Red coral. valuable red coral (Corallium rubrum) has a tree-like form. and sometimes reaches a fout in length. The most impurtant eoral-fisheries are on the coasts of Agers, Tunis, and Mormere, but coral is also chbtimed arear Xaples, Leghom, Surlinia, and Corsica, ame Xaples is the center of the roral-trade. The annual collection of a fishine-fonat raries from 400 to $\mathbf{t h 0} \mathrm{lb}$. In 18.3 the Agerian tisheries produced about $\$ 500,000$ worth of the rame coral. The price varies according to color, lirge piepees of the finest rose pink being valued at from s 400 to 5500 per oz., but small bits of the porer colors, such ats are visel for fhildren's neeklaces, are worth sit to 1.50 per o\% of the Mermeoralle, Ahtiputhes of the trop ies protuces the valmable black coral. The lrain corals (Diploria, Sanicima), slar-corals ( 1 sfrep $)$, ete, are massive. The Madrepores, Oenlinas, etc., are branching, while At/aricif, ette., form incrusting masses. Sine of these have any eommoreial or eemomis value. exent as a soure of lime: they are, lowcerer very impront in natures ecomomy in that they all aid in the luiding up of coral reefs amf islands. No true reef-buidding corals en live where the water fallis below to F... but some of the licyonoid forms oceur even in the Aretiesens.

Coral linads and coral Recfare among the most characteristic features of the tropical sens, They meren in several different relations: fringing recfs, harrier reefts, and atolls,

Fla. 1.-1Bnlabola, with harrier, reof. Ingoun, and coral islamds. Fringing reefs lie close along the shor of some isiand or hani mass, mot of cural formation. Parrier [ew fo are separated from the adjacent island or mainland by a lagom of relatively shathew water, varsing from a mile ur two lumany miles in wielth (Fig. 1). The Sio(anty intands of the mid-Piacific are semerally survomblad by more or lice contimuous harriw reofs, with la-

 with wheh it is romelty parallel. is the haresest reef af this kinc. Stulls are romplly oval reefs, inthene a hallow hamon, sellom orar 200 or 300 teet deat and untreken by any central ishamb.
*t ls hardity necescary to say that the (wnal-making animalsar* oot "insects" and thal curat is not the" houre" whith they "build."

These are sen to the mulner of eighty in the Pamota or Low Archipelaqn: to a smewhat greater mmber in the Conthe-Mashall Arehipelago and elewhere in the I'acifie. The teron afoll is adopted as a generat mame for such islands from its lonal use in the Datdive Arehipelago, s. W. uf India.

C'omlitions of coral Gromfth, - 'raral reets are formed by the erowth of varions epecies of cotals, of =mall fulypis. living in communties. Daeh individnal may he comparel in form to a minute sea-ancmone: it sectere earbonate of lime from solution in sat water, mol thus forms a stony skeleton, growing slowly to a eonsideralide mass. The destruct ive action of the waves, as well as of varions horing mollusks. breaks up, this limentone framework: the finer partiches are washed out into deep water, and the comarser sand is thrown back on the oldar part of the recf. The surface of cortal reefs and atolls is built a few feet abvere the level of the sea by the heaping of cerral sand from the beach by waves and wiuds. The brealth of the strip, of land thus formed may reach half a mile on more, 'The reer is more or less intterraphed by thanswse dhanels, comerting the lagoon with the necan, held opele by tidal or wimd eurrents amb frequently giving entrane to protected harlors. Hence an atoll may consist of many small linear intends slighty disennecteil. laef-milding corals thrive only in water Whase lowest monthly temperature does not fall hedow fis F: hence they are exeluded from the patern equatomial Pacific, where the con Pezuvian entrent flows north from far sumthern latitudes: even diredty under the equater the water about the (ialspagos islamds is too coll for reef-building. The central and western equatorial Pacific. together with the torrid Indian Ocean, where the surface water is wamer Irom a longer residence in the turrid zone, are the regions of most numernus coral rects and islands. Ther are relatively uncommon in the Alantic: alhough the Bermulas. Buhamas, and llorida heys are eoral built; and many reff ocenr around C"uba and other West ludian islands. "licefbuilding corals are also limited by depth. none growint more than 190 fet from the surfice: although the sumb and mul from the wasting of the reef are spread to much greater tepths.

Theories of leef Formation.-The origin of the varions forms of coral recfs, particnlarly of atolls, which oweur amid great deluths of the uren ocean has naturally given rise to many theries. Those now current may be outhect as follows: In 183. Danwin, while on the British exploring vessel beagle, conceivel that the varjous forms of coral reefo might be "xplained as the result of slon submerrence of a fringing reef. Recognizing that a shathow foundation is necessary fon the hegimuing of a reef. Darwin believed that the frimging reef is the primitive form of all reefs, the implying the presence of some pre-existent land, such as a rokanie ishand, on whene shoal waters the yonng Whating toms af the coral pulyp cublonized from some other source. I fringing rect thus formed is shown in Fig. 2.

Fig. 2-Diagram illustrating llarwin's thenry of atolls, by submer-
 sera when the 1 resent barriee rewf was tirst formed ns a fringing

 indering a broad lagton. (i, This stage illust mats the perfecterl atoll. It is manifest that as tho oriminal hase of the ref sinks, the thickness of the upgrowing reef greatly in-
creases. The size of the final atoll will deprent not only on the measure of the initial fringing reef. lont also on the rate of submergence a ritpill submerquace presmmably catusing a diminution of the diameter of the reet, a slow sulmors.ence allowing an increase of dimmeter. Danwin's theory Was independently inventel ly bana. natumalist of the $[$. explaring expredition under Wiakes in $1 心 3 \times-42$. It grainnd wifle acceptance.
semper in 1863 first cost serions donbt on the assmmed necessity of submergenow: and since then somper's theory has been vigorously adracated hy Murray of the Britisil Challenger exprolition. - ssomming that the hevel of the seat remains constant, these observers maintain that the fommation on which the fuitial revf is fommed may be either' a dwindling Volouno, wasting under the attack of weather and Waves, or a submarine hank, rising by accumulation of marine deposits. The coral rect once begm, it extemda outwird. alwars growing most rapilly in the orean surf. Its waste is washed down the steep onter sloges, and forms a platform on which further outward growih mat extend: aml at the same time the solrent action of sem water on the decaying coral sand consmmes the inner margin where the coral growth is slown : thins the lagoon is kent open bedind the alvancing reef front, as illutrated in Fig. 3. Barrier

FIG. 3.-Diagram illustrating the Semner-Murray theory of atolls, by ont ward growth of reef with constant level of the sea: VCV, to V L V . a submarine platform: F p onduced by rain and waves fin of volcanice platform, V:R R P origiual site of reefs on warwin of volcanic platform, V: R R, later form of rewfs, due to natward growth on ocean side and selection on inner or lagoon side.
reets might thms be formed even rluring an uplift of the sea botton, if the coral growth were active and the uplift relatively slow

It is manifest that these two theories are not contradictory. Indeed, Darwin clearly reengnized the power of fringing reefs to grow outward on the banks of their own formation, thus converting themselves into harrier reefs; but he did not emphasize this process as has since been done, hecanse it would not easily account for atolls. The Semper-Mnray theory of outward growth is a valuable extension of the Darwin-Dana theory of upward growth; but the new theory does not supplant the older one. It is now recognized that wide barrier reefs may he formed withWut submergence, and that the supposed demonstration of submergence given loy such reef- is weakened: but many farts prove that sulinergence can not be negleeted. The chinf of these are the known nccurrence of changes of sutlewel on many (ovste (q. e.): the grneral assuevation of signs of "levation of the land with fringing reefs and clevated reep: the irrecular outline of the central islands within harrier reets. like those in the Fiji group, as if partly submerget: the great mumber of islame group in which atolls atone arcou-it would the dillieult indred to acemont for these withont sulmurrene; the comparatively mentar distrilmation of the varius. forms of rets in great belts, as if broally inthencal hy whe widely acting control.s. such
 of drowned atolls, as in the Chapos banks, Indian Ocean. as if submerqence had here adranced at a faster rate than the upwari growth of the corals

Completed comal islants or atolls afford very imperfect suphort fur man. The form of the islinds is low and monotomos: the arthle portion is hat a small part of the Whote and wen this may he overwhemed hy storm or rarthouke waves: the variety of phat and animal life is wery small. the comamet palin buing almost the only nseful Thint. 'There is only whe kind of roxk and ho? metal. The lower forms of marine life thonrish in great variety and banaty on the suter wer and in the gutet waters of the lagon, bot the mative human popmation of sach islands is legrades. Fumine is not infreguent, Magembering infanticide, war. atm commibalimm. II. M. Davis.
('or'allines [an callat from their resmblane to the eorals, to which they wop formerdy reforred): ecretain plants claned with the red algal (Floridect) and refermd ionth
family Corallimacere. They eonstitute the genns Coralliur, and several other genema. These plants arr peculiar in being of a rigid, stony character, and from the presence (in most species) of a larse proportion of carbonate of lime. They are not abumant on the Atlantic const of the U.S.. Int are of mueh more frequent occurrence in the Pacific. From their highly differentiated organs of fructification " the speeies of Comilinarpe are now plated at the head of the Floridea." They necur ahmulantly as fossils. The Corullima ofticinatis is common on the northern shores of Emrope, and also Oecurs on the Atlantice conat of British America and the U. S. The name curalline is often given to varioms marine polyps, but should be restricted to corad-like plants.
Cural Recfs: Sce Coral Islands and Coral Reefs.
Coral Suakes: varions serjents marked with conspicuous red bands which suggest polished red coral. Some of
these snakes. like Elons fulcius of the these snakes. like Elups fulcius of the U. S. anl E. corallina, are venomons, while others, which resemble them very closely, are hamles. Among these litter are varions speeies of Ophibulus, Oryrlopus, and Erythrolampris.

## Coramach: See Corovach

F. A. Lecas.

Corato. kō-raatō: a torn of italy, province of Bari ; 24 miles U. of Bari (q. ic.). Near here in 1503 a combat took place between thirteen Italian and thirteen French knights, led by Colonna and Bayard, respectively. Pop, 33,258.

Coray, or Koray, Dianant: Greek philologist and patriot; h. at Smyrna, Apr. $\%$ lits. Ite studied medicine at
Montpehicr, in France, and lecame a resident of Paris in
1-8s. To prounte the 1788. To promote the regeneration of Grecee and the revival of the Greek nationality, he published editions of ancient Greek authors and wrote several political tracts. 1). Apr. 6, 1833.

Cor'loel [viâ Fr. from Lat. corbis, basket]: in architecture, a projecting hracket, often senlitured like a modillion, sometimes in the form of a lasket, fur the purpose of supporting a superineumbent object or for receiving the springing of an arch. A corbel-table is a projecting battlement, parajet, or cornice resting on a series of corbels.

Corbet. Ririard: English hishop and poet; b, at Ewell, Surrey. 158. He was chncated at oxford, and was successively lean of Charist (hureh Colleg. (1620): Bishop of Oxford (1624): and Bishop of Norwich (16i22). His poens, which are sprightly and hmmorons, inclule a Jourrey inlo France (161:3) and Potica stromata (1648). His best-known verses are his Furevell to the Fotiries. D. in Norwich, July 28, 1635. See the memoir by Oetarius Gilehrist prefised to his edition of Corhet's pioms (Lomdon, 180~; rep. by Alexander Chat-
mers, 1810 ).
Corlould, Edward Ifesry : listorical painter; b. in Londun, bee. 5.1815 . Won two gold medals of the Society of Arts: momber of the Institute of Painters in Water-colors; teacher of drawing and painting to the children of Queen Victoria 1sio1-is. Among his works are Fall of Phaëllon (1834): St. (ieorye und the Dragon (1835): IHermage of Nigel Bruce and Agnes of Buchan (18.0) ; Queen Victoria (1871): Conterbury Pilyrims (18it): Iris (18is).

Corboulo, ('vars Domitics: Roman general who flourished umder Clamdius and Nero. He commanded the Roman army in a War against the l'arthians, whom he defeated. Nera, who was jeatons of him, ordered him to he put to death; when Corbmb heard this he fell on his sword, 66 A . D . A memoir by him of his exprriences in Asia is mentioned by the elder Iliny, but is not extant.

Corcoram. Miomale : hrigadier-grneral of U. S. volunteers: h, in Carrowkeel. Irelmd, sept. 21, 1827; d. Dee. 22, 1863. Ife emigrated to the IT. S. in 184!, and settled in Now York city: It the commencement of the civil war he departel for Washington with his regiment, the sixty-ninth New Vork, ant burticipmed in the first battle of Buil Rom. whare he was takin prismer and contined at hidmond,
 changed he organized the Coreoran legion. and was mate a brigadier-gencral of valuntecrs, to date: from the day of his capture. July 21 , 1 wht. Ilo was thrown from his horse near Pairfax Courthomse, V゙a., Dee. ge. 1e6is, and fatally
injured. injured.

Corinthian Order：in architecture a form of colmmen and entablature invented in（ireeep but purfectal by the Romans．Its origin is uncoptain，the Vitrusian legend of Callimachus and the basket encircled by acanthus leaves having been wholls discredited by modern archaeology．It was not generally isent in Greece before the age of Nliexan－ der（ $3: 30 \mathrm{~B}, \mathrm{c}$ ．）and the few remaining examples differ widely from each other．In Greek hamels it was treated as a variant of the lonic，having no distinctive form of base or entablature but chalacterized mainly by its slenter shaft and tall，hell－shaped capital encircled by rows of acantlas leares．In the maler of the Sower of the Winds there is but one row of these leaves，and the upper part of the bell is nearly plain：in that of the Choraric monument of Lysic－ rates there are two rows of leaves，abowe which appear coupleal scrolls under the comers of the abacus，with honey－ suckiles in the midule．The Romans greatly atfecterl the Corintlian order，and developed it into a distinetive order by giving it a special form of hase and modifying the en－ tablature to the comice of which they arbled modillions or torackets．＇The Roman Corinthian capital is somewhat over one shaft－diameter in hright ；it consists of an abacus with concare sides sumounting a bell－shaped core，around which are sixteen acanthus leares in two tiers．From between these spring eight stalks（rauliroli），out of which grow branching leaves and scrolls，which meet under the cor－ ners of the aboucus，with smaller scrolls and a rosette in the mithlle of each side．The shaft is evither fluted．as in the temple of Castor and Pollux（miscalled＂Jupiter Stator＂） at Rome，or a smooth and polished monolith，as in the porch of the Pantlieon．The whole column varies from $9 \frac{1}{8}$ to $10 \frac{1}{4}$ diameters in lemesht，and carries an entablature whose urchitrave is usuatly profiled in three unequal bands．thonoh sometimes there are but two．The frieze is usually richly sculptured，and is surmonnted by a highly ornate cornice， decorated with carved moldings．dentils，and modillions faced on the under side with acanthus leares．Among the principal antique examples of the order are the Pantheon， the temples of Nars Ultor，Fespasian，and Castor and Pol－ lux at Fome；the temple of Zews at Athens，and the Maison C＇arrée at Nimes，the last two being doubtless extented by Greek hands．The Corinthian order was frequently used by the architects of the Renaisance．The Capitol at Wash－ ington is a good modern example of the order．See Arcur－ tectere and Orders of Architecture：

A．D．F．HAMLIN．
Corinthians，＇The F＇lRst AND Second Eipistles of St． Pavi to tue：canonical hooks of the New Testament． First Corinthiuns was written from Ephesus in the spring of the year 57 ，to rebuke the（＇hureh at Conintl for party spirit，iliserenere to the apostlu＇s authority，licentionsuess， improprinty at public meetingo（especially at the lluly Com－ mumion），wanity，an！self－secking．The ajostle also settles some cases of conscience as to tating idol－sacrifices．and a print of dnctrine as to the resurrection．Second Corin－ thians．－l＂lo：first Lipistle hat heen sent tuy＂Titus probably． whose repret erratly（＂omfurted the apostle（？Cor．vii．4－16）． wo he sembs him hack with this second lotter，which is a sotier and conmilitory hut warnest statmont of the apostles true and just authority．Frum no othere source fon we learn so much regamlisg the presumality of the ajonstle．When he wrote he had ronched Dacedonia on his way to Achaia； was pmobally in＇Thessalonica．The time was tla summer

 lations are to the seen in Whistuns futhentir Fecorels．and

 has been regardel as ifurions by wome，but without suf－
ficient reason，and its gemminemess is now eonceded．It is translatud in rol．i．．1P．5－21．of the fufe－Niceme Fathers （New York）．The so－called Siecond Epistle of Clement to the Corinthians is doubtless a part of the psendo－Clementine homilies．io which it is now generally referred．See Clemest of Rume．

Corinto：a port of Northwestern Nicaragua；in the de－ partment of Cbinandega；on at bay ot the Pacific Ocean（see map of（＇entrin］America，ref． $6-\mathrm{Fl}$ ）．It is commected by rail with Manatrua，Masaya，and Granala，and the Pacific mail－ steamers tonch there regularly．The trade is important， the railroad having made this the principal port of the re－ public．Businles the enstom－house and warehonses，the town is eomposed main］y adobe or straw hats．Pcle，probably less than $2,000$.

H．H．S．
Coriola＇uns，Caits Marcico ：Roman hero，who，accord－ ing to tradition，recejerl the surmame Coriolanus becanse he defeated the Volsci at C＇orioli about $490 \mathrm{~B} . \mathrm{c}$ ．During a famine he advised that grain should not be distributed gratis among the plebeians unless they abandoned the right o1．privilese of electing tribunes of the people．For this of－ fense he was banished．Having obtained command of the Volscian army，he marched against Rome，the citizens of Which were unable to resist lim．IIe wats at length ap－ peased hy a depmotaon of Roman matrons，led by his mother Veturia，and his wife Volumnia．The story of Cori－ olanus forms the subject of one of Shaksjeare＇s dramas． See Arnold，History of Rome．
（oxip＇pus，F＂Lavit＇s（＇resconits：a literary man（gram－ maticus）．who was born in Africa and flonrished probably in the sixtly century ：known as the author of an extrav－ agant panegyric upon Justin the Jounger．who was Byzan－ tine emperor from 565 in 578 A．D．，and of a poem called Johammis，celehrating the exploits of Johannes，a pro－ consul in Africa in Justinians time．it is believed by some．lut withont full evidence，that lie was the same Cresconius who wrote large and important collections of the canon law，and who was an African bishop of uncertain age．Corijppus was a writer of abilitry and those parts of his work which are now perfect are hinhly prizenl．Nuch mystery formerly existed with regasd to the authorship of his writings．bit the tiscovery of a fairly preserred IS． in 1814 cleared away most of the ditficulties which had beset this rexed question．The above works lave been often reprinted．see especially the editions by I．Partsch （Berlin， $18: 9$ ）and by Mr．I＇etschenig（Perlin，1886）．

Cork［from Span．corcho，cork，corche，cork－shoe＜Lat． corler，－icis，bark］：the thark of the quercus suber，a species of ak growing in Spain．Italy，and the south of France． The bark may be remosed ammally without injuring the tree．Cork is extensively used in the form of stoppers for glass bottles，and in the consiruction of life－presersers and jife－boats．When rasied cork is digested in water and aleohol．it leares about 55 per cent．of insolnble matter， called suberine．The cork－tree has bemintroduced success－ fully in the southern $\mathrm{U}^{\prime}$ ．
fork：the most southern county of Ireland：bordering on the At antie Ocean．Area，2． $5!10$ sq．miles．It istrained by the rivers Blackwater，lee and handon．The surface is diversified．and presents picturesune scenery．The coast is deeply inlented with sereral hays and inlets．Which form exvellent harbors．Among these are Bantry Bay and the harbors of（＇ork aurl kinsale．The predominant rocks are old red sundstone and monntain limestone．Mere are mines of copper and coal．Capital．Cork．Pop．（1891） $486,641$.

Cork：eity：river－porl and third city of Ireland；capital of C＇ork county：on the rivel Lee， 11 miles from the sea， and 136 miles $\stackrel{H}{ }$ ． $\mathrm{H}^{\circ}$ of Dublin by rail（see map of lreland，
 which is lure crosed by nine inolern briders．Many of the housps are of some and brick，amal the main strects are wide and well－paverl．but the suburbs are mean．Among the principal edifices are the comrthonse．matision－honse，the rachanges，a custom－homse，a lumatic asylum，and on epis－ Copal palare．It contians a Protextant and a Catholic cathe－ dral and two lara，lonnatu Catholic clmreles，Queen＇s Col－ lege，the cork lihnary，a modical shool，wo or three thaters，a forer hospisa］，amb sewral convents．The chief manufactures are glass，jutur，gingham，iron，gloves，efe． Conk has a large safe，and lamdluchand harbor．fommed by an estaner of the river lece．＇lhe antrance，which is a mile wide，is 11 miles from the rity．（pheenstown is on an island

R．Thurneysex．
Corn－laws：laws regulating the trate in grain：specifie－ ally tha laws enacted M！the British Parliament controlling the exportation or importation of grain．In feudal times The lesishation of birmpean countries was lireeted to lower－ ing the price of fool products，and to this end the exporta－ tion of crain was mohibited，fut in Dogland this jolicy was
 1．430 Parlianent pasised a law permitting exportation when the price of crain fell bolow a ertain limit．Ifeary dutiss． however，Wers still impesch．Jo William and Mary＇s retign these duties were abolishod and bounties wert wranted io exporters．In the meanwhile the Government had songht
 law pased in 1 bib：prohibited importation．and subsequent statntes held it in rambint by ligh anties．Ill throngrly the efoghtmenth contury these two methorls of keeping up the prim－the wranting of tranties and the heary tasation of maports－markod Great Britain＇s polieg in realing with the grain trale，but in $181+$ bonnthe wera ibolished．In $181 . \bar{\circ}$ a law whs paced makinor sow，a quarter the price at which importation inight herin．In leas this law was amended so as to permit impertation when the pries reached oos．a guarter．＇l＇lu＂price did not rise to this point，and af further
 a quabter foreign grain was admitted with a muty of ais． when the friee rose ubove $73 x$ ，the duty fell to 1 so．and bee
tween these two extremes of pice the cluty varied．This was the principle of the sliding scale，more fully applied in this than in any previons statute．

After the Reform 1sill of $183:$ secured for the mannfactur－ ing classes and the great towns representation in Parlia－ ment，opposition to this protection of the landed interests began to make itself felt，and in 1834 a motion was offered to impose a fixed duty instead of the sliding scale．It was lost，and a motion for repeal introduced in $1833^{\circ}$ met with the same fate．Ilenceforth the chief opposition to the corn－ laws cane from outside of Parliament．At Manchester in 1838 （or．as some say，in Jan．，1839）was formed an anti－corn－law association，which later，under the name of the Anti－Corn－ law Leagne，enteren upon a campaign of agitation for re－ peal．1ts leader was Kichard Cobden and its most eloquent spokesman John Bright．liepresenting that cheap food would follow the remission of duties and that the corn－laws were solely in the interest of the landowners，the league constantly won new adherents hoth in and out of Parlia－ ment．In 1842 Peel caused a further modification of the corn－law，improving the operation of the sliding seale，but this did not placate the foes of protection．The potato blight in Ireland in 1845，followed by the failure of the corn crop in England，caused one of the worst famines of modern times．The high price of corn in the midst of the general distress gave the league its opmortunity．Its agitation be－ came more vigorons：Peel，then Prime Ninister，was con－ verted to its doctrines，and in Jan．，1846．declared himself in favor of repeal．An act providing for the gracual aboli－ tion of duties was passed Jume $\mathbf{2 5}, 1846$ ，and Great Britain has never since returned to the policy of protecting corn． The effect of the repeal measure is a matter of controversy between free－traders and protectionists．The latter point to the depression of agriculture in recent years as a conse－ quence of the change of policy．

F．M．Colby．
Cormplanter［Iroquois，Garimurarhin，the planter］：a half－breed seneca lndian and chief of the six Nations：b． about 132；the son of John Abeel or O＇Bail，a white trader． lle aided the French against the English，and was a deadly foe to the colonists during the Revolutionary war，but after－ ward became the steady friend of the white people．He was a man of great intelligence，lignity，and moral worth．D．in Warren co．，Pa．，Feb）．18． 1836 ．A monument was erected in his honor by the state of Pemsslvania in 186\％．See Snow－ den，Historical Sketch of Cornplanter（1867）．

Corn－suake：the Coluber guttutus，a colnbrine，non－veno－ mous serpent of the southern U ．s．，of a brown color，and often 5 feet long．It is generally not seen except mornings and evenings．It enters honses，devours young chickens and other small animals，but is of gentle and familiar disposition．

Corna．Julus：Professor of Romance lhilology in the University of Prague；12，at Basel，Feb，24，1849．He is one of the collaborators in Gröber＇s Grumbriss der romamischen Philologie，and has published important studies，especially口ини Sunish and Portuguese subjects：e．g．Glanures pho－ nologiques（1873）；Études sur le poime du（＇id（1881；1830）． A．R．N．
Cornuropial［for Lat，cormu co＇piaf，hern of plenty］：in the fine arts，an ornament representing a horn，from which issup flowers，frmits，and leaves．The lable accounting for the origin of this emblem of plenty is that Amalthea，when one of lur goats hat broken off a liom，presented it to the infant Jupiter wreathed with Howers and filled with fruit．

Cornu＇tus，Lh．AnvaEn＇s：a Stoie philosopher of Leptis，in A fricat，who lived in Rome moler Nero，and was the teacher and friem！of Persins，whose satires he coliten．He was ban－ ished hy Noro togelher with Musonins Rufns．Of his works we have only a mamal in Greek，known as De Nohure Deo－ ram，compiled for stations．youth from the etymolurizing
 by Osann（1841）und（．Lang（1881）．

their size and lengeth the most magnificent stramers in the solar system. 'lhey may be sand to be the prototype al' the terrestrial anroms: in fibel. the solur atmd the termet rial sustems have several puints of resemblancer, amd they mo dosubt ale also conneroted with ato h other through the bintervening space, as is sugrostod by uttons known for ocemr atmose simulameonsty on the sibu aud the rarth. "These ratys are seen by the whiserver as projeeted on the backgromen of the sky, those in front contrally forming the polar soparatod streamers, the comes depenting on the lines of projerotion: these toward the sides of the helt as it prasees around the edire of the sun overlapping. and making the nebulour suatrilateral eminences. The atetion of the originating formo touts to transport tine matorial from the poles of the sum
 lated the equatorial extonsions, and perhaps the mattor of the zodiacal light through whiell the ratiant sunlight is sema streaming in straight lines. The coronal poles in all probne bility rolate with the sum, jmblying some kind of a muclabs within its photosphere, and the syonlie premb of rotation from three eclipses has inen computed to be effofis sidereal days at solar latitude $\pm 80^{-0}{ }^{\circ}$. This result will need further starly in future ecrlipses.
'lihis solntion of the problem agrees with the facts derivend from other someres. The spectroseope slows that the corona consists of tine solif] particles like dust, amd incombesecent. grass, as inlieated by certatin lines, namely, the green line 1474 (coronimm), ( $: \mathbf{F} .11$. K. of hydrogen, an unmateled line (helinm), aml traces of some of the metallic lines. It is also rich in the ultral viold actinie rays suitable to photography The polarisenpe imdiatus that there comes 10 us reflected light which is polarized in planes radiating from the center of the sum, these planes being somewhat disturbed in the coromal belt region, as also is the ease with the number of The solar prominences which show a falling off at the same latitudes. 'The evidence is very gent that the foree chietly concemad in distributing matter about the sum is of the same genoral matne as electric and magnotic forces, if mot ichentieal witlo them.

While mueh las been done to elear up its mysiory from and ast fommical point of view, the real nature or the physics of the subject yet remain to be elacidated.

Frisk Il. ligelow.
Corona: in mrehitecture, the flat, share massive membor of a classionl comico. ofton callet the drift or larmier sithated hetworn the cymatiom amb the bed-molding. Its use in to carry the wator, (lrop ly drop, from the hailhime.

Coroma. Coronat. or Crown: a botanical trmatylad to an aplembage in the interior of the corollat of sume flowers. In soma cases the comona has the form of a emp, ats in the
 of moxtition stimens, or supermanerary putals: the temteney now is lo regard it as compunch of minted pelalime stipules. The five hooded borlios semblol on the tube of the stamens of the avelepias are cabled the choum.

Curomal Anstra'lis, or sontlarn \{'rown: a constellanion of the sonthern hemisphere: almot the knee of sugillarins; soarely visible in the northern temperate zonte

Coronat lbaroa'lis, or Northorn ('rown: : small but very beantiful rondstelation botween llerenhes amd baitesa furmed of a somicorele of starss whicla may be seen butr tho zenith from May till July.
 comh, with + ran. shrink : a funeral alige or lament, minghed with the shricks and wallings of women; fommerly heard
 which is still userd at waks in remoto pates of Ipoland, is
 are fommi amonig many puinitive peophes.

Coronada: Seo Visupt 1:Z.
('oronation from lant. cormatio, the crowning: deris
 efromony of phacing the (Town upon the had, commobly

 tomary lof at hishop to phato the erowa on the lamil wit the soveredign. In others, as in Prusis. the urown is summennes pheed mion the lead by the monareh himsell." The core-
mony of coronation is a very ancient one, at least as old as King Solomon's time. Anointing often accompanies the coronation, and in Great Britain the sovereign also takes an oath to support the laws customs, inm statutes, the laws of Goul, the l'rotestant Reforned religion, the Church of Englamd, ete.; security for the Church of Scotland being promiseef in the oath of acecssion, which in some instances long preceles the coronation. For exmule, fenre IV:'s accession was lan. 29, 1820, hut his coronation was Ifeferred nealy eighteen months-till July $19,18 \% 1$. The ceremony of coronation is not necessary to the authority of a monareh.

Revised lyy C. К. Adams.
Coromer, anciently Crowner [literally, an officer of the crown: lat. coro na]: formerly in officer of high diguity. who served as a depouty of the crown and is chief justice of the kinges bench in England. It present, in England and most of the U. S., a coroner is an oflicer who in catie of sudden or mysterinus death summons a jury, which sits in sight of the boity, to cletermine the canse anil manner of death. Coroners may commit persons suspuded of homicite after inquest without warrant, for trial, and are empowered, in the U. S., to take ante-mortem statements. They also hold incuests in regard to salvage from shipwrecks. They hat ancleutly powers much greater than at present.

Coronet [climin. of O. Fr. corone < Lat, coro'na, crown] in heraldry, an inferior crown belonging to the nobility. The monument of John of Eltham (second son of Eilwarid II.), who died in 1331, is silid to atford the earliest English representation of this ornament.
C'orol, kö'rō', Jeas Baptiste Camille: landseape-painter: b. in Paris, July 20, 1796: d. there Feb, 23, 1875. Pupil of Michallon and Vietor lertin: second-class medal, Salon, 18:3; first-class medals, Salon, 1848, and l'aris Exposition, 18is\%; second-class medal, Piaris Exposition, 1867: officer Legion of llonor 186\%. Dis father, a native of lionen, had been a hair-dresser, but marrsing a milliner, took up her business, and in a little shop in the rue de Bac in Paris accumulated a competence. Corot as a boy was sent to school at Rouen, remaining there seven years. From school he went to a clothmaker's shop in P'aris, and there spent eight years. In his holitay walks along the borters of the seine it Houen, and at the lovely Jaris suburb Ville d'Avay, where his parents had a little summer home, he grew to love nature. before long set up an easel in his bedromn, and meeting Michallon, a young painter, and getting an insight of what art really meant, resolved to devote himself to it. II is father. finding his son's purpose inflexible, guaranteed him a pension of 1.500 franes a year, and ou this modest pension Corot lived for thirty rears, working early and late. His first instructor was Jichallon, who counseled him to put himself face to face with nature, and try to paint what he satw. When Michallon died, soon after he hegin to work with him, Corot went to Bertin, who had heen Michallon's master. but who was himself as severe classicist of the Poussin school. Ilis influence dif little to take away the truth to nature that Corot's temperament and work up to that time had made so strong in his studies, and he learned from Bertin io draw aceurately and to pay attention to compositiom and style. la 182, he went to Rome and Naples, returning to louris in $18^{2} 2$. . He sent his first picture to the Sit lon in I82i, and exhibited there regularly every rear until he died. 110 visited ltaly again in 1834 and in 1842, and in his later fears travelod in France, Switzerland, the Low Comntries, and wont one to England. He never married. and lived chielly at Ville d'Aray, where he painted many of his piotures, lle alwiys han a studio in Paris, and went into ahmost no other society than that of his lellow-artists, who lowed him theply and erected a momment to his memory at Ville dityray in 1880). As a lamiseape-painter he stand- als the greatest and most pordical painter in the mosement, hegron ly Delamoix ind Giricault, that discarded elassicalism and conventional forms, and turnod the attention of artist to mature itself for their inspinttion. La*s maturalistic than Dabigny, who must be consildered his greatest rival, his work is always fommed on truh h, and is preerminently true to nature in its great facts. He is a type of the synthesist in painting, supprosing detail to obtain mity of foffert, ami making the most of the great things in nuture as they present themselves the the eye in mass. TIe is a fine, though not a profuse colorist, amel the tone of his best handeapes is indeccribably beatifui athel tender. Corot painted ligures sometimes, and some single figures of peasant women are fine in color and gen-
eral aspect. He painted the mude occasionally, but with rarying snceess. There are several works by Corot in the Lourre : a number, inclnding The Erening Star and Biblis, a landscape with a little figure of the nymph, prolably lis chief masterpiece, are in private galleries in the IT. S., and his Dunte and lergil is in the lioston Museum of Fine Arts. William A. Coffin.
Corpan'cho. Maxuel Nicolas: Peruvian poet; b. in Lima. Dec.5. 18:50. In 1851 he male his debut in literature with a drama, Et Puetre cruzedo, which received warm commendation in Pern and ('hili. The same year he finished his medical studies, and was sent to Enrope by the Government to study ind travel. In 1853 he retumei to Peru, and many lyries by him appeared in the Lira Pratiófica, a jublication in honor of the anniversary of the battle of Ayacncho. In 18.54 a volume of poems by Corpuncho was published in Paris, eutitled Ensayos poéticus. In 1855 appeared the drama El Templurio. Besides these, a variety of shorter protuctions cane from his jen. 1). Sept. 13, 1863.
A. R. Marsh.

Corporal [a corruption of Ital, caporale deris. of capo, head, chief ; Lat. coput]: a non-commissioned military ofthcer; next in rank below a sergeant. He is distinguished by two cherrons worn on the irm. A "lance corporal" is a private soldier who is allowed to wear one chevrou as a mark of distinction. IIe may or may not perform the duties of a corporal, lont he has no increase of rank or pay.
Curporal [from Jat. corporatis, belonging to the body (cor'pus)]: in the (Treek and Roman Catholic churches the altar-cloth upon which the Eucharistic species and the vessels containing them are placeci. A "corporal oath" is an oath sworn upon the corporal. The name is retained by the ritualistic party of the Anglican Church.
Corporal l'unishment: See Bastixado, Flogging, Knout, and Whipping-post.

## Corpora Quadrigemina: See Brain.

Corporation [from Lat. corpora'fio. embodiment, body: deriv. of corpus, boty]: in law, an artificial person, consisting of one or more individuals, having certain legal capacithes, sucli as succession of members, powers to sue or to he sued, and to act, no matter how numerons its membership may be, as a single individual. This new person is to be thought of without reference to the members of which it is composed. It must be carefully distinguished from a partnership, in which there is merely a collection of persons, no artificial person being constituted. A contract made with the corporation is not made with the members, nor do ther, in a legal point of vjew, own its property, though they may hare an interest in its management on the theory of a trist. Cornorations may be considered under the following divisions: 1. Their tarions kinds; 1I. Their mole of creation; 1II. Their powers: IV. Visitation; V. Dissolution.

1. They may be variously classified, as regard is had to the number of nembers, their objects, and the fullness of their powers. When considered as to numbers, they are either aggregate (more than one) nr sole. When regarded as to the ntijects to be accomplished, ther are ecclesiastical or lay, white lay corporations atre either civil or eleemosyary. It can scarcely be suid that there are auy "ecelesiastical" corporations in the U.S., in the proper sense of the term. They rather belong to the English law under the rules of an established Churef. Corporations in the U. S. may be said to be lay. The term "elermosynary" is substantially equivalent io "charitable," and embraces all that large class of corporate institutions established to promote religion or learning, to relieve the sick or the pons, and in general to accomplish meritorious public objects. Another division of eorporations is public and private. A publie corporation is designed for govermmental purposes, as a city or a vilhage. Others are private. The importance of this distinction lies in the fact that a public corporation, heing a more instrument of grovermment, can be ereated or dissolved by the lawmaking power at will, while a private corpration only comes into existence hy the compuntion of the will of the sovercign power and 1hat of the corporators. Its charter is in the nature of a contract, and it can only be dissolvel by an olservance of the rules governing the dissolution or innbairment of the obligation of eontracts. When a compration is regarded as to the completeness of its powers, it may be wither one of full 1 wwers or imperfect in its character. In the last case it is termed a quasi corporation. Towns in the New England States are true corporations; in New York
they are political divisions with certain specified pherre, heing yuest corpurations.
2. A corpmation may for creat cither by prearigution.

 powers for an indetinite periol without interfornow on the fart of the sowerign jower. By a diethon of haw it is then fresumed to have hat a charter. The mothol of creatiner cerporations by reval chatere was formerly in use in the [". A. as a bramely of the Enerish lans. Of canse the lealing moxle of creation is an act of the dewishature. It is not mecowary that carh institution shonh? receive a ils-tinct and soparate organization. There may be a seneral formula provided by the hexislature with which any particular bonly of men desimine to becone a corporation may cormply. and thas berome incorporated. In orher words. (andurathan may te created moder general laws as well as organized moler special acts. It may be admed that the fewislature may ate indirectly as well as dimedty. It may conter mon sheme intermediate authority the ponier to incurporat. In this way in New fork an organization known as " "The Resent- of the Eniversity, etc.." has the power nuder certain corditions to inemporate colleges and academies. To the existence of a private corporation the consent of the members is necesary. This consent maty hown cither he an expersact of aceptance, or by implication from the exercise of powers umder the charter, terthically calle " nser." It shonl have a name wherdey to act or to contract, which may be from time to time changed either by apecial legislat tive uct or by general law.
3. A corjuration, being by fiction of law a permon, mas have the power to make eontracts and to ilo most other acts pusemed by natural petsons. In greneral, howerere it has capacity to ilo such acts as are necerary she comenient to carry forwarl the special ends for which it was ereated. At the present time it is usuably formed to accomphish a detinite object. and it is masomale that it shomb have the antthority necesary to athieve it, A compration, like a matural ferson, may tramseress the rules preseribed ty law for its action. This fact has caused many proplexing ofnestions to arise as to the elfect of an unathorized act. This subjuct is know: as the duetrine of ultre cires-transgression of penwer. In sumba ade the better opinion would seem to be that the corporate act, considered as a montract. Wand In witl. though the enporation might lue liable to an individual injured by its negligent monle of premoming an act which it hau no legal anthority to undertake. The orlinary powers of a corperation are 10 thake such contracts as are necesary to the accomplishment of its purpoose, to hold and acquire property, both personal and real. to have a common seal. to inake br-latw for the trovernmont of its members or of others and to elect new members or officers in the place of stuch as may resign, die. or bee removel. The act of removing a member is termed dixformchisement: the sume act exrriowd thward and officur is caller] amotion. From early times in Great Britain thero have been statutes termed "hortmain acts " (see Mortmasis) to rostrain corporations from aconiring hands withont licemsio from the king. suel statutes do not, in general, exist in the $[$..$\therefore$. The common practies is th limit in the specifis act of incerperation the value of the land which may he aequired. If this restriction lie exceeded, the tille is still valid, unles the state intervenes and institutes prowedines for a forleture. It is a general mule that a corpatation can nut actuire lamb by will except for charitable purnmes. It is mot themmon, even in that calse, for a state satate to limit the amont which a testater may bestow, or to repuire that the will shall $\mathrm{b}_{\mathrm{e}}$ made a detain thme hefore his death. I corporatien may, liki a matural person, iet throurh agenthevond the limite of the state where it is organized, mule restrainen by law. It hould be mhed that a coppration may commit a wreng for which it will the liably in danagro.
 can not. in gencral. commit is crime excert ar renulting from a failure to ferform a duty preceriluet liv latw. In or-

 proceeding against a non-resident corpuration wonld in general be confined to the property within the juriadiction. Corprations sometimes are made trustore for wato sume dians forminors, ete. In onch a ca-* they wombly heded aremontable in a court of erpuity in the same way as other trustees or snardians.
il. By "visitation" in meant the power of surerintomp-
me the corphation and controlling it antron. The sulpect is puronliarly apolicable to the manaroment of charitable (oorprations. "the commot law diatimguishes letween a fomber of such a corpmation, whe suphers the funds for its pratical working. and the soverejgn funw which gives it lewal eximence. The foumber in the first anse is allowed to provite rules for the gevernmont and diocipline of the collowe of ofter institution which ha has istablisheed. and
 that the rule are progerly whorven. The exerciec of this power of visitation is summary, and without resiow by the comuts of justice except in extrome casis. This pewer in the
 in bengland, but boards of trustere ate intrusted with it. This dene rine does not prevent a conert of equity Rrom controlling the funds on the theory of a must, so as to prevent Wathe mismanaw ment, of ferversion from the phopese intended be the denors. In this arpect a copporation is to be
 the state may apply to the court to corrert almans in the manasement of fimiss which are in the eve of the law directerl to publie uas. Whoth thu (ase is sutliciemty grave the "harter of the corporation may le forfeited.
V. A cmpration may he disulved fither by compulsors 1. gislation, ly survender of its franchises compled with acceptaner of it by the state, and by judicial decrec. In England an act of Pirliament is bomilhess in its operation, ancl a corporation may be arbitmaly diswhed ly law. In the U. . a diatinction has been takem lutween pivate ant fublic corpmatims. As has been alrealy yeem. a charter of a Private curporation is a contract, and as mader the $\mathbb{E}$. Comstitution mo state can pass a law imparing the obligation of contracts, the power of the state le ginature ran mot be exurnisul so as tomaterially change the prowimis of the charter without the consent of the corpuraters. (/hertmouthe (ollegers. Whombtral, 4 Wheaton.) The effect of this derixion is evaded in a number of the states by the insertion of a clanea, wher in the charler on some general law, ar evan in the sate constitution, proviling that corprate charters are to be held subject to altemation or repeal. This ctame is of course valid as to all charters granted smbequently. The most common monk of dixwobving a corporation is lis judicial dectes. Exery frandise is aceepteri on the imphed condition that it wall be properly exercised. If there
 promending may lu instituted in hehalf of the state it forfoit the charier. The abman or neglect does mot of itself lectroy the chartor. no can the canse of firfoiture be bric sented to a court in an indirect manner. For example, it conld wot be urequ ty a deher as creating an incalpaty to sue, or by an heir as an ineapucity to take an estate ly will. A prowaling must be resortal to for the very purbose of forfeiting the charter, state lans sometimes provisle dis--olution a a mote of enforcing the conlection of weths the property lecing maraded as a trua fund for that purpose, and at court of eguity will administer it for the beredit of rreditors. The [. -s statutes of bakruptey are extended to businces entporation. It was an ohl rale of the common law that a dixolution of the corpuration extinecuishad its dhots. lis daims contal he no longece collectenl. Ats persomal property pasal to the state, and its hand fowernd to the granter. It premt there is little rom for the aphlimalion of these rules. A cont of "unity would. in general, fation a trast upon the property in favor of crevitiors, and in all hasines corporation for thestorkhohders. Charitable funds would be administared lay other truaters.

Herbert h. sisutu.

Correa de Scrra, kō̄r-ràău-dā-ser răa, José Fraxcisco, LIL. D.: a Portuguese botanist; b. at Serpa in 1550. He risited the C.s. in 1813, ant beeame Portuguese minister at Washingtom in 1816. He wrote several treatises on regetable physiology, but his principal elaim to literary fame is his Colectóo de Lirros inerlitus dit Historia Portugueza ( $1290-1816.4$ vols.). D. Sept. 11, 1883.

Corregrio. kōr-rel jō, Axtoxio Allegri: Italian painter; b, at Corregrio, 20 miles E. of Pama, in 1494 . He was of the most individual character and had rery great teelmieal power. but there is litlle else in his work than that to command our idmiration. He can hardly be attributed to any one of the Jocal Italian sehonls, hat was rather the result of all the strong talent of his time. whieh was the height of the ltalian Renaissamce, acting in an imitative nature, gifted ith great executive ability. He seems to have hat a very early success, and the story of his having died from the fatigice of carrying home a load of colpler enin in which he was paid for his work has not the slightest foundation in histnry. Ile died young, but belowe his death had lived in a comparrative retirement for several years, and, so far as is known. no longer in the practice of his art. The distinguishing equality in his painting is his large. rapid, and extraorlinary brush-work, and his impasto is not surpassed in masterly precision and largeness be that of Titian or Tintoretto. Sir F. W. Burton, keeper of the National Gallery of Lomdon, one of the most competent technical critios if our time, says of him: " Taking this great genius by limself, it is diflicult to overestimate his powers. But the inHuchee he exercised on later art was more baneful than otherwise." His most important works are the great paintings at Parma. where the tome of the cathedral and that of the Church of St. John the Evangelist were covered with his work, in the one case the ascension of the Madoma, in the other a rision of st. John. Tn the convent of St. Lodovieo. in the same city, is a large work of his youth, covering the valtting of a large roon. His best known and most admired easel pictures are perhaps the Marriage of Saint Catharme and the Jupiter and sintiope. in the Lonare; the Tativity of (hrist (ealled The Night), and the small pieture of the Braydalen, at Dresten; the Leda, at Berlin; and the Temus und Cupid with Mercury, in the Niational Gallery in London. D. in Correggio, Mar. 5, 1534. W. J. Stillmax.
Correlation of Fores, or Transmutation of Forec or Ehergy : Sie Exeriy: Dissifatios of Exergy.

C'orrize, kon'rez': a department of France near its center: a part of the former province of dimonsin. Area, 20. 6.5 miles. It is drained by the rivers fordogne, Vezere, ind Correze. The surface is hilly : the soil is mostIr poor. The staple productions are grain, timber, coal, Copper, leal, iron, ind chestunts. Cipital, Tulle. Top.

C'mrimbles: a provinee of Argentina: bounded N. by Pamgay, K. by the river L'rugnay, separating it from Missimpes, brazil, and Cruguay, S. by the province of Entre lios, and W. hy the river laramá, separating it from the brownee of santa fé and the teritory of Chaco. Area, $45.3 .5 \mathrm{~s} f$. miles. The extreme sontheastern portion is hilly: the memander is a phain, with numerons lakes and swamps. The Lagum Hhra, in the northern part, is a swamp covering abont 4,004 sy, miles and thooded ammally. The land is gencrally oper and adated for pasturage, but themere exProsice tracte of forest. The climate is semi-tropical. Grazing is the principal induatry : oranges are extensively laised for the markets of Puens Ayres and Monteviden. (apital, Corrientes. Pop. (18!5) 249.344.

Cortés. Jusé Domivio: Chilian author; h. about 1830 . He was varions? employed as a jomrnalist, als utherhé of the (hilian lecation at Brussels, and in Bolivia as directorgeneral of libraries. He published a large mumber of hiographical and historical works, among them the Diccionuriobingrafico Americuno. Ilistorite to Bolivia, Estadistica bibliogretica de Bolivin. Los Remolncionarios de le intependencin de Chite. Poptas Americrnos. and Repúbica de Mejico. IIe also edited at gencral coblection of the works of Latin-American authors. D. in 18s4. II. H. S.

Cortés, Martin: illegitimate son of the eonqueror by the Iudian Marina: Is, in Mexico alwont 1521. He was taken to spain in 158s. was legally recognized by his lather, ande a knight of santiago, and serveld as a sollier in Algiers and Gremany. Ile retnrned to Mexico with his brother and mamesake, the Marques del Valle, in 1562; was arrested in July, 1566 , on suspicion of being concerned in the alleged flot of the Avilas ant during eighteen dars was subjected to torture, but contimued to declare his innocence. In the end he was sentenceld to be exiled tor life and to par a fine. It is believed that this sentence was never carried out, for in 1568 he was still living in Mexico, where he probably remained mutil his death.

IIerbert H. Smiti.
Cortés, Martis: legitimate son of Heruando ('ortés: b. in Nexico in 153. His lather took him to Spain in 1540: he received a liberal ealucation, and inherited the title of Marques del Valle. I great portion of the Mexican estates wonld have heen lost to him by a decision of the conncil of the Indies, but they were restored by Philip II.. with whom he seems to have been a favorite. He accompanied that monarcle to Flanders and to England at the time of the marriage with 3ary: surved with listinction in the army, and was at the battle of st-Quentin; and, on his return from the Flanders campaign, married Doña Anal Ramirez de Arellamo, his niece. In 1563 le went to Mexico, where lie iived ingreat splender, and had much influence. thongh not directly concernel in the govermment. Owing to discontent respecting the new laws of eucomiendes, the brothers Avila, Aguilar, and others are sald to hatve tormed a fian to murder the jndges of the audience and make the Marques dul Valle subereign of Mexioo. It does not appear that this phot was ever definitely dreided upon, and it seems certain that the marquis nerer treated it seriously : but on Auly 16, 1.066, he was arrested, as were Alonzo de Avila and his brother. The latter were executed, and the marguis was sent to Spain, his entates boing sequestereld. After several years they were restored to him. D. in Spain, Aug. 13,1589 . I'lue lirect line of cortés ended with the fouth marquis, lowlro, in lfios. The title eventually passed to the Dukes of Termano and Monteleone, one of the proudest fumilies of Italy. The extates lase passed through many vieisitudes, and have sexeral times heen sequestered : but is large purtion is now in the posession of the heirs of Cortés. Herbert 11. Smiti.
Corthell, Ftama Lawrawe: civil enginere; 1) at South Abington, Mass... in lato; eduented at Brown University, Providenec, $R$. 1 . : served in artillery in T'nimn army during (ivil war, heoming captan of a light hattery: stablied engineering: from 1sik-it in charge of important work in the Westurn $1^{T}$. Ebitor of "standard."
Corfona, Pietro. di: painter; B. Nor. 1, 1090: went to Rome in 1 wor circumstances. The Marchese Sacchetti, seping him painting in the slop of a gilder, undertook his maintenance and placed him in the art-sehool of Baccio Carpi. lle aeguired his drawing trom ancient bas-relicfs and the art of grouping figutes from Lanfrumen. The Repe of the Sabines and The Buttle of Atementer were the first works which male lim noticeable. On the strength of their suecess Urban YIII, chose him to piant a chapol it Bibiana. A little after he decorated the great reception-room for the Barberinis; this is one of his finest works. He spent some years in Florence, painting for Ferdioand II. several rooms in the Pitti ladace. His great sllecess in the execution of this work attracted the envy of many of his imitators. He was acensed of having sold to the grand duke, as originals. eertain copies after Titian; this brought hin into disfavor, and he left Florence in dudgenn, never to return there. Ile then lived in Fome, where he eontinued to paint remarkahle Torks. When umable to mount on a seaffold, being much atllicted by gout in his later rears, he painted casel pietures, which are rare. D. in Rome, May 16, f660. W. J. Stillman.

Cormmbit: city of the state of Matto Grosso, Brazil, on the west side of the river Paragnay, in $18^{\circ} 59^{\prime} 3 s^{\prime \prime} s$. lat. It was a mere hamlet until the opening of the Jaragnay to steam navigation in 18.56; it then beeame the port of entry for Matto Cirosso, the entire commerce of this vast region passing through it. Pup. about 5,000. From July 3. 1865, to Jme 1:\%, 1467, it was held by the laraguayans. Besides it- river trale, Corumbá has a considurable commerce with bulivia. Three miles below the eity, at Ladario, is one of the principal marine arsenals of Brazil. with a strong fort.

Herbert 11. simta.
Cormondum: a mineral consisting, when pure, of native oxide of almminium, which is, however, almost invariably mixed with magnetic oxile of iron. It oceurs crystallized, massive granular. in impalpable powder, and in layers. 11 ineralogically, cormondum is dividel into three rarietics: (1) Sapphire, which ineludes the purer kinds, at sapphire, ruby, Oriental topaz, salamstone. Oriental amethyst, ete.; (2) corundum proper, the duller kinds cerstallized or semicrystalline, including abmantine spar ; and (3) emery, the darker and coarser hinds.
The specitic gravity of cormmlum is about 4, while in hardness it is next to the diamond. It beeomes strongly electrieal ly friction. Its erystalline form is rhombobedral. The ruby or red sapplate is valued next to the diamond, and beyond a certain size (31 earats) ats equal to it in value. Its color is supposed to be due to chronic acid, but the amount of coloring-matter is so smal] that it eludes the ordinary tests. The crystals are seldom above half an inch in length. Two crestals an inch in diameter and ahout 2 inches long are said to have heen in the possession of the former King Thelaw of Burma. The largest ruby known ("me from China, and, after having been in the possession of Prinee Mentzikoff, was finally made one of the jewels of the Russian crown. The largest rubies come from the Capehan Mountains, Ira. Smaller ones are found in Sixony and Buhembant acersionilly in other localities in Europe a also in the U. S. The blue sapphive necurs much larger, erystals : inches in length beng sumetimes fond. The erystals sometimes exhihit a rallated interior with a play of colors, when it is known as asteria or asteriated sapphire: Sapphimes are obtainel in Ceylon. India, and (hina, principally in the lirst-mamol cometry. Fine specimens are often found in the beds of st reams, whither they have been carried after the deemposition of the rock originally inclosing them. The lighthlue sapphires are often exposed to fire by lapidaries to ren-

Cor'ymb [from Gr. кópuußas, ulpermost point, head: ef. кópus, helm]: in botany, a form of iniloresence consisting of a central asis and lateral pedieds, of which the lower are Jonger than the uppromal the lengths of the malicels are so graluated that the flowers are all on the same level, as in the s'pire, halmio, anil (rutuegus (hawt loom).
Cor'ypha [Gr. корифグ. tip, summit]: a genus of tropical fan-leaven palms, , ne of which, the (oryphin umbrarntifere. or talipot pralm, grows in ('eylon to the height of 60 or 30 feot, and hears circular leaves often 12 feet in diameter
Curyphe'us, or (orypheus (in (ir. кopupaios): the leader of the churns in ancient chasical hramas, ly whom the dialogne between the chorus and the nther actors of the drama was carried on. and who led in the choric song. The name is metaphorically applied to any great leader: thus Dr. sammel Johnoni is sometimes callen "the eorypheve of English literature."
Coryph'odon [from Gr. корифй. tip. :nmmit + oboús. -óvtos. tooth]: an extinct genus of ungulate mammals from the Iowest Eorene of Furme and America. The skull in this genus jursents many perissodactyl features. It is elongated in the facial region, anel the nisal opening is large. The Alental fermula is-incisoms, $\frac{3}{3}$; canimes, $\frac{2}{1}$ : premalitrs, $\frac{4}{4}$; molars. ${ }^{3} \times \mathscr{2}=44$. The hain carity is quite small, as in all Eucenc mammals, and indicates that the hain it welt was of a rey inferine type. It most striking features were the small size of the hemispheres and the large expanted certthellum. The limbs were short, and the femme hat a third trochanter. The teet are especially interesting, as they preseit a primitive or generalized type, laving five thes hoth before and hehind. The list known species was destribed hy Prof. Wwen under the name $f$. $\quad$ refons.s. and was from the londen clay. $C$ oweni is trota the loweat Wurne of Framee. $r^{\text {: }}$ hametur, the best-known Amprivan species, is from the base of the Eocene in Wroming. and other species occur in tha lowest Euceme of [1ah and Xew Mesion. The genus is thus of er eat importance as indicating the parallelism of Eurepean and Anerican strata. The animals were about the size of the tapir.
O. С. Maksh.

Cosmorony [from Cri. кormozovia, origin or development of the uniwrse, as word constructerl on the type of $\theta$ ogovia, thenguny : кófuos. miverse + -rovía, heriv, of ruot gent, becone in govn. ete.]: the seience or theory which treats of the origin of the cosmos or universe. It we except the cosmonghy of the Fast ludians. the earliest extant is that of Ilesion, which is deliwred in hexameter verse. The first 1ruse cosmoronies wire those of the early Ionic philoset phers, of whom Thales, Anaximenes, Anaximander, and Anasagomas are the most aldehrated. In modern times a Theory of the Howld his been praduced hy lomplet. The ditferent theories of the origin of the worlit may be comprehended maler three classe: 1. Thase which suppose the world to have existol from etemity under its achul form. Aristotle hadd this doetrine, and, conceiving the universe to be the elernal effect of an wernal comse matintined that not only the hatens and the eath, hut all inimate and innomate bengs, ate withont hegiming. 2. These which consider the matter of the universe etemal, lut not its form. This Wa* the system of Epicmus and mest of the ancient philosophers and prots. Who imaginel the world either to lie produeed by the fortuitus concomse of atoms existing from all derity, or to have sprung out of the chantic form which precefet it present state. B. Those which iscribe

Iroth its matter and it form to the direct asury of a surit ual cause．

The ateount sivan in（imesis of the erreation is olsionsly not a scientife cosanorony，which wonlel not only hawe been
 part relirious truth，but woulal，if eriven in a sedontitie form （since science is constamtly frogresing and therefore datne ing），have been alapteal to atime ate on perimd only．At． supposing the highest and ulfimete finets of sederoes hat bern given，it wombl have bown on far in wlvane of all scientifie thonght yot reached，of that will hue reachad pet－ haps for fifty thonsand years to combe that it womble be wholly unintelligible，and woulal in all frobability alpear uttery ahsurd even to the most aldaterd inteltects．There－ fore those few great facts which wore necessiry do be indi－ cated in order lo point out the relation betwerin the creator and his works hase heen presented in a pmondar rather than a scientifie form．Sor can it be sain that they are any the less true because mot presented in scientile phrasembogy． An excellent axposition of the hamony betwean the Masate and the geolurical recomel of cration is ervern ly l＇mot．Dima at the end of his Jommal of creology． 10 which the rouler is referred．See alsa＇Tayler dewis＇s six．Days of（＇retetion （1以゙ラ）

arranged or not, the top alge passed under loth arms and was then bronglit up to meat at the top of each shmalder. and held there by a bromeh or clasp, the ams left free and lonse folds of stuiff formenl muder each arm. Sleeves for the upper arms could then be made br jinning the top edlees of the garment together at several lioints. When a waist-belt was worn, the long shift could be pullerl up so that the feet and ankles and a part of the legs were lelt free; the loose fold of the stuff then fell outwitd over the belt, hiding it, and this feature has otten been mistaken for another sarment. The men's shirt was not unlike this, but generally much shorter (see Fig. ?). Fither sex would wear the pephos wer the chiton (see Fig. 4). But men are more often represented wearing a very louse clonk, which we know from Greek anthors as

Fig. 3.-Greek vase-painting: King or chirs with a long rhiton aad a chlnind uver it the chlaina, the himution, the chla$m y s$ and by othar names between which it is very rlifcult to distinguish. In thesecloats there was probably no sewing at all, unless in the case of the (omamenting of the edges, and not otten then. These eloaks are comtinually represented ats the only srament of the rasming men (sce Fig. 1), and it is oue af the puzzles of this sulyject how far we are to take this as the common custom of froek life, and how far it istheresilt of thaintrasit which freok soulpurs took in the inde brily.
'T"M, Kヵman custhate Was mut viry manlike that of the Grectis, for in aarliop limes the dress of all the Italians seme to have herom akin to that de more Fastern jeuphes, and afterwarl the liomanc alrew most of

 tow, slowine the sleeves of the maderew on to the wrist; in the fiffeenth eentury the matergown hat it-ixalice ent low in the neck, tud it skirt reathing the gromm, white the
oremless was open in front, but came higher on the shoulders, and its skirt was carried ont to a long train for ladies of wealth and their imitators, while a broad belt kept all the complicated attire in place. In the fourteenth century, too. was worn that jacket which is so commonly taken by modern artists as a general dress for their mediaral laties, the emious garment with an edging of fur sweeping down from the shombler to the hips on each side, a fashion which prevailed so long that a heraldie bearing was derived from it. Firied as were the styles of dress, and far removed from classie simplicity of make for both men and women, it must he said that the shape and the movements of the body were studied. and that they controlled the style of garments thonghout the Minlle Jges. The whims of tashion were rather shown in the hools and hats, the caps and reils of the time. for which see IIfan-dress.

The end of the Middle Ages is marked at onee by the change in architecture from a natumb to a delibmately copied style, the almost complete abanelominent of body-armor except by the richest men, who conld pay tor the costly bulletproof corselets and taslets of the day and who, moreover, were monnted in battle aml on the mareh. and finally a general ahandonment of simplicity and reasonableness in dress. and the introduction of the most fintastic tilloring and trimming for lonth sexes. Splendid stutfs, such as silks brocader] with flowers, satin of rich lesign and color, velvet both plain and figured, and cloth of gold and of silver, beeame common among the nobles of the courts of Europe. The display at a tomrnament or other court function must have been in every way more splendid than we can now imagine, for men fied with women in the splendor of their material, and the strangeness of cut and shape of their garments, when embroidery was fuedy larished upon cloaks, horse-housings, binners, and hangings, and heralilie display gave an exeuse for the most positive colors in boh contrast ; कhen, too, rich men and women dial not leave to their servants the use of color and grble of harges and signifieant devices, lut thenselves wore garments of unrestraned magnificence and emormons eost.

But the general fashion of men's ilress in the middle of the sixteenth econtury, llenry 1l, reigning in France and Edwari YI. in England. is not so mnnatural ; it may be deseribed as follows : A gentleman wore a donblet or mourpoint with long sleeves, fitting the borly and arms easily. gircled at the waist, having short skirts below the belt but not reaching mueh below the hips: trunk-hose mate very large and full, statfed ont with hair or wool or held in place with some elastic material, so that the skirts of the donblet land to be ent with a decided shapre to allow of them; the stockings fitting tight to the thigh and leg, a fashion helped by the introduction at this time of tricot, or what we call now "Jusey" or stocking-stuff, the elastic material of our motern unlerelothes; over the donblat wonld be worn a full Clowk, resting on both shoullars or on one and capahle of being drawn around the body, but rery short. scabcely reaching the hips. All this might be pitain enough, though of some delieate chonce of color and of hrading or trimming, but these garments conld also be made very showy with phats which, seeming to be in one rich material, showed as they open anothar even more splemdiol within, with gold asul silver lace or rither passementerie (real lace in the mod(rul senso litl not (exist), with buttons of preeions material momet in gold, with cmbroilery and the use of pearls and prefous stones in the embroidery itself. 'I'he dress of women had whated less from the mediaval type; it was not irrational in shape and makr.
The erreatest extravagmoes of dress came in with the last years of the sixtenth rontury. Those wem the days of exchsisive stulling. or bombesting, as it was callad afterwam. The trunk-home were studiol ont su emomonasly that jt was with erveat difleculty that the sword could he worm. And this was followed by the stulling of the domblet into that extratorlinary shape wheh is grpetnatod for us in the pro-
 11. shows the fummel-shaturd tommation of the body wit the donblet rearbing fine below the waist. The habit if msing thiek stulling of this surt hat been gatmel in warfore, for very marh of the armor of the time wis malle up of gen-
 known to the are show in meratiners of the time as a part of the war dress of lisis), and the gatnlesont fur the body in many froms hul han worn tor at least three conturies. It this times about losil, starch was introlneed. and was immediately put to use in stiffening the neek-rutf, which, be-
ginning with a diameter of perhaps a foot, soon atlainet a breadth equal to that of the sloulders, and was worm by buth sexes for forty years together. While the men wore the bombasted doublet, the women pinehed their waists as much as nature could hear: a surgieal work of the time deseribes the effects of this with the rilis forced to overlap one another ; and these slender waists were prolonged downward by the immensely loug ind pointed stomacher, from which the skirt putfed out behind and at the hips to a cirenmference of 10 feet or more, whieh size it retained to the floor. A court laty of the reign of Henry 1II. of France should be contrasted with at Greck lady of 300 B . C., as seen in the bas-reliefs of the time, for al full understanding of the natural and the soplisticated in mutters of costume.

From A. D. 1600 to the time of the French Revolution whimsical extravagance of taste groverned fashionahle dress, a pretense at simblicity in the dress of one sex being aceompanied by wild ragaries in that of the other, and followed by equally strange ones of its own. It is ditficult for us to realize the fantastic unreason of the outfit of a monsquelaive of Louis NII1.: or to conceive how the simple bead-dress with curls which we associate with Madame de Sevigne conded be followed by the "tuwer of lace on the head of a laty of 1690 , and that by the structme of gamze, lace, flowers, and feathers which, conbined with the putied and cushioned hair, rose above the head of a lady of Marie Antoinettes court. The only parallel to these is in the gown of the same lady, 18 feet in circumference at the floor, very nearly as great at the hips, decorated with festoons and bonquets in a way which can not be clescribed here, or else in the mens wigs of an earlier epoch.

With 1650 the waistcoat ind coat had hem evolred from the doublet and cloak, the waistcoat having still the long flaps which were left from the skirts of the cloublet. Kineehreches and long stockings were the nearly mehanged hose of the Midile $A$ ges. J'antaloons followed knee-breeches, and were wom for a very short time; they fitted the leg snugly, and were buttoned or tied at the ankle. Trousers followed these: the thaps of the waistcoat disalpeared, and the costumes of the past were all merged into the milormity of the last eight decades. What costnmes still remain in existence are to he found where modern progress toward unformity and modern disregard of indiriduality of design and of style have not penetrated. Wonten indeed retain the taste for novelty and for brilliamey of attire, but bave lost the nower of regulating it: costume has leen lost in fashion. For bibliograplyy, see Dress.

Dirtmonth, and Cambridge. Dr. Cotling acquired repotation by his publications in chemistry and geology, and hy an arricultural surver in Georgia. In was the anthor of an Introduction to chemistry ( $1 \mathbf{8} 2 \mathrm{e}$ ) ant a synopsisuf Lectures on Geology (189.5. He held professorships in Amherst College and at Pittsfich Medical school. D. Oct. 13. 1867, near Hilledgerille, Gat, where he had spent the last thirty yars of his life.
hevised by George P. Fisher.
Cotton: a soft, downy fiber which sumpounts the sects in the capenles or bolls of plants of the genus Gossypum and order Mahacer. This speries ate numerons, but only three are important. viz.: (iossypium herbucerm. or fiossypium album, called also short-staple upland, woolly-seedet, amt green-seederd. This is the species gencrally enltivated. Vitrieties of it have been multiplied by selection and by special cultivation, anl by hybrinizing with Ciossypinn brebchlense or G. nigrum, known ilso is seit-ishand, long staple, or hackseched cotton. The cultivation of the latter is confined principally to soils bathed in a salt atmusihere. It reaches its highest jurfection along the coast of sumth Carolina, Georgia, Florila, and in Egypt. Both these species are annuals. Gossypina arbuream, or treceoton, a perennial species, grows in sonth Ameriba and Africa. It is interior to the ammals both in yield and quality of fiber. All the species of the cotton-plant originated in the tropies, a fact which the cultivator must constantly bear in mind. Like the suntlower. it tums its leaves to the morning and evening sun. Though a tropical plant, it is most successfully cultivated in the temprate zone. The climatic conditions favorable to its best development are six months' exemption from frost, a well-distributed, moderate rainfill during the period of growth, with little rain and abmulant sunshine while maturing. These are hest supplied in the southern tier of the North American States, which have no competitor exeept Egypt in the quantity or quality of fiber prodiuced.

While the cotton-plant is cultivated chinfly for the fiber, which grows upon the wed, the sed itsolf has hecome wommercially valuathe, and the filwer from the inner hatk, litthe inferior to amt restombing that of jute, also has pusibilitions of comerserial importanco.

The flower of di. burfurlense is of a rich cream eolor: that of fi. herbaremem anie white when first onen, changing to remt the soemel hay. The thower is hisexual and produres a "apsule known as tho "Joull," which rearhes maturity in six to seven wedk, when the surfiem contracting exfoses the lint-rovereal sued realy for pirking. 'Jhis is done almost entirely hy hat. A "haryester "rembly inventel attainet] part ind shectes in 1*91, at dry athum. This gathens learos, holls, and shat stoms, fiom which the lint is afterward separated by mallinery made for the purpose.

Originally, the cotton-gin was an apparatus in which the cotion was prassed between two rollers revolving in opposite directions. This, the "roller-gin," is still used for ginning sea-island or black-steded cotton, which is quite easily freed from its seeds. But green-speded, mphand, or short-staple cotton, the species most generally grown, can not be ginned by such simple means. The lint of the woolly seeded varieties is separated from the seed by means of the saw-gin, invented in $1: 93$ by Eli Whitney, a native of Massachusetts. This consists essentially of a eylinder composed of fifty to cighty steel disks, the edges of which are shamply serrated. These saws cut the lint from the seed while revolving with great velocity. The lint is taken from the saw-teeth by another cylinder called the "brush," and conveyed to the "condenser." The lint is then packerl into balles weighing 4.5 to 500 lb . each. Formerly the hales weighed only 300 1b., and were long ancl round and packed by hand, as wool and the sen-island cotton are still packen. Seatisland cotton is separated from the seed, to which it adheres but feebly, by the roller-gin, which pulls rather than cuts the lint from the seed. In this species the lint separates readily and entirely from the seefs, leaving them sleek and black. A part of the lint adheres to the seed of the mpland cotton. These are reginnerl, betore extracting the oil, and yield alonat 3.1 lb . of short lint to the $10 n$ of seed. This is used for wadding, batting. and other purpoes lor which inferior grades of cotton are used. The secd is then decorticated, the lmuls constitnting by weight one-half of the seed: the meats, or kemels, are then steamed, sucken, and the oil expressed, yielding 30 to 3 . gatl. of emde oil to the ton of seed. The cake is clried and ground, yelding about i00 ib. of meal per ton of seed.
The refinal oil is used in a great many ways, such as in the manufacture of substitutes for butter ami staniard lard; for oiling machinery, dressing moroces, mixing with other oils for the proparation of paints. am ofter a vorase to Europe remms as fancy Lrands of "olive "oil. See C'otrosseed Oll.
The meal is exturivaly employed as a somece of nitrogen in the prepration of commercial fertilizers. It is also used directly as a fertilizer, and for feedingstock. Large quantities are shipped to the Northern U. S. and to Europe as fool for catlle. The meal and hulls are fed to cattle without other provender with satisfactory results. buth as regards "economy" and as regards the protuction of tlesh and fat.
The cotton-plant is subject to the attack of injurions insects and fungi. The larva of Alelia. the cotton caterpillar. is no longer dreaded as fomerly, since the means of destroying this pest with "laris-green " is within the reach of the imos hmmble planter. Neans of destroying the "hohl-worm," which is very testructive in some seasons. by puncturing the yong bolls or (apmules. have not yel ben tevised. No satisfactory preventive of the attack of several very destruetive fungi have the din liscovered.

The experiments conducted at the expriment stations in the cotton states have materially improvel the methods of cultivation and romeributed to cennomy in fertilization.
The introntuction of emmmerefalf fertilizers has rxtendwd the area of politable conton-culture about 50 miles farthol north than formerly, in consequence of their cflects in has tening the maturity of the plant. Their use has also improved the quality of the lint, by giving it greater lenget and strongli, ami by hastening naturity has chabled the planter to harsest the crop at leon cont anil in better comblition.

The early history loth of the enlture and the mannfart ure of cotton is obeme. It seme to be generally admitted that India took the initiative in Doth, and attained askill in the latter which was bere equalel elsowhere previons to the invention of machinery for its manntather. Warly in the
 rated for its flowers in Tabot co., Ms. Small patehes were grow in Virginia athl aljacent states prior to and after the war of the hevolution, the lint being pieked from the seed hy hant, the thread spon, and the doth for domestio use woven on the farms.
The saw-gin, won in its earlint history, had a capacity aqual to that of 3,000 pairs of hands in minarating the lint from the seed.
The Southro L'. S., British halin, Ereyt, and Brazil proThe practically the cotton-suphly of the world. Intia ranks next to the ['. S. in quanity produced, but in quality of lint her product is inferior. Not only are the soil and
climatic combitions of the Fonthern $\left[\begin{array}{c} \\ \text {. } \\ \text { s. superior to those }\end{array}\right.$ in any other part of the glowe, hut the plant has reverved more intedigent cultivation there that elewhere. The vielal

Westminater, in 1iab, and, after suftering from tire in 1/31, was finally plated in the British Mlusemm in 17.53.

Coffon-sin: a mathine for frecing colton from its seefs. which athere to the fiber with emoterable tenacity. See ('otton and Cotros Masteactlobs.

Cotton Mambictures: lextile fatheres composed of cotton and the promeses lig which they are protured. The libur of the cotton-phant is well adapted for the production of yarn or theal, ath thas for employment in the falnication of wowen cloth. Wath fiber if left to itself aeduires at twist which adde to its tomite strength; and it is ley twisting many tibers of coltom around one another that the st rengt $h_{1}$ necesary to its usefuhers as the material of a textile fathice is imparter to it. The spinning of cotton yarn and the mambacture of coarse eotion cloth have been practieed in Many parts of the world fom a periad of remote ant apmity. The arts were established in Egyt, India, and ('hina cemthrics before the ('hristian eva. They are fombla he practiend by ame tribes of teentral Arria whe hate ouly lately been hrought in emtact with molern evilization. They
 long before the spanish emquests in the sixteenth century But the application of machinery to the prepation, the spiming, and the weaviner of cotton dates bask lithe mome than a hamped years, In the homes of its origin the mannfincture has remaineel to a comain extent what it has always Bect-a handiceaft in which human haber avaleel itself of nome bat the rudeat implements. The enterprise of mondern (rmmere waries the chap prothet of modern mathinery to cwer more remote corners of the earth, and will sum retidere extind the hamespun and elamsily wown cloth of the native. "The development of the eotton mandethme bergan with the last process in the making of choth, amb the eyelo of fimblamental infrevements was completerd ly the int tion of ahdeve for romoving the sem from the baw material as it comber from the firld. The tly-shathe wat invontel atwout foro. liy means of this imprownent the efleciney
 later dames largrawes, an illiterate Lamashire weacer, marto an invention for the catting of conton, which was gukkly inprovel hy anoher unknown inwothe and thes the prineiple of the earding-machine of the day was intro-

which are fully exomplified in the mule. Rivenard Ark= wright patented in lifit a spinning frame. of "throstle"." talled at tirst a "water-fame", the ehide and most medral novelty in which was a derien for spinning with follers. The "roving." of slightly twisted material, patsing het wern two pairs of mollers, the formand pirir rewheng at a much higher sperd than thas hehind, hraw ont the roving, and make it finer and more regular lefore it encotes the final twist which concerts it into garn. Arkwright andopten in this machine the prine ible now known as the tlyer, by whith the yarn is twisted and womal upon the habin at the same time. Simmel (rompton in 16.9 combine the ideas of Hargraves ant Arkwright in the mule jenns. In lisionr. bawan ('artwrisht, a clergman, invented the bwwer-lom. Two thinge remaned to render possihle the gigantic expansion of the cotton industry whicta this century las withesomed -at quiek and inexpensice methen of sembating the libet from the send, which up to that time hat hern a slow and laborines proens, amb a new mechanien fore to drive machimery ut a high :pewd. The cotton-win of bili Whitney supplied the lirst, ant the seam-engine the strond, taking them in the order here mentinarl: hat the first steam-engine set up in of cotton-mill, in 1 is. antedated by som years the great invention whicl made pessible the production on a large sate of eotton in a combition fit for mandiacture. The progres mate in mathery during the nimet eenth century has hern rapil, and has rentemb hoth in an enormons saving of labar and in a most wondertal increase in the prodnct resulting trom a given "xpmediture of power. fer "xample, the speed of the spindles nsed on Arkwright"s " water-faum," so called hectusi it was usually driven ly the speed of a mondrm sindle is fully 9.010 turns. In no other industry dons the keemmen of cometition require so extensive and so freguent changes of machinnry to keep a factory up to the rexpinments of the times. Improvements are made constantly, and ohd machinery must he molaced with new long before it has worn out. The chief proesses in spiming are directed to the following oljects: (te) opuring and cleaning: (b) layine the filors straight amel jarallel; (e) making the contimums bundle of filers which is to form the yarn exactly even in size and strengtlo ; (d) hlawing the "stiver"-the limmen of fibers juat mentionmellown the the repuired size, when it is kimon as rosing: ( $e$ ) giving the roving the marsary twist and winding it uren the boblin. The first mathin is the opmer, or picker. Lomse cothon from the hate is fiol into this mathime evenly, and is suls jected to the action of a batem. "This mathine separates dust and other impuritio fron the enton, which is delivered at the end of the mathene in a unifum layer, callent a lap. A lapping-machine comes next. It is tell with three lap at once, and the the layers ane drawn ont to the thitkness of one. "Ihe nbject is lo nemtralize the irreguhaties of each lap be averaging them with the irverulatites of two others. It may be remarked that this winciple of doubling and drawing for the prapor of renturing irreguatities is followed at every step of the peomes dewn to the simble. Altor the lapping-machine the cotlon goes to the catel, he which the
 ganzy film. upata teet h covering a cylinder. and then siripyod olf hy a vibrating comb, and drawn toselber in what may
 bled and drawn in a drawine frame. In the manamente of sewing totton. howere and in the prombetion of fine sarns for weaving, thre is an intermediate process, the comining. by whel the short staple is remosed: and in the manufertive of all fine yarns the "sliver," as the prokuct of the carding and combing mathines is ealled. passes soveral times throgh the drawing Prame. 'There are next there mathenes: known as the "*luthiner frame". the "intermediato frame: and the "roving frame." through each of which the sliver passes, heing in ench drawn out and slighty thistemb, It has now heerme " roving." a onft, light twisied cord, and it pacse to the lase prodes. the simines. "The imprownents in spinuing darine rement years have lwen nomoms and impurtant. 'The sujeriority of the modern antomatic male Wer the flyer frame for spuning fine yarns was so great That it surivaedel frame-spinning to a hirge extomt part ionlarly in England, where a large part of the yam prombend is gam of hiuh counts, which is ultimately tw be loachet with "sizine." and thus inchased in wiglat lint not in strengeth. But the invention of the "ring fram ". in whieh the work fomerly dom the the "tywe" is purformed ly pasing the yarn thiongh a bit of enved wive, known ats in "traveler."

Which moves around the suindle on a ring．has revolution－ ize p pinning．The spindle itself has been meanw hile greatly improsed．Inasmen as the proluction of yarn is substan－ tially in proportion to the speed of the spintle．it tollows that the new spindles are moch more ceonomical as well as more efficient．For the modern spinalle：make ！0，000 turus a minute－is against a maximun of i．510 turns only so lately as 18.0 －and they run so much more easily that the same power moves 2.5 per cent．more of them at the higher speed than of the old ring spindles at the lower speed．All the fundamental improvements of the ring frame and of the ring spindle are of L．N．origin，and the reintrotuction of frame－spinning has male much greater progress in the U．S． than it has elsewhere．By far the largest part of the yarn spun is woven into एlain cotton cluth；but considerable amounts are sold for use as waps in woolen and torsted goods．or for knitting into unlerwear：and a large part of the produee of se：a－isiland cotton，after being spun into rarn， is converted，by doubling and twisting．into sewing thread． In the［．．S．the whole manufacture from rals cotton to woren eloth，or to sewing thread，and sometimes from raw cotton and wool to the condition of woven mixed textiles，is ordinarily carriel on by one and the same establishment． In Great Britain and on the continent of Europe spiuning and wearing are almost universally separated．bee Loom and Wearint．
Cotton manufacture has its chief seat in Great Britain． In 1 isi the total importation of raw cotton into Great Brit－ ain was $90,80,000 \mathrm{ll}$ ．In 1890 the amount consumed in the mill：of the Cnited Kingdom Was 1.6 .56 .000 .000 lb ．，and the value of coltan goorls exporterl reached the enormons amount of $\leqslant 4,410.000$ ．Of late rears the expansion of the cotton insustry on the continent of Europe and in India has been much more rapid than it has been in Great Britain． The nomber of spindles in operation in 1si5 and in 1890 is shown by the following：

| countries． | 1875． | $1 \times 90$. |
| :---: | :---: | :---: |
| Great Britain． | 32.000 .0 mo | 43.850 .000 |
| Conrinent of Europe． | 19.440 .800 | $21.575,0160$ |
| India．．．．．．．．．．．．．． | 1.150 .0000 | 3．250．010 |
| Tnited States． | $4.510 .046)$ | 14．156．103 |

The first suecusful cotton－factory in the $\left[. . \begin{array}{l}\text { was that of }\end{array}\right.$ Samuel slater．estahlished at Pawtucket．R．I．，in 1990．For many years the progress was slow．In isiu the whole con－ sumption of cotton in the conntry was no more than 10,010 bales．The consumption reached 90.000 bales in 1815 ，the War of 1812 having cut off foreign manufactures and com－ pelled the production of goods at home．Ender the stimulus of favoring legislation the increase was rapid．But the groatest development has been in the last half of the nine－ tecnth eentury．The total value of all products of the cot－ tun manufacture according to the ceusus，beginning with 1s40，has treen as follows：

| $1 \times 11$ | S 46.350 .453 | 12.0 | \＄1\％1，489， 339 |
| :---: | :---: | :---: | :---: |
| 150 | 13，M69， $1 \times 1$ | 18＊） | $210.951 .3 \times 3$ |
| 1400. | 115，137， 1206 | 159. | 267.981 .24 |

Inasmuch as this increase in gross value has been acom－ panied by a steady and a wry wreat reduction in the aver－ ase price of yams and cloth，the actual growth of the industry has been vastly larger than is indieated by the figures above given．The marnitude of the manutaclure is fully exhibited by the futlowing facts obtained by the census of isto：

|  | 14．188， 103 |
| :---: | :---: |
| Number of loroms | 324，$\times 156$ |
| Bales of cottor consumed | 2．2ご $34 \%$ |
| Puands of coltou consumen | 1．193．5\％ 4.641 |
| Silare yarils of woter goods protuced | $3.1102 .601 .103 \%$ |
| That watue of produc | $82650 \times 1.74$ |
|  |  |

NLMBER OF PERFOXA EMPLOYFIO NNH AMOUNT OF WAGES PAID．

The chief sat of cotton manufacturing in the $\mathcal{E}$ ．S．is New bingland，which according to the census of $1 \times: 4$ en－ tained if per cent，of all the spindles in the country－ar ratio which has rematom uearly combant luring the whole history of the manafactur：－himong the States of New Foglamd， Mascachusetts is vory far in the lead．In $18: 00$ it himl 41 per cent．of all the spindles in the L ．S．The greatest
eoncentration of the manufacture is in the city of Fall River， Mass．The two adjoining counties of Bristol，in Massa－ chusetts（in which Fall River is situated），and Providence， in Fhotle lijand，contain 30 per cent．of all the spindles in the U．S．The decale from 1880 to 1830 witnessed an ex－ traordinary growth of the eotton manufacture in the South－ ern States，particularly in North Carolina，Suuth Carolina， and Georgia．The number of spindles in the Sontherm States increased threefold during the ten sears．

## Euward Staxtrood

Cotonseed Oil：an oil ohtained from the entton－plant， Gossypium barbadense．herbacerm，and allied speeies．The bolls of the plant contain cotton fiter and seed in the pro－ portion of 1 of fiber to $2 \frac{1}{2}$ or 3 jarts by weight of seed．The average percentage of oil is put at is to 20，while 25 per cent．is regardel is high．
Although the cotton－plant has been cultivated for orer a thousand sears，no use has been made of its products，ex－ eept the cotton－liber：until comparatively recently．It has buen found that the fiber of the plant－stalk can be made into a coarse bagging，that the root is susceptible of use in dyeing and pharmaty，and that the sceds will yield as a princilal product the oil，besiles several raluable by－prod－ ucts．In 1861 it was asserted by Mr．Edward Atkinson that the cofton－plant would lee a raluable plant for cultivation， even if it produced no cotton．In the preparation of the oil two difticulties presented themselves；the＂lint，＂or short fiber surrounding the seed，retained much of the oil when the seed was crushed and pressed，and the oil，after expression，had a strong coler．In 1iss the Society for En－ couragement of Irts and Commerce offered a prize for the manufacture of cottonseed oil on a commercial scale．At the British Exhihition of 1851．Burn．of Edinhurgh，and De Géminy，of Marseilles，exhibited specimens of cottonseed oil and cake，for which prizes were awarded．In 1852 ent－ tonseed oil was exported from Egypt to France．The first attempts in the T ．S．to extract the oil as a merchantable product were made at Natchez，Miss．．in 1834 ，but both those experiments and others mate in 1845 at New Orleans， La．were unsuccessful．In 1855 the derortieating machine of L．Klapp was introluced，by whieh the hulls were sepa－ rated from the kernels；and since that time the industry has grown rapidly．

Mamufaclure of Cottonseed Dit．－The＂lint＂is usually remored by one or more alditional ginnings．The elean seed is passed through a hulling or decorticating maehine． The kernels are then erushed between iron rollers，when thes are ready for pressing．Hydrautic pressure is used， the intensity being 250 to 500 ib ．per square incls．Fif－ teen to 20 per cent．of＂crude＂cottonsect oil is thas ob）－ tained．This product is thiek and turbid，has a deep brown－ red color，and deposits a slimr sediment on standing．The oil is refined by agritation with dilute alkaline lye（contain－ ing 3 to 4 per cent．of potash or sorla），heating，and allow－ ing it to stand．when the lye carrving the impurities，set－ tles to the bottom，con－tituting what is known as＂cotton－ oil soap stock，＂while the clear gnlden－yellow oil is drawn off from the top．In some cases this treatment is repeated， a lye still more dilute being used．Processes involving heating with milk of lime or with oil of ritriol，either alone or with bichromate of potash，or simply steaming， have also been used in clarifying the oil，while some have reeommended or used blearhing－powder or nitric aeid and chlorate of wotash to improve the color of the oil．By these processes of refining the oil loses about 10 to 15 per cent．of its weight．
The grades of wil fouml in T．S．markets are erude oil， summer vellow ant summer white oil，winter vellow and winter white oil．By eowling the smmmer wils to the freez－ ing－point the palmitin（called by the manafacturers＂stear－ in＂）ersstallizes out，and the wil serarated by gressing the zolidified material comstitutes the＂winter oils．
Propprtios－Cottonswed nil（Mod．Lat．Olemom gossypii， Fr．huite de coton．Girm．Baumurollensamenöt，Buamuot－ lensaatö）consists chictly of palmitin and olein．It contains about 1 s．per cent，of a non－silpmifiable hylrocarlon．The winter oil eonsist almost entirety of olein．The elementary composition is given as－

> Carbon...
> Ilrdrugen
> 76.4 per cent.
> Gxyg+1.
> $\begin{gathered}114 \\ 120\end{gathered}$
solidifies at about $32^{\circ}$ F．or a littlu above．The remoral of the Iralmitin in the preparation of the winter oils slightly

## Congar: See Puma.

Conglu: a sudden inspiration. followed by closure of the glottis, and a sudden expiration, causing a strong current of air to sweep through the air-passages and ont of the month. Congh may be due to irritation of foregn particles or gases, or of diseased secretions in the larynx, trachea, or bronchi, and tends to remove these. The act is more or lass refiex and involuntary. and may lecome exeessive it the mucons surfaces are abormally sensitive, or if the general nervons system of the patient be excitable. Disease of the bronchial tules-bronchitis-is the most frequent cause, and in many other fiseased conditions of the lungs the associated mronchitis is the real canse of the congh. ('ertain diseases quite distant from the hangs, however, may culse this symptom, "specially in chinher, as inflammations in the nose, with swelling of its mucons membrane, enlargements of the tonsils and irritation clsewhere in the pharyax. and oceasionally abominal discates." $A$ persistent congh is always reganted with dread, and may indeed be the only symilom of consumption for long periols of time. (if especial significance is persistent slight congh in one of pronounced phthisical hathit or hereditary tendency.

The treatment of cough varies largely isith the cause. It is by no means neressury in every rase to attempt to reluce its severity, since in many the get is conservative in tending to remove an irritant. When, howerer, the secretions arr dry and tenaminns. the enugh is int to become exemsive without accomplishing any result in the way of remoral of the irritant. In such cases muriaginous drinks ame seftatives, experially ophum, do much gron ly redueing the congh. For thic rest the treatment is directed entimely for the general disease and comlition. Fibrifuges for fever, expectorants, such as ammoniun chloritle, ipectac, and squill, to lowen the secwetions and hasten their dischargo, smil tonics to increase the general strength. may all come into play.

W゙illlam Jeeplek.
Couloub, krotlini': in dectricity. the practical unit of quantity. It is the quantity of thectricity transferted per secomi ly one amper. The eoblomb is $\frac{i}{10}$ of the atsolute (C. (G.S.) mit of quantity. It is named atter (miarliss A'erctine (or loma (q. c.)

('ousts-palatine were originally "nthers of the imperial palace" in cermany, who pussessed hiph judicial functions. The tern was afterward appliel to feudatories who had palatiae jurisiliction (see Palatine) wer matlying teritories, where they mantannal a pace and the other machinery of a eourt. The terin came still later to be applicel as a title of honor ly several prinees, but is mow ohsolete.

Connterfeit from (1. Fr's. contrefuit < Lat, contra.opposite + fortus marle]: that whichis marle in imitation uf sonething clse without legal autherity and with a framdent intent, applied chiefly to smatious coin or bank-notes, on other factitious curreney. The uttering of such coins or notes is a felony punishalile by imprisumment, or even by leath in some countries. To guard against counterfeiting. hank-nutes are engrayed with designs which can not be reproduced exeept at great expense. There are also secret marks and combinations of ketters and firurs koown only to the proper anthorities. A pentiar ink and paper are used. the mantactur ur unawfol possession of which is mate a criminal ollemse. Pamphlets called "deteetors" are printed with lists and descriptions of comenterteit notes and coins. See Forgery.
lievised by F. sturges Allex.
Comberfort (Fr. contrefort): in arehitecture a buttress or pier built against or at right angles to a watl, to strengthen it and enable it to resist a particular thrmst. In fortification a mass of stome or brickwork adfed to the revement of a rampart in such a way as to form a buttress.

Comber-gnard: an outwork dexigned to lefend the two faces of a bastion or ravelin from a direct fire, so as to retard a breach being made. The counter-guad consists of two lines of rampart parallel to the faces of the bastion or ravelin, and separated from them by a narow ditch.

Counter-irritants: a group of substances which are used for the purpose of prombing local in thammation, generally upon the external surface of the booly, in order that ther mar inthence deep-seated inflammation or eongestion. The rutimule of their action consists in the reflex influence which may be exereised on centrat organs when irritation is apptied to the surface of the bodr, cansing contraction of congested or byperamic vessels in internal organs. Comb-ter-irritants may be divided into several classes, namely: rubefacients, or substances which produce reddening of the skin, which exurcise a fleeting influence; epispastics. which are so severe in their irritating powers as to produce blisters; and canstics, whieh actually destroy the tissues with which they come in contact, so that the irriation produced ly them Jasts for a very considerable period of time. The mild counter-irritant or rubefaeient is the one which should be applied in casces where the congestion or inflammation of the internal organ is not markent, and where it is likely to last for a short time. The uther measures are to be emphyed when the diseased condition is severe and where continued action is required. Thus no one would apply a caustie in the ease of pain in the alrlomen due to inflammation produced by cating bad forx.
In the application of commer-iritants, they shond never be applieat to the area which is actually inflamed, but at sume distance away from this area. Thms in eases of inflammation in the knee-juint the plaster shonld not be applied over the joint where the skin is redtened, but upon the healthy skin, either above or below the joint. It has also been Jearned by partical experience that where we desire to inthence the pye by cumber-irritation, the counterirritant shomb he phacen that of the ear or on the temple. Among the chass of milh conuter-ir itantsor rubefarients may he ronsiderel mostari, ret pepper, aml the spice phater. The chice of the copmast ies is cantharides. aut of the canstioss. which are at the present time very rarely used, eanstic potash, (rantic soda, and atid nitrate of mereiry. II. A. Hare.

Combter-mark : in momismatics a stamp often seen on ancimit coins or metals: gromaly a ligure or inseription. shme antiquaries suppme this mark was struck on mone taken from an chemy.

Comiterpart: a correspontent part, abepy, andricate. In law, when the pats of an imdenture are interchangably pxented ly the speral parties, that part which is exeented by the grimor is trmos the original, and the others are fonnterports. A munterpart is primary evilonce against the party exernting it. Revised by for surges Ileen.

Connterpoint (Fr. contrepoint: Ital. contrapunto): the art of writing music in several distinct parts. 'I'be name is deriven from the circunstance of the notes luing placed one against or over the other in the score. Sce Music.
Connterpoise [Fr. contreporids, i. e. that whieh "weighs against" something elsol: a weight sufficient to balance another in the opposite seale: eqnal foree or weight acting in opposition tosomething. In mechanies, a mass of uetal conneeted with an instrument or machine, either for the porpose of giving stadiness or diminishing the pressure on some particular print.
Counter-proof: a print taken from print which has been taken from an engraverl phate, and which is still fresh: the ink not yet dry. As this counter-prof is reversed from the first proof and corresponds with the engraving on the metal, it is a useful gnide in retouching the latter.

Comitersarp: in fortification, the side of the ditch opposite the scarp. A revelted counterscarp is eonstituted usually by a wall of masonry catled a connterscarp-wall; an unrected conntersarp is of earth at its natural slope.
Conntersign: a watehword given daily by the commander of an army, in order that friends may be distinguisher from enemies ly their knowlelge of it. Sentinels rapuire erery person who approaches their posts by night to give the countersigu.
Countersion is also the signature of a pmblie officer or sectetary to the charter of a king. or to any writing signed by the principal or superior. as a certificate that the charter or instrument is anthentic.
Connty (Fr. comte) : originally the teritory of a count or earl. In motern usage it denotes a division of a state or kingum. In England or Scotland the term is equivalent to shire. The term shire in England is not applied to those emunties which were originally listinct sovereignties, such as Kent, Fisee, Norfolk, Cumberland, and Sussex. Lancaster, Chester, and Durham are called comenties palatine. (See lalatine.) The primary elivisions of the provinces of Ireland are callet connties. bach state of the U. S., except Louisiana. is divided into comnties. each of whieh contains a capital or countr-town. in which the court-house is lucated. In Lonisiana the divisions are called parishes, but are similar to comoties.

Coup l’état, kocidai taa' [Fr., lit., a stroke of state]: a violent ami illegal exereise of power on the part of a government for the purpuse of establishing, increasing, or retaining anthority. A coup iletat differs from a revolution in this important respect. that. whereas a revolution has for its purpose the orerthrow or molification of the methois of a reqularly organized and recognized government, a coup d'étrot, on the other hand. aims at a firmer establishment or increase of the anthority alrealy cetablished. A revolution is the result of political action taken by large numbers of men for a common Int wften a somewhat ind finite purpose : while a coup $d$ etat is the work of a single man who has a definite end in view, and who strikes quiekly for the accomplishment of his purpose. Revohtion is often protractect: hut a coup d'ctut invarially results in immerliate suceess or failure. Some of the most remarkable instances of violence of this kind are the following: In the carly history of fome daring the conspiraey against the edder Tarquinins, Servius Tullins appeatef to the plebeians and noceeded in getting himself Hamed king by the assembly of the curies. It a later perim the (rmachi, who hat come to have so great influence with the popular party as to threaten the legally constituted anthurities. were assailed ant put to death by direetion of the govermone. If $^{\prime}$ a similar gature was the death of Julins Casar at the hams of the republican leaders. (icerocaused the coarljutors of ('atiline to be put to death withont the forn of a trial. 'The booly proseritions of Sylla were a gross violation of legal forms: and the fall of Sejames was also acenmplished by itlogal muans of the same kinul. In madem times the masacre of st. Bartholonew in 1502 was a celebrated instance. Thongh several grool illustrations of this method of accomplishiner political ends occurred in the reigns of Louis XIIT, and Louis NIV., it was not till the Revolution of 1 ise that coup)s détat became a common medhow of acomplishing desired results. It was in this Way that the Montagnards owerthere the Girombists, ind the Thimilorims in turn proscribel the Nomtagnards. Robespiorme aftor having put to death Jhbert and Danton, was himself sacrificel hy the coup d'étut of the th Thermitor. The Hirectory, which suceeded in proseribing two of its
own menlurs and fifty－three deputios on the lxth From－ tiblor，was itself ovorthrown by means of a violent conf

Comrtesy (or Curtesy) of England : the tenure by which, at common law, a man upon the death of his wife holds a life estate in the lands or tenements of which she was seized in possession in fee simple or in tail during the mariage where they have had lawful issue. born alive, and capable of inheriting the estate. This tenure exists in England, and also in its original or in a molified form in many states of the LT. S. An estate by courtesy is a freehold estate for life. See Estates.
F. Sturges Allen.

Comrtesy Titles: titles assumed by individuals, given by custom, but to which they have no legal claim. Such titles are common in comnties where there are different orders of nobility, in which cases it is cnstomary to give to the sons and langhters of a peer having several titles one of his inferior titles. $A$ courtesy title has no effect upon the legal status of the person to whom it is given, and does not raise him above the rank of the commoner. For example. the eldest son of the Duke of Bedfurd has the title of Marquis of Tavistock, and the eldest son of the Duke of Bucelench has the title of Earl of Dalkeith. The younger sons of clukes and marquises take the title of " lord." The Junghters of lukes, maryuises, and earls have the courtesy title of "lady." I woman marrying a person with a title infering to hers, or with no title, retains her own title as a conrtesy title. In sicotland the eldest son of a viscount or waron lias the title of "master."
F. Sturger Allen.

Court Martial : in the army, navy, and marines, a trilmnal for the examination and punishment of oflenders against martial haw or against good order and military or naval discipline. The subjects of courts martial are usnally oflicers or men in actual service, but when martial law prevails courts martial smetimes punish offenses committed by persons not in the sarvice.
Courts martial are callet " general," "s garrison," and " regimental." Summary and informal conrts held in the held are sometimes colleil "drumheal couts martial." The oflifers of military and naval courts are a presilent, a Jubeeadvocate ( $q . a$ ), and a clerk, all commissioned otlicers. The sent, mees pissed by thes courts are hathally sulyect to the appowal of department commanders of other ligh oflicers, ar even to that of the Presilment of the U.S. See S. V. Benét on L'uited states. Militury Luen (1862): Clonle, Military and 1/artinl Lan" (1s72): Simmons. On the Constitution and Pratice of Courts-martial (18is).

of a confirmation of title has no further effect than to release all claim of title by the L's. An appeal lies for either party to the supreme Court. F. Sterges Allex.

Courtois, koortwiat, Gustue: figure and portrait painter; b. in l'usey, llante-Saône, France, 1852; pupil of Gerome. Buyadere (1882) is a single figure of it young Woman in gauzy black drapery that contains the eleverest possible painting, but his work in general falls short of a high level on account of a somewhat flippant air that is given by what can only he termed falsi cleverness. His Dente and Tergit in Hell (1880) is a powerful conception, and serionsly painted. First-class medal, l'aris Expmsition, 1889 ; Legion of Honor 1889. Studio in Paris. W. A. C.

Courtrai, or Courtray (anc. Cortoriacum: Flem. Kortryh): a town of Belgium; on the river Lys: 26 miles $s$. W. of (ilient (see map of IIolland and Belginm, ref. 10-B). It is well built and clean, has a castle. a fine old bridge, a nohle town-hall, and a leautiful (Gothic choreh founded in 1035. Here are manulactures of damasks and other limen fabrics, hosiery, lace, paper, metton goods, soap, cte. This place was taken in 880 A. d. by the Normans, who fortified it. In July, 1302, the Fleming: here defeated the French in the famons "Battle of the Spurs," so called from the great number of spurs taken from the fallen knights. Pop. (1896) $32,517$.
Conrts (in law): public tribmals established for the administration of justice and the interpretation and enforcement of the law. The protection of private rights, the punishment of criminal offenses, the regulation of conflicting interests of individuals ani states, the exposition and application of legislative enactments, and, in some nations, even of constitutional provisions, are the various important functions which are generally deputed to such judicial organizations. It can not be sitid, however, that all tribunals which have loen designated courts in various countries and at different epochs have enjoyed all these prerogatives, or have excreised them so exclusively as is understood to be the apmopriate province of courts at the present day among civilized commonities. In a primitive form of soeiety the powers of the judiciary are ninally much restricted, and suljected, to a greater or less ilegree, to executive and legislative interference. This remark ipllies also to drspotic governments, even though a high degree of civilization le attained, as the history of France and Germany bears ample witness. In molern times, however, it has been reeognized as a necessity to confer upon the courts the powers above emmerated, and to render their indrendence of the other departments of government as complete as possible. They are generally composed of distinct hodies of oflicials holding their positions during stated terms, and are under no supervisory control for decisions rembered or other legal acts perfomed but that of superior or appellate organizations of a similar nature. In the exercise of their powers courts do not attempt to ferret out and redress every evil and torm of injustice that may exist within society, and determine the law of their own motion by the direct establishment of legal principles. but are confined to the decision of controverted questions presented to them by injured parties, and thus evolve the law indirectly and mediately. Criminal eases are presented by the govermment, while those of a civil mature are bronght either by states or inlividuls affected therein, at their own option.
But while there is a general agreement among civilized nations at the present day in regard to the objects to be attained by the creation of courts, the modes by whieh the same results are songlit are notably and strikingly diverse. The courts upon the continent of Europe and in Sentland administer a system of jurinpudnce derived from the civil or Loman law. while in England and the U. S. They apply a system which they themselves have originated, called. by way of distinction, the "common law," In the latter the rule of precednut lowlds sway, in accordance with which primples determined in previons mecisions are, in general, to be deemed anthoritative in subserfucnt canses involving similar eircumstances. In this swstem, moreorer, the mode of triad by jury was develoned as a sufeguarl against oppressive adimith the rents and has been setulously maintained as far as its aplication is reasmably practicable. The judge floes not examine witnesses nor ilecile any questions hut pints of law, so thent ivery inducement may be removed which would lead him to act as adroeate instead of arbiter, and awaken his persomal interent in the cause.

A bromb distinction is also drawn betwern actions which are termed learal amb suits whely are called equitable, the hatter disparning with is jury. miministeriner at turo able quate relief in many finstances, amd in varions ways suple

 which proceed upan the dortrines of the civil law, the force of preerdent is mot recognized as a controlling printeiple. Jury triads hato only bede introducerlas atoreign system, are "mployed in a compmotively smatl class of mstames, und are lesked upon with so little favor that any extonsion

 of witheses and prisoners, and not infrequentls, partionharly in criminal trials, afpear to become as sirongly biand in eonsequenes as serionsly to impair uncos boliep in the impartial whminatration of justice. Amp lastly, no distinction of eanses amb remalios as lecoll or equitable is attomptent. In fact, the linglish practioes in thin reopuret has even excited the derision of enntinental lawrors, who

These eonuts had jurisuliction orer cases arining from the withholding of thes, the non-payment of ecclestastical dues to the clerery, the spoliation of a henefiee, ecclesiastical waste, and the negleet of reparations of the clurch, churchyard, and the like. Ther also had jurisdiction over matriinonial and testamentary canses, In 1507 the ecelesiastical courts were deprived of their jurisdiction over testanentary and matrimonial canses. In $1 \times 56$ the question was raised whether an ecclesiastical ennrt had jurisdiction in a criminal stit against a larman for false swearing. In holding that the jurisdiction did not exist, the judge declared that while such jurishiction hat not beon expressly taken away by statute. 毕 it had inferentially, at the statute save jurisdiction orer cases of false sweariag to the temporal courts, eiting a maxim from Coke that "where the cmmon or statute law givech remedy in foro seculari (whether the matter be tempmal or spiritual), the conusans of that cause belonseth to the king's temporal courts only, unless the jurisdiction of the ecelesiastical enurt be saved on allowed by the same statute to proceed according to the ecclesiastical law.". The julde writimg the opinion said: "It cannot. I think, lre foubted that a recurrenee to the punishment of the laity for the good of their souls, by ecclesiastical conrts, wouk not be in harmony with molern illeas, or the position which ceclesiastical anthority oecupies in the countre. nor do I think that the enforcment of such powers where they still exist, if they do exist, is likely to henefit the comminity." (Phillimore vs. Machon, I P. D., 488.) Practieally the eivil jurisdiction of the ecelesiastical eourts over the liity has ceased to exist, exeept in matters relating to the fabric and ornaments of the church, the churchyard. and churchwardens. Ther are now about on a level with court martial, exereising jurisdiction over the elerge of the Established Church in their professional character, as the military courts deal with soldiers and sailors. (Wilson's Moderin English Lew. p. 24.) The common-liw courts restrain, by a writ of prohilsition, the ecelesiastical courts from exceding their jurisdiction, and can compel them to exereise their jurisdiction by a writ of manlamus. The right to practice in the ecclesiastieal conrts, formerly eonfined to proctors, has been extended to solicitors, and in the taking of evilence oral has been substituted for written testimony. In the LT. S. ecclesiastical erourts bave never existed in the sense in which ther have existed in England.
(4) The Courts of Probate. Derorce, and Admivalty.-The Court of Probate and that of Dirore were established in 1857 to superserle the former ecclesiastical courts, and received more extended powers. Their names suthiciently detine the nature of their jurisdiction. The judges of either of these tribunals could try duestions of fact with a jury, or could order an issue to be tried by a court of law. Appeals could he taken to the Ilouse of Lords. The Court of Probate had only a single judge, who eonld, however, associate with himself a common-law julge or judges. The appropriate labor of this tribunal was facilitated by the estahlishment of district registries throughout the realm. These wre forty in number, besides the prineipal registry in London, all haring power to grant probate aul adiministration.
The Court of Divoree consisted of the judge of probate, the lord chancellor, and the julges of the superior commonlaw courts. The probate judge was made judge ordinars. and could act alone or with the other judges. The power to grant livorce, which was conferred upon this court, was exereised till 1x.iTh only by Partiament. Aetions for criminal conversation could also he maintanes in this court.

The Migh court of Admiralty had cognizanee of eauses of action arisinge from tha navigation of the seas, as e. $g$. claim- for repairs of foreign rissels ant for supplius furnished them, actions for filetage fees. for semmen's wages, fur personal injerices infliceld at apa co injuries by collision, seizure, and the like; ateo to determime matters if prize in time of war, and iceree the froftiture of veseds of the ennmy or of nentrals in proper cases. This court was held by a single julge, who was apointer by the crown. II cimald be the same person as the judere of prabati:
(5) The 'rimimal Courts.- These ware diviled into the inferior and the superior, the former including the general
 the assizes, the uhmiralty semons, the ('ourt of King's (or Quern's) benels (now a part of the ligsh ('ourt of Justicé), and the Central Criminal Court, which is retaned in the prome syatem of comerts. The assige Wrre amb still are hell by raval commission twice a yar in wearly all the comoties. The julges act ly virtue of varinu* combinions, the most
important of which are those of "oper and terminer," hy which they are empowered to try treasons, teloniex, aml trespasses, and "general jail thelivery." empowering them to try every prisoner in a specified jail, for whatever offense committerl. so as to clear the prisins.

The King's or (!ucen's Bench was the highest court of criminal juriseliction. This prerogative, as has heen seen, it enjoyed to the exclusion of the other superior commonlaw courts.

The Central Criminal Court was erected in 1834 for the trial of treasous. felonies, and misdemeanors committed within the city of London and comnty of Miedleser, and certain rarts of other munties.
The other criminal courts require no particular mention. (6) Appellate Courts.-(o) The Excherper Chamber, to which apleals were first taken from the King's Bench, the Common Pleas, and the Exchequer, wats comped, as already explained, of the jurlges of the two courts in which the action was not heart originally.
(b) The Judicial Committee of the l'risy Comencl is a tribunal of privy councilors, established to try appeals to the sovereign in eouncil from colonial and ecclesiastical conrts, from the Court of Admiraltr, and from certain orders in lunaey. It is a court of record, and is composed of a lord president, all the equity judges, the three chief judges of the common-law comrts, and certain other officials to the number of twenty or more. Only fonr. however, are requirel to constitute a quorum. Of the whole number of members (exept (wo retired East ladian judges) onls four receive a alary as sucls, are required to attend the sittings, and retain their positions during gond behavior. The members of the Comeil generally hoh office during the pleasure of the erown. There is no appeal to the Ilouse of Lords, and there is, consequently, danger of a contlict of anthority between these tribunats of last resurt. The juristiction of this cout in appals from the High Court ot Admisalty and from orders in lunacy was taken away by the Judicature Act, $1873, \mathrm{~s} .18$.
( $c$ ) The lIonse of Lorts. Thongh, in theory, this entire body constitutes the appellate trimanal, and any of the lords might, if so disposed, assume to act as judres. yet the judicial functions are, in reality, entirely delegated to a few members of the legal profession. known as the "law lords." The services of the others are only available when they are needed to make up a quorum, for which three members are required. The organization of this eourt has several objectionable features, sinee the sittings are only held while Parliament is in sessinn; there is no regularity of attenlance required on the lart of members: and a judge may sometimes sit in review of his own deeisions. The decisions rendcred, bowever, enjoy generally a great reputation from the eminenee of those who usualtr aet as judges.
The system of courts above described has been remodeled in recent years hy a series of acts known as the Judicatore Acts, leginning in 1883, and known as 36 and 37 Vict., $\varepsilon$. $60 ; 37$ and 34 Tict., c. $83: 38$ and 39 Vict. c. 77 ; 39 and 40 Vict., c. $59: 40$ and 41 Vict., c. 9. By this legislation all the higher courts of law and equity were merged in a Supreme Court of Inclicature, consisting of a High Court of Justice and a Court of Apreal. The Dligh Court of Justice never sits as a whole, but is divided into five depurtments, four bearing the names of the fonr great courts which precerled them, viz. : the Chancery Division, the King's (or Queen's) Bunch Dirision, the Common Pleas I Ivision, and the Fxcherner Iivision. The other department is known as the Probate, Divorce, and Admiralty Division. Wach of these divisions possesabs rery much the same jurishliction as did the courts of the sume name which they di-placed, and which have been previously deseriled, thomgh withs sme important differences of anthority The lord hirh clancellor presides orur the (hancery Divisinn, and the lord chief justice over the Quern's Bunch bivision. The conrt of Appeal is composed of six julges, and sits in two divisions, one for law aml the other for ergity, although any julge may sit on cither wide. The judge hold ottice for life. though they may be renoved by the crown on the allidess of I'arlinment. Their salary is Ejonoo. The salary of the lord ehancellor is f10,000 and that of tha lord ehief justice is E. $\mathbf{4} 1000$. A uniform system of pleating ant procedure has Ween cobablishod, and it has been providel that in every civil canse or matter contertained in the Supreme Court of Judicature law and equity slabli be concurrently administered. and that culutable rules shall suprsede those of the law whon any contlict arises. It is still true. bowever, that canses of ation whieh in themselves have been hitherto
consinlered distinctively equitable are to tae lromeht hefore the ("hancery bivision, which task the plate of the four chancory conets of ortginal juristletions.

In a barge nomber of yteations several divisions hater concrdinate juristiction. It is acoordingly proviled that any berson commenciner a canse may asign it to any proper livision he may think fit ly marking his doe taments with its uame. If a wroner assignment le matle, at transele maty he had, on proper apllication, be direction of the comat of by a julge of the division in whila the matter is bromedat, of the "anso may cren be retained if atamafer wonlal be inexpeclient.

Every aphed to the Comer of Apmeal is heard rither by the while comut or loy a divisional ramot comsisting of any mumbre not less than there of the judeme thereof. - ppeals

The llonse of Lorels still has thpellate jurisdiction from the Court of $\Lambda_{\text {pheal, athenth its funerions in this respect }}$ are really exereised by a commitiee composed of suchi peres as are holding or hase held high judicial otlice, and three lemets of appeat in ordinary. The llouse of tords has been recognized as a court of appeal from thr dity of Queen Elizatheth. From the time when $0^{\circ}$ (ommedrs ease came hefore the Hunse on apreal, in 18.1\%. no attempt has ever leern made by the lay peers to exercise judicial functions. So strong was the feeling against o 'onndl that a numbar of the hay peers, who conld not bear to see the lrish agitator estape punishment for sadition on a purely technical proint, expresed an intemion of votiag on the appeal. It was, however, so strongly urged on them that by custom, though not by strict law, the juclicial functions of the louse had mot been exereised hy bay peers. and that it was only by the ubsurvance of this custom that the decisions of the House could command respect, that they finally withdrew and left the matter io the law hark alone. No disposition luas since ben manifesterl to infringe this princiule.
11. Tue ('or*Ts or SiothaND.- Ithough both Englanel and scotland bedong to one united kinglonn and have but a singry legislative lrody, the llouses of Parlimment, their julicial orsmization is amost entively diverse. There is mo tribuat of supreme appellate jurisdiction, the llouse of Lords, which is common to bath count ries. but this is the omly clement of correspondence in the two systems. Sootland aministers the civit law insteme of the commons. The contrts of chicl importance are the court of the sheriff, or shrift-suhstitute, and the Court of session. The sionttistr sheritf differs from the longlish in not being eonfined to the prerfonmaner of merely ministerial duties. He atcts also as the chicf loral judere of the coonty to which he beloners. "Phe jurisdiction he exeroisos is hoth civil and criminal, ant is fubte extensive in its soope In civil causes it extends to all actions on contract and for damates, foo matter how barge the amount involved. In maters, however, relatinur to fanded property his anthority is much restrictel. Ile has also a summary jurisdiction, conforred by statute, in small-debt cases, where the sum involved is not above $\mathbb{E}^{\circ} 1 \%$. In most cases of this kind there is no apreal from lis decinions. The steriff also takes ongnizante of bankruptey, insolveney. aml admiratty puestions. Itis criminal jurisdiction extends to all cases which do 1 ont infer aloath or lanishment. No jury is employed in the trial of eivil canses. but only in thome of a criminal nature. Though, howerer, these various powers tue dosedibed as appertaining to the stherifl himself, yot in prototice, so far as the "aproity of hemriner canses originally is comemmed, they are delegated to a subordinate allicer. appointed by the sharitr, and stylal a sheriff-suhstitute.  original jurishlition, and coonstitutb collecetively what is known as the "Onter Honse". "The vight remaining judges form the " hamer llonse" and have, as a pemoral rale, only adyedlate jurisidictime. They are divided into two divisions of form rath, either of which posaresses the sane anthority, and may be selected by any party appobling, at his own optiont "tmo division is presided over by the lowd justice elork, the other by the loml president. In some few instancers the buno thouse may exercias orisimal juristiction, and in cases of exceptional difliculty the whole bondy of thirteren julges may consinler a question upon apreal: but surh canes How very vare. lathe trial of civil causes in the first instanee bufore a lod ortinary jurios have hen employed since ist but by no means to so gratit an extent as in the Fnglish practice. 'The jury syotem wis introduced as an oxotic, and does not thriwe wry vigorousty under the unfarorable conditions of a common prejulise against it on the patt of clients and lonstile criticism by able members of the far. Juries may be clispensed with, in gemetal, in the disctetion of the conit or by comsent of partien: ant, as might be supposed, a resort to these expedients is not infrepuent. The "onstitution of the arpellate branchas of the lanor llouse in this system is evidently faulty. There may be an expral division of the jutges in erither bonly, so as to rember the determination of any questan impossible, of the dectsions of one branch may directly antranlict those of the uther, so as (1) make the law fuctuating and uncertain. 'The first evil is remedied hy calling in a lord ordinary or three judges of the othor louse to attwat a rehearing of the canse, by which meaus tha whole mamber of juages is made umeren and a majority rembered certain. In the second cave the opinions of the whole conm nuty be taken, but this mode of reference is disuretionary, and therefore inadeynate to meet the dithiculty. The linal apmeal, which may be taken from the Court of session to the Honse of 1 ords. has this peculiar conse-quenee-that it refers questions arising under the civil-law procedure to jurists trained only in common-law methonls as a genural rule. It can not be said, howerer, that any mace tienl wils lave resulted from this en-oneration of systems.
'There are several whet courts in Scotland compersel of nembers of the Conrt of session. Only one, however, deserves mention-riz.. the High Court of listiciary, atribmal exercising an important criminal jurisdietion. The other cenrts are of inferior impertance.
111. ThF ("ourts of Fraver.-The most important eourts are the Tribunats of the First Instance, the Courts of A preat, the Courts of Assize, ant the Court uf Cussution. The Tribunals of the first hnstanee. ats their name implies, eutertain canses originally, and they excreise buth civil and criminal jurishliction. One of them is establishmd in each of the atrrondissements into which the whole country is divided. Each of these conrts consists of finn thate to twelve judges, the number varying with the popmlation of the districts. When their number is seven or more, they are formed into two chambers-one for the hearing of civil and the other of criminal cames. When there are twelve julges, three obambers are formed, two civil ant one crinumal. Thetribunal at laris is su large as to be divided into ten chambers. In eivil
 eivion, while in crimimal actions the aereement of five is necessary. Apmak may he taken to the Comats of Appeal.

The ('morts of dpmat are twenty-sesen in mumber, and each of them is named from the "ily or phere in whielt it is situatnd. They masist sorverally of at heast twenty-four judges. who are watally divided into three chambers-one of civil juriodidtun, another of criminal. White the third hears ajpeals in pulice matters sevorn pudges mast coneme in the deTermination of efvil canses, five in criminal acrasations. '1"he Conart of $\frac{1}{\text { Prosal }}$ in l"aris has six chanabrs amd fifty-nine juderes. Finch datmbiry in all thene courts lats its own fresi-

 may lre rivens. Sprato lie from these courts to the fomirt of Cussation.

institution is peculiar. as compared with French courts in general, in that it exhinits the emplovment of the Encrish jury system. The jnrors. however, are not required to be manimous in theit verdiet, a majority sutficing. The numher of judges in wach court is three, and sessions are beld every three months. The amount of bnsiness in Paris. however, requires two sescions a month. Appeals may be taken to the Court of Casiation.

The Court of Cassation (i. e. court having power of annulling) is the higliest permanent court of appeal in France. It is composed of a first presirlent, three presidents of chamhers, and forty-five other judges called counselors. It is diviled into three chambers-one for the hearing of appeals in civil causes, another in those of a criminal character. while the third is termed the Chamber of Requests.and takes cognizance of petitions, determines whether appleals are atmissible, etc. Appeals must be brought within three months after the previous decision was remkered. The julges, as in all the higher courts of France, hold oflice for life. The constitution and functions of the Court of Cassation differ quite essentially from those which are conferred upon aplellate tribunals in England and generally in other countries, and even upon the subordinate French courts of appeal : for it possescis no power to affirm the jurlgment of the conmt below, but only, as its name indicates. to rewerse a decision, and transfer the canse for another hearing to some trihunal having co-ordinate jurisdiction with the one in which judgment was first rendered. Noreover, notwithstanding the preemirent position of this court, its determination of the law is not considered authoritative upon inferior tribunals, but on]? as presumably correct and open to contradiction. Instances in which its views are disregarded, however, are of course very rare.

Other French courts of limited jurisdiction but great usefulness are the Tribunals of Commerce, established in all the commercial cities and towns, and the Courts of P'rulbommes. existing in Paris and a few of the larger cities. The former consist largely of men experienced in mereantile pursuits, amb take cognizance of quest ions arising in commercial transactions. The latter are mechinics' courts, eonsisting of mamfacturers and artisins, and take charge of matters arising from the relations of employer and employed. They relieve the ordinary comrts of moneh labor.
IV. The Courts of the Cisited States.-In accordance With the provision of the Constitution establishing a Suprene Court and conterring upon Congress the power to create inferior tribmals, a regular system of courts has been formed throughont the Cnion. The most important are the District Courts, the Circuit Courts. Circuit Courts of Ippeals, and the Court of Claims. Final appeals are taken to the Supreme Court at Wrashington. All these tritumals exercise both law and "quity jurisliction, and the juricial anthority given by the Constitution is rariounly apportioned anong them.

The District Courts are now (1893) sisty-six in number. Each state generally constitutes a single district, thongh some of the larger omes, as New York, lennsylvana, Illinois, and a few others, are divided into two or three. New districts are formed by Congress as the population increases or new states are adinitted, so that the number is subject to constant variation. Each court consists of a single judge, When mast rosifle in the district for which he is appointed. Oripinal jurisidiction is estreised in civil, criminal, and adminalty causes. ']herlasses of questions of which these courts take cognizance are determined entirely by enngressional enactment, aml aro varionsly molified at infferent times. They enturnin exelusively questions of admiralty or maritime jurisdietion in the first instance, inclubling all seizures npon navigathe waters under laws of imposts. navigution, or trame of tho: C. S... actions for injuries committal upon the hish seas, suits to recower upon maritime contretcts, actions for sulvare, for injuris hy collision. and matters of prize. They aloo lave sole miginal (mynizance of questions arising from soizures mpon land. umb of all suits for pronalties and forfoitures under the [. S. laws am] also of actions agatinst consuls or viow-consinls. In addition, they have oricinal jurisuliction in all caties monlon the bankrupi laws. They exercise "oncomment jurishletion with the ('irenit ('ourts of all crimes and offenses agninst the [T. S. the punishment of
 all causes eivil or criminal, atfectime persma who are rlenjed in the Siate eourts their rights of citizanship und r the C . S. laws. 'laey alsa have concorrent jurisidiction with the "ircuit (omrts or with the state Comrts of all "anses where an alien sues for a tort in violation of the haw of nations or a
treaty of the U.S. and of all suits at common law where suit is bronght by the [?.s. or any officer therenf. The tria] of issues of fact in the District Courts. except in civil eauses of a maritime character, is by jury. No person can be arrested in one district for trial in another.

