lliseres：an linglish fambly，seretal members uf which

between Walsinglam, Burleigh, and others conerming the marriage of Elizahetly and the Dake of Anjou (1642), and the ('ompleut Ambussador (16.i.s).- 1 lis son Duney published Crituwfuthess of subjects Tuking up Armes atyuinst their Socereign (164i3). 11. in 164?.

Dishton Rock, ditin'rok': a stone bearing a rude and unveatabl. inscription, attributed by some to the Northmen; stands on Timuton river in the town of Berkley. Bristol co., Dass.

Digit [from Lat. digitus, finger] : in arithmetic, one of the ten symbols. $1,1,2$, , ete., by which all numbers are expressed. In astronomy the term is used in speaking of ecrlipses to denote the twelfth part of the diameter of the sum or moon. Thas the eelipse is suid to be of ten digits if ten parts of the twelve are conctaded. Digit is alsu a mensure of dimension eqnal to the breath of a finger. and estimated at abont thre-fourths of in inch.

Diwita'lis [from Lat. digitnle, glove, or digita'lis helonging to finger (digitus), used as translation of thimble (ferm. Fingerfut]: a geme of plants belonging to the family smophularimere. With the exception of the common foxglove (Digitatis purpuren), which is a native of (ireat liritain, the speries tre mostiy foumi in Suthern limope and diff rent parts of Asia. The leaves of Digitalis purpurea are largely used in metlicine. They are dried and reduced to powder or dissolved as an infusion or tincture. They have a very bitter taste, and ure administered in diseases of the heart, to which they act as a powerful stimulant. They contain a crystalline prineiple ealled digitalin, and also digitonin, digitoxin, ind digitalein. Several of the species are cultivated in gartens.

Disitate [from hat. digita'tus, having fingers, deriv, of digitus, finger?: a botanical term ilplicel to compound leaves, the leatlets of which are all borne on the apex or tip of the petiole, as the clover and horse-chestunt. Such leaves are also called palmate.

Higitigrada, or Diy'itigrades [from Lat. digitus, finger + grali, walk]: these carnivorous quadrupeds that walk on their tous. as opposed to plimigrates or those that walk on the sole of the foot. As a matter of fact. a large number of quadrnperts walk on their toes, notably the ungulates, but the term is commonly used in speaking of the carnivora. A group of carnivorat is so called in the system of Cuvier. Among the digitigrada are included the cat, the dog, the hyana, weasel, etc.

Digne, deeñ (anc. Dinirt): town of France; capital of the department of Basses-Alpes; on the river Bloonne, 60 miles N. E. of Marseilles (see map of France, ref. 8-I). It has a eathedral, a public library, and several tamerics; also a trade in almonds. prunes, grain, honey, wax, and hemp. It suffered much on several ocensions during the Huguenot wars. Pop. (1896) 7.276.

Dimitary [from lat, dig'aittes, rank, deriv, of dig'mus, worthy]: in eanon law, originally an ecelesiastic of higher rank ihan an ordinary prist. To this class exclusively beloured all bishons, deans, anil archleaeons, but it now in(Indes alsu) prebendaries am canons. Any officer of high rank inay be called a dignitary.

Dihong, He-honet, also callod Tsinuo: the upper part of the Bramaputra river above Asian. (Sie limanaperrat). It rises on the morth side of the llimalayas, (ravcrass part of 'Pibet, ame lursts throngh that momian-chan near lat. 28 i5 N.

IIijon, dece zhon' (anc. Dilhio): town of France: capita\} of the departmont of 'ooterf'(or: sithated in a plain on the river Ouche at its junction with the Suzon : about $17 \pi$ miles $\therefore$ E. of l'aris, anl 120 miles N. of Lyons, with both of whith it is combeted Iny ralway (see map of France, ref. 5-11). Its muvirons are remarkably beatithal. Dijon was furberly the celpital of Burgumly, and the residence of the Dukse of limennuly for three centuries. Origimally a Roman fortitied eamp, it fassed throngh many vicissitules. being hurneth by the satmens in the eighth cutury. sucked by the. Nommans in the ninth, again lextroyed by fire in the twelth, and lusieged by the Swiss in 1503, hat samed by the concelnsion of a hmoliating treaty. S'erere fighting took place aromm it in the Franen-fieman war, and it was surcessively ceptured by the Germans and the Frenel. It is well buitt, has spacious and cleath strects, aml is inclosem by ramparts. Among the primeipal publice editioes are the paiate of the frinces of Conde ; the cathedral, a Gothie struet-
ure foundet in the thirteenth century; the noble Gothic churelı of Notre Dime; a theater anit town-hatl. Dijon has a large pablic library, a botanic sarden, and an accelemir memersituire: also mannfactures of Leer. brandy, woolen cheth, bunkets. hosiery. chemical prolucts, eaton fabrics, and mottery. Its prosperity is largely derived from the trade in Burgnody aines. flowers, and agricultural prot uets. Pop. (1896) 67,736.

Dike or Dyke [O. Eug. die (whence also with umlant ditch) : Germ. Teich ponl: Fr. digue is borrowed from Low Germ., ct. Dutch dijk]: in engineering, an embankment erceted on the shome of a sea or river in urter to prevent inundation. Sueh embankments raiset along the Mississippi river are catlid levecs. The coasts of Holland are proteeled against the encmachments of the sea by dikes constructed on a grand scale and in asstematic mamer. A larere part of that country is so low that it would be owrflowed by the sea during high tides if it were not protected, partly by natural sandhills or dnnes and partly by artificia\} dikes. The latter are also raiset on the lanks of the Rhine, Wial, and other rivers near their months. The dikes are broad at the bise, and are usually of such magnitute that there is room on the top for a public road. The fabrie is strengthened by willows, either growing or interworen as wicker-work on the sides of the tilie, which shoutd present a very gradual slope towart the sea or river. The Ammophiti and other creeping grasses are carefully cultivated on some of the dykes, and contribute much to their security The base is often faced with masumry, and protected by vait heaps of stones (usually bronght from Norway), and by rows of piles projecting 6 or a fect above gronnd, eonnected by timber, and filled in with fascines weightet witls stones The most stupendous of these embankments are the dikes of the Helder and of West kippel, at the westem extremity of the islanch of Walcheren. The term dike, as the equiralent of the Fr. digue, is applicuble to Breamwaters, Jetties ( $q q . u$. ), to the dams of Holland constructed for engineering purposes, the most remarkable of whieh is the work hy which the I is isolated from the Zuyder Zee (see Caxal), and also to that by which one of the outlets of the Maas has been olstructed.

Dike: in geology, a broal and relatively thin plate of igncons rock, migimally introduced while molten into a fissure. Dikes are inclined at all angles to the horizon, but tho greater number are approximately rertical. When inserted between the layers of a sedimentery formation, they are called intrusive sheets. Rocks traversed by dikes usit ally show alteration at and near the surface of contact, due to the heat of the injected liquid. As dikes are latid bare by erosion, their material often proves more resistant than the inclosing rock, in which case they project above the general level in wall-like ritges, whence their name. See lionks and Volcanoes.
G. K. G.

Dike. Samurl Warren. LL. D.: minister; writer on economic and social questions; b. at Thompson, Conm.. Feb. $13,183!$; graduated it Willians Collere 1863, and at Anlover Thoological siminary 1866: held pastorates in the Congregational church 1s68-82: enrresponding secretary of the National Divorce Keform League 1881; assisted Caroll D. Wright in the preparation of his report on marriare and divorce in the L. $\therefore$ and Europe: has prominently urged the study of sociology in edncational institutions: author of numerns papers ipons sociology and the mariage :und divorce problem, which have been puhlished in the Political Sichace Quarterly, Century, Arena, Allantic Monthly, ete.
C. Il. Therber.

Dildomma [Gr. $\delta i \lambda \eta \mu \mu a$ a double assumption, argument from a double assumption: $\delta \iota$-, two $+\lambda \hat{\eta} \mu \mu \alpha$, assumption, deriv. of $\lambda a \beta \in i v$, take, assume] : a syllogism with a conditional promiss, used to prove the alsurdity or talsity of some assortion. A emblitional proposition is assmbet, of which the antecetent is the assertion to the disproved, and the consequent is a lisjunctire proposition setting forth the supposition on whicla the assertion can be true. If the smposition be denied, the assertion must also le denied. Thus, if $A$ is $B$, wither ( is for E is F ; lut C is not 1 ), and E is not F ; therelore A is not E . The dilemma was ealled the sytloyismus cormutus (horned syllogism), the two members of the ennsequent being the " lorins of the dilemma," on which the alversary is canght. Since there may he more than two horns to the dilemma (giving us a trilemma, tetralemmat, or polylemma), llamilton proposes the term hypothet iea-disjunctive.

Dilettan'te [lable pres. pte of diletteres Lat. detectare. delight]: tu Ltalian twon naturalized in English, livench, and (icmath; orginally symonmons with an cumatere or lover of the fine arts. It is sometimes apflied tor a prexom who persucs an art withont serious purpoce or for mere amusement, and is uften usid as a term of repmath for onte whene knowletge is surertietal and atfertend. The phral is difettenti. In 17a. the socioly of the bilethanti was extablishen in Grat britain to cheourage a tasto tor the fine arts. It sent an expelition to the liat in lifid, and publisher in 169: the first part of the lourien - lutiquiters, the fonuth

 ligue Sculpture in 1s:35, and Alhenian Archilecture in Lsit.
 throngh "attention," "spect, "experition." "dispatedt"]: a four-wheled public vehicle used in Furope. The Fronels dilizence is sery stronerle lonitt, and drawn by four or six huses at the rate of 6 miles an lowr. The fromt, ealleal the coupre, holds three persons, the second compartment (the interifur) six, and the rotomde. entered from hehind, alsn six. Diligenees are also weel in (iermany, Italy. Spain, and Rusin: the lierman dilivence (Eilnergen and Postmegon) is attached to the fuct-onlice. Diligenerisure much less used than formerly, owing to the facilities of railway travel.

Dilke, Charles Wextworthe linglish critic aml journalist: b. Dee, X. 12se; enlucatel at Cmblridge, and served for twenty yars in the nawy pay onlice ; edited Ohd English Plitys. ( 6 vols., 1814 ). Ile purchased in 1830 the theneme which he edited with ability and suceess until is 46. He established the Daily Nems, a Lithral journal in 1546 , and eelited it fur three rears. W, at Aliee Molt, ILants, Aur. 10, 1864. See the collemtion of his comtributions to newspapers atmel periolicals. with biographical sketch, entitled The Papers of a Crilic (1sion).
bilke, Sir C'marles Wexworth: politician: ly, in Chel-

 Anstralia, and halia, and on his retmrn published Greater Britnin. a Revorel of Tratel in English-speaking Coun-
 speral editions, and procured the anthor"s dection to Parliament for Chelsea. He was re-plected in Not, though vinlently ophsed hecausi in the meantime he had acknowledped himsolf a republican. In $18 \times 0$ he was apminter! un-der-secretary of state for foreign affairs, and in I \& \& p president of the leow sempmont hath, with a seat in the cathinet. In 1 set he was appointed chairman of the lenal Commision on the lumsing of the Working Clasese the other mombers heing the Prince of W"ales, Lomd Salishmry, and Cardinal Maming. In lest he was defeated for lenrliament, dubletess for having lum the co-respondent in a thivore suit bronght by ('apt. ('rawfort. He was mot again in public life mutil iste, when, after a contest of mach hitterness, le was returned to Palliament as : Liberal be the Forent of Dean, with a heary majority. Ip to his retiremont in lssio he lat been regarded as a probable future lealer of the liberal perty: The suceceded his father and

Dime[o. Fradisme $<$ Lat. de cimbes, tenth]: a siber coin
 lur. It was formetly writhen disme.

Dimension [from Lat. dimerisio. deriv, of dimbiri. measure off]: in mathematies, the capacity of expmion to tee measured in some diremion. In geometirs a point has mot dimensions; a line, whether straight or cmiveld ha one di-mension-bamely. length: a surface has two-length and breath: and a solid has thre dimensions-length, Ireadth, and thickness. As the lattre is the most general form of extension, space is of three dimensions. space of four dimensions, at expression used by some mathematicians, is simply all ilgebraic term.

Diminution [rom Lat. diminu'ere make small: de, ofl + minus. less]: the act of makng or becoming less: wedrease: in irchitecture, the gradnal decrease in the diameter of a column from the have to the upper end. In heradery, the word diminutions is sometimes used for differences, marks of cadency, and brisures inditferently.

Diminntive [from Lat. diminuti cus. derir. of diminucre. lessen. make smaller]: in grammar, a elervative which softens the meaning of its phimitive. of expresses a yong or a small objeet of the same kind as its primitise: thas (enimutrule (Lat. amimalrulum) to animat. The principal diminutive sullixes in Einglinh are: -pf, -lef. -cle. -rulr, -kin.
 leuflet. lambikin. manikin, duckling. gusling. darliny, bulfock: hlloch. hammorl: (c)mpare hatin fitioliss littio som. with filius. son, hommacuhs: little man, with homm, man, regulus prince, with rer, ling: so Fr. maisomette little house, with maison, homse: Germ. mädchen, with mayd, ete.

Dimity [riâ Mecliary. Lat. from Gr. ठfatos, of dowhle threat; $\dot{\delta}_{--}$, two + pitos, thread]: a cotton fabric of thick texture, and generally figured or atripend. It was formerly much used for hel-hangings and window-curtains. Originally dimity was commonly white, or, at last, of one minform color, but now they are made of different colors. The doth is made with a worem pattern and a plain bame alternating, and a colored pattern is printen on the latter.

 the same species under two distinct forms. which. were not the connection known, would be regardert as distinet species or even as distinct genera. In many eases the dimomphism is sexual. the male and female presenting entirely different characters. Thas in the anker-worm moth the math is winged, the female lacks the wings. In other casws diffurences maty be seen among the indivituals of the same sox. Thus in a South American Isponl (Thats) there meur two types of males, one strunger and with strong pincers for Clasping the female. the othor weaker, with a ditlerently shapet pincer, and with almmdant smelling hairs. For other instances, see PoLryorphiss.
J. s. k.

Dimorphism: in errstallography, the capacity of a substance to crystallize in two distinct forms. (arbon, sulphur, and calcimi carlonate are examples. sulphur when obtained by eraparation from its solution in carbon hisulphide crystallizes in netahedra. but sulpher melted by heat on cooling forms prismatic crestal- The latter have a tendence to break up into octahetra. but these when heaten form smaller prismatice erystals. ('arbon, as the diammel. crystallizes in ortaherlea and allied forms, but as graplite it froms lexagonal crystals.

Diman, down năiti : all old towa of France: deparment of Côtce-du-Nord; on the river lance, 30 miles N. W. of

Rennes (see map of France, ref. 1-1). It stands on a hill of granite abont 250 feet above the river, is inclosed by walls and defended by a castla. It has it handsome cathedral, a puhlic lihrary, a college, and a tow-hall. Here are mannfactures of linen and cotton tabries, saileloth, hats, heet-root snwar, etc. The Rance is navigable from its nouth to Dinam. Pop. (1596) 10.620.
Hinant' [in Fr. pron dee năm, lat. Dinanfium]: town of Belgium ; province of Namur: on the river Meuse; 15 miles S . of Namur (see map of IIollamd and Belgium, ref. 12-F). It is on the declivity of a rocky hill, and is surrounded by picturespue scenery. It has a Gotbic cathedral, a town-house, two hospitals, anl manufactures of cutlery, paper, woolen goods. hats, and leather. Dinant was founded in the sixth century, was strongly fortifiol as early as the twelfth century, and has suffered inuch from sieges. Pop. (1891) 7,048 .

Dinapur, dee-nă̈-pon' : town and important military station of British Imalia: province of Bengal ; on the riuht bank of the Gianges. abont t? miles abore P'atna (see map of N. India, ref. 6-11). Here are spacious barracks, and about 3,200 houses, mostly of mud.
Dinar'elins ( $\Delta$ tivapoos) : one of the ten Attic mators; a native of Corinth who came to Athens abont 34? B. C. and took up the profession of a composer of speeches. IIe rose to influence under bemetrius Phalereus, and fell with him in 30\%. After spending fifteen years in exile at Chaleis in Euboea, he was allowed to return, but it was omly to die in penury and almost total blindness. Though a virulent opponent of Demosthenes, against whom his principal extant oration is directed. he imitated the great orator in a rough way: and hence was called a "barlerbread Demosthenes" (кpiewos $\Delta \eta \mu o \sigma \theta e \nu n s$ ). This imitation is eviclent in the three speeches extant, all pertaining to the miserable affair of
 Mätzner (1842): critical edition by Thalhem (1487). See Blass: Athische Beredsamkeit, vol, iii. (B) Pp. 2e6-24才.

Dinarnie $1 l_{\text {ps }}$ (in Lat. Alpos Dinarices): the name given (1) the range of montains comnecting the Julian Alps with the westem ranges of the Balkan. It divides Dalmatia from Thusiat and Herzegovina, amd a spur extends into Dalmatia. The highest summits are Mt. Wrjen and Mt. Dinara, the former of which rises ahont 6 gej feet ahove the sea. The rocks of this range are mostly limestone.

Din'dorf. Wilafly: philologist : h. in Leipzie. Saxmy, Jan. 2, 1sw? became Profesor of Mistory and Literature there in $1 \times 28$. but resigned in 18.33 in order to derote himself to the pulilication of a new edition of the Thesmerus of Stephanus. Which his brother Ludwig lindonf and Hase had legun in Paris. Along with this he prepared critical elitions of rerr many chassical anthors; among them, an edition of Demosthenes for the Cniversity of Oxford (18t!), and editions of Eschylus. sophocles. Euripides, and Aristophanes, to which were added commentaries and a work on the meters of the same poets: later he empiled a Lexicon Sophocleum and a Lpricon Eschylum. I). Aug. 1, 1883. Sce Biogr. Juhrbuch, vi. (1-8.3), pp, 112-191.
lievised by A. fichemas.
Bingedings. The: a part of the Straits Settlement colony (British) on the west chast of the Malay Peminenla. It consists of the island of l'anglor, with a small strip of the coast of l'erak. It is abont 30 miles $S$. of P'enang.

Hingelstedt. Fravz, won: (ierman peet; b. at Halsdorf. in Hesse, Jan. 30, 1814; apminted lihrarian to the king at Stutteart in 1843; intendant of the rayal theater of Munich in 1850 ; an intendant of the 11 cimar theater in 18, 9 : directtor of the court olera at Vieman in 1N67: and director of the Burgtheater of Viema in 1*í1. Author of Lieder cines hasmmpulitischen Fachorücherss (Sonigs of a Cosmomolitan Nightwatch, 1841): the tragedy Mus Mons der Barneteldt ('1'he llonse of Barneveldt, 1s.0) ; Xiuht und Morgen (Night and Morning. a collection of pens. $1 \times 50$ ) : severd novels, mostly homorous, sketches of travel. etc. His free translations of thakspeare's works, "plecially of the historical dranas became famons on thw (remman stace. Ilingo (the native Anstralian name): a species of dog (Conis dengo) inhabiting Anstralia. It is somewhat larger than at shepherl's dog, of a tawny color, with erect ears and a bushy tail. The dingo is extremely tierce, and heing very destructive to sheep, its numbers have licen greatly lessencil by the efforts of the colonists. In its wild state the dingo lines not bark, but learns to do so in eaptivity. It is re-
markable for being tho only dog living looth in a wida amd in a domesticated state and alse，from the faed that it is the sole large terrest rial mammal nos a marsupial foum in Ans－ tralia．From itc atriking comtrat to the other Austratian mammak it wombere that the dingo could searecly have reached Instralia whont the aid of man，aml ret its remains

Diocle tian (Iat. Dinelefiomus), or more fully, Cains Valerius Aurelins Diocletiamus: a Roman caperor; b. in Dalmatia, in 245 a b. of humble parentage. Ite served with distinction in the army under Aurelian and Probus. On the death of Numerianis, in 284 . he was proclaimed emperor by the army at Chalcellon, and after a brief war in Moesia, in which his rival Carimis was killet. he was installed at Nicomedia. In the year 286 he adopted Maximian as his colleagus in the empire, which was distarhed by ineursions of barbarians and memaced by the Persians, They suppressed revolts in Gianl, and, in order to divide the labor of raling so vast an empire, chose Galerius and Constantins Chlorus as their assistants in sog A. D. and gave them the title of cesar. This was the beginning of the division of the empire into Eastorn and Western: Diocletian reservel to himselt Asian aml Erypt: Mavimian reecived pewer over Italy and Afrima: Thrane and lllyicum were asigned to Galerius : and (Gani and Spain to Constantins Chlorus. The supremacy of Diocletion (whose court was at Nicomedia) was acknowledged by the other threc. Aftur this distribution of power the Roman armies gained successes in Eqypt, l'ersia, and Britain. Diocletian protected or omitteil to persecute the Christians until 303 A . D. when a prersecution was commenced at the instigation of hialerins Dioslotian ablicateal the throne in 305 A A. D., in favor of Galerius, and retirel to Sulona, in !almatia, where he wrotel his time to horticulture. The immense palace which le built at Solona marks a great change in architecture from the pure classic Green-hman st ye to the earliest Romanmentue. This palare is the sulbject of an excellent bow by k. Adim. published in 1564, and one of the earliest attempts at a true archatological treatment. The ruodern town of spalato is almost wholly containal within the walls of this palace. 11. in 313 A. In Sec stibbon, Dectine and Fatl of the Fiomm Empire; Tillernont, Mistoive des Em-

Di'wlon [from Gr. $\delta$-- two, double + doous. os óv, tooth]: a gemns of inarine fishes of the order I'leftognathi, withont distinct teeth, but having the jaws eovered with an ivory-like substance, which is formed by the blenting of the teeth into one. Some of them have the power of filling their stomachs with air and assuming a globular form, whence they are called globefish; others are designated porcupine-fish from their nmmerous spines, which stame out like those of a bedge-hog. Most of the diodons of the Atlantic waters of the $U$. S. are called balloon-fish. They are
of several species. of several species.
Diodn'ms Nic'ulus: Greck historian ; b. at Agyrium, in Sicily; thourished about $50-20$ в. c. He traveled in Europe and Asia in order to collect materials for a muiversal histury, and afterward became a resilent of Rome. 1Ie expended manr years in the composition of his history, which
 books. It is a bistory of the worll from the earliest times to 60 в. c. The name describes it fitly. It is a collection of books in abridged editions, the facts of the greatest interest and importance, the authorities otten a matter of dispute. The librarian lacks knowlenge of the work, critical faculty. vision, and sense of proprtion. The annalistic arrangement is umhappy and the style, though clear and simple exrept where it rises by a spasmodic rhitorical effort, has little movement and is wearisome by its repetition of set phrases. Fitteen entire books of his work, and some fragments of the others, are extant. Anong the best editions are those by Bekker ( 4 vols., 1*is3-54) and by L. Dindorf ( 5 vols., $186 \%-68)$.

Revised by B. L. Gilldersleeye.
Diog'enes (in Gr. $\Delta$ toy'uns) : a famous Crnic philosopher; b. at simple, in Asia Jlinor, itbout t12 B. c. He was a pupil of Antisthenes, whodeclared that it was god-like not to need anything. Accepting this principle, Dingenes inured himself to extreme privations; his honse was a tub. his wealth a cloak, a wallet, a staff, and it woomen cup, and this he threw away on seeinr a lat drink from the hollow of his hand. ITe was a serrere and caustic censor of the follies and vices of the Athenians, who allowed him a great latitule of comment and reproot. De was renownel for his witty and sareastic sayings. He once received a visit from Alexander the Great, who inquired, "What can I lo for yon!" Diogenes replied, "Cease to stand between me and the sun." Having benn captured by pirates, who offered him for sale in a slave-market of Crete, he cried, "Who wints a master? The man who buys me must ober me as masters obey their physicians." He was purchased by Xeniades, a citizen of Corinth. Who was a kind master, and soon liberated him and employed him as a thtor of his children. D. about 323 B. c. Sce Vitter, Mistory of Philosophy: Grimaldi. I itta di Diogene C'ynico (17T).

Diogemes Laertius (in (ir. $\Delta$ toyévns $\delta$ Aat́ptios): the name attacherl to a kind of scrap-buok libeled Lives and Doctrimes of Famous Ihitusiphers. Of Dingenes himself we know alisolutely nothing. The work contains impurtant information. interesting anculotes, and priceless extracts from lost worke all put together in the most mechanical way. See Trencr"s Epicurea, introdnction. The standard edition is still that of IItibuer ( 4 vols., $1805-383$ ).

Dionysins (Gr. Aoviotos) Hoe Elder: tyrant of Syrucuse: b. about 480 b. c. He was in his youth an obsomre private citizen, and beeame a general in the service of the repulilic of Syracuse when Sicily was invaded by the Carthaginians. In the year 40.5 he usurped the supreme power in syrace. which then ceased to be a repmblic. Ile suppessal soveral insurrections of his subjects, and in 397 B. C. hegan or renewed hostilities against the Carthaginians. Who then held some towns in Sicily. Ilis tleet was defeated by the Carthaginians. who besieged Syracuse, but their suctess was hindered by a pestilence. and Dionysins gained a derisive victory over them after they had hist great numbers by disuse. He also cuptmed several towns in sicily, and nate comquests on the Italian peninsula. He was an able ruler, Hisplayed superior political talents, and was me of the most powerful princes of his time. At the request of Dion he invited I'lato to lis court, but the lectures of that philosopher offended the tyrant. who ordered the captain of a slip to take Plato away and sell him as a slave. He was ambitious of literary fiume, and wrote prems and tragedies, some of which he sent to the (1lympic games, but he failed to obstain a prize. It is stated that in the latter part of his life he was very suspicious, and took many precantions against the traitors and conspinators who (he imagined) intended to kill hinn, and there are many stories told of his cratt and eruelty as a tyrant, as, for example, that of the so-called bar of Dionysius, a cave hewn in the rock, and commmicating with his room, from which he conld hear all that was said by his victims in the arljoining 1 mison: but these traclitions are doubtless exaggerated. i). in $367 \mathrm{~B}, \mathrm{c}_{\mathrm{c}}$ and was suceected by his son Dionrsius. Sice Grote. Mistory of frrece. part ii., chaps. Ixxxi--lxxsiii.; Holm, dieschichte Siciliens. ii., 92 foll.

Dionysius the Youmger: fyrant of syracuse: son of
 Was indolent, dissmute, and inferior to his father in poditical talents. Ile was jersuaded hy broy (q. $\tau^{\circ}$ ) to invitu I lato to his court, but the elormence and wisdom of that philosopher were unavailing to reform him, Jionysins banished Diom, Wha in 356 B. c. returnel with as small any and expelled the tyrant. The latter fled to Lorri, and became the despotic rinler of that eity. lle recovered power in syracuse about the year 346, soon after which the oppressed Syracusans applied for aid to the Corinthians, who sent Timoteon with an army in 344 Br . $\because$. bionysms was then deposed, and went as an exile to Corinth, where he is said to lave tanght school.

Dionysius Thrax, or He Thracian: diseiple of Aristar-

 the lasis of grammatical study, and has come down aceording to the juigment of well-qualified scholars, substant ially in its original form. Ed. by lickker in his - tneedota firtert.

## Diomysus: foe Bxeru's.

Dinphan'tine Analysis [so called from Dromastes (f. $\because .0$ ) : a brameh of algehra not reducible to systematic mule. Whicht trats of imleterminate problems, priveipally such as involve squate or enbe numbers, or the relalions of the parts of rightangled trianerles; and in which integral or eronmensintable ralues are fombler for indeterminates by means of artifices suggested by the nature or comditions of the prob)loms themselves. The sulject is now generally included in the theory of mumbers.

Di"phan'lus (in Gr. $\Delta$ óф aveos): Greek mathematician; liwed at Alexandria, probaty het ween 200 and 400 A . It . Ile is the authom of the most anmiont extant treatise on allgelera, and is the repmed insenter of alselma, acemding to hagrage and others. He wrote an important work calted 1 rithmetict, in thirteen lrooks, of which only six are extant.
 terons inserts holonging to the family of hios (IMwside) remarkable for havinis the eysumb ant inna the end of long. horny stalks growing from the sides of the head. In some instances the distance uf the eyes from the heal is ahmost as great as the longth of the wings.

 genmetrial uptice which treats of the refraction nf lient or of the chages which take place in the direction of pays transmitterl from one mestinm to another (as from air to water, etc.), or throngh merlia of varying density. It is api-
plied rhiefly in the construction of telescopes, microscopes, aml other inst ruments requiring the use of refracting lenses. See Oprics and Lexs; also Littrow. Dioptrik (1830): Prechtl, Prectische Dinptrik (1804): Steinheil. Angemendte Optik (Leipzig, 18!0); and Mascort, Traité d' Optique.

Dioptric System: an arrangement of lenses for condensmg light in lighthouses; deviscd by Fresnel about 1819, anul based on the discoveries of Buffon, Condorcet, Brewster, and others. See lafheholse Illumination.

Diora'ma [from Gr. סad. through + ópāua, vision, spectacle; leriv. of opāv, sce]: a mode of scenic display invented hy Daguerre and llouton, and first exhibited in Paris in 1822. The painting is viewed throngh a large aperture or proscenium, beyont which it is placell at such a distance that the light is thrown upon it at a proper angle from the roof, which is glazed with ground glass, ami can not be seen by the spectator, who is in emmparative darkness, receiving no other light than what is reflectet from the painting itself. By means of shatters or curtains the light may be diminished or increased at pleasure ; and some pats of the picture being transparent. light may be whitted throngh it-an artifice which secures the adrantages of painting in transparency without its defects.
Di'orile: a name given near the beginning of the nineteenth eentury lyy the French mineralogist Haüy to a rock belonging to an important gromp of gramular and massive greenstoncs, which in appearance and structure resemble granite, but which in compmition difler materially from this rock type. Hiorite is composecl msentially of the two minerals hornblemie and triclinic feldepar (oligoclase, andesine or labmadurite). It is to the sharp contrast between these constituents that the rock owes its name (Gr. סropl\}erv, to distingnish). (Other minerals may, however, also be present in varying amonnts, giving rise to varietics of the main type. thas the most acid contain free quartz, and are known as quarlz-diorite; the hornblende may be partially rejlaced by mica or augite, producing mica-fiorite. angitpdiorite, etc. The most frequent non-essential constituents are magnetite, apatite, amp sphene. In general appearanee and mode of occurrence dionite is so like granite that it is, as a rule, popmlarly kmow by this name. It is available for all the nses to which granite is applied.
In its urigin diorite also resembles granite. It is usmally an igneons rock, which owes its coarse and granular structure to the fact that it solidified slowly while deeply huried in the eathis crust. In chemical composition diorite is about equivalent to the volamic or sufface igneous rocks called Axoestre ( $q, r$.), and it occupies tun intermediate position betwern granite and gabbro. just as andesite tloes between rhyolite and basalt. In many eases diorite has been shown to hate originated from an angitic rock (gabbro) by the gradual alteration of its agite into hornblende. See Granite, Gabbro, ane Rocks. Georie II. Wilhiams.
 Greek hotanist; b. at Anazarha in Cilicia; lived between 50 and $200 \mathrm{~A} . \mathrm{D}$. He traveled in Asia Minor. Grecee, and laly to procure information ahout plants, and wrote in Greck a celehrated work on materia medica, in which he deseribues or names more than 500 plants. This work was regarded as the highest authority for fifteen centuries or more, and was universally used br medical and botanical stulents. Best edition by 今jurengel (2 vols., Leipzig. 18:9-30).

and plemipotentiaries, which latter tem generally means less than its derifation implies. There are arain ambassadors sent for a purticular object, and others whose functions relate to all the political transactions of one nation with another: there are temporary and resident ambassadors; there are also persons who discharge the office without taking the name. Thus kings or commanders of armies sometimes negotiate treaties. All ambassadons, of whatever rank they nuy be, have the privileges which belong to this class of persons by the law of nations.

Is for the relative rank of diplomatic agents the rules lail down by the plenipotentiaries of the eight leading powers concerned in the Congress at Vienna ale generally followed, together with the supplmentary rule adopted at Aix-la-Chapelle in 181s. The ramks tre-(1) ambassadors, legates, or nuncins; (2) entors, ministers, or others accredited to sovereigns: (3) resident ministers: (4) chargés draffaires aceredited to ministers of foreign affairs or secretaries of state.

The distinctions between these classes are not very clear. Ambissators represent the person of their sowereign, ind are receivel with almost equal dirnity. Agents of the second class represent their sovereign in his affairs rather than in his person. Resident ministrers deal usually with the state department. though representing in some degree the person and dignity of their sovercign. Ther are treated With less ceremony than amhassadors or envoys. Chargés d"affices represent their foreign ministers only. In the diplomatic service of the U. S. ambassators are now employed in some cases, but minister resident is the rank customary, and previons to $189: 3$ no diplomatic agent of higher rank than that of enroy extraordinary and minister plenipotentiary erer represented the U . S. in foreign countries.

In each class or rank the diplomatie employees take precedence among themselves according to the date of the official notification of their arriral. When the ministers of several powers sign acts or treatios in common the onder of signature is determined by lot. 'These mules cut off some of the quarrels between ambassadors of different nations in regard to rank and national honor, which were not infrequent in earlier times. It may be noticer? here that one minister may be aceredited to two different powers ; on the other hand, two of the smaller states may be represented by a single agent at one court.

Ambissadors hare had from very early times a sacred character, which has been sometimes accounted for by their being originally persons of a religious order; but it is better to sir that the affice was protected by religious sauctions on acennnt of its great importance and because withont personal inviolability it could not be usefully arministered. The ancient herald became a sucred person brause he could not otherwise safely meliate between armed men. The ambassador needs for his protection the same sanctions, und, as he represents the hiofhest interests of a state, it is a greut erime to treat him with indignity or injury. There is a ditference betreen the ambassabors of ancient and those of modern times, consisting especially in this-that the former were sent for a temporart purpose, and returned alter completing their work: but the lattur since the time of Jouis Xl. of Franee amd Ferdinand the Cutholic of Spain, have generalty resided in the formgn emmtry for a considerable time. 'The residint minister is now expeeted to make himself wequaintel witly the polities of the country where he lives, th "alculato the chames of war and peace, to use a eonstant inllume in betalf of his own cunntry: and thes. since this enstom hegan, nations have felt themselves mure semure tham before. As interewurse is suspented by war. ambassators, on the outbreak of a war or in exprectation of it. are either dismisselt or smmonmal home. When peace returns, the remewal of intercomese is marked by the parties receiving rach other's dijplomat ie representatives.

In ambissalor repreatents the subereign or the sovereignt $y$ of his country. In a remblie the prower of apminting such atlicers is determinel hy the consitution or the laws, but instractions are given by the exocotive tuthority. In the U. S. diplomatie acunts are appowinterl by the President with the eontirmation of the semate. In nost momarchies the king or enpperor appoints those who represent him in foreign courts. but this he does as the hert of the sovernment. Jonae, when a sovereign is depanel :mal is no longer the actual leal of the alministration, other countrise are not bound to recomize his ambasalars, nor, on the other hand, are thoy hound to receive those of a new sovereign de facto. The ruke here, apart from dymatie and pulitical
preferences, is the same which holls good when new states are recognized. When the de facto govermment is acquiesceri in by a conntry, and is in orderly operation, other comntries will enter into new diplomatic relations with it. If agents of the old and displaced authority are receired also, they will bave no rank, and to do this at all after an establishei state of things exists in the revolntionized conntry is an mnfriendly proceeding, implying a hope that there may be a connter-revolution.

There is no positive obligation on the part of oue state to enter into diplomatic relations with :mother. But if such relations have been customury, to break them off is proof of an unfriendly tisposition. As a rnle, a government will accept the agent accredited to it without question. His social position, religion, profession, traming, and fortume are matters which eoneeru only his own state. lBut there we certain reasons which will warmant a country in declining to receire him. If he be a notorionsly bad character, it will ill accord with the dignity of a state to do so. If be be a subject of the country to which he is sent, he maty be objecterd to, since his diplomatic immunities will contlict with the rights which that country has over him. Mr. Burlingame, for instance, the negotiator of a number of treaties with foreign powers in behalf of China, was treated with in the C.s. as a special agent and not as an envor, since he was still a I'. S. eitizen. If a proposed minister has expressed views hostile to the goremment to which he is accreditert, or merely if he is personally disagreeable or unacceptable to it, a persona non grata, hiv coming may be dectinet, though not withont explanation, for one of his chief duties is to foster friendly relations between the two countries and if his chatacter. sentiments, or antecedents render this work clearly impossible, he may lue fairly ohjected to, Thus, in 1092. China declined to receive Senator Henry W. Jhair. leeause he had spoken in Congress in faror of the exclusion of Chinese from the L.S. and had denounced the Nongolian race. But it an amhassador is receired he is entitled to all the privileges of his office. whaterer may have been his history, as when. in 1888, Mr. Carl Schurz was sent ly the U.S. to Prussia and lulfilled his mission. though a politieal exile from that country.

The privileges of ambasadors may be comprised under the terms invinlahility and exterritoriality. As the privileges themselves arce in great part at loast. due to comity, and as the feelings of men will change from age to age with changes of civilization and greater closeness of intereourse. these terms, especially the seennd. may vary somewhat in their extent of meaning. It will not he safe to give to exterritoriality the broadest meaning it can bear. and then from that incaning detuce the privileges accorded. We must inquire what is the genemal understanding of the present age in regard to the prsition which an ambassador may take in a foreign land, amd then perhaps it may happen that his own country will somewhat eontrict his latitnle of privilege. The privileges in question are ( $a$ inviolability of person: that is exemption from all violence, whether proceeding from the publie authority or from private persons. The excentions to this rule are that the public anthority, when he has comnitted a gross crime, maty send him beyond the horders, using so much force as is necessary for this end: and that privite perions do not lose their rights of selt-rlefense if he is an iggressor: (b) He has rarions privileges, summol up in the wom exterritoriality, which amount to exemption from the operation of forcign law. There is no depurtmre from the theory of his otlice if whon he returns home be is ealled to account for transaetions pronouncerd to be illegal by his eountre"s laws which take plaee while he rexides abroad. and if he commits a crime such trial is a matter of course. 11 is first privilegewhich may be referred to his inviolable character, as well as to his extrritorial-is his rxmption from the criminul jurisdiction of the monntry where he is resident. If there he commits erimes, acknowleded to be such hy the moral sense of mankind. he can not he triml or punished. but can be required lo leave the land, and only in in extreme case, if he refuses to do this, can force be applied. He can not he forced to testify in a crimimal case where he has heen witness to the set, thourh lis gevermment may instruct him to do so. Ife ean mot commit trasun, but he can abet treason and be a party to resolutionary measures, yet his punishment mast be loft to his own sovereign and comtry. Some of the ohter british haswers, as sir Jathew Hale, thought that any copital offense ixeept treason-as rape, murder, or theft-inight subject an ambussador to indictment and triai
like other alims: and still hater it was hold that for erimes committal the them aratine those moral laws whinh keep all somictics twapher they might low boment to gustice like
 at present. Both the law and the fieline of Einglamd have incrased in the reapet they attand th then foreige reper rentatives. The meed of at chle is obviens, for it sulbect to arret and trial an ambasalor might mot be ahbe to discharge his fumplons: (c) The diphonatio agent is exemply from the civil juris laction of the land where he is mesident This expmption is concended to hime everwhere althengh it is not stritly mecessary for the disehatere of his dution. If he contracts dobts, the only remely is by appal to hie sow exegn or hes at in his emmery comerts after his refurn homes. The laws of the ET. S. indelule distrese for rent athong ther lual remeaties which are deniod to the erent iturs of a formign ministry. Motenvers it is not mough that lie lie fren from the conseruences of convietion: the suit againat him should he hrought. In the abice of M. Dromet. a biblan secretary of legation in 15s), the British comts denise! this but if this minciple held there wonlal be no real immmity. (f) The hotel alson and the grons of an ambisallur have the same immonity from local juristietion. Is far as he himsolf and his retinte ari concerned, his house is a suncturry, hut the immmity will not all wh him to dufy the Jaw of the land lie sheltering transeressors. It is ahmittel. on all hambe at the present day that crimimals belonging to the conntry of his residence, if not his servants at the time of the crime, may be searchet for and srizen in his homel, and that all the forec necessary for effecting an ent rance for this purpore may be applied. ( $\rho$ ) by manal comity the personal effecte of the forem minister and the articles from ahmat which he needs for himsitf amb his famity are exempt from duties. He is also free from the payment of lowal taxes, escept upon real property not used hy han for leration purposes. ben on the leration property, owned hy himself or his govermment, taxes are levied in somestates, and certainly all police, sewerate strex. or other lotal ilues shonld be path, though they are mot rentectible by promes of law. In the U.s. the rale of reciprocity is observel, mater, paring, and sewerage dues and tixs-on legation property beine collected if similar property ownet by the $\mathrm{C}^{2}$. S. in the country of the formgn ministri in puestion be taxed. He is liable to the payment of tolls and postage, but can mot le compedled to have tropss ghat tered unon him. Formerle ambassadors abused their privileng of having groals passed free of duty throngh the cols-tum-houst, and, as Byakershock, near the beginning of the eighteenth century, charges upon them, they imported merchandiee which they afterwarl sohd. The sime ahbere contimed for some tinie afterwath, and was, when dismoverd, complanet of in more than one country A minister of the E . A in Spain has been chared with makine importatims fur himself on actount of erritin morchats. It is phan that exmptions: from duties were nower intended to cow any artides herides thase intented for the tase of the rmbasey aml it wond be no brath of eomity to have even this privilere taken away. (f) Diberty of worship. This is allowed in all Christian Jands, ant even bevond their furdere to armbesators, theit tanitios, and, by a stretch of comity, to other forens helonging to the same mation, lat en-religienists wilh the ambassator, if sulyeets of the state in
 (1) be prement. This exmprien, of enture has mo signiticance where as in the $\mathrm{l}^{\circ}$. - ., all religione are fret and it has, at least in one instance, heen clatimel that, where there was alrearly a churell of the religion which the formen min
 might be etengind hims. The jealone one of (atholie and l'rotwiant Christians in fimes pat have lat to the rule that the anhassuldors worshjp mat he primete, and "went houspworship, withom holl, wrgan, or wther figa making it komen to the pmblie, and that the chaplain must mot appear in his
 vions. S゙ostate coula with any rexarl tor it a uwn dignity consent to send a minister to another eont where he was forbinten terestise his own or his mantrys religion, and no honest or honorable man wentel he willing to reprewent his guxproment where such prohibition exi-toms. (g) That the foreign minister may freely dixeharer his functions he must have some asimano of having his retinne at come mand. Aecordinely, his fanily. the secerary of lewation. and the uther ottininls who compun his tram have the sume exemptions which are connectod to him. In this privileg.
his servants ate mimally melutat, ate with as the herareve of

 whose hite ctansel intense thirst, deriv, of aita, thirsi]: a geme of non-venomons serpents befonging the the (ohebridep; natives of the wamer parts of Amerien amb Asin. They are frep-shakes, greatly elongated in form, and having a hroad, thick hend; sme are of large size. Bitymologically the mame is inapropriate.

Dif-sector: an instrment constructed on the prineiple of the sextaser (y. $r$.) for ascertaining the elip of the horizon.
 pathology, a morthid craving for alcolootic drinks, sometimes calleal methomania. The disirase hats been succes-fully trated in "inebriate asylums" in various comatres. "lhe term is also sometimes applied to Debariun Tremess (q. u.).

Dip'tera [rom Gr. סíntepos, laving two wings: $\delta t-$, two + तreporv, wing : the orter of thue inserets which inclutes the flies. They are the most diflerent iaterl (highost) of all insects. and are chameterized ly having the varous month parts so modified into a piereing and sucking orsan that the different elements cam only with ditliculty be tracel. 'Ilae eves are very large ; the anterine wings abone are of use in thicht, the second pair are reduced to shont chabed "hateres "or" hatancers," the Iatter name given in allusion to the fart that withont them the fly can no hager direct its flight. In their dewopment the llies untergo what is known ans a complete metamophosis," The larvir, commonly known as maggots, are usually footless, and some have lost the sinse orgins and biting mouth parts. In some (Coarelata) the papa is inclosed in a hartenerl prpa case: in others (ohtertia, e. g. the mosquito) the phat is free and eapable of motion. The Diptera are divided into two sub-orders: (1) Brachyeren (Cir. Bpaxús. short $+\kappa$ кépas, trorn) with short mutmmir. ILere letong the common house-llies, how tlies, bat thes, and the like, as well as certain forms which, like the sheep louse, haver no degenerated by parisitism that they have lost the wings
 fonthered, antenme, containing the midyes, the mosfuitors.

J. S. Kingisey.

Dipurvearpus [from Gir. $\delta$ intepos, 1 wo-winged + карт $\delta$ s, fruit ]: a Eenns of resinoms trees of the family Diptermempee including about fifty species, nll matives of tronical Asia, They are large tress with opmsite simple, entire or chentate deaves, chasters of harge white flowers, esth with a tulutar, tive-cleft conlyx. which in fruit has two wratly enlarged Iows, petals five, stamens many. ovary superior, threccelled, each cell witt two ovules. D. tirbimutus of India attains the height of elom fret, and is valuable not only fous its durable timber, bat ako fur an oil whell is used in monlieine and the arts. Other species yield resins. ( $\because$ E. D.

Dip'terns [from Gr. $\delta i \pi \tau \in \rho a s_{0}$ two-wingell: $\delta$ e, two + atepob, wingl: $n$ genas of ganoid fishes whose fussil w-
mouns comprising two speeins are found in the old Red mams comprising two speciss are fomd in the old Red double anal and ilorsal lims, opposite to each other.
biptyeh. dipitik [irrom (ir. סitrouos, of thable fold: $\delta$ -
 in the later times of the Roman pmpire a pair rit tablets of ivory or wool, covered on one side with wax. This form had been in use from early times, hut the name is qenerally given to the presentation tablets given as presents hy eonsuls and questors, under the empire. A mumber of these of the fifth and sixth centuris manan; they are elathorately carved, contain the mane and titles of the cmand. and were distribued by him anome his frients on entering his ofliote. On one side of the stered diptyeh were inseribed the bames of living. and on the other those of deceasem, eceleciasties and benefartors of the chergy, whieh were roml thring service by the deaton. Ther were often hecorated with seenes from hiblicall history, hiptyels ane still used in the Eastern ehurehes. sem Tratyoir.

## Dirie: See Eumasides.

Direen: nom de phume of the Brazilian poet Twomss Antosio Goszani. (q. u.).

Dirmor [lat, deriv. of dirigere, directus, dired, control ; di (dis-), anmert regere, direct $\mid$ : one who direct: or manages ; nsuatly on of a number of individuals whose duty it is 10 comblact the attuiss of cortain amerprises, such as lanks, ralwass, insurate companics, ete. Thectors are usually elected by the stokbohers from their own momber they have the right of suphlying castul vacancies, and may delegate their [owers to committees of such mumer as they may juige expertient. The title is aloo nsuatly given to the chitefticer or superintentent of an atronomital or physical ohservatory.
Direchory (in lor, direloire): in French history, the ex eative body of the French romblic extablisheal hy the comstitution of 179.5 whicl represented moxlerate republicanism and marken the lowntall of the Jarohins. This constitution vested the legislative anthority in the Comencil of Five Hundred with the exclusive right of initinting the laws and in the comncil of the ancients ennsisting of eno memters who eonsidered the laws proposed by the fommer body. The Directory consisted of five persons called directors (diverteurs), who were selected by the Comeil of Ehters firm a list of candidates presented ly the Coundil of Five Ilumdred. Their manes wore Barras, C'arnot, Lareyellière de Lépraux, Letournenr, and Rewhell. One of then retired every Year, und was succeeded by another chosen in the same way. bach director presided for three months in turn. They came into power at a time when France was involved in war with marly all lomone and was distmeted hy domestic faetions. Thi French armies gamed many victories under this regime, but the home policy of the lifectory was unpopwhar. The birectory was dividell into two parties and the majority consintime blimas, Larevelliere de lipmux, and Rewhell, remaved thair adversarics ly the comp defot of the 18th Fruetidur (sept. 4, 1\%9\%). In Fivi the directors were Barras, Ducos, (fohier, Doulins, and sicyes. The growing popularity of Napoleon, the dissonsion in the govermment, amd above all the disastrons results of its military policy in 1739, prepared the way for its ow erthrow by the coup defat of the 18th Bramaire (Nor 9, 1299), in which Napoleon, his brother Lucion, and sieyes were the chief actors. see barante, Mistuire du Directoire (1850). Sue Frave.

Directory: a book contaning the manes of the inhabitants of a city arranged in alpabetion order. toget her with the place of business on resitence or buth. The first Lon-
 was puhlishem in 16at, on the U. Ň, as in Great livitam. every town of importance has its own directory. In several States there amo ako published State derefories. 111 New Fork rity the entiest prablisted was in lish-a small volume of eighty-two pages with about !00 names.
Diroctrix, ph. Directricreffemin, of direfore formed on analogy of Lat. ju nitrix: ju uitor, ge netrix: ge nitoml: in grometry, a line which serve for the deseription of a curve or surface. The directrix of a eonic is a right line perpendienlar to the axis, whose distane from any mint on the eurve bears a comstant ratio to the distance of the stome peint from thathens. Quadrie surfare have also directrices possessing athalogns properties. Whan a surface is conceived to be senerated by the motion of a line. right or enved, which always rests on other lixed limes, the latter are sumetimes alled directrices, but more frephently directing lines or diecters, the former being distinguished an the senerator.
 impre of dirigure: the initial word of the funeral hym hambing: :" Dirige bomine, thens meus, in comspectu tho vian matm" (I irect, olata my (iond, my way in thy sight),
 much usen in ita serviees of the Roman Catholic C'lurch.

Dixahility: in law, the ghality or state of beme inem[mbla of enjoying certuin lequl henctits or of hoing a legal
act : also. the fact or circumstance which makes a prom so incapable. The disability is either absolute, as in the case of outlawry or attainder. or it is partial. as in the case of infancy and coverture. It mar arise from the act of (ron? rif the law, of the person himself. or of his ancestor. Capacity. Revised by F. Sifuree Alles,

## Disappointment. Cape: See Cape Disappontment.

Disciples of Christ: a religions bouly often, in the southern and Western U. S., called the "(hiristian Church," or "("hurch of Christ"; sometimes "('anuplellites," al name which is repudiated. however, as they are opposed to all prarty or sectarian names.
Origin.-Tn Scpt., 1809, Thomas Campleell, a minister in the Seceders' branch of the Presbrterian Clhureh. who had migrated from North Ireland in 1807 to Western Pennstrania, being grievel ly the bitterness of party spirit among Christians of different denominations, issued a "declaration and address" deploring the divided state of the Church and the evils resulting therefrom, and urging, as the only remedy for this state of things, a complete restoration of primitive apostolic Christianity-its faith, its doctrine, its ordinances, and its life, and the consequent rejection of all creeds or confessions of laith which stood in the way of such return to the ancient order of things. An association was furmed. called the Christian Association of Washington, Pa., for the purpose of promoting the principles set forth in this new declaration of independence. About this time Alesander Campbell, son of Thomas Camplell, arrived on the scene. fresh from his studies at Glasgow University, seotland, heing then in his twenty-first rear, and having but recently dedicated his life to the ministry. He threw himself heartily into the new movement, and by his ability, learning. and force of character sonn became its recognized leader. It was not the intention of the Camplells at first to form a distinet religions body, but so to learen the churches with the principles they adrocated as gradnally to effeet the neened reforms. Failing. however, to find hospitalits or eren tulerance for their plea within the fellowship of any of the denominations, they found themselves compelled, br the necessities of the case, to assume an independent position. lecordingle, the Brush Run chureb was organized on May 4. 1811, leing the first congregation formed by the new movement.
Busis of Chion.-In assuming an independent position, the reformers, as ther were then called, did not cease their plea for Christ:an union, which they believed it their special mission to promote. Hence in forming the first church they were careful not to inelude anything in the terms of fellowship which the seriptures dia not expressly warrant. I favorite motto at this time was, "Where the Scriptures speak. We speak; where the Scriptures are silent, we are silent." Uniler this rule, first emunciated in the "declaration and address "of Thomas Campbell, they felt compelled to surrender some tencts and practices which they had hitherto held as binding, and to alopt others which they had heretofore disregreded. Having, however, repudiated the authority of human creeds, they felt free to make such changes as womld bring them into strictest harmony with the Worl of fiend, and enable them the more effectively to plead for union on a divine basis. In vielaing the practice of infant baptism because they could find no seriptural anthority for it, and in alopting immersion as the proper form of haptism hecmse the New Testament seemed to teach clearly that such was the original practiee, they fonnd themselves so nearly in accord with the lhaptists as to be received into one of their associations, and for a time cosoperated with them. But it soon developed that the prinriples of restoration held by the camplells and their coandjutors were tow sweephing for a matjority of the baptists, amd the relation was diseontinued, thongh many Baptists emlowed the principles of the Disciples, and went with them. llenceforth new congregations were formed on the simple New Testamment hasis. Ill who gave credible evidence of faith in Jesus ('lorist were, uphn coufessing him, batized and received into the followship of the Charch, heing isked only to take Christ as their leader and the New Testament as their guide
C'ardinal Principles.- Iside from the great fundamental truths which the Bistiples of "hrist hote in common with all evangelical ("hristians, the following are sume of their wharacteristic principles: 1. The ('hureh of Christ is intentionalty anel constitutionally one: and all divisions which mar this unity are contrary to the will of God, and should
be terminated. 2. As these divisions resulted from a $d \rho-$ purture from New Testament Christianty, the remedy for them is the resturation of the Gospel in its purity. 3. 'This restoration intolves the surrender of all human formulations of doctrine as authoritative bases of Church fellowship, and the acceptance of the Bible alone as the rule of fisith and practice: and the confession of Jesus as the Christ, the son of the living God, hy Simon Peter (Matt. xvi. 16) as the creet of the (hurch; the exchange of all party names for seriptural names, and the restoration of the ordinances to their original meaning and place, baptism heing the burial in water of a penitent believer who has died to sin, and the Lords supper being a memorial feast to he observed each first day of the week as the central act of worship. 4. The faith which justifies ant saves has Christ, not dogma, for its oljeet, and is a vitalizing force which issues in practical righteumences, and leads to a life of obedience, and not an orthodos set of notions about God. The polity of the Disciples is congregational, the lowal officers consisting of elders and deacons, besifles a minister or pastor, who mar be one of the elders. Ther combine in district, State, and national urganizations for missionary work, but have no general ceclesiastical body for legislative purposes.
Nimerical Strength.-The growth of the Disciples has been remarkable. Begiming in 1811 with a single congregation of about thirty members, they numbered at the death of Mr. C'ampbell, in 1866, orer 300000 . Statistics fur the U.S. taken in 1892 show 8.419 churches, 5.506 ministers, ise.497 members, and 484.662 Sunday-school scholars and teachers; total number of chmrehes in all lands, 8.976 ; ministers, 5.142 : members, 826.679 . The General Christian Missionary Societr (home), organized in 1849, raised and expended during 1892 \$40,984.3.3. The Foreign Christian Missionary Society, organized in 1805, has missions in India. China, Japan, Turker, England, and Seandinaria. Its principal stations are 24; out-stations, 35 ; missiomaries, 64 ; native helpers, 46 ; in all. 110. In 1802 it raised and expented şon,320.84. The Christian Woman's Board uf Missions (home and foreign), organized in 18.4, raised and expended 838,000 in 1892.

Institutions of Learning. - Among their juineipal schools are Bethany College, Bethany, West Va.; Kentnckr Cniversity, Lexington, Ky.; Butler Cniversity, Irvington. Ind.; Drake Universitr, Des Moines, Ia. : Iliram College, Hiram, O. Eureka College, Eureka, Ill. : Christian Luiversitr, Canton. Ho. There are, besides these many small colleges. All these make the Bible a text-book. Their prineipal publish-ing-honses are the Christian Publishing Company. St. Lonis, No., and the Standard l'ublishing Company. Cincinnati, O. The Disciples publish twelve religions weeklies and one quarterly magazine. See Coristlass and Christlan Conxection.
J. If. Garrison.

Discipline, Eeclesiastical: the means employed by churches to maintain correctness of life among their menbers, orterly government in church atlairs, and to prevent the suread of heresy in their ranks. In the Middle Ages aliscipline was either penitential (that is, inflicted on those who ennfessed their sin: see Pexasce) or punitive, which was. in theory at least, frequently administered by the civil power.

Discipline. First and Second Books of: important documents in the ecclesiastical history of scothand.
The First Buok was drawn mp in 1.60 by John Knox and four others. It lays down rales for the election and support of ministers and other ollicers: for the conduct of priblie worship and the administration of the sacraments: for the maintenance of schools and colleges; and for ceelesiastical discipline. Though sulserithed to by many of the molles, it was never acknowledred by an act of Parliament.

The Second Book of Discipline was drawn up by a committee, and submitter to the Gencral Assembly in $15 i s$. Andrew Melville took a leading part in preparing it. It was allophed, hut Parliament would not ratifr it. It was designed to eorrect ant angment the First Book, which was a hasty performanec, and on the basis of it the present constitution of the Church of Scotland rests. Both books are standarls in that chureh.
The Discipline of the Methodist Episcopal Church is a rolume containing all the doctrines, administrations, and ritual forms of that donomination, and is revised evere four years, so as to inclute the changes made by the quadrennial or general conference.
 soldier or saline in all the eluties of hin profewima, and the implanting of that rexpect for anthority which catses him to ohey withour question the legal orders of his sumpers umber

 Horomard and contimed instrudion. It is the esemtial fitetwo in preserving the zall, opirit, and contideme of tranis under the depressing inthuce of elefat, as well as in re--training the exersies and preventine the demoralization wheln result from sictory: the term is frequenty, but imfroperly, so restrictem in its meming as to include only in--trnetion in drill and the puntive or "diseiphinary measures" used in armies and maves.

James Merctr.
Disclaburr: in law, (a) in mpity phatinge a plea containing an experss denial or remmetion of some clam alleged to have bom made by the paty pleating. (t) 'The ate of one who remmene or refuses to aterpt at rift or devive mate to him of land or other propery, and gemeraly to the waiver of any claim. (r) for the law of landlord and temant, a denial by the tenant of the lamporde title, in such a way as to eanse a forfoitum of the temat's esiate. (if) In patent law, the renumeation of all clain to what is. or apperts fot he, chaimed at at pert of his invention by the patentec in his application for a patent.

Revisul be F. Sturebs Alles.
Dican: lage istand in Davis's stmit ofl the weatem coast
 Demmark, is mombamos in waracter, and has vatuible combl mines. On the sumthern coast is the harbor of Goulhaven.
 quoit + Bereiv, throw : sur calloal ins ahlusion to the hathit of the fish of placing its disk on some firm bonly: a group of fivhes, containing two or thre fanilies, having the rentral fins united to form a sucking disk on the under surface of the baly: by which the amimal is enabled to attach itself firmly to a rock or other fixed body in order to ohtain hookl. To this group helonge the lumpacker (C'yelopterns lumpus) and the sea-smai- (Lipuris).

Disoboblas for etymologys. ser Discoboli]: a quaitthrower: an anciont statne representing a man ether hokding at cirealar quot, latt at rest. like one in the Vatican, or in the very ate of haming the guoit, like Mrrons statue of which a cops exints in the Vatiears, ane in the British alaseman, and one of peculiar importance in the patace bancelluttiat Roms.
 sulporder of tishes in which the anterior dopsal is musified into a sucking disk. Jhis disk is phaerl on the heal, and is composed of hamine so arranged that by exhanation of the water the fish is enabled to adhere to harger fishes or to ships, and is thus carvien to great distanere without effort on its own patt. The group conatios one lamily, the EerneSEIMDE (\%. e.).
bayto
Diocontinums Fonetion: in mathematics, a tumetion which dene not contimmoly incteane or liminish when the indenemdent variable inceases milormy. The function lenn. $x$ is aiscontinums; for thongh the are $x$ inepases uni-
 $-x$ at $x=$ :0 and $x=$ ? 20 .

Diseord [from Lat, diseordia, deriv, of diseros, inharmoninus: dis-, apart + con romlix, heart]: want of concord: disemsion, striti*: a combination of somme which have no harmonical relation. In muxic. a combination of mote more or lens disagremble the the enr. Diseords are lagely employed in musien! compositions, beins intremect by way of
 by contrant, to heishten the pheasing effect. Ther are there-
 shon. The coneod preceding a purposely introducel disenord is called the fromertion, aml that which follows, the resolution.
 compula re seckon]: an allowame or implaction mate for eash of advanced paymone. Than- if a rether athows a dis comet of 15 per cemt. for the promp or alvancel payment uf a bill amominer to seot, the purchand may pay with
 deducted from the face vahe of a promisory mote, bill of excturge. on the like in purdasing the priviture of contect mg it at maturity. Brank divernht, the form recognized in
hasiness and law, is simple impere pail in sudance, and rechoned on the amonnt of the paprer inmead of on the amonat adsanowl. Ther discount is such a deduction as
 comen a mote or bill fens shm doe in twolve monthe, if dis-
 the sime pilper would bring statial (compmed by dividing slom, the fite value. hy $\$ 1.06$, in $81+$ the rate).

Disonsery: in equity jurispronane (ate Equary), the act of diselosure by a defemitant of facts fo which he is required to answer ty reason of a "bill uf discovery" wheh has been tiled aganst him. Tho court mertains sioch al bill to secure the due adminisiration of justice. There mus he minterest on the part of the phantiff in the subject to whels the discovery refors ame the information songht mant appear to be material rither to the prosecution of the suit or of sme other nit or action then pending or which may he hegun. The defembat will not be compeiled to make the discotery when diselonere would suloject him to eriminal proveredias or to a harfoiture, (The works on equity jurispudence should be consulted for fuller information: those br story Adims, Surnce, ete.) In a mumber of the thited stares, following the lead of the New lork code of procelure the hill for iliscovery is aloblished. Either party to an action under that system may ohain an order from a judge to examine a party to an action before triah. The mate of examination is regulated by rule of court. This proceding is a subatitnte for the former bill of discovery. .W. Dwiont.
Dismory of Amorieat See llwet-shas, licsunce samt brembin, Lofty Frussos, Vixhasd, Normbega, Madoc, and Colfombes, C'mbistopher.
bincosery of Terrilory: the clam to territory on the ground ol disenvery, though alwas somewhat vage in it: character, has been a positive somre of state agrandizement sime the fifteentl century, and ewen tholder is mot obsolete. In the early days of adventure and disoovery mariners salkd along a coast, perlaps up it principad rivers lambed, planted their sovereign's flag, arms, or a eross, and clamed as his territory in comsequene the coasts visited and all the comtry drained bey the rivers thas diseovered. The righte of the ahoriginal inhathitants were of amatl imporance. Jlo whole of the American comtinem, Nom and South , the limet and Wrest ludies, and large partions of Avit and Ifricio, were portioned off on the hasis of sheh clams. Uriginat diseovery, however, was nol chough to found a permanent itle to tervitory: but must have been followell by ocenpation and "homeficial use." Bys this latter phase was moant any Weahth-premeing emplosment of the soil or adjacent waters whether for argriculture, fislowies, or the capture of and trade in furs. The indetiniteness of clams to territory based on surh gromads as these. both as to edarmeter and extent, natbrally brought natims into emollict.

## thon of Diseases.

Disfrau'chisemput: the act of depriving a person of any privilege liberty, franchise, or immunity, such as depriving a member of a corporation of his corporate rights. It is distinguished in this case from "amotion," which refers to the removal of an ollicer of the corporation from office, without affecting his membership. Another instance is the act of depriving a person of the rights and privileges of citizenship. This term is often applied to the act of depriving it person of the right to rote, and in Great Britain to the act which deprives a constituency of the right to retum a member to Parliament.

Revised by F. Sturges Allex.
Dishonor [from lat. dis- nn- + honor, honor]: in mercantile law, the refusal or neglect to pay (or to arcept) a draft or a bill of exchange at maturity, or when duly presented for payment. The act of drawing or indorsing such a bill or draft involves the drawer and indorser in an obligation to pay it in case the drawee dishonors the sume. In order that the prem in whose laror it is drawn may have recourse against the drawer and intorser, it is necessary that notice of the dishonor shall be given to these parties without unreasonahle delay: Revised ly F. Stures Aleen.
Disinfection [from Lat. dis-, apart, un- + inficere, infec'tus, affect, intect, taint, stain]: strictly, the destruction of the canses of infections and contagions diseases, disinfectants heing the agents emphoyed in the process of destruction. It is now lelieved that the causes of all infectious and contagions distuses in man and the lower animals are minute organisms and for a certain mmber of theminchuting anthrax, tuberculosis, glanders, malignant adema, erysipelas, various forms of suppration, diphtheria, typhoid fever, tetanus, etc.-these organisms have been isolated, identified, and shown to belong to the family of hateria. For others, inchding some of those against which disinfection is commonly pricticed, sueh as smallpox, scarlet fever, measles, yellow ferer, and typhus fever, the nature of the organism is unknown: but from manifold experience it is inferred that it is destroyed by the same agents that have heen shown to be "ffective against the specific pathogenic bacteria. As employed popularly the word disinfection is quite as often nsed to denote e.fforts at the destruction of infection supposed to be present as it is to denote the actual destruction of infective mathers in the striet sense of the worl: but as there is no other single word which can properly be applienl to the use of disimfeetants, when, as in the great majority of cases, we do not positively know that the canses of infection are present, but only believe them to be there, this loose employment of the word is likely to contimue, anl we therefore speak of disinfecting privy vaults, sewage, or the hold of a ship, althongh in many cases we do not know whether any really infections matter is thereby destroyer].

Disinfection is accomplished by both thermal and chemical means. Thermal disinfection inclndes destruction of infection by both hot air and steam, while chemical disinfeetion implies the destruction of intective particles by the use of substances of a chemical nature. In either case the vitality of the infective agents is destroyed throngh alterations in the protoplam compasing them by the agent conployed. In some cases this involver the decomposition and disintegration of the infedive particles, in others they may be simply killed and not otherwise alteren.
sterilization is the killing of all living things, ineluding spores and regotative forms of mieromerganisms, that may be present in a sulstanco or inclosed space, or on a given surface. Sterilization may be said to involve dixintection, for, althongh a sterilized thind might contain emough of the specific products of the diphtheria beillas to produce the porthological results of the iswase if injected into the living bonly, there wobld be no inceraso of the virus, and hence the persin thas disemat womla not conver infection to another. On the other had disinfertion does not always reguire sterilization, for in a mixther of bateria contaning pathogenic forms many of the hater may be destroyed by mesns: which womld have little effect on the spores of some of the non-pathogenic hacteria pesent.

An antiseptic is a suhstance which hinders or prevents the growth of micro-organisms, ant in its employment is directed especiatly against those forms of bacteria which canse fermentation or putrefaction, or which give rise to supparation in the living bady.
In certain cases the action of a dixinfectant may be limited to the time of its application-as is the case with steam-it kills the living organisms present, but leaves the place or the substance capable of supporting a growth of other living forms that may subsequently gain access to them: while the action of an antiseptic is more permanent. hindering the development of not mily the bacteria present but of those added afterwaril, although it may not kill them. Agents which destroy or mask fonl and unpleasant odors are sometimes called disinfectants, hut this is an error. It is true that some deotorizers are disinfectants, and vice rersa, but there is no delinite relation between odors and infection. and the absence of the one does not imply the absince of the other. The specific organisms of contagions and infections disenses differ in their vital properties and powers, so that what will destroy one may not serionsly injure another, hut in general it may be said that sumlight and the drying action of the air are unfavorable to their development and are nature's chief disinfectants. The action of the oxygen of the air as a disinfectant appears to be often indirect, by lavoring the growth of the common arobic bacteria of nitrification and decay, which either destroy the organic matter required by the pathogenie organisms as food, or develop products which are Ifirectly poisonous to such organisms. Cold is the natural disinfectant for yellow fever -the first frost puts an eml to an epidemic of this disease. and if cases oceur afterward they can be traced to inclused rooms in which the temperature did not fall to the freezingpoint. Even zero temperatures do not destroy the infection of anthrax, of trphoid, of tuberculosis, of smallywx, or of some of the pathogenie microcueci. Disinfection is to be applied to substances ant surfaces which are supposed to have become infected, either directly or indirectly, by the presence of specific pathogenic micro-organisms. The process of removing or destroying all micro-arganisms on the instrmments or hamts of the surgeon or obstetrician, or on the skin of a patient to be operated on, is sometimes called disinfection, but it is more properly named sterilization.

In selecting it disinfectant the following points should be considered : (1) its powers as a germicite under ditferent conditions of concentration and length of time remuirel: (2) its liatility to produce injury to persons or property: (3) the ease and certainty of its aplication by mekilled persons; (4) its cont.

The most certain and valuable disinfectant is heat, which may be applied by fire to effect complete destruction by burning, by laking in dry hot air, by steam noder slight pressure, and by hoiling water. For all articles of clothing and bedding, towels, or other things which can be washed and boiled without injury, this is the cheapest, easiest, and most satisfactory methot of disinfection.

The experience of the large laundry connected with the Hospital for Infections biseses in Ghasgow. extending over fifteen years, has practically proven, what might have heen anticipated from laboratory experiments, that the elothing and bedding of small pox, typhas, scarlet fever, and other similar cases may be freely mingled and passed through the tubs and kettles without risk to subsequent wearers. Simple boiling for fifteen minutes will destroy all known infection except possibly that due to spores, which may require an hour. Even an hour's loiling will not certainly destroy the spores of the hay hacillus, but this is not a dis-ease-prodneing organism.

Dry heat or baking at temperatures of from $230^{\circ}$ to $260^{\circ}$ F. or npward is useful for sterilizing anticles of metal, shiss, erockery, ete., which will not be injured by a little execes of heat, but it is not a gool method of disinfecting blankets. mattresses, pillows, ete., although it is still used in many places for that purpose. Dry heat penctrates very slowly into articles having many air spaces and otherwise heing gond non-conducturs, and the degres and duration of heat which is required to destroy spres (24. $\mathbf{F}$. for five hours) is perilonsly near the (minerature which will injure the texture of wowen stutis, and make them either brittle or change their color. Such a degree of heat fixes stains from blool, excretia, etc., so that they can not be washed ont, and it is practically impossibhe to regulate the temperature of a large hot-air chamber so that all parts shall be of a sutlieient temperature and yet no part in excess.

For this reason disinterting owns are now beng replatel by cylimese or chambers into which stean unter slight presure is admittong. It is desirable that the stam shomid
 only just suthedent to prevent any deposition of monsture in the chamber, and that it shall he so adminted as (t) drive out all air from the interstioes of the inferted artieles as well as from the chamler at laree and thm insure it penetration into the interior of mattreses, pillews, de. The operator shand know when this penetrathen has ben effected by the action of a themometer paced in the interion
 when the desired temprature is reablemb.

It is of adrantare in this form of stem sterilizer to have the chamber so armaged that for a periud bofore tha steam is introduced hot air can be allowed to cuter the chamber. and penetrate the materials to be disinfected. Thens wams all objects, and prevents eondersation of the stem and wettine of the materials in the chamber.
These disinfecting thambers ate nsually mate of boiler iron, and may he fixed or mownble. Nhist large cities in Furope now have one or more slisinfecting stations under the direction of the health authorities, and here a stram dismfocting eylinder is so set that its opposite ends upen intu different romes in orter that the articlese which have 1nem disinfeeted may not he expeseal to the dust of a rom which has reeently contained infected things.

Dust is a most important fartor in practical disinfection. Bacteria and spme rarely exist as free particles in the air, but rather as athering to fraguents of carlon, finely pulvarized straw, sheds of cotton, ete. Ther are not given ofl from the surface of liquils nor from theronghly mist surfacto. unfess with partiches of the liquid thrown into the air as a sprys. Thene it is of the ut most importance in handting infected artieles to ketp them mois until they are dismfreted. Shests, moderelothing. ete.. should be thamoghy mosistenel. or placed in ressele of water before they are taken from the infected room to the lanndry, and mattereses and other artides to be takn to the disinfecting station should the catried in rulber bars.
There are many infected thing amb surfaces to which havt can mot the applimed, and fir these crisems or litguid disinfectants are neet. "ff the gaveous dixinlectants sulphurous acil and whorine are those most heed. "The air of a sick-rum can mot be disinferom while the patient is in it. The wee of chlomite of lime in sumerse or of atrips of chent
 (b-a) far as hisinfection is concement.
The removal of infection from walls, flowes, and the surfaces of fumiture is best effected hy thorugh rabhing with rates or simges mostemed with solution of corronve sublimate 1-1.000, or of cartolic acid:3 per cent., in wnch a wat a- to remove all chas, and then boiling or haming the rags liubbing walls and ceilings with must breal erumbs is a gon way of removing infectims dast. Fspecial care is to be takni to remove the lust from all comiens and project

It will uratly be fombl, however. that the walls and
 Iarning sulphar in an iron got placell on samd. All opne ings into the rom should be tighty chosed, and the fumes should be left to fill the room for at heast twelse hours. It leand 4 th, of roll hrinstone per 1.000 rable: feed will be reo animet, and if the rewn is not more than ustalty airtight if 1b. will be needed. The gas dilluses with great rapility. pone rating uphonory and chothing and has litthe injurimis - ffact "fun furniture of woven stuffs. Ite ethi-iency is preatly ineromand by saturating the air of the row with water-vapur at the time the sulphur is beimp bormal. This is
 ath of builing wher staming at diferem parto in the remm.
It will not destroy sores, and is chindly und fal againet the
 wo be rehiod upon in anthrax. diphtheria, or tuberenhom.
 commen whitwas made with freshly sackel lime, 4 -pmo

The sulution usel in the Pari-disinfertinn rervice is composerd as follows:

A few drops of a i -proment. sulution of earminate of indigrare aded to give it a distinctive color, and the whole added to 2 liters of water.

Halt an ome of eorrosive sublimate to : gal. of water and a few grans of anilin bhe makes a solution of eremeral utility for ilisinferting surfaces of all kinds.

For the disinfection of fecers and of suta a $\overline{5}$-per-cent.
 of carbolia atal is recommondel. "1'hey shatd bo allowed tor remain in entact with the "xoreta for from six th twelve homrs. For disinticting privy valts and cossiunls strong milk of lime is the lest. Corrosive sublimate should not be ased for the disinteetion of exereta or shata, as it forms an insoluble compound with alhuminoms mathers.
Sulphate of iron is not a disioferetant.
Gher chemieal disinfectants which are mone rarels weed are promangante of potash, chloride of \%ince, and sarions coal-tar problucts. These, wilh such substances as iondoform, proxide of hydrogen, eteo, are used for apecial phrposes in modical and surgieal praction, hat are more costly, nore liahe to intlict injury, or in other ways are less disirable tor gempal ase in disinfection than heat. lime comprive sublimate, carlolie acid, chlorine, and sulphurons achl.
For the sterilization of insfruments used in surgion operations it is becoming customary to boil them in water containing? pur cent. of common soda. This methen has been shwn ly experiment to possess much value as a means of disinfection.
f.s. Buhives and A. C. Absott.

Disimteration [from Lat. dis-, mu- + infugrare make whale (in leger), renew]: the separation of the interrant particles of a borly; the dest ruction of cohesim: in meology, the gralual wearing away of a rock by ordinary amospheric action, ete. ; the mocess by which a solid rock is recheced amb comminuted to samel. gravel, or suil. Soil or arable tam is formed and preprated by he disintereration of rocks. The action of the weat her is helpel by frequent alternations: of temprrature ahore and below the peint at which water attains its greatest density-i. e. 34 F .

 northem, eastern, and wothern mareme; sto highest fart is al feet abowe tide-water.

