## PECLLIAR PHONETIC SYMBOLS

## USED IN THE WRITING OR TRANSLITERATION OF THE DIFFERENT LANGUAGES.

$\overline{\mathrm{A}} . \overline{\mathrm{e}}$, ete.: long rowels: in the Seandinavian languages the aecent ( $a, e^{e}$, etc.) is used to dennte length.
ą: a nasalized $a$; so used in the transliteration of the Iranian languages.
$\AA$ : labialized guttural $a$ in Swedish.
x: open $a$ of Eng. hat, used ehiefly in O. Eng.
ui: used in Gothie to denote e (open), in distinction from $a i$, the true diphthong.
ań: used in Gothic to denote o (open), in distinction from au, the true diphthong.
bh: in Sanskrit a roiced labial aspirate (ef. ch).
b: roiced bilabial (or labio-dental !) spirant, used in discussions of Teutonie dialects.
¢: voieeless palatal sibilant, similar to Eng. sh, used especially in transliteration of Sanskrit.
č: frequently nsed, e. g. in Slavonic languages, to denote the sound of Eng. ch in check.
e: voiecless palatal explosive commonly used in transliteration of Sanskrit and the Iranian languages.
ch: as used in the transliteration of Sanskrit, a voiceless palatal aspirate, an aspirate being an explosive with excess of breath; as used in German grammar, the symbol for a voiceless palatal or guttural spirant.
dh: voiced dental aspirate (ef. ch) in Sanskrit.
d: voicel cerebral explosive, so used in transliteration of Sanskrit.
dh: woiced cerebral aspirate (cf. ch) in Sanskrit.
d: voiced dental (interdental) spirint, equivalent to Eng. th in then: so used in the Teutonic and Iramian languages and in phonetic writing.
ę: a short open e, used in Teutonic grammar, particularly in writing O. ll. f.
a: the short imlefinite or "ohscure" vowel of Eng. gardener; nsed in the reconstruction of Indo-Eur. forms, and in transliterating the Itumian languages.
gh: in Sanskrit a voiced guttural aspirate (cf. ch).
$g$ : voiced velar (hack-guttural) explowive, used most frequently in ludo-Eur. Feconstructions.
द. Voicel guttural (or palatal) spirant, mpivalent to Mod. Greek $\gamma$, and useal in transliteration of Iramian languages ant O. Fing.
! : a voiceless breathing, the Sansk rit visarga.
$h$ : a labialized $h$, similar of wh in King. what; used in transliteration of Gothic and the lranian huguages.
$1_{t}$ : voiceless guttural (or malatal) spirant, equivalent to German ch , and used in transliteration of the lramian languages.
1: the semi-vowel $y$, or consonant form of $i$; used in phosnetic writing and reconstructions of Indo-Eur. forms.
in the transliteration of Sanskrit and the Iranian languages a roiced palatal explosive; in the Teutonic languages a semi-vowel $(=y)$, for which in Indo-Eur. reconstructions $i$ is generally used.
jh: in Sanskrit a voiced palatal aspirate (cf. ch).
kl : in Sanskrit a voiceless guttural aspirate (ef. $c h$ ).
1: the guttural ("thick" or "deep") of the Slavonic and some of the Scandinavian languages.
vowel $l$; used in transliterating Sanskrit, in reconstructing Indo-Enr. forms, and in other phonetic writing.
: uasal rowel: used in reconstruction of Indo-Eur. forms and in phonetic writing.
in Sanskrit the cerebral nasal.
in Sanskrit the guttural nasal (see following).
the guttural nasal, equivalent to Eng. $n$ in longer; used in transliteration of Iranian languages.
$\pi$ n: palatal nasal, similar to $g n$ in Fr. regner; nsed in transliterating Sanskrit and in phonetie writing.
ö: palatalized $o$; used in German and in phonetic writing.
Q: short open 0 in Scandinavian.
$\mathfrak{a}$ : short palatalized $0(0)$ in Scandinarian.
$p h$ : in Sanshrit, voiceless labial aspirate (ef. ch).
\{: roiceless velar (hack-guttural) explosive; used in reconstructions of Indo-Eur. forms and in other phonetic writing.
rowel $r$ : used in transliterating Sanskrit, in reconstructions of Indo-Enr. forms, and in other phonetic writing.
s: roiceless cerebral sihilant, equivalent to Eng. sh: used in transliterating the Iranian languages and in phonetie writing.
voiecless cerebral spirant; used in transliterating Sanskrit.
th: in Sanskrit a voiceless dental aspirate (ef. ch).
ṭh: in Sunskrit a voiceless ecrebral aspirate (cf. ch).
$t$ : in Sanskrit a voiceless cerebral explosive.
$t$ : a form of dental spirant used in transliterating the Iranian languages (represented in Justis transliteration by t).
f: roiceless dental (interdental) spirant, equivalent to Eng. th in thin; used in Teutonie dialects and in phonetie writing.
$\underline{\mathbf{u}}$ : consonant form of $u$; used in phonetic writing.
ž: voiced curebral sibilant, equivalent to $s$ in Eng. pleasure and to $j$ in Fr. jardin; used in Iramian, Slavonie, and in phonetic writing.
7. a symbol frequently used in the writing of $O$. H. G. to indicate a voiced dental sibilant (Eng. z), in distinetion from $z$ as sign of the affricata ( $(s)$.

## KEY TO THE PRONUNCIATION.

ö. ....... as in Göthe, and as eu in Frencl neuf. Chintreuit.

そ........ obscure $o$, as final $o$ in Compton.
ii........ as in German süd, and as $u$ in French Buzangais, zu.
y or $l \ldots$ see $t$ or $y$.
yu....... as $u$ in mute.
y̆....... same, but less prolonged, as in singulur.
ch....... as in German ich.
g........ as in get, gize (never as in gist, congest).
hw...... as wh in which.
Klo..... as ch in Gemman nacht, $g$ in German tag, ch in Scoteh locil, and $j$ in Spinish Budajos, ete,
n........ nasal $n$, as in Frencli $f i n$, Bourbon, and nasal $m$, as in French nom, Portuguese $S(\iota m$.
กั or n-y.. Spanish $\tilde{n}$, as in cañon, piñon, French and Italian $g n$, cte., as in Bonlogne.
1 or $y . .$. French $l$, liquid or mouillé, as (-i)ll- in French Buwdrillart, and ( $-i$ ) in Chintreuil.
th....... as in thin.
th. ...... as in though, them, mother.
$\cdots . . .$. . as $w$ in German zwei, and $b$ in Spanish Cordoba.
sh...... . as in shime.
$z h \ldots .$. . as $s$ in pleasure, and $j$ in French jour.
All other letters are used with their ordinary English values.

## NOTE.

The values of most of the signs used in the above Key are plainly shown by the examples given. But those of ï, ï, ch, $k$ h, $\bar{n}$, and $r$, which have no equivalents in English, can not be sutheiently indicated withont a brief explanation, which is here given.
i. The somil represented by this symbol is approximately that of -u- in hurt or-e-in her, but is materially different from cither. It is properly pronounced with the tongue in the position it has when a is uttered and with the lips in the position assumed in utteriner $\overline{0}$.
ii. This vowel is :romomb with the hips romfed as in uttering oo and with the tongue in the position required in atteringere, into which somol it is most maturally corrupted.
chand ih. These are both rough hreathings or spirants made with considerable force. ch being made between the flat of the tongue and the hard palate, and hat betwe the tongue and the soft palate. chapproches in somd to Enclish sh, but is hess sihitant and is made further butk in the mouth; 价is a guthural and has a hawking sound.
 in lamyre. Final l, that is, (-i)h, may be approximated by starting to pronouce lawyer and stopping abriptly with the $-\%$ -
ñ or n-y. The consonants represented ly in (Spanish ñ, French and Italian gn, ele.) are practically equivatent to English -ni- or -ny- in bunion, bunyon, onion, ete., and exwpt when final are represented by n-y. Final ñ, as French -gn(e), may be produced hy omitting the sound of -om in the promunciation of onion.
2. This may be pronounerel by attempting to utter Enerlish $r$ with the use of the lips alone.

Ser Prffale (vol. i., p. xxiv.) and the article Pronuschation of Foremen Names.

 the lant, and the sixth eames lo at emb at the same time with

secomd vear. This made the vear to consist in effect of $366 \frac{1}{4}$ days. thout the year 400 b. $\because$. the decemvirs resulated the calcman once more amd placed February letween Janmary aml Darch, both af the whd of the yeal: "The months were now-whether so settled by Sinma on the decemvirs is un-cortain-Martins, 31 days: Aprilis, 29: Mains. 31: Junins. 2!1: Quintilis, 31 : Sextilis, 2!): Suptember, 211: Oetolror, 31 : Norember, 29 : 1eetmber. 29 : Januarius, 29 : Fehruarius. 28. The intercalary month wis insirted between the $3: 3 \mathrm{l}$ and 2tth dave (as we count thens) of Fehruary, on, in the Roman manner of speaking. lefore the mixth calends of March. The reason for an placiog it was that the seventh calembs of Mareh, or Feb. 23 , was the list day of at romel year of 360 days, and was celebrated as the festival of Terminus, the gorl of limits, umber the name Terminalia. The Romans, like the Egyptans, seem to have rusarded the remaining fire days as hardly belonging to the vear, hat as being a sort of interval hetween two years. The odd day arliled to the 354 for hock was not howerer, interealated in this place. but was intrednced wherefer it might be necessary to pevent the mundinse from falling on the calends of January or the nones of any month-such a coincilence being eleemed inamspicions. The year on this system being, as we have seen, a day too long. added twenty-four days too much in twentr-four rears. It was provirled, therefore that during the last eight years of this period these twenty-four dars shomld be dedncted in making the intercalations. The pontiffs, however. who had the control of the intercalation, used their powder capricionsly for personal ends-sometimes to lensthen or shorten the term of a magistrate, sometimes to benefit or injure the farmer of the public revemmes. As a natural conserpuence, the calemdar fell into extreme confusion: so that in the time of Jnlins ('asar the civil differed from the astronomical equinox by nearly three months. This powerfinl juler resalved on a thorongli reform. Ender the advice of the astronomer Sosigenes he abolished the lunar year: lle rearljusted the montha to their proper seasoms by inaking the year o(0) A. $1^{\circ}$, C. $44 . \bar{\circ}$ days long. extending from Oct. 13. inclnise (according to our present count), to the 31 st day of the second ensuing December. This rear is known in chronology as the rear of confusion. lle reconstructed the months. qiving $\mathbf{3} 1$ dars each to the first, third, fifth, seventh. minth, and cherenth, and 30 , lays each to the rost, except Februars, which had $3!1$ onlr, hit every fourth sear receivel an intercalary day, makins 30 . The intercalation tork place for a reason atready given above, immediatels after the teast of 'Terminalia, and was nade by repeating the serto Kulemites Ifortics: whence the vear in which it oreurrerk eame to be called bissextile. Finally the beginning of the year wat transfermed from Mand 1 to Jan. 1. To flater the vanity of Octavins after he had secured the sufreme powor and har reccived the titlo of Augnstus, al day was taken from February by a syoophantic senate and given to August, which had been inamed from him, for the frivolons purpose of giving to his month no less dignity in point of mumbers than July, which had received its name from the first ('asar. The lengths of the later mont hs were then altwred to frevent three long months from oceurring consecttively:

The Jnlian year consisted of 36.5 days, and consequenty ditfered in excess by $1 t$ mimutes $13: 1 \pi$ seconds from the tme sular year. Which com-ists of 365 days 5 hours 45 minutes $46 \cdot(1)$ secumbs. In eonatrpence of this ritference the equimox, in the conrse of a fow centuries, fell back sonsibly toward the begimning of the year. In the time of Jnlius ('isatr it corrempmed to Mar. 95: in the sixteenth century it hat retrograded to the 11th. I'he correction of the wror wa- ome of the furposes sumght liy the reformation of the

 al leap yeat: 17100 and 1 - (0) were common yara: 1900 will be

vear by 2505 secouds an error which amounts only to one day in 3.32. years. The interalations might lee so marle as to make the calendar vear emrespond even more closely than it does now with the solar rear. but no other method conll be as convenient ats the Gregorian.

The new calendar was receivet immediately or shortly after its prommlgation by all Roman Catholic countries. The Protestant states of Germany and the kingdom of Demmark adhered to the Julian calendar till 1700: and in England the alteration wats successfully opposed by popular prejudices till $1.5 \%$. In that year the Jnlian calendar, or old style, as it was called. was aholished by act of l'arliament, and the date used in all public transactions rendered coincident with that followed in other European countries, by enacting that the day following sept. 2, 1753 , should be called the 14 th of that month. When the alteration was made by Gregory it was only necessary to drop ten days: the year 1700 having intervened. which was a common year in the Gregorian, but a leap-year in the Julian calemdar, it was now necessary to drop eleven days. The old strle is still mbered to in Pussia and the comntries following the eommonion of the Greek Church: the difference of chate in the present century amounts to twelve days. For fuller information on this sulject. sec Delambre* Astronomir Theorique ot Pratigue, tom. iii., chap. xxviii.; lileler"s Lehouch der Chronologie; and Inthon's Grfek amel Romun intiquities.

Ecclesiusticul Culemdor.- The adaptation of the civil to the solar year is attendel with no difficulty, but the church calendar for regulating the movable feasts imposes conditions less easily satisfied. The festival of Easter commemorates the resurrection of on Lork, which momentous event having occurved near the time of the Jewish Passover was naturally associated in the minds of the early disciples with tlat anniversary, and its ammal returns were made dependent upon the same ealendar regulations. The I'assover was olserved on the fourteenth day of the moon-that is, near the full moon. The guestion what day is most moper for the ohservance of Easter hecame early a subject of warm controversy. In order to put an end to an unseemly eontention, the Council of Nice ordered that Faster should be celdrated on the Sunday which immediately follows the full moon that happens upon or nest after the remal equinox. In order to determine Easter according to this rule for anv year, it is necessary to reconcile three periods-namely, the weck, the lunar month, and the solar year. To find the day of the week on which any given day of the rear falls, it is neces-ary to know on what day of the werk the year began. In the Julian calemlar this was easily foums hy means of a short period or ercle of twenty-eight years, after which the year berins with the same day of the week. In the Gregorian calemar this order is interrupteel by the omission of the interealation three times out of four in the last year of the century. But, to reneler calculation unnevessary, a table is given in the prayerbooks, slowing the comespondence of the days of the year and the week for the current century. The connection of the lumar month with the solar yenr is an ancient problem, for the resohntion of which the Grecks invented cyeles or perionts, which remained in use with some modifications till the time of the Gremorian reformation. see Delambre's Ifistoire de I Astronomie Moderne tom, i.. liv. i. : I e Morgan's ('ompanion to the British Almanac (IS4.5): Barnard's Hou to Finel the Cluarch Fresticals (1872).

A new reform of the calendar was introduced in France during the Revolution hy a receree of the National Convention passed Sov゙. 24. 17:13. This took for its epoch the midnimht next precerling the autmmal equinox of 1702 , from which point of time the successive feats were mumbered I., II., ete., "of the French republic, one and indivisible." The Year was divided into twelve months, each of thirty days, luwing. in orlinary years, five days necessary to eomplete the year, and in lenj-ycar six. These days were placed at the end of the last month, and umler the name jours complammotaires were celehrated as festivals. As during these celehations the ordinary oceupations of life were suspended, and the popudation ware expereted to give themselves up withont restraint to pleasure in "rery form. they obtamed the name of sume-culuthitus. Fach prerion of four years terminating in a leap-year was also colled a Fronrinde. The hapi-ynar was also called an olympue rear. The names of the jours complimentaires were the following, with the dates as they occur in a leap-your: Primidi (rlediented to Virtur), Sept. 16; Dumli (rledicated to Genims), siept. 1s; Trids (rledirated to labor). Spet. 18: Guartidi (lembeated to Opinion),

the protection of the manufactures of the U. S. than the collection of revenue, until the protective principle. so called, hould be so tested and deeided br the state courts. This was in pursuance of Mr. ('alhoun's peculiar doctrines. known as mullifieation. He held that under the Federal system the judiciary of mach state had the reserved sovereign right to lecoide in the last resort upon the extent of the powers delegated under the Constitution by the States respectively. This ordinance was to go into effect on Feb. 12. 1833. The determined attitule of Cien. dackson against these nullification doctrines cansed general and serious alarm lest a conllict of forees should ensue between the Federal and State authorities. It was in this condition of affairs that Mr. Clay. as a mediator, came forward with his famous "tariff compromise " of 1833, which was founded upon the avowed principle of an abandomment of the protective policy after 1843. To this measure Mr. Calhoun gave his cortial support, and in this way the anticipated perils of the crisis were arerted.

As a dehater, Mr. Cahoun oceupied the foremost rank among V. S. Senators, and was scarcely equaled by any of his contemporaries except Mr. Clay and Mr Welster. These three were known as "the Great Trio." The debate between Mr. Calhoun and Mr. Webster on the nature of the Federal government and the doctrine of mullification, so fallet, in Feb., 1833, was one of the most noted for ability and eloquence in the amals of this conntry. Mr. (alhom retired from the senate in Mar., 1843 and was appointed Secretary of state he \$1r. Trler in Slar.. 1844. It was under his auspiees that the " Tyler treaty," as it wascallem, for the annexation of Texas, was negotiatell in the same year. Ile was re-clected to the senate in 1845, and oprosed the Nexican war in 1st6. He continned in the senate until lis death at Washington, Mar. \$1. 1850. His mind was eminently metaphysical, and his private character was without reproach. Anong his writings are two postlmmous worksone, a Disquisition on fiorrmment, and the other, 1 Discourse on the Constitution and Government of the lraited stutes. These are both held in high estimation by lis admirers and men of his school of politics. See Cahoun, by fl. Ton Ilolst, in American Statemen Series.

Cali. kia lee: at town of the state of Cauca, Colombia; 0 miles N. hy E. of Popram: on a western declivity of the Andes (see map of south America, ref. 2-B). It has two fine churches and an active trade. Pops 12,iou.

Calibre or Caliber [riî Fr.. perhaps ultimately from Arah, quatib, moll! ; but deriv. from Lat. que libra-of what weight 1 -is not impusible]: a Freneh word which is also much used in English: siguifies the diameter of the bore of a gun or ans firearm. It is usually measured and described in inches or parts of inches. The camon in which solid shon is used are often denotel by the weight of each shot, as a 24 -poumer. but mortars which throw shells or hollow shot are usually dengnated by such terms as a 13 -inch mortar, cte.

Galico: a kind of eotton cloth; said to be so maned from Calicut, a "ity of India, where it was first manufactured. It was imported into England by the East hulia Company in 16:3. She (shle u-pratisg.
(calicu-tass: a species of sunfish (Pomocis sparoides) fomm in the rivers of the Fistorn U. S.. so callet from the coluration.

Calica-printines: the art of prolucing patterns on eotton eloth either hy brinting in chlors, or in mordants which become colors when sulsempently dyed. Cloth made from cotton and wow, when similarly printed, is hown as monssolime de laine. (alico-printing originated in Intia in wery anciant times. Pliny deserike the art us practiond hy the Eryptians. Fur a loner time chinty counterpanes were imported intu Englam from India. The art spreal west ward to Asia Minor amo the Larant. It was impurtere into lholland ly the Whtch La-t ludia Company. and spreat into

 Calieotprinting was intruluced Imto Fongland during the seventecnth erntury, but the development of the art was for a lone time serionsly remarden by the olponition oft the silk and woolen weaser:. It their instisation the importation of chint\% from (ahiout was prohilited, and a havy revenue tax was plew upon Einglish walious. Finally, in Reo. a law was enacted prohiliting the weariner of any printed
calicoes whatever, whether of foreign or domestic origin. This law was repealed in 1736 , but it tuty of $6 d$. per yard was still levied. In $18: 31$ all duties were repealed. Great Britain is now the largest producer of calicoes: the U.S. stand secom. The finest calicoes are made in Alsace, at Mühlhatusen. Caliero-printing involves a varietry of operations, some of which are peculiar to certain styles, while others are common to all.
Singeing.-The first operation is the removal from the surface of the cloth of the fibrons nap or down, which, if not remored, would serimsly interfere with the uniform application of the colors. The remoral of the nap is effected cither by passing the cloth ranidly over a red-hot plate (Fig. 1) or bet ween lines of gas-jets. A shearing-mathine is also in use for this purpue.

Fig. 1.-Hot-plate singeing: A, drivingengine: BC C are semi-crlindrical red-hot plates of copper or iron: D is the furnace door: $E$ is the ventilator: $F$, a woolen box filled with water. through which the cloth rans after singeing ; G are three rollers which remove the excess of water from the singed choth; $H$ is the fold-ing-reel driven by a belt, 1 , from the lower roller, L is an is the cloth: Lis an arrangement of cevers and
the cloth from the plates in case of stoppage.
Bleaching is then effected be hoiling the cloth with lime, souring with sulphoric acisl boiling with sota-ash and rusin, boiling with soda-ash alone, treating with bleachingpowder. souring again, and finally washing thoroughly with water. Sie Bieachivg.
Caleulering is sometimes resorted to in order to make the cloth smooth and even. It is effected by passing it between very heary rolls.
Fixing the calors upon the eloth is effected (1) by the aid of mordants. substances which have an athinity for hoth fiber and eolor, as matder. logwool, Brazil-wood, artificial alizarine, cte., fixed hy alumina. axitle of iron, oxide of ehromium, ete., aniline colors, fixed by albumen, gluten, arsmite of almmina, tanate of antimony. etc. Sumach and cutch, which probluee drabs and blacks with oxide of iron by the action of the tamnic acid they contain. betone to this class. It is imposible to make a distinction between the action of true mordants and of agents which simply produce insoluble colors in the tissue of the cloth, as the two classes pass into each other hy insensible erratations. These insoluble color- are prodned by double or aimple decomposition, by the successive treatment of the eloth with the neeessary reagents. Thus Prussian blue is fixed on the choth either by first applying an iron salt and then treating it with ferrocyande of potassimn, or it is produced by the decomposition of ferroceraninle of potassium alone, under the inllnence of certain aidids. Chrome vellow is produced by the successive aplication of a lead wilt and hichomate of potassa. Indigo is fixed by aplying it in selution as colorless reduced indigo and developing it as insoluble bhe pigment by oxidation in the air. Brown oxife of manganese is formed by aplying sulphatio of mangance, with hawing the sulphurie acid hy an alkali, and wxidizing to a hrown oxide hy hepochlorite of lime. Aniline bark is produced ly the ixidation of am aniline salt in the chath. (き) Colors are fixed liy agents which. heing first mixel with the color, are applied to the cloth and then rendered insoluble, when they hrid the empor mon the tibers ather mechanially. as ultramarine hue, Ghignet green. elrome vellow, madder lakio or mechanically and themieally, as anilime colurs, fixed by alibumen coaqulated by heat.
Petterns ary prolumed (1) Dy printing the mordant in figures, und submequently frombicing the colurs in the nyelipwors: madder sfyles: (3) hy printing one component of the eolor, and 1 hum passing the cloth through a solution of

The other component, or of the agent necessary to develop the colur: pmdeliny, bronzing, intige. perneil blue, and rhene Gine styles: (3) by printing the color logether with the mordant or lixing agent, and rembering it insolnhte, (s) dewhoning it log atir or stomm. Thas is callay topical or -hrface printing, amd forms the mos importan hramels of alion printing: stretm colors, spirit colors, anilires blect, coniline colors by albumen. pigment minling. motutlic prinling: (-1) by printing resiot or reserve pastes, which protere cortain portinms of the coth, amd prevent the tixime of the whor in the submeduent lyaing operations: resisl s/yles: (o) hy disrharginer the enfor from pertions of the eloth previonsly dyed: discherge styles.

Revised by J. S. Iunlan.
Cal'icul. or Kalikat: a seaport-town of British India: presideney of Naslras; on the Imlian Ocean: 102 miles . W. of theringrpatam, and about 570 miles S. S. E. of Bombay ; lat. 11 15 N.. lom. $\mathrm{Ta}^{5} 46^{\prime} \mathrm{E}$. (see mail of South Inclia, ref. 6-5). It was the first place in India visited by Vaseo da (ramit, who arrived hore in May, 1408. It was then a popmous and important city, and it eontinued to be for nearly two conturies a flourishing emporium. Its prosberity then deelined, hat has more recently revived; the anchorage is a roadstead. This town gave name to calico throught the Portuguese. I'op. (1891) 65, \%00.

Calilor'nia: the largest of the Pacific States extending from $32^{-2} 8^{\prime}$ to 42 N. lat., and from 114 :30 to $124^{\circ} 45$ W. fon. It is boundeat N. hy Oregon. E. hy Nevitia and Arizona, s. ly Luwer ('inlifornia, and W. Wr the l'irific. It has a coant-lime br more than 500 miles, amblan average brealth of 200 miles. Irea by the elerenth rensus (180) 158.360 :ri. miles, or 101,350.400 acres, nearly equal to N(xw Finglanet, Ni•w York, ind Pemsylvania.

Califormia, by
censtas of $18: 0$, ranket twonty-second among the States in pojnintinn. twellth in value of agricultural promets, first in vine conlture, and ligh in the second rank in value of manufact ures.

Tupormaply : Komonains, Lalips. aml Rivers.-The to-
 miles aphat, rumning from N. W. to S. F. throngh the whole length of the state, inul with athoal valles, mostly fertile, lyiner butwern. These mombatin-ramges are of varing Width, sometimes consisting of three, two, or t simgle claing, sum with spurs and ontlers rxtemding at some points nearly from bele to the whor. 'The mann of the $\mathrm{W}^{\text {r }}$. range is the Comst liane-mot always duropriate-ind its hranches hater many local names ; the host known of these is the sion Diahlo ratige, liol miles Jong ly 50 braml ; botween this and the comsi are lower ranges, as the ['alos Sorito, Sintalacia, Sitn Ratuel, amel Santa law monntains. In Southern (isliformiat this ("ast hamge spreals out in a comfusomb mass of monntains extoming across the State-the hin Bernardino, San davinto, amb othor clains. The areat lis lature is the Sicrar Sevata or Sonwy Mountains. forming a bummlary betwen Coliformin und Xevmla for a purt of the distance, but about the thiterevighth parallel thrniner dues. and divinliner into three paralled chains, and furthers. uniting with the coast Range in masores of momntains amt hills in a wild, rugered, and desert region. Thare are many lofty leaks in
both ranges. thongh the himhest are in the Sierra NevadaShasta, Spanish Peak. Mts. Dina. Lyell. Brewer, Tyndall, Whitney, Lassen": Bntte, Pyramid l'ak, and others. Some of these have lreen, and prothaps still are, voleanoes. What is known is the California Valley, abont 400 miles long and from 40 to 100 milco in width, Jies between these moms tain-ranges. There are also other large vallevs, rich and fartile, as well as some which are waterless, harren, and deadly in their mephitic vapors. The most picturesque and remarkable of the valleys of California are the Fosemite (see Vosemite) and the Tioolumme Valley, which much resembles it. Hast of the Sierra is a series of lakes extending nearly the whole length of the Sitate-Klamath, Goose, Homey. Owens. and others, some of them being alkaline, others sall, others llry most of the year, and 'Tahoe, one of the deepest, sweetest, purest, and most elevated lakes on the continent. In the $s . E$. and $S . S$. E. there are deep depressions (former lakes) like the Death Valley, 400 feet below the sea, and the bed of an ancient esthary, 600 feet below. In the Califomia Valley are seseral important lakes, of which C'lear. Tulare and Kern are the largest. There is only one narigable river which discharges its waters directly into the ocean, the salinas, at the Bay of Monterey; ot her mountain-torrents of monerate length, inet navigable, are mumerons. Two important navigable rivers-the San Joarpuin from the S. F. and the Sacramento from the N. E.-as well as seweral smaller naviguble streams, flow into the San Pablo. Sulsm, and Nan Franeisco Bays. Tulare Lake receives King, Kern, White, and 'I`ule rivels. The harbors of C'alifornia are San Francisco (the best on the Pacifie coast), San Diego, San Pedro, san I uis (Hispo, Nonderey bity, etc. There are mumerons islands near the cons, some of them inhahited and cultivated.

Mimerals.-Gold and silver lave been found in paying quantities in many places-the gold pure, in scales. fine flust. nuggets, erystals, and combined with copper. silver, lead, zinc, cimnabar, arsenie, iron, sulphur, tellurim, iridosmine, wte: silver native, in combination with lead, eopper, sulphur. iron, etc.: copper native and in many forms ; guicksilver aboundantly as umabat, amb oecasionally mative; platinum and tin not in large puantity : load and imon almost cerywhere : arsenic, tellurimm, sraphite, borax, salt, socla in several forms ; sulplur, gypsum, harytes, antimony, ocher, ababaster, fluor-spar, cornmbum, ant cobalt; diamonds, tourmalines, zircon, garnets, chrysolites, etc.: (cosl] of fair quality, petrolemm, amd bitumen. The gold-mining is of three kinds-common placer-mining, now nearly ahandoned; hydratic mining, which is placer-mining on a large scale: and mining in guatz reins or lodes. T'lie silver is mined only in veins: copper may be found native, but is generally atn ore ame in veins or londes.

Irrigeition-The great Merced, Kem Comty. Fresno, and 'lulare irrigation canals, which have cost $85,000,000$, irrigate $1,000,000$ arres of fertile land and furnish water-bowre, decoiving an inexhanstible smply of water from the Kern, King, and Mared rivers. Other areas irrigated are in the Dolave and Coloriddo valleys of Sian Bermardino Connty, and Lassen and Butte Counties of the N. W. In these canals $\$ 30,000,000$ are estimated to have been alroady expended, and the system is widely extembed every year ; abont one-tenth part is done by artesian wells of an average deputh of less than 300 fret.

Soil comd legetation.-Nost of the arable lamals of California have arich deep suil uf womberful firtility. Some of it reguires to be puickened into activity by irdigation. but is then astonishingly productive. 'There are 48 'rombramel 105 spreins of forest-tues alreary known in C'ilifornia, mostly not only juligenoms, hat peciuliar tothe Pacifucslope. Forty species abrevergreens, including the two sertubias or giant redwomas (see seqroin), the sugar and 15 other species of pine, 6 surcies of the fir, 12 of oak. white cedar, 4 species of cypress, mamzanta, wila nutmer, ('alifmoia lanrel. ehin(apin, maples, ete. J'lere are many valuabli, shruls and small fruits, only one native grape, lut all the European and kastern specise and varicties thonish well, and California is abrady the vineyad of America. There are many mutritions grasses, hut with few exerplions there is no sod, nop grass tit for lay. Alfalfin, wild oats, Ilungarian grass, and millet are moch used for foeding cattle. The dowers of Califurnia arr abmalant, frasmont, amf beantiful.

Arimuls:-There are 115 species of mammals in Califurnia. こ\% of which are eamivorons: they inclule the grizzly. hack, and brown bear, raccom, badger, 2 or 3 species of skunk, the wolverine, fisher, Americint sable or marten,

mink, weavel, California otter and sea-oter, cougar, jaguar, 2 species of Jynx, ructom-fox or inountain-cat. pray wolf,
 sea-elephatht. There are e of moles. Q of shmws, 16 -pectics of bate, $\overline{\text { an }}$ ) sjecies of roulents, some of them (the spurrels) speciatly destrutive to grain: of rmminants, the alk, 3 species of dere, the Americun antelope, and highmen of cetacea, 11 speries. There are 3.00 species of hirels native to Californa, incluling a great varicty of cach family, ordor, and tribe. There are many reptiles, but no sambins, and only one pisomous serpent, the rathesnake, of which, however, thare are $\overline{3}$ specins. The tish are of 240 species, of which 185 are edible; 60 mollusk ant 8 crustaceras.

Climule.-Prof. E. W. Hilgard classified the chimate as follows: 1, bay anl const rimate: characteristies, small range of therimmeter, extrmes only ins apart, means of summer and winter muly 6 apart ; no intense heat ; frosts very rave: fogs from the sea in the afternoms of summer : ranfall arerages $27: 3$ inches of which about 2.5 me bet ween becember and May. ©. ('limate of the great interior valIey : characteristics, average winter temperature lower than the coast, thongh minimum temperature about the same; frosts rare: smmor heat very high-above 100 F. many days of the sidson: nights warm. but the dry air is less oppressive thana most ond : extrme annual rampe io : math range, 2366 : rainfall for year, $21: 00$ inches, of which 1980 is het ween beromber and May. 3. Climate of the slope of the siemal Nevala: characteristios, considerable snowfall and much rain: cool stummers. summer thunder-storms;
 summer tomperature, 50.5 : mean range. 11 : raintall, $5 \cdot 0 \cdot 4$ inches. But, nside from thest, there are many loomil dimater. Eren in somphem ('alifornia, on the coast, the heat is not so great is in the interior valley, inul the climate of Los Angeles, san Diego and simta barlata is dewirable for consumptive invalids.

Sgricultural Products.-The following summary from the census reports of 1 sio and 1890 shows the extent of farm operations in the state:

| FABNS, ETC. | $1 \times 80$. | 1850. | Per cenct.* |
| :---: | :---: | :---: | :---: |
| Total number of farms. | 35.934 | 52.4.4 | $4 \cdot 2$ |
| Total acreage of farms. | 16,593,242 | 21,427,203 | 29.1 |
| Value of farms, inctuting buiddings and f+nces | S2for051.232 | \$097,116,630 | 1660 |

The following table shows the acreage, vichl, and value of the principal eropis in the calendar year isum:

| cames. | Acreage. | Yield. | Value. |
| :---: | :---: | :---: | :---: |
| Corn | -1,7\%5 | 2.2\%5, 2 \%\% bush. | S1,135,6i34 |
| Wheat | 2,620,4\% | $34,852,517 \quad \cdots$ | 18,4i1. $\times 34$ |
| Oats. | 53.011 | 1,504,54] " | $5 \pi 1,617$ |
| Rye | [20,5016 | 514, (1) 6 | 302,400 |
| Barify. | T\%).716 | 12.116,110 * | 7.128. 860 |
| Potatoe | 37.203 | 3,5T1,154 | 1, ¢0, int |
| Hay | 1, +6 1.921 | 2.842.4titons | $22.350,050$ |
| Tutala | 5.259,914 | ..... | $851,524.245$ |

California is admirably alapted as recrarls both soil amd climate for the cultivation of the grape. In 1 sam 200,060 acres were coverel with grape-vines, the pronluct in that
 and $1.372,145$ boxes ( 20 lb , ach ) of rasins. Oranges, lemons, peaches, apricots, pears, phoms, "te., superior in size anil beanty, thongh not in lavor, to the fruits of the Lastern states, are shipped in large quantitice to all parts of the E . s.

Manefnctures.-The census returns of 1 wion showed that T.se3 manufacturing establi:hments reportmi. These had a

 and had protucts valued at sol $13,404,016$. The prolachs include mining and agricultural madhinery, lumber for buid ling purpases and ornamental wondo. (anting and dressing of leather and leather manufactures, woolen goods, flour-ing-mills, silk fiber and fabrics, the prolluetion of wine and brandy, relinel sugar, sirup, and candies (from sand wich islamds sugar): grain-bases, dynamite, giant-powder, and \&hemicals for mining purpuse.

Mineral Produrtions.-The probuction of gold in 1891

bitaminous coal, 93.301 tons, value 5204.902 ; petrolenm, :23:,600 bbl, (of 42 gal. each): sranite. value $\$ 1,300,000$ : sandstone, value $\leqslant 100,000$; limestone, value 8400,000 ; and marble, valne so0,060. In 189 the prombet of gold was estimated at $\leqslant 13,000,000$ : borax, $81,000,010$; petrol-un and hituminous prodncts, $81,000,000$ : mineral waters, 8200,000 ; and salt, \$100,000. The production of gold between $1848^{\circ}$ and Ian. 1, 1894, was estimatel at $\$ 1,246.40,400$ in value.

Fisheries.-According to censas of 1890 there were 5.338 persons employed in the tisheries of California, *2, 684,210 invested as capital, and the product valued at $8.463,369$. The whale and seal products were valued at ©, $4.4,373$ : canned salmon at sit64,232. The herring-fishery was next in value to the salmon of river and sea-fish, but the cirstertrade exceeded both, and its products came to s.09. $1 \pi^{\circ}$.

Raturays.-The number of miles of railway operated in 1841 was 4,336 ; in $1893,4,490$.
Finances. - The assessed valuation of taxable propertr in
 348.163 : personal, $173.553,2 \pi 3$; railway. 42.4 - 6.640 ; totaI, $\$ 1,216,200,243$. On Feb. 1, 1894, the total funded debt was S2,282.500, milumded, none. The state held in trust its own bonds for $\$ 1.526 .500$ for the sehool fund, and tor $\$ 7.51,000$ for the State university fund.

Banking.-On Jan. 1, 1894, there were 35 national bank:。 with combined capital of $88,125,000$, surplus and profits of $83,51,539$, and individual deposits of $\$ 12,421.405: 175$ State banks, with eombined capital of st4.!25,69?, surplus and profits of $\$ 14,0 \times 0,235$, and intividual deposits of $\$ 4!,-$ 584,189 : and 60 savings-banks, with an aggregate of 176,383
 ref in intividual deposits. The State banks incluted five

C'mmerce athl Varigation.-The number of American and foreign vessels which entered and cleared at San Franciseo andl other ports in the rear ending with June, $1 s!1$. Was 2,136 , ant the tonnage $2.431,533$ tons. The number of reqistered, enrollem, and licensed vessels of those ports in the year 189 was 55 , and their tonnage 316.872 . The value of the imports from foreign countries into Califormia in 1591 was S. $51,481,365$; of domestic exports, $839,632.314$ : of foreign exports, 8131,281; whole exports and imports. sy3.044.460. The interstate and internal commerce of the state ly railways und steamers is still greater, though exact figures can not he given. Lines of ocean-steamers ply to Ataska. Whaliington, Uregon, and the Mexican coast, Panama, Chili, Honolalu, China, aut Japan.

Churches.-The census of 1890 gave the following statistios of the principal religions boties

| denomisations. | Onsadiza tions. | Churcbes ad balls. | Metriers. | Value of church propiorty |

in the latter part of July, 1536, intending morely to stop over night, hut larel laid hodl of him, and solemmly adjured him to remain as pastor of the feeble evangelical church there lately gathered, and be consented. Pereciving the imperative ned of a $=$ trong moral govemment, he proeceded to give one, but the diseipline he set up was tom stern to be endured. He was banished $\mathrm{A}_{\mathrm{p}} \mathrm{r}$ : 2 , 15:s ; went first to Bern. then to Zurith, and then to Basel. In soppt., 15\% \% , he settled as pristor in st msburg, and there in 1.50 he married the witlow helette de Bure, with whom he lived happily mine years. In $1 ., t 1$ he returned in trimuph to femew, being reiabled by the united voice of the secular and religions anthorities, with the general assent of the people. He arrived sept. 13, went at onee at work, and never ceased his beneficent activity. He ruled the city with an iron hand, and by his writingsexerted a dominant influence upon the Reformed Church in all lands. His reform mel with vigerons ophosition from the so-called Patriots and hibertines and for ten year he kept up the fight. He eompuerel at last. He opjosed heresy ar well, amd his opponents, as Bolsec. Curio, Gehino, and abow all servetus, felt his resisthess power. He was yreat ats a preather. unrivated as at clear amd profonmel thinker. 110 correspunded with the Protestant lealers in all lans. With Melanchthon he enjoyed peculiarly fricndly relations. The French language owes him atebt like that which the Cerman harmage owes Lather. C'ivil biberty the world over is likewise his debtor. He is the father of Presbyterianism, and the greatest of all I'rotestan commentators and theoborians. There is but one bot upon his memory: The burning of servetus for heresy (Oct. 25, 1553), though sanctioned even by Melanchthon, was athocking tragedy. Calvin died in (Peneva, May et, 1.56t. The standand edtion of Calvin's works is that of Amsterdam (16:1. 9 vols. fol.). The exhanstive ellition by (i, Bam, b. l'unitz, and E. Keuss (Brmswick, 1863 , sq4., vol. xlwiii., 1893) is not yet complete. There is an Finglish trandation nearly conplete (Edinhurgh, $1443-73$, 50 volo.). Most accessible are his. Inshtutes and Correspondenre, 4 vols. (hoth jub. Presbyterian Bel., Phila.). The best hiographies are by T. Beza, in Latin and Frencly (feneva, $506 f$ ): Panl Hemy, in (ferman (llamburg. $1 \times 3,5-4,3$ vols, p partially translated, Jondon and New Sork, 1881, :2 vol.): Henry abridged his book (lhamburer, 184ti); T. H. Dyer, in Finglish (bondon, 18.50) : E. Stahelin, in German (bilberfeld, 1863, 2 whe.) : ef. espectially schatf, /Kisi. ('hr. Ch. vol. vii. (leformation in Switzerland, pp. 2ex-84t). The Roman (iathole scholar F. W. Kampechulte left unfinished at his death an execllent study of C'alvin's Genevan activity (1aipzig, 1869). See the article Calytism.

Revised and enlarged by S. 3l. Jackson.
Cal'vinism: Calvinism (like Pelagianism and Latheranism) is a term used to devignate, not the opinions of an imlivilual, but a mode of religious thought or a system of religious doctrines, of which the person whose name it hears was an eminent expoumler. It is syonymons therefore with what is technicatly called "the Jinformod Theolory:" There have from the begiming eoexisted in the Christinn Church three specially well-marked amd generiendy distinet systems of doctrine, or mones of conceiving and injusting the facts and mineiples umberstood to the revealed in the seriptures, under one or the other of which noarly every form of thenlogical thourht may be smbinmed. One of these is the Pelagian, whieh denies the mative guit, polhtion, and moral impotence of man, aml makion him intepmbent of the supermatural assistance of (iorl. At the other pole is the Calvinistic system, which emphasizes the guit and impotence of man, exalts (iond, and refers salvation absolutely to the infinite love and undeserved favor ol fod working in harmony with his justier, sovereignly seledturg ito ohjects, and saving them by the abmightymwer of grace. Bot ween these comes the manifuld and clastic srstem of compromise known in one of ite earlior forms as semi-l dagianism, and in a more modern type as Aminimism, whid ahmits man's original pollution Gut denies his native suilt, regible rendemption as a componsation for innate and consequently irrespmeible disabilities, and refers the moral restoration of the indivilnal to the eooneration of the human with the Divine energy, the determining lactor being the human will. 'The system to which this artich is devoted was known historicaly, in its opposition to Phagianism and somi-lehgianism, and is now designated more gemerally and indefinitely. by the title Augustiniturm. from its enflect chumpion, the illnstrious Augustine, Bishop of Hipmo lingins in Northern If-
rica (305-130 a . 12) : while the more modern and specific title is C'tlenism, from the fact that it was developed intoa perfect form, and infused into the ereads of the Reformed churehes, and into the life of modern nations, through the instrumentality of John ('alvin, the Reformer, of Ceneva ( $1509-15(4)$. The authentic statement of its constituent doctrines is not to be drawn exchasively from the writings of either of the great men mentionel. but from the publie confesions of those Churches which have protessed this form of doctrim, and from the classiod writings of their representative thendogians.

The lieformed confessions are very nomerous-more than thirt in munber-hot they substantially agree in the system of doedrine which they teacll. Those which have been most widely acegted an of symblial authority are the Seeond Halvetie Confession, prepared hy Bultinger. 1eftam adoped by all the liefomed ('hurelne of switzerland (with the exeeption of Basd) as well as be the leformed (huredes of Pohanl, Hungary. Scotland, and France: the Heidelberg or lalatinate Catechism, prepared hy L'rinus and Ohevimus, 156: indonsed liy the senod of Wort and accepted as a doetrinal standar by the lidformed Churches of Germany and llolland, as well as by their representatives in America; the Thirty-nime Articles of the Chureh of England: the ('anons of the Symod of Wort. 1618-19, an (Eemmenical Symod of the Ruformed Churehes; and the Westminster Confession, whth its atcompanying Larrer and Shorter Catechisms prepared by the fanons Westminster Assembly, 1641-1i. and anepothif as a doctrinal standaril by the Presberian Churches and ber Brish Cabinists in general. The Canons of Dort are not oo mucha a complete confession as a supplemont to the previous confessions of the Reformed Churches, which was mectsitated by the rise of the Arminian controversy. Tlue Westminster Confession is the only lieformed ared of wide incep,tance which was tramet after this controversy: it was promed with the intention of exhibiting the hamony of the lieformed Churehes, and with acmmenical purnse and hreadth; and it presents." the fullest and ripert symbolical statemont of the C'alvinistic system of doctrine"

Whan Calvin remans the most repesentative thenlogian of (alviniom. Perbaps a list of representative theologians after him wonld incluha wercally Bullinger. Aretins. L'wimus, Zam hins. Polames, of the fint are. with such others as Amosius. Voctus. Witsius, Hoidegger, Turrefin, and among Enelish writers John Owen. dohn Howe, and Jonathan EdWards for the mext age. Domem Problerian Calvinism "is best represented by the theological sistems of Charkes Howge, W. (i. T. Shedd. and Hemry H. smith " (Sidatf. History of the (heristien (herrch, vol. ini.. p. it it). The vade merem of the heformed pastors was in early thys Bumans:" Invitutiones: this was suphanted hater by Amesins Merlullt: and it in turn by Marek's (ompentium: perhaps: no hambork is more nsed to-day than A. A. Ilodre* Outlines. Attempts more ar less sucenstul have been made to present the Calvinisticestem frem the writings of its representative theologians by among others. Heinrich Hepp (Jhip Impmatic der cemigelisch-wformerten Kirche darge-
 sichweize (the Glanbensleher der "nangelisch-ceformirlen hirrthe therqeatollt unt aus den Quellen belegt. Zumieh. 18tt4i): and d. II. Schohton (Leer der flervomele hects in here, gronalteginselea wit de bromma roorgesteld en beoorderdet, 154s-.io).
It is proposed in this article to present, in necessarily mosger outlime, at statement (1) of the fundamental characteristies of the syatm; (ll) of the history of its development and prevalence both before and atter calvin: and (131) of its pratical monal influme upon individuals and upon commmitios.

1. Stutment of Irinciples.-There is a very important diatinction betworn the fontral, formative or reat prineiple of a setem and it distinghoning featmere, which is not atWhaled to when it is satd, as it is semetimes sain, that the "prineiple" of Coulsinism is "the metaphysical principle of predestination." Predestination is rather a lorical "onsefuene of, amben essential element in, than the determining pincoijle of. Cabinism. "lhis is rather the glory of the Land (ioxl. Shaighty. 'llue formative ithe of Calvinism is the eronception of forl: and it is its determination that ford shall be and remain (fod in all its thought-to embrace (rod in the wholeness of 1 is mature and to do full justice to (rod in all II is rehations- which itself inetermines all thase doetrines which have from time to time been mistaken for its "prim-
eiple." On the practieal side this is equivalent to saying that it is the effort of C'alvinism to do full justice to the essence of religion. "since all religion springs from the relation in which fren the ('reator has plawed as, Itis creatures. to himself. it fothows that the greatest religions height will be reached by him who at every pant of his horizom yiews Gent as Goul, by homoring Him in all things," as the Almighty being who has ereated all things for His own sake, who is bonni hy nothing out of himself, and who determines for every creatare boilh its heing and the law thereof, hoth now aml fon cternity. Anl "as religion on earth finds its highest expression in the act of prayer." ". Calrinism in the Christian Clmureh is simply that tentency which makes a man assume the same att itnile toward Gorl in his profession and life which he always exhithits in his prayer. .

Whoerer truly prays ascribes nothing to his own will or power exeept the sin that condemns him lefore God, and knows of nothing that could embure the judgment of Goul except it the wronght within him by the bisine love. But while all other tendenries in the church preserve this attitude so home is their prayer Jasts, to lowe themselves in ridically ditterent conceptions as soon as the amen has been pronomeced, the Calrinist adheres to the thath of his pryer in his confession, in his theologr, in his life, ant the anen that has closed his petition re-echoes in the depths of his conscionsucss and thronghout the whole of his existence." A. Kuyper, The Prestoyterinn und Reformed Reciew, ii., 35-38?
Thuse teachings which distinguish the calvinistic from other systems of theology are simply the onterawth of this fundanental attitude of mind. The syon of Dort defined the distinguishing doctrines of Calvinism as over against Arminianism in five propositions, which have therefore since theen called "the five points of C'ilvinism," thongh they are rather the Calvinistic response to "the five points of Arminianism" than an imlependent statement of the differentiating elements of Calvinism. These five points athrmed ahsohute predestination, particular rememption, total depravity, irresistible grate, and the parsererance of the saints. If a single distinguishing principle is to be thiscriminated among these it will not be tount in "predestination," but rather in "irresistille grace." Predestination is acknowlelloed by both parties, and is indeed a necessary postubate of natural religion ; the difference bet ween the parties here hies in the conception of the gromed of the predestinating decre. The distinguishing mark of Calimism as over agatinst ath other systems lies in its doctrines of "eflicacions grace" which, it teaches, is the umleserved. ant therefore grafuiture, and therefore sovereign, merey of Gorl, by whieh lle cothencomsly brings whon ITe will into satvation. Calvinism is specifically the tholngy of grace and all atre properly Cilvinists who contess the absolute sorereignty of (rod in the distribution of H is saving merey. Two motifications of trpieal Calvinisim latre been attempter within the limits of the system, and have had considerable temporary and local inthence. Onc of these, callerl Sahmurianism from its phace of wigin (the thenhurical school of Sammur, in France), sught to reconcite the sovercignty of grace with the doctrine of a nuirersal atmement, which had heen timght previously only by l'etagians and Aminians; this involved at modificttion of the doetrine of "purticulan redemption," and with it of the nature, purpose. and effect of the aton+ment, but left the doetrine of " irrexistible grace" nnatfectef. The nther moxlification sumght to reconcile the soverwignty of grace with the Pelagian theory of the will and of mame power to the contrary; in its highest form (as taught by Bellarmine and certain Jesuit theologims) it has receirel the name ot "the duetrine of congruity," and teaclacs that foral adapts the smonnt and time of the persuasive inllumen of His Spirit to the furresen state of mint of those whom Ho elects to sut vation, and thus serentes their free acceptance of llis offers of merey. 'This movlifieation affects direetly the doctrine of "irresistible grace," but remains Cahvinistie so long as it makes (fod's seledion of the rempipents of the saving merey entirely sumereign, and his application of rrace to them certanly ellicachus. Typieal (ahrinism. which rematins the fuith of the ereat borly of those who hold this type of doretrine, teaches that "endica-ons grace" is the creative ellidiency of the Holy Spirit operating hemeath consoionsness, mot hy monal suation hut "physicilly," the somb remaining paxive themem until it has heron quickened and remewed by the Holy spirit and therely chablent to act in the powers of its new life.

The following is an exposition of the chief fratures of Calvinism as a syetem of doctrine.
A. The Relation of the Creator to the Creation.-There are three generically distinet views as to the relation of the Creator to the creation, each, of course embracing many specific varieties under it. 1. The Deistical view, which almits a creation er nihito, anm :an original enfowment of the clements with their active prowers, and the sulbjection of the whole srstem of things to certain general laws, autapted to the evolution of certain fixed phans. The general plan and order of the creation is attributed to the Creator, and all events are referred to Him in a general sense as the indefinitely remote First Cause, who inangurated the ever-onflowing line of seconl causes. This view, however, denies the continued immanence of the Creator in the creation, and the immetiate clepremtence of the ereature on the Creator for the continuance of its substance, the possession of its properties, and the exercise of its powers. 2. The oponsite extreme is the Pantheistic mode of thought, which identifies God and the universe as lis existence-form, or at least so contines Ilim to it as to deny II is transcendence beyond the miverse as an extra-mundane Spirit and eonscimis Person whose actions are rationally determined volitions, 3. Between these extremes stands Christian Theism. It emphasizes at once the transcendence of God beyoul, and the immanence of Gol within, the worll. IFe remains ever a conscions personal Spirit, withont and above the worlh, able, in the exercise of llis free volitions, sovereignly to exercise a supernatural influenee (potestros libera) unon any part of that systen of nature which lle has establisherl, orlinarily working throngh second canses, "yet free to work withont, ahove, and against them at His pleasure." At the same time He continues to interpenetrate the inmost being of every element of every creature with the infinite energies of tlis free intelligent will, and Itis creatures momentarily continne absobutely dependent uron the energy of that wilj for substance and for the possession of the powirs communicated to them ass seoond canses in all their exeroises.

All Christians, of course, are Theists in the sense thus defined; hut the different schools of Christian theology take their points of departure here, as. on the one hand, they press the essential dependence of the creature upon the Creator in substance. properties, and actions, or as on the ot her hand, they press the self-active power of second canses, and by consequence their self-sulticiency and indeprolence. Here we have the ultimate antithetiod gromuls of Pelagianism and Angustinianism. Pelagius, who was characterized by a rationalistic habit of thought and a superficial religions experience, believing that power to the contrary is an inalimable attrimite of every act of free will, necessary to renter it responsible and therefore moral, maintainet, in the supposed interests of morals, that every free arent is so adequately cullowed hy Gol an to be inalienalily self-suflicient for action, cach in a mamer appropriate to his kind. Augustine, on the contrary. held that every creature exists and acts maty as its sulstance is momentarily sustained, and its action conditiomed, hy the ommipresent and omnipotent energy of (borl. While athrming the free selt-determining power of the human somb, he roferred the moral chatacter of the rolition to the disposition which pronpted it, and the persistence of the moral mature of man to the immanent iniluences of the Spirit of Goml. Even anterior to apostasy, therefore, the spirit of man dependen for spiritual life and moral integrity "pon the concm:sus of the Spirit of Goll, ant the withdrawal of this would be the immerliate canse of spiritual death aml moral impotence. This Divine influence. in one degree and in one mote or thother, is common to all creatures and all their actions. This view of Augustine was subserguently elaborated by his disciples into the thenry of the "previous", "simultaneons," and "determining" concmsw.s of the Thomists and Reformed thenlogians. Sce the
 and $\%$.
13. The End or Design of God in ('reation.-Wercy intelligent Theist must regart the miverse as one system, and must therefore believe that the Creator had from the beginning one genoma end, for the acomplishment of which the whote and all its prats were intombed. This general end must have determinel the (reator in every step he has taken in the evolution of the universe, and herice our conception uf it will give shape to any speculations we may form with resperet to the relations of Goul and II is works. It is evident that no solution of this transcendent question can be reached by veatsoning from a prori prineiples, or ly generatizations drawn from the comparatively lew facts at present accessible to our observation, and that it can be rationally songht
for only in a direct revelation, For the most part, this genaral enil has been reterien to the (xsputial benevoleme of
 of blesempess, in the highen forme of excelleme. unen inmumerablo objects of His lewe. Deibmitz in his Throdierie (1710), which has exerted a wide influence on all motern speculation. lowered this viow loy emphasizing the '. happiness" of the ereatures as the eneat ent of the creative gemalness. The seriptures, on the comtrary, cmphatically dedare that the manifestation of 1 is own grimusprifetions in the actuat and most worthy fosible eml of the great Tesigner. in all llis works of cration, providnce. and redempition: and hane likewise the tinal bud of all 11 is intelligent creat tures in ali moral ation. The recognition of this grat principle, ant its appliention to the interpretation of all coul's tealinges with man, and of all manis datios to Goxl, has always been an esomtial chameteristie of Calvinism. Pelagians and semi-Pelagians, with more or lese decision, place the generat emb of the system of things in the wenl-heing of the creature: ( alvinists place it ahsolutely in the glory of the Creator, which carries with it, mot as a co-medinatedenign. hut as a subordinate yet certain effect. the blesselthes of alt loyal ereatures.
i'. The lidution whirh the Eternal Ilan of God sustains to the Actuat Erotution of Eituls in Time-Every Theist Indieves that the cterman and abolutely profect intelligence of the 'reator must have formed from the begiming a plan enmprehending the entire system of cration aml providnce in reference to the great end for which they were designed. Pelagins himself admitteat that the ahowhte foreknowlede of Gem embracel the future volitions of fres agents. as well as all other clases of events, whike he tenjed their foreortination. The socinians, who have developard Telagianism into a complete system, wore concistently deny foreknowledge, as well as foreorlination, simere if it is issential that a volition shoult he purely eontingent in orfer that it shoula be responsible, it must be imleterminate before the event, and while indeterminate it can mot be eertainly foreknown. The Arminians (thongh not without exceptions, such as Alam (larke aml the late Dr. Me 'abe) whit toreknowletge, but deny foreotlinatinn. The Colvinists argue that, in an intellisent being. prevision implies provision; and that the admission of (somp's infinite fordowledge therefore newssurily involves the admision of llis eternal foreordination.
Inthis matter they maintain the following poutions: 1. In the case of an infinitely wise. 1wwerful, ant free Creator of all things ex nikiln, it is obrions that the certan foreknowlellge of all events from the absolute treginnine virtually involves the pruletermination of eath eront. Withont exception; for all the cunses and consequences, direct and emtingent, which are fimem before erimation are of course, de-
 (Inisenssions, Appendix 1. .1). "the two great artieles of
 the selfsame dithiculties." S. Since all events constitute a single systen, the creator mast mbane the system as a whole, and every infinitesimal element of it, in one all-comprehensive intention. bohls more or less general must lan determined as ents. aml means aml conditions in all their sewral relations to the cmals whichare mande dependent uph then. Hence, while wery erent romains dependent upon its canses and comtingent upon its conditions, none of Geml's purpases can pusibly tre contingent, became in turn every camer and comtition is leterminem in that purques, as we il as the ends whith are suspuded upon them. All the decrees of forl are hence called abonlute, brome they are altimatrly determined atways by on the counsel of ilis own will," and mover by mything exterfor to Him which has mot in tura been previnuly determined by Him. 3. This dotermination. lowever, instemb of interfering with, maintains the true cansality of the ernature and the free molfdotormitation of men amb angels. The eternal and im-
 consequently om mever intertere with the exercise of that freelom of which it is itsilf the fomdation. Howerer, necording to the pinciphes abovestatel, this created frem will is not indersmbent, hut ever montinues to have its gromm? in the conserving margies of the ombiperent Creator. Since the holines bi the ervatel momal agent is comationed upon the indwelling of Divine grace, amb its turning from grace is the canse of sin. it follows that all the weme in the volitions of free agouts is to her refered to fool ac its positive sourec, but wh the evil (which origimetes in defeet, privation) is to bu refermel simply to llis permission. In this
view, all exents, without exerption, ate embracel in Gom: eternal purpme: wem the primal aposanies of satan and of
 from then. It in in viw of thene principes that Calvinism has bern so of en confombed wath fitalisin. It is, however. the amtipules of fatalism, preserving the real efficieney of secome canses while subjerting their action to intelligent ematrol. It teat hes that the ati-penctrating and all-energrizing will "f the persomal dehowh. who is at once perfect Love amb jerfer light, eonstitates and comserves one frem asoney, and thoner its fres iphtancily works contimally the exp-blesed comsel of Itis own will, waving even rebellious volitions into the insommentalit is. of Hife porpere. and making way conmentisy soul a conseions coworker with himedt.

Is to the baming of this primeciple upan the question of the desien of (ion in the aplliation of redemption (arealestimation), sue helow.
1). The Menure in which the Jimine attributes of Benwrodence, Justice, and firace are ithustrated in the stheme of Redemption-Arminians have generally helah, with Leibnit\%, that " justier is henewolonce anting acording to wis-dem"-i. c. infliding a lesser pain in order to effect a grenter or more seneral happiness. The necesoity for punFshment therefore lies not in the ceontial amb ine xomble demands of rirhteomsness, the in its heing the best means to sceure the moral reformation of the simer, and the best motive to restrain the community from disobedience. Grotins maintamel that the mural law is a promuct of the Divine will, amp therefore capatle of heing relased by that will. In the goyel schme, therfore (homl. in the exereisp of 1 l is sowreigu promgativ, relaxus Ilis law hy forgiving simers upon renmanco and reformation, white as an antministrative preantim he makes an exhinitisn of severe -ufloring in the person of llis sim. in orter that all other sulbjects of Ilis moral gevernment may be detered from making the impunity of repantant mon an enconragement to disoberlience. Thi atomenent, therefore, wat an exhihition solely of the bivim henewalere that not of justice in tha ordiniary smase of that word.
('alvinists, on the contrary, hald that justice in the striet sma', as woll ats hevolener, is an exsential and matimate property of the bivine mature, amd hetuce hies back of, and determines the charater of all the bivine wolitions. liy the perfection ot (iod's nature the is allwas lath benevolent and just in all llis actions. The atomement arombingly was an a d of infinite love seeking and finding a way to he loth jus anm yet the justifer of the simber: it provides a livine -ulntituti for the simner. who mometakes for him and hears his funalties, and works ont a prefect righteon-ness in his Alomb, with regard to which (gonl mas aecept the permon of the sinner as (judieially) rightwos in llis sight. While
 C'alvinists in thoir viow comblavize justice and grace.

 answers respectively given to this puestion impor form and charartur upon all the various systems of theology:

1. Dיalugius held that free will (liberum urbitrime), in the Anse of all aholut ly unomitioned f"wer of choie be-
 amd hence inalienalide from homan mature. Since, then, all men contimue after the umotasy to the responsible moral aronts, their mature in this essemi ial rexped mas remain in the same contition in whith it was ereated. 'The moral
 pharacter of his momal aremey at ayy other moment, and he possesses throughont his cotive existene athility to will and to do all that Gon hats any right to reguife of him. Hence Pragrians deny-(1) All oriqinal sin werruption of na-

 phanary ability io will aright. (2) 111 original guilt on desion of pmishmont common to the rate, and prion to the attual transervion of the imbivilual. ane it would ter a violation of justice to hodl war maval aqent repponsible for the wrong valitoms of another. (i) Flowe men netel redemption through (hri-1 only th deliver them from the gnilt
 who howe thus sinmet. Thase dying in infancy ate thorefore worlhy of neither reward nor fomishment, ambla be Indefited liy Christ only hy being raisel to a hisher phane of hesembest than that belouging to bature- 10 theregnem colurum ns distimenishad from the citu aterna.
2. Angustinians and Calvinists, on the contrary, maintain -(1) That the entire soul. with all its eonstitutional faculties and incquirel habits, is the organ ol volition, the agent willing. (2) That this sonl possesses the inalicnable property of self-ctetemination, the momal character of which determination always depends upon the moral condition of the soul acting. (3) That the holy moral condition of the soul, ant hence its spontaneons disposition to wild that which is right, depents unon the indwelling of the Divine Spirit. The tree agency of God is an absolute self-existent amb selfsufficient perfection, self-determined to good and incapable of evil. The freedom of saints and angels confirmed in holiness is depemient upon Divine assistance, but, Jike that of God himsclf, it is the very opposite to the "liberty of indiffarence" $1 H^{*}$. power to the contrary," being a non posse peccare, a felix: necessitas boni. Ahan was created in fellowship, with Grod, amd hence with a holy temdeney of heart. with full power not to sin (posse non peccare), but also, during a limited perion of probation, with jower to sin (posse peccaro). He did sin. Is a punishment the Moty spirit was withdrawn from the race. and be and his descendants lost the pesse non peccare, and retained only the posse peccare. which thus heeame the fatal non posse non peceare.
This thenlogient roctrine of total moral inability has nothing whatever to do with the psychological theory of "philosophical neeessity" as an attribute of voluntary aetion, which, sinee the time of President Edwards, has been too frequently regarded essential to the defense of Calvinism. It has been conclusively shown by Principal! ('mnningham (Theology of the Reformers, Essay 1X.) that this metaphysical doctrine is not essential to Calvinism: while Sir William llamilton (Discussions, Ijpendix 1, A) ind Sir James Mackintosh (Dissertations on the Progress of Ethical Philosophy, Note O) propose to prove that it is ahsolutely inennsistent with Calyinism as historically tanght. The jhtases "boudage of the will." ete., so frequently usad by all classes of Augustinitu theologians, and above all by Lather in his treatise De Serew Arbitrio, are intended to apply only to the eorrugt spontaneous tendency of fallen man to evil, which can be reversed only by a new creating energy from above. At the same time, every Calvinist holds devoutly to the free self-determination of the soul in every moral aetion, and is at liberty to give whatever psychological explanation of that fact may seem to him most reasonable. See (onfession of Faith, el. ix., atud Calvin's De Servitute et Liberatione. Ifumani Arbitrii.
Hence Calvinists hold-First: as to original gailt. (1) Iluman sin, having originated in the frec apostatizing act of Alam, deserves God's wrath and eurse, and immntable justice demands their infliction. (2) Sneh, moreover, Wis the relation subsisting between Adam and his descendants that (rod righteously regards and treats each one, as he comps into being, is worthy of the pmonshment of that sin, and consequently withdraws His life-giving fellowship from him, Some refer this responsibility of Aclam's descendants for his apostatizing act to is purely sovereign " hivine constitution" (New Fingland view) ; others hold that we all were in our generic essence guilty congents with him in that act (Realistic view) : while the common opinion is that frod, as the gumblan of our interests, gave to as all the most favorabie probation possible for beings so constituted, in Adam as our covenant represontative (Federal view). The whole race, therefore, amd each imbividual it embraces, is umber the just condemmation of Goul, and hence the gift of Christ, and the entire selemu of redemption. in its conception, exe(antion, and appliation, are thromghont and in every sense a protuct of sovereign graee. Grod was tree to provide it fur fow or many, for all or none, just as lIe pleased. And in every cast of its spulieation the motives determining God ean not he domm? in the ohject, but only in the good pleasure of the will of the Ibivine A gent.

C'alvinists aso hold-Secondly: as to original sin. (1) Since every man thas comes intes the word in a eondition of antematal fortcitime beanuse of Jham's apostasy, be is jurdicially exclumed from the morally quickening vinerer of the Tholy ©hosi, ant hence begins to thme, feel, and ace without a spontancous lias to moral grool. (2) But since moral obligation is positive, and the sonl is essentially active, it instantly develops in action a spuritual hlindocs and deadness 10 divine things, and a positive inelination to wil. 'I'his involves the corruption of the whole nature, and absolate impotencer of the will to goorl; is, hmmaly sjeaking, withont remedy ; and neecsanily tends to the indefinite ine rease both of clepravity and of ghilt. It is therefore said to be
total. Some Calrinists hold original guilt to be eonditioned upon original depravity ( $e . g$. the advoeates of mediate imputation). Others, including the large majority, of all ages, hodd original depravity to be the jenal consequence of Adam"s apostatizing act, and therefore to be conditioned upon original guilt (hence immediate imputation).
3. The adrocates of the middle selneme have, of course, varied very much from the almost Pelagian extreme oecupied by many of the Jesuits and of the Remonstrants, to the almost Augnstinian position of the Lutherans and of the great Weskyan Richard Watson. The Semi-Pelagians admitted that the nature of man was so far injured by the fall that he could do nothing in his own strength morally goon in God's sight. But they held that man is able to incline himself unto gool, thongh he is not able to effeet it: so that in every case of spiritual reformation the first movement toward gool may be from the sonl itself, while the pertormance of it is the result of the co-ojeration of Divine grace with the hmman will. They consequently denied the gratia preveniens, but admitted the gratia ro-operans. The modern I'rotestant Arminians (Limboreh, Episcopins, ete.) artmit original sin, while they deny original guilt, and regad innate cormption rather as a rice or fanlt of nature than as a sin in the full sense of that term. Dr. I). I). Whedon (Bibliotheca Sacra, Apr., 186?) admits-1. That Adam and Eve by the apostasy morally corrupted their own nature and that of all their deseendants : 2. That every child of Aclan is born with an inhorent tendeney to sin which le cam not remove by his own power: 3. That Adam and Eve were fully resionsible for their ajostasy, because they sinned in spite of possessing power to the contrary, and therefore might justly have been damned; 4. Neverthejess, their descendants, although corrujt and prone to sin from birth, are meither responsible nor panishable until there has first been bestowed ulnon them redemptively a gracions alility to the rigint: 5 . After Adam simned, therefore, onjy one alternative was open to Divine justice-either that Adam shomd he punished at onee without issue, or that he shonld be allowed to generate seed in his own morad likeness, when equity required that an adequate redemption should be provided for all ; 6. Tlence Christ died for all men. and sutlicient grace (inchating gratia proveniens and gration co-operans) is given to all men, which is essential to render them responsible, and they become guilty only when they almse (hy failing to co-operate with) that gracions power to the contrary (posse now preare) which bas been eonferred on them in the grospel. Gunting the dictum of Presifent Elwarls (Hill, pt. 4, 心. 1), "The essence of the virtue or vice of tlixpositions of the heart and actions of the will lies not in their cialuse, but in their nature," Whedon salys: "too this we oppose the eomnter-maxim, that in order to responsibility lor a given alet or sate, jower in the agent for a contrary act or state is requisite. In other words, power underlies responsibility." The only limit he allows to this principle is in the case of that moral inability which results from the previons alsuse of freecion by the agent himself. This he dectares is the fumbamental ground upon whieh all the issues between Arminianism and C'ilvinism depend. Thus while Calvinism exalts the redemption of Christ, in its "xecution and in each moment of its application, as an adorable act of transcenctent grace to the illdeserving, Arminianism, in its last amalysis, makes it a compensation brought in by the equitable Governor of the wortd to balance the flisabilities brought upon men, withont their fantt, by the apostasy of Adam. This thlference is the practicill reason that Calvinism has such a strong boin upon the religions experinee of Christians, and that it finds sueh frequent irrepressible expression in the hymms and prayers of evangelical Arminians.
F. The Tuture and Necessity of that Divime Grace which is exercised in the Moral Recovery of Ifuman Nature.Grace is froe sormpign faror to the ill-aleserving. It is the motive to redemption in the mind of Gobt. It is exareised in the sacritice of lits son, in the free justification of the bedieving sinner on the grombd of that son's vicarimas obedience and sufferings, and in the total change wrought in that simner*s moral character and actions by the energy of the Inly Ghost. While the worl graer ipplies equally to the objuctive change of relations and the sulyective ehange of character, it is used in this comoection to designate that energy of the lloly Ghost wherely the moral nature of the hmman soml is renewed, and the soul. thas renewed, is enabled to act in eompliance with the will of Gotl.

Pelagius fouml in his spstem neither need nor room for
this Divine energy, and confined the concoption of grace to oljective revelations amb elncational and provilential inHucnees.

Semi-lelagians admitted its mecessity to help man to complete that which he hat himself power to commonce, and held that it is athally given to all those who had thas prepared themselves for it amd mate themselves worthy of it.

Arminims admit that it is nectasity in order that the corrupt will shall be exen predinposel to good: hut they regard it as a miversal compensation for the irresponsibte defects of an inherited nature, which restores the native power for either good or wil; and they make all futher effects depend wholly um the use made of it hy the sont in which it acts. This is styked the theory of Co-operation as held by the Aminians, and of "symerism" as hell by the followers of Mehachthon in (emman. Regemeration is the rewnlt of the coworking of two energies but the betemining fator is the hman will. Hence grace is sufficiens in every case, and efficur ub erentur rel conyruitate.

Augustinians and ('alwinists, on the other hand, hodd1. That, for christ's sake, and in spite of all human demerit, a gracions influence is exerted on the minds of all men of varions intensities. This is "eommen grate," ant is a moral and sasory inthence on the sonl, temding to good, restrining evil pissions, and atorning the sonl with the natural virtues; it may be resisted, and is always prerailinely resisted by the unregenerate. 2. But at His phature, in certain cases, God exarts a new crative energy, which in a single act changes the moral character of the will of the subject, and imptants a prevailing tendency to co-operate with future grice in all forms of holy obechence. This is gralia efficax, "effectual calling." which is always effertal because it consists in effecting a regenerative change in the moral nature of the will itself. The change which this srace ellects is the "new heart" of seripture, the conrtrion habimalis sen passime of which Gent is the agent and man the subject, which as a new habit of soul lays the fommation for all holy activities. Augustine has been gencrally followed in strling this grace "irresistible," because it can not be resisted. Yet this is as incomprous: designation as it would be to call the creation of the work] or the generation of a child "invesistible." Eftrectual ealling consists in a new creative energy within the sonl, making it willing upon which it spontaneonsly enbraces Christ and turns to God (the romerrino actualis sen arfien). It merges itself into the very spontureity of the will, and enfranchises it from the corruption which had hitherto held it in bondage and restores it to its normal equilikrimm, in harmony with reason and conscience and the indwelling spirit of God. 3. Afterward the Divine spirit continues to support the soul. and prepare it for and to eoncur with it in, every gonal work. this grace is now prevailingly en-operated with by the regenerated soml, and at times resisted, until the status of grace is sureceded by the status of glory

Candinists hold that this" grace" in all its stages is purely underven faror, and therefore sovereiguly exercised by Goul upen whom and at what time he pleases; heme it is aalled gration graluitat of gratis dutu, otherwise grace would be mo more grace, It alow work in its varions stages progreswively, except in the single remenative act. It is at tirst the grative propeniens, then the gration aperons. then the gratiun co-opmrths, and finally the gratine perficions. inchadins the domum persererantio, intallibly securing perseverance in faith and obedienere, buto the complete redemption of sonl amblenty in glory.
(i. The Relation whirh the Etrrnal IMm of Gint bears to the Appliration of Redemplion In Individuuls.-Since
 things that eque to pass, none of whith comes to pass without llis prevision and provisom, it includes also the destinios of all creatures. Predestination, in its restriched sense. is the term cmphoyed to axpress than prose of (iond in relation to the salvation of individual men. Arminans mantain that this prapose of (ion is with reference to "ath man
 faith and rempatance: but (anlvinists insist that shere fath and repentanere are the gifts of (ion and the fruts of 1 is Spint, their presene ore absence am mot the condition of predestination, but mast he rather its predntermined and eracionsly effected result. The primary efliciont cause of premestimation is therefore tion llimself: the liscriminating canse lies in the hidden comnsels of llis own will. Predostintion therefore in the remand, inserutable, and mohangeable decree of Gut concerning the salva-
tion of individual men ; it ennsints of two parts-etemal alection on the one side and etcrual peterition on the other. It thus includes both the sclection of one portion of the race to be saved and the leaving the rest to perish in sin. This act of diserimimation is necessarily alsolutely soverrign, and can limd its canse on neither side in anglit in the creature moving Gent to elect or pase him by: ex hypothesi, all stand in like condition before (ion prior to this act of diserimination, and what is common to the whole can not be the ground of discrimination between the barts. But the subsequent treatment to which each section is subjected is not sorereign, but is ronditioned on the one side on Ciods purpose of hove to llis clect, and on the ot her on the guit of thos sin which the monelect are left. The dectere of election to eternal life is followed therefore by the foreordination of all the mems thereto. And the pirposie to pass ly the rest and leave them in their sin is followed by the ortination of them to dishonor and wrath for their sin. A discrimination is thas drawn bet ween the sovereisn act of perterition and the judicial act of repohation; or, as they are othersise callivd. betwen the sovereign ant of " negative reprobation " and the judicial act of " positive reprobation." So far all historical schools of Calvinism agree. Adherents of what is known as the school of sammur are equally exphicit and decided in theer points with typical (alriniste. (Hece e. g. Amyraldus, Defense of C'ulyin. ch. xiii., Declaration againsl the Lirmos of the Ammians, 1646 . 1. 6 : and in this country dames Rithards, Leftures th Hentel Philosophy and Theology. 1846, 115, 3:9, weq. : 11cmry B. Smith. Systrm of ('hristian Thrology, 1880, p, 508.) Iecordingly the (Exumenical Rafomed synot of Dort (1619) and the broally Calvinistic Assembly of Westminster (1644-4) so detine the doctrine.
In the further derelopment of the subject, howerer, diverging achools of thought emerge within the limits of (alvinisu. The erreat majority of Calvinists have always bern what has come to the known as Infra- or sulbap-sarians- That is, they hold that God's predestinating decree contemplates man as alreaty fallen and resting under the curse of the broken law. God is conceival of as moved by inetiable love for man. selecting out of the mass of guilty simets a people in whom to show forth the glory of Uis grace and then as providing redemption for them in order to carry ont llis loving purpose in clection. The "order ot dermes." as it is techmically colled, stands in this view thus: Creation, fall, election. rudenption hy ('hrist, applieation of redemption ly the Holy sirit. A few Calvinits, whoe inconsiderable number is balaned by their considerathle learning and logical power, have always contuded that on legical gromeds it wonld be better to phace the deeree of cleation in the order of thonght before that of the fall: they are therefore called sumalaparians, and give the "order of derres" thus: Creation, election (or even election. (reation), fall, redomption, application. 'This question did net come into disenssion until the close of the sixterenth antury, no that the position upon it of Calvinistie writers before that date is usially in dispute. There serms no good reason to doult, however, that Augnstine and Calvin were essentially Infralapsamu in their fundamental conceptions. On the other hand, the supralapsarian scheme was adopted by men of such mark and influmer as Beza, sucessan to (filvin in Ceneva: (iomarus and Voetius, the great opmo nents to the Remonstrants in lodland ; Twison, the prolow or of the Westminster Assembly: (Exumenioal Calvinism ranged itself explicitly a Infralaparian in the Canons of the syond of Durt (16it), and with less explicitness but no less reality, in the Westminster Conforsion (164-4i). The ditherence "hetwen the two views is. howerer. ahomet entirely a logical one and has little or no theologival importance.

 labus on siystematic Thenlogy. po Di33.) (ha the wther hame. a depurture from typieal (alvinism was propoed by the school of sumur in the first half of the sermentent hemitury, in the glpasite direction. In the eflort to conneme of the work of Chriat as having copual reforence to all men indiseriminately. they propusel to flace the deeree of election sub secpemt in the ouder of thonght to that of redemptions. making the "orcher of thercess" the following: "reation, fall, redemption ly christ, clection, applimation of redemption by the Iloly spirit to the elect. "lhis change is of greater theolocieal impontance, as it involves an entirely different view of the nature of the atonement from that taught by typieal calvinism, It has exercised far more intluence than

Supralapsarianism : but has left the great majority of Calrinists unaffected, chiefly on account of its inability to coalesce with a truly substitutionary doctrine of the atonement.

In all its forms alike Calvinism makes Gol the sole arhiter of the destiny of His creatures. liut in no form does it make llim the nuthor of sin. or the condemner of man irrespective of his sin. In all forms alike man is mate the author of hisown sin, and sin is made the ground of his condemnation. God posit ively decrees grace and thus produces all that is good. He only determines the permission of sim, and punishes it hecause lie forbins and in every way morally discountenanees it. Ile elects of tree grace all those He purposes to save, and actually saves them, while those whom lle does not elect are simply left under the opreation of the law of exaet justice, whatever that may be in their case. Archbishop Whately, himself an Arminian, in his essays on Some of the Difficulties in the Irritings of the Aposile Poul, honorably almits that the apparent harshness of Calvinism lies in the fucts of the case as admitted by all Christians. It is obvious that all who are horn sin and die, that all do not believe, and that all are not saved. Calvinistic "particularism " embraces the actual results of salvation in their widest scope, and refers all to the gracions purpose and power of chol, hut does not restrict it one iota within the fimits determined by the ficts themselves.
11. The IVistory of Cultimism.-The C'bristian doctrines of $\sin$ and grace were. like other doctrines, brought to clear definition only through controversy. The intellectual energies of the Chureh were at first ahisorbed in the realization and definition of the doctrines of Goll and of the Person of Christ : and it was only after four centuries of controversy hat brought these doctrines to clear expression that the Church could turn its attention to the more subjective side of truth. In the moantime all the elements of the composite ductrise of man were everywhere confessed : the evil conseguences of the fall and the necessity of Divine grace for salyation were as universally recognized as the freedom of the will and the complete responsibility of man for sin. But the prevalent Gnostic and Dlancham heresies, which represented sin as a necessity of nature, led necessarily to a very special emphasis being thrown upon human freedom and responsibility by the Church teachers of the time. In necessary antugonisin to these fundimental heresies, the early Fathers. especially Origen and his colleagues and followers of the ilexandrian sebool, were led to insist in a very mqqualified manner urw the independent, self-determining power of the human will, and to maintain that sin is the prorluct of that freedom abused. They unisersally heh that human nature was morally ruined by Adam's sin, and that it was redeemed by the blood and restored by the Spirit of Christ : hut they conceived of these great principles in a crude and indefinite manner, without determining their relations to eilch other. But in the special attention to the refense of human self-tetermining power as the basis of responsibility, which all were in a manner forced to give. it was ineritable that sonter or later some one wouth arise who should so one-siledly emphasize this element of the truth as conseimsly to deriy its other hemisphere. As a general fact, the Greeks were especially distinguished for emp hasizing the antoraty of the will, though without denying the need of grater. Sut the anthropolory of the Greek Church has continued to preserve the same characteristics to the present diey (Athanasius, Expmes. in Psatmos, Ps. 1.7 ; Orthodore (onfession of Pater Mogitus, 16t?). On the other hand. there was, during the third century, a marked temleney in the Latin Clureh to more profemmid views as to the moral and spiritual nat ure and relations of man. This characterist ie was develomen most owiously in 'lertullian of Carthige ( $\because=3$ ( $\mathrm{A} . \mathrm{D}$ ), who 1atught the propagation ( $\mathrm{P} \boldsymbol{x}$ treduce) of a

 the most explicit fofention in that age of the sover"ignty of Goul and the momil impotenee of mam, and the immediate teacher of sugnstine.

The inevitable heresiarch came at the opening of the fifth century in the prosin of Pelagins (Morgan), a British monk, a man of pure life, clear, practiol mbellect, and carnest zeal for the momal interasts of human hife. Ile was the momal anthor of the system whicll bears hise name. while its intellectual constructur was (crlestins, a youthful Roman advocate: and its most colfective adrocate was Juliam, the deposerl Bishop of bismum in Campania. 'rhe ecotral and formative principle of Pelarianion was the inalienable plenary ability of man to do all that can righteonsly be
demanded of him; from this principle it inferred that men are fully capable in their own powers to attain and maintain entire perfection of lile, that they come into the world without entailment of moral weakness or sin from the past, and that they need and receive no divine aid in the sense of inward renewal and sustaming grace, to enable them to do their full duty. It was this denial of the necessity and reality of the inward oprations of God's grace which most outraged ('hrist ian hearts, and Augustine lays the chicf stress in the controversy on the reality of grace, and its necessity is arising out of original sin. In opposition to Pelagianisin, the distinctive features of the theology of grace were developed out of the Seriptures and his own deep experience hy this profound thinker, Augustine (354-430), a mative of Tagaste, in Numidia, the som of a leathen father and of the sainted Monica, in turn a prodigal. unbeliever, Manichaean, I'latonist, diseiple of Ambrowe. Christian of profound experience, preacher and teacher of transcendent genins, Bishop of Mippio Regius from 395 to 430, and the greatest theologian of all time. The result of the controversy was not doubtful. The opinions of l'elagias were univerally condemned by the whole Church, Eastern and Western, at the councils held at Carthage 412 and 418 A .1 ., at the Council at Mileve. 416 A . D. by the popes lnnocent and Zosimus, and hy the Ceumenical Comeil hetd at Ephesus. 431 A. D. This rapid and universal condemnation of P'elagianism, after making all due allowance for extraneous influences, proves that, lowever indefinite the views of the ancient Greek Fathers may have heen, nevertheless the system taught by Angustine was in all essentials the common and original faith of the Chureh. In the listory of the entire Church to the present moment. Pelagianism has never been adopted into the publice (reed of any ecellesiasticel body except that of the socinians (Racovian (atrechism. (605), and it has prevailed pactically only anong Rationalists, whose Christianity was disintegrating into Deism.

But Pelagianism did not so die as to leave no "remainders" behind it. Already in Augnstine's lifetime (as carly as 428) we liear of a hody of monastie leaders in Southern Gaul seeking a middle ground between Angnstinianism and l'clagianism hy admitting inherited sin and the necessity of grace hut denying that this grace is either inevitable or necessarily prevenient. John Cassian, a disciple of C'lurysostom, abibot of the monastery at Marseilles, was the leader of this middle ststem of compromise. whose adrocates were at first styled Massilians, tut during the Middle Ages and at present in the Romish Church Semi-Pelagians. lis most influential supporters and followers were Vincentius of Lerinum (4:4), Faustus. Bishop of lhegium (475), Gennadius, and Arnobius: and his opinions prevailed in France for a leng time, and were confirmed by the provincial synods of Arles (4i2) and of Lyons (150). Against this party Angnstine wrote his great works De Predestinatione Sunctoram and De Jono Persererantice, and he was ably represented by Prosper and Hilarius, and the unknown author of the great work De Tocatione (Immium fientinm, aseribed to Pope Leo I. (461): by Avitus, Arelibishop of Viennal (490-
 gentius of Ruspe ( 1533 ). Semi-1elagianism was contemned by the teeree of Pope Gelasius (406), and linally in the sinorls of Orange and Valcnce ( 529 ), which were contirmed liy the exlict of lope Boniface ( $5: 30$ ) : from which time a monlifed and softened form of Augustianism lecame the recugnized orthodoxy of the Westerm C'lureh. It was taught by Gerery the Great, and held by the Fmperor Chirlemagne, the two persons who exerter the greatest influchee in the reconstraction of Europe at the commencemont of the Middle Iges. It was held throughout those ages hy all the greatest church teachers and ormaments, as
 Thrin ( $8: 30$ ). The history of the persechtion and condemnation of Gottselalk, under the intluence of Rabanus Maurus and Ilinekmar, with whieh scotus Erigena was involved (abnat 8.0), show, howerer, how deeply the ever-increasing somi-l'chatim learen was alfeeting the whole Chureh. All the most illustrions teachers of the scholastic age, making allowance for the exisavagane of many of the eir speculations, preserved, however. more or less of the tome of Augustinian thought, as for example Ansehn, Arehbishop of Canterbury (!10): Sl. Bermard. Bishop of Clairvanx (1140) Peter Lombard, Magister Sententiarum: Inugo de st. Victor; aml, abose all, Thomas Aquinas. Doctor Angelicus (1247); and 'lhomas lBradwardine. Arelibishop of Canterbury (1348).

Thomas Aguinas fairly represpats the result of the driftage of the Augnatinian inthodexy toward simi-Pelagianism lisesstom is almost exatly intermetiate between thas bo great types-with the one he athirmed that man sime the fall hat lost all ability to anything spiritually whal, amb withont grare be coulid do nothing Heceptable to (ixa or whieh secered salvation; while with the other he represented origimal sin as rather a haguo and a disemse. and affirmed the power of fallon man to co-operate with grace. The distinctive point of semi-Pedugianism is the denial of prewenient grawe the distinetive paint of "lommism is the leubal of "irtesistible " grace-i, e, of perenimt grace conceived of as a reatime enerey of (iand. The hominisams as a class followed Aquinas, white the Frameisems: followed their champion, Duns scotus (t26is). Duetor subtilis, and in that age the ablest adwonte of pure Somi-Prlagimism.

The controverses then weverl have continned to agitate the Romish fhurd up to the presemt time. Ihe Commel

 Hollame, Fonglat, aml senthon it has bewn motified in form by the "Federall scheme" introducen by the What-
minster divines ( $\mathbf{1 6 5 0}$ ) and the Dutch school of Coeceins. In France it was temprarily modified by the Untuersulismus IIypotheficus or the miversal impetration and limited applieation of redemption (164?), as held by Amyraldus, Daille, and Placens on the Continent, and by Baxter, Davenant, and in modern times by Wirdlaw and others, in Enolaml. In America it has been coereed throngh more radied amd more trasient transformations in the speenlations of Ilopkins, the younger Elwards, Emmons. N. W. Taylor, and others of the New England schonl. But its vitality is ever exhibited by its power to take upon it various forms, and to live through periods of depression, and to enter the hearts of men is a power and new life after long epochs of religious death. It was the inherent power of Cidvinism which revived religions life in switzerland in the early part of this entury, in the humble teaching of Haldane and the powerful preaching of Malan, Ganssen, Merle d'Aubiguy, aud other colaborers. And our own lays have seen a new exhibition of its power to awake to new life in llollanl, through the stealy testimony of the Christian Reformed Church and the great leadership of Dr. Kuyper. The history of Calrinism exhibits it not merely as a system with great inherent ritality, but is the system of truth in which abides the springs of religinas lite.
111. The Practical Effects of Caluinism on Personal Moral Chartacter, and upon the Socinl and Political Interests of Mfor-From the time of Colestins and Julim, in the fifth centary, to that of Heylin (1659) and Tomline (1811), the a priori objection has been brought against ('alvinism that its principles shond leal either to lieentious liberty or to abject inbserviency, to discouragement in the use of means, and to andue disparagement and neglect of human reason. It is argued that the doetrine of the absolnte moral impotence of man's will shouk destroy all sense of accountability, and that the doctrine of absolute deerees should canse the use of means to appear either umecessary or ineffectual, and leal to despair upon the one hand or to licentionsness upon the other.
But the moral character of Calvinism is aloundantly vindicaterl in two ways: 1. On the gromen of reason. The recognition of the troe (i. e. actual) condition of man's nature an! relations to God, as this is revealed in Scripture and exprrienee, must he more moril in its effect than the most skillful misrepresentation pussible of that actual condition ean be. The historian l'roude, himself held hy no trammels of seet or party, says in his well-known aldiess at st. AnIrews (1871): "It irminianism most commends itself to our feeling , Calvinism is nearer to the facts, howerer harsh or forbidding those facts may seem." Archhishop, Whately, himself in Arminian (in his essay on Some of the Ditioculties in the Writings of St. Puni), aeknowledges that the ordinary objections against the moral attributes of Calvinismire in ctlect objections to the open fuets of the ease. That standami of morals which places the grombd of obligation in the supreme will of the All-perfect, instead of in a tembency to promote happiness, and which ntterly compmos fallein man, is obviously higher, and therefore more moral, than a more self-pleasing one which eithrer justifies or exenses him. The system which teaches the total depravity and guilt iness of human nature from birth, its absolnte dependence upon Divine grace, together with tha miversal sweep of Ctol's ahsolute decrees, at once maintaining the iree agency of man amb the infallibility of the bivine purpose, must of crourse compty man of self, make all men equal before the law, and cxalt the all-wise and all-powerful Father to the control of atl events: such a system must make the highest attainments the conditim ime the fruit ot (bolls faror. an! must raise oven the waikest believer to the position of ans invincible champion for (ionl and the right, "a coworker togethro with Giml." 2. In thu seentil plate, Calvinists clam that on the gromed of an illustrions and unparalleled historical reemod they can show that their system has been cminently distinguished by the elfects prodiced by it upon all the commmities which lave conbraced it in its purer forms, as to the following [articulars: (a) the general standard of momal chaveter pactienlly realized in personat and sterial life: (b) the amome of rationally restulated litherty realized Imith in Churd and state; $(r)$ the sandard of popwher intelligence and education acthally atthinem: ( $d$ ) the temtimony fieded to the power of the trath ly the mumber and illustrins chareter of its matyrs: and (e) the zeal and devolion expresed in shatained miswimatry clforts for the extension of the kinglom of 'hrist.