The Circuit Courts are nine in number, and each circuit in which one of these courts is established consists of sereral States. The nine justices of the supreme Cunt are alloted, by their own selection, each to a particular circuit, and each is required to attend at least one term of such comrt to which he is appointed in each district of his circuit cluring every period of two years. There is also appointed a special circuit julge in each circuit, within whose limits he must reside. A Circuit Con't is held by the Supreme Court justice thereto allotted, or br the regnlar cireuit judge, or by the district judge of the district sitting alone, or by the Supreme Court justice and circait judge sitting together and the former presiding, or, in the absence of either of these by the other (who then presides) and the district judge. Such courts may be lield at the same time in the different districts of the same circuit. Two sessions of each court are held annmally within eacli district of the circuit. The Circuit Courts have no appellate jurisdiction. Their original jurisdiction extends. concmrrentls with that of the State courts, to civil suits in law or equity for more than $\$ 500$ when the U.S. are plaintiffs, or an alien is a party, or the suit is between a citizen of the state where the suit is Irought and a citizen of another state. They also entertain causes arising under the revenue laws and some questions of a particular nature in bankruptey procedure. Their important concurrent jurisdiction with the District Courts has already been mentioned. Provision is marle, moreover, for the remoral of certain canses-such as actions against revenue oflicers, suits on titles to land derived from other sitates. ete.-from the state courts to the Cireuit Courts. on proper petition by the defendant and the entering of security.
Cireuit Courts of Appeals were established by an act passed Mar. 3,1891 . This act creates in each of the nine cireuits, already referred to, n Circuit Court of Apreals, consisting of three judges, of whom two constitute a fuorum. The act provides for the appointment in rach circuit of an additional circuit judge. and then declares that the chief justice of the Supreme Court of the U. S. and the associate justices of that court assigned to each circuit, and the several district judges within each circuit, shall he competent to sit as judges of the Circuit Court of Appeals within their respective circuits. But no justice or judge hefore whom a canse or question may have been tried or heard in a district court, or existing court, can sit on the trial or luaring of such cause or question in the Circuit Conrt of Appeals. I term is to be heli] annually by the Circuit Comrt of dppeals in the several judicial circuits at the following places: In the first circuit, in the eity of l3oston: in the seconsl circuit. in the city of New York: in the third circuit, in the city of l'hiladelphin: in the fonrth circuit, in the city of lichmond: in the fifth circuit, in the city of Sew orjeans : in the sixth circuit, in the city of Cincinnati; in the serenth circuit, in the citr of Chieago: in the eighth circuit, in the city of $\dot{\delta}$. Jouis: in the ninth circuit, in the city of Sun Francisco. Since the passage of this law no aypeals, by writ uf emor or otherwise, can be taken from anr Jistrict Comrt to a C'ircuit Court, and all appeals from the District Courts are subject to review only in the supreme Court or in the Cirenit Courts of Appeals, $A$ ppeals or writs of error may be taken from the Distriet Connts or from the Cireuit Courts direct to the supreme Court in the following cases: In any case in which the jurisdiction of the court is in isue: from fiml sentonces and decrecs in prize canses; in cases of conviction of a (ablital or otherwise infamous crime; in any case involving the constrmetion or application of the Constitution of the $\mathrm{U} . \mathrm{S}_{\mathrm{o}}:$ in any case in which the constitutionality of any law of the L.S. or the validity or construetion of any trenty made under its antlority, is drawn in question ; and in any case in which the constitution or law of a state is clamed to be in contravention of the Constitution of the [T. S. The Cirruit cunrts of Appeals rexerse aplellate juriseliction over final tmoisions in the District Courts and the C'ircuit ('ourts in all cases other than those montioned above, unless itherwise provided by law. The judgments or dereres of the "irenit Conrts of Appeais are final in all cases in which juristiction is depentent eutirely unon the ( 1 posite parties low the suit or controversy, being aliens
 in all cases misine under the patent laws, under the revenue laws, and mater the criminal laws and in admiralty cases.

 ity．ceraboul a great somsatimen the art word by the＂xhilsi－ tion at thes．alon of $1 \times \frac{1}{2}$ of his great picture The I）ecolence
of the Romates. which is now in the Lourre. It is a work of wonderful power, and fine in composition and drawing. In color it may be reproached with a tendency to ton great warmth in the shadows. but it is harmonious in tone and complete in eusemble. Ite had many purils, but his intuence was not always goot on young painters, many of whom adopted his peculiarities of methor without attaining to the results achieved by the master. The motern school in France has now completely outgrown the once marked influence of his strle. A canvas by him, a stuty for The Tolunteers of $1: 93$, is in the Boston Mneum of Fine Arts William A. Coffin.
Corenant [O. Fr. conrenant, pte. of concenir < Lat. conreni're, meet tagether]: in theology, the promises recorded in the Seriptures made by frod on certain conditions of obedience, faith, ete., on the part of man. The old dispen-
 i. e. the ohd corenant: and the ner dispensation (or Testa-

The so called "Theolocr of the Covenants" or "Federal Srstem" was elaborated liy Cocecins (1603-65), who tanght 1, the covenant of works before the fall ; 2 , the corenant of grace after the fall. And moler this second covenant three economies: 1, prior to the law ; ? under the law ; 3, under the gospel. This ststem is the theology of the Westminster Standards.

Corenant: in law, a promise under seal, There are sereral words appropriated to sealed instruments or promises contained in them, as lond. covenant. deed. and obligatim. The first, third, and fourth words are used to express the entire instrument, while "covenant" is commonly employed to designate a particular clanse in a sealed instrument. Thus there may be many covenants in a deed. The subject is fruifful in distinctions, corenants being treated in the law-books as to their form, their nature, their relation to other cosenants, their assignatility, and the like. One of the most important of these is that which elassifies corenants into those which "run with the land" and those which do not. To explain this subject it is necessary to state that in ordinary converanees of land there are found certain clauses which atfirm in sulustance that the grantor is owner in possession, actual or constructive (or seized), and has a good right to convey ; that there are no incumbrances on the land: that the purchaser shall quietly enjoy the land without being evicted by any person having a superior title: that the grantor will warrant and defend the title; and that he will make such further deeds or conveyances as he may be called on to make to prerfect the title. In brief terms and in technical language these are covenants of seizin, good right to conver, against imenmbrances, of quiet enjorment, of warranty, an. of further assurance. The first three of these, it will le observed, athirm an existing fact; the last three concern the future, and are promissory in their nature. The first three do not run with the land; the last three "In. The reason of the distinction is technimal. The first three, if untrue at all, are so at the very moment when the deed was delivered. and accordingly then conferred a right of action. This immediate right to sue is in the nature of persenal property, and closely resembles ordinary rights of action, such as a claim on a promissory note alrendy due. decordingly, if the grantee in the deed should convey the lamd. he woild not live that act alone transler these rights of artion; they would not, in techmical language, "run with the laml." On the other hand, as to the threw covenants in the future tense, it is elear that no action can be bronght upan them until the event against which ther are dewigned to gumel happens, or, in other words, until thu *mpenat is broken-that is, until the quiet enjoyment
 phant will "rum with the land." by which expression is meant that the mere converance to the second grantee transters these covenants, as it would the houses, trees, and other adelitions to limd. The distinction thus pointed out also applies to the case of landlori and tenant, and there are abstrase distinctions hare to be nuted which can not propery be stateal whin the hrief compas of this article. Sone of the common covenants in a lase which run with the land are the agrecment of the tenamt to pay rent, or to make repairs, or to keep honses insured. It shabla brembed that the rule respecting the aswisuabilty of rovenants in leaves applies to cowenants himding either on the tenant or the landorel. There in a growing practioe in converances of land in towns and rities to insert clanses binding the
pnrehaser to use the land in a particular mamer, as to build dwelling-houses npon it, and even such as are of a particular description. Although these clanses do not strictly fall within the technical dactrines of covenants ruming with the land, yet the are binding in equity law on a subsequent purchaser with notice. The record of the deed containing them will in general be sullicient notice to such subsequent purchaser. The covenant mas be enforced throngh the medinm of an injunction or other appropriate equitable remedy.
T. W. Dwight.

Corenant, National (of Sentland): an agreement to protect the Reformed religion in the Church of sootland from the attempt of the Eaglish Government to enforee the Episcopal form of worship: drawn up and puhlished by the Four Tables in Eulinburgh Mar. 1, 163s. It professed to be based upon a document which James VI. had signed in 1580. The Four Tables, as they were called, consisted of 1, nobility; 2. gentry ; 3, ministers; and 4, burgesses; and in their hands the whole authority of the kinglom wits vested. They elected a general assembly which met at Glasgow in Nor., 1638, and abolished episcopacy; ordering that every person should sign the Covenant on pain of excommunication. The Covenanters prepared for war, and thongh a treaty of peace was conchuded in Jume, 1639, they entered England in Aug.. 1640. An agrecment was signed at Ripon Oct., 1640, by which commissioners were to be appointed, to whom the points in dispute were referred. A settlement of the matter was reached, which. under the mame of the Solemn League and Covenant, was received by the English Parliament of the Assembly of Divines Sept., 1643. It differed essentially from the Corenant of 1638 , and, according to Hallam, "consisted in an oath to be subscribed hr all sorts of persons in both kingtoms, whereby thes hound themselres to preserve the Retormed religion in the Church of Seotland, in doctrine, worship, discipline, and government, aceording to the word of God and practice of the best Reformed churches; and to endearor to bring the Churches of God in the three kingdoms to the nearest conjunction and uniformity in religion, confession of faith, form of chureh government, directory for worship, and catechising to endeavor, withont respect of persons, the extirnation of popery, prelacy (that is, chureh government ly archbishops and other ecelesiastical officers), and whatsoever should be found contrary to somal doctrine and the porser of godliness; to preserve the rights and privileges of the Parliaments, the liberties of the kingdoms, and the king's person and authoritr in the preservation and defense of the true religion and Jiberties of the kingdoms: to endearor the discovery of incendiaries and malignants who hinder the reformation of religion and divite the king from his penple, that ther may he brought to punishment : fimally, to assist and defend sill such as should enter into this Covenant and not suffer themselres to be withdrawn from it, whether to revolt to the opposite partr or to give in to a detestable indifference or neutrality." This document was signed hy members of both houses and by civil and military officers. A large number of the beneticed clergy who refnsed to sulbscrihe were ejected. Charles II. simned it rery reluctantly at Spey in June, 16.5. in the hope of recovering the Engliwh throne. After the Restoration a majority in the Ilouse of Commons ordered it to be burned by the common hangman in May, 1661. In the same year the Scottish Parliament renounced the Covenant and declared the king supreme. The Covenanters became "Protesters" aganst these wrongs; Ejected from the churres they became "Conrenticlers, ans. later, "Hamiltoniams." Under all these names they were subjectet to a fierce and ernel persecution. in which neither age nor sex was spared. After the accession of William in 1688 I'restiverian government was restored in scothand, but in the form in which it existed in 1549 , thus avoiling all mention of the cownant.

Revisel by Willis J. Beecher.
Coremanters: (1) the signers of the Covenant in Sotland and thase who after the Fiestoration adheme to the Covemant. (See Covevast.) lore specifienly (2) the religious hody fommed by didhard (ameron about 1650 (see (ambron and (ambentass), and represented by the lieformed Prosbyterian churches mow in existence. Bend. Ide Wheeler.
Cowen, Frederic Ilmaex: musician: b. Janr. 29, 1859, at Kingston, on tho island of Jamaica, West Lndies; was taken to Landon when very yonng: studied under Benedict and Goss, and then at the Leipig and Berlin Conservatories, returning to England in 1868 . Since then he has followed the profossion of a composer and conductor, refusing to teach. 11 is principal works are an operetta, Gariballi: cantatas, The Rose Maiden (1870): The Delinge. The Cursair (18j6), for the Birmingham festival; St. Trsula (1881), for the Norwich festival; The Slpeping Bernuty (1885) for the Birmingham festival: the oratorio Ruth (1885) for the Woreestry festival; the cantata S\%. John's Ere fur a festival at Melboume, Anstralia: the operas Patine (Nov. 22, 18ifi), anmther, hased on Muida's novel Sigma, and Thorgrim (Apro, 1890) for the Carl Rosa ('ompany: five symphonies, some other orchestral pieces, and many songs and part sones. In 1s8x he was appointed conductor of the london Phitharmonic: Gociety, which post he resigned about three vears later. Cowen's musie is exceedingly graceful and inelodions, and is everywhere very popular: In 1888 he visited Melbonme, and while there produced his cantata i 1 Song of Thenkingining.
D. E. Ilervey.

Cowes, West: a seaport and watering-place of England, on the Isle of Wight; ; the the month of the river Medina; 102 miles S. S. E. of Southampon (see maj of England, ret̄. 14-1). It is built on a steepslope, presenting a fine appearance from the sea; contains many elegant villas and hotels, hav an active coasting trade, and is a general rendezrous for vachtsmen in the yalliting season. It is the ehief port of the island. Pup. (1s!!) 10.648 .

Cowlage (sometimes called Mucuna): a drug which consists of the hatirs of the pools of Mucnua prurions (of the lamily Leguminmere), a kong twining plant with large trifoliate leaves and dark-purple or dark-greenish flowers, and largely cultivated in looth the bist and the West lndies. The liais are about bmesighth of an inch long. and of a glossy-brown color. They easily penetrate the skin and produce an intolemble itching, which instead of heing relieved by washing or rubhing is greatly inereased. Sery little is known of the chemieal composition of the drug. it was originally employed as a vernifnge, but is now very little usch. At one lime it was made into an ointment and used as a counter-irritant to the skin of limbs which were suffering from paralysis, bat this treatment cin not naly be of no value, it may he distinctly harmful by irritating the surface of limbs which are alreaty in a condition of bad nutrilion.

## II. A. II.

['owl [0. L. cuhle, from lat. cucullus, hood]: originally simply the hood which the monk draws orer the head in order to provent the wyes from glancing either right or left, and thus shat himsilt up in solitude wen while anong the multituch: but, us the cowl is the most characteristice part of a monk's drosis, the worl eame in course of time amd by an easy transition to mean the whole monastic garment.
('on'ley, Ansansin, X. 1).: English poet: b. in Lemblon in 1fis: entered 'rrinity (onlleare, Cambridge, in 16:3\%. Il is luve for poctry was moused by realing The F'aery Queen, and he began to write at an carly age, publishing a volume of poems ralled Poctic Blossomes when fifteen years ohd. He was ejected from eollege as a loyalist in 1643 , and removed to Oxford, wherw he cont inmal hisatudies. In 16.16 he went to l'aris with the unetu, and remainml ten yrums. lle puhlished in $164 \%$ The Mistress, a serios of peroms which aboumd in frigid consecis. In 16.5 he returned to thyland, was imprisoned as a royalist, hut was relaased thromorh interest, umb obtained the usulruct
 he again lived in Paris. He studied naturat history, and
issued Liber Plantarum (1600-88). The epie Davideis, commenced in college, was never finished. His essays, as well as his anacreontics, evidence sensibility and refinement of thought, a facile imagination, a brilliat wit, and coultured mind, but are marred with the prevailing trivial love for glittering ingennity of style. The most anlmired poet of his day, he is called on his tombstone " Anglorum Pindarus, Flacens et Jaro." Ilis works were pmlitished by sprat (1680), by Aikin (3 vols., $180^{2}$ ), and by (irosalt (1881). I). in London, July $28,166 \%$. He was hiried in Westminster Abbey, beside the remains of Chancer and Spenser, where the Duke of Buckingham erected a momoment in 16:5. Cowley holds a high position as a prose-writer and an essayist.

Cow-parsnip : a large herbaceous plant of the genus $/ I e-$ racleum of the family ('mbelliferue, or Umbelworts ( $q . u$ ), natives of the northern hemisphere and chicfly of the temperate regions of the Old World. The plants of this gemus are characterized by their strongly flattened fruits, eonspiouous white flowers in broad umbels, borne upon tall branching large-leaved stems, the leaves ternately compommd. Aloout fifty species are recognized by botanists. Ilerecteum lenalum js the only North American representative, It occurs from Newfouniland and Labrador to British Columbia and Alaska sonthward to North Carolina, Kentucky, Texas. and Califomia, and its fruit is said to be eaten by some of the native tribers. In the Old Worll it oecurs in Jitran and siberia. It is a tall-growing woolly plant from 4 to 8 feet high, with a grooved stem and broarlirregularly ent toothed leallets. It is said to possess poisonous qualities. C. E. B.

## Cowpen-lird: same as ('owbird (q. $\cdot$.).

('ow'priss: a village of Spartanburg eo., S. (C. ; ahont 100 miles N. N. WV. of Columbia, Here during the Revolntion (ien. Morgan defeated a British force under Col. Tarleton, Jan. 17. 1781. The lbritish lost 300 killed and woumded; the Revolutionary lorce took 500 prisoners, 2 camons, 800 muskets, ind 2 standards, and had 12 killed and 60 wounded.
('owner (properly pronounced "Cooper"), Farls: Viscomots Fordwich (Great Britain, 1718), Barons Cowper (England, $170(6)$, Barons Butler of Moore Park (England, 167(9), Barons l)ingwall (scotland, 1607), and hatonets (1642).Francis Thomas De Grey Cowper, serentle ear, a prince of the Holy Koman Empire, captain of the corjs of gentlemen-
 from 1880-8:2 Lord-Ljeutenant ol Ireland.

Cowper. William, Earl: English judge and orator: b. in 1664 . He was called to the bar in 1688 , and elected to Parliament in 160\%. He became an excollent debater and the lealer of the Whlig party in the Ilouse of Commons. In 1\%05 lie was appointerl Loril Chancellor. He resigned the grent seal when the Torjes obstained power in 1910, but was reappointed in 17i4. Having resigned office in 1718, he was then created an earl. I. Oct. 10, 1723.

Cowper, Whllam: Fnglish poet: h. at Great horkhampstead, Ilortlorishire. Nov. 15, 1731; the son oft the rector, John Cowper, claphain of George 1l.. und nephew of Earl Cowper. Deprived of his mother at the age of six, he was a temder, shmbing child, and a sensitive, molancholy boy at Dr. Pitmm's school, mate more so by the rough fagging at Whatuinster Ghool, where he adramed in elassical soludies. First articled to an attorney, living in the Templo in 1752 , and called to the har in 1504 , he never practiond. Apromed chork of the journals in the llouse of Lombs (1663), he could not luing himself to appear for hervonsmess. He determined on suicide, hut w:anted courage. Morbidly dejected, he was taken in Dece, 166:3, to the private asylum of In: N゙athanied colion at st. Albans, where he spent a couplo of forars, and then wont to Jomatinglum, where he came to know Mis. Tnwin, "Mary" in his poems. The acouaintance grew into a tender friendship, and ultimatoly to an engagement ot mariage. her hashand dying in $176 \%$. liesulner with the [rnwins anid gentlo and roligions inthences. where his spinit fomblemse and cata, he came to be intimate with their fridul, Rev. Cox. Kemrox : figure-mainter; b. at Warren. Ohio, Oet. 27. 18゙56: son of Jacob I). Cox; pupil of (iérôme and Car-olur- Duran. Paris: speond Hallgarten prize, National Academy, New York, 1s59; two third-elass medals, Paris Exposition, 1889: Temple silver medal. I'emstrana Academy. Philatchhia, 1s:nf member of the soctety of American Artists (168?) ; honorary memher and instrictor Art students Leaque: member Architectural League, New Tork. He began his art stulies in C'incimnati; workel atter that for a time in Philadehpha, and went to laris in 18~T. He is one of the best of American dranghtsmen, and frequently paints pietures of the mude figure. His prortraits are notable for simple arrangement and fine technical qualities. some of his hest works are Jacob Wrestling with the Angel; Portruit of Augustus St. Grudens: Jision of Moonrise: Blonde: Flying Shadous (a landscelpe) : and Íainting and I'oetry, a large itenrative composition. He is a prolific and talented ilhustrator. His designs for The Blessed Ihemozel, hy Dante Ginbriel Rossetti, are justly ranked with the hest illnstrative work of the dar. His drawing of the human figure is generally marked bs simplicity, and he has a strong feeling for style: more distinguished as a dranghtsman than as a eolorist. his wnrk is by no means deficient in the latter quality, and in some of his pietures the chief charm lies in the color scheme and the artistic harmony with which it is expressed. lle is a vigorons and able writer of criticisms and reriews. Studio in Jew York.

Williay A. Coffis.
Cox. Melfille Peveridge: the first Metholist Episcopal foreign missionary; b. at Itallowell. Me., in 1799; entered the ministry in isi2, and sailed as missionary to Liberia Nor. 3, 183. Here he lahored with great zeal and success for some months. He died of the "African ferer" July 21.

## 1530 .

Cox, Richard: Pishop of Ely: b. in 1499; was the tutor of King Edward VT. He translated for the Bishops' Bible the four (rospels, the Acts, and the Epistle to the Romans. I). July 29,1581 .

Cox. Samuel. D. D.: General Baptist: b, in London, England, Apr. 19. 182t: graduated at the Stepney Baptist Theologieal College, Londor, 1801 : was pastor in Nottingham from 1863 till his death at IIastings. Mar. 27. 1893. He founded The Expovitor in 1875 , and edited it till 1884 with markel ability, but his adrocaer of Restorationism compelled his resignation. He was the greatest of modern English Bible expositors, as distinguished from exegetes. His principal publications are The Quest of the Clief Good, a (commentary upon Ecclesiastes (London. 1865; 2d ed. 1890): The Private Letters of St. Paut and St. John (186i): The Pitgrion Psutms (18it); Ruth (18ī): Saluator Mundi (defense of Restorationism) (1875; 11th ed. 1888) ; Job (1880; 2d ed. 1885); The Larger llope, a Sequel to Sultator Mundi (1883) : Bulaum (1884).

Cox. samlel Haxsox, D. D., LL. D.: Presbyterian author and divine of Quaker parentage: b. in Rahway, N. J., Aug. 25. 1793: was ordained July 1, 181\%. Me was pastor of the Spring Street ehurch, Sew Vork (1830-33), Professor of Sacred khetorie at Aulurn Theological Seminary (1834-2\%), and bastor of the First Presbyteriau church. Brooklyn, N. Y. (183i-i4). He was an carly and eminent alvocate of temHerances, anti-slavery, and other reforms. Ile wrote Quakerixm not (Christicnity (New York, 1833). D. at Bronsville, near Jew York city, Oct. 2. 1880.
('ox. Sasuel sildivan. Lh. 1).: b) at Zanesville. O., Sept. 31. 1sel: graduated at brown University in 1.46: was a Wefucratic nember of ('ongress from Oho 185\%-6.), and frum New York rit! 1869-85. He was a well-known lecturer, and in addition devoted much time to literature. He published Eight Years in ('ongress (18fia); Why He Laugh (1si6): Three Dendes of Federal Legislation (188:), The Ihiersions of a Jiplomint in Turkey (1ski), etc. Deeame L. S. minister to 'lurkey in 1885; resigned 18e6; re-edected member of Congress from New York in 1swif for unexpined turm of I. P'nlitanr, and for 1ssi-s9: re-clected Nor. 6. 1888. D. Sept. 14, 18\&!.

Coxal'gia [Jat, corn, hip + for, axyos, prin], or Coxittis (technitally known as Mlortues coctrills, or hip-joint disease): an intlamination of the hip-joint. sometimes very raphe, more often slow and insitions, which may bugin either in the head of the thigh-hone or the sucket of the lip-hone or else in the membrane (symorial) that lines its eavity, lut which finaltr exteruls to all its tissurs, cartilages, ligaments. and surrounding soft prats. Intlammation of the bones
(osteitis), by far the most common origin of the disease in children, is usually chronie and insidions in its development. and is favored hy the incomplete ossification and active nutrition of the bones in childhood. Inflammation of the lining membrane (symovitis) is a not infrequent form of hip disease in adolescence and adult age. Chronic infantile cositis principatly affects children between one and fire years of age, and is often awakened by a fill or blow, especially when such accilent oceurs to children of a tuberenlous or scrofnlous constitution. The first symptom is lameness, followed by pain. first felt in the knec. afterward excited in the joint itself by direct pressmre, by motion of the limb, or by the weight of the body resting upon it. To lessen this weight the patient rests on the ball of his foot, and drags the leg in walking, stiffly extending it. At this stage it is turned a little ontward by spasmodic contraction of the muscles on the outer side of the joint. But very soon, in order to still further lessen the weight, the bodr liends orer on the thigh, and the arm and lame part of the back. with the abdomen, are carried formard. When the patient lies down, therefore, a space is left between the body and the bed, and if the spinal column be forcibly straightened ont and the curve flattened, the thigh in turn is bent on the body by contraction of the muscle that runs from the spinal column to the neek of the thigh-bone (psoas). Still. for the purpose of lessening weight, the hips are tilted toward the painful sile, and appear oblique, while the leg is thus apparently lengthened. Behind, the nates are flattened. It soon becomes impossible to more the head of the thighbone in its socket: the whole hip moves with every motion communicated to the leg. This sign is most characteristic of the confirmed disease: it is dne at first to the spasmodic rigidity of museles-later to inflammatory adhesions.

In the second stage the amount of serons flnid in the joint caritr is increased, the thigh is more strongly bent on the bouly (flexed), anl drawn inward (adducted), so that the foot crosses the onposite leg. The affected limb is therefore apparently shortened. Swelling mar appear in the groin and at the outer aspect of the thigh : the pain becomes severe; standing and walking are difficult.

In the third stage the carity fills with matter or "pus." the ligaments of the joint are relaxed, alseesses form in the neighborhood, and all the soft parts are swollen by inflammatory exudations. Dislocation oceasionallr, though rarelr. oceurs. Sometimes the head of the thigh-hone separates from its shaft, and adheres to the socket of the joint, while the socket itself is enlarged. The patient's strength is severely undermined, hectic ferer sets in, the emaciation is extreme, and death may occur gradually from exhanstion, or more rapidly from aeute absorption of poisons produced by pus.
The diagnosis of morbus corarius is only difficult in the first stage. The lameness may simulate that of muscular paralysis, from which it is distinguished br the freedom with which the head of the thigh-bone mar be mored; or the pain in the knee may fix suspieion on the wrong joint ; or the thigh may exactly imitate hysterical muscular contraetion: but in this affection the limb relaxes completely under chloroform.

The prognosis for spontancous cure is always very menavoralle. After suppuration death may be causcd by pyamia, by exhaustion, by general tuberculosis, or by amyloul disease. Appropriate treatment of the first and second stages offers alont 50 per cent. of recoveries: operative treatment of the third stage has so far cured about one-half of the eases snbmitted to it. In a large nmmber of cases, although the inflammation is arrested, and hence life is saved, the joint becomes permanently immobilized (ankylosis) by fibrons bands within and around its envitr, that holil the articular surfaces firmlr together (false ankyiosis). This result is to a certain extent favored hy the treatment adopited for the cure of inflammations: it is important therefore that the stiffened limb be left in the most farorable position for use-namely, extension.

The treat ment raries aceording to the stage of the disease. During the primary osteitis that so often precedes infiammatim of the juint. and is indieated ly the one symptom of lameness, constitutiomal treatment is to he adopted-colliver oil, iron, cinchona. nonrishing food. fresh air, and saltwater bathing. As soon as the morements of the joint are compromisel, loeal treatment becones of primary importance. 1t aims- 1 , to immolilize the joint, so as to prevent friction of the inflamel parts; 2 , to extend the limb, so as to orercome the tension of the apasmodically contracted and shorteved museles, and to sejrarate as nuch as possible the
folls of the linine membone，to rethe to a mommon size the cavity of the joint，and thas faver the ratmontion of Ahids：timally，to leave the limb in the best position for ure should it leceme promanentyr stitened．The limb can ondy he maintainad in extension by fore anticient to ow r－
 ratures ate devinel for this purpose in which the limh is st mishtened ont and fastened to an indasible phane and forcibly retamed in this pusition by mems a ther of a weight attached to the fort on a sliding serew at the knoe．The simplest form of apparatus is made by what hing the limp in tandages stilfened by patareof－laris or destrin．Thene are only alapteal to the earliest stage，or when cure is abrealy progresing．It cmables the patient to wall abmat．This facility is also alforded by sted apparatus that supports the limb at the wain and foms，and gradually extends it by con－ timued traction at the knee．In other eases the patient is kept in bed，the leg fistened to a simple longe splint，with a cross－piece muler the font，to whieh is altacheal a whight． A large double gutter．in which were laid the entire pulvis and both lower extremities of the pationt，was formerly fumous，but is now seldom used．Wher methents，as by ex－ ternal applieation of blisters or ointments，or repeathed blisterings，or hy the use of the cantery，fomerly much in romed are not generally condemned．
Whan suppuration has orcurred within the joint，or even when there is any thekening of the mper euf of the fenms， or of the joint simetures，and capeciatly when pus has dis－ eharged externally by one on more listulap，it is heremary to amputate（resect）the heal of the thigh－bone．Very extur sive destruction or the hip－bone amd certain general disenses， anyloid diseate or general tubercalosis．With incorreilh， diarbhea contra－indicate the＂preration．After it，leath may result from such（emplications or from surgical forer （pyamia，septicarmia）．When suceesful．howerer，the patient is resched from an otherwise certain death and the joint recovers a curtain degree of function，with some shortening of the limb，nevertheless with rery great usefulness：anky－ losis being murd les freguent than atter treatment by im－ mobilizing apparatus．

（rabs：the common name of rarions arthropontons ani－ mals，most of which belome to the hachymroms Hecapoda
 which have no common names．The following are the best known：
Fidiller（＇rub－－Suecins of the genus Gelesimus，chatae－ terizen by having a rhmboid bodys and in the mate one pincer cnommady develonal so that it is likenet to a violin． Fidfler crabs are amphilioms，and live in large colonies in holes in the senshore in the warmer parts of the world． some forty or tifty suctes are known．
ILermit ceab－Anomntrons decapods of the family Pa－ guridte．Lenem Peyuras，Diegones，etco，in which the abolo－ men is not hardened，and hence is exposent to injury．To protect itself the crab inserts its hinder body inten the cavity of some east－ofl shail－shell，which，hed in powitinn by the motitied legs of this region，is carried about by the crab．

At the approach of danger the crab retracts itself entirely into the shell, closing the opening by the hard pinching

Hermit crab (in shell).

Hermit crab (without shell),
claws. Hermit crals nceur in all the seas of the world, some living on the shore others in deep water.
The Lady rrab is the Plutyorichus ocellatus of science. It has a circular body. with flattened feet, and is ornamented by small circles of darker color.

There are several species of lamd crabs in the tropics, mostly belonging to the genera Ccu and Gectrcimus. They have heart-shaped bodies and long legs. They live mostly in the forests, only going to the sea to lay their eggs. When abundant ther can canse considerable damage to fiehds of sugarcane and the like as they are largely regetarians in their diet.
The (yster Crab (Pinnotheres ostreum) is a small round erab with thin shell and weak legs, the female of which spends its life inside the shell of the oyster, while the male is but rarely found in such places. The name Pinnolheres (pinna $=$ guardian) was given to another similar erab which lives in the pinna-shell, under the belief that it lived lere as a guardian to the mollusk, warning it of the approach of danger and telling it when to close the shell. It is lardly neecesary to say that its choice of i home is made for protection.
The Palm. Crab (Birgus lutro) of the East Indies is a near relative of the hermit crabs, but mulike them it never protects its abdomen with a shell. It is a large form, weighing

Palm crab: Birous Intro.
sometimes 20 Jh . It lives in boles in the grount which it tines with the titur of the emonamot. It is said by some to climb the palm-trees for the memmuts on which it fecols; others say it eats only the muts which fall to the ground. These it opens by luring into the "ever" and then hreaking the shell with its stont clats. Eiperial interest centers in the patm erab from the fiset that it has deweloperf, as a result of its terreatrial life, a songy mean distinct from the gills which fumetions as a lung althonsh, of course, it has no homology with the hugss of the vertebrates.

The Porcelain Crabs (Porcellana) are small tropical crabs with very hard, brightly colored, and highly polished shells, resembling porcelain.

Spider crab: Maia sqinado.
The Rock Crabs (Cancer, ete.) live among the rocks, and are usually large and strong forms, the common rock crabs

of C'alifornia (Cancer magislev) measuring 2 feet across, All have elliptical shells, the edges being frequently twothed and the body brightly colomed.

The swimming crab.

Cramer, Micmael Jogs. D. I, : author and minister of the Methorlist Episcopal Cluurch; b. at Schaffhausen. Svitzerland, Feb. 6. 183.5: graduated at Ohio Wesleran Iniversity, Delaware, O.. 1860; chaplain L.S. army 1864-67; U. S. consul at Leipzig 186\%-i0; U.S. minister to Denmark 18;0s1: U. S. minister to Switzerland 1881-85: Professor of Systematic Theology, Boston L'niversity, 1885-8\%, resigning on account of ill-health. He became associate editor of the Thenlogical Qumeterly. Reriex" in 1889, and contributed largely to the Methodist Review, the German Theological Keriev, and other periodicals. Alter filling the chair of Church History at Drew Theological seminary for a year, he became, in ivyi, Professor of Philosophy in Dickinson College. D. at C'arlisle. P'i., Jan. 25.1898.
Cramp: a spasmolic. involuntary contraction of voluntary inuscles. often painful in charaeter. 'lhe name cramp is popularly applied especially to the form attacking swimmers, which very often leads to drowning. It may similarly result from chilling of the boty, certain persous being more liable to this, as to all other forms of cramp. Localized muscular spasms not infrequently result from plaeing the parts, most frequently the feet, iu strained positions, and in some people a spasm invariably results from some such posture. Similar localized cramps of the legs are a common and distressing symptom of eholera, and more diffused slasms may be met with in rarious diseases, especially in children. "Writer's cramp" is the name of the most common of the so-called "professional neuroses," conditions in which spasins affect certain groups of muscles which are nsed excessively in the occupation of the person. Thus in "writer"s cranip" the effort to write or even take a pen in hand is sutheient to provoke a painful spasm of the muscles of the hand and forearm. Curionsly the muscles may often be used in any other way excepting in that sequence or combination in which they have been overtased. In other worls, the finely co-ordinated movements displayed in the work of the patient can not be perfurmed without spasm. In inany cases localized pralsies instcad of cramps are seen. Similar affections are seen in telegraphers, metalworkers, dancers, and others. Tetaxcs ( $q . i$.$) is a disease in$ which spasms of certain. and finally of all. muscles constitute the characterintic feature of the disease. Stryehniapeisoning may present an almost identical picture.

## William Pepper.

Cramp. Johy Москett, D. D.: clergyman; b, at St. Puter's. Inle of Thanet, Kent, England, Jily 25, 17. cated at Stepner College : ordaned May 7 . is 18. In 1844 he became presilent of the Paptist College, Montreal, Canada, and president of Acadia College, Nova Scotia. in 1851 ; the urincipal of the theological department 1853 - 60 : Wis reappointed president in 1860, and retired in 186\%. In 1831, in Duthin (3d ed. London. 1sin), he published A Text-boob of Popery: in 183: The Reformation in Europe (issued by the Religioms Tract Society, Lombon): in 1841 Lectures for These Times: in 1 sis Biplist History: in 1sin The Lamb of Cod; in 18:3 l'me and Christ: a Portraiture and an irgument. D. in Wolfville, Nosa Seotia, Dee. 6. 1881.
Crampotons fap: a pass in the South Monntains, near Burkitswille, Freflerick co., Dh. The left wing of Gen. NcClellan - army, under command of Gen. IV. W. Frantlin, approached this jass ahmut noon Sept. 14. 1sti, to find it defended by a portion of the (onfederate general NcLaw's division of heres army. under command of Gen. Howell cohb. After at stablom light of four or five hours the Confederates were forced cut of the gap. having sulfered severe lass in killed and wounded, hesides losing 400 prisoners and many small-anms.
Cra'nach, or Kranaclı, krănak, Germ. pron. kiaánăahh, Ldeas: called Tine Elener: (ierman binter and engraver; 1. at Kronach, a town near lamberg, Oct. 4. 14id. Hlis family name is growrally said to have been SuxDer. Ife became conrt-painter to Frederick, the Elector of Sasony, in 1504,
and worked for many years at Wittonberg, where he was mueh respected absl was male burgomastir: He comtimad to hoh the oflice of cont-panter under the two successors of Fereferick, John the Comsant and Iohn Firelarick the Magnamons, ami when, after the bathe of Whblbere in 1.57. John Prealerick was taken prisoner", 'ranach shared his live years captivity. Thuy were both releasul in 1aise. Ho was bisa an intimate friemi of Luther and Mclandithom, whome purt raits ha both painted and eneraved. Ilis works consist of oil-paintings, engravings on copper, and wonlruts Ifis most important pietore is at llemar. It is an altar-pice representing the crucitixion. He was sor ripid and prolitic a worke that he was called pielor celeberimus, and it is not surprising that his pictures are foum in csery
 mens of his work in the bryan (rallery, Niw York llisterical shecty, a lopus and Cupid and a forfroit. and one in the New Sork Metropolitan Mucenm, a portrait of Johat live crick the Mugnamimms. I sot of the Fussion of ( 'hrist, a Trmptation of St. Anthony and a S. Jerme in the Deserf, are aswell known as any. Sictledler, Das Leben und die Iferke Luchs ('ramueli's (2delel. Bamberg, 1sh1) ; the lateat and best authority, howevor, is Schuehardt. Luras: Cranuch des Atlferen Leben und Werbe (Lajpigig. 3 vols., $18.5(-i 1)$.

Cranacho loweas, von: portrait painter: bo in 15月5: a som of the precediner: was burgmaner of Wittonberge. A good specimen of his work is in the Metrophlitan Musemm, Xew York, entitled Iovtrail of a German Laty. D. in 1586.

Cranbery [for cranu-bery]: the frut of several species of a sub-genims, Orycoccus, of smath, mostly prostrate evergrem shuns of the natoral family liricucce, belonging to the genns bierinimo. hut difiring fron the rest of the gemis in hating a whecl-shapel corolla. with its four petals deciledly rewolute. The species are few. natives of the colder regions of the northern hemisphere. "he fruit is acin, and is in great repuest for making sances, jellies, etc. larcininm oxyroccus is a native of the northern parts of Europe Asia, and Americal It grons in marshy groumds in the Xorthern I. ... and is a wiry, creeping shrab, with small owal loaves stronsly rovolute at the margin. The hlosemus are smatl, but beantiful, and of a deep rose-enlor. The berries are often kipt for a long time in watel. They are an excellent antisenthatic, and valuable in sea-stores. A sort of wine is mate from them in Siberia and Kussia. I'he berrios of the cowlerry (T'areinium ritis-idua) are sold under the natne of cranlerrios in sootland. and used in the stme way: In Norway the froits are extemmal. They also grow in Xew England and northward, where they are often colfected for culinary purposes. The "hish-tush crunbery:" is the Gihurnum opilus of the U.S. and Europe. Hts truit has littlo value, although it is sometimes eatern. The name momatain crambery is often given to the . Irctostaphylos ura ursi of the l . S. und Emope, a plant whos: laves are of value as a diuretic.

The eranterry of U.S. markets is Saceinitm macrocarpum. It is a larger phat than the Europan suedes, mith farger invries and leases with less revolute colges. It is gathered extensively from wifd hogs. Farly in the nineteenth centary effirts wore made to coltivate it, and now the ammal field from the coltivate boge of the $L^{H}$. $\delta$ is abme san 000 lmshels. The largest areat of cultivated cranburies orenr respetively in the Cape Con rewtom, in Now Itrsey, Wiseonsin, Long lslame, amd prhaps Dichigan. Nataral swampe or hos are draned he meme of open ditches, the furt is removel. and the whole aren is conereal 4 to $f$ inches deep with samp. in which the cuttiners are set at intervals of 14 or 18 inches. The heg is provifel with a damand gates at the buthet of the main ditch, so that it is posible to flow the area for winter motertion, of to escape frosts. or to destroy insect or fungroms injuries. loor this

Crambh, Whatim. Wh. D.: jurist: b at Weymonth,
 was Appointel chief justioe of the U. S. circuit court for the Jistrict of ('oluntbia in 180.). He held this position for fifty rears. during which, it is saik. ouly two of his deceisions were oremulad ly the supreme Court of the E . S. Is reporter of the dedisions of the supreme Conat he prepared nine volumes of reports ( $1801-1$ on). His legal learning was very profount. Judge (ranch was first ennin tol'resident Jolin (hainey Alatus D. sept. 1, 1855.
Grane [O. Fing, cran, of. Germ. Krranich: related are Gr. répowos, lat. (frus): any one of rarions hirds of the order firalle or Alertarides, and belonging to the family Graida, of whith the gemss frus alone orours in the U.S. They are noarly all large birds, with long nerks, long leos, and puwerful wings. Their wings are not elongatca, but monded. The rames are often pemblarly confused with the herons, hut structurally the two groups are quite distinct. white externally the cranes differ from the herons in having a compuct plunare. tors of moderate length, hind the short and elebated. and part of hest nsually lare ame rough in the adnlt. The common Buropem crame, Grus cinerea. stames about 4 feet hight is ashen gray in color, with face and neck nearly hack. It hreds in marshes in morthern Europe and Asin, migrating to warmer climes on the approach of winter. It formerly bred in Englant, lout long ago it censed to the more than an accidental risitor. Crames migrate in large flocks, flying at a great height and like grese in a $V$-shaped hody. The whoping crame (firus ammerana) is larger than the common crane, which it resembles, except that its adult plomage is pare white, the wings tipper with hack. It erequents the sonthern parts of the U. S. in winter; in summer it migrates northwarl. This (rame is remarkable for the extent to which the windpige is eonerated in the breasthone, and for the eomplirnted turns taken by the concealed prortion. The V. S. have aloo the samd-liill crane ( (irms canclensis) and the litle crane (Corts fruterentus). To this fumily lelonge alon the demoisplle or Xumidian crane (Inlhropoides rirgo). with which, rather thath with the true crame, the Balearic cranes (Batearica) are ranked. ('rathes use their hills as a weapon of cleferse, attacking the eres of an assailant. The bhe heron (Ardea herodiuss) is sometimes, thongh crroneonsly, callad the blue crane.
F. . . leces.
("rame: a mochine employed to raise heary weights and to depmsit them at whe distunce from their former position. It has two kinds of motion, mamely a lifting motion and a horizontal one. 'The latter may be circular or along a radins or a combination of both kimls. The simplest form of erane has an morisht post, moviner round a vertical axis, a swinging arm jointed to the post at its lower cud and fastened to the post by means of apulley at its outer end, and a winch or other hoisting tackle.
 pupil of A. It. WYant, New fork. Fizst exhibitul National Acondemy 180 . His pistures are generally panted from Amoricon motives, and are fresh in colom and fratakly

## Crayfish: See Crawfish.

Crayon [Fr. deriv. of craie. chalk : Ital. creta<Lat. cre'ta, chalk: so named from island of Crete; cf. Germ. Kreide]: a pencil used for draming and made of chalk or a hardened paste of any finely powtered material, so as to make black, colored, or even white marks on paper or other surface: but not inchuling ordinary lead-pencils. nor, in general, the slips of charred willow-wood used for charcoal drawings.

## Creameries: See Butter.

Cream of Tartar (acill potassium tartrate, bitartrate of potash), in Potasse Bitartras [pharm.]: a compound contained in grape-juice and leposited trom it in the process of fermentation, as it is less soluble in alcohol than in water. The crsstalline crusts deposited are called crude tartar, or aryol. When this crude tartar is purified it yields cream of tartror, which is the acid tintrate of potassium, Fi $\mathrm{H}_{5} \mathrm{C}_{4} \mathrm{O}_{6}$. This salt is diffeultly solnble in water, and insoluble in strong aleobul.

It is frequently alulterated with sawduct, clay, gypsum, flomr, chalk, alum, and sulyhate of putash. Simples purchased from several grocels in New York were found to contain considerable proportions of gypsum. or sulphate of lime, in one case $\sigma 0$ per cent. Cream of tartar is extensively nsed. in connection with biearbonate of soda, as a substitute for yeast and leaven lor raising bread. (See Bread.) Crearrs of tartar is often used as a mordant in dyeing wool. In medicine it is used for its cathartic, dimetic. and refrigerant properties. It is frequentls prescribed in combination with senna, sulphur, or jalap. it is also used for the preparation of soluble tartar (neutral tartrate of jotash), Rochelle or Scignette sults (tartrate of potash and soda), tartar emetic (tart rate of liotash and antimony), tartarized iron (tartrate of potash and iron), white and black flux. etc. Salt of tartar is the earbonate of potassa. prepared by the incineration of cream of tartar.

Editor of the Einglish Historical Revieu since Jan., 1886. He represented Emmanuel College ut the \%opth anniversary of Harvard College in 1856, when he received the degree of LL. D.

Cremation [from Lat. cremalio, deriv of cremare, to bum] : the act or custom of burning the dead, especially as a substitute for earth-burial. The custom, which is one of great antiqnity, previaled in Eastern $A$ sia and WVestern Europe and was observed by not a few North and South Ameriean lndian tribes. The few instances of cremation given in the Old Testament narratives seem to indicate that the Jews resorted to it rarely. The l'hrggians are believed to have introduced the practice into Gromee, where, as the poems of llomer shom, it was common at the time of the Trojan war. although it did unt supplant earth-burial : and the homans burowed it from the Greeks, or perhaps from the Etruscans. Among the Romans it was gemerally pratoticed during the last years of the republic and under the empire, hat was abandoned toward the end of the fonsth centin'y $A$. D. It was at one time the favorite methot nt dispusing of the bothes of the dead among the Chinese. and Hareo Polo, who triveled in China towad the end of the thinteenth century, found a erematory in erery town he risited: but the custom is no longer observen in that country, althongh umiversal in Japan, into which it was introduced by the Budulhists. Casar relates that the Gands bumed their clead, ant the relies and urns found in burial-moundsof Germany. Denmark. Seamdinavia, ant Great Britain, testify to the prevalence of cremation in Northern Europe in the "bronze age " if not at a later perioul. The ancient proctice was to burn thr dead upon a fumeral pyre of wood, non which oil, jncense, and spices, and sometimes foodand elot hing, were placed (a practicesimilar to that prevalent amons savages of burying food and weapons with the dead, amb of merificing lorses, dogs, or even slaves, for the service of the departed). Finally, the embers were quenehed witly wine and the ashes, placel in a Cinerary Urs (q. ..), were deposited in a sepulcher (colnmberium) or subterranem cell, or in some cascs buried in the earth at the spot where the cremation took place. Cremation was unknown among the early ("hristians, chiefly becanse those who har come ont of Judaism had inherited the custom of entombing the dead, and that methon was hallowed by the lurial of their lord; with the sprearl of Christimity, the enstom was perpetuated, and cremation came to be looked 110, with abhorrence. harely becanse it seemed inconsistent with it helief in the resurrection of the deatl. The burning of the boxly of the poet shelley and that of his friend Edward Willians. in 1822 and one which ocemred in South ('arnlina marlier in the ninetecnth century, are among the few instances of the ocomrence of cremation in Christian lands before the yen 186!).

It the present day, in lmbis and uther Eastern count fies, as well as in Japan, the dead are ushally burned, and in India. until 1847, it was a common practice fin a wite to burn herselt in a funcral pile alonge with the bexly of her lomshanel. (See SI'TTEF:) Some native tribes of Northwestern British America still diepuse of deat bodies by cremation. During the Fremeh hevohtion it was proposed tor rintroduce the practice of eremation, imt no flecieled step)s were taken. In 18.20 l'rot. 11. ('. Richtore cantributed an article to the Giorlenlaube of Liplaig, in which a crumatory furnate was deacribed. The subject was dixemand hy scientists in Italy in 1866: in 1869 lrof. Brumetti, of lialus, cremated the luoty of a woman; and in 14: at the Vienna lixpmition, he exhibited a model
furnare, lowether with some results of his experiments. In 15it, whern a chased rereptade was used for the firal time the Luedy of a woman whe crematel at Breshan amb another at Hrasiden. Whe of these was the wife of sire Chathes Ibilke. In
 society for the promotion of armation was formed in dandon, and infsisa cromatory was hails at lleminer, in sumer: fut the tira cremation in Einctant did mat take phace until
 act was dechared lewal in (ireat Britain, mule er main condi-
 of cremation med in loresten, and the puldishat report of theirpreceedines did much to remove popular perjodiees. In
 Washingon, Pat, atm in December the lowly of Baton de Patm, who handiem in New York, was bumed. In that same yara a haly, that of llemry Berry of Matrion, S. ('.. was hurned on a funtral pile. ('romation is now very qenernl in laty, where it was legalizell in 1sis. P'ario. fotha, ant other conitinental dities have crematorios, and surdetios advocatines the measure exist in combtriss where it is atill prohibited. In =ome phates, as at (intha, conlumbria are athached to the eremat fory tempthe In the UT. s. ermatories have leen built in a
 telphia, L'a.. Fresh Pond, 1.. I., Pulfilo, N. Y., Detroit, Mich.,

There are two distinet elanes of arerument-bygienic amd sentimental-in faven of cromation. The santarian urgers the danger to the living of phang lemeath the surface of the exth great numbers of the deat near large cities, gradually fondecmunse, this contaminating the Water and poisoning the air lis the liberated saves, the overlowded suil hoing able to do its work of disintection only to a limited extent. The
 ranse acting in favor of cremation. It simplifies very mucht the funeral rite, and lence from its economy commends it wif it at large clats. The objections to crematom, on religious gromend are met hy those who faror it with the statement that it makes the words of commithent. " a hes to ashes. dust to dust," literally 1 ruc and that to deny the possibility of resurrection in such case is 1o deny the omnipetence of the 'reator. F'urthermore, it frrmits the use of the same religions (ertemmies as lafor: : and en merally a chapel for services is attached to a "rematory. The misi important objection raised arainst mel total and mapid destruction of the boly is medico-hersit, as it is clamed that evitences of poisoning amb violeme wouk be destrowed. This is met by the state ment that meresabily there would be a more ereful examination of hembes hefore burnines and probably a more eseneral detection of crime. In all casos, the most deoted masares are taken to prewt any irreghar twe of the procese.
('remution Formares.-The simems cremation furnace. Which is used in Cimmany, consims of tist. a fumber, in whieh the baty is planed tir cremation; and, secondy, a refromator, in wheh the gats and air used for combastion are heated before enterine the eremation-chamber. 'l"he gas for rembustion is prepsured it a distaner from tho furnace, and bed to it through underscomad thes. Fiof ermemblemerpet ion of these furnaces ser Frase (siemnens iron). The reqenarators consist of fre-hrick chambers fillol with fire-irick
 which the air and gas can pass. The gas and air are all-
 valves, and pass upard through the loomely laid tiredrick. (1) lerconu heateal bey eontact with them-in what way will be shown preently. Cre'osote, or Creasote [from Gr. кре- the combining form of крє́as, flesh $+\sigma \dot{\sigma} \zeta \epsilon \in \nu$, save]: a sirupy liquil obtained for commereial purposes chielly from wood-tar and coaltar, especially from the latter. Poth rarieties of creosote are very complex mistures of compounds related to phenol or carbolie acid, and of varions lyydrncarlons (see liydrocirboss), as naphthalene, phenanthrene, minthracene, etc. Wood-tar creosote has a strong, penetrating odor resembling that of wool-smoke. It is a goonl antiseptic, and has liecome a valued remedr in tulberculosis of the lungs. Coaltar crensote is very extensively employed for preserving timber. for softening hard pitch, as a fuel as an antiseptic, and as a cattle wash for the purpose of destroying ammal parasites. It is generally adulterated in commerce with a large precentage of phenol (see (carbolic A(b)). Which can with difficulty he detected. It is also employed in toothache, in obstinate voniting, and as an outward application in cancer. In an orerlose it is an irritant 1 pison, for which any soluble sulphate (as magnesium sulphate) is an antidote.
lievised by lra hemsen.

## Creosoting: See Presertation of Timber.

Crescen'do [Ital., increasing]: in music, a gratual increasing of sound, or changing from piano to forte and fortissimo. It is marked thus $=$, or with the abbreviation cress.

Cresicent [from Lat. crescere, grow, increase]: the figure of the new moon. The standard of the Turkish army bears the figure of a crescent; the worl "crescent" itself is often used figuratively for the Turkish military power. It had also been the emblem of the Greeks before the conquest of the Eastern empire by the Turks, and was used by Genghiz Khan's Tartars and other nations of Central Asia.

Crescent. Order of the : an order instituted at Angers in 1464 ly René. Duke of Anjou, brother and heir-apparent of the Neapolitan king, Louis III. The badge was a crescent of goll, on which the words "Loz en Croissant " ("Praise to that which increases") were enameled in red letters. Its ains were those common to all military and religious orders-defense of the Church and of the innocent suffering, deference to ladies, and to all divinely appointed anthorities, etc. The order is not known, however, to have surrived its founder. The Turkish decoration of the Crescent, sometimes called an order, was institnted by Sclim III. after the battle of Abukir, 1799, and was designed to be given only to Christians who in some way or other had aided the sultan. The lirst to receire it was the British admiral Nelson.
Cres'eo: city : capital of Howard co., la, (for location of connty, see map of Jowa, ref. 2-1); on the (., M. and St. P. R. R.; 60 miles $W$. of the Mississippi river. It has seven churches, a high school, a parochial school, fonndries, lrick and tile works, flour-mills, creameries, etc.; it is the center uf large dairy, poultry, hog, and eattle interests. Pop. ( 1880 ) $1,879:(1890) 2.018:(1893) 2.300 ;(1895) 2.529$.

Eimtor of "Howard County Times."
Cu'sol from creosote + alcohol; called also Cresyl'ic Ac id and Cres'y Al'colol]: a compound ( $\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{O}$ ) derived from coal-tar or from wood-tar by fructional distillation. Most of the ('arbolic Acid (q. $c$.) of commerce contains a large pereentage of cresol. It combines with alkalies, like its analogne phencl, and hence is br some called an acid; it is isomerie with benzrl alcohol, and is itself properly one of the aleolonls. It refracts light stromgly, and boils at $397^{\circ} \mathrm{F}$. It is not jrlentionl rith carbolic acid, but is used in its place as a disinfectant.
Cresses: plants having a pungent taste and diaphoretic amb other medicinal qualities: belonging chiefly to the naturalorder Cruciferw, and found in the temperate and northern parts of the etryh. Many are used as articles of foom. The common cress, Lepuilumi sotivum, an annual and a native of Asia, has theen intrulnced into other countries. In the U. S. it is usually sown out of doors in the autumn or wory early in spring. It is bed as an antiscorhutie during Aretic vamages. The Virginia cress (L. cirginicum) is cultivated as a satad in Nonth America, the Wiest lnties, and (ireat Britain. The hitter cress (Cardamine amara), the laty's smock, or curkon tlower, as it is called in Fingland ( $C$ ? pratensis), and the hairy cress (r: hirsuta) are fonm both in Europe and Noth Americh. Whter-cress (Nasturium officimete) is a perminia, upatic plant, nsed as a spring salaid, and is a native of almost all parts of the world. The leares have a pumgent taste, to which is adderl a little bitternoss
and saltness. They are very refreshing, howerer. It grows best in shallow runing water with a bottom of sand. It is often cultivated and bronght to market in North America and Eurone. See Nasturticm.

Cres'son: railroad junction; Cambria ro., Pa. (for location of comby, see map of Pennsylvaia, ref. 5-D.) : 252 miles W. by N. from Philadelphia and 102 miles $\dot{\text { E. . of }}$ Pittsburg. It is heautifully situated on the summit of the Alleghany Monntains, about 3,000 fect above the level of the sea. It is a fashionable place of summer resort. Pop. not in the census of 1890 .

## Cressy, in France: See C'récr.

Crest: something worn on the lelmet in ancient warfare. Among the Greeks it was often ol' horseliair, forming a stiff ridge along the top, but falling in a long soft apperdage behind the nipe of the neck. Among the Romans it Tas sometimes of stiff urright feathers, but was not in general use as an omament. In the Middle Ages, as the helmet often corered and concealed the face, the crest lrecame a means of knowing the wearer. It was often very elaborate, mate of thin metal or of boiled leather, and painted in rich colors.
In heruldry, an appendage to the escutcheon, usual though not necessary in a man's achievement, or general display of armorial bearings, but not in place in the achievement of a woman. It is carried upon a so-called ureath, Which is sometimes put above a helmet, and sometimes directly above the escutcheon.

Crested Butte: city; Gnnuison co., Col. (for location of county, sce unap of Colorado, ref. 4-C): on branch of Denver and hio Grande R. K.; 18 miles N. of Cimmison. It is engaged in mining cold, silver, and coal, and in manufacturing coke. Pop. (1840) $85 \pi$.
Crestline: city and railway junction (fomnded in 1850); Crawford co.. O. for location of countr, see map of Ohio, ref. $3-\mathrm{F}$ ) : 63 miles N. br E. from Colmmbs. Here are 6 churches, ? schools, extensive shops of the Penn. R. lk., lockworks, a inrnace, and artesian water-works. Pop. (1880) 2.848 ; (1890) 2.911; (1893) 4.500. Editor of "Adrocate

Creston: city and railway junction ; capital of Union co., Ia. (for location of county, see map of Jowa, ref. $7-\mathrm{F}$ ); 190 miles $\mathbb{W}$. of liurlington. it has several lanks, a graded school, wagon-factories, and large machine-shoms and carworks. Poy. (1880), 5,081; (1890) 7,200 ; (1843) estimated, 9,000: (189.5) 6,630.

Editor of "Advertiser.
Creswell. Jous A. J. : lawyer ; b, at Port Deposit, Md. Nov. 18, 1828 ; educated at Dichinson College, Carlisle, Pa.: became a prominent lawyer: allied himself with the Whigs, the Democrats, and finally with the Republicans. He was appointed adjutant-gencral of Maryland in 186?: in the same year was chosen a Republican member of Congress. and in 1865 was elected a senator of the U.S. for a short terin. He was a member of the convention which renominated lincoln, and of that which nominated Grant. In Mar., 1869, he was appointed Postmaster-General of the T. S. Ile resigned in Mar.. $18: 3$, and was then reappointed, sering antil July 3, 18 i4. D. at Elkton, Md., Dec. 23, 1891.

## Cresylic Alcololo, or Cresylic Acid: See Cresol.

Cre'ta [Lat., chalk, originally Cretan earth]: a pharmaceutical name for chaik (native carbonate of lime) and for the precipitated carbonate of lime. The fomer is more generally used. The chalk is powdered, washed, and dried, and is then known as creta proparata (jrepared chalk), an exeellent antacid remedy. Cretu procipitata (the chomically prepared chall) is more fintly divided. See Chalk.
Cretaceons Period: the dirision of geologic time following the Jura-Trias and ireceding the Encene. In England and France, where the name cretaceons was first used, the principal formation representing the period is of chalk, and chalk-beds are also found in Texas and Arkansas, but in other regions the name is mot descriptive of lithologie character. The life of the period is profusely represuted by fossils; among the more characteristic are the Rudistes, an aberrant family of lamellibranchs; ammonitids with shefls partly uncoiled : amd lirds with teeth. Cretaceous rocks have a great develogment in North America. Ther necupy a belt on the Atlantic coastal plain from New Jersey to Texas: cover an immense area on the Grat liains from Texas to thatasca : reappag frequently among the moun-tain-ranges of Wyoming. Colorado, liah, Arizona, and New Mexion: are gratly drweloped in the monntatins of Northeastern lexieo; and appear at many points on the

lat ortar that a person may be gully of a crime there
must be a concurrence of capacity, intent. and wrongfu? act. The questions of capacity ind intent are, in fict. closely related, since the law adjudges a person incupable of a criminal uffense only becanse it presumes him incompetent to form a criminal purpose. The prineipal causes of incapacity are infaney and the want of mental soundness. Infuncy exempts from responsilsility only when children are so fonng as to bave no acquaintance with the nature of a criminal uffense. It the common law a child mader seven years of age is conclusively presumed to be nuable to cominit a crime; between seren and tourteen. his liability depends upon his actual discretion, which must be determiued in each prarticular instance by special proof after fourteen he is consilered presumptively capable. The want of proper mental capacity to form a criminal intention exists in the case of idiots, lunatics. and all persons who are either permanently of imsound mind, or so deranged at the time of the commission of any wrongful act as not to be atrare of 1ts guilty claracter. Exactly what degree of mental alienation should be safliodent to exempt trom responsibility is a matter difficult to determine. The only criterion that can rentrally be adopted is the wronsdoer"s power of appreciation of the wrongfal nature ot the barticular act which he committed. (See Issavity.) Voluntary drunkemess, however, though it may confinse and disorier the moral percentions and produce a kind of temporary insanity as perncious in its effects as natural aberration, affords, in general, no defense for the criminal offenter. Only where a specific intent is an essential element to constitute a crime can a person intoxicated be excused for that particular offense. As arule, the intent to drink is sulliciently culpable to make the resulting act punishable. If, howerer, true insanity or delirium tremens should be produced as a consequence of intoxication. and the victim of it should commit an act which if he were sane would be a crime, he will be excused. The law in that case onls regards the fact of insanity, withont reference to the means by which it has leen occiasioned. Besides these natural incillacities which exempt from penaltr, there exist certain other causes for exoneration. such as duress and corerture. Whenerer an offense is not perpetrated roluntarily, but under the compulsion of force or fear, there is wanting that willing pursuit of crime which is alone a just reason for condemnation. In like manner, the stress of overwhelming necessity relieves from guilt the inroluntary wrong-doer. Corerture also, or the condition of a married woman, exempts from liability in some instances, because her action is considered to have been oceasioned by constraint exerted by her husband. Thus all crimes committed by a wife in the presence of her husband, except some of a graver class, as treason. murder. robberr. and the likc. are presmmed to be done by coercion. This presmaption is not, a conclusire one, but relieves a married woman from any consequence of her aetion until rebutted br direct evidence that the crime was exclusively of her own commission. This mode of justification by alleging ennstraint only applies to marmied women. Servants and children are not excused, thougla acting moder the command of masters or parents.

The necessity for the existence of a criminal intent in order to nake a person responsible for his wrongfin acts forms an important distinction between criminal and civil liability, for in civil cases intent need not generally be proverl. It has always been a well-recounized maxim in criminal jurisprudence that " the act cloes not make ia man guilty muless his purpuse also be guilty." But the intention need not necessarily contemplate the commission of the particular consequenee which results. In most instances, of comrse, the atst done will be the specifie act intender. But yet, if there be a purpose to prepetrate one crime, and the mems msed for its accomplishment mexpectedly result in a ditforent oflense or affect a person dogainst whom they wre not directed, there is still a sulticient connection of intent and act to warrant a holliner to arconntability. 'lhus if a man intends to shoot d and his act results in the death of B , whmm he did not intend to injure, he is nevertheless responsible, as thongh he had netually intented to kill B. 'Jhis principle. however, is not in all its rigur applicable when the trime committel is strietly in the chass of mule prohebitu, for the original purpose is not then deemed sutliciently reprehensible. A still different case arises where the preenneervel intention laad reference to the spreifi- act performerl, but did not include knowledge of its criminality, as where a person shoots game at a certain seasou when it is prohibited, without being
aware that he is violating the law. In this class of instauces it is likewise true that all the necessary elements of a crime are suffieiently present to justify punishment. The principle is that ignorance of the 3 aw must afford no excuse. If such were not the rule, all laws would be ineffective, for wonld-be offenders wonld be likely to abstain from examining their provisions. and thereby secure impunity. The accompaniment of intent and act. therefore, which will constitute criminal transgression, may oceur in three different forms: First, the intent mas be wrongful, and contemplate the rers ollense committed; second, the intent may be wrongful, but contemulate another offense than the one committed: third, the intent may be really innocent, but contemplate an offense which happens to be prohibited by law, and so criminal.
There are some cases in which, thongh no actual criminal intent is conceived, ret the law presumes its existence. When acts are characterized by such a degree of negligence or carelessness as to evince a culpable indifference whether wrong is done or not, the wanton disregard of commonly recognized duties is essentially criminal of itself. But if an nnlawful act is committed, through mere accident or misfortune. in the prosecution of some legitimate umlertaking, the unwitting offender is excused. In like manner, though ignorance of law atlords no justification, ignorance of fact, Where no reasonable opportunity is granted for acquiring currect information, is a valid excuse. The law may alwars be known when the facts can not be ascertained. "The guilt of the acconsed," it has been said as to these matters of fact." must depend on the circumstances as they appear to him."

The necessity that an act must coneur with the intent depends upon the principle that no mere mental conception or fancy, no natter how reprelnensible morially, can ever he taken cognizance of at law without some overt expression of it in an objective result.

The parties engaged in the commission of crimes are distinguished either as principals or accesouries. A principal in the first degree is one who is the actual, direct perpetiator of the offense. A principal in the second degree is one who is present, aiding and abetting the act to be done. An accessory is a participant in the wrong-doing in some more lemote mamer. either by promuration or assistance before the act. or after its occurrence by sharing in the profits acquired or shielding the immealiate offenders from justice. In the one case he is called an accessory before the lact; in the other, an accessory after the fact. "This distinction between principals and accessorjes is majntained only with reference to felonies, and even among these an exception is mate of the crime of treason. There is no accessory before the fact in the common-law crime of manslanghter, for in it there is no preconteived intent to kill. In treason and in misdemeanors all the participants are decmed principals: in the one case, from the enormity, and in the other from the comparative triviality. of the offense. Where the distinction is preserved there is no reason for diversity of pmonishment as between principals and accessories before the fact. Accessories after the fact are not so severely punished, as their offerse consists in an attack on the administration of justice. A wife is excused for thus shielling her hnshand. It was formerly the rule that the accessury could not be brought to trial before the prineipal, bnt this doctrine has becn ouite generally changel by statute.

The rarious crimes which may be committed are classified by legal writers in different ways. Blackstone in his Commentaries treats them as either offenses against morals and religion or the law of nations, of as against the existence of the govermment or state, sueh as treason, or against public order under the respective titles of public justiee, public potre, public trade, public health or economy, and fintly, deranst individuals. These last are subdivided into those which we committed agrainst the person, agramst habitations, and astainst property. "This chassifieation is incomplete. and no place can be fommal in tor certain well-establishen? crimes, particularly those which have been created by statute. The most satisfactory treatment of the subjert is that alopted by Itr. Bishop. who discnsses the general principles of law governing erimes, and then consillers specifically each crime known to the law under m alphabetieal arramement. It shouk be noticen that the criminal law of the Federal Government is wholly created by statute. Congress having enacted so-called "Crime Acts." Under the Siate Governments the common law of crimes exists unless ehanged by statute. It will be impossible in this brief

He caused the death of Therumenes. and not long after perished himself in a battle with the men of Thasybulus to4 b.c. Ble wrote politieal pamphlets, dramas, clegies. The fow fragments of the elegies that remain ant characteristic of his carping temper. Sce Bergk's

## Critical Philowobly: see R゙Ant.

(biticism: the act or the art of criticising. In the later signification it has bern defined is "the art of julging with propriety coneerning any object or combination of ohjects." It a more limited meaning its provine is confinel to literature, philology, and the fine arts, and to subjects of antiguarian, simitific, and historical investigation. The demente of eriticism lepund on the two principles of beaty and truth, one of which is the final end or objeet of sturiy in every rnme of its jursuits-beanty in lethors mat the arts, truth in history ant the sciences. Thus historical criticism traches us to dintinguish the true from the false or the probahb form the improbable in historial works: seientific rition fan the same object with respect to the alferent hranches of selence: while literary criticism, in a general sense, has for its prineipal employment the investigation of the suerits and demerite of desigh, style, or diction. acterding the the gencral primiples of composition and to the re-
 thel the arts. criticism devons the principhes of that more refined imbl exquisit: mose of hatuty which torms the ideal mondel of prefection in erch.
Of all the cribis of antiguity, the grentest beyond comparison was umbobtomly Prictolle. Arivarchis. who is often stapl "the prince of eritics. was more propry a grammarian and commentator than a critie. in the wister motern aceqpation of this torm. Among the Romans

In numbern times the greatest names in gencral ariticism
 $\therefore$ T'. Cobrridge, Hazlit, Mackintosh, and 1lallan : to which may be alded thone of Lods Jeffrey, Bromgham, and Macmiluy : mat, lasily, that of ('arlyte, whe, if tom often extravagat ant wayward, is perhaps, when not hiasel by pirne or prejudio, tot supased he any in breadth of emi-

Emeram, James Rassell Lawell, Gporge Ripley, Etwin Perey Whipple, Henry James, Jr., and others, have distingnished themselves in this branch of literature. Among the French the most celebrated names are those of Boileau, Voltaire, Villemain, sainte-Benve, and Taine. The literat ture of Germany is rich in illustrious erities. Among the greatest of these, in the department of general criticism, are Lessing, Gocthe, anil the two schlegels. It is proper to olserve that the (icrmans have studicd the great principles which lie at the hase of all sound criticism-i. e. the art or seience of judging-more phitosophically and more thoroughly than the critics of nther nations. But it is perhaps in paiticular criticism that the Germans are most distinguished. Among the most remarkable examples of this kiml we may cite kant in the department of philosophy. Winckelmanin in art, and Niebuhr in history, besides a host of other less distinguished names.

Crilieism, the 1 ig ghe (biblical): See Ihgher Critursm.
Cri'to. or Cri'ton (in (ir. крiтшv): Greek philosopher; a citizen of Athens, and a Iriemd and disciple of Socrates. whom he attented in his last hours. He wrote seventeen dialogues on philosophy, which are but extant. Plato grave the name of "Crito" to one of his books.
Critola'us (in Gr. Kpıтблaos): Greck philosopher; b. at Phaselis. in Lycia, Ile wits the heal of the Peripatetic school in Athens, and was eminnint as an orator as well as a fhilosopher. He was sent to Rome on an important embassy with Carneades about 1.5 .5 в. с.

Crittenden, George Bibb: general; son of John Jordan Crittenden: 1t. at liussellville, Ky, Mar. 30, 1814; gradnated at West Point 1882: began to practice law in Kentucky in 1835: served with distinction in the lexican war: resigned his commission of lientenant-colouel in the U. S. army in 1861, and joined the Confederate army. If became a majorgeneral: deleated at Mill Apring, Ky., Jan. 19, 1862; was censured for his contuct on that occasion and was kept in arrest by the Conterlerates till Nov, $1 \times 63$, and soon after resigned, inut continted to serve in the army as a volunteer. 1). at Frankfort, Ky., Nor. 27, 1880.

Crittenden, Joms Jordax: statesman: h, in Woolforl en. Ky... Sept. 10. 1テ*i. Ile graduated at William and Mary College in 180t, ant stndien? law; removed to Tenneasee; in 1 co9 was appinted attorney-general of the Territory of Illinois; served as a volnnteer in the war of 1812: retumed to the practice of the law, attaining distinetion; and was elected to the senate of the U. $\therefore$. for a short term in 1816. In $181!9$ he remowe to Frankfort, Ky.: from 182? to $180!$ was U. S. district attomey. amb in 183is was re-elected to the national senate by the Whigs for a term of six years. He was a personal anid politieal iriend of llenry Clay In Nar., 1841, he was ajpointel Attoncy-General of the U. S., but he resigned in ceptember of that year. Ite was again elected a Semator of the T . S. in 1843, ami was thosen Governor of Kentucky in 144s. He was Attorney-freneral in the calbinet of l'resident Fillmore from Jnly, 18.50, to Mar., 18.53, scon after which he joined the Native Imerican party. In 1855 he again became a $\mathbb{C}$. S. senator. Ite opmowe the vecession mowement in 1860-61, and. performing the part of a mediatur, oflered in the Semate a series of resolutions calleal the "(rittenlen Compromise." which were not adoptent. On the other hand, he uppusel the employment of slaves as soldiers, and denomeet the conserintion hill. He was noted for his elofuence. D. near Frankfort. Ky.. July $96,1863$.

Criltenden. Thomas Leonids: : general : a son of John Jortan Critbrulon: h, at lansollville, Ky.. May 15, 1*15: State attorney in Kentucky 1842. He served with honse in the Mexican war. He emmanded a division of the Union army at Shiloh. Apr., 1stis, and olitainel the rank of majorgenerat of colmeners in the summer of that year. He commanden a comp at the hattle of Stome River in 1863. Colnnol of infantry 18fit. Retired Miy, 1881, D. Oct. 23, 1893.
Crivelli. (sabo: painter: bo in Venice abont 1435; sturlien unker Antonia and Bartolommeo la alurano. When he be(:nne famons he was commissioned to work in different parts of laly, so that few of his jaintings remain in Venice. Ile lived chielly in the Marebes, where his works nay be seen in erment muntiors, as at Missa, Iseoli, and Ineona. Nothing is known of hin after 1493 .

miloticus, revered by the ameient Egyptimes and mmmanied when deat, is now so persecuted hy tomists that it has atmost disappeared below the First cotaract, and has in other plates berome exceedingly wimy. It is, howerer, still wideIy distributed in Afrion, and in some lomatios is so danarerous that the natives are obliged to huild inclosures of stomt posts, reaching into the rivers, in order to draw water with sifety Other Ifrican crocodiles are rrocodilus catuphruc$t u s$, with a long, thin mazale, and the black crococile, C. miger. with it short head, both from the watem part of the continent. The mugerar or marsh crocodile (rocoditus palustris), is abmadant in rurions purts of southern Asia, and in some localities of India is still held in some reverence, amd fed and protected by its fakir friends. It ranges from the hot swamps of the seacoast to the snow-fed streans of the IIimalayan valleys. The salt-water crocodile (Crocorlilus porosus) occurs from Intia to Northeast Instralia, being especially abomelant in some portions of the Malay Peninsula and Pomen. It is partial to the estuaries of rivers, and not infrequently rentures out to sea for a mile or so. This animal has an excedingly massive head, reaches a great size, and is so mach drealled from its man-eating propensities that in some places a price of so much per foot is paid for its capture.

Three spueles of emendiles occur in the West Indies and Sonth Ammica, one of which, Crocarilus umericamus. is fombd sparingly in southem lilorida. See Alligator. Caymas, and Gatíl.
F. A. lucas.

Crocodilu Bird, or Crocodile Watelare: a small species of Hover (J)utianus agyptuss) ; fonnd in Northern and Western Africo, and rarely on the northern shores of the Mediterranean, So named foom its hatit of feediner around or upon the crocodiles is they bisk in the sum. It even ventures to pick the leeches (Brdullu milotica) from the rery months of these linge reptiles, a fact noted by Herodotus and confirmed by Brehm. It is called zic-zac, from its note. F. A. Lecas.

## Crocodilopolis: a city of Ancrest Egypt (q. $r^{\circ}$ ).

Crocus [Gr. кобкоs, erocus, saffron]: a large genus of iridaceous blants (herbs) native of Asia and Europe. The Croeus vermus and other species are well known as affording many varietien of very early spring tlowers, which are common in cultivation, Procus sativus and other species hossom in autumn. The antumm crocuses are rarely cultivated in the U. $\mathcal{S}$. Their ormge-red stigmas, when dried, constitute the drug known as "true "Saffros $(q, i$, $)$,

Croerus of Mars: the fincly divided red axide of iron used in medicine imbl in the arts. The "crocus of antimany " of the old chemists was a mixture of the tersulphide and teroxide of antimony. The "crocuses" received their name from their satfron color.
(roes, Joinn, S. T. D. : first bishop of the P. E. Croffut. Willian Augustus, Ph. D.: mlitor and author; h, in Redding, Coman. Jan, 2! , 1s:36. The received on academie edncution; taught a publie school for a time; served in the civil war as soldier and correspondent, and afterward lad editorial chare successively of the New Jlaven (Conn.) Pullalium, Rochester (土, I.) Democrat, St. I'aul (Minn.) Times, Minmeapolis Tribune, "hicago Erening Post, and Washingt on Post, and was an elitorial writer on the New York Ciraphic, New York Tribune, and New York World. He has thrice visited Europe, and has nlso traveled through Mexico. Yucatan, Cnba, Nova Scotia, the Bemmadas, Enypt, Irabia, and Talestine, and has been a voluminous writer of *yudicate lettrs to newspapers. Ife was executire officer of the $[$. S. geological] survey from 1888 to 1891 , when he took charge of the editorial division of that bureau. He is the anthor of The IV 186\%): 1 Ilelping IIand (Cincinnati, 1868) ; Bourbon Ballads (New Fork, 18s0) ; Deseret, an opera, music by I Mudley Bnek (1881): I Mirlsummer Lethk (188?): The Tanderbilts (1886) ; Folks Nert Door (1892); The Prophecy and other Poems, a second volume of poems $(1843)$; also of a yoem read at the opening of the Columbian Exposition at Chicago (May 1, 1893). IIe has received the degree of Ph. D, from Union College.-His wife Dessie B. Croffut. has published several stories and contributed extensively to encyelopadias.
Croft, Willian : composer of cathedral music; b. in Warwickshire in $16 \pi \%$. He was appointed composer to the chapel-royal and nrganist of Westminster Abrey in 1708. He compased Tirine Iharmony (1712) and Musica Sacra (1794), D. Ang. 14, 17:3.

Crofters: in Sentland, tenants who reside on holdings the ammul rent of each of which lloes not exced e30. The term commonly rlesignates a small tenant of land who lives mainly by farming or the raising of live stock. There are two classes: First, those who ocmpy land in separate tenancy only; and seeond, those who oceupy tillable hand in sepurate tenancy and hold mountain bastures in joint tenancy. The first class are sometimes called "independent" erofters and the second "township" erofters. The latter are so much the more mumerons that the joint tenaner of past ure is the charactoristic foature of the crofting life. They are fomm in the lower parts of the Westem IIightands and islands. Sinthermm, Caithmess, Orkney. Shetland, and in parts of lass-shire and lnvemess-shire, and less trequently on the eastrm seatomad. In their lowi govermment and in the possession of common rights and common obligations they preserve many leatures of the primitive communitr. The system is a partial survival of the custom of land temure that was once common in all seotland and in many other comotrics. The crofters generally derive a gart of their sumport from employment sutsile of the labor on the land. The cottars are closely related to the crothers in origin and pursnits, but they aro lower in the ecommic scale, being frequently mere squatters. The cottars are fomme mingled with their more fortunate neinhhors, the erofters, throughout the crofting country, both of these clasoes have had special grievances, which lal to the appointment by the Ilonse of Commons in $188: 3$ of a royal commission io inrestigate their condition. It was not, howewer, nntil 1886 that the Crofters Holdings det received the sanction of Parliament aml the crown. The numerons wise provisions of this act have not resulted in mush jmprovement, owing to unfavorable eonditions. The erotter ind eottar poptrlation is computed in rommel numbers at abont 200,000 .

Cromp'ton, SamCel: inventor of the spimning-mnle: $b$. near Bolton. Lancasline. Englamb. Dee. 3, 1753. Farming and weaving were the employments of his boybod. For his invention, which was perlected in 17ro. he received, in subseriptions from the mamfacturns, only $£ 656 \mathrm{~s} .6 \mathrm{~d}$. Il is means Wre so limited that he eould not go to the expense of taking out a patent, and he was consequently glad to make private arrangement. with the mannfacturers for the use of his invention, many of whom. however, did not scruple to evade their obligation. Heanwhile, the male spread so rapidly, and its influence wats so palpable, that in 1812 be fraw up a petition to Jurlament for a public reward. Parliament roted him ty5,000. He was a shy. sensitive. stndious man, fond of mathematies amd of masie. But his business talent was very limited; be once more fuiled, and a new petition to Parliament was refuserl. D. at Bolton, June 26 , 18:\%. See French, Lifp of Crompton (1860).
('romwell, II ExRy : a younger son of Oliver' h, in lluntingrion Jan. 20, 1628 . Je servel as eolonel under his father in Ireland in $164!$, hecame a member of l'arliament in 1653 , and lord depnty of lreland in 165\%. Jlis administration Was moderate and popmlar. After $\mathbf{1 6 5 0}$ he lived as a private citizen. I). गıır. 2\%, 16\%s.

Cromwell, Olver: Lorel Protector of England; b. in Jhantinglon, llantinglonslaire, Apr, 05, 1599. In 1616 he enteret Sirluey Sussex College, Cambridge, which he guitted on the death of his father in Jume. 161\%. Ile marred Elizahetlo Bourchier in 1620 . amd settled on his estate at Jluntingdon. In the Lhort larliament of 1628 he made but one Slewe and aming the eleven years prorogation he devoted his time to the cultivation of his farms. He represented ('ambritge in the, chort l'arliament, which met in 1 pro, 1640 , and in the Long Parlament, whieln met the same year. lle was then a zablons member of the Conntry party, and took an ative part in the husiness of the House. Having raised two companies of volmenters, he entered the almy of Parliament in $164^{3}$ as a eaptain of eavalry, and distinguished himself by his strict discipline. He was soon promoted to be colonel. On July 2, 1644 , he commanded the victorions left wing at Marston Moor". The Parlimmentarians were dividerl into two parties, Preshyterian and Independent, of which latter Cromwell was the master-spirit. He was excepted from the "sell-l)enying Orlinance," whiel excluded from military conmmant members of larliament. When the army was reorganized, aud Fairfax appointed general-inChef, Cromwell was promoted to the mink of lieutemant-general. In command of the riglit wing at Naseby, June, 1645, lar greatly contributal to that hecisive victory. In May, 1646, the king surrentered limself to the geottish army, which transferred him to the custody of the English Parliament, in which the Presbyterians had a majority. In June, 164\%, the king was seized by one of Cromwell's oflicers, and remover? from the custody of Parliament into that of the urmy, which the Imlependents enntrolled. ('harles hoped to profit by the dissensions hetween the Presbyterians and the lnilependents, and intrigned with hoth. Cromwell defodtel the Duke of llamilton, who commanded an army of Sonttish royulists, at the hattle of l'reston, Ang., 1648. In l becomber of that year forty-one l'robyterian rovalists were - jectot from 了"arlament hy what was called "Pride*s Purge." ('romwell was an momber of the conut which tried the king
 now the most powerlin! man in the country, amel beeane a momber of the new rommeil of state. In 1649 he went to Iroland as lomplemtenant with an arony, and snlmbed the rehollious lrish royalists with extremeserabity. The footeh

 mestic polioy was favorable to relierime liherty and rombluaive to the prosperity of the combtry. Ilis foreign peliey was
dignifiod and enlightened, and secured for England a more commanding position than she had previously oceupied. The title of king was ollemed to him hy Jarliament, but he deelined it. The was stigmatized as an usurger by the royalists, aml also by the repmblicans. He died on Sept. 3,1658 , and was succeeded hy his son Richard.

It was long the fashion for historians to represent Cromwell as a fanatie, a hypoerite, amd it man of cruel temper and mediocre talents. Ilis character was vindicated from these calumnies by Carlyle and other writers, and it is now generally admitted that as a statesman and commander he displayed abilities of the highest order. "Never." says Macaulay, "was any ruler so eonspienonsly lum for sovereignty. The cup which has intoxieated almost all others solered lim. J is spirit, restless from its boyancy in a lower sphere, reposed in majestie placiblity as som as it hat reaclued the level congenial to it. liapidly as his fortumes grew, his mind expanded more rapilly still. lusignificant as a private citizen, he was a great gencral; he was a still greater Hrinee."

Crombell, Rimard: som of Oliver Cromwell; b. at l] untingdon, Oct. 4. 1626. He mitereal Lincoln's Tm as a student of law in $164 \%$, and married Dorothy Major in 1649. 1le was a man of molerate capracity, virtnous and mambitions. After Oliver lweame Protector, Richard was elected to Parliament, and was a member of the Jrivy Council. Jle suceecded his father as Protector in Sept., 16.58 , but the army was disaffected, and he was not earnestly supported by the frople. He resigned his power in Apr., 1659, and passed the rest of his life in ohseurity and peace, spending ahout twenty years on the Continent. 1). at Cheshunt, England, July $12,1712$.

Cromwell, Thonas : Earl of Essex ; an Eaglish courtier and minister of state; b. at Putney abont 1485 , and hred to the law. His early life was suent on the Continent, where he successively surved as a sohlicr. a morchant's clark, and as a trater on his own aceomnt. He returned to England about 1513 , and acruired wealth as an wobstapler and scrisener. Je became an axent of Carlinal Wolsey, who employed him in important lnsiness. Soon after the fall of Wolsey he enterd the civil service of Ilenry TllI., whose fator be gamed. He prommted the Reformation by his stremous efforts to destroy the smpremacy of the pope, and co-operated with his friend Cranmer in estiblishing a new ecelesiastical polity. In 1534 he was apmointed principal secretary of state, and in 10.0. vicar-gencral with power to suphess inonasteries. lle was for several years the most powerfal subject in Englanc, ank was created Farl of Essex in 1540, He was a min of silurrior talents, but is salid to lave been unscrupulous and raparious. Froule, however, ilefends hin against these imphtations, and gives him a high chatacter. Tle promoted the mariage of Ilenry VillJ. with Anne of Cleves, hecanse she filvorid the lutheran doctrines. His agency in this :ffian was contucive to his own ruin, for the capricions king regarled her with disgust. Tromwell was triod foy treason, amd was belomded July 28,1540 . See Michnel Irayton, Mistorie of the life mmid Ieath of Loord Cromucell (1609); Froude, Ifistory of Eingland, chaijs. vi.xvii.

wood. about 4 by 6 inches, laid flat to serve as a cushion whence caroms can be made; the corner pieces to be of same material and 8 feet long, inside measurement. All arches, except the center arch, to be $3 \frac{1}{2}$ inches in the clear. The course of balls is indicated in the diagram. Many clubs still adhere to the old rectangular form, without any slope inside the border to bring the halls into the field. and with the wickets all mule in the direction in which the player is going. In less scientific games the cage in the center is replaced by a single arch, which is made the same as the other arches. In the ordinary croquet set the wickets are very much wider than stated abore. The game was oriminally and is still commonly played as a lawn game. Nuch more scientific play can. however, be made mon a ground of well-rolled dirt. lightly sanded to hold the balls. All national mateh games must be played oll dirt ground. The mallets should be of boxwood, 7 or $6 \frac{1}{2}$ inches long by $2 \frac{1}{3}$ to $2 \frac{1}{2}$ in diameter, and the handle from 8 to 30 inches long, to suit the player. The best balls are of hard rubber, $3 \frac{1}{4}$ inches in diameter. Balls of boxwood and other hard wood are commonly used.

Terms.-Some of the commoner terms are: Roquet-to hit another ball with one's own bill : croquet-to place player's ball against roqueted ball and strike player's ball, moving both-called loose croqnet or roquet-croquet, as distinguished from tight croquet, where the player's ball is held with the hand or foot, allowing onlr the roqueted ball to move : carom-relrounding from arch, stake, or border: deal ball-ball on which plarer has played since making a point: set up-same as in billiards, that is, leaving balls tavorable for next shot; wiring-learing balls so that following player has wire or stake between his ball and ball to be 1, ayed upon; object ball-one at which player aims: jump shot-atriking a ball with force on tof just back of center so as to make it jump orer any obstacle between it and ob-

Fig. ..--" Jump " shot.
ject aimed at: grilty or danger ball-one nest played by adversary: imocent ball-hall last played by adversary: rover ball-ball that has made all the points except hitting the finishing stake.

The Game.-The game is played by from two to eight players. It needs no special dress, does not demand vigorous exertion, furnishes moterate exereise, and is not fatiguing even when long prolongerl. The elements of the game are essentially the same however the wiekets mar be arranged, and whaterer the ground. The object is to make the player's ball phss in succession through all the wickets, striking the lower or turning stake and the home stake, all in the order and direction indicated in the diagram. (Fig. 1.) In this journey, however, the player's ball may be aided by friends or retarded by enemies. The clief points of excellency are: 1 , accuracy in roqueting, for which an accurate eve and trained hand are indispensable; ?, alility to secure position in front of arches; :3, skill in wiring an at yersary's ball ; 4, good genprutship. l'osition in striking varies according to the plater. It is well not to be too long in aining: a quick stroke atter getting the lime letween two balls is apt to be most aceurate ; but after the line of aim is sccured, the eye should be kept lixed on the player's own ball. Important points to be observed are kecping your own balls together ant separating those of your alversary; keeping the immocent bill of your alversary with you or your partner, and the guilty adversary ball wired: giving your parther a set up when you can make no further rum; and, in making a run, providing for points aleat and leaving no batls behind.

Rutes.-Following is a simmary of the most important rules; some of the popular variations from them are also noted. The phayer must always strike his ball with the face of the mallet, the stroke being considered to have been "delivered "whener the ball is mored by the touch of the mallet, however slight. The player must never strike lis bull twice, and must not push or follow it with his mallet "xcept in croqucting. The first play with each hall is made after placing it midway between the home stake and the first arch. The players phay in regular order, jartners a]termating with opplonents, and a phayer's turn continues so
long as he makes a point or roquets a ball not dead, or until he violates some rule of the game. A point consists in running an arch or striking a stake in proper order of play. Roquet gives the player the privilege of roquet-eroquet only. and in taking it he must move the croqueted ball or end his play. (In the popular game the player is not thus limited, and may besides take tight croquet insteal; in either case he has also a second stroke.) If the player roquets two or more balls at the same stroke, he croftuet. only the first. A player, in each turn of play, may roquet any hall once only before making a point. Roqueting a dead ball by direct stroke ends the play, and the dead ball should be replaced. If a roqueted ball is beyond an arch, and the
 playing ball rests through

Fig. 3.-A nossible croquet: C. line of aim: A, course of player's of aim: A, course of player's made. A ball is not throngh an arch when it is touched by a straightedge laid across the two wires on the side from which the ball cane. A ball is not in position to run an arch when it has been placed under it in eroquet, or when it rests under it, having been shot from the wrong direction. If a bell first roquets another, and aftermard at the same stroke makes a pint, the point is not allowed. A ball making two or more points at the same stroke gains no greater privilege than for making one only. (A popular exception is to allow an extra stroke the first turn if the player makes the first two arches at the same stroke.) If a ball not rover be driven tlirough its arch or against its stake by croquet or concussion, it is a point for that ball. A ball shot over the boundary must be returned at right angles from where it stops before play can proceed. A rover has the right of roquet and of consequent eroquet on every ball once each turn of play, and is also subject to roquet and croquet. Rovers must be continued in the game until partners become rovers and win the game by successively making the last point. i.e. striking the home stake.

Croshy, Alpheus: educator: b. at Sandwich, N. H.. Oct. 18, 1810; graluated at Dartmouth in 1827; was tutor and Professor of Ancient Languages in his alma mater (18:95i), ant principal of the normal school at Salem, Mass. (1857-65). He edited Xenophon's Ambasis, and published a Greek grammar and other works, which bave been extensively used. D. in Salem, Mass., Apr. 17, 1874.

Crosby, Howard, D. D., LL. D.: b. in New York city, Feb. 97, 1826; gradnated at the University of New York in 1844: became Professor of Greek in the sime in 1851: Professor of Greek in Rutgers College, N. J.. in 1859 ; nastor of First Presbyterian church in New Brunswick in 1861 ; resigned his pastorate in 1862, and his protessorship in 1863, when he became pastor of the Fourth Avenue Presbyterian chureh in New York eity. He was chancellor of the University of New York $1800-81$, and one of the revisers of the New Testament. Of bold, ardent, and energetie temper, fearless in the defense of his opinions, wise and broad in his judgments, tireless in his energy, he was for years a synonym for erery Christian virtue and a leader in every practicable refurm. By his personality, and not by his pulpit gifts or scholarship he filled so large a place in the eity's philanthropies. His scholarship was put to popular use. Besides other works, he published Lands of the Hoslem (New York, 1850); (Edipus Tyrannus (1851); Notes on the New Testament (186:3) ; Bible Manual (18i0): Life of Jesus (1871); Book of doshur (1875): The Christian Preacher (Yale lectures on preaching, 1ss0): Commentary on the New Testament ( $1 \times 8.5$ ): Bible Vien of the Jewish Church (1888): The Sewn Churches of Asia: or, Worddiness in the Church (1890): Sermons (1891). I, in New York cits, Mar. 29, 1891.

Crusby, Jons Scutuler: soldier: b. in Albany, N. Y., Sept. 14,1839 ; educated at Universits of New York; entered the remular army as second lientenant of artillery in 1861: served with his hattery under Meclellan in the Army of the Potomac: Was brevetted major and lieutenant-colonel after the battles of Pleasant IIill and Sabine Cross-lioads; was in 1864 promoted to the staff of Maj-Gen. Cross-examination: in the law of evidence. the examination of a witness by a party against whom he is calleal to testify, and thus distinguished from a direct examination, which is lanl by the party calling the witness. 'lhe range of a cross-examination is much wider than that of a rirect exmmination, the farty examining being allowed to impeach the crerlit of the witnoss, and to show the inconsistency of his statements, his bias, his want of memory, and other matters tending to reduce tlan value of his testimons. The rourse of the examination, depending on the cireunstances of the ease, mast be largely left to the discretion of the preshling judgre. For these reasons leating questions are regularly allowed, though they ine in general excluled on the direct examination, as tending to make the answers of the witness mere echoes of the guestions asked. It is, however. a rule that if a merely collateral question be askod amd answered, the crossexamining connsel will mot be allowed to fall witnesses to dirprove the truth of the answer. This rule would not extemd to a question as to the point whether the witness had not previonsly given a different version of the facts form that to which lie testines. If such a question is properly put to him as to time, place and circumstances, and he answers in the negative. he ean be contradicted by other witnesses. The same remark may he marle as to a guestion put to him as to expressons used by him showing hostility towart the party against whom he is called. A witness on crossexamination can not le required to answer whether he has commatted a crime the commission of which would suhject him to pmishment, or has done any act which would subject him to a forfeiture of his estate: though this rule dues not extend to an answer which would merely expose him to a civil liability: So he may, to a certain extent, he compelled to answer questions tending to discredit and degrable lim. Thas, according to the better ppinion, he may be asked whether he has not been contined in the State prison, as the whject of the question is not to exclude him from testifying, hat to affect the credit due to hisstatements. IVe conld lee shown to le imcompelent to testify only by the produetion of the record of his conviction. The trine thenry of a eross-examination is to qualify the direct testimong: and accordingly the witness shonld mot at this stage of the case lie callent on by the crossexamining counsel to give indebrenlent testimony sustaning his part of the issue, thongh this rule is not always atlered to in practice. See Evidexte. T. W. Ilwidut.
Cross Keys: a prost-otlice of Ruckingham eo. Vin. (for lo"ation of county, sele mill of Virgmia, ref. $5-F^{*}$ ). Crotell. Willian: musical eritic ; b. in Norwich. England, July 5,1750 . He showed when an infant so precocious a tajent for musie that In, Charles Burney gave an account of the prodigs in the Philosophical Transactions of the Royal society (17~9). In 179 he was appointed Professor of Mnsic at the University of "xford, and in 1820 principal of the Royal Academy of "Xusic in London. As a composer he did not fulfill the great expectations he had awakened, though he published many vocal and instrumental compositions, but as a critic and historian his works are still of interest: Elements of Musical Composition and Thoroughbuss (1812): Styles of Music of All Ages (1813). D. at T'iunton. Dec. 29, $184 \%$.

Crotehet [Fr. crochet, f little hook; alimin. of croc]: in masic, one of the motes or chatracters of time, equal to hall' a minim.
Cro'ton [Gr. коotav, a tiuk, in almsion to the appearance of the seeds]: a grnus of about 500 species of trees, shrubs, and herbs of the spurgeworts (q. 4.), nearly all of which are natives of the tropical countries ol both hemispheres. They are stellate-downy, senfy or glandular-hairy, and bear alternate or rarely opposile, mostly entire simple leaves. The flowers are mourecious or rarely dioccious. and usually bear potals. The ovary is three-celled, and contains one ovale in each cell. Over twenty-five species occur in the Southern U. S., fonr of which extemil into the Northern States. ('. figlizm, il small tree mative of China, produces seeds about onchalf inch in diameter, which are known as croton seeds, and are extensively used in medicine. From them a drastic purgative oil is obtained.

Crotóna, or C'róton : an anciont Greek eity of Italy: on the Brattian peninsula and on the Mediteranean Sin. It was founded i10 B. C., am? hecame a popmlous and inportant eits. The Crotonians worshiped llercules as their thtelay divinity, amp, led hy the famons athlete Milo, they in $510 \mathrm{~B} . \mathrm{c}$. conquered tybaris and levelod it with the gromm. The decline of C'rotona hegan with the arrival of Pytharmas. The eity was originally governed by a comeil ot 1,000-men whe descended trom its Acham founders-lmt 300 atherents or diseiphes of Prthagoras once sneceeded in owrawing the conncil and sifining the supreme anthority. They were soon expelled by the pennle and a democratie fom of govermment established, lut from that time the stability of the government was lost, and the effects of the Gosw son herame visible. During the war between Pyrrhms and the Rommens the citer suffereri still more; one-third of the spher within the walle was mocenpied. During the latter years of the second l'muic war hamibal took up his hombuarters at Crotoma duriug three successive winters, Whirh seems to hare completeri the ruin of the city. It is mentionorl again in the wars of Narses and Bojisarius. Its site is now recenpied by (ontrome. In the days of its prosperity its territory was extomsive sheteding from sea to sea. and it was unted for its saluhrity. To this ciremmstancethe heallafulness of the situation-was aseribed the great persomal heanty of tja youlhs and matcons of the city, though the Crotonian methou of training and education wis also celebrated.

fish, flesh and fowl, eggs, snakes, iross, crabs, shell-fish, grabs, fruits, seeds, and berries. The common crow of North America is particularly abundant in the Eastern U. S., and is generally looked upon as the inveterate toe of the farmer from the amount of injury it inflicts on growing

Hooded crow of Europe.
crops, and especially upn com. There is, it is true, a credit side to the account in the dextruction of grubs, but as the crow is a great destroyer of the egrs and young of other and beneficial birds, it must, on the whole be regarded as harmful. The crow can also be charged with disseminating the seeds of the poison sumach ( $R$ hus renenata), which form a considerable portion of its tood in tall and winter. At these seasons of the rear crows assemble by thousands in great roosts, or rookeries; one of these roosts, on the IPomac, above Washington, has been estimated to contain 40,000 crows, while others are still larger. In the gray of the morning the birds leave in clamorons crowds for their feeding-grounds, often many miles away, and in the afternoon they mar be seen winging their way homeward in long lines. himh above the earth in fair weather, low down in fonl. The Eastern fish crow (Corews ossifragus), frequently found in company with the preceding, is a smaller bird, and can readily be distinguished by its hoarse caw. The carrion crow of Europe and Asia (Corrus corone) closely resembles the North American crow in form, size, and habits, but is perhaps a little more destruetive, attacking and killing lambs, or even weakly shecp. The hooded crow (Corvus cormix), found in Northern and Eastern Europe and in many parts ol Asia, is gray, with hack head, thoat. wings, and tail. These two suecies interbreed, and hybrids between them are common. The graynecked crow of lndia (Corvers splendens) is a small but boid and mischicrous species, stealing the very food from the table. Un the other hand, it does much good ass a scavenger, forming an able afjunct to the vultures in this respect. See also Chovgh, Raven, and Rook.

Crowfoot: ang plant of the tamily Rimencuracee. Plants of this family are characterized ly having all parts of their flowers separate. and usually mumerous.

Diagrammatic section of the Hower of The flower is thus but a slightly altered shont, and may be regarded as the typical or primitive flower of the dicutyledons.
C. E. B.

Crown : a decorative wreath, ring, or cap, intended to be worn on the head, and used either for ornament at times of festivity, or as an honorary badge, or as a mark and symbol of high rauk- $e$ :specially, in motern times, the mark of sovereignty. The fillet or diatem of the ancient Oriental nations anl adopted by the Greeks can hardly be called a crown, bor should the Persian tiara be called so, and the tiara of the pope is really a cap adorned by three crowns which surround it. Crowns of olive, laurel, etc., and wreaths of varions flowers were used by the Greeks very freely at feasts and ceremonies, and as prizes in athletic and other contests, each plant when so used having its especial significance ; and similar wreaths and garlands were made of gold and other metals in imitation of natural foliage. Such crowns, made of leaves of thin gold, are found in tombs and are common in motern museums. The liomans imitated the Greeks in their use of such wreaths. One snch was granted to a general who had cansed the siege of a town to be raised: it was made of plants wbich grew within the place. In like manner the civic crown was given to one who had saved the life of a citizen, and the nazal croun (called corona rostrata because it was adorned with figures of beak of ships) was granted to a victor in naval warfare. A corpse was crowned on the occasion of funeral rites, and both bride and groom at a marriage ceremony.
The metal crown, with sharp upward-pointing rays, is probably of Oriental origin, and when originally nsed in the West demoted deification. In this sense it is idded to portraits of Roman emperors made after death, beginning with Augustus, although it is probable that no kind of crown was assumed by any emperor during his lifetime before the time of Constintine, more than three centuries later. In the Middle $A$ ges erowns were of many forms. It came gradually to be considered that a mere ring around the head, eren if adorned with spikes or flowerlike ornaments on the top, was of lower dignity. and that the crown of a sovereign prince should be closed at top, or should have arches orer the heild from side to side. The crown of the Kings of France had eight half arches meeting in the middle and carrying a kind of finial. The modern crown of the sovereigns of England has four half arches. Each of these crowns has a velvet cap within the arches and covering the head. Crowns of nobles not sovereign princes are generally called coronets.

This inhmman form of pmashment was visited upon Christ by the Jews in aceortance with the nuwilling sentence of Pontius Pilate. In addition to the scourging, whieh seems to have been a legal part of the punishment, he was forcel to wear the crown of thorms, and subjeeted to other indignities by the brutality of the soldiers and populace. See the accounts given in the four Gospels, whiel give all the neerssary details.

Revisul hy Samuel Il acauley Jackson.
Cro'den. Alexdsuer: author of the Biblical Concordance; b. in Aberdem, sootland, May 31, 1\%o0. lle was graduated at Marisehal Colleqe, therdeen, and edncated for the ministry of the kirk, but never preacherl, a disappointment in love, it is said, having hrought on an attark of insanity, to which he had always had a tendency, aml le was put inder restraint. On his release in 1 ion he removed to London, and tanght the elassies, and trical to teach French without knowing how it was prononnced. In 1729 he went to the Isle of Man, In 1733 he moturned to London and opened a booksture. In 1730 he became "bookseller" to Quen Caroline, wilfe of George II. In 1737 he puhlished his Comptete Concordanre of the Old and New Testaments, which is still the best in the English linguage. He wats several times an inmate of lmatic asylums, and during all the latter part of his life was llighty and extravagant. Ile set up as a reformer. calling himself " Alexander the Correetor." Ile died sudimaly, while praying, at Islington, Sov. 1. $17 \% 0$.

Cruikshank, George: illustrator and carieaturist; b. in Londm, Sept. $97,17!2$. He worked with his father, Isaac, and his elder lrother. Robert, and hegan to publish his work when only twelve rears old, some very tolerable designs having leen issued when he was fifteen. From this time until he was nearly eighty he produeed etchings and wood-cuts incessantly. "Iuring his early life his most important work was in the way of large politieal and social caricatures, often colored, and often of extraordinary bodness. His attacks upon the prince regent, afterward King George IV., and equally upon the queen. Who was the opposite party in a scandalous disenssion and trial from 1815 to 1801 , were tur mensured and ferocious. From about 1893 on his more inportant work was book illustration: Points of Ifumor, in 1833: Grimm's German Popular Stories, in 183:-27, with perhatus his most fimmons etchings; Greenuich Ilospitul, in 152.: The Jouetists Librery in 1831, with illustrations to Tom dones, Ilumplirey Clinker, Roderick Rentom, The licar of Hekefield, ete. The Cowie Almentack, from 1835 to $185 \%$, with twertre full-page etchings in earh of the volumes hut one or two: Olimer Turist, which hegran in Bentley's Miscellan! in 183\%. and wis the only mo of Jickens's movels illustratiel by (ruikshank; hoohwood, ofuch Sheperd, The Tourer of Lomdom, and other novels of William Harrison dinsworth, some of which apprared first in Bentloy's Aliscellany: The Ingoldshy Legpads, also from Bentley: Frank Fairlegh, likorge Cruilishanh's Fuiry Library. in which some of the ohl fairy-tales are told anew in the interest of total abstinemee from alcohol, and are illustrated with ehaming etehings-all were publishal before he was sixty yoars ubl. After that time his work was less abmolant and hese vignoms, but had still great morit. One of the best thing ol his later work is the Life of Sir John Fertstaff in latre rethings, published in 18.58. I). Feh, 1, 187s.

Crusade [probably from lrovençal crosada, marked with a cross: Fr. croisade : Ital. crociata < Lat. type *erucin'ta. deris. of crux]: a war waged for the delense or atvancement of the cross; specifically one of the religions wars carried on by the Christians of the Middle Ages for the recovery of Palestine from the Mohammedans. From a very early period the Christians were in the habit of making pilgrimages to Jerusalem and other parts of Palestine renflereal sacred by events eonneted with the Giviour's life and death. These pilgrimages continuell with but little opposition till the year 1065, when Palestine, then governed by the Fgyptian caliphs, was overun and conquered by hordes of Seljook Turks. 'l'he accounts (Ilonbtless often exaggerated) of the indignities intlicted on the Clristian residents and pilgrims hy these barbarians prodnced a deep and jowerful impression in all parts of Chastentom. At length. Peter the Ilermit, a monk and native of Amiens in France, having visited Palestine and witnessed the cruelty of the Turks. reported what he hal seen to Urban Il., by whom encouraged he traveled through Italy and Franee, and by his zeal and eloguenee exeited in extraordinary religions enthmsiasm anong ail] elasses. In 1095, at a eonneil held at Clermont. a crusale was resolved on. On this oecasion the pope himself addressed the multitude. Previous to the setting out of the true erusade, four armies, eonsisting of disorrhely multiturles of the very dregs of Christendom, had daparted for l'alestine. The first consisted of 20.000 loot, commamfed by Witter the Iemmiless. It marched through Humgary, but was almost entirely destroyed by the natires of Bulgaria, a lew only escaping to Constantinople. It was followed hy a secumd, ennsisting of 40,000 men, women, and childran, mater Peter the Hermit. The two united at Constantinople, rossed the Bosphorus, and eneountered the Jurks at Xice. They were utterly routed. Another morgmizefl Inand of 15,000 Germans was ent to pieces in llangary, and its fate was shortly shared by an immense mot of 200,000 persons from England, France, Flanders, and lomainc. It was only now that the true crusaders entered uhon the scene. Six armies, embracing aht the chivalry of Europe, and led respectively by Godfrey of Bouillon, Jherh the Great (Comnt of Vernandois), Rolert Curlhose, Comit Robert of F'lanelers. Prince Bohemond of Tarentum (mmer whom was Tanered), and ('ount haymond of 'Tonlonse, set forth for Constantinolle. Having united their forces and spent some tinte at this place, they crossed into Asia Minor. Here then lirst step was the capture of Nice, June 24, 109\%. Ther also deleated the Sultan Soliman at Dorvarum, and took the principality of Elessa. They then marched into syria, and laid siege to Antioch. Difor seven months' siege, iluring whieh the erusaders suffered trathly from famine and dispose the eity surpendered dume : $3,10!8$. The inhabitants were massared by their eaptors, who were besieged in their turn by an army if soo.000 Mussulmans. On Jnme 28 , 10 O8, the Mohammedans were put to ront, and the way upencel to Jerusalem. In the smmmar of 1049 40,000 emsaders, the remmant of a rast host which had comprised not less than 600,000 warriors, lain siegre formsalem. Tha eity was taken on July 15 . after a siego of somewhat more Chan five weeks. Eight days Iater Godliwy of Bomillon was elected King ol Jerusathem.

Thes three Latin principalities of the Fast (Edessa, Autioch, aml demsalemb maintaned themselves against the attaclis of the Mohammedans till the year Iltt. When the

Cruz José Maria, de la: Chilian general : b, at Concepcion, Apr. 21, 1801. In 1811 he joined the revolutionary army as a cadd. served through the following campaign, retreated with Carrera to Menduza after the lefeat of Roncagua, and returued with the army of san llartin in 1818 . From these youthifl beginnings he rapidly rose in rank, and was trusted with important commands. In 1831 he wis minister of war: in ts38 chief of staff of the army which invaded Peru, and became general of division in 1539: Was again minister of war and marine in 1541 , and the same year governor of Filparaiso and commandant-general of marine. In 1851 he was the liberal candidate for presilent, but was defeated by Gen. Montt: he then header a revolt in the sonthern provinces, during which, it is said, 4.000 soldiers were killed. Me was finally defeated at the bloody battle of Longamilla Dec. 8.1851 ; amnesty being proclaimed, he retired to a farm, where he died Nov, 28 , 1873.

Herbert II. Smitil.
Cruz y Guyencelte Lus, de la: Chilian seneral: b. at Concepeim, Ang. 25. 1i6s. During the colonial period he held varions eivil ollices, prineipally at Concepeion. In 1806 he made an important exploration over the Andes. di:covering one of the most practicable passes: his repurt of this mas published at Buenos Arres by Angelis in 1830. He joinel? the revolutionists in 18t0, was a member of the junta of Concepecion, and commanded a division in the patriot army, tut was eaptured hy Spanish guerrillas and long imprisoned in Peruand on Juan Fernandez. Released by the rictories of $181 \%$, he was named commandant-general of Tolca, and was acting president of Chili during the temporarr absence of OHIggins; went with San Martin's army to Pern 15:0. where he was director-general of marine, and was made grand marshal in the Peruvian arur: returning to Chili at the end of the war, he was a deputy to the Constitnent Congress of 18\%6 and afterward Minister of Marine. D. Oet. 14, 1828.

Herbert H. Smith,
Cry'olite [from Gr. kpúos. frost $+\lambda i$ oos, stone; so named because it melts in the flame of a candle]: a double fluoride of alumininm and sulum. It is snow-white when pure. It vecurs in a large bet in gneiss at Evigtok, West Greenland, whence it is shipped to Pemsrlvania for use in the mannfacture of sodit. The finely divided mineral is mixed with chalk and is fusent. By lisiviation, sodimm aluminate dissolves calcium fluoride remains. By passing a current of earbonie acirl throngh the solution, almmina is precipitated, a solution of carbonate of soda being thus obtained.
(ryoph'orus [from Gir. кpúos, frnst $+\phi$ épeiv. bear] : an instrment invented by llohlastom to treeze water by the abssorption of heat arising from jts own evalporation. It consists of a ghass tube with a hulb, at each emi. One bulb contains witer. A ricuun is produced in the tube and opposite bulb, and the empty hulb being placed in a freezing misture, the vapor arising from the water is condensed, so that the water som rongeals in the other bulb, thongh the intervening tuhe lee ? or ${ }^{3}$ feet long.

Crypl [from Cir. криatós, hinhen]: a vanlt nnier a chureh nsed either for sepulture or, in rare instances, as a chapel. Crypts generally do not extend beyond the limits of the choir or chancel, mal some are of smaller dimensions. They were not common after the early Romanesque or Norman period, and where they exist under churches of a later date they are usually much ohler than the chureh. They seem to have Inell designed to recerive the todies of saints. martyrs and Chureh chirnitapies, and are in many cases heantifully thougla simply linished structures. One of the finest examples is that unter cilasgow Cathedral ; nthers are fonnd under the cat hatrals of Chartres, Canterlury, Herefort, and Crhucester, anl wuler the ehurches of St. Wark at Fenice and st. Entrope at suintes. "There is a vast erypt under st. Petcreat Rume
hevisen by A. I. F. Hambis.
cryplocialsimists: a name appley in the last half of the sixternt ly emtury to tho fullow ren Milanchthon (eatled also Philippists), whe eamestly desired the union of the Lutherans and (atrinists, and were charged with leaning too strongly towarl the (al-inistic doctrine of the Jonts Guper. Also applied to the Nisomri Latherans, heeance they defend the diretrine of uncomditional election as taumph in the Formula of concord.

Cryptos'amonas I'labls or ('ryptorams [from (ir. kpurTós, hifden + qduos. marriage ): all phants bolow the PhaneroLimnse or fhowe whar hants. The name were livet nase hy
all plants possess sexnality. (They do not.) For a long time the vegetable kingdom was divined into two gronps, as follows:

1. Phanerogamia, with stamens, ovules, seeds, and embryos.
i. Cryptogamia, without stamens, ovules, seeds, and embryos, and with spores. These distinctions, althugh long since acknowledged to be unseientifie, are still maintained, especially in mopular usage. The Cryptogans, insteal of being a single group co-ordinate with the Ihanerogans, include several such groups-e. g.: I. Water-slimes (Protophyles); II. Spore-tangles (Phycophytes); III. Frnit-tangles (f'arpophytes): IV. Mossworts (Bryophytes): Y. Fernworts (Pteritophytes). Dore commonly, instead of 11. and III. as given above, we have 11. Algot, and III. Fungi, based npon physiological instead of structural characters.
('harles E. Bessey.
Cryptog'raply [from Gr. криттós, hidden $+\gamma \rho a ́ \phi \in i v$, write]: the art of writing or telegraphing in cipher, or in snch a way that the matter written can not be read by any one not in possession of the necessary key. Many plans have been devised for this purpose. hut almost any person who has taste for the solution of puzzles or enigmas can readile understand most writing of this kind: and it is probaile that no kind of cipher could be invented whieh wonld be proof against systematic and ingenious decipherers. Military and naval signals resemble cryptographie writing in this respect.

Cryptoproc'ia [from Gr. кри $\tau$ ós, hidden $+\pi \rho \omega \kappa \tau \notin s$. rent]: a carnivorons mammal, peculiar to Madagascar, related to the cals and civets: placed by Flower with the civets (limerritie), by Gill in a separate family (Cryptoproctide), of which it is the sole member. The skill and teeth somewhat resemble those of a cat, but the cranium is longer and narrower, the latter more numerons. The cryptoprocta, locally known as fonssa, is about 5 feet long, including the tail, being the largest carnivore foum in Madagascar: it is clothed with short, pale-hrown fur; the soles of the feet are naked. The animal is plantignade, climbs trees, is nocturnal, and savage when wounded. It is sutficisntly powerfal to carry away kids.
F. A. Lucas.

Crypluri [from Gr. kpuntós. hidhen + oủpá, tail]: th order of birds. so named becaluse the tail feathers are very short and sometimes wholly coneealed by the tail coverts. It contains ouly the Tlvamide (q. r. ).
Crystal: See Crystallograpirs.

## Crystalline Lens: See Eye.

Crystalliue schists: in geology, a generie term emphemi to designate more or less pertectly crystalline rocks which posises a distinct foliation or parallel stimeture. Such roncks are more abundantly developed in the earth's crust than any others. In some cases they can be proved to be metainorphosed or recrestallized sediments. In other cases they are igueons meks which have been rendered schistose by shearing and pressure. Other eauses of a foliated or parallel structure are the movement in a partly consolidated and viseous mass (flow structure), and the injeetion of cleared rocks, whether igneons or sedimentary, by later eruptive material (injection guciss). By far the most common of the erystalline schists is GxEIss ( $q$. r.), whieh always contains feldspar. Others are horntikude, mica, suricite, quartz, chlorite, and ottrelite sehists, crystaline limestone, and quartzite.

Thay handed and foliated gueisses have the same ehemieal and mineralogieal composition as well-kown ignenns rock:. The origin of crystalline schists may in certain cases he clealy male ont, bnt in mans others it will probably always remain problematical. So reneral theory of thir origin can be relied on to explain all oceurrences. See Ginelss, Metamonmish, and Rooks. G. H. Willays.

Crystallog'raphy [from Gr. кpúgzadaos. clear-ice (cf. крúos, frost), erystal + $\gamma \rho \alpha \phi \epsilon \Delta \nu$, write]: the scinnee of erystals. A crystal is a natural or artificial solid, bounded by phane surfaces, which are symmetrically arranged around certain innarinary lines called axes. Kpúoтa入入os originally meant "ice": it was afterward applied to the transparent rariety of guart $z$, hecanse it was thought that rock-erystal was water turnel into stone, anl this idea was not challenged until the commencement of the serenteenth contury; it was subseppently applied indifierently to any solid wheh assumed a grommetrical shape by natural laws.
All crystals may be referred to seven systems, six of which
are refermel to three ases amm one of them to fond. Thase sestems are divided inte two clases, actording the the are or not at right amoles. Thene whill ate at right musles are callet the orthometric, ant those whith aro tot art walled chmometric systems. In weth one on then there are there varieties. When all the axes are engal and at right angles, the sotem is called isometric. When only two are mgand, but all at right amges, it is called the telretgomet. When nowe of the axes are whal, the all are at right angles. it is called the urfherthmbic. 'The clinometric systems are ended, reppetively. the monorlinic. the dichinir. and the trichaic, ateroming as the axes have diffome inelinatoms.

In all of these systems one axis is placed upright, and is called the vertiond axis. Th the ismotric, totragenal, amel hexagonal setems the other axes are simply ealled the hasal axes, while in ench of the other systems bath axis has its own name, 'The axes atways terminate in homologons parts, whe the these parts are elges on angles.

The axes form a system of co-ordinates hy which the pusition of any face may he determinel. Taking the most enoncral case of three noerpal anes, the wrtical axis is nowatly designated by $c$ : the one from left to right, $b$; and the one from front to behime, $u$ : $c$ is always writton last. Starting from the origin, the hafences are dotermined as on (Figs. 43, 4) ; when all the anes are eptal they are all dowisnated byo. The distances on the half-axes. cut onf be any crystul fince, are calted parameters. One of them can atways be make erpal to unity, so that ma:nto ac. with their sigus, will always give the fusition of any cerystal face with remerence to a qiven varicty of axes, When a hace is paralled to an axis, it is satil to cut it at a distance eghal to infinity, and its eocdicient for that axis will be so written, as su: seb:c. Every face of a crystal wheh dnes not eut all the axes must sither cut two or be parallel to two of them. . $\begin{aligned} & \text { ereording to }\end{aligned}$ Weise, the symbol of any face will the me:nb:c. Nimatinn simplifies it by using two Letters, or thill numerical valuas. and writige fetwen them the capital hetter which represents the type of the system-0 for octahedron. I for pyramida, and for riombohedron. The twobters are always written in the same order: mis always equal to. greator on les than unity, and always greater than $n, m \geqslant 1, m>n$; $m$ therefore varies between zoro and infinity, while $n$ varios between one and indinity. The coediabon I is never writum.
hanas smbols are simply a contration of Namamn's, in which the letters for the primitive form of the system are left out, and $\infty$ is written $i$. Thas, man becomes tha, athl a() oo beemes ii. Miller's sysm consists in writing the reciprocals of the parameters in the order of the axis if. $b, c$; cheing always the vertieal axis. Thas xla becomes 1010. They are always writton in the same order, withent any derignation of the crestaline syem. The lownem hit written in brackets \{hki\} indicate a comphete form: written simply hikl, they indiate a form in which all the phas axes are cut: writen hit. it indicates that the plane cuts a megative axis at the listance $k$.
In every crystalline system a single form is taken as the base of the syinm. Suy form befonging to the system may be taken for this hase, but it is gamerally cuncomed to alopt pramids. From this form all the others are derived hy thire rery simple laws: (1) IUl the simalar parts of a crystal may he simitarly and simulamoons monditere. This gives rive to holoh dral forms. (3) Hall the similar patte may bo smilarly and simultamensly monlifiol. This gives risie to hemihedral forms. which in sume of the systems are known
 the similar parts mey he similarly the simultaneobsly merlified, giving rise to tefurtuhedral Imms.

In the ismmetre seten the mondifeations may be em-
 hexaronal, of one and two: in the orthorhombic, monclinic: diclinic, and triclinie, of only one plane at a time.

## 

## lsometric Srstem.-1. Holohedot Formis.

Three axes, c, a, a (Fig, 1), all oqual amb at right angles. The base of the systom is the entahelron.

Octuhedrom, O.-When the axes "e ent in the mation $a: a: a$, the solid is mate up of "ight froses which mex anilateral triangles (Fig. *). There can ha. but me wetabedrin.

Mexahedron, olle.-When the sollilangle of the netahedron are morlitiet by planes which are jurathel to two of
 ines solid will be a culne, and will have the symbit et: xu: xu ( ${ }^{2}$ ive. 3).
 octahedron are modified itn such a way that two the them are cut at a distathe equal to uniti, while tha phan is parallel to the thirel, the symbul will he: ":at: ev (Fig. 4). Thare can be bat one rhenthis doxdecthedron,
 dron are monlificul, so that one of the axes is cut at unty. ont at infinity, and one at $n$, the furmula wild be ce: on: ane (Fig. D). Is there is mothing to limit the ine fination of the phanes there may be an infinite varicty of tet rahexahmatra (Figs $5,6.8$, the limit being se0 on the one hand when $n=1$, mind $x$ ase on the other when $n=x$

Trigonal Trisetuhetron, m0.-When the edges of the octahedron are rephacel, so that two of the axas atre ent at unity and the third at $m$, the formalit is mo:co:c. L'meth Hane of the octahedron becomes rephaced by three frangnfar planes; hence the name trisectathene As there is nothing to limit the inclination of the flane there maty be
 Thein limit will be (O on the ome hame when $m=1$ and aco on the other when $m=x$.

Trtcugomal Trisuctahedron, $m \mathrm{O}$ m.-When the solid angles of the cetahedron are motified su that two of the axes are cut at a distance $m$ and the third at unity, the symbol will he ma: at ma. The faces of the octahedron will be replacetl by three tetragonal phanes As there is nothing to limit the inclination, there may be an infinite number of tetragonal trisutahedra (Figs. 11, 12. 13). Their limit will he 10 on the

Hexorfubedrom, mun.-When the angles of the octahedron are mulified so that each axis is cut at a different distance, the symbal will he 7ua: $n a:$ a. Each phane of the octabectron will be replacerl by six triangular phan"s. As there is nothing to limit the inclination of the planes, thore may be an infinite number of hexutaherlma (f"igs. 14. 15. 16). 'This solin is the most interesting of all the solids of the system, fur by snccessively changing the values of $m$ and $n$ all the uther forms of the svatem may be derivel from it. Thew can all be secn upan of in outline.

## 2. Hemihedral Forms.

In the isometric syan there are there kimk of hemihe 11ry: (1) inclinut. (e) pmothel, atul (B) gapoutel. (1) 'The' forms are satil to be felruhedral or indiand when the faces are not parallo?. This is promured whon atl of the moulifications ine carried ont on alternate homolugens parts. (?) They are dudecthedral on pereallel when alternate modifications are carreal ont in the same emate on all the homongons 1 ards. (3) figroiful forms are pronlucel when altermato moditieations are carbind out alternately on all the homodngous parts. The hexerotherforn is lite only solid wheth ahows of hemihelral forms accoreling to all of the three laws.

## (1) Inclined or Tetrahetrul Furms.

Tetruherlon. $\pm{ }_{2}^{\prime}$ - When atternater faces of the ortaliedron are prothem the the exclusion of the othere (Fig. 1\%) a tre raberma (Fig. 18) is formal. 'Ihere can he but two tetrahedra, which are distinguished ats + and -
Itmi-Trigenal T'cisortuhedron. $\pm \frac{m(1)}{2}$, When mo is modition by this law, a tombentron is produed. each of whose faces is rolaced by three tetragonial phanes (Figs, 12, 20, 31, \%

Hrmi-Tetragonul Trisuctuhedron. $\pm \begin{array}{ll}\mathrm{mam} \\ \bullet & \text {.When mom }\end{array}$
 one of whos. phan- is rephaced by thre trianeralar phane

Hemi-Ilesortahwelron Thelinet, $\pm \frac{m 0 n}{2}$.-When mon is
 Whe of when fotes is roplaced ligsix triangular blathe (Figs
 mit of inclined hemilendry.
(2) I'trallel or Dudecatedral Forms.

Hemi-Tetruhexahedron, culn.-When xen (Fig. Sn) is moditied, so that every alternate five is produced, a solin is
formed (Figs, 30, 3t, 32), which is olter called the pentugonal dodecahedron.

Hemi-Hexoctukedron Parallel, $\pm\left[\frac{\mathrm{mO}}{\stackrel{2}{2}}\right]$.-When $m \mathrm{On}$ is modified so that every other plame is takrn in the same order on each face (Fig. 3.3), a solit (Fig. 34) is produced, which is often called the diploid.
edges terminal angles and planes. The general formula for these pyramils is $t: a: m e$, for which the symbol is $m \mathbf{P}$, in which $m \gtreqless 1$; hut in that protopyramid P which is selected for the hase of the system the value of $m$ is taken for unity. As $m$ may have any value, there may be any number of pyramids. They are called acute or obtuse according as the terminal angle is acnte or obtuse.

B. Cryroidal Form.

Gyroid, $\pm\left(\frac{\mathrm{mO}}{\sim}{ }^{2}\right)$. When $m \mathrm{O} n$ is modified in such a way that the taces are taken alternalely above amd below (lig. 35), a solid having twenty-four pentagonal taces is produced (Figs, 36, 37). This solid has not been found in nature.
(3) Tetartohedral Form.

Tetertoid, $\pm r l \frac{m \mathrm{On}}{4}$. $-m \mathrm{On}$ is the only form which allows of the carrying out of this law. When the lexoctahedron, the diploid, of the hemi-hexevelahedrom inelined, is medified as shown in liges 38,3 , and 40 . Figs. 41 and to are prodhewd, and as there are two pairs of these, which are right and left forms, they are distingrished as + and $-r$ and $l$.

## Tetrmanal Sistem.

The axas of this systm (lig. tis) are of two kinds: a, the vertical, being longer or shomer tham $b, b$, which are both equal.