Dispensary [deriv, of verb dispense $<0$. Fr. despenser $<$ Lat. dispensa re, weigh out, distrihute; dis-, apart + pen'dere, pensum, weimh]: a charitable institution in which medical and surgieal ain is gratuitously furnished to the poor. During the Middle Ages dispensaries were set up in the houses of the wealthy and in monasteries and towatl the end of the eighteenth century were established in their present form. They are now established in most large cities. The oldest in Great Britain, the Royal General Dispensary. Battholomew (llose. Lonkon, was openel in 1720. The oliest in the U. S. was foumled in New lork in $1 \% 95$.
Dispensation [from Lat. diapensetio, Wistribution, assignment, management ; letiv. of dispensare, weigh out; dis-, apart + pendere, weigh]: in the Roman Catholic Church, an exmption from some canon or other law. Bishops and pricsts grant dispensations in some cases, but the pope alone has the prower of giving them in the more important ones. Papal diepensations were first granted in 1200 by Innocent 1II. After the English Reformation the dispensing power was assumed by the kings, hut it was abulished by the Bill of Rights in 1689 . See Pardos.
Dispen'satory [fur etymology, see Dispersary]: a book containimg an account of the pliysical qualities and medicinal powers of different drugs, with their natural and commercial history, and their preparation and combinations, One of the most complete works of the kind is the U'rited Statps Dispensutory, by Wood and Bache (1833: 13th ed. 18i0).
Dispersion [from Latt. dispersio, scattering: dis-, apart + spar'gere, spar sum, scatter]: in opties, the angulat selmration of the constituent rays of light when decomposed by the prism. Owing to the unequal refrangibility of the rays of different colors, a beam of light admitted through a small aperture in the shmter of a darkened room, and refracted by passing through a prism, lorms an elongated image or spectrum: the red rays, which are the least refracted, oceupring one end of the spectrum, and the violet rays, which have the greatest refraction, the otherend. The rays after refraction are no longer parallel, so that the index of refraction (the ratio of the sine of the angle of incidence to the sine of the angle of refraction) is different for each ray; and the difference of the indices for the extreme rays is called the dispersion of the light. The amonnt of dispersion varies with the angle of the prism and the material of which it is composed. "n the latter, too. depends thearelative breadth of two parts of the spectrum, or irrationahty of dispersion. It had been supposed by sir Isaac Newton that the dispersion was proportioned to the refraction, but it was soon found that although the colors in spectra formed br prisms of different substances are always arranged in the same order, they tho not occupy the same relative amount of space; a prism of lint-glass giving, in proportion, less ref and more violet than arism of crown-glase and that substanees for which the index of refraction of the middle ray of the spectrum is nearly the same. produce spectra of different lengths.
Disposition [lat, dispositio, from disponere dispose, pnt in order, arrange|: in architecture, one of the six essentials of the art. It is the arrangement of the whole desigu hy means of the iclangraphy (plan), orthography (section and elevation), and scenography (perspective vieir), and differs from distribulion, which signifies the particular arrangement of the internal parts of a building.
Disratli, diz-ray li, Bexinmax, Earl of Beaconsfieln: statesman and novelist : b) in Lomlon. Dee. 21, 1s04; of Jewish extraction; ellucated hy his father and private teachers. He enteren a solicitor's office but had mo taste for legal business, and finally trok to literature. II is principal novels are Iicien firay (1*20): The Joung Duke (1530): Contarini Fipming (1832) ; Itrmirtlu Tomple (1N36) : Comingsby (1844): Lothair (1s̃0): ant Eudymion (1880), some of which wero sucecsful-not so much on acrount of any great literary merit as on account of their clnse reference to actual circmmstances. He hegan his political carver as a Ralical, and offered himself as a candilate for larliament in 1831. but was hefiated. Having hecome a Torr he was again rejected by the electors of Taunton in 1885, lint was elected a momber of Parliament for Maistome in $18: \%$. His mailen speech was so pretentions, and uttered with gestures so extracugant. that he excited the laushter of the House ani clowed abmptly, saying." I shall sit "hwn now. bit the time will come when you will hear me." the married in is $3: 1$ the widow of

Wymdham Lerris. Having gradually acguired skill as a debater he hecame, about 1842, the leader of the "Young Enghand l'arty" and an opponent of Sir Robert Peel, whom he denonnced with unsparing invective because Peel advocated the repeal of the corn-laws. In 1846 he was returned to Parliament for Buekinghamshire, which he represented for many reurs. He succeeded Lorl G. Bentinck, who died in 1848, as leader of the Protectionist party in the House of Commons. He was Chancellor of the Exchequer in the Conservative ministry of Lord Derby for nearly nine months in 1852. About the cud of that year he resumed the post of leader of the opposition in the House of Commons. Early in 1858 he was agrain appointed Chancellor of the Exehequer in the new Conservative Derbe-Disraeli ministry. In 185 : he introduced a bill for parliamentary reform, which was rejected by a majority of the House of Commons. He therefore resigned with his colleagnes in June of that year. He opposed the electoral Reform hill of Russell aml Gladstone, Which was defeated in June, 1866. The Liberal ministers then resigned and the Conservatires formed a new cahinet, in which Disraeli was Chancellor of the Exchequer. He also became the leader of the Honse of Commons and the most prominent minister except the Premier, Lorl Derby. He was the princijal anthor and manager of the Reform bill which became a lav in Aug.. 1867, and extenderl the right of suffrage to every householder in a borough. This bill enfranchised nearly a million of men, mostly workingmen, and Was consillerel a dangerous innovation by the Conservatives. Disraeli succeeded Lord Derby, who resigned the place of Prime Minister in Feb.. 1868." He opposed the resolutions or bill whieh Mr. Glalstone introduced to disestablish the Irish (Episcopal) Church. After a long debate, Nr. Gladstone's resolutions were adopterl her the House of Commons on Nay 1, 186s, br a majority of sixty-four. Disraeli, though defeatel on this important question, resolved not to resign office, lat to wait for the result of the general election, which occurred in the next November. The Liberal party having secured a large majoritr in the new Parliament, he and his colleagues resigued Dec. 2. 186s, and Mr. Cladstone then hecame l'rime Minister. He was chosen lord rector of the Cniversity of Glasgow 1873, and was l'rime Minister again 18it-1880. During this his last term of power he was principally occupied with the formg policr of the country. Among the characteristic measures of his iministry Were the creation of the title Empress of India, the estaljlishment of the "scientific frontier" between Afghanistan and the Russian possessions in Central Asiat, the acquisition of Cyprus, and the subjugation of the Zulus. I). in London, Apr: 19. 1881. See his Selected Sppeches (? vols. 188?); Life, by IItchman (3d ed. 1884) ; Brandes (isia) ; O"Connor (hostile, 18:9); Keblel (1888): Froude (1890).

Disracli. Isac: English author: father of Benjamin Disrati: 1J, at Enfield in Nay, 1766. He studied in Amsterdim and Leyden, and spent some years in France. Inheriting a fortune from lis father, a Hebrew merchant originally from Venice and belonging to one of the Jewish families who escaped to Venice from the Infuisition in Spain in the fifteenth century, he devold himself to the study of literary history. 11 is pincipal works are Curiosifies of Literature (1700): Catumities of Anthors (1812): Quarrels of Authors (1814): and Amenities of Literature (1841). D. at Brandenham llonse, Lhekinghamshire, Jan. 19, 1848.

Disruption [from Lat. dis-, asunder + rum'pere, rup'tum, brak: ct. diruptio, derumpere]: the selnism in the Church of Scotland in 1843. See Free c'inercin of Scotland.

Dissection: See Axatomy.
Dissection Wounds: See Worzos.
Disseizin, or Disseisin [O. Fr. disseisin, derjy, of desseisir $>$ Mod. Fr. dussaisir, disseize; dis-, des-, away + suisir, take. seize]: in law, an unlawful ejection or one who is seized of a freehold in lands, so as to deprive him of the $\operatorname{sensix}\left(q, \varepsilon^{\circ}\right)$ and place it in another. The modern equivalent for this word is "adverse possession." There is also "disscizin by clection." where a person chooses to consiler himself disseized, though he is not so in fact. in order to avail himself of legal remedies applicable to a true disseizin.

Dis'seh, Genrg ludolph: classical scholar: b. Dec. 17, 1ist, near coottingen; a pupil of the philologist lleyne mat the philosopher Herbart : professor in (iottingen from 1N13 till lis death. llaving occupied himself in his earlier years with grammatical and philosunlical investigations
(esperially of Plato), he afterward devoted bimself ixclusively (o) atheitual exergos of the claseios, laying special monHhasis uphn the development of rigid strbiztic litws, whin he comtenced groverned all poetioal mad oratorical compossition amoner tho ancients. This nuw dextrime, thongrh at bottom a sombl one, was carried by its inventor to an mbarmated extreme in his sucoesive conmmentaries on

 Bursian, Giesch, eler chess, Philulugie in Dentschlemd. ן. Tis in. (). Sipt. $21,18: 3 \%$

Alfred Globeman.
Dissenters [deriv, of dissont. from Lat. dissentire diffor in opinion: dise, apart + wentire, think]: Buglish l'rotestants who differ in their views from the Chureh of Finglamd. This party originaly represented the desire for a nome radionl reform than that introtheed by the Jngrean ("horch, ambl was divided into the l'mitans amb the sejuratists, the former of whom expered to reform the Church from within, while the latter resolver to leave its commonion. The Jets of ['niformity in the reigns of Edward V'l. and Eilizabeth late the ettecet of aliemating both these mronis, amb, in spite of severe penalties, the Puritans followma the suparatists in withlrawing from the Church. The tyran-
 lessand the hope of reconciliation, amb the repressive enactments of the stiarts served to embitter the noncondorming Protestants without suppressing the practiee of their fath, till the tables were turned in the civil war and left laritanism in the possessinn of the erowernment. Inother Aut of [ ni fomity, passed after the Restoration ( $166^{2}$ ) , eanseal the acese sion of about 2,000 chrrirynen, who in a restricted sense of the torm have leen called the lissumers. . Dil who refused to take the oaths of allesiance and supremacy, and the Eucharist aceordiug to the rites of the Extablished Chureh, were exeluded ly the $\mathrm{T}^{2} \mathrm{est} \operatorname{Aet}(16 \% 3)$ from Govermment (mployment. By the Tolaration Act ( 1689 ). Dissenters obtainet legal security in celebrating their worship, and the Corporation amd Test Repeal Aet (Ise8) enabled them to ateept publicemploynent without taking the Encharist. In 15.36 they were fiest anthorized to solemnize marriages in their own phaces of worship or at a registrar"s ollice. '1he Gemeral Bory of Protestant bissenting Ministers of the "lhare Wenominations is the oflicial name of the mion of the there boards of the l'resbyterian, Independent, and Baptist ministers resident in and about the eities of lomelon and WVestminster. This union was organized July 11, 172\%. and has always taken a leading bart in the strugele for the disestablishment of the Chureh of Finchand. In some European eountrios Dissenters are called Dissidents. So also Nosionformasts and sepsiratists.

Dissepiments [fromlat. disarpementum, partition, herpive of dissupire: dis-, apant + supire, holare in, foncol: in botany, the partitions formel in the ovary by the mited siles of the colnering coupels. Sometimes dissopiments moed in the center, and divinte the ovary or the fruit into ecells: in other cases they are parial, and lave the ovary onecellet.

## IINSilonts: See I)InsEXTERS.

Dissocialion, or Disassociation [dissociation is from Lat. dissociet re, dismpt the companionship of ; dis- apmet + ao cins, eompmaion]: in ehemistry, the resolution of mare emmplex molecules into simpler ones by the wetion of heat ; also called thermolysis.

The worl was tirst introdnced into chumical nomenchature Iy llenry St. Claire Deville, who presented a paper (a) the
 tuntons Dle composition of Bodies under the lnllumen of lfent. Thevillesays in this paper': "When heat acts upon any brily it produces an expansinn which we atribute to a foree calleil
 and beating it subledently, the distane fotween the molocules and le incoresed to surh an extent that they will sepat-
 derompesition mot determined by any chemical actinn. I Lromese to coll it the tissuriation of eompronad lundies.

A very fall disonsoion of the shlyjer of dissuriation by

 Grove, Rugnanl, lam?, lamburt. Frankland, and C'lausins.

Divolvinur Vions: enlarad images of transparent pice
 blaced side hy side, with their lens tuhes a little convergent,
so that the projected innges may be supernosenl. By means of mechanical contrivances, which difler in ditherent forms of the apmaratus, one ot the imates is gralually extinguished while the other is similaty developerl. At the midtle pmint the two are confusedly intermingled, and afterward one serms toswallow up the other: sim Mate laviters.

 those intervals in mosie whose relative propurtions ane unsatisfactory to the car. In a -ruedial sernse, the term is applicel toa disomant interval jurjosely introduced by the atlition of a dissonant mote to a concord, or by the substitution of a dissonant for a concorelant note.

Disfall [ II. Eng. distuf = disestof; for former eltanent ef. Low (ierm. diesse, husch of flas on the distath, of which noun dizpn, to deck out, represents a dravivative: the latter element is Fing. staff ]: wne of the marliest and most simplo implements used in spinning, (onnsisting of a stick with it cleft or pronged end, around which the fiber to be spun was woume. The distall was usually heda uader the lett arm, at phande was attached to the end of the thread and sot rotating, and the thread as it was drawn out rapilly hy the right land womd itself arouml the spimde. When the sinall whed used for spimning flax was invented the distafl was attached to it. The Fiates are represented as spiming the thered of life from the distaff. The distaff is at present not much used except in rude and harharous countries; but no spinning-wheel, much less any machinery driven by water or stam, has evor prohaced work which ean compare in delicacy with the finest products of the distuft.

Disfance: in music, the interval between two notes; in astronomb, real distanee is an interval between two heavenly bodies exjuressed interrotrial measures, as miles, meters, ete. monn distance is a mean between the perihelion and the aphelion: curtate distance of a phanet is the distance from the sun wearth to that point where a perpendienar let fall from the planet merts with the ecliptic. line of distance in perspectise is a strainht line from the eye to the principal point of the plane, Ihe point of distance is that point in the horizontal lime which is at the same distance from the principal point as the eye is from the same. Distance in naviration is the mamber of miles from print to point in a shifis course. The arc of a rhmmb line between two phacess is the nautieal distance. Distance in horse-racing is the last 2jo yards of the enorse. Any horse not reaching the dis-tance-ponst before the wiming horse las reached the end of the course is said to he distaneed.

Distemper (in Fry detrempe: Ital. tempera): a method of paintine in which the pigments aro groumd up with size and water, white of equ with gmm-water, or similar vehicles. It is omployed in scent-prainting amd in the proparation of wall-paper, bintomper was the ovdinary method of painting in the higher shartments of art hofore the invention of pranting in oil. "he rapitity witlo which the vohicle dries remelors it ditlicult to blend the tints in distemper

Histompros: that nome of certain diseases of animals. Sem log lhistamper, und llorse lostemper.

Disthene: Sice ('rasite.
 verse : a conphet of burses. la the Grock and batin hanghatge the distich consists of : Wexancter followed ly a pentametor virse. It was math nsed by the bareks and lomanns in the expmossion of single thonghtsand sentiments, and in the compersition of eprisrams.

Dislillation [from lat. destillertio, a ilripping or oozing
 stille. a dropl]: in chemistry and the ants, at promess hy which sulnstances which are vaphrized at different tomprotatures are swatated from eately other, or substano which can loe raporizel atre sebarated foom those which catn not. When tha vapuri\%al substance assumbes a solid furm after distillation, the prowess is called "sublimation." Listillation i- nsually performorl lyy means of a builer for raviner the
 solid form. The condenser is often aspiral tabe or w worm," whinh is kegt rond hy water while in ume Vindoms insituments for distilling are need in tha laborators of the chatur

 wigin to a hioh lout carefully reerulated heat. "I hese proct wots are ufter complex, but sombetmes perfertly definte "Fractional" distillation is the selaretion of ofre vulatile
substance from another，hy collecting the parts that pass over at different temperatures in different vessels，and after－ ward distilling each of the fractions a number of times．

To produce spirits two distinct operations are required： one to convert vegetable prineiples into alcohol：the other the separating of the alcohol from the several substances with which it is united while being proluced．Sugar is the principle which is necessary to the formation of alcuhol，and is used directly when molasests and similar saccharine prod－ ucts are submitted to quick fermentation：and indireefly when sugar is produced from the stareh which certain grains contain，and afterward converted into alcohol．The latter method is commonly emploved in distilleries，and grains of various kinds，generally with some malt，are mushed．To arcomptish this result，a mixture is mate of the ground grain and crushel malt，and infusion made in hot water． constantly shaken in the mash－tul，which is lest made of circular cast－iron phates，after which the wort is rmn off and water adden until the soluble matter of the grain is ex－ tracted．White in process of mashing，sugar is formed from the starch，and changes intu alcohol while fermenting；the mash gratually beeomes thinner in consequence，ind as soon as the proper state is reached，which the hydrometer determines，in ordwr to prevent acetic fermentation it should be distilled．See Whisky for full aceount of its distillation．
Much skill and care in mashing，fermentation，and dis－ tilling is necessary to the successfut production of the greatest possible amount of alcohol from a given quantity of grain，fruit，or other raw material．According to Herm－ stalt，about 51 lb．of alcohol and 49 nt carlonic acid may be obtained from 100 ll ．of sugar： 100 lh ．of stareh yield 35 1h．of alcohol and the same y⿴囗十⺝丶⿱一土儿，ty of the following grains yield．a spirit containing 4.5 per cent．of alcohol－namely， whent， 40 to 4511 ．：rye， 36 to 42 ：barley， 40 ；mats， 36 ；buck－ wheat， 40 ：maize， 40 Rerised by ira Remsen．
Distilled Water（in Lat．aquu destilluta）：the comlensed product oltained by the distillation of water，which sepa－ rates from it ull saline matter and impurities，and also most If the uir which it hud previously contained．On this ac－ count it is flat and vapid to the taste．It is much used in chemical and ，harnacerntiend operations．In some points on the finlf Const of the U．S．，as at Brazos santiago，Tex．．． where st reums are unknown and spriags scareely exist， water is procured fur drinking and other ceonomical pur－ poses ly distilation from the sea．On some sear－going stumers the prolluct of the comlenorso of the low－pressure engines is utifized for cooking，washing，ett：

Distillery：an witabliwhment fittom up with appratus for the distiflation of spirits．Sire Distllatios．
Distress，or Distraill：in Euglish law，the taking of a pressonal chatel willout process of law ont ot the possession of a wroug－doer．． 1 y way of plelper for relless of an injury
or fur the performance of or fur the performanee of ainty，as for non－payment of rent or taxes．ple．

## Distribution of Specias：Sice Zoülorical（ieograpix． Distributive Co－operation：Se Cobomizaton．

Disirict［Fr．district（thomblet of detroit），territorial division，from Lat．destrictus，past partic．of destrin yere，
draw away from］：a territorial division：a defined portion of a state or city，which is divided into districts for judicial， fiscal，or elective purposes．The U．S．are divided by the Federal Government into judicial districts，for each of which there is created a district contt（see Courrs）．Wach state having a sutiecient population is divided into congressional districts，which are nearly equal in population，and elect tach one member of Congress．By the census of 1890 ，the population of a＂district＂is to be 173,901 ；the number of districts is 376 ．The ratio is raised atter eich census，in order that the number of members in Congress may not be－ come inconveniently large．Each State is，hy the Constitu－ tion，entitled to at least one representative，though its popu－ lation may not equal the preserribed number for a district． Nevala，with less than 50,000 inhabitants，has one represent－ ative，and Delaware，with less than 170，000，also has one． But each of these States has two Senators．Every State is also divided into senatorinal distriets，each of whicii sends a memtur to the Senate of that State．There are also tax dis－ tricts，lam districts，etc．Townships in many parts of the U．s．are divinded into school districts，each of whieh main－ tains and manages one or more pullie schools．

District Athomeys of the Cuited states：the officers appointed to act as attorneys for the TV．S．in the several judicial districts．Formerly，in Greal Britain，a district of country embracing several counties was assigned to a judge， in which he held criminal conts called oyer and terminer－－ to＂hear and determine＂－as is still done in some of the U．S．An attorney to represent the erown or stite was necessary to enter unn trials．As he was stleeted to pro－ ceed through the whole district，he received the appellation of＂district attorney．＂In the Federal courts，and in many of the states，the duties of this oftieer have lecome local， confinced to a part cular county or place of holding a single court，and the oflicer is called district attorney，as being the attorney appointed for that district only．It is the duty of the district attorney of the U ． S ．to prosecute in his district all delinquents for crimes and offenses cognizable under the authority of the U．S．．．and all civil actions in which the U．S．are concerned，and，unless otherwise directed by the Secretary of the Treasury，to appear in behalf of revenue officers against whom proceedings are pending to recover money exacted by then and paid into the treasury．The office is much sought，buth for the honor attached to it and for the profit arising from it．The district attorneys， with two exeeptions，reeeive a nominal salary of $\$ 200$ ，and the residue of their compensation is mainly derived from fees prescribed ly act of Congress．The amount of the fees and emoluments which may be retained ly a district attorncy is limited by law to 86,010 over and above the necessary expenses of his office．When they defend officers and others at the instance of the Government，their remu－ neration is not regulated by law，but depemls upon agree－ ment．The district attorneys are under the direction of the Attorney－General，and must render to him an account of their official proceedings，and the state and condition of their offices，at such time and in such manner as he may direct．
kevised hy F．Sturges Alles．

## Distriet Comrts of the United States：See Cocrts．

District of Colnmbia：since 1800 the seat of govern－ ment of the U．S．；bounded N．，N．W．，E．，and S．E．by Maryland，and W．and S．W．by the lotomae river and Virginia．Area， 64 sq．miles．originally its area was 100 sq． miles，eonsisting of a traet lying in both sides of the Potr－ mac， 10 miles square，ceded to the U．S．by Maryland and Virginia ti88－89．The Virginia portion，with the eity of Alexandria，was retroceded to Virginia by Congress July 9 ， 1846.

The soil of the District is a light sandy loam，well wa－ tered in most parts．It belongs geologically to the Crua－ ceons formation，with deposits of marl underlaid by gneiss， the surface exhihiting sandstone，limestone，peblies，clay， gravel，saml，and hoam．
The fama and flora are generally identical with those of Easterin Virginia ahd Mariland（ $q$ q．e．）．The l＇otomace river abounds in shal，herring，black bass．perch，rockfish， sturgem，ete．

Climute．－The temperature has a wide range，suddenty rising or falling many degrees，but the climate is as equa－ ble as is common in the Atlantic States，aml generally loolthy，though miasma prevails near the lotomac flats． The mean temperature of summer is $70^{\circ}$ ，of winter $36^{\circ}$ ，and of the whole year $56^{\circ}$ ．A yerage rainfall， 90 inches a year．

The snows of winter rarely lie long on the ground．Storms sehom hast twenty－fur hours．

Ifamfarlures are limited．Actording to the rensus of the U．S．for 1800．Whey comprised 2．3um estabishments，with

 Carpentering showed the larerst aggregate product，s．3，319，－

Finumes．－The assessed value of real estate and personai property in the District in 1891 was $\$ 1+1.609 .891$ ．By law On－half the total expenditure for the District of Colnmbia is borne ly the general fowernment，the other half being taxel on private propecty．The net public debt of the bis－ trict was $819,133,400$ ，mainly ereated by the vast stret im－ provements earried ont hy the shert－lived territorial govern－ ment and board of public works in 18il－it．

Railway－－There are tive street railways uperated ly eable，electric，aml horse power．The Balt，and ohio anit Balt．and Potomate（brancle of the Pennsylvania）atford ramy transit to the North，Sonth，and W゙est．

The commerce of the histrict is trifting．though dienrge－ town is a port of entry and the Potomac is navigable for large vessels to the nary－yard on the eqst branch，and to the head of tidewater ：Georretown．

Brakes．ote－In $1 \times 91$ there were 18 mational banks，capi－
 264s07： 3 loan and trast companics，capital s．？ 80.3 .510 ：de－
 There are s iire－insurance companies，capital，s．800， 0 ；

Fitucution－The publie schome of the District have an enrolment of 35， 664 pupils ont of a popmation of 5 ． 590 children of the sehool age（six to seventern years），with average attendance of $2 \pi, 61 \%$ ．Amont expented for free
 saburies．Private shook for both sexes are numerous and well attended．Thare are 5 miversities or colleges，with it in－tructors and isilis sudents．Georgelown（＇ollege，foumi－ et in lis9（Roman（＇atholie），Columbian University（1814）， and lhward C＂niversity（eolored）have each law，medionl，
 （ $\%$ ．$c^{\prime}$ ）and the Nationat Musemm，erecterl in Now，are free phlific institutions with extensive exhibits in natural his－ tury，etholory，ete．There are 66 public libraties，num－ bering $1,203,1: 56$ whines．
（rocermment－－ 1 territurial gowernment was created by Congress for the Bistrict of Colmbia in 1sil，repeating the charters of the cities of Wahington and Georgetuwn， mad merring them into the wane government．This was ubolished in 18：4．ant the affairs of the bistrict，including thene of Wanington，are now managed by three commis－ sioners under the dirmet lacristation of Congress for the heving and dishursemont of taxes and for all pablio im－ provenumts．The eitizns have no vote，either in District or nathonal affiors．dutice is alministated by supreme fourt of the Dintrict of C＇humbia，having six judges，and by a poliee contrt，presited over hy two juffer．
 tion，ser WAsmintitos，city of．
hevised ly A．R．spormond．
Distri＇tu Federal（that is，the forleral distriet）：a res－ ervation abont the national capital in ferberal gowemments in Latin Suerion．The example was set in the District of Columbin．It was later adopten in Mexico，whote the dietrito federal cmbraces the city of Jexicos and late an area

 sil．miles and ：population of about renor）this inclubes

 present constitution of Rrazil prowido for a national reapr－ Falion in the gengraphial center of the conntry．which dall at some future time serve for the seat of the capital．

M．W．П．

## Disulphide：see Cerrbos Bracthrhos．

Dildh，or Fosse（in Latt．fosser）：in furtilication，a dreep treneh or＂xatration around a fort，serving as ans whatuch to the rachy and eupllying eath for the parabe or ram－ part．It is gemeratly dre hut is sume imper filket with water． In permanent works，such as the regular fortifientions of a town，the rampart and diteh are the most impertant：the former lning beside the latter，and formed of carth exca－
vated from it．The diteh is wften 1100 fret wide，and 12 feet deep below the natural level of the gromod．
 et that．obscurn ：a kinf ul lyric porm sums in homor if Ratechus．It was invented by Arion，in Corinth，ahout 6 ？ B．c．．aceording to Herenlotns．It was of a lofty but often intlated stye ohence the tern dithyramb is frepuenty ap－ phed to any lyrie of a boistermas charactere，suchas might be suppusel to be eomposed in a state of intoxication．

Dilmarschen，or as its Scandinavian mane rabls，Dit－ marsken：a district of Western Holstein stretching atong the North sea from the montly of the Ellue to the mentho of the Eiler，and comprising an areal of about 500 ㅇ．miles， witha population of（1885）79．34\％；its origimal name was Thintmarestyhu－that is，＂Jietmar＂s（ian．＂At bresent it forms no indequatent communty：it is merely a portion of the frussim province of Tholstein．It was imhatsitd by Friwns in the two coast－marks．Nomerstrand and süder－ strand，and by Exams in the two indme marks．Sorder－ hamme and Shlerhume：hat al strongly marked com－ munty in all the piacipal contitions of life spems very early to have obitorated the tribal differences．Charli－ mage clamed anthority over the comtry and conferred the nutlority upan the Arehbislupe of bremen，hat some form of suli－government had alrealy develoned in that （armer of the worth，and the pretensinis of the arehbishon？ romained mere vain－glory．The Danes defeated the bit manchers toward the dowe of the welfh ecntmry and the （ambtry leeame a part of IJolstein under Denish rule（1509）， but conitinued to prearve much of its ional inderendence． It was anmexel to Prossia，with the rest of Mhstein，as a （remsectrenere of the war of 1anif．

Dittany［0．Fr．ditain，dictnme：Ital．dittamo＜Lat． dictemmum＝（ir．סiктauvov，a jhant sath to he so naned be－ canse it grew on Mt．Wicte．in（＇retel：a plant of the genus Hictamrus ami fanily litucer：with the calys five－par－ tite．five petals，uncqual，ten stamens，and five one to three seeded follicular capules．The Dichomus fruximela（ruber ur albus）is a permaini indigenom in simutern Euron。and is oftmentivatel in gardens．It has row on white flowers，
 is often called ras－zalant，and the mame dittany is given to the Cunila mariman，of the orler Labiata．It is probable that the tictamnus of the ancients was the Origunem dir－ tamuns，a labinte plant to which the old authors ascribe the most marvelons powers．

## Ditléah：same as Dativa（q．r．）．

Dit＇lon，Husphrey：mathematician：b．at Salibury， Fngland，Xay en， 16 in：was minister of a bissenting chareh at Thubridge．Die was hefriended hy Sir leare Iowton，whe proured his apointment as mathematical master of （thrist＇s IJopital．He wrote able works cutitled lours of Nature und Jotion（1705）：a Trettise on flurions（1706）： amd Synopsis stlgebraica（170：）．I）．Oct．15．1715．

Dilu：an ishand of Julia，in the drathian sa，near the coast of linarat ：has a forthiod seathor，Din，with a toler－ ahty sate harbor and the remains of a famms bindu temble

 に，го．
Dinretios：meficines whinh promote the sectetion or dis－ charge of the mine．They are wand in certain tages of kidnery diseasco in attrectimis of the urinary zasag＇s．Ama in
 is lacking in certant y，and fioments uph various eanditions． surh as the state of the kiduers themsolvers，the condition of or har crgats，anel the surtumbings of the jatient．

Divan＇from Arah，firmen．comacil，conrt of justice our uf

 thathused ：a wond（x）mmon to several brichtal lansuages． It is employed by the Previans ter demote at collecting of pems ly ene anthor，as the livân of samli and the divan of 11afi\％．The term is also applicel to $n$ muster－10nt on military day－bonk．The Thrkivt divan is the ereat eomed of the empite or－ is alow among the Trubs a common aprollition for a satom or hall which serve for the reception of company and ather

Diver：any hire uf the genus（＇olymhors and family（＇ob lymbide．The bill is straght，otronge ant phintel，tril and
wings short, and the toes wobled. They dive with great facility, and pursue the fish on which they live under the water. The principal species are the Lons (q. r.) or great northern diver (Colymbus glacialis), the black-throaned diver (Colymbus arelichs) and the red-throated diver (Colymbus septentrionatiss). The name is also proubarly applied to mumernas arquatic birds, such as the gredes and auks.

Revised by F. A. Lucas.
Divers: persons who make a lusiness of diving, as in fishing for pearls, sponges, etc., in blasting and other engineering operations under water, and in the recovery of sunken property. (Nee Pearl-fisheries.) In the fisheries, divers still work largely without meehanical aild although the Diving-dress ( $q$. $\ell$ ) is employed to some extent. Amother important device employed by divers is the Divangbell (q. !.)

Divertimen'to, or Divertissement, dée'vã'tečs măй' [didertimento is the Italian and dicerlissement the French word for diversion]: a kind of musical composition arranged for one or more instruments. It has generally no fixed eharacter, and may be classed between the flude and the copriccioso. The term is also appled to a ballet, or songs introduced between the acts of an opera.

Divide: See Basin and Valleys.
Divilend [from Lat. dividendus, to be divided, fut. pass. partie. of dini'dere, divide]: in arithmetic, the nomber or tuantity given to he divited: also the sum apportioned to creditors from the realized assets of a hankrupt's estate, the annual or half-yearly interest on the public funds or national teht, antl the distributed profits of joint-stock companies, which are paid annually or half-yearly to each stockholder.

Dividers: instruments for "dividing" or marking off distances, or for drawing eircles, ellipses, and other curves. They sometimes consist of two or even three hars or legs, joined at one ent by a hinge. Sometimes two movable points are arranged tioslide along a " beam " or straight bar. "Proportional diviters" are made of bars crossing each other and pointed at both ends. By means of a sliding joint at the point of union, dimensions ineluded between one of the pairs of the points mar be made greater or less than those included between the other at the same time in any proportion.

Dividing-engine: a machine for marking the tivisions of scales of measurement in scicutific, mathematical, and astronomical instruneuts. Scales tor mechanics' work were formerly diviled by hand, but it is impossible to attain accurate results by such methots, while by a carefully made engine a must sirprising degree of meceision is reached. The diviting-engine depends primarily for its accuracy upon the degree of precision attainable in the cutting of a sted screw. The most remarkable serews as yet constructed are probalhy those in two dividing-engines designel by Prof. Rowlims. They are used in the ruling of ditlraction gratings for optical work. Test-plates for the microscope have been ruled by Mr. F. Nobert, of Barth, Pomerania, with divisions only $\frac{10000}{}$ of a French inch apart. See Rellag-macmines.

Divi-divi, dee'vě-tlee' vee (Cosalpinia coriariot) : a leguminous shrub of tropul America; ralued for its pols, which contain tamin and gallic acil. It grows 20 feet high, and the poud is 3 inches long. It is used principally for tanning leather and dyeing cloth, and large quantities are exportod from savimilla, lifo Hache ant Naracaibo.

## Divina Commedia, or Divine Comedy: Sce Dante.

Divinalion [from Lat. divinatio, lleriv, of dixina're. [rophese, have divine (dicimes) foresight]: the art of forr1, गhag events by surnstitions experiments, ete., by observing the thight of birds, the plamels, chmals, and also by the allowed imfunce of spirits. Imons the ancient lomans divination was practiced in rarionse forms, amb is supposed
 were fordidhan by the law ol Mases from performing divinat ion of any kind. Among the ancient (irerks divination was extensively practieen\}, Sout it flomishod especially in Chaddarame bigyt. It was mot confinul to anciont races,
 varions ats of divination were commonly phaticed in Fu-

Hivine Risho ol Kinss: the doctrine. prolably of wery ancient urgin, that a monarch was the immediate represent-
ative of Deity, by whom alone he could be held responsible for his actions. It would alpear that the idea was gradually developed out of the principle of anthority that prevailed in the Roman Citholic Church, the power of whose ruters was derived fum above, and we find the divine athority of the civil magistrate assarted throughout the Mitdle Ages. In the grat , pipal-imperial struggle the divine nature of the emperor's anthrity was maintainet by Ghibelline writers, and Dante's De Monarchio reveals the dremm of a new world emperor ruling by the grace of God, but the ifleit was not systematically advocated till the time of the Stuarts in England. The mist complete exposition of the theory is to be found in Sir Robert Fihuer's Patriurcha. Hobbes and other prominent writers supported it. Among its opsponents were Milton and Algemon Sidney.

## Revised by F. M. Colby.

Diving-hell: a hollow, hell-shaped chamber, open at the hottom, used by divers to descend into deep water for the purpose of contucting varions subaqueous works or explorations. A kint of kettle is said to have been uset by divers in the time of Aristotle. John Tainnier (b. 1509) makes in his works the earliest mention of the practical use of the diving-bell in Enrope. In 1665 it was used to raise portions of the Spanish Armadi. Though of clumsy thmensions and imperlect in the manner of supplying air, it was sinilar in construction to those of the prescut day. 1)r. Halley's plan for supplying freslo air was introduced about 1715. His diving-bell consistel of a wooden chamber open at the bottom, where it was loaded with lead to kcep it perpendicular in its lescent. Light was almitted through glass set in the upper part. Air was supplied by means of a hose attached to casks filled with air and weighted with lead, which were let down lower than the bell, In the year 1729 Smeaton first applied the thiving-bell to engineering purposes, and in 17 es he contrivet to supply it with air by the use of the force-pmon. He constructed a diring-bell of cast iron, shaped like it square chest, its greatest thickness being at the lower part, that it might not overturn. It sinks by its own weight, and attords room for two men, being $4 \frac{1}{2}$ feet long. the same in leight, and 3 feet wide. This construction of the eliving-heli gives those within it no power to raise or sink it. The blows of a hammer on the inside of the bell can be heard by those above the water, and in this manner the divers communicate with the assistants by a series of concerted signals. On account of the eumbrousness of this apparatus it is little usef except for heavy works of subaqueons engineering. For most operations carried on beneath the water a submarine armor or diving-dress is employed.
Divins-dress: a waterproof dress worn by divers, enabling them to walk and work under water, An aquatie armor, consisting of a leather dress and a helmet, is seseribed in sehntt's Technice Curiosf, published in 1664. An india-rubber cloth diving-dress was invented sulsequently, with a metal helmet having in front pieces of phateghass. Attached to the hehuet are two tubes-one to admit fresh air in the same mamer as for the diving-lelh, the other to carry off the waste air. Leaten weights are attacleed to the diver. enabling him to descend and walk about. Communication tan le carriet on with those abore by means of a cord romning between the diver and the attendants. The diving-dresses in use at presont make the diver indipendent of any comection with persons above the water. They are elastic and hermetically elosed. The diver carties npon lis back a reservir containing air compressed to thirty or forly atmospheres, which is supllied to him for breathing by a self-regulatiny apmatns at a pressure corresponding to his dephl. When he wishes to ascent, he simply inflates his iress from this reservoir. For full information see F. A. P. Barnart's Fieport on the Poris E.rposition of 1 sit\%.

Divininer liod (in Jat. virgula divina): a Y-shaped or forket brach of wood, usually "ut from a trew ; smetimes artificially male, or a metalice row similarly shaped; by which. accordine to the belief of the vugrar, water or minerals hidden under gromm may twe disenverch. Ithe operator grasps a prong in ench hand, bolding the rod before him as he walks, imd when the exact woot is resehed the rint twists suddenly. puinting to it. The superstition is one of very sreat antiguity. In Eurone the rom used for finding water is nsinally a liranch of the rowan tree in the U. S. it is grameally cut from the witel-hazel. or from a fruit-tree.

Dixom, James, D. D.: Methodist minister; b, at King's Nlills, Leicestershire, Englant, Oct. 28. 1788: heeane a preacher in 1812, and occupied important pulpits in his denomination; was the president of its conference in 1841, and its delegate to the American Nethotist General Conference in 184s. He wrote, hesides other morks, Methodism, its Origin, Economy, and Present Position (London, 1843) and Melhodism in America (1849). D. in Bradtord. Yorkshire, Dec. ${ }^{\text {os. 1871. See his Life by his son R. W. Lhixon }}$ (Lontion, 18i4).
Dixon. James Matx, M. A.. F. R. S. E.: teacher; b. at Paisley, Scotland, Ajr, $20,18.56$; edneated at Ayr Academy and at Edinburgh and St. Andrews Universities. IIe was Tyndall Bruce ©cholar and Tutor in Philosophy, st. Anlrews, 1879: Professur of English Literature in and secretary of the Imperial College of Engineering. Tokiu, Japan, 1856-93, and became Professor of English Literature, Wishington Thiversity, sit. Louss, Mo., 1892. He has publishet a Dictionary of Idiomatic English Phrases (London. Edinturgh, and New York. 18, 10 ) and rarions papers in the Transactions of the Asiatic Society of Japan.
Dixom, William Mepworth: author and eritie; b. in Nlanchester, Englaml, Iune 30. 1821, of Dissenting parents: settled in London in 1846. and eontributed to the Daity Neus. His articles on London Prisons, iu book form, in 18.50, were the preeursors of Mayhew's inquiries into the comlition of the london poor. In 1849 he published a Life of John Horcard, which passed throngh three editions in one yar. In William Pem, an Historical Biograplyy (1851), he replied to the animadversions of Nacaulay on the character of the philanthropical Quaker. He was the chief editor of the Athenarum from 15.53 till 1869. Among his other works are a Personal Mislory of Lord Bacon (1801) ; The Iloly Land (1N65): Yeu America (1860): Spiritual ITices (1868); Her Majesty's Tourer (4 sols.. 1869-i1) : Free Russia (2 rols., 18:0); Brilish Cyprus (18i9); Royal Windsor (18ic-s0). D. in London. Dec. 2T, 1879.

Dixon's Entranee: a strait on the west coast of North America, 100 miles long. It separates Queen Charlotte island from the Prince of Wales archipelago.
lljemil Pasha, jem-eel'pa-shaa, or Jemeel Pasha: Turkish statesman; b. at Constantinople in 1825: the ellest son of Resheel Pasha, lle was educated at Paris and London, and was for many years a public officer, especially in diplomatic affairs. In 1866 he was appointed ambassidor to l'aris. D. sept. 29, $187^{\circ}$.

Djezzar, or Jezzar (the hutcher) : surname of Achmed Pasha: Turkish soldier and governor: b. in Bosnia, 1735 ; left his country to escape punishment for a crime, and after many harlships was sold as a slave at Cairo to Ali Bey, in whose sprvice his suecess an an assassin of his master's enemies won for him the title of butcher. But his relnctance in one instance to commit murder cost him Ali's favor, amd he som had to thee the comentry. 1he then sought service in Syris, where his bokmers and duplicity exalted him above his rivals and brought him to the favorable notice of the sultan, who mate him l'ashan of Acre with the missum of crushing out the imlependenee of the Druses, a work that he executed with savage clfectiventos. His riolence to the French consul and resilents at Acre was one of the ustensible grounds for Nianlemis invasion of Srria in 1709. Though alarmed by the victories of the French, Djezzar was induced by sir sifney smith to attempt the defense of Acre. The result was a sumbs chate tor the French arms. A three monthe" sixge, in the eonree of which several assants were made, provet unavailing: a pustilence liroke out amone the bexiegers, and the threatened attack of the English on Egypt (atused their recall. 3). at Acre, 1 so4.

Hịinn: Sce Jıw.
Dmitrof, f"meetwif: tuwn of Russia: goverument of Noscow; 40 miles $N$. of Muscow (sec map of liusia, ref.

7-E). It has seven churches. a college, and manufactures of entton and silk goods. Pop. 9,206 .

Huieper, neeper [the Borysthenes of the Grecks, the Danapris of the Romans, the Lzi of the Turks, the Elice of Visconti': map (1381), the Lerene of Contarini (143i)]: a river of Russia. and, next to the Volga and the Danube, the greatest and most important river of Europe; rises in the government of Smolensk, at the foot of the Valdai Ilills, near the sources of the Volga and the Dwina, in lat. $55^{\circ} 52^{\circ}$ N. It flows nearly southward to Kief, helow which its direction is southeastward to Ekaterinoslaf. It afterward runs southwestwarl, and enters the Black Sea on the north side. Its length, including windings, is ahont 1,170 miles. The greater part of it is navigable, but some rocky rapids oceur below Ekaterinoslaf, where the river has to make its way through the granitic offshoots of the Carpathian Momtains. At Kief the river is free of ice 267 days in the year ; at Ehaterinoslaf, 2i4; and at kherson, 280. The fisheries are insignificant in the upper part of the river, but very important in the estuary. Where ther employ between 2,000 and 3,000 persons. The Borrsthenes was known to the anlcient Greeks, who regarded it as the greatest river of the globe next to the Xile. Its principal tributaries are the Berezina, the Pripet, the llerea, the sozh, the Borona, and the Desma, all of which are navigable.

Whiester, neester (ane. Tyras, afterward Danaster): a river of Enrope; rises in the Carpathian Nlountains in Gaticil, and tlows southeastward into Russia. It forms the boundary lietween Bessarabia on the right and Podolia and Kherson on the left, and enters the Black sea near Akerman. about 30 miles S . of Odessa. Its total length is ahout 760 miles. Its navigation is difficult : besides frequent shallows, the Yampols rapids, cansed br a granitic spur of the Carpathian Mountains, obstruct the course. For ordinary river-craft the passage of these rapids has been made possible, though not free from danger, by an artificial channel.

Doab, or Dnab, dno-aab' (i. e, two waters): in Mindustan, a tract between two rivers, especially that hetween the Ganger and the Jumna. This doab extends from Allahabad to the base of the Himalayas, a distance of 500 miles or more.

Doame, George Wasmingtox, D. D., LL. D. : bi.hop and poet : b. at Trenton, N.J., May 2i. 1999; graduated at Union College in 1818: ortainet as an Episcophlian elergyman in 1821 : 1 reached in New York city, and chosen Bishop of New Jerser in 1832. He published a volume of poems (1824) and sereral works on theology. D. in Burlington, I. I.. Apr. 2i. 1859. See his Life and Writings (4 rols.. New York, 1860).-One of his sons, Williay (roswell Moave. D. D., 1.1. D. (1. in Boston. Mass., Mar. 2. 1832), also an Episeopalian clergyman, was on Feh. 2, 1869 , consecrated Bishoj, of Albany--A second son, George Mobart Doase (1. in Boston, ilass., Sept. 5, 1830), became a lioman (atholic priest ; was in 18.3 appointed ricar-general of the diocese of Newark, and in 18*6 received the title of monsignor.

Dobbin, Jayes Cochrane: politician ; b. at Fayetteville, N. C.. in 1814: graduated at the Cniversity of North Carolina 1832: admitted to the bar 1835: became a member of Congress in 1845, and was appointed Secretary of the Nary by President Pierce in 1853. D. at Fayctteville, Aug. 4 , $185 \%$

Hohbs Ferry : village: Westchester eo., N. Y. (for location of countr, see map, of New York, ref. \&-J): on railway and on Jlution river: 20 miles N. of New York city. It has manufactories of gas-burners and piano-stools, tuld is a place of summer residence. llere are remains of military works erected during the Revolutionary war. Pop. (1840) 2,083.

Dobell', Sydnex: poet : b. at Crambrook, Kent, England, Apr. 25. 18.4; a wine-merchant's son. He began his literary carear br The Roman, a poem (1850). Among his other works are Bulder (1854) : England in Time of $\mathrm{H}^{\prime}$ ar (1856); ant England's Itay (18i1). Ilis poms exhibit a mixture of the philosophical ant poetieal spirit. D. Aug. 22, 18.4. See his Life and Letters (S rols., 1878).

Dibereiner, Johasx Wolfgasg: chemist: 11. near llof, Bararia, Dec. 15, fixo: studied at Jena, where he became in 18 tu Professor of Pharmacy and Chemistry, a position which he held until his death. Ile was an intimate fricnl of Geethe, ly whom he was aifled in his investigations. Notwithetanding the whiohs impertance of wot dueks to the sast trade of landom，it was mot untal a few vears pre－ vious to the begiming of the nindeenth entmry that phas for docks on unything like am adentate soald we re，at the
 Telford and bought，among other phans for tha improve－
ment of the port of London. The act authorizing the construction of the West India Docks was passed in 1799; work was begun in Feb., 1800, and in 1802 they were so far completed that a homeward-bound vessel entered them.

These, the first docks of Londou, with their entranees and hasins, extend across the isthmus (at low water) of the island formed by the Thames on the Mirdleses side of the river and called the Isle of Dogs. They originally consisted of an Import Dock containing an area of 30 acres, and an Export Dock with an area of 24 acres, comecting at both ends by basins and locks with the Thames. They were constructed of brickwork ant timber. There was a canal on the sonth side of the dueks, which was subsequently converted into a doek called the south Dock, the retaining walls of which are $34 \mathrm{ft} .10 \frac{1}{2} \mathrm{in}$. in height from the bottom of the dock to the top of the coping, where the width is $11 \frac{1}{2}$ feet, spreading downward with a batter of 1 in 24; the face and back of the wall are of brick, the former 3 tt. $4 \frac{1}{2}$ in. the latter 18 inches thick. connected by vertical transverse walls 2 ft .8 in . in thickness, and placed 10 feet apart, the pockets thus formed being filled with concrete, upon a fonndation of which, $3 \frac{1}{3}$ feet in thickness, the wall stands. The bettom of the dock is covered throughont with a layer of purdle 18 inches in thickness. On the north side are sixteen jetties, projecting into the dock, of timber, 130 feet in length, furnishing accommodations for thirty-two vessels, and opposite each jetty is a buor for mooring vessels. The area of the south Dock is $2 \boldsymbol{2} \frac{1}{2}$ acres.

The cost of the south Dock, with the machinery, railway extension, dock-basins, warehouses, etc., was $\$ 2,800,000$. It will be seen from the plan that an incoming vessel can pass directly into the lmport Dock, unload her cargo, and then, without boing locked out into the Thames, when the tide permits may pass into the Export Dock to receive her out-ward-bound cargo.

The East India Docks, which are a short distance to the east ward of the West India. were at first intended exclusively for ships in the Hast lndia trade, but are now open to vessels from all parts. Their area is 27 acres, exclusive of en-trance-hasins, and their depth of water is never less than 23 feet. Ther belong now to the same company as the West India Docks, and have magnificent warehouses for tea, indigo, drugs, spices, etc., attached to them.

The London, the St. Fatherine, and the Victoria London Docks, also on the north side of the Thames, are under the control of one company. The Lomlon Docks have a waterarea of $3+$ ares the $s t$. Katherine Docks a water-area of 11 acres, and the Vietoria London Docks, situated immediately below the East ludia Docks, have an area of it acres in the inner dock alone. exclusive of 16 aeres in the tidal basin. The depth of water in the inner dock varies from $24 \frac{1}{2}$ feet to $26 \frac{1}{2}$ feet. The entrance to this dock from the Thames is by means of a lock 320 feet in length, 80 feet in width, and with a depth of water on the sill of 28 feet. The jetties, with the sides of the dock and of the basin, provite a length available for quay-rom of nearly 3 miles.

On the Isle of Dogs, S . of the West India Docks, are the Nillwall Docks, comprising two basins, one having a water-area of 2 , meres, the other of $10 \frac{1}{2}$ acres. The surres Commercial Docks, intended for ships with bulky commodities, are upon the south side of the Thames, and have a water-area of 176 aews.

These rarions ducks have undergone extensions and inprovements, to keep pace with the remirements of commerce, the latest addition heing the Albert extension of the Victorial Dock, "penter in 1ssul, and affording an additional waterarea of fores. It is one of the mist eomplete docks in the world. The Tiltury Doeks opened in 188.0 provide $\boldsymbol{i} 6$ acres. The total wator-area of the north side docks exceed. 46i) acres, and the surrey aml Commereial docks, on the south side, cover $3: 0$ acres, giving an aggregate of over ins aeres. Including the land contignons to the quays there are over 2.000 acres devomi to terminals.

The dorks are also provided with cranes and other appliances, workenl hy stam or hydraulic pawer. for the rapin] transfer of carcuis.

The dock estathishments of Liverpool are not excellow in extent and arrangement by those of any port throughout the work. Thongh the number of wemels belongine to this port is less than that of lombon, yet the fact that they can not lie with safety or case in the Xerme on acermant if its raphid current and exposed situation, and the great rise and fall of the tides (2) feet at noap and at feet at spring tides). require the dock accommodations to be of suffieiont extent
for the entire trade of the port: while at London the Thames afforls a secure and convenient berth for a great number of vessels.

The Liverpool docks have, on the side next the river, a sea-wall of $6 \frac{1}{4}$ miles in extent, which, when considered in connection with the obstacles to be overcome, is one of the greatest works of modern times. In most cases ducks are formed by excavations made on the bank of the river, l:ut at liverpool they have been formed in the river itself by inclosing within the wall referrell to a portion of the beach of the Mersey, and afterward exeavating the part this reclaimed to a proper depth. The wall is 11 leet in thickness and 40 feet in height from the foundatiou, the more modern parts being faced with granite. There are between thirty and forty docks, having a water-area of $363 \frac{3}{2}$ acres, exchasive of 19 acres of entrance-basins. The quay-space is over ${ }^{2} 4$ miles. Must of the docks have a separate entrance from the Mersey, and ennmunicate with each other, so that ships may pass from one to another without the necessity of being locked out into the river and back again into the docks. They are also connected with the different railways entering the town, and by a series of locks with the Leeds and Liverpool Canal.

The new North Docks are estimated to cost $\$ 20,500,000$. They will include the Langton Doek. of 18 acres; the Alesandra Dock, of 44 acres; and the Hormby Dock, of 17 aeres.
Large steamers of an aggregate tonnage of 34,197 have been docked and cleared in one tide of $2 \frac{1}{3}$ hours.

The whole of this immense dock estate is rested in the Mersey Docks and Itarbor Board, who enforce strict rukes for the maintenance of good order and prevention of fire and depredation. Erery precaution is taken to prevent the injury of the docks from the acenmalation of mud by the use of steam-dredging machines. The income of the Mersey Docks and IIarbor Board for 1889 was $84,950,000$ on 9,292 ,000 tons. The revenue of this board, after paying expenses and interest on moncy borrowed, is applied to the reduction of the dock rates.
The lanting-stage is 2,063 feet long and from 80 to 110 wide, covering 4 acres. It is supported on 158 boiler-plate pontoons, 80 by 10 by 7 feet, and cost $\$ 2,350,000$. Seven hinged bridges and one floating roadway lead to it. The tratic amounts to about $2,500.000$ passengers per year.
There are 25 graving-docks, with a total floor length of 12,490 square feet. costing $\$ 4,500,000$.
The warehonses are rery extensive, covering 03 acres, with sheds sheltering 94 acres more, while their cost has been $\$ 16.660,000$.

Birkenhead, on the Mersey, directly opposite to Liverpool. has a water-area of 165 aeres of dncks and subsidiary basins among them are two large docks, one of 59 , the other of 59 acres. The quay-space is between 10 and 11 miles in length. At Southampton there are docks surrounded by quays and bonded warehouses, and provided with powerful shears for shifting boilers, heary machinery, masts, etc. Among other ports of the British islands which possess large docks may be named Bristol. Mull, Grimsby, Parrow-in-Furness. Sulderland, Glasgow, Leith, Newcastle-on-Tyne, Tyne, Cardiff, and Belfist.

At Iavre, where the rise of the tides is from 20 to 97 feet, there are capaeions docks. At Antwerp. where in 1803 Napoleon 1.. who intended to make it a great naval establishment, mulertook the construction of doeks on a grand scale, new and consenient ones with warehonses have been opened. At Bremen and Amsterdam doeks have been constructed and improverI.

The port of Cardiff is celehraterl for its large docks. It is located on the river Taff, a short distance from the bristol Channel. where the spring tiles rise $3 \frac{1}{2}$ feet and the neal ?!) ; conserpuently the flats, which are hare at low water, may be realily traversed at high tifles. The town is of recent origin. In 1839 the West Bute Dock mas buitt, eovering 20 acres, at a cost of abont $\$ 100,000$ an acre. The opening of the Taff Vile Railway in 1841 so stimulatel commerce that in 1851 the East bock was enmmenced and opened in 1855, althongh not finished until 1859. It eovers 46 acres. hat was sonon fonm to be too small, and the Roath Dasin was openetd in 18it, cowring 12 acres. Another large dock connecting with this basin will extem the total area to abont 113 acres. The Wrest Doek is only 200 feet wide, while the East llock is from 300 to 500 feet in wiuth, the Roath Basin 550, and the New Basin 600 feet.

These basins are supplied with fresh water from the Taff. The quays are fully supplied with coal tips or staiths, 13
halance tips at the West Doek，1：balanee and v liydralice tips at the bast． 8 at the honth basin，and une at the ent ranew－ chamel．Ono movahle hytranlic ex－ton cratue is aboused． and over $12.000,000$ thes if cond can be shippet here each vear．＇The gratoc brialges and machinery are all＂proatel fin hotranlic puwer．There ate also straving－docks，vary－ ing in length from den to fion feet．The tomage las in－ reasen so rapiolly as to give rise to rival docks at Pemath and harry，which are also growing raphlly，leing thoroughly equipped with the hest mondern applinuces．

In many ports throughout the worlel－such，for exumple， as that of Scw York，where the hartor is naturally pro－ tected，and as ulse in the Mediternmean，whete the rise and fall of the tides is so small as not to olstruct the logding ame moloding of ship－wet docks are not an abolute ne－ cosity to commerce．
but，though in many cases they may be dispensed with， all first－clase ports need dry docks for the examination and repair of these parts of a ship，which are usually immersel in water．Dry dochs may be sparated into two classes－ the stationary dry doch，to which the name graring－dock is generally applient，ant the floction doch．
In ancient times，whre there was no rixe and fall of the tides，vesids were hanled up on the hath and＂careened＂： wher the tiles permitted they were grounded at high water， so as to be expusel？at low．sometimes the lowing－down flan was mbinted：this was to attach ropes to the heats of the masts of the verat and to the mooring rings of a quay，or to the deek of another resel，so as to haml the ship neer into a nearly horizontal position on the water，the bul－ latit or weights being remored or shifted．It was while un－ derening this wery hagerous opration that the loyal ficorge Pommerel at spithead in 1 Tise，with 600 dersons on hwarl．

This method was supplanted by the graving－lock，gener－ ally const pucten of stone，thonerli sometimes of timber，amb usially of such timensione the to contain only one vessel at a time．The sides are formed in steps or ahais，so that the form of the bock is somewhat similar to that of the vessel which it is to contain，but sulfienent space is left around it to enable the workmen to get at every part of the buttom of the wessel and tor athod sndiefent light for their work．The entraner is elosed bygates，which open siteways，like a lock， of full umen the hed of the matrance or he caisume；the latter，sine the introluction of iron for ship－building pur－ powes atmits of their being made of that material．are al－ most unirersally alopted for large dorks，and have the alvantage of affording the means of retaming the Water inside the deck as well as of kerping it out，whell is of impertance where the tile is elbing rapidly，in allowing time to aljust the ressel before it suttles down on the keei－ hancks．The resed is flated into the deck at high water， the gates closed．the sluives opmod，and the water allowed tor run wht with the eblh of the tide，or，where the fall of thr tide will not promit，is pumped on，leaving the dork jopt－ fortly dry，the wessed heing suphited on timber struts and Shores resting upon the stepe alrealy mentioned as forming the siltan of the ilock．
The L．S．mat gravinghoek at Brooklyn，N．Y．．was， in its lay，one of the finest in the world．W the time nf its cemstruction it possosed many features and imprownomes that were mumpaled hy any oilher graving－texk．Wwing to the hature of the suil selectind for ite site．the exearation for the fommation was attembed with many obstaldes，and nt－ forded＂Imertunty for the display of great matincering skill． This lower suil wis an almont impalphble quicksond，becom－ ing semi－tluid when saturated with water；and hefore the required lewe for the tombation had hem remed springs coming from a drat depth burst up thromgh it，remdering nevesary masares to wercome it．＇Yhis was timally dome by driving piles inta the catites formed ty the aringes on which a therrine of phank was latid：apm this hricke wore laid in hydranke cement，and mpent the brivk thene comere to masoury，the whole heing dome with the groment diejuteh： rent－hale for the water were left matil the permanent fom－ dat ions wore completed．In this manner the thow of sand Was cherkiel．

 25 fere of wator oroo the sill and the dontho derk at Papts－
 l＇ortsbunth has hesides nine single gravingotlocks．thet
largest of whieh is 406 feet in length at the bottom．Der－ onport has five．Cherbourg eight，theerness five，Toulon six，Brest fonr．There are several on the Thames，and many other ports have one or more．Soutlampton has three．one of Which，the Eisstern Dock，is 42.9 feet in length， with a width of entrance of 80 feet．made，in $18 . \%$ ，of brick－ Work with Portland copings，and is stated to bare cost ธ 260.000.

The largest dry dock on the Great Lakes of North Anerica is located at Detroit，Nieh．It was built by the Detroit Dry Dock Company in 1891．The eaisson gate is of steel， 79 ft .5 in ．long and 12 feet beam．It contains five 30 －ineb valces for flooting the dock，which it is estimated will re－ quire twenty minutes．The time required to empty the dock in an hour and a half．There are two centrifugal pumps having 30 －inch dis－ charce－pipes，nper－ ated by two $150 \mathrm{lI} .-\mathrm{P}$ ． Westinghouse en－ gines．The fuel for the three boilers is oil．The dock is founded upon 2．000 piles driren into a fine blue clay and surrounded bra wall of pmblle 5 feet thick． The cost was se 00 ，－ 000

The Simpison dry dock is built of tim－ ber．Its inventors claim for it greater economy．freedom from water，facility of access for work－ men，and better light and air，due to the great breadth at the eoping．The altars have abont the size and piteh of an ordinary staircase．The inereased area of base the to the splar of the sides is compensated for by the use of timber in constuction，and its durability and ecunomy have proven to be so satisfactory that not less than fourteen of them have heen constructerl on the Atlantic coast．The one at St．Johns，Newfounclland，was buit be－ tween May 28，1883，and Dee．10．1884．The cost of the two docks at Brooklyn with one set of pumps was 11.283 .356 ， and that for the one at the League island navy－rard，built in 1889－90，was $\$ 48.700$ ．This structure is 500 feet in length： 130 in width at top： 50 at bottom； 80 at entrance： $25 \frac{1}{2}$ feet depth on the sill，and 32 feet to floor．The dock at Newport News is 600 by 130 feet at top．the di－ mensions and draught being almost exactly the same as those at sit．Johns．It can be emptied in an hour and a half．
A prominent feature of thesc docks is the gate，which is made of iron or steel plates fastened to a trapezoidal frame， which rests in a groove in the abutment．On the outer edge of the groove there is a heary semi－cylindrical strip or bead of rubber，which serves to maks a watertight joint against the ontside．In consequence of the great spread of
the $[$ ．S．The soil is sand，gravel，and elay，with some hard－pan．
The last Brooklyn dock was opened in Mar，1890．Its general dimensions are 530 feet long；inside of caisson， 500 feet ； 130 ft .4 in ．wide at center on top，and 50 feet at bottom． The entrance is 85 feet wide at top，and 53 at floor．The sill is $30 \frac{1}{2}$ feet below coping，and $25 \frac{1}{2}$ below mean high water． Depth of floor， $3 \cdot \frac{2}{3}$ feet．The total cost was 8595,892 ，while the adjoining masonry docks，only 359 feet long，cost $\stackrel{\text { B }}{2}$ ，－ 241.000.

The largest dry dock now building on the Southern coast is at Port Royal，S．C．It will be 500 feet long and about 120 feet wide．In its general features it will resemble that at Bronklyn，$\overline{5}$.

Of the floating dock there are several distinct varieties：

Fig．4．－Sectional tloating dock．
the sectional doct，such as is in use in the Philadelphia and San Francisen narr－yards；the Gilbert balance dock，in use in the Portsmouth，Va．，and Pensacola，Fla．，navy－yards； the iron floating dock of the Bermuda dock patern；$G . B$ ． Renmie＇s patent iron floating dock，of which the Cartagena dock is an example：and Eduin Clark＇s hydrautic lift dock，in use in the Vietoria Docks，London．

The sectional floating dock in the Philadelphia navr－rard is made in nine separate and independent sections，differing only in their widths．Each section consists of a pontoon or tank，watertight， 105 feet in length， 30 or 32 feet in width， and 11 feet in depth：two end－frames，and two end－floats． Together，the sections form a floor of orer 300 feet in length and 105 feet in width．At each ent of each section is an open framo in which is a float，connected with the four posts cf the iramework，which is raised and lowered by machinery －raised to assist in sinking the main tank to the depth re－ quired，or lowered into the water to give it greater buoy－ aner．

When the dock is to be used a suflicient number of these sections are joined together to give the length required， and firmly connected by beams so arranged that they mar

Doctor of Music: the superior of two musical degrees conferred by the English universities, the inferior heing that of Buchelor of Husic. It Cambridge and Oxford tive years must elapse before a bachedor of lusic can receive the degree of Doctor of Music. The honorary degree has sometimes heen confervel on distinguished musicians who had not graduated as bachelors. The following are the published conditions for Oxforl: "Cantidate must compore and sent to professor a vecal composition, secular or sacred, in eight-part harmony and good eight-part fugal comnterpint with accompaniment for full orchestra. Length of performance, forty to sixty minutes." If this "exereise " he approved, a written examination follows, in "harmony, eight-part counterpoint, fugne, finm, instrumentation, musical history, acoustics. so far as related to thenry of harmony, and knowledge of the scores of great masters." " If the camdidate passes this examination satisfactorils, then he "mmst have his exercise publiely performed in oxtord, with complete band and chorus af his ver expense. He must furthermore deposit the manuscript full-score in the library of the music schonl. Fees for this legree, ED0." Conditions, fees etc., at Cambridge and Dublin are about the same as at uxford. The Archlishop of Canterbury still possesses by liw the right to confer the title of Doetor of Musie ly diploma without special examination. The only condition appears to be the payment of $\pm 63$ in fees. Germany and France confer no such degrees.

In the C.S. many colleges confer this degree oftentimes Withont technical examination, so that the title no longer implies any specially learned or scientific standing in the protesxion.

Dudeley Buck.
Doctors Commons, or College of Doctors Commoms in London, England, the popular name for the courts. oflices, ctc., formerly occupied by the bodr which was incorporated Tune $\stackrel{2}{2} .1768$, under the title of "The College of Doctors of Law exercent in the Ecclesiastical and Adimiralty Courts," and which had previously existed for more than two centuries as a roluntary organization. These buildings were on the east side of St. Piul's Churehyard, and were so called in allusion to the "community of board," or dining together, of the mumbers of the college. The college consisted of a president (the dean of the arches for the time heing) and of those doctors of law who, having regularly taken that degree in either the Lniversities of Oxford or Cambridse and having been admitted adrocates in pursuance of the rescript of the Archlishop of ('anterlmry, had been elected fellows of the college in the manner preseribed in the charter. The functions of this body of lawsers were much diminished by laws passed to reform the system of courts, and the property of the college was sold, the charter surrendered, and the corporation dissolved under powers

Doctors of the Chureh: in the Roman Catholic Chureh, certuin saints who, after death, have received this title on account of their superior wistom and excellence. They are at present nineteen in nunber. viz.: Sts. Hilary of Poitiers (1]. 368 A. d.), Athanasins (373), Basil (379). Gregory Nazianzen (3:4), Ambrose (3:17). Johm Chrysostom (40\%), Jernme (430). Augustine (430), Prler (lirysologus (450). Leo (460), (iregury (604), lidere ( $6: 36$ ). Peter Damian (10:2). Ansehn (1109). Bernard of ('iteaux (15:3), Thomas Aquinas (12:4), lonaventura (12i4). Francis de Sates ( 1622 ), and Alphonsus of Lizumi (108\%). Outwile the koman Catholic Church the seven Christian Fathers mentioned in the article Docron (q. $l$. ) are more cspecially designated by the title "Docturs of the chureh.

Hoctrimaires. dok-tri-nãrz' the politicians who in France, just after the destoration of $1 \mathbf{N} 5$ corcupied in the Chamber of Domies a place between the Center and the Extreme Laft. The ehicl men of this party were systematic writers and speakers on eswernment. who wished to atablish a form of constitution somewhat resembling that of Englabl, amb suphortm sedentific doetrincs of constitutional liberty aminat the arbitrary will of the king. 'The woml doclrinuire whe nswa hy their opponents to stigmatize them as pelantic amd umpractional theorists. The leallers of the lowetrinaires were Roser-tollarel. rivizot, the bue dre Broclie, and the Duce the Wectares. They ceased to exert any influence as a party after the revolution of INAS. The torm is now frefurntly usicl to desigute the partians of absuact theorics, the direct opposites of "practical politicians.

Document [from Lat. documen lum, proof, example, i. e. something from which one learns: deriv. of doce re teach] an original or otficial paper or writing relied on as the hasis or proof of something: in law, a written instrument ad duced for the purpose of evidence.

Dodd, Charles: the assumed name of Hugh Tootel, a Roman Catholic miest of England; b, at Durton-inBronghton, near Preston, Lancashire. 1620: educated at Douay: returned to England 16\%s, and had two charges, the last at Harrington, where he died Feb. 2\%. 1749-43. He was the author of Church IIistory of Englund from 1500 to 1688 ( 3 vols. folio. Brussels. $1 \% 3 \%$ ), and several other works chiefly polemical. His history was a reply to that of Burnet, and has been in part republished down to 1625 ( 5 rols.. London. $1839-43$ ). Its value is regarded as considerable, but it is characterized by severity and unfairness.
Dodder-taurels (Cassythacese): a family of parasitic plants having the habit and appearance of dodders, but in other respeets resembling the lantels, to which ther are generallr referred. Ther replace the dodiders in lot regions, where alone they grow. The U.S. have but one known species, the Cussyth" filiformis of Florida.
Dodders [0. Eng. douldre: Germ. Dotter, connected with O. Eng. doff, point, spot. ling. dot, point]: leafless jarasitic plants. generally placed by botanists in the genus cuscuta and famils Convolrulucere, but sometimes made a distinct famity called Cuscufacece. Ther have twining thread-like stems of orange yellow, and flowers in thick chusters. They are fomd native in the temperate zone, in both the Old and New Worlds. and are sometimes injurions to the flax, claver. hop, and bean crops by smothering the plants. The dedders are remarkable for having their embryos withont cotydons. On germinating the slender stem grows up from the ground, and having attached itself as a climbing parasite to herbs and shrubs the proper root dies, leaving the vine to subsist upon the juices of the plant which supports it. This it does by means of papilla-like roots. which penetrate the hark of the plant on which it lives. Huge dodders in Ifghanistan grow upon the trees, and even prey upon themselves. About twenty species are known in North America, growing upon many herbacens plants and even a few shrubs. C'artensis sometimes attacks clover in the U. S., while C. epithymum, a foreign species, is very destructive to clover in Europe, and is sparingly introduced into the C : C. epitinum. another foreign species, is occasionally foum in flax-fields in the U. S. Revised by Charles E. Beaser.
Doddridge. Johs: jurist: b, at Barnstaple, England, 155. He entered Exeter College, Oxford. in 150 , and Legin the study of law at the Midale Temple in 1576; was justice of the hings bench $1613-98$. Anthor of The Latuyer's Light (London. 1629): A Complete Purson, or " lescription of Adrousons and (hurch Litings (1602): The History of the Ancient aml Motern Estate of the Principality of IIcales (1630): The English Lauyer (16:31): Opinioms Touching the Antiquity, I'ourer: Order, Stule. Ionner, Persons, and Proceedlinys of the High C'uurts of Parliament in Englund (1656). I). in L.ondon, *ept. 13, 162 s.
Doddridge. Pumip. D. I.: preacher and author: 1. in Lnudon. England. June $26,1 \% 02$. He became pistor of a Dissenting congregation at kibworth in 1293, hut left in 1725, went to Market Harborough, and remored in 19e: to Northamton, where he was prineipal of a theological seminary and at the same time pastor of a large congregation. In 1 t.30 he married Dlerey Daris. From prineiple he avoided controversy. but that course drew uphin him the charge of being a trimmer and double-dealer. He was an tarnest and devout preacher, and acquired a high reputation as a writer. Ilis most impmitant works are The Mise and Progress of Reliyion in the Soml (1745): The Family Erpositor ( 6 vols. ton. 1:3:-5i() : Life of C'olonel Gardiner (1747): - Course of Lectures on Pneumatology, Ethics, and Ifirinity (1:63); and A Commentary on the Deir Testament. He also was the author of improvements upon Jeremiah Rich's Brief and Easy System of Shorthand (1709). Ile wrote 3 it hymns, some of which are almirabie. D. at lisbon (whither he had gone for his health). Det. 26, 18in. sie Job Orton, Life of Dordridye (London, 1766): Thomas Stechann, Lellers To ind from Dr. Duddridge (170): Correspondence and Piary. edited by John Doddridge Ifumphress (5 vols., 189.9): especially the Life by ('harles Stanforl'(London and New Lork, 18s1).

Dodóna (in (rr. $\Delta \omega \delta \dot{\omega} \nu \eta)$ : an ancient city of Fpirus : seat of a celebrated orade and temple of Jupiter, fro a time the most famons oracle of Greece excent that of Deluhi. Its origin was attribnted to Dencalion. This macle was consnlted by the Athemians, Spartams, and otlere nations, aml its responses wera delivered from an oak-tree; or, aceording to another legent, by the agitation of a row of kettles suspended in the air, the noise of which was interpreted by priests as the answers of the oracle. 'The temple of Dodona Was destroyed by the Etolians in 219 B . C.

Hods, Jarcus, I. D.: Seottish rlivine of liberal tendencies: : minister of the Free ('hurch of Scotlant; b. at lellford, Northamberland. England, Apr. 11, 18:34; edlucated it Damburgh Unisersity ( 11.1 .1854 ) and at New Collecre, Finlinburgh ( $18.5-58$ ). Ite bocume pastor of the Renfieh Free Church, Glascow, 1864; Professor of New Testament Bxegesis in New College, Etinhurgh, 1889 . Jmong his published works are the following, some of which have passed through several editions: The Pruyer that Traches to Prey (Ealinburgh, 1sij3); The Lipistles to the Seren Chwrehes (186.5): Isruit's Iron 1 ge (London, 1874) ; Mohummed. Bôdllhe, aml Christ (18\%): ITamdbook on IIeqgui, Zerhariah, amd Jaluchi (Edinburgh, 185!) ; Iseree, Jucobe, aud Joxpph (London, 1880) : IFerillouh on Gempsis (Enlinbu'gh, 1882 ): ( 'ommenfury on Thessalonioms (1882); The I? 1 rubles of Our Lord (1st series, $188: 3$; 2d series, 188.3 ) ; Introduction to the Veu Testament (London, 1858) ; The Book of Genesis (1888) ; The First Epistle to the Corinthichs (188!); Erasmes and other Essays (1891); The (iospel of St. John (9 vols.. 1891-92).

Willis J. Beecher.
Dodsley, Robert. bookseller and imthor; b, near Mamsfield, Englind. in 1703. He opened a book-store in Lomion, and became a friend of Pope and other literary men of his time. The protuced in 1737 a farce called The Fint and the Diller of JIansfield, which wis successful. His tragedy of Cleone (in.js) was performed with great applanse. ITe jurchased Dr. dohmson's Loudon for ten guineas, and his Finily of Thumm, 17 ishes for fifteen gnineis. IIe published a Select Collection of Old Plays (12 vols., 8vo, 1780 ) and other works. D. Sept. 25, 1664.

Dodwell, Hexry ; chronologist; h. in Dubliu, in Oet.. 1641; educated at Trinity College, Dublin: elected Camolen Profersor of 1 listory at Oxforll in 1688, hut depusent from his chair in 1691 because he refuser to take the oath of allegimee to William III. Among his notewnthy eontributions to Greek and Roman chromology are his Anmoles F"elloi, Quintil., Station. (16is) : Amumles Thucyd. et S'enophont. (1702). D, in Schotteslmook, June 5,1711 . See TonlWell's Ilorks, abbidged, with im acenunt of his lifre loy Fr. Brokesby ( 2 vols., Lundon, 1723 ).

Doe, homs : a name in legal clocmments for a person whose name is manown; specificully, the fietitions plantiff in EJECTMENT (q. 飞.)

## Doeberainer: See IÖberelnek.

## Doederlein: Sue bömbrbeis.

Doghann: a flant of the grams stpocyumm and family
 frut a pair of folliches. Soma of the species are herlaceous, ot hers shrubhy, and some are fonnd in collere climates thim
 America ( 1 pheyneme androsemifotimem) is a perennial lerbacoons phat atout 2 fecot high, with smooth stom, milly juide, smoth orite leaver, ant light-pink flewers. It mrows in opres, hamen phanes from (ianalar to (imorgian. and is valued for the mollicinal projertics of the hark of the ront,
 atul the Imlian homp) (A. comumbinum), which contains similar medicimal properties, yields a coppons time flax-like fiber, used by the lonlians: bint otherwise the jhant is employed only for medicimal purpmes.

Bog Days or (anienlar bays: the forty lays between duly 3 and Ans. 11 . C'anicnlat is derivel from 'enicula, the Latin name of Sibius, the chosestar, which rose lreliacally near luly 1. The abriants aseribed the groat heat of summer to the influmee of this star, hat it was by aecielent
only that its rising concidel with the warmest season. The time of its rising depends on the latitude of the country, and, owing to precession, is later every jear.

Dog Distemper: a disorder common anong young rlogs, considered to be of a catarrhal character. $A$ general ruming from the nose and eyes is a leading symptom, together with a short dry congh, sneceeded by loss of strength and wasting of the brily. The flow from the nose, at first Watery, in a little time leconnes moons and purnent, filling the ryes and choking up the mostrils, and is attended by coltghing and romiting, with an increased wasting of thesh and loss ot appetite. A convulsive twiteling, paralysis of the extremities, attended by fits, with symptoms of an affection of the bratn, appoat when the disease becomes naligmant. At wheh a time the sight of another tog often brings on a fit, which may be somewhat checkerl by fondling. The fits usually pove fatal if they continue to increase in violence and trequency. a frequent ennsequence of the distemper is inflammation of the lmgs and a dysenteric disclarge, indicating ulecration of the intestines.