1. As to the intlicence of C'alvinism on the moral char-
acter of individuals, it is only necessary here to quote Mr. Fronde's citation of the names of "William the silent, Luther, Calvin, Knox, Andrew Melville, the regent Murray, Coligny, Cronwell, Milton, John Bunyan-men possessed of all the qualities which give nobility and grandenr to human nature." As to its effect upon the general moral character of commmities, it will be sufficient to cite the Waldenses; the little radiant state of Geneva, whose Protestant reconstruction began with the establishment of a Court of Morals: the lluguenots as compared with their Catholic fel-low-citizens: the Jansenists as comparel with the Jesuits; the Dntch Protestants of their beroie period: the Scotch Covenanters; the English Puritans, whose very name signalizes their eminent moral character, in contrast with the colruption brought in at the Restoration (see Mneanlay's Essays on Mitton and Hallam's Constitutionnl Mistory); and finaly, all those sections of Americal settled by English Puritan New Englanders by the Scotch and Scotch-I rish, and by Presbyterians from Frince and 11 ollant. Mr. Fronde (Address, p. T) says: "The first symptom of its operation, wherever it established itselt, was io ohliterate the distinction between sins and crimes, ant to make the moral law the rule for states as well as persons." Pascal, the snblime arenger of the persecuted religionists of Port Royal, slows in the first nine of his Prorincial Lefters the connection between the infamous morality of the Jesnits and their Semi-Pelagian views as to sin and grace. Sir James Mackintosh, in vol. xxxvi. of the Edinburgh Review, vindicates at length the morality of the theological doctrine of predestination by a general review of the history of its most conspicnons professors.
2. It appears superfluons to prove the tendency of Calvinism to promote freedom and popular govermment, both in Church and state. Its principles strip the ministry of all sacerdotal powers: they make all men and all Christians equal before God: they make God abolute and supreme over all. and the immediate controller and disposer of human affairs. Ilence all Churehes accepting Calvinism, unless prevented by external conditions, have inmediately adopted popular constitutions, either Presbyterian or Judependent. This is true of all the Churches of Switzerland, France. Holland, the Palatinate. scotland, America, and the Free Churches of England and Ireland. The apparent exception is the English Estahlislment. The history of its political relations explains its prelatical character. Cranmer and the other Calrinistic fomuders of that Chureh held, as did Archinishol! Usher, it very moderate theory of the episcopate, and submitted to the constitution actially established only for state reasons. Afterward, as Calvinism became more thoroughly incorporated in the public faith, Presbyterianism was established by the Long Parliament, and lindependency ly the Puritan irmy and Protector. It is a conspienons fact of English history that high views as to the preroqatives of the ministry have always antagonized Calvinistie doctrine.
The political influence of Calvinism was at an carly poriod discerned by kings as well as by the people. The Willtenses were the freemen of the ante-feformation period. The republie was established at the same time with Presbytery at Geaeva. The Hollanders, grouped around the sublime figure of Willian the Silent (Calous et Culrimista), performad deeds of heroism against odds of tyranny umparalleled in all foregoing and subser ment history. This lattle was fonght by Calvinistic Ifollank, and the victory won (1590) eomplet cly, hefore the Arminian entroversies hat eommenced. Add to these the French Hagnenots, the Sotch Covenanters, the English Puritans in the Chat and in the Niw World, amd we make gool our claim that Calvinists have been suceessful champions of regulated freedom among mon.

Pancroft, the historian of the U.S. attributes the modern impulse to republican liberly to the little reputhic of Gencra and to its Calvinistic theology (vol. j.. $266 ;$ ii., 461-464). Ile ereelits the moleling of the insitutions of North America chiefly to New England Indelements. and to Butch. French, and Scoteh-h rish Presinterians: "the Merklenturer lecharation, signel on llay oo, 1755, more than a yar hefore that of July 4, 1rift, agned in Philadelphaia, was the first voice publiciy raised lor American indepudenee. And the conrention by which it was adopitel and signed consisted of twenty-seren delegates, nine of whom, including the president and secretary, were ruling "ders, and one, Rev. Il. J. Balch, was a l'reshiyterian minister." Tucker, in his Life of Jufferson, silys: "Every one must he promadel that one of these papers inust have been borrowed from the other" ; and

Bancroft has made it certain that the lecearation of Jefferson was written a year after that of Mackbonhmp. The correspondence hedwem the representative system and the gradations of sesions, pesbentics, provinctal symols, and national gromed issemblies, ilevelopeel in the Prospoterian system, to the foderal systom of State and motion govermments in the constituion of the U.S., seems too remankable to have been aceidental.
3. The refation of C'alvinism to aduation is no lass emonspicums and illustrons. The little republic of (remera became the sun of the buropran worll. The Calvinists of France, in spite of all their cmbrrmonmens, immediately fombed and sustaned there ilhatrinus theological selwols at Jontantan, Simmur, and setan. The Hutherots so far surpased their follow-coutrymen in intelligener am! skill that their hanishment, om the nceasion of the keveration of
 trades of (immany, England, and Amorica, and for a time almost paralyzel the skilled industries of brance. (See Weiss's Ihistory of French /rotestumt lidfuyers.) 'The frasment of marshy sumbet constituting llollam herame the eommercial focis of the world, ons of the most powerfal communities in the socrety of nations, and the mother of tlourishing colonies in both hemiquheres. "Ihe pencantry of Sotland has lxern rased fir above that of any other Eifor fean nation by the universal eluegtion afforded by her parish schooks. The common-school system of Puritan New England is oproing up a new era of himan history. In this country. for the tirst two humbed vems of its history "almost every college and seminary of learning. and almost
 been built up and sustainal beg Calvinists." see New Einglander. Oct. 1stis.

C'al'vis, fants hicinius Marer: a Roman orator and poet; b. in 89, il. in 47 B. 1 . In oratory he was an Atticist in poetry he followed the Alexandrians, being a kindred spirit with Catulhus. Only short fragments are extant. Ho Was of diminutive stature, and feeble in body.

Calycan'thos [Gr. кádug, husk, pod, bud (used here, however, in sense of eup: (f. s.v. caly.x) + ávos. Hower: the bottom of the flower being cup-shaped]: i genns of plants of the family Culycanthacere: allied to Remunculucere. It comprises only a few known slecies, which are natives of the U. S. and Japan, and are shrubs with square stems. The flowers, hatk, and leaves are fragrant and aromatic. The Calyconthus formbus, a native of Carolina, called Carolina allspice and sweet-seented shrob, is enltivated in many gardens of the U.s. lts flowers are of a lurid purple or rich-brown color.
Cal'ydon (in fir. Kàvṓv) : an ancient and celebrated city of Etolia: on the river Evemen, at few miles from its entrance into the sea. It is often mentioned hy llomer, and continued to be an important city in the historical period.
Calydo'uian Hunt. The: in elassie mythology, was a celebrated enterprise against a wild boar which raviaged the dominions of (Whens, King of Calylon. Among the heroes who took part in this hunt were Meleager, Thesems. Jasm, Nestar, and the heroine Atalanta, who flrew the first hood.

Calym'ene: a genus of trilobites. A speejes of this genas, ('ulymene blumenbachai, described by Brongniart, is one of the most charateristic: fossils of the upher silurim formations in Europe. Its heanty and ahmodance let to its receiving a commen name " Imalley loenst." suygested ly its resemblance to the wingless bonly of a lomens. A closely allien species ( $r$. senaria) is found in the Niagara gromp of America. H. s. Willidas.
Calyprso (in frr. Kàvұ屯́) : a heautiful nymph ant demigoddess of classic mythology : aceording to Homer, a daughter of Atlas. She reigme ore the island of Ogyin, on which Clyses landed after he had been shipwrecked. She treated him kindly, and tempted him to marry her with the promise of immortality, which he dechned for the sake of Penelone. But she ditained him by her arts seven years. bore him two sons, and died of grief at his going away.

Calybso bormalis: a rare and beantiful plant of the fanily Orchiducete : growing in cold bogs and wet wools of the Northern [. S. and 'inalit. The flower is variegated with purple, pink, and yellow. If has a single, nearly heartshaped leat.

Calyp'tra [Gr. кали́лтра, veil, deriv. of кадúnтєь, cover]: the hool which covers the urnlike spore-case of eertan mosses. It is the od archegone wall, enlarged, Aried, and more or less rupturet.

Calyptran [ifr. кади́ттрa, envelope, eover] : a genus of gasteropod mollus's comprising the forms commonly known as the bomet-limpets. They resemble the true limpets ( $\operatorname{Pt}$ tellidse) in their hatsits and in the flattenel wide-mouthed shells, but there are important structural differences, and hence the bonnet-limpets are placel in a separate group, the Monotocardiu. (See (instrmpoba.) The shell is a flattened cone with a slight spiral, while on the insite is a small fold. About 12 living species ant 30 frssil forms are known. Allied to the homet-limpersare the slipper-limpets (Crepidula), in whieh the shell is deeidedly slipper-shaped. J.S. K.
('a'lyx. pha. Cal'yces [Gr. кánuģ, cover, hask, pot, but. from same root as Lat, uceilere, (Germ. hehlen, hide. Being adopted into Lat, as effly, it mot there calix. eup (: Fr. кúdig). The blenting of "har two words in Late Lat, accounts for the modern nse of culy $x$ in the meaning of cup, ftower-emil]: in botany, tha flower-eup, or ontermost of the projer Iloral envelopes, or of the eibelise of moditied leares Which surmund the organs of reprotaction, and aloner with themenstitute the thower. The leaves or separate parts of the calyx are called swpets. They are genemally grem, lut in some eases are richly colowed sum petuloit, as in the Mirabilis, Selvide splendens, and Fuchsia. The calyx serves
to prolect the interior organs of the flower. If it falls off before the eorolla, it is called coducous, and if it remains until the fruit is ripe it is called persistent. When the calyx is atherent to the sides of the orary it is superior, and when quite free from the sides of the ovary it is inferior.

Cam, or Gramla: a river of England: rises in Essex; flows northeastward through Cambridgeshire: enters the Ouse $3 \frac{1}{2}$ miles almove Ely. Length about 40 miles. It is navigable from its month to C'ambridge, which derives its name from it. The Cam is considered as a elassic stream, on account of its associations with Cambridge University.
Can [atso spelied cromb; loan-woril from Fr. came or Ihteh hrom, cognate with Fing. comb, Germ. Komm < Tenton. *kambers, toothed implement: Gr. rópos, jeg, tooth, skr. jumbhu-s, same]: in machinery, a contrivance for converting a unitorm rotary motion into a varied reetilinear motion. The end of a rod which is free to move only in the direetion of its length is hed in contaet, by the action of a spring or weight, with the edge of an irregularly shaped mass which revolves uniformly upon an axis. A vared motion is thus commmicated to the rof, which carries with it the machinery by whin the motion is to be applicel.
Cam. Droco: a Portuguese navigator of noble ancestry liverl in the last half of the fifteenth century; and earriet on under Alphonso V. the diseoreries commencel by Prince Henry in Western Afrieat. Ife doubled Capes Gonçalvez and Catharina, and. having acquired great influence over the King of Congo, prepared the way in that combtry for Christianity. Cam was accompanied on his tirst voyage (1484) by Martin Behaim, the astronomer and cosmograjher, and atterward explored as far as $2 ?$ S. lat.

## Camaïen: Sce Camatet.

Camadulen'sians. or Camaldolites: an order of monks founted in 1012 by St. Romuaid at C'anatholi, in the $\Lambda_{\text {pennines, }}$ ahont 30 miles from Florence. They are divided into two chasses-Citnobites and Erenites-ant follow the rule of St. Benedict. There are also a few honses of Camaldolite muns, foumded in 1086. The order was primarily noted for its extreme severity. hut was after homuald's death relaxed. It was injured ly interior dissensions, and is now well-nigh extinct. The habit was white.

Gamamele Indians: See Shoshoxean lxdans.
Comargue, kuámaarg', La: a populons islaml of France; Alepartment of Bonches-du-Rhone: at the mouth of the Rhone, and inelosed on two sides ly the arms of that river. It is an alluvial fertile delta. partly oceupied thy marshes. Area about 240 sq. miles. Large quantities of salt are obtaineal here.

Camaril'ta [span. dimin. of comara: Ital. comera: Fr. chumbrr < L iat. comara, camern<(ir. кацápa]: a sjpanish worl (Span. pron. kat-man-reel'yat), "pplied to the private chamber or cabinet of the King of Spain, or to his courtiers ant conticlential advisers, who usually had great power in the givermment and exerted a provicious influcnce. The term is also used in other Europum cometries and languages to denote the influence of courtiers ant secret emmselors comaterating the opinions and policy of the legitimate ministers.

Camari'na: a cofemated Greck eity of Sieily ; on the sonthern coast : about 20 miles E. of Gela. it was founderl by a colony of syracnsans in 599 b . c. It is said that no trace of it now exists.

C'mansial [Latiniz, form of native Amer, name camass, or quamash $]$ : a genus of plants of the lamily Liliacere; incluales two species. Comossia exmento, the fuamash of the Nortka lndians. grows in swampy phaces in the U. S., W. of the Rooky Mountains, and protuces bulls which the savages use as foml. C. fraseri necurs in the Eastern U.S.

Canayen, or Camaien, and Monochrome are French terms used 10 denote a painting in a single color. l'ictures of several 1 ints. whieh do not represent the natural colors of ohjects, are saiil to be en comayple. The same term may be preperty applied to drawings in india ink and red chalk, as well as to angravings.

Cambon, kuañ bōn, Joserh: statesman and financier; b. at Montpellier, France, June 17. 1754. He was elected to the National Convention in 172\%; voted for the death of the king: became a member of the committee of putblic safety in 17\%3. ITe promoted the fall of Robespierre in 1704. As a nember of the committee on finance he mate several abje reports, and is said to have laid the foundation of the modern financial system of France. Ile procured the adoption of the great book or register of the pablie debt. He held no olfice mader the empire : was exiled in 1816. 1). near Brussels, F'eb. 15, 180.

Cam'borne: a town of Cornwall, England: 11 miles N. W. of Filmouth (see map of England. rel. 15-B). Ilere is a church which has a slone inserpition of the tenth century. l'roductive mines of copper, tim, and lead are worked in the vicinity. Pop. (1891) 14.800.

Cambray'. Fr. pron. kian brai (in Lat. Cimeracum): a fortified city of France; department of Nors: on the Scheldt: 45 miles by rail N. N. E. of St. Quentin (wee map of France, ref. $2-F$ ) the seat of an archbishop: celetrated for its fine linens, called combries. Cambray is an ancient city: with grabled honses, hamlsome streets. and is surrounted by a wall with ancient towers and gates. It has manufactures of laces, tulles, leather, soap, etc. Pop. (1891) 24,122; (1896) 25,250.

Cam'lria: the ancient and Latin name of Wales, which the Romans callet Britamia Secunda. Cambria is lerived from Cymry, by which name the Welsh [rople have always called themselves.

Cambrian Period: the earliest division of genlogic time eharacterized by a well-preserved fama. The title Cambrian was first applied by sollgwick to a system of rocks in North Wales (Cambria), and was subsequently alopted for the corresponding time division. It has hat two rivals, some writers contending that the name Tacomic stoonld be used insteal, others that the Cambrian period shondel not be separated lrom the Silurian. The resulting controversies, turning largely on 'uestions of priority in the giving of names, have received attention beyond their deserts. In the U. S. rocks of this period have been found in New England. New York, thence southwest ward through the Appalachian momatain-belt, in the States bordering on Lake superior, in Missonri, in Texas, and at many points in the Cordilleran region. Although the Cambrian faumas are the oldest known, they incluile hichly organized species and do not exhibit the beginnings of life. Our knowledge of American Cambrian rocks is summarized hy ( C ). Walcott in Bulletin No. S1, Znited States frologicril Survey. See Fossul Isvertebrates and Geolois, Mistoric. G. K. Gilbert.
('am'bridge (ance (irante ; in Lat. Centabrigia): a town of Eingland: capital of Cimbridreshire: on lwoth sides of the river Cam, and on the Eastem Counties Ralway; 48 miles N. S. F. of London (see map of Englami, ref. 10-1). The site is Jevel, and the town is embosumed among lofty trees. It is the seat of one ol the great miversition of England. and contains many noble cdifices belonging to that institution. (See Cimbrimie, Untrersity of.) Among the remarkable buildings of the town are Trinity chureh and the Church of the ILoly Sepmlelre, which was built in the reign of llemry I., and hats a romed tower. It is said that Cambiduge was destrosed by the Dandes in 8 al A. D. The Doumsday Pook mentions it as an important place under the name of firentubige. It ohtainel is charter from King John in 1200. Jeremy Taylor was bom liere. Cambridge returns One member to Parliament. busides those who represent the university. Pop. (1891) 36.9 s ?

Cambridge: capital of IJeny co. Ill. (for Jocation of county, sece mat of Illinois. ref. \%-( ) : on lis. Is, and Peoria
 rich agricultural :und stock-raising district, and is an important grimin-market. It has excellent sclows, a publie Ghary, handsome county builings, and manfacturing es-

Cambridue: town, on ratamed; capital of Dorelhester eo. Mal. (for Levertion of comety, see man of Maryland, ref. 4-1"): on the sonth side of the Choptank river: formiles A. W. of Baltimore. The river is here abont 2 miles wind. Canbrifger is the western torminus of the Dorehoster amd Belaware k . Ri., which extends iob miles to seaford. It has armbmies for toth sexes, excellomt pulalie sohouls, five churches, a tlouring-mill, ice, phosphate, mulerwear, tobuc-
co, and stave factories, and several canning establishments, and an oyster and lumber tralle. Pop. (1880) 2.26: : (1840)
4.192 4,19?. Editor of "Chronicle."
Cambridge: a city of Massachusetts: one of the capitals of Middlesex Comnty (for location of county, see map of Massachusetts, ref. $\mathrm{D}-\mathrm{H}$ ) : is on the Fitelburg K. R., and the N. W. bank of the Charles river, which is here about a mile wide, and separates Cambridge from Boston. Cambridge, thongh incorporated as one citr, was formerly divided into several villages, the local names of which still survive; these are Ohl Cambrilge. Cambrilgeport. East Cambridge, and North Cambridge. Harvard University is in Old Cambrielge. Cambridgeport and East Cambridge contain many mercantile houses aml manufactones, mostly of glass, fmrniture. organs, steam-engines, and boilers. East Canbridge. where the manufactories are chiefly located, is connected with Boston and Charlestown by bridges. West Boston bridge connects Cambridgeport with Boston. Extensive printing establishments exist here, ame the lirst printing-oflice in America was located in Cambridge. Near Harvard University is a fine soldiers momument, erected in 1869-50 at a cost of 835.000 . The citr-hall is in Cambridgeport. Cambrikge is leantifully situated on a plain. contains some handsome fublic buildings, and a great number of elegant private residences, with sjacions groumls ornamented with shrubbery and llowering plants. The eity was founded in 1631 under the name of Sewtown, and was much favored by the Gencral Court, which in $16: 36$ appropriated $£ 400$ to locate here a school which became Harvard College. IIere Hooker, who founded Hartford, first lived (1653-36) in America. The city is furnished with water from Fresh Pond. In 1890 there were $\leqslant 20,259,547$ invested in the manufactures of Cambridge, employing 14.000 persons and producing commorlities ralued at s:35.490,345. Of these the principal industries were foundry and machine-shop protucts, \$2.4i8, i30; printing ant priblishing. \$1,80 4,425 : soap and candles, $\$ 1.303,870 ;$ musical instrments, $\$ 1.55 .783$; furniture, $\$ 756,740$ : emfectionery, 884,855 . Here are loeated the celebrated shops of the Clarks, the astronomical instrument makers. Pop. (1880) 52,669: (1890) 70,028 ; (1895) 81,643. See Harvard University.

Cambridge: village; Washington co., N. Y. (for location of countr, see map of New York, ref. 4-K) : on II. and H. R. R.: as miles N. E, of Albany. The village is attractively sitmated in a broad valley, with the Green Mountains on the E., ami has excellent drainage, water-works, and elpetric lights, good public school, and a fine driving-park. There are here a fomblry machine-shop, tannerjes and seed-rooms. The Canbrifge Yalley Agricultural Society and Stockbreeders' Association have here extensive and well-equipped exhibition gromnds, on which is held an anmual fair, unexcelled by any other in the sitate. Pop. (1880) 1.48: : (1890) 1.598. Editor of "Washington County Post."

Camhridse : city ; capital of Guernsey co., O. (for Jocation of connty, see map of Ohio, ref. $5-11$; on lhalt. ant $O$. (Cent. O. Division), and Clev, and Mar. R. Rs.; s5 miles E. of Colmmbis, ant 5 j miles N. of Marietta; has 3 mion schools. 8 churches, several mills mamfacture of roofing, and Cler. amd Mar. R, R. general ollices and shops, and electrie lights. It is situated in a good agricultural and mining distriet, and is the center of an important coal-fiehl; there are dejosits of iron ore aml limestone formations. There is matural gas for heating purposes. Pop. (1880) 2,883; (1890) 4,361; (189:3) estimated, 5,000. Emtur of "Guerxser Thmes."

Camhridge. George Willian Frenerick Charles, Duke of: British general : son of Aholplins Frederick, sixth son of George 111. (b. Feb. 25, 15rit: d. July R, 1850), and first eousin to Queen Vietoria: b. in Hanover, Mar. 26, $181!1$; became a colonel in the liritish army in 183\%, major-general in 1854; commanded two brigades in the Crimean war. 1854-56; became general in 186?, field-marshal in 186? and was com-mander-in-chief of the Britisla army from that rear until Nor. 1, 189\%, when he retirel, and was succeeded by FieldMarshal Lord Wolseley. He is now honomry colonel-in-chief to the forees amil chief persomal aide-de-cimp to the Qucen.
('anbridge City: railrowl junction: Wayne co. lad. (for loeation of cointy, see maty of lomiana, ref. 6-6 ) : on the Whitewater river; 1.5 miles W. of lichmond. It has the car-shops of the Indiana Car Company and other manufactures. Pop. (1880) 2,380; (1890) 1, i8?.

Cambridge l'latform: a system of chureh government drawn up, by a synof at Cambridge, in the colony of Massa-
chusetts l3ay, in 164s. The Congregational churehes of New England at that time differed somewhat in resard to disciphine, some being inclined to Preshyterianism and others to Independency, while the majority avoided Ioth extremes. The synod reatirmed the doetrines bught in the Wimminster comfession, but recommended a form of church discipline substantially the same as that which now prevaits in the congregational churches.
Cambridge Platouists: epithet given to Peter siterry the founder of the school, Ralph Cudworth. Denry More, Joh smith, and lienjamin Whicheote, and their followers, who mplied in the sevententh century lhatonic idens to theology: They ledonged to Emmanued Colloge, (ambridge, which was the Puritun college of the university. Se Tulloch:s Ratomal Theology, vol. ii.
('am'bridershire: a countre of England: bounded N.
 and Hert ford, and W. by ledford and lluntinglon. Tres,
 hat, and ahout one-fourth of the county is occupied by fens or marshes. The northern portion is jart of the liedFord Level (q. r.). The soil is fortile, and the mhabitimts are mostly encared in argroulture. Among the staple prot nets are wheat, hems. hay. oats, hutter, and eheese. It is intersected by the river Oise, and also drained by the Cam. In the north part is a tract called the Isle of Dif:" The chief towns are Cambrilge, Fly, and Newmarket.
Cambridse, Cuiversity of: one of the two ancient unipersities of Eingland. In 1110 Joftrid. Ablot of ('royland, sent to his manor of Cottenham, near Cambidge, Gisjebert, a professor in divinity, with three other learned monks. They in a short time drew togellor so great n number of scholars that in the seromblyear no single building was able to contan them. When difme of Beverly was theme in 1129 A. b, there were ne public halls, bat each one livel in his own ludgings. Wbont the year 1937 stadents beran to live together in hostels. under a principal, at their own charges. The hostels were named after sitints or the churches which ther adjoined. or the persons who built them. Trinity hosel survived to 1.500 . The hostels were the begiming of the colleare system whinh distinguishes the universities of Oxford and Cambridge. In the year 1893) there were 17 colleges and 2 hostels, of which one was public and one private.
Before the close of the sisteenth century nearly all the foundations were endowed which now constitute tho miversity: The predominance of the religious elene ot in the discinitine is to be atributed to the usiote of the times in which the colleges wem founded. There had ben, from very carly times. "religions houses," which were in many cases innited with collegiate foundations, as, for example, the bominicans: whose honse is now Fmmamel (ollege. The friars who lived in these convents kept their "arts". or exereine for degrees like other university mon. To the same cause is traced the condition of eclibacy, upon which, with sateredy an exerption, the fellowships are temable. With some exceptions, the feflows are obliged to take holy orders within a limited period or to vante their followshij).

A new code of statntes for the university was appowed by the Qumen in comeil in 18*2. The great legislative ussembly of the university is called the senate; it is composiol of all thas who have oftained the degree of duetor or mater. and whose names are still on the recister: . It university laws are aproved ly the comberil, consinting of the vitechancelfor and sistecin members of the senate, befure they are submitted 10 the sate. The executive powers are a chancellor, high steward, vieqchancellor, commisary, and asseseor. There are there terms- Michathas, Lent, and Easter. blisentors are mot excladed from taking derrees, except in divinity.
There are fomr classes or orders of students-viz.. fellowcommoners and noblemurn. pornsioners, sizars, and scholars on the foumation of their college. The dirat are so called from their dining at the fellows' table; they wear silk or
 are the stadents not on the fommlition, who pay for their own commons and for their chambers. The sizars are the pourer students, who are admitted at lower charges than the pensioners, hat wear the same dress, and no lonirer preform menial otlices, as they once did. St. John's and Trimity lave very liberal endowments for sizars, ame pecomiary assistance is given. Ill students coming to the misersity aro entered in one of the above chases. The seholars are elected
by examination from the pensioners and sizars; they have romes and commons free and other emohments. The fellows are genrally elected from the scholars. The fellowships are griven to members of the college and are not. as at Gxtord, open to the whole miversity. Before a student ean he admitted he must be sufliciently instructed in Latin, Greek, and mathematics.
When the underymbate comes in he is called a "fresh. man" ; in his second year, a " junior sol ${ }^{\prime \prime}$ " in his thind year, a "senior soph." " The degree of hachelor of arts reinnires nsally nine terms, or three yom of residence. The mater's dagree is conferred three sars later. "The candidates for deqrees are called questionists.
The inathematical examination embraces the whole range of mathematies. The sucessfal candidates are arranged in a tripos-i. e. in three clases, called rectectively wranglers, senior optimes, and junior optimes; the first mathematician is colled the senior wrangler. In the examination for classion honors the candidates are arranged in at tripos, and distinguished as first, sceond, and thiral class. The examinations for degrees are called the "great go." The previous examination, which comes in the second yar of residence, is catled the "little go." There is also a tripos for the natnral seinuces. The peemiary value of the first place in either the chassical or the mathematical tripos has heen estimated at £10.000. for it secures to its possessor high social position, as well as lucrative employment. The next prizes are the fellowshiph of which there are 400 tenathe for life. The oflice of thtor is one of great honor and (molument. James I. granted to the university the privilege of sending two members to Parliament, which it has ever since enjoyed.
The following is a list of the colleges and hostels, with the dates of their toundation, ete: :

| Founded. | colleges. | Grose uncome. | Undergraduates. | Members of the senate. | Member on the books. |

 lirecon in 1sfik, and sucepeded to the marquisate in the same pear. D. 180. when his infant som, John Charles Pratt "horn the same year, inherited the title.
Comden. ('maras Pratr. First Earl of : English satesman amplawyer: 10 , in 1713 : sha al a Deronshire man, Chiof Justiow Sir dohn Pratt: Was called th the bar in 1 B:38: bemme attornyyenmal alsont liss; chiel justice of the comrt of common pleas in latie. Itis deeision arainst thu legelity of general warrants, whe he sease in the trial of dohn Wilkes, remdered him very popmar. Hu reecived the title of Baron ('anden in 176.5, and was appointed Lord ('han-
cellor, but he resignet that office in Jan., 1rro. He afterWard dist inguished himself as a champion of constitutional liherty, and acted with Lord Chathan in opposition to the American policy of Lord North. In 1883 he became president of the council. Ite was 'reated Earl Canden in 1786. I). in London. Apr. 18, 1794. "Among the names that alom the legal profession," says Lorm Bromghan, "there are few which sand so high as that of Camden." On atconnt of his liberal policy during the Revolutionary war his name beame very popalar in the U. S.and was given to several counties and many towns and villages.

Camden, Willlam: English antiquary; ho in London, May 2, 15.5: yraduated at (Ixtord. Tle went to London in 15:1, and there was apprinted second master of Westminster school in 1505. His most important work is a tleseription of Great Britain in Latin, entitled Britemmia sice Regnorm -tngliep. Scotiop, of IIthermiw. ex intimut Antiquitate Chorographiere Description (1556: 6th ent. 1607: Eng. trans. 1610; last 18060). He pmblished several new editions of it, enlarged and improved. Among his works is 1 mats of the Reign of Elizabeft (in Latin), highly commented by Hume. Ile became head master of Westminster school in 1593, but retired when made Clarenceux king of arms in 159\%: His promotion to this position over the heads of all the College of Heradds led to many heart-burnings and recriminations, and embittered many years of the life of this worthy man. who las lucen callet "the juticions Camden" and "the British Pimsanias." He refusel] the honm of knighthool. D. in Chislehnrst (afterward the scene of Louis $\mathrm{Na}_{\mathrm{a}}$ poleon's death), Nov. 9,1623 , and was buried in Westminster Abbev. He endowed a professorship, of history in Oxford. In his homor the Campen Sochety ( $q . r$.) was founded.

Camden society : an association organized in 1838 in London for the purpose of publishing the MSS. of old British authors, historical docmments of imprortance, old records, visitations, both heraldie and ecelesiastical. and other matter of antiguarian, literiny, or historical interest relating to Englanl. Some of their materials are not very ancient. hat are published for their gencral interest. 'Ihe results of" their work are contained in about 160 (18:9:3) volumes, which are, as a whole, of very great value.
 cf. IIebr. $g \bar{a} m \bar{u} l]:$ a common name for the two species of ruminants belonging to the genus Camelus, although of en ased in a restricted sense for the two-humped or bactrian

Bactrian camel.
camel only. Camels are characterized by having the knee free from the body, by large, solt. cushion-like feet, partially cleft and terminating in nails, and by hasing, according to the species, one or two humps on the back. The upper lips is divided, the nostrils are slit-like and oblique. the ears small, and eyes prominent. The neck is long and curved; legs comparatively long. Threre is a large callosity on the center of the breast, on which the animal rests when lying down, and the hody is clad with soft brown hair, varying in thickness according to smann and louality, but longest on the under side of the neek and about the knees. The sin-gle-humpel camel, or l) romenary (q. ".), Camelus dromedfrius, is found in Northern Africa, Syria, and Arabia. The two-humperf or hactrian camel, Cametus butrianus. ranges from the Black Sea, northward and castwarl, into Siberia, Tibet, and China. Besides having two humps, it is further
distinguished from the dromedary by its slightly larger size. The wall of the first division of the camel's stomach is remarkable for the presenee of numbers of large cells, like small poekets, into which water anters when the animal drinks. These cells, whieh, when full, may lie 3 inches wide and as many deep, retain the water for some time, and ennstitute the "reserwir" which enables a camel to gn without drinking for a considerable periont. 'I'he large surface offered by the sole of the spongy foot mapts it for walking in saml, and this, congled with the ability to endure long contimed thirst, makers the camel particularly fitted for life in sandy dwerts. The animal is still further able to underg') privation from the fact that it is able 10 subsist to sonk extent on the store of fat laid up in the hump. With these varions adaptations it is not surprising that camels have been used as benste of burden in arm, desert countries from time immemorial, and they are mentioned in Genesis and the book of foh. I camel will carry a load of from 500 to $1,000 \mathrm{lb}$., or fur short distanees somewhat more, but at a rather slow rate. from $2 \frac{1}{2}$ to 3 miles an hour. some breeds of dronedaries, whith are used only for riding, and are to the others what the race-horse is to the eart-horse, vastly surpass this, mahing as much as is miles in twelve hours. The gait of these animals. which is a pace. both legs on a side moving together, is extremely trying. Noreorer, the camel kneels to be londed, and its notions when rising are rery vident. The popular idea of the docility of the camel is erroneuns, for the animal complains bitterly when being Ioaded, each package added to its lowd ealling forth fresh outeriss; so far from being doxile, the ermature is ohstimate and malicious. Its intelligenee is small and its cowardice extraordinary, for the canel takes fright at any umsual sight or sound. The mates are very vichous and fight sarugely with one another, inllieting serious womms: with their sharp canimifurm terth. 'lhey also possexs the very undesirable trait, common to the Cimelider of sitting mon persons whom they dislike. ('imels have been used to a eonsiderable extent in warfare, camel corps being attached to the British army in India, while they proted extremely valuable in the sudan campaign. Besides being used as a beast of burden, the hair of the camel is woven into cloth, the hine is male into leather, and the dried dung usell for fuel. Camels mere introduced into Australia with a view to their nse on the central teserts, hat the experiment was only moderately sucecssful. As rarly as 1in1a few wore hrought to Virginia, and in swithoit the $\mathrm{l}^{\circ}$ Government imported a number with a siew to thrir emphoyment in Texns, Arizona, and New Mexien. They were stationed near situ Antonio. Tex., and at the breaking out of the civil war were turned lonse, and seatered over the combry in twos and thres. In $186 \mathrm{c}_{\text {it }}$ fow wore captured hy an cuterprising ranchman and sold to showmen, and it is reported that a few are still to be found at large. Wild camels have been taken in Turkestan. See also Chmilin.z. fr, A. Lécas.
Camel: a contrivance by which ships are floated over sandbars and shoals, or sunken ships are raised. A long caison, or "camel." nearly filmel with wator, is fastemed to each sitle of the ship : when the water is pumpen ont the caissons rise and lift the ship with them. The principhe is more fully explained in the article lor k (q. $\boldsymbol{r}_{\text {. }}$ ) for it is essemtially the principle of all thoating loeks. (amele were formerly usel ut Nanturket and New Redford, Mass.

Camel'ida: a family of eren-tofl, ruminant manmals. contaning the exnels and damats. distinguished by having the thigh largely free from the loty, the ranines of the lower jaw pointed and distinct from the inesorss and two pointed, eanine-slaped incisors in the upper jaw. Tha, stomath is imperfectly divided into fone compartments, and
 filasimo, und lama.

Camel-inseed: an insect of the gemus Mantis (q.er).

Shatd (byous are male from sach shells as have layers of differmaty coloned materials, such as the conch-shellis of
the Bahamas. The art-a motern one-of cutting these shells has been earried to a litigh degree of perfection. These eameos began to be cut at home uboul 1805, and the best work is done there now; but many shells are cut at Patis, especially for exportation to England and America.

Camera Lucila [Lat., light chamber]: an apparatus for bringing into a single field of view two objects, only one of which is in the direct line of vision, so that they may be observed simultancously with one eye. It is used chietly as

Fig. 2.

## Camera lucida.

an attachment to the microscope to facilitate the drawing of microscopic objects. The original form, which was inrented by Wollaston (1812), is shown in Fig. 1. It consists of a triangnlar prism placed in front of the eyepieee of a horizontally monnted microscope. The observer, looking past the edge of the prism, sees the drawing surface by direct vision and the mieroseopic image by total rellection from the prism. The image thus appears superimposed upon the drawing surface. Wollaston's camera lucida is not conveniently used with it vertical microscope. Another wellknown form is that of Abbe (Fig. 2). In this instrument the microscope is vertical and in the direet line of vision, and the frawing surface is brought into the field of view ly means of a mirror and a pair of prisms above the eyepiece. See, further, Gage, Mistulogy and the Microscope p. 47.
E. L. Nichols.

Camera Oliseura [Lat., dark chamber]: a device by means of which a real inage of distant oljecets or of a landscape is thrown upon a drawing surface within a darkened chamber for purposes of delineation. The device usually

Camera obscura. consists of a lens (l) of long focus and a mirror $(m)$ mounted together in a hood and capable of revolution about a vertical axis. hays passing the lens are brought to focus mon the plane surface $s$, where will be seen an image of that portion of the landscape toward which the loond is directed. The insirument is given many forms, according to the especial purpose to be attuined. The figure shows a form of eamera adapted for field-work. The camera of the photographer, which may be ennsidered a development of the ordmary comera obscura, has almost completely supplanted the delineating camera. The name is likewise ipplied tor any dark ehamber used for the observation of "pinhole" innges. The camera obscura is of carly origin; it is usually ascribed to Roger Bacon (1214-92). Sce the article Photogranyy.

Cames's merit as a poet is as great in his lyric productions as in his epic prem. The Lusiouds (Us Lusiarlas). but it is by this latter work which, commemorating as it does the great achievements of the Portuguese nationalitr, constitutes the bond of the momal unitr of the Portugnese preple, that he has become the principal representative of Portuguese literature. The best edition of his works is by the Visconde de Juromenha. Gbras de Luis de Crames (Lishon, 1~60-69. 6 vols.). The best English translation is by Richard F. Burton, Crmmens: Ifis Life and his Lnsimds (London. 1s81, 2 vols.): and ('mmons: The Lyrichs: Enylished by R. F'. Burton (London, 1884, 2 vols.). The latest life is by Withem storek (1aderborn, ts:0).

Hexry li. Laxg.
Camomile or Chamomile: a name given to several herbs of the family Compusitu, lut espechally to Authemis nobilis ann Matricaria chamomilta. Both Enropean heris closely resemble each other. and are nearly identical in order and properties. thomgh the latter is mider, and in Germany is more generally esteemed as a medicine. The one first mentioned is common in gardens in the C . S. Cumomile is much used in domestic medicine: has tonic. stimulant, and diaphoretie powers, and was once used as a febrifuge. Its smell is agreable. and depends upon the presence of a volatile oil. The camonile flowers imported trom Great Britain are of the first, those from Germany of the second, species. They ure largely, but illegally. nsed in the Pritish islands in tlaving beer-a practice which is said to be injurious to health.

Camorra: the name of a seeret society of ontlaws and robbers called Camorristi whon infested the former kinerlom of Niphes. This society hat a remperous in every harge town. Under the Bourion lynasty its members openly presented themselves at markets and publice spectacles, where they extorted a portion of the money that passed from hand to hand. They were also addicted to violent crimes, and conlil be hired to commit inurder. The society was thoroughly wganized and subject to strict discipline. Cundidates for membership were not admitted until they had passed through a probation for a year, and given proofs of courage and obedience. They are said to have been tok rated ly King Ferdinand II., but Francis 1f. vainly endearored to suppress them. They aided the Garibaldians in expelling the Rourbons from Naples, but continued their depredations under the new government of Italy. Sce Lwilta, Camorra et Meffa (Neuchâtel, 1s\%\%).

Camp [Fr, comp, from the Ital. or Picard form of Jat. compus. tieht. tranning-ground: cf. C'ompus Martius. The inheritel Fr. form is chemp]: in a general sense the groum? (constructions incladed) apon which tents, huts, ete., are erected for the shelter of any collection of hman beings: in a military sense, that occupied by an army under tents or temporary shelter in the fieh. It is usually distinguished from brounc by the use of shelter (such as tents), as distinguished from passing the night in the open air (ii la belle efteite). Mone exclnsively yet, the ground and shelter of an army in tents: lut in the trmy lipgutations of the L. S. a camp is the place where trons are estallishen in tents. in huts, in in hivonac. The Roman camp (Lat, mastra, a wort which in the form of the termination cester or chester imicates the origin of numerous Englixh towns, ats arising from a Roman camp, and to which also are due the worrls chitenn and rasiflo), describud with great detail in most eyeloperliens. was in reality an morenchell rump. (S.ee Barvin, Dictionmaire de TArmie de Terre). Surh were constructed in the hourt of invalen countries to semure for the troms a place of retreat. to control the district, to provide secure dépots for provisions of all kinds, and to proteet the communications with the frontier. I koman army might ocerup its camp several winters. lut the meantime it sallied forth to resume its operations. Most commonly. when the lerions haul thus wacated them to unlertake long marches, veterums remained behind is guarl the rmparts, and thms beeme a kind of permanent garison, which, by intermarriage, gave migin to a town or colony: e, ir the English " ("hesters" and the German Cologne or Kïln (Coloni().

The lomans necessarily hal, hesides thexe temporary camps, sometimes of huts, but more genemally tents of skins of animals. The details of thece Roman camps are of little interest (unless to antiquarians); neither indeed, execpt to
soldiers. are those of the motern military camp, Its arrangements (as practiced in the U. S.) are set forth in the Army Regulations. Strictly speaking. the arrangements of a camp for a regiment of infantry or cavalry are governed purely by considerations of discipline and administration. The encimpment of an army must indeed be sedulonsly governed by tactical considerations, such as the defense of the position and the formation of line of battle, the character of the issues, the approaches, ctc. But these arrangements belong to "Tactics." An Istrexched Casp (q. $\imath^{\circ}$ ) is a fortified position of greater or less extent. usually of field-works to be occupied during a campaign or the duration of a war.
Campan, kiăui puanai, Jeavie Loutse Gexest: b. in l’aris, Oct. 6. 1\%5: reader to the daughters of Louis AV.. and a companion and friend of Marie Intumette. Atter the Revolution she was a teacher of high reputation, and by Napoleons appointment head of the institution at Ecoluen for the daughters of the olticers of the Legion of llonor. 1). in Mantes. May 16. 182. She wrote, among other works, Memoirs of the Private Life of 1larie Antonette (1023) and Corresponilence with Guen llortense (1824).
Companel'la Tomaso: Italian philosopher and Dominican monk: b. in stilo. Calahria. Sept. 5, 1568. He published, in Naples, in 1591. Philasophy Ifemonstrated by the Senses, which opposed the scholastic philosophy and gave offense to the partisans of Aristotle. (ha a charge of heresy and conspiracy against the Spanish Government he was in 1509 committed to prison in Naples, where he was contined about twenty-seven rears, during which be wrote several works. Pope V'rhan VIII, procured his release in 1636. Campanella, after passing several years in Rome. retired to France in 16:4, in order to avoid the renewed persecution of the Spaiards: He was kindly treated by Cardinal Richelien. Among his important works are Civifus Solis, ete. (The City of the Sun, or the ldea of a Philosophic Repulbie. 1633); The Five Parts of Rational I'hilosophy (1638); and a Discourse on the Spanish Momarchy (in Latin, 1640). D. in Paris, May 21,1639 . His complete works were published in Turin 1854, 2 vols. His sonnets were translated by J. $A$. simonds (in wol. with Bnenarrotti, London, 1878). See his Life br M. Baklacehini (Naples, 1840) and L. Auabile (Nitples. $188 \%, 3$ rols.).

Campanha, kiam-paan'yăı: a town of Brazil: in the state of Ninats Geraes, about 156 miles N. W. of Rio de Janeiro (see inap of South America, ref. i-G). It has several churches, a hospital. and a theater. Gold is found in the vieinity. Pop. 7.000 .
Ciumpa'nia: a province of ancient Italy ; bounded N. E. by Simnium. E. and S. by Lucmnia. S. W: by the Mediterranean, and X. W. by hatium. The Apennines extended along the northeast border. Between these mountains and the sea was an extensive and very fertile plain. which was the Regio fetix of the Romans. It was traversed by the Appian Way (I'ia Appia), the greatest thoroughfare of ancient Italy. In all its conquests and mutations the basis of population remained Oscan. and hence came the present knowledge of that language. From its town Atella arose a popular form of ancient Irama. (See Atellane Fabules.) Its principal cities were ('ipun, Pompeii, Neapolis (Naples). Comar, Aillermum, ant Iereulaneum. Among its physical features was Mt. Vesurius. It embraces the moderm provinces of Benevento. Naples. Principato Citeriore, Principato L'lterime and Terre di Lavoro, with an area of 6.948 sq miles and a population (18!0) of :3,045, 4 at.

Campanile, kăm-pa-nee le [Ital., hell-tower, steeple, from II d. Lat. campa'na, bell]: a bedl-tower: especially a detached belfry adjacent to a chureh. Italy possesses many such, some of them dating from the eighth century. They are often of hrick, square in ground plan and eapped be a low spire. Among the hinest are the campanile of St. Dark in Venice the "leaning tower" of Pisa, the exquisite marble tower at Florence, lesigned, in bart at least, by Gioto, and the Giralda at seville, Suain.
A. D. F. Itamlis.

Campaninio, kăm-pa-neénĕ. Italo: singer ; b, in Parma, Italy, in 1816. Ie was the son of a blackinith. At fifteen he was a soldier in Garihallit's army, serving in two campaigns, in which he was hadly wounded. After the war he returned to the forge, and worked until he was eighteen years uht. I singing-teacher who atmired his voice gave him lessons. Campanini stmlied a year at the Parma Conservatory, and soon after appeared as the Notary in La

Sonnumbula. He failet, and was langhed ott the stage. Ile jobned a traveling company, amb saved a little money, which he devoter to takiner lessons from hamperti. the sime ing-teacher of Milan. He was engaged at Lascoala, Milan, atul sung in Fetest with success. IIE appeared in Iotondon

Habbart JI. Amph.
Camphene or ('amplime: parifich oil of turpentine, who
 has beet burned in lamps for the purpase of illumination,
 been surerseded by coal ail or reditied petrolnm.

Camblilene: a name that has been applied to tro ditferent things. One is a compound formed when hydrochborie acid gas is passed into of of turpentine. This is a solin that resembles camphor in its onlor. appearance, and volatility, aud is hence called "artificial camphor." The other eompomin, called camphiluce is one of the "terpenes."
('am'phogen [from camphor + -gen. prolucing (Gir, rev$\nu d \omega$ ) because obtained from camphor]: a synonym of CasDHENE (g. r.).
(amphor [lat. form which has displated the older cromphive viâ Fr. from Arab, hüfur ] : a stearontron crode volatile oil poseresing the nature of : ketome and obtaineal from ('innamomum rimphora, a hamhome laurel from 25 to 30 fert in height, withevergren, shiny leaves. Firery part of the tree possessesia camphoracoms shlor and taste, hut gum camphor is ohtained from the root, trumk, anel limbs by hacking the woul into chipsand then boiling these chips with water in a covered ve.od lined with straw, and on this straw the gum emmphor conlenses. In commerce . 1 iphan or tub-camphor comes in tubs contuining about $1=3.5$ ib, It oecurs in white grambar masses, and these hare a parplich or redtish tint. The comphor which comes from Fommon is usually parked in chests lited with lead. Refined gum (amphor oiturs in large, somewhat convex cates with a round hole in the center made by the aperture of the resed! in which it is sublimed. The drug is suluble in atcolol. It is somewhit translucent yot upape, and rontains mumron- time fiscures. It is quite tough, and can mot he pulverized exeep it be moistened with nlendal, chluroform, "ther, or sume one of the wolate oils. Fixposed to the air it ripsilly evaporates. and if lightol hums with a very dense smake. If a piece of eamphor is thrown upon the sirfacp of water it tevelops a prouliar rutatury motim. whinh is probably the to its raliul 'wapration and show solubility in water: Its chemical formula is ( ${ }^{\prime}, 01510$ ).

The worl mamphor has heen applied to other crystallizing stearoptens derived from wolation oils. Culer the mane of Olem camphore there was ollicimal in the U. S. I'harmacoPnia of 1800 a canphur oil of Formosa ohatinell in the "onrse of the preparatiom of ermbe grom cmophor. 'Ihis oil is a dark yellow or light hrown in color, tasting and smollines sompthing like camphor itself. hnother form of canuphor is Linrneo or Sumatra camphor, sometime callul Burns canphor, which is fomult in cracks of the wom of Pryohealonops comphora. It diftiors in oxlor slightly from ordinary camphor. In order 10 ubtain it the tree is cut down, mul owing to the expense thereby incurred through the deatrettinn of the eamphor-trees this form of ramphor is very costly, and is ortharily not found in commeree. "'mule' the name of
 a fall wed of Southenstom dian, which mells there at a higher price than ordinary comphor durs.

C'mphor is somet imes taken intermally as a mervons sedative or dilfusible stimalant in the dowe of firm 1 to : grains. and erenerally in pill form. It is peymar with some women as a lotion for the soothing of mervons sick hemberfe eit her in the form of the spirit of famphor, made ly dissolving gum whmpher in aldohol, or the water of esmphor, which is male by taking adranage of the slight solubility of camphor in ordhary water. 'Ther prepations are sometimes taken internally for the reliof of wind colic ann wher painfal attections of the bowels atul stomich. It is also lused sometimes
 nary organs and allaying sexual excitement. 11. \&. II.

owing to a marriage of the Lord of Campreer to a daughter of James I., was transferred from liruges to Campreer in 1444, after which this town had peculiar trading relations with Nocothand for several centuries.

Camwond : See Barwood.
Cu'na: a village of Galilee: the scene of Christ's first miracle (.John ii.). Its site is suppomed to be indicated by some ruins 6 miles N . of Nazareth (see map of l'alestine, ref. 6 D ). The natives call this place Cuna-el-felit.

C'i'naln [lowland, netherlands, with immediate reference to the low coastland. Where the Canaanites dwelt]: the name of the yonugest son of Ham (Gen. ix, 18): of the tribe dascending frum him (Hos. xii. $\boldsymbol{J}$ ) : and, most frequently, of the land inhabited by that tribe-the "land of Canaan" (Gen. ix. 31). In the last sense it denotes the whole region between the Jordan and the Mediterranean, from the Negebh in the S. to Ploenicia in the N. The rulers of the Canaanites in 1400 B . c. used Babylonian as the official language of diplomacr. Which would seem to prove that the babylonians hat previonsly conquered the country. Like the I'honicians, they were a commercial people and lived in peaceful relations with the people who occupied the land before their arrival. They had, moreover, cities with walls and gates (Josh. x. 20), fortresses on the heights, and formidable chariots of iron (Josh. xi. 4). One of their cities was called Kirjathsepher-that is, "the city of books" (Iudg. i. 11)which shows that they were not illiterate. They were divided into several tribes, each governed by a king and a council of elders. Recent discoveries have demonstrated that the country was in 1400 B. c. a dependener of Egypt. Many of the cities had Egytian governors called in the Authorized Version "kings," and all paid tribute. On the N. the Canaanites were threatened by the Hittites, on the S . and E. by predatory tribes. The people worshijed Baal and Astarte, practiced witcheraft and magic, and were idolatrous, superstitions, and licentions. See Records of the Pusl, vol. v. (189?). See Palestine.
Canala. Dominion of: all the British possessions in North America, except Newfonndland and its dejendency in Labrador, lying N. and N. F. of the U.S., embracing the provinces of Ontario. Quebec, Nora Sentia, New Brunswick, Nanitoba, British Colnmbia, Prince Edward Island, and the Northwest Territuries: bounded on the S. by the Arctic Ocean, E. by Baffin's Bay, Davis's Strait, Labrador, aml the Atlantic Ocean, S. hy the Great Lakes and the parallel of $45^{\circ}$ N. lat. east of the lakes and that of $40^{\circ} \mathrm{N}$. lat. West of them N. Wr. by Alaska, and WT. by the Pacific Ocean: area, 3,456.383 sq . miles. of which $140, \dot{\text { th }} 36$ were water ; population (1891) $4,833.239$. The principal cities, with population in 1891, are Montreal, 216.650; Toronto, 181,220; Quebee, 63,090; Hamilton. 4s.980: Ottawa (the capital), 44.154; St. John, 39.179; Halifux, 38,506; London, 31,977; Winnipeg, 25,642; Kingston, 19,264 : Victoria, 16.841: and Vancouver, 13,68 J.

Physical Fealures.-The coast-line is broken on the E. by the Gulf of St. Lamrence, the Bay of Fundy, and the Bay of Chaleurs: on the N. hy Iludson Bay, Baffin's Bay, the Gulf of Boothia, and Melville and Lancaster Sounds; and on the W. by the Straits of Juan de Fnca, the Gulti of Georgia, ant Queen Charlotte Sound. The principal mountains are the Rocky Mountains, extenting from the Arctic Ocean to the U. S., on the W.: the Cascade Momntains, between the Rocky Monntains and the Pacific Ocean; the Laurentian range, extending from Labrador along the N. of the St. Lawrence river: the Notre Dame Nountains in Quchec: and the Nortil and South Mountains and the Cobequid Monntains, both in Nova Seotia. Vancouver and Quen Charlotte, on the W : : Prince Erlwarl, Cale Preton, and Anticosti, on the J3.: and the chainalong the entire north const, known as the Aretic Archipelaso, are the principal islants. All of the region from the Ithant ie to the northwestern boundary of ontario was oncer a vast forest, and still contains the principal timber growths. NVere the forest has been eleared the soil is wrll adapted to agriculture. The great wheat-growing region is between the northern boundary of ontario and the Rocky Dountains, and contains the hed river valley and the lake W'inniperg platean. The north part, from the Rocky Mountains to Mudson Bay, is heavily wooded, contains large auriferous deposits, and is still the great fur-preserve of the world.

Laties rond Rivers.-The most important system is that of the St. Lawrevce ( $q, v^{2}$ ), through which lakes superior, Huron, Erio. and Ontario. lying partly within the Dominion, find their ontlet to the sea. Its principal tribntaries in its

lower courseare the st. Amarice and the remarkathe saguenay. The st. John lorms the N. Woundary of Maine ats fir as Grand Fralls, and then becomes the great river of New Brunswick. Ju the Jontheast Territory the Koksank or sonth river fows nothward into Lngava bay, while the Little ant the Great Whale, the Big, the Sast Itain, and the liupert rivers entre Hulson baty from the enst. Albany river forms the sreater part of the northern bmondary of Ontario provine receive through a sonthern tributary the waters of lake Nipison, and empties into dames bay. The vast area betwen hhulson bay and the liocky Memotains is a region abomiling in lakes amblaving intrieate river systems. 'They may be divided into thre parts, two of wheh are tributary to lladna bay and the other disehames directly into the Aretie Oeram. The mest sontherm if these is the Nelson river. Its upper castern eomst ensists of Ramy Lake and river and Lake of the Wors, which discharge through the Wimniperg river, after it rectives Fhglish river from the li, into Lake Wimipeg. The Red River of the Nuth flows into the sombern cul of Lake IVimipers. Its lower course lies in Mantoha, where it recerves the Assiniboin, the great river of this provinee. The saskatewewn supplies the principal drainage system of the tervitory of the same name and of Assiniboia, and finds its way through Cerlar Lake into lake Wimipeg, which also receives the waters of the very considerable Lakes of Manitota and Himiperosis on its $W$. This entire system discharens throngh the Nelson river into IIudsum bay. The second of the systems is that of the fhurchill river, which foms the southern hasin of the Northwest 'lerritory, and is intermediate between the Saskatchewan and Ahabam waters. lts greatent lake is the leinder on the N... and it rmpties into Ithdson Bay ahout 150 miles N. of the Nelson. 'The Mackenzie system is the most considerable, next to the Mississippi, of Nomth Amorien. It rises in Alborta Tortitory. On the W. the leace river, which breaks throngh the locky Momatains, reaches it on the eastern boundiry-line of Ahamsea Territery, just below the inlet of thabasea Lake. The united streans are now called Slave river until (ireat slave lake, in a complieated and extensive lacust rine basin, is renched. From the ontlet of this lake the waters flow S. W. under the name of Mackenzie river, makins a stretuln of 900 miles. The largest Inke entirely in the Dho minion, Great Bear Lake is tributary to the lower Mackenzie. Un the liailie const the kintenay and tho north branches of the Cohumbia river, after formine great loops in the Roeky Mountains, unite near the sonthensism boundary of British Cohmbia. of this powince the cho fiver is the Fraser, which rises in N. lat. abont in, drains the basin between the Casoude and Rocky Momatains, flows sontherly until near the sonthern bomblary of British Columbia, whin it turns to the W. and empties into the Straits of Ceorgiant Vancomver. Guing N. the next emsiderathe rivers of this province are the skeena and stickern. The unyer waters of the great Sukon river are in the Dominon. It is known as the Fukon below Furt selkitk: abowe the primeipal allluent is the Pelly river. Further N. rises the Powempine river, which forms another tributary to this Ahakan syatem.

Climate.- The climate of the Athatic provineres respmbles that of Norway: that of Ontario is emsiderably modilied by the induence of the Great Lakes; and that of laritish Columina, like the rest of the Pacilic cosst, is more womble than that of the Athatic in correspmong latitndes. In general, the elimate is moch wamer in summer and colder in winter than in Gerat britain. Tha mean summer tomferature in ninety-nine phaces shows a range of trom 14.7 to 69 , and the mean winter temprature a range of from -1 to 404 . The fall of rain and show gives a total precipitation ranging from $10 \cdot 41$ to 31.44 inches.

Government.-The movineses were mited undar the British North Amoricadet, which went into operation on July 1, 1 shi. it provided in sufvanue that the comstitution of the Dominion shombl le similar in prineiphe to that of Great Britain, that the execotive anthrity shomad be rested in the British crown and caried on in ifs name by a governor-general and privy eoncil, that the legishative fower shonld be rested in a partianment consisting of two houses to be called the senate and the llone of Commons. The Governor-Genemal, who is appointed by the crown, has a sulary of $f^{\prime} 10,000$ per anmm. The stotors. of whom there are eighty, are nominated for life by the GovernorGeneral: a senator must be thirty yent of ane hud have real or personal property of the value of s, 8,000 . The minbers of the House of Commons (one fur every 20,000 per-
sons) are chosen by the people for a torm of live yars there is a slimht property gualification for the right of sutfrage. varying in the diferent provinces and teritorics, exeept that in the Northwest 'Werritory there is no property quatilitation. The paviners hatve also each a seprate legislathre and a lientemant-gomer.

Finances.-The total duht of the bominion, incurred ehiefly on account of pmblic works, on July 1, 1sem, was

Bunking. -The Bank Act of 1890 provides that no bank shat be incorporated with less than siono.000 in caphat stock; that all motes is-sum for circulation shall he redernathe at par in any part of the Pominion: that mo bank shall issur rirenlation notes in exess of its mamparel capital; mon that the payment of emeulation motes shall be the first (harge on the assets of an insolvent hank, any amonit the the I hminion (fovermment the secom charge, and any amonat due a provineial evermment the third charge. The bominion Goveroment holds a fund, formed by contribntions from ewery incorporaterl bank, on of which the holdurs of notas of finiled or suspented banksare rembursed. Thater
 in connection with the post-oflice depmetment.

Industries.-Canala hats large agricultural interests. 1met there are no reports for the whole of the bominion. Lumbering is one of the most important industries. The tishcries, comprising and, hadtock, herring, mackerel, sahmon. lobstere etco. are extensive and have an amal valuo of nearly sela,000.tou. The principal mineral tanorces are conl, gold, iron, petrolem. asbestos, eoppr. silver, and nickel. Nova Srotia, British Colombia. Quebece, Ontario and part of the Northwest Territories are the chief mining distriets. The mineral production in 1802 hal a value of s $19,500,000$. The census of 1891 showed that 7,568 mamufacturing establishments reporterl. These had a combined (rapital of sam: $536,81 \%$, employed 365,496 persons, and had produts valued at s. 4 a. 445, , $0 \%$.

Commerce. -The trade uf the Dominion is chiclly with the U. S. and Great britain. The prineipal imperts from timat hritan are iton and cottonamitwoten woods: the chief expurts to (Great Britain are breatstuffs, timber, whese, eattle, and apples, and to the U. S. breadstuffs, Iumber, eatele fish, iron, and coal. The tofal trate in 18:93 amounted in value to 82ti,638,620, of whic \$108.184,978 was with the CV.S. and \$107,391,070 with Great Britain. The imports were os 1210 .04,268: exports 8118.564 .332 . The total remistered shipping on fan. 1, 18: 8 , was 7,007 vessels,

Merme of Commumicution.-The totil mileage of camal, river, and lake navigation exceds d, $\boldsymbol{t} 00$. The 'anals are designed principally to facilitate navigation between the Great Lakes and the st. Lawrene river. In wat they comprised the Weltan, st. Lawrence system, "hambly, othawa, Rideat, st. Peter's, Trent Vialler, and Murray.and had cost for construction and chlargement alone sisw sision dil the systems befone to the bominion tovernment. The railway system is yry extensive. 1n 189 there wer $14,8 \%$ miles in "peration, and concessions hat been granted for d,000 miles more. 'lhe bominion (iovermment owned the Intereotonial, the Windsor lirmela, and the Prine Edward Eshan? mitways. The Camalian lowific Jialway extents from lontral to Vanomber, 2.906 miles.
(hurehes.-There is no state Chureh in the Dominion, eath religions dommination being gowerned by its own haws. 'llar census of 1891 gave the thlowing sittistics of

 Charch was the strongest in Quebee, and the Anglian, Presbyterian, Mathorlist, and Baptist Churches were the strongest in omtario.
 high. nomal, and model schonls, with seb, efth pupils in the former and $114.2 n$ in the hater. 'row annual expemeliture exemols si0,000,000. Thare rere 14 universities, 10 colleges, 15 classical colleges, 6 collewes for woment, 5 agrienltural colleges, the Royal Military Colleqe at Kingston, and several schools for artillery and infontry instrution. The publie-school system in Gutario is mater the controt of the Sinister of Education; in other provinces it is under super.
intendents and boards of elucation, who report to the provineial secretaries. In Manitoha all public schools were made non-sectarian in 1890; in Quebee education is hased on religions teaching; and in Nova sootia, New Brmswick, [3ritish Columbia, and Prince Etward Island the sehools are strictly undenominational.
Mistory.-lacques Cartier (q. $\sigma_{0}$ ) entered the St. Lawrence river in 1534 and again in 1035 , and the first permanent settiement was made by a French colony under de Honts at Port Royal (Annapolis) in 1604. The French fonnded Quebee in 160 . after which numerous Frenel colonists seftled in Lower Comada, netr the st. Lawrence river. The British general Wolfe captured Quebec in 1750, and the conquest of Canada was completed in 1760. [pper Canada was settled mostly by English and Scotch emigrants. In 1 T91 Camada was divided into two provinces, called Lpper and Lower Cumata (afterward called Camala ITest and Canada East, and later Ontario and (Guebee). Both were disturbel hy an insurrection in 18:3, and reunited in 1840. By in act of the British Parliament, passed Mar. 29, 1sif, and taking effect July 1 of that rear, the C'anadian provinces, ontario and Quehec. and New Brunswick and Nova Scotia were federally mited into one Dominion of C'mada. The Legislature of Newfondlant declared in favor of joining the Dominion, but the people, in Nov. 186!, by at large majority, voted against it. From the Iludson Cay Company the Government of the Dominion purchased in the same year its vast territory. An insurrection of colonists and natives, who protested against having their land treated as a dependent territory, induced the Government to organize in $18 \% 0$ that part of the newly purchasell territory which is situaterl bet ween lon. $96^{\circ}$ and !19 $0^{\circ} \mathrm{W}^{\prime}$, and the U. S. boindars-line and lat. $50^{\circ} 3 \mathrm{~S}^{\prime} \mathrm{N}$. , as an independent province of the Dominion, under the name of Manitoha. The immense morganized territory beyond the timits of Manitoba is called the Northwestern 'Territory. On Mar. 31, i871, British Colnmbia was received into the Dominion. Invasions of Canadia by armed Fenians from the U.S. were attempted in 1566 and 1870, but were repelled withont dithenlty. The long-penting controversies with the U.S. were mostly settled by the Washington treaty of $18 \% 1$. In 1873 Prince Edyyard Island joined the Dominion. The Northwestern Teritories were partly divided in 188 into four provinces-Assiniboia, the 000 sq . miles: Saskatchewan, $114,000 \mathrm{sq}$. miles: Alberta, 100.000 sq . miles: and Athabsica, $122,000 \mathrm{sf}$. miles. The half-breed and Indian "rebellion in the Northwest Territories in the spring of 1885 , led by houis Riel, was put down in a few months. Riel was hanged the same year.

Politicul Misfory of Comada : Aldam, Conudian Jorlhuest und the Rebellions.

## Reviset by Mare W. Marrington.

('anada Balsan (in Lat. Balsamum cancelense"): a turpentine ur olomesin whatame from the thies batsamern, a somece of fir which grows in Camala and the CV. s., and is sometimes called halsam fir. It is a pabr-yellow, transparent lifuict, having a prealiar and arrecahle odore and an writh taste. When it exudes from the bark it has the comsistonce of homey, that by age and expmore to air it heomes solid. It was formerly used in medicine as a stimulam to
 now sedtom nseet. It is valuable for a viriety of pmopenses in the ants. in photorgraplyy in montine wijects for the microserge, and as angredint in varnishes.

Camala (ionose, W Wild Ganse (Brentu comealensis): a
 ish athow, lighter hemath, with the heal, neck, bifl, and feret bhack, athite pateh on cach cheek: inhabits North Imerica, breding at the N. and wintering in warmer regions. These hirels usmally tly in a> -shaper] figure (though somet times in a st raight linet), led by an experianeed gander, who frepuently gives uttoranes to his familar hemk. "Their spring migrabons usually lake place from Mar. ${ }^{0} 0$ to the last of April bit arr wholly dependent upm the state of the sensen. 'They

Ireed at the N., and linger there till the hard frosts warn then that the lakes ind streams will soon be frozen over."

While performing their long jonrneys they usually fly at a great height. probally a quarter of a mile or more.

Camalian Literature: British ('anada has literary men, merbaps in fulf proportion to her cirvimstances and opportunities: but she com not be said to have a national literature, as she has no distinet mationality. Her leading writers commonly puhlish in Lonton, Erlinhurgh, or New York. Of her native authors some have gone fo reside in other parts of the british empire or in the C. S. Some of her authors are not native. The late sir Daniel Wilson was a conspienons meminer of a gronp' resiflegt in Camada. but fulty as much British as C'madian. French Canada, on the other hand, has a mationality distinet both from that of the British, with whom her jeople, thongh politically united, do not amalgamate. and from that of the French, from whom she has been not only severed ly conquest, hut est ranged lyy the Frencll Revolution, the effeets of which she did not share Iler literature therefore may he said to be national, and torms a suly ject for sepmate nutice.
Literature in Canada had its beginnings with the fomding of the Catholic missions in the (e)] lony in the days of Champhain. From that priod hoth the civil and the ecelesiastical history of the conntry dates. The chicf literary product of tha era embraces Champlain's volnminous narratives of his voyages: Lescartmots Ihistory of Nem France to which is appented Lees Muses de lit Tomelle Fronce: Sagard's Le firend loyage du I'uys des llurons: and the famed Relatioms des Jismites. a work replete with thritling ineidents, fohd with murh simplicity of style, of missionary adventure. A collected and scholarly cedition of Champlain's works, in six guarto volmmes, appeared at Gucbee in 1870 . under the edtomship of Abse laverdierc. The crude records of the voyages of the carly diseoverers. ('artirr, Roberval, and others, can hardly lie said to belongr to native literature, though C'mandian reprints have been issud by the Quebee Diterary and Historical society.
'The liater writers of ohl Francer identified with Canada pror to the "onguest are also cerlesiastics, at lached either to the desuit or to the Romollet order. lee Cler, is known by his work entithol LiEtublissement de la Foi, which was published in France in 1691, and was translated with a m-moir. ly the late Dr. J. G. Gilmary Shea, of New York. The work wives an account of the authors missionary labors in the Gapre region, and is chictly notable for its satirieal remarks on the fesuits and their politic methods. A work hell in some estem hy wollectors is Les Miphrs des Somages Ameriquainex, by the lisuit Father lafitan, which consists of an intimate stuly of the Iropuois confeleracy, among whom the untlor hitored. The early literature of longlish-xpaking ('mand is chiefly concerned with the varind aspects and resumes of the country. The writers were, in the main. chane visiturs from the motherland, or the more intallethal ty of of immigrant and sother. Shmetimes we timd among them a
 master. on a memher of the ofler-hohling chase whe hat eome to the combtry in the tmin of a colonial fovernor. At a still earlier asa wind the writer either a lladson's bay Gactor engaged in the peltry trade, or somer restless pirit whom has of fortune or other aredent had turned into the untroden widnomes. 'The pmosut of the fur-trade. as we haw hinted, hed to explotation aml disenvery partieulatly in the erreat humting-gremuls of the C'analian Northwest. Two of the mere motabe atremburers inter the vast
 and of the lat century. the works of leth being tronght
 Bay Company oflowr, wholiseovered the coppermise river, and Nexandir Mackomar, a partner in the Xorthwest ly
 bears his names. Mackenzie, who was knighted fur his sorvices, was the first white man to erose time lenky Momains
 mi the hisper si\%. Laturrater theengh the (tontiment to the Frozen rend lociffe oterans, gives a valuable atecomat of the fur-trade, and is rich in the results uf grearaphical discoverg. Iburmes woilh maratos his admentures om a Jour-
ney from Ifudson's Bay to the Mouth of the Coppermine River, with some account of the Escuimanx and other tribal inhalnitants of the resion. The Red river conntry, in thet leart of the continent, is full of the memories of lard Salkirk's ill-tated colony at Fort Garry (now Winnipeer), an accomt of which is to be found in the nobleman's published Farpative and in Prot. liryce's recent work on Manitoha. The transfer in 186! of the IJadson's Bay territories to the Dominiom, and the subsequent carving ont of Manitaba and the provincial alistricts of the Forthwest, gave hirth to a number of books on the eonatry, of more or less inturest. The ehicf of these. omitting English works, such as Milton and ('headle's Horthmest Passuge by Land and Capt, Butler's Great Lone Land, are Prut. Hind's Red Rimer E.dpluring E.rpedition, the same antlar's I Ixsinibuia amd the Seskatehenven, and the Rer. Prineipal Grant's Orean to Hrean. The '"enadian Sorthuest: Its Mistory rend its Troubles, by f . Mereer Alam, may also be consulted for an account of the region, from the granting of the charter to the Ilumson B Bay Company, throngh the tromblons era of Lord Selkirks conflict with the rival fur-trading cor[aration on the kerl river, to the aerpisition of the Territory hy Canada, with the narrative of Riels two rebellions and the military oprations in suppressing them.

A new literature arose with the settlement of the british province of Cpper Cimatia, which occorved shortly after the close of the war of indepembence and was limgely recrnited from the foung remblic by incoming bands of United Empire loyalists-that is, of the aublerents of the British erown who preferred to live under the old thag even in the wilderness. At first this literature, as we have said, consisted chirfly of works of travel by old-country writers, then, as the provinces opened up, of works af a topographital and descriptive character: after which came the era of politioal astation and of clamer for the reform of atmses connected with the antocratie form of colonial government which prevailed, together with a fleatiful crop uf political diatribes and other literary heralds of revolt. Prior to the political ontbreak oucurred the war of 18te, which ealled forth a number of works, in prose and verse, full of patriotic andor. The more important of these are the worlis of David Thompson, (iblbert Auchinleck, and Col. Cothin, Students of the perion shomld also be directed to Tupher"s Life and Correspondence of Sir Isecec: Brock. For an ateconnt of the routh of the provinee, inclading the raw materials of history, two works may he referred 1o: The Loygelists of Almerica cend their Zimes, by the Fev. Ir. Egerton Byerson, and The Settlement of l'pper Canula. with Special Reference to the Bay of Quintr, by Dr. Willian Canniff, thongh the literary form of neither is good. 'Talbot's Five Ierrs' Resilence in the C'anculus, Dunlop"s Stutistical Shetches of Ipper (ranomb, and Bonchettes British Dominions in Sorth A mericr, beloner also to the descriptive works of the period. The Crenalas, by John Galt, the Seottish novelist, and sketches in C'muda. by dameson, the English art-writer, and Col. Sirickland's Tuenty-seven Terts in ("anoula, are to be added to the list of works whicll record the sucial ammals of the time. Roneghing it in the Bush, ly Mrs. Mnodie, sister of Agnes strickland, the historian, is a marrative of a settlerstrials.

The literary outcome of the political agitation on the reform sine are (fourlay's stutisticnl Iccoint of IPper Canadre amd the voluminons writings of William Jyon Mackenzia. On the Tory side are sir Erancis Band lleads Varratior of miy sldministration in Cenader and the heport of Attorney-(ineral fobinson, the head of the framily Compact. An nble state doeument, from an independent standpunt, and the chicf fruit of this distracting politieal period, is Lorl Durbam"s fimmons heport to the imperial Government on the alfairs of the colony: Jhis state paper, compiled, it is satid, hy ('harles Buller, the Govermor's able secretary, gives the resinlt of lome burham's dingmsis of the politioal situation, and reoommends enlarged metasures of self-covermment to the enlony.

The later works on the ram of revolt and the politicas history of the times are mumbroms and for the most part eontroversial. The lifp und Times of WFilliem Layom Alarhonzie, hy lis som-in-law, '’harles Limdsiy, mud Bent's Ilisfory of the Rebullion thal with the outhraik. The period is also historically treatenl of in Jar.llallons /listory of f'emma, the mast motahbremository of facts, carefully set forth from a bibural stamponit. coneranger native history 'Iherlist mating perion betweon the revolt and the confederat ion is deall witla in Inent's Laxt fonty Vears of ['pler

Camalian history: in Collins's Life of Sir John A. Macdomald. edited, with udditions, by 'ir. Mercer Adam; in Sir Francis Hinck's heminisrences: aml in Mackenzie's Life of the Ifomoreble lieorge Broun. The ammals of the Firench province sharing the geriod of pulitical agitation are to be found related in Christie's Mistory of Lower. C'amedo, the chicf parliamentary and politieal tuxt-book which deals with the haldecentury between the passing of the Constitutional det and the maion of 1841. Dr. William Kingsfords IVistory of C'mumb is an industrionsly rabated repertory of facts, from the discovery of Canada to the conquest. The old movince of deadia has several annalists, the chief of whom are Murdock and llowe, in whose histories the political and sucial life of the maritime province may be traced. Annand's Life and Times of the Ilom. Josepili Howe and the humorous works of Judge Halihurton ("Sam Slick, the ('lockmaker ") shomal be consulted by students of the loeal history of Nova scot in. The constitutional history of Cranada may he studied in the works of Todd, Bourinot, Watson, OSullivan, and Ihoutre. The prelections of the first two of thase writers have found readers beyond the colonr. C'anada "mid the Canadiun Question, by Goldwin Smith, embraces a hrief history of the two odker provinces of Cinada, with chaters on the constitution and the economical questions of the time. Olver Howland's The Nru Empire is an inportant work on the imperial and colonial system.

Confederation, which gave birth to the Canadian Dominion, lmonght to the front a momber of writers, inchating not a fow poets. space forbits onr doing more than emmmerating the chief works of the period. Lattray's The Scot in British Sorth Americu and Daviu"s The IVishman in Canada are more biographical than historical, though they set out to review imporiant elements in the formation of national life and charater. In the same category may be plated Dr. Bryer's Short Mistory of the Cmatian Jeople. A popmlar text-hook clealing with the annals of the Doninion is Dr. Wjthrow's Mistory, as is also his ilmstrated handbook nntitled Our Comutry. Licturesque Canadu, edited hy l'rincipal Grant, is rich in the material descriptive of the siscial. industrial. and recreative lile of the people. Canada from Sied to Sea. Illustrated Toronto, and Illustruted Queber, hy G. Mercer Adam, deal with pincturesque features of the country. Dr. Scathling's valuable work Toronto of Old is of more antiguarim interest.

Fiction is not strongly represented in Conarla, thongh the materials are plentifu?. 'The three best known works of fiction are The Golden Vorg ( Brestomnais, by John T'alon Lesperance : and An Alyonguin Kaiden. by G. Nercer Arlam and A. E. Wetherala. 'The first deals with tragic incidents in the social life of Quebee during the French regime: the second treats of the Blontgumery invasion of Cannda in 1755 ; and the third is a romance of Upler Canada before the revolt, with types of character trawn from the french, English, and native races. In the department of belles-lettres Canala has proIneed several works denling with eriticism and the essay proper, a few of which may be mentioned. Among the more important of these are s. F. Jhawson ss Stuly of Temmysunis Princess, Ir. R. M1. Bneke's stury of Hrilt IVhitmon. Prof. J. C. Murray"s The Bullads mill Songs of Scotlend, in Tirep of their Siffuence on the Charurter of the I'ente, I'rof. Wrillian C'lark's Seromerola, lrof. Watson's Truatmp on Kunt, Sir Daniel Wilson's C'aliban, Bourinot's Intrllectual Derelopment of the ('ammatiun People, George Stewarts monorraph an Frontenac, Morrison's The Art Goullery of the linglish Lemguage, and Juseph Pope's A Crymes Cartier. Bography is represented in IVent's Canadian Partrait Gullery. in Fennings Taybors Portmit of Lritish-smuricams, in Hodgin's Life and Times of the hez: Tr. Ryersem. the edneationist, in l'maf. Harrington's Life of Sir IFilliam Lagran. in Collins's. . Idminstrotion of the J/arymis of Lome and in Leqges and in Itr. Stewart 's histories of the alministration of $\mathbf{L}$ orel Intrerin. Recent arditions to the liturature of liograply inchade I). F. Head"s Liffe of Major-(fonerut Simerap, the stame writer"s lives of the Judyps of lyper Comaln, and a memoir hy William Buckingham and the Ilon. (i. W. Ross. of the late Hon. Alewander Mackenzie, Jremier of ranada. (i. Mercer Allam's Life umb Times of the Right Dlon. John A. Macdomald has bren abredy refermed to. ('anal-locks: A canal-look is at chamber with side waths and with gates at cachond, and is intembed to receive and
 Camal-lecks were nead in Ilollamlam in lably turing the arventernthentury, and the invention is clamed in both comutries.

The proede of locking a boat from a lower to a higher level may be bridly dexerihed ans follows: The water in the Joek being at the same height ats the water in the lower level the boat inters the lock, and the gates at the lower end are chased. 'llof bat being now in a comparatively water-tight thander, valves are openel in the upper gatres and water from the ulder level thws into the chamber until it is at the same height as that of the upper bevel. The upper gates are then ine ned and the hat passes mat on the uprer fawel In locking from the under to the lower level the process is wupred.

A latk may be dividen into thre parts- the chamber or birt betwern the uppr and lown gates: the lumd bay or purt above the upprestes: and the tail-by or part ben the lower gates. The side walls of the thamber are designed to withetand the fowsure of saturated earth when the Jok is cutirely emply of water. Their widh at the base is usnally froni four tio five tonthe the locight. It the upper end of the chambre a wall. called the heast or lift wall. is huilt mendy to the heright of the hottom of the Bh"ne level, and on it is platen! the miter-sill. iganat which the lower fart of the gates reste when elosed.
The side walls of the head-hay are simply a contination of the side walls of the elamber: Ahowe the gato the walls we the bemb-hay wo back from the fane line of the chamber, forming the upher reqes into which the upper gates folld bave whon opra. This is of sulliciont dopila to allow the gates to fall datiery within the late of the thamber wall Whan they :14 (川"en. 'I'lat part of the revess in which the herd or puoin-puist thrn is called the hallow quain. The recemon lhe lower gates are within the lock chamber at the bower ent, and are similar to thase in the heal-hay Above the rectsits the walls of the heal-hay diverge sombwhat, and are cembertm liy twist walls to the shate walls of the calal.

Ther side walls bit the tail-baty are also a cementinuation of the elaminer walls for a distamer athent equal to the length of the gate rewes. and thon diwrer as wing walle to juin the shope walls of the lower lerel. The thitkness of the masonry hatk of the lower hollow quoins is incerased to withesand the preseure of the gates at that point. The low tom of the tail-hay, called the apron, is plankel or pased for some distanco to ammeract tha eflet of the curvent cansed by the lischarge of water from the lock chamber.

The miteresill is a tringular-shand frame, usually of wom. from 10 to 12 inches high. Which extembs ancose the lonk helow cach pair uf gates, and against which the Jower part of the gates rists when elned. The altitulde of the triancle is nsially from ene-fourth to out-sixth the wilth of the lock.
dock-qutte is compued of two heary uphight timbers
 (1) the uperir sile with hemp platis. 'Jlue weright which fits in tho hollow quain and whith ade as an axis tor the

 tishtly that of the opjrosite eate when the gates ane cluserel. The liorizantal pieces are called girts we cros-arms. The

 about a horizmal or werticen axis. The lewers other arrangoment for oprating the valves une platerl at the top of
the gate, and are reached by mons of a wite hoart, termed the runming-toard, secured by brackets to the top of the gate. The balance-heam is a heavy timber extending from the toz-fost over the heel-post, and several feet beyoud. It is used as a lever to open and close the gate, and to jartially balance the weight of the gate. The quain-past rests upon a casting placet on the chamber floor catled a step, which projects upward into a hollow casting ealled a thimhle, fitted in the post. The top of the heel-post is held in prsition hy an iron strap ealled the collir, which is fastened to ancher irons seeured to the masomry.

Machinery is sometimes used to haul the boats into the Jock, and is driven by a turbine utilizing the fall between the two levels.
In the larger loeks of ship-canals the water is manitted to the lock chanber ty rulverts constructed in the lork masonry. These usually pass atomed back of the hoilow quoin, and are providen with gates. sometimes, howerer, the culvert passes umberneath the lock chamber, and ralves in the crown open into the lock bottom.
The lucks on the Frie Canal, which are among the bent of those used exchusively by canal-hats, are 110 feet long hetween miter-sills, 18 feet wide at the water surface of the lower level, and have a depth of a fect orer the miter-sill. The lifts range between.5 and is teet. The locks. lengthened to admit two boats, have nearly the same dimensions, excopting the chamber length. Whith is 221 feet.

The loeks of the Caletonian Camal in scothand will admit the passage of frigates of the second class. They have a chamber length of 180 feet, a toj) wirth of 40 feet, amblhe a depth of 30 feet orer the miter-sill. The lift is 8 feet.
The loeks of the enlarged Welland and Lachime Canals have a chamber length of 200 teet, a width of 45 leet, and a lepth over the miter-sill of 14 feet.
The locks on the st. Mary's C'ilnal. on the Michigan side of st. Marys strait, are, from the amount of tratic passing throngi them, perhaps the most important of any in the word. As origimally built they consisted of two locks, with chambers 3.50 by 70 feet, and iv feet derp. The lift of each lock was about $?$ feet. They were emmpleted in $18: 6$. A single lock intuded to take the place of those two was milt alongsile of them. and completed in 1883. This lock is 515 feet long in the chamber, 80 leet wide, bat narrowing to 60 feet at the gates. The depth of water over the mitersill is 17 feet, and the lift is 18 feet. It the time of its completion it was the largest lock in the word. The sates are operated by halraulic power. A culvert connerting the upper and lower levels passes underncath the chimbere, and water is almitted through apertures in the eut-stome lock bottom. The total cost of the structure was $\$ 1,0$ th,000. A new lock is now being constructed on the silf of the first two. It will have a total length of 1,200 feet, am a chamber son by 100 feet. The depth over the miter-sill will he 21 feet. The estimaterl enst of this structure complete, including the exabation, foundation, masoury, gates, ami machinery, is $82,234,000$.
Temperary locks for the Pamana Canal were proposel by 11. Fiffel. The chambers were to the $590 \frac{2}{2}$ by 59 teet, and the lifts were to be from 2t+ to 36 feet. The chamber walls were to be manle of irm caissons, braced with cant iron, and filled with conerete. The gates were to be mate of iron and slide directly across the lock, being suspembed at the top to an iron drawhritge, which conld be swang over one of the sile wahls when the gates were open.

On the Nicaragua (anal, now being eonstructed, there are six locks. The chambers will be $6 \overline{0} 0$ hy 80 feet, and the lifts will vary from ? 1 to $42 \frac{1}{2}$ feat. The estimatem cost is from $\$ 1,20,000$ to $\$ 1,630,600$ per lock.
The lasthan or tidal loeks on the Manchester ship-eanal bave the walls mate of conerete, with granite eoping, fender courses, and hollow quoins. Three luke of different sizes are placed side by side to serve the ditherent type of vessels. The chamber of the smallost is 15: by 30 fret: that of the next in size 3.50 by 30 fect. The largest, which is also the largest completeol look in the worth, has a lenerth of 600 feet bet werongates, and is 80 feed wide. The depth over mitersill is $2 f$ fent, amb the walls are $4!$ Feet high. The walls dividing the luks are 30 feet thick, and the filling and emptying enlverts are built into each wall of the lacks. The loek gates, molike mont grates for large lucke, are lmilt of wood instead of iron. The heel-pens are ef inches in diameter. The gates are each lis fed with by 40 ft . 5 im . in height, and 5 feet thick at the centor, and each contains 180 toms of timhor. The total wright of a grate is 200 tolls.

The literature of the subject is mostly found in reports made by engincers to canal companies and to govermments. Stevenson's ('anal and River Engineeriny (Edinhurgh, 1872) and Hagen's Whaserboukuast (Berlin. 186?) mas, however, be quoted. For some of the attempts to avoid the use of locks, see Fulton's Treatise on the Improvement of Canal Samgation (London, 17!6). See also the articles Cisals, Ship-canale, and Laclined Planes.

Join E. Ostravier.
Canals [Fro, from Lat. canclis, or Ital, canale]: artificia] watercourses for drainage, irrigation. and especially for aavigation. Whenever fossible, adrantage is taken of the natural river-courses for the purpose of camalization. A canal must be very nearly upon the same level. Whenever eonsiderable efevations are to be overcome, it is usuafly accomplished by means of loeks. Valleys are genprally crossed by means of embankments. with openings called culverts fin the pasage of streams. Canal-boats are usnally hanled hy animals which walk upon a tow-path, upon one side of the canal.
Among the ancients, when civilization was confined almost entirely to the neighorfood of the ocem, inland navigation was yery limited, and means of overcoming differences of elevation were unknown. The first canals were built for purposes of irrgation, and their enlargement to form navigalile channels was an afterthought. The roval canal of Babyon, so enlarged about 600 m. c., is among the earliest recorlet. Among the projects for connecting wivers and oceans hy canals among the Egyptians, Grecks, and early Rumats, we may mention the camal of Marins. b.c. 102 (see Fossa Mariasi), connecting the fower lihone with the Mediterranean: the canal of Alexambria, B. C. 330 . by which the port of the new eity fommed by Dexamer was put in navigable communication with the Sile, all the mouths of which were obstructed by impassible bars. About the Christian era the Emperor Claudins, on account of the ob--truction of the port of Ostia, comnected the 'liber with the Mediterranean by a short canal. and the new ports of "Claudins" and of "Trajan" were made at its termini. About the fourth century the Romans made improvements connecting rivers in Lombardy, and in the fifth century Odnacer built a canal from the sea to the Mentone, above Ravenna. Charlemagne in the eighth century hegan canals joining the Main ami the Rhine with the Danubr, and the veean with the Black Sea. In China the Grand Canal, joining the Pei-ho and the Yang-tse-kiang, 500 miles apart, was built in the thirteenth century. This great work, itself about 6 on miles fong, is a series of canalized rivers, and gives, with its commecting rivers. an infand navigation of nearly 1.000 miles. Its depth is 5 to 6 teet. (Changes of level are surmounted by drawing the loats up inclines? phanes. The boats are either rowed or tracked along liy men. Several canals were built in Ihlland and in ltaly from the eleventh to the fiftenth eentury. Ahout 1400 A. i., in span, the Moors built a canal from Gramada to Catiz, Imt after their expulsion internal improvements thagusheri. In the earty part of the sixteenth century the Ehro and Castile canals were partly built. but mot completed. The pirit which dominated this nation is thoronghly exemplifirei in a decree of the enuncil about 1680 regarding a project for improving certain rivers, which stated that "if it had Beased Gool that these rivers should have been navigable. he would not have wanterl human assistimee to hare made them such: but that, as he has not done it. it is plain that he did not think it proper that it should be done. To attempt it, therefore, would be to violate the decrees of his providence. aud to mend the imperfections which he designedly left in his works." In 1570 the Spaniards legan a canal in South America, from Cartagena th the river Magelalena, 8 a miles, including varinns lagoms on its route, and 14 miles of bay and harbor. It has been badly neglected, but ettorts are heing mate to have it repaired.
In 1481 the invention of locks for passing from one ele vation to another rendered canal mavigation mach more generally a valable. This invention. mate hy two engineers of Viterbo in Italy, at once gave an impetus to camal construction. Several important chamels of commoniontion were opened in ftaly. The first French canal was that of Briare, built t605-43. The orleans (anal was built in 160\%. The greatest work of that age was the Languedoe Canal, from Narbome to Toulouse, tiol miles, its summit-level heing 500 fret abore the seat (built $1665-81$ ). In 1200 Peter the (ireat began the immense srstem of canal havigation in Fussia
 land districts, atfording eontinums navigation for $1,4 \% 1$ miles. Clartenasne "onceived the idea of connecting the Danube and the Slain by it camal, but the project was not carried out until $1 \times 36-16$, hy 1 anin 1 . of Bavaria. The cenal is 108 mikes hong and its summit-level is biso feet athove the Main and era fee above the Danube. The Danish Canal, 100 miles long timishert in 15:5, unites the Sorth seam and the baltice In Jrussia water-communieation is hat by canalo and risar improwements between lhamburg and Dantzie. "the (iotha (ianal in sweden, one of the largent Fimmatan worke of this clises, was phamed in 1716, the first part unened in $1 \times 10$, and compherd in 183$)^{2}$. It (Toses Sweden from staekioh to (inthembures, is sen mites bong. and at its greatast elevation is bos fect alame the seta. There are altogether sum milte of eamats in swealem.

From a very early prond extensive canal were nead in India lor parjoses of irrigation. Some of thene have in later times temendared for navigation. A camal for irrigration and for uavigation by stemboats from sunkelasia to (nddapar, 1 ! (1) miles, wat buill in 1 a $61-71$.

The oded British camal, the Lows Dyhe, in Lincolnaime, is a cont originaty made liy the Romamis. Internal navigation was the sulyeet of legistation in 1-P? 3, and there exist locks on the rivel bee built in 150. At Exeter. Hagh Courtenar, Fart of bewon, in 1:316, in revenge for an alfront, ruined the navigable approach to the town ley dam- wo the river. Parliment pamed an ant for creatige a navigable ranal to the city in liabl, but the work wan not begm until
 of bridgewater procured a grant for the construction of ranak, and for forty years there was as great a rater for canals at in the secom quarter of the ninetenth ecntury for railroals. The ramal excitement contimed, smewhat sublued. lowever. for thirty years during that efollury. sumth of Burhan mo place in Fncland is more than in miles from mavigation. Thuring the same perion seseral short eanals wre emstrocted in scotland. The Forth and

 amd surmoments a summit of 160 feet by 39 lows. It is now in eontemplation to make this a ship-anat with summit level sto feet above tide and le locks. The Calemosian Cisil, (q- e.) is properly elased under tha ham of ship-ranals. In Ireland the Grand Canal, from Duldin to Baflinaloe, $16: 1$ miles in length with its combections, to feet witle and 6 feet deel. Was huilt in 1 tho. Immense sums were thrown away in earrying this canal acress the bog of 1lhan. In 17: the Roval (amal, from Dublin to Tomans-
 allel to the (irand. The result is that neither of them has
 maviquble eanals exist. Many of these canals hawe haver lumght by raikay combanies, and are oproted in commetion with the roils, the net protits per mile on (anals an

however, was mnsatisfactory, and after a prolonged insestigation the substitution of an independent canal from Georgetown to ('umberland tris recommended (182;) by the engineers, Jess M. Dloore and Briggs, appointed by the two States. It was to be $1 \mathbf{N}^{\circ}$ miles long, 30 feet wide at surface. and 3 feet rletp, with $6: 3$ locks, it an estimated eost of \$1.575.094. Jbont this time the general Gorernment inangurated its so-called system of internal improvements by act of Apr. 30,1834 . ami a board of engineers wis appointed. by whon the entire ronte to the Ohio at Pittshorer was surreyed. and the homel rendered a report Oct. 23. 1se6. estimating for $: 41$ miles of anal from Georgetown to Pittsburg, to be 48 feet and $3: 3$ feet wide at surface and bottom, 5 feet decp, and to cost refuired was inordinate for that early day. $\ln 1830$ the eastern division was anthorized to be built from dlexandria to Cumberland, Congress providings a subscription for 10.000 shares of stock: the city of W ashington, 10,000: (ieorgetown and Alexamlria, 5,000 ; and the states of Maryand and Virginia, 7.186 shares: the remainder being taken by individuals. The fist blow struck for the actual construction was Iuly 4. 18.2x, by the Presiclent of the U. S.. John Quiney Alams. The dimensions were increased to 60 and 40 feet surface and bottom width, depth to 6 feet. The aqueluct hy which it was carried across the Potomac at Georgetown, constrmeted (18:0)-40) maler direction of Major Turnbull. U'. S. Fngineers, was one of the most important engineering constructions at that date momertaken in this eountry. The main portion consists of a wooden trunk resting on twelve masonry piers founded by coffer-dams on rock averaging os tert, and toward the western shore 40 feet, below the surface, cosered by 15 to 30 feet of murt. Up to the year 1 st5 there hat been expenderl on the camal S $9.502,345$, and subsergently ahout $81,500,000$; besiales. charges of interest. loss on sale of honds. have carried the aggregate expentiture to $\$ 15,000,000$ and upward. Its main business has been the transuort of eond to tide-water at Georgetown. The "eastern division" (from Georgetown to Cumberland), as it now exists, follows the north side of the valley of the Potomac to the eastem foot of the Alleghany Mountains, at Comberlane, Ma. It departs from the immediate valley of the river by a cut-off and a tunnel of 3,118 feet in length at Piaw Jaw Bend, 27 miles E. of 'umberland. The distance saved by this tunnel is about 6 miles.
 locks, varying from 6 to 10 fret lift, with chambers 100 feet long and 15 feet wide. From Georgetown to JTarper's Ferry, 60 miles, the canal surfice is 60 feet wide, and from IIarper's Ferry to Cumberland it has an average of 70 feet width, the depth thronghont its length leing 6 feet. The eanal is supplied with water from the Potomace river by means of seven dams thrown across the river at suitable distances. The boats used on this canal are ordinary flatbottomed boats from $6^{\prime \prime}$ to 45 feet long. and 14 feect wide, drawing $5 \frac{1}{2}$ feet when lomed. They carry from 110 to 115 tons of $2,240 \mathrm{lb}$. The terminus of the canal at Cumberland is $\mathbf{3 0}$ miles from the coal-lield by the Cumberland and Pemmsylvania $l$. R., its principal connection therewith.