Holaledral forms.-Closed Forms.
Tetragomul I'gramid of the First onder, I'. When the axes are cut in the relation a: at: the promid of the first
 which inchudes the axesb is a square, and in calliod the haval plane, and its angles and rulges are colled hasal angles and ediges. The phanes which include the axes $u, b$ are rhombs, and are callod the tominal phanes. amb their angles and

Iyramid of the Siecond Order, $m \mathrm{P} \infty$.-When the terminal edges of the protopyramid are modified by one plane in the relation ma: $\propto b: b$, it solid exactly similar in all respects to the protopyramid is proiluced, hint turned $90^{\circ}$, so that the basal axes terminate in the center of the basal ellges (Figs. 46, 47). As m may be $\leqslant 1$, there may be an infinite number of denleropyramits. The two forms, Pos and $2 P^{\circ} \infty$, occur where $m=1$ in the first ense, and $m=2$ in the second.
Dilutrugonal Piframid, mPn,-When the terminal edges of the protopyramid are motified in the relation $a$ :na:me, a solit is protuced in which each plane of the protopyramid is replaced by two planes (Figs. 48, 49). This solid $m \gtreqless 1, n>1<\infty$; hence there may be any number of ditetragonal pyramils. This solid bears the same relation to this systemi that the hexuctahetron does to the isometric system.

## Opre Forms.

Telraymal Prism of the First Order, $\propto \mathrm{P}$. - When the hasal eiges of $P$ are modified hy one plane, the axes will be cut in the relation $a: a: \propto \infty$, which produces simply fonm vertical phanes (Fiy. 50), these as they nre not closed, protuce an opern form, which is the protoprism.
Treragomal Prism of the Sceond Order, aPo.-When the basal angle of the protopyramit are modified by one plane in the relation o: $x$ ot: $: x$, , it ]rism ( Fig . 51 ) is prolucel similar to the protoprism, hat turned $10^{\circ}$.

Ditelragomal Prism, $\alpha$ l'n.-When the basal angles of the protopyamid are merlified by two planes in the relation
u:no: ex, a prism (Fig. 52), made up of cight faces, which are parallelograms, is prodneal.

Bused Plentoid, ol'. - When the axes are ent by planes in the relation oxa:xu:c, we have simply a pair of phanes parallel to the basal axes.

## Pyrumidal Hemihedral Furm..

The pyramilal hemiherral forms of the tetragonal syom are calhich (1) scelemoledral or sphenoidal, (2) frepuezoidal, (3) pyramidu?

## (1) Scalenohedrul.

Sphenoid of the First Order, $\pm \frac{1}{2}$. When alternate planes of P are produced, a solid resembling it tetrahedron is formed, in which the faces are isoseeles triangles (lidgs, 5is, 54). There will be two of these sphenoils. This sellil is mamed after the mincral sphene (htonile), in which it lipequently occurs.

Sphenoid of the Second Order, $\pm \frac{m \mathrm{I} x}{2}$. When $m \mathrm{l}^{\prime} s$ is treated by this law, another sphenoid is protucel. similar in every respuect to the shhenoid of the first orter, but turned $90^{-}$(13igs. 55 and 56 ).
the seend order, except that the hasal axes terminate to one side of the center of the faces of the prime (rits. 6i).

## Tefurlohedral Forms.-S'pht nuitat.

T'etarlo-Sphenoid, $\pm{ }_{i}^{r} \mathrm{mP}^{\prime} n$. Whan mlan is moditied as shown in Fig. is, it prothers at sphemoil (Fig, 6th, called the sphenoid of the third order.
 it protures as sphemoill (Fig. il), callerl the sphenoid of the fourth orlar. It has not been found in mature.

## (Ofthonhombe Sister.

The axes of this system (loig. 潼), $a, b, c$, all unegual, but all ut right angles.

## Holohedral Forms.-Closed Forms.

Rhombic or Irolopyromid, P.- When the axes are cut in the relation $a: b: c$, the solid probuent is a pyramid, whose fuces are sealene triandes (tiy. 73 ). The phanes ab, ac, and be are rhombs of different vilues. As the basal axes form the diagonals of the rhombs be, they are allet, $b$ the macro or longer, and $c$ the bruchy or shorter axis or tiagonal. In

Telragonal Scalenoludron. $\pm{ }^{m l^{\prime} n} 2^{-}$. When two fueds together, taken altermately almose and below, of $m$ l'n are taken ( $\mathrm{b}^{\prime}$ ig. $\boldsymbol{\sigma}$ t), the solid resulting is a sphenoid, eath of whose face is replated be two planes (Fis. 58 ).

## (2) Trappzoidut.

 modifiod be taking one phane attornately above and below
 from the other lemihedral forms of $m P^{\prime} n$, the are called right, $r$, and lift, $l$.
(:3) I'yramidet.
Tictragonal I'tyramial uf the Thirel Oreler, $\frac{r}{l}$ aml $\frac{1}{r} \frac{\text { ml'n }}{?}$ -
 the same plane thote anil helow (Fige 61), a pramat is formed wheh remembers the other pramids of thio sy-tem (Fige for). It is, howerer, terned to one side mare of has. deproding whe thate of $m$ Pro. The relations of the owat mids and prisms of the there orders ate illut rated by big. 63. Another pramid which is purely themedical is [omat as shown in l"ige 64 and Bis. $^{2}$

Prismulic Hemihelral Forms.
 When al'n is moditied so that only every other flane is taken (Fig. 66), at pisu is produced rasmbling the priom of
bimb speries a walue of $a$ is selocted for unity, and this value is repesented in 1 ', the lase of the system. 'The generat formula will, howeser, the ":h:mr., ir ' ll '. in which $m \equiv 1$.

1/turopyramit, m1'n.-This solid (1iy. 7.1) pesembles the profopyramid, hut the symbel is a:nb:me, in which $m$. The macro axis has fur its eoflicient $n>1$. The planes therefore sut the macro axis extemed. The long mark through the P symbolize this Pact.
 bol is a:nb:me, in whin $m>1$ ant $n>1$. The planes. therefore ont the brachy axis "xtented, which is expressed by the curse dawn through the 1 ?

## 

Whombic ar lrotomism. $x l^{2}$ - When the hasal alges ni 1' are mostitied hy om phane whel is parallel to the vertical asis $f$, accoreling to the law 1 : b: xe the resulting fomm is

Burraprism. x'rn.-When the hasal edere of $m l^{\prime \prime n}$ are
 whinh $n>1$, the maceraxis extembed will he ent. The form consists of four vertion parallelograns (Fig. ito.
 moditied acomdiar to the law mo: $n: x \circ$ of which $n>1$ ( (rige Fr), the resultiner form is at prime, in whinh the hathy axis extemend is cout.

modified according to the law $a: \propto b: m e$, in which $m \gtreqless 1$, the form is roof-shaped, and is called a dome. from dumus, a honse. The dome is always orer the axis, from which it takes its name.

Brachydome, $m \mathrm{P} o$. - When the terminal edges are modified according to the law ocu:b:me, in which $\Rightarrow 1$, a clome orer the brachy axis is formed.

Basal Pinacoid, oP.-When the ares are cut in the relation oce: $\alpha 己: c$, planes parallel to the basal axes arte produced.

Macropinecoid, aPx.-When the axes are cut according to the law $a: \propto b: \circ c$, planes parallel to the axis $b$ are produced.
be formed by these and the other pair of planes behind above and in front below. The pyramill itself will be $\pm \mathrm{P}$ (lig. 83). The two planes, above in front and below behind, are by convention called $-P$ and the others $+P$. When $m$ is int equal to 1 , the symbol becomes $\pm m \mathrm{P}$.

Orthopyramid, $\pm m \pm n$. When the axes are cut in the relation na:b:me, the two forms produce the orthoprramid (Fig. 81).

Clinopyramid, $\pm m$ Pn.-When the axes are cut in the relation $t: n b: m e$, the two forms produce the clinopyramid (lisis. sis).

Protoprism, $\propto P$.-When the basal edges of the protopyramid are modified, the ases are cut in the relation $a: b: \infty c$. A monoclinic prism (Fig. 86) results.

Brachypinacoid, $\propto \times P$. When the axes are cut according to the law oa $a: b: \propto c$. planes parallel to the axis $c$ are moduced.

## Heminedral Forms.

The hemihedral forms of this system consist of one solid. the rhombic sphenoid, and pairs of planes or single planes.

Rhombic-Sphenoid, $\pm \frac{m \mathrm{P}}{2}$. When alternate planes of the protopyramid are taken. a sphenoid is formed whose faces are scalcne triangles (Fig. 81).

## Itemimorphic Furms.

According to the lam of symmetry, when a crystal is terminated by modifications at one extremity of an axis, the same planes should be aepeated at the other. In this and the heragonal system there occur crrstals where this law does not hold good, and these exceptions are called hemimorphie forms.

## Limit Forms.

WHen the protoprism is accompanied by the macro and brachy pinacoids, the prism has a hexagonal section. W'hen the angle of the prism is near $120^{\circ}$, forms are produced Which are so similar to hexagonal combinations that it is frequently dithicult, without a determination of the optical properties of the mineral, to make the distinction.

## CLINOMETRIC SISTEMS.

Monoclivic System.
The axes of this system (Fig. 82 ) are of three kinds, and have only a single inclination. The angle $\gamma$ of the piane

Orthoprism, $x$ Ph.-When the basal edges of the protopyramid are modified by one plane in such a way that the ortho axis extended is cut at a distance $n$, the relation is $n a: b:$ ace (Fig. 87).

Climoprism. otn.-When the orthopyramid is modified so that the clino axis extended is eut at id distance $n$, the relation is $\ell: n b:$ oce (Fig. 88).

Orthodome, $\pm m P x$.-As the edges which join the axes $a, b$ are of two kinds, only parallel planes will be produced by a single modification, $\alpha a: b: m e$. The orthodome (Fig. 89) will thertore be made nip of two hemi-orthodones. The same convention for the signs + and - is made as for the bymmid.

Clinodome. mPx. - As the edges which join the axes $a$, e are alike, a dome results from the relation $a: \propto b: m c$ (Fig 90 ).

## Ticlinic Systen.

The axes (Fig. 91) of this system are of three kinds, and have two inclinations. The ingle $\gamma$ of the planes $a b \gtrless 90$, the angle $\alpha$ of the planes $b c=90^{\circ}$, the angle $\beta$ of the planes $u c \gtreqless 90^{\circ}$. The basal axes are thus at right angles to each other, but the plane which contains them has two inclinations to the vertical axis.

Diclinic Pyramid. ' $\mathrm{P}_{1}$--As the faces of the pyramid are equal only in pairs, the fyramid is made up of four tetarto prramids. This system admits of only hemi forms and te-

91 tarto forms. a is called the rertical, $b$ the macro, and $c$ the brachy axis. It admits of tetarto, macro, and brachy pyramids and prisms, and tetarto, macro, and brachy domes and the pinacoids. Mitscher-

Monoclinic systern.
$a c=90$, the minle $\alpha$ of the plane be $=90^{\circ}$, the ancle $\beta$ of the plamo $a b \geqslant 90^{\circ}$. $a$ is called the mertical, $b$ the clino, and $c$ the mflon axis or diagromal. The plane of the basal axes is thus inctined to the vertical axis, while the ortho and clino axes are at right angles to each other.

## Holohntral Forms.-Open Forms.

Monoclinic Pyramid. $\pm$ P-Is the ares a and $b$ are of muegual lonoth, and the plane which contains them makes two angles with the vertical axis, the one in front being an obtuse and the one behind making an acute angle, the relation $a: 8$ :c will produce only a hemipyramid or a pair of planes, alrove in front or behind below. The pyramid will

Lich amomed that he had discorered this system in a erystal of lyposulphite of lime, but subsequent erystallographie and optical researches proved that this salt was triclinic; in eonsequence of which the system was ubandoned by most erystallographers. It has, however, the same theoretical hasis as any of the other systems, and there does not seem to tee any grool reason why it should not be preserved.

## Triclinic System.

The axes of this system (Fig. 02) are of three kinds and have three inclimations, the angles $\alpha, \gamma, \beta$, are $\geqslant 90^{\circ}$. The axis $c$ is called the vertical, $b$ the macro, and $a$ the brachy asis.

Triclinic Pyramia, I'. When the axes (Firo (1, ) are cut in the relation $a: d: r$ a bair of planes ate prouncerd. The pramid is mate up of four theturto-pranill. which arn distinguished by accents, 1 's signities the planes right above.
dihexaromal prramid are morlified by one plane, so that the axes are cut in the relation $\mu b: l:-\frac{\mu}{\mu}-1$ b:xe, a dilexagomal prism (fig. 106) is protuced.

Triclinic system.

'I' the phanes loft above. P, tho planes richt below, and I' the phanes left helow, with thoir diagomally opposite phanes. The pyramid is ' P '. The protoryamid ( $\mathrm{lo}^{\circ} \mathrm{g}$. (43) will atwas be m? exed when methals one, the macropyramid (Fig. 94) is m' ${ }^{\prime}$ 'n, and the hrachypyramid (Fig. 45) mi', $n$.

Trielinic Irrism, s'l'. - When the relation xa: $b: c$ is earried out, it brouluces a single pair of phanes, whose symbol is $x l^{\prime}$ or $x^{\prime} l^{2}$, accorling as the planes are to the rimh or the left. Each prism is made up of two hemiprisms. Th,
 $x^{\prime}$ ' $^{\prime}$, and the macro prism $x^{\prime} l^{\prime} n$.
Trictinic bomes.-The domes are single patirs of phames, and each dome is made up ol two hemidomes. The macrodomes are made up of $m^{\prime} P^{\prime} x$ amd $m \mathbf{P}^{\prime} x$ (l'ig. !s'), and the brachydomes of $m_{1} \boldsymbol{y}^{\prime} x$ and $m^{\prime}{ }^{\prime} x^{\prime}$ (Fig. 199).
The only other phanes are the basal jinacoid. of the macropiacoid, of'so and the brachypinacoid, xlex.

## Sgsten watll poth ANES.

## Hexagonal. hystem.

The hexagonal system is referved to fom axis. One of these $c$ (Fig. 100 ) is sestical. 11 is at right anglos to the phane of the basal axes 6 , whids are inclined to bath other at an angle of 60, The rertieal is the optient axis. and is consequenty the line of greatest physical as well as mathematieal importane.

## Holuhedral Forms:-Clowd Furms.

Ifragonal lyramid, P'-When the ases (Fis. 100) are cut in the welation $x b: b: b: c$, the mamiel of the first orler (Fig. 10t), or protopymmid, is produced. In the form chomen for the base of the system the rertieal axis is cutat a distane equal to unity. but it may be eut at other distanees, $m \geqslant 1$, so that the general symbel is mI'. 'The 1 yramids are said to be acute or obtuse aceording as the termimal angle is acute or obtuse.
Hexugonal Iyramid of the Secont Order, mP.-When the terminal effes of the protoprisn are replaced by one plame, so that the axes are cut in the relation $2 b: b: 2 b: m e$. thother pramid called the denteropyranid (Fig. 10:3), which is similar in all respects to the protopyrmide. exep that it is turned 30 from it, is produced.
Nihexagonal Pyrumid, m1'n.-When the terminal edgess of the protapymind are replaced ly two phanes, all threm of the axes $b$ will he cut at unequal distances. If the shortest parameter is called mity or $b$, and the longest $\mu$, the thind parancter will have a value of $\frac{\mu}{\mu-1}$, and its length will be between 1 and 9 . The axes will he in the relation $\mu b: b:_{\mu-1}^{\mu}: m r$, or $\mu b: b: n b: m e$, in which $m \equiv 1, \mu \geq 2$, and $u=\stackrel{\mu}{\mu-1}$ (Fig. (0;3).

## Open Furms.

Hexagonal Prism, xl'-When the hasal eilges of the protepyramid are modiliod by one phan which is barulled to the wertiend ases, the are ent in the relation xf:b:b:xe and the protoprism (Fig. 10.1) is produed.
 hame cedres of the dentwropramid are moditied lyy one phane
 (Fing. 10.3). The axes are cut in the relation xa $: 2 b: b: 0 b$. This prism is in every resuet similar to the protention, but it is furnel : 30
Diheroyomal I'rism, al'r.-When the bnsal enters of the

Dirasal Pimemoid, oI'- When the aves are cut in the relation $x b: x b: x b: c$, the basal pinated is produced.

## Pyrumidal Iremihedral Forms.

This system admits of four different kinds of lemihedral forms deriven from its pyamids, which are called (1) sedlenoluedrul. (2) trapesoidal, (3) pyramidal, and (t) Prigonal hemikedry.

## (1) Sinlenohedral.

Whombuhedron of the First Ondur, $\pm \frac{m \mathrm{P}}{2}$. When mJ is modifiod by poducing every alternate jlane (Fig, 100), the rhombehedron (lig. los) is jroduced. As there are two of them, they are designated hy the signs + and - .
Rhombohetron of the Sicmul Orare, $\pm \frac{x l^{2} 2}{2} .-$ When
 healral (lig. 110) are jroducet, similar to those of the dirst order, but turned 30. As there is no limit to the angles of the pyramids from which they are probneed, there are an infinite variety of rhombehedra. They are ealled acute or olituse aceording as the terminal angle is acute or obtuse.
Hermgonal Sculcwherlron, $\pm{ }_{\sim}^{m}{ }^{2} n$. When the dihexagenal promid is modified. so that ewre two athernate fites nhowe aml below are taken (Fig. 111), the sealonohedron (l'ig. 112) is produced. There are four of these sealenoherim. In onder to get a chan idmaf them, we have only to supmese that the terminal or basal edges of the rhombohedrat were moditied by two or the terminal angles by six phanes.

## (¿) Trupervidal Hemilhedry.

Hexagonal Trapezotedron, $r$ or $l^{m P^{2} n}$. When the dinexagonal pyramid is modified by the extension of every alternate phane atowe and below (Fig. 1r3), the he xigonal trapezohedron (rig. 114) is produced. They are distinguisheel as right antul left.

## (3) l'yrumidal Hemithedry.

Hrxayonat Pyramid of the Third Orter: $\frac{r}{l}$ or $\frac{l}{r} \frac{m l^{\prime} n}{2}$. -
When $m$ [ $n$ is molificd as in Fig. 115, a hexaroma pyramid, in which the basal axes terminate to one side of the eenter of the basal edges, is produred (Fig. 116), which, to distinanish it. is calted the promid of the third order.

## (1) Trigonal Itemittedry.

Ditrigonal Pyramit, $r$ or $l\left[\frac{m \mathrm{P} n}{2}\right]$. When $m \mathrm{P}$ ' $n$ is modithent so that every alternato pair of phanes, but the sume
 pranial (Fig. 118) is parlucod; to elistinguish the symbol it is writton in brackets.
Trigonal Pyramid of the Firwl (trder, ror $\frac{\mathrm{ml}^{2}}{2}$. -When
 but the same flane alowe and helow, al trigonal plamul of

When mi? (l'is. 121) is modilied by the sume law, a trigomat pratuid is producen.

Prismatic Itmihedral Forms．
Itexagonal Prism of the Third Order．$\frac{r}{l}$ or $\frac{1}{r} \frac{\alpha \Gamma n}{2}$ ．－ When $\propto \mathrm{P} n$ is modified by the extension of every alternate plane（Fig．123），a hexagonal prism of the thind order is produced．
plagihedra．Ther rary in form aceording as the terminal angle is acute or obtuse．

Trigonal Pyramid of the Third Order，$\pm r$ or $l\left[\frac{m \mathrm{P}}{4}\right]$ ．－ When $n \mathbf{P} n$ is modified as shown in Fig．140，a trigonal pyramid（Fig．141）is produced．

Ditrigonal Irism，$r$ or $l\left(\frac{x \mathrm{P} / t}{\frac{2}{2}}\right)$ ．－When $\propto \mathrm{P} u$ is modi－ fied by extending pairs of alternate planes（Fig．125），a ditrig－ onal prism（Fig．120）is produced．

Trigonal Prism of the First Order，$\pm \frac{{ }_{2}^{2}}{2}$ ，When $\propto \mathrm{P}$ is modified he the extension of every other plane（Fig．1：2），a triconal prism of the first order（Fig．128）is prodnced．

Trigonal Prism of the second Ordrr，$\pm \frac{x l^{2}}{2}$ ．When $x^{2} P 2($ Fig．129）is modified by the same law，an obtuse tri－ gonal prism is produced（Fig．130）．
The relation of all these forms to each other is made plain 1，Friss．1：31 and 13：2．Fig． 131 shows the relative positims of the hexagonal pryamids and prisms of the first，sceond， and third corders and the dihexagonal pyramid and prism （Fig．A32）shows the rehations of the first，second，and third orters，the scalemodedron，the trigonal and ditrigonal pyra－ mide und prisms．

## Pyramidul Tetarfohedral Forms．

There are two kinds of pramidal tetartoherdry in the lusugnal sy：tem，rhombuhedrul anif lrapezoidul．

## Rhomboherlcal Memikedry．

Rhumbohedron of the Therd order．$\pm \frac{r}{1}$ or $\frac{1}{r} \frac{\mathrm{mPr}}{4}$ ．－When the dihexagonal aramid or the hexagonal pramid of the third order is modifiod an shown in Figes is：3 and 134，a rhambededron of the thim witer（Fig．18：3）is producel．

## Truprevirlul／Hrmihadry．

Trigenal Trapazoherlron，$\pm r$ ar $/^{m \mathrm{P} n} \quad$ ．When $m \mathrm{I}^{\prime} n$ is
 and 13：3）are prowneed．Theo whils were formerty called

## Prismatic Tefortohedral Form．

Trigonal Prism of the Third Order．$\pm r$ or $l \frac{\propto \mathrm{P} n}{4}$ ．－When $\alpha^{2} n$ is modified as shown in Fig．142，a trigonal prism is produced（Fig．143）．The position of these tetartuledral torms is illustrated in the diagran Fig．14t，which shows the relative position of the hexagonal pyramids of the first and second orders，the dihexagonal prramid and prism，and the trigonal pyramids and prisms of the thind order．

Thomas Egleston．
Crystal Palace：a structure composed mainly of iron and glass，especcially that it sydenham，near London．The tirst crystal palace was erected in Londun in 1851 from de－ signs by Sir Joseph Paxton，and was nsed tor the world＇s fair of that year．It was constructed wholly of iron and glass，except the floors，which were ot wood；was 1.851 feet long，and cowred 21 acres．It was taken down after the ex－ hibition．Twn rears later a world＇s fair was held in New York in a crystal lalace designed by Carstenson and cillde－ meister．This was bmed in 1855．＂The present edifice at Sydenham was built in 1sigt，and contains an extensive museum of art and science，bevides a promanent fair，con－ cert－halls，etc．Nany similar structures hate since been ererted in Europe anil the［．S．，but the name of＂erystal palace＂has passed out of use except for the three historic edifices above mentioned．Revised by A．D．F．Il AMLs．

Industries.-Manufactures of sugar, molasses, rum, and cigars, preparation of coffee for market, peserving fruit, bleaching wax, and minor industrics, The local consmmption of sugar was 70,000 tons. There are about 1.000 miles of railway operated in C'uba, also athout 3,000 miles of telegraph and 153 telegraph ollices.

Government.-In 185 there were a Governor-General and a Conneil of Administration, nominated ly royal decree, and sisteen senators and thirty leputies chosen by the inhalitants representerl the colony in the spunish cortes.
Finances.-In 1893-94 the estimated revenue was $\$ 24$. $410,75!$ : the expenditure, $\$ 25,08+259$; and the debt abont 285.501,000.
(hurch and Education.-Roman Catholie only established religion; eltucation tas mate obligatory in 1880, and in 185034,813 chiriren attended sehool. There are 843 pmblic schools in the islant, besitfes schools of secomelary education in the towns, ant it miversity at havana.

Thistory.-Island disenvered (net.. 14 是. by Columbus; colonized by spaniards 1at1: Indians ervelly treated by Hernando, Spanish govemor, and in 1553 the entire Indian popnlation became extinet. In 15034 and in 1054 Harana destroyed by Fromeh, but speedily relmilt and strongly fortified in 1584; in 1624 taken by Wnteh. but son restored to Spain; from 16 GOO to $1 \pi 00$ often ravaged hy filitnsters: Puerto Principe plundered and destroyed by them in 1588. After 1 Tou Cuba mospered greatly. Tobaceo monopoly established 1717 aml not abolished till 1816. In 1762 Havana taken by English, but exchanged in 1763: its commercial importance rapidly increased. but it became the center of the slave-trade for Slamish America. During the prevalence of the slare-trale. 1 ras-184. it is said that over 500,000 slaves were bronght into C'uba. There were Negro insurrections in 1844 and 1848 ; more tham 10,000 Negroes perished in the latter. For a great many yeurs there was a stromg pressure upon the $[T$. $\therefore$. Govermment, mainly from the South, to obtain possession of Cuba: President Polk offered $\$ 100,000,000$ for it in 5840 : in 1854 the Ostend Manifesto, signed by Puehanan, Soule, and Mason, clamed the right to take and annex it if Spain shonld retuse to sell. Meantime, in 1849- 11 , there were insurrections, led by Aneriean adventurers. The Spanish revohation of 1868 led to an effort for C'uban independence, which rontinned with varying fortunes for twelye years: the war was a severe one on hoth siles; Cerpertes wis the insurgent president. In 1880 it was substantially put down, but the island was left in disorner, and with a deht of $\$ 85,000,000$. A law for gradual abolition of slavery in Cuba was passed by the Cortes in 1878 ; in 1886 slavery was abolished absolutely. Early in 1sth a formidable insurrection was begun to seeure c'riban independence. See Cuba in the Appendix.

Popmlation and Polifical Dirisions,-The latest eensus shows $1.591,644$ inhabitants, composed of Spaiarls, 977 , !192; foreign whites, 10,1632 ; Negroes, 489,24: ('hinese, 43,811. In 1890 the population wasestimated at 1 . $6: 31,68$. C'uba is divideal into six provinces. The largest cities are Havana (eapitab), population abont 250,000: Santiaro de Cuba, 71,307 ;
 4:3): 11 olguin. 84, . 67 : Suncti Spiritu,
 interior de Cube (18s!). Lievisel by Mark W. Iharmegton.

## Cubamiad, lsland of: See Margarita.

('uhas, likaz: Porngmese cavalier: b. about 149i. In 1.33 he reecived irom the domotrerio Martin Affonso de Sonza at grant of lamels in the eaptaney of siñ Vieente, and som after he fommetal a settement flere; in 15 th he endownd a small hospital in the place, calling it the lospital de Suntos: gralually this name sprad to the settlement itsidf, now the impurtmat, 1 net and city of simens. ln 1545 Braz Chhas wat namel ('apitno-mot, or governor of sĩo Vierente, actiag for Martin Affonso. J), at wantos in 159). llerbilet 1F. Smitu.
Cofbature: the measument of the volme of a solid bobly. If the empation to the surfice inelosing the body be given in rectangular "o-ordinates its volume is expressed liy the triple interal fef der dy dz, where the integration is to be extembed to atl paints of the solicl.
('ube [from Cir, kißos, culw, die]: in geometry, a solid lwhy eombaned hy six equal spmates. It is also called a regutar hexalmedron, and is ome of the five recolar solines. It is a form whith offen necurs in nature, cepecindy among crysbals. In arithatie the eabe of a momber is its thirl power,
or the product obtained by multiplying that number by its srume. The cluplication of the eube-that is to say, the finding of a cube having donble the volume of a given cube -is one of those prohlems which almit of no solution by the geometry of the right line and eirele. On this, as on the quadratire of the eircle and the trisection of an angle, a vast amount of ingenuity has beca vainly expended since the dawn of mathematieal science. The solid contents of a cube are equal to the third power of the number which expresses the length of one of its sides.

Cubeb [Fr. cubebe. Span. cubeba, from Arab. kabäbrh, an aromatic berry]: the dried, unripe frnit of the Cubebo officinalis (and probably of other species), elimbing woody plants belonging to the order Itiperacece. The enbeb rine resembles that which produces the ordinary black pepper. Cubebs are brought chiefly from liava. Penang, etc., and are used as an aromatic and stimulant diuretie. Their aetive properties ilepent on the volatile oil which they contain. They also have a crustalizable principle ealled "cubebin," and a balsamic resin. The oil, tincture, and extract are used in medicine.

## Cube Root: See Roor.

Cubic Equation: an equation which involves the cube of the unknown quantity. A pure cribic equation contains only two terms; as e. g. $x^{3}=27$; all others are said to be adfected ; as e. g. $x^{3}-5 x^{2}+4 x+7=1$.

## Cubic Niter: See Salitpeter, Chili.

Cubit [from Lat. chbilus, ellow, ell $>$ Fr. coude : Ital. cuGito]: a linear measure of the smeients, equal to the length of a man's arm from the elbow to the tip of the middle finger. It is generally stated to be 18 English inches. The ancient Egyptian cubit, or "cubit of Memphis," was abont $20 . \%$ Tritish inches. The mean of Sir lsaac Newton's determinations, from the careful measmrements of the great lyramid by Trof. John Greaves (published in 173\%), made it $206 \%$. The mean of still more carefinl measurements by Prof. C Piazzi Smytli in 1865 made it $20 \%$. According to Newton, the cubit of Babylon was rery nearly 24 British inches; the roval cubit of Persia, 21-195 inehes; the culit of the Romans, 1. 406 inches: the eubit of the Greeks, $18 \cdot 1308$ inches; the Egytian cubit in nse in 1787, 21.888 inches: the sacred enbit of Moses he calculates to have been not greater than 24.9359 inches, nor less than 24.262 and its probable value to have been ${ }^{2}$ fors? inches. I'rof. Piazzi Smyth thinks that lie has proved that the nnit of measure employed by the builders of the Great I'yranid in laying out the groundl-plan of their work was identical with the salered cubit of Moses. and that its value was 25025 British inches; which is, according to the most recent determinations, almost exactly the $10,000,0004$ h part of the earth's polar ratins. He supposes, therefore that this unit of measure, which was divinely given, was male by divine intention to be in this exact decimal relation to the invariable line aromod which the earth revolve. If the British inch be increased ly foro th part, it becomes what ['rof. Smyth calls a "pyramidi-inch"; and at pramid-cubit. or sacred cubit, is $2 \boldsymbol{j}$ pryamid-inches, or Dondoñ th part of the earth's polar radius. Prof. Smyth maintains his hypothesis with immeh ingenuity, but it has not been generally received with favor.
The value of the liblical "culsit of a man" is extremely uncertain. Dr. Willian Smith, in his Dictionary of the Bible, has discussed the question pretty fully, and inclines to regard it as having lat a value, feduced by Thenins (Theologische Stulien und Fritiken for 1846) from the Egyption cubit moasure preservel in the Turin Ilusemm, of 2:3 digits, each digit beiug 0\% 238 British inch $=18.257$ British inches.

## Cuchan Indians: See Yeman Indias.

Cuckoo: a birl of the gems Cucnlus, anl allied genera, helonging to the family C'uculide. The family is represented in temperate and tropioal regioms throughont the world, and comprises birds of great diversity of size and plumage. Aside from certain anatomical charators, they agree in having the fourth outer tee turned basward like the purmots. althongh they are not climbers. Many of the species have the libit of making no nest, depusiting their eges in the nests of ot ther and smaller birts, The most noted among them is the binronem curkoo (ruculus comorus), which breels throughont. Europe and a great purt of Asia, retreatinge soth in winter, the Furopean hirds migrating to Afrien. It is a litte over is foot in length; the greater part of the plumage is ashy gray, but the muler side is grayish
with bark han：the winge and tail are black，the latipr with white spots．The cuckor）frequently paces hare eqge in nosts so situated that she can not sit upmorn aceom－ plishing this by depositing the egg upon the gromed amt transferring it io the nest with her month．The young cucknother crowds，＂t deliberately throws out．the eges or voung of its foster parents，and thus secures their indi－ vidual care．

The coucals，or grouml cuckons，of the genus Centropus． are large spectes characterizel by a long，straight claw on the imner toe．They are fond from Ifrica，eastward to Australia．are poor tlyers but rum well，frequenting thick underbrosh amt feeding uphn small reptiles，insects，egess． etc．They nast upon the gromed and ratise their own young． The golden cuckous，Chryearoccyx，are small birds whose fhomage，like that of humming－birds，glows with metallic greens ant eoppery red．They inhabit the warmer pertions of Africa，Asia，and Anstralia，one speries regularly migrat－ ing from Australia to Siw Zealam imel hack．The giant of the family is the Australian chanmel－bill（weythrops nomp－ hollandie），a bird 2 feet in length，with a large bill，and Wumare rather resembling that of its European rotative， whom it is also saill to resemble in depending upon other birts to raise its rompr．The common cuckoos of the L ． s ． are the yellow－hilleq（r occyzns omerictuns）and hack－hilled （C＇oseyzus cryflerophthelfomus），both fornd from the Rocky Monntains east ward，the first also ocenreng on the Jacific const．＇They are both satiny，olive gray above，white brlow， with long tails tippral with white．Aside from the fiffer－ ence in the conlor of the bills，the lack－hiltom cucko is slighty the larger of the two has less cimanom color in its wings and less white in the tail．They brith flimse nests of twigs，and lay four or five pald greenish－bine reges．

The roal－runner，or chapmal cook（ritoctecy，culiforni－ （anиs）is a large cuckw found in southern Colifornia，New Mexito，and the abjacent region．It is so named from the rupidity with which it runs its sured un foret heing some compersation for ferble powers of llight．Like many other euelinss this one themsits it eqers at combiderable intervals， so that loy the time the lat in hateded the lirst bem is hald the size of the parents．Lashy，there are a liew Amerian

 either buile a sepmate nest of chab tued her in partiow of four or tive anal builal a common mot，in which as many as twenty eges may be Angoited．They inhathit the watmer parts of America．fron＇reats and Florida sunthwatd．

Gueva Badazar. de ha: Spmish stalesman; lo in Madrinl, 1626 . De was a yonger som of the seventla Duke of Alberguerguc, and became Come of Custellar and Marpuis
of Malagon by marriage. He groluated in law at Salamanca, and hold important judicial posts: was councilor of state and afterward of the lodies, ambassader to Germany, and in $16 \% 3$ was named Viceror of Peru. T'ierra Firme, and Chili. He entered Lima Aug. 15. 16r.4. During the four years of his temm he pail especial attention to the finanees, and renitted large sums to Spain. Peru at this time was regarled only as a means of enriching Spain, and the vicerors were constantiy hampered by demands for money; notwithstanding this ifrain the Count of Castellar did minch for the peophe and especially legislated in faror of the Indians. In 1674 he ordered that Arancanian Indians taken in war should no longer be held as slaves. He also tried to relax the severe Spanish monopolies on commerce; but this caused an outcry from the merchants, and in Jnly, $16{ }^{\circ} 8$, the viceroy was ordered to turn over the government to the Archbishop of Lima, and to reside in l'aita until the charges against him were tried. The sentence of the court, given after nearly two years, exoncrated the viceroy, lont pronounced for the continuance of the monopolies. The Count of Castellar then returned to Spain, and resumed his post as councilor of the Indies, which he held until his death at Seville, 1686.

Cnlverin [Fs: couleurin, adder-like, deris. of couleurre adder, U. Fr. culuerve: Span. culebra: Portug. cobra < Lat. co lubra, adder]: a cannon belonging to the earliest days of artillery. In the sisteenth century it was the heaviest gun used, throwing a shot of 15 lb . weight.
Culvert [riâ O. Fr. from it deric. of Lat. cold're, cleanse, $>\mathrm{Fr}$. couler]: a channel for carrying water underneath a rodway, embankment, or canal. Where stone is scarce ther are made of timber. and are reetangular in section. Masonry culverts of less than 20 sq. feet waterway are also usually rectangular, and are colled box culverts. Larger ones are built with the upper surface arched, and are called arch culverts, the largest ones having spans of about 20 feet. Pipes of vitrifiel clay and of cast iron are now much used for small culverts. In order to avoid injury to the embankments by high water, the ends of the culvert are usually provilet with wing walls. A box culvert 3 hy 4 feet and 25 feet long costs nearly 8000 , while an arch culvert of 12 feet spam and 25 feet length, with wing walls, costs about $\$ 1,200$. For full details, see Baker's Masonry Construction (1890).

Mansfield Derriman.
Culverwell, Nathanael : Platonist ; b. in Midellesex: entered Emmanuel College 1633; 5. A. 1636 ; M. A. 1640 ; elected fellow 1642. D. before 1651. Anthor of Light of Nature, a work of great power and letming (new ed. 1857).
Cu'mze : an ancient and famons Greek city of Campania, situated on the Nediterranean, 11 miles W. of Naples. It was founded conjointly by colonists Irom Chalcis in Eubcea and Cyme in Asia Minor. According to Strabo, it was the most ancient of the Greek colonies in Italy. It becune an opulent commercial city, built several harbors or port-towns-among which was Neapolis, the present Naples, which has outlived the mother-torn-and for a period of 200 years ( $700-500$ B. c.) it was the most important city of Southern Italy. The people of Cuma raged war against the Etruscans, who disputed their supremacy as a maritime power, and for a time they were successful. But eventually it proved impossible for the Greek colonies in Italy to maintain themselves against the rising power of the native states. Cume was conquered by the samnites in 41 i B. $\mathrm{C}_{\mathrm{n}}$, and became a Roman municipium in 338 . In the second Punic war Ilannibal tried to capture it, but failed. Comme was famous as the residence of the sibyl ( $(\mathrm{y} . \mathrm{r}$.). It was the last stronghold of the Goths in Italy, and helil out for a long time against the Byzantine army which captured it from them in ays a. D. In the ninth century it was completely burned down by the Saracens, and in the thirteenth, having become the rendezvous of a desperate gang of robbers, it was razed to the ground by the inhabitants of Napies. But few reluains of Cume are now in existence.

Cumaná koo-măi-naa : seaport-city ; state of Bermudez, Venezuela; on the Manzanares river, a mile from the Gulf of Cariaco (see map of South America, ref. 1-D). The climate is hot and unhealthful, and the place is visited by frequent sarthquakes. The exports are coffec, cacao, sugar, hiles, and tobaceo. Ships anchor in the roalstead, as thele are $n 0$ wharves. ("umanai was settled by missionaries in 1512. but son abandoned; it was refounded by Gonzalez Ocampo in 1590 , and is thus the ollest city of European origin on the continent of America. It gave its name to one of the old Spanish provinces. Pop. (1891) 12,05\%. Herbert H. smith.

Cumberland: the most northwestern county of England; boumled N. by scotland and the sulway Firth, E. by Northumberland and Durham, s. ly Westmoreland anil lancashire, and 11 . by the lrish sin. Area, 1,515 sto miles. The surface is montainons and picturesque. The bighest puints are sca Fidl, 3.210 fert, and Shildaw, 3,058 feet, above the sea. The thief rivers are the Esk, Eden, and Derwent. The secnery is ulomed hy numerous heautiful lakes, inclading Derwontwater anil C'llessater, the latter of which is $y^{\prime}$ males lons. "The lamd is divited into smatl freeholes. The main crops are wheat, cats, and turnips Nearly threefourths of the corn cropsemsist of oats. That rainety of oats which is kowm by the name of the potato oat, and which now is cultivated in every 1 art of the Lnited Kingdom, was first discovered in C"mberland in 17se. Sheep anil cattle are reareal to some extent. ('oal. copper, silver. iron, leal, phomaso, limestons, marble, ami silurian slate are fombl here. Thate are manumernes of woolens, cottons, linens, earthenware, and glass. The chief town is

Carlisle. This county formed part of the ancient Cembria (q. ع.). Pop. (1891) 266,550.

Cumberland: city and railway center; capital of Allegany co., Md. (for location of county, see map of Maryland, ref. 1-B); romantically situated on the Potomac. In jopulation and commerce it is the second city in the State. It is the head of navigation of the Chesapeake and Ohio Canal (leading to Georgetown, D. C.) and the shipping-point for the semi-hituminous coal prodnced in the vicinity which constitutes the principal traficic of that canal. It is 178 miles $W$. by N. from baltimore, and 153 miles S . by W. from Pittshurg, Pa. Its manutacturing industries comprise extensive rollingmills for rails and bars and factories for other railroad iron, a factory for the manufacture of steel, foundrivs, machineshops, glass-manufactures, flour and cement mills, railwaycar and repair shops, and numerous minor enterprises. Its mercantile interests employ a large capital. An admirable system of water-works (on the Iolly plan) furnishes an abundance of water. The steadily developing coal-trade of Cumberland, in conncction with its growing iron industries, forms the chiet source of its prosperity. Pop. (1880) 10,693; (1890) 12, \%99.

Editor of " Times."
Cumberland : city; Barronco., Wis. (for location of countr. see map of Wisconsin, ret. 3-B); on railwar ; 87 miles from Minneajolis, Minn. Its principal industry is lumbering. Pop. (1880) 政; (1890) 1,919; (1895) 1,426.
Cumberland. Richard: English dramatist and essayist; a grandson of lichard Bentler; b, at Trinity College, Cambridge, Feb. 19, 1732. As secietary to Lord Halifax, he entered diplomatic life, but was unfortumate in this and retircd to the pursuits of literature. Of his many successful comedies. the best known is The West Indian. Among his miscellaneons writings, the most important are his Memoirs (1806). D. at Tunbridge Wells, May $7,1811$.

Cumberland. William Augustus, Duke of: the third son of George II., King of England: b. Apr. 26, 1721. He commander the allien army which was defeated by the French at Fontenoy in 1545. He defeated the army of the Pretender at Culloden in Apr., 1746, and was censured for his cruelty in that battle. During the Seven Years' war he commanded an English army, which was defeated at Hastembeck in 175\%. D. Oct. 31, 1;65.
Cumberland and Teviotdale. Duke of (Great Britain, 1709), and Earl of Armagh (Irelamt, 1799): titles bome by the ex-King of Hanover, who was a prince of the blood in Great Britain, being first consin to Queen Victoria. II is full name was Ceorge Frederick Alexayder Charles Erxest Augustus. He was born at Berlin, May 27, 1819, and was married Feb. 18. 184; , to the Princess Alexandrina Marie of Saxe-Altenlurg. Ife succecded to the throne of Hanover Nor. 18, 1851, as George V., on the Ceath of his father, Ernest Augustus. He took sides with Austria against Prussia in 1896, and was deprivel of his kingdom, which was annexed to I'russia, Sejtt. 20, 1866. D. June 12, 1878.-His eldest son, the present cluke, is Prixce Ernest Auoustus ; b. Sept. 21, 1842. See Haxover.

Cumberland (iap: a narrow pass throngh the Cumberland Mountains, on the line between Kentucky and Tennessee and at the western extremity of Virginia. It was an important strategic pint in the civil war (1801-6.9), and was strongly fortified by the Confederates. It was abandoned by them June 18, 186? and on the same liay was occupied by the national troojs under Gen. G. W. Morgan. In Aug. 186 . Gen. E. Kirly smith outlanked this position by a march throngh Big Creek Gap. and Gen. G. W. Morgan, in conserquence of lack of forage and supplics. was compelled to destroy and evacuate the works, which was successfully done on Sept. 11. IIe was hotly pursued northwaril by a firce of Contederates under Jolin II. Morgan. On Sept. 9 , 1863, Gen. Frazer, who hedel the gal), with a brigade of Buckner's troops, surrendered after a siege of only fun thas to Gen. Burnside's tromp. The gap, itself is a cleft $\mathbf{b} 00$ feet deep, ant in some places is only wide enongh for a road. If well provisionerl, it might have been held by a small force against any ofposing army.
lievised hy J. Hercera.
('untrorland Island: peninsula of Paffin Land. North America; forms a fortion of that const of Davis's Strait which lies between Iudson's Sitrait and Lancaster Sound.
('umberland Monutains: a range of the Appalacham svetem, forming part of the homilary between Virginia and Kentudy. The range extemis in a generaltys. W. direction across Temnesser, dividing Finsi from Middle Tennes-
see. These mountains here form an alevatod phatom, saldom over ?, (0no fret high, but at mome points nearly 50 miles

(Guberland Preshytorian Churelu: a chureh originatincr in the nineteenth century. In 17!! a very romarkable revival of religion hegan to develop in Southwestern Kinturky. The principal minister commected with its early history was Lies. James MeCreaty. Mr. Mefiready was a Preshiverian, and was eduented in Western Pennsylvania, at what became afterwart Jeflemon Colluge, hat he began his ministry in Nurth Carolina. De was at man of unasual tarnestness and power in the pulpit. Ilis earnestness amd zeal brought him into eoblision with the eommunity in which he was laboring. The result was a removal from North Carolina to kientucky in 1896. Je was settled in chatge of thee comerneations-two in Insan eoo, liy.. Guspar River and Little Muddy River, and one in 'lennessee, Red River, near the dividing line between the two si ates.

Mr. Nucrendys great zeal soon hegan to show itself in his new field of labor, and in order to bring his people into syumpathy and co-operation with him, he propsent to them a writion cosenan, which they were to subseribe as a pleden of their earnest intention to fulfill its maditions. The measure was an incijpient elfori toward what was felt to be so necessary-a great revisal of religion. A copy of this covenamt is embodied here. as sun illastration of the views and feelings. at the time. of a country pastor and a Christian peoplensurtomaded as they were by a literal and a spirinam wiklerness: "When we consilure" say the covenanters, "t the Work and promines of a compassionate God to the frour kst family of Adam, we find the strongest encouragement for Chrisitans fo pray in fath-to ask in the name of Jesus for the conversion of their fellow-men. Fone ever wont to Christ, when on earth, with the case of their friends that were denied, and athough the days of his humiliation ar* ended, yat for the encomragement of his people he hiss left it on record ' that where two or three arree upon earth to ask anything in praver, believing, it shan be dunc. dgain, - Whatsoever ye shall ask the loathre in my mune, that will I do, that the Father may be glorified in the sum. With these promises bofore us we feel rneournced to unite our supplications to at praver-hearing God for the untpouring of his Spirit, that his prople may be quickened and conforted, and that our children, an! simmers generally, mat be converted. Therefore, we hind ourselves to observe tha third Suturlay in each month for one yeare as a dity of fasting and prayer for the concorsion of simners in Lagin C'umaty and throughont the wordd. We atso engace to spend one half hour every Saturtay evening, begiming at the setting of the sun, and ma hafi hour every Subbath momange, hergriming at the rising of the sun, in flembing with (ion to revive his work."

This cowconant was eviduntly not a mere formality, The heart of the promeher amd peophe were in it. In Ilaty ot 17:\% oecurred the tirs elevelopments of the desired work. In duly of 1800 oncurrent the lirst campemeeting that ever wis hell! in Christendom. The phan of the moctinir was surgesterl by the cireumstances of the country. and the fact that vast stremmental meetings frum Jistames varying from 10 to 100 mides. fireat numbers probessed religion at the camp-mentings and upon other ocensions, nal the work surent with wonlerfu\} rapidity and power over Southwestern kenturky and what was (allod the Cumberland Country-now Middle Temnessec-lying adjacent.

The ministers who en-therated with Nr. Miffrealy wore
 Wohn lankin, l'reshyterians, and Mr. *ohn Mofree, Methodist. These men were all of seoteh-lrish origin, and hat emigrated from North ('arolima, It may lo mentioned here that when the Cumberand I'reshyterian Chureh came to be fully organizel nine-t (anthe of its minist ry and at least four-fifths of its membership, were of Seoteh-lrish dencent.

The rapid progress and widespread influence of the revisal protuced the nerecsily of orranizing at ereat many
 for more ministerial laborers. Thee lopebsterian (horeds coudd not supply thon in the ordinary way, 'There were no schools, and if sehouls hat bern elmmant the congreegat tions conkl not wait until youner man would be able to ero through such a conmes of literary ant theolacical traminge as is constomarily required in the l'reslsyterian ('hanreh prepatatory to licensure and ordination. "The patriarch* of Presibyterianism in kentnoky visited the region of the revival, and, seming the neessithes of the eongrectations, atvisul the ministers and bading laymen of the ('hureh to select such young men as they thought promised uscfuhbos, and lirect iheir attention to the work of the ministry, although they might mot be abte to obtain what was eonsubermat a full ministerial education. The comsel seenmed praticat. and three young men at first were eneouraged to prepare thenselves for the work as well as they conlel. These young men presented themselves to the Transylvaniai Prestytury in Oet.. 180h. 'Ihe prestbyery hessitater\}, hat at hagth, in Uot.. 180?. they were and licensed as probitioners for the holy ministry. At the same preshytery two others were receiverl as candidates for the ministry. opposition, howerer, at onee doveloped itself. In Det., 1802 , the 'Iransylvania lrosbytery was divided, and the Cumberland Prenbytery was tormed, embraing the more immediate region of the revival. The ('monberdand I'rosbytery from time to time licensed a few others and wrelanind two or three. These Wroe all what were eabled maducated man; thay were all, howerer, men of promise, and sone of them leacame distinguished in subserguent years. 'The oprosition was continued in the new preshytery:
'J'here was difitonlty from another souree. The revival ministers were warm-hearterl, and controlled less by theological and technical than by practical, and what they regardeal as spiritual, considerations. The yonme men, too, hat not lammed to split all the motablysical hars of theology, and there were some expressions in the fonfession of Faith which semed to thmo to teach the doctrime of fatality. This they cond not receivo, and were allowed to except to it in their licensure amb ordimation.
'Yhers were thus two subjects of dissension between the partios; on was aducatimal, the other thenlowical. I'he revival ministers did not object to etducation for the ministry, but to the rigid appliestion of the rule in the circumstances surommding tlem. The youmg men din not object (1) the Confession of lath, foms to those expressions in it Whieh scomed to them to imply the thoctrine of fatality. Their warm-hemed and liberal fathers thought propur to indulere them in their sheptiojim on this subject. Thery
 The ritliculties berame surous, and were finally brought before the sumb of Kentucky. 'Tho synot of 1 sol appointed a commition to attend a meeting of the Comberland l'resbytery and inquire into the condition of things. None of the commite forlthed the abpointment exeept one, and he was noturiously a persomber of the prosbytery and was re-
 symod at its mext meeting, in isula, appointed a commission consisting of fiftern matmers to visit the region in which the dillionlties existed, to confor with the Cumbertand lresbytery, and to maleavor to restore quiet and harmons. The
 honse, in logan en.. Ky. 'The first measure of the commis-
 young mons who had hern licestised and orelained in what they regarded a puestionahbe mammer, for a reasamination by the commision, with a siew to a comfirmation or an anninling of the provedinge of the prosbyerg in each partic-
 thus requined to be surrenteroll on the commission were themshdes numbers of the presbytery. 'I'ho presbytery declimed complianee, mon the gromid that the comstitution of the 'reabyterinn Church cives tan the preshytery alon" the power "to examme aml liccosi camlidates for the holy ministry to ordain, instatt, retmeve, and judge ministers * ; that it gives no sueh power to a sybol, much less (o) a commission of sunod, nos to any other jullieature of the ('hurch. The commisain then catle ed upon the young men to submit themselves for reexamination; they atso dadined, wherenpon the commission [nssed the following resolution: "Iesolved,

* Rev. Darid Rico.

That as the above-namel persons never had regnlar authority from the prestytery of Cumberland to preach the gospel, etc., the commission of synod prohibit, and they do solemnly prohibit, the sail persons from exhorting, preaching, ant administering the ordinances, in consequence of any authority which they have reecived from the (umberland Presbytery, until they submit to onr jurisdiction and undergo the refuisite examination."
The names of the persons thus proscribed are omitted as a convenience. Four of them were ordained ministers and members of the presbytery; the others, eight in number, were either licentiates, camidates for the ministry, or exhorters. The presbytery took the ground in the controversy that the procecdings of the commission were unconstitutional, anl, of conrse, that the proseribing act was nuconstitutional and void. Nevertbeless, from a general respect to authority; and from an obvions desire to procure a reconciliation anil enjoy peace and quietude as far as possible, both the proseribed members. and those who had promoted their induction into the ininistry and sympathized with them, constituting a majority of the presbytery, organized themselves into what they called a council, determining in this manner to endeavor to carry forward the work of the revival, to keep the congregations together, but to abstain from all proper presbyterial proceedings, and :uwait what they thought would be a redress of their grievances. The synod of Kentucky at its sessions in 1806 dissolved the Cumberland Presbytery, and annexed the members who had not been placed under the ban of the commission to the Transylvania Presbytery.
The council contimued their organization from Dec., 1805, to Feb., 1810. By that time they became satisfied that they had nothing to hope either from the synod or the General Assembly. As a last resort, and in order to save what they represent to the General Assembly as "every respectable congregation in Cumberland and the Barrens of Kentucky," two of the proscribed ministers, Finis Ewing and Sammel King, assisted by samnel Medilam, one of those who had been phaced under an interdict by the commission for his participation in what they lenominated the irregularities of the presbytery, reorganized the Cumberland Preshytery at the house of Mr. Mcadam, in Diekson co., Tenn, on Feb. 4, 1810. It was organized as an independent presbytery. It will be observed that it was a reorganization of a presbytery which had been dissolyed, and which had received its name from its locality. The Church which grew ap from these beginnings naturally took the name of its first presbytery ats a prefix. Hence this Chureh is called, from the circumstances of its origin, "The Comberland Presiyterian Chareh." It extends now from Pemsylvania to the shore of the Pacific, but it originatel in what was called, at the time, the "Cumberland Conntry." The name suggests nothing connected with the denomination except the locality of its origin.

The new presbytery hell its first aljourned meeting in March, the montis following its organization. There were present four orlained ministers, six licentiates, and seven candilates for the ministry. These men constitutel really the fathers and foumlers of the Cumberland Preshyterian Church. Early in the year 1813 the presbytery had become so large that it divided itself into three presbyteries, and constituted the Cumberland Synod. This synol, at its sessions: in 18t6, adopted a Contession of Faith, caterhism, and system of churel orler in contormity with the principles arowed upon the organization of the mesbytery. The Confessinn of Tath is really a modification of the Confession of Faith of the l'resbyterian Church. It was intended by the framers to exclude only the offensive coctrine which hat been a prineipal canse of all the ditheulties. The government is Preshytirian.
In 1826 its first eollege was organized under the supervision of the church. It was located at Drinceton, Ky. it was a manual-latior sehoul. In 1 s:30 its first paper was publisleal under the patronage of the 'luarch. It was a week ly religions and literaty journal, also published at Princeton. In 1 cov the "umberland syosl was divided into three synods, and a (iencral Awombiy suceediol. The first mecting of the Assembly was held in May, we9.

The church has umber its patronage threa weekly newsbupers, one guarderly, anu two monthlies-ome devoted to the internst of women. It has also under its pat ronage three chatherd universities and suvera! colloges, hoth for young mon and women. One of the miversitios has regular colleghate, theological, law, um medical d"partnents.
In $188: 3$ the Cumbriland Presbyrian 'hurch alopted a
line of those made in the revisions in progress in the other Presbyterian Churehes. This ('hurch is a recognized member of the Alliance of Presbyterian Clurches. It 1891 it mumbered 121 presbyteries, 1.875 ministers and licentiates, 2.844 congregations, and 165,422 commmicants. Later and fuller statisties will be found in the article on the Presbyterian Church ( $q . l$.).

Ricilard Beard.
Revised by Widlis J. Beecher.
Cumherland River: an affluent of the Ohio, rising among the Cumberland Mountains in Kentucky, near the sontheastern bonndary of that State. It flows nearly westward, crosses the southern boundary of Kentucky, describes an extensive circuit in Middle Tennessee, passes by Nashville, and returns into Kentucky. It afterward flows northwestward, and enters the Obio at Smithland. The Cumberland and Tennessee rivers areonly abont 3 miles apart at a point nearly 20 miles from Smithland. Length, estimated at 650 miles, Steamboats can ascent it to Nashville, abont 200 miles from its mouth, and it is navigable ahove Nashville, at certain seasons, 400 miles.
Cum'bria; an ancient principality of the Cymri in Great Britain: comprised Cumberland in England and part of Scotland, namely, the southwestern portion of the region lying between the Ribblo and the Clyde. It was ruled by its own kings until about $950 \mathrm{~A} . \mathrm{D}$. Scottish Cumbria then became the kingdom of Strathclide (q.v.).
Cumbrian Mountains: a range or group of monntains in the north of England, occupying parts of Cumberland, Westmoreland, and Laneashire. This region, calied the "Englislt Lake District," is remarkable for its picturesque scenery, and is much frequented by tourists. Here are numerous lakes, the largest of which are Windermere and Ulleswater. These monntains are mostly formel of granite and Silurian rocks. The highest point, Sca Fell Pike, rises 3,216 teet above the sea.
Cum'min- (or Cumin) seed: the fruit of Cuminum cyminum, a plant belonging to the family Umbelliferce. It is the only known species, ind is found in Egypt and the adjacent countries. It is an annual with branclied stem, thread-like leaves, with umbels of small white or pink flowers. It has been cultivated from remote times for the sake of its seals, which have an aromatic taste somewhat resembling caraway. In Germany and IIolland it is used in cookery. As a medicine it is mostly limited to veterinary practice. It is cultivated in Northern Atrica, India, and Sonthern Enrope ; bnt the seeds are mostly imported from Sicily and Malta. Oil of commin is abmidantly obtained from the seet. The oil of cummin consists of a mixture of two distinct oils, one called cymene ( $\mathrm{C}_{20} \mathrm{II}_{14}$ ) ; the other regarded as a hydride of cunyl ( $\left.\mathrm{C}_{20} \mathrm{IH}_{11} \mathrm{O}_{2} . \mathrm{H}\right)$. This oil is of a strong bitter, disagreeable taste, with the general properties of the other essential oils.

Cummin is mentioned both in the Old and the New Testaments (Isa. xxviii. 25-27; Matt. xxiii. 23), and in the works of Hippocrates and Dioseorides. Among the Romans it was taken medicinally, the seals leing gromd and mixed with water and wine. It was believed to produce pallor of the face ( Ilorace, Epist. 1. 19; Persius, Satyr. 5. 55), and Pliny tells us that the followers of the famons rhetorician Porcius Latro commonly used it in orter to protuce a eomplexion bespeaking close applieation to study. In the Middle Ages cummin was one of the most common prices grown in Europe, and much appreciated. It was used as a stimulant also, and the seeds brought in the thirteenth and fourteenth centuries a price of about $1 \mathrm{~s}, 4 \%$. per pound.
Cmmming. Jons, D. D., F. R. S. E. : Scottish preacher ; b. in the parish of Fintray, Aberdeenslime, Nov, 10, 1807; became in 1832 minister to the Scottish Church in Crown Comrt, Covent Garden, Lombon, and so remained till his resignation in 187!. He published interpretations of the aporalyptic luopheries, The Gireat Tribulation, The Destimy of Nations, "tc. He was a zailoms opponent of the Roman Catholic Church ami a defenter of the National Church of Scotland. D. in ("hiswick, London, July 5, 1881.
Cumming. Roraleys Gordox: known as the "lionhunter" : b. at Altyre. Scotland, Mar. 15, 1820 . He was the son of a baromet, was educated at Addiscombe, and entered al cavalry regiment in the East India service, and afterward took a commission in the Cape Mounted Rifles in South Africa.  The writings of the babylomians and Asymians are usually umberstond by the term，becomse these pardues mate such latge use of the script．But it was by mo means eonfined to these lt was likewise used in Irmenia，Rlam，Asia Minor，Lalestine，Persin，and on the Euphrates in the Jlit－ tite country．＇Jhe nes in lalestine and the Hittite land was as early as the liftepnth century b．C．，though the fact of surb ur was unknown in moderi times until the great din－ covery made at El－Amarm in Egypt in 158．．The lam－ guage in this ease is mainly Asyrim，though there aro a fow specimens in amother tongue not yet known．The nse of the cuneifom seript in Persia does not semm to have antedated（＇yrus the（ireat，sisth century B．C．；at last no surcinen of older date has yet been foumi．

The origin of this mothoil of writing helongs to a prehis－ toric time．Like all carly systems，it developed from jic－ lurn－writing，in whiela each character was a representa－ tion of an entire object or iden．If few of the cuncitorm signs have retained a likeness to the original object，but most of them hate changed so greatly as no lunger to sug－ gest a picture．Thus the sign for a band was originally male of fire straight linc：representing the fingers（ $\overline{\text { ）}}$ ） In later fimes one of the lines was rejected．and the four horizontal wedges may the thought of as representing the fingers．while the perpendicular wedge represents the thumb

The oldest forms of the writing，like the seal of sargon of Akkad and the inseriptions found br De Sarree at Tello，are real from alnve downward，the colimms，how－ ever，advancing from right to left．By changing the col－ umns or lines to horizontal，the writing in later times eame to read from left to right，as in Enerlish．Thus the Assyrian lauguage，like the Ethiopie，came to differ from the ither scmitic tongues，which read from right to left．The oldest specinens of figyptian writing likewise read from ahove downward，as the chinesa still does，eren though it may mot be jossible to prove a direct connection between the three systoms．

Who the inventars of the cunciform seript were will per－ haps always remain unknown．Most students of Assyrinl－ ogy give the eredit to the non－semitio people．commonly known as Akkalians，who preceded the semites in the oecri－ paney of the Babylonian teratory．Not only the writing but a large part of the culture of the baloghonian semites is likewise attributed to these Akkadians，or more strictly to them and to the closely related sumerians．There are bow－ ＂wer，superal eminent cholars who call in quest ion this the－ sis．Chiof among them are Josef Hatevy，of Paris and l＇ro－ fesoor lerichrich Welitzach，of Leipzig．Both theny that there －ver was such a geople as the Sumero－tikadians，llakery maintaining that the supposed specimens of their writings are but a cryptoxraphic manner of writing Assyrian，while Delitzeds holds then to be only an are haie form of Assyian． While the guestion as to the existence of a sumero－ 1 kiadian people and civilization must the be called an opern one．the great body of specialists allims sueh existence．Whaterer may be the truth in the casc，there are various phenomena in the bathlonian－Aswrinn civilization which sem to print to a mon－semitie origin．Such origin for the seript in par－ ticular sems best to account for the ill sucerss in adanting a considerable manter of the signs to the semitic fonso－ nants．Fiuthemore，many of the syllabie values of the signs are based on work which have no natural semitio ＂t ymolugy．

In thi evelepment of the seript from jicturewriting maty of the signs have gene thengh mamerons whages depenting on the era and the beality．Thus a stadent might he perfeetly fomilime with the late Jowrian tspe an al still be unable to feald the hate labyonian，or he might know buth wedl and still bepowerdess in the presence of an arehane text．＇lare differnees are greater than between 11 ，alplat bete of the（iresks，limmans，ank Germans．Bn the later the syian and Dabydonian times，when men atme that the an－ tique，there was a temdency to revert to the whom types of the cuncifom writing．
The pascage from the pictorial stace of the soript，in which hoth curves and straight lintw wore aith，whe the sas
in which only wedges were employerl was gradual. The rejection of curves and the development of wedges seem both to hare resulted from the use of soft clay as witing material and from the form of the stylus, which was made hy three plane surfaces meeting at a point like the angle of a cube. The stylus was pressed into the soft elay, traving on this material being difficult. There are as many impressions of the stylus as there are wedges in any giren character. In the case of building-bricts stamps were at times employed, so that an entire inseription containing name and titles of the royal architect was stamped by a single inpression on the clay. This may he compared to printing from plates. The stone seals which were rolled over commercial documents imparted their carvings and inseriptions likewise to the soft clay. The stamps and seals thus described excepted, the writing on clay was a slow and painstaking process, the point of the strlius making the head and the line uniting two planes of the cube making the body or tail of the wedge. When the writing is on stone it is chiseled into likeness with that on clay. The number of wedges in a single character varies from one to fifteen or even more, there being however, no relation between the number of wedges and the complesity of the idea repressuted.

Out of the pictorial use of the seript the ancient seribes derived a series of syllables. Their methoil was to employ a sign not only to represent an object. but also to represent the first syllable of the word expressing that object, and then they conld use this sylabic sign in spelling any other word in which such syllable occurs. Thus the Alkidlian word for heaven is ana, and the $\operatorname{sign}(\rightarrow)$ representing this Word came to be nsed in spelling any worl containing the syllable an, like the Semitic word annu, this. With the rise of writing by syllables the pictorial, or, as it is called, ideographic, way of writing was not discontinued. Nearly or quite all extant inscriptions contain a mixture of ideograms and of syllabie signs, and the ease of reading depends on the relative proportion of the two systems. As time went on the tendency became more pronounced to use syllabic signs exclusively. stive in the case of certain worls of very frequent occurrence, for which ideograms were retained. The Japanese writing is tikewise syllabic, while the use of many Chinese characters representing objects makes the Japanese writing precisely parallel to the BabylonianAssyrian methorl.

The nest step. that of deriving an alphabet from the syllabic script, the Pabylonians persistently refused to take. They were too conservative and their scrift too sacred. The step in adrance was reserved for the Persians, loubtless under the influence of otleer nations using a regular alphabetic srstem. We ean see no indication of a tendeney on the part of the Babylonians to adopt the improved method of the Persians, nor does the Old Persian cuneiform alphabet of some forty-five or fifty charicters seem to have had any snccessors. Comparel with other alphabetic systems, it Wis indeed too cumbrous. Eren the Persians did not use it exelusively. The royal records are also mritten in the mised sylahie-ideographic system of the Babylonians. This mixed system maintained itself at Babylon in spite of political changes and the encroachments of alphabets till the first century before our era. It was employed by the seribus even of the Greek kings of Babyion.

The separate signs of the cunciform seript are several hunitred in number. Some of these are used only as ideograms, others very largely as syllables, some both as ideograns and as syllables. The context usually shows how a sign is to be milerstood. Some signs have a variety of valnes both as incograms and as syllables, while certain ideas and syllables are represented by a variety of signs. This diversity is often perplexing to the modern stadent, but becomes lews so at every adrance in the staly.

The wedges of the cemneiform scrijit are arranged horizontally, perpenclicularly, or obliquely downward or upward at an amgle of about $45^{\circ}$. Complex sions may be composed of welges arranged in all of these directions. The point of the wedge is towarl the hottom or toward the rinht. There are separate signs for expressing the vowels, but none for the ennsonants (except in the J'ersian). Each syllahie sign is comprosed of one rowel and one or two consonants, never more than two. 'T'hus we have such syllables as rab, ib, ub, $b a, b i, b u$, or $b a b, b a g, b a r$, etc. Besirles the separate simp for such syllables as bab, bay, b(tr, it was also possible to write the same sounds ba-ab, ba-ag, ba-ar, pronounced bab, bay, bar.

The decipherment of the cunciform inscriptions began with the alphabetic variety of the Uld Persians. Two men

Inscription from a clay tablet. It reports to the king (presumably Asshurhanipal) the arrival of the rernal equinos. It reads:

1. (On the) day 6th of (the) mouth Nisan
2. (the) das and (the) night
3. were equal.
4. were equal.
5. 6 kas -bu (the) night.
6. (The) god Nabu (aud the) god Marduk
7. unto (the) king my lord
acting independently of each other were here the pioneersGeorg Friedrich Grotefend in 1802 and Henry Rawlinson alont 1835. Though Grotefend has the distinction of being first in point of time. his work was not very fraitful until Christian Lassen, of Bonn, took it up in 1836. At the same time Rawlinson was in Persia copying the inscriptions and deciphering them by the same methol which Grotefend had pursued. The suecess of both Grotefend and Rawlinson was an eminent stroke of genius. Grotefend relates how he began by applying to certuin short inscriptions from Persepolis a formula which was contained in some other alphabetic writings from the same region. In this formula the word king frequentls occurs. Grotefend noted at once that a particular group of signs always oceurred in his inscriptions at intervals corresponding to the word king in the formula. The formula marked out certain other groups as proper names, and Grotufend believed from historical considerations that these mast be the kings of ancient Persia. He thus determined the groups for the names of Hystaspes, Darius, Nerxes, and by this means made ont sereral of the Old Persian letters. After the Old Persian was made out by Grotefend, Lassen, lawlinson, Mincks, and others, it became possible to pass to the decipheruent of the BabylonianAssyrian, because these Old Persian inseriptions froni Persepolis, Behistun, and Elwend were aceompanied br translations into the Babylonian-Assyrian seript and language. The greater complexity of this script. as already described, made the progress of decipherment slow and painful) ; but, on the other hand, the discoveries at Khorsabad, Nimrud, and Konyunjik gave a great mass of new material and a new impetus to students. 1 By 18.50 the work of deciphering the form of the serijpt as nsed by the Babylonians and Asssrians may be said to have been practically accomplished.
See Friedricl Delitzsch's Assyrian Grammar: Lyon's A ssyrian Manual; Grotefend's atcount of decipherinent in A. II. L. Heeren's Ideen über die Politik, etc. (Göttingen, 1s15. Toll. i.): Rawlinson's account in Journal of the Royal Asiatic Society (18t7, vol. x.).

Fr. A. Lecss.
Curate [Mid. Eng. curnt, from Late Lat. curutus, p. partic. of curt re care for, heal > 1tal, rurato: Fr. curé]: one who has the (wre of sonk. The term has hem varimsly ap)propriated to different oflicers of the Church. but since the close of the sixteenth century in England has been restricted to assistant clergy, deputies or substitutes. The hishop, or some oflicer having eipeopal inthority, appoints the curate's salary and grants his license. There are "temporary" and "perpetnat" curates. The temporary or stipendiury can be remover at the will of the bishop vicar. Perpetnal curates can not be thus remuped. Their silary is paid from tithes established at the fundation uf the chapel, and it lecomes the duty of the impronjature tu supprt them. The salaries of curates are too often dispruphtionate to their services. ant they are almost leatitute of legal rights, being entirely: subject to episcopal anthority. The worl is retamed in the Ordinal of the American Epincopal c'hurch, Iut it is msnally supplanted in orlinary spurell by the term "assistant mininter.
Curcu'lin [lat., weevil]: a mame given to many weerils
 laps mose frequently mplied to the conotruchelus nenupher, a small dark-hrown insert, speekno with yellowish white and blark. In suring and carly smmer it attacks the roung fruit, such as apples, pears, apricuts, etce, but its object of special attark is the phum. The tenale makes a cresent-shaped puncture in which she deposits her egg. The were ox hateles, mind the matgot feeds upon the young flum, which gentrally falls to the gromal in a short time, and the larva burruws in the earth, hecoming a perlect insect in about three weds. Several \&remerations are said to apprar in one seasom. "lhe ansmetion cansel by this insect upon all kinds of smonthoskimod fruits is a very serious liss. Another dest ruction curenlio is the pinm-renger (Anthomomus moniridet, whelh oerenes very abmendantly in the
 trantornation insite the kernel of the pham. Another insort of this gemms makes momeroms hows in the apple: still mother lays her erese in the eranbery, amd then cuts off the stem. The grape (ournlin (Colionlos infounlis) and other spectesare very destractive to grapes. Ferut-trensand grapefines shonla the frefurntly shaken in summer. when the fall-
 swine and sherep render great arvion by deroming the fallen fruit with the lare contanul in it. Somty 10,100 species of this family have lwan deeribed. Thery are arranged in more than mato genera.
Curculion'idar: sue Wrwwa。

## Curd: See ('heese

Cures: an ancient and famous city of Italy; the capitat of the Sabines; near the "iber, alont 2.5 miles N. N. E. of Rome. It was celebraten in the early history of Rume as the bithplace of Numa, as well as the city of Tatins. The site is occupied by the modem village of Correse. Cures was colonized by siula abont $100 \mathrm{~B} . \mathrm{c}$. See Quirates.
Curfew Bell, or simply ('ufew [O. Fr. coure-fun; comir, cover + feu, fire < batt. focus] : a bell rung at cight in the evening as a signal for extinguishing tights and fires-at fractice said to have been introduced into England by Willlun 1. in 1068. Is the custom existed in France, Spain, and other countries at the same time, it is probable that it was not originated by William I., but the strictness with which he eompelled its observance cansed it to he attributed to him. The stringlncy of this law was relaxed by Henry I. in 1103. In the reigns of Edward 1. and Edward III. persons were ont permitted to he ahroad in the city, armed, after corfer. In many parts of England and the U. S. the practice of ringing the lefl at eight or nine oclock still prevails.
C'nge or Coorge: a prowince of Sonthem helia: situated herween lat. 11 की and 12 $45^{\prime}$ N., and boundet by Mysore. Malabar, and South Kimara. Area, 1.583 sof. miles: pop (1891) 122,630. The combtry is high and momatanous; its general elevation is about 3,000 teet above the level of the sea, and its highest peak. Tandiandamol, rises $5 . i 81$ feet, It is drained by the Kaveri, which rises on the eastern side of the Western Ghats, and a number of minor streams, whieli rise in the conntry itself, and during the rainy season carry grvat masses of irater. Parts of the surface are covered with dense forest--teak, sandalwond, red and white cedar. thony, ete-with an undergrowth of cardamom, wild pepper, armis, and ferns. In the fields rice is cultivated and excellent fruit is raised. especially ormges. The fana comprises the elephant, tiger, tiger-cat, hunting-leppard, wild-dog, elk, several species of deer. wild-boar. the cobra di capello, and the alligator. The inhabitants are of Iravidian origin, and speak a Canarese dialect. Ther are well formed, hold, and active, but ignorant and nnskilied; the only manufacturing inlustry they have developed is a kind of coarse blankets used as garments. They are also superstitious, having retained the devil-worship of their ancestors. Polrandry and polygamy prevail among them, the wives of the brothers of a family being consintern as common property. They were governed by imdepentent rajahs of the Nair caste from 15s:3 to $18: 3$, when the mismanayement of Viraraja caused Great Britain to interfere and annex the country.
Cu'ria (plu. Curiat) : the Inilding in which the senate hedr its sewions in the cities of ancient Italy. Also a subdivision of the Roman batrician trilues, each of which was divided into ten erriu. These tribes were three in number. the Ramnes, Tities, and Ineres, so that there were thirty curis. These curia contamed only the patrictans or popilus proper. but clients were regardel as passive members of the curia of their suluerior. lif early times the curiat wre of the greatest importance. Each curia had its own name, but only a few of these names have come down to us. In later times the curia lost their political importance, but long retained their ancient and mysterions religions rites, which were maintained by the priests called curio and flumen curialis. In still later times even these old offers Were sometimes conferred upon pleheians. The curia voting together constituted the comitia curiala, once a lighly important pmblic body with legislative powers; hut hefore the fall of the repmblic this holy lad fallen almost into disuse and obliwiom, thongh it still had a formal existence. In it weh of the curie had one vote, and in each curia each marmber had one vote. In the languge of modern Eurone. euria is the Latin word for comrt or place of justice.

Curión kon-recki': a province of Chili : s. of santiago, hetween Colehagua on the N. and Tallea on the S., and extrating from the Paeifie to the summits of the Andes: area about 2913 sq. miles. Capital, ('urice with 10,110 inhabitants (188.). The westem part is erossed by the coast chain, and the eastern is broken hy spurs of the Andes. The central portion is a fertile plain, in which Curico and some smaller towns are situated. Wheat-raising and grazing are the principal industrics. The province was createrl in 1865 by a division of (colchagna, Pop, (1845) 103,24?.

 manor, the aloverymar, and the viluage blacksmith mats be fonnd on than sume riak, with thas smitls in combuatut, and

 the avils attamline so many manly patimas have ever be-
come athached to this game．It is almost the only game which has an extensive and raried literature of its own． There have bern over 300 songs written in its praise，amb many sermons have recedved thrir most powerfal applica－ tions from referances to its practice．

For a diagran of the rink，see Fig． 2. The centere of the rincs is called the＂tce．＂The stome may be delivered with an＂in＂ 1 urn or an＂out＂tarm，that is，bringing the ellow in towad the bosly or out from the body，which gives an ＂Furlish＂to the right or left，and which makes the stome ＂eurl＂in or ont，amd honce perbaps comes the mame of the game－＂eurling．＂d and B in Fig．：3．

Fonr on each sirle make a game，and the captain is called a＂skip．＂In a large tommament the opposing clubs are divided into＂fours，＂who play against cach other．When a stone is clelivered amb is moving too slowly the skip ealls on his men to＂sweel，sweep＂（in אiotch，＂soop），soop＂＂）．After a rink has been swopt many times it may be imagined that sweeping can be of little ins，fint it is held that a rapid motion of swecping immeniately in front of the roming stone creates a racuinm whieh accelerates the motion of the stone by the air rushing in from hehint．

There is no limit to the variety of shots playen，amb，in this it is rery diffurent from yuoits and is more like billiards． Sometimes the player must＂draw＂a quiet shot to place the stome on the tee；sometimes he is called on to＂guatd＂or lay a stone in front to protect a winning stone；again，he may be askol to play a swift shot to break the guards off， or run a narow bort－then he may have to inwick or out－ wick（carom）otr atome at the side．and enrl in upon the tee or run a winnor wht．＇I＇he game can hardy be made in－ telligible by a printed desaription．It has to be seen to be umlerstoonl．
from the ice，unless prevented from passing by striking another payed stone resting insile the hog score．The swerbing score is drawn across the tees for the guidanee of the skips in sweeping．The back score is drawn just ont－ side and brationd the 14 －foot circle around the tee（the home）； all stunes that have passed this score wre removed．Natches consist of the majority of shots won，after playing a certain number of heals or aletinite periond of time．In the event of both parties being egual at the conclusion of the mateh play is rontinued for another hatab or for such madition－ il number of heals as may be meressary to deride the match．Every rink is eomposed an four players al side，each using two stones，and playing one stone alternately with his opvonent．J＇he motion of players observed in the first beacl is not changed．The two skips opposing each other settle by let，or in any other way they may agree upon， which party leads in the first heal，after whidn the winning party leads．＇J＇he skips have the exclusive management ol the game for their respective parties，and may play last or in any part of the game ther please．but are not entitled to change their places when once fixed．Whan their turn to play comes they appoint one of their players to act in their plaees as skips of the game，and take the position of orrli－ nary players until they lave played and returned to the tee－heal as skips．Players are arranged along the sides， but well ofl the rink，as their skips may direct：and no party，except when sweeping according to rule，can go upon the midulle of the rink．Skaps alone stand within the 14 foot circle or home；the ship of the party playing has the choice of place，and must not be obstructed by the other in Front of the tee．while behind it，the privilege of both as regards sweeping being equal．Every player must be ready when his turu comes，and must not take more than a reason－

## B．DIAGRAM SHOWING THE＂OUT＂TURN，REVOLVING TOWARDS LEFT．

Fif． 3.

The following is a summary of the rules as laid down by the Northwestern Curling Association of Ameriea，which do not differ matrpially from those of the Royal Caledonian and Grand National Curling Clubs：
The standard length of the rink for play is 42 yards from hack to tee．The tees are ：88 yards apart，and around each， ac a center，is a circle of 7 feet radins，whieh is called the ＂home＂on＂ring．＂To facilitate measurements，inter－ mediate circles are also described around the twe．Every stone within or resting lumon the outer ring is entitled to be combterl in the game ：no stome is considered without a aircle unhes it is cutimely clear of that circle，nor is a stone consintered over a lime unlass it has crossed and entirely cleared it．This is decident by a spare placed upon the ire．From，sum in exact aligment with both ters，a line． called the ernter line is drawn to a point 4 yarls behind each tee：at this print a line is Arawn at a right angle to the renter linw wh which the hatck is ent．The hack does not exceed 6 indhes in longth，nor is the inner etge thereot more than ？inches from the center line，so that all stones are eleliwerel with their center upon the renter lina：Uther lines，calted the middle scome，the hogs score，the swepping score，and hack score，are Irawn on the ice at right angli＇s to the cunter line．The mindle seore is drawn midwat le－ t wera the two tres，to print wht the place at whieh sweepp－ ing may orelinarily te comunned．The hog seore is drawn at a distance from cach tow of one－sixth of the lencth from hack to further ter，and indicates the puint at which，if a played stone fails to phes，it is combtal a hag，and removed
able time to play．Should he play a stone belonging to another，any of the players mar stop it while mnning ；bat if not stopped till at rest，the stone which should have been Flayed may be put in its place to the satisfaction of the op－ posing skip．If a player plays out of turn，the stone so phayed may be stopped in its coursp and refumed to the player；should the mistake not be disenveren till the stone is at rest，on has struck another，the opposing skip shall add one to the score and have the option of allowing the game to proced or dectaring the end to be null and roid．But if amother stone be played before the mistake has hem noticed， the emb must he finished，as if it had been played properly from the beginning．If any player engaged，or belonging to cither of the competing clubs，speaks to taunts，or other－ wis＂interrupts any other player not of his own party，while preparing to play his stone，and so as to disconcert him， one shot is added to the sere of the party so intermpted for cach inturuption．If in sweepiner，or otherwise，a remming sthme he marred by any of the party to which it belongs，it is put off the ice and the pposing skip las the option to add one to his score and allow the game to proceed，or to （all the end mull and void ；lat if marred by iny of the ad－ verse party it is placed wherever the paity to which it belongs may direct．If marred by any other means，the player replays the stone．Shonld iny played stone be dis－ phaced by any of the players hefore the heal is reckoned，it shall he placed as now as possible where it lay，to the satis－ faction of or by the skip＂pposed to the party displaing it． If dioplaced by any nentral party，tooth skips agree upon the
position to which it is to be returnerl，and if they fail to aurec，the umpire deeides．The sweeping is umder the di－ rection atmel control of the skip»．It is not allowable for the party to whom a ruaning stone belongs to plate a bromm before it or behned it to screen it from the wind．unless with the consent of hoth ships．The use of a broom or any other instrument as a fan，either to promote or retard the rumbing of a stone，is strictly furbidhen．All stones are rircular in shape，ami none including the hamelle，is of a creatre weight
 or of a leses height than one－eighth of its eroatest cir－ eumfermee．No stome or side of a stone can be chanmed more that once after a mateh has heen begun，unlass with the eonsint of the opposing skip．Shoulal a played stone roll over ur sop on its etge or top，it is put wif the iece． Shomel tho hamble quit the stone in telivery the player is not entitled to rephay the stone unless he retains liohl of the hamble．So measuring of shots is allowed previons to the termination of the cond．Disputed shots are detwminea\} by the vice－skips；or，it they disagree by the umpire：or，if there is no umpire，by sume neutral person chnsen by the skips．If any of the eomputing rinks are not raty to bearin play at the hour mamed for a mateln，one end is comnted as played for every ten minutes delay ：and the oplosingr rink， If rearly to play，counts one point in the grame fir each such period of tine it is kept wating．

 national banking system grew up in the years 1－4i3－ 6.5.

Menntime , under the war exigencies, the U. S. hat bern issuing legal-tender notes, ar greenbacks, on an enormons seale, completely driving ont the gold eurrency, in atcorlance with Gresham's law, and then issuing an excess of unnecessary paper money to such a degree ats to constitute an inflation. (See below.) In 186:3 a paper dollar was worth decidedly less than a gold dollar. In 1864 it was at the lowest point, worth only 43 cents. The restoration of contidence at the close of the war brought the value of a paper dollar up to between 70 and 80 cents, but, the amount of paper money contiming excessive, no gold or silver was used for ordinary purposes of trade for many years alterward. The efforts of Secretary McCulloeh to eontract the curreney in such a way as to bring greenbaeks to a par with grold provoked widespread opposition and threats of further inflation. It was not antil 1874 that arrangements were made for the resimption of speeie payments. Though the law was conceived somewhat at haphazard, a succession of favorable events in the commerial world, combined with the skill of Secretary Sheman, enabled the Treasnry to a commulate such a reserve that at the time appointed for resumption of specie payments, Jan, 1, 18is, there was no contraction whatever and no presentation of greenbacks for redemption.

Fractional silver came into use in the place of the fractional entrency in 18:5, Silver dollars were coined by the ate of 1878 at the rate of $2.000,000$ a month. By the act of 1890 this amount has been abuat donbled. (See Siluer.) Mach of the silver coinage lies in the Treasiry of the U.S. Certificates of deposit tor such coin or silver certificates circoulate in their jlace, while since $18 y 0$ notes are in circulation on the hasis of mucomed silver tying in the Treasury. There are also gole certificates and legal-tender certificates, representing similar deposits of gold or greenbacks in the 'Treasury, the sole purpse of the latter lofing to substitute notes of very large denominations in place of small ones. The chrvency of the U.S. at varions perions has been as follows:
July 1, 1860.-Specie, S235,000,000; Slate bank-nutes, 820) 0000,000 : total $842,000,000$.

The eurrency of Great Britain consists of gold, subsidiary silver, and Bank of England notes, with a tew notes of local banks, mut having much importanee for the general circulation. Of the Bank of Englind notes, $\mathbf{E}^{1} 15,000,000$ are lased on seeurities held by the bank itself, and in this respeet are somewhat like national bank-notes. All notes in excess of that amome are seeured, pount for pount, by coin in the valults of the bank, and are to all intents and purposes, analogons to the gold certificates of the U.S. The Govermment does not use paper moner of its own. The currency of Franee eonsists mainly of gold, under a system of free coinage and legal tender, with a good deal of silver having the legal-tend ${ }^{\text {d }}$ (haracter, but not free coinage. Notes are issued by the Bank of France in very considerable auounts. but without the restrictions as to reserve that govern the Bank of England. The eurrency of Germany is like that of France, without the legal-tender silver. Rnssia has a depreciated paper currency. Austria and Italy have a paper currency, but on a much sounder basis than that of Rassia. The volume of currency in different states of the world at the end of 1885 was estimated by Haupt to he as follows:

| COUNTRIES. | millions of dollars. |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Intiction and Depreciation of the Currency. Whatever is used as a gencral medium of exchange naturally serves as a measure of value. A man will not eommonly speak of a ton of coal as worth five bushels of wheat, beeause he tloes not actually exchange one for the other: but will speak of a ton of coal as worth $\$ 5$ or a lonshel of wheat as worth $\$ 1$. Moner thus becomes the general measnre of debis and olsligations, and this in civilized states grows to be its most important function. In the older eontracts, for instance, in England in the cleventh, twelfth, and thirteenth centuries, and in the feudal obligations of the same time, the services are lound measured either in day's labor, bushels of wheat, ut provender for horses, and each inan's obligations were fixed in this way long after money hat come into frequent use But from the thirteenth to the filteenth centuries there was a eommutation of lahor dues or dhes in kind, for money payments, so that a man hela his land not in virtue of so miny days service per year, hut of so many jence or shitlings per year. When noney heeame so important a feature in contracts one of its chicf uses was to pay interest or priacipal on debts; and the question whether tingthing was or was not money came to depend not so much on its acenptability as on the question whetler the Government and the courts mate it a legral tender for the liselarge of such delat. This legal tender might also vary in value from time to time. Rometimes, either liy the debasement of the roin itself or ly the issue of paper money and other sulstitutes for the mitals, it would ilepreciate, ind the amount of work necessary for the diseharge of a deht be less than was at first contemplated: sometims, though less frerpuently, money would become samer and the quantity of labor necesary to liseharge a delot grater.
The value of money, like that of anything else, deymels
 thing which increases the amount of moner while the amoment of transuctions remains the same will ilminish the value of mon'y or increase the value of everything ase measured in momey. In other words, it will rase prices. Conversely, anything whith diminishes the amonnt of money while the transactions remain the same, or increases the amount of transation while the suphy and the circulation of money are not increaset, will tend to lower prices. It should bi olserved that it is not the quatity of money alone which enters into this calculation, hut the quantity of moner and the rapidity of edroulation, A small amonnt of money in a country with a ghod hanking system may go further than a much larger amount of money where jaynents lave
to lo made from hamd to ham by old emonerome methous: but with this reservation, the retation betwern ghantity of money and quantity of work to the done he that money determines prices. An increane in the mumber of dollam will make a dollar purchase len gook-: 19 . to put the matwor in mother way, inflation of the enrrency mats prices all समound.

The danger of "fiat moner" or light woight money, or any ofher money mot used hy other nations whith whon the $\mathrm{C}^{\circ}$. A deal, lies in the liability to intation hy ate of ("mgress. If the (bovernment tathes a certion monber of grains out of every !? llar and at the same time coms no more dollars than wonla otherwise have bem issued, the mathe of a dollar may for a long time remain unchanged. "Or if the (rowermant substitutes paper dollars which have no intrinsie value for mobalie dolars whith have atent intringe valoe, prices may remain nemrly unchanged as longe as the issue is trictly limited to the wh ammat. Such a casa was seen in lirance foring the war of 18.0 , where the disphacement of gold amed silver by paper did not haven corresponding effect in prives. mor came a large whll promimo became the bank of Frace restrictod its iswe to the amomet actually inowded. Some what the same comse of cerents is seen in the $\mathrm{U}^{\mathrm{C}}$. S. to-daty where the debasement of the silver dollar has mot podued a goll preminm, becanse the isste of silver and patperdallars
 hint such sidferestraint rately lasts for at long times. It delated eurrency is demamed, ats a role from one of two canse: either by the (iovermment oftienls in some fiseal exigeney where they wat to isone as many dollats as thoy (an, of he dehtore as at chas where the wish to have the curreney iepreciated. L'mber the oneration of there comes exossive isuos are abost incritable when debasement or revourse to irredemanhle paper hat unce hugna.

Curso'res [Lat... the runners, deriv. of cur'rere. cursus. run]: an order of birds comprising the ostrich and allied forms (see Brevpexyes) : also sometimes used for a group containing many of the warling birds. In entomologr, cursoles is applied to certain spiders which capture their prey by running-the wolf-spiders (Lycoside)
F. A. I.

Curtein. or Curtana [Anglo-Fr. curtein: Medier. Lat curlana < Lat. curlus, broken off]: the name originally given to the sworl of Rolaxn ( $q$. $v^{\circ}$ ), the print of which bruke off when it was first tested. The name has since been giren to the point less sworl carried, as the emblem of merey, before the sorereigns of England at their cotonation.
Curtin, Andrew Gregg: Gorernor of Pennsylvania: b. Apr. 29, 1817: son of Roland Curtin, one of the earliest iron manufacturers in Centre Countr, who removed to the [. S. from Ireland in 1693. He studied law in Dickinson CoIlege, canrassed the state in 1844 for Ilenry Clay, was appointed secretary of the emmonwealth in 18.54, was elected Governor in 1860, and displayed great energr and promptitude when the first call for troops came at the opening of the civil war. In 1e68 he was re-elected by a large majority, and in 1869 was appointed minister to st. Petersburg was member of constitutional consention of Pennsylvania; joined the Democratic party, and was elected to the 4 th. 48 th , and 49th Congresses. D. at Bellefonte, Pa., Oct. 7. 1894.

Curtis. Bexjamix Robbins. LI. D. : lawyer: b. in Watertown. Mass... Nov. 4. 1809: graduatel at llarvard in 1829. and was admitted to the bar in 1832, after which he practiced law in Buston. He was appointed a judge of the sinpreme Court of the U.S. in 1851. but he resigned that of fice in 185\%. He was one of the comnsel who defended President Johuson in his trial before the Senate, in Apr. 1868. He was the author of several rolumes of legal reports. D. at Newport, R. I.. sept. 15, 18it. See his Life and Writings, edited by his son.

Curtis. Edowad. A. B.. M. D.: physician; b. in Providence. R. I., June 4. 18:38: Was educated in Xew York graduatet in 1859 at llarvard College ; studied medicine at the Eniversity of Pennsylvania, where he took his degree in 1861: served in the regular army as a surgeon 1861-f0: was appointed Professor of Materia Nedica and Therapentics at Columbia College. New York, in 18: ; has devoted himself much to the study of photographing microscopic objects hy means of the microscope, and has published rarions papers on the subject.
Curtis Edwarn Lewts D. D.: theologian: b.at Amn Arbor. Mich., Oet. 1\%, 1s5:3; gradnated at Yale College 18\%4, and at Union Theological Sminary 1879, winning a fellowship. He studied in Ciemany, and on his return in 1881 became an instructor: and in 1884 Profesour of Hebrew and Ohd Testament literature in the McComick Theological School. In 1891 he became professor in the same department in the Yale Divinity thool. He has contributed to the reviews articles relating to hiblical subjects. George P. Fismer.

C'urtis, Teorge llfarr: musician: b. in Tros, N. Y.. 1819 ; attended Trinity sidnol in New York city, under his elder brother, the liev. John W. Curtis: legan studying masic against the wish of his parents. but persevered and became a good pianist, organist. and theoretical musician. His first important compusition was the cantata Elentheria. the text written by lloratin Stome. This work was produced in Apr.. 184!. Dlr. Curtis composed a number of songs aml choruses to poems by Bryant, and a cantata on the sulject of Julian the $A_{\text {pustate in }} 1$ sik. This was never performet. He is the anthor of a number of school musie books, and in 1set puhlished his lrima Dhana and Sicenes from. Real Life. He was for thirt-four yoars a class teacher in the New Yurk public achorls.

Curble dasistracies: those of the greatest dignity in ameient Rome: so called because the persons who held then enjoyed the privilege of sitting on cmule chairs (selle curul $r$ s) when engaged in their public duties.

## Curupaity: See Humaita.

Curve [from Lat. curive, bent, crooked]: a line which continually changes its direetion, or, to speak with more ac"uracy, a line no part of which is straight. A plane curve is one all parts of which lie in the same plane: one not plane is called a curve of donble curvature or tortnons eurve. In a plane curve we recornize at each point (1) the direction of the eurve represented by the tangent line at that point ; ( $\sim$ ) the degree of curvature of the curve, represented by the rate at which the direction is changing as we pass along the curve. and equal to the curvature of a circle having the closest possible contact with the curve at that point. In the case of a tortnons curve we have at each point (1) a certain direction, as in a plane curve; (\%) an usculating plane, which means the plane having the closest possible contact with the corve at the point, or, in mathematical language, the plane containing two conseeutive tangents, or three consecutive points of the emrve: (3) the principal normal to the curve, heing that normal which lies in the osculating plane, and therefore the same as the line in which the osenlating plane intersucts the plane perpendicular to the carve itself. The binormal is the nomal perpendicular hoth to the osculating plane amil the tangent to the courve. The curvature is equal to the curvature of the circle which lies in the oscnlating plane, and has the closest possible contict with the curve. The angle of tersion is the angle betwen two consevative osculating planes.

In modern geometry curves are classified aceording to the degree of the equation by which they are representerd. A staight line is represented hy an equation of the first degree between the co-ordinates: a curve by one of a higher degree. To represent a tortuous curve two equations between three co-ordinates are necessary.

lained a priest 14:30. Ile soon obtained preferment. Jlis knowledge of mathematios and astronomy, of Hebrew and Greek, of philosophy and theology, gave him a great anthority. He was made Archdeacon of Liege, and as such he was sent to the Council of Basel in 143\%. While there he wrote his De cathotica concordantio, in which he attacked the secular power of the pope aud the donation of Constantine, and his De authoritute presidendi in concilio generati, in which he defended the supreme anthority of the ocumenical council and the independence of the secular princes. Nevertheless, a few years later on, as the intimate friend of Eugenins IV.. Tho sent him as papal legate on many important missions, amb of Nieholas V... who made him a cardinal in 1448 and Bishop of Brixen in 1450 , he maintained and propagated the very ulposite views. This singular change las generally been ascrived to ambition and cowardice, bint the simplicity homesty, and aseetie tendeney of his prisate life forbid such an explanation, while his philosophy seems to motfer another. In his The docta ignorantia and De conjecturis. his two principal yhilosophical works, he starts from the proprosition that albsolute truth is completely ineongraous with the haman mind, that the human mind ean only form oninions, conjectures alout absolute truth, ete. But this doctrine, which mate him a mystic, and not a slieptic, goes far to explain the above change of views : and it must be added that his mysticism was of a rather obseure and confused deseription. Jle carried it along with him also into his scientific studies; thongh he actually anticipated the improvements of the Julim calendar, introduced by Gregory VII., the Copernican view of the earth's prosition in the solar system, etc., he also wrote De quadrutura circuli, in which he asserted that that problem was solven, and De novissimis diebus, in which he prophesied that the world would be destroyed in 173. He was the intellectual parent of Giorlano Bruno, and the first to break with Seholasticism. The last years of his life were very much troublen. Arehduke sigismond would not recognize him as bishop of Brisen. The duke imprisened the bishop (145i), and only released him on very hard eonditions. The pope vigorously aded him. and the case was lad before the emperor. Cusanus died at Todi, 24 miles $\underset{\text { S. of Perugia, Ang. 11, 1464, be- }}{ }$ fore an agreement was reached. The decision given after his death was in his fiver. The latest edition of his works

Cottings：in hortienltare，living asexual portions of phants which are deluched and inserted in soil or water that they may root aml form new plants．Cuttings are usually matle of stems，alt hough they are sometimes mate of leaves， as in certain hegonias and in gloxinias；sometimes of ronts． as in backberics and many ormamental plants，and they are sometimes taken from tubers，as in the potato．Steni－ rultings are of two general kinds．soft－wood and hard－wont． sult－wood cuttines are employed in most common green－ lowse plants，as geranimms，coleus，carnations，and the like． These are pinces of the firm growing wook，omprising one or two joints and inserted in the soil usually not decper than a fourth or half inch．Ilard－woot cuttings are mate from mat ure and lormant wood，as in currants and graper，and they are most eommonly planted ont of doors．The best condi－ tions for cuttings are a unformle moist lut not wet soil， Which is jurous and wedl draineti，compratively uniform temperature，and a greater or less degree of botiom heat． Fuld directions for jropagation be means of cuttings may In found in Propagution of P＇unts，by A．S．Fuller，and The Nursery－book．1y 1．II．Bailey．

1．11．Jalley．
（＇uthefish：any one of many dimanchiate cephatopotous mollusks，estecialif one of those of the family sopiele，the species of which are numermes and almost world－wide in dis－ tribation．The termpoparly includes nearly all the di－ branchate cepliatopexts．They are charactarizel by the pres－ ence of an ink－hag tilled with black or brown＂scipa，＂an sub－ stance whidn the animal ejects when pursued．so as to conteral itself frow view by coloring the waters around it．This sulsablue was formerty much moplayed in making sepha or india ink（now mate of lamp－ black，（tt\％）．This coluring－ matter is so permanent that it has oreasionally liefor prepared from fossil specimens．＂Cut－ tlehme＂（sometimes ralle ent ch－ lemary）is in reality the cal－ carems internal shell of these animals．wperially that of the Simia oficimals of Ěurope． When paswlemed it is sold muler the name of＂ponnce，＂ mind is used for pulishing．for tooth－powder，ant in making moble for delicate castings．

Cuttlefish ：Sepier oficinales． It was formerly much used in medicine but is yaluable only for its feelily antacid properties．In the tropical seas cuttefish lave been foum wrighing 2 tons．Thy areall
marine. Many fossil species ocenr. Several species are founil on the Athantic cuast of the U.S. See Squed.

Cutty-stool [scottish, cutty or kiffie, a woman of light or worthless character], in Creepie Chair: formerty a seat in Senttish ehurches where offenders against chastity were obliged to sit for three sumlays, and receive a reprimand from the minister.

Cutworms: larve, mostly behnging to lepidopteroms insects of the family Foctuctitue and especially to those of the genns Agrotis. They cut off Indian com, cablage, and other phants just below the surface of the ground: and one species at least (Agrotis cocheroi) climbs apple and pear trees and destroys the young buds. No effective remerty for their ratrages is known.
 Frederic Dagobert, Baron: naturalist; b. at Montheliard, then in Wurtemberg, whither the family hat removed from Jura in the sisteenth century upon embrating Protestantism, Ang. 23, 1769. His father was an offeer in a French regiment of swiss mercenaries. Ile studied politieal science at the Cornlinian academy in Stutt gart, through the interest of the duke. Ir was an enthusiastic stmdent from burhool. and his passion for natural history showed itself in his thirteenth year. 11. Ineame in 1 zis8 tutor to the son of Count d'Héricr, who lived in Normandy, and rematined in this situation nearly six years, at the same time pursuing his studies. Early in 1\%95 he removet to Paris, where he associated with Jussipn and Geoffroy Silint-1lihaire. He became in July. 1205 , Professor of Compative Anatomy in the Musenm of Natural Ifistory, aml hegan to form his great cabinet of comparative anatomy. Jat 1796 he was admitted into the Instimtes then just fommerl. IIe displavel? his genius for classifieation in a work valled Tablrau Elémenfaire dos -tnimenct (bins), and succeetied Daubenton as Professor of Nithral IIistory in the College of Frumee in 1soo. In 1801 he commenctil the pinblication of the important Lecrus d'mutumie comparér (5 vok., 1801-0.5: new et. 1840). He married Madane Duratucel, the widow of a farmer-general. and was chosen perpetnal sectetary of the Acalmy of sciences in 180\%. In 180 he was appointed ennucilor to the Jmperial University. He displayed a rare faculty of expressing scientitic tuthe in pophat amd elegant haguage in his Dispourse on the Repolutions of the Surfuce of the Glabe, in which he propomiss the theory of the correlation of forms in organizel heines. the was appointer master of regnests ly Xapoleon in 1813, and commcilor of state in 1814. Ile published in $181 \%$ his celehrated Animal Kingdom. (Regue Anemal distrilué d'après son Orgumisation. in fonr volumes: new edition by his pmpils, 11 whs.., with 99:3 plates, 1 w3 6 - 49 ), in which lie proposed the arrangement of animals in four divisions-the Vertebrata, Mollusca, Ietienlata, and Ladiata. Soon after the restoration of the bourbons he was appointed chancellor of the U'niversity of I'aris by Lomis XY'Il. He was elected a memar of the Fronch Acaldmy in 1s18, and received the title of baron in 1s?0. He wrote many able notices of scientific $n e n$ for the Biogrophio l'miterselle. Among his other works is an wxellent Thtural Mistory of Fishes (1s1830, with the continnation by Valencienues. 2y vols.). of which eight volumes were tinished cluring his life. is a professie he was distingnished for ficility of elencution, clearness of itteas, and the art of fixing the attention in philosuphical or historieal digressions. Ile first applied to zöology the natural method, and founded a syotem on the hasis of the invariable characters of anatomical structure. Ile is regarded as the foumber of the science of comparative amatony, and his kuow lelge of that seience was such that a lume or small fragment of it fussil animal enabled him to chetermine the order: and even eroms, to which it belonged. During the lant twelverns of his life he rendered important sorvices as president of the commither of the interior. Ile was ervated a pere of litane in 1s:3. D. in laris, May 13. 18:3. He had several childwen, hat none of them survived him. 11 is dis.josition was amiables, and his moral character

Lonis-le-Crand, and beeame in 1819 private seerefary to Louis Bonaparte, ex-King of Ilolland. In 182 $\mathbf{T}$ Louis Philippe chose him as tutor for the I ouke of Ammale, and in 1834 lie entered the stati of the Journal des Dibats. Of his articles there exist various collections: Portruits. Politiques el recolutionnaires (1851-52): Etudes historiques et lilteraires (1854): Courelles Studes (1sin); Toyuges ef loyageurs (1854); Deruières études hisforiques et littéraires (16at): Misforiens, Puptes el Romanciers (? vols., 186:3); Eludes et Portraits (1865-68). I) in Paris, Oct. 18, $188 \%$.

Cuxhoryen: seaport-town and watering-place of Germany ; on the left bank of the Elle, at its entrance into the German Ocean, i2 miles by rail W. N. W. of Hamburg, and about 50 from Bremen (see map of German Empire, ret. 2-1). It has long been the port whence Ilamburg steamers depurt when the Elbe is frozen: recently, however, nearly S2,000,000 have heen spent in improving the hathor, which has an area of $60,000 \mathrm{sq}$. meters, ind a depth at low tide of $26 \frac{1}{2}$ feet, and is to he lased lay the largest steamers all the jear round. Pop. (1845) $5,300$.

Cuyabat. kwee-ăa-haa' : eity of Brazil : capital of the state of Matto Grosso: on the Cuyaba river, an aftuent of the Sa Lourenço and Paraguiy (see map of South Imerica, ref. J-E), It is an episconal town, and has a large military arsenal and baracks. Cuyaba originated as a mining lown in 1518, and for a time the gold-washings were enormonsly productive : at present they are nearly abandoned. and the exports are umimportant, the surromiding region being very thinls setthed. The climate is hot but generally healthful. Pop (1893) about 20,000 .
11. 11. S.

Cuyahosa, kī-a-hō ga, Falls: town in summit co. O. (for location of connty. see map, of Ohio, ref. 2-il): on C. A. and C. and E. and W. R. Ris. (Badtimore and Ohio swem), and on Cuyahoga river: 5 miles N. of Akron and 34 miles S.S. E. of Cleveland. The rillage has 5 churehes. 'schools, mannfactures of clay-working machinery, rivets, electrical machinery, bolts, japer. sewer-pipe. tife turhine water-wheels. wire-machines, tinware. paper hass, flour. יtc.: it has abundant water-power, and medieinall waters. Growt ham nomal hevelophemt in wher reswets are rately attamed.
lievisefl by William Pbppar.

Cra'thea [from the (ir. кuatos, a cup. alluding to the shape of it indusia]: a gemis of beantiful tree-terns of the fanily Polypodicucere, found in the tropical reatons of the Ohd and New Work. The species are numerons. (yuthea arborea, a native of the West lndies, Mexico, and sonth America, has hiphnate leaves. Cyathet medulturis, a New Zealand species, has edible starchy roots.

Cyathophyl'lum [from (ir. кúzAos. cup + фúndov, leaf]: the typical genus of a prominent tamils of Paleozoie corals (Cyathopliyllithe). The Greek name, as well as the English name cup-corals, is applied to corals of this genus on account of the eup-shaped corallum of the single polyparies. The enp-corals are either simple or compound, and their septa are arranged in gronps or multiples of fonr, and they are particularly abundant in the limestones of the Devonian srstem, althongh the genus Cyathophyllum ranges from the Silurian to the Carboniferons.
H. S. Willelays.

Cyax'ares (in Cir. Kuagápns; Ohl Persian, Truhshatara. i. e. beantiful-eyed 1.: a king of the lhedes: began to reign in 633 B. C. He wagerl war against the Scrthians, who invaded bis dominions, and agrinst Alrattes. Fing of Ledia. A total eclipse of the sun which occurred about 610 B. $\dot{c}$. induced Craxares and Alyattes to make peace. Cyaxares and the Fing of Babylon took Nineveh in tios. Ile ilied in $59: 3$ B. C.. and was snicceeded ly his son Astyages, who reigned from 593 to 569 B . c.

Cyaxares II. : a son of Astyages, gramlson of Cyaxares I., and uncle of C'yrus the Great. Though not mentioned by Herodotus or citesias, he is namer by Xenophon as the successor of Astrages in the Median kingtom, and is probably the same as i. Damilu the Median "spoken of by the prophet Daniel (5. 31). The is supposed to have reigneid in Babylon for two vears after its confuest by Cyrus in 53s B. C. He came to the throne of Merlia in 5698 b. $\dot{c}$.
 Gr. Kußíß $\beta$ ) and Rhe'id (in Gr. Péa, 'Péa, or 'Peíq): a goldess of classic mythology; called in l'hrgia and elsewhere in Western Asia "Mother of the Gouls or "Great Mother." She ras supposed to be a daughter of Cranus and Terra. the wife of Saturn (Cronos), and the mother of Jupiter. In Phrrgia her priesto Tere (alled Corybastes ( $q$. r.). . She was sometimes styled the "Berecynthian mother." from the hill Berecynthus. where she had a temple. She is renerally represented riding in a chariot drawn by lions, with a diadem of towers upon her head.

Cy'eals [of uncertain origin]: a small fauilr of trees and shrubs (Cycadect), related to the conifers, with which they arree in being gymnorpermons. They bave mostly sinule stems, with a large pith and large pinnately compounch, evergreen leares, which are clustered toward the summit of the stem. They are of slow growth and are long-lived; the stem elongates by a slowly unfolding terminal bud, much as in the palms, which they resemble so remarkatily that they are popularly called "sago palms." The ovales are produced on the inargins of slightly modified leaves (in ('ycoss) or on the scales of cones (in other genera). The pollen-bearing fowers constitute cones, roughly reambling the cones of the conifers. Cycals were very inmerons in anciont geological priots, but they are now few in number (abont eighty Freecies) and are restricted to the warm parts of the worlic. The living species are disposed in two families as follows: 1. r'yradricer, including but one sonus - Cyras-represented ly sitteen speries, of which C'reroluta of China and Japan is common in conserratories. Its pith contains much starch, which is the "sago" of commerce.
2. Zumiacere, incluting uight genera, of which Zemia (thirt spec(jes), Dioon, and Enrephalartos are best known. Two species of Zommin are natives of the Southern U .

Charles E. liesset.
C'chlla, or Cichla, sik'ti: a genus of perch-like, freshwater fishes of the fumily Cliromide, sonetimes placed in a separate family, Cichlidie. There are three or four hrightcolored species, found in I'razil, (iniana, and Pern, and nsed for food.

Cyclades, sik la-dipz: a group of islands in the Esean. numbering twelve in all, accorling to strath, so called beo cance they surponiled the sacerd island of Delas (see map of (Greece, ref. $1 \boldsymbol{i}-\mathrm{h}$ ). Thuce islamls are Syra, indos. Andros. Tenos, Nlyknes, Naxus, laros, Intiparos, Sijhmos, scriphos, Kythnos, and Kews. The nonarcher of the C'yelarles in the molern kinglom of firecer includes. in adilition to

Phulecrandros. Sicrnos. Ios. Amorgos, and Anaphe. The surface is momtainous, the soil proluctive. Pop. of the nomarchy (1496) 134.iti. Irea, 926 sq . miles. Syra or flerrucpolis is the most improtant city.
 plant-name]: a name given to plants of a genus of the l'rimrose family. There are two chief species in eultivation. Cyclamen europreum and ( $\because$ lutifolium ( $C \cdot$ persicum of florists). The former is the framrant and the hardier species, and is native to the south of Europe. The latter comes from Persia. The flower is one of the midest in form, its brilliant petals being strongly reflesed, giving it the appearance of being turned inside out.
Cyme [from Gr. núnגos, wheel, circle]: a period of time which finishes and recommences perpetually. The term has been employed for marking the intervals in which two or more periods of unequal length are each completed in a certain uumber of times, so that both begin again exactly in the sane relations as at first. The creles nsed in chronoling are three: the cyele of the sun, the cycle of the moon (or Metonic crcle), and the cycle of indiction. The crele of the sun, or solar çele, is a perion of time after which the same days of the week recur on the same days of the year. If the number of days in the year were always the same, this cycle could only contain seven years: but the order is interrupted by the intercalations. In the Julian calendar, the intercalary day returus every forth year, and the cycle consequently contains twent $y$-eight rears. This eycle is supposed to have been invented about the time of the first Council of Nice ( 32.5 A. D.), but the first year of the first cycle is placed nine rears before the commencemeut of the Christian cta. Hence the year of the cele corresponding to any giren year in the Julian calendar is fount by the followiug rule: add nine to the date and divide the suin by twenty-eight; the quutient is the number of excles elapsed. and the remainder is the year of the cycle. Should there he no remainder, the proposed year is the trenty-cighth or last of the eycle. lu the reformed calendar this rule can only apply from century to century, for the order is intermpted by the omission of the intercalary dar every lmadredth year. (See Domincal LetTER.) The crele of the moon is a period of nineteen solar years, after which the new and full moons fall on the same days of the year as they did ninetecn years before. This cycle was invented by Meton, an Athenian astronomer, aml is known as the " Metonie evele." It contains 8.940 days. which exeeeds the true length of the nineteen solar years by nine and a half hours, nearls. On the other haud, it exceeds the length of 235 lunations by seren hours aud a half only. The framers of the ecclesiastical calendar, in adopting this period, altered the distribution of the lumar months, in order to accommodate them to the Jnian intercalation; and the effect of the alteration was that every three periods of 6.940 days was followed by one of 6.939. The mean length of the cyele was therefore 6.9393 days, which agrees exactly with nineteen Julian years. The number of the year in the cyele
 the year in which the new moon falls on Jan. 1. To find the number of any year in the lunar evele or the golden number of that year; we have this mule : add one to the date and divide by ninetcen: the quotient is the number of cycles elapsel, and the remainder is the rear of the cycle. Should there be no remainder. the furnused year is the last or nincteenth of the cycle.
The cycle of indictions, or Roman indiction. is a period of fifteen rears, not astrommical, bit entirely arbitrary. Its origio and purןose are alike uncertain, but it is conjectured that it was introiduced by Constantine the Great about 31: of the common era, and had reference to certain judicial acts, that took place at stated intervals of fifteen rears. It is consilered as having commencerl on Jan. 1, 313. By extenting it backward to the beriming of the era, it will be found that the first year of the era corresponded with the fourth of the cicle. In order, therefore to find the number of any year in the cycle of indiction we have this rule: add three to the date. divile the sum by fifteen, and the remainder is the year of indiction.
Crelie Planes of a Cone: the two planes through one of the axes which are parallel to the planes of circular section of the cone. The prependiculars to the erclic planes through the vertex are the foed lines of the reciprocal cone. A sphere around the rertex of the cone is cut hy the latter, its cectic phanes, and its foeal lines respectively, in asphero-

The revely has become an important factor in the businces as well as the phesure life of two continents．The adrance in construction has ardapted the motern machine to the needs of both sexes and all ages，while the approximate por－ feetion of the fuemmatic：tis and the movement for better roats have mate toming rioy permatar in Europes and
 from the［F．S．Lo IBritish and continental ports．while over 4．850，000 wore transported varionas distance＇s on U．S．rail－ ways．Bievele purcel－carriers are common．

The bievele has heeume a poteut fater in awakening reopln to the necessity of better romals．The strength of hatf a million cyeling votars is foll in the $\mathbb{L}^{+} .5$ ．manicipat，State， and bational politics ：and many sitates，notably Jaswacha－ sutts．Stu Jersey，atml Comueticut，are now making liberal anmal apmopriations for pramabent highway improvement． Fiarly in kof the $\mathrm{L}^{-}$．s．Congress establislad a national bu－ reats of highways，underi the divection of the chasf of angi－ neers of the army．and the special supervision of the depart－ ment of rasd inguiry，whase province it is to have charge of the seimbiffelaring out of all roalwass in new forritory， amd to ain the movemont in the varions states hy the dis－ covery and free testing of building materials．In mhlitinn to the impetas erverl the canse of improved highways by the evelists of the L ．S．．．thousands of miles of situ jathe are leing built by popular subaription．
＇Thes safoty type of wherl has hean the subject of eonsid． erable experiment by the $\mathrm{C} . \mathrm{S}$ ．Wiar Department．and hew nearly every luropman wavernment．Its uspfulnes in mond－ ern scientific warfare is numpotionables．but its plaw will not bo so much in actual warfare as for the rapid move－ ment of troops，for mossenger service，and for skimmishing．
＇l＇ests of the evele for the earrying of disputches over lons routes lase been made in Europe but especially in the［＂ under the direction of Major－General Nelson I．Miles，com－
mander-in-chief of the U. S. army, the most inmportant of which was the "military relay race" from Washington to New York, in Dec., 1895, in less than twenty-four hours. under the most unfavorable comlitions. The nationat guarls of several States have adopted the birrcle into their solunteer service, and the [T. S. Military Wheelmen, branches of which have been formed in many cities, consists, in 1896, of several well-drilled battalions of eyeting soldiery:

There are national cycling organizations in the various countries, formed and sustaned to promote the good roads movement, to protect the richts of its members as eyclists, and to govern the racing and in some instances the trade interests. The league of American Wheelmen, the National Cyclists' Union (Great Rritain), LiUnion Vélocipedique (France), the Deutscher Radfahr Bund (Germany), the Canadian Wheelmen's Association, and the league of Victorian Wheelmen (Instralia) have a combined active membership exceeding 250,000 . Ench association has its of ficial organ or regular bulletin. The League of American Wheelmen has, in June, 1896 , above 40.000 members.

Cycte-racing has become a very popular sport, reaching its greatest development in the U.S.S. In speed trials the bicycle has beaten the best time male by the ruming horse. The principal roal and track recorls, brought down to dune 1, 1896, are as follows:
One mile, flying start. 1 min. $39{ }^{5}$ see., by W. W. Namilton, at Coronato, Cal., Mar., 18\%.
One mile, standing start. 1 min. $49_{\overline{3}}^{2}$ sec., by 1I. S. MeCrea, Coronado, Cal., Feb., 1806.
One mile, unpaced, 2 min. $\frac{3}{3}$ sec., by W. C. Sanger, Denver, Col., Oct., 18:5.
One mile, competition, 1 min. nis $_{3}$ sec., by E. C. Bald, Denver, Col. Oct., 1845.
One hundred miles, 3 hours i2 min. 93 see., by C. Lesna, at l'aris, Aug., 1895.
American 24 -hour track record, 452 miles 1,715 yards, by Louis Gimm, at Clereland. O., Ang., 1895.
One thousand miles road record, 4 days 17 hours 45 min., by J. F. Gunther, Chicago, 1ll., Oct., 1894.
One linndred miles road reeord, 4 hours 40 min . 9 sec., by A. B. MeDonnell. Rochester, N. Y., Oct., 1895.

Five hundred miles track record, 22 hours 42 min. 40 sec., by (. Iluret, Bordeaux. Sept., 1895.
One hour track record, 30 miles 1.50 yards, by Tom Linton, Paris, May 19, 1896.
During the year 1894 A. II. Hansen, Minneapolis, Minn., rode 21,053 iniles.
During the year 1895 W . A. Rubey, of Louisville, Ky., rode 95 centuries-that is, 100 miles or orer per day for 95 days during the year.
The international chanpionships are held annually for the pupose of bringing together the speediest racing representatives of the various cyeling countries. In 1893 these championships were held at Chicago during the Wrorld's Fair: the year following at Antwerp, Belgium : in 1895 at Cologne, Germany: and in 1896 at Copenhagen, Denmark.

There are now over ${ }^{2}$. bicycle journals in the U. S. and 15 in Great Britain, not includisg club organs. The combined circulation of these pmblications argregates 550,000 weekly. The U. S. has 1 daily cycling paper, France has 2. and Germany 1. Nearly every Juropean country has one or more werkly or monthly thieycle journals, as has also Australia, New Zaland. Camala, and Gonth America.

kintor "Bictelivg World."
['ycloid] [trom (ir. кúrdos, circle + suffix -oid, lused] on
 senerated by a point in the plane of a circle when the latter is rolled along a straisht line. If the generating point is in the circmitarme of the rolling cincles a "common eycloid" is gencrated: if the gunerating pinint be outside the circle, it marks a " curlate " "yeloid o. while if it be a $p^{\text {wint }}$ within the circumbermeo a "prolate" or "inlleded "cyedrid is the result. That part of the cerloid which is gemerated in one revolution of the genmating circle is called whe "branch" of the "ewloil. Thu brathes may be intinite in
mumber. That part of the straight line which is traversed in one revolution of the gemrating circle is the "base" of one branch. A line lisecting the branch of a cyeloid and it a thase is the "axis." The common cyeloid is the "line of fuickest descent "-that is, if one print be paced above an"ther. but not in the same vertical line. a folling bodr will move from the higher print to the lower more quickly along the are of an inverted common eyeloid than by any other comrse even if that comrse le a straight line. If a pendulum be male to vilrate in the are of a common cyeloid, no matter what the lengtlo of the are may be, the time will always the the same. In practice however this result has never been attainel. Experiments show that cog-wheels with teeth bunded by this curve have their friction reduced to the minimum. See Epleyclon and Hyporyclond.

Cyclones [from Gr: кúкдоs, eirele]: whirling storms of large horizontal dimensions. The whirling character of these storms was not discoverel until atont the end of the first quarter of the nineteenth century: A cyelone is characterized by a center of low atmospheric pressure toward which there is a spiral inflow of air. The inflow is against the sun (contra-clnckwise) in the northern hemisphere, oppositely in the sonthem. A eyclone is meteorologically a "storm" but it varies through all degrees of gentleness and severity. (See Storm, Storm-area. Hurricane, and Typhoon.) These large storm-areas are often accompanied by smaller ones called "secondaries," and the latter, when severe, have popularly, but erronensly, received the name of cyelones. See Tornado, Thunderstorm, and Hallstorm.
Cyclopardia [ablirev, of pacyclopedia $=\mathrm{Gr}$. е́үкикдотаи$\delta \in l a$ for tycúkג $\quad$ os $\pi a i \delta \in\{a$, the circle of arts and sciences composing the standard ellucation of a free-born citizen, the liberal curriculum]: properts, a work which takes in the whole circle of leaming. The temn is often, thongh incorrectly, applied to a work treating very fully of some one or two important smbjects, as a Cyclopredia of English Literalure, the Cyclopudita of Anatomy and Physiology, ete. See Encyclopadia.

Cyclo'pean Walls : huge structures or walls of uncemented stones, the remains of which are found in Greece. Italy, and Asia Minor. These structures wre so-ealled becausethey were supposed to lave been built by the Cyelopes of myihology. The architecture is very different from that of the historic period. Some persons believe that they were arected by the Pelasgi, more than 1,000 rears before the Chistian era. The Crelopean walls at Tirys in the Pelopomesus are formed of mhewn stones from 6 to 9 feet long, and nearly 3 feet thick. At Myene are found massive walls of stones, which are more accurately fitted and are specimens of an architecture less rude than that of Tiryms. A more adsanced style of architecture appears in some remains of Etruria. In the Etrusem masonry called C'volopean the stones are hewn or sfuared and laid in horizontal courses, int are not cemented.

C'clopism: that form of monstrosity or malformation of the fatus in which only one eye is present, usually on the median line of the hearl. Sice Tfratology.

Cy'elops [Gr. ки́кда廿. litemally, romul-eyed: ки́кдоs. cir-
 of gimes or monsters having each one eve in the middle of the forebeal. Acrording to Ilesiod, ther were the sons of Cranus, ant were named Brontes, Arges, and Storopes. llomer rejresents them as gigantic and lawless shepherds and camihats who lived in sicily. The most famousamong them was Polyphemns.

Cyelops: a genus of copepodnos Entomostraca; so called from the fice that its two eyes are united in the middle line. It has al shrimp-like body, the anterior segments heing umited into a crphalothoras, the pasterior forming a jointel abdomen. The species are minute. and we very abmmant in fresl water, but nome occur in the
 soth They fom an impertant clement in the foom of many fishes. About twenty species are described from the U.S.
J. S. K.