The leading remedies, which must be applied in the early stage of the disease, are laxatives, emetics, oceasional bleeding, ete. Astringents shonll be useri to check the diarthom, and the violence of the fits may be faclled by warm bithis and imodynes.
Doge, düj [Ital. < Lat. dur. ducis, leater]: the title of the chicf magistrate in the republies of Venice. Amalfi, and Genoa. The origin of the oflice in Venice dates as far back as 6.\%. Previously Tenice had been governed by seven tribumes, but the intrignes consequent on their election, and the rising power of the republic, mate it expedient to concentrate the power of the government. The first doge was laoluccio Anapeste. The doges were elected by the people, but the chnice nisnally fell on a member of one of the powerful families. They were invested with almost absolute power (ill about the year 1172, when the legislative power was placed in the hands of a great council of 470 members. This conncil elected twenty-fon of their members, who in tam electerl twelve of theil own mamber, upon whom the choice of the loge devolved. The first doge elected in this manner was sebastiano Ziani, who, on the occasion of his installation in office, scattered money among the people to win their favor-a custom which was followed by his sinecessors. This doge also introluced the enstom of walding the Aitriatic Stu. This wis a marriage ceremony which tonk place on Ascension Day, and which typified the absolute dominion which the Venetians clamed over that sea. On these oceasions a ring was thrown into the sea from the ship lincentamr. The principle of indirect election has probably never been carried to such ibsurd lengths as by the electoral mathinery established in 1268 . Ten or twelve borlies of voters were successively thosen before the actual electors were reatherl. From this time the council grannally narrowed the fowers of the doge, till in 1628 the offices of commamier-in-chief of the army and high-admiral of the nary ceased to lrelong to the slorate (or dogado, as the dignity was called) unless by apecial decree of the council of forty, a high eonart of justice composeal of forty members. In the fonteenth rentury the conncil of ten was estahlisherl, and vesterl with the highest power in the state, which entideal it to pass jurgment even upon the doge himself. Whont this time the powers of the doge became so restricted as to be liftle more than mominal, and the constant espionuge to which he was subjected mate the othee no longer ann wbject of ambition. In 13399 it wats fonnd necessary to bass a law prohibiting a doge who lad been elected from rosigning his phace. The olliee disappeared with the fat of the Penetian repmblic in 1797. Lodovico Manin, elected in 1768 , was the seventy-thind aml last doge of Venice.

T'he first doge of Gerioa was Simon Boceanera, elected by the peraple in 183:39. Like that of the longe of Yenice, lis aflure wits origmally for life. llis powers were shatred, though mot riotriciorl, hy twelve aldermon. In 1508 the Gomucse framed : brw constitution, by which the roge was to be realeotod evory two yoars, and the powers of the ollioe wor lesiricted by two conneils, of which one comprisel :30 and the oflete 100 members. In 1797 , when the
 In 1802 it was restomed with the rentoration of the republie, but it finally disapmeared in 1801 . The republie of Amalfi in 897 A. . exchanged its qovernment by annually clansen ennsuls for the dogate, which was held for life: but its republiean govermment eeased in 1350. lievised hy F . M. Dowfooth spar: certain pinted crystals of caleareous spar, somewhat resembling the teeth of a dog.

Dow-watcla: on shipboard, a short watch of two hours. There are two dow-witehes-the first from 4 to 6 orduck P. 3., and the secoml from 6 to 8 P. M.

Doswools: small trees of the gems Cormus and family Cornacer, which inchules the cornel trees or dogwoods of Europe, the Cormus floride of the C.S., and others. The larger species are characterized by their hard wood, which is useful in turnery, and by their bitter tonic bark. The Cornus florille is well known for its white, show involueral blossoms, appearing in May and June. Tn the West Indies, ete., other trees are known as "dogwoods." One of these, the Piscidia ezythrim, or Jamaica dogwond, a small leguminous tree, foum also in Florida, has a valuable and rery hard timber. Its bark is a powerful narcotir and anodyne poison, which has heen introduced into medicine and used quite largely to take the place of opium for the relief of biain. It is int a rery successfnl substitute.

The "poisonous dogwood" or "pison smmach" (Thus renenata) is probably much the most poisonous to the touch of the native plants of the U.S. It closely resembles the Whus vernix or vamish-tree of Japan, and may be distinguished from the harmless sumaehs by its panieles. which are loose (not thyrsoid or closely clustered in a spike, like the harmless ones), and which are axillary, while those of the harmless species are terminal. (Sce liucs.) The common dogwood of Europe. Cormussongninea. which is found also in Xorthern Africa, is a shrub of 14 to 10 feet in height, with greenish-white flowers of an unpleasant orler.
Dohrm, Axtos: zoölogist : b. at Stettin, Prussia, Der. 39, 1840; stuthed natural sciences in serema miversities, finishing his course at Jena. He then applied himself to the study of the crustaceans of the Enghish coast and the shores of the Mediterranean, and in 1800 founded a zö̈logical laboratory at Niples whieh, within the next ten years, beeame one of the most noted establishments of its sort in the worth. Anong lis writings are Der Ursprung der llirbertthiere (Lejpzig, 1875) and Studien zur Ungeschichte des Thirbelthierkorpers ( $\mathrm{t} 8 \mathbf{8}$ ).
F. M. Colby.

Dojni, Grovanyi : Italian painter. See Dossi, Grovinni.
Dolabel'la, Publius Corvelus: a profligate Roman patrician: b. about 00 B. c. : married Ciceros danghter Tullia. He fonght for Casar at loharsalia in ts p. C., and hecame consul abont the year 44. Ile was afterward a partisan of Antony, was defeated by Cassins in Syria, and killetl himself in 4:3 в. с.

## Dolby, Charlotte Helen : See Sainton-Dolby.

Dolce. dōl'chā, Carlo: painter of satered subjects: b. in Floremce in 1616. II is powers were feeble and his feeling limitel, but his work is popular with the masses on account of its smonthess and elaborate finish, and its religious sentiment, which at lost is weak, Ilis art may be designated as the inleal of prettiness. Ilis pictures, which are mostly small in size, are chielly of mulonnas and saints. D. Jani. 17, $16 \times 6$.
Dol'cinites, or Din'einisfs: a sect of the Apnstolici ( $q$. r. ), foumed by Segarelli luring the later half of the thirteenth century, hat deriving its nime from his abler and more distinguished successur, Woleinn, an Italian born at Novara in the thirternth rentury. 'They opposed the popes, and. according to Milman, beld kindred tenets with the Fraticelli or sifiritual Franciscans, with some leaven of the old deetrines of the l'atarines (Puritans) of Lombarty. Doleino ant some of his followers wore burned alive in 1307.
Dole, Sanford lbahard: jurist; b. in Honolnhn, Hawaii, in 1814. He was the son of at American missionary who went from Maine to Homblula in 1840 ; received his early edueation in l'utahan ('olleme; orme to the U. S. in 1866 , and stulies in Willians College a year; studied law, and was almitted to the bar in koston : practiced in llonolnln from $18 \% 0$ till $1 \times 5 \%$; and then berame a julge of the sinpreme Court of Hawaii. On the abrogation of the IHwaian monarehy in Jan., 1893 , he was chosen president of the provisional govermment, and om the proclamation of the repmblie of IIamaii on July 4 , 185 , he hreane its ehicf exeeutive. See llawait-Ni:.

Wolet, dülä', F́tienwe: author; lo, at Orleans, France, in 1509, probably on Aus. 3. He lived at lyons, where he established a jrintingr-jress ant published able works on
theology and other subjects. His writings were burned by wrler of Parliament as heretical in 1543. He translated some works of I'lato and Cicero, and wrote a great work, Commenturionum Linguce Latine (1536), which has an important place in the history of Latin lexieography. Ile was first hanged and then burned in I'aris, in the I'lace Maubert, on a false charge of heresy, Alig. 3, 1546. On the scene of his martyriom a bonze statue of him was ereeted in 18:00. Sechis Llife by Joseph Bonlmier (I'aris, 185\%), and by R. C. (hristie (Lonton, 1880) : ef. alsu A. Firmin-1)itlut, Essui sur le Typogruplie. Levised by A. R. Marsh.

Dolgelly, dol-geth'li: market-town of Wales; capital of the countr of Merioneth : on the Wnion, here crossed by a bridge, 46 miles W. of shrewsbury (sce map of Eusland, ref. 9-E). It is in a rich villey at the foot of Cader Idris, and is surmunded by beantiful seenery. It has mamfactures of coarse woolens anti tlamels. Here in 1404 Owen Glentower signed a treaty of alliance with Charles VI. of France. Pop. 4, 000 .
lolgornki: name of one of the ollest princely families of fussia, connected with the present ruling dynastr by the marriage of Maria Dolgoruki to the ('zar Michael in 1624, and having at different times exertel great intluence in the imperial court. In the reign of Peter the Great the most rrominent member of the family was Yakov Federovitch. who served as clief of the first formal embassy sent to France ant Spain (1687), fought against the Turks (16!6-97), winning honor at the siege of Azor, was captured at the battle of Sarva ( $1: 00$ ), and held a prisoner for ten yars, Upon his release he was made a senator, and held other important dignities till his death in 1r20.-Vasili Vadminovitci, also a soldier and a diplomatist, rose to the rank of majorgenelal, was banished in $1: 18$ for suspected disloyalty, but recalled ly Catherine in 1220, and plaeed in command of the army in the I'ersian war, Peter II. gave him the rank of fieldi-marshal, but in $1 \pi 39$ he was imprisoned on a frivolons eharge. Ile was released in 1741, and reinstated in his former dignities. D. 1746.-1lis nephew Visila conquered the Crimea in a remarkably brief campaign, and received the title ol'krimskoi from the empress.-Peter Vladmirovitch. author, was horn 180\%, wrote a number of political works, of which La térité sur la Russie (Paris, 1860) eaused his banishment and the confiscation of his estates. He also wrote La Frence sous le régome Bonapartiste (l'aris and London, 1N(6): De le question du sertage fn Ruswie (1'aris, 186t); anel Let question russo-polonaise et le budyet russe (1ueiprig, 1861). 1). at Geneva, 186s. Two vohmes of his Memoires were published ifter his death (Geneva, 1860-71).

Dolgoruky, Fatmarisa, Princess: favorite of the Czar Alexander II., whose letermination to contract a morganatic marriage with her cansed much unhappiness in his fimily. The marriage nevertheless soon followed the death of his first wife, Marie. After the ezar's assassination the princess lived at Genera, and published, in $1 \times 82$, under the pseudonym of Victor Laferté, Alexamder 11., Détuils inédits sur sa vie intime et sa mort.
Dolichocephal'ic [from Gr. סoдıхbs, long + $\kappa \in \phi$ адй. head]: long-headed; applitel to human skulls which have the oe-cipito-frontal diameter (that from the back to the front) much in excess of the transerse diameter. The native Anstralians and West African races aftom extreme examples of this form of skull. Those skulls which have a relatively short oecipito-frontal diameter are called brachy-cephotic-i. e. short-headet. Examples of both forms here notm are fouml among the remains of the prehistoric rates of Eurome. Which of the two types belongs to the earlied period is an unsettled question. Among the historic pepples of Furope the dolichocephatic form prevails anong the Into-Furojean rarieties, and the hrachycephatic among the Finnis. See Wison, Dretistoric fimals of Scollumh, and Labbock, Prehistoric Races, 11 90-116.
Dol'iclus [(ir. סodixos, long-in allusion to the length of the ports]: a gemes of leguminous plants, allied to Phuseolus. They are natives of the East and West Indies. where the pools and seeds are used is foot. The Chinese satuce called soy is made from the Dolichos soya, or soy berth, and the tuberous roots of somespecies are eaten in (hina. Other species are enltivated for the beaty of their flowers.

Do'limm [hat., a large cask or jar]: a gemms of gasteroport mollusks of the family Ioolidie, having spirally
furrowed shells，which surgest the hoops of a barrel．Some fourteen living species are found in the warn scots of the

eastern hemisphere，and several fossil ones，mostly from the ＇lertiary．

prolonged residence in a particular place eonstitute a domicile, unless aceompanied ly an intent to acyuire it. Domicile is acquired by operation of law when it is a consequence of certain legal relations, as in the instance of it wife. The rules affecting domicile have much importance in international law, whether publie or private, and for this purpose it mar be distinguished into domestie and mutional. Questions concerning the ralidity of marriages and divorees, the exemution and construction of wills, ind succession to estates. frequently depend on the law of domicile

The leading rules governing domicite are these: 1. The domirile of orimin continues intil a new one is aequired. The same rule of continnance applies to suressive dumiciles. $2 .-1$ person having legal eapacity may in gensral, change his domicile at will. Persons under legal disability, such as minors and lunaties, hase no such power. 'The domicile of a minor is in general that of his parents or guardian. 3. The law in some cases fixes the domicile of a person at the place where the person is umder a duty to reside. Under this rule the holder ot an otfice may be domicilerl at a place where offeral duty requires hinn to resisle. On the same principle the wife's domicile folloms that of the hasband. thongh this rule is modified in matters of dirorce. 4. To change one's domicile there mast he both an intent and anact. The intent may he inferred from a varicty of circumstances, and in some instances the inquiry ranges over a preriod of many years. Ctmber this rule an entored sojoum in a place will not in gencrial constitute at domicile. See Internathosal Law, Private.

Dominant [from pres. partic. dominons of Lat. domino re, rule]: in music, the fitth tome of the scale. The dominant is the ruling tone of the key, and next in importance to the first tone of the scale. See Cadexie.
Dominant Tenement : in the law of easements or servitniles, the tenment in lavor of which the easement is created. Sue E.serients.

## Domingo. Santo: Sise santo Domifo.

Dom'inie (Sp. Domingo de Guzman). Sarst: founder of the order of Tominieans; b. at C'atahorra. in the diocese of Owma, Oll rastile, in $117(0)$ d, in the monastery of St. Nichotas, at Pologna, Ang. 6, 1291. He stalien theology in the University of Palencia, and was in 119.5 made a canon of the chaptei of Osina. In that position he distingushed himself hy his zeal for the reforn of canonical life and by his sucess as a miswionary among the Mohammedans in the neighborhood. In 1204 he was chosen to acconpany the lishop of Owma on a diplomatic erramb, and on that oceasion he came into contact with the Albigenses of Sonthern France. The ecclesiastical sithation in thome regions was rather critical at that moment. The C'istereians, who had been sent to convert the Albigenses, gave up the task in despair and retired. Dominic. supported by a small brotherhond of followers, took it up and hegan praching. He was not more snecesfal than the Cistereians, that he was more persistent. Inment 1II. proclainet a crusule against the Altrigences after his legate. Peter of (astelnau, hat becn murderen. 120s. hy a partisin of the ('omnt of Tonlonse, who was farorable to them. In 12:3:3 the diseiptes of hominie were gixen charge of the lmpuision institnteit to pht down the heresy. (sor Dominecise and Ixquisitens.) After the sutecessini clase uf the erusade. Fmminie determined to transform the brotherhora! into at monastio order, silenere porenty, faーt: complete abatinome from flesh. linen elothes, and prepetual preaching against hereties heing the wows. Immocent 111 . heeane the comerils of that priond discoumper the establishment of new orders, harely allowed it to be fommed. His surecosor, however, Honomits H1., was mure favorable. Tle conlimad the order ( 1216 ) and gave it great privileges. Vonaturio wore fommbed at Metz and Venice, ami Dominic himself. laving preached durige a visit to Rome to the gapal homedohlatmb mate a great impression, was appointed muyisfor sermi pelutio, or comet-preachare to the tupe-an oflice which is still held by a Dominisan. Nevertheless. the now orler would mot grow: aml it was not
 held at dsati be the bramosems, disenvered the highway

 or shape, and :uloniner daty lugring for the means indisfrosathle to the sustanance of life. "Ihat prowed the key to the pupalar sympthy, amb when the next chapter-genemal
was held (Tologna, 12:1), sisty monasteries were represented, and members were sent to distant places to make preparations for new foundations. Thus Hominic lived to see his undertaking in a fair way to sucress. Thirteen years after his death he was canonized hy Gregory IN. (1234). His Life was written by Jordams, his suecessor as general of the order (Lacordatre, Paris, 1840, and (aro, l'aris, 185:3). levised by Join J. Keane.
bominiea: a British West Indian island, abont midway Inetreen Guadeloupe and Martinique; crossed by lat. 1ar $1 \underset{5}{5}$ N.: 30 miles long by 11 in greatest width; area of about 290 sq . miles (see mafi of West hndies, ref. i - ll ). It is mountainous throughont, and the peaks are the highent in the Lesser Antilles-the Morne Diablutin is said to exceed 5,900 feet in altitude, the Tres Pitones measures 4,660 feet, and there are many lesser mountains. There are no voleanoes whicl have been active within historical times. but evidences of voleanie action are very apparent. Several bot sprinss are known some of themi impregnated with sulphurons acil : the largest, called the boiling lake, oecupies a hollow which is supposed to be an extinct crater. The coasts, in great part, are sheer precipices, and even where the shores are low there are no good harbors. Much of the land is still covered with forest ; the ralleys, which are very firtile, have been ntilizel for stgar-planing, the chief industry of the island. latterly cocoa-planting has risen in importance. Dominica is one of the "lueeward Islands" colony, the central government heing at Antigua. The local government consists of an administrator, an executive council, and a legislative conncil of seven nominated and seven elected members. The ishand was named by Columbus in allusion to his discovery of it on Sunday (Domingo). Nor. 3, 1493. It was then, and for a long time after. inhabited only by Carib lndians. It was first settled by the French early in the surenteenth eenturr, taken by the English 1759, retaken by the Freneh 1ane, and restored to the Euglish by the prace of 1883. A few descemlants of the ancient Caribs still live on the inlam, oceupying a small reservation. Pop. (1842) 29.500. Capitat, principal town, and port, Rosean, or Charlottetown. See Oher, Comp.s in the C'aribbees (1886); Coke, Ilistory of the Hest Indies (vol. ii., 18t0).

IIerbert I. Smith.
Domin'ical Letter [dominied is from Lat. domínica, Sunday (for dominicu dieso Lordls day) > Ital. domenied: Fr. dimanche: Span. domingo < dominicus (dies)\}: in calendiars, the letter used to denote Sundar. The Rumans used the first eight letters of the alphabet ( 1 to II) to mark the conseentive lays of their recturing nundinal period. The early Christians adopted the same plan for marking the days of the week, drming the last one (II) as nonecessary. In the Churelh calendar I has always stood for the first day of Jamary, B for the second. and so on. (i) therefore marks the seventh day, and the crele begins again with 1 m the cighth. A retims in like manner on the 15 th, the sed, and so on. Each day in the year has thus its calendar letter, and the letter which falls on sunday is callical the dominiral lefter of the year. Feb. 28 has always the letter C', and Mar. 1 has always the letter 1). Feb. en in leap-year has therefore no letter provided for it, and this makes a change in the simmay letter atter February, so that in leap-year there are two dominical letters. As the common year contains fifty-two wecks and one day, the dominical letter changes from year to year. going hackward one pace for every common year and two places every leap-year. This mote of representing the days of the week hats heed unintermptedly enphoyed in the calembar of the Churels throughout the worl from the earliest ages of Christianity.

Dominican Republie (Sp. Republea Dominicana): a conntry oremping the castern and larger part of the island of sinto Demingo, in the West Indics. Area eakenated at $1 \times .045$ sq. miles. The twumbary with Ilatitis uncertain and liable to change. For physical features and early historr, see sinto मomisio.
P'opulation.- Ollicially estimated in 1808 at 610,000. which is prubably too high. The events which led to the establishmont of a French rolony in the western part of the island lid not greatly affeet the eastion portion. It long remained under the me of Spain, fand the Spaish hagnage and custums were prearred. (cnmparavely few Africh slaves were introducel. Hence the richor and more inltuential dass in the Dominican hepublie is largely composed of desecmetants of Spanards, more or less mixed with Indian, and, to some extrn, will Negro bloonl. The mass of the

Meister Echart Joham Tanler. Heinrich Suso. Savonarola, Las Casas. Vincent Ferriel, ant Vincent of heansais. It has given to the Church wome than s00 bishops. 150 archhiphops, 60 cardinals, and 4 propes. The reputation of the Dominicans in history, howerer. is famons for their connection with the Inquisition. It was in 1233, twelve vears after the weath of their founder, Dmminic, that they were alp pointed inquisitors. Their principal rivals were the Franciscans, and the two orlers for a long time divided between them the intellectual control of the ©hurch. The history of theolory, philowphy, and science was for a conple of centuries wholly taken up by the rivalre of the Ihminicans and the Franciscans. Ail nacntal exertions were absorbed by the controversy between the Thanisty and the scotists. The Jesuits in the sixteenth century gradnally took possession of the intellectual supremacy formerly exercisel by the Dominicans. Dominican movk and nuns are. howeser, still fonm in most countries.

After the discovery of Ameriea the order took a prominent part in the erangelizing of Mexico. Peru. New Granada, the Flands of the Mexican gulf, Florida, and New Mexico. Las Gasas, the champion of the lutians against the ernelty of the Spanish colonists, was a Mominicall. They were introduced into C:alifornia under the Spanislo domination. Their first foundation in the U. . . was made in springfieht, ky.. in 1~UT.

Revised by John J. Keane.
Dominion of Camada: see Caxada, Domintox of.
Dom'inis, Mareo Axtosio, de: an Italian theologian: b. in the isle of Arlat, near Dalmatia, in 1566. He hecame a Jesuit at Padua 1.ist, ind professor of philosophy, aml wrote a curious treatise on light, entitled De Rudiis Jisus et Lencis in Titris Perspectivis el Iride (1611), in which the phenomena of the minbow were explained for the first time. In 1596 he left the Jesuits. became bishop of Segni. and in 1.50s Archinishop of Spalatro and Primate of Dalmatia. He got out of sympathy with the Foman Church, in consequence fell under the suspicion of the holy Inquisition, and to escape trial fled to England, professed Protestantism 1616, and was made llean of Windsor $161 \%$. He wrote De Republicâ Ecclesiasticâ (On the Ficelesiastical Fepublic, 1617) and other treatises against Rome: lut he did not feel at home in his new surrombings. itis oll friends pleaded with him to return. especially Cardinal Ladovici, who had become Pope Gregory NV.., and so in 1622 he returned to ltaly and the Roman Catholic ("hurch. He gave his reavons. 1. A. de D. sui lielitus ex Anglia consilium exponit (Rome, 1623; Eng. Trans., My Motives for Renouncing the Protestunt Religion, in. e. Lumtom, 1827). Shortly after P'ope Greary dieal (1603). He then was accused ot heresy befure the Inquisition, thrown into prison, and ere his trial was finishee the died, sept. 1624. On Dec. 21. 1624 . sentence wat pronounced; his hoty was dragged through the streets of Rome burned be the hangman, and its ashes thrown into the 'Thiber.

Iomin'inm [Lat, sorereignty, deriv. of do minus, master]: in loman law. full legal right in and to an object, but which coukd not be conferred by actual possession atone unless such pusimsion hat endured for the period of legal prestription.

## lmon'lian, or, more fully, Ti'tus Fla'vins Domitia'mus:

 Vespasian. He surcoedect his brother Titus in the year 81 . and began his reign with monleratimn and apparent respect for justice. In the year $8:$ ho was unsuccessful against the Mareonami, and som afterward was deferated by the Darims, who conurelled him to pay tribute; hut in srite of his reversis he celohrated a trimmpli, and asomed the victorions titlex of (rermaniens and Dacicus.  ment of Then, ant flows in at troneral sontheasterly diretion to Kachatinsk. below the fown it runs nearly somtheretwarl, and enters the northogktern part of the sea of Azof. near the town of Izof. Its total length is abont $1,12.5$ miks. It. navigation is diffent during low water, but when the whar is high (i. e. in April and May) vensels (an asecond
abont 600 miles from its mouth. The Don in it e upper course is connected by canal and railway with the Volga. In its lower course it is suiject to two floods, called respectively the cold water and the warm water, of which the former is cansed by the melting of the snow in the country of the Don Cossacks, and the latter by the melting of the snow in the regions of its uppre course. When floculed it presents a rery lively arpect. a great number of steamboats traversing its waters from its month to Kachalinsk, on the IVolga railway. But when the flood subsides, in June or July. navigation almost ceases. The river is generally closed by ice from Norember or December to March or Apiril, and in rare cases the freezing has taken place in October. At Aksai it remains open 250 days in the year, but at the inthux of the Medrieditza only $23^{3}$.

Don, Covetry of the: a prorince of Southeastern liussia: on the lower Don river. N. E. of the sea of Azof. Area, 61.586 sr. mites. Pop. ( 1897 ) 2.55, 818 . It is a low, level plain. a burt of the snuthern steppe of Russia, alkaline and monotonons in the E., but somewhat diversified in the W5., abounding in marshes and lakes, some of them saline. Forexts nccupy only 2 per cent. of the surface, and the soil is such that it is generally incapable of forestation. The country is clevoted to the rearing of eattle, but the vine thrives aling the right hank of the Don, though the wine is poor. Fish form an important resonrce of the province, and consitlerable salt is prohuced. The country is well provided with milways. The people are mostly Cossacks. Capital, T'aganrur.
M. W. H.

Don: a river of Scothant, in therdeenshire: rises in Ben Aven, and enters the North sea a mile from Old Aberleen. Its general direction is eastward, and its length. including windings. Ts miles. Yearly a mile from its month it is crassed by the "Brig o" Balgomnie."

Donaldson. Edward : rear-admiral U.S. nary : b. in Baltimore, Md. Nor. 17. 1816 ; enterel the navy as a midshipman July 21, 1835. IIe commanded the steam-gunboat Scioto at the passage of Forts Jackson and st. Philip and capture of New Orleans April 24.1862 and at the passage of the Vicksburg batteries lune $2 *, 1 \times 62$ : and the steamer seminole at the battle of Mobike Bay. D. May 15, 1889.

Domaldson, James: ellucator and author: b. at Aberdeen, Scotlant, Apr, 26, 18:31; appointed Greek tutor in Edinhurgh University $185 \cdot 3$ : rector of the Migh School of Stirling 1854: classical master (1856) and rector (1866) of the Migh School of Edinhurgl, and Professor of Humanity 1881. In 1890 he became principal of the University of St. Andrews. Besides many contributions to British periodicals, he has written critical and grammatical works of great valic, among which are a Moderil (ireth Grammar for the use of Clussical Stmlents (1803): Lypra Guraca: Specimens of thie Greek Lyyric I'outs from Callimus to Simtsos (18.j): Critienl IIsistny of Christian Literature and Doctrine from the Drath of the tpostles to the Virene Comeil (3 vols., 1864 66). In emjunction with the liev. Alexander Roberts he ellited The Ante-hicene Chrislian Library (2t vols.. 1*6i-22).

Domaldsom. Dames Lowry: U.S.militare officer: b. Mar. 1\%. 1s14, in Baltimore. Md.; ©raduated at Whest Point, 1836 ; and July 28. 1866, assistant quartermaster-general U. S. army (rank of colonel): served in Florida war 1836-38; in the war with Mexico 1846-48, and in the civil war. Ile was made hrevet oolonel ant brigadier-general selp. $1 \%$, 1864. for distinguished services in the Athanta compaign, and major-general U. S. army Mar, 13, 1865, and major-general
 services; retired Mar. 15, 186: ; resiuned Jan. 1, 1sit. He wis anthor of Sergraut athims, a tale of andentures in the Florila war (14il). 1), in Baltimore. Not. 4, 1885.

Donaldson, Jons William, D. D. : phiologist and billieal critio' 1 . in London, Fugland. June $\pi, 1811$; was erlucated at Trinity Conlecge.  Sarllumench fofeated the Bawarin- duly e, 170.and here
the French general Sonlt gained a victory orer the Austrian general Maek Oct. 6, 1805. Pop. (18:40) 3.73).

Do'nax [Gr. obvag, reed, name of a fish]: a genns of bivalve mollusks of triangular form, belonging to the Domacide. There are forty-five living European and tropical speeies, and thirty fossil ones from the Eocene of Europa and the L. $\therefore$. Lonate is also the specific name of a reed or grass (Aroudo donax) found in the south of Europe, used for fishing-rods and other purposes.

Don Benito, dōn báenee tō: a town of Spain: province of Badajoz; near the river Guadiana; 69 miles by rail E. of Bardajoz (see map of Spain. ref. 17-D). It has manufactures of woolen goods. wine, and oil. Pop\% (1587) 16.28i.

Don'caster (ane. Danum): market-town in the West Rirling of Yorkshire. England; on the river Don, 35 miles S. of York (sce map of England, ref. i-1). It is pleasantly situated and well built; has two stone bridges across the Don, a fine parish ehureh, a publie library, and a theater, and has manufactures of irm, brass, sacking-linen, locomotives, railway cars, and agricultural machines. There is a large corn market here. The town was burned by lightning in 759 A. D. It is famous for its anman horse-races. for which col. St. Leger foumled the stakes in $17 \pi 6$. Pop. (1891) 25,936 .

Donesal' : a eounty in the extreme northwestern part of Ireland, province of "Llster, boumled! N. and W. by the Itlantic Ocean. Irea, 1.820 sq. miles. The coast-line is $3: \%$ miles long, and is deeply indented by many bays and longhs. The surface is mountainous and boggy ; about onethird is arable. Granite. Devonian rocks, and earbonifer ous limestone are foum here. This eounty has some manufactures of linen and worsted hose, and good fisheries of cod, sole, plaice, herring, and mackerel. but it was at one time also the chief seat of illicit distilleries in lreland. Capital, Lifforl. Pop. (1881), 206,035; (1891) 18.,211.

Doneral : a seaport of Donegal countr, 1reland ; on Donegal Bay, at the mouth of the Eske. 11 miles N. N. F. of Bahlyshannon (see map of lreland, ref. 4-F). It has a harbor for vessels which draw 12 feet of water. Com and butter are exported. Lat. $54^{\circ} 39^{\prime}$ N., lon. $86^{\prime} \mathrm{W}$. Pop. 1,400 .

Donegal, Marquesses of (1591): Farls of Donegal (164i), Earls of Belfast (1791), Viscounts Chichester and Barous Belfast (Ireland. 162.), Barons Fisherwiek (Great Britain. 1798), Barons Ennishowen and Carriekfergus (Uniterl Kingdon, 1841).-George IIamliton ('michester (b. Feb. 10, 17!8), third marquess. K. P., G. (1. H., F. R. S., aide-de-eamp to the Qneen, suceceded his father Oct. 5, 1844. I3. in Oet., 188\% He was suceeeded by his brother Enward (b. June 11, 1299). who died Jan. 20, 1n89, aml was suceeeded by his son, Geortie Ataustus Hamiltox Chichester, fifth marquess, b. June $2 \pi$, 18??

Dm'elson. Andrew Jhckson, LL. D.: U. S. military officer and diplomatist; b. Aug. 2. 1800, near Nashville. Tenn. : graduated at West Point in 18.20 . He served (18212.) as lientenant of engineers aml as aide-de-canp to his uncle. Alaj.-Gen. Jackson, when governor of Florida, just aequired from Spain, lle resigned from the army Feb. 1. 18\%, stulied law and became a cotton-planter near Nashville, Tean. He was private secretary to President Jackson 1829-30; charge duffires to Texas 184t-5, negotiating its amnexation to the UT. S.; ['. S. minister plenipotentiary to P'russia $1846-49$; and to the federal government of Germany 18t*-49. Soon after his return from Europe he became enlisted in etfort- to secure the settlement of the slavery agitation growing out of the aerpusition of territory from Xexico. With strong national views he became editor
 didate of the Smerion party for Vice-President of the L. s. Aftur his defeat he retired altogether from public life, and devoted his time th plantiner interests in Mississipni. (1). at Demplis, Trann... June 96, Iril.
Domelson, Forl: Sue Fort IIenry and Fort Donelson.
Do'nets: ariser of somthro linscia; the ehief atluent of the Hon: rises in the gevernment of kionsk. It flows nearly sentheatwarl, and maters the Dom 40 miles N. E. of Novo-'Tcherkask. Length, about 40 miles.

Doneola, dong gö-la: town of Nubia, in East Sulan on the left bank of the Nike (sem map of A fricel, ref. 3-F). It is generally callem Donsola Makarah, or New Dongola, in montratistinstion to Dongola Angusa, or Gld Dongula, a village, half in ruins, situated about i.j miles farther up the
river and once a flourishing place, but destroyed by the Mamelnkes in 1820 . New Iongola grew up armind the new military and administrative buildings which were establishal on the spot in 1820 by the Fgyptian government, and it is now a thriving place with well-furnished bazaars, an imfigo-factory belonging to the govermment, public baths, and it consiterable trade. Pop, 10,000 .
Donizet'ti, Gaetaxo: eomposer; b. at Bergano, Nov. 20, 17:3\%; receivel his musical education in his native city and in Bologna; prodnced his first opera, Enrico, at Vienna in 1818 : composed about thirty other operas, now forgotten, in the style of Rossini: entered a new stage of development by his Amat Bulena (Milan, 1830), partly under the inthence of bellini, partly in rivalry with him; aequired a Emropean fame by his Lucia di Lammermoor (Naples, 183.⿹) : probueed at Paris in 1840 La Fille du Rigiment: Íliuto, and La Furorifa; at Viemna, in 1842, Linda di Chamomi; at Paris, in 1843. Don Fusquale: was in 1844 stricken with paralysis, and spent his last years for the most part in a lunatic asylom. I. at Bergame, $\Lambda_{1}$ r. 1.1848.
Donjon, or Dmigeon [O. Fr. dongeon, Dtot. Fr. donjon <Med. Lat, dominio. donain, castle]: the eentral bulhing, tower, or keep of an ancient castle or fortress of the Middle Ages. It was olten erected on a natural or artifieial eleration. The lower story of the clonjon was used as in prison. See Castle.

Don Juan: a legendary personage ; accorting to Spanish tradition, a profligate nobleman who killed in a duel the father of a lady he had attempted to seduce. The story is localized at Seville and the hero's name is given in full as Ihon Juan de Tenorio. In later versions, however, he is confusel with one Don Juan de Marana, who sold himself to the devil that he inight intulge his untritled sensualitr. The original Don Juan having invited to a feast the statue erected to his victim, he challenged the spirit, whose existence he denies, to manifest itself to lim. The spirit thereupen proves its power and eondemns him to perdition. This story was dramatized by Tirso de Molima; it also forms the subject of one of Molières comedies. of luzart's celebrated opera, Don Giovenni, and of Byron's famons poem.

Donme, Jons. D. D.: poet : b. in London, Fngland, in 15:3: educated at llart Hall, Oxforl: entered lineoln's hinn. London, 1502. He married Anne Nore, a niece of Sir George More of Loxlr, Inrd-lientenant of the Tower, who was risiting in the house of Sir Thomas Egerton. afterwart Lord Claneellor Ellesmere. where he had a position as private seeretary. Though Donne had already acquired a reputation as a pet. Sir George absolntely refusel to give his consent to the marriage and when they were nevertheless, married clambestinely ( 1600 ), he disinherited the danghter: Donne afterward became a priest of the Anglican Church ( 161, ), although of Roman Catholie parentage, and not withont seruples on that aecomot. But James l. had conceived high ideas of his theolugienl capacity, and would give him no other preferment than in the Cbureh. Having gainet distinetion as the only eloquent preacher of his time. he wals arpointed dean of St. lauls, Lomben, in 1621. Ite wrote elegies, satires, and other poems, and belonged to the sechool callenl "Metaphysical Poets." whose works abuund in forcel conceits. Some of his early porms are rery licentious, but many have great poetie merits. His sermons are justly admiret: Ther are given by Il. Alford ( 6 vols., London, 1839). The first complete edition of his poums was is-
 sire Izak Walton, Life of J. Donne (1640): 11. Alford, Life of Domne (1839).
Donnelly. Igiatus : politicianand writer : 13. in Philadelphia, Nor, i, 1831. Since 18,50 he has resided in Minnesota, which state he has several times represented in Congress. As an author he is known chiefly from the eceentrie geological theories propomiled in Atlantis (1882) and Ragntrole (188:3), and from his clain to have discovered a eryptugram or word-cipher in Shakspeare's plars which transfers their authorship to Franeis Bacon. Itesry A. Beers.
Bomoner, Johany Jacob Christlan: tramslator: b. in Crefell, fermany, Oet. 10, 1769; professor in Stuttgart. He translatid Homer, Pindar. Eschylus, Sophoches, Euripchles, Aristophanes, Plantus, Terence, Jnvenal, and P'ersins, in the meters of the originals, D. in Stuttgat, Mar. 28, $18 \%$.

Doré. dörà, (flstate Pacle : figure-painter, ilhstrator, and sculptor: b. in strastburg, Jan. 6, 18:3: went to l'aris at the age of fifteen and began his carcer hy making sketches for illustrated papers: exhibited his first picture in oil, BatIle of Alma, in $1 \times 55$ : afficer Legion of Monor 1899. Doré worked rapidly and produced in large number of pietures. His illustrations are almost countles, inchuting designs for Rubelats (1854). Balzac's Contex Drôlutiques, Don Quirole (1862), Itantes Iufromo (1861), Bihle (186ij-ti6), La Fontaine's Fables (18fi). Idyls of the fing (1-9i-6s), The Athcient Mariner (18i6), and Pae's Poven (188:3). As an illustrator he was marvelously fertile in invention but a poor technician. He exhibited frequently at the Paris Siton, being exempt from the examination of the jury through his first decoration as cheralier of the Legion of llonor given him by the emperor in 1861. I). in Paris, Ian. 27. 1883.

Willian A. Coffin.
Doree: same as Dory (q. r.).
Wore, Monl. mōndōr: at group of high mountains in Arvergue, France: department of lay-de-home. They are of voleanic formation. The highest summit is the fic de Sancy, which has atm altitude of 6.190 feet.
Dorémus. Robert Oqden, D. D.. L.L.. D.: (hemist : son of Sarah l’latt Doreme's (q. e.); b. in New York. Jan. 11 . 1829: studied at Columbia College: graduated at the University of Sew York 1842: studied chemistry: assistant to Prof. Draper in the medical department : went to Enrope in 1sfi to contime his chemical researches and graduated at the medical departonent of the Niw York University (1850). He was one of the fonnders of the New York Medical College. In 1861 he was appointed Professor of Chemistry am Toxicolngy in the Belleve Hospital Medical College, and soon afterward he was appointel to a similar position in the college of the (ity of New York. Ir. Doremus has Jevoted much time to applied chemistry and has patented several processes.

Doremis, sarah Platt Haises: philanthropist; b. in New York, Aug. 3, 1802: married Scpt. 11, 18:21, to Thomas C. Doremns; in 1800 , with eight other ladies, organized the Greek Relief Society. Whose almoner was her. Dr. Jonas King: in 1836 aided Madame Henriette Feller in her Grande Ligne Dlission to the French peasantry of Canada: with Dliss Catherine Sedgwick establishot in 184? the Home for Women from Prisnn, now called the Isaac T. Hopper Home: one of the founders of the llonse and school of Inlustry, and a manager of the (ity liblle suciety and of the C'ity Mi-wion and Tract society from their beginning: in 1849 labmed efticientir for the meliel of the taminestricken people of Ireland; in 1854 became vice-president of the Norsery and Child's Hospital: in 1855 aided in organizine the Woman's Hospital Assuciation; in 1863 assisted in orgaizing the Prebyterian lome for Aged Women. For fifty rears she labored in behalf of foreign missions with untiring zeal. Her memorial in this direction is the Woman's Inion Missionary Surety, organized in Sow York in 1860, and the prototype of similar organizations all nver the $\tilde{E} . \mathrm{S}$. Her labors in bhalf of the sick and wounded soldicts from North and si, uth during the civil war were not "xcelled by these of any other woman in the U. S. D. in Now York city, Jinn P?, isfi.

Ho'ria: one of the four most mole and powertul families of Crenom. It was attacherd to the (ihibelline party. In 183.9 the families of Doria, Spinola, Crimathi, and loieschi, which hat by their rivalry long troublet the republic. were exilat.-l'wistwo Dorta. a fanous Genoese admisal, cained a haval victory aver the Ventian admiral Disani in 18.35.
Doria, Inoken : admiral amd patriot, called the restorer of (remoese liburty: lo at Oncerlia, Italy, in 140ti. IIe entemel the popes guards and afterwarl served with honor mater the Dake of Urbino and Alfomso of Naples. Roturning to Genom he was rewarded for his military exploits, and rose to the rank of atminal in 1513. For several years he applied hanself to the task of suppressing the Turkish consairs in the Mediterranean. A sincere patrint. he dreadad the less to Genom of her indemondence throngh the anhition of France or spain. In 15s: the imperial interest beeame paramome in Suples, and Duria save in his allegi-

Dorner, Isatc Argrst, D. D.: Protestant theologian: b, at Neuhatisn-ob-Eck, in Würtemberg. June 20, 18(i9; cdueated at Tübingen; became Professor of Theology there 1837: at Kiel 1834: at Königsberg 1843: at Bunn 1847: at Göttingen 18:3: and at Berlin 186 . He wrote, besides other works, a IIistory of the Derelopment of the Doctrine of the Person of Christ ( $1839: 2 \mathrm{dl}$ ed. 1845-56; Eng trans. Edinburgh. 186i-63) and an able work entitled History of Protestant Theology. varticnlarly in Germany (1867: Eng. trans. 18:1, 2 vols): also History of Pietism, especially in Whrlemberg (Hamburg, 1840); The Principle of our Church (Tiicl, 1841): - A System of Christian Doetrine (1879-80; Eng. trans 4 vols, 1 1sso-s ) ; System of C'lisistian Ethics (185.) : Fing trims. 185\%): his correspondence with Jartensen was published in 1siss. He visited the [. S. in 1873 as a delegate to the meeting of the Evangelical Alliance. Ihe was the leading Geman conservative theologian. D. at Wiesbaden, July 8. 1884.

Ior'uocll: a roval burch (established in $16{ }^{\circ}$ R): eapital of Sutherland county, scothand; on an inlet of the sea called Dornoch Frith: 14 miles N. of Cromarty (see map of Scotland. ref. $\bar{j}-\left(\frac{1}{2}\right)$. It has an old cathedral. whieh was restored by the Duchess of sutherland in 1837. P'ol. (1891) 514.

Do'rogobusil: a tom of Russia: government of smolensk: on the river l)nfeper: about miles E. N. E. of Smolensk (see map of liussia, ref. i-D). An engigement took place here in Oct.. $1 \times 12$, hetween the liussians and the rear-suard of the retreating French. The latter jartially burned the town. Pop. 9.000 .

Dorp: a town of Prussia: in the Rhine province; on the Wupler (see map of German Empire, ref. 5 -(b) : has iron steel, and paper factories. It was before 1849 an insignificant place. hut since that time like many other towns in the Wupper ralles. it has greatly increased. and has become the center of a considerable manufacturing industry, owing prineipally to the presence of extensive coal-deposits. Fop. 13.500 .

Dor'pat or Derpt (Rusc Yoorief): a town of Russia; government of livonia; on the river Embach: 13s miles N. E. of Rigra (see maj of hussia. ref. 6-(). It is well built. and hat a stome bridge across the river. The old ramparts have been converted into gartens and public promenakes. Ilere (instavis Adulphus founded in 1632 a nuiversity which becone a large and celebrated institution. Nearly all the lectures at the university are given in the German languafe, but the fiussian Government has since Alay. $18 \%$, tumed it into a thoronghly Russim institution. Struve and Hädler have sumecssivedy directed the atror nomical observatury of Dorpat, which their labors have marle famous. There ire five faculties in the university and about zooto students. Dorgat was fonnded in 10:30, became an imputant town, sank into deeay, but revived at the beginning of the pighteputh ventury. "] was captured by the Swerle's in 1625 , and by the Rusians in 170t. Pup. (189\%) 42.421 .

Wurr, 'Pomas Wilsos: pulitician: b. in Providence,
 Democrat and a leader of the siffrage parts. Under the old eharter the right to vote was limited to men who posssessed a certain imonnt of real estate. and to their clelest sons. In 1841 the sulfrage party formed a new constitution, and chase Mr. Worr (iovernor of the State. Ilis otheial action was resisted in May, L-2. hy the government chosen according to the whe charter. Dorr was arrested, convicted of treason, and sontenced to imprisonment for life, but was
 lorur liebelams.

Ibrregu, dōr-rāgè, Maskel: - Irgentine statesman; b. at Bucnos Ayres, 1is\%. He sturlied law, and in 1810 went to Santiago, Chali. to complete his logal edneation there. The Chilina revolution breaking out that year, he joined the pat ri-
ots and servel through the earlier campaigns. Returning to Bnenos frres he joined the army encaged arainst the Slaniards in L'puer Peru (Bolivia), attaining the rank of colonel. In 1816 I'tevaredon bamished him for alleged acts of insulsordination, and le went to the $\left[{ }^{\top} . S\right.$. lieturning after some years le became the leader of the fieleralist party, and in Alug. 182T. he was eleded governor of Buenos Ayres. lle at once molertook to organize a new confederation of the provinces, and at first was suceesoful. In 1828 the war with Brazil was brought to an encl. buth countries agreeing to recosnize the inlenendence of C rugnay, which had been the territory in dispute. A revolt of the army under Lavialle compelled Dorrego to fly from Buenos Ayres, Dee. 1, 1828: joined by the forces of Fosas he attempted to regain the city but was deleaterl and captured by Lavalle, and shot without trial Dec. $1 \%$. 1828 . Dorrego was a man of estimable character; his lawless execution gave rise to disorilers which culminated in the trranny of Rosas a few vears later.

Herbert H. Smith.
Dorr lifbellion: a popnlar uprising in Rhode Island $(1841-4 ?)$ under Thomas Wheson Dore $(q .2$. ), for the purpose of securing an extension of the suffrage. Up to that time the people of Rhode Island hat lived under the charter aclouted as early as 1663 , according to which none but freeholrers of an estate valued at not less than $\$ 134$, or renting for $\leqslant \% .00$ a rear. were enfitled to vote. liepresentation in the Legislature was also very unequal. in consequence of the growth of certain towns and the decline of others. The Legislature, made up under the provisions of the charter, was stubbornly opposed to any important change. New comstitutions were proposed in 154 and in 1834 , but were defeated. The popular zeal. however, conld not be suppressed or ignored. A suffrage association was formed, and a convention, summoned without regard to legal voters, Wis brouglit towether in 1840 , and having framed a new constitution providing for unversal suffrage and equal representation, submitted it to popular vote. Another convention, called by the Lemislature. proposed a constitution providing for a more linited suffrage. The so-called peoples constitution was alopted by a vote of 14,000 against 8,000 . There were charges of fraud in the election, but it was erident that the supporters of the jeople's constitution now stoud face to face against the regularly organized government under the charter. The Legislature mulertook to suppress agitation by declaring that any persons who shoukd preside over illesal meetings or allow their aames to be used on illegal tickets should be subject to fine and imprisonment; but the agitation, so far from being discontinued, increased to such an extent that the Governor called for aid upon the President of the U. S. President Tyler reblied that be would render assistance in cane any violence should be committech. But the mupulists were in no way intimidated. They proceeded with their election and chnse as Govemor the nost conspicuons of the popular leaders, Thomas WV. Dorr. Civil war on a small scale immerliately followed. Dorr organized his govermment at d'rovidence, white Governor King at Newjort was helpless. The Gorermor renewed his call upon the Presickent, and U. S. troops mrived at Newport in May. 184?. Dorr made an attempt to get possession of the Providence arsebul, but was unsuceessful. This defeat discouraged many of his followers, and Dorr hinself fled from the state. But he suon returned. Throwing up intrenchments a few miles from l'rovidence, he assumed an attitude of definnce. It hecame evident, however, that even the insurgents had little faith in his courage or ahility ; for when within a week several thousand men had volunteered to mareh against them, they fomid that the works had been abandoned. Though it is customary to refer to the movement of which Dorr was the leater with ridicule, it can hardly be demied that it was indirecoly the means of secoring the desired end. 'The insurgents disbanded in June; in the following September a State convention adoputel a constitution which embodied nearly every provision that had heen advocited by Jorr and his followers.

It was a city of the Ilanssatic Leagne, and was the chief seat of the bedmic Court. Ats trale was nearly roined by the 'Thirty Kears' war. Dertmumd was weded tif Prussia

Dort, Synod of (in Lat. Symorlus I/mertracemen): a great synod of the national Chureh of Holland; convened at lort
from Sor. 13, 1618. Lo May 19, 1619, consist ing of 39 ministers, is ruling elders, and 5 profesors, deputies from the several states of the Xetherlathls, hesides 2.1 foreign deputips representing the Anglican amd most of the Calvinistic charehes. The symol was convend by the statesteneral on acemant of the enomowerses hetween the (fomarists (talvinis(s) and Remonstrants (. Irminians). The latter derived their name from the remonstrance whieh they mhlressel to the States-Genemal delining their religions dodrines in the five articlos henceforth known as the five pains of Amini:mism. The synod was convened in the dalvinistic interest, and there has bean much differpuce of opinion an to the fairnes of its procedings, hecause of its refusal th formit the Arminian depmtios to aid their bedhern who were rited terfure the symal to defond their riews. The frincipat work of the symal was the [urepration of canms anting forth the t'alvinist ie dootrims, and the publiention of in mechosiast ieal censure against the bemonstrants, calling upon the eivil pewer to enfore the decres of the synest hy hanishment, imprisomment, or tines imposed upon the refractory The canons are ably drawn up, and were ollicially reperach by the Redtumeal chur hes of the Low (ountries, Franere Switarland, and the Palatinate, but were some vears later rejected by the ("hurch of Enghand. See the ollierind Actce Symudi (tio, 1120).

Ravised by F. M. Colby.
Jory, or Jotn lory [Jory is a corruption of Fr. dorée. gilded, in allusion to its solden tinge. John may be merely the proper name, or as some give it, a cormpion of ler. joune, yellow]: a marine lish (feus fuber) huving the membrane of the back tin extending, like stremers, far beyond the spines. "lhe head is large, and there is a comspucuons black spot on eath sule. It is fonnd on the coasts of Enroper, and attains a length of 1 s inches. It is among the variuns tinhes ponnted out by tradition as the one from whose mouth st. Peter took the penny, the sfots on the siden being the imprension of his thamb and linger.
F. A. Lecas.

Dosith'eans: an unimportant sumaritan sect founded in the first century alter Christ by losithens, who is saill to have represented himself to be the Messiah. In the fourth century there still remained a few who believed implicitly in the clatus of beitheus.
Woswrt, Frave (is : organist and composer ; I) in buffalo, N. Y., 1561: at the age of eightern suerected his father as organist of the cathedral. De has held several important organ positions, and since lsals has been organist of st. Stephen's Roman Citholic: church, New York eity. 11 s emprositions inelude sungs, motets, several masees, anil other sacred works, a mass in E mmor, and some pinces for orelestria. One of his masses, dedicated to l'ope Leo DIll., was promeced at home in 180\%.
D. E. Herrey.

 In comnection with his brother Battista he worked muela at Fervara and at Modena. Perhaps his most important work still existing is the Medonne and Sinints in the Ferrara Musomm. He died at Fertara in 10te. He is often called Dusso Dossi.

## Dost Mahammed: See Aphinatistax.

 13. in Moscow in $18{ }^{20}$ ? . Ins literary eareer began in $1846^{\circ}$ will the book foor leople, in which he described vivilly and bathetienlly the life of the smat tradesman and laborer in liasisit. In isty came an event of the most terrible comsequence in his own life. An eager liberal, he had asociated himself with a chnb whome aim was the reform of gor ermmental abnsis. suspieion som fell upon the club; its members were arrested and at once condembed to doath. Only on the senffold itself was their sentence: eommuted to banishment to siberia. Bostoileraki was given ten years of hard hatior in phace of demth. The full penaliy was, however, not intietend: hy 1sit he was relieved of the requirement of hard labor. let it was scrid before he was able to gor to sit. I'etersharg. There he fomad his wife hopelessly broken in health, his own fortune ruined, and want staring him in the face. The rest of his life was given to the hard struggle of earning his ineml with the peon. In 1861 he published The Dormtrodeden amb "pprossed, a nowel fall of the sume sympathy for the proor and watk and lowly that he had shown before his exile, still he womld not ally himself with the nihilists; and in Isti子 his novel Ecil Mearts scemed to eman his remanciation of their
principles. Later in the same year the greatest of his works, Crime and Panishment, mate this still more elear. In fact this terrible book, with its poychological analysis of apparently the utmost realism. diil, taken as a whole, seem to show in human life a threat, a temteney, a purpose of a distinctly spiritual and even religious character. The extreme party was not slow to see this, and denounced the author as a reactionary and mystic. In 1869 appeared The Idiot: in 18\%.). Podrostok, The Brothers haramrusor, Krothaic, anl The C'uderground Spirit. In 1856 Dostonerski umbertuok to prodnce by limself alone a periodical entitled $t u$ A $u$ thor's Jonrnat, in which he printed from time to time his reflections upon the fundamental cuestions interesting Russia, alwars from the point of view of an ardent stavophil. Although denounced by the nihilists, he remained exceeciingly popular among the educated young men and women, even of literal leanings, in Russia. Ilis death was the cause of almost national mourning. D. in St. Petershurg, Jan. 28 (Fubl 9 of the English calendar), $1 \mathrm{~s} \mathbf{*} 1$.
A. R. Marsh.

Dotis: same as Totis (q. r.).
Botferel : the popular name for a slecies of plover (Eudromites morinellus), common in Furope and Asia. The phmage above is varied with black and rustr red, the belly is black, the breast yellow, and there is a bant of white and black on the neck. The bird is about 9 inches in length. The yomng, which run about as soon as hatehet, are good examples of protective coloration, so blending with the samly pebbly places which they frequent as to escape deteetion hy cronching flat on the groumd. F. A. Lecas.

Dowai, Ioo a (in Lat. Duacum): fortified town of France: department of the Norl; on the river Scarpe and on the Chemin de Fer du Nord : 21 miles $\mathbf{S}$. of Tille (see map of France. ref. 2-F). It is well built, has several fine churches and hospitals, a theater. an arsenal, a botanic garden. and a natinnal college representing the Donai L'niversity founded by Philip II. in 156 . with which was affiliated the famous college for the education of English Roman Catholic priests, founded by Cardinal. Allen in 1562 . For more than two hundred years Douai was the center of English Roman Catholicisu and the refuge for the persecuted members of that Church. Missionaries from the college returned to England and worked for the restoration of the old faith. of its alumni it is staterl that thirty became bishops, while 160 sacrificed their lives on the scaffold for the papal eause. The college was suppressed and its property confiseated by the French Govermment. Oet. 12, 16! 3. After their expulsion the members of the college. among whom was the historian Lingard, founded a similar college at Crook Hall, afterward transferred to Ushaw, near Durham, England. It Bonai are manufactures of cotton stuffs, lace, ganze, paper. slass, pottery, and soap. Donai existed in the time of "asar. It has often been besieged and taken by the Freneh and Flemings. Pop, (1896) 31.397.

Donai, or Donay. Bible. The : a translation of the Bible by English Roman Catholic divines conneeted first with the college at Rheims, and afterward with the college at Douai. The translators were Gregory Martin, William Allen, Riehard Bristow, William Reynolds, and others. The New Testament was published at Rheims in 1582. The Old 'Testament, then alrealy translated, was published at Douai in 1609-10. Both Testaments were trauslated from the V'ulgate. The annotations were quite copions, and intensely Roman C'atholic. Nnmerons editions have appeared, which greatly vary both in the text and in the notes. An exact reprint of the original Rheims New Testament was published in New York in 1833. Of the original Douai Oht Testament there has been no exaet modern reprint. See Henry Cotton, Rhemes and Doray (Oxford, 1855).

Doub, Peter, D. D.: minister of the Methodist Episcopal Chureh South; b. in stokes ro., N. Co, Mar. 12, 1796. He joinel the Virginia Conference in 1818 . Many thousands in Virginia anul Sorth Carolina were brought into the church by his ministry. He was a polemical preacher of great power. He was for three years lefore his death Professor of Bitlical Literature in Trinity College, N. C. D. in (ireenshoro, N. C., Aug. 24, 186!).

Donble Conselonsuess, sometimes called Domble Personality: a form of mental disease involving cunfusion in the idea of persomal ilentity. Persons with this disorder are varionsly affected; some conceive that parts of their
frame belong to another person; athers that they are inhabited by another entity in aldfition to their own, and which opposes itself to their will and interests; othors appear to be posessed at one time of one personality, at another of another, according to the mental or physieal conditions under whith they are placed. In the last-named form of the phenomenon the person affected can not remember in one state the events whieh happened during the other. The phenomena of double conscionsness have never receired a satisfactory explanation. For some striking examples of the last-named variety, see Wayland, Intelfectual Philosophy. See also Psychology (Physiological).

Doubleday, Abyer: general ; b. in Pallston Spa, N. Y., June 26, 1810: graduated at West Point in 184?. He became a eaptain in 185.5, ami was one of the garrison of Fort Sumter in 1861: brigadier-general of volunteers Feb., 1862: major-general Sow., 1862, and engaged in battles of Manassas, South Mountain, Antietam, Chancellorsville, and at Gettyshurg eommanled the First Corps in the first day's fight after the death of Gen. Reynolis; brevet brigadier and major-general U. S. army ; became a colonel of infantry in 1867. Retiret in 1873. He published Reminiscences of Forts Sumter ant Moultrie in 1S60-61 (New York. 1876) and Chanceltorseitle and Gettysburg (1882). 1). Jan. 26, 1893.

Double Refraction: a phenomenon exhibited by Iceland spar and several other crrstals. A ray of common light passing through them is divided into two polarized rars. which take different directions and are refraeted according to different laws. See Refaaction and Polarization.

Domble stars, or bimary Niars (see Binary System): sidereal syitems composed of two stars, one revolving around the nther, or both about a common center. These were noticed by Sir William Ilerschel in 1803. Subsequent observations have confirmed this discovery, and in some instances the periods of revolntion have been determined. Some of these binary systems have periods of great length. and some of them atrord curious instances of contrasted colors, the color of the smaller star being complementary to that of the larger. In such instances the larger star is usually red or orange, and the smaller star blue or green.

Doublets: in historical grammar a pair of words in a given language, which have been differentiated out of what was originally one and the same word ; thus hotel and hospital, which are historical descendants of Lat. (rulg.) hospitale. The differentiation of form is almost always found to he utilized for the expression of some variety of simnification. It is this indeed which, hy giving the doublets a reison detre, insures their existence. Their linguistic importance lies in the fact that their divergence of form exhibits an accurate measure of the historical forces that make for change in the different linguistic routes which the words have followed. The differentiation of form may be either phonetical or analogical (minor variations of suffix being disregarded in our classification).
A. Phonetical differentiation may make itself apparent(1) When a giren language borrows a word cognate to one of its own from a related language: thus nome is the native English word of Teutonic stock, whereas noun comes viâ Freneh from the cognate Lat. nomen; so brother: friar (0. Fr. frere) ; so the vert ward (=Germ. rarten) : guard, which has come to us from Germ. viâ Old French; so wain ( $=$ Germ. wagen) : wagon (Dutch). (2) When a word is borrowed from the earlier sourees of a language. This is called "learned" torrowing. Thus Fr. meuble and mobile both represent Lat. möbilis, cf. chose: cause, droit: alirect. mûr : mâture, chétif: captif. (3) When different dialeets of the same language contribute cognate forms to its literary languare: thus church : hirk (No. Engl. Scandin. influence); so road : ruid (cf. inroad), whote : hate. Germ. sanft: sacht (Low Germ.) ; Lat. popina : coquina; palumba : columba. (4) When a language borrows from two different dialeets of another langnage, or at two different periods of its history : thus suit (from O. Fr.) : suite (from Nod. Fr.) $=$ Lat. secta; hostel $:$ hôtet ; reuson : ration $=$ Lat. ratio'nem ; beust : béte = Lat. bestium; corpse : corse : corps; rout : route $=$ lat. ruptam $:$ cudence $:$ chance $:$ fashion $:$ façon $=$ Lat. fuctionem. (5) When a language borrows cognates from two languages; thus guitar (Fr.) : zither (Germ.) $=$ Gr. кwápa; gopher (Heb.): cypress (Gr.); czar (Russ.): kaiser (Gem.) = Lat. Ctesar; castle (Lat.) : château (Fr.) ; btame (0. l'r.) : btuspheme (Lat.) : preach' (O. Fr.): predict (Lat.); place (0). Fr.) : piazze (Ital.). (6) When a language gives per-
manent recongition in its literary form to variants of a single word oriminally due to different fositions in the phonetic sentumee：thus of：off：we：wh：lat．prekent－ dere：prendere；procidens：prulens；ticm，junyfrau： jungfer．

Senate for mother full term，after one of the fiercest and bitterest contestsever hefore waged in the U．s．for a similar position．

As early as 1852 the name of Mr．Douglas hat been Hought prominently before the Demoeratic nominating convention at Baltimore as a candidate for the presideney， but，at his own instance，was not pressed by his friends．In 1856 it was again in like manner presenterl to the Cincin－ mati convention，but as soon as he disenvered that Mr．Bu－ chanan hat a majority in that body he gave positive in－ structions to his friends in that convention by telegram from Wishington to withdraw his name and not to allow it to be used in any contest for the nomination under the two－ thirds rulp．The platform of political principles which had been adopted there betore the subject of nominating candi－ dutes had been taken up was just such as hul governed the whole of his public life，and he gave Mr．Buchanan a cordial support upon his intorsement of them．In I860，after his triumphant return to the Senate at his last election，he was the most prominent candidate of the Democracy of the U．S． for the presilential nomination at the convention held that year in Charleston，S．C．，and very probahly would have re－ ceived it by a two－thirds rote knt for the withdrawal of the delegates of the States of Alabama，Arkansas，Florida，Lou－ isiana，Mississippi，Sonth Carolina，and a majority of those from Georgia．The presidential canvass that rear was per－ haps the most exciting that had ever occurred since that be－ tween Mr．Jefferson and the ehler Adams in 1800．Four tickets for President and Vice－President were in the field－ Lincoln and Hamlin，supported by the Republicans：Bell and Everett，supported by those styling themselves the American party：Touglas and Johnson，supported by one wing of the Democraty，and Breckenrilge and Lane，sup－ ported by the other．＇l＇he chief ohjection to Mr．Douglas on the prat of his former Jemocratic associates，who refused to suprort him，was what was called his squatter－sorereignty doctrine．The result of the election，by the popular vote． was for Lincoln and Jlamlin．1．855，610；for Douglas and Johnson，1，565，9\％6；for Breckenritge and Lane，Sti．953； and for Bell and Everett， 590,631 ．The result by the college of electors，however．Was very different．By this Messrs． Lincoln and $11 a m b i n$ received 180 votes：Messrs．Brecken－ ridge and Jane， 12 ；गessrs．Butl and Everett， 39 ；Messrs． Douglas and Johnson received 12 onlf．

The great events of $1 \times 61$ followeid in rapid succession． Mr．Douglas was spared their full development．Ile died， after a short illness，at his residence in Chicago，Jume 3， 1861.

Donglas Island：an island of Southeastern Alaska，cele－ brated for its gold mines．It is X．of Admiralty island and opposite Junean，in lat．is $20^{\prime}$ N．．． $\ln n .13430$ E．：is about 20 miles long hy 10 hroad，separated from the mainland by a very narrow strait，and is nearly oplosite the mouth of Takninlet．The Trealwell gold mine on this island is the best－known mine in ．Ilaska．It works a pyritic ore which is rery easily reached，and though yichling only \＄t pror ton gives a good profit．

Castle, which is built on chalk-cliffs $3: 0$ feet high, and is a fortress of great strength and extent. This castle is said to have been founded by the ancient Romans. Dover contains a custom-house, a town-hall, a theater, and a military hospital. The harbor is protected by a stone pier built of solid masonry, 60 feet wide. and extending about 1.800 feet into the sea. Dover is the chief port of commnnication between Fngland and France, and is onls 21 miles distant from the nearest part of the Continent. Steamers ply taily between this port and Bonlogne and Calais. Dover returns a member to Parliament, and is one of the Cinque Ports. A submarine cable was laid from Dover to Calais in 1850 With respect to its phrsical condition, the place is one of the healthiest in England, and the agreeable variation of open downs and step cliffs in the surronndings makes it a favorite summer resort. Pop. (1891) 33,418.

Dover : capital of Delaware and of Fent County (for location of county, see map of Delaware. ref. 4N): on St. Jones river ant on railway; 48 miles S. of Wilmington and about 5 miles W. of Delaware Bar. It stands on high ground, the streets are wide, well shaded, straight. and cross each other at right angles, and most of the buildings are built of brick. The prineipal buildings face an open square planted with fine elins. It has ichnrehes, an excellent pmblie school, 3 select schools, the Conference Academy, a Statehouse, with a State library containing 50.000 folumes, a fine U.S. post-otlice building. a job-printing office. ? fruit-

packing houses, 4 fruit-evaporating honses, flouring-mill, sash and fruit-crate factory, foundry, machine-shop, carriagemannfactory, stocking-factory, gis-works, and the Jlolly srstem of water-works. It is the center of a great fruitgrowing section. The town was settled in 1687, and was incorporated about 1020. Its first church (Protestant Episcopal) was completed in 1708 . lover became the capital of the State at the time of the outbreak of the Revolutionary war. A handsome monmment commemorates the patriotic services of John Haslett, M. F., colonel of one of the Delaware regiments during the Revolution, who fell at the battle of Trinceton. Pop. (1880) 2,811; (1890) 3,061.

## Editor of "Delawarean."

Dover : city and railway center : capital of Strafford co., N. II. (for location of countr, see map of New llampshire, ref. 8-G) ; situated on ('ocheco river: 68 miles N.. of Boston and 10 miles N. W. of Portsmouth. It is at the head of sloop navigation and at the lower falls of the river, 32 feet high, affording abundant water-pwer: the city has twelve churches, high school, private academy, a siate library of 16,000 volunes, several large cotton-mills, extensive printworks, a large number of brick-yarls, lelt-factory, and manufactures of wonlen cloths and flannels. shoes, machinery, etc., electric railway 4 miles in length, and a costly system of water-works. The Dorer Navigation Company has a flect of fiftern schonners, and the amount shipped from this port is very large. Dover was founded in 1623, and is the
oldest town in the State. Pop. (1880) 11,687; (1890) 12,791; (1842) estimated, $13,500$. Editor of "Republican."
Dover: town; on railway; Morris co., N. J. (for location of county, see map of New Jerser, ref, 2-D); on the Morris Canal, and on Rockaway river. 'It has several iron-forges, iron-foundries, steel-works, spike-factories, and rolling-mills. Pop. (1880) 2.958; (1895) 5,091.

Hover: town : capital of stewart co., Tenn. (for location of county. see map of Tennessee, ref. $\overline{0}-\mathrm{D}$ ); on the Cumberland river; is miles W . by N. from Nasaville and a mile $\mathbf{E}$. of Fort bonelson. A national cemetery is situated a quarter of a mile W. of Dover. Pop. (1880) 317 ; (1890) not given in census.
Dover's Powder [named from its inventor. Dr. Dover, an English phrsician]: a sudorific composed of ipeeacuanha and opium. 1 part each, with sugar 8 parts, rubbed together to a very fine powder. Where the brain is unaffected and the tongue and skin moist it is of great service. Its compusition now differs consideral,! from that given in Dover's formula.
Hover. Strait of (in Fr. Pas-de-Calais: Lat. Frehom Gallicum): the strait which separates England from France and connects the English Channel with the North Sea. It is alout 30 miles wide at the narrowest part. The depth raries from 6 to 29 fathoms. The English side of the strait is bordered by chalk-eliffs, some of which are about 600 feet high. Chalk-cliffs also oceur on the French shore. It has been proposed to unite England with the Continent by way of the Straits of Dover or the channel hy a bridge, a tubular railwas, or a tunnel, but all these schemes have met with Government opposition.
Dov'refield : a mountainous plateau in Norway, forming the northern end of the central mass of the Scandinavian system. It extends along the north side of the Rauma valler, which separates it from Langfeld plateau, to the sources of the Lougen, and thence N. E. to those of the Glommen. Its highest peak is the sneehaettan, 7.613 English feet, formerly considered the highest in Scandinavia.

Dow, dow, or Doum, Gerard : painter: b. at Leyden, IIolland, Apr, 17, 1613 ; a pupil of Rembrandt. He eseelled in chiaroscuro and in technical skiit, and finished his works with excessive delieary. Among his works, which are small in dimensions. are The Chartatan: The Dropsical Woman; The Dentist ; and The Village Grocer. D. in Feb., $16 i 5$.

Dow. Lorezzo : clergyman; b. in Coventry, Comn., Oct. 16,1 1:~; received a meager education; admitted to the Cumnecticut (Methodist) Conference 1798. Ile soon dropped his oflicial relations with that body. and went to Ireland to preach against Romanisn. Immense crowds listened to him, attracted by his cloquence, his eccentricity, and his evident sincerity: Returning to the $I^{\top}$. S. he directed his efforts against the Jesuits. preaching mostly in the South. Here, ton, he attracted great congregations, despite the prejudices exeited by his inereasing eccentricity. He published Polemicat IForks: The Stranger in Charleston. or the Trial and Confession of Lorenzo Dour; IHistory of a Cosmopolite. or the IIritings of the Res. Lorenzo Dous. comtaining his Experiences and Tratels in Europe and America up to near his Fiflieth Iear, etc. D. in Georgetown, D. (.., Feb, 2, 1834.

Dow, Neal: temperance reformer: h. in Portland, Me., Mar. 20. 1804; edncated in Portland and New Belford; was very early interested in the temperance cause; while mayor of Portlaml. 18.51, drafted a bill to prohibit the manufacture and sale of intoxicating liquors; took the bill to the Legislature then in session at Augnsta: had a public hearing before a special committee which roted to report the hill exactly as presented. It was printed that night, and the following day, May 30, was passed by both honses. That aet became widely known as the "Maine Law." During the civil war he was eolonel of the Thirteenth Maine Volunteers, and afterward brigadicr-general. He was the Prohibitionist candidate for President in 1880. D. at Portland, Oct. 2, 189\%. C. 11. T.

Dowarer : a widow endowed-that is, who either enjors a dower from her deceased husband, or has property of her own brought by her to her husband on marringe, and settled on hrrelf after his deceasc. In (ireat Britain the term is used in a less technical sense to distinguish the widow from the wife of her husband's heir of the same name and tille, thus the dowager duchess, dowarer countess, ete: No man can marry a c pucen-dowager without special license
from the sovereign on pain of forfeiting his land or gonds． A queen－towager does not lose her regal title when she marries a subject．

11．1．13．
Dower［O．Frr．duaire $(>$ Mod．Fr．dwmare $)<$ Lat．＊do lorium，deriv，of dos，dofis，dower］：in the common law of binglamb，ath eatate for life which a widow has in omethirel part of all the lands and tenmments of which her herstand Was seized hemeficially．or of an＂state of inheritance at any time during the marriage．

1．The Suhure of the Estate－I Inwer pases throush throe stages．While the hushand lives it is but un inchoate right and incapable of chforemment．Shombt the lusbond sell to a stranger and leave her destitute she would have mo claim to the land while the hushand livad．On her hashantis death，and before fower is assigned，she has a right of action． After dower is assigned she has an estate in the land．The rights of dower depend bpon a rule of law which is foumderl on public：polieg．The law of the place where the land is situated soverns it．

2．The Requisites of Dower．－These are threafold－mar－ riage soizin of thw hashathd，and his death．The leadiner questions on this sulbect concern serixin．By this is meant beneficial ownership of a prosent estate of freehohd，which may descend to the hasband＇s heirs．There can be no Howor in an astate for yars，lanever long it may last．Nor （an there be in a reversomary estate which is preeeded by a prior estate of frechold or for life owned bey anot her persion， thongh there may be where the prior estate is for years．The widow of a truster can bot be endowed，as he is not a bebe－ fieial owner．Thas proposition would be applied to the widow of a decensed partner，who combt only the endowent sulijeet to the adjustment of the affairs of the parthership． Farmerly the trust eatate itself was not the sulbject of fower． This rule duss not preval in the U．sto，ant dower maty sometimes be had in mones．Which by the doetrine of erpuitable conversion is treated as lath．Whenever the husbund＇sestate is defoated by a superior title dower falls with it．

3．Issigmment of Dower－－Is dower is one－third part of the hashand＂：estato，it mast be assigmed cithor by the par－ ties or by act of the law．Cortain legal rules must recur larly be followed，when dower is suid to be assigned of comt mon right．These may be rolaxed by aremoment under seal， when the assignment is said to be agrainst common right．

4．Burring of Doner．－Whe right ran mot be destroymt by the mare aci of the husinand．（reditors also take sub）－ joet in this cham．It can in wencral be bareed onty by the wifes own act．as by joining in a converance with the has－ hand，or by a jointure settlect before imarriases．The hus－ band often in his will，cither expmesly or by implication， gives his wife propery in lien of Aowar．In this cose she mas．after his derth，elect to tako suld property or her dower，bimt ean not take both．

This rimht oceasioned much incomvenience in Encrand by imperding the conveyance of property．Far this reason，by the［ower det of Aug．3！，1N3．3，the right of dower was virtually phoed entirely in the hands of the hushand in the case of all marriages contractorl after fant， 1, sast．The hushand may now dispose of his lands ly will or otherwise． free from uny claim of dower on the part of his wile．If， however，he dies intesiate，his willow，under thr satute of Wistribution，recoives not mewn for life lat abolutely．one－
 of the English common law still prevail．Is at graneral rule also at loast ore－third of the hushandes persomal estate is given to the wife，as lyy the binglish statute of divirimution．

July ?, 1871: succeeded his father Mar. 31, 1874.
Dowry [for douery, an exteuded form of Dower (q. e.)]: in law, the marriage portion brought by a wife to her husband. This term is often confounded with douer, bat has a rlifferent signification.
 a form of praise said or sung in divine service, commonly at the close of a praver. The Great Doxology, as it is called, is an expansion of the angelic hymn, and is sung in the Roman Catholic Church at the celebration of the Fucharist. It begins with the words "Gloria in excelsis Deo." The Lesser Doxology is the "Gloria Patri," the substance of which appears in the metrical doxologies in use among Protestants generally.

Doyen, Garriel Francois: artist ; 1) in Paris. 1726 : studied under Carl Vanloo, and gained the great prize in 1246. After seven years study in Italy, he returned to Paris in 1753. Ilis pietures attracted wery little attention; they were even condemnel. But he was too proud to yiehl to the bad taste reigning. We concentrated all his powers on the marnificent picture La Mort de Virginie. and it took the public by storm. His masterpiece, however, is Le Miracle des Ardents in the Church of St. Roch, in Paris (17~3). In 1791 he removed to St. Petershurg, as director of its acalemy of art. 1). in St. Petersburg, Jine $5,1806$.
Doyle. Richard: illustrator and caricaturist : b. in London in 1826. He was one of the statf of Punch, fonnded in 1841. and designel the cover of that paper. which has never been changed; but he lelt Punch in 1851, becanse of the attacks of that paper on the new Roman Catholic hierarchy in Englanti. He illustrated nany books, such as Thackeray's Teucomes: and published some collections of his work in Pruch, such as Manners and Cusloms of ye Englishe : other himorous stories, chielly told in pictures, such as The Foreign Ther of Messrs. Brown, Jones, and Robinson; and some charming howk of fairy-land illustrations. D. in London, Dec. 11, 1883.

Russell Stirgis.
Woylestown: borongh (incorporated in 1835): capital of lucks (\%). Pit. (for location of county, see map of Pennsylvania, ref. 5-d); terminus of Doylestown Branch of Pliil. and Realing R. R.; 32 miles bey rail N. of Philadelphia: hits a public library foumted in ts.06, grated public school and private seminary, spokefactory, agricultural-machine works, water-works, gas-works, and electric lights. It is much frequented by summer visitors from Philadelphiat. Pop. (1s*) 20.050 ; (1840) 2,515; (1848) estimated with suburbs, 3,000 .

Editor of "Jemocrat."
Dizy. Remiart: Semitist : b, at Leyden, Mollama. Feb.
 1850 he hecame 1'rufessor of 1listory at Levien. Most of his work are contributions to the history of the Moslems in Spain and Nopth Arica. Especially important are Rpcharches sur l'Mistoire ef la Lilléralure de l' Espugne pen-
 1husulmans d'Expetme, a bork of extraordinary charm (Paris, 1 stil and lssi); (ilossaire des mots espagnots et portuguis derimérs de l'arabe (2d erl. Lerilan, 1s69). C. 11. Tor.
Draa Wali: the longest river of Moroceo thengh some others contain a greater robune of water. hising in the
 ary, which it then follows through the Western Sahara till
it reaches the Atlantic at Cape Nun. It is the only river of the Western Sihara that has a constant flow of water, anel it forms a natural hommary bet ween the nomads of the desert and the settled tribes of South Moroceo. Its hanks and bed are of light alhwium, eapable of great fertility if cultivated. The river is not navigable.
C. C. ADams.