In 1890 the company owed $\$ 1,699,500$ in bonds and twentyfive years interest on them, and after litigation the camil was handed ower to the bondholilers.

In the early years of Western sottlement, when the great rivers formed the only velicle ot transportation, an obstruction to navigation sio rave as that mate by the rapive known as the Fulls of the Ohio at louisville conld not fait to compel carly attention. In 1805 the State of Kenturey authorized a private corporation to construct a lateral canal (known as the Lonisville and Porthmal), whieh was completer in $18: 30$ at a cost of mbout $\$ 1,000,000$. Jeength, $]^{\frac{7}{7}}$ miles: wiclth, 6.| feet; with three locks, each 200 feet long and so feet witle; lift, $8 \%$ fore. In 1860 an enlargement, planned by ' I '. k . seowden, was mulertaken, and $\$ 1,500.000$ expended, the rivil war interrupting the work. The Ohio being a great mational higlway, this work was deomed a proper oliject for wovernmental eare, and in 1868 was placed in charere of the chief of agineers U.S. army, ant carried on by appropriations of public money by Congress. A new enlarged canal was openeal to mavigation in Freb. 1872, and entirely rompleted Nox., 1873; the extra enst of enlargement (incluting the $81,500,000$ already mentioned) was $\$ 3,2-70,000$.

The present canal lonves the Ohio river in front of the fity of Louisville, passes in a westerly direction armund the falls, and conters the river just ubsove Portland, liy. Its
length is $2 \frac{1}{10}$ miles, and its general width $86 \frac{1}{2}$ feet. The upper entrance is 400 feet wifle, and subtable turn-out basins are provided. A dam on the erest of the falls enables a minimum depth in the eanal of 6 feet to be obtained. The depth depends upon the stage of water in the river: the least depth being 6 feet. and the greatest depth known about 42 dt . 8 in . The great expense of this work is the to the fact that its herl is ent through lard limestome rock, and its sides are protecterl by stone walls, above which rise earthen parapets to a height of 44 feet above canal botfom and $\frac{1}{3}$ l'ect above highest known floml. A set of guard-gates at the head proviles for shatting off water when necessary. At the lower end are the ohl loceis, still prosirved as originally constructed, and the two new locks Which torm the outlet of a short branch have litts of 12 anrl 14 feet: their length between miter-posts is 372 feet, trailable length 385 feet, width No feet.

The guard or floon gates at the hean of the locks are 478 feet long and 46 ft .11 in . high. The upher litt-gates are $47^{2}$ feet long, $24 \frac{3}{3}$ feet high, and built of a combination of oak and pine. The middle and lowr lift-gates are $4 \%$ feet long. 31 ft. $2 \frac{3}{7} \mathrm{in}$. and $2 \sim 1 \mathrm{tt}$. 2 in. high, respertively. They are built entirely of oak, except planking, which is of pine. The uper lock was improved in 1890 hy raising the lock Walls and middle gates by buidding on them with timber 15 inches, increasing the practicable use of the canal 17 per cent.

Exeept during high water, when there are 10 feet or more at the learl of the falls, the entire commerce of the Obio river passes through the canal. During the rear 1890-91 3.940 boats passed through the locks, and 3,878 down the river.
The Chesapeake and Delaware Bays were connected in $1804-29$ by a canal through IDelaware and Maryland nearly 14 miles long. The summit-level, 16 fect above mean tide and 10 miles long is supplied by pumps. Survers have heen in progress for a few years for a new eanal between these bays. This work was aided by the U. S. Government. In New Jersey the Delaware and Raritan Canal, built in 1831-3-1, 44 miles long, connects the Delaware and Raritan rivers, making an inland navigation from New York to Phildelphia. The first application of steam-nower to operating locks was made in 1868 on this canal by Ashbel Welch, C. E., and increased the capacity of the canal 50 per cent. The Norris Canal, 101 miles long, built about 1830 , conneets the coal-regions of Pennsylvania with New York harbor. This eanal was purchased by the Lehigh Valley R. R., but has been operated by it at a loss.

In the Sonthern States over 250 miles of eanal have been built. Among the most important of these are the Chesapeake and Ohio, the llunois and Michigan Canal aud the James River ajd Kanawha Canal (qq. v.).

The sleenlation in canals which began in 1820-21 was checked by the introduetion of railroads, and, of more than 5,000 miles projected and begun, less than 3,000 were built. A very small proportion of these have paid interest on the money invested. The New Fork Litate canals were built by the state Govermment. Of 006 miles built, $5 t 4$ miles are operated by the state at an anmal expense of about \$00,000. No tolls have been collected since Jan., 1883. For the twenty-eight years $1862-90$ the average tonnage was 5,714 ,170 tons. Themetual expense of the eamals to the state up to Jan.. 1889, has been $539,851,986$ in exeess of all revenue derived therefrom. This sum represents the premimen which the people of New York hase paid in taxes to secure and encourage the use of these waterways for purposes of transportation. The annual eost for construction. maintenance, and operation from 1885-90 averaged $\$ 1.500 .000$.
The Ohio canals, built by the State Govermment, were a continual source of expense, and in 1861 were leased to private parties for an anmal rental of about one-tenth of 1 per rent. on their cost.

The emuse of the failure of through routes of canal transportation to be remmerative has apparently been the insulliciont channel dimensions which for ceonomy were given them, and the consequent small lomds which eould be carried. Hxperience has proved that with inn enlarged section of eanal prism, recommodating larger boats, the carrying copacity is three times as great, while the towing expenses are increased less than 50 per cent., making the cost per ton per mile on a large canal $41 \frac{1}{2}$ per cent. of what it is on a small one. The carrying eapacity of a canal accommorlating boats of a given size depends upon the umber oi lucknges which can be made in a given time. lncrease of

Cañár. kahn-yaar : a small highland province of Eenador, lying in lat. 2 to. 3 s.. between the provinces of Chimborazo and Aznay. Pop. 64.014.

## Cómara: See Kaxara.

Canarese Language: Som Dramman laxgrages
('ana'ries, or Canary Islands (anc. Fortmente Insulu): a group of islants in the Alantic Ocean; belouging to Spain : about 60 miles W. from the coast of 1 frica. They are lntween lat. $27^{\prime} 49^{\prime}$ and $2926^{\circ} 30^{\prime \prime}$ 人.. and hetween lon. 1325 and 1816 W . (see map of Africa, ref. $2-1$ ). The names of the seren largest islands are Lanzarote. Fucrterentura, (iran Canaria. Teneritfe. (tomera, Palma, and Ferro (or Ifiero); besiles which there are sevemal small islets. Their total area is 2.808 sy. miles. The Camaries are of wheanic formation, and have high rocky coasts. The surface is monntainons and the highest point. the l'ico de Tevale. in Teneriffe, rises 19.18: feet ahove the level of the sea. The climate is mild and equable the heat being moderated by the sea-breczes. The vegetation is arranged in zones. according to the height above the sea. The first or lowest zone protuces the late-pralm. sugar-cture, ete.: in the second flonrish the grapevine, olive, and maize. The highist summits are harren and naked rocks. Administratively the group is a province of spain. to which the African possessions Rio de Oro and Ahrar are subordinate. The largest island of the group is Teneriffe. which is nearly $6^{1}$ miles long. and has th area of 8 ir sy. miles. Its chief town and port is sinta Cruz de santiago, where the officers of the general government reside. Las Palmas, the former (apital of the province, and the most populous of its towns, is. on Gran Canaria. The Canaries hate belonged to spain since 1493, and the population is spanish. The aboriginal race, called Gnanches. was contuered in the latter year. The islamls were known to the Romans, and have lgeendescribed hy the eliler Pliny. who. however. states that at his time they were uninhabitet. They are considered to be the Fortumate islants of the ancients. Incilentally rediscovered in 1834 by a French vessel. they were for a century and a half the prize of variou- French and Spanish adventurers. By the final eonquest the native popnlation, whose former history and ethogqaphical relations are entirely monown, was nearly eliminated. The meridian of the island of Ferro (17 30' $51^{\prime \prime} \mathrm{W}$. of (rreenwich) is usually taken as the dividing lime hetween the eastern and western hemispheres. It was considerel by ancient geographers the most westerly point of the world, and they drew thrmgh it the first meridiam. Longritude is still rechonct from it by some geogra,hers. Pop. 2si.22x. See Ulivia Stone, Teneriffe and its Six. Sintellites (1808).

Canarium: a genns of trees of the family Burseracese natives of the East Tmlies; having componit leaves and diacions flowers. The truit is a drape. The Comarikm. commun is cultivated in Java and the Noluceas for the sake of its fruit. which is elible and yields a lamp, oil. This tree grows ahout 50 feet high. and is sinplosed to he one of the trees which produce clemi.
(Ganary Bird (Sirimes concrius): a well-known singinghirt of the family Fringilliche; native of the Chary islants. Its color in the wild state is gray above, with darker spots: the other jarts yellow. In its domesticaterl form the whole bird is often gellow. In its will state it hilete on shrubs or trees, and jumbues five hroods in in yar. In confinement it seems to be contented, and hreeds readily several times ina year. Its favorite articles of food are canary seal. hompered, sugar, and hamb grean haves, such as those of chickwed or letthee. It han great imitative powers, and (an be trained to sing varinus notes. sime of the wild ramery birds are saifl to surpuse the bestarained singers in loultress and clearness of note.

Canary-grass: the Plataris canarimsis: a short, erect annual grass with a large ovate spike, whose rather large sends are usel as fond for Cavary Bimds (q. r.). Athough a native of Sonthern Furope, Wrstern Asia, and Xorthern $\Lambda$ frica, it has long been grown in other regions, and now grows spontaneonsly in many places in the U . S. When gromed into flour the seeds form a valuable food for the inhabitants of some of the comentres horlering on the Mediturranean sea. A clowidy related species. $P$. intermedic, is a native of the sonthern T. S., and may be called the native eanary-grass. Another species of this renus is Parendinacea, known in some places as the "will ribbon-grass." It is a stout, peremial, broad-leaved grass, 2 to 4 feet high,
with a branching panicle of large-flowered spikelets. It is found on wet grounds, and is widely distributed. Althongh a coarse grass, it yields a good deal of forage, which has some value in har-making.
C. E. B.

Canary-sed : the product of Cayary-grass (q. $x$. ).
Canary Wine or Teneriffe Wine: produced in the Ganaries: so much resembles Madeira wine that it is often sald for that article. It is improved be a lons voyage. The term Canary is properly applied to the Bislogue wine, which is the juice of grapes gathered before they are ripe, and is not grul until it is rendered mellow lyage.

Camdia: Sce Cmete.
Candia, Pedro, de: soldier; so called from the Greek island of Countia, where he was born ahnat $1+\%$. He moved to Ameriea as a sobdiar in the Spanish army, and in 1527 was with Francisco Pizarro in the semme expedition in search of Peru. In 1528 he was Pizarro's companion to spain, and received the title of "Crami Pilot of the south Seas," During the final expedition to Peru and the march to Cuzco ( $1532-3: 3$ ) he emmanded the artillery. consisting of two small guns. He served against the ehder Almagro, but after Pizarro's death joinch the rebeltion of the younger Almagro, and commanded his artillery. It the beginning of the battle of Chupas, Candia pointed his gums too high: and Amagro, snspecting treachery, ran him through with his sword (Sept, 16. 154?).

Herbert II. Smith.
Candidate [from Lat. comdidutus, clothet in white]: the name given by the Romans to a person soliciting the office of quastor, consul, ete., from his apparing in publie dressed in a white (rumdila) toga. Among the carly ('hnistians converts newly baptized were called cambinates on accoment of the white rohes wom by them cight days atter baptism. In Germany, at the present time, a theological student who has been approved hefore the highest authorities in the Church is called an candidate and the term is generally given to any appliant for oflice, religions or secoliar.
Candidus, Whliay: opmatic tenor singer: b. June, 1840, in Philatelphia. Inring the civil wat he served in the Union army. If its close he resided in New York, and hecame a member of the Arion and Liederkramzsocietics. In 1sfi6 he sang the part of Max in Dre Freisehutz. Then he went to Gremany, and made a fine repmation as an operat singer. Ile wasone of the members of the Amerian Opera Company in 1886.
1). E. Herver.

Candle [O. Fing. candel, an early loan-word from Lat. cande'la, derir. of comde're, shine]: a cylinder of wax, fatty matter, or paraflin, through the axis of which runs a wick, used as a source of light. Though among the earliest forms of illuminants, the candle in its modern perfected form is an extremely ingenious device. It differs from the lamp in the faet that the combustible substance is solid at ordinary temperatures, while in the lamp it is liquin. As som as the canHle is bronght into action, however, the solid embustible substance becomes liquid, and ar reeptacle for this liquil is formed antomatically. A candle in action eonsists of some fusible. combustible substance through which in infusible, combustible sutstance - the wick- passes longitudinally. When the wiek, which projects at one and, is lighted, the heat developed melts the material of which the cande is matle, the melting taking place to a greater extent near the wick than near the outer edge of the candle. 'The result of this is that a small cup-shaped cavity is formed aromed the base of the wick, and thissurves as a reeptacle for the molten matorial. As the candle burns away, the conditions remaining the same. this receptacle remains, and thus the eandle by its own action is convert al into a minature lamp. The lignid moves upward through the wiek in conseguence of what is called capillary action, and is swom converted into gases, which, buruing, give the flame and the light. The earliest form of the candle was the dip, Dips were male on ther small seale from refuse kitchen fat by melting this and dipping the wiek into it. On the large seale, nf comrse, the wirk was more earefully done, but the methon was the sames l'ractically, all candes are now made hy molding. Nuch depemes unon the const rnction of the molds usen. The wick is plainly a rery important part of the caudle, and much ingenuity has been displayed in bringing it to its present state of perfection. Thtil about 1 No the wieks were made of twisted enton yarn. As the eandle burned down the wiek purnjected into the flame and serionsly interfered with the combustion. It was neerssary from time to time to remove the superiluous mater by means of smuffers. At firsumt the wick is plaited, and this eanses it to bend downward as it is releasel, and the ontur com, thus coming in contact with the air, is burned ofl, so that smulfers are
no longer needed. The lurning off of the wiek is further facilitated by "pickling " it-that is to say, by soaking it in a solution of some substance such as borax, niter, or sal ammoniae, that has the effect of eansing the wiek to burn in a clean way without smoke. The materials used for eandles are at present palmitic and stearic acids and paration. Tallow, spermaceti, ozocerite, and heeswax are also nsent. Stearin candles contain some paraffin, and paraffin candles some stearin.

Ira Remsex.
Candle (in photometry) : the practical unit of illuminating power. The standard eandle of Great Britain, which is also legal in the U. S.. burns 120 grains of spermaceti was in an hour. The standard candle of Germany is otherwise defined. It has a diameter of ${ }^{2} 0 \mathrm{~mm}$., is composed of paraffine wax, and must produce a flame 50 mm . in height. In France the practical standard of light is the Carcel, being the light produced by the lamp of that name. The relation between these standirds of light is is follows:

> 1 Carcel $=9.5$ standard candles $($ (English). 1 Carcel $=7.5 \quad$ (German).

## See Photonetry ; also Dibdin's Prarfical Photometry.

Candle, Electric: an early form of the electrie are-lamp, which was devoid of regulating mechanism. The best known is the Jahlochkotr candle, whieh was extensively used in Paris in the early days of clectrie lighting. See Electric Arc and Jablochkof Caxile.

## Caudle-lish: See Oclachan.

Candlemas: a festival to commemorate the purification of the Virgin Mary ; observed ly the Roman Catholies on Feb. 2, when they fom a procession with many lighted candles. On this diy all the chureh eandles for the year are blessed. The institution dates back to the reign of Justinian, 542. Candle-carrying on this hay was eustomary in England till its abolition by order in comel in the second year of King Edward 17.
Candle-nul (Aleurites tritoba): a tree of the family Euphorbiteere: a native of lava the Moluccas, and the Pit eific islamls. It lears a nut as large as a walnut, having a hard shell and a kernel which is edible when roasted. It yields an excellent hand oil, which is used for food and is burned in lams. The natives of the society islands arrange the perforated kernels on a string or rush and use them as torches.

Cand'lish, Robert Smitu, D. I. : preacher; b. in Edinburgh, Seotland, Mar. 23, 1806. He was educated in Clasgow, licensed as a minister in 1828 , and began to preach in Edinhurgh in 18:34. He was one of the prominent leaders of the popular party, and co-operated with Dr: Chatmers in orgmizing the Free Church after the disruption which occured in 184: In 1847 he was chnen Chatmer's suceessor as Professor of Jivinity in New Collere, Edinburgh, but declined to serve. In 1862 he became honomary prineipal of New Collere. He was particularly interested in education, and in movements looking towari the union of the varions Presbyterian budies ontside of the Estahlinhment. He acquirct mueh distinction as a pulpit-orator and a debater in religimus assemblies. I). in Wlinburgh, Oct. 19, 1873. Ile mulitished, imons other works. Can'ma [Lat.. reed]: a genns of plants of the family Scifommere. The firnt is a eajusule containing hard black seeds, whicls are eallat hadian shot. The flower has one fertile petal-like stamen, and a petaloid style. One or more species are extensively cultivated as ormamental plants. The starch of Cumuce coccinen is used sometimes insteind of arromront, under the name fons-les-mois. The C'thnat flaccillu is a native of the Southern I. S.. near the const.

Can'unbis [Gr. кávpaßıs, hemp, a word probably of Serthian orisin]: the typieal senms of plants of the fimily Cannabinncer. The nnly known suecies of it is C'rmabis sutiea. or hemp. a tall diocious annual with elegant palmate leaves. It grows widd in India, ind is cultivated for its fiber, ete. (hee II EMP.) The intoxicating elrug called hashish by the Arahs and bhang by the IJindus is procured from it varicty called Cumuubis indicu. Entler the name of gunjuth the dried female flowering hemp-jlants are sold in bumbles for smoking. The resinons estract called churrus is swallowed for infoxicating effeet. Several Ifrican tribus ne it. There appears to he more of the active resinoid (commabin) in the Indian tham in the Enropean variety, owing prohah]y to the tifference of celinate. It has been proved by the experiments of Itr. II. C. Wood, of Philablphia, that the extract of Aneriean hemp has the same kind of influence on the brain and nervons system as that from lndia. (Care shoulal he taken to separate distinctly fanumbis indica of American growth. which is what Wood used, from - 1 purynum camuabinum, somet imes called American or Ameri(a)-lndian hemp, which is an intense irritant prison.) The effects of lndian hemp vary considerably with litferent pernons. Lsually the are agrecably exciting. the plant heing known in India as ihe "increasei of weasure," the " cementer of friomblip." and the " ]anghtermover." Some persons become violent under its use. The word assassin is derived from the Arabic hashshashin, one who drinks or smokes hashish. With many there is an exaggeration of ordinary impressions, so that slight somnds are taken for thamber, one sheud seems as large as a house, ete. Others have their sensibility diminished or suspended liy it. It dors not. like opinna, affect the seeretions, and seltom prodnces natasa. There are no cases on record in Which a cammabis-intica" "habit" has develojerl in a Etropran. What is guite as important is the fuct that no death fras ever been recorted from overdeses of the drug. and enomons amounts of im active proparation injected direct? into the cirenation fatil to caluse death.

The ancients fossersed some knowledge of the narcotic powers of hemp. The seythians matle a vapol-Jatly of its fumes by throwing the seeds on red-hot stones. Ir. Royle suggeas that it may have been the nepenthes (фapuakov $\nu \eta \pi \in \nu$ $\theta$ és) which, ateortiner to Homer. Helen received from an Egyotian woman and gave to 'relemachus in the honse of Menclaths.

Extrat of hemp (Eyfractum chnnalis indice) is now used as a medicinc for neuralgia and some other nervous affections: The variability of its effects, however, has hithertos interfered with its extensive employnent. See IIare, Pructical Thorapentics (31 ed. Philatelidia, 1832). liovised by Il. - I. Hare.

Ohio river: abont 68 miles above Evansville. Camelton has 6) chmohes. : schools, water-works. a large eotton-factory bnilt of sandstone (in whirh over 400 oneratires are employed). $\underset{\sim}{z}$ saw-mills, planing-1nill. thour-mill. brick-yard, comper-shop. and manufacturies of draming-tiles, jottery, picks, and chairs. Bituminons coal aloumds in the adjacent hills. and is smplilied in large quantities to steamboats. An excellent quality of sanclstone is quarriod in large quantities. 'Ihe walls of the Louisville C'anal around the falls of the Ohio river are built of it. Pop. (1880) 1.8.34: (18!0) 1,491.

Emitor uF " Fxquirer."
Cannes kuan: a seaport-town of France: department of Alpes-Maritimes; on the Meditemmean sea: 25 miles S. E. of Iraguignan (see map of France. rel. ! 1 -1). It has an old Gothic castle and a good quay. It is also the center of a large industry in raising fragrant and ormamental flowers. The mildness and salubrity of the climate renter this a favorite winter resort for English families. Napoleon landed at Fréjus, near Cimnes, after his escape from Elba on Mar. 1. 1815, and Lord Bronglam died here in 1868. Pop. (1891) $19,983:(1896) 22,959$.

Cammibalism [from the Span. comibales, derir. of a variant of C'aribes. a tribe in the West Indies]: the practice of eating human flesh. This has prevailed and still prevails among many savare peoples. It was in fore among the aboriginal inhabitants of America. Modern salors have found the enstom in Sew Zealind, in Polynesia, in Malarsia, in the interior of Africa, and even in lidia. Javing its origin in hunger, the hahit has developed from the pirit of rengeance and the taste contracted lor hmman flesh. Nany tribes eat only the enemies who are taken prisoners. As prisoners of war were eaten, war was waged for the jmrpose of gratifying the appetite thms excited. In some cases superstition and even religion mingle with the custom. It is said that the inmabitants of New Zealand think that by eating an enemy the prot they assimilate his life and his eomage, rob him of the protection of the gods, and gain donble faror thembalism is sairl to tike tlie place of burial. The Rhinderwas of India, in orter to propitiate the farm of the goddess Kiali, kill and eat those of their relatives who are attacked by an incorable maludy. or whom uld age has renclered infirm. 'The tribe of the Battas of sumatra make camnihalism a part of the judicial system. Insteat af comdemning a man for certain crimes to lo lamged, they saltence him to be eaten. In this case the condemnet eriminal is Jed out alive and those who have the right cut oft in order the parts that they themselves prefer from the living vetim. The custom is closely related th that of human sacrifices, and donbtess the latter in many instances give rise to the formel: Cannibilism as a costom among sarage races must be under peched from occasional acts of the kind committed of ajparent necesits peculiar ciros and even umber the pressure and owing necessity. With the atrabce of eivilization, rible custom is clying ont in most of the places where it is still found.
C. H. Thl'rbrr.

Cañon City : capital of Fremont co.. ('ol. (for lecation of county, see map of Cobrado, ref. 4-I): a beatiful little city situated on the main line of two railroads and at the mouth of the Grand ('anon of the Arkansas, 5,280 lect above the sea-level. It is a celebrated resort for invalids, having hot and cold mineral spings, hot sulphur baths, a mild, healthful elimate, and first-class botel accommodations. Within one day" drive of Canon City are many points the scenery of which is among the grandest in the Rocky Homitans. The river fumishes abmant water-power, and in the near vicitity are coal, iron, limestone, and oilwells. The city is 162 miles from benver. and is one of the oldest and most pincturesque towns in the state. Pop (1880) 1,501: (18!90) 2.se5.

Eidtor of " liecord."
Canoness [cthon + suthix -ess, hut ef. Fr. chanoinesse and Mediarv. lat. cmonissef]: one of the members of certain religions orders of the Roman Catholic Chmelt, who often took no monastic vows, though they lived in common and nsually observed the rule of 'st. Angustime. Many noblemen sught well-endowed eanomical livings for their danghters, who were at liburty to mary when they rhose. The custoni nevailed in Germany even after the Reformation, and there were many homses (Stifter) of Protestant canonesses, esprecially in Westohalial aml Mecklenhmy. See Nux and Sistervoous.

C'monical Honrs in the Roman Catholie Church are rertain fixed times in the day for devotions. In the Chmer of Eughand Bishop Cosin published a book of Ifours for these who liked to use then. 'lhese hours are called noeturnes, matins, lands, tierce, nones, respers, athi complines. The hreviary has seven camonien hours, because the Palter says, "heren times in the day will I praise Thee." In England the hous betwen 8 A. 3. and 12 , are canonical, and until recently no marriage cond take phace in whrches of the Fitablisliment exerpt in cumonical time. Recent enactments extem the emonical hours $10: 3 \mathrm{p} . \mathrm{m}$.

Canonical Vireins: yomg women who, in the early agrs of the Church. remaining in their homes took upoit themstlves vows of perpetual virginity. They were eurohtel in a list or canon, whence their name.
Cimon'icus: an American Inlian : chief of the Narragansotte, who, thongh at tirst hostile to the l'ilgrims who handed at Plymonth in 1620 , subseruchtly beeame frimely to the whites, amb especially to the inhabitants of the colony of Rogre Williams. 1). June 4, 164\%.

Cimonizalion: the act of declatring a jurson a saint: a repmony in the Roman Catholie anid Cireek Churehes bis which ifeceased leatifind persons are enrolled in the eatat logne or canon of saints. In the Roman Catholie Church it takes phace through a solemm and public decestration of the pope that the presion in question is to be looked on as - noying the vision of fert, and to be veneraterl (not worShifal) and invoked thronghat the whole ('lur (h) Regularly, canomization can mot take place mail fifty years after

 The prove uf canonization is usually a longe ane mimite one. It includes (1) at preliminary oximimation on the part of the local chareda anthoties coneroning the fact and antiquity of the local wementiom, the rempation for sime ity and miracles. amb the reality and frepueney of the latere,
 (?) A protratiol stuly of the same points ly the Roman Congregat ion of lites secombline to a procedine especially dexignof to prevelt doception and armor. Besides the presmerling puints, the orthentoxy of the writings of the berchus and The larality of any provious vencration are sperially considererl. It is at this stage that the promener of the faith, usually called the devils alvocate is obligell to mene all possible onidetions and tho strictest comppliance with The emmplicated procelnre. (3) The solemn ceremony in sit. Peter's. which ineludes a jerocession with bamers decorated with the port rait of the new saint, amp a sperial rituat. On this occasion the pepre orders that the bectum the enrolled in
the catalogne of the saints, and a day assigned in the calendar for the yearly celebration of his reast in the whole Church. in honor of the Iloly Trinity, for the greater glory of the Catholic faith and the advancement of the Christian religion, hy the power of Jesus Christ, by that of ss. Peter and Pan, ind ty his own. He also issues a bull, in which le informs the 'hurch of the life, miracles, and canonization process of the saint. Frefuently letters are issuch to the mation of the saint. tu the local episeopate, or to the rublic anthorities. The first solemn papal canonization of which history speaks is that of st. Crich, Bishop of Angsburg, by John XV., in the Lateran Comeil of 993 . In 150 Alexamder Ill. reserved to the holy see this right, formerly rxercised by hishops of synots. In $16: 3$ the reservation was reneweil anl strictly iusisted on by Urban VIII., since which time it has remained the sole prerogative of the see of Rome. The grat anthority on cammization is Lambertimi (Benedict XIV). De brutificatione of canonizatione sanctormm (best ed. Vinice, 1 ت66. 7 vols.) ; partial trans. under caption Heroic l'irtue (London, 184\%, 3 vols.).
doun J. Keane.
C'auon law: a system of rules for the discipline of the Churel. it broadly divides into that of the Eastern and that of the Western Church. The former was finally comliled about 880 A. D. by Photins, Patriarch of Constantinople, and its principal docnments are given in Beveridge's synodikon or landectio (2 vols., Oxford, 1672-82). The name in the Wrat is especially applied to the rules of the early and mediaval Church. which are also in foree to some extent in the thmrehes of liman obedience and of Englimd, Scotland, and Germany. This system of laws is hased largely upon decisions of ancient conncils, and also shows marks of the intluence of the Bible and of the Roman jurisprodence. It received frequent additions and other modifications from the dereetals, hulls, and extraragants of the luphes. The collected materials are known as the Corpes Juris Ctmoniri, of whieh a standarl edition was pmblished by Gregory XIII. (sen Fruidberg ind Richter editions, $\underset{\sim}{2}$ vols., Leipzig. 1879). In Fngland the kings and parliaments were always jealons of the introduction of foreign canons, but permitted to some extent their application in rases Where they lid not interfere with the statntes of the lamd. In this way the common law came to receive the influence of the papal decretals, which are sometimes cited as of anthority in matters of marriage, divorce, inheritance ete., since these affairs were unler the entrol of the ecelesiastical courts. In scottish jurisprudence the influence of canon law is very great, it having been originally received as of equal Force with the statutes of the realin. In England the ancient canom law is in force in ecresesiastical canses so far ass it dues not contlict with the statutes of Parlimment or later callons. Much of the code of 1603 has beemme obsolete, as ineompatible with acts of Parliament, especially that one which transferred matrimonial and testamentary cathses from ectlesiakifal to secular courts.

In 1847. in New York, W. II. Odenhemer, afterwarl Bishop of Xew Jersey, published An Exsay m Cronom Lare
 of the Drimifier Litasern ounl Wpster" Chereh: and also A limest of the Gronen Lan" of the chareh in the l'nited Simes. In 1870 Dr. Frame is Vintom published A Jumal C'ommentary me the fipmernl C'anan lume and the Consfitution of the Thotestunt Lipiscopal ('humh in the L'uited Stutes Lallor English works on this snlaject are Irinciples of E'nglish C'thom. Candavins, Smoxe, also called Simone da Pesarese: painter: b. at Oropezza, near Pesaro, in 1612: d. in Verona, 1648; was a pupil of (ruido and a fellow-student with Domeniehino, Pictures by him are found in Dilan (a Transfigurtion), bologna (at pertrait of Guido), I'esaro, and other places.

C'anleen' [Fr, cantine, cellar, small shop, and in volg, use a small vescel, from Ital, contimt]: a military term naed in several senses: 1, a small tin or wooden wessel which each soldier carries and uses for holding water : 9 , a small woolen or leathern chest or coffer containing the table eqnipage and utensils of an officer when he is in active service: $\%$, a public-house licensed in British garrisons and barracks for the sale of malt liquor, ardent spirits, and groceries, in order that the soldiers may obtain such articles without going heyoud the preeincts of the barracks.

Can'lemir, Demetrics: historim: b. in 16\%: a son of the Moldavian waywold: was early sent as a hostage to C'onstantinople, where he received an excellent education. He moderstool several Oriental and several Enropean languages, and lecld positions of trust in the Turkish administration. In 1710 he was made waywode of Moldavia, but the conspiracy into which he had entered with Peter the Great miscarried, and in 1711 he fled to Russia, where he died in 1723. While there he wrote in Latin lis IFistory of the Ottoman Empire (English translation by Tindal, 17:4).

Can'terlury (anc. Durovernum): a city of Kent, Fngland: on the river Stour ; 56 miles E. S. E. of London, with which it is connceted by railway (see majp of England, ref. 12-L). It is the metropolitan see of England, heing the seat of the Arehbishop of Canterbury, who is Primate of all England and has precedence immediately after the royal dukes in court ceremonies. The itrehiepiscopal see or province of Canterbry comprises the dioceses of C'antertury, London, Winchester, Bangor, Bath and Wells, Bristol, Chichester, Ely, Excter, (Hloncester and Bristol, ILereford, Lichhield, Lincoln, Llandatf, Norwich, Oxford, Peterhorough, Rochester, st. Albans, sit. Asaph. St. David's, Salisbury, Soutliwell, Truro, and Worcester. Canterbury stands in a vale or level space between hills of moderate height. It contains fourteen old chur hes, mostly built of Hint: also remains of St. Augustine's Benclictine ahbey, and the ruins of a Norman castle. Among its institutions are sereval hospitals, a museam, and a theater. 'anterbury returns one member to Parliament. It hat manufactures of linem damask, and is noted for its brawn. St. Angustine beeane the first Arehhishop of Canterbury in SiA. A. About this time the fown was the cupital of the kinglom of Kent, and was called Caer Cont (i. e, city of Kent). Arehbishop, Cuthbert Inilt here. alwut it0 A. D., a chureh which received numerons additions in succeeding ages. The choir having been destroyed by fire in 115t, it was soon rebuilt hy William of Sens. This restored choir is probably one of the oldest parts of the cathedral, which presents a magnificent union of ahost every st yle of ('laristian arehitecture. The central tower is 234 feet high, and the total exterior length of the cathedral is Fis feet. Immense mmaters of migrims cane here to worship at the shrine of Thomas it Berket, whe was killed in

 and h. Jenkins: İisersan Mistory of Canterhery (London, 1580).

Canterbury: al fovincial district of 14.010 sy . miles: on the censt chast of the norlh islame of the New Zealand groun). ('apital, Christ chmeh: latteltom is its chicl port. The prolucts are potatoes, oil, whalebone, gelli-fust, and hides.

## Canterlnry Bell: Sin ("Ampanta.

Cantharides [phual of ("astiabis ( $q$. $r^{2}$ )]: the group of insercts to which the gemus Contheris belonges. Alow a meticinal preparation ot Bumish-Ilies.
('an'lharis [kaveapis, the Greek name]: a genus of beetles ( (hopoptera) boloming to the fanily of Contharidee or blis-ter-bectles. The sueches. of which more than wot are known, have elongate hasios, a vather large head bearing long slender ancomar, whl long wing-covers, true wings heing present. Shas important of all the species is the so-called Spanish-fly, 'antharis resecutoria. This is common throughont the warmer parts of lourope, where the alults feed upon the ash, elder, honeysukkle, maple, pophar, lareh, and other trees. It is golden or bluish green, less than an inch in length, and appears in June, when it does considerable damage to the
foliage. The female lays her eggs in the soil and the larver live as parasites on the bumble-bees. The adults are collected by beating the trees in the cooler hours of the day and catching the inseets as they fall on cloths. They are usually killed by the fumes of sulphur or vinegar, and, when dried by heat, are ready for the market. They owe their use in therapentics to a peculiar sulistance, cantharidin $\left(\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{O}_{4}\right)$, whieh when placed on the skin produces blisters and when taken internally causes serere and even dangerous inflammation of the throat, stomach, kidneys, etc. On account of the presence of this poisonous principle the gathering of these insects is often accompanied
 with disagreealile results. They are
used in varions ways, the most common being in a plaster composed of the powdered beetles mixed with lard, etc., as alcoholie tincture, ete.

Other members of the family Cantharidap possess the same vesicatory properties, though possibly in a less degrec. In the U. S. there are many allied species, The most common species belong to the genus Epicutata, and the adnlts feed unon the leaves of the potato and the pollen of the golden-rod. An abermat member of the family is the "oil-beetle," Metoe angusticollis, so named from the oily fluid which exudes from the abdomen when the inseet is handled. J. S. K.

Can'licle [from Lat. centiculum, little song; dimin. of can'ticum]: callerl in the common English version of the Bible Solomon's song: in the llebrew (i.e. song of the Songs, of which the Vulgate Cunticum. Cunticorom is a translation): a lyrie poem with a dramatic arrangement in the form of a clialogue (as is evident from the change of number and, in the Hebrew, of gender). The subject is chaste love. The rablis first begam to interpret it allegorically of Goil and his people, and this interpretation was so established before the time of the Massoretes that they did not hesitate to recognize the look as canonical. The same method ol' interpretation prassed into the Christ ian Church, only that the allegory was there accepted as referring to Christ and the Church. The more rude torms of this methofl of interpretation have been abandoned. Int the effort is still made ly types or symble or ather therices to give to the book another significance than that which it bears on its face, Not a syllable appears in the book to suggest any such hidhen significmence, and this interpretation rests on the assumption that, since the book is in the camon, it must be something more than it ippears to be. The Cantirle is still :1n misolved riddle, but it is one of the finest products of llebrew poetry, and unsurpassel in any poetry for genuine sympathy with nature and as a deseription of pure love, the strongest and holicat of human passions, a flime of Jchovah which ean not be extinguished. This leve in its purity and faithfulness is canonized by this book. Niehuhr replied to a yomg man, who regretted its place in the canon, that he would not "onsider the Bible complete as "the look of lumanity" if it contained no representation of pure and faithful love. The look prohally belongs to the time of Solomon, thongh there are no satisfactory data tor deciding as to its late and anthor. The hest monlern commentaries on the funfirles are ly IIerher. who first fully appreciated its peetis thed dramatic character: Umbreit (1828): Magnus

 (iritis (1s90). ('omp. Driver^s Introduction to the Literature of the Old Tratament (1891), 1'p. 409. syq, inul Cornill's Ein-

Can'lilever: the part of a heam which projects ont from a will or lnyond a sulpurt. A haleony in front of a window of a honse is often suppurted by wantilever heams or brackIts, and another example is that of the projecting beams whelt supprot a sidewalk plated ontside of the trusess of a brider. A loam supprod at its middle peint consists of two equal cantilever arms: When a ham is smported at one ent and the other projerts heyond the second support, the projeding part is at cantilever, and some times the whole bem is said to be a cantilever hean. A matilever bridge is formed lig 1 wo such cantile ere beams or trusers extending out from ofmesite slames and naited over the middle of the river by a short truss. See brabes for allull aceome of
this important class of structures, which, although developed since 1880, is now applied to the longet spans.

Mansfeld 3mbrmin.
Cantire, kăn-tiro or Kintyre : a long narow peninsula of sootland: forms the aonth and of the eomety of Irgyle. It is boumled on the F . by the Rrith of (lyde or אilhraman somul, and on the W. We the Athantic Ocem. Its length is to miles, and its arrage widh fit miles. It contains a large portion of arable land. A lighthouse stands at the southwest extremity. which is called the Null of C'matire.

C'an'to Fop'mo [fal.], alsw Cantus F'irmms [hat.]: in music, the subject-song or theme. Devery part that is the suljecet of counterpoint, whether phain of figuret, is called canto fermo by the Jathans. Ja chareh masie this tem means plain song or choral song in unison, ind in notes all of egual temgth.

Can'lon [Fr. canton, from 1tal. contone, corner, district. deriv, of ranto < ('elt.* combitos, eormers, (rrook): a =mall piece of territory: the name of calh of the states or independent porine which mited form the federal republic of switzerland, mad retaining its antonomy in matters of intermal administration.

Canton: in heraldry, a division of an eseutcheon monsistilg of a square in the dexter chief. It is sometimes a bearing and sometimes is usel to receive a speeial bearing.

Can'tonment (Fr. cantonnement) : a military term applied to temporary resting-phaces of European armies. When troops are cetached and quartered in several adjacent towns or villages they are said to be in cantonments. In ludia the term is applied to permanent military stations of the British army, or to regular military towns at a considerable distance tron any city, and which sometimes contain magraines, mblic ollices, etce
Cantio, kŭn-too', ('varare: Jtalian historian; b. near Milan, Sept. 5,1807 ; lectured in various Italian universities on history and literatnre. His IVirersal History (35 vols., 1834-42) has been translated into English, French, Danish, cte. He also wrote The Mistory of the Italiuns (Turin, 18.4): The Last One IIundred Fears (Florence, 1864): The Ilalian Heretics (Tarin, 1866-68), etc. D. Mar, 11, 1895.
Cann'simn (in Gr. Kavúaıov): an important and very anrient city of Apulia, in laby; on the river Aufidus (Ofanto) : abont 15 miles from its month. 1t was probably fonnded by the Greeks. The inhalitants were called bilingues by Horace, becanse they spoke (ireck aml Latin. It was captured hy the lomans in 318 в. $c$. Its site is occupied by the modern ('avosa ( $q . r_{0}$ ). Here were fomm. about 1803, remarkahle momans of ancient art, among which were painted vases, marble statnes, and jewels of expuisite workmanship.
("anute', Kıut, or Kınd: Ǩing of Denmark; conqueror of England: s.n of Sweyn, King of I Enmark, who died in 1044 ; snceedenl to the English conquests of his father: thed before Ethelred to bommark in 1014 : returned next yar. and overam the realm, except London; after the hatile of Insandmn. Ehmund Ironsides divided the kingdom with him, retaining Wessex: on death of Edmmod he hecame sole monareh, sending Elmmol's infant sons out of the Fingdom. Ile contirmed his pwor by mildness and prudent policy: phed Sixons in power: Barriol Emma, widow of Ethelred: dividet the kinglom into the earldoms of Nereia, Northmberland. Wersex, and East Anglia; inherited the crown of Denmark on the death of his brother Itarold, 1018, and Norway on that of Olaf. 1030 , and hecame the most mowerful Eiropatimonach of his time. Ite founded monasteries, patronized minstrels, and wrote verses or ballads himself. I) at Shafteshary, Nov. 12. 1035. leaving three sons. Sweyn, Iharold, and Ilarlicanute. The story of his courtiers and the rising tide which wond not recede at his command rests umon the anthority of llenry of Huntington.
 mecio $<1$ hat. *eruncebe ceus, of hemp: lerive of cantnabis, hempl: a "oarse hempen or linen cloth which is extensively used in the form of tents and the sails of ships. It is also the prineipal material on which artists paint oil-purtures. The word is sometimes employed as synonymous with sail. In Old English it meat alsin al st raining-cloth or sieve.

Canras-bark (Aythya wellisneria): a species of North Ameriem duck, the liesh of which is highly prized for the table. It freguents the hays of the sea ant the est naries of rivers. The phamage is diversified with black, white, clasthut trown, aml site-color. The length is about 20 inches. These hirds, after breding in the northern parts of the continent, migrate somthard about November.

## Canzonde: see lake Poerry.

('alomatho: a Carib who had been adopted by the Indians of Hayti. In 1 tas he was cacifum of Magnama, a region in the cint ral and sothern part of the island. He was married to the celphrated Anicathil. In 1493 he massiacrel the small ionlony which (olumbus had left at Fort Nasidad, amd mante war on Concanagri. the ally of the spanards. In 149: hae haded at genmal leagur of the Iadians against the whites. Attacking the fort of st. Thomas, he was repulsed hy Ojoula, and finally with an immense army of lmbians was ronted he columbas at the batto of the Vega Real ( $A$ pr. os. 1.fain). Shortly after ajefia prenet rated to Comabis comentry with a small force, and motomed to treat with him. Gaining his confidenee, Ojedat indaced the ehief to mount a hores, atud suddenly simed and galloped off with him. He was sent as a prisoner to spain, hut diad on the vosage (14!6).

 [(anutchoue is viâ fro. from ('xpiblean cethuchu]: a valuable subatane used in the arts for a sereat variety of pmefuses ; the inspissated juice or satp of several specine of plants

Apmeymeren. It is problued chiofly in tropical aml sub-
tropical comntries, especially in the East Indies and South America. The milky juice of the tree is obtained by incisions in the bark, and is dried on clay molds over smoky fires, which gives it its usual black color. Pure catoutchonc is a hydrocarbon. ('s $\mathrm{H}_{14}$. It is extremely valuable in the arts on account of its elastic and waterproof properties. When combined with less than 25 per cent. of sulphur, and expmed to a temperature of about $270^{\prime} \mathrm{F}$., it is converted into soft vulcanized rubber, a substance much more valuable than the original caontchone, By adding 50 per cent. or more of sulphur, anci heating to $300^{\circ} \mathrm{F}$., it forms hard vulcanized rubler or ebonite. See Impla-rubber.

Capacity [from Lat. capacitas, deriv, of capar, competent]: in liw, ability or power to do a jarticular thing, such as to take or to hold lami, to sue and to be sued, and the like. Capacity may sometimes exist to do one of these acts, and not to do another. Thas one may be alle to take and hold land, and not have capacity to dispose of it, as in the case of an infant ; or one may be able to take, and not have the power to hold against another, as in the case of an alien, who may at common law take land as bet ween himself and his grantor, but can not hold it as against the state. C'apacity may be conveniently considered under two general heads -caparity to have rights, and capacity to act. Some rules as to incapacity depend umon natural disabilities; others rest upon arhitrary gromels. This subject is closely connected with the doctrine of stalus, as treated by writers on public haw. This has been shown by Maine in his work on Ancient Law to have had its principal origin in the early inde of the family. The arbitrary rules of archaic law have been, to a considerable extent, grarlually supplanted by the modern idea of fixing one's relations to another by contract, so that the movement of modern progressive socicty has been from status to contract. This doctrine is well illistrated in the ease of master and servant. In ancient law the position of the servant was fixed by an arbitrary rule, so that he was a slave. In modern times the relation depends on contract. Still, there always will be a class of cases where legal capacity is denied, as where persons, including infants, insane persons, and halithal drmakards, have not the mental power to enter into a contract, or where a supposed rule of public poliey may intervene, as in the case of aliens. Niens are still in sime of the American States denied the power to hold lanl ly purchase, or even to take it at all by descent. In fact. capacity to have rights largely depends on the general convictions of the people of a State, while the capracity to att is commonly determined by a desire to protect one who has rights from an improvident surrender of them.

> T. W. Dwignt.

Capacity, in electricity: the quantitr by means of which is measmrel the charge of a condenser. The relation bet ween capacity, potential difference, and electrical cuantity is expressell by the ermation

$$
C=\frac{Q}{1_{1}-T_{2}},
$$

where $C$ is the capacity and $Q$ the quantity of clectricity necessary to prohnce a ilifference of potential $\left(1_{1}-1_{2}^{*}\right)$ betweon the plates of the condenser. Sice Coxpenser and Elecorrictit.

 mate is hol. The group consists of fonrteen islames nine of which are inhahiterl-mancly, Sal, Roavista, Mayn, limo,
 They are all mumatainoma aul of wolemice formation, anel the
highest puint is the peak of Fugo, which rises 9,15 , feet, and is and active volcano. They have mostly a fertile soil, and are covered with luxuriant vegetation. Sugar, cotton, colfec. maize, indigo, satt. and tobaceo are the staples. The majority of the inhabitants are Negroes. The principal ocenpations are cattle-breeding and the making of salt from sea-water. The most imporfant articles of exportation are coral, salt, physic-nuts, hides, and coflec: and of importation, cottun cloths, timber, glass, crockery, hardware, and wine. I'op. (1885) 110.930.
Cape Viucent : a port of entry of Jefferson co.. N. Y. (fir location of county, see map of New York, ref. P-G): on Rome, Wat. and Ug. R. R.. and on the St. Lawrence river: 25 miles W. N. W. of Watertown. Extensive sed warehonses are located here. In the ricinity is good tishing, and the phace is a facorite resort for smmer tourists. Pop. (1880) 1,361 : (18!10) $1,394$.

Ehtor or "Fagle."
Cape Wratl: the northwestem extremity of scolland: projects trom sutherland into the Atlantic Ocean. It is a pyrmid of gneiss about 600 feet high, and is remarkable for the wildness and grandeur of its scenery. Here is a lighthouse 400 feet above the sea, in lat. $5 s^{\circ} 37$ N., lon. $458^{\prime}$ W.
Ca'pias (Lat. yon may take): in law, a common-law writ requiring the officer to take a person into custody. It as sumes a number of forms, still designated by the leading words in the old writs, which were framed in latin, such as (1) ''apias ad cudiendum, issued to bring up for judgment a defendant who has been fonnd guilty of a misdemeanor or minor crime. (2) Copius ud respondendum, or, as it is frequently termed. simily capius issued to the sheritf, commanding him to take and safely keep the defendant, and produce him in court on a certain day to ensuce the complaint of the plaintiff. This writ, which was furmerly resorted to ats a mode of commencing an action, is now, as originally, issued only as a part of the Mesce Process ( $q$. $r$ ) It las been much morlified in Fngland, ant altogether abolished in most of the U.S. (?) Capiuss sutisfaciendrme (abhrev. ca, su.), a writ of exeeution against the person, commanting the sheriff to take the person mamed, ind lave his horly betore the court on a specified day to satisfy the claim of the party resorting to it. The result is that the party is retained in custody until discharged by due coure of law. The debtor coutd be released only by showing an irregularity in the writ. or by satisfying or reversing the judgment against him. Statutes abolishing imprisonment of debtors have much restricted its use. (4) Capias in withernam, issucd in an actiou of replevin. and commanding the sheriff to take goods of a distramor eftual in value to other gools taken under a distress by the distrainor.and hy him removed or concealed so that they ean not be replevied by him. (5) Cupius uthegutum, used to arrest an outlaw.

(inpilara: see Capybara.
Cap'illaries [from lat. capillu'ris, of hair: derir, of sfunithos, hair]: the minute blood-vessels intermediate lortwen arteries and veins. They have but a single roit, eonsisting of a single layer of flat cells arranged cilge to edge. In size they vary considerably, most of them heing too small to almit the passage of more than one or two blood-corpuscles at a time. Their arrangement differs very much in the different tissifes and organs. They can be examinefonly hy the aid of the microscope, hence their existrmee was not known to the ancients. During lite the capillary motement of the hoond may be seen in the woll of the frog. the tail of the tarlpole, or the wing of a bat. The nse of the (a) pillaries is to subilivide and distribute the hood amongs all the organs and tissues of the body. Their improtaner in nutrition and in the performance of all the organie functions is very great. Sce Circulation of tie bloon.
Capillary Action: primarily, the devation or depression of lieguils in fine hair-like tuber, iss compred with the low of hiquils in equitibrium in vessels or in wide tubes. If ac clean wide ofrot tube be plungel into water. nite ohservation will show an clevation of the thid next the walls, toth within and without the tube. If the tube be very fine the water within rimes very considerably above its level outsille. and the finer the hote the higher the rise. C'arrful examination will show that the upper surfare of the water in the rapillary tube is concave. The comeavity of the "mmiscus" is greatest in the finest tubes. If two glass plates are united at one efge, the opposite engers being slightly sepa-
ratel, and the plates are placed in water with the united edges vertical, the water will rise between the plates, forming a curve which asomes the form of a right-angled hyprbola, of which the asymptotes are the commen vertical edere and a line at riuth angles to this empe so drawn as to be equidistant from the two panes of grans. If mepenry be substituted for water, the eapillary action is reversed : the mercury not rising in the tube or het ween the plater, but heing depreseed. 'The menisens, fos, is contex in this case, amb the hypertala is likewise reversal. In the harmeter amb endininetre it is netessary to make corrertions for this capitlarity.
The came of capillarity is well understorn, and jts results can he mathematically ixplainal. It depembe on the all hesion which exists between the fluid and the material of the tube; white the degree of cobesion betwen the partictes of the lluid itself mast atfert the result. Sis the size of tubes infermes, the cohmen within inereases whith the square of the biameter, while the attrating surlace increases only with the diametre. Attraction is therfore relatively muth greater in fine tubes.

The following table exhibits the relative capillary deva-
 1) (', acenrding to Frankenhein:

| Liquit. | Height of cap. column |
| :---: | :---: |
| Water. | . 15338 |
| Acetie acid | 8510 |

Capilal Account : a term used espectally in connection

 for shares of stock and that hartowed nom mortigage (t) bentures) or the pronerty if the company, and luwins with the lirst preparatury apreations of the empany: wheras the revenue acomot sommencos with the rotnris from acthal tratlic or ohar proturtive business.
('apitaligation (of words): tha use of (appital hetters in begiming words. The practicw of differm hations varies,
as in some smath drerge dors that of individual scholans. The langes in English are, however, virlually miform. Capitals are emploven allike in Mlsis. and in print to begin a scutene and each line of protry. The (iermans hegin all nouns and words heed sulstuntively with capitals, lint not thatirderivatives (unless used substantively), even thourh derived trom proper nams. The general rife in English is to bequall proprer names, and efth scparate word composing as boprer name, with a capital. The rule is expanleal to apoply to the yrecilic names of institutions, demominations. countries, towns, and in general to words and colleqtions of words used to prrform the fimetion of proper homes as a mems of individualizing any single prrson or thine. Thus to write the "Reformation," or the "French lievolution." or the "A Acension." is to indiente at well-known olecofferent. Titles of bookis, churdes. universities, works of art, and other styles cmbracing so woral worls. have the principal, but not the comertive or minor, words in initial catitals. dijectives derived from proper namos are berwn with capitals in Lingish almost universally. lut a few scholars follow the French and Geman use, which refuece initial capitals to aljectives. The names of dritiose of days ant monthe. and all tithe ol honor begin with capitals. The persomal pronoms relating to (iod, hat not the relative pronom nor the derivative Ifsomal pronom, should he caphalized: e. g. Ife. His, and llim. hut not whom or himself. The first word of a quatation preceded by a colon should also begin with a capital, hut but when the quotation is virtually a part of the statcher. When at pae-nanc is preceded by an adjective of location, the adjective is capitalized ; e. ir. Central New Fork. In the natural seiences the names of hranches, urders fanities, and gencta are indicated by initial capitals. hut when the sureitie is added the the generic mane in this work the suceiti name, even when derived from a prap nom, hagins with a shalt lettre: e. \&. Aloe cemerictum. Physeldospmate bidurellii. All abbreviations of substantive worls call for eapital letters, exerpt the names of weights Hut measures and the names of haw writs: lut not so the albineviations of more comertive words, as A. W, for Amm bumini (thongh small capitals are frequently used in this
 i. $\rho$. for it \&st, ib. for ibidem, cire. for circa, e.g. for exempli gratiâ, ete.

Conital Punishment: the punishment of denth (so called frome the Latin capmet, heal, anso lif(\%). Is the prenalty for murder it has prevailed from the earlient times in all parts of the word. In moet nations treation or rethellim against. lawful wewnment has also bern thus pmished; and in England and drawhe down to a very reent period. The
 and several other crimes. Tha manner of exerotion vario greatly. Dilitary eriminals, in momme times, are usually shot. In civil alministration the moles most prevalent. have lown dectpitation upon the "blow." nsed for political
 in Fratore: in spanish countries the Gakorve ( $q$. or) ; and hanging. On Jume t, 1scs, hanging was atholished in the Stato of Now Yotk for all murlers committed after Jan. 1. 1sol, and heath ly electrie show sulstituted therefor. In Chimathere are thire degres of capital pmishmat: lingchion slow death by hoing out topicees. decapitation, ant atragling. The lasi mationed is profered for many reasons. In lapan, fir some othenses the criminal was forimerts condomend to take his own tife ley diembowedment in the

In Chrimembon the tembery in modern times has bern to limit capital punishment to the greateot crimen only, and many intelligent furwons believe that it -hould he abotishen! athogether. The gromats mon which the quation is arruad are chiody-1. common right : s. Scripture: :3, "xpedieney.
 ments, 170.7) danies the right of gowemmente to take haman lift, under any circumstaners, in punislment of (rimas. It appears th he evident. howeser, on ming theory of socinty that such a ritht cxists in all ceases in which the safety of the community requites it. Is to seripture, the old Thestament, in nceendance with the words. ." Whoso sheddeth man's blome, hy man shall his blomi be shed" (trom, ix, fi), atfurds
 anthority: and the New Twament contains no prohibition of it. it is urewd. nevertheless. that the homevolene of Clriatimity and it- hieh regarel for human life mpuse the continume of the death-protity. In Winlian loans ende
of laws for Pemertvania it was prescribed for two crimes only-murder and treason. 'The chicf reatson for its retention in Chrishadom is perhaps its liblical injunction, esperiafly as this injunction (as ahowe) was given to Noah when he represented the whole haman race and is not therefore merely a Mosatic or Jewish statute, which might be supposed tu be superseded. like the Hosaic system generally. by Christianity. It has been phansibly rejlied, however, that the Nonchic law may reasmathy he supposet to he sulbject to modification by the progress of the race. like the Mosaic : and that Christendom has mactically recognized this fact by abolishing the eapital pmishment of brutes, which was eijoined in the same Noachie law that enjoins it for man, and withont any discriminative qualification whatever. In the early training of the race such means of teaching the vallue of human lite. it is argued. might be necessary : hat as one part of the law is now deemel nnnecessary, and its execution would be extemed preposterons, it is inferable that the other is equally subjeet to change. Beccurit and many others deny the exuerliency of capital pumishment, asserting that it does not lessen the ammont of crime; but whether this be true or not, it is a fact that such public executions as formerly tonk phace in England are brutalizing and injurions to jublic morality. Although some of the U. S., as lihode Island Maine, and Wisconsin, and some other gorermments, as Brazil, Hollant, and Portugal, have abolished capital punishinent, the effect upon the commission of crime has not been decided enough to prove such a step either advisable or unarlvisable. See Basil Montaru's On the I'unishment of Deuth (1809-13); Memoirs of Sir S. Romilly (1840); , Jeremy Bentham's Ralionale of Punishment (1830); E. G. Wakefield's Furts Kelating to the Punishment of Death in the Metropolis (1831): F. Hill's Crime: its Amount. Causes and liemedies ( 1858 ): Bovee's heasons aguinst ('apital Punishment; T. Pyne's A IMea for the Itolition of Crapital Penishment (1845); Report of Select Committee om 'apital Punishment, New York State Assembly (Alhany, 185t).

II. H. S.
('in'ifos [from Lat. Capito'limm]: the magnificent temple of Jupiter Capitolinns, which, together with the citald or fortress and other buiddings, occupied the Capitoline IVill (Mons Crapitolinus), in ancient Rome. These erlifices were fommed by the Taryuins ahout 600 b. c., anl delieated in 507 b. © The temple was hurned in the time of sulla, in *3 a. 1., was soon rebmilt, ant was hurned agrain in 6! A. D. Here was also the Tramburium, containing the public archives, anl hrre the senate often met in both ancjent and motern times. 'The steepless of the sides ol the Capitoline llill rendered it a natural fortress. On one side of it was the Tarpeian lock, trom which traitors and state criminals Were thrown. The name C'npitolinn was often applied to the whale hill. The site of the Capitol is now occupied by the Church of S. Maria in Artuepl, and the lahazo del Campidorlios, built by Michiel Angelo. More than twenty prorincial cities of the empine are known to have hatd capitols monted on that of Rome, and that of Toulonse has luen the seat of anthority for that city for centuries. The tem C'ipitol is also applied to the imposing elifice in which the Congress of the T. S. holds its sessions at Washingtom, and to tha stall--honses which are arected at the capitals of the sweral states.

Capilalinns, Joluts: a Latin bographer: one of the amburs of the Kistorin Alagesta: liven ahmat 300 A. D. The biographies ot the Emperors Antonimes lias. Marens Amelins, leminax, Opilins Macrins, the 1 wo Maximins, amb others, are ascribed to him.
(apit'mariss |from Med. These laws were general for all the states of the kingem, while those eallad leges wore issumb for the serval states. The most celdmath caphalames were those of r'hartetnagne and st. lanis. After Charles the simple, in (1)2, they were no longer ismen). The best collections of
 in the Jomumpula fiermunia, and of Boretins (Hanover. 188:3).

Cipilula'ion [Med. Lat. capitulatio. deriv. of capilula re, draw up under heads, Iraw up articles of agreement, as for surrender]: the act of capitulating or surrentering to an enemy unom stipulated tems; a treaty of surrender to an enemy. which is concluded when the garrison or besieged force lloes not surrender at discretion or meonditionally. The treaty often consists of several specified conditions or articles, and those who surrender are sometimes permitted to retain their arms and to march ont with the honors of war. The name is alsoapulied to those agreements whereby citizens of one state resiting in another are released from the juristiction of the country of their residence and placed under that of consular courts of their own nation, as is the casc in Egypt and Japan.
 fied seaport-town of Austria; in Trieste; sithated on a rocky island in the Gulf of Trieste: 8 miles S. W. of Trieste (see map of Aastria-llungary ref. 8.(). It was formerly the capital of latria. It is comected with the mamband by a brilge athout half a mile long. It is the seat of a bishop, has a cathedral and other churches; also manufactures of soaty and leather. Pop. (18:00) 8,646.
Capmos'trias, John Anthony, Come : 1, in Corlu, Ionian islamts, Fetb. 11, 1726 ; 11. in Namplia, Oct. 9, 1833. His father practiced as a physician, amb he began himself to stucly melicine, but entered afterwarl upw a political eareer imh hed a high position in the Govermment of the republic of the s'ren United Islands, when, in 180\%, by the Peace of Tilsit, that repablic was incorporatert with France. lle obtaned an aprointment in the Rossian diplomatic servGee, and was finally made secretary of Forrign Athairs. The aid he thus was able to give his comntrymen in their exertions for the establishment of an inderendent Greece induced them to elect him presithent of the (ireek republic in 1827 . But lue was utterly malle to keep his comsse straight through the tempest of the moment, and while prosecnting Manromichati for some uriminal oflense he was assasinated by two of Manomichatis consins, an incident cleply deplored by all frimals of the great cause he serverl. Sce his Life (Berlin, 1864) by Mendelssohn-Burtholdy.
Caponière, or Caponier [Fr. coponnière: Ital. capponiera, a covered lodgment]: in fortification, a defensive outmork sitnated in the ditch of the main work. 1. A massage or commmication covered from horizontal fire by a barapet on both sides (double cajonière) or on one side only (single or half caponiere). The parapets are usually $6 \frac{1}{2}$ or 8 feet high and are provided with a banguette. The superior slope usnally forms a glacis and extends to the bottom of the ditch. 2. A casemated structure. situated at the middle of the face of a polygonal work to flank its diteh. These were formerly made with two or more tiers of fire, hat in modern works they have but one. They have bomb-proof roofs and are protected from camon fire by their location in the ditch.
(npon sprimes: 11 anpshire co., W. Vis; 17 miles E. of Rommer and se N. W. of Winchester (see map of West Tirginia, ref. (6-1); has celetrated wam springs, usefnl in a very wife range of diseases. The seencry is line and the tront-fishing exenlent. The hotels aml bathing-honses are extensive. lop not given in 1890 census.
(appadócia (in Cr. Kamtaookía) : an ancient province of Asia Minor: bounded N. by Pontus and Galatia, E. ly Armenit, 太. ly Mt. 'Taums (which separated it from Syria and (ilicia), and W. by hyesonia. It was thaversel by the river Halys. Among its chief towns were Comana, Ariamthia, and Tyant. It was conquered hy Cyrus the Great of Persiat, and was rulud by independent kings Irom the time of Alexander the (irest mitil 17 A. n, whon Tiberins reduced it to a Lioman province. 'The greater part of it is incluted in the modern Kamamaia.
Capmel', wr Capmellas. Loms, or Liporwes: hiblieal critie'; l. in St.-Elien, ual Sedan, Oet. 15, 1585: educated at Sedan, Oxford, aml Samme ; becane Professor of Hebrew ia the Protestant Seminary of Soumur 1613 ; of Theology thore 16:3. ln his book ircunam punctationis revelutum (Levilen, 1624) he proved that the vowel-points and accents are mot a part of the oriminal INemew thxt of the Old Testanown. 'This work called forth a passionate controversy, in Which the laxtorfs fow a leating part in behalf of the traditimal opinion, Cuppel follumed up his attack in his

Caravaea, kumban-caa kăa: a town of Span: province of Mureia: on the slope of a hill 40 miles N . W. of Murcia (ece map of spain, ref. 18-11). It has an old castle, a college, and a fine elmech. Excellent wine is protuced in the neighborlhoor. Pop. 15,01\%.
 Italian puinter: b, at Caravaggio in 156!. If is proper name was Mrehael Angelo Amerighi (or Morigi). Me imitated no model except nature, and formed an original style; lived a turbnlent life: painted scenes from the lanes and allers of at wild and gloomy nature: was effective and excelled in chiaro-or-nro and coloring. Among his masterpieces are a Supuer al Emmous, in the National Gallery, London. The Froudulent Gamblers, in the Sciarra Gallery, Rome, and a Buriut of Christ. D. near home of wonds and fever in 1609.

Caravan [from Pers, kārmen]: a company of merchants or pilgrims whe associate together in order to traverse with greater security the deserts of Afriea and Asia. The commercial interchurs of those regions has been from the remotest ages carried on chiefly by caravans of camels. In Nohammedan conntries large carams of pilgrims are annually assembled to perform the journey to Mecea. The most impurtant regular caravans ate those whieh ammally trivel to Mecea from the three following points-1 hanascus, Cairo, and babylon.

Carayan'serai', or Caravan'sary [fron Pers, käman, earrann + sectā, inn]: also callet] Khall: an Oriental pub-fic-house or unfirmished imn for the shelter and lodging of travelers in Asia ind Africa. The travelers in those regions usually carry thrir own food with them. Each of these inns is commonly a square buitding of four wings built round a courtyard, in wheh the beasts of burden are confined. There i, always a well or spring of water in it. The wings are disided into small lotging-roms, in which the traveler finds no bed of furniture but that which he carries with him. In many caravanserais the hospitality is gratuitons, their erection being a work of pious charitr. It was in the stable of one of them (called inns in the lible) that our Sivinur was born.
Caravel, or Carvel [Fr. cerarelle: Span. caravela, or carabela, a caravel: Portug. cararela, deriv. of craba: MeHier. Lat. caralus. a kind of boat]: a resel of from 100 to 150 tons, usell by the Portugnese: a resel of from 25 to 30 tons, used in Normandy amd licardy in the herring-fisheries, The mariners of Tunis and Alyiers apply the same name to a frigate, and a large Turkish ship of war is also called a caravel (qurazela). In the fifteenth and sixteenth centuries

The caravel santa Maria.
a caravel was a galley-riged bark, employed by the spaniards and Partugum for purposes of commeree and $\times \mathrm{x}$ ploration, its lishtne- cmabling if to rum cloce to shore athl to chtir shallow harbors. The Portuguese mate use of it in war, as well, on aceonnt of its swiftnoss aml the ease with which it (muld be managerl. "The chief features of the caraval of that diy, which was not mulike a dapanese tradingjunk of the present time, were a single deck, a narrow and
very high stern, a hroat how, a rabin at stom and how three masts, latem rigerel, and a kownerit. The venols cmplowed by Columbens in his diferem sornge were empers. although one of the three, with which he mande his first trip across the Alamice, the Santa Mirm, Was aremeline to the nomenelature of that time, a carath, binge much harger than the average comacd. Late in the sixtenth century, howerer, it was customary to apply the term caravel to ships of harge size. Leppoductions of the resseds used by ('ohm-

 the sulphate of samim, are wery eflichent antidotrs to arlodie : Wid. 'They have the power not only of nempalizing the acid in the gasiro-intestinal tract lefure absorption, but of follow-
ing the poison into the luod and general tissnes of the body, and there converting it into a harmless sulpho-carbolic acid. They therefore shouh be administered freely at any stage of the proisoning at which the patient is first seen. lisilf an ounce of carbolie atid taken by the month bas cansed death, while the free cexternal use of the agent in surgery has sacrificed many victims. In internal medicine carbolic acid is of very littile use, save only for its benumbing influence upon the gastro-intentinal nerves, and to "heck fermentation in the gistro-intestinal tract.

## 11. C. Wood.

C'arhou [from Lat, carba, -onis, coal]: one of the elementary forms of matter. Its symbol is $\mathcal{C}^{\prime}$, and its atomic weisht 12. It is the prineipal constituent of all plants and aminals, in which it occurs in a great variety of forms of combination. Among the most abmelant natural substances of which it fomm a part are celmbose, starch. shgar. the fats, albumin, tibrin, etc. It is also fonmlin immense quantities in the solid portions of the earth in the forms of carbonates, of which limestone, chatk, and marlle are the most common Farieties. In the atmosphere of the earth it is present principally as carbon tioxide. which is commonly called carbonnic acil: and this gras is also found dissolvert in all natural waters. The different varieties of coal consist largely of carbon, the proprotion of this element being largest in the hard casals. Further, carhon is the principal constitucut of petroleum.
Carbon wecurs in mature crystallized in two forms, diamond and graphite or plumbaro. There are therefore three forms of the element, (1) diamond. (2) graphite, and (3) amorphous carbon, or charcoal. Of these, diamond is the purest. All three forms. thongh they differ so markedly from one another in some rexpects. have certain properties in common. They are all insoluble in all the orthary solvents : they are all infusible: and all are converted into carbon clioxide, $\mathrm{CO}_{2}$, when heated to a high temprature in air or oxygen. Lampblack, coke, and charcoal are impure forms of carbun. Lampblack is deposited from Hames of burning vil; coke is formed when coal is lutated so that it is protected from the air, as in the manufacture of gas: and charcoal is made by hating wood in kilns by which the action of the air is prevented, except so far as may lee necessary to keep up stow burning.
('hemically carbon most resembles silien, which is one of the most importint constituents of the inorganio or inanimate portion of the carth.

Ira Remsen.
Carbon: town: Ciathon (w). If y (for location of count 5 , see may of Wyoming, ref. 1i-d); un T'n. Pille. R. R.: $1 \neq 0$ miles $\mathbb{N}$. of cheyeme. The chief indnstry is agriculture. Pop. (1880) 365 ; (1890) 1,140.
Carbonari [lat., charoal-burners]: a seceret political society; founded during the French mule in Naples in the beginning of the uinetcenth century. After the restoration of the Bourbons in Naples the society rapinly increased. In tse0 they organized brambes in France, and after the defeat of the revolutionary party in Naples and Piedmont, Paris became their headipurters. After the revolution of 1s:30 the society disapmared, althongh as late as 1841 a society of Carbonari was found to exist in suathern France. $I_{10}$ the revolution of 18 ts they took no part.
('irbonated (or Aridulons) Walers: those waters which contain a latse portion of carlonie acole gas. The term is ap1) ied to mineral springs, as those of seltzer, Vichy, Demmont, Salabrum, leime \% saratuga, cto such waters sparkle much what poral from one worl to another. Carlon'ic Acid: a name commontr given to the oxide of carbon of the formula $\mathrm{CO}_{2}$, whith is calle cotbon dioxide by chemists. Itwocemence in nature is referred to in the article un Carbon (g. r.). It is constantly formed by ammber of natural proceses, as comblastion, respiration, and fermentation. All substances used for frel contain carbon as one of the chic ${ }^{\prime}$ constituents, and when they are burned the carbon combines with the oxygen of the air to form carbon dioside. In the process of respiration waste-prodnets are exposel in the lungs to the action of the oxygen of the air. and they are burnt up rery much as if they were pot into a stove. the carbum contained in the waste-products being converted into carlon dioxide and given off from the lungs. There are many kinds of fermentation. this name being used to designate clanges hrought about he the action of minute organims. One of the hest-kuown kimls of fermentation is that by which sugar is changed to aleohol and carbon thoside. This fermentation takes place naturally, and gives rise to the formation of large quantities of carlon dioxile. In 10,000 parts of the carthe atmosphere there are about 3 parte of cabon lioxide. Notwithstanding the fact that sucflarge puantities of the gas are constantly being introluctel into the air, the relative quantity remains practically constant. This is due to the fact that all plants make use of corlam dioxide as food, dromposing it, and building up fron it the complicated componems which furm their tisines.
Carbon dioxide is a colorless gas, abont half again as heary is ortinary air. It has a slight taste and slight odor. In it the process of burning can not take phace, nor can the process of breathing.
Carlon dioxide is easily made by bringing together limestone, marble or any utlict cantminate and hydrochloric or sulphuric acid. In geveral terms any carlonate gives off (arbon dioxide when bronglit together with an acid.
At a low tempratme and noter high prossure the gas is liquetind. and when the remol containing the liquid is openel at the ordinary tempurature a part of that which escapes beomes solid. owing to the great ahmurption of heat cansed by the conversion of a part of the lifuid into gas.

Carbon dioxide disoolves in water at the ordinary temperature and under the orlinary atmowheric pressure to the extent of one volume of gas to one whmme of water. Under hisher presenre the anoment whith can lo dissolved is much grater. amd when the preswre is remowed a lage part of the gas escapes. The afmeseent waters which weenr in nature, and which are mannfactured, owe their effervescence to the furseme ut cartun dioxide. This is true also of berers, champagne, and ot her similar be rerages.
liquid carton dioxiche is mow ohtamalle in the market. and is used as a fire-xthurusher and fon the pmpose of giving life to lxar.
It is frembently statem that the bat offects cansed by breathing the air of butly ventilated roms are due to the

Car'diranshire: a maritime county of South Wales ; boumled X. hy Merioneth, N. F. by Montgomery, E. by Radnor and Brecknock, S. by C'armarthen and Pembroke, ant W. by Cartigan Bay. Aren, 693 sif miles. 'The surface is diversified with rugged hills, fertile valleys, and small lakes. The rocks which mulerlie this county are lower Silurian slates ant shales, in which rich veins of copper, lead, and zine occur. The chief articles of export are cattle, sheep, oats, barley, butter, slates, and pigs. Capital, Cardigan. Pol. (1881) 70.226: (1891) 62,596.

Cardi'idar: a family of lamellibranchate hivalve mollusks: inchates those specties in which the mantle is open anteriorly for the foot, and has two nrifices, one lor respiration and the other for excretion, as the cockle (Cardium edule).
('ardim, P. Fernão: Portuguese Jesuit: b, at Vienna do Altivo, Nemtejo, 1540. He was sent to limail in $15!49$, and traveled over the known portion of the rountry la 1601 he went to Rome as procurador of his ordfr, and was there namet provincial of Brazil; but on his return he was eaptured by English corsairs, and only relased in 1604 on payment of a ransom. He then went ta Brazil, where he Was provincial until 1608 , and subsequently dretor of the Jesuit College at Bahia: Ile wrote Narmblum ppistolar de
 lishem in 184\%. and of great historical interest.
|lerbert I|. Smith.
('ardinal [subst. use of an mli. from Lat. curdinalis, pertaining to in hinge, 1 rincijual, deriv, of cordo, cardinis, hingel: the title ot an ecelesinstie in the lioman Catholic C'lureh. The cardinals are the highest dignitaries of the Church, except the pope, of whom they are the electors and the connselors. Their distinetive dress is the scarlet birretta, (:ap) and cassock. 'The scarlet hat is only symbolical, imposed once by the pope in person, and aftre death hung up in the titular chareh or the catherlat of the caldimal. Pope
 which is still used. They are appointed by the pope. Those resident in liome are sibid to be in curia, and are nsually employed in the administration of the great congregations. The renainder are, as at rule, bishops of the more imporiant sees of C'luristentom or men of mark in letters, Church administration, and the like. At presednt camlinals are rarely sent nu foreign missions. The see of Rome conducts sueh business througl its numeios ant ablegates, or the ehief erelesiasties of the tifferent nations. The horly of cardinals is callal the saered College. The total mumbre of these prolates has been for several centuries limitet to seventy, of whom six are bishops of small suburban sees in the vicinity of Rome: tilty, styled cardinill-priests, lood their titles from batishes in lome (many of them being at the same time bishops of foreign dioceses) ; and fourtern are eardinat-leacons, holeling their titles from ancient diaconal churehesot the city. The actabl nomber of cardinals is often less than seventy. When the pope dies a successor is chosen by the cartinals, who are assemblad in conclave at lione, and who usually elect one of their own mmber to the vamat pontificate. buring the election, which in the past was oceasionally potractmi several wecks or months by their inability to rarere, they areconfued in a certan building, formerly the Quirinal Pilates, and debarred from intercourse with the mblic: "ven the foor through which they enter the canclave is walled up, and only a smatl alderture is left, throngh which forel is bronght to them.

Revised hy dous J. Keane.
('ardinat-srosbate (Cardinalis cardinatis), called also Redhird: ont of the finest of Americian somg-hirds; a native of the $U$. $A$ : remarkable for the heanty of its form and plumage. The bill is thick and broak. fut not long. It helonins to the family Frimgillider. The back of the male is a llasky red, and the rest of the flumage is a bright, vivid scarlet. It has on the coown long feathers erected into a conical or pointed crest. Whicll it is said to raise and lower at pleasure. The fatal length is ahout 8 intines. It visits the Northern Stales as it summer bird of" fassige, and spends the winter in the southern slates, whaw some of them remain all the year.
('urdinal-luower [so colled from its luiglit-rod flowers, in color like a cardinal's lat]: the Loblelia combinulis: a per"nnial herbaceons plant of the fimily ('ompanulurer : commen in unst parts of the U.S. in wet places, in the Athantic regron. 'There is a similar speejes or a now variety of it in Nexico. The color is a most intense red.

Caribe: Sce Cabire.

Caribou (Rungifer tnrandus, var. Carabou): the American reindeer; inhabits Maine, New Brunswick, and other cold regions of North America. The carilom is remarkable for the great development of the hrow-antlers or branches. which extend in both sexes forwart over the forehead. The color of its hair in summer is at rich reddish brown. The arerage weight of this animal is about 2.50 or 300 ib . Its flesh is much esteemerl as foot, and its skin is of value. The "barren gromol caribon" (var. (frcenlandicus) also regarded as a variety of the European reindeer, is found farther N.

Caribon: village in Caribon township; Aronstook co., Ne. (for location of county, see map of Maine. ref. :3-F); on the Vancehoro, Woodstock, ant Etmundston Division of Can. Pac. R. R.. ant on Aroostook river, 150 miles N. by d. of Bangor ( 250 miles by rail). The village has churches of five denominations, high school, starch. carriage, and sash and door factories. foundry, urist-mills. lumber and shingle mills, wooken-mills, water-works and electrie lights. The principal industry of this section is agriculture. The first settlement here wis mate in 1844. Jop. of township (1880) 2, $5 ⿹ 6$ : ( 1890 ) $4.05 \%$
E. W. Will. town clerk.

Ca'rib: a race of lmainas who, in the fiftemth century, occupied portions of the northern comst of South America from the Amazon to the Orinoco, and heyond and far op the latter river: they had driven the Arawaks from the Caribbean islands, and ocenpuet most of them. The Ciribs may tre desaribed as Indian freebooters; they were comstantly at War with surronding triber, by whon ther were much feared, and their incirsions in camoes often extended for humdeds of miles. In battle they were very firce and ernel, hut treated their prisoners well, and often married the women: hence there was a constant change going on in the race. Camibalism was practiced in their war-feasts, but its extent has been greatly exaggerated. The tribal ties were rery lonse, and the chiefs had only a nominal authority. At the time of the conquest they practiced agriculture. The Spanish courts condemmet the Caribs to shacery as eannibats. but for a long time they were hardly molested, probably be(ense they were dangerons foes and useless as workimen. The French and Engisish oceupation of their islands led to hooly wars with these Indians. Their last stronghold was st. Vincent, where they mixed with furitive slares, forming the rave called black farils. They were conguered by the Fuglish, and the survivors, to the number of 5,000 . were tramsprted to the island of Ruatan in the Gulf of Honduras (1796): thence they passed over to the mainland, where their descendants now live and are estemed as excellent workmen. I few humbred were allowed to return in sit. Vincent. where they have a resruation, and there are a few others in the of her jshans. On the mainland some thomsand live in a semi-wihd state on the Orimoeo and in Guitnat. The early Spandrds appled the name (arib indiseriminately to any Indians whom they regaded as camibats or very sayage.

Iherbert H. simith.
Carjcature [from lta], rericeturf, sharge, loading, heriv. of curceare to load]: al groterpue prepresentation in art. Carieature is of two kimes: the firs confine itorlf to giving merely an exaggeratell prominence to fleformities and physieal intimities ; the serond, whichalone is worthy of serious consideration. while giving prominence to the grotesque asperto, is enncemed mome expecially with man's vires, weakneses, of pasions, The firs is a more srotergue ammsement ; the seromil may become cruel personal injury. rerengeful satire. or the most redoubtable means of publie censure. ('aricature in the latter aseret. has mumestionably playd no small pant in political and social movements. Caricature is more than pisturesque satire: it partakes of the character of the hurlespue and of comeds. It is violent anll umpestrained only in perionsof social effirvescence ; but it is hardly just to say that it has no sirnificance exeept in crises, for its rife in kess to reflect revolutions than to prepare the way for them.

Caricature was employed in romote antiquity to seore and to ridiente viece. The Asorians, the Egrpuans, and the Grecks cultivated this hranch of art sucerestully. The Grecks expectally carried this specios of satire so tar that they did mot aren spare their gools. The most notable Grekartiot in this linc was P'ozon. Jigypt was as hold in caricature at Greere. 'The Equptian Dhisenm at Turin possesses the fracments of a papyus which represents people by iminals, which (aneful stuly has shown to le a caricathe of an Feyptian sculpture of tour women playing on musionl instrunconts. Thu, Mritish Musemm possesses a

Serverl as Profesor of 11 istory in Upsala, and was twiec a cabinet oflicer: Anong his mumerous historisal works the most excellent and important is his Sreriges Misemtin under fonuryarne uf Pfulziskit Invert, which may he regarded as at continuation of treijer's histury. I). Mar. 18, 185:

Carls'rulue, or (Germ.) Karlsiuhe, kark ron-e (i. e. (harles's rest): a city of Germany: capital of the grame duchy of Baten: 46 mites ly rails. of Jannheim (sce map of German Empire, ref. 6-I). It is commeeted by ralways with all parts of Germany. The strects are arringed like the ralii of a semicirele, convrsing toward a central point, which is oceupied by the palace of the grand duke. Connerted with this palace is it museum and the ducal library of 150,000 volumes. The town also contains a botanic garden, a mint, a theater, an arsenal. and several hospitals. Here are manutactures of mapets, jewelry, chemical prodnets, carriages, etc. Carlsruhe was foumled in 1315 ly Charles Willian, Margrase of Banten. Pop. (Is85) 61.074; ( 18.55 ) 84.030.

Carl'stad : a town of Sweden: on the istand of Thingwalla: in Lake Wener : about 141 miles W. of Stockhohm (see map of Jorway and Swellen. ref. $11-\mathrm{E})$. It is conneeted with the mainland by a large and handsome bridge. It has a cathedral, a college wit In in observatory, and a cabinet of natural $^{2}$ history. Copper, iron, timher, and grain are expumted from this town through Lake Wener and the (rotha Came ; sufFered by fire in 180., -ince which time the town hats greatly improved in appurance. $\mathrm{l}^{\prime}(1]^{\prime}$ ( $1 \times 51$ ) 8.516 .

Carlstailf, Inmefas Rombphes Bodessten: 1h, at Carlstalt, in Franconia probably two years before Luther (1481); 1. at basel, Dece 25, 1541: played a singular part in the history of the Reformation. lle stultied thenlogy at various italian unirersitios, smi was in tish appointent professor at Wittenberg, where he rapmonded the Christ ime doctrines in the usual manner of the schoolmen. After an absence of some time on a visit to Rume, he foum the whole theolory of the universily changed by lather. Ile first offered shme opposition, hut then suiddenly adopted the views of the leformer inm carriad them to extremes. During Luther's stay at the Warthurg hermsed great disturbance in Wittenters by his riolente and recklesshers. and it cost hather great exertions to matore order. Ihmiliated at his fallure. C'arlstadt brequ to attack I Juther, and made himself the center of a cirche of ill-alvised enthasiasts. In diob he was hanished from saxony, and in 1.530 he settled at Stras-burg. Sidhes with Zwingli in the controversy concerning the Lomd's supper, he was apponted pasfor at Basel, where the continued his attacks on lather. (Sre his Life by liger, stutharlt, 185i.) A complete list of his work-miontly phomical, anil oftom rather unsicory -has been given by Rotermund in his Lirmortes A Andenher (Bromen, 181s).
('arloon. Tnomas. I). D.: elereyman of the Methodist Episcopal Chureh; b, in hontonterry. N. II... Duly 26 , 1805 : began his ministry in the Genese conference in 1 Ne9: ofrupied important pulpite in Rochestare, Bultala, ant other places for several ypars. His superior adminisitative and linanciat abilities led to his apmintment as agent, for threp years, of the Genese Wempyan scminary, as presiling elder of important districts for siven wars, amb prinejpal agront or publisher of the Methonlist Buok Conerrn in New Fork.
and treasnrer of the Methodist Missionary Society for twenty years ( $1852-7$ ), D. in Elizabeth, N. d., Alur. 16, $18 \% 4$.

Carlulovi'ea Palma'ta: a tree or slirub of the order Pandanacese ; grows in the tropical parts of South America. It produces the leares of which panama hats are made. Those of the best quality are plaited from a single leaf without any joints. As this process rectuires several months, the price of such a hat is very ligh.
Carlyle kar-lif' : capital of Clinton co. 1hl (for location of county ser map of llimois, ref. !?-1); (in raihoad and on the Kaskakial river: to mites E. of St. Louis: has fine churches, school-houses, and stores athl it spoke-factory. The public libary contains 5.000 volumes. There is a seminary for young ladies. Pop). (1ss0) 2.015: (18tH) 1.24.

Editor of "Cosstitetros asd Cnon."
Carlyle, Alexinoifr, D. D.: Scottish Preshyterian divine: 1. at Preatonpans, Jan. 26, 1ia2: ellucuted at the universities of Edinhmogh. Glasgow, and Levilen; ordained as ininister of Inverek. near Elinburgh. Its: molerator of
 His Autobioyraphy. edited by Burton in 1win (London). excellently deserilns the society and evento of his time. D. in luveresk, Aug. 85. 180.5.
Carlyle. Thomas: a distinguished British eritic and bistorian; b. Dec. 4, tath, at Eiclefechan. Scotland. IIe was of a tamily of peasants, "pithy, bitter-spoken bodies," and his father was an stone-matom. Ble was educated at Annam school-the "Hinterselhag (i. e. whip behind) Gymuasium " of Surtor Resertu:-and at Elinhurgh University. At school he made acquaintance-which ripened into it warm friendship-with Edward Irving. afterward the famous preacher and fombler of the lrvingite communion. In 18f4 Carlyle hecame mathematical master in Annam Academy, and continued to teach there and subsequently at Firkealdy till twhs. Ilis first published book was a transLation of Legrndre's Geometry ( 1824 ). The hegan to contril)ute to the magazines alrout 1 too. and net himself especially to the task of acquainting English reaters with German liferature throurh his tranlations ame ritieal essays. His Life of sehiller was published in the Lemdon Mrigazine in 1033-24. 11 j translation of 11 ilhurm Meister appeared in 1524, ind Syprimens of German Romance-Tiech Richter, Iluse burgh, Forrign. and It estminster Reviens and Frasers. Magazine articles on Gothe. Thener. Nowalis, lleyne, Richter, German phawrights, early German literature, the Nibelungen Lipd, ete. His own style became gralually more and more tinctured with Gemminisms. Hichter had a particularly strong influence on him, and his imitation of that writer's whimsical, meonth, and rhapsondical manner prowluced in time a vicious and affected hetion in his imitator. In 1824 he went tu landon. narriod Jatue Welsh in 1826. and after a Nhort residence in Eitinhurgh removed to a solitary farm received by her as an inheritance, it Craigeuputtoch, among the wild granite hills of Damfriesshire. Here he was risited by Enerson, by Francis Jetriey, the editor of the Edinburgh Reriex. with whom he had formed as close intimacy, and by oflers who were attracted ly the power and originality of his writings. In 1833-34 he published in Froser's Magot zine his first great book Sertor Resarfus (The Tailor lietailored). This was a satire on shams, conventions, the disgrises imil wrappings of the human soul. It purported to be the life and "clothes-philosophy" of 11 err Diogenes Teufelsdröckh. J'rofessor of Things-in-Gencral in the U'niversity of Weissticht wo (know-not-where), and was possibly suggested by a paragriph in Swift's Tate of a Tul: "A sect was estiblished who beld the universe tis be a large suit of clothes," atc. In $18: 34$ Carlyle remoset to ("husea, a honton suburb, where he resided for the reat of his life. In 1833 he pullishod his Frenef Remotution, which is not so much a history as a serips ot vivid pictures. IIe conceivel of history drilmatically and defined it as " the ewsence of innmerahle lifngraphies." His French Revolution is really a great trugedy acted out by a few lealing eharacters. Mirabean. Dinton, aml others. Thas MS. of the first wolume hat been lent to . lohn stuart Mill, amb white in his posession was accidentally burned. (sarlyle rewrote it with infinite pains, but he said of the new rersion, "1 linna think it's the same." (Fartism ( $1 \times 3: 3$ ) lealt with a monlern sorial and political prohlem. In Ile rops amd Hero Wrorship (1841) he repeated and developed most fully the political philosophy of Chertism and the idnas skethed in his three carly esselys, signs of the Times (188!), Ifistory (1830), and Charecteristics (18:31).  jzer of the suil.
 town of North W: the: explial of Cornaroonshire ; on the dast
side and near the southwest end of the Menai Strait, which separates it from the island of Anglesey (see map of England, ref. 8 -D). It is 7 miles $s$. W, of the Menai bridge, and about 60 miles W. S. W. of Liverpool. The harbor will admit ressels of 400 tons, and stemmboats ply between this port and Liverpool. Carnarvon is amuch-liequented watering-place, and has beantiful scenery in the vicinity. Here is a castle founted by Fulward I. in 1282, which now forms one of the most imposing ruins in the kingdom. It has thirteen embattled towers surmounted by turrets. Carnarvon is about half a mile from the site of Segontium, an ancient Roman town or station. Pop. 10,000.

Caronaryon, Ilexry lloward Molvety Ilerbert, Earl of : an English Conservative statesman: b. in London, June 24, 1831; succeeded lis father as fourth earl in 1849. He was appointed sueretary of state for the Colonies in June, 1866, and le framed al plan for the confederation of the British North American colonies, which was approved by Parliament. IIe resigned in Mar., 186\%. beeanse be was opposed to the Reform bill which Dispali introduced : resumed office under Disraeli in 1874 : resigned in 1878 . Inring the Conservative alministration of $1885-86$ he was lort-liputenant of Ireland: author of The Druses of Mount Lebanon (1860), etc. D. Jume D8. 1890.
Carnar fonshire, or C'arnarvon : a county of North Wales; bordering on the Irish sea; has an area of 575 sq . miles. It is bounded N. W. by Menai strmit and Carmarvon Bay, N. by the Irish Sea, E. by Denbigh, aud S. by Merioneth and Cardigan Bay. The surface is very monntanous, and the scenery is remarkably grand. Ilere is Snowdon, which is the highest mountam in Winles. and rises 3.571 feet above the level of the sea. Among the minerals of this connty are eopper, lead, zinc, coal. and roofing-slate. The chief branch of rural industry is the rearing of black eattle for the clairy, Carnarronshire is traversed by the Chuster and Holyhead Railway, whicherosses the Mlenai Strait. Capital, Carnarvon. Pop. (1891) 118, 205.

