to Luther, the leader of the lieformation (A. D. 151\%). Character: The Greek aml lioman Churches, divided, pursue their independent course: the Latin ('hureh extending weat among the Celtic and Germanic races, the Greek northeast among the Slavonians (in Russia) : conversion of the barbarians of Northern and Western Europe: contlicts with Mohammedanism: the erusales: rise and progress of the papacr in conflict with the holy Roman empire: church arehitecture; scholastic philosophy ind theology; mysticism; the reformatory councils of Pisa, Constance, and Basel ; revival of letters; invention of printing; discovery of Anerica; biblical theology: forerunners of Protextantism (Wyoliffe in England, Ilits in Bohemia, Sawonarola in Italy. Wessel in Holland, etc.). Subdivisions: (1) The missionary period of the Middle Iges, from Gregory I. to Hildetnand or Grecory VII. (590 to 1073): (2) the paliny period of the prapacy, from Gregory VII. to Boniface VIII. (1073 to 1294); (3) the decay of the inedieval papacy and scholasticism, and the preparation for the lictormation, from Boniface VIII, to Leo X. and Martin Luther (1904-1515).
(c) History of Moderm (hristianity, from the Reformation of the sisteenth century to the presput time. Protestantism and Romanism: founding of the various eringelical chnches, the Lutheran, Calvinistic, Anglican, ete. ; progress of Protestantism among the Teutonic races; restoration of Romanism: Jesuitism : Jansenism: Puritanism and Methodism in England: Pietism and the Morarians in Germany; settlenents in North Amorica ; growth of the Greek Church in Russia, and of the I'rotestant in the United States; revival and trimmh of ultramontane Romanism; conflict of faith with motern rationalism and infidelity: immense activity in theology, literature. missions. and all forms of Christian philanthropy, subativisions: (1) The age of the Protestant Reformation and the Roman Catholic counterreformation or reaction (from lint to the Peace of WestThatia, 1648): ( 2 ) the age of scholastic and polemie cmmfessionatism in conflict with nonconformity and suljeetive piety (from the middle of the seventeenth to the Freneh Revolution, 1i89): (3) the age of revolution and revival; contlict between christianity and various forms of skepticism and secularism: progress of missions in all heathen lands: separation of Church and state: development of the voluntary principle: growth of Christimn philanthropy; movements toward the reunion of Christendom on the basis of treedom.
socrees.-They are mostly written, in part unwritten. The written sonrees include (ri) the uthicial documents of ecclesiastion and civil authorities, such as acts of councils, ereeds, liturgies, hymn-hooks, church luws, papal bulls and encyclicals: (b) the writings of the personal actors in the history, and contemporary observers and reporters, such as the Fathere for ancient ('hristianity, the Schoolmen for medieval, the Reformers and their opponents for the lieformation perionl; (c) inscriptions on walls, pietures, churehes, tombstones, and other momments.
The untritten sources are works of Christian art, as charehes, chapels, pictures, sculptures, crosses, crucifixes, relies, and other remains which stmbolize and embody the spirit of Christianity in ditferent ppochs and phases. Thus the Roman catacombs, with their vast extent, their snlemn darkness, their labyrinthine mystery their rude epitaphs amd senlptures, their symbels of faith, and their relics of martyrdom, give us a lifelike idea of the Chureh in the periol of presecution, its trials athl sufferings, its fith and hope its simple worship inll devoted jiety. "1Je who is thoronghy stecped in the imagery of the catacomls will he neaver to the thoughts of the early Chum than he whe has leamed he heart the most elaborate: treatises of Tertultian or Origut." The hasilions are chatacteristic of the Nicene. the Braantine churehes, of the Byzantine age, the (fothic cathotrals, of the palmy days of the Miblle Ages, the Remaissunce style, of the revical of letters. Even now most churelnes and sects can le best apmeciated in the localities and in view of the momuments and the people where they originated or have their center of life and action.
 in the original languages in which they were written (fireck. Latin, mid the modern languques of Burene); separating
 fioms and interpolations: sifting the truth from falsehom, the facts from tiction and partisan julement: comparing the acromits of all actors, frieml and foe narmator, enlogist, advocate, and antaronist, whether orthonlos or heretie, whether "hristian, Jew, or "fentile: aming in all this laborims investigation at "the truth, the whole trath, anal nothing lat the truth," (?) He must then reprochuce the clearly nsereminel farts and results of his inwestigation in a faithfal and lifelike marative, so as to present the ohjective couse of history its.lf as it whe in a miniature photograph. The gembe witer of history differs as much from the dry chronicler of isolated facto and dates as from the novelist: history has a buly and a living somb, and its facts are animaterl by thoughts and prineiples. 'The hise torian mast exhinist both: he must be ahde for particularize and to genoralize to desemd into mimete details, and to take a comprelnensive hird s-rere view of whole ages aml periouls. Hle most have a judicial mind, which deals impartially with all persons und events coming ispore his tribual, ind is swayed by mo consideration hat that of strict jnstice. 'This aini shoiltl he constantly kept in view, atthough in the limited and imperfect state of our informat tion, and the inability to emancipate one's self from all the intluences of efucation and prevaling opinions and prejudices, we can expeet no mors than ni apmoximate solntim of the lithimat task, It is the exclusive privilege of the Divine Mind to wiew all things sub sperip efernitatie, to see the end from the begiming. We can only know things consecotively and in fragments. Put history is its own best interpreter, and the farthor it advonces the more we are ahle to understaml and appreciate the past.

Value,-Ploe study of history cmables us to noderstaml the present, which is the fruit of the past and the germ of the finture. It is the richest storehonsis of wistom and experiense. It is the beot commentary of Christianity. It is full of eomfort and encouragement. At verities on every pase the promise of the siviour tu be with his pepple aitWays and to huild his chureh on the rock against which power of Christ in all its forms and phases and the trimmphant mareh of his kingem from lame to land and generat tion to generation. Warthly empires, systems of philosophy have their day, human institutions deciay, all things of this world hoom and fade away like the grass of the fied ; hot the Christian religion hat the dew of peremial youth, survives all changes, makes stemly progres from age to age wereomes all persecution from whithont and comantion from within, is now stronger ant more widely spreat flan ewe lefore, directs the comse of civilization, and hems the hopes of the human race. The history of the work is govarned in the intrest and for the ultimate trimph of "hristian truth and righteonsmess. The experience of the past is a sure gramanto of the future.

Phllip Scilaff.
Churchill. or Missinuiph a : river of the Dominion of Camala; rises in a lake near lon. $109^{\circ} \mathrm{W}$. It flows nearly northeastward, passes through Nelson's Lake, and enters Iurlson's Bay in lat. $59^{\circ} \mathrm{N}$. Length estimated at s00 miles.

Churehill. Charles: poet and satirist: b. in Wextminster. London, in Feb., 1\%31. He was a fellow-stmlent and friend of the poet Cowper. Although he hat a strong aresion to the clerical profession, he was ordained as a priest in 1756. In 1758 he succeeded his father as curate at at. John's. Westminster. His parishioners were scandalized by his lissipated and licentious labits, and by his negligence of his duties, He produced in $1 ; 61$ The Roscial. a witty satire on theatrical managers and performers, which was rery successful. About this time he resigned his curacy and yutterl the profession of clergyman. He defended himself dgainst certain crities by a poem entithed The Apmbogy. He was an intimate friend of John Wilkes, whom he assisterl in the Jorth Briton. In 176:3 he publinhed The Prophecy of Frmine, a satire on the sicotch. Among his other works are The Conference. Golhum. and The Author. D. in Boulogne. France during a visit, Nor 4. 176t. see Tooke, Life of Churchill, and Macaulay's essay entinled (harles Churchill (1845). Revisel by II. A. Beers.

Churehill. Johs Weslef. A. S. : instructor in elocution and author: 1, in Fairlee. Vt.. Mar 26. 1839: edneated at Plillips Acallemy. Andoser, Mass.. at llarrard College, grailnating in 186., aid at Andover Theologieal Seminary. gradnating in $1 \times 68$ and being onlained to the ministry. In 1869 he was inaugurated Jones Professor of l'ulpit İelivery in Andorer Theological Seminary; has been instractor in Elocution in Phillips Academy, inflover, since 1815: in Ahbot Aeadmy, Andover, 186:-92: in Wellesley College three years: in Smith College five years; in Mt. Holyoke Seminary five years: in Harrard Lniversity divinity school since 18:\%. He is a trustee of Ahbot Academy ami an associate editor of the Amborer Rerien: has contributed to periodical hiterature articles chiefy of a biographical nature. He received the degree of $A$. . . from llarvard University

Churchill, Land Raxdolph Mexry Spexcer, M. P. Fnctish staterman: 1. Fels. 13, 184!) the son of the Duke of Marlhoroush and his wife, Lady Frances Ame Emily, danghter of the Marquis of Londonderry: educated at Merton College Ux forl: represented Woodstock in Parliament Foh. 18it. 10 Nor. $1 \times 8.5$ : after 1880 he became monspichous in the lhonse of Commons br his attacks on the Liberal party. and was the leader of the su-catled Fourth party; Secretary of state for India in Lom Salishurys movernment 1885: Chancellor of the Exchequer and leader of the Ilowse of Commons in Lort Salisbury's second andministration 1886 but resignet in lecember; at present (1syB) member for Paddingtom. He was regarded at one time as the coming Tony leader and successir to Lord Reacomsfeld. In $18 \mathrm{~s}^{2}$ he traveled in sontheast Ifrica as correspondent of a London newspaper. Lord Churchill married in 1sit Miss Jennie Jerone, of New York. D. Jan. It, 1895.

Chorchiug of Women: the publice thanksgiving in church hy young mothers, both for their motherhoot ant their recovery from the perils of ehildifith. In former days the practice was nsuat, if not obligatory, although no forminlaries for the service have come down to us from anciont times. It imitated dombtless the Mosaic remulation (lev. xii.) : antl, as chill-bearing lefilet, the womalu was not to be churched till forty days after her parturition.

Chureh Jurisdiction: estahlished by Constantine the Great in 831. This such as it was. did not simply mem that the Chureh shonk exercise jurisdiction in all ecelesiatical affais but actually meant an ahmotion he the Clurch of the jurisalietion of the stat also in eivil atlairs. St. lanh had antmomished the cluristians not to bring the ir cases before unbelieving julges, and thus arose a practice which was legatized by comstantine. When. however, the court and the julges had become l'hri-tian, there was no reason for so extensive a church jurisdiction, ant the state immontiately began to mbuner lank its ohe rights, confining the Cliurd juristiction to purely spiritual alfaims. Sut the contest was long and fieret, and is ly mo mans condend as yet in certain countries of Furope. I striking exposition of the

 LavD.

Churrli Rates: a tas, as the name implies, formerly Ievimi umon the oempiers or homses or lamls, or both, in an English or Jrish farish for the incidental exjenses of serviee in the provish church, apart from the priest's salary, but inchuling repairs of the building. 'Iher rate was resolved upon at a regularly called reshy mediner. By 31 and 32 Votoria, c. 109, prissed in 1868, its payment was mande voluntary in lingland, and when the Chuich of Ireland was disestablishod. rates also ceased in that comontry. Wharn rates becian to be exacted is not known. "lohere" is nothing improbible in the supposition that the rejuir of the jarisht churehand other similar expenses worn af tirst vohntarily assumed by the well-to-do ar devotal membrers of the parish, but ufter a time when zorsh derelined the dunches were
 beeame a matter of abligation. The mamilest injustice of comprolling persons who mot onls did mot atterad the parish chmreh, frit lublonged tu rival or loostile commmonons, to laty derhajs large amounts for the adonmment or repair of the parish chareh srambally inturesal the eonsefornce of the English pernde, who in overwhelming numbers belong to the established chureh.

Chorn: an apporatus for acgitating cream so as to make the fat-ghobales unite to form latter. There is a great vat riets in the forms of charns. The phatere churn is one of the oblest and simphest forms. In the box churn the agitation of the eream is brought abont by dashers revolving on a spindle, which passes throngh the center of the box. In rowolving rharns the barrel eontaining the (rasm is sup)ported at lath emds, and made to rotate by means of a hamdle; or it may hang from two proints on the siles and be marle to turn over and over. In churns constructed and used in this waty the action may be ereatly incrased by the ase ul internal dashers. In the swinging churn a long box is hung by four elatius and swong back and forth. Jlorsepower is often used in the working of churns in large dairies. See Butter.

for Cicero, hut as the consuls were hastile to him. he yiedled to the storm and went into exile in Apr... 58 b. C. A law was then speetily enacted to interdict ficero from carth and water, aurl his homse on the Palatine llill was lamed by Clodius. The lack of fortitude which he exhibited in his exile (which was passed in Greece) is severely criticised hy severalwriters. In a letter to his wife Terentia he wrote, "It is not my crimes, but my rirtue that has crusbed me." The excessive violence of his enemies tended to promuce a speedy and strong reation. The new consnls and tribuncs dectel fur the year of were friendly to Cicero, whose recall was also adrocated by Pomper and a majority of the senate. In Aug. 5 , a hill for his restoration was adopted by an owerwhelning majority of the voters, who had come from rarions parts of Italy to the comitio centuriata at lome.
" There had never hecn known," says Middleton, "sn numerous and solemn an assembly of the foman people as this." On his return to Rome he was greeted with abundant demonstrations of popular favor and enthusiasm. Between 5 and 5 ? he pleaded several causes in the comts, and found leisure to write two important works, entitled De Republica (On the Repuhlic, or the Principles of Government) and De Oratore. The Ite Legibus, a philosophieal treatise on the orimin. nature, and perfection of lam, was probably begun in $5:$.

For a term of one rear (beginning July 31, 51 B. c.) he acted as proeonsul or governor of Cilicia and Pisidia, where his administration was a model of moderation, purity, and probity. Ile returned to Italy in the year 50 , and found that a civil war was imminent between Cosar and the senate. ITe hesitated whether he should take an active frart in the eoming contest. and wished to aet as a mediator, hat eventually he joined the army of Pomper, who fought for the senate. "Ile fluctuated greatly," says Plutareh, and was in the utmont anxiety: for he says in his letters, "Whither shall 1 turn? Pompey has the more honorable cunse, but Casar manages his affairs with the greatest address. In short, I know whom to aroid. but not whom to follow." Ilis wit, however, ditl not fail eten in this glonmy crivis. When Pompey asked him, "Where is your son-in-law?" (Dolabella). (cicero replied." "He is with your father-in-law." After the battle of Pharsalus (Ang., $48 \mathrm{~B}, \mathrm{c}$.). Cato offered the command of the army to Cicero but he declined it, and, returning to ltaly, submitted to the power of Cessar, who trated him with elemency. He afterward devoted himself to literary labors in retirement, and found consolation in the calm enjoyments of speculative philosophr. In the ensuing perion of three or fon years ( $4 i-14$ ) he prodneed numerous works on philosophry and rhetoric, which are admirable nonuments of his profoum and raried learning as well as of his immense mental activity. As a philosofher he prefermal the principles of the New Academy. In the year 45 he lost his accomplished daughter Tullia. whom he regarked with the fondest aftection. He approved the assassination of Cisar, and denounced the conduct of Mark Antony in a series of orations called Philippies, the first of which was spoken in the senate in Sept., 44 . The second Philippic is a masterpiece of eloquent inveetive. For a few months in the year 4.3, while Octavins co-operated with the senate ayminst Antony, Cicero was the most prominent state"man in Rome. Between Dee.. 44 , and May, 43 в. c.. he utterod his last twelve Philippies, which were received with general applause, hut the republican canse was som ruined by the coalition of Octarius with Antony and Lepidus. (ifero was proseribet by them, and was tilled by the soldiers of Antony near his Formian villa Dec. 7, 43 B द. c. He left one son, named larens Tublius. The moral character of Cicero is sulmitted to be excellent eren by those whe consure his pmblie conduct. Ilis worst foible wis vanity, exhibites in a habit of self-ladation. Aecording to Niembre "the prolominant and most brilliant faculty of his mind was his wit. In what the French call espritlight, unexpetel, inexhanstible wit -he is not excelled ly any of the ancients." As an orator he smrpassed all thie ancionts excent bomothenes. Nodern critics concur in unanimons admiration of the consumate grace ant beanty of liction which enchont sucessive generations in the prionts of 'icero, the amplifies everthing. Ilis words seem to gul forth withont (ffort in an :anple stream : and the shetained dignity of his mation is preserved from prompous stiffness by the lively sallies of a prody wit and a vivid imagimation. His perinils are somorous, lime present a great variety of cadonces. llis Letfers, of which noarly solf are extant, are models of excquisite latinity, and are highly
prized for the light whieh they throw on the history and antignities of the Roman republic. Among his works which remain entire are fift r -seven orations: also treatises. entitled De Finibus, litui : (an lnguiry into the Supreme Gooul); Brutus seu de Claris Oratoritus (a critical notiee of lioman orators) ; Ite Amicitiâ (a dialogne on friendship); De Senectute (a dialogne on old age): Tusculance Disputationes (disputations on rarions questions of philosophy): De Taturu Denrum, libri iii. ( $\mathrm{H}_{\mathrm{n}}$ the Nature of the Gorls); Orator, sen de Optimo Genere Dicendi (The Orator. or On the Best Manner of Speaking) : ant De Officies, libri iii. (an excellent treatise on ethics). One of his greatest works, De Repubtic $\hat{A}$, is lost, except a large fraginent. The also wrote treatises, De (rloriâ (On Ghary) and De Timhtibus (On the Virtues), which are not extant. Mutilaten copies have heen preservel of his works entitlet De Legibus and Acalpmicorum. libri iv. Among the hest editions of his complete works are those of Ennesti (1lalle, 5 vols. 8 vo, $17 \pi 4-7 \pi)$ : Orelli (Zurich, 9 rols. 8vo, 1826-i88); Baiter and Kayser (Leipzig, if rols. 8vo, 1860-69) ; and C. F. WV. Mülher (Leipzig, 1878. still in course of pullication). The eorrespondence, chronologically arranged. is being edited by R. I, Tyrell; $\dot{3}$ rolumes have alreadr appeared (I)ublin ani? Londoni). See Platarch, Life of Cicero; Conyers Middluton. Ihistory of the Life of Cicero (1741); Alrken, Cicero in Seinen Briffen (1s35), and an English version of the same (180̄4); II. Forsyth, Life of M. T. Cicem (2 vols. 18(ia): Lamartine, Cicéron (1852) ; Orclli, Onomasticum Tullianum: Hrumann. Geschichte Roms, vols. v. and vi.: f. Roissier, Cicéron et ses amis (Paris, 1884). The mosi vivid and popular Life of Cicero is by Anthony T'rollope (1880, 2 vols.).

Fievised by M. Warres.
Cicero. Marcus Tclelus: the only son of the preceding: b. in 65 B. c. He is said to have been dissipated, indolent, and intemperate. In the year 49 he joined the army of Pompey, and received the command of a squadron of cavalry. Soon after the battle of pharsalia ( 48 B. c.) he went to Athens, and studiel philosoplyy under Cratippus. Having been appointed a military tribune by Brutus in 44 в. c.. he defeatell C. Antonius, and did good service in the Macedonian eampaign. By the favor of Octavins (Augustus) he became consul in the year 30, and was gorernor of Asia (Syria) in 29-28. The year of lis deth is unknown.

Cicero. Quintus Tulics: a mother of Cicero the orator; b. ahout $102 \mathrm{~B}, \mathrm{C}$. II was elected prator for the year 6i2, after which he officiated as governor of Asia for there yeurs, and returned to liome in 08 b.c. In Asia, however, he gave great offense to both the Greeks and the Romans ly the violence of his temper and the corruption and licentionsiness of his favoritez. He was appointed in the ycar ing legate (legutus) to Casar, whom he attended in an expedition to Britain, umi in 54 he commanded a legion in Ganl. In the civil war he took arms against (iesar, but he made his peace with him in $5:$ b.c. He was proseribed by the triumvirs, and killeal in 43 b.
('icoguara, chee-kon-yaa răa, Leopoldo, Count da: an Italith antiquary and writer on art: h. in Ferrara, Nov, 17, 1767. He designed a facinle for S. Maria del fiore which was prolably the classical one, which was destroyed by the Merlici. D. in Rome, 161\%. WV. J. Stalaman.
('il'ia [Lat. phur. of cillum, cyelid, eyelash]: the hairs which grow from the margin of the eyelics. The term is mure usually applied to microseopic tilaments which project from animal membranes. and which are endowed with tquick, sibratile motion. Ciha are tistinguished frompandoporla on their permanence, and from lagella by their smaller size and assuctation in groups; athomgh practically as tlaydhum is a large, single cilium. In vertebrates cilia occur upon the equithelima of the meons membrane of varions organs; their movements are aplarently indepardent of the newous systen, and will continue lomgatter the amimal is dead. Among minute invertebrates, such as the Fompera and hatsorm ( $q$. $r_{0}$ ), cilia are pesent in delinite tracts, atme serve by the rapis vibration as organs of lommotion, or to weate currents by which particles of food ate bronght within reach. The embryos of many of the lower animats are also frequontly prowited with cilia by means of which they move about.

In borasy cilia are long hairs situated on the mareins of vegetable boodies.
In ExTombone fringes of hairy such as are fomm on the hege of some beethes are termed cilis.

to an invitation to Rome，where，in 17\％4．he put on the stage the lumorons Italian in London．He pursmed his art in Naples，Rome，Florence，and other ltalian cities，composing cantatas，sacred and comic operas，and chureh musje but little of his work of this jeriod has survived．In 1is？he went to st．Petersburg as a court musician．and four rears litter to．Vienna，where he produce？his masterpiece， $1 /$ Ma－ trimonio Segrelo（The Secret Harviage）．Keturning in 1783 to Saples he placerl on the stage his Le Astuzie Feminiti and $L^{\circ}$（Olimpiade：engaged in the republican agitation while the French troops were in Naples：was condemned to death on the return of the Bourbons：escaued to Venice，where he dical dan．11，1ヶ01．Tis works are remarkable for originality and spirit．

Cim＇lri（in Gr．K\｛ $\mu \beta \rho o u$ ）：a warlike penple of ancient Eu－ rope whose origin is involved in obscurity．They were re－ garded as Germans by Casar and Tacitis，whose opinion has been inlopted by most moderns．11．Nüller und other writers suppose that they were Celtic，and that Cinbri is another form of $K^{2} y m r i$ ，which is the mative name ol the Welsh．In 113 B．c．the Cimbri and the Tentones issued from the nowth part of Germany，crossed the Eastern Alps， and invaded the territory of the Romans，whom they de－ feated in battle．Ther afterwarl mosed across the lihine， and pillaged part of Gaul．The Cimbri and Teutones gained another victory over the Romans in the vear 109．Within a period of six yeats thes defeated four consuls and ronted five lioman arnies，so that great constermation prevallen at lomme．＇They invaded Spain in $104 \mathrm{~B}, \mathrm{c}$ ．In 102 B ．c．Marins defoated the Teutones at Aquatexitia（Aix），in（riml．The army ril the Cimbri at the same time invalded the north of Italy by a dificrent ronte，and gained a victory orer the Ro－ man consul Coitulus near the Jelige．The infantry of the （＇imbri had shiedds fastened together with chains．The two Ronan inmies were then mited under the joint command of Cittulus and Jarins，who gained a great victory over the Cimhri near Verona，or，as some place it，near Vereella （Tercelli），in Jnly． $101 \mathrm{~B}, \mathrm{C}$ ．It is said that more than 100 ，－ ooo Cimbri were killed in this battle．T＇he Cimbri in the time of＇lacitus lived near the North Sea，and in Juthand． which was called the（imbric Chersonese．See Pullmann＇s Die Cimbirn（18：0）．
（＇immérians（in（ir．Kı $\mu \mu \neq \rho ь o t$ ）：originally a mythical people living on the confines of the world．where they were shronded in mist and cloud，untouched by the rays of the smn：hence the proverbial expression＂Ciminerian darkness．＂ There were the groves of Persephone，the entranee to the dank house of llades，and there is a roek（Mt．Taurus），＂and the meeting of two roaring waters＂（between the Sea of Azof and the Euxine Sca）．The historical Cimmerians in－ habited the Tauric Chersonesos（Crimea）and the eountry E．of the Straita of Kerteh（＂Cimmerian Bosporos＂）．They gave place to the Sevtlians，who in turn were banished by the Gresk colonists．

J．R．S．Sterrett．
Cimo＇lian Earth（in Gr．$\gamma \hat{\eta}$ Kı $\mu \omega \lambda(\alpha)$ ：a kind of eartlı which the ancients usea？to oldan trom the islamds Cimolas and Siphoms in the Cyolades．It wiss sometimes nsed in medicine．hut was especially employed instead of somp in washing chothes．It ajprears to have hem a variety of stea－ tite or soanstome．

Ci＇mon，or Ki＇mon（in Gr．Kl $\mu \omega \nu$ ）：an Athenian com－ maneler and statesman：b．abont 502 1s．c．：a son of Miltia－ das who commanded at Marathon．Ile served with distine－ tion at the great battle of Salamis， $480 \mathrm{13}$. c．（＇imon and Arist ides commanled the A thenianc，who，eo－operating with the uther（ireek armies．proseconted the war ingalnst Persia in tif 13．C．Soon aftur this date he became rommanlor－in－ ehief of the allies，who preferred him to the spartan leans：a－ nias．Ile defertem？the Persians on the strymon，and in 466 gatimed a great naval victory at the month of the Euryme－ Ton．If was for some time the most prominent statosman of Ithens，amb a rival of Pericles．C＇imon improved Ithens by planting trees and lmilding walls to the Pimens．In 461 B．$\because$ ．he wic hanished ly ostranism，hut he wis permitted to return in tisi．He olotained commanul uf al floet in 44！，and bosieced fitimm，in（＇ypros，where he died in the same pear． He was a comservative in frolitics．see Plutareh，Life of （imon：（＇ormelins Nepus，（＇imon：Grote，IVistory of Gicece； Thirlwall，Mistory of erreece．

Cillaloa：stme as sinaloa（q．r．）．
（＇imclona，sin－kō na：a genus of trees of the family Rubi－ acet，from many of the species of which is derived the bark

(sometimes popmlarty (oalled leruvian hark), from which are obtaned the alkatoids quinine and ciachonia. (inchouatrees are indirenous (1) Sonth America from 10 N. Aat., to 19) or $20^{\circ}$ S. hat. 'They are foum? chielly on the eastorn sope of the central chain of the Indes in fifolivia athd l'ern, and it is stated that the elimate which is most faworable to their growth is chanacterizd by a rainy season lacting for nearly nine months, the mean annual temperature being pret!?
 and Joes not grow in the valleys. It is an evererreds, from f0) to 80 feet in heispla. With laurel-like uphosite leaves abl fragrant lluwers. "lowe 'inchona calisuly is an exeending-
 6,000 feet. suy cinchona bark which will yived a quantits of alkaloid amonntiner to $\overline{3}$ per cent. can be itsed for medio.jnal purproses, but half of this quantity of alkuboid should in quinine. So fess than thirty-six species of cinchona hark are known, but comparatively few of them (alout six) viedd the reyuired amomat of alkaloid. From the barks of these sis species may he derived not only the alkalond quinine but tive other alkaloids, two of whicla are artificial. 'I'bese alkatachs are divided into two series. known as the guinine and dinthonine series. In the guiniue serise we have gunine quinithere and quinicine. Th the cinchonine surios we latve cinchonine, (einchonidine. and cinchonisine. It is the quintione and conchonicine whith are artificial alkaloid: ("inchonat lark also contans kinic and kinovic atelals. At the froment time most of the einchona bark is slerived from coltivateal trees, simee it has been fomm that by the coultivation of the trees ablal the cartal conllections of the hati a geater pere centage of quibine can be ohtained. The largest gumant uf cultivated einehona bark comes from lablivia. The einchor nattree is also grown for its loark in Java and in India, and cinchona phantations have been started in Wratern dfriest, in Nexiew, bentrit America, and in the fitmits fettements. The chinf use of rinchonat and its alkaloits is in the treat ment of malarial infeetion. Uriginally introulucoll to the world at latee fur this purporse as an anti-malarial by the Countess of ('liondon, it was aftorwam takorn uy by the Jesuits and for a certain length of time wis called "Jonuita hark." [ff to within a few years the pmulaymont of this drug in malarial fever was purely empribal, lat owing to Whe stmeles of laveran, a French army surgeon, and of Marchatava and (edli in ltaly, Osler, Conncilman, and others in the $L^{\circ}$. S., it has now been telermined, first, that malarial fever is alway due to the mesence of what is known as the malarial ferm in the hhond, amb, sceont. that yninine comes makarial fueer by destroying these mieroorganisus. Owmer
 form, but this very bitter property makes it also at vanabie bitter fonic in easis where the mucous membanmes and nersous system of the human body are below par. In addition to being employed for malarial fever it has also bemon fombl to be at lestroyer of tho amoda eoli, a miotoorganian pros duciner curtain furms of dywutery, and it is therefore employnd as a sumitie remedy in anubie dysentery. It is alsus usced for the purpose of buraking up eolds in their early stages. With the object uf incorasing the pawtr of the uterine cont rations daring parturition it is manally given in the dose of ebt or 30 giatins dissulved in wialor. In

 Value in certain cases of whophine-eongh, tgininte itsolf is rarely employed. boing nearly always in bo form of a sall surh as the sulphate of puibines, the hrelrowhlonate the bisulphate, the bydrobromite of quinime, on' sombe similar anmbimation of ati arid with tho alkatoid. (ot theser. the luot eombination is the hydrondorator and the bisilphatr. wworer to their soluhility, bite the sulplate of quabium is the preptaration whith is most widely employed. purely as thas reath of enstom.  late griven an unfavorable improsemon of the "ily arehi-
tecture．No Chicago fire came to remove them，and later growth did not demand their demolition．They are now giv－ ing way to stately and permanent buildings，of the most sub－ stantia）constrmetion．（ionspicuous examples of this renais－ sunte may be seen in the United bink building．the bmildings of the First and Third Niational Banks，the Neare building， the new udd Felfows Temple，and many others．

One railway brilise，two liridges for railway and high－ way purposes combined，and two used exclusively for high－ ways，none less than $\frac{t}{2}$ mile in length，span the ohio river．

The Tyler－Ilavidson fountatin，the gift of lIenry Pro－ baseo，erceted on Fifth street，surrounded by an esplanale， is the most striking and chaborate monmment in the eity． The statue of Garfud delivering lis inangural addres． and the equestrian statne of Gen．William Hemy Hamison are notable works of art．In Spring Grove Cemetery there is an impressive monnment erected to the memory of the Ohio volunteers who died during the ciril war．St．Peter＇s Cathedral contains a beantiful altar of Carrara marble，and an altarpiece．St．I＇eter Delivered．by Marillo．

Insfitutions，efr．－Cincinnati contains 2．26 churches，rep－ resenting every phase of Christian belief and eustom．The most notable luifdings are St．Peter＂s Cathedral，st．Francis Xavier＇s churel，the second Preshyterian，St．Paul’s Epis－ copal，St．Paul＇s Methodist，and the First Presbyterian， Which has the distinction of the lottiest spire in the West， 2s．feet high．There are $1 \%$ hospitals，namely， 1 extensive City Ilospital， 1 L．s．Marine IIospital： 4 are private enter－ prices for profit，ind 11 are supported by private charity．

There are $3: 0$ building and loan assofiations organized umbre the laws of the state，which take the place nif sav－ ings－banks．There are about 1,000 societies and associations． social，benevolent，ant commemorative．

There are＂public high schools， 31 district schools． and 22 intermediate schools，with t 36 male and 649 temale teachers．and 37250 pupils enrolled．The cost of the public free schools in 1830 was $810,073.83$ ；in $18+3$ the cost was S06． 85.29 ；in $185 \%$ it was $103,712.92$ ；in 1562 it was \＄2 12 ，－ 2！ 4.46 ；in 18.2 it was 864.027 .03 ；in 1882 it was $859,39 \% .12$ ： and in 1892 it was＊ $814.333 .+2$ ．

In addition．there are now forty parochial schools，with in－ structors and pupils numbering about 15，000．

There are five Ioman Catholic colleges and six academies． The McJicken Lniversity，which originaterl in a bequest of Charles Mcllicken now amounting to $\$ 600,000$ ，has been further endowed from the anmual revennes of the city，and is rapidly growing into an important institution of learning． Sew buildinars are soon to be erected in Burnet Wools Park，where the city las sut apart 30 acres for a site．The aim is to crown the free－school system with a completely equipped university．The Colleqre of Ansie is very largely attended，and has i large number of instructors．

The Ohio Mechanics Institute has long been a great educational force in the city．It owns in ample buikding． with library，lecture－hall and sehool－rooms．It inaintains courses of fectures specially devoted to the mochanic arts， and a nicht－schoul with foo pupils．where instruction is given in the ruliments of seience，mathematics，architec－ ture ama kinilred sulyjects．
The irt Scllool，in conneclion with the maseum，which contains many tine paintines，statues，and other works of art， is attenteal by humitreds of students．It is perhaps the most liberally endownol of all thr private institutions of the －it y，lue to Juscpld Longrworth，（＇hanles West，David sinton， anil lenben springror．

The Zoiblogionl farden is siluated near the northern houmlary of the city．It cowers 80 aeres of picturesiule hills and ravines anil is well stocked with wifh animals， Birds，ete．It origimated with the public spinit of Andrew Lirkenbrecher．
The prineipal libraries are the Ponblic Libury，with 167，T3．
 with J0，000 woluma ；the Law Library with s， 000 volumes： the library of the lliatorical society，with a larpe number of rave books，pamphlets，mamucripts，etco ；and the library af thar Mecthatuič Institute．

Amoner manicipal，benceolent，and penal institutions are the rity infirmary，tha workhonse for franishment of miste－ methors amd violations of ebty ordinances，the Honse of liefare for incorrigible wr lomiless buys and girls，ant an extensive hospital．Besides these，there are supported by Private charity mamy orphan asylums，protectories，and fomes for boys amf girls，for fallen women，for whews，and
for old inen for uliliaen．

The city has one police court with a single judge for the trial of minor offenses，and five justices of the peace．There is alsu a suparior court with three jurlges，which has jurisdiction ouly of civil causes arising within the city．It is intended to expedite the hearing of causes arising in a commercial business．

The conrl of common pleas，with seven jurlges，has juris－ Jiction in connty and city，in caves buth civil and criniual． A cireuit court，with three julges，hears appeals，second trials．etc．

Gocermment．Finmee．rte．－The city is divided into thirty Wards，each of which is a civil division for choosing olli－ cials．
The covermment of the city has much of the so－ealled ＂ferleral＂plan．The mayor is elected every three years，and is not elicrible for re－election．Ile appoints a board of ad－ ministration，which has charge of the repairs，improvements， and preservation of streets，of the water－works．citr infirm－ arr，etc．，consisting of fuur members；a board of park com－ missioners，in charge of the use and improvement of parks； a board of review，six members．with authority to examine and supervise city oflicers and fix rates of taxation ：and a board of elcetions，four members，which appoints all election officers，ant conducts the elections and canvasses returns． lle also appoints the prosecutor of the police court．He is the chief of police，with powers similar to those belonging to an olficer of the army－to aliscipline and command，but not to appoint or discharge．There is a board of four police commissioners．appointed by the Governor of the State．The masor nominates all ollicers of the police foree，and with the approral of the board iphoints them．Police oflicers hold luring＂goon hehavior，＂and ean only be removed or pun－ ished apon charges and a hearing by the board．They ninst pass a medical and a literary examination before appoint－ ment．
The judge of the police court and auditor of the eity are electer］by the people，The board of legislation cunsists of one member from each ward，one half elected each year， who serve for two years．There is no other legislative body．

Commerce．etr－－ly the Ohio river the rity is in convenient commercial relations with the entire Mississippi valley．The river navigation is of the first importanee，becanse it brines the vast conl，iron，and timber regions of the Alleghany hills to the city＂s wharf．These materials of manufacture float to Cincimnati at trifling expense．The Government has ex－ pended large sums wisely and skillfully in deepening and elearing the river＇s clambel，and now maintains throughont its entire length a system ol lights which serve as a safe guide for navigation．

The rigorous growth of railway facilities has apparently reduced the importance of river transportation．But the figures show an enormons tonnage by river larger eacli year． During the year ending Ang．，1892，Cincimati alone re－ ceived by river 2，its．s09 tons of coal，mearly 200,000 tons of mamufactmed iron and steel，more than $1.000,000$ tons of pigs iron， 60.000 harrels of salt，$\$, 000,000$ brick，and many thonsand tons of other crude merchandise．The gen－ eral use of barges has redueed the cost of river earriage， and enables the steamboats which trathe with Cincinnati to handle this great volume of business．

The city is also a railway center，every important railway system having lines passing throngh it．Its indand situation precludes it from forcisn eommerce．but its loeation in the most productive portion of the U ．S．．with its ample means of eommonication，must always make it a most important center of domestic trade．

The trafle in $18!4$, which inchuled almost every article of trale．made an agregrate in receipts of si346，4ius 34 ，and in shipments of $\$ 3+6.363,504$ ．
There are 13 banks，with an aggregate capital of $89,918,000$ ， and elearings in 1892 amonntinus to site 0,639 ，t50．

It is，however，chictly a mambiacturing city．Its inchas－ tries ran in this diredion at an early late．The distance from any sompe of suply and the compenience of all sorts of materials made matufatofariner protitable，abul there was asteaty and increasing demand from the growing regions lying soutl anul weot．

Aecorating to the census of 1890 it had 218 manufacturing industrics，with 7．661
 nually in wiges，nsing materials to the value of $58.3,090.96 \mathrm{x}$ ，
 The total population was ？36！！us，so that the preprobderance of manufacturing is readily seen．

The municipal difht by the census of $1=10$ was $2=1,73 \%, 611$ ，
 suthem k．K．，britt wholty by the city and now yiplding an anmal rental of nearly a million dollars．The romatuder of the debt is manly for parks，public buidinge，and strect improvements．The assets of the city ure largely in excess of the clebts．

History．－Cincinnati was settled in Wece．lixs（probahly the 2－th），on land bought from the（．，$\therefore$（ Juhn cleves symmes．The land had bern lanked wed hy its proprietors on sopt． $2 \cdot 2 \mathrm{BE}$ ，and a decision renched to call the place lasantiville，a pedantic mame spanily－ ing the town opposite the month of the licking．Indige Symmes lain！out another city at the junction of the（Onio and tireat Miami rivers，but a great thood in the spring of lise male umatilable the sites of several great cit ies．amb the decision of the military amthrities to buih Font Wish－ ington at the month of Mill ereck aided in makins 1 ananti－ ville the center of settement．In bigo llamilton County Wita organized by Gen．St．Clair，who was a menther of thi Soriety of the（incinnati，mol whe changel the nome of the sethement，also making it the comety－stat．For ten years or more it was a village of $\log$ cabins，peophed by ithers and dissolnte frontiersmen，and in 1800，when the rillage was organized．the population mumbered only 750 ．In isus a goung ladies sehoul＂was opened and in In if the lancus－ ter Acadeny，which later became Cincinnati（ollege．An energetic pepulation．first from Nen Jemey，and later from l＇emsylvania．V＇irginia，Maryland，and Kentucky，laid sumbl foumdations：in 1815 the first steanbent from Kew Orleans reachel（＇incinnati，and in a few years a wide commore was male possible．In 1819 a city chater was receival： the city became a manufacturing ceuter and an important distributing－puint，and its growth continued steadily until 1sif0．It that date the area of the city was ？somper． From 1s4．\％to 1860 there was a large ferman immigration， aml sis or seven wards are stil known as（iwman，though the great majority of the＂Germans＂now living in the eity are native－bom．The civil war（1861－6．3）scrionsly in－ terfered with the development of the city，chicly hy the destruction of its trate with the sonthern states．In 15.0 the area of the city was increased by the adhition of auljoin－ ing villages，embracing an area of 17 sif miks．The proviod since 186.3 has heren distinumished hy advance in art，archi－ tecture，music，and educational institutions，and under therse inthences a very composite population is slowly becoming homngenenys．

 （ $1 \times \pi 0$ ）216．239；（1500）2！心．000．By the censme of 18.50 the resident population within the city limite was ？日月，gos．The surtoumling villages aml eitics contain abont 100,000 peo－ ple．Like New York，Cincimati will always have her cen－ sus pupulation reducel by the overllow into an atjoming state．

Cinnanon: a drug and flavoring mixture derived from the inner bark of shoots of Cimnamomum zeylatuicum, a tree some 20 to 30 feet in height, with branches mostly horizontal or drooping. Jlost of the cimmamon of commerce is obtained from C'eylon, although other sonrees are largely drawn mpon. Chief among these is China, from which immense amonnts of cimmamon are anmally exported. (immamon bark has also been artificially cultivated in Java, in the C'ape de Verde 1slaml, in Brazil, in a number of the $V^{\top}$ 'st India islands, aml in Egypt. As with many other lrugs, the quantity of its volatile oil depends very largely, indeed. upon the charaeter of the soil in which the tree grows, the climate, and the mode of culture to which it is exposect. The presence of sunlight and shade also intluence the development of the oil in the hark, The bark was collected at one time from treas which were growing widl, but the Dutch, recognizing its valne, first introdnced the practice of cultivaling the tree. In commeree the Chinese cinnamon bark is called lasia. Ceylon cinnamon oceurs in long cylindrieal pieees lowking like guills, the smaller quills being placed inside the larger ones. Sometimes these are as long as $:$ : leet. Chinese cinnamon is of a darker color than the best Ceylon cinnamon, and is more rough ant lense. Besides these and the other forms of cimmamon which we lave mentioned, there is a variety callel saigon cimamon. which bas now heeome ollicotal in the U. S. Pharmacopecia. Little is known concerning the trees from which this bark is derived. Its introduction into commerce is comparatively recent, lut. it seems to be increasing in quantity from year to year. It ap)pears in commeree in the shape of unscraped quills about $f$ inches long and $\frac{1}{2}$ inch in diameter. Their thickness varies from ${ }_{1}^{1}$ th to $\frac{1}{8}$ th inch. The imme surface is ruite dats brown in color, somewhat striated, and grannlar. The taste is sweet, decitedly aromatic, slightly astringent, and whou the bark is ground into a powder it yields a darker-colored mass than does the Chinese emmamon. The odor which is given off by all of these barks depenus upon the presence of a rolatile oil known as the oit of cimnomon, which is a warm aromatic liguid possessing a taste which is very peculiar. Besides this volatile oil, cinmamon bark enntains tannic acid ats its chief ingredient. It is one of the best of the various aromatic nils employed in medicine, and seems to possess fertain antihamorrlamie juwers when administered internally in cases where there is a tendency to an oozing hamwronge. The dosc varies from 1 to 5 drojs. Ejon the nervous aystem it acts as a feeble sedative. In the gastrointestinal tract it tends to stop fermentation and decrease 1latulenee. The vi] of cimmomon is also largely employed in the preparation of what is known as cimmonon water, which is usel as a pleasantly flavored rehicle to earry more powrrful drugs.

Editor of $\cdot$ Daily Ilerald.
Circuit [from. Lat. circuitus, a going armund: circum, around $+i r e, g o]$ : in electricity, the path of the current in magnetism, the path of the lines of force which constitute the magnetic field to which the lines in question belong. An electrical circle is "closed" when no portion of it olfers an infinite resistance to the flow of electricity. It is an open circuit when any portion possesses so high a resistance as to prevent the passage of an appreciable current. The electrical circuit may be said to be uade op of the lines of flow, each of which is a closed curve. No two lines come into contaet at ans point, and all of them are everywhere perpendicular to the equipotential surfaces. The total number of lines of flow in any cireuit is at erery part of it the same: bat their distribution depends npon the specific conductivity of the material of which the circuit is composed.

The simplest case is that of a batter or dynamo sending a current throngh an external circuit composed of a uniform wire of it single metal. The circuit may be divided in two parts, that within the battery or within the armature of the dyano (internal cirenit), and the wire, which constitutes the external circuit. In such a wire the lines of llow will be parallel and evenly dixtributed throughont the metal. The current density, measured by the number of lines per nnit of cross section, will be everywhere the same throughout the external circuit.

Circuits are however, frequently of a much more complieated character. The current mary be made to traverse the ground through a portion of its course, as in telegraphic cirenits, etc., in which case the lines of flow will disseminate themselves through all neighboring portions of the earth's crust, following watercourses and whatever other paths offer themselves. The existence of currents flowing within the earth at great distances from the direct line between the terminals inserted in the ground has been repeatedly noted, but the principle already stated, that every line of flow is a closed curve, is a rigorous one; and every such line issuing from the positive terminal into the earth will be found to enter the negative terminal, however devious or indirect its path may have been. Where several listinct paths between two points are utferd, the current will use them all, each one in direct proportion to its conductivity, or in inverse ratio to its resistance.
E. L. Nicholes.

Cirmit: a division or district of a comntre or state at varinus places in which court is successively heid by a judge or judges appointed for that purpose. Originally in England the judges of the courts at Westminster held their sittings only at that place, or wherever the king might be, but as early as the reign of Henry II, the kingdom was divided into districts or circuits which were risited, commonly twice in each year, for the trial of issues of fact, the issues of law being reserved for decision by the full court sitting in bane at 1 estminster. (See Baxc and Nim Prics.) The julges while traveling circuit were anciently called ". justices in eyre" (deriv. ol Lat iter, itimeris, jonrney). Essentially the same system is still preserved, and England and Wales are now diviled into eiglit circuits, and seotland and Ireland are divided in a similar way. In the U.S. the term is applied to a julicial district over which a Cracetr Court (q. $v$.) has jurisiliction.

Revised by F. Sturges Illex.
('irmit Comri: the name of the principal inferior conrts of the $[T$. S. which, until the establishment of the circuit court of appals in $[8: \%$, were next inferior to the supreme Court. The $I^{\top}$. s.are divided intocircuits, and in the juticial districts of each circuit one of these conts holds its sittings. The court may be held by the chief justice of the T . S ., one of his atsurciates, a surcial cirouit justice, or a district judse, or any two of them, siting together. In general the cirenit comrts have original jurisliction, hoth in law and equity, in civil citses involviner sums of soth or over, and in all criminal cascs. They no longer have any appellate jurisifetion. The term cirent court is also applied in several of the states to certain cuarts of record hariug at genemal oriminal jurisdiction, from whose deeinions on questions of law an appoal lies to a superior court. See (ondets.

> Revised by F. Sturges Alles.

Circuit Court of Appeais: an apicllate court of record of the $\mathbb{U}$. S., established by act of fongress in 1891 ( 26 Stat. at Large, s.510) to relieve the supreme Court of a share of its burdens. It consists of three judges, two of whon
eonstitute a quorum, and is presided over hy the chicf justiee or one of his associates, or by a circuit judge. One or ruore julges of the district courts mar sit when necessary to make a full court. Br this act the appeal which formerly lay from the distriet conrts to the circuit courts is taken away, and all appeals mnst be taken to the Cireuit Court of I ppeals, except that in any case iu which the jnrisdiction of the conrt is in issne the question of jurisdiction mar he curtified to the Supreme Court. and an appeal may be taken directly to the supreme Court, from final sentences and decress in prize cases, in cases of conviction of a eapital or otherwise infamous crime, in cases involving the construction or application of the U.S. Constitution, in any case in which the constitutionality of any law of the U. S. or the validity or construction of any treaty is involved, and in any case in which the constitution or a law of a State is clamed to be in contravention to a law of the U. S. The Circuit Court of Appeals has final jurisdiction in cases where the jurisdiction depents entirely umon the parties being aliens and citizens, or citizens of different States. and in cases arising under the patent laws, the revenue laws, the criminal laws, and in atmiralty cases. It may, however, certity to the Supreme Court any questions or propositions of law concerning which it desires the instruction of that court, and the Snpreme Court may require by certiorori or otherwise ant case to be certified to itself for its review and determination.
F. Sturges Alles.

Cireular (Lat. circuturis; Fr. circutaire): ronnd, like a circle, circumscribed by a circle; ending in itself, as a paralogism in which the second proposition proves the first, and is proved by it. "Circular salifing" is the method of sailing by the are of a great circle. (See Great-circle Sailixg.) Is a noun cirenlar sometimes signifies a document alddressel to a circle of persons or to persons having a common interest, as a circular letter.
Circular Finuctions: the inverse of the trigonometrical functions.

## Cirenlar Notes: See Letters of Credit.

Circular Numbers: numbers whose powers have their last digits the sime as their own; such are numbers ending in $0,1,5,6$.

Circular Points at Infinity: the two imaginary points in which any circle intersects the infinitely distant right line in its plane.

Circulating (or Recurring) Decinal: a decimal in which certain digits are continually repeaterl. Thas, 1572:32:3..... ad infinitum, is a cireulating decimal of which the figures 23 constitute the recurring period, called also the repetend.

## C'irchlating Library: See Libraries.

Circulation of the Blood: In all animals, even the simplest and lowest, there is a movement, more or less regular, of blood, or of a tluid equivalent to it, furnishing material for the growth. repair. and snstenance of the boly. Sponges. while living, have no closed internal circulation. but their notrition and aerration are sustained by the incessant flow of the water in which they exist through their numerons pores. Other Protozoa (as the lowest group of animals is designated), as Rhizopoda, hare, within their soft. jeily-like substance, cavities (vacuoles) which alternately contract and dilate, serving the purpose of circulation within their bodies and redistribntion of their material. Animals a grade higher, as the Actinia (sea-anemone). have a free communication between the stomach and the general cavity of the bouly, from which, throngh fine ramifiations to certain parts. the nutritious tluid is circulaterl, though never separated as true blood. In woms no distinct circulation of blood has been proven to exist. Cavitios (lacume) there are, and in some. as the leech, ressels called psendo-humal resids. ramifying through the huly and containing a fluid, renerally red, but these always have a tubular communicafion with the exterior. In insects there is a dorsal segmented wessol. with valves botween the segments, which convers the blond forwart hy its rhythmical contractions. The bloml. Which is olten eolored, and contains corpuscles (thomeh never colnted, as in wertebrates. by the empuseles), then flows into lacuma, or spaces through the borly. coming in contant with the air introducel by the tracheal tnbes. (rnstaceans, as the lohnter, have a musen]ar heart, with six artorial branches, going to the head. stomach, liver, and posteriur parts. Thence the hoot passes through a number of lacunze, and returns by a number of veins, which expose it.
in the gills, th the air lefore remmeriner it the the hat.
 in it : monde of distribution of the blewd. The asster has a heart, not far from the muside which thene if shell: its vacular sytem, howerer, is incemplately cherent. In the enthe-fish there is a strone systemic heart, with valves: it rend bluwh to all the orgats except the gill- The blomi raturns into a monactile vemus enlargenent (sinus), whith Cunvers it to the gills through from two) to four branches if wins: Other simust thon receive it. and these, lwing contructile, semb it hack to the hart. All invertebrates (ani-mak- without an internal skeleton) have, if any, a sysfermic hrart, and culy few of them have colored cormuicles in their i) 1 lew.

Cietchratel animals alwass (except the amonalous stmphingns) have blewal containing Inth rell and colorlest corpuathec, the former of which give to it its cenlor. In fishers the heart is liranchial or reppiratery. Consisting of an anricle amd a ventricle it rectives vemus blonl from the boly, and propels it, ly four or five arched vesiels, through the gills, whence it circulates. to be returnel by veins in the auricle. In the pell, torpeito and one or two other fishes. contractile renous -inusis: anist this return.
In lishew gemerally it is - nypposel that the impulse of the hratt sulfiow for thi whole round of the circulation. Alore proliald!, however, this is surplementer by arterial, if not mons. propulsin, and by a power acting in the (intermediate) calpillary region. All vertomathel inimals have a clusel circulatiry system, consisting of a hoart, arteries, capillaries, and veins. In all vertebrates there i . also. a [urtal system, comprasel of veins going from the ligestive, and sonetimes othery argans to the liver-in fishes the the kidney alw)-whence veins again convey the bloal to the heirt.
Hiptilds amed amphibia have a heart with three cavitietwo mricdes sum one ventricle. of the auricles, one weet ves Howd from the lunge (exerpt in the early stage of life of the fromend some other amphitiat and from the lungs and gills buth in the fwremibranchiate amphihin, as l'rotens): and the other receives the bow from the body generally. These two kinds of bloond (aematelel. or arterial, and nonaersated, or winneme) mingle in the single ventricle, whence they are remlitributed to the lungs and all over the body thy arteries. In the crocodile. howerer, a partition almont separates the two latues of the ventricide, thas appromeching the arrangermont in the higher animals.
birde hase fur carities-two auricles and two ventricles -making a completely double heart, il ways situated in the middle of the tharax or chast. One anizich receives the blonl by larte weins woming from the bexly gemerally. This auricle prasion the blowl inten the comecter ventricle, which simpls it. hy pommary arteries, to the lungs. Thene it returne. by pulmonary seins, to the other auricle, and this (onnery it inte) its attached ventricle. That cavity then propels if throush the aottas, or main arterial trunk, for genetal distribution orer the berly. In birels the pertal venous systom manly ennects the fiver with the digestive organs: but a few of its veins communicate with the kidneys, posterior internal organs, and hwer extremitios.
. 111 mammals (viviparous vertelrated animals which suckle their young) have a double heart. consist ing of two auricles and two ventricles-a rexpiratory and a setemic huart conjoinel. In man, for instaner, the right auricte and ventricle constitute the recpiratory or minmomary hart-the
 ent turenlier, no direct cummuication exists betwem them. In the dugny the two ventricles are partly eqparated by
 dnpesit strenglh on the inter-w ricular wall. Omly in main amb sone of the anthrophid (man-like) alpes doe the heart incline to the left sife: in ofler animals it is usually median. This prommes the eymmetry which is so enverially importhat in swift-ruming animals, ax the hemen and dere and in hirise fur flight.
The arrangement of the branches of the anera differs in
 or fiew aurtie arches gring to the wills. The lower reptilins have three auryic arches on eath sidu: ; the higher reptites.

 The right murtie arch. pasing ower the runt of the right lung. In mammals, inetuling tome there is unly a chale amrtio areh, wer the rwot of the left lung: this, giving off

The manuer of origin of the ase niling hruyches cuthelavian and carotid) of the gorta differs also, (wen amone the Mammalia. In man it is leatet symmetrical. now arterial trmaks pawing ulward from the anita on the loft vile (left carndil and sululavian), while there is one (arterin imnominetu) only on the right. won shlmbiviling into two. The herer and ruminants have hut a single aurtic principal hranch, whith gives of all four of the caronid amin suthelavian artorime. The pertal cireulation in mammals is mever conncetell with the killneys.
A rete mirubite is a net work of closely interjuining (anastomoting) urteries, which finally unite into a single trunk. Whales amp other Cetacen (aquatic, tish-like mammals) have retie mirabilia connected with thrix infercostal arlorims within the chest, evidently serving the purnse of rewervois th troain and distribute aitrated blow while the animad is submerged for a long time. 'Tlure are also in the same unimals venms plexuses or retin, for the detention, undwr like circumstances, of impure, non-air rated blowd. Protective arrangements of the arteries exist in certain special instances as the passago through the pelvic bonew of the main artery of the hind part of the tail in the whale: of the great artury of the anterior extremity throlgh the humerus or arm-ione of the lion: and of the corremponding antery through the coffin-tione (hoof-thothe) of the horse. In all theee cates rigerous action of the muscles in locomotion or prehencion might unduly obetruct, at timee, the llow of arterial hond tuit for such a provision, he which muscular or temlinoms pressme apon the artery is jurevented ly its inclosure within body walls.
The circulation of the blood in man correg onds altogether (except in the unsymmetrical location of the heart and of when en the arterial trunks) with the mamalian twe abure therriteel. In connection with the human circulation, howexer, some additional partieulars may be here given:

Astion of the Heart, - Bering compowed of frectliarly arrauged museular fibers, the heart, hy its rhythmical comtractions and relaxations, alternately cmptiow itself and lwecones filled with blooll in an adult mall of woman. leetwenh surenty and eighty times a minnte while at rest in health. From the right ventricle the remons: bleod (poured into it from the right auricle, which receives it from the grat mome (ame) is sent through the pulmonary artory and its branches to the capilaries which ramify mimtely thrmanhut the lungs. These combine to form small wins whose unim into larger trumk finally constitntes the four pulaconary veins, which emptr the (now aërated or arterializel) blonel into the left auricle. This conseys it imm the Jeft ventricle, whence it is impelledt through the marta, wh the liranches of which it heeomes distributed all over the hedy in capillary net works, to return to the heart ly means of the veins: all of which emply at last into the asicumane
 and Thes.
For the mantenance of this roum of the eirenlation the velues of the heart are indi-gensable. Membramus aml
 cald anriele and its corresponding ventricle. Poeket-like (1) ree-folded, semilunar) walves also exist at the memiths of the two great att ries which conver Dond from the heart: namely, the pulmonary artery from the right ventricle and the aorta from the left ventricle. When the auricles are (ontractine. the (tricuspind and mit ral) valves hetwern them and the ventricles are open, allowing the thood to flow through. The anriclos luing emptiell and the vembicles filled, the latter then contract. and at the same fime, and in the same ant, close the auriculo-ventricmlar valves: st that the llond is foreed onwarl through the two arteries ahmow mamed (1nulmumary artery and aneta). While the vent rictes are "omtrumg (this: being (callew the systort), the huart is
 to a riumd conc, and thrast slighty furward against the quace he ween the lifth amd sixth ribs. bylow the left niphle This quite prectutille movemunt is the impulse of the heart Xo phewer other than that of elasticity has: hered froved to exist in the dilatation (lizastule) of the cavities of the huart. The immediate canse of the eystolic enntraction is mast probally the irritability resident in the heatts manembar and nervons tiselues anting under the st imulus of the flomel. It is also placed under the moclify ing influene of the urervons apparatus connectel with the wain and spinal corll by hramedne of the pamogat rice nerve and bitere raming thromph the sympathetic nerses. Why the action of thit heat thould the so regularly rhythmical is net kmwn. With
some (especially cold-hlooded) animals the heart has been found to cont ract for some minntes, or even hours and days, after its remoral from the body, and sometimes when entirely deprived of hloat.

Of the sounds of the heart, andible when the ear is phaced over it against the chest, the first (longest and londest) is explained principally by the closing, with vibration, of the auriculo-ventricular valies during the systole of the ventricles and the sound produced by the cont raction of the muscular fibers. Other minor causes are the impulse of the heart, the rush of blood intos the great arteries. The secoml sound has been shown experimentally to be caused by the closure, after the systole, of the pocket-like (sumilinar) valres at the mouths of the aorta and pulmonary artery.

Arterial. Circulation.-Since the arteries contain, in their middle coat, a portion of (smooth, pale, involuntary) muscular as well as elastic tissue, this must have an important inflnence upon the boxd-movement. The fact that the relative amonnt of museular tissue is greatest in the smallest arteries, which are farthest from the heart, suggests their ardaptation to the purpose of supplementing the action of the heart in propelling the blowl throngh the eapiliaries, as well as fo act by dilating or contracting in modifying the bloodsupply to the varions parts. After death the arteries are always found to have enpptied themselves, by their last contraction, into the veins. The valne of the minscular fibers in propelling the blood is also supporterl by the apparent need of such an arterial power to complete the circulation commenced by the merely brachial (not systemic) heart in fishes, and by the fact that in acephalous foorn without a head) childron the lieart is found to be absent, so that the circulation in them must have been arterial and capillary only: as Wroll as by the proof that luring early embryonic life every laman being is likewise withont a heart, the blood-movement then dependiag on the blood-vessels alone. Notwithstanding these and many other obvious reasons in favor of sucl a view (which was accepted by the distingnished Joln Huater and Sir (Charles Bell), the more common opinion among physiologists has been, for many years, that the offee of the miscularity of the arteries is of a "stopcoek" or "tlonl-rate" nature, ofposing a graduated resistance to the impulse riven to the flow of blood by the heart. Certainly these vessels, by their change in caliber brought about by the muscular element, have to to with the regnlation of the changing supply or determination of blood to varions parts of the borly at different times. This variation we see in blushing: in the erectile tissucs and organs: in the effect ol friction or mustard, etc., npon the skin; in the increased How of blond to the juws dining the time of dentition in infants, to the ovaries during ovalation, the uterns in gestation, the male reproductive organs of some animals at certain periods, and the antlers of the deer during their annual new growth. In all these variations the rasomotor nerves and centers have an important influence.

C'opilluries.-Having but ia single elastic coat, without muscularity, these very (microscopically) miaute vessels simply arlapt themselves to the lood that passes throngh them. Vet besides the tramsulation of lympin or modified hlool-plama from them tor the mutrition of the tissmes, and the absionption into then of waste materials, a force is probably added to the forwand movement of the blood in the applaty rogion. 'lhis may ocenr in two ways, both of which are common to animals and plants. One is capillary attraction-i. ". the attruction of fine thles cor lignids in whinh lhey are immersid, such as is wherved in inanimate (metallic or elass) tubes or porous bonlies as well as in living plats ami amimals. The other is the "vital aftinity," or attraotion of matrition, wereised by the tissues toward mat torials prosent in the hoond, and wathotrawing them contstantly from the enrrent, thas making romm, by dimimiton of resistance, for its onward llow. "The volmme of the capil. lary system in man is ahmat 300 times that of the arteries.

I'pionts Cirmblelion. - On accomet of the rlistance travfrsod by the hlomb (phiscinar as it does through the capillary ramitheations) hofore it reachos the veins, and their ereater acrercate voluma (three times that of the arterial systom). as well as the obtusenos of the andes made cenerally by thein hranches with the matn tranks, mat the various other factors which ather resistane to the blomel-enrment in the artrines and capillarios, the flow of the hlood is monch slower thoong the vans than thomgh the arteries. Veins have, as the arteries have not, valyes along their course, opening only toward the heart. By these the propulsive power is eqonomizel, ant, on aceomit of their inflacnce alson, the effect of
movement during exercise upon the veins always favors the bloor-movement toward the heart. Inspiratinn, by causiog a condition of negative pressure within the thoracic cavity, tenels to promote the return of venous bleod to the heart. Fonced expiration has an effect the reverse of this, hut by increase of pressure upon the heart and aorta it favors the expulsion of the blood through the arteries.

The velocity of the morement of the hood through the arteries averages from 10 to 20 [eet in a second; in the capi]laries, about 2 inches in a minute; in the reins, from 6 to 12 fret in a second. Experiments prove that the whole round of the circulation is aceomplished in a little less than half a minnte during rest and health.

The riscovery of the circulation of the blood, as now understoort, was mate by Dr. W̌illiam Tarvey in 1819, furst puhlisher by him, however, in 1628. Ite was partially antimpated by Servetus, Realdus Columbus, and Ciasalpinus ; almost entirely so by Paolo Sarpi. whose clam in this respect las been generally overlooked. The discovery was completed by the demonstration (with the aid of the inicroscope) of the hlood corpmseles amd the capillaries, between 16.54 and $168 \%$ by Swammerdam, Malpighi, and Leenwenhoek. Sce, on the eirculation, Foster*s or Tandois's Trentises on. Physiology. Revined by Edward T. Jeichert,

Cirenlating Medinm: See Moner.
Cireulation of Sill in plants: It was formerly supposed by botanists, and is Fet popularly believed, that higher plants possess a nutrient fluid, the sap, which ascends and descends by regular paths, after the fishion of the blood in higher animals. This is now known to be erromeons. See Botasy, Physiology of Larger Plants, and Physiolony, Vegetable.

Cirenmeision [from Lat. cireumeitsio, a eutting round; circum, aronnd + catdere, ent]: the removal of the foreskin of males. This practice comes down from the earliest times. It is depicted upon a temple of Karmak, in Egypt, and was certainly known to A braham (Gen. xvii. 7-14). It was patacticed by the Indians and native tribes of North and South Imerica, among the Kaflir and other Negro tribes of Ifrica, in tustralia, and in the sonth Sea islands. It is today universally observed by the Jews, by the Mohammedans, and by the Copitic and Abyssinian (hristians. It can not be traced back to any one land as originating it, nor is there any satisfactory explanation of its origin : perhaps it should be referred to the general connection between expiation of offenses and shedding blood. But however or where the practice originated, it certainly mast have puickly recommended itselt., and is to-day arlvocated by some physicians on the secre of health, for it promotes personal cleanliness, and also renders less the likelihond of venereal poisoning. It was formerly considered to increase the fruit fulness of the male. With the Jews circnmeision was performed on the eighth day of the child's life, but Mohammedans usually circumcise between the eighth and twellth year. Bothmake quitc an occasion of the act, inviting comprany and giving an entertaimment proportional to their means. The operation is patinful and in the case of mon-infants even dangerous. The operators are not surgeons, nor necessarily priests. The parts are commonly healef up in a few days. In the reign of Intiochus Epiphanes the attempt of cirenmeined lews to unde their circmmeision was made ( 1 Mace. i. 15 ; dosephus Intio., xii. 5,1 ) : so later the attempt is allumed to by l'inl( ('or. vii. 18) and by the Joman poet Martial. and described ly Celsus (book vil., chap. xxy.). It does mot seem to have been very successfal. In the Bible the word "cireumeision" is used fisumatively to express a change of heart. The carliest ("hristians loing Jews, naturally considered it necessary that the Gratile comrents shomb enter the C'hristian Charch by the rite of circumeision. lint b'aul saw clearly how detrimutal such a ropuisition was, und the council of Jerusalem (a, n, jo) formally absolved the (rentiles from it. In the Dohammerlan world, female cirenmeision is practiced, which consists in the renoval of the elitoris. In Arabia there nre female profosional cirenmeisers. see P. ( (Remondino, Ilisfory of ('ircumcision (l'hilaldelpha, 18:n).

Ciremulereme from Lat, cirenmferentia, circuit ; circum. aromel + ferre, carryl: a rurved line whicl incloses a plane area, and is syonvimons with periphery. It is applied esperially to the arved line formed by a rircle, ant its length hears u certain constant ratio to the diamoter. (hee ('IRMA.) The tormperimeter is used to dexionate the length of tho bommling lims of a plame area incloserl by scveral straight lines, as a sifuare or polygon.

Cirenmallex [from Lat. circumflerus, bent abont ; circum around + Heçtre. bend; a transintion uf the (ir. тepoaná-

('isleitha'nia: since $180 \%$ the usual, though not ofticial. colleetive name of that part of the Austro-Ilungarian monarcley which is situated this side (as riewed from Vienna) of the river Leitha. It embraces all the German crown lands, Istria, Dalmatia, Galicia, and the Bukowina; in general, all the provinces not appertaining to the Ilungarian crown. See Traveletthania.

Cispalane Republic: a former state of Itale; was organized be the French after the battle of Lodi in 1:96, It was bounded on the N. by the river Po (ane. Pudus), and comprised Nórlena. Reggia, Bolouna, and Ferrara. In 179 a it was n:arged in the Cisalpine liepublic.

## Cisplatime Republic and Proviuce: See Truguar.

( ${ }^{\prime}$ is'rhellane RepubIic: a name selected in 179 for the projected confederation of the Cerman towns situated W. of the lhine. The project was not carried into execution, because the peace of Campo Formio transferred the entire left bank of the Rhine to France.
('issam'pelos [Gr. nafáurte入os. a plant which elimbs like the ivy ( $\kappa \iota \sigma \sigma \delta s$ ), and has fruit like the vine ( $\alpha \mu \pi \in \lambda o s)$ ]: a genus of woody climbing plants of the Moonseed family (Vemispermace(r), natives of tropical regions in both hemispheres. It is of importance on account of the speeies C. pareira, a native of Brazil. which is one of the sourees of a common adulterant of the drug kmown as Parelra Brava (q. r.).
('iscee, séesay', Erxest Louls Octave, de: general and senatur : b. in Pinis. Dec. 23, 1810: educated at sehool of St.Cyr 18:30; distinguished himself in Algiers and the Crimea; becume a general of division 1863 ; shared in the events attending the investiture and capitulation of Metz: served against the Commune in the siege of Paris in Mar. and Alre. 1871 ; was Minister of War from July, 1871, to Aug.. 18i6. 1). in Paris. June 15, 1882.
 like: кьoбds, ivy + єīos, appearanee]: a curve invented by the Alexandrian mathematician Diocles, with a view to the solution of the problem of the duplication of the cube. or the insertion of $t$ wo mean proportionals bet ween two given straight lines. It may be regarded as the pedal of a parah)ola with respect to the vertex: in other words, it is the lonis of the vertex of a parabola which rolls upon an equal parabola, so that corresponding points of the eurres always coincide with their point of contact. It is also the invers of a parabola with respect to its rentex.

Cisterians, or bpromblimes [Cistereian is from Ciso lercium, the modern Citeaux. formerly Cist max. in Chedor, France, 160 miles S. lio. of laris, the site of their first ahtier]: an order of monks and muns, established in loote by loobert of Champagnc, who had been abhot of the bimedictine monastery it the forest of Moleme, hut who, desiring a stricter rule, induced twenty of his momks to accompany him, and they chose a desert spot given over to wild beasts and overgrown with brambles for their site. The next year liobert returned to Nolesme, and the remain-
ing monks became discouraged. for, not withstanding the vigorous administration of stephen Harding, who is esteemed the second founter of the order, it did not flourish. Its austerities repelled and many considered them too serere. But they were the attraction which in $111:$ induced Bersard (q. v.), son of a Burgundian nobleman, and thirty companions to join it. The rank and size of the company and the enthusiasm of Bernard soon gare the order fame. It was necessary in two years to send Bernard forth to found a new monastery, which was established at Clairveaux. Inside of forts years there were 500 abbers of the order, in the thirteenth century 1,800 . The Cistercians originally wore a brown habit, but Stephen llarding adopted a white one, at the alleged suggestion of the Tirgin 11 ary, to whom he solemnly dedicated the order. Ther mere addicted to contemplation, and so chose "lonely valleys and sequestered nooks" for their sites. They slejit little and worked hard; fasted from Sept. 14 to Easter: never ate meat, fish, eggs or grease, and rarely used milk. Their churehes were noticeably bare. They had seventy-five monasteries and trentyfive numeries in England when Henry VIIl. dissolved the monasteries. The mins of their abheys at Furness. Tintern, and Woburn in Eugland, and the still more famous ruins at llelrose in Scotland, attest their greatness. But the order is now practically dead.
S. M. I.

Cisterif [fom Lat. cisterna, subterrancan reservoir, deriv. of cista. box]: a tank constructed for lolding water. Where the suply of water is uncertain, or where rain-water is used. every house requires a cistern. A cistern in the top ol the house is usually constructed of wood. and generally holds less than 1,000 gallons, which is sufficient to supply a family only two or three dirys. Larger cisterns are excavated in the earth, and have masonry walls which are cemented. The cylindrical form is the best, as the earth excaration and the amount of masonry are then the least for a given capacity. Cistem water collected from the rainfall is usualls good if the roof be thoronghly clean before the Water is allowed to be admitted and if the cistern itself be emptied and scrubbed once a rear. A eistern should not be placed within 20 feet of a cesspool, and it is better if the distance between them is greater yet. Charcoal is often thrown into eisterns under the idea that the water will be rendered purer, but its utility is donbtful unless applied in the shape of a mechanical filter connected with the pump.

## Maxsfield Merriman.

Cistus: the rock-roses: a genus of plants, the trpe of the family Cistucetr: comprises several species which are natives of the Levant and Southern Europe, and are cnltivated for the beauty of their flowers. The Cistus creticus and a few others yield the resinous halsamic sulstance called gum latdanum. The cistus of the English poets is the rock-cist (Helianthemum), a genus of which there are four British and several American species.
Citadel: an especially strong part of a fortress, as in a fortified town: a separately inclosed ant defended place, which mar be leld after the surrender of the rest of the place. Thas when William 1II. of England besieged Namur in 1695 , the town surrendered Ang. 4, after a month's siege, but the citadel had to be besieged separately, and did not surrender until Sept. 1, and after an assault had been repulserl with great slanghter.

Citation, in lat: 1. A summons issued by a court of comperent jurisdiction directing a person to appear before it. The service of the eitation gives the court jurisdiction orer the parties cited or summoned. The citation is chiefly used in England in the ecelesiastical courts, and in the L. S. in surrogate or probate courts, whose jurisdiction corresponds in part to that formerly exercised by the English ecclesiastical enurts, and in the L. S. supreme Court in practice on writs of crror. 2. A reference to precedents or authorities in support of a proposition of law. F.S.A.
Cíteanx, formerly ('islpaux, seétō' (ane. Cistercium): a hamlet of France. in cote-d'Or; about 10 miles S. S. F. of IDijon (see map of France, ref. J-II). Tlere was a celebrated monastery of the Cistercian order founded in 1098. Rimains of the magnificent hoildings of this monastery are still visible. Sce Cistercuas.
('ithe'ron (in Cr. Kitapúv), Monnt, now Elatea: a famous mountain-range of firece: on the boundary between Attica and lbootia; was covered with forests. The highest smmmit rises 4.620 feet above the level of the sea. It is often mentioned by ancient classical poets.

 never resited in the $[$ ．s．＂It the theory of Itr．Jimary be
correct, this statute conferred citizenship where it disl not hefore exist : if that of Ludlam vis. Ludlam he somme, then it restricterl the rights of the foreign-born rescendants of citizens, perhaps umnecessarily.
3. Citizenship by Vatmalization.-In alien may be made a citizen by the act of a state or a nation co-operatine with his own act. Sometimes this citizenship is complimentary or honorary : usmally it is attemled with trme or intended. renunciation of forign citizenship. The question thus recurs whether a person can hy his own act put off his citizenship. The doctrine of the common law was that naturalborn subjects can not bo absolved from allegiance to their sovereign without his consent. It one time the eonrts of the U. S. asserted the same doctrinc. But Conoress has enated that expatriation is a matural right of all persons. England no longer insists on the cloctrine of indelible allegiance. The theory formerly held was this : the tie of allegiance creates reciprocal rights and duties; the state can not rightinlly diseard the vitizen without just cause of forfeiture, nor can the citizen repuliate his obligations to the state without its consent. Assuming that motual agreement is necessary to dissolve the relation of sovereign ind eitizen, the more ditlicult furstion is whetler the agreement of lissolution can be infrroed from the prolonged absence of the citizen, coupled with foreign naturalization, and the failure of the state, after notiep, to rechaim him. The better opinion would seem to lee that there must be some allimative act of renunciation on the part of the state to which the allegiance is due, though there are weighty opinions to the contrary. For the purpose of settling perplexing and irritating questions that frequently arise. the IT, S. have entered into treaties of naturalization with a number of forelgn powers. (For details, see Naturalization.) Naturalization may take place either by a mere law of a seneral nature. such as that which provides that every alien woman who marries a citizen of the U. S. shall be deemed ant taken to he a citizen, or it may oceur in special instances atlimative on the part of the individnall to be naturalized. In tho U. S. the power to naturalize is exclusively vested in Congress by a provision in the U.S. Constitution. There is an inportant provisim concerning citizenship in the fonrteenth amembment to the $[$. S. Constitntion as follows: "dll persons born or naturalized in the U. S., and subject to the jurisdiction thereot, are citizens of the L".s. and uf the state wherein they reside." The precise effect of this provision has not yet been settled by judicial dreision. It would seem, however, that it shoulil not he ennstrued by implication to heprive any person of citizenship who would frosess it by commoni law, such as the children of ambasmedors or other eitizens born abroad. The ninth amendment would lead to this conclasion: "The enumeration in the Constitution of certain rights shall not be construed to deny or dipparage others retalined by the people."

Citizenshipe at prement, as will be shown hereafter, leads to important lights ant privileges, of which it would he unjust to deprive any one entitled to them. The words "sulyject to the jurisuliction of the $U$. S." wonlu exclude from ceitizenship the chaidren of toreign public ministers and members of tha lndian tribes, thonsh Indians hom ont of the tribal organizations woulal seem to be citizens. Alien Chinese mun not heonme naturalized citizens of the $T$. S., but a chilf born of (hinese parents within the linits and jurisdiction of the $\mathrm{J}^{\top}$. S , is at citizen.

Interestiug quastions concerning citizenship arise in case of the union of two spparate nations, or of the division of a single mation into two separates slates. The tirst of these Gises was tiscusamb with much acutemess and leaming when scotland and lineland were monted uncer bames I. : the secomb has heron extensisoly masinleved by the conarts, looth in (ireat britain and in the [. S., in connection with the latter"s inulependenere froleinis cume (\% Coke's Reprots), the leanling binclish anthority upon the whole subjuret. aleplaterd that the past mali (jersams bom alter the union) of Sicot latul wore natural-born stappects, amd could inherit limes in bingland. In raperet to the result of the revolt oft the condonion usinions lifire as to the time when the separation hoowern (irnal britain and the $[$. S. became romplete, thomgh they sulntimtially argere as to the effect of the divisimu. 'Jhe $V, \therefore$, vinw is, that the separation
 the linitish, that it was comsummated at the treaty of peace in IFs.3. Dcondingry, a permm bmon in (ireat Britain be-
 date, became, as to the U. A., an alien. ats well as all his de-
scendants. The effect of this rule is not to work a forfeiture of vested rights, and the real estate owned by a former citizen continterl to be rosted in him, thongh he conld not, after the day named, acquire an indefomsible title to land.
11.-The provisions of the $U . \therefore$. Constitution concerning citizenslip have assumed great importance, growing out of the controversies concerning the legal condition or status of prsons of Ifrican descent. The Constitution as originally alopted made no provision concerning citizens of the U.S.. except an incidental direction that senators, Representatives, and the Fxecutive slould be minh citizens. There were, however, distinct clanses concerning the rights and privileges of the citizens of the several States, such as that the judicial power of the [ ${ }^{\top}$. S. shall extend to controversies between a state and a citizen of another State, and between citizens of different States, and that the citizens of each state shall he entitled to all privileges and immunities of citizens in the several States. This last clause has led to much judicial discussion. some points of which will be noticed hereafter. Under the clatuse which provided that the judicial power shond extend to controversies between citizens of different states, the question arose in the now famous case of Scott vs. Sandford (19) llowards Reports, 39), whether an emancipated Negro could Le considered as a "citizen of a State"; and it was decided that he coukd not be so regarded, and accordingly that he could not maintain an action on that lasis in the Federa] courts. It would seem to follow that he could not claim the benefit of the other constitutional provision respecting rrivileges and inmunities. The division of public opinion occasioned by this decision, and the desire to settle by a positive rule the condition of the slaves emancipated by the thirtemth amendment to the Constitution, as well as that of the colored race in general. Jed to the fourtenth and fifteenth amendments, the provisions of which are now to be considered, as far as they affect citizenslip. All persons born or naturalized in the U.S. are declared to be citizens of the [. S. ind of the State in which they reside; aul it is provided that "no State shall make or enforce any law Which shall abridge the privileges or immunities of citizens of the $U . S$.": and also that the "right of citizens of the U. S. to vote shall not be denied or abridged ly the U. S. or by any State on account of race color, or previons condition of servitude." Though the condition of the colored race led to these amendments, their constrmetion is not to be confined to it. It will be olserved tlat the same words are here used as in the body of the C'onstitution-" privileges and immmities "-except that they are here declared to helong to "citizens of the $\Psi^{\top}$ : s.." while there they appertain to "citizens of each state" in reference to the "sereral States." The meaning of the words "privileges and immunities" in the bolly of the Constitution has been, as already stated, much considered. They have been held to mean such privileges, etc., as are of a general nature, such as stcurity to life amb liberty, the right to acquire property, to have access to courts of justice and freedom to pursme and obtain happiness and satety with such restrictions as are necessary to the public good. Whatever guarantees upon these points a State accords to its own citizens, it must extend to citizens of other States. But the Constitution before the amentments gare no directions as to the mode in which a Slate should treat its own citizens, except in a few specially marked instances, such as the prohibition to pass bills of attainder and ex-post facto laws. In other resperts the state was left to itsown action toward its people. Under the amendments there is provision made for the privileges and immunities of eitizens of the U. s. A momenthis fuestion mow arises: Does this provision trench on the grant power which has all along been vested in each state to regulate the conduct of its own citizens? Does Congress unter it have the right to enter unon the onee exclusive tield of State legislation and the domain of State constitutions, and to override all its action as to privileges amt in-
 ransideration belore the supreme Court of the U. S. in the rory important case of the Butchers Benembent Associntion vs. The (rescent City Lime Stuck Compary (土.1). 1853). Thes State of Loulolana had granted an exelusive right to thio lattor company to engage in the business of slamghtering athle within a certain district, incluling the city of Sew Orleans, It was clained hy the plaintifs, who had heen engriged in the same lusiness, and who were by the act pohibited trom following it, that the law created a

## C'ines: See Cohives.

Civet [from Fr. cicette: 1tal. zibetto, from Arab. zatād]: a name applied to a pale-yellow or brownish substance, about the consistency of honey, seereted by the anal glands of sorral carnivorons mammals of the genus liotera and lamily Tiverride ( $q \cdot v_{0}$ ). Cipn exposure to air the eivet thickens, acquiring the consistency of lard, and becomes darker. When pure it has a strong, unpleasant musky odor. but when diluted, say 1 part of civet to 1,000 of aleohol, the umpleasunt quality disalppears. It is still in great rogue as a perfume in the Eist, but in Furope it is usef not so much on acrount of its own oulor, but beculase when combined with other perfumes it has the property of increasing and presurving their quality. Tlhe civet of commerce comes mostly from Nort hern Africa aml southern Asia ant the adjoining ishams. It is prepared for market by removing the hairs. washing, and drying. When pure it is worth from 810 to $\$ 12$ per cunce, but, on account of its valuc, it is frequently adulteratel with hard or butter. The animals which furnish wivet are alsu, known as civet., or civet-cats. They are kept in confinement and the seretion removed with a small suma once or twice a werk. The most common sperines, and most important commerially, is the drican civet, Vicerra cietle, which is found from Dorth Afriat sonthwarl to the latitnde of Fernado l'o. It is from $: 3$ to 4 feet in length ineluling the tail, and 10 or 12 inelues high. The fur is rather harsh, and along the center of the baclk is quite long, and can be erected to fom a crest. The general enlor is a brownish gray ; there is a tortk line down the wemter of the back, and the upper parts of the benly are marked with mumerons rows of hatek spots. The legs and greater portion of the tail are black, there is a black jatch abmut each eye and two or threblack stripes rus oblifuely townward and backward from near the car. The uppur lip and sides of neck are whitish. 'The pupil of the eye is round even in a strong light, the toes are short, and the claws partially retractile. The Indinn civets "inerre zibethe amil". (animbunga are somewhat smaller and lack the dorsal erest. They are found in India, C'hina,
and the large islands of the enast of Southern Asia. The rasse (Vinerricula malaccensis) is a much smaller animal, likewise inhatiting Sonthern 1 sin tur the aljoining islands, Whose civet is nsell by the davanese. While kept in confinement these animals can scurcely be ealled domesticater, for, with the exception of the zibeth, 1 . zibetha, they are cross and treacherons. As a recompense for this, the secretion of the ghands is greatest when the animals are irritated. Care is taken in remoring the civet to have the creature in a cage so narrow that it can not tum around. The civet-cat of Mexico and the sonthwestern L. S. is the cacomixl. See Bassaris.
F. A. Lécas.

Civetta, cherevet tiă, otherwise Heinrich von Bles: b. in Bovines, near Namur, Belgimm, 1480; d. , rrobably in Liege, 1550. A Dutch painter who lived in Venice, where he painted at strange inferno in the dncal palace. Alis most noted picture is one of a peld ler asleep while monkeys rille his pack. Ile was known as C'ivetta from the habit of painting an owl in his jictures.
W. J. S.

Civil Action: an action which is institnted for the recovery of private or civil rights, or of compensation fur their infraction.
Civil bamage lets: laws giving to husbands, wives, chilhren, purents, ghardians, and others who have sustained injury in person, or property, or means of support by any intoxicated person. or in consequence of the intoxication of such person, a right of action against any person who has br selling or giving away intoxicating liquors cansed the intoxication in whole or in prat. In some of the States this right of action is also given against the owners of the premises on which the intoxicating liquors are sold. The right of action is not restricted to cases where the dealer made the sale himself, but it extends to cases of sales made by his agent even against his explicit instructions. The liquordealer's license to sell is not a defense to the action, as liability under the acts does not depend on whether the sale was lawful or unlawful, or on any question of negligence.
henry Wade hogers.
('ivil Death: in lam, the cessation or loss of one's ciril rights and capacities so that he becomes, as it were, dead in law while the physical lite remains; or the state of a person who is separated from civil society and has lost his civil rights. ('ivil death may arise from various canses, such als ahjuring the realm, entering into a monastery, banishment, etc. In Great Britain it arose where a man by act of Parliament was attainted of treason or felony. Formerly in the ease of one entering a monistery and becoming a monk his next heir succecded to his estate. In some States of the U. S., as in New York, the sentence of a criminal to imprisonment for life causes civil death and mullifies an existing marriage.
F. Sturges Alfen.

Civil Ensineer: a term originally used in contradistinction to militare engineer, meaning a person whose profession was the planning and construction of roads, bridges, machinery, river improvements, etc., for the uses of the general public and not for the special pmrposes of warfare. The term is still sometimes used in this sense in Europe, but civil engineering is often held to inclute all brinches of engineering, even thinse purely military and naval. In the U.S. this latter use of the tem is not ohsolete: for instance, the constitution of the Ameriean Suciety of Civil Engineers proviles that "a member shall be a civil, military, naval, mining, mechanical, electrical, or other brofessional engineer, an architect, or a marinc architect." There is also a tendeney, which is seen especially in some schemes for classifying books, to omit the worl "civil "entirely, and subdivide the various branches of engineering into mechanical, hydraulic, sanitary, bridge enginecring, cte. See Engineeriva.
According to the usage most provalent in the U. S., a civil engineer is a person whose profession is the plamning or construction of works which promote inland transportation för the public benefit. The word transportation is here used in is rery broad sense, and inchudes the moving of water in lipes, and of sewnge in sewers, as well as of froight and passengers on roads and railrouds. Under this defnition civil enginecring incluthes snrveying, or the measmemonts necessary for making the plans, the construction of vessels, st reet railways, railroads, canals, sewers, and methods of watcr-supplies, as also the improvement of rivers and harbors. The word works, used in the above definition, does not inchule prime motors, machines, or maehinery, although such must be necessarily used by the civil engineer in his
 or chectrical plants．

Parliament. In absolute sovereign needs no civil list, since he disposts of the contire revennes of the state at will : lut in conatitutional monarchies a fised sum is assignen] by Parliament. nsually at the beginning of the reign, to be fiaid ammally for the support of the roval family in proper fignite. It may be voted year by year. hat this is mere formality, The impression sometimes prevaling that the sums paid on account of the ciril list are raised directly from taxation is erroneons. The ruling families have al ways possessed large hereditary estates. the incomes from which were as rightfully their own as those of any other landed propritor. They have turned the revenues from these hereditary domains into the public treasury in retmm for a fixed ammial allowance. The civil list of the Queen of England amonnts to less than the incomes of previous sorereigns. By 1 and $\underset{\sim}{2}$ Vict., c. 2 , it is established that during her Majestr's reign all the revenues of the erown shall hecome part of the Consolidated Fund. The Gueen is allowel an annual allowance of $£ 385.000$. of which the Lords of the Treasury are directed to pay yearly f60.000 into her Majesty* prirs purse: to set aside 9231.260 for the salaries of the royal honsehold ; $£ 44,240$ for retiring allowances and pensions to revvants : and $£ 13,200$ for royal hountr, alms, amd special services. The Queen haz also the revenines of the duchy of Laneaster. from which she received $£ 50,000$ in 1890 . The heir-apparent to the crown has an ammity of 40,000 , and receires in addition the resenues from the durhy of Comwall. Under George I. the crown revenues amounted at times to $\pm 1,000,000$. The civil list of Napoleon III. was 25.000.000 franes. In the German states the expenses of the sovereign and their families are chiefly met by the income from hereditary estates The Emperor of Austria has a civil list of $\$ 300.000$ tlorins (about of Prussia enjoyed the whole income of the state domains, anounting to abont $85.000,000$ a Year, In 1830 and again in 1850 this was rehnced, but in ts.59 was increased 500,000 thaters, in 1sits $1,000,0100$ thalers, and Feb, 20. 1889, 3,500. 000 marks. The total income now is something like st.000. 000. hut it is deprodent on the revenue alerised from the domains and forests. The king of sasony has a civil list of 2.940 .100 marks (ahout $5 \mathbf{8} 00.000$ a year). The former royal domains. consisting chiefly in pxtensive forests, became the property of the state in 1830 . The civil lists of some other monarchies are: Belginm. 3.300.000 francs: Greece, abont 5200,000 ; Italy, $14.250,000$ lire (abont $82.800,000$, the greater part of the private domams of the king having been given mp to the state in 1848): Japan, 3.000 .000 yen (the yen being equivalent to the silver dollar of the U. S.) ; the Setherlanis, $600,0 \mathrm{k}$ g cuiklers (abont $\$ 2.500,000$ ) : Portngal, $57 t, 000$ milreis (a milreis equals abont sil): Spain, about S.000,000: Swelen and Norway, ahont $2,000,000$ kronor
 000 ). The presinlent of France has 600.000 francs, with an additional allowance of 600.000 franes for expenses. The Emperor of lillsia hats an enormous revenue from the crown donains. which consist of more than 1.000 .000 sq . miles of cultivated lamd and forests, but the amount is not made known, as the crown domains are considered the private property of the imperial fanily.
C. H. Thurber.

Civil servier and (ivilstrviee Reform: In its comprehensive sense, the civil survice of a mation, state, or city embraces the whole boty of oflicers who manage the civil affairs of is: govermment. It conld hardly include a person employed only as a laboure for the government, but it is very ditlioult in some casus to decide whether a person employed and paid by thu quermment is an officer or simply a faborer. The whole pullie servier of civilizer states is in threne ereat divisions-the civil. the military, and the naral. Cet it is not easy in erory instance to decede whether an othicer should be elassel in the military or in the naval service, as he may strve in both. Gis varions otficers have both ciril and military functions. The President of the U. S. is the lead of one wit the ereat hranchen of the civil arovice, but he is ako commmamer-in-chiof of the army and nary. amd of the militia of the several states while in the actual service of the nation. 'The prestion of govermors is amalogons. The functions of the sercretary of War anml those of the soeretary of the Nary are in pist, but not wholly, civil, oflice in exery part of the publie servier is a trast the anthority and frinctions of which shoulal be "xecoterl at all times umber a sense of buth moral and legal whligation, solely for the publie good, and therefore not in the interest of any
party, fartion. family. or individual. The duty to be fuithful. efficient and economical in every public oflice is as absolute as it is in any private station.

The civil service, noder enlightened forms of government, is separated into three branches- the legislative, the judicial, and the executive.

1. We need not stop to notice the Iower grades of offieers in towns and villages, where legislative, executive, and in some legree judieial. functions are united in the same ofticer. The legislative branch is essentially representative. Everywhere-in theors at least-it represents opinions, and. in greater or less degree, interests and property also. In republics it is also especially representative of numbers and localities : and in monarehies, of classes, of the state Chureh or religion, and of hereditary privileges. This representative function of legislators and the duty of adapting the laws of a people to their varied and changing interest and opinions make the riews. interests. and, to some extent. the residence of candidates for legislative oflices an important part of the proper tests of fitness for the places they seek. Such considerations also point to popular elections as the best means of selecting such officers. But in the U.S. different considerations shonhl prevail in the stlection of the clerks and other subordinates of the homses of Congress and of sitate legislatures. The functions of these subordinates. from the secretaries and chief clerks down to the coprist and the messengers, are in no sense representative. Tُher owe no duty to members of one party that ther do not as much owe to members of the other party. To make them partisan workers for the dominant party is to mistake their functions and to practice despotism. That knowledge of form and of details which such subordinates have learned by long practice is particularly valuable to new members. and greatly facilitates the business of legislative bodies: yet nearly all state legislatures and both houses of Congress, as well as almost every municipal comncil, are in the habit of treating these subordinate places as so moli parts patronage, to be grasped at the cost of long, angre. sometimes ignominions, controversies. It is phain that their selection shomld depend solely on their capacity for adrancing the businese portion of that work. There are varions officers-of which presidents, governors, and in a degree mayors, are examples-whose functions are in their nature both legralative and executire. Their duty of approving or retoing bills is in kiml wholly lecrislative. It is for this reason. and for the further reason that they are to carry ont in their executive sphere the general jolicy approved by the people in their selection, that these oflices also are properly mate elective. It is plain that representative officers wonld soon cease to be such if their terms were made long, and otlicers whose functions are both legislative and execontive shonld also be given a fixed term, thongh it should be longer than that of officers who are solely representative. In close analogy to presidents and governors, in some of their duties, are the heads of departments (generally members of the cabinet) amd comeils of appointment. Being the confidential advisers of the chief executive, they need to have his confidence and to share his views in regard to the execution of the poling to which he is pledged. Their political opinions therefore are important tests of their fitness, and their terms of oflice shonkl not be longer than that of the chief. 2. The jmbicial branch of the govemment is in no proper sense representative. A Jespot may make it surh lo intrench his respotism: an aristocracy may make it such to add] strength to class privileges: a jarty in a republic may make it suclı to perpetnate its power and reward its admerents. In eacla case it is a prostitution of judicial functions and a calanity to the state. It is too much to expect that julges who feel the need of conciliating voters for re-election at the end of a slort term will carry the sales evenly between a humble citizen who can control no rote but his own and a grat vorporation, or a great politician, who can control many humberls. In the $\mathbb{C} . \mathrm{S}$ it has been but the natural fruit of a short-turn dective julliciary that remes and other comrt oflomb have leomme a part of the spoils of party victories in many of the states and pities. And this is the view which hats hern ansingso many of the States to retrace-in part, at last-their disastroms adraneos in the direction of a short-term jartisan juliciary
2. In the rexentive department is foumt the vast majorits of those civil ollieers by whom the Government is carried on 'There are more than 150.000 in the civil service of the $\left[^{\top}\right.$. $S$. without including those of the grate of mere laborers. A ide

 were apminted to the clasifies? service from anong those examinel.

The state of New York enacted a civil-service law smilar to that of Comgress, May 4. 1ses, moder which a State commission has ben appointed. A like law and commission were establisheal a year later in Massachusetts. The system in New York has not given complete satislaction, owing to its not heing thoroughly carried ont, save in one or two places, notably Tutfalo, where it has worked admirahly. Competitive examinations are now enforced as qualifications for admission to the civil service of those states and their large cities.

Durman 1B. Eaton.
Revised by Theodore Roosevblt.

## Civil War of the Cnited states: see Coxpederate

 States.Civitali, chey-vectaalce, 3latteo: bo. in Lncea, Italy, in 1435 ; al hirler of lacea who studied in Florenee and became a scolptor in his thirticth vear. Jis master is not known. He made the monument of Pietro da Noceto, the statue of st. shbastim, the fine pulpit, the altar-piece of $S$ Regulas two knceiing angels of the Chapel of the sacrament, and especially the "Tempietto" or eight-xided marhte shrine for the limons "Yolto Santo." a cedar-wood erucilix said to have been hronght miraculonsly to Lucea in the year isil. . $11 /$ these work of sculpture and derorative architecture are in the "athetral of Lince. He was called to Genoa, Where he exechasal six fine statues for the eathedral. Ilis: figure of Fuilh is in the L'flizi (iallery at Florence. He was also an architect, and did much to murore the buildings of his native city: I) in 150 .
IV. J. stillas.
 anc. ('enthem ('elle and Trujemi Portus): a city and fortified staport of Italy; province of Rome: 36 miles W. N. W. of lione ly railway (see majp of laly, ref. 6-D). It is inclosed ly walls anil well brift, has a targe church, an arsenal. a theater a liyhthonse, and a castle founded in the reign of Julins 11. The harlom was constructed liy the Fmperor Trajan, and is formed by two large moles, and a breakwater whirh protects shipping from a heavy sea. It was destroyed by the saracens in 819 , and rebmilt moder Pope Len IV. on the retnon of its fomer inhabitants. Pop. about 13,000.

Civali, thee'víle, Ledovim: Italian painter; b. in ('igoli, Tuscany, in 10.99: 1. in 1613; a pmpil of Alessandro AlInri, though lue sems to have formed his style on studies of Michael Ingelo, Correggio anel Ambrea del sarto. the berame insame cither on account of the persecutions of his enemiso or becanse he was pisoned by a cornse after which he momeleh. Ilis mental alienation lasted for three years After a prolonged visit to Lombardy he settied in Flomence, and there her sumt most of the remainder of his life. His masterpire is an Erce Homo, which was taken by Napolem to lermer and placed in the Lonvere, but after isto was returned to the (irand l)uke of Tuscany. In lione are The Holy 1 pastle ('uring the Larome, in the Church of St. Peter : The ''onerssion of S'. Penl, in the Church of St. Panl: The History of liymer, painted al fresen in the villa Borghese,
 in the 'Chured of simata Maria Maggore Imt an ill-choan diopasition of the frerapativa spoiled the picture, and the painter thes from chatrin.

Clackman'nan: the smallest county of Scotland: area, Is sif. milts. $I t$ is bumded $s$, by the river loorth and $N$. by the Wehil llills. It consists chinetly of the romantio rallay the North bewor 'the soil is partly fertile. Coal. ironstonl: colperr, sundstone and gremstone are fomme here. The chief articles of "xport ate coal and iron. 'lactimannatn and Kimmes tosether relurn one member to J'arliament.

C'arkmanuan: capital of the combty of same name: on the river Iferon, hear its entrance intor the Forth: ! milese E. of stirliner (are map of senthand, ref. 11-(i). This town is
 still stands near liy. rombed here in 18300. Pop, :3.tik).
 hornl: small intomostraca with few suments: the sermal antennar nsed for swimming, and the bouly inchased in a bi-
 niu is the best-knewn gethus.

C'laf'lin. Lex: a listinguished philanthropist of Buston,
 wealth in the manufacture of shoes, and liestowed munifiwent gifts of money upon the Wealeran acatemy at Willoraham, Mass, the Methodist miversity at Midheown, Comm., amf the linston Theological Seminary. U. in loston, as the result of an accilent, Feb. 23, 18 it.
C'largelt, Tnomas Jonv, D. D. : first Bishop of Maryland 1, in Prince Guorges co.. Nal., Oct. 2 1ite graduaterl at the College of New Jerser (Princeton) 1263 , and studied theology with his uncle, the Rev. Johm Eversfiel!, D). I).; ordaimi] deaconsept. 20, 1:67, and adranced to the mitesthomi Oet. 11 in the same year, by the Gishop, of London. His whole minisIry was spent in his native state. Ile was consecrat ed bishop in Trinity chuch, New York eity, Hept. 12, 12!2 by Prowont of New York, assisted by Seabury of Comnecticut, White of Lonisiana, and Madison of Virginia. This was the first consectation of a bishop in the $\bar{L}$. S., and the lines of succession of the English and Scottish C'hurches mited in it. Jishop: (laggett was a chaplain of the ['. S. Senate in 1800. 1). at ('room, Ma., Ang. a, 1816. Every bishop of the Protartant Episcopal Church traces his succession to Bishop Claggett.
W. S. Perry.