Dracu'na dra'co, or Dragon-trea: a tree belonging to the family Lilincers, some examples of which grow to proligions size in the Canaries and Intia. The height is not proportioned to the thickness of the stem, and the head is crowned with short branches having tufts of swort-shaped leaves. It produces a part of the resin called Dragos's Bloon $\left(q . x_{0}\right)$. A specimen in the island of Teneriffe was described by Humboldt as having a stem about 45 feet in circumference in $17!9$. It hail the same measurement in 1403. It was worshiped by the Guanches, and its hollow trunk was converted hy their ennquerors into a chapel. This extremely old tree was overthrown in 1868.

Drachenfels, hraa chen-fels (i. e. dragon's rock) : a moun-tain-peak in Rhenish Prussia, on the Rhine: about 8 miles S. E. of Bonn: 1,050 feet high. It rises abruptly from the river, and is renowned in Byron's veraes commencing-

The castled crag of Drachenfels
Frowns o'er the wide and windin
Frowns o eer the wide and winding Rhine.
Its summit, crowned by a ruined castle, commands a beautiful prospect.

Drachin. or Dram [from Gr. Soaxun: in Fr. drachme; Lat. drachma]: a measure of weight. The aroirdupois drachm is one-sixteenth part of an itvoirdupois ounce; the apothecaries' drachm is the eighth part of a troy ounce. The orthography dram is commonly employed in avoirdupois weight, and drachm in apothecaries weight. In apothecaries' measure a fluid drachon is one-eighth of a fluid ounce.
Drachma: a silver enin, the unit of the monetary system of ancient Grecce. The Athenian drachma was equivalent to six oboli, or nearly twenty cents, and weighed from sixtythree to sixty-six grains. Other Greek states had drachmas of different values.

Drachmamm, draak'man, Molger Tienrik Herholdt: Danish poet; b. in Copenhagen, Oct. 9, 1846. In his routh he studied art and won some reputation as a marine painter. In $180^{2}$ he published a volume of poems (Digie), and another of sketches (Med F̌ul og hridl). and since that time he has made literature his profession. producing with astonishing fecundity lyics, narrative poems, dramas, novels, tales, etc. Ilis best work is his lyric verse, which takes rank with the hest in Danish literature and his sketches of the life of fishermen and sailors (ef. Blicher). Drachmann is the most eminent of the Danish writers that have been influenced by Geore Praxdes ( $q . i$.) and follow what is called the new direction. (See Danisn Literature, Latest Periol.) At the begiming of his career he was intensely radieal, but his sentiments have undergone some molifications. He has traveled much and made himself intimately acquainted with the life of nany conditions of men. The restlessness of the last part of the nineteenth century is in him comhined with a remarkable peetic genins, which, though manifesting itself in very lifferent decrees in his varions works, has already given them the position of classics. Of his numerous publications the following may be mentioned: I Storm og stille (1s.4): En Orerkomplel (1876); Lngl Blod (1802) : Songe red Mavet (187i): Tamhhiuser (187i); Pua Somamls Tro og Lore (18i8); Derorve fra Greensen (187万): Prinsessen og det hulwe Kongerige (1sis) : Ranker og Roser (18i9): Chydom i IIgt og sung (1879): Östen for Sol og Tresten for iluane (1sco) : Irandenes Dotler (1s81); Strandly Folk ( 1883 ): Der tar on Gang ( 21 ed. 188i) : A7kilhicedes (18s6): To dromatiske Digie (1888); Troldtaj (188: ff.); Tusind og en Nat (188:9); Forshrevet (18!10); Turvis (1心91).
G. L. Kittredee.

Draco. or The Dracon: a constellation near and around the north celestial pole. It was from observations upon the star $\gamma$ Draemis that Bradley was led to his brilliant discovery of the aberation of light.

Hraeo (in Gr. $\Delta \rho \alpha \alpha_{k} \alpha y$ ): a Greek grammarian of Stratoniceat in Caria. of whose life few traces are found, but who flemrishet probably about 195 A. D. Suidas and Eudocia assign to Draco a great number of works on grammar, on moter, anel om the poems of Pindar and Alcans, all of which have perished, with one exception, a treatise on Greek meters
 of Draco's work, with numerons imterpulations frous other fuarters by a later hame. This was edited by llermamm (1, eipzig, 1*12).

Bra'co. or Dra'eon (in Gr. $\Delta \rho \alpha{ }^{\prime} k \omega \nu$ ) : an Athenian lequishator who was archon in fill B. c.., and was the author or (onupiler of the first writen kaws among the Athenians. Indgel by the standarl of a more homane age, this rode was extremely harsh, the death penaley, ateoring to Plutareh. beine inflided for every offense, bit of the cosle itself not a tine has come down to us, and tratition has molombtmally exageraten it cruelty. while, il it be taken in conncetion with the rode state of society at the time, it will apmear a distinct alvane in the julicial system. It remainel in furce until the time of solon, who substituted milder peralties. 'I'he term dracunic is sometimes applied to laws which are excessively severe.
 from some suphesel fimeitul likeness to a limon]: an gemus of plants of the natural family trecere. The Druconfium polyphyllum, a native of Giuiana, India, and dapan, has a bowerful action on the mervons sysem, and is used as a remedy for ast hma. The tlower enits an intolerable stench when it first quens. "The Drucontium of the U.s. Pharmacopoia is the skunk-cabbare (symplocarpus fortidus'). whelh has similar mention properties. It is kindreal to the true Drucontiam, and like it lats a strong offensive onlor.

Dracon'tins. Buastos Fmilus: advocate in Cartlage; flourishel in the lattor half of the fifth century: was a writer of petry of comsiderable merit. Besides several epyllia on mythica! suljects, two epithalamia, and an elegiace pom called Sutisfuctoo, addressed to Gunthammed, King of the Tambals (fat-4!6), hy whom he latel then imbprisomed. he wrote a ditactic poem in three books entithed Letudes ele i, apart of which (the Ilexameron), containing an atceount of the six thays of creation. was edited sepmately, and is prased by Inilurus. In the seventh century Eugemins, Bishop of Tobelo, adderl to it an account of the sebenth day. Dracontins shows a surprising familarity with clasical writers athl his mamer is very rhetorical. On accome of the resemblances in dietion and meter, the puem known as orestis tragedert is now generally aseribed to ) Pracontius. Ser edition of the ('arminu minore by F .

M. Warrex.

Draff: a bill of exehange: an order for the payment of money drawn by one porson upon another ; also a tentative eppy of a leqat durmment or other Cormal writing made for the purpose of aljnsting the matter which is to be admittel intu the fair erpy. See Bille of Exchange.

Draft Riots: certain cutbreaks that occurred in the streets of New York city, July $1: 3-1 \mathrm{i}, 1893$, necasioned hy the
 proviled for the enrollment by provest masials and en-
 eighteen and forty-five to be chasen by lot. The dratt was hela by many to be not unly uneonstitutional in itself but most unfar in its working on arcount of the execesive fuotal refuired of the urban districts. Nomoser, the elanse propmitting the phrehase of exemption from service for the sum of sisho camend muld dissatisfaction. Inthamed by the intemprate word of some of the nowspapers and hy tha hat magres of aritatas. the mob, consisting chatly of the perter clases and thess of foreign birth. burst into at house in the yיpre part of the cily where the drawing was gong on. Irowe ont hlue elerks, dextroyed the papers, and set lime to the hailding. Then fullowed a series of thutal out rages, womeh the poliee thouls eflicint were powerless to present. Stores were plondereit, buildings hurned, athl unoflending citizens murdered. The fury aganat the colored race showed itself in the marilor of several Negres and the burning of the Colored orphan tislum. The erowel, now wollen to thomsimes, oncomatered ino serions oppesition till the tropes from the posts in the harbor gathored in the stmets. From that time collisions were freguent, with the havier losses on the sile of the rioters, but for fons days the tumult comtinued. The return of the militia from lemsylvana and of ome regiments of veterans from the dray of the Potomate reatored order. The loss of property was sesere, lut the nwners were in patt indemnified by the fryment of 81, iom.000 by the eity government. (ios. Seymour, sympathizing with ithe oprusition to the draft. pelitioned the president for its suspernsion matil its constitutionality shonith the de-
cieled upon, and comphainet usperinlly of the unfair apportionment, but President lancoln, thingh willing to consider the question of a more equitable distribution, thonght the matter too urgent to admit of delay, lu the following month the draft was resumed in New York and emmpleted without resistance. sce iveeley, 1 mericun conflect.
F. M. Colby.
 tagumf: in the Levant, an interpmer or guide for fomigners. The dragoman of the sublime Porte is an impnant Turkish ollieser, who forms the medium of commanieation between his awn Gowemment amb Toreign ambasatome. The term is ako applied to the interperers attached to Eurepern emhassies and romsulates in the Levant. They are asually mative of Italian extraction. '1hery and their families are not subject to the "lumish laws, hat are under the protection of the embassies which they serve.

Dragon [deriv. of Gr. סókwy, a serpent, a drugon]: a small inotlensive East Indian lizard of the genus Ihaco, 'alled winged dragon, or tlying dragon (Ibreco fimbrietus and rolomes), remarkable for an expansion of the skin on each sikh. supported by the greatly domgater last six rils, forming a kind of wing, which sustains the animal like a parachute: whem not in use the ribs and thel of skin are folted along the body: Other species, tha dragn lizards (Atu), belonging to the Tejide, are natires of sonth America only. They have the tongue forkid like a serpent, lack and tail cresterl. and are sumetimes 6 fert long. they are bold and resolute in self-defense.

$$

$$

Bramennet: any fish of the genus Callionymus and family Fivbictu (goly family): found in the temperate stas of the Ohl Worlal. "lhere is no air-blatder: the ventral fins are larger than the pectorats and placell muder the throat, and the gill-openings are reduced to a small hole on each side of the mape. One of the finest species is the gemmens dragonet (C'cllionymus lyra), of a golden color, variegatell with sapphire blue.
1)ragon-fly (in Fr. dimoiselle: Germ. Stectettiege): the popular namio of the members of the finnilies Libelletide, Eschmider, and - 1 grioniter, which inclule an inmerne num-

brar of sperebs of nemopterons insects. Thbey hatre large grobmar heads, stroner mamblibles, eyos lateral, large, and projecting, antemne short, fon harrow, ganze-like wings,
strongly reticulated, and the abdomen often remarkably slender. They are found in northern countries, but they are most conmon in the warmer climates, and frequent marshes, lakes, and rivers. Their food is insects, which ther devour with great voracitr. They are sometimes known as "devil's darning-ncedles." and are often regarded by the ignorant with groundless dread.

Dragomnade, drag-on-ned : a persecution carried on with the aid of troops ; specifically, one of a series of persecutions which the French Protestants suffered in the reign of Louis XIV.: so called because dragoons (in Fr. dragons) were employed as instruments of the persecution.

Louvois, the king's minister, is thonght to have originated these measures, which were executed with great severity in 1684 and the rears immediately succeeding the Revocation of the Eliet of Santes (1685). A body of dragoons led by a bishop and intendant marched through the provinces, requiring the Protestants to abjure their religion, and persecuting those who refnsed. Troops were quartered in Protestant households and allowed to subject the inmates to every kind of insult and injury, from which the only escape was conversion to the Roman Catholic faith. Such conversions accordingly took place in great numbers, but with questionable sincerity. See Perkins, France under the Regency: see also the article Fl'guenots.

Dragon's Blood. or Gum Iragun (in Lat. Sranguis draconis) : a resin obtained from various trees growing in warm climates. Among these are the Dracexa draco (q. $r$ ) , the red sandal-wood (Pterocarpus sentalinus) of the East Indies. the Itprocarpus draco, a leguminous tree of South America, and the Calamus draco, an East Indian rattan palm. The dragon's blood of commerce is of a dark reddish-brown color. smooth, and brittle. and dissolves in oil, alcohol, and ether. The solution is used for staining leather, wood, and even marble. The resin is also an ingredient of some varnishes and lacquers. It comes from the Moluccas, Socotra, Mrazil, and Teneriffe.

## Dragoon: See Catalry

Drainage: the removal of the excess of water from the soil, either by means of canals and open ditches or by underground sewers, pipes, and hollow tiles. No part of farmhustandry pars a larger profit upon capital invested than the judicious drainage of land. In the U. S. there is very little ground that is not too wet in rainy weather and too dry in the frequent and long-continued droughts. Thorough drainage not only relieves the first-mentioned evil, but. strange as it at first appears, it greatly mitigates the bad effects of dry weather. When soil is drenched with water and dried by evaporation. it hecomes hard, especially if it be argillaceons: land that is driad by drainage is porous and permeable to the dews and showers: while the soil deepened by drainage permits growing crops to put forth longer roots, and thus become secured against drought. Experiments in draining bogs have shown that when the water is given free passage through a cold soil by thorongh drainage its temperature at the depth of $\tilde{\sigma}$ inches may be raised 10 above that of the adjoining undrained soil.

It appears also that gool drainage diminishes the relative number of fevers, especially those of a malarial origin, while it is almost certain that excessive moisture in the soil is a fruitful canse of consumption. So important is this sulbject considered in Great Britain that Parliament in 1846 offered in the Drainage Act to alvance moner on easy terms to landhulders for the purpose of improving the drainage of land. The act has proved a great blessing.

Culerground Arainage is the best for land that is not deeidedly marshy: and of all nuderground drains those matle with tiles (hollow evfinders of porous burned clay) are the most effective. The tiles should be laid near enongh to the surface to effect a thorough drying after rains, and deep enough to escalp the plow and frosts, and to afforl " (lraingt" from the soil above. From ist to 4 feet deep is considered the proper depth. The ineal drainage system places these tile drains at a distance apart of about i mols throurhout the fiedd. It is very important to avoil curves and angles in the vertical plane of drains, because any earth which may enter the tiles will he sure to lodge at depressed pints.
braining lakes and marshes is a matter requiring great capital and much enginering skill, but it is sure to become a very important question in the south and W'est of the U. S. In Hollanl, steam-pumps, wind-mills, and tile-gates are ased extensively. The great Haarlemer-merer was drained and is kept ifrained by steam-power. Ste Ilambera

Lake. For the drainage of cities, see Semerage, and for house-drainage, see l’lumbisg.

Drake. Bexjamin M., D. D.: minister of the Methodist Episcopal Church South; b. in Robeson co.. N. C., Sept. 11, 1800. He joined the Tennessee Conference in 1820, but the next year was transferred to the Mississippi Conference. Me built the first Methodist chureh in New Orleans, was president of Flizabeth Female Academy, the first Methodist school establisherl in Mississippi. 1824-32. and was president of Centenary College. Jackson, La., from 1854 till his death in Mississippi in 1860.

Drake, Charles Dantel: jurist; a son of Dr. Daniel Drake, an eminent physician and writer on medical subjects : b. at Cincinnati, O., Apr. 11, 1811. 1le served as midshipman in the navy 182--30, and was admitted to the Ohio bar in 1833. In 1834 he removed to St. Lonis, where he became eminent as a laryer and politician: was in 1864 vice-president of the convention which revised the constitution of Missouri : was U. S. Senator 1867-71, and was appointed chief justice of the U. S. court of claims in 18:1. retiring in 188.5. He was prominent in the councils of the Presbrterian Church : published Law of Attachments (1854) and Life of Dr. Daniel Drake (1871). D. Apr. 1, 189?.

Drake, Sir Frascis: English naval hern: b. probably at Tavistock, Deronshire, about 1540. Nothing is positively known of lis carly life. In 150 i be commanded a little vessel, the Judith, in the squadron of his kinsman, John IIarkins. Which was seized and destroyed by the spaniards, only the Judith and one other vessel escaping. He made voyages to the West Indies and the Spanish main (13:0 and 15i1), and in $15: 2$ he left England with two yessels and ser-entr-three men. the object being to attack Nombre de Dins. As England was then nominally at peace with Spain, the enterprise was practically a freebooting expedition. Nombre de Dios was taken, and an inmense amount of treasure was found: but Drake was wounded, his men became disheartened, and the town and treasmre were ubandoned (July 29 , 1522). Later. Cartagena and Porto Bello were successtully attacked, many Spanish ships were taken, and a vast amount of silver was capitured on the Isthmus of Panama, most of it being abandoned because the men were unable to carry it. Drake crossed the isthmus to Panama. and was the first Englishman to see the Pacific. In Dec., 15\%\%, he started on another cruise with five ressels, as before without a royal comnission. The object was to attack Spanish ressels off the Pacific coast of America. The squathon passed the Straits of Magellan safely. but shortly atter one ship was lost and another turned back. With the rest Drake plundered Valparaiso and Callao (Jan. and Feb., 1579), captured a treasure ship with over B800,000. crossed the Pacific, and, after crusing among the Malay islands, returued to England by wat of the Cape of Gooll Hope. Sept., 1580. Queen Elizabeth visited Drake on his ship and knighted him there. and thereafter he held important commands in the royal nary. In $1584-85$ he was a member of larliament. In 158.5 he commanded an expedition to the West lndies and Virginia. Spain was preparing the great armada for the invasion of England. Early in $158 \%$ Irake was sent with a strong flect against the Spanish coast to "singe the King of Spain's bearl," an operation which he conducted with his nsual daring and success. Nearly 100 unfinished ships, intended for the armada, were sunk or bumed at Carliz and clsewhere, and a homeward-bound lortuguese East Indiaman was capturel with a rich booty. In Jule. 155s. Drake commanded a division of the English fleet under Iloward in the great fight with the Spanish armadia. In 1595 he commamied another espedition to the TWest Indies, but died Jan. 28. 15:9, as the fleet was appoaching Porto Belln.

 originally the exhibition of hmman actions（esperially those which reveal the fertings and pa－sions：upon the stage．The anclent treen drama，enmedy as well as tracenly，had its origin in the worship of lacolus（Ionysus）．The Ihonysian dithyrambs sumer at the festivals of lianolus sometimes ex－ presed wild and boisterons gavety at of her times passionate sorrow．From the former wats at lenghtheveloped the old Gretk comedy，which may he suld to have attamed its high－
 latter arose the Greek tragedy，whioh fomind its must prertect expresion in the immortal works of Jeselyyhe，sophocles， annl Enripides．

The Roman drama was dorivel from the fireck，to which， in the opinion of all the most distinguished erities，it was much inferior．The most colebrated Romin dramatio juets， fhatus and＇Terenee，uppear to have taken Vemanter amd fhilemon（of the Sew（ireck eomedy）as their modelso and their froductions have exereised considerable influme on the modern comedy．In tragedy andent Fione produceat one truly great pued，Semeer．

The llindu drama，puite indepemant of the drama of En－ rope in its origrin，has produced some works of great merit． the most celabrated of which is the shatomutuld，or the hoat Ring．of katlidâsa（who is supposed to have lived about $\mathbf{5 0}$ 13．C．）－a work which has received the highest commendation from some of the most eminent arities of mondern burope． and has been pronomeed worthy of the romius of shakspeare． ＂This remarkathe promlation，instean of heing alivided into five acts，like the classic amb modern drama，cunsists of seven sets．

The Chincse atso have at trama，hut areatlo differing in
some respects from that of the Wevtern mations：at single piece heing oftera extanded through no inconsiderable por－ tions of several suceresive days．

In modern times the elramal has been coltovated witl sue－ eess，it may be sudi，by all the primeipal Furopean nations， hut mum esperially by the ltalians，the spaniards，the Fremoln，the Enirdish，ant thw（iexmans．For a long period the French were gremerally suppusen？to surpass all other nations in the genius and skill of their dramatic writers，as well as in the admirable performance of their actors．T＂le Frencheritice usually insisted on the strictest adheremere to the rules of the classic arama，and darticondarly to what are eommonly termed＂the three unities．＂［＇ntil thes time of Lessing the forman theater was sompery more than a re－ flecetion of that of laris，lant that wreat anthor aml critic tanght his countrymen to throw wif the trammats ant atfee－ tations of a foreign seloon，and to srive entire frentom to the cultivation of the national genins．Sinee that time the German author：，tukine the Finglish for their model rathur than the Freneh，hut without servilely following any，have protured the finest dramatic works that have appeared in Eimope since the time of Shaksprare．Among the Geruan dranatic writers，（iome hend sehiller，fy universal consent， wocupy the foremost rank．Ibemmark has also pronduced some eminent dramatic writers，amoner whom Ömbes－ scmuanaEk（q．J．）js the most velebrated．Italy can searcely be said to have produced any dramatic poets of the highest order：amonor her best are jerhaps Goldoni in comedy，and Alfier，Man\％oni，and silvio Pellico in trasedy．The span－ ish drama has given to the world many productions display． ing rare genius，but none that are worthy to be placed hy the side of the greatest dramatic works of Greece，England， Germany，or France．The most celehrated mames in Span－ ish Iramatio litarature are those of Lope ole Vega and（＂al－ deron，the former surpassing alt that is recorded in the his－ tory of the homan mind in the marvelons fertility of his genius；the latter bre－eminent for the brillamer of his im－ acination，as well as for the fertility of his invention，but neither of them producing any work of the hiochest order．

The Frend drama justly holds a ligh place in Euromean literature．It is not tor imnch to say that in eomenty the writers of un other mation．either in meient or montern times，have equalel the French．The heat plats of Dlo－ liere may be suid to be not only umivaled．but unapproached， by those of ally other atut hor．shakspare，（iouthe and sehiller excepterl．In tragety，Corneille，Kacine，and Voltaire all ex－ hilnit erenius of the highest order，but liacine in the natural， sraceful simplicity，as well as in the exquisite finish，of his probluctions is renerally admitted to have approached most nearly to the hest sperimens of the aneiont（ireek travedy．
Thongh the dramatice literature of Eugland Iresents us with lewer writers of the highest oriter han that of France， the former can boast of onse whose dramatiof gamias sur－ passes everything to be fomm in ameiont or in modern times．While in his best comedies shationeare is pertaps not inferior to Moliere，in his trugedies，not merely in the exhifition of the contlict of the mightiest human liassions， but aloo in his representation of the wonkinge of the most int ricate and subtlest of fuman suotives，he las no equal． In the opinion of many critioes the hishest exhibition of betice genins is to be found in the tragic lrama．which mat－ umally combines the tire and passion of lyric inspiration with that representition of outward cirenmstances，conduct， and events which helongs to epira poetry．It thas unites every advantage for the exhihition of haman eharacter．It not only shows us the external conduct，but in the virious solilonuies and diseourses of the dromatis persomer it revents to us the didulen thoughts and passions of the sonl．In this last respect it hats a great superiority ower epin poetry，in which，though the expresonon of feeding oecasionally oecurs， it is always made subordimate to the events of the story． See Theiter．

Jram＇men ：seaport－town of S゙orway：in Aggerslums ：on both sides of the river Wrammen，mear ils entrume into the Christiania V＊iord：alonat $2 \cdot \operatorname{miless.~W\% }$ ．of Christiania（see map of Anrway and sweden，ref．10－C）．It has a colloge． extensive sawmilis，and mamufactures of chicory，sailchoth， ropes．ete，large quantities of timber are exported from this port．Yop．（1591）20，684．

Draper. Wildiam Hexry : Canadian jurist; b. near London, England. Mar. 11. 1801, and removet to Canada in 1820. He was admitted to the har in 1825 ; beeame member of the Legislative Comncil in 1837: solicitur-general of Upper Canala in 1838. and afterward attorney-general. He was appointed puisne judge, court of queen's bench, in 184~: chicf justice court of common pleas in 1856; chiel justice of Cpper Canadia in 1863: and president cont of errors and appeals in 1869. He was a brilliant and eloquent speaker. D. in Toronto, Nov, $3,187 \%$ Neif Macdozald.
Drapery [O. Fr. draperie deris of drap, cloth: ltal. drappo < Lat. drappus. possibly of Germ. origin]: cloth or woolen stuffs, clothing, or apparel. The dealers in such eommodities are called drapers in England. Drapery in painting and sculpture is the elothing applied to the human figure, the various costumes and modes of dress used by different nations and classes of people. The ancient Greeks, although they often executed mude statnes of heroes and gods, surpassed all other artists in the representation of dapery and costume. The art of disposing the folds of drapery forms a consiterahle part of the painter's and sculptor's study, and requires good taste and judgment. See Costcae.

## Draught (of a chimney) : See ('nmaney. <br> Draughts: See C'heckers.

Drave (anc. Drazus; in (rerm. Dran: Slavonic Drava) : a river of Europe; rises in the Tyrol, and flows nearly eastwarl, through ('arinthia and Styria, to the western frontier of Hungary. It afterward runs southeastward, and forms the boundary between llungary on the left and Croatia and slavonia on the right, until it enters the Danobe 14 miles E. of Essek. Its total length is nearly 400 miles. It is navigable for over 200 miles
Dravid'ian Languages: a family of languages formerly ealled Tamulie, from Tamil, the chicf member of the group. The objection to this name was that it was not sufficiently comprehensive. Dravidian is not aitogether free from the same objection, for the name which the Aryans first gave to this family was "Andhra-Driyida-Basha"" which means "The Telugu-Tamil Language." Nerertheless, Dravidian has hecome the generally accepted term for this group.
scholars have been divided as to the relation which the Dravidians snstain to the Aryans. Carey, Colebrooke, lope, and others have claimed that ther were of Aryan origin, and that their language was an offishot of sansitit. On the other hand, Rask. Norris, Max Müller, Caldwell, and others clain to have demonstrated that the Dravidian languages are independent of Sanskrit, exeept that they have borrowed largely from the sanskrit vocubulary. What Trench says of the eontribution of Anglo-saxon and Latin to English may be said with equal truth respecting the relation and proportion which the Dravidian and Sanskrit elements bear to Tamil, Telngu, etc. "All its joints, its whole articulation, its sinews and its ligaments, the great body of artieles, pronouns, conjunctions, brepositions, numerals, anxiliary verts all smaller words which serve to knit together and bind the larger into somences. these not to speak of the grammatieal structure." are exclusively Dravilian. The Sanskrit "has contributed its tale of bricks. yea its polished hewn stones. lmit the murtar, with all that holds and hinds these together, and constitutes them into a house," is Uravidiam.
A few of the distinctive characteristies of the Dravidian haguages are as follows: The vert occupies the hat place in the sontence. He struck me is rendered he me struck. Prepositions become postpositions. To men becomes men to. Nouns are intlectal by means of postpositions. The first frsm phat has two pronouns, one of which includes and the other excludes the person adiressed. Lelative partidiples are usid insteal of relative prenoms. The person who rame is rembered the who come person. There is no passive mide.

The forritory eovered by the Dravilian langages is. in gencral, the whole of the lisdian priminla, from the Viadhya Nomatains, in the north, the (ape Comorin, in the south, and itson the now hern half of the ishand of Ceydon.
The monlor of Dradian langhage is twelve-lamil, Telugu, Malayahan, C'marese, Tuhu, Tuda, Kmbagu, Kota, (fond, Khomt, "trom, and liajmathe Gf than only the tirst four are coltivaten lamguages, thongh cost amb ithers melude ako Tuln and Koulagu. As Tamil is untoubtedy the repusentative member of the bravidian gromp, a fuller aecount of it may be desirable. Telagn, thomgh seome only to 'thmil, need not be so fully disensom, ami the remaming members need hut the briefer mention.

Tomit.-Tamil was suken in lndia before the Aryan invasons twok place, or probably a thensand yeare helme Ghrist. But when the Aryans entered lemia the 'Tamils were friwen somth and now necupy the emmery lying hetwen ('alpe Comorin. in the extreme south, and Lake Ponli-
 of Bengal abom half-way across the peninsula where it joins the C'marese country. It is also the lithguge spoken in the nothern hatt of the island of Cevlon. "The momber of people speakins Tamil is about $16,01 m, 000$.

There are two kinds of 'ramil- the elasient and the endto-quial-ame they arealmost as different as Latin amd laliam. It is the most copmos an well as the most highly cultivatert of the bravidian languges. On this point lir. Caldweld ays: "Ihe extrambiny eopioushess of the Tamil rocabnlary is shown be the fat that a sehood lexjem of the Tamil langage, publiched by the Amorican missonaris at , latma,
 it wouk be neeessatry to add sewral thonsamk of terdmieal terms, besites provinctalisms, and thonsands apon thousambs of authorized compemads, in order to render the list "omplete." It atso has an momons number of smonyms. There is reasm to believe that ancient Tamil and Matayalam were identiond and there are the chearest evidences that the coltiation of the wher bravidian languges was long subsequent to Tamil. This is proved by the eandy Thmil instriptions which exist. Thene are allwas in the Tamil character, and no simskrit inseriptions are to be met with in the Tamil comitry wrlier than the fourteenth ewncury: 'This is not the case with the inseripuime of the other Dravidian languages. Dr. (ahdwell also fimts momertus manes of jhaces which low say are pettified into Creek and batin nanes. This shows hoth the antiguity of Tamil am? the early date at which Imdia began to be known to Europeans.

Telugu.-Tolugu ranks at leat serom among the bravidian languates. Tamil is prokhly ohder. as it erramly is mose (op ions and more indepembent of formgh words. In euphony and melodious woetness, howewr. 'Telugn the serventy holds the first pare. Irom this lathe quality it has been likemed to Italian, and has in fact, been callerl the "Italisn of the bast," As might be expertee from the dominating intheme of the Aryans, the 'Telngu, in common with the 'Tanil and other bravidand languges ham ineorperated a large number of sanskrit terms. of the higher or literary 'Telugu fully one-thime of the verabulary is Simskrit. The proportion is less howeser, in the language of the common penple. It is chactly hermse of this large sanskit elloment in the bravidim langnages that sume have animed for them an Aryan origin.

The Tolugu country was orgimally divided into two king-dome-the Amduras and the kalingas. 'The former wenfiel the interior and northern pertion of the eometry. 'I'lo latter mempial the seabarl. amb athough lese kinown to the Aryans, whe gave the name Andhras to both nations, get it is to the Kalingas that the name Telugn is to the wase From Kalinga came Talinga and Temon-tha hame which is "yen now frepumbly :iphied to the lamuare hy some
 Telugu is Trilimga, of amotry of the thre lingas. These three celebratel limpas or stone emhthems of the divine creative power. am satid to be at kalahatry in the south, Bremsilem in the west, aml bracharame in the bortho I butter known hambary is Palicat in the somth, (chisadhole in the

 bravitian group. Its turritory is W. of the Telugn emmtry: S of the Mahmata, and inehules the Mysore platem aid portions of the Nizam's territory. The pepla speaking Charese mmbar ahont $10,000,000$. In common with 'Tamil
and Treluga, Camarese has a classical and colloquial diulect. The dialect of the batugns, at momerons (ribe inhabiting the Seilghery hills, is at very ancient one. The Canarese character has a very close resembance to the Telugn.
 Crast, and indules the mative states of tratancore and Cochin. tahtwell places Malayalam seemen in the list of 1 mavifian lampuaces, becanse of its chose resemblance to Tamil. Cust, on the other hamd. regards it as simply an otlishon of Thmil, though greatly alterent, and for that rery rasem puts it fonth in the list. Natayam is the limenge of the 300,000 syrian ('hristians who dwell theye. 'There is alse a colony of white bews who have liwerd there from a very early perind. The pobulation of the Malayam enomtry is alout 4,000000 . Malayalam has a larger propertion of Sanskrit words than any ot her of the Dravidian languages.

Tohle- - Whongh Thlu has neither a character of its own,
 Cahlwell and othors claim that it belongs to the coltivaterl lamgnges. The mumber of peophe paking Tulu is so omall ant they are so mixal with other tribes that the langhage will pobably som disaphat.
fiulugu.-This also is regartem by fahtwell and const as being a cultivatm languge, but like the 'Tulu, it has neither character nor literature, and hence the chaim is a doubtru! onn. The name kulaga is seldom heard in Imbla, 'urg lowing the mondern mane of the country. Like the Tudas, the mople practice polyandry am wornip demons. The protabilition are thal buth prople and language will soon beextinct.

Tudn.-Tma or Tonda is the language uf a rode tribe Who claim to be the original nwners of the Neilgherry hills. Their claim, however, is doned, and the probability is that they were farly emigrant to the hills from the Canarese emutry, and iheir languare is probably a corruption of Canarese. They momber only ahont $\mathbf{T 0 0}$; they practice polyandry, and are fact dying ont.
hoift.-The Kotas aro a small tribe of penfe of a very low type. Thoy are, however, an industrim, peace ful preoble dwelting anong the Todas on the Neilgheries. 'They pay a small trilmete to the Tolas. who clam to be the fords of the hills. Like the Toda, the language is alliod to the ('anamese. It has no imblemolent character of its own, nor any litorature
fromd. -The fonts are: a widd jugle people, numbering ahout 1.506000. and ocemp the hill cumbtry now in--Wmend in the Central lrovinces. They are tiviled into a momber of then four of which arecalled kentors, and has is the hame which the fomets, as al whole, prefier to (ath themswos. 'To the miswonaries who have sottled among them we are indebted for nearly afl that is know of the (ionds.
fhomd.-The liboms are a wild proplo inhabiting the hilly parts of orisa. Ip to a sery recent date they pace tien in ham survitices. The mame khond is trated by some tu the Telugu word kondr, meaning a hill. But the Telugus do not call the people khonds, but donds. and as they call themselves Kins. 1he derivation from limuta is at leasi donbt ful. 'The number of' Khomels is alomt 150,000 .
 the district of Chutia Xagpon in the province of bengal. The lamgater, though elearly Dravidian, is suromedod by the Aryan to sulh an extent that it has not only incorpirated a larese momber of Arvan worls, lat wen the prontan-

 Yot, sinee it han arither a charator of its own hor a literature it wall samely survive the stragy fer life.
Rommehat. -This is the natue of a mountanoer tribe wecupying the hille of the sume nams in the lrovine of Bomgat. The hancuage is bravidian, though the samals, who Gexply fortions of the same hills, ste not havitians, but Kolarians. Amother name for liamahal is Malor, hat the enmman name is liajmahal. Yory lithe is known almut the Language. is few watolaties have been compiled, bat it is not at all likely that the lamguage tan =nvise
The mumber of püple speaking the braw lian lanemages

According to this estimate the Dravidian races may be put lown at not far from fifty millions.

D. Downie.

Dravidian Literatmre : Tamil literature is of considerable extent. The more ancient portion of it was composed in verse. Works on grammar, medicine, theolory, science, or art were, by the nniversal law of enstom, written in verse, It is only of late years that Tamil prose has been cultivated to any considerable extent. Concerning the precise date of the rise of Tamil literature nothing is known with certainty. The ripest Tamil scholars can to no more than guess when any question of date comes up respecting the ancient works or their authors. One of the oldest. as well as one of the greatest, of Tamil poems is entitled the Furcl. It was composed by Tiruvallurar, a pariah, and probably was written before the tenth century A. B.

The following is one of the stanzas of the Kural:
The flute is sweet; the lute is sweet say they
Who have never heard the prattle of their own children.
Another celebrated poem is the Ramayara. in Tamil. The version is by Kamban, one of the most fluent and ornate of the Tamil classical writers. The Tamil Ramêyana is not a slavish translation of Valmikis Sanskrit epic, but it is rather an alaptation of it in Tamil. Two other famous Tamil poets of Kamban's time are Pugalendi and Ottakknttan. Apparently there did not arise any great Tamil authors until two centuries after the death of Kamban, when there was a literary revival. A new poet, Athivirarama Pandya. now flourished, and this elegant writer protuced the Teidadam, the Faisikundam, and Teltri Jertri-the latter a small poem which has attained enormous popularity. About this time, too, Villiputturâr translated the Sanskrit Mahabharata into Tamil verse. At this period also was probably composed the most noteworthy of the Vedantic poems in Tamil, the Gnana l'âsishthem. Not much later than this time were written those poems, full of similes and metaphors and pleasant moral aphorisms, which are tanght in every Tamil vernacular school in the Iladras presidency.
Since the beginning of the eighteenth century several writers of the highest eminence have flourished in the Tamil country. Among these Tayuminnavar, of Trichinopoly, and Besehi, of Madura, have left an imprint of their genius on the literature of Tamil which will not be erased as long as that literature exists. Taynmanarar is perhaps the purest and most chaste of Tamil writers; his style is a model of elegant simplicity. His poems have a high philosophic and religious tone, and in some of them distinct traces of Christian ideas are to he met with. Beschi composed a large number of controversial treatises, as well as a Tamil satirical novelette, the first in the language. It is greatly owing to him that Tamil now possesses a prose literature. But it was especially as a poet that he left his mark upon Tamil. Ilis great poem the Tembarani is recognized by the most learned Hindus as a Tamil classic of the lighest merit. Brahman pundits named him Vira Mamuni, "the heroie devotee." Since bexchi's time the hiterature of Sonthern India has been enlarging itself at a prodigious rate, but, though a large number of works has heen produced, their quality las sally fallen off. The Tamil Bible, translated and published uneler the auspices of the Madras Bible Society, is acknowledyed to be a work of rave seholarship and a most faithful rendering of the sacred Word. The Madras Religious 'l'ract and Book Society has also published a large number of Tamil and Telugu work: prepared chiefly by missionaries and native Christian seholars, and a school lexieon in the Tamil haguage is published by the American missionaries at Jafna. Like Tanil, Telugu has a considerahle literature, inchuding all the great epic poems of the Hindus. In the library of Brown University, Providenee, R. l., there is a copy of the Mahablarata in cight volumes, written in sanskrit in the Telugu character on palm leaf. Willium (arey, the Baptist missionary, was the first to translate the New Testament inte Telugiu. The missionaries of the Lomdon Missionary Society were the first to translate the whole Bible.

C'anarese' literature is not extensive, hut it has a mumber
of linguistic books, and the Bible has been translated into the language. There is a grammar of the Tulu language. Certain portions of the Bible have been translated into Ghond, and a brief grammar and vocabulary of that language has been pulbished by Rer. J. Dawson, of Allahabad. A few Khond books have been written in the Uriya character, and a few vocabularies of the Rajmahal language have been compiled.
D. Downie.

Drawback: in commerce, a paying back or remitting of money paid as duty, freight, or other charge. The term is especially applied (a) to the refunding or remitting by a common carrier of a part of the regular freight charges paid by the shipper, so that he really pays less for the services rendered than athother person or persons is charged for similar services; (b) to an allowance made by the government to merchants on the re-exportation of certain imported goods liable to duties; also a repayment or remission of a duty laid on any article produced in a country and suitable for the foreign market, when such article is entered for exportation. In some cases this allowanee or remission consists of the whole of the customs or excise duties ; in others, of a part only. In the U. S. Irawback has been regulated by varions rets of Congress. Such duties are, of course, an enhancement of the natural price of the commodity on which they are imposed. The object of the allowance or remission is to establish or stimulate a trade with foreign countries in the eommodity. Allam Smith, in his Wealth of Nations, thus speaks of the remission or repayment of the latter form of duty: "To allow." he sars, "the merehant to draw back, upon exportation, either the whole or a part of whatever excise or intand duty is imposed upon domestic industry, can never occasion the exportation of a greater quantity of goods than what would have been exported had no duty heen imposed. Such encouragements do not tend to turin toward any particnlar employment a greater share of the capital of the country than what would go to that employment of its own accord. but only to hinder the duty from driving away any part of that share to other employinents. They tend not to overturn that balance which naturally establishes itself among all the various cmployments of the society, but to hinder it being overturned by the duty; they tend not to destroy, lut to preserve what it is in most cases advantageons to preserve, the natural division and distribution of labor in the society." These remarks are subject to this qualification: provided the drawback is equally applicable to all domestic productions that are sought to be exported. It might, perhaps, be shown also, by experience, that the practice of giving drawbacks is liable to abuse ; for, supposing a great fall in the value of some excisable article. it may be exported with a view, partly or entirely, to get the trawback. An important species of commerce would thus be fostered. Of conrse the government must guard against deceptions by exercising an oversight of the packing, weighing, tying and seating of such gooms, of their ownership, ot the time when such goods were charged with the duties, and of the exportation ; and in some particulars it requires a verification by oath.

Revised by T. D. Woolsey.
Drawbridge : a bridge which can be drawn lack, lifted up, or swing aromed so as to prevent travel over it (as at

Tower bridge, London, England.
the portals of fortifications) or to allew vessels to pass. The swing or pivot drawbridges are in most common use, and these will he fonnd deseribed in the article Bridors. A rolling drawhidge is placed on friction mollers, and the
shore crad is counterwerghted so that it eatheasily he drawn back；these have boen used but to a limited extent amt only for rery short spatm．Lifting drawhridges consist of one or t wo leaves，or spans，which tura in a vertical plane：these have also hern little uad．but there are two which deserve notice．
＂the Tower bridge acrose the Thames in London has two movable leaves eatel of which is 50［ect wide， 100 feet long． and ：50 tons in weight．When closed these form a roatway $2!1$ feet above the water and 200 feet in suan．When they are opracd to allow the bacige of vessels，font pussengers can cross over by ascending in plevators．situated in the towers，to a jermanent font hrilge phaced 13.5 feet above the water．This strueture has also iwo side spans of azo feet earls．Tis total eost is stated at about $8: 3000,0000$ ．

A liftiner raitroal atrawhrider was completed in 1802 at the erosing of the Sow Vork Central molllulvin River R．R．wer the Jarlem river at liath Street．New Vork．It
 carries the lifting machinery is 1 Do feet high．The bridge has two connterbabuee weights of 45 tons each，und it can he raised or lowerel in twenty secomsts．Se Brabers．

Dredges amd IVredgiug：the machines and operations employed in romoving submerged obstrmetions by mecdan－ ienf moms rather than by utilizing the natoral forces of currents and tides，as in scouriner．

The material muy be lifted entirely from its site by van－ ous clasises of dredeges known as the lueg remel spoon．dipmor． clum－shell．ledder，grapple，and others，whieh hosist a definite ghantity of rock or eatrla at each mowement ；or it may be raised by vacurm，stud，or centrifugral pump）s，and be ejected into barges or directly apon the neighboring shores throush comhlats；or it may lie merely dragged oft the reefs or bars by serupers or scoops into deeper water adjacent to the lo－ cality．
The earlier forms of these machines as used ly the Ital－ inns and Intch were cmule．limited．amd expensive．The bay ami sponon tredge．the simplest and earlisest form，was mach nsed on the shallow canals ant ditches of Molland．It com－ sisted merely of a leathore sack laced to an iron ring of about 2 leat in Jiaineter，having a entting elpe．It was operated by a pmle，which served ds a guide，white a rope fastened to the ring servelt to drag it along the sille of the soow，at the bow of which a winch was fastened．I similar device was nsed on the Fosshlike（anal in Englant for removing ］35， 000 tons ol solt material．It is slow and rery limited in application．

The scruper consists merely of a seoop of iron or steel at taclied to the lower end of a beam，which is pivoted at its mpper end to a scow．It is operated by fowing or dratering the scow over the bar，from which the material is scraped off mechanically．It is a rery ineflicient device in this form， and the results are not pramanent where there is a current． The earliev form of seraper drederes ronsisted of two barges monrad an ofposite banks of the channel to be improved， ant ronnocterl by ropes moning over pulleys．A bucket was suspended by chains so as to travorso the intorval be－ tween the bonts，accoss the bottom of which it was drawn by a windlas and crab，operated hy six men for the full

bucket and two for the empty．This promess way in use on the river Iay in scotland until 1s3：3，but was primitive and prevented navigation furing its operation．
＇the ayblication of stem to dredgimp is mid to lave heen first made on the Wear at sumberland，lingland，in 1796, when a machine was made for Mr．（irimshaw ly Boulton and Watt．

Ladder or buctivedralgosenasint of a sutries of semops or
buckets attached to an endless belt or chain passing over the side of the vessel or through an opening amidships, and working over pulleys or wheels so arranged that the chain can be lowered or raised to suit varions denths of water. The buckets descend emptry. fill themselves at the bottom, and when they rise over the upper wheel discharge into troughs leading to scows alongside.
lig. ? show a longitulinal section, and Fig, Sa an em-
exclusive of depreciation and interest on plant. When the mud-pumps and distributing-pipes were used the cost was increased to $i \cdot 5$ cents per yard. The season was but 200 days long, and coal was dear on the lower Danube. In the inner port at Bonlogne, France, the plant consisted of two powerfill bucket-ladder dredges, which discharged into hopper barges having a 2 -mile hanl. The contrict price was $24 \frac{1}{2}$ cents per yard in the barge. The material was mud and sand mised with stones; umderlying this was at hard stratum of clay and schist. for which the price was $64 \frac{3}{3}$ cents. The buckets were too light, and repairs were frequently neeessary.
The first bucketladder dredge was driven by steam at sunderland harbor, Oct., 1811 , of which it wals said: "A steam-engine of great hower was erected upun a floating harge, which continually Arove round a number of iron buckets fastened to a chain, which filled them-
larged view of buckets int lower wheel, of a powerful steam-dredger used on the river Clyde Scotland. The hull is of boiler plates and angle iron, being 161 feet long, 29 feet hreadth of heam, and 10 feet greatest depth of holld. An endless hand, carrying 40 dredge-bnckets of nearly 14 cubic feet capacity each, works through a well amidships, passing over two wheels, one at either end of an iron bucketgirder 90 feet long, and weighing 125 tons when working, inclusive of the contents of the ascending buckets and hoisting chains. The axis of the upper wheel is stationary at the height of about 30 feet above the water, and the girder revolves about this axis sutliciently, by raising and lowering the submerged end, to allow the dredging to be carried on at any lepth from 6 feet to 30 leet. One man, by means of a lever on deck, has complete control of raising and lowering the bueket-cirter.

By suitable appliances provision is made for moving the vessel ahead, astern, and athwartship. Surging heads are also fitteal to crahs to haul the hopper barges alongside, also hand gear to work the surging heads independent of steam. Friction gearing is provided and aldapted to work these moorings at three different sperls. The main gearing and girder hoisting gear are also fitted with adjustable frictionWheels, to prevent accidents in case of nombe strain coming on the buckets or girder. 'Hhis derelger, working at full speed in 10 or 15 fert of water, can raise about 500 tons, or 380 cubie rards. of ordinary soil per hour: The Eurobein commission employed on the Sulina branch of the Danube the open-epuled sin-gle-ladder mathines with mul-pumps, such as were used also on the Amsterdan ship-canal as well aat St. Petcrshburg.* The material was conveym throngh Iloating tulusover dikes 8 feet hirch. The dreelges were 11 fis fort Jong, 25 butha, and liss draught. Dach machime was operatem be a po-horse-juwn encine, aml had a copacity of mily 1,300 cubic yards pir day of twelve loours in favorable ground. The average cost of this dredging was (6:2) cents per cubic yarl, and for towing 4,000 feet 2 cents,

- Sec Engineering, Nov 8, 14i2.

Fin. 3
Whefl Dredgers-lnstead of an endless chain to carry the luckets, these are sometimes phacel upon the perimeter of a whed 15 to 30 feet in diametar, or larger acending
to the depth to the dredged. This whel is set in a well in the boat, its axle or shaft working in boxes that van be howered or rased by suitable machinery as the denth requires. As the whed revolves the humbts semp themselves fulb at the bottom, and in aso ernding lift in suceression the upper cud of a shoot arlusted against the perimeters of the wherl. which, fallinir back to its phace canses the bottom of the bucket to unlatch, and the contents to the discharged into the shoot. and thence into a serw alongside. The dredgehoat is trawn ahoner by a cable leading to the engite at the preme rate which the progres of the excacation mquires. Under favorahite circumstances a 24 foot wheel carrving four buckets has buen known to excacute 1,200 enbic yards in ten working homrs se Fig. \%.

Clam-shell Dredyers-Each dredge-boat oprates but one bueket, which is it two parts hinged toget ber horizontally, something like a clam-shefl, with arrangenents ly which it is opened and closed hy the same power which howers and raises it through the watar. The bucket, being ofen and suspented from the ent of a crame-jils, descends verticatly throurh the water until it rests on the bottom. It is then tilled by chosing together the 1 wo purts, when it takes the form of a short horizontal trongh or hollow semi-eytinder closed at the mols. It is then raised out of the water, swumpromd over a seow, opened, and emptied.

When working in hart material like compact clay, hard sand, or gravel, the cutting eflges of the bueket are provided with sharp tecth.

The bucket is guided in its desednt by a pair of womben foles attached the puides of the erosshar, and working (11) and down throngh cyes near the end of the crano-jih. For raising stones, logs, frarments of wreek after hlasting. ete., a strong graphe with stop-pointed prongs is used in place of the hacket.
I mammoth graphedredge was used in removing ohstructions in the Bat river at Now Yirk. Tla' haten was

heaperl up, and the larget weighs 6.500 or 7.000 fl ., with 3 cubic yards actual capacity, or $4 t$ to 5 yard when heaped up. The treth are made from fi to 9 inches long. The graples aho are of wame sizes, the hargest being is feet ahone the hinge. and 8 feet wide between the points of the prongs when one In. In feet of water three lifts can be made in two minnits with the 3 -vard bucket. "Ihe largest dredge-hoats are So feet long amd "30 fret wisle, and the smatlest fit feet long and 25 to 30 feot wide. The power for the heary grapte is supplied by two 20-inch eylinders with en inches stroke 4. 5 lh . stam-iressure, and making from 40 to 60 revolutions per minnte: for the large buckets, two $12 \frac{1}{2}$-inch colinders with 30 inches stroke, 0.3 th. steum-pressure, and making from (6) th io revolutions per minati": and for the smath buckets, two 10 -ind cellinders with 24 inches struke, i. 1 lh . stean-presure, and making from 60 to io revolutions per minute.

In baltimore harbor a machine with a $:$-sard tmeket, oncrating partly in soft mond and partly in oyter shells. in 26 working days, of whish F were foit ly havages and kad weather, teaving only 19 lays work if 10 hours each,

 108
two were fus. raisend bt 109 cubie yarls. The agerverate quantity rasisil by the four dredgers during tho raplective periods above specilied asreed to whim about 150 cothic yards with the weturn mate by the ensinew in- pectur, upon which payment for the work was made. In Bu-tum harlor

 or $12 \times 4$ yards par day of 10 hours. In this case the tecth did not penctrate more than 8 or ! ind hes, twation up the chay in large hmps, lut not so ats to lill the binket.

In making shallow cuts much time is lost in moving the dredger forward.

Single-scoop or Dipper Dredgers (Fig. D)-By these machines drelging is pertormed with a single bucket, shaped, as the name impties, tike a sonop or lipper, having a swinging door closing with a catel at its back, by which it is emp)tied. This bucket is fixed to a beam or handle of a tength suitable for any depth of water in which the dredger is

Fig. 6
placed in the center of the how of the dredge-boat. The crant-post, jib, and stay are each built of two parallel timbers, secured to one another at the foot of the stay, neek of the frost, and end of the jib. The bucket handle works in the space left between these parallel timbers. This beam or handle is slotted for the greater bortion of its length, and on the back, on either side of the slot, has two racks working on zimions whose shaft is tixed upon the crane-jib about one-third its length from the post. These racks are kept in contact with their pinions ly a friction-roller pressing on the front of the handle, and made fast by a link passing through the slot to the shaft of the pinions.

An improvement on the ordinary crane, which had a radius of about 19 feet, has been applied to the scoon used in the Osgrood dredge. namely, an extension of the end of the crane-jib, by which a longer cut ahcad can be marle be the bucket and a greater width of bottom covered liy the swing of the crame. thins saring time which would otherwise be lust in moving the machine. The extemion of the jib is carried out nearly horizontally, the bueket being suspeluder 1 as before de-
seriberl, with the exception that the onter shive at the end of the jithecones a traveling one, with a tendeney to keep, a prastion directly over the burket, In machines with the larger-sized buckets the cranes have a combternoise attardent. In wery hard gromud the bucket is taken off and a piek or plow uttecherf, with which the gronnd is broken up, to he allerward pieked up with the bucket.
There machimes are matr of various siges, those most. commonly built having backets of 3,18 , and $1 \frac{1}{2}$ cubie yards
capacity. The dimensions of boat for the larger machines are about 65 fect length, 20 feet beam, and $6 \frac{1}{2}$ feet depth of hold, and having a lowisting chain of $1 \frac{1}{4}$ inches. Their power is deriven from a pair of 15 -inch cylinders with 12 inclues stroke.
The larger machines of this pattern, with 3 yards capacity of bucket, when working in soft mad under the most fivorable cir-cumstances-that is to say, from it fixed position-will average in 20 feet of water about 2,000 cubic yards per day of 10 hours. Under ordinary circumstances it may be exprected, in a series of working days of 10 hours eachi, to average about 1,300 eubic yards of soft mud or 800 cubic yards of gravel and sand.

In the slips of New York a machine with a bucket of $1 \frac{1}{2}$ cubie yards (apacity, 7 -inch cylinders with 12 inches stroke, a steampressure of $60 \mathrm{lb}_{\mathrm{c}}$, ant with 200 revolutions, working in soft mud, in 12 days of 10 hours lifted 10,302 cubie yards, IT 859 yards per day. The best day's work was !e8 yards. The same machine working in soft mud at Waltabont, Brooklyn, with a cut of from e deet above to 10 feet below low Water, in 131 working days of 10 hours lifted 72,621 cubic yards, or nearly 505 yards per day of 10 hours. At the same place the same machine, working in gravel and sand, with a cut of from 15 to 22 feet below low water, in 14 days lifted 5,591 enbic yards, or nearly 399 yards per day of 10 hours.

Another machine with a 18 -yard bucket, and with cylinders of 10 inches diameter and 15 inches stroke, cutting to a depth of 10 feet through a meadow at the junction of the Delaware and Schulkill rivers, the material seemingly consolidatel 1.10 d , in $\mathrm{i}_{6}$ working days of 10 hours lifted 12,582 cubic yards, an average of 482 yards per day. The same machine, near Phitadelphia, working from a fixed po-

sition, picking up soft mud which had heen dumped under it from soms, and lomding into cars, lifted 1,000 cubic yards in 10 hours; its arerage, howerer, was about 800 yards per day. "These working days include the time lost in remaring chains and other slight damages incidental to the best ruming machines.

A tug of 100 horse-pwwer can. with 4 scows of about 150 yarls capacity wach, kep one of the smaller machines busy when the tow does not exceed 3 miles. The smaller
 of coal per day.

Fig. s.-Osgood dreigic.
 are cheat, simple, and ethertive. The principle embedied in them is that of a vertical deflection of the emrents and a partial reduction in the aren of the cross section, whereher the heal as well as the velocity due to it are increasol. Thas in the formula for the discharge of a stram, $Q=A \mathrm{I}$, the velocity $I$ varies directly as $Q$, the quatity, and inversely as I. the area of cross section. Is the bettom veloedies are bery iow, while those near the surface are high, to ntiliza these higher velocities for seour many simple devicts have been tried.
hingston dredger was one of the carlier forms. It was used on the river Stour, in linglamd, and consisted of a hat with a broal rake fitted to the trow, and canable of adjustment to different dephs. At the side of the loat were hinged two wings of the same depth. The rake being dropped

Fig. 3. -Kingston's dredge.
to the required depth and the wings extended, they formed a tomporary dam, causing a "head," warying from 6 to 12 inches, which drove the boat forward and carried the mud with it. The rate of motion was 3 miles per hour. and the results were very satisfactory in cleansing the river.
For removing the silt from the tail bays of the Indion canals at Calentta and on the Orissa eoast, Mr. Joln Kingston propused a simple wodn shield to be lowered over the down-stram end of the barde and hated taut at angle, so that its lower edere rested near the bottom, thus foremer the current mater it and cutting away the har. The harge was let down stram by hawsers or by a tur at as slower mate than the eurents. sie Fig. !
This idea has also bem applied on the Garonne, in Franee. Where a very similar device was emphoyed for remosines hars at the rate of about 60 yards of chay and sand perlay, at an expense of $4 \frac{1}{2}$ eents pri cubie yaid. The boat was but a small atfair.

Mr. . . Henry Apjohn has anlarged and improved upon Mr. Kingston's mementary device, matil he has producel an iron eatisum carrine aldereor operated by a walking-bam. wherey the bats are cut down at the rate of from 6 inches to 2 fert for a length of : 30 feret in abom two homes.
In les. the writer, helieving himself to be a pioneer in the matter of atizing surface carronts for some, patenten the simphe device shown in Fig. 10, and som after tested its chlieney ly erectiner a temprary phat supported on piles driven into a bar on the Detaware. In two tides, or after athont 22 hours, it hat increaserl the depth from 5 to 18 feet. and for a distance up and down stream of ahoot buof feet, at the 9 -foot curve, leaving no doult as to its fracticability

Where the material is not regniend to he laken ont of the bed of the stremm.
'The general pinciple howper, had twen anticipated in the dewiee of (ien. I'. A. '1'. Beanregarl, of New Orleans, La.
 tos opro at both emes, but having an inelined eliaphagem of timber phacel inside. thes making the passage wertgeshaper. It was expeeted that the chbt tide passing lhermagh this eontrated opening at the onter end would remove the sand of the hars from the month of the Mississipyi. The apparatus was to be anchored with henve stone, No merns of homontion ware prontidet, and it was useless
In 18.6 Capt. J. (irant used a surime of phans attuchet] to repical rous near the botom, and so arranged as to be raised or fowered to the the bed ot stram. "Hey were held in phace by a framework phated on a barge, which was lowd hraselside to the eurrent with whieh it drifted down, ami by theme means the bars on the lower Mississippi were shorn off

 matcrial was elischarged in hins on deck through a 9 -ineh pije, which was bifureated into two 6 -ineh pipes. "the engine was a low-presure one of 120 horse power, contating two 10 -inel eylinders of 10 -inch stroke, ruming at $2 \overline{3} 11$. pressure with is speed of fixo revohtions preminute. The prump was rent he a hedt at 315 powntutens.
The lower ends of the surtion-pipes were lomed with an iron frame and thag, end weighing about $2(10)$. To the under elge of this frame, helow the mouth of the pibe, a number of teeth were attached to lonsen the samt. Finch pipe was mpported by a chain reaching upt to the deck of the stramer, and tackles were used for regulating the depths. The total enst for equipping this steamer was so, ono while
 panse per month, including interest. was s:3,000.
At high sheed. frem 50 to in per cent. of saml was pumped, but in consequence of the swell ower the har 45 per cent. was soldom reachat, the average under furorable conditions lowing 33. The Jeat enst during any one month was in May, 189, when it was 26 cents per cuhbe yard. "The greatest

best day's work was on May 14, 18\%2, when 770 yards were removed in $10 \frac{1}{6}$ hours, at at eost of only 13 cents per yard. The average cost for the entire seven months was de? $_{3}$ cents. Mneh time was lost, due to low water and bad weather. The total quantity of sand removed during the fiscal year $18 \% 2$ was 40,762 yarts, giving a channel 150 feet wide at bottom. $9 \cdot 7$ fect deep, and 2,400 feet long at low water. The tide is 54 feet. The total expenditure during the year was Si?9, 803.
This early and experimental drealge was improved upon from time to time until it has been developed into a machine capalle of handling 8,000 yards per diem. The completion of the contract for dredging the main ship ant Gedney's channels leating into New York harlor gives for the total cube of exaration under the several contracts $4.299,854$ yurts, costing $\$ 1.285 .862 .94$ or $24 \frac{48}{200}$ cents per yard, which, it is said, is only 2335 per cent. of the original istimate. The dredges employed in this exposed locality were the Advance, with two 15 -inch centrifugal pmps, ancl capable of carrying 500 yards; the Mt. Waldo. 275 yards capracity; and the Reliance, with two 18 -inch centrifugals and a eapacity of 650 yards. The material was raised from a depth of 24 to 3.5 l'eet under water to the bins on the dredges, a total height of from 36 to 46 feet. In addition to the three dredges there were morideri four large seows of 500 vards cach, four tugs, one steam supply-boat, one stemm tender, docks, repair-shops, ete. The working capaeity of the Mt. Waldo was eight scow-loads of 500 yarts per diem.

The suction-pipes are 15 and 18 inches in diameter and about 60 feet long, terminating opposite the stern in suitable month-pieces, temmed drags, to fit the bed of the channel and facilitate the ingress of material. The pipes contain a flexible rubber section to provide for rolling, and are suspendet hy chains, as in Gen. Gillmore's design. The Airance wat sunk and destroyed by a collision during the work.
The following data are from the record of the Reliance: Average time pumping a had in sept. and Oct., 1891, 486 minutes; enbic yards, 5848 ; time per day in pumping, 4 hours 584 min. ${ }^{\text {a tine from har to dump, } 34 \text { min.; dumping, }}$ $12 \frac{1}{10}$ min.; back to bar, 257 min . L'nder steam per day, 16 hours $4 \stackrel{2}{2}$ min. Number of luads per day, $6 \% 3$; cubie yards per day, $3.136 \cdot 65$, rate per minute, $12 \cdot 03$ yards. Time lost in repairs, 2 hours 24 min.; by bad weather, 32 hours 50 min . The total time lost out of is $\frac{1}{3}$ working days was 4.88 hours. Portions of the work were done at the rate of 946 cubic yards per hour. 'The round trip to the dump averaged 26 to $\gtrsim 8$ miles for part of the work, and from 12 to 14 miles for the balance. These pumpls have raised up from the occan bed bars of pig iron and camon balls, passing them through the pumps to the hoppers 46 feet high. It is an elticient method of remoring bars in a seaway, but there is in general no assurance of permanener in the results.
Another form of hyuraulic dreige which has been brought to a high stage of perfection and remarkable efficiency is the machine patentel by A. B. Buwers, of Californiat. 'ihns consists substantially of a large barge carring engines, hoilers, pumps, cutters, and grearing, with a flexible distribut-ing-pipe supported upon tloats, whereby the spoil is conreyed ashore, and used for hack filhing am? reclamation of low or marsh hams. The boat is so arranged as to cut a swath of abont $1: 30$ feet in length, and to a depth of over 30 fect. The earth mixed with water is fed to a delivery-pipe satending to the cutter, and Jrawn into the delivery-pipe by a centrifugal pump. The invention dates back to 186 . when hydraulic dredges were very crude, but so rapilly has umprovement been added to improvement that dredge No. 3 , working at Taroma on Puget Sound, put in phace 165.000 cubie yards in Inly, $189 t$, and during the year, with a loss of three months, it handich 821,200 cubie rards.
The stimulus given by Mr. Bowers to this class of drmages has effected great ceonomy in the remoral of ohstructions to navigation. In 1887 sir John Coode described a small centrifugal drelge in use at the month of the Mans which lifted 400 tons of sand in 22 minutes. Jlad the hoper been large enough it could have pmured 1.000 tons in one hour. Ten or more smaller mathines of this type hati herin working at that silt for seven or cight years in an umblation of from 2 to 3 feet. The proportion of sand was about 20 per cent. The general minciple of these machines, as covered by Mr. Bowers's patents, is a revolving cutter with interior delivery, connceted with a non-rotating suction-lipe, whereby the spoil is removed from the cutter alter suitable dilution with water, and pumped ashore or to hoppers or barges
alongside. The proportion of earth to water removed by these dredges has reached over 70 per cent. Where the material must be removed from the stream they are the most etficient machines known.

Among the other devices belonging to this class of hydraulic machines may be mentioned the various pulsometers and the three-throw plunger pmop patented by Mr. C. II. Booth and the sncker dredge of Mr. J. M. Roblins.

Dredging opperations.- Where the activity of the barmilding agenciew is greater than the eapacity of the drelging plant, successful competition is out of the question. Such instances are frequently found along the seaboard. where, bet ween wave-action and littoral currents, the littoral drift is supplied taster than it can be remored. In rivers and embayed someds or estuaries, the conditions are much more favorable. In Great Britain the best examples of successfnl works are to be found in the Clyde and Tyne. In the former the depth at Glasgow has been increased from 5 ft . 8 in. to 26 fect. Here the operations exteml over 150 years, and athough many millions of yards have been removed the improvement is not permanent, and a floet of heary dredgers is required to remove annually the million yards necessary to maintain the channel. The Tyne improvements date from 1861 , and there is now a depth of 97 feet. The floot line has been lowertd, and the scour greatly inereased by the removal of the obstructing lears at the month of the river,
In the U. S . numerous attempts to dredge ocean bars or to cut through spits of sand have resulted in failure. It is only when such work is supplemented by permanent stractures which modify the physical conditions that satisfactory results can be expected.

For mene detailed and specific information, the reader is referred to Minntes of Procedings of the Institution of Civil Engineers, especially vol. Ixxxix.

Revised by Lewis 11. Haupt.
Dred scott Case: the ease of scott us. sambord in the Supreme Court of the U. S. in 1856, reported in 19 Howard Ii., $3: 3$. A slave named Dred Scott was carried by his master (Sandifod) from Mlissouri into lllinois and Wisconsin, and thence back to Missonri. sent was descended from Africans who were slaves. He brought an action in the (ircuit court of the U. S. to assert his title to freedom. The judgment of that tribunal was carried hy writ of error to the supreme Court. It was there decided by a majority of the court that if sentt were assumed to be free be was not a" citizen of a State", sn ass to bring the action: and further that he was still a slave. Acrordingly, the case Was dismissed for want of juristiction on the part of the cirenit court. In reaching the conclusion that he was still a slave, the court hell that the act of Congress which prohibited a citizen from holding slaves in the Territories of the U. s. N. of $36^{\circ} 30^{\prime}$ N. lat. was uneonstitetional and voil. The action of the court has been severely criticised in respect to this last point, as being unwarmated after the decision was mate that scott, considered as a treeman, was not a citizen. It is maintained, on the other hand, that buth questions under the pleatings were properly decided. Some information as to the circumstances under which the decision was rendered will be tound in letters of Justices Camploll and Nelson in Tyler's Life of Chief Justice Tuney, pp, 382-385, The chicl justice, when delivering the opinion of the court. made an historical survey of the public opinion of the civilized word concerning the African race at the time of the formation of the American Constitution. Among other things he said: "They (the Africans) had for more than a century before been regaded as beings of an inferior order, and altogether unfit to associate with the white race, either in social or political relations, and so far inferior that they had no rights which the white man was bomat to respect." Duch injustice has been done him by an erroneons statement, still oceasionally repeated, that the chief justice had himself affirmed that the Negro had "no rights which the white man was bound to respect."

Dresten, Battle of: a battle between the Freneh amd the allied armies of Russia, Ausitra, and lrusia. Sug. on, 1813. Wresten was oreupiod by at feneh army of 30,000 men, when, om Aug. $23,1 \mathrm{si} 3$, the amy of the allies apmeared before it. Napolem, with the man army , "ame to relipve it. and entered the eily on the goth of the same month. Shwarzenberg, the commander of the allied army, immediately assaltel and hombarded the eity. Having bern repulset by a sally of the Frencla gatard on the a6th, he re-
 was fought, Napmeon gaining the victory. The French were fored to surrandoy the eity on Nov. 11.
bress [subst, of yh. dress < M. Fing. dressen, set right. make straght, clothe <0. Fr. dresser, arruge, dress : Span. derezer: (Man, drewer: lal. dirizarte < Vulg. 1at. *direclia re. make straight, deris. of directus, straight $>$ lat. dirtto: l'r. droit > Sban. derpecho]: Jrom the time of the first crude envering of the holy will leaves, tratition and history furnish interesting areombs of the importance which savage and civilized people alike hase attached to the (dothine and omamentation of their persons.
With all eivilized or semi-civilizel rases some form of cowring has bern considered necessary th modesty amd decency, hot the ibleas of what comstitntes modenty have differed widely with different poples amb ares.
The history of dress is full of interesting inconsistencies ant incongribites, and carelnd analysis of the sacecssive forms of eovering worn by shecesive races pablishes the
fact that mether mature mor art has been revognizerl in ayy modern form of dress as fully as among the aneients.

The earliest semitic races of which we have any anthentic account-the Assyrians, Babylonians. Hebrews, "Egyptians, scythians-wore but fuw garments. The oll Testament uften mentions raiment for the bodr, and the vestments of the early priesthood are enumerated in several inportant passages-Exod. xxviii. $42(1491 \mathrm{~B}, \mathrm{c}):$ : And thou shatt make them linen breeches to cover their nakedness: from the loins even moto the thighs they shatl reach." Other passages necur in Exodus, Leviticus, and IJ accabees concerning sacerdotal vestments, and in other books of the Bible important mention is made of the raiment of needlework and jewels worn by kings and the danghters of kings (Gen. xxiv. 53 ; Fzek, xvi. 10-1.?, (etc.). There is frequent mention also of purple and fine linen, and the saekeloth of sorrow and repentance.

Among the lhehrews mantles were made fonr-cornered and Trere, according to the law of Hoses. bordered with fringes and ribbons of bhe. Herodotns refers to Egyptian dresses of fine linen having a bordering of fringe about the legs. With the Tsraelites fringes and fine needlework seem to have been in miversal use. Their garments were few in number. The salin was worm nest the skin, ind the outer tunics were known as coats, Gold and silver were undoubtedly regarded as important adjunets to the costumes of the Israelites, aml there was a wide distinction in the richness of the garments and omaments worn by people of different degrees of rank.

The monmments of the early Theban dmastiex show little difference between the garments worn by men and those worn by women, the long flowing robe and girdle being common to both. Shaves and others who were ohliged to labor were girt about the loins with a single garment. The early Eagytian dress was very simple, hat aftel the new empire ( 1600 b. c.) it becume exceedingly elaborate in onnamentation among the higher classes, and gold and precious stones were used for every form of personal adormment.

The Assyrians, who were intvanced in the arts of dyeing, weaving, and mbrointery, wre celebrated for the beanty and richness of their attire. The invention of the Assyrian dress of rank has been attribnted to Semiramis. This dress is said to have consisted of an umbergament embroislered and fringed, and confined with a girdle laring cords and tassels. Over this a second garment, also richly embroidered, was worn nearly the length of the first. Sandals were worn by both the Issyrians and Egyptians, The fabries umployed for dress were very largely marle from cotton and flax. Among the Egyptians woolens were forbidden to be worn next the skin, and priests were not allowed to enter the temples when this material formed any part of their attire: such parts wore lilid asirle for the time.

Tlie Greeks accepted and retained a tashion of clothing which gave the firtur porfect frembon, serving at the same time as a graceful and attractive covering. There can be no doubt but that a kind of noble simplieity marked this period in tress. The chifon was the chief garment worn by women. This was a single piece of material sewed together and worn in the limm of a long gament which was confined under the bust hy a zoster or srixtle. See Cosrume.

The lonians wore a long linen rhiton with sleeves, and the mitside mirment, known as himation, was of wool. The sheres of the rhifon were formed hy drawing the tolds of the garment down from the shoulders, and fastening them around the arm with buttons intol loons.

Sime mokkra writers haviz contemped in support of the corset of the prostht dity that the women of freece and liome wors a ramment whibh survel the same purpose. but there is nowhere any acoonnt of a similar gament. Both "iperk and Roman women seem to have worn a kind of breast sipiport, hut it was a single band of choth which served its purpose withom haviner the ulijectimable tendency to compresion and dwormity which distingnishes the stays of hatere centuries. For extm warmoth a hate-lencrin garment, known as the diphodion, wat worn ontside the chiton.

Much attention was mondonhtedly given formbondery and dignitied ormamentation by both the (ireeks and liomans. While the character of their dreas was simple, its perfect adapation to the neads of their lives, to climato. and other conditions is not to be questioned. Amoner men there was a distinclion in tha garments worn. Workmen wore a garment whicls loft the arms and logs free, while whicials, priests, and those of rank wrapruxl Themselves in
the ample classic folds of the himation. Among the early Romans the loose and flowing tunica and toga found favor, and much attention was given to covering for the teet. The artistic value of dress during this period of the world's history, especially in the dignity of its flowing lines, has been established beyond a peradrenture of doubt.

With the deeadence of Rome's eivil Jower, changes oecurred whieh afforded practieal advantages for war and work, and the trousers or bracae of the more active barbarian races came into use. There is no doubt that trousers originated in the highlands of Centril Asia, which is now recognized as the birthplace of the Aryan race. The first tronsers were worn by the Aryan people, who, under Cyrus, descended from their mountains into the fertile plains of Mesopotamia and overthrew the Semitic empires, which had ruled the Euphrates from the beginning of histury. From this time the history of dress in Europe is changeable and nondescript, but the tendency for many centuries has been toward the degradation of the human form, and away from the recognition of that symmetry and simplicity which was the result of the idealization of bodily proportion as immortalized by the sculpture of the Greeks.

Throngh the centuries of the Christian cra there have been certain arbitrary distinctions in dress. like the ecclesiastical, monastic, jurlicial. etc., which have been comparatively permanent, but the dress of the masses has been subject to freguent change, without reason, for a long period.

Among Eastern and Oriental nations generally no such changes have taken place, and very nearly the same simplicity of general lesign prevails century after century, all changes in dress being ornamental in character. The Orientals delight in flowing robes, gorgeous coloring, and rich ormamentation, but not in change of form. Western nations, on the contrary, revel in the most extrente and novel changes in the shape and cont of their garments, and pay comparatively little attention to true art in decoration.

Flis love of change in the torm of dress has necessarily led to some most extravagant departures from symmetry and proportion in effects, and consequently to deteriorated physical conditions, since the intermal organization has been comprelled to conform to outward changes which were in direet violation of physiological law.

During the early centuries of the Christian era the robe of the primitive C'hrisian minister was simple. loose, and dignifiel. and the magnificence of ecclesiastical costume oblained between the tenth and twelfth centuries, when the plain white of the early priestly rohes gave place to materials of different colors, rich with virions lecorations of gohl and silver work and gems, and wronght with elaborate embroideries. The principal restments of the Christian ministry since the seventh century have been the alb. stole, dahnatic, chasuble, amice, tunic, cope, pall, surplice', and miter. The hood or cowl, gown or cassock, and rloak form the principal garments of the monastice order.

All nations have paid more or less attention to military dress, even surages having an instinetive appreeigtion of the effect problueed mon their enemies by a brilliant display of paint and feathers; while more civilized mations have replaced the feathers with hallion amt gold lace and other equally gorgeons paraphernalia tor making their othcers of rank infuressive.

For many centuries a kimd of dignity attached to men of profouml laming, to judges, and othwr oflicers of state, which fontud expression in ceremonial these of anple dimensions: bat thas age of reverence for everything lamman having passed, the leveling tomeney of morlern life has beren toward doines away with all costume amb insignia of loarning amd otlicc: and what still ubtains among the royalty and mobility of oleler countries is tolerated as an att rative spertacle where it was formerly regarded with respet ful awe as the assutial ospression of superionity.

Plame he writes of chess during the first centuries of the Clristian era: "We must resort to those mosaice of ltaly which have heen preserved tor us for a view of those dresses abd ormaments which, worn at the court of Constantinople, hecame the fashon amoner the varjous races that had over ran the wost of biurope dhring the first five centmrice of the Cluristian era-the fireeks, the Goths, the Framks, and lomhards. In the Revue Archeologique. 18:30, are copied mosaies from the originals of st. Titale, Ravema, one representing the limprom Justinian. his court, and the clergy of hivenna: and the other his wite, the Fmpress Theotoria, and her attendants, said to have been the work of artists about the year j40. A singular mixture of (iret. Roman,
and Asiatic decoration gives a peruliar character to the eostume of ath classes at this periot, and it will be remarked that while an Oriental taste was gradually incersinge, to the obliteration of all fatures of ancient lioman clasical dress among the prople in and adjacent to Constantinoph. the Franks amb other Scethic or Teutonic uations oectuying the odd proviners of lime were asuming more sull bure the dress and habits of the former empire of the West."

Medieval dress is interesting as far as any historical facts are ascertainabla. Men of the higher chasest, wobles and haishte, were se constantly in an attituble of aggression or defena that the prineipal feature of their attire was necessarily the potectine amor and gamments to be wom umber or over it. confoming to regurement. The thre centuries following the serthement of the l'ranks in (ian? and the sixons in Puglam were marked by simplicity of attire aml little variation. With the Norinan compuest. however, many absurfitios were int rodheed intodress. Ihring the f with century seves became ntherly preposterons in size and style. reacling nemply or quite to the feet of the wearer, white all manner of excess am? luxury in fersonat adormment was indulged in. See (owtome:

It would the impowible in a limited artielto to do justice to any of the important features of Apess sine the twelth century, but af few of the mone extravaght and ercentric fancies that have appeated in the chothing of men and women will serve to illustrate the utter degenerary of dress at intervals foring several centurios of our atvancing civitization.