Carna'tion [from Jat. caruatio, fleshiness, deriv. of caro, farnis, flesh: but ef. Itil. carnrgione. flesh-color]: This term is used in jrainting, and is applied to the flesh-tints or natural color of flesh: also to the parts of a picture which represent the nude human figmre. The tern is not in vers common use at present; the phrase flesh-tints seems to have replaced it.

Carnation: the most popnlar ormamental plant of the pink family, known to botanists as Dianthus coryophyllus. The aboriginal form of the carnation is not certainly known, but it is protty generally agreed that its wild prototrpe now grows in France and some other parts of Europe. The carnation has heen enltivated for several centuries, and flowers were known in old times which were nearly 4 inches across. The species is immensely variable, in the color and shape of the Hower, and in the character of the plint. The common

> Carnation.
carnations are ensentially sreenhunse plants: but there is a tribe of outdone of border varieties which deserves to be bettey known. ('arnations are commonly ilassified into four groups distinguished by the markings of the flower: Selfs. or those having but one solor: picoteew. those having white
petas margined across the end by a band of color: flakes. with two cobors in broad stripes ruming lenethwiee the petals; and bizurres, with three colons dispmased in stripes or spots. The common carnation is ordinarily treated as an anmal. It is started from short cuttings in late winter, and the phats are commonly sol in gromm in the open during summer. They are taken up late in the fall amt transferred to the glasthonse. where they boom more or less contimumsly throughont the winter. Gme of the chiof fanles of the large carnations is their hathit of harsting the calyx with exparsion of the flower. Carmation-growers now desire varmies with short and homl calyx which posess pouch-like expansions to take upand equalize the prissure
('arue'ades (in Cro Kapveáôns) : a (irpek philusimber and orator: 1) at C'yrene. in Africa, in 218 B. C. ('aruelian, or Corme'lian [Fr, cornuline. drove of lat. cormu, horn: the other form with cor- is che to inthence of lat. carnem. Hesh]: a name given to a fine raviety of chatcelony: red or flesh-color. ant rarely milky white. It has a conchoidal fracture. Beatilul specimens are found in Hindustan, where they are highly prized, and are mamfactured into varions ornamentalarticles: it is fomed also in Soothat and in many parts of Europe and Amerion. The bright, clear red carnelian is most valued.

Garnilex Ferry: orer the Ganley river. Nicholas co., Va.; about \& miles below Summerville: gives its name to the sewre ation on the north bank of the river near this ferry Sept. 10. 1sti. The (onfederates under Gen. Floyd, mumbering about 5.0 , 0 , hat st rongly intrenched themselves in this position, where they were attacked by the forces under Gen. Lowerrans on thi afternoon of Sept. 10. Darkness terminated the battle of the day, and during the night Gen. Floyd, being hargely outnmmixred, escaped with his command across the Gauley river. Jestroying his bridge behind him, which prevented pursuit. All the camp equipage and munitions of war fell into the hands of the Federal forces.

Carnio'la (in Germ. Frein): a division or erown land of the Austrian empire: hounded N. ly ('arinthia, N. E. by Styria, S. F. and S. by croatia, ands. W. by the Arratie seat and the littoral province. It was formerly a part of the kingdom of Illyria. Area, 3, sigesq. miles. The surface is mountamons, anil partly occupied ly the Carint hian Alps. Among its remarkable physical features are Lake Zirknitz and the rock-bridger of st. Kamzian, which is $1: 30$ feet high. The chief river is the Save Carniola contains the quicksilver mines of Jdria, which are amone the richest in the wordd. lron, coal. and marble also occur. Amoner the products are tlax, silk, honey, and wine. Pop. (1840) 45, 458.

Carnival from Ital. carnexale explained either by help of the Med. Lat. carneleverin, cornilere men as removal of Hesh, or from a Lat. rumus mora lis, hoat on wheels, from a supposed usage of the procesions. The exphan. from Ital. come, flesh + lat. ralp, farewell. is more folk-etym.]: a festival in the Loman (atholic countries of Euroje just preceding Lent. It was formerly most briliantly celebrated at Yenice : later, "specially in Rome. Like mani other usages in modern Europe the cinstoms connected with the carnival probably oricinated in the heathen sprinotime festivals, as The Luprealia and louchanalia of the Romans and the Yule-feasts of the Germans. During the Didtle Agres costly banpuets with the rich. and drinking-bonts among others, marked the time. The carnisal at fome sometimes hasts eight days during which the whole city is given up to revelre, the center of which is the street called the forson. In this all the honses are hong with crimson drajery, aml each afternoon continuons lines of carriages ant promenolers pass throngh it. Nost of those who aprar in the streat are maskel, and an incessant interehange of banquets, comfrtti, and other harmless miswiles makes a stene of extrenc liveliness. At six oclock, atter the firing of camon and the clearing of the Comb by trogers, a mumint of hosessare let lowe at one end of the strect. and are urged hy the shouts of the people to full speet. The last event of the Carnival week is the celemation of the Moccowfti. For this after dark, all the revelers. on foot, in carriages, and at the windows of the corso. provide themselves with a mumber of small lishted tapers, which each endeavors to preserve, while fue puts out as many as possible of those of his meightors. The political disturhanees of lavy somewhat depressed these festivities from 18.59 to 1800.
 thesh-eating: curn-em, flesh + rore re, devour]: amimals which prefer tle ham at little or no vegetable food. They belong to the chass Mummulia, the name Fera being an eartier mane for the same roup. It is charateristie of them (1) have sharp (eutting treth, simple stomachs. very muscular bodies, and artive habits. This order includes, among other
animals, all those quadrupeds which are properly called beasts of prey, excepting a few of the marsupials of Australasia. Which are carmivorous in their habits, and resemble in their extermal characters certain animals of this order, which they may be said to represent in the native fauna of that region. Interesting fossil remains of carnivora are referred to the eras just preceding and just followiner the glacial period. The order is divided into several families, as Felid.e, Mustelid.e, L'raid.e, (Gavid.e, Phocid.e, etc. (q. r.).

## Carnirorous Plants: sec insectivoroc's Plants.

Car'nochan, Jome Merriy, M. D.: b. at Savamah, Ga. July 4, 181 ; : studied medicine at Ellinburgh and yarions places on the continent of Europe; began practice in New Fork in 1847: soon gained ulistinction for his bold and suecessful surgieal operations. Thus he excisel the whote trunk of the second branch of the fifth pair of nerves for the cure of neuralgia, depending upon disease in the nerve. This nerve wis cut out from the infraorbital foramen to the foramen rotumtum, ind consecquently involved an opreration through the malar hone to the base of the skull. In 1859 he tied the femoral artery, and thus ingeniously cured a disease of exaggerated nutrition, elephantiasis arabum, which operation has been accepted in Europe and extensively practiced. Ile also tied the primitive carotid artery on both sides for the cure of elephantinsis of the head-base and neek. IIe exrected the entire radius in 18.3. the cntire ulna in 1854, and also exspetel the cntire lower jaw and the calcancmm. In 1851 he became Professor of Surgery at the New York Medical College and surgeon-in-chief to the State Immigrant 1 ospital. He published many vahable prof essional monographs and lectures: a treatise mo Congenitul Dislocutions (1850): a translatinn of Rokitanskys Pethological Anatomy. etc. D. in New York. Oct. $24,180^{\circ}$.

Carnot kăar nō. Lazare Hippolite: a French radieal republican: son of L. N. M. Carnot; b. at St.-Omer, Apr. 6, 1801. Ile was a member of the Chamber of Deputies from 1840 to 1848 . and was Blinister of P'ablic Instruction from Febrnary to July of that year. In $1864-68$ he was again a member of the Legrislative Assembly. In 1801 he was again elected to the Assmbly, where he voted with the extreme lelt. He wrote an able work on saint-Simonism, and published the memoirs of his father ( 2 vols., 1860-64). I). Mar. 16. 1888.

Camot, lazare Nicholas Mariterite: soldicy and statesman; 1, in Nolay. laugmoly. May 13, 1953, of one of the oldest and most distinguished fanilies of France. Ite was educated as a soldier :und a military engineer, and at eighteen distingnished himself so greatly as to earn a second licutenancy in the corps of engineers. Ife was honored with the laurel crown in 1 is3 for his eulogy on Vauban, and was sent to the legislature by the Pas-de-Calais, and later, ass a member of the Convention, voted tor the execution of Louis XVI. He took a prominent place among the revohutionists, and was regarded by his comntrymen as the genius of victory, exhiliting the talents later illustrated by the German Von Moltke. He was Minister of War before the consulate was established, and voted against its extension, as well as against the empire: but, lefeated, retired to private life in the carly days of the latter. He died, proscribet, at Magthenag, in frez.
R. II. Thurston.

Carnot, Dabie Frascors Sadi: President of the French Republie; 1, at Limoges, Aug. 11, 1s35: the son of Adolphe ("urnot and grandson of L. N. M. Carnot, "the Brganizer of victory" of the time of the first Napoleon. He was a grandnephew of the famons "founder of the science of thernodynamics," the first sadi Camot, amd was by profession an conginerer. He was educated at the Eeole Polytechnique and the École des Ponts ct Chanssées, Paris, graduating at both with high ristinction. Ho was immediately assigned to duty in the enginecr corps and given tasks of considerathe importance, which were admirally performed. It is first active service was performed during the siege of Paris, 1871, when he was male Pretêt do la Sine-Inféricure, and diseharged the duties of commissary-reneral under peculiarly trying circumstances with marked success. He took part in alt important works of defense, and distinguished himsedf as much by his knownerge of the art of war as by and arnest in his repmblicanism. Ile was elected to the National Assembly in 1871 by the (Cote-1'Or, and immediately became pronincot in its aliscuscions. In $18: 6$ he besame the secterary of the Chamber of Deputies taking his
seat as nember for Beaune; became Secretary of Public Works in 1878, and there had ample seope for his engineering and constrnctive talent. He was promoted to the ministry of Public Works in the cabinet of 1881-82; made Minister of Finance in 188? and again in 1886, with Brisson as Premier: and on the resignation of M. Grevy was elected by the Legislature, Dee. 3, 188\%, to fill the president's chair.
In his message of Dec. 12 he outlined a policy of practical reforms, economical administration, peace with foreign nations, and the promotion of the efliciency of the army and nary-a policy which he followed with fidelity and success throughout his administration. He had many ditticulties to contend with in the hostility of the different factions. The supporters of Bmlanger, the socialists, and the anarchists were the most disturbing elements in the state, but he won the confidence of all conservative republicans. The attempt of his enemies to involve his name in the Panama scandal proved an utter failure. On the night of June 24, 1894, while attending an exposition at hyons, he was stabbed by an Italian anarehist and died the following day. His successor in office was M. Casimir-Périer. R. II. Thurston.
Carmot, Nicholas Leovard Sadi: "founder of the modern science of thermodynamies ": b. June 1, 1796, in the smaller luxembourg, where his father, the genius of the army in the clays of the consulate, was living as member of the Directory. A year later they were obliged to flee in consequence of proseription. The boy, delicate in constitution and affected still more seriously by the vicissitudes of the life which his mother was compelled to lead, continued weak in body, but grew rapilly in power and strength of mind. His father returned to France during the cousulate of Napoleon, and was made Minister of War, the chitd thus being brought into Paris, where he was educated, in part, in the presence of Napoleon. He was admitted to the Polytechnic School at sixteen in the year 1812. Two years later he left the school with the rank No. 6. and was sent into the field to engage in work on fortifications. In 1819 he was made a member of the statf, where he found large opportunities for scientific study, and devoted himself to it with enthusiasm and success. The outcome of this work was a small but now famous book, Réflexions sur la prissance motrice du feu, the first of modern works on thermodynamics, the science of heat and work transformations. In this little tratise, as subsequently brought to light by Sir William Thomson, Carnot anticipates all thie great discoveries and principles of science of the later thermodynamists Rankine and Clausius, including the common efficieney of all working substances, the constant values of the specific heats, the thermodynamic cycle, and the idea of its reversibility. He even computed a rough measure of the "mechanical equivalent " of heat, and asserted the unclangeability of the aggregate energy of the universe and its transformability. He reconnized the modern theory of the nature of heatmotion, but based his work on the older material theory in deference to the views of the scientific men of his time. Carnot's studies were interrupted by the revolution of 1830. into which he entered with enthusiasm. D. of cholera in P'aris, Aug. 24, 1832. See Réflexions sur la puissance motrice du fen (Paris, 1824 ) : also a translation by the writer
(New York, 18:10).
R. H. Therstos.

Caro, kirr'ö: eapital of Tuscola co.. Mich. (for location of comnty, see map of Michigam, ref. 6-J); on Mich. Cent. R. R. (Bay City Div.) ; on (ass river: 100 wiles by rail N. N. WV. if Detroit. Caro has five clumethes, new central school, new city-hall, flouring-mills, hmbre and stave factories, water-works supplical by springs, and electric lights. The chief industries of the surrombline reqion are agricalture and stock-raising. Pop. (1580) 1.242: (1890) 1.701: (1894) 1,780 .

Caronge, kă'roozl': a town of switzerland: canton of Geneva; on the river Arve; $1 \not+$ miles s . of Geneva; beatifully situated, and surrounded by elegant villas and orchards (see map of Switzerland, ref. $7-1$ ). It has manufaetures of watches, leather, pottery, and threal. Pojp. (1s88) 5,703.

Carp (Cyprimus ruppios) : a fresh-water fish of the family Cyprinider; distinguisinel by its thothless juws. its theshy lips and small month with four tarbele on its upper jaw, its stont teeth on the pharyngeal bones, its olive-hrown color above shating off into yellow below, its excellence for fool, the ease with which it is propagated, and the variety of eomditions under which it will thrive. It will live for days with no other water than that aftorded hy wet moss, and it is said to attain at times to the age of wo years. A carp weighing 10 lb . was found ly shmeider to contain no less than Golnoo egga. It thrives best in the quiet waters and soft, muddy bottoms of the smuthern temperate zone, thongh is is foum in all the countries of Northern Europe and in Anerica, and is a tavorite fish in China. The weight at five years old is from 3 to 6 lb . It is now hecoming ibumtant in the lower Sacramento, where it has fallen under the displeasure of hunters and sportsmen, hecause it feeds upon and destroys the water-eclery which makes a large part of the food of the canvasback-iluck, :uml upon which the delicate thavor of that bird is supposed to depend.
Carp-culture. -The eulture of carp for tood has long been a very important industry in many parts of the world. "This fish is eommon not only in most of the lagerivers of Sonth-
much from the 'Thirty Tears' war, passed into the possession of the l'rinces of Schwazzenbery in the year 16\%0. At the present time it is said that artificial ponds for the culture of carp in these domains comprise an area of no less than 20,000 aeres, with an annual product of about $500,000 \mathrm{lb}$. Carp are said to have been imported into England in the year 1504, and are now fond in very many of the streans and ponds of Great Britain. Of the species most profitably cultivnted there are three varieties, popularly known as the scale-carp, the mirror-carp, and the leather-carp. The first of these is characterized by regular, concentrically arranged scales covering nearly the whole of the body: The miror-cary is so named on accomet of the extrondinarily large, brilliant scales which rum along the sides of the body in three or four rows, leaving the rest comparatively hare. The leather-eary, has on its back only a few scales or none at all, and is covered with a thick, soft, relvety skin. All three of these valieties are suitable for calture. Thongh the scale-capp is perhaps the most popular in market, the others are erually gool for food, and the leather-carp has the advantage of being less liable to injury in trmsportation. The lneaking of the sales from any accidental canse is liable to injure the lish so serionsly as to produce its death. These species of carp are trequently (rosed with related species, the result generally being the production of an inferior fish; and in stoeking new ponds care should be taken to ascertain the gemineness of the species offered. There is a very common cross between the gemine carp and what is known as the (irucian carp, resulting in a very poor and bony fish which in (iermany is often called the "poor man's carp." lit should be well understoon that succese in carp-culture inpends very largely upon the care with which varieties are selected. Idaptability to Artificiel Culture. - For marp-culture it is of the greatest adrantage that this fish is ible to live and thrive in waters where other fish could not possibly rxist-for example. in the pook of bogs anel sloughs. The (arplives upon vegetable food as well as imon worms and larva of aquatic insects which it finds in the mum. It is easily satisfied with refuse from kitchens, slaughter-houses, and inweries, and even with the excrement of cittle and pigs. Alded to these advantages is the fact that it takes no food from about the first of October untilahont the end of March. buring this period each year it hibernates, and, though it eats nothing whatever during its winter sleep, it does not diminish in weight. In summer it grows rapidly. In the month of May a carp two years old increasts in weight muler good conditions aboni 15 per cent., while in Jume its incrase is alont :39 perent. and in July about :3f per cent. If the weather is not musnally eoln, a carp may be combed mon to incrate cluring the semmed year of its growh by abont 110 per eent., reaching a weight at the third rear of its age of about 3 or 4 lb . Under favombla comitions the fish grows steadily year by yar until it reaches 15 or 901 b ., although the growth after the fifth or sisth yar is hess rapid than before. Cirp worghing from 40 to tio lb, each have teen taken in some of the waters of Enrope. These, howerer, are so monsial as to attract wery gencral attration. 'Ihe lungevity of the fish is remarkable, imelividual sherimens having herin known to live move than 140 yars. Not less remarkable is its extraorlinary mate of increase. A fish weighing from 4 to 5 lh , contains, it is sainl. on an awrage from 400,000 to 500,000 ecges. The egers, after being depositol. dewoloy themselves rapielly if assisted by warm water. Chont the twelfth or, at the latest, the fiftrenth day the embryo fish breaks through it envelope. In colder waters as many as twenty days are sometimes re-

Carpenter, William Berdamix, M. D., LL. D.. F. R. S.: physiologist; son of Dr. Lant Carpenter: 13. in Exeter. Oct. 2!, 1813 ; studied medicine and grahnated ats M. I. in Edinburgh in 1839. In the same rear he published an important work entitled Principles of (ienerul and Comparatice Physdology. Llis reputation was widely extendet by an excellent work called Principles of Iluman Physioloyy (1846). This has gone through nime editions., and is considered by many to be the best work extant on that sulnject. He became Professor of Medieal Jurisprudence in Cniversity College. London, and for many years edited the British and Foreign Medicn-chirurgical Reriper. Amons his works are Zoüloyy and Instincts of inimals (2 vols., 150゙す): The Microscope (6th enl. 1881): and Vature and Mran (1888). Te had few living equals in acquaintance with natural science, capacity for original inquiry, and skill as a scientifie writer. Some of his latest investigations have been in regard to oceanic currents. Ile was president of the British Ansociation for the Adrancement of science in 18\%. I), from accidental canses Nor. 19, 1885.- I I is son, Philip IIerbert. b. in London, Feb. 6. 1859 , 1. in London, Oct. 2?. 1891, was etheated at Eton and Cambridge; gare especial attention to decp-sea life; fellow of the Royal Society: worked on the U. S. survey in the Caribbean seas.

Carpenter: William Buyd. 1). D.. D. C. L.: Bishop of Ripon, Chureh of England; b. in Liverpool, Mar. 26, 1841 : graduated B. A. at Cambridge 1864: became bishop 1884. IIis publications consist mustly of disconrses, but they inchule the Hulsean lectures. The Hitness of the Heart to Clirist (London, 1879), and the Bampton lectures, Permanent Elements of Religion (1889).

Carpenter. William Hexry, Ph. D.: phitologist; b. at UTica, Oneida (oo.. N. Y.. July 15, 1853 : ellucated at Utica Academy, Cornell University, Leiqzig, and Freiburg; Ph. D., Freiburg in Baten; fellow, by courtesy, Johns Ilopkins University 1881-83; instructor in Rhetoric ant lecturer on North European Literature at Cornell 1883; instructor in German and the Scandinavian Languages, Columbia College, Sew York, 1883-89: assistant professor 1859-90; and adjunct Professor of Germanic Languages and Literatures 1890. He has published Grundriss der Nevislandischen Grammatik (Leipzig, 1881) ; Niholas-draym Malls Prests, an Tcelandic poom from A. D. 1400 (Ductor's dissertation ; Halle, 18\$1).

Carpenter-bee: the popular name of hymenopterons insects of the bee fanily, which show great skill in working

Carpenter-bee.
wood. These insects, including sume of the truc lees, mostly inhalit warn countries. Perhaps the most celebrated of the
tribe is the Nylocopo rioluces of Southern Europe, a beautiful insect of a rich bhe color: about the size of a large humble-bee. It attacks dry wood, especially when partly decayed, cutting a longitudinal canal about a foot deep and more than a thind of an inch wide. After finishing one of these canals, it lays an egg at one extremity of the hole and places near it a mass of pollen ant honey as food for the future larva. The egg and its aceompanying store of food are then hermetically sealed up by a thin wall composed of powdered wood, formed into a very hard compound by being mixel with a substance secreted br the insect. In this manner the mother bee divides her house into many little chambers with one egg in each. In due time the eggs hatch. each of the larve devours the food prepared for it, and then passes into the ehresalis state. At last, when the perfect insects are developed. they destroy the partitions made by the parent bee, and eseapre into the air: the one produced from the egg first laid esciping first, through an opening made for it hy the mother. and the others following in order. The genus is also American. See Bee.

Carpentras (anc. Carpenloracte): a town of France; department of Taucluse; on the river Auzon: 1.5 miles by rail N. E. of Arignon. and near the lase of Mont Yentoux (see map of France, ref. 8-11). It is surroundell by walls which were built about 1365, and are flanked by towers, and is mostly well built. It has a Gothic cathedral, part of which was erected in the tenth century. and a public library of 25. 000 volumes, containing also a large eollection of medals and antiquities: also mamfactures of cotton and roolen fabrics, brandy, etc. Here are remains of a Roman triumphal arch. Pope Clement V. removed the papal court to this town in 1313. Pop. (1896) 10, 997.

Carpentry [deriv. of curpenter. viâ Norm. Fr. from Lat. carpentrius, carriage-maker; deriv. of carpentum. carriage. a word of Celtic origin]: the art of bilding structures in wood: and mure especially the construction of wooden buildings, wooden bridges, and the framings of heary machines. The labors of the carpenter are necessarily directed by some knowledge of the forces which mar be brought to act upon the strmcture when completed? that is, by some knowledge of the principles of engineering.

The lesser and lighter works of wool, such as furnish the interiors of dwellings, are the products of another branch of labor, termed joinery.

The skill of the carpenter is directed toward giving iwo distinct qualities to the structures he Inilds-viz., sirength and rigidity or stiffness. The first is secured mainly by dimensions assigned to the different narts. and the skill with which these parts are nuited: and the latter depends upon the arrangement of the several members.

Strenght.-Timlers designed for structures are subjected to one or more of the following varieties of stress: transverse, tensile, compressive. A transverse stress is a force applied to a beam in a direction more or less perpendicular to its length: the timbers of a tloor afford examples. A tensile stress is one that tends to elongate, and a compressive stress one that, acting in the direction of the length of the member, tends to shorten or crush it.

When the entire structure is of sueh dimensions that each member of it may be formed of a single stick of timber. the work of the artisan is comparatively simple, and is guided by phain and brief rules. But when by reason of the size of the entire work single parts are required of greater dimensions than can be supplied by single pieces of timber, then skillful joining of simaller purts must be relied upon to meet the emergency. Now, to so combine sebarate pieces of timber as to form a single member, and therely emplor the arailable strength of the component parts, at the same time to form such a commection with adjacent protions of the structure as to transmit properly the force assigned to the position, is to apply in the fullest sense the science of carpentry.

It may lee remarked here that even in our most important hridges no speeial effort is made to secure solid timbers for the larger members, hecause the ctuality of thorough soundness can be more easily secured by a judicious selection of smaller parts, and then a proper combination can be made to insure the requisite strength.

When a heam is snbjected to transverse stress the fibers upon the side that teml- to become convex under the action of the st rain are snljected to a tensile or pulling force. while upon the opposite site they are at the same time compressed. It lecomes evident upon slight reflection-first, that the extreme upper and lower fibers are most severely strained;
and second, Wat the central pertion of the stick is acted npon by forces eomparativety slight. The nbwoms renclusion is that the portions of the timber most actively engaged in sustaning the foren are thme at the ereateri distance from the middte of its deph, and consmpently that heams acted upon by transverse forees should presont ionsiderable widh in the theretion of the baring force. $1 t$ is easily demonstrated that the strengeth of a bean of given leneti, and bealth, to bear a weight betwen two supports, varies as the spuare of the depth of the heme. Filour-heams are aecordingly made narrow and deep.

To seeure depth of beam withont mploving material Which is eomparatively of little use the methot has been employed of joining two sticks hy blocks aml bults, as shown in lig. 1.

It will readily be sen that the combition of providing material where the strains are greatest has been secured,

providey the combination when under stran acts as a single stick. The phan faits when through want of secure bolting there is any motion among tha component parts. The chances of failure incretse very rapilly as the halves of the contround beam are soparated by larger space, as the point is soon reached where each half aet: like a simple heam. Componnt beans are most frequently made in the simple manner shown in Fig. ?.

The most common way of re-enforcing the strength of a simple bean is by the addition of iron rods. as shown ly

Fig. B. The consideration of sush at combination belongs to the suligeet of trussiss.
When a stick of timber is emploved so as to resion a tensile force the manner of connecting it with the protions of

the strueture through which or to which the forse is tu be thasmited become a matter of ereat impurtance. hi the case of an iron rom, which can he furnished with a hemb, an eye or at mut. the problem of attaching it so as to resiot a tensile foree is ensily solved; but when the conditions require a woden liederam. the problem of mitines the varions parts so that the strength of the stiek shall met be too hares ly sacrified requires comsideration. beanses to join timbers implies mone or less cutting of thair subtance, mad this in turn sacrifices materiad.

In the common king-post truss, as the combination represented in Fig. 4 is termed. the methots of miting parts that fultill different functions are emphoyen. This trusis is frequently employed in romfs, amd also brike of moderate spme. In the lator mase the thoring is sutamed be the horizontal member or tie-bean: a large partion of the weight sustaimed is tram*uitterl through the uphight, amel is received twe the inclined pieces or struts and convered to the extremities of the the-luam. "Tlue tie-heam and post are thus subjected to tensile, and the struts to eompressive, strain.
In order that the tie-ham shall properly foreive the thrust of the strute, the former mast be motehed to meroive

Fig. 4.-King pust truss
the ends of the lutter. Fig. $f$ shows the method usuatly employed; an enlarged view of the ends of the strat and
tip-lum is wiven in Fine i. In constructing this truss it is necessary to regarl the trmbency which the strut exerts to

Fig. 5.-V゙iew of rnds of strat and tie-beam.
Shlit off the portion 1 BC . Tt is wonstered sufficiently serare in most kimls of timber if the length B C is ten times the dephli 13 . as, when his proportion is olserved, the (\%) hesion which resists yhitling off is equal to that which resist: the cxushing of the fibers exposed to the direct pressure on the lesser surlate. In motern britge constructions it is quite common to substitute an iron roll for the upright post in the frame of Fig. t. and also to employ a cast-iron shoe bolter? to the tie-heam to receive the end of the strut.
When the length of the tie-beam is such as to require the uniting of two or more pieces, the skill of the earpenter is again called in requisition to prodnce such a joint as shall safely resiat the fores to be met.
The simplest of all is the so-collerd fish-joint (Fig. 6), the atrength of wheh dequends partly upen the few fibers of the

timber that bear upen the bolts and partly upon the friction arising trom the prosinme of the fish-plates. These latter are madeof irom, and are furnided with progections that are let or forceet into the timber when lualted on.
Another sum a cmmon form is the single-luck joint or senf, shown in Fig. $\overline{7}$, in which the resistance to direct ten-

Fia. f.-Single-lock juint.
sile strain drpends upon the surfaces opposed to mach other at A. and whith mat he one-third the sectional area of the beam. A moxilication of this methen of starting is exhityited in lris. 8 , in which one-half nf the bem is mande asailaWhe in resisting tonsile strain, as the joints A and bare fach one-fenith of the depth of the lemm. The methon of Hirg. 8 has the adventage aver Fig. 7 of greater stronth, hut it is also far more difficult of comstruction, as there are two bearing surfaces that must act thether; the titting of the juint therefore requires mpecial care. This dillinulty is mometimes met by hatring spaces at $A$ and 1 . into which wedres or heysare driven as the searf is bofted therether. Fishmplates are quite commonly used in comection with the methods

Fro. x-- Modified single-loch joint.
 ployen in wath at pace ats the lower beam of the frame repro resentid in lig. t. the joining would obriously be mate at the midulle of the tie-beam.

Fiis. It represents another form of searf: the key at $A$ is made of hard wood, and foreed in su ats to briner the surfaces of the sourf to a lirm bearing. Of course this methorl of Jocking cun te epually well applied to the methods shown in loigs. $\boldsymbol{f}$ amm $\%$.

Many intricate forms of scarfing have been devised, and are exhibited in treatises on curpentry. They belong mostly to the time when but little iron was employed as an aldunct

Fig. 9 -Scarf.
to timber construction : and even then most of the elaborate forms were rather fanciful than nseful.

When timbers are united to resist thrust or compressive strain only, less skill is required than in the constructions just described. But little more is required than to bring the opposing surfaces fairly together, and secure them by the sinplest possible means. Hence the "fished joint "shown in Fig. 6 will fully satisfy the conditions, and will employ the full available strength of the timber. Care must be taken, however, that the joint is not strained by a tendency which is mmifested in long columns or struts to bend sideways when under pressure.

When a strut is joined to its neighboring member at an angle, as in the case shown in Fig. 4, the precantion is taken to so form the joint as to present either the whole of the end surface to the end pressure, as in the upper end of the strut of the king-post truss, or a part of it, as in the lower end shown more fully in Fig. 5. To prevent any disulacement in such joints through accidental forces, they are seenred by various methods, either a bolt, a notch, a tenon, or even a few nails, being employed accorting to the liability to lateral forces.
The tenon employed is exhihited in Fig. 10 : the cut which receives it is called the mortise.

Fig. 10.-Tenon and mortise.
If the joint is liable to be urged by a force tending to pmil it asunder, some security is obtained by the use of a stont

-

pin through the tenon. A dovctatil joint is also employed for the same purpuse (see Trig. f1). 'IThis form is common in joinery.

Rigidity. a quality which was referred to as somewhat distinct from strength in structures is secured by surh a disposition of material that no change of form of the entire system can oceur without bringing into action the ternsile or
compressive resistances of certain members of it. A plain square frame fastened however securely at the corners, may be lengthened and shortened cornerwise without ealling into action the strength of the materials of the framing. except such as is concerned in fastening the corners. If, however, a stick be firmly secured to the frame, diagonally across it, no change of form can take place wit hont extending or compressing this added brace. A trimgular frame will not admit of change of form without a change in the length of at least one of its siles. Hence diagonal braces are important members of timber framings, inasmuch as they insure stiffness

Fig. 12.-Miter joint. or rigidity. The braces are secured by mortising, by iron straps, or more rudely by outside pieces fastened as in the joint in Fig. 6.

Fies. 13 and 14.-Dovetail joints.
Joinery may he considered here as comprehended under the more general term of carpentry. It is, however, usnally restricted to the lighter constructions in wood, surh as the subordinate parts of dwellings, cepecially the interior woorlwork and the furniture.

The work of the joinor is directed toward ellecting the - losest and firmest practionhle union between the component parts of eonstructions in wond. Sitifferss is an essential quality in joinery. ind it is manly secured by the

Fig. 15.-Lap dovetail. more or less intricate method of uniting the parts that meet at an angle. Some of the common forms are shown herewith.

Lap and seevet dovetails are emploved when it is deemed desimble to parlly or quite conceal the form of the joint. See Tredgnhl's 'urpentry, ly JIurst; also Inavidson's Drawing for Corpenters and doiners. Geo. W. Plymptos.

Carpel-hagere: a term used in the U.S. to denote an adventurn withont property interests in the State where he resided. In the West it has been applied to wildeat hankers. In the South it was usel at one time to indicate a man, born and reared in the North or Wrist, who went South with or after the Federal armies, planted himself in one of the States being reconstructel under military rule, wha aided in organizing and drilling the Negroes to rote the liepublican ticket. Of course the term originated with those of adverse politics, who applied it as a stigma and with considerable hoseness, any one not a native of the South being denonnced as a
 and to the nammer born," He was termed a "stalawag."

 coreringo at articles of lusury in her anciont days of splentor.

Is atommeroial term, " (anpot" ol" " "anpeting " is the generio name for the varions grimis of ermels in that lime. whatever their materiat, made of construction, of terhmiond appelation. The original form of the carged wive that of a large rug, which was spread 1 pan tho form when eneasion recpured: and is still the custom in the Fist. The moderat way of weaving carpeting in bong, nimow strips, to he sown together, doubtless had its arigin in the greater convenione
 tation to the ordinary loom

Before the invantion of the dackurd loom, howners, "anpels wore cither of very simple pattern, or, if ahborate in
 attached to tha anciont wosal manafactory of the: (ishelins in Paris. hat alwas ocempied the tirst pace in requrl in artistic profecton* sione of tho (onrputs produm? there cost from 100,000 to 200,000 frances requicing tive to ton yenrs for their eompletion. Nune af them have bom for sule sinee the sear 1 ag ; they have been presented to the difforent sobrecisns of limope ant are only to bo fomber in the palaces of conats. The invention of Jarduart, wn fercoliarly mapted to the weaving of varions grakles ni' car|cts. togethor with the still more recent innuowments in lomons, has gratly facilitated the probluction of competing at once beatutifut and durable, and at the same time elmap noum for frsons of moderate means ar economiond tantex, sa that the wise of tanpets has prohatly incronsob more aluring tha las fifty yours than that of any other commonlity of afually anment arierin.
'The $[.$, is by far the greatest prombere and consumer of carpets of all the mat ions bit the world.

The prineipal grates of carpoting known to commorer Geaviner out the Gohelins, Turkisla, Persian, and othors of similar rur-like make) ano Chevilte Axminster, UFitton, Arminster, Joquette, beluet, Jrussets, I'apestry Brassels, In-
grain (two or three phy) and limetion, taking rank, as to Falue and general desirability, about in the crater mamed.
("honille Axminstor, of which none is male in the U. B. is a very excellent carpot-fiabric, of high cost hectuse of the mature of its construction. It eonsists of strips of worsted chanille, so colored as to produco a pathem when woven to-
 ato prodteed therequattors of is yatol wiote in rolls and alse
 or size of remm. Their importation into the ly $\mathrm{s}_{\mathrm{o}}$ is int. very heary. but shows amall, stomby growth. The largest mill for their probuction is at Gangow, seothand. Severat earpermills in the $\mathrm{C} . \mathrm{S}$. have promberd watle bxminsters in modrrate quantity and gemel quality, but tho demand for the dommatic goods has meser been sufliciant fo matie it at problitable madertaking.

Womentic dxminster and Monputhe are very similar in apsfatmmed and construction, and are mate with a high tufted file, thick ant! durable. Jhe Axminster is finer in quality dand ustally mate of better material than the Moquette. Thes ame construeted with arm erommerk of jute or eothom. 1 pun which the pile eontaining the dosign is fast enmb in tufts of soft woolen yam. An these tufts are supplied from a serins of rollers correspombing in number to the picks or wefts compheting one pattern, mand in length to the willh of the earpet, and in their aetion are entirely independent of the wary and woof compring the braly of the fabrice, the employment of an atmost mulimited number of endors is admissible and the designs in thense grades are therefore generally of the most perfect and rlegat deseription.

Willon and hrussels are woven alike and of the sime materiolls (limen batck and worsted face); the face of both is formed by inserting wires between the warp, threats in such a mammer that on their withatrawal a meries of ratsed loojs of the worsterl warp is formed, npon which the design appeals. In Wilton these boys tre cut whon ant sheaced smooth, while in Brussels they romain ument. The worsted portion of the eapet heing exulusively in the warp, the thareads of which are of rontimons eobor throughont the bece, cach particular color requires a surobal sid of threats, workml in an independent manner by what is techmically cathed "frame." "this arrangement securs great perfection and chearness of design, fur each color being brought to the surface entirely by itself, whide the others are warted under or through the hmen back until bronght up in their turn, the work has the appearance of cmbroinlery un cabsas. But as the colors in the direction of the warp are usmally limited to dive (no larger mumber of trames heing eronvoniont), the flesigns in these gomls are of neressity simple, amd mo jattforms requining elaborate shating combe attomptorl in them. brome the mmmber of colors thas rmployerd the different fualities of these empets reerive the manes of threr, four. and tive frame resperfively.
Felveds and tapestry brisisels aro adso mannficturmd aliko in at manner correspoming to Wilton and Brussels, with tho difermore that only one set of worsted warp threads is msed. upan which all the eolors are printed by means of eotorrollers lefore the fabrice is wower, and upen the corvere probretioning of nates of the varions colors the prefection of the goorls is in a grat measure hemembent. ludesigning patterns for these gands the artist is allowed frem sope as
 in that respect boos not add very grontly to the cost ; bence We find these suods usually mond mome elahorate of dexign and more lavishly colored and shamed ofl than Wiltan and Ihensels. The nambincolure of tapostry (both volvet anm] limsols) was commenece in Finglam in 18f?. It was sonn after introluced into tha [V. 太., but for twenty yeals, by reason of patent restrictions, $t$ Wo establishmatats monoprolized the hasiness. Sinen the expiration of the patents it. has berome the most important hranch of canpet-manulanture in the comatry. Tajestry (andxts me now natid to an extent greater thain that of all uther grames combined, with the excrption of ingrains.

The ingrain carpet (abo cabled Kiblumanater, aftor the
 kind of curpet mate exchasively of all woul. and it may bo worn on either sitle. though neltilly ano side is more denirathe in collorimg than the other". The mames "ingrain" and "thar uly "are derivend from the momes ot thedr construstion. Thar former is comurnsel\} of twa alistimot thicknessts. interwoven of "ingratmel" whereve the conlats change or mingle: the fatter of there layers, atso intorlanemer each other. "lhe design is very similar on both sides, tut the
collors are reversed. Philadelphia has upward of 5,000 looms employed on ingrain carpets, and very large establishments in connecticut, Nassachusetts, and New York State furn out the better qualities. Venetian is the name given to a falric composed of woolen warן and coarse hemp filling, usually striped in color. and made in widths suitable for stair-eorerings. Philadelphia fornishes in that gride nearly all the cheap stair-carpets used throughout the 1 . S

Floor oil-cloth is manufactured with a burlap foundation. upon which successive coatings of coarse paint are applied. On the face is a colored paltern printed with hlocks. These blocks are made of wood, and are usually about is inches square. There is one block for each color applied; less than seven colors are generally used. Floor oil-cloths are made in many qualities aml of various witths, ranging from 3 feet to $? 4$ feet in wilth. Yery much the larger business is done in the medium-weight narrow width:

A floor-cloth with the coined nime "linoleum." consisting of a mixture of oxidized linseed oil and findy ground cork pressed upon a lacking of coarse burlap, is now very largely used. It is the invention of an Englishmen, Willian Walton. Several large mills are manufacturing it in the U. S.. the patents having expired, and its extended use has serionsly curtailed the prohuction of the heavier grades of floor oil-eloth.

The manufacture of carpets is confined to the States of Massachusetts, Comnecticut, New York. New Jersey, and Pennsylvania. The number of factories in the U.S. in which earpets other than rag-carpets were manufactures in the year 1880 was 19.5. In ise0 the mumber had decreased to 175 . But while the value of the product in 1880 was *31.79.802. in 1890 it amounted to $\$ 4,801.499$. The value of land. buildings, and machinery devoted to the industry in $18!10$ Was $\$ 18.915 .634$. In 1880 the average number of operatives employed was 20.371 ; in 1890 the number was 29.189. The total amount praid in wages in 1880 was 868835 .218 : in 1890 it was $\$ 11.639 .176$. The cust of the materials employed in 1880 was $\$ 18,984.879$; in 1800 it was $\$ 28,640$,$0: 1$.

William Berri.
Carpi: a fortified town of Northern Jtaly: province of Mólena: on the Canal of Carpi; 12 miles N. N. W. of Módena (see map of ltaly. ref. $8-\mathrm{D}$ ). It is the see of a bishop, and has a citadel, a fine cathedral, a seminary for prients, and manufactures of silk. Pop, 18,856 .

Camio, Maneel: Mexican poet: 1. Mar. 1. 1791; well known in Nexico for his sacred poens, and for some others upon patriotic subjects. He was edueatel as a phesician, and lieame in 183? l'rofessor of Phrsiology in the Iniversity of Hexico. He took an active part in Mexiean polities, beiing a leader of the conservative purty. IIe was deputy in 1855 and 1848: senator in 18.51: councilor of sate in 1853. As a poet he excellet in subjects like the Destruction of Sodom. the Chastisement of Pharaoh, the Witrh of Endor, etc. 1lis Puesins have been several times published-last in Vera ('ruz and Paris, 168:\% D. Feb). 11. 16b0.

Carpmael. Charles. M. I. : sumerintudent of the meteorologieal service of the Dominion of ('mada and director of the Magnetic Ohservatory at Toronto: h. at Streatham Hill, Surrey, England. Sept. 19. 1846 : elucatel at Clapham ( $r$ rammar S̈chonl and St. John's College. Cambritge, England (where in 1869 he wats chased sixth in the list of wranglers), anl was olected fellow of that college in 18:0. In Der.. 18:0, he was al momber of the british ectipse expedition to spain. He was appointed depmets sumerintendent of the Cimatian service and director of the Magnetic Observatory in 180. in Feb., 1880, he beeame superintendent of the service. In 1882 he was appointed by the Marcuis of Lorne a president of Section 111. of the Roval Society of Canada. ILe Was repeatedly elected tiow-president of this snemety until 1886. when he becane president. The meteorelugient stryie has heen fery prosperons under his alministration. II. W. H.
Curpoc'rates, or Car'pocras: a philosopher in AlexanIria in the reign of the Emberm Iharlian: foumderl a Cinstic see about 130 A. It. Ble helievel in the transmigration of souls. amd maintained that the worh was created by angels. He is accustl of temeling principles that tent to subvert morality. His followers existed is late as the sixth century.

## Carpugones: Sce Carpuphytes.

Car'pophytes [from (ir. кap $\boldsymbol{\text { B }}$ s. fruit + фutov. phant]: the fruit-tangles (Corpophlyfa); une of the lramehes of the
vegetable kingdom, characterized by the production of antherids and carpogones, the latter after fertilization developing a spore-fruit. The carpogone consists essentially of a cell (in some cases of several cells) containing the protoplasm to he fertilized: except in the characere, it is not surrounded by a cellular covering. Five classes may be distinguished, viz.: (1) Simple fruit-tangles (Colecheten), minute plants, with single-spored spore-fruits: (2) sac-fungi (Ascomycetes). degraded parasitic and saprophytic plants, with spores produced in sacs; (3) higher fungi (Basidiomycetes), degraded parasitie and saprophytie plants, with pores produced by protrusion from certain cells (basidia) ; (4) red scaweeds (Floridec(), mostly branching plants, with manyspored spore-fruits; (5) stonewort- (Charophycere), branciling plants whose carpogones are covered by a cellular meminane, producing a one-celled spore-fruit.

Cuarles E. Bessey.
Car'pus [Lat., from Gr. кapads, wrist]: in anatomy, the serits of bones hetween the forearm and hand. In man there are eight small bones in two rows; the upper row consists of the seaphoides, lunar, cuneiform, ant pisitorm: the lower, of the trapezium, trapezoides, magnum. and unciform. The upper row is articulated with the radius of the forearm: the lower with the metacarpal bones of the Haxd ( $q . i$.). The mumber and form of the bones of the carpus vary much in different animals, hut rudiments of them, at least, appear in all mammals. They are quite distinct in the flipper or paddle of the whale, as well as in the foreleg of the ox and the horse.

Carpozov: a Saxon family celelrated for learning, of Which the most distinguished members were Besedict; b. in Wittenberg. May 27. 1595: professor at Wittenberg; author of Definitiones forenses. Practica nova rerum criminalium, Jurisprudentifa ecclesiastica, and Processus jurisworks which had an extented inthence on Geman laws: al. in Leipzig. Ang. 30. 166f.-Johass Bexedict; Professor of Theology at Leipzig: hrother of the above, who wrote Isagage in Libros Symbolicos; 1). in Rochlitz, June 22, 1607 ; d. in Leipzig, Oct. 22, 165\%--Johaxx Gottlob; b. in Dresden, Sept. 26,16 :! : grameson of J. B. ; Professor of Oriental Languages at Leipzig, whose Introductio in Libros Canonicos and Critica sacra Jeteris Testamenti were epoch-making works that elevated biblical introduetion to the rank of a special theological science. D. in lübeck, Apm. 7, 1767.

Revised by llexry E. Jacobs.
Campines, kear-kee'nes, written ako Kargnenas: a strait of Calitornia; connerts the Bay of San Pablo with Suisun Bay; lat. $34^{\circ} 04^{\prime} 16^{\circ} \mathrm{X} .$, , lon. $102^{\circ} 15^{\prime} 19^{\circ} \mathrm{W}$. It is from 1 to $\approx$ miles wide and $f$ miles long, and is narigahle for steamboats. Large ships can ascend it to Benicia. The Carquines Strait forms the boundary between Solano and Contra Costa Counties.

Carr. Ecgeve A. : soldier ; b. in Eric eo., N. Y̌.. Mar. 20, 1830: graduated at Thest Point 1s.3: bevame colonel Sixth Cavalry Apr. 29,1859 . The served on frontier 1850-61; scouting against Lijuan Indians 18.54 (severely wounded in skirmish near fiablo Mountain): on Sions expedition 1855, Utah 1858, and Kiowa and Comanche expedition 1860; engaged in several skirmishes. In the civil war beeame colonel Third llinois Volunteer Gavalry Aug. 15, 1861; was promotel hrigadier-general U. S. rolunteers Mar. T, 1sis. serving in operations in Missouri 1861-62; engaged at Wilson:s ('retk: in eommand of division in jursuit of Price into Arkansas 146? engaged at Pea Ridge (thrice woumped) : in command of the army of Southwest Missouri 186 . and st. Louis district 186?-63: in command of divisiom in Vickshurg campaign : engaged in operations against the phace: at 1'ort fibison, Champion 1lifl, Bitward's Station. ('arriaters: wheeled vehicles of whatever kind nsed for marying or conveying persons or things on land, including combers, chariots, warons, carts, cars, ete. 'The name, howaver, is now commonly restricted to whicles for the concey anow of proms. on lusiness of for pleasme. It is probable that the ide of a vehiche with whels, to bedrawn hy animats, must have ocenred to man sonn after the domestication of the herse the the ox. The first attempens in this dieretion must haw been wery rude, much bike the bullock-catso of Intia and south central Ifricas of the present day-the Wheels sotid biecess of worl, thin sliees of the trunk ut a 1 res, and the axto an wolid boam, with the ents rounded and thrust through the rule wherls, whith araked as they revolved. From this combromsaxh a pole or shafts extended forwand, while attached tiredty to it was the body of the cart or wagon, no springe or intervening clatio substance mitigating it: inevitabla jotting: The cart was undoubtedly of carlier origin than the chariot: hat thateh progress in those days was slow, yet within tion yars after the flood the Egyptians and probsh! the Asyrimes also (for the two nations kegt pare with eath other in mechanial inventions),
were constructing both chariots and carts or wagons, which indicated a great advance in mechanical knowlenge. They were at first, and indeed for several eenturies, two-wheeled velicles, but the wheels were no longer solid pieces of wood, but had a hub in which the axle was inserteil, and at first four, then six, then eight, and finally (though not till near the close of the Assyrian or $1 l$ edo-Persian monarehy) twelve spokes, the diverging ends of which were inserted in a rim of wom, which was bound with a tire of bronze. Whether this rim was originally whole or composed of several pieces or felloes is uncertain, but at the period of the Assyrian monarchy felloes were in use. The chariot was box-shaped, but opened in the rear, the front being alout 4 feet in height. It was probably 300 or 400 years later that those intented as state carrages were provided with a back. and a seat in whieln the nobles or royal personages sat or reclined. while a charioteer stood in front and llove the horses.

The chariots were used for two purposes: first, as an evidence of the great dignity and exalted station of the king or prince who oceupied them, as when Pharaoh made Joseph "ride in the sceond chariot which he had " (Gen. xli. 43), and as when the funeral procession for Jacob went up out of the land of Egynt, and " there went up, with Joseph both chariots and horsemen," in token of the high rank of the deeeased (Gen. 1. 10). It is noteworthy that during the time which elapsed between these two incidents we find Joseph sending wagons (probably carts, or simple two-wheeled vehieles, drawn by oxen) from Egypt to Canaan for his brethren to bring their wives and eliildren to Egypt (Gon. xlv. 19). A seeond use of these chariots was for war purposes. It is hardly probable that they were used in this way so soon as for regal pomp and display. There is a tradition that Erichthonius of Athens built the first war-ehariot about 1586 13. C. At the time of the Exodus (B. c. 1491) Pharaoh had 600 war-ehariots, and it is implied (Ex. xiv. 7 ) that hesides these there were other chariots in Egypt which were employed for the same purpose. These war-chariots had on their sides eases for the bow and sheaf of arrows, and also for the spears or lanees, and usually an archer or a spearman stood on cither side of the chariotecr, and shot his arrows or hurled his spears at the enemy as the charioteer drove furiously to the contlict. The Canaanitish kings and the Kings of Moab, in the next foo years after the Exochus are often spoken of as having numerous chariots ol iron: by whieh is gener-

Fig. 1,-Assyrian war-chariot. the theorraey were prohibited the use of chariots, but in the time of David, and still more in that of Solumon, they began to acemmalate them, and Solomon maintainerl a force of 1,400 chariots: these and the horses which drew them were mostly imported from Expyt at a cost of about 1.0.0 shekels for each chutiot-about $\$ 650$. or, reekoning the differenee in the value of money then and now, rynivalent to at least $\$ 3.000$ of our money; so that his forve of (hlariots must have heen worth at leqst $84,2090,0100$. But other items in the cont of these estalhishments were the richly embroidered housings and trappings for the horsess and the cloths for the chariots, manufactured for a long perionl in Tyre or in some of its tritutary states (Fzekich xxii. 20). Until noar the close of the Assyrian monarchy the chariot was genorally drawn by three horses. At that time the third horse was withlrawn, but the Persians a litile later
ally understood, not ehariotsconstructed of iron. but with iron or bronze seythes attached to the axles of their chariots. These, driven at great speed against a force of footmen or cavalry, proved terribiy Ilestructive. The lerachites under

drove four horses, attached, like onr stage-horses, to the charint in pairs. The chariot eontinued to be a two-wheeled vehicle until near the Christian era, when its use for war purposes was discontimuel, and among the Romans, Greeks, and the sybaritic nations of the Orient it beeame the synonym of luxury and effeminaey. It was monnted on four wheels and drawn by four or six horses elegantly caparisoned, and the chariot itself was trimmed and eushioned with the most huxurions embroidered cloths of the East. Usually but two persons besites the driver occupied it. though there was often room for six. There were chariot-races in the Olymbian and Isthmian games, and the nobles of Greece and Rome drove at full speed along the magnifieent Roman roads and highways, It was prohably in one of the more modest of these vehicles that the Ethiopian treasurer of Candace, Queen of Ethiopil, was returning to his country from lis visit at Jerusalcm when he met Philip (Acts viii. 27.28). During the period ol the later Roman empire and the decline of its power these richly decorated carriages multiplied. with the other indications of the luxury and effeminacy of the people. There was not, however, even in the most eostly of these vehicles, anything answering to the springs of our modern eoaches and carriages. Leather and steel of the best quality were both abmulant, hut the idea of using either for rendering the motion of these carriages easier did not oceur to the earriage-builders of those days.

During the lark Ages the roads were so rongh and poor that carriages were almosi entirely abandoned as a means for the conveyance of persons, the onty method of landtrivel heing on horsebick, and even the broad-wheeled heavy wagons or wains, usel to some extent for the transportation of gools, moved over the highways with the greatest difficulty. On the Continent, asses, mules, and the large lut slow and sure-footed Norman horses were used for the moving of gools from one country to another, the huge pamiers on cither side of the
 from sight. In 12so. according to Beckman, Charles of Anjou and his queen entered Xaples in a caretta, a small but highly decorated chariot. Fourtecn years later, in 1294, Philip the Fair issued an ordinance forbidding the wives of citizens to nse earriages, or perlaps more aceurately cars, probally open two or fonr wheeled vehicles, which seem to have come into use alout that time. For the next 200 years their use was very infrequent, and seems to have been confined to royal personages. Yet in this time there had been introducel one change which was perhaps an improvement. The canopy (probably borrowed from the Oriental umbrella held over the monareh in his ehariot), which had hitherto heen sustained by four pillars, and hat been open at the sides, now gave place to a close drapery which concealed the necupant from view excert when looped up. The Emperor Frealeric 111, attended the council or dict at Frankfort in $14 \pi 4$ and $14 \pi$ in close or covered carriages, that of the latter year being magnificently deeorater. Soon after this time the German prinees seem to have entered upon a rivalry to ontshine each other in the splentor of their equipages. In 1509 , at a tournament in Raphin, the Electress of Brandenburg's carriage was completely covered with gold, and those of the other dnehesses were ornamented with crimson and purple curtains and draperies of the ridhest satin. From this time the use of enaches by the

FıG. 3.-Qween Elizabeth's state carriage
nobility, and especially by the femdal lords, spread gradually wer continental Furope; bnt, though the coaches were low and browd-whested, the condition of the roads was a serious obstacle to their use. In 1550 there were only three
coaches in l'aris. In 1610 Henry [V. was a<sacisuated in his eoneh. Rude carriages, called whirdeotes, twowheded vehicles without at rajs of springes, and haviner the homes attached to them by popes, hat been occasionally sern in Fongland as carly as the time of Richad 11. (1:3iか-ind), and it is recomled that his mother was moneved in whe at the time of the relellion of lama. But the state eonel was first

The ommibus has not been used to any grat extent except in cities and large towns. hut in these. until the ahrent of the street rilway, it whs the favorite rehicle for $]$ mblic travel.

Moderx Carrlage-Carriages may be classified in sevenal wars, according as we regard the number of wheels, the methor of entering, or the number of seats, and the methot of seating the occupants. Among two-wheeled rehicles may be mentioned the cart the gig, the sulky, the hansomcab, the Trish janting-car, and the Japanese jimikisha; among four-wheelers the wagon. the cab, coach, haggy harouehe, etc. Some are entered at the sile, as the coach, the buggy, etc.: ntbres at the rear, as in the omnibus, the wagonette, and the herdic. In some the occupants are seated facing one another along the sides, as in the strect-car ant the wagonette: in others they are back to hack and face outward. as in the jaunting-car. But the usual way is to place the seats crosswise, with the oecupants all faeing one way, as in the break the phaeton, the brougham, and the surrey, or back to back, as in the dogeart, or face to face, as in the ordinary family coach.

Turo-uheeled Curviages.-Vehicles with only two wheels require shafts which are more or less rigid, as the horse has to bear part of the loart. In four-wheeled vehicles the animals have simply to hraw. Of the two-wheeled rehicles now in use in the English-speaking world the gig is prohahly the nhtest and

Fig. 6.-Tiltary most typical. It is a one-lorse conveyance, the body of which usually rests on two or more semielliptical springs. and may or may not have a hood. It is intemed to earry only two persons. Its best-known barieties are the stanhope and the tilbury. The dogeart is also a two-wheeled veliele for one-horse or for tandem driving, and accommolates four persons hack to back. The body rests on half-elliptical springs, and is furnished with appliances for shifting the boty or the seat so that the loal may be balanced and the
 waight taken as fir as mossible from the horse's buck, This form of conveyance was originally intended for hunting burlowes and earrided dogs, hence the name. The whitechaper cart is one of the hest-known varieties of the tlogrart. The trotting-sulky like the trotting horse itself. is peculiarly a U . S. prodnot. It is of very slight baib, hats two wheels, seats one person, aml is renerally used in speeding trotting horses. In 1892 the rubher pueumatic tire, so suceessfully used on the bicycle, was appliel to the sulky and the trotting recort at once lowered by about four seconds. The road-eart, which is constructed in a variety of fums, is a cheap mondification

Fig. R--Pneumatic-ure sulky. of the sulky, with the addition in some limels of conrenienees for cotrrying artiches of greater or less lumk. It is lipht in construction, is lonige low, and is "Xtensively usel in the arroutultaral regrions of North Smericia. The

of the most useful public comefrances. and is admirably adapted for the crowdet streets of great cities, such as London, where it has had its chief developunent. It Was invented in 1835 by an Englishman named Ioseph Ilansom. It las I wo wheels, with the body (with paneled

Fif. 9.-Road cart hombl) hung very low between them. The coachmans seat is behind and abore the borly, to enable the driver the more readily to control his horse, and the whole is so balanced that little if any weight rests on the horse : batek. The jinrikisha, or "man - p.ower carringe" of

Fig. 10. Hansom-cab. Jipan. is but a miniature hansom-cab with a folding hood. without the driver's seat at the back, and with a man in the shafts instead of a horse. H.mmtreds of thousands of these handy conveyances are in every-tay use in Japan, in China, and India. The invention has always been clamed by a Baptist missonary from the $\mathbf{V}$. ふ. named Jomathan Goble. See Japax.

Four-ulheeled Comriages.-Among four-wheeled covered vehicles may be mentioned the coath, the landau, the mougham, and the rockaway. The conch is a family carriage with either full paneled body or with guarter panels, and is intended to earry four insitle and two on the coachman"s seat in front. The body is suspended on elliptieal springs alone or in combination with curved $C$ springs back and front. This latter methoul of suspersion is called "domble suspension." The conch is sometimes constructed with audthitional ontsitle

Fig. 11.- Berlin, or town conch. seats, and nsed with fond horses as a road coach, and is then linown as a "mail"onch," "dras." ur "tally-lio." The limhan is a carriage of the coacoly family and lakes its name from the town in Baviaria, where it is supposed to have beca first built. It fiffers from the coach only in having a filling toj. mate cillher en-

Carrical: Siee Kiarikal.
Carricklergus : a seaport-town and borough of Ireland: on the north shore of Carrickfergus Bay or Belfast Lough: 10 miles by rail N. N. E. of Belfast ; in the county of Antrim, but forms a county by itself, called "the county of the town of Carrickfergus " (see map of Ireland, ref. 4-J). The town extends about a mile alung the shore of Jelfast Longl. It has a fine old parish clurch. said to have been founted in 1164. It contains also Presbyturian, Methorlist, and Isseenting meeting-houses a Roman Catholic church, a tow-hall. court-house, etc.: also several spinuing-mills and manutactures of linen and starch. It was formerly a place of great strength. Jere is a remarkable and picturescule castle. supposed to be $i$ oo years old. standing wn a high rock and on the sea, on which three sides of it are situated. It is nsed as an arsenal, barracks, and a fort for the defense of the harbor. King Tilliam HII. of England landed here June 14,1640 , sixteen days before the battle of the Borne. In 1 itio it was surrendered to a French naval force under Thurot, who evacuated it on the appearance of the British squadron uuder C'ommodore Eliot soon after, which captured Thurot's squadron. Capt. Panl Jones captured the sloop-of-war Irake in Carrickfergus bay Apr. 응. 17is, hut made no attempt to seize the tom. The surlace of the comnty is generally hilly, and its chief crops are oats and potatoes. This locality has lung been noted for its cheese. ('arrickfergus has important fisheries, and is celebrateal for its oysters, lobsters, and scallugs. It has considerable trade with Liverpool, though its harbor is shallow and poor. The people are mostly l'rotestants of Scotch descent. A prat of the ancient wall is still standing. The town is connected with larne by railway. The rural district contains Lough Mome, which has an area of about 90 acres, and is situated at an elevation of 356 feet abore the level of the sea. The port of Caricklergus was for a long time the chief market on this part of the coast. It returns one member to Parliament. There are mines of salt in the vicinity. Pop. $10,000$.
Carrickmacross: an inland town of Treland: in the county of Monaglian, prorince of LTster: 46 miles $\mathrm{N} . \mathrm{W}$. of Dublin (see map of Ireland, ref. i-1I). The town consists mainly of one long street. One of its churches serves as the eatheiral for the Ioman ('atholic Archtishop) of ('logler. The town has a savings-bank, a Presbyterian igeeting-house. a house of correction. and a well-endowen grammar sehool, and has a fair, held fire times a rear. Pop, i,040.
Carrick-on-Shanon: an inland town of Treland: capital of Countr Laitrim. province of Comaught: situated on both sides of the shamon river; s.i. miles W. N. W. of Dublin (see map of Ireland, ref. $-11^{*}$ ). The town lies principally on the Leitrim bank of the shamon ; is connectel by a bridge with that part of the town which is on the Roscommon side ; is on the Minlland Great Western Railway. It has a church. a Roman Catholic chapu, two Dethodist meeting-houses, and a county infirmary and lispensary. It also contains the county conrt-hmse, jail, and honse of correction, and has considerathe trade, chiefly in provisions. A canal has been cut from this place to Lough Eirne. Pop. 1.384.

Car'rick-on-Sinir: an inlami town of Ireland: in the south riding of the countr of Tipprary, province of Munster; on the river Suir: is miles by rail ty of Clonmel (see map of Ircland, ref. 12-(i). It has an old Iridge, a parish chureh of high antiquity a Roman Catholic chapel, at hospital, a convent, and a picturesifue ruined castle built about 1310 by an ancestor of the Farl of Omond. The town is situated near the junction of the comnties of Tipperary, Kilkemne, and $\mathrm{W}^{\text {at }}$ tertord. Grain and other products of the soil are exported from this place by the navigation of the river. It has linnoll and woolen mamfactures. Slate is extemsively fuarried in the neighborthood. Pop. 6,000.
('arroich's Ford: a point on the cheat river near st. George, Theker ro. West Th. The Conferlerate forces under (ien. R. P. Gumblt, in retrat from Laurel Ilill, where they hat abandonoll most of their artillery and storns, were heris attacked by three regiments of Fealral tropss under Gen. ${ }^{1}$. A. Morris. A brisk chatarment ensued, in which the Confelerates ware routed and Gem. diarnet killed. The Federals captured the conferlerate wagon-train and one pice uf artillery. This athuir nedurred July 13 , 1*61.

Cur'rier. Alotstus Stues, lo, A.: Professor of Hebrew and the Cognate Languages in Meformick Theolugical Seminary: 1, in Ripley, N. Y... Dec, 30, 18ij: : graluated from Sale College dris, and touk the theological course at An-
dover and Hartforl Seminaries. He was pastor of a Presbyterian church in Bloomington, Incl. 184t-85: became instructor in MeCormick in 188\%, and professor in 1692. IIe published The Hebren Terb: a Series of Tabular Shudies (Chieago, 1891).

Carrier, kăarib-ay'. Jeax Baptiste: a Jacobin notorious for his cruelty: b. at the village of Yolai, near Aurillac, in Ilaute-Auvergne in 1256. At the commencement of the French Tievolution in 1789 he was only an alseure attorner, but was brought into notice by its progress, and was sent to the National Convention in 1,92. Ile was sent to Nantes in Oct., 1993-where he fonnd many Vendean prisoners-to assist in repressing the civil war commeneed by the priests and rovalists in La Vendée. Ile selected a committee in ortler to give the appearance of legal sanetion to his cruelties, but took them from the lowest and most vicious class of the people. He soon dispensed with all formality, and esecuted his prisoners in large numbers at one time. He murdered multitudes of men, women. and children by rarious modes. Many of these vietims were crowded into boats which were senttled and sunk in the river Loire. This was called "Republican baptism." The cruelties and obscenities related of this worst of Jacobin leaders are almost incredible. More than 16,000 persons were put to death hy him in a single month. Soon after the fall of liobespiere the public called for justice against Carrier, and he was finally recalled by the committee of pmblic safety, and condemmed br the revolutionary tribunal. He was guillotined Dec. 16,1:94.

Carrier, Joneph Augute: a French painter of portraits, miniatures, and forest scenery: 15. in 1800 at Paris, and studied under Gros. Prudhon, and the chevalier Naint. Ile first exhibited in 1834, won several medals, and in 1866 was decorated with the cross of the Legion of Honor. D. in Batignoles, Feb. 21. $18 \%$.
 of the French sehool: b. at Gournay-sur-Marne (Seine-etOise): pupil of C'abanel: second-class medal. Paris Exposition, 1889 : Legion ol' Honor 1889. The Sich Child (1885), musenm of Montargis, and The Firsl Teil (1886) are two of his most important works. Ite paints in a general gray tone almost devoid ol color, and envelops his figures in a misty sort of atmospheric effect. Ile has a considerable following among the yonnger French artists, Int his methods have a pernicions influence, as they tend to eliminate both color and exictness of form. Studio in Paris.

Willeam A. Coffin.
Carric̀re, Moritz: German anthor; b, at Griedel, in Hesse, Mar. $\overline{0}, 1817$; studied philosophy at Giessen, Göttingen, Berlin, and in Italy. In 1s4! he became Protessor of Philosophy at Giessen, and after 18.93 held that position at Mmich. Ile published Der hölner Dom als freie deutsche Firche (Stuttgart. 1843) ; Abülard und Ifeloise (Giessen, 1844): Die ReFigion in ithem Begriff, etc. (1541); Die phitusophische Hellanschanng iler Refomationszeit (1845); Die letzte Nacht der (rirondisten (a poem. 1N49); Religiöse Reden und BeIrachiungen für das dentsche '̄olk (1Ñ̈0): Jas Gharaklerbild C'rommells (1551): Das Hesen und die Furmen der Poesie (1854); Denhshe Geistestolden ion Elauss (18:1); Die Lumst im Zusammenhang der hulturentutickelang und die Ideale. der Menschheit (186:3-il): (ieschmurh und (iewissen (188:); and nther works: He defended Christianity, opposed Ultramontanism, and was of the liberal selool. Is an art critic he took a high rank, D. at Munich, Jan. 19, 184.

Carrier Indiams: See Itmapascan Immass.
Carricr-pigenon: Sue Pagen.
Carrières karruiant, Locrs, de: a Roman (atholie thenlogian: 1) in 1662 in Clusilé, near Angers, France. Ne became a soldjer, and in 1689 joined that Congregation of the Oratory. Ho hecame distingnished as a thenhgian. and pulhished, at the recuest of Bossuet, a Commentaire Litteral (94 vols. 12mo, 1-01-16). This work is very popular in France even at the prement day. Most of the comments are mate in the translated words of the Bible itself. and are interwoven with the text. It has been often repminten, e. g. Taris. 1872. seq. I). in Paris, June 11. 171\%.

Carriors, Common: those who undertake for hire to transport from one phace to another the goons or persons of surb as chase to employ them. They are distinguished from privale carriers by his readiness tio atford accommolation (1) the public gemirally, and are subjected in law to a ditferent respmsibility. T'her may the cither carriers by lam or carriers by water. Faniliar examben of the fomer kind
are stage-emach proprivens, milway companies, experes companies, wagmers, and tramaters, ele: of the latter, the owners and maters of stamshipls, ferry-huats, anm wesche of all kimbe engaged in a gencral tranportation buriness. The principles of law exhithiting the rights and duties of common carriors form a suberdinate department nuder the general -ubject of limanexr ( (q. $\cdot$.), amba, as in other varietios of the same lowal relation, the derree of care neessary in the chstoily and tratment of whatever is received ley the bailee is not dependent on all reperes. for its delermination upu the
 rules. The difirethe in these regnirements, depwling unn the circumstance whether there ber a carringe of sombe or a earriage of passengers, hemands that thesc two brame hes of the sultieet lue examimel s"parately.

Common cerriers of gombs are placed under a responsibility of excessive atringuley. They are lach liable for all luss on thatage which newis during trumpration wexp,t, that occasimmel by "the act of (iont or the pmblice comemy." They are made virtually insurers of the goods againa all previls except those arising from thene two moreens and the infregnency of exmphion must be sa great as to afford relief but wery rarely. The ravens fur impowing at duty so severe grows out of comsiderations of public puliey. The facility with which the sarrier or ther who may conlude with him can purthin or injure soonds int rute ecl to his wersight amd dispural. and the dilliculy of astertaining the true canse of the loses are thought to phace the members of the (o)mmanity so chtirely at his merey that their interests demand the mote ample protections. Morewser, the lact that the applicalien of this rule has not prowed detrimental th the growth and pomperity of transportation comanime indicates that its atprent umbue severity. While condncing grently to the advantage of the public, has workend no pace
 "act of fiul" is held to exteml only to surh inevitathe ance

 and carthoukkes properly would hi ineluded under this tesiemation and the varrice would loe relievel from Hialisity. But rohblery. wen if committeld unexpectully and he in

 their deet ination and hern actually deliverewl. But if, Man the lapse of a reasomathe time after arreat, they are not chamed and removel, the carrier's lablifity is min entirels ended, 1,at only modified indegree. It is than his daty to
 the ownor's demand, ame he is only aceombtable therafter for ordinary care. Important distinctions are drawn brotwen varions dasse of carriers in reterne to the propror mote of delivery. 'thase are rendered newesary by the diffirent kinds of transportation athenten in the several cases. Thas exprese companise employ conveyances whieh can be
 yucmily hela bond to make actual persenal delivery at the owner's phace of lasiness or residence. Carriots hy watars on the other hand, can proeed no farlher than the wharf.
 to sea-going ships, no oher delivery is demandel than can be mate there ; bat the convenience of the comigne is stith mondent, as far as practicable, by imbosing upon the carrime the ohligation, renterel menessary hy the mewtain time of arrival, that utice be riven when the vesed has reached luer place of dischare of tho vargo. ln milway trameportation, again, the ciremotances are still ditwent.
 mims ami trains are rum uniformy in aceorlance with published time-tables. Ilener, areoring to some anthorities, premal dedivery is so eombletely exched that not even notiece of arriyal is necessary. "Iloe better opinion seems to be that notice is reforinel, and that the monignere has a reasonable time within which to take the gouls before the strict liability of the carrier is motilied inth that af the warehouseman.
'The burpose of these varioms ruqulations manifestly is that the interests of both earrier ami owner be promotels. The "reasonable time" after arrivalduring which the canriors hatw pemonilitity a insurer is to eontinue will he most spedily terminatid when the owner has immediate knowledge hat the goods lie at his disposal.

There are instaners, however. in which dedimy is sufli"ient to thischarge the carrier, thongh not mathe to the owner himetf. This oceurs when several phet iss are pogagel succesively in the tramsportation of the same articters. The liatility of each, in the absence of special diremstances temmintes when the next undertakes the duty of carriage
 (isions of the Amerien eourts. In Englami, on the contrary, the rule is maintaned that the first carrier who recepive the grouls, if he ateppts them for an datination lapyom his own route, contimes lialle until the entire jonmey is completen, and the subserpent pars ies, thomgh the injury or los max ocenr on their own linew of travel, arre exemptad
 tion that the contract fortramsuration is tacitly mande with the finst carrier. Aeconding to the preabiling opinion in the $1^{\top}$. S.. the cases in which these views shomla the followed aro those in which the linst carrier engages hy spectal comtrate for the entire ronte. It shond be aldeal that thore may he sud a hasines connection lyetwem various partios comberned in contimems tramportation as to make them all liahle as part ners for the entire transportation.
Questions of mach impurtance arise as to how far a carricor* duty ant responsibility may be monified hy usage or (nas om, of ley specific contract entered into) with the owner. on by notice given lim. It is whll etahbished that common
 cat ion of pernliar regolations andpeil. Thas the nature of the gonls which will la rexemed or the reute which will be senerally pursued may he demminel in this manner:

At this puint there is a great pational difionty The que-tion is: What will has sufliment wibuce of an-wth on the nomers part to a motioe it is plaint, at lemat Hat then mite must the so given lay farvin as mathally for
 and elear that he can readily actuaint himedt with its cen-

ertraortinary responsibility by notice? It is now quite clear that he can not. He may make in this manner reasonable regulations in the nature of by-laws. bointing ont the articles that he will carry, or requiring a statement of their value, so as to know what care will be properly demanded of him, and what reasonable charge he should make. But When all this is tone he can not shake off his character of insurer by notice. To do this there must be a contractsome evidence of assent ; and notice by the carrier is no evilence of assent by the shipper: He. ly his silence, slownd fairly be assumed to insist on the earrier's common-law responsibility. The English courts held otherwise at one time, but the salutary floctrine here mantaned is now substantinlly establishel in England by statute. Under its legisation the earrier may relieve himself to a considerable extent by notice. but can not escape entirely the eonsequences of his own neglect or misconduct. The notice must not only be really or presumptively known to the owner of the goods, but must also be reasonable in its character.

Common Carriers of Passengers.-These are not held to as stringent in liability as carriers of goods. They are not made insurers of the passenger's safety, but are nevertheless recpuired to use the utmost eare, and are responsible for even the slightest negligence. The reason for this ditlerence is that they can have no such complete control over persons as over goorls. Passengers must largely retain freedom of movement and self-lirection. It is no more than just, therefore, that the earrier's duty should be correspondingly modified. Extreme vigilance may be demanded, but not the duty of preventing injuries to which the passenger's own heellessness may expose him. In accordance with this principle injuries occurring from any defect in the construction of machinery or vehieles which proper care should have guarded against, or from their unskilltul management, sulfject the carrier to responsibility. Ite is answerable for the acts of his agents. Whether negligent or willtul, done within the scope of their employment. It is his duty to exclude lawless and disorderly persons from his conseyances, or, failing to do so, he may, itreorling to some authorities, be hehl responsible for any violence they may perpetrate on the passengers.

When, however, the passenger"s own negligence is the proximate canse of the injury the earrier is not liable. Thus if an attempt shoukl be made to get upon a train while the cars were in motion, or a passenger's head or arm should be thrust from a window, ant aceilents oecur in consequence, his own imprudence would be fatal to any claim tor damages. This proposition leads to an important brameh of the law termed "contributory negligence," which may be lefined to be that negligence without which the injury would not have happened. while at the same time, on the part of the carrier. on leing male aswe of the passenger's neyligence, there must be reasonable care used to avert its effects.

The common duties of passenger earriers are to reecive all who offer to take passage as long as their vehicles suffice, to carry them the entire ronte, to treat all with civility and propriety and bring them to their destination within the stipulated time. They are not, however, compelled to receive persons of offensive or disorderly conduct, or any who by reasim of disense or disgusting habits are unfit associates for the ot her pasengers. Reasonable regulations may be adoped concerning the control of passencers, such as that fares must hos prin in adrance, tickets must be exhibited when called for, ant the like. Expulsion of persons in a suitahle manner and without neressily force from their vehicles for rofusing to comply with such rules are considered justifiable.

The liability of passenger carriers for hagrage emmitten to their charge is in gencral the same as that of common (atriens of gools. In other words, they are held bound as insuress. 1 , howeve, the pasonger prefers to retain exclasive entrol of his own property, as it coat, an umberlia, or a satheld, the rarier's responsibility is monlifiel. The lintility contimes until delivery is male, either to the owner at the final destination or to amother carrier in a contimums line of transit. and the luty of storing and preserving grools is the same that has heme already detailem in the ordinary case of rarriage of gools. The effeet of contract or notice is also similar. The obligation to convey bagerge arises independently of any special arement in relation thereto, being considerel as incidentally connected with the undertaking to carry the passenger himself, and no addi-
tional payment is necessary. But some measure of relief is granted the the carrier on aceonnt of this lack of remuneration by defining his accountability more narrowly. He is only liable for articles properly denominatel laggage, and not for everything which the passenger may choose to consider such. Articles of neecssity or personal eonrenience are reasonably included within the meaning of the term, but not merchandise or large sums of moner or silver plate, and the like. For instance, jewelry used for personal ornament, a reasonable amount of money for traveling "xpenses, the instruments of a surgeon required in practice in the course of his journey. lave all heen considered "baggage," and the carrier made accomitable for the loss. But the samples of a traveler acting for a commercial house would not he baggage, but merchandise, mless the carrier was manle aware of their nature, and then withont objection receivel them as baggage. The principle governing this matter is that concealment of the true nature of the package presented as baggage is a frand on the earrier. All infrence of fraud is dispellen if the contents be disclosed, and there is no olvection to the carricr accepting merchandise in trunks if he see fit.

Appropriate remedies exist in faror of carriers. They may detain goods for the freight. They have an action against strangers who interfere with their possession, and may even recover the full value of the goots, holding the surplus above their charges in trust for the owner.
In this trief smmary of the rights and duties of common carriers attempt has only been made to exhibit cont-mon-law provisions and principles. Statntory enact ments exist in the Cnited Kinglom, and in varions States, relating to the snbject. The sulvject is treated in mueh detail in such works as Redfield On Railurays and Angell On Common Carriers. The rules of damages will be found in Sedgwick or Mayne On Demages.
T. W. Dwight.

Carrillo karar-reel'yō, Bratzio: a statesman of Costa Rica; h. at Cartago, 1800. He was a member of the Federal Congress of Central America 1*34. and twice president of Costa Rica (May, 183.5. to 11 ar., 1837, and Mar. 1838, to Apr., 1842), his administration being marked by wishom and prosperity. In $18: 36$ he suppressed a rehellion. Carrillo's government was overtumed by Morazan in 1812, ant he was driven into exile. He was mardered at San Niguel, Salvador, in 1845.

Cartage'na: a city and fortified sempert of spain: prov-
 $\therefore \therefore \mathrm{E}$. of 11 urcia; lat. $8 \mathfrak{r}^{\circ} 36^{\prime} \mathrm{N}$., lon. $1^{\prime} \mathrm{W}$. (see map of spain, ref. 1!1-11). It ocoupies the declivity of a hill and a small plain which is hetween the hill and the sea. The harhor, which is one of the best in the Mediteramean, is eapacions enongh to hold the largest lleets, and is protected trom winds hy highlants which inclose it on sereral sides. The entrance to the harbor is delembel by a fortified island. ('artagena was formerly the chiof maval arsenal of Spain. It has a Doorish cathedral. numerons chmedes and convents. a thater. and an ohervatory; also manalactures of sailchth ant whas. Wet mathle is abunlant here, and is nset for buikting. Nines of silver and leat have been opened in

 Nora.
Carlarena: a seaport-city of Colombia: rapital of the departmont of lowivar; on a low islam of the C'ariblean coast at the entrance of tartacrena hay (see map of Sonth America, wef. 1-1\%). It was tommert by Petro ite Iteremia in 1533, and durine the eolonial probed was one of the most important ports and st rongholesor spanish America, having the mompoly of at yast commorese. It was sereral times sinkel hy hacempers and English corsairs, and in the effort

 it was taken he the Spaisme, aftor sustaining an heroir siegre ul four monthe (145). V'artarena is an episenpal city. It has a fine cathermal and several other elmeless a hejpital. theater, and many convents and other ohd huidings of hislurion interest. The eity is surromber hy thick walls. The bay is a large and deep landorked harher, with two man thatrancos: of these the larger was armificially obst moterl in the cishternth century and shaps use the smather O,pe, which is rery narmo smel 8 miles dist ant from the vity. There are
 the hathor. Owing to its hot and oftem monealthy situation.
and the lack of good water, the prosperity of Cartagena has declined. A railroal to Calamar on the Magdalena river is in course of construction (1893). The principal exports are hides and tobacco. 1'op. ( 1892 ) about 12.000.

JIerbert H. Smitn.
Cartaso: a city of Costa Rica; near the center of the repmblic, in a valley at the foot of the lrazit voleano $; 4,900$ feet above the sea (see map of (entral America, ref. 8-J). It was founded by Coronadn in 156.5 , on the site of an Indian tuwn, anal was the capital of Costa Rica until 1823. It was nearly destroyed by an cruption of the volcano in 1293 , and was ruined by an eart hquake Sept. ㅇ. 1841, but soon rebuilt. The streets are wide and well paved, and the honses sulstantial; the water-supply is excellent, with several fountains and separate pipes to dwellings. There are several churches, a college, large harracks, and it hospital. The railroat from Limon to Alajnela pases through Cartago. The hot mineral springs of Pella Vista. 3 miles tlistant, are much frequented by invalids. Pop. (1892) about 12.000. Cartago is the capital ot a province of the same name, containing about 200 sq. miles; prop. (1888) 30,88\%. Ilerbert IH. Smith.

Cartaso: a town of the repullic of Colombia; in the state of Cauca, and on the river Canca, about 135 miles W . of Bogota (see map, of south America, ref. ?-B). It has a catheedral, and at trade in coffee, cocoa, iried beef, tobaceo, etc. Pop. 7, 9696.

Carte, Thomas: historian: b. at Clifton, near Rughy, England, in Apr, 1686; elueated at Cniversity College, Oxforl. Ile became a priest and Jacolite. Juring the rebellion of 1015 a large rewart was offered for his arrest. but be escapel to France. Ilis chicf work is a Ilistory of Englumel ( 4 vols., 1i4i-55), whieh is prized for its faets, hat is not well written. Many volmmes of his mannseripts are preserved in the bodleian hibrary at Oxford. D. Apr. 7 , 10.5.

Cartel [Fr., from Ital. cortello or Span. centel, dimin, of carta, letter, card]: an Anglicizel French worl which in France signifies a "challenge." As a military term it is ased to denote an agreement hetween two belligerents for the exchange of prisoners. I vesel usen in exchanging prisoners or carrying proposals to an enemy is called a cartel-ship.

Carter, Franklix, Ph. D., Lh. D.: president of Williams Conlege; 1, in Waterbury, Com., sept. 30,1837 ; educated at Yale College and Williams College and in Universitr of Perlin; Professor of Lat in, Williams College, 1865-i2: Professor of German in Yale College in 18:2-81; president of Williams College $1 \mathrm{si1}$; has pullisherl an edition of Goethe's Iphigenia. Shudy of Jlark llophine (18tr2), and articles aml essays in The New Englander, Tramsactions of the American I'hlolagienl Society, etc.

Cabter, Sumuel Powhatas: rear-almiral L', S, naw ; b. in Elizabethtown, Carter co., Temn. Aug. 6, 1819; cntered the navy as a midshipman Feb. It, 1840. Ile served on the east coast of Mexico during the Mexican war. While attached to the stcmmer San Jacinto in 1856 he participated in the attack on the barrier Forts at the month of the Canton river, China, which resulted in their capture. In duly, 1861 , Garter was ordered to report to the Secretary of fiar for duty, and proceeded at once to East Tenmessee, where he orgmized the Temessee hrigade. He was appointel a lnigatior-general of whunteers, and continmed on active duty with the amy thring the entire war, duing most imporiant amb gallaint service in Temmesee, Kenturky, Virrinia, ant forth (arolina, and rexeiving the brevet of major-gencral for gallant and distinguishel services. Ile was apminted a rear-admiral on the retired list May 16, 1sse. 1). May ? 1 , 911.

Thay planted colonies in llivamia (śpain), and derivel much riches from the gold and silver mines of that peninsulat: hut their relations with the natives were peacelul, ame they dial nut attempt to subjucrate Spain before the Punic wars. Polybius states that all the islands of the Western Dediteranean helonged to Carthage at the commencement of the Punic wars, $264 \mathrm{~B}, \mathrm{c}$. In 509 B, c. a commercial troaty was concluded between Carthage and Rome. This celehrated document has been preserved by Polybius. The setonn treaty hetween these two nowers was made in 34 B .6 . It appears that the Carthaginians never came into hostile contact with the Athenian republic, although the latter was a great maritime prower while Carthage was near the zenth of her prosperity

The army of carthage was composen chiefly of Lihyan conscripts dint slaves and foreien mercenaries. This defect in her military system was probably one of the chiel causes of her ruin. This system conded not afford the republic internal security, for the soldiers had little devotion to the "ause for which they fought, and the enemies of Curthage fonm it their best policy to "carry the war into Africa." It wonld he an errob to regarl the Carthaginians as a merely commercial people. Agrioulture was a tavorite pursuit if the mobles, citizens, and colonists, aml the soil of hor African territury was extremely fertile. Her proserity was alon promoted by manufactures and meehanical arts. (fold and silver were the standard of valne at Carthage bui we have no evidence that the remblic coinel money, as no Punic eoins are now extant which were struck before the lommans congluced that state. Jer merchant-ships passed heyond the Pillars ol IIercules and made royages to the british islands. The ('arthasinians aloo carried on an exfensive inland trable hy earavans, which traversed the descots to the valleys of the Nile amd Niger.
('arthage and Rume were the two greatest powers of the world when their rompetition for the rich ishame of sicily involved thenı in the tirst l'unic war, 264 в. c. The Romans, who hat no navy when the war hegan. suffered several defeats at sobi anil one of their generals, Mareus Regulas, who invaded 1 frican was taken prisoner. They gained a great naral vietory near Lilybam in 241 в. C ., which ented the war. 'The (arthaginians obtamed peace by coling sicily and Sumlinia to the victors. ('arthage was so impoverished hy this long war that she conk not pry her armies. The niercenaries revolted in 240 B . ce. and were joined by most, of the sulyject Lihyans in a civil watr which bronglit ('arthage to the brink of ruin. Aftor the sinplession of this revilt the peace and stability of the state were menaced by a fedd butwern lanno ami Ilamilear biaca, who became rospedively the leaders of the aristoreatic and democratic parties. 'The wreat abilities and sagacity ol' llamilcar restoren the prosperity of the rabublic by the eonquest of Suain, which, says Jleeren, " Was then the riehest cometry of the known wimld." The inventerl Spain in 23i b. c.. and gained suwral victorios, luat ho sublaterl the spaniarifs by kimbues rathor than loree. Carlier. Jacquas: a French maviqutor: b, at St--3ale, Dee: 31, 14:4. He diseoverelt the river st. Lawrence in 1534. and asemuded it arar as the site of Montreal. He returned to Frane in 153th, taking with him Domacona, in Intian chict, and several other Indian leaders, whom ho treacherouly carripe atl. He joined Loberval's expedition and sailed again in 1.itl. exploring the raphes alove Mon-
 and sailed forst.-Malo. The King of trance ennobed him for his discoveries. 1), abont 15.5.
Car'tilage [from Lat. cartilago, gristle]: a mariety of ennmetion tissue of more or less chastic and translueemt character and whitish of yedlowish in color: commonly known hy the name of gristle. In stmeture cartilage present: two distinct rarietio.. One known as hyaline the other as librous of fibro-tartilage. In the former there is found a homosemeons transhuent matrix in which atre embethed the proper cartitage eells. 'jlae latter are large ovoil or irregulat-shajed cells, having a large nuchens and lying in groups of wo to three or four inclasal within a capsule. In the cave of fibro-artilage the interedhatar matrix contains a greater or less abondance of fibrous st roma. and in some eases the latter is largely composel of yellow elastio fibrik. (Carthage mav he chasifiem as temporary or permanent; and we may dindinguish that which is commetel with bene or which lembs to bone fomation. and that which is indenembent of bone or bune formation. 'Temporary cartilage is the hasis of all ositication, and in an infant or youthful prevon the majority of all hones consists manly of cartilage. As age alvanem the formation of true bume increaso and by the twentioth or tworty-fifth year the prowes is nonally complite. There are beft, then, only the cartilages which furm the artionlar emes of bums. Even these may become partially ossitiod in admacel life. The sternum, the costal cartilages, the larynx, the cartilages of the nose, wat, and hrondit rardy become vasifict. See the artiches lonex and llistulatis.
I'artilaseimons Fishes: those fishes whene skeletons ate deatitute of true bume, as the sharke, watce, - turgeons, ete. see Fisu.
Cartography: sem Map.
 angmentative of curta, parer ] : in the fime arts, a disign
drawn on strong paper or other material, and used as a motel for a piot tare to to excentel in freser, ail color, tapestry, or glass. 'Ile cartorn is drawa the same size as the pieture to be excented, this method rabliner the artist to alter the drawing or connmition rembly. The drawing is mate either in chalk or distemyner, and is sometimes jrimet or washen with grount-color. The cartom is transferred to cancas or plastre cither by tracing the lines with a hard point or by pricking them with pins. In the first intance the lack of the cartoon is tirst convered with sume coldringmather: in the second a bag of palserized chatenat or colored powder is pased over the perforations, pomang the design onto the surface to be worked on. It the picture is to be phaed at angeat distance from the eye of the spectaturs, allowance mat be made for this in frawing the cartom.
IThe wise of cartoms is paticularly impontat in fresen paintinas, of which only a small protion cam be exerutad at atime because the plaster mast be moist when the jigment is npplime to it , and it would be impossible to skitch the whole design on the phater in the first instance. "Therefore the cartoon mus be traced in comproments so small that the artist can tinish one hefore the plaster becomes ary The most famous eartoons at the present day are seven hy Raphat which ate preservel in the south loensington 11 uselim, Lomden. These are a part of a sot of twoty-live Which were sent to Flankers to be copiest in tapestry for lope Leod. After the fabrication of the tapestry, which is said to be extant in liome, the cartuons lay neglected at l'massols, and many of them were destroyed. Seven were pmrehased by Rutiens for Charles I. of England, representing the lollowing subjects: 1, St, l'and preaching at Athens; 2. Whe death of Ananias: 8. Elymas, the soreprer, struek with bindness; 4. Chtist delivering the keys to st. Peter: 5 . the sarrifice at lystra; 6 . the apostles healing the sick in the temple; T. the miraculous draught of fislues. These have bem engraved by borigny and Aultan. When the collections of ('harles i. was sold these cartoms were pur(hasel for the nation by (romwell's secial commant.
The full-pare political sketches in comic paters also are called cartoons.
Tatridge [fom Fr. corlouche, small paper bag, a roll
 deriv. of Latt. charta. paper : at case containing the poper quant $y$ of fowaler or anmunition required tocharge a gun or liverm. (fartridges for muskets are usually gater tubes. rach containing a smablamonnt of powder and a leaden ball. These are called hall cartridges. The paper uscol for this parpose is strons, amb is mate into a tale by means of a mandrel. Thimer paper is applied to certain jarts of the tubre, wo that the powher has two or three thinknesses of paper around it. but the hall has only one. hesides this form the are several latent eartridges. A coutringe which collains powder ondy is called a hank eartridere Gartringes for camon or lage guns are chielly made of serge or Hammel sewed up in the form of a hag, which, filled with a given weight of jowder, is tied aromal the merk and strenghencel hy iron horjs. (artuidges for pintols are ushally coplere ofinders, having at the hase the froper anenit of thlminating prowler. Which inflames the charge of cumpower upon lathe strack by the hammer, not these ent indere are haed in most brech-loading fireams. See Blastivi.

twentr-one: resigned in 1879 , and in Deeemher of that rear sailed for Africa unter commission from the Società d'Esplorazione Commeriale diAfrica. After varions wamderings in the Bahr-el-crazelle ralley, where he joined his comntryman, Gessi Pasha, and in the Niam-Niam comntry, he found himself shat in with Emin Pasha by the operations of the Mahdi. At the request of Emin Pasla he went to live as "resident" in the territory of King Kabba Kiegi, son of Iltesa of Unyoro, where a part of his duty wits to ate as Emin's postmaster. At first kindly treatel by the king, he was afterward condemned to denth, hut managed to escape to the Abert Nyanza Lake, where, after undergong great harelships and peril, and losing his notes and MSS., he was rescued by Emin P'asha in $188 \%$.
Casan'lon, Isatc: Lo in Gerevil, Switzerland, Fel). 18, 15is! ; A. in Lemben, July 1, 1614. Arter the pultieation of the edict of Jan., 1561 , his parents, who were ${ }^{-}$rrencls refugees. returned to Framce, and his fither was settlet at ('rest in Dauphiny as pastor of a Inguenot congregation. The circumstances of the family were humble, and times becane hatrd. Un to his nineteenth year latale received no other instruction than what his father could give him ; he had his first Creek lessons in a mountain-cave where the tamily was compelled to hide from a Roman Catholic mob). In 1505 he was sent to the Aeademy of Geneva, aml so great were his accomplishments that in 15se he was appointed Professor of Greek there. Hu held that position till 15!6, and in 1542 he published his amotated edition of Theophastus's Characteres, which gives a goonl idea of his pecular style as a commentator. But he lacked hooks in Geneva, and in 1.:96 he aceepted the chair of professor at Montpellier. The office of teaching, however, was not consenial to him, and in 1600 he remored to Paris as librarian, having in the meantime published his most ambitious work, the revised and annotated edition of Athemas. The ten years he spent in l'aris were the busirst and the brightest time of his life, but he allowed limself to le dragged into the theological controversies of the perion. After the death of Ilenry IV. he left France and took up his abote in london, where he was made prebendary of Canterinury and Westminster, and where he wrote his Excrectatiomes contra Baronium. which were left unfinished, aml his Ephemerides, published by the Clirendon Press in 1850. Sue his Life by Mark l'attison (London, 18:0).-llis son, Meric (h. Lug. 14, 1599: al. in Oxford, July 14, 16:1), was coluceted at Oxford, where he also tanght thealogy. Ile repmblished editions of Terence, Epictetus, and Marcus Aurelims.