Chaihorne. Clayborne, or Cleborne, Willim; b, in Westmoreland, England, abont 15s! ; was the second son of Sir Ledmund Cleborne of Cleburne llall, Westmondanl : was appointed by Charles I. his secretary of state for the dominion of Virginia Har. 4, 1626, and treasurer of Virginia for life Apr. 6. 1642. He discovered, purchased, and planted Kent island in $16: 3 t$, moder a scoteh signct eommission granting trading privileges with the Indians, and owned a large portion of the land nyon which Annayolis now stamls, as well is great estates in Virginia. He battled for his rights aganst Lord baltimore, who clamed jurisdiction under his charter, and twice reduced the island of Kent hy ams. Claibome hat specured the representation of Kent in the Virginia llomse of burgesses, but, faling to maintan his claims, he purchased other islands in the Chesapeake which proved to be within Daryand bounds, and he contended in support of his venturs with varying snecess until 1651 , when he withdrew into Virginit, and was appointed by Parliament a commissioner for the reduction of the colonies. He subturd Virginia, overtumed the Calvert gowemment, and restored religions tests, which excluded Roman ('atholic: from franchise. Cromwell did not sustain his operations and restored the Calverts. After the restoration the court neglected his petitions, and he sank into retirement upn his Virgimia estates. Recent investigations into colomial history prove him to have been the rictim of court favoritism, injustice, and misrepresentation. He has heen styled "the champion of "irginia" and the "evil genius of Marymel." (). in Virginia ilvont $16 i \%$.
Clain [from O. Fr. claime, connected with clamer, claim < Lat. clamere call out, cry]: a demand of a right: the at of demanding from another person something due: a richt to claim or demant : a title to any debt or privilege. The term is sometimes applied to the thing elamed, as land or other property: In tiw, claim is a challenge of interest in anything that is in possession of another, or at least ont of the possession of the person who clams it.
('lams, Court of: a court of the U. S. for the relief of those proms who have clams against the Government. Befure the year 1850, when this conrt was established, such daims conlid be settect only by act of (bomeses, as a sope ereign power can be shet only hy its own consent. It is a court of law, without cenity mowers, and consists of five jutges (appointol by the President by and with the advice and cmanent of the semate), two of whom constitute a quorum for the transuction of business, hat thre of whom mast concur to wader a julgment. It has a single ammal session, berriming on the first Mmblay in becember, hed in

 Frweh anterss: b, at saint-Wanom de (onke, in Flambers, in 15:33: 1. in Paris. lath. 18, 1803. She was edument in Paris, and so prencions were her presion and har tahent for the etage that in her thirterenth year she made a brillime debut as sonhrette in the Theatre Itabmene. In 1et:3 she made her dibut as Plow in the 'Thétre Framonis. and from that perion down to 1765 she repremend all the tragie characters of In Belloy, Saurin, Marmontel, Voltaire, amil the wher dramatists of the time. She was pat ith prisum for some insignilicant insubordimation, and she devared that she wonld mever tread the stage again unless sher receivel due sativfection: but wo satistaction was ever wheren, amb she remained in retirement. During the lievolution she Inst her formur, and died in rery stratened circumstances. Her Memoirs atprared in 179!.

Claifvanx, clar vo: a village in the department of Sube, France : alout 10 milos above bar-sur-Aulse: stande on the Jeft hank of the river Aube, and is notewartly as the site of the fanous (fiscmoian abbey of Clara Villis (see map of France, ref. -(i). This wat foumed in 1115 ly st. Bernatrl, who was its abbot till his deatlo in llis, and who threw such a giom over the place that in 1143 the kingedom of Portugal extravagantly declamed itsolf a diel of the ablhey of ("atirnax. It afterward became famons for the architect tural merits of its mareh. During the Revolution the comvent was closed, and the rast buiddings are now turned into a prison, Sen Laskin's Praterita.

Clairnoy'ance [Fr., derir. of clairmymen, clear-sisthed clair. cluar + royat, secing]: The power hy which persums in a mesmerie state are suppord to br able to sere conceated thingor or to see what is latipening at a distanere. Hitherto the nature of spirit has freen diseussed thoologioally ant metaphysioally, Its seientilic insestigation ham been considered either impracticable ar undesirable. In this horterfand betwen the known and unknown ignorance and charlatanism have held high carnival. Srienee, purely matr rial, is entirely oecopied with mater and its inherent foree, and beyond the retort and crucible has no place for spirit. Belief in spiritual heing outside of physical existemee is superstition. The mention of a fact bearme in that direction provokes a smile of scorntul pity. When the oil is exhansted the thame no longer burns; when the fred is sumt the fire gres out : when the instrment is flestroyed the manie is not hard: when the complex co-ordination of conditions called a living luing is suhverted, life intelligence. spirit, ate no mow, Sueh are the illustrations of material stiente. The siritual reatm has remained mknown, or rather its exintence hats buth denied.

Thene relloctions are rendered pertinent hy the sumstheration that whatever clse of preteno and folly be blown away, the cestral lact of elairoyanee remains umfintabod: and charverame is a supersosumbs preeption depending on the spiritual nature of man, without whid it would he ingnsible. In the presint state of poydhorgical knowleder the facts are ill-observed, lomedy recondal, and thente's out uf plate. The world of spirit, io which "e forese" fumshem the key, perhaps may at some future time hatade into an wide a lield as the physical word now presemte supenti-

" lt is now that Vindens burns?" Trertultian dereribes two women andeated for their baty and ersatas: that they enfered that state in the midst of the congregation, revalded celestial secrets, and knew the innemost hate of proms. st Justin athims that the sibyls foretold ewots correctly, and grotes Plato as coinciding with him in that view. Sit. Athmagoras sats of the faculty of premence that "it is propr to the sonl." Volumes might he radij? tilled with frumations like the foregoing, showing that clairwoyane has heen manifested and received as a truth hy profomed thinkers in every age. Swemborg. Zachokke and Dawis are not peculiarifies of molern times, but are repetitions of toerates. Apollonins, and comblese other sages who decply impresed their personality on their timas.

Prrhaps for purgoses of incostigation the artifietally inducel mesmeric state has alvanages acer the shomaneots, whidh present itself ut multerminate times, athrough its spmaturons exhibition is more reliable in its results. Its natural manifentation requires an findy develoned nervors $\rightarrow$ som. It is not always, though at times it maly apmer to la. the result of diseate. The more perfect the himath the mone reliable the remults. 'The visions prowned by diseate. like those hy druse hear to true chairvyance the sime relatime that the dreams of imdigetion do to thase of refreshing sle
finerovane mus be regarded as a peentiar state of the mind, in whol it is in a greathr or loser dugre indenment of the physical body. It presents many grabations from
 eve indaced, the attemding phenomatare similar. The cembition of the physical herly is hat of deepest sleep. A Aame may he applied to it without promenge at guiver if the neras: the most pungent sulsanters have no afeet on the nometrik: fins or nemides thrust into the most sulnsitive parts give no pain ; surgieal oprations can be made withont masalion. Ilearing, tasting. ancllins. ferling, as well as soping, are stomingly inden-mdent of the \|fisical urgans The musendar syatem is mither mased or rixid; the cinemation impedod in coses unt the phlse heomes imperceptidn; amel rapiration luaves no sain un a mirror hetd urel the Hustril.

In pasing into the coarwome sate the extremitios hecome ruhl. the brain congeled, the vital pumers -ink, as
 a semiation of sinking of Ileating. Viter a time the forepp
 thay are of the louly, which for the time is insomstinte. The minh sum withont jhysical angan- of vising, hears withont
organs of hearing，and feeting beomes a refined ennseions－ ness which brings it en rapport with the intelligence of the world．The mare death－like the comulion of the body the more lucid the perceptions of the spirit or mind，which for the time owes it no fealty．If，as there is erery reason to believe elairvoyance depents on the unfolding of the spirit＇s perceptions，then the extent of that mofolifing manks its perfection．Jlowever grat or small this may he，the state itself is the same，differing only in degree，whether ohserved in the P＇ythia of Delphic oracles，the vision of St．John，the trance of Mohammed，the epidemic catalejsy of religious revirals．or the illumination of swedenborg or Davis．The disclosures mate hare also a general resemblance，Int they are so colorel with surroumling circumstances that they are extremely fallible．The tendency of the clairvoyant is to make objective the subjective illeas he has acquired by edu－ cation－if a Christian．to see risions of Christ；it a Moslems． of Mohammed－somewhat as dremms reflect the ideas of wakefuluess．Vet there is a mofomen eondition which sets all these aside．and the mind apmerts divested of all physical trammels．and to come in direct contact with the thomght－ at mosphure of the world．Time and space have no existenee， and matter becomes transparent．

If there is an indeprmbent siritnal existence after the reath ol the plysimal bomy，the clairsoyant in this independ－ ent stage closely approximates to that existence．It may be an open question whether the spirit leares the body anil aetnally visits the remote places it deseribes，or gains such knowlelge by intensity of perception that annuls space，as it does time，in its retrospection and prevision．The many anthentic instancos of＂donble presence＂which have been obsersed lead to the former conclusion．

Baron Reichenbach，in his Dynomics，has investigated the sensitiveness of the clairvoyant to refinell emanations of force，and Denton，in his soul of Things，has carried the investigation still further，thongh in a somewhat similar direction．The field is broad as the spirit of man，and its threshold has been scarcely erossed．Clairroyance is no miraculous power，but an inherent faculty，a foregleam in this life ol the nest spiritual life．For if man exists as a spirit atter the dissolution of the physical body，bis present life is that of a spirit clad in flesh，amil should manilest some of the chatacteristics of the next untrammeled condition．

Iudson T＇uttle．

## Clakama：Sive Chmookay Indias．

Clam：a name varionsly applied，according to locality，to many hivalve mollusks of difermi genera．The common elam of the New Fingland roast is Mya aremaria，a speeius ranging from south（＇arolina to the Iretic（hean，and found on the northern coasts of Furope and $A$ sits，as well as on the sholes of Jalan and Alaska．In the $\Psi^{\top} . S$ ．it is of consider－ able importance as an urticle of tood．athd it is extensively used for bait，while rast shell heaps along the New linglanil （a）ast lestify to the extent to which it was lor centuries caten by the Indians．Very corionsly it is not nsem for bait in En－ lojes．The Little Neck clam of New York is Tents mer－ funtrie，known in New Englam as the guahang or lard dam．It drives its specific name from the fact that the Indians of the Fastern E．S．used the purple maroin of the shell for making the lark wampum．The great clam of the northwnst coast of America，lulario marima，is a staple article of fous for the coast tribus of Indians，who dry large numbers for winters use，a practice pursued in earlier times by Eashars 1 tibus with Jya arenuria．Cilyuimeris generosa， the eriant clan of the $l^{+}$．S．lawife coant．attains a woight uf 5 or 6 llo．，and resimbless at Jya which has so outgrown its shell that the sult portion is not wholly covered．This
 abose＂xtromb low－water mark．The term wiant clam is alas appliod to Tridurnurgigres，the limerent of hivalues，whose －Holls attain a woicht of Dath lb．each，and are sometimes used in limman（＇utholice churches to contain the holy water． Thin linge mosllask is a native of East Indian seas．It sfesh is edible amb the natives of the（＇uroline islands use pieces nf the shel］for ases．＇The rampus specios of freshrwater mussels，or C＂nios，are［xりmlafly termed 「resh－water clams in the U．

（＇lamator＂as［flur．，from lat．clommitor，the who fries out］：a division of Ihspossmes．or perching birds，distin－ guished l）y the armandacht of the maseles of the lower laryox or syrinx．There is usmally but one pair of intrinsic miscoles，nevers many as fonm pairs，and these are athelued to the middle of the lalf rings of the hronchi，an arramgenent
termed mesomyodian．The gronp is named in contrast to the Oscines，on singing birls．which have a more eompli－ cated sinming apparatis．

F．A．Lucas．
Clan［Gaelic，clann，offspring，family，stock］：a body of kindred larger than a household and smaller than a trive， and recosnizing relationship in only one line of descent－ i．e．either through the muther or through the father，lont never through both．In English msage the word＂elan＂ speeifically means the kinship organization of the Scotish lighlanders．Corresponling terms in other langnages are the lioman gens，the Greek gévos．the Jrabic hayy，the Irish sept，and the North American Indian olem（totem）．In eth－ nology it has become necessary to have a general name for the gentile organization whrever fomnd．and by common consent the word＂clan＂has been adopted for this purpose．
＂＇lue earliest type of the cran is the totem－kin，the best ex－ amples of which are found among the North American Ind－ ians．＇lhe gromp＇of kindred takes its name from sone class of natural objects，usually a species of plant or of animal－ e．g．the hawk，the turtle，or the bear－whieh is supersti－ tionsly regrarded，ind from which the group is supposed to be descended．Rehationship is metronymie－i．e．it is traced only thengh mothers．A woman＇s sons and dianghters and the sons and danghters of her danghters belong to her clan， but the children uf her sons belong to the clans of their mothers．A later form of the clan is patronymic－i．e．rela－ tionship is traced only throngh fathers．Hebrew，Arabian， Grecian．homan，German，and Celtic clans were patronymic in the earliest historieal period．but there is moch evidence to prove that originally they were metronymic．

A elan is essentially a juristic orcanization．Its members are unter obligation to avenge one another＂s injuries．They have common lights and duties，among which marital rights and obligations are of the first importance．A man may not malry his clanswoman．Therefore no clan is self－perpetuat－ ing，and a tribe aecordingly comprises two or nore clans whose members intermarry．A clan nsnally has a judicial officer and a dhet or military ollieer．See hocrology，To－ temism，and Tribe．

June 2t, 180.

Clarendon, Constitntions of: certain laws made by a general conncil (or prrliament) of the English barons and prelates at ('larenton, in Wiltshire, in 1164 , wherehy King Henry 11. checked the power of the Church, and narrowed the exemption which the clergy had claimed trom secular juristiction. These ordinances, sixteen in number, defined the limits of the patronage and jurisdiction of the pope, and provited that the crown should be entitled to the election to racant lignities in the Church. But the most characteristic of all the stipulations-that one which most puintedly indicater the new jelea of the relation between State amil Chureh which was dawning upon men's minds-was that concerning the exemption of the clergy from the secular jurisdirtion. It was agreed that in criminal cases the clergy should be anenable to the common courts. Heretofore the clergy were judged ind punished by ecclesiastical tribunals even for crimes in eiril life. As those tribnnals could not intlict death. the result was unpmished and therefore increased crime among the clergy- The Constitutions were unamimonsly adopted, and Becket. the primate, relnctantly signet theni. Bat they were at onee rejected by Pope Alexamerer IIl. when sent to him for ratification, not so much that they sought to bring guilty clerics to deserved chastisement, as that they infringed on acknowledged rights of the Church in the collation of benefices and dignities, and Bueket thereupon retracted his consent, and imposed upon himsolf the severest penances. This, and the other measures anlopterl by the archbishop to vindicate the independence of the clergy, led to disputes between him and the monarch. (Sice lecker.) Notwithstanding the humiliation to which the king submitted after Becket's death, most of the provisions of the Constitutions of Clarendon continued permanent. Sce Stubbs's Constitutional IIistory. and for text lis Select Chaters: ef. Schall. St. Thomas of Canterbury in Papers of I Imerican Socitly Chureh IIstory for

Revised by J. J. Keane.
Charendon I'ress: a celebrated printing and publishing establishment connceted with oxtord Cniversity, England. It was foundel in 162, and took its name from the fact that the printing-house erected in $1: 11$ was built from the profits arising from the sale of Clarendon's Mistory of the Rebellion, of which work the university has a perpetual copyright.

Clarel [ 0 . Fr. claret. dimin. clair, clear, bright $<$ Lat. churns]: a hame given in (reat Pritain and the U. S. to red French winus problued near Bordeanx ( Fr . vin de Bordenux). The French cluiret signifies " pale wine."

Claretie, klărtee, Arsexe Arxaud, ealled Jules: Frenels litterateser: 1, in Limoges. Dec. 3, 1840. He has writlen an enomons quantity of book-novels. plays, eriticisms, historical essays, ete. His Pierrille (186:3) obtained the praise of troorge sand, and his Molle. Cachemire (1s(i.) and $t^{\circ} \mathrm{A}$ Issussin (tsitif) raised for him farwable expeetations in the public mint. His Derniers Montagnards: histoire de l'insurpection de prairinl. an $I I I$. [1\%05] ohtained Michelet's approval in 1sin. A longer historical work is
 (6). Jle las contributed hiegraphies of Victor Ilumo. Emile Augier, A. Dumas fits, Alphonse Daudet, Victorien Saryou, Frampis coppmon, and several ithers to the series contithed (aibrites contempmomes. Sime O.t. 20, 1885. he hats been senerat administrator of the Comedic-Framsaise.

Clarimala : city: capital of lage co.. la, (for location of county, see mapl of lowa. rof. i E): on the Nodaway river: fie miless. fis of Conncil bhaff. It has an asyun for the insame, ami stock-raising and agrienltural industrits. Pop,

Clarinet, or Clariond (Fro clurimette): a masical instrument, sait to have hero invented hy Johann Demer, of Numberg, in 16\%). It consists of a cylintrical tube, termi-
nating in a bell, with eighteen holes in the site, half carah. he of heing closed by the fingers ant half by kers. The mouthpiece. which is prosided with a single rect, is a conical stupper flattened ou one side to form a table for the read. The somals of the instrument depend upon the vibration of the reed against the table. The fumtamental seale consists of nineteen semitones, of which cighteen are arodued ly removing the fingers from the holes and lifting the keys, the lowest note being emitted through the bell. As one clarinet can not be played in more than one key, it is usmal for the performer to have in reserve two uther instruments in different keys.

C'arion. or Clarin: a small high-pitched trumpet, chiefly referred to in puetry; also the name of an organ-stop of the reet species, usnally sounding an octnve higher than the trumpet. It was formerly used as a bearing in heraldry.

Clarion: borough (incorporated Apr. 6, 1841) : capital of ('arion co. Pa. (for location of comnty, see map of I'emsylrania, ref. 3-C) : on Pittsb. and West. R. Ii, and on Clarion river: about in miles న. N. F. of I'ittshurg. Here are churehes of six denominations, large and excellent public schools, and the Clarion state Normal Sillool. The borongh is situated in a farming. lumbering. mining, and oil-proluciag region. Pop. (1880) 1.165: (1840) 9.16t.

Editor of " Democrat."
Clarion River: of Pennsylyania: rises in Mekean County: flows nearly. W. through Elis and Clirion Counties and enters Alleghany river. Entire length about 130 miles.

Clark. Abrabay: signer of the Declaration of Independence; b. at Elizabethtown. N. J., Feb. 15. 12:6; beame an attorney and surveror: high sherifif of Essex Connty; member of the New Jerser committee of puthic safety; was chosen a clelegate to the Continental Congress of $17 \% 6$, and signed the declaration. He was re-elected six times to the Continental and twice to the Constitutimal Congresses; member of the constitutional convention of 1787; very dominant in the New Jersey Legislature 1782-8\%. D. from sunstruke in Rahway, N. J., Sept. 15, 1794.

Clark. Alexander. D. D.: b. in Jefferson m.. O., Mar. 10. 1534: educated in the common schools and by his father, : chassieal scholar. It the age of seventeen he became a teacher, and while so occupied started the schoolday Visitor, which was afterward consolitated with St. Vicholas. In 1861 he was ordained a minister in the Protestant Methodist Church. He preached in Philadelphia and Cincinnati. and went to Pittsburg as pastor of the First Protestant Methodist church in 1866 . In 1870 he was elected elitor of the oflicial papers of his denomination-the Methoflist Recorler and Our Morming Guide-whieh position he held at the time of his death. He hat a high regutation as an author, editor, and poet. Among his works are the olld Log Schoolhouse and Workeday Christianity. D. in Georgia, July 7. 1si9.
Clark, Adonzo, MC. D., LLL. D.: physician: b, in Chester, Mass., Mar. 1. 180~: graduated A. B. at Williams College 1828; took regree of M1. D. in College of llysicians and Surgeons of New lork in 1835: was for a time Prolessor of latholngy and Materia Medica in the Vermont Medical College at Burlington; Professor of Physiology and lathology in the Xew Fork College of Plysicians and Surgens from 1848 to 1853 ; chair changed to pathology and practical meticine in the same institution 1850.sin: aml tean of the faculty $1 s^{2 \pi}-85$. Ihe was apmointed physician to Bellerue and Si. Luke's Hospitals. New York. In 1833 he was clected presiclent of the New Iork State Medieal society. He pulslishef valuable professional papers. D. in New York city. Sept. 13, 188i.

Clark. Alvan. A. M. : h. in Ashfieht, Mass., Mar. 8, 1804 ; an ingrnions farmer"s bov; became in yonth an engraver for calien print-work at Lowell. Mass. Clark. Lewls Galond: writer: b. at Otise onondaga co., K. Y., in 1810 . He was for many years editor of the Knickerbocker Maguzime, about which gatheres Irving, Bryant, Longfellow, and all the prominent literary men of the time. It was the precursor of the motera popular magazine. In 1839 this periodical ceased, and Clark found employment in the custom-house, his friends hought a residence for him at Piermont-on-the-Hudson, and there lie died. Nov. 3. 183. His only publications were the Finickerbocker Shetch-book (1850) and Kinich-hnachs (185). Ihe was t win brother to Wiflis Gallord Clark ( $q . r$. ) .

Revised by C. II. Tucrber.
Clark, Nathaniel Gforge, D. D.. LL. D.: Congregationalist: b. at Culais, V't.. Jan. 18,1825 : graduated at the University of Vermont 1845 , and at Auburn Theological Seminary 1852; became a professor in the latter institution in 1853, and in Uuion College, New York, in 1863; and one of the seeretaries of the American Boart of Commissioners for Foreign Missions from 186.5 to Oct., 1894. D. at West Roxbury, Mass., Jin. 3. 1896. His writings consibted chiefly of articles and reports relating to missionary subjects.

Clark. Thomas March. D. D., LL. D.: Protestant Episcopal Bishop of Rhode Island: b. at Newburyport. Mass, July 4. 1812: gramuated at Yale in 1831. and at Prinecton Seminary in 18,35: received holy orders in 1836: held rectorships in Boston, l'hiladelphia, and llartford; consecrated bishop in 18.5. He was an efficient member of the Sanitary Commission, and a lrequent contributor to popular literary periodicals. He was long the Episcopat leader of the liroad Church school in his Chureh. Besides his Formution of Character (155?) and Primary Trulhes of heligion (1sfit), he has published some devotional books. Three of his brothers. Rufers Wheelwrigbt (1813-86). George Hexry (b. 1N19), and Sambel hams (1892-i5), became prominent clergymen, and the first of these wrote many popular religious buoks.
Clark. William George: English man of letters: b. in Mar.. 18\% 1 ; edneated at Trinity College. Canbridge; ordained in 183. , but rexigned his orders in 1869 , giving his reasons in the pamplet. The Present Dengers of the Church of England; culited the first series ot Cambridge Exsays (180.): Gerree Brinler's Jsserys (15.58) : and. in collaboration with others, the 'cambridye Shakspeare (9 vols., $186 ; 3$ 66). In 1ste he published Lectures on the Middle Iges and the Revital of Letming. D. at York, Now. 6, 1578.
C. H. Therber.

Clark, Willis Gaylord: poet; b. at Otisco. N. Y., in 1s10: was twin-brother of Lewt: Gaylord (cark (q. r.). 1le wrote for the Kaicherbocker Magazone a series of amusiug atticles called ollopodiunt. Among his poems is The Spirit of Life (18;3). In the latter part of his life he was the chief erlitor of the Phiradelphia Gazette. D. in Philadelphia, 1’a., June 12, 1841. His Literary Remains were problished in 1s4t, and a reissue of his collected poems in $16+5$. Revised by 1. S. Beers.
Clarkf, ADay. Lf. D.: Wesleyan divine and commentator; b, at. Moybeg. Lontonderry, Ireland, about 1762. Ile Was mbented at Wesley"s Kingswood School, near Pristol; sent out by Wesloy as an itinerant preacher in 15xe: was prexident of the Wesleyan Conference in 1806. 1814, 189?: becauc eminent for lis Oriental and biblical learning; held Arian views of Clurist; published a Bibhographical Dictionary if vols. $12 \mathrm{mo}, 1802$ ): Bibliographical Miscellany (2 vols., 1 (NOti) : Suercession of Sucred Litrmfure (1807): Cummentury mithe Bible ( $1810-2,5$, $\&$ vols: several later editions and reprints, e. 品. Now lork, 18:3T, 6 vols: New Testament furtion condensed hy Danicl Curre 188\%-84, ? yols. : 3ll vol. 1N: 2): Rymer's Fudere (1819): Wrestey Femily; sermons

Clarke, Dndrew. Sir: lieutenantogemal in Britisarmy;
 Military Acaslemy ; enteryl the corps of Royal Engineers June 19, 1844, in which he became a captain in 1s.54, lien-tenant-colonel in 1sfi, fulh collonel in 18\%, mijor-grueral in 1sso, lieuthant-general in 1svif; was acting serertary of the Brilish Govemment in Sin Fiemen's Land 185l-5?, and surveor-genral and whicf commissinner of crown lands in Victoria 1850-58. In 18.50 le became an executive
councilor and member of the first cahinet in the hatter colony. For his services in inangurating the new governments in the young colonies, and for his sagacions administration luring the excitement which followed the discovery of gold, he was created a Knight Commander of St. Nichael and st. George. In $150 \%$ he made an inspection of the African west cumst colonies. In 1864 he was appointed director of the works of the nave under the Admiralty, and as such designed and expented the great docks at Malla and Bermuda, also the extensive new works at Portmouth and the extension of the principal dockyards. For these sirvices he was created a C. B. in 1860. In 1873 he was a 1 pointed governor of the Straits Settlements, including Penang, Singapore, and Malacca. In 18 方 he relinguisheel this office, and became Minister of Public Works and member of the conncil of the governor-general in ladia. He was commandant of the Chatham School of Military Engineering 1881-82. In the latter year he went to Cairo to reconstruct its sanitary arrangements.

Clarke. Charles Cowden : author; the lmsband of Mary Cowden Clarke (q. $\imath_{0}$ ): b, at Enfield, Middlesex, Dec. 15, 1787 ; became a bookseller in London in 1820 ; delivered courses of lectures on dramatists and poets $1834-54$. Among those published are Shakespeare Characters (1863) and Moliere Characters (1865). Husband and wife jointly produced an annotated edition of Shakspeares works (1869), now known as Cassell's Illustrated Shakespeare; the Shakesperere hey (18:y) : aml Recollections of IIriters (18is). D. at Genoa, Mar. 13, 157\%. See his Biography by his wife (1857).
C. II. T.

Clarke, Frank Wiggesworth: chemisi ; b. in Boston, Mass.0 Mar. 19, 1847: graduated at the Lawrence Scientific School of Harvard in 186\%, and was assistant in Chemistry at Comell for a year. In $1803-24$ he was Professor of Chemistryand Phrsics at Iloward Caiversity, Washington, D. C., and in 18:4 was called to the Cniversity of Cincianati. where he remained until 1883. He then resigned to hecome chief chemist to the U.S. Geological Survey. He has published many articles on chemistry and allied subjects. His most important work is the Constants of Nature, in five 8ro pamphlets. Of late he has been engaged in work on the constitution of the natural silicates, and has contributed to the journals a number of valuable artieles on this sulbject.
I. R.

Clarke, Hugh Archibald: Professor of Music in the University of Pennsylvania; b. in Toronto, Camala. Aug. 15, 1839: studied first under his father there and in the C'anada Univervity. In 18.5 was appointed Professor of Music in the University of Pennsylvania, from whieh, in 1866, he had reeeived the degree of Mus. Doc. Has been the organist of several churehes and the leader of some societies in Philadelphia. His compositions, thongh not numerous, are important, and include Jerusalem, an oratorio; overture and choruses to Aristophanes"s Acharnians: a treatise on IItermony. some instruction books for the pianoforte and organ, and some songs and pianoforte pieces.
D. E. Ilervey.

Clarke, James Freemax. D. D.: Cnitarian preacher, editor, and anthor; b. in Hanover, N. H.. Apr. 4. 1-10; was settlet in Louisville, Ky., 18:33-40; was pistor of the ('hureh of the Disciples in Boston, Mass. (organized especially for him). from 1841 until his death, Resiles other works, he published Serrire-book and IIymn-bouk for the Clurch of The Disciples (Boston, 1811-56): Christian Doctrime of Praypr (18.54): The Howr uthich Cometh (1864); Orthorloxy: its. Thuths and Errors (1866) : Steps of Betief (1870); Tert fireut heligions (1871: vol, ii. 1883): Self-culture (1880); Luwntund Epochs in Religious History (1881); Anli-Sharery Inays (188.1); The Idens of the Apostle Paul (1884). 1). in Boston. Inne 8. 18ss. His Autobioyraphy (which extents only to 1840), Diary. and Correspondence, edited by Dr. Edward Everett Hale. appeared in 1joston (1891).
J. IV. Chabwick.

Clarke. Ions: physician and preacher and one of the founders of Rhode Filand: b. in Suffolk, England, Oct. \&, 1609. He was educated as a physicima and practieed in London; foined the Puritans and emigrated to Massachuselts, lanting at Boston Nor.. 163\%, but was driven to Rhode Island in 16:3s, and in the same year fommed the first Raphist clurel at Newport. This churd clams to be older than the first church it Providence, and therefore the first of that faith in the New Worll. The buildinge are sa far，them in nomber：the centrat
building is 204 feet by 114. is four and a half stories high, and has 50 roms: another, a chemieal building, contain bs romms. The gromme ennsist of an s-acre lot and three smallen lot-o all located about $\frac{1}{2}$ niles W. of the railway station.

It is the desire of the founder that the highest acalemie standards be here forever maintained: that spectial opmortunities be oflered for independent researeh : that to this end the instructors be not overburdened with teaching or examinations: that all available experience. both of the ['. S. and of older countries, be freely ntilized : and that new measures and eren innowations, if really helpful to the highest needs of science and culture be no less fredy adopted. He chose Worcester as the seat of the new foundation because its location is central anong the best colleges of the East. the work of which he desires to supplement by an institution devoted to the training of professors.
I. N. Wilson.

Clary: a gray hairy annual plant (Seluict sclarea), of the Labietie or Mint family, native of suntheru Europe. now somethat cultivated in the U.S. for its leaves, which are used for seasoning. It grows to the height of 2 feet or so. and bears oblons cobtise leates and spikes of small red flowers, whose broad bracts are red and very showr. The fuliage has also been usect in domestic medicine. C. E. B.

Class [from Fr. clowsp $<$ Lat. classis, a division or class of the lioman people. what is called together or proclaimed, deriv. of cala re, proclaim: cf. colendae intercalaris. sume regard classis as loan-worl from Greek (Dor.) кגẫts, deriv. of кaдє́ $\omega$, summon]: in natural history, a large gronp of plants or animals formed by the mion or association of several orters. Classes orlers. families, genera, and species are common to all methods of classification. The term cluss is also used to denote a portion of society separated from other purtions by some distinction of rank, fortune, or more intrinsie qualities.

Classic. or Classical [from Lat. classicus, of the highest rank or order: deriv. of cluswis: see Class]: pure, refined; conformed to the best and most perfect stambard; also pertaining to the ancient Greek or Latin anthors, or rendered famous br assuciation with ancient writers. as "classic groumi." The ancient Roman people were divided into six classes. and the persons of the first or highest class were callod classici. Hence the term came to signify the highest and purest class of writers in any language, though formerly it was applied only to the most esteemed Greek and Latin inthors. The f pithet "elassical," as applied to ancient writer. is determized less by the purity of their style than by the period at which they wrote. The classical age of Greek literature legins with Homer, the earliest Greek writer whose works are extant, and extends perhap to the time of the Roman emperor Antonine, but signs of decadence appratel about 300 в. с. The Latin clasical period is shorter ; its earliest writer is Plautus, and it ended about $200 \mathrm{~A} . \mathrm{D}$. some critics, however, inchule Claudian, who was born about $36{ }^{\circ} \mathrm{A}$ A. D., among the classies.

## 

Classis [Jal.. a clans]: in the lieformed Churches in America and in llollancl, a church court corresponding to the presbytery in l'reshyterian churches. It is composed of the elders delecated by the "omsistories (the governing body of (ach church), one from cach, of the pastors and all the ministers in a certain district. The classis hears appeals from the comsistories, and apleal from the classis is to a particular synoud. The clac-is also confirms ant dissolves pastoral comections, ordains and dejuses ministers, sends 2ninisters and थ delemates to the smod and 3 ministers and 3 delegates to the general syond.

Clande dobheville: French Capmehin missionary and anthor: b. at Ahereville. Ilis secular name was Fermin Fowhon, and he took the name claule when he entered the C'apurhin owler in 1601. In 161 ? he went with other Capurhims to cotablish a mision at Varanhão, lirazil, then a French colony. Foturning in 1614, be published his Mistaire de la Mission des Pires C'apreins en llile de Maraghan (l'aris, 1611: P Portuguese translation, Maranhān, 1874). a work of the highest valua. not only as a history, but for the minute account qiven of the Thpinambas lndians. The narrative of Yves blispelx ( $q . v^{\circ}$.) is properly a contimation of it. D. at Ihen, 1616. II erbert Il. Smiti,
Clande. kion ifas: I Protestant theologian : b. in La Sanvetat, Muthern France, in 1614: bermue pastor at Niwes 16:3.
and of the Protestant chureh at Charenton, near Paris, 1666. When the Lidict of Nantes was revoked (1659) he removed to The 1]ague, where he died. Jan. 13, 16s7. He was distinguished ats it dispmant. Among his works are A leferse of The Reformation. again=t Nicole (Quevilly, 16:3; 4 the ed. Paris, 1s44: Engo trams. London. 181.5) i I Short iccome of the Complaints and ('ruet Persecutions of the Irolestants in France (11, e. Cologne. 1713: Eng. trams. F6st; n. e. 170s); and, best known of all. Essay on the Composition of a Sermon (Enr. trans, n. e. 1-53). swe his life in French hr De La Deveze (Amsterlam, 16si). Fevised by s. M. Jackisos.

Chaule. Jeas Manme: genre and lamlscape painter; b, in Paris. June 24. 18:4: pupil of Galland: seennd-class medal,
Paris Ex1msition. 184): Legion of Honor 1s84. His pictures of hunting-parties and equestrians in the Paris and Lomlon parks are distinguishet hy their good taste and fine qualities of color. Studio in Paris.
W. A. C

## Clame Lorrain: See Gelée, Clatde.

Claulia'mes. Cladedtes: a Latin epic poet, whose birtlyplace is unknown. who went to Rome trom Alexandria in 395 A. D., and gained the faror of Stilicho. His poems were so popular that a statue was erected to him in Rome ter the senate and the emperor. Among his works are The Rupe of Proserpine. The Batlle of the Giants, and a Eulogy of stiticho (De Consulatu Stilichonis). He probably did not survive the death of his patron Stilicho in $408 \mathrm{~A} . \mathrm{D}$. Ile had a fertile imagination, and is regarded as the last of the classical Latin poets. The lest editions of his works are those by Jeep ( 2 rols., Leipzig, 18i6-7.9) and T. Birt (Berlin, 1s! 3 ). There is an English translation br Abraliam Hawkins (London, 181\%), but it is of slight merit.
Clau'dins, or, more fully. Tiberins Clandius Drusus Nero: the fourth Emperor of Rome: b. at Lugdumm (Lyons) in 10 b.c. He was a son of Drusus Nero and a nepheir of the Emperor Tiberius. He was naturally infirm in body, and his education was neglected. He was lame and paralyzed, and by nature so diflident and timid that he was generally considered half imbecile, and by his family he was treated as an object of seorn. On the death of Caligula (who was his nephew) he was proclaimed emperor by the army in 41 A. D. and was unwillingly recognized by the senate, who preterred a remblic. Me ligan his reign with a show of clemency, but his wife, the infaruous Messalina, acquired great power, which she abused by acts of cmelty. When she finally pushed her recklessuess so far as to marry one of her lovers. Clandius had her put to death ; but her successor. his niece Agrippina, was even worse. Clandins wrote several historical works, bnt they have all perished. He built a great aqueduct called Aqua Claudia. and successfully invaded Britain in person. He was poisoned in 54 A. D. by his wife Agrippina. See Suetonius, Claudius; Tacitus, innales.

Clantius. Appits, sumamed Crassus: Roman patrician ; decemrir in 451 B. C. He rendered himself infanous hy an attempt to enslave and dishoner Virginia, whom he claimed the right to retain as the slave of one of his clients. Iler father, vnable to obtain redress from the courts, slew her and appealed to the army. A popular revolt expelled the decemviri. and Claurlins was seized and imprisoned. According to Liry, le committed suicide. The story is rehearsed in Macaulay's Lays of Ancient Rome. See Amold, History of Iiome.
Clandins. Appics Cectus: a Roman patrician who was censor about 312 b. c., and consul 306 and 295 в. c. He constructorl the great roal called Via Appia from Rome to Capua. and huilt the first great argueduct which brought water from Tusculum to the city. In his second consulship he defeaterl the Samnites and Eitrurians, and about 980 secured the rejection of the terms of peace offered by l'yrihus. He became blind (bence his name (fecus). He wrote a legal work and a poem. IIis danghter Claudia, a restal virgin, is said to have proved her suspected chastity by drawing to land the stranded ship, which brought an image of Vesta to Rome, althongh the men had not been able to release it.
Clamilis. Marces Aurelius, sumamed Gotures: Emperor of liome: b. in 11 yricum in 214 A. D. ; proclaimet] emperor by the army on the death of Galliems, 2tis A. D.. and their choice was ratified by the senatc. He defeaterl the rebel Aureolus in the same year. and gained a vietory over the Goths or seythians in Sersia in 869. D. at Sirmium, 270 A. D., and was succeeded by Aurelian.

llerbert H. smith.
 cler: d. in 1412: a native of Madrid; was sut by Menry 1II, as ambassador to Timur. He started from serille in 1403, reached simareand viâ Constantinople, Trebizond. Tabreez, and Tcheran, and retumed in 1406. Ilis itinerary was published at Seville in 158:, IIistoria del grom Tomerlan eitinerario. etc., and again in 175?. There is an English translation of the work hy (lements Markham, published by the Hakluyt society in 1860.
Clay: any fine-grained earth which is stieky when wet and coherent when dry. Clays differ widely in composition, but sifica is nsually the chiet ingredient and almmina stants second. Dinor compments are water, iron oxide, lime, magnesia, and the alkalis. Classed as to origin, clays are (1) selimentury, the finest sediments deposited by water: (Q) residurl. the material left after the removal ly percolating water of the soluble parts of rocks, especially limestnnes: (3) glarial, the fine rock-flour gronnd up, by glaciers and depositex in till. They are also variously named, according to their nses as pottery, slip, porcelain, tera-cotta, brick and fire clar. Fire-elars, mate into fire-bricks, crucibles and other objects that must endure great heat. are composed almost wholly of silifa, alumina, and water: slip clays, used in glazing pottery, are characterized by large percentages of lime and the alkatis.
Clays nerur in every state of the Crion, and in nearly every county, being so abundant that their immense importance is rarely appreciated. In 1894 the valne of buikl-ing-briek was $835.200,000$ : vitrified paving-brick, $83.200,000$; drain-tile, $5.500,000$ : sewer-p,pe, $\$ 6,300,000$; and roofingtile, terra-cotta work, etc., $\$ 8,200,000$. See also Sorls.

Clay, Cassits Marcellcs: statesman: b. in Madison co., Kr., Oct. 19. 1810. He gradnated at Yale in 1830: opposed the annexation of Texas to the Union; advocated the abolition of slavery; made specches in the Northern States in 1844 in suppert of Henry Clay as a candidate for the presidency. In 184.5 he becane the editor of the True American, an anti-slavery paper issued at Lexington, Ky. He was attacked by mols, against which he defended himself bravely in sereral biooly contlicts. He served as a captain in the Mexican wat (1846-47); supported J. C. Fremont in 18.50. and Abraham Lincoln in 1s60; became a major-gencral of volunteers in 1 pr., 1862 ; resigned Mar. 11, 186:3 ; was minister to Riusial 1662-69; subsequently he becane a Democrat. although he adrocated Blaine's election in 1884. In $18 \%$ he was tried for killing a Negro servant who had threatened his life, and was acquitted of the crime charged. See Horace Greeley, The Life Memoirs. Writings, and speeches of Cassins 1I. Clay (2 vols., Cincinnati, cold of 1886).

Clay, Clfarext (lahborne: b. in Huntsville. Ala.. in 1819: son of a [. S. Senator, C. ( Clay (1784)-1866), who was tor many yeurs a prominent oflicial oif the U.S. and of Nabama. The younger Clay became a lawer in 1840, a julve in 1844: was U. S. senatur from Mahana from 18.54 to 1861 , where he advorated extreme stalle-rights views. In the latter year he entered the Confederate semate; was also a secret agent of the Conferleracy in Canadi 1s64. Alter the war he fled to Cimala, but surrendered himself to the U. S. on being aceusen of complicity in the murder of President Lincoln. After a shont imprisimment he was released in Apr., 1866. and returned to the practice of his profession. F. in Iluntsville, Jan. :3, lass.
Clay, Frfdertek: masioian ; h in Paris, Ang. 8, 1840, of Fhylish parents temporaty residing there: edurated in Paris am! lefipais. With few exceptions his enmusitions were entirely for the stape, and include a number of operettas and masical dramis, Ile wrote two cantatics The finights of the (rows (trifif) and Lallu Rookh. for the Brighton fectival of $1 \times \frac{\pi}{3}$. Amoner his songst the ane entitlet she Haudered hom the Jomntuin side was exceedingly popular. D. in Lomdon in Nov., 1ssit. H. E. Ilerver.

Clay, Ilevry: lawyer, matom, higislator, and statesman: thrice a randidate for Pmendent, and ones very nearly elected; 1. near The shashes, in Hanover county, not far
 baptist preacher, who diel in tixe; his mother-a woman
of nohle character and fervid piety-married again ten years atterward, and migratel to Kentueky, leaving this son (the fifth of seven children) a clerk in a retail store in Richmond, which he soon left for employment as a copyist in the office of Peter Tinsley, clerk of the high court of chancery, whom he served four years, passing thence to the office of Robert Brooke, then attorner-genemal, atterwarl Governor. Licensed as a lawyer in 179\%, though not yet of age, he followed his mother to Kentucky, opened a law-office at lexington, and soon achieverl a lucrative practice. Kentueky, separating from her parent, Virginia, soon ealled a convention to frame a State constitution, and young Clay publiely besought her to provide therein for a gradual abolition of slavers, but was sternly overmled, as he was hall in century later, when, in the fullness of his tame, he renewed this counsel on the revision of the State constitution in 1849-50.

Kentucky strongly srmpathized with her mother State in its oprosition to Jolin Adams's administration and its Alien and Sedition Acts, and idolized Jefferson. Virginias oracle, for whom she cast her first presidential rote in 1800. Young Clay was one of her favorite orators in that excited convas, and was first chosen to represent his county (Fayette) in the Legislature of 1803-04. Late in 1806, when scarcely eligible, he was chosen by the Legislature of his State to fill a raeancy in the U.S. Senate caused by the resignation of Gen. Jolin Adair. His term expired with his. first session, but he had already made his mark as a champion of the policy of internal improvement by the construction of roads, bridges, ete. He was again chosen to the Legislature in 1807, and elected Speaker of the House. Ife now proposed that each nember slonld elothe limself wholly in fabries manufictured in the U. S.. which Wias stigmatized by Humplrey Marshall as the project of a demagogne-language which led to a duel wherein both parties were slightly wounded. At the session of 1809 Clay was again chosen to fill a vacancy in the U.S. Senatethis time for two years. In Ang., 1811, he was elected to the House, and on the first day of his serrice Was chosen its Speaker-an extraordinary proof of his ahility and pophlarity. This Congress in Jnne. 1812. declared war against Great Britain, Clay being one of its foremost adrocates, an he remained throughout the struggle, until dispatelied to Europe ly President Madison as one of the negotiators of peace-a service which he readered at Ghent with eminent ability. Returning to his country in Sept., 1815, he was received as a victor, and, having been re-elected to the Honse in his absence, he was rechosen speaker without opposition. Ite had beenconspicnous in lefeating the recharter of the first Bank of the U.S. in 1811; he was erqually active and intluential in promoting the charter of the second in 1816. He was now, as he had been, a champion of protection to home industry. and of national internal improvements: and he was foremost in elfecting the compronise whereby Missonri was admitted as a slave State, on condition that all Federal territory north of lat. $366^{3} 0^{\prime}$ shonld be consecrated to free labor. Having favored in 1816 an increase of the lay of members of Congress from $\$ 8$ per day to $\$ 1.500$ per aminm, (lay was formidably opposed in his next cantass ly John Pope, afterward Jacksons Governor of Arkansas Territory, but saved his seat ly a vigorous effort.
In $18^{2} 4$ fire candidates were started for 1'resirlent-William II. Crawfort, of Georgia, who had the cancus nomination ; John Quincy Adams, of Massachusetts, then President Monroe's Secretary of State: Gen. Andrew Jackson, of Tennessee, then a U.S. Senator: John C. Callom, of South Carolina, then Secretary of War; and Henry Clay, of Kentucky, then Speaker of the House. Calhoun somn withdrew, and was made Vice-Prewident by pretty general consent, while Jackson, Adams, and Crawford (no one having a majority) were the three highest on the electoral vote, which compelled the House to choose between them. Clay, having receivel the votes of Kentucky, Ohio, and Missouri only, with four of those cast from Ni'w York, was four votes behiml Crawforl, and so conld not he voted for in the Honse. He and his friends cast their votes for Adams, electing him by the wote of thirtem states, to seven for Jackson aml four for Crawford. Alams made Clay his Secretary of state; wherenpon a ery of "hargain!" was raised, and Gen. Jackson was at once proposed for uext President. Ne was elected wer Alams, and (alhomm was again chosen Vice-President. At the next choice of Jresillent (1832) ('lay was run against (Gen. Jackson, and was batly deleated by him. He had just hacer returned to the $\mathbf{U}$. S. Senate, in whieh he played a lead-
ing part for many years maing, "pereally, the tariff compromise of 1sis, wherebe a conllict with sumb ('arolina was averted, and in resistane to the new financial pelies propounted hy Van buren in Najo. whereby the frosary Was to le divorced from all conmertion with lanke and their notes. (lay was againa candidate for J'resident, before the first Whig mational convention, bedal at Harrisbure in

Fridius，instand of daly－a course that inducer much exil． Fridisy，instan of daly－a course that indaced mach evil．
This was obvaterl by the elearing－honse system，through which the sethlements are so simultameonsly and almost in－ stantly effecolel that the tramsuctions adjusted throngh it live fimountel in one day to the enormons sum of sems．－

house system closch 2，500 bank ledger accounts，with mu－ merous daily entries in each：enabled the banks to settle every day with each other withont delay or loss through the dearing－house they now having no lireet business with each other except through that medinn ：and with compar－ atively little tronble bronght each ollicer into intimate and friendly relations with the others．thus enabling them by unted action to aid and strengthen ench other in times of excitement and financial danger：and to exert by their com－ bined power a salutary influence upon the banking business of the country at large．

It is donbtful if without the aid of the banks of the city of New Sork the $L^{\top}$ ．S．．upon the braking ont of the civil warin Is61，could have raised the loans necessary to carry on the war in time to prevent the success of the enemics of the Union．It is certain that without the（＂learing－lrouse Association the banks could not hare finmished the finds which at once established the crellit of the Government， and enabled it，by the restoration of confichere to nego－ tiate its bonds to the enormons amonnt of over $\$ 2.000 .000$ ． 000．During those exciting times the machinery of the clearing－honse worked with regularity and exactioss：the banks，united as one daily equalized their resources，and presented to the world a most important as well as practical proof that in＂union is strength．

The panic of 18，3 was only checked hy similar action，as also in May，1sst，the experience of the war enabling the banks to act with such promptness in combining their entire resources by the use of over $25.000,000$ lom certifi－ cates as to sustain themselves against a panic，the serious results of which were greatly mollified by their action．

From Oct．11． 1 s5\％，to Siay 1， $18!12$ a period of thirty－ eight years and seven months，the total transactions of the 1．I．clearing－house amomed to the sum of $\$ 1.015 .343$ ．－ 101．554．53．an average of S8．5，ind．5．5．0s per day for the en－ tire period．The largest average daily transaction for any one Year was for that ending Oct．1：18x1．amomnting to $516 \pi, 055,201.22$. The present daily average is about $\$ 130$ ． 000．000．Of this vast business so exact and complete is the system that no difference of any kind exists in any of its books or accounts：neither has a loss occurred from its or－ ganization to the present time．

During the war the Government issued＂eertificates of indebtedness＂bearing interest，which were fouml to be de－ sirable as a reserve for the banks．Arecordingly，an ar－ rangement was made for the issue of sureial certificates bearing interest，and arailable only to banks heing mem－ bers of the Clearing－house Association．and which were recognized in the National Banking Act of 1864 as part of the lawful reserve for a national bank．The principal of these certificates was made javable on demand in legal－ tender notes at the office of the assistant treasurer of the Z ．S． in New York，and the inturest to the manager of the clat－ int－house and chairman of the clearing－honse committee jointly．This interest was payable semi－annnally．＇The certificates wre made available by a rote of the associa－ tion for the settlement of balances at the clearing－house， and wrie so used，thus changing daily the amounts held by each hank，and frequently（by the presentation of them by imlirional hanks to the $[\mathcal{E}$ ．S．treasury for pamant）chanc－ ing the agregate amount issmed．The interest was col－ lecterl and fiskmred to the several bunks by the elearing－ house regularly every six months，and each bank received the exact amoint of interest due it，notwithstanding the anounts held by it for the whole period had changed daily．

The apparent intricacy of the calenlations nevessary to arrive at such results tronbled some of the banks in other cities．which were lesirous of avaling themselves of the priv－ ilecres offered by the use of these certificates：and in one or two instances committees were sent to New Vork to ascer－ tain the process of computation in use．the simplicity of which，when explained，not on $\begin{gathered}\text { astonished them，but con－}\end{gathered}$ firmed them in the opinion of the usefuluess of un institu－ tion（apable of adjustine with so mucll ease enlculations which，at first sioht．appearme so dithenlt．The largost amount of elarimorhouse certificates in use in the city of Nexp York at any one time was $36,000,000$ ．
The clearing－house is located at So，If Pine Street，the buidling being owned by the association．The clearing－ room is prowifed with a contimons line of desks，sixty－five in number，one for each bank，each desk bearing the name and number of the bank by which it is occupied ：the banks being mumberel accorling to the date of their organization， the oblest（tlue Jank of New York）being No．1．Each bank
is represented every moning ly two clerk－one a measit ger，who brines with him the ehecke．drats，wi．，that his
 whieh are called the＂＂xeltinges．＂and ane asombal fon cach lank and phaced in envelopes．On the outonde of eath col－ velope is a slip，on whel are listed the amomats on the sari－ ons items which it eomains．The en envelun are arrangend in the same order as the desko for the sermat hats．The messengers sixty－five in mumber，take their flaces in a line
 to his hathk，while on the other side of the deak is a che rk with a hert containing the names of all the hanks arranad in the sume order．with the agreregate atmonto his mean＋hec． hat agaimet each trank．
The hour for making the exchanges of enemeral delivery is 10 A ．M．buat presions to that time the manager take his guation at an elavated desk mal calls the homer to order．It at sienal from an bell struck previsely at tom oclock．eath mesenger moves forward th the dew next his own，and delivers the enveloges contaniner the chreke．cte． for the lank represented by that desk to the clerk on the inside，thegether with a priniof list of the hamks in the sance order，wiht the amount oppuite each bank．＇The cherl re－ copving it digns and returns it 10 the mevengre who imme－ diately pasees on the next deck，deliverime the exelampe for the lank represented by that desk，and sn on motil he has mate the reirenit of the ramin and reichad his own desk，the startinespint，having deliverel to each hank the exchanges he hat for it，and consequently delisering his mite ex－ changes for ath the hathe．livery other mesunger due that like，the whole moving on at the same time．In other womk． each messenger las visitold acery bank and dedivem to each arerthing his bamk has receivel the day provious from it．aking aremp for the same consergently the en－ tire pxhangi are delivered；while each derk upm the in－ sule hat of conse medivel from espry other bathe the anmunts each hat against his hank．This opration ocen－ fines exartly ten minutes，mat accomplishes what conkl not otherwise be done in lios than six or eight hants．

Besides the saving of time gainerl ly this unethom，eath hath is enablen to know the extet balane for or agame it at once．as the derks，after receiving the whemperamtath－ ing the ehe ks，etc．．．immediately enter from the slips．pun their own sheots，the agorequte amomit from esth benk； the diltorence betwern the that amount they haver meceivet and the total anomut brought by them being the balance cither due to or from the charing－homse to and bank．

The messengers then reenive from their neveral clerks the varions anvelopes containing the exchanges，and redurn to their banks，reqorting their conditins，dedtor or crentitn at the rase may he．The elerks then report to the amistant manage the amont they hatere recensot，they hasmer re－ furtal the amount each frompht umon first entering the

EDitor of "Herald."
('leveland, (stephfi) (irover, LI. D.: twentr-second I'resilent of the [.. S.: b, in (ialdwell. N. J., Mar. I6. 183T. His father, liev. lichard Falley ('leveland, was a l'resbyterian cldrgyman, and when his son was four years of age accepted a call to Foyetteville, near syrachse, N. I. It this place, and a little later at Clinton, Grover received a guod academic education. In 185: he went to New York eity and became a teacher in an institntion for the blind, lut not finding his duties congenial he determined to go West in search of other emplorment. Throngh the interest of an uncle he stopped iu Butiolo, where in 18.5 J he became a clerk in the law-atlice of Rogers, Bowen $\mathbb{E}$ Rogers. Admitted to the bar in 18.59. he was managing elerk for the same firm unti] 1862 . In 1863 he was appminted assistant district attorney for Erie County, a position which he held for three years. In 186.5 he became the law partner of 1saac V. Vinderpool, and in 1869 a member of the firm 1 sanning. Cleveland \& Folsom. From 1si0 he was for three years sherifi of Eric County. Ifter nine years of professional prosperity he was in 1881 nominated for mayor of Bulfalo, and elected by the largest majority ever given to a candidate in that city. He became popularly known as the "reto mayor", and the use of his prerogative in arresting measures which he decmed unwise and extravagant saved the city nearly $\$ 1.000 .000$ in the first few months of his administration. Ilis popularity as mayor brought him prominently before the reprementatives of his party, and in Sept., 1s8. he was nominated for Governor loy the Demoeratic state convention held in syracuse. The election which followed in November proved to be one of the most romarkable in the history of the country. Mr. Cleveland was clected by a jurality over his Republican opponent of 1!2, 594 . In office his policy was an expansion of that which he had pursned while mayor of Butlalo. In July. 1884. Whe Nitional Demoeratic convention at Chicago selected hin as its candidate giving him on the first ballot $30^{\circ}$ ) of 820 votes, and on the second 683 . In his letter of acceptance he nade it plain that, in casc of election, he should consider himsell as the serrant of the prople, as he had done while Governor and mayor. The canvass, in which Ir. Cleveland took no persontl part. was remarkable for its discussion of personal peculiarities rather than for its consideration of political issues. Of the 401 electoral votes Mr. Cleveland recejed 21!, Mr. IBlaine, his RepubJican opjonent. 182. Of the popular vote Mr . C'leveland recuived $4.874 .986 . \mathrm{Mr}$. Blaine 4.8is1.981.

On the part of the adrocates of a reform in the civil service (sce C'yll Service Rfform) there was a strong desire that the principles of such reform should be respected in Mr. Cleveland's atministration. To a letter addressed to the President-elect. Mr. C'leveland, in a carel'ully prepared communication dated Dec. 25 , replied that be recornized the justice of the elemand for reform, and regarded limself as pledged to carry ont the statutes on the subject in grod faith. IVhile the gemeral tenor of the letter was favorable to reform, it was evielent that the President would hold himself lree to exrecise lis discretion in all cases involving what he regrarded as "offensive partisanship." Ilis views on the sulhocet were embodied in the following sentence: " But many now holding such positions have forfeited all just elaims to retention because they have used their places for party maposes in dismegarl of their duty to the prople, and because, instead of being decent public servunts. they have proved themselves offensive partisans and unserupulons inanipulators of local party managrement." When the president-elect entoral upon ollice lie annomnced that." with the cxeeption of hewls of departments. fureign ministers, and othel oflicers elarged with the exeration of the joliey of the mbministration, no removals would take place except fur ramse:" Hy this poliey he at onee vame into eollision with many inlluential members of his jarty who advocated the general mul sperdy removal of Republicans from ollice. The'l'recident eleeited to pursme a medium connse. lle made "roffensive partisanship" a eroumd for resnoval, and the fhrase became a by-wom not very long after his inangurafion. ln 1 le course of his first year in oflice about 18 per fent. of the foshansters were removerl. and about 8 per cent. of the elark in the repmemonts in Winshingom. S be harl
 oredsed the vetw pewer with great freedum. This was par-

 to the prematation of his views in faver uf a meduction of
 isting puliey by the adogtion of a law famed with a view to the sumely entahlinhment of the prine iples of free trade. The Repuhlicans immetiately took uf, the issue thas presenter). amb the question at once theame the probomitant issur of the canvas. Mr. Clewdand was manimonaly rambinated lew the National Demoeratice eonvention in sil. Ianis on fune 5 Esis. The eftorts of twoth patios were diteded chindy to the dont ful states of Imbiana, Now Vork, New dersey, and Comecticnt. Mr. Ileweland arrion all the sombern Siates, and in the Forth Sew Jersey and lommediont, white of the douhtul states Mr. Harrion recejom the botes of Stew York and Indians. Of the electutal rotes
 for ('leveland was $5.540,329$, that for Harism $5,4,3,853$

It the chase of his administration on Dar. 4, 1sen, Mr. (levehand retired to Now Vork aty, whem ha remomed ugon the partice of his pathesion. It san beeande wident. hewever, that he wond be prominenly urged as at candidate for remomination in 1 sar. Is lime progresed. the probability of his nomination became more and mom ertath, and at the Sational Domberatic comvention, which met in ("himago Inne t? he receiven mare that twothirds of the roter on the first ballot. In his speech of aceeptance.
 New lork, he reiterated his views as to the mecessity of tariff reform, and thus made it certain that the barifl question would be the principal isane at stake at the election in dov., 1s!e. In that election there was a monathan revoral of the popular will of four yars before. The bemocrats earriml twenty-three shates, indmling, for the first time in years in a presidential contest, Illinois, Imdiana, and

Clill-dwellines is tan L. A.: dwellings and grompe of dwellings buill in natural recesses in the clifs in the walleve of the Rion firmde and the Rio Coloralo, and more naperathy upan sume of the rastern tributaries of the latter stram. The walls are skillfully ronstructed of stome laid in mortar matle of the native adobe clar. In some cases the stone is broken into somewhat uniform bocks, which are rudely dressed unen the exterior surface. The interions of the homes are often pastered: in some instanes the exterion also has remiwed a roat of chay, and ung this has been latid in rate cases at wash of white clay
Nany of the houses are small and oremr singly, oecmpying restrided nithes or shatwes in the edifts. buf when the rerases ate large the plan is often expandel, and the stacture beromes a cummual dwelling or village of many rows irrequlaty arranged to fill the spaces, hat with exterior wills rombming to the itregular margin of the preeipice. Two and been threw stories are not monsuat, and. although the work is all primition the offert of findal arditerture is suggonded by the mund towers, the diversition phan, and the inferulat distribution of windows and dons over the crumblins fackle.
The doors and windows, which are somewhat square, have wowlen limeds. and appear to have bed closed by stone slabs, skins, or blankets. The arch was manown. Thes Hyper floms and roof were shiportod by poles set in and graceally pemetrating the wallo. fa many wase the owerhamging eriling of the remenses math roots : walls being carried the entire height.
"The many striking fenture exhibital hy these strange dwelling have axeited much interes, shat led to serions misernertions as to the status and aflinitioe of the perabse concerned in the ir constmettion.

The proples new oremping the gablo town of this region mombedre reperent to a larese extent the andent tribus.
 this pwint. This evidence is derivel manly from two sumere-at stady of the traditions of the motere fooples. and a comprative stady of amedent and motern art.

Thu stomine related by the town-hilhers of to-lay are interesting and somantic. 'lha Tusatan lodians, weroding to tratitions, dwelt at firs in the hwor thpthe of the earth,

 of the lower world. Suisted by the magic gumdians and divinities they learned the waysand ate of the upher wotd. Tharir wanderinge before they timally setthed umon the masas of Thas an were long and full of adventure. One myth exphans the existene of deserted dwellings seatered aber where owd the deser as follows: the smake gens lived at first, wath family in a smake shin hume on the end of a ramlow, which, as it swong areund in the sky, tromed them her and there und the emeth, where they immetiately began to fath their dwellings. At another stage of their watheringes at milliment star urose, whide wonk shine for a while and than disupurar. The wise men sad that beweath that star the prople for whom ther somght would he fommt. So they fallowed when the star shone, and when it disappered bailt. their dwedlinges to alwait its reapparamere and in the end a vast momber of ruins were seathered over the lamd.
 Tunvan, is desprind as a manom with high, slat) walls, in Which was a ruminge stram. How they haile a haree honse ill a high, varmons reves. Mush timic was sumt in mak-
 The womoll and chidere gethered the stames and made the mortar fur haiding and pertions of the tribe atternded the gathons in the valdey helow. Many of these tratitions are
 litule relianer ran be placed upen the whatiteations. The sthit: are not derived from the past, but are invented to
explain the puzzling culturephemomena of the surroumding country

The Zuñis and the tribes of the Rio Grande relate similar stories of the past. Althongh there is in a general way close analogy between the tratitions, the arts. and the customs of the several puehlo trihes of to-diay, the marked differences in language elearly inclieate the presence of at least four stocks of people. A glance at the art remains seems to indicate greater muity in arehaic times. Ancient art in stome and clar corresponds rery closely orer a wide region to the botter of the clifithwellings. This unity of art is indieative in a measure of homogeneity of people.

Explorers tell us many wondertul things of the ancient ruins of the pueblo country-of ruined cities on the plains, of fortresses in the clillis, of standing stones, of walls and towers and cistems and cinseways and canals, of cavecities dug in the chalk-like bluffs, and of burmows beneath beds of lava or in the sides of eones of indurated ash. Much has been made of this remarkable diversity of remains and complexity of peoples and cultures, and a succession of periods of oecupation hais been assumed, but much of this diversity may be explained by calling to our aid the simplest principles of art growth. The dwellings of a people are to a great extent what the immediate environment of that people makes them.

The pueblo country is a smi-desert. made up of tablelands of rarying heights, cut by the waters of rivers which rise in the mountains amil radiate to the sea. This cutting gives a multitule of irregular plateaus of varied and remarkible untlines, with steep sides and escarped margins. The geologic formations lie to a great extent in horizontal beds, and consist of alternating groups of hard and soft strata. The streams as they cut down through these formations eat their wily to the right and left by attacking the softer layers. These boing removed, the hard strata above break down in masses of varying sizes all along the sinuous margins of the plateaus, These constitute nature's quarries, and linmish, reaty-shtped to the hand of the home-maker, unlimited quantities of material. This methol of erosion, by undermining the hard ledges, giver, besides these deposits of bullang-stones, a peculiar conformation of the chills, afforling natural dwelling-places for men. Everywhere there are shelres, shallow shelters, and capacious recesses, and where the valleys are deep there are tiers upon tiers of these natnral dwellings, many being beyond the reach of man.

Now, it is not hard to foresee the effect of these remarkable combitions. A tribe of wanterers approaching from the south, scorcherl by the sun and stifled by the alkali-hlust of the plains, woull seek the shadows of the great rocks and make their homes in the cool recesses. A borcal people, coming down from the north, wouk find shelter beneath the roofs of the desert into which they had wandered. Men approaching trom any quarter, and from lands far or near, would at once make thrir homes in the eliffs, and before a generation had pasmed they wond not only be eliff-lwellers but clint-builders, For convenience of occupation, they would level n' a lloor, To shelter from the wind or to protedt [rom an enemy, they would raise huge stones or buikd walls accross the oprnings. Three walls and the roof were alrady fomished hy the natural reeesses, and the stones were at hand to chose in the tront and complete the dwelling. Nature, under such conditions and by such suggestions, would make elifl-lwollers of any rate beneath the sim.

On occasion, when the accommodations of modified natural sholurs hecame insulheient, when stone was plenty and chemios were not thrateming, building extended to indeprodent vonstruction. and houses aml commonal dwellings uf stone spraner up wherever hon was fertile and the watersmunly was abumbint.

With these peoples twellines in vallevs and upon plains mombutedly wome first, ds valleys had to be acembed and phans crossor before tho phateai land was reached. but not matil this land of ex"r-presint stone emviromment was reathed
 breonne a prevalent aml a well-established art. It any

 renectlpation of nature's st lownholits.

It is not macommon to sere qummmat dwellings, romml
 fing all in a single group, abl connected, and grading in their features of construetion one into the other.

Cliff and cave dwellings are not known to have been oce
cupiod extensively in recent times, but limited occupation hat bepa recomed in a number of eases, and the newness of the masomry, the freshness of the plastering, the wonderful state of preservation of pottery, wooden tonls and utensils, woren fabrics, baskets. sandals, mats, hows, arrows, and hatten tools of all kinds, and the practical identity of all thes things with modern work, connect them definitely with the present perion, and lead to the conclusion that the ancient and modern peoples are elosely related in bloorl and in history.

This table brings out the suprising fact that the solar intensity is not always greatest at the equator, but that athont the vernal equinox it is actually greatest at the pole-due to the continuous day then existing in that latitude. It is a well-known fact that in midsummer the heat in high latiturles in the afternow is greater than in the tropics.
4. Defining a "thermal day" as the equiralent of an average day at the equator (in mean intensity of solar ratliation), the table annexed will express the annual sum of solar radiation: it is taken from Itamns

cause an independent series of fluctuations. The distribution of land and water, the ocean currents, the elevation of the land above the sea-level, the greater or less efficiency of momtain ranges as wint-breaks, and the clothing of the earth's surface are the leading canses of the variations on solar clithate. The combined effect results in the following tylues of climate:

The tromical climate is usually mild. equalle. and warm, not often disturbed by general storns, hut subject to smald local storms, usually coming on in the afternom. Buth seasonal and diurnal phenomena usuatly occur with great regularity. Jlurricanes and typhons are oceanic, antumnal, gencral, storms of great violence which originate in the tropics lut pass into the temperate zones, where the take on the character of general storms of the temperate region.

The sub-tropical climate has the equability of the tropical, but not its mildness. The weather is generally settled, and storms are relatively infrequent. It is more liable to insufficient rainfal than the adjacent climates of higher or lower latitudes. Gencral storms rarely originate in this latitule: local storms, though less regular than in the tropics are frequent and sometimes violent. Areas of high pressure are mare inclined to become stationary here than in higher latitndes.

The temperate climate is the elimate of unsettled weather. and is consequently more serere amb more rigorons that the preceding. It has more clond and fog. stom conditions pass frectuently east ward. Local stoms are usnally cuntined to the wirm season.

The crefic climate is cold ansl rery severe, precipitation small, smmmers short and very hot.

The alpine climate, fond on high monntains, is mure rigornus than the arctic climate. and has a longer summer, with great sular intensity, because of the rarity of the air at high elevations.

Ocemir climates are relatively cool. mild, equalile clondy. and moist. Insular and littoral climates partake of the same chamater. ('ontinental climates are relatively sewe. rigorous, clear, and arit. In desert climates the continental feitures are still more strongly accentuatecl.

Where momatains serve as wind-brealis. the air is forced upon the wimdward side, becoming chilled and losing its moisture. It descends on the other, alreanly dry and becoming warm by the fact of the descent. When the wind is high this air beeones a warm. drying wind, callect the Füh, chimook, etc. Trinduraw climate is consegmently cool comly, ant wet. Leeword climate is warm, dry, clear, aml subject to the chinook winds.

A glance at the isothermal map herewith shows some interesting cases of the causes of rariation of chimates mentionel above. For instance, the western coants of continents are warmer in temperate regions, the eastern in the tropies. This is due to the prevailing winds, aided by the ocean currents. The most ellicient current is the Gult Stream, which gives Jceland the ammal lemperature of Newfoundland. causes a temperate climate far into the Arctic at North Cape and even affects the amual isotherms of Spitzbergen and Nova Zembla. On the rainfall mal! which atcompanies this article, the heavy littoral rainfall on the west const of the Americas in the higher latitudes, comhincel with light rainfall inland, is due to the break of the winds by the C'oast Range in the one case and the Andes in the othri. Exactly the reverse prevals in tropical America. Similar considerations enable ns to explain each great departure from symmetry on the maps.

Climatograpm--1. The I wited states reach the tropical climate only in the sonthem part of the penimsula of l'lorida. The remainier of the area is sub-temperate and temperate in climate, except Northern Alaska. which is aretic. More thim half of its sub-t'mperate area rerpires intigation for suresofnl agriculture. A large part of the westen temperate region has a leeward climate the windwind part heing confinet to relatively narrow strips on the westem slopes The shores are all bathen with warm water, except New Englant, where the deflection eastward of the Gulf stream permits aceces of colder northern waters. The Great Lakes morlente the cont inental features of the climate in the recion to the cast of them. The great thetuations in the meterologie elements are chicfly due to the general storms or areas of high pressure which traverse the comutry from west to east. The monst of these appear first on the northwestern border. and, becuuse of the lack of a transwerse range of monntains to the north, these are apt in winter to hring severe eold with them. Few cross from the Tacifie or orig-

 home, and fevers of other endemie divasom and deat bualy f.nlow
 is a ereat difference in indisidat rach as is stomen in their
 surfare. 'The Eximo beare their hypromen ragion with
regret, and suffer greatly from homesickness while away frum it. The $L^{\top}$. $\therefore$ (iovernment find great difliculty in transplanting their Inslian wares. esuechally if a consiblerable change in latitimbe is attempted. The Inclians of the elevated phain of the - ineles of Eeuador (elevation 7.000 to 12.000 feed) and those of the hot phains at the base, thoush they are prohably members of the same stock, can not endure tranaplantation each to the other"s climate. Indech, in the cotjee regim, intermediate between the two. laborers from the siera sufler from ague and drsentery and thone from the plains from influenza and nemralria. and neither (an dos more than remain during the harvest seasoln of three or fonr months. A longer residence means sidkness, and often death. The Hotsentots whom Livingstone took with him into more tropical latirudes in Africa proved to he generally unable to stand the change in climate, and in general Livinustone endured these changes better tham anc of his blarli companions. On the other hand, the Jews have spread over ahmost the entire inhabited earth with equal tulerame everywhere and as they do not intermix with of ber vaces, it is a case of pure racial tolerance. They hare mattiplied to enommous numbers in the severe chimates of Poland and Ros-ia; in Sweden ther are said to increase more rapidly than the native population: in Algeria they maintain their numbers; and they form permanent communties in lato- 'hina. The Chinese live in confort in all latitules from British Columbia to Australia. The Cbaniards have spread from Lonisiana to Chili, and are entirely acelimatizenl. In some places, as in Guayammil (lat. $2^{\circ} 13$ ), the blood has been carefully preserved from any native admixture but the acclimatization is none the las complete. The Porturuese live in entire comlort in the tropies thronchont the worth. and the drabs are scattered throughout all Ifricia. wet and dry. The same thing is true to perbaps a less leeree of the Teutonic stock. The British have peoplel the I. s. and Canada (with if anything an inprovennat of physique), Autralia and south Ifrica. Every jort has its scotchmen. The Intch Boer of sonth - frical represents a remarkably persistent colonial stock, and the luteh embure the East Indies ratlicr better than the british emdure llindustan and Bumma. Acelimatization seems to te rather a moral than a physical matter. The whiter and les civilizen races have less jluck and conrage. become homesick. and are not adaptable to changed conditims. Uf the civilized races, it is noteworthy that the two most temperate and thrifty, viz... the Jews and Chinese. are the best colonizers. and something of the same thrift is foume in the spanish and Portuguese. Temperate habits are of the hirhest importance in the trojucs. and it is in humorous allusion to this that the tropieal Britisb refer to al drink of spirits as a "peg." meaning a peg in one" eoffin. The relative insuceres of the British and the Dutch in tropical colonization is the to their large consumption of lignors.and! to their insistence in retainins their bume clothing annl liet.
3. The spreat or sulwiclence of many diseases may be tricell to efimatic conditions. The germ diseases which become epidemic in tomperate latitnles manally have their lommes in the filth of tropicall cities stewing moler the vertical rays of the sum. Thus vellow fever is at home in the newleriect parts of Havima, Lal Guayria, and Veral Cruz. and spreads morbwaml in favorable sumbers and autumas. reachinir Aemphis, Temb. or Cairo, J1, The cholera is at lome in truphoal daja, and in favorable seasons, sprembimer mothwurl anl westwarl, it passes throngh T'urkey and Chasia, and then spreals aloner commerciatl lines throngh
 arved in warm houses through the winter to spread in the "fern aif in the next smmer:
('limathe extremes also cause siokness and death indiretty. I drouth condenses the drinking-water and increases the power of its impurities, thus producing alysentorys typhoid fever, and similar illmeses. Catrietl further it becomes a famme, amt caties death by famine forer and other diseatise of the same ilk, as will as ly starvation. Kiswonk dimates caure people to herd together, and thus permit the spreal oi connmmption the semm of which is su delirate that it ean pasa from one to another only unler the most favorable circumstancers. Ilot streets and hurry combined canse sumbtroke, amd the contrast between overheated houses and [xlreme cobld outsitle briners on colis, eatarmh, fremononia, ant a host of similar ills.

On the other haml, climate suppresses disutses and heals them. J'he approudi of winter suppreses yellow fever and
cances cholera to subsile. Many climates are healing for the diseases of other elimates. Southern (aliformit and II estern Jexas, and the region between then, Colorado, Forthern Ninnesota and North lakuta, the deirondacks, and Western North Carolina, are all well known as resorts for the corre of consumption. Florida, and indemathe whole Gin]f coast of the [ $V .8 .$. is a place of refuge lirum the ills of winter. Sonthern France, Algeria, the livicra in Northern [taly, and Eoryot, are celebrated as climatic heilth resorts in their season.
5. C'limate makes a deep impress on man socially and intellectually. The family is the fundamental unit of social life, and its unity and coherency is largely a matter of chimate. Thus the patriarchal family is a result of nomadie life, and the latter depends on climate as one of its essential elements. The cool, temperate climates give rise to homes of the Anglo-saxon type, while arctic climates cause the association of a larger number of peonle of different families, giving occasion to commmnal honses. The prevailing winds and great ocenn eurrents have given direction to eonquest, commerce, and riscovery. Commolore Naturys stukly of the climate ot the ucean surface enabled him toimprove the courses for ships between frequenter ports, and wave these an economy of time in each voyage. Climate almo determines the charaterer of dwellings, which, beginning in the tropies with open. dimsy, single-storied stmetures, gradually expand with increase of Jatitule until the enormous "skyscrajer" is reached, inclosing in its walls a whole villatge. and uate compact for economy of heating, lighting, and access, as well as economy of ground rent. With greater increase of latitude the dwellings lwindle, until far above the Aretice circle the final form is tound in a low, tight, solid, hemispherical shell of ice, approached on hands and knees through a long. low, winding, coyered jassage. Architecture and other branches of engincering are especially dependent on climate for the raried forms their structures take.
Through the channels already mentioned climate affects the mind and son] indirectly, but it also has direct inthenees of the highest importance. The myths of the childhood of races oftern atmit of jurely climatic interpretations. What may be called atmospheric effects, incluiling loth climate and weather, comprise a large part of folk-lore, and jervade loctry, especially the poetry of races in their youth, as the I'edas, the Mindi, the Fialrivala, and the Shah-nameh. The effect af climate on the disposition is familiar orer the most of the northern bemisjliere in the contrast letween the more serions, latborions, and determined northomers and the more genial, leisure-loving. and diplomatic southerners. Whether we compare Scotch and English, Briton and Gascon, Citalonian and Andalusian, Lomband aml Licilian, ankl North and south (ierman, Russian, or Chinese, the contrast always exists in jopular estimation, and it is not entirely lacking in the L . S. thongh heredity, slavery, the eivil war, and migrations of northermers southward have masked it. And this contrist in disposition camies with it differences in character and moral force. The greater labor in higher latitudes mereesinry to the support of life and to ohtaming comforts, ame due to the stronger contrast of the seansons. brings with it a stronger will. a more powerful frame. and a greater caphatcy to enture severe privations: canses moncy abd power to accunulate in the hands of the northermers, and these camse the ajp arent paradox that the laborions climates ribld men of the leisure necessury for a distinctly intellectaid and artistic elass. The conqueriner races have usially come from the north. From the southware migration of the early Aryan stock, wave alter wave of northern proples have swept orer the lower littitudes, until the last Ware has swopt past the equator and fairly taken possession of the rutire sonthern hemisphere.
6. While climate, as already jwinted ont, hats had perhaps a fommative influence in the lape of ane on man's physical frome, its immediate and direct uffects are of quite subordinate importance. The black, yellow, ropper-coloren, and white skins, with the other clifferemees whifh go with them, are rather racial characters than climatic variations. 'the Segro was the same in anelent Vigytian times as now, and be holds his characters from the Gudan to the Cape of Good 1lope. from Liberia to Ansiraha, anel from Canata to Irazil. Duljoinng tribes otfer far greater ditherences than those due fat mansorlation to Amorica and two eenturins of jesidence theres. Nisration to hotter climates induces languor ame latk of emorgy, as when the Vambals settled in what is now Tonis, and cipusure wives a fronze to the skin which may heconte horeditary; but these never change the white

man into the Nogro, nor does residence in the Northern States and Conada perform the reverso. In the alantation of all the fonetions to slimatie conditions ceptain mino characters are induced which may Fe reatily uncertent. Four insanee, the tropical diet indeldes lithe fat, the . Wertie con-sish-almost enfirely of fat. Monatainerers are more polmst ant hardy and less sensitive to changes of temperature than dwellers on the phains. For rasidents of arid regions the skin beemes tillad with fine wrinkles. the voice is shatpened, the nervous system is affected by the fonstint stimnlus on the skin, ami they are mowe irvitable and aldert while for residents in wet rerions the skin is smanth. the woree is mftened, the nerves are less stimulated. atul they are more aven-tupered but more lymphatic. These charanteristics are not sery deep-stated, and tond to reversal om chame of climate. Nim has gradually withdawn himself fom the direct inflanere of climate.
. The reverse problem of man's influmere on climate has twen much disenseed, but no semerally abeepted comelusions have bern reaberl. There is no doult is thans intlume in a small deyree and to a rery local extent, but to such Gunstions as these, " Has the climate of Patentine changen! greatly in 3, 1月0 yoars and is this change due to man ? " yery diveri answers are given by serions students of the subject. It may be sately admitted that to a small degree and choce to the earthes sirface such hmman oprations as the cultivat tion of the liedu. the clearing of forests. the drainage of marshes, and the conservation of nataral waters may offert climatic changes ; but we mast also admit that in the presance of the great operations and changes of the atmonghere his pigmy eflorts are without appredible efliect. The best disensinioh of the subject is that by ti. I'. Mardh, in his Mun and Valure afterward revinol and isenol under the tithe of The burlh as Modified by IHuman - Iction.

Climate and other Form. of Life.-The relations of animals and plants to climate form a topic of very great importance in theories of evolution and in argientitre but it is ton extensive a subjeet to treat in full. A few of the salirat fiacts will be pointerl out.
Animus are more inderemdent of elimate than plants 1 necanse the former are generally capabhe of bemotion, white phat - can not escape fron unfavarable comblitions which may surround them. The amount of tolerance of climat ifehange for animals decreases on the whole with decrense of rank, ns fas already been foum? to the the case with man. The medium also phay an important part. Fish ate bery sensitive to changes in the temperature of the water, and biak and insects living in the atmonghere ant with lowlies more completely permeated with the air are loss tolemat than mamak whish are confined to the surface. Tolerance is alse a matter of species. shme speciss range over enormons regions, while others are eontined to wery limited dintriets. Thus the bepard ranges ower the whole of . Trieat and were the aonth of Asia to Wat (lhina and Dinrmen, while a ecetain species of the ibex is contimed to the l'ypures. The weprey ranges over all the continents southward to brat rit and Tasmania, while a hematifal smbtird is limited to the marmer part of the valley of the Jordam, and at spectes of humming-tirel is contined to the womdel crater of Chimipui. in لimgua. hange of spectes, lowewr, depends on many Wher amditions ass well as on the present climate. This Mataracear and atjowent Afrien differ in their lama, white bali and Lombok, only in miles apart at their mearest parts, have very ditferent biral fanas. I'robahly amon fowerfut rantrollir than climate in the diatributing for sperios is the (ombutition with other forms in the struggle for existmes.
of very great interest ate the meras prowided animals for the protedion of the individal and the preservation of the

 the allientor to the homse-1ly, amd in rathe from the hear downwart. The covering of the wartu-lideeded amimals. hair, wool, fuathers, serves as protedion from axtremes of
 are also diremed in such a way that in the hathitual pusitum of reat on the part of the mimal the will shot rains, and
 ply of oil. In many aneme there is an maphation in the hainy coverine to the samon; the hair thins ont in wam waiher to thicken agrain in cobl.

Many of the instimets of anmats have refermese to prot toction again-t climate. "The almost miomeat migration of birds with the seasmens comsists in a motion toward the
tronins on tha approath of winter, and a return fo their old hannts with the armonch of smmmer. Thae migrations of lonensto are of differont characory, lom they are samomal in their time of ocemrence, and therefore clinatic diwe ly or

 favomble seasons stores of fond which ain tu- used in unfavorable ones. When the diren rats of the smo aro hat. animals remain pencratly moter cower in the wamed part of the day and hecome mone or kes noeturnal. Ihents fallev of Califurnia has an comsiderable limma. lout it is so completely nowturnal that an elabmate expluration was repuited (1) discowe it. Tropical forstanare very sint carly in tho afternom, but they beeme wary rocal in the early evening amp at night with the cries if animals of all dergrets.
Dost animals are (apable of thomishing moder a much greater mane of the climatic elemonts than that foum in their halitats. Parrots will tive amh multifly in the denglish chinute without protection, as has been prowen in Nomfolk. That they do not take posension of the wands in the to the competition of other animals rather than to climate.
 ries in tomperate regions even when the temperature falle to zero or below. The homse and domestic fowl, both matives of very warm climates, flourish with little protection over ahmost the cutire habited parts of the ghobe. There are however, some interesting cases of lack of tolerance of climatic change. The sak of Tibet thrives in some parts of Fhrone hat can not indure the plains of Indial. The New[tomdland dog will not lise in India. Insets are often contimed within narrow limits of lompernture, and snakes. commen in the tregnes decrease rapinly with increase of latitude, disappearing in hat. (ix. With climate certain changes often take phace in the ammal. In Angora togs and cats have fine flece hair. Sherp transpated from tembunte elimes to the Wiest Indies undergo a change in the character of their wool, but it takes thre genemtions to complete it. Fnglish oyshers framepreded to the Merliterraman ahter their mode of growth, an? form prowinemt diverging rays like those on tha sla lls of oysters mative to that sat. (feese transported to Bugota were at first phite infertile, hat by degrees improwed, until at the end of twenty vars the protuct in cgass was as large as in the home oliinate. It is also found that in introfucing domestic animals or phants into new dimates it is well hor mike an intermoliate station of acclimatization. Sherp hed at the Cape of Good Hope do much letter in India than those bronght directly from Creat Britain.
In the case of plants the relations to climate are still chaser. The range of species through dimate, the widely dittering tolerance of ditherent species, the appliances for protertim against climate. the sulwervienter of pant-life th ine seasons, tut the fhemonema of arelimatization, are of the sane charmeter qualitatively in phats and animals, but more marked in quantity in the phants.
The relations of the phenomena of amimat and pant-life to the stasmes, the adrent of hirds. their nesting, the hatehing of the young, and the departure toward the tropies, the :pronting of the herbs or appearance of heaves on the thee. the thewring and fruiting, form a series of phomoma which are grouped tore her under the mame of phentoyy. The phemolory of plants has been inn लpereal abject of sthely, mat the problem to solve ran le stated as follows: 'To express in a simple mathmation form the rebations of temperature to the lifferent stages of planterowh. The initial tempra-tur-that ot which regetable lite legens to stir after the winter sherle the buds to spront, amd sede to smminate- is
 ture of the stages following this have been varionsly $x$ presicel, lom mone of the mothonk is entirely satisfactory. The methoal mose employed is that of accumbiation of tem-

 tembrature maty be the initial abovemonem on may be the mean temperatures fore ditys observed. The lather is usat to give some ithat an to whif her erops are ablvaneed thrond or retarded hehmod their unalal state at the date comploseal. The temperatare at which the phant the its teret is mited the oplimam. and this differs for differno sumets. Many studics of the alvance of thawering. lealing or other
 chartend, with a long serbes of intomaner and valuathe comChsims: but in general it may les said that in phomology whervition is tar aheal of theory.

The prevailing winds play an important part in the dispersal of plants by the trimemotation of the entire phant or of the seets. Dis ritals of minute organisms, mosily how forms of plant-lite, are transprted fonlity in this way More than 300 species of diatoms have been fount in deposits left by dust-storms. In some cases the plant is transported as a whole even when of large siza. The tumbleweeds of the Western plains of the $[$. S.. when mature, loosen their hold on the earth and are carried forward by the wiml in a compaet ball, 2 or 3 fuet in diameter. seattering their seeds as the roll. Ther continue their journey to great distances, until ther finally come to rest against i rock or in a pavine or strean. The so-called Russian thistle, recently introduced into the Dikotas, makes a new form of tumble-weed, and is sprealing eastward with considerable speerl: lout, if not sooner rooted nut, it will he stopped by the lime of forests on the upper Mississippi and Red river. Hore often than the plant as a whole the seeds are made with reference to easy transportation by the winds; and nature takes many methors to eflect this. One of the most effective is that employed in the thistle, and one of the most claborate is that of the common dandelion.
Plants are especially sensitive to the climatic element called humility. Vegetable life of all grades attans its greatest development, other things being equal, where the humidity is greatest. The tropical forest of the valleys of the Amazon, of the upluer Congo, and of the Brahmapitra, are in regions of great humidity: and on the west coast of the Ameriean continent, in Alaska and Chili, the heary rainfall in high latitudes pushes the region of great forests into high latitudes, well toward the polar circles. On the other hand, in aril regions phant-growth is usmally small and the number of forms limited, while at the same time these forms take on special and remarkable shapes, and assume a series of surface structures of defensive order to a degree not found elsewhere. The yncea, the century-plant or maguey, the cactuses of unique form and elothing, are trpical of American arin or semi-arin plants, while plants of other families, but similar in torm and surface, take their place in other atid regions. The plants of arid regions are usually hairy, woolly, thorny, spiny, or covered by fine prickles primarily a protection against enemies, but indirectly elimatic. It has bern suggested that the inmumerable spines and prickles of the cactuses alsn phay some part in protecting from the burning rays of the sun through the diffactive phenomena occurring about slender buties.
The mutual influences of forests and climate hare been much discussed. The internor of the forest is nmenbtedly eooler and its climate mider: the relative humidity is undoubtadly greater therein and the moisture is conserved: the evapmation is decreased both by the forest and by its litter : the sround underneath is kept more moist and surings therein are conserved; the outflow of water is made mole regular and the snow within is more slowly melted, thus freventine dangerous flomis: moreover, the roots hold the soil together, thus preventing it from leing carried thown montain-slopes and overwheming the cult ivable findob below. These are all conclusions which are generally acepped. Formts ato sure an winthreaks for open resims atout or within them; but that they increase the fall of main wer their area. or the intensity or trequency of rainfall, or in any way friele, attract, or repel local storms. are conclusions bot wet miversally rewived by compent julges. I stromg cass cen be mate ont for each one atbut it is hot yet in any on whong enongh to carry the matter into the rerion of eertainty:
(limute in Physiogmphy.-Phywiosraphy is a description of the dathes sutiace, with ant account of the catmes which prolucel the structures fond on it. Imong thes canses are to be fumbe the demento of climate in varying dewres.
 hig and fowing waters in permanent show and ioe, in focstions relating to the palenorytie seat and to glaciere. in the ocean currents and in the weathering of rocks and soils. 'The wind is inmortant in considemation of loess ant of Waves. Humbity determines the oevorremes of arid and semi-arid resions: while ou precipitation depend har multifle problems of moman hy water, the hatance of sam ant fathes. the thuethations of rivers, ant thas oreumence of
 phyrography. They interact in such a way that catch en-
 on throughant the hintory of the ghobe. and to them is
largely due the sculpture of the earth's surface. The operations of heating and freezing, wetting and drying, weathering aml erosion, have not only gone on formerly; they are still going on, thongh the rate of change may be much less than formerly.

## Climate, in relation to medicine

1. Crimete a rause of Diserse.- $A$ sturly of vital statisties shows that many affections are directly caused by the mifavorable inflnences of the various elements of climate upon the human organism. While man is not alone in his susceptibility to these changes, his higher organization has made it possible to dillerentiate more clowely in his calse whaterer alterations ocem. The unfarorable effeet of increased or diminished atmospherie pressure of heat and cold, of moisture and drymess and alterations in the quality of the air, is most conspicuons in atieetions of the lungs anil air-passages. The most serions of these is phthisis. Phthisis or consumption differs widely in its degree of prevalenee throughont the world, among the varions States and Jomitories in the T. S., in combies in the same State, amperen in tho seyeral warls of a city. In Europe it attains its createst preatence in lustria, Mungary, and Germany. The Anstrian mortality from phthisis, $1882-46$ was $1.0^{2} 06$ per cent. of

 million inhabitants, raming from 20 ber cent. in Vermont to 2 per cent, in Xew Xexiers. The climate of the North

 with hampmes of the air and wil. and the changeable met eorological contitions due to the frequent passige of stomraters down the valley of the st. Lawrence combine to pander pulmonary lisesice in this portion of the U.S. excondingly common. The somh Jllantic and Gulf coasts
and the northern pertion of the Papifie slope slate although to a lowe extent, the satme atmoxpherio lumithy and elouldel skits, and yied a deathorate from phthisis far in execse of what is experiencel in the interior Wemern plains and pateans, where dryess of air and soil and :m
 to the development af the tubercle bucillus.
Bromehitis. phemmonia, and pleurisy are distinely cobldweather divanco. The areas of areatest presalemon of puchmonia in the LI. A. are Northwestern Lonisiana and Irkansas, the state of Sevala, and the western prortons of cinoralo ant the bakotas. Although altitude does mot appear to la a factor in the production of pmenmomia, the seasomal relations of the di-ase are well recognized, for it is four times as fremont in March and April as in duly amd Aughst. Long-eontimud coll raises the mortality from pmeummia and bonditis more than lower temperature lasting a shorter time. Tho dense, smoky fog ofruring in linglam] in conjunction with severe cold is invariably followed by incremeal mortality from these alfeetions. Diphtheria and (ropl), patholosieaily identical, jrevail more in rural districts than in cities and are more strongly inlluenced by lowal climatic eanses, such as soil-monsture ilne to impertect drainase, than by general climatie conditions. scallet ferer, purpural fever, ersipelas, and ratdiae rhomatism exhibit a striking uniformity with respect to seasomal relations. It has been demonstraterl that yoars of seanty rainfall in fingland have been coincident with or followed by a rise in the number of leaths from these diseases, while exeress of rain correaphls with the periods of greatest immunty. This is in acembance with onr knowledge of the manar of the ditfusion of alfections of this class. During rainfall the Hoating matter in the air is beaten to the carth, and there retamed until the surfere dries; it is then widely disominaten by the currents of the air.
Darmona and dysentery preail in lot weather. Twose times as many drathsoechr from these diseases during July or August as in February. Cobd and wet summers chech the prevalence of these diseases. Dysentery is not a lisumpa which is camsed by heat atome, but it is believed to the a communicable zemotie disease which thrives bet in hat weather. and the organisms of which seem dependent upon prolongel high temperatures for their activity:

Malarial fever is a distinctly climatie lisease. It prevals in its charatoristic forms at how altitudes and in hot dimates. Wherever the requisite conditions of water, heat, and wathtion are found in connection with the soil womtaining the organisms, malarial disease is posible of development. The entire coast-line of the finf of Dexieonand the tariblem sua presente these favorable conditions, tund mure virulemt tyms of malarial clisumes are heme met with than in any of her portions of America. While a dixasae primarily of low altitude. it is bedieved to be identified in a morlitied form with an atfection met with in the mountain: ons recion of the Western $\mathrm{C}^{+}$. S. termen " momatan fowno" There is from year to year a wide variation in the precralence of malarial divease at any given place.
yellow fever (hasen fewer jungle fever, and allied fevers origemate in the torrid zone, hut may he importmb into temprithe olmates. The occurrence of frust inariably terminates ath epidemie of sidow ferer.

Iticetine of the nerrous sytem are frequently agerarated by comatio agencies. Pain bas a tembency to inerease uph the approth of worms: nemalgic attacks ite thas soed to bear at close and direct relationship to stom-t racks. Fixcosive cold and wind provoke pain. Ditacks of charea are far nore from to ocelur in the spring than at any other matsthe, and the frepurney of attacks in directly refatm th the pacmaze of sorm-ectuto. Infantile patalysio ns maty urigi-

 and in the urnthern swaperto of sulth Amerita.

1hepatie diomaters are common in low conatriow, aboces of the liver frequenty eansing death in buromatas who visit India amp fail to andopt the ximplety of hife. parturaharly with rearat to forl and drink, lematulal on a trapical climatic.

 dilatation of the heart and in ail casme of athermata ove eially in the areal. removal to an elevalime is athombly with
thined. On the nther hambl, serions resilts attemt subjeetion tor incerand at mexplerie presure. 'I lane who work in eatsons atre liable to a form of paralys attembant upen a (on) rap pil tramsition from an artificial idimate of high at mospharic juesure to that of the and-wel.
11. 'limatr fowning Remorery from Miseasp.-For at leat 2,000 years the value of thange of climate has been reenguizal in the treatmont of disease. 'The fommens sent patients with ulerated lungs to Litwa and we are informed that by beathing the halamie eflluvial of the fines with which the comary abomed they were said to have lived many years freel from their moplaints. Change of climate has a powerful effece on troth minul and buly: in drawing inferenees as to eftect of a certant climate in a partionar ease all the assuciater comelitions, such as change of scene. diet, and persomal associates, should be given their re-pective values. On the other hame, the thet climate in the woml may be fatile if suitahle food and shelter and attendance are not ohtainable.
The principad diseases amenable to climatio trat ment are phthisis, bronchitis, laryngitis, asthmat hay ferer, catarrhs. lyspepsia, Bright's diseare, melandolia, hypochondria and insomaia, and varions foms of nervols fatigue, as well as convalestemo from many acute diseases.

It is quite as desirable to seck a climate for the prevention of tuberculosis as for its cure. For consumptives the bust climate is that which combines drymes. whmeth, and the greatest proportion of clear lays. Local conditions. such ass a sampy soil and an atmosphere purified by pasing owr surronnding tracts of evergren forests, may compensate to some extent for the lack of either of these characteristies. It is not absolutely essutial that the locality should prosics: a high altitude, nor, on the other haml. need the dimat. tre an entirely equable one. Great diurnal and anmual ranges of temperature are fond in the larger number of places where experience shows that fhasis is least prevalent and least likely to lead to a fatal termination.
 hemisphare are those of Agiers. Mornero, and Egypt, the plains of Tartary, and the lable-land of lemsa. In the western hemisphere the best regions are those atjacent to the Korky Momatains in the north int to the Andes in the somth. As a rite. the climate exeresson more controlling intlume in prasing in a southern direction. In the [ C . favorable locations may be fonnl in Montana, ldaho, and Tryoming,
 Mexico. The last four of these furnioh ley far the hest an(emmentations for invalids. and enjoy a wide rejutation as health resents. The Adirombark Mommans in Siew York and the mountains of Western Nortl Camolina attract many Ly ration of their alvanages for comsumptives. Although the rainfall and hamidity are greater that on the western

 raco. Thar mecesity of superision aml protection of pationt- from the intiscretions the to changes of weather, rembers it posible to foltain much better results in samatoriums than oulside of them. 'To get the has influences of climate the orensir mot hod of trathant, by wheh patients ate gradnally aceustomed to spome a larer portion of the time ont of deors should he moderel. Ber means of sutable she Jter and chathin this may he carried ont despite indement weather. Sow Cosssurtios.

In Coloraduand sumbern l'alifomia, and in the high ta-ble-ant of Mexicte changes of wather du not orcure with
 life is more reatily enjoyed. The lofty pains of Honturas.

 dismae is salil tu be almost maknown in Rogruti, the mome tanome reaion of the Argentine licpublic: D'erna, and Bulivia.
lusular olimates and sea-woyares do not vield such gratifying ranto : an thow whaned in inlamel (limates.

 thate. The dry Wiano platus are frequintly remberal unfavomble hy reazon of volent dorms of dibe dast, uften of

 climat":
Ahthma, mat dependent on careliate diseaser, is usually re-
lieved hy residence at an altitude of from 5,000 to 8,000 feet. Hay lever is likewise avoiled lo elerated climates in which regetation is searce. Many find relief in the lacky Mountains, portions of the White Momitains, or at the sea-level in those islands lying neur the coast, ret distant sufficiently to be free from the offending vegetable prolucts.

Gout and chronic rheumatism reguire a mild, erguable climate free from dampness. The sand hills of south Carolina and freorgia, the dryer portion of interior Florida, and San Diego in Southern Calilornia, present favorable eonditions.

Disorlers of the digestive organs, partieularly cases of nervous dyspepsia, wre frequently mach benefited by change of climate. Warm, mild tlimates are to be chosen; cold and damp are particularly injurious to dyspeptics. aggravating their liatility to colil hands and feet.