From the thinteentlo contury to the sixteenth heat-gear was eceentric and exagrerated to such at begree as to defy arenrate description. Addison, in the spectutor. chronided the sureess of the monk Thomas Connecte, who traveled from town to town preaching down that wonderful heatcovering known in his day as a hemm, with suld vigor that women threw them aside in the middle of his somomand mate a bonfire of them in sight of the palphit. Sumg the most celebrated of these monstrons head-dresses were the bornet? hadelress, the miter, and the buthertly. These strange devices were lmith to such leight as to render passing through in ordinary doorway without stooping in impossilidity, and the drapery depended from them sometimes ramed in the flow. Arithing more utterly at variance with all laws of boatr and art ase a head-eovering the human mint can not concerive, while ingennity must have been exhansted in their construction. But head-dresses came in for part only of the exacgeratem hioplay of this periol. From the time of liufus to that of llenry Vil. shors were ser grotesque in shape as to exate ridicute from poets and histurians, as well as censure from the clergy. It one time shose were worn so long and gointed that their Wearers were compelted to fister the tes to the kness by small ehains. Wiaists were contractel to wasp-liki dimer111. tailors adrertised "Codrington corsets amd Petersham stifferes for the benefit of gentlemen of fashion ": difteenthcentury sallants deserve smpathy in retrongect for the misery ther most have endured in their clothing. "The tunic was worn chose amb showt, and their hase so tight that they were compelled to have assistance in dressing and unIresing: their maists were laced and their shoes so pointed and long ats tombarras movements

Catherine de Medici is said to have invented a conset which was ofnomed longitudimally by hinges socmed hy a hasp and pinlike an ordinary box fastening. Among other absurtitios in trese the enormous, rutls of Queen Elizabeth: time mut he mentionch. Concerning theos siluhbs wrote in hise as follow: "There is a certain liguid mather Which they call stareh wherein the devil hath learned them to wash and dye their rulfs, which being elry will then stam stifl amb intlexihle athout their nerke." The farthingale for women, a whed-like eontrivatee whieh carrime the skits out from the hips, and the trumblowe for men came into use at about the sume time. Of the farthingate sir lingr de Coverbey satit that it made his sreat-ureat-grambmother lenk as if she were standine in a drum. The partrais of Quen Flizatneth was ginted in this unsighty gari, which continned in favor during the entire rifen of Janes $T$. Early in the piohteenth century the dress of women was so fantastic that the specfufor dectared the wifo of a dignitary of state to be looped, rihbund and wrinkted and furbelowed until she resemblet a friestand hen. It is worth noting that during all of these successive ernturies of exaggerations in the shape of dress, estravagace and shambor
of fabric amd ornamentation kept pace with the cemeral spirit of excess. 'The aldeves to the humppland of Clartes. Duke of Orleans, had embroiderend urin them the warls and music of al sug. The lines of the ranse werw worked

The nineternth century has witnowed oume romarkable changes in the shape imil style of the garments worn by womens sudt contradictions indeed of the buman form in its purity that it is diflicult to bedicue that modern women ennd he fomm to dishigure themsetres su. The emomons hoope worn in the sixties, in which women looket like animated pyramids, were nos less artistice amt certainly mot so vulgar as the linsthe which after some years sucerented them.
In the early effirts of the few at "dress rioma" theme was mo coneerted movement in faver of all-romm improvement, and there was a very widespreal loblief that freedom of bedy and artistio gricu were inemuratible, is theory which gained force with the mases by the example of the early dress-refomers, who offented gexal taste and aesthetic scisilitity wit their utterly graemese hathiliments. 'The work of modern dress improvement is foumf to rest upon the somb principles of asthetie grime no bos than upon anatomical and physindogical laws. The fature of marly "dress reform" was lhe to the failure on the part of its adrocates to recogniza all of the principles involvel in any semeral change not autlorized by that arbitrary and inexilicalde force known as fashion. The dresereformers sail, "The drese worn by wonen is wrong." hut they diat mot demonstrate how to make it right upon any hasis that appeated to critical judgment as embulyine all that was neded in at change fiom existing forms and fishoms. Dress reform. howerer well meant, did not rest ufion the essential hasis of symuttrical bodily devopmont as a bive principle, and the israceful and artistic chothing of the perfectel structure in accortance with the laws of propurtion. utility, and harmony. Without recogntion of the philosopyy underlying hodify expression. improved dress is impusithe. Fashion dues not reengnize the hody: it sul jugates it. and becomes itself the mentral and athitrary peint of attraction. Foshion does not denamf the co-operation of the budy in expescion. but rather seeks in every bosible manner to deprive the body of independent expression in order that it may serve as an inconsequntial montel for the exterual decoration. Fashion dues not serk to ormanent the woman, but rather to nse the woman as a lay figure for the display of its own novel features of attratimenes.
When. howewr, integrity of bofly function is the end songht. all of the conditions are reversed and the wonan becones a median for siving expression to elothing. Decoration is then studief with the wheret of hringing ont her hest, drapery is designet to meed her requirensents for ntility and patry of motion. and sheroted instend of revealed form beeomes the supreme ideal. lietwen therse two extremes the work of cally dresserformers came in as a nondeseript movement, conforming to mether the laws of frahion hor the laws af expression. Dress reform demanded of beaties that had here crampend into stays to the point of actoal deformity. of sumken thests, rmmilet shoulders, curvel? spines, and phontrding ablomens. that they should not only get along withont the artilional supherts to wheld they were arenstomed, hat that they shand in sueh a stateof physical degeneraey prove atration prints of display for elothag. which was in its main features devord of all artistic comsid

 domend to fitiliore. latut mach goon has come from the ais-
 reformers: the dres-refomers mate the dres-impowerprosible becuse they awakened thought. and thought hat led to study of the actual principhes involset in a syatem of healhaful and at the same time attractive dress.
Correet aress should not violate either heahh or the phastic lumty of the ligure by crampine any part. The natural pmints of support. like the shoulders and hips. shombl be recognized as those from whela all dranery should radiat in fim flowing lives free to follow and aceent nate the movements of the body untit the outward covering expreses the Wearer's pelsomatity and shogests something special to wach individual. The ligghest tyle of dress must recognize not onty fremdom. expresion, radiation, and colon, lut sweh subdivisions as utility in freedom, grace in expression, hamony in radiation, and subthey in color, ghanities that shond remain supreme throght all the variations affecting the minor changes of dress. See Coste Mr.

Bibliography.-Of the few books which give a critical account of dress there may be named: Planchés Cyctopedia of Costumes or Dictionary of Dress; Viollet-le-Duc's Dictionnaire Raisonné du Mobitier Français (vols, iii. and iy.): Paul Lacroix, Mueurs. L'sages, et Costumes aut Moyen Àge pt à lépoque de la Renaisance: XI'IIne Sirele: tes Institutinns, Lsages, et Costumes de la France 1590-1;00: and XIIII me Sicle: Institutions. Lsages. et Costumes de ta France 1~00-1is9; Hefner-Alteneck, Trachten des Christlichen Wittelalters: also a later and larger work; Lane's Jhaners and Customs of the Modern Eyyptiuns: Smith's Dictionary of Greek and Roman Antiquities (new ed.? vols., 18:2) ; Ary Renan, Le Costume en Frence; Fairholt's Costume in Engtand, a IHistory of Dress to the End of the Fighteenth Century: Hughess Dictionary of Istum: M. A. Raeinet, Le Costume Ifistorique: Quicherat's IIistoire du Costume en France: Buring's Chinese Costumes: Iuard's IIstory of the Dress of the British Soldier from the Earliest Period: Strutt's I)resses and Habits of the Engtish; Melan and Logan. Clans of the Scottioh IItghtands: Wilkinson's Manners and Customs of the Aucient Egyptians.

There exist also many elaborate books of plates more or less aceurately representing ancient costumes, but without any examination into their significance. such are: Bonnard and Merenri, Costumes IFistoriques des $X I^{\mathrm{me}}, ~ X I I I^{\text {rue }}$. NITme et $\mathrm{I}^{\mathrm{Tm}}$ Siècles: Bruce's Bayeux T'apestry; Hogarth's Irorks engraved by himself, with descriptions by J. Qichols: Holbeins Portruits of the Court of IIenry IIII. Lodge's Portraits and Memoirs of Iltustrious Personages of Great Britain: Du sommerard, Les Arts au Moyen Âge: Jaqnemin's Iconographie méthodique du Costume du I'mo aul $\mathrm{N}^{\mathrm{N}} \mathrm{N}^{\mathrm{me}}$ Sièete.

Many books exist deroted to ecclesiastical restments and costumes, for which see the artiele Vestraents, Ecclesiastical. Also for modern military costumes, see Thoumas, Les - tnciennes Armees Francaises (very full, for the eighteenth and early nineteenth centuries); Scott, The British Army: and a number of books similarly devoted to different national armies.

Axme Jessess Millea.
Dresser, Hexry Erles, F. Z. S.. F. L. S.: ornithologist : h. at Thirsk, Yorkshire, England, May 9, 1838; edneated in England. Germany, and at Upsala, Sweden: a business man who has devoted his leisure time to ornithology, especially to that of Europe. A monograph of the bee-eaters is one of his most important works, but that by which he is probably best known is A History of the Birds of Europe, a monographie work in eight quarto rolumes, with colored plates (London, 18:1-81). Mr. Dresser has been a member of the conncil of the Zoulogical Society of London, president of the Yorkshire Naturalists Union, and secretary of the British Ornithologists' Union.
F. A. Luctas.

Dreux, Arö (anc. Durocasses) : a torn of France: department of Eure-et-Loir: on the river Blaise : abont 50 miles W. S. W. of Paris and 22 miles N . of Chartres (see map of France. ref. 3-E). It has a fine Gothic chureh, a town-hall. a theater, and manufactures of serge. woolen hosierr, hat: etc. Within the precincts of the old half-ruined castle of the twelfth century, which erowns the hill overlooking the town, a chapel of great magnificence was begun in 1816 by the Dowager-Duchess of Orleans, and completed by Louis Philipue. IIere the Roman Catholic arme, led by Constable Montmorenci, defeated the I'rince of Condé and the IIugnenots Dec. 19, 1563. Pop. (1896) 9, 718.

Drew, Daviel: capitalist; b. in Carmel, Putnam co., Y. Y.. July 29, 1797; began active life as a cattle-drover; became conspicuous as a steamboat-buikder, still later in connection with railways, especially in the fortunes and misfortunes of the Erie road. and at last was recognized as a learler in the stock speculations of Wall street. He was also distinguished for libseralitr to certain edueational interests of the Xethorlist Episcopail Church, having founded the Drew Ladies' Scminary at (armel, N. I., and the Drew Theulogical Semisaby (q. 2.). D. in Nef York city, Sept. 18, 1879.

Drew, Jous: actof: belit. 3, 1825. He first appeared at the lowery theater, New York, in 1845, as Dr. U'Toole in The Irish Tutor. After acting for some time in Albany, N. Y., he went to Philadelphia, where he became a farorite and was manarer of the Areh Strect theater in that eitr in 1853 , in conjunction with William Wheatler. He acted in the principal cities of the U. S., and afterwarl visited Ensland and Australia. Ile returned to the U.S. in 1862, and retirel from the stage May 3 of that year. As an Irish
comedian Drew hat few equals. D. in Philadelphia, Nay 21, 186?.
B. B. V.
1)rew. Jopn: actor: b. in Philadelphia, Nor. 13, 1853 :
on of John and Louisa Drew; cdncated at the Episcopal Academy in that city; made his first appearance at the Arch Street theater, Philadelphia, Mar. 22, 18i2, in the character of Plumper in Cool as a rucumber. He played many and varied parts for two years, and on Feb. 1\%, 18\%a, appeared at the Fifth Arenue theater as Bob Ruggles in The Big Bonanza. Then followed the long rmm of Pique, and a short season of Shak-peare at the same theater with Edwin Booth. playing such parts as Rusencrans in Hamlet, France in King Lear. and other minor rôles in the tragedian's repertory. During the temporary retirement of Augustin Daly from the theater in America during the season of 1878-79, Drew traveled through the country playing Henry Beauelere in Diplomacy. The opening of the new Daly's thenter in New York in 1880 found Drew again a member of the conpant, where he remained until 1892 , visiting Europe with Daly's company, creating many parts in original plars. and plaving in Slaksperean, Sheridanian, and other classic rôles. In the autumn of 1892 he began his career as a star in a comedr translated from the French of Bisson, ealled in English The Musked Ball.
B. B. Vallentine.

Drew. Samuel: Wesleyan theologian and metaphrsician: b. at St. Austell. Cornwall, England, Mar. 6, 1665; was a shoemaker: settled in London in 1819. He was an intimate friend of the famous Dr. Adam Clarke and of Dr. Thomas Coke, the first American Methodist bishop, whose Life he wrote. Among his other works, the principal are Essay on the Immateriality and Immortality of the Soul (1802): Essay on the Identity and General Resurrection of the IIuman Body (1809); and History of Cormualt (1820-24). I). at Helston, Mar. 29, 1833. See his Life by his son, J. H. Drew (London, 1834: 2d ed. 1835; abridged ed. 1861).

Drew Theological Seminary: an institution founded in 1866 by the liberality of Daniel Drew, of New York. Its olject is to train roung men for the ministry of the Nethodist Episcopal Church. The seat of the seminary is Madison, N. J. 2.5 miles from New York. The seminary park contains 05 acres of land, a portion of which is ornamented with walks and drives, trees and shrubberr. On the northern side of the seminary park are the buiddings, four in number. Over purchase of these grounds. the erection of the necessary additional buildings, and in seeuring the valuable collections of books that now compose the library. The Cornell Library Building, entirely fire-proof, cost $\$ 80,000$. The library itseif is large and is rapidly growing. The institation was formally opened for students Гor. 6, 186i\%. The conse of study occupies three years, and is adapited to the needs and attainments of college graduates. The general conference of the Methodist Episcopal Chureh in the U.S. has the direction and supervision of the faculty, seminary, and the theological instruction and education therein. constituting the bishops of the Methodist Episeopal Church as its board of supervision, and thus virtually controlling the management of the seminary. The Rev. Dr. John Me Clintnek was the first president of the seminary and the organizer of its course of study, and was sucereded br hev. R. S. Foster, I). D. Dr. Foster was elected hishop in $18 \%$ and was succeeded by Rer. J. F. Hurst, D. D., as president. Dr. Hurst was elected bishop in 1880. His successor in the presidency was Rev. Ilenry A. Buttz, D. D. For the encouragement of advanced scholarship two fellowships are endowed. Those who hold them have the privilege of stulying either at the seminary or in foreign lands.

Jons F. Ilcust.
Dreyse, drize. Jonasy Nikolaus, von: inventor of the needle-gun : b. at Sömmerda, in Prusia, Nor. 20, 1587; the son of a locksmith: worked in a Paris gun-factory 1809-14: after his return to Germany established an iron-ware factory in Sömmerda, and devotet his attention chiefly to the improvement of firearms. He perfected the famous Nebdlegux $(q . v$.$) in 1836, and in 1841$ he established an extensive gun and ammunition factory. D. Dec. 9, 186\%.
Drift, or Glacial Drift : certain detrital deposits of distant origin, for a long period unexplained, but now known to have been produced during the Pleistocene period through the agency of glaciers. The most characteristic deposit is till or borlder clay, an indiscriminate mixture of fine and cuarse material, nsually without lamination or hedding. The fine stuff, constituting a sort of matrix, is usually clay, but sometimes sand. The coarse stutf, imbedded in the fine,
ranges from grains, pehbles, and colbles to bowlders of great size-oceasionally many yarls in diametor-and is characterized by wom surfaces, with grompe of paralled scratehes, and often with farets hathoned bygrinding. L'sually the fragments difer in character from the rock on whiph the doposit rests, and it is often demonstrable that the parent beds from which they were torn lie many miles away. From this fact the bowdersare called ertetios. Asmelited with the till are u-ually grovels and sambs, likewise of distant origin. hut more or less st ratifiod and asorbat as hy the action of running water. In some regions hroal thets are covered ly hanated days inchuding seratched pebles and buwlers like those in till, and thewe loposits are aseribel to howles of water in which icenorge theated.

The sumerticial forms of drift are no less chametoristic than its material. Is ground morecine the till mantles the land unequally and presents a gotoly molulating surface. As maryinul moraine it is heaped in irregularly disposed hills and hillocks which inclose undrained hollows and these hills are grouped in belts one or mome miles lomal and of great length. tramg on the face of the country curved and more or less escalloned ligures, and outlining the bomelarics of the ice at varions times. It also forms drumlins, isoluted oval or lens shaped hills of symmetric form, trending in the direction of ide-motion. The assorted dritt. gravel. and sand constitutes kames, or irrecular grouped hills similar to morane hills: kome pains, ur plains diversitied by abrut kettle-shaped depressions and margined by kames fromal aprons, or soping alluvial phans on the outor llanks of marginal moraines ; ind osar, or long narrow ridges trending in the lireation of ice-motion: besides other rater features. The laminated clay with stones has the smooth surface charactristic of lachatrine and marine deposits sec (ilacibor. I'leistocenf, and Gi:ologis. (i. Ki. (ilbbert.

Drill: See Blastive.
Drill : an old Finglish word for aןe ; supposed by Huxley to be the sumree of the name mondrill (i, e. a man-like ape), that the latter word appers to be the original one. (Gee Manirill.) The term drill is applied effectally to the ('ynocephalus lemrophteus, it halnon of Ifrica.

Drill. Military: the instruction of soldiers and the exereises through which they are requirel to pass. See Tactucs Militares.

Drip: in architerture, the same as Corosi ( $q$. r.).
Driv'lere Ilexry, LaL. I) : scholar: b. Dee. 2i, 1str: gradwatel at columbin (ollege in 180?: : classieal instructor in its grammar schon! for several yeats : sppointed tuto of the (irvek and Latin haquages in the colloge, 184:3; adjunct professer in the same department. Isti5; Professor of hitin, 1857: transferred to the chair of (rreek on the death of 1) Anthon. 1867 ; in the same year was acting presilent of the college during l'resident Barmard's ahsonce as a commissioner to the Fxpmition Universelle in l'aris. The again be came acting president in $1 \times 5 \mathrm{~s}$, and was deat of the seloen
 Drisler was for several years engaged with 1r. Anthon on his series of classical text-hookis. ete. Il is contributions to elassical learning are an enlarged edition of Liddell and scottPassow's (ireph leficon (18:16), eto-operation in the seventh revised Oxford edition (1ssi), and a revised and greatly onharged edtion of Yonge's English-Gresk Lexicon (180(1) general editor of llarpers Clasiond series.

IIroultuda drokbeda: aseaport-town of Teinster, Ireland; on the bommary betwen the connties of lonth and Meath, amb on the river loyne, 4 miles from its entrance into the
 W: (see map of Irelamd, ref. 8-I). The Inablin and lelfast Railway here crosers the Boyne hy a vinduct 9.5 feet hirll. The town has a lioman Cntholi. cathedral, sereral convents. gund a custom-house, and manulactures of cot tom and limen fabrics, stemb-engines, ete. Vessels of 400 tons can ascend the river to this part, from whin grain, cattle, linem, hides. butter, and ale are exported, mostly to biverpol. Drogheda was tormerly a town of great imporance, the mact ing-phace of several parliaments amens them that at which loyminges laws were "naeted in 149., mad the rhice military station of Leinster from the fourtemth century the seventemth. but it is, above all, motel ns the place of a massicre: be: Cromwell in 1649. After a brief but comragems resitance he captured it, and put to the sworl all the inhabitants, except thirty, who reapen, but were afterward captured and : ransported to Barbados. P(p. (18!) 11.812.

Drobobirza, dröhö-hitch: a town of Austria, in Calicia; on a tributary of the Duicster: is miles S. 18. of sambor (see map of Anstria-Ihangars, ref. 3-K). It has al castle, two handsone churches, a monastery, and extensive salt-works. 1'01'. (1840) 17, TR.1.

Hroil d'Anhaine. drwăd do hen': the right of a sovereigu to inlorit the promerty of a forisener lying intestate without native-born heirs. This practice was abolishod in 1790, but was restored by Nupmleon !. Sec laternatiosal 1.А末.

Droit'wich (ance Salince): a town of Worcestershire. England; on the liristol and Birmingham Railway a miles
 derives its prosperity chietly from its trad in salt, for Which it has heen famons frem remote times. Dlere are brine-surings rising from a diphty of 200 fat throngh new
 salt, vais to be the best in limpere also saline baths which are visited by thomsunds anmally. l'oll. (1s: 11 ) 4,021 .

Orolliner dröling. Michel Martix: historical painter b. in latis. Mar. i, Lisk: pupil of lis father, Martin Iroilling, a genre-painter: studied also with Tavid, and took the Grand Prix de 1 ome; member of the lnstitute $1 \times 833$; Legion of llonor 1s:3\%. lle was the master of several of the great Freneh painters of the present day. His works are classical in style? Thore is a coiling by himin the Louve. D. in Paris. Jinn 9, 185).
W. A. C.

Drombe, drōn: a department in the southeastern part of France: area, e.519 so miles. It is homuled th. by the river khone, and drained by the Drôme. The surface is party hilly and mountainous. Coal, coppor, irom, lead, and marhare found here. The highlands are covered with forests of oak, pine, berch, and chestnut. Among the staple productions are grapes, olives chestnuts, silk, and wine of excellent quality. The wine called L'llermitage is celebrated Drome is intersected by the Lyons and Arignon Railway. Capital, Valence. Pop: (1*91) 306,413; (1896):303,491.

Dromedary from Late lat. dromeder rius, deriv. of dromas
 to run]: the Aralian am! Ifrican camel (Camelus dromederius), a surcies differing from the liactrian camel in having only one hump on the back. It las also more slemterness

and swmatery of form. Its nsinal pace is a trot, which it ofter mainains tor many hours together at the rate of 9 miles an hour. 'The dromedary surpasses other camels in
 ten-ively med as a benst of birden in Afrima and Arabia. See t'amel.
Drongo-shoike: any hird of the family licmurdes, a group of fly-catching lieds velated to the crows inhabiting Drica, sonihern Asia, and some of the aljoining islands. The dromgos are about the size of an imerican roling of a hue or metallic blup-hack color, with long forkent tails. the outar feathers of which are in somes species courved ontward and have a racket-shaped termimation. 18, A. Letons.

## Dronthoim: Sce Troxmmen.

Droppoine Tobe: in chemistry, a slomber tapering tube open at both ems. Int terminating at the loser in a harrow orifice used to supply liquids in lelicate experiments. drop by drop. A bubt to hold the lipuid is hlown near the upper
extremity. The flow is regulated by placing the finger on the open upper enu, so as partially or entirely to close it.

Dropsy [for Early Fing. ydropsie < O. Fr. hydropisie <

 by excess of the matural thid in any of the serons cavities of the holy or in the areolar tissue. Dronsy was fommerly thought to be a lisease, lut it is now recognized as a symptom of many diseases, cansed for the most part by distarbances of the circulation of the hlow on other vascular derangements. If the cereluro-spinal fluit be increased, it constitutes hydrocephuhes, or "water on the brain." If the excessive secretion (exudation) takes place from the pleura, it is called hydrolhmrar, or "dropsy of the chest." If the fluit collect in the abdominal eavity, the disease is called Ascjetes ( $q, v^{2}$ ) a disease which may arise withont assignable cause. but which most frequently comes from cirrhosis of the liver, a contracted, hardened condition of that organ, medianically olstructing the portall cirenlation, and this leading to transudation of serum from the blood-vessels. Mabitual intemperance is its most frequent cause. Gencral dropsy of the serons and areolar tissues is called anasarca (from Gr. àvá, thronghout $+\sigma \dot{\alpha} \rho \xi(g \times n . \sigma \alpha \rho k \dot{\sigma})$, flesh). Obstructive organie disease of the heart and degenerative diseases of the kidneys are the most frefurnt catuses of general dropsy, which is therefore a very important symptom. Hydropericardimm, or "water on the leart" hydrarlhrus or elfusion into a joint, hydrorachis, which is seated in the spinal canal. and hydrorefe, in the scrotum, are lorms of dropsy. Ovarian dropsy is a fluid collection oceurring in ovarian eysts, which may be unilocular (of one sac) or multilocular (composed of many aggregated eysts), the whole frequently forming a mass of enormons size. Thus far its only suceessful treatment consists in the remoral of the eysts by excision, one of the boldest, and, on the whole, one of the best, of the more recent surgieal operations. Revised by Willian Pepper.

Drowhky, or Droshky [a Slavic word, Polish drozhka, Russ. drozhiti, dimin. If drogi, earriage, which has phased into most European langhages ; cf. Germ. Droschke, Swed. droska]: originally a low fonr-wheeled linssian carriage in which the passenger sat astride a seat placed lengthwise. with his feet resting on steps, to which were fastened fenders which eurved over the wheels. When other forms ol publie conveyances were introduced into St. Peterslurg. the name was transferred to them, and it is now applied in both linssia and Germany to a fiacre or other comfortable public earriage resembling a vietoria.

Dros'era [from Gr: $\delta \rho o \sigma \in \rho \sigma$ s, dewy]: a genus of peremnial herbaceous plants of the lamily Droseracece, popularly called sundew, several species of which are natives of the U.S. and of the United Kingdom. From the glands of the leaves exude drops of a clear fluid glittering like dewdrons; hence the name. When tlies or other small insects light upon a leaf they are held by the sticky fluid of the glands: the leaves then roll down from the apex amb eventually surround the inseet. It is pretty certain that the insect is digested and aboutbed by the leaf. Ruvised by Charles E. Bessey.

Drosom'efor [from fir. $\delta \rho \sigma \sigma o s$, dew $+\mu \epsilon ́ т \rho o \nu$, metsure]: an instrument for measuring the quantity of dew which falls upon the surfare of in exposed body. It is in the form of a balance; the body under observation is supported by one arm, while the weights are placed in a scale-pan attached to the other, and protected from the dew.

Drostr-II ïlshoif, Mros'te-hül'shöf. Axnette Elisabetit, von: German poet; b, near Mïnster, Jan. 12, 1ヶ9\%. Her works (frdichte, 1838; letzte Guben, 1859) show deep sentiment, powritul dietion, amd rich imagination. No woman of modern times in tremany has execlled her in poetry. I). May D. 1848, at Meersmarg. Sce Levin Schücking, Alinefle won Droste (2l el 1871 ).

Julus Goebel.
Droste zu Yisphering, Mroste-tsu-fislie-ring, Clemens August, von, Fribher: Veclesiastic: b. at Vrorhelm. near Münster, Prussit, Jan. $\because 1,171: 3$ : Dreame vicar-general in 1807; assistant bishop of the diocese of Münster in 1827, and Archbishop of 'ologne in 1835. In consequence of ditficulties with the Prussian Gowernment in regard to mixed marriages, which the ardbishop forbade the priests to solemnize nuless they receivel the promise that all the chilitren should lie brought up in the Catholie relligion, he was imprisoned in the fortress Minden in 1839 but was releasel in 18.1. If is imprisonment called forth an extraordinary excitement in fiemmay, amo greatly strengthened
the Roman Cathotic Churelı, I), in Mïnster, Oct. 19, 1845. See lis Life ly F. A. Muth (Ẅ̈rzhurg, 1874).

Iromet, droo'à, Jeax Baptiste, Comte d'Erlon: general ; b. in Liheims, France, July 29, 1765 ; fought in the campaigns of $1703-96$; general of brigate in 1799; won praise by his skill at Ulm and Ilohenlinden, but especially by his mrilliant manotuver which is said to have decided the victory at dena ( 1806 ) : was consuicuons in the siege of Dantzie: severely wounded at Frienlland (1807), but afterward served with distinction in the Peninsular war. He was trusted and honored by the liourbons, but soon disgraced on acconnt of suspected treachery. On Nimpleon's return from Filha lie succeeded in capturing and hokling the fortress of Lille for the emperor, who wade him a peer of France. In the campaign ending at Waterlon Irouet commanded the First Army-corps. On the day of Ligny and Quatre liras he wasted the time in which he might have been of inestimable sarvice to Ney in a fruitless marel between the two battlefields throngh a misapprehension of Napoleon's orders. This unfortmate mistake brought upon him the keenest reproach. When Paris fell he fled to Bavaria, but returned to France in 1880, and was placed in command of the army of Vendée in 1832. Ile was governor-general of Algeria 1834 35, and in 1843 was raised to the rank of marshal. D. Jin. 2it, 1844.

Dronyu dr Limys drooăn'de-lii-cé, Émouard: diplomatist : b. in Paris. France, Nov. 19. 1805. Me was appointed director of the commercial burean in the ministry of foreign atfairs in 1840. Having voled in the Chamber of bepaties against the ministry, he was removed from office in 1845. Ile was Minister of Foreign Affairs in the first cahinet of luonis Napoleon in 1848, and was sent as minister to London in 1849. Te was again appointed Minister of Foreign Affairs in luly, 1859, resigned in 1855. and was restured to that position in Oct., 1862. IIe again resigned in 1s66i. D. in P'aris, Mar. 1, 1881.

Drowh, 'homas Messinger, M. D. : ehemist : la. in Philadelphia, Mar. 19, $1 \times 42$ : graduated in 1859 at the Philatelphia lligh school: stulied at the University of Pennsylvani:, where he graduated as M. D. in 1862; at the Sheilicld Seientific school, New Haven, 1862-63; at the Lawrence Scientifie school 1863-65; and at Freiberg and Heidelherg 1860-fis. Ile was Professor of Analytical Chemistry in Lafayette College for seven years, and held a similar position in the Missachusetts Institute of Teelmology from 1885 to 1895, when le beeame president of Lehigh University.
Drownines: death by submersion in water or the like. The lollowing rules tor the recovery of persons alter appparent death from drowning are derived from the experience of the best physicians: (1) It is neeresary in all cases to keep the body cool until respiration be re-cstablished, since the application of warmth (both in frozen and nearly drowned ${ }^{n}$ rrsons) seems to arouse those dmmant energies that absolutely require the aëration of the blood, which failing. death ensmes. (2) Respiration must he artificially established, either by direct inflation of the lungs by the hreath or the bellows, or, muel better, by the "Marshall Hall methoul" or some of its modifications. The paticnt being in a horizontal position to facilitate the exit of water from the lungs, and the head being slightly raisel, the lungs are alternately inflated and compressed by gently rolling the hody from a prone to a half-prone position (i)hon one side), and reversing the process. The lungs may also be inthated hy retracting the arms with some force, and by pressure upen the thorax. (3) Expose the face and chast to the air, umless the weather be very cold. (4) Ruh the limhs upwarl, and as soon as dry clothing ean he promed pint it upou the patient. (5) Avoid the use of the galvanio batthry. which is always hangerous, even in expericnced hands. (6) Contimue these operations until, if possible, natural respiration be re-established. Cases are reported where artificial respiration hat to be kept up for hours before sigus of life appeared. Similar treatment shoulal be employed in all cases of su-called "aphyxia" from whatever canse. Ser Resuscitation.
Drowxisg, as a capital punishment, was formerly practieed in various parts of the Old Worll. In the AngloSaxon corles women convicterl of theft were combemend to be drowned. Thu ancipat Bargundians condemmend if fathless wife to be smotherel in mul. 'lhis form of punishment was common in the Middle Ages, and serms to have bect prineipally intlieted upon women. It was not abolishom in scotland till 1645, and in Anstria it landel till 1776.

Hrom: a martial musieal instrument, consisting of a hollow evinder of worl or metal having skin on parehment strehed across ane or both ends, on whish the hummer beats with a wonlen stick ealleal it drum-atich. The military drum is used to eque various signats, as well as for music. There ate thee kind- of droms-t he side drum, the bige or buss drum, and the ketle drum. The first of then is suspended at the side of the drammer, whe lyents on one embl
 across the other enel ; hence it is uften callenl a sume drum. The bass drum is leaten on woth ends. The kettle trmm is of hemispheriogl form, sum has but wne hate! or parelment. It was formerly used in martial music, bur is mow comfinel to the urchestra. In its orchestral use at letst fow kothe
drums are used (racely three), thent at intervals of font his of fifths apari, somitimes in cetaves, as in Theethoven's sther\% in the Xinth Swophons

Wres. in arehitecture, the ujugatht part of a cupola below the carsing or romudel part. The shlind part or vase of a Corimthian or compusitu capital laforal the acantans leaves is abo called a tram, though more often at bell. The term drum is applied in mathinery to a hollow eylimer fixert upon a haft for the purpose of deving anot her eylimer by a band.
bera, the name given in the cightemeth ventury in a crowded fashomable assmbly, so stym, says simollett. "from the noise amp emptiness of the entertamment." I hatere assembly of the kinel was calloch al "drum-major." The name "kettle-trum" "nplitud to an informal afternom ripception appeass to have originated in the nineteenth cernlury
Hrumtish: a marine fish (Iogntas chromis) belonging to the family Scientide fomm on the Athatice const of America from (rape Col to Brazil. A similar surcies (atplodinotus yrunnims) eremes in the Great hakes and the Missisuphi river. 'The drumbish derives its name from the emission of a pecoliar somad, somewhat resembling the beat of a drum, and thanght to be enused by the movement of the air in its compliented air-hladder. A similar power is possensed by most other members of the Scicuidne.
lievised by D. S. Jormas.
bromlin: in genlogy, a smoth oval hill emmpend of till. 'lhe names, fist aphlied in Irelaml, was afterward intrelaced in Amerina. Where it suphantel " lenticular hill" and "mamillary hill." 'The cont ours and profles of dranlins are smonh curves, attributed to the moleling paner on glacial ice. Their tops are rommed: their sides are froGuently steep, hat merge gradually with surcounding surfaces. Theiremoms are oval, sometimes long and narrow, somemen nearly fircular. The longer timeter always liew in the direction of the ice movement. Where the hithe ne grouped together, the grophs trequenty constitute belts rumbiner parallel to neishluming termimal moraines. The till of which they are chiefly condtated is thomghy compacted, and is surfused to have been blepsiten by the Plecisterene iecesherets from their under surfaces. In the I. they are experially abmulant in New Finghand. Western Contral Sew Sork, and Fastem Wisensin, Se Drer and Plesstodexe.

 whe macated at Fidinburgh University and studiad law in Pramere. He resided on his bomatial paternal estato of fawthomen, where be pased his life in retirement and
in literary pursuits. In 16ty Ben Jonson traveled several luandred miles in orter to visit Itmmmond, who wrote Notes of Bert Jomson's Contersatiom on this occasion. These notes are among his most interesting productions. He was suthor of Tears on the Death of Melicudes (1613): Poems (1616); Forth Feasting (161i); Flowers of Zion (1623): besides a Ilistory of the Fice Jameses, and some politieal tracts. D. Dec. 4, 1649.
Drummond Island: an island in Lake Ituron: the most western of the Manitoulin islands; belongs to Michigan. It is 20 miles long and 10 miles wide.

Drummond Light [named from Thomas Drummond, its inventor], also called lime Light, Calcinm lisht. etc.: an intense light prodnced by throwing the oxyhytrogen blowpipe tlame upon a peneil of lime, which is thereby raised to vivid incamleseence. If magnesia or metallic magnesinm be used insteal of lime, the light is rich in actinic rays, and hence is useful in photography. Zirconia is often employed insteal of lime, on account of its non-volatility.
Drminemess: See Dipsomanta and Istemperance; also Chil Damage Acts.
Drıpe [Fr. drupe < Lat. druppa, ripe olive, apparently an abbreviated form of Gr. סpumє $\frac{\pi}{\prime \prime}$ s, ripened on tree, or סрuтєт $\eta^{\prime}$, readly to fall]: in botany, a one-celled. superior indehiscent fruit, having a single seed or kernel, usually inclosed in a hard rand bony enducurp called a stone, as a peach or a plum. The onter part of the fruit, which is succulent or Heshy, is called the sarcocarp or mesocarp. The term putamen is applied to the hard, stony substanee which incloses the kernel.
Dru'ses: a people of mixed race (largely Persian and Arab), almost limited to the Lebanon and the Ilauran; speaking the Arabic language. They number nearly 90,000 . They are industrions, hospitable, brave, temperate (all are required to abstain from tobacco and wine), cleanly, and very prond of their birth and ledigree, but revengefut and arnel. Their chief business is the production and manufacture of silk. For about 800 years they have maintained a distinet religion and an independent nationality. Their creed is an offshoot of Mohammedanism, probably developed by the shiites, or more especially by the so-callen lhatiniya, or Batenians, the most radical branch of the Shiites. In some of its fundamental tenets, however, it is directly opposed to the very spirit of Mohammedanism, and seems to approach Christianity. It emphasizus the unity of Gorl as strongly as Mohammedanism. "There is no grin but Crol," the Drnses say, and he is nnknowable to man. But, though he can not be grasped by the senses, he becomes known to man throngh revelation, they add; and then follows a doctrine of incarnation not altogether unlike the C'lristian loctrine, but an abomination to all Mohammetans. The highest, and also the last, of these incarnations was, according to the Druses, that of Hakim Biamrillahi, the sixth of the Fatimites, caliph from 1019 to 1044. Hakim was a halfinsane tyrant; and when lis favorite, Ismail Darasi, a lersian by birth, one day in 1040 began to expound to the audience assembled in the great mosrine of Cairo that Allah had revealed himself in Hakim, that Hakim was an incarnation of Allah, a riot immediately ensuet, and it could not be smpresseal until Darasi was expelled from the country. He went to the regions of the Iolbanon, and his doctrine wis aecepted by the people living there; hence their name Iruses. But though the new sect thus formed even developed a literature, its later history is very obsenre. Externally, the Drases saw fit to profess Mohammedanism, and nothing was known abont their pectiar creed and their sacrest looks until the latter part of the eighteenth century. A Whody war hetwern them and the Maronites lefl, in 18ifo, to European intervention on hehalf of the Christians. See Maronires. See also the Earl of Carnarvon's Jrases of the Lebanon (London, 18fio); Rev. John Wortabet, Researches into the Religions of Syria (1860); II. Guyo, La théogomie des Druses (Paris, 1sitis); and La nation Drase ('aris, 18(i4) ; and particularly C. 11. Churchill. Ten Fears' Residence in Mt. Lebrnon (3 vols., 18.53); The Druzes and the Maronites under the T'urkish Rule from 1840 to 1500 (1862); Laurence Oliphant, Land of Citead (1880) and Invifa (1887). Revised hy Samuel Macaudey Jackson.
Dru'sus, Claumus Nero: a Roman general ; Is, in 38 n. c.; son of T'iberius Nero and Livia (who subsequently heeame the third wife of the Rmperor Augustus), ami a younger
brother of the Emperor Tiberius. Ite married Antonia, a danghter of Mark Antony. In 13 в. c. he defeated the Gerinans near the Rhine. Having conquered the Sicambri and Frisii, he extended the Roman cmpire to the German Oeean and to the river Elbe. For these victories he received the surname of (iermaxicus. He died early in 9 b. c., leaving two sons. Germanicus and Claudius, the latter of whom hecame emperor.

Itrusis, Marces Livius: a Roman orator and politieian: became trilme of the people in 12: n. c. as a colleague of Cains Gracehus. Ite supported the cause of the senate and optimates, opposed the policy of Gracchus, and gained popularity by planting colonies. He was elected consul for 112 в. с.

Drusins. Marces Lavios: a son of Marcus Livius Drusns and an unele of Cato Uticensis. He is said to lave been ambitions, prond, and arrogant, ant a champion of the senatorial or aristocratic party. Having been chosen tribune of the people for 91 в. c., he conrted the popular favor by passing an agrarian law. Tnable to win the support of the semate, he attempted to gain the support of the colonies by promising them the right of citizenslip. He was assassinated by a politieal opponent in 91 в. с.

Dry Bank Light: a lighthouse on the Florida Reef: situated on Sombrero Shoal, near Dry Bank, Coftin's P'ateles, and Sombrero Key; in lat. $24^{\circ} 3 \gamma^{\prime} 36^{\prime \prime} \mathrm{N}^{\prime}$, lon. $81^{\circ}$ $6^{\prime} 43^{\prime \prime} \mathrm{W}$. It is an plen framework of iron 149 feet high, with a fixed white dioptric light of the first class.
Dryden: village; on railway ; Tompkins co., N. Y. (for location of county, see map of New York, ref. 5-F); 32 miles N. of Owego. It has a large woolen-factory, a tannery, and sulphur springs. Here is the Dryden Spring Place, a resort for invalids. Pop. (1880) 779 : (1890) 663.

Iryden, Jons: poet ; bat Aldwinckle. Northamptonshire, England, Aug. 9, 16:31: a grandson of Sir Erasmus Driden, created a baronet in 1619. Ie was a pupil of Dr. Busby, and entered Trinity College. Cambridge, in 1650. Having granuated is master of arts in 165\%, he beeame a resident of London. Ife wrote Iteroic Stanzas on the Death of Crom$u+l l(1658$ ), and celehrated the restoration of charles II. in 1660 by a poem entitled Astrcea Redur. His first drama was The Hild Gallunt (1662). He married Lady Howard, a daughter of the Earl of Berkshire, in 1663, and wrote in 166\% a poem called Amms Mirabilis, or Fear of 1 Honders. la 1668 he was appointed $1^{\text {met-laureate, with a salary of }}$ £000 annually. He afterward wrote 1 mmerous comedies and tragedies, among which are Marriage it la Mode, All for Love (16\%8) and Aurungzebe. Ilis Inilliant political and poctical sutire of Atbstom and schitophel (1681) is directed against the party of which Lord Shaftessury and the Dukes of Buekingham and Monmonth were the leaders. He annonnced his conversion to the Roman Catholic religion by his allegorical poem cilled The Mind and the Panther (1678). He produced in 1696 a metrical translation of Yergil. which Pope commended as "the most noble and spirited translation I know in any language." It is, however, defieient in fidelity. Among his other works are an excellent prose Essay on Dramatic Poesy (1660) and an Ole for Saint Cecilia's Day. Ilis later works exhibit a purer taste than his dramas. 1). May 1, 1700, and was buried in Westminster Abbey. See English İterature.

## Dry Dock: See Docks.

Dryimemachine: a device for extracting the moisture from fabrics. A machine most commonly used by dyers and large laundry establishments, called an "extractor," eonsists of two cylinders, one within the other. The inner one is the reecptacle for the goods, and is made to revolve with great rapility, expelling the water throngh perforations made in the sides. The outer crimber reecives the water, and from thence it is earried off by means of a pipe. By this process the trying is not quite complete but what remains is expelled by drying in a hot chamber or in the open air.
Dryiug 0il: in painting, oil which has the property of drying quiekly; especially linseed oil and other seed oils. The process of drying is hastened by heating the oil with oxide of lead. See Ons and l'asts.

## Dryobalanops : See Camphor.

Dry'ophis [from Gr. $\delta$ pûs. nak + üфss, serpent]: a genus of snake's lielonging to the' Colubritce, natives of tropieal Amerira and the Last Inlies. Like the Dendrophider, to which they are allied, they have ext rembly slemder, elongated forms,
and live on treps．They are sometimes pheal with other related genera in a separate family．

F．A．L．
Dry Pile：a kind of voltaic pile or hattery，eroustructed without liquids，and furnishings a feeble etectric conrent． The stry pites of Zambmi and De Lu＂consist of disks of ＂olper and zine paper phated in pairs bark to back and piled up or parked in ghas tubes，with the＂opper surfates all in the same direction．

In Bellay：See liellay．
Inblin：a county of Leinster，Ireland；area，3ot sq． miles：hounded on the E．by the Xrish sea，and intersected by the river Liffey，which tlows into Inblin Bay．I＇le sur－ face is nearly level：the soil is productive and well eulti－ vatel．Granite，copper，leal，and carboniforons limestone occur here．Chief town，Dublin．Pop．（189t）429，111．

Hublin：city ；capital of Ireland and of Dublin enunts ； on the Liffey，at its entrance into Wublin Bay ： 66 miles W． of IIolyhead and 135 miles W．of Liverpool ；lat． $53^{\circ} 20^{\prime} 38^{\prime \prime}$ N．，Ion． $6^{5} \quad 17 \quad 30^{\prime \prime} \mathrm{W}$ ．（see map of Ireland，ref．9－J）．Mean annual temperature， $49^{\circ} \mathrm{F}$ ．The river，which runs eastward， diviles the city into two nearly equad parts，which are con－ nected by nine bridges－seren of stone and two of iron．In the northeastern and sontheastern parts are many beantifu］ sqnares，streets，and terraces，occupied by the aristocratic class．The mereantile business is mostly transacted in the central and northwestern portions，where are many resi－ dences of the midille class．The city is surrounded by the Circular Road，nearly 9 miles long，which is a favorite drive and promenade of the citizens．The most imposing street of Dublin is Sackville Strect， 120 feet wide ant 700 yarls long．Among the numerous squares is Stephen＇s Green，hav－ ing an area of nearly 20 acres．＇The inost remarkable public buildings are the Bank of Ireland（formerly the Parliament llouse），Trinity College，the custom－house，the Four Conrts， Dublin Castle，occupied by the Lorl－Lientenant，and st． George＇s chureh with a steeple 200 feet high．The cathe－ Aral of St．Patrick is one of the most interesting buildings of the city．It Tis founded in 1190 by John Comyn，Arch－ bishop of Dublin．In the next century it was burnt down， but was immediately rebuilt in still sreater splendor．At the time of the Reformation it was closed，and Edward VT． thought of using the building for a university，but the plan was refeaterl．Near the north end of Sackville Strect is a monument to Lord Nelson， 134 feet high．Among the lit－ erary and spientific institutions are the University（see Dub－ Lin，Universtity of），the Royal College of science，the Roman Cathotic University，the College of Surgeons，the Roral Hublin Society，the Royal Irish Icademy，the IIthernian Academy for l＇antings，and the National Gallery．Inblin is the seat of a Protestant Episeopal and a Tioman Catholic archbishop．In the environs of Dublin，which are remark－ ably beantiful，is（ilasnevin，rnce the favorite residence of Adhison，Steele，swift，and Sheridin ：and Phenix Park， which contains nearly 2,000 acres．The fine scenery of this noble park，the massive public buldings，the spacious squares．the clean granite quays which lime the river，and the bennty of the hay which expands before the eity，render 1）ublin one of the most heantiful and agreeable eapitals of Enrope．Railways extending in several directions conneet this place with the chief towns of Irelamp．It is the eastern terminus of the（iritul and loral Camals，and has a goot harbor，which has been improvel by the construction of two breakwaters．This city has glass－works，fonmdries，and dis－
tilleries；also manufietures of poplin，whith is much cele－ brated．lublin returns four members to Parliament，be－ siles two who represent the unitersity．It is a very old town，and its ancient history is mainly legendary．It was taken in the ninth century by the Danes，and，though they were several times expelled，and completely defeated in the battle of Clontarf，they managed to hold the city until $11 \% 0$. In 11领 lienry II．landed in Ireland at the head of an Anglo－Norman armament．He went to Dublin，held his court there with great magnificence，and made an alliance with the Irish chiel＇s．In 168！）James II．took up his resi－ lence in Dublin and held a parliament there；after the bat－ tle of the Boyne he speedily departed．On Jan．1，1800，the imperial standarl of the United Kingrom was hoisted on lublin Castle．Pop．（1891）254，709 in the vity proper，but 361,591 within the metropolitan police district．

Dublin，Universily of（otherwise called Trinity Col－ lege，Dublin）：an institution of learning．said to have been founded in 1320：re－established in 1593 ly Queen Elizabeth． It was endowed by the corpuration of Lublin and by pri－ vate gifts，and still further by grants of James I．，who in 1613 gave it representation in Parliament，which it stil］ possesses，sending since 1832 two members to the House of Commons．Its government is moteled upon that of the English unirersities，but its fellows（since 1840）are at liberty to marry．It has a full corps of professors in all depart－ ments of knowledge，who．like the fellows，are liberally sup－ ported from the income of the college．The students are of four classes：（1）Noblemen，liaronets，and the sons of noble－ men，who have peculiar privileges，and，with the exception of baronets，obtain the degree of B．A．withont examination． They pay about \＆\％o0 a year in fees．（2）Fellow－commoners， who dine with the fellows，and have one less examination than the third class，at about one－half the cost in fees of the preeeding．（3）Pensioners，to which class most of the students belong．Their fees are little more than half as great as those of the second class．（4）Sizars，thirty in number，who pay a nominal fee．Each of the ranks wears a rlistinctive dress．．The examination on entrance is thor－ ongl，It is possible to obtain degrees withont great exer－ tion，but the honors can be obtained only by severe study． No restriction is mate with regard to the almission of those who are not members of the Anglican Church．The fees for graduation are much higher than in American colleges．Dub－ lin Unirersity occupies a high rank among European insti－ tutions of learning．It has special departments for the stuty of medicine，divinity，and engineering．Among the cminent graduates were Berkeley，Ussher，Swift，Burke， Goldsmith，sheridan，and Sir W．Iamilton．An unsuccess－ ful attempt made Mar．11，1873，in the British Parliament． to unite the Catholic University，Magee College，Belfast， and the Queen＇s Colleges of Cork and Belfast to the Uni－ versity of Dublin，and to abolish the Quecn＇s College at Galway，led to the temporary disruption of the Gladstone ministry．

Diilner，Jilp＇ner，Friedrich：classical philologist；b．in Ilörselgan，Germany，Dec．20， 1802 ；jrofessor at the Grm－ nasium of Gotha 1826－31．After 1831 lived in Paris，where he smperintended 1）idot＇s new edition of the Greek The－ saurus of Stephanns．Subsequently he became the chief editor of Didot＇s Bibliotheca Graca，for which great under－ taking he himself contributed the scholia to Aristophanes， Theoeritus，the Anthologirt Palatima，Theophrastus，Plu－ tareh＇s Moralia and the Fragmentr et spuria．At the di－ rection of Napoleon III．he prepared a critical edition of C＇pear（Paris，1867）．For the Cottection Elzevirienne of the same firm le wrote the commentaries to Ilorace and Versil． He is also the anthor of numerous school mbitions，a Creek grammar，anm a（reck－French lexicon．lle rlied in Mon－ treuil－sous－Bois，near Paris，Oct．13，186\％．See Fekstein． Allgemeine deutsche Biographie，v．， 440 ff．

Duetility [lat. duch litus, deriv. of Lat. ductilis, capable of being drawn, caprable of extension; ducere, draw]: capability of heing drawn ont into a long and slender form. The metals having the greatest ductility are yold, silver, platinum, aluminium, and iron. A grain of gold may be frawn into 500 feet of wire, and a wire of platinum not exceeding a 30,000 th of an inch in diameter las been obtained by placing a fine wire of platinum in the axis of a lareer silver wire, then drawing the compound wire in the usual mode, and finally disoolving the silver by nitric acid. The ductility of glasis (when melted or heated to a red heat) is almost unlimited. The ductility of many bolies is modified by temperature.

## Du Deffand, Marquise: See Deffand.

## Duderant, düde-văaí, Madame: sce Saxd, George.

Dulley: monicipal and parliamentary borongh of England: in a detached part of Worcestershire and south staffordshire: ! miles W. N. W., of Birmingham (see map of England. ref. 10-(G). It is well built, and is one of the clief seats of the iron-trade. Here are manafactares of glass. grates, fire-irons, nails, vices, chain-eables, etc. Near Dulley are the ruins of Dudley Castle, founded in 760 A . D. by Ibido a Saxon prince. Mines of coat and iron and guarries of Silurim limestone are worked in the rieinity. Dudley returns one member to Parliament. Pop. (1891) of muniejpal borough, $45, i 40$ : of parliamentary borough, 40,203 .

Dudley, Bexamin Wixsow, 1.f. D.: surgeon; b. in Spottsybania co., Va,, in 15is: he began the stuly of medicine in Lexington, Ky., and took his degree in the U'niversity of Pennsylvamia in 1806. Ile went to Europe in 1s10, and during his four years of absence studied with Sir Astley Cooper. Abernethy, Cline, Larrey, Dubois, Boyer, Marjolin, and others. In 181\%. in conjunction with Blythe, Caldwell. Brown, Richardson. Irake, etc., he organized the medical department of the Cniversity of Transylwania. which was long the leading school of medicine in the West. Ne heeame known as one of the most successful surgeons of his day, and is said to have performed lithotomy 295 times with but six deaths. D. at lésington, KY., Jan. 20, $18: 0$.

Hudley. Charles Edward: L.S.Senator; b. in Staffordshire, Englant, May 23. 1780; emigrated to the U. S. in 1394. He was elected mayor of Allany in 1821, and a Senator of the U . S . for an unexpired term of fon years in 18:9. D. in Albany. Jan. 23, ist1. The Dudley Observatory at Albany, S. İ., was founded by his widow, who gave it 8 §o,000.
Dudley, Edyuxd: minister of IIenry VII. of England; b. atout 146?: notorious for his extortions from the people in ennection with his associate Empson, in order to gratify the king's ararice; becume privy conncilor, but was sent to the block by Ilenry VIII. Aug. is. 1510. He was the father of John Ditley, who was created Farl of Northumberland in 1551. See Nurthioyberlayd, Joms Duddey, Déke of,

Hudley. Hexry Bate: journalist and dramatist; 11, at Fenuy-Compton, England, 1r4.5. He was edueated at Cumbrilge and destined for the Chureh, but devoted his time and energy chiefly to literatnre. In $18 i 5$ he founded the Morning Pust and in 180 the Morning Merald, both of which achieved a great and rapil success. Of his plays the most impertant are Flitrh of Bueon (1:i9): The Hobilmun (1751): The IBlackamoor Fushed White (17r6); and The Trovelers in Suritzerfend (IT93). He was an intimate friend of Garrick. 1). in London, Feb. 1, 18:4.

Hulley, Josept : Colonial Govemor ; son of Thomas Dudley, Anputy (iovernor of Massachusetts: b. in Roslury, Muss., July 2:3, 164T. The was apminterl chief justice of Massachusctts in 168f, chief justice of New York in 16m, and was fovernor of his native province from 1.02 to 1715. D. in Roxbury, Apr. : 1720 .

Dudloy. Pail, F. R. S. : lawyer; son of Joseph Dudley; 1. Sept. $\%$, 16 io ; graduatel at Harvard 1690 . anm studied law at the Pemple in Lombon. Ile was distinguished for ehopucuee and taknts: hecame attorney-general of Massachusetts in 1502, and chinf justice in 3 fis : fombled the Ihalloian Ieetureship at Ilarvarl College. I), in Roxbury, Jan. 2.), 1751.

Dulley, Thomas: Colonial Governor: b. at Northampton, England, in 15:6: served in Holland in Queen Elizabeth's army, and in 1630 went to Boston as deputy Governor of Massachusett: Bay under his son-in-law, Governor Bradstreet. He held the office twelre vears. He was Governor of the colony in 1634. 1640. 164.5, and 1650, and became major-general in 1644. 1). July 31, 1693, at hoxbury, where he left an estate long held by bis descendants.
Dudley. Thomas Underwood: bishop: h. in Richmond, Va., Nept. 20, 153: : graduated at the L"niversity of Virginia; served in the southern army during the civil war; studied theology after the close of the war: and was ordained deacon in the Protestant Episcopal Church in 186\%. He lecame rector of ('hrist charch. in Baltimore, in 1869: was chosen assistant Bishop of Kentucky in 1874, and in 1884 became lishop of the diocese.
Dnel [Fr. duel: Ital. duello, hasetl upon duellum, the Old Lat. form of bellum. which was adoptel into Romance on the pedantic but mistaken presumption that the word implied a contest hetween two (duo): the word mar be connectel with Gr. $\delta \alpha$ Fis. battle. $\delta \dot{\eta} F$ tos, hostile, or with Sanskr. duis- hate]: originally a trial by batte resorted to by two individuals, either for the purpose of determining the guilt or innocence of a person charged with a crime, or of deciding a disputed right: in more reeent times a hostile meeting between two persons in conseruence of an affront given by one to the other, and for the purpose of affording satisfaction to the injured party:
The practice of fighting duels as a means of deciding private differences seens to have originated, at a comparatively recent date, with the feulal system. The appeal to arms is an alternative to the trial by ordeal was placed under definite regulations by a cole promulgated by Philippe le Bel, of France, in 1306. "This same monarch, however, discouraged private duels.
In England. dneling does not appear to have prevailed until the latter part of the reign of Queen Elizabeth. At this period appeared the famous Treatise of Honor. by Vincentio saviolo, a fierce and punctilious Italian. Ife was a fencing-master by protession. His work, published in 1.94 -now little known-apruars to have been adopted as a standard book of reference in cases of supposed insult. saviolo resolves all charrels into the lie---that is, he supposes the original insult to be followed by a regular series of replies and retorts, until one of the parties is reduced to give the lie direct; which. like the phrase "stupil youth" in some German universities, was immediately followed by the appeal to arms.
Henry 11. of France issmed an edict in 1504 prohbiting the publie or judicial combat. This deeree was eaused by the death of his favorite La Chataigneraye from wonds received in the lists. The public duel survived longer in Itale. Its abolition in France was not followed by the good effects which the statesmen of those days probably anticipated from it. Private duels, condueted with a sangninary spirit before unheard of, became very prevalent. Brantôme gives instances of duelists who prided themselves on advantages which they had taken of their opponents, and were not less esteemed in socicty for having done so: there were said to be regiments in the same serviee the officers of which were bound to fight one another whencrer they met. Lord Herbert of Cherbury mentions the honor in which the French ladies beld the brave Balagny, a man with neither wit, figure, nor fortune, but whose merit consisted in the fact that he had killed eight or mine of his friends in single combat.
In the reign of Henry 111. the enstom of the seconds taking part in the gnarrels of their principals seems first to have been estahtished-a custom which did not cease till the beginning of the eighteenth eentury. When sueh practiees were rife in all parts of Franee we can seareely doubt the extraordinary assertions of writers of those times-that 120 gentlemen were killed in duels in a single province in six months: that in the reign of lleury IV. 4.000 fell in tro years; and that this mania cost France more gentle hlowd than thirty years of civil war. Henry 1 Y . issned edicts against dueling; Louis X111. procerted against it with such severity that it is said wounderl duelists were dragged from the fiell to the gibhet: lat this extreme severity, as ustal in such cases, appears to have had no good effect. In the minority of Lonis XIV. the bake de Nemours, a prince of the blool, fell, with two of his seconds. in a quarrel with another grandee. Soon after this many noblemen and gen-

Hemen of undoubted conruge made a voluntary comparet to abstain from ducliug．This resolution was secomed by Lonis XIV．when of age，in several ediets．It shonh he rememberel to the henor of that monareh that he lathored during his whole life to（o）rece this abuse and wh consid－ erable sueves．One of his expedients was the establishment of a court of chavary，the Harehamsié or Cometablie．the members of which were the marshats of liranee，which was to decide on all questions in which a gentleman might com－ ceive his lumer to be involved．French dued are generally
 surely，were those of Gambeta and Fourtom，who in $1 \times$ is fought on a foges morning at adistance ot forly paces，and
 gencral＂spittol＂himself on the rapior of the retireal attor－ ner．Killine in chels in lramee is now punishatle as homi－ ciole，and a civil antion lies on betalf of the frimats of the math who has heen slain．

The fist attemp made in（ireat lbritain to int rodnere legis－ lative enactments for the suppession of duels is satif to have taken flace in 1713，when，after the duel of the buke of Itmilton with Lord Nohm，a hill for that purpuse was brought into the fommons，hut lost on the third reading． A－hallenge to tight is now a high mistememor．In scon－ Jand as hate，it would appear，as fhe midule of the sixtemth century，liennses lor durtines were sponted by the crown． and forment a source of revenue：killing in at duel without license was murder．la（ierman hols are gunishable with imprisomment in at fortess，yet in 5 sis an ohlow was ex－ fellend from the army for refusing to challenge one who had insilted him！In no country were duts more prevalent formerly than in Ireband．In france the prerion of the re－ stored momarehy（ $1 \mathbf{- 1 5}-1 \mathbf{N}$ ）whe one of those in which duels were most rife，not only amone the military．the immog civilams：but since fst they have greatly diminished．In freat britain a hesty bow was atmeal it ducluse in the army by anew artiche（the ！sth）inserted in the articles of war of isth．rendering it an offense punishalle hy ceasher－ ing．Dhele are comparatively rare in Belgium，athongh the soil of that country is fremuently chosen for the encoun－ ters betwen wenthemen from whacent states．

The first duel in North Imerica is sath to hatye ocemed at Plymonth．Mass．，in 1621．The most famous duel in the U．S．Was that betwern Aaton burr and Vlexander llamit－ ton，in 180h，in which the latter last his lite．Other notable duels were those between Henry（＇lay and John limulnhth．
 son，in whieh the latter was killed：and bet wern Thomas 11. Benton and haens，the latter being killed．In the［．．s．by commen law the surviver and the seconds are gnilty of mur－ der when one of the perties is killed．It is，moreover，not only made illegal hy statute．but is formiden in the army and may by the articles of war．Notwithstanting all the efforts mate to suppres dueling，it is noteworthy that the custom is still puralent in some form，more or lesis serions， in all but the Finglish－iveaking conntries．
The weatmes unally emploged in dueds are the pistol and the sword or rapier．＂In semedinavian combers what was known ats the＂girdle duel＂was formerly practicem，in which the two combatants were stripperl，tieil toge her liy a girsle，amd a knife given to each．＇They then fonght unti］ othe or both sincembed．This sluel is the subject of the famons statue on the quay at stockhom．In l＇ibet it is reported that the two adversaries throw a white pisece of metal and a black piece of metal into a caldron of heiling water，plunge their hathls simultaneously at at given signat into the water，and the one who sucereds in sembines the white piece vindisates his honor．In Cermany in what is curiundy mough called the＂A meriean duel，＂the two farties draw lots．and the macky one is boumd to die by his own

 then in lonfast; was one of the foumders of the vintion, which become the orcan of the Young lrehand party. and at first \%cabous? supported wommell ; was tried and con-
victed of sedition along with OCommell, but the House of Lords quashed the eonviction on appeal. He was again tried with the leaders of the Young lreland party in 1848 for treasnn-felony, but was aequitted. 1le was eleeted to larliament from New lioss 1852 , but resigned 1856 and emigrated to Australia, where he filled a number of important offices in Victoria, becoming Prime Dlinister of the colony 18il. Ile is the anthor of The Bullad Poptry of Irelamil: Jonng Ireland: a Fragment of Irish History, 1840-50 (1880) ; and Four Yeurs of Trish Mistory, 1845-49 (188.3).
F. M. Colby.

Dufour'. dü'foor', Giotlayme IIexri: general: b. at Constance, Barlen. sept. $15.178 \%$; entered the French arny in 1809, and rose to the rank of captain in the Ilundred Diays, but retirel from the French service after the battle of Waterloo and resumed his swiss eitizenship. In $184 \%$ he Wis chosen commander-in-chief of the tederal ammy raised to chefend the integrity of the republic anainst the Roman Catholic Sonderbund. He quickly quelled the rebellion. In twot he was presillent of the frenera convention. Among lis works are De la fortitication permanente (On Permanent Fortification. (reneva and Paris, 1894) and Cours de T'uctique (Hannal of 'Tactics. lst0). Il. in Geneva, July 14, 1870.

Dnganne. dü gathn'. Avevstixe losern llacker: poet and novelist: b. in Boston. Mass.. in 1803: published a volume of prems (1850) and a prose work entitled a Class-book of (invermments und Civil Society ( 1859 ). Among his poems are The From Harp (184\%) and The Mission of Intellect (185\%). D. in New Jork. Oct. $20,1884$.
1)ugdale. Sir William : antiquary: b. near Coleshill, Warwickshire. England. Sept. 12, 1605̈: apluinted blanch-lion pursuivant-extraorlinary in 163s; ronge-croix pursuivant-inordinary in 1640 ; beeame Chester herald in 1644 : was a rovalist in the civil war ; hecame Norroy king of arms in 1660 , after the restoration of Charles 11., and Garter king of arnas in 16\%\%. Duglale and Doblswortl published an important work on English monasteries entitled Monusticon Anglicunum (3 vols., 165.5-73). Among his other works are Antiqnities of Haruichshire (1656), which is highly esteemed, and Origimes Juridicintes (1666). I). Feb. 10. 1686. See Life and Diur! of sior 11 . Thuglale (edited by Hamper, 1827).

Dngliet. diiigä', Gaspard (known in france by the name of (isspard Putwin): landscapepainter: lo. in Rome, 1613. IIe stulied with his brother-in-law. Nieholas Poussin, up to the age of eighteen. Ile then worked mmler Clamde Lorrain. After this, his reputation being made, he worked for the Princes Porghese and Panfili, and the Constable Colonna and even Thernini employed him to decorate rooms. Hle was a popular landscape-painter ; his works are to be found in almost every gallery in ltaly. Many of his pictures have been engraved in Eingland. D. in Rome, 16ã. W. J. S.

Intsonse [a worl of Malay origin] : a marine animal of the genus Inalicore, belonging to the Sirenia. The dugoug of the Australian seas (INulicore australis) is generally about

8 fect long. The upper lip is thick and fleshy, and forms a kind of suont ; the upper jaw bends downward almost at a right angle; the eyes are very small, with a nictitating membrane ; the skin thiek and smonth. In its intermal structure it has considerable resmblance to the pacloyderms, and it fords chielly on algar. It is also remarkable for the ventricles of the hart boing entirely detached from each other. lts flesh is said to resemble heef. and is prized as footl. The oil is recommemled as a substitute for robl-liver oil, and there is a regnar tishery for the lugong in Moreton lay. The species inhabiting the Indian Ocean is Incheore dugong. that fonnd in the Rad sia has been called IIalicore fabernaruli, from a belief that the skin of the animal was used by the Jews to eover the tabernado.

Bonlap. Wildias: painter and writer: bo at Perth Ainboy, N. J., Feb, 19, 1766. Among his paintings are (hrist Rejected ( 1821 ) and Culuary ( 1885 ). He was me of the earliest dramatie writers in the $\mathrm{C}^{4}$.s., and from 199 s to 18 sh was manaser of the l'ark sitreet theater in New York. Among his plays ate The Futher: a comedy, acted in 1ien, ant Leicester (1994), the first American tragely regularly produeed. Among his other works are Life of 'harles Brockden Brown (1*20): Mistory of the Rise and Irrogress of the Arts of lesign in the L'nited Stutes (1584): and a History of the American Theater ( 1830 ). J). in New York, sept. 28 , $18: 3$. Revised by H. A. Beers.
Dunlin, called also Sca suipe and Oxbird: a sandpiper (Tringa alpinu) fomm in most prarts of Europe, and oceurring as a strageler in (iremland. It is about 8 inches long. and is of a black, rufons, and gray color on the back, and black and white beneath. A distinct geographical race, or

The dualin.
sub-speeies (Tringa alpina pacifica), inhabits North Ameriea, breeding in the northern portions and migrating sonthward in winter. Domlins are nimble-limbed birds, always on the move, kepping elose to the water's enge, runaing along the sands, peeking tagerly at mollusks and worms. hevised by F. A. Licas.
Dnnmora: horongh; Laekawanna co.. Pa. (for location of conty, see map of Pennsylvania, ref. B-L) ; situated on the Eric and Wyming Valley Railtoad. 2 miles N. E. of scramton. It derives its prosperity chiefly from coal-mining. Pop. (1880) 5,151; (1890) 8,35.
Dnu'net IInad: a rocky peninsula of Caithmess. Seotland, 100 to tiol leet high; the most northern joint of Great Britain. Ilere is a lighthouse 340 feet above the sea.
Dnnuvillu: a town and port of entry of Nonck co., Ontario. Canada: on the Grand river; 43 miles ly rail W . of Buffalo and 40 miles s. of Hanilton (see map of Ontario, ref. $5-$ - ). It has several mills, a foundry, and a considerable lumber and grain trade. Pops $1,80 \mathrm{~s}$.
Dunois, lĭi nwă', dean, known as the "Pastard of Orleans": soletier of the Ilesured Years' War (q. u.); b. in P'aris, Noy. $2 \%, 1402$; the natural son of the Duke of Orleans, hrother of Charles V'. As the deliverer of France from the English he stands forth as the most prominent French warrior of the fifteenth century. His first important aehievement was the dolfat of the English at Montargis in 142\%. In the following year he ocenpied Orleans, which he held against the binglish till Joan of Are eame to his relief, and to) Dunois as well as to the Maid letongs the honor of the vietory at that pace in 1499. He was again victorions with her at I'atay, and thongh checkel for a time by her eapture and death, he renewed the war with all his former vigor aml suress, capturing Chartes, forcing bolford to rase the siege of hatny, aml driving the kinglish out of all lirench territury except Normanly and (iniome. 'lhese provinces were attacked 144-51; iwo monthe suflieed for him to swerp the English from the former, and by 14.55 Chais was the sole reminter of foreign domination. As a reward for his services Mmois was legitmated by Charles VII., who gave him the tithe of 性mbler of his comntry and the office of granl chambrian. His revolt muter louis $\mathbf{X l}$. Cansed the lons of his dignities, hat they were restored to him under
the treaty of Conflans ( 140.5 ), and he was named president of the council for the reform of the state. 1). Nov. ©l. 1468.
F. M. Colby.

Mmraven, Windham Thomas Whmoham Quen, Fourth Earl of: h. at Alare Abley, Feb. 12, 1841 ; ellucated at ('hrist Chumeh, Oxford; entered the First life Guards 1865̈; was war correspondent for the Daily Telegraph in Abyssinia 106\%, and again in the Franco-ferman war: snceeded to the title 18il: Under Secretary for the Colonies in Lord Salisburys two administrations, but resigned Feb., 1887.

Duns, John, 1). I), F. R. S. E.: minister of the Free Chureh of Scotlant ; b. in Duns, Berwickshire, in 1820 ; educated at the University of Eilinburgh. Atter some work in the pastorate he was, in 186t, appointed to the chair of Natural science in New College, Eidinburgh. IIe has published Biblical Nutural Science: Science and Christian Thought; Life of Sir James Simpson; Life of I'rofessor Fteming; Life of the Rec. Situmel IIartin; Creution according to Fienesis and the Confession of Faith: and a very large number of papers read before the Royal Soeiety of Edinhurgh, the Royal Physieal toeiety, the Society of Antiquaries of Scotland, and the Victoria Institute. IIe is a contrilutor to the Jorth British Review. of which he was for four years the editor; was lhind lecturer in Arehwology 1890; und is a member of several American scientific societies.

Willis J. Pefecher.
Dums Scotus. Joanves: sumamed The Suble Doctor: theologian and scholastic philosopher, about whose life nothing is really known. The following statements are traditional. He was born about 1965 ; is elaimed as their (\%untryman by the Scots, the English, and the Irish. He was of gentle blood, studied at Oxford, became a Franciscan friar, am? in 1301 Professor of Theology at that place. In 1304 he removed to Paris, where he taught theology with great distinction. He wrote many works on theology and metafhysies, and was a realist in philosophy. Aie athirmed, against Thomas Aquinas, that the existence and nature of Goid can not be proved by reason, but is known only through revelation; that the will is absolutely free; and that the faculties of the soul are not subjectively distinct from ach other, but are constant modes of action of a unit of existence. In theology he favored the doctrine of the immaculate conception of the Virgin Mary. He was the founder of a school callerl Scotists, who maintained for several centuries a controversy with the Thomists (i. e. the diseiples of Aquinas). 1). at Cologne, Noy. 8. 1308. 1 is works, with a life, were etited by lalke Wradding ( 12 vels. fol., Lyons, 16:3). See Scholasticisy.
1)unstan, Sant : an English prelate; b. at Glastonhury in 925 A. D. He was a man of extraordinary abilities, and gained renown by his ascetic piety. Of gentle birth and dauntless courage, he aequired the favor of Edrel, who began to reign in 946 A . De, and he took a prominent part in the govermment during his reign. He was buished by Edwy in 955 , but ohtained the chicf power under Edgar, who lrecame king in 959 and appointed Dhnstan A rehbishop of C'anterbury. Dunstan enriched and exalted the monks, in learning, religion, and morals, and deprived the married clergy of their class privileges. On the accession of Ethelred in $9 \sim 8$ his political power was lost, but he kept the arehbishopric. D. in (anterbury, May 19. 988. See Memorials of St. Dunstun, ed. W. Stubibs (in the Rolls series).

Revised hy Sanuel Macalley Jachson.
Dunster. Hesty : the first president of Harvarl College; b. in Lancashire, England ; educated at Magdalen College, (ambridge (B. A. 1630). To escape mersecution he emigrated to New Fingland in 1640, and entered upon his presidency Aug. 27 of that year. In 1654 he was compelled to resign, in consequence of having borne public testimony against the baption of infants, for which offense he was afterwart tried by a jury and plaeed under bonds. Still later, he was again presented by the grand jury for neglect to have one of his ehihdren haptized. Ite removen to sicituate, Mass., and preached thare until his death. Ife was esteemeal for losrning and piety. He assisted in the preparation of the Tene England I'sutm-homb (1640). He sectured the charter of 1650 and, it is surposed, ohtamed that of 1642 . I) at Sicituate, I'eb. 2T, 16.59. Stu his Life by J. ('hap)lin (Bonton, 1872).

Hunton, Jons: eccentric English writer and Dissenter; b. at (iratham, May 4, 16:9. He opened a bookstore in Lomdon about 1685, but failed in business. Ile puhlished The

 the midille from Es，to W．，giving ont many ymos on cach
side. The conntry is wodl wateral and fertile, senerally frairie lanl, though there are some woods near the rivers Negro and Yi. Stoel-raising is almost the only industry. some of the largest and finest stock-firms of Cruguay are sitnated here, and in connection with them are extensive meat-drying extahlislments and some tameries and soapfactories. Capital, Durazmo, on the river Yi, comnected with Montevideo by railway, am having aboat 2,000 inhabitants. Pop, of department, 26,000 . IJerbert JI. Smiti.
Durazzo, doo-raat'sō ('Turkish Dreseh; ane. Epidamums, afterwarl $D$ yrrhuchium) : a fortified maritime town of European Turkey; in Albania ; on the Adriatic; lat. $41^{\circ} 18$ N., lon. 1928 E. (see map of Turkey, ref. 3-15). It is the seat of a Roman C:atholie arehbishopric. It has a safe harthor and an active trade in grain, tobacen, and olive oil. The ancient Epidammes was a pupulous city. The expulsion of its aristecroey in 436 B . c . Was the origin of the leloponnesian war. It was captured by the Noman chief Robert Guiscard in 10s? amd by the Venetians in 120. Pop. $5,000$.

Durban, dŭr-hăn' (formerly written $D^{\prime}$ Ciben, in honor of Sir Benjamin D'trban, once governor of the Cape): the principal commercial town and only port of the British colony of Natal, south Afriea; on the north side of the bay of Port Natal; in lat. $99^{\circ} 53$ S., long $31 \geqslant$ E. (see map of Africa, ref, !-(G). It is on a saml flat, but is well laid out with wide, shaded streets. It wis founded in 1834 as the capital of the republican colony of Victoria. Pop. (1866) 4.991 ; ( $1 \times 91$ ) $25.51 \geqslant$. M. II. 11.

Jir'lif. Johy Price, D. D. : Nethodist preacher ; b. in Bourbon co.. Ky.. in 1800): eftucated at Miami University and Cincinnati Colloge; entered the ministry in 1819. Ile was president of Ihekinson College, Carlisle, Pa, from 1834 till 184.). llaving visitel Larope and the Levant, he published Observatimes in Europw, printimally in France and Great Britain ( 2 vels., New York, 1s44) and Observations in Egypt. Palestine, ete. (2 vols., 184.). For many years he was missionary-secretary of the Methodist Episcopal Chureh (1450-r?), displayed great administrative ability in its affairs. and gained a high reputation for eloquence. Hie contributed largely in periodicals, etc. 1). in New Sork eity. Oct. 17, 18.6. Sue his Life by J. A. Roche (New Tork, 1879).

Dii'ren, or Mark Diiren (ane, Murcodurum) : a town of Rhenish Prussia; on the river Roer and on the Cologne and Aix-la-Chapelle Railway; 18 miles E. of Aix-la-Chapelle (see map of German Empire, ref. 5-()). It has a Roman Catholic gymnasium, a high school, a female high school, an asclum for the blind, several fine churches, and manufactures of woolen choth, carpets, cotion goods, ete. It was besieged and taken by Charles V . in 1543. Charlemagne held diets here in Thand To9 A. b. Pop. (1890) $21,602$.