Casca, Publues Serphifs: Roman conppirator; tribune at the time he asisted in the assasination of Inlius Consir, 41 в. $C$. Aceording to l'lutarch, he struck the first blow. He fonght in the battle of Philippi, f? B. c., and diet soon alter.

Cascade Range: a chain of mountains which stretches from Sonthern Gregon throngh Washington into Pritish North America: nearly parallel with the eoast of the Pacific Oeem, and a contimution of the Sierra Nevada of ('aliformia. The direction of the range is nearly $\mathbf{N}$. amb s . 1ts distance from the seacoast is in Oregon about 120 miles. The Cohmbia river breaks through this range, forming the cascades from whiel the name is derivet. The range is constituled chictly of rolcanic recks, which were sprad in great sheets and aftirward upheaved; and several peaks, including all the most lofty, are extinct woleanoes. Among the highest summits of this range are Mt. Lagan, 19.500 feet; M1t. St, Blias. 1s, 101 : Mt. 11ood, which rises 11,225 feet ; M1. Adlans, 13,254: and Mlt. Rainicr (also called Theoma), 14.44.
('ascaril'la [span. - dimin. of casecte, hark]: the hark of Crolum rluleriu. which grows in the West Inlies. It is a shub of 3 to in fere in height, and the stem is fresmently as thick as 4 to 8 inches. It is used in medicine ats an aromatic tonic, and was formerly nsed in the plate of cinchona bark in the froitment of malarial fevers. It is useful in the treatment of (lyspepsit, indigestion, or flatulent colic.

Cas'en Bay: in Maine; washes the shore of ('momberland Comby: i- about miles loner. The city of Parland is at the wetern extromity of this bay, whel inclomes about 300 intme.

Cans, in law: an milion, canse, or controversy, cither in law or equity. submittel for derixion to a court of justime. In particular (1) a form of action called "an artion on the" chse." or, mure fulp, "perial action of trespass on the case", (Siet Trespass.) This ation did not exist in the early Engr-
lish law, hat was introluced by a statute of the reign of Edward l. (Westminster 2il). It is founded on the peenliar cireumstances of the case. and supplies a remedy for such wronds as ean not be ineluded inder the term "trespass"" and which are in their nature indirect and consequential. It applies to such wrongs cither committed against one's person or broperty, whether real or personal. The action is sometimes called "trespass on the case," and at other times simply" cuse." Ont of this action grew the modern action of "itssumpsit," which is really instituted to recover damages for breach of contract. (2) In U. S. constitutional law the term ease is applied to a civil or eriminal action, as distinguished from a controversy, which term is applied to a civil action muly. (b) a written or printed statement of facts for the opinion of combel or for the deeision of a court or judge. A question of law. The facts are sometimes presented by agreement, and at other times after being sub)mitted to a jury. This may be either a "case reserved" or "case marle" by which questions of law arising in the course of a trial are summited; a "case stated." where the faets are agreed upon and the ruestion of law is sulmitted for decision withont a regular trial ; or a "case on appeal," hy which the facts which oecurrell at a trial are presented to in appellate court for reviow. It the parties fail to agree on a statement of lacts, the court hefore which the trial necurred passes mon them, and is therenpon said to "settle" the case. Revised by F. Sturges Allex.
Case Augustus ludow: rear-adiniral U. S. navy; b. in Newburg, N. Y., leel, 3, 1813; entered the nary as a midshipman, Apr. 1. 182s. He serverl on the east coast of Mexico thring the Mexican war. priticipating in the capture of Tera Crnz and Tolasco. Early in 1861 Commander Case was appointer theet-captain of the North Atlantic blorkarling squalron, in which capacity he took part in the capture of Forts Ilatteras and Clatke, Jug. 29, 186t, and in the operations in the sounds of Norila Carolina in the winter of 1862. In 1v6:', in command of the lroquois, and assisted by the stemmers Janes Adger and Mt. Vernon, he cut ont the blockade-runner Kate. muler the fire of the forts and batteries at New Inlet, N. 1 . He was chief of the burean of ordnance Hrom Ang., 1869, to May, $18 \% 3$; in June, 1873 , he Wis appointed to the command of the European squadron. Fetired Feb. 3, 183.5. I). in Washington, I). C., Feb. 17, 1893.
Case-hardening : a process for covering artieles of cast iron, wronght iron, or steel with a coating of steel. It is a rapid and partial process of cementation, the object of which is to combline ability to resist surface-wear with the tenacity due to the character of the original material, which still constitutes the bulk of the article after case-hardening. It consists in packing the articles in vessels filled with some snbstance yielling carbon when exposed to a red heat. This carbon alloying with the surface of the artiche converts it into a steel-like skin. After it has been heatel for a proper length of time the article is plunged into water. Formerly amimal matter, like hoofs, homs, bones, skins, etc., were nseil as the casc-hardening material. Now yellow prussiate of potash is almost exclusively employed. The coating of steel is usually very thin, seltom exceeding $\frac{1}{16}$ th of an inch.
C. K.
('a'spill [mol, deriv. of Lat, caseus, cheese]: a nitrogenous organic substance allied to albumen, fomd in milk, and most abundantly in that of thesh-eating animals. It is said to be occasionally found in the fluid of cysts. It is also foumd (as legumine, and probahly as amandine, both being regarded as identical with it) in pease, beans, almomis. and other seeds. Vegetable amb animal caseins behave exactly alike with chemical tests, and when pure can not be distimguished by the taste. The portion in cow's milk is ahont 4 per cent.; in dried peases esprent. Cosein is eongulated (anrlled) hy acids or by remet, and is the ehief constituent of ('ieeser (q. r.). It aiso forms insoluble precipitates with corrosive sublimate, with nitrate of silver, and with acetato of leat. Hence copions traughts of milk atfort a rearly antidnte in cases of pisoning with either of the above salts. Cascin is also used in ealico-printing. 'The probable proportions of the eonstituent elements of casein in 100 pirts have been given as follows: Carbon, 53:83 parts: oxygen, 20.52: nitrogen, 1505 ; hydrogen, $7 \cdot 15$; snlphur, $(\cdot 85$, with perhaps a little phosphoris; but its composition is not exactly known.
C'asemate [lal, cast, house, moftr, foolish, also dark, dark honse or room; or (ir. хaбرa, ditch]): miginally, a diteh defense similar to a Caroxime ( 4 . r.); later, a chamber with a

Casimir-Perier, Jean Patl Pierre: President of the French republie: b. in Paris. Nov. 8, 1847: the grandson of Casimir Perier, the Prime Minister of Louis Philippe (see Perier, Casimir), and the sun of Auguste Casimir-Perier. Minister of the Interiol under Thiers: served with honor in the Franco-German war. receiving the decoration of the Legion of IIonor for bravery, and after the peace entered actively into politics, holling an important oflice in the ministry of the Interior. of which his father was then at the head. In 1sit he was chosen conneilor-general by the electors of Nogent-sur-Seine. and in 1876 was elected to the Chamber of Deputies, to which he was successively reelected. Thongh suspected of Orleanist sympathies, he voted steadily with the moderate republicans, won the contidence of his colleagnes, and was elected vice-president of the chanber in 1890 , having in the meantime held important posts in the ministry of Public Instruction and the ininistry for War. In $1 \times 43$ he became president of the chamber, and was re-elected in Novenber of the same year. but resigned Dec. 3 to become president of the conncil. His ministry, which lasted till May 22, 1844, was marked by its stern attitude towarl disturbers of the public peace. as exemplified in the passage of a law to punish indirect, as well as direct, incitements to crime in the public prints, and in general to strengthen the hands of the anthorities against enemies of the frovernment. On June 27, 1894. he was chosen on the first ballot by the National ciongress to succeed I'resident Carnot (q. i.), but resigued suddenly Jan. 15, $15 \%$.

## Casino, or Monte Cassino: See Cassino.

Caspari, kŭus-paa rěe, Carl Patle. D. D.: Lutheran theologian: of Jewish origin: 1. at Dessau, in Anhalt, Germany, Veb. 8, 1814: edueated at Leipzig and Berlin; went to the U'niversity of Christiania, Normay, as Professor of Theolory in 144. He wrote many works on Arabie grammar, Olid Testament exeresis. etc.. and translated the Book of Concord into Norwegian; but his chief listinction lay in the important results he attained by his diligent researches into the history of the cenmenicil creels, especially the Apostles' and the Nicene. D. in Christiania. Apr. 11, 1892. Henry E. Jacobs.
Gaspe: a town of Span: in Aragon: province of Saragossal : situated har the river Elno; 53 miles.s. L. of Saragossa (see map of Spain. ref. 14-1). It hat three churches, a town-hah, and namufactures of oil and soap. Pop. 9.100.
C'as'pian sea (in Lat. Mare Cospium, or IVare Hyrea-
 part of the boundary hetween Emope and Isia. It is now within Russian trritory, except at the southern end, where it is margined by Persia. It is alront bilo miles long from N. to s.. and has an average wilth ot near 200 miles. The area is $169.3 \times 1$ ッr. miles. The depth of water toward the $\stackrel{\text { s. }}{ }$ is neaty 3,060 feet, but toward the N. it is shallower. A submarine rilge continues the $\Lambda$ pheron peninsula across the rea in an "asterty direction, thus dividing it into two lasins. The decpest sombling of the northern hasin is about 2.500 fret, but the water js sery shallow for a long clistance out from the shore, "xpeciathy from the month of the Culga. where mure than 100 miles away the depth is only ia feet. The flepression of the surface of the Citupian Lulow that of the Piatk Sea, according to the lansian surwes, is thout !n fert. The cisplan receives several large rivers-viz.. the Volga, the Tral, anll the Kima. It has no ontlet, and its superfluous water can escape mly by ceapmatien. That the Gaprian and the sab of Wral were one connected is remberm evilent ly the nature of the rocks in the vast patas whel extent from them in several directions, Great numbers of sturgons and salmon are eatught in this sed. in which varions other kink of tish are also ahmment. A communication hats hew oppent between the Caspian Sea and the lablice by a canal which ennncets the Volgat with the rivers Tvertza inn sidlima. steam-parkels navigato the faspian, the commerce of which is mostly in the hames of the linssians. The chine furts are Satrakhan, Derbent. Detrorak, Baku, and krasmordsk.

He was rabised to the rank of hrigatier-gemeral in 1813, ant
apponited Gorernor of Michigan Territory in 1814. After he hat hell that wifice sixterll years, and negotiated many treaties with the lndians, he was appointed Secretary of War by President Iackson in 18:3. He was sent in $18: 36$ as minister to France, where he succeeded in keeping lirance from joining the "quintuple alliance" intended to enforce British clams to right of setreh on the high seas. After visiting Mesliterranean ports in a U. S. frigate he returned home in 1842, and was elected a Senator of the U.S. for Michigan in 1s44. Ilaving opposed the Wihmot Proviso, he was nominated as Democratic candidate for the presidener of the U.S. in 1840 , but was defeated by Gen. Taylor the Whig candidate. who received 163 electoral votes; Gen. Cass receivel 137 electoral rotes. In Jan., 1849. he was re-elected to the Senate of the ['.S. Ihe supported Douglas's Kansas-Nehraska bill in 18.34: became Secretary of State in llar., 185: resigned in Dec.. 1860, hecanse the President would not re-cmforce the garrison of Fort sumter. 1). June 17. 1866. Ilis pmhli-hed writings are not numerous, but are well written abd display much ability. See H. R. Schoolcraft. Life of (ipneral C"ass (184) : W: L. G. Smith, Life of Lewis (cass (1856): A. C. MeLaughlin, Leuis Cass (boston, 18:11).

Cansagnac, Paul Granier, de: See De Casfagnac. Matl Graviek.
Cassan'ller (in Cr. Ká $\sigma \sigma a \nu \delta \partial o s$ ): a Macedonian priner; a son of Antipater, Regent of Macedonia. When Antipater died, in :31s b. c., Cassander and Polysurchon became competitors for the regencr, and appealed to arms. Cassamler was victorious, and, having taken Athens, restored the aristoeracy under Demetrins Phalerens in :316 в.c. He marricd Thessalonich, a sister of Mexander the Great; obtained bosession of Alexander's wife Roxana and her infant son Egus: whom he put to death in 309, and usurped the throne. 11 e jnined Selenets and Polemy in a coalition against Antigonus, whom these allies deteaterl at the battle of lysus in 301 в. С. IIC dicd in ent, and was succeeded by his som Philip.

Cassandra (in Mr. Ka $\sigma \sigma \alpha^{\prime} v \delta a$ ): Trojan princess: a danghter of Prian: celehrated for her prophetic in-piration. According to the potical legend Apollo was enamored of her, and tanght her the secrets of fate. but he ordaned that her prophecies shouh not be arelited. During the siege of Tros she predicted the ruin of that citr, but she was regrated as al luatic he the Trojans. She wate carriet away as a captive by Agamemmon, and stain by his wife Clytemnestra.
Cassandra. Gulf of (anc. Toronacus Sinus): a part of the Egean sea: in Macedonia, Fumpean Turker: extends between two penimsulas, the extremities of which are called Cape Drepano and Cape I'alluri. It is nearly es miles lons. The peninsula to the W. of the gulf and a cape on its western side have the same mane.
Cassano. kăas-siainō: a town of Italy: province of Calabria: 30 miles N. of Cosenza (see map of Italy, ref. 8-(i). It stands in the concave recess of a steep minuntain. in the midst of heantiful scenery. It has a cathedral, several conwents. and an ohl castle $\vdots$ also manufictures of silk, linen. cotton, and leather. Pop, 9,216 .

wite of Cepheus and the mother of Andromeda. She was said to have been transformed into a constellation.

Caswiopeia, or Lady in the Chair: a constellation in the northern hemisphere : has several stars of the second magnitule. It is represented on the celestial globe as a lady sitring in a chair. Five of its most conspicuons stars are arranged in a figure like a W. In 1502 a new and brilliant star suddenly appeared in Cassiopeia. It was observed by "recho Brahe in November, and is said to have surpaseed all the fixed stars in splendor. It disappeared in Mar." 15\%4, afler a gradual diminution of luster.

Cassiqniare kăs-si-kct-aa'ré, or Cassitniari : a river of Sonth America; in Venezuela; a deep and rapid stream, forming the south bifurcation of the Orinoco. It issues from the Orinoco about lat. $3^{\circ} 10 \mathrm{~N}$. and lon. 6620 W .: and, flowing sonthwestward ahout 130 miles, enters the lio Negro near San Carlos. This remarkable river opens a navigable communication between the Orinoeo and the lio Negro, but ahore the midlle rapils of both rivers. It is 600 yards wite at its entrance into the latter.

Cassiler'illes [name applied by Iterodntus and later writers to the islands (Great Britain) whence were procured the early supplies of tin; leris. of kaafitepos. tin, a word probably of Assyrian origin. ('f. Assyr. Fitsuzafirul): the ancient name of certain islands, supposed by some to be the Scilly isles. and by others some little istands of Vigo Bay on the Spanish coast, from which the Phenicians procured tin.

Cassit'erite [from Gr. kaббitepos. $\mathrm{tin}+$ suff. -ite]: native peroxide of tin, composel when pure of 21.62 per cent. of oxygen and $\operatorname{sivis}$ of tin. It is the common ore of tin, and the only one from which the metal is obtained. It occurs massive (as tin-stone), disseminated and fibrous (as wood tin), in rolled pieces, and in grains as sand (stream fin): also crystallized in quadrangular prisms, terminated by foursided pyramids. Its luster is splendent. It is olitained chiefly in Australia. Cormwall. the Malay Peniusula, Renca, the Black Hills of South Dikota, Virginia, and California, Revised by C. Kírehнof.
Cas'sins Longínus. Catus: Roman conspirator and general; a friend of Marcus Brutus, whose sister he marricd. He served as questor under M. Crassus. and distinguished limself in the expedition against the Parthians in 03 b. c. After the death of Crassiss lie defeated the Parthians. In the civil war that ensued he fought for lompey against Cirsar, and after their defeat at Pharsalia was pardoned by the victorions Cassar. He was one of the conspirators who killed Casar in 44 b. C., soon after which event he commanded with snccess in Syria. Ihis army was subsequently united with that of Brutus. Brutus and Cassius, who were the principal leaders of the republican party, were defeated by Intony and Octavius at Philippi in 42 b. c., and then killed themselves. sice Plutareh, Life of Brutus.

Cas'sins Parmen'sis. or Ca'ins Cas'sins Severus: a Latin peet who wrote epigrams and elegies. lle was one of the conspirators who killed the dictator Cissir. 44 в. C. Hawing enterel the service of Mark Antony, he fonght against Augustus, by whose urder he was put to death about $30 \mathrm{~B} . \mathrm{c}_{\text {. Only small fragments of his works are ex- }}$ tint.

Cassivelan'uns, or Cassilielan'mus, sometimes Anglicized as Cassibrelan: a chief of the ancient britums who ruleal over the country N. of the Thames. lle fought havely aganst (asar when the latter incaden lritain in 5I b. $C_{\text {G }}$ but Cesar took lis capital and compelled him to pay tribute.

Cassock: it tightly fitting garment as regards the body, but loose and flowing bolow, worn by cectesiastice of all orders. It varies in color. In the Churel of linglame the clerey of all orders wear black; bishops on state oceasions fremundy weat purble. In the lioman Catholie Chureh, pricits, deacons, amb sul)-denems, with persons in the minor orders, war black (eassorcks: hishops wear purples Scarhet casoocks were wom by doctors of divinity and civil law and are still part of the diess of camlinals. The Bishop of Reme alune wears a white casanck. The media wal Chureh of lingland cassock was without buttons, and was nanally gathered in at the waist with a girlle or cincture of the same material quite similar to that now in nse.

Cacoop'olis: capital of ("ass co., Mich. (for Jocation of county, see map of Michigath, ref. 8-H); on Mich. Cent. and

Gr. Trunk R. Rs. : 98 miles S. W. of Lansing, and 100 miles E. of 'hicago. The principal industrial cnterprises are a flouring-mill. wooken-howl factory, cooper-shop, lumbermill. and a combination wire-and-slat fence factory. Cassopolis was founded in 1536. and is situated between Diamond and Stone Lakes in a fertile agricultural comnty. It is a place of summer resort. Pop. (1880) 912: (1890) 1,369; (1894) 1,3き4. P'cblisher of " National Democrat."

Cas'sowary: the common name of several large flightless birls of the genus Casuerius; related to the ostriches, but generally placed together with the emus in an order Casuarif (g. $\cdot$. ). The phamage is loose and coarse, the wings small, the quill feathers represented by four to six strong bare shafts. The inner toe bears a long. straight elaw, which makes a furmidable weapon, the more that the kick of one of these birds is sufficiently powerful to knock a man down. Parts of the head and neck are naked and colored bright red atid hlue or blue and yellow. The neck bears wattles, and the head is furnished with a conspicunus compressed helmet-like excrescence formed of very thin bone, covered with thin lut firm horny skin. The ten or 1 welve members of the genus are confined to New Guinea and the adjacent islands; one species occurs in Northeastern Australia. They frequent clense thickets, are wary and fleet of foot, fond of fruit and berries, but eat worms and insects of various kinds. The nest is a mere depression anid fallen leaves; the eggs are green and usually five in number. The best-known species is the hemeted cassowary (Casuarius galeatus) from (cram. Bennett's cassowary ( $r$. benneftii) is from New Britain and C. austrulis from Anstralia.
F. A. Lecas.

Casta'lia. or Cas'taly (in Gr. Karcadia): a fomntain which issued at the base of M1. Parnassus, near Delphi ; was sacred to Apollo and the muses. The anciunt poets imagined that it filled the minds of those who drank of it with poetic inspiration. All persons who visited the temple of Delphi for any religions olject were obliged to purify themselves by bathing their bodies or their halr in this sacred fountain. It is now called the fountain of St. John.

Castalio, kăas-taali-ö, or Castel'lio. Sebistuax: b. at Clatillon, a village of Savoy, 1515: d. in Masel. Dec. 29, 1563. He pursued the common lumanist studies of the time: acted for several years as a tutor in a noble French family; was in 1547. ni Calvin's nomination, made rector of the Latin school in Geneva, but publicly dissented from Calvin on predestination, and resented the restraints put upon private liberty; was banished by the syndics for calumniating the clergy 1544; went to Basel, where in 13.53 he was appointet 1'rofessor of Greck. His listory of the Bible in the form of Dialogues was often reprinted and used as a text-look; 1 ranslated into English under the title Fouth's Scripture liemembrancer (Lomon, 1,43). Mis Latin translation of the Bible he dedicated to Edward VI. of England: his French translation to Heury II. of France. These translat ions are very characteristie for their humanist standpoint, but do not deserve the merciless criticisms which they received from the hands of Calvin and Beza. Castalio deserves to he remembered because he was one of the very few adyneates of religions toleration in that age, His life was written by J. Mihhy (Bascl, 186?), and most elaborately by Ferl. Buisson (laris, 1892,2 vols.).

Castan'ea: the Latin name of the chestnut: also the hotanical name of agonus of trees of the family cupuliferie. Three species of chestuuts are indigenous in the U. S.- viz., Castenea sative Var, americana (chestnut-tree), the Castemea pmila (chingu:phin), and the golden chinquapin, or chestnut of the lacifie ernast, now referred to an allied genus, Cestenopsis (C. chrysophyllo). See Chestsut.
Cas'tanets [from Span. castañeta. deriv. of castaña< Lat. casfanea, clestnut ]: it musical instrument consisting of a pair of concave shells of ivory or wood, originally chestnut, which are losely fastened together by a band which is passed orer the thumb, and used in beating time to music and dancing, and much employed by the Moors and Sraniarls as an accompamiment to the guitar. In most countries they have becon introduced on the stage, expecially in opera.

Castanheda. kăas-tăan-yādăa. Fervio Lopez, de: Portuguese listorian: b. probably about the rear 1500: d. in 1559; went to India with his father in 1028, and devoted many years to stuly. personal examination of local records and scenes of important erents, and to the composition of
his valmable Mistorit do Drscobrimentro e ('onquistu da India prose I'ortaguezes, the several bouks of which (as far as compheted) were printed in diferent years from 1551 to 1561. The publiention of the tirst and secombl books preceeled that of the first decome of a site of barros, hat hy so short an interval that the work of Cast anherla coubd hardly have hern used by Barros, who no doubt devival his materimb chicdly from origimal sources. For some not obvious reasum, the Mistoria of Castanhedat seems to have mate a grater mopression on the biaropean publie than the more attractive labors of Barros, for the limst bork of the llistorio was translated into French in 15ins, and the whole work into Baglish some years laters, while Barros, wo believe, has never leen trandated into wither hagnage, and even "amoins is said by Portuquese critios to have drawn his historieal faets altugether from Costanhedta. Castanherla has the merits of fullmese of detail. clearmess of exposition, and fidelity to the best authorities, amb, thongh inforior as a writer to his distinguished rimal, he is by mo mans superseded as a sonree of information on his subject.

 whamed the command of a corpsin leve and defeated the French gromeral bupont at baylen in duly of that vear. Dupont then surrembered his army, amounting to $1 \mathbf{s}$, ato men, hut ('astañes was defeated the sume year at Tubla by Lames. He distimguished himself at the lattles of Dhamet, 1811, Sahmanea, 1s12, and Citnia, 1s1:3. He was apointed raptain-gencral in 18:\%, and ofposed the Carlists. 1). seph. 24, 18.92.

Caste [from Span, Ptge resta, race, hreed: suhst, use of fem. of adj. costo < Lat. crestus. pure]: This term, thongh often used loosely to indieate a class distinction of any sort. was origimally emploved to denote divisions of the social system in Imlia. The word is atymologianty from the Latin (resthes. pure) ; historicallys al lorturuese equivalent of classdivision. The earlicst European settlers in ludia were from Portugal, and they gave the name to the social system foum there. But that system was known and explained hy Greek writers from the time of Aleximber the cireat. Our earliest information in regard to caste eomes, however, from the Hindus themselves. who in the ledas and in their lawbroks hawe first expressel the consciousness of the distinctions involved and then claborately systomatized the whole state of society acrording to formal divisions of ocrenpation. lemend sitys that the higheat quad crathed fimer catses: the priest fromi his month, the warrior from his am, the lushandmath from his thigh, the slave from his font. Sut the native simbirit woml for caste is rarnu, color, and this alone sulliciently indicates the chief factor of diatinction bet ween the castes as origitally organized. The distinction is historically this: The Arran invalers of Imata were of a different tye from the aborimines: the latter were dark, the former were light; the primary distinction of easte was no more than this, a semaration of the two great lonties of inhathitants into two clases. the lisht-skimad Aryan conquerms and the dark-skimmel natives, whon the former hat sulndued and relued to slavery or driven into the hill country to live as samares. The conscionsmess of this ratial differneer is very strongly marked in the earliest liternture (e.g. the Vedas), where inkeed withont caste deximation there is even a stronger caste feding in its litural sonse than in later timex, a rreater hate of the un- Sryan native, and a more promomoed conscionsiness of ramial differace. For, as time went on and the contest between tho nation of the eonguerors and that of the compuered grew leses, inasmuch is chatom atul sorial usidre bended to unte the 1 Wo, natiomal antasonisin sank into sorial antipathes anl the
 of materand servant. Surch was in general the orimin of the whole caste systom. lint other factors of geval national impurtaner cami into plas. The latere me makes out four recular castes and thiry-six lowest cates, the hatter buing too elegraded amd ton reent in origin to lue included among the "ranlar" form of the systrm. In print of fied the rise of new phebeian induatries was the real cance of promduciner may of the new " low" easter, for, an cante was insepatable from ocenpation, cach new indust rial deselopment grase rise to a new social ordar. This face is commonly stated incorrextly, in that the new cate is aswmed to give rise to the new ocenpation, which is the unhistorical native point of view.

The furr censtes of the empleded system wore: 1. The Brêhmante, or Brahmin: ?. The hshalriya, or wartior: 3. The V"tioga (Vaisya), of farmer and hashandman; 4. Tha Getra (Smlra), or slave. All other castes were mither "mixerl," or "ontensts." i.e. degraded members of the four castes who hat been expeded from saticty. Of the fome castos here ennmerated we timd in the early period of the Rig-lieda no fomal mention, vet not a tew imications that caste feeling was already beginning 10 mect ns in various pasages of this satur work. Thins the distinction betwern the frist (brahmama) and king as reprentative of the warior (kshatiya) cante is elemrly mathel, and, as stated athore, the graeral antagonisul to the " robhore and "slawe " makes it crident that the thre first mases of pricst, wartior, and hushondman regarded thomselves as a gronp apart from the fonth class, which hater herame incorgerated into the caste system ats the Çindral (rindm) or slatye caste. But the mily formal recogrition of four social divisions to be fombl in the litg- I'ake is the sentence quoted above on the origin of the priest from the month of the god. lirahman, ete. Before deseribing the duties and pmiviluges of these castes, however, it is neressary to show how the third castu arone. for. as alrenty said, the distinction between friset and wartion was alreiuly so strongly felt in the earliest time that the difference amounted fraetieally to a caste ditlerentiation, although it was not yet sutheiently established to preclude a warior from excrising priestly functions or a priest from catering hatle as a participant in the fray.

The third mate of Vaiças (Vaisya), or hoshandmen, arose gradually. No trace of such a class as a caste meets us in the Rig-Tedu. It is firmly established in the next period, that of the Brahmanas. Whence arose the caste? A1though mothing save a rather alsurd tratition is cextant in the way of historical evidence, the real gemesis of the Vaiura (Vaisyai) caste is not dillicult to discover. It is. in fact. not a casto fommed by separation from the 1 wo ligher castes, hut the result of climinating these castes from the working hody politic, the residum of the Aryan people left the the selfexplusion from the general hody of thene who arrogated to thenaches the rights of priest and warrion respectively, thus leaving to all those not entring these ranks the duties and privileges of the working-classes. This development came as a result of the gradual settlement of the cometry. When the Aryans first cintered hatio they did oo as an invaling army : every man was for himself warior anl cattle-lifter. The eomqueros atrove before them the mative batatians, setton down and herame a matheraising, ultimately an agricultural people. It was at this juncture that those of the people at latre who had more tasto for war than for peaceful pursuit: bogan to agreqate thmelves as a wartior enste, at standing army at the service of the kiner, and in the elimination of the warrior and the gractual separatiom of the priests from all the other antes is fol loum the origin of the su-ablem cantr of hushandmen; they wepe the people divesten of presty amd tighting elements, and it was mainly from this caste that the "mixed "eastes naturally arose.

These four eastes, partially foreshadowed in the era of the early Vedie songs, were establishoel ind their position formulated in the next perisl, that of the first prose writings (the Brihmana periow).
(1) The Pruhmun, or Priest.- His duty was to make saerifions, to (eath members of the there ujper eastes. and to stuly. His privilege was to tako gifte in return for makinge sicrifter, athl receive daly alms of members of the pure calstos. In the carly feriond ho was permitted to be a soldier. but hater this is forbidden. except in case of necessity. when it is even conjoined upom him to bear arms. It is persing is regaded as sured, and he is even ilentified with the gixd whom he worships. He may not change his mode of fife, unters in danger of starvations in which "anc he may temporarily assum the life of a workingman. Ine is regateded as the sole muthority in all questions of law and right, and in lated times is oftern fomm as minister and judge. Ho is mot respmsible for his acts 10 any one, accorlines to the trmitional list of his privileges but since the law frowides
 against the laws, this statute is clearly mugatory, 11 was. however. at no time permissible to put a Brathman lendeath; and the king is expressly fordmatern to tas his property.
(e) The Wrarrime-Ilis one duty was to fight. lin was the king's sulther, lived at the kings expense and was hiable at any time to be calleel intuthe lieve. His rimhts, so far as cante grese were to stuly the ladex, a wery highly estemed privilege. and command the two hwer castes.

Like the priest．in arse of necessity the warrior may as－ sume the manner ol life of the luwir castes，but in mi case may he exeroise the duties of a priest．Vet interchange between the two castes was not unknown prior to the period of formal law．In war the personal reward of the warrior，besides his monthly pay，is the pessession of what－ rver he wins in battle，armis，jewels，cte．，after＂the＂kines＂s shane＂has beent teducted．
（3）The ITusbundmun．－The third maste slared with the two upper castes the privilege of sturdying the sacred writ－ נHE（see SANskRIT LITERATURE）and attendance on sacri－ ficial riehts；otherwise his position was pactically moch lower than that of the priest and warrior．Me tendeel flocks，tilled the lamd，pairl a large share of his gains juto the king＇s treasury to support the military caste，and was in person superior only to the（ûtra（hindra），or slave－aste， with which caste lee scems often to be on more familiar terms than with his Aryan brothers of the upler castes． In the Epic period，which represents the completed catste－ system，he is the prey of the linges officers，amd retains fittle more than a nominal superionity to the lowest orters．
（4）The stace Cosle．－J＇he＇ruma（Simma）was the slave of every coste dhore him，but was regarded as more partic－ ularly the servant of the priest．Je had no rights what－ ever．Ilis slightest oflense against the upper classes was severely punished，oltell witl flath．He could possess no property save what was wiven him by his master，and that Wias liable to be taken awily without redress by any momber of the pure arates．In distinction from these pare castes． ［alled－regenerate，or luice－borm．（the＂second bith＂being the formal initiation as a member of the pure castes），the Cudra（Sudrat was eahled umregenerate，or＂onct－born，＂ Ile was not permitted to stuly or even hear the ledus re－ cited．Is the descembant of the barbarian native he was regarded as ontside the pale of society，and was permitted to come into contact with it only to serve its necessities． The mixed castes，resulting from intermarriage of the slave with the regenerate catses，were regarded as too low even to serve the＂twice－born．＂They lived apart，practiend the lowest trades，and mingled with the upper castes only in soldiers，heriled together under the command of a real ＂warrior．＂It is mot till the liter literature that they make any figure in the sucial stheme and they are then mentioned only to be disparagerl．The＂outcasts，＂or ］＇ariahs，consist－ ad if all the members of the pure castes who fur any reason hat been expelleal from the social world into which they were born．The usual cause was mésullionce with a lowne caste； ansl while the ollsprines of the mesullinace were Pariabs， the descendants wf the Pariahs themselves were usually in－ corporated into a＂mixed colste．＂Iet there was practically no distinction between outeast and lowest caste．

mostly natives of Australia: some of them are large trees, prodheiner hart and heavy timber of excellent qualit y, which is called trefwood, from its resemblance to the eolni of raw beef. One species, the C'rsturina equisetifotia, grows wild in the South Sea islands, the peninsula of Malacea, amb other phaces. It is a lofty tree, vilued in India lor its timber. which is very rumable and hard. All the trees of this genus have a pecnliar appearance, baving long, slender, creepung or droophing hrandoes, which are jointed, and bear scales instead of leaves. The flowers lave nuither calys nor comolla, and the stamens ant pistils are in suparate llowers.
levised by C'harles İ. liestey.
Casnistry [derir, of casuish, to Lat. cusus, case]: means the application of juritical methods of reasoming to moral ftuestions, or, better, to seecial casets of practieal momality. It may develop sontanconsly as the neressary result of given ciremonstamees. It thas developed amoner the Jews. As the Greeks mever leamed the absolute distinction lestween morils and westheties, so the dews never knew the absolute distinction between morality and legality. 'l'heir moral cote aml their civil law were one and the same thing. In that preliminary stage of civilization casumatry became necossary to guile prople to a striet fulfillment of the litw, It can, lawever, mader wher ciremmstances, dewlop as the resule of moral decatence, anel its latent pharjuse is then to lemp poople to cirmmoent the anthority of conscience. It thms leveloped in the (theot-Roman civilization during the first two centuries of the Christian cra, when treatises on the right to commit suicirle, on the pussible collision betwern the duties of exitizenship and friendshipe ete. brgan to engage attention. Jut its most damacteristie development it reverad from tha hands of the Jesuits. Traees of rasuistry are met with vely early in the history of the (")ristian Clumeh, and the Ife Mentlerio and Contra Men-
 on rasuistry. A great impulse was given to this art by the lateram Council, $1: 15$, which directed controsion of every momal sin to be made to a friest, who was supplied with a penitential bonk. It crept into the c'hurch throngh the saframent of comfession; it. Comml its recognition in the Libri pronitentioles ; it moldel the form of the whole mediaral treatment of sins as a selener of moral theology ; and it still provails in the loman Gatholie ('hureh. Traces of it may le formed in the lieformed Chmehes, as in the writings of Jeremy Taylor amel Amesins. (see also Melanchthon's Conriliou and F'erkins's (eteses of ('onscience.) lont all this is simfly the casuistry of muripeness, after the. Jewish type. A new blivelument rimu with the Probabilism of the bominican
 expansion in the eighteenth centmy it the hamds of Liguorr ( $\%$. $\because$ ), on whose treatises most modern mamals in use are hasod. IIe was expectially followed by scavini, Gury, lahmknhl. For writers of the semantenth century, sev. Escobar's Moral Theotogy ( 1646 ) and C'uses of Consciencer (1626), and Cammmuld de Johkowitz.
('alsus Bel'li (a case of war, or, in other words, a case justifying ware: a Latin phrase nsed to denote an act or "rent which involves war or justifies its decharation.

river drift has frequently diverted rivers from their former conrses liv a sreater or less distance, and tumed them over buried spurs or ledges, where falls are subsetuently developed; thus the falls of the Rhine at Schallhamsen ( 60 feet). the rapids of the sit. Jawrenee, and all the water-powers of the Merrimack and other New Pagland rivers have been prodaced. The greatest of such lialls is Niagara $(q . r)$. W. M. Davis.

Gatarrl' [ohler spellings cathur, entarr, caltar, ete. : from Fr. cuturre: Ital. catarro: Span. cuter < Lat. catermus, $=$ Gr. катáppous, a running down, discharge'; кaтá, down + рєiv, flow]: a condition characterized by hyperamia (or congestion) of the blood-vessels of my mucons surface, with great increase of the proper secretion of the part. Thas there may be eatarrh of the nose, the thront, the air-passages, the bowels, the vigina, the bladler, or the urethra; but in popular language "entarrh" Jesignates either a "cold" in general. as "cold in the head." or" a chronic catarth of the posterior nares (nostrils) and throat. Catarths in general arise from exposure to cold and wet, and to sudden atmospheric changes. They are most common in persons who are ill-fed, and who are not accmstomed to out-nf-dnor exercise, atml in chidren. The latter are especially apt to sutfer when they are of the habit called serombons, and the longstunding nasal catarth of elaituren are generally of this nat ture. The variety of eatarth known as a "cold" is by no means always easy of cure. The popular belief that " a cold must have its rum" has some fommation. Hot foot-baths. laxatives, sedatives, demulcents, mild stimmants, or diaphoreties may, however, prove aseful in many cases. Judiciuus exereise, bathins, and life in the open air tend to overcome the morbin inclination to take cold from which some patients suffer. ('hronic eatarh of the postrior nostrils is an obstinate diseace, best treated by systematic excreise and attention to other hysienic conditions, and be the use of salt water as a nasal douche. See Nostrils and their Diseases, and Throat Diseases.
 nose]: a collcective name for the apes and monkeys of the Ohl World, on aceount of the narrowness of the nasal septum and the consement diwnward dirertion of the nostrifs: the character shared by man also, but not found in the New World monkeys in which the septum is very bruad.
Cahasan'tua: horongh of Lehigh co., Pa (for location of county, see map of l'ennsylvania, ref. $\overline{\mathrm{j}}-\mathrm{I}$ ) : sitnated at junetion of C'at. aml Fogr. N. J. Cent, and Leh. Val. (atawissal borongh; Columbia co., Pa, (for location of countr, see map of Pennsylvania, ref. 4-11); sitmated at the month of Catawissa creck: on the east bank of the north branch of the susquehama river, and on the Pa., l'hil. and Liead. ant Wel.. Lack, anl West. R. Re.; 150 miles from Philadelphia. It has fine schools and churches of four denominations. The principal industrial establishments are fiber and paper mills, machine-shops, a fonndry, shoe-factory, and a novelty manufactory. There is a good system of water-works. The original grant for Catawissa was from the proprietaries of Pemnsylvania to the shippen brothers Feh, 14, 1760. It was then known as "Catawasey or Lawpaughpeton's [an lndian chief'] Town," and the rrant covered $2 x^{2} \frac{1}{4}$ acres. In lins William llughes acquired title to $!2 \frac{1}{4}$ acres of the tract, which be ploted and sold in town lots. The town was incorporated into a borough in Dee., 1842. I'op. (t880) 1.427: ( t 840 ) 1,849: ( 1893 ) with suburls, Editor of " News Item."
Cat-hird (Galeascoptes carulinensis): a song-bird common in the U. S.; of the family Turdider: related to the mocking-birl, which it resembles in its rocal powers. It derives its common nane from a note or cry which it utters. It oceurs in the Middle states as a summer bird of passage. and breeds in gardens or in the ricinity of dwellinghonses. The color of its uper plumage is dark gray or slate-color, the heal is Hack, and there is a conspicuons reddish patch on the moder-tail cowerts. It is serviceable to man in devouring insects and wnems. It sometimes imitates the somg of other lirds, and is remarkable for its boldness and rivatcity.

Catchfly: a popular name for many species of Silene: a genus of pinkworts (Caryophyllacep). The name refers to the fact that insects are frequently canght in the viscial exudation from certain belts upon the stems.

## Charles E. Pessey.

Catean-Cambresis, or Le Catean, le-kma'to' : a town of France: deplartment of Ford; on the river selle: 14 niles E. s. E. of (itmbrai (sce map of France, ref, ?-F). It is well built, and was formerly fortified. It has manufactures of shawls, merinoes, and caliones. The importunt treaty of Cateau-Cambresis was concluded here hetween Menry 11. of France and Mhilip II. of Slam, in 1559. Pop. (1896) 10.4 \%).

Catechet'ical sehools: a name given to the ancient Christian sehools of theology, of which the principal were those of Alexandria ( 160 - 400 A. D.) and Antioch (from ast) A. D. through the fifth century). The most noted teachers in the great schol of Alexandria were Clement and Urigen.
Catechism from Jat. catechis'mus, as if from a Gir.
 katá, down, thoronghly + ǹ $\chi$ eiv, ring, sommi]: an artangement of questions and answers, gencrally designed to teach religions doctrine to the young. Catechetic instrnetion has long previled among the dews, and in the early ('hristian Church the catechumens (or persuns receiving instruction preparatory to haptism) constituted, according to several of the Fathers, a separate order in the membership of the Church. This order comprised both the children of believers and aldits from heathen society who desired admission into the Chureh. What would now be called catechisms were nsel to some extent in those remote times. C'atechisms were used in the Middle Ages hy the Waklenses, and later hy the Bohemian brethren. It has been sais that tha catechisms of Luther ( $1518-24$ ) were the first which received this name, but this point is not quite certain. The Ifonan Catholic Chureh hat long used catechisms, though called by other names. Kero of St. Gall in the eighth century prepared one of the earliest in the German langate. The principal catcehisms of later times have been those of Luther (the Exposition of 15t8, the Catechism of 1500 , the Smaller and Larger (atechism of 1529), still extensively used in the Latheran Church: Cilvin's catechisms, the smaller and Larger ( 1036 -4t); the lleidellerg Catechism ( $566: 3$ ) (leformerl) : that of (Ecolampadius (1545); of Erasmus (tind): of Len.Julie (10n3) ; the Tridentine Catechism ( 15066 ), a standard in the Roman Catholic Church; the Angliwan catechisms-the Larger (hatin, 15i0), the Shorter or Midule Catechism, amd the smalher, whieh, with a few changes, is published in the Book of ('ommon l'rayer; the

C'aturere: a minimg town and distriet in the morethern part of the = lato of San hais Putosí, Mexion. The hame
 whe wore once the tirmor of the weightmorlathe. The silver mines are in the nemphoring monntatums revion, and for many fors were among the richest in the republice They
are now prartially exhausted. Nuch of the ore is reluced at the neighboring town of Cedral. It contains sulphur, and reguires to be roasted. During the French invasion a mint was estahlished at Catorce. which up to 1 sti\% coined over Siv,0u0,000. Former jopulation of the town 20,000 . At present it varies with the productiveness of the mines from 8,000 to $15,000$.

IIERBERT II. SMITH.
C'atostom'ille from Cutostomus, the typical genus of the family: from (ir. кará, down + $\sigma$ tó $\alpha$, mouth]: a family of freslo-water fishes of the order Eventognathi: containing the suckers, carp-suckers, and buffalo-fishes of North America and Asia. The body is usually lengthened and nearly eylindrical, but in the carp-suckers is high and conpressed ; the scales are of rather large size, and smooth; the lateral line is generally mesent and decurved: the month is usually on the lower side of the head, and provided with flesly lips; feeth are wanting in the jaws, but a row of numerous comb-like teeth is dereloped on a pair of sickle-shaper bones (the pharyngeal bones) located in the back of the month; the gill openings are restricted to the sides; branchiostegal rays three on each side: pectoral fins inserted low on the sides; ventral fins abluminal; the intestinal canal is very long; the stomach simple and destitute of pyloric creca; the air-bladder is large, unprotected by an osseons capsule, and divided by transverse constrictions into two or three resions. The family is a very charateristic one and is richly developel in the fresh waters of the North American continent, but a few species are also fouml in Northern Asia (Siberia, China, and Japan). About fifty species of the family hare been describerl. They are among the most abundant fishes in the regions where they vecor, and sometimes. in farorable localities, ant when they are excmpt from the attacks of comies, they litemally swam, and coser the bottom of the waters with their compact masses. The months of the typical species are small aml protractile, and well fitted for sucking in the aliment upon which they feerl. Many of the species are guite apathetie, and remain basking in the sun or suspembed almost motinnless in the waters for a long period of time; and this halit is taken adrantage of by boy-anglers, who attarh a stitl loop to the emb of a gole and drawing it over a fish toward the midalle, suddenly jerk it from the water.

Jackson during one campaign: hecame state attorney for his circuit; removed to Aashiville. Tenn.. in $181 s$, and wis prominent as a chancery lawfer; became jutge of state supreme Court in 1524; was chief justice 1830-36; in 183) hecome a justice of [. . Supreme Court. He opposed secession in 180-61, and was driven trom Tennessee, but returned in 186\%. 1). at Tishwille, Tenu., Hay 30, 1865.

Cats. Iwob: Dutch poet: b. in Prouwershaven. Nov. 10 , 15\%: has hat extraordinary popularity amoner the Duteh mirluln class, being known as .. Father "ats." The was ethcated at Levden, mit receiverd the loctors slegree at Grleans is France, and spent some time at Paris, perhaps more in Ileasures than in studies. Then he sottled at The Jague as an adrocate, and obtained marked success. In 1622 at jrofessership at Feyden was offered him, hut dectinedl. dhoint the same time, however, he became pensionary at Midflelburg: in 1624, at Dordrecht. In $16: 36$ he olitained the highest political preferment, becoming grand pensiomary of hollamd. This otfice he held till $160^{\circ 3}$. Ile was twice sent as amhassador to lingland. Neverthelems his politionl powers wowe anything but remarkable, and his snecesses seem to have heren due in the main to his convenient colorleminnss and his readiness to further the policy of the stadtholoters. Ilis last years wroe spent in retirement upm his cotate Zorgrliet, near schereningen. There hr dief sept. 12, 1660.
buth as a man and as a poet Cats retlected to a remarkable degree the inteals of the Dutch tomrgeasie. As a man he was a emrious combination of piety anil thrift ; as a pret he was mimagimative prolix, dinlactic, though also oftom shrewd and evon witty. It is poetic purpose, as he expressed it himself, was to "1]raw from all kints of things teaching that shonld make him lretter" ; and elsewlure, "to furnish his comblymen simple and gond reatiner and so to propare them for household and civie life and for a lapply eme." llavime this in view, he eared little for poetic form and (andensation, and his productivity was very great. Perhals his most noted and at the same time characteristie work is Het Itowelich (1/arriage: that is. the whoie comres of the married state, divided into sir heads, mad. sureetheart,

The Wiolsh catle aresmallarthanthe ree realing, lut are highly esteemed for practical usto. The vary smewhat in different locelities, and different local names are applied to them.
The Itrot Mightend, or Kylop. oricinalls found in the Hehrides and the enonty of Aryyle. seem to have retaimed most of their athoriginal character. They have remained muchanged, or improved only by selection, for many genryations. They are a beef rather than a dairy breed. They are of varied colors-dun, red, black, brown-but never praticolored.
Iypshire cutlle originated in Iyrshire. Sentand. and have for many years been comsiderel as a leatimg diary breed. the dyrshire cows are uf medium size, with wetlge-shaped fooly. Slim neck, a small hend, and graceful upturned homs. In color they rary comsidembly. red and white smoted or mottled being the most common. lirown and white is a favorite combination with Ayrshire breders. Ayrshire milk is hetter ablapted to checse-making than to hatter.

The Kerry rou of lredanl-sometimes ealled "the poos man's cow " from her moderate size hardiness good milking qualities, and docility-hats a neatly formed head, upturnd homs, lisely and expresive eyes, and a body bat lit1le more than 3 feet hight. Black is the common color.
stort-horns.-Tlus justly celebrated breed has been prominent in the combties of Durham and lonts. England.

Short-horn. since the latter part of the seventernth century. They have hem bred with ervat care and skill since 12rin. See Short-borxs.
The Chammid Isliend catlle from the islands of Jersey ambl fuernsey, in the Brit-
ish channel, have long been noted for their silperior value in the proluction of milk rich in butter properties. Many of them have hem exproded from Jerser, the lareses island of the group, aml in the 1 . S. ther are gencrally known by the name of dersey, themplo formerly they were often called

Jursey.
Aderney. The Jemery has a small dect-like hemb: muzale fine and dark and encireded hy a light colar; homs small.
crumpled, and of an amber enlor: clest inclined to be narrow ; tail tine ; whler full in form. well up behind, and running well forward: milk-veins prominent: escutcheon or milk-mirror high aml broad, and full on thighs. They give a moderate amount of milk rich in butter fat of a deep yel-low-color. Fawn is a common amb favorite color. Fawn and white and gray are also quite common. The Jersey is not excelled as a family cow. Small, docile, and easily liept, she in a markel degrese combines beauty with practical uses. The Guemseys are larger and hardier than the Jerseys, but have the same general characteristics.

Holstein-Friesian ('uttle.-This famous hreed takes its name from a regien in the northern gart of the German empire, but it is foumd in greatest perfection in the provinces of North Jolland and West Frieshand in the kingem of the Netherlinds. They are large, heary anmals with form indicating milking fuality, mazzle hack. colors black and white sputter or motled in greater or less inequalities of proportion on the body. They are a hardy breed and large teeslers. $1 \mathrm{lol}-$ steins are remarkable rather tor the efuantity of their milk product than for its richness. and have bern thought better adapten to the manutacture of
 cheese than to that of buttre.

## Holstein.

hecontly, however, attention has been called to the lares yield of butter from sume of the liest specimens of this breed. Many of these cattle have been exported to the I. S., where, like the Jersys. they have reached a higher development than in their orginal halitats.
Pollud or Hornless Cattle.-The most prominent are the Galloway ant the Aberteren or Angus both Scotch breeds, and the Norfolk or Suffolk, an English breed deriving its name from Norfolk. The Dberteche and the Galloways are black, the Norfolk red. The first have been housed and fed better than the second, and have become smoother, finer animals of most excellent feeding quality.
fievised by H. H. Wing.

## Cattle-plague: See Rivderpest.

Cat'lleya: a genus of remarkably showy nochich: matives of tropical America, esperially of Cohmbia, ant numbering abont twenty species, whicli have under cultivation given rise to momberless varieties. Many of the tlowers are of great size, often ito 8 ind ant varied tolors, and are much grown in greenhouses. The plats are epiphytic, and form thickenet hulb-like enlarements upon their leaf-stalks (psendo-hulbs), which serve as remvois of fool material. Lmong the notalile suceies are C: gignes, I. gultutu. C. intermedia. C. Inbiata. C. mossitp. Citrinue. Co umeri.

To arnid these peik seme states have pased haws proviling for primury thechons, in which the suembers of each
party are registered and vote by hallot inder practically the same laws that oltain at a general election. The candidate receiving the highest manber of hallots then becomes the regular camdilate of his party. This system, however. only throws the informal cancos hack one step, and it will still be held to select candilates for the primary elections. Sce Prmary Elections.

Pertaps no better method of purifying the canens has heen suggesten than to insist upon all legal mominations being made by petition of a comparatively tew voters, and to have the names of all emmidates so nominated printed upon the election ballot without party designation. It is doubtless true, however, that no perfect mode of seleeting candidates for the popular sultrage has yet been deviser. Sice Ballot Reform.

> Revised by Jerbmian W. Jexks.

Can'dine Forks (Lat. Furcule ('audince): two narrow mountain-rorges or defiles near the tomn of C'andium, in ancient simnium. They are celebrated in comection with a homiliating disaster which the Koman army suffered in 321 B. C. A lirge army commanded by the consuls Titus Veturius and Spurius Postumins were marehing against the famnites. According to Livy, this army, suppusing the Samuites to be far distant, marehed through one gorge or pass into a small valley inclosed by high mountains, and soon foumd that both of the passes were blocked up with trees and stones. The Romans were compellel by famine to surrender uneombitionally to Cains Pontius, the simnite general, who requirel then to pass muler the yoke, and then permitted them to return to Rome. Caudiun was on the Appian Way, 21 Roman miles E . of Capua. Niebuhr expresses an opinion that the homans must have been defeated in batthe hefore they were shat up between the two patses, aml Cicero twice alludes to the hattle and defeat of the Romass at C'mulim. In one phee he sits, "Cum mate prgnatum id Caudium esset." (De Officiis, iii., 30.)

Canl: the thin membrane which sometimes envers the hearl of the child at birth. This is part of the general memIranons sae enveloping the child in the wonl, and its appearance over the childs head is the to musual phace of rupture of the sac. In ancient times it was considered a highly popitions cireumane to be born with a eanl, and the person purchasing a caul thereby secured for himself varions happy prospeets. The canl was of particular value to advoeates, who by its possession thought to obtain elogrence, and to seamen to seeure therm against drowning, mal in consequence large sums were at tilles offered for the charm. This sureratition has continned to the present day as far as seamen are eoucemed, and adymiscments of cauls, so eommon in the newspapers of the last century, are still occasionally seen.

 military sotome of modern thes will show: In Prasiat the army grew ont of the lenly-ghard wablish wh lay the deden freaterick 1. This foree was inceramel and diaci-

 it was formatrick the (i) fat that the army own ite aliaci-
 son to the throne he innad his military rex blanmos. and in
his efforts to perfect the efliciener of his army he paid speciat attention to his cavalry. To his reign belong 1 wo of the ahdest and mont hrilliant cavalry leadersof history-Zisthen, who fomme the Pruswim hussats, and seidlit\%, who framed the camalry tactice. So hesirons was Frederiak tolning this arm of the service to the highest perfection that he eallets to his aid the most distinguished !lugamim cavalry ollicers to drill and discipline his trems: and so etheint ilid they beeme that under the great lembers just maned they ganet? some of his most imbertant vietories. Some of these battles gise the happiest illustration of the etheiency of cavalry When properly used and ably handled. In that of hossbach, Seidlitz threw his troperes againsi the French columns, broke than, an! never allowed them to rally again. So brilliant were his survies un this field that frederick conferred on him the order of the Black Eagle-the highest mark of faror-aml made him lieutenant-reneral. On the boody fithl of Zomblorf it was reserved for the same gallant leader to save the day, for when the Prussian infuntry gare way he charget the advancing linssians, hroke both the ir cavalry and infantry, and sabere! thousands of them. Ziethen, ton, Frederick"s other great leader of cavalry, contrilsuted largely to the success of the l'russian army in Freder-ick:- campaigns, expecially on the feld of Torgau, which wats won ly him.

The I'rissian cavalry has well sustaned the reputation it won luring the wass of Frelerick the Great, and it has been regarled is among the finest in the worlil. It is diviled into cuirassier, dragom, hussar, and Chlan regiments. The first are armed with long struight swords: the others, with curvel sathers, and all with cathinem and lances. Fach regimem is made up of 616 men- $i$ isis; in those of the gnarisant is composed of four squadrons.

The Austrian cavalry is mate up of dragoons, hussars, and Chans. The reriments are composed of tive squadrons with a total of !nin monted ollicers ind men, but there are some differences in arms and orqumization. In time of war one squalron is in dopht to serve as a nuclens for recruiting and to train new men.

The Russian catvalry is mate up of the cuimssiers, dragrens, lancers and hussars of the guard, the regular regiments of dragomes, tha localized recriment of Finland and that of Crimean Tartary. Besides these is her foree of Cossacks.

The regular regiments are made up of 4 squalrons, cach of 6 oflicers and 175 men. and are armed with the Bertan ravalry rifle with bayonet, and the saber. The lancers or Thlans in the front lank are armed with the lance, those in the reat rank with cartine: all carry the saber. The 10 regiments of the gnamt, 2 localized, and 42 regular regiments make up a force of $5 \pi, 464$ mm, and the 23 reriments of Cossackis, containing 11 squalrons of about 150 men each, and
 men, heth on a war tinoting. In peace the Cossack troops are reduced, but the ollers are not.

Anng the French the cavalry is divided into cnirassicrs, hragrons, chassem:s of chevel. hissats, chossemrs d' 1 frique, and the irregula Arican troop, phatis, ete. The regiments ate made up of five squadrons, one of whish is at the répit during wat:
The frtwoms, lmsars, and chassems are armed with carbines, and the charassime with revolurs in andelition to their sabers, ete. In France, as wedl is in most other Furopean nations, eath subildrom hats a rectain number of monnted [ioments tranm in hestroying lridges. che., and carrying fools and matertials for this kind of work.

The Fremell eavalry semas to owe its origin to Chatles Ylh., who about the midtle of the fiftemith erntary tomk
 506) men. In the reign of hamis Sth. The cavalry appears to haw bern tist organized in a sepmate borly, with its own groneral ofticers and statt. Napmeten used his cavalry with Terifie ditect, and he callell to its commanel some of his mont distinguinhed licut manto. thonghtheathest in this arm of the serviep was Murat. The batile of Marengo was con-
 mann at the heal of a small frote uf ensaly : and one of the

 20,000 inell and 16 guns. wheh fore deeded the alvane
 sunce. ortlered a mall body of Polish lancers to charge the formilathle worlis, which they did with embleter sumers.

This is one of the most striking instances on recerd to show not only what cun act wally be accomplished by cavalry when Properly ditected. but the jowerthl moral effect produced by this arm when used with eclerity and bohnces.

The cavally of Great Britain consists of life guads. which are cuirassier regiments, composed of eight troops of hifty to sixty mon each-arms, straght sword ! dragom guards, same strength as life guards-arms, stright swom, , pistols, and carbine : heary and light eavabry-arms, saber, pistols, and carbine: and lincers-arms, salier, pistols, and lance. The British cavalry is the best in the world, having proved itself gencrally superior in the field.

The organization of the cavalry in the smaller states of Europe is very similar to that of the great powers already given, and we therefore do not deem it necessary to rnter into details regarding it. In the East, too, especially anong the Turks, an effort is heing mate to conform to European organization, armaneat, an! drill. Ismail Pasha, Khelive of Egypt 186i-79, made rapid progress in this direction, and had for a mumber of years in his service several oflicers who served in the Confellerate and Federal amies during the civil war in the $\mathbf{U}$. S.
In the U. S. military system the organization of the cavalry is, with some slight modifications, the same general me which prevails in Europe. A regiment consists of twelve companies or troops of sisty-three men each; two troops form a squadron. All the cavalry in the U. S. shonld be elassed as dragoons, their arms being saber, pistol, and carbine. During the civil war, when large masses of cavalry were hrought together, they were formed into hrigades, divisions, and corjs, a migate being composed of several? - generally four or five-regiments: a division, of two of more brigates: and a corps of all the livisions serving with any army. When in ative service it is usual to attach batteries of horse artillery to the cavalry. allowing generally one battery to each brigade. The camnonerrs are alf mounted for this service, and the gems used are usually light rifled pieces.
During the civil war the cavalry was neel on both sides to picket all approaches, to cover all mosements, to protect advances or retreats, ind to make remonoissances. The character of the groumd on which the armies operated prevented as active participation in the great battles of the contest as is nsual in European warfire, but the history of the war, when fully an! impartially written, will show that on both sides this arm was not interion in eomrage, diseipline, soldiership, and achievements to any other.
Juring this war, however, the cavalry am was not employed in the same manner or with the same effect as it has becin in European armies in the great battles. In point of fact, as one of the "three ams," it was comparatively ineffective on the great battle-ficles. Cavalry charges in actnal hatthe were seldom mate, bxcept in cavalry combats. although on a few oreasions they were employed against infantry. Most of the notions prevailing on the subject were found inapplicable to the actual conditions. Hence the use of cavalry was little more than to serve as momed infintry: that is, for the purpose of convering men rapidly from point to point, for the purpose of striking some sudden isolated how or making what is called in reid. In most of the battles. howeser, the cavalry were dismonted and fonght as infantry. often taking an important jart. Two most notable instances of the kind ocemred-one at the fight at Ream's Statim, Ang. 25, 1864, where the dismounted Comfenderate cabalry carried a line of beastworks hell hy infantry; the other at Five Forks, where the Ferlcral civalry performed the eame feat. During the eivil war. 1861-fis, there were many instances in which dismonted (avaly fought with the constancy and discipline of the best infantry, and despite the cireamstances which preventen? their use in herty massos on the grat hattle-fields, many of the most gallant actions were performed by this arm of the servie. 'The eiremstanms under which the wir was fomght. partioularly the toweraphical features of the hatle-fichls. Wre sush is to make it dithecult to lning cavalry to larar in 1mas.

if he expressly stated that the sale was "with all fialls." cte (8) Whein a sale is made bey a mannfacturer for a special furpose the better opinion is that the rule in guestion has mo application. In wther words, there is am implien warmaty that the chatel is reamblaly fit for the prapose for which it is bought. some anthorities of weight manfain that there is an implied warmaty in all sales by mamfacturers that there is no defeet in the process of monnfacturing, though they wonld not extenil the doetrine to He materials used. (i) Wherefer the reason on which the rule is founded fitils, the rula itseif gises way. The only rational ground of the ductrine of curput emptor is that when a purchaser has an oppmrtunity to exmmine goods he should act in the way in which a prodent man wanally manages his affairs, and shombt notice such refects as he may the ahle to thecover. Where there is mo such aportunity for inspection, or where the seller takes the burden of edeetion mon himalf. there is no rom for the application of the rule. Aerordingly, it does not apply to a true salle hy sample: that is, where the bulk of the commality is not present. In this case the seller impliedly warrints thit the huik of the commodity is equal to the sample. The furchaser must examine the sample for himself. If. howerar. that course is not mpen to him, the bulk nf the commodity must he efual to the "ppurent qualitie's of the stmple. Thus if an artime like mandin were sold by a sample comtained in a sealed botle, the bulk must cymal the sample as it apjears to the exce. The same general rule womlid apply to so-called execintory eontricts of sale, as where georls are sold at srai "to arrive" at a prescriberl time. In the special case wher the selection is made by the seller. the rule also fails. The distinction is put by one of the British judges in an ant form. He says: It the hayer silys to the seller, "soll me "gray horse to ride," thare minst be a homse supplied which the purchaser cun rite. If. however, he had said. "sill me that gray horse to ride." pointing to a particular amimal, there would be no remety, in the ahsence of framb, if the home were unfit to ride. In these fanes amother view might be taken. 'Ihere is really no contract if the stipulaterl article is not suphlied. the minds of the prorties mot having met. It seems wery dear that if I proposes to sell l'w what hy sample. and he furnislues on delivery whent that dows not rorresman with the simple, there has heen mo artement to buy the thing finmishet, and it miy acentingly be returned 10 A when its 1 me charator is disomembly (t) There is an exception to the rule in American law resting upon peculiar groumls, and it may be mantained thoug there be no fraud or other surcial circumstances. This is the sale of provisions for domestir use. There is an impliad warmaty that the gools are wholesome. The exeption is not extemed to salow ly one dmater to another. It mas be mblen that there is a cemtepoming mule (ement wenditor) apdicalble to the seller, who is hand in like manner to be on his guard in leating with the purcharer. thengh this would also give way in cases of tratud. An instance is where the hinere. having learned that a war has phded, takes alvantage of his sumprior kuowledge to make purchases. Suth a purvhase would be logally valid, thomple if he mishel the seller the [rand would vitiate the tramsildion. T'. W. Iwfint.

aml air, and in convenient proximity to streams of water. The entrances are usually wide, the ronl high, and the cavity mot def. Sometimes the walls were left in their natural state, hut olten they show signs of having been carved or dressed to render the eave more agreeable as a twelling or mure reatily defensible against enemies.
The most characteristic caves of this protiot have been discovered in shathern Belgimm, along the valley of the river Meuse. and in the valley of the Fezere, a branch of the Dordogne in Sonthwestern France. About te60 much attention was excited by the explumation of al cave near Aurignace in southern France, by M. Lartet, who was among the first to define clanly the traits of this ancient population. In Fngland the carern of Kent and others in Deronshire have vichled similar remains, and others on the Clvele and in Wales have been claimed hy some to present the oldest specimens of man's handiwork yet discovered in Great Britain. referable even to at prion before the glaciai epoch. White all have not allowed this claim, there is no doubt that many English caves were inhatrited in early palaolithie tmes. On the borders of Switzorland, the contents of a cave on Mont Saleve, near Genera, and the celebrated Kessler-hole in the cantom of schaffhausen, prove that the typienl eave-dwellers extended that far to the east. To the south, near Mentone, at a locality called Baoussé-Roussé, remarkahle caverns have been explored which were occupied hy haman heings at a most remote eqoch: in spain, near Santamler on the northern coast and along the slope of the Sierra Nevala on the southern, evidences of like chanacter have been exhamed.
The relative antiquity of the cave-dweilers has heen ascertained by the close association of their relics with the remains of amimals now extinct either altogether or in the locality. To the former class belong the cave bear, the saber-toothed tiger-a mont formidable animal-the woolly rhimoceros, the Irish del: some species of hyanas, and espeeially the bairy mammoth. Of animals which then lived in Southem Enoope, lyt disappeared from there before the dawn of history, may be especially montioned the reindeer and the musk inx, whose bones are found in large quantities in the caves, and the presence of which testifies to the prevalence at the time of a climate in Southern France almost as cold as that of Lapland tor-day. Bones of a small species of horse are ahmodant, lut it was evidently merely regarded as game and was killed for food. No remains of dogs have been fomm, showing that at that early day this companion of man in so many climes had not yet hien domesticated. The almonane of dish-bones indicates that the cave-twellers lepember on the water for a large part of their smbsistence while the relative scarcity of the remains of hims, as well as the character of the weapons found point to the interence that they had little skill in securing flying animals. Aothing indicating the pratice of agriculture or the domestication of mimals has luen discoverel. In French archaeology the greneral type of culture of the cave-dwellers is calfet the "Monsterrien," from the eave of Le Moustier, a station which has been pecalianly rich in chameteristic object:-
The cave-dwallers were acquanter with the nee of fire, which was imdend necessary in their rigorms climate: but they had not accuired the art of pattery. nur that of polishing or horing sone. They were aceustomed to cook their food, as the endition of the bones testifies. Their weapons and ntensils wrere of hone, stone, horn, and donbitless wood, though the lat or have perisheth. Comotless amow and lance heads of flint and wher harl stones, knives, scrapers, and goages of the same material. have been exhmond, maty of them of symmetriowl form imel fine workmanship. The presence of bone medles and ands justifies the infermes that they were used in scwing wins tugether for ramen, and the efore that the eave-fwellems wont alont clotherl. Whistles or hunting-calls. made of the brome of the himi foot of the reindeer. Wre evidently employed in the pursuit of that animal. Small fubhlos having al cavity on onte sille amd which ine helievel to haw hern usal for pain-puts, indicate that thay were gisen to lequmben in colns. This is cormanated he the frempent liscowery of omaments made from ivory or thy prrforating tho teedi al animals in order
 rine and frosh-water shells, amd flat pieres of ivary similarly loread, were doubtless esteremed is halges or gorgets. Remarkable artistio skill is imlimated hy the dignres cut or scratehed om many of the pieses of iomes and horns exlumed in the cabes. They represent, ofton with surprising

 1nwer．His idea was＂a tree（＇hurch in a free state：＂N＂ult freedom shmald he securem for the＇hurch in all stiritual
affairs, and for the state in all civil affairs. 'The radicals, who propused to confiseate all the estates of the Church. he opposed as decidedly as the Ultramontanists, who hoped to make the state a mere tool in the hands of the Church. The grand aim of his diplomacy was to promote the union of the Italian peoples and the libreation of Italy from foreign domination, and his first moves in that direction were the formation of an alliance with France and (treat Britain and the participation in the ('rimean war: When the audacious schome proved successful, im Anstrian diplomatist said, with grod reason, that it was a pistol-shot fired in the face of Austria. It the congress of Paris in 18806 he succeeded in lminging the Italian question on the tapis, and prowed the hostility of Anstria. In 1858 he male a secret treaty with Nambeon 111 . involving a plan to drive Austria from 1taly, and the Franco-Sindintan war followed the next year. The Anstrians were defeated, and obtained peace by ceding lombardy, whith was ammesel to the sutrlinian states. Cawonr resigned offee in July. 185! . becanse he disapproved the provision of the treaty of Villafranca, which allowet Austria to retain Venctia, but he resment the position of prime minister in J:an., 1860. In conserpence of the victories of Garibaldi and the general mprising of Ttalian patriots in 18.59 and $1 \times 60$, nearly all Italy wis liberated and mited. Cavour was prime minister of the new kingdom of Italy when he died on June 6, 186]. He was never married. He left the reputation of being one of the greatist statesmen of modern times. See Reminiscences of the liffe of Cotome, translited from the French by Elward Romilly (1*(i3); Edward Dicey, ('umour, a Memoir: Bianchi, La Politique de Cumer (Piris. 1885); and the bographies by Hassari (Turin. 1si3) and Hazade (Eng. trans. London, 187\%).

C'a'y [from the native Guiana name coliai]: the name of varions South American tailless rodent mammals. closely related to the porempine fanily, and by most naturalists referred to the family Coublue. There are fomr molar teeth in cach jaw, and in the geme fomia these are compound: there are four toes on each of the fore feet, and three on the hind teet, the feet not heiner webbed. The females have only two teats. One species, Cuvia cobayd, hats long been domesticateal as a pet and plaything of children. It is called usually the "Crinea pir." althourh it is neither a pig nor a natise of Guinea. Other related species are very humerons in parts of suth America. Sce ficinea l'ig.
C'awnine or Campore: : town of IVimhastan; on the right lank of the Ganger, which is hore nealy a mile witle:
 $0^{5}$ E. (ree map of N. Indial wf. (6-F). It is an important British military station, having cantomments whith accommodate about $\overline{6} .000 \mathrm{men}$. 'onnected with the cantomments are several hundred bmgalow: for the oflicers, whiela are fitted ul luxurionsly amd have large garilens. During the matiny in 1siot, Nana sahib massaced here a mumber of liritish eaptives, including 12.5 women and chiddren. $A$ handsome monmment to their memory has been erected over the well into which their buties were theown. P'oj]. (1881) $110,60: 3$; (1891) 182,310 .

Cin'fon, WilliM: merehant: h. in Kint, Enghat, ilout 1422 ; Was the tirst to int rodure printing into Figland. In 1464 he was employed to nogot inte a traty of conmerce be1 weon Elward IV. of Englam and the Dike of burqudy. He translated from the Fremelh a IFisfory of Troy, whirh he printed in lenges in 14\%4. This is satid to the the first Jook ever printach in the English lansuatere as his Dictes ant Stuyingse of the Philosmbers is the firs howk, so far as known. published in Englamb, 14is. After be had rewided for some time at the comet of the burchese of limernaly, her returned to Finglat and established a printing-other in Weaminster
 14!2. Itost of his books were of his own tramilation, were
in folio, and may he called "black-letter" hooks. See his Life by Blades (1861-63), also his Biography and Typography of ('axton (ell ed. Lomdon, 1842).

Cayamber, ki-ăm' baĭ. or ('ayambe-Cren': a monntain in Eidnalor ; a peak of the Colombian Andes: is directly moder the equator. and alout 45 miles N. E. of Quito. it has a beantiful conical form, and an altituld of 19,386 feet. It is covered with Purpenal snow, and forms one of the most remarkable landmarks on the globe.

Cayenue, kā-ren', or ki-en': a seaport-town of South America: capital of French Guiana: on the Athantic, and on an island of same name; at the month of the Cayenne river: lat, $4^{\prime} 56^{\prime}$ N., lun. 52 13' W. (see map of South America, ref. 2-F). It has a shallow harbor, and is defented by a fort and batteries. Considerable quantities of coffee, sugar, cotton, indigo, and cacto are exported from this place. The imports are French wines, spirits, ligucurs and vinegar, silk and cotton stulls, tohacen, hardware, glass, earthenware and clothing, preserved meat, fish, vegetables, ruaize, flom, lay, cte. For many years the import trade has been steadily increasing and the export trate is steadily decreasing, (ayenne island is about 30 miles in circumference, and is separatel by a narow chamel from the mainland. Cayme is a penal colony to which criminal offenders are transported. Yellow fever and other fevers often attack the residents, probably oricinating from the vast swamps which surround it on two sides. Pop. (1886) 12,524.

Cayeume Pepper: Se l'spper. Red.
Cayes kay: a seaport-town of llayti: on its southern cont: 92 miles $W . \therefore$. W. of Port-an-lrince (see map of West maties, ref. 6-F). P(1), 8,000 .

Cayoley, Arturer: mathematicion: h, at Richmona, Surres, England, Aug. 16. 1831 ; grathated at Trinity College, Cambridge, 184? becane a barrister and conveyancer, but at an eirly age devoted himself to mathematies, which subject he enriched by a series of memoirs continued without cessation from 1841 until his death in London, Jan. 26, 1895. In 1861 he was appointed Sudlerian Professor of Pure Mathematics in the University of Cambridge. In 1882 he lectured in Johns 1 Iopkins Unirersity, Baltimore. Simon Newcumb.

C'ayman, hay'man: the name applied in many parts of Smith America to any of the alligator family, or even to the crocoliles. In a scientific sense it is restricted to certain speries of the genus (wiman, inhabiting Central and south America. They are distinguished from other crocodilians, other than the jacares, by an armor of hony plates on the muter site of the boty, and from the jacares hy having the lumy pait of the eyelids smooth, and hy the alssence of a bony ritge between the orbits. See Crocodile.

> F. A. Licas.

C'aymans. The: threr small islands in the Caribhean Sea; helong to Great Britain: 130 miles N. W. of Jamaica (see map of West Indies. ref. in-('). ('hief product, turtles. Area, 29.5 s. miles. Pop. 2,400. They are pliticully attached to Janailca.
(Bynfa: a pest-town of Ontario. Cimada: capital of Haldinamd County ; on railrond and Grand river, which is navigable: 14 miles from its entrance into Lake Erie, and 3.) miless. of 11 amilton (se map of Ontario, ref. 5-1). It has a heary trade in grain ame plaster. P'ol, about 1,000 .

Chyuga Indians: See Iroquonay ladmas.
Caynsa Lake : a beamtiful lake of New York: on the bounilary between (inyugann Seneca Comnties: is about 38 miles long. Its width varies from 1 to 8 miles, and its greatest wepth is supposed to be above sol feet. The surface is $38:$ feet athore the level of the ara. Its banks are formal of Silnrian and Devonian rocks. Whitetish and many wher species of fish are canght in it. Steamboats ply daily between ('aynga Bridge amd Itham, which is at the heat of the hake. The outlet of this lake flows into Seneca river, at tributary to lake Ontario.

Gayne Indians: Geq Wambatpeax lmmans.

Cel'ebes (native, Tegri-Orang-Bugis) : a large islanl of the Malay Archipelago; about in miles E. of Bomeo, from which it is separatel ly Macassar Strait (see map of East Indics, ref. i -(i). It extends from lat. $1^{\prime}$ 50 N. to $\mathrm{a}^{2}$ 30 s., and is mostly inclurled between lon. $119^{\circ}$ and 125 E . It has a why irregular form, being divided by deep bays into four peninsulas. one of which (eatled Menato) is about 400 miles long aml rery narrow. These peninsulas are formed by chains of mountains rathating from the central part of the islank, and in the N. there are lofty voleanoss. recently active. imh still giving rise to earthquakes. The highest summit (Bouthain) rises !).924 feet above the level of the sea. Thongh the area of Celebes is only $71,150 \mathrm{sq}$. miles, it has a coast-line of nearly 2,00 miles. The peninsula of Menado is hounted N. by the sea of Celebes, S. hy the Bay of Tomini. The two southern peninsulas are separated by the large Bay of Honi. 'lhe fana comprises some animals peenliar the the islam, as the tailless baboon, the babirenssa, the machs, the sapi-utan or wild cow, sewcral species of starliniss, and magpies. The regetation is luxuriant, and the islant is matly coveret with forests of nak, teak, palm, cetar, and upas trees and partly by vast grassy champaigns which are nseal in common ly the natives. The nutmer, the elove. and the bamboo also flourish here. Among the minerals are soht, copper. tin, and iron. Coffee, rice. stgar. indigo. and manioc are caltivated. The most cultivated distriet of the island is Minahassa. it e coffee enlture being in government control. ('hief town, Macasiar ( $q$. re). The, pretty town of Menato is the seat of a Datch residence. Celebics is partly ocenjuied by a race callef Bugis, who are stroner and well huilt, revengeful in character, and fond of the chase. The tribe of Watlus are an intelligent race who pursue commeres: the Arafirin inhabit the eentral regions, and art the ahorigines of this archipelago. This Fliand was visiterd by the Portugnese in 1.50 . The Dutch expellet the Portugiese in 1660, ami planterl there colonies, which they still mosecs. Pop. of Celebes (18:00) 262,284 . see luahme, Lille de Célibles (Paris. 18:9).

Revised by M. W. Marrington.
Cel'ery [properly stery or sellery, as in Ear!? Modern Englislp; from Lat. selinom: Gr. $\sigma \in \lambda$ devo, a kind of parsler]: a phant of the parsley family ( ( mbellifere), which is widely cultivater in temperate climates fur its leaf-stalks, which are bleached by varions means. One form, the celeriat or turniprooted celery, is grown for the swollen subterrancan part. Celery is native to tamp places in the Ohd Trorld, ranging from sweden to the Cancasus, and even to the higher parts of Intia. Its technical name, tpium gratpolens, recorts the heary seent of the foliago. The acrif principles of the plant are greatly mollified by cultivation and blaching. ant the tissues alion become more tender and brittle. 1 variety of celery ealled celeriuc is raised in Europe for its root.

The cultivation of 'relery in the U.S. has increased rapirl]y in recent years. In 1800 there wre 15,381 acres devoten to the erop in the truck-gimlens of that country, besides a large area in smaller gambers. The increase in celery cultivation is largely due to recent improvements in methods of growing the crol. Formerly it was grown in drills from 6 inches to a fuot deep, a methon! which wat thonght to lie neerssary to insure the proper blarding of the leaf-stalks. It is now grown in lewel culture, the hathing being performet by heaping carl is asint the plants or by the use of bourts. pipur. or other material: or the phants may be set so thickly as to bleach themelves, as in the so-colled "new celery coilture." In many whery-gwing localities hanking with eartlo is giving phate to banding by means of boarts. Boark about a font wide are usmed, one heing paterd on elfer against either sile of the row. The fower and mondry hats are ondinatily flevoted to celery colture althumer the plant grows well upm rich and friable uphat. Alhwial deposits
 marshes unally mater good celdry lamk. Colery is marly always startal in hotheds or cold-fames. or the late crop
 in the tiehl when alanu if inchere hight, in rows from ?) to 4 feet apart and a fort or less apatt in the row. The crop often tollows semm whur early (erop), is beets ar carly cal)bages. Bleaching is delayed until the plants are well grown, the hate erops mot being " hamfled " until late in fall. The late varieties can he stored in pits montil spring, and most
varieties will keep until the holidays. Nearly fifty varieties are known in the U. S.

Revised by L. H. Bailey.
Céleste, sily'lest', Madane: a slaneer; b. in Paris, Ang. 6. 1814: hecame in childhood a pupil at the Conservatoire in that city. When fifteen years ohl she removel to the L. S., ant soon after inarried a Mr. Elliot. After her husband: death she went to England, where she met with great professional suceess. Subsequently she passed several years in the U.S. (1834-3: and 1865-6S). where she was received with great enthusiasm. Most of her life was sjent in Finglamd, where she was successfal as an actress ant a theatrical manager. 1). in l'aris, Feb. 20, 188?.

Crlestine. or Colestine [from the Lat. caplum, the skr, in allusion to its color]: a mineral which is essentially sulphate of strontia, with occasional misture of sn] jhate of baryla and carlonate of lime in small proportions. Its color is often a heautiful indigo bluc. It resembles heavy spar, but is not cquite equal to it in speeifie gravity. Fine specimens of erystallized celestine are fomm in sicily. It is useful as a soiree of strontia. The finest erystals of celestine are found on Strontian island, Lake Eric:

Pope ; b, in Isernia, Italy, 12t5; was elected July 5. 12:4, as the suceessor of Nicholas 1V. Refore that event he had founded an order of hermits callen L'elestives (q. r.). 1le abrlieated the oftice after a disastrous reign. of his own wolition, but with universal approval, Dec. 13, 1294; retmond to the monastie life; was succeeded by Boniface VhII, who confued him in the Castle Fumone, near Anagni, and there he died May 19, 1296. Jante put him at the enttrance to hell because of his abdication. He was canonized in 1313.
Celestines: an orter of hermits or monks foundel in 12. 4 by Pietro da Iurrone, who became Pope Celestine I. (1994). This outler spread rapidly in Franee, Italy, and Germany between 1264 and 1400 , but it is now nearly extinct. Ther were at first ealled Ilermits of st. Damian or of Moronc ami after 1294 Celestines. Their costume is white, with black hood and scapulary. These monks followed the rule of st. Benedict. and premed a contemplative life.

Celibacy [leriw, of Lat. celebs, mmarried]: the enmition of a persm never married; applied often to the voluntary life of abstinence from marriage assumed hy religions devotees and the cherg of some churehes, such as the Roman (atholic. Practiced in ancient home in the case of the vestal virgms, in Judara by the Essenes, and in the East by the priests of bind dhism, it fossibly took its origin among them in tha belief that the material boly is the sonnce of evil and the prison of the soul. Among Christians it was the natural outrome of the ascetic teachings ant spirit of the Gospel, ns well as of the example of Christ himself. It showel itself at once with the new doctrine as a higher fom of life, and spreal with it all over the worh. Firginity was hed in pecaliar honor in the early Chmel, the priesthon especially being urgerl to celibacr by the example of ("hrist, aml by the motives suggested 1 Cor. vii, $8,3,3,3$. But it is certain from the inscriptions fonm in the catarombs. from pasages in the canon haw, and from the positive textimony of history. that celibacy was not enforced from the beginuing, erem anong the ligher clergy. Commencing as a counsel anul as : "thstom, it grahally developed into a law, which Was much mome strietly enforced in the Westem or latin than in the Oriental Clinures. Thus the Conncil of 'lours (a) $\mathrm{i}_{\mathrm{i}}$ ) suspumbel from thir functions for one year all secuiar prients and deacons with wives: whereas in fige the thind Council of ('mstantinople allowerl salerel orders to be given to those who had been married but once; and in parto of the (hrel Church their marriage is compulsory, though hishops and patrareds are celibates. In the $\mathbf{W}$ est, decretals were from time to time issued against the marriage of the elergy, leal-
ing to many struggles within the thureh．These struggles culminated in the elevent cent ary，and the pint was tinally settled be the vigor and tetermination of（iregory Vll．in 10nt，positively forbideting the mariage of the elergy．The

Ironertios. Wh hen purn, andulose is ditmous or spongy, white, and translueront, and ofton silky. ['mator thes nieroseope the fibmos variolios apporar like spon glass It is
 it is maltorahle in the air. lont when assoriaterl with allonminoms smb other easily alterable Lomlios, it grablatly deeompuses (clecays) in moist air, molergning a slow combustion, and changing to a yedluw or brown friable sub-
stance callud fouchwood, and then finally to humus. (See Jermentation and "reserviation of Timiser.) Cellulose is insoluble in water, alcohol, ether, and oils-both wolatile and tixed. It is not sensibly affecterl by lwiling in water muless it has been derived from a rery soft or intuerfectly developed protion of a plant, when it becones julpey; and in the calse of cellnlose from Teeland moss, which is easi]y disintegratenl am? finally converted into soluble dextrine. Mnlimer ohserved that on builing Swedish filter-paper with water under fressure at $400^{\prime}$ 1. a dittle glucose was pro1]ncen. Another property is that of swelling Wher wet; hemee efllulose from conconut fiber is now used in the eonstrution of war-ships, being packen? in a enffor-ham at the waldr-lime, extending all aromed the ship, where it serves to elose any aperture before much water enters.

Solutiont of cellulose.- An ammoniacal solution of oxide of copur was discoreved by sehweitzer to dissolve cchnlose without charbing its chameter. The solvent is probared by dissolving eupric hydroxile jn anmonita, or jartially immersing coupler turnings in ammonia. I'lie celluluse is precipitated from the solution in amorjhons lhakes by boiling, dilnting, or the ardition of acids in exces. By dibping piper or cotton or linen fabrics in the copper ansmonia solution, ant then bassing them between rolls, they ture rendered waterprof. Several layers of sum sheets or ciothas pressed together form an artificial wool of great strongth. A plastic mass can le prepured of this material shitahle for the mamofacture of water-jipes. gas-pijes, hats, - lothing, boats, ete.

Action of Acids, etc.-Coll dilute acids and alkalies have little action on cellulose. Iong boiling witl dilute hyrfrochhoric or sulphuric acid converts rellulose into glacose. In comeentraten hydrabloric and sulpharic acids it dissolves, exhibiting lifferent products according to the temberature and the duration of the treatment: (1) disageregated, dissulved rellulose precipitated by dilution: (2) an amyloid borly : (B) dextrin, which differs from starel dextrin in having little action on polarized light. Strong boiling liflrochlorie acid converts it into a fine powder, without elamge of composition. Boiled for a short time with dilute sulphmic adid, it is converted into a pulpy mass, still exhibitinge the vonjonition of fellulose, and nut semsibly soluble in water. lig dinning masized patper for a few sconds into a mixture of $\mathfrak{g}$ volumes of shlulnric acid and 1 volume of water, and then thoronghly washing with water and dilute ammonia, it is converted into "parehment-paler," a substance of the apporance and properties of animal parelsment. Xemmann proposed to make eottom and linen falmies stronger. more compact. and waterproof by subjecting them to the above treatment and pressing between molls. l'arelt-ment-paper is an axedent material for the septa user in dialysis. (See Eximosumsis.) If celluluse is ground with eoncontrated sulphurie acinl, without allowing the mixture to become lamed, it fomms a pasty mass, amd this when largely dibuled deposits om amorphous hody which is blued hy ionline, and is hence coalled dmyloid. "Tomere digestion with sulphuric: ache converts collulose intorlextrin, and, on liluting with water and bitiling, into glucose. Strong nitric acoicl, or a mixture of nitric and sulphuric acids, or of niter and sulphuric alod, converts cellulose into nitro-sulstitution products. such as Guxcotron (\%. q.). Mnist chlorine gat fand warm sulutions of hypochlonites rapidly canse the oxidation of relluluse. For this reason cate must be ohserved in hleathing paper-stock and fabries by ehlorinte. See

C'ellolose in its more comparet forms is not rendered bloe by iudine mutil it has buen blisintegrated by sulphoric acid or caustic alkalies. sume lichens and alga-lechand muss, for cxample-give the blue color atter being boiled with water. Hated in close vessels, cellolose in all its forms undergos rlpstructive distilhation, yiehling ehareoal. which romathe behind, and combustihle gases, tar, and a mixture of water, acetio: acicl, and methylic alcohos, all of which distill over, Sice Acritic A(ID, Cnikeual, ant Tak.
ligestibility of ('ellulose.-Althongh wood and st ruw are not risily digestille by most aminals, the crollulose of young and suceirfent stems. leaves, and fruits is digested to al large "xtent; and therefore velliluse, which for'ms a Iarge juroportion of the foml of borbivorous animals, contribntes direetly dollwir nutrition. Fuengin, from fungi, and medullin. from the pith of various trees, are mere modifications of cellulose. Ilordein, from harley, is a mixture of cellulose with starcle and a nitrugenized holy.

 The solid tombations of' Celtic philology were haid by a. ("
 This work treats of the grammar ol all the Coltie bagnages staljen from their eatient doverments. Sinee this the history of the lifferent languages, me-mminently of the lrist and bretomic. has been the subject of diligent investigation. 'haracteristie of the "eltic family is (1) the lows of IntoEur, $p$-(initial): Ir. athir: Latt, puter, father: (e) the ehange
 the mase. genitive in -i, Gall. Ihemotuli (momin,-fulos). The passives aml deponents with -r. Ir. wechidir: Latt, sequitur, he follows, unite with other things to thow that sungig the

Indo-Europeans the Italic tribes (the Latins, Umbrians, Sammites. etc.) held the closest relation to the Celts. The languages of the island Colts lack an infinitive proper, and hare presered but one of the original participles.

Among the C'elts. the Britons and the Gauls have generally been regarded as elosely related, and some consilerations faror this view: thus fiall. and Brit. $p$ for 1r. $c i<i . e$. q). e. g. Call. Tetru-corii, Welsh peturer, four, but hr. cethar (: Lat. quathur). In other points, however, the lifitamie mites with the Irish. so that it sems to ocenpy a mean position letween the two. Whether the Celts of the Iberian peninsula were closely related to the Jrish is uncertain, as too little remains of their language. The island-Celtic (neoCeltic) languages of $\mathbf{M S S}$., since the wighth century, holl a relation to Oha Celtic and Gallic similar to that of French to Latin-abmost all the final syhables have disappeared. The Irish branch is however, more primitive in type than the Britamie, the former retaining the noun inflection, while the latter from the earliest priot uses hat one form for the singular and ne for the phaml. The Old lrish vocabulary is also purer than the Britamic, as the latter muler the Roman sway arlopted many latin worls: of. Luth, Les mots tatius dans les lungies brittomiques (18:92). Both branches are remarkable for the sariation of the initial element of words: thus Irish buerd, bart, according to the worl immediately preceding it, is ako pronouncel as werd and mord: Welsh perm, head, also benn, fenn, and whern. In other resuects the two branches are strongly differentiated. but the subdicisions of both are closely commented among themselves. Welsh and Bretonie too were carlier. but little iliffrentiatel. In the course of the centuries, howerer, they have followed distinct courses, the former adouting mueh English, the latter much French material. A journal especially devotel to Celtic philology is the Repue Celfique (since $1 \times 20$ ), in which a discmssion of the more recent literature will be found. $\quad$. Thuraersen.
(Translated by Benu. Ide Wheeler.)
C'eltic literature: See Gaele Literature and Kiyuric Literature.
Celts, or Kelts [Lat. Celtue. Gr. Keגtol, Kedtal (Strabo), a name. like most names of jeoples, of doubtful origin]: one of the great divisions ol the Indo-European family of mankind, itself divided on the hasis of language into three groups: the (Gaclie, Britamic, and Gallic. The Gralie division of languages comprises the Irish, the Scotch-Gaelic ant the Mans (of the Isle of Man). The lrish and the Scotch Gatlie have been ditterentiated only siuce the eighth or minth centmry. The Britanuin comprisis the Cymric or Welsh, the Cornish (extinct since early in the nincteenth century), and the Bretunic (Amoric) of Brittany. The Gallic, or the language of ancient Gaul, is known only from a few inseriptions and coins, and ('eltic names queted by Latin and Greek writers. (See ('eltic Lavoraties.) But the Celtic blood is much more widely ditfused than those relies of their languare would seem to indicate. Ahnost all Franee (Gallia) Was inhahited by Celts. The Belgie are thought to have been partially Cymrice as the ancient Britons undoubtedly were. The nume (eftitere indicates that in span the Celtic was probahly long ago mixed with the Basque or Herian blom. Xorthern ltaly was loner so metirely Celtic as to be callad (isalpine Gianl. The Celts under Brennus invaled Cirese. In Asia Minor they suttlell and gave name to Gahatia. In Germany the Brii gave name to Bohemia and Bavaria. In Great Britan the ('ymui long had sway in Cornwall, ('umbrefland, and stratholyde. It is probable that the present Cymuic clement of Northwestern France, though generally tracel to immigration from Englamf. is partly of direct Gaulish descent. Many of the Lation and (iermanie

The ancirnt celtic religime was a rmbe polytheism, the mythelory ant boetrines of wheh are now for the most part manown. The friestly caste of Dmide were lawgivers, poets, and prophets as well. Thuman sarritices were common. The common pepple were wrosily superst itious amil igumant. Weakeneal by the workings of hair rude social svistm of chans and septs, Dpressed by the exations of their priesthool, and harassed thy the constant inroads of Rome and the (iermanic tribw, the Celts, allare the dawn of history, are almost constantly sect to the the losing race, Jut thry yeducd nothing exiopt to forers and among ali the races nome was erer more dixtinguished for rator. Amony their other eharacteristiss may be mentioned profound religious feeling amd acote sensibilities.