Warm, efuable climates are also the most favorable for relieving acute and chronic Bright's disease. Exposure to wet and coll, and climates where rapid changes occur, lead to the probluction of this class of distases. Wiam seashores, such as those of houthern Califormin, are advantageous.

For cases of insommia, melancholia, and hypor hondria, a change of climate may be of adrantage. Insomnia usually vanishes upon going to the seachore, lut often proves trollblesome for a while in those who remove to a high altitude. Degenerative diseases of the norvous system are usmally unfavorably inthenced by a high altitude. Ilypochondriacs are oftei benefited by travel. Camp life sometimes rields gool resulte, especially in despondency the result of business anciotr.

Guy Ilinsdale.

## Climatography and Climalology: See Clinate.

Climax [from (ìr, $\kappa \lambda \hat{\mu} \mu \xi \xi$, ladder]: a figure ty which several propositions or several objects are presented in such an order that the proposition or oljject adapted to prodnce the least impression slall strike the mind first, and the others rise by successive gradations of impressiveness. A sentence in which the order is reversed is called an anti-climax.

## Climbers (in ornithology): See Scassores.

(Climbing Fern (Lygodium palmatnm): a rare species of fern of the fimily Schizuncere; remarkable for its halit of climbing or twining upon shrubs and weeds. It occurs in the U.S. from Nassachusetts and New York to Kentucky and Florida.

## Climbins-pereh: See Avabantid.e.

Climbine Plants, or Climbers: those plants which support themselves npon roeks, walls, buildings, other plants, etc. They have weak stcms which are unable to bear the weight of their foliage and fruit, and they trail upon the ground unless they find some support. They use various devices. Thus the momins-glory twines its stems tightly around suitable objects; the ivy sends ont its innmmerable routs from its stem, and these insimate themselves into cracks and crevices. The vine twines certain special branches (tendrils) athout the twigs of other plants, the clematis uses its leaf-stalks for the sime purpse. Some plants again use their spiny leaves and smaller branches for lifting themselves, the spines catching upon the swaying branches. Darwin has pointed out that the free ends of many climbing plants, as in the morning-glory, are continnally moving about with a swayg or somewhat circular movement (known as mutation), until they strike an object about which they may coil. Sei Pmyshogy, Vegetable.
C. E. B.

Clinell River: a stream which rises in the sonthwest part of Vircinin; flows southwestward, anl enters Want Tennessee. Pursuing the same wemeral direction hetween two ridges callod Clineh Mowntion ant Powell Nombtain, it nnites with the Tennessee river at Kingston. The whole length is estimated at about 300 miles.

Clingman, Thoma Lasise: U. s. smator: bu, in Hunts-

 ville. N. $1:$ : served in both toramelues of the state La wistature: wat sent to Conyress in $18-13$, and six thnes reselectel: apponinted in 1 sos to fill a vactury in the IT. s. sinate, ami Wat eleted thenelof for the lemm hemiming Mar., wist: withIrew on the sermsion of his state and entered the (onferlerate sevier ascolomel, and for three years helal the rank of brigatier-penemal. He matatued the highest pata in the black Montutains, aul it was called ('lingman's Ponk for
 mate known the existome of erons ind mre minembs, sis platinum, cornulum, and lie ruby, in North C'arolina; pub-
lished a molune of speeches and Follies of the Positice Ihilosophers(Raleigh, 18is). D.at Morganton, N.C., Nov. 3, $189 \%$

Clingman's Dome: in Swain che, N.C.; the highest peak of the Great Smoky Momntains, thetween North Carolina and Tennessce. It risis to 6,660 feet atrove the sea, ind is the second in height in the dipalachians. It was namel after Thomas l. Clingman, who ascended it in 1858.

## Clinkstone: See Proxolite.

Clint, Alfred: landseape and marine painter: 11 . in London, $1 \times 00^{:}$: pupil of his father, (ieorge clint, portraitpainter ( $1: 00-1854$ ) ; jresident of Society of British Artists 1869. D. Mar. 29. 1883. His father's repulation grew out of an engraving of the trial of Queen Caroline, into which he introduced portraits of the Kemble family, and after this he became a famons delineator of actors and actresses. some of his work is in the South Kensington Maseum.

Clinton: town of Huron co., Ontaio, Canada; on Buffalo and Goterich Branch of Gr. Tr. Railway : 13 miles from Gorlerich (for location, see map of Ontarin, ref. 4-B). It has a collegiate institute, a model school, and churches of six denominations. There are here 2 extensive organ-factories, threshing-machine factors, tannery, 3 planing-factories, flaxfactory, faming-mill factory, large tlour-mill, grain-elevator, 2 carriage-factories. 2 salt wells the headquarters for the Canada Salt Association, and a large number of other industries. The town is lighted by electricity. Pop. (1881) 2,606; (1891) 2,6:35. Editor of "Huron News-Record."

Clinton: city; capital of De Witt co., 111. (for location of county, see map of Illinois, ref. 6-E) ; on Ill. Cent. R. R.; 23 miles S . of Bloomington. There are here 6 churches, p publie sehools, railroad machine-shops, electric lights, and waterworks, Agriculture is the chief industry. Pop. (1880) 2,509; (1890) 2,598; (1898) estimated, 3,000.

## Editor of "Public."

Clinlon: city: capital of Clinton co.. It. (for location of countr, see map of lowa, ret. 5-k) ; on (cli. and N. W., the Ch., B. and Q.. the Cho, B. ant N. B., the Ced. Rap, and N. and the Cll.. M. and St. P. K. Rs., and on the Mississippi river; 42 miles illove Davenport, and 138 miles by railroad W. of Chicago. The river is here crussed hy an inw bridge which is ahont 4,000 feet long, and cost $\$ 600,000$. The cars of the C'l. and N. W.. the Cli., B. and Q., and Clı. B., and N. R. Rs. lass over this bridge. Clinton contains the repairshops of the railroad company, foumlries, sash and hlind factories, a paper-mill, eight sawmills, etc. Pop. (1880) 4,052; (1890) 13,619; (1895) 17,375. Editor of "Dally llerald."

Clinton: eity : capital of Hickman co., Kr. (for location of countr. see map of Kentueky, ref. 5-13); on In. Cent. R. R.: about 200 miles $W$. S. W. of honisville. The eity has churches of four denominations, two colleges (laptist and llethodist), creamery, and a roller flouring-mill. It is locater in the midst of a rich agricultural region. Pop. (1880) 506; (1890) 1,34i. l'tblisher of "Democrat."

Clinfon: eapital of East Feliciana parish, La. (for lopation of parish, see map of Lonisiana, ref. 9-E); 32 miles N. of laton Rouge. A railway 25 miles long comects it with Port Hudson on the Nississippi. The parish ships yearly 30,100 hales of cotton. Pop. (1880) 1, 1s9: (1890) 9\%4.

Clinton: town: Worcester co., Mass. (for location, see map of alassachnsetts, ref. $3-F)$ : on the Boston and Maine and the Old Col. Div. of N. Y., N. II. and Mart. Liy., and on Nashua river; 45 miles W. ly N. from Boston and 16 miles N. E. of Worcester. It has manfact ures of ginghams, Brassels and Wilton carpets, wire-eloth, mathinery, worsted goorls, elc. The Lancaster mills of this place employ about 1,500 hatuls, operating on 1,050 loems, and protheing amnally nearly $\overline{7}, 000,000$ yarts of ginghams and plaids. The city has a free lihrary of 17,000 volumes, and is lighted witl electricity. Popo, including tomship (1880) 8.029: ( $1 \times 10$ ) 10,424; ( E (5) 11,497.

Ehitor of "Courant."

 aroll, and in the other a cithara. She is lirst memtomed hy Ho゙iolnc, and whs smactimes portrayed sitting, often with ann inen chest of hooks heside her.

Clion or Clione: a genus of molluses belonging to the group of Praropoba (a. $z^{2}$ ), emblaciag abomt a dozen species,
living chieft in the Aretic and Antaretie seas. Ther are withul sholl, hare a distinct head with two pairs of ten-

Clio borealis
tacles, and the bodr pointed behind. ftio borealis is from 1 inch to $1 \frac{1}{2}$ inches in length, ("lio anstralis nearly 3 inches long. These forms wecur in immense swams and in the coller seas, and together with ne or two other species form the "brit" of the whalers, the chief food of the whalebone whales, as well as of many other animals. Clio borealis rarely appears on the New England coast.
J. S. К.
('lis'thenes, or Clois'hemes (in frir. Kגaratems): an Athenian stateman : the grand-uncle of Periches: lived about 500 b. c., and took it prominent part in the expulsion of the Pisistratidie. He increased the number of the tribes of Attica from fonr to ten, and made important changes in the constitution, which lue rembered more democratic. Jle became very fopular, and was the formost Athenian statesman of his time. He institutel ostracism, and was himself the first sufferer from it.

Clith'eroe: a market-town of Lancashire, England : on the river libble: 28 miles N. of Manchester, with which it is connectel by railway (wee map of England. ref. 6-Gi). The homses are of stone: It ins itnated at the base of Pendle Hill, which is 1.s:3I fect hirh. and near Pendle Forest, which is reputed to le the scene of the exploits of the Lancashire witclies. It has the ruins of a castle built in the tweltth century. Here are manufactures of cotton fabrics, and a grummar school fonded in 1504 . It returns one member fo Parliament. Stonthurst College is 4 miles to the southwent. Pop. (1891) 10 $\$ 15$.
Cli'lus or Cleitus (in Gr. Kגeitos): a Macedonian offecer, and foster-brother of Alexander the Great, whom he accomlaniml in his expelition against Persia, and saved his life at the battle of the Gramicus in 334 B. c. He enjoyed the favor of Alexander, who apmeinted him satrap of Bactria in $3 \geqslant \begin{gathered}\text { в. ©. In the same vear a dispute occurred at a feast be- }\end{gathered}$ tween them, and Alexander, excited with wine, killeel Clitus with a spear.

Clicz. Ilexry Borstox: general: a son of Capt, Iolin
 groduated at W"est l'oint in 1545: served with honor in the Hexiran war as an infanter officer: wounded at Vorktown, Yit. and (ranes's Mill in 186? and taken prisonere in the Jatter engarement: sorver as commanlant of conlets ant instructor in tacties at Weat l'oint (186?-64): became lientebantentond sixth lafantry. and in 1etig eolonel Tenth Infantry. In wain he was brevetel hrigaliergenemal C .s. army. hetired fuly 1.18s. Aceorling to the Army Reminter for Jam. 1, 1sut, he was last sem at Xiagara Falls, N. N.. (net. 3u, 18世木

ciples on which clocks were made in Great Britain, France, and Germanyilid not change, exeept in a single particularthat of a substitution of steel springs for weights-from the leginning of the eighteenth century to the present time. Even now, very considerable mumbers of these brass-wheel clocks, mith weights, and standing in cases if feet high, are still made, and some of them are till exported to the U. S. The manufacture of this description of clocks was introduced into the U. S. before the Revolutionary war, hat comparatively few are made, though these were of good workmanship.
The tall. old-fishioned cloek, with its long pendulum and heary weights, seems very different from the little " nutmeg lever," but both depend hipon the same prineiple.
Eli Terre, of Windsur, Conn., Was probably the first cloekmaker in the U , A . His clocks were made entirely of wool. They were sood timekeeners, and wrere sold in large quantities by pethlers. In $180 \%$ he undertook to make 500 clocks at one time, but overstocked the market and reduced the price from se5 to $\$ 15$, ind at last to $\$ 10$. It was not till 1837 that lnass-wheel clocks were marle in the IT. S. From 1506 to 1815 the number of clockinakers largely inereased (Messrs, Seth Thomas, Silas Itoadley, Herman Clark, Asa Hopkins, and others engaging in the business), and mans thousands were made. In 1814 Mr., Terry invented what was known as the "short-shelf clock," in which, by a ehange of arrangement and smaller weights, the pendulum being brought forward and greatly shortened, and the weights being carricd and rum on cach side, the whole was reduced to a more compact form, and clock and case were sold together for a molerate price. This monlification was adopted by other manofacturers, and soon became general. These choeks were made with woolen wheels, but after the introduction of rolled brass into the market, machinery was invented by which the bhank wheels of the clock conld be

dred years, but only with the most eostly parlor clocks, and the springs used were equal in quality to the best watch prings, Uf course this wonk not answer for cheap clocks for the million, aul varions experiments were tried with cheap springs. Coiled brass surings were used, hut these som lost what little temper they hat, and so did their purchasers. An elliptic steel spring connerted with a fusee was tried, hut with no better success. Finally, a new and completely successful process of making at suprior steel spring was invented in the [T. S. ; and the springs the produced have for many rears been sold at a price compatible with their use in cheap clocks. This, together with the cheapening by machine-labor of the production of all parts of the clocks, has hed to their very general introtuction, anul to the relluction of the size of clocks, till now twenty-fnur of the smallest sizerl pendulum elocks can be packed in a hox of a cubic foot in dimensions. One result of this reduction in the size and price of elocks was an enomous increase in the demand for them, both in domestic and foreign countries. Clocks to run thirty hours were made which soll in quantifies at 89 the dozen, and a fair cight-day clock at $\$ 48$ the dozen. Since then many improvements have been introduced, and clocks of all kints made in the U. S. are now exported very largely to all the conntries of Eurone, to China and Japan, India, Wैestern Asia, Egypt, Sonth Africa, Mexico. and South America.

Turret-clacks, which were formerly imported, are now made of exeellent quality. Fig. 3 represents the movement of a Hotchkiss tower-clock erected in Steubenville, $O$. and a similar one is on the City Hall, New York. These clocks are remarkable for their accuracy and the perfection of their meehanism, and have proved admirable timekeepers. They have the pin-wheel escapement (very clearly delineated on the second and third cross-bars), the pins having an ingenions contrivance of a shoulder to keep the oil mon them: and also a very remarkable arrangement (at the right of the figme) for regulating automatically the gas-jets which illumine the face of the eluck. so that they may bun any requirel number of hoirs. Kegulators, formerly imported in all cases, are now male of the best quality by several firms in the ${ }^{\dagger}$. S. The wooden pen-dulum-rod, eovered with gold leaf, which is one of the characteristies of these regulator clocks, is, it is believed, the invention of Silas B. Terry, a son of Eli, already mentioned. The French parlor or mantel clock, a custly and beautiful ornament to the homes of the wealthy, had so long been imported that it was considered hopeless to attempt to compete with it : but since 1866 these artirles have been manufiectured in the $\bar{T}$. S., and in the perfection of their workmanship, their accuracy as timekeepers, and the elegance and variety of thicir patt terns, as well as in their morlerate price. compete so favorably with the foreign parlor clock that they hare well-nigh driven it from
struck out of the rolleel brase with a die, ant the teeth afterward cut hy mathinery, suth the bras-whed stocks coubl be made chataper than wouthen ones.
The next improvemout was the sulatitution of coilest steel sprines for the weights, thus assimilating the elock to the watel. This has been done in Europe for two lum-
the market. Of other special kints there may be named the ratendar clock, tint sucuessfully made for the general markel in the C.S., which gives the day of the week and month, and sometimes the changes of the monn; the marine chack, a watch on "t lage scale, which. properly mate, is an excellent timekecper: the railway clock, which is of similar

(hondomst : an extremely hary rain oxemring ower a small terytory. Such rains ineme only wish local. not wenaral storms: are most ermmon in the hotlest season and at the hottiot time of day : and ocene most frequently in the arid rowhens on mountain-sides. The ruin sumtimes falls at the rate of 4 ort (and possilly mome inches per honr, lut it comimes noly a few monents. Heantime the phomemena of atmospherie electricity are usually pery marked. The thond of water that descends thow onfl rapidy? coming down the streans with a hemb of wate whith is often very deatructive. A distinetion in u-ually drawn
betreen eloudbursts and torrential rains. The latter beloner to general storms, the former to local ones, the remarkable clond formations and subten clearing afterward making the name very appropriate for the former and not at all for the latter.

Mark W. Ilarrington:
Clonds: collections of extremely minnte particles of water suspended in the atmosphere. These partioles are often iee crystals, in consefuence of the elevation at which they float. Aitken's researches have shown that the nuclei of clouls and logs probably consist of minute dust particles. While fog is frincipally formed by the cooling of the lower layers of the atmoshere, elomls owe their existence more especially to the rising currents which, when cooled to the dew-point. condense into chand. The lower linit of the cloud region is therefore determined by the height at which the rising currents reach their dew-point, and the altitude of the eloud formation depends upon the humidity of the ascending currents; the drier it is, so much the ligher mnst it rise to have its vapor condensed. The cloud masses, being heavier than the air, tend to sink, lut the sinking takes place very slowly partly becanse the water particles and the ice neeiles which compose the clonds are very small, and partly because the rising cuments to which they owe their origin connteract the sinking process. Sometimies the rise and fall of the cloud is only apparent. being due to the comdensation or raporization of it: jarticles. Frequently the rising current mingles with it horizontal current. which carries with it the upper portion of the clond and covers the sky with a uniform stratum. The summits of mountains are often enveloped in clonds becanse they faror the ascent of air up their sirles, and canse the condensation of the contained rapor. The rind drives these clouls over the summit, but when the air currents descend on the other side the vajor particles are again lissolved. A classification of clouds, according to strict scientific principles, has not yet been made. Existing classifications depend rather upon the form of the clonds than upon their origin. The classification most genfrally used is that originated biy lloward in 1803 . Another system, due to Abercromby and Hildebrandson, was recommented for general use lis the laternational Meteorological Congress at Munich in 1891. In all srstems the chief forms are the cirrus eumulus, and stratus, which, in the nomenclature last mentioned, have been subdividerl into subordinate types, which may be lefimed as follows. The average heights and rilocities of the different classes of clonds tor the year, cutainel from measurements by Clayton at the Blne Hill Ohservatory, are also given.
Cirrus are thin. fibrons, detached, feather-like clonds furmed of ice crystals. Ther are the highest clouls averiging orer 29.000 foct, and move with the greatest velocity, their mean heing win miles jer hon:
('irro-stratus form a thin white veil. more or less fibrons. which produces halos and other optical phenomena. This cloud has an arcrage height of 97.000 feet, and an average velocity of $\% 0$ miles per hom.
('irro-cumulus are flocks of small, hetacleel, nceey clonds, at an arerage height of 23,000 feet, and have an average velocity of 82 miles per hour.

Ifto-stratus is a sray-blue reil, through which the sum and monn are faintly visible. Its mean height is about $1 \bar{v}_{4}-$ 400 fert, and its mean velocity to miles per hons.

- He-cumulus consists of large, more or less romoded halls, flat rolls or lisks of tleecy clonle in flocks, white in color: excopt at dark shading here ant there. They average 10,000 feet in height, and move with an average speed of 34 miles: per hour.

Siruto-rmmulus are large lalls or rolls of dark clonds; avarage height. 6.200 ferl arerage relocity, 22 miles.
('umulus are piled up cloud- with conical or hemispherical tupsand that bases. They are formed of rising enrents of heated air, and are therefure most common in summer and in tropionl regions. 'Their average height is 4,800 feet, and ayrater wheity 26 milas per herur.
commlo-nimbus, is a massive chond from which showers fall. Its mean heirght is t,500 fod, and its average movement is :3 miles pre hour.

Simbus is a dark here of ragged (loud from which rain
 storutus is erither cluvated logy thating in the nir or a thin unifom laver of (lond at a wert low level (1, su0 feet), which moven only 16 mile per home. These haghtsagree with those frumd in Eurere. Dut the selocities of the highest elouds mensured at blue llill are nearly donble thase found in Europe.

Cloud-forms have been shown to le identical in all parts of the world, but their scasonal and diurnal distribution as regards both kiud and anount varies. As weather prognostics. clouds have long been studied. but it is only reeently that this has been systematically done by means of symoptie charts covering a large extent of coumbry.
A. Lawrence Rotch.

Clonet. Kloo'ay', Cloêt. Frasços: portrait-painter: descended from a family of Flemish artists: his fatler. IEdx ( $1450-1545$ ), a court painter, was the first of the family horn in France, and figures in the royal accounts as Jehannot or Jehannet Clouet, a name soon abbreviated to Janet. under which form Francois was popularly known. The sun was born in Tours about 1510: became a court nainter and a ralet de chumbre to the ling on the death of lis father: He was an enulator rather than an imitator of llolbein, and has left many prortraits of distinguished people of the highest interest from their remarkable fidelity and technical excellence. Among these are Ileuri II., Charles MX., and Elizabeth of Auslria. in the Lonrre: the child Francis II. at Hamptoi Court, and a notable Darephin Francis II. and Marie Stuart. D. about 1580.
II. J. Stillyax.

Cloneh, klŭf. Axwe Jemma: ellucator: h. in Liverpol about 189?: sister of the pet Arthur llugh Clough: lived in Charleston. S. C.. from the age of three until sixteen; returning to England, became interested in national sclools: began private lar-school in 1842: hecame strongly interested in the idea of combined elucation: wrote on the subject in Macmillan's Magazine 1s6it: throngh her efforts in liverpool and Manchester founded the North of England Council for Promoting the Iligher Edueation of Women, from which came the itea of the Cambridge higher local examinations, first instituted for women only and afterward afened to men. Lectures for women were established at Combridge 1864: Oct. 18i1, Miss Clomgh took charge of a honse of five women students at Cambrige: this mumber rapidly increased and Tewuham Hall was built (1875), a second building, larger than the first, 1850, and a thim hamesome hall in 1888, and over the administration of these Miss Clongh previted. Her powers of organization, tact. and sympathy contributed to her suecess as a leader in the movement for the higher education of women in England. D. Feb. 27. 1649. See Newaham Colleae.
Clough, Arthur Hegम: poct ; b. in Liverpool, England, Jan. 1. 1819: lived five rears in Charlotom. … C.; educuted at Rugby anl at Balliol Colleme, Oxforl, where he twok his Lachelor's degree in 1841. From Balliol he was elected to a fellowship at Oriel, and he remained at Oxford until 1818, in which year appeared his first published poem. The Bothie of Tolu-na-Vuolich: a Lony-Vacution Pastoral. The poem is written in English hexameters, abl recounts the alventures of a party of (oxford reading men in the scoteh highlands. Clough was deeply stirred by the Jligh Clurch revival in Oriel, of which Nemman was a leading spirit; was driven by the honesty of his mind to examine the basis of religions belicf. and altur a painful struggle folt comfelled to withatraw Irom (xford in 184s. He spent a year or two in travel on the continent, going as far as the Italian lakes. On his return he published in 1819 a series of pooms. of which the carliest date back to 1840 , under the title of Ambarvalia.
He now prassed from one employment to another: was warten of $1^{+}$niversity 1 Iall, London : visited America, and rcsided at Cambrilge, Mass.. for a few montlos in 18, 22, returning to England toaccept an appointment in the catation department of the Priry Council office. Clough was a math of strong religious feeling, but unfixed heliefs. In his I'uems mi Life and Duly and the subtle dialogne pem of Dipsychus he gives expression to this hesitation between doubt and faith. His other lomger pooms are A mours de Voyage and Mari Magno a serics of metrical tales. I) in Flenence, Nor, 13. 1861 . Matthew Irnolds fine elegy Thyrais celebrates his "contention-toi" friend. sce Clough's Porms (1sfie), with a memoir adted hy F". 'I. Palgrave and his Tooms and Remains (2 wols., 1stit), clital by his wife.

Clover, or Trefoil [clover is from O. E. clabre. clafre: Low Germ. härer: Fries. hafer: these represent a deriv or comp, of the worl appearing in High Germ. : cf. Mod. Gem, Kler Not conmeterl with Eng. cleare]: a mame pronely applied to plants of the genus Trifolium, family Leymminose, eomprising about sixty indigenous sjecees in
the ['. S. and many in the old World. The woml is also und for other related phants which have three leatlets. as Melilotes. the swe chaver: Hedicteres the lum elower: Jespedeza strictu, the Japan clover" Prtalustrmont. the prairie clover, ate. The true clowers are invaluable agents in agriculare, not only heratue they make goml has and athond acedent pasturage, but chienty bectuse of thatis power of apmoniating atmospherie nitrum ly means of their ronts. Thavers hise lohg bedi renguizel as productive of great ralue to limd, but the full meanine of this thenefit has not been understare matil within the last one or two decades. They are invaluable in the rotation, because, in addition to their power of mitrugen-gathering. they develop at deep and strong ront-system, therehy hing ing uf fertilizing materials from the droper pats of the soblad leaving then in avaidabe form netr the surface. and also filling the earth with vegetable liber which aids greaty in nerating and waming the soils, ane therefore indirutly incerasing its fortility. ('lovers urdinarily refuire little fertilying to bring theni to portatule eonditionse partientarly little of nitrogen. In hard limes they are a most eflicient means of leombing and pulverizing the suil when plowed under, and they add greater to the power of light and leachy suils to hod fertifity and moisture.

There are live chicf spectes of elover in cultivation. The most impurtant one is the comman or red elover i Trifolium protense). Wthers are the mammoth clover ('T. me-
 tum) : the alsike clover (T? hydridum); and the (oumen white or creeping (dover or shamrock (T, repens), "phese are all matives of the odd Worla, although the last is sup promed to be alse mative to the UT, S. They are all perennials, except the erimsm clower, which is an ammal : Dnt they usually legin to fail in vigor after they have oreepried the land two or thee vears. The alsike presists the longet of those mentionel, and is best atapted to moist grounts. The white clover is genorally sown only unom lawns, although it forms a very expellent "loetton" for mowing and pasture lanls. The crimsin clover has come into great pominence in the U . S. within revent rears an a cover on catch crop for orehards, being sown when the regular cultation of the orchard land is stopped, late in summer, and being plowed underenty in the sprims. It thus oretpies the land at a time when the teens are mot making grent demands "10nen the soil, and it helds the rame and snows of winter and prevents the soil from puddling. When turned mader, it uthords mu-h available plant ford. Ret ehover is clistinguished from the mammoth clower by a whitish sput ons the leaves, and by haing the hem edosely submed by involucral leaves. In the 1. S. the red duver is more weel than the mammoth. The average foeding vatue of the wred forlder is as follows: water, fos per cent : and 2-1: motom, 11
 ing value of the grepo fother is as follows: monstare, (4) per cent.: nit rigen, of: ! phosphric acid, ols; potasiun oxide, 046 . The fertilizing analyses of the dry hay show moistme, $11: 3$, per emt. : ash, 643 ; nitrogen, 2.0 : phos-
 is very like the common red clover, but attains to a larger sizn and ripus a weok or two hater.

Con aceont of its heavy grow th it is mome difficult to cure Well than the common rloter when male into hay, but it manmial value is therely the greater when it is phowed minder. In some tests it has given a greater yich of mured hay than the other, but in other tests the yifde of the dry promet have lown promically alike sea the loporte and Bulletins of the ditferent agricultural cxperiment satimes, and Cheer C'ullure, by llenry Wallace, I. II, Banmes.

Clobes [riâ Fr. from Lat, clomes, nail: so called from its

Where there was unly a single clown bi fortormed thath functions, and in this thap he heromes the jester of
the molern eireus. Court-fools were known to the Baghtad ealiphs, and Bahalul, the jester of Harnn al-haschiol. is a character in Arabian literature. See Doran, History of Court Fools (1858).

Club-foot, technieally known as Talipes: a deformity, mostly congenital, whichin usually allects both feet. In the most common form the inner margin of the foot is elevated, the external one depressed, tonching the ground: the middle and anterior portions are retarded in their growth. and the joints become immovalle. This condition beenmes more prominent when the child hegins to walk, sometimes to such an extent that the upper part of the foot takes the place of the sole. Simmltanconsly the muscles of the leg become emaciated, and lose their characteristic texture, The canse has been sought for in diseases of the brain or spinal cord, contracted before birth; some are supposed to be due to a continued pressure in the womb; and a rational explanation for many cases is offered by considering the early condition of the foetns. The lower extremities are formed at about the first month of pregnaney on the anterior aspect of the abdomen of the foetus, under the skin. with the knee-pits facing the body: consequently to assume its normal position a rotation of the extremity around its axis, ineluding the foot, is necessary. When this process, as far as the foot is concerned, remains incomplete, elubfoot is the result. Some cases are the result of an almormal obliquity of the small bones of the tarsus or posterior portion of the fort, and a primars shortness of the gastroenemius muscle of the leg. Chib-foot actuired after birth is due to misentar paralysis bone disense. or traumatism. In paralysis one group of muscles promits the unrestricted action of the oprosing group, which eventually results in a leformity of the foot. In mild cases manual stretching of the foot, proper bandlaging, and the application of a phister dressing will sullice. More marked cases require the eutting of one or more tentons and subsequent use of appropriate apparatus. In the acquired forms, especially eases due to traumatim, where the use of apparatus often is attended with pain, complicated operations are frequently necessary. A. Jarobi and F. E. Sonders.

Clut-mosses, or Gromb-pines: small plants with a moss-like aspect belonging to the families Lycopodiaceae (elub-mosses and ground-pines) and the Stlaginellacere (little club-mosses). These families, with the modern family Isoetacere, and several which are extinct (Lepidodendrere and Sigillarif(o), constitute a well-marked class of the "fernworts" (Pteridophyta) under the name of Lycopodiner, commonly called the Lrcopons (q. c). See LrcopoDlum.

Charles E. Bessey.
Cluls: societies of persons united for social, scientific, artistic, literary, or politieal ends, or for purpose's of recreation, The etymology of club in this sense is obsenre. It may be derivel from the Sison cleofion, to cleave, in allusion to the division of the reckoning of the guests of an ale-house; but in its present signification it is perhaps closely allien to clenue. to adhere. It is also said to be derived from the Swedish klubb, us meaning a clump, or tightly packed body of men: Carlyle, in his Mistory of Frederick the Great, assumes that the vow of the chivalric orders ("Geliibde"). in vogue A. n. 1190 , passes to us in the singularly dwindled condition of the modern word club. The Friday Street, or more correctly Bread Street, Chub, in London, was long regarded as the first in Enghand, but in the reign of Inenry IV, there was a club, called "La Court de hone Compagnie", of which the pret ocelave and probably (hancer were members. Ahont the fuginning of the seventernth contury or the end of the sixfrenth the famons (hub) at the Mermaid Tavern in Bread Strect was estalilishet. It had Shakspeare, Feammont, Fletcher, Raleigh, Donne, Selden, ete, as mumbers. Abont the same time Ben Jonson founded a club which met at the Devil Tavern, let ween Temple Bar and Middle Temple fate. In 1659) the first political club, the Rota, was established, meeting at the Turk* llead in New Palacy Yard. In 1669, three years after the great fire, the Civil Club, which exists to this day, was establishod in the city, all the members of which are citizens. fume of these early polition clutsis phyed important parts in the history of the times. surh was the Octoler ('lnh), mumed after the cherer for which it was faned, October ald, the members of which were artent Torics. Swift was al lading spirit of the October, and frequent ly almoled to it in the Journat to Steple. The saturduy, Brothers, and suriblerus (labs, each having Swift as a member, and the Calves-heat Clob, formel in ridieule of the
memory of Charles I.. the King s-head Chub, founded by the unscrupulons shaftesbury, and the Mug-house Club, so called from the ale-mugs used by the members, were among the more noted political clnbs of the early part of the eighteenth century. Another unicque cluls, the Fit-Kat, tamons in literature, dates from the year 1600 . Its eurions mame is said to be derived from a hoted mutton-pie man, Christopher Katt, whose Christian name was shortened to kit. Anong the members were the Dukes of Marthorongh and Devonshire Lort Halifax, Sir Robert Walpole, Congreve, Granville, and Litlison. The club hat each of its toanting-glasses inseribed with a ruse to some reigning beanty. Contempe raneous in origin with the Kit-Kat were the Tattlers Club in Shire Lanc. and the famons Becfstcak hociety, bearing as its badge a gridiron with the motto "Becf and liberty," Among the "steaks," as the members were called, were Ciarrick and Hogarth.
Feaders of Boswell are familiar with the Iyy Lane Chub establishet by Dr. Johnson at the King's Ilead. a beefsteakhouse in lvy Lane, and the Literary ('luh, founded by Johnson and Sir Joshna Remolds in 1\%6t, which had among its members Boswell, Goldsmith, Burke, and others famous in literature.
The proly social club of the present day owes its origin to the famous coffee-honses of the eighteenth centurs, where congenial spirits nsed to meet for social intcreourse and comradeship. In time the proprictor of the coffechumse was persuarled to exchute all lint a chosen few from his doors, and none were to he alloitted except those halloted for by the members. These cotlee-honse cluls were in most cases known by the names of the original proprietors, and many of them have remained in existence to the present day. Among these proprietary chibs may be mentioned Ahmaek's (1764), Brooks's (1778), Whites, originally established as White's Chocolate-house in 1698, and atterward removed in 1350 to its present site in St. James's Street, and Boodle's, the resort of country squires and hunting-men.

Of these White's and Brooks's were in the early days famous ganning-establishments, frequented by the young men of fashion, where such erratic geniuses as Fox and Sheridan gambled away their fortunes, and thousunds of pounds changed hands in a single night. White's has retained its aristocratic exclusiveness to the present day, and is still among the most prominent of Lomden clubs. About the close of the Napoleonic wars the motern-club era began with the organization of the Travellers' ('lul) in 1814 by the Marquis of Londonderry, which is to-day one of the most exclusive of English clubs.
The period from 1815 to 1855 saw the cataldishment of the palatial modern chabs lining Pall Hall and Piecatilly, which form so important a part of English social life. Among these may be mentioned the Athenam (1804), the resort of anthors, artists, and patrons of the secences and arts; the Garrick (1831), the home of patrons and professors of the drama; the Oxforl and Camlindge (1835), for members of the two universities; the Carlton (1831), Conservatives (1845), and lieform ( $18: 50$ ), composed of prominent members of the two great political parties; the United Service (1815), the Army and Nary (1851), the (inarts' Club (1850), and the Junior United Scrvice, in all of which the membership is confined to naval and military officers in her Majestr's serviee; the Martborough, fostered by II, R. II. the Prince of Wales; and the Bachelors' and Wellington. Where gentlewomen are admitted with certain restrictions. There are in addition to the famous political, literary, and social clubs. institutions devoted prineipally to athletic sports, such as the Marylebone Cricket Chb; Thames and Leander rowing Clubs; and the Inurlingham and Ranelagh country ehus, where polo and pigeon-shonting are the attractions. The worl clul, however, is not confined to the select social organizations owning their own buildings which line the prominent strects of great cities, hat the organization of sociefies of men or women banded together for some. specific interest or pursuit, and bearing the name "chul," has become so general that clubs of some form are now fomul in "wery city in the civilized world, From England the designation "prititieal clubs" was adopted ly similar organizations on the Continent during the eighteenth eentury, where they played an important rôle in eontemporancons political history. In 1703 they were prohihited in Gemany. In Frane they became the hotbed of the Revolution. The first French soclety that took the name club was the Club Politique, established at Paris in $178^{\circ}$, and shortly atter, in 1785, a second wats organized muder the mame of the Club de Boston, or
"des Americains" : amd sonn the apmellation was mopted by

 the ele of the higher thonglat, and the demoerat iespirit that ha- hem fustereel. In gemeral terms it may truthtuly he sald to have changed the tome of whele commentities. In paticolar. it has tanght women haw to think how to suak. fow to are for the bed good of the communty in which thay live. It has mule them anequationel with the lest work, the heot ideas, and the great thinkerso of luir own and all times. It ha- tamght them valum and firopurtion and the historice
 tion of the fhilosonly of life and duty and dostroying
 divedions, purtionlaly in the father West, where organizations for the bentefit of women and children and mefredborhow improvenent hardly exited mat the woman: club

lambun has semal chabe for whme hut they are not as brad in their aims as these of the [". S. 'The 大ow somer-

 more mertins are hafl monthly at which papre om pon-

 or have had, an thatents or leenurers connection with

 and follew- - Imericau ideas.

One of the strumgest foars expressed in regard to women's clubs in the begmming was the fear that they wonld tend still more tos the seldaration of sexes. This result has not followed. On the contrary, club-life is bringing mow and women tugether, and the latest outcome of the woman's club is the mixed cluh of men and women, with higher standarals than men's clahs have before known. But this would not have buen posible had not women gained knowledge ant experience in tlubs of their own. J. C. Croly.

C'luntacs. The, or C'ongresalion of Clugny (Chuniacum in Burgundy, a very influmtial monasticinstitution): founded in 910 by Duke William of Aquitaine. who put his relative, Abbot Bermo of Beanme, at the head of the new institution. As the aim of the duke was to effect a reform of monastic life. which had sunk very low in France, Berno enforced the strictest observance ot the rules of St. Benedict: but just this severity struck a rich rein of sympathy in the time. C'lugny became the roformer not only of the Benedictine order, but of monastie life in general, and its rules, Consuctudines Chumidsenses, were generally alopted. Three popes issumd from its cells, Gregory Vli., Urban II., and Paschalis T1. Privileges and endowments were showered upon it, and it soon became one of the richest and most magnifieent institutions of the Middle Ages. It received at one time Pope Innocent IV. and the King of France with their whole retinues in 12t5. Hut laek of diseipline and the dissipations of the abbots sreatly imporerished the institufion luring the next two centuries. Under the Revolution the Constituent $A$ ssembly closed the convent, confiscated the property, and sold the buillings. The church was broken down. Some of its priceless literary treasures were saved, and ire in the Paris Bibliotheque Nationale and the British Insenm. The palace of the abbots in Paris became in 1833 a museum of antiquities.

Authoritien.- Lorain, L'Abbaye de Clıgny (Dijon, 1830); the works of Pignot, ('uchérat, and Champly: Dnckett's Rerord Eitidence of Clumi(1886); and Churters and Records of Clumi (1888).

Cluny, formery (lugni (ane, Clumiacum): a town of France: rlopartment of saone-et-Loire: on the Grône, liere crossed by two stone bridges: 14 miles N . W. of Mâcon (sce map of France, ref. $6-G$ ). Flere ate the remains of a rich and famons benedictine abber, fonmiled in $910 \mathrm{~A} . \mathrm{D}$. It has also the Churel of Notre Dime of thirteenth century. Clung has mamufactures of gloves, lace, linen, paper, and pottery. Pop. (1896) 4,273.

Clupea: See Aspis.
CInpeidie [from Lat. clupea, a herring, the trpieal genus]: a family of fishes containing the herrings, shad, sprats, and closely allien species. Its members are characterized br having a compressed body. covered with easily detachable and nsmally rather large seales, sometimes forming a serrated ridge alung the abdomen. The head is naked, month large and terminal. Jlaxillaries of three pieces: teeth, when present, small am? numerons. Gill-openings large, gill rakurs long and slender. There is no arlipose dorsal fin: the anal is rather long; tail forked. 'The group eontains about $1: 10$ species. fount in all seas, although mostly near the const ; many species ascend fresh waters and some remain there. This gronp probably comprises more individuals than any other, as some species, like the emmmon herring, nsamble in imnense schools and are taken in nets by tens of thomsamb.

C'lnsia [so ralled in honor of the butanist Lécelnse or Clusius]: a genus of dicot yledonons trees and shmbs, many of
which are epiphytic, belonging to the family futtiferce. About sixty :peries are known, all natives of tropical or sub-tropical America. They have opposite, coriaceons, entire leaves, and terminal, solitary or panieled, diuecious or polygamous, showy flowers. The sepals are from four to sis, the petals from four to nime, the stamens numerous and indefinite, while the pistil is compound, with five to fifteen cells, with many ovales in each cell. On account of the yellow resinous juice which they contain some of them bear the name of balsam-trees, and in some cases this when dried into a resin is used for plasters, and for other medieinal purposes. One species, ficuro is found in Southern Florida. It occurs also in the West Indies, and is known as the yellow balsam-tree on account of its medicinal yellow resin. C. rosea from the West lndies is grown in conserratories for its beautiful rose-eolored flower. C. E. B.

CJustered Colnmns. or Componnd Piers: piers which are composed or appear to be composed of several columns clustered together. They form one of the richest features of Gothic ecclesiastieal architectnre, in which they serve to support the pier-arehes under the clerestory, and the vaulting of the side-aisles. The eolumns may have senarate shafts grouped around a central core, or may be attached to each other and to the core throughont their whole length. In English Gothie they are frequently adorned with encircling bands or fillets at regular interrals.
A. J. F. HAMLIN.

Clyde: the principal river on the west coast of Scotland; celcbrated for the beanty of its scenery. It rises in the Lowther and Moffat Hills, and drains an area of abont 1,500 sq. miles in the counties of Lanark, Renfrew, and Dumbarton. It flows at first $N$. as far as Biggar: it then takes a $\mathcal{N}$. W. course, receiving the Douglas on the left at Harperfield. At Lanark, both above and below the town, are the Falls of c'lyde, where the river clesconds about 330 feet in 4 miles. The highest fall is Corra limn. in which there are three leaps aggregating 84 feet. The river then passes 1 lamilton, Glasgow, and Renfrew, and reaches the firth of Clyde at Inmbarton. Glasgow may be reached by the largest ocean stemmers, and at Dumbarton the river is 1 mile wide. Total length, $\%$ miles. The valley of the Clyde is one of the most prosperous parts of Scotland.

Clyde: city: Cloud co., Kan. (for location, see map of Kansas, ref. 4-G) ; on No. Pac., Ch., Rk. I. and Pac. and Lnion l'ac. R. Rs., and on Repmblican river: has a trade in grain. hogs, ete. Pop. (1880) 956 ; (18!0) 1,137; (1895) 1,129.

Clyde: village: Wayne co., N. Y. (In location of enuntr, see man of New York, ref. 4-E) ; on the N. Y. ('. and 11, R. and the West Shore R. Rs., and on the Frie C'anal and the Clyde river: 43 miles E. of Rochester. It has churehes of five denominations, a large high school, 2 glass-fatorjes, 6 malthouses, caming-factory, $\underset{\sim}{2}$ hamess-factories, $\underset{\sim}{2}$ grist-mills, tanners, steam-engine works, and a cooperage. Pop. (1s80) 2,$896 ;(1890) 2.638$.

upon accumnlations of marine plants, like the sargassum fituls of the -Itlantic Octan. The theory which, however. finds most general accentance at the present time is that ably presented by Leo Lesquereux, of the (ievogical surver of Pemsylvania. that the verctable matter accumulated in peat-bogs. The aceumulations thus fumed in different geological periods, bot having their greatest development in what is known as the Curbonifervis age, were subjecterl to enormous pressures and to a slow and general distillation. resulting in the different rarieties of chal, from the more modern lisnite to anthracite and graplite. In ismlated instances the chemical changes have beem hastened by local rolcanie eruptions and lava-streams, and in many distriets wilespread fisturbances of the strata bave facilitated the escape of moisture and volatile matter.

All the rarieties of coal shate into each other, and we have lignites which exhibit every degree of approach to bituminors eoras. semi-bituminoris coals intermediate between these latter and authracite, and graphitic anthracites by which the anthracites are connected with the graphites.

Carbouiferous strata-W. Pennsylrania and Ohio.
Geological Formation.-The geologieal position of the different varieties of coal accords with the theory of their origin. For example, the ollest rocks known contain comparatively little carbonaceons matter, as they date from a periml when the regetation of the glohe was scantr and mostly marine. Here we have only the residual products of the distilhation of regetable tissue. graphite and anthracite. In the (arthonifernus age the terrestrial vegetation was luxuriant over large areas. and conditions jrewailed favorable to the formation of leels of peat. These, submerged and deeply buried umber sediments which were deporited npon them. have, as a general rule, heen changed to mur beds of hitmmous coal-to anthracite where local wases have carried the procecs of di-tillation further. In formations more madern than the C'arbunferons the acomulations of vegetable matter are u-ually classed as lignitus. Theme contain more water ath nxyen, and are lese valuahte fueds than the true coals, but slate into them imprepptiby. In the present preiox wo see the formation of coal only in its initial stares-riz. then growth of revetation and the aecomulation of bitumanizel wisatalde tissue in prat-loges and marshes where oxilation is prevented or retarled by wathr. lir artificial practses we can, luwever, haten the changes in seantahle tiscue and by properly combluct distillation pro-
 that nature is lowally acecelemting lur processes, and by wol(:anic hat distilling lignites and bituminoms comals to anithracite. In Culoralo, New Dexieo, amb on Qneen 'harlote"s iskurd, excellent anthracite has heeta proineed by robeame hant from Cretacens lignites. It Las Broness, in summa, Triasiece col is converted into antharite by a similar cance. In Lastern America all the coul strata, excejt those of the
small Triassic basins of Virginia and Norll Carolina, are of Carboniferons age. In the valler of the Missinsippi, where they have suffered no local metamorphosis, they are all of the bituminous class. In the Alleghanies the same strata, haring been somewhat affected by the eauses which resulted in the uphearal of the mountains, have lost a portion of their volatile matter, and hare become what are known as semi-bituminous coals. Tho this group belong the eoals of Blosshurg, Broad Top, Frostburg, and a helt running down to Alabama. Still farther E. the Carboniferous strata are more meturnophosed. and the coal which they contain is converted into anthracite. In Rhode Island a coal-basin of limited extent, and of the same age with those of Pennsrlvania, seems to have been still hearer the focus of metamorphic action: and here the coal is partially converted into graphite, forming the variety known as graphitic anthracite.
The following sections, general and local, will serse to give an idea of the mode of occurrence of coal in the Carboniferons rocks, and of the nature of the associated strata

Coal measures-N.. Ohio.
As members of the stratified scries of rocks the coal-beds were originally deposited horizontally, and large areas are known in the C . S. and elsewhere in which this position has been but little modified. In many cases, however, the strata often have midergone violent flexures and extensire faulting, and they frequently occur in basins. In thickness the strata vary from seams as thin as knife blades to betls above 100 feet through. The berls very rarely consist of one nnifom mase of coal, but are subdivided by layers or strata of slate called "partings." and often these lavers differ in physical structure and chemical composition. The coal itself is generally watherel along the outerop, deteriorating it so that explorations must generally be carried to varying depths under cover before the fresh coal and its true value ean he determined. In mearly all conl-fields there are a mumber of beds. The minimum morkable thickness depends upon a large mumber of contingencies, the character of the foot, wall, and roof, the distance from maket, the quality of the coal. the sup, fy of latur, the How of water, etc. Mining is rarely carried on in seams smaller than $3 \frac{1}{2}$ to 4 feet. See Mנмivi.

Chemical Comstitution.-Chemically. coal is not a compound of free carlom with volatile hidrocarhons, hut is regarded hy mote recent authombes. like Mack, as a mixture of a latice series of hyimarhons. The comstitnents prot ducing the asls are cherived hoth from the original vegetahle tiscmes from which it was formed and from mechanical atdmixture of the mineral sulstances constituting the rock in which the seams were imhelded. Sulphur. generally present. and important as affecting the reonomicul ralue of the fucl, is partly traceable to tha chemical combination with the hydrocaibons and fartly to almiature of iron pyrites,

 lluringe the fisatal Varar 1sk！a，amenrl－ ing on the eman report（if Jobn 11. Jones，and lurintr

The distribution of the coal product was as follows:

| distribution. | 1889. |  | 1s90. |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Anthracite. | Bituminous. | Anthracite. | Bitumidous. |
| Loaded at mines for sinipment.................. tous. | 40.166,814 | 23,609.883 | 41,011,08i | 8*,372,5\%1 |
| Sold to local trade. | $1,113, n d$ | 6,418,647 | 12,000881 | T, 105, 394 |
| Used by employees. <br> Used for steam at mines | 324.991 $3.942,293$ | 1.439.672 | 3,456.663 |  |
| Used for steam at mines Manufactured into coke | 3+12, m | 13,561, 4.48 | 3,406. | 15:331,760 |

Labor and Wages-The census reports show in detail the number of men employed in the collieries, the length of employment, and the arrrage wages. In the calcmar year 1889 there were enployed above gronnd 2.285 foremen. 8.603 mechanies. 38,413 lahorers, and 17.836 boys under 16 years; below grond there worked 2,859 orerseers, 158,060 miners, $58,7 \pi 1$ laborers, and 9,696 hoys: total, 296,623 employces. to whom an aggregate of $\$ 106,937,058$ was paid in wiges. The data tor the leading producing States are given below:

| EMployees. | Pennsylvania, anthracite. | Peunsylvanis, bituminuus. | Illinois. | Ohio. |
| :---: | :---: | :---: | :---: | :---: |
| Above ground. |  |  |  |  |
| Foreman aud overseers : |  |  |  |  |
| Number . . . . . . . . . . . . | 561 | $3{ }^{2}$ | 210 | 291 |
| Av. wages per day | $8: 71$ | 8257 | \$2. 34 | \$2 26 |
| Merhanics : |  |  |  |  |
|  |  |  |  |  |
| Number. | 4.720 | 1.0\% | 605 | 81.31 |
| Av. wages per day ..... | \$1 92 | $5: 11$ | 5203 | \$191 |
| Ar. no. of days worked. |  |  |  |  |
|  |  |  |  |  |
| Number | 23,149 | 3.366 | 1,for | 81.41 |
| Ar. wages per day ..... | 5129 | 81 tirs | S1 5: | 8151 |

| Boys under 16 years: |  |  |  |  |
| Nımber . . . . . . . . . | 17,091 | 80 ${ }^{2018}$ | 80 84 84 | 40 ${ }^{83}$ |
| Av. wages per day | (0) 62 | S0) 86 | \$0 80 | \$0 11 |
| $\begin{array}{llll}\text { Av. no. of days worken. } & 185 & 200 & 200\end{array}$ |  |  |  |  |
| Below ground. |  |  |  |  |
| Foremen and overseers : |  |  |  |  |
| Number. | \%3 | 606 | 305 |  |
| Av. wages per day | \$30\% | \$2 56 | 8.38 | 5232 |
| Miners: |  |  |  |  |
|  |  |  |  |  |
| Av. wages per day | 83410 | 8193 | 5198 | \$1 95 |
| Av. no. of dass worked. | 179 | 210 | 170 | 151 |
| Laborers : |  |  |  |  |
| Number | 35,376 | 5.303 | 5.068 | 1,955 |
| Av. wages per day | 8163 | 8185 | \$1 \% | 8163 |
| Ar, no. of days worked | 1.41 | 220 | 193 | 185 |
| Boys under 16 years: |  |  |  |  |
| Nimbler . . . . | 4,1,11 | 2.14 | ${ }^{595}$ | ${ }^{31} 6$ |
| Av. wages per day ..... | S11 | \$0 \% | \$0 91 | 8073 |
| Av, no. of days worked. | 181 | 217 | $1{ }^{17 i}$ | 181 |
| Total emplosees.. | 123.674 | 5, 53.132 | 23.934 | 19,343 |
| Total wages in 188\% |  | \$20,325,805 | S5, 4:9,553 | \$6, 30,478 |

These figures may be acepped as fairly representative of the wages earned and the average number of days of employment. The boys enumeratel as working above ground at the :uthracite collinries are employed chiefly as slatepickers in the coal-breakers. Those working milerground are generally engagel in watehing ventilation-loors.

Cost of Production.-For smme of the leading States the expendiiures incurred in mining, according to the pretiminary reports of the census allice for 1889, the final figures, incluthing those lon the Pennsylyania mines, not havig ben published (18:3), are talmatad ats follows:

| STATES. | Trages | Salaries to otfires force. | Supplies. | Ta conIfa fors. | All other mining expensen. | Totral mining expreases. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Pennsylvania anthracite. . | - |  |  |  |  |  |
| Pembsylvania |  |  |  |  |  |  |
| bituminols. |  |  |  |  |  |  |
| Marslant .... |  |  |  |  |  |  |
| 1llinois | S8.129.5.83 | S361,791 | \$9tic.93 | S26,66\% | Şrix 133 | \$10.3tif,069 |
| 1)hin. | $6,730.768$ | 161, 8:4 |  | $5 \times .767$ | Tu2.7012 | $8,032,113$ |
| Intliana | 2,141,568 |  | $2+1,091$ | 5, 80\% | 133.7. 11 | $2,581,669$ |
| W0est Virginia | 3, $148, \%$ \% | 133, 9 91 | 462,512 | 47.099 | 418.394 | 4, $\times 11,076$ |
| K゙ゃntricky | 1.669,584 | RB, 439 | 23, 3,321 | 45.1999 | 1112\% $\%$ \% | $2,156,518$ |
| Tenntesere. | 1,514,392 | (10) 918 | 211,340 | 13,321 | 2111.2 ¢ | 2,113.24, |
| Virginia. | ti0 1.75 | 16.4\% | \|fi,751 | 932 | 13, 4.56 | $6 \times 2,418$ |
| Alabama. |  |  |  |  |  | . . . . . . . . . |

Out of total expenditures, for the states enmmerated, of 800.973.965, the outlay for wares was sot.8i6.330, thus showing that the labon cost is sty:3 pur cent. of the tutal.
(Inessificution.-Drof. Persifor lirakro. of lhiladelphia, has
suggested a classification of coals based upon the ratio of fixed carbon to whatile lydrocarbons. He has promosed the following:

| Classes or coals. | Ratio, fixed c, to vol. hydroc. |
| :---: | :---: |
| Hard-dry anthrncites | Irom 41): 1 to 12:1 |
| Semi-anthracites | 1: $: 1$ to $8: 1$ |
| Semi-bitnminous. | $8: 1$ to $5: 1$ |
| Bituminous. | $5: 1$ to $0: 1$ |

Arbitrary commercial livisions are howewer. heally made, which do not accord with the classifications established by scientists.

The most recent and eomprehensive classifieation of the fituminous coal-fields of the I. S. has heen made by the late Charles A . Ashburner, with an estimate of the areas of sume of the fields:

(6) Besides the Rocky Mountains inclutes large coal-fields. in North Dakota, Montana, Jdaho, Wyoming, Utah, Colorado, and New Mexico, the areas of which are not even approsinately determined; and (i) the Pucitio cousl includes coal areas in Washington, Oreron, and California.
The first five groups embrace an area of 214,225 sq. miles. It is surmised that the sixtl group has hetween 200.000 and $300,000 \mathrm{sq}$. miles more, while not even a gness has beenmade concerning the serenth.

Triassie Fipld. -The eastern Triassic area is composed principally of the Richmond basin in Virginia and the Deep river and Dan river fields in North carolina, the former having been one of the carliest districts developed in the $\mathbf{U}$. \&. It is only recently that extensive operations have been resumen!.
Appaluchion Field.-The Appalachian field, from which T3,005. 102 tons of coal were mined in 1890. lies immediately W. of the eastern frontier of the Appalachian Mountains, and extends from the state of New York to the state of Alabama, its length being a little over 900 miles in a N. E. and $\therefore \mathbb{W}$. direetion, and its width varies from 30 to 180 miles. All the coals are bituminons and are of great variety, both in chemical composition and plysical structure. Although it is diflicult to make any general comparisons, the best and most productive coal-beds lie probalhy in the littshurg distriet and in West Virginia. Some of the best coats in the ficld are mined in hasins detaclied from the main hody of the field. sueh as the Blosshurg and broadtop basins in Pemasylyana, and the Cumberland in Maryland. The thickness of the coal measures in the different sections of the field raries from 100 to over 3,000 feet.
Forthern amd Central Fiplds.-The conl of the northern field is inferior and is mined only for local consumption.
The central field, in which there were mined $20.093,533$ tons in 18:0, inclules the ewal areas of Indimat, hlinois, and Kentucky. On neeount of the great extension of the field in that state it is often simply called the llinois field.
IVestem. Field.-The mont extensive mining operalions in the western field are earried on in Towa and Missouri. The best coal so far mined is that from the ladian Territory, the total product of the field in 1890 having heen 10,470 ,439 net tons. The coals are of great varicty, and, sinee the
region in which they lie is a rich agrionltural romutry it is probable that the brids will be very extenaively derabojed to supply locial lemathds.

In the Rocky Mountains the comblomb have lewn fomme in the geological formations from the (armonforons to and in-

 tion has bern divided by the frolarical Simery ul that state into-1, the LPper barren Heasures: 2 , the Epper Prometive or Jonomgalaek River sories, combaning the Wayme burg, ['nontown, sewickley, ant liodstome coal-beds and
 Neasmes ; the lawer Proluctiva or Alleghmy liver Series, incoluding tho Freepurt rioup at the top with three coal-beds, the Fibtaming sroup in the mildle with three combeds. and the ('lation gromp at the hettom with three conl-beds: but of these mine coat-limels not more than two, or at most three are anywhere lomod workahle directly one over another, so great is their variahility in size and quality : 5, the l'attavile ('omerlomerate Sorios (So. XIJ.), containing small berls of comat and resting on the shaton comblode celohrated for its bhak eoral in Ohio hot worthless in Pennsylvania exeept in Dercer Comoty: ti, the monsures down to am? incluling the Pocone smbletono (No. X.). Is inclicatiner the enommous amoment of coal, it may be stated that Dr. 15. M. ('hane in lswl eatimated the tomage of awatahle
 which nemyly onc-third was assigned to the l’ittshurg bed.

In Pemnsybania the most important hed is the littshurg. in Commelsville, varying in thickness betwern 6 and $1=$ ford.
 30 to ${ }^{3} 4$ per cent. of volatile matere, 8 to 6 per cent, of ash. ! per cent. of sulphur, and 1 per cent of wator: It is mined in tha Manongahela river conl region, which ships upwarl of 4,000.000 toms ammally by river alone to the markets along
 come tho comls which are mannfactured into cote in the great Comollsvilld region, and the stem and gras eomas of
 or Lower V'renport, i: to 5 feet thick, and the Lower lijtturnning heds are minal in the "learfield distriets, which is one of the principal somros of sumply for the illantice comst trade, the total whiments of the histrict hating been about Esmo, 0 on tons in $18: 4$. I third leadiner district is the lior nohlsville of Jeffersin (onnty, in which the lower fireoprott is mined, the cont heing shipped rhiefly for steam furposes

Targlamb-Gme Gi the most importime coal distriets in the djpalachian field is the 'mmberlamel, Frostlmege or George's ('reek, in W"ratern Marvinnd, 30 miles long, with an average width of $4 \frac{1}{2}$ miles. The hook. Whith tips steeply. varies in thiokness. but is equerally thicker than the bitlsburor hed whioh it represonts. "the problect is at famons
 1890 ont put having luan close winn 3, 000,1000 tons.

The firginias.-The youmpot and most vignoms comm-
 fron, which is silmated alomg the lime sopmotiong the two
 coso, West V̈a. $1 t$ protuces a cont of exceptional pumity, making an "xadtent colke, From the mroat lomahontase in So, 3 hol, which is 10 to te fort thick, ame in some font inns of the field is split into two distinct workable sedams, yieldiner about! feet of cond, It is chapply minet, mot refiniring any
 tams of comb amd 400,000 tons of colie. amb is expambing rapilly.

Wrest Virginia is pro-emiment for its conal resonmens. the
 that state. Mining is uis in fuce seale in the kinnawha and
 to F feet in thitoknes, is gnite chenply prolneed and is lareng shiphed by river, beines a formidable compertan in the lower markets af the Jonemgahela dist riat in leennsylvaniar The shipments fron the Kanawhan in ls! ware !eft,

 smpplies the stme markets as the ('umbertand distriot of Marylaml.
 of both the Appuhabiam amel the ('ontral fichl ami has shared in the generally rapid development of the eom mo-
someres of the Southern States during the past fow years. In the castern aroa, which is a gart of tha A prabichian

 Thio, West Virumia, and lemastrania, and the lower the conglomerate amb subronstomerate conts.

Tronessere-The conl of 'rembesser is confined to what is known as the C'mblerland phatem, which is broken into by the seruatchic valley. That part of the platenu to the IV. (if the valley retains the name ('monderkand, while that to the
 agr of the comb mined is used tor the manufature of cobre for the blast furmaces of the State.
 trame southern pat of the Appalachian comb-liolif, amb in-
 after the rivers which dratin them. 'lthe aron of the first is nomrly tern times that of the latte two combined, mal practienlif supplies abone the fuel for the great Birmingham irom imbastry, the enat for coking heing minet from the Pratt sean, whioh arerages 4 to $4 \frac{1}{2}$ feed in thickness. Whate the WHarior field yietded in 1850 nearly $8,000,000$ tons of conal, the ('alawha, next in importamer. furnluced a little more than $1,000,000$ toms. The Malama mines during the bast few yours have duveloped an important trade with the countrieson the (inll of Mexico.

Ohio.-More than onm-lourth of the State of ohio is underlajl with conl-bouring strata. The conl measures are dividal into three series: the lower, about sootect in thickness: the barren, for tosoo feet thick: and the UPrer, 600 feet in thicknoss. The coal is mow chiedy drawn from four to five diflerent seams. The womb-producing portions of the state are dividen into twelve dishricts: 1, Jackson: ? (Hher valley, in-
 som, and Medina Commlios: 3, llocking valleg. Enclumping Vintor, Ilocking. Ithens, and a purt uf Ierry Countios;
 ing Washinstom and Noble Comuties; 6 , ('arrollon valley, in llarrian C'munty: í Muskingum valley, ineluding Aluskingum and a phrt of Perry Counties: 8 . Thesearawas valloy, including ('oshocton, 'liswarawas, stark, summit, and

 fons; Mocking valley, 3, 005.46 .1 has: Muskingrum valley,

The Central lioh inclulos the coal areas of Indiana and llimois, and a part of the veral area of kientucky.
minois-sixty commes of llthos ate molerlaid with comb, the field conaminer sixtern distinct seams of bitumimons combl, fumishing an excellent stombing fuel, but litt be suitable for cobing or gas-making. The heds which are araitahke for mining generally lie at considerable depth and are reacherl by shafts. "The ('arboniferous systom has an agere-
 Hlinovis, while in the northern pertion of thestate the entire

 boing the characterint ic conl of lioce lsand and the adjoininer counties. Beal Sor. H. has its greatest develomment in
 Somermom and Macompin (ommties, while No. Vl. is most
 where it is di to 8 foet in thioknoss, amb is wasily mimed. So. VII. has its maximmm revelopment in Williams County in the southorn part of the state. The ofler beds ane

Initimme- - 'ha (entral field extends eastward ower the southwe tios, Wrarron limunty tying at the northern limit and a line

 ing bend discovered. howeser, to represent the letters (' I),
 Intwern : ft . $:$ in, and is feet, which produce the "hock " comb, ami b, er the stamem herl, which is is fect to if feet thok. vielding hifnminoms eoal.

Fintucky.- The C'entral tield covers also that lart of

Kentucky which lies $S$ of the Ohio river, between the Rolling Fork ant ('momprland rivers. The thickness of the conal measures is about 600 feet. Twelve eoal-beds are identified in this district, but only five are workel to iny extent. In the weatomaz well as in the eastern district in the same state are found some of the finest beds of cannel coal known in the country, which is distributed windely for domestie grate fuel in the latern cities, ant has heen shipped abroad intu markets hithertocontrolled by Enylish cammet.

Iow a. -The chal-fied of lowa forms the northern part of the Western. or, as it is frequently callend, the Fourtlo Coalfieh of the L . S . The coal momsures of the state have been divided into three groups the Upper. Nidalle, and hower, the former ocenlying the sonthwestern corner of the state ant carrying only one insignificant bed and the middle measures cropping out along the line of the Des Jnines river, from at little above Fort Dodge to near Keokuk, thronglout a belt of country some 50 miles in width. These are the measmes which contain all the larger berls of coal in the state. In the main coal-field are eight commties which have bed ranging from $5 \frac{1}{2}$ to 9 feet in thickness. The coal is of a quality generally well ablapted for steam and leating purpuses. No cannel or gascoal is found in the State.

Missomi-1 line drawn from the junction of the Des Noines river with the Mississippi to the sonthwest corner of Missouri will have N . K . of it nearly all the coal territory of the State. An arm of this territory. however, follows the course of the Missouri river E, for a short distance, and coal is fonm in the vicinity of st. houls. The lower coal series is considered to enntain the most important and the most productive eoal-heds. The coal is semibituminous, and is alapted for steam and heating purposes. as well as for smithing.

Nebrasku. The southwestern corner of Nebraska is corered by a portion of the Missouri coal-fieh, but the outcrops helong entirely to the upler measures and no deposits of valne have yet bem discovered in this state.
hrusas.-The coal measures of Kansas underlie the entire eastorn part of the State, and hare been divided into-1. the (herokee anl Crawforl Countr coal-fiehl ; :2, the Osage, Shawnee, and Coffer Comnty field, the mont important; 3 . the Neosho County field: t. the Franklin Connty field; and 5, the Bonrbon and limn County field. The coals are bituminous in character, similar to the coals of other States in the Whestern field, and are fond to be excellent for coking, steam, gas, smelting, and domestie purposes. Lignite demosits bave also been worked to some extent for local trade along the western limits of the enal areas in Cloud. Republic, Ellsworth, linssell, and Jewell Comutics. In the coal measures there are $2 \boldsymbol{2}$ different seams, varying from a few inches to $\boldsymbol{r}$ feet: ten of these are orer a foot thick.

Arhunsus.-The coal deposits of Arkansas are located in the western part of the State, upon either side of the Arkansa: river, extending with more or less persistener between Fort Smith am Little Rock. The principal districts in the State are-1, the Western, or Sehbistian Countr district: ${ }^{2}$, the Coal Hill: 3 , the Philpott: and 4. the Ouita district. The beds wary in thiekness from 20 inches to 7 feet. The coal is mostly semi-hituminous, but much of it deserves to $\mathrm{l}_{\text {no }}$ clased as semi-anthracite.

Indian Territory.-The cuals mined in the Choctaw coalficho, Indian Territory, are ponounced by far the best mined in the Southwest, and vastly superior to Kansas. Missouri and lowa conts. The Choctaw field is a direct wentward "xtension of the Irkansus coal-field, hut its coals are not like thos of that state, except in the emnty immediately andjoining the line. Inr. M. M. Chance estimates that the coal measares arr at least 8 , 0 (0) fret thick. They inChalw the Graty group of coals at the hottom of the series, and ahme them, in succession, are the Mc. Wester coal, 4 feet thirk; the Nomman coral, :3 fur thick; the Secor coal, $2 \frac{1}{2}$ feet thick : ant the Maymery 4 to 6 feet thick.

Treves. The principail boly of bituminous coal in Texas hise in the northern ceatral portion of the state, cxtouding $\therefore$ W. from the Red river in Dontasue County, to the Colorado river, this hasin formine the southern extremity of the Wewtom ticha. Along the Rio (irande lies another.
 fitir semi-hituminous product, while the upper midsures are smmewhat lignitic. An extendel area. bramed by lines drawn from Clarksury in Rad Riwer (bunty onthwesterly to the Ris Crante and heme N. Fa, to the Sabine river, is sain to eontain important deposits of lignite.

The Dakotas.- Very little mining has thus far heen done in North and South Inakota in the Rocky Monntain field. The ascertained colal areas lie in the western counties hetween a line drawn from the Turtle Mountains in the N.. through Burleigh County, to the sonthern borders of the Black Hills an? the western houndary-line. The seams of what is a fair lignite vary from a few inches to 12 feet.

Montana.-DIontana jinssesses quite extensive coal and lignite fields, among them the Bozeman, with their distinct beds. producing grod coal whieh makes fair coke and the Judith. Belt creek. Sand Coulée and Deep creek field in Which the lignite lies under the prairie. Pesides these there are the Rock creek field, with seven workable seams aggregating 46 feet, and the Gartiner field on the upper Iellowst one.

Hyoming.-The conl-field of $W$ yoming are of great extent, but no systematic survers have been made of all the areas which will permit of an estimate as to their size or the relative ralue of the beds which ther contain. The enal is a trpical lignite, which is minel quite largely in Carlon Comuty, where the bed is ! feet thick, at Kock Springs, Sweetwater Country anl at Mmy, Minta County. Quite recently important tevelopuents have been made near Newcastle. Weston County, where the lignite has been partially metamorphosed to a enking coal by heat.

Colorado. -The coll reources of C'olorado are particnlarly extensive and raried, the beds of the State furnishing the entire range of coal from lignite to anthracite. The state is grouped in four divisions- the Northern, including Weld, Boukter, Jefferson, Arapahoe, and Routt Counties. furnishing lignite of fair quality. except in the last-named county, where some anthracite is foum. The reins worked range in thickness from 3 to 12 feet, the prineipal mining operations being in Boulder County. The Midale Ditision includes Park, Fremont, Douglas, and El Paso Comnties. The former, which pretominates as a producer. furnishes a fair semi-bituminons coal, while the cañon coal from Fremont County ranks among the first for thomestie purposes. The other counties mine some arerage grade lipnite. The Southern Disision is the most productive in the State, ineluding Iluerfano Country, with the Rouse, Walsenburg and Soma mines. Las Animas Countr with the El Moro coking coals, La Plata and Dolores Counties. The fich of the Western Division, in Pitkin. Garfieh, Mesa, and Gunnison Counties, is remarkable from the fact that it proluces ant hracite coking and non-coking coals. the alteration being elijefly due to the rast eruptions of porphyries which huilt the Elk Mountains.

Cteh.-The prineipal protucing mines of Utah are at present confined to Summit, Sappete, and Emery Counties. It is extimated that the following arras in Ctah are underlaid with coal : 500 sq . miles in the vieinity of Sunnyside and C'astle Gate: 300 sq . miles on the Weber river and its tributaries; Grass crelk, Chaw eveek, cte., from 100 to 200 sq. miles in the ricinity of Pleasant ralley: 150 sio, mikes back of Cedar ('ity: and $1,000 \mathrm{sq}$. miles in C'astle rabley.

Teue Merico. -The New Mexiem enals range through all the varisties from lignite to anthracite. The principal districk are the laton. from which a coking coal is obtamed, and the Gallup, in Bernalillos Countr, where lignite is mined from two bed:, The Cerillos district produces both bituminoms and anthracite coal.
Preific States,-Although cond deposits of more or less importance have been diseoverel in many of the counties of California W. of the Sierras. from Siskirou in the vienity of Ilt. Shasta in the north to sim Dieqn in the sonth. no mining operations upon a cummercial scale have heen proseented, except in Amaden and Contra Costa Counties. In Oregon outcreppings of coal have leen found in nineteen connties, both J. and W. of the Cascade lange, hut mining operations are reported only in Coos Countr. Washington is known to possess rery extensire deposits of lignite, semibituminous, amt bituminons coal. and several important coal aras have been opened botlo on the western turd the rastern slopes of the Cascade lange. See map of North America for emal-fichs.

Lses of l'ariptios.-The rlifferent chemical and physical properties exhibited by the varis kinds of eoal fit them for a whle range of uses in the arts. Comals are primarily divited into two great groups-t he ham and suft, or the anthracite and hituminoss conds-but cach of these groups is capahle of subdivision into several varieties. For example. we have at the bave of the series-l. Grephite, which is a coal deprived of all its bolatile matler, and consisting only of a por-
tion of its carlon, mingled with all ite ahn. 'This is practically incombustible, and is mer used as a fuel or chassed
 wht, of gaseons matter, isnitime with dillionlty, and torming an infertor fote. This is the previling variety of conal

 cent, of eathens. (Sice Axphestese) 4. Semi-htuminoms cond, containing from ioto is fer cont. of gisoons mattor, lut generally caking in the tire of little value as an ithuminator, hat kindling readily, with high honting power. It is the most highly valued of all coals for the wemerntion of stem. The semi-hituminome erals proshace a donse whe and in the raw wate are permred to all oblere for hacksmiths' use, as they form a hoblow tire and prohne intense hant in combustion. E". Bituminons. conls, whilh have bere subjered to mo local motanorphe action, but are the natural product of the slow and erenerad distiliation of segetable tissure buried in the marth since alue latamaice nges. In lituminons coals the valatile matter varies in quantity from to to ay per endt. of the mass. They are sumbiveded inte roking, furnace, and cunnel coals, of these the coking coals melt and adhere in homines, and when the gaseons matter hats maped a mans of "eoke" in left wheth haw the properties of anthrasite. hat is cellalar or spongy from the expansion of the ganes. (sece ('one.) Most hitiminens eoats heloner to this sariete, ot which the l'itstharg emal may he takn as a typ. They are extensiwly employed for the generation of steam, as honsehold fuels, and, when coked, for smelting the metals, their adhesive character preventing their heing read for this purpmee in the raw state. Cakiner "Yils which are sufficienty free from sulphar, their great contaminating ingredient, are termen "gas coals," as they were chielly cmphayed for tha produrtion of ithoninating gas. In the volume amd ilhominating power of their gas they are exceded by the canmel conk, but their deliciency in this respect is more than compensated for by the greater value of the coke which is derived from them. The fumare conds are those bituminons coals which do not melt or athere in the fire, and can therefore lie cmployed in the raw state in the blast furnace. These are termed opph-broning and sometimes splint conls, hut the lattor tem is more appropiately applied to a kind of camel coal which comanis a hate premate of carlon, comparatively little gas, and has high beating power. The fanous Brier ilill coal of Ohiond the Brazil cont of louliana are typical lurnace coals. The cammol coals have a more homogenoms texture and are less pitedy and hrilliant than the other hituminons coals. They represent the carbondems mad wheh accumatated in the Gum lagoons of the coal mashes, while the surmmung mass of spongy veretahle tisste formed the cultical coat, The eamnels ame rich in gas, but have comparatively low hoating power. Thay ure faverite honsehodd fuels, and have heen emphoyed for the production of oil ly distillation, bat tre narly valueles for metallurgicol parposes, Nearly all enal-fiehls contain more or lese canmel, whed is either interstratilied with the cuhical coal or gradally passes into it in one or another direction. Is a cremeral rule, the cammels comatin more ash than the furnate or gas conls: and as the marthy matter incrases in quatity, they shate off imperceptibly into bituminons shale.

## 

 Pollactives, virrne, a lish nearly related to the common coul. Given on actount of the dark color of the bacts. due to a peculiar pigment, which ruts off on thu hands when the fish is handled. The coattish is found on hoth sides of the Forth Athatic, and is taken in ennsidurable quantities for foorl, being haed fresh, salted, or dried. Its ascrage weight is 10 or 12 lb ., thit it sometimes reaches 20 lh . The oil elerived from the liver is used in the alulteration of colliser oil.

Coas- : the margiu of a lant-arm, limitet ly the ocena (1) its foulfs or hays. The elaracter of a constline deprome ehindy on 1 wo things: 1. Goolarical hange of lewel, by which the sea is phaced on the slope of the lam-mass: if by elevation of a smouth sea-hotion the comst-line is of simple form ; if he depresion of a land-area the coast-line is irtervalar, the more on the more raried the relief of the submeryed lams. ©. The time during which the sat has tond at a given level, allowing is wawe to cut back hadlank into cliffs amd form beathes and bars, and jermitting rivers 10 luidd out dedtas, thes simplifying the coas- -ine from its tiost irrerularity. A liat sembitom, as the up-
 comst-line. "The equst-line of T"xas is almost as simple, with Whe adition of hore samdars built off shere by the wave ath inclosing linar lasems. The Corolina coast is of some what greater irrequarity, the remult of gentle submergence
 thus produeing anonds, as . Ithemarle and Pambice, inclosed by extensime off-shore hars, loseally called hatis, swerping in hong current-mate corver cencespe to the oceath, and juin-
 -anty shals driftine out to wa. Norway is an example of extreme irrequarity of com-line, prodeced by strone sahmerence of adepply disected mountainous remion; its dep inlols are callad Ftombs (y, e.). Many hroken const lines have risen sumewhat sine? their ilepresion, but
onlr enough to reveal sea deposits in local coastal plains. without entirely overcoming the effects of earlier and greater submergence. The Jaime coast is thus of composite character. its low sandy plains alternating with rocky headlands and long bars: the partial emergence of its submerged land contrasts witl the coast of the Carolinas, where there is a partial submergence of an emerged and somewhat dissected sea-bottom. The diversits of a coast-line has much influence in determining the developanent of maritime pursuits, by affording shelter from heary waves. and by tempting exploration of ontlying islands. Eurupe is remarkable among the greater land divisions for the diversity of its coast-line, the result of the comparatively small scale of its geological construction, is well as of maririnal submergence. Its influence over the rest of the world may be in no small part aseribed to the numerous harbors on its broken coast. The coast-line of Europe is nearly 20,000 miles to an area of $3,816.400 \mathrm{sq}$. miles: of Africa. 15,000 to $11,600,000$; of Asia. 30,000 to $17.310,000$. The Itlantic coast-hine of the U. S. is $\$ 3.000$ miles long: that of the Pacific coast, exclusire of Alaska, 15,500 miles. See Beach. Cliff. Delta. Dune, Estuary. Fiords, Harbor, and Islands. IV. D. Davis.

Coastall llailu: ane of the physiographic provinces of North America, comprising a system of lowlands bordering the Ithantic Ocean and the Gulf of Mexico from New York Bay to the state of Vera Cruz in Mexico. It is in general from 50 to 900 miles broad, but extends northward in the ralley of the Mississippi as far as the mouth of the Ohio. Topographically it consists of a plain or a series of plains. interupted at the north hy a great spstem of estuaries. and everwhere more or less dissected by strean-vallers. Geologically it includes Cretaceous, Encrine. Neocene, and Pleistocene formations. Which retain approximately the prosition acquired during deposition, except that thes have been hodily uplifted above the ocean. On the landward side these formations rest mon and against older formations, which have sufferel serions disturbance und been greatly eroded. In the - Itlantic district a cataract is nswally found in each stream just where it passes from the older formations to those of the coastal plain. A line connecting these cataracts, known as the Fall Lime, incheates approximately the western boundary of the coastal plain. G. K. G.

## Coast Castle. Cape: See Cape Coast Castle.

foast and (ieudetic Nurvey: a bureau of the Treasury Hepartment of the L.S. Gorermment, whose principal office is in Washington, and whose field operations are co-extensive with the territory of the U.S., including Alaska, together with that portion of the ocean which is under the jurisdiction of the U . S. Or of which an accurate knowledge is essential to the interests of commeree. as the Gulf Stream and such parts of the Dtlantic Ocean and Gulf of Mexico as are closely related thereto.

The Coast and Geodetic Surrey is the oldest of the scientific burealus of the Government. It may be most conveniently treated under three heads: (1) History, (?) Organization, $(3)$ Uperations.

History. - To all nations whose territory touches the sea or other water narigable to any extent, or who have any interests in the commerce of the sea, a complete knowlerge of the coast. of its natmre inkl form. of the character of the sea-hottom near it, of the loeation of reefs. shoals, and other dangers to navigation, of the direction amb strength of currents, and of the character and amount of magnetic dist urbance. is of the greatest moment. To supply this knowledge the governments of all maritime nations liave executed in moulern fimes survess of their coasts by the most exact mothods, publishing chaborate and accurate charts for the priblance of the navigator, on which are indicated the location of lighthonses. huoss. and other aids to mavigation, torether with currents, tibes, and compase directions.

Abont the year $1 \times 00$ the only charts of the $\left[^{\top}\right.$. $S$. enasts and harbors wore thase prepared charing the latter half of the preading century umber the direction of the british Armiralty. "lhew wore in the nature of a preliminary recommoisiance. and were inadequate to the demands of the insorasing (enmonco of a rapilly erowing nation. The thenamd for a thorourh surver of a bigh character was felt very early, and its impurtance was urged by Thomans. Jefforson. On his recommandation while l'recident of the U. i... ('ongress in 1 sof pasced an att anthorizing him to inangurate such a survar, numb derdaring that it hould include a designation of the islanls. shoals, mul places of anchorare within 20 leagues of the shores, and such other matter as
might be deemed proper for completing an accurate ehart of every bart of the coast : it also authorized the surver of St. George's bank, and the soundings and currents beyond the limits aforesaid to the Ginlf Stream.
The execution of this work was assigned to Ferdisiand R. Hassler ( $q . \%$ ) a native of switzerlind, who, by his previous experience in Europe and the high character of his ittainments, was admirably fitted for the difficult task. Il is first step was to proceed to Europe for the purpose of obtaining the instruments necessary for the operations of the survey. Ilis standard of excellence was high, and he was content with nothing short of the best appliances for his work, which at that tine conld not be procured in this country. The instruments had to be specially constructed, and there was maturally much delay incident to the new enterprise ; so much. iu fact, that the work was entirely arrested by the war with Great Britain in 1812, and it was only in 1817 that suticient progress had been made to justify a commencement in the important larhor of New York. It had scascely begun when it was again suspended on account of failure on the part of Congress to provide the necessary funds for its support.

It was not until 1832 that Congress, urged by the Secretary of the Nary and others, made an appropriation for carrving ont the jlan of $180 \%$, placing the work again under the direction of Mr. Massler. This was the real beginning of the continuous operations of the Coast and Geodetic Surrey. Mr. Hassler was authorized to employ astronomers and such other experts as he teemed necessary, and officers of the army and navy were detailed as assistants. He continued to direct the work until his death in 1843.

The commection of Mr. Hassler with the surrey, and especially at its inception. Was a matter of great importance to its welfare. He may be said to have "set the pace "for its work. He had heen highly educated in a school of precision, and he knew the importance of the sixth decimal place. Ile was the first to introduce accurate standards of length and mass, and to him was assigned the construction and adiustment of the Govermment standards of weightsand measmres. During his superintendency a good begimning of the great work which he had planned was made. A base line was measured in the vicinity of New York, the triangutation was extended thence eastward as far is lihode Island and south to the lead of Chesapeake Bar. A "primary" triangulation had been begun. the toprography and hyctrograplay had kept pace with the triangulation, and many charts had been issued.

The work did not go on, howerer, withont meeting obstacles such as had more than once confronted it during its sixty yenrs of continued activity. People who were nnaccustomed to operations of precision protested against the unnecessary refinement of the work of the survey. and declared that its results did not justify the expenditure necessary to maintain it. Clamors against the administration of the survey arose, and finally a severe and unfriendly investigation of the service was made by a congressional committee. The result of this was a compilete indorsement of the principles on which the surver had been conrlueted by Mr. Hassler. At the same time a plan was developed for a more comprehensive organization of the service, which shortly brought it into the form in which essentially it exists at the present time.

It was fortunate for the survey that Mr. Hassler's sueeessor was Prof. Ilexanider Dalias Bache (q. \%). Under his administration the work was rapidly expanted. the Pacific coast was tahen into the seheme, and the general system of triangulation extended and enlarged. His keadership covered the period of the civil war. during whicle the regular work of the surver was practically suspended. It Was then discovered that the accumulated knowledge of the sorvice, incluming not only that in the archives in the form of mapr, chats, "tco. but is well that of the oflicers of the surver, was of incalculable value in conducting the operations of the army and hary. Many civilian members of the coms weme detailed tor the varionis fleets on acoount of their special knowledge of the coast, and served so well as to receive special reorgnition at the hands of gemeral oflicers. Others joined the armies at different points to aid in making reconnoissances. surveys, ete. (ifficers who had been detailed from the army and navy for serviee in the bureau at once juined thair respective corps. There had been accumulated in the arehives a collection of all mals issued of any part of the country. and by means of these the superintendent was able to compile and publish maps of the

Sombern states which were of great value in grnding the morements of the V"nion tronps.

At the close of the war the regular operations were rosumed on an enlarged soate, demanded loy the increased connmercial activity of the comatry, l'rof." Bache died in 1867 after a lingering illness, and was sucererbed by Prof. [BESJAMIS I'IERCE (\%. \%), who served unti] Isit. i)uring his administration the scheme of transeontincotal triangulation was developad and inamgntated.

Ile was succemed by Mr. ('arlile l'oldork P.atterous
 surver as hylrogrtulaic insuectur. Mr. "Patterom servad
 was appointed as his successor. Prof. llikgral had hoen ath assistant in the surver for many pears. haviner hemen in charge of the ollien in Washington iluring the loner ineapacitating illness of Prof. Barhe. During his honer servioe his profesional paturs. puhlishet mostly as ajpu-blices to his Ammal livmorts, were numerons and varierl. He repme sented his Govermment in the lnternational Burean of Wrophts and Measures at Paris. sarviner moon its execoutive committee. He resigmel in 1885, and was suroreded by Frask M. Thors (q.r.), who assumed the sujerint mency of the survey under peremliar ciremmstames. shomily after the bearmanig of the administration of President ("Jeveland charges were marle involving the integrity of the maname ment and of some of the frimeipal oflieers of the survey. Panding their investiantion, a tank which had been asoimend to Mr. "lyorn he the I'resident. He was directed to sasume dharere of tho bureat, aml to perform the datios of superintendent. Ne erntinned to discharge these daties until

 husiness oprations of the serviee and introntuced methonls of importanes, as atforeling jrotection to those chatered with the expermbure of momey againal charges of irmegulaty or corrujition.

White finding that in afow conse the hasimes of the survey lad heren lomely cumburted. He diseovered that most of the charges were afiner entiredy unfomaled or based an tecthnical grommas. and that, "xecept in rare instamees, the wark of the service had laen homestly done. Ile became tho defender of the surver atainat the attacks of irrospmeinhe
 Mrisinesililla (q. ce).

Orgmization. - The plan mon which the Coast and] (ieodetic survey is organized is the omprowth of trial amd experisuce during the dirst fifiy years of it: existence. . Itmost every var has seen sume new fature alded or some odd one discrumed.

There ure two great divisions of its work: the fidd and the nilice.

Field work includes the operations of the smeve on land and at seat. Werk uphn the land is direcoty conilueted by what has bern callent the "nomal furce" of the survey. at bukly of civilian experts parmatmently attached to it. numbering between fifty amolsixty. They are of three grathes, namely. ansistants, sub-assistants. and atids. Jlat hylrographic: work is in general comblattal leg matal otliours temporarily dotaiked to the surwey, and rommandine men e-pecially conlisted for the servier from the nasy. "heotr contnetation with it usually latsts about threb yars. during which time they recpive the title of ascistants. The surviee owns a fleet of about fifteen vessels, vight of which are teamers. special hydrograjhice work is sometimes exaemted by memlers of the civilian statf. Ahl tieh otheers, civilian of maval, recoive their instruetions directly from the suburintombent. for ennranience of administration, however, the matal assistants are moler the immediate diberdinn of the herdrographic incfecetor. who is hedd responsible for all diants in the organization of natal partios and for the profne cxecution of the work assigned them.
 the records, origimal shows, ete. repmomentiner the results of the tiold work. They are rexistomed and depusitad in the arehives, matil in turn they are taken up for (xamimation. computation, and naljustment, and finally julhiched. Wrizimal charts are medned or enharemb. engraved, electrotymed, and printed.

The divisions of the ollice are ass finlowes: ('undmtine.
 arehives, mal librat.

Fatch division is directed by a chiof, who is usually an aso sistant (liedal onfere) tempurarily detailed to this duty.

The whole is andar the charse of an ofliocer kowna- the "ancistant in chatre of the ntlies.

Mose of the livitrorraphic material when racejved groes at first to the otlien of the hyalrograbithe inspeator. In this othice there are the hyirosraphic divisons and the const filot division, the chiofs of which are usually naval aticers.

In addition to the above there is an aceomotiner division with a dishorvinor agent, and the required force of
 ment-makers, printors, etco. numbering in all ahout 125 at the ofloce in Wrashingtom.

There are subtobltoes at san l'ranciseo amd Prilatedphia wader the immerliate charge of ansistants

The dopregraphic "prations of tha survey bave beren monl? restricteal (o) a mirrow maryin, not wlen orer ib io
 base, rivers, 11p to the head of tide wator, amd other loces-
tions where bedrographic survers have been marle. In some cases it has been more extensive. and in the Histriet of Combubia a survey was exeented by order of Consress in which the scale was $\frac{1}{400}$ aml conton-lines were developed separated by only $\overline{\text { a feet. The plane table was very early }}$ alupted by the topographers of the servico. and their work has always been distinguished for accuracy of representation.

The hydrographic operations of the surrey have extended as far out from the coast as wan necensary for the interext. of navigation, and have inchuded all harbors, channels I ays, etc.. as far as the work has gone. Deep-sea smundings have been made extensirely, pspecially in and abont the Gulf Stream, and two inportant volmanes upon the sulject have been published. Sinme idra of the magnitude of the topographic and hydrosmahio operations can be formed when it js remembered that the shore line of the $\left[\begin{array}{r}\text { }\end{array}\right.$. S., as surveved. has a length of about 30.000 miles, exclusive of that of Alaska. which is several times longer. Much attention hats also been given to the tides. and continums series of tidal records have been maintained at sereral important points.

Limited space will not permit more than a bricf reference to the extensive aperations of the surrey in the study of torrestrial magnetism, the fruitful results of which are exhibited in its numerous publications on the suliject. In amdition to the determimation of the magnetic elements at many widely distributed points. and their frequent redetermination for secular variation. it has long mainuained a bhotographic registering magnetic observatory, which is mosed from one part of the country to another, remaining a scries of rears at one point.

The study of the force of gravity as a part of the great gendetic problem has received attention within recent years, and the survey has developed methods and instruments which will lead to a great extension of the work at a less cont than hy older processes, but withont lowering the standard of accuracy.

A system of precise or meorletic leveling, extending across the continent nearly in the line of the great chain of triangles, and checked br lines extending to the (tult, the froat Lakes, and in other ilirections. is in process of execution.

The surves is anthorized by act of Congress to funnish. monder certain conditions. points to state surves, which it las done quite extensively by extending its triangulation into the States. or by determining geographical positions, or he extending its line of precise levels. To enable it to do this it is authorized to employ during certain months of the yetr acting assistants in the Sitates receiving this aid. who are generally professors of enginearing or physies in the leading institution of learning.

Thronghout its history it has eonstantly been ealled upon to determine honnlarr-lines which hare been in dispute. One of its oflicers is a member of the International C'ommission for fixing the boundary-line between the $L^{+}$. S. and Nexico. Another is by law a mmber of the Hissiscippi River Commission: others are called upon for temporary service on harbor commissions and many other national, State, or manicipal boards, for which their special traning and exprrience tit them.

The operations of the office consist in gencral of the redantion, discossion, and proper preparation of the resnlts of the sperations of the field foree. amd the publication in such a form as to the of the inost vilue to the public. Finislad charts from the original field sheets and notes are prelured in the oftew induding drawing, photography. eopperplate engraving, electrotyping. phate-printing, etco, except in the ease of such charts as receive preliminary publication by means of photolithograply

An impertant part of tha nllice is the inst moment division, where most of the extromely accurate and delioate instruments used in the survey are eonstrueted, adjustad, and re[aited. This division is extujpued with a well-stocked protussinnal library.

Ihatientions.-Those of most interest to the mariner are charts, conast-pilots, ficle-tables, and motires to mariners. dhont 50 different charts in all are published. These inchude the matin serims of ecoust charts, mostly on a seale of त्रणण. numbering about 220 . A series on a smaller sate abil of a more general character includes about 35 , while harhor charts on a very much larger seale, varying acenotins to circumstances, number about 250 . These charts require eonstant revision, athd frequent resurveys are neces.
sary on account of the ever-changing character of the reabottom, and, in some lucalities, of the confignation of the coast.

Elahorate coast-pitots, or books of saliling directions for the Atlantic and Pacific eoasts, are published, and are continually rovised that thes may be kept correct to date.

Tide-tables contaming the predicted tides for all principal and mane minor ports are phalisher annually about six months in atrance, the predictions being mostly made by a tide-predicting machine inrented by the late Prof. William Fecrel during his eomnection with the survey. An edition of abont 10.000 copies of a circular known as Jotices to Mariners is issmed monthlr, and circulates gratuitously, containing notes of all changes in bars, soundings, etc.
The lieport of the rocot and Geondtic Survey is published anmally in an edition of abont s.000. copies, by joint resolution of Congress. It contains the report of the superintendent. together with those of the assistant in charge of the office the hydrographic inspector, and the chiefs of the various divisions. It gives a detailed account of the expenditure of the sums appropriated by ('ongress for the support of the surver together with progress sketches showing the condition of the birious limes of work on which is is engaged and the varions lopalities in which the field-parties hare been emplored. It also enntains the report of the Office of Weights and Measmes, the important operations of which have always been moder the eharge of the superintendent of the Coast Sirrey. In addition to these the Ammual Report contains as appendices an extensive series of special reports npon the rarious technieal and scientific operations of the service. Pulletins are also occasionally issmed for the purpose of making public such discoveries or results of the work ot the surver as are of immediate importance to the public.
T. C. Mendenhall.

Coastguard: a hody of men stationed on the coasts of Great Britain and Ireland, under charge of the Admiralty, for the purpose of preventing smogring and serving as a rlefensive force with certain powers of a nolice. With regard to the coastguard service the coasts of the United Kingdont are divided into eleren districts, each having a chief port, in which there is a guardship. The latter is used as a training ressel for boys preparatory to their entering the naval service. The revenue cruisers and gunboats of the defensire branch are attached to these ships as tenders and obtain their complement of men from them. Each distrjct is in charge of a naval caltain. The coastguard service is dirided into the sereral classes of commissioned oflicers, chief officers of stations, petty ollicers, and boatmen. They are instructed in gumbont exercise, naral gunnery, flag-sigualing, etc. They are liable to be called out for active setvice in the narr in case of war. Their total number was 4.200 in 1895. This service originally belonged to the customs department aud was solely designed to prerent smnggling; it was hence called the preventive service. In 1856 it was transferred to the Idmiraltr, which was empowered to raise the number of the coastguard by additions at any time, so that the total should not exceed 10,000 .

Coastiur-trade: the trade carried on by ressels sailing along the coast between different ports of the same country as distinct from orersea and foreign trade. In a looser sense the term is applied to trade between ports of neighboring countries on the same coast. The coasting-trade is roverned by special rourulations. In the U. S. a a statnte, called the Coasting Act, was passed in 1793 for enrolling and licensing ships engaged in the conasting-trate. No foreign vessel can engare in the comsting-trade of the U.S., but since 1804 the enasting-trade of (irfat Pritain is open to vessels sailing untler any flag. The coasting-trade of the U . S. is wery extensive. Formerly this trade was chiefly earried on by means of schooners and slons, but of late rears its charaeter has much changed. It is restricted to registered ressels carrying the U.S. flag. Since the introduction uf screw steamers for this service there is a prospect that they will to a great extent smperselle the use of schooners.
( Gast Province: same as Maritime Protisee ( $q$. ro)
Coant Range, or Coast Ranges: a title applied to the mountains adjoining and near the Paeific coast within the U. \&. from ('spe Flattery nearly to the sonth line of Oregon they constitute a single runce, sometimes called the Olympice, sematiml from the Cascade lange by a series of fertilo valleys. Tho highest peak reaches over 7.700 feet. The ("hehalis. Cobimhia, Uimputio, and Rogne rivers here cut across from $\dot{H}$ to $W$. Thence to the latitude of Mt.

Shasta in Northern Catifornia the Const langes merge with
 and in this recim they are taversed by the klamon vives： Thence to lome concepion they constitute an important

Boston, 1808); The Morlern Ructi: Pupers on I'ivisection (1ss9). She has also edited a complete edition of Parker"s works.

Revised by Jonn W. Chabwick.
Cob'bett. Willam: writer on polities and economics b, at Parnham, Surrey. Kurland, Mar. 9, 1763. Ne abandoned the plow, betook himself to London. and tecame an attorncys serivener : enlisted in the British urmy, and at ('hatham devoured the books of a lending litrary; served in New Brunswiek 15x--91; retnrned to England and got his discharge in 15!2; married and emigrated hy way of Frunce in the same year to the U. S. ; settled in Philatelphis, whew he edited a Voweralist paper called Peter Porcupine's (tazulte. in which he derided the lirench lievolution and its American sympathizers, and ribliented the phlebotomy of Dr. Rush in the treatment of yellow fever; was mulet in ss.006 costs amd damages for litering the doctor, and thas was forect to retum to Englamd in 1800 . and beran to issme in London, in 1sns, The Treply Iobltical Rogister, which was at first a Tory paper, but gradually changerland teremme a strenums opmonent of litt and an aulvocate of raticalisin. Ile was prosecuted for libeling the (divernment becase he denomaced the llogging of militit-
men by Hessian officers, and sentenced in 1810 to a fine of El,000 and imprisonment for two years. Ile contimed to publish the Register until his death. From 1817 to 1819 he resided on a farm on Long lsland, N. Y., to escape prosecution under recent statutes leveled against the independent press. The rest of his life was passed in England and devoted to authorship. Among his popular works were an excellent English (frammar (1818); Rural Rides (n. ed. 1885); History of the Reformation (1827); Cottage Economy: and Ahice to Founy Dlen and Women. He was the orjginator of the parliamentary reports known as IInsurd's Debutes. ln 1832 he was elected a member of Parliament for Oldham. I). near Guildford, June 18, 1835. Ile was a vigorons writer. ant distinguished for his common sense. A selection from his political works, in nine volumes, was publishet in 1848. See his Life (Philatelphia, 1883), and also E. Smith, Life of C'obbett (London, 1878).
lievised by H. A. Beers.
Cohforn. Richard: statesman and economist: 1) near Vidhurst, Sussex, England, June 3, 1804; a son ol a poor farmer who lost his frechok in 1814. Ite was for five years at a miserable school in Yorkshire, then learned mercantile business in the warehonse of his uncle in London, for whom he was a commercial traveler. In 1808 he formed a partnership to sell calico falmies in London; ant three years later the company founded print-works in Manchester, a city with which his name is inse parably linked. Retween 18.54 and 1838 he 1 raveled in Egypt, Greece, France, and the U. S. In 183T he offered himself as a candidate for Parliament in the borough of Stockport, lut was not electenl. Ife was the most prominent member and orator of the Axti-Conn-law League (q. e.) formed in 1839. In 1841 he was returned to Parliament for Stockport. From 1839 to 1846 he was a ceaseless and uncompronising opponent of the duties imposed by the corn laws, and advocate of free trade: anil his canvaiss of the country in behalf of these measures was one of the most memorable in the history of political agitation. Alter the corn-laws had been repealed in 1846, Sir Robert Peel acknowledged that Mr. Cobden was entitled to more credit for this reform than any other mam. In $184 \%$ he was chosen to represent the West Riding of Yorkshire. Ile was one of the leaders of the Manchester party or school. which adrocated electoral reform, a pacific foreign policy, and non-intervention in foreign quarrels. He was defeated in the election of 1857 becanse he opposed Lord lahmerston's ('hinese policy. In 18in he revisited the U. S., and was elected a member of Parliament for lochdate. Lord Palmerston in that yem offered him a seat in the catrinet as President of the Board of Trade but he declinct it lecause he disapproved the foreign poliey of Palmerstom. Ite negotiated in 1860 a notalble commercial treaty with France in the interest of free trade, which expired in ten years. when the Thiers government refised to renew it and France retumed to protective taritls. He was one of the few British statesmen who sympathized with the Union canse in the American eivil war. D. in London, Apr. 2, 1865. Itis influence extended far beyond England, his liree-trade principles having found followers and encrgetic advocates in all civilized lands. His great contrimfion to free trade was not in orisinality of speculation, but in putting its thectrines forwarl as ethical laws and giving his crusmle on its behatf a moral character. thus aronsing enthusiasm lor it. Sce J. Gamier, R. Cobnden, les Liguenrs et te Ligup (1846); J. McGilchrist, Life of Richard Cobden (186.5); Life, by John Morley (1881-83): Molitiral Hritings (188ti).