Cyelósis: Sme Protoplasm.
C'yl'uls (in (ir. Kúdoos): a river of Cilicia, flowing throngh the eity of Thasso into the Mediterrancan. It was
eclebrated for the clearness and coldnces of its water．It was ancienty navigable up th）Tarsus（12 miles），but its mouth is mow ofstructed ly bars．＇lhis riser was the seme of Clenpatra＇s celebrated weyage to meet Autony in 11 B ．c．
Cydorna：an ancient city of trete：on the morthement coast of the island．It was inotel for the production of the quinece＇（Cydoniu）．
（＇yrous（the Swan）：a constellation of the morthern hemisphere in the Milky Way，Letweer Lyra and Cusionnem； comprises several hright stars tive of which form a crows： The parallias of the hinary star 61 C＇ygui was monasured by Bessel，who published in 1s：3 Mtersure of the Distente of the stur 61 in the comstellation of C＇ygmus．
Cylinlew［from Gr．kú̀ıupos，from кu入ivóev，roll］：in ele－ mentary geonetry，asolid bombed by two ecqual and paral－ lel eireles or ellipses，forming its lases，and a curve surface generated by the motion of a st raght lime，calied the genera－ trix，which moves aromed the circumferemee of the bases so as to remain always parallel to itself．If the generatrix is perpendicular to the basts，the cylinder is right：if nut．it is oblique．It is called circular or elliptio，ancording to the figure of the lases．A noteworthy property of this solid is that its contents are to those of the inseribed ellipsoid in the ratio of 3 to 3 a a property discovered by Archimedes in the special case when the eylinder cireumseribed a illhere．
Cylle＇re（in Gr．Ku入入ín）：a mountain of Grecee；in the northwestern part of Arealia；was supposen to the the birth－ place of llercury（llermes）．who was callull（yllenius，and had a temple on its stmmit．Height above the seat， $\boldsymbol{\pi}$ ，iws feet．It is mow called Zyrim．
Cy＇ma［from Gr．кíuc．a wave］：in architecture，a molding haviny a wave－like profile of thouble eurvature．When the farthest projecting portion of the molding is concase and that nearest to the wall consex，it is celled a cyma rectu； when this succession is reversel，a cyma recersa．
Cymbal［fron Cir．кúußa久ov，from кúuBos．hollow］：a brass musical instrument of percussion，circular in form and abont \＆inches in ，diannerer．（＇ymbals are playen in pairs by
striking one aganst the other，and produce a lound，haursh sound of no fixed pitch．The best are those made in china and Turkey．（＇ymbals were employed by the Grecks in the festivals of Bacchus and Cobele．
Cyme［from Lat．cymuc，spront $=$ Gr．кîua．fuetus，sprout． derit，of citu，becone prequant］：A flat－－opped or convex
centrifugal influresence－viz，one in whimh the central thower of each chuster or division upens first，that flower torminating the axis．Limniths restricted the mame to com－ pound inflorescence of this surt．of which the clder（Simb－ bucus）and liburnum odfer well－markel examphes：1 hat monl－ ern botunists，making the distinction between flowers from axillary and from terminal buds，employ it as a general term for all torms of inflorescenee of the latter kind．

 hermaphrodite flowers and compund pikes of numerous tworowed glumes，without trist les．It contains mumeroms ＊peries，thany of which are natives of the tropice，and others of the［＇s．Some of them have tulters or corms which are murilaginons and muritions．The C＇yperus esculentus（rn：1－ nut），a native of shathern Furope is cultivated in 1 taty． Spain，and lrances and bears farinacems tubere which arn as larse as a hazel－mint，and are called amomed do tore （grombdalmond）ty the frenth．They are eaten ats dessart and are uxed in making orgeat．The pap rus phan is oftem rifforred to this genus，thongh splarated from it hy some thotanists．

## Gyplur：Sew fipler．

（＇y－pure Ductrine see prā－dok trin：the doct rine or mut of whity that where at twator manifontsa gencral intemtine and has adopted a particular mode of carre ing his seneral in tention into offer，which，haweser，is comitry to law，or im－ pessible of fulfilmane then the ernural intent will he given eftert as nearly as may te consistently with the rates of law． The doet rime is more partiendarty appliod to caso of＂har－ itable luequests，where the particular form one mamur of
 sibl＂，in which case anther mole com－istrmt with the geth－
eral intent will be ardapted, so as to substantially give effect to it, if not in the exact mode indicated. It is also applied so as to molify the strictness of the common law in the case of personal lecacies upon conditions precedent. in which case it is held sulficient that the condition is complied witb as nearly as it practically can be, where a literal compliance is or hecomes imposihle or contrary to law. The doctrine is derived from the civil law, and rests upon the assumption that it gives effect to the real intention of the testator, who is presumed not to have intenced that the impossibility of a literal comphiance with his directions should defeat the seneral object of his bequest. The application of the clocfrine has in some cases been carried to an umreasonable extent. The varions states of the Union differ in their attithde toward it, some approring of its application, and some repudiating it. All of the New Encland States, except Connecticut, have approred it. In New York, Indiana, Iowa, and other states, it has been repudiated in whole or in part, and in still other States it has not been deciled upon. See Interpretation.
F. Sturges Allen.

Cypress [from O. Fr. cypres < Lat. cyparis sus. cuparissus. cypress-tree $=$ Gr. кuлápıббos, a name of Semitic origin, cf. Ileb. gopher]: evergreen trees and shrubs of the genus Cupressus of the family Pinucece. (See Conifers.) Abont a dozen species are known, natives of temprate Asia, Southern Europe, Western North America, and Mexico. The genus is characterized by having globose cones, composed of shield-shaped, ralvate scales, each with mmerous ornles, seeds narrowly winged, embryo with two (rarely three or fonr") cotyledons. opprosite, evergreen anl-shaped and scale-shaped leaves, each usually with a dorsal resin-gland. The bestknown species is the cypress of the Old World, Cupressus sempervirens, an upright, narrow, tapering tree with erect branches and a dark-green foliage. It is hardy in the Southern U.S. and the south of England. The Monterey cypress, C. macrocarpa, of California is a more spreading tree, of rapid growth and much greater hardiness. It is one of the finest of the cypresses. C. funebris of China has widely spreading, horizontal, and at length pendulous branches. Cypress wood is very dusable, and specimens are known which are said to be several thousand years old. The deciduous or bald cypress. Taxodium distichum of the swamps of the Southern $\bar{\top}$. S., is a tall tree with spreading branches, which bear linear, decidnous leares. Its wood is soft but durable, and the tree is much planted for timber and ornamental purposes. It commonly sends up, from its roots curions, hollow, conical growths ("knees") which rise a yard or more above the gronnd. Their function is unknown.
C. E. B.

Cyp'rian, Shint (more fully. Thas'cius Ciccil'ius Cypria'nus): a bishop of Carthage and Latin lather of the Church; a native of Africa; b. about 200 A. D. He was a teacher of rhetoric before his conversion, which occurred abont the צear 246 , and he was chosen Bishop of Carthage in 245 A . D . In 250 he retired into the desert to escape from the persecution which was ordered by the Emperor Decins. Tle returned to Carthage in 251, and then assembled a council on the subject of aprostates who had lapsed in consequence of persecution. He judged that these should be treated with moderation and lenity. He enmphasized the idea of the Church, insisted upon the three orders of the ministry, and stontly mantained the parity of bishops against the claims of the Jishop of lome. Jle suffered nartyrdom unter Valerian, by beheading. Sept. 14,258 A. D. IIe was eminent for his learning, eloyuence, and zeal, wisely tempered with molleration. His works consist of thirteen treatises. the most important of which is his De Catholice Ecclesite Conitute, written in 3.3. besides eighty-one epistles. including a few adressel to him, all of which have reference to ecolesiatical affairs. See his Life by G. A. Poole (Oxfurd, 1840). and hy l'eters (Regenshurg, 18~T): cf. O. Ritschl, ('yprian und dir J'effussung der Firche (Giottingen, 1880). Best cul. of bis works liy W . 1 l artel ( 3 rols., Viennal, $1868-71$; Ens. trans., Inte-Nicene Fathers, ソ. 2033-516).

Cyprinida [from Cyprimus, the longest known genus, to which the corry belonss]: the carp family; an enormons group of fresh-water precies, about 1,000 species in all, fouml in the rivers of Europe, Asia, Africa, and North America. They are soft-rayed fishes, with smonth or eycloid seales, and with no teeth in the mouth, the lower pharyngral bones (modification of the posterior gill arches) being armed each with from four to eight highly specialized teeth. To this family belong the cary, roach, dace, tench,
harbel. gudgern, gollfish. and the great array known as chuts, minnows, shiners, fallfish, and the like. They are tasteless fishes, and full of small lones, hence of little valne as fool, but usetul as food of predatory fishes. Most of the species fonnd in the Eastern ${ }^{5}$. S, are small, inder 4 inches in length, the fallfish. which rearlhes 18 inches, heing the largest. On the Pacific slope these fishes reach a monch greater size, one species of 1tychocheilus in the Colorado reaching a length of 5 feet, and being the prineipal foodfish in the rivel.

Damid S. Jordas.
Cyprinodon'tidte [from Gr. кumpivos, carp + ỏooús. ỏóóvtos, tooth]: a family of soft-rared fishes, superficially resembling the ('yprinide. bnt with the jaws provided with teeth and the pharyngeals entirely different. To this family belong the rarious species known as top-minnows, mummichogs, killifishes, etc., abounding in brackish waters in most parts of the world, and often ascending rivers to the fountainheads. Nlany species are viviparous, some are herlivorons, and some are extremely small.

Mavid S. Jordan.
Cypripedinm [from Gr. Kútpıs, Venus + Lat. pes, pedis, foot]: a genus of plants of the family Urchidacese: remarkable for having two lateral and perfect anthers and another forming a dilated fleshy appendage above the stigma: also for having the lip or labellum large and somewhat pouch or slipper shaped: hence the pmpular name lady's slipper. Abont fortr species are known, all terrestrial in habit, ranging from the tropics to the colder regions of the northern hemisphere, and often found in bogs or in hilly woods. Eight or nine species are indigenous in the U. S.. the most common being C. arcalle, the moccasin fluwer. This ranges from the Carolinas into Canada, and has a large purple-pink flower. The largest species, $C$. spectabile, often 2 feet high. has from one to three purple-pink or almost white blossoms.

Cypris [from Gr. Kúxpis. Venus]: a genus of ostracod Entomostraca, occurring in both fresh and salt water. The species are minute, have seven pairs of appendages, and are

Auimal of Cypris in the shell. after Claus : enlarged: c. caudal fork e.eye; $l$, lirer; $m$, muscle ; $o$, ovary ; $s$, shell gland ; I, II, III
inclosed in a horny hivalre shell. The species are very nn-
merous in both recent waters and in the rocks of almost all formations.
J. S. Kingeley.

Cy'prus (in Tork. Kibris; (Gr. Kúmpos): in island of Asia, in the northeast corner of the Nediterranean; 44 miles S . of Cape Anamoor in Anatolia. and abont the same distance II. of the coast of Syria. It is abnut 140 miles long, and 50 miles broad at the widest part. Area, 3.584 sq. miles. The interior is occupied by a range of mountains, the highest points of which rise nearly 7.000 feet above the sea. These mountains are of limestone formation. The soil is generally very fertile, but the island is not liberally supplied with water. The staple products are cotton, wheat, linseed, olives, silk: nlso grapes and other fruits. Wine of good quality is also made. In ancient times Cyprus was devoted to the worship, of Aphrodite or Venus, who was fabled to have here risen from the sea. Her temple was at Old Paphos, now called huhlia. The original occupants of the island were probably the Japhetic Kittim (Gen. x. 4), who left their name in the old capital, Citiun. Cyprus, scarcels ever for any great length of time independent, was held by the Phomicians from about 1100 to $225 \mathrm{~B}, \mathrm{c}$; by the Aesyrians from about 700 to 650 r. C.; by the Egyptians from about 550 to 525 B. C.: by the Persians from 525 to 333 B. C. : and then. after 323 в. c. by the Ptolemies till 58 B. c., when it became a Roman province. In 44 A. D. it was visited by Paul in his first missionary tour. The Saracen: (from $649 \mathrm{~A}, \mathrm{D}$.) took and retook it sereral times. Wrested from the Saracens by Richard Cceur do Lion in 1191. it was governel by kings of its own from 1192 to 1489, and belonged to Venice from that time till 1573, when it was conquered by the Turls. In 1878 the island was ceded to England in consideration of an annual par-

Czech Literature：the literature of the Czecho－Slars， i．e．the Slavic portion of the population of Bohemia，Nora－ via，and Silesia．＇l＇o the same stock really belong the Slovaks in Northwestern Hlugary：but since the begiuning of the nineteenth century they have endearored to keep themselves distinct from the other Czechs，and now their literature requires separate treatment．（Sue Slovak Latera－ tLRe．）Ot the three provinces named above，Bohemia is far the most important．and czech literature is in the main the literature of Bohemia．

The（＇zechs entered the circle of the civilized word at the time of their conversion to Christianity by Cyrillus and Methodius，the Greek apmetles to the slars，in the sec－ ond half of the ninth century．They hat already come into slight contact with Latin Christianity，but their real embersion was due to the Greek Church．Hence their first acquaintance with letters was under Greek influence．They adonted the Cyrillie script，and this survived among them for several centuries．It does not appear．however，that during this periorl they created what can be called a litera－ turc．During the romatic revival of national feeling in the first half of the mmeteenth century，to be sure．certain supposel discoveries of ancient manuseripts led many Czeelis to believe that their race had hal a biterature even before it bermac（＇hristian．Such were the höniginhofer MSS．con－ taining framments of carly epic songs：the Judgment of Li－ buše（Libusin soud）；the Old（＇zech gloses in the su－called Mater－lirtormm．a glowary of the thirtenth century；and the fiorfitz Frugments of i vely early translation of the Gospel of John．Snspicions circumstanees about the find－ ing of these mamseripts，however，as well as the charac－ ter of them，led almost at mee to a doubt as to their am－ thenticity：and now，after a vehoment literary controversy of more than half a century，few Czech shholars still deelare their tere ine in them．

The real literature of the（gerchs did not begin until after（iredk Clmistianity had yiedded to Latin．This proc－ ess began as parly as the tentli century，and was helped on hy two influences－lirst．the introduction into Bohemia of Loman Cotholie Slavs from Bosnia and Dalmatia，bringing
their so-calleal glayotilic s-ilavonice ghegnt $=$ word) manners of writing : and secomd, the political and social dermani\%ation
 mal abamboment of tireck rites and of the (yrillice seript. the visible signs of commertion with by\%antine civilization: and by the emal of the elevently ceatury looth hat disapfeared in all but the remone parts of the ('zedy land. The Germanizat ion of the (zends was a slower matter: but it went (oonstantly on, owing tor the (iemman conmections of the ambitions linman C'atholie celerey, and to the fose ination for the (zeeln nobbles of the fondal sirstem the they saw it in (rer-
 in its German form had everywhere penctrated bolmemia and Maravin, amd, furthermore, sreat numbers of (iemmans had settled throughout both prowinces. Their fendal dependence tjon the German emperors hat bequm almont two eenturies carlier. Ibaring the thirteath century -verything helped wh the change. King Wenzel (Vaskm) I. (!2:30-5:3) mate his comrt as German as jossilhe. surroumderd himself with (ierman knights and minnosingers, loved tourmaments, the chase, and all ehivalrie amasements. His son. l'temys Otokar 11. (105:-s-s). continued in the same course and the politioal events whioh eanm nat making him, in-
 amprors were very favorable to the ditlusion of German betens. These conditions eontimuel thronert the whene of the next century. In 1310 the family of the levenyslids whs suce eded by the pure (iomman fanily of lavembours: and the two most motahle kings of this lime Kiarl l. (13ttiTix) Jater as (ierman emperor known as kiall IV., amd Whazel IV. (1:1:5-1419), diel not conceal the mainly frerman character of their interests mad designs. It was not unti] the very end of the fondeenth century that the agitation frodured by the dlassite romtreversy led to a distimet uational ratetion against this jrevaling (fermanmon.
 first ennsiderable manifestations of ('zech literary atelivity closely commeeted with those literary movements which !ppear in fermany in the thirteent and tourteroth cempuries, and which, in finet, lad their origin still firther west than diemmany, i.e. in France. It thes Latin chromicle of Kiosmas of Jracrue ( (1. 112i) und a few other works of the same kind are omitterd. there aremonomments of importance in Buhenia or Noravia mutil the thirement century. Then appear works both religious and protinne of the deterninate mediarol character just described. whicla extemel on throumb the whole fomerenth contury, and even later. 'Tha" oldest mulombed religions momment is a preme of the thirteenth cantury, beqimming stow do serte stomirni (The Wiord crerted in the iforTd). It is a some based on some latin miginal, and the precursor of many. Jerome of Prague (1), about 1859: (1. 1416). As the din•ussion of the Wreliffe ductrines grew heater in the miversity, Huss endearored at first to explain them and to show that they were not heretieal. But the question wis speedily confused by the mace jealmaies between the fonr " nations " into which the university was divided: and when it hecame clear that the Czech "nation" alone srmputhizal with the new teachings. Huss threw his fortunes in with bis comntrymen. Ite was instrumental in persmading Wenzel $\mathbb{V}$. io give to the Czech "nation" three votes insteal of one (INecree of Nuttenberg. $14!5)$, as acconsegnence of which all the fureign teachers and students, to the number of nearly 5, ono left lrague quing for the most part to Lapzig. In 141) 10 Ilass was again rector of the miversity. The Church, however. din not submit peacefnlly, (n July 16, 1450, Arehbishop Zhynek orlered all of Wyclittes writings to he hurned, and Hiass to lie exiled. After vain efforts at conciliation on the part of Fing Wenzel. Iluss. by the king's adrice, withelrew from J'rague in $1+12$ and lived unietly in the country until 1414. when he went to the Council of Constance, uniler promise of protection from Wrenzel's 1rother Sigismunt. As is well known, this protection a a ailed him nothing, and on July 6,1415 , he was burned as a heretic in Constance.

For two centuries the intellectual life of the Czechs was mainly determined ly the events just described. National and religinus feeling were alike aroused ly the strngsle which Iluss mspired by his tragic death. Noreover, he had been a prolific writer, brith in Latin and in Czech. His Latin Truchatus de Ecclesia (1413) Wis an epoch-making work for all Eurupe. What he wrote in Czech was of consequence mot only becanse of its religious import, but also because of the great affection and care he displayed tor the national idiom itself. ludeed. it may be sait that Huss gave final form to the literary language of the Czechs. Ilis Postillf, his Deerhit, o pozuání cěsty pravé $k$ spaseni (Dunghter, or on the Knowlelge of the True Wray of Saluafion. his spirifual Songs, from which the sacred poetry of the Hnssites began, and many similar works, have remained molels of literary excellence even to this dar.

It is impossible here to do more than inclicate briefly the conrse of the Inssite movement, and the literature it gare rise to. It became almos at the start a national and popular movement. including far the greater part of the Czechis. A frient of lluss, also a vohminous writer, Jaceth of Mies (Jakoubek ze Strílra, d. 1429), intronluced the donble form of the Euelarist. with bread and with wine. whence the Itussites were known as ['tragnists. As time went on the more radical Ctragnists threw off entirely the anthority of the Church. and were called Taborites (from the town of Tabor. where they were strongent). Other sects of a still more rerolutioniry chametere as the Alamites, also formed themselves. The ('hureh, meantime, undertook to root out the heracy by means of crusalles. These were victomionsly withstoorl, however, until 1434 , when the Taborites were rirtually destroyed in the battle of Lipan. Their ruling ideas, nevertheles. lived on, and, as interpreted by the eloqnent and able Peter Clelëicki (b. 1390: d. 1460 ), formed the basis of the fanmms C niom of Bolicmian lirethren (Jednotre bratris ceskijch), which tork final shape in the years from 14: i-6i.
Of names ind works from this confusiel time we ran montion only the following: John of Priburam ( (l. 1448), anthor of Limes of Tuborite Priests (Žiot Kuzzi Taborskyrh): Iohn
 and ' 'zerch polemical works; C'tihor of C'imburg and' Tohit-
 and :unthor of the famons Tobitschan Book (Hühe Toresfromstati): Viktorin of Vehrll (1460-150) also a writer on jurispmakene and anthor of the Nine Books of Sam and Justife. etc., in Bohmiue (huihy driatery o primich. vte.) : Petur Chelëckstalrealy mentimed, author of the Sirt of Fuith (sif riry). the Fionk of Explenution of Sundays Les-

Nen like Buhtislat of Lobkoric ( 140 -1510), Fiehor̆ IIruby z Jelení (felenius, d. 1.514), his son Zikmuml Ifruby (14!ǐ15.4). Mikulás Fonác of IImlist kor (Finitor, t. 10.06), and many others, by their grammatical and lexicographical Works, their trandations from the clasics, ete., greatly enlarged the circle of existing ideas, Scientific studies also began. and by the end of the sixteenth century Bohemia Was the farorite resort of scholars like Kepler ind Treho Brahe. The indigenous literature obtained at new largeness. Members of the Bohemian Brotherbood, though still essentially Itussite. showel a new range of interest. Thus Jan Blahoilav (1023-if) labored for the education of his race, aml superintendel the great translation of the Bible from the Hebrew and Greek known as the hralitz Bible ( 6 vols.. 1579-4:3), which was published at the expense of the Muravian magnate Janz Žerotina. Poetry. which had suffered somewhat from ovemnuch of controversy, revived-both sacred and prolane. Hynek Podebrad ( $1452-92$ ) wrote his $1 / i=$ jory sen (Hay-droam) and other sentimental or allegorical pieces. Dlikulás Jačický (1535-1626) produced, besides historical works, his Prostopruedu (a book of songs), ete. Simon Lomnický, of Budec (b. 1552 : t . after 1622), composed religious, didactic, and satiric pmems: e. g. Cupil's Alrou' (Hupidove strela). A short (iuide for a Young IIonseholder (Krâthé naučen i madému haspodầri, 1586) ete. The sacred songs of Martin Michalec, of Leitmeritz (1454-1545). Adam Sturm ( $(530-6 \hat{i})$, Jan Augusta (1500-i2), Martin Zámrskỷ (or Philadelphus. 1550-92) are worth mentioning. A great quantity of Latin verse was writter during this jerionl, and the Czech drama wis de veloperl.

Among the Czechs the period we have just been considering, from 1526 to $16 \div 0$, is known as the golden age of their litcrature. In it culminated the expression of national impulses and experience, as well as of imported culture. And at its very end came two men, whose names are among the gratest we have to mention. Veleslavin and Comenius, in whom appears the best the Czech literary genius has been E:!pable of. Adam Janiel of Veleslavin (1546-99), though not of striking originality, was a man of universal interests. I] wrote schnol-books, scientifie works, historics; translated, edited, revised. Ilis chief production, the Misforical Calendar (ȟalendär historichýy, 15is), was inthential both for its method and its strle.

The creater pirt of the life of Jan Amos Komensky
 hemia. Ile harl harlly attained maturity when the battle on the White Hill (Bila-Hora, Nov. *. 1620) destrored the freedom of Bohemia for nearly two centuries. Catholicism was trumphant over reform; and although the Peace of Wistphalia (1648), which ended the 'Thirty Y ears' war. left the Lutheran Protestants in enjoyment of their faith, it did nuthing for the Hussite Bohemians. Etraquists and Brethren were obligeal to tlee from their homes, settling as "Exnlants" wherever they saw hope of safety. The Victorious Catholics proceeded io root out, as far as possible, every trace of llusitism. Czech books were seized and burned wherever found. Even a century later, Antonin Koniás (1691-1;60). the fanatic inquisitor, coull bonst that he had himself caused 60,000 ('zeels books to be burned. The very language was held in suspicion, and its use in the schools Was prohibited as late as the reign of Maria Theresa. In suite of these terrible sufferings of his fatherlam, however, and in spite of his own exile, Comenins was able to win a European fame. His labors were indeed ustonishing. By. his works on pedagogy he reformed the educational methofts of all Eurnpe. Most noted among these are his Didahfiha (written 166-32), his Informutorium, and esprecially his Jumur linguarum, reserata aurea (16:31), published atiso in !'zech in 16ia3. His enevolopedie, philosophical, and religions writings were widely almired-as his irodromus pansiphlies (Limblon, 16:3); his Pensophtie diatyposis (London, in Enclish of Collier, 16:11: Dantzic, in Latin. 1643): his ('entrum securitalis (Inubinu brzpeçmati. eteo, 1625). and many others. And, tinally, his poem Labyrint seche " lidij sredir elc. (Latyrinth of the Word and P'urutise of the Heurt. 16:3). has rematined one of the chief monmments of all ('zech literature.

After Comenins, as has heen inelicated, ('zech literature protionlly came to an whe for nearly a humbed amb fifty Vears. lu all that timm there is not a name worth recording. It somem as it the rery pmsilility of revival hat passed. When the revial at lat eame, one of the men most responsible for it. Josiph Thoroval y. supponed himsid to be working at a task of merely antifuarian or seientific interest.

Bohemia sull Moravia were firmly tient to Austria, and the Austrian ('atholies took goxl care to stamp out wery indication of Ilusite or mational feeling amone the t\%echs 'llanurs might have gome on thus hat not l'rench illeas inFaled hustria, ant hal not in emperor (Juseph li., Bisu!(0) mounted the throne whese sympothies were with foltaire and binderot rather than with the desuits. Da capor dat kat $\bar{\theta}$ [thal. from the begiming: copo, head: Fr. chef < Vhlor. Lat. *retmeme for cupt]: a musical term, ableverated 1). (.a an instruction to the perthmer in such airs as end with the first strain to return to the beginning and repeat the first part.

Daceat: a tivision of the province of Bengat, Jritish India. Srea, is.000 sqo miles. Popo athent 8.800.000. It is sulvivited into five diatricts, the of which is called Dacera. 'The distret of Dacea loms part on' the delta of the (ianges and brathatputra. It extemde from lat, $23^{3} 1210241 \%$ N.
 The smrface is low and havel: the soil is well athptet to the

Dacea: a city the eapital of the district of batea in Pengal; on the Buri gangi, a naviquble stream eonnected with the Ganges: 13 miles N. 1\%. of Calenta (see map of Nouth India, ruf. i-b). At the berrinning of the ninetermth century it was a thriving and a papuloms eity, but later host most if its pmanity. Since INTO, howerd, its trade mal mamfactures have revived. It contains several ruined palaces. 180 mosiquen 115 phtodas or Hindutemples, a govern-
 has montfactures of tine maslins, cotton dothe embroidery, bothry, and silver-work. Magnifient rans of palace,

Dace: the Lonecisus lemersus, atmall lish of the carp funily, common in the strmme of Western Enrope. It has

 batek is blaish, side abd moder parts whine more or less
silvery. It rarely reaches a pound in weight, and is not very good eating, but as it goes in schools, is abmondant and rises to a dy, it is nevertheless popular with loeat anglers. The dace has nomernus relatives in Furope and the U.S. anong them the horned dace, semotilus corporalis, of the Middle states.
F. A. I. .

Dace'lo [transmosition of Lat, alec do. hingfisher]: a genus of Australian kingfishers, of which several species have been observed. Of these. the best known is the Dacelo gigus, or latughing jackass, a rather large and handsome birl of New south Wiales. It takes its popular name from its harsh, dissonant cer, which greatly recembles the so-called laugh of the hyana, and is not altogether unlike the bray of the ass. This cre is uttered at carly duwn. The hird inhabits hollow trees, ancl feeds upon fish, reptiles, insects. etc.
Dachshumd, datakhs'hoont (Ger: Duchshume, badger dog: so-calted from being emploged in unearthing that animal): a Ireed of long-bodied, short-legged dors. with "rooked forelegs. The hind quarters shouk be higher than the fore, the elbow and forefoot should point ontward, the wrist inward. The color may be black and tan. dark brown. golden hrown or gray of various shades. Weight, 10 to $2 s \mathrm{lb}$. F. A. Lucas.

Dia'ci, also called Gr'lax: an ancient barharous people who inhalited Iracia. They are surposed to have emigrated from Thrace to Dacia before the time of Alexander the Great.
Da'cia: a former comntry of Europe; ocompied by the Daci, a warlike people. It was bounded on the N. by the Carpathion Mountains, and on the S. by the Dannbe. The Dacians waged against the liomans a long detensive war which began in 10 в. с., when Angustus sent an army to conquer them. In the reign of Domitian ther comprlled the Romans to pay tribute. Trajan conquered Dacia, and rerluced it to s lioman province in 106 A. D. It was formally relinquished by 1 iadrian $\left(117-13 s^{\circ}\right.$ ) on his accession to power, and yet remained under Roman masters till the time of Aurelian (200-25), when the Komans finally withdrew within the Danube, leaving the country to the foths. This province comprised the eastern part of Ilungary. Transylvania, Moldavia, and Wallachia.
Dacipr, dam'si-ā, Avse Lerèrbe: classical scholar: b. at Saumur. France, in Mar., 16.04. She was instructed in Greek and Latin by her fathor, the learned Tanneguy Leferre, became a resident of Paris in $16 i=$ and was employed by the Duke of Montansier to erlit several latin anthors for the use of the dauphin. She was marriel to Antre Dacier (1651103 ), librarian of the king, the translator of Plutarch, and editor of the Dolphin Homace, etc.. in L683. She published French translations of Amerem ( $16 \$ 1$ ) of Terence of Homer's Iliad (1694), and of the Odyssey (1708). As an enthusiantic admirer of Homer and other ancient poets she became engaged in a fimous controversy with La Motte, and wrote her Trate de centse de la corruption du goût. Sere Burelte. Bloge de Mome Ducier: Rigault, Lhistoire de la querelle des dnciens of des modrthes (Paris. 18:39), 1p. $35:-$ 411. D. in Paris, Ahg. 17, 1izo. Alfren Glthemas.

Da'cifr: certain volcanie rocks comprising the quartzhatring, or most acif members of the andesite series. The temm was pronnsed ly von llater in Iveis tron their oreurrence in Southastorn Antria (limanan province of Inacia). They are widesperad in many volcanie regions, and wore formerly known as quartz-tachyles. Sie Anobsire and Kocks.

In $186 \%$ he was created a K. ( 6.3 . ; was decorated with numerons foreign orders and medals. In. Mar., 1854.
Dactyl [from Gr. סákтuas, finger, supposed to he an allusion to the one long and two short jnints of the finger]: a metrical foot in Greek and Latin poctry, consisting of a long and two short syllables, as carmină. The term is also applich in the English and in other huguages to a foot or mewsure consisting of one stressed and two mistressed syllahlus, as destiny. The light or irvalionat dactyl has the same representation in sylables, but its value in time is only that of the trochee, so that the three syllables of the one are pronomed in the same time as the iwo syllables of the other. See Meties.
Dactylology: the science of finger-signs in commonicating ileas. See Deaf axi Demb.
Dactylop'terus [from Gr. $\delta \alpha{ }^{\prime} \tau \tau \lambda c s$, fingur $+\pi \tau \epsilon \rho \delta \nu$, wing]: a genns of spiny-rayed fishes. more correctly known by the earlier name of cephalaconThus, remarkahle for its mailed heal and for the great development of its pectoral fins. It constitutes a distinct family. Cephalacanthide. The best-known suecies is the common tlying gumard. formod on looth shores of the Atlantic, a brilliantly eolored little fish,

Flying gurnard. often spen llying abore the surface of the water, and occasionally tonehing the summits of the highest waves. Dayid s. Jordan.
Dado [Ital., die (plur. diee) : Span. dado: Fr. dé $<$ Lat. dü tum, past pte. of dar re, give: the development of meaning: what is given, result of the throw, the throw, the die]: the enbical portion of a petestal comprised hetween its base and cap. Also a broad band of wainseoting, marble, prainting, or the like, decorating the lower part of a wall.
Jied'alus (in Gr. Aaibaros): in Greck mythology, an inventor and mechanical genius. He was the rented inventor of the auger, saw, and other tools. Aceording to tradition. he huilt the Labyrinth of Crete and fabricated wings with which he flew from Crete to Sicily. Ile was the father of Icarns. The inventions ascribed to him are partly artistic. such as the opening of the eves, which hat formerly been closed in stathary, and the extending of the hanks, which had fomerly been placed down close to the sides; partly mechanical. such as most of the tonls emplored in carpentry, the mast of the ship, the folding-chair, etc. It seems, hiwever, that when the Greeks ascribed a certain invention (o) bidalus they simply meant that it belonged to the periord when the arts first surung up among men.

Dadalus of Nicyon: son and pupil of Patrocles: himself a distinguished artist ; flomrished abomi 400 B, C. He made for the Eleans, after their victory over the Latedemonians, the trophy which they erected in the grove Altis. Besides this he fishoned stathes of several athletes, a Victory, and others enmerated by lansimias.

F. Dupont of that command in the harbor of Port Royal, S. C., duly 6, 1863. He at once commenced aetive operations in eonjunetion with Gen. Gilmore. U. S. amy, which speedily resulted in the possession of the greater part of Morris island and the silencing of Fort sumter, and secured a safe anchorage for the monitors inside the bar of Charleston, thus effectually putting a stop to the blockade-running which had heen before so suceessfully practiced, and reducing Charleston to a place of no importance for the rest of the war. After the fall of Charleston. in 1865, Dahlgren resigned his command, and in 1866 was appointed com-mander-in-chief of the Sonth Pacifie squadron, in the discharge of which duty he remained for two years. In 1868 he was a seeond time appointed ehief of the burean of ordnance, from which station he was relieved at his own request in 1850, and ordered to the command of the mavy-yard at Washington, in which eity he died July 12, 1870. He was the anthor of Exercise and Mancurer for the Boat Howitzer, United States Nary (1852): System of Boat Armament, Lnited States Javy (1852) ; Ordnance Memoranda (1853): Shells und Shell-guns (1856); and it is largely to his labors that the narr is indebted for the great improvement in its orduance which has taken place since 1840. He invented the Dablgrex Gux ( $q, u$.).

Dahlgren (fim [named from Admiral Dahlgren, its inventor]: an improved form of ordnanee used for howitzers, heary artillery, and especially in naval gumery. It haring been demonstrated that in ordinary cast guns the weight of the metal forward is greater than is needect, and that br far the greatest strain in firing is at the breech, Dahigren greatly increased the relative size and weight of the breech, with the best results. These guns were chiefly used by the U. S. nayy. See Artillery.

Dah'lia [named after Andrew Dahl, a Swedish botanist]: a genus of plants of the family Composite and sub-family Tubutiflorce. They are natives of Mexico, and the numerous varieties cultivated are chiefly derived from two species - Dahlia coccinea and Dahlia variabilis. Dahlias have been very popular, being conspicuons for their varied and exquisite colors and regularits of form, hat less attention is paid to them now than formerly, probably. The tuberous roots of these plants, although not agreeable in taste, are used as food in Mexico. A light and moderately rich soil, with plentiful moisture, appears to be best adapted to the cultivation of dahlias.
Dahlmann, daal măan, Friedrich Christoph: German historian; b. at Wismar, Hay 13, 1785. He beeame in 1813 Professor of Jlistory at livicl, in 1809 Professor of Politieal Economy in Göttingen, and was deprived of his chair in 1837 on account of his protest agrainst the abolition of the fundamental law by King Eruest Augustus. In 1842 he was appointed Professor of History at Bonn. In 1848 he was one of the leaders of the constitutional party. 1 is chief works are a Ilistory of Demmark ( 3 vols., 1840-43) : a Mistory of the English Rerolution (6th ed. 1864); and a Mistory of the French Revolution (3] ed. 1864). See Life by Springer (18:0). D. Dec. 5, 1860.

Dahlone'ga: capital of Lumplin co., Ga. (for location of county, see melp of reorgia, ref. ${ }^{\bullet-G}$ ) : on a hill about 66 miles N. N. E. of Athanta. "There are cold mines in the ricinity. Hlere was before the civil war a braneh mint of the U. S.: the building has been eonverted into the North Georgia Igricultural College. Pop. (1880) 602 ; (1890) 896.

Dahonmey: a kingrom of Western Afriea, in Guinea, on the Slave coast, roaching the Gulf of Ginea at Whydah, but hroulening inward ant forming a strip between the meridians 130 E. and 240 b., which extends northward to about \& K. lat. It forms the background for the French
possessions along the coast, and is practieally mider the French protection, having been eonquered in war with France in 1890-93. Area ahout 4,000 sq. miles. The surfaee is generally level, but the northern part is diversified by hills, which are eovered with luxuriant forcsts. The soil is fertile. Maize, entton, sugar, yams, tobacco, beans, pease, and manioc are cultivated here, and the coroanut tree and other species of palm flourish. Among the wild animals are lions. tigers, and elephants. The people are fetieh-worshipers, their principal fetich being the tiger. The Dahomans are bloodthirsty and crnel, but hospitable and courageous. IIuman saerifices and savase religions rites are practiced by them exeept when moder the restraint of civilized racus. The king is a sort of military chief, whose will is law. Jlis wives are numerons, and his chief military ofticers follow his example. One division of his army consists of several thousand female warriors. Owing to the peculiar marriage eustoms of the people and the wartares with other native states, the kingdom, which was once one of the most powerful in Upper Gninea, has become mueh weakened and reduced. Capital, Aboney. Pop. about 250,000 . See Forbes, Missions to Dahomey (1851) : Burton, A Mission to Dahomey (1864); Skertchly, Dahomey as it Is (18i4); Chaudoin, Trois Mois de Caplicité au Dahomey (1891).
Daimiel, dī-me"-al' : a town of Spain: province of Ciudad Real; 20 miles E. N. E. of the city of Ciudad Real (see map of Spain, ref. 17-F). It has a Gothic church, a townhall, and a hospital : also manutactures of linen and woolen fabries and blond lace. Pop. (1887) 11,508.
Daimio, di'mrō': literally, great name; the title of the feudal barons of Japan before the abolition of the feudal system in 1868-i1. These were all vassals of the mikudo, but during the Tokugawa shogunate they gradually became subject to the shogin, who compelled them to hre in Yedo with their families and a large number of their retainers for at least six months every year, their families being retained as hostages for their gond behavior as against the shogun during their absence. When the shogumate wns abolished they numbered $25 \overline{3}$. but their number differed at different times. Each exercised independent anthority, and kept in his employment large numbers of samurai or armed retainers, to be placed at the service of the mikado when neederl. In 1871 the daimios surrendered their lands and privileges to the mikado, who relieved them of the support of the samurai unt granted each a pension proportionate to his former revenue, the lighest being $\% 0.000$ yen per annum. Some years later these pensions were commoted into interest-bearing bonds. redcemable after five and within thirty years from date of issue. The title has been abolished, and both the feudal or territorial atod the kuge or court nohles are styled kwazokn, the stmurai being classed as shizokn. The liatamotos or vassals of the shoguns were called shomio, or " little name." See Japax, shogin, and Toklgawa.
R. L.

Dairy-husbandry: the branch of agriculture which pertains to the hreeding, leeding, and management of milch cows, the production of milk, and its conversion into butter, cheese, and the like. Milk has always been in important article of human look, and the making of butter and cheese sems to have been understood and practiced from the remotest periods of history. In earlier times and in some countrics, besides the milk of cows, that of asses, goats, and sheep was extensively nsed ; but now the cow is practically the only anmal that is kept for its milk. Both in the U. $\stackrel{S}{ }$. and in Furope, dairy operations long formed at part of the bousehold duties of the women of the farm. Lnder these conditions, while there was wide liversitr in the quality of the product, much of it heing inferior. certain localities. either becimse of certain natural advantages or by reason of the skill of the dairy women, becane famed for the pecnliar qualities of their dairy prombets. A most striking insance of this is the many characterist in and peculiar variet ies of chose for which France and switzerland are noted. The introdnction of the factory system of manufacture of dairy prodacts marks the crat when dairy-lmabandry mar be said to have become a distinct branch of agriculture. Jisse Williams, of Oneid: co., N. Y.. established the first cleese-factory in 1860, since which time the principles of mondern dairying have been almost wholly developed. Factories for the manntichue of buttor soon followed the establishment of chese-lactories, and both rapidly increased in mumbers. A primary elfeet of the factory sysiem was the prodnetion of a better and more uniform grade of product : this led to increased consumption, and consequently greatly stimulated
production. Since the intruduction of the factory system the two mast important indlu-nces in the tle erbpment it the dairy industry have been the invention of the eentrifural machine for the sparation of croun from milk, wherety a great economy in the manufature of buter is sectured, andi the diseovery of methents determining the atmont of fiat in milk rapilly; easily. cheaply and acelrattely, wherphy a great aid is given to the selectun and improvenent of dairy cows. See Better, c'uerse, and Mhle.

Daiisy [0, Eng, flege, riage, i. co duy's cye in allusim to the form of the flow ras resemhting the simit: a small perennial plant of the gemus Bellis and Lamily Compmsite. The daisy is a native of Europe, and the speeies Bollis perennis is very common in Great Britain, whre its delicate crimson-tippeet llower has bech immortalized ly Purns and other poets. Xew and very beantiful varieties with rariousty celored blosems have heen introduced hy the horists. Sonie kinls have the main bosom surroundeil by a dozen small flowers formed in the arils of the scates of the invohuere. The term daisy is also loosely applied to various composite flowers. The ox-eye daiss, in native of Fiurope, is Chrysanthemum leucanthemiun, and is extensively naturalized in the U. S.

Revised by L. H. Ballex.
Daknits, or Dacoils: armed ganos of rohbers who about in India and Burna phumering travelers and villages, Daknity, as the practiens of the Dakoits are called, was Furmerly itry common, hut has almost disappearel in British Intia, owing to the active memsures of the anthorities for its suppression.
Dakota: a former territory of the [..S. See Sorta 1)akota and soutif ()akita.
Dakota Formation: in geology, a gromp of rocks belonging to the Amerisian c'retactous period; first described in territery of the Dakota Indians. Its characteristic beds are of coarse vellowish sandstme, but shates are frequently associated will theste. It exhibits a nearly continums outcrop along the western Lurder of the" Great Plains from Texas to Alberta, amb appears also at many points in the cascern portion of the phais, being overlaid in the interval hy more recent Cretacenus furmations. In Thesas it rests upon Cretactous beds of the c'manache serises, and in Alberta on the Kootanie formation, also C'retacenn: but in the interrening region it rests in apparent conformity on beds of Jurasic age, as well as uncouformathy on more ancient formations. West of the plains it realperars in the district of the Culorato plateans. Fossil shells show that the water bolly hepositing the formation was partly fresh and partly trackish. Ahmmant remains of phats inidiate a luxnriant furest upon it, bauks. The formation contains a valualle store of eonla and its sambstones constitute the most impurtant reservoir of artesian water in Western Nourth America. The water receivell ulong its onterop at the western or upper elige of the freat plains has been tapped by the drill at many points furt her cast wart, and affords a series of large foumtanks, expectially valuable in a district sparingly supplied with rain. Sue Cretacems P'ermo.

Dales Jony Blakely, D. D., LL. D.: minister of the Cnited Presbyterian Church: b, at Fortright, N. Y., Aug. 6,1815 . IIe was gralnated at Union Cullere, New York. 1835, and at the Associate Reformed Presbyterian Theo1835, and at the Associate Retomed Sminary at Newburg. N. Y., 1839. From 1840 till 1893 he was pastor of what is nom the second Uniter l'resbyterian church of Philadelphia. During portions of this time he was Professor of Pastoral Theolngr in the Newburg Seminary (186i-76) and one of the editors of the Christian Instructor. He published Roman Cutholicism (Philadel ${ }_{\text {phia, }}$, 18t2); The Jangers and Duties of Foung Men (1851); Biographical Sketrhes of Dis. John Mason, John M. Mason, Thomas Clark. and Alerander Proudtit: The Gospel Minister (150): Mistory of the Associate Reformed Church and its Missions in the Chureh Memorial (Xenia, 1859) ; A Memorial Discourse (on his fortieth anniversary, Philadelphia, 1880). As secretary of the Board of Foreign Xissions of his chureh, he published its annual reports from 1859 to 1892. I. Aug. 28, 1893.

Willis J. lieecher.
Dallousie, dual-hoozi : seaport; capital of Restigouche co. New Brunswick; at the mouth of the Restigouche river (see map of Quebec, ete., ref. 2-G). It ships large quantities of salmon, lumber, and lobsters. Pop. 3.000 .

Dalhousie, Earts of (1633) : Barons Ramsay of Dahonsie (1619) and of Kerington (Scotland, 1633), Barons Panmure (Tnited Kingdom, 1831).-Fox Madle, eleventh earl, was born Apr. 2?, 1801. He beeame a Whig member of Partiament in 1835, and was Secretary at War from July, 1846, to Febo., 1852. In Apr., 1852, he succeeded his father as Lord Panmure. Me was Minister of War in the calinet of Lord Palmerston from 1855 to Feb. 1858. In 1860 he sueceeded to the earldom. D. July 1, 18.4. II is successors, George, his cousin, twelfth earl (b. Apr: 20, 1806; d. July 20. 1880) and Jomin William, thirteenth earl. son of George (b. Jan. 29 , 1847; d. Nos. 25, 1887) were in tura succeeded by Arther Grorge Macle Ramisy fourteenth earl (b. Sejit. 4, 18:S) the eldest son of Juhn William.

Dalhousie, James Andrew Ramsay, Earl and Marquis of: a British statesman; b. near Fdinburch, Apr. 22, 1812: a son of the ninth Earl of Dalhonsie. He was returned to Parliament for Haddingion by the Conservatives in 183\%. and succeeded to the earldom on the death of his father in 18:38. In 1845 he was aplointed president of the Boartl of Trade by Sir Robert l'eel. He was retaned in that offiec by the Whig Prime Minister who came into power in 1846, ani] he becume Governor-General of India in 18:1\%. IIs administration was successful, though his somewhat aggressive policy contrihuted to produce the mutiny of 185\%. We annexed l'eru, Oule, the S'unjaub, and Berar to the British dominions, and developed the resourees of Intia by canals and other public works. In 1849 he was createt Marquis of Dalhousie. The returned to Fngland in 1850, and died, without mitle issue. The , 19, 1860. See Arnold. History of the Marquis of Duthonsie's Administrution of British India (1803-64).

Dalin. dataren, OLof, von: Swedish poet and historian; 1) at Winherga, in Holland, Aug. 29, 1708. It weekly paper, Hen srenstio Argus (The Suredish Argus), 1033-34, moteled on the spectator. Won him popular recornition, and procured him the farim of the Govermment. In 1737 he was made ruyal librarian; in 1741 he was commissioned to write a histury of sweden: in 1 1.j1 he was emnobled, amb shortly before lis cleath, which tork place Aug. 12, 1663, he was apppinted hofkanster. Datins elegant prase style, seen to advantage in his Srea rikis Mistoria (History of Sweden. to the reign of Carl IX., published $174(6-62)$, hat great effect on later swedish writing. Ilis more serious poetry, connposed under the inlluence of French classicism, has little originality, but is marked br a "correctness" and polish
which did much to refine the language and improve versifi-
cation. In his snugs be is simpler and more spontaneous. Ilis tragely Bryuilda (1;39), his comedy Den afundsjukie (The Entious Man, 173S), and his epic Sienska Friheten (Sicedish Fredom, 1:42) deserve mention. D. in Drottningholm. Aug. 12, 1763.
G. I. Kittredee.

Dalkeith: a town of Midlothian, Scotland. not far from Elinburgh; has large corn-mirket, com-mills, breweries, iron and brass foundries, and tanneries. The chief chnm is Dalkeith Palace. the principal seat of the Duke of Buccleuch, built in 1200. It was the temprraty residence of Charles l. in 16\%3, of George IV. in 182? and of Qucen Victoria in 1842. Pop. (1891) 6,952.

Dall. Willay IIealet : naturalist: son of Caroline (Healey) Dall, reformer and author; b. in Boston, Mass., Aug. 21, 1845; edueuterl in private and public sehools in Boston: in 1863 a slecial rupil of Prof. Loouis Agassiz and of Jeffries Wyman and Dr. A. A. Gould; served in Massichusetts militia in riots of July, 1863; held several positions on geological surveys in 1866 going to Eastern Siberia in charge of the works of the Western Union telegraph expedition for an international line to Furope viâ Bering Strait; has since made several expeditions to Alaska, exploring for the U.S. coast surrey : palaontolngist to the U.S. geological sursey 1884; honorary curator of mollusea in the National Museum; member of many scientific societies at home and abroad; author of numerous scientific papers on brachiopods, mollusks and the ethology and general natural history of Alaska, besides Alaskia and its Resources (1870); Meteorology and Bibliography of Allasku (U. S. coast surver, 1879) ; Coast Pilot of Alaska (T. S. coast survey. 1884); MöIuscu of the Southeast Coast of the United States (U. S. coast survey, 1800); Reports on the Molluscte of the Blute Expedition (Bulletin Museum Comparative Zoölogy, 1880-ro); edited the Marquis de Nadailac's Prehistoric Man, with notes.

Dallas: town: on railway; capital of Paulding eo., Ga. (for location of county, see map of Ceorgia, ref. 2 -F); 33 miles W. N. W. of Atlanta. Here oecurred a battle between Gen. Sherman and Gen. Johnston in May, 1861. Pol. (1880) 169 ; (1890) 455.

Dallas: city and railwar center (settlel in 1841); capital of Dillis co., Tes. (for location of connty, see map of Texas, ref. シ-I); on Trinity river, 315 miles N: of Galveston. It has a university muder the anspices of the Christian Clurch, an Episcojal college, several business colleges, a school of fimearts, a convent and parochial school, merchants' exchange, alliance exchange, U.S. court-house, pnblic parks, Tesas Stute fair and Dallas exposition buildings, covering 8 acres, race-course. grain-elevators, planing-mills, cotton compress, 110 manulactories, large and small, cotton and woolen mills, a meat packing honse, 11 banks. water-works, sewers, suburban dummy railways, street railways, ete. It is the center of extensive wheat and cotton belts. A district 10 miles sfuare, with the court-lonse as the center, embraces Dallas city proper and five suburbs. Jop. of city (1880) $10,3.58$; (1590) $35,06 \%$.

Edtor of "News."
Dallas, Alexayder Jayes: U.S. statesman; b. in the island ol Jamaica, Jume 21, 1759. He emigrated in 1 ins to Pliladelphia, where he practiced law, and prablished in 1790 Reports of Cases in the Courts of the L'nited States and Pennsyluania ( 4 vols.; Bu ed. 18:0). In 1801 he was appointed a listrict attorney of the U.S. Ne became seeretary of the Treasury in the cabinet of Mallison in Oct., 1814, when the national revenue was insufficient and the pullic credit was impaired. He wrote an able report to Congress recommending the establishment of a national bank, raised moncy by a luan. and restored the public eredit. He resigned olice in Nor., 1816. D. in Trenton, N. J., Jan. 16, $181 \%$.

Dallas, Grorge Mifflix, LIJ. D.: U. S. statesman; a son of Alexander James Dallas; b, in Philadelphia, July 10, 1792. He studied law, and was atmitted to the bar in 1813. In 1824 and 1828 he supported Gen. Jackson as a candidate for the office of President. He was elected in 1831 to the Senate of the U. S. for a short tern, which expired in Mar., 1833. IIe was sent as minister to St. Petersburg in 183\%, returned in 1839 , and was elected Vice-President of the U. S. in 1844, when Mr. Polk was cloosen President. In 1846 he gave his casting rote in the senate for a revenue tariff bill which was opmsed hy the protectionist party. In Feb., 1856, he was appointed ininister to Ehyland, where he remained until 186I. Ilany of his speeches were published, and a Series of

Lellers from Landon appeared after his death. 1). in Philadelplial, Dec. 31, 1s64.

Dalles of the Columhia: a marrow portion of the ('olumbiar riwer, 4.) miles abse the (atsomes. 'The river here rubues riolently throngh a chasm only is yards wite, inclosed between sterep, walls of hasaltie rook. Dalle is a french word signifing "dag-stone," and also a "spont" for water.
Daltes of the st. lanis. The : a beantiful spries of rapids in the St. Louis river, near Duluth, Minn. The river falls (40) feet in 4 miles over a bed of shate.

Dalles. The, or Walles City: city (fommed in 1852);
 of Uregon, ref. 1-k) : on (nion Pacitie ki. li., and on the south hank of the Columbiar river se miles k. from Portland; has 4 schools, 1 acalemy, a seminary for girls (Catholic), T chmednes, 1 large thouring-milh, and a machine-shop. The river is obetructed above here by ratids and falls. The Dalles is a great shiping-point for grain, stock, and wool: 5. 50000 olh , of wool are hithded here ammally: Pong. (18s0) 2.232: (1800) 3,029: (184:5) estimated, 4.600.

Daly, Charles Patrick, LL. D. : jurist: b, of Irish patentage in New York city, Oct. 31, 1816; admitted to the har in 1539; became judge of eommon pleas in that eity in 1845 , and was chief jurlge 185 to Jan. 1. 1886. 1Le was anthor of articles in Her. Ampricun Cyclopedia, lecturer at Columbia College law school, published a history of the courts of New Vork (18j5), a memoir of Chancellor lient, and many papers on banking. law, sejence. ete.. and is an able jurist. He has been, since its foumtation, president of the American Geographical and statistical society, and is a frominent member of the Eithmulugical societs.

Daly, Joun Augrstin: manager and playwright; b, at Plymouth, N. C., July 20, 1*38. Ilis fimily removed to Norfolk, Ya., and after the death of the father came to New Fork, where Augustin attended the public schools, and was subsequently apprenticet tor a honse-furnishing firm in Maiden Lane, where le remained until he was about twenty years of are. Ile lerrom his literary carcer as dramatic editor of the Sunday Courier. IVe also wrote for the New York Express, sim. Timps, and Citizen until 1869. L'nder the Graslight and Leesh the Forsaken, the latter an adaptation of Mosenthal's leborwh, and Flash of Lighlning were among his first tramatic ventures. On Ing. 16. 1860, he opened the Fifth Areme theater in 'Iwenty-fourth street, the first one so named under his management. It was mont Jan. 1, 18.3. (1n Dec. 3, 1si3, he opened Daly"s new Filth Avenne theater. Twenty-eighth street and Broalway. In 18 sis he abandoned mathgement and went abroad. In 1879 he established Daly's theater in Broarlway, New York. ITere were produced mumerous alaptations from German furees, Shaksperean revivals, jlays of Pinero, and standard old comedies. lle has taken the whole of his well-organized eompany to Great Britain, Franee, and Germany several times, and is the lessee of a theater in London. B. B. Vallentive.

Daly, Malachy liowes, Q. C.: Canadian lawyer; lien-tenant-governor of Nova Scotia; b. at Marchmont, near Quebee, Feb. 6, $18: 36$; elucated at St. Mary's College. Oscott, near Birmingham, Fingland. He represented Halifar in the Tominion l'allament $18 \%$-8. and was appointed lienten-ant-governor of Novi Scotia, July 15, 1890.-Wis father, Sir Dominie 1).Ay (b. Feb, 9, 1798 : A. Feh. 19, 1868), represented Megantie Comnty in the Canadian Legislature. He was for twenty-five years colonial secretary; lieutenant-govermor of Tobago and later of Prince Edwarid Islant, and gov-ernor-in-chief of South Australia.

1Ham: a bank or mole of earth, or a structure of wood, masonry, or the like, built across a stream of water so as to obstruct its flow aud raise its level. bams are flesigned for the purpose either of creating a reservoir or of securing a head of water to be converted into yower, See Reservorn Dam.

Damages. Measire of: in law, a collection of the rules Which govern the awart of damages in courts of justice. The snbject is one which in intual practice runs ont into great complexity, amb forms the topic of extensive legal treatises. All that ean be dune in this article is to state a few of the prineipal rules that are applied by the conts, and to rufer the realer to leadingtext-hooks and ot her sources of knowledge for clutailed information.

It is necessary in the outart to notice the settled distinetion that provails in the jurimumbence of England amb the U. S. botween courts of law and equity. (See Eotity.) it is the principal prevince of courts of law to award damages as a foompensation to an injural plarty for breach of eontract or other invasions of private right. Courts of equity on the other hand. seek to prevent threatened or apprehended injury, or to comper a party in case of a coutract to perform it. Instearl of "ansing him to gay damagos for its violation. still, in special cases. the equity cumrts, as anxiliary to wher refief, enturtain the matler of clamages. It is not necessary in this genmal survoy to consider these special anses and the rexilue of the disedssion will be confined to the examination of rules concorniner damages provailing in conts of law withont rofurming to special inslaners reangizal in conts of equity. : prehminary remark is that courts of justice als not sark lo gifor an injureal party compensation for all the chamages that he may, by a striot eourse of reasobing, be supposid to have sustained. Thus no conmpensation is given for mental anxiety or sulTeriug, nor is full and ablequate imbonity nocossarily made for
|he costs and expenses to which a party is unjustly subjected in the course of a groundless litigation. The courts adopt rules of practical convenience which, while they may not supply the demands of an ideal system of jurisprudenee. work out sulstantial justice. The principal propositions recognized in the law of damages will now he stated in the form of rules.

Kule $I$. The great general principle governing the law of damayes is to give compensation for the right riolated, and nuthing more. If a party to a contract plainly stipulates for a larger smm in ease of its breach than compensation, he will wot be allowed to recoser it. The stipulation will be regarded as a "penalty," and will not be enforced. This is well shown by the case of an ortinary bond for the payment of money. This is so drawn that it woulel appear that the debtor woulal forleit twice the amount of his lebt if le did not pay with punctuality on the appointed day. still, no more can be collected than the actual deht with interest. The great point of inquiry in regard to the fact whether a stipulation is a penalty is whether the amount of damuges can be ascortaned by a mimerical calculation or its equivalent. It so, an agrement to pay more will not he enforead. On the other hami, if the damages are uncertain in amonnt, and the parties choose to enter into an agreement as to the smm to be paid in case the contract is broken, the corrts will not interfere with it.

Fule II. Fxemplary or vindictive danages are allowable in certain cases, notwithstanding the general principle that the tamages must be compensatory. "Exemplary" or * vindictive" damages mean such as are not in their nature compensatory, but are awarled with a design on the part of the court to punish it wrongloer. The rule respecting them must be regarded as exceptional in its mature, and founded to a certain extent on theories of publie policy. There is a certain chass of injuries (mainly wrongs or torts) in which the bat intent of the wrongdoer is allowell to enter as an element in fixing the damages. So the absence of an intent may lead to their reduction, as where the act was aceidental or committed by an irresponsible person-e. g. at lunatic. Buth of these cases may fall within the rule of compensatory danages. since the presence or absence of an evil intent may increase or diminish the injury sustained. Vindictive datmages go still further, having in them no element whatever of compensation, but are strictly junitive. The eases in which such damages, among others, are allowed are aggravated cases of trespars upon property or upon the person, slander, libel, seduction, cases of frand, ete. Thu theory alopted, as already suggestet, is that ower and above all compensatory dimages the wrongloer should be made to pay a sum of money as a punishment tor his quasi eriminal act. This is but a rude and imperfect kind of justice, and not reconcilable with soum prineiple; for if there is to be an amercement of this kind, reason would dietate that the anomit shonld be paid to the state in the course of some appropriate proceetling, rather than to the injured party. The rule has, however, become too well settled in the practieal administration of justice to be shaken. Puhlic embernence is promoted by it. since the law in a mumer of these cases permits no eriminal proceeding, ant without the doetrine of vindictive damages the wrongluer would escape all pmaishment.

Rule $/ / J$. ln making up an estimate of compensatory damages there are varions cilcumstances to be tiben into acombit, lessming or increasing their amomit. Among them are bodily pain catumbl by a personal wrong. The haw listinguishes between borlily pain and mere mentat suftering. Damage is assumed to be derved from the former, and not. from the latter. In some enses damages enter as an elemont. into the canse of action itself. some forms of slamber are only made actionable by allirmative proof that actual damages of a perumiary mature have been sustained. Thus a forarge of mathastity against a female is not by the common law an aetionable shanler. It may be mate so by proof of eonsequent loss of employment. So in certain cases of slander actual malice on ill-will on the part of the defemdant is proper to be taken into aerount. The fact that a slander known to he false has been deliberately repeated may he used for the phrone of enhancing the lamages in an action simply for the first ufteranee, as it temels to characterize the intent of the tefamer: No damages can be given for the repetition of the slamder in that action, since that maty be the fomblation of a subsectuent proceding, and it would be unjust to award damages twicu for the same violation of right.

Fible I F. From a violation of right the law assumes, as
a rule. that damage will follow. If mo arethat damage is proved, "nominal" damages will bereroverable, sueो as at farthing or a pemyy, It has been said by high authority that "every injury imports at danage." it might at first thought be regarded as an idte and fontisth thing to brine an action when it must be known in advance, from the eiremmstances of the case, that only nominal damages are recoverable. such actions, however, are frepurntly instituted for the purpose of establishing a right. Thas if inspectors at a public election should willfully ind improperly reject an vote, the right to vote might bre vinicated by an action for damages, though it may the ditlientit to say that the elector has sutained any appreciatho damage. A judgment in his faver would at leat estatilish his right. So it one should assert a right of way over another's land, the owner might istablish the nom-existence of the right by bringing an artion agamst the claimant for its exereise. even thang the tropase was really mominal. A judgment to this effeet might be highly important, sime an mumolested exercise of the aserted right for twenty yeas might give the clamant at way by preseription. (Gre prestrbetos.) There may perhape be mases whe no fussilhe present or prospertive damata wombl be sustained by an invasion of right. thence cilled cases of injurius sine demmo (invasion of a right withont danare and accordingly no recovery even of nominal damages can be had.

Kule 1. The ctamages must not he too remote. This is a rule of great importance. and one in respect to which it is easy for inexperienced proms to err. The damatre comphained of mast have been the natural and reasonable result of the act of the wrongloer, or, in cases of contract, mut have been within the contemplation of the parties. Simple as these statements are, they are found in practive to be quite diflicult of applicationi. A wide range of inquiry is open as to the point when the result is nat urat and reasonable. It is plain that no recovery should be had if the damages are realiy attributahie not to the wronglul act of the defendint, but to some intermethate cause. If A were slightIy injured by B, and the medical treatment of the wonnt thas ucensioned were so mskillful as to lead to a dangerons renult, the damage is not to be imputed to the act of li, lout to the want of skill on the physicim's part. On the other haml, if the intermeliate act be in no sense a canse. but ouly an attemant upon the injury, the author of the primary act is liable for all the lamage sustained. there is a well-known case in which a spaib was unlawinlly thrown by one person at another, who warded it off an as 10 direct it toward a third, and so on until the plantiff. a momote preson in the series, was so injured by it as to lose his eye. It wasdecided that the true anthor of the plantitrs injury was the person who first east the spuib, the intermediate parties not having ated deliberately: lat invohutarily and ly way of self-defense. There is an impurtant distinction to be whserved in certain cases betwern actions of tort and upon comtract. In the former ase any one directly or consernentially injured by the acd of tho wrongdoer may hring his action: In the latior the plaintiff man be subtimtially a party to the centract. "Ilus if a person thould lend to another" for use a tood or machine which he know to be dangerems and unfit to be nsed, and diel not give notice of the deleet to the borrower, he wonld be liable to him for resulting damagen. thet not to a mere stranger who might easally make use of the machine. as he would have no connection with the contract of lending.

One of the most impurtant cases that arises moder a contract is whether in an action for fita breach profts that might have treen realized if it had been fultithed may be reeorerel as lamares, shactimes the question womerns the right to as rise of price occurring between the time of the making of the contract and of its fultilluent. It other times it mates to the profits to be gatned from the we of an article, such as a steanaboat ruming for hire, on a mamfactory. The inquiry is to be solved by determining whether the profite can in at just some he said to have hern within the contemplation of the parties. Thas if a seller hand merely contramed to sell a chattel, as, for instance, a stmanbont, is a mere article of merchandise, supposing perhajs, that the purchaser intented himself to sedl it aspin, it combl sarcely he clamed that anything more eonld be recovered for breach of enntract than the rise in price of the stemmtont. Wh the ather hand. if one contractiner to repair sueh an artiele for an owner had been informed that it was to be used for a season to carry passengers on a particular lime. and that for the use of it a large rent could be obtainel, and
he failed without canse to perform his econtract, it might be just to hedd him for lase ol rentel ratur. It wonld he necessary to dist inguish hotwern profits that are in their nature eonjectural and arbitrury, and such a priow as that for which the thing in question womld rent in the market, since the latter would be reasonalhy certain. 'Tle irme line of distinction is betwern that which is unererain, fluetuating, and therefore not ascertainahle, and that which is capable of being measured and ascertained. The same general line of argument must be adopated as to losses sustaineel. If a common carrier. to whom had been intrustel by an owner a broken shaft of a mill to have it repared at a distant point and thon returmod. should nogled to perform his eontract, and the mill shonld consequenty hie idle. lose of rental value conld not be charged to the cancor untes when the contract was mathe her was informed of the relation of the broken shalt to the mill. and thas had the means of knowing the consequences that would naturally result fom his want of diligence. Without such information he might supuse himself liahle simply for the piere of iron considared as a chatele and might lor that reatom fail to exereise the extreme diligence that he wonh have whared had he known all the fucts of the case. Similar qu"stions will arize where ond is deprivel of his property ley wrong. The damages should be the harat, direct, and neepsamy result of the act. Conjectural prolits can mo more he recovered than in the case of cont ract. Thus if one shonh unlawfully deprive another of the nse of a mannfactory eompensatury lamages (as distinguished from vindictive, already explained) would consist in awarding the rental value to the party injured In the case of personal injuries dispualifying a persom from labor or dimini-fing his productive power. the question has arisen whether aceount cen be taken of the presomal profits of a business in which the injured party is engaged. This will themen upen the paint whether thie prolits are reasonably cermain. Thus it has henen decided that the past profesional inemue of a physiom can be considered in such a case. The New York court of appeals has reeently refused to extend this principle to the past profits of a commercial business (such as importing teas), as being 100 mecrtain. (Mfrterton vs, Momt V'ernon, os New Vork heporta. 330, 1sin.) it good illustration of the general prineiple is to lo fomm in the case where a salk of gomeds is mate with a warmanty of their quality. They turn out to be dofoctior, and loss is sustainel. No recovery can ha had except for loses directly attributable to the defects within the wope of the warmaty. Aceordingly, if one should purchase with warranty serds of prass simply as an artiple of morelanlise without informing the soller that he intemded to sow them in his fiehl. and he shond sow them aceordingly, aml, owing to their wat ol germinating qualities, shmid lose the use of his sail for an wasm. he cond unly recover the markel value of the gras-s-sed, anel not for the losenf the nsent the ground. Another conchasion would be reashed if the dealer in eremb had bem informed that growing seed was wated for the purehasiots use , on be sown upm his farm. In a like principle if one should my a ships cable under a warranty that it was a gome cable it would appar, notwithotanding a questionable decision to the rontrary, that he conld not recover tor the boss of an anchor which it failed to lubld owing to its poor quality, unless he hat informed the seller, or that person hat reasin to know, that it was to be nsed in and about a ship, It shonlal be alded that damages are deemed to bo loo remote when ther are probluced or agrervated by the phantiff 's own net or ueglisence. ["uter this salnary rute an injured party is not hy his own remiseness and imatention to allow the damages to become nonecesarily swollon, mal then charge them to the wrongdoer. If a trepmeser shond apen the gate to a farm, and the owner beome aware of it. the latter shmald mot leave the gate onn for (att to to despoil his fied. and then bold the Trespasser responsible, so, if a servant is hired for a definite perial and is wrongfully discharged by his mastor lefane the time has charset, the is not to lie idle if oppartunities to work present themselves and wharge his master for an amount equivalent to his wages Ho shmald have aceepted an offer to lator in the same hasines. received such wages as he could obtain, and only have helld the master for the defieiency. This rule is one of genrral aplication in ath hanclus of hasinese amb dietates that an injured party should use reasonable efforts to confine the Jamares for a wongful act within as narow limits as passible. Damages will also be too remote in al clase of cases where the defendant may have set sumther person in
motion who was the immerlate anthor of the wrong．and vet the loss sustained conld not reasomably have been with－ in the defendant＇s contemplation．still，if the damages could have been foreseen by the dofembant，and were the natural result of his atet，the modern view is that he ought to be responsible．It was at one lime supposed that if the injured party had an action against the direct aththor of the wrong，the instigator of it．being more remotely related to the ocourrance．Wias not liahlo．An illustration of the correct principla will bs fomme in the case where a man－ uger of a theater had induced a singer for a rival thenter to hreak ler engagement for the theatrical seasen．In this ciase the injured party had an action argainst the singer for violating ler entract，and ret the rourt，affer full discus－ sion，helf the manager also liatbe，as the dantitre sustamed was the natural result of his act．The following may serve as an illustration of a case where no liability would attach ： A person defames anothrr，who is a sorvant，in greneral con－ versation．One of the listemers mpeats the conversation to the master，who wrongfully discharos the servant，so as to make himself liable to an action．In such al＂ase it is plain that there is no natural connection between the slander ant the master＇s wrongful act．It may be that the slanderer did not even know that the person defamal was a servant．or，if he diul，harl no expertation that the conversition wonld be repeated to the master．

Inother important question in the law of remoteness is whether the costs of an action growing out of or incifent to the elam in respect to which damages are demandod ran lie recovererl．For instance，suppose that $A$ is a surety for 13．The latter makes default in bityment，and the for－ mer is sued，incurs a bill of eosts，and finally pays the ＂reditor．Shoula he be allowed hiscosts？＇This will depend nfon the point whether his resistance to the action was rea－ sonatble or not．Porhaps it was wholly nseless and moneces－ sury．In such a case the consts can not be regamed as cle rived from the principal＇s default，hat from the surety ${ }^{\circ}$ s own obstinacy or pertinacity．It is a wise course when a suraty or other person is sued，who，in case he is made to par．has a claim over against another，to notify that per－ sum tis make a defense to the action．If he morlects to at－ fomd to this notice，and the parts surd acts reasonably amd in good faith，he may compel the party notified to repay him such costs and expenses as he was ohliged hy the riles of law to pay．Even in this case of notification there must have been some reasonable gromad of defense，otherwise costs cam not be revovered．It has been well sitid＂that nu person has a right to inflame his own account against another by ineurring adelitional expense in the umrighteons resistance to an action which be can not defend．＂

Rule JT．Losses not yet acceram may be inelnded in damages，provided that they are naturally derived from the wronrful act，and fo not themselves supply a sepmate eause of action．If a man were wounded in the skull，and at dif－ ferent timas fresh pieves of the skull shoukd come out，he would not lave a separate action for each piece but only onc for the whole．Aecordingly，whenever he brourht his attion he shoulal reeorer damages for the entire injury sus－ tamed，both present and prospective．Where minjured party may recover the entire damage in one action，in ern－ eral hemast do so，It lue lials to demmat the whole amount， the jurgment will be a har to all further proceredings．It is sometimes extremely diflicult to derermine whether the en－ tire damages can be renovered in mo intions and the law ＂pon the subject secons to be in in poxisjomal and unsatis－ factory condition．Reformee must be made fur precise in－ formation to the deondons of the courts．＇IThe rula now nuder eonsideration beabs a clase ratation to the statute of limitations（see bismations，statiote of），since if the lam－ aras are all meoverahle when the wrenerfal ate is done．that slatate will bexin to run from thatima when the womar was committerl，rather than from the proverl whem subsian－ tial loss is actuilly sumained．7hus if ath attorncy who Was employed（o＂xamine a title should doh his work in sueh a negligent mathor as to induce his elicot to pay a prow for incombered lant while ho only intonded to pay for un－ incumbered，the shatho hegins to rim from the time of the breach of duty，rather than from the formonsure of the in－ cumbrance．

Rule VII．Intorest is frecuently to he paid by way of
 contract to pay intornst；in others，Hue duty to pity interest has no relation to contract，but it is allowell as a comperisa－ tion for the detention of proproty malawfully withhelal，of
is imposed upon a wrongloer as a punishment for his wrong－ ful or frandulent conlute．It is unnecessary to do more than refer to this topic here as it has been sufficiently con－ sidered under the topic of INTEREST．

Rule［III．An important rule applicable to the subject of plealing mast be adverted to．For this purprose a dis－ tinction is taken between general and special dimages． The fommer are such as the law implies or presumes to lave occured from the act complained of．Special damages are such as are not noessarily implied by the law，but in the particular case do in fact arise，and are sufficiently proxi－ mate to be recognized by the mules of law．In this case the law of pleading reduires that such special damares should be set forth in the plaintiff＂s declaration and as a part of his claim．The particular cases to which this mule applies must he sought in the spreial treatises ipmon damages and in works upon fleading．One or two instances may lie re－ ferved to．In an action for a prosonal injury danages for an interruption of the plaintifls ocenpation must le espe－ cially staterl．The same remark may he made of a loss of rent in an action for injuries to real estate．

Rule $I$ ．The rules concerning the measure of damages are matters of law，to be docilled ly the court rather than by the jury．The amount of damages is frequently in the discretion of the jury．This is the case in mant actions for wrongs and in personal actions upon contract，such as a breach of promise to marry．still，over these rases the court exercises a superintending power，and may set asible verdicts for excessice damages，showing，as they frequently do，unlue prejutice or passion on the part of the jury． This．power is sparingly exercised．and only in extreme cases．In extraortinary cases verdicts may be set aside where the damages are too small．This is mainly the case where no damages are allowed by the jury when some ought to be given．

The cases to which the general rules thus referred to are to be applied are very numerous．and require eareful con－ sideriation on the part of the courts．Among them may be mentioned actions to recover jossession of real property or for wrongful interference with it ：actions for the breach of covenants for the tonveyance or use of land；also upon bills of exchinge or promissory notes，upon polieies of insur－ ance，upon the sale of goods，contracts growing out of the carriace of goods，including bills of lading：also botween special parties，such as principal and agent or principal and surety．Actions for wrongs involving damages are among others for specifie gourls wrongfully taken（replevin），for their value（trover），for injuries immediate and direct，to person or property（trespass），for injuries indirect and con－ sequential（trespass on the case）．Underlying all these ac－ tions will be found the rules already stated．For example， if a principal should bring an action against an acent for volating his instuctions in selling merchandise below a fixed price the measure of damages is the loss shstamed， and not the difference between the pries receired and the instruttion price．The fommernle supplies complete com－ pencition，since the principal could obtain equivalent goods by moans of the sum awariled to him．So，if goods be wrongrfully taken of＂converted，＂the general rule of dam－ ages is their value at the time of ennersion，with interest． though，according to some authorities of inferior weight，a much wider range is allowid．so as to include the highest price dusw th the time of the trial．

A pecouliar mule prevals in most of the $[\mathbb{C}$ ．S．，as well as in Englame，in case of a contract to convey lamd．In the alb－ sine of frat or of kowdedge．or reasmable manas of knowledge，on the fendor＂s part that his title is defective． only nominal damages ean be recovered if he fatils to make a coorl fitle to the property which be has contrated to cont－ ver．The prineipal reason of this rule is that in an omli－ mary envenant for title in a decel the ntmost amomat of danamas allowed liy the law of most of the states is the con－ sidaration－money amd the interest．If mo eonsideration has lum paid，nothing can be roobered，so that rise of price dows not euter in as an elemont in an aretion upon a cowenant for title in a bavi．It wombl not be reasonable that，in a contrace to comwer any higher rate of damages should be allowed than would he griven in caso ：m actual deed had heen delivered aml the title had proved defortive．＇I＇le law of damages in real－estate transactions is the refore somewhat anomalous and exeeptomal，and differs widely from that whith prevalls in the case of the sale or contract to sell per－ somal property．Sce the treatises of Sedgwick and Mayne．

Da'mianists: a sect originating in the sixth eentury the followers of lamianms. it Donophosite Pitriareh of Alexandria, who tanght that the 'l'rinity are God only in their unity, divinity boing dividen amming them, not that rach is (Cod in himsolt alome. So the grobleted of the father, sum, and Holy Sjurit forms one simple substance. His adheronts were alion cibllod Ingelitus, from their place af mewing in Aleximbla, the Angelium.

Datmia'nas: a distinglishorl sumhist and rhetorician of Ephests, of whom an aceomm is qiven he his friond Philustratns in his liven of tho Gophints. In his yonth Iamianus had attemded the lectures of Solriamms ant A?lims Aristides, amb he formad himself after the monlel of these. II e tamght rhetorice in his native phas. with great sucorss. IIe was aman of wealth and great liberality, and erected
for his fellow-citizens a beantiful portico. He appears to have left no writings.

Danien de Venster, diăa'mi-ăan'de-vös'tā (Joseph de Venster)."Father Damien" : Roman Catholic missionary, who devoted himself to the lepers of the Ilawaiian island of Nolokai ; b, at Tremeloo, near Louvain. Belgium, Jan. 3,1840 ; entered holy orders at the age of nineteen. Having been sent on a mission to IIonohnlu he learned of the terrible condition of the lepers, in number some 700 or 800 , and in 1873 establisherd himself among them. He was physieian, magistrate, carpenter, teacher-everything. For twelve rears he escaped contarion, but in 1885 the fatal disease seized him. Ife continued his heroic labors to the last, and died Apr. 15. $188 \%$.
C. II. Thlerber.

Damiet'ta: a town and river-port of Lower Egypt: on the right bank of the east mouth of the Nile: about 8 miles from the llerliterranean and 110 miles N. by E. from Cairo; lat. $31^{\circ} 25^{\prime}$ N.. lon. 31 4\% (see map of Africa, ref. A-F). It is irregularly built, but has some good mosques, bazaars, and marhle baths. The modern town was founded about $1 \geqslant 60$ four miles $s$. of the ancient Trmiuthis, which in the time of the crusades was a strong fortress of the Saracens. The latter was razed and the river blocked in 1251, so that large vessels have not been able to enter the harbor since. The eloth known as dimity was first manufactured in this town, and received from it its name. Pojp. (1897) 31,288 .

Ham'mar, or Dâmar [from Hindustani damar, resin, pitch]: a resin prodnced by the dammar pine Igathis lorunthifolia (formerly ealled Dumman orientalis), one of the curions, broad-leaved evergreen conifers from the Malayan Archipelago. The resin is used for varnishes and in mieroscopy, and for other purposes. The dammar-pine grows to a great height, and its trumk is offen many feet in diameter. Its woot. while valuable for indoor use. is unfit for use where it is exposed to the weather. An allied species is the Kauri pine. tgathis australis, of New Zealand, a tree 200 feet in height. Its leaves are linear, about 2 inehes long, and from $\frac{1}{2}$ to $\frac{\sqrt[y]{4}}{4}$ of an inch wide. The tall, straight trunks are mueh valued for masts and spars of ships. This species also yiells a resin known as Kauri resin or Kauri gnm. I thind species, Agathis vitiensis of the Fiji islands, yiedds a valuable resin, and a still more valuable white, durible timber. Other resinous substances are to be found under the name of dammar: thus, Intian dammar is the protuct of species of Mopea, tall trees of the family Dipterocarpers, while black dammar is obtained from another tree of the genus Canarium and family Burseracea. (.. E., B.
1):'110: daughter of I'ythagoras, to whom he left his memoirs ( Gr. íтоцдquara), with strict injunctions not to allow them to pass out of his family. This injunction she obeyed. though in great poverty and tempted with offers of considerabie sums of money. She transmitted them to the care of her daughter Bitale.

Dam'ocles (in Gr. $\Delta \alpha \mu \kappa \kappa \bar{\eta} s$ ) : a syraeusan parasite and courtier who livel at the court of Dionysius the Elder, and was the subject of an experiment recorded by Cicero. As an antidote to his fond admiration of regal luxury and happiness, the tyrant invited him to a sumptuous banquet, where a sword whas suspented by a single hair directly over his head.

IDi'mon: a distinguished musician of Athens. celebrated also as asmphist. Plutarch ascribes to him the invention of one form of the IJdian melody. He taught Pericles music, and was his adviser also in many of his politieal measures. Ilato has spoken highly of the abilities of I amon. Late in life he was banished from Athens, no doubt from the objectionable character of his political opinions.

Di'mon and Pyth'ias (or Phin'tias): two Syraeusans, followers of Prthagoras noted for the firmness of their friendship. Phintias having been eondemned to death by Dionysius I., the trrant of Syracuse, was at his own request permitted to return to his home to settle his affairs, Damon pledging his urn liberty and life for his return. Phintias returned just in time to save Damon from death. and Jionysius, eharmed with sueh fidelity, not only pardoned Ihintias, but asked lemve to share their friendship.

Damoph'ilns of Bithyn'ia: ealled hy Suidas a philosopher and sophist ; reared by Salvins Julianus. who was consul umfer Nareus Antoninus. He wrote a number of works, of whieh Sullas suy he found the following in the libraries: Jhilubiblus, concerning Books worth I'nssessing, and Concrining the life of the Ancients. The notices of Damoph-
ilus are collected by Miiller, Fragm. Hist. (irrec.. val. iii, p 6.76.

Damophon, or Demophon: a statary of Masene,
 and Megalopalis with his works, which were chiclly statues of Parian marlale and of woon. l'a samias mentintis among the most important of his works a stathe of Lacina, ome of Seculapins, of the Mother of the Gods, of Mereury and of Fenus. He was alse (mpheyed to repait the Bympian Jupiter of thidias, the ivory of which han herome lomened in many phaces.
Damophyle: one of the latre group of (ireek lyric fomate potis who were propils. companions, and followers of Sapho. she flourished about 610 b. C... and was a l'amphylan by hirth, but lamphyla was largely (irmok. like har mistress Sapho, she bastracted other foung women. She wrote howequ-ms, and compused thase biymas to. Artio mis which were sung at Pergat. Sone of hor worts is now extant, and very few facts with regard to her are known.
Damoxemme: a comic poot of the new - Ittic comety. probably reaching tack also into the midde periou. He is referme to by thenalus, whe with suidas has pererved the titles of 1 wis of his comedies and has given amsiderable extracts from one of them. Wht that remans of his writings

Dana, Edward Salisbery: mineralogist; b. in New Haven, Conn., Xov. 16. 1849: son of James Dwigut Dava ( $q . r_{0}$ ) : graduated at Yale College. 1800 : assistant Professor of Yatural Philosophy at Yale, 187a: Professor of Physics, 1890; associate editor Americin Journal of Science. 18:5: member of the National Academy, 1884; member Mineralorical Society of St, Petersburg and Geological Society of London : author of Text-book of Mineralogy (187\% ; rev: ed. 188:3); Text-book of Mechanic.s (i881): Sixth Eetition of Mineralogy of James D. Dana (18y?). C. Il. Thurber.
Dana, Frasers, LL. D.: statesman and jurist; b. at Charlestown, Mass., June 13, 1743: a son of Judge Richard Dana; admitted to the har, 176i: joined the Sons of Liberty ; was chosen a member of council of Nassachusetts at that time the supreme executive power in the state, 176:
 he sailed to Europe as secretary to John Adams, who was sent to negotiate a treaty of peace aml commerce with Great Britain; appointed minister to Russia, 1500; appointed a judge of the supreme Court of Massachusetts, 1780: a delegate to the convention which formed the Constitution of the U. S., but his judicial duties and ill-health prevented his attendance: voted for the Constitution as a member of the state Convention consened to ratify it in 1788; chief iustice of Massachusetts 1791-1806. In politics he mas a Federalist. D. Apr. 25, 1811. He was the father of the poet Richard II. Dana.
Hana. James, D. D.: Congregational theologian ; b. in Cambridge. Mass., Mar 11, 1 \%35; graduated at Marvard in 1393, and was pastor of the First church in New llaven, Conn., 1:89-180 . He published an Excmination of Edwards on the 1 Fill (anonymous, Boston, 1rio), and An Et $x$ amination of the same Contimued (New Haven, 1its), in both of which he strongly opposed the doetrine of necessity. Ile received his degree of D. D. from the Lniversity of Edimburgh, 1 i68. I memorable controversy was caused in the denomination by his settlement in his first charge at Wallingford, Com, (158-89), as his liberal primeiples gave great offense to the consociation, but his patriotism during the liewolution did much to allay prejudice. D. in New llaven, Conn., Aug. 18, 1819.
Dana, James Dwight, Ph. D., LL. D. : mineralogist: b. in Utica, N. Y., Feh. 12, 1813 ; graduated at Yale College in 1883: was appointed instructor of mathematies to midshipmen in the U.S. navy and sailed to the Mediterranean, returning in 1835; from 1836 to $18: 38$ assistant in chemistry to 1'rof. Silliman at Yale. He published a System of Mineraloyy (1837; 5th el. 1868). In 1838 he becane mineralogist. geologist, and zoölogist of the Government exploring expedition under Capt, Charles Wilkes which visited the Southern and Pacific Oceans. The expedition returned in 1842, and Mr. Dana was oceupied for several years at Washington and New llaven in preparing for publication reports on the results of the explorations. Among these were Report on Zouphytes (with atlas 1846) : Report on the Geoloyy of the Pacific (with atlas, 1849); Rrport on C'rustacea (with athas, 185:-54). The first-named rejort deseribed s 30 new species and the thind 658 , and nearly all the drawings in the atlases were made by Mr. Dana, In 18.5., soon after Prof. Silliman's retirement from active duties. Mr. Dana hecame silliman l'rofessor of Natural Itistory and Geology ; in 1864 the title of the professorship was changed to that of geology and mineralosy. Ile retained the chair until May, 1894, when he was mected professor emeritus. About 1850 I'rof. Dana hecame associate editor of the A merican Journal of Srience and. Arts, which his father-in-law, l'rof. Silliman, had founded in 1819, and ahont $1 \times 63$ became its senior editor. In 185 t he was elected presitlent of the American Asshation for the Adramemont of sience. In 1820 he received the Wollaston medal from the Geological society of London, and in 1857 the copley gold medal from the Roval Soriety of London. He received the degree of Ph. D. from the University of Munich and that of 1,1」. I). from Harvard University, and is a member of many foreign scientitic societies. Iis principal works in howk-form not mentioned above are Manual of Mineralogy (New llaven, 18ts; 4thed.

New York, 1856): Coral Reefs and Islands (New York, 185:3) : Manuul of Geology (Philadelphia, 186:3; 3d ed. New York, 1880) ; Text-book of Geology (1864; thed. 1883). D. in New Haven, Conn., Apr. 14, 1895.

Dana, Napoleon Jackson Tecumseh: U. S. military officer; b. in Eastport. Me., Apr. 15, 1822; graduated at West l'oint in 184, and May 29, 1562, major-general U. S. volunteers; served chicfly at frontier posts (1842-45); in the military oecupation of Texas 1845; in the war with Mexico 1846-4i, and on quartermaster duty 1848-5.5. He was a banker at St, Paul, Minn., till the beginning of the civil war, when he became colonel First Mimnesota Volunteers, and served thronghout the war, rising to the rank of majorgeneral and filling many important stations with distinction. Resigned May 25, 1865 , anl engaged in mining operations in California and as superintendent, president, ete., of several railroads in Missouri, Hlimois, and Montana 1878$85 . \quad$ Revised by J. Mercur.
Dina, Richard Hexry: author; b, in Cambridge, Mass., Aug. 15. 1887; son of Chuef Justice Francis Dana; educated at Marvard College: studien haw, and was admitted to the har of Boston in 1811. He was one of the editors of the Horth American Review in 1818 and 1819. Itis first wolune of verse. containing his best-known poem, The Bucconeer, was published in 1827 . Ite published in 1833 a collection of his poems and prose works, ineluding some essars which originally appeared under the title of The Idle Main, in 1821-22. D. in Boston, Feb. 2, 189.
Dilia, Richard Hexrx. Jr.. LL, D.: lamyer and author: b. in Cambridge. Aug. 1. 1815; entered Llarvard College in 1832 , but in 1834 suspended his studies on account of the weakness of his eyes. He then made as a common sailor a voyage to Calitornia, of which he wrote an interesting and popular narrative cntitled Tuo Vears Before the Mast (1840). Having graduated at llarvard in 18:39, he studicd law under Judge Story and was admitted to the bar in 1840. He published in 1841 The Seamon's Friend, containmg a Treatise on Practical Secmanship, and also an edition of Wheaton's Intermational Lont in 1860; was one of the founders of the Free-soil party in 1848, and an orator of the Republican party in 1856. In 18.6 he was nominated minister to England by President Grant, but the nomination was rejected, chiefly on account of opposition made by Gen. Butler. D. in Rome, Italy, Jan. $7,188^{2}$.
Dana, William Parsoxs: marine and figure painter; b. in Buston. Feb. 18, 1833. Pupil of Pieot and Lhe Poiterin, Paris; third-elass medal, Paris Exposition, 1878; National Acarlemician 1863. His Chase of the Frigate Constitution is in the eollection of Mrs. William Astor, New York. Studio in Paris.
W. A. C.

Dan'ä̈ (in Gr. $\Delta a v a ́ \eta$ ) : in classical mpthology, a daughter of Acrisius, King of Argos, who confined her in a brazen tower becanse an oracle had predicted that her son would kill her father. She theeame the mother of Perseus, whose father, Zeus or Jupiter, is said to have obtained aecess to her in the form of a golden shower.

Danaus, or Daneat, Lambert : Calvinistic divine: b, at Beaugency, France, in 1530. He studied first law at Orleans, afterward theology at Geneva, and became pastor of Chien; but was compelled to leare his charge in 1563 . After the massacre of the night of St. Bartholomew (15\%2) he fled from France. For several years he was pastor in Geneva, and afterward pastor and professor at Castres. Nle was a very prolific writer on various subjects, exegetical, doctrinal, ethical, etc. His Commentary on the Minor Prophets was translated into English by Stockwood (London, 1594). A complete list of his work' is found in La France Prolestante, iv., 194. In the history of ethics he has a prominent place, as he was one of the first who treated Christian ethics separately from dogmatics. Down to his time and, indeed, for a lonis period thereatter, ethics were not treated as a distinct part of the theological system, but simply as the practical side of dogmatics, the practical application of the dogma. D. at Castres, in Navarre, 150.3.

Dan'aid: an ingenious hydraulic machine, consisting essentially of two hollow eclinders, placed one within the nther, with a comparatively narrow space between; the innor eylinder closed at buttom, the onter having an aperture at the bottom in the center. Between the two hottoms are partitions radiating from the center to the circumference, but the annular cylindrical space is withont partitions. The whole is sustained by a rertical axis, about which it

train them for the armed dance, and was accompanied by songs or hymas. In ancient times, dancing in private entertainments was performed by professionals. The Romans counted it disgraceful for a free eitizen to dance except as a religinus rite.

In Egypt there are dancing and singing girls. who improvise verses and are called almeh. In halin there are nautch (nâteh) girls, who dance on public nccasions. Among savages dancing is still used as a religions rite or as a sort of stite ceremony on important oecasions. Among civilized nations it is a frequent mode of recreation.

Hancing Mania: an epilemic disorder of the fourtenth. fifteenth, and sixteenth centuries, similar to choreat. It is supposed that much imposture prevaled in many forms of this epidemic, hut there were ako many eases in which the subject entirely lost control of the will. This disomer is even now known in Abyssinia. Something similar to it in Italy was ascribed to the bite of a spider called the tarmalua. !ut its greatest prevalence was in the cities of Germiny during the Middle Ages. At Aix-la-C'hapelle, in 1374, there apjearel on the streets crowds of timeing men and women, apparently excited thereto ly the frantic demonstrations at the festival of St. Johm. The dancers were said to tre moljservant of cutward things. but sensible of visions. They appeared to lose all self-control, and would dance till they fill is if dead, and would sometimes heat ont their brains upon the ground. The mania extended to the Low ('ommtries, as well is Cologne, Metz, and Strasshurg, amd comsen much demoralization. Exoresisn was at firs found remeaial, and cold water, as applied by Paracelsus in the sixteenth eentury was very etticacions. At the beginning of the sewenteenth century the St. Vitns's Dance, as the disorder was then called. was alating, and is now ahmost unknown. The "sit. Vitus"s Dance" of our day is Chonva $\left(q \cdot v_{0}\right)$. The excesses of the French "prophets" of the eighteenth century ind the convulsive disorders sometimes seen in the eamp-meetings in the U. S. are prohably of similar character to the dancing mania. sce J. F. ('. Jecker, Epialmics of the Midale Ages (Eng. trans., 3 ed cd. 1859).

Dandelion [for earlior dent-de-lyon $=$ Fr. dent de lion, lion's tooth, probably from the appeanance of its leaves: of. (ierm. Lomenzolta]: the Tararacum officinale, an herhacenns plant of the family Composike, with a peremial fusiform ront. The leaves spring immediatcly from the root, are long. feather-shaped, with the divisions twothed, smooth, and of a fine-green color. The plant grows spontaneously in most parts of the gloke. The leaves when very young are tender, and are often used as a potherb, and it is cultivated and brought to market in considerable quantities for this use. It is a popmar remedy with many medical practitioners in the U. S. ant Europe, having gentle tonic powers. The root in somefimes prepared and ground with colfer, the taste of which covers that of the damlelion. The phat callecl fall dandelion, in New England, is a species of Leontodon. sece Hawkbit.

Dambo'lo: noted Ventian family, extinguished in 1866. The most notahle member was Einero; I. 1108; became boge of Yenior 1119 ; participated in the fonth crusule : eonppured Constantinople dune 17, 1203: extablished the Latin empire under Baldwin of Planders, having himsilf derlined the imperial crown. Though bind when elected doge his :ummintration was brilliant. He secured to Venien hor lull share of the spuils of the conquest, hoth in powinus and treasire, besides commerifal privileges of the greatest importance. The four horses which now sulon the wedern tront of the cluech of St. Mark werw among the booty which was sarried to Venice. I). in Constantimple,

Dandroff: a kind of sipupf that forms on the skin, especially the sealp. The outer layer of the skin is composed of minute horny plates, whichare comstantly and impereeptibly being rubled or washed away. In the feeper layer are mumoross oif glands, atul these are especially well developed ypon the hairy parts of the looly. Tpon the soalp there is frepuently a tembency of the horny celle of the cpidermis to ho formed in extess, and this abmornal comtition eanses what is commonly known as the flry form of tandruff. Those sulforing from this atfection arr nsmally anoyed by tine whitish seales falling upon the shombers in grvater or less quatity whenever the hair is hushed. This hram-like Ilespuamation of the seatp, is termed Pityriosis copitis. I simblar mealy condition of the skin, with slight redness, is sometimes secin upan the haw and other portions of the body.

There is also a frequent tendency of the oil glands of the scalp to secrete an pxecsive amonnt of fatty matter or selmm, which usually dries upon the surface and forms a scurf or thin unctuous erust. To this form of dandruff the term Solorrhout capitis has been applied. If the secretion from the glands is not removed by fremuent washing of the sealp, it is apt to accumulate amb form a thick greasy erust, accompanied by considerable itching and in time by falling of the hair. lin most cases of damfruff there exists in the scurf which forms upon the scal 1 , mixture of epidermic scales and sebareons matter.

As dandrutf is a frequent precursor of bablness, the importance of trating it at an early slage is quite apparent. Whan no indlammation of the scatp is present, persistent Washing and brnshing will often restore the affected part to a nomal condition. The practice of digging the scalp with a comb or wire brush and the use of stimulating "hair tonies" can not be too severely condemned.

George Menry Fox.
Dandy Fover: See Dexgue.
IDane, Natman, Ll. I).: jurist: h. in Ijswich, Mass., Dee. 27, 1752; grambated at Harvarl in 1788. He was one of the most able lawyers of New England, and a member of the Contimental Congress in $1785-88$. in $178 \%$ he framed the ordinance for the govermment and organization of the Nurthwest Territory, in which he inserted a elanse prohifnting slavery: also one prohibiting all laws imprating the obligation of contracts. This, at few months later. was inserted in the U.S. Constitution. He serverl in the State Senate for several years $(104-18)$ : in 1811 was appointed a commissioner to revise ami publish the chartere which hat been grantod in Massachusetts, and in 1812 to make a new pubFication of the statutes. Ile published An Abridgment amd Digest of $t$ mprifon Lenf (!) vols, $1823-29)$, and an t ppendix (1830). In $1890-31$ he gave $\$ 15.000$ to Harvard College. to fonmet the Dane professorship of law. D. in Beverly, Mass., F(l). 15. 1835.

Danegelf, or Dancoold (i. e. Dame-money or Dane-tax) : a tribute of one shilling levied on every bitce of land hy the Anglo-Saxon ind barly Norman kings originally for the purlose of hyyine off the Inames. It was smbeqiaently increased to two shilling:, and thongh albolished by EdWard the C'onfessor' and again by Henry IJ, it reappenred for a time as late as the reign of Richard I.

Dinnelag [for O. Fng. Dena lagu, law of the Danes]: name applied under the later Saxon and caller Nomman kings of England to filteen or more counties of the north and east of Fingland, where the Iname were confined by the Wars of Alfred the Grat : reduced by Ellward the Filder ( $901-135$ ): rose in revolt in the reign of Ehdral, but were foreed into submission in 954.

Danenhower. John Wilson: Aretic explorer: h. in Chicago. 111.. Sept, 30,1849 ; edneated in the puhlic schonts of Chicago and Washington: mradnated from the U.S. Naval Arademy. 1870; commissioned as ensign, 187I: as master, 18\%; as lientenant, 1879 ; served on a surveying expectition in the Forth Pacifie $18: 3-74$; helped to snppress an insurrection in Homolulu. Hawaii, 1873 : served on Vandalia during Gen. Grant's visit to Egypt and the Levant; joined the Arctic sleamer Jeannette at Il arre, France, making the voyage to San Francisco and into the Aretic Ocean. The expedition left San Flancisco July. 1899: the vessel was crushed, aml the crew retreated for ninets-five days over the ice. Lient. Danenhower commanded a boat which landed at Lema Welta, Sespt. 17, 1881, ant reached the U. S. in Jume, 1882. Juthor of The Narralive of the Jermmetle (1882). I). at Anmablis, Ajr. 20, 188\%.

Danos: a yellow-hairod. bhe-erom poople of monderate heifht, bearing resembliner to the Northern Seandinavians, their kinsmen. 'Their hahits are much like the North Germans. Tho Ithash petasant holds his land independently, is
 rant events, and lailly educated. The Dinish painter represents luithlully all form, hut is lacking in vivid coloring and imagination. The Janes deljght in masic, and boast comgusers like Hartmam and Gade. See Devmark.

Danial (Goxl is Tulder, or (rod will jutge): one of the great llobrew jrophots: was a youth when he was earried with many other Jewish captives to hoblon in 60.5 b. c. Whather he was of rofat or only of noble thesernt can not for letermined. Je was macateil at the eomrt of NebachatHez\%ar, and was embnent for leaning and wisdom. JFis
skill in the interpretation of drams weoned for him the favor of the king. why apminted him governor of the province of babylon and ehtef withe mati. Jle explaterd the fandwroting on the wall at lachsha\%zar"s tasat almat oiso
 sians, Jinied wainel the faver of harins the Dede, amd was the first of there prosbents who had anthority over the $1 \geqslant 0$ satraps of the empire the alen "presered in the reign of

Modern Danish is the direct descendant of the Zealand dialect of Oh Danish．Its beginning is approxinately coin－ cident with the Reformation，and its earliest literary inomu－ ment is the Damish translation of the Bible，the so－called C＇hristian III．Bible of 15，50．The Janguage as a whole had Jong before this period assmmed a thoronghly characteristic form．The general tendencies toward weaker phonetic con－ ditions and simpler inflections，which had shown themselves dialectically almost from the beginning，had in some cases already been carried out．as，for instance．the specitic Ban－ ish change during the thirteenth and fourteenth centuries of $k, t, p$ ．to $g, d, b$ ，after vowels．In the fourteenth and fif－ teenth eenturies falls，too，the first considerable influs of foreign words，Low German forms．namels．that were intro－ duced through eommercial connection with the Itanse cittes The influence of German upon the vocabulary，rendered easy at the outset by the contiguity of German territory and the inherent similarity of the adjoining dialects，is one of the most important elements in the external history of Dan－ ish．It was further exerted，after the mildle of the fif－ teenth century，under the Oldenburg kings，and in the six－ teenth century by the Reformation and the retranslation of Luther＇s version of the Bible into I anish，and the devel－ opment，in this and the following century，of a whole litera－ ture of translation based upon German originals．Finally， in the eighteenth century，unter Christian VI，and VII．， German beame the otticial language and in part the mediom of public instruction．The result of this extended influence upon the rocabulary has been to make it in its origin at least half German，although these elements have been thor－ onghly assimilated and accommodated externally to the formative spirit of the language．Since the latter half of the eighteenth centurr．when the lauguage may be said to have assumed its present appearance，a reactionary tendencs has set in to make it in furm more characteristically scandi－ navian by means of a purification of the orthography，the exelusion of additional German words，and the reinstate－ ment of Danish forms

The principal typical characteristics of Danish as a Scan－ dinavian language are the use of the sutfixed definite article with substantives，and the formation of a passive voice of rerbs by the addition of the reflexire pronoun，in Danish－ 8 ． to the active form．With Swedish，as contrasted with West Norse，its most prominent agreements are the change of the diphthongs ei，$a u$ ，and $e y$ to the long vowels $e$ and os respec－ tirels，and the almost total absence of $u$－umlaut．Unlike Swedish，however，it has throughout weakened the vowel of the inflectional ending（in Swedish still $a$ and $o$ ）to a roice－ less $e$ ．Swedish still further differentiates itself from Dan－ ish by the retention of the old $k, t, p$ ，after vowels，and has characteristically maintained as a whole a much more an－ cient condition．In the simplification of grammatical forms Danish occulies an extreme position．The distinc－ tion of masculine．feminine，and neuter in substantives ant adjectives has been reduced to two，in that masculine and feminine hare been united to a common gender；in the de－ clension of substantives but a single case ending，－s in geni－ tive singular and plural，has been retained：in the verbal inflection there is throughout un distinction of person．

Within Danish territory itself the spoken dialects have maintained themselves side by side with the literary lan－ guage in two main groups－the dialects of the islamds and of Jutland．The former，out of which the literary language proceeded．naturally most nearly approximates the literary form．In general the dialects have been less conservative than the literary language．This is particularly the ease in Jutland，where，for instance．in some toealities all distinc－ tion of gemder is lacking，amd even such an inherent Soundi－ navian chatracteristie as the sutlixed article has wholly dis－ appearel．

William H．Carpenter．
Danish Literature－Pre－Reformation Irriotl．－The elain of Weumark to slaare in the glories ol＇the Old Northern literature rests chiefly on inferential gromms．The sagas are an Icelandie development：the skaldie petry is Icelandic－Nor－ wegian．and the songs of the so－called Elder Edda（see EdDa） belung to Iceland and Norway，if not to Iceland alone．（See Icelisilic Literatcre．）It is，however，strongly probable a prior that the Danes had their own heroie and mytholog－ ical lays（or their own revions of lays that were common property in Seandinavia），and some of these are no doubt preserved，though in a much altered form，in the Historica Danica of Saxo Grammatiens，finished about 1907．（See saxo．）Though Saso has much to say about written sources， it is donbtful if any of the Danish poems whieh he para－ phrased had ever been committed to writing．The prose parts of hiswork must also be to a considerable extent based on oral tradition．Whether song or story．Some of the Danish popular ballads also give ceho from leathendom． but none of these are preserved in anything but a compar－ atively modern form．（See Ballads．）The oldest laws date in part from the heathen age，though not codified till Chris－ tian times．

By the middle of the tenth century Cliristianity had be－ enme firmly established in Denmarli，but it was some time bufore the new religion produced any litemry activity．of the Latin historical or bingraphieal works that precede Saxo little need be said．They are brief and feethle，mostly of the ordinary monkish pattern，and show no national or pop－ ular spirit，being intended rather to edify than to instruct or inspire．Three of them deal with the king．St．Kinut： Pussio S．Kanuti．De Ilartyrizatione S．Kamuti，and Ilis－ toria Ortus litre et Passionis S．Camuti．These were doult－ less all composed between 1095 and 1125 on Danish soil ；but the Historia is the work of the English monk Elnoth，and the other two are perhaps also by foreiguers．The Iter Hierosolymifanum Srenomis and the Iita Beati Chetill： also belong to the twelfth century．
Of a somewhat more popular character is a Latin account of the life of St．Kinut（Kinut Lavard，Duke of Schleswig）， written about 1170 and preserved in a MIS of abont 1300 ． A longer Life of the same saint，ascribed to a Scotch ecelesi－ astic．Robertus Elgensis，is unfortunately lost，exeept for a few fragments．（See Waitz，Abhandl．der k．Gesellsch．d． Itissensch．in Güttingen，Phil－hist．Ct．，viii． 3 ff．）Besides these biographies，we have Calendaria．Necrologia，Libri Datici，which are merely records，and，thougl important for the historical data they contain，can not be regarded as literature．The earliest innots are of a similar enumera－ tive character．but these gradually become lessarid．Amons the most interesting is the Anoinmi Roshildensis Chroni－ con Denicum（from sid to 1157），whieh，however，is partly alstracted from Adam of Bremen．Of a sery different sort is the Compendiosa Regum Danire Historia of Svend Aagesen（Sren Aakessmn），which gives evidence of warm national feeling．Svend was a friend of Saso．and，like Saxo，hased his history on oral tradition，at least in part． Most of the works mentioned in this paragraph may be found in the great collection known is Langebek＇s scrip－ tores Rerum Danicarum Medii Eui（Copenhagen，1：i2－ 1ヵデメ）

The Ilistoria Danica of Saxo Gammaticus（finished about 1207）is．though written in Latin，one of the most notable works in the whole enurse of Dinish literature．A store－ honse of ancient heroic tradition．its importance in several later periods of literary historr，and especially at the time of the lomantie revival．can hardly be rated too high．But its effect on the Latin writers that immediately fullowed saxo is hardly berceptible．Immals，clronicles，and accounts of ecelesiastical persomages and foundations continued to ap－ pear．From the fourteenth century may be mentioned the （bumpentium Mistorive Drmice，which long went under the name of Thomas Gheysmer（alive in $[+3 t$ ）．hut which is nuw known to lase been written not far from 1830．This is in part an abstract from saxos Mistoria，which it brings down to 1341．It includes some traditional matter．and is marked by some warmth of patriotic sentiment．The sys－ tem of the sehoohmen was mate known to Denmark by a contemporary of Saxo－Anlers sumessen（Archbishop of Lund 1201－29）－whose two Latin poems，the lost De Septem

Stecrementis and the IIPromeron, an aceount of the ('risition with an exposition uf l'eter lambant's theology, hat of course nothing national abont them.

Of vernucular literalure the ohdest monuments are the laws. Of these, the Shetenske Lon (Law of skanme) is referred to the beginning of the thire emoth century, but mast te derived from a redicetion still more inteiont. 'The two sealamel coles (known comvent hombly as Valdemar*s and Erik's). the dyriste Lore (law of Jutland) and the by-laws of labenshorg, are extant in mamsoripts of abont 1:30. . 111 these laws are essentially of a popmba character amel apo pear to be in the main digests of very whe enstomary cods.
 Thlalirifter udginne af del Fomliske literatur-Airmfund. Next in age to the laws are the two Crorbeyro (l'lat-bouks) and the sitenborf (stome-hook. Wielly lrom Dartmolus de Lapidibus), whith go under the name of the physielan Henrik Harpestreng (cl. 184t). (Sue Jlenrik Marpmatrengs

abont 1710. The university in a sense serered its comeetion with the world. Seliohars formed an exclusive guild, concerning themselves little with the popular life. Polymathy ami its inevitable companions, petartry and supurficiality, tlonrished. Great names in science and scholarship belong to this perion-Trghe (Tycho) Brahe. the astronomer (1546-1601): Brochmant, the theologian (1555-1659); Ole Worm. the antiquary ( $1588-16.54$ ): Kaspar Bartholin. the physician ( $158.5-16999$ ): Thomas Bartholin (1616-80) and Siels Stensen (1638-86), the anatomists: Ole liomer (164t 1310), Who in $16 \pi$ calculated the veloeity of light-but none of these men dit anything to encrirage a national literature, and the condition of the people was one of great intellectual dullness. The conrt spoke German. scholars spoke and wrote Latiu. Yet there were signitioant exceptions to the general neglect of Dimish. The popular hallads. as we bave seen, were sung and collected by laties of rank. A hundred of these songs were edited in 1591 by Velded (154?-1616), who also dit good service by his translation of Saxo (15:5). The Norwegian Peder Clanssan Friis (154.)1614) transhated Suorri's Rommgasögur. I'eter syr (16311:02), the anthor of the first Danish grammar in the vernacular (168), re-edited Verlel's hallad-collection, adding a second hundred ( $16: 5$ ). Religious tyrie reached a high position in the psalms and hymns of Thomas Kingo (163t 170:3). The Norwegian l'eter Dass (1647-1708) also deserves mention as a hymn-writer, but still more for his descriptive proen Sordlands Trompet (begun 1688), which has remained popular is a chapbook. Of it diflerent sort was the intluence of Ambers Arrebo (1587-1635), who made a partly successfu] attempt to introluce into Denmark the spirit of the Renaissance. Arrebo is particularly noteworthy for his retormation of Dimish meter in accordance, to a eonsidcrable extent, with the rules of Martin Unitz. Sice G. Rode, Rentissencens tidligste Efterirlining para densh poetisk Literatur (Copenhagen, 1866).

Though there is abondant evidence that Denmark was not ignored by the medieval joculatores, we have no testimony for a regular dramatill the latter half of the fifteenth century. Danish inamatic history begins with three vernacular plays of the pre-Reformation period-the Comued in de Sincta Dorothen (1531) ant two other comedics. called by their editor De utro Mustru (The Faithless Wife) and Puris.s Dom (The Judgment of Paris). The Domothet is the work of one Christiern Jensen (or llansen), who may also be the anthor of the other two. These plays belong to the schoolIrama category, ind were doubtless performed by grammarschool scholars. They have been edited by S. Birket Smith (De tre aldeste danske Shnespil. Copenhagen. 18it). During the sixteenth and seventeenth centuries the school-trama continueld to he productive. The plays dealt with both sacred and protane subjects, and were sometimes performed at court. The most important playwrights are leder llegelond (1.54-1614) and Hieronymus Kanch (1.939-1607), both schoolmasters, (See s. Birket smith's edition of Hegelund's Siesanna og Catummin. ('openhagen, 188s-9n, and of Rameh's Sheuspul, Copenhagen, 18:6-7.) Thongh the schnol-1) rana serml to shme extent to foster a taste for ilramatic representation, it exercised no such influence on Ioblberg and his suressors an can be traced in the ease of the medieval English plays in their relations to the Elizabethan revival. After Herelund and lanch, imleth, there is a distinet decaldence. which may be ascribed in part to the diseonraging effect of the Latrned Age on vernacular literature.

Ifolbery and his Successons (1710-1N0). -The eredit of breaking awat from the scholasticism of the heamed Age belonse to ludvig Ilolberg ( $16 \times t-1$ \%) 4 ), whose literary attivity lasted trom 1701 till the time of his death. A man of cilture and learning. Well versed in French and English literature, Itolberg worked with one clearly defined jurpose - for rescme the banish people from their intellectual starnation amb social provineialism. In his historical writimes he aimed to make the results of schularship accessible in the varnucular: in his satirical poms and his comedies, to anuse while inenleating some moral or social leseon. So part of his work faldel of its aim, but it is on his connedies that his fame chially depends. 'Ihese were writhon for the newly opened "owharem thoghr. They form a long series of lrilliant dramatic sketches, moteled on Moliete ant showing Finglish intinence as well, but finting thair material in contmonrary Dinish life and manners. Their inexhamathe hamor and grom-natura so far deprived their satime of its sting that the muthor was able to teach his lesson anci to delight his muibure at the same sime. The fun, thongh
not always refined, sinks to positive coarseness surprisingly sehtom. Ilolberg's style is always lively and attractive, but his language shows a greater proportion of French words than it was the lot of lanish finally to assimilate. Holherg Was hy lirth a Norwegian; but there is no separating Norwegion literature from Thanish from the time of the Reformation, when the sealand dialect became the literary language of Norway as well as of Denmark, till the separation of the two countries in 1814. See Danisu Lavguge, NorWegrax Lavgtage, and Norweghan literature.

Thongh he left in disciples, Iolberg is with much propriety called the father of Ianish literature. He successfully assertec the rights of the vernacular; he showed that anthorship might be nade lnerative. and he created a reating public. The period from his death till the rise of the Romantic school under Oehlensehläger (sometimes called the tge of Enlightenment, 1500-1800) was a time of misguided effort in literature rather than of performance. The intellectual tumoil in which the nation was involved by the contest between orthodoxy and free thought was not fiarorable to creative genins. and there was grave danger that Danish literature would wear itself out in pitifnl imitat tion of second-rate French ant German molels. For nearly twenty years $(151-50)$ Klopstock resided at Copenhagen as a sort of literiry dictator see F. Ronning, Rationalismens Tidsalder. I. Thet K7opstockske Tidsrum, Copenhagen, 1886). exercising an influence from which even so original a genins its Johannes Ewakd (1743-81), the great lyric poet, freed himself with difficulty. Ewilds tragedy of Butder's Dod (Balder's Death, 1733) is important not only as sigualing his final emancipation. but as pointing ont the path that Danish Romanticism was to follow. (See Remming, Rationatismens: Tidsalder. II. Det Eurald-Wesselshe Tidsrum, 17T08.5, Crpenhagen, 1890.) Ilis contemprary, the Norwegian Wessed ( $184-8.5$ ), thongh his literary opponent, Wis unconsciously working to the same end when, by his celebrated dramatic paroly hjoerlighed uden Stromper (Love without Stoekings. 1720), he tid so mnelh to free the stage from its servitnde to French sentimentalism. The great comic phet Jens baggesen ( $160418 \cdot 6$ ) marks the end of this periou, but his unique genius forbids our reckoning him as a member of any school. II is homishe Furtallinger (Comic Stories, 1 r<a), which shows Wessel's influence, mate him the literary lion of the day, and his prose. seen at its best in his Labyriuthen (The Labyrinth, a work of trawl, 179-93), would alone entitle him to a high position as a classic. But him spirit and his life were alike too restless for sustained effort. He anderstrod and partly sympathized with the liomantic movenent ; but his luve of clearness and his sense of form were offended at sume of itstendencies. The result was at long literary fend with Oehlenschläger, which is perhains the most lmmiliating clapter in the amnals of Dathish hetters. Soe K. Arentzen, Baggesen oy Vehlenschläger ( 8 vols.. (opeuhagen. 18j0-is).

The Romantic leriod.-The center of the Romantic movement in Demmark was Adan (Chlenschaiger (15:u1850). Introduced (o) the ideals of German romanticism by Steffens, one of the immediate disciples of Schelling, Oehlensehniger breame an ardent devotee of the new school, and nower wavered in his allegiance. The rubustness of his genins, howere, prevented his being a mere imitator, and his tortunate cloice of subjects (made mater the intluence of Ewald's Bulder:s Denl) was an additional safeguard against the danger of sentimentalism. In the mythical and hernicil song and saga of the Xorth Oehlenerhliger found material for a series of noble poems epic and iramatic. which at once ralisel hanish literature to an honorable position in Europenn letters. It is largely due to him that Dinish Thomanticism did not fritter away its strength in whimsical prettiness like that of the swedish Phosphorists. but became a reqenerang force not only in art and letters. but in the whole socialand political lite of the people. Contemporary with Ochlensellaiger, hut survising him more than twenty years. N. F. A. (irmultrig ( $1083-15 \pi$ ) deserves mention in the same hreath as bearing monall share in the restoration of a healthy mational life. Grumetvir is olten arcountel a member of the Romatio school, partly becatise of the freshness and ent busiexin of his grenius, part ly becanse of the nature of the subjects with which his writings deal; hat this clasification is not quite sommd. Grmadtrig's aim was not aristic, bat practical; ho vahed literature and selon:ashiju only as a means to the ethical and religious regeneratim of the prople, and for this he labored with tongue inal pen throughout his long lite. Dante Alighicri (or Allighieri), Ital, pron. datanta-ahi-lee-gue-ailre: the greatest of Italian poets and author of the Divine Comedy. one of the most famous of Italian and of thll poems. The suliject of Dante's life ant works is an intrieate one, and the number of treatises upon it already runs into the thousands. The limits of this artiele preelude the disenssion of disputed points, and permit the statement of only what is now reasonalbly certain. For the sake of clearness it will he well to divide the matter into three por-tions-the first dealing with Dante's life; the second, with his spiritual history; the third, with his works.

## I. Dante's Life.

The poet was born in Florenee, in May or June, 1265. His father was Aldighiero (or Alighiero) degli Aldighieri, a lawyer by profession ; his mother, Bella, of mhnown but probably plebeian origin. The family was almost certainly not noble, and the attempts to conneet it with the Francipani and Elisei, supposably of Loman descent, are more than douhtful, and this in syite of the faet that they were early (perhaps by Dante himself: cf. Inf. xp, 70, seq.) believed to be well fomnted. The earliest known ancestor of the poet is his great-great-grandfather, Cacciaguida by name, mentionell hy Dante (Per. xy. and xyi.). This Cacciaguida married a wife from the valley of the Po, an Aldighieri, probably from Ferrara. Hence came the poet's surname. Une of the two sons of this marriage was Aldighicro; he had two sons-one named Bellincione; the latter had among four sons one named Ahlighiero, who was the lather of Dante. Little is known of the history ot the family thus outlined. Dante makes Cacciaguita say that he followed the Emperor Conrad (probably Contar III.) on his crusade (114), was knighted by him, and perished by the hands of the infiltels. The first Aldighimer is mentioned in a document of 1201, and is placed by lame in Pargatory becanse of his pride. In the thirteenth century the fimily was strongly Ginelph, and was twice ( 1244 and 1260) obliged to go into exile for its opinions. The faet that the latter exile enter only in 1267 has been thought to make doubt ful the poet's birth in Florence: lout this is elearly estahlished by his own statement that he was "horn and nurtured there till the enlmination of his life." (Cone. i. 3.)
Of the boyhoot of Dante we really know very little. There are plenty of fables alont it, but they have no tommation in provalile fact. An important event in his youth we do know-his love for a young girl of slightly less than his own years, who for centuries (ontil our own time, in faet) has lienn believed to be Beatrice, daughter of Folco Putinari. Of this matter. lowever it will be better to sperak in connection with hantr:s spiritual history. Whoever the maden was, she died rougg as Dante himself tells ns. June 9. 1290 ( Vita -Vura Xxx.), and this arent produced a painful perturbation in his lifi. Still he hat to lulfill his duties to the world in which he lived: and accordingly, after some years (probably loward 1205). he maried Comma, dangliter of Manettol lomati. By her he hal at least four chilitren-Pietro, Jacom. Beatrice, and Antonia, Fonr other mames of children aseribed to him (Gabhrielo. Aligero. Elisen, lernarde) appear' lont the existence of these is donbtful. It has been suppoelt that the marrage was not a happy one, and in pron of this passages from the pret's works unfavorable to women, as well as statments of his carly biorrapher, the novelist and romancer Boceaceio, have heen atduced. This, however, is mere conjucture. The indubitable liats are that Dinte nowhere speaks of his wife; and that after his exile (1302) she probably remained in Florence being still alive there in 1:33:?
Bante was, however, not memy a lover, a hasband. and a fathr. He took an eager part also in public athairs. Writing
alout 100 years after Danters death, his himerapher Leonarda Irmin cites a letter of the juet in which he demeribes himself as having taken part with the Florentines in the batele of ('ampaldino, June 12, 1024), This lether, howerer, no longer
 som saty mething about the mator. A pascage in hi-work(Inf. xixi., $\because, \hat{-}$ ) has bern taken to imply that he tow part in the war of the larentines aganat the Aretimes in 135: and he charly informs us that he witnessed the captor
 whether as a shliep he does not say. There is more that is certain in revarl th Danteis conmection with the internal aftairs of formere thongh here also many legend-
 hasies to other states. is has hern satid, he bedonget for a family traditmally Gomplo, yet mot moble and as such he can hatrdy have lomed witholistaste upun the demoeratic movement whel finally in 1903. be mane of the famons Ordinaness of Justiere compelled the old Ghibelline (and (inelph) nohility to cenoll itself in the Arli, or guiles on puin of lase of avil rights. He himself, prohahly at the preseribed age of thirty, enrolled in the Art of Phesians and $A$ puthearies. 110 at once began to holel pablie funsi-
 Humbred, and he was still a member in Mar., 103n. In May, 139. he was sent on an embassy to the commme of San (iemignant-1 he only sure one anong fourtern reputerl embasies. From June in to Ause 15. 180t, her was one of the six prime of the republic. In $1: 001$ he delated in buth the aldermane conncil ('onsiglion delle (apitulimi) and the Council of One Ilmadrad. In April of the same year he was given charge of the widening and reparing of a street-the Viadisun I'rocolo.
In the meantime events wore shaping themselves, with and without the poot's en-opuration, far the groat matastrophe that was to athet more than all else his future life.-
 tione the turbment mobles of Flarence emontimed (o) disturb the life of the republice. The Ghitrollines, as such, hat mandy lost their jower: but sonn two parties appearal among the cinelphs-the one headerl by the hamety Domati. the other by the rich but sumewhat plemian Coredi. From 1300 these parties bore respertively the mames of Seri (Bhacks) and Bimeht (W゙litros), derived from a smilar intsime femal of the neighbring city of Pistois, in which the Florentimes had interferel. The vionene of the enntes in Florence led the fore Boniface Vill. to interpose. Ite took the side of the feri, and intrigued vigomously for thair and his own adrantage. The Biturhi, howewr, had the u!ner hand in lilorenew: and earle in $1: 300$ three partisans of the Neri, alon, it apmears, emisaries of the bope, were condemmed to hory fines. "This drew from the per iwo haughty hat vain letters to the Bi-hop, of Forence, demand-
 In bune of the same year the Serimade direet ipplication to the prop for help. Ile matertonk to sive it, sembing ('ar-

 sontiment tonecur, and the prions determined to exile the heals of hoth parties. Aceording to Dino 'ompagni (but the authenticity of his chronicle cannot be rehed upon), the immediate wempon for this netion was an motheak on June 24, when Dante was one of the priors. From Villanis accombt, however it would seem that the date was hater, after fante had giwn up his ofliee. It is certan, however, that 1):nte inelined to the side of the Bionchi-that is, agamet the fry: It was not long lefore bomface foumt ant her way to aretmplioh his purpose. On the alyiere of C'orsu Whatio is is said. he nominated Chaples of Vahos, hother of Philip, the F'air of Prancer. to the paideater of Fherence.
 Flamentines to rexpet their rights and fortunce contered the
 whe ravared the 'parters of their andersaries with fire und sword. Thus the firi presessed thenselvers of the erowernment, and determinel upen a prowrinion of the Branchi.

 the undisputed tomimony of $t$ wo withestes) of rexturtion anel
 Jemed to a fine of 5,000 -mall florins ant other permalties. Forty days later (Mar, 10, 1:30?) for contumacy in not al pearing aid laying his fino. Lo watembomad to he burned, should he ever be fumel uman Forentine teritory.

When and how Dante left Flarence we the mot know. Relying apprenty upot a statement of Roceaceio that hante Was nomitated by thr Becuehe as luand of a commission to go (1) Rome to pirntest to Domifare arainst the coming of Charthe of Sabois, Lemardo hruni, in his Life bhelared that hinte was in home when sentence was pasad npen him, and lies leard of the full extent of his misomene at ciena on his way home. The hest anthrities (e. os. Scatazzini and bartoli) now agree, howerer, that this mbass is improbmble. Dinotompani, the sucperted chmonicler. atone of contempramise mentions it, ambl many facts are agations it. Buctacedo himself morely states that bamte was nominated to gotulane: but declates that when combenmed he Left Florenoe armetly with Vieri de (erehi. At any rate the pert went into exile, "o to learn haw salt is the taise of nheres brad. how hard the aseent and deseent of others stairs" (l'eral, xrii. ise seq. Whither be went is also in the main dark. Die tells us limself that he journeyend. nearly a herarar, almost everywher the latian tongure Wats spoken. "showing against his will the wound of Fiortume, which oftimes is wont to be anjustly infuted to the wommed " (Com. i. 3 ). The only contemprary statement. berond his nwn hints, the to lies movements is that of (iturami Villani ('romicu ix. 10.1 ): condossene ullo studio u Aolompa, " poi a P'trigi, e im più perti del mondo. Legenes rapiolly wrew, and son winus places in lialy clamet the homo of his presence tor at least a time. When we study the evilener. howerer. we liml that we get maly now nut then a sure glimpse of him; then he lisappears agath from view:
It is wonth while, nevertheless, to give hrimy the story of his wanderings. in so far as it may he made out with reasomablu certanty. From the laseage in the I'erediso (xvii. \&t seq.), in wheh (soceliguida is mate to predict the suffering. that were to the fall his great-great-grandson, it is elear that not long after his hanshment the latter somght refuge in Fermat all the court of the Sealigers. 'I'his (anciaguida deedered. should br binte's first refuge and first restingplate. In spite of this apmently conelasive statement,
 hetwern the date of the perts: banishent and his revort (0) Vermat and that fhese months were fout by him. atong with his fellow-exiles, in rain efforts to effert a return th Flowenes. Ilis name apmars, with the names of sowntern other Forentines, appended to a document diawn
 of the date dune 8. 130?. The downment is magrement on the fant of the signer to make gom any damage inexumed hy Ugolino Chatdini, his shas, or whersof his house,
 the interet of the exiled Bianchi. The attempt was and cess. thomghatuen a lar as the nhtimate purpone of the axile was comerned. How long thereafter thate remained with the exiles is sery meertain. It is certain, howeres, that, from whatever enuse, low foum himself as time went on in a state of growise indighation and age aramat hisown former friende, and at lation hent himself off from them and from all thir progects. In the wods uf laceinguida (t. c.), be loamed by experience the "course af the lestiality, so that it hecame well lor him to have formol at party ly himself." Whather this samege criticism was justified wo know mot ; we know maly that the affais of the exiles went from bad to worse, and in 1304 not inmerievale shipwreck. And it is probable that before this atate bante had gone to Crerom, to lo kimbly rewivel ley the "gran Lambardo," who ahoot certainly was: Batolimumen della sicala.