Dii'rer, Albrecht : painter and engraver: b, at Nuremberg. Germany, in 1471; son of a goldsmith. The day of his birth is uncertain, owing to the way in which it is insarted in his father's liare, but it was probably May 21. He Was a pupil of Nichael Wohlgemntl, with whom he stndied and worked three years (1486-89). He afterward passed four years in travel, visiting various parts of Germany, and returned to Nuremberg in 1494. He visited Venice in 1505 , suld while there painted a pieture for the Tedeschi, or guild of German merchants, which was probably The Ferast of the Inase Gurlunds, now in the monastery of Strahow at Prague. This was his first picture of importince. In 1520 he went to the Netherlands, accompunied by his wife, and during his journey, the ,hject of which is not known, he kept it minute diary, which was first published in Yom Murr's dournal zur homsigesphichte (175-88). This curious and interesting recond of early travel has heen several times translated into Finglish, bibrer returnerl home in fial, and continued to live in his native town mutil his death, Apr. 6 , 1528. Dürers works consist of pantings in oil anel ongravings on wond am! coppre. Ifo has also left a number of etchings: and owir $\mathbf{5 0 0}$ of his dratwings in pen ant ink, water-color, clalk, charcoal, india-ink, aml with the silver point, exist in public and privat colledions. These drawings and sketcluss are remarkable for their precisinn, delicacy, and firmanes of tomeh, ame fur the fower of observation and pationt study they reveal in the masher. The finest collee ions are in the british Musem, the Allertina Gallery at Vienna, and the U'lizi at jolorener. His most colebrated painlings are The Four Apmotles, micrinally presented by him to the city of Nuremberg, but now in Nunifl
his own portrait in the Pinakothek at Munich, painted in 1500, and another-an earlier one-in the Utlizi Gallery at Florence, and an Adoration of the Magi, a most beautiful pieture, well worthy of the place it oceupies in the tribune. Uis best wooil-cuts are the four series, The Apocalypse, The (ireat Pussion, The Little Pussion, aud The Life of the T'irgin, but there are many fine single ents. Dürer is not believed to have engraven all the wood-ents that bear his monogram, but only to hate made the designs. Perhaps the works by which Dürer is most widely known are his engravings on copper. Of these the most famons are the Adam and Eite, the Melencholiu, the Knight, Death, and the Decil, the Suint Eustache. Stint Jerome in his Study, and The Great Fortune. These are all large, but many among the smaller engratyings are eftual miracles of execution. Dïrer was much beloved by the Emperor Maximilian I . and by many of the most distinguished men of his time-ly Lather, by Melanchthon, by Erasmus, as well as Camerarius and lirkheimer. When in Teniee he received much kindness from Ihellini, and Raphapl and he exchanged suecimens of their work. Dürer has luft us valuable portraits of Mlelanchthon. Erasmus. Pirkheimer, and many other notahles of his time. He was the author of several treatises-Instruction in the Arl of Mensuration with the Fule and (Compass (1ins): The A1t of Fortification (1.52T); with one on The Praportions of the Ihuman Boaly ( $\mathbf{5}$ (5s). A work on the Proportions of the Ilorse is lost, as is also one on The Art of Fencing, with perhaps some others whose names are not known. The most important works on Dürer are J. Heller, Dus Leben und die 11 rothe A. Dïrers (182\%-31)-only the second volume of this valuable work ever appeared; his Life by Thausing (Leipzig, 1876; Eng. trans. $188 \%$ ), and by Mrs. (harles lleaton (Lonton, 186in), with the Albert Därer, ses Dessins, by ('harles Ephrussi (Paris, 1882). An English translation of lis writings is published by the Clarendon Press. Ilis engravings on metal have been reproduced by Amand-burand, of Paris, and his wood-cuts of his Apocalypse and Life of the lirgin by Van de Weiger, of Utrecht. A photo-lithographic repruduction of The Little Persion was issued by J. W. Bonton in 1868 , and copies of his coplyer-plates by J. R. Ospoot, of Boston, in $18 \pi^{2}$.

Clarence Cook.
Du'ress [O. Fr. durece: Ital. durezza: Span. dureza < Lat, duri liu, hardness, deriv, of durus, hard]: in liw, restraint of the person or of goods. 1. Of the Ierson.-This is exereised in two modes, cither by threats or by imprisonment. Duress by threats (per monts), aceording to the older authorities, oceurred where a jerson entered into a contract or performed some other act through fear of loss of life or limbs, or griesous bodily harm. It was even an excuse for some crimes, hut not for those of the graver class, such as the killing of an innocent person. The modern eases do not take quite so technical a view of the suliject, and the tendency is to make the presence of duress tum on positive inguiry whether the threat was of a kind calculated to orercome the witl of a person of ordinary firmness and prudence. In equity jurisprudence the word is used in a broader sense than in the courts of common law, and includes cases where a party is in extreme necessity and distress; and duress may be exercised not only towarl the person who makes a contract, but in certain cases toward one standing in confidential relations with him. Thus a threat to prosecute criminally a son, wherehy a father is induced to excente a deed in order to save him from arrest. is sutlicient duress in eqnity to furnish a hasis to set the conseyance aside. A contract execonted moder duress is not void, but only voidable at the clection of the injureal party. Duress of imprisomment can be allirmed only of the case of unlawful restrinint.
2. Duress of Gomls.-This phrase refers to a ease where a person having gooms illegally detained bus money io whain their release. If such priyment is made under protest, the money may he recuserel is being paid under compalsion. An instance is an exaction of umathorized duties upon goouls by the collector of a port. The mode of making the protest in this special case is regulated in the U. S. by at of congress.

The guestion has been ratised whetler the doetrine of duress can be applied in international law to relieve a nation from the onligutions of a treaty of peace. The answer must in gemmal te in the negrative, as the terms of petare. howerer hamiliating, are the chances of war to which the parties have appeald.

Dis'seldorl' (i. e. Ditissel-Town) : town of Rhenish Prussia: the former capital of the dachy of Berg: finely situated on the right bank of the khine, at the month of the river loüssel: 1 \% miles N. N. W. of Colngne: lat. $51^{*} 13{ }^{\prime} \mathrm{N}$. lon. 645 E. (see map of German Empire, rel. 4-C). It is cunnected by railwars with Cologne, Elberfeld, and other towns. The khine is here crosed by a britge of boats. Dïsseldorf is mostly huilt of briek, and has wiele and regular strects. It has several fine churches, a fine public garden called the IIofgarten, a celebrated academy of art (see below), an olel clectoral palace, a gymnasium, a Realschnle, a townhall. a public library, a theater, an observatory, and mannfaetures of woolen and cotton fithrics, jewehry, hats, leather, carpets ete. Its prosperity is derived partly trom trade and the navigation of the lihine; it became a free port in $1 * 29$. Рор) ( 184.5 ) $175,985$.
The Düsseldori leademy, founded in 176 ar brince Chatles Theodore, leil a languishing life until, under the patronage of Frederick William 111., Cornelius was appointet director, which position he continned to fill until his removal to Munich in 18.6. A man of such ability and force naturally quickened the growth of art, and the acmlemy soon hecame the center of a new life. On the departure of Cornelius, William von Schadow was made rirector, and his great skill as a teacher, added to his proficiency in his art. Encreased the reputation of the acatemy as a school, and drew to it more and wore of the rising, undeveloped talent of fonng Germany. The names that make this perioll in the history of German art, in the eyes of Germans at least, a morlern Renaissince-Koch, Overbeck, Veit, Schnorr, Von Schwind-are most witely known by the freseoes with which they adomed so many palaees, vilias, churches, and pablic buildings in Rome, Munich, and Berlin; but the artists of the Ditsseldorf school have spread the name of their alma mater far and wille by means of their easel pictures. Their chief influence ontside of Germany has been in the U.S., where many of their best works have been exhibited and solid. Several artists who were trained in Düsseldorf and returned to the $\mathbb{T}$. S. To live aided in sureading the doctrines of the school through their own productions. In 1853 an exhibition of Düsseldorf pictures, belonging to Mr. Boker, was opened in the city of New York, and long continued one of the principal attractions of the town.
The school at Düsseldorf was early divited into two marties-the loman Catholic and the l'rotestant, the former seeking to restore the ancient exclusive devotion of art, as in the Old Cologne school, to religious, chiefly Roman (atholic, subjects: the other, of which Lessing was the acknowledged head, refusing to be shut up in such narrow linits, and painting all subjects-landseape, genre, historiral, and religions-having, however, a strong leaning to the Protestant side. The harm the Dinsseldorf schemb has done is not perhaps greater than has been done by the schools of berlin and Munich. It inculcates the fatal doctrimes that art ean be tuught sutliciently by an academic process, and that its ministry is that of a preacher of doctrines or a narrator of anecdotes, religious, historical, domestic. It confounds ant with science and dissects where it ought to create. Liut in their own narmow, pelantic field here were mon of sense, talent, leamine inclustry-everything hut genius: the mon of qunius in fiermany, as everywhere, have grown up and worked outside of ati schook-ind they have hat the reward that always awaits the rommonplace and the practical. They have hern extremely popular. they have stimulated a great number of kindred minds, and they have more than supplied the demand for works of art that everybody can understand.

Dust: particles of matter so fine that they may be raised and wafted by the wind. The recent liscoveries of seience have shown that dust plays an important part in the spreating of infections diseases, and in the occurrence of many cosmie, metrorological, physical. and geological phenomena. In meteorology it is important for the fine colored effects it produces in the sky. These were well illustrated in the brilllant twilights, green sun, bishop's ring, and other phenomena which followed the Krakatoa eruption in Aug., 1883. These phenomena are the to the diffractive effects of minute bodies. A study of the phenomena showed that the minntest particles, which were thrown the highest, traveled on a high west-bound current of air whose existence had hardly been suspected before. They also showed that these extremely minute particles fell through the air with such slowness that they were inonths, possibly years, in rlescending.
The relation of dust to the condensation of moisture in the air has been expecially studied by a sootch physicist $^{\text {the }}$ namerl Aitken. He belioves that he has shown thit the moisture in the air condenses to form the particles of fog, rain, and snow, only where there are particles of dust prescut to form a mucleus. His themry is that moisture condenses with difficulty unless there is a free surface or particle of matter for it to condense upon as a nuelens, and that the particles of dew, fog, rain, snow, and hail are formed by condensation upon the dust on the surface of the earth or particles of solid matter suspended in the atmosplere, as the case may be. This theory is not yet universally accepted, thongh all competent juiges adinit that condensation is eacier on free surfaces.

The dusts at the earth's surface consist of comminuted earth and rock. particles of fibers and riagments of vegetable tissue, smoke and to a greater or less degree of living organisms and spores. The last play an important part in disease, the nature and extent of which we are just beginning to umlerstand.

Many of the showers noted as extraordinary, such as showers of sulphur, bluok, cte.. are due to dusts of varions sorts which mingle with the rain.

The electric reactions of dust are also remarkible. A piece of rosin rubbet will attract or repel dust, and it is said that the fumes proluced in some furms of mannfacturing can be expelled ly electric action. See Afterglows and Loess.

Cosmic Dust consists of the ashes of meteorites. The smaller meteors nsually undergo complete combustion in the air becanse of the lieat generated by their rapid motion. It is possible that some of the results or remains of combustion reach the earth's surface, Nortenskiold in 18.0 found on the inland ice of Greenland tear-shaped grains of magnetic iron with cobalt, whiel he attributes to a cosmic origin. There is a high degree of prohatility in this hypothesis, as volcanic dusts are not of this charater, and dusts of other origin are improbable on this ancient ice-sheet. He has since foumd dinst of similar character on Spitzbergen
 see Nurtenskiold, Joyage of the Tega (18*6).

Mark W. Marrington.

 unclerstoorl withont regratl to its connecetion with the lutch dialects. There are three quite distinet sats of dialcects fomme amone the dirmanice inhabitant: of the Sutherlands annl folginm, which extemel as far bath as our suntces guF゙risim, Saxon, and Framkish.
(1) frision was oriomally in enomrapheat area the chitef dialect. hat has gralually rotrograled belore the two wher diaterts. In the earliest times lirisian tribes oecoped the whole noth hand wost of the Sethertands. from the inonth of the Kims down beryond the mouth of the sehelde, viz, the provinces Groningen. Friestand. I) onthe Orar ljwel. Nowh Ilolland, sonth ITollamk, Zanland, and ( 1 . of the Iepije and Sthelde) Wast and West F"landers. But as eatrly as in the nintl centary we tim! part of this temitory ocempied by Frankish and saxon tialects. In the twelfth contury pure Frisian was confincel to Frieskand. the northern fart of North Iladaml, and the morthern jurt of Went blanders (along the seacoust and in the "Vrije van bangere"). A mixture of Frisian and sixon was then soken in droningent Wiestern l)renthe amd Westorn (wor ljssel, and in the southerast corncr of North Thollamh. A mixture of Frisian and Frankisla was found in the southern part of North Holland (the Xatdingeland of Geoiland), in somth Ilolland, Zoaland, and in the grouter part of Fiast anel Wiast Flamelers. it present l'risian is heard anly in the provisce of F'riesland (with the exception of the towns and a small arma of the conntry, where Dutch has rephaced it) ame on the ishands
 presurved in the Framkish dialect of the castern prat of North IIolland and in the siaxon dialeds of (ironinurem (espectally the " Wexterkwartier." where the dialed is half Frisian).
(2) Sidon formerly oecopied a much smaller area than Frisian, but has spread uver former Frisian territory. It Was it first confined to the southeast part of (iromingen and
 At present the Saxon dialect is fouma in almost the whole of the porinces (ironingen. Irenthe and "ver ljsel, amd in the conanty of Zutphen belonging to the prosinee of Geddertand: but a ditherence is still moticuable in the dialede of the oriminal saxon territory and that of those lewalities whirlh have adopted the saxon instead of theib former Frisian languag
(3) F'rentish hedd and still holds the remainder of the Fotherlands and of lbelgium. It had its midemal seat in himburar. Satwern, Sonth and Xorth Brabant. Vast and West Fibmaras (exopting tha pats of these provinees which
 land (rxerphing the commy of \%atphon). Jike saxon, it las expanded at the expense of Vrisian, Tisplaning the dia-
 whereotigimally Frisianamd later on amixture of Frisian and Frankish was bukern, viz., the provinees North ims sumth

 and Bedpinum may at present be sublividenl into (1) Nomth IIollamitish, (2) the dialeet of comath IIollamd, Itresht, and
 folemish. (i) Zaalandish, (i) Limhturyish. Sll of these helong to the law (ierman division of Frankish, while the l'ramkish dialects of (immany (save a small area nome the 1)ntch turritory) constitno Mtidille Frankish and the Ilish F'rankish. 'Tle diterence between the three divisions may Wriefly he indicated by stating latt Ihinh Framkish has gome Throngla the socond shifting of consmants, wherema Iow Frankish (like Iow finom) has not bean allected by the secoond shifting. ant Midelle Frankish takes an intermediate position between lligh and Low lirankioh.

Tef Literary Lavguage.-White in the development of the pupular dialects both Frankish and Saxon have gainect at the expense of Frisian, the written language manifests a listinct and early preponderance of the Frankish over the Saxon as well as the Frisian dialects. The later can seareeIy be saill to have ever been literary languages. Otlicia\} documents, laws, treaties, contrats, ileals were drawn up during the Mitdile Ages in Frisian and Saxon. Bnt even in this limited use of an oflicial language they were at first superseded by the Saxon of Northern Germany, ant in the seventeenth century by the written language of the Low Frankish tribes. Traces of the Frisian and Baxon dialects are still found in the vocabulary of Modern Duteh about to the same extent as traces of low German are found in Moderiu German. On the whole, these dialects have protably exerted less influence on Bodern Dutch than the written language of France and Germany. The appearance of the written language has in comse of time considerably changed. Its development may be divided into three periods (corresponding to the division of Low German into Ohd Lnw German, Middle Low German, and Modern Low German).
(1) Old Dutch (from the earliest times until about the end of the eleventh century). - It goes back to a time when the difference in spelling pronunciation and inflexion between Dutch and German was not quite so listinct as it became later on. The most noteworthy monument of Old Dutch or Old Low Frankish is an interlinear version of the l'salter, dating probably from the tenth century, but only preserved (in a very fraginentary condition) in eopies of the sixteenth and sevententh centuries. The language of the 〕salter represents, on the whole, an older form of Middle Dntch, although its dialect does not entirely coincide with what we may suppose to have been the original form of the latter.
(2) Midllle Dutch (from the twellth century until about about 15:0). - The difference between Middle Dutch and Old Dutch is especially moticeable in the inflexional endings, Where the various full vowels of the older language have given way to a monotonous $e$. Other changes have taken place in the stem-vowels, consonants, and inflexions. It is noteworthy that these changes sometimes agree with the changes which Low German and High German underwent at abont the same time (e. g. the $e$ of final syllables or $d$ instead of older th), while in other cases ther are peculiar to Dutch, or only shared by special German dialects (e. g. cht instead of olfer ft. or wif for older (d). The earliest anthor in Miflle Dutch that we know of is Meinrik ran Veldeke. who, in the latter half of the twelfth century, wrote his prems in the Limburgish dialect of Mastricht. As Limburg is near the German frontior and its dialect inclines toward Mirlle F'rankish. it is natural that Yeldeke's language differs to some extent from the general type of Widdle Dutch. It is not before the thirteenth century that this type took a definite and lasting form, which is especially represented by the works of the well-known Flemish author Jacoh vam liacrlant (183.5-1:300). The language foumi in the works of Maerlant and his followers is the one which is called "Dietsch." It is a literarr language of a distinct South Low Frankish character. It was based upon the diaject of Flanfers, lut almitted from the begiming words from the closely related dialects of Brabant, Limburg, Zealand. Later on it was subjected to the influence of German, French, and the Northern Low Frankish dialects. Still its character remained ahout the same until 1450, when a period of transition to Modern I Mutch ensued.
(3) Holurn butch (from abont 1550 to the present time). - Modern Dutch ditfers less from Middle Dutch than e. g. Molern German from Middle lligh German. Its relation to Midule luteh finds rather a more exact parallel in that of Modern (ierman to Luther"s language. At least in spelfing, phonetics, and intlexion the difference is not greater than that between Modern German and Early Modern German. Nore consideralle are the changes which the voeabuIary has umfergone. The reason for this is that while there is a break betwern the literary tradition in Nimme lligh German and Molem German, in that the Jiterary Janguage in Xoulern (iermans started with a dialect different from that upon which the Jiterary language in Mildle High German was basel, Nidfle Dutcla and Nodern butch may he saitit to represent one and the sanse dialech. The Jiterary language which originated in the sonthern provinces was gradually adoptel liy the writers of the northern provinces after these had been drawn into the literare movement and hat become interested in literary eulture. It is from the middle of the
sixteenth century that in the literary language the supremacy of the southern provinees declines, the influence of the northern provinces gradually becoming predominant. This change coincides with the opposition of many anthors (southern as well as northern) to the great number of foreign. chietly French, words whish had been introduced into the Mildle Dutch Janguage especially during the period of tramsition (with the government of the Dukes of Burgundy), and with a general attempt at purifying the language and revising its spelling, rocabulary, and syntax. The shifting of the center of literature from the south to the north was also aided by the separation of the southern from the northern provinces after the conquest of Antwerp by Parma in 1585. While during the sixteenth century Frisian and Saxon were still used-besides Low Frankish-in official documents, in the course of the seventeently century the latter ohtained the supremacy over the whole of Northern Hollanl. Another noteworthy fact in the history of the Dutch language of the seventeenth century is the publication, under the authorization of the States-General, of the so-called Statenbijbel, i. e. the translation of the Bible begun in 1619 and finsishet in 163\%. This translation has contributed much to settling the spelling and infiexion of the literary language, and to strengthening its position. On the whole, the history of Modern Dutch is remarkably similar to that of Modern German. In the sixteenth century the literary language predominant, but stif] struggling with dialects which attempt to gain Jiterarr influence: at the end of the sixteenth century, and especially during the seventeeniln, the formation of learned societies whose members are interested on the one hand in poetry and literary production, on the other hand in grammar. spelling reform, and in purifying the literary language: in the eighteenth. systematic and often arbitrary and hair-splitting rules, dictated by grammatical authorities for so-called logical and practical reasons. but without any knowledge of historical grammar: in recent times (from about the middle of this century), a steady emancipation of the language from the fetters which are due to the narrowness of former grammarians and the application of the results of modern historical grammar. The comparison may be carried up to the most recent times. when in the Netherlands as well as in Germany a new spelling has been introduced. In the Netherlands the spelling reform is especially connected with the names of L. A. te Winkel (1. 1468) and M. de Vries, the two chicf editors of the great Woordenboek der Tederfandsche Taal, who proposef the present orthography in 1863 (or in its final form in 186.). Their proposats met with general approval on the part of the public, and were adopted by the Belgian Govermment as early as 1864, and finally by the Dutch Govertment in 1883.

Literary leferences.-(a) General.-For the etymology and history of the terms Dutch. Deulsch, etc., comp, J. Grimm, Deutsche Gramm.. i., 30 ed. (1840). Pp. 10-20; Er, curs über Germanisch und Deutsch: and E. Verwijs in Taalk, Bijdr.. i. (18iT), pp. 217-232. For a general introduetion to the Dutch Janguage, see J. B. Vinckers and J. 11. Galle. art. Molland:-Language in the 9th erl. of the Encyclopipdia Britamica: Jan te Winkel, Gesshichte der Niederländ. sprache in Paul's Grundriss der germen. Philologie, i. (189) , pp. $634-722$. Important essars on varions matters ennnected with the Dutch language and its history are contained in several Dutch perimicals, especially De Toulyids (U'trecht. 1859-6̃): De Taal en Letterbode (ITaarlem, $1870-$ 66): Taalkundige Bijdragen (Haarlem. 1877-79) : Noord en Zuid (Knlenborg, since 18i6); and Tijdshrift voor Neder. Tanl en Lefterkunde (Leyden, since 1881).
(b) Dialects-On the modern dialects of the Netherlands, see especially J. Winkler. Alyemeen Nederduitsch en Friesch Dinlecticon (The Hague, 18.4), and II. Jellinghaus, Die Nioderlïud. Mumbarter (Norden snd Leiprig, 1s:12). Comp. also the references in P'al's Grumlriss, wol. i., p. 971, syf. A special periodicul on Dutch dialects is Onze IolhsInth. ed. hy T. II. de Beer (1882. sfm.). Specimens of the tifferent diafects are found in Winkler's work, in the third volume of Firmenich's Germaniens lohlterstimmen (Berlin, 18.06), ann in Leoproht's Fan de Schelde tot de Weichsel (Groningen. 1883). For a stulty of the Frankish dialect in gencral, comp, Brame in Paul and Brames Beiträge, vol. i. page 1 ff ., and Heinzel's Geschichte der Niederfränk Gesehiffts.pmache (1'aderborn. 18i4).
(c) Oll Dutch.-The remmants of the Ohd Low Frankish Psalms ine easily aceessible in Heyne's fitinere Althiederdrutsche Denkimiter (ed ed. Paterborn. 18:̃). On the dia-
lect. see 1’. J. Cosijn, De oudnoderlandsolie l'swlmen (IIanrl(In, 18: 23 ).
(h) Middle Bntch.-There are iwo rocent grammars of Midsle Wutch-J. Franck, Millelmirderdïndischp fíanuma-
 lundsrlie Surtatitunst (Groningen, 1sx6). A Middeluederlumbeh Woordenlook is being published by of. Vordam and Verwijs (The llague, ls*?, sqg.). Volumes i. and ii., containing the lettars $A$ - (i, have appearent; for the rest of the alphabet the glossaries of Widdle Duteh texts lime to be consulted. ('mag. 1. D. Pertit, Bibliographiv der Midele nwlerl. Taal en Latlerkunde (Layden, lNSS).

iIermañ Collitzo
Ditel Literature: literature in the language of the people of the Nethorlands. It may be said to have had its herimaner about the midile of the thirteenth eentury, though a few fragments dating from the eighth century and writton in Old Doted are still extant, and translations of the Chanson de Rolond and other French romances bat been made as carly as the end of the twolfth century. Abont 1250, hawever. appeatera a butch version, probably hy Willom the linstrel, of the epie Reguerd lhe Fox, written originally in Iatin by lemioh priosts, and regarded as one of the finest and mosit spirited product ions of the butch literary genins. It beame very widely known and popular. especiaily by means of a Iow German version, lipinete der fos, which was juhbished in biabeck in 149s. Willem tha. Minstrel's work was loblowed (about 1260) he iranslations of several of the Arthurian logends, of which those doaling with Merlin and the IIoly Grail were rendered into Dutch by the fammos Jatioh van Xaerdant (1035-1300), the so-called father of Dnteh poetry. Van Maerlant, indeed, was the fonnder of a new sehool of writers, who protested arainst the works of the legendary poets and romance writers of the day. and devoted themselres to elhies religion, history, and naturad scienee. We left the domains of Arthorian legond ant romances of chivalry (ridderomens) for tyrie and didactic fuetry, und it is in these liedds that his leset work was done. Amoner his didactic works may be mentioned Jor Foturen Bhame (l-lowers of Satnre), a treatise on natural history in thirtwen troks, contaning many moral relfections and satiricul? whervations on the soriety of his time, amb his masterpiece, šuipgel Historiael (Dircor of Ilistory). Ot his
 don Lathere wen Owosere are speeimens:

Among the immerlate successors, imitaturs. amd diseiphes of Van Marlant may be mentoned Melis Sioke, who wrote the history of the siate of Jholland (Lijnthoniti) down to the yeat 130.5, at wort which for its acourary amb fulloms of detail has beref of great serviee to subsequent writers: Jan lonembale the anthor of a rhymed chronicle. 1 he Brabantacher Jipation in 1:315: and Jinn du: Werert, a satirical and ethieal writer.

A new chapter in the history of Patch literature hegins with the intitution of literary guilds called chembers of rhe uric. Thase ghilds had their urigin in thentrical eompanies.
 mystery and mirucle plays or religrions dramas of that time.

The earliest of these litarary guilals dates from the erind of
 ing the lifterenth atal cixternth cionturise. They wero wholly mediabal in character. fashiotaed on the motell of the eraft
 Ilarily a town of importance in tho low Comentries was without one of these gruilds. whase wealthand powor beeame considerable, and whost-splendid tomratment: (lundjumeplen), at which prizas for literary skill were awardal, were orchsions of great sucial importance. But the inthences of the suitas was not favorable to genaine litorary tate on to poetic feeliner and exprossion.

To the fater previoul of the history of these chambers beo long the names of two prominent writers. IJemetrik lamenszown Spinghel and lioemor Visscher, who were eonnerted with the Ansterdam suild called De Eiglentier (The Firlantine the chief of the rhamber in LIollamb. Another eminent anthor of that time. bat mot rommected with the chambers, is l)irck Volkerts\% ('oornhart (15202-90), the first to expound the principles of humanism in the butch langrtage. Ile tramblated the De rofficios of (icoro and the Do Benefirits of seneca. wrote plays, puens, and controversial Works, and linally produced? as his masterpioce the Zedelaunst (Art of EOthies), a philosophital treatise in which ho. strove to set an example of pure and gracernl atyle. Thos period that followed was the most brilliant in the history of Duteh letters. Among the noted writers were Jacob Cats (15\%7-1660(0), Pieter Corneliscen 11owft (1581-164\%), Constanlijn Inymens ( $1596-1687$ ), ant. grastest of all, Joost rin Vondel (158 $-16: 1)$.

Jacom ('ats (g. r.) or Veubre (als (Father ('ats) as he is affectionately foblel, was the writer of several long joems, whose simple, homely style excellent moral tome, and shrewd common sense have made them womlerfnlly popular with the midlle clasees.

Hooft excelled in the writing of tracedy amd of histors. In the latter departmont he took 'lacojnis as his model. Hotley speaks of him as one of the greatest historians of Europe. He was a werere purist in style striving to rid the language of foreogn amel hastard words: but, on the other hamb, he introduced many latinisms of stye and constroutiont.

Of Iluygens it is sad that "while be land but little of the swertness of Ifontt on of the smblimity of Vomle?, yet his genins was pminently lright and vivacions, and be was a consummate artisi in motrical lorm. The Intch language has never provmd so light amd sumple in any hathds as in his. and he attempted no elass of writing. whether in prose at verse, that he did not adorn by his deliente taste and summe judgmont."
Fin Vondel is the greatest mame in the history of Itureh literatmre. 1lo excelled in the lottiest species of foetry, lyric, satire, and 1 morndy. 11 is masterpioces are fijsureghe tun temstel and hacifit, whidn. like his wher tragedies, are lyric and mastic rather than dramatice luciter was juhlished in 16.5. many gears before Milton wrote the work treating a sumewhat similar theme, the immortal Paralise bost, and it is thought by some to be not imprubathe that Iliton derived his material from the work of Somel. This brildiant period in the history of Dutch librature (ame to an end about 16 ( 0 , when a long interval of literary dechine began. lasting until the elosing years of the dighteconth centur!

Among the more moted names of this feriod are latibert Comelissen loot ( $168(1-173)$, a pastorat prot, who sang in emotional and mapordions vorse the praines of eountry as opposed to city lifu: dustus Van leffon, who was strongly inflaenced by the writing of - Mhlison, swift, and lberoe, amel

 tonder and tomehing hallats in Duted on in any other langhage, and wf many odes much mhmired in their daty.

 alkalics，tin salt，ahum，ded
For aljective dyen，thome which whll mot untit directly
with the fibers, the aid of morlants is mecessaly Mordants are borlies which possoss an allinity for the condors. and which can be fixed in an insalnhle condition on or within the fibers. Some are motallie oxiles or salts, as almmina, oxite of iron, oxide of ehromium, asite of tin tamnate of tin, ete. others. as tammin, are of a dillorent characters. The mome of applying the mment depends on the fabric, as well the on the eliaracter of the mordant itself. silk and wool, when immersen in a solution of alum, take up a considerable prantity of the salt withont decompusing it. 'The ane ates of alumina, iron, ind chrominm are easilf decomposad. with the liberation of a porthon of the acetic acid and the formation of an insoluble basic acetate. By boiling entton in their solutions the fibers become thoroughly impregnated with the insolnble compounds, and when the yann is transferred to the solntion of the dyestutf the eolor mites with the mordant, forming insolnble colored bodies in wo unon the fibers, which are called Lakes ( $q$. $r$ ). The goods thus heenmu permanently dyed. The same decomposition of the aluminoms or ferrons salt oecurs if the goonls are simply immersed ant then hang up in the air. Chloride of tin is deenmosed by boiling its dilute solntion, with the liberation of hylrochloric aciul and the formation of insoluble uxide of tin. sometimes the insoluble oxide or salt is proctuced by first immersing the goods in a soluble salt, and then passing them through a seeond solution of another agent. Exposing fabries to an iron salt, and then to an alkialine lre, fixes oxide of iron. A lead silt and an alkaline lye fix oxide of lead. Stannate of soctib, followed by a solution of nutgalls, sumiach, etc., fixes timmate of tin in the fibers.

Mordants often affect the natural tints of the dyes, thus enabling the drer to promence a varioty of shates with the sume dye. Wxide of iron is most remarkable in this respect ; it changes the red color of madder. Ioswool, lirazilwood, ete. to shades of puple. lilac. chorolate. and eren black, according to the proportions in which it is employed. The oxide of tin temds to brighten the shades, while alumina fixes them in their natmral tints. This is a very important circumstance in ealico-minting, as it mables the dyer to prodnce several colors on the same cloth by ome opelation of dyeing. (See ('alico-printing, Vurlifer style.) Jletallie pigments are often produced in the yarn or cloth hy the successive application of the agents necesary for their production. Thus when cloth momianted with oxide of iron is passed into an acidulated solution of ferrocynaide of potassium, an insohble Prussian bilue is at once produced. Goods imprognaterl with oxide of lead lyy immersion in acetate of lead become bright yellow in a solution of bichromate of potash, owing to the formation in the fibers of insoluble chronate of lad. By subsequently lobiling with lime-water the yellow is changer to orange basic chromate. Imlign blue is pronlucel in cotton by immersing in a solution of colorless reduced inligo (see (ialico-printina, Indigo styles) and exposure to the air, when the indigo blue is regenerated by oxidation in an insoluble form.

The following methods of dyeing are in nse:
(1) Direct dyeing in water, usually with an assistant; is: example, see receipt ?3.
(i) Direct dyeing with the momant in the dye-bath; as example, spe receipt 5 .
(3) Mordanting follower by dyeing; as eximple, see receipt 15.
(4) Iyeing (atlonl here stuffing) followed by mordanting (callod saddenimy) : as in recelpt ins.
(5) Mordanting, dyeing, and saddeniner.
(6) Production of the coloring-mattor upon the fiber, us in the case of some azo-rels.

The following are a few tylund ways of dyeing : more dotailed statements are given in the inticles on the varions diyestuffs:

## livens.

Oh Cotton.-(1) The most heautiful red on cotton. Twrkey rmi, is producal by mofans of alizarin dyed nuon an alumina mombant. This has hem largraly superseded by the adizarin red, dyed frosuently as foblows: The hamehed entton is thoroughly impregnaterd with n watw solntion of ali\%arin ascistant (malc by the action of sulphorbe acid upon eastor sil), drisal, stramod, mombanted in acetate ot alomina,
 zarin hath, again treated with alizarin assisiant. after thormush washing, teamed, and rary cancolully washad with hot soap. (2) Iniline roals and pholis an ('vitun mordantert
in nut-galls or sumach, followed hy a tin or minimony salt. (:3) Substantive rets produced hy binzopurpurin and C'ongo red upon unmordantel cottom, imil ilyed in a bat containing soaps or carbonate or phasphate of sula.

On Wool.-(4) Hordant with alum and tartar and dye with alizatin. (5) Cochineal, with ('veam of tavtar', stmach, amd fustic. (6) An artiticial red (azo-red) in a trath containing sulphurice acin and sulphate of soxta. (r) Pinh. An eosine in ithath contaminer inlom. ( $B$ ) Aniline shates aro fixed on woul without modants in accid hathes.
(III Silh.-(! I) Peach-wool and fustic, followed hy red spirits, with annatto lor sconlets, cochineal and safflowro for tiner tints. (10) Pink, Safranine or rhodamine in sonp Hath, ol an eosine in a souju bath acillutated. (1t) Benzidine reds in a soap bath, or bisic anilines. (12) Leid artificial reds are applied to silk in a warm hath, slightly acidulated with acetic, tartaric, or sulphuric acid.

## 13Lles.

On Cofton.-(13) Prussian blae protured by an iron mordant, followed by ferrocyanile of polassium. (14) Indiern vat, a solution of rednced indiso. (15) Amilime blues. Mordunt with sumach or tamin, then a salt of antimony or of tin: dre in warm bath.
On IVool-(16) Pruscian hlue, as for moton, (17) Indigo extract, with argol and alnu. (18) Inilime blue, with sulphuric acid and sulphate of soda.

On Silh:-(19) Pluscian blue, its for cotton. (3) Indigo extract ant alum. (2l) Inilines, with soap and sulphuric acid.

## Yellows and Oranges.

On. Cotlon.-(92) Chromate of leat, produced by bath of acetate of lead, followed by bichromate of potassa. (23) Tha chrmme vellow is deerened to orange by boiling in limewater. (*4) Mordant with lannin and dye with chrysoidine or auramine: (25) Mordant in weak protochloride of tin, dre in quercitron bark, fix with protochlorime of tin. (26) Chrysamine in a bath contnining soap or phosphate of soda.

On Ilool.-(27) Nordant in tartar and ilum: dye in mixture of quereitron, sumach or fustic, und red spirits. (28) Wele, with alum and tartar. (29) Picrie aedl. (30) Acid coal-tar yellows. (31) Flavine, with a tin mordant. Orange. (92) Alizarin orange with alumina mordant. (3:3) Acid artificial orthgr.

On Silk:-(34) Iellow to orange. Annatto, with alum and white soap. (35) Wed, with almm and tartar. (36) Pieric acid. (30) Artificial neutral and basie yellows and oranges in soap baths. (38) Acid artificial yellows in acid baths.

## Greexs.

On Cotion.-(39) 1ye blue, then yellow with fustic quercitron hark or chrome yellow. (40) Aniline green, on cotton mordanted with sumac.

On Wool.-(41) Dye yellow with fustic and alum, then blue with indigo. (42) For olive, use lustic with logwoot, madder, and peach-wood, following with eopperas. (43) Aniline sreen. (44) Pieric acid and indigo carmine.

On Silli.-(45) Fustic, with sulphate of incligo and alum, using logwood and copperas to darken slandes. (46) Basie artificial greens in at soap bath. (4i) Acid aniline green, with sulphuric acill or cream of tartar. (4S) licric acid and indigo carmine.

## Jurples, Violetso and halacs.

On. Colfnn.-(49) Mordant with red spirits, and dye with logwond, to which a little red spirits and acetate of alumina have been added. (50) Dyo light blue, then redden in logwool with alum. (51) Jordant in smmaeh, then in red spirits, and tye in loswood. (52) Saflower latmoler. Dye light blue, then cover with safranine. (53) Dyc alizarin on abomant of ahmina and oxide ol iron. (54) Amiline colors. Morthat with sumach, followed by perchloride of tin or tatar emolic.

On $11^{\text {vol }}$-(5i.) Cudbear, logwood, bnrwood, camwood, or peach-wool, with ahnm, (56) liasic aniline violets in at netutral or soap bath. ( $\mathrm{b}_{\mathrm{a}}$ ) A(id vinkets in acial baths.

## RLAMたs.

On (otton.-(59) fimmach, followed by enpueras, then hy logwoul, than by walk rol? anfling fusitio abd raplatiner the secomi conperas bath by acetate of iron. (60) For hlac-black breced 5 ! by the in-
dign vat．（61）Aniline hark．Impregnate with anihne safte and anovidizing agent．Wxidize hy lunging or an an oxidizing machine，and treat with hiclirumate of putash．

 mate of pertasi ；hang in the air：dye in lugwood，harwenl， and fustic ；sumetimes finish in copuntas．

On silk－（6．1）Copluras and logwool requated ；the all－ dition of nitrate of iron and futtie improwes（tio）For hhe－huck，dye in I＇rusian bhet and follow with 61．Arti－ licial blacks in acid or soap baths．

## 1）а．

On Cotton．－（6b）sumach，followed hy weak（enperas． then fustic，Limatwond，amd lugwod；raised with alum．

On Wool．－（iii）Madder，peach－wowd，logwoenl，fustic．with alum and copproas．

On Silk：－ $6 \times$ ）sumach，fustic，and logwoun，with enp－ perus．

## उвия以х

On Collon．－（69）Catech broun．Boil in catecha．patis through hot hiohromate of got assi，wash in hot water con－ taining a little soap．（ $\mathrm{O}(\mathrm{O})$ Chocolate or French brown． 1）yo in spirit yellow ens．then in logwood，and rate whe acetate of atumina．basic aniline browns on tamin mor－ dants．
On Wool．－（71）Pasis throurg a bath of fustic，madder． peach，and lorwool：then through dilute eopperas．$(f)$ Bath of bichromate of potasa，argoh，and alum：then of madler，prath，and logword．（ $\%$ ，$i=1$ ）Sentral and acid coal－tar lrowns．

On Silh：－（ia）Nentral and hasic coal－tar browns in soap baths．（ 76 ）Leid coal－tar hrowns in acid baths．

Fior further details，see sansone＇s Dyeing：Delnart＇s Echtfürbervi der lusen Wolle；soxlet＇s Färberei der Bawn－ wolle：llurst Silk Dyeing，Printing，and Finishing； Hummel＇s Dyeiny of Thatile Fubrics；and Fertess＇s Die Anilinfurbstoffe．

 thecer，naturalized in the vicinity of New lonk．It wno siderably restmbles its congener，the mirnontte．it is es tensively contivated in 11 alland and frame⿻ and to some extent in Fingland，and is a valuable yellow dyestuff．Its quality is much improwed by cultivation．It was lormerts uscd in medicine as a sedative，diaphoretic，and diuretio．

Drusulfs：bodies ual to impart coinr to textile fiber and fabrics．Many colors exist already formed in plants： others are prontaced from colorlass bexlies by oxidation or other procesus．Lakies are compoumds of coloring－matters with metallic uxides，such ats ahmina，the oxides of tin． lead，antimony，and inrium．They are senerally prepared from cechinuil，alizarin，weld，Brazil－wond，aniline coloss ele．（sure lakfs．）The following are some of the most im－ purtant dyestuts of animal and regatalue origin：

1．Avimal byes．－＇orhineral，the female insect of the species Cocrus carfi，is by far the most important．It－ eoloring principle is carminie acisl．It protucess searlets and crimsons of great brilliancy on silk and wool．Car－ mine is nearly pure carminic：accid．hermes，hermes grains， allermes is tha insect roctus ilicis，one of the mant ancient dyes for rad shates on silk．Luec is the Corens lucere it similar invect．The Tyrion purphe was outainet from mol－ lusks，and is min longer used．fichllsame exerescences produced on the leaves and fouf－stalks of the onk by punctures of the gall－wasp，made for the purposi of depositing her equs． Their charactoristie constituernt is momic acid，which pro－ duces drats and blacks with iron sults．Thay aloo serve as a mordant for some aniline colors，mud tre the tasis of mont writing－inks．Sepia is the thaid of cuttlefish：it is mut usid as a dye，but as a water－colon hy artists．Ifureride is a pmple compond produced lay the ation of aitric acid and ammonia on mice neid from guano it is no longer used．
11．Vegetable 1）res－－Thene are extremmymmerons，al－ 1hough only it few are in getneral use．They are derived from clifferent parts of plants：（1）From rots the most in－ portant is madder（Rubiu tinctorzm），which comains two principlos，alizarin and paphrin．These bodies produce on cotton the most pronament reds，purphes，and chroolates． which makes them specially apphicathe for calico－printins． Madder appears in commerea in the form of ground root： garancon，the groum root hoilel with sulphuric acid and Wathed ：and extrace，a toleratly pure alizarin．The use of madder as a dymot has nearly ceasod，and it has then re－ phaced by alizarin manafactured artificially from the an－ thatene of enal－tar．Wenjeet is the lndian nudder．Iltanet is the inchase linctoria，tormerty used for lilace lawemher． and purple on silk．Its colors were always furgitive．Bher－ Unry pronuces a yellow of lithe importanes．Tarmeric．the tuhtr of corcuma timetora，oir Indian safforn，provinces a tugitive yctow．It i now chitly used for yellow herpucts， as a test for alkalies，for mixing with comryonwler and with mustard，and in dyeing woml．Sionrengio is a yellow much used in Indiat．（2）Among the mere inphetant wanls are lognowe contaimg hatmaxylin，extomively meed for

 South America amd in lapan，known a＊lamal Permabuco， Sunta Martha，Parh．Dicaragha，Sapan or dapm，＂tce，It yiuhs a cohoring－mater known as hazilin．Whith produres
 mond，from drico contam samtalin，which gives reds．volets，
and searlets. Fustie, or yellow wool, is the Morms finctorie from the West lndies. Fustef, young finstic, or Hungarian vellow wool, is the Rhus cotimas. (3) The only lark of Elecial importance is the quercitron from the Querens tineforia, which contains ritureitron ind produces in rich yellow, and greens whon combinel with hue; a pulverized preparition made from it is known as florine. Lu-kao, or (hintse green is a green lake prepared ly the Chinese from the laik if a species of Rhummes, or lonekthom. (4) Leaves of the Rhus roliuns are known iss sumach: they prothce a yollow, but are generally used, on account of the tannic acid they contain, either as a mordant or to pronence blacks. otc.. with iron salts. Thert, whieh gives an orange on entton, consists of the leares of Bignonia chica. (5) Flowers. The petals of Carflamus finftorius const itute saffower. They contain a useless yellow coloring-matter. soluble in water. aml a beantiful pink (carthamin), soluble in alkalies. S'ffiron, a heatiful yellow Ilye rensists of the stigmas of Crocus sutime. (6) Fruit. Persinin, French, Turker, ete., herries are derived from sereqal species of Rhomms. Ther contain a beatiful yellow dye (chrystorhumaine) and olive yellow (ranthorhammine). They are used in calico-minting. for mper pulp, and for lakes. Ampetto or cmmutto is an extract of the sembpellieles of birat orellamu. It is nsed for yellows, oranges, and with reds for searlet. It is also employed for coloring hutter am! cheese. Dive-divi is the pol of the Casslpinia rorimbit. It contains tannie acid. Chtechu, terra juponica, and grmbir are the extracts prepared from the fruit, wood, twign and moripe pots of several plants growing in India. Their active principle, as well as that of divi-diei, is a species of tamic acid. They are used as mordants, with iron salts for trats amd blacks, and in tanning skins; catechu and gambir furnish browns. (i) Entire phents. Indigo trom Yarions speries of the Indigofera, and aroad from the Isatis tinctoriv, contain a glucoside (imdicim) which by fermentation yields imligo blue (indigotine). This color has long heen ised as one of the most permanent blue dyes. Several preparations are employed by the drer: (a) solution of enlorless or redued indigo, with whieh the cloth or yam is impregnated, and from which the insoluble blne indigotine is precipitatial on exposure to the air: (b) in solution in sulphurie acid is sulpho-purpmie acil, purple blue, or as sulpho-imligotic acin, treep blue; (c) as carmine of indigo, or extract the sudit componnds of the above-mentioned acids, nsually the solimin salt of indigo-disulphonic aeinl. It is used for cotton, silk, and wool. and in calien-printing. Lichens. A variety of lichens yield, hy a kind of oxidation, a series of prolucts known as archit or orchil. cuilbeer or persio. and litmus. 'Jha' weeds (from the Canaries, the Prrenees, etco, are pulverized and moistened with urine, whon certain acids they contain are changed to the coloringmatter orcin. irchil appears in commerce as a purple paste, enthear as a red powiler. litmus as a blue lake. lacfore the intronturtion of the aniline colors the most beautiful purples for silk were obtained from archil. Weld, the litsedu luteola, contians lutioline, whieh yields a rich but fugitive yellow. Fxtracts containing the coloring-matters in concentrated form are prepared from most of the dyewonde, and are fomm in trade in the lignid or solid linm.

11I. Artificial or C'iemifal Colons.-(1) Pigments are insoluble metallic compomds either produced in the sam or clath by sucensoively amplyg the necessary reagents. or attached inerhatically to the surface by albuinen or other adhesive sulstances. Prossion b/ue is a ferrocyanide ol irm: chrome yellou und orugge are chromates of leal; Archereinficrt yren is the acco-arsenite of copper: falignel's grepn is a hydrated oxide of chrominm; uttremarime is a compomad of alumina, silica, soda, ambl sulphur. (?) ('oul-fur colors, which have heeome equal to if not more improtant than the batural ones. The ronsumption of these colurs is rapidly increasing in the tinctorial arts. This entirely new class of dyestuils, the creation of modern chemiatry, is derived from the vefuse tar producet in gas-works from bituminous eot, The colors belong to fone distinet serins: (a) 'The amitime sombe incluling the ret rosaniline salts, the purple, viold, and blue suhatitution products tlerived from them, the ghtens, yellows, hrowns, black, and pinks,
 The phomel ur carbolic aritl sories, inchuting pieric actil, and other nitro-mhomer matters. the eqsines, coerulein, ete. (s, l'hewo, Conors.) (c) The azo-coloring-mattere, chrysuidine, bismatel brown, the tropacolins, the numerous wool searlats, and the buazidine or tetrazo-eolers. (d) Anthracome series, of which atificial alizarion anthrapurpurin, aliz-
arin orange, anthracene blue, etc.. are the representatives. See Asthracese, Alizarix, and Madeer.
All the important animal ind regetable dyestuffs above mentioned are deseribed more fully under their respective titles. For fuller information. consult the works on dyeing mentioned in the article on Deeing. C.F. Chandier.

Revised lyy L. M. Norton.
Dringe or Deathred, Deelarations: in law, statements male by a person in the prospect of impending death with regalud to the cause of his death. In most countries such statements can not be received in civil eases as evidence, and in criminal cases only when the eanse of teath of the leceased is the sulject of the charge. They must be made in the firm beliel that death will soon follow, must relate to fact: only, must be complete and ungualified, and mist he freely made. They are lurther subject to the ordinary rules of evilence. The theory is that the knowledge of the approach of death creates an obligation at least equal to that of a juticial oath.

Revised ly F. Aturges Allen.

Greal Themes (18:

Willis J. Beecher.
lynameter [enutraction of dynamometer: from Gr. ס́váus, power + $\mu$ é pov. measure]: an instrument for determining the magnifying power of a telescone. This power is expressed the the mitio of the solar focal distance of the object-glass to the foeal distance of the eye-piere, considered as a single lens: and this ratio being the same as the ratio of the effective diameter of the object-rylass of the telescope to the diameter of the image of the same formed at the solar fucus and seen through the eve-piece, the object of the instrument is to measure the exact diameter of this image, which can be either projected on mother-of-pearl or measinced hy optieal means. Ramsden proposed for this purpose the donble-image dynameter, or mierometer, which is formel by dividing the eye-lens of a positive eye-piece into two equal parts, and monnting them so that the divided edges are made to slide along each other by means of a fine screw apparatus. Each semi-lens gives ia separate image; and the distance of the two centers, measured ly the revolutions of the serew when the borcers of the two images are hrought into contact. gives the distance of the conters of the images or the diameter of one of them.

Dynam'ies: literally and in modern usage, the science which has for its object the investigation of the laws and principles which govern the action of forees. The science of dynamies may be divisled into varions branches, each embracing the priniples applieable to some spreial conditions of the action of forees or of the bodies acted on, such as the subject of staties, or the equilibrium of forces; the subjeet of kinetirs, the atim of forces in connection with the motions and changes which they produce; and the special applications of both these sulpjects to bodies in the solid anm Muil slates.
The abstract idea of force is derived from our kowledre and exprownee in regral to the fures of nature-gravitation, inortia, friction, molecnlar fore museular force, ete. Thase forres are so far similar and identical in their effects as to athmit of a common measure, and of heing subjected to the sime laws and principles. In general they arise from the action of one bouly on another in such a inamer that this adition is distributed among all the purticles or is exerted through a surfince. Jnt it is nearly always possible to
assume a single fure acting through a definite foint and in a partientar directim，which thall be equivalent in it－of－
 gravity，for instance，is an attrative inthenere exerted bo－ iween iwo bulies，which can unly be suldmad to the exertand by the separate particles or molecoles of cond，and yot at single forcen equisalent to the sum of the attractisnc of all the partiofes of a hols，and arting through its center of gravity，is usatily asomed to mpenent the fore of gravity． A fore may this be regarded ats an intluene or action he－ twern two horlies or hat ween two monereles of matter which requires two elements for its detomination－its lime of action and its mapnitude．

This abstrat jifats apllieable tor all forese and furnishes the sturtine－puint or hasis of the system of pinepintes which comstitutes the acience of fores．These principles depent also on certain axioms of physical semene herwed from th ronsideration of the nature of forees and their effects：and also upon eertain geometrical haws involving the redation tofwedt the magnitmes of fores and motions，and their ryuivalent compments．＇To compare the marnitudes of furese atamard unit or manare must be montor which is applicable to all firees under all ordinary conditions． A．all stambards of measure are arbitaty，such a unit of
 will prodnce muder conditions which promit uf the efleet Weing measured by some other known standard of metsime

To explain the standarl or wait of fore alopten in dynamical supplee．it will he neressary to＂xplath junt what is underataral he the mass of a budy．If we shplesie（for the purpose of this explenution only that the whimate par－ ticles ur malember of all suhatamees are the same，and that we may devignate hy the term densily the degre of prox－ imity if the partiefos of any lenly to cath wther，then the number of partides in a sivion colume may be laken to did note the mase of the motr－i．es this mamber would repre－ sent the quentity of malier in the berly．This quantity of matter or mas：has important properties as regurd fores． First the aetion of the fore of sravity upm the thaly is
 a pecoliar power of resistame to any force which ants to change its etombition in respet to motion．It is inert its regrats any power in itoolf to whage hat a fored of reaist ance is developen with the sution of an impersal fince． The truth of this principle is so well estahtished that the following relation bet ween an impresed foree the mase of a loxty free 10 move withont resistane（uther than its inertia），ant the velesity which is producet in a unit of time has the fore of a semptilie axion．＇Phis relation may be stated as follows：The erlocity protuced in＂b buly frep to move urithout resistatere it ot unit of time will he di－ rectly preportional to the intrasity or amount of the 1 mperssed fores，med ineresely mopertional to the mens of the berty． in algebraic symbuls，it＂the the velority，Fe the fore and It the mass，the relation will be expresed by the equalion $r=\frac{\mathrm{F}}{\mathrm{y}} \quad$ Vrom this is determine the value of the forete $\mathrm{F}=\mathrm{Mr}$ ．If the mas 3 he that of agiven volume of sombe subtance assumet as atambarl，the binit of fore may the aswimed to be that furee which will probluer a given velacity －the unit of whocity，for insamer－in a unit of time．＇l＇his is an absolute unit of force，and serses as a buiwnal moms－ ure．Snother meane adoped is more vacilice，lut not ans invariahle standurd．It is，however，that in mest commen use and is perhaps the mose universally understome as the shatard of mosisure for forest．If the force $F$ instad of heing any fore be be taken as the fore of cravitation．the

 Brifish measures reforved to the latitute of lamelons．The
 alont ぶき liritish nuits．

I foree being fully represented ly its mannilude dimer form，an！point of＂pplicetion，the tirst problems in orter in the action of impressed force pelate to the laws of equilith－ rimm，or the rules for limding the resultant of any nomber of foressaming on a butr．If the lines of direction of the forees all pase through the zame point，the rewaltant may lue frumb by the applicat ion of the eromet rival therom catle the parallelogram of forece，if two fores ast uporn one print，and protions of their lines of thention he taken th remesent the magnitude of the forere，their resultant，of a single force equivalent to the action of the fwo，will the rep resinted ley the diagonal of the parallelogram comstructed on the line of the ahore two be bentine the forees which and on a point lwo and two and repenting the protess，a siugle restultant for all may be foumb．（of，to determime graphically the resultant，from the extromity of the line representing smo of the forecs draw a line parablel to the diection of any other fores of a length romenenting the mannitude of this forex；then from fhe extremity of this last line draw another．parallel to and equivalent to another force，and so on：the final resmitant will be at line drawn from the extremity of the bast line to the orisin，or print of mplutation：if this line is zero，then the forees are in expli－ librinm．If the fores do not all ant on one pains in the bods，the comblitons of emailitrime require that the action of the forees shat he such that they net only produe bo motion of the body in at staght line，hat thene must he no mhataned follort to turn the bobly about any line as an axis．

The moment of a foree in reference to an axis is the protue of the intensity of the fore into the perpendicular distance of its time of action from that axiz．
several surtial（ases may be（omsidered as lembing to the mons general ease of the efpilitrinu of any number of forees acting upmatigid haty in any direetion．

1．To lind the resultant of two patald forecs acting in the same dievetion，divite ally fine atross their commen direction intu parts insurely propmotional to the magni－ tades of the forces：the pinn of apmitation of the resultant may thes he fomul，amb its masmitule will he eqpal to the sum of the mavnitudes of the two foreres．A thire fore
 lihrimo．
2．The resultant of any numine of paralled fores acting in one flame and in the same direction may be found ly first fimbing the resultant of ？wo，then the resultant of this with a thime and so omb．
3．For any mumber of pralla foreces nut in one phane the combitions of equilibrium require that the algethrate sum of the forees shall la equal to zome and the almonaie sum of the mmments of the forese in refermee to any two red． angular axes in the plane：that is．the exmbined action of the forete mast prolume neither a motion of translation nom of rothation．
t．Thwe equal paratlel amd contrary forees bont and ing on the same print produce a eouple which hats no single resultant．

5．When a sastem of forces ads in various directions and
 at mixht anghes los ewd other，rach of the fomes may he re－ Whacel ly there compment fores in the direction if these
 tiphying the macnitale of the furce hy the ensine of tho angle whele its line of ation makes wh the tirectimo of the companent（at frovere which depmesk whe theorem of the parallehgram of farces）then the monlitions of chui－ lihnium of the－r：stem ate that the algenvice sims of the
 and also the alentraice sums if the moments of the forces in referene to these anes must her zern．
＇The aplication of these punciple to find the enters of
gravity of various lines, surfaces and solids is made by supfosing the body to be divided into small elementary portions, and these portions to be acted on by the parallel forces of gravity acting on each. In ia corresponding manner the ecmer of pressure of duids resting uron surfaces may be fimmul.
The various cases of equilibriun when no other forces act on a body than the force of gravity, and the pressmre between the body and fixed supports, constitute a large class of problems which oceur in the applications of dynamics to engineering; the stresses and strains which are produced in the pieces of a structure being the principal objects for calenlation. In the action of forces where motion is protucemd, the elements of timu. space, and velocity enter into the discussion, as well as the mass of the body acted on.

The three fundamental axioms or truths on which the science of dyamics principally rests are:

1. Every boty continnes in its state of rest or of uniform motion until compelled by impressed forces to change its state.
2. Change of motion is propertional to the resultant of the impressed forees, and takes place in the direction of the straight line in which that resultant acts.
3. There can be maction of a force withont a contrary and erual reaction.

The uork of a fore is the product obtained by multiplying the intensity of the force by the space passel uver by its proint of application.

According to the above axioms or fundamental principles, the effort of any firce must be opposed by an equal and contrary effort from some other force. In cases of bodies free to move under the influence of thy force, a prortion of the resistance to the external force is alwas supplied by the inertia of the body. If no other force acts ujun the body than the force which produces the notion, the whole of the resistance will be snpplied br inertia, and the expression which has been employed, $\mathrm{F}=\mathrm{M} u$, gives the relation between the force and the resistance in terms of the mass and velocity. The quantity Me, called by some writers quantity of motion, and by others momentum, may be interpretel as implying that this is the meresure of a force which, acting for a unit of time upon the mass (M), generates the velocity $\because$. It the force continne to act on the body so as to accelerate the velocity, the work of the impressed force must be equivalent to the work of the resistance during any given time or through any given space. A body moving, for instance, with a velocity $r$, and having by the action of an impressed force its veloeity changet to $u$, the change of momentum will be M. $\left(v-\dot{v}^{\prime}\right)$. The force necessary to produce this change in the time $f$ will be $\mathrm{F}=\mathrm{M} \frac{x-v^{\prime}}{f}$. If during this time re suppose the body to have passed with a uniformly aceelerated relocity over the space $s$, the worh of the force $F$ will be $F s$. But the space $s$ is equal to the mean velocity multiplied by the time, or equal to $\frac{v+v^{\prime}}{2} t$, and we have

$$
\mathrm{F} \times s=\mathrm{H}^{r-r^{\prime}} \frac{r^{\prime}+r^{t}}{2} \cdot t=\mathrm{M} \cdot\left(\frac{r^{2}-r^{2}}{2}\right)
$$

If the bodr start from rest, the initial velocity will be 0 , and We shall have

$$
\mathbf{F} \times s=\frac{M x^{\prime 2}}{2}
$$

The same may be proved whether the impressed force is constant or variatile; and the important principle is thus established that the produet of the mass of a body multiplied by half the synare of tho volocity with which the loody is moving, is equivalent to the work of the impressedt forre which produces this velocity in the body. And generally a change in the value of $\frac{\lambda 1 t^{2}}{2}$ is always equivalent to the uork of the force which produces the change. The quantity ${ }^{31}:^{2}$ is called living furfe, amb sometimes actual forrgy of the body, beranse it budy moring with the velocity $r$ will always require the expenditure of the work represented by $\frac{31}{2} \mathbf{2}^{2}$ to bring it to rest.

In eas's where external rexistances act on the body in oppasition to the impresed foree the work of the rexistance. added to the wonk of inertia, will he equivalent to the work of the impressed furw. 'this grives rise to a very simple enumeration of the lavs of all machines-viz, the work of
the effort or prime mover must always, during any interval of time, be cqual to the total work of the resistances added to the actual energy or living force aceumalated in the moving pieces. If during a given period the living force of any piece is alternately increased and dimimished, the quantities of energy stored and re-stored may just equalize each other; and such a piece may be employed simply for the purpose of storing up and restoring work, as a regulator. The common fly-wheel is such a piece in machinery.

If a body has a rotary motion about any axis, the actual energy or living force due to the rotation is expressed in terms of the angular velocity and the moment of incetia of the body with reference to the axis. If the angular relocity be represented by $a$, the actual energy chie to rotation will bir $\frac{a^{2}}{2 y} \mathrm{~J}$; the monent of inertia I being found hes means of what is called the radius of gyration, which is that radius or distance in a rotating body the square of which is the mean of the squares of the distances of the partieles of the body from the axes. For the fly-wheel this radius is approximately equal to the mean ridius of the rim.
When a body in motion is constrained to move in a curve. the force which causes it to deviate at each instant from the tangent is found by multiplying the mass by the square of the velocity, and divifing by the radius of curvature. The deviating torce is equal and opposite to the influence whieli temls to draw the froly away from the axis. the centrifugal force, and hence the centrifugal force is always proportional to the square of the velocity, and incersely as the radius of curvature.
In the application of the laws of dymamics to fluits the priuciple of living force holds true als for solids. Every fluid mass in motion has a living force froportional to the mass, multiplied by the square of the velocity.
The force of heat is derived from the same general dynamical law. It has been demonstrated that the molecules of all bodies have a constant vibratmy motion, and these molecules having weight, the energy exerted when a body is cooled is equivalent to the expenditure or change of living force; and when a body is leated. the vibratory motion of the particles being imereased in velocity, living force or aetnal energs is stored.
The properts of matter which is called inertia, br virtue of which masses in motion possess a force which is appropriately called liring force is of great importance in the economy of machines, and of special importance also to living beings. In nearly all motions of animals this principle acts to aid the muscles in the execution of particnlar movements, which would otherwise be accomplished ly fatiguing exertions, and would often be otherwise impracticable.
The demonstrations and applications of the various principles which have been enunciaterl, with their secondary consequences, usually occupy entire volumes. Works of this character have generally been entitled works on mechanies, and are often divided into two subjects or parts, statics and dynamics, but the tendency of inolern writers is to exclude the word mechanics from definitions connected with abstraet seience, and to employ the term dynamics to tlesignate the whole science of foree.
W. P. Trowbridge.

Dynamic Inits: units for measuring forees and their effects. The simple unit of force has been defined under Divamics. A mit of mork combines two elements-viz., force acting, and space throngh which it gets; and is the product of a unit of force and a unit of distance. Such is the foot-pound, which is the work done in raising 1 lb. 1 foot; or the kilogranmetre, the work done in raising 1 kilog. 1 meter. A rnit of power, or of rate of zorking, involves the additional consideration of time. It is a definite amonat of work ennwintionally fixed unen for purposes of comparison as the work of a unit of time. Thus the horse-prowe. P . the unit of rate commonly used in the $\mathbb{T}^{\top}$. S. in estimiting the 1 rerformance of machines, is 500 toot-poumds per semond, ar 33,000 per minute. The cheral-rapent (French horse-power) is 75 kilogranmetres per scond, or 4,500 fer minute; equal to $542 \frac{1}{2}$ foot-poumis per seeond, or 82.550 1er minute, nearly-a little less than the former.
W. P. Trowbridge.

## Dynamite: Se Explosives.

Dynamite-gun : a gun for throwing dyamite. An experimental gin for this jurpose was made in New Tork city and tried at Fort Hamifton in $A$ pro., 1884 . The gun eonsisted of a tube 40 feet long ind onte-eighth of in inch thick,
with a bore 4 inches in diameter, commerten with a larese stoel evlinder suphlient with rompressid air by atomm-engrine. The tarect was \& feet liy $10,1 \frac{1}{6}$ milus dictant, aml the proj-

In nll dymamomectric mathinery the colleeftion of parts in whind the elertrical entrory is aronerated is eatled the remmeture. The collection of farts utilized int providiner the magnetio fiedi is callod the fimed. Ju Fior, fi the portions of the liehl from which the munnetizn enters the armatnre are called the poles; tham about which the aurent cirendates
for setting up the magnetism are called the field corps: the portion that joins the field cores together at their extremities opposite the poies is called the yoke; the windings on the eores througlo which the exeitation eurrent is set up are called the field coils. In general the constrution of the magnetic circnits of direct-current dynamos necessitates the use of laminated iron eores in the armature for the purpuse of lessening the relnetance of the magnetic eircuit. The lamination is accomplishel by building np the cores with insulated iron disks about :015 inch in thickness, and arranged parallel to the lines of magnetie force. Iron wire is oeeasionally used for buiding up armature cores. The lamination prevents the loss oif energy that otherwise would oecur throngh the parasitic enrrents that are formed in solid iron when rotated in a magnetie fiedd. The space in

M. M. F. IN AMPĖRE-TURNS PER CM. LEXGTH. Fig. 5.
the magnetie eircuit oceupied by air and non-magnetie materials is called the air-gap. The distanee between the surface of the armature core and that of the poles is known as one-half the depth of the air-gap. The magnetic density raries in ditferent parts of the eircuit and with different materials. Cast-iron field cores are worked at 6,000 or 7,000 lines per sq. centimeter: yokes at 5,000 lines per sq. centimeter; and poles at 3,000 lines per sif. eentimeter; field cores. poles. and yokes made of wrought-iron or steel castings are worked at 14,000 to 16,000 lines, 7,000 lines, and 12,100 lines per sq. centimeter respectively. The magnetie density in the air-gap varies in different makes and sizes of machines from 3,000 to 7,000 and sometimes 10,000 lines per sq. eentimeter. Two classes of iron cores are used in armatures, depenting upon the method of winding the conductors. Those of the one class are solid evtinders, nsually

longer than their own diameter; those of the other elass are hollow eylinders, generally shorter than their own diancter. The tirst are uscd in drum-armatures, and the second in

Gramme ring-armatures. Disk-armatures are sellom provided with iron cores. Drum-armature eores are operated in practice at magnetic densities varying from 5,000 to 10,000 lines per sq. centimeter, while ring-armature cores at the point of maximum density are generally operated at from 12,000 to 18,000 lines per sq. ecntimeter. Becanse of the permeability of the air which everywhere surrounds the fieh of the dynamo, quite a considerable prortion of magnetism that is set up through the yoke and field cores by the exciting eoils leaks by the armature. The ration of the magnetization throngh the fich, M, 骐, the magnetization througli the armature. $M_{a}$ or $M_{\mathrm{M}_{\mathrm{f}}}$, is the coeffieient of magnetic leakage, or $\gamma$. This ratio is generally abont $1 \cdot 4$, so that in such eases the field cores and yokes must be proportioned so as to aecommorlate 1.4 times the number of lines of magnetism that are needed through the armature. The following is an expression for determining the number of ampere-tnrns that is requisite to set up a given amount of magnetism through the armature:

Where
$T \mathrm{~T}$ ( is the number of ampere-turns,
$\mathrm{B}_{\text {as }}$ the magnetic density in the air-gap,
$\mathrm{H}_{\mathrm{f}}, \mathrm{H}_{y}, \mathrm{II}_{\mathrm{p}}, \mathrm{II}_{\mathrm{s}}$ the magnetomotive forces obtained from the above diagrams for setting up throngh a distance of 1 em. the corresponding magnetic densities in the field and armature cores, poles, and roke,
$L_{\text {ff }}, L_{L_{y}}, L_{p}, L_{a}$, and $L_{a g}$ the distanecs in centimeters through which are set up the respective magnetic densities in the field cores, yoke, poles, armature core and air-gap.
The magnetic density in any part of the magnetic eircuit is $\frac{1}{5}$
section in square centimeters at that point.
In the armatures of direct-enrrent machinery, eonductors, or groups of conductors, called sections or coils, have their terminals attached to insulated bars arranged eylindrieally or annularly forming the commutator. To obtain a direct current it is necessary for the armature to rotate with reterence to the lushes or field, or vice versa. The former methof is usually adopted, since in practice the brushes must oceasiomally he adjusted while

Fig. 7. the dyamo is in operation. With alternators either the field or armature may rotate. In direct-current dynamos there are two classes of armatures, open coil and closed eoil. The latter are used mueh more generally than the former. In upen-coil armatures there is one commatator bar for each terminal of a eoil that is bronght to the commutator ; while in closed-coilarmatures there are two roil terminals,

Fig. 8. usually the ent of one enil and the beginning of the next, for every commutator har. Figs. $\tau$ and $\&$ illustrate the two methots of commutating the current. In open-coil armatures the terminals of one eoil, or two or more joined in series, are conHeted to opposite commutator bars. While the coils are passing through the magnetic fieht, and are therefore active in producing an electromotive Poree, thiot commotator bars are passing muter the

Fig. 9. hrushes: at the same time the idle coils are cut ont of the clrcuit altogether. This method of commatating the eurrent has been found to be
especially adapted to the generation of small currents at high volugres, such as are used for are lighting. In the chosed-coil armatares, as sen in lios. s. me-half of the coils or sections are constantly in multiple with the other half. Bach set froduces the same electronotive force as the other, which therefore is the full electronmive fore of the generator, and being in muttiple are cath furnishes half of the current.

Fither open or elosed coil armat ures are still furt her distinguished a* Gramme ring and drum armatures. In tramme ring-armatures the core is in the form of a ring or eyfinder. and the coils are womd on this core, as shown in Fig. X. lin drum-armatures the ene is like a drum or solin cylinder. Fig. 3 gives a diagram of a dram-armature wimhing for a two-pole dyummo. The following expression is used in designing direct-current closet-coil armatures:

$$
\mathrm{E}=\frac{B_{\mathrm{ag}} \times N_{\mathrm{c}} \times 1_{\mathrm{c}} \times 1 \times \rho}{k \times 10^{n}}
$$

Where
$\mathrm{E}=$ the electromotive fore generated.
$\stackrel{N}{c}=$ the number of conductors un the surface of the armature.
$L_{c_{c}}=$ the length in centimeters of the portion of each conductor that is active in cutting lines of force.
$r$ = the linear velocity in centimeters per second of the conduetor.
$\rho=$ the percentage of the armature circomference covered by the poles,
$k=$ the number of circuits in parallel.
The maximum allowable current that an armature may furnish is limited only by the maximm heating effects that may be fermitted. Ileating effects in armatures are produced by hysteresis and Foucault current losses in the revolving iron cores, and by the resistance of the collar conductors. Cotton-covered. varmishel wires, as used in armatures, will stand a safe allowable rise of temperature of 70 C. above ordinary temperatures. At this rise of temperature the output of an armature is gencrally determined. In wenmode armatures 30 of this rise is produced by the heat developed in the core, and the remaining $40^{\circ}$ ly the current in the copper conductors. With this performance the crosssection of the copper combutors is generally about 450 cir©olar mils per ampere. birect-current dynamos are built in practice to prodnce cither a constant electromotive force and variable current or a constant curreat and variable electromotive fores. The former are known as constontpotential and the hatter as constant-current dynamox. In all direct-current dynames the fiefl is proulaced ly a courrent generated in the armature. In constant potential dymamos the fiefl is womm with fine wire and the terminals are connected to the brushes at the commutator. as shown in Fis. 6 . A smatl current is thus whtatet from the armat ture or shonted from the man current. Such a machine is called a whut dynamo. The field exeiting current is variod by means of an adjustable resistance. Every variation of field current produces a corresponding variation of the amont of marnetization through the armature, and of the electromotive force generated. At a given sjeed the rela-

tion between the exciting current and the electromotive force gemerated is called the internal charnetrevisic of a dynamo. The relation at a misen sued hetween the elertro-
motive force at the brushes and the entrent delivered by at dymmo is cabled the esternat churacteristio. The diagrams in F"ig. 10 give the extermal and internal characteristics of a shunt machine, havinge un outpyt of 100 amperes at 110 volts and a speed of twol pevolitims 1 ner minute. These charactoristics are to a lymamo what an indicator-rard is to a steam-encine. They are of great ascistance in determining whether the dymamo has been properly comstructed, and whether it is proparly operated. Frequently heavy turns of wire are womm about the field, amd through these the main current produced by the armature passis: by this means more magnetizat ion is produced throngla the armature as the current matput increases, enabling the armature to produce a higher electromotive foree to compensate for any naturab falting off of the sectromotive furce due to the resistance of the armature, increased reluctance of the field due to the

Fig. 11.
magnetic action of the current in the armature, or falling off of the speet of the prime moyer. Such machines are ealled compound dymmos. Hachines in which the field is produced entirely by means of turns through which the main current of tho armature fases are callod series rlynemos. These are generally used for the production of a constant current and variable electromotive fore . There are two methods for constant corrent regulation, giving rise Io two elasses of constant-chrrent dyamas. In the one chas the constant qurrent protured by the armature circulates through the fiell for all electromotive forces, the magnet ization through the armature remains constant, amb the edertromotive force is varied by antomatically shifting the lirushes at the commatator. In these machines the fall of matretie potentat between the pole faces is just aqual to the magnetomotive furce of the ampe-turns on the armature in the dianeter ocenpied be the brashes. There is no magnetization in the armature along the diameter of the hrushes, so that in any [msition the brashes are on a neatral pint, and current may be taken off without sparking or disruptive effect The electromotive fore is a maximum when the broshes me at right angles to the tied and eomciflent with the nommal diameter of commutation, und it is zare when the brushes are parallel to the fied or at richt angles to the nomal diameter of eommotation. In the other clase the brnshos remain almost in a tised position: the requisite variat ion of eleetromotive furee is protheed by varying the magnetization through the armature. 'This is accomplished by varying the current throng the fieldwinding, by atomatiently changing the resistance of a condurtor that is connected in multiple are with is.