Coblet, Carl Gamriel: Dutch philologist; 1. in Paris, 1813; Professor of Greck at Leyden for nearly forty years; one of the greatest text crities and palaographists of moderu times. His work was chiefly confined to classical and very late (ireek writers. Among his publications may be mentioned Oratio de arte interpurtandi (1845); Diogenes Latertius (Didot, Piris. 1N40); Furice Lertiones (18\%3.2d ed.) : Nomen Lertiones (1858); Miscellanea ('ritica (1876). Fonnder and editor of the philolomical priwdical Memosyue. ('̆'e .J. J. Hartman, Biograph. Juhturh, sii., p. $53-67,1889$. ) 1) at Leyten, Oct. 20, 1888 .

Alfred Gudemax.
Cobija, ke-tee han : a selport-town of Chili; in the province of Atacama; lat. 29. 54 . (see map of South Anerica, ref. 6-(!). It was formerly the eapital of the Bolivian littoral province of Atacama or Lamar, and the oflicial name was Puerto Lamar, in honer of the tirst president of Peru.

The place was then important as the principal seaport of Bulivia. Faken by the (hilians in 1si9, it has been supphanted by other ports, zul is mow at mere village. The landing is land, and the survombine conntry is a desert withont water.

It has a gemel and commotions harbor, and recular lines of stemmers to many of the principal bake nod river ports of Cumda sul the U. A. The town is tincly laid mut. well built, hisheol with gas and electricity, ant supplide with at system of water-works. Amone the finest buidings are Vintiria 1 hall, ownet hy the town, and Victoria (obltoge (Wi.enteyn Methatist). coninected wila Vietoria Vnversity, the Arlingtom hotel, a summer resort for tonrists from the L゙. S. Cobumar has manfatures of woden goods. railwaye carringes, cantings, hminer, here ette, nuil experts homber, provisions.

Cobhra de Capetho [Pothe. homen] snake: cobra : span.

 omons serpent of the ermus Shjo, of the fanily Sifioter. The name is ustally limited io Nigine fripedtums, a native of the bast fudies. one of the most wemman hnown mptiles. Other ynecios of ligis are foum in the warmer parts
 The term cobra de cannllo is derived from $n$ singular fannity posesised by these suakes of expanding and elevationg the skin of the back of the neek inten the rexemblane of $n$ lowat. This phenomenon is shown when the creature is macry or excitat, and is produced by the structure and action of the skeleton, as well as of the skin and.muscles.

The hark of the hood is umally ormamentod with two eye-
 hling as pair of spertacles: hemee it is oftom collted the "spectacle-snake". The coler of cobras is not uniform: some are brownind oliw, having the speracles white, eqged with hlack. Another variety has (ross-bands of hack. Specimens without spertacles have been fomm in Java, Borneo. and other islands. The cobra attains a lengeth of from 3 to Tor more feet. It is slugerish in its habits, and casily destroyed. It feeds on lizatrels and other small animals. Its.
 bemom is secreted by two large glath in the head and is extrencly powerfal, often camsins death in 1 wn hours or less. 'Ihis poisun, thongh geverally fatal it introfeem throngh at womb, is sald to be harmiess when takem info the sumarh. The only sucessful tratment is immediate "xision or thermugh comerization of the womb, bat Fayter believes that artiticial reybimation will save many cotes. Coblure (lat. Wefocubus) : a town of (emenal Commany:
 ralway fron Drealen to Munidh: 6 miles N. of Bamherer (ser map of (reman Empite ref. $\bar{j}-\mathrm{F}$ ). It is the capital of the ducty of the same name. and contains une of the resichomes, ereeted in 15.4. of the Duke of Saxe-coburg-Cotha, and in the seat of all the high conts of the duchy. It has a ducal batace with a large libary, a theater, an observatory, an erangelical gymmsimm, and it hare ansomal. On a hill 500 feet high is in ohe cast in whe whin her was conconled
 into a musemm of art amd naturat history. A pabace of the Duke of bidinhmegh is here, and a stathe of his father. Althert, l'rinee Comsort of Great Britain. Where are manufactures of coltom. linen, and woolen fabrics. cte. Pop. (1895) 18.649.
Co'ca: a drug derived from the leaves of Erythroxylon cocu, of which there are two distinct species, one in Bolivia and one in Pern. The drug is also cultivated in British India, dava, and l'eylon. It contains an alkaloid known as cocaine, which. when it comes in contact with any one of the mumus membranes, prodnces loeat anast hesia. The loaves chasely resemble the ordinary tea-leaf, and are ? inches or more in lungth and abont 1 inch wide. Cuea has been used for many years by the natives of Pern as a nervons or sexual - imulatit. Fromit are now prepared a large momber of offiecal preparations, of which the wine of enea and the flual extrant of enca are the ones most commonly employet. In eaves whero poisoning by cera has taken phee there are evidences of great nervons exeitement, consisting in mania with delnsions atul hallueinations, sometimes followed by collapse and excesively high temperatnres. ('oca belongs to that. elass of drugs which shonld always be used eantionsly by both physicians and the laity.

Coname kōkatia : an alkatoid ( $\mathrm{C}_{18} \mathrm{H}_{28} \mathrm{NO}_{4}$ ) obtained from The leaves of the Erythroryfon coce, at semth American ilmb. It crystallizes in colortess, oforlese prisms and has a slighty bitter taste, Its salts are soluhle in water, and it is grenerally
 (nined are enormmaly nised in somth Amerian as at buertul more stimulant and intosicant. In the mative of simall - Imerica thay are suif toprohee a most agreable intoxisatim, with extraowimary cmoniomal cxaltation, ame a most vivid suries of visions. It is denhtul whether the activity of the lation depmots soldy upen the comene or in part upen a volatile substance whioh is low during transportathon. Tertandy the sympons produced he eocuine in burapuas arre enanially iliterent froms these described by travelers A= Mand ly iovelo
 the phatmacompia in malemimes. Whik known for many

 hate been cmpleged in disenses of the eye and ear, and in
minor surgers generalls. It can not penetrate the skin. and therefore is never used to affect nerves protected by that covering, but it paralyzes the peripheral sensory nerves of mucons membrane.

A number of fatal cases of poisoning bave been caused by cocame. many of them following the local use of the drug. The symptoms are extreme weakness, frequency of the pulse and of the respiration, muscular twitchings: in severe cases followed by nansea, womiting, almost imperceptible, rapil. or slow pulse, great perspirat ion and collapse. Convulsions are usually present, may come on early, and mar be very violeut: often they are partial. When cocane is taken into the system in moderate doses, it acts as a stimulant to the hrain and to the spinal cord. It is also it muscle poison. Clinical esperience has shown that cocaine is of very little value in the treatment of mental llerression, or for the relief of constitutional depression of any kind. It has ralue as a respiratory stimulant in the treatment of narcotic poisonines. but it is chiefly administered internally in irritability of the stomach. upon which organ it acts locally.
The dose of cocaine is one-fourth of a grain. In the U. S. cocaine has been habitually used in excess as a stimulant by a few persons, but the effects are rarely sufficiently pleasant fur the habit to become general.
H. C. Woon.

Coccéius. Nerva: an eminent Roman jurist ; a grandfather of the Emperor Nerra. He was elected consul in $2 \because$ A. v . His leaning is highly extolled by Tacitus. D. about 33 A. D.

Corcéjus, Cocreilus, Koch. or Kokem, Johavaes: theologian: b. in Bremen, Aug. 9. 160:3. He was Professor of Hebrew at Franeker from 1636 to 1650 , wben he became Professor of Theology at Leyden, where he died Xor. 5. 1669. He wrote commentaries of great learning and alility on nearly the whole of the Old Testament, but is best known as the founder of the so-called "Fetleral School" in thenlogy. His doctrine of the eovenants of works and grace is drawn out in the treatise Summu Doetrince de Fredere et Tesfamento Dei (Leyden. 1644; 2d ed. 16.3.3). His Hebreu and Chaldaic Lexicon (1669) was one of the carliest complete Hebrew dictionaries.

Coccejus, Samele, Baron: statesman: son of Heimrich Coccejus (1641-1719), a civil-Iaw jurist: b. in Heidelberg in 1679: became in 1iat Prussian Minister of State, and in $1 \pi 46$ Chancellor to Frederick the Great. Me was the author of a ners code of laws (Codex Fridericianus. 1iti-a0). I). in 1755. See Trendelenhurg, Friedrich der Grosse und sein Grossianzler Samuel von Coccrjus (1863).

Coccol'oha [Gr. коккоs, berry + $\lambda 6$ Bos, pod]: genus of evergreen trees of the Buekwheat Family ( $q$. 2. .), natives for the most part of tropical America. Several of the species hare been grown in conservatories, viz.: ( $\because$ oborata. a large tree of New Granada, C. pubescens and C. urifera, smaller trees of the West Indies and Florida.
(. E. B.

Corco-root: the root of any one of sereral species of aroids of the family A racere. These belong to the genera Colocasiu. Culalium, and others, «bose starehy root-stalks are collected and, after roasting. used as humai food.

C'occos'teus [frum Gr. кбккоз, grain, berry + ó $\sigma \tau$ є́ov, bone, in allusion to the prominences on its bony armor]: a genus of fossil ganoid fishes found in the Devonian of liurope and Canala. The head has distinet bones, covered by bony plates, and the front part of the body was protected by a shield-shaped dursal plate, flanked by smaller phates, and by a single plate beneath. The hinder part of the body was unprotected. There was a dorsal and anal fin, but no peetorals.
F. A. L.

Coreulus Indicus or Fishberries (sometimes called Indien hrriex) : berries derivel from a climhing shrub of the family Menispermortr, which is a native of hmdia. They occur as somewhat kidney-shaped masses about as large as a pea, with a dry, black, som-what wrinkled covering. They possess no oher, but an extremely lasting bitter taste. From them is prepared a tincture which is, however, practically never employed in medicine. Jost commonly cocenlus indicus berries are used for the purpose of thetroying lice in the hair of the heal, or elswhere, but as they contain a very poisonous alkaloid known as picro-toxin it is not safe to employ them in too strong a colution or ton large quantity lest they cause convulsions. Particular caution must be emplosed if the surface to which they are applied is broken. 11. A. H.

Cucrus [from Gr. коккоs. grain, berry, seed: so called becanse formerly supposed to be the seed of a plant] : the trp-
ical genus of the family Corcider, a group of bugs (see HeMurtera) including the scale-insects, bark-lice, mealy-bugs, ete. They are the most aherrant of all the bugs, ther rary greatly in appearance. and even the two sexes of the same species bear but the slightest resemblance to cach other. The male undergoes a complete metamorphosis. has but a single pair of wings, and in the adult stage has no organs for taking food: the female is wingless and has a scale-like or grub-Iike body, frequently eorered with a mealy powder or a wax-like secretion. She inserts her beak in the plant on which she lives and through it sucks her food. As these inseets usually occur in large numbers they occasion great injury he destroying the vitality of the plants on which they feed. V"arious washes of soap or alkali are used in killing them. The cottony cushion-scale (Icerya purschasi), which at one time threatened the orange industry of California, has been almost completely exterminated by the Australian ladybug. From bugs of this family are prorluced the dyes Lierves and Cochineal (qq. $r$.), while to others we owe Lac (q. c.) and China wax.
J. S. K.

Cocliaham'ba: a central department of Boliria; bounded N. by Beni. E. by Santa Cruz, S. by Chuquisaca and Potosi, and W. by Oruro and La Paz: area, 26.668 s 4 . miles. It hies to the E . of the highest mountain-chains, bnt the average eleration is probably 5.000 feet, and it is crossed by many -purs and ridges, some of them loftr. The elevated vallers and plains between these have a delightful, spring-like climate, and are very fertile. There ate extensive forents on the mountain-sides, containing cinchona and other valuable trees. Wheat, corn, potatoes, and coca are extensively raised on the open lands. and there are large floeks and herds. The department is said to be rich in gold, but it is not regularly mined. The principal exports are wheat, cheese, wool, and coca, which are earried over monntain-rods to Oruro and La Paz. Pop. (1888) 1!6, i66. Capital. Cochalamba.

IIerbert II. Smith.
Cochahamha: a city: capital of province of same name in Bolivia: situated in a fertile plain, surmounded br mountains: 8. 100 feet above sea-level (see map of South imerica, ref. $\overline{-}-\mathrm{D})$. A large proportion of the population are Indians. still speaking the Aymara language. Cochabamba was founded in 1465 , and has a number of ancient churches and other interesting buildings. Hand-woren cotton and woolen eloths, pottery, and leather work are manufactured in considerable quantities, and the city is a trading-point for all Central Bolivia. It is very healthful, the mean annual temperature being about $63^{\circ}$ F. Pop. of city (1858) 19,500: with surrounding villages abonf 40,000 . Illerbert H. Silth.
Coche, Island of: See Margarita.

## Cochimi: See Yuman Indiass.

Co'chin: a feudatory state of Madras. British India; on the Malabar coast ; bounded S. W. by the ocean. and on several sides by Travancore and Malabar. Irea, 1,361 sq. miles. The climate is very wet. Here are extensive forests of teak and other trees. Rice, pepper. ginger, yams, and sweet potatocs are among the productions of the soil. Fop. 600,000 . Chief town, Cochin.

Cochin : a seaport-town: formerly the capital of the state of the same name. It is situated at the entrance of an extensive back-water or lasoon, so miles S. S. E. of Calicut (see map of south India. ref. $\overline{-}-\mathrm{D}$ ). The lagoon, which is nearly 120 miles long, and is navigable, aftords raluable facilities for communicating with the interior. Cochin has great natural advantages for trade and ship-building. The Jerss, of whom there are many both of the white and black castes, have a synarogne. alimost the only one in India. Cochin is also a Fioman Catholic episcognil see. Here the Portugnese erected in 1.503 their first furt in India. They were expelled from Cochin by the Dutch in 1663. The town was ceded to the British in 1814. The chief articles of export are teak-timber, cardamoms, coir, ete. Pop, $1 \overline{5}, 060$.

Cochin-China: a name applied to the eastern part of the Indo-Chinese preninsula. See Assim, Tosqua, and CochasĆus: (French).

Cochin-China (French or Lower): a French colont on the delta of the Mwong river; extending from Cape C'amao to about $11^{\circ} 30^{\prime}$ N.. and from lom, $104^{\circ} \mathrm{E}$. to $107^{\circ} 30 \mathrm{E}$. ; bounded N. be Caniholia, N. E. by Annam, and elsewhere br the Chinese Sea aud Gulf of Siam. It is a portion of the former Annamese prorince of (hampa. Area, 23.000 sq . miles. The surface is composed of alluvial deposits is very dat, and is said to be in places below the level of the sea

to Maranhão he reduced that place, remaining there until 1825, when withont leave he matle a cmise to Englant. He clamed that the health of the crew required this, but the Brazilian minister at London aceused him of desertion and ordered him home, whereat Cochrane resigned. In 18:2 and 1828 he hat charge of the Greek navy, but accomplished nothing. After long etforts he olitainet in $18 \% 2$ a "free pardon" for the affense for which he had been convieted in 1814, was restored to the order of the Bath and to his naval rank, becoming rear-admiral by course of seniority in 1854 . Ilis fathers death in 1831 had left him a peer of England. Nuch of his later life was devoted to meehanical invention. and he claimed to have perlectel a system for the testruction of a fleet or fortress at a blow. Ife wrote Naratite of Services in the Liberation of Chili. Peru, and Brazil, and Reminiscences of a Seaman. D. at Kensington, Oct. $31,1860$.

Herbert II. Smith.
Cocinic Acid: a rolatile aeid fond in the butter or oil of the cocoannt.

Cock: in its common and restricted sense the male of the domestic fowl; in a wider sense used for the male of various birds. While domestieated in the East at an early date, since it is figured on Babylomian cylinders six or seven hundred years betore the Christian eria the cock does not appear on Egyptian monuments, nor is it mentioned in the Old Testament, nor by Homer. The first reference to the birl in Greek literature occurs in the works of Theognis, somewhere abont 600 B. . .. where it is spoken of is "the a wakening cock of dawn," The cock has figured largely in literatthre and art, being sacred to Mars, on account, perhaps of his having been at an early date the god of agriculture. In allusion to St. Peter it is frequently introduced into maintings of the passion of our Lord, and it is the emblem of St. Peter. Among the early Christians the cock was symbolical of rigilance, and it was carved on tombs as an cinblem of the resurrection, metaphorically signifying the coming of light after the niglt of death, or annomeing the general awakening of the resurrection. See also Fows. F. A. L.
Cockade: a hadge, usmally in the form of a knot or rosette, worn on the hat or cap by officers of the army or nary; also at times ly citizens as a party distinction. The Boirbon cockale in France was white that of Spain red. During the Revolution of 1:s9 the French people generally assmmed the tricolored ribbon (red, white, and blue) as a hange of patriotism or the symbol of the new régime. The army also wore the tricolored cockade unti] the liestoration. when the legitimists resumed the white color. It became also in the U.S. a badge of the Jeffersunian Republicans until war seemed impending with France in 17is. In Great Britain a white rose was the hadge of the Stuarts, and became a favorite theme in Jacobite sengs after the stuarts had ceased to reign ; the yellow cockade was introducel into (ireat Britain with Willian of Orange, ant the black with the house of Hanover, and was a mark of both civil and military rank. Thence it passer] into use as a part of the livery of coachmen and other servants.

Corkatoo [a word derived from the cry of these birds]: a common mane for the members of the family Cacatuider. a group of large parrots inhahiting Aust ralia, New Guinea, the lhilippines, and some of the alfacent islands. They are distinguished by conspicuons crests, large bills, moderate wings, and large, slightly roumbel tails. 'Hhey nsually associate in large flocks, breed in hollow tres or wevices in the rocks, and feed on tront, seeds, and the larve of insects. Their cry is harsh, and as a rule they do mot readily learn to promomer worls. The sulphur-crestel comatom, so frefuently som in menageries, is the best-known spereis. It is a native of Anstralia, and in some localitios does great damage to growing crope, being in consequence shot without merer her farmers. Leadheater's corkatoo (Geculue leadbrutrio), in allied speciosalso from Anstralia, is white, tinted with rose color, which deepens to salmon untur the wings. The base of the crest is crimson; but this. like the yellow of the preceling bird, does not show muless the erest is open. Thes great black cookatoo, Nicroglossum aterrimum, found in Now duinea, is the largest of the parmots. It is distinGuished ly its emommen thll, bare, ret checeks, clossy black phomare, and long cylindrical tongue which is tipped with a horny pint.

The raven cockatoos, of the genns Celyphorhymehns, have longer tails and smaller crests and beatk than those previonsly nescribed, and also ditier from them in not assembling in large focks. The gencral color of their phmage is
hack or dark brown, and the tail usually has a band of red or yellow. They are residents of Australia and Van Dieman's Land, and, with other species, formerly played an im-

portant part as an article of fond among the natives, who killed great numbers with the kiler, or boomerang. Like the Carolina parrakeet, they hover about a dead or wounded

The bird builds a nest, something like that of a chimney-swallow, on a large seale, in holes and fissures among the rocks. The featlers are much used by the Indians in ornamental work, and the skins are largely exported.

## Cock of the Woods: Nee Capercalzze.

Cockpit: in a ship of war, a roon where the wounded men receive smrical treatment during an action. Fommerly it was situated under the lower gun-deck.

Cockran, Williay Bocrke: b. in Ireland, Feb. 28, 1854 ; educated in France and in his native country; removed to America when seventeen years of age; soon after his arrival received the appointment of teacher in a private academy ; was prineipal of a public school in Westchester co., N. I.; while engaged in teaching read law, and was admitted to the bar in 1si6; was a member of the Fiftieth Congress; was a member of the commiswion to revise the judiciary article of the constitution of the State of New Vork; was elected to the Fifty-second and Fifty-third Congresses as a llemoerat. Mr. Cockran is a prominent leader in Tammany lIall, and has won mational distinction as an orator,
fockroach, or Roach : a common name for a large number of flattened insects belonging to Blutta and allied genera of Olituoptera (q. $i_{\text {. }) \text {. They are adapted for ruming, }}$ and have the head drawn back under the plate-like prothorax so that it is not visible from above. The wings are of little use in flight, and in the females of some species they remain undereloperl. The females lay their egrs in a satchel-shaped cocoon, which they carry about with them for a time. The roung which hatch from the eggs closely resemble the parent in all but size and lack of wings. The larger proportion of the species live in the forests, where they feed upon decaying wood, etc., and are of little importince to man. A few species, however, exhibit a considerable partiality for homan society and have followed man over the worlel. Of these the most ubiquitous in the $\mathbb{C}$. S. is the small imported species known as the "Croton bug," or "black bectle" (Ihyllodromia germanica), which multiplies rapidly and is dinlicult to exterminate. It is most apt to congregate about waterpipes, and with its tlattened borly can hide in the narrowest cracks. Most ellicacious in ridding the premises of these pests is borax or insect-powder, liberally and perseveringly applied. 'The larger "common cockroach" (Blatta or Periplameta orientalis) is fortunately less common with us. It is about an inch in length, blackish brown in color, and ommivorons in its diet. It infests houses, and espeeially mills. bakeries and ships, and gives a disgusting smell to everything orer which it passes. Its original home is unknomn ; it first appeared in Europe 200 years ago. Some of the tropical species are even larger, reachingr a length of $\underset{\sim}{2}$ inches. Fossil cockroaches oceur in the Coal period. See Enjomology (Fig. 7). J.s. Kingeley.
('ocks'romb [from the resemblance of the heat of flowers to the comb of a cock]: the Celosia rristata, a tropical plant of the Amaranth family, cultivated for its showy flower-crests. These crests are elusters of very aumerous small and ineonspicuons flowers which are agereqated on a nore or less flattened or fasciated stem, the hrilliant searious luructs producing the ornamental effects. The species is an umnal of easy cultivation. It was formerly very popular, hut it has suffered somewhat in reputation in recant years from the int rotnction of morr sraceful plant forms.

Corles. ku'kleez, l'rabils Horatiles: hero of liome who in 507 B . C., with two eombanions, detended the bridge over tho "libur arainst the whole anny of lars lorsena while the bridge whs destroyed behind him. wherenpon he planged into the river, ansl, although nemmbered with his armor, ruached the opposite shore in safety. Ile was rewarded with as much lamd ns ho conlel plow around in a day, and a statue was ereeted in his honor. II is memony was held in great woteem. Namanay has familiarized the legend in his Lays of ilnrient liome.

## Comal : Sice ('Arso.

('aconnut: thre fruit of the Corns mucifera, a tree of the
 tuguese for monkey, in allasion to the resemblanee of the emb of the mut to a monkey's face] includes about thirty speries, all tronical, and monrly all American. "lhey aro tall or low trees, with slember or stout stems. bearing upon Heir summits a crown of widely sprading. mostly smonth, pinmately compound lawes. The stems are at first covered
with the closely cowded bases of the old teaves, and when these fall away the surface is ringed and nearly smooth. The flowers are moncecious and are borne in spadices which appear in the axils of the leaves. The staminate flowers are irregular in shape, and contain small sepals and petals and six stamens. The pistillate flowers consist of sepals, petals, and a three-celled ovary, each with one ascenting ovule. In the after-development of the ovary but one of the orules continues its growth at the expense of the others; the fruit is therefore one-celled and one-seeded, there remaining nothing but mere vestiges of the other cells in the form of narrow crevices in the fruitwall. The embryo is relatively small and consists of an elliptical or nearly cylindrical mass (in the cocuanut from a thisd to half an inch long) lying in the great mass of endosperm. The position of the embryo may be made out esternally by the thinner areas in the bony shell. It will be seen that there are three thin areas, one fur each of the ovules originally formed, and the most marked of these indicates the position of the embryo which is developed. In some species the cndosperm is solid throughont, but in the cocoanut onls the esterior becomes firm, the central portion heing filled with watery contents, the socalked "coeoanut milk."

The cocoannt propel appears to have come originally from the last Indies, but it las been so long in cultivation that it has become widely distributed in all hot regions. The tree attains, when well grown, a height of 50 to nearly 100 feet, and its leaves may he as much as 20 feet in length. The nuts are borne in clusters of a dozen or more, and on the tree are covered with a thick covering of fibers, while each nut is imbedded in a firm, woody hask. It is innossible to enumerate here all the uses of this most valuable tree, and we may well quote the old adage, its uses "are as numerous as the days in a year." No part of the plant appears to be useless, and these mses are not confined to tropical climates. Thus the fiber from the spathe is used in the making of ropes, matting, brushes, brooms, etc.; the fiber from the stems is extensively used in the manufacture of brushes: the shells are made into ornaments: the contents of the nuts, in addition to fumishing a mutritions food to people throughout the civilized morkl, viehls also a rahuable vil, of which large quantities are imported and nsed in the making of candles and for bnming in lamps.
C. E. B.

Cncoa-plam: the edible fruit of the Chrysobalanus icaco, a shrub of the tamily Rosaceu. growing in the sonthern part of the U.S. and the West Indies. The fruit resembles a large plum, yellow, purple, or black in color.

## Cocoon: See Curysalis and Silkworsy.

## Cocos Islamds: Sce Keeling.

Cod: the Gulus morrhua; a fish of the family Gadider, the most abundant and important member of the group. The general ajpearance of the fish, which ordinarily reaches a length of 3 to 5 feet and a weight of 10 to 40 lb ., is shown

by the cut. Fish of 50 or 60 lb . wefght are not uneommon, and exceptional individuals have been taken weighing from 100 to 150 hl . The color is somewhat rariable, being inlluenced by food and surroundings, but is nsatlly brownish or greenish, although it may have a red or yellowish cast. The back and sides are marked with numerous dark spots: the latoral line is light and the fins dark. It is found at moterato depths, 10 to 150 fathoms, in the North Atlantic and lacific, and while ranging south to Japan, Oregon, and Virginia, is most ahmolant in the nortlern portion of its habitat. Cod migrate with eonsiderable regularity from deep into shallow water, or rice rerar, being inllnenced by temperature, or hy the pursuit of food, or for the purpose of spawning. The eggs are small and cxtremely numerous, a fish weirhing ? 1 1b. containiner $2,700,000 \mathrm{eggs}$, and one weighing 7.5 Ih . the almost incredible number of $9,100,000$. The period of pawning is protracted, lasting, on the coast of

he unfit for publication．At Tischendorf＂s suggestion the monks were at last persmanded to offer the whole corlex as a gift to the grati monarch whom they reongnized as the shield and lonlwark of the Eastern Churele ：andin a little Jess than eight months after his discovery of the treasure they committed it to his hamels to be bume to sit．Petersburg －to be ladd for a time，however，as a han mate simply to facilitate the publication of an aceurate edition，until the confirmation of their new arelibislops election should en－ able him to present it formally to the emperor，as he after－ waml did．

The rodex Sinceiticus is whitten upon vellum sheets of ex－ treme fineness anll beatys the delicate skins of antelopes or of wild asses（prohably the former）．It consists of 346 leares， of which 199 contain 2.2 hooks of the Old Testament and Apocrypha in the septuagint version，hegiming at the first bow of Chronicles；while the remaining $14 \dot{\text { i }}$ present the whole of the New Testament，the dipistle of Barnabas，and a part of the Shepherd of llemmas．（To these shonld be added the 43 leaves of the（ordex Friderico－stugustomus．）It is written in mocial letters of exceeding beanty and simplicity of shape，approaching closely to the forms of the hest paprif． such texting characters as alpha，helta，epsion，pi，and sig－ mat are as unadorned as fossible，without flourishes，knous， or the kened joints at their extremities－a pronf of antiqui－ ty．It resembles the I＇atican Codex in the absenee of imitial letters larger than the rest，which seem to have been regn－ larly used after the begiming of the tifth eentury．It Ias but litnle punctuation，and that in the oldent manner．Its peculiarities of arthugraphy and et ymolagy belong to a pe－ riod as cirly as the fouth century of our era．It is conspic－ uous fur the brevity of its titles ant subseriptions－c．g． ＂Aecorting to Matthew，＂＂Acts，＂＂To（the）Romme＂， Longer titles，as＂The 1 loly Gusiel acending to Mattlew （wrongly tramslated in oul version＂The Gospel aceording to St．Matthew＂－Home＇s Intruluction，Bd ed．，p．410），ware not introlucerl motil a later date．

It has，morenver，certain other signs of antiquity peenliar to itself．It has alwas been regarded as one of the striking broots of the remote age of the $\mathrm{l}^{\text {ratican Codex }}$ that it is writ－ ten in three columns on each phge，presenting to the eye， when the book is open，six namow colnmms at onee，thereby the more clusely resembling the aplename of the ane ient zolumine or japyras serolls when extended for realing． Just an in the first tomks printed after the invention of printine many of the pecoliarities of the manuseripts wore carefully imitated，so when mamseriphs began to be written on leares instead of scrolls it is uatural to suppose that some of the peceulasities of the ohler form wonld be retained．A very fow other mamseripts have been found with the same nmmber of eolmmas on a pare as the laticur．But the Simnitir（oolra stands aloum among known mamoscripts in presconting funr narrow columns omi a pige，seldom exceet ing ？inches in breath，and eight eolumis at once when the book is opened：so that its clams io the benefit of this argument for antiguity are the strongest．This fact，with certain other indiations，remders it probable that this coules was copurd directly fom an old Eryplan papyrus manu－ seript．The remarkibly large size and great heanty of the vellum sheets is anotleer prowi of high antiguity．In size， indeed，they are the largest known，＂rach page being aven at present as large as $13 \frac{1}{2}$ inches in lemghth，hy $14 \frac{7}{8}$ ineles high，although marginal wotes have sommetimes deen partially cut off by the ancient himber．＂A single amimal could cunt tribute only two leaves，on one sheet，of such umsmal size． As time went on，smaller and coaser sheets of pareloment took the place of the exquisite vellum used in the ohlest manuscripts．＇lhe peculiar moler in which the hooks of the Bible foblow each other eormeromis with what Epiphamins， who flourishal towam the end of the third eentury，testifies to asexisting in some manmseripts of his day，amd proves that the culex wats written before ont present inder lad be－ come astahlished；while the presence of the Epistle of
 tion that it was writtern hefore the age of Cyril of Jermsalem
 Those divisions ealleal＂the latger chapters．＂with their cor－ resputhog summaties of contonts，which aplear in all the conpies of the（fospels writton from the fifth century down－ Warl．are wanting in thesinstice and Vaticun mannseripts alome．On the wher hamb，tho simaific＇orlex exhibits the Ammonlan aretions and Ensehian canoms in red ink in the marcins：which，if written ly the original（opyist，prove that the mannarpipt can not lie nseribed to an emplier date

Cod-livire Oil (ollom morthed) : an wil whane ifrom the cend (fotus morrhuat), in wlich the tissue comatain f the oil ss almos entirely eontinet to the liver. (ivel-liver nil is propard in Great Britain, Newfommant, and the [. S.
but chiefly in the northern part of Norway. There are three varieties in the market-pale, pale-brown, and dayk-brown oil.

Until the year 1853 cod-liver oil as a food and therapentic agent was, in fact, no more thath in crmike prodnct of tomestic imbustry, diflienlt of ingestion, anel not well supported by patients. who, inded, would not have tonched it had they known of the loathsome details of its preparation. Physicians, though in a measure aware of the oljectionable features attendant mon its manufacture, and cognizant of its tendency to injurious decomposition, continued as a matter of necessity to preserihe it, while they were unable to employ it in those cases in which it was most needed-that is, for those conditions of phthisis and struma in which the eligestive organs were in a supersensitive condition. Peter Mïller, of Norway, took the mamfacture of col-liver oil ont of the hands of the fishermen, and in 18.53 he succeeded in introducing his celetrated steam process. In this process the livers are taken from the tish and treated as soon as possible after heing receiven. Small, bruised, amd diseased livers are rejectet, and the selecterl livers are washer until free from blont. membrane, and other impurities. They are then minced? to a pulpy mass, which is phaced in an apparathe and heated externally by steam to the degree of 100 to 102: F. The oil as it exutus is drawn and filtered. Fresh livers and low tempratures give a pure. swect, light, but brilliant anber-eolored oil. Fery pale or colorless oils are artickes which have been subjectect to deleterions bleaching pocesses. The darker oils prepared in the ohd way are now considered as unfit for thrempentic use. The light oil prepared by the Peter Möler process is not a refineh product, Dut the pure, fresh oil, as it existed in the hepatic cells of the living fish.

The constitution of col-liver oil has ever siner its appeatrance as a therapentic remedy: been an object of curiosity to scientists, who, armed witli the latest amp hest analytichl weapons of chemistry, have tried to solve the mystery surroundiag this ratuable agent. The first chemical research on ond-liver oil dates as lar back as the year 1828 by Whrzer (Ilufel Journ., 1832) ; the most elaborate work lif latir investigators was dune by De Jongh in 184:3 (Disquisition romprentira chemica medira de tribus oblei jecoris aspli sprciebus, 1843). Amony more recent workers may be mentionel schafer (Higger's Johresh., 18(6)) P'. (harles (Ph. Centralh., 1882); hremel (Ph. Centrall., 18ی4): Hager (Ph. 'entralh., 1885): Gratier and Morgues (Les alcaloides de lomite de foic de morue, 1888). All these agreed that the main part ( $\%$ on-98 per cent.) of the oil consisted of the three glyecribes, olein (about 00 per vent.), palmitin, and stearin (together about $25-28$ per cent.). These compomms being the regular emstitnents of well-known fats, no importance was athached to them. but diligent search was made to fint the active principle in the remaining part of the oil. A variety of things was thus fomm, one by one of them being in succession presented by their hiscoverers as the muchwanted puacea. such. was the state of affairs when P. Heverdahl, Peter Möller's chemist, in 1891 succected in establishing the fact that the three above-named glyeerites do not form the chief constituents of the oit, but, if present at all. they are sis to a very limited extent. On the ot ther hand. he fomm that the fats of the oil consist of some hitherto unknown glyceritles. The arids of two of them lue sueceeded in presenting-one as a bromble, the other as a hymoxy anicl. To the former he gave the name of therapic acid ( ${ }^{1}{ }_{17} \mathrm{I}_{20} \mathrm{O}_{2}$ ) and to the latter the name of jeenleic aeid ( ${ }_{10} / \mathrm{I}_{36} / \mathrm{O}_{2}$ ), cach heing presenterl in the oil to the extent of athout 30 per cent. Therapie acid in the form of at glycerite is maily attacked by oxyren, forming hyhuxy acials. which shoubtlios canse the well-known repeating after a lose of conl-liver oil. hecause this umplomant effect hees mot appear after taking the oil never expeniol to the adion of air. The isnkted amb is still less siable, so much so that it hat hitherto frust mater all attempts to prosent it, no matter how arefully the experiments are mate. As will be seen from tho formala $\left({ }_{17} 11_{28}\right)_{2}$, it is an unsaturated aeid with four
 arifs. whith las hitherto renaimetl completely unkinwn. thengh the posibitity of their existence has for a kong time Inedn themotically maintained with mueh certainty. After Ileyordahl's disemery there can be no donht that con-liver coil iowes its unsurpasisel etlieacy as a material for buiding up, the human syacm to this acid, on accomat of the greit (ase with which it is broken upsan alapted to the formation of these other compemmls of which the organism in its
expenditure and change of matter is constantly in want, The many and varied componnds which have been found in the rest of the oil and proclaimed is the active principle, such as gatuin, morthuin, mortmol, asellin, etc., are nothing but decomposition products formed during the process of anatysis, or by living micro-organisms atter the oil has left the hepaitic cells. The jecoleie acid and one or two other acils, with one louble linkage, have not yet been suthiciently examined. together with therapic acid-all of them in the form of glycerides make up the bulk of the oil. palmitic acid being present to the extent of abont 5 per cent. Of stearic and oleic acid there is still less, if any at all. That part of the oil ( $2-5$ per cent.) in which the active principle formerly used to be lonked for consists of cholesterin, albumen, traces of iron, manganese, sodium, calcium, magnesium, phosphor, chlorine, bromine, iotine, coloringmatter (lipochron), and smme other not yet recomized componnds, probably decmposition prodnets of the pure oil. From this it follows that cod-liver oil should be kept from any contact with the air until it is to be taken by the patient. It is commonly taken in doses of from a dessertspomful to a tablespoomful three times a day.

Rasmus B. Anderson.
Codman, Jonx, D. D.: Congregational divine; b.. in Boston, Mass, Aug. 3. 1282: grabuated at Harvard in 1802; studied in Edinhmegh, and became pastor of a church at Dorchester, Mass., in 18018, and so remained till death. He was a prominent inlocate of clerical education. He published many semons, and bequeathed his large library to the Andover Seninary. 1). in Dorchester, Dec. $33,184 \%$. see his Mfemoin, with six sermons, by Rev. Dr. William Alten (Boston, 185̈4).
Col'rington. Sir Edwarn, (i. C. B. : an English admiral; b. in Gloncestershire. Apr. 22. 1 aro. He served as enptain of the Orion at Tratalgar in 1805, and hecame a vice-andmiral in 18:1. He commanded the English, Freneh, and Riussian thects which mefeated the Turks at Navarino in 1897, and was recalled on the pretext of having gome heyoml his orders; became admimal in 18:3\%. D. in Lamdon, Apr. 28.18 .51.

Codringtom. Sir Willan Jonx, G. C. B. : generat: a son of the preceting: 1. in N゙N... 1804 : etucated at Ifarrow and Sandhurst: entered tho army in 18:1; went with the Coltstream (inards to lbulgaria in 1854; was mate majorgeneral by lirevet while at Jarna, and distinguished himself both at the Slma and at Inkerman in 18.54, and directed the attack on the Redan of sebastopol in Sept., 1855. In November of the same year he became commander-in-chief of the army in the Crimea, a member of Parliament in 1857, and in 18:9 governor of (iilnatar. In 1863 he was promoted to the rank of general. amd in $1877^{\circ}$ he was phaced on the retired list. 1). Alug. 8. 1s84.

Co'drus (in Gir. Koboos): the last King of Athens: is supposed to have reigned athout 1060 ह. с. According to tradition, he sturificed his lif( for his country haring a war between the Athenians and tha Dorians. Ai oracke having predicted that the people whose king was shan by the enemy should be victorions, Codrus went in disquise to the Dorian camp, and prowoled a cquarrel in which he was killed. His son Nedon was then chosen archon of Jthens. See Athers, Inetrist.

Corllicjent [from lat, ern- + efficiens, -enlis, effecting a result, pres. pite, of effi irref]: in algebra, one of 1 wo simple or componnd fictors whese product constitutes a term. Thus in the term $2 a b^{2} r$. $2 u b^{2}$ is the eoefliciont of $r, D_{t}$ of $b^{2} c$, and $\xrightarrow[\sim]{2}$ of abor. In the latter case 2 is frequently called the "namerieal eroflicient" of the term, the others benge distinguishod as " literal corflecients." In an algehraieal expression, and esperially in atantities whose terms involve constant as well as wimble factors, it is manal to restriet the tarm" "codlicient" to the former.

Cochorn, kühom: sin hamed from Baron van Cochom, who inventel it : a small mortar, frepuently a 24 -pounder: Comhorns, boing asily moved amd taking litile powder, are found wery useful in simges, if grouped in grat numbers. Ther are generally made of bronze.

Cochorm. kon'hön. Lient.-Gen. Mexvo. Barnuran: Dutch military engineer : a contemporary and opponent of Vanban; 1. near Leenwarden. Fidtoris（hF＂ 1 ERiLI）．＂
Collece［lr．．Span．，and Portuge cufé；Ita］．caffé；Crerm． Ruffer；etc．First nsel！in the seventeentla contury］：（1）the berries of Paffere efrebien，a tree whidh when wild reaches a loight of $100^{\prime \prime}$ to ：$: 0$ fort．and bears bint fow branches：and？ （2）a heverage made from these berris after romating imm griading．The trae erpows wide in Contral Atric：and in Mowambifur，and originally was a mative of Abysinia and Arabiat．

It was first cultivaterl in Java during the seventeentla century，and latur in the TVest Indios amu sonth America． The tree is at prosent cultivated in moaty all the tropical and suls－tronical countries of the worlel．I distinct species of coffeeplant is the so－cabled Librian coffee－plant，which sems to be mome lamely than the C＇affere arubice amd there－ forr more cisily cultivited．

Inast of the colfue of iommerce eomes from coffep－planta－ tions which are lain out in qualrangles，the groumb in which they grow hoing kn！well wenderl．When cultivated the tree is very frequently prumed，so that it is only 6 to 10 fore in lutiont，while its bramehos almost tomeh the erround．
 length，leathery and shiny，while the lowers are snow－white，
exceedingly fragrant and small．being clustered in the ax－ les of the leares．It has a succulent fruit which，when it is ripe，is of a thak－red culor，aud which contains two cells， each of which contains a single seed．These seeds are hard， semi－ellijses，and fom what is known in commerce as coffee－ nils，coffee－barries，or cotiee－beans．

There are a mumber of surcies of coffee which rary in their characteristics according to the portion of the world in which they are grown．Unc of the must noteworthy of the varions farieties of coffee is that which is known as Hochar，which enmes from Arabia，and which many persons think is sujurior to any other form．Mocha coffee－beans oecur as small grenish－glay masses of the sliape first de－ seribed．The dava or Hast lndian beans are large and yel－ low iml the ．lamaica smaller and of a greenish tint．

These berries when they are roasted develop an empy－ reumatic oil which is known as eaffeol or caffeone，and when ground into a powder of varying coarseness are used for the purpose of making the leverate which is called ＂colfee．＂in which the active principles of the coffee－name－ ly，the empyreumatic oil and the alkaloid caffeine－produce a charmeteristic and agreable flawor，and provides the per－ son that drinks the beverage with a powerful nervous，cir－ culatory，and respiratory stimulant．Coffee has been in gen eral use as a bererage for about 300 years．

Asile from its effects as an oil calreol，the emprrematic oil of coffice，possesses no linown influcnce upon the animal ecomomy，according to the investigations of Reichert，Mar－ shall，and Ilare．

Caffeine，the alkaloin of colfece is employed in medicine both as caffeine and as citrated caffeine，being soluble in about is parts of water．It is to be noted that citrated caf－ feine is not the ciltate of caffuine，for chemists do not con－ sider that a definite chemical componnd is formed between coaffeine and citric acid．

When taken internally，coffee or its alkaloid caffeine， produces a lapielly stimblating effect．Which is chiefly ex－ erted upon the intellectial portions of the hrain and the re－ flex tracts of the spinal cord．As a result of this，it pro－ duees a marked increase in the rapidity of thought，and enables the individual who takes it to do more intellectnal work in a given space of time than he conld do otherwise， but this is always accomplished at the expense of nervous energy．A period of raction is very apt to follow its use， and ultimately a lman driven along by caffeine breaks down， or at least is incapable of doing as much good work as be－ lore coffee or cathuine wore resrrted to．Coffee also stimu－ lates the heart－muscle and the general circulatory system． The kithers under its influmee are also stimulated，and both the liquids aud solids of the urine are increased in quantity．It the same time it diminishes the waste of tis－ sues．The empyremmatic oil of which we have spoken is probably the canse of the＂biliousness，＂so called，which is produced by coffee－drinking in sume persons．As much as from 20 to 30 minims uf this nil is present in an ordinary enp of strong coflee．Fither when in the form of a bever－ age eoffee is prepared in such a way as to be exceedingly black and strong，or os caffeine，it is exceedingly useful in many cases of heart and kidney lisease，and is of the ut－ most value in the treatment of opium－poisoning．some－ times when ton much calfene is given for a considerable period of time as a melicament，it eanses so much nervous excinment as to produce delirinm．
（＇affeine is an allialoid which is closely allied to guara－ nine，theime，and thentromine，and it is siated on gome atr－ thority that most of the su－culled confeine of commerce is in rality theine derived from damaged teat．as this somree is a much chearer ame than coffer．It is wortly of mote that while coffee is more ant to protuce bilionsmess than is ten， tes．on the other haml，is more alpt to protace consti］ation， becanse of the tannic atid whirh it contains．
［＇ufortunately，a numbrer of smbstances in powdered form have lne introlucorl into commeree as adnlterants of this rahuable substance，untuhly chion＇y root，harley seets，butck－ wheat，rye and dandelion loot，and sometimes charred hrad eritis armemployed．It is monecessary to state that these adulterant substances are most only frambulent，but that in all instances thay lack the active principles of colfer．Sere the anticle duthteratms．

It is sald that in sumatra the leaves of the trees are used instom of the seeds in propmring a drink．Not only have coffeeleaves bern omploved as a substitute for the ordinary coffee of commorm，but in addition the pericarp of enffee－ fruit has been recommemed as a subntitute．It is free
form eaffeine, and therefore faik to produce the stimmant intluence of that drus. hut the perieary of the seent or lanas do contatin small quathtitics of catmeine, and base leen employed for the purpan of impruting the thator of the cuttereberries themselves. such a cotlee is known as sultan or Surat cotrer.

The objucet of roasting coffee is to remder the seds more radily pulverizably, amil to develop, the paroliar aroma and tasie which is due to the presence of an emplyenmatio oil. of whicla we have spohen. The semb unter thes ciremastances leroome ab chestunt brown, and lase alhout is per cent. of their weight.

Cu'lourt [from Jat, colors, ortis inclosure, one-tenth of it legim: cor-, together + hortus, inclosme]: in the armios of ancient Rome, the tenth part of a legion. aml consisted usially of 600 men. The pratorian cohort was a borly of pieked troops who attemed the commander of the army, ant at a later perionl formed the guard of the em1eror.

The term " fohort" is applied hy some botanists to groups or assemblages of natural ofders.

Coimbatore: at district of British India: presidency of Madras: bommled N. by Mysore, E. by the river C'auveri, which semarates it from the district of Salem. S. by the states of Marlura and 'Iravancore, and W. by the state of Cochin, the district of Malabar, and the Nilgherri llills. It is a llat, open comntry about 900 teet above the level of the sea, simpounded N., If., and $S$. ly mountains rising $!1.000$ fect, but opening eastward into the plams of the (arnatic. Thu principal rivers are the Cauveri, lhawani, Noyel. aml Amarawati. fom which numerous canals lave been cut in all directions for the prome of artificial irriga-
 $2.48,000$ acres, are repurted as being under caltivation. Excellent cotton and tobacco and good craps of grain, wilseerls, and fruit are raised. Extensive thak-foresta are found. Pob. $1,657.6!0$, nearly all Ilindus. The district of Coimbatore was acquired liy the british in 1799. when the war clased, after the death of Tippu. Cinpital, Combstore. Pop. (1891) 46,383.
(Coimbra, ko-eem'biar (anc. Compmbrica) : a city of Portugal ; capital of the province of Beira; on the river Mondego; 115 miles N. N. E. of Lisbon (see map of Spain, etc., ref. $15-1$ ). Tt is built on rising gronma, and seen from a distance has an imposing itspect, but the streets are narrow and the houses mean. Coimbraderives its importance from its unirersity, the only ome in Portugal. It was foumded in 1291, but at Lisbon, and not finally established at Coimbra until $152 \%$. It has a library of 84.000 volumes, and in 1892 had 1,166 sturlents and it professors. It also has a military colleste, a royal eallege of arts, and a botanie garilen. There are speral tine ehmeles: also manufactures of linen and woolen labries, pottery, articles of horn, ete. ('oimbra was fommed by the (sothsomul afterward ocenpied by the Moors, from which it was taken by Ferdinand 1. of Castile in 1064. It beeame the capital of Portugal in $11: 39$ and continued so until 1429. Pop. (1890) 17,329.

Coimbra: a brazilian fort and settement; on the right bank of the river Paraguty, at lat. $19 \quad 55 \mathrm{~S}$. The river is
here marrowed by two opmang hills, and the point has long heen rexarded as the key to the navigation of the uljer Pararuay. The tort was fonded in 10an, and, as the mavigration of the lower Paramay was chosed to the lomtugnese heary camon were bromght up the Amazon, Madorita and timajure, thence draged werlamal to the l'armgay, amd floated down to Coimbra. The spanards attatked the lort in 1 sot . but were repulsed: in Heco.. 1sfit, it was taken ly the Paragutyans. Shout a mile above ('omban there is a remarkathend very large cavern, the firuta do informo.

Coin, kōecu': a town of Spain: province of Matara:
 It has an epriseopal palace and soveral tonsents; abo dine publie waths and gatdens in the envirns. Here are mannfactures of linenand wolen fabrics, paper, and somp. Pop. 1887) 9,825.

Coinare: 1. The art, act, or practice of stampins metallic money. 2. Coin. coined moner; a piece of metal of a sertain weight and lineness issume as a measure of vahee and instrument of exchange be the government and bearing its anthorized stamp. See Mast, Money, Nomemaras, and Wehats and Mensurfs.

Before the invention of the art of coining. traffice consisted of Darter. Among gatoral people values were estimatal in the produce of the hasl. This practice gave way to the nse of different kinds of metals, definite quantities of which tw weisht pased as meacures of value of commontities. such do oxim sum sheef. Hence the nanes carly given to moner: ". or. the Latin permia, from pecus: the English " Pow," from the same ront the therman lieh: and the hatian ruper, from the Nanskit rupa, all meaning " eattle." So, 1 ore, with the shekel of the Baok of dohs there called keviluh, and remdered fyy the interpretess as "lambs."

The art of eoining was practiced in Lydia in the time of Gyges and in the belopmasese in the reign of bhiton of - rases but from the carlies times it has been a question as to mority of invention lnetwen . Sia Minor and the ancient treeks. The system of weights used in both comares is - mpowerl to he of Assyrio-bahymic origin. and to have been trammitted to the shores of the Argean sia by the marly lownician traders by sand land. The sombe of anofent comage weights is believed to have been further transmitted from Peloponnesus to laly. Spains (ianl. and Britam, and thas to have been the derivation of later systems of weiphts.

The eomage of Willian the Conqueror was terived from the lomans, the same as that of Charlemarne in Framee. The measure of value throghout Wenem Europe was the Roman lount woight of silver bullion, and known in
 nally divided into $\partial+4 i$ crins callet ponce (drnarii). 12 of which were ealled a shilling (solidus). Tha entili, or 20 thillings, therefore, actually worbad a jemond of silver bullion. Down to the time of (Geore 15 . muncrons altorations of the coinage took phace in Engtand: so that the pount of silver in coin came to the mud less that a pemat of metal in hullion, until in the time of Elizale th the pemmed weight was roinem into it prices, or 62 shillings, representing the mominal ralue of e: es. In sconland the depreciation of the coinate procecded to much greater lengthes and sill further in Frames and hale. The Fremel lime las Wwidled to a frome the hasis of the modern metrical system of coinage, and the original solidus to a sou.

Gotel coinge wis tirst succe- fully int rowncen into binslame by bilward 11.. but it was not until the reigu of Tharles 11. that the quantity of gold coin was sullicient to prevent it- disapparane from cirenlation. "Then gobl from the (ininea comat of friea was wined into pombls -terling or guineas intemted to the of the watue of elas. in silvar. Disarrecmant hetwen mint rating and market value of gold amb sibwe amb debasemem of the silwe eomage eansel guinens to rion in value and to disaldwar from circulation. Thonath partially rectibed by the reoinate of 16:\% it was mot till 1 Fis that the value of the guinea was setted at 3 as., or the abowe the parity as determined by Nowton, wheng ghld was lixed at the mint price of tes lix.
 to be unlimited leral terner. But, as the true value of the gunce was overratel by td. and silver undermed hy the sime amomit. Jehts were proferably paiol in wrhle, while sibur eoins were exported. Thus giold the mat the rowernized mensure of value in Great Britain, thongh exchathes

Were still in terms of silver, and for an exarly opmosite rusma silver beome the recognized measure of value in France. At the great reeomage of 1616 this chsom passed into haw. Gold was then dechame to be the only legal measure of walue amd lagal tender to an unlinited amount. and the sovereigu (!1) was sicuck to represent the waluent that time of 20. in silver. Sixty-six shillings, 22 (aratom for tim. are coned to at pund Troy weight, $6 ;$ pence to arn cunces giving a value-ratio hetween goled and silver of $1: 14$
 tion of the metric system of wrights amb measures, the has was eatahished for a reform in the currency: the franc. a vilver piece of is grammes, ro fine loming made the unit. Frobl and silver were both to be coined freely at a ration of 15d to 1. Many other countries conformed to the example s.i hy France. Se hatix Unios.

The roinage of American colonies was bacol on that of Enorlaml, but became much deprechatel about the time of the Kevolution. Ha the reforn of cine the spanish milled dollar was taken as a model. "lhe law of fan provided for the coinage of engles of the value of tem dodlars, fo contain 2tit grains of pure gold : half and fuater eargh of correspondine woights; dollars, to contain :31t grans of pure siver, with hatses quarters, dimes, and half-times of correspmoting weights, and cents and halferents of copler. The law of 180.4 roduced the weight of gold in the etyle to 232
 alloy, and ather gold coins were reduced gremmetionally.
 the siluer coins. refueing the grose weight of the silver ilollar from 416 grains to $412 \frac{2}{2}$. but lowing the amount of pare metal modanget. The law of $184!$ authorized the cwinage of gold dollars and of double eagles. The law of 1Nol anthorizel the coinage of silver three-e law of 1 No reducel tha weight of fractional silver coins to
 for smaller picers. It aloo provided for a thredollar grobpieqe. In 1850 the comage of hall-wents was wholly disem-
 In 186. the hronze ernt was subsituted for nickel, mon iwocent piseres of the same metal were ant horized. Fo isfis the roinage ol the nivel threecent was intitutod, ant in 1N66 the nickel liveremt. The act of $1 \times 0.3$ diseontinued the silver hatfolime and three-cent eonage. which had praptially ceasel long before. The ade of 18 and disent iname the comage of the silwer dollat (sersumpr Consam forthis amad for tle ats of 18 as and 1s90): it establisked a trate dollar of 120 grains far use in castem trads, whose combe was limited in 18.6 and abolished in 188\%. The coinate of the
 pice washmbish in 1890.

suspended the eoinage of silver except such as was necessary for trarle with China. In Anstria-llumgary gold ouly has been coined for indiviluals since 1879, except trule silver erims called levant-thalers. The onlr mints open to the coinage of silver for individuals at this time are those of Mexico and Japan.

Millesimal Fineness.-The purpose of nlloving enld and silrer with a base metal in the manufacture of coins is no lnger, as in earlier periods, to dchase the coins, but to increase their durability.

For the jurpose of determining the proportion of alloy best suited to resist wear, experiments have lieen made from time to time-notably in England in 1798, and afterward at the Rosal Nint in London. The composition of 900 parts of pure metal and 100 parts of copper, first prescribed in France in the coinage law of 159.5 , being in consonance with the decimal system of comage. has proved the must durable, and in all respects the most desirable-at least, for gold coins.

Among nations whose coinage is imprortant. Great Britain may be said to be the only one whose gold ewins do not now conform to the millesimal standard ot 400 parts of pure metal to 100 parts of copper: the British proportion leing $\frac{1}{12}$ instead of $\frac{9}{10}$. In the composition of full legal-tendersilrer enins there is even greater nniformity than in gold coins. The standard of 800 prarts of pure silver and 100 parts of copper is almost universal. The more noteworthr exceptioms are the two great silrer-coining countries of lindia and Nexico. India has the sime stamblard for silver as for gold coins-viz. $\frac{11}{12}$ of pure metal to $\frac{1}{2}$ of copper. Mexico employs the anomalous standart of 902. . Holland has a standard of 045 parts of pure silver to 55 of copper.

There is more dirersity in regard to the composition of limitel-tender silver coins. The majority of countries employ either the standurd of the U.S.-manely, 900 parts of
pure silver to 100 parts of copper-or the standard of the Latin (Union. 835 of pure silver to 165 of copper. In some countries a ditference betreen legal-tender silver coins and silver coins of limited tender is mate by adoption for the latter of a lower degree of fineness, or else, as in the case of the snbsidiary coins of the $L^{\top}$. s. . of less proportional weight, but of the same fineness as compared with standard coins. See Latin Unoz.

The following countries have the same system of coins as the Latin U'nion, althongh the south Anserican states, with the exception of the Argentine liepullic, have the silver standard-viz., Argentine Repmblic. Rolivia, l3ulgaria. ('entral American states, Colombia, Ecuador, Peru. Fiomania, servia, spain. and Venezuela.

Free and Grutuitons C'oinage: Seigniorage.-Free coinage exists where any man can take bullion to the mint and have it male into coin, either gratuitonsly or with a deduetion not to exceed the actual expenses of coinage. Both Great Britain and the U. S. have free comage of guld: but in Great Britain it is gratnitons, while in the U.S. it is not. Any deatnedion in excess of the actnal cost of eninage is known as seigniorage. The objects of seigniorage are many -sometimes to debase the coin for the sake of the fiseal exigencies of the government: sometimes to secure money like the fractional cuins which shall be secure from the danger of being melted down for exports or for use in the arts. In all cases of this kind the govermment makes an apparent profit on the issue of all such coins: bnt, if this is carried far, especially in the "legal-tentler" coins which anyone must receive in payment of all debts, it is subject to great danger.

Falue of Foreign Coins-An authorized statement on this subject is published quarterly br the secretary of the Treasury. The statement for Oct., 189?, is as follows:

VALUES OF FOREIGN CONS, OCT. $1,1 \times 9 \%$.

* cold the nominal staudard ; silver practically the standard.

In estimating the whe of foregn enins the same practice has heen followen is horetotore．The value of the monetary unit of cenntries having a gold or domble stambard was as－ certained ly comparing the amonent of pure goble in such unit with the prure endel in the $1^{\circ}$ ．S．donlar，atul the silver coins of and countries were griben the same valuation as the corresjanding guld enins with which hey are interehange－ able by taw．

In combries having a silver stambard，the values of the silver cons were fixed at the comberem walue of the pare siver contained in sach emins．It shoud the foted that in mathy of the countrixs put down as having a silver stamderd， the abolition of free comage of siker makns this statement protically untrue．

miles from Pittshurg. It is a slender prong, aplarated from the Upper Coal Momares, and may be regirmed as extending from s. of Latrobe, in a southwesterty dimetion to the Tirginia line. forming a hasin some 3 miles wite and $\overline{50}$ miles long, ahmost withont a fanlt, the beds yiehing from 8 to 10 leet of workable conal. The same trongh that contaius the Comellsville conl extents northwesterly from Lat trobe. but the Connellswille remion is requated as extenting no farther N . than this peint indicated: the district N . of it being designated as the Upper Comellsville, ur "wnised coal" district. which in 1888 prodnced 441.966 ton of coke. The other leading districts of Pennsthania, with their ontput in 1888, are as follows: Allegheny Mountain. 33.5, 689 net tons; Clearfieh Center, or snowshoe, $115,33,3$ net tons: Broad Top, 119,469 tons: Pittsburg, 264,156 tons, and Reynoldsville-Walston, 253,662 tons. The State next in importance is West Virginia, with a profuct of $531,26 z$ net tons, from the oller Xew River and Kanawha and the Upper Monongahelia or Northern districts, and from the youngest and most vigorous, the Pocahontas Flat Top, which supplies the furnaces of Virginia, and largely those of Tennessere and some sections of Alabana. Tennessee produced in $1888: 385.643$ tons amd Dabama, to supply the heay refuirements of the birmingham iron region, made 50x,511 tons of coke in 1888. In the Rocky Mountains, Southem Colomdo makes nearly all the coke used by the local industry and the lead and copper smelters. In the last few years experiments have been male in coking at the hearl of Lake Superior, coal conveyed to that point from Pemsylvania, in order to smelt the cheap and rich ores of Lake superior, using the pig iron male as the hasis of iron manfacture to cover the reguirements of the growing Northwest. See Jos D. Weeks"s Ifrenffacture of Coke: Report Tenth Census and Anmal Reports, by Joseph D. Weeks, in the Mineral Resumeres of the Unitet States, published by the U. S. Cicohogical Survey.
C. Kirchuoff.

Coke, Sir Edwird : jurist ; 1, at Mileham, Norfolk, linglam, 1502; educatel at Trinity College, Cambrilge, Cliffort's Inn. and the Jnner Temple; rose rapidly in his profession, becoming sulidor-generial (1.592), Speaker of the Honse of (commons ( $15!3$ ), attorney-general ( 1594 ), chief justice of the common pleas ( 1606 ), and chicf justice of the king: hench and prixy comeilor (1613). During the carly part of his career his regard tor royal favor betrayed him into a certain harshness and unfairness towarl those bronght before him for trial, as, for example in the cases of southampton and Essex (1401) and in that of Raleigh (1603), Dut ifter his appointment to the common pleas his attitude changed to that of a stromg supporter of civil rights against royal eneroachment:- The attempt of the king to give tos the roval proclamation the force of law was stoutly resisted by Cuke, who won over the other julges to concurrewe in the apinion that such an assumption of power was in violation of the trablitional rights of Linglishmen. His appointment as chicf justice of the king's bench was designed to bring him to a more compliant spinit, while at the same time it male way for the promotion of his ohd eneny, Sir Fram is Dacon, bit the warning was insuthicient to deter him from opmosing the exprose of arbitrary power by the king, ami three Fers: later he was removel from wife. Then tolbowed the moat brilliant perimb of his life. He became an conemy to the conrt party, and as member of larliament in 1fet Was one of the foremost champions of partimmatary privilegr against the king's attacks. Ite heew np the great protestation in support of the right of freedom of debate. The king tore it from the journal of the lemes, dissolved Parliancat, and Coke paid the pomalty of his \%eal by a ninemonths imprisomment in tha. Tower. We carriel lis opro-
 was framed and pasion hargely through hisefforts. He died at Stoke Poges in 16:34. Th arolte and able lawrer and a man of deep leaming and fempess chamacer, he lacked the sulf-poise and cothmess of temper that should dist inguish the jurdge. Of his Foue Institutes. the st-tellew cole upen. Litiletom is the most fatuons, and is still :l work of real value. Ulis Lane lionots are equally woll known.

Coke, Thomas: I). I., Lha. It.: the tirst hishop in the $\mathbb{U}$. s. of the Mathotist Episeopal Chureh; b. in berem. Wrales, sept. 9, $17-17$; edtucated at oxford ; became a minister of the Churel of Fhelani, but sulserpurntly joimet Wrasley, and was a moat hahorinus and fiathful itimont. He was mate a bishop for Sumpiat by Wedry in 1ast; ordaned Ashary the same yerar as joint superintentent of the
church in America, hat did not confine his labors to this country, He traversed Great Britain and Iretand trequently, and (rossed the Atlantic eighteen times. He fomnded the Wesleyan missions in the East and West Indies, in Gibraltar and sierma Lenne, and expenderl nearly all his harge fortune in these umbertakings. 1). May 2, 1814, on a royage to India, and was huried at sea. Ile was it voluminous writur and left a life of hexley (1792) ; Commentary in the lloly Srriptures ( 6 vols., 180:3-07): II istory of the West Indies (1808), ete. Sece stevens's IIistory of Methodism, aml Inistory of the Methodist Episcoput Chureh.
Cola (more correctly hota) : the mut of the Colu acuminotu, a tree growing in Africa. It depends for its activities upon two alkaloirls, colanine and caffeine. Its action upon the boly is partly that of coffee and partly that of coca. As a drug its exact value has not ret been delermined. It has been nsed in sick headithe, sea-sickness, and feebleness of the circulatory and nervons systems.
Col'ban, Adolpinine Marie (Schmilt): Norwegian novelist: b. in Christiana, bee. 18. 1814: d. in Rome, Mar. 27, 1884. Her best story is perhaps Jeg lerer (I Live, 18io): others are En grmmel Jomfru (An Old Main, 1879) ; Cleoputru (1880); Thyra (1882). She also wrote translations and short tales.
G. L. K.

Colberg, kil'birch : seaprot-town of Prusia: province of Pomerania, on the river Persante near its entrame into the Baltic; about 143 miles N. E. of Berlin (see map of German Empire, ref. :-11). It has a handsome lathhaus, an ohd cathedral, satmon and hamprey fisheries, commerce, and salt-works. It has snstained several protracted sieges. Pop. (1890) 16.99!,

Colbert, käl hatr, Jeax Baptiste : statesman and financier: b. at Rheims, France, Ang. 29, 161!) ; entereal the service of Cardinal Mazarin 1648; became sectetary to the yneen 1654. Mazarin at his death recommonded Colbert to the king, who in 1660 appointed him controller-general of the finances, which were then in a minous condition. The annual rewenue exacted from the people in 1660 was about $84,000,000$ livres, bat only $32,000,000$ were receivel into the treasury, the reet being kept ly the famers of the revenue. ('nlbert retormet) the financial system, and established order and economy in the government. In the carse of twenty year's he raised the gross reveme to $115,000,000$, while the expense of collecting it was rednced to about $30,000,000$. He promoted tommerce and mamfactures, opened canals and roads, and founded colonies in A merica. the also made reforms in the Department of Marine, of which he was appointed minister in 1669. No minister perhaps ever contributed so mueh to the prosperity of Framer. He was a liberal patron of litcrary and scientific men, and was the founder of the Acalemy of Inseriptions and Acadeny of Sciences. Ifis intlucnee at court was undemined by Louvois, and his etfurts to dissuade Louis XIS. from his minous wars and extravagant expenses were mavailing; but he retained the office of controller-gencral until his death. I). in Paris, Sept. 6. 16世3. See Gmirtault, Collurt, Ministre de

Colborne, Lasgmox ; mganist and (ommoser ; b. in Lomdun in 18:37, and whemet there. In 18(i) he was organist of St. Michacl': ('nlloge, Tenhary, and remained in that position for fourtem Years, taking his degree Mus. Bace. during that periox from Cambrilge Vnixersity. In 1807 he sucecedrul the lite Townshent smith as organist of Hereford Cathedral, where he still remains. Ilis compositions are chiofly church masic. that they inchude one oratoris, Somued. for the Ilemforl festival of liss.

Cold: abseme of teat. Tn the popular neace eold is a rehative form, the distintion hotwen it and heat depmoding uphn the assumption of some arbit rarys stanctarl of fomFrison, as, for instance, then motmal lemperature of the
 somght for the greatest cold, and in the older lit ratume one meets with variou- lreazine mixtures which were shly med
 howerer, the mather has been put upom sementifice hasis, and we maty how spask of absolnte cold. Jroording tor the modern " dynamie' (heory" Heat ( $4 . \quad$.. ) is a modro of motion. the minute particles on moleroles of whichany laty is conmprome bring in ronstant vibation; and the more rijuid this molecular vibration. the warmer the body: the slower they become, the colener it is. In this way we can rendily eonceiva a combition at whieh this molecular vibmentom shondel entirely cease, and this womd be the absolute coll or absu-
late zero of the physiojst. Alhomgh this point has never
 the centigrade sende helow the freezing-tnint of water, or 4.5! thedow zero by the orlinary or Fahrableit thermometer. The speenations regarding the conditions of matter at absolute zoro are most interesting. There is much avidence to show that chemical ithinity would disabpeat, grases woukd not exist, aud that matter wonld break up inter its constituent atoms.

The rrmatest degree of cold as yet obtained is about - ? ?o) ('. (atront B3a bolow zero F'ahrenhoit) produed by boilings liguid axygen under redued prossure. 'Tuming now to the ordinary signtionate of the word cold-a lower tumperatnre than the nermal-some int eresting physiologionl barnomemat
 which life emmot exist. 'Those limits varys somewhat widely, and death from cold may be produced in suberal ways 'Hhes in man death oredurs by a retardation of the cirenlat tion and a slowing of the action of the heart acoombanied by loss of leat, until fimally respiration and virendation cease and death supervents, and this may ocem, as in the casm of persons long immersed in cold wathr, without the lowering of the temperithue to freezing. (in the other hand, mang anmals and phats 1 loumsh in tho dretic seas, and some forms can withstand an even greater ext mat than this. Thus yomst may be frozen amd cooled to-5 (. (23 F.) withont injury, and, if dry, the temperathre could tre rodemerd to that of solid earbonic acid ( -60 ( withont being killed.
 dezemb upon its dogree, mothod of aphication, the extent and region of the boxy affeeted, and the general combition of the lomdily structures. Thes are of a incal and general charamor, thin former being mamifest at the region of the applicettion, and the latter by the organism as a whold When the cond is moderate in ilegree and transiont, as whon an imlividul aters anod room, is sulbjected to a cond douche or drati, or planges into a cold bath, the chicf immodinte effedt aro a rednetion in the tomperature of the skin. comstriction of the cutameons capillarios a sensution of ashd. shavering, and roughening and paleners of the surfiner of the skin, which breomestike "gunse-1lesth." The secondary or after efferts are thase ot an opposite eharamtor. or those of " reation." and there is experiencol a sense of exhilaration ath woll-being. In heathy individuals donehex. baths. and simila alpliations, when followed by reatiom, are of a decodedy stimmbatine and tonde cobaracior: but in those weakener\} by disanse or wherwise enfeebled the system may wot buper? ramer, so that the serondary effects may be those of depmesion, continumd chilliness, etc., and prove injurinus. Imeleed. eben among healthy perple we dind thene whor at times of always do not seede to bove the power of hoathy reate ion from sulden, 1 hough transiont changes in surroumiing tempernturs and whas are likely as al consertuoner to sutfer from varions seducher which dejend apmon the nervenirvitation and the temporary vongention of the interion of the landy camsen! he the drivitg of the blow foum the skin,

 atricted, with the conserpunt deprivition of nearly all of than nommal homed supply of the skin and the pronlaction of internal angertion; hom is rapmly lost, owing to the matkol

 is increased to make ip for this loss with the conseduent comsumption of the fixides and of the nutritive suldetances stured in the uramisn ; and the eirenlation and respration
are increased. These effects are som followed by dibatation of the cutaneous ressels. with atteurlant congestim, and shwiner to this there is an increased tendeney to a loss of leat and diminution of the body temperature: the heart's action becomes enfeebled. and the circulation grows more and more shaggish, so that there is insullicient oxymenation, the blood is moduly rohbed of its oxygen by the tissues. eansing lividity of the skin: the sensory nerves are first irmitated and then depressel, owing to the lowerat temperature and deficient blood-sipply, catasing first pain, then numbuess, and finally complete paratysis. The lowerul bodily temperature and the imparment of the eireulation depress all the vital prosesses: the ressels in the interion of the borly also mallugo dilatation, so that the lungs. lrain, and other important organs are in a profound condition of congestion, with an extremely slugrish circulation: the action ot the heart become feebler aml feebher: the waste products which rasult from the consmmption of the tisanes and mut ritice sulastances rapidly iccommlate. owing to the lessented activity of the excretory orwans, and act as depressants to the alrearly weakened orrans: the nerve centers are more and more depressed. which is specinlly marked in a sense of fatigue, mental apathy, druwsinesis, sleep, impairment of all the special sensex. coma. general paralysis, anal death. When the action of inture cold has heen carrial to it dangerous stage the after effects may he appurent for hours, days, or even indefinite perions, and commonly are manifest in a slow reovery of the nommal conditions, but the dangers of serbinc sequele are very great.

Pantions of the buly that have been frozen can rencrally be restored by proper treatment, the wand method being to gradizilly resture the lomperature of the affected parts by ghbling with snow or hy the application of iced water, but any undue rubhing and iny movement of the frozen structures must he avoided sedulously, lest the delicate tiscues be torn or cut by the crystals of fiozen blood ind lymph.

The moderate use of iced water as a heverage is not only a sombce of creat refreshment to most people, but is rarely attunded with evil conserpuenoos: yet when taken in excessive ghantities especially when the body is orerheated. it maty ranse serious internal ilisturbances, partioubirly conqestive and inthmmatory disorders of the stomath, liver. intestines, amb kidnevs. [cerl water. ices. ete., taken witli mads In not seem to exert any perniovous intlumice on the digestive procesaes. hat dignstion is alwas more or less seri(maly interfered with if they are taken during the tine when antive digestion is oroing on, i. e. during the two or three lomars immerliately after in meal.

In the tratment of diseasmi conditions cold has proven of creat salue, and its us" as armemial acrat is of incorasing impurtance. As a lucal application it is of groat benefit in benumbing the sensory nuves, thus relieving paim and other phenomena dae to irriation. So powerful are its elfeots in this respeet that lyy appopriate means the semsory nerves may lo. completely paralyzed. amd thas a condition of loval atiomithesia prortiuend. This may be arempplished by bolding a piece of ice to the part for a few minutise or hetoreme commonly by the ase of a spray of cetler, rhenoline. wo other highly volatile thanl. projected upon the part by means of an ordinary hand-atomizur. The flud by its rap iet evaproration alostracts the heat fum the part. constricts the coplillarime, bemmos and then destroys the irritathility

 her har with iop in it), moist ( 1 ay or a compress of a mumber (1) thiceknesers of wet foloth, cold is often applied to the "hest in the tratment of memmonit amp plobrisy, to the ablomuen in peritonitis. to the head in meningitis, and to other jarts whan inflamed. Collao, köl-yar- $\overline{\text { a }}$ : that portion of Southern Peru which lies within the Titicaca basin. or which would be defined by an irregular line incluling the heads of all the Peruvian streams which flow into the lake. It consists of elevated plains nowhere less than 12,000 feet high and bordered by lofty mountain-chains. The collao is incluted in the modern ilepartment of luno.

Herbert 11. Smith.
College [from Lat. colle gium. a boly of colleagnes. a fraternity]: originally a body of persons associatel? together for the prpose of pertorming common functions; a bodr of colleagnes. Inder lioman law there were the colleges of angurs, of pontiffs, of tribunes, and of artisans. In mediaval and modern times the tern has heen applied in a similar manner to bodies quite dissmilar in their purposes. Thas it is common to speak of the conlege of hishops, the collese of carlinals, and the college of presidential electors. But it is in educational matters that the term has come to have the most marked and important significance.
It is prolahle that colleges organized fur acalemic purposes had their origin about the end of the twelfth century at the University of Paris, where persons at the university who had common emds in ciew associated themselves together for a mutual advantage. A little later the term Was applied to institutions of learning in other comntries. In frermany and Italy, however, the tern collegium did not. as in England, come to be applied to institutions or corporations, hut only to associations of seholars coming together simply in a volintary capacity. It was in Englamit that the worl came to have its most important siynificance. In the thirteenth century colleges were extablithed in consinlerable numbers at "xford and Cambridere: and these institutions were bound together in what we know as the nniversity: It is probahle that the origin of the college in England was not unlike that in France. Stulents went to the universities in large numbers ann for ditferent purposes and fomme it convenient to separate into gronse of persons havine a common conl in riets. It is recorded that at one time the number of students at Uxford was 30,000; the mumber
 atereregtion of students in haldings where ther could at wne adrance their emmon interests and receive protection in their common and persomat riyhts was encouraged hy prines and bistonp. as wedl an by private benefactors. In this way the group of buildiners kinown as the colleres at Wxforl and Combride came into existence. The colleges at Uxfond, with the dates of their fomblations, are the fol-

Trinity. 1546: Trinity 1Jall, 13:0. The college in England is not so much an institution for teaching as one for furuishing a residence for students where ther will be surroundel with the most encouraging and insiiring opportunities. Formerly all stulents were requirell to live in the dormitories furnished by the college and to take their meals at the common talle or college hall. Those who, on accoment of intinguinhed attaimments. were appointed after gramation to fellow hips were requised also to occury roms in the college and eat at the common table. Until recently the fislows forteited their fellowships in case of marriage. In the colleges at Oxfort and (ambrilge the student is entirely at liberty tos seek whatever instruction he may choose, but, if he is a candidate for a degree. regularity of work is generally secured loy the knombere that anceess in his final examintions will depend very larely upon the excellence of his instruction, as well as upen his own diligence. Students of any college may take instruction in any other. The colleges of Oxford and Cambridge hold no examinatioms. Students, when prepared [on final examinations for a degree must apply to the miversity, the special function of which is to hold examinations anil grant degrees. The course of matergraduate study at an English college ordinarily continues abont three years. The number of sindents in alif the colleges at Oxford is nsually about 3,500 ; in C'ambritge the mumber is slightly less.
Colleges in the U. S. were founded on the English model. Among the early settlers of Massachusetts a large number of influential men received their education at Emmanuel College, (ambritge. Harrard College. founded in 1636 , was organized in imitation of Emmamuel ; the College of William and Mart, in Virginia, and Yale College, in Connectient. imitated the orranization of Marvard; and they in tum were imitated liv the colleges estahbinhed during the nest 150 years. In Eigland students offering themselves for degrees were formerly examined for the most part either in the ancient classics or in the mathematics. This fact gave great mrepomderance to those studies. The training was purely disciplinary and preliminary to professional study. The same was true in the colleges of the U. S. that were organized on the English model.

Early in the nineteenth century, however, there began to be not a little distrust of this method of organization. President Warland. of Brown L'niversity, at J'roridence, R. 1.. and Previlent Nott. of L'nion College, Schenectady, N. Y.. were jioneer in the general movement that now took' place. Som after 1500 President Bamaml, of Columbia College. Imblished elabmate statistics. the result of careful invertigations, which showed conclusively that the proportion of stndents going to college in the V.S. was stearlily growing les and les. This tendency was believed by very many to he the result of a deep-seaterlamb wide-spread disatisfactiou with the limited range of studies offered by the ordinary colleg. In 145? Ir. Ilemry P. Tappan. on entering upon the dutirs of his atfice as presilent of the Vniversity of Michigan. holdyy prodaimed the doctrine that seience, the modern langnages, and history were entitled to the same prominence in the college curriculum that should he given to the ancient languages and the mathematies. On this theory the college of literature. science, amd the arts was remolelen. The suecess of the miversity semed to justify the change, ant the new? modified course of study hecame the morlel in the orginization of the other State miversities. The spirit which led to this change in the comrse of a few yeare aloo rery greatly modified the colleges that lamd been established on the old model. While Greek, Latin, amd the mathomatics continued to have a Inminant intluence in the first two yerrs of the eomse. the molem lansuages and the matural seienees, as well as history, economice, and the monlern literatures. foreed their Way into the arrangement of (enursts for the third and fourth vear:- Trebuical sturline also pressed for meornition. College of cnginecring. agricntture and arclitecture were entablisimet. Some if these fermed a fart of institutions alranty extahlishen, and some were established on an indeperdent hasis. lirom every point of view, howerer, it was apparent that the whe exclusiveness was piving way, and a moklern methot was taking its place. The natural comsegurnce of this movement was that sreat varicty and even (Jhos ensual. some of those in dharge of calleges were conservativ: whers were fond of ehange. The former very sumprally whered to the chassical model, the latter as genorally alvoeated the introduction of what were called studies of mondern importance. There is therefore a marked
abence of uniformity buth in the reinitement－fur admis－

 ami homorary when thoy have not heren initiatmi while mas

frequently form chats in the largel eities and sometimes, as in Jew Jork, rent buiklinge. They are nsually well allphinted and succrastul.

Literulure.-The fraternities have issued puhlieations in the form of eatalogues, histories, whg-hooks, music. and magazines. All but one wr two have publisherl eatalugues. Previons to 18.9 surlh compilations contained merely lists of the members names, but since that time a great alvance has been mate. and the more recent eatalogmes have contained full but comblenerd biogriphies of the members, historical sketches of the fratermity and the institntions at whieh the ehapters are located. the geographical distribution of the menhers, and various statistical tahles of interest. Among the more noticuable of recent catalogues are those of Alpher Deltu Phi (1s8?, with a supplement in 1sitl): Brta
 Epsilun (1891): Deltre Then Delte (1s84): Deltre (psilom (1××4): Phi Deltre Thetre (1888) : Psi Lpsilon (188!!) : :mul Sigmu ('hi (18!)0). Sni Tpsilon. Sigmar ('hi and Betn Thatet J'i have also pablislate historics. Song-books have been generully issmed. 'They do not differ materially from current collections of erllege songs, and. in common with the instrumental pieres bamed atter the laternities, they contain mothing motahle.

Proivdicils.-Aside from purely ephemeral attempts at publishing jourmals male by Delta Epsilon in 186 s and Theta belta (hi in 1a69. the firat fratemity jommal was the Beta Thectar $P i$ issmed by the fratemity of that name in $18 \mathrm{sin}^{2}$. and still publisherl as imonthly. Utlere journals, with the alates of thoir estahlishment, are as follows: The Palm, of Alpha Tau (bnemin, 18*); the Chacteft, of Chi Phi, and its predecessor. the Qumeterty. 1484: the Purple and Gold. of
 of Di-lta Tan Delta, and its predecessor, the (reescent, 1ssi: the Qumerterly, uf Dulta ['jsilon, 188?: the Sourmul, of Kiappa Alpha. 1xis: the reflucers of liapla Sigma, and its prederessur, the Quarterly, 1Sy : the Scroll, of Phi Delta Theta, 1876; the (burturly, of Phi Gramma Delta, 1879; the Phi Kimpa Psi Shiphf. and its quarerly and monthly predecessors, 1sin; the Phi Kiapal sigmal Quraterly, 1890: the sig-
 1881: the sigma Nit J). He, 1ssl: and the 'lheta Itelta (ehi Shiedd, 184. In addition to this list. Alpha Inelta Plii pu? Lished the Star amh Crescent f1om 1880 to $1 \times 85$ : Psi Crpilnom. the Dimmond from $1 \times 2$ s to 1886 ; and Zeta Psi the Jonthly and Quurterly from 18st to 1886. The women's socictice have also issued similar jourmals, the first of which wats the Goldan Key, of kiapla kialut (iamma, 18s?, which sine 1syd has been called the Sry: whers are the Amou' of Pi Beta Phi. 1ssig: the Iuchoret, wi Delta Gamma, 1s84: the Qumporlies of Kiapra Nohat Theta and Apha Phi, 1sxis and 1 ses : and the Trimut of Delta Delta belta, $1 \times 51$ Fearly all of these journals have bepn irregular in their pmblication, or have suspended one or more times. Ibit they are all now in fair condition, At first they were sectert, and designed to circulate only among members. but now they genemally recore sulncerpitions from outsiders at the
 Sigma Chi issue secret permolicals in addition to their regular jommals, called rexpetively the Mystic Messenger and the Bulletin.

The fraternities may be cunveniontly gromperl into men's general ami lucal fraternitios, women's societies, and professional sociotios. A few details only con be given, and thas only in regard to the more frominent in the following list. The ame of the fratemity is fint given, then the total membershijp, the plame amblate of origin, the chameteristies of the bulle: the eolor: num flower if any, and the number of inactive and active wapters, with their general lowation. "The tatisties are given for the summer of leal. This is the latest date at which trust worthy figures in requal to
 though chtainalike, womld, if wiven, forose mislonding for purpanes of comprariconl.

 of the sumar women is higher at the time of xathat than it war at the time of catheriner colle eqe．In the mattor if

 regular cha－－work and in cxaminations，are－Thatoly hathor
than the attainments of the young men. This result apt pears to have hern mumistakily shown ty statisties prepared at the Univervity of Mirhigan, at Comell C'niversity. and at the Chiversity of Wisemsin. While this fact should not be remated as proving tom mad. it does at least show that under ordinary circomstances foung women are salpable of eollegiate proticiency that will compare favorabl? with that of young men in the sime classes. But in regand to the third oljection experience has not qiven somambignous an answer. It is certain that sucial distractions from study are often very considerable, and it is probable that collegre oflicers of mehe experience with coeducation would generally admit that objections to the system om this gromu are the only thes that any longer con be urget with any apparance of reason. And on this point all that can be wiul is included in the siatement that until a yonne woman is so mature and serions in her jurpone as to diserminate wisely hetween her studies and her social recreations, she is not in a prsition to profit in a cueducational institution.
While the higher education of women has hem makiug ratid progress in the L. S., similar advames have been made in some of the contries of Europe. At Oxforl and ('antringe women have not yet hem admitted to academic degrees: lout at hoth of thone venerahle institutioms colleges for women have theen fonded, and instruction is given ly teachers of the highest rank. At Paris and at a few of the unisersities of Germany women are admitted to lectures thourh the a are not yet entitled to examinations for degrees. of the few Formean institutions in which the higher degrees ire given to women on the same conditions as to men, the University of Zurich in switzerland is the lese known.

The following fables, mate up from official reports, show the anmber of women pursuing cither graduate staties or a collegiate course of four yaus in the larger colleges to which women are admitted in the U.S. The figures, unless otherwise indicated, are for the years $1891-12$ :

 pogulaten purtious of colombia. A brameh extemels nopthWard on the Viene\%uclan frentier, neaty to the sta, W. Wif the northerm extremity of this brandh. on the Carblam romet, is ant isolatel monntan region with ${ }^{n}$ culminating

 athans 1s. ted feet and is potably the highest foak in Cobombia. The fetmat of Pasavis (e. 2.) is hilly rather than mountainous, and its central ridge is much hroken. I brands of the fanama hills: is continned southward aleng the facifie comst to ahont lat, 5 . Frather st the comst region is low and oftem swamy.
Betwern the montain-ranges and their attembant tahlelands are three great moth and south depressitus, the valley of three rivers which flow to the C'minhean sas. The wistermones and smalles of these is the Atrate valleys between the Histern "ordilhmand the coast range and hardly soparated at its head from the Sum Juan valley. whicli opens to the Pacific. The whole Atrato depression is low, and much of it is swamp. The (anca and Magdalena dephessons oceupy the spaces respertively between the Western and Conmal and tha Central and Fistom Cordilleras: bondening ont mothward, they unite in the greal plains of the Caribhean coant, with wide flomb-lands along the rivers.
From the Fastem Cordillera a table-Tand of monown extent arethes E. and s., with an arevage clevation of 1,500 or evono feet, ant with sereral ranges of higher hills, This table-land is similar to the phateats of brazil and Gmiana. amd aructurally may be requated as a portion of thens. It is cut deeply ly riser-malleys. and the edges fall abrupty to the low phans of the Amazon and Crinoco, an immense. trackless foret. The escarpments are the so-called Caymota Momatains.
 way, mall stomers and bots ascembing it to llomata, not far fron lowgotí. lis tributary, the ('anea, is navigable for a considerathe distance. The Atrato has been deseritnd as a mosing swamp: it is partly covered with floating begetation, but there is generally a flem chanmel, and stemmers ean aseent it dariner the flools. On the lacifie side there are no important rivers, Colombia lays a vage clam to the nothern shore of the Smazon from the Napo nearly to the lifu Segro, with the whole of the sreat branches the Patumayon or leá and the ('apletif or Japhaí. Both of these branche are navighle and their byper eourses are cortainly in Cohantian feritory. At 1 recout they are frequented whly herazilan rubher-gatheres: wive stamens of the Amamian (ompany ascond them for some distance in the mhar senson, and wensional trabers lave reached the hichlamls of 'olonhia by the Jeai. There an be no donht of their fut ure importance as chamuls of emmmanication. The trape flowing into the lion Sugre, ant the fibaviare and yota, bramelnes of the orinoed, ate hardly less impertant. Numberless smaller st reams in these phais are as yet unexplored.

Iolchouss rend S:urlhquaks,-In Sonthenstern Colombia there is a group of andive amb extinct volmones, the most important bring l'uraci (nest l'oparan), Iluila, Azufat, Patho, and Clifles. Tonlimami other peaks of the Cont rat and Weatern ('ordillatas are extinet whameses. All the manntain rowion is subjeet to eary hatakes.
(limute-This varies extremely in elitferat parts, not only with the elowation, but as the wints lase free toeess or are ont off log the montan-chains. Cenerally apaking, the comse lewer river-valleys, and the nowhern and unt liPastern datins are hat, damp, and in parts very unheath homl: the central platems and momatan-flanke latic a d clighbin]
 Cobmbia some of the clevated plains are so dry as to ba pradically leserts.

Tequctulamo-hproprotion to its area Columbia has more
mus of lamama，the Pacific，and Caribhean enasts．the vallers of the morthern rivers，and the great sonthwestern phains are all cowred with dense tropical growth，and simi－ lar forests extend far up the monntain－sides．On the plat tean they give phace，where the land has not been cleared，to wonds of waks and other trees of temperate climates，and still higher to pines．E．of the Bastern Combllems are ex－ tensive llanos，or grasy plans，oceupring much of the（＇a－ quetr $\begin{gathered}\text { table－lands and cantimuns with thase of Venezuela．}\end{gathered}$ The low that lands extembing from the lower Magdalena aromed the somathern side of the santal Marta Mountains are in great part eovernd with grass，and there aresimilar plains W．of the Magdedema．

Minerals．－hald and silver are almost the only metals extracted，and the monntain regions are rich in both．＇The principal wold district is in the central department of An－ tiopuia，between the Cauca and Magalena．wher the pres－ ent ammal problution is about $\$ 2000,000$ ：the entire gola out put of culombia is about $\$ 3,000,000$ ．The rearly output of silver is valned at alome $1.850,000$ ，the richest mines he－ ing in Tolima and Cau＊a．luring the colonial prriod the yield of precions metals was very lares．Copper，lead，and jpatinnm exist，hut are not extemsively mined．The ener－ ald mines of Muso department of Boyaca，are the richest in the worh，and the principal source from which this gem is obtained．Coal－heds are reported in varions parts of the country，and there are extensive beds of rock－salt and sa－ lines，it present worked only for home comsumption．

Plants and 1 tumals．－There have a general resemblance to those of other parts of tropial America．（See America． Soutu．）The mumber and variety of species of both is wom－ derfal：Colombial has hem called the paralise of natural－ ists．The himbend insects are espechally momerous amb beantiful．Among the cummen mammalia are jaguars，ta－ pirs，deer．wild hors nonkers，ant－eaters，and in the moun－ tains bears and llanas．The forest prolucte include rub－ ber，cinchoma，frory mats，vanilla，mahogmy，and other calinet womls，and varoms druge．
Prople and fomemmpht．－＇The civilizel popatation is con－ fineal to the nothern and western protions．and in great part to the hiphamps and platems．F．of the Cordifleras the vast forests are inhahted mly by savage Indians，am！ but small portims Lave ever been explomed；the lamama isthmus and the lower river－vallers are very thinly pupu－ lated．The chief towns are Bugotín，the eapital（ 116,000 in－ hahitants）：Xeahellin（30，（0）0）；Bucaramanga（18．006）：Cali （ 16.1000 ）；and the forts of Panana（ 25.0601 ）and Cartagena （11．000）．Drobably three－funtho ot the people are of hul－ fan or mixal race：the dricem clement is small．Spanish is the universal lamgage．except with uncisilized hul－ iatns．Colombia is ：centralizal republie，somewhat re－ sombling trance in thenry．The president and vice－presi－ dent are chosen by anselectoral college for six years，and the ministers，mominated by the president，are theoretically re－ sponsible to the senate for their ints．There is a conncil of state of six mombers．Comgress consists of a semate and home of repermatatives．There are twenty－seren sonators， （rhomen by tha departmental hapislatures．three from cach clepartment，amb ond representative for every 50，00t in－ hathitants：the suffrase is limited by eheational and prop－ erty qualitiontions．Prambally，the president has almost absolute power，the more so as he is eligible to immediate reabedion．The combtry is divided into nine lepartments （romesponding nearly to the ohs statos），emeh with a govern－ or appuinterl by thi president，and ant assembly dected hy the people．The depmetment of lamama，however is ruled diretly hy the natimal growemment．The state religion is Roman（hatholic，but other seds ale toleralmo．There have ben great improwempats in the educational syam．Nearly 100.000 pupils are tanght in the patbice seliools．and there are mumems private selmols．＇Tlu＇shate supports 14 mor－
 gool litrarios in some of the citios，amb an ohervatery at
 metric：

 do not inchule tha finanees of the deparments．The peso is nominally a dollar，hut is acthally worth from oo to si
 the eirenlating medimm is silver and paper．

Industry end Commerre．－lericulturr amb grazing are
the principal industries，and dn little mom than supply the home demand．Manix，plantains，sugat－cane，čacoo，and tropienl fruits in the lowlands，coffee and thanew on the sopes，and maize，potatoes，beans，etco．on the plateans，are the common crops．Extensive herls of cittle and smaller ones of honses and mules，are pastured on the hancs．Comse cotton ant woolen eluths，unrefined sugar，molasses and rum， cignos，leather－work，fumiture and hats are abont the only minnfactures．The anmal exports average alome sis．000，－ 000，the frincipal items being cottee，gold，silver，hidis，to－ baco，cacan，india－rubber，and cabinet wombs．The lars－ est export and import trade is with Great britain．In 1890 the imponts from the U．S．Were ollicially valued at $1,218.4$ tif pesos，ind the exports to that country at $4,636,480$ pesos．The transit commerce across the 1 －thme of Pamam is free of duty，and exceeds $\$ 10,000,000$ ammally．

Colombin has as yet very lew railrouls，ennsisting of the Panama line and a few short isolated tracks，connecting the eities with narigahle waterwas，In 18 ， 2 the aggregate in oporation was $\boldsymbol{2} \boldsymbol{3}$ miles．lnterior commeree is manly by the rivers and by ox－carts and mule－trains，often over very bad roals．
Misfory．－Before the conquest the highlands about bo－ gota were dominated by the thibcha or Mluysea lndians，a puwerful tribe which had attained some degrep of civiliza－ timb．（Siee（bummas．）The lowlands and consts were in－ habited hy savage lordes．The nothern const was diseov－ （aid by Bastidas in 1500）and Columbus followed the Nores of Pamma in 1503．Darien was fomded in 1510 and lamama，Sianta Maria，Cartagena，and Nombre de Dios within a tew years after．In 153.3 Benaleszar marelod N ． from Quito abl empuered Popayan，and in 15mb Quesela． at the heal of a hand of Spabials from Santa Marta， reached and captured the Chilecha eapital．On the highlanls of Lhgotí，Quewela，Benalcazans，and a third band，that of Fellemam from Venezuela，met，and their united foress sonn reduced the Indians．Smanish setthenents rapidy sprung up．For a long time the provinces of this region were subordinate to the Viceroys of leru：but in 1740 the vice－ royalty of New Granala was formed，including the present Cobombia，to which Cuito and Venezuela were attached later． An insurrection against Spain began in 1811，following that of Venezuela in the general revolution in Spanish Fonth America．The first movement wats crushed，and handreds of patriots were shot in cold blood；but the war broke out again， and on Aug．T．1819．l bolivar＇s rictory at Boyacá opened his way to the eapital．In December of that year Venezuela and New Gramblil were united in the republic of Colombia，witly Bolivar at the head：Eenador was amnexed soon atter． The union was dissolved in 18：31，and the republic of New Gramadia was formed．lint the comontry was in a restless state；political struggles and revolutions followed，and the form of govermment was modified or changel as the terleral－ ints or centralists were in power，In 1861 a federal consti－ tution was alopom，and the country took the name of the Urinted siates of tolombia．The present constitution dates from 1886.