What the pet dial at flerona is unkenw, as indeed his mestus of livelihond thronsh mast of the yerre of his exile we unkmwn. It has hem tonjertured hy sewal critios
 sey.) that he mate use of his great harning as a teacher. But this in highly uncortain, at any rate in the early yars of his axile. Protably he did not long remain in ferona,
 by his buther Alhim, of whon Dante in at well-know
 oft-memtimen agourn an bologna fell in the yats imme-
 has sumpentei. he was one of the (fhibellime driven ont of Bobugha ly the timelphe (Mars, 1. 1306), and wont with uthers, motalily several profesors and seholars of the uniwerty, to
 ans dwelling in Padon. Sparemty, lowerer. لip did mot

1306, as intrusted by the Counts of Malaspina in the Lunigiana with the task of proeuring peace between them ant Intonio, Bishop of Luni, which task le satisfictorily accomplisherl. And now all certainty fails us for a considerable perint. We do not know how long bante remaned in the Lunigiana, nor whither he went when he left it. It has been said on the anthonity of the fiftemath eentury writer. Flavio Biondo, that in 1308 he was in Forli, employed as seeretary by Scarpetta degli Ordelath. This may or may not be so. Nout this some rear. 180s, the general drift of the evidence, rather than diny definite fact, leats most anthorities to place the poet sojoum in laris. The lloubt, however, as to whether this visit ever took place seems ill-founded, secing that we have the prositive statement of Gioranni Villani (l. co), confirmed by the unhroken tratition of the early hographers. from Boecaceio slown, as to its reality. About what the poet hid in Paris, whether he stmbied or tanght. dill or did not take a degree, and so on, we have no sure information. llis smpposed visit to Osford, which rests upon a rhetorical passage in Boceaccio's Latin C'armen in taudem Dantis, and the statement of the fifteenth century emmmentator, Johames de Serravalle, is, on the other hand, very improbable, to say the least.

If Dante was in Paris in 1308 or 1300 , when did he return to Italy 8 Bocuacio says it was when Henry of Luxembourg (IIenry V'II.), the news of whose exjedition hat filled Dante with joy, was besieging Brescia. But this was in the summer and fall of 1311 , and we hate better evithence than Boccaccio's that Dante was already in Italy in the end of 1310. This is the famous letter adhlressed $\dot{\text { E }}$ 'niversis ot singulis Italice regibus et senatoribus almue L'rbis, nec nom ducibus atque populis, humilis Italus Dantes Alegevii glorentinus of erul immeritus ornt pacem. The letter is undated, but its character is such as to make it certain it was written soon after flenry's entrance into Italy (Oct., 1310). It is a pran, a hymn of congratulation and joy, addressed to all ltaly on the coming of its deliverer: It hegins: Ecce munc tempus arceptabile, quo signa surgunt consolatiomis et paris. It ends: Tic est quem Petrus, Dei ${ }^{r} t$ rarius, honorificure nos monet; quem Clemens, nunc Petri successor, luce apostolicae benedictionis illuminat; ut ubi. ratius spiritualis non sufficit, ibi sptendor minoris lumimaris illustret. The patriot welcomes the restorer of peace to his fatherland: the Ghibelline, the new representative of the lloly Koman Empire: the illealist in thought, the idealist in practice. On Mar. 31, 1311, the poet wrote to the citizens of Florence, scelestissimis $F$ lorentimis, a letter full of litter exultation at the pains they were soon to endure: and he must have been on the borders of Thseany when lue composed it. (Srriptum prid. İel. Aprilis in finibus Tusciae sub, fontem surni, faustissimi cursus IIenrici Cosaris al Itulian anno prima.) On Apr. 16, 1311, fimm the same place he dirseted a third letter to Ilenry himself (Sanctissimo Triumphatori et Domino singulari), in which he urged him to leave for the time the rebellious cities north of the Apennines, and to hasten to the punishment of Florenceripera versu in visera genptricis. From an expression in this lotter it seems elear that Dante had sometime previously seen and done homage to Henry, but whon or where we do not know. Nor do we know the furtunes of Ininte in the years inmediately succealing. The tisappintment of his eager hopes and dreams is of course clear. Henrys doath it Buoneonvento, Aus. 2t, 1313, destroyed them all. No report tells us where Jante was when this catastrophe occurred, nor how he bore it; but of the latter we can judgre from the solemn and bitter words of Beatrice, the last she speaks to the poel (Por. xxx. 133, seq.), as she points out to him in the circle of the celestial rose the great seat already crowned that awaits othe high IIenry, who, to set Italy straght, will come ere she is realy., One more point is clar, i. e. that Dante's bitterness against Florencu had confirmed his exile. Under pressure of the impenting attack of Henry, the city had recalked (Apr. amb supt.. 1811) many of bur hanished sons; but in the list of those exchuded from the benefits of bablo ichgugliones riforma stands the name of baute. And this exchusion is agrain confirmed in a decere of Vov. 6,1315 , but with the adalition this time of the penet's sons. It is not prohable that this attitute of the city towart her greatest citizon was changed during has life. A passage in Boceraccos's Life of
 nificent letter of Dante to a lrurentine friend, bas berb many to believe that the poet was in 1316 given an oppertunity
to return on certain humiliating conditions, but refused inlignantly to aecept the same. The letter, however. exists in but a single and in many ways perplexing mamseript (Laterent. xxix. 8), and is in other respects suspicions, so that little confidence can be felt in its anthenticity.

The truth is that from Noy, 6, 1315. until the year of Dantes death. we have not a single really certain date. In the statements as to his abiding-ulaces and oceupations we are sure there is much that is fabulous, though mondoubtedly something that is true. To draw the line with confidence between the two is well-nigh hogeless. Boccaceio tells us that after the death of Menry VII. Dante went across the Apennines into the Romagna, and was received by Guido Novello da Polenta. "at that time lort of Ravenna," and entertained hy him for several years. Alas! in 1313-14 Guido Novello was not lord of havenna, only podestà of Cesena. So the whole statement beeomes suspicions. Nor is it made less so by the letter in Italian, first published by Anton Francesco Doni in 154. in which, under date Mar. 30,1314 (or 1313, for there is trouble over this), Dante purports to write to Guido Novello from Venice an account of an emhassy undertaken by him for the latter to the Venetians. It is a strange letter, and there are things in it (e.g. that the Tenetims have been umable to modersand the Latin of diplomacy) that can only he said to be inexplicable. Perhaps the best thing is to eall it outright a forgery. The forger, whoever he was, was rery chmsy, for he was trying to connect his falsifieation with an event the true date of which Giovanni Villani gives ns-an embassy of Dante to Venice in 182$\}$.

We can not be sure, then. that immediately after Henry's luath Dante went from Tuscany to the Romagna. Guido Novello became lord of Ravenmafter the death of his unele Lamberto. June 22,1316 . It is possible, perhaps even prohable, that soon after this date Dante first received the aid and protection of the man who undoubtedly made his life less lard at its very end. It is not likely, however, that the poet resicled constantly at Ravenna through all these years. Indeed, we know that now and again (though the precise dates we do not know') he was elsewhere. We need not discuss the long list of unecrtain places with which local pride or eritical ingenuity has striven to conneet the poet's name. Each has its shade of probability or improbability. but it would require a volume to determine it in every case. We shall simply pass over Pisa. Gubbio, Fonte Ivellana, Urline, and the rest. In two eities, howevor, Lacea and Verona, it is practically certain that Dante sometime during these years was, and in both cases the certainty arises from Dante's own worts.

In the twenty-fourth hook of the Purgatorio (v. 34. seq.) Dante represents himself as conversing with Bonagiunta, a poet of Lucea. and as being told by him, among other things, that a mainlen is already born (by mame (rentucca) "who slall make pleasant his city to him, however men may blame it." ('learly when Dante wrote those words he has been in Lncea. and had known the delicate kindness of Gentueca. But when? Troya, basing lis argument uron his identification of Dante's Veltro (Inf. i. 101). with Uguceione delta Fagginola, tells us that the chate must have been later than 1314, for in that year only elid lucea fall into Uunccione's power, having before that been absolntely chosed to Ghibelline or Bianeo (henee to I)ante). Ilere, however. all is conjecture. We cin only say that the date as a terminus a quo has probability on other prounds also.

And now for Verona. We have already seen that a passage in the Paradiso (xvii. 70, seq.) proves that bante was in Verona not lone after his exile, and enjoyed the hospitality of Bartolommeo della Scala. The same passage further on proves that at a later date he was in Verona and reeeived the kindly aid of Bartolommeo s younger brother, C'an Grande della Scala, who becane lord of Verona in 1312. Here again we do not know the date, but it was probably after 1316. Of the intimacy between the poet and Can Grimde the best evidence is the famous dedieatory letter to the latter. expounding the true intent of the Diaina Commadia, which, in spite of all the attacks of the eritics, seems still to remain probahly anthentic. Less fortunate howevar, is the attempt to prove that Dante was in Verona in 1820 upon the anthority of the treatise Quaestio de duobus elempntis rquue et terrae; for this treatise is ahmost certainly a fabrication of a later time.

In the year 1320 ! (hnt, lett us repeat, how long hefore that we do not linow) Dante was eertainly in lavema, at the cont of Guido Nowcllo da Polenta. In that year
he went on ant embasy for the latter of Vinice (ef. G. Villani, (ron. ix. 1:36), anil 1!pon his zedurn from the same he
 the done of the greater chmeh (Sin Pier Magerome ) le was buried with wreat homor, in the gath of a poot and wreat philosophere" let even in death the woary exile was not to have fuate. It wonld be too long atory for sehearse here the vielssitudes of his mortal remains-the longereres of frustratod or but hatf-fulfilled plans of magnifierent preservation and commemoration: the edforts of fanatic chumblmen to briner igmoming even mpon donth: the biekroings of pobrence and liaremat over the gossemsion of the preerous relies; the nlisalynamente of these from their sarenphagus jus hofore they were to he given owere
 hy the master mason Pio lobletti, ats he was tearing down at wall in the old Francisann monastery that statmle rolose by San lier Magrioro ; the conserpent jubilation of all laty. The story can be found in everydetail in the work hy liocei, mentioned below.

## If. Daxte: Spletteab llistory.

Of all poets Dante has most elearly and ummistakably given form and pressure to his own experiente, his owit ideals, his own aspirations. As we stuty his works we grow more and more convincod that they are maderstandable only if we compreheml something of the course of his own imner life. And yot this comprebunsion is in many ways hard to attain, and the confusion of opinion we have fomid in regard to his cxtermal lifo prevails even mor" here. fill it is useful am! even mecessary to imfieate What lines seem in the man to have established themselves. We must speak briefly of his educution; of the hegiminge of his individnal experience : of the phases of thought atul belief throngh which lue passed.

We to not know at what seloons or buter what mastors Dante recoived his marly elueation. Emboubtedly this ednration took the regular mediaral form of the trivium and qualriviun, for the poet knows no other sehmene of instruction (ef. Conr. ii. 1f). Itratition, begmonge as early as the fourteonth contury, represents him as having been taight by Branetto Latini, and this has been thonglat to be eonfirmed by the bemutiful words addressed by the puet to the latter (Inf. xr. X2, seq.):

Ches in ta mente med fitta, ed or mi accora Di voi quando nt pagn paterna
M"insegnavate cume l'uom s'eterna or
These worls, however, sem hartly to imply tho relation of master to pupil : and on other gromms it is improlmble. Branetoo hat inded daring his long exjle in France hecone a man of universal learming, as his Trésor shows ; ame he was, in the words of Giovanni Villani (C'ron. viii. 10). somme masestro in rellarica. as woll as comineiatore e maestro in digrossare i Fiorentini, e fargli soroti in hone parlure. e in satpere guilare e reglyere lat nostra repmblime secomdo la polifica. But in Plorvace be was fully occupieal till his doath $(1 ? 94)$ with orrat publice eoneras. ame cortanly ain not have wiven systematio instruction to lolorentine youth, still his influeno upon finte and the gromp of yoning men to which lanate belonged is undeniablan; and it may well have been moser his imspiation that the port latid the fommation of that laramer which sulsompently mate Villani sisy of him: Questi fle yronde letterato quasi in ommi srienze, hotto fosse luco. 'Jhis learning. as we see it in bante's works, was natnmally the result of the toil of a lifetine not of youth moly. Before his dentla it embraced practically all that a man of has time and commtry conld know. the was deeply versed in many litera-tures-latin (hoth elasical and mediaval), Prowençal,
 Arabic. lle was an meger stulent of philovophy. He was ncepaminted with most of the mathemational and jhysioal soiente of his age. lle know something of music and bainting. Fet he was mever a scholar for the sake of seloblarstijp. dil he knew he used for his own purgoses, not subordinating himaslf to it and beeoming lest in it.

Wore important thme the history of Dante dearning is that of his imorinative life. It is jrobathle that with him the impulse to imaginative expressim and the beginnings of imaginative exprioncя werr eontemporancons. 'I'he former, perhaps, arose from the example of those peets. somewhat older than himself, whe were giving to Italian poetry a meaning imberndent of the Iroverachl tradition-
the poets of the dolce stil monem. The ohamer hat bees begun by the Bulognesp (inidu (inimicedli, whon diod while
 recogrnizes when he calls him (I'urg. xxvi.! !ot):
il padre
Nio e degli altri miei miglior, the maj Rime d'amore usâr tolei é leggiadre
From Joulogna, however, the ". swert new styte" hat passerl oxer the Jpenmines into 'luseany : and there in Hanters boyhood it was pronticed by a whole group of Hets, the mosi frominmet among whom wore lapo diammi. llino Frescobaldi. ('ino dat Pistnia, amd líndu Cinvaleanti. Nible by side with these were poets of tho shle" "Proverteqaizing" sehosl. such as bante da Majano, (inittome (1. Arezzo, Gnito Ormadi, and others. Hence mach pertionl aliscussion amb sume shapp mutual eritio ism. Whether thoow perets belonged to the ohl or the new schonl, however. their subject was the same-manely, love. 'lhis was the theme which the poets of Provener had sot, and it wis mot teparted from esondially. Thate himself at lirst writes about nothing "loc. "Jot he pords of l'rownce, however, lowe was essentially a social fumetion-the servieq of noble and beantiful women for the sake of knightly perfertion and renown. The ltalian jnets of the "sweer hew style "beann to incentify the service ol love with the survice of all spiritnal ileals, making of the particular woman served rather the incamation of these illeals than a person to be humanly admiren and sought. Int this idontifioation was earried by fonte to its utmost proint, until in him we find the whole higher life, intellectual, moral, aml imaginative, conceived in terms of lowe and the service of woman.
barly tomelned by this poetionl theorizing, and thoronghly imburn with the doctrine that earacity to love is the one unmintakable mark of the gentle heat, Dantes imatrinative preocertation soon found an object, a eenter abont which to gather itself. This object was the woman whose mame is forever consecrated in the poot's works, Deatrice. Abont her, whoever she was, the whole spiritual life of Dante adtrwarł revolved. To his arly love for her his fita Nuom is dedicated; to the histury of his later regemeratiom through and hy her his Dimine Comedy is devoterl. And yet. Alospite the fame she has thas attained. she remains for ins remofo, macertain, dim. Putting asible the manifestly romantic account of Boecaceio, we know nothiner abonit har exompt what the poet tells us ; and to him she hemme more aml more simply the incarnation of his own highor natura, so that his words abont her are tull of allimetties and seraning impossibilities. Indeed, there lawo been those wha have denied that she was a roal woman at all; anal chabriate theories have laten constructed to prove that sha was only an deal eroat ure of $\mathrm{J}_{\text {anters own spiril. }}$
lf. however, we take what apturats on the fare of finters words, lbeatrice was a florelitime maiden, nearly a yond yomger than himself, who toward the cald of his ninth year, first attracted his attention and stirred in him the impulse to love. From the time when he dirst saw her he almired and sught hor ; and timally, aftor nine years more, slee hestowed 1 pron him a greeting that mado him firmly her own. "I'heneeforward his mind and imagimation were absurberl in devotion $\{0$ her, and he began to compose poems in her honor, which he eommanieated to other poets, hrawingreplies fom them. For a tima he eomo alded the dentity of his renl mistress by seming to serve another laty (le domue delfe difeove); lint at last. finding that this was eatsingr comment, aml having on one oceasion been ovarcomo by his emotions in a eompany where Beatrion was present, he tohl his seceret for friemb, and soon it had hecome common proprrty, 'l"hongh kwowing that his suit cond yielll him nothing lont at the mosi a greeting and llo plasure of spaking and writing about the laty le loved. So yot contimmed to edmhite hor, until on June $9,1 \geq 90$, she dion, Jeaving him in groat pain and eriof.

 for Boceracoio, in his Life of Donte fo state who Bo:atrico Was. Acoording to hima, sla was the danghter of froloon

 in it we fiml it stated that his damghtor Buatrice wis alroady at that time wife of a certain simone olei bambi. The tratition given by Boceaceos has boon generally acemterd by bante"s biseraphers from the fomperenth to the nineteenth contury, and very reecnly an impontant condirma-
tion of it has heen diseovered. It is the statement of Dante's own son Pietro that his fathers mistress ratly was Reatrice Portinari. (Sce Luigi Roce, Del Comm. di l'ietro di Dante cont. nel Coul. Ashburn. St1, published in the Giorn. Stor: della Lefter. Iful. vii. 3.) Yet in strange and umreal is Dante's account ol his love in the Titu Nuome that, as has alvesely then sail, there are ihose who altogether deny the identitication of Boteaccio, and some who refuse to Beatrice real existenee at all. As early as the fifteenth century Filelfo declaved Reat rice to be only a creature of Hantes imagination : in the eighteenth eentury Biscioni undertook to prove lier a personification of Wisidoin (Sipienzo). In the nineteenth, Grabriel Rossetti has believen her to represent the Holy Joman Empire: Perez, the Active Intelligence; Bartoli. woman in general. others, the latest perhaps seartazzini, have admitted her reality, lut deniet that she was Beatrice Portinari. 'These theories cam not be discussed here, but it may be said brielly that a mere persmification could hardy be honn in a certain year, go into companies, talk over the poet mockingly with other laties, live in a strect in the midmle of the city, and die June 9, 1290. Amb if Beatrice really lived, no argument that has been yet adranced seems sumficient to arcthrow the tradition, lieginning with boceaceio and Pietro di Dante, that she was Beatrice P'ortinari.
While beatrice lived she at once engiged bante's heart and stimed his imagination. by reason of her he wrote rarions poems that gave him a jlace among the best pocts of his time. When she died he meant still to serve ber, innl meditated songs in her honor. But there cane perturbations in his lite. He tomen it hard to keeptrue to leatrice's memory. IIe swervei in his allegiance, exactiy how we do not know, thengh we are sure of the fart, hecanse in P'argitfurio xxx-xxxi. heatrice sharnly repmes him for his faithlessness, and he admits the justice of her words. Moreover, his lapse attracted the attention of his friends. Guido (ivalcanti in particular sent him a somut full of bitter blame ( $I$ ' regno 'l giomo a te 'nfinite mble, e trozedi pensar lroppo rifmente, etc.). It is probable that Dantes fanles at this time wrote both moral and intellectual. Buctaceio has left us the hint that the pet had not abways control over his passions: ant, althongh this statement has been again and again indignantly denied, it semms to he bome out by certain worls of the poct himselt (ef. Perg. xxiii. 115 : Xxvii. 46 : xxxi. 58 ; and the sumnets to Forese Donati). But, besiles moral aberrations there were also spiritual. This too wo know on Danters won authority. In the Fita Fuome itself he has told ns how, some time after Realrice's death, a certain piteons lady (Dmua Diptosa) came to exercise over him an attraction so ervat as almost to drive Buatrice from his mind. And in the Cometron he tells us who this lady was, She was Jhilosaphy, to whon lie turned first for comfort, lut whom he som eame to believe a better mistress than any woman could be Indeet, his powerful imagination, taking a hint, perhaps, from the be Consolatione Philosmphime of Buethins (onn of the books, is he tetls ns, from which his passion for philow phy irose), gave form and personality to this new mistress, and he ronfld think of hep in truly amorons terms. For several years he tried to live by the scrvice of Philosophy, and there have been some to think that he inclinet at this time to the doctrines if those skeptienl and worhtly thinkers, then sonnwhat numervus in Fhnence, whom he himself colle Epicureans. This is, howewr, impobable. There is no cridence in ant of Dante's wroks that he ever censed to he thoroghly a Catholic Christim, ever domberl the immertality of the soul, or therwise shared the unbeliefs of his time. What is more probable is that in a self-confibent and healstrong way, with (ow) little of hamble fath, he strme to penctrate the mysteries of the universe and foml. He tells us himself that he was guilty of the sin of pritie (I Hory. xiii. 136, seq.): : mul his cratemproary (ibosmai Villani silys of him (roon. ix.

 non sapert commosure soi latio." Wै are liel. therefore, ly the germeral drift of Dante's own worls of confessioni to imagine him, atter beatrioes sleath, in a sumewhat reckless and perturbed state of minu, weking rebief in eager stublios, and joining with other young men (perhaps Chide Cavalcanti amoner them), who, thung not unlehevers or Epientreans, had not preseremp an attiture of humble faith. This was that "school" which Beatrice chargeol Dante with having follower (l'urg. xxxii, sa), ahlimg that "his way hat been as far distant from the divine way as is dimant from carth the heaven that highest hates.

Something feverish and meontrolled, then, there was abont these years of Dante's life. And one can not help feeling that this appears in other ways than those already mentioned. For instance, in spite of the great talents that from the start gave him influence and power, no man was ever really less fitted for political life than Dante. Passionate, promil, nnwilling to yided or accommodate himself to others, he can have obtamed only pain from mingling in public atfairs. Jet this very time was when he was beginning to take part in the bitter struggles of Florence. Then, too, it is improbable that Boccaccio's story of Dante's marriage, as arranged ly his relatives in order to distract his minh, though natuifestly in many respects mere romancing. is totally dewirl of foundation in fact. One can not help thinking that here ton the poet showed the effects of a disturbed ind uncontrolled mind. Fiercely studying, hanghtily insisting on his own learning and superior wistom, hastily mingling in public atfairs. recklessly marying, he appears to us as one going throngh a phase of expritience probably inevitable and also prolitable to him, yet such as later to canse him litter regrels.
It was, however, ompy ahase. Dante's passionate spirit speedity ran throush the alluring assumements of grief and fomb them empty. Ani then his imbination began once more to turn to its whl object. Peatrice was dead; thut even so she was superior to any living interest, and the service of her was the service of all betmal and spinitnal things. Gratlually the thonght of her heman the all-alisorl)ing thought, and the whole higho mature of the man found its ideal olject in her. He conceived her as watching over him, even from heaven, and is finally etfecting his conversion from error and sin. 'I'lu" story' of this eonversion is told in the Dicine ('omedy: and there the time of Beatrice's effective interposition in his life is put in the julsilee year 1300. the thirty-fifth year of his own age. In the Vitu Jhoma. however. which was certanly, in greater jart at least, composed before 1300, beatrice is made already to have resmmed her sway: and, indeed, that work ends with the expressed hope of the poet "to say of her what was never said of any womam." It must he then that, during the last years of the thirteenth century. Dante was more amil more clearly finding ont the trme meaning of the service of Beatrice: and That from 1300 he fully saw that this was the tulfilling of his own higher nature-the aspiration and the effort for wistom, for righteonsness, for the grace of God.
And this remained to the end Jante's conviction. No other great change came over his spirit. We do not know, of couse, the exact history of his inner tite lluring his long exile. We can imagine that he was a weary-souled and sorrowful man. As far as this word goes he probably longed most of all for the ent-for peace. This is a favorite word of his, and the story ol Fra llario * wond confirm this view, if we could trust the letter haring his name. Yet Iante hat lecome a citizen of the eternal world, of the city of Goll, and in the light of that he viewed the happenings of our lesser sphere. A sad place this seemed to him, but fortumately temprary. At the very end of his life, it may be, he knew some relief from his prevailing melimeholy. At the court of Guido Yorello at Ravenna he hald, at last, respect and quiet: and if we conld be sure of the anthenticity of the latin eclogues that purport to have been exchanged between him and Giovanni del Virgilio, we could say positively that he became, before he died, ealm, and even at times ghad of heart. But there is great uncertainty here, and we can only leave him, as we see him last, a serrant of heat rice and, throngh her, of God.

## DII. Daste: Works.

1. The Vita Niona.-This, the earliest of Dante's works, whome parpose has been alrealy deseribed, consists of a series of sonnets and canzoni。 aceompanied by a comment in prose. The puems were writhen before the comment, and the latter serves to bind them lugether into an account of

* The famous Latin letter purporting to have been written by Frater Llilarius, a monk of Corvo in the Lumiriana, to Uguccione
 places, in Fraticelli, lita di Dinte, 18th1, p. 35\%. ser. The story menlinned in the text is the following: bicce igitur. quod cum iste homo [Dante] ad partes uttromomtamas ire intenderet. et jer tonensem diewesim transitum foreret, siee loci derotione, size alia causa motus, afl locum monusterii supradicti [Corvo] se transtulit. Quem eqo cum viderem adhur et mihi et atiis frutribus meis ignotum, in-
 Tunc ille, circumspectis m"cum frutdibus, dixit-Pucem.
the port's earty love. "The emmpletal whole, howerer, is rather imaminative than historice in ehatacter-bichtang und Whhrheit in propurtions hard to determime. The date of fimal composition is very uncertain-ruties having varied in opbinion from $12!0$ to 1334 (!). Wanters own statement ( 'ome. i. 1) is that he wrote the work dimanzi all entratel di mine giorentute. If the word giorentute is lespe useld rimblly, as the poet chewhere uses it (efo. (omésxiv.), we shombl have the date fogo. But the book contains an allusion to the date June 9. 1291 ( $\mathrm{I}^{*} . \mathrm{I}^{*}$. xxxv.), and to events
 citeot, soms also to imply smme delay in the fultillment of banter purpose uftur linatrioes death to collocet his poems about her into a book. It is safest. therefore to suppose that
 perias of recent loss, atal to return to the thonsht of bentriee, carried out a phan malier conceivel, and porluced the Fita Jeure. "This would give us the ajpmoximate date 13:14 or 12!s. Ome thing is cloar. i. e. that the tithe - Vonerg stands in essential commertion with the fomrivios and the Dicinu Commedia. It is, in short, the first momber of what Witte las admirably called a trilogy.
 work (ef. ('ome. ii. 13, 16 ; iii. 1) was to set right thene pursons who. misreading Dante's words alsont the Domma Pictose in the lifu Faove, hul hamel him for changing his love. This pitems lady was no carthly reatum, says litnto. bat Jhilosophy (per inia donema intevido sempmer duirla che nellue precalente C"anzone e ragionala, cumpla Filosotia. qualle luee virtuosisximu, etc., ('mor. iv. 1). Hosites this object, huwever. Dinte had anothrr, namely, to gresent to iunorant and erring men a rich bantuet (Conreicio) of reasom, by partaking of which they should be encouraged to noble virturs, amd redeemed from the brutality of the emmon herd. In mader to attain this end Dante thousht to publinh fourt cen uf his own exnzoni-si di comore, come di virlie mutrriate-iccompanying them with an exposition in prose. For some ratson he completel his comment on three poems only: annl to the thre Trolluti thus obtamed he prefixed a gencral intronlace tion. The work is therefore ouly a fracment: lut it is very precions to the sturlent of the Diaine 'omely. lreause it contains inmmerable hints and explanations of " lantu"seonception of philosophy, of momals, and of art. The date of componition has to be lixal by ronjecture from intornal widence: but it serme probsbla that the three canzoni expounded were written betwem 12!.5 and 120.0. and that the comment was begron before 1300, but not cenajletell as we have it until $13060-08$. The work is esuedlially an expression of the frriod in Danters life when he was riving special attention to philusophy: yet it sems. as one ramps, as if when the finishing tobleles were given, the exelusive entt of philosophy were only a reminisernce, and the fusion of phinsophy with faith, both realized in litatrites. Were alrearly complete. It can nol be too mach insisted upon that to the emb Dante newer rejected philosophy; he simply put it by the side uf fath, ats useless and mischiceous without the light of that.

3. THE JIMNA Commedis.- Already when he was writing the Vilu S Fuove fonte hat begnn to busy his inngination with a great poctica! project in honor of batrice (ct. T. . V. xliii.), mol this projnet had probably taken on somewhat the form of the later Divine ("nmedy (l. V. xix.). "'hast is, in ordor the better to show the trme eharacter of boat rimes interposition in his own life. Dinte hat (onleaived of an im-
 eternal life, as doterminod. lowerer, by the chatadero of its life on eurth. In this wise he conld both exprese his derotion and gratitude toward her, who hat come to be the inrarmation of his own higher silf, amd aloo make reat to his fellow-men the true character of their relation to the universe and (iond. In form the aceromt whond le a vision. similne to many vivions that had beror written buth in the
 cursuri di bunte, Florence, 18ith. but loseribud with the immansurably greater charmesc am! tangibility that Jantes fonius mate poscible. "Thus, by means of a imilitule, the inner mature of things shoukl be set forth. sumelh sobeme permittel not merely a literal deseription of the unsend world. but all kinds bf admmbrations of all kinds of truth. Hante was thoroughly imbued with that themry of the fomyfold meaning of all ureat literary works which the most ardent spirits of the Minllle dives lield. He sot it forth in his Conmivin (ii, 1), declaring that what is written must be expoumfed (1) literally, (2) allecrorically, (3) morally or ethice
ally, (I) amagorioally, or spritually. Sud later. in his letter

 such at plat and purpose in hiv mind he maturally filhed his

 where in the st ructure of thes spiritual world. "The whole poman has 100 cantos-the Jull $3: 3$, with an intronluriony eanto, the I'urgulory ant the f'mentisp each :33. Ame in all manture of other wats the same thing apluats. क्ज the student is "raywhere met by pussibilities of at me:luntr that does mot show itself in the mern words.

It womld be too long a task to give a complete ax(onment ot the form and matter vt the Durimp ("omealy. sullice it for say that Dante represputs himself as conducted, to the ent that he may be saved from his own life of errow aml sin (cf. The composition of the Dirine Comedyprohably ocerpied all the last years of Dante's life. If Buccaccio's story of the finding of the lirst seven cantos of the Inferno iu Florence after the pret's exile be trie. he must have begun to write it before that event took place. Jiut undoubtedly what lie wrote then was worked over again before it saw the light. There may be some truth also in Boccaceios tale about the disuppearanee and cutions rediscovery of the last cantos of the Paradiso after the port's death. The mmerons allusions to contemporary persons and events which the perm contains afford a considerable nnoment of light as to when the rarums portions of the work were in Dantes hanls. But these same allusions are abo somerbat confusing at times, and have given rive to great divergenees of opinion. One thing is clear. i.e. that immediately after Dantes deatly his work was received with universal acclamation in ltaly. It was not called Dieine perhaps until early in the sixteenth century but its pre-eminence orer all other ltahan poems was long before that fully estaltished.
4. It Canzoxierb. - Besides the poems incluted in the Jita Jrourt and the Comvito a number of lyrical poems bearing Jante's natue have survived. Solue of these are undonbterly spurions: of some it is hard to determine whether they are gennine or not. The question is made more difficult ant also more importint by the fact that among them are productions of a chameter greatly at variance with the larger works of thate. Such are the coarse sonnets to Forese Ironati. which have often been rejected by lovers of Dante, but which many of the best scholars now admit to be gemuine.
5. The De Vcleari Eloqcextla, or Eloquio.-This Jatin treatise thongh, like the Commin, ouly a fragment. has peeuliar interest both as containing bantes maturest virws on the subject of his native tongue, and as being the very earliest critical work we have upnon the Romance Janguages. It arose from the eager discunsion in the poet's time as to whether a serious writer could venture to use any langnage but Latin. Dante was naturally deeply interested in the question, because he had written or was to write his greatest works in the vulgar speech. He diseussed it in the introduction to the Commio, and there stated (Come: i.j) his intention of writing a book abont it. Just how soon he partially carried this out is uncertain: Boccaccio says it was when he was already near the eml of bis life, but this is a loose statement. It is more probable that the treatise was undertaken in 1309 or 1:310. The work contains some of Dinte's noblest words (e. g. Vos autem cui mundus est patria, celut piscibus "quor, etc.., eap, ri.) aml delightully indicates his final convietion-not that of his earlier rears (ef. J. I. xxv.; Cone. i. J)-that a man's native sjeech is. after all. the noblest and best (1 ulg. Eloq. i. 1).
6. The De Mosirchia. - When Dante felt his political convictions to be mature and his jndgment raluable through experience, he undertook to discuss in Latin, and after the most rigid dialectical method of his time. the nature anti meaning of the great institution whose incompatinility with the pretensions of the C'hurch gave rise to all the larger political troubles of the Middle Ages; i. e. the Roman empire. And in particular he undertook to answer in three books three questions (murerning the empire ( $D e$ Mom, i. 2): 1 . Whelleer it was neressary for the urlfare of the urorld. 2. 1 Wether the Roman people took to itself liy right the office of monarchy or empire. 3. Whether the authority of monarchy comes from (find directly, or only from some other minisler or vicar of from. Eviduntly the third of these fucsions was the critiral nes, consideriner the pertion in which Dante lived. Hin answer to it was that the atherity of the empire came direqly from (tom, and not from Geid llerough the 'lhureh. Thi" | wo institutions were paralle]. Hither wing obe inene to the othor. And yet it hehowed the pulitical and fmparal power to show rejuet and hefor-
 in deternining the date of the treatice some crition (amenis them Witte) bedeving that the abonow of any mention of Dintes exile proves that it wat written hefore 1 Bos. Dhers, howewr, relving an the prommetelly thibelline -haracter of the opinions (:xpessit, boliver it to belong to

withe Explanatory Vistes, pte (Beston, 18:91), contains full infirmation about them.
*. Imotbtret or sptrious Works.-(1) Least doubtful among the works attributed without certainty to Dante are the two Latin Eclogues adrensel to Griovanni del Virgilio (see above). They are mentioned by Boccaccio and Bruni. and were commented by an anonymous commentator of the fourteenth century. Still, stroug objections have been made to them, from which they are not yot allogether redeemed (cf. the article by Paul Mever, in fomanin. 188? p. 325, seq.). (2) Almost certainly spurious are the Seite salmi penilenzinli and the Credo (trasportati alla rolyar poesia da Dante Alighieri). (3) Spurious also is the soncalled Qucestio de Aqua et Terra (the full title is much honger). This treatise, which purports to give the substance of a public disputation held by Dante in Ferona, Jan. 20. 1320, was first published in V'enice in 1508 , by a certain Joanmes Benedictus Jancettus de Castilione Arretino, as he styles himself. It is not mentioned by a single early biographer or cenmmentator, and there is no early manuscript of it. There is reason for believing Mancetti not to have been a very scrupulous person. Moreover, the work itself. which is devoted to the question whether the water, i.e. the seat. is anywhere, owing to its sphericity, higher than the land. is full of the most extraordinary anticipations of the science of the fifteenth century. Mancetti admitted that he hall not given the text as he found it, because it was pherimis locis aluhterinum. but castigatu, limala, elucubrata. Who knows how far his corrections may have gone, even if he had an authentic manuscript to stirt with?

Danton, dumitōn' George dacques: a lemder of the first
 a respectable fimily in very mondrate circmmsinces: received a gombledncotion, and entered on the pratatice of law in l'aris. At the beriming of the revolution he was practicing law with sucress, happy in his domestic relations and fond of goor reading. lle was one of the founders amd leaders of the chub of Cordeliers, which was from the first the eenter of the extreme popmlar party in the French Revolution. In the autumn of 1790 he was chosen commander of the battalion of the national ennard of his district, and in the begimning of 1391 eleeted delministrator of the elepartment of Paris. Is a great revolntionary leader he first won prominence in 1762 . In the carly months of that raar the breach betwean the logislative fisembly amd the king and gucen daily incrased. In dpril war was loclared agsinst Anstria, and the agitation of the foreign war was thus uded to the tumult and confusion of eivil affairs. l'aristinally hroke ont in the blooly insurvection of lug. 10. 1742, which hegan the Reign of Terror. Denton is generally aredited with having instigated this rising. Cortain it is that on the day following it he was raised to the post of Minister of Justiee. Here he was associated with lionamd and others of the Girondists. The success of the enemy on the frontier threw Paris in a panic which presently hecame murderons. On sept. 2 1 anton delivered a powedful speech in the assmbly, clusing with the words, "What must we (lo to conquer and ernsh them? Dare, dare again, and forewer slare!" (Il nous frut de l'auduce, posore de limulace, ut toujours de l'auduce.) 'The same evening the septrmber massacre took plate, whon several hmodred prismers were hutchored in the prisons. It is not clear that Danton did more than make the best of this terrible action.

Te became a member of the Convention: took a foremost part in its deliberations: joinas the Mombain, ws the most extreme revolutionists wre called. on accoment of the high ath remote bomelas they orempied: woted for thas dath of the king dan., 1793 ; was prominent in the establishment of the Revolutionary (ribunal: was a member of the Come mittee of lublic safety ; aided in the overthrow of the Ciromists, but did mot beeomm a member of the new Committee of lobblie sufoty, althourh he himself had proposed criving it dictatorial powers. The Terror polioy was now thorearthly intrenched. Danton conda not approve of the unnmessary excesses, but he was not able to provent them. seroning to fall into a sort of abothy, he either thoment himself helpless or undermated the strength of his enemies. At last Billand de Varemmes imblaced Robespunere to move amainst
 lis followers ware suddenly arrested and takon hefore the Revolutionary tribunal, whiah procerded to shlteme him at once. llis volement horing leal the anthorities to frar that he might excite the erowd in his fewor. When puestioned as to his mane and residunce ho sado. " Ny name is Danton, my clwelling will som hot in amihilation, hut my mane will live in the pantheon of history." Ile folt that he left everything in terible confusion, and prediceded that Robespiarre would som follow hinn to the giaillotine, whicls prediction was varifed three manths after. Tantan, with fourteen others, invluding losmonlins, was guillotimed Apr. 5, 189t. Ile exhituited to the last his usimal intreynd hameanor. Th person [anton was tall, muscular, of ardent temperament, and stemtorian voice. "Nature" said lar.
"hats given me the athletio form and harah expression of lihorty" Ile was a powerfal surakir", and, after Mirabean, probably the ermatest orator in a provod whan great orators were so numerous. Jle was an able politician, thotogh a whement onte and prosonally coburageons (in this a striking contrast to liobespiever). Ile prolnably mulerstand mote clearly than any other man the foree mad direction of the fulitionl comrents ol those turnmant times. Vialent ans his measuras wore his yoliey wat yot marked by steatfantmess and pationl julgment. "Nothing." says Lamartine," was wanting to make Danton a great man except virtue."

Dint'zic (in (ierm. Denzig): a fortified eity and seaport of West Prussia: on the lol't lank of the Vistinlat: Be miles from its entrance into the Baltie sea: lata $54^{\circ} 2 J^{\prime}$ S.. lon. 18 40 H. (ser mith of (rrman Fmpire, ref. *- 1 ) It is traversod hy the rivers Motlan and Radanne, which here enter the Visfula, amd is the tominus of a ratway from burlin, 2i0 miles to the W゙.s. W". The mouth of the Tistula is obstructed by sand-bars. which prevent the acoess of vessels trawing more than! feet of water. Dantzic is surrounded by walls, and derenied by a cititel and outworks, it contains a tine cathedral, berm in 1843 and finished in $150: 3$; numerons Ioutheran and Roman ('atholic clurclaes, an exchange, a town-hall, two gymmaimms. two grammar sehools. losjitals, sohools of navigution, milwifery, und commerce. a schonl of arts and trade, an oliservatory, a publie libary, it musum, an arsenal, and a lock-yarl. Dixcellent timber is exported from this place and great yuantities of wheat out of Poland. The granaries on the Speicher island, on Which fire is prohinited. are capable of storing 2.000 .000 to 8,000,000 bush. Ifuch of this grain eomes down the Vistula and ling on male floats. The manutactures include beer, spirits, Tobacen, sugar, flour, ironware, machinery, amal gold and silver ormaments. In $188!1,339$ vessels, of a thital tommage of 430.914 tons, entered the port, and 1.735 vasels, 50 i.s.98 tons, left it. The exports amount to $\$ 15,000,000$ ammally. Dantzie was founded in the tenth century or earlier. It was oceuplied by the Teutonic Knights from $1: 30$ till 14.54 , when it hecame a free state under the pro tection of loland. It also was for a long time one of the cities of the llamseatic league. On the partition of Pohand in $17!3$ it was amexel to Prossia. Dantzic has been twice besieged. The first and most timous sioge was by the French in the winter and spring of 1 sor, in which the ntmost skill of the French engineer and the science of the Fronch artillerist were sureessfully illustratal. Darshal befehree the Frenth commander, was ereated Dnke of Inantzic. The secomd sieqe was more property a blockate matle by the allios (Prussians and Russians) in the winter and spring of 1813 after Napmeon's lisastrous Lussian campaign. Gen. IRap! ' commanding the Tenth Corps, hela the place, and brilhantly maintained himself motil the enssation of hostilities (Jume 10 ) muler the armistice concludiol between Sapoleon. Dlesamder, and the l'russian king. Pop. (1880)

Win'ulpe (ture. Ister and Danuluius: in frem. Dunau: 13nn. Juma): the largest river of Fimene next to the Volga. Jroording to the rasual view the bambe is supposed to be formad by the mion at Donamesthingen of two streams, the Brigitrh and the Broge, whieh ris" in the Black Forest of Baden, at a hoight of dazo fad above seatlevel. It flows through Wiftemberg and through bavaria with a N. Li. course. It then turns to the s. lis amd reroses the boundary of (iermany and Instria at l'assan, where it is 230 vards wide. In laviaria it recorves tiva Alpine rivers, the luerh, Isur. Inm, Dlmilhl, aml Regen, From Lintz to l'resburg in Humgary it takes a gememaly E. conmes. rowiving the Ens and the Murava. It then flows s. Fio to jts junction with the liath, and lis to Wraitzen. whence it tlows s. through the great phan of IIungary, receiving on its conmen the Whag, the Gran, and the Drave. After maeting the latter it flows s. lis, taking in the Theiss and the 'Temes, and at Belgrate, tho save, where it hestins to form the boundary betwern llungary and servia. It sumlin, opposite lielgrale, it is 1.700 yards wible, hat firther on it be-
comes much narower und very turbulent. beine only 129 yarls will at the pasage of the Iron (iate below Orsova, where it leares the fominions of llungrary.

Many attempts have heen made to romiler this part avallable for navigation. At the lron Gate a chammel it miles long and so yarels wine will be onened for tratlic' dnly, 1 sho. From Orsovia the river llows S. H., N. E., and N. to Cralatz,
making a loop of a curve, after which it receives the Pruth and llows E. to the Black Sea. The delta covers an area of $\mathrm{f}, 000 \mathrm{sq}$. miles and consists of inmumerable lakes and channels. Shipping enters by the sulina or midalle month, from which 1,716 ressels of $1,619.703$ tons clearen in $1 \mathbf{N}^{\prime \prime} 4$. Improvements at this mouth (1894-95) have raisel the denth over the bar to $23 \frac{1}{2}$ feet, and enttings have been made and are still in progress (1896) with the object of avoiding difticult bends. The total length of the river is anout 1, irio miles, and it drains an area of over 300,000 sq. miles.

Dambe. Rembation of the: placing the river umber the protection of international lar in accordance with the terms of the Peace of Paris (1856). Its navigation was made free to the ships of all nations, and a juint commision, composed of representatives from the seven signatury powers and known as the European Commission of the Damule, was appointed to prevent the violation of its neutrality amb to promote works of improvement along its lower course. Successive treatics have continued this commission, guaranteeing the permanent noutrality ol all improwerbents that it shall make, ant granting it various sowereign powers over the river helow Isakeha, such as the collection of taxes to pry for the expenses of the wonks undertaken. The riparian powers are represented in another commission, also fermanent, whose primary object has been to remove obstrnetions in the Iron Gate, for which purpose they have the right to collect a tar from vessels navigating the river. The Anstrian Govermment changet the course of the lamube opposite Viema bre confining its current to a straight, deep channel along a well-constructed quay. A large area of limb was reclaimed for agricultural purposes, and a fine water-front secured. The work was begun in 1869 , under a commiswion, completed in 1881, and cost not less than 32,000,000 gulden, erqual to about $\$ 16,000,000$.

Daphnae: Sce Egrpt, Axcient, am Thmpanhes.
Haph'me (in Gr. $\Delta \dot{\alpha} \phi \boldsymbol{u}^{\prime}$ ) : in Greek mythology, a nymph beloved by dpollo. T'o cseape from him she hesought the aid of the earth, which opened to recerve her, and sle was transformed into a laurel-tree.

Daphne: a celehnted growe and smonary of Apollo, 5 miles S. W. uf Antioch in Syria: fretuented by heathen pilgrims and roluptuariss. Hire was a temple of $A$ pollo, surromed by heautilul groves of liturel and eypress trees, gardens, and baths. "Ihis place was apropriated to the indulgence of licentions pleasmres, amd was the scene of an almost perpetual festival of vice.

Daplue [Gr. $\delta \dot{\alpha} \phi \nu \eta$, the laurel-tree]: a genus of dicotyledonous shrubs of the family Thymelurcere, incluting thout eighty species, all natives of the temperate ant sul)-tropical portions of the eastern hemisphere. They have entire, often evergreen, leaves, apetalons, clnstered thowers, a evlindrical four-lobed corolla-like calyx. bearing eight stamens, and including a sewile, one-celled, one-ovuled ovary, which becomes a one-sected berry, reputed to be prisonons. Many species are grown in conservatories, and the more hardy sorts are plantel in gardens for their beantiful flowers and foliage. D. mezereum, with deciduous leaves, and D. cneorum, with evergreen leaves, botlo from Europe, are hardy in most portions of the U.今.

 water Entomostracans belonging to the order Cludocera, and characterized hy having a bivalve shell, five pairs of feet, and long swimming antenna. They form an important element in the diet of many fresh-water fishes. J.S.K.

Daph'nis (in Gr. $\Delta x \phi=(s)$ : in Greek mythologr, a beantiful youth of Sicily ; the sm of dereury and a nymph of the comtry. He was reared amid groves of lanrel ( $\delta \dot{\alpha} \phi \nu \eta$ ), whence his name. and was tanght by Pan to play on the pipe. Ile became a herdsman, and teniled his heris on Jount Etna, where he won the love of a naiad, who for his supposed unfaithfulness punished lim with blindness. Ite $1^{\text {rayed his }}$ father for relief, and Mercury transferred him to heaven. The invention of bucolic poetry was aseribel to him. The story of Thaphis forms the suliject of the fist idyl of Theocritus, and the name frequently ocurs as a character in destriptions of pastoral life.

Da Ponte daa-pon'tá, Lonexzo: pet ; lo. in Venice, Italy, Mar. 10, 174. Ile became Latin secretary to the Emperor Joseph II. in Viema, where he eomposed several operas. After he had resinled for some years in London, he cmigrated to New Fork in 1805 . About $182 y$ he was appointed Professor of Italian in Columbia College. He wrote the lihretto for Mozart's Ion Giouami and other works. D. in New York, Aug. 17, 18:38.

Dabhhan'ra: town of India; canital of district of the same mame: on the Baghmati; is miles by rail N. E. of Patna. It has consilerable trade in salt, timher, grain, oil seeds. indigo, ete. Pop. (1891) 7.5.561. The district is a very fartile alluvial plain. Manufactures of cloth, saltpeter, potery, etc., are also carried on. Area, $8,335 \mathrm{sq} . \mathrm{miles}$.

DArhlay, Dadase (originally Frances Burney): English novelist: b, at Lym-Ruris, June 13, 1752; a daughter of Charles Burney, the musician. Her father removed to London in 1rifo, and his house was frequented by lurke. Dr. Johnson, Garrick, and other literati, but in these assemblies "Fanny" was a silent and difident spectator. Her first novel, Ecelina, published anonymonsly in 1 ais. had a great success. In 1782 she producel Creilia. She was second keeper of the rohes to Quen (harlotte (1F:(i-91), am wrote an interesting accome of conrt experience in her Diary and Lefters (i wols, 184-46). In 1793 she was married to Count d'Arblay, a French exile. In 1 ats she published a tragedy, Eduy (iml Elrina, which was a failure, as was her last novel. The Handerer (1814). Her third novel, ('amilla ( F 9 9 9 ). was only a peenniary sucess. sha livel in France much of the time between 1802, and 1818. I), at Jath, Jan. 6, 1840.

Darboy, clanr bwăh. Georties: ecelesiastic: b, at FaylBillot, France. Jan. 16, 1813: became in 1839 teacher of philosophy and theology at the seminary of Langres; in 18.01 Bishop of Nancy: and in 1863 Archbishop of P'aris. At
 fallibility, but he recegrized it when it was prombleatme
 when the gumpment trops thak the city he wam with dive others shot at the prom of La Rengette Maty 4 . Smong his prominent works are Les sambes frmmes (1siso); toes

 adided Ojetho laneled a furee which put the lmbina to dight. gum tinally wileol away th his own gowernment. "jpedit then went on th the finlf of barien, where, on the enstern side, wear the butranes, he luilt the font of san somastian. intember to ha the hasis fin his celpital wits. He sum hat so mech trouble with the maties that he enomb hardly leave the fort, and the spaniant iliol in great mumbers from
famine and disease. Ther obtained some seanty supplies from one Talavera. a piratical eruiser who touched there; and at length Ujeda. who had been severely wounded br the Indians, sailed off on Talaveras ship to seek aid at San Domingo: shipwrecked at ('uba, he returned no more. Francisco Pizarro had heen left in charge of the fort, with instructions to wait fifty days for Ojela. after which he and the garrison were Joft free to do what they pleasel. When the fifty days had passed they fomml that their number. though now rellucel to only serenty men, could not crowd into the small vessels which had been left to them: and they deliberately wated until disease and starration had reduced them to the capacity of the boats. Then, sailing to Cartagena Bay, their mumber still further reduced hy a shipwreck. they met Enciso, who haI at length come with his tardy re-enforcenents. Enciso deposed Pizarro and resolved to return to sinn sebastian. Ile found the fort and houses destroved. and by adrice of Ballooa, who had come with him and knew these coasts, he crossed the Gulf of I arien, and about Aug.. 1510. foumted the colony of Santa Maria de la Antigua del Darien. This town prospererl. Enciso, who was distiked, was deposed, and Balboa and Zamudio were chosen learders. Meanwhije Nicuesa's expedition had come to grief, and he was left with a fers men in a terrible condition near Nombre de Dins. Hearing of this, ant remembering that the were now in the territory assigned to him, the eolonists of Darien sent for him. But his overhearing conduct quickly: provoked their enmity; he was forced to sail away in an old, Jeaky ship, and was never again heard of. Bajnoa remained the Jeading spirit at Darien until the arrival of Pedrarias in 1514: and from this point he made his eelebrated journey across the isthmms, discovering the Pacific. In 1519 Panama was founleal and lecame the capital. and the original town of Darien, being in an unhealthy loealitr, was abancloned. But at P'anama the expeditions parted which eventually led to the conquest of Peru. Chili. Chareas, or Bolivia, and New Granadia. and on the other side a large part of Central America. Thus Darien was the nuckens from which sprang al] the great states of Spanish America, except the islands which were already colnnized, Mexico. Venezuela. and the Rio de la Plata. See Helps, Spmaish Conquest in America: Bancroft, Central America, Yol. i.; Oviedo. Historia general.

Dari'us (in Gr. Dapeios: Ohl Egryitian, Ntreioush: Modern Persian, Dera or Murab: Ileb. Daryavesh; (1)d Persian (cuneiform), Duryuhtsh) J., or Darins Hystaspes: King of Persia: son of Hrstaspes, a memher of the noble family of Achemenidic. He was called Gushtasp in the legends of Persia. Ite was one of seven unble Persians who conspired arainst and killed the usurper smerdis, whom he suceected in $521 \mathrm{~B} . \mathrm{c}$. Ile married two danghters of Cyrus the Great, and organized the extensive empire which Cyrus and Cambrses hat] enlarged by conquest. Babylon revolted against him. hut was after a jong siege reduced to suljection in 516 . Soon after this diate he conducted a large army against the nomadic seythians of Europe. Whom he was not able to confuer or defeat. He sent a great ariny to conquer and chastise the Greeks, some of whom harl offended him by aiding the Ionians in their revolt against Darius. His army was routed at the great lattle of Marathon, $490 \mathrm{~B} . \mathrm{c}$. Ile was preparing to renew the invasion of Greece, when he died in 486 b. $c_{\text {., in }}$ in the sixty-third year of his age, and was succeeded by his son Xerxes, who reigned from 486 or 483 to 465 в. c. There is little doubt that at first the name Earius was a title rather than a proper name.

Darius 11., callerl Darins Ochus, or Nothus: King of Persia : a natural son of Artaxerxas Longimanus. He married larysatis. his aunt. a daughter of Xerses I. In 434 B. c. he deposed and suceecled the usurper Sogdians, who had killed Nerxes $1 \mathrm{l} .$. the lawful heir. 11 is reign was ignoble, and disturbed by the rebellions of several satraps. He had two sons of whom the rounger. Cyrus ( $q . v_{0}$ ), is famous from the deseription of his life and character contained in Xenophon's Aubbasis. II is character was weak, and he was the slare of the eunuchs of his court. The died in 40.5 в. с., and was suceeeded by his son Artaxerxes Mnemon.

Birius Ill., surnamed CoDomaxyes: the last king of the ancient Jersian monarchy. A descemlant of Darius II., he ascended the throne in 336 в. C.. on the death of Arses. In the rear 834 his empire was invaded by Alesander the Great of Macedon, who gained a rictory at the river Granicus. Darius. commanding in jerson, was defeated at Issus in 333. and again at (iangamela, near Arlota, in 331 в. c. He retreated toward Mactriana. pursued by the victorious army, which hat nearly overtaken him when he was murdered by Bessus, one of his satraps, in the year 330. The wife and daughters of Darius were captured at the battle of Issus. Alesander married his danghter Statira.
Darjil'ing, or Darjeel'ing : a sanitary station of British India; in a dist riet of the same name, belonging to the Rajashahi division of Bengal; at an elevation of over 7,300 feet above the level of the sea: on a narrow rilge rising from the river Runjeet : 308 miles N . of C'aleutta. It has a sanatorium and a good water-supply, and is a favorite resort of the An-glo-Indians, especially in October after the cessation of the heavf snmmer rains. Pop. witlı cantonment (1891) 14.100.

Dark Ages: the period between the fall of the Roman empire and the reviral of letters abont the thirteenth century. As this revival occurred earlier in Italy than in Northern Europe, the Dark A ges may justly be said to have been of longer duration in the North than in the South. See Mindle Ages.

Hark Day: refers especially to May 19. 1880, which was rery dark in Comecticut. New York, and New Jersey, eausing great alarm. similar days have oceurred from time to time in other places when, as in the case above, the failure of light is not rhe to soliar ectipses. The darkness is sometimes due to fog-as in Condon-sometimes to an unusual thickening of the clonds, or an abumlanee of smoke.

Warlinestornia [named in honor of Dro William Darlington]: is genus of herts of the family Siurnctuiucere, comprising but one known species, the Ifurlimytumide colifornica, a peremial phant of Calitornia. Its leaves are all radieal, ant resemble somewhat elosely those of the Sarraceniss (pitcher-phants) of the Atlantic states, but the size of the lempes of the Barlingtonia is much the barger, the length in wme instances exceeding? feet. The leaves are hollow and twisted, the upper part being turned over into a hoom-like dome or vault, beneath which is the orifice which opens into the eavity or pitcher of the leaf. On either side of the opming two lobes depend, which may be taken to repesent the true leat, in which case the ascidlium or bitcher must be considered as representing the petiole or leaf-stalk. Inside the pitcher the remains of insects are often fomml, their exit 1reing impeted by long slender hairs within the leat. The flower-stak is sometimes 4 feet high, single, and furwhed with bracts: the flower regular. nodding. and single, and about ? inches across: the calys straw-chlored, of five sepals, all printed; the five petals are pate purple, the stamens twelve to fifteen, nearly hickden by the top-shaped Wary, upon which there is a style with a diver-parted stigma. The capsule is tivecelled, many-speded, and an inch long. This plant is the representative of the samacenias of the Alamtic states, and with them and the Meliumphora of South Amorica comstitutes the whole family as far as it is kuown at present.

Harmesteter, Irsixe: French scholar: h. of Jewish parents, Jan, 5, ik40. Ile was destined by his father to be a rabhi, and received the education customary in such cases. His father. however-a very intelligent man-wished his son to have more than the enstomary training; to be a doctor of letters, as well as a rabli. The son, meantime, inclined bure and more to the stndies this phan implied. Already seientific impulses had lseen awakened in him. In the Jewish achool he had been struck with eertain Ohd French glasses upon Hebrew words, ocenring in the commentaries of Raschi, an eleventh-century Talmudist. These lauz, as they are called. written in liebrets characters, had never beell deciphered or explained in selentific fashion. Before he had done with them, Arsene barmesteter had proved them to be our most precions evidence as to the exact form if the French trague in the eleventh century. In 1868 he Breame a pupil of Gaston Paris in Ohd French, and from that time his name is indissolnbly connected with the history of Lomance philology. With rate sagaeity, with creative imagination, with deep enthusiasm, he gave himself up to the study of the real life and history of the French tongue and of French literature. No one in our time has done more to throw light upon both. We can not here follow his researeles: we can only give the list of his contributions to science. sutfice it to sity that averything he produend abounds in original and profound shggestions, sach as emly to creative mimil is capathe of. In trit he was assorinter with M. Itatzfeld in making a new dictionary of the French language and he bithored inkm the task for the rest of his life. A series of artieles in the Romania showed his constant interest in the problems which hat early engased hin attention. In $18: 5$ he ohtained the Doctors degree on a highly original thesis tonching the history of Fronelo apic (Fluwent). The same your he published le la

Darninism: a tom frepuently nsed as symmymons with awhation. but [roperly more restricted in its meaning. Evolution is the hoader term, and impties dewelopment by deseent wherever it may ordir-that law of nature wherehy the simple is constantly lending toward the complex, the matifermatiod towarl ditferentiation. The formation of
the solar system from the primordial nebnlous matter and the differentiation of the modern Romance haguages from the parent Jatin are instances of evolution. Darwinism, on the other haml, forms one portion or one aspect of organic evolntion. Organie erolation teaches that all living furms have descended by wiriation ltom a smaller number of more primitive original forms, while Warwinism is an attempt to explain one part of that process. For a more extended view of Darwinism the realer mast refer to the article EvoLution, but here it may be briedly stmamarized as follows: Aceorling to barwin the existence of variation is admitted without much refremee to its canses. II is great principle is what he has called " natural selection," and what Jerbert Spencer has aptly termed the "survival of the fittest." In originating new Farifties of plants or new breeds of anmals the farmor exerefses an artificial selection. He takes those individaals which present variations in some desired line, and uses these for reproduction; with the next gencration a similar sefection is male, and so on until the result is far ditlerent from the parent stock. Darwin maintains that a somewhat similar, though not intelligent, selection ocemrs in nature, those individuals which present some variation which better fits them to their surroundings being more apt to survie than thoir less finored relatives. That this seleetion must oreur is ohvions. 'the rate of reproduction of any organism is so riapid that were it not eheeked it wouhl soon completely fill the earth. There is consequently what may be metaphorically catled a struggle for existence, not only between indivilluals of the sime species, but between different species as well, and in this struggle it is evident that the fittest nost, as a rule, survive. Thus nature exercises a selection and. like the breeder, originates new rarieties. The sume prores carried further produces wider diverences from the parent stock until at last new species and higher gromis are differentiated. It must be understood that the initial variations procect in alt directions. One plant may have the advantage through the development of spunes; another through the existence of poisonous juices; a third throngh an inconspicnons habit. So it would follow that these forms must continne their evolution in different directions.

Thus with Darwin (and this is Darwinism) the great iclea was that the factors in the origin of species are: animals Vary; there is a struggle for existence : nature selects those best fitted for their environment, and these survive. A few years later two other schools arose. Both believe in evolution, but they diller in their ideas as to its methods. Darwin pait little attention to the origin of variation; its existence was emomgh. He recognized that variation maly be spontaneous, i. e. that it may originate in some recondite nodifieation of the germ-celis: anm also that it nay result from the ctrects of use and disuse. Ile regarled the fact of variation as all important, hat aplarently did not give mach consideration to the canses of ewolutionary variations. That he saw some of the ditliculties connected with the inheritance of acquired characters is shown by his provisional theory of pangenesis. See IIeremitr.

Under the lead of Prof. August Weismann, of Freiburg (Baden), a third school-sometimes called "Neo-1)arwinians "- arose. For a summatry of the groands of their belief the realler is reformed to the article Henemory; they helieve that those variations which are produced by use and disuse, by enyironment anel by all other than moditications in the germ itself, are incapable of inheritance, and hence can phay no part in the evolution of new varieties or higher groups. The variations which ean be inherited must arise from and in the germ itsolf, and hence must he, so far as we can see, largely formitoms, and by acting mpon thew, natural selection und herality prodnce their results. Opmosed to this is the "Nen-lamareki:n "sehool which believes, with Iamarcok, that in evolutionary viriation use and disuse and enviromment are eflective canses, ame that these "acfuireal variations" are (atpable of transmission from one gemeration to amother. (Gee lamarchianism.) The struggle between these schosls is not over, and it can not be predicted which will provaik. At prosent the majority of the embryologists are followers of 1 V"asmant, whila inost palamotologists follow lamarek. Foor the argmments of those who oppose Darwinism, see sir J. W゙. Jawson's article amber Wvolution.
J. S. Kingislisy.
 ant anthor; b, at st. Fincout, What Indies, in 1830: graduated in 18.60 from Magilalea Ilall, Oxford; was calleal to
the bar at the Middle Temple in $185 \%$ and appointed civil service commissioner in 1870 : was for some years one of the assistant editors of the London Times, and beerane in 1871 editor of Fraser's Magazme; translated The Founger Eddu (1842), anl published The Vorsemen in Ireland (185.5); The Story of Burnt Njal (1861); sielection of Norse Tales (1862), etc.; also edited An Icelamlic-English. Dictionary based on the MS. collections of the late lichard Cleasby, enlarged and completed by Giulbrund Tigfusson (1874). He received the honor of knighthomd June 27,1876 , and was an original member of the Royal Commission on IIistorical Manuscripts. D. June 11, 1896.

Dash'iell. Robert Laurenson, D. D.: clergyman; h. in Salishury, Ma., Jume 25, 1825; graduated with honor at Dickinson College, 1846 ; joined the Methodist Baltimore Conference, 1848 , and oceupied prominent pulpits in the Wirldle states down to 1868 , when he was elected president of Dickinson College, P'a. ; resigned in $18 \mathrm{~F}_{2}$, and same year became corresponding secretary of the Missionary Docicty of the Methodist Episcopal (hmreh. 1). Mar. 8, 1880.

Dash'kol, Ekaterina Jomacoyna, Princess: a Russian laty eminent for talents and learning: b. of a noble family, Mar. 28, 1743 . She became the wite of Prince Dashkof and a triend of the Empress Catharine ll. She was one of the chiefs of the conspiracy which dethroned leter II. Soon after this avent she lost the favor of C'atlarime, and passed several years in a tome through France, Germany, and Italy. llaving retumed home in 1 -82. She was apmointed president of the Academy of soiences at St. Petersbnig. She was the tirst president of the Russian Aeademy. fommed in 1784. and sumerintented the compilation of a great dictionary of the Russian language. D. Jan. 16, 1810. Ner autobiograHyy was published in English in 1840.

IHa'sya [a mod. quasi-1at. formation from (rr. $\delta$ oaves, thick, shaggy]: a genns of red alge, of the family hhodomelacere+ nine or ten species ol' which are tound in the U. S., and seven species in the british ishands. They have peat-shiphed spores, borne in ovate conceptacles apon the smaller branches. The grenus inclurles some very handsome seaweeds.

Dasyporlida [from Dosypus, the typical genus; from
 mammals comprising the amoadillos; characterized ly having the back and head protected by bony shidds lommed of mumeroms pieces, and the tail encased in bony rings or covered with irregular plates. The tedtare momerous and simple, and, with the exception of Tatusia. there is but a single set. The neck vertebre are short and broad, and the second and third or more are nnited. 'I'lue lumbar vertebra have long processes reaching to the bony shich, the clavicles are well developerl, the femur has a third trochanter, and the fore lont has three, four, or five strong claws. Jyy some anthorities the gencra Chlamybopmores ( $q . x_{0}$ ) and Tahusia ure made the types of distinct families, leaving the Encri Imsypus, Jenurus, Iriodon, and Tolypeutes. Wice Armadillo.
F. A. Lucas.

Das'yure [from Gr. $\delta \alpha \sigma$ ús, thick, shaggy, hairy + oupá, tail]: the common name for any member of the genus Dasyurus and fanily Dasyurider ; a group of flesh-eating marsupial unmmals, which plays much the part anong marsitpials that the weasels do in the order Carnivora. The dental formula is I. $\frac{5}{3}, \mathrm{C} . \frac{1}{1}, \mathrm{Pm} . \frac{2}{2}, \mathrm{M} .4 \times 2$, or 42 teeth in all. The lasyures are animals of moterate size, found in Australia, Tismania, New Guinea, and some of the adjacent islands. Most species are more or less spotted, and, as the mame implies, they have bushy tails. The viverrine dasyuro (I). vivervinus), a typical species, is about 2 feet in total length, gray or brownish-black above, spotted with white on the head and hody: light brown or whilish beneath. It is a resident of Tasmania and New South Wales, and is destructive to poultry. See also the articles Tasmanian Devil, Tasmanian Wolf, and Thrlacinide.
F. A. Lucas.

11Anhigué. dū buen rä., Jeas Hexri Merle. D. D. : Swiss divine and historian: b. at Eaux-Vires, near (reneva, Aug. 16, 1794. His father's name was Lonis Merte. Having studied theology at (ieneva and Berlin (umber Neander) he became pastor of the French I'rutestant church in Iamburg, 1818: conrt preacher in Brussels, 1se3; Protessor of Churel History in the Theological seminary of the Evangelical Church at Geneva, 18:31. His mincipal work is a History of the Reformation in the Sixtenth ('entury (1835). translations of which have ohtained extensive circulation in Great Britain and the U. S. In 1863 he logan to publish a History of the Reformation in Eurupe in the Time of Calrin. He also published the Protertor (Cromurll)-a Vindicution (1848). He is much praised for the vivacity of his strle, the fervor of his pietr, ind the pronounced ortholaxy of his opinions, hut he has no standing as an authority. I). in Geneva, Oct. 2I. 187.

## D'Anhigué, Théodore Alirippa: See Aubigné, d’.

Daubiguy, dóhen yec'. Charles Fraxçors: landscapepainter ; b. in Paris. Feb. 15, $181 \%$. Pupil of Edmé Daubigny and of Paul Delaroche; first-class medals, Salons. 185\%, 18.9. and 1869: officer Legion of Honor 18:4. Daubigny is commonly associated with the fammus Fontainehleau group uf painters. just as Cornt is sometimes, though neither of them painted in the forest or at Barbizon. They both belong to the same general movement in art as Millet, Romsscan, and Diaz, but baubigny has gone further in the direction of absolute truth to nature than any of them. IJe lived and stadied so much out of dons that he has tried in his pictures. more than any of the great landscapre-painters of his thay, to preserve the actnal lakk of nature. He was not contrut to use facts for a hasis and paint his remembereal impressions. Perhays it was a matter of temperament with him, or possibly he found the results of such work as he may have attempted, if he followed the methots of Corot ant others who preceded him. less satisfactory than those he achieved when he adhered more closely to his sturlies from nature. Be that as it may, there is in his work more of the impression of what we fincer we have seen onrselves than there is in the creations of the other great artists, and we are apt to think that Daubigng's landscapes contain more actual truth than is to be found in any others. But while filelity to nature's looks is a conspicuons quality in his painting, it by means overshadows others that are essential in the highest fieks of landscape. His work is most highly appreciatel by artists, and he is distinctly a " painter's painter." They like his honest direct method, his evident sincerity, and they admire his winning, teader way of leppicting Nature. copying her many moods with a loving hand that fears to add or take away lest her fair beauty be marrel. There is no exaggeration, no falsifying in his pietures in one place, or toning down to make them more forceinl in another ; everything is kept in its just relation to avery other thing, and his work seems as absolutely truthful in effect as paint can make it. One of the finest of his landstapes is in the collection of John G. Johnson, Philadelphia, representing a view of a town by a riverside' and a small eanvan On the Ricer oise, a wonderfully heantiful effect of aftrmon smshine, was in the collection of G. I. Seney (sold in New York, 18!11). His pictures are frequently seen in public exhibitions in the L.S... and a large number of excellont canvasises hy him are owned in this country. Sercual works are in the Lonvre, and an especially fine one, A Stuice in the Opferoz lafley, formerly in the Luxembourg Gathery, is in the Phasem at Ramen. Daubigny traveled and stublied in ltaty when a roung man. but painted almost all of his pictures in France. Dle han a studio at Ausorsisur-0ise, mother in Jaris, and a stutio boat in which he male loisurely trips along the seine and the oise, painting as he travelem. Ho was an etcher of great tatent amd left a larg number ol phates. It may juatly he saik of him that he never panted a had pieture and he ranks deservedly among the three or fom areation masters of landseape-painting of his cyntury. In excellent hiographical sketch of Thubigny was phisishet in the cemtery Magazem, duly, 1s!? I) in Paris, Feh, 19, 18 is.

Whimam A. Coffis.
Dambigny, (harars bierre (ealleq Kiard): landseapepainter; son of ( ${ }^{\prime}$. F', Wabliguy; b, in laris, June ! 1 , 186.
 Salon, 187. An excellent painter whene syly is imlivilual and whose melhots are frank ame dirert. De painted in company with his father in the valleys of the seine and

Oise, ant also on the Normamty coasts. One of the best of his works is The St. Simeon Furm (1879). D. at Auvers-sur-Uise, 1lay, 1886.
W. A. C.

Danluée, dō brā', Gabriel Atgeste: mining engineer and geologist; member of the Institute; b. at Metz, 1814: from the Polrteehnic schonl and the School of Mines entered the corps of mining engineers in 1834 , and was one of the commission to explore Algeria. In 1839 he was Professor of Mineralogy amb Geology at the Acalemy of Strasshurg and engineer of mines of that residencr, and engineer-in-chief in 18\%\%. In 1861 he was called to P'aris as Professor of Geology in the Museum of Natural History : the next year professor in the school of mines: in $1866^{\circ}$ inspector-general of mines; ant in 1823 director of the school of mines. Oticer of the Legion of Itonor in 155s. he was made grand otheer in 1864. In 1861 Ianhrée was elected almost unanimonsly a member of the Institute. He published many memoirs in the Amales des Mines and in the Comptex Kendus of the Academy, D. in I'aris, May 29, 1896. W. R. H.

D'Aulbissoli. Pierre: See Aubuston, d'.
Dandet. dōdā'. Alphosse: author: b. at Nîmes, France. May 13, 1840: settled in Paris in 185: ; made his debut in literature with some pooms-Les A Aoureuses (1858); La Double Conversion (185\%). In 1864 he liecame secretary to the Duke of Mony. As a dranatist he achiered no small success-La derniere idole (1862): L'(Eillet blane (1864): Le sacrifice (1869) : Lisp Turemier (1892), etc. But it is b5 his prose-writings that he acquired his great fame-Lettres de mon monlin (186i6): Lettres (ì nu absent (1871); Arentures modiyieuses de Tartarin de Tarascon (18i尺): Contesdu lundi (1673), etc. He is best known by his novels-Jach (1876): Le nubab (18i8): Les rois en exil (1880): Juma Roumestan (1881): Siepho (1884): Turturin ser les Alpes (1885): Lat Belle Nirernuise (1s8(i): l' Immortel (1ssk): Port-Tarascon: dernieres aventures de rillustre Turtarin (1890). Several of these books have been dramatized, but withont attaining the success of the originats. La Lulte pour lu I'ie. amplifying bart of the story of ' Immortel, has perhat's come nearest. Dandet was one of the leaders of the naturalistic school in France. and in one respect he approached real life nearer than anyhouly else; several characters in Le nubab, Les rois en exil. and especially in ICImmortel, a satiric picture of the Académie Française are recognized portraits. D. Dec. 16, 189\%. See Jules Claretie, Alphonse Daudet, in the series Célébrités Contemporaines; aloo Dantet's own reminiscences, Trente ans de Paris, à tracers ma rie et mes limes (188i).

Revised by A. K. Marsi.
Dandet, Louts Maris: Fixest: nowelist and historian; brother of Alphonse Daudet ; h. at Nimes, France, May 31, 1832. He went to Paris in 1857, amol, with the exception of a year or two of work on journals of the prorinces, his livedf there ever sinee. From 1860 to $18: 0$ he was a public functionary, but after 1870 he became a reactionist-now Bonapartist. now Legitimist. Ite early began to write both novels and historieal works, and has carried on the parallel profluction of the two. Anong his novels the following are worth mentioning: Jean le Gueur (1xi1): Les Dames de Ribeanpin (18:2): Le homan de Dplphime (18:3); Henriette (18:6): La Bavonme - fmalfi (18:i); Malume Robernier (1879): La Carmelite (18:3). Amoner his historical works are Le C'umlinal Consalui (1868): Lílgonie de la Commune. La Frame ef les Bonapates (18i1): Le Ministire de M. de Martignar (IsTa): Lu Proces (les Ministres (I8TI); IIstoire des conspirctions royalistes du Midi soms la Rerolution (1481): Mistoire de lu liestunation (1882): Mistoire de Témigration (1886. seq.): Les Bourbons et lu Russie pendant lu Rérolution francaisp (1884).

Stephen's church, Jondon. In consequence of his I'uritanical principles and practice he was obliged to leave the Establisheed Church and in 1633 removed to Holland, returning in 1633 to Finglant, where he aded in ohtaining the patent of the Massachusetts colony. In $16: 3 ;$ he went to Buston, Massachusetts Bay, and in 1638 became one of the founders of the New llaven colony. In 1639 he hecame one of the "seven pillars." as the governing bordy of the settlement was called, and in 1660 he sheltered Goffe aml Whalley, the regicides. He opposed the union of the colonies of New Haven and llartford, ame chiefly for this reason aecepted a call to the First church of Buston, over which he was installed Dec. 9. 166s. Published A Discourse ubout Civil (iorroment in a Tem Plantution (16\%3) and other works. I). of apoplexy Mar: 15, 1670, and was buried in the tomb of his friend Jolin Cution.

David: chief town of the district of Chiriqui. Nepartment of lamama, Colombia; on one of the narrowest parts of the 1sthmus of lanama, near the boundary of Costa Rica (see map of Central America, ref. $10-\mathrm{K}$ ). It is ma river about 10 miles from the lacific coast, in a ricls alluvial plain, and near the extinct voleano of Chiriqui. - A coal field extends nearly across the isthmes in the vicinity of David. It has considerable trade. Pop. abont 9,000 , M. W. II.

David (in Hels. דוד. Meloved: Gr. $\Delta a \beta i \delta$, or $\Delta a y i \delta$ : Arab. Dâood): one of the most remarkable character's in history a son of lesse: 1. at Bethlelem in Judea athout 1085 в. с., according to the chronology of Ussher. In his youth he followel the oceupation of a shepherd, and he acquired great skill as a musician. He was received into the household of Saul, King of Ismel, who, we are tohl, was troubled with an "evil spirit." batvid, by playing upon the harp, soothed and "refreshed" Simi, amd the evil spirit departed from him." Not long afterward. David slew in single eombat a lhilistine giant named Guliath, and, as a rewird for later exploits, received Michal. Sanl's daughter. in marriage. But Siul was offended by the praises which Daviel receired for his prowess, and not ouly regarded his son-in-law with hitter jealons, but made repeated attempts upon his life. David was obliged to Hy fur safety to Achish, King of Gath. When Divil was thirty yearsold salul was slain in a hattle with the Philistines, and Inavid was made king of the tribe of Judah, reigning at Hebron for seven years and a half, while lshbosheth, Gaul's son, was in power on the east side of the Jordan. and for two years was oheyed by all the tribes except ludah. After the murder of Ishbosicth, David hecame king of the whole natiou. He was victorions in all his wars, and under his sway the kingrom of larmel acquired great prosperity and power. One of his sorest trials was the rebellion ant aleath of his favorite son. Thist lom. David died in 1015 B. C. and Solomon, his son, succeeded to the throne. In Davil all the fuelings and passions appear to have been singulary intense and jowertul, and by them he was again and again betrayed into great faults and even crimes. Fit his charator, on a whole, exhilits a rare magnamimity, as shown in his sparing Sanl, his bitterest anemy, when that king was completely in his power. (See 1 sum. xxis.) it should be borne in mind that Divid was not subjectel to the powerful restrants which public opinins exereves in sume directions on modern European monarchs. 11 is fear of fond and his genfrous feelings were the only choeks to his mighty passions and that license which
 nw in dominions tembei to foster. If we consider these thinss, we shall pubably find few sovereigns, even in the most civilized thues. possessing despotic power, whose characters will bear a farorable comparison with that of David. The Bible accomit of Invic, as traditionally interpreted, is perdaps self-condrulicory; lut it heromes comsistent when lue attention is pain tusuch chronolngical details as those given in t Chron, xiii, o. xxil. 31: Sam. xy. T. etc. As a writer of religious putry, and especially of that kind which comes home to the fordings of all sorely tried heats. David lats no ergath ammer the poets of the homan race. Il is name is in the title of its af cur 1.50 P'salms, and yet others are attributed to him by the bouk of Chronicles and by the New Tentament. For an acconst of the Pralter and of commentames and othors works upon it, see lsalus.
lievisel liy |filala J. Beecher.

Mavid I.: King of scotand ; sixth som of Malcolm III.: b. 1184. IVe matried, in 1310, Jland, a great-nieere of Withism the Conquers. Hu succemlet his hrother, Alexander I., in 11:I, and swore to maintain the right of his niece

Matilda to the throne of England in case her father, Henry I., left no male issne. Henry lied in 1135, and David afterward waged war against Stephen. who disputed her chaim to the throne. David invaded England, and was defeated at the "Bittle of the Standarl" near Northallerton in 1138. He promoted mannfictures, elucation, and civilization. In his reign the feudal system was placed on a firm basis in Scotland, and through his efforts the Celtic and AngloSaxon ejements of the kingdom were hrought into more harmonions relations. As a wise latw-giver and zealons patron of the Church he holds a forcmost place among the early Seottish kings. Though never formally canonized he has often receised the title of saint, and his name figures in the calemdar mefixed to Laud's Prayer-book for Sootland (165\%). Ile died in 1553 , and left the throne to his grandson, Malcolm IV.
David II., or David Bruce: King of scotland; b. in 1323: a son of Rohert Bruee, whon he sneceeterl in 1329. 11 is kingdom was invaded in $133 ?$ by Eelward Baliol, who defeatel the army of David in the batile of Dupplin Moor, and in 1333 the Sooteh were again routed at llatidon $11 i l l$. The king was expellet, and retired to France, but his subjects continued to fight for him, and he recovered the throne in 1342. Having invaded England in 1346, he was defeated at Neville's Cross, captured, and detained until 1357. From that time till his death in 1321 his base subservience to the English throne phaced his kingdom in a condition of depentence.

David, duă veed', Féliciex César : composer; b. at Cadenet, Vaucluse, France, Mar. 8. 1810: (i. Ang. 29. 1876. He wrote a momber of operas, smmphonies. efe., but his fame rests chielly on the symphonic ode entitled The Desert, for orchestra and male voices.
David. daa'vit, Ferdinand: violin-player and teacher; h. in Hamburg, Germany, Jan. 19. 1810. He was a pupil of Spoler and in intimate friend of Mendelssohn. Jle was greatly beloved by his pupils, among whom are a large number of celebrities, the most eminent being Joachim and Wilhelmj. He revived many works of the old Italian, German, and French schools, which he edited with accompaniments, bowings, marks of expressions, etc,, and was songht for by publishers to edit all the later critical editions of the violin classics. D. in Leipzig, July 18, 1873. Dudeey Buck.
Davil, hiă reed', Jacques Locis: historical painter: b. in Paris, Aug. 31, 178; pupil of Vien: Pris de Rome 1rit; commander leegion of Ilomor. He was the recognized head of the Fyench school during the first empire. llis style is clasical in the extreme, and he considered truth to nature as of secomlary importance compared with the conventional furms of the antique. His principles were combated by Ingres, and the revolt against classicalism was carried on by Delacroix and Géricanlt, the chiefs ot "the men of 18:30." $\dot{A}$ portrait hy David of Malame Récamier, in the Lonvre, is one of the best works he protuced in that branch of art, in which he was highly successful. Several of his most improtant enmpositions are in the Versailles Musemm, including the Coronation of Sapoleon and Jusphhime. 1). in limssels, Dec. $29,1825$.
W. A. C.

David. Jérome Frénérte Pacla, Baron: French politician; b. in Rome. June 30, 1023: a grandson of Jacques Lmis Darid: in 185: becane a member of the Corps Législatif and a leader of the ultra-Bonarartist party: was in 1867, and again in 1869, vice-president of the Corls Législatif. Atter the resignation of the Ollivier ministry (Ang., 1870), he was minister of pmblic works in the short-lived cahinet of Connt 1'alikao. He wrote Réflecions et discours sur la propriété chez les Arabs (1562). D. at Lathgon. (rimmite. Jan. 2s., 1889.
David. Pierre Jeas, known as David dingers: senlptor; b, at Angers. France, Mar. 10. 17s9. He gained at Paris the first prize (with a pension) in 1811. and then went to linme to pursue his studies. IIe formed a friendship with ('anova, returned to France in 1816, and produced a statue of the great Prince of Conde., by which he aequired a high reputation. In 1806 he becume a member of the Institute. Soon afler the revolntion of 1830 he was employed by the government to fill the perliment of the Panthen with sculptures. Among his works arm the statue of the young drummer-boy Barrah. busts of Waslington, La Fiavette, Arago, Gouthe, and Lamartine, and statnes of Cuvier. Rarime, and Jeflerson.  at West Point in 181.\%. Liter a year in garrisen at New England posts, he lesigned Dece. 1, 1816, and was attached to the Military Acadeny as asisistant professor till May 1. $1 \times 2: 3$, when he was appointed Prufessor of Mathematics, holding his position till $1 l_{11}$ y $31,183 \%$, when he again resigned lor a like position in Trinity College, IIartford, Comn. He was appointed parmaster U. S. army Nor. 17, 1s11, holding office till sept. 20,1845, and was subsequently Professor of Mathematics and Philusphy in the Cniversity of New Fork $1848-4!9$ and of Hirher Mathematies in Columbia Collage, New York city, 185\%-fion. After leaving West Point in 1837 he devoted most of his time and talents to the preparation of a complete series of mathematical text-books, adopet largely in publie schools. II was a member of several scientific and edncational tssociations. D. at Fishkill Landing, N. Y., Seןt. 18, 1sio.

Havies, Hexry Euame, Jr.: lawyer and general: bo in New York, Jnlv. 2. 1836 ; edhented at Ilarvard, Williame, and Columbia Colleres: studied law, and was admitted to the bat in 1805. In Ayril. 186t, he entered the army as captain Fifth New Vork Volunteers: was transferved July, 1 eifl, as major to the Second New Sork Cavalry, of which regiment he subsequently became colonel, remaining in command till Sept., 1563, when he was commissionel a brigadier-gencral of volunteers, and insigned to a command in the cavalry corps of the Army of the Potomace serving with listinction till the close of the war (brevet major-general of volunters Oct., 1864). In June, 1865, he was mate a majom-general, and assigner? to the command of the midule district of Alat bama, which he held till Jin. 1. 1866, when he rexisnet. He was pmblic administrator of the city of New York from Jan., 18fif, to Jan., 1869, anl assistant ©istrict attorney of the southern district of New York from July 20, 18:0, to Dec. 31, 1872. D. at Middleboro, Mass., Sept. 6, 1894.

Davies, Sir Jons: pret and judge; b. in Wiltshire, England, in 15.0 ; educaterl at Oxfmel. He was apmented solici-tor-reneral of Ireland in 160.3, and published in 1610 A Discourse of the True Reasons I'hy Lrelund has Temer been Entirely Subdued, an able work. In $16: 0$ he was elected a memleer of the English larliament. Ihis chief prem, entitled Nasce Teipsum ( 1599 ), is a gromi type of the intellectual on metaphysical style of poetry, and from its elear and condensed expression of alstract thought has been likeneal to Pope's Essay on Man. Its influence can be traced in the writings of Sir Willim Wayevast ( $\% \cdot v$. and other witurs of philosophic verse. He becane lord chief justice in 1620. and died Dec. 7 , in the same yoar.
Dayies, Louts Mexry : member of Canadian Parliament; h. at Charlottetown. I'. E. I., May 4, 1845, and elluented at Prince of Wrales College. He wis admitted to the bar in 1866 ; has been solicitur-general, premier, and attorney-general of Prince Elwarl Fslaml; entered the Dominion Parliamont in 18s?, and has bern returned at each subsequent cleation up to and ineluding that of 1891 . IIe wase one of the C'malian counsel before the International Fishery Commiscinn at latiliax in 1sto, and is now (1893) ]resilent of the Merchants" Bank of Prince Edward Island.

Neil Macnoxalid.
Wavies Sambl, D. D. : Preshrterian divine of Welsh desent: h. near Summit lidge, Xewoustle co., Del., Nov. 3, 1201. In 1718 he was motined as an erangelist, and spent some Years in missionary Work in Hanover con., Vin, organizing the first presbytery in Virginia in 189. He was one of the founders of the Collewge of Xow Jerser: ind succereded Ionathan Edwarlsas pusident of it in 1anis. Ile was notell for his elownence the a prearhor. Davila, or De Avila, dā-aa'verthă, Alovzo: a Sjanish soldier; b. alont 148. He went to America, and in 1518 was in Caba, where he joineri the expedition of Grijalva to the coast of Mexico, commanding one of his ships. Returning to Cuba ( 1.519 ) he took service with Hernando Cortes, and during the marel to Mexico was one of his most tristed eaptains. In 1520 he marched with Cortes against Narvaez, ami subsequently, it would appear, was employed as an arcont to the audience of san Domingo, where he obtained for Cortés authoritr to concpur and govern all of New spain. Returning to IJexico, Davila was sent to Spain with the treasure which had heen collected, and important dispatches (Jume, 152:). Near the Azores his shipswere captured by French corsairs: all the treasure was lost, and Iavila himself was heht a prisoner for several rears, though he succeeded in sending his dispatches to Spain. In the end he was ransomed, and retnrning to Sipain was appointed comtador of Jincatan, a province which had not yet been conquered. Montejo, the newly appointed govermor of 'racatan, had equipped an expedition to take possession of his domain, and Darila acconpanied him as second in command (1527). Soon after they arrivel there Montejo sent him to a region on the west const, in search of gold which had been reported; there his headstrong proceedings provoked conflicts with the Indians, Divila wasmable to retmrn, and after terrible sufferings made his way to Truxillo in IJonduras. lle subsequently rejomed Montejo, and in 153 took part in another expedition to Incatan. Of his sulsequent carecr nothing is known.

IIerbert 11. Smim.
Javila, or Ile Avila, Aloxzo: nephew of the soltier; b. in Mexico city about 1540. In 1566 he and his younger hrother. Gil (ronzalez Javila, were accused of ploting to overthrow the goremment, murder the menbers of the: andience, and make Martin Cortés (the Marques del Valle) King of New Spain. It is doubtful if such a scheme was ever serionsly contemplated, or that the Davilas were guily of anything more than disenntent and grombling; but they were tricd. comdemmed, and beheaded at Mexico, Ang. B, 1566. Sue Cortés, Marin.

Herbert Il. Smiti.
Davila, or De Avila, Gil Gonzalez: Spanish historian b. at Avila. 15:0. He stmied at liome, subsequently had a minor ceclesiastical office at Salamanca, and in 1612 was made royal chronicler of Castile. Among his works are Tilla del rey Ilenrique $3^{\circ}$ ( $16: 5$ ) and Teatro eclesivistico de las infesias de las Indias occidentales (1645 and 1649). 1. at Madrid, 1658.
11. II. S.

Davila, Pedro Artas: Sce Pedrarias.
Davila y Padilla, dacetin: Mexican historian; bo in the city of Mexieo, 1ifi?. He entered the Hominican order in 1579, and was prior of the convent of Puebla de las Angeles in Tlaseala ; he was alsu a noted leeturer on philosophy and theology. In 1599 he risited Span and home on business of his ordur, ani was alpminterl Archhishop of Nanto Domingo the stme year. I), at Santo Domingo, 1604. His Ilistorin de la morincit de simtiago de Thefico was first puhlished at Madris, 1596. There are later editions, that of Valladndid, 16:3, having the title l'ariu Mistorin de In - Iueva Enjañ! y Florida. The work is primarily a history of the Dominicans in Mexico, but contains mucl of general interest.

Herbert H. surty.
Davin, Nirnolas Floon: Canadian author: h, at Kiltinane, lreland, Jan. 13, 144:) ; duraterl mivately and at Qucen's College, Cork. He was almitted to the English bar in 186 , and was correspondent for the lomion sfandard during the Framen-flemana war. Ihe was sent to Whashington. B. C., ly the (anadian Government in $18: 9$ to inguire into the system of managing Indian industrial selonols; a secretary to the royal eommission respecting the Paritic
 resent the reguirements of the Northwest before the Dominion forermment. He was elected to Parliament in 188i amb again in 18: In. In established the Fegima Leoder in 1sio3. Davis. Jefferson C.: general ; b. in Clarke co., Ind., Mar. 2. 182s: served in the Inliana volunteers in the llexian War' ; second lieutenant First Artillery 1st8; captain May, 1801; brigadier-general volunteers Dec., 186L, to July, 1866: colonel infantry July. 1866. He was one of the garrison of Fort Sumter when it was bombarded by the insurgents in Apr., 1861. He commanded a dirision at the bat the of Stone kiver. which emded Jan. 9.1863 , and a congs of the army of Gen. Sherman in the matreh from Atlanta to the sea, in Nor. anl Dee., 1864. D. in Chicago, Ill., Nov. 30, 1879.

Davis, Mrs. Jessie Bartlett : operatic contralto singer: h, in Chicago, Ill., in 1860; was a church singer, and joined the Chieago Church Choir Opera Company to sing in Pinafore. in which she won success as Little Buttercup; at fifteen she sang with ('aroline Richings in her Ohl Folks concerts, and in 1882 sang Siebel to Patti's Marguerite in the Mapleson fompany at the New York Acantemy of Music. She joined the American Opera Company as leading contralto in 1886. Il er husband, W. J. Daris, was the manager of the Chicago ('hureh Choir Opera Company.
D. E. IIervey.

Davis. Jons: Finglish narigator of the sisteenth centurr: b. in Sandrilge abont 15.50 ; made three voyages to find the northwest pasage to the East Indies. On the first he discorered the strait bearing his name, 1585 ; on the third, 154 . he reached the strait afterward explored by Hudson. D. at sea, near the coast of Malacca. in Dec.. 1605. see his The Horld's Mydrographical Deseription (1595).
Ilavis. Jons, LIL. D.: U.S. Senator; b. in Northborough, Mans., fan, 13, 135T: graduated at Tale in 1812. He was elected a member of Congress in 182t. ind Governor of Massaehusetts 1833-35 and 1840-11. In 188.3 he was chosen a senator of the U. S. for six years by the Whigs and again elected in 1845. He ardvoeated a protective tariff. opposed the Mexican war, the introduction of slavery into the Territhries, and the compromise acts of 1800 . De was often called ". Honest John Davis." D. in Worcester, Mass., April 19. 18.54.

Davis, John Chandler liancroft, LL. D. : diplomatist; b. at Worcester, Mass., Dec. 99 , 182? : ellucated at ILarvard, stutied law and followed the practice of his profession. lu 1849 he was appointed secretary of legation at London, bat retnrned to the U. S. in $185{ }^{2}$, and resumen his profession. Ile was assistant Secretary of State 1869-71 : agent of the U. S. at Geneva during the meeting of the tribual of arbitration for the settlement of all points of differeme hetween the U. S. and Great liritain 1801-i2; assistant Secretary of State $1873-\mathrm{ia}$; U. S. minister at harlin in 18.3. and juilge of the U . S. court of clams in 18T: assidant Secretary of State 1881-8? ; became a selurter of the U. S. supreme Court $18 * 3$.
Llavis, Sir Jolin Fraxers, Bart., K. C. 1\%.: Pritish officer and Orientalist; 1) in London in 1695. He first went to Thima in 1816. He was chief superintenclent at Canton. and in 1441-48 governor of 1 omgkone. Among his works is The Chinese, a dieneral Doscription of Chince and its Iohabitments (: vols, $18: 36$ ). We wrote several works mpon (Chinese liturature. 1). Nov, 13, 1890.

Davis, Jonn hee: rat-admiral [..s. navy; h, at Carlisle Sullivan (o), lad., sipt. :3, 1s:20: chterel the nary as a midshipman fin. 9, 184. He was the executive oflicer of the Waterwitcll in her engagement (0)ct. 19. 1e61) with the Coufedemete ran Manassas, and atterwarl with a squadron off Pilot 'Town at the month of the Mississipli. He commanded the gunbat Wisahickon trifo-63, and the ironchat Montank in the summer and fall of 1sfis, participating in many trattles. In command of the sassacins he took part in the Fort lisher fishts, anl was recommented for 1 romotion by Mdmimal Portur. 1). Mar. 12, 188!.
Davis. Matthew La: writer: 1, in Now Yunk in 17ef: was an intimate fricul of Aaron liner; under the ben-name of " The syy in Wishinghe" he wrote letters from Waslaington to the New Vork courirr and Enquirer, and under that of "The fienvese Traveler" contributed hetters the the Jomaton Tlimes. His chiof work is Jomuirs of the Life of Aturon Burr (: vols., 18:3-3i). 1). June 21, 1850.

Davis, Rebecca (Ifarding): novelist; b. at Washington. Pa.. June 24, 1831. She was married in 1863 to L. Clark Davis. then editor of the lhiladelphia Inquirer. Among her short stories contributed to the magazines, Life in the Iron Mills, originally published in the Atlantic Monthly, attrated perhaps the most attention. She has written a number of novels, including Dallos Gulldraith (1868) ; A Law L'uto Herself (18:8).
H. A. B.
lyavis, Richard llarding: author and ealitor; b. in Philatdelphia, Pa.. Apr. 18, 1864; son of L. Clark Davis, journalist and author, and Rehecca (Harding) Davis, the novelist. He was edueated at Lehigh University. Lehigh, Pa., and Jolns Hlopkins University, Baltimore, Md.. paying especial attention to studies adapted to fit him for a joumalistic career; was a rejorter on the Press and other Pliladelphia newspapers: in 1888 joined the staff of the New York Euening Sum, to which he contributed some of his best short stories: in 1890 becane managing editor of Marper's Wechly; author of a number of works, including fiallegher and Other Stories (1891): Stories for Boys (18i1): 1an Bibber and Others (1892); The West from a Car Window (1892).

Davis, William Morris. M. E.: meteorologist and geographer: b. in Philadelphin, Pa.. Feb. 12, 1850: educated at the Lawrence Scientific School and Harvard University. In 1866, al the age of sixteen, he made one of the two observations in the U. S. on the new star T Coronce borealis. From $18: 0$ to 1873 he was assistant in the Argentine National Observatory at Córloba, and on his return he crossed South America. He was made instructor in Geology in Harvard University in 1876, and I'rofessor of Physical Geography in 1890. He is a director of the New England Meteorological Socicty and a corresponding member of the German Meteorological society. He is a jrolific miter, haring published numerous scientific articles and studies, and his published lectures on Whimminds. Cyclones. and Tornadues (1s84) are a valuable introduetion to ineteorology.
M. W. Harringtox.

Davis's Strait (named in honor of Capt. Jonn Davis. q. ...): a strait connecting Baffin's Bay with the Atlantic Ocent ; lies between Greentand and Pritish North America. lt is about 160 miles wide at the narrowest part. A constant current runs southward throngh this strait from the circumpolar regions. Davis's Strait is frequented by many whaling ships, and became. after its discovery in 158.5 , the slartingpoint for the expeditions to find the northwest passage to India.
Da'vits (pla.): the wooten or iron frame used for hoisting and lowering boats on shipboard. The "fish-davit " is a gatf used in fishing the anehor. Boat-davits lave been to some extent supereded by ingenious Boat-Lowering Apparatus (q.e.).

1avitt, Michael: Trish political leader; b. at Straide. Mayo. Irelant, in 1846. His parents were of the poorer class of Irish peasantry, ami when he was five years old his father was evieted. Michael worked in a cotton-factory in Jancashire, where he lost his right arm; then, from the age of fifteen to twenty-two, in a printing-office: joined the revolutionary movement begun by James Stephens in 1866 ; in $18 \% 0$ was arrestel on indictment of treason-telony and sentencel to fiftem years' penal servitude; released on ticket-of-leare after serving seven rears and a half: in 1879 started the land agitation in his native county; Oct., 1879, in conjunction with Mr. Parnell and others, foumled the Land Leagne and herame its most prominent manager ; lecame superintembent of the orgaization of the Americun Lama League 1880; arrested Fitb, 3, 1881. on account of the state prosteution of the exceutive of the Land heaguc. and went to Portland prison on the revocation of his tieket-of-leave; again released on ticket-of-leare after fiftern months of imprisonment: hat served two other terms of imprisonment; an incessant propagandist of Lant League and nationalist principles. While imprisoned in Porthmi, 1st's, was elected member of Parliament, but was disqualifiel. Ile was one of those accused in the artictes on latnellism and Crime in Thep Times, and defented himself in a powerful speech (1889). In 1891 he visited the [ $4 . S$, and in July, 1892, was returned to the Honse of C'ommons as member for North Mcath. On May 8, 1893, he was delareal bankrupt, and accepted the stewardship of the ('hiltem hundreds.
C. II. Thurber.

Da'vors, Jo: author of a work, now rare and valualbe, called The Ścrets of Angling (London, 1613). This work
is quoted by Walton, and the writer's name is dombless a
 Dome, John Shavison, Juhn Javies, and other writers of that day.
 Suerstalt and Prinee of Eekmiahl: Fremeh marshal; in. near Noyers, Vome , hay 10. 172). He was a fellow-student of Bonaparte at Brienne and entered the army in carly gonth. In 1 as:3 le gaineal the rank of general of migate, amb in 1 tas went with Bomaparte to birypt. He became a gencral of division in 1800, andel commanited the vavalry of the amy of laty in that year. Having received a farshat's hiton in Lot. he led the right wing at Austmite in
 stadt. Wet. 14, 180f. For his services at Eekmioh he was (.reated l'rince of Edomühl in $180 \%$. He torak jart in the liusian eampaign of 1812 , and was wombed at lurodimo. He was afterward gowmor of the hlanse towns: and defembed lhmburg for several months aganst the allies. During the Ilundred Days ( 1815 ) he was Napoleon's Minister of Wiar. Ile was commander-in-chict of the French armies in 1815, after the battle of Whatoro, ant in 1819 was made is pur of Franes. D. in Paris, Jume 1, wes. See his Correspmonlence (1N.⿹\zh26): Chénier. Vie du Maréchal Dumout (1Nith); and his Life hy his daghter. the Marghise de bloergeville (187! - -80)

Dax, daax (anc. Aque Alugustre): a town of France: deparment of Landes: pleasantly sitnited on the Adour: 9.5 miles N. F. of Barome see map of France, ref. S-('). It has a cathedral, a bishop's palace, and some manufactures of earthenware. brandy. leather. ete. Ilere are hot saline springs, which were used for bathing by the ancient Romans, and are still frequented by invahuls. Pop. (1846) $10,146$.

Day (in Lat. dies: Fr. jour: Ger. Tag): cither the interval of time during which the sun is above the horizon, or the time occupied by a complete revolution of the carth with reference to nther celestial borlies. In the latter sense it denotes intervals of different duration, according as the borly with which the revolution is compared is fixed or morable.
The astronomical or solar day also designated the apparent Jitr, is the time which elipises between two consectltive returins of the same terrestrial meridian to the center of the sun. Astromomical days are of unequal length for two reasons: 1. the mequal velocity of the earth in its orbit. which results in a greater apparent daile motion of the sun in winter than in summer; 2 , the obliquity of the ecliptic. which caluses the sun's apmarent daily motion in right ascension (or in the plane of the earth's equator) to be less at the equinoxes than at the solstices. The astronomical day is computed from nom to noon.

The civil day. or mean solar lay, is the time oceupied by the earth in one revolution on its axis as compared with the sun. It is supposed to move at a mean rate in its orbit, and to make $36 \% \% 48$ revolutions in a mean Gregorian year. This mole of measuring time make the days all of equal lengtlo, ind any special homr of the civil day stmetimes precedes, and sonnetimes succeds, the corvepponding hour of the astronomical clay. Most nations agree in fixing the begimiug and end of the civil day at midnight.
The sidereal day is that portion of time which elapses between two successive culminations of the same star. Owing to the great distance of the stars and their apparent fixedness in suace it is not perceptilly affected by the earth's orbital revolution, as is provel by all known astrononical observations. A silereal diy contains twenty-three hours fifty-six minutes four seconds of mean solar time. It is dirided into twentr-four sidereal hours, which are subdivided into sidereal minutes and seconds. This is the miversal astronomical mode of computing time.
The Jews. who used a lunar calendar. reckoned the day from erening to evening. The day was divided in different manmers-in three or in six parts of mequal length. Before the Captivity the night was divided into three watches. IW hem the New Testament mentions four watches the reason is that in the meantime the Grace-Joman division of the night had been adopted. Hours were probably derived from Ballylon, as was the dial. It the time of our Lonl the division was eommon, howeser. The sabbath was the onty day which had a name; the others were simply numbereh. See Firtio. Tue.

De: a Latin particle commonly signifving down or from. It is often intensire, and sometimes privative or negative. having occasionalls nearly the force of the English particle un. Examples of its use are the Latin descendere (from scandere climb), literally, to climb down: decoquere, boil down, hoil thoroughly: and the Enulish deform (from Lat. forma, form, beantr. grace) to mar in form, to deprive of grace or beantr: decompose to un-compound. De is also a Latin preposition signifying concerning, also from or down from.

Heacon [O. Eng. deūcon, from Lat. diticonus $=\mathrm{Cr}$. סdárovos. minister, serrant]: in early times an officer of a ehureh, whose dity it was to collect and dispense alms. The Roman Catholic Church maintains that their ministry wa* from the beginning both corporal and spiritual, hut aceording to an opinion generally prevailing among Protestants the office was at first secular, although it is evident that deacons frequently exerciset spiritual functions. The office grew, like that of the bishop. out of the apostolate, which at first embraced all ministerial functions and duties, but which afterward maturally and necessarily split into manr otlices. according to time and cireumstances. The church at Jernsalem first chose seven deacons, who taught and baptized, as is shown by the example of Philip the fleacom. In the seeont and ihird centuries the duties of deatons were incrased. and it subserfuently became expedient to divile their functions annong the archedeacons, deacombend abb-deacons. The ntlices of archrleacon and deacon were counted anong the higher clerieal orders (ordines majores) : and after the twelfth century that of sub-deacon Wis so reekned. In the Greek. Roman Catholie, Angliean, and Methodist Episemal Churelhes, deacons are eleryymen inferior in rank to ministers or priests, and are usually probationers for the latter oflice. For a long time the deacons contimet to be what ther had been in the Apostolic Church - the dispensers of the charritable funds of the congreqation: Jerome ealls them "ministers of the tahles and of widors:." Their duts was to risit the ohl and the sick, the willows and the amficted, the prisoners, etc.. and to administer relief unter the direction of the bishop. lint in course of time. as the sick were gathered into hospitals, the por into almshouses. the orphans and widows into nsymus, and as each of those institutions received a special officer for its proper manarement, the principal duty of the deacon became to assist in the public worship, more especially in the arministration of the sacraments- $t o$ arrange the altar, to distribute the consecrated cup, ete. In the Roman Catholice Clmreh the peenliar robes of a deacon are the dalmaticai and the stole. Of the Jimman cardinals fourteen are styled cardinal deacons: but the term deacon, as this nsed. merely demotes rank in the sacred enllege withont reference to hierarchical order. many of the cartinal deacons having the episcopal character. In Protestant Churehes the position of luacons is varions. 'I'he Baptist and Congregationalists have thacons as superintentents of the tempral affairs of the chureh, and also as assistants in the administration of the sacraments. Lmong Prealyterians their place is often supplied hy the ruling elders, but in the Free Church of stotland and in stme nther Presbyterian bodies there are regularly ordainet ileacons.

Deaconess [in fir. ŋ̀ óárovos: Lat. meilla, ministra. dice comissa]: a fomale officer in the Christian (hurch. In the
 the care of the pron, espectilly of their own sex. gave instruction to the vomger catectumens, arranged the agalas ill love-feasts, anil tork care of the siek. Lntil the fourth contury the dearoness was required to he a maiden. or widow but oner marrien, and sistry years of age. hot the are was fixed at forty he the Comucil of Chalcedon (tin s. a.). she was assisted hy the sub-deaconess. The oflice grakually died out, hut somer in the Latin than in the Greek Chureh. creval Westem councils in the fifth and sixth canturies furbule the ronsecration of denconesses, althongh the ofliere appurs nut to haw been whilly extinet thll the tenth erntury or the eleventh. At constantinople there were deaconeses as late as the hesimning of the thirteenth century, with no trace of them anywhere clee in the bast. In mon-
asteries, nuns who take charge of the altar are called deaconesses. The sisters of Charity and other like organizations perform a work analogous to that of ancient deaconesses. The oftice has been revived in the Church of England, and a diocesan deaconess institntion tras established in 1861. In the Protestant Episcopal Church in the U. S. Trainingschools for leaconesses hare been established in Philadelphia and Xew York, the latter in connection with Grace church and under the faroring care of Rev. Dr. Wr. R. Huntington. The admission, conduct, etc., of deaconesses are regulated by a canon of the church. A deaconess is not under life-long vows. She ean las aside her vocation and. in certain circumstanees, take it upagain. The Church of Scotland adopted the otfice of deacones in 1887-88. Some of the English Separatist ehurches of the serenteenth century had deaconesses. and many of the congregational churches of the U. S. statedly elect deaconesses with their other officers. Among the German Protestants the experiment has been successfully tried, and there are now more than sixty such institutions in different parts of the world. A large and excellent lrotestant school for deaconesses was established in 1836 at Kaisersmerth. Prussia.

## Dead, Book of the: See Ritual of the Dead.

Dead-letter or Returned-letter Office: a division of a post-office to which all mail matter that remains untlelivered at the end of a specifiet time. or is of such a nature that it can not be transmitted, is sent for disposition. Letters addressed to persons "not fonnd," and paekages containing articles of a perishable or injurious charaeter, constitute a large proportion of the matter dealt with. See Postal sertite.

## leadly Nightshade: See Bellanonsi.

Dead-mettle: a herbaceous, annual, or perennial herb of the Mist Famit ( $q . r$ ) and the genus Lamium. It has a tubmar bell-shapel, five-toothed calyx. labiate corolla, four stamens, and a four-lobed orary which develops into four sharply three-angled nutlets. There are about forty species, all native of the eastern hemisphere $N$. of the equator. Four species. L. purpureum, L. amplexicaule (both annuals), L. album. and I. maculatum (both perennials), have beenme naturalized in the Eastern L. S.
C. E. B.

## Dead Oil: See Phexol.

Dead Reckoning: in navigation, the ealculation of a slip's place at sea withont taking observation of the heavenIr bodies. It is derived from the distance which the ship bas run and from the eourses steered after departure from a place whose latitude and longitude are known. The distance is obtained from the rate of sailing as shown by the log and the time elapsed, and the direetion of the conrse is obtained from the compass. The data are liable to errors and uneertainties, in consequence of currents, changes in the course and intensity of the winds, fluetuations in the declination of the compass. and other eauses of disturbance. See Nayigatiox.

Dead sea. or Lra of Sodom [in Arah. Buhr Loot. Sea of Int: anc. Lacus tsphaltites], called in Seripture the salt Sca. Nea of the l'ain, or East Sua : a colebrated lake in the southern part of Palestine. 11s morthern end is alout 20 miles E. of Jerncalem. Its length. as tetermined by Lieut. Lynch in 1848, is 40 gengraphical miles, and its brealth from 5 to ${ }^{\text {g }}$ geographical miles. The greatest depth, whieh is found in the northern portion. according to Lient. Dale ( 1845 ) is 1.308 feet : according to Lient symonts ( 1811 ), $1,350 \mathrm{fect}$. Its lepression below the Nediterranean, is measured he Lieut. loale, is $1,316 \%$ feet, and its bed is aceordingly by far the deepest known fissure on the surface of the carth. The Deal sca is led by the Jordan and other streams. lont has no apparent outlet, and the surplas water is earried off by evaporation. It is inclosed between naked cliffs of limestone, which on the eastern side rise 2.500 feet above the water. The shores present a scene of desolation antl solitude encomprased with deserts and dreary salt-hills. On the southern shore is a remarkable mass of rov-salt calledl Colum (Sorlom). which by some has been supposed to indicate the site of the aneient city of sodom. Large quantitios of asphaltum were throm uji to the surface of the lake by the earthumakes of 1834 and 1837. The water of this lake is remarkahle for its great specific gravity (which is $1 \cdot 25$, or one-fourth greater than pure water) aml its intense saltness nurly seven times that of the sea. but varsing considerably at different seasons. Ibout 25 per cent. is the average proportion of saline matter by weight. The chlorides of sodimm, magnesimm, and
calcium are the most ahmmant salts dissolred in it. Ducks have heen seen swimming on its surface. The bet ocempied be this lake is part of a long amd narrow depression or tissire which extends from tho lake of Galitee snuthwam, ant is nearly zow miles in length. The andjacent table-land is more bhan soon feet ahove the Meliterranean, so that the fissure is nearly $(6,000$ feet derp. See lient. Dÿnch. Vorretive of Clnitod slates Eippedilion to the River furdan and the leend sira ( 1540 ) ; and Prot. Hall, Survey of Western F'ulestine (1886).

Healwood: city; eapital of Lawrence eo. S. J) ak. (for location, see map of sonth [bakota, ref. 6-A) ; on railmath, in the western pat of the sitate ; the meronatile. finamein, and mining centar of the Black IIills. It has two daty pruers. good pablic selools, a private academy, electrice light, watorworks, llouring-mills, saw-mills, plaminr-mills, aml manufactures of lumber, flour, brick, lime, efce Its principal streets
 $4,204$.

Ebitur of " lilark Ifolds I'oselk.
Dnaf-mmtes: those who are hoth deaf and dumb. Those horn deaf are dmmb, beranse they can not learn io speak withont the guidunce of the surne of hearing, which enables them to imitate sounds. The same is true of those made deaf by elisease or accident in early infancy. After learning to speak, the oreurrence of debfers does not erveatly immar the speerh, although nersons becoming deaf during childhoot sometimes retain throughout life the childi-h tone which they hawe learnet.

Congenital leafness is rasonably beliered to be camsed is imperfertion of dewelopment umber influences which lower the grale of matrition in the embryo daring gestation, or which affect, through thr eomstitution of one or lonth of the parents the immerliate result of conerevion. Among these influences the most marked appeat to be intemperance, marrages betwen those nearly related, syphilis, and scrofnla. Bomlin userts that in Frano nearly 25 per cent of deaf-mintes are the oflondig of marriages of consanguinity; and sumewhat similar estimates have heen ohtained by fir. Howe and Ir. liemiss in their statistical inquiries umon the effects of such murriagus in the $\left[^{\circ}\right.$. S .

One-hamed alphabet.
On account of the comparation hoplessmess of deaf-mintes they were placed, in the roxle of Justinian, among persons incapalule of the legal mamarement of thoir alfairs. Thuring the Midhle $A$ ges they wore leprived of the ristat of femulal succession. Fet in all times they have ocrabomally shown
considerable eapacity for eulture bling mentions Quintus I'edins. a deaf-mute related to the Empuror Augustus, as a succesfind painter at lonme : and in later times the mele of one of the Kings of Sumbia, not withataming the same defect, acouired a good edtention. The earliest acoount of a

deaf-mute being taught to speak is ascribed to Bede. about (th) A. D. Rotolyh Agricola, of Groningen, who diod in 1f45, tirst mentioned an inslmacted deaf-muta. derome (ardin, half a enentry later, wrote philosomhically on the principles involved in such instruction, fonce de lam, a Sbanish monk, who died in list, and l'asch, a clergyman of binndenburg were the first teachers of whom we have ans aceomet. Juan Pablo Bonet publishod at Madrid the farliest known tratise on deaf-mate instraction. He gave at manald alphabet quite ditlerent from those which Benle has preservad as usel by the ameients. Whout lfibo to 1700 13r. John Wallis, of (oxford, amd Joln Conrad Amman, of Ifolland. bublished remarkahle tratises on this art.

In Enorlat the first manual alphatet was pmblished by Goorge Dilgarno, by bieth a soutwoman, but residing for a long time at uxtord. He died in $16 \times 5$. 'lhe first school for deafomates in lirat britain was establishon in Edinhurerh in 1 -60 hy 'lhomas Bradwood. some years atherward it was removed to the werhborloon of Loudon, and thes no

 'the dirst publice exathlishment in the world for the instruetion of deaf-mutes was foumden al lenjoig in 185 by hlue Elector of Sixumy, umber the directorslif of sammed Ifeinexcke.

The eredit of systomatizing the insturtion of the deat and dumb in Framer is ascribed ot to the Abhe chandes

 Pervia, whme school was comburted at Bombams. These men madoultedly both condributed to the work: ats did alon
 the [. S. the system matured by the axjutatme of the
 Gallandet, with the personal aid of laturent (Chro, ant edu-
 useftal habors on behalf of the same class itre flewe of lor. F'. A. 1'. Batmard. Dewis W"elel, amd William IV. 'T"umer, of the Hartford Institntion; Harsey 1'. I'ert. 1.1. 1)., of New

York: Alraham B. Walton, of Philatephia: John A. Jacobs, of Kentuckr: the two sons of Thomas II. Gallaudet (Thomas and Edward M.), and Dr. Samuel G. Howe, of Boxton.

The most remarkable instance on reeord, perhaps is that of the instraction, under the care of Dr. Howe, of Lacers Bridgmax ( $q . c_{0}$ ), By attracting her attention throngh the sense of touch, it was found possible to develop to a considerable degree her intelligence and capacitr for communication with others. I similar example oceurred earlier in Iulia Brace in the American Asthm, at Hartford. Comn.. while under the charge of the Liev. Thomas II. Gallaulet.

The two jrincipal modes of convering instruction th the deaf and duml, are by the mamal sign-language and by the pupils watching the lips of the teacher during articulation. Real objects and models, pictures, etc.. can. of course, also be used. The sign-language is much the most easily and rapidly acquired. and is more generally employed in Europe. as well as in this country. It is largels in use among the American Indians, andi br means of it natives of the most distant portions of the eontinent can understand each other. It is said that a partr of Indians present in Lundon at an exhibition of performances br deaf-mutes were deliglited to find themselves able to conrerse with the latter by signs.

The nethor of teaching hy articulation, the pupil learning to recognize word, (and, in time, to utter them) by closelv ratching the motions of the lips and tongue in speed, is not farored by all experienced instructors. Except in rery few cases it has not been adopted in the Hartforl Asrlum. The argument urged against it is that the great length of time required for its acquisition can be hetter employed in obtaining knowledge according to the sign-methorl." Yet it has sometimes proved very successful, as in the prirate school of Miss Rogers at Chemstord. Ma M . In Christiania, Norway, in 18:2, a deaf-mute was, by instruction in this way, prepared creditably to enter the university as a stulent. Some have supposel that hy means of lip-teaching intelligent deaf-mutes might become pupils

Bell's visible speech.
in the eommon schouls. Itaril and his sueressor. Blanehet, in lerance, and the dhai ('arton, Founder of an institution for the diaf ant dumb in Brages, Belpium, are among those who have especially latured ma behalf of the methon of teaching ly articulation. This method was at first employed
at Northampton, Mass., but has now given place to the Bell system. See Tisible Speech.

A new method of teaching articulation by what is callent risible sperch has been introducel. It wis inrented in $18+8$ by A. Melville Rell, a professor in Elinhurgh of voeal physiology. It ennsists of a species of phonetic writing. basel] not upon sumuls, but on the action of the rocal organs in producing them. The characters of this universal ahphabet, as matured in 1864, reveal to the eve the position of those organs in the formation of any soune which the homan mouth can ntter. In 1869 the first attempt was made in Great Britain to apply this alphabet in the instruction of deaf-mutes: and in 1 sio it was introduced br $A$. Graham Bell, the son of the inventor. into the Clarke Institution at Northampton, where it has supersoded the ohd mothod of imitation, and is the mly methor of teaching articulation used. Revised by Edward M. Gallatdet.
Deafness: loss or imperfection of hearing: may be congenital or aequired, permanent or temprary complete or incomplete. It mar be (1) "nervous"-that is, caused bo organic or functional hisense of the anditory nerve or of the brain itself. Deafness of this kind is sometimes curable, but frequently it is nermanent. It mar he (2) the result of local discase nr accident. Disease of the structures of the ear frequently follows scarlet fever, and is often of a scrofulous character. When such disease leads to organic changes, even if they be slight, permanent, and perhaps complete, deafness mar result. (3) Cerumen (ear-wax) frequently fils the passage ol the ear. In such cases oil should be droppeal into the ear, and a gentle flaw of warm water from a syringe will generally remove the obstruction. (4) When the membrana tympani (ear-trum) is accidentally perforated. much good is often done by the use of Tornibee's artificial eardrum. (5) The Enstachian tube mar ise the seat of mucous inflammation, and may require surgical treatment. Comm-ter-irritation behind the ears, the use of general tonics, ete., may be beneficial; and this is more especially true of the deafness of agel proulle. See Toynber on Diserases of the Ear (1860); Ronsa, On Diserses of the Ear (nem edl. 18:4). Since the year 1844, when the attention of jhysicians was first called to the subject, the growth of minnte fungi (Aspergillus, ete.) in the ear has been reported to be a common cause of disease of that part. The meatus and tympanum are sometimes covered with the growth. in the form of white or yellow inould on their surfaces. Timnitus, inflammation. and the accumulation of wax are attendant symptoms, and the treatment consists in the application of a solution of carbolic acid, 5 grains to the ounce of water. The fungi are perhaps the effects of disease rather than the canse.

Deak, dáaak, Fraxcis: Itugarian statesman and orator: b. at Kehila in the county of Zala (Szalad), Oct. 1i, 1803. He studied law, which he practicerl in his youth. was elected to the National Diet in 1832 and became the leader of the liberal party. Soon affer the revolution of Mar., 1845, he became Minister of Justice and projected important reforms in that department. ITe resigned office when kinsuth obtained power in sept., 184s. On the defeat of the Hungarian patriots in battle, in 1849, he quitted jublic life and retired to his estate. Maving been elected to the Diet in 1561, he became the learler of the moderate party and the most popular man in Hungary. He was the author of the address sent by the Diet to the rmperor requesting the restoration of the constitution of 1848 and of the protest against the imperial rescript in 1stit. [leak is regardecl as the master-ppirit of the movement by which the constitutional autonomy of Hlungury was restored in 186i, and large enncessions to eivil and religious liberty were extorted from the emperor. From that time he remained the recognized leader of the liberal party, commonly called after him. the "Deákist" and which had without interruption a majority of the IIusgarian Diet. He refused all offers of a place in the ministry, but no change in the ministry was male withont his consent. 1). in P'e-th. dan. 2!, 1s:6.

Weal [from Dutch dele (Mod. deel): O. II. Germ. dili, dilln, Nont. Germ. Diele. phank. crign, with Engl. thill. The word in Bing. often contused with deal. part. cogn. With from. Theil]: a conmereial name for homeds exceeting o feet in lengtly and T inchers wile. When I inchus or less wide they are called hattens. Deals are gencrally 3 inches in thickness and 3 inches in wilth: when thinner ther are usually called phatis, but thin boartis are often callerl deals. The word deal is commonly used in (ireat britatin and rarely in the U. s .

Whath Vallioy（so malled breathe a jarty of omigrants perishad thate from thise ant starvation in 10．［日）：an me row salley of（atifornit． $1: 30$ milos in length．tran lmy nearly northwest amd somblhost，and walloed at the rdus by the l＇amanint and Funcal Donatains．The molde ain！lowet pumtina uf the valley bottom is a glain cow eroll by a laym of erlittering white salt．Tha－plam lies he

 is a tuore grailail rion to the cond of the lome ral Mumains． where the valley eratences with arms of the Amarsona des－
ert of Nerada and the Mohave desert of Southern Catifornia. The so-called Amargosa river, a long and broad channel, usually dry throngh the greater part of its length, drains a large desert tract in sonthern Devadi, and crossing the Amargosil desert with a sonthward course curves about the south end of the Funeral Mountains and enters Death Valley. It is probable that the channel carries water only at rare intervals, but the volume of its torrent must occasionally be great. Whatever water it brings to Weath Valler must gather as a lake in the bottom of the palley until evaporated by the sun, and the salt accumukated in the valley has unquestionably been bronght by such torrents from the surrounding eleserts. In connection with a scientific expedition sent to the valley in 1891 by the Department of Agriculture, the U. S. Weather bureau inaintaned a meteorological station for fire months at the hase of the Funeral range. During the month of July the mean temperature was $102^{\circ} \mathrm{F}$. ; the highest temperature was 122 : the mean of the highest temperatures observed on the several dars was 1156 , and the mean of the lowest temperatures observed on the sereral days was 868 . The relative hmmidity for the same period was "o. This recorl, althongl not made in the lowest part of the valles, indicates that the locality is the hottest and driest in the $\mathbf{L}$. .... and it is not surpassed in these respects by any other jlace at which a record has been kept.
G. K. G.

Death-watclı: a small beetle inhabiting human dwellings, and producing a sound like the ticking of a watch. This sound being more readily heard in the stillness attend-

ing sickness, it has given rise to the superstitions belief that it prognosticates death; hence the name " death-watch." The noise is producpal by the insect heating its head agranst the wood in which it is concealed. It is supposed to be the call of the mate to its mate. The common death-wateh (Anobium notatum) is a species of borer. It is about a quarter of an inch in length, and of a duskr-brown color. A number of species are fonnd both in Europe and the $\left[\begin{array}{l} \\ \hline\end{array}\right.$. The Atropos pulsatorius, a very different insect, is called in England by the same popular name, and for the same reason.

Iblatable Land: a tract of conntr? at the head of the Solway Firth on the western border of scotland and England; lying between the Esk amd sark. It was for a long time a cause of contention between the two countries, and -ven after its division by royal commissioners in $15 t^{2}$ continned to be a refuge for outlaws. It was divided by a line draw from 5 , to $W$. between the rivers, the southein part being adjudged to Fingland and the northern hadf to Scotlaml.