The fields of direct-eurent dyamos are distinguishot hy the nomber of their pules, is two poles, tome phes, six pelles.
 Amatures for the multipolar fiells have hollow colimitral cores that may have either (irambe or drum windinge. In the dimmme windinge for multiphar fields there are as thay sets of covis in multiple with tath wher as there are pols, whike in drum windings thre are gnorally hat two. The two styles of wimling arw illustrated in Figs. 11 and 12. Whltipular dynamos are usually built as shont or compoumd
generators for constant potential and variable current．The multipolar forms possess certain great adrantuges over the bipolar forms for the large sizes of generators．Chief amoner these are slow speed and great output per pound of material insed in construction．

Alternate－current dynamos are msed extensively for elec－ tric lighting．They are generally nade to develop electrical energy in the form of high alternating electromotive forces and correspondingly small currents．In this form large amounts of elec－ trical energy may be trans－ ferred to erreat distances with little loss by the use of comparatively small con－ ductors．At distant points where lights are needed the electrical energy is changed by means of a Trassformer（q．v．），a re－ rersed induction coil，from the form of high electro－ motive foree and small cur－ rent to that of the low electromotive force required to oper－ ate incanlescent lamps，with a corresponding increase of current．Transformation by means of the induction coil can only be effecterl with alternate－current enersy．Two succeeding alternations of electromotive foree or eurrent are known as a complete period or cycle．Alternators are generalls built and operated at from 40 to $1: 30$ periods per second，and at electromotive forces from 1,000 to 10,000 volt－．When higher roltages are required the alternate－ current mergy is developed at lower electromotive forces． and then raised by means

Fig． 13. of transfomers．Alterna－ tors rary greatly in clesign and constmation．There are two great classes－those with and those without iron cores in their armature． Fig． 13 illustrates an alter－ mator＇with a revolving inon－ cored armature．Thearma－ ture is wound with as many coils as there are poles．and produces as many alternations per rev－ olution as there are poles． or half as many periods． one of these alternators With ten poles making 1.200 revolutions per minute will pruluce，therefore． 100 periods per second．The iron cores in alternator armatures dissipate considerable energy，even when well laminated and made of the best wrought iron． It is for this reason that many altemators are built without iron armature cores．They are generally disk－like in form， and must be made as thin as possihle in order that too many ampere－turns may not be needed on the field fur pro－ ducing the necossary regree of magnetization through the air gap which the armature oceupies．The field of alterna－ tors is usually exeited by means of current generated in a small auxiliary direct－current dynamo．

The commercial etheiencs of a dyamo is the per cent．of energy given up to it in the mechanical fom that is received from it in the electrical form．Well－made dynamos have a commercial efliciency of 90 per cent．American dynamos ascraye in weight 100 lb ．to the electrical horse－frwer ont－ put．

The following are the most important faets in connection with the histury of the dymamo．Fararlay in 1 道 1 discovered the electru－lynamic induction of currents．Jacol，Brett in 1848 suggested the use of the induced currents for increas－ ing the strength of the magnets used in inducing them． Dr．Werner siemens in 15.50 developed the siemens shattle armature，by which greatly augmented effects were obtained． l＇acinoti in 1864 gare us the first mondern armature with a commutator amb commeted conductors，that made possible the generation of an unfluctuating current by mechanical muans．Cramme in $18: 1$ produced the ring－armature with its commutator，substantially as used to－tay．In 1873 Ilefner Alteneck give us the modern drum－armature．From this time on dynamo－electric maehinery has enlisted the serious thought and attention of a host of engineers，by
whose combined efforts it is rapidly being brought to a high stage of development．

Harris J．Ryan．
I）ynamom＇etex［from Gr．$\delta$ b́vauss，power $+\mu$ ќтpov，meas－ ure］：an instrument or apparatus for measuring energy ex－ erted or work performed．Any contrivance may be so ealled which indicates the intensity of a force used to produce motion．The work done is found bs multiplying the mean effort thus indicated into the space passed over br the point where the force is applied．A dynamometer nas record only the intensities of the force，space being ascertained in－ dejendently，or it may record both force and distance trav－ ersed．A spring attached to a plow－beam may by suit－ able mechanisin，be made to record the rarring force of traction，and thus become a dynamometer．The mean force shown by it．multiplied into the length of the furrow，will give the work of the animals drawing the plow．Prony＇s friction dynamometer is the form most easily applied to re－ volving shafts．A flexible band．enreloping either the shaft or a drum turning with it，resists the driving force by its friction．The resistance is measured by a weight required to keep the band from turning with the shaft，and this weight，moltiplied by the circular distance through which it would have been carried in a given time if it hat revolved with the shaft，gives the work of the prime－mover．II irn＇s torsion dymamometer measures the force applied to a shaft by the toision caused by such foree in the shatt itself．This dynamometer was an ingenious device，but has not been applied to any extent in practice．The torsion dynamon－ eter and the spring drnamometer are best suited to meas－ ure variable forces，bint there are instruments of this class in which force is measured by the resistance of fluids driven through small apertures．For measuring the work of fluid pressure，the steam－engine indicator is the lynanometer in common use．In this the pressure of the fluid upon a small piston is resisted by a spiral spring．A pencil which moves with the piston traces upon a moring slip of paper a curre， of which the ordinates give the pressure，while a straight line perpendicular to these shows the distance nassed by the surface pressed．The mean pressure multiplied by this dis－ tance gives the work done．Transmission dynamometers are intended to measure work transmitted ：as，for example， the work transmitted by belts．

W．P．Trowbrivge．
Iyne：the absolute unit of force．（See Dřsurcs；also Unirs．）Forces are measured by means of the motion which they are carable of imparting to matter．A dyne is the force which applied to a gramme（mass）for one second of time will impart to it a velocity of 1 cm ．per second．In other words，a dyne is the force which acting upon a gramme of matter gives it a mit of acceleration．The poundal，a force unit used to some extent in the Britisl empire and in the U．S．，is equal to 13.625 dynes．

E．L．Nichots．

## I）yryachinil：See Durazzo．

Dyscra＇sia［from Gr．бuбкрабía：$\delta u ́ s, ~ b a d+к р a ̄ \sigma t s, ~ m i x-~$ ture］：in medicine，a morbid condition of the body in general．anciently thought to he due to disorders of the hlood and humors of the bodr．whenee the name．Sec Cachexia．
 bowel：］：a fehrile disease，characterized ty paroxysms of pain in the bowels，and by seant though often frequent bloody，mucous stools．The glands and tissue of the harge intestine are inflamed，and sometimes，though rarely，the small intertine shares the disorder．It may be acnte or chronic，and is a frequent and formidahle disease．especially in hot elimates．It is sometimes epidemic，and then is pe－ euliarly fatal among chidren．Many times it attacks and decimates armies．Sporadic eases in civil practice usually recover with little treatment．Dain is relieved by opium or I）ofer＇s powder．Gentle purgatives are extrenicly useful． Finemata of warm water will often relieve tenesmins．As－ tringents，ipecae．opiated starch injections，etc．，are useful adjurants in some cases．
Niemever rerarls epuctemic dysenters as a disease distinct from the common or sporadic dispase．IIe considers it truly infections．The severer cases of this disease are not muel bencfited hy treatment．Eren the mild cases are apt to as－ sume a clutonic form，Which may prove fatal．＇Jhis disease is akin to cholera，and perhaps to intemmittent fever．It is condemie in Southern Europe．Certain dysentery－like diar－ rheas oceur in Egypt，and are cansed by a trematorle worm （Bilhurzia h（emalobium）in the intestinal walls．The cause of some forms of dysentery is now thought to be a form of
 cral andearances of ordinary water amobs.

## levined! ly Whatas l'smpre.

 fora. flow]: [nintul and elitlienlt menstruation. It may bu varionsly eaucol, ats (1) by flexion or di-pharemedt of the uterus, in whieh erve the proper tratment is the restitution of that urgan to itw normal position: (e) by an exoromively or morbidly excitable nervous emmlition, inst retievent bis sedatives at the time of attak, and by sujporing treatmont able correet lyorienic regimen; (3) repentedly hy uterin" rhenmation, in which ane it may require the treathant appropriate to rhemmatisun ; amd (4) by a varioty of othor lexal tronbles which may rexuire special tratmont.  $+\pi \in \pi \tau \delta s$, Jartic. of $\pi \epsilon \sigma \sigma \in ⿺$, soften, rijuen, coonk, wigest]: a elisordered state of the stomach, attended by a grat variety of symptoms. Itysuepsia may be a purely functional dis-easc-that is, miy bo unattermed by any structural alteration in this organ-amd such is inoubtlews often the caser. On the other hamt, the lisorlived state of the stomach may be the expressiom of the orgatic diviase, or may be the result of liserase elsewhere, affecting the stomath secombarily. The symptoms of ilyspepsia are as wodl hown as they are rarici, and aceordims as onw eroup or another predominates. difterent forms of the disase have been deveribul. T"he feeling of weirht after cating. flatulence. Jeartburn, of [yrnsis, coated tongue, comsipation, headache, and qeneral malatise are amoner the common symptons. In some cases in which there is artublly an intlamed condition of the stomach, gastrilis, mure or less pronotneed, the diseomfort after eating may be immediate, and may amonnt to serere pain; there is apt to be vomiting. ant the tomerne is lumrily contol. Casco of acute gastritis are not semerally peckoneal with dyspepsias, hat onfy the subaente and chronio forms. 'J'he term catarrhal dyspepsia is aplolied to such casos. In other cases flatulence is marked, all foml rapirlly malergoing fermentative decompusition with jroduction of gans: the stomach is distended. Where is great discomfort or pain, constant helching and sumctimes romitines: the pressure on the diaphragin way influence the heart amil lead to palpitation or intermittent action. The term flatulpht dyspepxit is apphied to surb cases. lin a thiral gronp of casts the symptoms of the disease partake of a nervous character, such as heataches, depression, collicky or menmadere pains in thas somath (fastralgia), tremulous, ghacel tomgu* and is.neral hwryons disturbance. The term uerrous dyspepsia is sometimes usid to dewignate these cases, which not infrequmtly bobng to a class of indiviluals in whon there is a general disturlanter of nutrition and assimilation, bearing a more or less close pelation to goat, and calleal lithemia, a condition in which nervols dyspepsia, vague rhemmatod pains, headaches, hopression of spirits, with urie acid or wrate deposit in the mrinis, play a prominent part as symptomi.

Thus it will be seen that the symptoms of dysuepsia are extremely variond, and the question of mmberlying vase so dillienlt as to tax the best skill of tho physioitu. ln ald cases it is of first importane to appreciate the vise of sy: tom or of habits lambing the malaly, and to eradicate this if possible. In many instances it wifl be fommd that fanlty habits with reference to fond lie at the root of the tronble. lmproper or improprery varim fond, coarse indisentible articles, rapin eating, with insulficient mastic:ation, banl tweth,
 rection. The foonl shombl be plain and wholesom", varial to an extent from lay tor dis, eaten shwly ame well ehewerl. [obl water slembl be taken only in suall amount.

In rugard to medicimal treat mont. tho mest important indieation is to avoid excessive medication. At times the sympoms require phliative remedies, rarely can moch pro manent gomal be done by drug: alone. If there be mand tendeney to formentation, carbolic or wak iniseral arobla act wedl by preventine the growth of the micro-oramisme
whish canse alemompusition. If the stomach lse irritable,
 pation is matkerd, the frome shombl he regralatiol to oblsiate this: lant pereryation modicinos must be amided as much as possible. When the inetion of the stonath serems functionally slucrish, stomathos, such as stryohnia, "pusuine, amb similar bittore may dos enot. P(0) ain and other digeatants may be nevled, but are to lo uscal sparingly.

(pron. $\rho \rho$ ): the fifth letter and seennd vowel of the Roman and of most modern alphabets. The Greeks hat two vowels represented loy the Latin e-the one short ( $\epsilon$. epsilon), the otlice long ( $\eta$, efor): e stood for the number $\overline{5}, \eta$ usually represented $\&$. The sanskrit has only one $r$ : this is always long (see SusskRIT), aml is usually represented in the Western languages by e circmmtlexed ( $\dot{\sim}$ ). In the Arabic and Persian the vowel fothor (see Aramian LaNGuage), being a somewhat obsemre somul. is often represented in the European languages bre é (short), thongh it properly corresponis to short ă: thms we mar write el-horan or al-Foran for the Foran, er-reshieed (rashîl) or ar-rasheed. the surname of Jlarun (Haromen), the celebrated Calipla of Bagdad. In like manner, the Arabian prophet's name may be written either Mohammot or Mohammul. The Arabs have no vowel sound corresponling to long $\bar{e}(e ́)$. although this frequently oceurs in the Persian.

In most of the modern Furopean languages e occurs more frequently than any other letter. This remark is espeeially true of the French and Engrish. One reason of this is that $e$ (mute) in these languages nsually replaces the terminal letter or Ietters of Latin or (ireek words, as in the following nouns: fame, frona the latin fama; muse (lat. musa; Gr. $\mu$ ой $\alpha$ ) : plume (Lat. pluma): bile (Lat. bilis): cone (Lat. contó; (ir. кйvos); frare (lat. facıes); so also in adjectives, as prone (Lat. prones) : pure (Lat, purts): rile (Iat. rills). etc. All the foregoing derivative worls are French as well as English. In a tew instances the final e, thoush found in English. is onitted in French; as pine (Lat. pinus: Fr. pin) ; wine (Lat. "incu; Fr. win), eto. but more frequently the reverse oceurs, particularly in adjectives; thas we have arid (Lat. aridus; Fr. aride) ; aridl (Lat. aviluts; Fr. (ulide): limd (Lat. lividus: Fr. lizide). etc. For the different sounds of $e$ in English, see Prosusciation.
$F_{1}$ in music is the third note in the diatonic natural scale of $C$. The seale of $E$ major has four sharps in the signature; that of $\mathrm{l}:$ minor one sharp; and C sharp and F are their relatives, major and minor. E is the keynote of the "Phrygian" mode in the old Greek srstem of tonality.

Eachard. echard. Jonn. D. D.: clergyman: b, in Suffolk, Fingland, in 16:36. He betame a fellow of Catherine llall, Cambridge, in 1658, and master in 16\%5, in succession to Dr. John Ligrhtiont. Je wrote The Gromud and Occusions of the Contempt of the Clergy and Rrligion Enquired into (1670) and a Dinlogne on Hobbos's sitate of Juture (16\%\%). lle was a writer of considerable hmor, but of no great ability. 1). in Oxford, July $7,169 \%$.
 United Prasbyterian Churdi; b, at Alva, Stirling-hire, May 9, 18 to. IIe graduated at the University of Glasgow. stmolied theology in the seminary of the United Presbyterian Chur.h. was appointed pastor of the Cambridge Street clarch, frlasgow, in 18:35. and in 1843 Professor of Bibliral Literature in the United secession Disinity IIall, Fanhbrgh, contimuing to live in Glasqow. In $1 \times 63$ he formol the new Lansdowne church, in lilasow, of which he was minister until his cleath. Eads, eedz. Jayme Berhanas, I.l. D. : eivil engineer: b. at Lawrenceburg. Ind.. May 23, 18:0. From childhond he was eager to learn, and slowed great mechanical ingennity. IWhile a mere lad he built and equipped a miniature steamboat, and a few years later invented a diving-bell boat for rceovering wrecks, which brought him an anple lortune. He built the first ironclad steamer used in the L. s. nary, and was instrumental in putting the first lleet of irnnelaris on the Mississippi (1861-62). Me completed the construction of the St. Louis bridge in 18 it (see St. Louts), was engaged for several years in building the jetties at the months of the Mississippi (see Jetties), and in 1899 prepared jlans for a ship-railway across the Isthmus of Panama (see Sump-Rallway). The Alhert medal was awarded to him in 1884. D. in Nassau, Bahama islands, Mar. 8. 1887.
Eagle [M. Fing. egle from O. Fr. egle (Mod. Fr. aigle)< Lat. aquila]: the popular name of several species of large rapacious birds of the onler Paptores and family Falconide. They belong to the senera Aquila, Haliaütus, ete.. und are characterized by hooked beaks and sharp, powerful claws. Ahout seventy species are known. They hare great powers of flight and of vision, are diumal and solitary in their habits, and use their claws in killing their prey. "The eagle was regarded by the ancients as a smmbol of royalty, and has the proverhial distinction of being the king of birds. Large suecimens measure about $3 \frac{1}{2}$ feet in length, and 9 feet from tip to tip of the expanded wings. Eagles usually breed in mountainous districts or forests. remote from human habitations. Thes are all monogamous, and it is said that a pair will live together in perfect harmony until death separates them. They mikl their nests on a high tree. a ledge of rock, or on some inaccesible eliff. The nest is inartistically constructed of sticks, which are rudely arranged. The eagle is supposed to live to a great age, more than one hundred years.
The golden eagle (Aquilu chrysmetus) is a magnificent bird foumd in Europe. Asia, and North America, deriving its name from the solden-red color of the feathers which coter its liend and neck. The plomare of the boty is a rich dark brown. This species is the largest of the European ragles. It feesls on hares, lambs, pigs, fish, cte.. which it cerrices to its nest. When in pursuit of its prey it is very audacions, and has been seen to carry off a hare hefore the noses of a pack ut hounts.

It is stated that the groden eagle can be tamed, and has been trained to ratch game for its master. The tlimht of this bird is very gracoful, and presents an interesting spectacle. It sweep through the air in a serjes of spiral curves. rising with every eurve, and making no perceptible etfort or motion with its wings. The impreial cagle (fquila imperiatis), which inhabits Asia and sonthem Europe, is mearly as lare as the golden eagle, and is similar in mprearance. It may be distinguished trom the other species by the white pateh on its seapulaties. Its head ambl neck are conereal with feathers of a deep fawn color. It generally builds on lofty fross.

Much mone common than the golilen easple is the seapagle (Ilclicullus albicilla), also called the white-tailed and the cinereous earle, beeanse the ablalts have a grayish-lrown color, with pale hrath. yellow hatak, and white tail-characters of plumate which. howewer, the foung ones do not assume

 large．

Tammals always have the internal and middle ear complete, and mostly also an external ear. This is slight, however, in diving quatrupeds, as the otter and beaver, and wanting altogether in the whale, seal, mole, ornithorbynchus, and armadillo. several aquatic animals have a valve near the entrance of the external meatus or canal of the outer ear. which closes when they are under water, protecting the membrana tympani against excessive pressure. The dephant also is provided with a sort of valve or ear-flaps Bats are endowed with vers large and sensitive external ears. Hany quadrupeds (e. g. the horse and dog) have considerable muscular power over their ears, by which they ean turn them so as to receive sound from different directions. Yan has three rudimentury muscles of the same kind, but ther are commonly powerless and without use.

The Iluman Ear. - This ennsists of three distinet though connected parts--the frternal car, the middle ear or tympanum. and the internal ear or labrrinth.

Of the outer ear. the expanded part is the pinna; its prominent rim or margin is the helix. The ridge next within this is called the anti-helix: it dirides above. Its lower and front part encircles a cavity, the concha, below

The human ear.
which are two opposite prominences, tragus and anti-tragus. The lower, soft, flexible part is the lobule. The whole external ear, except the lobule (which is formed of fat and conncetive tissue), is composed of cartilage covered with skin. सell supplied, however. with nerves as well as bloodressels. The entrance to the ear is the meatus auditorins externus. It is about $1 \frac{1}{4}$ inches long, directed forward and inward, slightly curved. Xear its orifice are the ceruminous glands, secreting the ear-wax. At the bottom of the meatus is the membrana tympani.

The middle ear or tymbnum is a sort of drum or hollow organ, containing air, and through its midule a small chain of bones-the mallens or hammer bone, the incus or anvil, and the stapes or stirrup. The trmpanum commonicates with the throat (pharyns) br means of the Enstachian tube. The fenestra ovalis, or oral window of the trmpanum, is a membranous partition between the internal part of the tymbanic earity anl the vestibnle of the labyrinth or internal ear. The fencstrit rotmmla is a round, membranous "window " between the tympanm and the cochlea of the labyrinth. Three muscles are asserted by most anatomists to exist in the tympanm-the tensor, tympani, laxator tympani, and stapmins: The second of these is considered by some to be only a ligament. In important part of the mildle ear, in grown childern and alults, is the mastoid process, It contains the mastoid celle, which communicate with the tympanum.

The internal ear is composed of the restibule, cochlea, and three remicircular canals. The restibule is the midale portion. the cochlea is anterior. and the three canals are above amd hehind the vestibnle. Within the latter are two small bulies the otoliths, or ear-stones, composed of carbomate and phosphate of lime. The semicirentar canals always differ dofinitedy in their direction, two being vertical and one hotizoutal. 'The corllea is shaporl somewhat like a snail shefl. lu its center is in conical bony axis, the modiolus. Aroumd this is a spiral canal, within which is the lamina spiralis, partly composed of bone and jurtly membranous. This divides the canal into two passages or scale -the upper mommionting with the vestibule, seala vestibuli, and the lower communienting through the fenestrat
rotunda with the trmpanum, scala trmpani. The bons part of the lamina spiralis has a grooved margin, the uppermost elge of which, toward the scala vestibuli, supports a finely toothed membrane, lamina denticulata. From each

of these margins of the lamina spiralis is given off a fine periosteal layer-the upper one of the membrane of Corti, the lower the basilar laver. Between these is a space called by Kolliker the scala media. Within this space are arranged two sets of minute, rod-like bodies, paraliel to each other, radiating from the axis of the cochlea, those of the two sets being inclined toward each other above. These are the rods of Corti. Looked at in a certain direction with the aid of a lens, they resemble somewhat the kers of a piano.
The whole inner surface of the bone labrrinth is lined by a fibro-serous periosteal tissue. This secretes a thin fluid, the perilymph. The membranous inuer labyrinth, which duplicates, as it were, the osseous wall of the vestibule and semicircular canals, secretes a similar liquid, the endolymph. The auditory nerve (portio mollis of the "seventh pair" of cephalic nerves, according to anatomists) is subdivided into branches, which are distributed to all the parts of the internal ear. Those filaments which enter the cochlea form a sort of ganglionic plexus in the scala trmpani : thence proceed some very delicate nervous extremities which in the scala media are brought into relation with the rods of Corti. and probally also with certain large nucleated cells in their vicinity called the cells of Claudius. For physiology of auditory apparatus. see Acoustics. See also Treatise on the Ear, by D. B. St. Jobn Roosa (New York, 1866).

## D. B. St. Jome Roosa.

Ear. Dispases of the: Foreign borlies frequently become lorlged in the auditory canal, as when children put beads, buttons, or other small objects into the car. or when it is entered by insects. The canal is also sometimes obstructed by cernmen, or ear-was, which mar accumnlate in great giuantities, so as to occupy and ocelude the passage and exclude sounds. It mar press on the membrana tympani (drumhead), the membrane separating the external canal of the far from the trmpanum. It is a most frequent cause of deafness. Cerumen is to be removed by the surgeon by the ear-syringe and warm water. A solution of hicarbonate of soda ( 1 drachm of soda to 6 oz . of water), used for a few hours before will greatly assist in the removal. The auditory canal is frequently the seat of little abscesses, or "boils in the ear." They are painful, though not dangerous, but their presence generally indieates a low condition of the general systom. For a time ther occlude the passage and canse impairment of hearing, which sobsides with the pain when the abseesers discharge. The treatment should be warm poultices and fomentations to the region of the ear, leeching in serere cases, and free use of hot water hy means of the fountain syringe, until the boils discharge. Incisions are sometimes necessary. The membrana tympani or drumheal of the ear may be injured by the introduction of sharp instruments, or ruptured hy sudden impaction of air, compressing it from without, as by a box on the ear, the noise of a lome explnsion, as of blasting, cannon, or even firearms. It may also be mptured by air from the throat, through the Eustachian tube, suddenly and forcibly pressing from within, as in violent blowing of the nose, vouiting, and paroxysms of whooping cough. sinch ruptures usually heal, Clecrative perforations may be minute, or include nearly the whole membrame. Often, if the Fustachian tube be not closed, a person can blow air from the throat through the perforated drum into the extemal, anditory canal with a perceptible sound. An artiticial drumhend or membrana tympani of hard rubber can be worn with benefit in a limited number of cases. A pellet of moistened cotton wool introduced eath day in at measure effects the same result.

The chief intlammations of the ear are thas that extend from the Clroat and none by the E＇ustachian tulse to the tympanam．They may be cutarthat of go ont to become purulent．In the hate en case the pus usmally heaks through the drumhead and canses a discharge of jus thatpear in the external canal of the ear（Otorrhom）．The catarthat form is best treated by the hot doncle to the anditory canal， and if this does not suthice the pain may be redievel by leeches．When the pain has sulsited，intlations of the tym－ famm Ly Politzors motherl should be practiced daily intil the hearing is restored．The purulent form is to be ireated by constant remowat of the jus，by shmging with hot water， and abo log intation of the tymumum．The athlory nerve is sometimes the seat of distore as a result of corntral in－ flammations，tumors，or the like．Inflammations，tumorsand hatmorrhares，syphilis．as well as the exetssive use of quinine in large doses，salicylic acid，wintergreen，may also profluce disense of the aconsio norve．P＇ersons in middle and at－ vanced tife sometimes suffer from impairment of hearing． which is protably due to shriveling or dryness of the tissues．This form has been callet preshyliousis（Rosa）， There may le a neuralgia of the ear with no apparont lesions resulting from deeayed teth or malaria，hat it is rare．Most of the painful aflections of the cat ate inflam－ matory in character．Diseases of the middle ear may be readily differentiated from those of the nerve or brain by the use of the tming－tork $(\%$ ．When such a vibrating tun－ ing－fork is placed in front of the external canal of the car． if there be disease of the nerve it is hard longer and londer than when placed upm the mastod process hehind the cerr． In diseases of the nerve the patients，like persons with normal hearing，hear better in a quict phace．＂Those who have discasc of the tympanmor or midhle ear hear botter in a moise．sometimes the catarrhal or purulent inflammation of the tympanmu extends to the mastoid cells．Should this becur this part of the ear becomes very painful and tender． If not very sperdily relieved by the use of leeches or punl－ tices，a surgical operation for opening the mastoid cells will be required．

Ear-shell: the shell of various marine gasteropods of the family Haliotide: found principally in warm regions.

The flesh, thongh tough, is ellible. The shells are used hy savage races for money and ornaments, by civilizel man for various kinds of ornamental work, and by the Japanese and Chinese ther are largely employed for inlaying laequer ware. On the Pacific const of the U. S. the shells of the ILatiotis are known as abulones, and there is an extensive fishery, chiefly carried on by Chinese, for the shells and the thesh, which is salted, dried, and exported. The genera and spedies, living and fossil, of this family are numerous and widely distributed.
F. A. Lucas

Earth, The: a planet of the solar srstem, the third in order of position. As the dwelling-place of man it is the subject of his most attentive study, which study constitutes the science of gengraphy. (See GEograpry.) It may he considered in its relatious to other globes, and in itself. Yiewing it as an individual, we may give attention to its form and dimensions, its mass, its densities. its temperatures, its composition. its physical constitution, its magnetism, its envelopes. its inhabitints, and the history of its evohution.

1. The Earth in relation to the L'niverse and the solar System.-As a star the earth belongs to the non-hminons gronp. It shines only by reflected light, and would be invisible to eyes like our own looking from any star more distant than the planet Jupiter.

As a planet the earth belongs to the inner group of four. its orbit lying without those of Venus and Merenry and within that of Mars. (See Solar System.) lis two principal motions are rotation abmut an axis and revolution abont the sun. Its period of rotation, known as the sidereal day, is 23 hours 56 min . and $4 \cdot 1$ sec. Its period of revolution, known as the sidereal year, is 365 days 6 hours 9 min . and $9 \cdot 3$ sec. (See Day and Year.) The axis of rotation is not vertical to the plane in which the orbit of revolution lies, but is inclined from the vertical at an angle of $23^{\circ} 27 \frac{1}{2}$. This angle is subject to a small and very slow variation, rancing from 22 ? $2 \frac{1}{2}$ to $29^{3} 33 \frac{1}{2}$. The direction toward which the axis inclines is likewise contimously changed, sweeping through it complete circle in about 2600 fears. This tuovement is anangous to that of an inctined top, which, while swiftly spinning, moves its axis slowly about an imaginary line rising vertically from its point of supurt. (See Precession of tife Fultinoxes.) L'pon this motion is superposed a sinaller, known as the nutation of the earth's axis. These axial movements are caused by the attractions of various hearenly lodies acting on the protuberance of matter about the earth's equator. A third small movement differs from the others in that the relation of the axis to the carth is changed, while its relation to the plane of the earth's orbit is mamered.

The orbit of the earth is an ellipse so nearly circular that its longer and shorter diameters differ only in the ratio of 60 to 59. The sun, being at one of the foce of the ellipse, is at a distance from its conter erpal to the 1 星th part of the diameter. The hast listane of the earth from the sun, at prerihelion, is $91,200,000$; its greatest distanee at apherion, is 1 t. 400,000 miles; its mean distance is 92.80000 miles. All these clements. except the morn ctistance, are subject to grahal but great variations, and the position of prihetion slowly revolves aluat the sum, consuming in a somplate cyene more than lom,000 yans. The mean velocity of the eart h in its journey arom d the sun is 1.108 miles per minnte. or $18 \frac{1}{2}$ miles per secom. The velocity with which an objeet
on the equator rotates about the axis is $1,3.3$ miles per minnte or 1,520 feet per second. The carth's mass is the $32 \%$. 000th part of the sun's, and is eighty-one times that of the moon.
The moon revolves about the earth in a slightly elliptic orbit at a distance of $\mathbf{8} 58.850$ miles, or about 30 terrestrial diameters. Its period of revolution is 27 days $7 \frac{3}{4}$ hours: its synodical period, or the mean interval between conjumetions with the sun, is 29 days $12 \frac{2}{7}$ hours. See Moon.
The solar system is separatel by in immense interspace from all other visible stars, and hetween its members there subsist numerous orderly relations pointing to community of origin. The planes of the orbits of the eight planets coincide nearly with the medial plane of the solar system (the "in rariable" plane), the most aberrant being inclined but $7^{\circ}$. The average inelination of the orbit planes of the 280 determined asteroids is 8 , and that of the most aberrant is 35 All these bodies revolve about the sun in the same direction, and sodo 16 of the 21 discovered satellites. The only bodies constituting exceptions to the gencral rule are the four satellites of Tranus, whose orbits incline about $90^{\circ}$, and the satellite of Neptune, whose motion is retrograde. The directions of rotation have been determined for the sun, the moon, and four of the planets, and these directions not only agree with one another, lut they coimeide with the direction of orbital revolution. These elements of order, to which may be added an approximate harmony in the series of intervals between planets, compel the belief that the assemblage of bodies is not fortuitons, and render plausible the hypothesis of Laplace, that all were evolved by the gralual condensation of an immense, rotating, nebulous mass. (see Nebular llypothesis.) This condensation is supposed to have left each glohe highls charged with heat, which is being gradually dissipated by radiation, and accordingly the sum, the greatest body of all, is now intensely hot; thaces of heat are believel to have been detected in the limht of the greatest planet, Jupiter : no such traces are afforled by the smaller planets : and the carth, which we can examine more thoroughly, is fomm to have an intermal store of heat. Accepting this hypothesis as more probable than any other, we are enabled to reason in regard to the early history of our clobe hefore the beginning of the long series of superficial changes constitnting the field of geologic research.
2. General Form and Dimpnsions.-The earth is a globe with a diameter of about 8.000 miles. Its form approximates closely to an exact sphere, but is slightly flattened on two sides, so that its diameter from one of those sides to the other is about $2 i$ miles less than in a direction at right angles to this. In technical terms, and more precisely, its figure is an oblate spheroid of revolution, with a mean diameter of $5,91 \%$ miles, and a thattening of $\frac{20}{25}$. The shortest diameter coincides in position with the axis of rotation, and the longest diameter passes from any point of the equator to the opposite point. Theoretically, a globe of any mobile material poised motionless in space and beld together by the mutnal attraction of its particles should assume a spherical form. If enduwed with a motion of rotation, the parts remote from the axis of rotation should tend to Hy off from the axis. and this tendency, combined with gravitational attraction, sheukd give to the mass the form of an oblate spheroid similar to that of the earth. The dimensions of the terrestrial spheroid, as determined by measurement (see (ieodes ), coincide closely with those theoretieally deduced from the relation of its relocity of rotation to gravitative force.

Dimensions of the Earth.

f. Internal Temperatures--Each tay while the sm shines all parts of the sufface acquire heat from the solar rays. At all times both lay and night, heat is radiated from the surface outward. As a result of this unequal heating and more equable cooling the surfaces of ruck and soil grow warmer during the day and grow cooler during the night. Similarly the soil is gradually heated during summer and is gradually conled during winter. These variations of the surface are communicated downmard, but with diminishing amount, so that at a short distance beneath the surface they cease to be perceptible. The diumal changes affect but a few feet of soil or rock; the annual changes a few scores of feet. Beneath the zone of annual change a constant temperature is found, and this ennstant temperature coincides closely with the mean annual temperature of the air immediately above. It raries therefore with the local climate, and is higher in equatorial regions than in polar. Passing further downward by means of an artiticial excavation, such as a mine or artesian well, a gradual change is foumd, the temperature of the rock increasing more or lexs uniformly with the depth. The rate of increase varies in different places, ranging from one degree Fahrenheit for each 150 feet of descent to one degree Fahrenheit for each 30 fect. The general or normal rate is perhaps one degree in in feet. The water which rises from deep artesian wells retains the temperature of its source, and is invariably warmer than the ordinary spring water of the loeality.

Similar evilence as to internal temperature is afforded by springs. If in any district the average temperature of springs issuing from the rock is compared with the mean annual temperature of the air, it is lound to be somewhat hishler; and wherever the relation of the spring to the rock structure indicates that the water has risen from a considerable depth beneath the surface, its temperature is notahly hiyh, so that the spring is classed as thermal. Other evidence of the same tenor is afforded by voleanoes, which bring to the surface from unknown depths not only steam, requiring for its production a temperature of $212^{8} \mathrm{~F}$, but molten rock with temperature of $2.010^{2}$ and upward.

These facts show not only that the interior of the earth has a higher temperature than the exterior, but thes show that there is a movement of heat from the interior to the surface, whence it is dissipated by radiation. It is a law of physies that where two bollies in contact have different temperatures, heat flows from the wamer to the cooler, and this flow contimes unti\} they have the same temperature. The progressively higher temperatures found at progressively greater depths from the surface demonstrate that there is an upward llow of heat. Heat is also brouglit to the surface by the subterranean flow of water. The water of each thormal spring was originally terivel from rain, and penetrated the earth at localities remote from its point of issue. As it entered the earth it had the temperature normal to the surface at the locality. In its subterranean course it received home from the rocks, and its acopured heat was eonveyed to the surface. Similarly the heat of lavas. derived from the terrestrial store, is brought to the surface and there dissipated by radiation. All the phenomena of wells, thermal springs, and voleanose are phemomena of the tervestrial crust. They tull us nothing directly of the temperature of the nuelens: but they are in full accord with that portion of the Laptacian hymethesis which supposes that the whole body of the earth was originally int cmety hot, and that the lost portion of the original store of hat has been gradnally disiputed at the surfacl. It may plasibly be assumed that the temperature continues to incrase downward for an inlefinite distance, the rate of increase gradually diminishing; but any more definite hypothesis with reference to the distribution of intermal heat must be haved upon special postulates as to the molecular comition of the melens and the
are, moreover, protountly i,nnorant as to the laws affecting the rate of movemant of heat in bodies snbjected to temperatares and presures far beyond those which can be rejroducce in our laboratorios. See liefrigeration of the jiantir.
7. Density and Metss.- Mhe density of a body is the ratio of its weight or mass to that of an equal volume of water. The data of astronomy, in conjunction with the daws of gravitation, give the proportion of the mass of the earth to the masses of the sun and the prinerpal phanets, and thus the determination ot the absolute mass of the earth will determine the absolute matises of the smind planets, and then their density can be found. The densities of the more important kinds of roek reange from $2 \cdot 3$ to $3 \cdot 1$, and the mean density of the visible portion of the crust, as determined from mans samples of roek, is approximately $2 \cdot \sigma_{\text {. }}$ As all subatances are more or less eompressible, we must suppose that the lower parts of the crust and all parts of the mueleus, being pressed mon by the weight of overlying portions, are compressed into less space and therefore have greater density than the superficial portions. The conelusion thus indicited by theoretieal considerations hats been amply sustained by the results of measurement. The subjeet has been appproached in various ways, depending for the most part on the eomparison of the earth's attraction with the attraction exerted by some smaller body of known mass. In the earlicer experiments the mass useal for comparison was that of a monntain or hill whose form was carefully measured. and whose density was determined br weirhing mumerons samples of rock. By means of astronomic observations the direction assumed by the plumb line was ascertained on each side of the eminence, and their eonvergence was determined. It was assumed that in the absence of the mountain ther would eonverge so as to meet at the center of the earth, but that they would be drawn together by the mountain's attraction so as to converge toward a point nearer to the surface, and from the observed convergence it was found possible to compute the relative attractive force of the mountain and the earth and thence to deduce the mass of the earth. In 17TS Maskelve and IIutton, from observations at IIt. Schiehallion, in Seotland, deducer 4.5 as the mean density of the earth. Subsequent determinations of the mass of the mountain and recompntations based on these gave to Playfair and Itutton sererally the densities $4 \cdot \%$ and $5 \cdot 0$. Similar obserfations at a hill near Edinburgh, known as Arthur's Seat, afforded James and Clarke the estimate $5 \cdot 3$; and Pechmann, from observations in the Alps, deduced $5 \cdot 4$.

A second method of determination depended on pendulum observations. One of the factors determining the time in which a pendulum completes its oseillation is the force of gravitation, and when the same pendulum is swung suecessively at different localities the comparison of its oscillation periods affords a delicate indication of the relative values of the attractive foree at the localities. As the force with which borties are attracted toward the earth varies with reference to their distance from the center of the earth, it was thought that the comparison of the oscillation periods of the pendnlum at the top of a mountain and at its base, or at the entrance of a mine and at its hottom, might afford a raluable estimate of the earth's mass and density, provided due account were taken of the masses and distances of mountains and other superficial boties in the immediate vicinity of the pemblum stations. Ohservations of this eharacter have heen made by carlini in the $\Lambda$ lps, by Bouguer and I A Comlamine in "'ev. by diry at a colliery in England, by Nondenhall at the peak of Fujisan, in Japan, ant by Sterneek in the mines of Buhemia, the results for the llensity varving from $4 \cdot 39$ (Carlini) to 657 (Airy). In 1589 Wilsing made in important variation in the pendulum experiment by substituting for change of pusition an artificial clange in lueal attraction. Ile emploved for this purpose a large mass of iron, which he placed successively in varions jositions with reference to a pendulun. The density computed by him was 5 os.
All experiments involving the weights of mountains are to a certain extent unsatiofatory, first, because it is difticult to deduce from supertional observations a close approximation to the weight of a mountam: and, second, because there is reason to suspect that the portions of the earth's crust immerliately hemeath mountains hare less density than the portions beneatly leep vallers. As early as 1698 an experiment was devised ly (avendish which obviates this objection, A slemter woonten rod, having a small lead ball attached to each cud, was susjended in a glazed box by
means of a delicate wire，un aparatus constituting the tor－ sion batance of Conlomb．In a jusition of rest the rod hangs lewer than in any other position，and the tendency of rank－ itation is to maintain that fosition；but the extent to which the rod is lifted by a sanall rotation is sos slight that it is posible to induce rotation by means of the attraction of bodise execedinely smakl as compared with the earth．（＂av－ cuntish used twa limge balls of hal，which he catsed to ap－ promeh the opprasite emts of the badance trom opprosite sides． From the resultiner detlection he derturad a terrestrial den－ sity of $\bar{\pi} \%$ ．Sinberfuently various students reperated his ob－ servations with more refinel apparatus，ohtanimer for the

 by loyntiner substituted for the tursion balance a delieate bemm ecale and yiblded an estimate of $5 \%$ ．An experiment by von Jully dopended，like the permblum experiments， upon the variation of gravity with distance from the earth． II itha beam seale he first compared two balls of mereury in the usual way，and then compared them again with one resting in the sento pan and the other suspended about of feet beneath．Il is reall for the density was $5 . \%$

Considering the variety of methols by which the subjeet has leen appooteled，and the vast disparity in size hetween the earth and the varions botles with which it has been comparch，the resulting estimates are wonderinlly ancordant． The resints which command the erreat－ cit confidenco are those nbtaimed by the mothod of Comerndish with the aid of more retined apparatus． and those obtuinel by Wilsing．The final determination of Kavel」，5．5s，that of Porma and Batill． 5．56．that of IBaily as corrected by Cormu aud baille， $5 \cdot 56$ ，and that of Wriluing orss， give as a meats $\boldsymbol{\pi} \%$ \％． antl this may be re－ grarled as a more ac－ curate determination of the earth＇s mean donsity than it is jus－ sible ios make of the $^{\text {a }}$ mean density of any mountain mases or of the earth＇s arust as a whole．The combination of the mean density with the volume．as given above，yelds as the total Milss of the carth $6,660,000,000,000,000,0010,000$ tons of 2,000 11）．with．

The mean density of the earth being 5o\％and the superfi－ cial lemsity but $2 \cdot \%$ ，it is manifest that the central density is consislerably greater than the mean，bat the vertiond distri－ hution of densities is mot equally clear．We lave learned little of the compressibility of rocks，and we are wholly in－ norant of their compressibility at himh temporatures．It is quite conceivable that the numens is constituted of mate－ rials like those of the erust，and that thrir great density is due purely to condessation under proswure．It is equally conceivable that the tendency toward condensation due to presure is in the main connterbalanced by the tendeney toward expansion due to heat，and that the nucleal density of the earth arises from the preseme of substanees specific－ ally havy．It $\mathrm{l}_{12}=$ been suggestad hy sume that the oxy－ gen of the earth occurs only or chictly near the surface，and that the Hedens oonsists labely of metals in an moxidized comdition．If the nucleus enntains a series of different sub－ stances armared in the order of their specifiegravities，then the downward sucuession of densities way be characterized by a series of ubormpt steps，eonecrning wheh it is rain to sieculate．If，on the other hand．the densities are due pri－ marily to compressinn，then their sepmence should eonform to sonie continuous law．Such a liw，surgested by the as－ tronomer laplace，is that the downwarl inerement of den－ sit $y$ varies as the sipuare root of the increment of pressure． I＇isfulating this law aml assuming the superficial densily of the marth to be $2 \cdot 75$ and its meam density to be sinu，Mr． RR．S．Woodwarl has computed the quantities of the table given in the next column．

＊This is the maximum value，At the corresponding depth，bill miles，a given mass wouh have the greatest weight．

In the great survers of Euroge Rudia，and the Thited States，measumbuts of high brection lave leen cartid by the methad of triagulation over hroad areas．Thromgh these measmements it has been possible to compare with one anothor ast romomic olservations made at many foints． and one of the results of these comparisons is the knowheders ＂1）the fact，which has theen previnusly mentioneat，that the geond deviates at nearly all points from the form of the theoretice spheroid．In ofler words，it is found that the 1／lambl line at a majority of localitios is but strietly normal to the general spheroid．＂，int inclines toward one site or an－ other．This is found to be the case not only in the visinity

of monntains，where exeeptional attractive masses are wisi－ hhe，but also upon phins，where it must be assumed that the deviations of the phumb line are caused lyy local va－ riations in the density of the crust．From a study of them variations，and from it（c）－ordinate study of pendulum obser－ vations，it has been determined，first，that the crust of the earth is emppienonsly heterngoneons as regards density． varving rapidty and irregularly ；and，secome，that in a geri－ eral way those portions of the erust habenth continemts and phateans are less dense than the portions bemeath oceans．I conchusion of the same character is foached trom the study of the gencral distribution of lamd and water．As geogra－ phers usually divide the earth into two hemisplares．castarn and western，the eastem eontains much more land than the wextern：or it it be divided into northern and sothern hemisphores，then the grater amomit of land is fount in the northern．The inequality may be remdered still mose striking by a division into lomispheres such that England Shat occupy the center of one and a point near Sew Kat－ land the center of the other．As thus divided，th per cemt． of the former hemisphere consists of land，and only 11 per exnt．of the latter．（hee figure．）If the highest lands lay in the hemisphere having the smaller lame armand it the deep－ est neeans lay in the homisphere having the smallo water area， these facts might compnosate for the inequality in aroms； but the actual condition is just the reverse，In the hemi－ sphere with the greater area of hand the height of the land is nearly on－fifth greater than in the water hemisphere：in the aren charaterized by the greater extent of water the depth of the water is nearly wh－thiral greater than in the land homisphere．The molility of the water enables it 10 more frecly in any direction，and we must assume that its position on the surface of the globe is determined by the
earth's attraction: nevertheless we find that more than half the total volume of water is gathered in one hemisphere, and that the hemisphere containing the greatest continental masses fails to draw to it a due share of the water. There can be little doubt that the excess of attractive furce on the ocearic side of the earth is tue to exceptionally high density in portions of the crust or nucleus on that sile.

Condition of the Nurleus.-One of the most difficult inquiries alfecting the carth's nuclens relates to the question whether it is liquid or solit. Early in the progress of genlogic inquiry facts indicating its liquidity were discovered. and their sufficiency was not 'flestioned. Afterward, however, other facts discovered in the progress of physical and astronomical science were found to indicate solidity, and the question is still involved in serious donbt. The consiterations favoring the theory of liquidity are as follows: 1 . The rate of increase of temperature downward. if continued, gives at a distance of hut a few miles a sullicient heat to liquefy all known rocks. 2 . The roeks which issue from roleanoes are actually liguid. and have temperatures commensurate with those deluced from the progressive inerease fonnd in wells and mines. 3. Rocks brought to the surtace by denudation in various regions are crumpled and intricately folden, as though kneaded while in a plastic condition. 4. From time to time in the geologic history of the erust not only hroal tracts but narrow belts of the crust have risen, while others adjacent to them have gone down -changes which appear difficult of explanation unless the crust rests on a soft substratum.

The first consiteration adduced hy the opponents of the theory of liquidity is that most substances and probably all of the ortinary ricks, expand in passing from the solit ta the liquid condition and contract in congelation. For this reason liqnefiction is opposed by pressure, and a muci higher temperature is neccssary to melt a rock subjected to great pressure. The fact that subterranean substances are hot dues uot. therefore, of itself demonstrate that they are liquill. It must be shown in addition that their heat is sufficient to wercome the restraining tendency of the pressure to which they are suljected. In the second place, it is pointed out that volcanoes not only erupt lava that also cease ermption. and it is argued that, if the lava erupted were part of a molten mucleus, the conditions necessary to the production of an eruption shonhalso suffice for its continuance. 1t is also pointed out that eruptions at neighboring vents do not exhibit such harmony of action as might be expected if they commonicated with the same body of molten material. Eruptions at different points in a voleanic district are neither simultaneous nor alternate, but appear altoget her intepurdent.

The precession of the equinoxes. as fully explained in the article under that title, is due to a twisting of the earth by attractions of other bolies acting on that portion in equatorial regions which projects beyond the surface of the sphere to which the earth's figure approximates. The twisting is opposed by the inertia of rotation, or the tendency of every rotating boaly-such, for example, as a top or a gyru-scope-to resist the deflection of its axis of rotation. (See Gyroscupe.) The olserved amomet of precession seems to inply all the resistance which can be ascribed to the carth's mass, whereas, if a liguid spherical nuelens were surrounded by a solid crust, resistance would be aflorded only by the crust. The carth thus sems to behare as a rigish and therofore solid boely. This argument, originally adrancerl hy Hopkins, has been much thiseussed by physicists, and its force has been smewhat weakened by consilerations subsifuently atduced by Ihemensicy and Thompson. In argument in facor of rigility has also been drawn trom the phenomena of tides. These depend on the inequality of attractions exerted by the moon and sun on the parts of the cart h nemest and most remote from them, which inequalities temd to produce a smadl distortion of the globe. Benbtless some distortion is produced in the earth, but a greater distortion is piroduced in its apheous anselope, and the dith rence hetwerm the two finds expression in the octanice tides. If the arth, or all of it excepting a thin erust. were liguif, it would respond iredy to the deforming force and there would he no lisereparay hetwern its tiche and that of the atpuents andope. It has therefore been argued that the marth either is a rigid body or clse hans a rigide erust of greal thickness.

The appratent emilice hel ween the greologice data and 1he data commected with the attractions of celestial bodies has
probably depended in part upon the diffienlty which the mind experiences in passing from the consideration of small bodies and small amounts of force to the consideration of large bodies subjected to correspondingly great stresses and strains. In relation to such forces as we apply in the arts, the rocks of the earth are exceedingly rigil, resisting great stresses and fracturing in a brittle manner when their resistance is overcome; but when masses and forces are considered of the magnitude of those witio which terrestrial physics deals, all rocks are properly regarded as viscous, beharing in a manner quite analogous to those of such plastic substiuces as wax and elay. At a depth of 2 or 3 miles beneath the surface it is quite possihle that rocks may be molded into new shapes, not only without fracture, but even without losing the strength which they exhint at the surface. But while this and other considerations may contribute to a coneeption of possible physical conditions and possible physical processes in the earth's interior, the problen of the actual conditions and processes remains an interesting and important field of investigation.
9. Magnetism of the Earth.-It is the property of magnets that, when brought near together, they tend to assume certain definite directions with reference to one another. Whenever a magnet at a distance from others is suspended in such manner that it is free to turn, it is found to assume a definite direction with reference to the earth, and the carth is thus shown to be a magnet. 13y means of the compass, a slenter magnet so suspended as to rotate freely in a horizontal plane, the horizontal direction of the earth's magnetic force has heeu oberved in all regions, to the great advantage of the mariner. By means of the dip needle, a magnet so suspended as to rotate in a vertical plane, observations have heen mavle of the deviation of the magnetic direction from the horizontal. Through these onservations it has heen ascertainel that the norith pole of the earthmagnet is not at the pole of rotation, lut lies about 17 distant. in the archipelago $N$. of Pritish America; that the south magnetic pole is equally distant from the south pole of rotation, and that the focal directions of magnetic force intersect the meridians of longitule at angles which vary from phace to place and from time to time. See Magnetism, Terrestrial.
10. Contiguration of the Surface-In comparison with the earth as a whole, the irregularities of its surface are small: if proportionately represented on a glohe 15 feet in diameter, the highest mountain woukd project hat the bighth part of an inch above the lowest phain. But nuon the scate of nature, and when viewed with reference to the activities of man, they are of signal importince. The geographer refers all inequalities to the level of the surtace of the necan. expressing their vertical dimensions as heights ilbove and depths below that surface. Above that surface spring a number of broat. low swells. called continents; below it are sunk still bronder areas called ocean herls. The surfaces of the continents are diversified here ant there by projecting peaks and mountain ranges, betwern and about which lie vallers, basins, and plains. The wean beds are similarly diversified, but their features have a different nomenclature. The lowest hollows are known as deeps, prominences approaching the surface are called shoals, and eminenees rising above the surface constitute islands.
To the orimin of the greater inequalities of surface, those of continental and oceanic magnitule, science has yet olstainerl no clew, and no meaning has been disenvered in the form and arrangement of the continental prot uberances. It is evident that the outhines of the continconts themsel res denend not only upon the ennfiguration of the surface, but also upon the volume of the water by which that smeface is partially covered. If the earth had less water, or it it had morr, some other contour of its surface would he followed by the enast line, and the forms of the areas wonld be very different. little importance is therefore to be attaclied to the conclusions of those who seds to diseover homologies of earth structure by sturlying the outlines of land arets and comparing them with friangles and other geometrical figures. On the accompanying map contours are drawn nyon land areas and ocean beds nt vertical intervals of f,then fret, and the areas comprised between each pair of aljarent contomrs are differently shamed. Fach of these contours shows approximately the form which would be given to the coast if the valme of water in the ocean were either increasel or fiminished so that its surface stoor at the eorresponting level. Collectively, they show the distribution of the greater prominences and hollows of the
earth's surface. It will be obsorval that not only the highest moumains hot the greatest mplanse of mphand oxemr in the llimalaya district of sumbern Asit, and that the greatest of the oecan dowes lies at the sonthern extremity of
 contomer at $8,010 \mathrm{f}$ fet atmere the ocean-lebol, we see that the principal plateans and uplands of the land surface are arranged in a loner line beginming with the sonthern extremity of Suth Sucrica, following the western coast of the two Americas to Alaska. crowsing Asia from loastern Siberia to Arabia, with a great expanse in the "pibetan rempon, and eontimuing throngh linstern Dfricato it sonthern extremity: A branch of minor importance rums from Wistern Sisa abone tho shores of the Dheditermacati to the Alamtice ame a hromal outhor ovenpies the ishand of firemand.

Earth-closet: a form of close-stool, designed to take the place, to some extront, of the water-closet, and frequently made portable for convenience. It is well known that dry snils have wonderful disinfecting powers, owing to their property of absorling ammonia and other gases. It is upon this abzorbing quality that the nsefulness of manures. when applied to soil. dupends. Adrantage is taken of this absorption in the construction of the earth-eloset. The faees are covered by a small quantity of thoroughly dried soil or peat. which completely absorbs all unpleasant and injurious rapors, and after a time the mass becomes perfectly inodorons. It is foum that the same earth mar, if necessarr, be used over and over again, and that finally. when it has becone thoronghly charged with excrementitions prineiples. it is one of the best forms of concentrated fertilizing material known. Orring to the expense of supplying fresh earth and removing that which las become foul, the earth-eloset has not been able to connete with the water-closet. except in conntry houses, where it may often lse nsed with adrantage.

## Revised by Maxsfield Merrimax.

## Earth-currents: See Magnetisn, Terrestrial.

Earthenware: eollectirels, ressels or objects made of earth and afterward baked. See Potrery.
Eartli-nat: a popular name given to the tubers or subterranean stems of several plants-riz., the Bunium flexunsum, an umbelliferons plant which grows in Europe; the Cyperus rotundus, a native of Egrpt; and the Arachis hypogua, a leguminous plant often called peamt or goober. The tuhers of the Bunium. which resemble chestmuts, and are sometimes called earlh-chestnuts, are extensively used for food.

Earthquakes: tremors or shakings of the gromm, naturally produced. An earthanake may be so gentle as to be imperceptible to the senses, and discovered only by the aid of refined apparatus, or it may be of destructive violence. The motions thus characterized are of small amplitude, but are so rapid and brief that they are called shocks. Usually the ground moves upward and downward, or in a horizontal or an oblique direction through the space of a fraction of an ineh, or at most of a small number of inches, and the oscillations are repeated several times. Vibratory motions are communicater! to buildings, and in tall buihdings the effects are aft to be cumulative, so that shoeks imperceptible on the lower floors may be detected on upper thoors. When shocks are severe ther are usually accompanied by sounds comparable to the detonations from explosions near or distant. Other associated phenomena are fissures, faults, extravasations of water and mod, elevation, subsidenes, the drying of springs, the opening of new springs, landslides, sam wases, und alluvial waves. The yreatest fissures are formed in unconsolidated deposits, such as alluwium. They may open witely and immediately chse, or they may remain open with a width of several feet. Theirdepth is undeterminet, but must in some cases be considcrable, as they have received the waters of streans for honrs, and even days, hefore they were fillen. Fissures formed in rocks are usually less than an inch in width. The partings known as "joints." which divide rock masses by systems of parallel planes, are thought to be due to the transmission of earthruake waves, fom fotimes the fissures become faults throngh the vertical or horizontal displacement of one wall with reference to the other. Sometimes they serve for the wance of gase, water, and mum. Where large quantities of wator and mud are extruvasated. the fissures are locally enlarged so as to form tubular conduits. about the mouths of which the solid ejecta are heaped
after the manner of a volcanic crater. The mud is supposed to be derived from subterranean lavers of alluvium saturated with water. The elevation and subsidence associated with earthquakes may be either general or local. When general it is rarely iletiected, except where the region atfected borders on the sea. whose level serves as a standard of comparison. The local phenomena consist usially in the subsideuce of narrow belts of lam lying between fissures. In some cases basins are thus created in which water gathers to form lakes. The vibrations not infrequently serve to precipitate partially detached rocks down mountain-slopes, ant thus oecasion avalanches, and from eliffs of softer material, at the margins of streans or umon coasts, blocks are detached whieh sink to the base as landshides. Sometimes the descent of an avalanche or Jandslide will throw a dam across a strean so as to create a new lake. When the slocks originate under the seat surface waves are generated similar to those prodnced by throwing a pebble into a pool. and these sometimes acquire great dimensions, so that when ther reach a coast they rush far up on the land. Analogons to these are surface waves jroduced in masses of wet allurium. In localities where the semi-fluid character of the substrata is shown by the extravasation of mud, the surface of the ground is sometines thrown into waves several feet in beight, whose behavior is elosely allied to that of the oscillatory waves of water. Violent earthquakes occurring in densely populated districts inflict great injury upon buildings, and not infrequently throw down their walls. It the seashore these disastrous results may be increased and even multiplied by the inrush of sea waves. Through the falling of walls, and especially through the rush of waves, many lives are lost. the fatalities sometimes amounting. in the case of individual earthquakes, to many thousands.

Earthquake Thaves.-The olserved tremors of an earthquake are superficial phenomena resulting from some subterranean shock, which is transmitted as an elastic wave through the material of the earth's crust. From the point of initial disturbance, known as the centrum, the wares pass ontward in all directions with gradually diminishing energy. In the ease of the earthquake at Charleston, S . C., in 1886 the shock was felt more than 900 miles away, and a comparison of time observations showed that its veloeity of transmission was about 17,000 feet per second. Theoretically the initial shoek gives rise to two waves, having different characters and traveling with different velocities. In one called the compression ware, the motion of each particle of the transmitting medium is forward and back in a direction radial from the centrum: in the other, known as the distorsion ware, the motion of the particle is to and fro in a direction transrerse to the radial direction. The wave of compression has the greater velocity. Whenever, as these wares pass through the earth's crust, a change in rock charaeter is encountered, they alre refracted and partially reflected. and as such changes are multifarious near the earth's surface the waves reaching the surface are of the most complicated character, the original direction and rhython being partially or wholly obscured. For an account of the principle of wave transmission, see the article WAres.

Cause of Earthquakes.- While it can not be said that the causes of all earthquakes are known, important progress has been made in this direction. Many earthquakes are associated with volcanic phenomena in sueh way that the mode of their origin can not be questioned. These are of two classes, due sereralls to explosion and to the formation of fissures. When the lava of a rolwano in eruption contains a large amount of water, the conversion of portions of this water into steam produces explosions which project masses of lava into the air, and the same explosions vecasion jarring of the gromul which may frequently be perceived at a distance of several miles, and which constitutes true earthquakes. It sometimes happens that the force contained in the heated and imprisoned water, instead of being spent in a series of mimor explosions, is stored for a long perioul, and then froduces a great explosion whereby the top of the volenno is blown off. A nmmber of catastrophes of this elaracter have oceurred in historic times, and each has been aceompanied br an earthquake extending to a distanee of many miles. Earth waves of feebler force but identical in character have been producen by artifieial explosives. The explosion of a mine for the removal of rocks from Hell Gate. near New York citr, produced tremors which were observed at Clinton, N. Y., 175 miles array.
 fany explowions, hat are the predule of ermptions. If ere a
 sured in oriter that the lava may wotap, and these tarthquakes are refereed to the fismang of the rock umber arains Whase culminating eflet is the opruing of a vent for the lava. Acenedant with this idea is the fact that the stamp, of extinct volannes, whose tomices have bem removed ly erosion, exhbit systems of ratial dikes formed by the injeetion of lava into tivares.
Earthquakes of a third dass are assoriated with the develmment of monntain structure of a certain type. In an extmsion district in Western North Anerioa the prevaldent structure of momitan-ranges involves "xtensise fanting. Each range consista of one or more huge blocks of rock, bonded hir fantis and lifted above their neithbors. In modern times there have heen two instances in which renewed movement has necurred on ofl fant lines of this region, and each of these movements has been ancompanied by a great eathquake. Emimy similar ghenomena wom ohserved in New \%alamd in 184.
 in districts where there is $n o$ onlare evidene of recent volcanie activity or of recent orogenice disturhance, and in
 it is not dithent to formatate a possible camse which, while undemonst rated, appors to he competent. In portions of the earth's ernst. Where deforming forces are not of such hature and distritution as to up-raise monntain-rikges, there are, nevertheless, more or les localized etevations and sulsidmices, and with these diffrential movements it is reasobable to suppose that there are associated powerful strains. Wherever and whenever such strains sattioe to overcuane the plasticity of the rocks involved, either viscons thexure or rapture mast resalt. If the locel combitions determine rujture as the mode of dislocation, an earthquake is one of the consequences.

In the Hescriptive literature of earthquakes there is probably considerable confusion of cmase amb elfoct. in conneetion with an earthonake in 18e3 several hundret miles of the cunst of ('hili were liffed to a height of siverat feet, and there is reason to believe that portions of the land at a distance from the sea were rnised more than these at its border. It was compatel that the rolume of mek changed from a prosition below the plane of sea-lewel to a pasition above that fane was comparable in magnitute with M1. Etna, and this stupendous result was supposed to have hen caused lis the earthouatio. Is the sutrject is at present understond, it aphears more reasonable to suppose that the continent-making forees of the earth's crust, whatex. their oricin may be tombed to elewate that portion of Somth Amerian, and for a long prion hat aceumblated stmins which were opposed ley the dasticity or rigidity of the crustal material. W"hen finally the resistance was owrpowed by the strans, fratetures oevirred atong certain critied lines, the tract of land rose, the strains were in great part relieved. and an parthquake ocomred as an inCidental result - at result of suprence importane to the amfortumato inhabitants of the comutry, but relatively insignifichat as a phenomenon of physionl geography. Ot the local derationsand subsidenoss which owour in alluvial tracts in connertion with arthonakses it is probahle that the greater mmber are conserpuences of the vibration of the land, and are more or leses analogons to hanslides, white a smaller mumber are dieet result of falls by which the eart hquakes were pramoend. The surface osillations of the sea and of allavial tracto and the vibrations of air observed as sound. wre all bedised to result from the moditication or transmutation of the reantie waves by which the shack of earth ruppture is primarity transmitted.

In the stuly if certhynakes three classos of instroments have bect empared. Sisinownus are dovices for determining antmationlly the time at which the vibation oce (ans: Sobsometers are thevios for demming the comparative tiolence or energy of earthquak shorks. Sicismographe acomplish twh these purpmos, and also indicate the forms of the eathouake waye as they arrive at the surfuce
 been attamed in the const metion of instruments of the hast chass that it is possible to remod tremors which eseape the senses, mat their emphament has lem to the diseovery that earthuakes ar. ar moie numerms than had been previously realizad. In some regions feeble slueks are of almost daly orcurrence. and thare is probathy no part of
the panth in whinh they comid not be detected at short interval.
Eiththquaps in the 1 . si-The more important earthquakes are woll descothel hy Sir ('harlea Lyed in the secome sotume of his Principles of /iegtogy. and other references (1) the literature are given it the clise of this artich: The must molable earthonakes of the L. So oenered near the hami of the Missisimpri delta in 1-11-12; in lavo valtey.

 eathophake, was charactorizet by the sreat prolongation of its phenomenat. surere shocks ondared at, shopt intervals dumgr a perind of several monthe, and the entire serjes of shows coweral a priml of about two years. is the comitry was sumsely settled litle is known of the distane to which the percemilole vibrations extemet, but in the central tract the phemomena were of the most impresive character. It is related hat athrial hand was traversed by visible wares which rocked the forest trees to and fro, mpowten some, and permanently ent angled the hraches of olhurs. Fissures were opened and clowl, not mercly once but at each sucessive shock, and mud of rarious kinds was thown into the air with such violence as to lodge in the bramehes of trees. Somm lakes were drained by the escapre of thoir waters into fissures, and other lakes were created ly the subsidence of the land. The largest sumken area is sail to have been 60 or 80 miles in length, and neady half as brom. The earthquak of anyo valley was occasioned by a renewed movenent alony the great fualt plane at the eastern base of the Sierm Nevalla. The chief shock lasted bat a few minutes, and those whieh followed at intervals were far inferior in violence. The series continned for 1 wo or thre months. A principal fissme was formed along the hase of the montainrange for a distance of about 40 miles, and the lam west of the fissure ruse. or the land east of the fissure fell, through a space of several feet. In some plares a second lissure was formed paralfel with this. and was associated with a smaller displacement in the opposite direction, so that a tract a quarter of a mile in width was depressed below the adjacent tracts. The greatest displacement of this sort was ahout 2.5 feet. There were also horizontal diyplacenents, a line of fence being in one instance dislocated 14 fept. Xmmerons fractures withont rertical displacement were opened in the alluvinm of Inyo valley. Owens river was temporarily swallowed, and a momber of springs were permanently distroyed. In the village of Ingo all the honses were thrown down and one-tenth of the inhathitants were killed. The Charleston earthquake was preceded by minor tremors to which little attention was given. The mineipal shock occupied about one minute, and ot her shocks followed at intarvals with graduatly diminishing vinlence. At the end of four weeks they bad ceasel to he destructive, but tremors were occasionally ohserved for several months innere. The foci of tisturbance was alout in miles Wh, of the city, and the most riolent motements there were rertical. Xumerons fissures were opened in the surrounling country and the extravasation of water and mme was suflicient to flond the chamels of all the stremms. The distortion of portions of the alhwial plain was illusitrated hy the disfocation mul buckling of railway tracks. At Charleston the movements: were oblique and although less vinhont than thase ontsite of the city, they were equally destructive. A large number of houses were thrown down, and nearly all were more or less injured, so that the danare was computed in millions of doflars. Twenty-seven persons were kilhd outright, and others died afterward from injuries received.

Luterature- - lieports of British it ssocintion Commitfee on Earthquakes (1850, 185?, 1808) ; Transactions of the Sie ismological S'ociety of Jupun (Yokohama, 1880-1890): R. Mallet.  Reporl, I: A. (ipol. Ǎuruy, Mashington, 1ssu): J. Milne. Earlhquakis enul other birrth Morements in Intoraat ional Scientific suries (Jow York, 185()
(i. K. Gilbert.

Earths: in chemistry, compmands consisting each of a metal combined with oxyen. 'The varthe proper are aho mina, ziremia, ceria, glacina, thoria, Alymia, lanthant, yttria, and erthia. Vaghesia, barya. fime, and stomtia are
called alkaline earlhs, because they are less soluble in water than true alkalies, though they exhinit alkaline reations. Their carbonates are insohble in water, and are not alkaline.

Larth-shine (or, as it onght to have been called, Eartlrlight): a rellection of the sun's light from the earth to the moon, and bate to the earth arain. 'l'his phenomemon is of ten seen when the moon is very old or very new, the ontlines of the full moon being rentlered visible by the rellection.

Eartlow : in eivil engineering, the construction of excavations. embankments in or with the natural eath. Farth is usially excavated and moved moder contract at a fixed price per cubic yarl, the measurement being made in the excaration. In coittings for roads amd raboads levels and measurements are taken at distances 100 feet apart from which the areas of the sections are computed. Then the number of cuhic leet of earth between two stations may be closely fomnd hy iddine together the two end areas and mmltiplying their sum hy 00 . This is called the method of mean areas, and it always gives quantities slightly in excess of the truth, except when the two end areas are equal. A more exact method of measurement is to find the areas of sections 50 feet upart, and then to nse the prismoidal formula, which is $C=\frac{1}{n} /(A+4 M+B)$ where $A$ and $B$ are the areas of two end sections, II the area of the section halfway between them, and I the distance between $A$ and $B$.

Earthwork oecupies less space in the embankment than in the original excaration, Sind and gravel shrink about 8 or 9 per cent., clay abont 10 or 11 per cent., and loam from 12 to 14 per eenit. When the cuts in a rallway do not furnish sntficient material for the embankments, the balance is procured from burrow-pits, or exeavations in some comvenient hilside. These horrow-pits are cut with vertical sides, so as to permit the precise measurement of the frumtity remosed, levels being first taken over the top surfice.

If earth be devoid of cobesion, the sides of the ents and enbankments will ultimately he inclined planes, each kind of earth having its own special angle of inclination, known as the "angle of natural slope." "The following table gives the angles of natural slope, the inclination expressed by the ratio of the horizontal to the vertical projection, and the

| KIND OF EARTH. | Abgle of natural slope. | Inclination. | Weight per cubtic foot. |
| :---: | :---: | :---: | :---: |
| Gravel, romind .. | $313^{\circ}$ | $1 \cdot 7$ to 1 | 100 |
| *. sharp | 40 | $1 \cdot 2 \cdot 1$ | 110 |
| Sand, dry.... | 35 | 1.4 * 1 | 119 |
| " moist. | $41)$ | 120 -1 | 110 |
| " very wet. | 30 | 17761 | 125 |
| Earth, dry..... | 40 | $1 \cdot \sim 1$ | (19) |
| ". moist. | 4.5 | $1.0-1$ | 95 |
| " very wet | 3.2 | $1.6 \cdots 1$ | 115 |

weight per cubic font of different kinds of earth. If, however, the eartla he cohesive, slopes steeper than the naturnl slope can be built, but it is neressary to protect them from the action of the weather hy sodaling.

The lateral pressure of earth against a vertical wall is always less than the prossure of water. If $w$ be the weight of a cenbie foot or the varth, $\phi$ its angle of remose, given by the above lable, and $h$ the height of the wall, the formalia $\mathrm{P}=\frac{1}{2} w / h^{2} \tan ^{2}\left(45-\frac{1}{2} \phi\right)$ maty be used to compute the horizontal pressure of the moth infon a lineal font of the wall. The point where the resultant pressure is applied is, as in the case of water, at a distamonabove the base of the wall equal to one-third its hergh. This formula applies only to cases where the surfilce of the earth behind the wall is level. If the surface be inclined backward from the top of the wall at the ancige $\phi$, the pressure is given by $P=\frac{1}{2} 2 h^{2}$ cos ${ }^{2} \phi$. Mansplelt Merriman.
Eartlworks: furtitications or constructions, whether for attack or dofense. in which earth is the prineipial material employerl. See Hortificatioxs.

Earthworms: the popular name of a larere number of species of worms belonging to many genera of Oldoonn. Fitse ( $q . v$.) which are eomprised] in the grat class of Annelida. Formerly they were all ruanded as fomming the fanily Lumbriciche so collad from its pincipal armos, Lumbricus, but now they are mach dividel]. In all the body is cylindrical, and is mate my of many essimtially similar riners flacel one after anothor, all without external organs, execpt small bristles varionsly arranged whieh are used in focomotion. The mosulh is poovided with upper and noder
lips, and lacks teeth. The earthworms live on decaying verotable matter, which they obtain either by swallowing leaves or earth which contains vergetable hamus. The indigestible portions are voided on the sulface as worm casts. The researdies of Durwin have shown that earthworms are of immense value to agriculturnl interests, for they oceur in the earth where there is moisturn enomgh to sustain life, and they are continnally working over the soil and passing it through their intestines. The earth thas eaten comes from below, while the wom casts are deposited on the surdace. In this way about a fifth of an inch is annmally added to the soil, while the same action serves to reduce Enequalities and to bury bencath the surface stones and other objects. The eartliworms are hermaphroditic. but are incapable of selffertilization. Their eggs are laid in cocoons, and in some species we have the rare phenomenon of one egg protucing two worms. Earthworms are also noticeable from the tact that when cut in two they are capable, to some extent, of reproducing the lost portions. In the temperate zone the largest species of earthworms rarely exceed 8 or 10 inches in length, but in the tropics they are much larger, an African species being an inch in diameter and nearly 6 feet in length. It is hadly necessary to state that earthworms do not rain down; those which are frequently fonnd on the ground after storms have heen driven from their burrows by the water. See Darwin. The Formation of Tegetable Mould Through the Action of Worms (Iondon, 1881); Rolleston, Forms of Animal Life (new ed. 1888). J. S. KNG\&LEF.

Ear-trumpet : an instrument for the relief of defective hearing. Ear-trumpets are of a great virliety of forms, but they all depend upon the same principle-that of colleeting and condensing the sound-wares, and thereby intensifying the impression made upon the ear. It is fomind in practice that a nice aljustment of parts is not necessary : sound being readily reflected along conical tubes, either straight or coiled, with great facility. Cases of pomparatively slight deafness are aided by the wearing of "comets," or small eartrumpets attached by a spring to the car and enncealed by the hair of the wearer.

## Ealwax : See Ceruaen.

Larwins [O. bing. eorniega; cf. Fr. perce-oreille, Gelu. Ohrourm]: insects of the family Forfirulide: su named from the popular delusion that they have a propensity to creep into the ear. 'They form a connecting link between the Coleoptera and the true Orthopera. Ther have a narow body, strong and horny mandibles, long antennat, and a pair of foreeps at the extremity of the abdomen. In the U. S. the name is applied to varioussmall centipetes fomm abont honses and beneath bourds. See Entomologr. Lievised by F. A. Lucas.

Easement: in law, in its most comprehensive sense, the right which the pablie or an individual has in the lands of another. not inconsistent with a general property in the latter. It is in the nature of a clarge or burden upon lame. It is called a dominant right, while the lamd bumbened is termed the servient pstate. Easements may be mere personal rights, when they are said to he in grosis, or they may be connected with the ownership of land. The latter only wil! be considered. 1. They are incorporeat. 2. Thry are imposed on corpmeal property. 3. They conter nu right to the substance of the land. \&. There must he two distinet estates-the dominant, to which the right helongs: and the servient, upon which the obligation rests. 'I'hey are affirmative or negrative. Athmative, when the owner of the dominant estate may do some act on the servient; and negative, Whon the owner of the servient estate must refrain from doing sone act, wherwise lawful, on his lind. The most important instances are the right of way (Ihe right of the ownel of one piece of land to pass over the land of another), of Water (the right of the owner of the tominant estate to reecive water from or discharge it across the scrvient estate), of' support of the soil or of the buildings of the elominant csate hy the adjacent soil or building of the servient estate.

Fasements exist i.t common haw, and may be created by statut". Common-law easements may ariow in varions moses. 1. By mature. This is a buief form of expression of a lonal ruke. that the ownets of aljoining parcels of land may have a hurden imposed mon them not to distmb the natiaral state of things. Thus where a matural strean of water flows from the lind of ono owner throwgh the land of amother. the former ean not divert or diminish the quantity of wator which wonld otherwise descemt to the probrictor below, hor can the latter prevent the stream from diseharging its witer meross his land. Wach has an easemme" by
mature" in the lam of the other. 2. By dedication. This means an appropriation of land ley its owner to a publie use ; e. A. as a strent or park or public lamlins-place. The legal tithe to the land dediatad is not changel, mat the public acguires a right to use it for the spee ial purpose to which it is dedicated. These ensements are sustaned in law on the dectrine of estoppel, although there is no specilie grantue. Xin particular form or ceremony is necessary to contitute a dedheation. It is sutheient if the intmion to dediente ap,pear, either by positive ats of the owner or long-ontinaed
 grant. In this eave the nature and extent of the ediement are determined by the words of the instrument creatiner it, which mast be siated. 4. By implied grant. An easement is created by implime grant when it is necos-ary fur the enjowment of that which is expresty errathed on reserved. Thus if A is the owner of two lots. the first of which can be approached only over the second, and convers wither to $\mathrm{B}_{\text {, }}$ the owner ot the back lot has by implieation a risht of way across the front lot. 5. liy preseription. 'This is the enjoyment of the right or privilage for so long a time ats to raise the preamption of a grant. The length of time necessury to raise this presumpion varies in different states, mit, alter the analogy of the statule barriner disputed chams to land, it is usally twenty years. To ohtain ly prescription an emsement in the land of another its enjoyment munt have heen uninterrnpted for the required mumber of years allverse to the owner of such hand, and exercised unter achaim of right. It must be open, so that the owner may be presumed to know of it. In England it is held to le a rule of common law that the risht to light may be obtained by prescription. This is called the doctrine of "anciont lights." It wothl take place where the owner of one lot of land hat windows opening on the vacent lot of another for twenty years. He would acquire such a ripht that buildings combid not be ennsiructed on the vacant lot so as to shint out the licht from his windows. But in the L. S. this rule has frequently heen repudiated le the courts as inapplicable to our rapidly growing and rapilly changing condition: and in a mumber of states an easement of limht ean be acquired only byexpress or implied grant.