The Celtic literature is of very ancient orimin, all the old Celts having a literary class called "bards," sometimes of noble and sometimes of sacerdotal rank. The ancient Irish wrote in a rude alphabet called the Ogham. The people of Gaul have left comparatively few inseriptions, and these are often moch Latinized. The chief existing Celtie literature consists of the hymns, mart yrologies, ammals, and laws of lreland (see (iaelic laxguage and heland) : the Welsh poems and laws. and many historical and theological works. mostly of a somewhat later date than the Irish, with the Mabinogion, a collection of tales. There are also extant a few Cornish religions dramas. The Mma literature is not extensive, and is quite recent. The number of people speaking the hish, Manx. and Gaelic languages is rapidly diminishing, while the number of persons of Cettic blood seems to be increasing. The English language is fast displacing the others in Treland, Scotland, and the Isle of Man. In Wales, however, the use of the Cymic language is probably much more extensive now than for many centuries past. Intense national feeling and systematic, persistent. and widely sustained effort have caused the old language to maintain its groumd. See Celtic languages, Irisi Langitage, Trish Laterature, Welsif hanguage, Welsil Literature, Maxx, Cornish, Gaelic, and Bretome. Revised by Bexj. Ide Wheeler.
Cem'bra Pine or Swiss Stone Pine: the Pimus cembra : a noble anil stately forest tree of Asia and Europe: cultivated to some extent in parks and arboretums in the U. S. It is prized for its seeds, which, though hard to extract from the cone, are very agreable, and are used for dessert, and with those of Pimus pinea (the stone pine of Sonthern Europe and Barbary) are sold under the name of pine-muts. The Cembra pine yields also a thin fragrant furpentine, called Riga balsam. ('arpathian balsam, or balsam of Lebanou. It is eanght in bottles as it flows from the wounded twigs, and is used in medicine.

Cement [from Lat. comentum, for codimen'tum (cf. $p \bar{u}^{\prime}$ -
 deriv. of cot dere, hew, lit., chipped stone, broken stone, applicd to hroken stone used in setting mortar, so, finally, mortar]: ans fluid, semi-fluid, or plastie substance capable of miting solid hoolies together when interposed between the surfaces, and afterward solidifying. There are many kinds of cement, animal. vegetable, or mineral, used separatcly or in combination with each other.

Glue is a cement of animal origin in eommon use. It is a hard, inrittle, hrownish gelatine, obtained by boiling to a soft jelly the skins, honfs, etc., of animals. When heated gently with water it becomes viseil. and is employed for uniting solid bodies, mostly wood. In drying it becomes very tough and hard, lint is eavily softened again by water. Marine ghe is formed by dissolving 1 lb . of india-rubber in 5 gal. of coal-naphtha, and adding to this solution an equal weight of shellac. The mixture is then placed over a gentle fire, and thoroughly incorporated by stirring. This ghe is insoluble in water, and is pry tenacious and adhesive. A cement for iron pipe, ete., is mate as follows: Mix together in a mortar 2 oz . of muriate of ammonia in powder, 1 oz . of flowers of sulphur, and 16 om of rastiron filings, and keep the mixture dry for uss. When the cement is to be used, take 1 part of this mixture, 20 parts of clear iron lorings or filings, pound them together in a mortar, mix them with water to a proper consintency, and apply the componud leetween the joints. $A$ good eement for resisting moisture is made by mixing 8 parts of melted ghe, of the consisteney used ly jomers, with 4 parts of linseed-oil. miled into varnish with litharere. This eement hardens in 4.5 to 50 hours, and rembers the joints of woolen cisterns and casks air and water tight. A gool rement for coating the outside of huilhings consists of linseet-oil. remered dry by boiling with litharge, and mixed with poreclain elay or well-htim pipectay in fin" powder, to give the consistency of stiff mortar. Oil of turpentime added in small quantity to thin the cement aids its alhesion to stone, brick, or wond. A eement designed to improve the enmposition of artificial stone. stneco, ete., is made by dissolving 1 H . of gum shellae in 3 to 4 oz of concentrated alkali in aqueons solution. This mixture is then cliluted with water, and used for mixing up the materials-hyIranlie coment. lime, aml sand-of which the artificial stone or stheco is made. The water required to mix 1 enbic foot of the materials should contain 1 to 2 oz . of gun shellat. Shellae disonveal in a comorntrated solu-
tion of horax gives a good cement for uniting herken stone. Singers cement for joints betworol lorase and alass is mado by melting tounther $\bar{b} 11$, of rosin, f ll), of leerswax, 1 lli. of red obloer, and 2 tablesponituls of gipsum. "re recomments for crmenting whatic phates into womber troughs, and for similar was, a coment mate of if lh, of
 linsed-oil: the noher and yybsun to be calcinal before homb, and adhed to the nther ingredients whila in fusion. Fronch phamber: vaphoy for the joints uf opla\%ed pottery pipes, used for distributing water, at cobld cembent made of quicklime, eherese, milk, athd the white of ergers, of a hot cement made by mehting rosin, beeswax, atul lime together. 'Ihbere ame di great variely of cements composed of vegotahle. minerat, and mimal shostancos mixel, which it is not deemumh necemary to mention.

Ther" is a class of cament- of whith plaster-of-1'aris on
 minon of the paster with water, and not to the formation of silieates, as in the hydrablie cements hereimafter described.
 and tenawity to ln teral with water alone. It may be mlvantagemali combintol with alum. Fieeness cerbent is
 of alum. then fusiting tha mixture until the water of combbination is triven off. It is then finely gronmel in at sutable mill, ant slaked withat solution of 1 fart of alom 1012010 parts of water Jọ woight. Dartincerment diffors from
 bonate of sola or of potassal. It is burnt with a highor degree of heat. In liarian coment boras is usid instead of the corphonate of sombar of potassa.
('emanl-C'onmon Lime. Iydrantic Limes and IIydrantic Cempat.-('onsideral as materials for use in the huilumers art. the probluts deriver from the calcination of pore and impure limestones are classifind into commen on fat lime hydranlic lime. and hydranlic cement. (ommon lime is simetimes called air line, hecause a paste or mortar make from it requines reposume to the air to cmable it to " set." of harden. The lyalratice limes atul cements are aboc colled Water linemame water cementon from their property of hardening undor water.
('ommom Limp.-'The linnstones which furnish the common lime of commerea are shlomif evor pore, hat watally contain, hesibus the carbontato of lime. from $B^{3}$ per cont. (i)
 sia, oxile of iron, wxiele of manganese, and traces of the alkalios. Lime, common lime atucklime, or ('antion lime (symonymons termis). is a protoxicle of catcium, and is produced when marble or any onter variety of pure or nearly pure carlenate of lime is ealdeined with a heat of sufliciont Intunsily and haration to experl the carlmonice arod. It has a specitic mravity of $3 \cdot 3$, is amorphous, hiorhty canatic. has at great aviblity for water, and when boowlit into rontact
 that substance, aceompanied and followed by at oreat eboration of temperature the erolution of hot and slightly comstic vapur, the hursting of the lime into pincos, and finally its reduction to n powdor, of which the rolume is from two and a hatf to thare and a hatf times that of the ordonal lime. In this condition the lime is satat to be slatkerd, und is remely for tase in makine mortar. 'The jorar the limestone the larger is its gromth or incerase of volame in slating. The pazto of common lime is metumbs ant impalathle to the sight and touch: lunce these limes are sumetime cotled fat or rich limes, ats dist imgishud from others known as poor or meager limts. These latter nsually contain more or less silica in the form of simbl, and a erreatere proportion of wher impuritios than the fat limes. and in slakimer whibit at more monderate elovation of temperature evolie less lant
 powiter, yould thin paste, and ate chatraterized hy leas frowth of volume "laty are less valuathle for mertar than the fat limes, but have an extensive application as a fartjli\%er. Whben thenl for buibling purgoses thay should. if practicabla be rerlaced to pewhar by grinting. in oraler ta remove all danger of sulsergerent slakimer.

Common lince when mixed into a paste with water, or when slakerl with sullicient water to probluow a paste may be kept for an indefinite time in that comtition withont deterioration, if protered from eontact witlo the sir so that it
 casks, or in wille, shablow boxes in whicll it was slaked, or heaped up on the gromme, covered were with the samd to be
subsequently ineorperated with it in making mortar. It is convenient. for some fromposes, to kep the slaked lime on
 eover, or in bulk. in a rooms sot apart for that purpose. Most common limes contath impurities which pravent a
 and hence the necesity of slaking some days before the lime is to be tased. to avoid all danger to the matsomy by vubsiquent enlargement of volume and change of onnctition.

A paste or mortar of common lime will not harden under Wator, or in eontimously damp places exeluded from contact with the nir. It will slowly hardern in the niv, from the surface toward the interior, ly desiecation and the gradual absuption of rarbonic acid gas, by which a sub(artomate with an excess of hydrated base is formed, or Cat). $\left.{ }^{\circ}\right)_{2}+$ CaO. HO .

The pastes of fat lime shrink. in haveming to such at ele greas that they con mot bemployed as montar withont a liargu dose of sand. In other sithations they have a very extansive application. pumasiar ats they do a great advantage in economy oser the hydranlic limes and cements, on ancount of the herge augmentation of their volume in slaking. thein "xtersive distribut ion over the surface of the ghome. and the simplicity attending their mannfacture. For masonry constructions of impartance, and particularly ubon our publice worts a mortar or a concrete containing common lime only as the cembenting medium is sellomensad at the prosent lay. Hydranlice lime or hydranho cement is nswally atderl, to a greater or less extent, in order to hasten the induration am\} socure srabiter ultimate strength and hardness.

The IIydrautir Property.- 1 limu is sainl to possess hydravic poperties when. after being oalcinal. rolumed to powder, amd made into a paste with water. it will hartan or sot amilue water. or in hamp plates excluded from (ontatet With the atmosplaric air. If the cotcomad stom, ean be staked to powder in the presence of water, it is enstomary to call it hydraulic lime. The rementspossess the hydranlic property to a ereater degree than the hyolranlie limses anel
 timate strength and hamłness. the helraulic mixtures are greatly sulerion to these of eommon lime, even when the Fitter are emploged under the mont arlvantageonte circominstancos. but their maximum strength is not reatedel under at perionl of seberal years. The bast coments. When mixerl to al paste witlont simd, attain during the first month, am month amd a half. fully one-halt their equatest ultimate atrongth and harchews. After the first two years, the inwrease in strongh and latalness proceds very slowly and at the emal of three years the month? increment revuires the use of delicate instruments for its measuroment. The primeiple of slow aral eratuatly diminishiner induration is characleoistie of all hydrantio mortars, whether derived from the
 The most atime hyidralic limes or emments, or those which - et tha mos quicifly, are mot neressarily those which attain the groatest iltimate strength amb harduess. 'The batter

"The argillareons hydranlic limes of commerer are grakrally derivel from limestones eontaining from 10 fo $0_{0} 0$ per cont. of clay: homengomentsly mixet with carhonate of lime ns the principal ingrodient. Trateso of the atkalios. and at small fererentage of the oxides of iron aml combonato of magmesia. are alm prosent in most "ases. 'The chy ingradicont usually contains from $1 \frac{1}{2}$ to 2 of silica (o) $f$ of alumina. During the juminge which is conductul at an heat just suflirient to expel the carlonice ateicl, atl the silio:a amb alumina is neatralized ly entering into emmbination whth a portion of the lime torining both tha silionte of lime and the mbe minate of lime. leaving in the humt product an excisse of yuick or constic lime, which imbues slaking. and becomes hydrate of lime when brought into conlact with water. As this lime ionsme at a low heat, the donble siliente of lime and

 ing ufont the quickling ats un weid. probluces aluminat an limu. When slaked by prinklinge the quicklime alone is ly1) rated.

Areitlatents hytrandic lime is therefore composad of-

 Ant hritrate of lime.............(a1).H10. on ! lime.... 34

When argillateons hyrdmalic lime is mixed into a paste with water or mate into mortar, the anhylrols silicate and alumimate of lime torm hydro-silicates and hedro-aluminates of lime by combining with six equivalents of water, aml subsequently undergo a species of crystallization techmically called sptting. This sedting will ensue umber water, amil constitutes the hyilaulic property.

If, in the gencral ease, more than 20 per cent. of clay be fusent in a homogenens limestone, a larger proportion of the lime will combine with silica or alumina during the hurning, Ifaving insufficient fuicklime present to induce sliking: and suth stome may be expectel to furnish a hydnanlie cencnt. Some hetemgenens limestones, however, containing as high as 30 to 35 per cent. of clay, will slake more or less thoronghly ufter buming, for the reason that the ingredients are not in sulfiementy close contant to comhine in the kiln in the formation of the hydrankic elements. In such cases the hurnt product eontrins an exerss of lime, of silicea, and of alumina, imb, after slaking as much as possible, there still remains a lumpy resilne.

Limes containing 10 ner cent, of clay are moderately hydromic. If matn into a pate and immersed in water in small cakes, they will harten so as to resist crushing hetween the thumb and finger in from twelve to fittern lays. The eminently hydratir limes, derivelt from honogeneons stones containing from is to 20 per cent of cliy, will handen umber water in from twelve to twentr homs. It the stone contans mome clay than this, mol still yields hymandie lime hy slaking the excess of clay dues not combine with lime. and therefore confers no adilitional hydraulic energy. (th the contrary, it impairs the strength and value of the lime for bilding purposes.
In consequence of their peenliar properties, the hydrantic limes can not loe kegit on hand in a state of paste. like common lime. They are preserved in "osks or sarks in the condition of powder, and in using them for mortar or concrete, mperially those that are emimently hydrulic, it is not well (1) mix more than one lays supply in atranct. The lime and the samd mar he mised together dry, and kipt on hame a long time in that combition if protected from the wather, but the water should mot loe inderd matil a few homes before the material is to he used, whether for mortar or concrete.
The method usually pursued in manufacturing liydrandic limes is as follows: The stone, alter being finariod and broken up into fieces not exereding generally 12 or 15 H . in weight, is hmont in any suitable kiln at a heat just sullicient to expel the carhonic abil, and then, after heing drawn from the kiln and while still warm, is sprinkled with from is to 20 per cent. of its own weirht of water. The slaking soon lu'gins, ant the stome falls to piectes, some of it in fine powder. and the rest in unslakel lumps of varions sizes. The mass is then thrown together in large haps, where it remains undisturned for sis or eight dieys, in order that the shaking may he campleted by the steam evolved. It is, then sereened through time wire-cloth to get rid of the unslaked hamp, packerl in sarks or barrels, and sent to markel.
It is not known that any deposits of aquilateons limestomes capable of furnishing good hydranlic lime exist in the $1 . \therefore$. It is manafacturet in several localities in Franee. notahly at soilley, atout a0 miles from Paris. The scilley lime is experten to the U. As in small ghantilies for use in making antiticial stome, Whon fyesh it weighs ahout 50 lh. (1) the si ruck $1^{\circ}$. © lushel loweely measurad. If mate into a stiff pata, it witl set in the air in ton on twaly homes and will resist censhing hetwern the thomh amb linger in from twenty to twenty-fom lomes. It is mot adive enomgh for layiner masonry miter water, lat will harden maler water alter The initial wet has taken plate in the opern air.
The sificemes hydruntir limes ater armerally derived from silierons limestones containine from 12 to is per anto of
 small prepertion of alumina and oxite of irom. The proc"as followed in thir mannlacture is similar, in all cesential resperts, to that flesedibed for producing argillacens hyirmulie lime. They owe their hyilaulie froperty, when mixerl to a paiste with water, to the erystallizing chergy of the anhydruss silieate of lime, formed turing the eatema-

The best type of siliceons hyedranlie lime is drived from the quaries at 'reis on the river lahme, Nepartmon of Arhehtr. France. It is known as hydraulic lime of Thil. 'The raw stone contains from 11
to 1 n per cent. of silita, from 1 to 2 per cent. of alumina, from 80 to 84 per cent. of carhonate of lime, and a trace of oxite of irom. When newly mate this lime weighs about 56 ll . to the struck $[$. s. buishel, loosely measured, but if exposed to the air it absorhs moistare so that its weight is considerably mgmented. In initial hydranlic energy the Teil lime does not materially differ from the lime of Seilley, but in ultimate strength and hardness it is believed to be superior to it. Analyses of the Teil hydroulic lime after burning, by Prof. Rivot, gave the following composition:

| Lime. | 78.29 | 73.60 |
| :---: | :---: | :---: |
| Silica. | 18:20) | 17:20) |
| Almaina. | 1:80 | $1 \cdot \%)$ |
| Quartz saluel. | $1.70)$ | 1.60) |
| Oxide of irm. | traces | traces. |
| Water and carbomic acit. |  | 5.00 |
|  | 959 | $99 \cdot 10$ |

The elements of hydraulic energy in this lime may be stated to le 60 per cent. ol the whole immediately after calcination, as indicated lelow, neglecting a small quantity of alumina and oxide of irm:

| Silicate of lime. ... 66 | $23$ |
| :---: | :---: |
| Free lime.......... 34 | 34 |
| 100 | 100 |

Hertyy, Slow-setting Argillaceous Cement (Porlland Ce$m+n t$ ). When a lomogeneons, argillaceons limestone contains so large a proportion of clay, usually exceeding 20 per cent., that it will mot slake alter calcimation, it may be expected to furnish some grade of hydraulic cement. The stome from which the celebrated Potland cement is derived contains from 20 to 29 per cent. of elay and is to 80 per cent ult tarlomate of lime. The elay itself is composed of $1 \frac{1}{2} 10 \stackrel{2}{2}$ parts of silica to 1 of alumina. When calcined at a high, long-contimed heat. all or nearly all the siliea and alumina of the clay rombines with a portion of the lime. pronacing hoth silicate of lime. mpresented by the formula $\mathrm{SiO}_{3} .3 \mathrm{CaO}$ I Silica, Z Lime, 4.3,
mina, as expressed by the formula

The burnt product dues not contain any meombined, and therefore inert, siliea and ahmina to adalterate the cement and impair its lydranlic properties; while the quantity of uncombined lime is not sullicient to canse the mass to slake to powdr in the presence of wader. After calcination the cement is therefore reduced to powier by grinding betwern ordinary millistones.
fiond lortland cement, when made into paste and formed into small cakes, will set under water in from two to four hours, so as to resist crnshing betwen the thumb and finger. When stone suitable for Porthand cement is caleined at a low heat, barely sufficient to expel the carbonic arid, the silicate of lime (as above) and the almminate of lime $\left(\mathrm{Al}_{2} \mathrm{O}_{\mathrm{s}} .3\right.$ (ara) are formed, and a light quack-setting cement is usually the result, greatly inferior to Portland cement in weight as well is in ultimate strengilh and hardness.

The superior quality of Porthand cement appears to deprod in a grat measure umon the presence of the touble silicate of lime and anmina, which is formeal only at a high heat. The weight of Portland cument, as well ats its hydranlic energy and its ultimate strength and hardness, is inereased by atumenting the intensity and duration of the hat cmployed in hurning, within the limit of vitrification. The initial hydraulie antivity however, is climinished by high burning, so that the lest Port lant cements are slowest in setting. i cement weighing 100 IL , to the struck U.S. Imsivel may be burnt to weigh 192. 16 , to the boshel, and its strength will be nearly dombled therehy.

Wrifirial /irflemd ('ement.-liully nineteen-twentieths of all the lontland eement used in Enrope is artificial. It is male by thorongh!y mixing torether, in suitalile proportions, clay and tinely bulverized carhomate of lime (either (thalk, marl, or compact limestone), burning the mixture in kihs at a high heat, ame then griuling the burnt product to fine powder betwon ordinary millstones. There are two methols of mannacture, hotli well atapted to the char-
arter of the materiats moployet, and kuown reveretively at the "wet prove" and the "dry procos."
 vicinity of Landon, Fingland, whuloy the wer proxero. The earbonite of time is furnisheat by both the white and gray
 shores of the Mealway ant "hamers, and from the menaningr marshes and inlets (contains abont 2 prarts of silion (o) 1 of all the other ingradients, comprising almmina, wide of irom, sorla, carbmate of lime, etc.

First. Ther clay and chalk are mixed lowether with it Jurpe guantity of water in a cirembur wash-mill of hasu. provided with havy harmows attachend to tha loorizonatal arms of a revolving vertical slaft. IBy this mestus the chath is thoronghty pulverized and incorporated with the chay in : semi-flaid state. The proportions are about 1 of elay for of chatle, by wight. Secombl. "The stome is puatrode and thon broken ap into pieces of irromber size, sedome exceedlat 12 or 1.5 It , ju waght, and liumt in an ordinary kiln (either intrmitemt or lerpethal), with "ither woot or coat as fued. Where coal is und the jerputhal mothod of burning is usually fothowed. the kidn heme tillet, in starting, with altermatic layors of comb amd stome, and then fired with wowl at the bettom. Is the burning proverede the dharge net tes down, the birnt stone is alrawn at the lontom of the kiln, and alternate layers of rom and stome aro added at the lop. The burnt eement is then (rushed up into small fragments hy suitable machinery. Iromal hotwern ordinary
 marturt.

In burning the argillo-magnesian cement both the lime and the magnesia combine with the silica aut alumina of the clay. The result is the formation of the silicate and aluminate of lime ant magnesia-compounds which become hydrates when water is addel, and are eapable of untergoing the species of crystallization or hardening under water called setting. The arsillo-magnesian cements can not be burnt with that intensity and furation of heat necessary in making l'ortland ecment withont fusing into slag, destitute of hylramlic energy. Those namufactured in the $\mathbf{L ゙}$.s. are all ipuick-setting, and their weight does not ordinarily excced $\mathbf{T} 0 \mathrm{ll}$. to the struck bushel, lonsely measured. The Rosentale cement is resarded as the most valuable of them all. but even this will never attain, under the most favorable circumstances. more than me-third the ultimate strength and hardness of the best Porthand cement.

The elements of hydraulic energy in limes and cements are composed as follows, the proportions being given by weight:

## Silicate of lime, $\mathrm{SiO}_{3} 3 \mathrm{CrO}$.

Ahminate of lime. $\mathrm{Al}_{2} \mathrm{O}_{3} \cdot 3 \mathrm{CaO}^{\circ}$.
Silicate of alumina, $2^{-5 i O} \mathrm{~S}_{3} \cdot \mathrm{HI}_{2} \mathrm{O}_{3}$.
$\left.\begin{array}{c}\text { Donble silicate of lime } \\ \text { and alunina......... }\end{array}\right\} \mathrm{SiO}_{3} \cdot\left(\mathrm{H}_{2} \mathrm{O}_{3}+\mathrm{CaO}\right)_{3}$
Silicate of magnesia, $\mathrm{SiO}_{3} .33 \mathrm{go}$
Mugnesion Cement.-Pure carbonate of magnesia, called magnesite. When burnt in a heat of moderate intensity, abont cherry-red. qround to a fine powder, and made into a paste with water, powesses consiflerable hydraulic energy. This calcined magnesite has been patented umder the name of Lnion cement. Its charactiristic property. however, upon which it depends for its peculiar rahue is not developell when mixel with water alone, for in that case the imburation or setting is due to the crystallization of the hyirated magnesia or exide of magnesimu. But if the burnt and pulserized marnesite, or Enion cement. be mixed up with the choride of magnesium-for which the bittern water of scasite salt-works has hern tound to he a cheap and suitable substitute-a chemieal combination takes phace betseen the oxile amd the ehloride of magnesium, and oxychloride of magnesium is tomed. This is a very remarkable hydraulic cement, heing sreatly superior to any other known cement in strength and hardicss. not excepting even lorthand cement.

Dulonite, or the donble carbonate of lime and magnesia, when burnt at a fow beat, reduced to powder, and made into mortar, alsu exhihits hydraulic properties. But if the heat he carried sullieiently high-say about $400^{\circ} \mathrm{C}$.-to reduce the carbonate of lime also thus forming caustic or yuicklime, the whlition of water eanses slakinge and the hySranice endrgy is clestroyed or impaired by the presence of the hydrate of lime.

Any magneximu limestone containing as hish as 60 per cent. If carhonate of matruesit may be presmmed to be "apalde of yiblling hyhraulic cement of greater or hos value, if propery bmberbunt. wo mater whether clay be present or mot, If chay exists as one of the prineipal ingredicuts, there are formed in thas kiln silicate and aluminate of mapnecia. as well as silieate ame alluminate of lime. All of these rompounds lineome hydrated when hrought in contat with water. amb aro ther in condition to unteryo that specip of crystallization cathen setting.

Sherlar.- Martar is a mixture of the pate of lime or cement with same. The pate may he madn hefore adding the samb, or the moterial may lne fowperated dry and aterewarl tomproml to a plastic eomblitm with water. In common mortar the cement ing substame is common lime. Hydrmalic mortar may the mak by mixing a pate of hydrantic lime or cement with samb, or by aldingr hytraulic materials to combum mortar.
Common . lurfor- - A- a paste of commen lime harkens or
 into small particle or thin films, it is important that the volume of limeprate in common mortar shonlet be imt slighty in exeson of what is sullicient in chat all the grains of sanit and fill the vaiks hetwed them. If this limit the excected the strengtl of the mortar will he impaired. With most sands the proper proportion will be from $\overbrace{1}^{5}$ to 3 wol-
umes of sand to 1 volume of lime-paste. Generally, if either less or mores sand than is herein indicated be used, the mortar will be injured; in the fommer case from excess of limepastc. and in the latter from porosity.

Hydrentic C'ement Mortar:- A 1 aste of good lydraulic cernent hardens simultanenusly and uniformly throughout the mass, and its strength is impared by any addition of sand. For ortinary use, however, it is colistomary to add as much sand as possible without making the mortar porous: 1 harrel of cement, as lackell for market. to 3 harrels of sand is the proportion usually followed. The usual practice is to mix the cement and sand together dry, and afterward temper to a plastic condition with water.

Cement and Lime Morter.-When it is desirathe, from any cause to lessen the cost of cement mortar, the best way is to add a portion of common lime to the cement, rather than to increase the quantity of saml, as this last method produces a prous mortar. The volume of the cementing paste, whether of pure cement or a mixture of cement and lime, shouht the slightly in excess of what is theretically necpesary to coat all the grains of samd and completely fill the voils. A mortar of cement amd sand loses about fourtenths of its strength if no-half of the cement paste is replaced ly an equal whume of common lime-paste. but is then quite suitable for orlinary work.

Tests for llydruulic C'ements.- The methods of testing hydramlic rements recommended hy a committee of the American sotity of civil Buyineers in 18.5 are now widely Hevl, and may be regardeal as stambarts. They have had the effect ul ereatly improving the guality of many varieties of eement- sold in tha market. These tests are three in number: firm. for finenes: meond. for eracking or checking; and third. for tonsile strength. The following is an outline of the methols of making them:
The strengh of a cement depmods greatly upon the finemose to which it is grombl, werially when mixed with a harge dose of sami. It is therefore recommended that the tests be marle with cement hat hats passed through a No. 100 sieve ( 10.000 meshes to the square inch), made of No. fo wire, stubbses wire gange. The results thus ohtained will indicate the grate which the cement ran attain, under the condition that it is tindy ground. lat it does not show whether or not : given cement offered for sale shall be accepted and used. But the finer the cement, if otherwise
good，the latere dose of samb it will take，and the greater is jts value．

The tests for chacking or cracking are conducterl by making two cotkes of nent verment ？me inches in diametor， abont $\frac{t}{s}$ incle thick，with thin edges，and noting the fime in minntes that these cakes，when mixerl with water fo the consistency of a stiff phastie mortar，fake to sot hard ononerh to support a wire $\frac{1}{12}$ inch dinneter lomded with $\ddagger$ llo．． and $\frac{1}{z^{\prime}}$ inch louled with 1 lh ．Who of these eakes，when hare！erough，should be put in water amd examined from
 themselves at the edges，surh contortions or erracks indiat－ ing that the coment is milit for use at that time．＇The remaning eake shmulal le kept in the air and its color ob－ sural，which for a gome ement should be unform througla out．Vellowish butches indieating a jur quality；the l＇ort－ lant coments being of a bluish grisy，and the maturad cements being light or dath，aceording to the rharacere of the rock of which they are mate．The color of the roments when beft in the air indiontes the fondity much better than when they are pat in water．
＂fite tensile lests are to be mate on hriguedes having an area of 1 sig．inch at the smatlest cross seetion．These aro mate in motds．kept in air for a desionated time，and then put unlar water until used in the testing－mathine．For a quick test the briquettes may he kept in air one hour， or untilstot，and be lorokn twenty－four hours after being mate，and in sthell case only neat coment wonld be nsad． But for tests of seven days or puward the hriguettes may be kept one lay in air before being put umber waters and a mixhure of 1 jurt cement to 1 jart of sand．for matural cememts，and is parts of samd for bortland cements，be Hed in mdition to trials al the neat eement．The quanti－ tios used in the mixture shond！be determined by weirht． To secure the hest compurative results the crushed puarts． usel in the manufacture of sampaper was recommended hy the commattee，the clegree of fineness to be such that it will all pass througl a No， 20 sieve aut be canght on a No． so sieve．＇l＇he saml and cement should be mixed dry．and all the water he addes！at once．＇Jhemixing should be rapid mol thorongh，and the mortar．which should he stiff and plastic，shombl he firmly pressed into the molds with the trowel，withont ramming，and struck off level：the moshts in Geh instanee，while being charemb and manipulated，to he lain directly on glass，shate，or some other non－absurhent material．The molding must be eompleted before incipi－ ent selting begins．Is soon as the briquetes aro hard amongh to hear it，they shond te taken from the modls and he kept aosered with a damp cloth nutil they are im－ murved．For thr sake of uniformity，the brisurettes．bouth of neat cement and those containing sand，should be immersed in water at tha end of twenty－fonm lomurs．exond in the case of one－day tests．The briquettes shond be pul into the test－ ing－mmehine and be broken immediately nfter boing takm mit of the wator，and the tomperature of the testing－room should be kept between tio and क0 f ．The stress maty be
 starting each time at 0 ．With a wak mixture me－half the sperd is recommenderl．

Similar stambard methots of tosting hydratice erments and mortars have been formalated hy assuciat fons of arelif－ tects and enginers in Finromen conntries．＂lhe demnsio vania Ratiboul（＇ompans suceifes requrling tonsile strongth

with more facility for neat ketping. Bricket vanls of greater or less size under ground are not uncommon, and a more general desire for those above the surface is observable. The latter should never be allowed unless provision is mate (ffectually to seal the erypt: in which bodies are deposited. Gramite is much used as a curbing: this sultices for the indosure and marks the possession of each family, und is the most enduring: the hest burnt bricks fior underground structures are also lasting: marble or other veneering gives out. and should be avoided, as the introduction of water in the interstices, whieh in freezing opens them with great force.

The best material for monuments is granite, either the expensive Aberdeen or the Imeriean. Italian marbles are not adapted to a cold climate; they inevitably aplit and crumble while the American will to the same if not laid in the frosition of its natural bed.

Cenci. chenchě. Beatrace: a leman lady: b. Feb, 1?, 152. Her father, Francesen, the son of a cartinal who left him vast wealth, was very depraved and extravagant, and treated his chillren with eruelty. Finally, Franceseo was found dead under suspicions cireumstances: Beatrice, her brother, and her stepmother were aecused of his murder, and for that crime were executed at fome sept. 11, 1549. Her story is the subject of one of Shelleys tragedies (1819) and of a novel by Guerrazzi (18.5). The long current story, with its well-migh incretible details of ferocity and depravity, is derived from the Amales of Muratori, and has been tamiliarized in these romantic forms. But there is no proof that Beatrice was beatilul, nor that her father committed incest with her, as her tlefender asserted in her behalf at the trial : while the pieture by Guido Reni in the Palace Barberini in Rome can hardly lo hers. surely not if by lieni, because he dill not paint in Rome until nine years after Beatrice's "xecution. For these facts, see 1. Bertolotti, Francesco

## Cenis, Mont: See Nont Cenis,

 :mimal]: the latest of the greater divisions of geoloric time, includinir the Tertiary and Quatemary of earlier classifications, and co-ordinate with Messzuic. Pilimozoic, and Protero\%oic. In this era are included the Eocene, Seocene, and Pleistorene priods. See Palentologr,
Censer [ 1 ). Fr, censier, short form for encensier (cf. Figg, encenser), as if from lat. *incensarium, deriv. of incensum. incence, deris, of incen dere, kimlle]: a vase or other ressel used for lurning perfumes and incense in temples and (hurches. Censers were usen) by the ancient Hebrews and (irech., and ate now emploved in the Roman Catholic Church al mass, yespers, and other serviees; also in some cervices of ritualistic Protestant Episcopal churches. The emsor now in use is suspendeal ly chains which are held in the hand, ant is tussel or swung in the air. It is frequently ralled the T"uurible (q. co).
Crusor [lat. censor, to cense re, rate, value, estimate, pass jublement]: the title of two magistrates in ancient Rome, whon were appointed to take the census-i. e. to make an rmmeration of the citizens ant] at valuation of their prop-arty-alon to inspect and regulate their manners and moral eomeluet. In the carly uges of the remblic these dutips were
 cheoteld for the pmrpose until 483 B.c. The censors were wriginally chosen for a term of five years (which was som rufuced io eighteen monthis), and only patricians were eligibhe to the atlice. In $3: 9 \mathrm{BB}, \because$ a law was ematerl that one of the censons must lie a pletheian, and in 131 both the eensors elereted were plebeian, The censinslip (in Lat. censura) was resarded as the highos dignity in the republic except the oflice of lictator. The power of the censors was in a great matare undelineal and irrecponsible, wivecially in the regnlation of morals (regimen morrm), They hall power to expel a senator frem the senate for a misclemstmor, and to pumish with marks of ignoming those whace comelnet did not areorl with their own idesix of rectituld: Ther conh dearale bersons from it higher to a lower mank, ant fill vacmeirs in the senate. Among thoir chatios wis the administration of the finances of the state ant the erection of new public buildings, As a gempral rule, the only perons (ligible to the otlice were those who previonsly hat bren consuls. No prison coulh he elected censor for a setome term.
Censurship of Books: term applied to intorference log

merly ewer books alone. but since the rive of journalism extented to preriodicals also. 'I'lie censorship, of hooks did not come into opreration until the invention of printing (except that heretical books were prohibited by the (hurch). It som lecame common to all European countries. Great britain included. The censorship of books was established ly act of Parliament in 1662, and renewed from time to time: but its renewal was refused in 1693 . In 1666 it was atholished in Sweilen; in 1rio in Denmark; in 1791 in France, where it was restored in 1805, again abolished in 1814, and after having again been in turn restored and abolished, was finally suppressed in 1802, but has since been from time to time, to some extent, revised. In Germany and Austria freedon of the press was promised in article 18 of the Federal Act (1815), hat not established until 1848. In Femany, however, censorship exists at the present dar, in Russia it is very rigorous, and in some other eountries the palice authorities have a supervision of books ant periodicals. In the repuldics of Durth and South America a censorship of books has never been known.
The Church of thome has long claimed the right of censorship over books. Sume of the early provincial conncils prohibited the reading of suspicious or heretical works, but the tirst catalogue of the kind now known was issued in 494 A. D.. in the time of Pole Gelasins. The authoritative lists of that Church have a contimuons history from the time of the Council of Trent. and ire known as the two collections. Index Librorum Prohibitorum. which forbits the reading of the book named at all. and the Index Expurgatorius. which requires the elimination of certain paragraphs hefore the hook named can be retal by the faithful. See lxdex Librores l'rohibitores.

Ceusus [ Lat.. registration of Roman citizens according to hirth, age, family, and property: the census-list; the sum total of property diselosedf : an othicial aecount of population or wealth. For a discussion of the origin and progress of statistical inquiry in general, see Stathetics.

1. Tue Cesses of Avtiquty has but little bearing upon the modern census, There are allusions in historical records, of greater or less validity, to censuses taken in early ages in China and Jajan. The book of Exolns (xiii. 11-13: xxii. 29: xxx. 12-16) contains ortinances prescriling donations for religious purnoses, which, based as they were upon the numbers of men and of berists among the Helnew tribes. required for their clue observance an oceational enumeration. In Ex. xxxvii. 26; Num. i. 2, 8 ; xxvi. 63 -65 ; 2 Sam. xxis. 1-9; 1 Chron. xxi, 1-7, 14; xxtii. 23.24 are found acconnts of several of these enmmerations, the most notable being that of liing David, whieh is stated to have been followed by a pestilence that destroyed 70.000 men. It is not safe to conjerture whether this succession of the plague to the consus became the canse of the widesprat arersion to enmmeration of inhabitants found later among Christian and Mohammedan nations. or whether superstition. pre-existing in the minds of the llehrew people, cansed the pestilence, whon it occurred to be considered the direct and proper result of the enumeration which had immethately preceded it. The consuses which are referred to in the New Testament din not originate with the people of Judara, but were initiated and conducted under loman anthority. By the Solonim laws an othicial detemination of the individual wealth of all eitizens, and their classification accorting to four grates in this resued. was mate a part of the constitutiom of Athens. This classitiontion, hased mom wealth, hat both a fixal and a pulitical purpese, the higher classes not only paring taxes at a greater rate mon their property, but poseming larger politieal privileges.
In Rome. Whence we derive the word, the emsus was at once a political, a military and a fiscal agroy. Its institution is attributerl to sirvins Tullius (5:50 3. e .). The first object songht was the dassifieation of eitizens acemring to the quantity of hand owned hyen. There were five classes of fremblders upm this lasis, the non-frecholders (proleterii) paying no taxes, having no vote, and heing exeluded from military service. The enumeration and consemment registration were accompanied by religions cermonial aml sacrifiees for the pmifying of the perple (lustration). As the ensus was taken finimgnemially the word lustrum came to signify a ferm of tive years. 'lhe census was conducted firat hy the kings, afterwarl ly the consuk, muti], in 443 B. C., two ollieers. whose powers werte of the highest in the state. were chosen at first solely from the patricians, to be callet censors, by whom this duty was to be disehargent. The ex-
 correction of momals amd acial relations, amd even to the

 of any morlurn mation. In adelition for this perionleal mameration. hirths, deaths, divore"s, and pussihly, also, marriages, were reguired to be regintored at loonte njom theis
 of the citiznship gengraphicatly, the census ol citizens conttimed to be taken in lame only, and by the censors alone: "onsequently the rol] of edizens hecame more amel mone inadeytate to the facts. Is the republiean spirit decelinet the rensus beame irreqular in neenremse. When Octavins, in his sixi heonsulship, numbered the limman people, there hat torn no cersus for forty-two yerse. 'The next two censuses look phace at intorvals resuotibely of twonty and twont one yans. While thas the Roman cemsus proper lost accor raty and validity with the lapse of time owing largely, it is frobable, to the exemption of atizans from the latulax, With a view fo whiol, in great moasnre, it hat been origi-
 with reference to the proviacials wherevor lam land-tax wis extendel. which more nearly appronclred than the cemsus hat ever flone to the moldrin forms of statistical induiry. The areounts rolating to the provineinds were not dignified by the name of census. but bore that of professio: thay were not taken in Roma. but in the reston to whith they related : they were not condatad hy the consor, but by the gromonsul : they were sanctitied by mor relions aeramenies or satritiees: thay were not even conincidiont, of neromity, with the census of eitizens. 'They eontanerl, howner", a irratly su-
 mombor of tremen and slaves, of women amb children, of eatle of every descriphion, of homam amblohlingra, but to the acrenge of every farm, to the amount mater tillary in [asture, or in wod, amd even to the mamber of vines abm of blive and other frait tress. " It was," says Mr. Morisule, "from the procise information contained in these ollicial registers that Iugustus, toward the chose of his retign, drew "p the eomplete surver of the loman empire which he phated in the hames of the vemal virans, to ha deblivered to the simate amd his sucesesor aftor his death. 'To this table of statistice he rave the natue of Fir riariom or Rationmer-
 eomprehented half the homan mos."

The growing intereat lhroushont Enrope in sinitary and sordologital inguiry hat increasest the demand for prostive information rexarling the mombres and combliom of prym-
 gian statistician, hat given intelligent direction to that demand. Decomingly, grat edtorts were put fortis to render

law enacteal for the purpose provided that the census should be taken on one and the same day-Mar. 31-in the three conntries: 30.610 emmerators were appointed. with the authority of the registrar-general, ly the 2,110 district registrats of Finglam and Wales. Only as much territory was assigned to eath emmmerator as combl be cansinsad by one person. There being no uniform system of registration in Scotland. the thirtyotwo sheritf of that country were anthorizal to appoint 1,010 temporary registrars-generally parochial schonlmasters-and 8.130 emmerators: the (rovermment appointed $25 ;$ enumerators for the smaller islands. some dars before the census-liny the emmerators delivered to every occupier of a honse or" tenement a " honseholdor"s schedule," containing inquiries as tos the name, the heat of family, condition, sex, age, nccupation, and birthplace of every person in (treat Britain. and also as to the number of bind, deat, amd dumb. For the use of the lower elasses of Wales scherlules were printed in Welsh. The schedule was to he filled up with reterence to the night of Mar. $30-31$. No one present on that night was to be omitted, except workingmen and others performing night labor away from their habitations. Trawelers were enumerated at the hotels and honses at which they arrived on the following norning. Simultaneonsly with the household schedules the enumerators distributed in the proper quarters forms for collecting information resecting places of worship, seholastic establishments. and miscellaneons institutions. The schedules were taken up by the enumerators on Mar. 31. The collectors filled up, those parts which persons lat neglected or were unable to fill. 'lhey also were required to note all the unncenpied houses and buildings in course of construction. The floating jopulation-that is, such persons as suent the night named in barges or boats on canals or small streatms in barms, sheds, tents, and the like-the emmerators were required to estimate atcording to the best information they coull obtain. special notice was to be taken of all extraordinary assemblages of people anywhere at the time of the censis. The enumerators were allowed one week for the transcrijtion of their schedules and the completion of summaries anl estimates called for. The revision of the returns by the district registrars had to be completed in a fortnight. 'The returns were subjected to another revision Ley the suberintendent-regintrars before they were transmit ted to the censns wllier. 'lhe custom-house officers took the census of sea-going vessels in port. Persons belonging to the navy and commercial marine were also separately ennmerated hy the proper aththorities. The Government furnisherl the statistics of the army. half-pay officers, and pensioners, the covil service, the civilinns and Enropeans in the East India Company゚s service. and British subjects living in fureign parts, as far as the could be ascertained througla consular and diphomatic organs.

The british census of 1851 was the most suceessful statistical operation, as regurls both ghackness and acemacy of excoution, proformed up to that time in any eomntry The consus of lingland and Wrales was taken in 1861, in 1אil. anel in 1ssi is of date Apr. 3. In the last pear maned 84.711 persms were emploved in distributing, collecting, and copring the bomsholbirs' schedules. To these
 registrars, making altognther 32.516 directly engaged in the lowal enllection of the required particulars.

The (emsus det of twot introluced some new features: proviling that inquiry be marle concerning the language spoken by persums emumeratma in the principatity of Wales:
 persons to be returnal either as employers, as employed. of as neither emplovers nor employed; also the momber of rooms occopion by a proson in jussexsion of less than five rooms. The whole "ountry was divibed into alont 40,000 enumeration distriots. Thim householehers schedules were liotributerl during the work amling sithorday, Aju: 4, and were collectad wn Inmlay, $\mathrm{I}^{s} \mathrm{r}$. A , with the required information respecting "every living person whonlox in ewery lonse on the nimht of the remsun day" (sumbay, Iur. í). Tho census ant remuirnd the publieation of the preliminary cusus report within live monthe from 1 pr. 5.

The erablishment of a permanent systemof oferish mation in
 in that country ( $1861,1871,1881,1897$ ) similar mlvantares to thase shrived ly the Vinglish ensus from the Registro tion let of Is:3t. "The history of the census in Treland hegins in 1811, coineidently with the second british census. The attempt renulted in a decided failure. The consus of

1821 Was of doubtfinl accuracs; the census of 1831 had subsequently to be corrected according to new data. The censuses of 1841 and of 1851 , taken by the members of the ennstabulary force, attained great perfection, the reports of the latter year. in seven immense volumes, constituting a monument in the history of public statistics. The famine of $1846-17$ gave to the results of this census a peculiar and painfal interest

France- ln France the census did nol find a place in the government until after the Revolution. Vanban, inteed, the ereat engineer of Louis XIV. in his project for equalizing taxation, addressed to the king in 170\%, strongly urged the necessity of an enumeration of the population, wealth, and inmentry of France. ."There is," he said, " no battalion in the kingtom. however insignificant it may be, that is not suhject to at least a dozen reviews and inspections during the year. Of how much greater inportance is it to enumerate and review the condition of the great body of the nation from which the ling draws all his glory and his riches!" Whether from repugnance to the ides of a census, or from the offense given by a project of just ame equal taxation in the dars of the old regime, the work of Vanban was by royal decree ordered to be seized and publiely burnct-an indignity closely followed by the deatly of the illustrions anthor. During the reign of Louis XV. some useful statistics were collected by the minister of commeree. In 1784 the gifted Neckar, a minister of Louis XVI., published his treatise on the finances of the kingdom, the riews and proposals of which were based on the fullest and nost athentic information regarding the state of the sevevil parts of the kinglom which could be obtained withont special agencies of enmmeration. Before the close of that century a law was passed requiring prefects of departments to prepare from the civil registers exact ammal abstracts of births, marriages, and deaths: this law, with some modifications, is still in force. A general census was taken in 1801, and again in 1806. The next snceceding enumeration was in 1821, since whieh time the census has been regularly taken once in five years.

Belgium, the country to which the science of statisties owes so mmeh, has earried to a high point the art of enumeration. Immediately upon the achievement of Belgian independence a special statistical service was created-riz. in 1831. In 1841 a central commission was established, with which M. Quetelet was from the first eonneeten. In 18.43 provincial statistical commissions were instituted throughont the kingilom. In 18506 a new law was enacted regulating the morle of taking the eensus and keeping the civil resister. It provided that a general census should be taken every ten fears throughont the kinglom, and that the popmation retums should form the basis of representation. The census was to be taken in such a mamuer as to give the actual as well as the legal population. The prescribed inquiries ineluded name. sex, age by vear amd month, birtlphace. civil status, oecupation or condition, habitual domicile, amd town and country population. Both the distribution and the collection of schedules were to bo mate in ont day. 'l'emporary census bureans were estahlished, one for dach province. Which were to receive the retums of He arcuts after they had leen revised hy the communal furies-hrelies apponted for each commonity, and consisting of oflicials and private citizens. The statistics of sulools and pulnice institutions were taken hy means of suecial sohedules. The military authorities were charged with the army census. The refusal to give information was punaloable ly fine and imprisonment. The central statistical commission receives the results of the successive censuses, yearly alsistracts from the ciril registers, and the results of special occasional inquiry. and prepares the same for publieation.

Pressia ohains popmation reports throngh a central hurean cstablished in $1 \times 0.5$. The labors of the hurem are directol to-1. general statistics: 2. births, marriages, and deaths: B, shools and chmrehes: 4. medical statistics: 5 . statisties of mordanical trades and manufactures. From 180.5 to 1820 these inguities were made anmmally, but since the lattor date the information relative to the first, thiral, ant fouth sulpects has bern collereted bul once in three yoars. When the customs union of 1834 was establisherl, irionnial consuses of pommation were anthorized, and lave been taken regrularly sinee. It first the inguiries relaterl to the $n u m b e r$ of the actual pepulation. acrording to the sex. age, hirthulace, religion, immigration, andrmigration. In 1840 the emmeration was requirad to he made by nome, which resulted immediately in a large increase in the population re
turns. In 18 th the mumber of familios was determined, ant in 1849 the eliatribution of the popmation liy habitations. In 1858 the persan of the two sext hotwent saventern and forty-five yars of atre were returned in five classes. In 1 wit the inmarried and widowed were specially clasifiod. With the census of the same var an inguiry was added in ref*rence to the languge spoken and the social emblition and oredpations of the popalation. The Prowian census is
 month of leecmher, on one day, by means of printed selhedt nle-. In addition to the statioties of population. many safisties are obtained howing the nature" "xtent, and disiribution of real propery, wages and sularis, insurance, aid mal
 ('atholic and I'rutestant churehes.

Iustrit.- Daring the last half of the eighteenth century and the first hall of the nineternth mo censusw were taken in Austra except those connected with military emseription. Siparate systems of mumeration prevailet in the different provinces, and the materialo for a general knowlelge of the whene population of the empire were very meater. In 1sed a eemtral hureat of statistics was ereated. A nuiform entimeration was matc throughont the empire for the first time in $1 \times 51$, but its revits were so imperpet that in 1sin) at combmission of high alministrative ofticers was appointed for the preparation of a new census law, which receivel the impreial sanction in 1sint. The military needs of the sate were no longer the main motive for a mensus, but atatisties of popmlation, wealth, and industry were to be oltained a* a basis for the safe conduet of publice atfairs. A census based on the actual prpulation was to be taken once in six years, exclusively by the civil authoritios. l'rinted siduediles were to be filled up he the heads of families, ownets of tenment-honses, am those in charge of eqnemts, sehmols, and pmblic institutions. Thoze that intentionally fated to furnsh the desired information were to be pinishat by fine and imprisomment. The schedules called for intormation under the following heals: Comprsition of fanilies, including servants: age: sex : names and titles: avil staIIs: social condition; religion; secupation; marriares, birthe, and deaths: the manker of cities towns, hambets, vilages, dweltines, and remters. The momber of Austrinn subjects living in foreign pates was to he oltamed through the imperial legations. The ernsus of the naval and mititary population was to har separately taken by the proper ant horitios. The consh- is now taken every ten years ( 18 si 0 , $1 \times 90$ ).

Russia.-Patial censuses were taker lyo Rusian fonermant in 1500. 1i04. 1i05. and 1i10. In 1318 leter the fient required all lamed proprietons to make a derlaration of the number of serts helonging to cardn. The same var be organizel a soecial commision to visit the separata jroninces of his empire for the purpone of makine a general census. So enumeration of females was made in there farly censuses, which ware taken solely for the parposes of revenue and military conseriphion. in heeree of 1 Tive directed that a consus shonlel la taken once in twenty vears. but this interval of time was not regularly wharemi. In 1903 a central burpan of statistios wate organized, merganizen in 1xive unter the name of the statistical commision.
 1840, 1850, 1880, 1846, and 185\%. The "ensme is taken ly means of primed schedules distributed hy the lamal anhoritins. The work of consolitating amb pmblinhing hwolves ugen the statistical commission.

Vormay.- A hecemial wensus was instit ated here in 1si.5, and has cuntinnel up to the prasent time comprising infuiries as to acre, sex, civil stathe, number of familios and hahitations, urfal domestice animals. and the territorial areat of mach thistrict. A burean of statistios smperimemeds all forms of publie statisties except those pertaining to the alministration of justier, publice alacation, and finameral moministration. Inguiries are male one in tive sears in regard to the combition of indutry. Imanal exhitits are math of hirth- marriages. amb deatho of comenere and navimation. of the maninistration of juatione and of the P"r alation sulterine fromp phys.al anel mental diabilition.
sipeim paid hat litho attention to publice satialie after her tensis of 1 gas until 18ati. when a whtral statitical comb-mis-ion was orgamizat, under whose sulnerisim a gemeral census was taket in 185 a, and since then once in there veas. The cemsus is taken in one night by (iovermment whieials charged with the collection, verification, and consolitation of the returns. I fimal resision is made by the statistical commistiol.

Sultzectend.-The original constitution of the Swiss fedaration fequirel at censu- one in 1 wenty yars. llost of the impuries were eonduetol be the seral cantomal gevcrnments. The returns wero not uniform, and were generally inacorate。 In 1stia) a law of the Federal assembly prescribed a deeminal census for the whole federatim, and instituted a federal bureau of statistios under the direction of the interior department. The first emsus anter the new law was in 1stio. The inguiries indndel sex. age civil condition, origin, hinthplace domicile, religion, langare, physical disatilities, imnigration. the dis ribution of real proparty, the munner of ramilios, and the muntur of habinations and other buidimes. The cantonal statistios colleceded 1 y the loxal grvermonts are consolidated ant phblished by the central burean. C'ntil a few years ago the tititerent cantoms followed different methods in the collection of vital and morthary statistics, 1 wit at the instance of the burean they have now atopted a unilorm phan. In laif the central harean initiated the cemsus of live stock, athl later colberted very full statistice of railways, samge-banks. and fire-insurane companies.

Italy.- Swon after the fomming of the montern kinglom
 with ample powers. The first grneral census, which was to atford the hasis of repremation in the natiomat parliament, was taken bee 31, 1wis. wnder a law prespibing general enumerations once in ten years. I'lue census is taken in one day by mans of previonisty distributed shedules. Since 1sit the central hareau has luen charged with additional
 lic charities. imdustrial (onporations, limaries and institutions of aducation.
frefere-The ernsus in modern Greece dates from her last struggle for independerce. The first general enumeration of the pemple was made in 1 wis6. From that date censmace were takind ammalty until 184.5, since when they have been taken at irrorular intervals-riz., 184s, 1803.01856 .1861 , $18 \mathrm{~m}, 1889,1 \mathrm{x} 46$.
111. The ( ensis of the Cemteb states is. in its latest development, unigne dittering witely from the European tybe the reaven for whel will hereatier arpear.
luring the enlonial perion the lisitish linurd of Trade attempted several partal emumerations for anministratise
 cially in the southern colonits. In the eensus of Sew York. atteninted by (iow. Hunter in 1il2, the sumertition already alluded 10** entored serionsly to atfer the compleneness of the returns. This fecting was so strong as to betom the gor emor of New hersey. a fow years later, from attempting the census of that rolony. suleferive were the eobonat censuses in general that Mr. baneroft. for the parposes of his Misfory, constructed in peberenes a table of population
 namely, taken in 1590 . Seweral ettorts we mato during the Revolutionary war and during the continanace of the grovermmont of the confenderation, hat without strectes, to seroue an emmeration of the pepalation of the sereral States, with a viow to apportioning requisitions for men and supplies. In these schentes, varimus estinates and computations wepe malc use of, all sulsequently ascertained to have been in a comsiderable denere errontons.

By the Comatution of 1 isa a deremial bonsus was made a montitume part of the pelitieal system of the C. . S. M. Doreau do domme has attrihuted great eredit to the U.S on this areount. dectaring that they present a phememenon muprewnated in histery-" that of at people who instituted the statisties of their country on the very day when they fonndel that govermment and who regulated, ly the same instrment, the census of inhahitants. their politiont rights. ame the destinies of the mation." The fate i - lowerer, that this provision of the 'onstitution was not in the leasi degree of a philospgheat origin. It wats a nerensity of the feederal requesentative charactor of the govermment then wablishet. on which hoth repromation and direct taxation were re-

 some pulstiv misfortme or an epillewical distemper should follow the numbering."
shals of the several judicial districts. who were authorized to appoint as many assistants as shonld be retpuirect, each of whom shoulal have ath assigned district. to be persomally enomerated by lim. Lists of inhabitants were to he set mp at two places of resort within each distriet for public inspect tion. All persons sixtern years of age and upward were required. under penalties, to qrive all neederl infommation to the census-takers. The incuiries were six in numbur for tach family: (1) name of the head of the family: (2) numbrer of free white males sixten yeats and upwarl: (3) numlno of free white males umber sixteen years: (t) number of tree White females ; ( $\sqrt[3]{ }$ ) mumber of all wher free persons: ( 6 ) number of slaves.

The results of the first mumerition caused much disappointment, owing to owerstramed "xpectations hamd on the extravagont estimates that hatl prevaled. as is usual in the absence of anthentic information: and Mr. Sefferson, then secretary of state. in semdine coppies of the census report to the ministers of the [. S. in foreign limds. carefully explaned that the ennmeration was largely defective. The results of subsequent censusis. howerer. established the sulustantial acenarey of the count made in 1590.

In 1s(0) two learned sucieties memorialized Congress on the subject. The Imerican Philosophical socioty, Thomas detferson prosidat, repmeanted that the decennial census offered an octanom of great value for ascertaining sumdry facts highly important to society, amp not otherwise to be obtained. It therefore prayed that the next census might be so taken as (o) present a more detailed riew of the inhathitants of the $E_{2} . \operatorname{tund} \mathrm{r}$ several different aspects, such as the effect of soil and clianate on human life; the incrouse of population ly birth and immigration: and the conditions and vonations of the jrounle. To gain the first of these ends. the society sugracest that the popsulation should be much more minutely analyzed with respect to age. To arain the second. it was propised that a talble should be used presenting in soparate conlmms the respective numbers of mative citizens, ritizans of foreign linth, and aliens. To reach the third end, it was proposid that the momber of tree male inhathiants of all atres angagnd in llifferent professions and pursuits should he ascultaned, such as merchants, agriculturists, handieraftsmen, mariners, ete. The other memoriat, to a similar effect. came from the connecticut Academy of Arts and sciences. Timothy I wight president. Botlomemorials were presented to the senate Jan. 10 , isoo. and were referced to the committer alremly charged with drationg a census hill. Ty the law of 1 soo the scherhule was somewhat externded. It remistered the nime of the head of each timily: the mumber of free white males under ten years of age of free white males of ton and under sixteen; of tree whitu males of sixteen amb umber twenty-six: of free white males of twenty-six and under forty-five of tree white males of forty-five and upwart. "J"he last five inquiries were dublieated in referenee to females. All other persons, except Indians mot taxed amd haws. were alsa enumeratem. bat without distinction of age. The general lirection of the cent sas Was placed in the ()epartmont of state, where it remaned until 18.50.

In Ixlot the population selferlule of 1800 was retained withwht monlifieation, hat hy athphementary ace ( Maty l) the soope of the wommertion was rxtended to embrate an acmont of all the manafaturing astablishmats, The construction of the relondula was laft to the secretary of the Treanary olhe rasults of thic new statistical effort proved (t) le of little value.

The eensus of $1 \mathrm{~s}_{2} 0$ presentmb no new features of marked
 foreignors maturalized and not mat aralizat, while shaves ant

 improscoment "pon that of $1 \times 10$. It complethemblal fower details, lut was mone diseriminating in impuries and more sciontitic in arrangement. This part of the work, however, Was so imperfectly dome by the cermas-takors that the resmlt: olstained poseressed little value.

In the census of $1 \times 30$ no ationnt was mate to olotain industrial whlistios of any sort. The selmente matre a more minute clasifiestion of jopulation. The mumber of the doaf
 ored. and save lopmlation was ascertaberlas far as pataticable in condureling a new experiment.

In $1 \times 10$ atill other stat ist ios of prymation were conllecterl-
 sons rhergad in the groat industries, such as agriculture.
manufactures, and commere : likewise the mmber of lievolutionary pensioners. Several columns were added to the schedule for educational statistics-the munber of scholars in schools, togethel with the number of white persons over twenty years of age who cond not real and write. The attempt to obtain statistics of industry was rencwed, and an exterded though bably arranged list of questions was in(wriporatel. Is there was no prailty for refusing to answer these questions. in some localities the people refused to answar them, on the ground that they were illegal and inquisitoribl. The industrial statistics ohtained. howerer, were the nost valuable yet procured.

Is the time for taking the seventh census drew near, the sulyect hegan to attract an umsual degree of attention. A censis- woard, consisting of the secretary of state the At-torney-(remeral. and the Postmaster-(imeral was created by an act approwed Mir: 3. 184!, This lmad was charged with the duty of preparing forms, selmelules, we. for taking the next census, but was instructed not to incorporate into the sehedules more than 100 questions of all kinds. At the next sesmon of Congress the senate rascal a secial committee on the censens, and imposed upmen it a similar task. The law. as prased. greatly extended the splere of the census. The act. approved Jay 23,1 s.0. is entitled " A general act providing. for the census of 1850, and for every subse-中unent eensus." It created a eensus office in the newly created Itepartment of the Interior. The six schedules incorporated in the law bore the following names ly number: 1 , "Free inhabitants": 2, "slave inhabitants": 3. "Persons who died during the year ending June 1 " : 4. "Productions of agriculture ${ }^{\text {ta }}: 5$, "Products of imlustry" : 6, "Social statistics." Several important new features were incorporated in the first schednle, viz, the name, age, sex, and color of each person, together with the platee of birth.

Thre third or mortality schedule contained a class of inquiries wholly new in the census. The fourth, fifth, and sisth sehedules related to sulijects that had received some attention in previous censuses, hut withont adequate provision for the collection of the satistios required. The census of 18.50 was a great improvement on all its predecessors. The addition of general statistics of manufactures and of agrieulture was a gain of the highest importince. Others of the new features of the act of 1850 never became proctically valuable.

The census of 1860 was taken on the same plan as that of 18.in, with but few modifications.

Before the census of 1890 was taken an attempt was made to procure a new law which shoukl provide now machinery and remodel the old schedules. An elaborate bill, drawn largely hy the late President Garfichd. passed the Ilouse of Representatives, hut failed to recrive the sanction of the Senate. The census of 1 sio was taken ander the law of 1851. Some important additions th the inguiries were made by anthority of the secretary ot the Interior. In conserivence of the abolition of slavery the ohl sohetule relating 10 stalistice of slares was dropped. To meet the requiremonts of the fomrteenth ammalment to the Constitution two colmmns were added to the pesplation selednde-the first to ubtain the number of male citions of the L'. S. in ratclastate of twenty-one yoars and ajward: the second to obtain the number of such citizens whom riglit to vote is dened or abridged on other grommts than ridethion or erime. The results of this sjecial inquiry were of little valuc. Many rhanges were made liy the comsam ollice in the forms of the inquiries. by which the were rendered more definite athd more casily umdersomd. Besides the imyuiries (macerning "place of hirth." two colnmons wrope added requiring a statement of the parentage of each gerson. This has provibed a way for ascotaining the number of citizems born of formen parents. In intury was also adder coneronine the public debt of towns, cit ies. comnt les, and states. 1 striking fentur" was addal in the publication of resnlts by the construction of mgraved maps, illustrating the varome chasses of stittistices.

In privaration for the tent h census (1s8(). Congress passen an act (11ar. 3, 18:!), supplemented ly the act of Apr. 20 . 1KN0. moler which that census was taken, and under which. unless new legislation shall be had, " a census will hereatter be laken every ten yeurs."

13y the art of $1 \times 79$ the census system of the U.S. was greatly changed, both as to the aigencios of ellumeration amal as to the subpets of inquiry. The most important of these will he now indicated.

1. Agpucies of Enumeration.-(a) By the act of 1870 the
superintendent of census hecomes an offer apmointed by the Presibent and eonfinmed by the somate instead of merely a "superintemdin! chark," appointed ly the sur. tary of the laterior. (b) No other important change is mece "sararily wrought by the new law in the organization of the equsus hareth as ablle for revising. digesting, compling. and publishing the results of the enmmeration. (c) lnstiad of the marshak of the several judicial districts (sixty-fom
 "supervisom of centus," are introted witl the charge of

U．S．census since 1850 has heen，in the phrase of the act of 18i9，＂is census of population，wealth，and industre：＂The amount of statistical dretal cohlected in the［．S．decennial enmmeration is greater than that obtained in any ot her comn－ try through the same ugence：and is satly greater than the snim of the statistical detaik collected in iny other country through all agencies combinet．The reason for thus im－ posing upon the census inquiries which in European coun－ tries are made，if mate at all，through other areneies，has been found mainly in the indisposition of Congress to raise the question whether．under the Constitution，the U．s．Gow－ ermment can institute or conduct prurely statistical investi－ gations affecting mivate persons，and enforced by penalties in the event of refusal to give information．except in con－ nection with the dermaiti emumeration expressly author－ ized and required ly the Constitution．Were this consider－ ation set asidle，there can be little question that the statisti－ cal work of the contry sonkl be better tone by agencies very differenty organizer．
The pulbications of the successive censuses of the $\mathbf{U}$ ．s． have bech as tollows：

1790．－lefturn of the Whate Number of Persoms within the Secermil Districts of the Cnited States，etc．（svo， 5 ？pp．， 1～リ）

1s（0）．－Retwrn of the Whole Number of Persons，efc． （folio．is 1P．1．6）i）．

1810．－（1）Iggregate imount of each Descripfion of Por－ sons，efr．（oblung folio，withont date）：（2）．A Series of Tables showing the Stereral Branches of American Manufactures， etc．（4to， 170 pp ．）．

18：20．－（1）（ensus for 1830 ，etr．（folin． $164 \mathrm{ph} ., 1821$ ）；（2） Digest of－Icrournfs of Jhanfocturing Estublishments，etr． （folin． 100 pl．．1sers）．

1830．－F＇flh C＇enshs of E＇numerution of the Inhabitrents of the（rited sitates（folio． 163 pp ．．1530）．This work was so badly compiled and printed that fongress directed a re－ pulbication．Even the latter is honeycombed with errors．

1840．－（1）Compowlium of the Ethmervition，etc．（folio， 378 pl．1841）：（e）Sirth（＇pmsus or Enumeration of the In－ habuttents of the Chited states（folio， $470 \mathrm{1m}$, 1841）：（3） statistics of the［rited states，elf．（Solio， 410 1p．，1s41）： （4）Census of l＇enswoners of Rerolutionary and Mititnry Service，with Sumes，iges，and Pheres of Residence，eft． （ $410.1: \% \mathrm{pl} 1 \mathrm{r}$ ）．

## Central! dmerieat Se America.

Central American Anfiquilies: The architectural robains which exist in such numbers in Central dmorica may he clivided into thiow oroups, differing in character. low tion, and constuction. Much the mast important of the three was that fommal within the area nccopied by the Maya linguistie stork, amb undoultemly the work of the ancestors of that people. Fower in number, lat presenting some unique examples of stone work, were the remains left by certain Sztec or Xahuatl colonists, who at an early promid settled in rarious patis of ('entral America. Finally, in Costa lica there are numerom relios attesting a comparatively bigh civilization loft by a trilu or hy tribes belonging to stocks diffornt from wither of those abose mentioned. We shall exmmine sach of these in turn.

Maya intiquities.- Wthough all the rematins fomed within the area of the laya sock of tribes gresent certain general similatitios, they offer special trats which sugges: their division into (wo sub-groups: the one incluting then within the area of the Mexisan states of Chiapas and Incatan, the other in the repmbles of (ruatemala amillonduras. The frinoipal sitps in the former of these sub-grompe arel'alenque, situated on the small river Otohm, a branch of
 structures: Comacalon, S. W, al Palenque, near the coast: Mayapan, the ancient native capital of Yueatan, S. E. uf Merida; [sma], $\underset{\sim}{16}$. of Jayapam, presenting some of the vastest mummonats of American architecture: Kiabah, Nochacals, ('hunhmhm. Mani. and mamy others, nearly forty in all, within a ralius of somiles from the capital, Alayajan, Further Fa are lammal and the singulat agglomeration ol buillings walled (hichom-ltza; on the eastern coast the city of Tuloom, fortitiod with strong walls and surmonnted with square towers; and on the island of Cozumel numerous edifiees of smallar juropurions, visible from the sea. In the south of the penmanla are the well-pmeserved strutures of Tikal, not far from lake leten, and on the Tsumacinta river at large mass of ruins, which has leen mamed Lorillard ('itr.

In the arehitwotural remains discovered in these locatities certain resemblances are fonand which show them to haw been the work of the same penple, and which separate them from similar relice of mative civilization sen elsewhere. It is evident on the ather hamb, from their state of preservition. that they are of wiklely diveran ages. Palenque was undonhtally an ahmotomed eity when Cortes conrumend Nexico, as be passed almont within sight of it and never herat of its existenore. Even at that time there were mascive ruined eitios in Yucatan. corred with a forent of seemingly primeval growih. such a one was liho, on the site of which Mérida now stamels, and whose materials served to build the present city: Othors again were in 1 rocess of construction when the Spaniarts arrivet. The nsual material of the buiblings is the limestone which underlies the surface soil in most parts of the comotry. The hocks were shaped by
summit of an artificial monnd or pramich. The structure of the prramid varied. Sometimes it was merely a heap of rubble and earth, kept in place by an external layer of
UIT
stone: elsewhere the foundation walls of the superstructure extend down through the pramid to the original soil, the mound being constructed around them. The base is generally rectangular. though rarely aceuratety so, and the sides are oceasionally terraced into one, two, or three platforms. The area of the gromid plans and the lieight vary

Central Foress: in mechanics, those foress which radiate from in point or centor. I body impelled by a constantly acting force toward a lixed center will move up to that print with a constantly increasing velocity: but if it have in initial motion in at direction toward some point other tham the center, the constintly acting central force will deflect it from its original path, bit will not drats it to the center of force. The resultant path will be a curve. The straight line from the moviner horly to its cunter of force is called a "radius vector," and it is fomm, mathematically, that the radius rector of a looly moving in a curve under the intluence of a central fore will pass over efthal areas in equal times. whatever the rate of motion. It is fomme. also, that the velocity of such a borly is at all times inversely proportional to the perpendicular from the fixed puint on the tangent to the rurve at the point comsideral. Theretore, if the motion be uniform, the path of motion is a circle. If the path be an ellipse, and the conter of force be the center of the curve, the central force is directy proportional to the distance: but if the center of fore ber at :i focus of the ellijse (or of a hypermolic or purabolie path), the fore acts with an energy inversely propertional to the spure of the distance.

Contra'lia: a city and mibual junction; Marion co., Ill. (for location of county, sce map of lllimis, ret. (1)-E) : 2.je miles s. al' 'hiense. It has machine-shong of the Ithois Central R. R. Centrarelidar [from Centrarchus, the name of a genus, from (ir. névtpov, spine + d̀p ós, ams]: a family of fishes of the onder Acanthopteri, peculiar to North America. They constitute a very characteristic type in at least the Eastern and Mississippi regions. The body is oblong and compressed, and divided into nearly equal and corresjonding halves by a longitulinal axis coincident with the commencement of the lateral line and the middle of the caudal fin: the seales are well developed, and generally ctenoid; the lateral line is continuons; the head is compressed, and covered with seales on the opereula and cheeks; the eyes are lateral. The specics are quite numerons (about fitty having been described). and generally among the most common fishes of the waters which they freipent. They are all earnivorons, and mostly quite bohl ind gamy fishes. In the breeding season they generally select a spot. which they elear of weeds and obnoxions substances, for deprositing their eggs; these the male and female guarl with zealous care, rushing boldly forward to drive away any introler not too large for their powers. It is to this family that the black bass, as well as rock-bass, sunfish, crappic, etc., belong. Neveral distinet types of structure are exemplified by the species. See Simpisin.

Theodore Gill. Revied by Davin S. Jordan.
Centre College (Danville, Ky.) : chartered as a State institution in 1819. Under the long presidency of Dr. I. C. Young ( $1830-5$ ) the college rose to great eminence among Western schools. Jt retained both its numbers and its reputation until the civil war, when the number of students was reduced from 900 to less than 50 . At the close of the wilr the syod of Kentucky was rent asunder, and the smaller body: and with it Centre College, adhered to the General Assombly. The libraries of the college contain about 8,000 volumes. Facilities for instruction in the sciences are good and increasing. The endowment yielding an income amounts to about sim,000; the buidings and gromuls are estimated at 885.000 additional.

Centreville: town: capital of Queen Ame co, Md. (for lowation of count $y^{\text {s }}$ see map of Maryland, ref. D-G): on dhil., Wil, and Batt. K. R.; 30 miles E. by N. from Annapolis; is situated in a large peach-growing region. Steamboats connect it with baltimore. It has in academy for boys and one for girls, an agricultural-implement factory, and a foundry. Pop. (1880) 1,196; (1890) 1.309. EDttor of "Observer.'

Centrip'etal and Contrif'ugal : terms used in holany, and applied to two moles of inflorescence. When the terminal flower-bud is the first to expamd. the intlorescence is sail to be centrifugal. When the expansion hegins with the bud which is nearest the base of the floral axis (or neatest the eiremiterence in a cyme or corymb), and procerds toward the terminal or central bud, the inflorescence is centripetal.

Centriputal and Centrifugal Forees [centrinetal is from Lat. rendrum, couter + pe'lere, scek (Nirwom used the Mod. Lat, centripetns and centrif fugus) : centrifugal is from Lat. centrim. center + fu'gre, floe]: If we suppose a londy to move in a circle with a uniform verecity, it is shown by the laws of motion that it must he acted upon contimally by a uniform fore directed towari the ernter: which foree expents itself each instant in deflecting the moving body from the straght line in which it woulit nomally mowe, this lime being a langent of the circle in which motion takes place. The force with which the hody is impelled toward the center is ealled centripetal; the equal and opposite raction of the body against this impulsion is the contrifugal force. Both together are the rentral forces. Each is equal to tho mase of the body multiplied loy the square of the velocity, and dividerl by the radius of the circle round which the hody moves.

 genus of fossil fishes armed with thomboilal ganmid platers of emamed hanye structure. Soveral spectos are fombin the Upur silurian and in the bowninn rocks. 'Tley had large Ieterocereal bails, and appent to have been rapitly moving, predacous tishes. The name is derived from the large phate which covered the heal.

Cophatization [derived from (ir. кєфasí heal] : a term introluced by Prof. Janmes I). Dana to demate simply the dearee of head domination in the structure of the boty. The following are some of the ways or methots in which it is manifested

1. With superion "pphatization-that is, as spmes rise in grate or rak-more and more of the anterin part of the buly or of ite members render servide to the heal; with mfrofor, lacs and less. In many cases, part of the ormans that serve as feet in the lower tribes serve jans in the higher, (or, in other worls, are transferred from the lommotive to the ecphatie serien, and thas the structure indicates higher (eplalization.
2. With superior cephatization the structure of the lead or of the anterion protion of the body becomes mome and mare somparted, perfected, and eontensed or abhereviated : with inferior. the same protion becomes more and mure has in its parts or loosely put together, and imperfect in the palts or members themselves, and at the same time the whole is more and more elongited and spacol out or enlargerl.
3. With superior eephalization the pusterior portion of the body becomes more and more compacted, or fimuly jut together and abbreviated : that is, as conecntration goes on enteriorly there is abbeviation posteriorly. Even the tail shows grade: for great length or size or functional importance is actually a mark of inferior grate, other things being equal.
-1 . With superior eephalization there is an upwatel rise in the head extremity of the nervols system: and this reaches its limit in ninn, in which it becomes erect. With infrion. there is the reverse condition, and the limit is seen in the horizontal fish.
i. With inferior eephalization there is not only a less and less concentrated or compacteal and perfiew int state of the whole strueture before and bohimat, but in its lower stages the dermation of the strmeture extends to in absence of essential parts, as tecth, members, senses: and often also to agrose culargement of the bextry beyn the size which the system of life within can properly wield, and in this case the berdy is stupid and slugrish.

(ephalu'nial (ane. ("ephatlenit: in (ir. Kєфaranu(a): the largest of the Ionian islands: one of the momarechies of the kinglom of Grecee: in the Mediterramenn, near the west coast of Grecee. It is about lat. is N. and lom. 30 :30 E. The greatest length is in miles and the ama 30 se miles. The surtace is momatimon-, the climate is pleasant, and the soil is montly thin. The highent summit. rises about 5,000 fert ahove the lewo of the sen. The chicfarticles of export are curmats and olive oil. 'The prancial towns are Argostoli an! hixuri. Thare are many theient mins upon the ishand. This ishad was called semos ly homer. Pop.

 the higheor class of the bollusen, ineluding cuthelishes senids. octopmas. sepmas, Fautilus. and 1 ryomaute (papernautilus). The (lase is "hamoterized by having a distunct head and by posessing a cirele of arms surrounding the month. Thio arms are regarded ns homongras to the pore part of the "foot" of other monlusks. 'The" arme are provider will suckers, the ctlicimer of which is in must eases greatly increasel by numerons fine looks arranged aronul their inargits.
The buty is eovered with a mathe, whith is in the shape of a hat of cons. from the aren motly of which project thas hat and arms. This covering (motains much musculas tisure. It is attacherd to the reat of the honly along the dorsal line. The water can pass firely into the month "avity aromed the collar; but when the mantle contrats. lay a peoblar arrangement it may lit so closely to the neck that the water can not return by the same way, bat is forcilaly expellech thronth a tube called the siphoni. commecting with the mantle cavity. By this means the animat may brow jentul backwat threigh the water. sometimes with grat rapility. By means of these movenents the water is also driven iver the gills which projer into the manthe chamInr. and thus repiration is acemplished. fin some forms. as in the sumide, the mantle may be raised into folds, which comstitute the so-called tims which aid in directing the movements through the water.

The nervons system is highly developed and gratly emtalized. The eyes are very harge and conspimos. and in
many forms are remarkalbly like those of vertelrates, althangh differing from them in vers important preticulars, both in structure and manner of development. The ears, two in number, consist each of a single sace imbeded in the head, coutaining in watery liquid in which is a single otolith.

A cartilagimons skeleton is present which surmonds certain of the nerve centers, supmorts the eyes and ears, and serves for the attachment of muscles. The mouth possesses two jaws very much resembling the beak of a parot.

In some forms an externall shell is developed, e. g. in the natilus; in others a shell more or less rodimentary is imbedted in the mantle. ant is known as the "pen" in the squid and "cuttlebone" in the cuttlefish; while still others, e. . octopi, are devoid of both.

There is present in most forns in ink-sac. which opens by a duet within the anus. It contains is black thuid which the animal discharges into the water, thereby rendering it so clouty that it may escape when attackel by enemies. The contents of the ink-sac of certain forms is the india ink or sepia of commerce.
The eaphalopods are marine and carnivorous in their habits. They are placed in two orders. The first. Tetrobranchinta, are those which have four gills, a chambered shell. and a siphon not closed into a tube. They ilso possess numerous tentacles surronding the mouth. The only living forms are of the gemus Xfuthlus, found in the Pacific and Indim Oceans. Members of this order were very mamerous throughont genlogical times, from the Lower silurian upward. Their shells are characteristic of certain geological formations. The most common are those of the genera Orthoceras, Baculites, Gunictites. Cerutites, and Ammonites.

The second order, Dibranchicta, are those which have two gills in the mantle-chanber, bear eight or ten arms with suckers, and have the siphon formed into a tube. In one group, the Decacera, or Decupota, there are ten ams, two differing materially from the others. This group inclutes the cuttlefishes, the spuids, spirnla, and the fossi] Belemites. The other group, Octopoda inclutes the various forms commonly known as octopi, or devil-fish.

Damid S. Jordan.

## Cephren: See Kephrea.

Ceram', or Zaram': an island of the Malay Archipelago ; the largest of the Molnecas except one. It is hetween Burn and Pipna, about $3^{\circ} \mathrm{S}$. of the equator (see map of East In(lies, ref. 8-I). Its length E . and W . is nearly 200 miles, and its area about $6,950 \mathrm{sq}$. miles. Pop, 200,000. It is partly oceupied by mountains, the highesi point of which, Nust keli, rises about 11.060 teet abore the level of the sea. The vegetation here is inxuriant, and the highlands. are mostly corcred with forests. The elove and nutmeg grow wild in Ceram. which also prodnces the sago-palm in abundanee. The lowlands are peopled by Malays, who are hold sailors. The monntains are inhahited by fierce Alfures. The Wutch claim the sorereignty of this island.

## Ceramics: See Keramics

Cerami'cus [Gr. Kєpaueikós, deriv, of нépquos, earthenware]: name of a reqion at Ithens, jartly without and partly within the walls, ind connected hy the bipylum gate. Inner Ceramicus extended ower the Agora, or market-place. Here pophlar assemblies and the sellate met for losiness, and the district was adorned with porticoes, the Prytaneum, the Thesenm, and othor public lnildings. Outer Ceramiens wats a suburl, where funcrat culogies were made over those who had died in battle and where their ashes were inmed. Inare the Athenimens erected inseribed statuary to celebrate their heroes.

Ceras'tes [Gr. kepáazns, hornod, horned animat, deriv. of népas, horn]: i genus of vemmons serpents, the hormed vipers, of Northem Afrima and India, having at flatened heat, two rows of plates umber the tail. aml keeled but not spinons scales. The nostril is small ant semi-lunar. its name is derived from the horned seale which grows upon the eyelids of the male.

Cerastes. sirveral deadly speries of ('totho of West and South 1 frica hase somewlat similar horns, and are by some ineluded in this cognate genus.

Ce'rates [from Lat. cera'tum, wax-plaster, deriv. of cera, Wix ; cf. Lat. cero'tum, wax $=$ Gr. кךршт $\boldsymbol{v}]$ : unctuous preparations cousisting of oil or lard, which have their consisteney increased by the addition of wax, resin, or spermaeeti, in order to prevent too great a diffusion of the ointment when it is applied to the skin. Cerales are employed to soothe irritation of the skin, or to bring in contact with it some poweriul medicinal subslance, such as cantharides.

C'erati'tes [from Gr. кépas. кépazos. lioru]: a genus of the fossi] cephalopods, of the finuily (eratitide: chavacteristic of the Triassic and Permian rocks. The shel] is coiled in a vertical plane, and is distinguished by laving the lobes of the sutnres serrated. while the intervening curves toward the aperture are simple.

Ceratodon'tidre [from Gr. кépas. -atos. horn + ỏסoús, ódóvos, tooth]: a family of fishes of the order Sirenoidei, supposed, until recently, to be extinct, but lately discovered to be represented by living species in certain Australian rivers. The diseovery of these living forms is one of the most important, if not actually the most important, of modern additions to ichthrology. The body is elongated, and of neary equal height from the head to the post-rentral region. Lut thence tapers backwarl toward the tail; the scales are larre oblong, and ure regnlarly imbricated; they have the surfiees senlptured with several concentric lines of growth, and the margins are rounded, entire, and membranaceons. The anatomical leculiarities are numerous, but can not be here signalized. Previous to the diseovery of the most noteworthy characters of the living Ceratodontille, it had been supposed that the representatives of the family were characteristic of the Secondary epoeh, aud that they had not survived beyond the Triassic period. It was with great istomshment, therefore that the discovery of living species in the fresh waters of Anstralia was halled. The living forms have even been genembly regarded as actually eongencric with the lyiassic species; but this seems io be questionahle and the differences between the dental lamime of the living and extinct sjecies are sufficiently great to warrant gemeric differentiation independent of any hypothetical considerations. For the living forms the name Teocerutodus, proposed hy ('astelnau, may be retained. The only certainly known living species ( $\mathrm{V}^{*}$, fosteri) was first discoverel in 1870 by Mr . Girarl Kreft, curator of the Anstralian Iluseum at Syduev, in a river of Queensland, but hats since been found in other streams. The fish is satiol to frequently leave the water and go on the land at night. It feeds chictly, if not entirely, on regetable matter, such as the leaves, ete., of various plants, It attains allogth sometimes of about 6 feet. The extinet speeies of the family flourisled chicfly during the deprsition of the Jurassic and Triassic formations in Europe and America, and were anong the most abmolant and characteristic of the fishes of those eprehs. Until the disonvery of the living forms they were supposed to have been shark-like animals; thus the finding of the Australian species has not only greatly extended the range in time of an ancient type, but has enablet] us to recognize the athinities of the later, and, in connection with them, of is long series of other extinct forms.

Tifeovore Gill.

## Ceratonia: Sce Carob.

C'ưherus (in Gr. Képßєpos): the triple-headed dog whieh, as the ancient Greeks imatomed. grarded the portal of the infermal regions. Ile was represented as haring a manc and tail composed of serpents: the prets gave him as many heads as they wished. Jle resisted only those who attenuted to come out of Hades. Orphens charmed him with his lyre, and 1 Herenles is said to havr overpoweren him and dragged him ont. The nume Cerlmons was given by Ifevelius to a northern constellation.

Cerea'ria [from Gr. képoos, tail]: the larvill form of varions trematorle worms (Jistomm, Bilhurzin, ete.). The adult worm of Distomn heputicum, the liver-flake, a parasite in the liver of many manmals deposits thomsands of eges in the liver, which find their way through the bile duct into the intestiness and from these pass out, and are finally washet by rains into pools, where they develop into free swimming embryos, which in a short time find their way into the fissues of a suall, himner truncatula. These embryos further develop into a form called Rrdia. The redice give rise to the cercerin, the typical larvar of the worm. The cercoria fimally escape from the smails when the latter make excursions on land. They become encysted on the
grass, and are swallowed with the foxul of eattle or sheep. They develong in the intestines of the hos, and pass to the lives, where the live till they leposit urs, and the cyrle again herems. The fiver-llute is fomm in many animals, inclurfine man. It is injuriuus, und may he fatal to its lonets. See Trbastoda.

Coreis canadoneis. Redhad, or Jndas-tree: a small
 tivatelas an ornamental tree. lit has cordate, pointert leases. and red-purple flowers in minel-like clusters, it thower early in the spring, hefore its leaves are opened. see dedasTRE:

Cerooce'hus [from (ir. кípros, tait + киิßos, monkey]: a genus of horg-tited African monkeys, collectively called

Cercacehus fuliginosus.
"mangaters" by Rulfon. They are remarkable for their Indicruns antics their almost constant grotesione grimning, and their general good temper. The sonty monkey (Cerocebus fuliginesuss) is the best known.
 genns of small, long-tailed African monkeys, the tye of

Cereopithecus cynosurus.
the family Cercopitherithe. The sumedes are very numerons. They have mostly long hair, anf long and layge tails, which they parry over the latek. They are eodlectively called gnenons hy some anthors. One of the best known is the malbrouck' (Cercopithecus cymown res), or dog-tailed nonker.
 dess of agriculture: ef. cerealio, the festival of (er res. the grains]: Bread or grain was once called cerolie menera (ereal gifts, or gifls of (ernes). In modern language cereal as an aljective means pertaining to emlible gram or hreadstuffe, as wheat, rye, maze, and barley; ats a noun it denotes those articles of food.

Cerealian or Cereal Phants: the plants which produce -dible errains, and are cultivateif for secets, whielh are used as brandstuts. They belomg to the meter (iramine ftrue grassen) althemph hick whoat, an momber of the knot-weed fanily, is sometimes clasisd with cereals, but dithers widely in stuchure and eharacters. Having been cultivated from a vary remote matiquity and moditied by cultivation, their oricinal forms and native cometrins can not be asertained. Dillioulty is fonnd in arranging the mumeross varietios in their prome surics. Thw mot important creal grans are

 greater mumber of the homan fanily than any other grain, Fut whent is wherally anmitual to le superior as a material for breal lo all the other cereals. Maize will thrive in regions whied are too warn for wheat. The cereal grains are extensively used in the manufacture of formented and distilled liquors. Revised by L. H. Baley.

Cerebel'lum [Lat., dimin, of ce relorum, hrain: used in dass. Latt. only in sense of -mall inam, hat uned by medieval translators of Aristotle and fralen to render (ir. $\pi$ apeqneфa入ls, himber brain, hence its modern ust ]: the little hation, or the lohe back of min above the mothlla ohlongata. Sce Brans.
('erehro-spinall Fhids : ascous kiquil, of alkaline reaption. containiny a small perventage of saline and animal matters. It tilfs the subarachowidmace between the arachnoid membrame and pia-mater, loth within the skull and the wrtehral camal. It prevento injury from concussions and Shocks, and perhaps presents umbe pressure upon the brain by withdruwing itself into the spinal canal at times when the brain contains more lown than usaal. In cortain diseases it is sucreted in great exeess.

## 

('ereoposis: : semus of Austratian geese, of which there is hut one kmon species. ('. nom hollondio, remarkable for its very shom and thickened hill. Unlike nther geese. it salfom secks the water. It is large and easily domestieated, but is quarrelsome, and when tamed is so tioree that it has mot been generally bred.

C'e'res: the Roman name of the godless of agrienlture. whom the cireeks called bemeter, and to whon men were sumpuscid to be indehted for the gift of breadstufs. She was said to be the daughter of ('romos (Saturn) hy Rhea and the mother of Jroserpine, known also as Cora in the Elemeynian legends. Like the other chitdren of Cronos, she was levonred by her father; but he gave her forth again after taking the cmetie whid Metis had given him, By lier brother Zeus she berame the mother of Persophone (Proserpinc). The most remarkahle part of the myth of Ceres was the abduction of her denghter hy Pluto, and the long search whech Ceres mate for her. P'ersephone, while gathering flowers in Xesia, Anta, was carried to the lower world by pluto the batin lerend pats the rape at lima, Sicily) : the mothor sarehed long for ber, and on disovering her abode left Olympus in anger to dwell among men, diffusing blessings of civilization and plenty where she abote. Fous eventually relogsel the dughter, amd she and her mother went again to dwell on Olympus, and the carth renewed her fertility. But Perscphone, having eaten part of a jomegranate in Hades, was decreed to dwell there lom it thirel part of each yar. These are legends fenoting the cyede of regetable growh. Though the details of thie mory vary considerably,
 embolied in bemetar. hat also disects war attention to Elensis, the principal seat of her worship, on which were $^{2}$
 Hemeter as the source of the prattieal arts which hat thair origin in agrienlture. Her chef festivals ware the Elensinia and the "themanthrit. ller eult amme to Rome through Sicily; her great Latin festival was the Crealia: her temple at lome was made the archives of the state. See Proserplase.
Cores: an ateroid disenemed ly Piazai ut Batemo in Jan.,
 size is nearly equal to that of a star of the serenth magniturle.
Ce'rens [from hat. ce'reus, waxm, derive of ce'ra, wax; in allusion to the colunnar or tiper-like form of one peceis: : a gemus of plates of the fanily C chetueper. It comprises about 200 spercis. *ome of which liase hemutiful thwers. The cicreus sprciosissimus, a native of Mexien, is cultivated in greenhouses. Its Howers are large and of a fine searlet
color, and its fruit, when well ripened, is delicions. The night-blooming cereus (Cereus gramliflorns), a native of South America, bears large. heantiful, and fragrant thowers, which expand and fimle in a few hours. It has been used in medicine as an antispasmodic.

Cevionola. cha-reen-yolăи: an episcopal town of ltaly; in the province of Fogria; $2 t$ miles S. E. of Foggia (see map of Italy, ref. 6-(6). It has a college and several comvents; also manufictures of limen. The spaniarts gained here a slecided vietory over the French in 1503 , and the French commander, the Inake of Nemoms. was killed in that action. I (0] $2.25,400$.

Cer'igo (anc. Cythera; in Gr. Kúdpa): one of the Ionian islands: now constituting, with the neighboring small is]ands, an eparchy of the nomarchy of Argolis and Corinth, in the kingtom of Greece: is in the Mediterranean, and is separated by a narrow strait from the Norea (see map of Greece, ref. 18-k). Area. 110 so . miles. The surface is monntainous ant rocky. The soil is not rich, but produces some wheat, olires, grapes, etc. Here are two remarkable stalactitic caverus. The ancient Cythero was sacred to Vemus, and said to be her fiworite residence. Capital, ('apsali. Pop. 13.250 .