Debentume [riom Lat, frbentar. 3u] plur. pres. indie. of dubire, owe:-acknowlerlgments of debt formerly began with the words dolomour miki, there are owing to me]: a downment of writing acknowledging a deht. The term is partionlarly applied to (o) eustom-honse certificates that an "xpurter is cntithel to atmunty or DRAWBaCK (q. $\because$ ). (b) One of a serime of insermments, msually muler seat. in which the party iswing than covenants to pay the snm therein declared ti be owing on the boldor at a iertain time with interist. Isually this debt is made a charge upon a fund or subject of property specified on referred to. Public compunies, esperiatly baiboad companies, have frequently resorten to these to raise special loans. The terminability amd fixity in amonnt of debentures boing often objectionable to lenders, debouture stork in many rases has been isstem. This is frequently irretcemable. aml may be trams-
ferred in any amount. The holder is entitled to a preferred rate of interest, which is a charge upon the ussets of the compant next to mortgages.

Rerised by F. Sturges Allen.
De'bir [Ifch.. in the rear]: a city of the tribe of Judah several times mentioned in the Bible: situated W. of IIebron in the hill-country, and in a dry ind arid place. It was captured by Joshna, and subsequently by Othniel; was inhabited by the Anakim, and bad a C'anaanitish king. It. was alterward given to the priests of the Hebrews. It was also culled Kirjath-sepher (town of the book) and Kirjathsimmah (town of the law), names seeming to indicate that a school or an oracle was situated there. Its site is mot at present accutately known. There was abo a place of this name near Jericho, and probably another belonging to the tribe of Gad. E. of the river Jordan.

Déblai, dā hata [Fr.. excaration, clearing. conneeted with déblayer, clear of rubbish, etc.: O. Fr. blef (Mod. Fr. blé, grain) : Ital. biado < Lat. abla lum, ptc. of aufer're, i. e. What is borne away, as grain from the field]: in fortification, the mass of earth taken from in excavation in the croumd in order to form a parapet. The earth used to form the entire rampart or parajet is called the remblai.

Melyorah: a Hebrew prophetess and judge : the wife of Lapidoth: gained celebrity hy hel suecessful efforts to liberate the lsraelites from Jalbin. King of Canaan. (See Judges ir.) she is supposed to have composed the spirited and beantiful lrrie which forms the fifth chapter of Judges, a parn orer the rictory, describing the battle in the most vivid colors.
Deloreezin. du-hretsin: a royal free town of Hungary: capital of the connty of Bihar: on an extensive sandy plain 116 miles E . of Bulapest (see map of Austria-TIungary, ref. 6-J). The houses are mostly only one story high; the st reets are unpared and dirty. It contains a handsome town-hall, scveral hospitals, and a Protestant college with twenty-four professors, over 1.000 stuitents, and a valuable library, it has manufactures of flonr, sultpeter, earthenware. soap, hams, sausages. and tobacco-pipes. IIcre are extensire markets for cattle and swine. I large majority of the inhabitants are Protestants and Magyars. It is connected with Pesth by a railwat. Pop. (1890) 58.9\%\%.

De Bry, or He Brie, Théodore: goldsmith, engrarer, and printer: b, at Liége, 1528 . Abont $15 \% 0$ he removed to Frankforton-the-dain. where he established a printing and engraving house, his two sons. Jean Théodore and Jean 1sracl, taking part in the engraving work. They made many plates of great exeullence for that period, which were published in various works; but the mame is best known in connection with the great enllection of travels first published in 1590 with the title Collectiones Perigrinalionum in Indiam orientalem et occidentalem. The designs for this work, as in most of those of the sixteenth century. are more or less fanciful. The vohumes were republished in German and Latin with rarions changes, and it is now nearly or fuite impossible to unite syecimens of all the editions. It is said that the most complete collection in the world is that of the Lenox Library, New Fork. De Iry died at Frankfort in 1598.

II ERBERT 11. Smitis.
Debt: in law, a sum of money due which is certain in ammont or capable of being reducel to certainty. such an indehterlness may arise either as the result of a judgment of a court of justice, or on a sealed instrument (specialty), or no an unsealed instrument, or on a mere oral contrach. Debts are thus distinguished into such as are of record, or of special contract or simple contract. They may arise either on an express or implied promise. Debts may be eoslecterl by an action of deht, or in some instances by an action of covenant. The last action is resorted to when the dutr to pay is derived from a contract under seal. The furin of action called imdebitatus rasumpsit (being indebterl, he promised) may also be used where the indebtedness is incarred by reason of a simple contract. A debt may be discharged in varions ways, as by Accord and Satrifaction.
 limitations will be a bar fo an action. The time within which the action must be brought umber such a statute risries in the different states. See Limitations. Statute of.
derow of bear is a common-law action brought to eollect a debt. It is ulso used to collect a penalty given by statuld. When an ation of deht is brought on a written instrument the defendant mat deny its existence. If he as-
serts that there is no sueh recorl as the phantiff atleges his plea is callad nul liel recoud；if he chams that a seated in－ strument which is set 日p as the fommation of an imblehter ness was never executed his blea is nom est fitum．Thesp pleas merely deny the erristener of the judgment or speciatty． It he has any other defotse he should diselose it by suecially setting it furth．So he may deny the existence of a simplip contriet debo or may set up in his pleatings any spectial facts which，while the admit the existence of the deht，show that the phantiff has ion right to recowr．A julgment in the aetion for the recowery of $a$ thete itself comstitutes a new Weht，on which another action may be brought，and sin on， unless there be some statutury reatriction of the right to bring an action unn a judgment，as there is in some of the Americanstates．Under the cenles of procelure of some of the states the technieal action of dobt mo lomerer exinte，as there is but one civil action．The same remedy may be had in substance under a complaint setting forth the fracts con－ stituting the cause of action． I．W．Dw1gut．
Debl．P＇ublic：The bulletin of thr $\mathbf{I}^{*}$ ．S．census for 1890 show：the argreqate debt of different nations in lise and 1850 to have beta follows：

| ＊atcre of debt． | Total debt less Enking fexd． |  | Per capita． |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 18\％\％。 | 1880． | $1890 \%$ | 1880 。 |
| National debt of forefig conntries． | －26，621，2220，135 | 825，484，492， 6.9 | 2328 | \＄35 bz |
| National debt of U．s．．．．．．．．．．．．． | 891，960，104 | 1．920，517．3f4 | 14.4 | 3833 |
| State aud local debt of U ． s ． | 1．125．210．414 | 1．123．25＊．617 | 1813 | 2240 |

These figures show that the national debts of the world hase inereased somewhat．bat that pepulation has increased fastor：that the lucal deht of the U．S．has remained nearty stationary，while population has inerensen noarly one－fourth； and that in spite of this last fact the national debt of the ［．S．has heren reducet one－half．＂The awerage anmual de－ crease in the mational delot of the $\mathcal{V}$ ．S．during the decade exceedert $\$ 100,1010,01(6)$ ；the decrease per capita of combinet national，state，amblocal dobt during the sume periol was from sol． 6.3 to s．3．：37．While wher slatisties show that the yalue of proprety astesed for taxation increased mean while
 dieating a reduction of public delt and an inerease of wealth for the conntry umpreculented，at least in modern times．＂

The nat imad debt of rarions foregn countrise in 1890 was as follow：

The actual amount of the French debt is，however，not sery much over two－thirds its nominal amonnt．
The earlier U．S．debts were of the same character．The national debt on Jan．1，1791，was $\$ 75,000,0(1)$ ，and remained almost unchanged for the next fitteen years．At the berin－ ning of 1812 it hat fallen to $\$ 4,000,000$ ．but rose rapidly in the war with Great Britain，and stoml at $\$ 127.000 .000$ at the beginning of 1816．This debt was grodually paid of at ma－ turity．and at the beginning of 183 J had been practically rednced to zero．In the years following a new debt grew up gralually，though somewhat unsteadily，amounting to $\$ 6.5$ ，－ 000,0010 on July 1．1860．the pulblie crodit at this time being very poor，owing to the dread of imprarling seccssion．The present dubt is to all practical purposes a war debt．The war loans beran with that authorized by the aet of Feb． 8,1861 of $825,000,000$ at 6 per cent．for twenty years．of which \＄18， $41.5,101$ were iswed，inminally at par bit rally costing about $1 \frac{1}{4}$ prr cent．in negotiation．Next，on Mar． 2． 1861 ，treasury notes bearing 6 per cent．intcrest were an－ thorizerl，of which $835.364,400$ were issurol．This was a most important act for the relief of the Govermment，the notes buing receivel for customs，and hing redecmable within two years．On July $1 \%, 1861$ ，\＄2．00，010．000 of i－prr－ cent．bouds，to run twenty yorrs，were authorized，with an－ thority to isone any part of this amsunt in the form of treasury notes，ruming three years，it $7^{3} 1^{3}$ per comt，interest $^{2}$ （sulsectibently known as sesen－thirties）．or notes not hearing intarest payahle on domand，or treasury notes for one yeal
 but the whale ammont demand notes not at interest shal not exced S50，000，000．An act of Aug．or，1Nfi，authorized the issue of bunds at 6 per cent．intorest，ruming twenty ymars，to exclange for the one－vear and three－yenr notes le－ fore anthorzarl，with accumnliterl interest，at ：ny time be－ fore or at thoir maturity；ambl the drmand notes were do－ －larell receivahle for all jublic dues．These acts were mosi wisely desirned ant signally succersful：the demand notes， thenghat first rejected by the hanks，hefore the cluse of the
 came very areqptable，and were reatily emvertet，with their aremmulated interest．into the promanent b－perecont，bonts． The enrent of public preterence was then changed in favor
＊Plas a number of terminable aumities amounting to nearly

of the Govermment issnes，which at first were received with aversion．particularly by the banks．A rery large issue of these notes took place，the seven－thirty notes reaching \＆ 140 ．－ $0!4, \pi 50$ ，and the ${ }^{4 i 5}$ ler cent one－real notes a large sum， with the tull $850,000,000$ of ilemand notes．Of the $6-\mathrm{gev}$ cent．twenty－year honds issued in redemption of the one and three year notes there were $18.1 .321,200$ ．Un Febs．12，1862， $\$ 10,000.000 \mathrm{more}$ ol demand notes were isemed．

The precerling very successful issues laid the basis for the first great popmlar lom，anthorized Feb． $25,186 \%$ of $\$ 500,000,000$ of 6 －per－cent．bonds，redeemable aftor five and payahle after twenty years－commonly called fire－twonties． A larue subscription was at once maile，and the tull＊isoo．－ 000.000 were issued．The acts of Mar．3，1864，and Jam． 28，1865，added \＄15，000，000 more to the anthorization．Isy this act of Feb． $25,1862,8150,000,000$ of circulating notes were anthorized and male a legral tender：$\$ 50,000,000$ to be in plate of the demand notes of July 17．1861．On July 11， 1862，$\$ 150.000,004$ more were authorized，and on Mir．3， 1863．S500．000． 0000 more－ $8450.000,000$ in all．The whole amomint was issmen，amd formed the great volmme of cur－ remey known as grepubucks．Of this issue $\$ 400.000,000 \mathrm{was}$ made permanent，lut contractions in 1568 and 1 stby reduced the amonnt to s3 46.681 .016 ．The act of Feb． 25,186 ，theo anthorized the aecoutance of $\$ 25,000.000$ of deposits at 5 per cent．interest ；this anthorization mas increased to \＄50．0no．－ 000 on Mar．17．186？and to $8100,000,000$ on Jnly $11,1862$. Tin June 30，1864，a further sum ot 850，000，000 was added， this to piy 6 per cent．interest；all this．deroribed as tem－ poray loan，was to be repaid on ten days notice，and was so repaid in 1865 anel 1866．except Sir，560 umclaimed．

The uct of Jar．1．1862，authorized the issue of certificates of indebtedness to public ereditors in adjustment of any clams，such certificates to beru 6 jur eent．interest，and to rum one year．The sum of＊ijb1． 53.241 of such certificates Wats issuch，all except $\$ 4.000$ of which were redeemed in 1863 ．1N64，and 1865．The act of July 17．1N6～，anthorized the $i$ sone of postace－stamps as currency，and made them re－ ceivable in parments to the U．․ in stims less than five dol－ lats．An act of Mar．3，1863．anthorized the nse of frac－ tional notes（jarts of a thollare in julace of postal currencr， limiting the amount to $\$ 0.000 .400$ ．which anthorization was confirmed hy the act of Jme 30,1864 ．This issue was prompt－ ly calleed for to the extent of from that sum to the large amoment of $\$ 45,72,061$ ，ontstand－ ing Jan．1，18：．3．In the fears begiming with 18 in it was rapidly withdrawn，and linctional silver sulstitutnil throngh the avails of 5 －per－cont．bonds sokl muder the acts of $1800-$ 51

By act of Mar．3．1863，a loan of s000．000．000 was author－ ized at 6 jer cent．lor ten or forty years，prineipal and iu－ terest payable in coin，of which siv．000．000 only wis issued， and taken at a premium of $3 \frac{1}{2}$ tu 4 fre enot．preference be－ ing given bectuse of a poswible distinction existing adrerse to the payment of the primeipal of the 520 s in chin．This act was lepealet June 30 ．INis．The same act．Mar， 3,1863 ， also anthorizel $\$ 400,000,000$ of one，two，and three year treasury notes，at not over 6 per cent．interest．to be a legal tender for their face－vilue，pincipal ind interest payable in lawlul money．Of these there were：
One－jear notes，issued ．．．．．．．．．St1．52n，（10n，at 5 per cent．S39，shis out．
Twn－jear notes． Three jear uotes（compunali．．． $266,595,140$ ，at 6 ．＂ $208,6.0$
This ant authorized the exchange of new treasury notes for any of these issmes ontstanding at any time，and provided for \＄150．006，000 more of curreney，not at interest，to facili－ tate such exchange．In all，s．tition． 440 of these treasury notes of 1863 were issued，practically all of which were ma－ celed on exchangerl holfore Hay 15.0 186．It will he scen that but a small amount of permanemt loans was created in 18（i．3），treasury notes heines lirycly usen．

An insme of sovtu， 100.0100 was anthorized Mar．D，1804．at 5 or 6 ［nu tent．．payalle in coin：$\$ 1!6,116,300$ was iscond at 5 pre cont．，redpemable in tom amb patyable in forty years in coin－the son：allerl ten－fort ice of 1864－and s． 3.883 .000 at 6 per cent．On Jume：30，1s6t，monther lom of $\$ 100,000,000$ was
 heing issmed．Thu loans not heine fully taken，the act of Jume 30，18if，authori\％ed the iswar ul＊200，00（1，0）\％of seven－thirty treasury notes，to run thre yestrs，which imthority was ex－

 bearing notes were issumb，which were duly redecmed or cx－ changed before July 15， $1 \times 6$.

 In apdied only to the reimbersement of treasery notes or

 thase sums bemer cmployed tore tine treasury notes and other obligations．but net to inerease the pablice debt．

All these were funding operations，whereby a dufinite cob－ ligation was substituted for on indelinite ome．The refond－ ing issues，whereby homes at lown rates were substituted for similar tomds beating higher mates，were intugurated he the

 cents．By the ate of wint these issues were made atailabie for use in the rexumption of specie payments as well ats in the re－ fumbine of the deht，and the prisible ambut ronsiderably incmered．The faromble eonditims of the forementrabe in the years lenc and 1Nig．coupled with the signal success of the resumption of specie payments，cansed the 6 and o per cent．bonds to be largely retired in atrance of maturity；a few were continued for a short time at at per ceat．or 8 per cent．under agrements of issl amd［sxe respentively．All these have betn sinee paid up，while nomb all the $4 \frac{1}{2}$－per－ cent．bonds，and sume of the t－putecents，have been pur－ chase in tha oper market，hong in adraner of maturity， from the surplus revenuen of the fowemment．

The defielney in the revennes of the U．S．since 1892 has shown itself in an increase in the nationaldelot．Hand all forms of L．．．currency been equally aecepatale to creditems the deficieney would have beet met by a rednction of cash in the treasury；hut the demand for gold com，as distinct from silver or paper．was so great that the treasury conled not safely meet it ont of acommatated stocks，and was forced to issue bonds to replemish the fold reserve．The total amount of such bonds issued in（＇leveland＇s administration was

 and of lagres．It at inst followed the claswal tratitions
of David, hut became with Delacrois and others a leater in the Romantie school of 1830 . His pictures are notable for depth and richness of tone. Ilis Ceraman and Toninglenrses are in the Lourn' Fight-wated at Smyrna in the Wolf collection in the Metropolitan Musenm. New York: and The Suicille in the collection of IT. T. Walters, Baltimore. D. at Fontainebleau, Aug. 22, $1 \times 60$.
William A. Coffin.

De Candolle. Me-kiănídol', Aveiestis Prame, Mr. D. botanist of French extraction: b. in Geneva, Felo. 4, 1778. He studied at Geneva and afterward in Paris, where he became a pupil of Desfontaines, and enjoyed the friemlship) of Cuvier aul Ifumbolett. Lamarck's 'Flora of Frence (180t-0.5) Wras prepared hy him. He hecame in 1808 Professor of Botany at Nontpellier, and published in 1813 his Elementary Theory of Botany, a protound work, in which he developed his new system of elassitication according to the natural methorl. In 1516 he removed to Geneva. He projected a great work which shoula give a description of all known glants, and published two volumes (1818-21), with the title Regui Vegetabitis Systeme Naturate, but modified his plan amd mudertook the well-known Prodromus Systemates Jituratis Regni Vegetabilis (17 vols., 18:4-73), which he did not live to finish. Among his other Works is Organogruphie l'ggétate (152\%). I). in Geneva, Sept. 9, 1841.- Mis som, Alphoxie Loers Pierre de Casprlef, b. Det. 28, 1N06, wrote several botanical works: 1 ublished his father's Memoires of Sontenirs (1462); continned the Prodromus, and began the Monographice Phoneroyamarum (18i8). 1). Apr. 9, 1893.-Casimir Promis de Canbolle (son of A1phonse, b. 1836) has aided in the prepration of the Prodromus and the Monographice.

Decapitation [from Jat, de. ott + cepput, heall]: a form of Capimal Puxisiment ( $q .1$.) in which the lead is severed from the boly by in executioner. Under the English Government hanging has taken the place of decapitation, the last instance of the latter having oceurred in 1745. This mode of panishment is still usen in some of the German states and in Frame. In France the Gullowine ( $q$. $\cdot$ :) is still used. Decapitation is of very ancient origin. It is a 'requent pmishurent among Oriental nations.

Decap'oda [from Gr. סéка, ten + mous, mosós, foot]: a subclass of Crustreca, most of whose members are characterized by having ten walking feet. The limits of the group vary in the estimation of various authors; as here nsed it is equivalent to Podophthrdmia, or stalk-eyed Crustacea. The body is divided into two regions, an anterior cephathonas bearing the organs of sense, of eating, and of locomotion, and a posteriur seveli-juinted abdomen. The eyes are placel on jointel stalks; the walking legs are ten to fourtern in mumber. The group contains the largest and best known of the Crustacea. It is divided into the Cumacere, the Stomapoda. the Schizopotu, ans the Dectpoda proper. lin the latter there are but ten walking feet, some of which may be arment with pincers: and in the alults these legs have but one principal hansll. The true Decaporls are diviled again into Ifacrura (with a long ablomen like a lobster) and Brachyura, with a short abwhmen folded under the cephalothoms, as in the crabs. Sce Lobstra, surdmp, Crab, ete.
J. S. Kingsley.
 eities of Palestine leagued theylier, like the Hanse towns, and having certain privileges not now known. Decapolis is thes ribect by busethins in his onomusticon as "the part lying on the wher sithe of the Iomban about lippos, and Tella, and (ratara." The ancient lists vary. Ptolemy speaks of cirlatern (it ins ; Finshitis omits Seytlopolis-the only one of the ten that was on the weat side of the river; Damaseus is sometimes nathed and sometimes onitfed; Plinys list includes Jamarons and mints C'apitolias. Ther weremostly direk cities, sme of which, at lenst, were setthen] by the foflowers of Alexanter the Great. They were suluheth by the ahacerbees (Josephas, Ant. xiii. 15. 4). When lompery conqured the last ( $6: 31$ r.c.), he annexal them to Sy ria, ilotakhing them from the Judam government. surmondea as they were by Jews, these eities then mited in atefensive allianne. Thas oricimal union was probably
 the west sile of the river). Ifterward there were alderl Philadelphia, Gernsa, Dion, Iaphana, Copitolias, am! Canathan. Of these len only soythometis, Gatara, and ('anatha are now inlabitem, thonich all hat haphan have hem identilied. Il ipposs has beroll itlentitied with l"ik; Pella with

Tubakat Fah'l; Gadara with Un Keis; Pliladelphia with habbath-ammon; Gerasa with Gerash; Dion with Eidun; Capitolias with Beit er Ras; ancl Canatha with Kunawat. Scythopolis the ancient leth-shean, is now ealled Beisan. See Selah Merrill, East of the Jortan (New York, 1881; 2d ed. 1883).

De Cassagnac, de-kăas'săn yaak', Paul Gravier : French journalist, politician, most noted duelist of France, if not of Europe ; b. Dec. 2.1843 ; son of Adolphe Granier de Cassagnac, a zealous Bonapartist ; succeeded his lather as editor of Le Pays: has been since 1874 a member of the Chamler of Deputies; noted as a fiery Bonapartist and especially for his mumerous atiains of honor. Author of Mistory of the Third Republic.

Deca'tur: city and railway junction: eapital of Morgan co., Ala. (for location, see mip of Alabama, ref. 2-C); on Tennessee river; 87 miles from Bimuingham: has numerons clurelies, saw-mills, planing-mills, and a basket-factory. Pop. (1880) 1,063 ; (1890) 2, 165 ; (1893) estimatetl, 4,000.

Editor of " News."
Decatur: fown : capital of De Kall co., Ga. (for loeation of county, see map of Georgia, ref. 3-(i) ; on railway, 6 miles F. N. E. of Atlanta; in an agricultural distriet. Pop. (1880) 639 ; (1890) 1,013.

Decatur : city and important railway center : eapital of Macon co., Ill. (for lueation of connty, see map of Illinois, ref. $6-\mathrm{E}$ ) ; situated abont a mile N. of Sangamon river and 3: miles F . of springfild. It has mmerous manufactures, flouring-mills, large grain elevators, large railway car and repair shops, electric street railways, water-works, and paved streets. There are here two coal shafts. Pop. (1880) 9,54\%; (1890) 16.841. Editor of "Merald-Dispatch."

Decatur : city and railway center: cupital of Adams co., Ind. (for lneation of comty, see map of Indiana, ref. 4-G); on St. Nary's river; 21 miles S.S. E. of Fort Warne : has $!$ churches, 2 public selools, a parochial school; has mannfactures of wimb-mills ant engines, spokes and lubs, mill machinery, salt-clazed tile, and has 3 grist-mills ; there are two stone quarmes ant a limekiln. Pop. (1880) 1,905; (1890) 3,142 ; (1893) estimated with suburbs, 3,621 .

Ebitor of "Demoerat."
Deratur: willage ; on M. C. Ry.: Van Buren co,, Mich. (for location, see map of Michigan, ref. 8-11): 116 miles E. by N. of Chicago. Pop! (1880) 1,26\%; (1890) 1,109; (1894) 1,386.

Decatur: town ; on ralway : capital of Wise co.. Tex. (for location of county, see maj of Texas, ref 2-11): beantifully situated $\mathrm{ai}_{\mathrm{j}}$ miles N . of Fort Worth; has six churehes, a grated schonl, a college (baptist), coftonsed-oil mill. canning-factory, ice-fact ory, and water-works. I'op. (1880) 379 ; (1890) 1,46 ; (1893) estimated, $2,500$.

Editor of "News."
Becatur, Stepies: naval officer; b. in Newnort. R. I., in 1751 ; son of a llugnenot refugee from Ruchathe, France, who han served in the French navy as an ollieer, and who after his emigration married it lady who was a native of Rhode lshand. Stephen becatur removel to Ihiladelphia, l'a., when a roung man. and there obtained command of a merelantman. During the war of the Revolution he commanded the Royal Louis and Fitir American, and captured soveral British vessels. On May 11, 17as, hostilities with France having begun, he was appointed post captain in the U. S. nary, and was placed in command of the Delaware of twenty guns, which, friming his cruise along the const of the U. S. and in the Wist Indies, captured the privateers Le (royable and Narsum. In 1800 he was appointed to the cominane of a situadron of thirtuen sail on the Guadeloupe station. In Oet., 1R01, he wis diwhenred from the service under the peace establi.shment, and engayent in business in Philathlyhia. D. at Frankford, near Philadelphia,
 great distinction in the nary.

Degitur, Stepife: commorore; b, at Sinnepuxent. Ma.,
 led a small party which hurned in the harbor of Tripoli the $1^{\circ}$. St frigate Philadilphia after she hat been eaptured by the Tripulitams. For this gallant exploit he was raseel to the ramk of eaptain. In the same year he alaled nther derds of valor in his record in the attacks upon Trijoli by fom. Ireble's stuatron, llaving taken command of the frigate [Thital states, he captured the British frigate Macedonian (ret 25, 1812. A gald metal was roted to him by

Congress for this wietory. Ho was howated by a suphor force in the harbor of New london in 1si:3-1t. In May. 1515, he was appointed commander of a spuadron of that frigates and seren suallor bessels, which was semt the chastime the Agerines. He capturen two Algerine vessels of war Inne 1 of that vear. and compelled the bey of dgiers to she for peare. IIN was killeal in a duel hy Com, Janues larron Mar. 20, 1800. He wats noted for his resolute spirit and cool intrepidity.

Wecazes, duä kanz, Bitaf, The de: Fremch statesman: bo at sto-Martin-du-Laye siept. 2s, 1800 ; berme the trusted counselor of Kiner Louis of lodmad, and afterward secertary
 Minister of Poliee 1N15; Ainister of the Interior 1sis. He was matle lrime Minister in Sov., 1519, and tried to kerp the balane between the radieal and ultarovalist parties. but was persing to nuither. 'lhe murder of the lhate of Berry was turnol into political capital hy the rovalists, who charged berazes with complicity in the rime. Wín resirumd: was ereated cluke ly the kinge and sent is ambassatur to Figlamel 14?0-21. After the revolution of 1830 he smpInrted Lonis Philippe and in 1 N:34 hecame grand referendary of the chamber of veers. In $1 \times 18$ lie hat leen male Duke of Crlickethre by the King of Denmark. In 18.46 be was acerentited to that comentry on a yuecial nuission, but the latter part of his life was gen rally free from political coneerns, and after 1848 spent in retirement on his estate of becazeville. D. Uet. 2t. 1sis0.
Decazes, Ludis Charles Elae Armaxiex, Due de: statesman; b. in Paris, May D9, 1819; chlest son of Élie Jecazes. He early entored the diplomatio service, and was minister plenipotentary to spain and lourtugal in lsk, but retired into private life when the Revolution broke ont. In $18: 1$ he was elected a member of the Xational Assembly. De took his sumt in the right center, hat, thomgh he gronerally followed his party. he nower operaly and formally declared himstlf amorchist. In No: he was appunted Mimister of Forerima Affairs, and he retained that position till 18 ir. under exmedingly trying ciroumstances, but with dignty, enjoring the contidene both of the homse of representatives and of the foreign cabinets. D. scpt. 12, 1self.
 mont of Iveyron: about ? miles N. F. of Villeftanche (see mag of France, raf. $8-1^{*}$ ). It han pxtmsive hat fumames and iron-forges. Coal mines are worked in the virinty. 1'ор. (1896) 9,634.

Decean, or The Dekkan [from Sanskit dukshime, on the right hand, henee in looking east, the wouth. south country; cf. (ir. $\delta \in \xi$ bos, Lat. deater, right hand]: a meographical term of historieal importances often applied to the whole of the peninsula of Ilimdustans of the Nerhudta river or Vimethei Mematains. bnt now ofton limiter to the comatry between the Nerbudis and the Kistnah. It comprises Aurnngalbal. Bitar', Berar. Bijapur, ('andoinh, Gumbwana. Surthern ('ipears, and Orisas. The Decean was first invaled lys the Mohammodan: in 12? W, When bioriri was stormed aind pillaged. Wver a gharter of a century later on, in 1355 , the Nohammetans phased their compuests still farther, and ammed to the empire of beblii the whe comery as far s. as the Kistmat. The mame has feem latoterty applied to one of the latere politiond sululivisions of the Presideney of Bombry

December [Fr. Desember, fron Lat, derem, ten]: the twelfth and last month of the year: so callend heratse in the ancient homan calembir it was the lenthmonth of the sear. By the Inglu-Saxons it was called l'ule momth and Midwinter month.
Derem'viri (sing. Deremrir) [Lat. deem, ten] + rir.
 painted for particolar purposis lat nore cepecially applion to the ten maristrates electer from the loman pat ritimes tedraw upa cople of haws fombed on the mom atprovel
 athaty to govern the state. The experiment prowe ent tirely shecesstal: their law were appored by the somato and engraven on ten metal tablets: and their citlicial dutios were discharged with mo much satisfation that, at the ex. piration of their year of wfice, it was reselvel, as their work was not completal, to continue the same firm of government. A new enmmision, invested with the same pawer. was apluintell fur the nest year, to whith the phenemas wore
almitted, the result of whith was two mhlitional mblets,
 quent times became the formation of all loman law. "The" new deremviri, howerer, pereded to the bust viofent acts
 and familise of the plebriatms. which so exa-pratell the
 drwon from odice, and the ordinary maristrates weme peestablislued.
'The drembiri litibus judicandis (ton men fur suttling lawnits) formet a kind of conrt for trying cyit cases, anf? later: for matters involving life and death. The decommiri steris fieriumlis the ten man for performing saced du-
 five plehemes who had charge of the sibyline looks until the find of Cisero, when they were made fiftern in number. They ware considered sacred to Apollo. There were alos decempiri for dividing tha public lamds.
 decem, ters + amus, yatrd: wectrring every ten years. Fior example the L. A. Arosus is dermaial." "The derennial games (dermmid of dernnelia) among the lator liomans were echomated in consequence of the lant that the Emb pror Augustus promaled to refase tha empire for lite. choosing fo bre becterl to it for a furiod of ten yeas, at the ent of which time he accoptend in for terns more, and so on till the pud of his life. The fietion whe kept up, till the last days of the empire by the olservance of the deecminal games.

Hecinhuous Tepfle [deridnous is from Latt, deciduens, itnclined tor fall, deris. nt defidert: de + che dere, fall], called also, in mamalals, temportry or milk topth: those which appent in infincy and which after at time fall mot, ithl are succeedend by the permanent teeth. In chiddren there arp twanty sheli terth, ten in pach juw-fomp malar. two camine, and fon incisom tectla. In reptilos and dishes all teethare decidunus, being continually cast out and remewel.

Heciduons Trees: trees whose laves fall in the autumn. leaving the branches bare of foliage sluring the winter. They are contrastel with the Everbirfass (g. r.), in which the leaves remain mon the brushes until after the apmarane of the new leaves in the spriner. There are many graditions between the two kinds. A tree which is daredumen in a colal climate will be evergreen or hearly so in a warm climate.

Derimal [from Lato decimus, tenth]: a number writton in the scale of tens. The nimme is ciperially appland to at Decimal Fraction (y. co).
Decimal Fraction: a fraction whose denominator is e decimal momber or power of tem. Thus $\frac{1934}{100}$ is a decimal
 $\frac{30}{30}+T_{0}^{0}=10+2+3_{0}^{3}+\frac{1}{10}$. by an ohwious extension of the methen of local values, whepe iath digit has ten times the value of the like digit which immediathy follaws it, the ahowe derimal fraction may be, and nsually is, written thes: 12. 31 , where the decimat point alter the d medely serves to indieate which digit represents mifs. In this lomm a dorimal fraction is termed a decimal.

For the purpme of indiating the unit" phate the methowd of Sir Tsanc Nintons of using a point placed for distimetion near the top of the tigures, is frepuraty nsed. The oprostions of ahbition, suhtraction. multipliention, ant division may be applied to leximals in cxitely the same mamer as to integers. The only alditional rults 1 n theimals refer th the pesition of the derimal peint.
In their ahmeviated form decimat fractions are new extensively emplared in arithmetion calcolations. A subdivision of weights ant mean-mes on the prineiple of checimal division was intralued into France at the time of the Revolution, and has sine laren atopted by a large pertion of the civilizel woth nutur the name of the Methe sistas (q. e.)

## Dewimal Nystom: som Metric system.

Docimalion [from Lat. decimatio, neriv: of decimater th decimato. to take by lat callatenta man for punishment in loman histury, the sidection by lot of ome man ont of every ten. Who wai pat todeath in casas of mating or other grave offense committed hy a boxdy of trouns. Dherimation

 Joonaml Moxion octasionally fratited it, ats in the case of the eitizons of the $\mathcal{T}^{\circ}$. S. captured in the expectition against Mier.

Decimi, dā chere-mée [Ita\}, from Lat. de cimus, tenth]: an
 Italan term used in music, signifying an interval of ten diatonic clegrees, as Irom small e to the oncemarked $\bar{c}$. The harmonic relations of the tenth are so similar th those of the third that in thor-ough-bass the same figure (\%) denotes either. I;ut while, from a harmonic standumint, the tenth is considered simply as a thirl, an octave removed trom its fundamental in combterpoint (polyphony), relations arise in which the tenth develops peculiarities, which require diferent treatment from that demanded br the third.

Decins. Cars Messic's Quntus Trajavts: Ruman general and emperor: b. in Pamonia about 200 A . d. Sent in 249 hy the Emperor Philip to appease a sedition, his arms revolted and proclaimed him empror. Philip marched against him, but was killed in the battle which ensued. Decius himself was shan two years later by a shower of darts, amd his army defeated while attempting to check the (rothic invasion.

Decins Mus. $\mathrm{l}^{3}$ crblics: a Roman consul and patriot who obtained colebrity by deroting himself to the Dii llanes as a sacrifice. In a hattle against the Latins (33i B. c.) he rushed into the milst of the enemy and was killed. Ilis son. P. Decius Mus, imitated his example in 296 b. c., when be commanded against the Ganls.

Deeker, or Dekier, Thonss: English dramatist : b. in London abont 15i0: began writing for pullication as early as $15 y^{2}$; collaborated with Ben Jonson, Middleton. Welster, and mans others; published in 1600 the comedies The shoemaker's Itoliday, or the Cientle Craft, and The Pleasant Comedy of Old Fortunctus: quarreled with Jonson, who satirized him in Lrery Mon out of His Humor and other phars, and was ridiculell in turn in Decker's Sutiromastix, or the Chtrassing of the Ihmorons Poet (1602); was several times imprisoned for debt: atcoording to his own acconnt, was "three score" in 163\%. Among the plays mritten in conjunction with others were 7 he Ifonest Whore or the Concerted Courlesan (1604; secoml part. with Middleton, 1630): The Roaring Girl, with Middleton (1611): The Virgin Marlyr, with Massinger (162?). Lle aided Romley anl Webster in the tragedr The Iritch of Edmonton (pul)lisherl in 165s). Fecker hat a sprightly and bumorons style, and was a realist in depicting the life of his time. He also wrote a number of pamphets chiefly satirizing English social life; one of these, Lanthorn ind Candlelight (1609), was republished as English Tiltainies (1637). These pamphlets were republished in Grosart's Hulh Library, and a collection of his plays appeared in fire volumes in $18 \% 3$.

Declaration [1at. declara'tio, deriv. of declara're make clear (clurus), publish]: an atlirmation; the act of declaring: a public announcement; a public expression of facts or opinions; a proclamation. Among the most memorable of all political documents are the Derlaration of Independesce (q. $\quad$.)., of the British North Imerican colonies, and the "Declaration of Rights" passed by the first Congress of those colonies at Philadelphia on Oct. 14, 17r4. The (onvention-parliament of England inlopted a "Declaration of lights" on calling William and Mary to the throne in 16sa. A ". Weclaration of the lights of Jtan "was adopted by the National Assembly at Paris Aug. 18, 1509. The "Declaration of Thorn" (Lat. declarutio Thorunensis) was a confession of faith drawn up at Thorn, in Poland, in 1645, for the nse of the Reformel churches, the design being to settle controverted proints.

Revised by C. K. Adams.
Heclaration: in eommon-law plearling, a specification of a canse of action by a plaintiff against a defendant: the phoning in which a plaintiff sets forth his case against the lefendant. It contanins certain formal or substantial parts. such as the title, venue, the cause of action, and the conchsion: it answers to the "hill" in equity. The declaration followerl after the service of the writ of summons, and unless it was delivered within a certain time the defendant could obtain a judgment of non pros. In Great Britain the declaration is 110 longer in use in actions, luing superseted by a "statement of "laim" muler the dulicature Acts, and in the U.S. the term "complaint "is used in the eode states to designate the phantiffs statement of his canse of action. The term is used in other hranches of the law, as in deelaration of trust, declaration of uses, thechatam in pvidenee. ete.. where it has its general sense of an express or explicit statument, an asseveration or acknowledgment of a fint. purpuse. or intent.

Revised by F. Atuages . LLLEN.

Declaration of Independence: the act by which the thirteen british colonies of North America assuted their independence of the mother country. The first Congress of the thirteen liritish colonies, which led to their nltimate union in resistance to the British crown, and their jointly throwing off their allegiance to the same, as well as their ultimate union as the 「uited States of America, met in Philadelphia sept. 5, 16it. The immediate canse of this assemblage was what was called "the Boston Port Bill"that is, an act of Parlianent by which the port of Boston was closed and the custom-honse removed to Salem. hecause of the destruction of the teat at the former place. This was looked upon by the friends of constitutional liberty in all the colonies as a direct attack by usurpation upon the chartered rights of Massachusetts. If they should silently permit this gross outrage to be perpetrated ppou a sister colony they saw no security against similar outrages being perpetrated in tum upon their own chartered or constitutional rights. It was now that the cry of "The cause of Boston is the cause of us all " was raised in Virginia, and extended from the Penohseot to the Altamaha. The result was the call of a gencral congress of all the colonies, to meet. by deputies, at the time and place stated, for joint consultation and joint action in maintenance of principles essential to the preservation of the rights and liberties of all. The idea of independence or separation was at this time entertained by no one. Cpon the assembling of this Congress. Peyton Randolph, of Virginia, was chosen the president of it, and Charles Thompson secretarr. In all the deliberations of this body each colony stood upon an equal foot ing with the others, without regard to population, wealth, or the number of delegates sent. All questions were decided by the colonies present, each having one vote only. They urged several measures upon the consideration of their constituents as proper means for obtaining a general redress of grierances, and also prepared and published a declaration of what they considered the indefeasible rights of all the colonies under the British constitution. They adjourned Oct. 26.1 irit, with a recommendation to the colonies to meet in Congress again, by deputies, Mar $10,17 \pi 5$.
In speaking of the papers issued by this assemblage, Lord Chatham said in the British Parliament that, though he had studied and admired the free states of antiquity, the masterspirits of the world. yet for solidity of reasoning. force of sagacity, and wisdom of conclusion no body of men could stand in preference to this Congress. All this, however, incensed rather than appeased the ministry. On Apr. 1, 1isio, ther had 3.000 troops in Boston for the purpose of enforcing their iniquitous measures at the point of the bayonet. Hostilities soon ensued. The battles of Concord and Lexington were fought. Engagements also took place at Ticonderoga, Crown Point, and skenesborough in New York.

It was in this state of things that the second Congress of the colonies assembled at Philadel, hia on Mar 10, 1 iñ aecording to the recommendation of its predecessor. Peyton Randolph, of Tirginia, was again chosen president, but soon being called home on urgent business. John Hancock. of Massachusetts, was on May ot chosen president of the Congress in his stead. The crisis was now becoming not only serious, but alarming. The purpose of Great Britain to reduce the colonies to absolute suljection without any redress of grievances seemed to be evident. The Congress, with firmess and without hesitation. determined to resist force by force. Troops were raised for the purpose. In setting forth the reasons for their action in thus defending themselves and their constituents, they declared that they had "no wish to seprarate from the mother country, but only to maintain their chartered rights." "In our native land," said they, "and in defense of the freedom which is our birthright, and which we have ever enjoyed till the late riolation of it, for the protection of our property, acquired solely by the honest industry of our forefathers and ourselves, against violenee at tualif offered. Wr have taken np arms. We shatl lay them down when hostilities shall cease on the part of the aggressors, and all danger of their being renewed shall he removed. and not before."

On June 14. 1 \%\%5. at the instance of Massachnsetts, George Washington. one of the delegates of Virginia, was umanimonsly appointed commander-in-chief of all the colonial forecs. He was eommissioned in the name of the united colonies the name of each colony present by its deputies being set forth in the commision. This oflice he aceepted on the cumbition that he should reecive no salary except the fiyment of his actual expuences.

Thre days afterward the battle of Bunker IIill was fonght. Whathington dill not reach the vieinty of bostan antil July 12, 1ant, when he asimmed the command of the colonial army assemblial there. It was not until the early part of the year loth that the public mind throughout the colonies began generally and serionsly tormsitler the puest ion of indepmolEnee thongh a portion of the people of North carolina had taken this view of the subject ahmet from the begiminer of the trubles. As carly as May po. Fio. their culebratol Meckhaburs convention assembled and anmoned their fammus declaration, werong themselves for ever from all their allegiance to the rown of Great Britain. Though the influence of this act upon the other colonies apreas not to have hean very great, the historical importance of it was vary considerahie, as it preceded the general decharation by more than a yoar, and gave expresion to many of the thonghts embodiod in the more coletnated document. Ste Meckiexberm; Deqlaration of Indepradence.

In Jan., 1766, Masachusetts instrueted her delegates in the Congress of the colonies at l'hiladilphia to sote for independence. The same thing was done hy Sonth Carohina in Narch, and Jy Georgia atnd North Carolina in April. In May, (ind. Washington wrote: "A reconciliation with (ireat Britain is imposible. ... When I took command of the army I abhorred the ilia of independence: but 1 an now fully satistied that mothing else will save ns." In the same month Virginia instructal low delegates in (ongress to vote for independence. New Hamphire, New Jersey, and Maryland followed early in.Iune. Pemsydvania and New York delayed action, still indilging hopes of an aljustment of the controversy. The general instrinctions of the colonies to their delegates werr to renoture all allegiance to the British crown, and to form a confederation among themselves as independent States. On Ime i Richard Henry Lee, a delegrate froun Virginia. moved a resolution in Congress that "t these united colonies are, and of right ought to be. free and indopendent States. . . . and that a plan of confetleratien be propared and transmitted to the respective colonies for their consideration and aproulation." This reselution was adopted on . Iune 11. Two committens were appointed under itone to prepare a luelaration of ludepentsenere and the othere to prepare - Irticles of thion or Confetheration. The committee to prepare the beclaration of Fudepentence emsinad of Thomas Jeffersom, of Virginia, Iohn Alame, of Massachusette bemjamin Franklin, of Pepnsylvania. Ruser Sherman, of Comorticut, and labert R. Livingston, of New York. They reperted on dune ex but action on the report was deferred for some days for the delecates from lemsytrania and Sew York to recelve their instructions and powers to vote for the berlatation. This eadelirated paper was drawn up, by Mr. Jeffersan, the chaiman of the committwe, buing only slighty moxitied in some parts, as it now stame, at the sugeretion of other members. It eame up for fime ation on July I. when it reciver the namimons vote. not only of atl the colonies, hat of all their delugates in Congress. it is given in full herewith, with facsimiles of the signatures. Revised by C. K. ADams.

## thet of the declaration

Is Congress, July ho rowe.
The Uxaymous Deflaration of Time Tuirteen Cimed statis of huerica.
When, in the course of human avents, it. becomes neeessary for one peeple to dissolve the political bams which have eomected them with anothor, and to assmme among the powers of the canth, the scparate and copual station to Which the laws of nature amd of natare's frot cutithe them, a decent respect to the opinions of mankind requires that they shonh declare the canses which impel them to the separation.
We hold these truths to be self-evident, that all men are crated "pala) : that they are endowed by their ('reator with certain unalienable rights: that among these are lite, lib)erty, and the pursuit of happiness. That to secure these rights, governments are instituled among men, leriving their just powers from the comsent of the governed; that whenever any form of government becomes destructive of these puls, it is the right of the people to alter or to abolish it, and to institute a new govermment, laying its foundation on such principles, and organizing its powers in such form. as to them shall seem most likely to effect their safety and happiness. Prudence, indeed, will dictate that goverments long established, should not he changed for light and transient canses; and accordingly, all experience hath shown. that mankind are more disposed to sulfer, while erils are sutferable. than to right themselves hy abolishing the forms to which they are acenstomed. Bat when a long train of abuses and usirpations, pursuing invariably the same object, evinces a design to reduce them mader absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guarids for their Cuture security. Such has been the patient sufferance of these Colonies, anid such is now the necessity which eonstrains them to after their former systems of govermment. The history of the present king of Great Britain is a history of repeated injuries and usurpations, all having, in direct ofject. the extablishment of an absolnte trramy orer these states. To frove this, let facts he submitted to a camid worlet:

He has refused his assent to laws the most wholesome and necessary for the public good.
He has funtidden his Governors to pass laws of immedinte and pressing importance, unless suspended in their moration till his assent shonkl he ohtained; and, when so suspuded, he has utterly nerlected to attemi to them.

He has refused to pass other laws for the acommonation of large districts of people, unless those peophe would relin! mish the right of representation in the Legislature : a right inestinable to them, and formidable to tyrants only.
ITe has called tuget her legislative bodies at places nousual. uncomfortable, and distant from the depositury of their public records, for the sole purpose of fatiguing them into compliance with his measures.
Ite has dissolved representative honses mpeatedry, for opmsing, with manly firmness, his invasions on the rights of the people.
He has refused, for a long time after such dissolutions. 10 canse others to be elocted : wherelos the legislative jowers incapable of amihiation. have returned to the prople at large for their exercise ; the State remaining, in the meantime, expused to all the danger of invasion from without. and consulsions within.
Ife has endavored to prevent the population of these States: for that jurpose obstruting the haw for the naturalization of foreigners: refusing to pasis nthers to cheourage their migration hither, and raising the contitions of new wpropriat inns of lames.
He has ohstruced the andmint ration of just ien by refnsing his assent to laws for establishing judichary powers
Tre has made judges thependent on his with alone. for the tonure of their offices, and the amonat and paymont of their salaries.
He has reveted a multitude of new offices, amd sint hither swarms of ollicers to harass our people and cat out the ir sulstane

Ih, has kept among us, in times of peace, standing armies. without the consent of our loogishather
lie has affected to remer the military indepenelent of, aml suparior to, the civil power.
He hat combined, with others, to subject us to a jurishliction fomeign to our constitution, and unacknowlederd by our has: giving his assent to their acts of pretended legistation.

For quartering large bodies of armed troops among us:
For protecting them, by a mock trial, from punishment, for any murders which they shone commit on the inhabitants of these States:

For anting off our trade with all parts of the world:
For imposing taxes on us without our consent :
For depriving us, in many cases, of the benefits of trial by jury:

For transporting us beyond seas to be tried for pretended offenses:

For abolishing the free system of English laws in a neighboring province, establishing therein an arbitrary governmont, and enlarging its boundaries, so as to render it at once an example and fit instrument for introducing the same absolute inge into these colonies:

For taking away our charters, abolishing our most yaluable laws, and altering. fundamentally, the powers of our governiuents:

For suspending our own legislatures. and deelaring themselves invested with power to legislate for us in all cases whatsoever.

He has abdicated government here. by declaring us out of his protection, and waging war against us.

He has plundered our seas, ravaged our coasts, burnt our towns, and destroyed the lives of our people.

He is, at this time, transporting large armies of foreign mercenaries to complete the works of death. desolation, amd trans, already begun, with cirenmstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

He has constrained our fellow-citizens, taken captive on the high seas, to bear arms against their country, to become the executioners of their friends and brethren, or to fall themselves by their hands.

He has excited domestic insurrections among us, and has endeavored to bring on the inhabitants of our frontiers. the merciless Indian savages, whose known rule of War-
fare is an undistinguished destruction of all ages, sexes, and conditions.

In every stage of these oppressions, we have petitioned for redress in the most humble terms ; on r repeated pettions lave been answered only by repeated injury. A prince whose character is thus marked by every act which may define a tyrant is unfit to be the ruler of a free people.
Nor have we been wanting in attention to our British brethren. We have warned them, from time to time, of attempts made by their legislature to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. Wehave appealed to their native justice and magnanimity, and we have conjured them, by the ties of our common kindred, to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They, too, have been deaf to the voice of justice and consanguinit. We must, therefore, acquiesce in the necessity which denounces our separation, and hold them. as we hold the rest of mankind, enemies in war, in peace friends.

We, therefore, the Representatives of the United States of America, in General Congress assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the name and by the authority of the good people of these Colonies, solemnly publish and declare, That these United Colonies are, and. of right, ought to be, free and independent States: that they are absolved from all allegiance to the British crown, and that all political connection between them and the state of Great Britain is, and ought to be, totally dissolved; and that, as free and independent states, they have full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which independent States may of right do. And. for the support of this Declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other, our lives, our fortmes, and our sacred honor.

Declaration of Independenee. The Necklentorg See Melelenblrg Declaration of Indepexdence.

Declaration of Indulgener : a proclamation issued by James II.. granting religious toleration to Protestant and Roman Catholic Nomeonformists, and ordered to be read in all the churehes. It was expected to alraw the Dissenters to the site of the king's Catholie poliey, since they, in common with the members of the king's fath, were benefited by it, but a storm of opposition arose in all çuarters; many of the elergy refused to read it. and at last the seven bishops, headed by Arehbishop Saneroft. presented the famons pettition for the remission of the requirement that it should be reacl. Their trial followed on the charge of seditions libel, ant amid the most intense excitenent resulted in their acguittal. The effect of the declaration was to consolidate the opposition and precipitate the revointion of 168s. F. M. Colsr.

Declaration of Paris: the decharation made by the delegates to the Congress of Paris, 1N56, in regard to privateering, blockates, ete. The Crimean war was waged on new and milder principles of naval capture. It its outset the allies amomed that ther intended to waive their undonbted right to seize enemy's goorls on a nentral ship not being contrabant of war. Yor would they confiscate nentral property not contraband on an enemr'ship. And they declared that it was not their present intention to issue letters of marque. The sentiments which led to these changes sarviverl the war, and animated the delegates to the Congress of Pilris in 1856. After settling various questions growing out of the war and its issue the plenipotentiaries united in the following declaration:

- Considering that maritime law in time of war has long been the sulject of deplorable disputes: that the uncertainty of the law and of the duties in such a matter gires rise to differences of opiniun between neutrals and belligerents which may occasion serious ditficulties, and even conflicts; that it is consequently alvantageous to establish a uniform doctrine on so important a point; and that the plenipotentiaries assembled in congress at Paris can not better respond to the intentions by which their govermments are animated than by seeking to introduce into international relations tixed principles in this respect-the above-mentioned plenipotentiaries, being duly anthorized, have adopted the following solemn deelaration:
$\because 1$. Privateering is and remains abolished.
"2. The neutral flag covers enemy's gools, with the exception of contraband of war.
"3. Neutral goods, with the exception of contraband of war, are not liable to capture under an enemy's flag.
- 4. Blockades, in order to be binding. must be effectivethat is to say, maintained by a force sutticient really to prevent access to the coast.
"The present declaration is not and shall not be binding, except between those powers who hate acceded or shall accede to it."

This declaration has since been acceded to by all the important maritime states, excent the $\Gamma$. S., Mexico, and Spain. The refusal of the U.S. was based upon its dependence upon privateering to supplement its small standing nary in case of maritime war. But Mr. Marey, Secretary of State, offered in return for the exemption of all innocent private property, even an enemy's, from capture, to give up privateering thus become unnecessary, and to accept the other articles. This" Marcy amendment" was deelined.
Thus the case rested until the breaking out of the civil war in the U. S. in 1861. Then Mr. Seward made haste to commit his Government to the declaration. Great Britain and France assented, with the proviso that the aceession of the U. S. shoull] not be retrospective for they had both recognized the lefligerency of the south, and its right therefore to issue letters of marque, and coukl not permit the North to limit those right: by aceeding to this decluration. and so preventing privatering ly neutral subjects. And yet both countries forbade their citizens to accept letters of margue to cruse against a fricmdty power as a matter of policy, and this practical refusal of the offer of tha $\mathbb{L}^{\top}$. S. seremed unfriendly. Upon receiving it, the offer to accede was withelrawn.

As regarls the rules of the declaration, all lout the first are accepted as a part of international law by the U.S., many of whose traties forbid privatering as between the contracting partics. The [ C . S. have not (1893) isoued letters of maryue for sisty years and more. Fast eruisers are
now built to do the same work and the privateer is not needed. What is needed is the right muder rules ? and 3 of the declaration-to carry the goods of a belligerent on U. S. ships. It present, unless in sprecial cases by treatr, the U. S. have no such right, and could not compete with the parties to the declaration on equal terms. If Creat Britain and France were at war French cruisers conld seize every cargo of U.S. grain or erery bale of U.S. goods afloat under the British flag, while if Gjeat Britain and Russia were at war British ships could capture all Russian goods sailing in U. S. bottoms. Neither the produce nor the earrying trade of the U.S. would be sate. So that by acceding to the Declaration of Paris the U.S. would luse little or nothing and gain a great deal.

Theodores. Woolsey.
Declaration of Rights: a state paper presented to the Prince and Princess of Urange (afterwakt William III. and Dlare II.) at the time the crown was tendered to them (Feb. 13, 1689). The declaration had been drawn up br the Con-vention-parliament, and complained of the following grierances which England had endured during the reign of James II. : The exercise of the dispensing power, the establishment of illegal ecelesiastieal tribunals, unlawful taxation, the unlawful maintenance of the arms. interference with the courts and the elections, the lerying of excessive bail. the infliction of barbirous punishinents, and the refusal to hear petitions. The cleclaration then asserted the rights which had been thus riolated. and claimed varions privileges for the nation. The substance of this declaration became the Bill of lights ( $q \cdot c^{\circ}$ ), yassed in the second session of the first Parliament nnder William and Mary.

Declaration of War: the formal announcement by one government of its intention to wage war against another. Formerly this proceeding was usually observed among civilized nations. But since the nniversal use of the telegraph in political correspondence and for conreying the news of the world, the events leading up to a war are so accurately and widely hnown that a formal declaration is unnecessary. and this with no design of taking an enemy unawares. it is still customary, however, for each belligereut at the outbreak of war to issue manifestoes (1) to its own subjects, to inforn them of the impending change and its risks to their property: and (2) to neutrals, to make known the principles and rules of war which will be enforced. In the U. S. an act of Congress, roting to carry on war, is constructive notice of war to all other states. At the begimning of the civil war in 1861 it was held that when the course of justice was interrupted, and courts in the South were closed, there was a state of civil war in existence withont necessity for any farther declaration. In the U. S. the declaration of war is a power exercised by Congress alone. During the age of chivalry a heraki made declaration of war at the enemy's court, his tahard on lis arm. No offense was taken at his defiance, which was frequently rewarded by gifts of money from the party defied. See lixteryational Law.

## Revised by T. s. Woolsey.

Declension [accommordated to analogy of endings like dimension, extension, etc., trom O. Fr. declinaison $<\mathrm{Lat}$. declinatio ( - nem), bending aside, inflection]: in grammar, those morlifications of form by which noms, adjectives, and pronouns express the various delations of case. These mollifications vary also according to number and gender. The rarions cases of nouns serve not only to name the objects of thought, but also to denote the relations which these bear in the sentence to the nucleus of the thought or statementi. e. the verb. In the so-called inflectional languages, like the Indo-European and Semitic, the modification of form is achieved without disturbing the unity of the word, in the agglutinatire, like the Turkish, by the addition of elements which preserve a conscious individuality. Those languages in which the relations of the wrils are commonly left withont formal expression are called the isolating. Such are the Chinese and siames.

The Indo-European parent-speech was provided with seven different groups of noun-forms for the conventional expression of the most important relations within the sentence. These are the nominative, accusative, genitive, ahlatires dative, locative, and instrumental cases. The vocative, which is merely the interjectional form of the noun, is not strictly to be included among the cases. In form it was either the bare stem of the noin. as in Lat. serce. (ir. mátep, or took the form of the mominative. The nominative case indieated the substantive idea in connection with which the action of the sentence as expressed in the verb gained its
expression and receited its psychological shane. In form it consisted in the singular of the stem of the noun of en with a heary final syllable, or was indiented he the sigu -s; in neuters it was like the acensative; cf. (ir. $\pi$,arifp, $\lambda$ oro s. In the pharal its prevailing sign was -es. which uniting with
 tinth. metfes. The tonlings dir. -ot and dat. i. ete., had their origin in the fromominal atedemsion. The atensitive denoted that toward which the action of the verb was amed or to which it was directly applien, or. in seneral, sorved as the complement of the verb. Its sign was in the singular $-m$, in the plural (maseutine and feminine)-2,s. The neuter phral used a distinct collective form enting in -ü (or a). The crenitive expressed at relation betweran nolan and nom or a tangency of the action of the rerts to a noms. In the singular its sign was -as $(-p, s,-x)$ or -sio, in the plaral -on. The ablative indicated the somree of the ation of the weth. In the singular its sign was -d (preceded ly a langthenell vowel). or it wat merged with the genitive; in the phural it was merged with the dative. The lative denoted that which the action eoncerus. 1 ts sign in the singuk was -at, in the plural-uhios or-bhos. The locative denoted the place or sphere within which the action took place. Its sisn in the simgular was $-i$, in the flural -su or -si. The instrumental expressed aceonpaniment or means, and its sign was in the singular -a or -bhi, in the phural-bhis. mis, or -is (pre(eeded hy a loner vowel). The number of these rases was generally rechuced in the separate languages. A single coseform often assumed the functions of two or more (ases. Thus in latin the so-called ablative case-form combines the meanings of loentive, instrumental, and ablative, and in the Greek the so-ealled dative inclucles the meanings of locative, instrumental, and dative, and the genitive the meanings of abhative and gentive. Such confusions or syncretisms were generally dhe to a confusimu of the ease-finetions in use, rather than to merging of form. As this conflusion inrereased with the development of the varions languages, the use of frepositions to supplament the delinition of the syntacti[al relations stemdily increased, so that e. s. in English we pussiss only bare remmants of three case-forms- the nominative genitive, and accusative-anl express the most of the casw-relations by the aid of prepositions. The arlverbs, prepusitions, anil infinitives in the various langunges are chielly made 1 ? of petrified cass-forms: thms the lat. monto, bené, malĕ are instrumentals: recté. optimé. pondo are ablatives: partim, stutim acusatives. The intinitives tir. סóueva, Lat. sequé are thatives, while $\delta \delta \mu \in y$ and regřre are probably locatives.

Weroralion fay: in the $C^{2}$. S., the day set apart to the menory of the soldiers ant salors who fell in the civil war of 1861 - 6.5 . It was originaly ralled Memorial hay, aml is observet hy processions and aratimes in honer of the deat, and especially by decorating with fowers the grawes of all who fonght in any of the wars of the U.S. The day ohserved at firs diffored with the various States, bat isage las settled on May ato. Which has bem mado a legat holiday in mos of the states. This day is said to hawe hern chosen beramse it was the date of the discharge of the last sobdier of the L'nion army in the civit war.

## Decorations: See Ormars.

Decoralive Art: fine art applicel to the ornamentation of ohjects whide exist for uther purguses than heanty. Thus: the hilt of a swort connisis of grib, pummel. ghard. etto.. :und needs no ormament. having indect a certain beanty ol its own from the fitness of its parts and the color of the motat, ete. : lout if it rereives cmbosing and chasing. or damakeening, or even an elaboration of form not recpuired by utility, then the fine art enployed in heantilying it in these ways is wecoutive art. By extension the terin is isell for the wations fine arto of less develoned and less dignitied charactor: thas: a statnette carved in wood nud painted, or one male of bewiden poreebain, is often spoken of as a work of deenrative art. although the shathette serves no purposs exemp as a work of art ; But a life-size statue wonla not be callet? a work of decorative art. nor womld own atatmotio of hronar or ivory he called so exeept erroneonsly, and beman it maty serse to "decorate" a rom. so a painting on canvas is not spoken of as decorative art, lat one on a furselain platur is so spoken of. thouarh it sorves no parposese lont that of a pioture. This extension of the term ames from the employment of those materials or these mpans of ormanemtation which are commonly used for decerative art proper. Thus, in the canes just now given. carvel and dained woml is so much usell lor ornamenting useful things, such as
buildings and parts of buildings, furniture, and the like, and porcelain is so much used for unomamental dishes, bowls, and cups, that these materials amd the ormamentation generally applied to them give the eharacter of decorative art to anything in which they are used.

The dhief of the decorative arts, or the chief manifestation of decorative art, is what we call arehitecture-that is, the making a work of tine art of a building which, if purely utilitarian and withont any application of fine art to it, would be equally useful as a building. But the kind of fine att used in making a luilding beantiful by means of the proportion of its parts, its generally grateeful furm, its picturesqueness or its tranduil majest $\dot{y}$, its light ness or its ponderous solidity : and alsoby means of the leafare, the anmal or other forms added to it in relief, inlay, etc., is exactly the same as that usal in the sworl-hilt, cited above. In times when art was great the same man would design it palace and a bronze medallion and a silver flask for priming-powder; moreover, the same man would paint a saesed picture on a church wall and a coat-ot-arms abowe a mantelpiece. Not that mob good decorative art was not produced by artists of seconiary rank, for undonbtedly the greater number of omamental weapons and pieces of fnrniture were made by men who did not make statues or paint frescoes on church walls: but there was no sharp and generally seen flistinction; the statuary was the more skillful carver, the religious painter was the painter of bridal ehests and armorial shields grown stronger and more skillful. and now generally recognized as a master.

I ecorative art may be divided into classes and groups of classes as to the materials employed or as to the articles and objects adorned. Usually a twotold classification is adopted, Thus in a great collection, which has now (1803) been dispersed, the classification was uniler thirty-six heads for mediaeval or later objects alone. Sometimes the material tetermines the title, as leather-work or ivory-carvings; sometimes the destination of the objects, as ams and armor, or coins, medals and counters, or church goldsmiths' work. To this list of the classes of Guropean objects for a term of eight or nine centuries only wonld have to be arded the laciuners of Oriental art, the lapidaries' work in rery hard and costly stones of both Oriental and Western mations, bookbinuling, the mosaics of antiquity and the Middle Ages, the architetetural inlays of stones, ete., of different colors, the glazed and other pottery used in architecture, the painted vases of the Greeks and their imitators, the painting of architecture in bright colors nsed by Egyptians, Greeks. and mediaval artists alike, and the whole immense worhe of architectumal sonlpture in all ages and all lands.

The field is vast, therefore. In fact, all the graphic and bastic arts are decoratice when used for decoration, and they have been so used far more than in any other way. (hee Fine Art.) When savages berin to make simple weapons and simple utensils, the disposition to adorn them in some way shows itself almost from the beginning. Ind this adorning is partly by adding color or sparkle. as by means of pretty bits of shell or stone or hright feathers, to the weapon or the utensil, and party by farving it, as by coutting rows of notches, sinking cireular pits, englaving wary and curling lines, and the like. But this coloring and carring is also connected in a comious waty with the attempt to represent beasts or birds or men. The inlaid bit of shell is often mate to look like an rye; the wooden point of a spear is sometimes worked to look like a tongue projecting from fomouth ; even the stiff and roctangulat patterns made by whaving together coarse titors of different colors are forced into some simblance of the human figure or of some beast of ehase. All this is decorative art, and this is the only art known to primitive peoplo, becanse they have not hegun yol to make picturas of has-relicts in our sense. All the artistic power of the primitive poople is civen in this ormamenting of spoars and puddles and tappa matting ami plated grass: hat this ormamenting itself involves a constant attempt to represent the living ereatures about the artists- 1 hat is to say, the things they care the most about.

Now this is very nearly deseriptive also of the condition of tine art in a community ot the reatively high civilization of the European Middle Ages. In the thirteenth century in France and Englamathere was still the same turning of all the urtistic foeling of the time to ormamentation. No bas-ruliefs were marle except to fill the tympanmm over a foor or to adorn the back of at smatl ronind mirror or the like; no statmes or statnettes exeept to form a parl of the architecture of a church porch, or a chasse or shrine for the
relies of a saint; no picture of men and their teeds was painter exeept as an acknowledged and, in a sense, necessary part of the decoration of a builaing or a piece of furniture. All the fine art of such a time is decorative art : and, as a result. the best artistic thought of the time goes into decoration. The wonlerful results of this cuncentration of thonght are seen not only in the decorative work of the time, hat long afterwurd. Thus in the fifteenth century in ltaly, althongh pictures and statues were produced which can not be chassed as decorutice art, the decorative art itself was kept up to a very high ideal. This is the result of tradition; the best artists of the Italian Renaissance had little time to think of jewelry and bookbinding, for their time was taken up with still nobler applications of their power: but the demand for high excellence in decorative art. once established, was slow to cease, and therefore there were still very able men ready to take up these arts and pursue them. At last, however, the demand for such excellence did cease : the high standard was lost. It is a rery ditticult subject of incuiry why the natural and healthy taste for ornamentation gradually disappeared in Europe, until the French Revolntion suddenly destroyed it, and left the European world with no beauty of costume, no natural architecture, no humor for ornamenting. The first half of the nineteenth century went hy with but little sign of improvement; lut in the second half there has appeared to be a self-conscious and deliberate effort to recover the feeling for decorative art and the power over it which the people of earlier times had held naturally as a part of their intellectual equipment. The predominant commercial spirit of the time has been, however, directly opposed to any such recovery, and the changes of fashion, largely caused by the commercial spirit, have prevented contimous and natural development of any siyle.

Among people of European civilization, toward the close of the nineteent century, deenrative art is commonly looked at from two rery different points of riew-the collector's and the constructur's or designer's point of view. All portable objects of art. such as rases of porcelain and of bronze, paintel tishes. enamels on metal, stuffs and embroideries, and the like have been for fifty rears the subjeets of a minute and really scientific study and investigation which has resulted in an historical knowledge of them which no other age of the world has ever possessed. In fact, a large part of the new science of archarology is devoted to these smaller works of lecorative art, lmmense and costly private collections hase heen formed, and are perhaps richer in the ascrecrate than the national nuseums, especially in containing mose of the exceptionally fine and rery unusual pieces. Enormons pices are given for such pieces; and this is so far fortunate that it has caused the preservation of manr valuable things which would otherwise have been destroyed. Collectors, then, will buy ancient works of art, rases, carvings, bronzes, and the like, rather than modern ones, not only because they are generally finer, lont also because they are more easily inderstood and classified. There are handbooks and dictionaries amd also more elaborate treatises to which to refer for ancient art, whereas the work of to-day has to be judged upon its merits, and few jersons feel themselves competent to do that. To possess a known and classed ancient work of art, deseribed in the books, or of a kind so described, is more than to have a new piece, however fine. This fact is a serions lindrance to the growth of monlern decorative art in portable olijects, as there is little encouragennent to the maker or the dealer. And here again modern commercialism intervenes to hurt moderis art. Any intreased respeet among lmyers and stmbents for modern design is preventen by the disappearance of the art-workmen among a crowd of employees in the shop of a large dealer, and the conseguent lack of intercourse between the designer and the employer or paymaster. Joreover, in the organization of a large establishment the designers are separated irom the workmen who earry out their designs, and the few instances of fine and orisinal work have senerally been oltained by deliberately reversing the ordinary commercial methods.

On the other hand, the decorative art of building-t that is to say, the arrhitecture-of the minetecnth eentmry is almost wholly a matter of copying from ancient buildings. Not only is the style of design, in the general mass and in detail, elosely followed, but the ornamental details themselves are eopied rely exactly. fir more often than composed anew, or with any degree of originality, An immense momber of cxcellent books on meiont arehitecture were pmblished be
tween 1850 and 1 s 90 , and photographs have been made in abuntince, and are to be bunght very cheaply. If a pamal of a oriven slatre has to be tilled with scrollowork, it is easy (o) find a photosranh of a panel of very nearly the same shale, off fine amojent work of any style that allows of such panels at all. It is far easier amil more certain ambl simple to eopy this with such slight morlifications as the shape calls for, or as comsiderations of expmase maty bid, than to strive for any originality at all. Is for the general derign ot a building, that gan not well he copied su) chosely in most (ases. for monlern reguirements are very diflerent from the ancout ones: but ancent styles are so closely followed, now one stye and now another, that no oproytmity is afforded for sullicient ronsideration of the proper form and the obsionsly natural decoration in any new building, and there is mone of that fresmess of thonght and of inspiration which comes from allowing the design to grow maturally ont of the necessitius of the case. No styte of architecture las ever arisen "xcept when all builders were following the same mamor of lmilling and the same fishion of decorating Slowly, for centuries, an old style, whieh all the builders and artisho of the day were using, as a matter of course has undergone modifations as the result of new requirments amb new ideas. nutil some unusual opportmoity has offered and anew style has developed itselt rapilly: Sever beform in histury was a time known like the rears from 1540 to 1890, when one dexigner imitates one strle, one another. am? only a few exceptims cxist of men or associations whon are trying to design indepembently and naturally. This state of things has heen ahmot universal in arehitectme proper throughont all that long perind: not quite so general in stained glase, decorative painting. pottery, furniture, and the like, it is the rule even in these. Sor does it appear that there is sion of improvement. Gee Fswios.

The above attimpt having been made to exphain the genesally admitted leficioney of the moxdern buropean nations in the matter of decorative art, it remains to be shown what there has henn done during the latter part of the nimeteenth century which is more encouraging ; and, first. it must he remarked that the workmen who ean design, upon whom Oriental and aneient decorative art has generally depended, rxist no longer in fintune or dmeririt, and that no designing ean be cot except from artists of suecial, deliberate, and contly training. Stamed erlas. for winfows is the one brameh of tecorative art most sucesstully practiced in America, and the most important part of this is produced by half a dozen painiors well known as artists of high rank, and who if they were not engaget in the sianed-glass business, would
 Modern wall deconation which is of any vahe consists of fully realizel paintings by artists of just such high rank. Hoblern arehitectural senlpture not merely eopied from uld work is of a wholly different character from that of the past: the foliated capital. the frieze of seroll-work. the eonvontionalized boast or man of ancient work are rephaced, in the few monlern building that aro tronted with respect emburh to haterich und eostly sompture, by stintues of comphete sejentitic excellenow, set up in niches or het ween windows. In all these. representatise and expressise art of skilled and highly taught artists, and of techamal excollemen apmotehing the highest, las replacel the effective decorat tion of the artisan working aceorling 10 fradition. when a moxdran manutacture of pothery hemins to he artis fic, it beeomhes so means of painting. as of flowers and lonsos, so fathfully stulied from nature lat it diflers from similar work on friper chictly in the limitation of its conlorEng. A rase will bre ornamented by moans of a spoic of
 and beck, and the painter makos this as like the maturat prier as lis means amblais ablity allow. The vase itsolf will le very simble in form: inderal. it is very chrions bow little divormilied and how simply morleled are all these riodly painted monlern vases. The maturalistice sprior or bomplet laid apon it is its only deeoration heromul al gremerally gratceful form and a pleasiat color and texture of surface.

And evidently it is in this way that moxlern dosigners onght to proceed. 'There is the line of leant resistance whill all marht to follow. The most accomplishem buropern artists are matbe to desion in memoingless patterns. scrulls. freto, athl ziezars, or in eombont iomalizet athe formal hints at amimal and regotable forms, as the hamble and maknown artisans of Earope once hesigntul, ami as those of the lint were still denigning until a tew years ago. They can not produce shawls like the people of Northern ladia.
nor painted phates and vases like the chinese, nor varnished boxes like the dapanese, nor russ like the Persians. Not ouly is liurope incapable of these lematiful arts, fant Einropean inlluence is ilestroving thom rapislly in thu lands where they are mative. Tha only chance for any decorative art is to employ the trantol paintor and senlitor, and to allow to them this innovation. that great simplicity of form and eolor shall ald mate with foully expressal art of representation and expression, no lower finds of ant being possible to lis.

Decu'rion [Lat. depu'rio, head of a decuriu, a body of (originally) ten]: the leader of al decuria, or body of ten men, in the Roman cavahry. Three decuriou constituted a furme. or body of thirty men, and the name decurio was afterward given to the commander of the larger body. There were also civil oticers catled decurions who during the republic constituted the executive authority in the Italian municipatities. ITnder the empire their functions grathally dwindled to those of mere tax-receivers.

Derussation [Lat. decussatio, deriv. of deenssare, to make in form of a cross $(X)$ : cf. decus'sis. the number ten (X.), a coin valued at ten (tsess: decem, ten $+a s$, assis, unit of value]: in anatomy, a crossing of nerrous filaments, so called from a fancied resemblance to the leter $X$. The innermost libers of the anterior pyramids and lateral columns of the mefullatobtongatre decussate freely from side to side; so that disease in one side of the brain frequently leads to paralysis of the opposite side of the body. Another decussation occurs between the optic nerves: this is often called the chiusma, also from its resemtlance to the letter $X$ (the Greek chi). The crossing of rays of light, ete., is also called decussation.

Dedham: town and railway center: capital of Norfolk co.. Miss. (for location of county, see map of Massachusetts, ref. $5-\mathrm{I}$ ) ; situated on Charles river, 10 miles S. W. of the State-house in Boston. It has a granite court-honse. jail, house of correction, a home for fallen women, town-hall, and large woolen mills. In 1820 part of Dedhan township, was inclucled in the new township of Norwood. Pop, of township (1880) 6,233; (1890) 7.123; (1895) 7.211.

> Evitor of "Transcript."

Dedieation [Lat. dedica'tio, deriv. of dedica're, publish, set forth, formally transfer, dedicate ] : a complimentary adddress to a particular person, prefixed by an author to his work. This custom was in uze at a rery early period. Horace, Vergil, Cicero, and lucretins were among those who practiced it. At the period of the revival of letters in Europe few works were published without dellications. Many of these are remarkable for their clegance and purity of style. But the practice became perverted, and many authors of the succeeding gencrations employed them chielly with the riew of securing the patronage of the great. Dedications were most abnsed in France under Louis XIV., and in England from $16 \mathrm{n}^{\circ} 0$ to the accession of George III. Dryden was a great dedicator, and Johnson wrote dedications for money. Corneille got 1,000 louis d'ors for the dedication of Cima. Some of the most beantiful dedications are those prefixed to the different volumes of the Spectator by Addison, and in more recent times those with which each canto of Sir Walter Scott's Lurmion is prefaced.

## Dedication, in law: See Hereditaments, Incorporeal.

Dedication, Feast of the: a Jewish feast commemorating the purification of the Temple after its pollution by Antioebus Epiphanes, b. c. 167, and the rebmilding of the altar of burnt-offerings by Julas Maccabmus, after he had Hriwn the Syrians out of Jerusatem, b. c. 164 (cf. 1 Mac. iv. 42-59). It was kept eight dars, and very joyously. It is only once referred to in the New Testament (Johin x. 22), losephus calls it "Lights" (Intiq. xii. 7, $\delta 7$ ). The use of lights was me of the characteristics of the festival. Jesus probably alludes to this when calling himself the " light of the worle " (Johm ix. 5). Simuel Macauley Jaceson.

Dednction [from lat. dednewre, draw from: de from + drecere, draw]: the mental operation which consists in drawing a particular truth trom a general prineiple already known. It is opposed to induction, which consists in rising from bandenlat trutse to the determination of a generai principle. The sylogisen is the form of Ilduction. Before we can tleduce a particular truth we must be in possession of the gencral truth. The mathematieal and metaphysical sciences are fommend on deduction; the physical sciences rest on lidictios (q.io).

Dere: a river of England. 80 miles long; drains nats of Merioneth, Dentigh, Wlint, Salop, and Cheshire, and enters the Irish soa through a tidal esthary 9 miles long and from 3 to 6 miles bromi.

Dee, Jous: astrologer and mathenatician whose life afforls a curious example of the superstition of the time; b. in Jondon. 1527: grallated at Trinity College Combridge, but was foreed to learo Eneland on account of the suspicions aroused by his suppesed pradice of magic; returned in 1551 and received a pension from Edward V̌. In Mary's
reign he was imprisoned on the charge of attempting the queen's life by means of enchantments, but from Elizabeth he received tavorable notice, heing consulted by her in the mysteries of magic, and on the oceation of her illuess sent to advise with the astrologers and physicians on the Continent. After his return his suspected intimacy with the devil again aronsed the wrath of the mol, who wrecked his honse and forced him into exile for the second time. Thenceforth be devoted himself to the study and practice of necromancy, and in company with one Kelly, an apothecary, traveled through Europe displaying his powers as a conjuror. Returning to England he was mate chancellor of St. Paul's Cathedral (15!4), and Warden of Manchester College (1595). D. at Mortlake, 1608.
F. M. Colbi.

Deed [0. Eng. doed: Germ. That: that which is done, aecomplished, executed]: a writing on paper or parchment, sealed and delivered. This is its most general signification. In a restricted sense it means an instrment for the converanee of real estate. According to Lord Coke, it should poisess the following requisites: Writing, parchment or paper. a person able to contract. a sufficient name, a person able to be contracted with, a sufficient name, a thing to be contracted for, apt words required by law, sealing, and delivery. Deeds pursue a regular form-containing the premises, habentum, tenenfum, reddendum, conditions, warranty, covenants, and conclusion. The premises express the names of the parties, the consideration to be paid for the conveyance, and a description of the property conveyed. This should be minute and accurate. The "habendum" expresses the interest which the grantee is to hare, whether it be an estate in fee, for life, or an inferior estate. The "tenendum" refers to the tenure upon which the land is to be held, and is at present of no practical importance. The "condition," "warranty," and "covenants " are not found in all deeds. They may be inserted whenever required to carry out the intention of the parties. When a condition is lesorted to, it may be either precedent or subsequent. (See Coxdition.) The covenants vary with the nature of the converance. In a conveyance in fee six convenants may be inscrted (see Covenant) ; and in such case the justrument. is called a deed with full coremants. In some instances the single covenant of warranty is introduced, when it is ordinarily termed a warranty deed. In many eases there are no covenants at all, the object of the transaction being only to convey whaterer interest the grantor may have. It is a rule of the common law that some words in a conveyance used by a grantor will imply a covenant. This doctrine tends to mislead grantors who are not familiar with the rules of law, and it has been abrogated in some of the U.S.-e. g. New York. There is, however, in important mbe that a promise may be implied on the part of the grantec from his accentance of an inst rument containing worls purporting to create a personal liability. Thus if there are words to the effect that the grantee assumes the payment of a cerfain specified mortage, he becomes liable by his acceptance, though he does not execute the instrment. Whether he is liable upon an implied corenant, or only upon a promise, is not clear upon the anthorities.

A deed may be cither an indenture or a deed poll. The leading distinction between these terms is that in indenture purports to be the act of both parties, a deed poll of only one. An indenture commences with the third person, a deed poll with the first. In an indenture the date is fonmd at the begimning of the instrument, in a deed poll at the end. An instrument in the form of a deed poll may be in substance in indenture if there be acts to be done by both parties. Between a strict deed poll and in indenture there is claimed to be an important difference in the construction of doubtful or ambiguous words. In the former these are interpreted against the grantor: the grantee may take the construction most favorable to himself if the words will rensonably bear it. To an indenture the mate has no application, and is not regardet in any case with as much furor in modern law as formerly. In a enuntry like the U.S. where many men not lawyers undertake to draw their own deeds, questions frepuently arise as to the effect of omissions or insertions by mistake, or of alterations or crasions. These ocenr in inany instances throngh mere inexperience, and without any exil intent. In the case of an omission or insertion of a clause by mutual mistake, an application may be made to a court of equity (see Equity) to rectify the conveyance and make it what the parties intended it should be. The case of an alteration by one of the parties creates more
difficulty. One of the mos perplexing yne inims presented is whet her the fact of an matere or other atteration raises any presmotion that it wis made after exeroution, on whe the the mposita view shond lue takn, that theme san be no presumption which wonll lead to the conclusion that the grantee has commited a wrong. The hetter riew would seem to be that the attemtant ciremmstanes shenke go to a jury, withont any presumption either way. and shonld he pasised upon as is mather of fiet. A framblemt alteratiom would in general witate the instrument, thangh it woukd not divest a title to ham whieh hat atready heome the property of the grantee. As to all instruments which dit not confer an estate: hut only created an easement or confered a right of action, the alteration would be fatak. Conweymees in the UT. S. are in general registered or recomed, their execution for that purpse being attented with preseribed furmalities. (Sem: hemistratios and lefcormini.) The instrument is in general valid between the parties without registration, its object heing to protect subsequent purchases or incumbrances. The requisites and validity of a deed of land in any particnlar State depend upan the law of the phace where the land is situated, though the question concerning them be raised in the courts of another State. See also Warranty, Qut Claim, Covenant, and Bargan and Sale. T. W. Dwiont.

Deems. Charles Force, D. D., LiL. D.: clergyman; b. in Baltimore, Md., Dece. $4,1 \times 20$; quadated at Dickinson College, C'arliste, l'a., 1839: served in the Methodist ministry of the South; was professor in the University of North Carolina 184?-4.5, and in handulph-Macon College 184.5-16: and president of Greensboro Female Cohlege 1850-55. In 1866 he became the pastor of the church of the strangers, New York city. IIe was an abundant and able contributor to the Southern. Methodist Quarlerly Recieu. and was the anthor of a volnme of semons; a Life of Mr. Athom Clarke (Aew Fork, 1840): Decotional Melodies (Raleigh. 1842); Home Altar (New York, 1850): Hhat Now? (185B); Weights and llings (1×2): Tucleve Colleye Sirmons (Philadelphia, 1N4); - 1 Srotch 1erdict in re Erolution (1586); The Light of the Sations (1sns): The Gospel of Common Sense as Contained in the Cunonicnl Epistle of James (1889); Chips and Chunks for E'very Fireside: Wii, Hisdom, and Pathos (1s:0): The (inspel of spiritual Insight: Stulies in the Gospel of John (1s91) : a rolume of poems entitled Triumphs of Peare (Now York, 1840). Ile was preninhen of the American Institute of Christian Philosophy from 1881, and editor of Christian Thought from 188\%. 'I). Nov. 18, 1843.

## levised by J. F. Hurst.

Deemsters, or Dempsters: the two chicf judges in the 1sle of Jan, one of whom presiles over the northern livision of the ishad, the other over the sonthern. Formerly in sentlant a dempster or doomstre was an ollicer. connected with the ligh court of justiciary, who pronounced sentence on combtmed persons.

Derp Bottom: a point on the noth sitfe of James river: in Henrion en. Va. : about to miles ly lat and 20 miles hy weter below Riohmmul ; opyosite the perninoulat of Joness Neck, and between 'I'lhree and Four Nife creks, ant war the lattle-gromen of Malvern 11ill: an important strategic point during the rivil War, 1sbl-6.5. It was occuphed by part of the trons of Cim. B. F'. Butler, June $20,1 \mathrm{NG}$, and a pontoon luidge was thmow acrass the river. Several important actions wire fought nome bedp Bettom during Ang. and sept. 1861, the gencral result heing favorable to the Union fortes.

Deep River (Imdian. Sapponah): a river of North Carohina; flows sont hear warl throngh Randoph Comnty, and Gearly enst ward througla ('hathime Comity, until it daters the Cape Fear river at Ilaywoul. Coal abomats on its banks. Lenghth, estimated at 190 miles.
Deep-sea lixploration: the limits of the region known as the "deep seal " have been differently defined at different perinds of its exploration. 'lo navigatios for over a century the 100 -fathom leat-lime for somming has been kaown as the "derp-sea lent," ant the general und erstandint of the term " heepsa" has been that portion uf the sea having a depth of 600 fect ur mure. huowledge of thalassography has progressed to a point where a mone ratimal sululivision of oceanic depths has taken the place of arbitrary selection, and at present they ari divided and designated in follows: 1. The rerion to which light wan penetrate and, therofore, that in which marine algre can grow, and animals, subsist-
ing only on marine plants, can live: this extemds from the shome sawarl to a barying depth in different regions, being dependent on the transluency of the water and the average migle of the sun": rays, lout in a mough way the 100-fathom depth correponds to its exterme stawarl margin. This area is known as the littinal resion. E'rom the spawarl edge of the lithoral wey the sathothom sopes more or less directly to the flow of the ocean, which is found, on an average, at a flepth of wown fathome, where it extents in a Gontly umhated or lovel plain wer vast areas. The latter is known as the benthat or ahssal region, while the intermediate area. chiefly on the eontinental siones hetwen the littoral and abysal aros has heen muned the arehibenthat reginn. The riogion comprised under the name "deep sea" inclutes the abyssul and archibent hal areas.

Jethats of Investigutim.- The exploration of the deep sea includes the collection of facts relative to its depth (sece Bathometer): the nature of the botom; the temperature. constitution, specifie gravity, and motion of the water: the nature and distribution of the organisms which inhabit it. This exploration has grown from small beginnings, represented by the tine of the deep-sea fisherman, which in the midille of the eighteenth century brought up the coralline l'mbelluluria from a depth of 234 fathoms in the Aretie Sea, to a suifence which employs a great variety of complicated and delinate apparatus, and enlists the most ambitions efforts of the physicist, the chemist, the mechanician, electrician, and biologist. Work was first done on the investigation of the depth of the sea. A weighted line was let down into the sea, and the amount run out determined by tags previonsls attached to the fine at measured distances. This method has been in use by all navigators from an unknown antiquity. In shallow irater it is of reasonable accurace, but for sounding the abyses it is an extremely imperfect method. Friction on the line required for great depths delays the arrival of the weight at the botiom, and renders its recovery slow and diflicult: surface and sulbmarine currents carry it out of the vertical, so that it does not measure the actual depth truly; and the storage of immense quantities of rapidy deterionting line offers a serions problem in the easie of a vessel engaged in extended sounding work. To overcome the friction of the line against the water extremely havy weights were first employed. Capt. Sir James Clark losis in 1840, off the rest coast of Africa, by employing a small line with a weight of some 300 lb ., oltained it sombing at the depth of $9.6 \pi$ fathoms, which was detormined by the sudten change in the rate of running out of the line when the weight struck the lrattom. This appears to be the first recorted attempt at alyssal sounding which met with success in approximating to the real depith. thongh sir dohn lioss as early as 1 sis sounded in Ballin's Bay in 800 to 1.000 fat homs, and even brought up a large Astrophylon, or basket-startish, on the line. The U. S. exploring expedition under Wilkes, which saled in 1838, was supplied with copper wite for sumbing purposes, which, however, proved too weak for surecesfill use. In 1849 Cayt. Barnett. Li. N.. attempted to nse an irom wire which broke at 2.000 fathoms: ant later in the same year Lieut. J. Walsh, L'.s: naty, trind strel wire, whith also failed from imperfect splicing. The next step was due to J. M. Brooke, U.S. navy. who inventem in 1 sist a detaching appatathes hy which the weight was thrown off, and only the line with a small sample of the botion romained to fre lauled iin. This method in princip is nuw in general ase.
'l'he employment of wire having seemed impracticable. the attention of those interested was directed to the improvement of hompen line, varions torms of collectors for bringing up specimens of the bottom, and other accpssuries. IIf the surveying of the ocean-hod for submarine telegraph cables, which gave a great impetus to depe-sar exploration, was done with hempen line and in the imporiant series of vavges (1, wit-is) emried on by the British Government for this purpuse, enlminating in the rovage of the chatlenger, hempen line alene was mate use of for sonnding.

In 1s: Sid William Tloman invented a machine for nsing steel phano-wire for somblines purposis. In this the wire furnished with on have woight was paid nut ditectly from a retl, on which, ly means of an aceessory rim, a frid-tion-lime checked hy a batane was so applied as to make the friction balance the weight of wire rum out. On striking the botturn the reel ceases to revelve and the number of revolutions multiplied by the cireumfermen of the reel gives the lengeth of wire delivered and the depth of the smanding. The introluction of this invention has revolntionizel decp-
sea sounding. Owing to some errors of constrmetion, the reel did not work perfectly at first. 'lo C'apt. (ieorue E. Belknap, [T. S. navy, during the voyage of the L . S. Tusearora in the North Pacific in 18i3, is ine the demonstration of the practicability of sir William Thomsons machime when properly constructed: and to Com. (., D. Sigshee, U.S. navy, the application to it of elastic appliances called ${ }^{\circ}$ iucuimulators." whieh rendered it possible to use steam in reeling in the line, thas perfecting the morlern method of deepsea sounding.

Numerors appliances for obtaining specimens of the bottom have been invented, beginning with the spoon-Jike tongs of Sir John Ross and incluting the "Stellwagen enp," the "Belknap cylinder," a modification of Brooks"s apparatus, the "Hydra" and ". Bulhog" machines, ete., the essential principle of which is a receptacle closing after striking the bottom. 'I'he determination of deep-sea water-temperatures was attempted by Ellis ahont 1500, who brought up water from a dejth of 900 lathoms and tested it at the surface. Later attempts made by sending self-registering thermoneters down on the line gave erroneons results, dne to the inflnenee of pressure on the thermometer balb, ealusing an excessive extension of the thind in the tube. To avoul this ditlicnlty a form of themometer wis suggested by Prof. Willer and constructeal by Casella, which consists of a Ushaped tube forming id maximm and minimum thermometer, in which the large bulb is protected by an outer bulb nearly filled with alcohol, space being lelt for the eompression of the onter bulb by the pressure it must enconnter. An objection to this form of instrmment is that it registers only the minimm or maximmon of the entire column of water through which it passen. To obviate this rlofect another form of instrument, mate ly Negretti \& Zambra, is eommonly used. This holds the thermometer in a reversed position intil the line begins to be hamled in, when it is released: by an ingenious arrangement the column of mereury above the bulb is then separated from the supply in the bulb and kept apart from it, so that the height of the enlumn at the lowest drpth rached may be determined when the thermometer is drawn ul. Inother means of continuonsly registering the temperatares on deck dmring the passage of the instrument through the water has been invented by Sir William Siemens, on the prineiple that the electrieal resistance of a eonrluctor varies with the temperature. 'This consists of an insulated coil attached to a eable and lowered with the sounding-line, and ennnecterl so as to form one arm ol' a Wheatstone bridige. The corresponding arm of the bridge is formed by aceond exactly similar coil, immersed in a copper vessel filled with water, which is heated or cooled until the brifge is balaneed. The temperature of the water in the vessel then eorresponls to the temperature of the enil. This instroment unler favorable eiremmstanees has given excellent results, but owing to the extreme care neeted in its uve is not likely to supersede the simpler thermometers above mentionerl.
For securing smbles of wated for analysis and specific gravity determinations varions forms of ". water-bottles" have licen devised by Wille. Nigshee, ant other investigators, on the principle of a metallie receptatel: (atpable of sealing itsolf atomatically at a given depal.

Instruments for determining the direction and foree of submarine currents have been devised by several investigators, and usually dmpend upm the principle of the serewpropeller and the iliftrential motion of surlitee flonts.

The ahysal fama have been explorml mainly by means of the treige, the beam-trawl, and the "tangles, which are simply large "swabs" mate of hempen line pieked out into twine. Wh the libers of the tangles spiny or rongl ormanisms allore in creat numbers, in places where the ronglmess of the bottom womlil ronder dreaging impracticable. The
 used in shatlow watar, and the ham-trawl is lika that of the fishrmon, "xomet that it is lowhe, so that whichover side falls an the beitom it will work afmetively. In deepsea work the handling and hanling of both dredice amd trawl are done with stcel wirw rope he stam-power. For seatchang the region intermediate thetwen the botton and the surlite varions forms of nets or traps have been invonted whirh can be sent down closed, "pened when at a feerlatin flepth, and elosed again hefore being handed mp, on as to investigate only the st ratum at a part ienlar hepth alesimel.

Progress of Exploration. - Fxchbling isolated experiments or inconclusive instances of the eaptare of living animals from the abyses, the finst systematie oxplomition of
the deep, sea was carried on by the Norwegians, led by Prof. O. Sars, in the archibenthal region of the north of Enrope. But owincr to the fact that the deep-water and shore fimmas of Norway are in most respects very similill, and for other reasons, the bearing of these reaiarehes was not ippreciated, and the old notion entertained by Forbes and other eminent naturalists that the dark. cold nceanio abyses are devoid of organic lite except stragglers from the surlince, thongh contested by Keferstein, Lovén. Sars. 'lorell. Wallich, Ehrenberg, Alphonse. Milne-Edwards, and others, still held general sway. In $18 t i$, however, the $\mathbb{U} . 太$. . Coast Survey ollicers, Ponrtales and Mitchell, hegan systematic explorations in the Straits of Floridit, reaching a depth of 850 fathoms. The animals captured were so protuse in quantity, so interesting, novel, and peculiar in character that the active interest of naturalists of all nations was aronsed, and explomtion began in varions quarters. This work has been carried on more or less continnously ever since. The most important researches of the English are the voyages ol the Lightning, Porcupine, Shparwater, and Vaborons, by whieh the Mediterranean and-North Atlantie regions were explored under the direetion of Wyville Thomson, Carpenter, and Gwyn Jeffreys, 1868-72, anl the world-renowned royage of the Chathenger under Nares and Thonson, 1873-i6, diring which all parts of the ocean were visited and olservations made at 860 stations. France, with the Traraillenr, 188081, ind the Talisman, 188:3, explored the eastern North Atlantic and part of the Mediterranemb. Norway continued her work in the boreal Athantic in the Voringen, 18i6-is, and Italy explored the abysses of the Mediterranean in the Washington. In the $[$. $t$, work has heen more continnons than elsewhere. The U.A. Coast Survey work of $186 \%$ was contimed in 1868 and 186!) in the bibb, while in the Blake, by the eo-nperation of Agassiz, Sigsbee. and Bartlett, 187\%80, most important results were ohtainerl. The U. S. Fish Commission Alloatross and Fishlawk lare been more or less continnously engaged since $18: 2 \mathrm{in}$ work on both shores of both Americas, muler the direetion of Baird ant his snecessors; and the nary, as represented by Belknap, Tonner, ami others above mentionet, has borue a most important pirt in the work in both oceans.

Editor of "Sigeal."
Degeneration : a term applied br Dohrn to those eases of Erolitiox ( $q . r^{\prime}$ ) where the line of descent takes aplarently a hackward direction. In most cases which progress far enough to come to our notice the line is from the simple to the complex: the allult is more differentiated than the embryo. the ntfinring higher than the ancestor. 1t. however. happens that frequently there is sariation in the opposite direction, and then by favorable circumstances, these retrograde modifieations are accumulated in snecessire generafions to such an extent that the degeneration is evilent.

Is stated in the artiche Evolution, one of the ascertained laws of the modern theory of descent is, the development of the individual (ontogeny) is a recapitulation of the development of the race (phiytogeny). In other words, if we know the life-history of any animal, we have in it an outline of its uncestry. Thus the gill-slits of the human embryo are a record of a fish-like ancestor: the three-chambered heart of a reptilian forefather. These are instances of an advancing ratution.

On the other hami. We find in many sedentary and especially in paratic animals cases which are different. Thus in the Tuvicata ( $q$.. .) the development is progressive until the result is a frec-swimming tadpole-like larva with a cartilaginons rod (notochoril) between nersous system and alimentary canal, and paired gill-slits in the throat in the sam" maniner as in the roung (tadjote) of the common frog. Than the larva settles fown, lecomes attached and loses its tail and notochom, and becomes twisted into a loop while the rills hecome converted into a sieve-like sac. The result is an anmal totally unlike the carly promise of the emburo, but rather one the vertebrate altinities of which would never be suspected from the athlt, tot which was furmerly classed with the mollowea. Interpreting the facts of derelopment, we say that the cmatates have dowencrated from a tadpole-like ancestor with many of the characteristies of the true vertebrates. Anulher example is furnished by the parasitic Extomustrasa (q. \%). Where the larva is a regulan maplins like that of the more regular Crustacea. This soon becomes attachoul to some other animal, ind, necting no longer to struggh for existence, it gradually degenerates into a worm-tibe organism scarcoly more than an apparatus for ohtaining fook, proviled with the means of reproducing its kind. The maplius stage (see ('kestacta) is a record of
a norinal crustacean ancestor; the adult is a degenerate descendant. The phenomenon also occurs in the root barnacles. See Cimripedia.
Degeneration is to be regarded as the result of remoral from the conditions normal to the group and exposure to those entirely different. Thus in the parasitic Crustacea referred to locomotion is no longer necessary, so the legs are lost. while the month changes from a chewing organ into one adapted to sucking the manens or the body tluids of some fish.
J. S. Kingsley.

Dexpeneration (in plants): In the erolation of the regeable kinglom as it exists to-llay there have heen modifications in many directions. White the general direction of evolution has apparently been from the lower and simpler to the higher and more comples, there have been many cases of degeneration from higher forms. If we represent the vegetable kingdom hy a many-branched tree, in which the branches and branchiets generally grow npward, we must also show some branches and branchlets in which the direction is distinctly downward. Iegeneration is most frequently associated with a dependent habit, as in parasites and siprophytes, in which the regetative organs of the plant-body liare suffered atrophy. Thus in the dodder (Cuscuta) the leaves are mere colorless bracts of no value. while the stems, no longer called upon to support large leaves, are weak and brittle. Could we restore to this degenerate plant its lost leaves and original regetative vigor, we should have something very much like a morning-glory. In Aphyllon, now nearly as leafless as the dodder, we hare a degenerated figwort (Scrophulariace(p). the floral organs being little changed, while the regetative parts are greatly reduced. Likewise Monolropa is a degenerated rhotolen-drun-Jike plant (Ericacea), and the enral-root (Cordllorhiza) a degenerated orchid. The "fungi" afforl the more notable examples of degeneration throngh parasitism and saprophytism. The black nonlds (Mucoraceet), the water moulds (Saprolegniace(e), and the downy milders (Peronosporacere) are clearly molified, and somewhat degraded pond-scums (Zygnemareut) and green felts (Taucheriacere), and the powder mihlews (Erysiphea) are probably referable to Coleochele (a genus of semi-parasitic fresh-water alga). In all these cases we obserse that the reproductive parts of the plant-body as compared with the regetative prarts are proportionately larger and more prominent than in the green plants to which they are allied. This has doubtless been carried much further in the enp-fungi (Discomycetece), the puff-balls and totd-stools, in which the reproductive structure is so large as to be commonly mistaken for the plantbody.
legeneration is, however, not confined to the vegetalive organs of plants. lin many fungi the sexual organs have become ahortive (as in Erysiphece), and in certain great gromps (Ifymenomycetre and (asteromycelea) it is the opinion of eminent botanists that they have entirely disappearel. In the flowering plants many families slow more or less degeneration in their floral organs. In this way most of the so-called "A Apetalie " have probably been derived. The willows, oaks, walnuts. spurges, elms, cte., have attained their present simplicity of floral structure by modifieations essentially of the nature of degeneration. So too, the sedges and grasses are to be regarded as simplitied from the Alisma-like monocotyledonons !ppe of tloral struet ure.

 of a wrise of progrestive steps also one of the unitary divisions of a scale of masmement.
Deithee is Alfrbba: the magnitude of the greatest sum that can be formed by adding together the expments of the facionts or variables which oceur in any single torm of an equation or expression. The terms degret amb order are frequent! used symonymously in alcebra, hut have distinet meanings when aphieil to dith rential equations.

Degree in Trhiovometry: a unit of measurement for ares of circles and for angles subtemled by them; the 360th part of the circumference of at cirele, or the !oth part of a right angle. A degree is subdividet into sixty minutes and rath minute into sisty' seromis. 'The notation employed for ata angle of six tegrees lifty-two minates and sixteen seeunds is 6 ; $520^{\circ}$. Thus there are 21,600 minutes and 1,206 , ooo seconds in the entire circle.

A division of the quadrant into 100 parts was proposed by the authors of the metrie system at the time of the French hevolution, and is sometimes used. These parts are sometimes eabled grades ; each grade is divided into 100 minutes, and each minute into 100 seonels. These minutes and mecondsare called "centesimal," and the signs 'and "are used to distinguish them. Revised bysmox Newcomb.

Degree (in music) : one of the lines or spaces of the slaff upon which the notes are marked. When nutes are on the same line or space, they are on the same degret, even thoush one of the nutes should be raisod by a sharp or lowered ly a flat.

Derrees: scholastie distinctions. These fall unter two dasses. First, those which are given as a testimonial of the cumphtion of a certain prescribed eourse of study; and secomd. honorary degrees conferved by the faculty and trustees of institutions of learning upon persons of distinction. not only in seholarship but in other lines as well. Originally the dearee signition simply that the holder was 'fualified to teacla in a miversity. The master's dearre Wis the one first emploved: at the C'niversity ol Bologna, in the twelfth century, the derree of doctor apparently was substituted for it. innoeent 111., in 1215. promulgated a body of statutes for the Uniwersity of Jaris, whieh stated that the bachelor shond begin be expaining sentences in the sehool of some doetor for the space of a year: he was then examined by the chancellor of the Catheitral of laris. and, if suecessful, hecame a licentiate until he reerived the dewree of ductor, when he conld opren a schnol of his own. The degree of doetor was first given in Enghand under King John about 1207. The medieval university inchuled the four facultics of arts, law, medicine, and thoology. The term master gradually became restrieted to the teacher in the first of chese, anil that of ductor to the other three. The 1 wpe the recognized heal of all universit ies, granted the right to confer degrees during the Midule Ages. He now exercises the privilege of conferring degree diratly upon whom he will. The government in momern states equlfors this right on institutions hy chartar. The degret of lathchor is now ustally granteil at the completion of a four vars course of collequate stady. The degre of mater reipuires a perionl of gratuate stind thereather. The degree of doctor, regardent as the highest andemie distinction, is the only degree conforred hy ferman miversities, except that of lieentiate, which is confereal be theologieal facmitios alone. 'The title boctor of Medieine antitles its holder to pratice medicine. In a similar way certain other degrees, as that of tivil Engimer. lome of bental surgery ete. denote the hitness of the prsamer 10 praction his profession. The degree of Whetor of Philowophy ranks as the highost distimetion to he wom outside of professional sebolarship. The universities of the E. S. have emahdished eratuate courses, and grant this degree on shletantially the same lines as those followed in the leat ferman unisersitios. There is, howerer, no unitomity of practice in the matter of conferring dogrees, atthongh the condition of atfairs in this resperet is much hetter in Europe than in the ['. S. : and the tendeney serens to be to restore to the degrese the dignity and distinction that orisinally lownemed to them. The origimal degreps of bachelor "f Airts, Master of Arts. Doctor of thilowophy, thoctor of Theoturs, Wewtor of Merti(ine, and Doetor of Law hawe heern wery greatly increased in mumber, so that now a persom may le bachelor, or master,
or doctor of almost anything. In Germany there are twentyone universities with the rieht to confer degrees: in (ireat Britain a murh smadlar number: whilo in the $\mathfrak{L}^{\circ}$. S. there are at least 300 colleyes and universitios entitled to cxercise this right.

The Luiversity of Lomdon is a benly which examines and grants degrees, lat gives no instrution. "lhe l"niversity of The State of Now York is the only similar institution in the [. S. As a rule, the tegrees represent knowledte actuired, in part at leas, in the institution confrume them.
 and the Origin and Sarly Mistory of C'niversitios. The requirements for ohaining degres from varions institutions of haming will frequently be found stated in the flemeriptions of these institutions. (. Il. Thurisir.

Derrees of Latitude and Longitude: The distane from the equator to the pules. alons a meridian is caded lefitude, or width; the distance from an assmmed prime meridian, along a paralles, in the direction of the eathes rotation, is callet longitude, or length. These expresions have heen handed hown to us by the ancients, who uned them because the world known to them was really more extensive, or long, from east to west, than wide. from north to smith. The degrees of latitule are eronted from the equator as zaro, both north and smoth, makind nincts degrees cach way to the poles. It would be most dowirable that all civilized nations should also agree on a prime meridian from which the degrees of tongitude should be miformly comnted; but it is not so. The British count 180 degrees east and 180 degrees west from the meridian pasing through their national observatory at Greenwich, near London; the French start from the merichan of their observatory at Jaris; the Germans often take the meridian of Ferro, the most western of the Ganary islands, because it leaves alt the lands of the old Word to the cast and those of the New Worh to the west: the Amerians uften use the meridian of the National Observatory at Washingtim. 'Therefore. when the longitude of a phace is mentioned, the prime merilian from which it is reckoned must he indicated. The seataring nations mostly use Greenwich longitude : the nations on the continent of Europe, Paris and Ferro.
The meridians being all great circles, the tength of their degrees, or of the degrees of latitudn, is alout uniform; they only show slight elongation towart the potes, due to the polar compression. But the degrecs of the parallels which mark the longitudes are rapinly decreasing with the cireumference of the circles from the equator to the ples, as shown in the following table
LeNGTH OF HEGREES OF LOXGitU゙DE IN MFFIRENT LATITUDES, 15 FNGLISH BHEES

Weh'rat or Dehra When : a distriet of Meerut, Nonthwest ern Provineps, British India; at the foot of the llimalayas, betwen the Ganges and duma rivers. It comprises the
ralley $(d u n)$ of the Dehra and aljacent hills. Area, 1,103 sq. miles. It is well wooderl, undulating, and well watered by natural and artificial channels. Tea cultivation and the rearing of silk-worms are thriving intustries. Rice, oil--eeds, millet, potatoes, and peppers are extensively cultivated. The principal town is Tehra, the headpuarters of the great trigonometrical survey of ludia; pop, about 9,000 . lt is in lom. is E., lat. 30 20 N . (see map, of Northern India, ref. 4-E). The hill station llussorre is a favorite summer resort with a population which fluctnates with the season. Landaur, near by, is a military tépôt for European convalescents. Total prep about 150,000 .

Deiphosophists: See Atnexicts.
Deists [from Lat. deus, frod]: a loosely defined hody of thinkers having their principal development in England from the last part of the sisteenth century to the middle of the eighteenth. With several beliefs in common, they differed widely in regard to in future life and other matters. Their temper was not less believing than that of their orthodox opponents. They rejected revelation because man's natural reason semed to them perfectly adequate to assure him of the existence of God and the right form of worship, viz., the practice of sirtue and enthusiasm for the beneficent order of the world. That their Gol was a mechanical ereator, but. having made the world, he was indifferent to its concems, is an idea often unwarmatably attributed to them as a class. They rejecterl the Trinity. the deity of C'hrist. vicarious atonement, the supernatural or infalible inspiration of the Scriptures. In general, ther regardel the Seriptures as male up of higher and lower things, the former a republication of natural religion, the latter the additions of the crafty and the sulerstitious. Lord Herbert of Cherbury ( $1501-1645$ ). caller the "Father of Deism." expresed the positive aspects of the system, but dealt little in negation. His temper was less phirelr intellectual and more religious than that of his suceescors. Blonnt, the first ot these $(1654-93)$, developed Hobbers objections to the Dosaic authorship of the Pentateuch: arguel the inconsistency ot the Mosaic cosmology with the Copernican; and by an examination of the alleged miracles of Appolonius of Tyana enteanored to discredit those of Christ. 1le set the Deistical habit of regarding religions doctrines and |ractices as the inventions of designing men. Shattesbury (16:1$1: 13$ ) differed widely from the other Deists, often critieising them. While the most intellectual and powerful writer of them all, his plea wis for the emotional origin and character of religion. Toland (16.0-120) argued that true Christianitr is not onvsterious and rodely anticipated the Tühingin eritieism of Christian origins. Collins (1676-1299) was strongest in his attack on prophece as an evidence of Christianity; Woolston (1669-1 733 ) against the miracles. Tindal (16.9\%-17:3) sought to make out that Christianity is "as old as the creation." Chubb ( $1674-1764$ ) was one of the least Learned and most systematic; Bolingl)roke (16is-1751), the most satirical and ironieal. Voltaire, the chief of the French Deists, adopted his opinions and his methods: Dilerot's position was similar: Rousseau's that of the more religious, (iibbon's famous chapters on Early Christianity gre belated Deism, and Paine's Age of Reason reprolnced its leading inleas. positive aml negative. With many shrewd anticipations of the higher criticism of the nineteenth eentury. Deism was singularly lacking in the historic sense and in iny real appreciation of the forces be which religions and their sucred books are develuped. See Leslie Stephen's History of Englisht Thuught in the Eightpenth Century (2 vols. 心sion).

Johx IV. Chadwick.
 in Greek mytholog?, a laughter of (Eneus, King of Etnlia, and the wife of hercules. She preserved some book of the centaur Nesus as a lovecharm, with which she saturated a tunie of Hercules, who was paisoned ly wearing it.

Dejazet, dp-zhă'zai', l'acline Virginie: actress: b, in Paris. Aug. 30. 1 万3: . She made her debut on the stage as Fanchon tuate seule whin sho was five years old, and plaved Buapartu i Briemne when she was seventy-five. Iler linst impersonations were those of boys and young men. In 1859 slee bought the Theatre des prolies-Nouvelhes, which, after her, is callenl "Theatre Dejazet." she left the stage in 1868, and dipllin laris, hee J, 1875

cago; has 9 churches, 3 graded schools, barbed-wire factories, large wire-drawing plant, foundry, agricultural-implement factory, shoe-factors, wlove and mitten factory, machineshop, and varions sinaller manufactories. The inerease in population since 1890 is due to the oprening of new industries. Pop. (1880) 1,598; (1890) 2,559: (1893) estimated, 4,000. Editur of "Chromicle."
De Kalb, de-kaalp', Jons, Jaron: general ; b. in Hüttendorf, Bavaria, July 9.1721 : served first in the French army, and was promoted to the rank of brigadier-general. He remored to the U. S. with La Fayette in 17Tit, and was appointed a major-general by Congress in the same year. He served under Washington in Pennsylvania and New Jersey until the spring of 1880 and then became the second in command in the army of Gen. Gates. He was mortally wounderl at the battle of Camden, S. C., and died Aug. 19. 1i80. See Kapp, Leben des Amerikan. Generals, Joh. Kall (1862). A bronze statue of Ue Kalb was unreiled at Amnapolis, Md., Aug. 16, 1886.

Dekay, Charles: joet and journalist : a grandson of Joseph Kodman Drake: bo at Hashington. D. C'.. Jnly 25. 1848; gratuated at Yale College, and has been since 1877 literary editor of the New York Times. Author of Hesperus (1880): The Vision of Vimrod (1881); and The Love Poems of Louis Barnacal (1883).

Dekkan: a gcographical designation in India. See Deccas.

## Dekker, Thomas: dramatist. See Decker.

De Kov'en, Reginald: mnsician: b, in Middletown, Conn., Apr. 3, 1859; graduated B. A. at St. John's College, Osford University, in 1879; studied music in Stuttgart: receised the degree of Mus. Doe. from Racine College 1890. He has composed many songs and several operas, chief of Which are Don Quirote (1890); Robin Hood (1891); The Fencing Master (1892); The Knickerlockers (1892)-all of which have been successfully pertormed. He has written musical criticisms for the Chicago Post, New York Horld. and Harper's Wreekly.
1). E. Hervey.

De la Beche, de-lă besh', Sir Hexry Thomas, F. R.s. geolugist : h. near London in 1396. Ile began the geological mapping of Great Britain as an attaclue to the Ordnance Surrer, and afterward seenred an independent organization. thus founding the first oflicial genlogical survey. Among his works are a Geologicat Mamual (1:32) and the Geological Observer (1851). D. in london, A pr. 13, 185.

Helaborde, de-hă'bord', Hexri, V'icomte: historical painter; b. at Kennes, llay 2. 1811; pupil of l'anl Delaroehe: first-class medal. Silon. 184\%; officer Leagion of Ilonor 1870; member of the Institute 1868; is a distinguished critic and writer on art. Kinights of St. Johin of Jerusalem (1845) is in the Versailles Museum : Hagur in the Desert (1836) in the musem at Dijon ; Passion of Christ (1848) in Amiens Cathedral.
W. A. (:

Delacroix, de-lăatwah, Ferdinand Victor Eugixe: figure-painter ; b. at charenton-sime-Naurice. near l'aris, Apr. 26,1799 : pupil of Guérin. He was the leader of the revolt against the bombastic classical style of David, and the chief of the Romantic school of 18:30. The revolt was really begun by Géricault, who did not live to earry on the war. and a considerable part of the glory that rightly belongs to him is attributed to Delaeroix. Delacroix first eame into notice in 1820, when he cxhilited his picture of Dante and lirgil in Charon's Burk (now in the Lanver). It is one of the hest of his works. The battle between the romanticists and the elassicists was a very hot one, and is not entirely fought out to this day. How much of the fame of Delacroix belongs to his part in founding a new sehool in art and how much is due to his merits as an artist it is difficult to detemnine. It is probable, however, that his ability hats been exaggerated, and that time will bring a more molest estimate of his worth and artistic balance as a colorist. while not detracting from his value as the prime factor in the development shown in the art of painting since kis adrent. He has high reputation as a colorist, and it is certain that he was wonderfully gifted in this respect. In his work he is at times flighty and fiery in the bewillering richness of a multitude of glowing tints: in others, as in the Buttle of Tuillebourg (Versailles Mnsenm). le is almost unintelligible. The Entry into (onstantinopte (Lourre) is perhaps his completest and finest work. In spite of faults and insufficiencies in the matter of form in his work, it is, taken as a whole, of extraordinary brillianey and power. 1lis influenee on the
modern French shoot was wery great, ant with him and with (iericault began a transfomation in the art of painting that has affected every sehoul of art in the word. 1) in l'aris, Aug. 1:3, 186:3.

Dela'for, in the pharal Delatores [Lat. deriv. of defer re dela'tum, carry off $]$ : a Latin worl, literally meaning carrier: applied in course of time to the carriers of evil reports, informers, or public spies. Uuder the Roman emperors the delatores were a class of men who gained their living by informing against their fellow-eitizens. They constantly brought false charges forwart to gratify the jealousy or avarice of the different emperors, and were generally paid aceording to the apparent consequence of the information they gave, althongli in some cases the law speeitied the sums which were to be given to informers. Thus if a murder had been committed in a family, and any slaves ran awar before inguest (questio) had heen made, whinever apprehended such slaves received for each one so apprehented five pieces of gold from the estate of the deceased, or, if the estate could not pay it, the govermment gave the reward. At various times attempts were made to regulate the pay of public spies and informers, who at last hecame so mumerons, and gave rise to so much tronble in society, that the emperors were obliged to expel and varionsly pumisl great numbers of them,

Delamuay, de-lönā', Charles Eegése, F. R. S. I. : mathematician and astronomer; b, near Troves, Franee, $A$ pr. 9 , 1816; edueated at the Polytechnie School, where he gradnated in 1836 with the highest honors. 11e was subsequently appointed prineipal engineer of mines of the first class, and Professor of Mechanies in the Polyteehnic Sehool aud in the Facnlty of Seiences. Ile was also an officer of the Legion of IIonor, a member of the lnstitute, and was the recipient of nmmerous native and foreign honors and distinctions. He became a nember of the Academy in 1855, of the burean of lomgitude in 1862, and director of the Parisian Observatory in 1sio. Me wrote, anone other works, Treité de Mécrmique Retionelle ( 3 ll (9l, 1*6?): Théerie de fa Lume (1866) ; Hupport sur le Progrès de litstronomie (186i). He was drowned at Cherbourg, Aug. 5. $18 \%$.

Delamnay, Jules Élie: figure and portrait painter: b. at Vantes, France, June 12, 1828; pupil of Flandrin : Grand Prix de home 1856; third-class medals, Salon, 185!, and Piris Exposition, $186 \%$; first-class medal, Paris Exposition, 1878: otficer Legin of Honor 18i8; medial of honor, Paris Exposition, 1889: member of the Institute 18\%9. His portraits are among the finest in modern art, and his work is distingnisherl by the most artistic equalities of drawing and composition. Ilis Deuth of the Centour D Desses is in the museum at Nantes, and Liena is in the Luxembonrg Gallery, Paris. He has done important decorative work, including several churches and the stairway of the new llotel de Ville, Paris. I) in Paris, Sept. 5, 1891.

Delamay, Louls Arsève: French actor: h. Mar. 2l. 1826, in Paris; appeared at the Oden 1845; played the fart of the son in Limivers pt lamison $1846: 1848$ aplpeared in Le Menteur at the Theatre Français, and in I'ythius el Dumon: he has shown particularly as Télemaque and Hernani.

Del'avan: (ity and railway junction: Tazewell co., Inl. (for location of county, see map of Illinois, ref. $\overline{5}-\mathrm{I}$ ) ; $157^{7}$ miles S.W. of Clicago. It has a library, a high school, a park, and various manufactures. Pop. (1880) 1.340; (1890) 1,176.

Delavan: village (seltled in 1836): Wahworth en.. Wis. (for location of county, see map of Wiseonsin, ref. $\bar{i}-\mathrm{E}$ ) ; on railway, and on 'Turtle Creek : is miles S. W'. of Milwaukee has the state institution for the deaf ind dumb, a foundry, chese factories, etc. There are mineral surings here, anid the sillage is a place of summer resort. Pop. (1580) 1.:98;

Fhetor of "reptrbicas."
 ist ; b, in llavere, France, Apr. 4, 1793. After the Rostoration he wrote a suriss of patriotic lyries called Messpmemenes, which were rewived with favor. The drumas Les Jepres.
 incroased his tatue. lu $188^{3} 0$ he wrote Ia Perisieme and ot her revolutionary songs. Delavigne octopios an intermodiate position between the 'lassieal and lismantic selloos). There are more piquancer and realistic spontemes in his relineations of characters than in those of Vobtaire, hut less gassion and fire of imagination than in those ot Victor
 1. Feh, 1, 1790, wrote with Casimir the words to Halery's opera of Cherles VI.. and in collaboration with Scribe Le liens (iargon ant other vuldevilles. 1), Nov. 1, 1868.

Delaware (named in honor of Lord Delaware, second Governor of Virginia): a river of the U. S. ; rises in New York, and is formed by the Cornago and the Popacton, which unite at Hancoek on the boundary between New York and Pemnsylvania. It flows sontheastward to Port Jervis on the Erie R. R., and reaches the northern extremity of New Jersey. Below this point it forms the boundary between Peninsylvania and New Jersey, ind runs sonthwestward to the Delaware Water Gap, where the river passes throngh a picturesque gorge in the Kittatinny Monntain. Thenee it flows sonthwart to the northern extremity of Bucks Countr, and sont heast warl to Trenton, where it meets tide-water. Below Bordentown it tlows sonthwest ward nutil it enters Delaware Bay, about 40 miles below Philadel phia. Its whole length is about 300 miles. It is navigable for steamboats to Trenton, iml ships of the largest size can atscend to Pliladelphia, where it is nearly a mile wide. It is connected with the Indson river by the Morris Canal and the Delaware and Iludson C'anal. Large numbers of shad are canght in the Delaware.
Delaware: one of the Middle Atlantic States, and one of the origimal thirteen. It is situated between $38^{\circ} 28^{\prime}$ and $39^{\circ} 50^{\circ} \mathrm{N}$. lat, and $75^{\circ}$ and 7546 W . lon. It is 96 miles long and from 9 to 37 miles wide. Bomeded N. and N.N.W. by Penisylvania, E. ly Delaware river and hay and the Atlantic. $s$ and II. by Maryland. Area, 3.050 sq . miles.
Topograply. The jeninsula bounded by Chesapeake and IMclaware Bays and the Atlantie, of which Delaware forms the nortli-
 east jortion, is
generally nearly generalty neary level and, except on Delaware river and bay, samly. There are no mountains, but some rolling lands with hills and valleys in the NT.; but below New Castle a santly and somewhat marshy ridge only relieves the eye from gazing on a dead level. This ridge is nowhere above $\% 0$ feet in height, runs near the west linmary of Delaware, and forms the backbone of the peninsula. The affluents of the Delaware river in the E. and of the five or six streams fathing into Chesapeake Bay have their sources in this low ridge. There are three shallow bays or sounds, landlocked by spits of sand, below Capre Ilenloprn-riz., Rehohoth Ray, Intian liver Bay, and the north portion of St. Martin's Bay. Most of the larger streams and hays are navigable for yessels of light draught, but only the Delaware river and bay and Christiana creek are 11avigable for large ships and steamers. Rehoboth Bay atmits vessels drawing 6 feet of water. Delaware Bay is a fine body of water, with a deep though tortuous ehannel, having froin 35 to 55 feet of water. The only good harhers in the state are those of Wilmington on Christiana ('reek, New ('astle, and Lewes.
Mimerals.-Bog-ipon ore, found in all the swamps, shell marl. in the greensant region, and kalin or procelain clay are abmolant.

Zviilogy.-There are few wild inimals in the state, except that may fommable reptiles are to be fonm in the swimps. The shores of helaware hay are frequonted by immense flocks of ducks and teal, as well as by wild geerse; the other birds of the state are those conmon to the Mildle Athntie States.
Sioil and legetation.-In the swamps there ate extensive forests of (oypress and other ewrerem trees and shrubs of a semi-tropical character, as well as bog-onk, hackmatack, atc. Eisewhere in the sitate there are no extensive forests, the land being ilmost wholly unter eultivation. The soil for eight or ten miles inland from Dedaware Bay is for the most part a rich clayey loam. but west of this it is samdy, and requires constant fertilization in order to produee henry erops. 'The swamp hands, when reelamed, are very prodietive.

-
-

The climute is mild and favorable for farming：health－ ful in the uorth amblenter ；some remittent and intermittent fevers prevail in the swamp regions in the sonth．

Agriculturel Products．－］helaware is eminently a fruit－ growing State．l＇eaches，aphles，aml small fruits raised here are in demand in the New York and Philatelpham mar－ kets，and，in connection with Nuw dersey and Maryand，sha supplies certainly seven－tenths of the eutire demambl for thise products．In 1850 were reprted $8,74!$ farms．of which 6．745－more than thre－quaters－were of 50 acres or more： of the whole number 3,7 （ax（ant thre－seventhe）were rented． and two－thirds of these were rented for pay in kind（gener－ afly fruit）．Farms ocenly ahout ten－thirtemths of the en－
 Indian corn，1，231，000 bush．of wheat，and tes． 0 ， 0 hush．of oats．Shont 50,000 tons of hay are anmally harvested．Po－ tatoos，sweet potatoes，and all garlen pegetahles are very larerly produced．The live stock of the Sitate in 1ste was Q5．301 horses， 4,512 mules and asses， 96.466 working oxen unt other cattle， 31.020 milch （enws． 71.79 g sheep，and $\$ 1,1 \mathrm{~s}$ ） swinc．The peach erop，varies in favorable years from 3．300，－ 000 to $4,000,000$ baskets or cratec．The appluch，jears，quinces． aml small froits produced are together worth more than the peatches．

Manufactures．－Delaware has extensive manufactures． Wilmington being the crenter of some impurtant interests： the prineipal are iron，mostry rolled，flom and meal，mo－ rocen and leather：ship－building，iron and wood；machin－ ery，car－wheels，elc．：railway and horse cars：cotton goods． miper，powiler and chemieals，arriages and wagons：canned prowisions，vegetables and fruitn：tobaceo，cigars，cigarettes， and snuff；woolen goods，boots，shoes，and findings．

Raihetys．There were in 1892320 mites of raiway in operation in lelaware．I＇luse lines penetrate each conint． Trunk roals to Baltimore，Washington，and the South pasis through the northern part of the siate．

Finences．－The total funded debt is（ 1 \＆： 2 ）s． 684 ，rion．Is－ sessed valuation in 1890 ，8． 4.134 .401 ．The state anmal rev－ anue，ats woll as that of Wilmington，exceeds expentiture． While the nominal State deht，as given above is $\$ 684,700$ ， the State owns $\$ 1.013 .385$ in bank stocks and railway nort－ gaves，an！is practically free from debt．There is no state faxation in lelaware，but the county and municipal taxes ratised amount to about $\$ 1,000,000$ anmally．

Commerce．－Though the foreign commeree of Delaware is conducted mostly throumh Philadel hiat and Baltimore，yet the Delaware district，of which Widmington is the port，had
 ton has a line of steaners plying regulardy to New York．ant steam and sailing vessels of lighter dranght run to various ports in the state．Deliware had $1 * 2$ vescels of all sorts registered，enrolled，and licensed in 1sy2，with a tonage of $19,0 \mathrm{~s} 8$.