C＇olombade［Fr．Heriv．of colome．colum1］：an architee－ tural feature：al row of colmms with all that goes with them，as the entablature above，the stylobate（if any）below， sometimes the space incloset behim them，with its rouf，etc．
Colony［from Lat．colonia；deriv．of colonus，planter， farmer］：a foreign settlement formed by emigrants under the protection or control of the mother conntry．The term is no longer limited to its original meaning of a body of farmers or cultivators（coloni），but includes any gronp of settlers whatever be their parpose or occupation，so long as they remain in any form of political dependence upon the home country，aud it is sometimes loosely applied to such a settlement eren after the tie between it and the parent state is broken．The chief colonizing nations of antiquity were the Phenicians，Carthaginians，Greeks，and Romans．The Phenicians established their colonies as commercial out－ posts on the coasts of the Mediterranean is far west as Spain，and traces of a Phonieian settlement have been found in the island of Britain，where the tin mines of Corn－ wall are said to have been worked by their colonists．Car－ thage，itself a Phoenieian colony，became an independent state，and founder eolonies of its own which adeded greatly to its commercial power．The Greeks began to plant colo－ nies before the berimning of authentic history，and the Eolian，Dorian，and lonian settlements in Asia Minor， named aecording to the tribes from which they sprang，were bound by no definite political ties to the people of Greece proper，thongh they reeognized them as kinsfolk．The same is true of Magna Gracia（Suathern Italy），and of Syra－ cuse in Sicily．With Rome，however，colonization was for political rather than commercial ends．It was a part of her systen of universal dominion，the means by which she Ro－ manizet her conquered provinces and fused them into an em－ pire．Each new conquest was followed by the phanting of col－ onies，which were not permitted to forget their origin or estab－ lish their independence．From the fall of Rome to the ent of the Dark Ages no colonies in the proper sense of the word were established，though the map of Enrope was fre－ quently changel by the inigration of whole peoples．With the rise of the Italian cities colonization was renewed and Fenice and Genoa owed their main strength to their colo－ nies in the Levant．After the vorages of Columbus and $D_{a}$ Gama，the nations of Western Europe took the lead in colonization．Portugal planted eolonies in Africa，India， and south America；Spain in North and South America and the West Indies；while Englanl．France，and Holland contendel with rarying success for a share of the new lands． In the sixteenth century Spain＇s colonial dominion was the greatest in the wrifl and she herself the wealthiest nation． IWhile the Christianization of the natives was a part of her frencral scheme，the paramount object was the curichment of the mother comitry，and little concern was felt for the welfar：of either natives or colonists．This poliey，carried out by those restrictions on colonial trale which made up the su－called Colosial Srstey（q．r．），was common to all these nations．The dectine of sibain＇s colonial power began in the seventeenth centary amd montinued steadily，matil，in the early part of the nincteenth century，she lost all her Suth Ainerican colonies：while Great Britain，after driving the French and the Dutch from hula，aml the Freneh from （＇anala（ 1 fib），sumpealed to her place beoming，as she has since remained，the greatest cobnnial ampire in the world．

F＇．II．Colbz．
Colophon［from Lat．colophon，finishing stroke $=$ Cir． кодоф́́y］：an inscriptima，monogram，or uher tlesisn planel on the last page of a book．The eotophon formerly gave the date，primer＇s name．etc．．with much of the information now convered on the title－pagre．
（＇olophon（Gir．Koдoфஸ́v）：an ancient Greek city of Jonia，

Y．of Ephesus．It was one of the seren eities which claimed the honor of being the native place of Jomer．

Col＇ophony［from lat．Colophonin re＇sina，resin of Colo－ phon，its former place of export］：resin of pine：rosin：a name now obsolescent．See Rosis．

Color：The structure of the eve and of the elahorate nervous system connected with it enables us to distinguish form and degrees of light and shanle，and in addition to these to recognize differences in the quality of the light whieh falls upon the retina．This power of distinguishing between kinds of light constitutes the color－sense．The sense of color has often heen compared with that by means of whieh we distinguish the pitch and timbre of musical notes，hut the analogy is not a very close one．In many re－ spects the function of the eve seems much more complex and hichly developed．The entire group of light waves which affect the retina are cumprised within a single oc－ tave，so that the range of sensibility of the eye may be said to be less than that of the ear．Within that narrow range， however，at least 1.000 monochromatic tints are distinguish－ able．These may be taken in combination with each other and with white the total number of distinct color－impres－ sions thus calable of being formed being very large（accord－ ing to Roorl，about $2.000,000$ ）．The sensitiveness of the eve to dilute mixtures of coloring－matter will white is astonish－ ing．The average ohserver of fifty－four persons whose power in this respect was tested conld detect the presence of 252 parts of ret lead in $100.000,000$ of white：
23.9 chromate of lead in $100,000,000$ of white： 8642 ＂chromic oxide in $100,000,000$ of white ；
1265 ＂．ultramarine in $100,000,000$ of white．
Nichols．American Journal of Sciente，vol．xxx．，p． 39.
The amount of energy which is necessary to produce vision is even less than that which will give the impression of enlor：Langley fount that when the energy of a light ray of green reached 0000001 erg ，an ohserver became aware of its action，but that the wave－length as indicated by the color could not be detected until the ray was much stronger．
Complicated as color－effects at first appear to he，it is found that they can all be explained as the resultant of three primary color－sensations：the scuse of red，of green， and of violet．It is generally asommed that there is a triple mechanism in the nervous system of the eye，by means of which these three fundamental sensations are received and transmitted to the brain．The absence of one of them，usn－ ally that of red or green，constitutes＂colom－blindiness＂or I）iltonism．The color－blint eve，then，pussesses a color sys－ tem which depends upon fuo．the normal eye a system which incolves threp，primary sensations．
Whenever，in the case of the normal eye all three primary impressions are producel in equal strength，the resiltant is white．All wher colurs，even those induced by monocho－ matic light，tliffer from white simply in the relative strength of the thres compments．

The chief source of color in external objects is the selec－ tive absorption of the different wave－lengths of light by the various substances in question．
Selective absorption is a property common，so far as known，to all forms of matter：Light reflected by the sur－ face－layer is，in general，umehanget in composition．This， however，is only a small purtion of the light which the body reflects．The irreater part penetrates the body and is re－ flacted from within．In its path within the substance the vartious wave－lengths whicle go to make up the incildent ray sulfer loss in varions degres．Some，to which the borly is oprtyue，will be entirely sulpresed ：others will pass with hut little dimimution of trightness．The resnlt is that the ray finally weflected and reaching the observers eye differs mone or less in composition from the inciflent ray，anm it is upon this difference that the color if the body deperads．A buly reflecting light withont moxification would be a true white．So such borly，so far as known，exists．A body whioh ahombs all light reaching it and reflects none would be a perfectly bluch body．The nearest aproaeh to such a purfet black is prolsibly lamplack．lont the reflection from it amounts to nearly 3 wrent．It shoule be described as a white of low intensity： 1 amphbiach illuminated by ali－ rect sunlight is as hright as tha average clomalless shy at $45^{\circ}$ from the sim．

A monochromatic tint in cender is one proluced hy some ray of single－wave length．Sull are the colors of the pure sfuctrma．The colors of the suedrum，however，are not simple．from the physiolerical puint of riew，since eacla sep－

Colorado Collese（Colorado Springs，（ool）：the oldest institution for higher education in the Rocky Nomutain re－ gion．It has four hatudeme stone buildings，and a gymna－ sium．with a campus of 56 acres．The metcorological obser－ vatory contains a number of continnons self－registering instriments．The callege，whith was chartered in 18 is and opened in 18\％t，has been completely reorganized since 1858 and its standard of work is now the same as that of the best Eastern colleges．The assiciate preparatory school．Cutler Acarlemy．fit：for admission to the freshman class of any conlege in the U．S．The Rocky Mountain region lumishes unsurpassed facilities for the study of geology，mining， metallurer，and kindred hranches：and the trustees aim to make the college a center for scientific work in all lines． Three courses of study are oftered，the classical，the Latin－ scientific，and the scientific．The faculty mombers sixteen．
Colorado Desert ：an arid basin traversed by the south－ orn l＇acific R．R．Jutween Fort Yumand sam Burnardino． Its principal depression is alson callen the Coathila valley． and its castern continnation is terned the Iuma desert．The Iower part of the Coahila valley．including an area of about 17,000 sif．miles in extent．lies ielow the level of the ocean． It was formerly part of the Gult of（＇adiforma，but in pre－ historic time wats separated therefrom by the growth of the delta of the Coloralo river，which grabuilly extended from F．to 11 ．until it joinem the preninsula of Lower Catifor－ nia，and thus shut out the sea．The river now flows across the south part of its Ilelta and contributes its water to the gulf，lut at some rarlier time，and probathly at several dif－ ferent epmels，it has lowed down the northwestem side of
its delta into ('oahuila valley, whiol was then ocenjed by a fresh-water lake. From this lake there was an outhe th the sulf by way of achanel known as "1lardy's colomodo." which follows the wetern margin of the delit. Sine the ocenpation of the country hy white men the riwer hats aceasomally, during high tlood, disehargel a portion wit its water towari the cowhila valley be mans of a chamel cathed New river, and in [s.al such at diecharge wan contimmed for several months, protucing in the bottom of the valley a broad but shallow lake known as salton Lake.
(i. K. (inbrirt.

Colorado. Rio: a river in the sonthem part of Aremtina, rivige in the Amber and howing with a feneral F.... lis course to the dhantic near lat. 3450 s. It is formed by the junction of the Barrameas and Rio diramle, and the length from the sume of the latter is about (促) milnes. It is navigathe for vessels drawing ar feet of water to l'iehemahuila, ubout sou miles. Tha' Colorato scparates the Argentine tortories of Pampand Rio Compo. Nong the fower cousse it is howdered lis pasture lands and in some phaces ly wools. The upper river flows through an arid waste.

Herbert ll. simeth.
Coloralo liner (of the West): a river which drains a harge platenturd mountain area of Wroming. (odorado, Liah, and drizona, which is wedl watered ahowe som ted. but is arid and deart at lower altitndes. Its head hamehes are the Grean from the north and the Grand from the enst,
 in the Wind River Mountains of Woming, amd flows south acroos a hroad hasin containing horizontal coal-bearing beds of an extinct lake, now much disseded by branch strems. The river then transerts the Cinta Donntains in several decpentons. The (irand river rises in Middle Park, on the went slope of the front rame of the liock Momatains, Cotorado, and dows west, reequing many tributaries in deep, valleys and canons. Below the junction of the (ireren and Grant, the Colorato cromes the phateans of Sum heast ["ah and Noth Arizom for 180 miles, pasing through the MarWe C'anon. 3, b00 feet deep, on the smath marsin of the laria phatean, before rewiving the Little Coloralo river. which comes from the smothast through a cañon in the brom? phatean of Eat Arizona. An irregular course then hads 218 miles, with ondy three consinmabe tributaris, thrmen the Grand Canon in the Kaibab, Kanah, Vinkavet, and shearwits phatems. Patsing ont of the phatad prowince. near the shutheast comer of Nivala, the Cohormo enters a lower desert region, which it traverses almost withont tributarics and in summer with diminishing volume fur? 10 mane forming the westem bonndary of Arizna to the enthate of the tila river at Fort Yuma, and theme in Mexion io miles ancross its delta to the present head of the diulf of Californis.

The seolegieal history of the Grand (añon is, in brief, as follows: Sum Arizona comsists of a vast sume of (arbm-
 Foneme lacmatre beds: in all originaly some botho feot thick. I great dome-like uplift, contral in Nonthwest Ari-

 miles, reducing the uplifted regrien to a lowland of moderate reliof, exepgt whre the edres of the more re-istant stata promanel arombt the margin in retreating pearpments. suth as the Vemmilion cliths (Tria-) on the ['ah- Arizona lime or whre hatay wolanic cons and lava flows promected the -traba bemeath them, as atout the San Francoren Monnatins of Central Arizonat or the Aquarius platean of sumblah. The lowland of denulation thes profluced was again nplifted with much volemie action about the chase of 3 lineme fime but this uphift di-forated the rection in ervat blocks sepatrated by dere fractures trending abuat $\mathcal{X}$, and - .  end high sohook in the siate without examination. Prosi-

Color-hlimlness, or Dallonism: want of whsitivemess in the rew to ceptain cender impressions. This detect is mot
 but it shows a peculiar domency to trimomission from
marent to child. When the nervons system of the eye is hormal there are three fundanental or grimary semsations -ret, ireen, and violet. From the combinations of these in varying intensities all culor impuessions are formed. The alisence of ome of these primary sensations constitutes enlor-blinduess. The lacking compment is usually real or green, very rarely violet. Sumal vision is therefore sait? to be "trichraje," colom-himel vision to be "dichroic." About 4 per cent. of all men we cither red blind or green hlimet; of wonen only a very small number possess dichroic fision. Temporary vinlet-blindness may le proluced by doses of the drug santonin. "Ihe excessive use of tobace also sometimes intuces partial color-hbindness.

Color-blindness is deterotel by the use of a proper seleetion of colored worsteds, a teit which has been applied with infallible results to orer tor,010 individuals in the L. S. and in Europe. The mothot was devised ty Prof. Holmgren, of Upala. (Feed Colas.) The name of Daltonism was given to color-hlindness beramse the distinguished John Daltom and his bothers suttered trom it. See also deffress Color-blindness and its lpeterfion: Heimholtz. Handbuch der physiologischen optik: Cumplell and Grarnett, Life of Muxurell (part ii.).

Colorins-matters: Nature abounds in these prineiples. and art hate added to the number. The colured appearance is mit an inherent property of the borly itself, but the to its eflect upon ordinary light, which is composed of ravs of all culors. See CoLor.

Colosisa' (in Gr. Koגoaral. or Koגaraal): an ancient city of Asia llimor, situated in l'hyrgia, on the river Lyens. It was nearly destroyed hy an earthouake in 6.3 i. D. St Paul's Epistle to the Colossians was mhressed, in 62 (some say $58-60)$ d. D., to the helievers at Colossit. Its site is about 3 miles N. of the modern Chonas or hhonos.

Colossal [from Colossus (q. $v^{\circ}$ )]: in the fine arts. a term applied to any work remarkable for extraondinary dimensions. It is, however, more especially applied to works in sculpture. Secording to the Book of Daniel, the palaces of Babylon contained statues of great size, and in the ruined temples of India are statues of extriordinary dimensions. The Egyptians surpassed the Asiaties in these gigantic monuments, their chief statues of very great size being set against the outcr walls of temples and often cut out of the solid rock. The taste for colossal statues prevailed also among the Greeks, sone of the most notable lwing the chrysele, hantine stathes ( $q$. $x^{2}$ ). The Lamous hronze statue of 1'allas-A thena on the Acropolis at Athens was visible many miles at sea. The principal Roman colossus was the figure of Nero, representing hin as the sun gol, set up by himself before the Golden llouse: it was in bronze, the work of Zenotorus; and lpliny says it was 110 feet high.

## (colosselum: Nee Ampiotieater.

Colos'sians. The Epistle of st. P'all to the: one of the books of the New Testancont : written at the same time and place as the Epistles to the Ephesians and Philemon. probably during the apostle ${ }^{\circ}$ first imprisomment at Rome, abont 68 A. D. It seems to be directed against certain Jewish heresits of the Alexandrian or Gnostic trpe. The hest comnmentary is that be J. 13. Lightiont (sth ed. Londom, 1~と6).
 liil, exectlere, rise up]: a statue of a size much greater than life. Hodem ones are more generally ealled culoswal stutues. and the term erolessus is applied to the gigantie figures. in Euryt and rlsewhere, of iutinuity. The colossus of Rlumbes was a bronze statue of apolio. standing near the muth of the hartwr. It was thrown down by an earthinake

Culostrum [hate]: the first milk yielded after accouehement or ls Tisery of oftspring. The cobestrman of a cow is also called bowsings. The colostrum comtains more sugar, more buttor, and rather hes casein than true milk, and also contains a much greater proportion of phosphates and chlorides, which may pessibly sicte to colostrum the evaenant propreties which it is saicl in possess. It also has a great number al lemeocytes, or "colustram corpmeles" see Muк.

Colymhonn, kō-hom', Armimblid Ross A. M.. (. F., F.
 1846 : entered Indian loublic Works bepartment in 18.1 . In 1881-82, in conjunction with Mr. Withab, he explored

Southern China and the Chinese Shan states. and in 1883-84, with Mr. Holt Mallett, the siamese Shan states, in view of a projected railway conneeting lndia and ("hina and opening up Siam and ("entral Indo-China. On his return to England he was awarded the gold merdal of the lioyal Geographical Society and pmblished Across (hryse, an aecount of his travels. in two volmens. Appointed dejuty commissioner of the Sagier district in Upper Buma in 1885, he has since enteavored to further in every possible way the proposed railways connecting C'hina and Siam with the British possessions in India.
('ulquhom, Sir Patrick (or Mac C'mombaicit de): lawyer; grandson of Patrick (onquhom, mentioned below; b. A Pr. 13, 1815: educated at Westminster, Nit. John's Cullege, C'ambridge. and Heidelberg. and was called to the har in $183 \%$. Anthor of Summury of the Roman (ivil Law ( $t$ vols.. $184-60$ ) and lledice cul fiomun Lute and various 1 reatises. lle was long in the diplomatic sorvice and was chipf justice of the supreme Court of the lonian islands when that arehipelago was orned hy (ireat lintain. Succeeded to the baronetcy on the death of his consin, Sir Robert Colquhoum, in 1 sio.

Colgmhoun. Patrick: a Seotish political economist; b. at Dumbarton, Mar. 14. 1is5. Ile became a merchant in Glasgow, amd promoted the manufacture of muslin in Scotlant. In 1261 he went to Virginia, and in 1559 settled in London. He pmblished On the Iopulation, Wealth, etc., of the British Empire, and other works. D. Apr. 25, 1820.
Colr, Samel: American inventor ; b, at Harlford, Conn.. July 1!, 1814. He invented a pistol called a revolver, for which he ohtained a patent in 1835. He began aboat 1848 to manufacture revolvers at Ilariford, where he erected an extensive armory. Colt's revolvers soon attained a worldwide reputation. (See Rerolfer.) D. Jan. 10, 1-62.

Colton: city: San Bernardino co. Cal. (for location of countr, see map of Califormia, ref. 12-(i): wn the So. Pac. and the So. Cal. R. Rs: 48 miles from Los Jugcles. The city has good schools, four churches, fruit camery and pachinghouse, cement-works, mirlle and lime works, brick-kilns, flouring-mill, winery, electric lights, and electric railway to liverside and San Bernarlino, and artesian wells. lt has an eleration of 1.000 feet above the sea-level and a dry, mild climate. Fruit culture is the principal industry. Pop. ( 1850 ) about 1.50 ; ( 1890 ) 1.400 ; ( 1843 ) estimated. 9.50 .

Editor of "News."
Coluhridae [from Cot uber, the trpieal genus]: a family of non-poisonons snakes. containing the great majority of serpents. They late mumerous teeth, but no fangs: the had is covered with plates, the tail is long, with a domble row of seales on the under side, and there are no rudinentary hind legs.
The family is widely distributed, and its members are varied in their hathits. some dwell unom the grount, some climb trees ant some. like the water-snake, Tropidonotus sipectom, seek their fool in the water. The gronp contains the snake romsecrated to Escnlapins, Coluber asculami, and such familiar species as the grecn snake (Cyclophis rrmatis), black snake (Bascanium comstriefor). garler snake (Eutrenior sirtulis) :thl misnamed blowing viper (Iheterodon platyrlionus).
F. A. Lucas.

Coln'en: a local name for the species of Gulcopithecus, or Flifing Lemors (q, c.).

Colum'ha, sint, ealled also Shint Cols : missionary; b. of nohle farents, probably at Gartan, county Donegal,
 to seotland. He fomderd in lona. onr of the llebrides, an abley and college which had a bigh reputation. Died on the islamI of Ioma, June 9, क9\%. Sce his Life by Adamnan (n. ed. ly Skene, Blinburgh, 1871).

Columbe [from Lat. columba, a dove]: an order of birds contuining the pigreons. The skill is schizognathous and schizorhinal, and hasipterygoid processes aro present. The sternum is narrow. deply keeled, and has two notches on either side, although the inner may be reduced to a mere perforation. The erop is capacious, more on less completely divided into 1 wo frotions, and during the breeding season secretes a milky lluid on whieh, mixed with partly digested foot, the young are fet. The gizzarl is powerful, carea are ahsent or small, and the gall bladder is generally absent. The oil gland is bare, and in some genera lacking. The base of the hill is roveret with a fleshy membrane, oliten very conspieuous, pherced by the nostrils. The tarsi
 are wh the whele hether litted for prething than fin sorateh-

J．II．Vix Ambinge．

CoInm＇hiad ：a seacoast howitzer，of cast iron，proposed by Col．Genrge Bomford，chief of ordnance．T．．N．A．．and in－ troduced about 1812 ．Some of these guns were in service rluring the wirr between England and the［ $5 . \operatorname{si} 1 \times 12-15$. Three calihers were recommented－50－pounders， 100 －pouml－ ers，and 150－pounders－for coist defense，particularly against shipping，as a sungle shell of the lareser sizes exploting in a ressel＇s side．or on her decks，would，it was thonght，proxduce great injury if not complete wreck．

Meyer＇s Terhnotugie des Armes a feu mentions，under date $1 \times 15$ ，＂the explosion of an English vessel hit by an American hell before New Vork＂：and suain，under the same date，＂Very goorl results were obtained in America from ovoidal（spherico－cylmbical）pereussion shells of the ealiber of 100．which are fired from a kind of carronate designater］hy the name of Columbitul．＂This is the first notice given by this diligent and acomrate anthor of the ex－ istence of such a sun，or of a premession shell，in the world． Ile seems to have searched thoroughly from the commence－ ment of the C＇hristian Era．

Halleck（Hititary Art and Scipnce page 2s0）statps（in a not（e），aftre designating large howitzers as＂I＇uixhanšguns．＂ or＂Colnmbiads＂－－＂the deseription of one of Col．Bomford＇s columbiads which was at Governor＇s island，New York har－ bor，was taken to France by a young Freneh otlicer，and thus fell into the hands of Gien．Paixhans，who immerlately introduced them into the French service．：
Whether Gen．Puixhans receiven as above the descrintion of the colnmbial ne not，there wonld seem to he no doult that this gun was the firmt howitzer of cast iron of like calli－ ber amd length that was successfally used for shell－firing． Dight－inch ant］ 10 －inch howitzers hinl been proposed and math at earlior dates－that is．chandured grans shorter than camos and longer than motatrs，amb having fromnons in advane of their rants，and mear the center of gravity of the gan－hat thase gans were of homar．gancrally shorter than the columbiats，thal were not ilesigned or used for shell－lir－ ing at low ancrles，but for heary projectiles，to whain wreat r：11は号。

 inch aml 11－inch huwitzers，fropmad hy Villantrois，were mande at Domai of virht caliners length，and were fired with lual－filled shells at hicrl angles：and in 1810 ，at seville．in
 （1）ohtain al lomer ramen at the siege of（＇adiz．
From $180: 9$ to $1 \times 19$ ，armaline to Meyer，Paixhans was in－ teresterl in expromonts to powe the superiority of hollow projertiles over hot het for hat wal wara amd the destruc－
 treatise Sommelle Forme．Marilime，but not pmblished until
 inch howitare shtell gran of rant iron．＇J＇he Enelish clatm That Gen．Dillar．Whan introlneed a like gun in［8゚．4．por perad it in $1 \times 20$.

In the $1^{+}$． S ．the －inch huwitzer and lo－inch howitzer shell gnons were remoteled in 18.11 and istl．intoming these last，called columbiends，to be diend with solid shot und with
one－sixth their weight of powder：but subsequently they were reserved for shell－firing only，and a new pattern was atopeted in 1sis：two of which（one cast solic］and one hollow，and as proposed by fien．Rodman，cooled from the interior）were subjected to compamative proof，both enduring the remarkable number of $4,0 \mathrm{~s}^{2}$ rounds，with solid shot and service charge，without destruction．

In 1861 the Rodman exterior form of guns was adopted for the columbiads，as for all sthers，and ealibers of 18,15 ， and 20 inch smooth－bore． 10 －inch and $1 \stackrel{y}{*}$－inch rifled，ant 13 and 1.5 mortars，adopted fom seacoast gims．
（＇ol．Bomfort also proposed the 12 －inch gin of 1846．and while testing its capabilities carried on a series of experi－ ments proving the best and simplest form of fuse－shells lired from heary guns，with the safety－caps sulficient to protect the fuse from extinction by licochet on land or water．

 the states, 冬, 000, (no : and the Miflway conessionaries invested in their enterprises about s;30.000. "Thus the grand total cont of the F'air exceded sto , om,000. 'I'lue following is a condensed halancosheet of the reecipts and expentltures:

 reprembting all mutsanding hethes and ohligations. On Wh. I. ('hiogse lhay, by a chetk of over spom,(0n) the treacher of the bexposition discharend its fimal indebednces by modeming the dehenture bonds with interest. "The pont on the loar was atont $\$ 1,50,00 \mathrm{OH}$.

Stumday flosang. - The sonvenit-win gift from (omures. remaited that the Fair shond the clomed ont sumbay, aud on
the first Sunday the Fiil was elosell. After some controversy between the national commission and the local threctury, the Fair was onened th Smulay. May 28 . Int closed agiin on July 23 , contrary to an injunction that had been granted Hay 14 by Judge sitein, whon fined the directorgeneral $\$ 20$ and live directors 1,000 apiece for contempt of court. An apheal was taken, hut remained undetermined until the Fair chsed, the grates remaining opell on every Sunday thereafter. 'The athendance on sumbay, however, was much smaller than on other days and many exhibits were thosed.

Arurds.-The awards were made aceording to a fixed standard of excellence, and not in competition, and hore the smallest propurtion to exhibits in the history of similar expositions.

Horld's C'ongressess.-l buring the Exposition conventions were helld under the amspices of the Worluls comgress Anxiliary, wherein were disenssed philusophical intellectnal, religions, and economic froblems from an international stamprint. Among the results was a memorial in favor of international arbitration sigued be the commissioners of forty nations ant presented to the l'resident of the U.S. and the secretary of State. Of these gatheringsthe World's larliament of Religions attracted the most attention, conventions of religions bodies being held from Ang. ? 2 nutil (ct. 15.

Phblography. - 1 harge mmber of works have appeared on the sulbect of the World's Colmblian Exposition, as well as on particular departments and phases of it. The following members of the enmmission, including President Palmer, were appointed to compile, edit, and publish the official history of the Exnosition: Gen. J. W. St. Clair, West Yirginia: O. V. Tousley, Minnesota; A. P. Butler, South Carolina; George Y. Nassey. Delaware: John B. Thacher, New Fork; P. II. Lamain, Utalı: and Euclid Martim, Nebraska.

Tudor Jenes.
Colnmbian University : an institution of learning, situated in Washington, D. C.; founted mainly by members of the Baptist denomination, but unscetarian in its administration. It was ineorporated by act of Congress in 18:2 under the name of Colmmbian Colleye, which name was changed to Columbian University by an act of Congress, approved Mar. 3, 187.3. In $1 \times 8.3$ a new and stately university building was crected in the heart of Washington, and in 1884 a new lepartment of instruction was added to its srstem, ealled the Coreoran seientific School in honor of W. W. Corcoran, the great benefactor ol the university and the founder of its largest endowment. In 1812 a school of graduate studies was creeted as a part of its miversity system. At that date its faculty comprised 110 teachers, and the number of its students in all sehools was stis.

Jabes (: Welline.
Cuhumodidae [from Columbu, the typical genus]: a family of hirds containing the true pigens and doves, of the order ('olumbe (q. $x^{\circ}$ ). See also Phbins.

Col'umbine: a perennial pant of the genns Aquilegit and family Romunculacere. Columbines have live petals, all alike, with a short spreading lip, produced backward into large hollow spars, mudy longer than the calyx ; pistits five. The Aquilegia mulytris. of common colmmbine a native of Enrope, is enltivatial in gardens for its showy thowers. Thes Aquilegin comenlonsis, a native of the U. S.. has beantiful scerlet thwers if curions strmeture. Soweral pretty specios grow in the Rosky Momtans.

Revised hy C'harles Fe. Bessey.
('ullum'himm, or Nio'bium : a rare metal oriphally discoorrel in columhite from Massablasetis ly Matchett in 1s01. Wollaston in 1 No! in invest igat ing minerals containing enlumbium, expressed the beljef that the motal was identionl with tantalum, and this view was gencrably accepted
 thongh tatalma weenss in maty of the columbium minerals. Linse inderd, inclined to the helief that what had bere descerineld as columbium reaty ennsisted of two metals, which he calleot niohinm aml pelonim. Further investigations showed him that hat one metal was the hasis of the suppused two: so the hamu pelopium was hropped and the name niohium was matned, the symbol Nhbring now used for columbinm. The hack juwider pordued ley heating columbinm compunds with salimen has beren sujposed to he the metal. but Domantaine states that this powicer is the pratoxide, anul that tha metal is a stoel-gray powder ulb tained by igniting the chloride Nbe $\mathrm{l}_{\mathrm{s}}$ in a compent of hydrogen. With ablalum, colambium fums agroup histinet from the other clements. The princepal mincrats in which
columbinm is found are columbite, a columbate of iron and manganese: hragite, a commhate of ytrim and iron: samarskite, a urano-columbate of ytrimin and iron: pyrochlore, a columbate of lime, cerium, ete. : aschynite, a titano-colnmDate of cerinm, irm, lanthamm, atc. Some of these minerals contain tungsten. They are fomd in small quantities in a tew localities in Europe and the U.S. The atomie weight of columbinm is 94 .

 at that fwricul the seat of the most active maritime interests
of Portugal, he had every encomagement to increase his knowlenge of gengraphy and of navigation. Ilis tastes in these directions receivel a great impmes in the year 1tit by some letters frum the distinutuisthed Italian geographer Toseanelli. This torre-pumblence makes it evident that Cohombus had alreaty conceived the ittea of reaching the East Indies by stiling westward. Toseanelli assured him not only that such a royage was practicable. but also that the size of the earth was such that he conhd reach Cipango and Gathey (hapan and (hina) by sailing westwad about 3,100 miles. There is pusitive proot that from the writings of John de Mandeville, of Potemy, and especially of Cardinal dithy. Columbus at this time had acquired a confident belief in the sphericity of the earth. He helieved that it could be circummarigates, and for some years before 1484 he directed all his energy and tact to the work of convincing the King of Portugal that Pontnguese interests wonk be suhserved by attempting a west ward conrse instead of perserering in the effort to iliscover a pasige by Way of sunthern Africa. In these efforts he was not sinceessful. But cluring this period of waiting he had many experiences that enconragen his belief and re-enforeed his zeal. In 14 ait he sailed to the far north. amel came to an istand which was probably Icelamb. Nere he may have learned of the disenvery of America nearly sen yars inefore by the Norsemen. The matter, howerer, is conjecture as Columbns nowhere in all the writings of his that have been preserved allules to any such information or report. Daring the same perion the narigator went upm a slave-trarling expedition to Guineat. and served un several piratical expeditions under the muchdrealed corsior C'ssseneure. Xot long after 14 is he married Felipa Moniz. of whom rery little is known. There is conflicting evidence as to whether his wife died before he left Portugal in 1484, for one authority sars that Cohumburs abandoned the country hecanse of grief at the death of his wife, while the navigator himself, in a letter to the Spanish court at in her prerim, sirs that in orler to enter the spanish service he "abmoned wile and chidren, whom he never again saw." If Columbs was correct in this statement, he had at least three chihlren when he left Portugal, for he took his son !iexo with him on going into Spain. All efforts to acouire further information in regard to the wife and rounger chithen have been fruitless.
Columbus enteral spin in the autumn of 1484 or the spring of 145 . . Before leaving Portugal he hat sent his brother Bartholomew to Enghme with instructions, in case of failure to interest the English court in his new project. to go to Framee on the same errand. Ite at once set about the task of persmading the momarchs Ferdinam and lsabella to remder him the assistance that hat been denied by the King of Portugat. lant he was destined to a long perioil of waiting and to many bitter disappointments. The time Was not propitions. spain was not yet a consolidated manarchy. The ressmrces of the varinus provinces had bern depleted hymmerons wars. Fur the extirpation of heresy the Inquisition had repently heen establinhed, and it was still a problem whether this terrible engine of persecution Was to he successful. The plague was sweeping off the peophe in some of the most prombons parts of Aragon amd Castile, and. worst of all, the samgumary eontest with the Moors had mate sueb dratts upm the treasuries that the com hand been delased, and ham so exhansted the resurures of the poople that no other poject cond receive a faromble hearfog. It is not singular that under these cirenmstances the monarels were slow to render the coveted assistance. But they were not inelined to answer him sharply in the negative. From the first they seemed disposed ion give to his cause a respectul hemping. Whether this was beraluse of a gencrens sympathy with his enterprise. or whether it was merely to juevent another court from setting the credit of surh diseoverise as might he mathe is a ghestion that mont probably forever be very largely a mather of conjecture The ernime pursucl, howewor, was not an untatural one. The project was acsion and again refered to a commission consisting of the leamed men in the vicinty of the ennt. The decisions, thongh n'ser quite manmans, were uniformly
 he hat a frew firm ="リmerters and ardent followers. bint the vieissitudes of war made the cond migratorv, and emsequenty it was bever prosible !o give lothe sulijeet the eareful and protrated considnation at any one time that was necsuary to bring it to a linad decision. At bength, howerer, when the lamer of the crose was plated on the last Nour-i-h citabel at framab, the monarehs had no lomger any
grod reasum for postponing a final decision. But notwithstanding this fact the slowness of the monarehs diseouraged the supphiant. On the very eve of success he decided to abanton the court and hetake himself to France for aid. The momey with which from time to time he hat been supphed ly the royal treasurer was exhamsted, am he was whliged, on his wiar to the port, to travel on foot as a mendirant. In this phight he presented himself with his litthe son at the door of the monaster La Rabida, and beqsed for a crust of breal. The abbot l'arez de Marchena listened to the sory with great interest. for he had himself at one time been the confessor of the queen. He helievell that he might have inlluence with the court. It was son armaged that he shomb set out at once on a mission of persuasion to Qneen lsabella. The journey required several dars, but in the end it was successful. The monarche ordered a suthiciput sum of money to be sent to enable Cohmbus to present himself at court in a respectable manner. lle appeared, and Ferdinand and Isabela at length decided that they would render the needed assistance. But the terms demanded hy Cohmbus threatened to defeat the whole project. lie askel to the made adminal of the ocean and viceroy of all the teritory he mirht aiscover : that he shouh have a tenth of all the gohl and other wealth that might in any way be acquired: that he should hare sole right to nominate julges and other subordinate officers: and that all his rights and titles should be hereditary. The monarehs very naturally regarded these terms as inadmissible, and Columitns, rather than athate any part of his claim, deeided to withlraw. He left the court at santa Fé. but the enthusiasm of the queen. re-enforeed by the persuasive worts of the Inchess de Moya and the minister Santangel, was finally successful. Colninbus was at once brought back, and it was soon agreed that three vesshs should be fitted out at the port of Palos for the expedition. Though the articles were sigurd on Apr. 1i, 14 , the expedition was not ready to sail hefore the sumner was well adranced.

First Toynge.-The difficulties and delays in fitting out the first llect were owing to a mumer of intowarl calses. For some misdemeanor the people of Palos had been condemned to Lumish the Gocernment gratnitonsly with three ressels ami all necessary etuipments. But as sorm as the nature of the contemplated expedition became known, the imaginations of the pepulace logan to conjure up all conceivalile horrors. It seemed to be impossible to enlist a erew. Finally it was proclaimed that a padon womld be isshed to debters and criminals in ease they wonld enlist. Many arailed themselves of the privilege thus offered and then deserted. It was many weeks before the necessary men, alont 120 in mumber, conlu be secured. Of the ships. the Sinta Maria, the Niña, and the Pinta, the first, which was the largest, was only about is feet in length, and abont 100 tons hurden. The character of the cerew incrased the dinliculties of the experlition. The flect, after the erew hat all contessed themselves and secured abmontion, set sail at sumrise on Friday, Ang. 3, $14!2$. But the rudder of the l'inta soon meded repairs, and the flect was dolayed more than a month at one of the Canary islands. Serting out again on sipt, 6 the hittle expedition onee more set its sail for the unknown. Fertile imaginations have done much to erowd this famons voyage with peribus experiences. But commbus's journal, publisher early in this century, shows that it was not remarkable for incident. There is no evidence that the crew mutinied, or that Columbus's life was at any moment in danger. During most of the passige the prows of the vessels were turned due west, Early in Oetnher there began to be increasing imlications of bimil. Loose seaweed and bits of thating wood gave nomistakable intimations that hand was not far away. Flucks of hirds flying for the s. Wi. finitly led Columbins to thon his eonrse a little to the $太$. of IV., a change which prevented the first lauding from taking place on the coast of Fleridta. At ton ciclatk on the evening of thet. 11 Columber thanght he saw a light. If he was comreet in his empereture the hight Was in a bat, for they were ronning at the rate of abont to milus an hour, and it was two $0^{\circ}$ clow on the moming of the 13th when lam was first seon. Sails were shortened and the ships diftem hefore is strong east wind mitil daylight. 'Turning to the $W$. the admiral diseovered the three momatains which he called 'rrimilad and a few days later the lowlands of the continent about the month of the Orinoco. This discovery, Ang. I, 1498, was the first sight the spaniards obtained of the mainand. Passing throngh the rush of waters of the trinoco and the channel which he named the Bocea del Jrago. or loragon's Mouth, he lingered for a few daysalong this interesting coast, aml then sated directly for llispaniola.
The harbor of San I omingo was reached on Aug. 30. There Columbus found attairs in a deplorable condition. The criminals transported to the Indies had already begun to exert a lalefnl inthance. The system of repartimirnos, or personal service, had converted the friendliness of the natives into the most active hostility. Whenever there had been any resistance on the part of the natives, the persons adjudged guilty had been rednced to slavery and sent to Spain. The iniquitous trallic thus thrived apace, and its very prosperity intensified the hostility that had now become universal. To add to the diffenlities of the situation the adelantado had become involved in a 5 war with a formidable chicf in the western part of the island. Though the natives were easily subdned. when they were subjected to tribute they only added to the mmbers of those who, on the least chance of success, were realy to break out into open insurrection.
The oceasion soon presented itself. Before departing for Spain Columbus had appointed Francis Rohlan chief justice for the island. He had an ambitions, arrogant, and turblent temper, and som fomm it easy to gather a strong following about him. He plannef to assassinate the ndelantudo. and then make himself master of the island. No effort to bring him to terms was snecessfnl. Colnmbus afterwarl wrote, concerming the enndition of atfairs on his arrival, "that he foum nearly halt the colonists of Hispaniola in a state of revolt." It was not until November that a form of settlement was reached. Columbins agreed to transport the followers of Rodlan to Spain with ample provisions. and to allow one slave, "man or woman," to each of Roldan's men. But vessels could uot at the moment he obtained, and it was midsmmer of the next Fear before the necessary ships were put at the disposal of RoWdan and his men. This delay was mintumate, for Roldan now refused to be bouml by the ofle contract. It was a year and a half after Columbis:s amial before terms were finally adopted. Roldan summitter only when Cohmbus agreed to appoint him perpetnal juige and write a letter to the Spanish monarchs exonerating him from all blame. But it could hardly have been expected that so conspicnons a reward of insml)ordination would promote goorl diseipline. No somer was Roldan lrought into subjection than another revolt broke out umler a turhulent apirit named Ojela. Meanwhile accounts of the condition of affairs were fimling their way thack to spain. Unfortmmaty there were no favorable reports to relieve the dark colors. Natters seemed to be growing worse and worse. The returns of gold hat been trilling in amount, and even the slaves hat proved to be of very little value. Ewry ship hromght demands for turther supplies, Withont bringing any word of improvement in the condition of the colonists. Diring all this perior the old enemies of Columbus in sjain wero busy with their work of denunciation.

The monarchs were at lengeth persmaded that the ammiral must he suspenfed firm anthority. The arrival of a carro of slaves spems to have completmit their tetermination. The agent selectel to execute thoir inthority was an olficer of the royal houstholl mamed Francis de Bobatilla. Ile was authorized to look into the conlition of affairs. and semd hark to spann "any cavalime or uther persens" in case he should find such a courac deximble. It is mot probable that the monarehs intomed to inelude folumbens in the list of persoms subjeret to armst, hit the language of the commission provided miommanty. Bobatilla arivol at San bomingo on Aus. 23.149 , and fomel affairs in axtrene dismber. lfis efforts during mome than a year to bring order ont of chans were unsurecossful. Ammest his tirst act showed an energy that amountel to butality: C'olumbus was thrown into chains and sent back to spain, where he arrived in Nov., 14:\%.

The motery aganst the brutality of Pobalilla was universal, and the momards mathe haste to lisarow the arres and set the atmiral fret. But the affais of the island were in sucla a rombition that not even Jsabulla was in favor of re-
storing him to his command. The most she was willing to do was to provide for the protection of his estate and furnish him with a lfeet for further explorations. The squadrom of four ships was ready to sail on May 4. 1502.
Fourth Toynge.-The purpose of Columbus in his fonrth expedition was to press on still farther to the west, and put himself into definite relations with the Asiatie mainland. He was still unshaken in the befief that the islands thus far explored were only a little E. of Japan aml China. After asking in vain for admission to the port of San Domingo to exchange one of his mnseaworthy ressels, he began the most perilous portion of his career. Sailing hetween Cuba and Jamaica he turned to the S . W., and suon found himself skirting the coast now known as Central Ameriea. But all the fates seemerl to have conspired against him. Tornado after tomado drove his ships about and threatened them all with destruction. However, in the course of the winter months he explored the coast from the Isle of Pines to a point E. of Darien. But want of supplies fored hin to turn baek. Gale after gale followed, and fimally, after experiencing nealls every form of vicissitude, the last of his vessels was wrecked on the northern erast of Jamaica, Aug. 12,1503 . Rednced at times to the point of starvation, he saw that the only hope of rescue was in the possibility of reaching San Domingo in an "pen boat. One of his companions, Mendez, volunteered to make the attempt. The first effort failed, but the second was snecessinl. It was June 25,1504 , when the admiral and his little crew, after ten months of suffering. were gladdened by the sight of approaching relief.
The thrbulent career of Colmmbus was now practically at an end. After passing a few weeks at 心an Domingo, he set out with two ressels for Spain, where, after a tempestuous voyage he arrived on Xov. \%. Though scatcely sixty years of age, he was oll and broken. It was evident that his work was donc. He wrote numerons letters for the purpose of interesting the ling in behalt of his son: but to these importunities Ferdinand paid very little heed. Cohmbus sank rapidly, and, atter providing for the disposition of his estate ly will, lied at Valladolid, May 20, 1506.

After temporary interment at Villadolid and Seville, the remains of the great explorer were transterred to the cathedral at San Domingo at some time before the year 1544. At a later period the remains of other members of the almiral's family form the same resting-place. In the year 1796 a vault in the cathedral, suppered to contain the bones of the diseoverer, was opened and its contents were conveyed, with imposing ceremonies, to Llavana. In $18 \%$ and 1s:1, however, evilence was discovered that the vanlt opened in 1706 was not that of the admiral, lut that of one of the other members of the tamily. It may therefore be regaroded as established almost beyond dombt that the ashes of the discoverer still rest in the eathedral at sin Dominge).

Colnmbins, Diego (in Italian, Giacomo Colombo, and by Latin writers callell Jacobus) : brother of ('hristopher Columbus: b. probahly at Genoa about 1450 . Ite accomfanied the admiral on his second royage, and when the latter went to explore Cuba was left in charge at Isabella. Ihe sulserpmently had a good deal to do with the affairs of Hispaniola: but his character was not fitted for command in such turbulent surroundings, and, though he seems to have been kindy and good, he effected little: In later life he breame a priest, and in 1509 he accompranied his nephew, Diego Columbus, to San Domingo, where, probably, he died.

Barly Christian architedute made fre nse of entums taken from earlin faran－Roman strmenes in the eretion
supports, carrying the arches under the clevestory. Fron this time on the column is a feature of interior architecture rather than of the exterior, as was the case with the Greeks. The Brzantine buillers, with better logic than that of the early ('hristians of Rome, rejected the classic lase and capital, and herised new forms better alapted to the function of supporting ponderous mases of vaulting. This allaptation of form was, however. carried to much greater pretection br the mediaral arrehtects of Europe. Who show off the last restiges of clawsie conventionality. The culumn Was now used more often in gronps of clusters than sugly; Was made sturdy or stember as cach case might demant, and its shatt left smooth, or painted with cherrons, stripes. or bands, in brilliant color. Sometimes, as in early French and Jorman poreles, the shafts were carved in intricate diaper-patterns.
The practice of henaissance and modern architects has nsnally followed lionan precedents; but the development of construction in iron and steel has giren rise to fregnent innorations in the forms of metal columns. The nse of monnmental columales is in our day very rare, those of the Lourre and of the Capitol at Washington being among the finest modern examples.

Columns have been in all ages erected as momments, standing isolated in the open, to commemorate important names or events, and in mosi cases surmonnted by statnes. The Romans excelled in such monuments, of which the Trajan and Antonine columns at liome are conspicuons examples. and the Vendome and July columns in Paris the best modern imitations. laut such columns are more properly called pillars. see Architectcre, Byzantine Art, Composite, Coristhias, Doric. Ionic, and Tescas Orders.
A. D. F. Hamlis.

Colnmin: a military formation of relatively great depth and little front, as distinguished from a "line," which has an extended front and little depth. Troops in column are easily movel alung roads and over broken conntry, whereas it is difficult to canse a deployed line to advance or retire over favorable gronnd without great irregularity or even disruption, and in broken gromel it is ahnost impossible. For this reason lines are alwars ployed into columns for any extended movement. A column may consist of a company, battalion, regiment, brigade, dirision, or corps. T'pon marches not in the vieinity of the enemy they usually have a front of four men, great depth, and are composed of all arms. Upon the battle-fiedd the 5 were formerly monch used for the attack with the beyonet. and riried in strength from a single battalion to a large division. In modern fields they seldom exceed a single compans, and are used for manoenver only, being deployed into line before ther are exposed to the full effeet of small-arm fire.

Col'ver, Nathamiel, D. D.: Baptist divine; b. at Orwell, Vit., May 10. 1294; 13. at Juston, Sept. 25, 18.0 . He received only a very limital mbutation, was loy trade a tanner, and served as a volunteer in the war of 18 ti . The began his min-i-try in 1836, and was sluccessively settled in Boston (183)! $)$. Sonth Abington, Mass. (1852), Detroit (1853), Cincinnati (10.56), anul Chicago (1stil). He was an able preacher, of great power with the masmes, amd eminent as an abolitionist. After the war he foumled in Richmond. Va., the Culver Institute for educating yourg ofored men for the ministry. and was
 low:hip (13oston, 1844).

## Cobville Iudians: fiee Shlisuan Jxmaxa.

Colvin. Sidery, M, A.: Finglish anthor: 13, in Norwood, Surrey, lune 14. 1845; mbonted at Trinity Collere, Canbrilge; slade Profeson of Pine Art at Cambritge 18:3-86: director of the Fitzwilhiam Alnsemm there 1876-84, resigning to lucome keeper of the department of prints and drawings in the british Masoum. He has written for the leating periodicals many critical ant historical artieles on art and literature; is author of Children in Italion and Emylish De-
 Men of Letters series; and has edited a volume of siflections from Landor (1884).

Coly, or Colite: any nne of several small birds of the genus Colines, restricted to Africa. All four toes are directed forwarl, lont the imer and onter can be turnel? backward; the phamage is soft and lair-like, and of a grayish cast (whence they are smnetimes called monse-birls); the tail feathers are lonig and stiff. The stracture of the colies is peculiar, and ther are related to the woodpeckers and kinafishers. They ereep athout the branches assuming very curious attitudes, and often roost in compranies, hanging heat hownward.
F. A. Lercas.

Colym'bidæ [Morl. Lat., from Gr. кóduußos, a diver]: a family of diving birds of the noder Preopones (q. $r$ :). The tamily comprises the grebes only. See Grebe.
Col'za : a variet of rutahaga or Siwedish turnip (Brassica compestris) which is enltivated for its seuds, from which oil similar to rapesed oil is made in Europe. The oil is used for lamps, lighthonses, and machinery, and the leaves and refuse seeds after the oil is expressed are tel to cattle and sheep. The roots are not bulloons. The term is sometimes applied rather loosely to other but similar crnciferous oil-plants.

Co'ma [from Gr. кómp. hair]: in astronomy, the nebulous envelope of a comet's nucleus. (See Conet.) In botanr, the natne is sometimes given to the head or top of a tree, and also to the hairy crest of certain seetls.
Coma [from Gr. көิца, deep sleepl]: a condition of deep sleep or stupor from which the patient can mot be aroused is a sumptom of great gravity. The face of the pratient is usually congested, the conjunction of the eyes injected with hoom, the pupil small or large. the breathing labored. often "stertorons." A varietr of canses produce coma, and the symptoms vary with the canse. Among the important cintses may be mentioned narcosis from alcohol and opium; Bright's disease; diabetes: apoplexy and injury to the brain; epileps: sun-stroke and leat exhaustion: pernicions malarial fever: and severe infections diseases of varinus kinds. The stuporons condition of extreme drunkemess is the commonest form, bit is nofortnnately sometimes assumed to be present when the coma is in reality the onteome of some of the other conditions named. This mistake is all the more apt to oceur, lecanse a person feeling fuint or ill may take spirits to revive him, and then fall into coma with the odor of alcohol still moticeable. or an intoxicated prrson maty fall and injure the heat, or may suffer apoplexy, when again the ollor of drink might deceive the ordinary ohserver. It should therefore be made an invariable rile in mrisons, or where drunken persons are kept, that in every ense of unconscionsness, no matter whether mere dronkenness be suspected or not, a physician be smmmoned. The diarnosis of the rarions canses of coma is so diflicult, and the neeessity of active treatment so urgent, that to none but experienced physicians should be intrnsted the care of these cases.

There are besides coma a few other contitions of nucon*Cionsness, such as hypnotic sleep, trances, and the like, but the rarity of these and the essentially different appearance of the patient readily separate them. The face in these eases rarely presents the same appearance of serious illncss as in coma, but rather appears placid or death-like, and it maty or maty not be possible to aronse the patient.

 whith the chataterivaro in motern usage are that its in－ cilente and lampage resomble thase of ordinary life：that the termimation of it－intrighe is happre and that it 15 dis－ tinguished by arenter howh and greater emmplexity of plot
from the lighter theatrical piece entitled a farce. The original dttic enmedy was a burlespue tragedy in lorm. in substance a satire on indivihuals, and fonded on pritical or other matters of public interest. The Attic comedies are usually assigned to three schonls- the "old." the "mithle," and the "hew" comety. The ohd comedy lasted till the end of the Peloponnesian war. It wat characterizel by personalities, great frechom and irregularity, and was a powerful political engine. The middle comety was more finished. less personal and direct in its aims, satirizing systems and opinions rather than indivilual men; it ceased with the Macedonian conquest. The new comedy was very much like our modern comedy in scope and general character. See Drama.

Comenins, Joms Anos (or Komenski) : elucational reformer: b. at Nivaitz, in Moravia, Mar. 28, 1592. Ilis father was a miller. and the family belonged to the sect generally known as the Moravian Brethren. His parents died while ho was still a chid. He attended first an elementary school at Strassick, not entering a lation school until he was sixteen rears of age. Later he studied at the College of Jerbom, in Nassam. Where he first saw the report on Ratich's proposen innovations issued by the miversities of Jena and (riessen. Shortly after he wrote his book Grammaticop factioris Irucepta. published at Prague in 1616. After traveling and studying at Amsterdim and Deidelberg he was ipponintel to the Brethren's school at Prerall on his return to Moravia, 1614. In the same year he was orlained and in 161s was placed in the most floutishing of all the churches of the Brethren at Fulneck, where he also had the superintemdence of the sehonls, and where he married and enjoyed some years of lappy life. In consequence of the battle of Prague and the ocenpation of the country by the suanish trogns, Comenins lost his catire property, incluiting his limary and manuseripts, in 1621. A year after his wile died and then his only dhim. In 1624 all Protestants were proseribed, and in 1 diz the proseription became so warm that Comenius, whe hat been in retirement, was obliged to leave the country and rotire to Lissa, in Polaul, where he was charged with the supervision of the Protestant schools, and became superintement of all the Moravian churehes of that country. Here he devoted himself to the study of educational matters experially to the thestion of methot, and compused his Didactica Magna, or Great Diductic, which, however, was not immediately prublished. In 1631 he published his Jonua Lingutrum Reserato (Gate of Tongues Unlocked), which brouglit him sudten aml world-wite fame. Haviner formen it sheme of miversal knowledge, to impart which a series of works would be necessary that were beyond his resonrees, he needed a patron. He presently receivel a call to improve the schools of sweden, which he deelinet on arcomit of the unsettled condition of the enutry, The English P'arliament, howerer, summoned Comenins to England, whither he went in 1641. His coming had been prepared for ly his friem, Naster. Samnel Hattlib, who had even published it sketch Comenims hat sent hins of his plans (Comutum Pemsophicorum Dilucidetis) without lis knowledge. It first his prospects in Englant seemed hright, but the cometry was in the midst of the civil war, and (cmenins. Jeeply disappointer), fually preparenl to returu to lionsa, it this moment he reccived a Letter from lomis Bi: Geer. a riel Butch merchant, who offered Comenins a lome and means for carrying wat his plats. Tha offer was acepted, ant Comenius joinel his patron, who was then living in sweden. He was most fitVorably received both by We Geer and Oxenstiern. While alduroving of his l'ansophic phans, these two and the chancellor of the university. Iohn Skyte, loth urged him to devote himself first to the reform of the schools and "to hring the st mly of the latin (ongur to a sreater ficeility." Dependent upon his friputs for support, he felt constrained to derote himself to this work in the main for dight years. having setteel for the phrpuse of guict work in Elhing. in Wrat I'rus-im. In lits he returnet to Lissa, where he became senior hishop, of the Moravial Jrothran. Ilis work at Elthing hal received the aproval of a comaission of learmed
 arum Worissimn, the most ehalonata of all his tratises on methon exeppt his fromat llidtoflic. While ocenpied with his duties a- hend of tha Momvian ('hureh he was called in 16,0 to Transylvania hy D'rinew Sigismumel hagotzki to undertake the reform of the schools there. Aecortingly he went to Sams Patak, where it molel sehool was formed, amb
there he labored from 16.50 to 16.54 and pmblished his most celchrated work, the famous Orbis Pichus. This was really an abridgment of his Jonua, with the important addition of numerous illustrations. It was puhlished at Nuremberg in 165\%. Having organized the scliond he returned to Lissa. The active Protestantism of the Brethren led to the burning of the city by the neighboring Poles ant Comenins again lost all his worldly possessions, including his walued work on Pensophia and a Latin-Bohemian dictionary on which he hat luen at work for forty years. Ultimately, Lawrence De (ieer, son of his former patron, gave him an asylum in Ansterdam, where his rmaining years were passed in ease and dignity, He earned a sufficient income by giving instruction, and was enabled by De freer's liberality to publish a tine folio edition of all his writings on education, completed in 1657. Unfortunately in lis old age he became the dupe of political and religious impostors. He died Nor. 15. $16 i 1$, and was buried at Naarden. The literature concerning Comenins is large.

Comenins may perhaps rightly be considered the founder of methonl. He strove for a natural insteat of an artificial education. for the subordination of Latin to the mother tongue, for the introfluction of geography and history into the sehools and thus enlarging the scope of school instruction, and for the nniversality of edncation as opposed to the itea that only certain special elasses and individuals were wortly of it. From the standpoint of to-day it would be easy to criticise him, but in the light of foni centuries of experience his works remain among the most important accomplished by any individual in the tlevelopment of education. Ile himself said that his objects in ochonl reform were "to give a compendium for learning the latin tongue that would make the atquisition of it pleasant : to introduce a higher and better philosophy in school-work so is to fit youth for the investigation of the causes of things: and to create a higher tone of morals and manners " (Von Rammer). llis personality is among the noblest and his life among the most inspiring in the whole long list of edncational heroes and martyrs. The three hundredth amiversary of his birth was widely celebrated both in Europeand America. On Oct. 1, 18:11, the Comenius society was fommed for the study and publication of his works. see Life of Comenius by S.S. Lamtie (london. 1881 : 21 ed. 1884 : Am. ed. Syracuse, N. Y., 1803): essay on Comenius in Quick's Eflucationat Reformers; The Éturctionat Revieu; Mar., 1892 : Joseph Payne, Lectures on the History of Educution (189)). See CzEch Literature.

Comes [Lat., orig., a companion]: among the later Roman emperors, the title of an officer with territorial jurisdiction. It was nearly equivalent to count or earl. See Count.
Conet-flnder: a telescope of low manifying power and large fich of view, used in searehing for comets. In the most apposed form the telescope is bent at a right angle, with the eve end horizontal, so that the olserver can sweep from the zenith to the horizon without moring from his seat.

Comets [from Gr. kouñ $n$ s, having long hair, deriv, of кбип. hair] : hearenly bodies, of a kind whally distinct from all others yet known. and in some points enveloped in a mystery which science has not hern able to prnetrate.
The infightcr comets, those risible to the nakel eye, differ little in their constitution. They consist of thee parts: a nuclus, a coma, and a train or tail. The nuclens is a star-like point of light, which in the telescope lonks like a small. ill-defined planet. The coma is a clomly or nelulons light surromang the nueleus anm growing brighter towarl its interior, so that it is difficult to doffer the exact boundary betwern the nucleas and the coma. The tail is a train of light, genembly fan-shapel, more or less curved, and always extemting awny from the sun. It shades away so gromually toward its end that it is diflicult to assign a definito Ienoth to it. In great conets it is the most impressive feature extemding over a long are of the leavens.
orhits and Origin of Comets.- 11 . Wonlel "preat that comots are not, like thie planets. permanent members of our system, moving in their orbits through indefinite ages without change. They appren to be fragments of nobulons matter, possibly scattered portions of the raw material from which systens were formed, which have wantered through the stellar spaces for unknown ages, perhaps since the formation of the solar syetem. One by whe they are attracted toward the sun. Revolving aromul the latter in parablic orbits, their momentum carries them off again
mot the ervat roinl from which they eame, there perthas Io reman for many ages, butil they are obe mere attraterl sumwarl. 'This would be the rase with alt emmets if the sun alone were the attracting holl: It is the case when the comet, in its path aronnt the sum, ches not ap-

 the velocits with whinh the comet is maving. In this case the latter will he sent off in at hymernelie orthe ame will cortainly wander off into spane never to return. Bat the
 Then the orthit will be changed to an ollipse and the comet will beome, aphatenty, a permanent member of our system.

It now appare when they the thes made members of our sistom, that comots, like animated boines, are mortal, and that in atronomial masurement then lives may be ennsilemed stort. As they mepat thair revolutions aroumb the sum, their tails, striking and hrilliant at first, gratnaily fale away. and then the muclens anme to crapurate intio the coma, so that, after the lape of a few eenturies, or promag a few thonsam years, nothing is left hut the comat. The comat is gradmally reduced to a mere pateh of notmo thas lioht. This patch grows faintor and fainter, umilat at length the most juwerful telesiopes rail to show a trace of its existence. The eromet is eompletely dissipatent. Thare has been at least one instane during the present generation of the dis-ipation of a cemet in this way, and there are one ar two others which will probably never again be secen, athonerh they have loner moved in wellodetined orbits.

1: To their urhits, ramets are divided into perionle and non-periodic. The former are thenc whith are known to return at cortain definite intervals, gensrally a few years The batter ean newer, sa far we wan know from expmience, be seen more than onde. They move in apparently parabolie orbite, and will ertamly mot return until ernturios at hast hawe clapsed. From what has been sadel, it will be sern that all the orbits were orginally matame, and that geriotie eomets beome such unly through having bern cathuted hy a phat, athe thas mate a member of the solar sestein. 'The theory of the rapture of comote hy planets lats bedn developed hy l'rof. H. A. Newton, of the [F. S., und Trisertand, of Pramee, so completely that the haws aceroding to which it orerrs are now fully mulestowd.

Niember of comels- T'0 the number of eomets it is impowihle to en atay limit. As a general rule, between twenty and forty alpar in meh century, wheh are sisible to the naked eye. Whey mey therefore, on the average be expected to atymar at intervals of thre or four yatrs. But half a dozen or mere are fomm with the telectore nearly arey year, the bajority of which are now ones of thase whith athally wisit the sum, obly a very smatl fration are ever seen with the teleseope, so that we con havtly toubt the sammess on the view of Kiepler that the extestia? spaces are as full of emmets a the sea of fi-h. So the great majority of thase which risit ome shem tos on only at intervals of many thonamde, pusibly hombets of thonsamis. of years, we can not set ans limit to the actual total nomberi of sumb beylies.
foustitution of Comefs.-When a bright comet is rate-
 times he wen, partially lent aromat the butence on the

 fusem, ant finally lose inself in the meblowity of the comm. Bufore it hoss so however, one or more new ones will the foum rising to take its phace. There bows seme to the formed of bemispherient mednges of vaper, which rise from tha nuclens itself, dissolve themselves in the comat, and are graluat! relueded from the sun so as form the material al the tail. If this the so, jt atemont. for the gratuad dis-
 foun is simply the mather which has exapmaterl from the nuclen-. That the tail of a comet is mot a sulal apmondand camion with it mus be evident. The centrifugal force Which a colerent berly Would sufter if swong arount the
 known substane cond h he trong emoth on sumain it. There (ean lue no dombthet the tail i- -imply of the mat ture of a strenm of a vaper, emtimat! thew att from
 the sun. That it is so sepelled by the sum, while the matlenis attracten, is ane of thase myturne whith atome hat not yet been able to sulse. "lice consant exajuration of
comeary matter to form the tatil cxphans the shortness of life of these thatio.
Suret masenic ohservations upan the light of eomets have onty sewal to deepern the mystery which surround them. Thai spertrum of at bright cond is fomat to ernaist prin"ibully of thece hands, and heats so striking a resemblance to that of errain hyterembens that mo douht of their iden-
 a hydrowhon the hatter mast he so hoo as to he selfhaminhs. Now, it would sem dertain that a comet is mother hot nor self-huminous. All the haws of latat womb tenl us to sulpume that it mast rather bo imenoply cohl. exmet when it erows insile the orbit of the earth; and were it self-luminons, we should see it when very dietant from the sun. A- a matter of fact, whervations serm to show that its hrilliancy variss with its distance from the sun,
 the wher hamet, the spetrum of smmight reflectend from a body having an atmosphere of hylrocatoms onght to be the nerative of that shown he the eaner : it would be dark just where the comet spertruin is bright. All we e:m say tharefors is that the light of the eomet mast be subject to some ation whel we have no means of producing in our Lubaratorises.

Among the most remarkahe nf known comets is one with Which the names of leexell and (handler may he assuciated.
 Which remainel vishlat atong thene, and ohsorvations showed the orbit to he an ellipse whore major axis was onty three times the diamener of the earthis orbit, amb indicated a purina of tive amd a balf years. It was impesible to identify this comet with anybefore obsered, and yet it was wry 1)itheolt tormene that a hright comet with so shom a pericul houlal haveprevionsly seaped ubservation. What was still more remarkable, it was urver seen again, though earefally lowed for in the phates when acemplate to previons wharyations its orbit should have heen. It gave occasion (0) Hany surasus by the wits of the day at the expense of astronomers. It present the explatition is easy. The
 point to the sum laving leen as (listant as the orlat of Jupiter. In 1afir it was in sum close proximity to dupiter, moving in the same dimetion, and bermy in the same phane that the attration of this great planet entirely alament its orloit. It- pasaque to the pribelion in 1206 took place by day, ant in 1 iab. hefore mother tetum, it again eneounterea the sast haty of olusiter. tha attraction of the planet thenting it into more disath racrions, and so changing the form of the orbit that it was mot arain oem for more than a erontury.
In 1se! a comet was tiscoveren hy Browk, of New Yurk State, whid prowed to have a purtor of only about sewen or Pight yours, and yet to he maving in an orbit not hefore rivoritand. A wery little computation solval the mystery, by showing that in the rear lsaf it hal passen in close proximity to the panel apiter. which must have caphured
 the chaturbing action of Jupitor mon it. ant show that in atl prabalility it was ithentient with Laxells emmet, which hand in the meantime bern moving in an orbit complety ontside that of huphter. It han hern hameht inter the systom by the attraction of this phate and thrown into a new orthit hy the same mande.
'lhe eomet of tet: was remarkite for its near approach (1) the sulu. A very slight wanse in its divertion would haw thrown it into the body of the sun itedf. When it
 cansing alarm the word ower, atd heroming ennected in nurns mind- with the prediot inn of Miller that the world Womben eme that year. What is most remarkahle about its orthit is that in 1 siv another conact was fomad to be mor-
 "hedher the two brelies mieht not he identien? 'This, how-

 same nethit. It would therefore sem that these theme weme were orimally in each wher"s neighorthon in the stellar
 hons mather, and were grablually attracted coward the sum, whe he our.
 medorated of all the periontio wome has hern so often writ-
 from seventy-tive to seventy-sesen gians. has last return

Was in 1835: it may therefore be again experterl about the year 1911. It is the only perindic cunct eonspicmous to the naked ere. That its tail at the last appearance din not correspond in brilliancs and extent with that recordod in earlice centuries may he aecounted for br the gradual dissipation of the cometary matter, already described. It was the object of very remarkahle observations by Bessel ant others. The orbit was so carefully valculated that the last return to perihelion was predieted within three days. In all probability the next return will be predicted with ret greater precision.

Birlu's rompt.-This comet is remarkable because it is one of which the amihilation has undoubtedly been ascertained. It was first observed in $17 \sim 9$, and the fact of its discovery at that time shows that it eondil not have been what we should now call a faint comet. It was again obsurved in 180.5. but not recugnized. It was rediscovered for the third time in $1 \times 9$ by the Austrian whose name it bears, and now was foum to tio periodie and identical with those seen in $1 \pi 3$ and 180.5 . The periot was fomed to be six years and eight months. In 1845 the first symptom of dissolution was seen in the separation of the coma into two distinet parts, so that there were two comets, a large and a small one. The latter grew at the expeuse of its companion until they were nearly equal. The next return took place in 185?. The two companions were then found to be more than a million miles apart, and of nearly equal brightness. Neither of them has since been seen; but in $187^{\circ}$, when the earth passed the point in its orbit near where the comet ought to hare been passing, a meteoric shower was ohserved. the result of the passage of the invisible fraginents of the ranished comet through our atmosphere. This meteoric shower is now well recognized, and the meteors which caused it are known as the Andromeds, becanse they radiate from the constellation Andromeda.

A more complete account of the relation between meteors and comets will be found in the article on the former sultject.

The following is a list of the comets which have been founil to revolve around the sun in periods of less than one hundred years. They are named after their discoverers. The second column gives the time of one revolution around the sun ; the thirl, the year and month of the last-observed perihelion passage. Several of them were looked for in vain at their last return, and have quite likely ceased to exist, but, as a new one is discovered every two or three years, there is no danger of their becoming extinet.

LIST OF PERIODIC COMETS.

| NAME. | Period (in yeari). | Last observed peribelion prasage. |

Comfrer, kun'frer: the name given to sereral plants, natives of Europe and Isia, of the gemus Symphytum and family Boraginacer. Thes have a fine-toothed calix and the throat elosed by fire convercring awl-shaped seales. Symphytum ufficinale is often enltivated in gardens. Its roots are used in decoctions in diarrhoea, ete. The prickly comfrey, S. orperrimum, is cultivated as a forage plant.

Comines, kömeen', or Commines: a town on the S. W. frontier of Belginm; divided by the riser Lys into two nearly equal parts. one of which is in France. It is 9 miles N. of Lille (see map of Hulland and Belginm, ref. 10-B). Here are impurtant manufactures of ribbons, threads, ete. Iup, of the French town (1891) 5.435 ; of the Belgian (1890) 4, 80:

Comines, Philippe, de: Tord of Argenton : historian and statesman ; b. near Menin. Flanders, in 144. The son of an ancient race, his education was conrlucted with the greatest care, notwithstanding he had early lost his parconts. He entered the service of Charles the Bold, who emplored him in important diplomatic business. About $14 \pi 2$ lie proved untrue to the duke forming a secret compact with Louis XI. while he was held a prisoner by Charles, who took him captive at Peronne, and became a minister of the French king, his enemy. After the death of Louis X1.. Comines was an adherent of the Duke of Orleans, ailling that prince in his ambitious plans against the French Govermment. This cost Comines his ministerial office; wherenpon he aitled the Bourbon prince the more zealously. Il is last vears were spent in quasi-disgraee, Louis XIl. making no isse of his politioal talents. This perion of his life he employed in writing lis Jémoires, for which he is now chieffr known. They cover the yars from 1164 to 1498 , and show the writer to liave been a jrofound statesman, an acote and impartial obserrer, a man deroid of noral enthusiasms Ilis fresh and naire strle refleets impartially the splendors and the Weaknesses of his time: but the new application of political reflection to historical events entitles him to be deemed the first molern historian of France. The Hémoires first appeared in 1523: later colitions are those by I)upont (1840-47); Kerryn de Lettenhove (186i-7t): Chantelauze (1881). Siee also F. van 110 k ., $P$. de Comines, and 1 R . Chantelauze, $P$. de Comynes. étude Liographique d'après monceaux documents, in his Portraits historiques (Paris, 1886). I). Oct. 18, 1511.

Fevised by A. R. Marsh.
Comiso. kö-mecesō a town of Sicily: proxince of Noto; abont it miles W. S. W. of syracuse (see map of Italy, ref. $10-\mathrm{F}$ ). It has mannfactures of paper. Pop. 20,000 .

Comitan: cits in the east part of the slate of Chiapas, Mexico (see maj) of Mexico, lef, !-J). It is noted for its fairs, which are much froquenterl ly traters and by the country population. Pop. (1ssi ) about 7.000.

Comitia. kōmish'"r-a [Lat. plur. of comitium, assembly, place of assembly; com, together + ire. gn ]: in meient history, were certain political assemblies of the lioman people. The eomitia werr of three kinds. distinguished ly the epithets curiata, cenfurinta, and tributa. The comitia euriata were the assmblies of the juatrieian houses or populus, and in these, before the pleboians attained politieal importance, was rested the supremp power of the state. The name curiata was given because the people voted in curice, each curia giving a single vole, representing the srontiments of the majority of the members composing it, which was the manner in which the tribes and centuries also gare their suffrages in their raspective comitia. After the institution of the comitia centuriata. the functions of the curiata were nearly confinerl to the election of certain priests and passing a law to confirn the lignities imposed hy the people. The eomitia centuriata were the assemblies of the whole Roman penple, including patricians, clionts, and pleheians, in which they roted br centuries. By the constitution of the centuries these conitin were chiefly in the hands of the pleheians, and so serven oricinally as a counterpoise to the powers of the comitia curiata, for which purpose they were first instifuterl, it is suid. by king servins Tullins. Thess eomitia quickly ntained the chicf importance, and public matters of the groatest moment were transurded in them, as the dection of comsonls. Iratom, ate. 'The comitia tributa were the asemblies of the plebeian tribes. Acoording to trati-
tion they were first instituted after the expulion of the kinge and in then were transacted matter pertaining to the pleberans alone. as the election of their tribmane, ete.
Comity of Nalions: Sce lnternatonal law, Probate.
Commambre: a naval oflicer of the grade next helow that of captain, and ranking with fientenanteotomel in the army. In the Finglish nary a commander may le the executive ollime of a large ship, or he may, as in the $V^{\prime}$. S. uary command a smaller viscel. There are eighty-five commanders allowed on the active list of the $\mathbf{U}$. s. naty.
Commander-in-rhitef: the officer in whom is sested the supreme command of all the land or haval forees of any nation. In (ireat Britain he is appointed by the soveregign and holds ollice fur life. His duties have never heen charly defrom as distingusised from those of the cathinet minister who presilles neer the War oflice. He is responsible for the discipline and edlecency of the army. 'The ofliee of the commanter-in-chief, technically called "llorse (fuards," comprises the departments of the military sectetary, the aljutant-general, and quartermaster-general. He is now strictly shbordinate to the secretary of Wiar, and is responsible to Parliament. The oflice is unally vatent, and its duties performed hy a ${ }^{-}$field-marshal commanding in chief." In the U. S. the President is ex-offecio the com-mander-in-cbief.
Commander Ishands (Russ. Komandorshi): two Russian Whanl- lying in the line of prolongation of the Aloutian Fislands : mat the Came hat kan coast ; in about lat. in N., lon. $16 \mathrm{i}^{2} \mathrm{H}$. The name was given in honur of Bering (known in those regions as the commander), whose desth necurred on the westernmost. which is also calleed by his mame. Bering islanel is sit miles long, with a greatest breadth of 18 miles: Mollny or Copper intand is almut 30 miles long, but nut more than 5 broml. Copper has beron fomal hare, hut in small '1mutities. The islands are momtanous and without trees. The climate is mild tor the latitude. Farthymates are frequent. Bop, ahout 300 .

## Commandments: See Decalorire.

Comuandments of the Church: rules imposed upon the laity of the Roman Catholic Churech. It is held by Roman Catholics as taught by the Sicriptures that the Clureh, heing a perfeet socicty, has power to make rules for her members, so that things lawful in themselwes hecome unlawful by the Church's prohibition. The Roman catechism makes no special enumeration of these commandments; hut such an emmeration is generally fonud in mpular clementary catechisims, and the numbie is relucent to five or six. They are frequently callel the six commandments, and are varioisty given. Tliove most commonly taught are as follow:

1. 'The Catholic Cluureh commands her children on Sundays and holly days of ohligation to be present at the holy vicritier of mass, to rest from servile work on those diys, and to kerp them holy:
2. She commands then to abstain from flow on all days of fasting and :lhstimence, and on fast duys to cat but one meal.
3. She commands them to confess their sins to their pastor at limat once a yeme:
4. She commands them to receive the ifussed saerament at lenat once a year, and that at baster or during the jmischal time.

万. The contribute to the suppurt of their pastur.
6. Sot to marry within the fourth dewrew of kindred, nor privately without witnesses, nor to sohmize marriaqe at certuin prohilited times. Revised hy Jons J. Kense.
Commomoration lay: the day on which oblemition are annually held in the Cniversity of Oxford, Furfand, in remembrince of the foumbers and henefacture of the university, when aperthes are made. prize compsitions in pres or puetry revited, and henorary despees conforme on histinguinhed promps. The sume ierm is useld to dexignte the degree day of the University of King's Conlowe, Wimbur I. S., the whest British culonial college: Th 'syssity slang the wherd is shortened to "eommem.
15. B .

C'ommen'da [1ate Lat,., charge, trust, deposit]: onivinally the cenfurring of a vamat benfice for temprary adminitration on a clerryman already prowided with one: afterward it came to be the lestowal of such a bendive fur a home perion or for a lifetimes. As, however, after the mowht eentury ahmes crept in, and inthential eeclesiasties "speeially arailed themselves of the commenda to inerease their
incomes, it was found neeresary to opyose it. This wha
 Councilis of Comsimen and Trent. Formerly in the church of Eugland, when a chergyman was promenem to a bi,hoprie, all his onher preferments became voik, but the imerest in the living was retained hy its being commended to the care of a bisholl (called the (mmondatury) by the crown till there shumbld be provided for it a proper pasior. Such a living was ealled an eccelesié commenenath, and it was said to be hetd in commundem. The holding of benefiees and livings in cummendem in Fughand las been abolished hy law since 1 n"tit. Among the ecelesiastical orders of knights the nane commenda ("tommandery) was given to the domain over which the members (commendatores) exercised jurisdiction.
Commensalism [from lat. fom, together + mensen, table] that association of animals which is not a true praraitism, but where ench gains an advantage from the other's presence, or at least dues not sutfer by it. Instances are comparatively numerous, and vary froin a mere association of freely moving forms to instances where the hecome elusely united. of the lisst type may be mentionelf those tishes which live among the tentacles of rurtain jellyfishes, and profit not only by the defense afforded by the nettle cells of the later lnt get certain choice morsels of fool from the particles drophed by the host. Somewhat similar are the associations betwien ants and plant-lice. Of the second type may be mentioned those combinations which orenr het ween critain cralls sund sea-anemones. Here the erab fast ens a seatanemone to lis back and carries it alhout with him. He protits by the protection of the nettle cells. The anemone gets his foul from the particles which drop from the crabs: meals. For another type, ste tixabrosis. J. S. Kingslet.
Commensurable from Lat. com, tore ther + mensurabilis, that can be measured: deriv. of mensis re, neasure]: Two mantities are said to be conmensurable when some common unit cma loe fomm which will measure them both, or when their magnitudes have the ratio of some two whole numbers. When no such unit or common measure exists they are called incommensurable. See Isconnexscrable.

Commentry, kom'măni'tree': a town of France: department of Allier ; on the (Wil) ; 8 miles s. F. of Montlucon: in the center of important coal-fields (sce map) of France, ref. $6-\mathrm{F}$ ). It derives its prospurity from conl mines amd irmworks, and has increanm ratpictly in recent times. Its manufactures of luokine-glasses are very celebrated and remunerative. Pop. (1596) 12,6\%2.
Commorce: the exclange of gonis in consifurable quantities lutween producers remote from one another.
Exehange arisiss out of the division of lathor, and is the only monhs by which division of labor ean be secured. If . 1 has sunfrior skill in farming, $B$ in wearing, and $C$ in shoemaking, the necessity for acystem of cxplange arises in orler that the community as a whole may secure the most aggregate comfort with the least labor. is lung ns his exchang takes the form of harter between individuals who produce gonds fur one another to order, we wan not speak of conanerce: hat when money is sulstituted for harter, and when the promucerse either carry their wares to market themselves or will them to a sterekeeper ats an int crmediary, we have the heriming of a commereial sy:tem.
In the Middle Ifres commerce was carried on in markets. (See Maket und Far.) Thwn to almut the welfth cemtury each villare, as a rule, formed an ind pendent community, having its own blacksmith, its own miller, and its own erafteman, as far as handicraft was developed, while the oprations of spinning and weaving were carriol on $1, y$ each honsichold for itselt. But as towns grew up they atequired markht privilegrs from the king. Certain days were set on which the cwuntry people would cary the ir crouls to town and make their purclases. These market-towns limeame nore anll more the resilence of craltiment, and the place in whicla the varions forms of manufacture tirst lleveluperd. Sores or shops, in the modern sernse, dinl not as yet ixis. The farmer sidill his produce at the markel and bought his sunuls of the crafteman. Bhe the first stop toWard - wmmerwe had hend tak+n, for he hat ceaserl to depend upun himede fur all his supplies. Survivals of this sytem of markets nere to tw sem in almost every thwn of continemtal E:uroper and "sen in the United Kinglom. In America such mankets are chinelly used for the sald of certain speritic clases of perishable goods. 'Thure gouds whicle can be kept
without damage are now sold in another fashion. In-tead of being brought to market by the producers and sold on their own acconnt. they are purchased by merchants or storekeppers, who aet as intemediaries, furnishing a constant series of supply to those who wish to bur goods. and a more or less constant demand for those who have goods to sell. We find a mereantile class organized, possessing eapiital. which it uses in the pure-hase of goods from the producers, to he sold at higher prices to those who want them, at such times and in such quantities as they mar choose. This substitution of stores for markets, of regular channels of trade for irregular ones, forms the basis of the modern commercial sratem.
The first rice to carry on commeree on a large seale was the Phonician. which furnished the most daring mariners of the ancient world: first in Sidon and Tyre. whose greatness goes back some ten centuries before the Christian era: and later on an even larger scale in the Phenician colony of Carthage. Nuch of the commerce of the later Roman republic and the early empire partook of the nature of tribute rather than of trade. With the downfall of the empire the lack of public security caused a great contraction of commerce as part of the general lapse into barbarism. Not until the rise of free or half-free cities on the shore of the Mediterranean was there a renewal of commercial actirity. Towns like Venice. D'isa. or Genoa derived much of their wealth from trade with the East : and the crusades, by developing intercourse leetreen East and West. laid the fommdation of the wealth of these cities. A few French trating cities also rose to importance: while the Moors in Spain showed themselves patrons of commerce as well as of science and art. Most important of all in some respects was the Hasseatic lafice ( $q . r$.) of free toms centering in Germany, but extending as far as England in the west. Norway and sweden in the north, and the fery heart of luassia in the east.
With the substitution of the modern srstem for fembalism. beginning about the yar 1310, national commerce began to take the place of municipal. The mariner's compass already known to the Chinese, was introfuced into Europe in 1302 : and this rendered josithle the substitution of open-sea royages for the coasting trude. The Portuguese were the first to take adrantage of this invention, discorering in rapid succession Porto Santo, Mateira, the Izores, and the rarmus coast lowalies of Ifriea as far as the Cape of Good Ilope. In 149 F Vasco da (fama made the sea-prassage to the East Indies. For the time being Lisbon seemed destined to betome the commercial center of the world: and the Catholic Chureh suphorted the claims of Portugal to the eastern discoveries. Meantime the spaniards were not idle. and songht to dienerer a westrard passage to the Indies, in the hope of connterbalancing the claims of Portugal. It was in connection with this attempt that Columbus, an Italian under spanish patronage, discovered America (1492), and pared the way for the Shamish conquests of Nexico by Cortez (1.02). Peru by Pizarro (1529), antl ('hili br Almagro (1535). Meantime. in 1514, Magellan han actually male the westward jassage to the Fast Indiec, sailing throigh the strait which bears his name; and there ensued at feriod of active rivalry between Suin and bortngal in the establishment of stations for Inlian and American commerce. But the power of spain and Portugal as leading commercial nations was short-lived. Lese than a hundred years after the period named it gave place to that ut Ilollitud and Englambl. Nee East lima ('ompasy and Naviathos Laws.) The century following was signalized by the risi of France as a great commereial powir. while the nineternth century witnesend a similar development first of the $\mathbf{L}^{+}$. - and then of Germany.

Thus far wo have spoken chally of foreign commerce. The devehpment of inland or internal conmere has tome later, bit has heen of even more importance in merdern times. bown to the rend of the seventemth century the badnes: of the roads formed an "flicient check upon transprtation of all kima. The ouly good roms in many parts of barope were actually the wirk of the Roman empire. For details as to the sulintitution of ganl radse for had, the introndelion of camals, and the development of the raibrate as a whief means of mowement of gublicand passengers, sene Trassportation. Hand in hamd with the development of the physical means of commerre is fombla a leveloment of the modern credit sratem which is of equal importance in fatilitating commercial tranactions. (An, Moxes. Crobsery and
 looking to the removal of rearictions, sce traee Trade and

Reciprocity. The upshot of all this is that the commerce of the work in a single day is now prohably greater in value than that of any rear in the eighteenth century or any decade in the serenteenth.

Until a comparatively recent period government policy has been, as a rule. rather unfavorable to the development of comnerce. In the first phace, taxes on trade furnish such an ease method of raising revemue that wholly disproportionate burdens of this kind were jut apon the community. In France a system of local trade taxes continued down to the Revolution of 1889 . In other purts of continental Europe the case was quite as bad. Remnants of these taxes survive in the octroi, the municipal tax levied on articles of food which enter the city limits. It is needless to add that such taxes of this kind were, as a rule. very bat in their working, and that they are prohibited hy the Constitution of the $E$.s. The ease is somewhat different with customs futies at the frontiers. Such taxes are vasier to collect than local tares of the same sort, and have at times seemed to further the development of national indepmendence. The whole suljeject is discussed in the articles Free Trade and Protection.
The second reason why commerce was lonked upon unfavorably was due to the fact that the govermments of mediaval Europe were in large measure in the hands of the landed classes, while commerce was managed either by the artisans or by the capitalists more commonly the latter. Anything which helped agricniture was a direct help to the governing classes. Anything which belped enmmerce tended to raise rivals against them. Tuder these conditions a public sentiment arose which, in continental Europe at any rate. made it impossible for a mobleman to engage in commerce and stigmatized it as a distinctly subordinate operation to that of land-holding.
The attempts to faror commerce did almost as mueh harm as the attempts to tas it. The ordinary method in mediarval times was by the grant of a monopoly or special trading privilege to certain indivithals. Such monopolies may have been necessary at the outset. but they were almost alwars lialbe to be alused. and to prerent subsequent progress. A marked instance is furnished by the history of the East India Company. At first it was important to give a monopoly of trate to a group of men who would take the responsibility of maintaining the police service a system of defense against pirates or natives which the government was unable to organize. But when the government grew stronger and pirates and natives grew weaker, the monopoly which had been at first justifable became more and more liable to abuse. (See Fast India Company.) An interesting attempt to develop a large kind of monopols is found in the navigation laws. wherebs England attempted to stecure to her own subjects a monopoly of the carring trade. An attempt was made to restrict the trade between England and any other country to the ships belonging either to Fnglant or to the country with which it dealt. and to prohibit the employment of third parties in the carrying trade. These laws were direeted against the Dutch, and were in some measure successful. But the miversal belief now is that Holland's loss was ly no means England's gain. It constituted a general luarlen on the tratle of the world by preventing it from being done in an efficient and economical manner: a burden in which all nations. through retaliatory laws. suffered in greater or less measure, so that in the second quarter of the present century smeh laws were gradually abolished. The injury done to the British colonies in America by these navigation laws is suecified in the Peclaration of Indepentruce as one reason for absolving allegiance to the crown.
With the abolition of narigation laws and the chearening of transportation, the amount of emmmeres has ileveloped mormonsly. It is estimated that the effective earrying power of the commercial marine of the world in the dece
 from 1840 to $18.00,3 \cdot 65$ jer cent. ammally: from 1850 to 1860. is per cent. ammally from 1 Ntito to 1880 . 2 it prer $^{2}$ rent. ammally: from 18.0 to 1880.356 per cent. anmally: and from 1 sion to 1890 probably more than from 1800 to 1sso. It is problable, though statistics are not equally acressible, that the interual commeree and the means of calrying it have increased in even more rapid ratio. Dr. Neumam-s.allart has made an estimate of the intermai i mal trade of the world in the years from 1868 to 1885 from which it applears that. in spite of the fall in prices. the total ralue of the toreign commerce of all mations hat increaset during that period from $\$ 10,500,000,000$ annually
to nearly $\$$ lin，000，001，000．Thaking the fall in prites into account this means nearly a dombling of the amome of goots mowel．Of this forcign commere in the yar has
 thing over s？，0010，000，006 in America，and the batane chicfly in Asia．If all the individual nations the commereme of ciregt Britain is the most important，amonating to nomely 20 pre enst．of the whole．France，Germany，amd the U．S． are not far apart，eneh with something like 10 per ment． while the Netherlands．Rassia，British India．Mantia，Rel－ gima，Italy，and Anstratia follow in the order namet．The change from $185 \%$ to 1690 wouk not materially alter these promertions．It is to be understored that these figumes refer to the actual conmeres，ase mearet hy imports and ex－ jurts，and not to the tons handled by the slips of the＂lif－ ferent bations．

pqssible under any system, but the chance for crises, affecting all industry for such a long time, is peculiar to motern influstry, amb forms perhaps the gravest charge which the socialists can make agranst the existing inulustrial system.

The first crisis of the modern typoccurred in 1se0." It cleveloped in France and Great. Britain almost simultanmonsly. In the yoar 1:16 John Law, a native of Edinhargh, under the authority of the French monarehy, foumbed a hank whose operations were extremely sucossiful. Not satisfied witly this success he soon atterwarl developed his Mississippi scheme, first known as the Western Compans. Ictual operatious hegan in 1718 ; in 1719 it was in possession of twentyone ships and nearly a million of cholmris of money and goods. All sorts of financial operations were intrusted to it by the Government. 'The shares went up to many times their original value. A fever of speculation set in which lasted until the beginning of 1720 . Then there was a sudalen collapse and an overwhelming reaction. About the same time similar speculation was carried on in Great Britain, not by a single company, but by a lare number of companies, known as "bubbles." the largest being the "south sea Bubble." There was in currencs infation in Great Britain, as there was in France: but except in this respect the speculative fever was wilder and the reaction equally widespreal.

There were commercial crises of less importance in 1763 and 1799 in lamburg. and there were inflation and depression in connection with the curreney of the French Rerolution, but no general crisis until after the close of the Napoleonic Wars. During the reign of Napoleon the continental ports liad been chami to English mannfactures. Great Ibritain at once took allyintage of the peace of 1815 to make up for lost time. It llouled the Continent with British goods, and made arrancements to promuce such goorls for the continental market on a seale which conld not possibly be maintained. The reaction was terrible. The cessation of the demand for British mamfactures threw large numbers of men out of cmployment, Another crisis developed about ten years later. In 1824 and 1805 specnlative companies were formed and speculative louns placed in the London market to an amount for which the linbbles of 1720 alone furnish a parallel. It the end of 1825 the unsouminess of these speculations hat begun to show itself. A tew failures were sufficient to destroy all credit, unly by most ralical measures was the Bank of England cmabled to give enongl support to the business community to prerent general suspension of payments.

The last-named crises were peculiur to Great Britain. That of 1836 , with its consequences, wis shared by the U.S. also. In fact it may be saill to have been primarily a $U$. S. crisis, It had tro distinct suts of causes. one fimancial, the other imlustrial. The financial causes are to be lound in the unsound organization of hanks in different parts of the country, not exdluding the U. S. Bink itself. The industrial causes were to be foumd barty in the overuroluc(ion of eotton on a cralit basis, partly in the system of internal improvements which haul locked up much eapital in works which were not productive, some on aecount of their incompleteness, some on acconnt of their inherent Worthlessness, Is long as the speculative fever lastell the unsoumb concems were able to support one another, but with the failure of a few the whole commereial fabric went to piecros. $A$ arisis which took place in $18: 37$ seemell for the monment to he checked by bold financiering and by the hopetul pirit of the people, but it recurred in equally disastrons furm in 18:3, and this time it seemerl impossible to stem the disister or to recover from its consequentees. The British crisis of $1836-3$ ? $)$ was much slighter than that in the U. S., and was chietly botable for the reform in the british curreney system whereby the danger of inllation Was dome awat witl.

The next crisis of inportance was that of $184 \%$ in the Britioh islands. Athough ritilroads had bran invented as
 were duveleped on a lareve seate. lat that poat and the two grass following the ammont of milromil construction in Grat litain was enmmons. Unnecessury roals were brouetht into operation. While other roals wore chartereal and hrorun which conld not bo put on a paying hasis for some timo to come. 'The mania for railmablomilding in Great Bratain was worss than that for intomal inprove-
 even sharper and more widespeatl, though mot uf such long duration.

In the year $185 \%$ there was a genoral crisis that affected
the financial world as a whole and not any one or two partienlar combtries, The discosery of gold in California in 1849 hat started a ferer of speculation which culminated in 1830. The Crimean war, producing an artificial demanel for special supplies, had tended to increase this speculation. France hat become deeply inrolved in the tirle. The Crélit Foncjer, the Crédit Igricole, and the Crélit Mohilier eneouraged the imventment of capital in all possible lines of productive industry. Germany followed suit, and attempts at restriction of bank-note issues hy the Prussian Govermment seemed of litthe avail. Railroads were built in Prussia and in Anstria on a large scale. British industry felt the force of foreign speculation. In the U. S. matters went quite as far as on the continent of Europe, and turther than in Great liritain. Railmads were extended firm the seaboarl to the lakes and the Mississippi. The poliey of land grants cansed unnatural development of certain scetions of the West and South with greater rapirlity than would have been causel br the legitimate demands of trade. Neantime the bank reserves hegan to fall, while the liabilities were constantly rising. On Jug. 20, 1857, the loans of the New Tork banks were $\$ 120,000,000$, their coin rescres but $\$ 10.000,000$, their circulation less than $\$ 9.000,000$. their deposits but $89,000.000$. Such a state of things could not continue. Tet the banking conditions in New York were far better than in any other part of the country. So loose were the State bank laws of the time that "wikl-cat" notes without any proper specie reserve formed a constant menace to commercial credit. When speculation lailed at any point tho banks were uscless: when the banks were useless the mears of payment failed at all points. The failure of the Ohio Life aind Trust Company on Aug. 2i began the difficulty. Other failures followed. On Sept. 30109 large houses had failed, forty banks were ruined, and many more were in such strats as to be of no service in helping their customers. On Oct. 13 the crisis cmiminates in New York city. The suspension of payments followed on the 14 th. Two months more and the large railroal and industrial companies were fatling to meet their interest obligations. Prices fell ruinously, cotton dropping from sixteen cents a pound to nine cents. In New York alone 30,000 laborers were out of employment. Nor conld Great Britain remain untouched by such a disaster loaded as were some of the British fimanciers with American inrestments. Larly in November several important failures took place. On the 9 th the largest Scotch bink suspended paynents, and this was followit by a gencral run on Scotch banks as a whole. The resources of the Bank of England were inadeguate to stem the tirld. On Nor: $1!$ the reserves had fallen to On Kow. 12 the Bank Act was suspended and the directors given anthorits to issue notes in violation of the provisions of the uet of 1844 . This checked financial panic, but did not prevent the inclustrial crisis that followed, with the inevitable resnlt of throwing large numbers of lahorers out of employment. The sime conditions ensucel in Germany, in Iustria, and in fant ahmost all orer the Continent; nor did anything like thorough recosery take place until after the elose of the civil war in the U . S.

There Was a crisis in 1Nifi in Thondon. and on Sept, 23, 1869 (Black Friday), in New York; lut ench of these was a finameial patnic rather than an inulustrial one, and was strictly localized in its eflect, the latter expecially being connocted with gold speculation. The crisis of 1873. on the other hand. Was industrial rather than financial, and was, on the whole the severest and most general one through which the world has passod. From 1869 to 1833 there was an "normons amonnt of investment of capital in machinery and transportation reroncies. Several canses combined to Mroduce this ettect. 'Thin oproning of the suez Canal liad givon a great ntimulus to trale. 'I'le sulstitution of steel rails for iron hanl cranted josilhilities of cheap and profitable railomal transportation undrenmed of ten years before. This choaps transportation farilitated the interchange of mannfictured goons with farm problice, and rendered ther concentration of manufacturing citpital and the conseupent - conomy in profluction easior thatu ever belore. It also mate it possible to devplop nuw lame which was previonsly ont of reach of any market. 'l'his was an important factor' in the growth of the Wisat, a crowth which was stimulaterl by the renewal of tho lant-grant policy atreaty described. Taking all these things togothrr, we find unjuredenterl buildiug of new railroinls, new factories, and new ships, and side hy side with it a development of new lame on a wirled seale than ever before. Huch of this was clone with bor-
rowed capital, a rate of interest being fixed om the lanis of
 long as these hioth prises continued all wont well, but by
 that it was no longer fossible for ath the probucts to lne solit at the wherices. First in manufachures, then in railways. then in farm prownets, there was a dovided fatl. The beginnine of this full oceurred in the latter patt of 15 霖. " On Sept. 18 the great banking-louse of Jity (ooke \& (oo. in Few York, fitiled, and this brought troutite to the hemee if Fink \& Hatch and to the Rondon House of Mcerallodh. with whicly it was comected. Involved as the whale financial world was in misouml speculation, this meant disater everywhere. It was not so sudden as the crisis of latio, loemse the hamking system was better. eypecially in the $\mathbf{L}^{-}$. but the realts were even more lasting. the slomt-time loans were better cuvered in 15:3 than they had bedn sixtend yers lafore, but mit the mongages and other homgtime lomas. (apital had been bormwed for inventment on false cetimates of laml watae. The year 1s: I, in far ans gencral industrial imodition was conecmed, wat worsa than in 18.3 , and $18 \%$, 18.6 and $180 \%$ impolved still greater dist mess in Emrope an! America alike. 'Ihe tronble was intensified be thwise legisation in various forms, and perthas showed itself at its worst in the middle of 15 ar, at the thme of the great railroal atrikes. Dfter this there was a slight improvement, slow in 18**. wery mind more rapd after the resumption of specie payments in 1859.
The years 1570,1880, and 1851 formed at time of active but. on the whole. sound sperolation. P'opld had not whilly forgotten the tessons of the erisis of 1sia. Iand was mostly held at a moderate valuation. Much eapital was borrowed, hat the secority for such loans was butter and the rate of interest lower than it had bern the ten yours hefore. But in 1882 railroad-huifling was carried to sitch a point that it was imposwible for the business of the country as it then storel to pay interest on the investments, and with this excessive ralload-buitding there was an exessive dnmand for ironand coal which conhl be onty temprary. At the chowe of 1802 clear-lewdert people feared a repetition of the experience of 18 sis. These fears did much to prevent the recurrence of the danger in the form which it took ten pars previnus. Alhungh a linampial panic occurted in May, 1884, it was at comparatively slight one, hat thre was
 by the unwise action of certan labor organzations in 188,3 and 1886.
Toward the close of 1886 ionfindence was restored-in certain lines too much restored-for the ralway-hilders mpeated the mistakes of 1 ese, and pavel the way for adverse
 curitur.
Burope was somewhat affected by the depmesion of PR4. (-5.), lut mot at all by that of 1888, which was in its matme focal and partial. The Faropan matkots wore far more tisturthed at the ene of 1890 by the lailure of a serite of spaculations in which the $[$. s. had taken litho on no part. Emepman honses had invested largily in Arioun and in Argentine sururitios. The financial movements in the Argentine litpulitic in 1 sat wre colosely paralled to those in
 and the reaction was earrespondingly sesere. Meantime French houses hat beol speculating in copper on a hage sombe. The failure of the copprre symieate, conphed with the collapere of Argentime cedit immotiat dy following. involved leading hakers both on the Continent and in Finsland in ditticulty. Public confidenere was shocked herame meature by the suppension of bitment of Buring brothers.
 hiefher than any other private concerto. Tho industriat crisis diel not it first appear to be prompotionalte to the fimancial danger, but the resulting deprasions, thomgh mot acule, has tued wideceremu and lastions.
such is the history and general charaver uf ammereial (risers. It rematis to exmme the theorice whith have been urged ans ceyhanations.

An ingentma lint unsound one is the sum-spot therere. It was ohservel that ther were rises of mure of low enverity in

 it happens that sum spots attain a maximm on wo ary ton and a half yars, and it werumed to certain ingenomio oth sorvers that these sum spots probably hat an eftiet on the harest, producing prosperity at one time nad depresion al
gunther. This thory wa- defmetive in stweral pmints: first. it condif not be prowid that there was any pasibhe commee tion betwen sun spots and gond ur had harsests: second, commercial erises smetimes onearrad just after a gond harvest and sometimes just attor a had one ; finally, the eivil war in the L. S. quite broke up the mosular tem-vear romud of crisen, amb, as it dial mot have any alpmeriation effect on the sum spots. it may be said to have moken up the thecry also.
'The seromel theory, and at hettor one. is that of misdirested moduction. The advorates of this thoory sat that a commereial erisis is due to the investuent of umerestary erpital in wronge lines of induat ry. Thay atene tha possibitity of genemb orerpolution, of anything like it. They shy that the somalled general overproduction is peally lowat or partial wroproduction, nnd means underproduction elsewhere. There is a special tomand for particular linps of mamfate ured gomb or for the development of internal improve ments in certain localities. Capitalists rush to take al ramtage of the special opportunity for profit and owerdo the matter. investing twier as much capital as is noet-ary ant (entracting large obligations in comaretion with such invistment. Fhis "apital. once inveded. can mot be withdratw, nor can it be proftably transfered to any ot her line than the one originally propused. Xaturally, howerer, the overproduction of 1 maticnlar lines of gooms or the overdevetopment of partienlar loselities brings its reaction. The expectal prices an not be realized; the obligations can not. be met. Producrors and bankine-fusess alike suffer severely from the misjudement of investors. and such sufferine mast continue until a part of the misappliel capita\} is worn out. or matil the needs of the cenutry grow uf to the rolume of copmal investerl. This theory is triw in a gemat many particulars, but it fais to take aberomt of $t$ wo sets of facts. $l_{11}$ the tirst phace, the commereial crisis, instead of boing local or partial. applics to a greater or loss extont, to all lines of industry. Lnder the theory just out lined, if manutacturebecome unproditable, we should expect to find farmers rejoicing in leing able to sell their goots to alrantage and buy those things that they wish whearer than before. But. in joint of ract, the farmers suffer at the same time with the mandecturers. We also lind that the finameind disastrre, instrad of boing a result of the fall in prices of certain gotils, usually precoles it-that erodit collansens first and problastion sithersafurwam: wherons the mistirected proifution theory woukd put these esents in the opmosite order.

The true explamation can be understoot only by a knowladge of the existing credit system. Sumbere a merehant wishes to extend his husiness. Jues he horrow the embh to do it \& Sol semerally. Ho goos for a lank to get his bill discounted. If $A$ hats sold gomels to $\mathrm{l3}$, an agrecment to Fay this bill at some time in the nar future serves as a basis on which I 'an incrase his line of lank deposits, and (ant draw more cheress that would otherwise he poseihle As lang as A and 13 are hoth groch, and as fong as the bill replrechuta an actual transietion, the bank will be ghad to diseome wheh paper. On the line of depesits this sreaterl a large propurion of the expanting business is hasol. Theme tank deposits are for many jurposes the chief emrency of the eonntry. The large husinces paymente are male by
 can be drawn is liased on the amount of the depmite in the hank. Tha amont of depesits in the hank depends in considnathte measura upon the amount of aecepped bills. If lritoc, for any reasm, begin to got wh, this fant increases the si\%e of the bills and creaters ant ine reand line of depmsits. particularly as tho banks are readier to furnish aceommonation on at rising market than in at falling one. But this in--reaso of cheeks temls in its turn again to insemes frice and thas maters go on, higher pices paducing more drposits, mome thpmeits invotving more checks, mone ehocks anting is a viethal inflation of the curreney and foredueing

 th their con reserve. such ofnerations must be rontracted. This enntraction of bank aceommodation. like a contatation of the currency, begins to produce a fall inpricic. As prices fall it is hamder to qet hills diseountad. This incemoul ditlitulty of ohatining acmomotation incerases the contraction and lowers the priw stilf furtlor. Jon who incorral whiGat ions on the basis of inllated prices now fint themedwes malhe to meet thes obigations, even though their husiness hats remainel the sime.