Cerin'thus: the founder of one of the earliest heretical sects in the Christian Chureh: aceording to Irenaus. a contemporary of the Apostle John: flourished, accoring to Eusebins, under the reign of Trajan. 98-117. He was a converted Jew, hom and edneated in Egypt, hat afterward removed to Asir Minor. where he propagated his iteas. II is system is decirledly Gnostic. He tanght that the world was not made by the slipreme God, but by a certain power which Was beparate and distinct from rool, thongh an emanation from lim. He also taught that Jesus was not born of a Virgin, lut was the natural offsuring of Joseph and Mary; that atter his haptism the Christ came down into him in the form of a dove, ant that toward the end the Clmist again flew away from desus. The Gopel of John was once said to have special reference tu Corinthos, but the error never had any foundation.
Crorinm [se named hy Hisinger and Berzelins, who isolaterl it in tso:3, after the recently (180t) discovered asteroid Ceres]: a rare metal which is obtained from cerite. Chem. symbol (ce; atomic: weight !e. It is not employed in the arto and mamutactures, bat its oxalate is a valuable inti"metic medicine in certatin eases. Combined with oxygen, it forms two oxides. It is aliflicult to procure it in a separate or metallie state

Cermusehi, Evruo: economist : b, in Miłan, Italy, 1821 ; fonglat as a revolutionist $1848-49$; in 1850 engraged in banking at Paris. On aceount of the bostility of the communists he left France $1 \mathbf{N}^{2} t-73$, traveling in Fgypt. China, and Japan: visited Fingland in 18.6 and the U. S. in 18:. lle was an alvocite of bimetallism: author of Mécanique de ク'Fohange (1sitis) : Musioms des Sociétés co-opératices (Lisfif) : Disconrs (1Kil): Silur l'imdicated (18\%6): Le Biméfallisme ìquinze ef demi (18x1) ; Anctomip ite la Alomnaie (1886) ; and mumerous other works. 1), at Nentone, May 11, 1896.
('erretosinnifin, charr-rāto-samn-nce tă : a town of Italy; in the proviner of lonevento: on a slope of the Apennines :
 a cathedral with lime paintimgs, at collegiate church, and manufactures ef coarse woulen cloth. 1'ip. $5,4.50$.
 of Jumin athl of the province and disfrict of its name: sitnatad in a blak monntain valley, thase feet above the sea
 14,000. It is built on vory irregular gromme the stretts are narrow and combed, and the houses have no architectural pretensioms. Owing to the greal revation the climate is Varysovere: hail and show aro common in August and siptember, and from October to April there are violent rainstorms. 'Thes lopmation raries ereatly with the season amd with the richl of the silver milmes which gave rise to the town. These extent over al larere tract of momatain land. and are atmong the richast in the world: there are said to lo

 I aring the ninwlemth wentary it feroreased greatly, not hecame the deposits wore exlansterl, bat form latk of labor and proper mining alpliancos. Jhe ('emo de lason mines are still the prineipal sonrec of the Peruvian silver-smply.
the annual output being ahont $1,500,000 \mathrm{oz}$. In 1891118 mines were worked. In 1889 the mines were ceded for a long term to the "P Permvian Corporation," represented by Michat Grace. "Phe Oroya R. R. is to be contimed to Cerro de Pasco. which at present ( $18: 3$ ) has a short local railroad.

Sce A. I. Horges, Jotes on the Topograpley and Geology of the Cerro de Pasco, in Trans. imer:. Inst. of Mining Lhgineers (1888): Paz Soldan, Diccionario geografico-estadistico del I'tru (18ĩ).

Herbert 1I. Smith.
C'er'ro Gor'do: a celebrated battle-field and mountainpass in Mexico. through which the National roud from Vera Cruz to the city of Mexico passes. Here Gen. Scott defeated a greatly superior force of Thexicans moler santa Ama, Apr. 18, 184\%. Following up his snceess at Vera Cruz, Scott's army hat arrived at Plan del Rio, a small plain 50 miles from Vem Cruz, when intelligence reachod hin that the pass of Cerro Gordo had been fortified by Santa Anna. The level gromnd temmates at. Plan del Rio, from which the road Escends in a long circuit among lofty hils, whose commanding points hat been fortified by the enemy. Ifis right rested on a precipice overhanging an impassable ravine. his intrenchments extenting to the road, on which was placed a battery. On the other side the lofty and ditficult height of Cerro Gordo commandet the approaches in all directions. IJalf a mile to the rear of this height the Mexican ammy, numbering upward of 13,000 , with five pieces of artillery, was encamped. Resolving to attempt to turn the enemys left and attack in rear while threatening his front, Scott cmed daily reconnoissances to lie made in the hope of finding a ronte by which to reach the Jalipa road and cut off the retreat of the Mexicans, A road was made throngh ditlicult slopes and over chasms. and was only ahandoned when a further prosecution of the work would have brought on an action, Scott now determined to gain the Jalapa road by assanlting and carrying the height of Cerro Gordo, and on the night of Apr, if issmed his plan of battle, which was successfully executed. Twirgs was re-enfored during the night by Shields's hrigade, consisting of one New Tork and two Inlinois regiments. In selceting their ground for bivonacking and an oppusing height for in battery, a sharp combat took place, but the height was oecmpied and a battery of three 24 pounders blaced thereon. During the night an 8 -inch howitzer was with great difliculty and labor jlaced opposite the enemy's risht battery.

Firly on the 18th the general attack enmmenced. PilJow b brigade twice assaulted the enemy's lime of batteries on the left; but, though unsuccessful, they served to distract their opponents: Twiggs's division, storming the strong and vital point of Cerro Gordo, piered the center. gained command of all the intrenchuents. and cut them off from support: Riley's brigade of infantry pushed on against the main body of the enemy, and, the guns of their own fort being turied on them, they fled in contusion: Shieltsis brigade bravely assaulted the left. carried the rear battery of five guns on the Jalapa road. and rendered important ail] in completing the ront of the enemy. At an enrly part of the agagement Gen. Nhields received a severe lint not fatal wound, heing shot through the lmgs. The moment the fate of the day was decided the leserve fores were pushed on toward Jilaja in adrance of the pursuing columms of Twiggs": division and shields's brigate (the latter now under (ob. F. 1). lbaker), and Gen. Patterson was sent to take command. The ront was complete; 8,000 prisoners wre taken, 4.000 or 5.000 stand of ams, and 43 pieces of artillary. (ien. fortt's loss in the two days whs 431. of whom 63 were killed. 'I'he immediate result of this important battle was the ocenpation of Jalaja the next day.
('rrro fardo de Potosi': a famous momman of Polivia; immenliately S. W. of Potosi. It contains rich silver mines. Iltitude, 16.150 fect. See Potosi.
Perro largu: a northeastern dopariment of [rownat; hetween the lion Negro and the Lagoa Merim, and soparated from Inazi] by the river Jacmarao. Area, 5, Fis sp. miles. Pop. (ts! (0) 25.041. ('apita], Ilele. It eonsists af rotling or hilly grass lands, well suitet for stock-raising, which is the principal intustry. There are consiberable establishments for salting amd diying meat.

Cesena, chăy-zay'mă (Lat. C(pseno) : a town of Italy ; in province of Forli ; on the ralway hetween Bologmand Ancona; 1.5 miles hy rail E. nf Forli (see map of Italy, ref. 4-E). It is situated on the slope of a hill which is close to the river Savio. It has a cathedral: a Capuchin chureh, in which is a dine painting by (ineremo: a library founded in 14 ios and severalmonents. It has sulphur mines in the vicinity. Pop. $34,500$.
 near Turin, laly, duly 29 , 1832: received his education at the Royal Military Acmlemy; was in the war for Italimen independence, and in the Crimean war ; removed to the U. S in 18tio: voluntecrell in the military service of the $\mathrm{L} . \mathrm{S}$ was made colonel of the Fourth legiment of the New York Cavalry, and served with distinction. Alter the war he received the brevet of brigadier-general, and was appointert U. S. consul to Cypurs. During his residence in this island bi Cesmola made excavations resulting in remarkable discoveries of statuary, pottery, jewehry, imp nther oljects of art, which were purchased for the Metmpolitan Musemm of Art in Now Fork, and constitute the Cesnola enllection. In tsi: he returad to Cypus and made other important diseoveries. On his return to New Vork in 187 he was made director of the museum; in 1850 Columbia College conterred on lim the degree of LJ. I. In tsis he published Researches and Discoteries in Cyprus. See C'rphus.

Crespeldes y linrges. Carlas Masuel de: Cuban revolutionist; bo in lhayano, Apr. 18, 181! : stulied law at 11awama amd at baredona, Spain, and in 1843 was banished from Spain for taking part in the conspiracy of (ren. Prim. Returning to Cuba in 184, he practiced law in his native town, and was a leader of those who seeretly endeavored to secure the independence of the island. In 1868 he headed an insurrection near Yara, and was soon joined by several thousimd men, a great part of the bural population whering to him. A congress of fifteen representatives met at Graimaro in Apr., 1869. promulgated a republican constitution, and prockimed Cespedes president. The had alremly issucd a proclamation freeing the slaves. The first snecesses were followed by reverses. Cempetes was driven to the monntains, where he was shot while resisting an attempt to capture him, Mar. 2: $18 \%$.

Ïerbert II. Smiti.
Cespedes, or Razzionere, Parlo, de: b. in Cordoya, Spain, in 1538; enlucated at Alcalá de Henares: stanlied theology and Oriental languages there; went to Rome on leaving the university and studied painting under Federigo Znechero, especially the works of haphael and of Miehael Angelo. Cespetes retmond to Spain, and in 15 Ti was installed in a prebent uf the cathedral at Cordora. He was noted as a poet. painter, architect, and senptor: and exeented the freseoes in S. C'arlo in Corso, in Ara Carli, and Trinitá di Monti. I Latst Supper, at Cordora, is his hest picture; wrote peem on trt of Painting. D. in Corlova, July 26, 1618 . See his Life by 'furino (Madrid, 186\%).

Cpspool: it woll for the reception of the sewage and dramage of a house. Its location should be at some distance from the lonse, mind its walls should be cemented, in order to prevent the rontunination of the soil. In a limestune recion the erselool is often earried down into the rock until fissures are found, and the sewage and water then run away. Usally, however, the cessponl is not deep, and its bottom is cemented, like the sillers, so that its contents must be remoral unce or twice a year. Such a cesspool shouk be rentilated by free communication with the open air, in order that gases mity not be driven hatek to the house. In small towns such methonds of dieprining of the sewage of houses are common, ambl many cossur are on reenrl of the pullution of webls ant cisterns thereby. In cities cessponls ate usually forbidelen ly law, amb ach homseholder is required to connect with the public sewer, (See Seweraek.) In orter to ascertain if air from a cesspool enters a honse a small guantity of the oil of preprermint may be thrown into it, when if such is the case the otor will soon be prereeiven! in the house. Massfield Mpromas.
Cestias, Pyramid of: an antigue loman momment standine close to the lourta San Pioho of Rome; is 12 m fuet high. It is built of brick and lufa, faced with Carara marble. The inkernat walls were deeorated with paintings. This pyramid is suppsed to have been erected before the Christian era.
('estoid Wurms [cestoid is from Lat, restors, ,rirtle (from Gr. кe $\sigma \tau \not \sigma^{\prime}$, grirdle, liter., embioictered, stitched (se. i $\mu d s$ ), leriv.
of кevteiv + suffix -oid, like; in allusion to the ribthon-tike form of many speeies]: the Cestoidea, an orter of parasitic Hatworms (Plathelminthes, q. ce.), the more common or better-known species of which are known as tapeworms. In all the body is elongate and is without month or alimentary canal, and in many forms it is dividel by transkerse eonstrictions into joints or proglottits. On the anterior end are hooks or suckers for fistening the worm to the lining of the intestine of the infested animal. A large proportion of rartebrates are subject to these parasites. The histories of but few, except those that infest man amt the domestic animals, have been worked up. Many of the cestoids which inferst the invertelmates are not jointed, hut in those of man proglotiths are produced by a division of the body. These proglottids are satrecly more than spxual sates, and as they mature they are loosened from the rest, while new joints are constantly forming in front. The separated proghotiols are carried witly the fieces out of the lody, and then diseharge the cggs which they contain. These may be caried about by wiml or water, and falling on grass, ete., be eaten by other animats-e. g. cow or pig. The eggs latel in the stomach ot this new host into al lawe (ciliated in the Bothrindel , the subsequent history of which presents many variations. In many the embryo swells up, into a binller (cysti(creus), in one side of which the head, with its tixing armor, becomes inverted, just as one might pmsh the finger of a glove into the palm. This cysticereus tinds its way into the flesh nf this host, where it may remain for a long time without further alteration. Heat like pork so infested is ealled "mansly." and when eaten the cysticerens or bladder-worm is set free, and, fastening itself by its hooks and sucking disks to the wall of the intestine, grows into the perfect worm. Many fanilies and sexeral hunlrel species are known, hat few are of general interest. Those atfecting man are deseribed in the article Tapeworm (q. i.). J. S. Kingeley.

## Cestracion : See Meterodontide.

Cestlit ses twee, or set'wee [Norm. Fr.., he, that one]: a worl used in law in several phrases: (1) Cestui que trust, he who has the beneficial interest in property the legal title to which is vested in a trustec. (See Trust.) (?) Cestuique use, he who has the right to the profits of lamis or tenements the legal estate in which another holds as feoffee to nses. (See Usk.) (B) ('estui que vie, the person during whose life an estate granted to mother is to continue. F'. Sturges Allex.

Ces'tus [Lat., girdle: see Cestoin Worms]: a givdle or band which women wore round the waist in ancient times. The cestus of Venus was supposed to have the power of exciting love. The gauntlet used hy ancient puggilists to protect their hands was called cestus or caestus.

Ceta'cea, or Cetaceans [mod. deriv. of Lat. cétus $=\mathrm{Gr}$. кintos, whale]: an order of mammals chameterizet by a fishlike form, idapted to strietly aquatic life, and a tail which spreats horizontally. Like other mammals, they have warm bloot, respire ly the lungs and the romg are born alive and nourished by the mother's milk, 'There are two existing sub-orders-the toothless cetacen (Mysticete) and the touthed cetacea (Denticete). The former comprises the Balanide, or right-whale fanily, and the Ralemopteride, or fin-harks: the latter, the Physeteride, ar sperm-whales, the Ziphtide. the Detphinider. or true dolphins, the Inider. ant the Platanisfide. or fresh-water dolphins. Another sul-orter (Zengloulonta) was represented by certain Tertiary forms. See Cacholot, Dolphis, P'hyseti:Ridaf, and Whale.

## ('etewayo: See Zululand

 stome]: a term applied to the fossil tar-bones of whales. These oecur so plentifully in the red erag (Plioeene) of Suffolk, Fnglimd, that being rieb in phosphates, they are ground up for manure.
F. A. L.

Celraria: See Iceland Moss.
('ette (on the ancient Mons Sefins) : a fortificel seaport of France : theprtment of Jéranlt, on the Mediterramean ; on a strip of land between the sea and the broul inlet of Tham, the outlet of the Camal du Midi ; on the railway to Borthenx; 18 miles S. W. of Montpellier (sere map of Franee, ref. : (-i). It has a grood harbm and a considerabla consting and inland trade, lage fisheries, manufactures of mate wines, pertumery, glass, soap, ete., large ship-yurds and saltworks, and the extensive export trade of the Canal du Midi, of which it is the port, and with which it is eomected by the cimal of Cette across the tongne of land. The harbor is protected by two large noles and a breakwater. The city

Was founder in ififf. It forms a half cirele about the clitfJike hill, on which is the fortres. Pop. (1896) 52.t?
 pality of Montencerro: i! miles Fo, of the Iustrians town of
 gary, ref. 11-(i). It contains at concent which was fombled In ithos and is the residenere of the hishop, the state prison, and the palnee of the prince. l'op), extimated at 1 , $\mathbf{s m}$.
Ce'tus [Lat., whate, from (ir. киิтos]: a arcolt consteflation: one of thowe calleqd somthern lyy l'tolengy. It contains the variable star Mira, or o Citi.

Cen'fa (Sp. pron, thay oottara) : a fortified somport-town (ance colled Siptue or Sightum; Morrish sibla) on the morth toant of Africa; on the Mediterrancan oppesite to (iihaltar: whieh is $1:$ miles distant (see map of Africa, ref. 1-13). It is in Norocere hat it has belomed to Simin since hive. The castle ocenpies the summit of a monntain which is the aneient boyle and che of the l'illars of Hereules. Centa is the chitef of the spmish mesidion on the African cmat. It is the seat of a lionam Catholic hishop, and has several convents and a convict cetahbishment. It oecrupien the site of the old lioman wolony $1 / \mathrm{l}$ Septen Fratres. It was strongly fortified be Justinitu, but was taken lye thethis in fils. Therongh Ceblat 'ount Inlian bronght the saracens into $S$ pain in the eighth e:entury. Under Aratic rule the wown was noted for it manufacturing infustry ; it is sid to have had the list paremill crea constructed and oprated in the West. It wis centumerd from the Moms in 1415 by King John I. of Portugal. Pop. 9.iot.

## Cevallos, Peino de: Sce Zebalos,

Cévellops, suyven (anc. Cebemat Monss) : a mountainrange in the somilh of France ; forms the watershed betwern the fhone and the Garome. It extends From the vicinity of (arcasonnte in a N. S. E. direction to the (final din Centre. The contral mass of the covennes is in the departmonts of Ardeche. Luzere, and Hante-Loire. The highest summit is Alont Mezin or Nexen, whieh has an altitute of $5, i 64$ feet. Some of the praks are extinct volemmes. These mountains were a strongholf of the Protestants called C'mmisards, and were the seme of several raligions wars. See le. L . Stevensun, Trevels in the Cévennes (18isi).

Ceylon. sec-lon' (native Singhala or Semhala: ane. Thaprobent): an island if Asis, belonging to tho Britivh: in the Inclian Ocean : about in miles from the somthern extromity of llimlustan, from which it is separated by Palk strait. It

 ern and pastern consts are bokl and rocky, and present it very pheturesque apmance, which is increised by the luxnriant tropical vegetation, the verdant slopes of its mountains, and groves of noble palms draped in peremial erreen. The surface is finely diversifed by montains, valleys, atul plains. The highest summit is Pedrotallagallit, whel rises sed6 feet alowe the level af the sea. The celchrated mountain ealleal Whm's Jeak is $\mathbf{i} .120$ fert high, ant is remarkable for its conichl form and the sacred thsociations with which it is comectect. The sinerhatese have at tradition that Buldha ascended to haven from this pata. The monntains of Ceflon are mostly formerl of pheiss and granito. and dotomite orecurs in the more bevel parts of the iskni. Among the minerals are irom, tin, coal, plumbage, and salt. Many sapphimes. rubies andethysts and of ber precions stones are found lure. The climate is humid and hot, hut more pleasiont amb moderate than the adjacent mainland of

Ceybon is rematrable for the laxuriance amb varioty of it a liral. Ameng its indigenoms trees are the coroa-palan. palmyrat and other sprese of palms, the eral-tree (SuryHerinit indicu), the leremflait, the cimmanon, the satinwood, and chony. The botren or pipal (Ficus retigiesta) attains a great age, and is chemed saterel by the natives. Finfee, coiton, rice, tobacen, ant pepper are cullisated heras. The chicf articles of export are collice cimmano comants cocomat oil, conr, hides. pearls, and plumbago. Amoner the wild anmals fomd here are the buthlo, bear, deer, hopard, and elephant. The hast are very numeroms.
The mative popmation is composid most ly of sinchalese. whese historieal records, exteming latek hrongh many centuries, are partially corbohorated by existing ruins of cities and temples, which indionte that Ceylon in a remote antiquity was inhabited by a mumerous and civiliza! prople.

The most eclebrated among its monuments is the eave-ternple of Jambula, which was built about 100 R.C., and is profusely adomed with images and selulpture. It was dedieatem to Butdha. Buddhism is stil! the prevailine religion of the island. The principal religious rreeds numbered, in ectisus
 hammedans, and 302,125 Christians. The native "hristians are mostly singhalese and Tamils. A mones the rematkable antiquities of Certon are numerous colossal ruined tanks. constructed for the irrigution of the soil.
C'eylon has three harbors-l'oint de Cialle on the sonth consi. Trineomalee on the northoast comet, and Colombon the sumthwest cobst. The hartor of Trincomale is one of the finest in the worth, and is capable ol admitting a mumber of the largest ships. It is the principal britioh mavalstation in the Thulian seas. The Griental mail-stamers. which fly between England and taleulta, tomels at this islamf, which has an extensise (e)mmerce. 'The value of the

 ancient times it was visited for the purpme of talfic ly the Eqyptians, Greeks, and Romaths. The value of coflee exported in $18 \%$ ? was \$15, 000.35 , hat in $1 \times 00$ it was only
 in value from sifoo in 1887 to $\$ 10.510,015$ in 1840 . Ceylon is divided into seven aministrative provincos, callede the Westem, North Central, Central, Buthern, Xorthern, Nowhwestern, and Eastern prosinces. ('apital. (oblombu). Kamdy,
 are also inportant cities. Ceylon had 1 sid miles of railway aud 33 miles of telegraph in isso.

Mistory.-The aborigines, on Yakhos, were conquered by Singhates: 54 B. C.: Mabars condured ('eylem abonit A. D. 1201, but the singhales partly recovered it in 1235. Thas Portuguce came in 1505; were driven out hy the Ibutcly 1fite and these hy the British in 17n⿻. Ceyon was anmed to the British erown in 180, and the whole dand was compuerid 1sin. It is one of the most prosperons of British colonies.

Populution (1891) 3,004.466; of these the native mibes mumber 20031.16: ; they are singlatese emigrants from Himlutan j43 B. ©o, and Linddhists; Kandyans, or Migh handers, and Matabats, both Brahmans: Moomene orginaly Prusians or Mabs, Mohammethms F Vedhars of out masts. of the lowest scale, without religion. The remainder are Enrasians or burghers, Romanists or Protestants, and Eurogeams, mosily Protestants. See Sir James E. Temumt, Ceylon. Chadwick. James Read, A. M., II. D. : gynecologist; A. B., Inarvard, 1865: M. 1.. Harvard Medical School, 1871 ; Clinical Instructor in Gynacology in Harvard Medical School 18i8-88; secretary American Gynxeological Society 1875-82: became Iibrarian Soston Medical Library Association, 1875: president Massachusetts Cremation Society 1892.

Chadwick, Jons White. A. M.: Unitarian minister of the radical school; b. in Marblehear, Mass., Oct. 19, 1840 ; educated at Exeter Academy and 1Iaryard University; graduated at the Divinity shool 1864; ordaned Dec. 21 , 1864, and at the same time installed as pastor of the Second Unitarian church in Brooklyn, N. Y.. in which position he still (1843) remains. He has taken an active part in all denominational disenssions, and has been a diligent contributor to periotical literature and to the daily press. mainly on liographical lines. Author of Wray. Truth, and Life; The Bible of To-duy; The Fuith of Rereson: The Man Jesus: Some Aspects of Religion: Brtief and Life: Origin and Ifestiny: A Iharing Faith: F'uth on the Eurth: The Revelation of Ciod und other sicrmons: The lourer of an Endless Life; A Book of Poems, the 8th ed. of the latter inchuding In Jazareth Toun and other Poems first published as a separate volnme; and A Legend of Good l'oets, delivered belore the Phi Beta Kappa society of Harrard in 1886. A select volume of his sermons has been translated into German as Religion olne Dogma. He has contributed largely to the present edition of Joluson's C'mixersal Cyclopuedice.
C. H. Therber.

Charc'mon: Greek tragic poet who flomished at Athens about $380 \mathrm{~B} . \mathrm{r}_{\mathrm{c}}$. He belonged to the group whose pieces were better suited for reading than for acting. Besides tragedies, Chwremon enmposel a dramatic medley of meters ealled Centourus. Fragments in Nanck's Fragmenta Tragicorum Grecortm, pp.

Charémon of Alexamdria: a Stoic philosopher and historian of the first century, who went from Alexandria to Rome in order to take charge of the education of Nero. He wrote a work on hieroylyphics and one on the history and religion of Egypt. The fragments, not without interest, are collected in Dinller's Fragmenta Mistoricorm Grucorum, iii., Pए. 4!5-409.

Charone'a (in Gr. Xatpóvesa) : an ancient town of Buotia; 5 miles N. of leladea; the native place of Phatareh. Here Philip of Macedon gained an important victory over the Ithenians and Thebans in 338 B. r., and sulta defeated the army of Mithridates in 86 в. c. The site is occupied by the molern village of hupurna. A few years ago a colossal lion was excavated from the mound which was raised in honor of the Thebans who were killed in hattle here in 338 B. c. This lion is described hy Col. Mure as a " noble piece of sempture, and the most interesting sepulchral monument in Greece."

C'hatodon'tidae [derir, of chuetodon, from Gr. xaíq , hair + ódoús, oisbvios, tooth]: at family of the spiny-rayed marine fishes, with very slender toulhbrush-like teeth and the fins closely covered with seales. Most of thespocies are brilliantly colorell. and they abound especially about eoral-reefs. They ars excellent ford-fishes. "IThe chief genus is Chatodom. Thery atmund in the West Imilies, racely raching the masts of the U.S. or of Emrope. Damid S. Jordan.

 grouj of small marine woms, so manel from the slender, Claw-like jrocesses on either side of the month which serve atows. They are known atow woms on aceomt of their clongate baly, whell bears on cacla side a tin-like structure surgestive of the vane of ann arrow. The boxy turminates in a dattened tail. The Chu lognulho are transparent, ramely exceed an inch in longeth, have a simple, straight alimontary canal. and are hemaphrodites. Fyes are presem on the heme, and numerons hairs, which serve at organs of tomeh, am seathered over the bodly: The group is wifely disuributed, and its two gerera, Sugithe amb spet delta, are divided into at considerable number of spectes. While the Chetognatha resemble the Nematode worms and the (ligochetw in many points of structure, their develop)mont is peculiar, and they are usually considenet as forming a separate elass of the sub-kinglom Vermes, of Wincus

F"A. Lects.
 an order of Ammils (jointerd worms) most of which are (dhataterizel by the pasession of ragutarly armaged hristhes upon every segment of the boly. In some, the the earthworms, these bristles are misuported, hat in othem they are surrombed by a tleshy outgrowth (paraporimin) on cither side of eacin segment. In the Archicmenelidet (a gronj of small forms by some regarted bse byimitive, by others as slegenerate) the brist les are ahent. The 'hettopoder are diviled into (1) Trchiannelider: (2) Iotyeheter (erntaining forms with many bristles in earh sugment, and in turn divideal into Errantice, or forms which live free lives, and Tubicola, or thome which builid tulnes) : (3) Oligochete

Chaflineln [rhaff + fineh. i. e. as specits of finch which sumbles for its food in the chatf: cof. Late latt furfurio, deriv, of forfur, ham]: at common fomporm, Lisatic, and Africin man-hird; the Pringithe calebs, whiel devoms not only seeds, but young fants, yot is wey valuable ats a destroyer of noximu insects. it is esteened for the lathle in sunibern Europe, and in (iermany is prized for it: Joud song, in whids sme binds greatly excel. Chain, or thator's 'hain: in surveying, a meanare 22 yards long. compusiol of lum iron or sted links atach of which is rate inches lons. 'I'en sgname chains makn an acre $=1,810$ squato yards. Tho elain now most eommonly uset by surverurs is 100 feet long, tho moder wom hatsing 100 links, while the more preeise mes are merely thin hambs of steel with the distances marked unn them. Sie survisian.
('Maimed Biblo: See Bable, Modem Versions.
Chaill ('ahle: Sce Cable.
('latin-mail: a fatric of small motal rings or links, interlinked together so that four or more liuks fass througls each separate link and form a flexible material of which garments can be made. Armor made of chain-mat was rare in antiquity lut common in the गidnle Ages
('hains and (ham-making: I chain consists of a series of links, nsually fllintical, neersionally oval or circular, and in a fow instances of rectangular or other forms, each interlocked with its adjaeent neightors in such manner as to form at continnons strong and flexible metal line, capable of sustaining heary loals whice "rendering" aroumb a barrel or a whed, or wapled athout any compenient thifect as a suprort. 'The chain is of mbnown antiguity: It is especially familiar in literatnre of maly date as a form of cable by which the anchors of ships were mon safely hell. It is commonly mate ol iron; lat chains of base of hronze. qud and silver, and varions other allogs and metals are often beed as ornaments, and for some special purposes for which iron would be mantable as heing too casily corroled and injured in appearater or in strength. Chains should be made of metal having ductility combined with strength and clasticity in the highest possible degree. In facd hrittleness is an irvemedialle befod a as all chains are ot times sulyject to such sudden stresore, and such heavy surges of thair deads. as could not salemy be withatomb if they wre not elastie amb luctile and capable of taking up a comsidtrable amount of energy of impact. Grom intended for surh use mast have hot only exeellent quality, as reapoets strengeth and ductilaty, but must also be capable of welding pasily and strongle: Sperial glates are therefore velectef for this purpace, ind are often distinetively known as chain-irms.
lleary chains, as lhose for ship's cables, are usually made with a cross-lar, or "siad," sel het ween the two sides fo hold them aparl, ami to prevent the siles elosing in when suhjerted to great stress. sud are called stmd-links. The
 dimmeter of the har hoing taken as mity: the stud-link being longest to give space for the intraluction of the stud. Their wilths rary, similarly, hetween :3. 4, and in diameters of the bar.

The strongth of the metal varies with its size, being much grreater in the sumalest than in the langes sizes of har. 'I'lus goml cable-iron in rots of 1 inch diameter, as fommi in the market, should hase a tenamity of ahout to, (0) 11. jer square inclo, while lams of 2 inches dimmeter yid at about 50,000 , and similar iron, in slaftine of 4 in 6
 hand, in smatler sizes, as drawn into wire, such iron rises in temacity to 100,000, and even to $180,000 \mathrm{llo}$. jeer square moh. (he Materinhs of Engineering, hy the writer, vol. ii., arts. 230, di:3.) The best thain-iren is of rather soft, quality, free especially from shlphar and phoshorus, and with just enouglh silicon to give good whding properties.
'The proes of manufacture consists in (1) cutting off the right length of har for a link: (?) leating the lofly of the pioce to a forging temperature, amd benting it to shap with the aid of a goox former and pattern, letwing. howerer, the fads of the piece separated sufficiently to promit the later manipubation of whiling: (3) loating these ends and forminge the surfaces for welling: (d) welling the link amd giving it its fimal shape: (5) bringing it togange and smothly finishing the surfaces, at the sambe lime if the sthd is nised, introducing it and closing down tho link firmaty uron it. The welding process is preceded by the introlusion of the aljacent link of the chain. Somethmes quantitios of links are mate independentr, and the intemetiato links are afterward wade and introluced betwen pairs of suth. th constitute the "entinnons dsian.

Clain-makiner machines, of whieh there are many known forms, commonly follow sulstamially the sume programme of work: first heating and cutting ofl the piewe of tar of the length repuired for the link, the cuts being mate at the right angles to give the hevel required for thes sat of the weld, next heating mul bending around the former or mandril to give them appoximately the form of the finished link: the next limk is then ind rolueed and the new link wedted, at the some time introntuedig the stut, if one is used. Fach operation is performefl by the manhine and in part antomatically: The hammer in such machimes is nest ally cither operated by stem-preseme or is a moditied
hydranlic press, ant the action is that of a single pressure rather than a surpesion of hows. In addition to the standard forms of chains and cables the chain-making machines produce a great variety of forms of chain, some of which are given their peculiar shapes as a matter of economy and convenience in manufacture, others as being ornamental, esuecially when the precions metals are employed.
The link, to be satisfactory, shonld have mot less than about 160 per cent. of the strength of the original bard, but it can not he expected to posess mare thim about 170 per cent. The average for good work is fount by experience to be not far from l6io. lroving strusses, as adopted by the U. S. Nary Department, range from $34,000 \mathrm{lb}$. on a 1 -inch chain fo $71,\left(460\right.$ on $1 \frac{1}{2}$-inch and $12 \mathrm{t}, 000$ on the 2 -inch eable. These differences of quality between the bar and the link are due to the process of heating and working, which eliminates some of the hardening elcments, reatuing strength to some extent, while increasing ductility, and to the imperfection of wehls, it heing impossible to secure absolute eertainty and thoroughness of union.
I. II. Tilurston.

Chain-shot: a name of missiles formerly used in naval warfare, consisting of two balls, or half balls, which were connecterl by a clatin about 8 inches long, and were discharged from a camon.

Chilatenan'go: a city in the northerm part of Salvarlor; capital of a department of the same name : beatitully situated at the font of high mountains. It has an active trade, especially in cattle and indigo, and there are regular marketfails. Fop. of the town abont s,000; of the dopartment 55,000 .

Chalcedon, kăl-spedon (in (Gr. Xaлкnסف́v): an zncient Greek city of Bithyna; on the Bosphorus. Oplosite to Byzantimm, from which it was about $I_{2}$ miles clistant. On all the coins of Clatecton the name is written Kadx $\eta \delta \dot{\sigma} \boldsymbol{\omega}$. It was founded 65.5 в. c., and became a large lown, containing numerous temples. The Romans obtained possession of it in it B. C., and under the Roman empire it was a free eity. The philusopher Xenocrates was bom here abont 306 B. с. In $451 \mathrm{~A} . \mathrm{D}$. a general conncil of the Chureh was held at Chalcetion. on the subject of the doctrinal dispotes of the Nestorians and Monophysites. This, the fourth ucumenical council, condemmed the heresy of Eutyches.

Chalcedony, kăl-sen'ō-ni [from Lat, chalcedonius, from Gr. Xa入knסov: so called becanse found near the ancient Chalcedon (Халк $\boldsymbol{\eta} \delta \dot{\omega} \nu$ ), on the Bosphorus]: a mame given to the erspto-erystalline varieties of yuartz or silica, and comprising those from the translucent to semi-transparent kinds, manty of which are heautiful ornamental stones. The opaque rarieties are called Jasper (q.e.). Chabcetony is found in trap and other rocks in many regions, and in the gravels, ete., derived from their necomposition. It presents a variety of colors-white, gray, bluish, often red or brown, rarely yellow or green, imbl is frequently rariegated or banded. The tonghness ind fine grain of all the varieties of chalcolony have made them the farorite material for gem-engrapers from the earliest time to the present. Among the principal varieties that have distinct names are the follow-1ng-(I) those of unifurm color:

Comeliun, or corneliun (the latter form a derir. of Lat. cornu, horn, the former a modif. tue to false comection with Lat. ctmens, flesh-like), ineludes fine semi-transparent varieties, usually light or dark red, also white, and sometimes yellow, the latter oceasionally cabled Ceragute. Most of the red carnelian of commeree is chalcedony artificially stained by boiling in nitric arin and then subjecting to great heat. Furmerly large natural pieces ware highly pized, especially the bright clear reen. Fine specomens are found in 1/inchastan, ant are wrought into ornamental irticles. Among the ancients it was also much useri. (Chrysoprase (from Gir. रpuods, grolal + $\pi \rho \dot{\sigma} \sigma o v$, al leck, in allusion to its peculiar tint) is a green chale didny, zare and hithly valued as an ornamental gem. It is hirgely imitatel in modern jewelry ly staining chalcedony with salts of the protoxite of nickel. Choice specinens of chrysoprase have a fine apple-green tint. The color is liahbe in fade by leng exposure to light, lut dampness favors its relention, and chrysoprase is frequently kipht in moist cotton. It is found in Lover Silesia, California, and Oregon, anel tine examples line the walls of a chapel in the Clureh of St. Wenzel. at Prarue. The stone called clirysoprasus by the Greeks and Romans is not certainly ilentitied hy modern authorities. Itasma (from (ir. $\pi \lambda \dot{\sigma} \mu \mathrm{a}$, an image) is a deeper green variety, ruych used by
the ancients and frequent in collections of antiques, hat not much esteemed at present. Sard (from Lat. surda, Gr. бápotov, stone. from Sartlis in Ludlia) is a rich deep-real variety, darker than carnelian and less semi-tramsparent, but of a fine blood-red color by transmitter light. Nearly all modern sard is artificially stained chaleedony, and rainges from cherry red to chocolate brown, erroneonsly called sardonyx by many jewelers (see below, under Agute).
(2) Bänled and striped varieties. Agute ( Gr : ả $\chi$ á $\eta$, sail to be named from the river Achates, in Sicily, where the stone was anciently found) is a name used for chalcedonies that are veined, layered, or variegated, presenting different colors or shates. This structure is due to their formation in successive layers on the walls of carities. usually in trappean or volcanic rocks. Agate proper is clouded or has many fine layers, parallel. concentric. or angular: those with fewer and thicker layers are called onyx ant sardonyx (see below), and are used particularly for cameo work. Agates oceur in nearly all comutries, though the greater part of those now used are bronght from Uruguay and Brizil, and are taken to Oberstein zud ldar. in riermany, to be cut and polished for articles of ornament. This industry, originally bronght from Italy, has been an important one at these points for over three centuries, and now employs some 15,000 people. Great skill is shown in this work, and also in artificialiy coloring the stones. It is possible now to stain gray or bhuish chaleedony uny color, and restain it into onyxes of any color, a result only possible in ancient times throngh natural processes. The ancients used to cover sard, carnelian, or other stones with soda, and then on calcining a layer of white was formed by the alteration of surtice. Agates in all ages, owing to their beaty and variety, have been a favorite material for seals. rings. pins, etc.. and for costly vases. coupes, and ornaments, as well as mortars for chemists. Agutized uood is a natural replacement of wood by agate or chalcelony deposited by silicens waters, whereby the ligneons matter is removed, but the form amit structure retained. It is in beautitnl material, frequent in the "petrified forests" of Colorado and of States of the American Union lying W. and S. of Colorado. The finest in the world oecurs at Chalcedony Park, in Apache co., Arizona. Fortificationagrete is al ierm applied to those agates in which the colored lines ron in several directions and make sharp angles in their course, like the refloults and hastions of a fort. Mossagate, moss-carnelian, or Hocha-stone (from Mocha, in Arabia, whence it is often olitaine(i), is a striking rariety in which a white or light chalcedony contains dark. trec-like, or moss-like markings, sometimes almost resembling landscapes. These are due not to any vegetable growth, ats often supposed, but to an infiltration of oxide of iron or of manganese, which has crystallized in these minute "dendritic " or tree-like forms, is frost does upon window-panes. Fine Mocha-stones come from India and Arabia, and they abound in some parts of W yoming. Onyx (from (ir. ơvog, a fingernail, a veined gem) consists of parallel layers of differentcolored chatedony, generally some shade of red or brown alternating with white. 11 one or more of the layers are of a brown red or pink the stone is called sardony.r. These varicties were highly prized by the ancients, and were much valued for ornamental work when cameos were in vogue. In modern times they are artificially colored to heighten the contrast of the layers, and all the black and white onyx is of this kind. The stone is boiled in hood, sugar, molasses, elc., and some of the layers alisorb the organic matter, while others do not. By immersion in sulplaric acid the organic matter is then curbonized, and remains as a black coloringsubstance in the absorbent layers. Of late an entirely hack chateedony, thus stained and called black myx, hals almost displaced the use of jet in jewelry. Chalcodonyx is a name sometimes given to onyx or sudteny in which one or more of the layers are transparent fuaitz or chaleedony. The term onyx belongs only to these varicties of banded chaladony, thonglt it is often wrongly applied to other striped minerals, esprecially in the mame " Mexican onyx," which denotes an cutirely different stone-a form of aragonite (carbmate of lime). see Mexicas Oxyx. When the lower layer is Whek and the uprer white, if the white is ground very thin it gives a gray apmatace to the onyx. which is then ealled Nicolo.

Chambers. in law. A jurge is sail to act at "chambers" when a legal proceeding is curried on belore him out of court. either at his oflice or lesidence or other convenient place, incluting the comt-roon itself. Business done before a julge at chambers, as distinguished from that transneter? in cont, is incrasing in modern times. The codes of procerture in some of the Amerionn States expressly proride that eertain acts shall be done by the court. and others by a judge, referring in the last instance to an act done at chambers. Through the same mediun a groat change has been worked in England in the practice of the connt of chancery. Formerly the details of business in that court were transucted by in officer termed " mastor in chancery," who exercised sul almost independent jurisatiction, acting without commanicating with the judge until he male report of his conelusions, which was then subuitted to the court as a basis for its decree. By the 16 Vict.. ch. 80 , the office of master was abolished, anil the bnsiness formerly committed to him was directerl to he transacted under the direction and control of the jusue, or, in other worls, at chambers. ['nder this system each of the judges has under his control chief clerks and junior clerks, who act in his behalf in taking accounts and making inguiries, and who are more directly responsible in him than were the masters under the earlier pratice. Unater the law of 1873 (which went into effect Sor. $2,18,4$ ) for the renrganization of the English courts ( 36 and 37 Vict., ch. 66), the dutirs of chamher clorks are to be performed by othcers of the court in the permanont civil service of the coown. The same law also provirles for otlicial and special referees, who may, unler the direction of a eourt or jurlge, perform acts similar to those formerly intrusted to masters in chancery.

Chambre intronvalle, shañbrant troovablol: a sarcastic name given 10 the French Clamber of 1)enuties which was elected after the second restoration of Louis XVIII. in July. 1815. The majority of it were fanatical royalists, were hinstile to the ministry, and supported an extremely reactionary police. They showe no inclination to repress the untrages comintel in the south of France by mals of royalists and fanatics, who massacred many l'rotestants and liberals. This chamber was dissolved in 1816 .
 ralist ; b, at the chattean of Bonewurt, in Champagne. France, Jan. 2T, 1ist. He removed with his barents 10 Berlin in 1 sion; learned the German languase (in which all his works are written): served for some yeurs in the Prussian army. In the capacity of naturalist he accompanied an exploring experition which sailed from Russia in 1s14. and circumnavigrated the globe. He wrote several works on natural history. but his reputation rests chiefly on his lyrical poems and ballads, which ate bery pupular, and on the highly original tate of I'rter sidemihi (1814), translated by William Howitt (1843). D), in Berlin. Anr. ?1, 1438. See J. E. Hitzig, Leben uni Bripfe ron 1. itm ('hrmisso (? rols., 1839); also F. Fulda, ('hrmixso und seine Zeit (1-pipzig. 1ss1); E. Du Bois haymond. A. r. C' uls Naturforseher (Leipzig, 18s!).

Chamois (in Ger. (remse): a goat-like antelope (Rupicepre fregus) of the mamtains of (entral and Southern Europe and Western Asia; found especially in the Alps. It is about the size of a large goat, and is remarkable for its great speed,

Chamois.
fur its ability to leap enomons chatms, amp for its delicate Phwer of semt. It is highly prizel as food, and chamoishuntige is a fasorite thongh prilous ammement in switzerland and the Tyrol. Ins sumber lamets ate in the high Ans, mar the show-lin. It. - kin furnishes true chanois leather. hut the artiol. en merally sold under that name is mate of sloepskin. The chamos is errexarions, ants in the
 than a humirel may be sech ; but in the swiss Atps their muntre has been misely meluced.

('hamonni, shat momine Valley of: in the French tlepartment of 11 ante-sawne: at womerful valley in the - 1 p:

 the N. F., from Martigny, by the (on de Thte Noire and at the other end by dilisence from (ienesa, is miles distant, thromerh the rathy of the dree It is inclosed ly Mont Blane and the Signilles Romge and Nont Breven. The glaciars Dler fe diate amb Argentiere are the most remark-
able in Switzerland. This heantiful valc. now visited by innumerable travelers each summer, was scarcely known intil it was explored and described ly the Jingtishmen Pococke and II ynulham in 1it0. Nany peculiar plants grow in the valley, and lurnish a remarkally rich-flavored honey. In 104 a Bencdictine monastery was established at the village of Chamonix or Prieuré. In early times this region was known as Les Montagnes Mundites-il mane still retained for the roughest part hetween the Dome of Dont Blane and theNer de Glace.

Champarine: a former province in the N. E. part of Frame: : bounded E. by Lormine, s. by Burgundy. It is drained by the Marne Seine, Aube, and other rivers and is now mistly eomprised in the departments of Marme. Aube, Ardemes, Hante-Marne, and Yonne. The surface is diversified with plains and hills, on which latter is grown the limous (hampagae Wine ( $q$. $c$ ). In the twelfthe century Chanpagne was independent or governed by native princes. Thibaul, Count of Champagne ani King of Navarre, who died in 125:3, was the most powerinl fendatory of the Frenela king. By the marriage of Philip 15, of France with Joama, the heires- of the King of Navarre, Champagne was annexed to France about 1255.

Chalupagie. Philippe, de: b. in Brassels. 1602: d. 16it; painter of religious subjects and landseapes, in the formal manner of the time, with a distinct emulation of the style of the Renaissance and of N. Ponssin. He was painter to the queen, worked also for Richelicu. was professor and rector of the French Academy. His work is timid and cold, but he was a ready and fertile designer.
Champagne Wine: a name applied to wines of varions kinds. white or red. still or sparkling, which are prodnced in Champagne. Of these the sparkling and foaming varieties (rin moussen. and demi-mousseux) are best known. Afterthe vintage-season this wine stands till December. is then racked oft, and finet or purged with ininglass ; in the following Marel it is hottled aml corked with care the bottles being blaced with the corks downward, so that the sediment may be drawn off. When this hat been removed, some hrandy and sitgils are introluced. and the hottles are recorked. While this process is going on the breakare of botles is often very great, and huyers estimate the value of the wines bartly by the breakage-the best wines breaking the mont bottles.
Evin in France, hut still more in other comatries, a very large part of the so-called champagne wine is factitions, being matle of cider, light lihenish and other eheap wines, and othol subatances. Maplily, in most cases these preparatime are quite as harmiess, and often fuite as jalatable, as the senuine probluct of the Clampagne sincyards; for some of the imitations are nearly perlict representatives of the"ppearance, taste, and boughet of the originad article.

Champagne wine is prized in medieine as a restorative in. rertain low conditims, esperially when the stomach is very irritable ani will hardy tolerate any other stimulant, the carlomic adil present acting as a sembitive to that organ.
 de, Duke of Cadore: h. at liname, Ang. 4, 17.50 ; d. in Paris. July :3, 18:'4. Elucated in the Nihtary Academy of Paris: culded the navy in fiso: was present in five batiles. Elected a member of the Slates-General, the National A:sembly. and the Constitnent Asembly, he diff goorl work whenerer the nary was concernet? In 1 ati he was imprisoned and not released until the owerthrow of Robespherre. Xibuleom was mer to sedure his sersices, and sent him in 1 sol as ambasador to Viema. In 1804 he was MinisWer of the Thterior, and in 180z Minister of Foregon Affirs, which latter pusition be resigned in 1811. After the restoration of the Bourbons he livel in retirement.
Champaign: city of Champaigh en, Ill. (for Incation of

 Chieago and sis mites N. R. if springfieh. It is favorably: situated in the midst of a fertile agricultmat risurict: has an excellent wstem of water-works, pased and tree-lined Areats; is lighted ly elee ricity and gats. An electrie strent railway threals the city and eommets it wih Urhana, the count $y$-sent. 'I'lo' ['niversity of llimois is locatert here. The(ity is well supplied with line pubtic and private schoolDuildings and clurches, and contains momerous mamfactories, clicf tumong which are lemp. binder-twinc. and mer-ehant-twines. and make a bulal faint. two of the corps to immediately return and join Hookir: in the meanwhile the remaining four (o)rps were to closs above Fredericksburg.
"This pan was suceresofully execatert. The First Corgs
 conimathel of Scderwiek, were moved mo the esth to the position assigned them, and on the g!th one division of the Sixth crosem the river abont in miles helow frederickshurg. and drove in the pickets, a division of the Finst cromanir about ? milas lower down, the other divisions with the
 Lees army, whose colimms were soon seen coming ul from Port lanyil. Wh the ath sickles silently withorew his eorps amd procomed to join IJoker. In the meanwhile the crossing of the Rappathanmerf alowe hat heengoing on; the Fleventh Comp erosied first (esth), followed by the Twelfth. then the Fifth (2!th): this colnmm moved along. crossed the Rapidan at (remmamadmel lelys ford: both columms then adrancing loward chanoellowsille, at the junction of the fordonsiblle turnpike with the Culperer and Orange C. II. plank road, liy the evening of the 30 th the second Corps (two divisions) had (r)ossed and were massed at the samb point. amb (ren. Ilookre had arrived and taken up his heatquarters at C'hancollowsille. lee, though thos far ontreneraled, appors to have been molismayed, and, quickly realizing dhe movement helow to le a feint, concentrated his army in front of llonker, leaving hot a small force in his works on the frederioksburg le lights.

Reconmoissances having been made by Hooker on Friday morning (May t) townrd Fredericksharg without opposition. an alrance of the Filth and Twelfth Corps was ordered to low made on two roads leading toward Fredericksburg, which was som 1 urd hy the Confederates: a favorable position ladd been secured. howner, when orlers were reeeised foom (ien. Jlonker to fill batck to the inferios one of the night before. The rimht of llooker"s amy was held by Jloward (Fleventh ('orgs), then a division of sickles ("lhird ('ongs). who had now arrived from below, then Slocum (Twelth (orps). ('onch (Seeond Corps), with Meade (Fifth ('orps) on the left. The other divisions were held in reserve.

Early in the mornits of the $2 d$ a movement of Conferlerates was olserved along sickless front and in lirection of the U'uion right, which being continned, Birney (in eommand first division Thirl (orps) reported to Sickles, who was orlered to make a recomoissance in foree and aseertain the nature of the mosement, which being promptly executed struck the rear of the alvancing columm, capturing many prisonets, from whom the intelligene was gained that the movement was unler command of stonewali Jackson. Lץp to this time the movemont had been interpreted an a retreat, Int in :anticipation of its purpose being a hank attack, Ifoward had hecm notitiod of the tact, and ordered to he on the alert. Sicklen now oltained permission to move in foree upore the flank of the mbancing colnmon, and being re-enforerd hy a brigate from the Twelfth and one from the blewenth Corps, torether with 1.000 cavalry and a horse-hattery muler l'lasombon, ham completed his preparations, when informed that Jackson hat struck his blow and wis in his raul. dithongh not ratirely mumticipated. it was believed the attack on the right womld he resisted ; but, heing surprisel. Devenses division wave waw, followed by that of Schur?.and though laschberk*s hrigade gallantly resisted it was timally compelled to lall lack, and the woods now swarmed with fngitive corpu, (losely pursued by the victorions Conferlerates. The pusition of sickles was eritical: hat formantely at this moment Plasonton. returning from the front with alont 5ow cavalry, met the advancing ('onfed(rates: the Dighth Pemsyluaia Cavalry charged vigornusly intothe woorls, while l'leasonton got hiswon hattery and such otlur arme as ho combl stogn, twentrotwo in all, intupasition. roubleoshothal them, amb imming low was just in time to re-

 right up 10 the grns. lut wore courh time repelled with erout lose: and the fatther alvanee in this direction wats finally

 Best, 1 homerh umablo on flowk the tlying trongs of the

Hooker, especially along Hancock: line, but was always hindsomely repulsed by the troops in the advanced line of ritle-pits. During the night Hooker contracted and ruformed his lines. The First Curps (Reynolds) arrivel duriug the evening. and witn posted on the right with Meade: the Eleventh Corps, whieh had been reorganized, was placed in the intrenelments on the left.

It daylight of the eld the attack was renewed, the Conferlorates opening a nusketry fire along the whole line : but the great effort was in the same direction as the day before. the posseswon of the plank road to Chancellorsville: and here they met the same trons which hatel sustained and pepelled their assalts of the day before Berrys and lirney"s dwisions (Third Copps), supported by Whipple"s (Third) and Williams's (Twellth (orps), supported the artillery of sickles, against which the Confederates threw themselves arain and arain, only to be cut downand hurled back, until sickles, for want of anmmition, was compelled to retire to a second line. Sichles had before retiring sent for assistance to emable him to hold his position: but Hooker, who hatd heren stumned by a ball which struck a pillar against which he was leaning. was in a dazed condition, and his aplesl was umanswered. French and llancoct, of the second Corps. lad done gallant work in charging and driving hack the Confederate left: but siekles was not reenforctal: yet though his ammanition was exhausted he contimed in maintain his position, reprling suceessive charges at the point of the bayonet till le was again compelled to retires and the whole line was now withdrawn a mile hack from ('hancellorsville, which position was strongly fortifierl.
sedgwiek meanwhile (May 2) had received orders to eross the Ralyrihannock and adrance on Chancellorsville until he should come up with the rear of Lees amol, whieh le was to attack simnltaneonsly with Hooker's attack on the front. This order was not received hy Sedgwick till nearly midnight, but he soon had his corjs in motion, and by noon of the $3 d$ had stormed and cmried Cemetery and Narve heights, and atter reforming his eommand moved on the roat to ("hamerlorsville: but he was soon met by the force he had driven from the heights, re-enforced by a portion of the army of lee, who heing now disengaged from llooker tmrned to cheek sedgwick*s advance: severe fighting continued till tark. Nedgwick being unable to foree the Confederates from the strong position they hat taken: the ehance of joining IIowker wis now small, and the mext day made it impossible. for the army of the now coneentraterl arainst him in large mumbers. Inring the night of the 4 hin and 5th he crosed the river at Bank's ford, having resomed his corps from its critical position by desperate fighting but with fearful loss.

On the 5 th llooker reerossed his whole army over the Rappahamoch without opposition, amd the lerrible struggle was ended. The losses on the Lnion side, 18.000; Conferlerate, 1:3000.

Stomeman returned on the 8th, having heen nine days in the rear of lues arny, and having advanced to within $Z$ miles of liehmond, hui his operations conferred no benefit on the Feaderal army:

Chamel Islands: a group of inlands off the northwest enast of France: behng to Great Britain: governed by their orn laws. 'They are the only parts of the dukednin of Xormandy now helonging to the British crown. King John in 1204 lost all the rest. The chief islands of the group, are Iersey, Gnernser, Aldemey, mal satk (qq. \%) The area of the whole is $6+\frac{1}{2}$ sq. miles. They are divided into two bailiwicks. viz., lersey and Guernsey, with the other islands as depentencies. They are not represented in Parliament, tat have their own institutions and law:. The legiskature of Jersey eonsists of fourteen deputies, twelve rectors, twelve consiables, and twelve jurats, presided over by the bailitl. Guernser is controlled by the royal comrt. These are the crown officers, lientenant-genem, attorney general. solicitor-general, and prévot. Taxation is light ; land holdings are small and mostly of yeoman tenure. The elimate is mild and equable: the scenery varied and exceetingly beautiful. The roeks are primary. The chicf iminstries are agrienture and the lreeding of cattle. Pop. (1s:11) 93.223.

Chamine, EDward Trrbel, LL. D. : seholar: 1h. in Newport, R. I., Dec. 12, 1790. Ile was brother to William Ellery Channing, and one of the tomnders of the Sorth American Revien, to which he contributed many critical and biographjeal artieles. Professor of Rhetoric at Iharvard from 1819 to 18.5. A volume of his lectures was mubtisher in 1859. 1) in Canbridge, Mass., Fels. S, 18.i6. Revised by H. A. Beers.

Chaming. Wilfam Ellery, 1). D.: the most distinguished of U E itarian preachers and writers in the $\mathrm{U} . \mathrm{S}: 1$. in Newport, $K$. I., $A$ pr. 7 , 17s0. 11 is matermal grandfather, Wiblian Ellery, was a signer of the Declaration of ludepenelence, and his own father entertained at his home the most distinguished Federalists of the time. Gradnating at Harrard in 1718 with the highest honors, he soon after went to Richmond. Via, to act as tutor in the family of I. F. Rant dolnh. The ascetie rigors to which he there subjected himself lest he should be effeminate impaired his health so much that it was always ichicate. At the same time he acguired a knowletge of slavery is a working institution which contributed largely to his later anti-slavery principles. He studied theology at combrige ant Newport (1800-180:3). It Newport he locame intimate with 1h: llopkins, the famons theologian, whose indepentent habit of thonght and philanthrop he gratly aImired. Is soon as Chaming hegan to preach he wats callet lyy two socicties, and, accepting that to the Federal Strect society. Boston, he was ordained Jume 1. 1sim. From the first he made an impression of great spiritual fervor and moral earnestness. He and Buckminster were the first New Engianif preachers who did not disdain to give their semmons fiterary form. The great merits of ('hamning's style, both in his semons and his literary productions, were an absolute lucidity and a remarkable flow of language. Ilis literary reputation was out of all propmontion with the anount of his purely literary work. which was limited to a tew maborate tasity or disenssions, the most remarkable of which was that on the Life and rharacter of Sapmeren Boumprte. It was the moral quality of theze essays, eren more than their intellectual clearness and their engaging style, that marle his reputation. For twelve yents after his ordimation his life was that of a faithful preacher and pastor. In the meantime the sepfos of the [Thitarian controrersy had lacell widely seattered, amd in 18 6 they here athund fruit. For many years ('alvinisn had berin undergoing a proeress of softening and abnibyment in some of the Sew Englamb charches. Sine the thegimming of the century this presess had bern much ace derated by some of the most prominent 'ongregational ministers in and ammal buston. The poliey of these liberal Christians, as they were called, lecemse they put a liberal cunstraction on (falvinim. Was to sily rery fittle alont the denctrins which they hal emme to dislielieve. The more
 liberals with dishonesy aml hypurfis. (hamming rephlied in ath ctaborate pulbice litter that at once gave him the leatlship of the bibral party, a position which he held thromerhout the controwers, thongh his eomtributions to it were hat few. The mont nitable Werte a sermon preathed in baltimore (1sy) at the ordimation of 1 atred sparks, a srmon at
 a fow attiches in the 'hristian firmminer and a fow puldie letters. Chaming hal no liking for eontroversy ant disdained all fuersomalitios. 'I'he mumer of his hatit wal preaching was the same after the beginning of the controwery as
burere. II is thre great affirmations were the Dignity of IImman Nature, the Simpremacr of Reason as the orgain of spiritual knowlenge, Religions Iiherty without sectarian exdnsiveness. He believed that all men are partakers of the Divine Nature, and have in them an intinite element. Accepting Christimity as a reasonable revelation, he sald: " I am surer that my rationai nature is from God than that any book is the expression of His will ": and again: "The truth is. and it onght not to be disguised, that multimate reliince is and mast he on our own reason," Denying the deity of Christ, he at first beld to his superangelic nature, as did the majority of Amerienu L'nitarims, white those in England, with I'riextley at their leiul. were generathy soeinians hohling to the human nature of Jesus. But the moral character of desus attracted him more than his special nature and as he grew older his Arian doetrine lecame almost or quite humanitarian. He regretted the development of what he called "a Unitarian Orthodosy" and "a swollen way of talking abont Christ." For Theotore Parker and other young radicals of the denomination he always had a willing ear. When Dr: Gannett became his culleague (1894) he had mope time for the expression of his philathropic srmpathies. Prollems of temperance ind social reform interested him deeply, and he spoke and wrote concerning them with impressive serionsness and real illumination. Fspecially diti the anti-shavery contlict excite his interest. Withont being himself an aljolitionist. he steatlity approximated to Garnisisn's position. Alone among Boston clergymen he invited the agent of the AntiSlavery Society into his pulpit. When Lovejoy was murdered he was the first to suggest an indignation meeting in Faneuil IHAl, and his speech was only less memorable than that of Wendell Phillips made on the same occasion. In is hast pmblie ntterance, Aug. 1, 1842, at Lemox, Masso, was rommemmative of cmancipation in the West Indies, and he demanded speerly following by the $\mathbb{T}$. $\therefore$. of that example. I). in Bemmington, Vt., Oct. ㄹ.. 1842. IIis works are pul)lisheil ly the American Lnitarian Association in six temo volumes, and his Life by his nephew. Wilham Ilemry ('hanning (Boston, 1848) in three. The Iforks and Life are aloo published in one volume 8vo. The centennial of his hirth Was widely celebrated in 1880, and much new biographical muter was jublished at that time. Jous W". ('нawwo.

Chareas: the mane given in colonial times to the region now called Bolvia ( $q$. c: ). The andiencia or government of Chareas was at Chuquisaca, and in common parlance that city was often called Chareas. The name is still sometimes used for the province of Chuquisaca.
H. H. S.

Cha'rax of Per'gamus: priest and philosopher: supposed to have flomished in the time of Marcus Aurelins. His historical works were prolix, and treated with minute detail the mythical period. Fragments in Müller's Fragmenta IIistoricornm Grecorum, vol. iii., pr. 636-45.

Charcoal [etym. doubtful: perhaps connertend with (obsol. verb chare, turn]: a common nume of a variety of carbon: a carbonaceons substance obtained ly hasting wood and other vegetable matters in chose vessels, or by partially burning them. The term is also applied to the solid residuam which results from the destruetive distillation of animal matter amd peat. fice Bone Black aml Aymal Charcoal.) The composition of charenal lepends on the temperature at which it is proituced. It high temperatures all the oxygen and hydrogen of the materials are expelled, and the black charcoal consists of carbon and the minetal matter (ashes) originatly present. When produced at lower temperatures the charring is imperfect, and a redilish charcoal results, which contains both hydrogen and oxygen. It burns without Hame or smoke. and [roduces a greater heat than an equal weight of wood. 1 it is used as an ingredient in the composition of gunpowder, as an agent in elarifying liquors, antofor other pmrposes, anong which is the smelting of ores. It has an extramonary capacity for absorbing gatses. It is said that it will absorb minety times its bulk of ammoniacal gas. It is infusible. is not soluble in acids or other lignids, is not liable to decay. and is not altered by any degree of heat if it be not expused to the air or to oxygen. It is a very bad conductor of heat, and hence powdered charcoal is flaced rombl tubes to prevent the escape of leat. Powdered charcoal is used to preserve flesh, or sweeten it when tainted. Common chareoal intented fur fucl is made by burning or heating a pile of wool withont free atcess of air. The sticks of wool, which are not more than 4 feet long, are arranged in a conieal pile around a central aperture, and covered with turf, sods, or uther material which prevents the free access of air. Charemal-dnst, mixed with earth and moistened, makes a good onter covering. An opening is left at the top for the escape of smoke and rapor. The pile is usually ignited at the top, and continues burntug with a slow smollering fire for a week or more. The charcoal used as in ingredicht of gumpowler is mate from wool which is free from resin, such is willow or poplar. Charcoal is often prepared by roisting wood in iron eylinders. By this methot there is a harger [rmportion of charcoal saved and the protuct is of better quality; there is also a larger quantity of lerroligneons aeid secured, which is of grat value in the arts.
Clerrbon rouge (i. e. red charenal) is charcoal obtained by subjecting wool to heated air or stemn raised to the temperature of $53^{\prime 2}$ F. By this process from 36 to t? per cent, of chartwn ronge is obtainet, whereas not more than 2.5per cent. of charemal is obtained by the ordinary methol. It has a dark-red color. and contains is per cent. of carbon. It is estensively used in Europe in the mamulacture of gunpowder and iron hlooms.
Clarcoal Blacks: pigments made from any charred material, of which lasypblate ( $q$. $\because$ ) is the most common instance. The chareoal crayons usid for making drawings are another instance. The name charemal black is given especially to pigments made from charred grapevine twigs.

Charcot, shathró Jeas Marpix: French neurologist; b. in Paris, Nov, 29, 18:5: 11.11 .1853 : member of the Academy
of Medicine $18 \%$ and of hegion of Honor. He made important investigations in nervos palhowg and hymotism.

the large funds raised in Fingland for the relief of the Lancashire sutferers by the cotton famine caused be the blockale of the southern ports of the U. S. during the eivil war: The administration of that and other emergener fumls in Jondon was felt to have misearied, and people hath grown realy for surer and better methods.

Effective, too, was the voice of Edward Denison, the son of a bishop and a member of larliament. who went to live in the East End of Lomdon in order to leam by daily contact with the destitute and depraved the sechet of their lives, and what they really needed for their redemption from wretchen sitnations. Influmtial friends. spurred on by oce tavia Hill's suceess with her foor tenants in the same part of London. jomed him to create some agency for staying the waste of benevolent money and exertion through disconnected agencies and almoners, and for reaching the roots of pauperism with effective remedies. The society ther fommed in 1609 has thirty-eight distriet agencies in as many parishes or unions of Lonton, and has mate for itself a world-wide reputation for the exercise of the true art of philanthrops. Its inthenee has permeated the kingolon to such a degree that there are now ( 1893 ) ninety-one analogons societies in as many towns and cities of Great Britain, amd seventy-eight corresponding societies on the Continent and in the british possessions.
lts methols were first eopicel in the U. S. in the Crmmantown suburb of Philadelphia. under the leatership of Rev, (harles (tr. Ames (1sia). Then came in 1sis the Butfalo Charity Organization suciety, virtually founded by Rev. S. II. Gurteen, a clergyman who had been one of the workers in the London society. From Butfillo it spread within tro years to lioston, Brooklyn, ('incinnati, Indianapolis, Newport. Philarlephia, loorthui, Me.. syracuse, and in 1880 to New Sork city. Now (in 1N: 3 ) there is a kindrel society in each of seventy-seron cities ant towns of the U. S., sme in fifteen other places where the frimeipal relief societies have atopted what are called "charity organization" principles. These monicipalities inchule (150) $11,080,40$ inhabitants, or abont one-sixtly of the total of the U. S. These societies have taken the diverse names of associated charitics, burean of charities, societies for organizing charity, Htc., but all are alike in papose. prineiples, and practice. They are allied with each other throngh representatives sent to the Sational Conference of Charities and Correction, whieh mets anmually: and are also elosely atfiliated with each other and with similar organizations all over the world (some 2.0 in namber) be correspondene and interelange of serves. This comection is volnatary, but none the lese real and practical: and it rests on thi inlorent mity of the morement and the now genmal recognition of the litet that the truest welfare of the pros requires intelligent and philosophical researela and methorl:
What is new about the orgmization of charities is not its fundmental principles, for these han been eliciterl bit by hit throngh years of experiment. Int the devising of a plan to apply these principles systrmatically to the legal, ecclesiastienl, and sotial conditions of English-speaking states. These conditions, at first confronted by the London socety, were very complex, but the illaptition of the suciety to them was ingenious and simple. The seleme was so flexible in "pration, so interworen into the nsages and raditions of the people and yet an distinetly embodying the eonvictioms of humane thinkers, that it was hopefily and loyally aflporal by thase who carnestly desired that benewience shoulal no longer miseary lat inded become beneficent.

Among the essential chatacteristies of "charity organization "are these:

1. Volevtary Prowipmo-lt is pmely a volmatary alliance anong bersons intasested or engaged in the alministration of "ivic, congregational, assomiater, amd individual relief. Thare ate three types of reliaf whiel protain to modern life: (11) The valuntary, the prodact of lamame or religions sentiment. Italy havimg, at least motil revently. afforled the most striking exampleof it: (l) a stato-supervisel alministration of confiseated palowments and whontary contributions, which has its best levelopment in France and
 shstahed ly taxation, such as obtains in Elberfelt, Prussin. benmark, and Sweden, where the statutes Jeelare the right of a paramer to state molief. In (ireat Britain amb the U. s. the whatary and leral methows yrew up side by side and, especialy in thatand, in great promigality. so havish hat the dhal practiee grown that Litward lenison, shortly Lefore lis death in 1850, wrote: "('ertain callenkations puit the

London charities at a total of $5.000,000$ - enough to give E1t a head to 400.000 souls." "hisis meant that every sew enth person in London at that time received relief, and that, if three of these persons (the probable numbers of breaclwinners in the average fanily among the por) be connted to a honsehold, its ineome from public charity would le S255 a year, or all that an miskilled workman steadily employed conld eam in wages dhatige the same perionl. The Elberfelel system, most influentially quoterl in 1869. is not a voluntary one: lnt while it is carried out by private citizens of high standing, and serving without bay, their work is 1 nactically as compulsory as the enforcement of jury duty in the $\mathbf{U}$. S., and it is holstered mp taxation.
11. Co-operatios-The next fundamental feature is cooperation or association. When Robert C. Winthrop, about 18.59, wrote the report of the Bostun Provident Association. in adrocating the erection of a milding in which the otlices of the varions civie charities and of the principal wolmtary sneieties of the city might hring their administrations unicer one root, he urgel as a motive thereto the nsefulness of asonciation, and it was partially realizet when the Charity Building in Chardon street in 1869 was authorized and erected. This was an important preliminary step in charity urganization in the T. S., and its history has made the term "associatod chanities" "the erpivalent in the U. S. of "charity organization." Prior to the invention of an avalable scheme for concerting the action of charitable agencies, the prineiple of imdividualism, or diesociation. ruled public and prisate benerolence. In the Cnited Kingdom and in most of the U. S., especially in centers of population. legal provisions for relief embraced every form of destitution, and were generally ample except in great emergencies, it was so profuse that it corrupted the por by its temptations to rolax offort, and to depend on tempor rary relief: it worked harm to wages, to indnstrial organization, to character, and to tax-pisers, some of whon in England saw their property nearly confiscated by the poor-rates. But, notwithstanding this, voluntary charity weat on to duplieate the legal novision in every imaginable way. Thus in New York city in Directory of "harifies, published in 1842, enumerates thirty-nine official agencies of relief sustained he taxation under the eity Commisioners of Charities and Corvection, and then describes $5!0$ more voluntary aroobiations covering like gromm. The latter are sectarim, secolar, mational. and racial, and devised for all sorts of ilistres. Fach of these agenops so common in large towns and cities, worked alme: they overlapped; they competent they fostered indonen ; they encouraged deceit: they disappointerl the humane: they agmented the evils they professed to ente. Charity organzation holus that it all this wasted strength were sived by co-operative action. the genercons provision of siciety would be adequate to overcome every form of misury arising from real misfortme or indisenct; and even to abate many cansed by vice

Clearing-houst - A chief mplince povided fro this concertel action is a charing-honse or registration burem. where every private individual, solnatary societs, thurch agency, and civie relef otlicer can send information regarliner the beneficiaries of bach. Here that information is classified, tabulated, and exhanged among all who wish to profit le it. Its result-ata abalable for the gutance of any one wishing to do an ate of charity. There is no dietation hy the charity Organization socicty. and there are no restrictions heyons those neemary fopmed the reputations of the poor. With the Charity Organization somety of New York city, in Jan., 189:3, more than 480 reliel agencies and 1.500 private individuals were eor-t) tration harean, which contaned records, more or less detailen, concerning fully 150.000 families which had been investigated hy it wr reported to it as aphlicants for or recipients of charitable relief. This sumety was appealed to for information 16.244 times during 1 wis. By the simple ex ${ }^{\text {ned }}$ licut of a central registration hurem (often compared th the hankers" "clearing-house "or a " merantile ageme") bene vohent activities that formerly montomated each other mow onoperate, the hants and methots of profosional mendicants and impentors are reveabed. bedter adtutations of relief ann frichlly treatmont arw bronght into view, and rills of servies hy the seme are combined in onf elfective strean of helphulness amb adequacy
1II. Repressiox is a third frature of the organization of charity. Urganized aharityamshat sommeh to protect givers or workers as to protect the wrotehem, the tempen, and the fallon, not only from themselves, but from the demomalizing
 imbulyenes. It belkeve that to give alme without knowlealge of the case is as abourd as to give medietine withot at diagnosis and should ineur like censure and that no ome remedy is a panaceat for all diseasis. it pheats fhat the strong and prosperons sloubl not lamage and acgrate the weak; but, nof reviling from any eontition, haserer dehased, hy an intelligent necpuintaniee with the state of each should addy their help and treatment to the prome case in hand. with the constant ain of restariner call sulfere to true manhool or womanhand, as well as to indepmonene and sel f -support.

If. And this liestoration may be mathen the fonth and the most humane fature of charity organization. Whon humatr leings lapse jnte porety of viep they too often lose their helpfil social embeetions, and exchange them fon those with it more degratom chas: and their only proper coure is restaration to right sucial relations. It is this view of charity which finds expression in college and mivorsity sethements, 'Tosubue halls, Ambore lumses, Hull homses, noighborhond guilds. athd all the contrivances for meknitting the social relations hetwen the proserems and the pron. Edwarl honison, as the result of his shareations in stepney, wrote: "1 am begiming serimsly to helieve that all bodily aitl to the poor is a mistake; that the real thing is to let things work thomelves straight; whereas be giving alms yon kerp then permanently aroked. Buik school-
 them to help themselves. lenel thom yond bains: hut give no money lut what yon sink in surb "undurtakings." Thas
 resture the pror to a useful and honorahle place in sonciets:

Frimally lisitors.-The pror fall behimd Decame of their isolation, inferine intelligence moral weakness, ami law itn-

 the hambe of the pere he received combitation of the pow-
ers granted at St. Denis twenty years before. Returning to the army. he prosecuted the war with such success that from the year $r$ Th be claimed the title of King of the Lombards as well as King of the Franks. The territory owning his sway reached as far S, as spoletn. An outhreak in the north called him back however. and in the winter of ri6 he reerosed the Alps with his army and not only defeated the oppowing forces, but reduced several cities to a hes. In ist attairs in Italy onee more reguirel his attention. for the pupe had beei unwilling to abandon his orerlordship, of Spoleto. The greater part of laty mas soon rewrganized in principalities. with the King of the Franks as smzerain. To the pole, however, was granted the exarchate of Ravenna and the territory along the Alriatic as fars as Ancona, together with a large number of minor cities and estates in Southern Italy. This agreement was the hasis of the pope"s temporal power during the following centuries. Affairs were mut settlet, however, until alter a long and stublorn campaign ending in 28 . but the ettects of Charles's policy in Jtaly were strongly felt in all Italian atfairs for more than a thnusame years.
While Charles was devoting himself to matters in Italy. atfins in the north were assuming an attitude that required his immediate attention. One of the most turbulent of all the Crrmanic tribes was the saxons. Starting from a small beginning about the mouth of the Elbe, they had grown in number and power until they hal not only made themselses masters of a large part of Northern Germany, but had made their name dreaded on the sea as well as on the land. With their kindred tribes about the mouthe of the (eeman rivers. the Jutes and the Angles. they hal conquered Britain, and now. having overfilled their own territors. they were about to fall with resistless power on the territory of the neighboring Franks. In the absence of national houndaries. collisions along the borlers had for vears been ineritable. These had become somewhat serions as early as ile. In Ti4 and iof they became formilable; but the saxons were speedily reduced to terms in 717 ly Charles himself, who took time enough from his Italian campaigns to march against them. Just after Charles had settled affairs at Paderborn, he received an embassy from Solyman el Arabi, the ruler of Barcelona, who desired to throw ofl the voke of the Ahhammerlan Amiades, inviting the assistance of the powerful King of the Franks. The incitation was welcome, for the Franks and the Mohammedans had been cleadly enemien for more tham a bundred years. Putting his forces in order. Charles at once turned toward Spain. The campaign began in a most brilhiant manner. He took Pamprena by storm and adranced as far as the Ebro. Saragosa, however, opphosed a successful resistance. Obliged at length to return, on lug. 15. Tis. his army was attacked by a horde of Basques and defeated at Roncesralles. I large number of prisoners were taken, and a large part of the supplies fell into the hands of the enemy. News of this defeat was the signal for another uprising of the Sasons, Against these Charles was obliged to turn at once. He deteated them in శi!), and in isl he began the reorganization of the government of the conquerel territory br putting saxon nobles in power under his sugerainty. As the prople were still pagans. he also organizel a systematic missionary service for their conversion. The work of reducing the saxums, howeyer, was one of stupromdons dithenties. ('ampaign after campaign was mecesary during the next twenty years. The A vars, occupying the right bank of the Ellhe, were not only reducul to sulpioction, but brought to at hast a mominal acmptance of Christianity. In the year The charles was able to report to the pope that the land as far as the Dambe had been ennquered and hyought to acknowledge Christianity. But opmosition was by no menns broken. In a!9) and agian in s 04 revelts broke nut which were repressed with dilliculty. But it was now evident that the concurest was substantially complete. It was in the vear sot that government was "stablished in something like a civilized form, and the lishoprics were foumbed which, with nnimportant modifieations, entured to the time of the latomation.
lsy a series of eampaiens, in many respeets unrivaleal in the listory of the world, Charles had now extended his power from the Fhro to the Filer, from the Atlantie to the Adriatic, and from the North sea to the (inlf of Beneventum. He hat so conciliated the firror of the pope that he not only received papat sanction hut was ollivinly recosnized as the protector and defender of the chureh. The relations of the Framkish king to the pope, which had beren begun in the time of his father, were in many ways elab-
orated and strengthened by Charles himself ; and the seal of ecclesiastical sunction was placed upon these relations when on Christmas Day in the year 800 he was crowned by the yope as Roman eiuperor:

As a conqueror (harles not only brought the whole of Central Europe into subjection, but he also reduced the tmrbulent warlike tribes of the time to something like the methods of cirilization. Eren in those restless days he did much to develo, the economic and agricultural resources of his domain. The minor governments which he invested with local responsilility proved au important barrier against the nomadic tendencies of the time, and had not a little influence in promoting peace within the empire. He estahhished schools at various points throughont the empire as well as in the court, and drew about him the greatest scholars of the time. He dien at Aix-la-Chapelle, Jan. 28. 814, learing behind him, as Gibbon has remarked, the only name in all history" with which the appellation "The Great " has become permanently incorporated. About his name many mediepal legends gathered which entered into the romances of rising Enropean literatures.

Authoritres.-Einhard, Tita Caroti Magni, written by Charles's son-in-law, and of the first importance (hest edition Germ. trans. in 2 vols.. 1839, by Jaffe. in Bibliotheca Rerum Germanicurum: senarate volume 1876: Enc. trans by Glaister, London, 187) ; Mullinger, The Schools of Charles the Great (1850): Gaston l'aris, Histoure Popetique de Charlemagne (1865): Guizot. Charles 1. (calked Tme Bald): King of France and second lloly Roman emperor: fourth son of Louis (I.) le Détonnaire and his second wife, Julith of Bavaria; b. in Frankfort-on-the-1tain in 823: received a kingdom carved out of a tervitory assigned to his elder brothers, on account of which wars between them ensued; on the death of his father. 840 . he received all of France $W$. of the Rhône, and in order to obtain the imperial title alliet himself with his brather. Louis the German, to wrest it from Lothaire, the ellest hrother: the battle of Fontanet ensued in 841, in which Lothaire was defeated in a blundy encounter ruinous to both sides. The next vear the allied brothers renewed their treaty, Louis taking the nath in the Romance language and Charles in German. The words of the oath taken hy Lonis are among the earliest specimens of the Romance language. Jiy treaty of Verdun, 843. Charles received France, Lnuis Germany, and Lothaire Italy and Lotharingia. This France embracel all territory $\mathrm{IV}^{\prime}$. of the Scheldt. Meuse, Fône and Hhône. ant apain from the Ebro to the Pyrences. The reign of Charles was paseed in efforts to subtue Brittany. Septimania, and dyuitaine, and in feeble attempts to repress the ravages of the Norsemen. On the death of Lothaire the allied brothers fought over the division of Latharingia, lut Charles was weakened by the independence of his frudal barons just coming into power, and resorted to the ('hurch for aid. In si. (harles was crowned emperor by the pope. To secure the aid of his great barons in his project of wresting the German crown from the children of his brother Lonis, he signed for them a capitulary at Quiersy-sur-Oise, which became the Magna Charta of French feutaiism. Sunn after he died (8ĩ), nuar Mont Cemis, while marching to relieve the pope from incursions of the saracens.
C. K. Adays.

Clarles II. (called The Far): King of Franee and third Holy Roman emperor : son of Lonlis the ferman; 1). 88? on the death of his hother, Carhman of Bararia, hectume King of Italy in 850; was (rowned emperor 881: gained poscission of Germany on the death of his brother Louls of Saxony in 880, amd of Frane on the diath of Carloman of Framee in s85; on account of his great weakness in resisting the invasions of the Norsemen was deposed in 887. D. in the cloister at Tribur, 888.
Charles IV. of the Jloy Roman empire: b.in Prague, May 14, 1316: was son of Johninf Luxembourg, King of Bohemia; riveroy in ltaly 1332: King of Pohemia on death of his father 1346, and the same year, through the influence of Pojer Clement VI., was electind emperor as the successor of lanis V.. whom the pope had deposed. This dignity ne maintained at the cost of many humiliating concessions. He was gencrally submissive to the pope, given to the ag-
qrandizement of has own honse ame -pintli... in remmant diarher. He inwed in that the dinden Bull. whith for mone Than four centuriss was the findamental latw to rewulate the Wection of (iorman emperors. Thi hall, hy hecrenius that the number of ehectors shmbl be seven. thite arehbishons

Charles V. ( (ralled The Wise): King of France: b. dan. 3I 13:7: son of Joln II. He acted is regent during the captivity of John, who was taken prisoner by the English in 13.36. His regency was rexed by the States-fieneral, which he convokedtand which refusel subsidies and. led by stephen Marcel, endeavored to rejress the anthomity of the crown. The murder of Mareel gave charles control again, but in $1: 860$ his father returned ani resmmed the govemment. C'lames hecame king on the death of his father in 13nt, at a time when France was insaded hy Fingli-h armies. He acted on the shefensive, and avoiled a general battle. The French gencral Du Gueschin expelled the English from Poitou, Gantonge. Brittany, and (inienne and rednced to submission the king of Nararre. He increased the relative preponderance of the crown over the nobles, and reformed the administration of justice and the procedure of Parliament. Charles foumded the Royal Libnary of larin. He died at Vincemes, sept. 16, 13*i0, leaving the throne to his son. (Charles VI. See Pay's Mistoire de (hamles 1'. (1st!).
C. H. T.

Charles VI. (called Tiue Belored): son of Charles V.; b. in Paris. Ine. 3,1368 , and was the firs prince whon received the title of dauphin. He succeeded to the comen at twelve rears of age and his minority was trombled by the rapacity and turhmence of his uncles of Berry Burgundy. Anjon, and Beurbon, against whom rebellions broke out in the cities of France ant Flanders, where they were directed by Philip van Arterelde, who was owerthrown in 1382 at Roosebeke. In lose Charles threw of the control of his uncles and assumel the govermment, but he beeame insane in 1342, alter which the kingdom was distracted by the rivalry between the Dukes of Buggundy and Orleans. In 140 a civil war hroke ont hetween the Burgundians and the Armaghacs (as his purty was called) led by the thake of Orlans. who was assassinated hy John the Fearless, of Burgunty, an atrocitr which increased the virulence of the civil war: In this. disturbed state of the country France was also invaled by Ilenry V. of England, who gainell a great vistory at igincourt (Net, 21, 145. Charles died in neglect Oct. 2n. 142.

Charles VII. (called The Victoriots): King of liance:
 in 1420. It that time the kingdom was rent hy the Burgundian and Ammagne factions during the insanity of his father. The assasination of Jolm the Fearless of Burgmady, in the presence of the dauption. Was followed by an alliance of the English with the Burgumbans, who gained almost a complate mastery if France. I:1 14?0 Hemry \% of Enolamd, who had married a sister of Charles, had his right of sucession confirmed by the treaty of Troyes. but le died in 142e and the mamintration of Finglish interests in Frame was committed to the able Dene of Benford ( $q, r$ ), who carried conquest still further. The court seemed ingulfed in frivolity and disipation, and the infant King Itonry VI, of England was requized as King of Franee hy a faction whoh had posesion of Paris while France was purtially aceapien hy the Eaglish. who hesicged Orteams in 14ss. From the ruinons state to which the country was rednced by intestine diseord and foreign invasion, it was restored by the heroism of Joan of Are (q. $c^{\circ}$ ), and the prulent policy of Charls, who had fallen among hetter advisers. Burgundy withdrow from the Foglish alliance and joined France : the Duke of Bedford died. and (harles hecalme master of Paris in 143f. IIe waged war with sucrese ngainst the Engrish, redueing their possessions in Fonmo to c'alais, and recovered Xrmmany in 1450. The great events of this reign, hasides the expulsion of the Eaglishand of meremary suldiers. were the creation of a standins amy, the introluction of commoners, as Jacples ('antr, into the royal comacil, and the Pramatic Sanction which. by montime the decrens of the Comail of Basel, laid the hasis nf the libertios of the fiallican Chume Charies's last years were shameless; he cmbittered his son, and, fear-

many of his men perished from enld ann want of provisions, and his army remainel inactive dhatig the severe winter of tras-0!. it the beginning of the next eampaign he hat only 18,000 swedes in his army. He lusiegel Poltava, to relieve which Petor advanced with an army of 60,000 men. The decisise hattle of Poltava, Inly 8 . 1Fob, resulted in the defeat of Charles, who lost about 9.000 men killedand 6.000 prisoners. Me escaperl into Turkey, and wis kindly reecoved by the sultan, who gave him a destitence at Benter. Ile induced the sultan to declare war against Russia, but this war was sonn emded by ab treaty. Charles remaned in Turliey several frars, and at lengtla was involved in a guarrel with the Turkish rulers, who trented him as a prisoner. He recaped in 1714. and traveling incognito through IIungary amd formany, reached stralsmal in November of that Gear. The linssims, Inmes, and Prussinns continued to wage Way against the King of Sweten, and they took Stralsund in The... Tis, after a long siege. The energy and andacity of Charlos remained mabated. motwithstanding his reverses, and while the allies threatenen to in vade sweilen he invaded Nomway. Ihe was killed at the sioge of Frederikshall Nov. 30, 1\%18. and left a great reputation as a military genius. The long-curvent belief that he wis treacheronsly shot by one of his own ollicers was aflectmalls dissipated in 1859 by an examination of his sliull. He was never married, and his sister, Elriea Eleonora, inherited the thome. See Voltaire, Lifo of (harles N11.: Nordberes harls N1I: Mistoria (1, 40): Landblad. Fomung Carls SlI. the Chartist disturbances led to a larger recognition of labor interests: a* in factor in legislation and in British politics. See Carlyle on CIuthom : McCarthy, Mistory of our oun Times: Cooper's Life.

Chartran, shaartrăaĭ, Théobald: portrait and figure painter: contemporare: b. at Besançon: pupil of Cabanel: Grand Prix de Rome isir: second-class medal. Paris Exposition. 1889 : Leyion of 11 onor 1890 . Ilis small portraits are finely drawn and cleverly painted. At the Salon of 1892 he exhibited a masterly portrait of Pope Leo X111. Sturlio in Paris.

Chartres, shaartr (anc. Autricum): a city of France: capital of the department of Eure-et-Loir: on the river Eure, and on the railway which connects Paris with le Mans: 49 miles S. W. of Pimis (see map of France. ref. 4-E). It is built at the base and on the declivity of a steep hill. The streets are narrow and crooked. Here is a Gothic cathedral of the eleventh century. said to be the most perfect in France; it is surmounted by two towers, one of them 382 feet high, with rich ornamentation, and the other exceedingly massive. Chartres has two other remarkable churches. an episcopal pralace, antl a public library of about 30.500 rolumes: atso manufactures of hosiery, hats, leather, etc. Here is a large weekly market for grain and flour. During the Middle Ages Chartres was the capital of the dietrict of Chartrain, made a duchy by Francis I., and given as an appanage to the Dukes of Orleans. Hence the title Duke of Chartres was given to the eldest som of the Duke of Urleans. More reeently the same title was given to Prince liobert of Orleans. grandson of King Louis Philippe, and second som of Thke Ferdinand of Urleans. L'op. (1891) $23,104:(1 \times 96)$ 23.1ㄴ․

Chartreuse, shantroizz, La tiramle: a large and fimous monastery in the french Alp: 12 miles N. N. E. of Crenoble; in the midst of widl and impressire sceners; 3,281 feet abore the seal. The convent was founded by St. Bruno in 1084. somewhat higher up the monntain than the present buildings. The name of the order. Carthusians, comes from this convent, and the English Charterhonse is a corruption of it, name. The buildings are extensive, but rudely built, and date from 16s\%. The monastery had been repeaterlly burned before the present structure was built. The monks werestripped of their possessions in the French Revolution, and abandomed the convent until 1826. They have never recovered their former wealth and dignitr. They manufacture a fanmos Laqtavr ( $q$. $c$.), which takes its name from the monastery. see Charterholse.

Char"tulary (Late Lat. chartularia): literally, a record or register. This term is specially applied to certain rolls or books in which corporations, especially religions and civil corporations, keep a record of their charters and privileges granted them by the statute, and in the case of the carlr Lat in Church a custodian of the charters, records, ete., of the Church was also so called. Some of these chartularies date lack in France as far as the tenth century, but it was not until the twelfth or thirteenth century that they were generally kept by corporations. Their value lies in the fact that they freguently contained archeological and genealogical information of great historical value. Many important chartularies have been jrinted.

Charybdis. kā-rih dis (in Gr. Xdovßors), now ealler Galofuru: an incesant untulation, rather than at whirlpool, on the sicilian sifte of the strait of Messina, upposite the rock of scylla. It is camser ly the meeting of currents, and is seddoin dangerons. It was anciently much elraded by mariners sce Rear- Wharal William Menresmyth's monograph on the Metiterranean, p, 519, *vo, 1s.5.

Chase, Iran. 1). D.: b. at Stratton. Vit., Oct. 5., 1793; gratuaterl at Middlehury College in 1814 and at Andorer Theological Seminary 181\%; in the same year was ordainerl to the laptist ministry. He labored as missionary in West Virginia, anl was in 1818 appointed Professor of Languages and Biblical Literature in the first Baptist Theological Selool. which was that year started in Philadelphia, but in 1803 removed to Washington. D. C.. and incorporated with Columbian College. There he remained till 1825 , in which year he became Professor of Biblical Theology, and from 1836 to 184.5 of Ecelesiastical History in the Theological Institution (which he was largely instrumental in founding) at Newton Centre, llass. Ile published several works, mainly controversial. I), at Newton Centre, Mass., Nor. 1, 1864.
Chase Phlander. D. D. : a Protestant Episcopal bishop: mele of Salmos P. Chase ( $q$. $c_{0}$ ) ; b. in Cornish. N. H., Dec. 14. 175: graduated at Dartmouth in 1896. De went in $181 \%$ as a missionary to Ohio where he planted the Episcopal Clurch. He beeame Bishop of Ohio in 1819, resigned in 1831, anl after a temporary residence in Michigan was made Bishop of lllinois in 18:3. He founded hexrox ColLege (q. r:) (Gambier. O., and Jubilee College (1*゚O) at Robins Nest, 111. Publi-hed Reminisernces (New York, 1848, 2 rols.). I) at Jubilee College. Robins Nest, Ill.. Sept, 20. 1802. The resignation by Bishop, Chase of the see of Ohio, on account of ditliculties with the faculty of the Theological School at Gambier. and his subsequent acceptance of the episcoprate of lllinois, gave occasion to the enactment of the canon on Episcopal resiguations still in force in the l'rotestant Episcopal Chureh.

Chase. Pliny Earie: educator; b. in Worcester. Mase, Ang. 18. 1*20: graduated at Harvard College in 1839. While engraged for many years as a teacher in Philatel hia, and afterward in mercantile life, he emplored his leisure in metaphysical. philological, and physical studies, prombeing many athle ami learnet papers, published in the Procerdings of the Amprican Philosophical Sociely and in varions sibitific journals, several of which were copied in the Loulon. Inblin. and Edinhurgh Philosophical Maguzines and other foreign journals. These artieles procured him wide distinction is a man of science. In 1801 he was appointed Profssor of Physics, and later of Languages. in Hiverforl Eollege. The Magellanic gold medal of the American Philosophical societ $y$ was awarded to him in 1864 for the Sumerical Relations of Gravity and Magnetism. Imong his works is Elements of Meleorology (1884). 1). in Haverford, Dec. 1\%. 1886.