Banks．ptr．－Delaware hal Dee．31，18：12， 18 national hank：
 C．．．bonds on deposit ：the outitanding eireulation was $81.42,1 \% \%$ ．Thre were in 18127 state hanks，savings－ hanks，and private hanking－hoses，having an aggrerate （aphital of $81,1 \times 0,000$ ；deposits， $85,5,5,5,5$ ）．There were also four loeal tire insurance companies and twent 9 －t wo mothal life insurance companies in the State doing husiness in llet－ aware．

Seuspopers and hibrarips－There were in 180245 mows papersand other proriolicals in the state－i laily， $3 \%$ weekly． and o monthly．Thore aro also 18 publie Jibrivies，having an agereqate of 64.320 wolumes．
（＇hurches and Education．－The number of churelpes of all Alomminatime is about 300：the Me tholists（lipiscopal ant Protestant）lead，and are followed in their oriler by l＇reshy－ turians，byisompalians．baptivts，Roman Catholics．Friends， Latherans，and five or six minor denominatiens．Helawars
 rulled in the pubtic seluobls：number of shool－henses， 45 ． value uf shool property，ahom sithose．There are 6ai tumbers（en：3 men，4．5 wonen）：lotal rempits for these
 schonk of Wimmaton are excellent．＇lhum is nomal in－ sirnctin，hat nu distinet normal selmol： 10 teachers insti－ tutes held．There is one stute college at Newark，with sti－ entific and normal departments a college at Wilmingtm． There are also 13 atactrmis＇s，seminaries，or high schou＇s．but no professional seloons．
Poputution．－In 1790， $29.096 ;$ in $1 \times 30$ ． $76.745:$ in 1870.

1400．16世，193（white 140，06\％，colored $28.22 \pi$ ．including 37 （hinese and 4 Indians）．

 Spanish-American author; b. at santiago de los Caballeros, santo Domingo. Sept. 29. 1\%s3. He gradnated in law at the University of Sinto Domingo. In isul he fought against Toussaint Louverture. The increasing listurbancesin \&ianto Domingo foreed him to emigrate to Cuba, and he finally fixed his residence in IJama, where he oceupied rarious government positions and practiced law. IIe wrote Mistoria cle Santo Domingo, of which the first volume only was published (IIavana, 185:3). I. at Ilavana, Nov. 19, 1861.

Herbert II. Smith.

1) Long, George Washingtosi: lieutenant-commander U. S. navy; b. in New York, Ang. 2?, 1844. He entered the LT. S. Naval Acarlemy in 1s61, wis grulnated in 1865, and served in the Jumiata on her trip to Greenland in 18.3 in search of the Pularis. From that time it became his great desire to be placed at the head of an expedition of Arctic exploration, a duty for which he was well qualified. In Nov., $18 \pi 3$, be explained his views by letter to Mr. James Gordon Bennett, proprictor of the New York Herald, who had already considered the feasibility of such ant expertition. The result of various conferences was the purchase, by Mr. Bennett, of the Engrish bark-rigged, steam-vacht Pandora, of 430 tons, owned by Sir Allen Young. By special act of Congress she Was allowed to sail under Ameriean colors, to take the name of Jeamette, and be narigited by officers of the U.S. nary, with all the riglits, privileges, etc., of a Government ressel. The command was given to De Long, who sailed in her from san Franciseo July 8, 18i9, through Bering strait in search of the north pole. On June 1:3. 1881. the Jeannette sunk, crushed by the ice, in lat. Ti 15 N., lon. 15.5 jo' E., and De Long, with a number of the party, perished on the banks of the delta of the Lena, in Siberia, in Oct., 1881. See The Toyage of the Jeannette, by Mrs. Fmma De Longr (Boston, 188t, 2 Vols.); also Our Lost Explorers (llartford, 1888).

Delorme, Philibert: architect; b. in Lyons, France, about 1500 ; one of the best French architects; after studying ancient art in Italy he returnerl to France in 1536 and diel his utmost to revive Roman forms in architecture in lien of Guthic. He worked for Menry II., being introduced at court by the Carlinal du Bellay. He buitt a part of the royal chattean at Fontainebleau, designed the châteanx of Anct and Menton, aml restored many royal houses. Catherine de Nedici employed him upon the 'Jularies, where he displayed all the resonirces of his genins in its decorations. He putbished a work entitled A Veu Wray of Building Well and with Economy, in which he suggests the use for roof construction of planks of fir-wood, instean of the usual building-wood, to combine tiglitness, economy, and solidity. He obtained permission of the queen to try this when he erected at Monceanx a most costly edifice for the jeu de porme. The experiment was most successiul. D. in 157\%.

Delort, de-lör', Charles Édouard: genre-painter: b. in Nîmes, France. Jan. 4, 1814. Pupil of Gleyre anel Gérôme; second-class merlal, Walon. 1882 ; legion of Honor 18s9. Ilis most important work is C'upture of the Dutch Flpel in 1ish (1880). D. Mar. $10,1895$.
W. A. C.

De'los (in (ir. $\Delta \hat{\eta} \lambda o s$ ), also called orty'ria: a small island in the Firpan sea, belonsing to the group of Cyclarles ; was collehrated in andient times as the birthplace of $A$ pollo and Diana. Arcording to trarlition, it was originally a floating isharl, ame was rombered immovable by Jupiter,
in ordor that it might be a place of rofuge for Latona. It Was the site of a famons temple and oracle of $A$ pollo, and was the ecenter of a great perionlieal festival in honor of him. In $126 \mathrm{~A} . \mathrm{C}_{\mathrm{C}}$. Delos was purified by the Athenians, who removed all the tombs, and enated a law to prevent it from being polluted by lirths or daths. It was roputed one of the holiont places in llellas. On the formation of the conferleratey in $47 \% \mathrm{k} .1$. for the purpose of resisting the Persian invalters, Delos was chosen as the common treasury of tho (rreak allics. After the fall of Corinth (146 B. C.), Delos, which liad : gonsel hartor, was the center of an extensive commorce. Here was a town of the same name, whitl is now a mass of ruins. shiploads of cohamns and other romains have been carried away to Fenice amd Constantinople. The island has an area of ioz sq. miles,
consisting for the most part of barrell rocks culminating in Mt. Cynthus, and is not inhabited.

Del'plit (in Gr. $\Delta_{\epsilon \lambda \phi o i ́) ~: ~ a n ~ a n c i e n t ~ t o w n ~ o f ~ l h o c i s, ~ a n d ~}^{\text {and }}$ one of the most celebrated places in the 1 lellenic world, on account of its oracle of Apollo. It was sitnated at the sonthern base of Mt. Parnassns, in the narrow vale of the Pleistus, amid sublime and beautiful scenery. It oecupied the central area of a great natural theater or semicircular recess, partly inclosed by stupendous rocky barriers. The origimal or proper name of the oracle was Pytho. The name Delphi docs not occur in the poems of Homer. Who mentions that Agamemmon consulted the oracle at Pytho. The I'ythian games were celebrated here every four years, the first celebration occurring in $586 \mathrm{~B} . \mathrm{c}$. D) became an opulent city and independent state, deriving its riches and importance from its oracle, which was the most tamous of all the oracles. In the eighth century b. c. its reputation extented not only throughont IIellas, hut also among foreign nations. Croesus, King of Lydia, gare rich presents to the l'ythian Apollo. The oracles were uttered by a female called Pythia, who sat on a tripod placed over the month of a cavern. She is said to have breathed an intoxicating exhalation of vajor which issued from this cavern or chasm and was supposed to inspire her with the gilt of prophecy. The fonntain of Castalia, issuing near the base of Parnassus, supplied holy water for the temple of Apollo, which was one of the largest and most beantifnl in Grecee, and had a front of Pirian marble. In 480 b. c. Nerxes sent a detachment of his army to plunder this temple, which contained a large amount of treasure. As the Persians were elimbing up the rugged path to the shrine, on a sudden thunder was heard to roll, the war-shout sounded from the temple of Athena, and two huge erags rolked down the mountain, erushing many to death. The surviving Persians were seized with a panic, and retreated without having effected their object. In 357 в. c. the Phocians seized the temple, and thus provoked the Sacred war, during which a portion of the treasures was expended in paying the troops of I'hocis. Delphi was attacked in 279 B. C. by Bremus amel an army of Gauls, who, it is saicl, were repulsed by the same supernatural agency as the Persians. The Delphic oracle was finally silenced by the Emperor Theodosius. The site of Ilehbli is occupied by the modern town of Castri or Kastri.

Delphi: city and railway junction : capital of Carroll co., Ind. (for location of county, see map of Indiana, ref. 4-D); on Wabash river and the Wabash and Erie Canal; has a fine court-honse, paper-mills, planing-mills, extensive lime interests, and excelleut water-power. Pop. (1880) 2,040; (1890) $1,923$.

Editor of "Jol'r val.
bel'phin Classies: an edition of the principal Latin classics for the use of the Dauphin of France, son of Louis XIV. (in usum delplimi), at the suggestion of his tutor, the Bake de Montausicr, and under superintendence of Bossuet and Huet, preceptors to the rlauphin. The series comprised ultimately forty authors or titles. See IIallan. Introduction to the History of Europe, vol. iii., p. 2t ; Baillet, Jugements de Sucuns, vol. ii., p, 2is.

Delphin'idar [from Lat. Delphinus, a dolphin, the typical genus]: a family of toothed whales, having for its principal characters numerons tecth msually present in both jaws, a short symphysis to the mandible. no distinct lachrymals, bony stornal ribs and a central, transverse. erescent-shaped blow-hole, with the coneavity forward. This family contains the greater part of the cetaceans, both in species and individuals. They range in size from the grampus, or killer (Orca gladiator), to the porpoise, or pufling-pig (Plocena communis). I few oceur in fresh water, but the great majority are marime and inhabitants of the waters of the globe, except the very colilest. See Beluga, Blackfisu, Dolpuin, Grampus, Narwhal, and Porpolse.

F, A. Lucas.
Delphin'inn [from Lat, delphínus, do]phin; so ealled from the resemblance of the nectary to the form of the dolphin]: a genus of poisonous herbs of the matural order Ramumotacte, commonly callerl larkspurs. The seds of Delphinium staphisugria anl Delphinium consolida have powerful cathartie properties, and the alkaloid (delphimia) is recommended for paralysis and rhenmatism. Both the annual and perennial kinds are favorite garden flowers; the double roeket larkspurs are especially rich and varied in color, and resemble hyaeinths in their regular clusters. The genns Delphinium is closely allied to the aco-
nites．Several－jectes are natives of Finrope the［T．S．，and Jexico．

 of hand by water，atorm esureially applied to the flond in the time of Nosh，an acconnt of whieh is given in cemesis vi．，vii．，and viii．$i^{t}$ is often estimated to have weourred B．c．S5l6，but its date may lave been monem earime．The Jewish narrative seems to have been drawn from a double
source-an Elohistic document extending the duration of the Flood to a whole solar year, ant alluding to the legal rlistinetion between clean and unclean, and a J hovistic-lant both sources agree in aseribing the Flood to the demarity of mankind, in the description of the resene of Nonh, and in the promise that a deluge shall never again take place. Traditions of the Flool occur in many countries. Among the more important of these is the Chalditan account preserved in a fragment of Berosus, and somewhat resembling that given in the Bible. In many of its details it completely coincides with the biblical narrative: thus in the triple letting ont of the bircls. Otherwise it secms founded on enneiform sonrees. Mr. George smith putlished (18i2), from the cunciform inscriptions, a very remarkable accont of the Flood, corresponding in many particulars with those of Moses and Berosus. It was found in the library of King A sshurbanipal. and dates from about 660 B . C. Sisit (Hasisadra), an old Chaldetan king, takes the place of the Xisuthros of Berosus and the Noah of Genesis. He deseribes the godlessness of the world, the divine command to builel an ark, the coming of the Flool, ete. Bunsen states that no trace of Noah:s delnge is found in the Chinese traditions, but missionaries, both Protestant and lioman Catholic, assert that the Chinese have a story remarkally like that containerl in the Bible. The Mahâbharrata of the Hindus coutains still another tradition of the same event. The ancient Jexicans and many other trihes of American Indians have similar accounts. The same is true of the aneient ploenicians, Greeks, and many other nations, ancient and modern. The Egyptian monuments appear to have no aecount of a general ilood.
It is now generally held by Christian seholars that the flood recorded in the Bible was local, and not miversal. The language of the original account does not necessarily imply more than this.

## Delunion : See Insamity.

de lutherhourg, Philip James: French lamescape painter; b. in strasimerg abont 1735 : d. in Lonfon, 1819. lle was a pupil of Casanova ; elected to the French, Acalemy; remorerl to London 1\%iI, where he painted decorations for the operi-honse, heeoming celebratedfor mechanical constructions. IIe excelled in landscajes, battle-picees, and sea views; he etcherl his own resigns.
C. II. T.

Delyamis. Théodore: Greek statesman: b, at Kalayryta in 1826; Minister for Foreign Affairs, 1863; associated with the so-called Economical ministry, 1877 ; represented Grecee at the Berlin Congress and was Premier 1855-86, and again in 18\%0. on the clownfall of the Tricoupis ministry; but on Mar. 1, 1892, was overthrown ly Tricoupis, chictly on account of his alleged incompetence in managing the finances. IIe Was again Premier from Apr., 1845 , to Apr., 1897.
Dema'des (in Gr. $\Delta$ nuáóns) : an Athenian nrator and (lemagogue, who was a riolent opjonent of Demosthenes. lle was witty, eloquent, and profligate, and aerfuired great political influence. He fought against Philip of Macedon at Charonea, 338 B. c., hut afterward took a bribe from that king, and favored the interest of Philip amp his son Alexander. Ile was put to death by order of Antipater (or Cas-
sander) in 318 b. $C$.

Demarend': a volcanie monntain of Persia, about 45 miles N. F. of Teherann is the highest peak of the Ellurz chain, which separates the low shores of the Caspian Sea from the high table-lamo of Persia. It has a conical form and a erater-shaped summit, which is covered with a large deposit of sulphur. Its height is 18,600 feet, as determined hy a hossian Caspiam surver. An Englishman (William T. Thompson) ascended to the top of Demarend in 1837. As it is a conspicuous object from the great trade-route betweer. India and Western isia, it is connected with the carly Persian legends much as Etna is witlo those of the Greeks. It is classed among extinct roleanoes.

Dem'hea, Tzama, or Tana: a lake of Alyssinia: in lat. $12^{\circ} \mathrm{N}^{2}$ and hon. $3 \mathrm{~m}^{2} 15$ E. : 40 miles long, and has an average width of 25 miles. It occupice purt of a fertile plain. and is 6,108 feet ahove the level of the sea. The Blue Nile issues from this lake.
Deme, or Ile'mos [Gs. ठinuos. perple]: one of the sinaller divisions of the ancient Attic tribes. When Clisthenes Mroke lips the four old Attie tribes into ten new ones. Herodotns states that he subdirided these into 100 demes, but as there is no other anthority lor such statement, and the number of demes was actually $17: 3$ or 154 , different explanations have been attempted of the passage in llerodotus. The demes were lucal divisions, in the registers of which the citizens hat to enroll their names for politieal and other purposes. These demes were named sometimes after places, smmetimes after persons, and those of the same tribe were not always maljucent, lnt might be in quite different parts of Attica. They had each its omn presiding officer ( $\delta$ t̀papxos), treasurer, ant other officers, and its own assembly. in which the business of the deme was tramsacted. Lists of the names of the demes moder their proper tribes are given by k. F. Hemmann, (riech. Alterth., Anhang ir. : by Leake, in his Demes of ittica ; and by Jüller. Ilist. Grefe. Fragm., vol. ii., PI. 3ñ

Demen'tia [Lat. derir. of dremens, demented; de, ofl + mens. mind]: a form of insinity characterizet by gradual extinction of all the mental powers. It is one of the most hopmess forms of mentald disease. See Insanity.

Demerara: river of British Guiana, rising in the Maeearí Mountains and flowing northwarl to the C'urihbean Sea: lensth about 350 miles . The lower jortion is navigable for about 75 miles for large vessels, ani ahove that small ressels aseend some distance fart her to the kaicoutshi rapids. This part of the river was originally lined with forest, but much of it is now under cultivation. The upper river flows through oluen lands, and is much obstructed. The Demerara has given its name to the most populous countr of Guiana, and the term is applied loosely to the whole colony, and in purticular to the capital, Georgetown (q. r.).

Herbert 11 . smitis.
Jemesue, clec-meen, or Demain: in law, originally that portion of the lands behnging to a lord which was held in his own occupation or reserven for his immediate use. lance it is sometimes used to denote those parts of a manor Which the lord has in his own hands. Copyhold estates are also considered demesnes, hecause the tenants are hedd to retain them only at the will of the lord. See Domasy.

Dem'ocles (in Gr. $\Delta \eta \mu o \kappa \lambda \hat{\eta} s$ ): Attic orator trained in the school of Theophrastus; a contemporary and opponent of Demochares ( $q . r$. .). Ile is believed to have left written orations, since Dionysius of Halicarnassus attributes to him an oration previously ascribed to Dinarchus. Dionysius and Suidas call him Democlides.
 government by the people; a state in which the people at large possess the whole sovereignty. There are lut three clearly distinguishatle methods of government-the monarehical, the aristocratic, and the cemocratic: that is to say, the rule of one, of a number. or of the whole. The prefises despotic, hereditary, and elective mercly describe varietics of the first: an oligarchy is only a particular kind of the second; and such terms as republic and commonwealth import little that is distinctive as to political structure. Of sovereignty in other forms there has been ample experience, but governments bascd exclusively upon the democratic principle, without any admixture of other elements, have not been known until a recent period on any considerable scale. But see Thomas Erskine May's Democrucy in Europe.
Essential Principles of Democracy.- A pure or simple democracy deciding questions of policy by direct vote is perhaps competent to the exercise of supreme power in an independent state of slight extent: opinions concur in denomeing it as impracticable in a large one. The representative form nay therefore be regarded as the only practicable method of ailministering govermment on the demucratic principle. Consistently with it political power may be denied to some members of the state, who are nevertheless entitled to protection and such privileges as are suitatle to their condition. Age, sex, or ascertained unfitness may form grounds of exclusion: so in respect to a distinct race very inferior in numbers, as, for instance, the whites of Haiti. The right to exclude criminals after their guilt has been ascertained is inclispensable to the preservation of social order-and, practieally, it may be amed argainst a class, as in the known instance of certain polygamist-hut it shonlil never operate otherwise than upon the offending individual as a consequence of his personal delinguency. Even in this case pernicions opinions can not properly be hell to impair the citi-zen-right, thongh foreigners known to entertain them may be denied naturalization or hospitality in any form. With this qualification it may be broadly asserted that democracy, as a principle, entitles each citizen, in common with every other, to an cqual interest in the state. A government based upon it can acknowledge no conflicting interests among the people to be favorel or opposed. All its legitimate ends are accomplished when public safety and individual liberty are maintained. Where the voice of the people is actually sorereign this must ever be the fact, for it is an irresistible deduction of reason that the supreme will never can intentionally enact a law which is not required, or, in other words. lay upon its own freedom any ncedless restraint. Hence the axiom that in a democracy every positive regnlation, not actually indispensable to the public and general welfare, which restrains or cren indirectly tends to restrain, individual liberty in any degree, however slight, so tar violates the spirit of the constitution.
Democracy and Pricilegrel Classes.-The exislence of classes is the very essence of monarchy. Their interests are necossarily adverse-a circumstance enforcing upon the rulers a gencral activity in support of their pre-eminence. In states actually or approximately despotic standing armics and frequent wars are the forces for this purpose: where a nominal phace is assigned to the democratic principle permanent political parties might serve in licu of the soldier to uphold the pelitical machinery, but in gencral they only supplement him. Thus in great monarchies the so-styled common people have always been oppressed by chormous establishments. military or naval, or both. Thicse are easily justilied to unreflecting observers on the score of necessity, for, agreressive wars ly monarchs in furtherance of ambitious designs being of emstant recurrence armed organization for defonse scems a requisite. War, with its inherent rapine and cruelty, is not, indeet, due to the arimes of any one monarch; but the fact remains patent that it is an evil fomuled in the principle of monarehy, and inseparable from it. The active and citerprising spirits of every clime and age have found seductive oecupation in these war-establishments, and through their agency large portions of society have always been withdrawn from useful employments to feed upon the lator of the rest. (Compare llerbert Speneer's Political Institutions.
chapters xvii., xriii., on the Militant and Industrial Types of Society.) The amals of government are conserquently little else than a recital of the devices ly which from the beginning every ciril society has been preyed upon by its own official corps. This is easily effected wherever monarchy or aristocracy prevails. Democracy, heing based upon absohte equility, admits of no governing class, nor of any interust adverse to the people in those who conduct the public business. But by artifice and irregular methods the latter may becone a class, may grasp powers incompatible With the nature of the government, and may involve their country in all the evils incident to hereditary rule. Persecution for moral nonconformity may be from time to time practiced until resistance is provoled and a color atforded for war. To this conlition the gramlly patrotic spirit engentered by free institntions gives great force and breadth; the cutire people at once rush to arms, and public debt is incurred at a pace twentyfold more rapill than wonld be tolerated under the cantiously regnlated corruption of monarchies. These are abmses, and are deviations from the democratic principle.

Democracy in the U.S.-The founders of the U.S. recognized not only the ineptitude of monarchy and aristocracy, but the necessity of repressing in the newly conccived system their most conspicuous abuses. Standing armies were denounced as dangerous to liberty: wars for the extension of territory were regarded as unjust, foreign alliances as inexpedient, and public delt as mischieroms; but, strangely enough, no larriers whatever were instituted against any of these practices. On the contrary, powers to introduce and fuster the most dangerous of them were expressly delegated, in the name of the people, to their public agents. The natural ill-effecls were forescen ; but they were deemed susceptitle of being kept within endurable bonnds. Monarchy and aristocracy were indeed effectually repudiated for the time. Neither could long exist without herelitary dislinetions, nor could these be upheld where commerce in land was free, and inheritances were equally partible by compulsion or from social habit: so primogeniture and the acenstomed contrivances for rendering estates permanently inalienable were extirpated. But the founders of the American Uuion invested the national government with most of the powers by which the fow had oppresseal the many in all previous times. The State governments were framed in the same way. The powers of government in common use, originally designed by the ofliceliolding aristocracy to crate or uphold their own interests against the governed mass, were all sanctioned. Under the vicious and unjust systems previonsly existing they were no doubt indispensable; they were therefore assumed to he nceessary, even in a representative democracr. As the cheeks and balances of the mixerl system existing in England had dereloped the best administration then known. it was thought that. monarcly and all hereditary distinctions being exclnded, complesity would afford adequate preventives of ollicial malversation. The same example induced a reliance upon the free action of political parties as a motive-power to keep the official counterchecks in healthy action. Obvious distinctions between the old and the new governments seem to have been overlooked. In the former permanently antagonistic interests were legalized, and so commingled in the political constitution as to induce and necessitate continual conflict as a duty. Each of the three estates was there obligel to maintain a constant contention with the others, in orler to protect its own peculiar and rightful privileges; while in the U.S. there were to be no classes, no scparate estates, and no peculiar privileges. Eserything was reduced to the clead level of absolute equality: there was nothing fundamental that needed a check or required to be balanced. Oppression hy a permanently privileged class had heretofore been the grievance of nations. Such a contradiction in terms, and apmarently in fact, as oppression of the people by themselves was not anticijated: to their virtue and intelligence it was therefore committed to carry the cxperiment to its full fruition. with an admonitory warning that perpetual vigilance was the price of liberty. The extent to which popular rigilance could be kept in beneficial action wa: then a problem; in some respects it is still so.

The Tendency of Political P'urties.-In a great and prosperous state the prisate interests of business or plasure affort engrossing cmployments. Minds fully occupied with such subjects can not be at the same time cinployed on large eonceptions of governmental policy and in devising plans for their execution. 'I'he wealthy are regardless of govern-
mental aetion, unless led to seek aid for their private enterprises through ollicial favoritism. The nexessary breoceupation of the citizens in their private atfairs, not lack of julas ment or intelligence, is the great impediment to wise and just administration in repremotative democracies. There is math injustioe on both sirles in the matual orminations which disfigured the eardy dobates of partios in the L. $\therefore$. on this topic. it was never a fact that one party distrusted the propular juderment, or that the other relied ujon it. Ith the leaders well knew that, as the potitiont system was arranger, the people conta never act directly on puhlice attaiss, and those learlers faikel to devise an eflectual method of sereuring in permanence the choice of desimble teristators. It is atelusion to suppose that in a representative demosoracy bopular attention can be lept riveted on public atrairs by the eotitentions of party. In mixed growernments this maiy the possibte. There antagonistital parties are supposed to be founded on ennfleting ideas or prineiphes expressed in intelligible maxims. and the uriginal fath of each prarty, together with the soetal and potitionl condition in which it originated, is consequently berpetuated in the same lines from ranoratim to generation. It may thas acquire a fixed place in the mind and heart, and may berome an aetive moral sentiment. In a representative democracy there is no legitimate basis for just and honorable antagonisms of this permanent characler. As in the nature of things was inpatable, the socalled jolitionl partios have ever since been gradually losing their bold upon distinctive opinions. and tencling to a unity of views and purposes in which prineiphes have little part. With sueh a unity parties ean he nothing more than lamds of rival leadors, keeping on foot, imd enployed as their respective forees, bodies of traders in the business or orempation of manipulating the masies. the batlotr.on the returns. A govermment carried on by such agencies must at hast attain a worse perfection than any which could exist mmer monarchical forms. According to these the king and his nohbes, as ruling oflicers, have a permanent interest in the state dracendible to their beirs. For the protection of that inheritance amd for the benefit of their pusterity they will take some care of the state. In a repuesentatire democraey the othichohlers of the hour are the rulers of the hour: their term is brief and if corrupt they will, like the similaty situated pashas of Turkey. make haste to grow rich. for their positions are suon to be sumendered to others.

Abuse of Jower by the rifficial Cliss.-It is not through parties contending for control of the government that the henelits of demoeracy con be rablized. 'Jhe buincible itself mast he placed berond the power of sinch prarties. Permanent harriers, like those devised aranst monarchy, must be introlueed, which shall absolutely restrain wovermmentad arents-that is to say, the oflicebobders-from any action not indismensibly necpsary to the common weal. Public whees and empoyments must be thus rendered undesirable to the indolent and the avaricoons. 'lhis safegrard can only be established by a representative democrasy, Donarchical principles are directly oprosed to such a contlition of things, amt wholly incomastible with it. lts practicability depends upon the question whe her a persistently active and eapable suburvision of the ruling oflicehobler can be establishod among those who neither hold nor expect ofliew-that is 10 say among the Immden-boming multitude who support tho otliceind roms. ha effect and quite conscionsly too during advanced stages of political derradation. the organized chass of ofleoreseekors will arotually become allies of the party in power. 'Their function is to perpetuate among the jeople a heliof that a condliot coneeming principhes is ever revintr wh. Throngh the ordinary revolutions of the politiond hoterysuch eontestants divide bee
 forms of hw ean be wrume from the maltitude. They have been known to eoncert in perfect hamony before elecelions the means of accomplishing a prompament reall. On puhtio emergencies the herofe virtues do indeed whibit themedves in acts of ereat disinterestednos.s. but there j very little of this spirit displayed whike mations are in their normat comditions. In un excemedingly small or groaldy impurarished country the viens matural io ruters mary, indeed, be withont opportuntites; but in a graat and prosporms tato thero is
 the machinery of eovernment, if the machimery he in itself retequate to elferet that objecet when pmshed to its utmost eapacity. Those who enact the laws and administer them will atways promote their private interests at the prablic eost if
rested with sufferient power. Such is human nature, no mattor what form or name the govermmont may adopt. Democrace aceuts this as an indispatable truth, and, distrustime all rulers, it erives to nome of them any power that an safely be withhed. The policy of instituting chooks upon powor unavoidably granted, though mot to be absolutely repurtated, is of little value. Appointing one sot uf ollicial persons to Watch another is a bootloss contrivanos. Ihe remedy ratly agoravates the diveare: it fosters the primary evil of gove ermment-a multipheation of puhbe agents. The wateher and the watched soon learn to co-operate for joint benedit in the work of deluding the mass, whom it is the interest of buth to cireumvent. The jurliciary may form an exception. The anment practice of assigning reazons for the judrmont pronounced still existo, and the rlaty is regarded as unavoin? uhbe. This, with the institution of review on apperal, does afford a protection of some strengeth. besidns, for the honor of our common nature let it be salid, as it is irue, that the habitual study of justice tends to erate a sincere love of it. The inherent vice of all govermments is a tendency among the oflievial rulers to devour the people's sulstance, and the onty remedy is in a strict andication of the democratie prineiple. All powers which cion be dispensed with should be withhed from the governmont, an! mumerous vicious methods now in the highest fator should be suppressed. Permitting revenue or the means of defraving fublicexpembitnes to be drawn from duties, imposts, exeises, loans, or any source whatever other than immediate taxation enahbes those who control the administration to conceat their waste of the peonte woalth, and protects them from any effective supervision. Compelling them to brocure all revenue from the last named source wouk obviate these evils.
Sinfeguardse agraimst Official Extramagance in the $L^{\top}$. S.In a democratic state of wide extent it is evinlent that the whole electoral boly ean not govern directly. Even were the electors composed ontr of the most learned and endightened of the non-officehoders, they combld afford neither thas time nor leisure to govern direcoty by their own act, or to watch the machinery of govermment in its varied details, and br that sort of muartianship prevent abuse They cond mot even sludy. in this extemded sphere. the character and capacity of their rebresentatives. To hope for any of these things were idle and risionary. 'There is only one thing that the mase can do to secoure good government. Each citizen can for himself-and of suitably surred to the cluty le will-give attention to proventing levies upon his own brivate purse, made directly bofore bis eves by govermment otlicials. Because of this tendeney of the human mind a supervisury spirit amons taxpaying eleetors may bo apoked. In great emercencios patriotic zeal may lo redied mon, but the needs of everyday life can loe supplied in no other way than by thas appeating to the common and constantly ative impulses of mere individual self-interast. The ditficulty of inducing the citizen to fay taxes blirectly must be admited. "he very quality of mind which is relied upon for thus controlling puhbie expenditura, and eonsequent taxation, cratates an averwion to this duty. 'The evil ant of the politician who ('alls himself a statesiman consists in lercerving and acting upon the absurd preference for locing robhed extensively through the soceret and unfolt instrmmentality of haties. execises. and the like, mather than paying direetly moderate pxactions in the form of taxes. This weaknes ol the citizen forms the strength of thase evil commshors who miswurern the sitate. It mast be corrocted ur intolerable evits will ansue. In the action of ('ongress, ot the state leriskatures, and of the moni"ipatitios otheial extravagance has been fostered to a shoreking extunt by allowing these unfelt mothods of raisins revame. barrowing moner for long terms on the mablie: eredit being the most proniment. Cules the mmonens governments intertwined in the dmerican system (an be
 ish. This cann not be aceomphished utherwise than hy atmon Lutely forbidding all mathods of ohtaining reventu ot tumds. for whthy of her than immerdiate taxation. fimple taxationt mast abwas he paid, in the first instance. hy these who possess property. I pmicy which would draw direotly at the moment of nerel, and from the porkits of this das. through the immodinte ageney of the faxgatherer, the whole supply for publie expenditute, womld keap its members. foum at regam to theipown privite intorests, mader the presure of n constant and potent stimulus to restrain injuiliofons futer prises in whe or peam.

Effect of Pubric Debt.-The creation of public lebt tliminishes present dhafte upen the prople, as duties. excises, and the like expedients conceal them. both, consequently, facilitate wars and needless public works. If every govermental outlay were immediately defrayed by the taxpayers, very hifferent results would ensue. The most wary and influential of the citizens, instend of being tempted to foster expense, would find in the approach of the unwelcome taxgatherer at potent stimulus to labor for its prevention. The conseqnent diminution of govermment jous would relieve from public employ the multitndes whon corrupt ollicials now drive to the polls as cattle to the shambles. The favoritism displayed in taxing all others for the means to confer a bounty mon manutacturers would likewise disalpear. T'lue obtitining of revenue by secret or unfelt methods independently of its keeping up a enstly and ricions establishment, is in itself a positive evil. A sensibly telt pressure, in the form of tasation, is an indispensable provocative to bigilance among the taxpaying electors.

Proper Limits of Legistation.-By means of general laws athitting of no faroritism or partiality all requisite facilities, through corporate forms or otherwise, shouht be afforded to intiviluals for conducting everr description of lauful business. This should inelute banking. insurance, the establishing of roats. canals, locks, tairs, or markets, and the furnishing of supplies of every description. Unter this head there is the greatest rom for progress in effectively applying the democratic principle, so as to prevent any needless action by the gorernment, or the employment of its officers in any atfairs that experince might show could be safely commutted to individuals as business. Regulation by general laws heing sutheient, no power should exist to create, repeal, or alter any private corporation. Monopolies and frandulent or extortionate rivalries in trade should be alike prohibited, as well as all lower of enacting private law:. I gencral structural law tor each kind of civil dirision, say comnties, towns, cities, and villages, shonld be adopted, subject to alteration only hy amentment: likewise general in their application. This irould at once rednce the volume of statute law. simplify its form, coulnce to its intelligibility, diminish litigation, and restrain corrupt practices. Under a system of which this afforts a speeimen, laws might become fow simple, and easily understood. There would not be seen in one single state of the Union a legislative boly sitting for fonr months of each rear, surronded by a hired lobby, and engaged in confominting the courts and the people with 2,000 payes of additional legislation, most of it hurriedly passed during the last week of the session in such contusion tom disorder that the clerks, if disposel. can make alterations in bills itter their passuge and before their formal engrosiment or authentication as laws. Little progress has been made in the application of the domocratic principle since its adpption. Few of the steps hitherto taken or as yet proposed by larties with that professed ohject are of a bencficial temlemy. A state school systm wis deemed julicions, anl hanl in its early stages. a bencficial ellect. It rispelled that low grale of ignorance which was the only evil under this head demanding strong measures. But in process of time the trading politician seized uponstate education, and rendered it, to a considerable extent, another foster-parent of the johbury and electionecring abuses incident to a loose muministration. It is in some phaces chormously expensive a means of official patronage, anil a fouthall to he tossed to and fro in factious contentions, involving at times a plain infraction of religious liberty. licligion can exist only as a conviction deeply seated in the individual mint, and it is believed to he essential in forming goxal ritizens; yet from the variety of its forms non-interference with it hy goverment is a fixed democratic dogma. 'Iheor"tically. there seems an inconsistency in these propsitions, mat practically they are foum to harmonize. Religions convietons bring into full action the voluntary principlo, amd divine worship is nowhere more amply providen for than in the $\mathrm{I}^{\top}$. S . The ditferences of opinion constituting what is cullell secturianism, apart from which religion is unknown, form the precise oljection to governmental interference with religious worship hitherto relied upon. The slatesman's assumed aifl to eitlice if it fo not herin in actuat obstraction is sure for end there.
Reforms nupted in the U. S.- (at The civil simpice.There is room for the intronduction of many real reformis. Short terms and frement clections are no douht necessary as to the chicf exrutive and the legishative boblies. Due responsibility to the real sovereighty-i. e. the people-can
not otherwise be manitainet; but as to all other officers removals should he for cause only-that is to say, fault or ineapacity. Rotation in resinect to public agents of any kind is a mistake in doctrine. Faithful service and proved capacity are singular grounds of dispualification. It must be admitted, luwever, that no absolute right of the citizen is invaded ly introducing certain limits to eligilility, and expediency may require it in respect to one office. Indeed, it can harilly be doubted that a long quarantine should be required between excrcising military command and aspiring to the chief magistracy.
(b) The Registration of Toters.- To guard against fraud, registry laws are expedient in densely peopled districts. A considerable period should elapee hetween the registry and the rote, without allowing exceptions on account of intermediate changes in residence. The more fixed and permanent the clector's habits, the better his duties will be performed. No public interest is subserved by a moltitudinous or floating constitueney; it is enouglt if the clectoral body be sufficiently large to secure efficient supervision in the choice of representatives. It would be expedient to exclude Irom the clective franchise all oflicers and emplosees receiving pay from the public, and vast benefits would result if severe penallies trere decreed against any who should compel this cliss to contribute toward the expense of elections.
(c) Conflicting State Lanes.-The Federal Govermment was designed as an orgin of limiterl powers, yet it has exhibited ample capacity to erush or mordify at will not only State institutions, but the States themselves. Practically considered. the latter exist merely by sufferance, holding, as it respects the essentials of political power. no higher relation to the central authority than towns or connties do to the states in which they are situated. As bulwarks of liberty or constitutional rights they are nearly if not entirely powerless. But wlile thus superamuated and rendered ineffectual for the high purposes of the fonnders. they exercice a power which tends to serious mischiefs. Throngh their conflicting legislation, enforced by independent julicinies, they may ultimately derange the laws concerning trade, contracts, and some other subjects of general concern. By the identity of their language, moral ideas. and social hibits, am? by their essential proximity effected through railroads and telegraphs, the inhabitants of the TT. $A$. have become commercially and socidy one nation. Conflicting laws and a jarring jurisprudence among them should be prevented, if presention be practicable. A cont of nltimate appeal, as well from the State as from the Fetcral tribunals, composel of judges selected by the states, and neither sulject to official interference nor possessing enereive machinery of its own, might preserve this desirable unity of jurispradence throughont the whole country, and might also defend the autonomy of the states.
The course of reform suggested would erentually mature the democratic system by securing to all citizens the utmost measure of freedom, affording material progress every aid to its most perfect derelopment which an equal and inpartial Government can bestow, and terminating official misrule. Its aim is to break the secpter of the trading politician, and thus, at last. to establish jibelty on the only reliable busis-a popular censorship on temocratic principles, perbetually stimulated to its duty by the simple operation of intelligent self-interest.
The fullest treatment of the questions here outlined is ftrund in liryec's Americen 'ommonueatth. Compare De Toçucville. Democracy in Inerice: stickney. Democratic Gorermment; aml an anonynous work, Closs Interests (New York). See also lBurgess. Political Science and C'onstitufional Lau. Complute articles Republif, and Sovereigsty. Revised by A. T. Iladley.
Democ'rates (in Gr. $\Delta \eta \mu o \kappa \rho \alpha \alpha^{\prime} \eta$ ) : a supposed Pythagorean bhilosopher (of whose personal lite no notice las come down (o) us) under whose name a collection of moral sayings called the "Golden Maxims" ( $\gamma \downarrow \bar{\omega} \mu a ః ~ \chi \rho u \sigma a i)$ las come down to our time. These are written in the lonictlialect, and are remarkable for their simple ant correct character, which highly reeommemls them even to a modern reater. The ather is otherrise unknown, and the age of the collection is not determincd. They are printed along with the collection of Demopirlis ( $q$. i.).

Democrates: an Attic orator who lived in the time of Iemosthenes, and was an opronemt of the Macedonian
narts. The is mentioned in the Deerees in the oration of

 other to tha 'Thebans to endist them on the side of . Ahens against l'hilip.

Wenoweratic Party: one of the two groat politionl parties of the $\mathbb{T} . \mathrm{S}$. In studying it listory the filct shonld be borne in minal that no part $y$ can be frem thronghont its cantere from apparent inconsistencies, in which its oripinal charateristics will be for a time lost. and its granume significance olsicared by its tempariuy jolicy.

From the very nature of mon opposing parties appear to be a necesvity. Roughly speaking, there is it radical differmee between those who phafer chation and thome who are in favor of the existing order of things. The force whiels lies in the dibection of proxtess and the conservatiom whicd desires to presere are always in oplusition. liy whaterer name men choose to clesiornate the voluntary organzations into whicla they array themselves. it may be latid lown ats a generial froposition that there will alwitys be found those who may be desigmated as progressive and those who may be called conservative.

Wherever there is any form of fremomelnolition\} garties will be organized, and the two great divisions will he of those who beliese that all powns syring from the prople. and these who, in some form or other, bedieve that powers are inherent in thosia who are cullent to rule. These two lines of livioion-that between the ratical and conservative. and that between those who believe in delecrated and those who bedevo in inlerent powers-can not always be parallet. The history of a batty will he somewhat like the meanderings of a great river. The gemeral direction will always be foward the ocran, but there will lue frequent windings, some making very sharp lurseshoe lomals, *) that the (atsual observer. stulying only a particular furion. will be whally manble (t) underisand the elyift of the jabty or to comprehend its enrrent.

Tha' Theory of Goremment proclaimed in the Ierluration of Inchependenere.-Whe formation of the colemoes in Amerioz neessarily frombed thiterence of intorests between these eommmities. Thume were also some difforences in blow and religion, so that there never wis a time when all the eolonios wre completely homorenonns, and in the nature of the ease it was and always will be immosible that this should be. Tha clinnatio intlueners whiclı lave so potemt and sultle a jower will alwars croate differences of interests hetween Sive Larlama amd the eoten States o betwern the wheatgrowiner States of the Northwest and the mineral rections of our mountain-ranues. There is an mecult growth for which we can not entirely aceonnt. (ever under the same woneral
 whicla ean be instantly diveovered as one crosers the imagi-
 itcelf hanl twodistinct influences-one to complatt those enionies in which it was jorofitable the other to separate the cobonies into two divisions. The differeme in monlation and sim between the enlonies also raisen tronblesome questions, su that it there had heen no division amonge the dmerioan coblonios on the grave question of sparation from the British cmpire amel they had attemped simply lo form a union, it womlal have learn al dilfient and delicate mattor:
 great enthasiasm and the eminent leaders whinh the Revo-
 fathepwere whiged to pass over those wher quest ions whith mishat have beob impussible of mutual (omplomise and settlemma.
'J"o justify that rabolution it was nceessary (on agree upun some thory of gowermuent, and that has never been so well expereed as in the becharation of lmberembentr. It has abays heen true that (rond created ment in his own likeness: that from this meressarily resultal tho trouth that men is man was (rapable uf selforovermment, and therefore was the equal of ewery other man, and therefore free: that thesp men when organized into communities onght to be aqual in catch commonity, amd that each commonaty ought tola froe: that the only riasm which justibed the ortanazation of society was the protection of its members in those inaliemables rights whiclo follow from frowlom and aquaty. All powors,
 which government eould rest would be the consent of the governed. For the purpose of securing mational indupendence those communities could unite with each wher, so as
to give to each the fower of all and yel to fresarve to cacha its frealom and equalisy. Lpent this theory, frombamed in the I bedaration of Indeperndenow, the ('ontinental Congress
 as havine at pincipal from whon it reequol its puwers. and in whose mane it actab. That principal was primarily the thirtern colonits arting sparately, but the powner exerevest in eatela colony by virtue of which ilsese delewatus were chosen was alos a delosixted power, being riven by the frojte of each colony, and therofore the principat wats the jeroples of each colony respectively. la that Continental Congress amal among those who were conspicunde in the witr were man who received theme opinions with grave gumstioning: thas donhted whether liferty conld be presterved under such institutions: they could not rid themselves of the uld concoption that in some form governmomts possessed their purars inderently. Whan it is remembered that for natme centuries kings reigned amd parliaments emactad laws lyy clivine right, That for much the labger patt of what we call tho history of dur racs men ruled by virtue of authority not derivod from those rubed: when we recall the strugerle betweren Churd and state, it is mot strange that among the ablest of those patriots were men who adhered to these tratitional uninicurs. A "strong" govermment was held to he necessary to preserve order, and a strong guvermment meant one in which The malers were jractirally withut himitation. smal where The permbe were without rights, having only prisileares. I'atemalism as nsed in the vermaculan of to-day is simply muther form of stating the wal claim made by "hareh and kins. hy whatever name they might choose to call it, that the power and right to rule were not deriven from the consent of the governed. Inder this theory, of course, min were not eitizens, but subjects: commantites were not free and "ymal on antonomons; distinctions and privileges were ul favor; taxation was a kingly frerogative, its extent, sulujecet, and mode to be determinal by kingly diseretion: publie moners belonged to the public authorities. who were not trustees for its expenditure. Inder this theory shlendid empires wrope possible, and sujerl) momuments of human progress cereited.

The Formation of I'rrties.- Even some of those who heliesed that power resterl in the people and was delegated hy them donbted the success of firee institutions. excejet in emmmunities comparatisely restricted in territory and small in p"pnation: that law and order could not be mantained under free institutions over a wide extent of territory. They also believed in what was called the necesobty of the hometgencity of prednles-that is, that, under any form of guvernmont except that of despotism. peoples uf different races or religions could not successfully work ont the experiment of freedonn.

Out of these varions conflicting vinws and out. of the diverse interests of the colonies there necessarily grew the formation of paties not with atrict lines of accurate or logionl division, and not with elose and connatot party organization. This division can be traced in the secret listory of the Continentil? Congress; it apmears very strikingly in the contest wor the serer trants oflared hysumand France by which it was proprosel that the united coblonies shonld reach only to the top of the Allerrany llountains, and that all west of the Alloghanies should be divided hetwern France and Syain, France to receive all north of the Ohio river and spain ald sonth. This was shofatom largely by men like defferson and Patrick llenry, who helieved entirely in the deretrines laid down in the " Derelaration of Independeme and the practical results which wond follow from those doxelrines and possibly the division pf parties may be found as well int that pint as at any sfosequent period.

Ton acouire the wostern country became the pascion of Henry, oferfatom, and that sehond of thinkers who bediered that under a confederation somewdat lonsedy formed, hont
 could the sucorestully establisherd whind woulal indate the entire continent. 'The opjusition of II mary the every step' taken toward the formation aml atonitom of the proderal Constitution can be understoorl only apon the hypulncis
 if not intermineal. to provent the expansion of the prapulatice toward the Wiest, and that he was convincerl that the sulecess of the Imerisan experiment deptuded upom the acquisition of western territory. This also will explain moch of the history of the conlest over the Constitution.

The deffersonian $I^{\prime}(n+y$ - The debates in the Constitu-
tional Convention and in the various State conventions ralled to ratify that Constitution. and in the pamphlets of the period, demonstrate that there was a division upon the general lines indicated herein, and that the Constitution was a compromise letween these diverse opinions. Those who believed that it was not wise to form a centralized republic, who securea the ten amentments to the Constitution, and who construed the Constitution to mean only delegated powers, unter the lead of Nr. Jeflerson grailually formed themselves into a party. lts first plattorm may be said to be the lettar of Nr: Jefferson to President Washington in whach le laid down with great clearness the Jeffersmian construction of the Constitution as opposed to the Hamiltonian construction. Without having any compact organization, and therefore not being in the strict sunse a party, those who shared these opinions carried their opposition to the administration of Gen. Washington to an extent sufficient to indicate that at his retirement from the presideney-there wonlal be an attempt to control the government in the interest: of their opinions. Mr. Jefferson, who was a great party leader, accepted the Constitution with the ten amendments as a finality, and so construed it as to give rigor to the Federal Government, preserve the sovereignty and antonomy of the States and secure the individnal Jiberty of the jeople. The acts of the Federal party under the lead of John $A$ dams, the jassage of the Alien and sedition laws, the known opposition of its leaders to the acquisition of Western territory, gave to Mr. Jefferson aul his followers great advantages.

The Resolutions of $1798-99$.-Permaps the first formal platform of any party were the Virginia and Fentucky resofutions of $1798-t h o s e$ in Virginia drawn by Mr. Matison, those passed by Kentucky approved by Mr: Jefferson, and arafterl in part by him and in part by John l3reckinridge. who offered them and drew up the additional resolutions passed by the Kentucky Legislature in 1799.

These resolutions were at the time, strange as it may seem, Union resolutions. They consolitated the Union. Kentucky had come to the conclusion that the Eistern States umler the Federalist construction of the Constitution were inimical to her interests ; that ander their control Kentucky would never secure the free navigation of the Mississipli river: and that the larger States close to the Federal capital would dominate the republic. The growing sentiment that continued union with the Eastern states was not profitable, further aroused by the election of John Adams and the consequent refusal to annes Louisiana, would in all probability have lea to an attempt to dismember the republie at the Alleghany Nountains; but if the construction put upon the Constitution by the resolutious of 1798 and tion was received as the proper construction, and the Federal Government shonid be controled therelsy, then Kentucky was urgently deairous to strengthen her ties to the Federal mion, amd intensely loyal to it. The election of Mr. Jefferson upon this platform obliterated all desire in the West for separation and insured the loyalty of the contire West and Southwest. It ereated a national pirty based upon that construction of the Federal Constitution which secured to each State the control of its own atiairs, which limited the general Govermment to Federal matters, and yet grise to the Federal Govermment the sovereign power of inereasing the territory of the republic, and turnished hope of unlimited expansion.

The Lonisicuna Territory.-The acquisition of Iouisiana teritory was really the first gleat act of sovereignty performed by the repillic. It practically dostroyed the Fedcral prirty. It fare to the I.S. the capacity for growth, and was in inspuration of invincible prestige.

Whaterer may have been the doubts of Mr. Jefferson as to the constitutomality of acquiring territory in the mone in which Lonisian was acquired, they were forever settled by the action of the republic, and from that day it may the romsiduren as settled that we have the power to açuire territory withent a tonstitutional amembment.

The Republictn Purty. The Ilocadence of the Federal phrty give to jts opponents oppronnity to comsolinlate themsolves uph the atheral prineiples laiel down by Nr. Jedferson in his inaugumal mhress.

If abll pople wro from and equal, and all power restorl in them, and the grants cullell the Constitution were wholly from them, it followed necessarily that those who wore chusen to execate those duties were trastees for the people: that all burdens were to be distributad equally; that all lemefits were to be impartially given: that no taxes eould he inposeal except for publio purposes: that those who re-
ceived these taxes were trustees of the people for their exlenditure ; that no expenditures conlul be justified except for rublic purposes. This would require an economical government, a strict account of the expenditure of public funds, constant reference to the Constitution to ascertain the grants and limitations contained therein, and upon any new question which might arise such a party would naturally decide according to these prineiples

Unuler the lead of Mr. Jefferson the Democratie party, then called the Republican party, was organized, and all his and its utterances are precisely in this line-to the general Government a faithfol allegiance and a loyal obedience within the limits of the (constitution; the carefu] and vigilant preservation to the states of their antomomy and independence in all matters not granted to the Federal iuthority: the equal and impartial rights and privileges of the common leople: the careful and ecomomic expenditure of public money; the just imposition of impartial taxation.

The Tendency to Free Trade. From the beginning of the struggle of the lievolutionary war the tendency of those who afterward became Iemocrats, under the lead of Mr. Jefferson, was toward free trade. Free commerce with all nations was consinered necessary for the growth of the country. In the Republican platform adopted at Philarlelphia hy the congressional caucus in 1800 the sixth plank was "Free comneree with all nations, politicul conncetion with none, and little or no diplomatic establishment." And this represented the almost manimous opinion of those who ealled themselves Jeffersonian Republicans. This was not considered incompatible with a system of imposts on imports by which revenue was raised, becanse the Government hat to be maintained by taxation: but it was looked upon as the object to be finally attained, and it grew out of the principles held to be fundamental. There is no right more sacred than that of free libbor. It is perhaps the highest form which freerlom can assume that a man shall have the right to labor for his daily bread and the support of those Jependent upon him as to him shall seem hest. Free labor necessarily carries with it free disposition of the product of his labor. It is illogical ant absurd to say that a man may labor as he pheases, but he shall not dispose of the product of his labor as he pleases. The dollar earned is the laborer's dollar, to be spent where, how, and as he pleases, save so far as his conduct may injure others. It therefore was almost a necessary tenet of those who held these gemeral views that a laborer may sell and buy in whatever market seems to him hest, the limitation being that he should pay ont of his labor his share of the public tases, which might be levied upon that labor in the shape of imports into which it had been transmuted.

But the question of protection and protective tariffs was not made a farty issue until long after this period, and did not become a divisive one until after the war of 1812. The right and power of the Government to lay imposts had been ascerted for many generations in every part of the world. and it was not strange that it was accepted without much question or consideration by that generation of thinkers and statesmen. It must also be remembered that during the debates on these finaneial questions from 1815 to 1828 there were no party organizations in the present sense of those words. The destruction of the Federal party had become complete and the election of Mr. Monroe was practically umanimons, so that men of various opinions claimerl to belong to the same ormanization. Inring this feriod began those divisions which resulted in the reformation of party lines under Gen. Juckson and Mr. Clay ; and it would be a curimo inquiry if there were any mote of making it certain. What would have lieen the result of party organizations if Mr. Clay lad in 1824 elected Gen. Jackson l'resident iustead of Mr, Adams, and ('lay and Jackson hat united in the same organization instead of becoming enemies.

The Ellection of Mr. Adams.-T'he election of Mr. Adams gave to (rom. Jackson and his followers a plea that public opinion had henn disregarded: and, while that clection was entirely legral acooting to the forms of law, it was hedd hy the subsequent judgment of the American people to be in violation of the spirit of our institutions, amm the election of Gen. Jackson was a deelaration of the American prople that rublic officers are public servants, to act eacel] in his place within the limitations of the law, but in obedience to the ascertained publice will: and that while it may not be illegal to do a certain act, in the lower sense of a biolation of statutes, it may be manaful in the higher sense of dis-
aboblience for the ascertained publice ofinion. "Those who womld most mobahly hase been intemsely dellaramian in
 vided as they were upon the fimancial questions of the day. and disapproving as no dond many of them dit, the somes-
 hin bexanse he reprosented the conception that publice
 fome enacted by law omerht to he dominant : that the people as feoble are soverefon, and that all grveromental anthorities are actencoice and hot rulers.
 with this division upon the election of Mr. Xhams. It was for umbatural that thone who helieworl that the tefeat of Gern. Jackson hr the Ihanse of lieprementatives was an improper ate shomble restive malder any system which gave (1) at mational bank areat powers aml which hoked tut the expenditure ly the foderal (iovermment of laren smans of money for internal improsmentio or which tombed in duy other way to ineroase the power of the Ferderal liovermment.

The sidelifieation rontest.- It the same time the contest between Jackson and ("alhomover the mallitication resolutions of south (samblim damonstrated that the majority of
 maintaning the Fomberal fovermment in all its viern. Gonth Cinmlina won that fight as to the pratieal results. That compromine masures allotiol hy ('ongress molay the lead of Mr. ('lay were practionlly a surventer to the clatan of sonth (amolina. Morally (bem, barkson achioved a motable trimmph. Sle both revealed amb intensitiod the sentiment of the eountry that the mion of the siates was extremely precions: From the elaction of Mr. Jetperson to 183 that antiment hand incerased. The war uf 1 ate had ewmplatemd the states, and tho slory won by our naw had added to the national pride. The nave is mar most national institution, and its trimmpls wore the common trimmph of the nation, and its vietorios gave strength to the belief that the union was in and of itself an inestimable bleseing. This was alac
 fanoms debate with Mr. Hayme and hy the fervent appeals of Mr. ('hay. so that, while sumth ('arolima obtained such modifiention of the tarity laws ase she eould homorably submit to, ant hor statesmati comble elaim that they hat triumplom in the eonlest, the result of these lebates and of fand. dackson: prodamation and action was to give tervor and almost universality the the mion whtment in the count ry.
 sachared for the bemoreatio pant the lecitimate sureremon to the Republiean party, amblave to it the rivht to luast that it was the party of Jeffersmen as well as that of .tarkson.  and which probably wonld have done so but fine the desire of the country tormex furthererritory, Nr. ('lay and the

Whigs mulde the same mistake in 1844 which Adams and the Federalists made in 1801. There are always loeal and transitory catuses which operate with permanent and deeper "motives. Mr. Clay's position on the slavery fuestion, his unfortunate Laleigh letter, the alleged frands in the Plaquemine precinct of Lonisiana, may have contributed to his defeat: but the inteuse desire of the American people to aequire more territory secured the election of Mr. Polk, which would have heen impossible even with all these other causes if it had not been for the position of Mr. Clay and the Whigs upon the Texas question. And looking lack upon that controversy, it can be asserted that no me now regrets the decision mider which we eltained Texas and acquired the territory extending to the Pacific Ocean. That election was the real deathbow to the Whig partr. It did not die at onee, even as the Federal party did not disintegrate ujon the defeat of Mir. Adams. It was enabled by a division in New York to elect Gen. Taylor in 1848 ; but the seeds of dissolution had been sown-the death of Gen. Taylor and the accession of Mr. Fillmore revealed that the Whig party was no longer a compact party, and the overwhelming defeat of Gen. scott in 18.52 practically put that party out of the active list of political combatants. Its lealers were as able and perhaps more eloquent, and certainly as patriotic. as the leaders of the Federal paty, but like the Federal party it ceased to represent citloer the nationality of the republice or any great local interest. The South distrusted its lovalty on the slavery question, the North looked upon it with suspicion because of its disposition to compromise, and its fitilure to recognize the inevitable destiny of the country turned from it the younger generation.

The Walker Tariff-The Demoeratie party under the lad of Mr. l'olk achieved two motahle victuries-the successful termination of the war with Mexico and the passage of the Walker tariff bill. Which was framed apon the general lines of bemocratie policies as laid down in the first platform of 1800. Taxation is always an important pmblic question. In times of peace it hecomes the most important public question. It touches everyborly: its burdens mast be borne, and they may become very lieary; it can he so laid as to give vast advantages to certain interests ; it can be the means of wide corruption; it involves every financial problem; it affects all industries: upon it men are forced to differ ly reason of climate, product, and interest, who would other wise agree mon principle. It is not, therefore, strange that at different periods, under different circumstanees, with diverse leadership, there should have been inconsistent declamations or legislation which can not always be reconciled. But the Walker tariff may he held to be the practical crystallization of the general views which the Demoeratic party then held on the subject of raising recenue by imposts un imports, and the experiment was an eminentiy sucessful one, as shown by the action of all parties in 18.56 aml the legislation of $18.5 \%$. The later clain that under that tariff our industries lagged and disunters oceurred was a new diseovery mate atter 18\%0, and is wholly inconsistent with the facts. The Democratic party in 1846-18 wonlh seem to have entered upm a period of control as long as, and as ahsolute as that noon which it entererl in 1801. That it did not do so is wholly due to the institution uf slavery.

The Slarery Question.-It is impossible to give a history of the institution of slavery in this article, but this murh may bre said: When the cargo of Africans was lamped at Jomestown in 1619 , prio to the landing of the Pilgrim Fathers in 160, slavery was miversally emsidered proper. It hecame leral in all the colonies. It was a local dumestic institution recognizet and legalized ly each of the colonies. it was mise recounized by the Constitution, and, in fact, a compromise was made ly which the importation of slaves was male legitimate till fros, upen the consifleration that Congress shoud have the power to pass naviration laws-a contract effectial ly a union of certain maritime Northern States and southern slaweholding states against the protest of the larger shatholding States. The invention of the cotton-rin ly Eli Whitury made slavery highly profitable. It was an institution which interwove itselt in the domestie fabric of subther civilization. The slaves were diterent in race and color from 1 he masters, and the problem of grulual emancipation was one from which the sout herin statesmen shrank. Many of the ablest men of Virginia, Maryhma, Kentucky, anid Tembsser, and other Southern States urgend the ahoption of some plan of gradual mancipation, am the majority of slaveholders were probably
always in favor of some sueh system. It was defeated mainly because of the inability of the men of the South to make 1 p their minds as to what conld be done with the emancipated negro. They did not ste how he could be deported, and they were not willing to make him a partuer in their political control or an eqpal in their social life, and they shrank from the experiment of having so large a body of freemen who were hela to be both politically and socially inferiors. Amalgamation was intolerable. And so the conservatism of preserving the existent order of things always prevented the adoption of any system of gradnal emancipation. To these motives may be addet the enormons value which the slaves represented. The South had bought and naid for them: to make the slaves freemen seemet to be an act ut confiseation of the most cruel character, and to inflict the imrden of compensation for them upon the non-slareholding purt of the commmity seemed to be equally eruel. So the slaves increased in number and in value, and the problem grew in danger and in difficulty. There was always a very wile anti-slavery sentiment in the North, and finally the Abolition party was organized, and became a factor in political matters. As a rule. the Demoeratic party, being in favor of the preservation of the power of the State over domestic institutions, rested upon the principle of Federal non-interference with slavery, and of remitting all questions concerning it to the various States. Mr. Clay, Mr. Calhom, and others of various shades of opinion, saw that this conld be only temporary. To postpone any national interference the policy of keeping the balance of power equal was adopted, so that with the admission of a free State a slave State shonld also be admitted, and the equality of power in the Senate be therehy mantained. Mr. Calhoun foresars that the acquisition of temitory under the treaty with Nexico would necessarily change the form of this proljlem and require congresional action, and he was indubitably correct. The compromise known as the Missouri Compromise could not be prmanent, for it is in the nature of all compromises that they are only temporary. New and unexpected transations produce new and unexpected complieations, and each generation must solve its own problems for itself.

From 1801 to 1850 this question had entered coustantly into politiall thought, but never in such a manner as to render it diflicult of solution, but it constantly increased in gravity. The sonth became alarmed at the dangers which threatened it; it became sensitive to attuek and anxious as to the final result. The mountainous character of so large a part of the South and the cheap prairie lands of the North made migration to the North so large as to render certain the loss of political power in the South. It took no acumen to caleulate when the Northern States would greatly ontrote the slaveholding states. Every day the disparity was hecoming more apparent, and if division had to come, the sooner it eould be brought abont the more nearly equal the struggle would be. So the south turned readily to that party which stood by the guarantees of the constitution, which denied any power of the Federal anthorities unless granted in that instrument which it regarded as its sole barrier and its only hope. On this issue the Whig party in the Sonth was practieally destreyed, but the Demoeratic party in the North had a dilficult if not impossible task to perform. As slavery existed in the District of Columbia, over which the L.S. had absolute eontrol, as under the fu-gitive-slave law the anthorities of the Northern states were oftem called to act, as there were territories ower which Congress legishatel, and which had to he organizet into and admitted as States, it was impossible for the Federal Govermuent not to concern itself with slavery ; and the Northern Democrat had to lace the question as to what his action wonld be concerning these fuestions, which were not within the domain of state action. Ho could well agree with his Smathen brother that as to the institution in the States Congress coubl "xereise no power, lnat he gratually ascertained that he couhd not agree as to what should be done on these other matters. To emancipate the slaves in the District of Columbia and to exelude them from the territories was practioally to limit this institation so as to make it the victim of the inereasing anti-skavery sentiment. Not to do this was held by the Forthern status to require of them to become purturs in the maintenance of the institution.
Stavery in the Trmitories, - When the question of the formation of territorial grovernments for the new territory acepured from Mrxico and of the admission of California cante up for decision, a division was inevitable. It was post-
 parently sethled by the umprecerlented viofory of Gers. Jiorem
 Was inevitahle. It nay have leem unwisc in Mr. Donglas: and
 (ompromise, and thereby to give the oreasion for the tommat tion af the anti-shavery jarty: hat if this had not then been done that destion Waild hate lad to he met in some form. and the same divisian wonld have oremred. Thweonvention of 1 sifif idopted a emompomise phat form on this guestion which emahlal the party io carry the election of that vear ; and if it had heen wiocto and ably led during the administration of Mr . Buchanan, it is prolahle that the division conld have hern postponed and sume patifie'solution of the problem aswrtuinet. T'he requirement of the southem I emorracy that the territury shonlaf be looked upon as a common territory purchased lig the joint contribution and atopred by the jeint expenditure of homod, aml therefore to he hell foir the juint bemefit of all the states and of all the prople, with the rieht of every cotizen to carry his promerty into that common territory, was alwass a lumen claim. and if admitted would never have made a single territary a slave State. The view of Mr. Donglis, known as "sratiter sovereisuty." fomever afote, was one which furnisherl no settloment, and the ponition of the liepublican party that slavery was suledy a lacal institution, and proproty in shaves parely statutory, and therefore not to bue rocognized heyond the territurial limits of the sorereignty whose statute ereated it, put in issut the antime question. "Thes llivision of the lemoeratice party at Charleston was inevitable, and its division made the dection of Mr. limeohn certnin. The war of secessium destroyd slavery, owertumod the state governments in eleven states, crated a large public debt, and cansert the issme of grembateks.

The Fiu' (upstions rerising out of the War.-The new questions thus arising out of the war had to be met under unusual and peculiar circumstane es. The Republican pharty was in control of every state of the Ľnion except Kentacky, Sow Jersey, and Comectiout. and the exercise during the war of those powers which, for want of a better name, were called "war powers" had loft in the lande of the President enormous power. 'To mect the expenses of the war had reguiret] in the judgment of those in control of Congress the issue of many millions of ereenbacks, to which the quality of leral temer fad been riven, and the ereation of a large publice lelot. The generif fiovermment hat lieome necessarily interested in the finameal affairs of the people. It hat iaxed out of existence the coirenlation of tlue 大itate hanks, amel substituted for stato banks a system of national hanks. 'The Walker taritl had heen repealed and the Morrill taritf enaterd. 'The lemmeratie party at onde, at its convention
 ciples apon which it was founded. As it had alwitys beliered in the equality and antanomy of the states, it decolared for the "immealiate rentoration of all the statea to their righats in the Union under the ('onstitntion, amd of civil government to the Smerican prople" ; and "amnesty for all past politicat uffenses, and the rogalation of the eloctive franchise in the states by their citizans." Boing utterly aproserl to contralization in all its forms, it alechamd in faror of the [avment of all the publig debt as rapidly as [ractionble : and that all money drawn from the people by taxatian, mot requisite for the necessities of the fovermment eronomically administerext, he honestly whlied to surlh payment. Bonngr committed to the arpan? ilistribution of thardens, it dectared for repual taxation of evory suecies of property aceording to its real value, athd for one curvoney for lle (bovermatint am! the people and for every class of citizens. It committer itsolf to "ecomman in the anminintration of the Govermment; the roduetion of the atanding arms and navy;
and a laritl for revame num foreion imports.and such equal taxation umber the intornal rovenue laws as will affor! Ineidental proteretion to domestic mannfactures. and
 den mpon, athl best promota and encomaine the great indastrial interests of the conntry."

From 1 hen to 1836 it vigomensly and censelessly contonded fur the rebahilitation of the elevan states which had partieipated in the ('onfermatco mosemment : for therestomation uf every aiti\%n t" equal rights: for the romosal of the army from thosestates for the (exsathon of milatary govermment; for the payment of the problie debti asmi for at
 ing these years questions of taxation were not as important
as they have since hecome, herance the guestions at issme involvid the very mature of our institutions and the existesee of State \&

The Contentions of $1 \mathrm{~s}_{2}^{2}$-In $1 \times 2 \mathrm{~A}$ Grecley and Frown, having leren momineted by the liberal convention, wore alsu nominated by the Democratic eonvontion, not beanase it arreed with the riows of these gent memen upon the ordinary fluestions of taxation. Int heoamse they represpated ernut fovernment : the limitations of the constituthon in Firderal matters: the restoration of the siates to their antumomy; the subertination of military power to civil ituthority: and the equality of eitizenshiji. Perlaps this athed the bemoreratio barty lo obtain the eontrol ot the IJotise of Lipprementatives in leit in the ['orty-fourth ('onsress, and it exerciserl the power thas oriven to it by reform of abusis and thereduction of ex[mblitures. Ender the lead of simunel. I. Ramdall the bemocratio: Honse secured a rexdection of over
 aml at oner restored to the IIonse of Representatives its buwer over the public purse.

The ("onerution of 18\%G.-In 1876 at St. Lamis the Demeneratic party in substance reathirmed the platform of 186 s . hnat. in addition thereto demathed that atl custom-honse taxation should he only for revenue. and on that platform it clamed? that simmel J. Tilden and Thomas A. Hendricks were legally eleceted l'resident and Vice-l'resident of the [T. S. The elec:tion boing disputed. (congress, conaposed of a Rejublican semate and a lhemocrafic Homsa, crated the Electoral Commission which lecolured Mr: Ilayes elected President. to which derdsion the Democratie pary y submitted. 'The result of that recetion at least was to canse the withrlrawal of the Ferlaral irnops from the Southern ritates, and to restore to the three states of Loulsiana, South Carolina, and l'lorida their antomony: to put an and to Federal interference with the lecal affairs of the Sonthern states: to have in both branches of Congress a full representation from those States, which was soon followed by having that representation rally elected by the people; and to enable the country to take up with more deliberation and Iess [hassion the eronomic questions which are now in frocess of discussion and settlement.

The (cunrention of $188 \%$ - In 18 si , at Cincinnati, the Democratie party was enabled to take position upon these roonomic questions with greater hope of manom, ant in that platform it "xpressed its general fuith in these worls:

- Third. Home rule, honest money. consisting of erad and silver, amd paper convertible into coin on demand: the strict maintomace of public fath, State and national: and a taritf for revemue only: the subordination of the military to the civil power ; and a general and thorough reform if the civil service."

 tive Denocratic bill known as thas Mills Jill, from the Hun.

Roger Q. Mills, of Texas, leuter of the IIonse and chairman of the Ways and Means Committee.

The Comerention of 1888 . -At St. Louns, in 1888, the conwention indorsed the Mills libl and constraed the phatiom of 188 t as contended for by the revenue Democrats, and nominated Grover Cleveland and Allen (i. Thurman upon that phatform. 'l'he defeat of Mr. Clevelami carricl with it the lefeat of the Bemocratic party in the Honse, and again the Republican party hat possession of the presidemey and both branches of Congress and again tork atvantage of it to revise the tariff hy the passan of the Mckinley bill, muder the lead of the IIon. William Mekinky, Jr., of Ohio, by which act the duties on such articles as were left dutiallie were greatly increased ; bounties were paid on sugar and other articles, and raw sugar made free. An attempt was made to pass an clection bill which has hecome known to the comblry as " The Force Bill", and the speaker, the llon. Thomas B. Rem, of Maine, reversing the mang of a homdred years, mled that a fromm of those present and not voting could be cumted for lerislative purposes. This Congress ako enactel what has become known as the shemman law, by which it is mate the duty of the Seeretary of the Treasiry to purchase monthly $4,500,000 \mathrm{oz}$. of silyer, to issue therefor treasury nctes, and with jower to coin only so mueh of the siber as in the diseretion of the Secretary mity be necessary for the redamption of these notes. Upon these issues - 1 , the tariff: ? the force bill: 3 , the eurrenty question; and 4, parliamentary liberty-the Democratic party appeated to the comery, and secureil the lower house of the Fifty-second Congress by an unprecelented majority, and upon the same issues nominted at Chicigo (irover (le veland for President, and Allai E. Stevensont, of Illinois, for Vice-l'resident.

The Election of Mr. Clerefand.-'The nomination of Mr. Cleveland was, even if no phatform had bem adoptet, "fuivalent to a pledge by the party that it wouk repeal the Mchinley tariff act and substitute in its phace a law imposing imposts upon imports npon the principle of raising revenue only. and that it woud repeal the Sherman law and give to the conntry a sound and stable curreney; it also Bledged repose to the Soubhernstates, and the repeal of all laws permitting improper Federal interference at the polls. The election of 11 r . Cleveland by so large an electural mat jority may be taken as a sulemn declaration by the perple if America that all interference by congressional legislation. or Federal authority: with clections in the States must rease ; that from this time forth elections are to be con1rolled by the people rewident within the several states. The battle for the equality and autonony of the states may be considered as wom, and the long contest for equal rights and priviluges of the citizens. for the preservation of the funwer of the local authorities, and the socmrity of home roke, may be consitered as ented. This much the Democratio party may claim as its contribution to the peace, repose, ami liberty of every state and uery section.
The Sherman Ĺcul.-The repeal of the sherman law must illan be consitered as promisent. What shatl be put in its place will be a matter of consideration and agreement by the Fitty-third Congress, which in both its lumathes has hecome Democratic under the verdiet of the American people unn the issmes submitted at the clection of 1892 . For the firmt time since Mar. 4, 18fil, the l'resident and Congress are Denneratic ; for the first time, therefore, can the Democratic paty umbertake to enact a statute and for the tirst time cem it be held responsible for legislation. It will take action upon the grestion of the currency, and settle it upon the principles thmonced in these varions plattoms, and probably never better than in that of 1880 in the words: " 11 onest money, comsisting of suld amh silver and piper, convertible into eoin on demam!." It declared in 1868 , "for one curreney for the foverment and the people, the laborer ami the othe hobler: the , pensionor and the soldier, the prodncer and the boudholder." These two dechations are cunimant, thongh in languge they seem to be difterent. They mona that every dollar issued hy the (tovemment shall he cyan to wery other follar, and slad be the "galal of any dullar in :ay imarket in the workt. This is in aceontance with the fandamontal principle of Demoraty. As the atent of the faple it must ser to it that no dishonesty is practicerl, and If follows that when it issucs a dollar it has phedred that it is in fact and valur a dollar, "qual to ewry other dollar, and worth exactly what it professes to be worth. How. praticolly, this is to he earricd ont is a mere cuestion of detail in statemanship. There is no denbt that it will be suecessfully accomplishenl.

Taxution.-The same general remark ean be made as to Low the questions of taxation and the revenues of the Government will be met. They will be rednced within the limits of a fair and liberal peonomy. What are proper governmental expenditures will he answered in the light of the principle that no money shall be taken by taxation from the citizens except for such puposes as are enumerated within the Constitution, and mily to such extent as is necessary to carry ont those purposes. To meet these expenses revenme must he raised hy taxation, and the bulk of this revenne must be raised first, ly imposts on imports: second, by internal revente from spirits amd whacco; thirk, the Weficit, if any, must be made up by some form of internal taxation, either by an income tax or by inereasing the subjects al taxation.
In laying impusts on imports the principle that it shall be for the purpose only of raising revemue will be kept steadily in riew; but in framing a tariff bill certain practical primeiples minst be observed to which the Democratic party is committed. In the Forty-ninth Congress, under the lead of the Uon. William R. Morrison, the Committee on Ways and Means reportet a bill repealing all duties on raw woul. This committed the praty to the principle "of free raw material." It may therefore be considered as settled that such material in its raw and crude state as ean not be used execp lor the purpose of manufacture, and upon which futher lathor must be employed betore it can go into consumption, will be admitted either entirely tree of duty or with the lowest revenue tax ; secom, that in all articles only such dinties will be laid as will produce a fair revenue, and that they will be han for the pupose of prodncing revenue, and not for the purpose of protection; third, that the necessities of life will be admitted free. The principle involved in this is that he who makes a dollar shall have the control of that dollar, and shall purchase in such market as he chonses free from any other limitation than that of equal taxation to support the government which gives him protection.
The Democratic party has always been in its action a conservative party. It has never lacked cuntion. The reforms which it has pledged itself to accomplish will be done in a spirit of conservatism and cantion. It will not destroy any industry which can live under fair and just competition; it will not make sudden ehanges, but will give fair and reasonable time for such necessary readjustment as modifications of the tax law may require.
The cenntry is so rich, its products so enormons, the value thereof so great, the surplus which mnst be sold abroad so necessary to the maintenance of piees at home, that under a proper finaneial system it ought to be able to control the markets of the woild. With proper amendments to our narigation laws by which onr citizens eat buy ships on precisely the same terms as citizens of other cometries, we can regain the control of the sea; by removing all unnecessiry barriers, taking off all improper burdens, and giving to American industry a fair murket. we can control the markets of the world ; and under a just and impartial taxation the income of Imerica will be justly distributed among those who produce it.
Under the mevideney of any bemocral who is a sincere heliever in Democratic minciples, aml who will see to it that economy is practied in all the departments, and that the civil service is fairly carried out, the expenditures can be greatly lessened; also umer such a President who will require of publie servants that they shall execute the duties of their office as if it were a public trust the revenues of the Government can be increased, and therefore the extinction of the public deht, withont an increase of taxation may be rasonably looked for.

This will divorce the Government from the financial operations of the eitizen; it will limit the "prations of the Tremsury bepartment to its fust functions-the collection amd disturstment of the puhbic revenue: it will atso divorce the (rownmment from the banking operations of its citizens, and limit the issues of its currency to the constitutional renuivements.
With the antonomy of the states entirely recognized, with rejose in every state, with mual taxation, with economice expenditure, with honest alministration of the Goverment, the future of the repmblic will surpass the utmost thight of our hopres.

Ihleiair C. P. Brec'kinridge.

sidered to be full of demons, and to their opposition the slow progress of the truth was attributed. ldolatry has frequently been represented as the worship of demons (e, g. 1 Cor. $x$ : 20 ).

As might be expected there are stories innumerable ahout demons. Many of them are collected in sneh books is ( T . Roskoff's (ieschirhte des Trufels ( $\underset{\text { Z vols. Leipzig, 1869) ; }}{ }$ E. B. Tylors Primitive ('ulture ( ( vols., London, 18~1): M. 1). Conway's Demomoloyg and Derit-lore (2 vols., Lomdon and New York, 1sio). SABuEL Macalley Jackson.

Denonstralion [from Lat. Ilemonstra're show forth] : an indubitable proof of a proposition: broperly, a perfect proof, such as a mathematical one. 'l'he term was used by Aristotle and the older writers to signify any manner of showing either the connection of a conclinsion with its premises or that of a phenomenon with its asserted canse : but it now signifies in philosophical language only that process by which a result is shown to he a necessary consenuence of the premises from which it is asserted tu follow. The word demonstration is also appliet io in imperfect proof. yet of a nature such that no reasonable doubt is possible, as Kepler's proof that Mars moved in an millise.

Demosstration, in common language or in evereday speech, signifies an exhilition or display, generally of an oppositional character: and very often the word is applied in such a manner as to involve i slight censure or disipprobation.

Hemoplíilus (in Gr. $\Delta \eta \mu$ óфiخos) : a philosopher of the new Prthagorean school, whose age is not certainly known. lle was the author of a work entitled Blou $\theta \in p a \pi \in i a$, from Which there is still extant a collection of moral precepts entitled gvousà $\delta \mu \circ \omega \mu a \tau a$. which are edited, along with the Golden IIarims of llmocrates, by Schier (Leipzig, 175t), and which are printed also in Urelli's Opusculu Greco. vet. Sententiosa, rol. i., p. 1, seq.

Demoph'oin, or Nem'ophon (in Gr. $\Delta \eta \mu о ф \delta \omega \nu$, or $\Delta \eta \mu \sigma^{-}$ $\phi \hat{\omega} \nu)$ : in (rrecian mythology, a king of Athens: son of Theseus and lhiedra, who is said to have accompanied the Greeks on their experlition against Tros, whence he reseued his grandmother Ethra. When Diomed. on his return from Troy with his Argives, ran in by night to the coast of Attica, and began to phumer it, Demophon attaeked him and carried off the lalladimm, or statue of Pallas. Demophon is said also to liave assisted the lIeraelide against Eurysthens. Who was slain in the battle that took place, and to have received Orestes when, after his mother's murder, he sought refuge at ithens.

Demopoolis: city : Marengo co.. Ala. (for location of county, see map of Alabama, ref. $5-\mathrm{B}$ ) ; on railway and Tombighee river just below the mouth of Black Wirrior ; has a cotton compress, two lirge lumher-mills, oil-mills, in ice-factory, and an active trade in cotton. Pop. (1880) $1.389:(1890) 1,774 ;(1893)$ estimated, $1,850$.

## Demus: S'飞 Deme

Demosthents: the most illustrions of Greek orators the son of I monosthenss. at well-torlo Athenian citizen, proprintor of a contlers establishment and a chair-fitctory Wharn in $3 \times 3$ (or $3 \times 4$ ) B. ( $:$, he lost his father hefore he wis ejght forars okl, atul fell into the hamds of unserupulons guambians, who apropriated a large part of the fourtera
 hatirs. Two vears attor rowhiner the legal age of eightern bemothemes, who hy that tima hat heron trained in law and
 and won his case. which he pleaderl in person, but deeoveram only a part of his proprety so that he fombl himsolf ohliged to mend his fortures by fibllowing the profession of a speechwriter. lle som becmine a distinguishod and shecesslul advomate, and we have a mumbor of sueveses prepared by him for nse in private suits from the gnarlian suraches just mentioner down to the varar ans. ln 3ns he began the proparation of specehes to he used in puhlie suits, and in sint
appeared in the case against Leptines and won his right to be eonsidered a master. In 3is1-the date of the first Philip-
pie-began his long struge with Philip of Dlacedon. The first Philippie, in which lemosthenes uttered his call to arms, was followed in $349-8$ by the Olynthiacs, three short speeches, which are marrels of condensed vigor. In the same twelremonth with the olynthiacs falls the speech against Mentias, who had assanled Iemosthenes while the orator was clischarging a public function, but this specch, one of the most famous among the extant orations, was never delivered. In 346 Athens made the peace with Pbilip known as the peace of Philocrates, and Demosthenes was one of the ambassadors sunt first to negotiate and then to ratify the treaty. The combluct of Eschines, who was a prominent memher of the embassr, gare oceasion to the famous speech "On the Malembassy" ( $\pi \in \rho$ t maparpeçelas). with the reply of Eschines ( 344 ), both of them in their extant form diligently manipulated by their authors. To this period belong the second Philippic (344) and the third Philippic (341). Open war was declared in 340. and ended in the crushing defeat of Charronea (338). Demosthenes took part in the battle, and shared the fortunes of the day. The cheap charge of cowardice did not affect either his position or his influence. IIe was chosen to deliver the funeral oration over the fallen. and was active (br personal smperintendence and personal contributions) in furthering the work of repairing the walls of Athens. For this patriotic service Ctesiphon bronght in a bill that Demosthenes shonlil be publicly crowned. 'I'his proposal was made in 336, shortly before the death of Philip. Legal technicalities were interposed by Eschines. who hronght against Ctesiphon a charge of unconstitutional legislation. The case dragged its slow length along. and did not come to trial until 330. Demosthenes trimmphed. and Eschines did not receive the fifth part of the rotes, and was foreed to withdraw from the eity. The Speech on the Crou'n is not onls the eulmination of Demosthenean eloupuence, lut outranks all specehes known to fame. After this achievement Demosthenes lived to be drawn into the disgraceful affair of Marpalus ( $q . u_{0}$ ). lived to be banished from thens in 324 on the charge of receiving bribes. In 323 the death of Alexander brought hope to Demosthenes, bronght him restoration to Athens. But the hope was of brief duration. Athens fell into the hands of the Macedonians, and Demosthenes wis eondemmed to death. Ile made his escape to the island of Calanrea, but was followed into the sanctuary of Poseidon by the emissaries of Antipater, from whom be escaped by taking a quiek poison which he carried concealed on his person (ox2).

Uf the sixty orations extant which bear the name of Demosthenes modern criticism has rejected a considerable nmmber, but we have ample material for a study of his art in its higher lines. That art was not easily acquired, and there aremany stories as to the painful processes by which lemosthenes won his way to perfect mastery. Natire was against him. Jle was of delicate constitution, his roice wias poor and ummanageable, his articulation so bad that he could not pronounce, it was said. the first letter of the word rhetoric (his own art), am? his manner was awkwarl. To remedy these defeets he reciterl verses with pebbles in his month. declaimed while running. while walking unhill, while facing the noin of the waws, and gesticulated hefore a mirror. Mooted down and langhed Jown in the assmbly, he did not despair. De tomk lessons of actors, and perswered until his delivery matehed his thonghts. and hecame dramatic and impassoned--too dramatic and impassioned for his critics-so that the prufessional actor . Fserhines sneered at the rant of the mateur actor lomosthemes. But Demosthenes was an actor" who harl "to know his lines": he had to be "piat't perfect," and sehdom trusted hinuself (o extempore suech, though evern ther he was brilliantly successful. He was first und last a student. and the story that he transeribed Thucridides eight times in order to steep himself in the style of the historian is of a pisce with the eurent criticism that his surerbes smelt of oil. Ile was a stument first and last: and jt is comly the close student of the original that can appreciate the fineness of the texture. Vocabulary, syntax, orter of worls in leference to somm as well as to sense, proionlology, rhythm-all these things that contribute so mach to the total" etfer. so mach to the "action " of oratory, are lost in translation. But the directness of his style, his manly contempt of ornament. "the lightniog and the thunder" of his elopuence. illumining, terrifying, transfixing, the rush of a great personalit ${ }^{\circ}$ which gives weight and cogency to argmment, the inspiration of a
passionate patrintism-thee are not all lens in modern renderings: and there is enomgh to justify the language of Bropham, who celled themsthemes "the first of omators at the head of all the miphty masters of specch." lifis nature was antere, it is true; he lacked tenterness, he dacked phayfulness: hut there was tittle rom for these in his puthe orations, amd with the private specenes criticism has bedn ton lisy to allow full juatice to the resource of this " Protens" of orators, as bionysium calls him.

Fiur the perimb, see limenes Mistory of Grevce, vol. wi.. ch. Txumii: Thirlwalts Ristory of fireece the exhastive work of Arnotd sehaifer, Jemmsthenes und seine Zeil (3 vols. 2d ed. 15:5-i). For the style, see Brougham. The chicf annotated edition of all the orations is that if Dindorf (! wols, Oxford, 1846-51); (ritical editions
 Tembur coblection. Among the best editions of single of select orations are thme of Bans, Butmam, Dissen, Rehdant\% Sandys, Shilleto, Vomel, Wayte, Weil, Westermam, Whiton, t. A. Welf. English tramil. by C. K. Kenmedy (5) wols.), in the Bohn libmary.
B. L. Gldersleeve.

Demosthenes: an Athenian general who acted a prominent part in the Petopmnesian war. Ile and Eurymedon juintly eommanted an army sent in 418 B. c. to re-enfurce Siciac at syracuse. After the Athemims had been defeated he suremered, and was pht to death by the victors in $41: 3$ is. C.

Demot'ica (anc. Didymolichos): a town of European Turker: in Adrianople protince, on the river Maritza, 25 miles S. of Adrianople (wee map of Turkey, ref. 4-1). It is lefended by a citaded or castle, and has several Greek churches: alsi manufactures of silk and woolen goods and puttery. Dlere Charles X $\mathbf{N} 11$ of sweden lived in retirement after his defeat in the battle of Pultowa (1709). Pops about S(1)1\%.
Demotie or Enchorial Writing : a cursive or shorthand alphabet used in ancient Egept. It was an abbreviation of the hieratie writing. which was itself an abridged firm of the true hieroglyphies. Its remains are ditticult to decipher. It began to come into use about the origin of the
 ?(0) A. D. It contained forty-two letter and fort y-wight syltabic characters. It appears on the Rosetta stone, and was exumsively employed even in public documents. Remnants of this alphabet appear in the Coptic. See Eurptas Lasfigge and Lateratcre.

Domurrage: in mereantile law, an allowance made to the mander owners of a ship by the merehant or freighter When be detains the ship in prit beyond the time specified in the charter-party. It is usmaly stipulated in the charterparty ur areement that if delay occurs in loading or unfonding the ressel, the merchant who charter and freight: her shall pay a certain sum per diem for the extra time The rule is that during the londing and unloading the merchant runs all the risk of intermptions, even from necessary and arritental canses. lint no demurrage can be clamed for a delay callsed by the detention of a ships by public enmy, or for delay emsed by the fant of the master, owners, or crew. The word demirrage is ako employed to mean the relay itself.
hevised by F゙. Strobifs Aldes.
Dembrrer: in law, a suspension of ation in a cause unti) the wetermination of some point he the eourt ; distin-
 Wedl as at law, it rases a gluestion as the the sulfieneney in law of the case as stated ley the opposite party. There may abse be a demurrer to evidenee, on the erommi that the testimong oflered hy a party in a canse is insublicient to mantain or overthrow the issite. Revised by br. stchees Alles.
 Peoth, Ihusary, in 184t: taught singing in Paris and Vienna, and made her debut in opmera in Flomene when ninetern yorsold. Apmared in London in 1865 , ant in Xew Vomb in 1sit, with great success. liter voice hroke and she suon sank into ohsturity and poverty, and died in Mumich, Jan. 1. 158:
II. E. Iheryby.

DCuain. 1 le năi' : a town of France: department of Nord: on the sthehte, and on at ralway ; it miles $\mathbf{W}$. of Vitenciennes (sere map of france, ref. B-(i). It is in an extensive enal-fieh, and has iron-works hud manufactures of heetroot sugar and hrandy. Pop. (1896) 14,916.

Dena'rius [a Lat. term, from dmi, ten]: a homan sitver
 Its woight varime at difterent perimds, and ite value was afterwat equivatem to sixtern ases, or about sixteen cents of L. .s. money. sed Acrats.
Wenhight den bow: ©ipital of Wenhighshire, Wales; in the
 and Wades. ref. s-Fi). It stands on the sides and at the hase of a strep limestone hill, crowned by the imposing ruins of a casthe built in 10xt, and has many handsome antique houses, an oh parish church, an ancient chapel, an anyom for hanatics a home for orphan girls, and manufactures of shes and leather. Pon. 6,53 .
Denbirhshire: a county of North Wiales; boumeal N. by the brih sea and 11 , ly the river 'onway, Area, bift sig. miles. The surface is mastly ruged amd momentanos, but firtile and leantiful valleys occor. ('ual, copper, irom, lemd. limestome, and slate are found in this eombly. The chiof towns are benbigh, Wrexham, thergele, Llingollen, and Kuthin. Pof. ( 1881 ) 10s:931; (18:91) 11T, 450.
Denderaln ane. Tentyra, probably taken from Tein thor, alode of Athor): a town of Cpper Exypt, near the left hank of the Xile: in bat. $26^{13}$ N.. lon. 82 to E., and onposite keneh. Here are the rins of a celehrated temple, dolicated to Athor, the Egyptian Vemus. It is one of the thest preserved of the ancient structures of Egrpit. It has a porticesupported by twent-four cohumns. The chambers and passages, the well as the exterior walls, are ornamented with port raits, among which are those of Cleopatza and her sun tasarion. There are aloo two other temples-one dedieated to lsis and the other called Trphonium. from the representation of Typhon on its columis. See Eifypt, Axciext.

Demdermon'de or Termon'de : a fortified town of Belgimm, in East Flanders: at the conthence of the Jender and the Schehd, and on the railway from Mechlin to Ostend: 1f miles E. of Ghent (see maj' of Holland and Betgimm, ref. 9-D). It has a tow-honse, and a wery ohd church called Sotre bame: also manafactures of linens, cotton yarn, and beer. Pop. (1490) 9, 2!
Wendrite [from Gr, ofuspov, tree + sullix -ile, used of minerals]: a peculiar minerat, containing int maty, or hasing its surface covord with, filamentary forms resembling muss, ferms, trees, ete. Noss agate and Mucha stone are examphes.
Dendru’hiun [from Gr. סívopov, tree + Blos. life; so called hecause they live on trees]: a genus of cpiphytic orchids, mostly matives of the tropieal parts of Asia and Australia. They have fowers of great beaty, somotimes also remarkable for grenesqueness of form or for fratace.
Dondralites [from Gr. $\delta$ évopov. tree + a corruption of Atoos, steme. under influener of sutlix -ite]: fretrifactions fonnd in secombary and cond formations. They consist of plants and jragments of trees. having. generally, mothing in common with thase now srowing in the sume regions. They are mostly cyeds, trederns, conifers, ete.

## Demdrolouy: see Forestry aml Nursiry.

Dru'drophis: [from for. סévopov, tree + üpis, serpent]: a genns of tree-shakes (Temtrophiter) foumd in hathan and Australia. The surcies are of moderate size up to 4 feet in length. very slemder, and either of a green color, which harmonizes whth the faves or brighty marked in a manner shgerstive of thwers. Thery feed on insects, tree-froges and limels.

Denison, (ieorge 'Tarbor: ofliecr; b. in Toronto, Canada, Jug. $31.18: 39$; educatorl at Upucr Camada College in that city. We was admitted to the har in 1861 ; entered the militia.and wat promoted to (onnmand of Governor-Gonerals Bodyguard in 18fic, and commimiled ontposts on Niugurn ribir luring the Fenian ridid the simo year. In 18 an and again in $187: 3$ he was somt to (ireat Bridain to represent Onlario in emingration matlers: anct in $18 \% \%$ Was appointed prlice macristrate of Torontu. His work, Mistory of Cratuly (lamalon. INTV), was awamlet a prize of 5.000 rubles offeral by the "hat of hassia for the host work on the sulbigect. Amoner his other works ate Manual of Ontpost Duties

 mitted to the hat in 18io. The served as malerly to Gom.

IVaseley in the Red River experlition of 1870; went to Fgypt in command of the ('madian royagenrs employed in the campaign for the reliat of (ten. Gorlon, and was made a C.M. G. for his services. He eutered the Dominion Parliament in 18s\%, and was rebelected in 18:11. I fellow of the Romal Society of England, and anthor of Mistorical Fifond of the Governor-General's Body-guamd.

Nell Macdonald.
Denison Unirarsity (fommerly known as Grantille Coldede): an institution of learoing established and located at Granville, licking co., O., by a vote of the Ohio Baptist bilucation socioty May, 1831. It was at first intented for a mamal-babor seloot, aud hence locatelf on a ?on-acre firm, $1 \frac{1}{2}$ miles W. of the town. As a manual-labor school it was. like most ot hers of the time, a failure. It was incorporated by the Ohio Legislature lebe. 3. 1832, under the mame of the Granville literary and Theological lnstitution. The name was changed in 184.5 to (itanville Colpge, and this again under the general law of Ohio was changed, June, 18.6, to the name it now heals.

The buildings are four, containing dormitories aml studyrooms for 178 stulents. besides a fine chapel, natumal history room, two society halls ind libmides, cobllege library (with over 14,000 volimes). lecture-rooms, recitation-rooms, etc. The fourth building is for the library, and is called Doanc Hall. It was the gift of W. H. Hoane, Esq., of Cincinnati, and was completel in 1879 . A fine science hall, costing s 40,000 , and an acadumy bulding, costing \$30,000, are in plocess of erection. These buildings are the gift of E. J. birney and IV. 11. Doane, respectively.

Five toni-year conrses are providel-classical, seientific, Latin philosophical, Greek philosophical, and literary. The preparatory delartment is called Granville Academy.

The board of instruetion consists of ten professors and five instructors in the aeademp. The mumber of students, including Shepardson College, is abont 600. The fixed propelty of the university, in gromm, buildings. etc.. is estimated at 110,000 ; library ind apparatus. 40.000 : and the produetive endowment is \$3\%5.000, making a total of \$595. 600 . Shepardson College for women, atliliated with Denison [niversity, established $188 \%$, becupies six mildings, has an endowment of $\$ 100,000$, and a fiactilt 5 of thirteen instructors, I. B. I'urinton.

Donizen [O. Fr. deinzein, one within, as opposed to for eiln, one withont; deriv. of deins, dens $>$ Mod. Fr. dans < latt. de + intus, from within]: in Great Britain, an alien who had received from the soreceign letters-patent to make him a British snbject. He mierht take lands by purehase and devise, but eould not take by inheritance. Since 1870 , however, aliens ean take and inlierit lands the same as natural horn subjeets. A denizen can not be a member of the privy commeil or of either House of Parliament, and can not hold any olliee of turust, civil or military.

Revised by $\mathrm{h}^{\mathbf{T}}$. Sturges Alles.
Deniz'li, or Degnizli : a town of Asia Minor: in Anatolia; 53 miles S. E. of Alashehr (see map uf Turkey, ref. 5-E), It is surrounded by mountains or hills, and has i castle and several mostues. Leather is marle here. It is stated that 12,000 of its inhabitants were killed by an earthquake in 175. Pop. about 30,000 .

Jemman, Herbert : figure-painter; b. in Brooklyn, N. Y., June 20. 1855. Pupil of Art Stulents League, New York, and Carolus-Durim, Paris: honorable mention, Paris Saton, 1886, and Paris Exposition, 1889: memler Society of American Artists 1887 . Ilis work. which is sumetimes deeoratire in charaeter, is marked by good qualities of color and drawins. Dennic, Joseph : anthor and critic ; h. in Boston, Mass. Aug. 10, 176s: graduated at llarvard and studied haw, which. howerer, he did not practice. From $1: 46$ to 1798 he edited The Farmers ITeelly Museum at Watpole, N. H. Having removed to Philadelphia in 1799, he founded the Portfolio, a literary magazine, which he edited with ability from 1801 till 1812. Among his writings is The Lay Preacher. I). in Philadelphia, Pa., Jan. \%, 181 ?.
Dennis. Jous: English dramatist and writer of satires and pamphlets: b. in London in 165\%. Ite studied at Cambridge, male the tour of Europe, and after his return was led to devote himself to literature through his acquaintance with Dryten, Wycherly, etc. He had no talent. Nevertheless, his trasedy Love Asserted ( 1 (14), achieved a success by its anti-Frencli tendency. Ilis temper was quarrelsome, and he provoked the enmity of many persons by his lihels. He Was lampooned by swift, and satirized by Pope in the Dunciud. J. Jan. 6, 1734.
Denuison: village: Tuscarawas co.. O. (for location of connty, ree map of Ohio, ref. 4-H) : situated on railway, 100 miles E. N. E. of Columbus: has railway ear-shops and machine-shops. Pop. (1880) 1,518: (1890) 2.925.

Demnison. Willam: statemm: b. in Cincimati, 0 . Nov. 23, 1815: graduated at Miami Cniversity in 1835; admitted to the bar in 1840: praetieed at Columbus, O., 184048 : was a member of the Legislature of Ohio 1848-50: president of the Exchange Bank and of the Columbus and Senia R. R. Co.; delegate to the Pittsburg convention in 1856 which inauguratel the Republican parts, and ako to the Philatelphia convention: Governor of Ohio 1860-62; Post mater-General 1864-66. D. in Columbus, June 15, $18 \mathbf{S H}_{2}$.
Denom. de-nēń, Domixique Vivant. Baron: artist and anthor: b. at Châlons-sur-Saône, Franee, Jan. 4. 17ti. Ile beeame ehargé d'affaires at Naples in 1882 and a member of the Royal Academy in 12si, after which le devoted himself to art. and gaiued distinction as an art critic. He accompanied Bonaparte to Egypt in 1998, and in 1802 he published an admirably illustrated work entitled Travels in Cpper and Lower Egypt. D. in Paris, Apr. 2t, 1885, learing an unfinished History of Art.

Density [Lat. den'situs, deriv. of densus, thick]: in physies, the quantily of matter which a body contains per unit of rolume. Density thus defined is called "absolnte density." The quantity of matter in anr borly is called its mass, and is measured ly the weight of the boty, to which it is always proportional. The density of bodies is therefore directly as their mass and inversely as their volume. It is customary to express density in terins of that of some substance selected as a standard. In the case of solids and liqnids water at 4 (.. is the nsual standard. Guses are comparel with air or with hylrogen. This is "relative density," a temo which is syonymons with specifie gravity.
F. I. Nichols.

## Density of the Earth: See Earth (Density).

Hental Formmla : a talmar mofe of indicating the kinds and number of teeth possessed by a mammal. The letters i., c., pm.. and m., respectively mean incisor, comine, premolur, ami molur, while figures afixed to these letters denote the mumber of each kind of tooth. These figures plaeed above or helow a horizontal line indieate that the teeth referreal to oecur in the upper or lower jaw. The dentition of both sides is often given, but, as the number of teeth on each side is normally the stme, it is common to give the formnla for one side mily. When it is necessary to specify the first, or milk dentitim, the letter $d$.. deciduous, or M., milk, is prefixed to the formula. The milk or deciduous molars correspond to the premolars of the alult animal.

The dental formula of an adult man is as follows : $i$. $\frac{2-2}{2-2}$
 The formula for a chith is M. i. ${\underset{\sim}{2}}_{2}^{2}-2$, M. c. $\frac{1-1}{1-1}$, M.m.

## $3-2$ $0-2$ The terms cutting-teeth and cheek-teeth are used.

especially by English writers, to anonote respectively the incisors anil canine collectively and the premolars and molars. See also Teetu.
F. A. Incas.

Denta'limm [Mod. Jat, deriv, of aphs, tooth, in allusion to the shape of the shell]: a genus of marine Mollused which presents so many puints of differenee from all other mol-
lusks that it forms a group-class Scaphopoda-by itself. The shell, shaped like anl elephant's tusk, is open at both ents, and from the larger opening the burrowing foot and the fringe-like gills can be protruded. The body is perfectly bilaterally symmetrical, the nerrous srstem is untwisted, the sexes distinct. With the month is connected a lingual riblon. (See Mullusca.) There is no heart and there are no distinet blood-vessels. The embryos are remarkable for the development of five ciliated rings about the body behind the ring which is characteristic of all molhuscan larra. About fifty species of Dentutium (and the allied genera Siphono-drutalium. Entalium) are known, all living in the sand in depths of 10 to 100 fathons in the seas of all parts of the world.

## J. S. Kingeley

Denta'tus, Maxies Curics: a Roman plebeian consul noted for his martial exploits, frugality, and integrity : said to have been born with teeth: hence the surmame. He defeated the Samnites in 290 в. с., anl gamed a decisive victory over Pyrrbns near Benerentum in 275 . He was consul for the third time in 2it. and censor in 2izb. c. During his censor:hip he constrncted an aqueduct which eonreyed water from the Anio to Rome. 1). in 265 в. с.
Den'tex [New Lat.. from Lat. dentix, name of a fish, now ealled in Ital. dentale; from Lat. dens, dentis, tooth]: a genus of marine fishes belonging to the sub-family Denticime (of which it is the type) and famile Sparidue. but resembling perch in shape. Ther have scaly

Dentalium elephantinum. cheeks, eurved canine teeth in each jaw, a single dorsal, and a forked tail. They are found in the Mlediterranean and Red seas, off the coast of south Africa, East Indies, China, and Japan. Some species attain a weight of 30 lb . and are valuable for food.
F. A. L.

Dentifrice [from Lat. dentifri"cium, tooth-powder: dens, tooth + frica're, rub]: a powder or wash of various kinds used for cleaning the teeth. Among the substances emplosed are charcoat, chalk, common salt, myrrh, catechn, cinchona. phosphate of soda. and cream of tartar.

Den'tils [mod. derir. of Lat. dens, tooth]: in architecture, square blocks or projections in the bed-moldings of the cornices of the Corinthian, Ionic, and composite orders. The term is also applied to mrnaments in cornices of rooms which are founded on the same style of decoration.
Dentin, or Dentine: See Teeth.
Dentiros'tres [from Lat. dens, dentis, tooth + rostrum, beak]: a term applied he Cuvier to a group of passerine birls whose members have the upper mandible notehed on each side near the tip. It included the greater number of inseetirorous birds. thrushes, warllers. Old World flycatchers, shrikes. etc., and was contrasted with Conirostres, Fissirostres, imd Texlirostres ( $q q$. i.). The term wa nsed in the same way by G. J. Gray in his Ifond List, and in a much restricted sinse hy more recent ornithologists. As groups thus chatacterizel have proved to be more of less unnatural, the use of the word has been practieally abandonet.

F゙, A. Licas.
Dentistry [deriv. of dentisf : Fr. dentiste : Ital. dentista. deris. of Lat. dens, tometh]: that lranch of the healing art which has tor its prowince the treatment of diseases and lesions of the human teeth and their replacement by subtitution when lost.

While civilized nations consider their teeth most beantiful in their natural form ant onlor, some nations mutilate their teeth by chipping. filing and altering their form in some cases also staming them to conform to their peentiar
 tribes of Ariea, Xew Gninea, Java, and the Tasmanian enast of Anstralia, and is pronpted by fashion, superstition, or conformity with religions rites. With the Malays filing the teeth is a religions act performed at puberty, while in Indo-China and Japun girls have their teeth stained lhack at the time of marriage. Filing the front teeth to puints is practiced by Abysinians to increase the savageness of their appet and terrify their fors.

Early Mistory.-Himdotus, the Greek historian (Fist. ii.,
84). Whls of the attemtion given to diseases of the teeth as well as of the eye and ear in birypt, and liekzoni and other writers daim to have fomm in Giryptinn fombs artificial teeth malle from ivory and wand, some of which were mount
 to have been fonmd filted with wohl and it white rement, but of this there is nos positive evilence. In kst 1rr. Vant
 ltaly, skulls exhumed from Etrusiman tombs in which phre golit wire was womm aromod natural topth amt the spaces Getwem them whare ter h wore lacking. in surl a waty as to indieate plainly that artilicelal or gossibly human toeth hat at some time been thas supported in plairo.
$A=$ the litrusums procented the Romans in oceupying the lanel now known as laty, the antiguity of this form of reparative dent istry is well establishof. As to the extent to whieh the rreeks or Figytians practiond Anotistry as a specialty lefore the Chrisian era, there is no delinite information. The only writings of ancient times extant where dentistry is spoken of ats an art are thoso of Gallen, who wrote in the seconnl contury after Cbrist. Fram Gatem matil Ambrose Paré puhlishod his celehtated work on surgery in 15jo. Hnt little was added to dental literature Duriner the sisteronth century polably less than a dozan dissertations on the peeth werr puhbishorl. In the seventeenth cantury shont 50 and int the aightenth some 150 esats and volumes upon the subjeet appeared, the result of thas laburs of suth men as Hunter, Jourdain, Licthze, Jlake, tto.

Later Mislory.- Buring the eiont eenth century dentistry became a subject of more critical impury and thomorh investigation. Men of intelligener amb edteation devoted themsehos to it exclusively and as a result its advamement in both laterary and scoutitio Aliecetions moring the nineteenth century has heen most marked. This is shown by the fact that from 1800 to $18 s^{2}$ there were publisined in birrupeamd Ameriea some 300 volumes trating exclusively of the care and diseases of the teeth, bestites numerons monographs upan the stme subject. Anoner tha' list of Eurapean anthors ajpar the weh-known names of Bell, Batum. Inolabarre, Luthrome. Fox, Maury, Le Maire, Owen, Namyth, Tomes, Wedl, Magitot, amd Cobles, while in the [. . . the mono prominent anthors are Gardette, Koecker, Fiteh, spormer.
 Fhager. Liteh, Black, uml Miller.

Until the lattro phat of the eighteenth century any advance in dentistry was confinm tu linmone but since then its most rapill strides have hem laken in the U. 心.

Denlistry in the $l$. S. uml Énrope.-Thue first dentist in the C . S, of whon thero is any aceomet was one Te Maire. whas acemmpund the frent army whith aided the rever lutionists of $1705-8 ;$.  dental jeriodical in the 1 . s. was gmblished at Baltimbire in

In burope the mamber of both perindieals amd suriotios is markmolly lese than in the ". S. 'To provent eharlatanism, ar well as to emourage a high stambave of athamment amoner those secking to rnter upon thental pratior. most conntries have emacted dental hws. whish require in general that the enmbinate for practice shatl ho a grambate of a reputable dental sehool a pass a satisfactore examination
before a legally eonstituted bomal. Some countries am] cortain of the l"nited siates repuira hoth a diphomatamban -xamination lefore permission to practice is granterl.
 performod all dental operation- and mataipulations. Many
 of diserse of the solt of bomy lissues of the momth, bestace
 rection of imwnhaty of position of the terth are usually referred to sperialise in these departuwnts. The making of sots of artiliofal teeth, ats well as what is denomimatoit rown amb bridge work, is attonded to hy practitioners Who limit themables to me or the other of thase hrandhes. The carving and baking of porcehain teeth, whieh was enree dome ly the gromer pratitioner, was more than didty yars ngo thrned over to mathufacturers.

Opratire bontistry.-The operation requiring the least skill is that of seating or chansing the teeth. "lhis consints in the muthundal removal of salivary calenlus or turtar, Which in mearly all mon he neemmalates ahout the teredh mont the grm margin. $1 t$ is almost entirely composed ol minerat ingredients. phophate and corbomate of lime hoing the chief, and unloss remosed in time is apt eventually to catase the teeth to become loose and fall out. Its rapid becumulation, even in themonths af the young, is one reason why it is well to have the tecth exmmima at Jast once a year. The use of a hrush of medimm hardness and tooth-powiler of very fine grit will do much to check the necummation of the acerotion. Thedentist removes fartar with instrments called scalers, and then completes the process of cleansing with wooblon prints chargenl with fine juwder. Whatever the comblition of the terth may lee, they should be brished at least twiee daily, and a gidil! tootlyinek or thoss silk should bo nsed after eath meal. for decomposing articles of food ghorate an acill which directly attacks and dissolves the toutle substance.

Filling.-When teeth have once breome affected by deeay, it is necosismy to clleck its inmonds and repaile the injury dome. This is aceomplished ly the uperation known as filling. The first step after enining proper arops ta the cavity is to remore all the deaym matier, shate the eavity so that it will mechanieally retain the filling. and dress the marsins in the line of strongth. After this the corvity is usmally swathm with sume medieament laving antise ptico
 the essantial oils. After carefind drymothe cavity is ready for a tilling. The mmber of materials for filling is very great, nome of them possessing all of the bers quatities. of the metals. goll! is protermed, bemase of its parity: admpt ability, and resisamee to both the fore of mas icention amb He action al the llaids of the month. 'Jin foil probally cenmes next to gohl, is worked in a similar manner, reguires smmewhat has tine for its intromuction, is atmost as durable, and is much less expensive.
dmulyom. which consists of malloy of two or more motnls (prineipally silver aml tin) mixal into at paty mass hy the atid of mereury is very largely used for the filling of terth. It is ensily jurnared and puitkly introluced, but the mblecular changes ocenring in the mass hluring solielifieation make it a foss perfeet stoplyng than any of the previously mamed motals, while its discoleration canses it to herome puite masightly. Nevortheless it clarabihty is often remarkable.
foutte-percha is the only requble proxhct in use for filling terth, and to ath to its resisting power it is mixed (after being refined and blenched) with a small propertion of inurganic mather. usually pulverized feldspar or oxile of zince It is introrlacel with heated instrments, and prosersors ransombhle dmability. lts inertmess, moneronluctivity, and color esperially recommend it in certain cotspos.
"l'hera" are only two combinations ul metallie oxides in (romman tis' : oriychloride of zime atul oxyphosphate of zine. The formare consists of zine oxide comblined wath dilute zine charible: the latter of zine oxide with delioquseet phosplorice neils.
'The eombination in wath cass is made just hefore in-
 phosphate, is very rapid.

The color of theme tillings is hamonions with that of the tooth, but ench is irritating to the vascular tis-lle of the tonth, and their durability is so slight that they "an be regatded only as tempurary tillinge

In the introduction of sur of the filling materials montimet, cxerpt gold amd tha, the eavity can usially be pro-
tected from the fluids of the month and kept dry sufficiently long for the introduction of the filling by the aid of smat month-napkins, but when ejther of the twis first-mamet met als is employed a longer time is required for insertion, and a cotfer-dam of rubber is used. This is simply a piece of sheet-rubber with a small bole punched through it. which when stretched and sliped over the tooth. grips it with such tenacity that all moisture is exeluded. It was invented by Dr. S. ©. Bammm, of Jew York, in 1864, and is probably the most useful dental apmortenance ever devised.
fold as prepared for ilental ase is primarily either in the form of foil or of a loose erystalline mass thrown down from a solution. Foil in being further prepared for use is folded into wide or narrow ribhons, twisted into ropes, os rolled into cylimers of various sizes and density. In whaterer fom it mat be employed, it is always introluced in small portions at a time and thoronghly condenser, so that the filling when compheted shall be as idense and homogencons as posible in order to exchme all moisture amd extraneons matter, and withstand the force of mastication. When introlucest, it is most important that the extermal surface be dressed to conform to the original outline of the tooth and be made absolutely smooth.

The instruments employed in removing the decay ant prepring the casity are nisually steel ham instruments of Farions forms, and technically known as chisels and exeavators. Since ahout 1870, however, hand instraments for these operations have been lavgely superseled by burs and drills, whelh, heing olerated through the medimen of a dental engine. do their work more satisfactorily and rapidly than formerly. The engine in its simplest form is a minature lathe-heal connected with a movable or tlexible shaft terminating in a mandrel which carties the various lurs. The lathe-head is monnted num at delicate but rigid poright stannard with base, the pwer being communicated to it by means of a cord or belt connected with the driving-wheed, which in turn may be operated by the foot a water-motor or an electric-motor. In some coses the head and shaft are monnted upon a swinging bracket, thas doing away with the stamulard and base.
The condensation of the gold during introdnction. which was at one time done entirely ly haml-pressure is now accomplished by the impacting power of a mallet in some form. The hand mallet, mate of wool or metal : the automatic mallet, merated by a spiral spring alternately compressed and released; the mechani"al matlet, operated by the engine: or the electrie mallet. operated by the electric current-all are in use.
The operation of preparing the cavity has been mensurably relieved of its most objectimable features by the present methots of desiecating the cavity with wam air, the use of medical pain-obtundents, and the employment of rapidy rewolving inm ken-etged burs

Another method of lilling is known as poredain filling, and possesses some alvantages over the alder methods. It consists in shaping at piece of porcelain to the form of the prepared cavity, and cementing it into place with thinly mixerl phosilhate of zinc. There are three ways of preparing and shaping the porcelain stopper: 1, by grinding a section from a porcelain tonth of proper shavle: ?. by burnishing into the prepared casity a piece of platinum foil, removing it, and filling the miold thus formed with pulverized sites of "tooth-boty," and haking it in a mufllefurnace; ;3, ty burnishing pure gold or gold and platimum foil into the casity, as in the previous case, filling the moted with pulverized ghas of suitable eolor, and fusing it in the lame of an aleohol lamp. In both of these latter methods the golli or platimm foil is strippel from the mass before it is cementel imto place: The third methot produces a filling which is simply fused crass, hat for convenience is inchuled under the head of purcelaintilling. Fillings of this chamolur have the almatage of heing fomed out of the month, and are lighly esteemed berause by the julicious almixture of carthy cothing-mather they chin be made to approximate the color of the natural tow in more clasely than uny other; but as the cement whide retains them in place is so readity andorl upen atol dssotved by the fluits of the month. their ilurability is mot angeat as might he desired.

Probably the most common complication met with in connation with the preparation of cavities is the expmare of that delieate and highly vascular organ of semsution and nutrition, ocenpying the central partion of the tooth, known as the dental pilp. In the earlier days of dentistry such exposure was lex.mal suthejent cause for the extraction of
the tooth, but later it was found that it might be rlevitalized by the application of certain metlicanents (usually arsemions acid), removel, and its place filled with some inert amd insoluble substance, thereby greatly prolonging the usifulness of the tooth. Such contimes to be considereel gooul practice, hat an advance has been mate in that simple expmsure of the pulp aloes not necessarily call for its revitalization. The more conservative methol now prevals of capping or covering the exposed portion with some nom-irritant substence, and filling over this in the usnal way.
When, as a result of long continuced decay or other canse, the pulp lases its vitality and is not removed, putrefaction sets in, and an abseess at the end of the root is the result. Relief is nsmally gained by perforation to allow the gases resulting from putrefaction to escape, after which it is necessany to remove the dead pulp tissme. and injeet into the canal forme oly ocempied by it such merlicaments as will sterilize and lentroy the microbie agents that were active in the prontuction of the abscess. For this pmone various drugs are emphowel, such as creosote carholic acid, iodoform, elugenol, nil of eassia, cte: Bufore introdneing any of these agents it is necessary to rid the abseess sac af its purulent contents. After each treatment some of the medicament used is allowed to reman in the canal which is hermetically sealecl it its onter opening. When a cure has been eflected. the entire canal is permaneutly filled, as in the case When remoral of the pulp followed immediately uron its devitalization

Amesthetics.-It is sild that at least one-third of the teeth extracted in civilized emantries are rmoved moter the influence of anasthetics. Ether and chlorofom, alone or combined, were in common use at ane time for the purpose, but nitrons oxide has largely supplanted them, its use being comparatively free from dangre and its effects evanescent. In cases where it is desimble slighty to prolong the anasthetic effert, combinations of the valpo of ether with gas are often used, and with sutisfuctory results. The reluctance felt by many persons to being placed in an unconscious condition gave rise to the employment of agents that would exereise a benumbing effect only opon the parts to be operated upon. Among these were the galvanic current and the spmat of such volatile lifuids as sulphurie ether and rhigolene, int all have been suberseded by muriate of cenine. This is employed in the form of a 4 -to-10-per-cent. adpems solution, and is hypolemically injected mato the solf tissues summonding the tooth. In some cases other drugs, suth as eathmie acil, chloral hydrate, menthol, etc.. are introdnced into the solution, but jrobably the cocaine is alme responsible for the efleet probuced.

Oral Surgery.-The treatment of all lesions, diseases, and ahnormal growths necurring in the soff aml hart tissues of the month, aside from the tecth themselves, as well as all surgical operations called for in the sime region, fall within the province of oral surgery. One novel operation in this department was advoented and performed hy Dr. Younger, of San Franciseo, in fssi. It is the implantation of a hman tonth in an artificially formel socket of the jaw. The operation may be briefly described as follows: A tonth that has been extracted (no matter low long before) is prepared by thoronghly reaming ont the contents of the root canal from the root emb, and filling it with softened gutta-percha, capred with a minute place of gold foil. The tooth thas prepared is placed for a time in a sterilizing solution of mercmic bichloride, kept at a temperature of about $110^{\circ} \mathrm{F}$. The cavity into which this tooth is to be implanted is formed ly making an incision in the soft tissues overlying the jaw-bone at the point desired, drilling into the bony tissue benenth with a spear-shapel drill to a depth corresponting to tha length of the root of the footh to he implanted, remming this to a proper size, and then, after irrigating the cavity with a sterilizing liguid. placing the fonth in pusition and ligating it to any adjoining teeth. Alter the lape of a weck or ten days the ligatures are removed, and the tooth is fomed to have lrecome firmly fised in its soket. The footh must be souml, must have upon the surlice of its root al covering of healthy peri-cemental membrane such as existed there at the time of its extraction, and most convespond in size and color with the aljoining teeth. A new bony material forms in the socket surronnding the tooth, bohing it fimly in position for amber of years. The percentage of operntions of this chameter that have been successful is large.

Regulating the Treth.-'The teeth of the seeond or permanent set are liable to be misplacel vither thring ermption
ur afterwaml，often erowding or worlitpling ench wher． The time at whish correetion can be most realily and fer－ fectly aceomplisherl is luetwern the twalth and twontocth vers，while the hamy bocess which holds them in position is still plishle．＇The ajpliances used ist the preration are

## Dentilion: See Teeth.

Denlou: city and railway junction; capital of Denton co.. Tex. (tor location of comitr, see map of Texas, ref. ?-II): has numerous churches, a piblic school, normal eollege. flouring-mills, two nurseries, cotton and oil mills, waterTorks, electric lights, and several thowing artesian wells. Pop. (1880) 1.194; (1890) 2,558; (1893) estimated. 3.500.

## Editor of " Cbroaicle."

I'Entreeasteanx, dănitrkaăs tō', Archipelago: a part of the british colony of New Guinea: lying N, of the sontheastern extremity of New Guinea and X. W. of the Louisiade islands. The largest island is Fergusson, the next Normanby and Goodenongh islands. Area, 1.214 sy.miles. Pop. estimated at 12,400.
Denudation [from Lat. denudare, lay bare. deriv, of midus, bare nakel]: in geology, as defined by Lyell. "the removal of solid matter by water in motion, whether of rivers or of the waves and currents of the sea. and the consecquent laying bare of some inferior rock. This preration has exerted in influence on the structure of the earth's crust as universal and important as sedmentary deposition itself: for denudation is the necessary antecedent of the production of all new strata of mechanical origin. The formation of every new deposit by the transport of sediment and petbles necessarily implies that there has been somewhere else a grinding down of roek into rounded frag-: ments, sand, or mad equal in quantits to the new strata." Demulation may be divided into subuërial, which is effected by the action of wind, rain, and rivers, and submarine. which is cansed by tides and currents of the sea. In many instances deep and wide channels or vallers have been excarated in rocky strata by the long-continued action of rivers; and these are called valleys of demudtion. Is the strata exposed on the sides of these valleys correspond to each other, both in composition and order of position. it is evilent that they were originally contimmos. .. The larger part of the vallers of the world," says Dana, "are furmed entirely by ruming water."
Denver : city and important railway center: capital of Colorado and of Arapahe County (for location of countr, see map of Colorato. ref. $2-\mathrm{F}$ ): heantifully situater on South Plate river, 15 miles F. of the base of the Rocky
 magnificent riew of mountain-scenery, including l'ike's, Long's, and other noted peaks pernetnally conered with snow. The climate is peculiarly serene and healthful, and the city is a noted resnt for invalids suffering from pulmonary diseases. The streets are wite and shady, and the residences and public buildings. bnilt largely of lyiek and yellow stone, are stately, handsome, and attractive. Denver is appropriately called "The Queen (city of the Plains."

Public Instifutions, efc. - The citr has over sist 5 clumelues, among them st. Johns (athedral (Protestant Episcopal). noted for its stained glass window representing the Crucifixion. The public schools are excellent, and the city is also

State capitot. Denver. Col.
the seat of Denver ['niversity, Winfe Hall (a ladies mominary), and several private schook. The state eaphol is 34*
feet long and 313 feet wide. It stands on Capitol Hill, where is nhtainel the best view of the city. Other prominent buildings are the city-hall, the county court-house, and especially the U. S. court-house and post-office. Denver has cable and electric street railways, and is lighted by gas and electricity. It has two excellent systems of waterworks, water for drinking purposes being obtained largely from artesian wells. Seven railwars center here, and the Union depot, one of the largest and handsomest buildings in the city, was destroyed by fire, Mar. 18, 1894.

Manufactures and Commerce.-Denver is an important center for mining, agriculture, and stock-raising, the leading indnstries of the state. it has a branch U. S. mint. many important manufactories, and great possibilities as a manufacturing city. Three smelting-works, one of them the largest establishment of its kind in the world, in 1890 prodnced gold, silver, lead, and copper bullion to the value of Eq, 880000 . Semi-official statistics for the year 1891 showed 85 F manufacturing establishments: capital, \$11.790.335 : average number of persons employed. 12,690 ; wages paid, $\$ 8,300.715$ : value of products, $\$ 50,931,890$.

Populution.-Denver was settled as a mining-camp in 1858-59. Its growth has been remarkably ranid and steady. Pop. (1870) 4,759; (1850) 35,62: ; (1890) 106., 13. including suburbs. 126.000. Editor of "Republican."
Denver. Gen. Jayes W. : soldier and frontiersman: b. in Winchester. Va, 1817 ; moved to Uhio with his father in 18:30; studied law: moved to Missonri ; raised a company and served in the Mexican war; went to California in 1850 , where he became prominent in politics and was elected Secretary of State, and afterward elected to the Thirty-fonrth Congress as a Demorrat. Before the end of his eongressional term he was appointed commissioner of Indian affairs. but left the oflice to accept the office of Governor of Kansas. The Territory was in an almost lawless condition. IIc returned to Washington after twelse months of service, leaving it well organized and law abiding. He retnrned to California in 1859, but soon after removed to Wilmington, O.: serred in the Union army during the ciril war until 1863. Gen. Denver suggested the name Colorado for the Territory formed out of Kansas and the city of Denver was named in his honor. 1. Aug. 9, 1892.

Ineodand [from Lat. Deo dandus, to be given to God; dpo. dative of deus, Gol + dundus, fnt. pass. pte, of dare. give]: in Fnglish law, any personal chattel, animal, or thing mhich had caused the death of a human being, and for that reason was applied to pious uses, or, as the term implies, given to God. It was, in fact. forfeited to the king, and distributed in alms by his high almoner. The origin of this singular law is rery obscure and the juridical development which in course of time it underwent affords no light. A distinction was made between an animal or a thing in motion and one at rest. If a sailor fell overboard and was drowned while the ressel was in motion. both the hmll and the cargo were forfeited; if the vessel was at anchor. only the hull, not the cargo, was deodand. If a man was thrown from a cart and killed while the cart was in motion, the cart and the load were forfeited : if he fell while climbing the wheel, only the wheel, and not the cart, was deodand. But these and other distinctions of similar description seem to be wholly arbitrary. Two hypotheses have been proffered. The Mosaic law demands that "if an ox gore a man that he die. the or shall be stoned and his flesh shall not be eaten ": and the Athenian law demanded that "whatever was the canse of a man's death be falling upon him should be exterminated or cast out of the dominions of the republic. therelyy ascrihing a moral effect on the animal or thing to the fact of its having caused the death of a human being. The law was abolished by statute 9 and 10 Victoria, c. 62.