The contraction thus deseribed may be either suldden or gramual. If there is a panice as in 18.5 . it will be sumben. If there is no panic, ats in 1884 , it will be gradual. But in any event the effect is the same. Producers who bave borrowed money and used it in making investments which can only be profitable on a high-price level now find themselves fored to sell the gouls at a sacrifice. Blore than that, ther must in some measure contract their operations. reducing their wages and their working time and spreating the distres from purelr financial cireles to the community as a whole. Ibusiness is done with eapital borrowed at rates hased on temporary high prices. If there is a general fall in prices, all business is liable to suffer. The eredit system is an exceedingly delicate means of getting goods into the right hands. A general failure of credit renders such a result impossible. and may crate all the appearances of general overprometion. whether we call it by that name or not, simply because the product can not be pint into the places where it is needed. Every producer finds it hard to sell his gomls; if his financial solvency depents upon selling them at a remunmative price, he goes under, and some one else takes his phace.

As long as itny one who can save or borrow capital is given the right to control industry, it will be impossible wholly to prevert this state of things. Some condtions, however, may increase the danger, while others temd to diminish it. I conntry with a metallic enrrency, accepted all over the world. is very much less liable to such dangers than a conntry with a paper curroncy which may be inflated, or even with a metallic conrency which other nations are mwilling to accept in proment of debts. Again. laws may he so frimed as to encourage the borrowing of capital on insuffieient secority ly giving every facility to reckless speconlators 10 manatre minoumd enterprises and then escape liability: or they may he so framed as to hold all such speculators responsible for damares. and liable in cases of frauld to actual imprisomment. The U. . is behinrl most other civilized nations in this respect. especially in the matter of the personal liabilits of directors. which is much greater both in Great Britain and in Germany. Such liability does not seriously interfere with honest enterprises. and it prevents many of the dishonest ones, which do the most harm.

Socialists claim that crises are a result of individual business activity, and wonld lre averted in a large measure if the conluet of industry were intrusted to the hands of governmont. Thes say. with some plansibilits. that it woukd be better to decide where and how capital should le invested on the bisis of indmetrial statisties instead of taking the chanee of individual gain with great mosible los to the community. To this riew it may he answered that no government has been fonnd wise pnongh to eonduct affairs of this kind on the swate propmed, and that the few experiments of the sort, like that in l'aris in the revolution of 1845 , have indicateal that such action wonh pronluce more trouble than it would avert. While priviat industry may produce goods that are not nedied, gorermment industry, under the direction of a socialistic anthority, is abmont surre to dos. Whether govermment action in these matters is to be increased or diminished. the remedy must be sumght in higher education of the busimes instinets of the commmaty. If the eommonity can not look fre years alead. it will be liable to the results of mincalculation, whother its business he managed by private imbivilals or by govermment. If the community can look tive yoars aboad, it will be eomparatively free from these evils. Whother intivituals or gevermments ame to he intristerl with this work of provention depends chielly om the question whether indivilual cippitalists or government olliobals are likely to presems this busimes intelligence amd forevieght in the higher clegrees.

Commerson, kom'marr mil. Pmarment : French botanist :

as naturalist the expedition of Bougainville. Which sailed in 1767 , and he visited South America and explored Judagascar, ete. Jte died in 1773 . leaving some worls in manuscript. Jle was elected a member of the French Academy in 1733. Commorsonia, a genus betonging to the family Sterculiacere, commemorater his mame.

Revised by Charles E. Besset.
Commination [from Lat. deris. of comminare. threaten, becallse in it God's threatenings against sin are repeated]: a penitential service in the Liturgy of the Chureh of England. In that of the American Episcopal Church the greater part of this service was omitted at the revision of 15s4. In the new Standard of 1892 portions of this ancient office have been restored, with the title $A$ Pentential Office for Ash-Wednesday, and are placed in the Prayer-book after the special Prayers and Thonksguings following the Litany. The commination in the English Book of Conmmon Praser comes with little ehange from the oll missals of Sarim and York. The Greek and Latin Churehes retain the commination, but only for Ash-W"ednesday. The commination is in substance a repet ition of the cirses found in Dent. xxili., and at the reading of each sentenee the congrecation responds itmen. It is read in the English Church Bpon Ish-W ermesday. and upon such ot her days as the ordinary shall direct. "Its use is traeed baek to about $700 \mathrm{~A} . \mathrm{D}$.

## Commines: See Comines

Commire. kōmeer'. Jess: Jesuit teacher of theotngy and Latin pnet : b. at Amboise. in France. Mar. 25, 1625: d. in Paris in 1才0?. He was remarkable for his frank and upright character and for spirituality. He is now remembered only for his I atin poems (Pomata. Paris, 1678: n. e. 1753, 2 voli.), which are mostly ujon religions and moml themes, and are remarkable for elegance of diction rather than for power or originality. He produced some fine Latin fables in verse.

Commissariat [Fr.. from commissaire. commissioner]: that department of the military administration which has in change the fumishing of food. forage clothing. eampequipagra, quarters, etc. In ancient Rome the quastors attrmaled to the rictualing of the troops. In the U'. S. these functions are divided between the subsistence department, which furnishes the food-supplies, and the 'puartermaster's devartment, which furnishes camp-equipage, quarters ete. The first Einglish commissary-generals were called proviantmasters. The british commissariat is muw under the charge of the quartermaster-general. That of the E . S. at present is under an officer who has the rank of a briga-dier-gencral and the title of commissary-general of subsistence.
('ommissary (in Fr. commissaire) : a term nearly symonymous with deputy, signifies one to whom the power and autlority of another is committed. It is sometimes used in a sense nearly equivalent to that of commissioner. in the army the officers of the eommissariat department are st yed commissaries of subsistence. The allicers bating charge of monsers in and ont are commissaries of mmsters. Tr eccelosiastical law, a commissary is formally appointed by a hishop to exercise jurixuction in his name or on his hehalf. The hishops of London, in whose jurisdiction the Sorth American colomies were before the Revolution, appointed commissaries in the various provinces who contvenerl the clergy, aljudged causes referred to them for spttlement, and alministered diseipline, suhject of comse to apjreal.

A papal commissary is a bishop or other high functionary deputed to perform dinties properly belonging to the pope. There ure tomporory commisinies appointed for the performanee of a single aco or a few particulars acts: and perputwel commisaris, who regularly represent the pope or some suphrion prelate in a sperifed place ore distriat. Often the duty of a commiwary is performed by a buard of oflicers, who together constitute in commission.

In tootland the sheriff of each conunty is coblled also commissury of that rumty. When the Reformation drove the [aphl commis-aries from Seotland, thwe was ewthlislued a silpome commisilly court in 1563 for atministering the lat in and cases as hat herm formorly decirled hy the ecelesiastical conats of the papal representatives. The eommissary comrt gralnally last its powers, its duties being performen ly the eivil eomms. In 1886 it was alolished; hut there are still commissury courts for the counties presiderl
over by the shoriff．They transanct some of the business

1789, and again in Hall's Reliquio Liturgico, and again as the Bishop Cummins Praypr-book of the Keformed Episcopal (hurch). This compilation was ehietty the work of the Rev. Dr. William smith. formerly provost ot the College and Academy of Philadelphia (now the University of Pennsrlvania). This failed ol general aceeptance. i return to the English book. with certain neeessary modifications, was set forth in 1789, which has been superseded by the present Stomdard ismed in 182, and more closely eonfoming to the English book than its predecessor. The standard histories of the Praver-book are by F . Procter (London. 18.55; 18th ed. 1889) imd W. G. IIumphrey (Lonndon, 18.53 ; 6th ed. 1892).
lievised by W. S. I'erry.
Common Schools: schools in which the common or clementary branches are tanght. In the U.S. the trm common schonls means sehouls for the common people, directerl and supported by the people themselves, and the term is used in that sense in this article when treating of education in the U. S.

Common Schools before the Reformation.-In the despotic civilizations of the East cincation was universally controlled by the Church, confined to special classes, and pail for by the recipients. The politien and religious organizations were such as could only exist if supported by the ignorance of the masses.

In Greeee, all the spartan children were trained physically, and tanght the severe virtues of the time under the direction of the state, hut the indivilual had to meet the expense. In Athens, the state cared for physical training, am? to some extent supervised the training of intellect and morals.

In Rome education was largely military and religions, and such schools as existed were private, and dominated by religion rather than by the state.

Throughont the Nidlle Ares, the state rarely interested itself in education. Such schools as existed were establislied and maintained by the Church. The troubles of the times, lowever, and the opposition to any free thought discouraged intellectual activity. The schools of Charlemagne and Alfred were but spasmoilic attempts, and did not affect the masses of the people directly. Not until the beginning of the twelfth century did any considerable interest in learning appear, and then it was confined to the higher institutions of learning. Universities sprang up, but common schools were not started.

The Reformation.-Schools of the people, for the people, and directed by the people, began funr centurics later, under the influence of the Reformation. The new faith preached by luther was not only farorable to common schools, but it cruld be realized only through common seliools. If individuals are to he personally responsible for their beliefs, and if those beliefs are to be hased on a personal study of a great mass of writings, then each indiridual must be tanght to reand and to express himself, and he must be given a trained juigment. Frour the dars of Luther, the Church has been compelled to found and support common sehools. All the other great movements of the early sixteenth century greatly strengthened this new interest in mblie edneation. The discovery of printing and of cheap paper, the broadening of knowledse through royages, the sturly of the classics, and the development of new arts and industries, all greatly airled the movement toward common education.

In Germony.-In Gormany, one would naturally expeet the most rapid development of schools after the lietormation. Luther vigorously favored schools for the people, and a number of fumons trachers arose. But the schools they sitahlishal were mainly confined to the cities. The Thirty Fears' war dostroyed nearly all the German schools, and left Germany in 164 abmost a desert. Sichools liegan to grow up a fow years later, sum they. like the manmers of the times. Ware formme after French mordels. In 1 7is a general schoul-haw for the Pruswian monarchy was passed, In 1763 Frederick the froat promulgated a code making attendthace compmlsory, ant establishing the lombing fegtume of later s.honl-laws in Prosia. "Jhe (hurd anthorities were to retain supervision of the sehools.

The morlorn systom of ferman common sehools dates back to the torvible disasters which brousht Prussia to the brink of national extermination. Jiter The treaty of Tilsit, which marks her howest estate fluring the Napoleonic wars, Prussian patriots tumed their thonghts toward an jutellectual and inoral rugeneration of their people, and naturally turmed to the public school as one of the most powerful aids
they could command. National education beeame a distinct and important branch of the administration of the state, and under the direction of such men as stein and Humboldt new ideas were introducerl, largely Pestalozzian, and the schools of Prussiit became the educational models for the world.

In France. In France, as in Germany, the Reformation encouraged popular education, and the Ilaguenots established a larese number of elementary schools, mainly for religions instruction. To oppose these Protestant tendencies, the older C'hurch established schools, espectially in the provinces most tainted with heresy. There was, however, no general system adopted by either Church. After the Revocation of the Edict of Nantes, which in 1685 drove the most intelligent part of the midulle elass out of France, the constint decline in revenue made any considerable government aid to edueation impossible. The Revolution, from the first, fleclared itself in favor of general education. Various measures were proposed, but none was carried out until the consulate. Publie primary schools under the direction of the state were first establisherl in 1833, mader the direction of M. Guizot. Minister of Publie Instruction.

After the terrible disasters of 18.0 , l"mace turned her attontion to her publie schools, as the only means of rehabilitating the country. She studied the German and Dutch schools, and within twenty years made her elementary schools sccond to none in Europe. Ther are under the direction of a Minister of Public Instruction and Fine Arts, who exercises very large directive powers. Inspection is in the hands of Govermment otficials, who inspect even private schools and home instruction. Instruction is free, and attendance is ohligatory.

In Scotland.-Superior schools for the common people seem to have existed in Sentland before the Reformation. From the first the Reformed Churches took the schools under their charge, and tried to make elemeutary education universal. In $16!6$ a statute was passed under which common schools were generally established. Ther were supported by local effort and directed by the clergy. In 1861 the schools Were in some degree freed from the Church and made more dependent on the state and the universities. From the first the schools hat been truly national; a conscience clanse protected the rights of IVinan Catholies, and all classes attended the schools. In adrlition to parish schools there were what we should call high schools, that were a part of the general system. In $18 \% 2$ a new school law was passed in Scotland by which schools were still further secularized, and attendance was made compulsory and funds were supplied hy national grants, by local taxes, and hy school fees. In 1883 the eompulsory laws were strengthened.

In England.-In England no such interest was manifested in common schools. Both the form of the Government and the form of the Church were opposed to a general cducation of the masses.
During the Reformation 250 grammar schools were founded for the boys of the middle classes. These schools were well endowed and cheap, but they were not "common" sehools, as the term is used in the $U$. S., though they are called common schools in England. In some parishes the Church established schools, but these were uncertain and poor. Not until the close of the eighteenth century, under the influnce of Bell and lancaster. was any considerable interest shown. The Dissenters, following I ancaster, established the British and Foreign School Society: the established Church, following Bell, established the National Society. 'These two borlies controlled and for the most part supported such schools for the people as existed in England down to 18:3. They drew revenue from voluntary contributions am? from tuition. Several attempts to obtain aid from the state were made hy Mr. Whithread in 180\%, and by Mr. Brougham in 1816-30, hint the jealonsy of the Churches made state assistance impossible.

In 1882, Hoting on its own respensihility, the Govermment granterl \&o,000 to aidl edncation, and it was divided hetween the societies already mentioned. In 1839 the grant was increaset to $£ 30,000$. aml a special department was ereated to supervise the work, hut it conld act only through the two religious societios. An inspector of schools was appointed, but he could only see that the mones was fuirly spent.

Various measures were hrought forward in Parliansent from 1840 to $18: 0$ bowing toward state control of common eblucation. It was proposed to establish schools for poor factory operators to raise a lical tax in aid of the sehools, to pass a conscience clause cacusing children from attendance
at religious exercises of which the parents diel not approve. -111 these menenres wre host. Momime the frasury, through the ducational department, which had no exi-tence in law, was disinarsing eomsantls incrensing anmab grants through the two great religions societies. In $1 \times 6$ this department adopted a revised eorle, adermining the eonditions under which publie moner shonld the granted. They demanden approved premises, cintitioaten teachers, a consilerable attenlance. am an examination of results.

In 18 io the forernment lirst passeal a law by which it aetuatly took eharge of certain lines of the common school work. Schoor districts were oresanizeth, echook were increased, chidren were freed from attentane at religions teaching, all sthosels were inspectod ant directed hy forermment inspectors. The work was still, however, under the immediate direction of the great religions soneseties, where they had sechools oremized or where they wished to organize them. Where the "luareh diel not act local schonl boards were established. A publiceschool fund was prowided. and shool bards comb, wader ectain restrictions, comped attemanee. In the next six yars aceommenations were nearly doubled, and the guality of work greatly improwed.

In isio an act of larliment dectaned it to be the duty of every parent to chlucate his child, and regulated in some negree the sehool attendance. In 1850 a compulsory attendance law was passel.

From $15: 0$ to $18: 1$ the arerage daily attendane increased from $1,15,5 \times 9$ to $3,75+4463$, and the mumber of teachers from 30,1:30 to $10-5,148$. In 1891 an act was pased making elementary edncation practienly free in England and Wales; but threeonuarters of the schools still remain under the direction of voluntars societies.

In the Cnited Stutes.-Whether the fundamental ideas emborlied in the common-school system of the C . S. originated in England or in Ilolland is a question involeal in too murh eontroversy to he taken up here. Certain it is that all the early settlers who wre driven to North Amerien by persection turned instinctively to the shool as a means of perpetuating their religious views and maintaining their liberties.
Puritans in New Englind, Dutch in New York, Swedes in Delaware, Germans in Pentsybuis, and Muguenots and Sicoteh-Irish in all colonies nate great sacrifices to secure education tor the youns. At tirst all the schools were connected with the Chureh, fut as (fovernment became secularized the sehools followed the Govermment.

From 16:3.5: schools existed in New England, intended for common people, partle eupported by public funds, and under public supervision. The legishation of 1648 recognized the right of Gevernment to demand that its ditizens le edueated. In 1615 Massachnsetts passed an act refuiring all townhips having fifty householders to extablish sehools umber a certain forfeit, which wis inereased by sulserguent legishation. In 1650 comentient pased a similar law. both of these laws repuired the establishment of a grammar school in larger towns.

It is chamed that in Now York, under the 1)nteh, schooks wera on common that in 1664 nearly every town hath its sehool. Dat it is certain that after the English ocupation th. schouls of Now York were inferior to those of New England, In l'emsylvania, whila schoole were favored be Penn and by the Cermans, they did not flourish as in New Fnethud. Thromshout the sonth the scattered life on phantations and the sorial customs of the time did not favor commonschools. Instruction was mainly private.

Duriner the whole colonial period enmmon shool instrustion was meager, boks were few, teachers wore porly prepared, and the payment of schowl fues kept the fueo away from the sehools or raised nnfortunate distinctions betwech pay and pauper seholars.
buring the long period of the Revolutionary war, from 1707-8:3 and down to 185, the resoureco of the states were ton heavily strained to atmit of my considurable extension of the emmonen schonls. With the ckose of that - rucrele the strensth of the mation was thrown into industrial lines-repaime the ravates of war, settling the lands ower the Alleghanits, devehping agrienture, commeree, and mantartures. some adrane hal howere been mate during this long perionl. In many phaces sehools hat been stablished for tirls, though seddem on a basis of equality with hays. some axperiments had bern made in school smpervicion, high or grammar sebook had heen extablisheel, and fumbs had bech sit aside for the support of schooks.

Ry $1 \times 20$ the industrial problems were so well in ham that
attention conld be turned to other things, and during the mxt decale there was a revival of lemmine manked by edtucational discusions in the press in legislative halls, and in City commeils: by improved organization of city schools; hy the estalianment or revision of the publice shool system in a majority of the states; be experiments in infant solacols and mannal trainine sehools: hy the exahlishment of mechanics institutes. lyemms. and teachers" conventions; and ly the broadening of programmes so as to include inore sionce.
The growth from this prond has heen steady and most rapuicl. Sinee the eivil war the south has developed lowe sehools with a rapility very remarkable, when one considers the destitution in which these states were left.
l'restut systems in the C"nited Stutes.-There are at present in the 1 . .5 as many systoms as there are States. The national Govermment ionlerets and distributes information through the bureat of education, eares for the military and naval instruetion, controls the schooks in the Territories int in the Histrict of ('olumbia, and sometimes grants public lands to aid edncation in the varions siates. Astrong effort has bern made to use national funds for edncational work in the south, but up to the pesent time (1893) it has been unsuceessful.
White meh State has its orm system of edueation, there is, nevertheless, a considerable unifomity. The sehools in all the states are sechlar, and no religious instruction is allowed. thangh in most phees the Bible is read at the beginning of the session and some sivecial moral training is given. No exposition of the Fible is allowed and no religions formula can be taught.
The selowls are all from, and the doctrine that all the property of the state should be taxed for edneating all the children of the state is miversally recognized. School money is drawn from permanent elluational funds, derived originally from puthie lands or special state grants: from a state tax. dishursed on a ba-is of school population and school attendance: and from local seliool taxes.
The local mit for purposes of school administration is generally the township, hat sometimes it is the county, or small siohool districts. The township system is most in favor, and seems destined to prevall. City schonk are gencally under a distinet city school administration.
supervision is reciving constantly increasing attention. Each State has at its hod as state sliperintendent of public instruction or a state boarl of educatinn. sometimes beth, and thes officers have general superrision orer its chlucational interest. Next blow thesp oflicials eome the combty and city surerintendents, who wisit and criticise the schools and smetimes license teaphors. Still below these come the trustecs or township and diatrict ollieials, who engase temehers. purchase sehool supplies. lomk after sehool himilainges and attend to the bumess details of the sehool-work.
"leadur- are hernsed by comuty or state examinations or by normal sclowols.

Most schools, execpt in some country distriets, are classifical. Children from six to ten form the primary classers, and those from ten to fourtem form the grammar grade. Dhove the grammar grade many eitios and States provide high schouls. Thesi furnish an education adapted to seholars from fourteen to eighten years of age.

Prest nt Problems-In the states thas hastily examined the movement has been stemdily fowad compulsory. free, secular chateaton. In all of them these aims are realized in harge manare. There are however, many important questims now pressing upon the attention of the people of the $1 . \mathrm{s}$

In some parts of the country large houlies of the citizons, bolioving that education should reat on a religions lasis. are maintaining batwhial sclools in addition to the taxes hay pay for the suppert of puthic free sothos. They naturally
 of the taxis be devoted to the prochial sehook. This question alpeas under many forms-centering about Riblerending in the sehook, use of particular text-books, and appointment of tenchers.

Politieal interferemee eity normal schools, and the em-
 of the gucstions foreing themselvis upon the attention of ait les.

Mothods of temong are mulergoing a very grom change. noder the influence of the better univensitis and the kimbergattons. This chatge may he described hy satige that the present am of aducation is primarily to develof the powere
of the individual child, while the older education songht primarily to give information to a mass of children.
The high school is beconing more firmly fixed with every year as a part of the common sehool system, and in many of the cities the kindergarten school is being andect.

One mar say that the whole tentener is toward stronger State supervision. Text-hooks are regulated in mot states, and in some they are published directly by the state. ('ities seem inclined to phere their schonls under the direction of strong superintendents. and county and State superintendents are gradually being granted larger powers.

The curiculum has ineen steady. Elementary seime has taken it most important place. and is even made the basis of much of the primary work. Physical training. manual training, cookingrechools, cummereial courses. and courses in motern languages have been added to mect the demand for more practical results. This change has not been made without opposition, and the whole tendency toward introdncing a larger range of elective studies is being seriously questioned by many educators.

The teaching force is stearlily improving; normal seluols are increasing, and eourses for teachers are being added to colleges and universities. The teacher's remuneration is steatily rising, and a professional literature is growing up. Since 1840 women have gradually superseded male teachers in common schools, until today, in some cities and states, they practically have a monopoly.

Earl Baries.

## Commons, Honse af: Sce Parlamext.

Commonwealth: a state; a bots politic; properly a free state: a republic. The oflicial title of commonwealth is used ly the States of Massachusetts. Kentucky, Pennsylvania, and Virginia.

Commonwealth of England: in history, the form of government established in England on the death of Charles 1. in 1643, snd which existed during the protectorate of Oliver Cromwell and his son Richard, until the restoration of Charles 11. in 1660. The sulstitution of a democratic for a monarchial form of govermment was provided for and enjoined by two successive charters. The first charter of the commonwealth was drawn up in Dec. 1653 ; it was styled the "Instrument of (iovernment." The secont charter, called the " Tetition and Advice," was framed in May, 16.57. Under the first charter the English Government may be classed :mong republics, with a chief magistrate at its head; moler the second it beceme substantially a monarchy, and Oliver Cromwell, from 1607 to the period of his death, was virtually monareh of England.

Commone of Paris: an organized band of socialists, outlaws. anl prolefaires. connected with the lnternational Association, who revolted against the new regime or Versailles govermment on Mar. 18, 1871. Paris had, a few days before this date, been evacuated ly the Germans, who had taken it after a long siwge. The National Guard of Paris had been permitted to redain their arms. and a large part of that guard supported the Commune. whose headquarters Were in the quatters of Belleville and Montmatre. Among the prominent lealers of the Commune were Flourens, Fólix P'yat. Assi, Deleschuze, Paschal, Grousset, Gen. Cluseret. Dombrowski, Arnould, Jnles Valles, Blangui, amd Rochefort. Their guinoiphes and ams are thas defined by one who was a membre of the Commume: "Their philosOphy is atheism, materialism, the negation of all religion; their politionl programme is alsolute individual liberty hy meats of the suppression of government, and the division of nationalitics into communes more or less federated; their pulitieal reomony comsists censutially in the dispossession, with compensation, of the present holders of capital. and in anvignment of the coin, lamed. cte., to assuciations of workmen."

As those members of the National Guarl who favored the cause of order were irpesolute and not inclinell to fight, the (ommmains quivky beame absolute masters of Paris. Their rankz were re-enfused by many emuticts. whom they
 The lembers who hat some intelligence, some definite purpose, and wome lingering seruphes wre son disearded one after atother and impriancel, and the control of the (bommune was obtained hy desprombes and outlaws, who initiated a reign of terror. On Mar. 26 an election was held in learis to choose members of the fommume, but as the party of urder decline to voto, only 180,0100 votes were cast, and the election resulterl in the trimph of the insurgents. The govermment organized at Versailkes sent an army
to suppress the insurrection. On Apr. 2 a large body of insurgents marched against Versailles, but they were repulsed at Meudon, and much injured by the fire of Fort Mont Valerien. The amy of thir repmblic began to hesiege Paris nnder the command of Marshal Mac Nahon. The chict command of the besieged forces was helel successively hy Dombrowski, Cluseret, Rossel, and Delescluze. Violent dissensions disturbed the counsels and hindered the success of the Commune. On Apr. 5 they arrested Darloy, Arehbishop of Paris, and other persons, whom they kept in prison as hostages. The insurgents, who occupied several forts in the environs, made an obstinate resistance to the besiggers. Having captured several of the forts. the lesieging arms, abont 90.000 strong, entered Paris on May 92 ly several gates inclosing the insurgents in a great semicircle. The latter continued for five ilays fighting behind barricades in the streets, and revenged their defeat by atrocions acts of crueltr and randalism. They set fire to the philic buildings, and enteavored to destroy the ancient monmments ind treasures of art. Among the finest edifices that were burned were the Tuilerics, the laalais de Justice, the lalais Royal, and the Hôtel de Ville. The Lonvre was bartly consumed. Juring the last days of the power of the Commmat they shot Archbishop Darboy, Bonjean. president of the court of cassation, and other persons whom they held as hostages. In order to execute their incendiary designs on a grand scale, they ignited petroleum. gunpowder, and other explosive materials in many parts of the city. Delescluze was killed while fighting in the street on May 26. The civil war ended on the 9 ith, when M. Thiers issned a bulletin stating that 25,000 Communists had been taken prisoners. Large mmbers of these were put to death, and several thousand were punished with deportation. The ringleaders of the Commune who survived the battles were mostly captured and exeented.

Commmica'tio Idiom'atmm [Lat., conjoint possession of attributes; idioma $=G r$. isicuma, peculiarity: deriv. of ofos, peculiar ! : the name marking the ductrine that the one person of christ has conjoint possession of the attributes of the two natures-that the attributes of the two natures are so held together in the one person as in it to have fellowship with each other; the person which conjoins the nature conjoins their attributes in itself. The two natures are inseparable, both actively and passively. What is proper to either nature in the abstract belongs to Christ in the concrete; and what the divine, which is the assuming nature, has in itself, the human, which is the assumed nature, has in and throngh its personal conjunction with the divine. See Krauth's Conservative Rieformation (476-481).

## Commonion Service : See Eucharist.

Commmmism: the theory which teaches that property slould le held in common-a theory which platu alrouates in his Republic, and which was probably practiced before his time hy the followers of Pythasoras. In later times the Neo-Platomist Plotinns attempted to establish commmaity of gools upon the plan whiel had been proposed by Plato. Anong the Jews the Essenes and Therapmin practiced a sort of communism. The so-called communism of the apostolic Ghureh in Jerusalem lacked the essontial features of communisu. It was only partial and woluntary, was not patterned after by other Christians. and was a failure. Bûddhism and otlier Oriental religious systems have for ages lad followers who have practiced a rinde communism. In Finrope there were numerons motioral sects ('atharists. Brethren of the Free Spirit, ete.) who idvocated some practice of the kind. Later came the Anabaptists of Minnster, the Libertines of Switzerland, the Familists of Fingland. Still later we find the Hermhutere. the Shakers the Harmonists, the Buchanites, and numarons other religions comu-munists-some practically suceessful and ithers not.
The osema comucniti (q. 2 .) is perhaps the best-known example in the L.s.

Bacon, More, and other English thoorists long ago woote treatises which lowed toward the ultimate establishment of commmism, but Rohert Owen was the first great admocite of the doctrine in the Cuited Kinglom. The tirst lirench rewhention brought forward is number of communist ic theories, but none survived long; the best-known writer of that

ity (see map of Austria-ffungary, ref. $5-\mathrm{G}$ ). The strects are narrow and irregular. The Damube is bere crossed by a brituge of boats. The fortress of Comorn, originalle built by Matthew Corvinus, is considered one of the strongest in binrope, and requires for its defense $15,000 \mathrm{men}$. It was besieged and bombarded by the Austrians in 1848 and 1849 withont snecess, but finally erpitulated of its own choice sept. 27.1849. Pop. 13,100 .
('om'oro Isles: a group of four larger islands and several smaller ones situated in the Mozambique Channel abont half-way between Afriea and Madagascur (see map of Africa. ref. $\quad$-Ii). They are voleanic in origin and mountamous, and the highest peaks rise about 8,500 fect abore the sea. The soil is furtile. The prolifie tropical vegetation includes the cocoa and ureca palms, e'xeellent rice and maize. yams, laanamas, mangos, pineaplles, oranges, lemons, cotton, wild indigo, and sugar-cane. Excellent wood for ship-building is fonnd. The principal exprots are palm oil and tortoiseshells. The people are pirtially Arab and partially Malagasy in hood, and are mostly Mohammedans. Ther support themselres chiefly by tillage: there are among them skillful cutlors, wearers, and jewelers. Nayntte, one of these islands. has long been a Freneh colony. "The island of Johanna is celebratmd for its beanty. The pntire group was ceded to France in 1886 . The islands once had consilerable trade, which extended to India. Pop. estimated, 47,000, exelusive of Mayotte, which in 1889 had $19,9 \% 0$ inhabitants.

Company: See Jonst-stock Company and Partnersmip.
Company: in military usage, a hody of troops commanded by a captain, sssisted by bis lieutenants, sergeants. and corporals. The Greek tetrarchia of sixty-fonr men corresponted to the company of infantry, which until quite recently varied in strength from about 60 to 100 men , the size being regulated so that the captain could personally watch and by his voiee and example control the action of every man, making the eompany the strict "unit of eombat." The strength of the company of caralry (troop) and of artillery (battery) is determined by the same considerations. In the Enropean armies of to-day the companies are much larger, giving fewer ollicers, and consequent ly redueing the pay-rolls. The war strength of the German company is 250 men. The captain is mounted.

## Comparative Anatomy: See Asatomr, Comparative

Comparative Philolniry: This term, when msed as it commonly is among English-speaking people, in the narrower sense of comparative grammar, lenotes that branch of the scienee of hanguage which seeks hy a comparism of the grammatical phemomena of engnate languages to reconstruct the parent speech from which these languages are elerived. and so to aid in tracing the historieal development of the single linguages. The former of its aims makes it an anxibiary of anthropology, of ethnography. and of history in foneral the latter makes it an anxilime of historical grammar. llintorical grammar ocelpies itself with the attempt to explain the grammational phenomena of a language as alevelopments out of precelent phemumena: i. c. it virws them ateording to their beroming, in distinction from theseriptive grammar which notes and stuelies them simply as lefing. Ifjstorios grammar, apurt from the help of comparative grammar, can pursue its investigation of tha development of a sount, a form, or a construction no further hack than the posint where the lamgung first nbtamed a recort. (see (bstitime.) Thus among the Varions brancles of the IndoFuropean family the slivic com be follownl hack to the ninth century A. D.. the (ialtice to the cighth, the Irmenian to the fifth, the Toutonic to the fourth, the Italie to the marly firt of the thimd entury B. '... the Gireek to jerhaps the nintl 13. C., and the Indian or Sanskrit to perhaps the fifteenth в, $c$. Without the help of comparative grammar Teatonic grammare would be compelled in lregin the history of the word for yolke with Cinthice juk, Greek grammar with Gugbv, latin with jugum, Slavie wills igo, sanskrit with ynugim: but comparative grammar, by domonstrating that the Into-finropean form from which all of these were difforentiated was yugom, adds a new amd all-inuportant point through which to "onsituct "ach sepmate lise of develop)ment. In like manner, from (bisthir sihmen, seven, O. Bulg.

 corded Valg. Dat. subst. *radentiu. a fall. derived from catere. I eonsiblution of the fact that the Gro genitive
and the Jat, ablative share, among the various forms of rerbal relation which they denote, only the from-relation, leads to the conclusion, which is atso supported by other evidence, that the original rabue underlying the use after comparatives of the genitive in Greck and the ablative in Latin is that of separation, so that, e. g.e the original meaning of the ablative in Lat. filius minom est putre, "the son is less than the father." properly is "measured from the father." The conscions beginnings of a science of comparative grammar were made by Fran\% Bopp (1791-1867), whose first work, I'eber das Comjugationssyystem der. Sanskritsprache un lergleichung mit jenem der griechischen, lateimischen, persischen und germanischent sprache. appeared at Frankfort-on-the-Nain in 1816. The immediate occasion of the development of the scionce was the attention which had hoon called to the Sanskrit language in the latter part of the eighteenth century, and especially the discovery first made and proclaimed in distince form by Willian Jones, an Emglish resident at Culenta, that the Sanskrit stom in definite relationship to the languages of Europe. The immediate purpose of Bopl's work as followed in the above-mentioned book and in his Vergleichende Grammatik des Sanshrit. Zend, Griechischen, Lrteimischen, Lilauischen unt Alfslanischen, Gothischen und Deutschen (1833-52: second edit. 185\%-61), was the explanation of the force und signifieation of the dillerent elements composing the forms of inflected words. Thus he isolates the nersonal indings of the verb $-m i$, $-s i$, $-i i$, and seelis to identify them with the promoms of first, second, and thirel person respectively. The angment he identifies with alpha-privativom, and attributes to it originally the power of negating the present and so of expressing past time. The ease-endings of the nouns he believes to have hive their origiu largely in pronominall roots: thas the $-s$ of the nominative was the pronoun, Skr. $s u=$ (ir. $\delta$.

While the hono of originating the comparative method rests with Boph, the real founder of historical grammar, in the service of which the comparative method has fonnd its chief application, was Jacob Grimm (1755-1863). To him we owe the first formulation of a law of somed, and the consequent pereeption that ehanges of sound take place aceording to rlefinite listorical lines. Il is Deutsche Grammatik (1810-8\%. 4 vols.) was not only the first example of an historical grammar: forming the prototype for the later great Works of the kind. sueh as Ibiez's (1794-1876) Grammatik der rommischen Sprachen (1836-43) and Miklosich's Vergleichende Grammatik der slavischen Sprachen (1852-74, 4 vols.), but constituted also an appliation of the comparative method to the various branches of a single language. As such it exareised in its turn a marked influence upon the plan and method of bopp's Terglcichente Grammatiti.

The application of the comparative method to the rocabularies of the Indo-Furopean linguages in the interest of etymolngy was the pre-eminent sorvice of August Friedrich Pott (1802-88), whose chief work is the Etymologische Forschungen ( $18333-36,2$ vols.: $2(\mathrm{~d}$ el. 1859-76. 5 vols.).

In the rapith clevelopment uf the science of Indo-European comparativo grammar since the foundation period, two clefinite points may he notch, each marked by the appearance of a great summairizing work. The tirst is Iugnst Sehleieher's (1821-68) Compendium dtor vergleichenden (yrommuntik der indogermanischen Sprushen (186t): the secomd hiarl Brugmann's Grinndriss der rergleichenden Siprachuissenschrift dop iudog. Ny"uchon (1886-92, 2 vols. : also an Engl. trimsi.) In the progress of the selence lave shared in most eminent degree, besides the abme-mentinued scholars, Theodor Benfey, Idabbert kinlın, (y. Asculi, Georg Curtius, B. Delbrück, Augnst Fick, August Leskien, Tohammes Schmillt. Ad. Bezzenberger, Hermann Osthoff. Jemmann Paul, Farl Verner, Fr. de Sansame, J. Wackernagel, Themrich Zimmer, H, Hühsehmann, Gustav Meyor, lor. Kluge. Hermamn Collitz, Rudolph Tharneysen, Naurice Bloomfield. K. F. Johansson, and others.

In the following hibliography moly works of present importance are given. and inasmurll as the progress of the science in other helds has gronmally followed in the wake of Judo-Furopean philology, the selections are made chiefty from that divaplino.

Compefition：See Political Ecosomy．
Compiesue，kōn＇pi－ān＇：a town of France：department of Oise；on the Gise and on the railway from Paris to St． Quentin： 44 miles N．N．E．of Paris（see map of France， ref．：3－F）．It has a commmal contege ambablic libary of 28,000 vohmmes ；also manufactures of masin，hosiery． and corlige．＇lhe town contans an interesting lioman－ esque church（st．Jacques）and a heautiful town－hall of the sixteenth century，The neighboring palace（Châtean de Compière）was completed noarly in its present form by Louis XVI ：it is hargely made up of oher structures，and， although its exterion is agreeable in style it is mot an im－ portant building．It is now used chictly as a museum．It was while herting at sortie from compiegne（1430）that Joan of Are was captury by the English who were besieg－ ing it．Pon．（18！（1）15．20． 5.

Complement［from Lat，comptemen＇tum，that which fills up；deriv．of comple re，fill np］：a full quantity or number ； the number reguired or limited；that which completes or fills up．In mathematics．the complement of any magni－ tude is a second magnitude，which，added to the first，gives a sum equal to at const：nat thind magnitude，whieh is purely arbitrary and conventional．Thas the complement of an angle is its defect tron a right angle．The arithmetical complement of in muber is its defect from the next ligher power of ten．The arithmetical complement of 64 is 36 ．

In astronomy the complement of a star is its angular dis－ tance from the zenith．

Complemexr．in music，the quantity required to be added to any interval to complete the betave：for example，a sixth is the eomplement of a thim，and is formed by the higher note of the third，and the note an octave above the lower note of the third．

Complenemtary Colurs：any two colors which when mixed prodnce white．The mixture shond be that of the light reflected from the surfaces to be compared，and not a mechanical mixture of the pigments themselves．The method which gives the best results is that of revolving disks painted in suctors with the colors to be compared． Owing to the persistenee of vision，such a particolored disk when in rapid rotation presents a maform surface to the eye．When the two colors with which it is paintel are com－ plementary，and are arrangel su as to oecup proper relative areas on the disk，this surlace will be white，or a mentral gray．This methol is due tor＇lerk－3axwell．Prof．Liond． using a modification of Maxwell＇s＇methot，has established the following st of complementary（chors：
Carmine and blat green．Gireenish yellow and French Vermilion ami gre⿻二⿰丿丨贝刂灬 hlue． Orame and greenish blue． Yellow and blue． Њие．
Gren yellow and violet． （ivern and purple． See Roorl＇s Text－book of＇olor，chapter xi．E．I．Nitnols．

Com＇min，or Com＇plime［deriv，of Lat．complere，com－ plete；st called becanse it chases the services for the day］： the last of the camomial low in the Roman Cathoilic Church，following vespers：it consists of a general confes－ sion，fund palms，a hyma，the Siene Dimittis，prayers，amb a commemoration of the blessed Virgin．The corresponding otlices iu the fircek Chureh is called upoteipmon the alter－ supper service）．

Compluten＇sian bible：a polyglot in six volumes，folio， so）（atleyl from＇omplutum，the Latin mane of Aleala in Spain，where it was printed．It，contained the original texts， the Vilgate the Septuserint，the Targum of Onkeles on the lentatench；the last two with a literal hatin translation． It was mojocted by Cardinal Ximones，who spant abont

 ropy purrhasel for L＂nom Theolegical seminary in New

Combosile Order：in arehitecture，a form of column and entablature inwoded by the lamans，and rhatacterizel by a combination of lonis：and Corinthian dements in the capital．This was composed of an Ionic abache and echams with large ererner voluties，and the lower half of a corinthian eapital with its two rows of actuthe leaves．＇The propor－ tions of the column and the contalathe were identical with the Corinthian．of which it wa－a mere variant（arch of Scpti－
mins Severus，baths of Caraealla．ete．）．The architects of the－ later Italian Renaissance invented various forms of cntab－

Composite order．From arch of Titus．Drawn by A．D．F．Hamlin． lat are to accompany this capital．The composite order has never had any great vugue in modern times，being at best a batchwork of forms．

A．1）．F．Hamlin．
Fompos＇ites［from Lat．past pte of compornere，put to－ gether，construct ：an chormons family（Composita）of flow－ aring plants（containing 12，000 or more species）now gener－ aly regarded as representing the lighest development of the dientyledmous strneture．All parts of the plant－body are well developed，and in the floral strncture we lind the widest departure from the primitive dicetyletonons flower（presum－ adly sommwhat like that of the linterenns－Ranumeuns）． The compond pistil is compacted into a one－celled，one－ semfed．inferior ovary．the stamens are unitedi into a single anther－ring．the petals are mited into a narmw tube of a Hat hade，am the calyx，when present，is nsually modified spacially（as a pappus）for the dispersion of the sted．More－ ow Pr，thi small flowers are massed into houls，which are often given prominence by the special modification of the marginal flowers．
（ommon examples of the composites are afforted by the sumblowers，thistles，astors，and gollen－rots，and the fanily is often called the sumblower finnily．They are widely dis－ tributed thronghent all parts of the world，being sepecially abmuant in Imerica．In temperate and cola climates they are mostly homaceous ammals or peremials，lat in wamen recions many are shubly or trea－like．On the Great Ilains of North Ameriea and in the Roxky Monntan region sple－ ries of Arfemisia，known as＂sage brash，＂are shrubs fom 3 to 10 feet in height．

Some enmposites are of economic interest，viehting foond or modicines，e．g．letture（IActura sation），at tichoke（Cynara soolymus），derusalem artichoke（lletianthus tuberosus），worm－ wood（Artemisia of several species），arnica（Armica mon－
(tomu), (ote: : many ate impurtant for ormamontal purposes.

C'ilarles Bo Bessey.
Composition with Creditors: an agreement botworn a debtor and two or more of his creditors, by the terms of which he is to bay, and they are to recoive, a ecretain percentage upnon theil chaims in lien of full payment. Such a contract is valinl, as it is helel that the mutual agreenment of the creditors is at sullicient consideration.
t.A. A.

Composition ol Forres: in mechanics, the discovery of one or a limiteal momber of forces which shall be the oftuivalent of a system of given forces arting on a boty. "Thas sinsle force or combination of forces to which the givm ones are reducerd is called thois resuldent. When the bonly is considereel as a material particle or point on which all the forces alt, any number of forees will have a single resultant, which may be leterminel ac follows:
lmatine mach furce to be represented as a straight lime gromer out in the diretion of the force, and proprortional in lenerth to the intensity of the fores. Armuge the lines thus fomme emb to emb in any order whatever, the tirst line going out from the point in the dirertion of the force to which it forrespomds: the second line from the end of the first ane, in the direction of the force to which it corresponds: the third line in tharin at the end of the second lime and to be drawn in the direction of the third force, ete: then at single line drawn from the beginniner of the first line to the end of the last one, will represent the resultant, both in intensity and direction.

We rondily see that if there are but two forens, the result ant will be the diagonal of the parallelogram, two of whose aljurent sides represent the given finces. "The theorem onf the composition of two forces in this way is therefore calleat the parablelorgam of fores. The exmposition of any mumfur of foreos. in the way we have described, is maivalent to the drawing of a series of parallelegranso the diagomal of eath beiner a she of that nest followiner.

When the forces act on at salicl homer, and tho limes in which they act do not all pask through tho same perint, 1 ho simplest form to which the resultant can always be peoluwat consimts of tworations: tirst, a force atoting along a cortain lime, with a certain intensity: meond. a coupho monding to turn the body aromud an anis jarablello this lime. This is Poinsatis theorom of the composition of foreves.

Intimata? conneded with the conmpasition of forces is thair resohtion, which centsiath in resnlving a single forea into three different forces, acting in given directions. 'Tho diarotions heiner ariven, the condition which the forees must fultill is that, when these two hametions ano combismet in the manmer above explaned, the resinlamt forece must bo equal to the given ons. hoth in intensity and direction. by combining the twourarations. any foreswhatcyer atting on it
 The comples of rotating forces may be compounded and
resolvel in the same way, the rasultant boing then repre-

the boxly around one of three given axes. sex. ('orrlat of

 Lat. compn situm. metht, of prat pre of compeintre puit togather]: an intlefiwite arricultural trom uned to desigHate my pile or mass of farmenting material which is to be used for the amichment of the lamb. Formerly comprosts were very much usot?, but they haver lwen largely supersethal in recont years by the concentrated or chemical fertilizfro in which the fortilizing materials are present in known and daffinite amounts, and which are much lighter and cheaper to hanalle. The compost still has a very important us upon the farm, howorer, becanse land often nereds the lonsening effect Which fibroms and bulky materials alone can grive because it aflomas ateady means of utilizing refose, antl becanse the pacaping or leaching elements of farm manures and other materials may be enught and saved if these materials are nixal in a connost heap. Tho organic acids "ngendered by the fermentation of the compost herpare oflen powertul arrents in the rembetion of the insoluble phompates in bome. "The componi heap is ordinarily a long, narmow, and low pile, which should bo "tumed" them or fomr times a yeat to insura nuifom formentation and to prownt heating. Gar demers manaly prefer compost at least is rear olel. 1. 11. B.

Concealment: in law, the suppression of the truth to the injury of another who has a legal right to know and rely upon the trath. A distinction is taken between such fact. as are extrinsic fo the contract. such as the existence uf war ur peace, aml those which are intrinsic. Conceament of extrinsic facts is not, in general, frandulent. See Fraud.
Revised by F. STURGES ILLEN.

Concepeion: a maritime province of chili: hounded by Maule on the X.. Xiuble on the E. and Bio-Pio wn the Irea, 3,535 sq. miles. It is traversed hy the bio-Bin. The climate is nild aml faromble for tillage and pastarage. Wheat and wine are the staple agricultural products, aml there are important coal mines. L'op. (to 95 ) 1*8, 190.
Comererion: a Anwn of Paragnay; caphal of a hepartment of the same name; on the Paraguay river, 135 miles above Asmeion, and just within the tropic of Capricom (see map of South America, ref. (6-E). P(0]. (1887) estimated, 9,920.

Concepeion del Urugnay, or simply Uruguay: a city of Argentina. province of Entie Rios on the rive Uruguay (see map of suath Imerica, ref. \&-E). It is connected by railroad with larana, and has a large trade in grazing products: the salting establishments, built by Gen. Urquiza, are among the largest in Argentina. Concepeion was formerly the capital of the province. and is still the episcopal town. The desertal palace and immense estates once owned by Urquiza are neat the twwn. Pop. 10.000 . H. II. S.

Concepeion. La: a city of Chili; capital of the province of Entre Kios: (nn the river Bio-Bio. 7 miles from its mouth: lat. 3649 s (see map of Sonth America. ref. 9-('). It is a bishop's seat aml the termims of a railway system. The prort. Talcahuano, 8 miles distant, is one of the best in Chili, having an extensiw forcign trade and exporting large quantities of hides and tallow. Concepcion was fomnded by Valdivia, Oet., 1550: flestroyed by Araucanian Indians 1555: refonmed by Garcia Hurtado de Mendoza 155\%. It was ruined ly carthquakes in 1730, 1252, and 1825. Pop. (188.5) 24.000 ; (1895) 39,837.

Concep1 [from Lat. conceptum, something conceived, brought together and grasped; con, together + copere. take]: in motaphrsics, it thing which may be conceivelf; a collection of attributes mited by a sign, and representing an object of possible intuition. Kant and his followers use the word concept to imlicate notions which are general without being alsolute. They divide these into three different classes: "Pure concepts," which terive nothing from experience; "empinial concepts." wholly derived from exprience: "mixed concepts," ascribable party to experience. and pirtly to the pure understanding. A concept is "clear" when its object can be distinguished from any other; " distinet." when its compenent parts can be defined.

Concrption [from Lat. ronceptio. deriv. of concïpere, gather therether ind take, take and hold, take effectively : on. tog ther + eft pere take]: in psychology, the last, finishing Inocess ly whicls memseionsmess takes possession of an object. It is tistinguishable from semsation as active from pasoive. Aslong as an objeet is allowed to impress 1 her minul throngh the whas, immodiately and directly, without any reaction or interference from the side of the mind, conscionsmes is in andely pasive state: and this passive state of comserionshoss is malled sensation. In oriler to maner an otyert, the mind "atn wot stop, however, at the mere senmation; it must make the sensation itself the subjeet of a sorntiny and diserimination: and this active part of the whole percholorical puress hy whinh the mind takes
 the former werming to the somation ins repremting the details of the onjout, the latter as involving the whate of it. Ss we go over an whject with the linger-tips to asoertain the exat powition and relatims of its cotlines, thas pereyt tion rums over all the onflins given in the semsation, partly verifying their trun with respere to the ohject, partly lifitug them into purtert eltarness of conneromeness. Concepption thes wot hain is wow until perception is throngh with its tack. 'Thas monle ambl the moming of an orjocet as a whole is the lask of concoption, aml thes the conception of an objot romacimuls vary noaly to that which we Wherally call a vew of the objorel: with this differmow omle, that a ciow alway is maloretond to be more or less inthifrem by the infividuatity of the subject, white the conreption alway is sulposed to he, strictly and scicutilically, the subjerdive aguixalent for the itlea of the object. 'Ilie
difference hetween concention and imagination is simply that conception is a process and imagination a faculty; in the process of conceiving the faculty of imagimation is very largely used.

## Coumeplion, in physiology: Sce Embryolgay.

Conception, Immacmate Doctrine of the: See Imacllate Conepthon uf the Vilgin Mary.
Conception, Orders ul the Immaculate: Among the orters of the Roman Catholic Church there have been the following: (1) 'l'he Kinights of the Immaculate Conception of the Blessel Yirgin, an order founded in 1618, at Vienna, with the intention of bearing ams against heretics and infidels. The institution was confirmed by Pope [rblan VIII. in 16e:3, bat the brotherhood did not flourish, and soon was extinct. ( 2 ) The Nims of the Immaculate Conception of Mary, fomeded at Tolelo, in Spain, in 1484. by Beatrix de Sylva, and confirmed by Pope Innocent Vill. in 1489. They afterwand joined the Clarisses and took their rule, which mule was changed hy Pope Julins II. in 1511. They are often called Conceptionists. (3) The Congregation of the Immacnlate Conception of the Blessed Firgin is the appellation of the lay sisters attached to the nuns of Notre Dime, who were established hy the blessed Peter Fourier ( $156.5-1640$ ).

Conceptualism: a doctrine of the Schoolmen intermediate hetween realism and nominalism. The Ieralist asserts that gencra and species have an independent existencethat there exist certain "ideas." the pattern after which single oliject- are fashionet. The Nominalist asserts that nothing exists hat things and names of things-that universals are mere names. The Conceptnalists assign to universals an existence which may be called psrcholorical-llat is, independent of single ohjects, but depradent on the mind of the thinking subject in which they exist as conceptions. Abrland is enmsidered the founder of this doctrine, which was beld ly licin, but the distinction arises from a misconception of the doctrine of Realisa ( $q \cdot \mathrm{c} \cdot \mathrm{c}$ ), and is, after ill, only Nominalis. (q. c.).

Comertina, kon-ser-tee'na: a musieal instrument invented hy Sir Charles Wheatstone in 1820. It is hexagonal in shape, with a keybord at each end and an expmsible bellows between the two. The air from the bellows pressing on free metallic reeds prodnces the sombl, and this is effected both by drawing out and by pressing the bellows, the same note resulting in each case. The compass of the treble concertina is four octaves, through which there is a chromatic scalo.

Conrarto: in music, (1) a composition for two or more instruments of the same or of a different kind, or (?) for a single instrument accompanied by an orchestra, designed to show the skill of an expentant. The modern concerto was invented by Ginseppe Torelli in 1686. Its form was finally settled by dilozart.

Concefti, kon-chet'tee [plur, of 1tal. conefto, a conceit, a fancitul notion or expression < Lat, conepplus]: ingenious thoughts or turns of expression, points, jeur desprit, ele.. in serims composition. In the sixteenth century the taste for this species of hilliancy, often false, ant always dangerons, spreal rapidly in the foetical composition of Europe; and toward the ad of the century fanous representatives of the tendency appented in at least three comotriss, i. e. Lyly (author of E'uphues) in Englum, Gongora in spain, and Jarino in Italy. Each gave a name to the style-Euphuism, Gongorism, Marinism. During the carly purt of the sevententhla century litorature was cererwhere allficted hy the passion for concetti, as witness Filicais in ltaly, the Hotel Lambonillat and the Précienses in France, and Honne whel (towly in England. Revisel by A. J. Marsi.

Conelı, Eiongr, or Coneh-shell: the shell of certain carnivorous: gasteropuls of the gencra Triton, strombus, elco., fomm chisely in tropical seas. Many tons of these shells are ammally exported from the Bahamas to Eumpe, where tha tinest are used in cutting shell-cameos, and the rest are useful in the perrelain manufacture.

Concordame [from Late Lat. coneorlentia, reriv. of concordans, jres. ptc. of comcorla re, arree; concurs, of ome mind: con, together + com: cordes. lwart]: an index or dictionary in which all the important words used (rerbad concordance) or subjects treated of (real concordance) in any work are arranged alphabetically, and references made to the places where they ocour. Wi biblical eoncorlances the number is rery large. The carliest real coneordance was to the Valgate ly Antony of Padua (h. in 1195; il. in 1231 A. D.) : the first verbal one by (artinal IIugo de s. Caro $(1944)$. Nest in order was the IVehrew concordanee of Rabhi I-atac Sathan (finished in 1448 . pmblished in Venice 1524 ). The first Greek concorlance to the New Testament, ly Xystus Betuleius (whose real name was Birek). appenred in Bisel, L546. ('onranl Nircher's concortance to the Septuagint appenred in $160 \%$ in Frankfort, and was the first of its Kinml. The hest are-for the Hebrew, Fürst (1840); for the Sew Testament (Greek. K. H. Bruder (Leipzig, 184?): for the Selstuagint, Trommins (1\%18), which will he supersedel by Edwin Ilatch aml Il. A. Redpath (London and Sew York, $184^{2}$, siq.) ; for the Vnlgate, V. P. Intripon (Paris, 1838: 7th ed. 1880). The first English concordance was hy John Marbecke (London, 1.500); the Jest by Alexander C'ruden (1735), Robert Young (Elinburgh and New York, 18:9: n. e. 18t2), and James Strong. The Englishmon's Gruek Concordunce to the Neu' Testament (London. 1840): 5th ed. 1868) is very valuable: also Thom's (oncordunce to the Rerised Xeve Testument (14:33). Among the chief concordances to the (ierman bible are those of Lanckiseh (Lejuzig. 16it); Schott (1897), and Hanfl ( $1828-34$ ), but the German Cruden is Gottfried Hiichner (Jena. 1740 : 20th ed. Prunswick. 1890). 'lhere is a French concordance ly Mark Wilks (l'aris, 1840). There is a concordance to shakspare by Mrs, Mary Cowden Clarke (1845), and to Tennyson by Brightwell (1869). 'I'he special lexicons, as to Homer by Crusius, and to Plato by̌ Ast, are essentially concondances. See Dictionary.

Revised by Fiablel Macalley Jackson.

## Concor'dat [Fr., from Tat. concorvatum, thing agroed

 ulom, pant pte. of concomatare; com, together + cor, cordis, heart]: a treaty between the pope as heal of the Roman Catholic C'hurch and a civil grovermmen in relation to all or some of the ecclesiastical affairs of the homan Catholie ('humeln in the respective state. ['sually the subjects treated of in concomats are those which have at once a rivil and a religious aspect, hence calleal "mixal" matters, thongh pmrely temporal and purely spiritual matters are occasionally contained in them. The concordat is sometimes published by a papal bull, followed by the ratification of the respective state, sometimms loy fomal thaty simed by the plenijntentiaries of the contracting parties. 'lhey are generally looked on as intermational contrats or treaties, binding on either siale. hat revocalne hy either party when the express conventions are vislated, when their fulfillment is physically or mopally impussible, cte: The most famons of the ancient conconriats are (1) the (oneordat of Worms (I'tartum. Calictinum, $11_{2}^{20}$ ) lietween Pope Calixtus 11. and Emperor llemy V'. hy which the quarrel of the investitures was endenl. 'lhe emporor gave up his daim to invest with ring and crozier, and allowed the fall liberty of episoopal elections and consecrations, while the pope conceded that the episeopal elections hrould take place in presence of the लmueror, exclusive of fore and simomy: the disputed eleetions to lo settled by the emprory atter hearing the juter ment of the respetix provincial hishons. The elect cond limemmly and ltaly aftur, the conserration. (o) 'l'le Concombiats of Constanioe made by Jartin V. in 1418 with the rojumentatives of the (x.rmam (inclusive of Polami. Il angary, Sromblinavia). the French (inclusive of Guin and ltaly), and the benglish nations. In these concombats were treated the special reform remands of thes mations: a numbere of gen-
 ly all. (:3) The Comendat if Feh., 14ti. betwern Engene 1V. and thas imprial Elentors of Germanys. (4) The Concomlat uf Vienna (br Avehalf(nhburg) ut Feb. 1448 , hetwern Nichans V. and the imperial wistas, in imitation of the Comeorelat of 'omstanere. (i) 'The Concordat of leo X. and

A standard formula for making Rusendale cement concrete mon U. $s$. public works is-
Conerete No. 1 .
1 barrel of cement $\}=3.2$ h harrels of concrete mortar ;
$\begin{array}{lll}3 & \text {.. } \\ 5 & \text {.. sand } \\ \text { broken stonc, or lorick, gravel, oyster-shells, or a }\end{array}$ mixture of two or more of them.
This batch will make 21 - 5 eubie leet of concrete rammen in place. The mortar of this cuncrete, tested by itself, possesses a crushing st rength of 1301 lb . jer square inch when two months old, the test heing applied to 5 -inch or 6 -inch cubes, For unimportant workn, 6 to $6 \frac{1}{2}$ harrels of lroken stone, int stead of 5, may be incorporated, and the concrete may be cheapened still further hy replacing a portion of the cement by common lime, as in No. $\stackrel{2}{ }$.

Concrete To. $2:-$ In foundations alove water the concrete mortar may be composed as follow:
1 harel of liosentiale erment $=30$ cubic feet of paste.
$\frac{1}{3}$ ". " common limu $=5 \cdot 50$
$33^{1}-4$ b.b. " samd, lousely measuret.
The concrete should contain 1 volume of this mortar to abont $2 \frac{1}{2}$ volumes of hallast.

Concretp No. 3.-Porlaml cement conerete possesing a little more strength than the No. $t$ above may he mate ats follows:
1 barrel of Portland (emmont $\}=10: 32$ barrels of concrete 1
10 slaked lime-powder
sind mortar:
broken stone or other good ballast.
 in position. The mortar of this concrete will sustan at crmshing weight of 154 lb . to the square inch whell wo months wh.
Omitting the common lime, the following formuli will sive a grod concrete:

Comereta No. \&
1 barrel of Portland cement ) $=5 \cdot 4$ barrels of concrete $5 \frac{1}{2}$." "stull
stand mortar.
$=12 \frac{1}{2}$ barrels mixed anal shaken down, containing $26 \frac{1}{2}$ per cent. of voids.
This batch of concrete prohuces in cobie feet rammed in position, and is suitable lien the best prality of concrete work.

It is desirable in all cass that the mortar for concrete should be hydrandie, in order to sequre simultaneous indurat tion throurhont the entire mass atter it has been compacted in position. laving established the quality of the mortar, whether of cement ime samb, or 'ement. lime, and sand, the propertion of mortar to the coarse materials shoula be atfusted, so that the volume of the former should be somewhit ill excess of the volume of voids in the latter.
In buiding the Mississippi jottios bocks of concrete were used which weighed [rom 2 i to $\boldsymbol{t} \boldsymbol{2}$ tuns each. The materials in this conerete were $!$ if per cont. of Porthand cement, $2 \pi-1$ per cent, of samd. 14.5 per cent. ot clean gravel, and 48.8 per cent of liroken stone. After setting, the volume of the enncrete was omly 6 bier cent. of the dry materials, then the contraction huring hardening was 4 per cent.

The word brton is sonntimes used as syonymous with concrete, but strictly beton is mopely hydranlie mortar, in which the cement ind sumb liave been thoronghly mixel hy proloned trituration when wet.

Concrete is extensively usel for the fommations of piers,
 of a rough artilitial stone. Momolithic struetures in the shape of almoments, arreher, and walls of farpories, hawe twem huilt in situ amd wholly of erncerde. Fior instanee, the lower part of the perlestal of the stathe of latherty in New Kork hartor is a solin] mass of "omorete !n fert splatere at

 it in paper lags which bured when homughly wot, and sometimes it is allowel to shite down through the water in at long low or tube, malled atrimir.

The ultimate compressive strenght of concrete ranges
from 200 to $3,000 \mathrm{lb}$. per square inel when two years old. Like cement, it is supposed to harden and strengihern with age. Its enst ranges from 82 to $\$ 10$ per cuhie yard, depending upon the quality of the cement and the met hods of mixing it with the other constituents. Sec Cement and Stoxe. sce Gillmore's Limes, Inydraulic Cements, and Mortars; Newman's Notes on Concrete and Works in Concrele: and Bakers Trentise on Masonry Construction.
Q. A. Gilliore, Revised by Massfield Merriman.

Cuncoution [from Lat. concre'tio, deriv, of concres'cere, grow together]: in medicine, an extranetus solid which accumulates within the brly. Concretions may be chemical preqipitates liom the secretions, and as such oceur in the bladder, the gall-cyst, or salivary ducts. These are called calculi. anl are sometimes of organic and sometimes of nonorganie matter. Arain, concretions may be of phosphate or carhonate of lime, occurring in tabcular or other degenerato masses; while in the joints they are sometimes of urate of soma, as in "gouty coneretions." Within the alimentary camal they are often eompred of hair which hats been swailowed, or of cholesterin, and sometimes of magnesia salts.
Concolonage [Fr. deriv. of conculin, concubine, from Lat. concubina: con, ingrther + cuba're, lie in bed]: the relation of a man and woman who halitually cohalit without lawful marriage : or, more frequently, a kind of inferior marriage, which does not give the woman the legil position of it wife. Concubinage was lawful among the ancient llebrews, as the cases of Abraham, Jacol, anil many other examples show. Comenbinage in ancient lome wis often a union between persons who could not legally intermary on account of difference in rank. It appears that in general the chiduren of a concubine were illegitimate among the lanmans, though many examples of thir apparent legitimacy have been aldnced. The church of Rone never formally lonhade concubinage until the Council of Trent. The I'rotestint ('lurehes hive uniformly opposed it, as contrary to the spirit of Cluristianity. The only relic of legalized concubinage in conlightened comentries is Morganatic Marrage (q. c.).

Comenrrent : literalle, moving in conjunction : hence, in law, having the same authority; contributing to the sume effect. A concurrent consideration occurs where the considerations are mutual promises. A concurrent jurisdiction (the most important use of the term) is jurisdietion which may be exercised by any one of two or more eotrits in the same canse. In such a cise the court which first claims and exercises jurishliction in the canse acquires the exclusive right of determining it. In the U. S. the Federal courts and the courts of the several States often have eoncurrent jurisdiction, and in such eases where suit is first brouglit in the State eourt an appeal lies to the U. S. courts on questions of law arising under the Constitution, laws, or treaties of the U.s.
F. Sturges Allen.

Comenssion [from Lat. concus'sio. derix, of roncu'tere, roncus'sus, clash together; con, together + qua'tere, elash, strike]: in medicine, a distnrbance produced by blows or falls, attender with violent shaking as of the brain or other parts of the body. The word is used particularly in regard to the risturbance of the brain in this way. Concussion of the brain generally results from a fall or blow in which the head is directly struck, or in which much violent shaking of the brain occurs in consequence of falling uron the feet, muttorks, ete. The tirst effeet is shock, the patient becoming pale and collapsed, the pulse small and feeble. and consciousness only partially preserved. When the shock has spent itself, and the symptoms of concussion proper are present, the patient lies senseless, his pupils dilated, his breathing feeble, and the skin cold and livid or pale. Involumbary diseharges of the bowels and bladder mas take place, and the patient may gratually sink and die. or lie may hecome more conscions, and at the same fime irritalle, erying comsamtly, and perhaps telirions and talkative. This comblition may presist for a short time and subside, or it may pass into one of cerehral inflammation with eventual dissolution. The treatment of concussion consists, first, in the treatment of the primary shock, lor which extemal heat, mustured pasters, and other stimulating measures may be requited. For the concussion itself, the patient is ti) be platerl at rest in a cool room. and eold applied to the head. No fool or merely light lingid dict should be given; the bowels shomld bo kept open by mila laxatives, aml the urine drawn with a catheter. Opinm and other selative remedies may be minirel.
W. I'.

 will，wherely the＂atate is created on entarem or thefeated，
or a like chuse affecting the existence of an instrument or the orration of a contrart. The leating instamee to be considered is a qualification ammered to an estate. It is important at the outset to distinguish hetween a commition and a corenaul. A condition cither enlarges on defeat- an ratate: a corenant is a mere chorement under seal to do an act. If a condition be lroken, the estate either dows not wist at all, or, if rested, the grantor may by appropriate means defat it. In case a covenant is broken the remedy is to sae for damages, of to compel the covenamor to priform it, or to prevent him hy injunction from lreaking it. The same act may by suitable words have imparted to it luth the character of a condition and a covenant when a grantor will have his choiee of remelies. Conditions as to Their form are either express or implied ; as to their relation to the istate ther are either precelent or suberfuent. I condition is suid to be precerlent when it precedes the restint or enlarging of the estate: it is subsequent when, the esfate having rested, its regular eflect is to defeat it. The distinction ilus not depend upon any form of words, hut unon the intent of the praties. It will be observed that the resular effect of a condition subsequent is to learl to a forfeiture. As the spirit of the law is oppusel to forfeiture, it is coverned hy technical rules that would not be applied in case of a mere action upn a promise or covenant. Great care mant he taken not to confoum rules which appertain to the one suliject with these which preval in the nther. It is an clementary rule that a rondition subseqnent does not affeet the nature of the estate: it only qualifies it to this extent, that in the happung of the specified arent it may he made to terminate before its Latural expration. This an estate in fee or for life or for rears remains a memher of it class though it may be defented he the hapmening of the went which is callel a condition. It should also be st:tted that the happening of the prescribed event does not of itself ilefeat the estate. There must be an athimative not on the part of the grantor wherehy he repossesses himself of his estate. This is technically called a "re-entry." In welldrawn instruments a power of re-entry is expesily reservel. This rule is so rigidy athered to that it a leace should prescribe that an estate of a tenant shomb, on the haprening of an event, be null and roik, a re-entry would still be necessarr. This rule leads to an important principle, that the right to take alvantase of the forfeiture may be waivel expreasly or he implieation, ats where rent upon a leme is acceptul with knowlatge of the cause of forfeiture. The technical mules of the common law do not apply to testamentary provisions or legacies of persomal property, as that branch of jurisprudence was heveloped by the ceclexiastical court from the Roman liw. Much cantion is accordingly necessary in discriminatine hetween derises of land and legacin of personal property, for, thongh in the same instrument. ther will be governed by different rules. The rule that the grantor must re-enter is to be confined to a striet cate of conlition. It ilwes not apply to a conditionmel limifution. 'The distinction batween the two should be puinted ont. In a comition the estate on the happening of the preserifol event is to return to the grantor: in a combitiomal limitation it is to paso over to a thind persm. An illustration will show the differenee lnetwen them. Thas if a tertator should give his danghter mestate to be defeated in case she entered at ennemt, there would le a condition; but if he had added that in the event supposed it shombly go to his hrother it would be a conditional limitation. The main impertamee of the distinetion is that in case of the eomelithanal limitation no reentry is necessary and the estate on the happening of the event pases at once to the person lesignated. The law of contitions will be fomm in the works on real property, such at Whahburn, Crume, and llilliard, aml to a certain extent in works on handord and tenment, surh is Taylor.

Condonation (in Lat. condonatio): in the law of dirome, the conditional forgiveness (exprens or impliad) of an offense for which, without such forgiveness, a divoree may be obtained. Comlnnation will be inplided from colabitation of the parties with knowledge that the offense has heen committer, and with the means of establishing its commission in a court of justice. but in other cases it is sometimes liflicult to lecifle whether the offense was condoned or not. Comdonation is conditional in this sense, that a repetition of the offense revives the original charge. Aecording to some authorities the original charge may lu revised by the commission of ath offense of an inferior grade.
lievivel hy F". Sturges Allex.
Condor [span. form of the native Perurinn name conlur]: the great vulture of the Andes, Sitrcorhamphus gryphus (tanily Cathartide). The aulult male is glossy black, with a conspicumus ashy white mark upoin the wing: a muft of soft white down eucircles the neck, which, as well as the heall. is tare and wattled. It is somerrhat under 4 feet in length, and its apread of wing is 9 feet. The legs are powerful, hat the feet are not fitted for seizing amal tearing. The female is duller colored tham the male and larks the wattles. The
 condor is a resident of the Amles from Ecuador to the Strait of Magellan, aml hreds upon precipices, laying two dull-white eggs on the bare rock. Its tavorite fool is carron, but it is sitil to attark and kill young or sickly amimals. lts powrs of tlight are wonlerful, amb it has hem sem saming above the smmmits of the Amles at a height of 5 mils sthove the sea. It is captured with the lass when gurged with fool, and also, we are toll, by enticing it to descend upon carrion phaced in a small pen, firm which it is mable to rise as the bird takes wing with some difliculty.
The ('alifornia vulture (l'sindeyryphus califormianus) is also somethere called comdor. It is of a brownish bhack, with a whitish line, formed ly the tips of the greater coverts, ruming acrose the choced wing, and a lroal band of white extends abons the mader sith of the wing, fomins a eonspicmons mark when the hirl is saling overhead. It is rather more lighty tmilt than its somthern relative. imt has a little the greatir expane of wing, sometimes measuring 10 feet frem tip totip: In hathe the twe birds are similar. It is remarkably restriecel in its range, wheh extemes conly from the Colorato river to the Colambia river and from the Sierra Nevala to the sea.

The eivil war, formally initiated by the lombardment and reduction of Fort sumter, was prosecited thenceforth daring 1 s6t with varyine fortmes. but with a preponterance of steress for the Contedorucy. Its first signal trimoph was
 three or fonm national ressels, ineluding the frigate Marimack (which some monthe afterwath, having heen thansformed into the ironclat Yirginia, wroneht learful havere among the national vessels in (lampon Roats), with nearly 2.1000 cannom, besides suallearms, munitions, ete., of immence valn-all ababloned withont firmer a shot by the naval onfieers who should have defented and saved them. The Sixth Regiment of Massachusetts militia. hast ming to the relief of menaced Washington city. had just hefure been assailed (Apr. 1! ) in the strets of baltimore by a moh. whied showered hardware, pring-stones, and other missiles upon it from housetops as it peacefully traversed their city: killing three and womatiog difteen of the Massumbsetimen, while eleven of the mob were killed, and four severely wounded. The militia pased on, but Baltimore was belid by the mols, and communication by telegraph or otherwise between the Fencral capital and the Forth arrested until (ien. B. $r$. Butler reoccupied it, maresisted, liy an advance from smapmlis (May j-13). That imporant city was henceforth limmly hedf tor the L'nion. Gen. Butler, being in command at lortress Honve. ordered an advance under Bricr-Gen. Piorce against a Confederate outposit at big Bethe]. Val., hut the ill-direeted attack was repmism by Gen. J. B. Magruder with considemble low to the Unionists. That portion of Virginia west ward of the Alleghany range having opposid secession, and still adhering to the L'nion, a Confelerate army was sent arros the momatans to overbear this (alleged) ilisloyalty to the state, but was pompty mot by a greater Union fore muler (hom. foorge

 rick's Ford (duly 10), and the remnant driven in disorderly hight over the diviting ridue. Hostitites were renewed on the Kanawha ly the adrance (Aug. 1) of a fresh Confederate force mind den. John B. J'loyd. aftorward sumeded by Gin. Robert K. Lee lont theo werp met and batled hy ia temger L'nu army under Gen. William S. Rosemans, and indecisivendinns ensmat Camifax Ferry, on (heat Nomtain, and at Alleghany summit, which left Wist Virginia almost wholly under the dary of the Cuion at the edore of 1stil. In Fastem (orold) Virginia hostile armies comfontend wheh other neat llaper's forry and Winchester under (rens. Robert Pattermm (Union) and Jowph E. olomston ('onfed(rate) for a month withot lighting, until astronger Cuion force, under (rent. Irwin Mchlowedl, was pushed forwart hy scolt from Waslington and . Wextutria to ('entrevithe, menating the Confelerate fore rencentrated aromit Manasois Junction, aml adranemg (Jnly 21) to attack its teft near sudtey Church. The adrance was gallantly mate ant for time jromised success ; hut Johmon's army from Wincheoter arrivel by mat at the critical moment and was hurried forward to the support uf the recoiling ragiments, so that the fortunes of the day smbenty chanest, and the ['nion trops, exhansted by twelve hours mathines amb fighting unter a July smi, had to give way hefore this uncxperted effort, and retimed in a disorder not nummmon on
 rates, maware of the enmpletroness of the ir victury, did not parane it, though their Proment. Davis, had arrivel on the tioted about the cluse or the hattle. The Cnion lose in this atriar was not lese thin 4.0 nomen, mostly wometed and prisGhers, with at last twenty eamom and large quantitios of

 were not far from 250100 on cach side. hat quite us many more [nion soldiers listened) to the sonnd of the guns at Centreville l'airfax Courthomse, in Washington, amd on the l'otomace whoshould have been on the blomly fied.
Gen. Meclellan was now called from IV est Sirginia, and
som mate commander-in-chiof, vice fien, soott retirel: but there was no more serimas fighting on this line till Oct. 20.
 mosite llarrison's island, was attacked near batl's bluff hy
 stroyed: its commander: fien, R2. 1), laker, of Oregen, being kilked, with 300 of his men. and more than soo takem prisonHs, Two monthe atter, Gen, B: O. (' Ort, with the Thime

 brigade under tion. I. E. B. Sinart, who was cuickly repulsed with a los of as: men. This elowed the campaign on the Potomace, Meantime (im, Butho: sailing from Fortress Monme (Amg. 20), had captomed borts lathras amd Chark at the entrance to d'anlico souml, taking $\% 00$ prisomes
 some stores. A more lormidable expedition, 10, mo stroner. under fien. T. W. Sherman and Commotere s. Van pont, left Hampton lioads Oct. 29, and steered for Port lenyal, s. C., where it hombarded and reduced the ('onter)erate forts on ltilton Itead and Phillipss's island, driviner ont their defenters and taking umbicjuted possession of the sea islands adjarent, which were thenceforth firmly hild by a Caion land and naval force which menaced both Charleston and savamah and repeatedly, though unsuenesfully, struck at the railroad comecting them.
In the What. Miswouri was this yatr the arena of a viohent thongh desultory conflict. Maj.-(ipm. John C. Fremont, who had heen ajpointed to command here, was hastening westward to orgatize at st. Louis an army under the depressing influence of the Bull Run disaster in the Fast, when fors C. F. Jackson retmed from a two months" -ojourn in the Confederacy and prepared to dispute prosession of the state, though a convention of her gupde had dectared (.Infy 20) his ollice and those of his atherents vacated by treason, and all their disloyal acts mull and woil. He thereupon asemmed to take Sisisuri ont of the I'nion hy proclamation (duly 31), negot fated a close alliance with the (onfeleradry and was raising a large army, in gool part from Arkansas, when Gen Nathaniel lyon, commanding 6.000 I'nionists at springliedd, tork the fidd against Jackson's far more numerous hat not so well-provided amy: led be Gran. Sterling Price, who suddenly resignol his command to (ien. Bran Mar'ulloch from Irkansas. Lyon, having advaned to Wilson's ereek, sent Gen, sigel with 1,204 men to flank the entmr. whom he assalled in front. but his force was the Small: L, won fell mortally womden, and the ['nion attakin fromt ind Hank were repulsed; lat the Lnionists retired deliberately and mumened to Spmothed. insisting that they had fonght quadrughe their numbers and not been heaten. Waj. sturgis, who succeeded Gen, Lyon, sonn atiterWard retreated to fidna abandoning all stouthern Missouri to the Confenterates, Necollorh returned to Atansas. Int Price atwanced in large fore to the Missouri river at Lexington, where he inveled loo. Hulligan and his lrish hrigrate, mombering aseo men, and presed then on vigorously That Multigan wis forced to surrmider (sront. 20) before lremont could relieve him. Fremont took the field diecetly afterwart, and pushed down to somgefietd at the head of 30, ,ow men : but Brice aroided him by retrating , and them
 alry, routcol a far larger force which held sprinctield, capturing that city. Fremont was still looking for Prier when the was relieved (Nov. 2), and ordered to thrn wer his eommand to (ien. David llanter, who in pursuane of his orders, retreated to linha, arain ahamoning all sonthern Nissowi to the ememy. Brige fien. U. S. (irant was at this time in command of the important post of cairo, at the junction of the Ohio with the Mississippi, watedned by Comfederate form at columbus, Kiy. Grant, with 28.80 men on fom stembonts. Mrophed diown the river to Commbus. landing at Behmont. in Missouri, mat attackert the Confederale camp on that side. The attack was spirited, and at tiost

 two gunkents, made direaty for the l"nion frigntes Comprex
 turepy the ther rapiol camomate, of whill the balls retronted from her stopling low of iron as thourh they were puas, truck the ('umberland with her iron heak, smashing in the frimaters law, so that she tibled and sank in half an hour, cartying down a part of her erew, The (ongress sening the fite of her consort, set sail and ran asrome under the hatteries of Newport Šews, where she was raked by
the ram until her commander, Licut. Joseph B. Smith, and most of her otheers and men were either killed or wounded, when her flag was hauled down; but her captors were prevented from burning her by a fire from the Lnion batteries on shore. The Merrinack afterward returned and hombarded her until she wasset on fire and hlown up, half her crew of 434 men having fallen. The stem-frigate Ninnesota and frigate Lawrenee, hurring to the aid of the cumberland and Congress, had severally gromded in the harbor: The Lawrence soon got off and returned to port. but the Minnesta. still agronnd, was cannonaded for hours hy the entire Confederate thotilla, the Merrimack being unable to approath neared than a mile, owing to the shallowness uf the water. At 7 P. M. all three desisted and steamed toward Norfolk. At ten the new Canion ironclall llonitor, Lieut. John L. Worden, steameel into the roadstead on her trialtrip from Naw York. It 6. A. 3. the hostile fleet reappeared and made for the Minnesnta, but the little Monitor interposed, and the strange combat was renewed and continued with varying fortunes until the Confederate fleet sheered off and stool for Norfulk. 'I'he Merrimack was badly crippled, her commander. Buchanan. having been wounded in the fight with the woold ship. She never fought again, and was hown up when Norfolk was evacuated by the Confederates not long afterwarl. The little Monitor (styled a " cheese-box on a ratt ") remained master of the situation. but was lost, months afterward, in passing Cape Hatteras.

Gen. M.Clellam reached Fortres Monroe $\mathrm{A}_{\mathrm{p}} \mathrm{r}$. $\stackrel{\text { ? }}{ }$. Of his army 58,000 had preceded him, and as many more soon followed. Adraneing up the peninsula, he was soon arrested by Confelerate batterice on Warwick creek (which nearly crosses the peninsula abreast of Yorktown), manned by Gen. J. B. Magruder. who had some 11,000 men in all wherewith to hold a line 13 miles long. Thirty dars were spent here. When Meclellan had planted his breeching-batteries, and was nearly ready to open fire, it was found that Magruder had retreated. On reaching Williamsburg. Meclellan's advance was stopped by works known as Fort Magruder, where Hooker's division fought nine hours and lost heavily, At length the Confederate position was flanked by Gien. Hancock of Sumner's division, and Magruder retreated during the night, leaving 700 men severely wounded. The total Union loss was 280 , that of the Confederates probably less. West Point, at the head of York river, was occupied May 6 with a Enion loss of 200 . This movement up the neninsula. couplel with Jurnside's successes in North Carolina, compelled the Confelerates to evacuate Norfolk, with its nary-yard, about $\$ 00$ guns, and some worthless vessels. that city they never recosered. Gen. MeClellan. no longer resisted, advanced to the Chickahominy on the 90 th .

Here he haltel and fortified with over 100,000 effeetive men, believing the Confederate army in his front nearly if not quite equal in mumbers to his own. Meantime Gen, Fremont, to whom Western Virginia had been assigned as a department, advancel into the Alleghanies aud threatened staunton from the direction of Monterer. Jackson sent Gen. Edward Johnson to oppose Fremonts advance under Dilroy, who retreated and was joined by Gea. Robert ( $\therefore$ S. Shenck near Mchowell, where a battle wat fought, with a L'nion loss of 461, the Unionists retreating after nightfall. fackson recrossed shemandpah Mountain, and marehed rapidly down the valley to Front Rocal, where he surprised and routel col. John R. Kenly, taking ro0 prisoners. Pushing on to strasburg, Jatekson eompelled Banks to retreat rapidly to Winehester, where he fought five hours, and then, being greatly ontmmbered. pet reated hurriedly to Martinsbury and Williansport, where he ermed the Potomae, having lost about 1.000 men, besides the sick and wounded in his hompitals. Jackems's cavalry pursued to Martinsburg. but most of his infantry were hatted not far beyond Winchester, and son retreated rapully to comfront Fremont and MeDowell, who were hasening io har his way. Fremont. crossing the Alleghanies hy a rugrel route, reached Strasburg olune 1, a few homes after farkion hatd passed that point. Jacknon, still retrating, destroyed the mamerous bridges hehind him, and turned to fight (.June 8) at Cros kers, where he checked bremont: than. again retreating, he crussid the south Fork at Pore Republice, falline with " superior force upon (ien. Tyler, who, with a part of shielus's division of Me Wowell's army, was forced back with loss Jackson thus batked all his fres, having lost but $1.16 \pi$ men since he left Winchester. 11 is hatlen pursmers were nuw recalled, ame he, trimmphant, was soon ordered to join Cipu. Robert E. lace, now in chief command at Richmond. The
rebel reneral Heth had attacked Col. Crook at Lewisburg, Went Ta., and been routed on the same day with Jackson:demolition of Kenly.

An unsuccessful attack (May 1.⿹) on Drewry's Bluff, 8 miles below lichmond, by a Union tleet under Commander John Rolgers, was tollowed, May 2 i . be a fight near Hanover Court-house between the U'vion Fifth Corps, Gen. Fitzdohn Porter, and Gen. L. O'Brien Branch's North Carolina divisinn, which was driven off with a loss of 800 , to 400 on the Union side.

Keyes's Fourth Corps having been thrown forward across the Chickahominy to Seven Pines on its right and Fair Oiks on its left, Was attacked (May 28) by the Confederates under Gen. Joseple Johnston, who judged that keves might he orerwhehmed before he could he sulliciently supported. Four divisions, under Longstreet, 1). Il. Hill, lluger, and G. W. Smith, were designated to make the attaek, supported by all the rest of the Confetlerate army. Hill, at 1 P. M., first attacked Caser's division at Fair Oaks, surprising it while its defenses were still uncompleted, and pushing it back on Couch's division near Fair Oaks, with a loss of six guns, two of its colonels killed, and many men. Keyes barely held his ground at Fair Oaks till sumners corps, thrown across the Chickahominr, canne to his aid. Lleintzelman's corps. though nearer. came into the fight later, and the Unim right was now attacked br smiths corfs, directed by Joseph Johnston as commander-in-ehief till he was struck ly a shell, and so badly wounded that he was disabled for months. Lee succeeded him. Mec'lellan was at New Bridge, several miles up the Chickahominy, with the corps of Fitz-John Porter and Franklin, which were not brought into action. The battle raged without much advantage to either side till dark, when the Confederates drew off. They made a pretense of attacking next morning. to cover their removal of arms and stores from the eamp of Keves's corps, but the fighting amounted to littlo. Ilwoker. by Ileintzelman's order, made a reconnoissance in foree tr within 4 miles of Richmond, meeting no resistance, but was reealled to Fair Oaks by Meclellan. The Union loss in this affair was 5, i39, including five colonels killed and seven generals wounded. Of Keres's 12,000 men, 4,000 fell or Were captured. Gen. Mecali's dixision of Mchowell's eorps now joined Mc Clellan, raising his total to 150,808 , and his effective force to $115,10 ?$.

No further offensive movement was made by him until Jackson, whose movements had been studiously concealed, came in on Lee's left, and was pushed forward to assail and turn Mecleltan's extreme right at Mechanicsulle, leing supportal by Braneh. D. H. Fill, Longstreet, and A. I'. Ilill, with the bulk of the Confelerate army.
A. P. Hill, on Jacksons arrival, crossed the Chickahominy and attacked Fitz-John Porter's corps of $2 \pi, 000$ strong, which, recoiling from llechaniesville, took up a strong position behind it across Beaver Dam creek, but was repulsed (June 26), Jackson having not yet got into position. Porter now retreated by order to Gainess Mill, where he was at once re-enforced by Sloeum's division of Snmmer's corps, raising his force to $35,000 \mathrm{men}$. But opposed to them were 50,000 veterans, led by their ahlest commanders, including Longstreet and Jackson. After fighting gallantly for several hours, he telegraphed for aid to Meclellan, who scnt two hrigales of sumaer's corps to his assistance, but the field was lost hefore their arriral. Porter lost nineteen guns. but halted just off the field, and was not pursued. The Union loss that day was 8.000 , that of the Confederates about 5,000. But McClellan's base of supplies, West Point, had been captured by Stuart's cavalry, and he deeided to retreat by his left Alank through White Oak Swamp to the James. "Ihis movement puzzled Lee. who did not pursue with rigor, and the first attacks upon the Eninn rear were easily repulsed. Finally, Mchall's division, serving as rearguard, was assailed (.lune 30) in great fore at Glendale, aml after hard fighting defeated and driven: McCall himself heing capturel, with most of his guns. The struggle ented at 9 18. M., Hooker's and two brigades of slocum's division having arrived too late to win the battle, but in time to check pursuit. The loss of men in this action was about 3.010 on cither side.

The L'nion foress were now conemtrated at Makern Mill on James river, where they were attackel hy the entire Confedurate army, which was signally defeated in one of the most desprate actions of the war. The dirst attack was made at 3 P. M. : the most desperate eharge was made at 6 . and repulsed with great slaughter. The Confederate loss
in this strugele must have been nearly or quite 10.000, that of the C'nionisw perhaps half as many. Noctlethan during the evening moved down the dames th Harison's Lambing, where hee did not choose to assail him. He clamod 10,000 prismers, 52 guns, and 3 3, 000 small-arms as cajtured during the seven days' fightimg. from Machanissille to Makern inchsive. The C'nion loss during those lays is reported by
 total, 15,249. Jackson's and A. P'. Hills losses during those days were rejorted by them as 1,58 killed, $7.6 \times 8$ wombled: motul, s.336. This is probably about hatif the total comfiderate loss, which inchuded Gen. Griftith and thape colonols, killod. Gen. Hooker soon afterwarll rencelppod Matrem Hill withont resistance, taking 100 phisoners, bat the ['nion amy was sunn withtrawn by the President's order to the Potomane. lis retreat and embarkation were umbolestord. Gem. Wec'lehan and his statf ratehed Aquia (reck Ang. W3.

Maj-Gen. John Poqe had been called from the Weest to Hashington, and given the chief command of Fromont*s Buks's, und McDowell's forees, aggregating 50.000 men. Maj-Cien. Ilatleck was also called from the West to Washington, and made general-in-chief. Pope concentrated his fores noar Culpeper Courthouse. and sent Banks formard with 8,000 men to Cedar llountain, where he was ennfronted by Stonewah Jackson, from Richmond, with 9.000 men. Banks attacked ( .1 ug. 9) moder every disadrantage of position, and was steadily repulsed, losing 2,000 men: Jackson's loss was $1: 314$. Pupu arrivel at mightall with Ricketts's division and part of Sigel's (late Fremont's) corjs. hut buckson, seeing that Pope was about to move against him in superior fores, soon ret reated across the Rapidan.

Fope, continuins to act on the offensive, soon found the Whole army of Virginia concentrating upme him, and retreated across the Rappahannock. liee did not chomse 10 force at passage on his front, and sent Jackson arouml hy a long flank march up that river. Encamping at salem, anel emerging through Thoroughtare Gap he struck the Alexanhria R. R. at Bristow htation, in Pope's rear, and capfured two trans of cars ruming westward from Wiartuton. He now sint stuart with two regiments to Manas*its Innetion, 7 miles farther north, which le surprisen, taking s guns, 300 prisonors, and otrains laden with prowisinns, etc. Col. Scammon, with two Ohio regiments, now crossed Bull Rum and asailed lackwon, hut was eavily beatels oft, and Gen. F. G. W. Jaylor, with four New dersey rugimonts, renewed the experinent with like result : all of Jowkson's and A. P. Hill's divisions being by this time at the dunction.

Pope, by this time aware that something was wrong in his riar, beguin to fall back on laristow Station. where Mooker arose Ewell, capturing jart of his train. Wwell fell batck on Manassts, which Pope's gathering forer compelled Jackson to abandon, moving westwarl, leaving the captured provisions. Whid he eobld not remove. Moving toward Thoroughfare Gap. he eneomered Rufus Kingo division uf Melluwell's curps, which fought him stontly, but dil not har his way: The loss on rithnr side was hoary, Daj.Gion. Fiwell heing among the Confederates wombed.

Poun, now at Contrevilhe, still hoped to envehop and erush Jatkson, hut was batlled by the nom-arrival of Fitz-fohn I'orter at Manassas Junction, and by the emerging of lonestret's corps through Thoroughfure Cap. driving off Rick-- Its": division, which attempted to push it hack. lefore nom (Aug. 2! ) Longstrect hat come in nem Ganesville, on the right of Jackson's lotly engaged corps at Groveton. and the battle raged furiously till night, when lope clamed adsuntage, and expected to crush the enemp next day. But the re-enforcoments he reasonably experted from Ne('lelhan's army hill not come mp; and lopue unsupported, was beaten atid retreated on Centreville, near whicli Franklin's corps, 8,000 strong, hat stood intle all that diy (Aug. 30). Here lope was re-enforcel by summer, as well as by Franklin; and see, now in commant, did not choose to atilack him in front, but sent Jackson to pain his rean again hy a thank march to the nothward. Gaining Popers rear. Jiaksunattacked lis flamk rear near (hantilly, where hanos two divisions and Phil Kamy's confrontel him. (ien. Kearny was killed, as was Gen. laate 1. Steras, commanding one of Ranos divisions: but Jacken gatmal 110 vietory. Pope quietly retrented to the Potomace unassaiked, and resigned his command, which was given to firm. MiClellan. The E'nion loss in this brief and hoody (ampaign was hardly less than 25000 . including 0,0 oh prisonem; the Confederate loss was hardly less than 15, (HOO. Cols.

Fletcher Widnster (son of Damiel), of Massachusetts, Roberts, of Wichigin, 1 '('omor, of Wisconsin. Kultes, of Pennsylvania, 'antwell, of ohio, amd hrown, of Inliana, were anong the Union killed. Naj.-fien. I: (1. Achanek was wounded.

Thscmubia, etco, and making comsiderathe captures of munitions, milroat cars etto. with little loses. dis attempt on Chattanooga mader Gien. Nexpley was repulsell by lirhy Smith. Sinbsequent to this the war in that quarter hmguished moter Ponelf's command, while change ratids were made in all divertions by
 and dohn Morgan. ('larksille, 'Temno, Henderson, and ('ynthima, ky, were anong the fown thas punced upon,
 I'nion troqus. "I'he gencral result of these partisiun conflicts Was alverse to the Cinion canse.

Gen. Bragg, having succeeterl Beauregard in chief command in this quarter, alvaned in Tune with 45,000 men from the heart of Mississippi into Tennessee erossing the Tennessee just helow Chattanowa, anl striking boldy northward througla is rugged, mountainous, thinly peopled region. At Richmond, Ky., his alvance, moter Kirhy Smith, fought (Ang. Q!) and routed in detail a C'nion division under Gen. M. D. Manson, of Indiana, who was taken prisoner with nearly 5,000 of his men. Smith hoasted that his prisoners equaled in number his entire force. Smith entered bexington in triumph. Dunfordsville, Ky., was captared (Sept. 16) hy Bragrs, who claimed 4.000 prisoners. Thence Bragg advaneed unoppused throngh Bardstown to Frankfort, where he inangmated (1)et. 1) Richaml Haines as : 'onfederate Covernm of hentacky. C'incimnati, in great alarm, fortified the Kentucky approaches to the Ohio, and Lonisville seemed in imminent peril.

Gen. Buell, leaving Nishwille strongly garrisonel, hat of late heen marehing nurthwari on Bragge left with an army finally swelled by raw levies to 100,000 or at least twice the number of Bragr's much better dispiplined force. Still, Buell hesitated to altack, distrusting the effectiveness of his men, but at length movel (Oct. 1) from Louisville to Bardstown and springfichd, Bragg retiring and concentrating lesfore him. Moring thence on Harrodshurg, his left was struck (Oct. 9) near Perrywille by five divisions of Bragg's army under fin. Ia. Poik, which ontmmbered and drove the interior force directly upposed to it, killing Maj-Gen. James S. Jackson, a Kentucky memler of Congwes. The fight was maintainel from 2 P. य. till dark. with advantage at last on the Union side, hut Buell's total loss this day was 4.34 . and brages but 2.500 . Bacll had 58.000 men nuler his command, but not halt of them were engaged, as he did not know his left wing was in action matil 4 P. m. Advincing at suntise the next morning to renew the battle. he learned that Brage had ibeamped, and he did not stop till he was beland the Cmuberdand Momntains in East Tennessec.

Gen. Grant, left in commam of West Tennessef, with Roserrans in Xorthern Miswissippi. the two attempted a combinel mowement on Gen. Stirling l'rice at Inkia, Miss. Rosectans alone attacked (sept. 19). Inat l'rice beld his ground firmly, almuloning it during the ensaing night. Tlis loss wat at least 1.000 ; hosectans's was N゙? Price retreated to Ripley, Mins.. where he was succeeded by Van Dorn, who now, with at least 30,000 men, undertiok to drive or capture Roserims and his $\mathbf{8 0 . 0 0 0}$. holding the former Confederate fortifiotions at Corinth. One of the great charges of the war was made by Price. Int lailed, because Van lom was seren minates tor late on his side. The Confederate hoss in this repule was at least r.000, incinding 1.433 killed and 2.248 prismurs. Whe then side 315 were killed, inchuding Gen. I'. A. Hackleman, of Indiana, 1.812 woundet, aud $2: 22$ missing ; total, 2,359. Van Dorn and Price retreated precipitately.
Gen. Rosecrans was hermpun siven command of the Army of the Ohio (ren:med the Aring of the Cumberland), in place of (ien. Buell. Whe hat tion 000 effective men, mainly clustered aromed Bowling Giecen, Ky, whence he som tramsferred his hombuatmors to Nosliville, and prepared to alvance. Neantime the brigate of 'obl. 1. R. Moore, of Hlinos, at hlarts ville, marty 2,000 strong, was surprised and eaptural hy John Dorgan with 1,500 eavalry. Rome crans, with 46.910 mon in three divisions, led by (iens. Thomas. Mef'mk, and Critumfen, left Nashrille Dee 20, advancing slowly, with asme desultory fighting, to Stone river, opposite Morfershoro, whem his right moler MaCook was surprisel amd crushed by lardee at \% ro, M. Wee. 31. Mcemk losing twenty-pight giths and moirly half his men. But when Rosectans: center was asalem in inm ly the triumphant confelerates, his firmuses amb sohtiership, with those of Com. 'Jhoms, sivel the lay. Deavy fighting comtimued thronghout the lay, with litthe 10 hoast of on rither
 saikel him at all pints without shemes, losing heavily having heen so ronghly hanlled that they lid not care to try again. Next day (olan, 1, 18(6a) there was a little desultory fighting, mainly at hograge. On the day following (Jani.
 replied to with -pirit: and at 3 r.m. al weat charse was made on the Lum left by brekempiders (ampen aided by a henry entilating fire from Polles artillery. Int was repulsed after a blooly struggle he the divivims of Negley and Jefferson C. Davis, supherthig the tire of Critemben's hatteries,
and charging in turn. The Confederates lost four guns and some prisoners, and were pursned across Stone river, where the victors intrenched and rested for the night. The next day passed with little fighting. Bragg at 11 P. M. began to evachate Murfreesboro, where Rosectans, on advancing next morning, foumd only the desperately wounded. Rosecrans repurted his loses in this protracted struggle at 1.533 killed. T.24 wombled, and 2.800 prisoners ; total, 11,518 ont of $43,-$ 400. Bragg reported his loss at over 10,000 , including $!900$ killed and womded ont of 35,000 . Cavalry raids by Forrest in West Tennessce. John Morgan in the heart of Kentacky, and Wheeler on the Cumberlam, were made this winter to little purpose. Col. 1. D. Streight, of Indiana. was sent by liosecrans (Apr. 10) with 1,800 eavalry to operate on lirages rear, but was surrounded mear Rone, Ga, by Forrest ami Redly, and compelled to surrenter. Sundry minor contlicts in this quarter inllicted in the aggregate abont equal losses on either belligerent.

Commodore Foote had trimphantly swent down the Mississippi from Cairo to Viekshurg. co-operating with Gen. Pope on the 11 isionri and Gen, W. T. Sherman on the Kentueky side. ('olumbas, Ky.. was abandoned on his approneh: New Madrid, Mo., and Island No. 10 in the Mississippi. were successively taken by Pope, compelling Gen. llakall to surrender 123 guns and 6.800 men: then Forts Pillow and Randolph, which openet the river to Memphis, where a Conterlerate fleet of stcumboats matertook to bar the why. but was soon demolished (June 4), when Memphis was quietly surrendered. An expedition thence up White river, to open communieations with Gen. Curtis, did not find him, but lost the steamboat Mond ('ity, with 150 men. by a brall through her boiler in an attack on St. Charles, which was taken. Commodore Dasis steamed down to Vicksburg. and communicated with Farragat belnw it from New Orleans: lut it combinet nasal attack (Joly 1) on that stronghold was repulsed, and the siege raised Jnly 24 .