Eascments may le extinguished ly a release given by the owner of the dominant th the owner of the serviont estate, or ly abandomant. The failure to make use of an caspment (technically ealled non-nser) for twenty years is strong evidence of abaniomment if the easement whis aerguired by preseription, althomgh the presumption may be rebutted: font if the easement wore aequired by acthal crams, no lenuth of mere non-users wombla operte an abantmment. In that case there must be acts inconsistent with the exist meve of the easement. An easement may also be extinguished by
a unin of the two cestites in tha same porson. This is a union of the two estates in the same presm. This
terelnically catled "merger."

 piur. ostarim. a feetival namell from the Tenton, godeless of
 usra]: the Lerd's dayorsumblay fowing that fourtornthday of the calendar mom which talls upmo or next after Mar.? (in) (ir. called $\pi$ á $\sigma \chi^{\text {a }}$. lat. pusefor). 'This is trme of hath old style an! new. Fister is the principal fostival of the (hristian yar. cobserved in commenoration of the mesurtectime of onr hlemed Lord. I'he returns of this amiversary were originally regulated, and in imitation of this carly usate have always continued to be, by the calendar of Jutea, in which the monthe were conterminons with the revolutions of the man. A mean lunation bringe, roughly, twent y-nine and a half days long, twelve lumar months, or a lunar yoar, lall shatt of at solat year by about elecen days. The ligenning of the Jewish year therefore gas back ward on the natural year cleven days amatly, reguiting an interealary month to be introduced in the third year, amd agsan in the sixth, nimth. eleventh, fourt centh, and so on. Any anniversary requlated by such a calemdar as this is comsempently movalie in reference to a endendar regulated ly the sum. The liesurrection took place just after the dewish feast of the fissover, which was held on the fonrteentla day of Xisan, the lirst month of the year-that is to saty, the fourteenth day of the moon, or nut far from the time of full moon. Thu Christians of Jernsalem, and after them those of the Asiatic Churches generally, were :cerustomed to hokd the Pexst of Easter on this same day or simultanemely with the dewish J'amover. "his nsage was unacceptable ios the Gentile Charches in Italy and the Went senerally. which proferred tocelebrate Easter on the sunday following the fourternth day of the moon: and the ditienence of jractice in this particular ded to grave dissensions bed weon the East and West. which were at length pacified by the agreement reached in the Comeril of Xicipal (A. D. 3in), to make the Western nage universal. In order to fund the time of Faster for any given year, it would sem that we shond ealenlate the cxact time of the now mon in that year for Hatrech. and try whether the fonrteenth day of that monn (the day of Hew noon itself being comatol fle first) womb fall not earlior than the 21st, in which case the smaday following this fourterenth day misht be presumed to be ELister. But should this fourtcenth day fall earlier than har. 21, we shonld conclade that the now moon of April must be takem. The ecclesiastient calendar, however, is only nominally deprendent on the moon in the lienvens, the true moon and the calendar moon sometimes dilfering in their are more than two dars. The practionl reason for this is that if the astronomient the of new mon is taken, this lime will mot be the same in the local times of different longitudes: so that a meridian may alway be assigned suct that the same new moom may fall on difteront calondar days on different sides of it. And if the calculation is very nicely made, when new moon happens exactly at midnight of suturday or sumday in the mildle of a large eity like Lomdon, the cast and wast lualves of the city may have thoir Easter unon two very differmi days. The erolesiatiomb mon is therefore an ifleal or artifiemb moon: and in detemining the begiming and end of eath lunation no aceome is takem of any diferences smaller than a day. In order to divest the rechesiastical colendar as much as pereshbe of complexity, advantage is taken of the fact diseovered by Deton, an Ithanimanatronomer in the tifth contury trefore one area, that in a freme of nineten solar years the sum and the mon return almos exaetly to the saime relative pusitions which they owomped at the bexriming of this periond, the dillerence ammatine to lit tle more than the space the moon wond mave over in two honrs. The calendar therefore asimmes that the mons de(erminine Eacter will recur in the same order every nineteen years thronghont an entire century, and stmithes thromgont two or thre conturies. The lhastors themstlves do not therefore necessarily recme on the same days of the month of March or April in each of these suceessive surics of ninetern years, but woukd do so if the same days of the week always correspandell to the same days of the month. 'This, hawerer, is not usmally the case ; ant as Faster mast be simulay, it is necessary, in order to fix definitely the date of baster in any riven yer, of kmow bath the phe of the year in the series of nincleen (or in the Melonice ovele) and also the day of the week on whieh the year thegeth, or (what is practically the same thing) the dominical letter for the sear. Vamions methenls have beon given fire finding biater, hat all of them hocens, expressly or implicetly, with the determination of these two elements. 'The rulus given
lre Prof. de Morgan in the Companion to the British Almanue for 1840 oecopy ahont a page. See alon The Rook of Almonars, with en Inder of lifferenre, by which the . $1 /-$ monue may be foum for emply year, whether in otd style or New, from any eporh. aucient or modern, up to 1. 11. 2000. with means of finding the day of any neme or full mown from B. C. simen to A. D. Jome compiled by Augistus De Morgan, etc. (1omlon. 185t), and Bishop Samucl Butcher's The Eicelesiastical Calendar: In Theory and Construrlion (Dublin and london, 1507). The formmate of lelambere, in the first volume of his History of Modern tstrommy, and those of Gauss, given in the first molune of the Theoretical and Practical Astronomy of the same writer, though concise as nathenatical exprensions, incolve much laborions compntation in their practical application. The following mles. however, originally devised by President Barnard, of Columbia Colloge, New York, are very simple and casy. It is to be ohmerved, first, that the fourteenth day of the Faster moon, being approximately the time of full moon, is calted the puschal frll moon. The number of the year in the lunar crocle is also called the Gohlen Number. (See (folden Nlyber.) Then, supposing that we know the golien number ant the dominical letter, we find, for the present century, the paschal full inoon as follow
If the golden number is odd: To four times the gohden number add ten; and
If the golden number is aven: To tour times the golden number add twenty-fire.
The result, in either case, if greater than twentr and less than fiftr, is the date of paschal fill moon, considered as a day of Mareh (that is to say, if it happens to be, say thirtythree, it is the thitr-thid of March = Apr. 2 , and sn on). If not greatw than fwenty and less than fitty, whd thinty, or subtract thirly, or fore thirly, if necessary to make it so, and the result is once more paschal full moon.
Then, to find Easter: To the constant number eighteen add the mumerical value of the dominical letter (i. e. $\Lambda=1$; $B=2 ; U=3$, etc.), and the sum, if greater than the value of paschal full moon just foumd, is the date of Easter ; but if not, ald serm, or turife sewh, or three timess swon, and so on till a total is ohtained which exceeds that value; amb this total is the date of Faster comsidered as a day of Harch.
To find the golden number and the dominical letter: In either case first separate the humbeds in the number expressing the giren year of our Lord from the years less than 100, and treat the parts indepentently of each other. First. for the dominieal letter: If the humiteds be divided by four. the remainder trom the division will have one or other of the following values-viz., $0,1,2,3$. Ind the dominical letters belonging to the hundreds which give these remainders respectively will he $\mathrm{A}, \mathrm{C}, \mathrm{E}, \mathrm{G}=1,3,5,7$. These, for convenience, call ceuturials. Then for the years take half the largest number divisible by four-i. e. hall the number of the latest leap-yeur-increase this by seven, and subtract the excess of fours (i, e. the remainder left in the previons division by four): To this result add the centurial, and the excess of sevens in the sum will be the value of the dominieal letter; it being observed that if there is no excess the dominical letter has the ralne of seven itself, or is G. Leapyears have two dominical letter-one for January and Febmary ; the other, which is less than the former by a unit. for the remainder of the year. This last, whieh only is used in finding laster, is that given ly the rule.
To find the dominical letter for Old style the 1 rocess is the same except as to the centurial. The eenturial for old style: is fornd by anding three to the number of humdreds, and suppressing spicens. Thus if the humlreds be fifteen, we have $15+3=18$. And 18 with seven dropped as often as possible leares 4, which is the ohd style centuria!. It there is $m$ excuss of sevens, the renturial is seven itself.

Semondy, for the golden number: Add a unit to the mumber expressive of the given your; then divide the yeurs by tuendy, and add the quotient to the remamber. Next divide the centuries hy four, and add the quotient to fove times the remamer. Jeinally, ald the two results, and the sum, if ninetern or less, is tho golden mumber. li it exceets nineteen, drop nimetem, or, if newessry, twice nineten, and the number heft. being not greater tham nineteen, will be the golifen number.
Thake, as an example, the year 187.3 . F'ur the doninical letter: $18 \div 4$ gives 2 remaimer, and the centurial is accondingly 5 . The number of the largent leapeytar in is is i2, and the hatf of this is 36 . Then $36+7=43$, thel 43
$-1=49$. Finally, $42+5$, with the serens smpressed, is evidently $5=\mathbf{E}$, which is the dominical letter of $18 \%$.

For the golden number: $18,3+1=18 \%$. Then, $74 \div 20$ $=8$, with 14 remainder, and $14+3=17$. Also, $18 \div 4=4$, with 2 remainder, and $? \times 5+4=14$. Then, $17+14=31$, and $31-19=12$, the griden mumber for 1873.

For Easter in 1870: $19 \times 4+25=73$, Then $73-30=43$. or paschal full monn is the forty-third dar of March. To 18 add 5 , the value of the dominical letter. and the result, 23 , is smaller than the date of paschal full monn. But $23+$ $7+7+7=44$, which is greater than that date (43), and Eastor is the forts-fourth day of Marel, or Apr. t3.
There is one case not provided for in the foregoing. If in finding paschal full moon we ohtain a result which is e.ractly tuenty or exactly fifty, adding or subtracting thirty will not bring it between those limits. In this case pasedai full monn must he taken at 49 . There is also an irregularity arbitrarily introduced by the mathematicians of Pope Gregory XIII., by whom the calendar was regulaten, which is this: Should the mos above laid down give forty-nime lirectly as the date of paschal full moon, this must be reduced to forty-eight in cuse the golden number is 12 or upuard; not otherwise.

For centuries earlier or later than the present, the rules are the same, except that the numerical terms ten and turenty-fire used in finding paschal full moon are liable to variation (but do not always vary) in passing from century to century. The second of these terms always exceeds the first by fifteen. The first may be found for any century up to the forty-seend by the following rule: From the number of the centuries take its fourth part and its lhird part (disregarding fractions in both cases), and increase the result by ho. Thas for the twenticth century we have $20-$ $5-6+2=11$. Hence these numerical terins for the next century will be 11 and 26 . In old style dates these numerical terms are invariable, and are always turo for ord golden numbers and serentert for even. See the Journal of the Proceedings of the General Conrmition of the Protistant Episcopal Church in the l'mited States for 1871, Appendix, Mp. $538-5.59$.*
The principal festivals and fasts of the Churel dependent for the time of their celebration upon Easter are Septuagesima Sunday, nine weeks before Easter; Ash Wednesday, which is the Weduesday of the seventh week before Easter; Good Fridar, which is the Friday next before Easter; Ascension Day, which is the Thursclay of the sixth Week after Easter; Whitsmn Hay, the seventh sunday after Easter; and Trinity sunday, the eighth Sumday after Easter.
levised by William stetens Perry.
Easter, or Waihn. Island: a small island of rolcanic origin in the Pacific Ocean; lat. $27^{\circ} 6^{\circ} \mathrm{S}$., lon. $109^{\circ} 30^{\prime} \mathrm{IT}$.; area, 47 sq. miles. It is 11 miles long and 4 miles wide; rises 1,200 feet above the level of the sea, and is scantily supplied with water. It is the eastermost inhabited Polynesian island. The inhabitants have traditions of their ancestors having come from the island of Oparo, 1,900 miles distant. The island has wonderful colossal statues in stone. It has belonged to Chili since 1888. Pop. (1882) 150.

Eastern Archipelago, also called The Malay Arehipelago: all those islands which lie in the northeastern part of the ludian Oeean. Area ahout $050,000 \mathrm{sy}$. miles. They are divided, according to their position, into three groups. The first group comprises the Molucea islands, the spice islands, Banda, Amboina, Ternate, and the Philippines; the second group consists of Sumatra, Java, and the small Sunda islands east of Java, from Bali to Timorlaut ; aml the thirll comprises Bornco and Celehes, together with a large number of smaller islands, as Billiton, Banca, Singafore, ete. In its position this archipelaco forms the connection between Asia and Anstralia. Its soll is very fertile, and resembles in its products that of the neighboring countries of Asiu. It has therefore attracted at all ages ahmost every nation. The original inhahitants comsisted of many tribes, hut all belonged to one race called the Malay Race (q. $r_{\text {P }}$ ). At a later age the Arahs went to these islands, and as a consequence Mohammedanism gained a good many followers. At. last the Europeans came and subjugated almost the entire archipelago. The butch have become masters ot the greatest number of islanis; while the Spaniards have only the I'hilippines; the l'ortuguese, Dilli and part of Timor;

* This valuable and exhanstive paper is prarbajs the most impor tant contribution to the jrinted literature of this subject extant.
and the British, Singapore, Labuan, and Northern Borneo. Besides these races, it large number of Chimese are found threughont the islands. The total population is mimated at 20, 000,000. Se Wallace, Malay irchipelayo (1890): Reane,

Eastern Churehes: several bodies of Christians in WestOrm Asia, Wastern ENurope and Arica. They are in three divisions: I. The Orthume (ireek ('hureh. composid of ton indeprendent bodes, substantially one in diseipline and doetrine. in mutual sympathy, ami in deference to Constanti-
 (0) are in Fussia. 11. The National thurches, consisting of: (1) The Nestorian (since tig A. D.), numbering about 150,000 in 'Thrkey and Persia, hesides 100,000 (Independent st. 'lhomas ('hristians) in hodia. (?) The Armenian (since 491 A. D.) very widely disperset, numbering about 3,000 000 . (3) The Syrian: 1. lacobites (sine 451 A. b.), numbering about 30i,000; 13. Maronites (since 680 A. D.), numbering 250,000 , and siner 1182 A. D. under the pope. (4) The Coptic, in ligypt (since 451 A. D.), numbering about 500.000. (5) The Abyssinizn (since $451 \mathrm{~A} . \mathrm{D}$. ), numbering about $1,200,000$. These all seceded from the Greek Church on Christological issues. HIl. The United Churches, which have subinitted to the pope, accepted the Filiogne of the Lat in Chureh and the doctrine of the two natures in Christ, and are allowed vernacular liturgies, clerogamy. and the communion in both kinds. These churehes are: (1) ['nited Greek, mostlr since the Protestant keformation, anll mostly in Austria, II ungary, and the Turkish empire, numbering nearly $5.500,000$. (5) United Nestorian (since 1553), numbering 20,000 in Turkey and Persia, and 150,000 in Julia. (3) United Armenian (since 1316-34 A. is.), numbering about 100,000 , among whom an anti-papal sehism otcurred in 1869. (4) Cnited syrian [dacobite], very tew in Sypin (since seventeenth century), Int 160.000 in India (sinc, $155^{2}$ ). ( $\%$ ) Luited Coptic (since 17:32), numbering about 10,010 or 12:000. (6) Lnited Abyssinian (since 182 $)^{\text {) , n m mbering, it is }}$ claimed, about 50,000 .

## Eastern Empire: See Brzaxtine Empire.

Emstern Question: the problem that confronts mations whase territoriss border upon or extemf into the Babas l'exinscias ( $q$. $r$.), or whose interests would be atected hy "hanges in the govermmental systems of that region. It involves the future of the conntries in Fastern Earome that have separated from Turkey, as well as the fate of the Europran pussessions of that state itself. Throughout the eighternth century Russia and Austria made attempts upon the Turkish territory in Europe, but the jalonsy of the other powers prevented the phuder of the weaker state. In the nineteenth century the steady tendency has heen towat the disintegration of Turkey in Europe, with the result of "recting on the Balkan peninsula a number of independent or semi-leprotent states, the fear of whase anmexation by one or another of the great powers gives to the bistern guestion its furmilable character. The qnestion has bean complicated by the desire of Russia to establish a protertorate over the Christian subjects of the Sulan, by her ambition to extend her borders to the Bosphorns, and by the aprehension on the part an the British Govermment that these laussian Aheigns might imperil the Eastem possessions of Great hritain. The term sometimes relers the condicting interests of Great Britain and Russia on the frontiars of their lastern territories, and in this aspect of the question Persia, Turkestan, Aformistan, and India all lall within its scope.

F'. M. Col,by.

Eastern Rite, or Oriental Rite: the ritual of those branches of the Roman ('atholic 'hurch which acknowledge the supremacy, of the pere bat which do met "mploy the Latin ritual. The Unitel Christians of st. Thomas have me hishop of their own, but are under the vicar-apostolie of Ferapoli, who is of the Latin rite: bat the peoplo athe clergy u"e, in part, a monlified syrian rite.

The Eastern rite diftes from the lating bot only in the languages employed in the service (irrevt, slavie Armenian, Syriae, Ethiopic, ('optie), but gempally also in the use of beth elements for thr lany in the Encharist. and in the permission of marriage to the lower clargy.

Eastern Rume'lia : a formerly antonomoms povinee, now Southern Bulgaria. It extemels from the upper waters of the Mariza castwat to the Black Sea, mul - of the balkan Monntains. It was coblhed as a province biy the treaty of

Berlin in 18:8, bnt, beranse of a sucereful revolution, it wats placed under the King of Bulgaria in 1s-b. and is practically a province of that kingelom.

Easterm thore: a name given to those parts of Marylaml and Virgimia which arw E. of Chesaluake Bay, und sometimes applied to the whole promsula, inchating, in athdition, the entire siate of Howare. The bintan shore has been prowertial for its conservation, and from the character of its inhabitants claimed the tithe of "the land of genthemen": but it is now traversed by railroads, and the excellonce of its soil and climate for proch-culture ant market-gardening has cansen the developmont of moch industrial entorprise. Its westorn side is remarkably indented by navigable rivers and erecks, affording ereat commercial advantages. The waters on both sides abound in oysters. which are a souree of grat weath. The theries are also extensive. Most of the surface is low and level, but healthful. Malarial fevers are mdemic at some phace. The climate is singularly mida. log-iron ore of tine quałity is extensively mined in some parts. Laolin is found in the extreme N. Oak timber is cut in some puts for market.

Bast (ireenwich: town (ineorporated in 1677): eapital of Kent co., K. I. (for location of county, see map of Khode Whand, ref. $9-N$ ) ; situater! on railway and on Nurraganset Bay: 14 miles from Providence. It has an academy (under the supervision of the Boston University), a free library, two miton-mills, a woolen-mill, print-works, and a good harbor. Pop. of township (1880) 2,887 ; (1890) 3,127; ; (1895) 3,016.

East Hampton: town and railway junction (fombed in 1664): Hampshire co., Mass. (for location of county, see map of Massachusetts, ref, 3-E): 5 miles s . W. of Northamptorn. It is the seat of Williston Seminary for young men, and has a public dibrary und manufactures of sispenters, shoe web, cotton yarns, pmps, valeanized rubber, buttons, etc. Pop. of towniship (1850) 4, 206 ; (1890) 4,395: (1805) 4. i.10.

Eutror ar ". News."
East Humbohdt Mountans: a lofty range in Elko co, Ser., some of whose peaks exced 12.000 feet in height. Sucert valley and Fremont Pass cut the range, which is in parts well timbered with pines and firs. affording lumber. Its snows feed the springs hy which fakes Franklin and Ruby are suppliel.

East India Compaty: a famous joint-stock trating company formed in Fingland to carry on commerte with the East Indies. In 16010 a royal charter was granted to a mmber of Londm marehants under the title of "The Governor and Company of Jerchants of London trading to the bast Indies" "This charter gave them an exelusive right to trade for fifteen years within certain limits, which were of immense extent. They established factories at surat. C'ambay, and other paces in India about 1612. The charter was renewed from time to time. Hadras was founded in 1639 , and Calcutta in 1645. In 1608 the king granted a charter to a rival company, bout the two companio were united in 150 a moder a new charter. with the title of .. The J nited Company of Merchants trading to the Fant Indies." Fvery person who hede dith of the eompany's stock hecame a member of the font of proprictors, who ammally chose a court of directors compent of twenty-four members, ach of whom must own ${ }^{\circ}$ ?.010 of the stork. 'The "xeeutive power of the company was wested in this court of directors. each of whon retained his ollice for four wars.

In 1 ion Parliament granted the commory the exchase privilege of trating to all places eastward of the (ape of food Hope to the strait of Magellan. The monopuly of the Chima trade was abolished in 183\%, and the company was then deprived of its original character as a commere ial asco(dation. Many yenss lefore this date the compray had become a great leritorial power, and had laid the fommation of the British empire in India. By "ongutet and othor menns the company obtainorl snertign fower oser rast regrims of llimhatan. This region was comed by the members of the compray not onfy as a sumen of momercial profit. but as a firlif in whicli their velatives might onrich and distinguish themsolves he pultitad amd military enterprises. By the ant is and of William IV, the functions of the East Inilia fompany were renderend momely politieal. It was to continue to govern lalia, with the concmerrence and under the supervivion of the lamat of comtrol. Ill the real and personal property ledenging to the company on Apr: 22, 1N3. was vested in the crown, and to the held or managed by the company in trust ton the same; and the
stockholders were to receive an annual dividend of $10 \frac{1}{2}$ yer cent. on a capital of $\$ 6.000 .000$ out of the revenues of India. The Sepur mutiny of $185 \%$ which was repressed with a great expenditure of life and treasure, combined with other causes, induced Parliament to transfer the dominion of India to the crown. This change was ettected. after strenuons opposition from the company, in 1858. See Kxdia.
The Dutch East holia Company was formed in 1595-1609. After more than a century of active rivalry with the English company, the two were forced to make common canse against outside idventurers in 1 dis. Soon after this a more formidable rival appearetl. The French company, established in 166t. hat under the able management of La Bourdosvals and Dupleix ( $q . v$.) hecome more than a match for the English company, and it was only ty the genius of Clive that the French were overthrown and English supremacy wis established. (For the erents conneeted with the growth of English supremacy in India, see (Lave and Mastivgs.) Other East India comphies (Danish, Swedish, Scottish) were of relatively slight importance. Revised by A. T. Hadley.

Easf Indies: a popalar that somewhat vague term applied to that part of suntheastero Asit occupied by farther Inelia or Into-China and the Malay Arehipelago, the prineipal sulnlivisions being Lower Burma, Siam, Laos, Annan, Sumatra, Jira, and the other Sunda islands, Borneo, Celebes, the banda istants. the Mulucea islands, and the Plailippine islands. The area of these, appoximately wiven, is 1.155.200 sot miles, and the extimated permation about 50 ,$3 \times 3,200$. As nsed thy some writers, the term inchades Ilindustan. and eren China and Japan. In the fiftecoth century India or the Indies wals a name applied by Europuans to an molefined region beyond the Indus, knom to them only through the reports of occasional traders. Columbus and the ather discoverers of the islands in the western bemisphere believed that the countries found were the western regions of India, and Ferdinand of Spain accordingly assumed the title of King of the lodies. Further exporations by the Spaniards and the discoreries of the Portuguese in the Fast led geographers to disam "the Indies" as too comprehensive, and to apply the name East Indies to Hindustan and that of West lndies to America. Subsequently" West Indies " was restrictet, as at present, to the archipelago comprising the Bahamas, the Greater and Lesser Antilles, and the Virgin islands, while llindustan and farther India were collectively called India. The Dutch in forming their first company tor trade with the East nsed the term East Indies in its wide sense. After the British oecupied Ilindustan that country became commonly known as India, but was often called the East Indies, especially in parliamentary papers. See East Inda Company.

Fan Chire, ōkar': city and railway eenter: capital of Ean ("laire en., Wis. (for location of comity, see map of Wismonsin, ref. 4-C) : situatol at the confluence of bau Claire and Chippewa rivers: has a private academy for girls, a high sehool, numerons sawmills and planing-inills, a fomring-mill, grain elevators, iron and brass foumlries, [aler-mill, sash, cloor, and blimi factury, furniture-factory,
manufactories of boots and shoes, pearl buttons, electric dynamos and machinery, electric lights, and street railways. The annual lumber output is from $250,000,000$ to $300,000,000$ feet. It is one of the chief commereial cities of Northwest Wisconsin. Pop. (1880) 10,119; (1890) 17,451 : (1895) 18.63\%. Editor of " Free P'ress."
Ean de Cologne, ōde-kō 'Iōn', or Cologne Water: a celebrated liquid perfume invented by Farina of Cologne, where large quantities of it are prepared. It is also made in France and almost all other comitries. The following recipe affords a good imitation of the original article: Take of alcohol 1 pint; of the oils of bergamot, orange peel, and rosemary, each 1 drachm; of bruised cardamom seeds, 1 drachm; orange-flower water, 1 pint: distill I pint from a water-bath.
The secret of the composition of true cologne has been carefully preserved by the Farina family, and the different business-houses of Cologue bearing the name of Farina prepare perfumes which are by no means identical in odor. One of the family is reported to have published in 1863 the following as the formula for genuine eau de cologne: Take of oil of lavender 4 oz : purified benzoin, oil of rosemary, each $2 \mathrm{oz} . ;$ strong alcobol, 9 gal. ; dissolve the oil and benzoin in the alcohol, and to the solution add suceessively oil of neroli, oil of young orange (huile des petits gruins), oil of lemon, each 10.4 oz ; oil of sweet orange, oil of lime peel, oil of bergamot, each 20.8 oz .; tincture of rose-geranium flowers, a sufficient quantity. Macerate for several weeks, and then bottle the mixture. There are hundreds of recipes, many of which are vouched for as the genuine, but all, no matter how complicated the formula, are simply aromatized alcohol. It is essential that the alcohol be perfectly deodorized and freed from fusel oil before use.
There is a class of cologne-water obtained by macerating aromatic substances in alcohol for some time, and then distilling the whole. But these waters require to be allowed a few months of rest to develop their better qualities. It is probable that the original article was of this class. Good colognes have a rich and permanent odor, not clearly alcoholic. Not one of the essential oils employed shonld be recognizable by the sense of smell. The best brands have long borne the name of Jeau Maria Farina, and there are many claimants to the original proprietorship of the name.
Ean de Javelle, öde-zhă'vel', or Javelle's Solution: a chlorinated solution of potash, analogons to Labarraque's solution of soda. It has bleaching and disinfecting properties, and is employed in removing fruit-stains, etc.. from linen. When swallowed in considerable quantity it has poisonous effects.

## Eau de Vie, óde-ree' : the French for Brandy (q. $v$.).

Eanx Bonnes, $\bar{o}$ 'bŭn' (i.e. good waters) : a fashionable resort of France; department of Basses-Pyrénées: 22 miles $S$ of Pau (see map of France, ref. 9-D). Here are warm sulphnr-springs, which are especially efficacious for disorders of the lungs and chest. Pop. (i896) 775.
Eanx Chaudes, üshōd': village of France: department of Basses-lyrénees : 2 or 3 miles S. W. of Eanx Bonnes: about 95 miles S . by W . of Pau (see map of France, ref. $9-\mathrm{D})$; has warm medicinal springs. The waters have a wide range of uselulness in the diseases of the lungs, joints, and skin.

Eaves [O. Eng. efes: O. II. G. obasa, eaves, porch, probably from same root as Germ. über, Eng. over; cf. Gr. vitép. The worl is properly of the singular number]: in architeeture, the lowest elges of the inclined sides of a roof, which project beyoul the face of the wall, so as to throw off the water from the roof. The eaves are sometimes providel with a gutter and a downpipe or "leader" to carry off the water, which otherwise would be driven against the walls by the wind.

## Ebal: Sce Gerizim.

Ebel, ābel, Mfrmany Wilhely : linguist; b, in Berlin, Germany, May 10,1820 : became in 1858 professor at the gymnasinm in Schmeidemiith; was professor at Berlin from 18.2. Ile publishod, among other works, a new edition of Zenss's Grammatice Cetticu (187t), and many essays in the Zeitschrift für vergleichende spructhforschung, and in Kuhn's and S'chleicher's Beilräge zur rergleichenden Spruchforschung, some of which have been translated into Engrish under the title Celtic s'tudies (1863). D. at Misdroy, Wollin istund, Aug. 19, 18 \%is.

Ebel, Jobannes Wilhelm: Jivine; b. at Passenheim, Prussia, Mar. 4, 1784; educated at Königsberg, where he becane preacher and teacher; was accused of lieresy and of founding a sect on grossly immoral principles, and although completely acquitted in two different trials was deprived of his pastorate and died in retirement at Ludwigsburg, Aug. 18, 1861. See his Life by J. I. Mombert (New York, 1882).
Eheling, abe-ling, Christopy Daniel: scholar and writer : b. in Hildesheim, Germany, Nov. 20, 1741. ITe devoted himself chiefly to geographical studies, and for his great work, Geography and Mistory of North America (Hamburg, 5 vols, 1793-99), he was thanked by the Congress of the U . S. His valuable collection of books and maps relating to this subject was purehased in 1818 by Israel Thorndike, and presented to Harvard College. D. in Hamburg, June 30, 1817.

Ebenslurg: borough; on railway; capital of Cambria co., Pa. (for location of county, see map of lennsylvania, ref. $5-\mathrm{D}$ ) $; 20$ miles W. of Altoona; has sawmills, woolenmills, and tanneries. Pop. (1880) 1,123; (1890) 1,202.
Elierhard, Ceristlan August Gotrlab: poet and savant; b. at Belzig, Prussia, 1769 ; was at first a student of theology at Leipzig, but afterward devoted himself to literature. In the lields of fiction and poetry he was very successful. D. at Dresden, May 13, 1845. Ilis collected Works fill twenty volumes, but he is best known in the literary world as the author of the idyl Hannchen und die Küchlein (1822) and of a long poem in hexameters called Der erste Mensch und die Erde (1828).
Eberhard, àher-hăart, Jogaxy Avgust, D. D.: philosopher: b. in Halberstadt, Prussia, Ang. 31, $1 \% 39$; studied theology at Ifalle; gained distinction as an elegant writer, and became Professor of Philosophy at Halle in 1778. He was a rationalist in theology, and an adversary of Kant in philosophy. Among bis best works are an apology for Socrates, Neue Apologie des Sokrates (2 vols., Berlin, 1772; 3d ed. 1788) : a theory of the fine arts and sciences, Theorie der schönen hünste und Wissenschaften (1783; 31 ed. 1790); a general history of philosophy, Altgemeine Geschichte der Philosophie (1788) ; and an excellent dictionary of German synonyms, Synonymisches Handuörterbuch der dentschen Sprache (Halle, 1802; 13th ed. by Lyon and Wilbrandt, Leipzig, 1882). D. in Halle, Jan. 6, 1809.
Eherhard, Konrad : sculptor and painter; b. in Bavaria, Nov. 25, 1768: became Professor of Sculpture in the Academy of Munich in 1816. He is best known as one of the followers of the religious or Catholic revival in art, of which Overbeck was the leader. Among his works are statues of St. George and St. Michael. His best works are in Munich. D. in Munich, Mar. 12, 1859.

Eberltard int Bart: the first Duke of Würtemberg; b. Dec. 11, 14.5; beeame count of a part of Würtemberg when only fourteen years old, and led a dissipated life: but reformed after a voyage to Palestine, and became one of the most popular princes of Germany. He visited ltaly, where he met the leading scholars of the age, and on his return fostered the spirit of the new learning in his own state. He founded the University of Tïhingen in 1477. Having consolidated his part of Wirtemberg with that of his cousin, the emperor created him in 1495 , in consequence of his services to the empire, Duke of Würtemberg. Is a ruler, he was wise and liberal ; his agreement to a limitation of the ducal prerogative was the foundation of the constitution of Würtemberg. D. in Tübingen, Feb. 24. [496. See Plister, Eberhard im Bart, erster Herzog in W"̈̈temberg (1822).
Ebernhurg, $\bar{a}$ bern-boorkh: a small town of the Palatinate, Bavaria; on the river Nabe: 20 miles s. W. of Mentz (see map of German Empire, ref. ( $0-\mathrm{D}$ ). Here is an old ruined castle which belonged to Franz ron Siekingen, and Was used as a place of refuge by Melanchthon and other reformers.

Ehers, ābers, Georg Moritz: Orientalist and novelist; b. at Berlin, Mar. 1, 18:37 ; lectured since 1865 in Jena on the language, history, and monuments of ancient Egypt, and became in 1870 l'rofessor of Egyptian Archacology in Lripzig. His chief work is a Commentary on the Books of Moses ( Die Bücher Mosis; Sachlicher Commentar zu Genesis und Exodus, vol. i., 1868). He also published an essay in Virchow and Von lloltzendorf's eollection, Mierogtyphisches Schriftsystem (1871): Durch Gosen zum Sinai, an atcount of his travels in l'alestine (1872) ; and Papyrus E.,

Echo (in Gr. 'H $\chi \omega$ ') : in classic mythology, a nymph who aided Jupiter in escaping the watchtulness of Juno hy detaining the latter with her amusing talkatireness: but that goddess. discovering the deception, ordained that she should not be able to speak until some person had spoken to her. nor to be silent after any one had atdressed her. Cherishing for Narcissus a passion which was not requited, she pined away until nothing remained of her but her voice.

Eelıo [Gr, 方的. echo, ringing sound, ef. $\eta \chi \not \chi^{\prime}$. $\bar{\eta} \chi o s$, sound. noise, Lat, rugor. rugitus, whining, crying]: the retlection of sound from a distant surface. Several conditions must be fulfilled before an echo can be produced. The ear must be situated in the line of the reflection: and in order that the person who emits the sound may bimself hear the echo, this line must be perpendicular to the reflecting surfice, but it there are several such surfaces the sound mar be brought back by a series of snecessive reflections. The opposing surface must be at a certain distance from the ear, for if the directed and reflected sommls succeed each other with great rapidity, they are confounded. Thus ranlted cares and large rooms have a strong resonance, but produce no echo.

Sound passes throngh the atmosphere at the rate of about 1,125 feet in a second; hence a person placed at half that distance would hear the echo exactly one second after the sound was emitted by him. The least distance of the reflecting surface from the point whence the sound is emitted must be about 50 feet.

Unless the surface refiecting the sound is of considerable extent, the echo will be too feeble to be heard. Some concavity in the surface by which diverging rays of sound are concentrated at the point where the echo is andible is favorable, if not absolutely essential, to the production of echoes. It is a property of the ellijse that esery sound proceeding from one of its foci and impunging against the curve is reflected into the other focus: whence two persons placed in the two foci of an elliptic chamber may converse with each other in a whisper, inl not be heard by those who are in the other parts of the room. 'Thas walls or buildings approaching the elliptic form return sounds with great force and distinctuess. The faintest somud is convered from one sile of the "* whispering gallery" of St. Paul's. London, to the other, but is not heard at anr intermediate point. Some cchoes are remarkable for their freguney of repetition. An echo in the simonetta palace, near Milan, is said to repeat the report of a pistol sixty times. To the same kind of multiple, or repeating, echo belongs that of lillarney. The phenomenon is cansed either by the occurrence of sereral reflecting surfaces at different distances in the direction of the sound, and with sufficient interral between them, or by two surfaces being inclined to ach other in such a way as to give repeated reflections of the sound from the one to the other, like the mirrors of the killedoscope. The number of syllables that any particular ccho will repeat depends upon the distance the sound has to traverse; an echo in Woodstock Park, Euglantl, rejeats seventeen syllables.

Eclo Cañon: a remarkable ravine or defile in Summit co., Utah; visible to passengers on the Union Pacific Railway; 975 miles from Omaha. It is inclosed bet ween high vertical Walls of rock of great grandeur and beauty.

Ecija, äthrewhitil (anc. As'tigr): a city of Andulusia, Spain: on the river Grenil, about 50 miles E. N. E. of Serille (see map of Spain, ref. 11-I). 11 is well built, and has mumerons chnrehes, convents, and losjoitals; aiso manufactures of linens and course woolen fabries. On the border of the river is an alamedu (promensule) arlorned with statues and fountains. Many Roman remains are fonmd here. The elimate is sn loot that Eciju is called "the frying-pan of Anclahnsis." The ancient Astigi was one of the chief towns of II ispaniar Batica. I'op. (1sหo) 23.615.

Lek, Iondox (properly Mairre): a learned and rigorons Toman Catholic opponent of luther; b, at Eck, Swabia, Nov. 13, 1486; was professor at Iuselstadt from 1010 until his death. II most fumons cnconnter with luther was at Leipzig, 1519. lle prepared a ferman translation of the Bible as a rival of that of luther (15:3i). 1). at Ingolstult. Feh, 10, 15.13. in advance in astronomical ephemerides, and hy means of them an observer can see exactly at what regions of the earth"s surface a total eelinse will be visible. If the shadow comes to a point before reaching the carth, as represonted in the second liagram, then there will he a region. $m \mathrm{~m}$. within which the moon will be seen projected nearly cemtrally on the sun, but, the apparent diameter of the sum being the larger, the enge of its disk will be seen as a ring around the lark hody of the moon. This remarkable phenomenon is called in ammlar eclipse of the sum. As in the case of a total eclipse, the annular phase will be seen along only a comparatively harrow belt of the earth's surface.
Owing th the cimemstances here described, the duration of a total or annular eclipe is always very small. That of a total eclipe ranges from a few seconds op to four or fire, or even, in exceptional cases, seven minntes. The duration of an anmar eclipse mat be a little greater.

Total eclipses of the sun are looked forward to by astronomers with the greatest interest, becanse during the few minntes of their cocurrence remarkable celestial phenomena can be seen which are not risible at any other time. The observer who is fortunate enough to be within the path of such an eclipse will see nothing remarkable until the sun is nearly obscured. As the moon gradually phases over the solar disk the latter is at leneth reduced to a small are of light. which hecomes thimer and thimer, and at length entirely disappears. At onee an extrantlinary effulgence. or corona, is seen smrounding the dark body of the moon. Which looks intensely hlack in contrast with it. An observer of the total ecliphe of Ang. 7. 186!, which was visible in the U.S. from lowa to North Carolina, thus describe the corona
"On looking up, one of the grandest spectacles of which it is possible to conerive met the eve. surrounding the dark body of the mon was a erown of light, with rass shooting out in five great sheaths to a distance equal to the sun's diameter, or nemy a million of miles. We gazed for eight or ten seconels with astonishment at this magnificent spectacle. No printing can represent it, and no pen can describe it."

The brightest part of the corona consists of a comparatively thin ring of white light, immediately around the dark hody of the moon, and shading off quite rapidly: The light is. however, very irregular. and the most striking features of the corona are certain heams of soft, white light, which extend out in varions lirections like the rays from an electric light, sometimes to a distance of several diameters of the sun, or several millions of miles. Photographs of the corona which have been taken from time to time show it to consist very largely of fine lines of light, having a general form some what similar to the lines formed hy ironfilings which are scattered upon paper over a magnet. This appearance suggestel to l'rof. F. II. Biqelow the ilen that the corona is a fhenomena of polar forces resembling those of magnetism, and a complete theory of the corona has been constructed on this hypothesis.
Besides the eorona, irregular patehes of red light are commonly seen here and there around the body of the monn. These have long bern known as protuherances, or prominenees, and during the total eelipse of $1 \times 6 \mathrm{~s}$, which was risible in Inlia, Mr. Lockyer made the extraordinary discovery that these prominences were due principally to hydrugen gas. It was subsequently fonnd that the whole bode of the sun is surrounded by a thin layer of gases at a very high temperature, composed of rapors if several known metals, and perhaps of most of the substances which exist in large phantities on the earth, changed to vapor by the fersent heat which there prevails.

The motions of the sun and moon are such that eclipses recur approximately at an interval of 6,5sp days and shmers, that is sears anif 10 or 11 diys acording to the number of lab-years which have ocenreal in the interval. This perion is calleal the simes. What makes it remarkable is that the time of yar of the recorrences will be noarly the same, and the previge and notes of the moon's orbit will also return beatly fo the stmue josition, so that the eclipse when repated will be of the same genoral kind. That is to say, if an ectipse of any sort is sten to-day, then by conting forwate a furionl of the sams, we thall have another eclipse of very noarly the same kind. Owing, howcrer, to the manler of tays mot being exact, wifht homs being left over, the secomb eclipse will not le visible in the same parts of the carth as the first one was, but gemerally in regions about te farther $1 \mathrm{I}^{\circ}$. in longitude. It follows inat
thre eclipses remarkable for the duration of totality will recur at the ahove-named interval. By a study of the motions of the sun and moon throngh many centuries, it is foum that one series of eclipses remarkable for long duration of totality at the present time are those of the years $1832,1850,186 \times 1856,1904,1922$, etc. Sut the duration of the eclipses of this series will continuously diminish, and after a few more perions the eclipse will cease to be total. Another renarkalile series will he the eclipses of 1ss:3, 1901, (9)f!, 19:3 , etc. This series will attain its maximum in the eclipses of the years 1935 and 1903 , anl the duration of Iotal phase prohably will be the longest that will have been seen for more than a thonsand years.
The pincipal total eclipese of the sun which will be visible in the northern hemisphere from $18!6$ to 1993 inclusive are the following:

Ang. 9, 18:06. the moon's sharlow will pass orer the northern bart of Norway, Smeden, and Siberha, across dapan into the Pacific Ocena.
lan. 3.185 , the shadow will pass across Northern Afriea and throngh India. near bonlay and Calentta.
May 28,1900 , the shadow will pass across the northern part of Mexico, throngh Texas, Lonisiana, Missimippi, and Sorth Carolina, passing nearly centrally wer Raleigh in that state and then across the Atlantie fo jais through or near Spain.

Ang. 30. 1905. the shadow will pass over the northern part of British America in the Ifudson's Bay region, across Labrader into the Atlantic Ocean, which it will cross, aml thence aeross Northern Spain, southern France, the Mecliterranean, and Egypit.
Jan. 14, 1907, a total eclipse will be visible in Central Avia, from near the Caspian Sea to China.
Jan. 3, 1908, and Apr. 28, 1911 , total eclipses will be visible in the l'acifie Ocean.
Oet. 10. 1912, the moon's sharlow will cross South America from Peru to Prazil.
Aug. 21. 1914, the shadow will pass aeross Norwny and Sweden, through Russia and Persia, and continne its course nearly to Inelia.
Feb, 3, 1016, the shadow will pass near the Isthmus of Panama into the Atlantic Ocean, and ross it nearly to England.
June 8, 1918. the shadow will crose the Northern Pacific Ocean, strike the coast of America near V'ancouver's islancl, and pass in a southeasterly direction ower the whole U. S. reaching to Florila, where it will enter the Athatic and terminate.
Sept. 10, 1023, the shadow will enter upon the Pacifie Ocean, and cross the sonthern part of Califormia and Texas, where it will enter the Gulf of Mexien.
It will be understood from the foregoing that a total eclipse of the sun at any one place taken at random is an extremely rare phenomenon. A partial eclipse of the sun. however. is risible at any woint on the earthis surface every few years. The total number of eclipses of the sun is greater than that of the moon, but an eclipse of the moon is visible over at least an entire hemisphere of the earth, whereas one of the sun can only be seen over a fraction of a hemisphere. Hence in any one place edipses of the moon may be seen more frequently than those of the sun. Only two, or at most three eclipses of the moon can uecur in any one year, whereas there may be four. or even five. eclipses of the sun.
An eclipse of the moon is for an ordinary olserver a remarkahle phenomenon, although it is of little astronomical interest. The time of its oecorrence, anm all the circminstances eonnected with it. can he prodicten with more exaetness than they can be observed. The most remarkable circumstance connected with such an celipse is that although the moon may he completely immeren in the shadow of thi carth, it is visille, shining with a lurid enymer-enhored light. This is owing to the carth's atmosphere, which reTracts the smis light passing over it. An olsermer of the mon at such a time would see a total eclipse of the sum by the earth. But after the earth hat completely passed over and hidhen the sma. he would see it surromded by a bright ring of reddish light caused br sunlight reltacted throngh the atmosphere of the earth. The lorillianey of this light woukd rery largely depent on the amome of cloudiness armuld that part of the atmosplace throngh which the san's rays passed. Hence the brilliancy of the moon in total eclipsis varies comsiderably. It is said to have totally disapmared on some occasons. The light by which it shines is real becanse the red light passes most freely throngh the
earth＇s atmosphore．＇The cathe is the same as that whinh makes the sm lowk rei at ortting．

## FCLADOR

Ecnador (Sp. Republica del Ecuador, Republic of the Equator, in allusion to its position): a country of Western South America; boundel N. and N. E. by Colomlia, S. E. and S. by Pern, and W. hy the Pacitic; area rarionsly estimated at 120,000 to $276,000 \mathrm{sq}$. miles. The latter extension was claimed until recently in Ecuadorian ollicial publications: it included an extensive region in the Amazonian basin, the possession of which is disputed by Pera, Colombia, and even Brazil. If the claims of these countries are allowed. Ecuador will be almost restricted to the Andean region and the Pacific coast; and even in these the Mira valley is disputed with Colombia and the Achira valley with Pern.

Topograply, etc.-The Andes traverse Ecuador nearly from N. to S., in two great parallel chains which inclose an elevated region or plateau. The eastern chain, facing the Amazonian lowlands, is, as a whole. the highest, and foms an almost contimous wall, piereed only by the narrow river valleys of the Pastaza and Pante: loeally this range is called the Andes proper. The western chain, known as the Cordillera. is, on the contrary. irregular and much broken: it contains, however, the highest peak in Ecuador, that of Chimborazo ( 20.496 feet). The platean between the two ranges has an average wilth of perhaps 60 miles and an elevation of $\mathbf{7 . 5 0 0}$ to 10.000 feet : it is divided ly cross ranges or knots into sereral minor basins or valleys, which, counting from sonth to north, are distingnished as the basins of Cuenca, Ambato, Quito, and Ibarra. North of the Cuenca basin the western Cordillem disappears ahost entirely, and the eastern range is lower than at any other point between somthern Chili and Northern Colombia; there is thes a kind of pass in the Andean chain which must ultimately be of great importance. Arombt the basins of Ambato and Quito are gathered many of the highest peaks in South America. including about twenty active or, extinct voleanoes. "Sowhere on the face of the earth," says Orton. "is there such a grand assemblage of monntains. Twentr-two summits are covered with perpetual snow, and filty are orer 10,000 feet high." Cotopixi, in the eastern range, is the highest active voleano in the world (19.614 feet). and Cayambe and Antisana are hardly lower.

West of the motuntain region the rallers end in low plains which skirt the Pacific coast. Nurth of the Gulf of Gmayaquil these are, in parts, 80 miles wide, but they are much broken by spurs of the Cordillera and lower isolated chains. Fast of the Andes there is an irregular fringing platem, which abruptly ends in the plains of the Nipu ind other affluents of the Amazon.
Rivers.-Nearly all the streams of the plateau pass throngh the western range, and some of them unite to form navigable rivers on the coast plains: the most important of these is the Guayaquil or (uayas, which flows into the Gulf of Guayaquil, and the Esmeraldas, in Northwestern Ecuador. To the east of the mountains the $\mathrm{P}_{\mathrm{izz}}$ taza and Sapn, with their numberless afluents, descend to the great Amazonian plains; the latter is the main and almost the only known ronte between the inhabited parts of Ecnader and the Amazon, and it can be navigated to a point within a hundred miles of Quito.
Lakes are mmerous, and some of them are situated at great elevations. Cuy-cocha, on the side of the peak called Cotosachi, is 10:200 feet abose the sea.
Harbors.- The Gulf of Gnayaquil is the largest and safest harloor on the Pacific coast of South America, hut will not auluit very large vessels. The only other shelterel harhors are formed by river mouths, and are of little importance.
Islonds.- I'una island, at the entrance of the Gulf of Guayanuil, is nearly 30 miles long, but it is low. marsly, and unhealthy. Numerous other small islands are scattered in the gulf and along the coast. The sutlying Cialapagus Archipelago ( $l$. $u_{0}$ ) is claimed ly Eenador.
rienlogy. Tulcanoes, and Eurthquakes.-Nearly all the ligher peaks are of igncous origin, and the platenu is covered in great part with tufa and voleanic conglomerates. Granite, gneiss, and metamorphic schists ocenpy extensive areas on the castern slopes of the Andes; the western Cordillera is largely porphyritic. ('retaceols formations skirt the highlamls in many places, and the coast plains are of Tertiary or Quaternary age, with large tracts of modern alluvinm along the rivers. The highlands of Exaudor are the great center of voleanic activity in sonth America. Violent eruptions from some of the nimerous craters are of almost yearly occurrence, and earthquakes are frequent and somptimes rery drstructive. 'I he great shock of Ang. 16, INeis, was felt from Colombia to Chili, but was most de-
structive in Ecuador. where, according to official estimates, 50,000 people perished; many towns were rednced to a mass of ruins. In 1797 the city of Riobamba was partly overwhelmed by earth and roeks loosened from a neighboring monntain by an earthquake.

Climate.-The const region is hot, damp, and in many places very multalthful. Yellow fever may be regarded as endemic at Guayaquil, and intermittent fevers are common and very severe. The plateaus have a temperate and pleasant climate. varying little through the year, and generally very healthful. Rains are less abuntant than on the coast, but there are almost daily showers. The driest months are July and December. The eastern flanks of the Andes and the adjacent plains are constantly soaked with heayy rains, and the climate is perhaps the most hmmid in the world.
legeletion.-Owing 10 the abundant rains and warm climate the plains of the coast and the Amazonian hasin are covered in great part with matted forests, which extend in many places far ap the mountain sides and valleys. These forests are rich in cabinet woods, drugs, dyes. ete., but almost the only products collected are rubber (ocenrring both on the coast plains and along the Amazonian tribntaries), irory muts. and small quantities of vanilla, sarsaparilla, cinchona, and tonka beans. There are extensive areas of grass land on the fringing platean E. of the Andes, and others near the coast. The elevated interior basins are almost devoid of forest growth, and portions of them, owing rather to the soil than to any lack of moisture, are sterile. The fertile parts afford excelient pasturage.

Animals.-Ecmador has the ustal rich finma of the neoIropical region (see Arerica, Soutri), the valleys of the eastern and western slopes being especially noted for their mmerons and heautiful species of birds and insects. The const forests have their own assemblage different in great part from those of the Amazonian plains, and many species are confined to single monntains or valleys. IIere the ham-ming-birds have their chief habitat. The largest animals are tapirs and jaguars. Ilamas are found principally in Sonthern Ecuador ; farther N. mules take their place as heasts of burden. Condors are conspicuous about the mountains, but do not descend to the plains.

Minerals-Gold and silver are almost the only metals extracted, and these not on an extensive seale. Quicksilver, copper, zine, and iron are reported, and there are salines of considerable value. Large sulphur deposits oceur in various volcanoes. Eineralds. long supposed to exist in Ecuador, have never been found there within historical times.

Inhabitants.-The poulation is officially estimated (1892) at $1,200,000$, of whom alhout 100,000 are classed as whites. 300,000 as mised, 680,000 as civilized Jndians, and 200,000 as wild Indians; 1 rohahly the latter are much overestimated. The African element is suall, By far the greater portion of the people are gathered on the plateam, in the western vallers, and at a few points along the coast. The region E. of the Andes has very few civilized inhabitants, and is imperfectly known. Quito, the chpital, on the plateau, has about 35,000 inhabitants ; Guayaquil. the principal port, has 45,000 ; Cuenca, $2 \overline{2}, 000$; and Riobamba and Latacunca 12,000 each.
The land is nearly all divided among a few rich proprietors, who hold the mass of the population essentially in a condition of serfilom. Agriculture and cattle-raising are almost the only industries, and these are curried on, with a few exceptions, in the most primitive fashion. Except on a few large sugar plantations, improved machinery and even plows are almost unknown. Coffee is cultirated to a considerable extent on the mountain sides: cacao is planted in the warm valleys and on the plains, atfording one of the principal articles of exprort. The large sugar plantations are generally on the allnvial lands near the coast. Lucerne is cultivated largely on the platean as food for cattle. In manufactures Ecuador is extremely backward, Asicle from the sugar-mills, tameries, and lisilleries, and a few small cotton-factories. they are confined to cotton cloths and lats made in the country houses, and workshops of the simplest description. There is a single railway from Juran, on the river Gnayaquil, to 'himhn, at the base of the Cordillera, 57 miles. The original plan of continuing it to Quito has nerer been carried ont, and the road is little nsed for merchandise. The only wagon road is from Quito to Riobamba, 81 miles. There are about 1.250 miles of inland telegraplı lines, and fanyaguil is ennnected by cable with Peru and l'anama. The experts in 18.10 were valuerl at $\$ 6,500$, 000. four-fitt his of which was cocoa, the remainder colfee.

 inal，heroic，satiricat．and dielaetice，with smme hits of pase，
 （the（＇urle，lígines）．These vary much in sivle，but most of
them are in strong contrast to the labored artificiality of what is known as the skallie poetry. Some of them are found elsewhere.ant the terms Eddu and Eddaic (or Eddic) are often extended to inchude other Old Norse poems (for example, the stanzas in the II radorer Suga) which resemble some of those in this colloction. The Fodex Regius was discovered in Tecland in 1643 by Bishop Brynjolft Sveinsson, who gare it the name Eddrt Somundi Miltiscii. supposing it to he a lung-lost work of Samund the Wise (1056-1133). This was a double misnomer ; for, in the first place, the collection has nothing to do with simmond, and, in the second place, the title Edda properly belones to the work of Snorri (wee I., above) and to that alone. This eror of Brynjoltr's has prosed stubborn of correction, and las given rise to many mistakes. The term Eiddet has been absumdy interpreted Greut-grandmother, and has been thought to indicate that the poems are, so to speak, the tales told by hoar antiquity to her listening descendints. (Compare the enurously similar error with regard to the Welsh TAbinogion, q. $\imath^{\circ}$.) The character of the collection has also been often misumderstood. The Elder Edcla is not a single work, in any proper sense. but the result of the attempt of some unknown Icelander to take down in writing such poems, orally current, as pleased his fincy or seemed to him Worthy of preserration. It is not eompiled in accordance with any plan, and is often confused in arrangement and corrupt in text. Some of the most interesting pieces in it are mere tattered remnants of what they minst once have been. The age of the Eidda has heen greatly exaggerated. In ansthing like their present form the pocms can not any of them be older than the tenth century, and the latest of them are premaps not much oliler than the Codex Regius itself (end of the thirteenth century).

As literature the Elder Fada is of the highest value. In the Jöluspá (The sibyl's soothsaring) we have the highest flight of the heathen Scandinavian religious imagination, assisted perhaps by half-understood reports of Christian doctrines. In the Lokasenna (The Flyting of Loki) the humor is at times fairly Aristophanic. In the Helgi poems, and in some of those which deal with the Volsungs and the Hniflungs (Wibrlungen), there is wonderful tragic power.

The standard critical edition of the Elder Edda is still Bugge's (Sorran Formkvent, ('liristiania, 186i). Other editions of importance are those of Fask (1818), Muncl (1847), Luning (1859, with a valuable commentary), Möbius (1860), Svend Grundtrir ( 2 d ed. 1874), Karl Hildebrand ( 1876 ; with an excellent wossary by $H$. Gering, 18si), sijmonds (1888, a valuable critical edition of which only one part has appeared). Fimmur Jonsson (1858-90). The Arna-1lagnam edition ( 3 vols., Copenhagen, 1787-1828), though antiquated, is still indispensable. Vigfússon's text (in vol, i. of Virfusson and l'owell's C'orpus Poeticum Boreale, Oxford, 1883 ) is quite untrustworthy, but his introductions and notes contain much that is ol importance: Powell's translation (in the same work) is practically useless for the general leader, since it, of course, follows Vigfusson's rearrangements. The favorite German translation is Simrock's. There are Jnglish versions by ('ottle (Bristol, 179\%) and Thorpe (1.ondon, 1s66), and some of the poems have been translated by R. B. Anderson in his Vorse Mythology (Chicago, 18iõ).
G. L. Kittredge.

Eldy, Claresice : organist; b, in Greenfield, Mass., June 23,1551 ; carly gave evidence of marked musical ability, and by the time lo wiss sixbern years old was regarded as a fine organist. He then began systematic study under Dudley Buck, and in 1871 went to Gemany and took a conrse mider Ilaupt. Ib fore ruturning home he gave recitals in several Europuan cities with marked success. Upon his return he settlet in Chicioro, where, in soz, he became director of the llershey Schmol of $>1$ usiond Art, and gave a series of 100 recitals, wills no repetitions. In 1876 he gave officially two comerts daty for a werk at the Philallelphia Fxhibition, and in Ixs! le was invited by the French (iorcrament as arepresiontative of American art to give othecial recitals in the 'l'roc:alero. Author ol The ('hurch cend ('oncert Urgunist and The Orgun in (hurch. 1). E. 11 ERVEY.

Filly, llentr Turner, (. E., Ih. D., LI. I). : educator and mathematician: b. in stonghtom, Mass.. June !! 1844 ; graduated at Yale in $156 \%$ with the decree of $A$. B. In Is $6 s^{\prime}$ The was instructor in survering in the shetlield sefentitie School; 1N6! - 44 assistant I'rotusor of Mathematies and Civil Bnginerring in Cornell [niversity: $18 \% 150$ Irofessor of Mathematics, Astronomy, and Civil Engincering in Uni-
versity of Cincinnati; and, since 1801, president of Rose Polytechnic Institute, Terre Mante, Ind. In 1884 he was vicepresinlent of the mathematical and astronomical section of the American Association for the Adrancement of science. lhe is the author of Analytical Geomptry (18:t); Jew Constructions in Graphical statics (18:\%): Researches in Graphic Statics (1858): Thermodynamics (18:9); and of many papers in technical journals, umong which may he mentionel Joximum Stresses under Concentruted Liads, published in 1890.

Eddy, Thomas Mears, D. D. : clergrman: b. in Newtown, Hamilton co. O.. Sept. 21023 : stumed in the classieal sminary of Greendoro, Ind. joined the Intliana Muthodist conference in 184?: was editor of the AWorthuestern Christian I drocale from 1856 to 1865 : served as pastor in Baltimore three sears: was appointed to the Metropolitan church, Washington, W. C., in $1 \psi^{\circ}$, and elected the same year corresponding secretary of the Methodist Missionary Society. Ile was eminent as a jonmalist, and was author of a Ifistory of Illinois during the Civil Har (2 vols. 8vo, ('licago, 186i)). D. in New York, (let. i, 1sit.

Eddystone Lighthouse: a lighthouse in the English Chamel; 14 miles $\mathrm{S} . \mathrm{S}$. W. of Plymonth breakwater, and 9 miles from the coast of Cornwall: lat. $50^{\circ} 10^{\prime} 54^{\prime \prime}$ N., lon. $4^{\circ}$ $15^{\prime} 53^{\prime \prime}$ E. It stands on the Eddystone rocks, which are daily submerged by the tide, and it rises about 85 fect above the high-water mark in the form of a circular tower, which gradually decreases in diameter from the bottom to the top. witli a curred outline resembling the trunk of a tree. It has a fixed light. visible at a distance of 13 miles. It was ereeted in 175T-59 by Mr. Sineaton. The material employed was Portland limestone. Stels Were cut in the rock, to make the foundation as solid as possible. The stones of each course of masonry were ingenionsly doretailed, and each course was doweled to the one below it. The result was an edifice of surpassing strength. The fate of past ventures made the destruction of simeaton's building seem probable. The first lighthouse hat been destroyect by a storm (1703), and the second liad been burned (1755). Smeaton's lighthouse was modermined by the waves and a new building. like the old in appearance but with improved appliances, was built npon another of the Eddystone rocks and formally opened in the spring of 1882. See the article LiguThotse.

Edelfelt, albert Gustar Aristid: genre and portrait painter; b. at Helsingfors, Finland. July 21, 1854: pupil of Gérôme, Paris ; second-class medal, Purís Salon, 1ss2: medal of llonor, Paris Exposition, 1889. II is work is motable tor excellent drawing. Studio in Paris.
W. A. C.

Edelinck, āde-link. Gerard: engraver: b. in Antwer], Belgíum, in 1640. He worked for many cears in Paris, and was patronized by the French court and Lonis XIV. IIe engraved portraits of many eminent persons, the Iloly Family. after liaplael, the lirgin, after Guido, and several works of lebrum. Itis engravings are remarkable for their delicacy and softness, and render costume, armor, etc., with singular perfection. He is ranked among engravers of the first order of those who are not original or, as they are called, 1ainter-engravers. D. in Paris, Apr. 2, 170\%.

Edelweiss, adplais: a white, woolly, perennial lierb (Leontopodium alpinum) lelonging to the fiamily ('omposite, and closely related to the common American plants known popularly as "everlasting," or "lanlies" tohacoo." It is a native of the $A 1 p$ and is annully collected for sale by the Swiss peasants. It is fredy cultivated in gardens in America and burope.

Charles E. liessey.

Edsartown: port of entry : capital of Dukes co.. Mass. (for location of county, see map of Massachusetts, ref. (i-d) ; situated on the east shore of the ishand of Marthas Vinefard, 30 miles from New Bedfird, on the mainland. llere is a small but safe harlor, and a pier on which is a fixed
 Edgartown is on the Marthas Vinevard Railmay, and has commmieation by stcamboat with the mainland. It is a summer resort and a heallquarters for whale-fishing. Pop. of township (1880) 1,303; (18.10) 1,156 ; (1895) $1,125$.
Edgefield. or Elgelield Court-house: town (founder in 150.5): capital of Ellqefield co., $S$ ( C. (for location of countr. see map of south ('arolina, ref. 6-C): stuater on railway, 24 miles N. of Aurusta, Ga. It has 6 churches. 2 schools, eottonseed-oil mill. brick-yards, fertilizer-factory, and tamerr. Pop. (1880) 80s: (1890) 1.168: (1892) about 1.800.

Edwehill: a ridge in Tharwickshire. Englant: $\tilde{f}$ miles N. WV. of Banbury (se map of England. ref. 11-H). It was the scene of the first great battle of the civil war. which occurrerl Oct. 23.1643 . The royalist army was commanded by Claarles I., and that of the parliament hy the Earl of Essex. Prince Rupert. by a charge of cavalry, broke the left wing of the parliamentarians, whom he pursue? to Kineton, while the right wing of Disses's army defeated the royalists. Thus the battle proved disastrons to both armies, and the loss was so nearly equal that neither party could claim the victory. Clarendon estimated the total number of killed at 5.000. Among the slain was the Earl of Lindsay, who had led the king's intantry.

Edgerton: city (founded in 1858): Roek co., Wis, (for location of county. see map of Wisconsin. ref. i-E) : situaten on Ch., M. and St. P. Railroad. 2.) miless. E. of Madison. It has 7 churches, a large high selmol, a potterr, and 34 tobacco packing-housex, and is one of the most important tobaceo centers in the state. I'og' ( 1880 ) 869: ( 189010 ) $1,59.9$ : (1895) 1,922.

Eiditor of "Jndex."
Edgewater : village: Richmond en., N. Y. (for location of county, see map of New York, ref. - - $)$ ): situated on the northeast shore of Stateu Island; 6 miles s.s. W. from New York city, with which it is connected by ferry. it is on the Staten Siland Railroad. has mumerous churches, and contains the residences of many New York busines men. Pup. (I850) 8.044: (1800) 14.26.5.

Edgeworth. Mexry Rasex: Roman Catholic priest : knowil as l'Ablé Edofeworti de Firmost ; b. at Eilgeworthitown. Irelanl, 1\%.5; the son of a Prutestant clergman who turned l'atholie: was ellucated at Toulonse and at the Sorbone, Paris; and aftre taking orlers herame the confessor to Nalame Elizabeth. Jle was afterwan :p-
pointel confessor to her brother, Louis NTI.. whom he had the courage to attend on the day of his execution, aceompanying him to the foot of the scaffold and sustaining him with spiritual consolation. An object of hatred to the mob, he escaned from France amid the greatest peril, and, in 1736. returnel to England. Where he was received with honor. He afterwarl became the chaplain of Louis XV11. at Mittau, Russia, where he died May 22, 180\%, from a disease cont racted by attenting the French jmismers of war at that place. His Memoirs were edted in English ly C. S. Eilgeworth (Lomion. 1815), and in French 1, Dupont (Paris, 1815). His Letters were published in Paris, $1 \times 1 \mathrm{~s}$.
F. I. Colbr.

Edgeworth. Mard: author: h, near Rearling. England. Jan. 1. 1767 ; removed with her father. Jicuird Luvell Eineworti (q. $r$ ), to Elgewarthstown. in Irelaml, in 1 iss. In 1 n01 she produced Casile Ruckrent, the first of a serics of novels, among the best of which are Betinda (1sil3): Leonora (1806): The Absertee (1812): Putronaye (1814); Ormond (1817); ancl ILelon (1884). She also publinduct Popular Teles (1804) and Tales of Fushionable Tiff (1-19-12), and wrote a number of works in conjunction with, her father, among them Essay on Irish Bulls (1s()? ), The I'urent: Assistant, and Ilarry and Lucy. Hler stories for children were as popular in the U. S. as in Englanul. I. May 21, 1449. See Miss Thackeray, The Book of Sibyls (1883), and the Life ly Helen Zimmern (1883).
Elgeworth, Richard Lorell, F. R. S.: inventor and author; b, at Bath. England. May 31, 154t. The belonged to a family that hand long been settlerl in lreland, and inherited his father's estate at Edgeworthstown. Countr Longford. Ho was educated at Trinity College. Jublin, and at Corpus Christi, Oxford: marvied in 1763 and settled near Healing, England. His mechanical contrivances brought him considerable fame, and in $1: 11$ be went to prance to superintmd part of the works undertaken to alter the course of the lhone. In 1ise he remorel to Eigeworthistom, where he dewoted himself to guestions of erfucation and political cconomy. Ile was active in public affairs and sat in the last Irish Parliament (109-0.90). Among his inventions was a system of communication by telegraphy. Ile puldisher several works, mostly in partnership with his daughter Maria, the novelist, anong them Pructical Education (? vols. $17!8)$ and on the Art of Conteying Suift and Secret Intelligence. Ine was married four times. D. at Edgeworthstown, June 13, 181\%. See Memoirs (partly autoLiographical) of Richard Lovell Edyeworth (18:0); 3d ed. 1844). by his danghter.

Edereen. Ansa Charlotta: anthor: b. in Sweden. Oct. 1. 1stu; the danghter of J. O. Lefller, a school superintendent in Stockholm. She has written a number of very popular realistic novels, Pictures of Life. True Women, ete. In 1822 she married Mr. Edgreen, from whom she was divorcerl, and in 1890 she married an Jtalian duke, by name Caianello. Among her later productions is the drama Ifur men gür godt (1low to do Good). D. in Naples, (let. 24, 1852
R. B. A.

Edhem Pasha: Turkish statesman : a native of Scio and of Greek lamily; 1), in 1823 : purehased as a slave in his 1oyhoul ; sent liy his master to the École des Mincs. l'aris: returnerl to constantinople 1839: phaced on the general staff. and rose to the rank of colonel: aide-de-camp to Ahel-ul-Mes jitl and captain-general of the imperial guard 1849. In 1NG: he was lhister of Foreign Affairs, and for the next "ight rears ambissador at different European courts. In Dec., isib, he represented Turker in part at the general ennference of the powers. J11 Feb. 1875. he succected Nithat Pasha as grand vizier. He served in 18\%! as amhassador at Viemna, and from 1883 to 188.9 as Minister of the Interior. He belongs to the "Young Turkish," "antisufta." party.

## APPECDIN

Child-sindy: the scientifie sthdy of chindrem. The miversal naive observation of childron, contributing as is does to unr "knowledge of human nature," stod leading as it dops in the hest cases tor insalable artistie in-ights, not only prepares the way for all mone syatmate ehifferthly, bat is likely to reman a principal sunce of our pationd knowl ahte of chill-lifes Inded, one impromt wheat of the childst undy movement of the present day is to armse athl internify interent in the natural history of ehildhond ameng mothons, tenchers, and others who lack scrpmifie traning. Such (1) servers ate alvisel to keep notes of the spontanems sayines and doings of children. senerally withe refermene to sume Ifluestion or system of questions propored he a peycholugist.

Chid-study in the more strictly scientific anse is historically an intgrowth of oider liogogical scientes. The carliest and the Pest reveureles in this died are the work of mon trained in anthomblow, physiology, menmlogy, pywhitry, Isychology or other related selence. The teneral aims, special probijems, methots, ami results of scientilic child-atudy have developed in close conmetion with the deselopment of these sciences, and they can mot he righty judned nor properly ntilized if taken from the whole body of sidenee of which they form an organic part.

The outline of sulnorimate topics here given follows the main lines which resench has actually takin. Purely medical stadies, anthropolegical stanle's of the primitive chald. and, in general, statips whose interest is manly theoretical rather than edteational, are omituat.

The fact that in weneral the more fumamental functions develop carly in life, and the consideration that the carly life of the imbividual is posibly, in a measure, an epinome of the race-dife, give sureial impurtance to the stuly of infants. Very careful and extended studies have heen made of the first thece vears after hirth. They cover almost ewery phate of phaseal and mental development, imelnding thi development of the senses, memory, imarination, and intellect (and in partientar the development of langage), of the emotions amiof impulsive. reflex, instinctive, imitative, and

 The task of anthropmetry io primarily to determine the weight, size and form of the human boty, together with the (anses of there characteristies: seembdirily, to "xplain the functional characteristies assistiatel with the foragoing. This tak requires the weighing huld mathring of many indiviluals varying in race, wex, age, and in strial and geographeal cusiromment. and at statiatical stody of the resmlts for the ewheral clases to determine with precision the inBnence of varying eonditions uphn structural ant functional derelepment.
Thee funlamental importance of sumb an exhilition of human growth in connerefon with the causes affecting it, for all mo cial and eathatiomal interents, is manifest. Amoner specilie results of the later mat clas-ical restate one in this tield are the fullowing: The rate of growth is not nufifur. lut varits with the mason of the rear and with aqe; and is charactoristically dillerent for difterent pats of the hody, for loys and girle for childron of diterent race combitions
 ation of motal vigor. If mow wo fake into ancoms the fact that the prion of maximun growth is the feriou of
 thile in the aerpirement of kill. the impertance of thene

 It is uread that primary instmethen should tee batal upon
knorledge gained by such studies. Studies exist upon children's ideas of sex and upon their religions and moral dideas which can not be summarized lere. (4) Practicp.-The rate of improvement with practice is not uniform, but it is first rapil and then gradual!y slower, Recent investigations indicate that in the acopuisition of a certain skill, for example, in the learning of a language, there are occa-ional brief perions of rapid improvement preceded and followed by long periods of slight improvement. As the preriods of rapid improvement differ for different functions, the teacher should know the practice-curve of the function sought to lie developed. (5) Aptitudes amd Interests.- Mans allthors have shown that minds are to be distinguished according to the sense whose impressions are apperceivel, remenbered, and enployed with most aptitude and fregnencr. Visual. anditury, tactile and motur types are distinguished. The importance of these special aptitules upom the development of the mind and even upon one's philosophy has luen shown. Most children are not exclnsibply or extremely of any one type, but there are many extreme individual cases, and these at least should be known as such by the teacher. Childrens interests hare been studied in a variety of ways. A study of the predicates chosen by children to describe familiar things indicates that yonng children are interested mainly in the motions and uses of things, only much later aerniring an interest in classifying things into larger groups. Children's drawings, their preferences among storits, their choice of future occupations, their collections, their plans for spending money, their asthetic ureferences. their imaginative ereations, their plays, their lies, their seeret languages, their rudimentary socicty, and the like have been stmelied both statisticully on large numbers and by personal aequaintance, all of which help to sound the character and range of their mental and moral tendencies and the trend of change in these as they grow older.

In summing up the applications of child-stuly to education, it must be affirmed, in the first place, that many scientific studies of children have no immerliate educational application whatever. Most of them were made, not by ealucators nor for educational purposes, but by scientists interesterl in the facts and laws of human development. To the scientists who believe that such work must lead to far more profonnd and just views of man's life than any one now has every such stuly is precious, as it is to the individual who has learned that the discovery of truth must often long precede any practical application thereof. To the unscientific teacher many of these studies must look like so many useless scraps. A recognition of these separate points of view should prevent mach misunderstanding.

In the secom place, it must be remembered that no sort of truth, whether philosophy, poetry, or science, is of much eclucational value except through persons who have thoroughly assimilateal that truth. To sort of truth ean get to the pipil in sealed packages. While, therefore, one thoroughly trained in scientific ehild-study would fund what knowledge we now possess a valuable help in the decision of almost every question in the school, one without such training ean be given comparatively few edneational prescriptions. The most valuable practical suggestion that can be civen teachers desiring help from child-study is aceordingly to become students of chilliren. The common-school teacher can be directed in doing this so firr as to bring immediate alvantages to the school, and the adrancel student of pealagory may secure training in scientific child-stury. As degards the study of childrens minds, it is almost impossible to give any other alvice of importance. We alremblyave from educational fhilosophies the maxim that We mist know the apperception ability and tembeney of chilrlen. But such maxims are only empety truisms unless,
 the chidmen they have in change.

Lastly, some of the hygienic ontcomes of child-study may be put in the form of speeific educational suggestions:

1. There should be cxpert mediosal examination of sehoolhonses, grounds, equipments, programmes of reguired work, mothome of teaching in so far these may atlecet the health of schond children.
2. All schools for the 1 raining of teachers shonld afford competent instruction and training on sebool hyciene.
3. Achool boams should canse the present teaching force to receive such instraction from remident plysiojans as will leat them to observe the more ubvious symphoms of sensory, motor, or mentad diflect. Reliohle diasposis can not of comrie be uade by untrained teachers. But earefin atten-
tion, directed by such suggestions as a physician could give. would leal the teachers to discorer in many cases the fact of defect, as defective evesight or hearing, special liability to take cold, stoppage of nose-breathing; motor irregularities, suclu as the twitehing of any museles: useless habitual rhythms, such is tooth-grinding, stuttering, inability to perform common tasks, incoördination of movements when the eyes are closed, absence of irjs light reflex, general muscular restlessness; signs of overlatigue in addition to the toregoing. such as nusual flightiness of attention, emotional depression, weakness of memory, slowness and ditliculty in reasoning about common things, insistent jueas, umusual indecision, and the like. When such or any defects are known $(a)$ the defectives of course will not be hiamed or munished, as may possibly now in ignorance be fone, for their imbilities: (b) they will receive special consideration in the assigmment of seats and in the requirement of school task: : (c) the attention of parents will be ealled to the defeet, and the child may receive competent medical treatment.
4. Those who have anthority to arrange school programmes shonla reeonsider many exereises and requirements in the light of the faut adduced above tonching fatigne. Eye-strain, due to bad light, bad print, fauly desks, fulty attitude in writing, or longecontinued or precise use, accelerates the development of hereditary optical defects as myopia, hypermetropia, astigmatism, etc., if it does not also eause such defeets. Fnither, eve-strain, inrolving as it does long-continued contraction of the delicate muscles of the eye, is succially fatigning to the corresponding nerve centers and is proved to induce nerroms rlisease. The literature of this subject is extensive, and includes quite specific directions from the highest authorities on school-lighting, books, desks, and programmes of work. These directions are much too extensive to be given bere, but they are casily accessible. (hee especially Cohn's IIygiene of the Eyp.) Uverfatigue of the nerve centers controlling the ham may be indnced by too long continned or too precise work in writing, drawing hand-work in the kindergarten, tool-work in the manual-traning school, piano practice, or the like. This effect can be prevented by shortening such exercises, by not demanding a higher degree of precision in such work than ean be attained by moderate etfort, and by enenuraging the use of the larger mnscles whererer possible instead of the smaller, Finally, it is important to note that the acquirement of skill is not hindered but facilitated by having regard to these hygienic conditions.

Whilam L. Bryan.

Cuba: On Fed. 2t, 1595, afterseveral years of secrut preparation, the lateat of the rebellioms against spanish sovercignty in 'uba began. The causes that prombeel it were the same that had kept the island in insurrection or disemtent for a half centurg. "Ihe insurgents soon formed the Republie of ('uba, hut their government subgh in vain to seente recornition from the C . s .

It the close of 1 wit the greater part of the interior of the foland was in the hands of the insurgente, hat all the large towns and the comsts were held hy span, whin, from first to latt, hal sent 290,000 soldiers tic C'nla. (rumeral Mattine\% ('ampos, who had been appontel captan-goneral ant instrueted tu put down the insarpertion, having revighel, was sucteeded hy Gen. Weyler. Weyler, as a wat medaure, ottherel all the dwellers in the rural district, under pain of Aleath if they disobered, to concentrate in the large towns. There they were known as reconem/retens. 11 momad in by the garrisiss, large numbers of them perished uf hunger. though relief was sent from the U. S.; and it is said the rural popmace of the western provinces of binar del lion. Havana, Matamzas, and santa (lara was practicully exterminated. Weyler was the olject of so moch imblignation on aecount of his allered inhmman methods that hee was fored to retire. and was suceeded by Capt.-(ien. Blanco.
In earlier years the sianioh erown had repatedly pomised reforms and, in partienlar, greater political privileges. No promise had been fulfilled, and the ("ubans rewardeol the pledge of an autonomist gevernment, grantetl late in 1897, as the merest subterfuge. The grievances of the Cuhans, the afleged inhumanity of the spanish conduct of the war, and the immense loss to the conmeree of the C . S. which hat derlined $669,000,1410$ a year for three years, or over two thitels of the normal trade with the island, had produced a profound impression in the U. S. which was greaty intensified by the blowing up of the U.S. battle-ship Mane in the harbor of II:wana, on the night of Pelb. 15. IN心, witl the lose of orer ebt of her crew; and on Apr. 11 President Mekinley sent a mescage to Congress recommenting armet intervention in Cuba. On the leth Congress demanded the withlrawal of Spain from the islam ; on the 2let the Presillent sent an ultimatum to Spain, and on the same day the U. S. minister to spain and the Spmish mimister at Whalaington reepived their passports. On the following day a 1 . S spuadron set out to blockade the ports of C'uba from Carlemas, on the north coas around the west end of tac island to C'innfumges, on the somth conast.

The loading events of the war were the destruction on May 1 of the Spanish llect in the lay of Danila, in the Philiplines, by (commodore 1)ewey's squadron: the hunt for the ipmish sifualron under Admiral Cervera by the spuatron of liear-Admiral Sumpom, enting in the kombardment of the forta at san Jun, the capital of l'uerto lieo, on May 12: : the blockate of the port of santiaro de ! uban. in whic fo Corvera's spualron lan taken wefuge beginning on Mayot: the landing of the first U. S. furce in Chba, till mames, at finantanamo Bay, on June 10 : the vain attempte of the Spaniards to dislodge them on June 11-14; the linding of
 fien. Shafter, on Jume $22,2: 3$; the first hat tight near Smingo, in which 16 of the attacking force were killent aml 40 wounded ; the assanlt on the onl Works of santiago on July 1.9, the total lose in the fighting before santiago bethe
 of Alminal Cervern's stuadron, while attompting to emape on July 3 , by the North Athatie Hent umber hear-hbmiral simpum, the spaniards losing form-ships, abome firo killen), and over $1: 60$ prisoners; the survemer of sutiaghand the