Deodar: See Cedar.
Deo'datus or Deus dedit. Sant: pope: succeeded Boniface 15 . in 615: died Fov. 9. 618. and was succeeded by Boniface V. He is regarded as a worker of miracles. His duy is Nov. 8.
Dealorizers: Sue Disinfection.
Doxidation [deriv, of denxidute; de-, privative + oxiIhto, a derir. of oxygen]: the chemical process by which oxyen is abstracted from a compomul. This term when apphiol to metals is synonymons with reduction. A comprumbl of a metal with oxygen mas in many celses be reduced or deoxidized by heating it with carbon or in a stream of hyidrogen gis.

Department [Fr. dipurtement. deriv. of dipurtir: Ital.
 fitcrally, a division; a mrtion : a liwtinet prowince: a territurial division: a prinipal division of execotive government. In the U . s. each of the members of the cathinet is the head of a department. These are called the Departments of Agriculture. Interior, Jnitice, Siay, lostontlice. State. Treasury, and 1 Far . A department is not defined by the Constitution. but is recognized and mentional saveral times in that instrument. It is a division of govermanent hasines over which the head. by law, exreriw's exelnsive emtrol, subject only to the supervision and direction of the President. The Attorney-General is the heal of the Department of Justice, establisherl in 18:0. Portions of the duties of several departments are alloted to bureans, hat there are no separate harmas in the beparment of state or that of the l'ost-otliere. The termdepartment is ako applied to the three principal branches or co-crelimate powis ol the republic. "Lnder the Feeleral Constitution," says Millat. "the national fonermment is compensed of three distinct and independent departments-1 he legislatice. the judicial, and threxemtice." 'The whole territory of the L.ふ. is divided into military departments, cath under a sencral oflicer.
Departmest in gengraphy a primary divisin of France. In 17:90 the ohd divisions called provinces were abolished, and the country was divided into eighty-three flepartments: most of which were dexignated by the momes of Frenel rivers or momtains. The old boundary-lines letween the provinees, with their toll-gatos, custom-honses, military posts, ete... Were effaced. and very often districts from two or three different provinces were united to form one dipartment : the object was centralization. During the firs empire the number inereased to 130, including helginn, furtions of ltaly, etc. It the besinning of the German war in 1870 the number of departments was eighty-nine. In 18.1 Franee ceded to the cerman empire the whole of BasRhin, a large part of Maut-khin, nearly all of Moselle, it small part of the department of Vosges, aurl a part of Nenrthe. Each department is divided into arrondisements, and is sovernel by a prefeet. The prindipal divisions of Bolivia, Pern, und some other South Ameriean re pulbics are also called departments.

## Departure, in navigation: See Namgation.

1) le laur Cuiversity: an institution of learning situaten in Gremeastle. Putham en., lut. It was fonnded by the Indiana Conference of the Methowise Episcopal Church and ehartered in 18:3\%. The tirst class grabluated in 1840. The campmes of the university comprise $1: 00$ acres. There are eight buithines used for eflucational purposes. Until 1 est the institution comsi-fel of a colleqe and a preparatory sehool, and was ealled the heliana Asmery lonversity Hon. W. C. De Patw, of New Abany, provited br his will for an endowment of abont $\$ 1.000$ oino, besides giviner luring his lifetime large suns for the better equipment of the university: In recornition of these mmifiernt sifts the corporation in $188 . t$ changed the name of the institution to Wh lamw ["niversity. It the time of this change the institation became a university in fact. I'rotessontal schouls of theology and law and special schoots of music, art, mod perlagogics wern establishet. and graduate connses were adted in the collerge of hibral arts. In 1s:0 the sehool of ferlagorics was discontimed, and at the same time the miversity adopual new courses of stuly in harmony with the lust tentencies of the age. A very liberal mate of electives is permittod. All matidates for an ateadenic tlearee must parsue a major cqual to one-forth of their entire conrse, and a minere equat to meocighth of the same. The major and the minor mos be in unlike sulgects. A limiterd numbur of couners is requirecl in mathomatica. history, linglish. a foreign langume and a haboratory scomee. Tha remainter of the course is male up of free" detetives, The ertimary elass distinctions ifo not exist. Mondern methotio of instruction are employed thronghont all the deparments. As the - whent advanetes in his emorse the indivilual rather than the distinetively clase methend is approximated. The libut
 modern plans, and seminaria are establishore in many of the
 examination on work done in residence. The fotal mmber of gradnates exceds 1,900 . The present facoly mumbers sixty professons and instructors, and the manter if stmentes execeds 1,000 . The president is Joha $1^{\prime}$. 1). Ahth, elected ins 188!
J. I'. I) donis.

De l'ere, de-per : city, on railway; lbown co.. Wis (for location of county, see map of W゙isconsin, ref. o-F) ; situated on the right lank of fons river, and cenneeted with West lo Pere, on the opposite bank, by a bidqe 1,500 feet in length. It is supplict with water-pmwer, and hats smelt-ing-furnaces, fron-works, amb mandactories of agricultaral implements, paper, tile, bricks. and wonlenware, ote. I line of stamms makes regular trips to ('hicago, and the Butabo line takes freight to Butfato and internediate ports.

 kill. X. Y.. Apr. os, 1834: graduated at liale conlege 1s.0; studied law : member of the New York Assembly Isfi-6i2: Secretarre of state of New Vork 1s(is-65: minister to Japan for a short periol ; candidate of the Liboral Republiem party For Lientenant-fowernor for Sew York 1872, but mot elected: whom regent of the State Unisersity 1 sit: appointed eapital commissioner 18:1: received the degree of LI. W. from Yale 1887: made the specelh nouninating Presidont Harrison in the lepulalican mational convention in Minmeapolis in June, 1s:30 thelivered the oratim at the dedicatory exercises of the Worlds Columbian Expenition at (lhicage Oet. 21. 1s: In $1 \times 66$ he became attorney for the Niw York and Harlem Railroad Company, and on its comsulidation with the New York Central, comsel for the united companics 1 sfy ; spond vice-president of the Now Fork Cental laihoal Company, 1803: president. 1sco ; alsor presillant of the West shore R. R. Mr. Denew has won cminent disinetion as a railway manager and as a pulitionl leader, and is one of the most popular orators and afterdimer sueakers in the U. S.
De leyntro. In póping, Georg Berxard: historian: b, at Münster, Prussia, May 11, list, lat removed in early life to Iaris, In 14:1\% he publishen in Leipzir it sammlangider besten alten spanischen hisfor. Ritter- omeurischen Romanzen. In 18:2 he publisherl in F'rencll L'Mistoire des expeditions maritimes des Vormands ef de leur द́fablissement en France au X. Siecle ; in 1s34, in Gumm, Die Juden im Mittelalter; in 1835 Mistoire de Cormundie (a contimation of the work of Liequet). He began a general history of Spain, but was obliged to give it up for political reasons. Of her works hy him have iess repute, though many of them are valuable. D. Sept. 5, 18.5:3.

Revised by A. li, 11arsil.
Depres, or Desprès, Jospus: musical composer: b. at Vermand, in French Flanders, ibhont 1410. He was at pupil of Ockeghem, or Ockenhrim, a noterl Flemish musician: at the age of twenty-five went to lione, on invitation of $l^{\text {boppe }}$ sixtus 15 ., to instract the masicians of Italy, and remained there matil the death of his benefactor (148.4), when he repaired to the eourt ol Hercules I.. Dnke of Este. After a time he become chief singer of the royal chapel of Lonis XII. of Frabee, but the closing years of bis life were suent at Conde. in Frencl Flanders, in the capacity of a cimen of the catherlay. He was a prolific writer of sacred mut sid. and was justly consildered by his contemporaries to be the greatest composer of his thine. D. at Conke, Aug, 27 , 1.21.

Deprez, dā-prá Maral: French engineer, electrician h. at Aillant-sur-Milleron. Loiret. Inec. 2i, 1813; studied at the Lycée st-- Louns; failed in his examinations at the Polyterehic school, and was not almiterd to the Sichool of Mines. Il is mechmical ind electrical invontions rendered him conspicuons, many of thrm being of great value, anel those mate for the lourem of Naval ordnance of France cansed him to be twice numinated as a chevalier of the Legion of
 patch was real from the rommittee on electricity of the Exposition of Manich amomating the complete sticerss of the attempt of Marcel Deprez fo transmit pwer ly means of an urdinary telegraph wire from Munich to Dliesbach, at ilistance of :30. miles. This was the first yanctical exanupho of the clect rical transmissinn of power to a distance, an application as now berfected of the utmosi value to the imlusiti:il wortil. In ises, a symbicate, healed lyy M. Rothischild and the mreat
 money for marlo more extensive experiments, which were mate on the line of the Now her hat way of France, the wesults of whiels were propted in $188 . ⿱$ to the lembery as a large adwate upm previous reperiments. The theory and person of Depre\% hayo heen the uhjeet of hither wititism as well as of the hionest praise. In iski he was mato chavalier of the lexion of lhomor, in 1sx: wfieer of the same, and in 1846 he was electel member of the Aradeng in the
place of Tresea. Since $i s, 00$ he has been proleseor of Elece-
tricity at the Conservatoire iles Artset Métiers, and of Physics at the College of France.
W. li, Hutton.

Deptford: town of Englind; on the Thames; 4 miles below London bridge, and separated from Grecnwich by the Ravenslourne, which here enters the Thames (see maj of Englinel, ref, 12-J). It is partly in Kent and partly in Surcy. The famous dockyand establishea by Henry Vill. in which Peter the Great workell as a ship-buidider, was elosed in 1869. Part of its site is ocenpied by a foreign eattle-market. The victualing-vard, from which the nary is supplied with provisions, is the largest establishment of the kind in the kinglom. There are large marine engineering establishments and an extensive electric light plant. Pop about 80,000.
Deputy [O. Fr. depete: Ital. depulato< Mediav. Lat. deputcitus, partie. of deputa're. (class. Lat.) prune down, (Merl. Lat.) select, appoint as representative]: a person appointed to act for another as representative, lieutenant, viceroy, or agent; a delegate ; a legislator chosen to represent his constituents. One of the legislative bodies of France under the monarchy ( $181+48$ ) was callell the (Chanbre des Députés, which term is now applied to the lower honse of the French National Assembly. In ltaly the lower honse is ealled Camera de Deputati, Chamber of Jeputies. It consists of about 500 deputies, clected by the penple who pay taxes.
De Quineey, Thonas : anthor: h. in Nanehester. Enghand, Aug. ${ }^{5}, 1785$. He was it younger stm of a wealthy merchant, lle once ran away from sthool and went to lonclon, where he passed nearly two months in extreme want and strange alventures. He enterel the University of Oxford in $180 \%$, and there contracted a habit of using opiam. In 1808 he quitted the university, hecame a friend and associste of Coleridge, Sonthey, and Wondswnth. and began to reside at Grasmere in the like district. He married in 1816. dewoted his time chiefly to literature, made good translations from Lessing and Jean Panl Jichiter, and contributed articles on biograply philosophy, and other sulbjects to Blachuod's Hagazine. When in the prime of life he overcame the habit of the excessive ase of opiom, and in 1821 he published Confessions of an English Opium-enter. He remored to Scothme in 1843 , imd passed the later years of his life near Edinburgh. He was one of the most irilliant magazinc-writers of his time, and wrote on a great vadicty of subjects, but his works are mostly frigmentary. The first edition of his collected works was published in Boston ( 18 vols.. 18.31-58). 1) in Edinhurgh, 1)ec. 8, 1859. See Manson, De Quincey (1881).
Dera fhazi hhan. dera-gutherenann: a town of the Punjaub, British ludia: on the river lnhlus, and fis miles N. IV. of Bhalpur (see map, of N. Inlia. ref. $4-13$ ) : in a large hit thinly popalated district of the same name, lying leetween the Inclus and Suleman Mountains. It is advantageously situaterl for trade, and has manufactures of silk :anl cotion grobs and cutlery. Pop. 27,886 (one-half Mohammedim). Silk and woolens are mannfactured here.
Derah (Arab. derat): the mit measure of length in Egypt. The subdivisions are the kalam $=$ one-half of a derah, the abdat = one-sixth of a derah, and the kerat $=$ one-twent $y$-fourth of a derah. Several demas are in useviz. the common deral of Egypt $=20.37$ British inches; the derah Hemlazeh, by which dry grods are sold $=25 \cdot 5$ British inches; the derah latambouli (comstantinemmitan derali), used for European (hy gools $=66: 34$ British inches: and the an - ient derah of the Nile or of Memphis $=20-690$ British inches. The first three valnes alowe are given on the anthority of the Repont of the Iuternationnl (ouferpure on
 on that of Prof. Piazzi smyth. This measure has some interest in consequence of its comection with disconsions concerning the Great Pyramid of Egypt and the purpose of its construction.
Hera Ismail Khan, eremati-eel kimn: a town of the Punjabl, Britixh India; in a very large district of the same name; on the Judus; 1 r miles N゙, N. W. ot Bulkur (ser map of N. India, rel, $4-1$ ). It has an atetive transit trade wioh

Dermoskeleton [from Gr. $\delta \in ́ \rho \mu a$. skin $+\sigma \kappa \in \lambda \epsilon \tau \delta \nu$, skeleton. neut. of $\sigma \kappa \in \lambda \epsilon \tau$ ¢́s, dried up, withered ( (e. $\sigma \omega \bar{\mu} \alpha$, body): cf. $\sigma \kappa \in e^{\prime} \lambda \epsilon \epsilon$, to pareh]: the ermstaceons, testacmons, or osseous integunent which covers many invertchrate animals, as the beetle and lobster: also some vertehrate amimals, as the tortoise. It serves to protect the soft parts of the bodramd affurds puints of attachment for the organs of locomotion.

Der'ne, Der'na, or Bel'ed-al-Soor (anc. Darnis) : a sea-port-town of Northem - frica; in Barca: a mile from the Merliterranean: lat. $32^{\circ} 46^{\prime}$ N... lon. $20^{\circ} 41$ E. (sce map of Africa, ref. $\because-E$ ). Its hathor is insecure and its genoral prosperity is deereasing. During the hostilities between the U. S. and Tripoli this town was taken in 180.5 br the forees under Gen. Eaton. Pop' abusut 6.tvo.
De Rusuy. dp-rïnce', Léox: Japanese and Chinese scholar; b, Apr: 5. 1x:37: professor in the School of Living Oriental Languages at Paris. Ile has published a history of the rellow race, a Chinese grammar, a Japanese anthology, and many dissertations on the peoples and the civilization of the extreme Orient.
C. II. Tor.

Déronlède, dā'roolad'. Pavl: politieian; b. in Paris. Sept. 2. 1848; stulied law : it voluntrer in the campaign of 1800; was wounded at Sertan, but escaped into Belgium. IIis (Wensons d'un soldet ( $\mathbf{1 s i 2}$ ) and Joureaur. chansoms $d^{*} u n$ soldat (18\%) attracted much attention, especially on account of their intense anti-froman spirit, and ran throngh many editions. Il is CIIetmon, a drama in five acts and in rerex, also provel a succese (18:i). But within the nest few rears his reputation rested mainly on his political activity, While chief of the Patriotic Lague an organization that appealed directly to the patriotic devotion of all citizens, irrespectire of party. In $188 \pm$ when Boulanger beeame Minister of War, Deroulethe, who was his staunch supporter, songht by all the means in his jower to further a vigorous foreign polier and excite anti-German fecling. He was conspicnons in the presidential erisis of Dec., 1887, attacking the financial seamals of the Elrsée. The power of the learue under his able and zealous direction showed itself in the election of Jan. 27, 1889. which, after the repeated suecesses of Bouhanger in the departments, gare him an cnormons majority as deputr from Paris. After the condemnation of Boulanger. Deronlede continued to be his faithful and ardent defender, and in sept., 188:, was elected a Boulangist deputr. Besides the works above mentioned, he wrote De r'Elucation nationale (188?); Monsipur le IThan et les Trois couleurs (1884): Refrains militaires ( 1 ;8x) ; and Ilistoire d Amour (1800).

Revised by F. M. Colby.
Derfui. sastagn: $]$ whitician ; h. at Cordova, Argentine Republic, about 1810. In the political struggles which followed the revolution he adhered to the Cothtario party, the aim of which was to bring the Platine states under one government. In 18t? he was at the mattle of Cuaguazí and in $1 \times 46$ he was hanished by liwas. After the fall of Rosas he was a mumber of the constitutional congress of the provinces at sionta Fe ( 18033 ): subsequently minister umler I'rquiza, and finally president of the Argentine Confeteration (not inchuding Buenos Ayrus) after the retirement of Irquiza (1sf0). The struggh with Bunos Ayres continued. and the army of the confederation was finally beaten by Gen. Mitre it Paron, near linemos Ayres, sept. 17. 1861. The rusult was the formation of a new ennstitution, and Derqui metired to Corrimtes, where he died som after.

LIerbert II. Smith.
Derrick [sn mamed from berick, originally an abbreviation of Theodoric, or Derrick, a selderated hingman at Ty-
burn in the seventemth eentury ：a limal of erant or apm－ ratus for lifting and transurtiner to short distanors heary
 tall mast supported on a pian，on which it may revolre，the jin being jonmaled in a hole in a large stane sumk in the groumd，heh］steady by several guy－ropus an ponls．amd pro－ vided with a boom himerel near the bothom of the mast． which mate be raised on lowered by suitable rope－tackle，the bocks of whith are fastened resercolively mear the top of the mast and near the outer omb of the twom．I latelle also depends from the outerend of the boon，by which the load is carrient．＇I＇he tacklo－ropes are oproated liy suitable wheel geuring fastened near the botion of the mast．

Jorvishes［from Pers，deruessh，mendicant，begrare］：an brder or seel among the Mbhammerdans，resembling in some respects the monkish orders of the Roman C＇atholic（＇hureh and the membiount friars，und having in some particnlars a resemblane to the lireemasons of mediaral bintope．The name correxponds to the drabie fakio，by which term the omere，or at leat the incerior jurtion of it，is known in Intia and Arabia．The ofler is also deseribed by the terms sem－ fore and suft，which latter term sir John Xaleolm uses in his IIisfory of Persia．
＇I＇he dervishes constitute a larger part of the population in Western and Central 1 sia and in Northern and Eastern Ifriea．The orimin tif the order is involved in a goorl deal of obscurity．It is char that the leading jhilosophical and religious it lens on which the onder is hised had bem long and widely jrevalent before thare was any formal mrganiza－ tion．They endeavor to trace their origin to the adiph Ali， one of the immediate successors of Mohammet．Thare is no clear proof of the existence of the sect in definite form earlier than the（wa）fth eentury．
＇lhis order has both a religious and a philosophical basis． At the center of its philosophy is the itlea that the soul is an emanation from fod，and that man＇s highest aim is in seek a total absorption in the Deity．On their surface the tenets of the higher grates of the order appear to be of a pure and cxathed elaractor．TJey partake largoly of the myaticism prevalent among the llindus，and have striking analogies with those of the l＇ythagormas．
＇IJe dervishes are an uscetic order，and practiee rery ams－ tere rites and eeremonies．But the mombrrship daes not involve the giving lup of private property or entire seclusion from the wodd：and many uf them are enorned in trube． unt some are allowed to inary．The varions and，to us， trang ritus and ceremonies in vogue amons them are only different ways hy wheh they sore tor union with and abj－ sorption in fran．They elaim that in these exererises they mavi in time beroms endowed with miractalons jowers：and their hook－term with wonderful staries of feats of mind－ ronling an！mesmerism performed by them in the ecatatic comblitions into which they are bronght by these exereines． The fents that they berforin as a part of their religions sow－ ice－thrusting swords and knives into thoid thesle，mating glass，and swallowing tire－seem little loss than miraculoms． Their chief reliotous exureise is the performanere of thr ＂\％ike．＂which is a rejectition in many different wass of the name and attributes of（amp，acemmanied with viofent exar－ tion of ams and hem！amb of the whole borly，with intense mental strain．This is practiped often ami for along time， until the bolily powers are oxhansted，and of en a combition of extalepsy induced．＂The umrit of the exereise depmats njon its severity amil the length of its eontinname．
 witlely from the fath of Mohammord．＇J＇he Nosloms in sen－ eral think of religion as having lit le todu with personal char－ acter，it being with them mamly a means of csaping from perditun：the dervish，on the other lamel，values religion as an aid in raining deliverance from the dominion of sin．I＇here arc anong the dervishes many seots or classes having umote or less complymand peraliantions The chief distinetinu is betwen those who are definituly organized and settled in convents，where the observereseribed ritas and give them－ sebere to metitation and penather，and those whotare whot－ ganizel，but still engate mate or less in the ajpointed rites
 which ate incatuble of alienation，and are of herwise the re－ cipionts of barge gifts．

It is nue of the traditions of the hervishes that at the tirst there wro only two orlors smonm them，and lhat altorward twelve nolers irmos，one from bath of the twelve inams who sucereded the first caliphis．The le st－known and most dis－
tinctly marked of the whlers in Turkey are the Meverit or whirling dovishes，and the bedovi，wi howhing dolevishers．

 number may br faken us prowf that shey do not exist，ob That they are very impertectly organized．

There are many dervishes isho lave no connection with any regular organization and no tixed aboule．＇l＇hey ger from place to phare in searel of employment，or aro simply men－ dicants：and in their trade they display great skill and effrontery，often demanding aill in such it way that rofusal is imposible or at least fangerous，dond so they have come to be both respecterl amd feared．

In the early times the higher orders of the acreishes had chietly und deciblelly a religious chameter，but for a long period they have wielded a puwerfal social and political in－ thance，and at times they have ben a dandrons jower in the state．As they acknowleclee mo mothority but that of their spiritual guides，amb do not accept the interpmetation which the ordiuary tribunals put upon the Jetter of the Koran，the sultans lave always regarded them with jeal－ onsy，la 18.2 the sultan Jahmoud II．，secing what they were doing，and apprehenting more serions tronble，put to deatl some of the chiefs，and attempted to destroy the order．There followerl，however，a reaction，and the order in a short time regameil its influme．Sie dablaten，The Turkish E＇mpire（London，1s6：）；Maleolm，IIstory of Per－ via（london．1899）：Lane．The Morlern Eggytians（Jondon， 1836）：Brown．The Dervishes（Phidadelphin，186s）：11ughes， Dictionary of Istam（1undon， 1885 ）．Jons Ebmasids．

W. A. C.

Descartes, dá kart, Revé: philosopher and mathematician: 1. at La Haye. in Touraine, France, Mar. 31, 153! ; educated at the college of La Fleche, where he acquied great proficieney in mathematies and astronomr. and formel an intimate friemaship with Mersenne. He left eollege in 1612 , dissatiffied with the method and doetrines which were then in vogue. He resolved to elfiace from his mind all seholastic dogmas and the prejudices of his celuration. to reject the authority of books, and to admit umly that which was confirmed by rason and experiment. He entered the Dutch army in 1ti6, and that of the Duke of Bararia in 16 19 , but renounced the military profession in 1621 . In pursuit of knowledge he traveled for several years in Italy, France, aml nither countrics. He settled in Holland in 162: in onder to derote himself to the study of mathematios. astronomy metablissics de. He mate important diseortries in algebra anil gometry, which he announcel in his Disenurse on the Mpthol of Reetsoming W'll and of Investigoting. Srientitie Truth (Discoms, de la Alithode jume lien comduire lo Ruisom, at (.. 16:3). This work comprises treatises on metaphysies, dioptrics, and gewmetry. He was the first who infromed expments or applied the motation of indices to algehraie fowers, and he gave a new and ingenimas alution of equations of the fourth degree.

Ite publisheol in 164! Ieditationes de Prima Philosoplein. whith gave a wonderful impuke to philosophical inquiry. Ile fombleal the superstructure of all prestive knowledye on
 scioneneso and existenec. which he expresed in this phrase: Coyito. pryo sum-1 think. theretore I exim. We workerl a Heratur whage in metaphysionl thourht than any motern philwopler. Tha innovations amb parmbexes of the Cartesian philosoply excital much hostility among the thenlogians and the diveiples of Aristotle. Ils hook was erondemnet by the enllece of ardinals at lime. Among his other work is Primeiphes of Philosenphy (Principia Philosophier. 1611), in which he propenmels his thenry ot the worlet -that the sun is the cember of a rorter of an at hereal lhide whose whirling motion prexume the revolation of the plande and other phemmena. Flim. French court granted him a pension of 3 ,006 livers in liti. Having hate invital to her court by Chrintima, Queen of Sweten, he went tustuck-
holm in 1649. where he died. Feb. 11, 16:0. Complete editions of his works were published in 1690 and 1824. Sce The Methud. Gaillard, Éloge de Descurtes (1765); Millet, Descurtes, sa Vie, etc. (186\%).

Descartes's Rule of Signs : a theorem by means of which the maximmm number of positive or nerative roots of an equation can be ascertained be inspection. The theory reduces itself essentially to this : The number of positive roots of an equation can not exceed the number of variations in the signs of its coetticients, considered in their proper order. Is an illustration, take the cubie equation $F(x)=$ $3 x^{3}-7 x^{2}+11 x+4=0$. Inasmuch as there are but two rariations of signs on passing from one extreme term to the other, through the intermediate ones, we conclude that the culvic can not hare more than two positive roots. To aseertain the maximun number of negative roots, it is merely necessary to aplly the same theorem to the equation which is obtained from the original $\mathrm{l}_{\mathrm{y}}$ ehanging $x$ into $-x$. Thus the positive roots $\mathrm{F}(-x)=-3 x^{3}-7 r^{2}-11 x+4=$ 0 are negative roots of the oririnal cubie and hy Descartes": rule their number can not exceed one. This rule is a particular case of Fourier"s theorem.

Descent : in law, the succession to landed estate after the owner's duath. in cases where he has not made prerions disposition of the estate. The rule of descent among the aneient Greeks was that the sons shared alike, and the danghters were dependent upon the bountr of their brothers. Among the Hebrews the eldest son had a douhle portion. With the ancient Romans sons and daughters slared alike. The former English law was very eomplieated, but has of late received important modifications. The law of primogeniture prevails as to males, while sereral females of equal degrec claim as one heir.

The subject of descent is regulated by positive rules in the U. S., and but few of general application can be stated. The following may be referred to as either of eommon reeognition or having some peculiarity worthy of notice:

1. Title by deseent depends upori a rule of law. The person from whom the land descends is termed an ancestor; the one to whom it passes is ealled an heir, who has no volition in the matter. The estate is east upon him. at the death of the ancestor, eren against his consent.
$\therefore$ The persons to whom land descends are specifieally designatel by pesitive rule and may he gronied as follows: (1) Lincal dexcendants. These, if of equal degree, take equally undivided shares or are "tenants in eommon." If of unequal degree. those who are more remote take the share that wonld have belonged to their parent if living. Thus if the ancestor had left a son A, and ( 1 , W, E. children of a deceased son B. the grandehildren taken together would hare the share of B . Those who inherit on equal tems are said to take per capita: those who take the shares of deceased persons, as alowe illustrated. are said to fake per stirpes. (?) Where there are no descendants, the next claimants would regularly be the parents (the father heing frequently preferred to the mother) as ther are removed but one degree from the intestate, while the mearest collitcral relatives (hrothers and sisters), reckoning aceording to the methods of the civil law (see Cossacoustry), are two degrees. still, if the estate drectilem to the intestate from matemal relatives, there are cosent reasms for preferring the brothers and sisters to the father, and the same reasons for prefering then to the mother where the land came from paternal relatives. [ndur these circumstances the law of some of the states gives the land to the tather or mother for life moly, as the cas may be. mil the extate itsolf to the hrothers and sisturs. (3) If there be no father on mother or descembants, the land will descemb to the brothers and sisters efually, with the same distinctions as to taking per cuphite and per stirpes as notiect under subdivision (1). (t) The next clamants are fither grand arents, or, if these be passed wer, as may be the (ase uncles amd aunts and their thespmants. In the insance of unclos, we., the law of some of the States distinguishes luetwent the case where the intestate acquired the entate hy his own act and where he obtainel it by inheritance. In the former instaner the descont would take place to matormal and paternal uncles and aunts and their descembants, withent diserimination;
 the family from which the obtate was derivel wombl lave
 moticotl. (i) Distintions sometimes are recongizal bet wern
 that the latter arre expluded from inhoriting . In illustration is fonmal in the law ot Sow lork, marler which, for example, at bother of the half hemed an the matormal side (froter uterinus) (atn not inlaril land from abother having a difurent fathor, which latm surh brother hat inhorited from his father, as the elamant is sum in that cosme of the home of the immaliate anmenter from whom the wiste was

 physiongey they are mpalak of living. (i) The Engrlish common law will prevall mass almexated hy statnte. Thus in Sew Vork. whore the spocial "ases rofirrad to in the statute of descont a do not nerour, primureniture still is rectsuizerl.
2. Illegit inster relatives ean not in trembaid inherit, thongh in a mumberot the states they may muder certain puatifiogfinns, particnlarly from the bother and matomal relatives.
3. The haw of the Gate where the laml is situate governs desent, without reforenee to the law prevailing where the owner resides.
5 . In general. all interests in and riothts to land are sus゙erned by the rulas of descent. 'I'hus should the intestate hate ondy atight of atotion, or be the owner of a futare ess tate, or have simply a bencficial ownership, such ats ath estate held in trust. lix rieht- and gralifiod estates of this mature will be transmitted moder the same genemb rules as it lu were legal owner in posession. This proposition is in some resperts in mathmi cont mat with the thetrinas of the common law. This system requimed the ancestor to hawe bern at some time simed or to have an estate of which seizin could be diflimed. (see sitazis.) Aceordingly it he had acogniral only a right of ation, this comble not doscernd from him, wor could in general an estate of whith he had aceuired the ownorship, subject to a life estate in mother still, if he hat once been w+izend. the malawful cleprivation of his seizin would not prevent the operation of the daw of descent.
4. In a mamber of the tiates abiens can mot inherit. 'Thes is a rule of the English common law. In ot lert statco it has been atorugated.

j）esiceant［from Lat．desic cons．pres．pte．of desiccare． to dry anything ul＇；de，ofl＋siccus，dry］：in medicine，an application used to check the secretion of a membrane or ulcer．

1）osiceation：a process of extracting moisture by chem－ iobl agency or by the use of air and heat．Fused calcium chlorinp，quicklime，fusen potassium cartoonate，and sul－ phurie acid are used for this purpose．

## Desiderio（1）a Settignano）：See Settigano．

Desima：a rery small artificial island in the Bay of Nagasaki，Japan，shaped like a fan，whence the Japanese name．In the early history of European relations with Japan，the Dutch were the only people ahmitted，and they wre eonfined to this island and subjected to many indigni－ ties．

M．W． 11 ．
Desjardins，dāzhăardăn＇：a seulptor，whose real name
 1650 he went to Paris，and in $16 \pi 1$ presented to the dead－ einy a bas－relief representing Herenles crowned hy Glory， and two other works．These caused his election into the A（ewlimy．Ile exceuted the equestrian statae of liouis XIV． for the city of Lyons，his first and finest work of this size． lu the vestibule of the church of the Mazarin College he seulptured the Evangelistsamd the Fathers of the charch in six groups；these ware destroyed in the Revolution；he pro－ turad the marhle statue of Erening for the park of Ver－ suilles，and finished luefore＇s trlemis．1le war commis－ sioned to erect a statue to Louis XIV．on the place de la Fictoire in Paris，for which he was paid a million francs： this was also dest royed in 172．D．in 1694．IV．J．S．

Dusiardins，Abruosise：member of Canadian Parlia－ mont：b．at＇larebunme．l＇，（1．May G．1811，and educateal at Masson C＇nlluge．lle was almitted to the har in 1862； in lsGs forsook law fur journalism，and has edited $L_{\text {dother }}$ and Le Sompon Jonitp newspapers．IL was one of the orchazers of the：Cumalian papal zouaves sent to aid the Pele in 1sfos：one of the authors of the Irogramme（cutho－ lique $187 t$ ；and was createl a knight of the order of Pius

1．：in 1872. He entered the Parliament of Canada in 1874， and has been re－elected at every subsequent election up to and including that of 1891.

Nell Macdonald．
Desman［swed．desmeti－ratla，musk rat］：the common name for the two species of musk shrews．The Russian desman （Myogale moschata）is about 8 inches long，exclusive of the tail，which is as much more．The fur is soft，brown，and glossy，the hind feet long and weblued，the tail naked and vertically flattened．In tiact．but for its long，slender nose， the desiman，although an insectivore，bears a strong ex－ ternal likeness to a small musk rat．It inhabits the lakes and rivers of Sontheastern Russia，and feeds on aquatic insects．The Pyrenean desman（M．pyrenaica），so naned from its habitat，is smaller，and has a round tail．See Tal－ PID．E．F．A．Lucas．

Desmits［from Gr，$\delta \in \sigma \mu \delta$ s，chain + єloos，form］：micro－ scopical，single－celled，fresh－water alge（D）esmidiacer），num－ bering about 1,100 species．In many ways they remind one of the Diatoms，but they hase true chlorophyll，and their walls are not silicified．In shape they vary from fusiform to cylindrical and disk－shaped，and are often much constricted at the middle．In some cases they have the power of more－ ment．somewhat as in Diatoms；but it is not known whether the nechanism is the same or not．

Thes reproduce by splitting（fission），and by a sexual process（eonjugation）．In the lormer the neck joining the two halves elongates，and divinles by a partition（Fig．1）， producing two nnsymmetrical individuals．By subsequent growth of the smatler lobes the two desmids soon become

Fig．1．－A．B，the splitting（fission）of Cosmarium；C，the splitting of Desmidium，in which the new indiviluals remain attached．
symmetrical，and usually separate from one another．In some species they remain attiched，and thms form long fila－ ments．

In the sexual process two contiguous cells break open， and their contents unite into a single mass which soon sur－ rounds itself with a thick wall，thus becoming a resting－ spore（zygospore）．In germination these syores separate their contents into two parts，each of which eventually becomes a new desmid．

In the classification of desmids three sub－families are rec－ ognized as follows：（1）Cells after division lorming a fila－ ment（Eudesmidiea），as in Desmidium（Fig．1．（1）．IIyalo－ theca，Gonutozygon．etc．（叉）Cells after division free，hat connected by a hyaline branching filament（（＇osmocladiect）， as in the single genms，Cosmoclerlium．（3）Cells after divi－ sion always free，usually more or less biluhed（Didymioidece）， as in Closterium（Fig．3．A）．（＇osmarium（Fig．2，B），Euas－ Irum，Mierasterias（Fig．2，（＇），etc．

Fia．2．－A，Closterinm striolatum：B，Cosmarium radiosum；C， Micrasterias americana，all highly magnified．
Literature．－Brifish Ihesmids，by II．C．Cooke（1884），with 6．${ }^{-1}$ plates：Desmids of the Imited sitates，by Francis Wolle （1884），with is plates；sylloge 17 garum（rol．i．．lp）． 7 to to 1236），by J．J．Te Toni（ 188.19 ，inehuding descriptions of all known species．

IV．A．C．
Determinants：certain srmmetrical algebraic functions of $n^{2}$ quantities of very freguent recurrence in the theory of erthations and still more in the higher geometry．Thus． if we take the product $a_{1} b_{2} r_{3} \ldots n_{n}$ of $n$ factors，and per－ mute the subseript indices in cere posible way，we shall have $1.2 .3 \ldots$ ．．．n prolucts．If now we give to cach one of these several promets a phes sigus whener the mamber of inter－ changes of indiens necessary to prodnct it from the above proxluct is emen，and a minus sign when the mumer of inter changes is odr．and add the results，we have the determinent of the $n^{2}$ quantitios $a_{1}, b_{1}, r_{1}, \ldots, n_{1}, d_{2}, b_{2}, c_{3}, \ldots n_{2}, t_{3}, b_{3}$ ，etc．

The determinant is usually written thas：

but it is also sometimes written $\Sigma_{ \pm}\left(a_{2} b_{2} C_{3} \ldots n_{n}\right)$ ，where the product written in the parenthesis is that of the fetters
along the diagonal of the matrix，theginning at the upper left corner

Determinants play a most important part in every braneh of adranced mathematics．The most extended treatise on them is the German one by Baltzer．

Rerised ty S．Newcomb．
Determinate Problem：a pohlem in germetry which admits of a limited number of solutions an indeterminate problem being one which admits of an indefinite number of solutions．Thus the problem．＂Given the base perimeter， and area to construct the triangle，＂is determinate，there be－ ing in general lut four solutions．By omitting one of the three data．however．the prohlem becomes indeterminate． For instance．an infinite number of triangles having the same perimeter can be constructed on a given base．The rroblem，however．is not perfectly indeterminate．for the vertices of all such triangles are restricted to a certain locus －i．e．the ellipse whose foci are the extremities of the given base．In general，the omission of ome of the conditions or data which render a problem determinate leats to a local problem．
Determinism ：the doctrine that denies the freedom of the will，and refers all acts of seeming rolition to a law of necessity．According to Sir Williann Ilamilton＇s nse of the term，it signifies the theory of the necessitarian school of philosophers，who hold that the acts of the will are deter－ mined by an inner necessity arising from the controlling force of motires acting unon character．These motives in man are the resolt of his peculiar and necessart derelop－ ment in accordance with the laws of the universe．of which he is a part．This doctrine is a part of pantheistic systems of philusophy，but helongs as well to other systems，and holds a prominent place in the philosophy of Leibnitz，ac－ cerding to which each monad，substance，or theing acts inde－ pendently of all others，but by a pre－established hamnony governing its internal derelopment is presented from con－ flicting with the rest of the miverse．The theory of deter－ minism has been maintained hy the exponents of rarions systems of philosophy，and approached from widely differ－ ent standpoiats．Schopenhaner，Julius Müller，J．S．Mill， and Bnckle have alvanced it in one form or another，and among theologians it has given rise to entless disenssion． St．Angustine employed the argument of determinism against the Pelagians，and the early Calvinists zealonsly maintained this doctrine as the necessary consequence of the theory of predestination．See Fate，Necessity，and Will．
Det＇inue［O．Fr．definu，past pic．of detenir：Mod．Fr． delemir．detain＜Lat．detine re；de．from＋lene＇re．hold］： in the common law，an action for the recovery of a personal chattel wrongfully detained，or its ralue．with damages and costs．The action is for the recovery of a specified article； the chatel therefore must be of such a character that it can be distinguished from others，as a horse．The plaintiff mnst have an absolute or special property in the article at the tine he brings the action．The defendant must have had possession at some time，which should have been aequired in some lawful manner．as by contract or finding．The nature of the possession must also continue．Thus，if a finder should sell the thing found before action．the proper remedr would be an action for conversion，though if he had not sold there might he a case of detinue．In the U．S．this form of ac－ tion has been laryely superseded br the less technical actions of trover or replesin．

Revised by F．Sturges Allen．
Detmold．det molt ：a town of Germany：capital of the primeipality of Lippe－Detmold；on the Werre； 42 miles S．W．of Hanover（see map of German Empire，ref．4－D）．It has a fine castellated palace．a musemm．a theater，a public library．and a celchrated teachers＂seminary：also manufac－ tures of linen and woolen goods，tohacco，cards，and carved work in wool and stone．Sear this town is the battle－field where Hermann destroyed the Roman ariny of Varus in 9 A．D．Pop．（1：90）9， 235 ．

Deneation (in Gr. $\Delta \in v$ rad $(\omega \nu)$ : in the Greek mpthology, a son of Prometheus and the hushand of Prrma : also the father of Amphictyon and Hellen. According to tradition, he saved himself and his wife from a deluge by thilding a ship or ark, which, when the water subsided, rested on Mt. Parnassns. As soon as the waters hat retired from the surface of the earth. Dencalion and his wife went to consult the oracle of Themis, and were directed to repair the loss of mankind by throwing behind them the bones of their grandmother. "This expression meant only the stones of the earth: and. after some hesitation ats to the meaning of this obscure oracle, they obeyed. The stones thrown by Dencation immediately becane men, and those thrown by Pyrrha women.

Dens ex machinti dee ŭs-eks-măk'i-na [Lat. translation
 machinery]: a supernatural deliverer: an expression horrowed from the classic stage with reference to the practice of the Greek dramatic pets, in having recourse to the intervention of a god, who descended by stage machinery, and hrought about a speedy dénoiment of the plot.

Denteronomy [Gr. סєvtepodouov (late), duplicate law: ofúcepos, second + youos, law]: the lanit book of the Pentatench, consisting in part of a restatement of the law, as given in Exolus, Leviticns, and Numbers, and containing also, besides sprecial commands and admonitions not previously given, in account of the death of Moses. The anthorship of this book has been traditionally assigned to Moses but of course the part relating to his doath is not supposell to have been written by himself. Much critical labor has been bestowed mon the hook, and its Mnsaie anthorship has been hoth assailed and defended with great learning and ability. See IJexaterch.

Deutself, doitch, Emancel Oscar Mexahem: anthor; b. at Xeisse, in Prusian Silesia, Oct. 28, 1800 . He sturlied, in Berlin, Hebrew, especially the Talmnd, Aramaic, Chaldee, ente; risited lhe Bast twice in 1869 amol 1873; was in 18.55 appointed assistant in the library of the British Jusemm. and contributed a munler of valuable articles to varimus periodienls and encrelopedias. His brilliant artiele The Talmud in the Quirterly Revien for Oct., 1867, was translated into several forcign langages. A volume of his hiterary Promeins, edited by landy strangford, with a brief sketch of his life, appentent in London and New York (18:̈4). 1). in Alexampra. Egypt, May 12, 1873.

Deutz doits (anc. Thitiom): a fortified town of Prussia; on the right hank of the lhine. opposite Cobogne (q. r.). It is the iemminus of a ralway extenting to Minden (see

Dent'zia [namerl after Mentz, a botanist of Imsterdam] a groms of shintss helonging to the order Sirifragueae, and intigensus in Nowthron hudin, Chins, and Japan. Dentzia scubru has laves very rough, with sibicenns hairs, which are nserl in Japan for prifishing woot, ant which are most beantifnl objects under the microseppe. Itenzia grarifis, a harly shrub with elegant white tlowers, is much cultivated in gardens in the U.S.S.

Denx Ponts: Soe Zweibri"cken.
Dens Sèpres: Sep siveres Delx.
Dev, dars, or Dew: a Persian word, akin to the Nanskrit. devo, gol, hut deriving its meaning of evil spirit from
the nse of the word daera in the Zend Avesta. For the peculair differentiation of meaning in the word-pair Sanskrit asura, dếa and Zend ahmro, daeva, see v. Bradke, Igûus Asuŕa. See Zoroaster, lielgion of.
Dêva, dàra: Sanskrit word from vide shine signifying gol, and forming a part of many names in Hindu mytholggy. as Kāmadeva (the god of love), Mahādêra (the great goil), a name of Sird (q. $\imath$.).

Hevaloka: literally, the sphere or abode of a deva or god. The Buddhist srstem recognizes six devalokas or celestial spheres, situated in tiers above Mt. Meru ( $q$. i.), and between the Brahmalokas and the Earth. The lowest is the heaven of the "Four Kings" who guard the Earth and the Heavens against the assanlts of the Asuras or demons who live beneath the Earth. Each of these kings gurds oneyharter of the heavens. The second devaloka is the heaven of Inira, and is called Trayastrinsha, or "the hearen of the thirty-three divinities." The third is that of the Yamas. beings who take no part in the war against the Isuras, and are hence called the "strifeless." The fourth devaloka is the heaven that is called Tushita. It is the home of the Bodhisatras, or persons who are destined to beeome Budthas. Maitreya, the coming Bndlha, now lives there and presiles over it. The fifth devaloka is that of the Nirmanarati, or deras who delight in transformations, or, according to another interpretation. who constantly enjoy pleasures provided by themselves. The sixth and highest, that of the Pamimita rasavartin, beings who constantly enjoy pleasnes proviled by others, or who, while others are transformed, are themselves independent. Jn the first of these devalokas life lasts 500 years. but one day there is equal to fiftr years on earth. In the second life lasts 1,000 years. and the day is equal to 100 earthly rears. In the third life lasts 2000 yers, and the day equals 200 earthly Fears, ant so on in geometrical progresion up to the highest. Where life lasts 16.000 years, and the day is equal to 1.600 years on earth. Above these six hearens are sixteen Brahmalokas rising one alove the other. In these there are no sensual enjoyments as in the devalokas, and there is no bain. though hodily form exists. Above all these are four formlese or spiritual frahnalokas, in the lighest of which life lasts so.000 Mamakapas ( $q$. $x^{\prime}$ ), during which the inhabitants are not fully conscions and yet not quite unconscious.

According to the Puranas (q. $\cdot$.) there are seven devalokas, the second of which is Indraloka or swarga, and the sereuth Brahnaloka or Satyaluka, "the world of infinite wisdom and truth.
i. Lilley.

## Devanagari: Sec Saxskrit Laxguage.

Devaprayaga: town of Northern Hindustan; in Gurwhal: lat. $308^{\prime}$ N.. lon. $5^{\circ} 39 \mathrm{E}$. : at the confluence of the Alakanonda and Bhacirathi. which unite to form the Ganges. As the urigin of that sacred river it is considered a holy phece by the Hindus, and is risited hy multitndes of pilgrims. A flight of steps is hewn out in the rock down to the very edge of the water, and two large basins have been formed for allution.

Dew [0. Fise drum: 0. sax. Ilau: Gemm. Than, connected with the Skr. root dhan-, flow]: moisture deposited during the night on the aurfaces of bodien exposed in the open air. few is proxuced by the comblomation of watery vapor from the atmospher. Lis deposition is. however, unacompanied hy the appearance of amy visible mist. suef mist apperars when the comdensation takes place within the hooly of the air itself, and is then called "f fig" in the lower regions of the atmosphere, and "cloud" in the highor. hew vecurs only at the surface of contact with solids, the air ahowe remilning clear. The deposit al' lew is cunsed by the continer of the bodies hedewed. tud this takes place in conseGrence of the radiation of heat intocpens space withont any "quivalent return. Expriments un vaporization lave shown that when a liguid is expmat in a confined space to a constant trmperature, vapor will be formed from it until the density reaches a certain determinate limit, invariahle
for the temperature hut greater as the temperature is higher, alter which evaporation will cease. This maximum density is called the density of saturation or the density due to the temperature. Air is sad to le saturated with yapor when the density uf the vapor in it is the density due to its temperature. Shonk the temperature of a body of atir in this condition be in the slightest clegree depressed, the air will be supersitlurated, and some of the vapor will be eondensed, forming a visible clonil. Bat if, the trmperature remaining the same a londy colder than the air be immersed in it, condensation will necur on the surface of that body only, and the air itself will remain clear. If. as is usual in the atmosphere, the air contain vapor without heing satnrated, it may be hronght hy cooling to a temperature at which it will be saturated, inul then any further cooling will produce precipitation, as in the coase before supposerl. Or if the trmperature of air in this condition remain unchanged, a hody enlder than the air immersed in it may produce condensation, provided its temperature be as low as the point of saturation. or lower, hut not otherwise. This point is called the Dew-ponst (q. $\quad$ \%)

During the day the lose of heat by bodis on the earth, in consequence of radiation, is more than compensated by the amount receivel directly or indirectly from the sun. After sunset all such bodies begin to eool, but they cool with umequal rapidity, beeanse of their diffrent relations to heat. The atmosphere cools very slowly. Barlly condneting solids coml rapidly. Gond conductors, if in contact with the earth. cool less rapilly, because the heat they lose hy radiation is, to an extent proportioned to their eondneting power, restored by conduction from the earth beneath. If of small mass, however, and imsulated by had eonductors, their temperature falls more rapidly. So soon as the conling proeess has depressed the tenjperature of any object down to the point of saturation for the vapor present in the air, dew will hegin to form ujon it. Sume bodies are bedewed rery soon, others more tardily, anel some oceasionally eseape altogether. Grass, which radiates well and conducts ill, is in the first class; wool and woolen stutis, cotton, linen, silk, wood, eartl, grarel, stone, and metals contract elew with less and less facility, nearly in this order. Polished metallic surfaces often remain untarnished by moisture throughout the night. In clear nights the difference of temperature shown by two thermometers, one lying on the grass and the other suspented in the opren air, a few feet above is often $8^{\circ}$ or 10 F ... and is sometimes much greater. In one instance, Mr. Glaisher (Phit. Trans., 1847 ) observed a difference as sreat as $28 \frac{1}{2}^{\circ} \mathrm{F}$., the lower thermoneter lying on raw wool.

Clonds check the formation of dew by obstructing ratiation, or restoring by counter-radiation some of the heat lost. When the sky is wholly overcast no dew is formed. Neither is any dew formed hericath an open shed or shelter, thongh the earth around may be so distinctly wet as to leave the form of the roof distinctly marked on the ground. Facts of this kind were long suppesed to prove that the dew descends like rain-a belief of which the trace is still preserved in the expression "the falling of the dew." Fiven a rery slight screen. as a sheet of paper or a cambric handkerchief. spread out above an ohject exposed in the open air, will protect it perfectly against moisture from dew. Winel also prevents the formation of dew, by continually changing the strata of air in contact with the colder solids. The nights most farorable to the leposit of dew are those in Which the sky is clemr and the nir motionless. The profnseness of the delosit will depend, however, unon the hygrometric state of the atmosjhere.

Very varions and very absurd notions prevalled among the ancients in regard to the clew. liy sume it was sulposel to descend from the stars, and to he possessed of wonderful virtnes. The Roman ladies wore accostomed to use it as a cosmetic, supposing it superior to all other applications for the improvement of the complexion. The true thenry of dew Wis first clearly sut forth by Williom Charles Wrelle, at jhysician of London, in his faimons Essacty on Dev, first publisled in 1814. This stambard authority has been many times reprinted.

Dewlet－（iherai III．：the last khan of the Crimea：suc－ ceeded his uncle，lierin－Gherai，as chiuf of the Crimean Tartars in 1769．Ile had more taste for court etiquette and ceremonies than for war，and，thongh supported by the Turks，he was expelled by the generals of（＇atharine II．D）． in Constantinople abont 1780．Three vears later the C＇rimea was incorjorated with Russia．

Dew－point：the temperature at which watery vapor in the air begins to be contensed．Its determination is of great importance to the meteorologist，as by comparing it with the actual temperature he can tell the relative hu－ midity of the air．The knows that at the actual tempera－ ture the air wonld be saturated il it contained a certain quantity of moisture；and also that the actual fuantity present is only such as would suflice to saturate air at the observed dew－point ；the ratio of this last quantity to the former expresses the relation between the actual humidity of the air ami the humidity of saturation at the observed temperature．The dew－point in the evening further shows the temperature near which the minimum during the night is likely to be．When the temperature has fallen to the dew－point．the vapor in the air will he conclensed，and an amonnt of heat will be set free which will raise the tem－ perature of the air．The temperature will again sink by radiation somewhat below the dew－puint ：dew will he formed． and the temperature again be raised．See I EW and Rain．

Diabu"tes [Gr. סaßŋ́r $\eta$ s, diabetes, also compass, siphon; its value ts a Gir. medical term is derived directly from its et ymology. סad, through + Baiveiv, pass, gol: dinease chatacterized by the excessive excretion of urine: occurs in two foms. Diabetrs insipudus, now called lolveria (q. $\%$ ), is distinguished from the other much more dangerous disease ly the fact that the urine is very watery, lut otherwise not abmormal. It is neither frequent nor tormidable. But Direbetes mellitus, "sweet " or "honeyel diabetes" ( (大lycosuriti), is often mre of the most incuratile and serious of discases. The urine is light colored, but has its specitic gravity greatly increased by the presence of cliabetic sugar. a substance believed to be identieal (in mose cases) with liver-sugar, and very clusely approchling graple-sugar in its composition and reactions. In some cases it appears to be muscle-sugar (inosite). The disease is further characterized by excessive appetite, intense thirst, wasting, and prostration of mind and holy. Its canses are obscure and its treatment not well understood. Some cases are greatly benefited by opium, the avoidance of sngars and starehy food, and the uise of strictly nitrogenous diet. like gluten bread and skim milk. milder form of diabetes is not infrequent in the obese and those of gonty habits. After a variable duration the glyeosuria may in these cases cease entirely; and there is rarely much disturbance of the general health. Temporary diabetes has been ohserred after the administration of langhinggats, chloral, chloroform, woorari poisom, ant other drugs.

Revised by Willian Pepper.

## Diacaustics : See Caustic.

Diadrm [from Gr. סodónua, fillet, band about the head; $\delta$ ó, through $+\delta \in i ̃$, hind]: the symbol of rovalty among several Oriental nations; originally a fillet wond round the forehead and temples. Among the Persians the diadem was at broml light-blue baind malle of silk, linen, or wool, hound rond the tima ar turlm, mad from them it was horrowed ley Alexander the Creat. The Ptolemps of Egyt ind the Sclencidir of Syria nsed plain tillets of gold encireling the head. Nark Antony assumed the diadem, but lineletian Was the first Roman cmperor who adopted it. After his time it was embroidered with gold and adorned with pearls or precions stones.
Diagno'sis [fir'. סááquats, discrimination, decision, connected with $\delta$ เaүเซváซкєเv, to discern; $\delta$ dá, apart, through
 of lisease, one of the most difficult and important branches of medicine and surgery. Diagnosis is based upn "physieal signs and rational symptoms": "signs" heing appreciable by the senses, min "symptoms" arrived at by the edncated judgment. Both. however, are popularly known as symptoms. Diagnosis is lwest learned at the lodisite, under the gridance of grod instructurs. The stethosempe, thermometer, laryngoseppe. etc., furnish important airl in this brancle of medical practice. The term is often used by maturalists for the diserimination of spocies of animals, plants, or minerals.
 conduct + pétpay measure]: © electric instrument for determining the conducting power of tixed oils. inventer hy 11. limmeatu. It eonsists of a dry pile, ly means of which a rurrent is passed through the oil, and the strength of the (arrent delermined hy a magnetizerl neetlis. It is nsed especially for the detection of the alulteration of alive oil. sand to have the lowest comducting power of such oils.

Diagomal [fron (ir. $\delta$ aqúvos, from angle to angle: $\delta$ od. throneh + povia. anglel: a straight line ilrawn throngh is dignre, jonning two opposite angles. The terma is chienly nsed in eremetry in speaking of fomr-siled figures, but it is also properly :uphlied with reference to all puly yons of more than three siles. Buelin uses the term demmere in the stane retace hut medern geometers mie diameter only when speaking of eurved limes.

Diaw'oras (in (ir. Araydas): Greek poet and phiknopher:
 to have been a diseiple if hemocritus of Ahatera. He was is citizen on resident of Athens. As he rejected or dombted the popular religion and polytheism, he was stigmationd as

 wity and tearless man of gront moral character. His works are not exant, He lised at lallene for a time amo then remmeal to corinth, where he diend. Se lienthen, le - I/heismo Jiayora, 1812.

Bial [from lat. dialis, daily, pertaining to the day, deriv. of dies, dar]: instrument showing the hour of day by the shaduw of :i gnomon or st yle cast hy the sun on a grarluated are; also called SuxdiaL. The invention is of great antiquity, the Greeks having, it is said, learned its use from the Chalideans, In the construction of a dial the object is to find the sman distance from the meridian by means of the shatow. When this is known, the hour also is known, proviled we suppose the sun's alparent motion to be uniform, and that it mores in a circle parallel to the equator during the whole hay. In point of lact, neither of these conditions is fulfilled. hint the error arising fron this is of small amount. Although dials have many different constructions, the general principles are the same. The style, gnomon. or axis of the dial is either a cylindrical rod or the edge of a thin plate of metal. It must be parallel to the eartlis axis, and thas it may he considered, on account of the smalluess of the earth's diameter compared with the distance of the sun, is coinciding with the axis of the diurnal rotation: conserguently the plane which passes throngh the center of the snn and the style will coincide with the shadow, and will turn with the sin, is the sun turns round the style, loy the effect of the diumal motion. Dials are horizontal, vertical, or inclined, according to the position of the plane of the dial with respect to the horizon of the place. The essential principle is that the rod shall point to the pole of the heavens.
 of discussion. lemin. of adjece $\delta$ балєктьќs. pertaining to discussion, conversation, (ir. סtádeктos]: technical term much used in both Greek and German philosophy, but of a somewhat vagne signification. In the cireek philosophy it may be best explained by considering it in its relation to logic. Lagic was the science of the forms of thinking, the science of conclusion and evidence: it tanght the manner by which to arrive at 1 ruth. Dialcetie treated of the truths arrived at: it was the science of expressing aml setting forth inleas, the seience of definition. With an itlenlistic thinker like Plato, with whom frath is an intuition and the idea an inspiration, dialectic, the science of definition, the art of detining, means the highest function of science-science itself. With a realistic thinker like Aristotle, with whom truth is the result of imbuction and deduction, and the idea an evidence. dialectic means only a part, and even an inferior one, of logic. Hence the multitule of contradictions which invest this word. In the (icrman philosophy it may be best explained ly considering it in its relation to the expression "dogmatical." Dogmatical is applied to a definition when it excludes absolutely the onmsite: "dialectical," when it combines the opposites as corrclatives. According to the dugmatical defintion, everything is either good or had; and if it is good, it is not hatl: if it is buth, it is not good. Accorrling to the dialectic definition, anything which is essentially gon? may hase some bad in it, and anything whieh is essentially bad may have some gool in it. According as the object passes inder different views. the different constituents of the idea shitt phace and importance in the definition; relativity is the character of the actual world, relativity mast be the character of the wom of thought. Both in the Greek and German plilusophy the word diatectic is sometimes used to signify a mere word-fence.

Dialects [from Gr. ì $\delta$ dá $\lambda \in \kappa \tau o s$ (se. $\gamma \lambda \bar{\omega} \sigma \sigma \alpha$ ), conversational language, liscourse, conversation, deriv, of ס位é $\gamma \in \sigma \theta a t$, dis(niss, argue, converse): vinions modes of peeh regarded as local amblivergent foms of a central or standerd language or as clnsily related descendants from a common originat. Ia the later, which is the less frequent meaning, the word is usen, for instance, of the four traditional forms of the Greck language - the Attic, lonic, Doric, and Fhlic dislects-and it was in this scmse and in eomection with thene that it was first appropriated 10 grammatical use hy the Greek grammarians. The common popmar view, that dialects represent a hehased or priverted form of the standand languge, is in general nearly the rewne of the truth. The standarl, sometimes known as the literary language is generally hased historically upm one of a mumter of sister dialects, but is generally more or less of an antition structure, incluting compromises aml mixtures with varions dialects. It is called into being by the practical necessities of intercommonieation in some form of centralizing civilization. and comesponds in its materials and shape, as well as in the extent of its reengnition. to the controlliner factors and constituency of that civilization. The dialects, so far
as they survive，represent the continnance of language in its natural erowths anul aconaling to ！la datural lawn of its

selves with the longer axis at right angles to the magnetic lines of foree.
The tine joining the two prosite poles of a horseshoe magnet is called the arriul line, while a line lisecting at right angles this axial tine is called the equatorial tine of the magnet. The space included between the upposite pola surfaces of the magnet is called the mugretic field. When small hars of iron, nickel, cobalt, manganese, ete, are suspended between the poles of a magnet, they place their lengths in the axial line. Substances taking the above position are called magnetie substances, or, as Faraday termed them. paramagnpfic substances. The majority of bodies, however (e. g. bismuth, antimony, phosphorus, heary glass, wood, water, blowl, breat, hydrogen, and ammonia), when delicately suspemed in the magnetic fieht, place their lengths equatorially, and to distinguish them from magnetic substances they were called diamagnelic (orá, across, and $\mu$ donns, the magnet) by Faraday, who, in bec., 1845, gave the discovery of diamagnetism to the world in a palrer read betore the Royal soeiety of London.
The difference in the beharior of magnetic and dianagnetic smistances in the magnetic field was thus concisely stated by Faraday: Magnetic subistances tom to go from weaker to stronger places of magnelic action, while thamagnetic bodies tend to go from stronger to weaker places in the magnetie field.
Faraday found that not only solids, but also liquids and gases, possessed magnetic and diamagnetic properties. In experimenting with these bodies he inclosed them in glass tubes, whose magnetie belatior was cletermined before they were filled with the tiquids or gases to be examined, and the previonsly determined action of the magnet on the empty tube was dedueted from the resultant magnetie effeet on both the lube and its contained liquill or gas. Or two tubes of exaetly the same size and material were hung opposite each other from the ends of a short piece of hight wood. which was then placed across the end of a longer wooden rod, and the latter was suspemled by silk fibers or by a fine silver wire. The two tubes hung on opposite sides of the axial line of the magnet, and with their centers equidistant trom it. By this ingenious arrangement the actions exerted by the magnet on the glass tubes neutralized each other, and whatever motion he observel was due to the difference in the action of the maguct on the two substances they contained. By filting one of the tules with water or air, and the other successively with lifferent tipmids and gases, he determined the specific mognetism of these substances relatively to water or air taken as mity. Further experments on the action of the magnetie fieh on water and air inclosed in a vachum gave the data tor reducing all of his measures to what he would have fomm hall all the substances been suspended in recuo between the poles of the magnet. Pliicker in Germany and E. Beconced in France atso mate extensive resparches in this fiedt, and oldatined very refined measmer of these actions.

In the following tathle are contained the results of Faraday's measures of the actions of attraction or repulsion of magnetism on varions substances, determined by means of a telieate torsion balance. In the enmparisons cqual volumes of the substance were nsed, and the action on water taken as the unity of intensity. 'The sign + indicates that the substance is magnetic, while the sign - shows that it is cliamagnetic

* Wefher's ralue, Berquerel's caliar is 2,0 on, 0n0 if we take the saturated solution of irutochloride of iron at 62.

The following tables contain additional measures by Bec'querel:

The general law of these actions was discovered by Faraday, and Beequerel has formally stated it as follows: If we place in the neighborhood of a magnetic pole a fixed vessel filled with a tluid, the latter will experience no motion. Imagine any portion of the interior of the fluid mass isolated; it is solieited, according as it is magnetic or diamagnetic, by a force $f$, positive or negative ; and as it is not displaced, the metium which surrounds it must necessarily exert on it an equal and contrary pressure equal to $-f$; this is to say, that the principle of Archimedes applies as well to these forces as to gravity. Replace now the mass of the fluid we sumposed isolated from the same fluid surrounding it by another which is bounded by the same surface as the former, but of a different magnetic nature ; it will receive from the magnet a different action $f^{1}$, positive or negative, and from the surrounding fluid the same action as above, $f$ : the resultant action on the new sulstance will be $f^{1}-f$. Consequently, the action which the pole of a magnet exerts on any body whatever, plunged in a tluid medium, is equal to the difference of the actions which it exerts separately on this body and on the fluid in which it is suspended.
From these considerations the following consequences result : When the medimn is magnetic, $f$ is positive, and $f^{1}-f$ is negative; consequently, any boly whatsoever tends to become diamagnetic in a magnetie tluid or medium. Conrerscly, in a dianagnetic medium $f$ is negative, and $-f$ is positive: and the substance may act as though it were magnetie, even when it really is not when tested in a racnum, and will becone more dianagnetic when it really is diamagnetic when suspended in a vacuum between the poles of the magnet.
Faraday beautifully illustrated the above prineiple by the following ingenions experiments: He filled glass tubes with solutions of sulphate of iron (a magnetie suhstance) of different degrees of strength, and suspended them between the poles of his magnet in similar solutions, also of different degrees of strength. When the solution in the tube was stronger, or contained more iron, than that in the solution in which it was suspender, it pointed axially: when it was weaker, or contained less iron, than that in the surronnding liguid it pointed equatorially; and when the solntion in the thise and outside of the tulve were of the same degree of strength the tube was indifferent.

In Sept., 184\%, Bancalari, of Italy, diseovered that when the tlame of a candle was placed between the poles of an electro-magnet it was deflected into the equatorial line the moment the iron of the magnet was magnetized, and the flame returned to its first position when the magnet was demagnetizal. Faralay repeated these experiments with the powerful magnet of the kisal fastitution, and greatly exlended these ohservations hy his diseovery of the magnetic character of oxygen, oleliant gas, and nitrogen, when these gases were contaned in tubes anl placed in a vacmum in the magnetie ficld; and oberved that hytrogen, cymogen. and ammonia were diamagnet ic when placed in similar conditions. Faraday made many important experiments on the elferts of the change of temperature and pressure in moxifying the magnetic conditions of gases, and found that the adtion in the magnetie fiell on these berlies diminished with an clevation of their tempreature and a diminution of their density. Thus hot air ss shown to he diamagnetie when allowed to ascend through cold air hotween the poles of the magnet. This aml other similar facts he showed by eausing the currents of gas in their progress towarl the magnetie tiedt to pas orer pieces of pancr saturated with chlorfyatrie
acid, whilw betwew, aromol, and ahove the pulds were phaced litule tuhes moistened with ammonia. When the gases entered one of than tubes the fate was known by the formation in it of white fumes of ehborde of ammonimm. He thas fond that the hated air on remching the magnetic died was repelled from the poles, while a deacending chrrent of cohl air was attracted towand the pules.

The writer of this article has devised a methend of observing thes fhenomena ly basing throgh the gases, as they ascend or desemb or pass between the poles, a st romy liserging heam from an ehectric light. The ditterence in refracting power of the hot or cold gas eurrents and the survounding air exuses shaluws of the currents to lo projected on a sereen phated on the side of the magnet opmusite the light: and thas ean the seen at one all the parts of the phemonem. In the ex experiments the powernl electro-magnet of the Sterens listitme of Terdmology was hish. With this marnet the experiments of bucalari are very remarkable. On bringiner the flame of a candle slowly minat between the poles of the mugne thi tup of the liane is first depressed and spread out equatorially in the magnotic liedel ; as the thame is ehevatel it spreads ont vet more, and often takes the form of an oval-shaped vase thattened efpatorially, with an anterior depresion extending down nearly to the base of the wick. I lirger tlame becomes compresemf into a flattenmedifutiond dish, with two curved arms or hamdles frojected upwarl.,

Ifter Faraday hal discovered the mapnetic propertios of oxyofo he expermentally detorminel that one cubic meter of ihis gras equaled in marnetice effect it centicrammes of irm, and heree that the whale atmosphere acted as wombld a laver of irom which envedened the carth and had a thicknese of tom. Parts of this graseous magnetic shell are sumensivly hated-athd therefere wemed in magnotic intemsity-hy the sum in his uparent daily and yearly changes of position: and hence Fambay reasonod that here was certainly a true, and probaby a sifficient, canse of the diurnal variation of the noedle. (IMit. Trens. R. S., Soッ., 1500.)
The results of Faralitys expmiments on the action of the masnetie lield on gases are given in the following table. It ghe which is magnetic in the circumstane stated in the toy line of the table has + hefore it. If it is diamagnetic it hans - bafore it.

Becpured (fomptes Rembus, Isol) hats found that ozone is more mapmot than oxgen.
Fataday, in the enorse of his experiments an bars of bismuth, met with the followine amomalons antions. He foum that some cast hars of bismoth peinted axially, others equatorially, white bet ot her bars twak imermenliato pritions of rest. These extrambinary phomomenta hoth he
 luth observed that there was some relation botween the fine forms of ervatals in the magnetue theld and their cerystalline forms. The phrmonena received their full explanation at the hands of Tymith.

- It is not meressary to use the ithe ense tiedo of a paserfut ele erernnughe tro ntain the phemoneras of tiamagnetsim. The writer has

 maguche and even a parallelopiped cot out of a binam thints
from his 1 bager on Diamagnthem and Datue-ryystullic Acton (L.. E.. (ant I). Phil. Mury... Waly, 1siti) the tollow. inge experiments, and giviner in his own words the law when embraces their chataterivic phomomena: " lf we take a slice of apple ahout the samm size as a funyy but somewhat thicker. and pheree it theough with shot bite of iron wire in a dirertion perpendieular to its that surtace, such a lisk. stispended in the magnetic fiedd, will, on the endution of the marnetio fores, recede from the fohes and set its horizontal diameter strongly egmatoriat: not by repulsion, but by the attration of the iron wires fassing throngh it. If, instead of iron. we nse bismuth wire, the disk, on exciting the maget. will turn into the axial pesition ; mut by attrate tim, but by the repulsion of the bismuth wire jassing through it.
"If we suppose the slice of apple to ber redaced by a little eake made of a mixture of dour and iron filings, tha bits of wire rumning through this will asirt their petominatnce as before: for, though the whole is strongly magne tic. the suluerior energy of ation along the wire will determine the prosition of the mass. $1 f$ the hismuth wire instead of piereing the aphe piere a little cake mate of hour and bismuth blings, the cake will stand between the peoles as the apple touds for though the whole is diamagnetie, the stronger attion along the wire will be the raling energy as regards position.

Is it not possible to emoceive an arrangement among the particlow of a marnetio on diamarnatic crestal camblo of produchug a visible result similar to that here deseribelt 14, in a magnet ie or diamagntit: mass. t wo directions axis, in one of which the emtate of the particles is doser than in the other, maty we not fairly conchule that the strongest exhibition of force will he in the former lime which therefore will wignalize itself between the poles in a manmer simihar to the bismuth or iron wire $\}$
"If analogic proof be of any value, we have it hore of the very strongest description. For example: himmuth is a brittle motal, and can readily he reduced to a fine powder in at mortar. Lat a thapomfal of the powdered metal be wettod with gum-water, kneaded into a paste, and made into al little roll, say an inch long and a chatere of an inch neross. lhang between the exciled poles, it will wet itself like a lithe har of hismoth-equatorial. lace the roll. protered hy bits of patetebard. within the jaws of a vice, simere it hat, and :mispend the ghate thas formon between the pales. On excitiner the maghet the phate will turn, with the energy of a magnel ic subsiance. into the axjal pasition. though its lengeth may be ten times its headih.
 and form it into a roll in the manner deacribed. Himur betwern the excited poles, it will stmed as an ordinary magnetios sumance-axial. Shneege it in the vise and shopernl it edgeways, its position will be immediather rewersed. (Hi the develument of the magnetic fore the plate thas fomed with recoil from the pohes as if violently remelled. and take up the equatorial position.
 is evident. The lime of elonest contact is perpendicular in each case to the surfaw of the phate-a conserpene of the breware which the partiches have umpergone in this direction: and this ferpendionar stands axial or copatorial

l'rof. Tyudall thus sums up the law whidy roldes all of these actions: "lf the armagement of the companent particlom of any bondy be such as to proment different dagrete of poximity in different diredims. then the lime of elosest proximity other cireunstance being equald, will be that chown ley the rexpective forees for the exhithition of their greates innergy, if the mass he magnetie, this line will stand axial: it diamatuntic, equatorial.

The above law explans deaty the anomatons andoms Faraday observad in his hats of hismath. Bismuth is a
 burtichas are in the divertion of its chmeage phames. There fore this lime of greatest combensation will always phaco itodf equatorialy in the magnetic field. In whar wimle the phates of chenage will lake all equatoriald dimetime
 solditication of the himuth, take varions pmitient in reference to the forgth of the hars: hene the momatons ace tions whicta are shatimes ohsorved in these hats

When the cryctal deaves equally easy in two plames the limes of preatest eompression will be parallal to buth of these planes, and therefore the interemethan of these phates
will determine the position the cerstal takes in the magnetic fiete. This is contimed by experiment.
It there are three cteavage planes, perpendicular to each other, as in rock-salt, or if there are none, as in quartz, there will be no line of clective polarity, and the body will act as though it were not erystaltizen.

Finally. when three planes of cleavage are not perpendicular, there is generally one direction of greatest compression, which is fount-for example, in calc-spar-parallel to the axis of crrstallization: this lime will place itself axially it the crrstat is magnetic, and equatorially if it is diamagnetic. This deduction has been confirmeil by experiment.

Villari (Pogg. Aun.. 18:!) has made experiments to find the time nreessary to produce the maximum diamumntization. A disk of dint-rlass was rotated in a magnetic field with the axis of rotation of the disk perpendicular to the polar axis of the magnet, so that the diameter of the disk was in the direction of the lines of force of the magnetic field. A bean of polarized light was passed through the disk in the direction of its diameter. When the disk was stationary the flint-glase disk cansed a rotation of the plane of polarization equal to 19 divisions. Velocities of rotation of the disk of 110 , 121. 143, and 180 thrns per second reduced the rotation of the plane of polarization liy $2,5.10$ and 17 divisions, respectively. Villari coneluded from these experiments that $\frac{1}{80}$ second is required to froduce a diamagnetization sufficient to he detected be the rotation of the plane of polarization. that $\frac{1}{7}$ second is reguired to develop the maximum diamagnetization of flint-ghass, and that its diamagnetism lasts shen second after the magnetic indueing foree has disappeared.

Alfred M. Mayer.
Diamantina, dee-ăи-măan-tećn:ă (formerly Trutco): a city of Brazil in the northern part of the state of Minas Geraes; near the eastem base of the principal chain of the Serra do Espinhace, about 4,000 feet athove the sea (see map of Sunth America. ref. (6-(9). It is built partly on the steep sides of a hill and partly on level ground above, presenting a curious appearance when seen from a distance. The surrounding conntry is watered by numerous streams, aflnents of the Jegnitinfomha. Diamantina owed it first importance, as well is its name, to the rich dianond washings of the vicinits; these are by means exhunsted, but since the discovery of the Sonth African diamond-fielts they have been in great part abandoned. The city retains its frosition as a center for the frade of Northern Ninas. It is the seat of a bishop, and has numerous churches. Pop, about 10,000 . Herbert H. Smite.
Diamantino: city of Brazil ; province of Ditto Grosso : or a small tributary of the Paragnay. It was founded in 1.30, and was a very flourshing place for a time after the discovery of diamonds in 1246, but now mumbers less than 2.000 inhabitants, mostly Indians. The chief products are ipectacuanha and vanilla.

Diameter (from (ir. 方 $\delta \iota \alpha \mu \epsilon \tau \rho o s(s c . \gamma \rho a \mu \mu$, line), the line measuring the distance across: סad, across $+\mu$ н́tpoy, measure]: a right line drawn through the center of a circle, and terminatal in both directions by the circomferenee. In architerture diameter is the masure across the lower part of a classic shat or cohum, and is used as a convenient soale of relative dimension for the varions jarts of an onder. Some writers, following the Itatian tradition, arbitrarily divide the diamstre into two molutes and twentyfour to sixty purts or minutes, aceording to the order. In astronomy the apmarent dianoter of a celcitial boly is the angle which the latter subtembe at the eye, and is measured by the micrometer: The distance of the buly in cumstion from the carlh, whon muttiphime by the sine of this angle, gives the real diameler of the henly. In elementary geometry diameter is any right line throngh the center of á figure. In eonies a diameter always hiseds a sysion of parallel chords. Newton shwed that the centers of mean distances upnu a system of paralld lines, of the $a$ intersections of cach with a curve of my order, always lie on a right line. which may be callefl a diameter, $A$ dianetor of any curve is simply the polar line with pespet to the curve of an infinitely distant point. The eth ditheter is the eth polar of an influitely distant print, and consequantly a curve of the $(n-r)^{\text {th }}$ orter. The $(n-2)^{\text {th }}$ diamoter is eablerd the diametral conie, the $(n-3)^{\text {th }}$ the dianetral ubic, etc. 'the same extension is applicable tos surfaces. Whon the primitivesurface is of the second order, there is but one diametral surface, and that is the diametral phane which lisects a system of paral-
lel chords. Three diametral planes so situated with restrect to each other that each bisects all chomls parallet to the inlersection of the other tiro, constitute a system of conjugate diametral planes, and intersect each other in conjugate dismeters.

Diamond [M. Eng, and O. Fr. diument: Ital. and Span, diumente < Lat. a dumas, -entis, with clange of du- to dia unter influence of Gr. pretix die. Lat. adamas, adamant, is a loan from Cr. àdópas,-ayzos, uneonquerable, a hard metal; $\dot{\alpha}-$, not $+\delta \alpha \mu \bar{v}$, to sulvhe]: a mineral which is the hardest known substance, aml the only gem that is combustible or that phosphoresces by attrition. Certain blue-white Brazilian diamonds phosphoresce in the dark after exposure to the sumlight. Diamonds can be split by cleaving them on the cleavage parallel to the octahedron, and are cut by rubling two of them together until they assume the desired form. They are then polished by leeing gronnd on a disk of soft steel about a foot in diameter covered with diamonddust and oil, the wheel or disk making about 3,000 revolutions per minute. They are generally cut in what is known as the brilliant form, having a flat table surrounded with thirty-two facets on the upper side, the small point called the culet, and twentr-four facets on the back. Rose diamonds are flat on the back and brought to a point above, the upper or dome-shaperl side consisting of triangular facets. Their weight is but one-third that of a brilliant of the same surface.

At present over 08 per cent. of the diamonds of conmerce are prodnced at or near Kimberley, Bonth Africa, where they have been mined since 18\%0. in what is known as the blue-stuff, which in lact is an altered peridotite (a voleanic rock) inclosing picces of a shale rich enough in carion to be ignited with a match. It is believed that when the rolcanic intmsion broke through this shale, the dianonds resulted from the distillation of a volatite hydrocarbon. Since $1868 \$ 300,000,000$ worth of rough diamonds, worth $8600,000,-$ 000 after cutting, have been produced here-more than the entire world's yield for two hundred years before the discorery of these mimes. (See Dlanond-fields of Soutu Africa.) In Brazil, India, and Borneo, diamonds hare always been found in an allurial deposit, but the mines have almost ceased to yield. Wiamonds have been found in Virginia, North Cutrolina, Georgia, Wisconsin, Idaho, and Cahiformia, but the entire prochuct of all these States could be hehl in the palm of the hand.
The largest diamond of modern times is the Victoria or Imperial diamond, pmrelased by the Nizam of Hyderabad for orer $\$ 1.500,000$. It is a perfect blue-white oblong brilliant. weighing 180 carats. The De Beers light-yellow diamond weighe 205 carats, and was bought by an East Indian potentate. The Regent or Pitt diamond, weighing 136 carats, now in the Galerie d'Apollon in the Lourre, is perhaps overestimated at *2, 400,000 . The Foh-i-mûr it Windsor Castle weighs 1023 carats. (The stone exhibited with the jewels in the Tower of London is only a glass model.) The largest diamond in America is the Tillany yellow, weighing 12.3 carats. Hore diamonds weighing over 100 carats each have been found since the opening of the African mines than wre known before that time. The llope diamond, privately owneld in Ruglant, is almost sapphire blne, and weighs $44 \frac{1}{2}$ earats. The Dresclen Green, at the Green Vaults at Dresden, Saxouy, is a rich light green, and weighs $4 \mathbb{R}_{2}^{2}$ carats. The red diamond of Czar Paul is at St. Pelcrsharg und weighs 10 earats.
Blue refl, and green diauonds are most highly prized, the red even more highly than the ruby, a $\frac{3}{8}$-tarat stone being sold for s 1.800 . Fine shates of brown an? yellow command wery ligh prices. Olf-colored and impurfect stones have gratily depreciated in price since the opening of the Sonth Ifritan mines, amd sill for sig a carat, and often muld lass, wen when of considerable size. The compact amorphons varicty of the diamond known as bort or bortz is foum in the provinces of Bahia, Brazil, and is of great valne in frilling tummels and recks, catting mill-stones, sawing and turning stone, ete. It must mot be confonnded with burrt, the imperfect and flawed variety of erystalline diamond. Diamomls are used extensively for forming splints, for writing on glass and stone, and, in the form of powder, for slitting rock-sections, glass, and in engraving glass and hard stones.
ciburge M. Tiunz.
Diamond-heelle: the common name of a Brazilian beetle betonging to the group of 11 ervise $(q, r$.). It is over an inch in length, black in ground color, with a golden-green band
on the prothorax and the wing－wvers with muncrous：row－ of metallic green sputs．It is the Eintimus imperintis of

naturalisists，and rececives its common name from its brilh iancy

Di'apere [ 1 . Fr, diaspre, jasper, a cloth of varions molors ( $(\mathrm{f} . \mathrm{Xlorl}$. F'r. diupré, variegated in color): Ital. dianpro: Span. diaspero, jasper < Lat, iaspis = Gr. Yaods, jasper, the precous stome]: textile fabric, such as toweling, in which a small and simple wown pattern is repeated over the whole surface. Also the decomave pattern itselt when of a similat chatrater, having one or two simple anits constantly re$1^{\text {rateded, }}$ ss in some wall-papers, and as often stencilod on walls. "lohese are the nore common uses of the temm ; origimally it moant a pattern of the same general (a) an as the gronmlareliever ether by heing of a slightly hatherent tint os hy the run of the theads in weaving : and alsu the fabrie it self which was s) deraraterl. Mumetimes diaper is distinguisher from a sprinliled or somé battern in that the latter consists of units which do nut tombh one abother atnd are separated ly tho tield or sromma, while the units of the diaper continmally grow unt wit ond sumther, or are formed each hy the
 plest pusible diaper, whereas a plain ground with romme - puts is the simplest torm ol sjrinklen pattern. In herahlry, diaper of direpering is an nmament not male up of true lowhlic bearinga or charges. hut cowning any surface, as of the fiedel or atharias. whied is then sainl to be diupered. It is not enmborl.

 tion ; óà, thronırh + фореiv, carryl: tha excretion of sweat from the skin without pereoptible moriture; insmsible forspiration. Dulicines promotine this exeretion are callad rlinplorctics. whila those prablueng perechtible watness of the skin are called sulorifies. But the terms dispho-
retie and diaphoresis are frequently applied to both the sensible and insensible perspiration.

Hiaphragn, or Midrill [7iuphragm is from Gr. סıáppayua harrier, uidritf; leriv, of סıaфpaүvóval, separate by a barrier: $\delta$ sa, apart + фрaүvúvar. tence in; midriff is from A.-S. millhrif: midel. widdle + hrif. Lowels, womits: the thin musculoaponeurotic septum which in mammals separates the abolominal cavity from the thorax. Its center in man is oecupied hy the eordiform tendon or trifolium (trefoil), so called from its shane, which ronghy resembles a clover-leal (Lat, trifotium). The diaphragin is attached to the vertebral colmmu by two muscular honttresses or pillars called crura (Lat. crus, cruris, a leg. It is tramersed by the phrenic (intemal respatory) nerves, and. like the other resuinatory museles, is partly involuntary. In forcible inspiration it is drawn down like the piston of an air-pmmp. It is one of the principal agents in the varions expulsive ats, and also in sncering, conghing, and langhing. Iliccongh (Lat, singultus) is a clonie spasm of the diaphragm.

Díarbekîr, lăe-ăn-bu-keer (in Turkish. hưa-Amid): town of Asiatic Turker: (apital of a pashalic of the same name: sitmated on the risht bank of the Tigris, near its source, and about 200 miles N. E. of Aleppo; lat. $37^{\circ} 55^{\prime}$ N., lon, $39^{\circ} \tilde{j} 2$ E. (see map of Turkey, lef. $\bar{j}-1$ ). It is inclosed by a ligh, stronge stone wall flanked with towers; is the seat of a Nestorian and a Jacokite patriarch, and of a Catholic and an Armenian bishop, and has numerons handsome mosques. bazars, and khams. It was tomenly a more populons city. and had extensive mannfactures of silk and cotton, but these have declined. 'The manufacture of silk is still carried on. Pop. $40,000$.
 throngh + $\delta \in \in \hat{\sim}$, flow ]: a disease claracterized by frequent sutt alvine discharges, 'The causes of diarrhua are very mumerous, and the condition must be consillered as a symptom of many diseases rather than a disense itself. Intestinal irritation and inflammation, acnte or chronie, are frequently the canses, and these depend on improper food and drink. The etfect of improfer drinking water is known to everyone. In the ease of children had milk is the common cause, and especially in summer when fermentative changes are prone to oceur from the hoat. lumam diseases, as cholera, typhoid fever, dysentery, and consumption, diarrhora occurs as a symptom, in conseruence of the intlammation in the bowel. IDiarrhoea is occasionally an expression of extreme debility, in wasting diseases like consmmption, and occurs from the leaking of the watery elements of the blood into the bowels. This is thin to the profuse perspuration of similar ennditions. sometimes the eliarmara mat be salutary, and an ellort on the part of natme to remove poisonons matters as in certain (ases ot Irright's disease. It would not be wise to check it suddenly in such cases.

The treatment of diarrhea requires a close consideration of its canse. If irritating sulbstances. as improper food, lave provoked it, a brisk jurge like castor ail or, especially in children, aromatic tincture of rhmbarb shonld first be given. The diet mast in all eases be regulated, especially in eliildren. Mikd astringents like bismuth and prepared chalk are freguently used with gool result. The more active, as iron, lead, and vegetable astringents, require more care, and obium should be given with great cantion, especially to children. who bear all narcotics poolly. Change of scone. climate and mode of life, all find their applieation, more marticularly in chronic cases.

## Jias, Axtonio (ronçalfes: Nee (insichlvis I)has.

 stand]: a substance contained in spronted barleg, that has the power to comvert stareb into elextrin and maltose and - lextrose. It is contamed also in the leaves of most plants, and many wher germinating seeds besides barley, amd in the harse-chestmot. Sitiva has the samu power as diastase, and it is wnelumed, therefore, that tiastase is contained in saliva. Disstase has not vet been prepared in a fine state, hut in coneentrated form it can be made from low-dried harley malt hy grinding, treating with water, filtoring by menns of a press, and arliling alonlonl. Tlis precipitates the diastase, which is then washel with alcohol, and afterward Nried in wacuo over sulpharie acid. Whatever method may be employed in the preparation of diastase, the product is not a pure chemical compoumb. Jiastase is a white solid substance, soluble in water. Its principal property is the
powe to ennert stard into dextrin and maltose. Smonding to recent researcher, when stareh is disolved in at shlution of diastase at fi 3 , one-thirl is comverterl into dextrin and two-thirats into maltose. It appers probahbe that some forms of diastase convert stareh into destrese or chatese. The antivity of dinstase is greatly inthencent by heat, the action stopping at in to $\mathbf{2 6}$. The activity is deatrosed by the ontinary minemal ands, as well as hy axale, tartaric. and citrie nefle, and many other sulstances, In the preparation of beer diastase elanges the starioh into sugars, and this change is then followed by lementation.

Diaz de la Peña, -ifelăa-pān'rān, Narcteo Virgilio: landscape and figure painter; b, of Spanish parents at Bordeaux, Ang. 21, 1808; fl. at Mentone. Nor. 18, 18i6. He was a painter on porvelain, and began to paint pictures without instruction from a master. Ilis figure-pieees are merely excuses for eolor compositions. and many of them are beantiful in color harmony: He was ne of the great landscape-painters of the Fontainchleau group, and in some ut his morks attains to a rers highlevel. His pietures of the forest of Fontainebleau are those which have mate his repmation. He receivel a first-class metal at the Saton of 1848 and the Legion of Ilonor in 18.5. His pictures are numerons but are often counterfeited. Several are in the Lonsre. A fine example of his work is The Storm, in the collection of W.' T. Wilters, Baltimore.
W. A. C.

Diaz del Castillo. Terasal: Spanish soldier and auther: b. at Medina del ('ampor, Valladolicl, about 1498. He ment to Darien with Petrarias in 1514 as a common soldier ; soon after drifterl to C'uba; was mith Francisco Hernandez de C'ircloha in 1517, when Yucatan was discovered: and with Grijalva during the exploration of the Mexiean coasts, 1018 . On his return he enlisted with Cortés (1515), and served throngh the subsequent campaigus and in the siege of Mexico never rising above sulaltern offices. Ile then marched with Alrarado to Guatemala, where he receired an encomiende of lodians: wats one of the first settlers of Santiago de los C'aballeros and regidor of that town. In 1668 he hegan to write his Coromied do la Conquistu de Jitera Espuma, a narrative of the events in which he had taken part. It was intended as a refutation of Gomaras historr, hot it remained umpublished until long after his death, which oceurred ahont 1593. It was first published at Madrid in 1630 and there are later edtitions, the best being that in the Biblioteca de +utores Españoles, vol. xxvi. The C'orónica is a simple soldiers narmative, embotied in rongh language. but full of information and having the impress of truthfulness. It is perhaps the hest original authority for the history of the eompuest of Nexico.

uncomgenial to his taste he left it and ontainerd a position as reporter on the staff of the Moming chronicle. In this paper appeared the first efforts of his grome, his Shetches of Life and Charater, which in 1836 were conlected and published in two rohmes muler the title stiptehes by Boz. The public gave these a favorable reception, and in $183 \%$ they were followed by The Iosthumous P'apers of the Pickurick Club, which first appeared is a serial in monthly parts. The work had an immediate an! almost umpralleled success, and raised its anthor at once to the first rank among the popular writers of the dar, In its peeuliar vein of humor it has never been erpailed in English literature. He was married in ta:3s to the danghter of (icorte Mogathla music critic, and in the same year appeared Oliver. Turst. a novel in three volumes. This was followed by The Life amb Adrentures of Vicholas Vickleby (3 vols., 1839): Master Ihumphrey's Cluck (1st0-11): and Bumaby Mudge (1841). In $1 \times 41$ he visited the U.S., and in the tollowing year s! peared his Americun Notes for General Cirrnlation, in which lite and wharacter in the L.S. were some what severely satirized. The Diotps whe followed in 18t3-4t by the
 whieh reflected still more on the faults and roibles of the prople of the $\mathbf{U}$. s.

In 184411 r . Vickens went to Italy, whence he returned in $1 \times 45$, and towatd the end of that year he assmmed the thief aditorship of the Deity Nerss, a Liberal joumal then just sitablished. He som. however, resigned this position. In 1sti-ts appeared his Dombey and Som. which, in some of its passages at least, is not surpassed by any of his works either in power or pathos. It was tollowed in 1800 by The Per*anal History of Davill Copperfield, which is regarded by many as the hest of all his nowels. Certainly in none other is the interest more intense or better smstained from the befinning to the ent. It is commonly understom that in the Aury of Dmeit Copprerfield the novelist has introduced many of the incilents or circumstances of his own life, withont. however, fullowing so chosely the real history as in any way to compromise the characters of those with whom he Asisiciatiol. Among his other works may be mentionel Bleth. Ionse (18.5) ; IIarl Times (1854) : Little Dorrit (185i) ; A Tule of Tuo Cities (1860); Great Erppetutions (1862); Our Mutail Frimu (185t-6.5) : and The Mystery of Edwin Irond, left mufinisletl at his death. Household Words. a weekly periodical originated by him in 1s.0, had a very extensive circulation. He atterward in 18,0 started another weekly journal entilled All the Year Romed. In $1 \times 6 i$ he made a setond visit to the U. S., and met werywhere with a cordial and pren enthnsiastie reception. He grave in the principal cities pulalic readings from his own works, which were attended by erowded andiences. He returned to his native comntry in the spring of $1 \times 6 s$, ind died at Gad's Ilill,
 14, $18 \% 0$. Sice his hife ly John Fustrer (3 vols. Swo. 18il-22-i4), ind Kent's Charles Dichens as a Reuter; also Miss Kate l'ield's Pen Photogruphs of C'harleo Dichens's Readings in America.

Diekey, Cilarles Andmews. D. I.: Preshyterian preacher and pastion ; b. in Wheeling. West Vi.. Dece 25, 1838; clu<aterlat Whahington and Jeflerson College (1858), He was pastor of the L'nited Preberterian church of Allegheny City, Pan 1sfi-69, of the Virst Preaberterian church of St. Louis 1s6i9-T.. and of the Calvary Preshyterian chureh. Dickinson, Anva Ehizabeta: orator; b, of Quaker parents at Philadelphia, Uct. 28,1842 : was educated in the Friends' free schonls. Her first public speech was delivered in fan.. 1860, at at meeting for the discussion of woman's rights, and at once entahlished her reputation. During the civil war she delivered many patriotic and political adIresses, and subserpently spoke much non labor veform, woman's suffrage, ete. In $18 i 5$ she entered apon the dramatic protession and poducel two plays. Marie Tudor and Ame Boleyn, in loth of which she performed the principal pirt.
Dickinson. Daxibl Stevens, LL. D. : Senator and lawyer: b. in Goshen. Comm. Sept. 11. 1s00. He was elected as a Demencrat to the Senate of New York in 1836, and became Lieutenant-Governor of that state in 184?. In 1844 he Was chosen a Senator of the IT. S. for six years. He was distinguishen as a debater, aml was the teader of the eonservative (llunker) 1)emocrats of New York. After he retired from the smate he practiced law at Binghamton with success. In 1 with he wis electerl attorney-general of New Jork. During the civil war he zealously supported the cause of the Uuion by public speches. He was apbointed district attorney for the smithern district of New York in the spring of 1 sios, 1). in New York eity, Apr. 12, 1st66. Sce his Life und Works by his brother (? vols., New York, 1867).

Dickinson, Dos M. : lawyer ; b. at Port Ontario, N. Y., in 1845, hut was taken when a child to Detrnit, Mieh., where he has since resided: studied law at Michigan University, and began practice in Detroit ; was I'ostmaster-General Jan. 16, 1888, to Mar. 5, 1889.

Dickinson. Joux. LL. D. : lawyer and statesman; b. in Maryand, Nor, 13. 1332. Ie received his legal edncation in London; practiced law with success in Philadelphia, and was a laputy to the first Cohmial Comgress in 1665 . He was a membier of the Continental Congress in 1rat, and wrote for that body several important state papers, among which was a Declaration to the Armies. Dle was an eloquent and ready debater. In 1756 he spoke against the Declaration of lidejendence, which he regarded as premature, and he was one of the tew members of Congress who did not sign that declaration. He consequently beeame mopopular, and was defeated in the next election, but he served as a private soldier in the war of Independence. In [ir) he represented Delaware in Congress. He was president of Pennsylvaia in 1202-85. He wrote nmmerons political essays. and had a high reputation for learning. In 1is:3 he founted and endowed Iickinson C'nllege at Carlisle, Pa. D. in Wilmington, Del., Feb, 14, 1808.

Dickinson. Jovaphax: Presbyterian theologian; b. at Hatfield, \ass., Ipr. 20. 1688: graduated at Yale College in 1706. IV preached at Elizalsethtown, N. J., from 1509 till his death; hecame president of the College of New Jersey 1746. The wrute several works on theology, 1) in Elizahethtown. N. I., Oct. 7, 174\%. II is collected writings were published in Edinhorgh 1793.

Dickiuson College : an institution of learning. situated in Carlisle. l'a. It was founded in 1783, and with the exception of the University of Pennsylvania is the oldest college in the State. In consequence of the valuable gifts and personal interest of IIon. John Dickinson, "president of Pennsylvania," the institution received his nume. The first president was Cllarles Nisbet, D. D., a native of Scotland and minister at Montrose. Later presidents have been Robert Davidson. D. D., elected in 150t; Jeremiah Atwater, D. D., in 1809 ; John M. Masnn. 1). D.. in 1821; Willian Neill. I. I., in 1894: samuel P. How, in 1830: John P. Durhin. D. I)., in 1483; Rolert Emory, D. D., in 1845: Jesse T. Heck, D. 1)., in 1848; Charles Collins. 1). D. in 1852: Herman M. Johnson, D. И., in 1860; Robert L. Dashiell, D. 1., in 186*: James A. M.C'anler, 1). D., LL.D., in 189: ; George E. Weeri, I. D., in $188!$.

The institution is demonimational. Uutil 1833 it was under Preshyterian enntrol, but the division of that Church into the obl amb new manehes brought the college under grave cmbarasements. The Oha school kept the educafional fumb: the New school hat a majority of the board of trusteres. but, being withont fimuls, transferred the college to the Methodist denomination, moter whose care it now remains. At the lreaking ont of the civil war (1861) it han many students from lhe somthern states; these left, others ware called to the hatle--licid, and the college suf-
fered in its fimane until the year of the cemtenary of
 000. Sine 1sw the mblowment has ben incerned by

Gazetleer is a name frequently applied to dictionaries of place-names, i. e. geographical dietionaries. This title is said to have had its origin in the name of an earle work of the kind. Echard's, The Gazetterr's or Newsman's Interpreter. Examples are Lippineott's (razefteer of the World. a Complete Pronowncing Gazetteer or Gengraphical Lictionary; De Colange. L., The Sutional Gazetteer, a Geographical Diclionary of the L'nited States.

Following is a list of dictionaries, selected and arranged. not on an historical, but on a purely practical, ba-is, as being the most important for general use in comnection with the English language, the historical development of the linglish dictionary being reserved for the artiele Lexicography (q. ‥):

Dictionaries of the English Language in English.-A Neu English Dictionary on Mistarical Principles, founded mainly on the materials collectel by the Philological Society, editet by James A. 11. Murray (Oxford. 1888). The letters A. 3 , and the greater part of $C$ ' and $E$ had appeared in Jan.. 14:3. The aim of this work is "to furnish an adequate account of the meaning, origin, and histore of English words now in general use. or known to bave been in use at any time during the last r00 years." It gives an acconnt of the varions forms in which each word appears since the formation of the language in the elerenth ecentury. or since the introduction of the word into the language, and is consequently invaluable for the history of orthography. It discusses these varieties of form in the interest of determining the historical develepment of their pronunciation. It attempts to arrange all the meanings known to have been attached to each word in the order of their development. and to aceount for this development. It furthermore seeks to give by application of the comparative nethod the prehistoric etymology of the word. Its purpose is not to dietate to usage but to record usage. It promises to be as valuable a classified word-inventory as bas ever been made for ant language.

The Cenhury Diclionary, an Encyclopadic Lexicon of the English Language prepared under the superintemdence of Witliam Dwight Whituey ( 6 vols., New York, 1891), addresses itself more directly to the demands of general use than Murray's Dictionary. It is far less pretentions in its aims, and is naturally less exhanstive in its treatment of the history of form and meaning, being based upon far smaller collections of material. Its etymologies are generally brief. Free use of excellent ilhustrations and much explanation of things as additional to that of words proper cause it to share sume of the characteristies of an enerelopadia. In its roeabulary (over 200,000 words) it goes far beyond any other dictinnary, having adted a great number of modern scientifie and techuital terms, and many provincial and dialectal words.

The Imperial Dictionary of the English Lanquage, a romplete Encyclopedic Lericon. Literrary. Srientitic, and Trehulegicul, by John Oqilvie: new edit. hy Charles Ammandale (Lomdon, liva). This is the prototype of the Century lictomary, which has fullowed its general plan and is based to some extent upon its material.
Hr-boter: Internntionat Diclionary of the English Languayp. being the Inthrntic Edtition of Webolur's ChetEridged Dictiontry. Rerised under Sugierivision of Siouk Purter (springfielf., (bet.. 1s:m). This is the most servicealale dictionary of its compass (one volume). It includes a dictionary of noted names of fiction, a promouncing gazet-
 rieabulary of scripture proper names, of Cireth and latin proper names, and of longlixh Chri-tian names, a collection of phrases and prowits from forequm langases, and one of arlitrary sims nsed in printing and whitio. [ts fefinitions ate precioce The etymongios thansh limited to the harest examials, repreme the hest scientific work. The eitations from literature are limitol.

1 Jictionary of the EMglish Lemgnayp by Rer. Jomes stormonth, the Prenumcielium Pavised biy Rere: I: If. Phelp (New lork. 1smi\%. 1 fietionary hased escentially upon the stambard English of Eugland, anl as such a pirticularly
valuable hook of reference. especially in the matter of prononeiation. It does nut seek to present an inventory so much as a norm of usage. A peculiar leature of the book is the arrangement of the worl-material in groups according to derivation, or sometimes according to etymology; thas in one group under music: musical, musically, musicalness, musicinn. music-glasses, te.

A Seu Lictionary of the English Language by C7. Richarlson (? vols.. London, 183:9). Valuable tor its numerous quotations from standarl authors, chronologicaller arrangerl. Its ctymologies are remarkable for their perversity. A new and greatly condensed edition, omitting the useful citations and retaining the baneful etymologies, appeared in 1860.

A Dictionary of the English Language. Founded on that of Dr. Sumuel Johnson, with Sumerous Additions and Ementations, by R. G. Latham (4 vols.. London. 1866); an unsuccessful attempt to adapt the famous dietionary of Dr. Johnson. which first appeared in 1055, to present needs.

A Dictionary of the English Lenguage, by Joseph Emerson Worcester (Boston, 1s60, and in many other subserquent editions).

Schmidt's Shakespeare Lexicon, a Complete Dictionary of all the English Hords, Phrases, and Constructions in the Horks of the Poet ( 9 vols.. 18it-7.5), may be mentioned as a sample of the dictionaries deroted to the explanation of the meanings of worils as used be particular authors.

Etymological Diclionaries of English.-Skeat. IT. W., An Etymulogical Dictionury of the English Languaye Arranged on an Historical Besis (0xford. 1N:2 : :d edit. 1ss : abbrer. of same. A Concise Etymological Dictionary. 2d edit. 1885). The best work of its kind, but very defective on the side of scientifie fhonology. This is particularly noticeable in the treatinent of the loan element of the language and in the field of general Indo-European philology.

Mueller. Eduard. Etymologisches itörterbuch der englischen Sprache (2d edit. ? vols., Cöthen, 18:8). Represents the best philological attainment of the date of publication. Needs revision.

Wedgewood. H., A Diclionary of English Etymology (?d edit. 14i2). Though containing much original and valuable material, its uncritical method and fantastic views of the growth of language render it entirely untrustworthy

Palmer, A. S., Folk-etymology, a dictionary of verbal corruptions or uords perterted in form or meaning by false derivation or mistuken analoyy (London. 1sso). A must valuable and meeful collection of material, neenling, however. a more critical treatment.

The Stanford Dictionary of Anglicized Words and Plirases, edited by (․ A. M. Fennell (184?). This work deals principalls with the material imported into English from other languages since the introduction of printing.

Dictionarits of Phrases amd Synonyms.-Iinget's Thipsaurus of English Words and Phruses, classified and arranged so as to faciltate the expression of ideas and assist in literary compuxition (London, 1852, 1879, 1886, 1842). I classified voeabulary of standard English, with a valuable collection of phrases and proverhial expressions.
Smith, Charles John, Synonyms Discriminated a diclionary of synonymous uords in the English Language, illustrated with quotations from standurd uriters (new edition 18s?).
Crabl, G., English Synonyms Explained (latest edition 1, $\times 99$.

1＇ilu．WV．．Ehymolugisches Hörterburh der arierle．Spruche （IN：3）．This is not strictly an etymolngital dietionarr，but
is a collection of the word-material of the language arranged according to emlings or sutlixes, and is often of great conrenience for etymological or grammatical purposes.

Vaniček. A., Etymologisches Wörterbuch der lateinisehen Spreche (I881); uncritical. Wharton, E. K., Etyma Latina (1890) ; a conrenient hanIbook. Breal-Bailly, Dictionnaire Étymologique Latin (1886) ; intended especially for school use; words are arranged into convenient groups around their primitives. Postgate and Vince, Dictionary of Latin Etymology (in preparation). A Latin etymological dictionary by Prof. Osthoff, of Heidelberg, is also in preparation. 'There follow two dictionaries of Greek loan-words in Latin which are serviceable for etymological purposes: Weise, $F$. O., Die griech. Wörter im Lateinischen (1882); Saalfeld, G. A., Tensaumus Italogracus (1884).

Diez, F., Etymologusches Wörterbuch der romanischen Sprachen(1887). Körting, G., Lateinisch-Romanisches 1 Örterbuch (1892). This is really an etymological dietionary of the Romance languages, having its inaterial arranged aecording to the form of its sources, i. e. generally under the Latin form ; a most valuable book. Brachet, A., Etymological French Dictionary, translated from French by G. IV. Kitelin (1878). Scheler, A., Dictionnaise d'Étymologie Française (1880). The great Frenclı dictionary of Littré ( 4 yols. and suppl., 187484 ) is also invaluable for its etymological material. Coelho, F. A. Diccionario manuel etymologico da. Lingua Portuguesa (1890). Schade, O., Altdeutsches Wörterbuch (2] edit. 187-80). Kluge, F., Etymologisches JFöterbuch der deutschen Sprache (4th edit. 1889). 'The fourth edition has appeared in English translation. One of the best etymological dictionaries of any language. Weigand, F. T. K., Deulsches Wörterbuch (i) vols., 188?). Of first importance for the modern German, especially for the devclopment of signification, is the monumental work begun by the Grimm brothers. Grimm, J. and W., Deutsches II'orterbuch (begun in 1892 still (1893) incomplete).

Fuist, S., Grundriss der gotischen Etymologie (1888).
l3alg, G. II., I Comparative Glossary of the Gothic Lanquage (1887-90)

Miklosich, F., Etymologisches Wörterbuch der slavischen Sprachen (1886).

Meyer, G., Etymologisches Wörterbuch der albanesichen Sprache (1891).

Scientific Dietronaries. - Dictionaries explaining the meanings of words peculiar to the arts or sciences or the technical or scientific meanings of words also in general usage have multiplied with great rapidity, keeping close to the development of the arts and sciences themselves. This is reudered necessary by the fact that the vast terminology of the arts and sciences precludes the incorporation of a great portion of their terms in any general dictionary. All the more important technical or scientitic dictionaries. as of "hemistry, electricity, mechanies, medicine, law, philosoplyy, theology, etc., are found in most public libraries.

Benj. Ide Wheeler.
Dic'tyogens [from Gr. סfктvov, net + root of Gr. 子évos, race]: a name proposed by Lindley for a sub-class of plants included by other botanists among monocotyledonous plants. While they agree with the latter in the structure of the cmbryo, they are distingnished by having net-veined instead of parallel-veined leaves, and the growth of their stems appears to partly resemble that of dicotyledons and partly that of monocotyledons. The most important families referred to this class are Diosporeacpe and Smilacen, and among the plants are the dilferent species of yam and sarsaparilla.

Die'tys Creten'sis: an apocryphal history or journal of the 'Irojan Wiar (Liphemeris Beili Trojami) in six books, purportines to have becn written by a eertain Dictys, who went with ldomenens, Kingr of Crete, to Troy. The original, writen on bark in I'henician characters, is satd to have been discovered in the thirterath year of the reirn of Nero. who ordered it to be translated into Attic Grees. The work in its present form is probably a compiation of the fourtl contury. Sidolams are still aliviled as to whether it is or is not a tramsation of a (imerk original. The professed Jatin trienslator. L. Septimius, dedicutas his work to Q, Aradius. 'I'lureare many imitations of sallust, Vergil, and othor Latin writers, Joctys and lames were very popalar in the llidelle Ages, and fronithem many llomeric legends were introduced into Romance. Sce edition hy K. Meister (Lojpzig, 18ン2) and article DAREs

1]. Warrben.
Dieyn'olon [from (ir. סt-, two + кvข-, nomin. кúav, dog + ỏoovs, tootli]: a genus of fossil reptiles whose rumains

Have been found in South Africa. Animals of this gemus united in their structure the characteristics of different reptiles. 'The closed orbits and sharp, compressed jaws covered with a liorny plate ally it closely to the tortoise, but it also has aflinities with the lizard and crocodile. It takes its name from a pair of sharp-pointed tusks growing downward, one from each side of the mpper jaw. The articulating surfaces of the vartebra being hollow, it may be supposed that these reptiles were good swimmers; and if they were inluabitants of the water, the construction of the bony passages of the nostrils proves that they must luave come to the surface to breathe air.

Didactic [from Gr. $\delta$ เסूкт $\quad$ ós, pertaining to teaching; סьסáбкєь, teach]: skilled in teaching, imparting instruction. Didactic poetry aims chiefly to teach some art, science, or system of philosopliy. Among the most remarkable examples of ancient didactic poems are Lacretius's De Rerum Natura (designed to explain and defend the plilosopliy of Epicurus), which Maeaulay pronounces "the finest didactic poem in any language"; Vergil's Georgics (a treatise on agriculture) ; and Horace's De Arte Pocticâ (On the Poetic Art). Many fine didactic poems lave also been written in modern times. Among the principal of these are Vida's Art of Poetry (De Arte Poeticâ) ; lloileau's Art of Poetry (Li Art poétique); Pope's Essay on Criticism and Essay on Man; Darwin's Botanic Garden ; and most of Cowper`s longer poems.

Didel'phia [from Gr. $\delta t-$, twice $+\delta \in \lambda \phi$ ús, womb, in alhusion to the double condition of the uterus]: that one of the three sub-classes of mammals containing the marsupials, or ponched mammals, equivalent to the Mefalheria of Muxles. Contrasted with Ornithodelphia, the Monotremes, or egg-laying mammals, and the Monodelphia, or placential mammals. See Mammals and Marsupialia. F. A. I.

Didelphys: See Upossum.
Diderot, děe'drō. Inens: French philosopher; b. at Langres, Oct. 5, 1713 ; educated by the Jesuits, and destined for the Church and later for the law, tut eagerly embracen the study of literature. His father, a prosperous cutler of stern character, withdrew from him all support upon his refusal to pursue his professional studies. Among lis first writings were a l'ree translation of Slaftesbury's Inquiry Concerning lirtue and llerit, with comments of his own: Philosophic Thoughts (1746), soon followed by the essay On the S'uffciency of Natural Religion, in both of which he presented the rationalistic ohjections to revealed religion; and Lettre sur les Areugles (1749), in which he showed the dependence of men's ideas upon the five senses, and foresharlowed the modern theory of variability and the survival of the fittest. ITe suggested too the possibilitr, since realized, of teaching the blind to read by the sense of touch. This work established his reputation, but cost him a year's imprisonment. His earlier works were all written under the stress of poverty. His reputation is founded chietly on the Encycloperdia (E'ncyclopédie, ou Dicfionnaire raisonné des Sciences, des Arts et Métiers), of which he and D'Alembert were joint editors. IIe wrote the articles on ancient philosoply, bistory, and on the arts and trates, and supervised other parts of the work. Ihe expended many years on this arduous labor, for which he was qualified by great quickness of intellect and extent of information. Grimm expressed the mpinion that he had perhapis the most encyelopadic heal that ever existed. The first volmme of this work was published in 1751. The Govermment suspended the publication because it revealed too progressive a spinit. The ideas which semmed so radical and dangerous to the governing class of france in $175!$ sonnd strangely commonplace to the modern reader of the Encyrlopedia. It did not advocate atluestic views, nor dirf it directly attack either the Chureh or the state; lat it took for grantal the righteonsness of religious tolerance, it exalted scientific knowledge and peaceful industry, and it assumed that the condition of the mass of the people should be the elicef object of publie concern. The trmelency of all this was hostile to the spirit of the old rigime. In spite of the suspension the work was clandestinely continued, but the greater contributors feared to compromise themselves by writing for an illegral publication, and for seren years Diderot worked almost unaided, finishing several hondred articles, reuling proofs and atterding to the details of the workslop, in the midst of repated insults ame the frequent interference of the poliere. It was completed in 1765 . In that year Catharine II. of Inssia granted him a pension and invited him to St. Petersburg, whithor he went in 1773 , but he soon returned
to France．Amone his works are nowels entithel The Vim and Jucques the Fululist．Ile is consitered ats the chief of the keptical philosmhers called Encyelopiedists．D．in P＇aris． July 30，1i－4．Itis complete works were published by Nai－

The harbor is one of the best in Madagascar. The governments of Nossi-Bé and Ste.-Maric de Madagascar were united with that of Diego-Suarez in 1850 . Pop. (1887) 4,007
C. C. Adams.

## Diegueño: See Fumax Ixdiass.

Diel du Parquet. Jacques: French soldier and administrator; b. about 1600. He was in the West Indies with his uncle, d'Enambuc, or d'Esnumbuc, and succeeded him in $16: 8$ as chief of the infant colony at Martinique. This position was confirmed by the French West Indian Company. Who gave hin the title of seneschal. with the rank of lien-tenant-general. His rule was eficient and generally prosperous. though he had some trouble with a rebellions governor of St. Christopher's (1643) and with the Caribs. In 16.00 he went to Fratuce and bought for 60,000 lirres the promietorship and guw wment of St. Lucia and Grenada, islands which at that time hat not been colonized. The Finglish opposed him it st. Lucia, and gained possession of that inland 1654 . Diel du Parquet snecessfully established a Frencll colony at Gremada, but in his absence the Caribs of the island ittacked it. A war ensued. in which the greater part of the Grenala ('aribs were exterminated, the survivors submitting. The (aribs also attacked Martinique. where Din Purgret only escaped through timelr airl rewivel from some Dutch ships. D. at st.-Pierre, Martiniчue. Jan. 3, 16.5s.

Herbert II. Suitn.
Dielectric $[$ di- $(=$ fir. $\delta$ da, through $)+$ electrir (see ElecTrictre)]: any medium within which it is possible to set up an electrostatie fich of foree; in other words, any substance throurh whied electrostatic incluetion will take place. Dieleceries are, as a clase insulators rather than ennductors of clectricity. कulins, liguids, and gases alike possese the dielectric pronerty, although in varying derrees. The diplectric value (specifie inductive catheity) of ach sulstance is mosturpl hy the ratio of the capaity of a condenser in whieh it furms the inalator, to the capaoity of the same combenser with a vacumm as a dielectric. For a table of cli.lectric conitants thus determined, see lvocotive Capacrits, Sperma.

On the efedro-magnetic theory of light, aceneding to which the nemfinm which tranmits ranliation is the same as that through whith induction takes bare. there shoulel be a refinite relation between the specific inductive capacity of a substanee and its indes of refraction, the syuare rout if the former constant being equal to the indes of refraction for
rery long raves. It has been shown br Arons and Rubens (11iedemann's Annulph. xlii., p. 5sl, anil sliv., p. 206. 1891), and by Rubens (Wiedemann's Amalen. xlv., p. 25\%, 1892), that in so far as the two constants have been determined, the above relation holds true.
E. L. Nichols.

Dielman. reel măan. Frederick: genre-painter: b. in Hanover, Germany, Dec. 25. 1848. Pujil of the Mnnich Academr: National Academician 1883 . Removed to the U. S. When quite a roung man, und spent six years in the U. S. engineering department in Virginis. One of the first pictures he exhibited in New York was A Patrician Lady, at the National Academy in 18\%\%. Studio in New York.
W. A. C.

Diels, deels. Mermans: classical scholar: b. in Hamburg. Germany, Mar 18, 1848: gradnated at Bonn in 1870: professor at the University of Berlin since 15S0, and member of the Berlin Academy. In 1879 appeared his epoch-making mork, Doxograpli Griuci, in which the sources of the doctrines of Greek philosuphers as luanded down by post-Aristutelian scholars are for the first time determined. Other publications are an erlition of simplicins: Commentary on the Plysics of Aristotle: a celebrated treatise on the Chronice of tpollodorus (hhem. Mus. xxxi., p. 1 ff.) ; on Aristolle. Rhet. bk. iii., Emprdocles and Goryias. Seneca and Lucan, Lercippos and Democritos, Sibyllimische Blatter (1s91). He is one of the editors of the Archic f. Gesch. der Philoso$p \neq i e$, begun in $188 \%$.

Alfred Gudeman.
Diemen, deemen. Anthont, van: naval officer; b. at Kuilenburg. Holland. in 1593. He served for many years in the East Indies, and became an admiral. Ite was appointed governor-general of the Dutch East Indies in 16:36. and sent out in 1642 an exploring expeclition under Abel Tasman, who discorered Van Diemen's Land. D. at Bataria, Apr. 19, 1645.
Die'penbeck. Tritten also Diepenbeke, Abraham, fan: historical painter: b, at Betis-le-Duc. Holland, in 160 ar or, according to some authorities, in 1596 ; was a pupil of Rubens, and after a residence in Italy hecame his assistant. In 1641 he was chosen director of the Academy of Antwerp. Iic painted with facility on glass but devoted especial attention to oil-painting and designing; imitated Rubens with great freedom, and gained a high reputation by his skill in composition and coloring. 1 mong his works is a series of fiftr-eight designs called The Temple of the Muses. D. in Dee., 1675.

Dieppo, dee ep': scaport-town of France; department of Seinc-Inferienre; on the English Channel; at the mouth of the river Arques, and at the northern terminus of the Ronen and Dicpue Lailway; 33 miles N . of Rouen, and 143 miles by rail N. WV. ut Paris ; lat. $49^{\circ} 55^{\prime \prime}$ N., lon. $1^{\circ} 5$ E. (see map of France, ref. 2-E). It stands between two high ranges of chatk cliffs, and is defented br a wall and a castle buift on a high cliff. Tessels of 500 tons can enter the harbor at high witer, but at low tide the harbor is nearly dry. Dieppe has a college and a school of navigation, a theater, a public library, and manufactures of watches, lace, fine linen, paper, and ivory wares. Ship-builling, distilling, and fishing are important industries. In the fifteenth and sisteenth centuries its commercial inportance compared farorably with that of the Italian cities. It became a center of Protestantism, and its inhabitants were among the first to support Henry IV. Nocity of France suffered more scverely from the Rerocation of the Edict of Nantes (1685). It is one of the most fashionable wateringr-1 haces of France, and is a farorite lamling-place of British tourists visiting Franee. Its import and expurt trade is chiefly with England and

Dies I're: a Latin hymn. probally written in the thirteenth century by a Franciscan friar, Thomas da Celano, commencing-

Dies Irae dies illa
Solret sioclum in favilla,
Teste lievid cum sibylla.
Day of Wrath! On that dread day
In asites rarth shall pass away,
Attest the King's, the Sibsl's, lay.
The Western Church soon gave it a place in its offices as the "Sernuence for the Deal," so collen hecmuse in the Roman mass it is sung between the Epistle and the Gospel, folloming immediately after the Gradual Hymn, when that is sung. In an Einglish form it las also been adopted into the hymi-books of the Church of England and others. It is chicf among the "seven great hymns of the medixval

W. А. C .

Difference Encine: a calculating-machine which operates by the methon of differences. such are the calculat-ing-machines of Babbage and Scheutz. Sec CalculatingMa'mines.

Dillerences. Method of: in algebra, a method of finding any distant term of a series or the sum of a definite number of terms. by means of the differences between the initial terms, the differences of their differences, and so on. A first order of differences is found by taking each term of the series from the next term following. Thus if the series be $a, b, c, d$, etc.. the first order of differenecs is $b-a, c-b$, $d-c$, etc. : and the first of these $(b-a)$ may be indicated hy $d_{1}$. The second order of differences will be foum by taking each first dilference from the next following first difference, and the first of the second differences may be inlicated by $d_{2}$. In like manner are found $d_{3}$. $d_{4}$, ete. If the law of the serites be expressed by a formnla in which the indices of the powers of the variable are integrat, or which is capable of being transformed into such an one, the differences of the order denoted by the highest power of the variable will be cupal and those of higher orders will be zero. Thus if this highest power be the $m^{\text {th }}$, there will be $m$ orders of differences.

Differential: in mathematics, an infinitesimal lifference between two values of a variable quantity. When a variable quantity, as $x$, is taken in two states indefinitely near to each other, as $x$ and $x+h$. the infinitely small difference. $h$, is called the lifferential of the variable, and is written in analysis $d x$. If the given quantity is not $x$ itself, but a function of $x$. sly $F(x)$, then, when $x$ hecomes $x+h$, $F(x)$ becomes $F(x+h)$, and the differential is $F(x+h)-$ $F(r)$, which may be written $F^{\prime}(r, h)$. The analytic method which is fonnded on differentials is called the differential calculus.

## Dillerential Caleulus: See Calculus.

Differential Thermometer : a thermometer for indicating very slight variations of temperature. The instrument as here deseribed was invented by Sir John Leslic. It consists of two glass butbs connceted by a narrow tube, which is nsuall bent in the form of a U. The bulbs are upinmost, and are fillell with air. While the tube contains a column of mercury or sulphuric acid. The measurement is effecterl ly the expansion of the air in one of the bulls. This instrument is far more sensitive than mercurial and mon ot her themometers, owing to the greater expansive power of gases. It is cstimaterf that a change not greater than the fiomh h part of a degree Fahrenheit can be indicated by it. The differntial themometer has bern largely superseded for dulicate measmements of temperature by the Tueryoptle (\% č.).

Dillirentialion: the operation in mathematies by which the differential of a function is teterminet. The allied nuration. Which loas to the determination of the derived fum tion (or differential (eoelficient), is ustally termed lerivation. The partial ditherntiation of a function of two or more independent rapiables is the differentiation of that functions. on the hypal hesic that onn ouly of these rariables suffers change. Finite differentiation is the operation by which the difierne of a function correspmang to a finite differnere of a varable is determinet. The tern is also use 1 to denote the prucres of development in plants and animals from simple to complex orcanizations.

Diffration [from latt, dis- a]art + jrangere. fractum, herak]: in opties a deviation or whectiom which the rays of light undergo in passing very near any opuque body. It
had been observed by Grimaldi. but Newton first explained its canse. Let a beain of solar liylt, retlected horizontally, be admitted into a dark chamber through a small round hole: and received on a white sereen. If the hole have a sensible diameter the image of the sun on the screcn will sutfer no semsible alteration of color; but if we place in the axis of the beam, ant at a distance of 5 or 6 feet from the hole through which it is admitter, a metallic plate haring a very fine puncture and intercepting all other light than that which passes through the puncture, the appearance on the wall will be surronided with several encentrie colored rings, covering a space far exceeding in extent that which the solar beam wonld have occupied if its rays hat followed their rectilinear direction. Br substituting a very narrow slit for the puncture in the plate or sercral punctures or slits close to each other, very beautiful phenomena are produced. See OpTtes and Colok.

Diffraction fringes produced by the passage of monochromatic light through a triangular hole.

The accompanying figure shows the series of diffraction fringes formed when lirht is allowed to pass through a mmall triangular aperture aml is canght upon a screen. The original photograple of which this is an enfargement (about 10 dimmeters) was obtained by 1'rof. B. W. snow without the use of lemses, the sensitive plate being exposed in the path al a beam of monochromatic light after the passage of the rays through a minnte triangular hole.

Revised hy Fi, L. Nichols.
Ilisamma [Gr, $\delta \iota$-, two, double $+\gamma \dot{\alpha} \mu \mu \alpha$, name of third letter of Greek alphabet ]: a nameapplied by the Greek grammarians of the Roman period to what was miginally the sixth letter of the Greek alplahet as received from the Phonicians. Its original name wis lau. It smrvived in many of the prorincial alplabrts, as in those of Laconia, Iheraclea, Arcos, Corinth, Coreyra, Ilegara. Crete, Phocis, Locris, Epirus, Thessaly. Boentia. Elis, Ircadia. but in the historical period had clisappeared from the alphatuts of Ionia and dttica, as the somed it clenoted lad disapreared from the dialects of those localitios. It passed oreve into the limman alphabet as F from the alplabet of Chalcis, of whel the Roman was only a continuation. The present standard Greek alphabet of litorary use is the Ionic alphahet as used at Athens since the end of the fifthentury. Diahectal and rare or obsolete words cited by the grammarions ind in the old glossaries, e. © that of llesphise often show the digamma nuder the guise of $B$ or $\Gamma$ or even $T$. The lat two are due to misconception of the form of the lettor, the first toran attempt to aproximate the somd. Trases of an existener of the sinnal at the protul whan the llomeric prems were first taking shape are found in its influence upon the quantity of syllahles and its closiner of andramt hiatus, thomeh it never
 lable of the former woril may be used as bong on acconnt of the $F$ which was orierinally pronounced as initial in the latter. The luss of the sombl in fireek may often also be reriferl by etymolories: thus olvos, wine: Lat, rínum: ibs, prison, Jat. löres, ete. The sound of digamma was a
bilabial spirant，probably unt malike the ferman $u$ in zarei， or spanish b．（＇f．Martel，／lomerische Studien：Meydr，（i．，