Gen. (irant, now at Jackson, Tenn., after the battles at Juka and ('orinth had his department enlarged so is to include Mississippi. while 11,500 men were sent him under Melherson. We had advancel as far as Oxforl, Miss., on the way to Vicksburg, when Van Dorn struck (Dee. 20) with eavalry at Ilolly Springs in his rear, where Grant's stores wore alwaiting is turther reopening of the railroal. That place was oeempied br Col. R. C. Murphy, of Misconsin. who survendered neariy 2.000 men. nourly half of them in hospital. Grant at once cashiered Murphy in a stinging order, hat meantime his stores, worth $\$ 4.000 .000$, hat been desirnyed or carried off, and he was compelded to tum back into T'emessee.

Gen. W. T. Sherman, with 30,000 men. left Memphis on steamboats, Dec. 21, and fell down the Mississippi to cooperate in the rodnction of Vicksurg. Ascending the Yizoo, he made (Dec. 2 ) a resolute attaek on the Confederate batteries commanding Chickasaw Rayon, but the gromed was dithicult, the hanks strong and well manmel, and he was repulser] with a loss of 2.000 , while Gen. Pemberton reported the Confederate hoss at $26 \pi$.

Gen. Jolm A. MeClernand now superseded Fen. Sherman, and at unce resolved on the rednction of liort llindman (known as Arkansas Post), 50 miles up the Arkansas river, llis loree was so large, and his clispositions so well made, that his first assault compelled its surrember, with 5,000 prisonens and seventecn guns. The Union loss in the assault Was! !it. Geu. Grant arrived from Momphis and assmmed chict enmmand Feb. 2. 1863.

Attompts to cut a channel across the narrow isthmus opposite licksharg on which the Union amy was encamped poved failures, and a boat expedition under Gen. L. F Rass from the Missisippl, through Yazoo Pass, into the Coblwaler and Tallahatohie river, was stopged and turned back ly Confocmate works at the head of the Yazoo, returaing to the Mississippi numolested: and one or more kindrel attempts formment the lefenses of Vicksburg were likewise hanlderl. It length Gen. Grant deeided to gain their rar by the sonth rather than the morth, and, delying high water and other impediments, marchet his

sared, and taken down to the Mississippi, passing Alexandria with great difficulty by the help of dams. Having now A. J. Smith's corps to spare, Banks continned his retreat, forced to fight and pmoh aside Gen. Bee with 8.000 men. with a Joss of 250 on either side. One steanboat was hurneal and three captured by Confederates near Dean's Bayou, 30 miles below Alexandria, sume 500 t'mionists heing male prisoners. Part of them were retaken in repulsing ( $\mathrm{L}_{\mathrm{ij}}$ y 6) a Confulerate attack on Banks"s adrance near Nansura, and an attack on his rear (Nay 19) at Yelluw Bayou on the Atchafalaya,

Gen. Steele's adrance from Little Inck to eo-operate with Banks was, hy the retreat of the latter, exposed to great peril. The Confederates under Gen. Fagan turned nion frim in great force. drove in or captured his foraging parties. and at length struck his atvance a heary blow (Apr. .25) at Marks's Mill. taking some 1.500 prisoncrs. Stee thereupon retreated, and was attacked (Apr. 30) by Kirby Smith at Jenkins's Ferry on the Sabine: but the "nionists, though inferior in numbers, had the adrantage in positim, and repulsed their assailants after a sharlo contest, in which the Tnion loss was 700 ; the Confelerate 2.300 , including three generals. Steele's refreat to Little Rock was thenceforth ummolested. Several spirited contests were afterward had in different parts of Arkansas with varying results, but the northeastern half of its area was genemally held by the Unionists, the other half by the Confederates nearly to the last.

In 1864, Gen. Rosecrans being now in command in Missouri, Gen. Price enterel it from Batesville. Ark., first resisted at D'ilot Knob by Gen. Harh s. Ewing. who hed his post throughout a day"s fighting, and then ritreated. Price advanced to Jeffersin City, but, finding it two strong to attack. pushed westward to Lexington, and thence to the Jittje Blue, sharply followed by Gen. Pleasanton with a superior force, and overtaken at the Big Bjue, where he mate a stand, but was soon driven westward. sharply pursued, Price was again overtaken at the littje Osage, where he was again ronted with the loss of 8 guns and 1.000 prisoners, including Maj-Gen. Marmaluke. a lrrigadier, and five colonels. The revidue were chased to Fayetteville, Ark., but without much fighting.
(fen. Horkrr, on sutccedjing. Jan., 1863, to the command of the Army of the Potomac. fomud it exceedingly demoralized by its disaster at Frederickshurg, the desertions averaging 200 per dier. After deroting two months to reorganizing and reinspiring it, during which its force had ben gradually raised to 100.000 infantry, 13,040 cavalry, ind 10.000 artillery. he julged himself realy to assume the oftensive. Bispatehing most of his cavaliy umber stoneman to destroy railrmuls, dépots, ete., in bee's rear, his van forted the Rappahanock at hellys: Fort, above Fretericksmrg. adrancintr rapidly to Chameellorsville, where he established his hralyuarters and paused. (ien. Andersom, who had been watching the forls, being tom weak to resist, fell back quictly Before him to within 5 miles of Frenlerickshurg, where Lee met him with two divisions. Meanwhile stoneWail fackson with two more moved rapidly from Lee's right
 right, several miles $W$. of chancellursvilh suddente just hefore sunset (May e), Mowards corps holding the Cnion right, was struck in thank and sear while ignorant of danger, and in part at supper with arms stackid, hy stonewall Juksmis rorps, 25,0hm strong. which hurst trou the thick woms of that rexpon and literaly demolishel it. "Ion minates after the firat shot its men were rushing in wide constormation thwat (hancedtorsville and the river beyoml: thussands of them wor marmet, whife reery many of them were made priviners. Two or thre reximents were surfificel in unsuccesful athempts to stay farksons impertuns rush. Fimatly, lien. Plasiontom got his ballery of horse artillery ints pasision, and arroned the ablyance by murderons ilischarges of erajue at shot range. Hare fell stonewall Jackson, momally wrendedt it wats saiti her a volley froms sume of his own inem. It was dark, anet they were in the womls: all that is cerrain is that he died of his womels cight atays afterwarl. The thicht was hore stoppoct, anel sume of the Jost grombl recainel, but the Filaventh copls Wits temporarils extinet ; so Howher drew buck his rishtit toward (haneetlorsvilte.
The ('onfederatus bext morning followed up their decided shmess ly charge after Marge in wat force on Cem. Siekles's corps, now holdine the Chion right, and cansed it to, give some gromd during the day. The carnage of that
day was frightful. Sickles having 4,000 out of 18,000 killed or wounded. Hooker had been stmmet by a cannon-ball striking a pillar of the Chancellorsville house against which he leaned. and hence failed to support Sickles when support was neederl.
Selgwick, with 92,000 men, had heen left in front of Frederieksimrg. He crossell the river early that morning just below that city, and was re-enfored by Gibton. Who crossed on a pontoon bridge, raising his troops to 30,000 . By noon he had stormed and carriel Narye's Meights, taking some guns and prisoners, thence pishing ont 4 miles to Salem Church. But this bronght him fulf upon Leees army, which, having crosset to assail Hooker, now turned upon him, fighting him till darkness interposed. Nest morning (Jay 4) Hooker remainell passive, and Sedgwick. finding himself orerpowerel, relreated across lanks's Ford, having lost nerarly 5 , 0100 men. Lee might now have turned in fuli force npon Hooker, but his men had been overworked, and he hesitated. Hooker recrossed the Kappahannock unassailed during the ensuing night, claiming that he lrought baek one more gun than he took over, and that he had inflicted greater loss than he suffered, though his own (including sedgwich's) was mo less than 17.19 men. Lee's loss must have been heare, hut was not made public. Stoneman's cavalry returned May 8 . having inflicted little loss and suffered little.

Lee soon after recalled Longstreet from a fruitiess demonstration against suttolk, Va., and while Hooker was planning to thank him hy crossing the Rappalannock below Freterickuburg, was himsejf executing a more extensive and daring flank movement ly Culpeper Court-house and Sperrvilfe into the Shenandoah valley, and down that across the Potomac. This movement was first fully developed to llooker ly an advance in great force under Gen. Early on Winchester, held hy Get. Milroy, of Indiana, who evacuated it when tum late, aml losi guns and 4,000 men in his hurried flight across the Potomae. Ewell pursued unresisted to Chambershurg. Pa., which Jenkins, with his cavalry, had reached some lays thefore (June 17). Early's division of Ewell's corps moved forward to lork, Pa., while Johnson': division pressed northward to Carlisle, and Imboden's brigade swept the valler of the Potomac westward to C'umberland, Jld. Br June 25 all of Lee's army had forlell the I'otomac. and was adrancing into Pennsylvania. Ewell's van reachet Kingston, but 13 miles from llarrisburg. As comed be two ['nionists as it passed through llagerstown, Lee had 91,000 infantry. 200 guns, and 6.000 cavalry, while 5.000 cavalry under stuart entered Penmsylania without traversing lagerstown.

Gen. Hooker hat waited fong below and around Washington, incredulous that Lee would invade the free States. It length he ton crossed the Potomac with 100.000 men, of whom $1 ., 060$ were spared him from the defenses of Washington. He wished to draw 10,000 more trom Maryland Heights, opposite lfarpers Ferry, but was forhithen to do so by Gen. Halleck. Hooker thereupun asked (lyy telegraph) to bie reheved from the commam, and was promptly directed by Halleck to tum it over to Gen. Meade, which be din, and was nomore seen in the Army of the Potomac.

I cavalry fight (June D. $)$, inalyurated by Stuart and repellomb likijpatrick, was the lirst notice that the two great armies were nearing each othwr. They casually rneountered near tiettrsburg.  pasily tomk possusion of Jicksonvillo and Batwin. captoring bahable stores, but advaning rahly weotward to blas-
tee. he was there suldenly attacked hy Gen. Finnegan, and beaten with a loss of 2.000 to $\begin{gathered}\text { th30 Confederates. Sermonr }\end{gathered}$ retreated to Jacksonville, harning \$1.000.000 worth of stores.

In North Carolina the confederate general M. Hoke hesieged and captnred ( 1 上, 30, 1N63) 1'lymuth, held by Gen. Wrescls with 2010 men. Among the spoils were 2.5 guns, F.010 small-itms, and 1.600 men. Hoke's liss was but 300 . Gen. Grant. having leen made (Mar. 1. 1864) lientenantgeneral of the Cnion armies, repared to Washington aml assumed the more immediate direction of the Army of the Potomac. which had hethl largely re-enfored. Gen. Kilpatrick hat just led his cavalry on a raid to within 6 miles of Richmond, whenee, after some indecisive fighting, he made his way unharmed to Fortress Monree. But Col. Clric Dahlgren. with t00 of his men, having advanced by a separate route on Kilpatrick: right, reached Richmond a day later. and striking thence by a more northerly ronte was stopped and killed br a regiment of militia at Dabners Ferry on the Mattapony, his men elispersed, and most of them captured.

Grm. Grant, with Meades arme, crossed the Rapidan unresisted (May 4-5) at Germania and Ely's Fords, striking due s. into the Wilderness. Lee thongh looking for him it a higher crossing, at once turned to the right, and attacked in full force. The gromad, thickly covered for the most bart with - mall trees, and thorongh! familiar to the Conferlerates, while strange to the Ctionists, was especially favorable to the army which must match its superior knowledge amd determination against superior numbers. Two days of desperate fighting, with great slanghter and little advantage to either sitle, were closed at dark on the 6ith with a dashing attack on the Caion right ly Gen. Gordon, who took 4.000 prisoners, including (ien. Trmman Seymour.
Next morning, Gen. Lee awaiting an attack behimf his intrenclments, Gen. Grom put his army in motion southWard. and wat ummolested sate hr stuart's cavalry daring his mareh to spotselvania Courthonse. Ife hat lost in the Wihernes no less than $\because(000$ men. including Gen. James s. Wadsworth, of New lork, killed, aml seven generals woundent. (ten. Sedgwiek. of connectient, was killed two days afterward. The Confeqlerate loss was 8000 , inchading Gens. Sammel Jones, Wounden, stafford, killen, and A. Gr. Jenkins, wounded, and Longstrem was disabled for months.

There was heary fighting around Spottsylvania Courthonse fin two or three days. On the 11th, at daybreak, Hancock's corps carried by assanlt it part of the Comfelerate works, capturing Gens. Edward Johmson and George $1 f$. Stewart, with 3,000 men. Gen. Lee narrowly escaped. Hancork captured thity gums. but after holaing them for hours only brought off twenty of them. But lee was unable to athvance, amid days of deyprate fighting, which cost the l'nimists at least 30,000 men at this point proved Lee's position impregnable. Aeting on the defensive and behind strong works, his loss was much less than Grant:s, but it ineluded Gems. Daniek. Perrin, and .J. M. Jones, killed.

Grant again moved sonthward, transferring his right 10 his left, while his cavalry under sheridan made a fresh rail toward Richmond, figlting (May 11) and killing Gen. 1. E. 13. stuart a ferm miles X. of that city. (rossing the Chickahominy at Meatow Bridge, Sheridan returnd with little luss $10{ }^{\circ}$ Grants army.

 foucht him (luly !) at the pasage of the Monocacy, mear Frederick, and was of emase lefeated, lowine poot men (manly primomes), white the vietens lost hut goot. Early
 skirmishing (laly 1? ) with its ontpost defenses, hut made off rapidly into Virginia with s.5ill emptured horses and 3,000 cattle.

Gen. Wright's Sixth Corps had just Jeen sent from Grant": army to the reliet of Washington, as had Emory's Nineteenth Corps, just arrived hy sea from New Orleans. Wright followed Early to the Shenandoah, where his rear was sharply turned upon and repulsed (July 19 ), with a loss of 500 . Wright retired to Jeeshurg, ant turned over his command to ('rook, white Arerell had (oluly 20) a eavalry fight near Wimehester, and took 4 guns and 200 prisoners.

Hrighte and Fimory"s corvo being now recalled to the James, ('rook, supposing Early gone likewise, adranced to Wiachester, and wis there beaten (Jnly 24), and driven to Martinshorg and across the Potomac, with a loss of 1,200 , ineludiug Gen, Mulligan, killed.

Early now sent B. T. Johnson with 3.000 eavalry on a raid into bennsylvinit, where they hurned without resistance ('hambershirg and the barracks at Cabliste. Averell, with an equad cavalry force, soon encontered the maders, but they eseaped with little loss into Virginia. Pursuing to Monefield, Averoll at last struck the raiters (Ang. 4) and worsted them, with a loss of their guns, wagons, and 500 prisoners.

Gen. Gant now sent Sheridan to command in this department, wher llunter's army, just arriving from the West, the sixth and Nincteenth Corps (whose recull to the James hat berm comentemanded), and Torbert's and Wilson's divisions of curalry from (imotis, had raised his effective force to $30,000 \mathrm{men}$.

Sheridan, after taking time to reorganize his army, advancel to Wiuchester, and found Farly strongly posted and fortified on Opequan creek, whenee he dislodged him (Sept. 19) after an obstinate fight, in which his loss was lully 3,000 prisoncrs, inchuing womded, while among his killed were Gens. Rhorlos and Godwin.

Early rallied his beaten army at Fishers Uill, a very strong position S. of W'inchester, where his flanks were guareled by two mountains. Ilere Sheridan again attacked and ronted him (Sejt. 22), taking 16 guns and 1,100 prisoners. lonrsuing the remmant to Port Republic, he sent his cavalry to Stanuton und to HFaymesboro, destroying provisions and monitons, then retired down the valley to Winchester, buminer all the grain ame forage as he prassed, so that the camy slould dimd no subsistence there. This devastation was made an exeuse for the attempts to burn New Fork and other eities by incendiaries soon atterward,

Sheridan had enomupat on Cedill creek, and, apprehendingro dangre, him grone on a visit to Hinshington, when Early, re-enforced, havings stealthily followed down the valley, determined to surpise tha misuspecting army before him. In this he sureeeded perfectly, thanking Cronk's force on both sides in the dense darkmess, and rushing into the camps with a fearful yell just bofore daylight, abl in fifteen minutes Crook's army was a Hreeng. janie-stricken mol, having lost 24 guns ind 1,200 prisoncrs. Sheridan was at Winchester an his retnm when the alisistrous tidings met him, and, riding at tull sperel, reacherd his beaten army at 10 A. M. He spent two hours in reviving the spirits of his men, and, alter rebulsing one tresh attack on his left, or-
 made, followed by a seronel charere, whieh was still more successinl-though the contembertes opposed to them nearly all the camon of both armios-limeing the foe to the rear, and driving tham throngh Siannom, recovering the ${ }^{2} 4$ guns lost in the momning and taking $2: 3$ others, with 1,500 prisoners. 'The: total less of men this daty was about 3,000 to catch side, incholing the' Confederate graeral hamseur and the [nion gencral bidwell. wt Kiew Fork, killed. 'J'his elosed the campaign in that quartur.

Therve wora variuls partisan conflicts in Alabama, Nississippi, and Weat 'lemmessup during tset, but none of consequence suve at lourt Fillow, I'cinl., which was assailed and taken ( 1 亿月. 1:3) by the fonfederate general Furest,

 them after rosistano hat ceasel. Thas was in acoordance with the threats previonsty made by (omenderate otlieers

(fen. S. l). Sturgis with 19.000 men wis sent from Mem-
 where Sturgis was sperdily routcd and driven hatk to MomGhis with a loss of at losist 4.000 , matuly prisothers Forrest's phtire foree was not murly greater than this dien. A. J. Smith bow assmand commami, and pressed lobrest hack to. Tupelo, Wiss., wherw the Comferlerates thrice assanded his lines, thal were repulsad with loss, Int with no rlecisive
result. Smith retreated, and again arlvanced to Holly Springs, not serionsly opposed, while forrest mided into
 failed to capture the Enion generals of whom he was in quest or to liberate the cabthred Confederates.

East Thmessee was this year the seene of several partisan conllicts to little purpose and John Morgin raided through lound (iap into Gastern Kentucky, eapturing and paroling Gen. Ilobson with 1,600 L'nionisis in a fiedd at Lieking kiver. Gen. Burbridge struck the raider at Mt. Sterling, and again near Cynthiana, cajoturing or dispersing at least hall his foree, and chasing the rest into Sionthwestern Virginia. Attempting here to destroy the salt-works near Abingrlon, Burbridge was beaten off (Oct. 3), with loss, ly Gen. Brockenridere.

Gea, Sherman, on Grant's dransfer to the Gast, was left in chisf command at the West. Adrancing with 100,000 men from 'hattanongat early in May, 1א64, le was confronted by Joseph E. Johnston, who, having but 54,000, declimed a juitched battle, hut availed himself of the broken conntry and fortitied positions on the rugged road to Atlintio. He was stubhornly resisted (May 10) at Resaca, where the railroad crosses the Oostenanla river, aml was at first repulsed with toss, but soon flanked the position and compelled its abandonment. ('hecking Sherman's advance at Alairsville and C'assville, Johnston made his next determined stand at the Allatoma Pass, and days were expended in fighting and flanking betore he conld agrin be driven. He next made a stand at Kienesaw Mountain, thanked by Jine and Lost Momntains, eommected by strong field-works, where he for severial days resisted every effort to move him. In one ussault. (June 27) Sherman lost $3,000 \mathrm{mon}$. including Gens. Hinker and Dan MeCook, killed; Confederate loss, 44. And now, by again advaneing his right, Sherman forced Johnston ont of his impregnable position, compelling him again to retreat, which brought him to Athanta. Ilere he was relieved by Gen. Ilood, who condemned his catious poliey, which had only depleted his army by 14,700 men in two months constant fighting. Re-enforecments had nearly kept its runks full, its present strength being 51,000 . Sherman mivancing his left under We? herson to brak Inood's railroat commection with the East, Hoon struck heavily (July 20 ) at his right under Thomas, but was rejulsed after a hoody struggle, which cost the Confederates at least 4.000 men. inchuding Gens. W. S. Feathrmon. of Mississipni, Armistead. of Georsia, and George M. Stevens, of Marylamd, killed. T'he Enion loss was but l.suo. simposing that Atlanta had been silently evacuated, the Unionists thereupon rushed up to within 2 miles of the city, hut found here strong works well manned, atud were rejelled with luss. Majo-tien. DePherson, of Ohio, was killed, as was (fon. Greathonse of Jllinois, and another blondy struergle resulted, with advantage to the Cnionists, thongh it cost them over tiofo men. The Confederate los was nearly Romble, induding Gen. W. H. 'T. Walker, of Georgia, killed.

A panse in the fighting now ensued, and Gen. Stoneman with 5,000 Union eavalry raded upon the railrouds and stores in Hood's rear, but, seattering or dividing his forces too much, he was smrommed and captured with 1,000 men, us 'ol. Harrison, with 500 more, had just beten.

Sherman now moved the Army of the T'enmessere, led by Iloward, from his extreme left to his extreme rioht, initinting a new fanking movement, when llood assailed Jogran's ( (ititenth) corps on the new Union right, but was repulsed with havy loss. Hoot now sent Uheeler's calvalry to ratid on the Ithon rear, while kilpatrick's Union cavalry pressed lo the Confederate rear, breaking both the ralronds landing southwardly from At lanta, and returning to many Ing. 98. shemman again threw forward his right till most of his army was behind Atlanta, bolding firmly the railrodd to Macon, llood hat already sent off part of his army to Jonsesoro, whence llardee with (wo corps attackerl (.lus. 31) Howat firrely, but was beaten off with a lose of 2,010 to Howned: 500 . And now Jommatoro wiss axsililed in its tumb beflersu C. Wavis's eorgs amb carrial, "ight ghas, Gobll. (invan, and many mon heing captured. Hood hereupon explonded his monilions amd lomed his slotes in Xtlant a and uscoped eastward. Slexum took quict possession of what wis loft sopt. 1. Sherman retmoned to the city, and gave his men a well-earned rost.

Whereres raid wis proseduted thronghont Northern deorgianad that Tennessere, retuming through the sequatchios ralley, and being chased actoss the ' Cm messor near Fobence.

lee，assuming the offensive．sont fordon with two divi
sions against the center of the $[$ nion line lefore Petersburg, ('harging at daybreak (1har, 25), Gordon surprised and took Fort Stedman in his lront, capturing three batteries and some prisomers, but, not heing properly supported, he was attacked and ronted in turn by the Ninth ('orps losing d,000 prisonets: besides which the loss to either side was alhont 2.500. Grant interpretel this rash assault as premonitory to a Confederate evacuation of lichmond and Petershurg. which he resolver! to haras:, if not intercept. Again throwing forwarl his left (Mar. 20) to seize the Boritom plankroad, while Sheritan's cavalyy on its flank adranced to Dinwiddie Court-house, he was opposed by Lee with most of his army, who smblenly struck Wirrens corps in flank and rear, with intent to riveat the lesson of Chancellorsville. Two divisions were then broken, but Grillin's, behind them, stood firm while the fugitives were rallied, and Warren was thus emabled to repel his issailants with heavy luss: but an attempt to carry their works was defeated in thrn. Meantime Sheridan hal gained Dinwindie Courthonse, but, attempting to advance thence to the boydton plank-roak, was foiled, bit wivanced agaliu next morning (Apr.1) to Five Forks. where he eonmecterl with Wiarren, advaneing on his right, and orlered a wemeral charge on the Confeclemte Works in their front. belil by two divisions, who were fearfully orevpowered and ronted, with a lose of 5.000 , mainty prisoners. The Union loss was hut 1.000 , incluting Gen. Frederick Winthrop, killed. And now, sending two divisions eastward to (idu velly Chureh, bheritan again connceted with the Union lines before letershurg. Whence a general cannonade prelmed the assault, which was delivered at daylight next monning ( 1 pr. D), Wright's Sixth Corps maining the rear of these works by the south, and taking many prisoners, while Ord's eorps carried Forts Gregg and Alexander by storm, losing 500 men. A. l' Hill, in attempting to retike some of the cintured works, was shot dead, and his eorjs utterly mefoaterl.

Lee now, at $10.30 \mathrm{~A} . \mathrm{M}_{\mathrm{a}}$ telegraphed to Divis that Richmond must lie evacuated at once, and it was evacuaterl betwern that time and next morning, while its immense warehonses, filled with provisions, monitions, and stores of all kinds, were fired by the departing Confederates, burning out the heart of the city. Flames and explosions notified the Unionists in front that the Confeterate capital was abandoned, and Gen. Weitzel it 4 A. a. (Apr. 3) was assured by a Negro from the city that lavis and all his official or military atherents had departed. Picking his war throngh the abatis, earthworks, rille-pits, torpetnes, ete., which encircled the buming city, $W^{*}$ eit $z^{3}$ at $6 A, M$, led his men into the eity soon followed by l'esident Linculn, who was at City Point. Petersburg was simmltanconsly abomboned. Lee retreating up the gidroud townd Dinsille, while ringing of bells and mamense githerings all over the North and West hatled the relinquishment of Richmond is the downfall of the Conferleracr.
bivis cosoped by train to Danville while Lee lalted two clays at Amelia fourt-honse, vainly seeking provisions for
 000 men. (irant was som on his trail. The fleeing host Was first sepra from Diatensville, amd was struck near Siabor"s creek by C'uster's horse, supported by Crook's und Inavis's divisions. Ilere 14 guns, 400 wagons, and some prisomers were takon, while Ewell's thinned eorps was eut "tif from leeg rear. and su "uveloper that it was obliged to moromer. Evedl himself wis smong this day's 6,000 prisoners.

Lee crossed the Appomattox at Farmville, repelling Gen Theodore Rean, who tried to stop his way with two regiments. But Humphores Somonl ('orps was arain su cluse on his rear that he was obligel to turn and fight a few miles beyond Fiambille, repulsing his assailants with a lose wi 600. Jut this lust a hay, which was wastet by attempts to bar the Danville romil. whinn Lere was really inaking for
 on the morning of thesth, (irant laving mantime sent Lee a courteras note invitiner a survemere. Sheritan pashed
 honsor: herating laeps army. intorepting its surely medeml supplies from lynchhmes, ame planting himself aceross the roan whereon it must move on thw morrow, and sembing woml to Grant, who orfored a foredel mareh of firitlins amel Ori's corps to Appomathox siation during the night. Lee had monntime sent at mote fo (irant inviting a meeding. with at view to pestee, at 10 A. M, In the morning (April! !) Grant replied, saying ho had wo athority to make jeaco,
bit urging a surrender. Lee's meary famished army set forth as usual this morning, and, seeing caralry in their front. alvanced to push it aside, when it was withdrawn to the dlanks, disclosing solid regiments of infantry behind it. Lee, secing that further fighting would be a useless slaughter of his men, at once called a parley, which rambled in a surventer, "each officer and man to be allowed to return to his home, not to he distumed by [ . S. authority so long as they olserve their paroles and the laws in force where thoy may reside." The momber thus paroled at this point was 27.000. Johnston's army in North Carolinat surrendered on the same terms to Sherman at Raleigh, Apr. DG, and Dick Taylor's to C'mby at Citronelle, Ala., May 4. K. Kirby smith, commanding the Confederates W. of the Mississippi, attempted to make a stand after the surrender of Liee, but his men all deserted him, and, taking whatever (onfederate property they could lay hands on, dispersed to their several homes.

Jefferson favis halted at Danville, anxionsly awating adviees from lece, until astommed (Aror, 10) by tiolings of his surmender. Sle then fled southward to Gremshomo, N. C'., and again halted till it was evielent that Johnston would soon cipitulate, when he flitted again to Wrashington, Ga., with a cavalry seout, which at first numbered 2.000 , but rapidy wasted. Here he abjured the state of a ruler, and was making his way to the coast with his family and an few faithind followers when he was surprised and eapomed (May 10) while encamped near lrwinsville by two detachments of cavalry sent out from Macon by (ren. Wilson to look for him. His family was liberated at Siavanah, but le was held a close prisoner in Fortress Monroe for two vears, then released on hail, and never brought to trial. so ended the Konthern Confederaey. Horace Greeley:
The abore account of the canses and the progress of the eivil war was compiled for the most part trom the anthors Amerieren ('onflict, and is generally so free from error's that it has not been thonght necessary to give it any revisjon whatever. It therefore stands as Mr. Greeley wrote it. For students who wonld stuly the suliject at length, the following are the most imporiant anthorities: Horace Greeley, The A merican Conflict (186t-66); PFrsonal Memoirs of [T. 太 Grant (1855-N(i); Jifferson Indis, The Rise relud Fall of the Goufederate Government (1881): A. Il. Sitephens, A Conistitutiomal liew of the Late Wrar between the States (1sti870) ; 1 Hmoirs of Gen, W'illiam I'. Sherman (18:5) : I'ersemal Mrmoirs of l'. II. Sheridan (1888): the C'ount of liris, $/ \mathrm{Ci}$ tory of the Civil War in America (18:6-88): Nienlay amd Ihay, Abraham Limcoln (18!0).
C. K. ADAMs.

Confederation [from lat, ronfaderetio, league: son, together + fredus, treaty, corenant, from I.-l*. root bheidh-
 $\pi\{\sigma \tau \leqslant\}$ : a lengre, a tenteral compact, an alliance of juinces, states, or nations; nearly synonvmous with confederacy. The republie of Hexien is called the Mexican Coufederation. The numerons states of Gepmany were mated in 1815 by the Congress of Vienna, and formed the Ciemanic comfederation (der Peutsche Bund in German). Before the adoption of the Pioleral Comstitation of the [T, S. in 1788 , tha Government of this country was a weak confederation of thirteen indenendent States, which recognized no superior or central authority.

Confedreation, Articles of: a document drawn up hy the Congress wh the U. ה., Nor, 15, 1727, and adopted finally July 6,17 R. hut not ratified by the States antil Mar. 1, 17si, by which tho several states united in a leacue of prupetan! friendship" for the common clefense, the security of their liherties, amd thoir mutual ant general welfare." Those articles, thirteen in number. proved very inadequate to the nemets of the situation. because Congresis had vory limited buters, ant the exomtive hat no means of enforeing its antlority in opposition to the wil] of individual sitatos. For these reastms a convention callat by Cougross met at Philadelphia, May 14. 178., with 11 ashington as its president, and on siph. 14 of that year the cansentinn elosed its labors and reported the Constitutios of tire Uvitid Statas ( $\%, 7$. ) The following were the Articles of Conferdration

Artictes of C'ONFRDERATION. -To all to whom these presents shall rome we, the undersigmet, drlegates of the states affired to out uremes. somd grepting: Whereas the delegates of the [Taited States of Ameriea in Congress assembled ditl, on the filmenth day of November. in the rear of our Lord one thomsand seven humbred and seventy-somon, and in the

If any person guilty of or charged with treason, felony. or other high misdememor, in any state, shall flee from justive, and be found in any of the ['nited states. he shall, upmon demand of the Gincmor or Executive fower of the Shate from which he flod, be deliverel up and removed to the state having jurisidiction of his offense.

Fonl faith and eredit shall be griven in each of these states to the recorls, acts, and judicial proceedings of the courts and macistratos of every other State.

Art. is. For the more conseniment mangement of the greneral interests of the Cnited states, delegates shall lee ammatly appointed in such manner as the Jemislatare of each state shall direct. (o) meet in comgress on the first Monday in Nowemher in every year, with a power reserven to anch siate to reeall its dolegates on any of them, at any time within the yos, ami to send others in their stand for the remainder of the your.

So state shatl la reprement in Congrese by hes than two, nor by more than wren memhers: and no person shat le capable of being a delpogate for more than there years in any term of six yars: nor shall any person, heing a lelegatc. te capable of holding any whice under the T'nited states, for which he or another for his benetit. receives any salary, fers, or emoluments ot any kind.

Fach state shall mantain its onw delegates in a meoting of the states, athe while they act as members of the conmmittee of the states.

In determining questions in the Conited States in (ongress assembleth, each state shall have one rote.

Firedom of speed and delate in ('ongress shall not he impeached or questionmi in any cont or place ont of ConFrise: and the mombers of comgress shall be fowectod in their persons from mrests ame imprisomment- during the time of their going to and from and attendano on (ongres. werpt for treason, felany, or brach of the peare.

ART. B. Sus Sate, withut the consemt of the [nited Statms in 'ongress aswmblan, hatl semp any embsisy to. (a) recoive any cubasy from, of entor ints any conference. agremment. alliance, or treaty, with any king, prinee, or stato; nor shali any premn holding any otlice of proft or truse momer the
 ment, oflice, or title of suy kind whatever, from any king.
prince, or foreign state: nor shall the l'nited states in Congress assembled, or any of them, grant any title of mobility.

No two or more States shall enter into any treaty, confedpration, or alliance whatewer, between them. without the consent of the L'nited staters in ('mugress amembled. specifyting arcurately the purpmes for which the same is to be inhtered into, and how long it thall continue.

No state shall lay any impost or tut ies which may interfore with any stipulations in treaties entered into hy the ['niter] States in congress assumbod, will any kingr prinee. of state, in fursmane of any tratios alreaty proposed by (ongress to the centur of Prane and spain.
Sou vesel of war shall la kept up in time of peace by any State, except such mumpry mys shall be deemed necesary be the L"nited states in Congress assomblen for the defense of such state on its trade; nor shall any boly of forces be hapt up by any sate in time of bace exepht such number unly as, in thi judgment of the luited states in Congress atsemblecl, shall bo deemed remuisite to garrison the forts Hewmary for the defense of such State: but every state shat alway kep up a well-regulated and disciphined militia, sufficiently armed and accoutred. and shall provide and have enmatatity ready for nse, in publie stores, a due number of field-pineces and tents, and a proper quantity of arms, antmnnition. and (amp equipage.
Nostate shall engrare in any war withont the consent of the L'nited states in Congress assembled, unless snch State Tw mothally invadeat by enmis, or shall have received certain allvicu of a resolution heing formed ly some nation of Indians to inverle -uch a state. and the danger is so imminent an mot to almit of delay till the Cnited States in Congress asismbled ean be comsulted: nor shall any state grant commissions to any ships or ressels of war. nor letters of maryue or reprisal, excepl it he after a dechamation of war by the Unitod states in Congress assemblect, and then only arainst the kingrdom or state, and the subjects thereof. aganst which war has heen so declared. and under such requlations as shall be established by the United States in ('ongres assembled, unless such stata he infester by pirates. in whirlo rase ressels of war mar he ditten out for that oceasion. and kept so long as the danger shall continue, or unti] the Coniterl States in Congress assemblel shall determine otherwise.
Art. 7. When land forees are mised hy any State for the (ommon lefense, all oflicer of or muder the rank of eotone] slall be appointed by the Locishature of each sitate respectively, hy whom such foress shall be mivel. or in such mannor as sird state shall direct, antlall wacaneies shall be filled up hy the State which first mate the apmentment.
Art. A. All charges of war, aml all other expenses that shall he incurred for the commondentise or general welfare. and athowe by the [aited states in Congrese assemhled, shal! he ilufrayed out of at common treasury, which shall be supulime the several states in propertion to the value of all hat within each stath granted to or surveyed for any furson, as subl land and the hildings and imporements therem shall be estimated nownding to sum mode as the Unitml states in (ongress assembled shall from time to time lireet and appoint.

The tases for jaying that propurtion shall be laid and leviol hy the anthority amb direction of the Legishatures of tho several states, within the time agreed upon by the Uniteel statas in Congrese assembled.

ART, IS The L'uitell states in ('ongress asspmbled shal] have the solt and exdusive right and power of determining on peace and war, exeen in the cases mentomed in the sixth
 treaties and alliance: prowidel. that no trate of commerce shall be made where the begishtive power of the respective States shall be restrained from imposing such imposts and duties on foregners as their own poople are subjectet to or from prohibiting the exportation or importation of any suecies of gouls or commotitites whatsorer-of establishing rules for deciding in all reses what captures on land or water Shall he legal, and in what manner prizes taken hy land or naval fores in the wervice of the [nited states shall be divided or appropriaterl-of grantine letters of marque and reprisal in times of 1 nace-anminting conte for the trial of piracies and felonies commiterd on the high seas and stablishing courts for receiving and dotermining finally appeals in all eases of captures: providel, that no member of Congress shall be appointed sa julge of any of the suit ecmirts.

The Linted States in Congress asembled shall aldan the
last resort on appeal in all disputes and differences now subsisting or that hereater may arise between two or more States concerning boundary, jurisiliction, or any other cause whatever: which authority shall always be exercised in the manner following: whenever the legislative or executive authority or lawful agent of any state in controversy with another shall present a petition to Congress, stating the matter in question, and praving for a hearine, notice thereof shall be given by order of Consress to the legislative or executive authority of the other state in controversy, and a day assigned for the apperance of the parties, hy their lawful agents, who shatl then be diructed to appoint by joint consent commiscioners or judges to constimte a court for hearing and determining the matter in question: but if they can not agree. Congress shatl name three persons out of each of the United states, and from the list of such persons each party shall alternately strike out one, the petitioners beginning. until the number shall be reduced to thirteen: and from that number not less than seven nor more than nine names, as Congress shall direct, shall, in the presence of Congress, be drawn out by lot; and the persons whose names shall be so drawn, or any five of them, shall he commissioners or judges to hear and fimally determine the controversy, so always is a major part of the julges, who shall hear the eause, shall agree in the determination: and it either party shall neglect to attemd at the day appointed. without showing reasons which ('ongress shall judge sullicient, or being present shall refnse to strike, the congress shall proceed to nominate three persons out uf each State, and the seeretary of Congress shall strike in hehalf of such party absent or refusing; and the judgment and sentence of the court, to be appointed in the manner before prescribed, shall be final and conclusive: and if any of the parties shatl refuse to submit to the anthority of such court. or to appear, or defend their clam or cause, the conrt shall, nevertheless, proceed to pronounce sentence or judgnent, which shatl, in like manner, be final and decisive, the julgment or sentence and other proceedings beiner in either case transmitted to Congress, and lotged among the ants of Congress for the security of the parties concernen : provided, that every commissioner, belore he sits in julgment, shill take an oath, to be administered hy one of the judges of the Supreme or Superior Court of the state, where the cause shall be tried. "well and truly to hear and cletermine the matter in question, according to the best of his julgment, without favor. affection, or hope of rewirl "; proviled, also, that no State shall be deprived of territory tor the benefit of the UTnited States.

All controversics concerning the private right of soil, claimed under different grants of two or more States, whose jurisdiction as they may respect such lands and the states which passed such graints are adjusted. the said grants or cither of them being at the same time claimed to have originated antecetent to such settlement of jurisdietion, shall, on the petition of cither party to the Congress of the L'niterl States, be finally detominel, as near as may be, in the same manner as is before prescribed for deciding disputes respecting territorial jurisdiction between ditferent states.

The United States in Congress assembled shall also have the sole and exclusive right and power of regulating the alloy and value of roin struck by their own authority, or by that of the respective States-fixing the standard of weights and measures throughout the United states-regulating the tride and manaring all alfairs with the Indians not members of any of the states; provided that the legislative right of any State within its own limits be not infringed or viobatad —estahlishing and rerulating postofferes from one Stater to another throughout all the ['nited sitates, and exacting such postage on the papmers pasing thongh the same, as maty lre fequisite to defray the expenses of the said onde-agpomting all officers of the land lorem in the service of the Inited states excepting regimental allicors-appointing all the othenes of the matal forces, and commissioning all otlieers Whatevar in the service of the L'nited States-making rules for the government and requlation of the said latnd and natial forces, amd directing their operations.

The United States in Comgress asiembled shall have authority to appoint a committee to sit in the recess of Congress, to be demominated "a committee of the States," and to consist ol one relerate from cacla state; and to appoint such other committes amb civil ofliors ats may he necessary for managing the gromal affairs of the United states, under their direction-to appoint one of their number to preside. provided that mo person le allowed to serve in the oflice of president more than one year in any term of three
years-10 ascertain the necessary sums of money to be raised for the service of the United States, and to appropriate amd apply the same for defraying the public ex-penses-to borrow mones or emit bills on the credit of the U'niteal Stites, transmitting every half year to the respective sitates an account of the sums of money so borrowed or emitted-to lmild and equip a mavy-to agree upon the number of land forces, and to make requisitions from each State for its quota, in proportion to the number of white inhabitants in such State; which requisition shall be binding, and thereupon the Legislature of each State shall appmint the regimental officers, raise the men, and clothe, arm, and equip them, in a soldier-like manner, at the expense of the United States : and the ollicers and men so clothed, armed, and equipped, shall warch to the place appointed. and within the time agreed on by the Cnited States in Congress assembled: but if the United States in Congress assembled slatl, on consideration of circumstances, judge proper that any State shonld not raise men, or should raise a smaller number than its quota, and that any other State should raise a greater number of men than the quota thereof, such extra number shall be raised, oflicered, clothed, armed, and equipped, in the same manner as the quota of such State, unless the Legislature of such State shall judge that such extra number ean not safcly be spared out of the same; in which case they shall raise, oflicer, clothe, arm. and equip as many of such extra number as they julge can be safely spared. And the officers and men so clothed, armed, and equipred shall march to the place appointed, and within the time agreed on by the ['nited States in Congress assembled.

The United States in Congress assembled shall never engage in a war, nor grant letters of marque and reprisal in time of peace, nor enter into any treaties or alliances, nor coin money, nor regulate the rahe therenf, nor ascertain the sums and expenses necessary for the defense and welfare of the Unifed States or any of them, nor emit bills, nor borrow money on the eredit of the T'nited States, nor appropriate money, nor agree upon the number of vessels of war to be built or purehased, or the number of land or sea forces to be raiserl, nor appoint at eommander-in-chief of the army and nayy, moless nine States assent to the same; nor shall a question on any other point, except for adjourning from day tu day, be determined. unless ly the votes of a majority of the United States in Congress assembled.

The Congress of the United States shall have power to adjourn to any time within the rear, and to any place within the United States, so that no period of adjourmment be for a longer Auration than the space of six montls: and shall Imblish the journal of their proceedings monthly, except such parts thereof relating to treaties, alliances, or military operations, as in their judgment require secrecy: and the yeas and nays of the delegates of each State on any question shall he entered on the journal, when it is desired by any delegate ; and the delegates of a state, or any of them, at his or their request, shall be furnished with a transeript of the said jommal, except such parts as are above excepted, to lay before the Legislatures of the several States.

Art. 10. The committee of the states, or any nine of them, shall be authorized to excente, in the recess of Congress, such of the powers of Congress as the United States in Congress ass+mbled, by the consent of nime States, shall from time lo time think expedient to vest them with; provided that no mwer be delegated to the said committee, for the exercise of which, by the articles of confederation, the voife of nine States in the Congress of the United States assembled is requisite.

Ant. 11. C'manla, aeceding to this eonfederation, and joining in the mensures of the United States, shall he momitted into, inul entitled to all the adrantages of, this Union; but no other colony shall he admitted into the same unless such atmission be agreed to by nine States.

Ant. 12. All bills of credit emitted, moness horrowed, and dehts contracted. by or under the authority of Congress. betore the assembling of the United States, in pursuance of the prescut confederation. shall he deemed and considered as a charge agninst the U'nited Sitates, for payment and satisfaction whereof the said ['nited States aud the public faith are hereby solemnly phedged.

Ant. 13. Every State shall abinle by the decision of the United States, in Congress assembled, on all questions which, by this confederation, are submitted to them. And the articles of this eonfederation shall be inviolably observed by every State, and the Union shall be perpetmal; nor shall any
alteration at any time heroufter be made in any of them． nondess such alteration lo arread to in a lonerress of the ［Tnited］States，and be afterward contimend by the dereis］a－ ture of every State．

And whereas it has flensed the groat（iowernor of the world to incline the hearts of the legesisatures we resport－ ivoly represent in Congres to approve of and to anthori\％e us to matify the said artioles of＂onfedcration ind per＂）etand union：finow $y^{p}$ ，that we．the undersigned delengates．hy virtue of the power and anthority to us given for that pur－ fase，do．hy these presents，in the mame and in lumalf of mor lusipetive constituents，fully and entirely ratify and confirm each and evers of the sild atticles of conferleration and prepetal maion，and all and singulare the matters and thines therein contaimed：and we do further solemaly fledge and ensage the faith of our reynetive connst itwemas that they shall abide by the determinations of the［＇nited States inf（ongress assombled，on all questions which，by the said confederation，are submitted to them；and that the articles thereof shall be inviolably observed hy the states wo respectively represent ；and that the［nion lne prrpuluat．

In witness whereof，we have herenoto set our hands，in
 vanam，the nintl day of duly．in the year of our land binn thonsand seven hundred and seventy－eight，and in the third yestr of the inderendence of America．

Confession [from Lat, confessio, deriv, of comfite ri, acknowledge: con, intensive + fateri, avow, connected with färi. Gr. фávak, assert]: the declaration of one's sius to a duly authorized priest with a view of obtaining absolution. Confession, this understood, is only a part of the sacrament of penance. Roman C'atholics and the Eastern ('hurches hold that confession is of divine institution, and therefore imposed by Church aut hority in the fourt h lateran Comeil (t215 a. D.). and that it was practiced from the very beginning of C'hristianity. Confession must (1) be entire, i. e, must include all the mortal sins committed after baptism, so far as the penitent can recall them by a diligent (xamination of conscience ; (Q) humble and sincere, and (3) accompanied ty supernuturul sorvou for sin, and a firm purpose of amendiment for the future.

Most Protestants assert that such confession is not enjoinet in the New Testament. The Greek Clonrch regards this discipline as necessary for the reception of the Eucharist. The Latheran professes that private confession may be retanel in the Chureh. but that particular statement of sin is not necessary. The ('hurch of England empluys a general form of confession in its services, but retains private confession in the rubric for visitation of the sick. The Scottisis and most of the other Protestant Churches do not recognize it at atl.

The siglley Coxpessions (seal of confession) in the Roman Catholic Chureh means the obligation of a confessor or priest not to divulge the secrets of the confessional. This obligation rests, 1 . on the natural ethical law : 2. on prositive divine law (for it belones to the rery essence of this sacrament) ; :3, on ecclesiastical law, fromulgated at lesst ats early as A. D. $52 \pi$, in the synod of Dovin, Canon 20 (Hefele. (omeils. wol. ii.. p. its) and reatfirmed in the fourth Lateran Council. A violation of this law by it priest wond make him subject to the severest ecelesiastical proalties.

Revised ly Johs J. Keane.
Confession: in criminal law, an admission by a person that he has committed or participated in a crime. Confessions are either judicial or extra-judicial. It is said to be julicial when made betore a magistrate or in court in the course of legal procuetings, as where the prisoner pleads "guilt:" An extra-judicial confession does not have the same weight as one that is judicial, and is insutficient for conviction untess corroboratell hy prof of the actuad commission of the offense (corpus deficto). A confession must he vohntary-that is, not clicited by the influence of fear or hope of faver applied to the prisoner by one having authority, such in a pulaic nfficial or the party against whom the act was committed (prosecutor). A confession made by a person under oath is not anlmissible, as it is held that he is then unter a species of restraint. It is not necessary that it shond be spontancors, nor that a warning should be given to the person making it that it will be nsed against him. The question of the admissiluility of a confession in evidence is decided by the judge: its credibility after its admission is determined by the jury. levised by F. Sturties Alles.

Comfessional: in the Roman Catholic Chureh, a place resorved for the hearing of confession with a seat for the priest and a place for the penitent to kneel. This has been commonly since the Midale Ages an inclosed cabinet or closet of wool, sometimes ornamental, and forming part of the chureh furniture. The priest's compartment has a penitent's compart ment on pach sile of it.

## 

 fines): the supreme sibuish wurt of the (entral American region. When the "now laws " were promukated in 154? it was ordered that the andienee of Pamana should be abolisherl, its functions being divided betwern the two andiences of Los Reyes (Lima) and hos comfines (Central Amerien). The hat for hawl juristiction ower (Chinpas. Yucatan, Guatemala, Ilonduras. Xivaragha, amb chatilla idel Oro (isthmus of lianma). Its powers were very groat. In criminal wases there was no armol from it, ami in civil cases an appent hay to the council of the latios only in cases involving ower 10,000 pesos de oro. It appinted temprary govemors, anl was suprior to the crown govmons on ail Tegal prints, being in fact, the highest repremtative of the king in ('entral Americal It emsisten of four oidores (anditors or jurlses), one of whom, as president, practically ruled the others. Comayagua was clowen for the seat of this aublence but it was fomd inconveniont, and the lirst

changed to Guatemala, where it remained until the revolution, except from $1563-70$, when it was at Panama. The new andience of Panama, established in 1545. took the isthmus region from the Audience of the Confines.

## Herbert Il. Smitn.

Confirmation, or Laying-on of Hands [confirmation is from Lat. confirmatio. deriv. of confirma re, nake firm, establish]: a sacramental rite evilently referred to in the Episthe to the ITcbrews (vi. 1,2 ), as one of "the principles of the thectrine of Christ." Notices of the administration of this rite are found in Acts viii. 5-20; xix. 1-8. In primitive times, and still in the Eastern Church, this rite was known as the "seal" and the "unction of the Spirit"; and under these names it appears to be alluted to again and again in the New Testament (e. g. 2 Cor. i. 21 : Eph. i. 13; ir. 30 ; 1 John ii. 20, 27). Notices of the continued and nuiversal use of this rite are fonnd in Tertulhan (A. D. 11/6-201), who, after describing the manner of laptizing as practiced in his day, adds," Next to this the hand is laid upon ns, calling upon and inviting the Holy spirit through the blessing" (De Bapt. viii. f-8). There can be no doult, from the testimonie's of the Fathers, that this rite, universally observed in the apostolical Church, was contimed in use the church believing that, although the miraculons gifts which at first sometimes attended the rite hall cerbed to be seen, the more important, becanse more lasting. graces of the lloly Spirit were still conveyed. As st. Augustine says (Pol. r., lxvi. 4), "Not by gifts of tongues is the spirit known in the laying on of hands, hut invisibly and secretly it is lelt." In the Eastern ('hurches it has always been the practice to administer confirmation directly after haptism, or as soon after as might be: but in the Eist priests were permitted to administer confirmation, using chrism consecrated by the hishop. In the West the rite of confirming was restricted to the bishop in person. Bede informs ns that in his time. the eary part of the eighth century, after the special seasons of haptism-Easter and Whitsuntide-the hishop made a visitation of his diocese for the purpose of confirming those just baptized. The pontifical of Eeghert. Arehbishop of lork circt 70. contains the confirmation service of the English Church at that perion. The earliest confirmation service estant is found in the Gelasian Sacramentary (A. D. 492). lts opening words, closely followed in the English and American confirmation otlices, are: "Then (after baptism) by the bishop is given to them (the baptized) the sevenfola spirit. He lays his hand upon them to seal them with these words: " Almighty Gol. F'ather of our Lond Jesis C'hrist, who hast regencrated thy servants by water and the Holy Ghost, and hast given them remission of all their sins, thon, Lord, send unto them thine Holy Ghost the Comforter, and give them the spirit of wisdom and understanding, the spirit of counsel and fortitude. the spirit of knowledge and piety, fill them with the spirit of the fear of God, in the nane of the Lord, with whom thon livest and reignest. Gol, ever with the IIoly Ghost, through all ages of ages. Amen." Anointing with chrism in the sign of the cross on the forehead was of very carly use in the administration of the rite, but the laring on of hands was the essential act. All three were in use in the English Church down to the end of the reign of king Ilenry Vill. In the first hook of King Edward VI. thu chrism was discontinued. "Then the bishop shall cross them on the forehead. and hay his hand npon their heads." In the second book of Fing Edward VI. the crossing was also discontiment. "Then shall the bishop lay his hand 1 pon every child 'sevcrally." The oflice in the English and American Praver-books is almost identieal. . In the Anerican revision of $189 ?$ the use of the "preface," originally a rubric, is made permissive instead of tring mandatory: a form of presentation to the bishop is addel, and the reading of the account of the laying on of hands given by St. Luke in Acts viii. is required. A rubric is alded at the close of the service as follows:

* The minister shall not omit errnestly to more the persons confirmed to come, urithout delay, to the Lord's Supper:
W. S. I'erry.

Confiscation [from hat. ronfiscatio, lleriv. of confiscare, confiscath: con + fiscus, basket. receptacle for money, treasury|: the forfeiture of land or other property to the Public treasury as part of the punishment of contain crimes. During the French levolution a large quantity of hand ownef by the f'hureh was contiscated-i. r. was taken from the Church in order to convert it into a sonree of national revenus.

 (q. $\quad$ ), sometime erronems! (y called at "religion," and domeribed tis "one of the thre religions of Chima." "This erremens motion had its orixin in the imperfect information of thase who wrote athot chinat in the early dass of forvigh intercourse with that country, and has bent pernothated by other more modern whiters, who needtes-ly include in thit ferm the aneient religion of ('hinta which hat bem in exint
 with which be had nothing to do, as well ass the teachings
 have as little as posible to in with them," represents his Jusition in revard to religion.

Tha key to the Confucian tombline is found in the state of the ermpire in hie thay. The honse of 'hew, which hat come to the imperiat throne about 11 de B. C.. had loot all influme with the fendal princes, who warred wath eath other or against the cmperar. "liagh principles," Menoius |ells ns, " hrad faled away, and ofpresision and blowthed prevailed." 'To remedy this state of things to renovate the pople, and inangurate a time of universal peace and prosfurity, was what confucius aimed at. "Fond of antipuity anm Carmst in seekiner knowledge there." he han! observed that in the gerd old times of "the :ancient kine" peace and properity were fomm ham in hand with beneficent govermment, the observane of "the rules of propriety:" and the cultivation of virthe. lan and shan, twenterthree centuries 13. i., had blothen evil, and poverty, and ignorance out of the empire simply by fair virtue and example. "Ihe upright were advameen to otlice and the crooked eet aside." The result was "universal coneord," a kiml of wollen age, which might again be fronght about by imifating the ancient kinds. Henee his inculcation of the five carlinal virture the olmervance by all clases of the duties 1"raining to the five relationships of life, viz, those of ruber anol subjeet, garent and child, lousband and wife, brother and bother, and frient and friend.

When the prime is prince" said Confacins. " and the minister is mimster, when the father is father, and the son is som," then there is goon covermment. and having good government righteonshes will prewil and the people will the haples: The system of Confucjus can perhaps best be -hown lis an extrat from the To Hioh, or "Great Lesson," a frarment of ens words attrihntal to ('oufucins, and commented on by T'sung sin, a disciple. The olject of this great lesem is said to le " (1) illustrate illustrions virtue, to renuvate the prople, and to rest in the highest excellence." It :uys:
"The ancients who desirel to illustrate illnstrions vitue throngrout the empire firat ordered well their own states IVinhing to oreter well the ir own states, they first regulated thoir families. Wishing to regulate their fimilies, they first cultivaten their own persoms: Wishing to coltavate their persom- they fim rectifiod thein hearts. Wishing for redify their heats, they firsi sught to be sincere in their thought: "Ishing to be sincere in their thonghts, they exten led their knowletge to the utmost: and this extension of knowletho lay in the investigation of things, Thinge being investigited, knowledge Berame complete. Their kow bedge buing ampleta their thotshat were sincere. Their thought heing sincere their harts were then rectition. The ir heate leme rectitied. the ir persons were cultivaten). Their peroms being rulatated, the ir familion were regulated. Their families being requlated, their sillow were righty woperned. Their Atate beiner righty fowernem, the whole empire was mathe tramuil nud haply. From the emperor down to the mase of the people, all must comsider the eultivation of the persom the rest of ewerything berifles." Chintse C'hossiex, thans-

Wön Wians, the fonurfer of the chow dymaty, in the
 montator tells is that as anereign he reated in bunver lenter as a minister in reverence, as a son in filial bive as a father in kindness, and in commmication with hic :nlo-

The resure with which confucius spuke of man's relation in the pewere alowe and of the future life maty lee due in fart to the influence of the carly (Chimese religion. This. Sike the Cowemment, was patiarehal in charamer: the emjerer. ats the reprecotative of his perple, alume ullared sac-
rifices to heaven. while the fropular religion was little more than ancestor-worship. But Confucius was also. by the native temper of his mind. inclined to positivism and secularism. Among the subjects on which he did not talk were "extraordinary things" and "spiritual beings." One of his iliseiples. Ki Loo, "asked about serving the spirits of the lead. The master said: While yom are not able to serve men. how ean you serve their spirit:? Kii Lon added: I renture to ask about death. He was answered: While you do not know life. how can rou know about death? " This attitude he has communicated to his followers, and that the Confu(linists have escaped the degrading superstitions and magieal practices into which the Butdeist and Taoist sects of thina hare falleu is largely due to the influence of Confucius.
Meamed by any standard, a high ethical ralue must be accordell to the teaching of Confucius. It was, moreover, peculiarls adapted, even in its limitations, to the genius of the Chinse people, already predisposed. like himself, to the conservasism which he fias done so much to strengthen. But his teaching alone, even with the aid of his strons personality, would hardly acenunt for the vast influence which he has hedd and stili continnes to bold over the Chinese mind. To explain this we must take into account also the place which the classical books, and throngh them the docfrine of Confucins, occupy in the educational and administrative systems of China. For ecnturies they have been the foumlation, and we might ahmost say the sum, of the instruction given in the sehools. and the main subjects in the examinations which guard the entrance to and regulate promotion in the public service. The Government by lavish honoms paid to his memors has added further to the weight of his authority. His family is emoblet, and the oldest reprecentative in the direct line bas the rank and revennes of a Juke, the sole hereditary disuity of Chinese origin which was respected by the reigning Hanchu drnasty: Twice a yar the emperor himself makes offerings in his honor in the hall of the imperial college at Peking. Temples dedicated to him are attached to the examination halls, more than 1.00 in number. seattered throughont the empire. In apan and Korea also, mong the educated clases, his anthority as a teacher is hardly less than in his native land.

Congarce: a river of south Carolina: is formed by the Broat and Saluda rivers, which unite at Columbia. It flows mutheastward, and joins the Waterce to form the Santee river. Steamboats ascend the santee and Congaree rivers t, ('olumbia.
Congé délire, kōñzhā dā̃ feer' : :t French phrase signifying ". ]mermission to chonse," is the name given in Fingland is the king's warrant or license to the dean and chapter in the ohder dioceses to elect a bishop for a vacant see. The king: wartant bowever. always cmatains the name of the person whom the dean and the chapter are to elect. and they have. aneording to 2.) Henry V'llı.. ©. ?0, no means whatever of aserting a wioh of their own.
Congenilal Diseases : diseases proluced or existing at birth. These ennditions are to be listinguished from herelitary alimetions, and from malformations of the infant, which irsult cither from arrested development or disease contracted during intra-uterine life; they are described chewher. 'ronernital diseases proper may he classed as follows: First, those tramsmittell from a disenset mother hefone or during birth: such as sphthits, various comlitions
 infection. swennd, thane acpureed slortly lefore birth: surl as acote wemeral fatty deverneration of the fortus and nowly lome and tamors of warme kinds. Thime those

 lumser, and cephathematoma, of a suguineon- thmer of the heal. Sybhili- may aflect the infant hy trmsmiscion from the mother to it in any premb of intra-nterine life. Whan the genital ract of the mother is inferted wish a
 a primary infection. Antisphititic treatment is urgenty indicaterl in all conce. From an septic purperal infection of the mother a direct Iransmission to the chihl may necur. in
 furitonitio, a spotic jaumliee with intlammation of the mm-
bilical vein, a purulent inflammation of the eye, and a pyamic condition with the formation of multiple abscesses, may be developed; these are several of the manifestations resilting from the same cause, as seen in different infants. Ther are all accompanied with hish fever, and generally son terminate fatally: Gonorrhea, when affecting the ragina of the mother, gives rise in the most dangerous form of purulent inflammation of the infantile eyelids. which unless immediately treated. is apt to result in blindness. In this condition the eve must he frequently opened and washed With mild antisentic lotions: also applications of nitrate of silver solntion, and iet-water soaked pads locally. An acute general fatty degeneration of mmernus organs is not frequently seen: the epithelium of lung bronchial tubes, uriniferous tubes of kidners. intestine, liver cells. blood-ressels, or even the whole body may be affected. such a condition interferes with the normal functions of these parts, and u-ually terminates fatally: uncontrollable hemorrhages from the stomach, bowels, or umbilical coril. frequently being the direct eanse of death. Congenital tumors are rather frequent, and generally call for operative interference. Asplyxia is a condition most frequently observed after protracted labors, especially in those cases due to abnormal presentation of the infant, where the breech or lower extremities are born before the head. This oftentimes causes a greater or less degree of compression of the umbilical cord, resulting in a temporary or permanent arrest of its circulation. and consequent jremature respirators movements. Thus the child is born almost or apparently lifeles. blue or pale, with no respirators attempts, and possibly no pulsation of the heart. This condition demands immediate application of respiratory stimnants, or artificial respiration. slapling the buttocks. alternate immersion in warm and cold water, slapping the chent with a wet cloth, forcible swinging in the air. electric current to the chest. etc.. may induce resuiratory movement. Artificial respiration br Marshall Halls, Sy'vester's, or Howard's method, or by mouth to mouth inflation, is of value. Atelectanis is the result of an absence of the normal expansion of the lungs. following the entrance of air. This condition mar be cansed by an insutficient derelopment of the chest museles. or thoir imervation mar be fanlty. due to some disease of the brain: the lunes mar be the seat of an inflammation, or ther mar he filled with mucus, or some foreign substance anpirated during birth, suth as blood, mucus. amniotic fluid. ete. Tis relieve this endition. emetio cause a discharge of the foreign matter. tickling the fauces frequently sufficing. To excite nerve action the clectric current is used, and mustard plasters are applied locally. Cephalhematoma may result from one of two causes. The external larer of the eranial bones of the new-bonn, being but slightly developecl, affords but little protection to the blood-vesiels ramitying in it. and in consequence of which bittle violence, and sometime: practically none at all, is necessary to canse a rupture. Or a hemorrhage dur to one of many causes may occur between the bone and its perinateum. or inveloping inembrane: this extravasation of hlond, small at finst. may in the course of from four to six dars increase to the size of a walnut or small apple. Such hamorrhages are most common near ons of the parietal bones. The condition in itself is usnally not dangerons, and the extravasation will generally be absombed in from four to ten weeks if undistmbel. Singical interference is but rarely indicated, and is apt to result in suppuration unkes the mont stringent antiseptic measures are ubserverl.
A. Jacobl and F. E. Sonders.

Conser: a marime eol, Ponger conger. having a more pointed tail than the common species. The skin is soalpless: head depressed and pointed : mouth deeply cleft ; under jaw slightly projecting beyond the upher; outer series of teeth in either jaw so closely set as to form a cutting edge. Color dark brown ahove, dirty white below: torsal and anal fins pale, elged with black, or sometimes entirely black. It is a widely distributed species, being found on the coasts of Furope, Japan. Tasmania, and the Eastern L'. S., preferring a roeky hottom. It reaches a length of s fect and a weight of $1000^{\circ} \mathrm{lb}$., and, although not particularls gooll eating, is sometimes used for fool in Creat Britain, the principal fishery being off the Cornish coost. It is voracions, active, and porterful, and large specimens require careful handling when caught. It seems remarkablr susceptible to cold. In Califomia the name is applied to Sidera mordar, one of the Mursmas, und in the Fastem L..S. to Zoarces anyuillaris. the eel-pout.
F. A. l.

 or active when the over-filling of the vessels is due to inareased flow ol blood to the part, or passive or vernots when it is due to ulstruction to the ontlow of hlood. Ictive come gestion rowits from excitement of the cirenfation by emor tional disturbances, exereise, aleohol or other poisons, from -xposure to cold, or direct irritation of the prart: phasive from meehanical obstruction of the riveulations and localizal [asivio from fressure upon the venous trunks of difforent parts. When active the atlected part is light real in color: when passive the color is dark rel or bluish. W. l'.

## Congregation of Clugny: Se Clunacs, The.

Congrecinionatisul : asstem of Churehpolity which embrace ine principle of self-govermment in the local chureh. and the duty of charches to stand in fellowship or communion with one another. It gives to each congregation the rigfat of regulating. withnut external interference, the detaits of its wordip and discipline according to its own understanding of the principles of the New Testament. while it inenleates the duty of mantaining the fraternal commonion of separate assemblies of ledievers, especially of such as profess the same faith and accept the sume order.

Accoming to the fundimental principle of Congregationalism, any association of beljevers, mited by formal covenant for mutual watchfulness and help, the maintenance of divine womship, the ohsurance of Christian rites, and eomhined $\cdot d$ Iforts to promote the kingdom of Giod, is a Church of christ, and as suell is competent to elect and ordain its own oflicers, admit or reject applieants for membership, oxclude matorthy monbers, enntrol its own property, and transint its owri hasiness. The orderly prosecution of chureh-work calls for the appointment of various oflieers on whon is lati! the speceal reeponsibility of owersight and direction: and lung nisage basell upmo the instructions of the Now Testament, reconsmizes the ollice of pasor amd that of deacon as nereling to be perpethated in the church. The paster holds the oftiep of hishop or elater. By virtue of his orrination he becomes at minister, whose function is not only to preach but to olliciate in the administration of sacraments, ac well as at the marriage serviee and the burial of the doml; anal this rank of a miniter he retains, even though his presition as a pastor of a particular charel may have bed resignem. On this point. it mathe remarked, an opposite vipw was prevalent in the carly lays of Now Fangland. Ordinarily card church has but ome pasture and for his support provision is matle in the form of in stipulated salary, volmutarily entributerl by the congregation. Among ministros, whether installen as phastors or mot. there is nodis. parity of ratuk. The deacons are not sulariod oftiopes, nor technically ministers, hut they are hoopres of the pactor, and have sureial chatge of reedivig the charities of the chureh.
amm making distribution for the relief of the poor. They recive from the minister and hand to communicants the bread and wine at the Lord's Supper.
The Congregational system hotls to the Holy Seriptures as the sufficient and exclusive rule of ecclesiastieal polity. but leaves to the discretion of clourches to establish formis and arrangements which are deemed expedient, provided they are not repugnant to the teaching of the Bible. It revognizes no organized and visible ('hurch inmet from local and purticular assemblies of believers, :nd repudiates all claims of superior bodies to exercise legiskative or judicial anthority over the brotherhoms.

Nevertheless, the relation of neighboring ehurches is most intimate and friendly, and is manifested in various ways: especially by mutual consultations and (a)-operation, the oceasional transfer of memurs, and formal or informa! assorciations for common work, The principal instmment of Church commumion is ecelesiastical cruncils, whose function is to give connsel and to express fellowship, lint ne rer to issue commands. Thus Congregationalism dillers from independency in maintaining the fellowship of distinct chnrches. and from Presbrterianism in denying the right of a presbytery or synod to exereise anthority over the churches. It is throngh this fature of the commonion of churches by menns of enuncils that Congregationalism in the U. S. diflers from Congregationalism in Great Britain. (See Inoepexdexts.) In 1891 an International Congregational Conncil was held in London.
In its principles this srstem is remankahly unsectarian and liberil, and its developinent luring the list 250 years has bren closely identitied with increased liberty of religions thought, and with the practical union of men holding difterent tenets in common works of philanthropy and bencficenc:
As a srstem of chmeh orver. Congregationalism is not necessarily connected with any school of thenlogr or any class of doctrine. Its methots of atministering ehureh affitirs may be adopted alike by Calvinists, Arminians, Sorinians and Arians. The chirch government of the different denominations of Baptists is. for the most part, simply congregational. Some Mothonlists have followed the same order. The Cluurches in the C. s. known as Cnitarian are huilt unn the same platform. This is trne also of thristians and Uuiversalists. 111 these denominations are to be grouped together as ocoupring commen ground in opposition to the ilea of a Chureh comprising many lual congregations, and of a government administred by a priesthond. The rise, during the nimoteenth century, in Sweden. IIolland, and other Emopean countrise of urganizations of Christians almust identical with the evangetical Congreqational churehes of linglish-spaking countries is one of the most interesting facts in the history of Congregationalism.
At the sime time, the clurches which are generally known as Congregational lave held to positive and evangelical views of truth, being Calvinistie rather than Arminian, Trinitarian mather than Socinian or Arian, accepting the dnet rine of a futnre state of endless retribution, recognizing the familios of believers as fit subjects of haptism, and regarding the monde of administ cring laptism as of comparitively small importance. Nodlifiotions of theological opinion, however, have appared from time to time. Fach clmech has its own articles of blief, which with greater or less tullness indicate the system of doctrine tanght from the pulpit and aceptent by the menbers. Some churches have taken as their standater the Confersion and C'atechisms of the divines who met at Westminster, Aondon. in 1648: but the creets in common use are much hriafer. They vary in their phriseology, and are commonly used as formulis for the reception of members.
The congrygatiomalists of the $1^{T}$. S... when assembled in a
 their "adherence to the faith and urder of the apostolic and primitim ("hurehes hedd he thoir fathers," lut "extended to all bedicuce the hand of thristian fellowship upon the basis of those great fumbamental trithe in which all Cluristians shouh aste." They framed a comprehensive ereed, called
 the elders and mesengers of the Condregational churehes of the $\mathrm{l}^{\prime}$. S . in forming a permancont national organization to ment frimainlly for iliselission thonght it sullicient to define their duedrinal pusition loy these words: "They agme in the belief that bhe Doly seriptures are the sufficient and only infalihte rule of religions lathand practice: their interpedation theremf being in whataniall aceordance with the
great doctrines of the (hristimn fath commonly anller] evangelical, hedd in our churehes from anly tinioc, aum sullicienty set lorth ly former gemerat councils." In lisel it new creed wat pat forlh. propared by a commisaion of represent-

 detemines the damation of each sucerding ('ongress. The Constidution also prosides that Congress shall med at least
 the suligect such nometing shall he on the first Womblay in 1)ecomber. ']he time al' dections is heteronimed by the individund States; but momfreve of the llumse uf licpuran tatives are commonly edeeted in Novembor of the efan-mumbered yeare takiarthur seats in the Congress whith beotins its

special sexsion is called br the President). Congress does not meet until the tirst Monelay in Deember, newly eleeted members do not take their seats until about filty-sis weeks after their election. The enngressional term is divited into two sessions. The first session hegins on the first Montay of December of the ohl-numbered years and continnes until iuljournment, ordinarily in sugnst. The second session begins on the first Momday of December in the even-numbered Years. and continues till $1 ? \mathrm{M}$. of Mar. 4 following By a law of the Congress elected under the Articles of Conferderation. passed sept. 13. 1785 . Wednesday, Mar. 4. 1789 . Was ajponted for the assembling of the first constitutional Congress and the inalguration of the new Govermment. No quorum, howerer, was ohtained in the thouse of Representatives on that day or until Apr. 1 following. and the President was not inamguratel] till the 30th of the same month. subsequently, by an aet of the comstitutional Congress, pased Mar. 1, $1 \% 0$, it was deelared that " the term of four years for which a Presintent and Vice-President shall be eleeted, shall in all cases commence on the th day of March next sueceeding the dar on which the votes of the electors shall have been given." At Wishington's second imauguration, ant at the inanguration of evers President since his time, the oath of otlice las been udministered, in each fourth surceeding year, on Mar. 4. it 120 oclock M. : and until 1851 it was understond that his term of service expired on Mar. 3 at midnight of the fourth year following. The linit of the congressional term was supposed to be the same: so that the legislative fowers of each succeeding Congress were presumed to cease at milnight of llar. 3 of each iltermate oddnumbered rear. At the close of the Thirtp-first Congress, however, in 1851. a disu ussion arose in which the propriety of this limitation was callerl in question, and the point was made that, sinee in the presidential years a new administration is not inangurated unti] 12 o'elock on Mar. 4, the interpretation of lisw commonly receired would ereate an interregnum of twelve hours duration. In conclusion, Ar. Speaker Ilowell Cobl, of Georgia, ruled that the tem of an ont going Congress lith not expire until $1^{\circ} 20^{\circ}$ clock noon of Mar. t. and that lule has sinee stood. In conformity with this rule, on Fel, 2.j. 1sis, l'resident Fillmore, in ealling al special sussion of the senate to organize the administration of his successor. Franklin Pierce, issued a proclamation in the folInwing words: "The attention of the President having been ealled to the proceceliners of Congress at the close of its session on the 4 th of Mar.. $\operatorname{li} 51$. from which it appears that the const $i-$ tutional term of that body was held not to have expired until $120^{\circ}$ clock at noon of that day: and a notice having leen issued, agreeably to formm nsace, to convene the senate at 11 oclock A. N. on the 4th of March next, it is apparent that such eall is in conflict with the rerision aforesaid. Now, therefore. as well for the purpose of removing all doubt as to the legality of smeh call. as of establishing a precedent of what is deemsed ${ }^{2}$ proper monde of convening the Senate. I, Dillard Fillmore, President of the United States, do issue this mr proclamation," 1.te. (eonsening the sumate for Mar. 4 at 12 óclock noon).

In $\mathrm{I} * 67$ a statute was passed declaring the rule specifically as follows: ". In middition to the present regular tjmes of the mectines of Conirres, thore shall be a meeting of the Fortieth ('maress of the lyited states. and of each sueceerling ("ongress thereafter, at 12 wclack, meridian, on the fourth day of March, the day un which the term begins for which the Comeress is clectenl, excopt that, when the fourth of Marth orecurs on sumblay then the meeting shall take blace at the sam lour on the sucereding day" (Ap[rosed Jan. Congressman at Large: : member elected to the House of Representatires by the roters of the entire State, instead of by those of a distriet in aecorlance with the ordinary plan. This mode of election is necessitated by changes in the apportionment after each decemial census. (See Apportionmbist Bill.) 'Thus by the act of Feh. 7, 1891. a new :pportionment was male of members of that llouse. the number being fixed at 35 t ; A speeific number of member: Wis assigned to each state. It was then provided that in each State entitled under the apportionment to more than one Representative the number to which sueh State may be entitled in the Fifty-third and each subsequent Congres. shall be elected by districts cumposed of contiguous teritory, and containing as nearly as possible an equal number. of inhabitants, the number of such districts equaling the number of Representatives to which the State is entitled: but " in ease of an increase in the mumber of Representatives Which may be given to any State under this apportionment, such additional lepresentative or liepresentatives shall be elected by the stinte at large, and the other liepresentatives by the listricts now prescribed by law until the Legislature of smeh State in the manner herein prescribel shall redistrict suchstate." This apportionment went intoeffeet Mar. $3,1893$.

Congreve, William: English dramatic poet; b. near Leeds. Felo. 16\%0. He was edueated at the Eniversity of Dublin, and entered the Jiddle Temple as a student of law. but he never devoted much time to its study. Ilis first literary attempt was a norel published under the pseudonym of Cleophil. In 1693 he marde a great suceess with his first play, The (ld Brachelor. which was performed at Drury I ance. The next year The Dowble Denler, a better play, was reereised unfaroribly, though it had the warm eommendation of fryden. He produced in 1694 a comedy ealled Lore for Loie. which allled much to his fame and fortume. and in $169 \%$ The Mouming Bride, a tragedy, which was greatly admired. Il e obtained several lucrative civil offices. His comedy ealled The $1^{\prime}$ uy of the 11 orld, though one of his best plays (1700). failed so completely that he renounced the drama in disgust. Ile affected to depreciate his dramatie triumphs, and wias ambitious to pass for a man of fachion. I). Jinn. 19. 1099. Sue ('harles IVilson's Memoirs of the Life of IH. Comgreve (1-30).

Co'ni (Ital. Cunfo) : a town of Italy: in Pimbmont ; capital of the provine of Cunen: on the rifer Stura: it miles by railway s. ly W. from Turin (see map of Italr, ref. \&-B). It has a cuthedral, a fine \{own-hall, a royal collece, a theater, several eonvents, and palaces. It was a strong fortress before 1800, and was dismantled by the Frencla after the battle of Marmgo in that year. Here are mamfactures of linen and hemp. Coni has an extensive trade. Pols. 24,424 .
Conic Sections: in mathematics, the sections of a right cone hy arlanc. If the eutting plane is perpendicular to the axis. the section is a circle if it is purallel to one side of the cone, the section is a parabola; if it makes a greater angle with the bise than is made by the side of the cone, the seetion is a hyperbula: if it makes a less angle with the base than the sule does, the section is an ellipse. The eircle. the line, and the point may each be recarded as particular cases of the ellipst: the line as a particular ease of the parabola: the triangle as a particular case of the hyperbola. 'lhe study of conie sections is sperejally interesting and imprortant cyi account of its connections with the latw of moving bodies. The orlnits of plamets. the paths of projectilan. the undulations of light amd sound are all either circollar. elliptic, jarabolie, or hyperbolic.

Conifers [Lat. comiferne. fem. plur. of sonifer. cone-

Elitor of＂Recorder．＂
Comsidérant，kōn seॅe＇dürăan＇，Victor：French socialist ： b．at Salins，（）．t．12，1808：was the chief disciple of Fourier． He tecame the editor of the Democratie Pacifique in 1845， and a member of the National Assembly in 1848 ．He wrote Destirue Sorime（3 vols．，1＊i）1－14）．He afterward founded a colony called Reunion，near San Antonio，＇lex．，but re－ turned to France in 1869．D．in Paris，Dec．27， 1893.

Consideration［from Lat，consideratio deriv．of consid－ era re，examine，contemplate：literilly，observe the stars； con＋sidus，comstellation．The word was probably，like riv－ sidereire，a technical term of astrology］：mature thought， serious deliberation．meditation ；also motive of action．rea－ son．In law，the material canse of a tontract，the reason which induces a contracting party to make a contract．The leading distinction respreting consillerations is that they are either good or raluable．I ruluable eonsidergtion either confers some luenefit on the promisor or canses some incon－ renience or damage to the promisce．Comder these rules marriage is：a valuable consideration．A good consideration is based upon relationship or natural love or affection，and is of arail only in an executed contract，e．g．in case of a deed of land where it has been delivered．The term grod consid－ eration is also used in a broarler sense inchuding valuable considerations．for any eonsideration sufficient to sustain a contract．See（oostract and Fratucleext Conveyance．

Revised by F．Sturges Alles．
Consignee：in mercantile law，the person to whom gomls are sent or transferred．either as lis own or for the carrying out of some purpose，such as sade or safe keeping．sure Bull of Laming and Shipping．

Consignment：in mereantile law．the act of consigning； also the goods sent or transferred to a consignce．

Consistory［from Lat．consistorium．meeting－place．deriv． of consis tore．take one＇s place locate one：s self］：the jlace of meeting of the cabinat of the Roman emperors：the name is also applied to the commeil of cardinals，somet imes assisted by other prelates．Who attend in person or by prosy．which meets in the Vatican to inlvise the pope in ecolesiastical and temporil affairs．I court under this title for the regu－ lation of discipline aml worship，composed of civil ind ecclesiastimal jurists．Was established by the Lutheran priners of Genmany at the time of the Feformation．The earlie－t was that of Wittenberg．founded in 15：3．The lower Chureh courts of the Reformed（＂Dutch＂and＂（rerman＂） Churches in the［P．S．are also called consistories．

Consolato del Mare ：a cote of early maritime law，to govern the states trading together along the Nediterranean． supposed to date from the fourteenth contury．This code is not to be considered a knoly of maritime law promulgated by the power and authority if a single people，but rather as a compendiun of the sea laws and usages then in rogue on the shores of the Merditerrancan，in which all powers trad－ ing together within certain limits conld muite because the focal law of each was represented in it aud formed a patt of it．Fommded ugon the Roman law，it includer（1）those rulos governing tho maritime relations of commercial states and their subjects in time of prace：and（2）the mates relating to a state of war．It is the recognized basis of moelern mari－ time law，moth Finglish and continental．Thus it liys down the rule that the nationality of property，both ships and gools，determines its linhility to capture，a principle still in vogue muloss altered by treaty．Theodore S．Woolsex．
（＇onsols［elip－form of consolidated（annuities）；cf．cab for cabriotet，yents for gentlemen］：the funded debt of lireat Britain，so called from the interest，which was termed＂con－ solidated ammities，＂＇This debt was contracted by loans negotiated at different times and ut varous rates of inter－ est．To obviate the confusion which arose from the varioty of storks thus createal，they were consolidated into one fund in 1 兮（1－5\％．Consols or the consolidated three per cents． were controrted in 1588 into consolidated stock bearing $2 \frac{3}{3}$ per cent．interest untill $190: 3$ and $2 t$ per cont．thereatter．

Cobsonance [from Lat, comsonan fix, harmeny: com, together r + whe re, sombl]: in masic, a combinatinin of motes sumding torather monthly, without any of the harshoss producell hey the disturbance of beats. Such beats, as has
 -ition of the overtones, which ahno always ace onpany the fundamontal notes. This must be taken with sone limitation, th the fourth is regarted as a dissonance, though it has no berits. The effect of a comsonance is the to the simplicity of the ratio of the vibration numbers of the sonstituent tones. Within the limits of the oetave the consonances and the ratios are: the oretave, $\frac{1}{2}$ : the fifth, $\frac{0}{3}$ : fourth, $\frac{3}{3}$; major
 There is thus but one chord of consonances in musie namely, the common chord, being a hane note with it: thied, fifth. ant ortive. The consonances of the unison, the octave the fifth. and fourth are called jerfect. The imperfect are the major and minor thids and the major and minor sixthe. Two perfect consomaces following each other in simple progression are not permissible.
Comsomant from lat. con somms: con, with + senter
 the mechanisu of speech only in asociation with another sound cabled a vowel. Thi- metherl of tefining vowel and consomant acerding to their respedive forctions in the formation of the syable is oproth howerer to the objection that it furbids of a definite and final classification of existing sounts. Cowel-spunts may he used as comsomants as i in eyp (pron. ai), ant consonat-snunds mat be used as rowels: cf. litle (fron. (ill), past! If, therefore we ate to give a definition by which rowels and consonant maty be always ilentitien, it must le based nyon their physiotoricald chatieter rather than their fanctions. The terms **stabie" ant "non-sylabic" may then be substituted to denote the dissifieaton armording for function. Vowets may be defined aneording to their character as free corrents of brath for whid the organs of the mouth and nose serve only to give resthanee, not to ald moise (Guer. (iprärsch). ('onsomants are prownepl hy narrowing or whecking the current of treath. and involve mone prolaced by the dowine or of"ning of the organs of the month or by the friction of the current agatinst their walls. somuls which lie near the bommary betwen the 1 wo classes are the liquits ro. I ant
 at the beginning or encl of thesemmbs through the natrowing on (losure clases them with the consomants. (onsonants which are produced by al friction of the curtant of breath against the walls of the narrowed organs of the mosth are cathed spirants (also frimbies; Germ. hithe-
 which are proxumed by stoppace of the current, as $t$ in at. or by bursting the obstruction, as $t$ in lo, are calleal res-

 anants are miend (aloo ealled sonanf. mediap: ferm, fönemb. sfimmhafh) when the rocal chords are trilled by the breath proluring them, otherwise voicelpes (also surd. tenurs: tram.

Misfory. - Constantine fumbled Constantinople on the site of Brzsticy (q. $c^{\circ}$ ) with largely increased teritory, and dedicated it May 11. 330. "to the service of Christ." since then, though besieged thirtr-one times. it has been captured only by the Latin crusaders ( $5203-04$ ) and by Mohammed 11. (14.53). Among the most memorable sicures may be mentinned that hy the Goths in 3:9; by the Arabis and Persians in 6165ff and by the Arabs themselves in 6ie-i9, amf also ili-1s: Iy the Bulgarians in st3 and 843: by the liussians in $865^{\circ}$ (who alse: mide attacks in ! 44.951 , anil 104:3); br Bayezid 11. in 1391-9x: and hy Dlurad II, in 142 . The chitf events in the history of the city are as fullows: The introfluction of the silkworm in 530; the separation of the Eastern and We:term ('hurehes in 1054 ; the fleath of 160.000 permons from the plague in 1812: Nestruction ol the janizaries in 1826 ; the proclamation of reforms by IIatti vheritf in 1839: the first Protestant Church organized in 1546 : railway to Adriamople was opened in 1873: the accession of Sultan Abubllamid Khan II., the thirty-fourth Ottoman sorereign, in 1si6: in 1808 the treaty of San Stelano: railway to Vichna was completed in 1sss. Sereral uecumenical councils have been held in Constantinople in 301 , in 553 , and in 680 , in 54 and in 860.

Intiquities.-(ri) The walls entirely surround the city: that on the wht sile (erected in 413) is 4 miles long, and has scren gates. It is a triple wall with 192 high towers and a moat 6il feet wide, all kept in sernpulous repair till 1453 , but now al magnificent ruin. (b) The sixteen cisterns, two dating from Constantine, are the largest in the world: one of Philoxenos. 1116 feet long. 133 feet wile, with 224 eolumns in 16 rows. supporting the roof; one Basilike, $10 \pi$ Yeri Batan Serail (underground palace), also roufed. $8: 30$ feet by 1.4 feet. with :336 marlile columns in $2 s$ rows. (c) The columins: the " Burnt Column." recetel by Constantine: the columns of Therdusius. of Marcian ; the column in the Atmeidan (Hippodrone) : the "Built Cohum" of Comstantine VII.; the obelisk of Thehes: and the brazen sorpent of Delphi. The last mentinned (consecrated tid b. c. by the Greeks to Apollo) was brought from the oracle by Constantine. On it are still visible the names of Greek cities which fought the Persians. This is the most precions antiguitr in the city. (d) Ancient ("hristian churches, many of which are now mosques. (e) The "Tower of Christ" in Galata, first erected in the fifth century. (f) Sareophaqi in various parts of the city. oue near the Cluirth of st. Irene, probably that of Constantine. (g) The palaces of Justinian and the Hebdomon (Tekour Serail) ; prison of Inemas; the Seven Towers (Yedi Konlé), formerly at (ireek fortress called Heptapyrginn : and the aqueduct of Valens.

Eifind A. Grostenor.
Coustan'tius I.. (alled Constantius Choorus. Flavics Valerics: a Roman emperor: b, abont $250 \mathrm{~A} . \mathrm{d}$.; the father of Constantine the Creat. The Emperors Diocletian and Maximian chose Constantins and Galerius in 292 1. b., and gare In wath the titp of carsar. Constantins unled over (iaul, Ibritain. and Sbain, inl became emperor in 305 , when Dindetian abdimated. I). July es. 306 A. D.
Coustantius II. F"Larle - Jelies : second son of Constantine l. and F'austa: th at Nimium in $311^{\text {s. }}$. . Ife inherited, in areorlance with his father's will, the Asiatic prowinces and Figpt in :33\%. He waged wat against the Persians, by whom he was several times defeated. IIe vantuinhed liagnentins on the brave in :3, and in Goml in 3n. In 30.3 he gave the tithe of casar to his cousin Julian. He showed fivor to the Arians. 1 e died Nov. 3, 36t 4. D., ant wis suerevded by Julian.
Constellation [from Lat, conatellatio, the position of the stars, grouping of the slare, group of slars; con, together + sted in, start : a gronp or cullection of stars. The use of the term has arisen from the obvious fact that the stats are not scattered equally ower the hearens. but ipplear to be collected, to a greater or less extent, into groups. In prelustoric timen names were given to thase groups, which were srmetimes supposal to have heen suggested by a facied rescmblance to figures of men, amimals, or otherobjects. In must casis, howerer, this remmblane is su fanciful that we can hardly suppose the name to have been determined by it. It wothed seem from P'indemy's descriptious of the stars and his list of the ennstellations that long before his time maps of the stars were formed on which the animuts, herous, or nijuects after which the eonstullations were named were drawn so as to include all the brighter stars of each constellation. The lafter weve then designated by the parthenlar part of the man, animal, or ohject where the sar

Wa- situated. For example. Aldebaran was in the ere of the bull: three conspicuous stars in Orion formed his belt; it small group formed his hasil: two bright stars were in his shomider, ete. Thirt P -six constellations are recognized by PIolemy in the Almagest. In modern times fitty-six hare been added to Ptolemy's list, sometimes by dividing up his constellations. and sometimes by ading ner ones. At the present time the fignres of animals are no Ionger used, but the entire heirens are divided up into regions bounded by somewhat arbitrary lines, straight or cnred, drawn so as to puss through the spaces containing as few conspicuous stars a possible. This inclusion of every part of the heavens in some constellation is the principal point in which the moderu system differ. from the older one. In the latter many minute stars were regarled as not belonging to any constellation. Within each constellation the brighter stars are distinguished by numbers, or by letters of the Greek alphabet. See Star.
The following list comprises all the constellations now generally recognized. although some of the more recent ones are mulerstool to be temporary. The first twenty are known as I'tolemy's northern constellations; next come the twelve zodiacal. and then the fifteen sonthern constellations of Pholery: the forty-eighth was added by Tycho Brahe. though first named by Conon the Samian ; the nest ten are from Hevelius. All after the fiftr-fifth are S . of the equator. Thuse from Indus to Apus inchusive were named by Buyer: the next thirteen are from Lacaille. and the last two from liorer:

1.2. Auriga.
13. Ophiuchus or Serpentarius, the Serpeul-bearer
14. Serpens, the Serpent
15. Sagitta, the Arrow.
16. Delphinus, the Dolphin.
17. Equulens, the Little Iforse
15. Pegasus, the Winged IIurse.
19. Andromeda.
20. Triangulum Boreale, the Northern Triangle.
31. Aries, the Ram.
23. Ciemini, the Trins.
24. Cancer, the Crab.
is. Leo, the Lion
26. Virgo, the Virgin
2. Libra, the scales.

ふึ. Scorpio, the scorpion.
29. Sagittarius, the Arclher
30. Capricomms, the finat.
31. Aquarius, the Water-bearer
32. Pisces, the Fishes
33. Cetus, the Whale.
34. Orion
35. Eridanus, the River Po.
36. Lepus. the Hare.
37. Canis Major, the Greater Dog
34. Canis Minior, the Lasser Thog.
39. Argo, the Ship Argo.
40. Ilydra, the Water-serpent
41. Crater, the Cup.
42. Corvis, the Crow.
43. Centaurns, the centaur.
4. Lupus the Wolf.
45. Ara, the Altar.
46. Curona Australis, the southern Crown.
47. Piscis Australis, the Southern Fish.

4א. Comar Berenices, the Hair of Berenice.
49. Canes Venatici (the Grey bounds,
50. Lacerta, the Lizard.
51. Lrex the Liza
5. Sextans Uranix, Tycho's Sextant.
53. Cameleopardalis, the Giraffe.
54. Vulpecula et Anser, the Fox and Goose
55. Leo Minor, the Lesser Lion.
55. Monoceros, the L'micorn.
r. Indus, the Indian.

Grus, the Crante.
. Photix. the Phouix.
. Musca, the Fly.
61. Paro, the Peacock
62. Toucan, the Toucan
63. Hydrus, the Water-snake.
4. Dorado, the Swordfish

Piscis Volans, the Flying-fish,
66. Chammeleon, the Chamælenn.
5. Triangulum Australe, the Southern Triangle.
6s. Apus. the Bird of Paradise. 69. Apparatus Seulptoris, or Reulptor, the Sculptor's Workshop.
70. Fornax Chemica, the Chemical Furnace.
11. Horologium, the Clock. Rhomboidal Net.
73. Cola sculptoris, the Graving Tnols
7. Equns Pictorius, the Painter"s Easel.
75. Antlia Pneunatica, the Air pump.
76. Octans, the Oetant.
-7. Norma, the square-rule
8. Circimus, the Compasses
79. Telescopium, the Telescope.
s. Microscopium, the Microscope
81. Mons Mensæ, the Table Mountain.
No. Crux Australis, the Southern Cross.
83. Columba Noaclu, Noah’s Dove. SIMON NEWCOMB.

Constipation [from Lat. constipatio, deriv. of conslipa're, erowd elose together: con, together + stipare stuft-referring to that stite of the rectum in which it is impacted with feral matior]: the disensed condition in which there is sluggish action of the howels. The term is more or less relative, but as a rule a motion of the bowels shonla oceur every twenty-four hours in health. The principal canses which lend to conslipation are sedentary hahits and errors in diet, direstive disturbinces, and a general sluggish condition of the system. "There may he speeial want of secretion of the intestinal juices due to diserses of the intestines, and mechanical constipution may result from narrowing or com-
pression of localizel parts of the lowels. In itself whotipafion is merely a srmplon amb may land to mu forther dix-
 resalt, athl headache, drowsiness, of loss of ajpetite ate frequent symptoms. Ohatinate constipation maty leme to fermentative ehanges in the intestines and absorption of frothets of fermentation which are puisonous to thressom.

In the treatment of this anfertion regutation of diet and of exereise claim first attention. Indiscriminate dongemeg i. mon frequently harmful than otherwise. The diet shonda low varid, and shond contain foom such as hown hread, oatmeal, froit and vocetables containing slighly irvitating refuse, Stonthing bland diet is required. Legulat exorefise and a morning hath followed by vigorons friotion ate grod. Ubstinate cases may call for chemata of water, etc.

Constitnicão: city of limazil. sere Pracmeaba.

 tion. 'l'low duty of decembinig this puint revelarly dezolvas
 fallows theib larl. Inwerer, hawing ober accealing to the state interpretation, if that la subatinently reversed in
the State court, it will not feel bomit to change its riew, but may albere to the first emstruction. There is thus to be collected from the decisions of state courts a mans of what may be called "state constitutional law." Nuch of this is special in its nature, having hat little vilue beyom state limits. Other parto of it are seneral in their character, while some partions of it are coineident with decisions in the U. S. comrt, as in some instances the same restrictions are tound in both instruments.
III. It is not intembed umler this homb to alvert to the general scheme of the varions state and $\mathbf{L}^{\top}$. A. onstitutions. The text of the later is given hereafter in full. (See cosstritution of tale Uxited ítates.) lifferenee will only be made to such provisions in the nature of restretions as are of it general nature. These are restrictions upom manomb legisfation, such as probibitions of bills of attainder and expost facto laws or laws imparing the obligation of contracts; sume of the states in the same spirit prohibit divorces by the Legislature. Op they mat he limitations upon legislation olpused to the spirit if American institutions. Under this lead may be ranked prohibitions against gronting titles of molility. There are aloo limitations for the protection of individual rights addressed to all departments of government. They fenil to secure liberty of speech and of the press, religinus treedom, to present deprivation of rights exeppt throngh onindy processes in conts of justice, incluting trial by jury: alsi to prevent renewen trials for the same nfiense, to check excessive punishments, cte. I number of such provisions are fount in the earlier amembments to the L?. Sonstitution. It is an important remark that these were umly intended to bind the ation of congress of other departments of the general govermment. For this reasm like clanses are inserted in the State cour stitutions. The last three anmenments (thirteenth, fourfeenth, and fifteenth) are operative upon the states as well a* uph Congres. Many of the provisions now consilered are taken from the Englioh lam, amd in the very words of stathtes or text-writers. They thas become fundamental low in the sense in which the were used in the country whence they wert derived. The last three amendments of the U. A. Constitution were specially intended to secure rights to citizens of Afrienn descent, thongh not contined to them. (hee (itizex.) Fundamental provisions of this sort. when consilered together, are frequently termed a " hill of righte." (sie Brle of Rlours.) There is in some instances a tendency to insirt in the state constitutions matters which are nore promerly the subject of legislation. Sometimes a pulitical party desires to make its policy on a question like that of internal improvenuents a permanent one, and secures to that end a provision in the constitution; or perhaps legrislatures prove themsilves to be unwise of oren corrupt, and it is thumght well to rednce their eapacity to to mishiof by shearing thrm of their legitimate powers. Provisions framed to accomplish such objects do not fong provail, and a reaction in pmblic sentiment soon leads to an athembment of the constitution. The better view is that ennstitntions shouli only leal with fumblamental law. When legishatus are ignorant of vicions. the true remedy is at the ballot-hox, where the voters may show their with to have more suitable mon. see on the general subjert, Conlay, On C'unstitutionul Limitutions:; Mongh's Cultretion of Shate" (onsstitutions: alsos the same anthor's Annotated Sour Errk fonstitution of 1 sist; Story, om the livited Stutos 'onstitution: Kient's Commenturies: and the treatiens of hawle, Sarrent, and laselall. The most complete view of the principles governing the whoke subject may be obtatined from the opinims written by the julders of the
 ing the construetion of the constitution. These are collewend in the regnts of ballas, Cranch, Wheaton, Peters Howarl, Blath, Wallater, etc: Ibstracts of the points decielon! may be found in brightly's piefest and Ahmotts Shtomal Ditpests. These works my be nsud for ensy ref-
 expmsitions of ghestions arising under the varions state constitutions will in like mannel he fomm in the public reports of the Anemions of the cours of the rempedive status. IT. II. INwient.

Gomstintion of the thited Ntates: the fumdmentat or Grgmie law of the mion of the states, the why united. This, with all acte of the status in Congress :ssamblem, and ahl treation man in manamos of ite provisinns, constitutes

Constitution of the U.S. Was the Articles of Conferteration, aloptrd by the States during the war for their independence. (See Coxfederation, Articles of: amd consult Curtis, Mistory of the Constitution of the C'nited States. p. 134; Sparks, Hriting.s of "rashingtom, letter to Henry Lee. Sept. Ne2, 1788, to Benjamin Lincoln, Oct. 26, 17 NS , and to James llonroe, Feh, 29, 1889.) The hirst Articles proving inefficient for the accomplishment of the objects of the Union, mainly upon the grounds that they conferred no power upon the central head to regulate coimmerce with foreign nations, or to act directly upn the citizens of the several States respectively in the collection of the quotas levied upon the states to meet the public expenditures and to snstain the public credit, etc.. the Consress, being urged by appeals from sereral quarters, took up the subject of amendment and general revision on Feb: 21, 1is\% and then came to the following resolution upen it :

- Resolven, That, in the opinion of Congress it is expedient that, on the secombl Montay in May next, a convention of delegites, who shall have been appointed by the several States, be held at Philalelphia, for the sole aml express purpose of revising the Articles of Confederation, and reporting to Congress and the seremal State legislatures such alterations and provisions therein as shall, when agreed to in Congress and confirmed by the States, render the Federal Constitution aderuate to the exigencies of government and the preservation of the L'nion." See Ellint's Debutes on ther. Felleral Constitution. vol. i.. 1. 120.
It was unter this resolution of Congress, and in response to it by eleven of the states in chonsing and sending delegates, that the ever-memorable Felleril Convention assemBled io Philatelphia, May It, Tis\%. Each of the obt thirteen States then compusing the Lnion was represented in it, except Rhote Ishand. George Washington ahost miversilly styfed the "Father of his Country", was unanimously chosen president of the conrention. Ls a whole, it was unquestionably the ablest body of jurists, legislators. and statesmen that hat ever assombled on the continent of Aorth America. The convention remained in session from May 14 till sept. Fr msuing. Their deliherations and proceetings were with closed doors. The journal of these proceedings was not publishef until over fort y years afterward. The actual and practical result, however, of their labors in the execution of the high trust committed to them was immediately comonnicated to Congress, and. being approved by that body, was speatily communicated to the respective States. This was their grand work in framing and proposing that matchless system of federal government set forth and cmboried in the new Constitution for the government of the L. S. of America, which was adopted and ratified by eleven states before the close of the year 1788; so that it went into oprration between the states ratifying at the time appointed in 178!. The other two, North Carolina amd Rhome leland, adopted ind ratified it in less than two years afterward. The last of the olf thiteen which cane into the Union. so remodeled in its felmmal structure. was lihate Island. Several teatures in this new form and constitution of government tor separate. States and communities are without a parallel in anciont or momern times. It was in contemplation of one of these peculiar features that De Tocpueville, an anthority thoronghly wersed in the science of politics, made the following commentary: "This Constitution, whinl may at hist he confounded with the federal constitutions which have preceted it. rests, in trath, upn at wholly now theory, which may be considered as a great discovery in mondern joliticall scinere. In all the confeterations whith prereded the American Constitntion of 17s.9 the allied states, tir a common whject, agreed to phey the injunctions of a ferleral govermuent. but they resered to themselves the right of ordiming and enfureing the laws of the Enion. The American shates which combined in 1 res agreet that the firleral govermment should not only dictate. but should exe'ante. its own entefments, lut bith cases the right is the s:mm, hat the exercise of the right is ditterent, and this difIerence produced the most momentons conseruences." sie De Trequeville's Demncrucy in Americt, vol. i.. 1. 19s.

Is to how far under the ('onstitution the Peoleral Gorermment hat a right to merce a state was not so charly stated in the Comstitution as to atford a guaranty against future disputs. lmpertant questions of interpretations on this smbject arose in the carly hishory of the Gowernment. During the first hatf century the New England states, in monepurnce of dissit isfaction with the course of the Fed cral faverument, asserted the right to mullify the acts of Con-
grese, and similar groumd wastaken by suthth C'arolina a few Femalater. "Ihns imprortant question was the oceasion of the funst monentons delsate ever held in the histery wit the
 silk aml baniel Webster the other. The views of Wr-l) Tet came to be generally hald in the North, while the sonth matintained thase of llaytur amd ('alboum with similar temacity. Kat the efleotion involved ton many interests to bex atollod hy discossion alune amd it thus berane what may be calleal thi Constitntimal oreasion of the rivil war.

Revisel hy ('. K. Abass.

## Consmmers Co-operation: See Co-uperation.

Consmontion [from Lat, consum'ptio, the wearing away : con, altngether + sumere take]: the popular name for tuherculows of the langs or phthisis pulmomulis. This disease. which carves off one in erery seven hman beinge, thongh sturherd with the greatest attention and care from the carliest days of scientifie medreine. Was little understomel until the present century and wryed as the nceanion ot the most active controwpies and as the han of eontlicting schools of pathelogy mut il the most reeent years. The general m:anitestations of the diswase its cliniond aspects. had been well enomgh studien, but of the nature of changes in the lungs mothing hut the most rague :uthermons ideas had been formod, until in liat Ballie ealled attontion to the little mondules in the lunes, furmations which are now called tuberedes. ('lowly following this abserver. Boyle (1s)0 still further therchind these nowles, thengh pernaps not with a muth aceuraty as his prederessor. and iffer the pheneermany of here inverigatel the disease from the same stambpaint of tructural change. The rewilt achieved were. however, tar short of the meel of the balur amb with the axedption of Lambere, wher was in these stadies led to

 ing knowledge. 'The "row of his early pathology lay in tha conforing and inaremato nomenchate and in averihing
 tural changes the chemy newnsis of the tuheredest the principal folle in the dicates. Sithing of any mement was moms

 seribud the minute -truchio of the small mombe or tubicer Which fomm- the c-antiol wement in the mortid anatomy wf the dixasec: and therely latid the fomatation om which

 the tuberele hacillos. The matenture of his atmonnement

such miformly convincing results, that it may be stated absolutely that the bueflus is not alone the accompaniment but alsu the cause ol' the disease. With this knowledge much may be hoped and expected in the way of prevention and of cure: without it aims in this direction mest have remainm as before, uncertain and enpirical. The tubercle bacillus is al minute microscopical organisin which oceurs abundantly in the expectomation of consumptives, and may gain acces to the air hy the drying of this and the subsequent disemination as dust. This fact has been determined not alone by thenretical reasoning, but by actnal observation by Cornet, whe fom the lacilliabundant in the air of hospital wards in which lay cases of phthisis; more sparingly in other wards, and least of all in rooms to which consmmptives hal no accers. The abrious lesson taught by this observation is that in cases of phthisis every precantion shonlil be taken to insure the destruction of the bacilli in the sputum, and, above all, to prevent the drying of this upon earpets, floors, etc., whene the germs are reali] spread through the air. Lung betore the discovery or even suspicion of the existence of the tubercle bacillus. accurate observers had moted cases which seemed to prowe direct contagionsness of tulurculosis, as from hushanl to wife. parent to chilh, and the Jike, but no rational plan of prevention conld be formed until the nature of the germ had been made known.
Once introduced into the lungs, the bacillus sets up by its direct action or by oleration of poisons generated in its growth the intlammatory changes constituting the disease phthisis. These consist mainly in the formation of small grayish norlules, the tubercles, which show a marked tendency to degenerative change, whereby chees masses. formerly considered so essential, result. In the furt her progress of the case two classes of changes mar follow, the unfavorable, when the destruction of tissue adiances, with breaking down and liquefaction of the nodules, cavities resulting; or the more firmrable. Then a capanle of fibrous tissues surrounds the nodule, which itself may or may not hecome infiltated with calcarcons matter. the result in this case being a more or less complete cessation of the disease.
The symptoms of the disense are verr olscure in the early stages, but generally hegin with slight cough of a dey, hacking nature, lasitucle and tendency to flushing or fereit Following thene come the more pronomed signs: exceswive congh with yellowish expectoration : hectic fever, the temperature becoming elerated in the aftemoob on evening, and the cheeks presenting the characteristic spots of relness: Arenching night-sweats and progressive weakness and wasting. It is this trpe of disetse to which the popular term "decline" las been aptly applied. In the further progress of the case intensification of the above symptoms is noted. ann in addition there may be onstiuate and debilitating diarrhora and the much-treated hamorrhages. The latter are due to uleeration of the hnod-ressels within the lungs, usually in the walls of cavities. Ther may be rery copions, and death may be directly due to loss of blood, thouglo such a result is compratively rare. In spite of this mont litiable condition, howerer. the patient generally continues serene and hopeful, and the mind remarkably elear and active.

The recognition of the disease in its earliest stages is of the utmost importance, amd uften taxes the most experienced physician. Much may le assumed trom the gencral applearance and previous healdh of the patient. It is unquestionahly tre that certain proms are perulially liable to tubercolosis. and it is this liabilaty which is tranmitted from parent to offering. 'lhe posibility of direct tramemission of the disema is still an gren ghestion, though the weight of ant homity inelines to suds a belief. Thase of tuberenfous or serofohis hatrit are grempally spare, Ioner limbed, whith harrow cheste, large jomts, dark hair and exes, sallow complexion, and a tembeney (o) hronchitis on : slight expmente.

America, and Sonth Amprica-and is divided as regards Anstralia, which is varimsly styled a contineut and a continental island. The title Chtiretic Comtinent is sometimes given to a great horly of land supposed to occupy the south polar region. Formerly Europe and Asia were aceomed as two continents.

Each of the Americas is characterized by a lofty mountainons belt along its western borler and ' he great plains extemling thence with little intermption to its enstern mast. Fach is also somewhat triangular in outline. with an angle towarl thes. These resemblances have led to much search for lomologies in the configuation of continents. int without vahable result. More fruitful inquiries have been prosecuted by the aid of the phmmet and dredge in oceamic iloptls, which are the complement of continental heights. It is fonnd that the gentler slopes of continental surfaces are continued muler water abont many coasts. constituting shoals, and that from the edges of these shoals or -continental shelves" there is rapin destent to depths much greater. It is fomb, moreover, that the detritus carricd from the land by rivers cosers the wean botom only near coasts. that the sediments of the decper parts ot the ocean are of an entirely different chatacter (see Oceas), and that the upraised sediments stulied by geolonists are of the coastal and mot of the pelagie type. From these facts it is inferred that the continental plateans of the earth, inclnding the contments and continental shelves, have had their present positions and extent lrom the remotest genlogic times ant that the ocean depths are eqnally permanent. If this view is correct, the complex serie's of clanges in the distribution of land and water demonstrated by genlogic phenoment have been restricted to the continental plateans, ami the geologie record of carth's history is less fragmentary than has been sulpmoetl. See the article GeotGGy, and also the eontour map of land height and ocean depth illustrating the article E.arth.

The following tables of continental dimensions and drainage areas are based on estimates by Murray (Scoffish Geog. Mlag., vols, ii. and iv.). In the tables Eurasia includes the British, Baltic, and Mediterranean islands, ant Ceylon: North America inclutes Newtimadland, the Aleutian isamds, and the Aretie islands W. of Greenlame ; and south America includes Terra del Fuego and the Falkland islamis:

Confinental [origimally used in the [ V , S . in eontradistinetion to proverial: belonging to the whole North Anorisan fontincut, and not to any one provine or colonyl: an frithet applied to the money and trons of the reviling enlonics dming the lawolutionary war. It was introblueqd in 1he carly part of that comber li,y the colonists to distinfruivi therir own foress frome those of the liritish forenti-
 umber the eontrol of the British ministry. The 'conifmental Congress" was the Congress of the colonies, ant after thi". Derlaration of Intepentence it was the congress of the lis. $s$, previnus to biax, when the Constitntion came into furce. It had only one lionse.

Continental System: Napoleon's policy of excluding from the continent of Europe goods borne in British vessels or in neutral vessels that had tonched at British ports. 11 is first attempt to establish this system was by the Berlin decree, Nov. 21. 1806, which prolnibitet all Furopean countries allied with France from carrying on commerce with Great Britain, or almitting any merchandise that had been produced either in Great Britain or in her colonies. Great lritain retaliated by the Orlers in Comeil of Jan. Tand Nov. 11, 180t, declaring all harbors and places of France, her colnnies and allies, in a state of a blockade: whereupon Napolem issned a decree at Milan, Hee. $17,180 \pi$, ant another at the Tuileries, Jan. 11, 1808, carrying the system a step further. Any ship sumitting to search by a British vessel, or sent on a voyage to Great Britain, or laying a duty to the British fovernment, was declared to be a lawful prize of war. Finally. at Trianon, Ang. 3, 1810, and Fontainehlean, Oct. 18, 1810, the policy was completed, and it was ordered that all British goods when captured should be lounel. At the Peace of Tilsit in $180 \%$ the Czar agreed to close the Russian ports. Thas almost the entire continental coast was in a state of blockade, which, though only partially effective. was still sulficient to cause a general depression of trade, and to exasperate the people with Napoleon's rule, especially in Germany. In the large trading centers merclants were subjected to a most galling system of espionage, ant their goots were liable at any moment to be seizen on suspicion. The jolicy was not only unjust and oppressive, it was a serions mistake. Russias abandonment of the system in 1810 was the chief cause of the war between her and France. The war of 1812 between Great Britain and the U. S. was due largely to the former's attempt to enforce her retaliatory Orders in Council. F. M. Colby,

Continued Fraction: one whose numerator is an integer, and whose denominator is an integer plus a fraction repeated in the same way. Thus in the continued fraction

$$
3+1 \frac{}{7+1}
$$

$\overline{15+1}$

$$
1+\frac{1}{25+1}
$$

$$
1+\frac{1}{\pi \frac{1}{4}}
$$

the whole number 3 is followed by a fraetion of which the numerator is 1 , and the demminator is $\boldsymbol{T}$ plus anmther fraction whose mmerator is 1 , and whose fienominator is 15 plus another fraction. cte.
To convert a proper fraction into a continned fraction, divile the demominator by the mumerator, and make of the mixed-number fuotient a new denominator to the mumerator: 1. Proceed in like manmer with the fractional part of this new denominator, and so continue as long as the division leaves a remainder, or as is necessary for the object in view. If the givell fractional number is, as in the foregoing case an improper fraction, it must first lee reduced to a mixed mumber, after which the above rule applics to the fractional part.

Revised by S. Newcomb.
Contimity. Law of: a principle of considerable use in investigating the laws of mation and of change in general, and which may be thus enunciated: Nothing passes from one stute to mathere mithout pussing throngh all the intermediate states. Laibnitz claims the merit of having first nade known this law; but, in so far as motion at least is conecrnen, it is ilistinetly laid down by Galileo, and aseribed by him to Plato. But, though a perception of its truth seems to have boen felt long hefore. Leibitz was certimly the first who aphlied the principle to test the consisteney of the wries or sumposed laws of mature. The arghment on which he attempted to cestablish it a prion is that, if any chate were tor hapmen without the intervention of time, the thing changel must be in two different conditions at one and the same instant, which is whimsly impossible. A remarkable application of the law of contimity was male by John linmonli in an Esxity the the Lan's and Commmicition of Jotion. whith gained the prize of the Acatlemy of sciences in Paris (1-24), to prow that perfetly hard burlies can not exist, beceause in thee collision of such bordies a finite change of motion nust take blace in an instant-an event which, by the law now explained, is impassible. This comelusion was enjeeted to loy D'Alombert and Maclaurin,
 continuity altorether; lout the dillicalty is ent ower ly suppesing (which on varione frombls is "xtremely probahle)

 Moreover, a helligerent morehantman maty bay wat materat

 ing conntraband is condiscation of the eromb firct, bat also of
 band are not inferted unless onllusion mo frame is -hown (a)nneoting them with the transaction. This pemalty maty attach at the ontan of the royate, if the shipis patuers on the atb-
sence of them or other suspicions circunstance may warrant． And the doctrine of continuous voyages may he applied，so that a nominal neutral destination does not shelter goods． In the case of the Vrow llouwina during the C＇rimean war， the cargo of saltpeter was confiscated，though bound for Hambure，a neutral port，since eventual transport overland to linssia was inferred by the court．See continuons Vor－ dGEs．

Curying Dispatches．－These are commonly classed un－ der the head of contrabuml．By hostile disputches is not meant the correspondence of a belligerent in the ordinary mails．Mail－bags are sometimes especially exempted from seareh，as in a treaty between France and Great Britain to govern the Dover and Calais postal service．The same prin－ ciple was allopted by the U．A．in the ktter part of the civil war．But where a neutral ship acts ats a dispatch－boat for one helligerent，carrcing military orders it may be which might otherwise be presenten，or serving to unite the scat－ tered portions of a fleet．it so itlentifies itself with that bel－ ligerent as to give the other the right to confiscate it．

In this comnection may te cited the famous Treat affair of Nov．，1861．The Trent was a neutral mail－steamer sailug between two neutral points．Mason and Slidell，agents of the Conforderate fowernment，though having no recognized diplomatic character，ran the blockude and took passare in her．She was stopped and searched ly a L．S．man－of－war． and Messrs．Mason and Slidell were extracted and lodged in a Northem prison．Mr．Seward defended this high－handed aet，thongh asserting that it had not been anthorized，under the plea that the Confederate agents were contraband and equivalent to dispatches．Becanse Capt．Wilkes had re－ leased the Trent，thus fitiling to have her character passed upon by a prize court，Mr．Seward survendered the pris－ oners．In fact，the search was lawful，but the arrest manw－ ful．Persons arre not dispate hes．The Trent was pursuing her route as a mail－steamer．She wus in no sense a dispatch－ boat．These persons conld not be contraband，having neither a contraband character nor a hustile destimation．

Again，if a nentral ship takes on the charater of a trans－ port by carrying trops or seamen for either belligerent，it is liable to confisceition．
The class of articles of doubtful character which may or may not be contraband has been mentioned．The right to declare such articles confiscable is called the doctrine of accasional contrebeend．It is a great hardship to the neu－ tral，since he can not certainly know in what he may law－ fully trade，and he has never aceepted the theory inless throngh superior furce．Thus in the wars with Napoleon when（treat Britain made provisions clestined for a Frenth port montraband，the U．S．．whose trate was largely in hrealstutts．consinteutly protester．except in one treaty． This bas led tu a softening of the rigor of the rule called pre－emption．This was the purchase at a fixed rate，none too high，of goods of doulthlul character instead of their confiscation．It the dactrine of occasional contraband is illugat，pre－emption also falls to the ground，for the une is but a conollary to the other．

Contractility [from Jat. contra here. draw together]: a property by which the parlicles of wome boulies resume their original position when the foree applied to separate them is withlrawn; also the vital property which gives to certain parts (museles, for example) the jowser of contracting. hay means of which animals perform their motions. Contrattility, in the latter sunse, is a moperty confined to living or ganisms. It is not peenliar to mimals. but is sharen loy the regetable kingdom: being, among plants, most apparent. as a rule. in the protophytes, whieh are microscopic plants of a low grado. Among the lowest forms of animals the whole substance of the organism usually possesses cont ractil ity. but in the higher amimals this property is. by differen tiation. limited more ol less completely to the organs ealled museles. But sucle mofions as those of cilia are common to both the vegretable and the animal kingdoms; and among animals are common to man as well as to the protozoon The existence of this important class of motions shows that in no urganisu is contractility entirely limited to the museles. Contractility in sueh cases is quite indeperdent of any will or self-detemining power. But at a rery low point-if not at the very lowest-in the animal scale we herin to find signs of a self-detemining jower, or will, residing within the orgmism, and having a edrain degree of control over that contractile quality ol the tisintes. L'pon the exereise of this control depends the jower of voltur tary motion. Contraction of a musele may inseed be quite indemendent of volition or conseionsness, as in the beating of the heart and in all motions of non-striated museles. But all organic motion or contractile action appears to depend ${ }^{n}$ unn some stimnlus. whether it he the mbsterions nervous force or the not less mysterions influences ealled heat and aledricity. The immetiate canse of musenlar con traction is quite amknown. The theory that it depents. solely upun the oxiclation of masculir tisnes is quite uxploted. It is now lrelel by many theorists that oxidation of non-organized hood-plasma within the eapillaries of the muscles is one of the causes of muscular contraction, and that this oxilation liberates heat, whieh by the nervons inHacnee is transmater] into kinetic encrgy. Electricity also aplears to have intimate relations with some forms at latist of urganice contraction.

Contraction: in surgery, the dimimation on obliterat fion of the caliber of any hullow vesurl, more frequently called sirncture ( $q .10$ ). But frequently contraction dim notw the permanent shrinkuge in bulk (of an orgati), in areal (of a surfice), or in length (of at muscle. temalon, or otler elengated part). (ontrietion may result (1) from arate indlammation, with the formation of neoplasms: the latter atterward ingencrating. or mather drying up. into ordinary connective tissue. Which oeropies lese than the space of the mriginal intrusire tisule. This is well illunt rated in the cose of tmrms whieh destroy mueh skin: the sear ventrats and oftern ratmons shocking deformity. V゙ot is theresult of a proxese which is essentially reparative, and which is nevessaly to the recorery of a healthy condition. (:) Fronn nevons irritation, direet or reflex. Thas the pain of a severe accident to the ankle has loen known to be mamediately followed by fermanemt strabismus. (3) From baralysis. "Thus when only une of a pair of matagonistic musclics loses its functiomas contractility, thas ot hoo by its mommal exoreise may prombe a permatent doformity.
('onltalto [labl. contre, olphonte + allo, high, the high (malle) voice $<1$ att, alfles]: in voral music, the part immediately lublow the trelne formerly ealled also the comenter-

Contreras, IIersando, de: sim of Tombrigo de Contreras; h. in Stain about 15?0. Atter the downfall of his father. $154!$, be and his younger brother, Pedro, remained in Niearagua. Maddened hy what they reganded as an unjust loss of their riglats. they formed a wila scheme for seizing Poru, which they clamed to have inherited from their grandfather, ledrarias. They were joined by some 300 atrenturers, many of them fugitives from Hemando Pianmo's army. The plan was to seize the Istlmus of Panama, destroy the towns and phantations thele so that a Suanish army attempting to crose should find 1 wo supplies, then to sail to Pern, where Ileruando de Contreras was to be prochamed king. As a preliminary they mordered the Bishop of Sicalogha, Valdiviero, who wonld have opposed them. They then exized ships and sailed to Panama, arriving just after the licentiate Gasea had gased on his way from Pern to Sbain with an immence treasure. The consurators easily took Panama (.1 pr. 20. 15.50), where they seized part of the treasime that was still there. Hernando then followed Gasea nearly to Sombire de Dius, amd another party went to Chagres to seck for more treasmbe. I'mama being thus left Weakly guadded, the citizens lose, recovered it, and elefented the force which lurried back from Chagres. Hermando, learing of the disaster, disbanded the rest of the mon and Hed. After wandering for a time with a few companions, le was doownod in trying to cross a river (lay, 1050). ## Contreris, Pedro Muya ne: See Moya y Contreras

Contreras liobrige, de: a hpanish administrator: b. at Segovia about 1495. He was of a noble fimbly, amel married Maria di Penabosio, the dimghter of Pedrarias who had been butrothed to Malloa, In 153 B he was appointerl governor of Nicanogna, amd thomgh he was oprosed by Las (asas. bishop, Osorio, and other ecoleriastion, his rule was in the main prosprons. From leon he sent an wamention under Diego Manduc:a, whiche exploned Lake Nicamagua and its ont let. the Rinn Jumi (then ralled the lesaguatero). arriving at Nombre de Jios. Thore Maclmen was seized by the governor. liobles, who sent two parties to take possession of the Thesumblero: but these were deren ont by ("ontreras. Tha promulgation of the "New Laws" relating to Indian encomiondes ( 1.42 ) threatened to deprive Contreras of a barge mumber of slawe whirh he helrl. Ile went to Spain, where he was conlimmed both in the pacompmbes and in his oflores: folmrmerl in 154, but gent into disputes with the Aullenere of the condines. Charges were made anainst him. and in list the pacomiendus were contisented In again went to Sjain, but condrl secture no tedress, From 1554 to $155 \%$ he was in Peru, where. probably, he died.

Hefbert I]. Smith.

Combersion［from lat，ronter sio，a tominer ahme ne－ riv，of ronvertere］：in metallurey，the process by which stee！
is produced from irom in from iron earbide (cast iron). Iron is (nnverted into steel hy long heating in contact with earbon. Cast iron is converted by "pudlling." or by the well-known process of Bessemer. The theory in heth cases is the same -riz.. to oxidize the excess of cirbon in the carbide.

Conversion: In law this word has two significations: 1 . In equity jurisprudence it means the theoretical or presumed change of property from real into personal or personal into real. The will of an owner of property to change into personal property, expressed in legal forms, is in some instances equiralent. in legal intemdment, to an actual change. as where a testator directs his land to be sold and conserted into moner. It is tleemed to be sold from the moment of his leath, ind to bave the qualities of personal property This is termed equituble concersion. If it becomes impossible to cary out the phrpose of the honor, testatur, or the like, reconversion is suil to take place ind the pruperty is treated according to its real nature. 2. In the law conrts the word" conversion" is applied to an mathorized exercise of arts of ownersip over the personal property of another. It is neemeal to be a wrong or " tort." and the owner of the property may cither reclain it or treat the wrong-duer as having become owner and recover the value of it. Conversion lies at the fombation of the common-law action of trover, which word is derivel from the French worl trouser. to find. There is a legal tiction that the defendant found the plaintiff's property and convertel it to his own use. The material part of the case is the conrersion. To emstitute a case of conversion it is not necessary that there should laye been any intent to deprive the owner of his interest. It is enongh if there were an intent to appropiate the goobs or to exercise an act of ownership over them, ceen though that were done in entire ignoranee of the owner's right. Thus if an anctioneer should sell stolen goods, not knowing of the thett, he would be deemed to have converted the goods to his own use. As the intent is a main ingredient in the eave. it has been considered that a mere trespass, or an accitental loss of property by it carrier, or the use of property as an act of kinduess to the owner without any intent to convert it, does not amomnt to a conversion. There is an important distinction between the ease where the original taking of the goods is liwful and where it is not. In the furmer case there must in general be a demand and a refusal before the conversinn takes place. Thus if a book is lent to another to be retnrmed on regnest, there is plainly no conversion until the book is demanded and there is a refusal to return it, since until that time there is no pxercise of ownership. When the original taking is unlawful, no themand is necessary. The better opinion is, when an atction is bronght for cuisersion, that the title to the ehattel does mut pass to the wrong-ther by mere force of the julgment of the enurt, but that there must be actual satisfaction of the jurlgment on his behalf.
T. W. Dwight.

Connersion, in logic: See Lome
Converter: in metallurgy, the receptaele used to hohs the iron or curbide of iron which is subjected to the process of conversion into stecl. sice strebl.

Conveyance: in law, a deed transferring property from me persin to anther. la the transfermee of personal property the term, though strictly applicable, is mat generally used.

Conveyancer: in law, one who makes a speeialty of the drawine up of converances. In (ireat Britain (anseysancers are premes whone sole business is the preparation of deds, assurane or other comberances of promerty. They are obligerl to take out a yourly eertiticate. "pou which a com-

C'onsict [from lat. compictus, past pte of comin'sere, refute. 1rinuph wer: cont + cim cerve, conk!ur $\}$ : at person adjuthed suilty of a "rime. whether by a verdiet of a jury or hy a jutge alone. 'the methot of treating convicts in any particular conntry or jurimbiction is termed its convet system. The question as 10 what is the best convict systeng is still unanswered. Experiense hats shown that mone of the many that have been tried are tree from very serions defeets, both in thrir effeets upon the commumity and upom the criminals. some of the okter conviet systems, surth as that of transportation and peral servitule, have hectin abanWhacd rather out of regad for their effect upon the nonCrimimal chass, than out of any regarl for the present or funure wellare of the convicts. Ithers have been disenntinneal as a result of a feeling against the infliction of crnelty
upon convicts, as well as out of regard for the commnnity and the moral welfare of the eonvicts.
F. S. A.

Convocation [from Lat. conrocritio. a calling together; com. Together + rocare summon]: it meeting of the clergy of the Clurch of Fugland to diseuss ecelesiastical matters in time of Parliament. There is one conrofation for the province of Canterbury anl one for the province of York, but the voice of the latter is only it feble ceho of that of the former. Each convoeation has two houses-the upper consisting of bishops, and the lower of deans, archdeacons, and proctors. Acts of convocation were formerly of great importance in the canon law, but since the time of Henry VIfl, they have no force when npposed to statute law. The convocations have been recently revived, but with little or none of their ancient inportance. There is an Irish convication with even smaller powers than those of the English Church. In the U. . . the worl is neually applied to voluntary associations of the clergy of the Protestint Episcopal Church. In Connectient, during the episcopate of the first bishop. Seabury, the clergy met in convocation under the bishopis aresidency each year, and even more frequently as need required.

Revised by IV. S. Perry.
Convol'vulus [from Lat, con, together + volvere, to roll, in allusion to the twining habit of most of the speeies]: a genus of dicotyledonous plints of the Morming-GLory Fimily (q.v.), including abont 150 speeies, widely distribnted in temperate and sub-tropical countries. Many of these are twining climbers, while some are erect herbs or even undershrubs. The leaves are alternate, undivided or lobed, the flowers funnel-shaped and usually showy and mostly solitary, the orary two-celled and fonr-ovnlen, and the stigmas two and linear. filifnrm or thiekenen. Many of the species have been cultivated for their heautiful flowers-e. g. C. arrensis, C. chinpnss, C. mouritanicus, anl C. ocellatus from Africa. C. panmifotius from the Cunary islanis. C. suffruticosus from Mateira, and C. fricolor from spain. The purgative drug scammony is a resinous exndation from the root of C. sectmmonia of Wi estern Asia.
C. E. B.

Comyoy [from subst, to O. Fr. combier. to conduct : Ital comia're < hat. *onrin re, make the way (ria) torether (f. the sulnt. Ital. connoglio. Fr. comoi]: one or more ships of war enploveal to protect a fled of merchant-vessels aqainst an enemy by escorting them to their destination

The right of comey is a limitation in favor of the nemtral upon the war right of visitation and search, and rests solely upon treaty agreement. In thenry the eonvoring ship is supposed to have accurate knowlentige of the lading, destination. and character of each ressel in the convor, and to be answerable that it riolates no belligerent right, that it carries no contrabant, that it is not bound for a hlockaded port. An inquiry of the convoving ship, by a belligerent crniser is therefore substituted for the actual examination of the ressel suspected. In practice it is very doubtful whether such complete knowleige of the eharacter and cargoes of a fleet of merchantmen can he obtained by the annvoying officer, prortienlarly as there may be strong temptation for fraul in regarl to these facts on the part of skipher or captan. In modern warfare it is believed that the right of convor is not a valuable one, because (1) of the growth in treedoni of neutral tathe and the variety of destimations involved: ( $\because$ ) of the differences in speed, making theet saiting impracticable.

Before the end of the eightenth century the attempts to maintain a neutral right to conroy originated among the traling nations of Europe as against Great Britain, and were not surcessfifl. lint the principle ot eonvoy was one of the firitures of the serom armed nentrality in 1800, by whiel Lassia, Sweden, Denmark, anl Prussia agreed to respet eonwoy as between themselves, and to ohlige other puwers, notably (irat Britain, to concede their right to employ it, if necessary by fored. This was so far succesoful that traties were marle hetween (ireat Britain and the three first-mentioned fowers prowibing for a montified sort of comvery insemf of search under definite conditions, though eventual joint seareh might the made. The U. Is maintams the principle of ionvoy in ten treaties, one with Parn heine as rement as 1 ssi. Oif these ten treatios only one is with a Euruman wower. laly, unter date of 187.

France has accepted the same principle in six treaties, all with Amerian repuhlies. Aul span, Germany, Italy, Austria, and the Baltic powers accept the right of convoy in their naval instructions. Sce letensatosial Law.

（＇owkery：the att of proparime amd drexine fond by tha a
ticed by the earliest known haman races. For eenturies but little adsancement was mule. We reat, it is true. of the masnificent feasts given in freete and home betome and early in the ('hristian ran : lout in thase times any improvement malle in the methons of propring fuxd was for the few, while the masses continuma to live in the rulest manmer. During the nimetestly eentury, however, great jnogress has bren malds. Sidentists havi wiven more attention to the stuly of nutrition, and in the last yuarter of a cenfury much has lneen elore to embeate all the people in the best mothols of preparing fomd. Creat Britain has taken the leal in this work, intrulueing enoking into her bentre and other schools, In the $[$. S., woking-sehools-private aud commental with the public schoms-have done much to suran the principles of hathaful cookery. Following out the proctical apllication of the therries of mutrition amb of food values expmonleal in reant reats hy Vait and his followers of the Innich sehoos of physiolorists, there have been "pened in the 1 . S. uxperiment stations for the study of haman fond and its best proparation selentifically and erennomically. I berinning only has bren made in cook-ry from in scientifie stamp onint, bial. under the mame of the New Fingland Kitchen, Mis. Lillen 11. Richards, of the Massachmsetts Institute ol ' Technology, with the assistance of 11 rs . Mary 11. Shel. has given this important work an impetus which is destincll to tell in finture work. With all these agencies in uperation the twentieth century shonld show great alvance in bealthfir] amd peomonical cookiry and conserqumtly a physical and mental improvement in the resule.

Effect of IImen on Foort-Cooking develops flavor : And lessens cohesion, thus making our vegetable amb amimal lowns more digestible. The eflect of heat on animal fomes is to coagulate the athmmen, solidify the fibrin. athe gelatinize the bhrons, tembinons, and connertive tisues. A piere of riaw heot will be spongy, twacious, and tongh. Cook it and it becomes fim, combiatatively tumber, cavily tomapart, and of an alpestizing ilawor. while if it be cooked rate the juices will run freply. Albumm when subjected to a high tomperature not only coagulates, but hambens. For example the white of an egor, whinh is almost wholly allamen, will, il enoked for ten minntes in water helow the boilmospoint, coagulate in a sott, croamy mass. If the eqge be cooked longer than ten minutes. sily twenty or forty, the white will Inecome a little fimmer but no matter how lomer the cooking may eontinue at the temperature below the boiling-point the white of the rage will he so soft that it will freak into small particles when pressed between the fingers. If, wh the other biaml. the eqge he romked five or tem minutes in loiling water the white will be transformed into il smouth, hamd, leathery sulstamee most hifheult of digeslion, berouse it deres not break np realily. In cooking meats the albmen and fibrin are atrectod by high or low temperature in the same mammer as the white of the roge, but the allommon in meals is so (r) os (0) y united with other elements that it is impossible to illustrate the effect of high or low 1 omperature with the same rlamess and atse as in the wise of the white of the wers. 'The result of the application of different degroes of heat to alfaminous sulstances is one of tho mo-t impurtant primuphes in cookery On the proper obsirvance of this primeiph depernds the healthfuland eoonombeal praparation of a large part of analy forn].
(tenural livinciples of ('tobling Mrat.-Some morles are more hatatind or more exomomital than others; ] ate sine

 not always fulloweyl. A piove of fresh mont, when exposed for a short tima to a temperature of 212 or more, will hos conme firm atul hami on 1 ha surface. If the high temperyture he comtinued for a long time not only the surfine will breome harl, but also tho entire jiece of meat, beiner stringy and indigestible as fare us the inteme homt has harl

 pincer of moat cookial at this high temprovature will, when

 lonerla of time in a tamperatur just below the hoiling puint it would have erat into smenth, tember, juiey slieas: forsurd at temprotaro woulal softom and wolatimize the tisilus. It this temperatme the jatom of the meat are lrawn to the

 on the pisee thromgh which the juices ean mot escone. I'lis
is done hy exposing the outsile of the meat to a high temperature intil a thin crust is formed thangh the hardening of the albuminous mattor on the surtace. Is soon as this result is attained the temperature shomld be realued helow the fooling-point. 3Ieats conked below or at the boilingpoint do not have the appetizing flavor possessed by thuse conked ant a hirher temperature, but the intruse hat which is applied it first to harden the surface develons the flavor in roasterl and hroiled meats. If we wish to draw the juices and nutritive qualities from a piece of meat we cut it into small pieces, put it in cold water, and heat it slowly almost t" the fobling-point. It must not honl if we wish to keep the allmmen in a soluble form, as it shoula be kept for beef teat. All aminal substances, it lepet closely covered for any length of time at a temperiture much below the boilingpoint, will spoil ratickly. This is parlicularly truc of liquids. It is therefore important that the cooking shonld go on steadily for the aprointwd time, ant then if the food is to de kept for any mumber of laours it shond boil hard for a few mimates and then be taken from the fire amd cooled riljidly. ln making soups and broths it is atrisable to have a slight vent in the comer.

With these few general remarks the special methods of eooking meats may now be considerul.

Boiling.-For all excent salt meats the water shonld he boiling rapilly when the meat is tirst put in. Cover the pot, and when the water begins to boil again. skim carefnlly. bet the water contimu to boil mpially for aboat fifteen minnatcs. In this time a thin. hard coating will be formed on the surface by the allmminons matter. 'This will keep the juices in the ment. At the ent of fitten or twenty minutes the pot should be drawn back where the water will just lmhble at one side, nut all over the surface. This temperature should bo kept up until the meat is slone. The imme refuirml for boiling a piece of meat depends upon the size anml kind of pioce usid and the tastes of the family: All red meats should be comked rare; all white meats, as well as all that have bees salted, shotild be well done. A leg of muthon whighing 10 or 12 ll . will be moderately mre when (c) alsed for two hours. A turkey weighing I! lib. shoukl be conkel? for thee loons and a half: if tonsh, it may take an bone longer. Fowl, when in good eondition, will boil in two lromes, but when old it sometimes takes fom hours to couk them. A piece of curned beef will cook in five hours. It matters mut how small or large the piece may be, the time will he alnont the samm, beanse the fibers reguire that length of tine to soften. Simoked tongues and hams should le well watich, smaked in coll water for twelve hours, then boiled for five lours.

Broiling.-This is probably the earliest known proeess of conking meat. Nimple and incient as it is, in many householids the broiling is ifone no better than, it as well as, in the days of scmi-civilized man. The secret of good broiling is io have the surfice of the article brown, not scorched, amd all the rest fomder and juicy. If the meat be red it should be rave, as lumfisteak and mution chops; lut if white it must be well dome. Thare are to-day so many appliances for this mote of cooking llat it may be dome owor, under, or in tront of a beal of coals, or under a sheot of flame in a gas-stove. In tho urdinary houscholel the comls mar come from wood lummal slowly to probluce a bright hect. of a charonal, inthrates or bituminots coal fire may be employel. Where matural gas is used a hed of fire-briek is mate hot ond the gis then turned otf. the hroiling boing done over the lant Wridks. This is not sitisfactorys as the hricks aro not hot chongh to give the first howning. A gas-broiler is ofter usem. It is mate somewhat like the Eroibers for attition wats, and the hroiling is done monder a shert of flame. This is much hettey than the heated bricks. The average homseknema broils over a beal of coals. The ecabls should be elear and red and all the dranghts la onened. J'late the piece of ment in a domble broiler anml bokl it cluse to thas fire turning frogumaty until the fool is brownea? (athont fonr minutes lur al sterk, chop, or small hirit); then lilt the broiler ups af fow inches atol continue turning contstantly until the meat is dume. A stoak or eloms eut a little more than an inch thick will tako tom minutes to cook: a smal! himl, like t quail, the same fime. White meat will retuite a longer timer, beratas it mast. be well done. "lhis meal, loweral, will wot need such comstant taming as the rarr meats: still. it mast be darmed frequmaty:

Pomesting.- Perferdion in roasting is gatmol by tho aso of a spil hefore an open fire hat so few monlom ranges are provided with the proper armagement for roasting before
the open fire that, as a rulde, most folk in this country, and indeed, in Eurchro, rast theif meats in atn oven. "l'lap same fixtures that are usad in the gas-stove for livoiling are used also for roasting. limating done in wom wis-stowes is al-

kettle while the cablage is in it. From thirty to forty-five minutes will suffice to cook a hear. C'anlitlower shonld be put, head down, into a kettle of hoiling salted water and cosked for half an hour, boiling gently all the while. Green peas should boil gently with the coner of the salleepan drawn a little to one side. Alhough a potato will be hard and indigestible if umbermene, it is only a step from this condition to orer-cooking. If a putato be baked, boiled, or stemmed too long, it will deterionte from the moment the over-cooking begins. Potatoes, placed in a kettle on the fire and covered with builing water, will corok in just thirty minutes. In a moterate overn a potato of medinm size will bake in forty-five minutes. If potatoes must he kept warm for any length of time after cooking. they should be covered with it charse towel thomgh which the steam can escalue. They never should be closely cosered.

Breurl. - All the riains, and even muts and tuberous roots. are bronght into reguisition in making this stati of the human family s life. Owing to the large amomet of whten in wheat. that grain is partucularly well alapted to breadmaking. The perfect loal' of breat] is the highest form of vegctahle foot. 'IThe amomnt of labor which a loat represents is almost meredihle. From the selection of the seed to put inta the gromm] until the bread is taken from the oven the physcal and chemical changes are many. Upon the quality of the wheat amb the milling depends largely the quality of the breal. Flome made from wheat grown in a Wert season, or that which has been wet and not properly dried. wr which wat grown in tow highly fertilizal soil, will not make prerfect breal. The glatern of such wheat will have a temdemey to sulten when mixed in the domgh. Freshly gromm thons, cren from the hest wheat aml the dinest mitling, will exhibit nearly all the characterintics of thour made from pron wheat, that is, it will solten in the dough; bint the lurearl will have a particularly swect, nuty flavor. The Wheat should be perfectly bly before being gronme and the Hour shomld have a monath or more to seasom before being usel. New flom amb that mate from grains grown in a Wet season are imphowed by heing dried in a warm place for a few homs before being used. Good flour will have at plemsant odor and a yellowinh tinge, but if marle from damp wheat it will exhale a musty, muleasant enfor. If a simall guantity ol tlour be mixed with cold water and formed into Hough and then be knented for a few minutes, it will show the quality of gluten in the flour. If the dough become smoroth ablul elastic it will be evident that the gluten is sound. and that there will be no difliculty in making crom breal. Flour and meals shond be kept in a pure, diy at mosphere.
In the earlient ages the gran was pounded and rubber between stones, or in a sort of mortar. later two mill-stones were nsed. the power being either animal. or wind, or water. Since then the improvenents in milling have been wonderful. The hest mills have machinery that separates eath part of the grainamd timally rembers the most desiralole (1) Homs. By thin new procese a laterer propent ion ol the inner conats of the grain is made into thom than by the old prones with stones: therefore the hread is richer in gluten amd phosphates. A whote-whent flomr also is mate in whieh at still larere jromation of the nutritive qualities is retameal than in fine white flour. 'The llaver of bread made from this thour is sweet and nutty: the loat is brown.  of Alome sud watrr, which was allowed to ferment: or a 1)
other. These two substances iure still used a great deal, but this mote of making breat light is open to many objections. [Tnless the dough be watchenl careful]y, lactic acid is formed, and often the stage of putrefaction is reached. Scientific men have sought lor some other method of making bread light. dërated hread was made by mixing, moder pressure. water, flour, and carbonic acid. Varions acids and alkalies were tried, and as a result of all the experinents we have many kinds of baking-powders. These answer for breads When baked in small cakes, but nothing has been fonnd Which can take the place of the yeast jlant for the large. sweet porons loaf. Abont 1850 Arlolph Ignaz Mant ner, of Viema, produced the press-yenst or what is known in the U.S. as compressed yeast. This ferment is perhaps the best of inything yet known for lireat.

There are many methods of making bread. lut they all aim it the same thing: a light, porons, ligestible mass. Breat manle in Great Britain and the $\mathbb{L}^{+}$. S. has a larger proportion of crumb than crust, whereas the reverse is the case on the continent of Furope. The more crust breall has the sweeter and more wholesome will it be. The elements of suceres in bread-making are romd yeast and tlonis, a thornugh beating or kneading, the tight temperature, the proper Alegree of fermentation, and careful baking. 'The dough is matre in the following manner. Snitable proportions of Water, flomr, sall, and yenst are mixed together, The dough is allowed to stand in a warm place until it has ehanged into a light, spongy mass, a little more than twice the original hulk. 'lhis dough is kueated again. and then shaped into lowes and rolls, after which time is allowed for a second rising. It is then baked. Simple as this process reads. it involves conditions and chemical changes which must be watched carefully, else the breal will not he porfect. The water which is added to the flomr thisolves the sugar and alfimmen, soltens the gluten, and hydates the starch. If the tmperature be right. active fermentation begins at once, although it is mot perceptible for sevpral bours. Some of the starch is converted into sugar : this and the sugar of the Hour are converted into alcohol and carbonic acid. This gas is dittusel through the mits. The minute bubhles, heing retained by the temacions gluten, cause the dough to expand. As long as the fermentation producus only alcohol and carbonic acid, it maygo on until the flough has risen sulliciently ; if, howerer, fermentation he allowed to go ton far, acetic acid will be fomed and the dough become somr, On the other hamd, if femmentation has not gone far enough, hary, indigestilie hreal will be the result. Fermentation is most rapid at ahout hoor-heat. 98'. 'l'he water with which the Honr is miserl shombl be at abont $100^{\circ}$ in colel weatler, and at about so in very loo weather. If the flomr he kopt in a cold place in winter, it shomkl be placed in a Warmer rom for several homs before being made into dongh. If comppressed yeast be used, it should he thoroughly dissulved in the winter, that it may be evenly incorporaterd in the brad. The hoting on kneading of the latad alsommst be thorough, that the particles of yeast shall reach every point in the mass of dhigh. (ireat care mut be taken that the domgh is not chillet while theing kneaded or in the first periot of rising. It is impossibhe to mathe goord bread with dongh that has heen chilled in the early part of the fermentation. Dough that has risen to a perfeet sponge. and then been kneatert and thilled, will, if marle intis rolls (whichmast rise in a warm atmosphere to more than double their size before the hakiner), give a finer, whiter, and tonderer texture thim il the rolls he made with the freshly risen fronge. One hamdrad degreps is the proper temperature in whicil to start the fermentation. After a few hours the heat shonld he lowered to abont 70 , and it should be contimed at this temperature until the chomph is a spmgy mass. When it has reachod this stame it shoukh he thonoughly kneaded, to break uy the gas hmbles and distribute them thronghont the bread. thas insuring a loal filled with small pores. After this kneading the freat must be shaped and raised again to ahont twite its original sizat. It is then placed in an wen hented to almat 400 F., the temperatnre being
 tation gros on in the interior of the loaf until the temperature is raiseal to almut $21 \geqslant$. It will he suen, then, that the lare loaves shonk not rise as murh as the small ones before baking: indmal, it is a pity that there ever shoult he a large loaf, beanse the small ones wive more erust, inn] the heat passes to tha interior so quiblily as to stop formentation beforr acetic acid ean be formed.
'The porosity of the loal' depemis upon the elasticity and

He was attorney-gromerah of Jemnsylvania in 1848, U. S. Sen-

 M1ar: wa. 146\%.

Conprir, Janes Fextmone: gopular novelist: b, at Burlington, N. J., Sept, 15, 17N!) : was a som of Inclse William
 and founded Connerstown. Fomng Comer entered Yate College in $1 \times 03$ and horame a midshipman in the $\mathrm{L}^{\top}$. S. mavy in 1stos. In 1811 he fuitted the maval service and mariod Susan de Lancey, a sistor of bishop de Lancer. Ile mullished anonymusly, in Le?o. Precantion, a novel, which was ennsidered a tailure. In $15: 2$ he promuced the spy, ot Tale of the Teutral (iromal, whoh had great success, was republished in ramos parts of Eurnpe ani translated into several languages. The spy onened a new and fresh field of national anl imagrative literature. His next work was the l'oneers (I*23) in which he gave a graphie description of American scenery and the atrentures of lite on the frontier of civilization. He published in 18e:3 The Pilut, a tale of the seat, Which was very pomar. He represented with great snceess in this work the chatereter of saloms and prentiar phases of maritime life and semery. In the Last of the Mohicans (1sotb) he gave a vivid picture of the life and chanacter of Americansarages and truphers. In 180 h he visitell Europe. where he rematined nourly six fars, huring which he published The Pruirip (1sen), The Liml Fover ( $1 \times 2 \mathrm{~s}$ ), an admired dale of the seat, and other works. He critucised and satirized the natiomat defects and fuhles of Amerienns in The Monihins (18:30): IImerenml Bonul (18:3s); and Ilume ne Found (1s゙心) A Among his ather works are it History of the Jury

 brever (184, ) : and Chli (ppenimys (14+8). D, at Cooperatown, sept. 14. 1551. Siw Lamstharys dames Fenimore C'ooper ( 1853 ) in the Americau Nl n of Letters Series.
(oopper, Hyles, Lh. D., Uxaln: an accomplished seholar; semnd president of Kings College now called Commbia (ollege). New York city; b, in Fighand in 1335, and educaterl at uximat; bectume i follow in Queen's College. He removed to America in 1662, is assistant to Dr. Simuel Tohnson, first presidunt of Kings College, and was made president in Mays, 1763. In the revolt of the colonies he remaincel loyal to the cown, and was compeltent to the the rountry. llie became ume of the ministers of the Euglish chapel in Elinburgh. 1). in Elinburgh, May 1, 1785.
('oopre: Peter. Lif. I): manufacturer, inventor, and phiInnthropist: I) in New York city Feh, 12. 1\%91. Ilis early life was one of lator ant st magle. He commenced in boyhood to help his father is al manufacturer of hats. IIe atthendel school only for half of cuch hay for at single year. aud hevond this very humbe instruction his acquisitions were all his own. It the age of serenteen he leamed the trade of comehmaking.

The foundation of Mr. Copper's fortune wats laid in the invention of an impowment in machines for shouring choth. 'This was largely called into use during the war of 1 sis with treat britam, when all importations of cluth frum that comitry were stopmed. The machines lost their wahe, how"ret. on the declaration of peate. Mr. Cooper then Gamed his shop into the manufacture of cabinet-ware. Ho afterWard went intu the grocery hasines in Now Yorke and finatly he engaged in the manufacture of the and isinglass, wheli he anried on for mase than fifty years. 11 is attentim wise early called to the great mandere of the 1 . S. . for the manfacture of iron. Tn $18: 0$ he areted works in Cantom, near Battimore Subsequently he encted a rolling and a wire mill in the city ol New York, in which he first suc-
 he remaved the machinery to 'l'renton, $X . J$., where he erected the largest rolling-mill af that time in the UT.S. for the manuffacture of railway iron. In these wenks he wats the first to roll wroght-isen beams for tireproof huldings. These works have now grown to be very extensive, inchaling mines, blast furnates, alml water-power.
White in Paltimore Mr. Cooper lutilt, in 1xam, after his

 tha Bahtimore and Ohin li. R. Nist we find Mr. Cooper taking gront interest and mowimer larere caphtal in the ex-

eighteen years. He was honorary director of the Atlantic Telegraph Company, prsident of the American Telegraph Company, and president of the North American Telegraph Asociation, which at one time represented more than twothirds of all the lines in the U. S . He took part actively in the first expedition that hail the Atlantic cable in 1854.

Mr. Cooper interested himself early in the New York State canals. Before the water was let inio the Erie Canal it was an anxions guestion what was the best propelling power for the boats to be cmployed on the camal. Mr. Cuoper then made an interesting exjeriment of propelling a boat by means of an endless chain 2 mites long, supported on posts and rollers, which was driven ly the force of elevated water, and might be driven hy any other power. Py means of this he propelled a hoat'? mike in eleven minutes, carrying with him the Gorernor, De Wift Clinton. ant other distingnished men at that time. Although this method of propulsion was not adopted at that time it has since been successtully applied in passing boats through the locks of the Delaware and Laritan Canal.

Mr. Cooner serred in the New York common comneit ; was a trustee in the Public schonl Society, first formed to promote public sehools in New lork, and when that was merged in the hoard of education he became a school enmmissioner: but the most cherished ohject of Mr. Cooper's life, early conceived and faithfully earried ont is soon as his means permitted, was the estithlishment of an institution for the instruction of the industrial classes. Accordingly, in the yar 185t. he laid the comer-st one of al large bilding at the junction of the Third and Fonrth Aventes in New York, "to be devoted for ever to the union of art and science in their application to the useful purposes of life." This instilution has grown under the fostering care of the trustees appointed by Mr. Cooper and his own unremitting attention till his death. It has a school of ant for women, tanght in the daytime, in which free instruction is given in all branches of drawing, in painting, wood-engraving, and photography, It has likewise a free school of celegraphy for yomg women. Thrie schools for the daytime accommodate about 200 . The Hrovision made by Mr. Cooper for this woman's art school has since been increased by sevemblueguests from others.
In the evening are opened the Iree schools of science and art for young men and women. Here mathematics, practical enginerering, and practical chemistry are thoroughly taught, and free lectures are giren in natural philosophy and the elements of chemistry. In the art department every branch of Irawing and printing is taught. During the year 1891-93 instruction was given in the tree night school of science to 1,266 male students, and to 1,758 in the art school. Pesides these free schools, there is a large free reading-room and library at the disposal of all comers. About 1, 000 resort to this dialy, where they have free aecess to 520 periodieals ant pipers, foreign and domestic, and athout 84,000 whlumes. hesides this, there is a free course of lectures given uvery Satmotay evening during the winter in the large hall of the Cooper U'nion, which will seat 2.000 .
On May 1s, 18 it the lndelument party nominated Mr. Conper for Presilent of the ('.s., and at the following election he received nearly 100,000 votes. D. Apr. 4, 1scis.

Ј. С. Zachos.

Cooper. Thomas: Chartist pont: h, in Leicester, Eng-
 maker: became seloohnawlu in 1s2i: led the Idecester "hartists in 1841; for lecturing during the "riots" "f Aner. 1842, received two yars imminomment. Puring this time he wrote an elic. The l'uryntory of surides, aut is series at storics, Wise Sanes and Jodern Insiances. In 1847 apprived his Triumphas of Perserercance and Triumphs of Finterprise. In 1849 he edited at ratieal journal, the Phain. Spuctier, and in 1850 it skentionl prodicalal, Corper.s dournn/; lecturel on history, pulty, unl literature 18.il- 5 : wrote the novels 1 hderman Rulph ( 1 No ${ }^{2}$ ) and The Fiemily Frond (1854). Co-upration: a mefhot of conducting inlust ry in when the "apital is supplieal by and the control rests with the onperatises whin the industry is productive, and the consmane when it is distributive.
['nler ordinary circumstances husiness is controllon] by capital. Sometimes a man usts his own eapial in amomots sushiciont to purchase the materiats and supplime and in live the laborers or clerks. Wore aiten he matise wememt cither commerial or industriat, for a part whe necessary candial. In the largent induntrine, like factories or mailways, the manarers represent the avociated capital of a mumber of stombholders. But in all these caser it is the cownership of the capital which gives the ultimate powa of saying who shath direet the industrial action. Thas state of thing has many alvantages (ses lomiteat bitovoms). lut it has also certain disalrantages. It often promeres confliets betwern capitalists and haborers: it maty sumetimes sive opfortunities of extortion from consmers. 'To remedr thane evils sehemes of co-nperation have been suggedet. wherey industry shond be managed either hy the poulncept or by the consumers, insteal of by the copitalista Where the industry is managed be the producers, it is callet prownctive co-operation. Where it is matagen hy the consmuers. it is called distributive co-operation.
The term conpration is most lowstly applied in current use. It is uften extembel to cover cases of profit-shuring. Where there is no change in methon of managoment, tont only a tistribution of protits from time to time amonge the majovers of a buiness, or, more rarely, among its custom-

It is easy to see how this matre arne. A comperative imfustry world nstally, though not atways. divide it-profits in this why. This livision of profits hatarally came to tre the prominent frature in the publie mind. and athy imblustry which divilemp profitz was called co-en)cratuse. But this usare is throurhly in orrect. Divisom of pmotits involom no nowe change in methots of management than is invelved in the substitution of picee-work for day-work. It is morely a ditarent methon of payment of the laturers. wherby the emploser hapes to atation an increase in alli-

 fur day-work, he can increase his trows camines, bey triving the laburers an interest in the perdits, he mas pertians increste his net earnings. Experiments in podit-sharing are
 shasini, but they lo mot invelse the change in indn-trial
 tion.

There are other forms of distributive comperation quite
as important as the stores. Chief among these are the so--cieties for furnishing (o-operative credit. The most important experiments of this kind in the $\mathbb{C}$. S. have heen the numerons building asd Loan Associations ( $q \cdot r_{0}$ ), and they have aceomplished a work which can hardy le overestiunated. I similar system of co-operative credit enterprises has been untertaken on a wider scale in Germany, under the leadership of Herrsclatze-Delitzach. These were first established in 1 Nion, and for a long time formed an important element in devehopiner the imdustry of the comntry. Dutual insurance forms another insportant field of co-operative enterprise. In the $[$. S. it las been most sneeesful among manufacturing indust riss. Ibout the close of the civil war a number of factories, which had to pay extremely high insurance rates on account of the general prevalence of fire in manufacturing establishments, undertook to insure one another instean of relying on an outside company for their insurance. Not content with aljusting the losses, they undertook to remiter those losses themselves as slight as possilule. antl to secure the arloption of rules and methods which should, in far as possible. prevent fires in the associated factories. In this they were extremelr successfu]. ['mder the leadership of Mr. Filwirl Itkinson, ther reduced the frequener of tires tos a rary small fraction of what hat hem ureviously the rule, and were emabled to do their business at appreciably less cost, on account of the reduction in insurance and the superior methorls of construction. We may also nate certain forms of distributive co-operation ammag farmers, of which the establishment in the [.S. at (0)-operintive creamories has heen perhaps the most surcessful. At first sight this seems like proluctive en-operation. but it is really malogms to the work of the -tore or the mutual insurance company. sinera the industly is managed by those for whom the surviee is remteres. For details with regaral to the success of fablure of many of these enterprises, ser John Hoplius [ niversity IHistory of Co-operetton in the L'mited states
Socialists lapleve that eo-rperation ought to be made more gencral. Jany of them rely in this means for changing the structure of intust rial society. The plan of Ferdinand Lasable contemplated the establishment of a system of government eredit, whereby any association of workmen combd mortgage the future results of their labor and horrow capital on this secority. In this way Lassalle thonglit that the present momoroly of the "apitalists in the control of industry wonld be done away with. A man who hal no capital, but was willing to work, would be on the same level as one who had inherited capital from his father. or sated it from his businems. But the history of co-operative enter[rises gises little ground to expere much arood from a projecet of this kind. "Nit the eontrary, it indicates that the waste of capital under the new system womld many times ont weigh whatever losass and ditliculties there may have heen unrler the oll. Its alrocates chain the following adviantagen from the en-opurative system: 1. It does away with the enothiets letween labor and capital. 2. It avoids the expenses of whertising and certain unnecessary expenses of mamagement, which are ineident to the conduet of hasimes forliy. 3 . It brevonts the exorbitant profits which capitalists lase hom wont to charge. The weak point in the atwomede of the co-operaturs lies in the assumption of the existence uf these pxorbitant profits. It is a guestion whether, under the existing methorls of industry, the loses from chepreciation of capital to not practitillly wipe ont most of the retmons receiven in the form of inturast. It is cortain that these profits are very much Jos than is orclinarily suppord, and that the loss due to any slight falling wit in velliciener and evonomy wonk be a much sreater humbn on the community than the profits which are now distrimotal among capitalists as a class. We eome lank, then, lothe question can we experel to have as high a degreq of whicioney amel eronomy when business is manasoul by lathores of ransumers as we have umber the present syofom. 'To this impuirs. at plusent at any rate, our answer most the in the mesative. Whike 'apitalistic manamemont does mot alwilys put the hest mon in control, it keepls many chasest of incompuetat men wholly qut of contros. It is a system of natural selecelion, mot
 If a man sees what the commmunt wants aml supplics it in an elliciont mammer. loe maknomonoy amd is ahle to externd his operations. If he does nut see what the eommonity wants, or fails $t$ os supply it in an rificient manner, he loses so much money that he is mable to ramain in control. Mat-
ters do not always work as well as this, but the general operation of the system is what has been here described. On the other hand, if the managers are chosen by the votes of the workmen or the eonsumers, experience, both of the guilds in the past and of the eo-operative soricties in the present, shows that we shall not ganerilly have the most etlicient men at the heal. They will supply goods which the eommmity does not want, or insist on making them by old methods when new ones would he better.

In the cases where co-operation has heen most suceessful, like loan associations or mutual insumace companies, their success has heen largely due to their educational character. sometimes they have tanght men to acquire business ability by showing them how the exercise of such ahility was an essential means of success. The adoption of a plan like that of Lassalle, which shonh give every workman the right to control eapital simply on accoment of his willingness to work, withont regard to his husiness ahility, Fonld tefeat the very end which the liest co-operative societies have had in view. sometimes thry have taught men to derelop new business methons of somaler character than the old. It may occasionally happen that abuses have introduced themselres into the enneluct of a lusimess, and under such circumstances co-operative enterprises may suceed in avoiding precisely those ahmses. The rase of the co-operaitive stores in Great Britain is an instance in point. Up to 1 s 64 business there was managed largely moder the credit system. and in many lines at least there was quite inarlequate provision against bad debts. Such was the conservatism of the prople that a stome that repuireal casla proment could not aecure the neceszary custom. But a number of persms, voluntarily associating themselves in a cob-operat tive enterprise. could and did acrue to pay cash: and by the substitution of cash for crealit they sared money in a multitude ul ways, and were able to obtain their supplies much cheaper, just as in the $\Psi^{\top}$. s. tha matual insurame companies were alole to obtain their insurance much cheaper hy boluntarily sulmitting to a nmmber of rules that they nude themselves, and which proved a safoguord against fire. As lumg as the old-fashioned stores in Great liritain continued to run on the credit system, so bong the co-operative strues hatl in ilocibled adrantage. The cash syatem has now come to prevail in the retail trade of the Enited Kingdom to neary the same extent that it does in the $\mathrm{C} . \mathrm{S}$. With this change of business habits the co-operative stores have lost their atVantage, and the regular joint-stock establishments are now able to make as cheap prices as the co-operative ones and to hokl their own with them in every respect. Jgain, it may reably hapmen that the workmen in some particular line of industry are not dong justice to their mwn ability-are habituilly working in a slack mamer. which involves waste of materials or loss of power, lut to sily loss of time also. Enuler such ciramstances the stimuhes which is given by working for thomselves may result in in increase of zent and ellichones which ontweighs any disadrantage in busines manamment. ]t it has furthor hapmend that the empitalist has been subject to the liability of strikes and that the co-operators are free from this banger, this alvantage is greatly increased. But the cases where the alloantages of probluctive co-operation have ontweighed its advintaren sem to hatre been relatively few-fewer, perhaps, in the $\mathbb{L}^{\top}$. Saml Great Britain than in France of Germany. Sinme think that this diflerence is due to the fact that the habor juwer of the British or [. . workmen is muler ordinary circunstanees far hetter utilizet than that of the Frenchman or (ierman, and that this leates loss margin of possible alvantace due to the inereasel stimulus of co-operation. If aman in the LT. A. is working nearly as lame as he cin, while the Frenchmatn or German is only working at half his possible sueed. the chanee for increased stimulus in the former ans is ohvinusly mond less than in the latter.

Taking all these things into account we most for the preseat regatal co-operation mather as an occasional monns of suceess and as a ureful cducator than ns a practicable method of eomblucting ordinary hosiness. It may fre that as the commanity hecomes more arnurally equatiol in husiness methouls and business habits the fiok of pessihtu sucreas for eo-opration will constantly widen. 'Jhio is a result that every onte mast acsire to sed ratized. Iint such an erhastional reanll can only come tharmagh gradual progress and vohantary co-opration. 'The attempt to clevise schames of universal creatit which shonh give the man who had not saved money the samo chance to manage business with the one who had wonh defeat the end in wiew.

Cohnsi Countr: Yoletabi, at Kıinghts Landing, Yolo County: Volo (Pop. $4 \overline{5}$ in 1884), in Yolo (county:
The name Wintu signifies Indians, or prople, more strict ly "the people." and is the name which the tribes comprising this division apply to themselves. Their territory extents [rom Stony ereek northward as tar as Mt, Shasta, embracing the uper Sacramento and uper Trinity ralkeys. Branches of this division were settled in 18.6-75 in Yreka and in Inyo ('onnty, and a small colony had wandered? as far as Murtano Park. Colorado. The tribes of the Wintu division are Danpom. of Cottonwool valley, Shasta Connty; Nomlaki, on Stony, Thomas, and Whder creeks, Colusa and Tumma Counties: Jormuk, on IIay Fork. Trinity Comoty: Suimok, on Lower Stony creck. Colusa Comity: Nummuk, on a tributary of the Cotionwood, in shasta County: Tien-Tien. on Hay Fork. Trinity Comery: Waikenmuk, on the urper Trinity. Trinity County. Wailaki is a general term nsed by the Norbo to designate all the Wintu N. of them.

The general characteristies of the two divisions are nearly the same. Physically, the Patwin have hombly owod laces, low, very wide foreheads, large eyes. straight noses, exceedingly depressed at the ront, and with prominent nostrils. The ir heads are quite small, and covered with a coarse shock of hair, and the skin varies from brassy aml hazel almost to black. The roung women are of small frame and comely. In youth all of the Patwin are excessively obese, fut the aged are hideously wrinkled and repulsive. The 11 intn, particularly the mountaneers, are generally larger in statHre.

On the plains the Patwin men and all children up to ten or twelve years of age formerly went entirely mule, while the women wore only a narrow slip of deerskin around the waist. In the mountains, however, the Patwin and Wintu Women wore short petticoats made of cottonwood bark, which were sometimes fringed and ornamentel with pincnuts and shells. The Wintu women ornament their faces, and sometimes the abomen and hreast. hy tattoming. In the plans the Patwin live in dome-shaped honses of brameles and carth. the floors of which are about 2 feet below the surrounding surface: but in the monntains, where woot is mone abmidant, lodges are construted withont the use of earth, two or three hamilies frequatly oecupying a single lolge. The Wintu lodges differ from those of the Patwin, in that they are sharply conical, and are composed of bark and poles.

All of the Copehan tribes are imlifferent hunters, but expert fishermen. salmon forming one of the chice arricles of subsistence, although in season wild fuwl and other game, clover blossoms, roots, bark. piñon muts, acorns, berries, and a nomber of tarimaceons seeds (including wilh oats and smeflower speds), and even vermin. contribute largedy to their mainthaner. For superstitions reasons they do not eat the grixaly bear.

Litile is known of the religion of these tribes. They celWhate by daneps an abmdant harest of acoms or a plentiful catch of tish. They have other cercmonials, one of wheh, performed hy the l'atwin, is for "raising the dead," in "arly times used for keging the women in subjection. The Wintu have a monber of cermonials, amomg which may be mentioned the pmberty, gilt, and sealp dances. Others of a sorial nature are also performed.

In war the Patwin employed lows and arrows and flintfuited ypars, and often diophayed mueh bavery. Besides these implements the Wintu use the sling-shot with great skill. Nealps wre not taken hy the Pitwin nor by the Tien-Tien, a W"intn trite; but, when vietors, the former oftem dexpitated a young fomald uaptive the head being betal aloft as a target to tmont and exasperate the ran\{uinhel\}. [buls were sometmes fonght by men with bows and arrows at long range.

nome of their errors. The Eggptians held that Mereury and Vems revolved around the sun, hut they also held that the sun, with Mars, Jupiter, and sitmm, revolved around the earth. Most of the philosophers, however, of the l'rthagorean school held that the sun was the center of the unirerse, and Heraclides and Nuetas even went so far as 10 explain the phenomena of the rising amo the setting of the stars from a daily rotation of the earth aronud its own asis. From thase various systems Copernicus drew his materials, the eareful digestion of whieh finally led to his great discovery, which he expounterl in hiw work the Ortailm Celesfium Kerolutionibus. finished in 1030, hut not published until 1.5t: from a lear of persecntion. Ile dedicated his book to the pope, amb cantinasly propounderl his system as a mere hypothesis. Acemerding to tradition, he received the first copy of his book on the day that he died. It was published in Nuremberg (1543), in Basel (1566), and in Amsterdam (161\%). Ilis thoory was rejected mot only by the clergy, hut by atromomers. "The whole weiglit of Aristotle's name." says liallam," which in the sisterenth century not mly biaserl the judgment. but engaged the passions, connected as it was with general ortholoxy and preservation of established systems, was thrown into the scale against Comrniens." I) at Framenturg, 42 miles $\therefore$ W. of Kimigsberg. Prussia, Nay 24,1543 . See the exhanstire Life of Copernicus by L. Prowe (e vols., Berlin,

Copiapó (in full. San Frunciseo de la Selra de Copiapó): a city of ('hili ; capital of the province of Itacama; on the weotern lase of the Andes, at an elevation of 1,300 feet, and 30 miles from the Pacific (see man, of South America, ref. i-('). It is watered ly the little river Copiapo, which Tries up, before reathing the sea: the surrombling region is a desert, and in the town itself rain hardly ever falls. The average temperature in summer is about $6 \dot{A}^{\circ} \mathrm{F}$., and in winter 51. Copiapó was founded in 170 near some goll mines, taking its name from the Copayap Imdians of the vicinity. It was manly a military and transport station until 1432, when rich silver mines were niscovered in the vicinity: these now yield about so,060.000 anmually: A railroad from Copiapor to the port of Calderia has branches to the mines, ant it is proposed to contime it over the Audes. P'op. (1895) $9,301$.

Herbert II. Smiti.
Copley, Jomes sixaber: portat and figure painter: b. in Boston, duly 3. 1835; d. in London. Selt. 9, 1815. He began to paint carly in life, ant received some instruction from his stepfather. Peter Pelham, a well-known painter and engraver. ITe hequn to print purtraits in Boston ahment 15i.t. but his work had little turtistic merit. Ile improverd, lowerer, as he went on, ind it portrait exhibited in London in 1760 received prase from benjamin 15 est and other artists. If: went alhoad in 17it, setteol in lombon in 1760 , and was male a hoyal Academician in 1 ain!. In contimed (t) piint portraits and pietures of historical suljects, and achioseal a wide reputation. His work is vary interesting (t) Americens, from the tiat that he painted the portrats of mumoroms celelnitios of the lievolutionary prioh. One of the beet of his work is :s family gronp now owned in Busion, ind whe of his bret pertritis is that of Mrs. D. I). Rugers, ownell by 11. Li, Rosers, lowton. it fine portrit, that of Ralph Baril anm Mra. Fzarl, belongs to Dr, it. E. Maniqualt, Charleath, $A$ C. It was paine el in lime in 15:4.

Coppée. Hexry, IJ., D, : sollier and author: 1 o in Sawanmah, (ia., Ott. 15, 1821 , gradnated at West Point 1845; was lientenant of artillery till he resigned, June 30 , 185., He served in the war with Mexico 1sti-48: engaged at Vora Cruz. Cerro Gorlo. La lloya, Contreras, amd Churubusce (brevet captain), Chapmltepic. and the city of Mexico, and as assistant professor at the Military I cademy 1sts-49, 18:0in. Professor of Fnslish Literature and History in the University of Penusrvania 1*50-56; anthor of Elements of Loyic (185s) and of Theforic (1859). of Grent und his Cempuigns (1866) and of several military works 18is-73: elitor of it Gallery of Fumous Pbels (185s), of Distinguishipd Poetesses (1861), and of the L'nited Service Magazine (1864-66); contribmor to the principal reviews and magazimes of the U. S. 1845-93: compiler of Song: of Pruise in the Cheristian. Centurips (fsG6): 1 resident of Lehigh University, Bethlehom, Pal, 1866-T5, resigning the presidency in the latter year. but retaining a chair in the college which he held until his cieath, Mar. 21, 1895.

Copper (in Lat. cuprum): an elementary metallic sul)stance, known at a very early period. Ihefore iron was used it was the principal ingredient in domestic utensils and weapons of war. The Romins ohtained the best copprer from the island of Cyprus, whence its Latin nane, cuprum, was derived. Copper is ristinguished from all other metals by its peculiar reddish color. It is very duetile and malleable, and requires a temperature somewhat lower than goll, but higher than silver (estimated above 2.000 F.). for its fusion. Nest to silver, it is the beaknown conducter of eleetricitr. Weing in the pure state 03.08 , while silver is 100 . The speefice graxity of eompre is brtween 8.91 and 8.5 ; atomic weight, 6:35: its symhol is ('u. It is very hard, elastic and tough, with in tenacity only less than that of iron. It crystallizes in the regular system, forming cules, octahedrons, etc. The principal ores if copper, hesides the mative metal, are the sulphiles of copper, either alome or combined with other metals, such as copprer glance ( $\mathrm{Cu}_{2} \mathrm{~S}$ ),
 ecpper ore ( $3 \mathrm{CH}_{2} \mathrm{CF}_{\mathrm{F}} \mathrm{C}_{3}$ ): Fahl ores, containing admiximes of sulphides of copper, iron, zine, silver, mereury, etc. : enargite, containing sulphicles of copper and arsenic: oxidized enpper ores. sucli as red copper ( $\mathrm{Cu}_{2} \mathrm{O}$ ) and black oxide of enper; and copper salts, sueh as matachite (which is carhanate of copper), silicate of copper, dimptase, ehloride of copper, atacamite, phosphate of copprer. and arseniate of copper:. Ill these ores contain eopper : it is found also in small quantities in most soils, in seaweed, and in the animal bodyCopper forms two oxiles the protoxide (C'no) and the sul)oxde ( $\mathrm{Cu}_{2}$ ) ; the former is found native in dark steel-gray cryatals, with a specitic gravity of 50 ; the latter ocens in red translucent "rystals, having a specific gravity of 58 : prepared astificially, it forms a heantiful crimson powder. Protochloride of copler is hrown in the anhydrous state, and green when hydrated: it is very soluble in water. There are several sulphides of eopper, the principal being the protemalphide and the disulphide. enresponding in composition to the two uxides. They are foth fommi native, and are worked as ("npler ores. The artwhate of copper is sold as a pigment under the name of hue werditer, and from the sulichloride of copper lapuswick grew is obtamed. The blue and green rembigris of commerce are made by the action of adetic arif upon oxide of coppur. The hlue vit riol so extensively used in dyeing and colien-printing is sulphate of copper. 'IThe allors of coprre are of grat salue. Brass is conper alloyenl with from $2 \times$ to 34 for cent. of zine: gunmolal consists of 90 parts of ronplar and 10 of tin; bell :and spectum metals contain a large prowntion of tin. Bronze is sometimes manto of 11 parts of coplyer, 2 parts of tin, $b$ parso of zine and 1 pail of lean. When exposed to the air
 (andonate, which protects it lrom furthre action. This canting is now gemprally produced atificially by a variety of methats, as lay whing the surface with in solution of salts and acils. Alhos with almminium containing the constituents in whdy diflement propertions are made. That with:3 fer cent. aluminitun is whiter than aluminium. the enlor being mose like that of silver. Au alloy of coppre containing is to 10 per cent. aluminium has a color residubling that of gold. This is rery hard ant clastic, and is known as aluminiun bronze. It is now used considerably in the manfacture of ornamental and useful artieles. German silver consists
of coplore, zinc, and nickゃ. Tetallie copper iso of wry great Falue in the arts, bering especially valuable for shigs" shoathfity and balts, amt is also the material nsed in the mantiteture of a great variety of wares. The developmont off clex-
 lal to an vormons increase in the consumptinn of rulyer, chiofly in the form wl wire.

## Copper-smelting: See Meralldrix.

Coprolite [from Gr. кómpos. dung + suflis -ite]: the fos il excrement of anmals. The term was originally applied hy Dr. Buckland to certain sleposits which he found in the lias, and determined to be the frecal remains of the gigantic saurims of that perion. The true coprolites of the lias are formet like lidmer jutatoes, of eartly texture. black or ash-gray color, and glasy fracture. They are twisted, showing the mark of fle intestine and freguently comain shells. fish seales ant bones. or, more rarely, the lintes of reptiles that were eaten by their larger relatives. The term coprolite has been extented in a commercial sence to include tleponits of phosphatic rock containing large puantities of water-rolled, fosebl bones of fishes anil saurians, such as occur at the base of the Red Crag of Sulfolk, England. The value of these minerals is derived from the phomphate of lime of which they are partly composed. It is used with great advantage as mineral mamore after having mulergone cheap chemical treatment. It is converted into a solwhe superphosplate by the action of sulphmic acitl. The trale in Crreat Britain is of quat impertance. and the profluction large. Some specimens riehi whon washeet and powhered over 8.5 per cent. of phosphates. The greensam varicties riek about 60 per cent. of phosplates. The anmalal yicla of England is from 30.010 to 40.000 tons. These coprolites contain from 4 to 5 per cent. of organic matter and a little silica, but from 0 to 80 per cent. of their whole sulsatace is a mixed phophate and farbonate of lime. Extemive heds of phosphates wewr in the Tertiary depmits of the Sunthemstates, notably in Soull Cirolima and Florida. and these contain many true coprolites mixed with other remains of vertelpates, especially of sharks, proboscidians, and cetaceans. The oupht of the suuth (inmlina phosphate muts fin 1889 was nut far from 500,000 tons.

Church has been peculimery exposed to persecution. Emirs vied with each other in the attempt to exterminate Christianity in Egypt. It is also a wonder that ther have not become extinct throurh internal dissemsions. Monophrsites, Monothelites. Jacobites, Melolites. Phantasiasts. Eutychians. Acephali, Exaianites. Gaianites, Barsanuphians, Anthropomorphites, and semilalites. now only names which perhajs excite a smile. are the epitaphs of so many wrangling sects that through centuries split the Coptic elurches. murdered and drove (oppts into deseris. caves, and dens. The coptic churels is far from leing in a state of peace. A party of reform among the laity is demanding that the large income of the church. from the rents of bequenthed estates, now secretly appropriated by ceclesiastics, be managed on business minciples: that Coptic schools be proviled for Coptic children: and that steps be takien to secure a better educated ministry, who shall he paid a regular salary. In early times the copts worshiped in Egyplim temples. Sur ther have their orn churches. but, with exceptions, they are sinall and dirty. At sumday services the men sit crossleqged cur mats, or stand leaning on cancs or crutches. At the close the congregation crowd around the pricst. Who lays. his hand on the head of each in hlessing. Their fasts are the "great fast " at Easter, filty-1 wo dars, the fasts of Christmas. Whisunday, and of the Ascension of Mary. Ihuring these only liread, onions, oil, and legumes are eaten. Neither the Coptic service nor the Coptic character is fitted to make anr impression on Moslem. favorable to Christianity. Eforts have therefure been made to infuse a better spint among ('uptic Chistians. Since A. D. 1250 the liomish Clurel has hal its. Francisem misionarice in Egypt. In 1ist Pius IV. established an apostolie viamship at Cairo. The present vien reports that he has s.006 ('iptic commmicants and thirty-one native priests under lime The Church Misciourt? Sedety of England began work in Egypt in 1No, and the Cnited Presbyterian Church of the [. S. in 14.j4.

as here used, are to be applied only to works connected with the fine arts or to pictorial illustrations, and are not to he extended to prints or labels designed to be used for other articles of manutacture. These last may be registered in the Jatent Ontice, In determining whetlier one of the above-named subjects can in a particular colse be copprighted, it is necessary to consider how fill it must be original with the professel author. There are some compositions of such a high and elevatet character that the guestion of originality ean not be successfully raised. It is conceded by all mankind. On the other ham, there are other works of a much humbler sort, lat still of a highly meritorions and useful nature, in which all the materials are existing in literature, and are well known to intelligent men, and open for resort to any one. and the only original feature is foum in the selection. arrangement, or combination of materials. Instances of this kind are works on grammar, arithmetic, or seography, maps, charto, etc. These, so far as they are the result of the work of the compiler or "anthur," are the subjects of copyright. He hats no claim, however, to the materials which he did not ariginate. Iny other person may resort to them and prepare a work from them, trut he muist not make use of the coprrighted book as a mode of collecting his materials. His correct course is to resort to the original smrees of information. An illustration of these principles may be found in the case of a law reporter. lle can have no coprright in the opinions of the judges, as of these he is not the author, while he might lay claim to a statement of the facts of the case, as well as to an abstract of the decision prepared by himself. A translator of a foreign work not the subject of a copyright here may lave a copyright, as he is for practical purposes an "author." Anyother person may translate the same work, and have himself it copyright. It was even held under the former law that a person might have a copyright in the translation of a work copyrighted in the U. $\mathbf{-}$. . though such translation were made without the author's consent. This rule was applied to an manthorized translation intu German of Mrs. Beecher Stowe's well-known work, Lncle Tom's Cabin. This anomaly has been corrected hy a change in the law which permits an author in taking ont a conyright to reserve the right of translation as well as of dramatization of his own works. So in the case of music, the composition of a new air or melody is sufficiently original, but it must be substantially a new work, and not a coply of a piece already in existence, with only such variations as any skillful composer can make. Uuder these rules there can be no enpright in a sulject, but only in a particular mode of treating it. For example, one can not ohtain in this wary an exclusive right to make maps of the city of New York, though he might acequire one in the results of his own labors and surveys. Any other person may make a like map from his own independent labos and survers.

The word "book," as used in this class of laws, has a wide meaning. It is not restricted to vohmes, but may inchnde a single sheet. It has even been decided that for this purpose a sheet of paper containing diagrams representing a system of taking measures for and cutting ladies' dresses. with instructions for practical use, is it "book." There can he 10 coprright in a mere title as unconnected with a book. Where, however, a title is usel to designate a work. particularly a periodical, it may berome of great value, which will he alministered by the ronts umder the law aplicable to the "goxd-will" of trale in analogy to the rules appertaining th" "trade-marks." sice Trame-makis.

There is a preuliarity to be noticet in the case of a comyright of a dranatie composition. In this cuse it is not merely an exchsive right to multiply emples for sale, but also to publicly perfom ore repesent the play upon the stage. The term "dramatic: cmanosition," an thins tsed, inchates all the parts which gis to make up a seme in a theatrical repmentation-te, g. fostures, spakn worls, ete. A rharacter in a pliy who, acenting to the part assignet to him, goes through with a serios of exonts withont speaking, making use of mations amb gestures, is as much an netur as the who uses his yoice, and the one part must be regarled as embraced within the expressinn "dramatio composition" as well as the other. The only difterene in the two parts is that the one addresses the cye and the other the car of the simelator.

The property in anconyight is of an incorporal mature. It can not, for example, be seized hy a sheritt in the exerejse of his common-law powers and solit on ath excontion. (ive

way a copperplate on which a coprrighted map was engraved, the purehaser would only actuire atitle to the copperplate considered as a corporeal thing, with no right to print maps from it. The incorporeal right to publish maps could only be uhtained in such a case throngle the action of a court of equity:

An applicant for a copyright in the U. S. must hefore publication deposit in the mail a printed copry of the title of the book, ete., or a fleseription of the painting, drawing, ete., iddressed to the libriarian of Congress at Washington, and within ten days from the pulnication must also deposittwo copies of the book itself, or in case of a painting. drawing, ete., a photorraph of the same. Without these deposits: the anthor or proprietor is not entitled to the coprright. A subsequent section of the law provides under a penalty that two copies of the best edition must be supplied, and that when any substantial change is marle in a subsequent edition a ropy of that must also be deposited. It is made by law the duty of the librarian of Congress, on payment of a fee. to make up and legister as prescribed by law a formal statement (termed a "record") of the name of the book and thefact of the required deposit. No action can be maintained by a proprietor against an infringer unless the former has cansed to be printed on the title-page or succeeding page of each cops of a book, or on the face of a map or jhotograph, a statement in a form prescribet by law of the fact of the entry in the librarian's office. The following brief statement may be used as an equiralent: "Coprrighted 18-by A. B." The regulations on this subject were much simplified by an act of Congress in 1870, the former law having required the recort to he made in the district court of the U. S. of the district of the author's or proprietor's residence. A single office under the present law takes the place of a large number under the former system.

The term for which the copyright is granted in the first instance is twenty-eight years. If the anthor be then living, or be dead leaving a withow or children then living, theremay be a rencwal on complying with certain preseribed males, for fourteen additional years. A copyright may beassigned by an instrument in writing. The assignment should be recorded witlin sixty dars after its execution. or it will he roid as against a subsequent assignee or mortgigue for a valuable consideration without notice. A simple assignment of an existing eopyright does not carry with it theright of renewal.
The leading questions in the law of coprright concern infringement. The fact that a copright is of an exclusive. nature necessarily gives the proprietor a cause of action against one who infringes his right by placing copies on sale or reproducing on the stage his "dramat ic composition." Infringement is a very plain mater when the eopyrighted work is simply reprodiced. It becomes a complieated and diflicult question when only extracts or puotations are mide, or when resort is had to the book to make the puhbie acquainted with its contents or to criticise its style or the substanee of its thomght. It has long been established that the identity of a literary work consists in its icleas and its hangutige. The thought is so associated with the form in which it is expressed that a copryight dues not protret an author agrinst the use of his thomghts in a substantially different form. It is for this reason that ly general rules of law the umathorized translation into another language or the dramatization of a coplorighted work is no infringement. Thomgh the sentiment remoins, the form is changed. On simitar grounds a true abridgment. though made against the anthor's consent, is no infingement. This consists in a condensation of the authores langmare, amel is substantially a different work. Where there is no such change it is an abuse of language to call the new work an "abringment." The litw as above stated has recently bern monlified ly the express statutory provision, hefore referred to, allowing an anthors it loe mee tit. to mesere the right of translation ur dramatization. bismissing these special cases of change of form lrom further consindration, it remans to inquite how far extracts or quotations maty be mate. Whem, for example, such quotations are mate for the jurpose of a review, the main inguiry is whether the act is a reasomable one as calenlaterl to show the charatore of the original work. The critice must bot gos so far as (0) substantially publish the copyrighterl work. The quastion thas beromes one uf the ralue of the extritets made. 'This must be determined by the facts of eate cuse. It has somelimes been thanght that the trus inguiry was whether there was an intent to infringe or steal. I'lus is not satisfactory. The real point is has the author
suntained sulvitatial injury. 'The same gempal rule must he applied to wher case where extracts an mate. There is a marked distinction in this branch of the baw hetwena true abridgment and a compilation. In the former, as has bern sern, there is a real and subatantial condensation of the materials, and this has been mate with inteliedtal latlum and judginent. In a compilation there is the at of taking the very worls of the author, or with such slight dhaners as to show servile imitation. The law at most therates the romdensation, and doxe not permit the enplying of the ant thor's words to such an patent as to shom sulstantial injury. Compiation is to some extent permitted in dietiomaries, gazetteers, cechondias, guide-boks. Mr., whre the main lesign and execution of the work are mow. In works of this clas. the materiak mast, to a considerable extent, be the same. Sovelty and improvement in then in gencral emsists in abridgment, changes in aramgement, more modern information, the correction of erross etc. It is seareely necessary to ahd that an infringement may take phace by jubdishing but a small portion of at work, if that fre a vital part and came a subtantial injury to the proprictur.
In the $[$. S. the remedies for the violation of a colvright are to la songht in the Fexpral courts, the sirenit comet muler the acts of Congress having original jurisdiction. The regular rentedies are ath action for damages or an injunction from a court of equity preventins the combinnanee of the aets of infringement. As inciflental th this relief, the cours may direct an aceount to be taken of the prolits realized by the infringer. The courts will not grant relief for an infingement in case the work eopyrighted is immoral or libelos. This is expmesty povided by the act of Congress and the same doetrine without such a provision wadd be alministered as a regular hameln of equity jurisprodence. Where an infringement ronsists in making use of part of a copprighted work in eonnection with other matter, the injunction will be so granted ans to prevent the publieation of that portion of the infringer:s buok which is ogen to abjection. without reference to the fact that the orter of the eourt may make the lnok, thus shorn of a portion of its contents, wheles. Severn penalties and forteit ures are also imposed by statute law unor promes who knowingly violate the frovisinns of the eopyigh acts.
Common-lmu copyright.-This is the right of the owner of an intellectual protuct ion in his work hefore publiention.

1. It can mot he suecesstuly disputed that if a person eomposes a laterary work, and dues not chonse to publish it, he has as complete an uwnership in it as of he had pratued a wated or other chattel. Conceding that he has no vested right simply in his iteas, he dons have a tithe to them considered in reference to the outward form in which they are clothed. Acemblingly the manar ligal rementies for the violation of rights of propert womal he appliable, and the usual inedents of propery wonld attach. Still, for shereal reasons, umphblished writings can mot be taken by erellime
 A leace of Lomis XV' of France of My $\$ 1,1749$, in favor of the lranch tragic por (rebiblan (the prenture of whose phay while acting at the theater was taken for his delns), Gectaring that the proluctions of the mind are not among
 a- a high honor to literature. (r'uriosities of Diteruture, ii., 1!2.) In mware of this kind of propry can ach it or divfore of it ly will, or it may pass to his reprenentatives at his hath in the ordinary conve of suctession. The etfeet of the at of adressing a hetter by an athor to at "orrespmatent has been frequently comsiderell by courto of justies. The result of the discusions is that while the anthor pates with the papre on which the better is written, he sial betains an ownership in the sentiments and expressions. Why his div ided ownership the receiser is emitled to the letter ermilareal aan autograph, while if he pullishes the content- he may lu. parsatef by an atetion in court. The awnership of the reeciver is curpural, that of the anthor is incorpmest. The same result would happen if one should ahtres in writing a purm or other literary work to a fricmod. S distinetion berwern the ownership of the paper and of the pum wonld immetiately spring up. Some jurias have entimed the applicability of the rule to letters having a literary characher. It is, howerer, believel that his distinetion is mot maintainable, and that in weneral a letter can mot for pollishol hy its
 thor, undess it may lne to vindieate the receiver's character or to subserve the embls of public justice.

One of the mest inportant instances in the practical administration of justice of this fom of literary property is an umblisheal play. A compuser of sheh at work may keep it alsolutely to himself, and maker it ats complethly his sem as any other speries of property, so he maty bappoprite acts catse it to become commen property and wholly ahandon ownership. In such at (ase he is said to "dedicate" it to the public. The ace of deationtion mast be distinet amil meplivocal, and can mot be presumed from the fact that he permito it to le pahibited on the stipe in the ordinary mamer. The most that can be clamed from such an oxhilhition is that any persom having the rich to attemd neon it may carry away with him as muth as he is able trom his unasisted immory, and may thas by means of his momory reprnine the play upon the stace $A$ to the last hanch of this propsition, even, there would seem to he some doubt. sine it may be plansibly maintamed that all that the auther intends to concede to the hearer is the right to the presomal enjoyment or instruction of the occasion. However this mav le, it is elear that there is no implied license to the andience to take notes, and ly this means obtain sufficiont kinowledge of the phat to represent it. If an ador becomes himself the author of a phy, his performance of it in public, or that of a theat rical company, with his consent. for a compensation, can not be regaralat as any evidence of his ahandemment of the manuseript to the pubilic or to the pres fession of actors, surh as surcial use of an umpublished work fon the anthor's benefit is perfectly consistent with the contimunce ol' an ownershij, in it.

Rights of this kind appertain to aliens as well as eitizens, having not hing to do with the statutes of copyright, and are accordingls of great consequence to foreign and non-resident ant hors, who, heing unable to nefuire a statutory coproright in their works, way still, by virtue of theme ownership of an unpublished flay, maintain an exclusive right to represent it uon the stage. Similar suggeations may be made as to lectures, whether written or oral. The at of delivering them before an sumience eonfers no fight upon the hearers Tu put confe of them on sule without the anthers consmat. Propery in lectures is protedem in Grat britain ly a sperial
 must roly umongencral principles of law, and may resert to aun injuntion or action for damares. So the exhibition of a statur or a picture gives no license to a spectator to multiply coplies and place them uponstle, These rules do not almit of evasion by the unathorizal prondaction of abridgments of manmerripts or eqpies of works of art reduced in size.
Not withstanding what has been said it is clear that an author of a manseript, che may ahsolutoly lose all proprictary right in it hy undguivend acts of dedieation to the pablice as e.g. by phating printod copins of it on sule withtout ohtaining copyryt, or by oltaming a copryght in a foreign comitry and selling the work there.
literary property may, in the stage of ownership now under consideration, Ine assignel, so that a divinotion will spring up let ween an athor and a more proprietor. Tho sald of a manserigh will in general give the purchaver ald the rights which hle author of it, comblemed as an owner of an umbuldished work, would fassess. Whether he eonhd take ont at appright or mot cmatd nut be thetormined as a mere matter of reasoming, but would depend on the special provisions of the eopright statutes.

A guestion of some ditliculty hat arise as to the pmint whothrany legal protection cand le exiven to a literary unpuhbished work which is masound on the seom of moratity or contans dect rines subversive of pablic julier. "l"his ques tion muth not he comfonmed with one which maty arive under coperight statutus an the emsiderations in the fwo caves are quite titherem. In tho later case there is sometime a distind provision that the roperight shall mot juteet am immoral ir tilnetone publications. As to the cate of a mambmeript, it would appar that the foblowing dist inction shoth her make: no protection should tee given to the author hy the rourts whid womld enalhe him to make his immoral work the soure of gain ur profit. (On the other hathe if he
 wht inhers from pmblishing it allagether, as well as to refram himsult-wary comsideration of justion and expetioncy repluires that he should la promited todn so. suplmee that a prom while in the immaturity of his powers semperes a Work extravagant or immoral in its views of the rights ot sombly ur of indivifuals, but that in latur lite his phinions are changed, and he comes (o) wiew with ahhorenmentren
that he onee warmly approved. and he finds that some persun against his eomsent has obtained possession of his manuseript and is about to publish it, shall he be prevented by law from suppressing such a publications Great jurists hare answered this question in the affirmative, on the theory that there can be no property whatever in such a manuscript. Their reasoning is unsatistactory and inconclusive, and the true view wonled seem to be that the author is stilt the owner of the work, considered merely as an item of froperty, but can not invoke the aid of the courts 10 enable hin to make protit from that which is inherently vile and hase.

In the $L^{\top}$. S. the remetlies for the violation of the proprietary rights of an author, being given by the common law, may be sought in the state courts, notwithstanding a IT. S. statnte allows an aetion against a person who publishes a mamuserint without the consent of the anthor or proprietor, such author, ete.. heing a citizen of the U' S. or a resident therein. It will be observed that the terms of this statute are not so comprehensive ats the rule of the common law, as it confines the remedy to a "citizen or resilent," and it appears to have been enacted for the benefit of those persons only who are entitled to the statutory conyright. Remedies, so far as this act extends, are cumulative. and may be sought vither in the U. S . or state courts.

Intermational C'opyright.-This is an arrangement by which an author residing in one country may secure in sueh other countries as are parties to the arrangement the exclasive right of multiplying copies of his intellectual prodnctions, and selling the sime. In Great Isritain international copyright was first granted by the 1 and $\$$ Vict., c. 59. This act permitted the Queen, in conneil, to grant to the atuthors of original foreign works such term of copyright in the British dominions as she pleased, provided the same did not exced the term allowed for similar works in the United Kinglom. Fnrther legislation on the subjeet was had in the 7 and 8 Vict., e. 12 , and again in 15 Vict., e. 12. By the latter act the Queen, in connciln may grant a copsright of five fears for an authorized translation of foreigif works, and also may prohibit for a simikn period, the representation of an matuthorized translation of a foreign dramatic piece. Prussia, however, first set the example of granting internatinnal copyright by a law, prassed in 1835, which provided that every country might secure copyright for its authors in Prussia by granting reciproeity. In 18.22 jrance passed u law forbinding the piracy of books and works of art published abroad, without requiring reciprocity. I'rior to 1891 an anthor was not entitled to a copyright in the U. S. unless he was a eitizen or a resident of the same. And in order to be a resident within the meaning of the law, the foreign author must have formed an intention, at the time of recoreling the title of his work in the foreign office, of making the LO. his permanent home. But in Tsol the Government of the U. S. abandoned the joliey which it had hitherto pursued, and enaeted a law which conferred on forejgners the privilure of conyright. The tow, however, only applies to a citizen of a foreign state or nation when smeh foreign state or nation permits to ejtizens of the U . s. the benefit of eopyricht on substantially the same basis as its own eitizens ; or when such foreing state or nation permits to eitizens of the L'. S. eopyright priviluges substantially similar to those provided fur in LT. s. law; or when snelo foreign state or nation is a prity to an international ingreement which provides fur raeizuocity in the grant of copyright, ly the terms of which arreenient the U.S. may at its pleasure become a party to such agreemant.

I). July 25, 18.5.

C'onnil'la-mots [span. dimin of coco, cocon-tree, cocoamut]: the seets of Attalea funifera, a South Ameriean palm. The shells of the seeds or nuts ine hard, have a elose texture, and are susceptible of a fiue polish. This shell is much nsed in turnery for the heads or handles of nmbrellas, for toys, and ormamental articles.

Counimbo, kō-keem bō: a province of C'hili; bounded N. by Atacama amrl s. by Aconcagua, and extending from the Pacific to the summits of the Andes; area. $12,905 \mathrm{sq}$. miles. Capital, La serena. The surface is much broken, but the valleys are very fertile: the mines, especially of copper, are anoug the richest in Chili. Pop. (1845) 160.89s.
H. H. S.

Cornimbo: the prineipal seaport-town of Coquimbo prorince (see map of South America, ref. 11-C). The harbor is good and the town is well built. Two railroads conneet it with the agricultural and mining regions of the province, and the import and export trades are important. Pop. (1891) about 10,000. Coquimbo is now essentially nnited to La Serena. the eapital of the province, just N. of it at the mouth of the Coquimbo river. Serena was founded by Valdivia in 5544 , and named, it is said, after his native rillage in Spain. Pop. about 20,000 .

Coquimbo Owl : See Burrowisg Owl.
Cofinina: See Lamestone.
Co'ra: an ancient city of Italy. in Latimm, about 36 miles S. F. of Rome (see map of Ttaly, ref. 6-F). Livy mentions jt as being a colonia Latine in 503 B . c. Few eities of Jatium have more considerable remains of antiquity than Cora. Here are relies of aneient walls built of massive polyronal blocks. The site is now oecupied by the town of Cori.

Cor'acoid Bone [coracoid is from Gr. коракоєьōns, rarenlike: $\kappa$ кopak, raven + eloos, appearance $]$ : a bone of the shoul-der-girdle, existing in man and the higher vertebrates as the coracoid process, a projection from the lower anterior borler of the seapula. In the Monotremes, echidna, and ornithorhynchus, the coracoid connects the seapula with the sternum, and forms a part of the glenoid fossil. In birds the coracoid is always present, and is the most important bone of the shonder-girdle, articulating with the front of the stemum and forming the man support of the wing. It is large in turtles, forms a part of the glenoid fossa, runs from earabace to plastron (the lower part probably being procoracold), forming the truss by which the weight of the body is supported on the fore limbs. In other repitiles when fore limbs are present the coracoid forms part of the glenoid fosisa, and inturrenes between scapula and stemmm. It is present in varions degrees of developmont in batrachia, lint, as a mole, is well develoned in the thoura, while in the tailed batrachians it is carililaginous, and forms the greater pirt of the shondier-girdle. Anatomists differ as to the homolormu of the coratoil in fishes. Aceording to Cope, it is the lower of the two bones situated at the base of the fretoral fin, the upher being the scapula; these are nanud by Gill respectively hypocoracoid anel hrpercoracoid. In transeentental anitoms it has ham considered as the hat mapophysis of the fourth (oceipital) eephalic vertebra.
F. A. Lucas.

Coria Indians: See Piman lidmas.

Coral [from Cir. ropad $\lambda$ sov, coral]: the hard skeleton secreted* by certain Cilesaterata (q.e.) of bith he llyehozoan and scyphazan divisions. It is compored of calcie carlumate phas a varying amomit of animal matter, aml is a sectetien of the external layer (eetontorm) or skin of the body. A few speries of ceral pulys, like the mushewm coral (Fungia) live separate, and in such the coral corresponds to the individual: but in most cases the enmonotucing animals are colonial, and in such insances the mass of etral is the produet of the whole eolony, the pusitions of its varions member being more or less clarly sen in the pits on the surface of the coral. Most of the soral-producing mimals hatong to the Letinozom divisiun of the scypheazor. the only exceptions heing the llydragoth taghom coral (Millepurre alecornis) and its allies, in which the pits ocenpied by the polypsare divided by horizontal partitions (whenee the ermup, tuget her wilh other nom-related forms. was formerly callet Tubuluta). Of the ereral-producing Actinozoa (see I'olyp) there are two divisions, the Oclocoralla, where the partsof the animal are eight-radiate and the Ifexacurtula, where they are in multiples of six. The the former belong the sea-fans and sca-whips (rorgomionand Maricert) of the southern coast of the $t^{\prime}$. S., ame the precinus coral of the Mediterrancom. The