Clase. Samox Portlasd: statesman and jurist; sm of Ithanar Chase, a farmer of New Hamphire : b, in Cornish, N. 11., Jan. 13. 180s. Ile was sixth in descent from Aquila Chase, who emigrated from England to Massachusetts in 1630. Ilis mother was of scotch descent. The stock to which be belonget was prolific in eminent men. His grandfather. Sammel Chase, had seven son:. live of whom receiver an alucation at Dartmouth College. During the war of 1812 Ithamar Chase engaged in the glass manufacture at Keene, N. Il.. but this business resulted unfortunately on the reintroduction of foreign manufactures. Ile died in 1817. leaving his family in stratencel cireumstances. Salmon's education, howerer. was not neglecter. He was first sent to a school at Windsor. Vt., and when twelve vears of ace went to Ohio to live with his uncle the hishop, who resided near c'olumbus. Here he livided his time hetwoen larel work on the bishops farm and hard study in the hislop's academy, which was afterward removed to Cincinnati. In 1 Nos he returned to New ITampshire and the next year enterel Inartmonth College from which he graduatid in 1sog. He then repaired to Washington, and supported limself by teaching a school while stutying law under the direction of William Wirt. IIere he oltained his beense to practice law in 1839. and in the spring of 1830 went to Cincimati to pursue his profession. Inming the weary hours of waiting for business he ocenpied himself in preparingan edition of the Slotufes of Ohio with notes and an historical introduction. This brought lim into notiee, and in 1834 he was appointed solicitor for the U. S. Bank in ('incinnati. From this period he never wanted cmployment.

Ife early engaged in the eontrowny moneotimg hawery sud the slive－power in the L＇．s．，and luik the then unponi－ har anti－shavery side．In lwat he appeame at commel for Matikn，a colored woman chamed as a furitive slave，amd ton， the gromed that Congress had no risht to impose on state oflicers the daty of assisting to rember up fugitive shues，nor to legislate on the subiget at all－that the States were，by the Constitution，solely resmusilhe for the perform－ ane of that duty，and had at right to prescribe sheh pro－ cecelinges as they silw fit to prevent unjust arrests and deten－ tions．These views were enforced with great clomunee and fower，though mineressful at that time．In a subsernent case la took the broad gromed that slavery was a doral in－ titution，depemdent upon state laws for its existence and continuance．His grat maxim was，＂shavery is sectiomal， fremtem is national．＂In ist？he was＂mphoyed to defend Van Zaflt，the orgrima of Van Tromp in＇ucle Tom＇s Cobin，who had heen a Kenfucky Parmer，Ime fom a con－ viction of the wrong of slavery hat liberated his staves and removed to Ohis，nar Cineinnati．Ifere he was indieted， under the Fugitive slave law of 1 ：93，for harboring fugitive ＊laves amb aiding them to escape．The canse was carried to the supmone Court of the U．S．，where it was aldy arguen］ hy $\mathrm{Mr}_{\mathrm{r}}$ ．Whase and llom． 15 ．11．Seward in 1stis，and lecame one of the consess cultiors of the country

The suljeet hat now hecome fully introlneal into the politios of the country，and Mr．Chase was virthally thas foumber and leader of the liberty party，which resulted in the formation of the Frec－soil barty，and ultimately of the great hepmblican party，whel breame the means of pros－ trating the sharepower and abolishing slavery in the U． S ． I combention of this party umber the guilanee of hir．（lbas Was hed at Columbus，O．，in Dee．，1841，after it tecame aplarent that no hope was to be expected from President fyher of the of whig jarty in the direction of anti－shavery． dither emventions were hed at Buffalo，（＂ineinati，and
 latter vear in the nomination of Mr．Van Buren amil（harles Franeis Alams as the camdidates of the Jrex－soil party for Prowident and Vico－President．Mr．©hase was the moving spirit in these conwontions．He presiled over the last，amol drew wh the plat form of principles and policy which it afopted．Most absorbing and prominent among these at this time was that of peventing the extension of slawery into the new Territories．

In leph．，1st！he wate elecemba C ．S．Senatne from Ohio and took his sent in the foblowing Mared，where lae uphede the sertional hature of satery，ofposing the rompromices of

(Hase. William Henry: b. in Massachusetts in 1ries: gradmated at the U. S. Military Acmlemy in 1815: appointed brevet second lientemant of enginecrs; first lientenant 1819, captain 18.5 , major 1838 . The events of the war of 1812 having shown the valnerability ot the ports of the Gulf coast, and especially ol the key to its westem territory, New Orleans, Chase was assigned to duty for their defense in 1819. Forts Pike and Macomh were his earliest works. 11 is most important were Forts Pukens, McRee, and BarRaxcas ( $q q$. $e^{\text {r }}$ ), for the defense of Punsacola, regarded then as the great naval station of the Guif. But subsequently. as senior engineer otficer, all the works of fortitication and of river and harbor inprovement (e. g. the Mississippi months) came unler his supervision. There was searcely a project commectal with the development of the region of his adoption in which he riol not take an influential part. In 1856 he was appointed by I'resident I'ierce snperintendent of the Military Aeademy, but resigned Oct. 31 from the army withont entering on its duties. We espoused the Confiderate cause, and was prominent in the seizure of the Pensacola nary-rard, but subsequently took no prominent part in the war. D. in Pensacola, Fla, Feb, 8,1870 .

Chase, Whblay Merritt: figure, still-life, and portrait painter: b. Franklin co., lnl., Nov, $1,184!$; pitil of L. F. flimmarth. New York, and of Wagner and Piloty, Munich; member of the Socicty of American Irtists (18\%9), and of American Water-color Society : National Academician 1890; second-class medal, Nunich Exposition, 1883: second-elass medal, Paris Esposition, 188\%\% Ilis work at first showed the influence of the Mmieh sehool, but after his return to New York in 1878 it partook more of the French methorls of totiay. It is notable for admirable technical qualities, for truth to nature and artistic arransement. His portrats are excedingly woll painted, and often remarkible for elfoctive compusition. IIe is an excellent colorist and good dranghtsman. President of the Society of American A Itists, ant one of the chief instrnctors in the Art Students Leagne, New York. Ilis Ready for a Ride (18:!) is in the Union leagne Cluß, New Fork. Stndio in New York. Summer studio at Southamotom, 1. I.. where he is the head of the school of art at Shimecock Ilills. William A. Coffin.

Chas'idim [Hel.. saints]: a name applied among the ancient lews to a sect of piotists who originally ained at atrict recemonial purity untur the Mosaic law, warmly esfousing the callse of the Naceabees, and opposing the IJellunizing tentencies of some of their fellow Issarlites. Some writers beliove that the Fisemes, Plarisees, and other striet followers of the law all spang from the ('hasidim, but that the mame was fimally daken by a monterate party, who recuberd the tralitions ats of egnal anthority with the law. In rement times the name is apllied to a sect of Jews who spanag u] in l'ohand in the "ighteenth (entury, and who aim at a rentoration of the ameient piety of their nation. Their cerpmonial is extremely formal. Therir peenliar mysti(abl and calablist ic: docetrinus ind customs are repartiated by the whotux Jows. "They are now chictly fombl in Eastern Europe. Sice dewisu sbers.

C'hatelet, shat lay', (iabmele Fimhas, Marquine du: b.
 was a danuther of baron do Brotenil, aml reqaived a most cateful whation. She understood Latin, English, aud Italian, and began on translate Verpil when sixteen Yours ohd. She stadied mathematien amd physios and philowiphy. and was one of the firs in France who dat and understaid Newtom, tramslating his Jrimeipin into brench, with algebraic notes (1riot). She published swered dissertations on philowh hy and physices and was comsiderel onf of the great mime of the agr. "In fred the Marquis du Chutelet married
her. She lived with Voltaire at C'irey, 1735-47, and later was engaged in a liaison with samt-Lambert. See Voltame.
Chatelgnyon, shatatele geotu' : a town of the department of Puy-de-Dome, France; the source of the celebrated Gubler waters. It is near Riom. with which it is comnected by stage (see map of France, ref. ( -7 - ${ }^{2}$ ). Pop. (1896) 1.61\%. There ate twenty-seven sprigs, affording saline. ferruginons, and magnesian waters, with temperatures from 55 to 110 F . The Gubler spring contains the most chloride of magnesium, and is the one from which the waters are exported.

Chateflerant, shatel'rō: a town of France: department of Vienne: on the river Vienne; 18 miles N. N. E. of Poitisrs (see map of France, ref. 5-1). It is near the railway from Tours to Bordeanx. It has a handsome stone bridge, an ohd castle, a theater, an exchange, amd hospital; also important manufactores of entlery, and a large trade in millstones, wines, ett. Here is a nitiomal manufactory of swords and hayonets. The scottish Inkes of ILamilton derive from this place the title of Duke of Chatellerant, which was given by King Ilenry II of France to James flamilton, Farl of Aman and regent of Scothand, in 1548, and by decree of Xipoleon III. Was contimed in 1864 to the Sottish Imke of Hamilton (Tuke of Brandon in the Linglish peerage). Pop. (1891) 29.522; (1896) 20,014.

Chat'licdd: city (incorprated in 1855) of Filhnore and Olmstead cos., Dlimn. (fior location, see map of Minnesota, ref. 11-G) ; is terminus of (hatfied branch of ('h. and Nor. West. R. R. ; on north branch of Rent river; 50 miles W. of Winona, 26 miles N. W. of Rochester: has churehes of five denominations, high school. and handsome opera-homse of brick and iron. Its principal industrial estahlishments are 3 flouring-mills, woolen-factory, aml a saw-mill, all cmploying water-pwer; 8 grain elevators and 2 grain-warehouses. The city is in a rich agricultural cometry, from which it has a large trade. I'op. (1880) 1.166 ; (1890) $1,33 \pi$; (1895) 1.435.

## Ehtor of " Юemo'rat."

Chatham: a fortified town, river-port, and naval arsenal of Englam: in the conty of kent ; on the right hank of the Medway; 30 miles E.S. E. of London (see map of Englam, ret. 12-k). The river here begins to expand into an extury. Chatham is defended hy several forts or castles crowning the aljacent heights, by which it is flanket on the $\therefore$ and E. It derives its impronce from its naval and military establishments, which are separated from the town and the comery by a line of fortifications which are considherl the best in Lugland, execpt those of I'ortsmonth. Here are a military hospital, barracks for infantry, manines, artillery, and engineers, and magazines, storehouses, and defots on a large scate. Chatham has also one of the hargest royal ship-tmilling establishments in the kington. The dockard is nearly 2 miles long, ami contains several hild-ing-slips and wet-tocks, sufficiently capacious lor the largest ships, and inelosing 67 acpres. Comected with it are extensive saw-mills, forges, mal a motalmill which prodnces copper sheels, eopper bolts, , Ne. Numerons brick-yards. limekilns, and llour-mills are tomu in the surmonding district, and the town carries on a large maill trade, jatly on aecomnt of the presence of the garrison. In ere is a large conviet establishment, the pisoners being employed on Government comstractions. In $166 \sigma_{i}$ the Duteh ahmizal De Ruyter sailed up the Medway and burned some shipping at (hatham. Pop. (18!1) 31, 311.

 hrigathos of infintry, which wire to march from chattiniungia achess the nerk of hum tu Brown's Ferry.

A11 this wats shecesslully ancomplishetion Oct. 2f, 27, anm
38. and the army was immentiately and abumenatly sumplied from the leépôt it Stevenson, viâ Bridgeport, hoat to Kiclly"s Ferry, and wagon train to Brown's Ferry and across Moccasin Point to Chattanooga. This ronte was kept open until the close of operations at C'hattinoogin.

Burnside at Knoxville, owing to defective eommuniaztions, was suffering from lack of suppliss, and Brageg, fetting himsclf strong enough to bold (imat at Chattanoora with less force, detached Longstreet with 20.000 men, on Sow. t. to capture Burnsime's commamt.

By the night of Nov. 23 Sherman's army had arrised, mond was posted on the north (right) bank of the river nearly oprposite the month of south Chickamanga creak, Jlooker was in Lookout Yabley, and Thomas, hminer the 28], had assaulted the Confederate line directly in front of Chatianonga, driven it back about a mile, amd ocenpied amd changed the front of the works which it hand previonsly ludn. By daylight on the 24 th Sherman's infintry hand corosed the river, ferried over in pontons amd in one sitanboat, and had ocenpind aml intrenched a position on the south (left.) bank. At a little aftre nown the hridges across the Temmessee and the South Chickamanga were completed, and all the cavalry and artiltery were also on the south side.

The troogs were immediately formed for attack, and at one "clock mored out. $13 y 3.30$ they han seenred : position on the top of the ridge, which was hell against the Conlederato attacks and was furtified drring the night. (See Persomal Memoirs of I'. S. (frant.) Latly in the morning of the 24 th llooker moved ont and fonght his way up Jookout Monntain. and hy evening had secured a pusition mear the summit. During the night the Confederates witladrew from his front.

It haylight on the 2.th the battle was omened hy Sherman's attack on the left. Tooker, eoning wer Lookout Momatain on the right, was delayed in crossing (hattanooga creek, and didnot strike the encuy wntil about three o'clock. To relieve shaman from the forces concentrating upon him, Thomas, in the center, charged up Missionary Tídge before Ilooker attacked the ('onfederate left.

Ilis troops, under Woot and Sheridam, once started, not only drove the enemy from the rifle-trenclies, but followed them up the hill, earied the works on the erest of the ridge, and ronter their defenders, jursuing them until dark and (a) it uring many prisoners. The troops in front of sherman, now manhurterl on their left, also retreated. During the nisht of the asth the pursuit was organized, and measures for the relicl of Burnside were tiden, which were carricd to a surecessful iscue.
Grant's total strength was about 60,000 men, his losses in killed, wommlet, and missing nearly 6.000. Brages's furce's were probathly alumt $: 30,000$. Ilis total loses are not exict ly known, but the number of prisuners taken exeeded 6,000 mon. with 40 gums and 7.000 small arms. James Meracer.
['hattel [O. Fr. chatel < Lat. capitale. propurty]: in hw. This is a word of comprehensive meaning. imbl, with certain -xepptions, includes all property of a personal or movable nature. The common law distingnishes between hereditaments on the one hand and chattels on the other. 'Thonerh this distindion is in the man founded on a difference in the natur of things, the one being in gratal immovalie amd the other movahle, yet it is part arbitrary, since there are some thinge which are in their matme chattels, and yet in law, in a partionlinl ("ase or for some sperial proposes. within the rules governine interests in land. No ore conld deny that pigenos are in general movables or chattels, yet they might frocome so connected with the land bw their abode in aporen-honsa as to descend as land to an heir. The same rematk might be matle of a key ol at honse, which, thongh in its owners pocket. miont be regarded in law as part of the hanse or lamd. Mr. Anstin expresses the same idea in tho following worts: "Things which are physically movahle naty le immovable by institution." to in some eases mon owner"s inluntion may impress uon a movable thing the logal qualities of an immosible as where money is dieseted fiy a testator to la lank ant in lamd, it is for legal purposes demed to be land. These sime doctrines may be regarded from an opposite point of view, mat that which is really himl may become in contemplation of liw a chattel, as where land is directed by is testator to be suld ind converded into money. (ertain temporary interests in land are in law troatid as chattels of a peculiar nature (eloattels pral), sueh as leases for a delinite nmmber of years. There is here no (onnt]leteness of classification, and much time must be spent
by a local practitionw in acouiting arhitrary distinctions. aid particolarly in cletemining when chatele athathet to the land are tis the decemed a lart of it. 'IMte' attlition of machincry, buiblins. trees athd shoubs 10 hand, vishor by the wwner or sume stranser. has siver rise to an important rhas of questions usaully treated mmer the temm " livinem." Sitr VixTLRES.

Chattels personal aro usually sublefived ley foxt-writers inte two principal clatses: such as are in gexses-son and in Hetion. The first term neerls no special exphamation. It would inclute the common chace of a movable thing like a watch or adomestic animat. in the fusecosion or under the control of its owner. I su-calleaj thing in atotion, or chuse in actions is intanerible. It is a mere right, and (ann only le made available or reduced into pussession by a legat procedoling. In instanoo is a note or bonde or acconding to sombe anthoritios, a right to reeover daname lim a wrong committed. This classitication is imperlied. as it is platis that there are some rights which con not be hromght within it : such as putents of enprights, which, thentrh derived from the state, and in the nat ure of monopolies, are fomsidered as chattels. siome writers woulal discame this emmonolaw distinction, and divile property of a mownlo mathre into em-
 such at distinetinn is prevalont in the law of real estate it is well shown by Nr. dustin to he mophilosmbieal. Ite adro-

('lumbes-Aigues, shol'zayg' : an old town of C'per Auvergne, in France; department of Cantal (see map of France, ref. -F); celobrated for its hot mineral springs, which were well known to the Romins and are mentioned by Sidonins Apollinaris. The water, whose temperature viries from 135 to 105 F., is slightly alkaline and is used not only for merlical purpuses, but also furnishos a cheap means of heating the houses of the town. Pop. abont 1,650.
Chadet, shöday', Antone Dexis: bo in l'aris, Mar. 31. 1563; d. in Paris, Apr. 19, 1810 ; senlptor and painter; left many works in sculpture of ligh importance, and portraits of Napoleon 1., and many of his contemporaries.

Chaudière, shō'li-ãr' : a river of the Dominion of Canada: rises in the south part of the provinee of Qurbee, flows northward, and enters the sit. Lawrence about 4 miles above Queliee. Length, 120 miles. Two and a lalf miles from its mouth is a remarkable cataract, called the Falls of the Chandiere, which is about 100 feet high.

Chandione: a lake of Canada : ahout 15 miles W . of the ity of Ottawa; is an expmenon of the Ottawa river.
Chammonot, shōmōnó, l'ighre Maria Josepit: a Jesuit and missionary to the North American lndians. He was born in France in 1611, went to C'anada in 1639, and after many lators and hardships died near Quebee in 1693. He wrote a grammar of the Huron language, which was published in 1835.

Chamont, shōmōn' : al won of France; capital of the delartment of Jlate-Marne; om an eminence nem the river Marne; about 141 miles LE. S. E. of Paris (see map of France, ref. 4-П). It is comnected by railways with Paris, Troves, and Tesoul. It has a trimphal arel eommenced by Xapoleon. and a public library of 35,000 volumes: also manufactures of drugget, hosiery, cotion yarn, and gloves. On Mar. 1, 1814. the aflied powers here concluded a treaty :ug:inst Napoleon. Pop. (18:6) 13.42s.
Chame'ey, Isasc: a commodore in the U.S. navy ; b, at Jilack Rock, Fairfich co., Como, Feh. 20, 1ri2. At an carly age he manifested a lowe for the sea and entered the merchat service about 1 axis ; ohained command of a slip When he was nineleen years old. On the orgmization of the hary in 1798, Chauncey was appointed a licutenant: promoted commandant in 18ios: captain in 1vig. He serverl with distinction in the war with Tripuli, and for his services there received the thanks of Congress, which body also roted him in sword, but the resolution was neser earried into effect. He was in command of the Navy-yard at Brooklyn, N Y. from 1 som till the whthreak of the wirr with Great Britain, when he was placell in the command of the lakes, whell position he retained till the chase of the war, and won for himself the highest homors for gallantry ind skill as a natal commanter. Ho sulsedpently commanded the Merliterranean squadron (1816-1א), was in command of the Nityyard at Brooklyn. and was president of the mavy commission at the time of his sealh, which oceurred in Washington, dan. 2̃, 1840.

 Professer of Gretk and Hebrew. He left the university in $162 \%$ and from then till leaving lighand was a clargyman in parectial duty in the: ('hureh of Bugland. Il is Pu-
ritan principles bronght him into trouble, and he emigrated to New England in 1638. He became president of llarvard in 16it, succeeling the first president, Henry Dunster, and d. Feb. 19, 16 T2 $^{2}$

Chautalugua, sha-taw'kwa : a widely known summer edueational center on Chantanoua Lake, Chautangua co., N. Y. (for location, see map of New York, ref. 6-B). The gromme, formerly known as Fair Point, were purchased in 18 af by the Chantangua Asembly, originated jointly by Lewis Diller, of Akrom, O., and Dr. (now Bishop) John "H.' Vineent, of New York. 'The town, containing more than 200 cottages, a large hotel. and 25 public buildings, lecture-halls, recitation-rooms a muscum, gymnasium. ete.. is built upon heavily wooded terruces, sloping gratnally to the lake shore. There are complete water and sewerage systems, fire department, clectric-light plant, and other municipal features. The averuge summer popmlation is about 10,000. Sce Cifaltalqua Sistem of Edecation.
Chaulaupna Lake: in Chantanqua co., N. Y.: a beantiful sheet of water atont 20 miles long, and from 1 to 2 miles wiuc. It is rea feet higher than Lake Eric. The surplus water flows throngh an outlet into Conewango ereek. Ste:mboats ply between Mayville, whieh is at the N. W. ent of the lake. and Jamestown, a flomrishing commereial city at the S. E. extremity.
Chantangua system of Education: The plan of applying seientific prineiples to Bible study and the training of Sunday-school teachers begun at Chantauqua in 1824 naturally expanded to inelude elasses in literature, language, science art, ete. In 1878 the establishment of the Chunfany"u Literary and Scientific Cirrle paved the way for a system of home reading and study, which has since been widely extender. To Dr. W. R. Harper, now president of the Chieago University, who has heen conneeted with Chautauqua since 1880 . much eredit is due for the development of the educational work. The combined agencies now employed are known as "The Chantanqua Eystem of Education." Two divisions are made: (1) Summer Work. The College offers eourses in college studies under instructors from leuling institutions. The Schools of Sacred Literature and the S. S. Yormal Depurtment give biblical instruction and pedagogical training. The Teachers' Retrent deals with peychology, bedagogies, and practieal methods for secular tearhers. The Sichools of Music aml Physical Lducatiom offer exceptional opportunities under teacluers of the first rank. 'Ihere are also classes in art, decoration, oratory, manual training, etc. The number in these schools varies from 1,000 to 1,500 each summer. A schedute ul daily lectures, coneerts, readings and entertainments. afforts instruction and recreation to all. (2) Home Reading axb Stidy. The college contucis entrespondenceinstruction in all regular college subjects. The instructors are professors in well-hnown colleges. Each course equals the work expecteal of a resident student in one subjert in a year, and regnires about ten hours per week for ten months. Lesson sheets are sent trepuently to the student. who returns them for eorrection. The examinations are condueted by the Eniversity of the State of New York. The Chantanguat Literary and sciontific Circle has enrolled over 210,000 reaters since 1888 . The iverage number of readers at one time is about 40.000 . The essentials of the plan are: A iletinite four-year conse in history, literature, seience ete. Specified books are aproved bra comeil of six. The reading is apportioned fy the week. A magazine, The Chumtuuman, contains alditional readings, notes, and general literature. A membership book gives snggestions for realing and review outlines. Isolated readers may have all the privileges. Laxal cireles may he formed hy three or mure members for mutnal aid. The time required is about an hour a day for nine months a year. Certificates are granted to all who complete the conrse. There are advinced courses for contimued realing in special lines, a pedagogital course for scular trachers, and a comese to enconrage the realing of good literature by the young.

 some watward and visible mans, such as a false twen or sign. A mope lie was not in this sense a cheat, thetesh in a

 erimimal offerse. This viow led to tint--jum athl artificial distinetions: For csample, if al man in purehasing ghals fave his own cheek 1 an a bate in which be linew that he fant no funels, it would ber at mere lie peduced to writing. and thus not in cheat: while if he gate another manes the under the same ciredumstanco the ade would be cheat inge as
the paper was then a token or symbul. Tomber these rules false personation may he a common-law cheat. particularly where the mersonator by dreas or thkens reprements himseif W) be another gerem, and thas rense injury to others. some have even mantaned that the def ramber might himalf he a symbel or token, as where kmowing that he beld a relation (such as apprenticeship) which prevented him from "htering into a publice engagement (*nlistitur as : soldier)。 he professed to he able 10 , and did in fart, onter into it.
The crime of forgery, thomgh nsally, from its magnitude as an offense. discussed separately from the varions rlasies of cheats, is in reality comprined within tha sume category. The "lalse token or sign" nesesary formstitute cheating at common latw must be of such a nature that its tembency in gencrat would bu to drepise, thongh in fach it may le used only to injure particular individuals: as ©. If. the use of false dice in games of rance. Morenver. it is esential that any injury sustamed be propery attributable to some confidence or betiel which the use of the foken, etco, inspired. If ather considerations than the deviee influence a persons action, the is merely an attempt to cheat. This is, however, also indictable. (lleating helonge to the lower grate of criminal offenses, lemed " misdemuanor*."
2. Fulse Pretenses constitute a very reprehensible mote of frabtulent decteption. The failure of the common law to provide a remedy where no symbt was employed made statatory provisions necessary for wrongs thas ocusioned. Reference can here be made only to such resulations as the varions states have genorally agreed in establishing. False protenses may be defimel as false representations. with intent to defrand, by words or acts conceming past or persent facts and events. Statements of a promissory nature in regard to any future tranaction, and jerhaps ath representations as to the future are insulticient to atford a gresund for prosecution. The fabse representation may be mate by acts without words, as if one jurports hy his pacular dress to belong to a particular institution of learning such as Cambridge C'niversity. A fabse sample may also be referred to. Shere expresions of opinion, however, or mere exaggerations of language. ly which he reasonable man would be influenced. can not he comsidered fate pretemses within the statuter. It is a further ruk that the deecption practiced nust he the efliciont uprative canse of the injury sustained. The eriterion atwas is whether. if there had been no suche deceit practioed. the tramaction let ween the partios would have hedn consmmated. There has been much discussion ujw the print whether the reprrosentation mut be calculated to deceive a presson of ordinary prudence or whether it will be suthicint, thongh the 1rarty was weak, that he was acthatly defrauded. The ghastion is stilf open. The false pretense may be made by an ageret in such a way as to make his princijal crimimalig liable.

Property acquired under lalse protenses is heted by tho
 true owner, but it transfermed to an honest purchaser. who ancts in grood faith, withont knowledge of the fimad, the latter"s chaim is indurfasible. (In the other ham, when grosk are stolen the thief cam, with hut few exceptions, give no better tito than he lamself posesens. The reasom for the difference is that in the one cane the wrong-doner acts with the owners consent, aven thongh it be procured frambulently, while in the other his will is in mo way exerted. Alcorting to general principhe this othense would be a misdomanor, thongh the stathes of mome of thestates make it a felony.

Check, or Cheque [O. Fr. eschec: ltal. scercro. from Arah. Pers, shith king, as a term used in game of chess]: a bill of exchange dramn upon a bank or banker. or person holding a position similar to that of a banker. It has some peculiarities which distinguish it from an ordinary bill of exchange. particularis when it is parable without any specific mention of time. It is then. in point of larr, parable on demand and without dars of grace. If payable a fixed number of days after date, it raries but slightly from a bill of exchange, and will follow the ordinars rules as to dars of grace. It is usually said in the lawhooks that a check is not accepted as a bill is. Acceptance, howerer, as will be seen hereafter, has recentle become quite common, and is perfectly hawful, A eheck inay he consilered under the following heads: 1 . It furm and requisites: 2. The duty of the holder as to demand of payment (a) toward the drawer, (b) toward the indorser, and herein of crossed ehecks: 3. The effect of the cheek upon the hanker, and, under this, of acceptance: 4. I check cunsidered as payment of a debt or as cash; 5 . The civil and eriminal liability of drawers having no funds

1. A check in its ordinary form is simply an order addressed to the binker to pay a person named or his order or bearer, or the equivatent of a hearer (sueh as a mere numeral), a sum of moner. A check may meserre this form and be post-laterl. This class of checks is not used in England, owing to the provisions of the stamp Acts. It is quite common at the present time to make a check payable to order. as the indorsement of the name of the pryee operates as a receipt. In smme instances a note mar amumt to a cleck. Thus if a customer makes a note payable at his hank. he implicitly requests its payment in the same general manner us if he had drawn his check. In filling up a check care should be taken to so draw it that additional worls, which might increase its amount, can not be inserted in blank spaces. Thus if the drawer had written the words "fifty dollars," and had heft sulficient space between the word "tifty" and that which preceded it to insert "one hundred ath!," and such words hat been fradulently inserted, and the bank had pail the check in good faith, sulpposing it to be drawn for sisn, the drawer would be the loser. When, on the other hand, due caution has heen excreised, the loss from forgeries will fall on the bank. rather than on the Hrawer, thengh the former mar in some instances recover from the holder. 'The drawer may simply sign his name to a blank printerl form of check, of even to a blank sheet of panar, at the same time anthorizing it to be subsequently tillen up hy some person acting in his behalf. If so filled the will be bomb. Even shond the agent acting fraudnlantly fill it up for a larger sum than was directet, the dratwer would still he boumd to a person who took the check in gnot faith. This would not hes strictly a case of forgery, but that of an agent defrauding his prineipal, and yet acting within his nppremt authority.

The Duty of the Modernsto Demand and Tofice: (a) ts to the Irmere:-The drawer has a right to expect that the hodier will demand parment with promptitnde, as, if the banker fatils to pay, remirse maty he hal to him. Presentment should ber matle in genemil. as parly as the next lay, and if payment is not mande, due notiee given. llowpore, a failure to present is not necessarily fatal to the bobler's clam. Whether it is or not dejeenis on the fact whether an injury is cansed to the Iribero. If for examphe. he lam no funds in the hank, want of presentment is momportant, ats it is pain that be sustans no ham; so if after eriving the chock, he witheraws his fumes. If. how"ver, the hamker shand become insolvent with sullicient funds of the drawer in his posisesion, want of presentinent
 -ladorsoments uph checks are common. In indorspment is umessary when the instrum is phyable to order : it isatmissible when payable to hamer Tho legal effere of imberement, as in the case of a bill of exchange is to make
 "harge him are taken. These are subatimitally the sime on-
in bills of exchange. There are cases in which no presentment is necessary to bind the indorser. as where he intorses and puts in eirculation a wid or forged cheek, eren though he does this innocently. In some eases custom enlarges the time for presentment. Thus if" there be a enstom to pay checks through the "dearing-house" (see (learixg-house), the time required for them to prass throngh the system of exchanges there adopted will be allowel. In Eingland a practice of crowsing checks is resorted to. A check is said to be "crussed" when it is marked by the drawer in such a way that, instead of being presented through an ordinary holder, it must come to the paying bank through a banker. This practice has given rise to a number of perplexing questions recently settled by statute ( 21 and 22 Vict. ch. 79 ). The atditional time necessary to present the check in this manmer must of course be allowed there to the holder. It is believed that crossing checks is not praticed in the U. S. A practice has grown up in some of the large eities to my drafts drawn on bankers by checks drawn by suth bankers, in turn, upon some regularly organized bank, instead of cash. This practice has an important effect upon the subject of demand. Though the check is not payment of the dratt, ret it must be presented on the same diny that it is received. ne the dratwers of the draft may be diselharged. The holder of the draft might have insisted on the moner instead of taking the check, and if not paid might have protested the alraft.
3. Effect of the Chect on the Banker on whom it is Drawn, and herein of Acceptance.-Accorling to the better opinion, a check gives no right of action to the holder against the banker. Of course the latter should, in general, lar it, but the holler has no means of enforeing this obligation if the banker refnses to perform it. This rule grows ont of the nature of a deposit in a bank, in respect to which there is mueh popular miseonecpion. This fact is perhaps partly due to the ambiquity lurking in the word "denosit." This is sometimes and property used to mean the act of intrusting a specific chattel to a person who is bound to return the identical thing lelivered to him. That, however, is not the nature of an ordinary bank account against which checks are drawn. The banker is not bound to render the specific money delivered, but ondy engages to pay an equiralent amount. The relation of debtor and creditor is created by the thanaction. Although the banker is bound to pay checks when he is in funds. it is a dute between him and the depositor or crelitor. It can not be enforced by the payee of the check, who is no prarty to the contract. Nor can the theck he treated as an assignment by the depositur of en much money as it repreatnts. These riles have led to a vere important practice of certifying checks. An oflicer of a bank-e.g. a teller or cashicr-has by custom acquired an authoritr to mark surh checks as are presented to him as goon. This act is treated in law as an acceptance, and the hank becomes liahle. The pratice is attended with danger, as it practically gives to a teller power to establish without limit fictitions claims against the hank, ats he may certify clecks for jersons who have overdrawn their aeconnts, or eren who have closed their aroounts, or have had no dealings with the bank, which will still he hinding um it on general minciples of law. (See Agext, Eitupped, and Brle of Exchame.) A cashie or teller, however, can mot, where he has no funds, villitly certify his own check. On the wher hand. ecetifiontion of acheck is attemded with some hazard to the hoddr. as he may therely release the drawer should the hank fail even on the same day and between the time of certifieation ant of presentment for parment. (Jitional Bank of Jorspy City ugt. Leuch, New Iork Court of Appeals, 1870. ) In the financial crisis of 1873 in New York, certified bank-checks by genemb consent played an important part in monetary transactions, and became for a considerable time. thrmgh the association of a nomber of nationald hunks, a subatitute for currency. It may be alded that hanks ametimes pay rhocks for customers who have no balane due them. These are called "overdmats:" The bank in such a case has at cham upon the deater for the sum overdrawn.
4. I (hierk Considered as Preyment or as Cash.-The general fresumption of law is that a chack is issued by a drawer to a pave in payment of tebtand ont as a means of making a ham. The intention, however, may be shown by atlimative proof. comsielered as payment, it is not in genemal ahmolute it is rather a means of ubtaining payment, whet her it be the detburs own check of that of a third perma. Acontingly, if the eheck is mot paid, the creditor
may resort to his original clatin，though if there be an agreen ment to recoive the clarek as full payment．it most be forl－ Jowed．In other wemels，it eheek is mot mentey hot a menns of whtabiner money，and delfs can not he paid in atrything but nomber，males there be an arrecoment tor smane substitutc． The gitt of ome＇s own（oleck，maless it be certition），is a mere maked promiso，and may be rotutermanded at any time br－ fore pityment．＇The death of a dratwer in sutela a case betore ［aynent wond the atovoation of the mathority．It iscome mon for a mank to receive on mposit not only zash，but checks drawn either on itselt or on some othere bink，payable （1）the depusitor．such a dhemit is mot to he treated as cand in case the chaek is dratw on another bank．It is ratlare
 the repositor will be liable on his insorsmont，which is usially required．Where however，the eherk is givera loy another dealer，the receiviner bank is absolut dy bount by the credit which it gives the depositor as il it liad paid the cleck．
 Having no b＇unds with the l＇ank：（er）C＇ivit leinbitity－－It is ageneral rule that a man who draws a checek with kbowd－ edige that hes has no funds commits a trand loward the
 stances the sellore cond resoind the sale as I＇ratudulent．It will not be enongh to mastan the sate that he las dratsonable prounds to experet fimuls，hat they mast ho ucturnlly on hend to pay the dacek．This view procerds upon the theory that at check is in the nature of a representation that the money is immediately avalable：amd where a drawer has notice to the contrary to makes a representation known lo he fialso Which avoids the contract as bet ween him and the seller． though it would be oflerwise should the rights of innocent jurehasers intervene．（b）＇rimimal Liability．－It was not a crime at common law to give one＇s own cheok for goots bought with knowledge that it was worthless，since this was only an atimmation or a hase bie redued to writime． and there was no token or syantol of falselamel on which the common law lays stress．It might acoordingly be a ［riminal chart（see（ine．st）knowingly to phiss off the worth－ less check of another．Under the statutery otense of lalsie pretenses it is criminal to give ones own cherk on sumb a sale，knowing that the drawer Jad no tumds nor any roa－ sonable grounds of expecting them．There might be cases， such as that of Lounghren aguinst Barry，above aited，whore the contract wond be reseinded on aceonnt of a represon－ tation known to he false．aml yet the drawor would not be guilty of erime，hy reason of the abspme of at true criminal intent．See sinuw．On the Latu of Bumbers＇（＇hechs（lun－ dom，18：1）：also l＇arsans，on Bills amd Dotes：amd bther text－writers on same subject，as（＇hitty，Byles Storr，ete．

It may he ealeulated that cheese can grive at loast one and
 The sonse of tanto has puwer to stimalate the secteplon of digestive indils：and the pangent，agrecalole favor of well－ comed ebsese rembers it a fond easy of disestion，eren to the ＂xpat of promoting the digedion of whter foots that maty have hean（onsumbed．

 comdition sf the milli fonm which it is mate．（therese maty he mate from the milk of any anmani，bat nearly all the ehecess of commere are mate from that of cows．Dilk is a very comples compouml，whl the milk ot ronws．ats the cheese－ maker mends to know it，is componed of sulatances purtly in sulut ion and party in shepension．It may be described
as a thin emulsion of fat, in a serum of albuminous matter, sugar, and mineral matters. Whell obtained from a healthy cow in its normal state it has a constant tendedey 1 owiril ucidity. It will chance the color of litmms paper herore lactie acid has been developed. I small quantity of catrbonic abd is generated soon after it is drawn, if left wam but that can be taken ont by agitation and auration. 'l'le thae somrness of milk is cansed by the development of lactic acint. The suecific erravity af milk varies berween 1.029 and 1.035 at $60 \mathrm{~F} .:$ that is 10 siy, a quantity of milk equal in bulk to as much water as will weigh 1 , oun lh. at 60 F . will weigh from 1.039 to 1.0 Bj Jh . at the same temperaturt. The effect of each per cent. of fizt is to decrease the specific gravity, because the fat of milk is lighter than its other parts. The eflect of wach per cent. of solids other than fat is to increase the specific gravity. The total solids of orlinary milk wary between 12 and 16 per cent. In some unusual instances the range of variation has heen known to be between 11 per cent. and 20 per cent, of total solids. and between ? per cent. and 10 per cent. of fitt. The solids of milk are its only constituents that have any real or ratable value. The water that is put into the milk by the cow, while the process of elaboration is proceeding in her ndder, is worth no more pes ponnd or per gallon than the water that may be put in by a man when it has come into his hambs for use or sale. "The limits of variation of the solids other than fat are usmally within one-half of 1 per cent. in the same cow at different periods in hel milking season. Ditferent cows of the sime breed varely show a variation of more than 1 per cent. in the solids other than fat contained in their milk. The greatest difference exists between cows of clifferent brechs: it will sometimes reach as much as $\frac{2}{2}$ per cont. as between the milk of cows giving estra rich milk and those yielding a yery poor quality. The solids other than fat, of the solids in the serum of the milk, also increase slimhty during the milking season; the rate is about 04 per' rent. of solids not fat per month.

Composition of Milk.-The average composition of milk from eows may be stated as

| COMPONENTS. | Colostrum. | Normal millk. |
| :---: | :---: | :---: |
| Water | Per cent. $75 \cdot 8$ | Per cenl. Si? |
| Fat. | 26 | $3 \cdot 60$ |
| Casein... | 15.0 | 3.50 |
| Sugar.. | $3 \cdot 6$ | $5 \cdot 0$ |
| Ash. | $3 \cdot 0$ | 0 \% 0 |

A great many vitriwties of cheese are now made. Many of then take their distinctive name trom a particular place or locality from which they come. All may be said to helong to one of the clasies ": soft cheese," ". medimm or firm cheese" of "hard cheese." Soft cheeses are seldom pressen, and therefore contain a larger per cent. of water than the others. In most cases soft cheeses contain from 60 to 40 per reant. of water, with an ayemge of about 50 per cent. Menlium or hard cheeses contain from 40 per cent. to 15 per 'rent, of water, with an average of about $3 \approx$ per cent. The following table shows the composition of the varieties of chereps commonly found in the markets of America and Eury"

| make of cheese. | W | Fat. | Caseiu. | Sugar. | As |

Consmituextsof C'uelsmo-The bereentaguaf fat contained in different individnal cherses of the make which is known :s Chectelar, and which is pratotically the checse of the Amorican contiment, may raty from en to 44 per cent. The per-
centage of easein and ablomen may vary from 17 to 28 per cent.: the per cent. of ash from 25 to 5 per cent.; and the per cent. of water trom 22 to 42 per cent.

The milk fut is held to consist of a mixture of several complombls, each of which contains glycerine with some alcill. The more prominent and important of those compmunls are olein, palmitin. stearin, and butyrin. The composition of the milk fat seems to he changed very shortly after the milk is drawn from the cow, and its exact character at any time is therefore quite uncertain. Fresh milk rloes not appear to contain any butyrin, caprylin, or caproin, while these appear shortly after it is drawn from the cow, and are toubtless the products of a degree of fermentition. The fat in the milk is in a condition of minute globnles. which are held in a state of permanent emulsion. ('ream has no definite or unvarying composition. It is a word nsed to define that part of the milk into which a large per cent. of its fat has been gathered by the influence of gravity or by centrifngal force. It is composed of the same constithents as milk, but they are not in the same nor in any constant relative proportion. (ream cheese implies the use of a quantity of cream inded to the normal milk.

The Casein.-The casein is the portion of milk which is coagulated by the action of remnet in the pracess of cheesemaking. It appears that the casein does not exist in the milk in a state of complete solution. some of it appears to be in actnal solution, while the greater portion of it is in a state of suspension in the form of minute granules. When milk is filtered through porcelain, the casein, together with the fat, is filtered out, and a clear liquid, which is commonly known as the serum of the milk, is obtained through the filter. Casein and albumen together are known as nitrogenous compounds, and have also been called albuminoids. In composition they closely resemble the albumen or white of an egg. Albmmen may be seen as a thin white scum on milk which has been scajded or boiled. The albumen is not coagulated by the action of remet, and in the process of cheese-naking mainly all passes into the whey. Jo dislinguish the casein 1rom the curd, it has heen called caseinogen.

Mill-sugar.-Milk-sugar is essentially of the same composition as cane-sugar, bul is less soluble and not so sweet as the latter. When it is acted upon by certain micro-arganisms or ferments it is changed, vielding as its main prorluct lactic acid. The presence of lactic acid gives the milk or cheese that quality which is termed sour. In the process of cheese-making most of the sugar passes into the whey. A small quantity of it and also of lactic acid is retained in the cheese. These are usually in tables of analyses classed under the head of extractives.

The ash of mith is mainly made un of such elements as calcium, phosphorus, potasium, sodium, magnesium, oxygen. sulphur, chlorine, and iron. It has been demonst rated that the calcium or lime compounds in milk are of particular importance in connection with the process of cheesemaking, since the rennet will not coagulate the casein of the milk unless some soluble calcium componnd is present. At the present time our knowledge of the changes which oceur in these constituents of milk and cheese during the whole process is quite meager.

The quanlity of milh required to yied 1 lb . of merehantable Cheduar cheese (which is agnin taken as typual of the ordinary checse of commerce) varies according to the source and quality of the milk, and also aceoraling to thr process and manner of manufacturing adopted. It will range from 9 lb . to 11 ll . of milk per pound of cared cheese.

The proper care and preparation of mill exercises a farrearhing intluence on the quality of the cheese which is male from it. Many of the varions forms of fementation which are manifested in milk and cheese are sources of trouble ant loss. All the forms of fermentation of milk or its protucts which have yet been studied and describedfrom the common soming to the pungent flator of old clucese-are due to contamination of the milk by some mi-cro-orgnisms which have reached it from ain external source after the milk is drawn from the cow. Thesa organisms of various sorts are so mumerons mat widespread that no practical mothod has vet been devised of adopted for kephing them entirely out of milk. Seeing that their presence appears to be inevitable, the dairyman must devote his eflorts to preventing undesirable sorts from finding a place in the prombet which he hamdles aml toward kerpe Ing the action of others within such bounds as wo promote the development of flavors whicl he will dimd valuable in food prorlucts. The best means to attain this end are per-
fect clembiness and a regulation of the temperature at which the milk or itsprodncts are kept. (arelesoness or matidinese in the milking of cows will introduce taints into the milk which no degrete of subsegtuent care can eliminate or hide. All the vessels and utensils which ate used in the dairy shouk be seakded with hoiling water as frequently as i- necesary to kepe them perfeet fy swet and chen. Fifthy thors and jroximity to any soure of foul air are frequent causes of enmamination. Nilk shombatways be stramed immediately after it is drawn from the enw, to remowe leares, straws, hats, or any other impurities which have falleti into it, and some of which might be dimolved to the injury of the whole promet.

AFration.-After the straning is athemed to, the milk should be aërated. Joon often it is jwared into one tirge can and left there just as Une cows have given it That neglect implies three things that are injurions to its quality for cheose-making: (1) The pectiliar olor which the com imparts to the milk will he left in it matil it heconmes lixet in its flatror. (2) The undewitable germs of fermentation that eome in the milk ani from the air have the laot conditions for growit ant action when the (3) The milk will become in a demilk is left undisturberl. (B) The mike win become one it is
gree unfit for perfect congulation by rennet. Hene nopland and advantageous to aerate it for thre reasons:
First, hecanse by paring, stirfing. dipping. or trickling it over an exposed surface, there is ofiminated from the milk by evaroration any ohjectionable volatile ement that may be in it. Secondly, beeanse, as ha- already heen statem, the milk contains germs of fermentation. A pecoliarity about some of theo microbes is that they herome active only in the absence of free oxygen. When warm new milk
 furni-hes the beet condition for the commencement of atetion by these almost invisible creatures. Affer they get started, they can kep, up their deesmpusing work, ewon in the presencip of oxycen. It is impraticable to perfectly coagulate sumblailk so as to yidd a fine quality of kopting elsese. Seglect of ar̈ution will incorase the quentily of milh requiren to make a pound of fine cheesp. Thirdly, becanse the airing seems 10 incerase the number and give vigor to the germs of fermentation that will hring about an acid condition of the milk. without prodneing the arid. So much is this - ot that it hes. bern fount impracticuble to make strictly firsl-class "heddar cherse from milk that has not betn aprouted.

Cooling.-'The subsequent cooling of milk retards the process by whel it becomes som. "Certain germs of fermentation exist in milk which in the aet of their multiptication split molerules of sugar of milk into mobecules of lactic acin. By delaying the opration of these germs the milk is kept sweet for a bonger gerial. The coraline of the milk should never prede the airation. A temprature of from to to $\% 0 \cdot{ }^{\circ}$, will he fombl colld enough for the kepping of milk over night when it has heen previonsly aimet.

Taints.-Milk is a lifuid of absorbent proclivitios. shonld be proteced against injoury that would result from exposure to impure air. Any faints which may he present in the milk from the odor ar flater of feed which has heen consmand lis the cow will he strongest when the milk is newly drawn from the animal. Tants giving off bad odors and imparting unpleasim tlavors from the action of hacteria become stonger the donerer the milk is keph. The colostrum, or time pertion of mifk given hy cows after the birth of the call, is mot lit for nse in the manfartmer of clecere That condition of the milk nasully lists until after the fourth day:

Proces of Mantofatione- The task of the cheremaker is to preserve as mols as jusible of the morishing constituents of milk in a conditinn at is - hest for human fond, and comveniently prepared for tranaportations. The first cisemtial tratment in the proness is to reduce the halk of the milk by the sepatration of a part of the water which it eenttains. The dexgee to which this sequation of water is effected wery lirgely aecomots for the differene betwen cheeses which are called "soll," "medium," ur " ${ }^{\text {hard.". A }}$
hrief deseription of the process which is followed in the manufachure of Chedhar checes will sutfice to illustrate the proces- whidn is adonted for the mamfature of checse of the varions sorts and which go moler difterme mancs.

The Cheddur chepse takes its name from a mall birish in Somersetshire, in Englami, where, buler the shether of the Mendip, hills. Vinglish dairymen lawe mambactured cheese for some two or three ecoturids. Their methorl was first impored and raised into a delinite system by Mr. Joseph Mareling, of Markhury.

The process of manitacture may be subdivided inter the following operations: The rijening of the milk: the coloring of the milk: the coagulating or solidifying of the enre : the cutting of the curd; the heating, scaliding, or cooking of the curd : the separating of the whey: the ripening of the eurd; the grinding or cutting of the eurd: the sating of the curl: the hooping of the curd, or pressing of the Whese; the hataging of the cheese; and the coring or rijuening of the cloces.

Fig. 2.-Mitk vat and heater.

1. Ripening of the Milk.-'lloe rijening of the milk is a term used by cheese-makers to expross such treatment of the milk as will bring it to that combition when the renuet will congulate the casein more quidlly than when jut into fresh ar mew milk. This is bronght abont ly the attion of vatons fermems in the milk when heha at at toprature suitable for their development. A temperature of from 85 to ! 01 F. scems best adamed to facilitate the change which is desired. The exalot degree of ripuness which gives the hea realt in chese is difticult to determine. The remmet test (or, as it is commonly sallesl, the cup test) is the mont practical test for the average cherse-maker. It is used to asertain the degree of aridity of the milk or its ribeness for checse-making. The test may heseribed as follows Ifter the wat of milk has been heated to the desired temperature take oz of milk from the wat (ancup is the best vessel to manipulate the test in), add I draclum of rennet extract of known strength. Jnst hefore aldine the rennet take a watch in the luft hand and a teaspoon holding the extract of rennet in the right hand. When the seconds hand of the watch touches at some tigure. drop the rennet into the milk in the eup and sive the milk a slarp stirring for about ten seconds to mix the penne thoroughly with the milk. If the milk thickens in the cup in twenty-five secomds it is mot ripe enongh fom selting, and shombld be altowed to malure longer. From twenty secomls down to fifteen sermals hy the tost indicate the condition of mill most desirable for alding the remed to the milk in the rat. The mont accurate way of telling when the milk in the cup has been congulated is to jut a small pinee of larot mateh or any small blatk speek in the cup lefore the remut is added. By stirring the black preck is put in motion, and when this stops moving it is a sume sign that the milk is coagulated. Stter the of"rator has practiceal the test a dew times he will be able to manipulate it with arempery.

Gond's phemol-whallefn ach test is also nsom in some facturies. 1 small guantity of the phenol-phthallein is put intu the milk. While the milk is amidy no change trom the
 for the test. This is added to a small portion of the milk which is hoing tested, drop by drop, and when an sulticient momber of drops bave lieen added to render the milk alknlime the phemot-phthallein at once changes the whole of the lipuid to a matenta color. "The mumber of drops of the alkaline mbution which are remireal to correct the arditity in the milk indieates the acidity or degret of rijeness which the mill has attainea.

To the urdinary competent cheesomaker a sense examinatinn sems adequate to give a knowlenge of when the milk has remelod the proper dagte of ripenes.
9. Coloring of the Hilk.-Anextract of ammeto, which is
nbtained from a plant (bixa orellana) is the common substance which is used for this purpose. It is added to the milk in a liquil formo. usually at the rate of from $\frac{8}{8}$ to $1 \frac{1}{\frac{1}{3}}$ fluid oz. per 1.060 lb . of milk. The extrate of ambatto is usually diluted with water to the extent of $\frac{1}{2}$ gitl. 1 er $1,0(1)$ 313. of milk before it is stirred into it.
3. Cougulating the rurd.-The coagulation or solisifying of the curd may be effected by the addition of rennet or the development or use of acids. "In most cases rennet is employed. It is a propation mate from the stomach of a calf, which has the power of precipitating the caspin of milk. It acts most effectivelr and rapilly it temperatures from 94'to $95^{\circ} \mathrm{F}^{3}$. The curding or coagulation of milk hy rennet is the only fermentation of milk which is known to be produced by ao unorganized terment. As far as known, all other termentations of milk resulting in coagulation are effected ly the ageney of micro-organisms. Rentet, or yiming, is a name also given to the fourth stomach of a young calf. In parts of Central Emrope the remet is prepared hy being hown like ablader until the membames are distender and very thin, when it is dried. In other places the fros rennets or yimings are rubbed with salt and left to dry, when ther may be kept for an imbefinite priod. In preparing it for use in cheese-making the (ly remnet is soaked in brine, sometimes ent in strijs, and always ruhbed frequently to cause the mens to pass into the liquid. The strength of the liquisl remet which is ohtained depends upon the quantity of brine which has been used for the soaking of each rennet. Otdinarily eath rennet has enough virtue to coagulate from 3.000 to $5,000 \mathrm{ll}$, of milk into the hest comdition of eurd for the manutacture of checse. Several brambe of eommereial extracts of rennet are now prepared by sece proceses, A somewhat similar process is descrihed is follows: Wilkins (Lenduirthschafll. Centrall. f. Dentschlumd. 1854) prepares rennet essence br rubbing fresh calves" anomehs with salt, treating with water for two lays at $100^{\circ} \mathrm{F}$. (or a mixture of equal parts of water and Rhine wine), adding to this solution alenhol (90 per cent.) contaning a little hydrochloric acil, and allowing the whole to stand cight days. The lipuid is then filtered, and will kerp for years. His proportions are 6 az. tresh rennet, $10 \%$ silt, $1 \%$ uz, water (or wine and water), 2 oz, akcohol, 12 grains ncin. One fint of the essence will curdle 250 gal. of milk in thirty to torty minutes. Schatzmumn (IViener Landsehofll. Zeit., 18荡) investigated the action of artilicial preparations of rennet, and found then to be very permanent, their action to he reliable and aecurate to the oinute, and the cheese to separate better, with a higher yielel. Hansen (Lamburthschaftl. Centrulb. $f$. Deutschlumd) is said to have prepared rennet from hog stomacha atter they had been nsed for making pepsin, using acid, and wbtaining rennet in solution and in the solid form.

The action of remnet is not yet well understoon or explaineel. It was Ilammersten, a swedish seientist, who first undertook the stuly of rennet in such a way as to present clear infomation on what the substanee is.

His researehes lasted several years, and he gave an account of this le rment which has been hat little changed up to the present day. In his tirst prer ( 1822 ) he demonstrated at the outset that the action of remet is entirely independent of the fomation of an iucid. The reaction does not change during the curdling. although the curd is nsually acht from the action of micro-organisms. He prover, secondly, that the atetion is entirely inden-ndent of milk sugar and affects the casem alone. Ite foumd that solutions of easein whirh hal been entirely freed from sugar would curdle reatily by means of the ferment. Nuw since, as lad alrealy been slown, the aetion of micro-organisms in suming milk is on the milk sugar rather than the cascin, these wonclusions proved that the two prenesses were entirely different, the one acting on the milk shear and the wher on the caseing the one curlling the milk hy the formation of an acid and the otber motaltecting its reaction. Hammersan also sureceeded in sparatines the aetive principle of ramet from the other ferments asmemtell with it in the gastrif secmetion."
11. W. Conn gives this explanation, which serms to be the best that has yet appeared, on the action of womet:

- This casmongens appars to he kept in the andition of semi-solution by the alkaline comelition of the milk, for it is easily precipitaicul from the solution be the presence of a small cumatity of acid. When thus precingated it seems to be simply thrown trom its solution withont being altered in its nature. But the active principle of renoct has it very
different effect upno it. Unaler the action of rennet the cascinngen is chemieally changed. It is broken into two clitferent proteids, one of which is easily coagulated, while the other is congulated only with great difficulty. The former is realily thrown from its solution by calcimm salts, and, since these are always present in the milk, the result of rennet action is always to throw down the casein. This portion of the origimal easeinogen is then manntactured into the cheese, while the other portion, being soluble, gness int" the whey and is lost to the eheese-maker. The amonnt of protein thus lost may be still further inereased through the action of bacteria, "Wheh have the fower of digesting even the curdled casein, tum this fact teaches the advisability of using rennet in a manner which will produce the coagulation as quickly as possible. The rapidity of the aetion will depend unon the relative amomet of rennet and the temprature, while it is delayed by alkalies and hastened by varions salts."

The active princinle of rennet is a ehemical ferment or enzrme, which is distinct from the other ligestive ferments in the stomach juices. It has been varionsly called rennet, lab. ehymosin, ind pixine. It scems to be somewhat witely distributed in nature among animals amp plants, and it is a common product of bacteria growth. It is killed by a temperature of 50 (. (155 Fo) and it acts best at ahont $35^{\circ}$ (. $(95)^{-2}$.). It is modoubtedly to be regarded as one of the digestive ferruents.

Elf. 3.-Milk vat and steam-heater.
Temperature of Mith.-In the making of clpese the milk is gradually hrought to a temperature of about $86^{\circ} \mathrm{F}$.; a slightly higher or lower temperature does not appear to make any appreciable difference in the qualitr or quantity of the cheese which result from the process. In mising the extract of remnet with the milk it is nsually diluted to the extent of at least 1 gal. to every 200 gal of milk. This permits of a thorongh distribution of the fermenting principle of rennet, in order that it may coagulate the caseinogen uniformly throngliout the mass. During the congulatinn the casein of the milk entangles and eneases mechanically most of the fat globules which are held in suspension in the milk. 'The quantity of rennet which may be used rarics very greatly. In milk which is almost sour a larger proportion of rennet shonld he used than in the coagulation of milk which is comparatively sweet. The quantity of reunct which is em ployed does not appear to affeet the quantity of cheese Which ean be olitained nor its keeping yualities, except in one respect. The use of a barger quantity of rennet extract in coaguhting milk is likely to result in the retention of an abnormally large percontage of water in the clacese. Chepsersentaining a large freentage ot watcre cure more rapilly and

Fias. 4, 5, and 6.-Gangeknives for cutting the curd. swoil more quickly than chersmes from which more of the water has been expelled. 4. Culting the furd, - When the curl? has becone firm cnough to split open before any dull instrument or the
finger of the oparator, it is considered as suflicienty firm por the frocess of cutting to be commenced. The tine required to attain this eomblition after the attelition of the rennet may bature from ten to sixty minates, with the milk at a temperature of sif F . Jor the cutting of the evorl, knive contaning saveral blates from 晋 of an ineh to $\frac{1}{2}$ an inch apart are used. These knives are of two sorts. inmo colts the curd into lurizonta! lines, and the other-the frorprombenlar knife-ents theae into (rubers. In small dairies, ame formarly in all dairies, the colting was effeeted by Humas of single knives or mathines constructed of wire stretchad on a trante which was lowered into strd again lifted through the soft carrl. 'The degree of limeness of coursmess to which the curd is cout ut this stare of the making has some inthomer on the quatit whell is ratainell in the cheses. The larger the size of the rubes which are heft, the greater is the quatity of water which will he retamet. I matural shrinkage of the entwo uf cumb oceurs from the time the cutting is ettecert. On the surface of each piece of ceurd a tilm is formed. 'lhis is spoken of to the lualing of the curd.
5. The Ifeating, Scalding, or (rowking of the (rurd.-'The whole mass of wher, with the curd in it, is usually raised to a temperature of from $96^{\circ}$ to $100 \mathrm{l}^{5}$. The hoating may ha efleced by the introtuetion of sleam under or around the tin-pan or vat in which the curd is helt. In private datries the common practice is to remore a portion at the whey and s'able it to a tempriture of 15.5 or 120 , after which it is pouren back on the otler bortion of the whey which contains the curd. Fig. 3 illistrates the form of it motern cherse-vat.

During the whole process of heating the ruml it is kept in astate of geatle aritation by the hands of the cheespmaker or by the use of a rake or some there stiring devise. A common test In diseem the approish or dearee of acciblity in the eurd is called the hot-iron test. A small portion ot curd is pressed in the hand until most of the fres? moisture is expelled. It is then toucherl lighty against a hot iron. When it is witherawn from contart with the hot iron, if there be any dovelopment of lace ic acial. a liscre mamione of very slemer filamonts, like the finest of threarls, will be strctchent betwen it amt the iron to which it hat athered. "The longer thes filaments or threads can be stretchel befare they break, the preater is the degree of the development of atid which is revenlent.
6. The Seperrutung of the If hey.-The beatinm and stirring of the curd will cause the part icles to slorint to about ont-sixth of their first size. When they have becomes sulliciently firm amd dry, they are allowed to settle to the battom of the pan or vat in which the mbking is binge varioel un, when the whey is drawn off. To know frecisely the propar stage at whieh to remove the whey requires eane and experience sn the part of the cheese-naker. When the thremts or filaments by the bot-iron test draw to the lenerth of alront f of an inch the curil has usully reached the stage when the whey shoukl be removed imnediately. Tho whey from curd which has been carefully ent and jroperly hamilled is brieht and char, with a slighty vellowish-green shate of color. When the eurd has been cut roughly or hanulled violently durine any of the stases of the process, comstederable quantitios of the casein or tat will loe lost into the whey Whey is sometines drunk as a beverage and is sometimes evaporated for the extraction of milk-sugar. It is usually fed to swine, and is a raluaho fond for then. 'There are thout a lb. of solits in every 100 hb. of whes. Its composition when slightly sour mily be giren as follows:

Fio. 11.-Compount-lever cheesepress. the drier will be the body of the cheese and the longer it will keep without deterioration. The process of ripening is also retarded iu proportion to the quantity of salt which is used.
10. The Hooping or Pressing of the curt.The pressing of the curd is effected not only to get rid of the superthous whey, but to give to the mass a desirable shape and sutlicient consistency to render it snitable for handling and transportation. The hoops are usually cylindrieal, from 12 to 16 inches luigh, and from 7 to 10 inches in diameter. They are made of heavy tin or galvanized irom, or of wooden staves held in place by iron hoops. In some presses the hoops stand on tables. Owreach one is an upright screw, which is used to exert sulficient pressure on the cheese. In other cases gang-presses are used, in which the hoops lie in a horizontal row. The pressure is exerted from one end of the row by means of a screw, and presses all the cheese in the several hoops at the same time.

Fio. 12.-Upright screw cheese-press.
Devices have recently been applied whereby a coil spring at one cud, or the action of a small water-wheel at the other, causes a comimuons pressure to be kept mp, even after the cheeses yield to the pressure of the serew and shrink somewhat in size.
11. Brandeging the Cheese. - The bandaging of the cheese consists in putting therering of fine cheese-cloth in position in the hoop before the curd is filled into it. After the mass has been pressel to give it sulticient consist ency to permit of the new cherse hring handled, the hoop is removed and the bambige of cloth carefully aljusted. so as to cover the sides and turn over the efters of the ends of the cheese. The cheeses are also turned uiside down in the hops haring the process of pressing. The usual time given to pressing cheese in cheese-factorice is from eighteen to twenty hours. Cloths are sometimes left on the enuls of the cheose, to prevent a cracking of the rind. In other cases when the cheese is taken from the hoop, the end-cloths are removet.after which the rinds are rubled with hot butter or whey oil.
12. The Curing or Ripening. - When the eherses are taken from the presses they are only compressed fuantities of curd. The ent is puite insipin, not palatable to most people, ami rather indigestible. 'To grive it the true characteristies of cheese it must be kept for a length of time varying from a
few weeks to several months, to undergo a process of fermentation, which is commonly called curing. The proper flavor is thas developed, which grows stronger the longer

Fig. 13.-Oyston's Herkimer County press.
the cheeses are kept. During that process the casein again becomes soluble, and the varions fermentations, which proceed simultaneonsly in the cheese. give rise to the distinctive thavors which often give different cheeses their names. The acidity of the eurd diminishes as the cheese becomes older and riper, ant in most cases entirely disappears. There is

Fio 14--Gang-press and hoops.
also considerable loss of weight in the curing process. That may be from $1 \frac{1}{z}$ to 3 prer cent. during the first seven days up to 5 or 6 per cent. during the following seventy days. The shrinkage in weight depends in some measure npon the quantity of water retained in the curd and the degree of moisture in and the temperature of the atmosphere where the curing goes on. In some cases the shrinkage has been known to reach 10 per cent. within tive weeks after the cheeses have been made.
The following extracts from Experimental Station Bulletin No. 9, of the U.S. Wepmrtment of Agrienlture (II. W. Comn), present the most reliable scientific information which is available at this date on the ripening of cheese:
"The ripening of cheese has been ennelnsively proved to be a matter of the action of micro-organisms. Coln (1875) first found bacteria in cheese. stating that Bacterium lactis was especially ahundant. But it was Duclaux who first connected the ripening with the growth of these organisms. His first paper (18ii) gave the reanlts of a chemical study of the ripening process. and showed that it consisted chiefly in the transformation of insoluhle casein into soluble albuminoids and that the process was associated with the production of several ferments. Three years later (1880) he made a study of the bacteria in sueh clicese, and determined that they were very numerons and eonprised several species. Some of them were airohic. while others were anatrobic. During the ripening there were produced several gasescarbonic acid, hydrogen, and sulphuretted hydrogen, and a large number of decomposition proxucts, such as alcohol, oxalic acid, carbonate of ammonium, leucin, tyrosin, ete. In
gencral the process was quite similar tuthe digestion by the digertive lluids of the stomach and alimentary canal．It this time Duelanx first sugested that wertain of the bacte－ ria prowlued as the result of their growth ferments similar in their charaters to the digestive ferments a diseovery Which we have seen to be so well established hy later work．

The ripening of cheese was now studieil hy others． Shafler，Bondzuski，and Bemecke all conliming Duchax． sichather prevented the growth of hacteria hy subjeeting the
 these comditinns the cheese would not ripen．Benereke（1ssi） roneludel that the speries bucillus subtilis was the chief organism eoncernm in the ripening process，ath hath others were foume with it．las a later work Inchan（1xsi）applied modern methork of bacteriological study to the subject，and fond serm species of atelohie organisms and three species of anamobic organisms present in the cheese．1h：regarded them all as comermbl in the process．The ripenimg，he sail，ennerned chidly the casin，amd was due to the com－ bines effeet of all of the bacteria present，each ading the whers，and each having an share in the decompoition of the eastin．The aerobic organisms anted at the shefare and the anampobie organims acted in the interior．and thas the whale these hecomes thorourhly ripened．

Thar most systematic work was done howe ver，lyg Adametz （1sw！）．This observer proved that the ripening was due to hatcria growth by treating fresh dheese with a disinfecting agent，which wonfle prevent bateria growth without affert－ ing the chemical contition of the cheese．Culder these con－ ditions the chesese dial not ripen．He also made quantita－ tive ratimates of the number of organims present，linding from s． 0,000 to $5,600,006$ per gramme and this number wat foum to incrase slowly luring the ripening process．It also tried to determine whether the ripening was due to the combined action of many species of organisms or to a single species．For this purpee luy stadied many suerimens，and studied the cheere at intervals during the ripening．IIe found many speries of harteria present，but as the ripening weat on one sperice was found to inerase at the expense of the others，and was murh more abombant at the elose of the ripening than any of the others．This species he alway foum，while the bthers were more sariable and hence he condelated that this species was the ranse of the ripening． The organism in fuestion was not Pacillus subtilis，as hat been supposed by Benecke，but a sjereies to which no name has been given．

Shortly after this Freudenerich（ 180 ）carried on a set of experiments of a similar import to those of Alametz．fon－ dirming his results．Ne obtaned rather large numbers of nrganisms in his chersis，hat agreed with Adametz that the ripuning was dur to a single speetes of organism rather than to the combined action of a large momber．

At this point the knowlenfee of the nermal ripening of checse rest－at the present time．But few ohservations have been made in regard to ahmormal ripening．The greatest ditficulty that the ehere manufacturer has to eontend with lies in this direetion．Ile can not be sure of a miform prodnct．In spite of all preamtions his cheme will some－ times unlerwatmormal tronbles and become worthless by change taking plaw during the ripening proces．These troubles have heen attributed to wery sort of ditliculty，in－ cluting health and condition of the＂ow．the condition of the harn，the fond of the row，ate．In some rams they lave adtually been traced to filth connected with the manage－ mant of the eows．Recent experiments have indicatent that the diret resnlt is in all cases to be attributed to the ate tion of ahnormal spectes of micro－organism：which ent inter the milk，and hence have a share in the ripening of the checese Cortain it is that black cheese，hitter cherese and wherse theekel with red spots are all the chusenl，and several other troubleome infections have with certanty heren traced to micro－organioms．Freudenreith（1stio）has exprimentally shown that if milk is inoculated with cortain spereses of bat teria which should not he pasent，tum the milk is them male into cheere，the cheese will ripnon in an abomormal man－ nor and heemme worthless．while the control shere is fre fertly good．Acrording to Alametz（l－9M），either loneteria， yeasis，or monlls may he the cause of the ahmormal ripern－ ing of cheese under diftrerent comlitions．13ut while at）－ normal ripening is maloubtedy due to growth of improp－ er speries of orgunims，we ani mot at preat detarmine how far the variations in the ripening are sluw to titheremt speries of organisms planted in the curd umb haw far to ditferent conditions of the ripening．Fach doubtess las
its effect，and much further stuly is medend in this direc－ tim．
＂It is evident that the presence of bateria in cheeve is in－ evitable．The milk from which it was mate always con－ tains them，and when male into cheese part of the bacteria at least will he inclosed in the wheere．1lare they find pormer contitions fer growth．The conditions are net wery favor－ able，it is true，for the density of the cheese prevents realy access of air，ant the aërohic organisms sulfer in ennsequence， （exerpt at the surface．The lack of mosisture is also doubt－ less a disinlvantage．But in spite of these lisatmantares the hacteria grow slow！y，amd som prodne profound chem－ ieal changes．＂lhey give rive to the fuphoming fermont which ats upon the rasein，rembering it party yoluble．Be－ sides this，they induce mumerons enther deemposition changes，the total result of which is the production of the rich，delieately lavored eheme for the market．The these－ maker thus fores the lacturia to give him protucts for which he obtains a high price．of course．so far as the foonl walue of these is concerned，it is the cascin and the fat which render cheese valuahle，hut its market priee depends not ufen the quantily of ensein，hut upen the flavor，and this flavor is supplied by micro－organisms．To at ecrtain extunt also it is true that the ditferent flavors of dilTerent －lieseses are due to the action of dillerent suectes of organisms in the ripening．althongh we know little in regart to this mather st the prasent time．

The lerms whirh are used in the frude，and some of the qualities of chesse whid have partieular commereial value， may be dadinel as：（1）rich．clean，creany flacor：（（2）solid， tim，buttery body：（3）line，close，flaky ferture：（4）hright，
 For the julying of cheres at competitions，ame for the making of recoris for romparison，the follewing sale of points las been devised and is serwiceable

Some experiments have been made recently－mostly in the experimental dairy stations of Camadand New York－ to rliseover the relation which exists betwen the percentage of tat in the milk and the fuantity and quality of cheese which may he obtained from it．＇Tlie results of the investi－ gations inilicate that，from milk containing hetween：3 and 4 pre cent．of fat for every two－tenths of 1 per cent．of fut contained in the milk．threetenths of 1 per cent．of cheese may be obtained，additional to the quantity obtaned from normal milk containing ：s per cent．of fat．
（＇onperatiee Fotertories．－On the continent of Norlh Amer－ isa the great loulk of the cheese which is prouluced is made in extoperative factories．Probably yerent，of it is man－ ufactured in chersi－factories aml not，as in Great Britain and other parts of burope，in private dairies．The fisst cheese－factory in the $[$ ．S．was erected and operated by $11 r$ ． Jense Willians，near Rome．Ň．V＇．．in 1Not．Mr．James Bur－ uett，of I moham．Que．，and Mr．Marwey Farrington，of Nor－ wirh．Ont．．divide the hanor of int roducing the eheese－factory sy－vem into（＇anala．
That haves unn which a cluese－factory may be estathishert and the hasines carried on are nenally：

1．A private anterpres，wherely some individual or tirm undertake＇s to provide buiklings and to conturt the hasi－ Hes：or

I1．The furmation of a joint－ituck company or co－oprerative as－ociation．

In the catse of private enterprise one of four plans may be followed：
（1）＇The individual or business firm．called the＂omanface ture．＂may charge such a rate fer pound of cheese ats may be agreed in wh with the patrons who turuish the milk，in comsteration of which the manfacturer will mutertake and agree to manufachare cherese of tirst－chass merehantahte quality，and to provide all fumishimes required in the man－ wharthre and laving or pathing of the same．

The collewting of the milk is sometimes done at the ex－ perne of the manufacturer and sometimes it is delivered at the factury by the parens．I different rate is charged by the manfanturer in the two canc．

Where the milk is collected by the manfacturer for
cheese-making. the nsual charge ranges from 2 cents to $2 z^{2}$ cents prr pound of cheese, atecording to the quantity of the outpnt, the distances to be traveled collecting the milk, and other local and particular circumstances.
(2) The manutacturer may carry on the musines and meet all expenses incident thereto, in the provihing of furnishings, ete., for a stated per cent. of the prownet.

The disposal of the wher is a matter for mutual agreement between the manufacturer and patrons.
(3) The manufacturer may purchave the milk from the patrons at such a price as may be agreed upon. The price may be uniform per 100 lb . of milk for the whole season, or it may vary for different months.
(4) A price for milk may be fixed on a sliding scale. aceording to some reergnized market quotation fur milk or cheese from time to time during the season.

In the case of co-operative companies and associations each maty be formed to conduct business as a manufacturer, in a similar capacits and on similar lines to those mentioned under the heading of "private enterprise ": or it may coniluct business in a special way for the benefit of its shareholders who furnish milk to the factory which it controls. In the latter case one or other of the subjoined sets of arrangements may be followef.
(5) A certain rate per pound of product may be charged by the company. or association, called hereatter the manafacturer. similar to the plan mentioned in (1). The balance between the receipts and the expenditures of the company or association, in its manufacturing capacity, may be distributed as a dividenil among the shareholders according to the amounts oft stoek which they hold, or it may be disposed of ot herwise as they maty direct.
(6) Each shareholder may be entitled to furmish to the factory a stated quantity of milk for every share which he holds in the company or association. The prodnct from such quantities of milk inar be mannfactured at a fixed rate per fround, sufficient to cover the actnal ruming expenses of the concern: and a slight additional charge (say $\frac{1}{4}$ cent per pound for chicese) may be made for all the quantities of milk furnisherl in excess.

A rate equal to or higher than the shareholder's excessrate may be charged for manufacturing the product of the milk supplied by all non-sharehothers.

According to this arrangement she of shares in cheesefactory stock might entitle the holder to furnish $9,000 \mathrm{lb}$. of milk annually at the lowest rate for manufacturing.
(7) Under the arrangements set forth in (1). (2). (5), and (6). a general meeting of the patrons, called for that purpose, designates some indivilual as salesman for the disposal of the products of the factory. The plan of appointing one salesman has been found inore satisfactory than the appointment of two or three with equal powers. The salesman mar have an adrisory committee associated with hin,

Stutisties.-No accurate statisties are available showing the quatities of cheese whichare manufactured in different countries. An English anthority (Henry F. Moore) estimates that the total quantity of cheese made in Great Britain reaches $300,000,000 \mathrm{lb}$. per anmum. It has heen calculated by a U.S. statistieian (.J. R. Dodge) that the net requirements of Creat liritain in cheese to be imported amount to about 200,000,000 13, amnually. France imports abont $25 .-$ $000,000 \mathrm{lb}$. per year and Italy imports ahout $20,000,000 \mathrm{lb}$. The U.s. exprit atrout 104.000 .000 lb , annually ; the yearly exportation from l'anala, which is steadily increasing, has reached $104,000,000 \mathrm{lb}$; Ilolland exports abont $60,000,000$
 Enropena comtries have as great imports as exports.

Varmethes of ('heme.-The variplies of cheeses which go under different namos are well-nigh innumerable. Nost of them take their linsinctive designation from the phee or locality where they were first mate. Counties. districts, towns, villages, sum parishus have all tent their mames to ditferent varieties. The cheests themselves olten differ: ( 1 ) according to the smure of the milk from which they are made: (2) as they are made from cream, whole milk, skimmed milk, or mixtumes of these: ( 8 ) sucorthing to the agent used to efliect consulation of the milk: (4) according to the methom of manipulating the curd and the temperattures to which it is rasised ; (a) aceording to the shape and size of the cherese ; (6) according to the manmer of the curiner or ripening: (i) and areording to the results which cunte from the milk, enrl. or cheese being inneulated by ectain furments or forms of micro-organisms whicls appear to prevail in different places.
some of the cheeses are pressed and others are left to dran dry tor perioals of several days or even weeks. The Cheddur cheese may be taken as typical of hard or firm cheeses: the cimyere or Stilton as types of mediam cheeses: aml cream cheese, as Jenfchatel or Brie. as represutative of soft cheeses.
The following list of the cheeses which are best known is taken almost entirely from Prof. James Long's pamphlet on Trate in Dairy Prouluce:
British Cheese-Pressed: Chedlar. Cheshire, Filoncester, Leicester, Dunlop, Derby. Wilthire Laaf, Blue Dorset. Literton, Capmhilly. Ünpressed: Stilton, Wensleydale, Cotherstone Colwick, slipeote, York (curd), New Forest.
French C'heese-I'ressed: Cantal, Iort-du-Salut. Septmoncel, Gex, Sassenage. Gruyère. ['mpressed: Gèrome, Void, Olivet. Rollot. Brie, Camembert, Comlommiers, Livarot, Ňeut châtel, Mont dOr, Troyes, Goumay, Gervais, Bondon, Mignot, l'ont l'Évêque.
Sheiss Cheese.-Pressed: Gruyère, Emmenthaler. Backstein, spalen, (Vessanay, Vacherin, Jura. L'npressed: Bellelay.
Italian Chepse-Pressed : Parmesan, Gorgonzola, Cacio Cavallo, Pecorino, Bellmese. Kubiole.

German Cheese.-Pressed: Ilartz. Unuressed: Münster, Limburg.
Holland Cheese-Pressed: Ellan, Gomela.
Suedish Chipese-Pressed: Herrgaardsost.
United States Cheese-Pressed: Cheddar, Brick, Young Amerieas, Ohio Flats, Skim.
Canadian Cheese.-Pressed: Cheddar, Loaf or Trnekle. Stilton, Cream. prepared checse in stone and glass pots. Unpressed: Stilton.

Emmenthal cheeses are the raricty which are produced most plentifully in switzecland. Each cheese is round, s0 to 100 cm . in diameter, 10 to 15 cm . thick, and weighing from 50 to 100 kilog. or more. Like all the rich cheeses (fromage gras), which retain nearly all the clements of the milk, its nutritive valne is high. It was first made in the valley of the Emme in the canton of Jerne, whence it followed the Bernese emigration into the neighboring cantons, where it is now made in large rpantities, and into Basaria, Russia, North Gerinany, and North and South America, The exportation began in the seventeenth century to Germany and ltaly, and now it is sent everywhere, the principal markets being Gemany, Russia, Italy, and the U. S., where it is known as Schurizer Kase. In winter a good deal of Emmenthal mi-gras is made, mostly for France, where it takes the place of butter.
Next in importance is the Gmeyire, called after the village of that name in Fribourg, another round cheese 60 to 70 cm . in diameter, 9 to 12 cm , thick, and weighing 30 to 4,5 kilog. It las come into great repute since the formation of a wealthy society for its mannfacture in Fribourg. It is also made in large quantities in Vaud and Nenfehâtel, and the French provinces of the Jura and the Donbs, where. according to some writers, it originated ahout 1750. It is mannfactured in much the same way as the Fmmentlal. execpt that a third or more of the ercam is removel, whenee it is classel as mi-gras. The exportation is mostly to France and ltaly, and recently to Sonth America.
Still more remarkatile is the Schabzieger, or green cheese (fromage vert), known in the U. S. under the corrupt name of saro or sapsago, and which some writers hesitate to class as a cheese. Its manufacture dates back to the ninth or tenth century, and it is still the most famous product of the canton of Charis, which turns out a qreat many ot her varieties, monly mi-gras and maigre. The pecnliarity of the Schabzieger is dne partly to the method of cournlation by azi instead of remet, and partly to treament by the zigerlec (melitotus cerrulea), a plant grown for the purpose in schyy\%. In 1869 the exportation amounted to 1.250,000 kilog. valued at $\quad \mathbf{5 0 0 . 0 0 0}$ franes. It is sent all over the world.

The forgonzolu cheeses are mate mostly in Italy. Stacchimu, of forsonzola, is made of milk eontaining the buttery parts. When the mountain pasture is exhansted the bergramese herdsmen drive, for wintering, thoir herds to the phans. Gorgonzola is their favorite falting-spot, for there they lirst find the luxuriant vegetation of the Lombardian platean. 'lhese herds, reveling on the rich grases of Gorsonzola, are, from the middle of september to the end of Uutober, very lactiferous.
( $h$ heese is made during these months in sinall rooms devotel to it in the homes of the Gorgonzolesp. who buy the milk of the herdsmen. The antumn temperature, being
monderate, is best for chese-making, as fon much hent, by hatening the separation of the wher makes it too dry ani? friable, while extemive end lwotures a wherey teltil and ensily spoiled cheese. The milk whik wam fom the cow is curded what well premed amb prepared calf romat. The quality of the cheese depembs much ujun that of the
 In fifteen or twenty minutes, when the milk is comernated and the whey separaterl, the curd is huge in hemp-ctoth hats to drain. As cows are milked twice daty the foregong is t wice done, viz.. momines and evenings.

The morning-lrained curd, inclosed in light, flexilhe, wooden bamts, covered on their inside surtaee with hempcluth, is phaced on an inclined bexirl strewn with ree dattr. Being of two milkiug the cual in party wam, parily collt, and, though mixed, care is taken to fom the upper and lower strata of the wam, hecanse it is cementithus. As hot and cold curd never perfecty nnite, minute interstices remain in the cheess, in which, while maturing, stem mombt, known as "parsley." forms and wives the starehime the delicions taste for which it is famons. The and is further Itained during the tirst day of the process by two the the tumings. On the following muming, when of some consistency, the eloth being renown, its value is tetcrmined by weighong. Alter there or four diys lementation begins. and the wooden hands are removed. It is thon, onee daily for eight or ten days, alternately salten on its upper and bwer side, $40 \%$ of pulverized satt bing, on an average. wied pur form of abl lb . The (ingronzolese admped some years aro the process of quickly thruine and pressing tho cheese against a sath-covered surface, thns insuring more uniformity and at better ermst. The color change in at monly to pinkish white if groul, to black if but. When black, the rerust is sort and the cherses perishathe in summer. If the cmst is sulliciently hard, the shade is improwed by one or two dipping- in salt water.

French Cream (herse-This variety of cheese is similar to most of the suft cheesiss which mast he emten fresil. In making it, enourt remet is admed to the morning mess of milk to congulate it in Lwo or three lomars at a temperat are of $0^{\prime} \mathrm{F}$. It is than left for twenty or twent -fonr hours. Dfter the whey which has colleeted on top of the curd is pmored off. the curd is cot in slies amb hat on a seve to drain. Aftur this is elowe, creun from as much milk as was first coagulated is added and mixel with the murd by moans of a woulen prestle untal it is unform in consist mes. The whole is phaced in wicker molhs-genembly hart-ibapedand is realy for usp. It con la kept gonal for several days if phemed in at refrigerator or on iee.

Limbury is a suft cheme formed at a low temperature and slighty presod. The euring process is matly allowed to proceed to the patrefietive hage before it is caten. Its odur is extromely offensive to persons with an atcole sense of smell, who hive wot acruired a taste for it.

Purmesen cheesp is used extensively for somps in ltaly, and is to lo foum man the dimer-tables commonly erated into a pewaler.

The lioquefort checisp was oriminalle, and it is at the present time to sume extont, mate from ewos milk: tmt in some instances cow s milt is added. It is highly thavored,
 caves in that part of ratere where it is prombed. The easmare conatatly eool at a temporature of 11 or $42^{\circ} 1$.

Stillon cherse taties its name from the villare or parish of Sititon in Finglame. It is pumbary beliesed to be make from milk with erem addel. The milk is comataten at a low tempratore, the cual is dipend but by lowls on a stramer usually male of cloth, it is moved gently to facilitate the splaration of the whey, anm while still in a moist and comparatively suft amf phastie combition is filled into
 dameter. These minds or hops are thmed maside down
 lated with the mondel and blaver which are chatacteristio. of stiltons, begatiner a small guantity of an abl Stilton rlvese betwem the layers as it is filled inter the. hen!s. sonctimes the chomesare inwolated by the insertion into their sites of women skewers whel have been atuck into atu old stiltun cheese for a few days.

Full-cratam cheres is a term now nsett to dexigute checese mate from Whole milk. from which no cream has twen removel, mal frim whith strippings have nol been kept back.
Shim-milk chepse is also extemsively natmfactured in many comnties, and sold often umber the name of whole-milk
cheese. It is gemembly hatior and mone transherent than other checse. Fometimes the milk is skmmed there times. ant yidhas an these which heromes so hard in in shot time that is piekaxe mast be ned to break it. Dy allowing the curol uf sim-milk to ferment somewhat, and by leaving considerable whey in it, softer cheose is obtamed." Surd is the uftemsive forman hand-ehrese.

Oleomergerime, or fillell flumes, devised by II. O. Freeman, of shrburne, N.. Y., is mate by mpacing the fat remowed in the eream with olcomargurine made from heof stid. The olemargatime is moded amd added to the skimmilk, which has ben previously heated to $94^{\circ} \mathrm{F}$.. and colored with amato. Tiennet mough is then added to curdle in eight on ten minutes. About $1 \frac{1}{2}$ Hh. of obeonamparine are retatued by foolh, of milk. When skillfully mate this checese apmears rich and well-tharom, and pases for fatir wholemilk chees, but poils very quirkTy amblatly.

Lard cherse has recently heen manufactured in Niw York amd other states. It is some what similar to oleomargarine cheese, beiner mate from skimmed milk and lard.

Butler-filled cheese is also made fom skim-milk and rancid or other cheap, buther, which is patty purifich by melting before it is mixed into the milk.

The mould on and in old cherese comsints of a few common spectes of green. Whe and wed fungi, such its lemicillinm glaurum, $P$. ylnhalosum. Turala mividis. T. auriamlia-

('hepsp-mifes. which appestr on some kinds of whe wese as a light buff dust are known as 1 farms domestimes or -1. siro. They are of the same gemms of the Arachmiter as the sugar-mites. They are harmbes.

Shippers, called also hoppres and jumpers, are the larraz or maggots of the cheesp-fly. Piophilu cussio which lays its egge in the erneks or on the surface of the dhepe. This thy is abment half as large as the ortinary home-fly. Care and clembiness are thr only means for preventing its inroads; frepuent turning, rubbing, brushing, ete.

Tyrotoricom.-Dr. Vietor ('. Vaughan has sparated from long-kept atid milk, from cheese which enused poisonous swoptoms, and from an ine-cram which similarly hall caused illness, a very poisonons substanee of the mature of a permaine, which he has mamed tyrotoxicon. The methon of sparation is excedingly simplo the acid-enagulated milk is filteren, ami the filtrate, thas freed from lat and casein. is Whaen 11] with cther after heing firs fantly ulkalized with putach. On filtering and eaporating the there a crystalline sulstance is Jeft, ext remoly small losis of which canse roniting and dimrhora in man, and kill small animals with chatera-like symptoms. There has beon revently adduced widence that this erystalline substance is probably diazobenzinc.

## Cheese－maggot：See Cheese．

Chee＇tah，or Hunting Leopard：the Gueperlu jubata－ or Cynclurus jubatus，a carnivorons mammal of the cat family，distinguishet by its slender build，long legs，and non－retractile elaws．The general color is pale yellow， marked with numerous small black spots，which，unlike those of the leopard，are not arranged in rosettes．The hair on the neek aud shoulders is lomg，the fur coarser and erisper than that of most eats．It is found throughout Africa，and in $A$ sia nearly as far N ．as Siberia．Its intelligence，lueility， and fidelity are so great that in Inlia and Persia it is trained for the chase of antelopes and deer．The cheetah is kept leashed and hooded until the game is fomd near，when it is let loose and，drawing stealthily near its victim，it rushes suddenly upon it，and an with lifficulty be made to let go its hold．This animal is readily domestieated．Little is known of its habits while in a state of nature．In Cevlon the true leopard is called cheetah．
Cheetham，Henry，D．D．：b．in Nottingham，England， Apr．2i．18．2i；educated at C＇hrist＇s College，Cambrilge；or－ dained in 1856 to the curacy of Saffron Walden，Essex；held the ricarage of Quarndon．Derbyshire，from 1858 to Sept．， 1870．He was then nominated to the bishopric of Sierra Leone，and was consecrated Noy． 30,1820 ，in St．Paul＇s Cathedral．He resigned his see in 1882，and became viear of Rotherham．He is the anthor of Ministerial Fruit Pro－ portionate to Jimisterial Fuith；Sermons etc．

Cheetham．Samel，D．D．：Arehdeacon of Rochester since 1882；b．in Hambleton，Kutland．Mar．3，1827：educatel at Cambridge，where he graduated in the first class both in classics and mathematics in 1850；was Professor of Pastomal Theology in King＇s（＇ollege，Lomiton，186：3－42．He eflited with Dr．William Smith the Dirtionary of Christian－t＂－ tiquities（London，18is－80， 2 vols．）．
Chee＇rer，Ezekiel：a New England school－teacher；1．in London．England．Jan．25， 1615 （N．S．）．He received an excel－ lent classical education，and emigrated to America in ．Iune， 1637，to enjoy Christian worship，in its marity．Ile was nne of the fomders of the colony of New Hawen，where he tanght sehool for twelve rears：was chosen deacon soon after the organization of a clureh there，and oceasionally served as a preacher．He represented the town in the General Assem－ bly in 1646；was afterward master of the grammar school at 1pswich．Nass．，for elever years，and subsequently tanght school in C＇harlestown，Mass．，nime years；removed to Boston Itan．6，t6it，and hat charge of the Boston Latin School for many years．During the time he was teaching at New Inavin he prepared the Accidence a short Intrombtion to the Latin Tongue，of which in 1765 twenty editions had been publishel，and it was in nse for over 100 yeats by the Latin teachers of New Englant．He also wrote Sreipture Propheries Expluinemb，in Three shlurt Essays．D．in Boston， Mass．，Alug．き1，1\％0s．

Cheerer，George Barrfil，D．I．：Congregational divine； b，at Hallowell，Me．．Apr．1\％．180～：graluatod at Bowdoin College in 1895，and at Andover＇Theological Seminary in 1830．In 18：33 he becance minister of is Congregational chureh in Salem，Mass．Tle pmblished，in 183．a a satirical allegory eallet Dencon files＇s Distillery，for which he was prosecuited by a certain distiller，and was condemned to im－ prisomment for thirty days．He was distinguished as is zealous adyocate of temproner and as an opponent of slavery．the resighed his pastorate $18: 36$ ，went to Euron＇． and contributed letters to the New Fork Obsermer，and in 1833．on his return，tom charge of the Allen St tuet Pres－ byterian church，Now York＂ity：amd held it till 18． 1 ；hu was corrmponding elitor of the New York Ewnmbist in 18.4 while in Burope，and was its prineipal editor for a Year after his roturn in 144．Itis contributions to the New York Indermentand the Bithethech Sitere were numerons and extensive．F＇rom 1846 to 1800 he was pastor of the Church of the luritans in N⿵冂卄一 York city．Among his works are Studies in Posiry（1s：39）：Lectures om P＇ityrim＇s Progress（1843）；Wranderings of a Iitgrim in the Shatum of

Mont Blanc（1846）：Journul of the Pilgrims at Plymouth in 16：20（1848）；and Gout uguinst Slatery（1857）．D．at Engle－ wood，N．J．，Oct．1，18：90．

Cheflontaines，shef＇fön＇tīn＇，（＇bristophe，de：a French theologian ；b，about 1532 in Brittany：became Archbishop of Cosarea about 1586，and exereised his episcopal functions in the dincese of Sens in the absence of Cardinal Pelleve， who was nominally in charge of it．Cheffontaines wrote， among other works，a Defense of the Fuith of our Ancestors （1570）and a Treatise agrinst Certain Doymas of Scholastic Theology（1586）．1）．May $26,1595$.
Chefoo．or Chifn：a seaport of China，called by the natives Ien－f＇ai（Smoke Terrace）；in the hien or distriet of Foo－shan， the foo or department of Tung－chow，and the province of Shantung．It is situated in lat． $35^{\circ} 35^{\circ} 56^{\circ}$ N．，and lon． $124^{\circ}$ 22＇ $33^{\prime \prime}$ E．，on the north shore of the promontory of Shan－ tung，in the sontheast angle of a small bay lormed by the peninsula of Chefoo，the sandy spit which eonnects this peninsula with the mainlam，and the hill Yen－tai，from which the town takes its name（see map of China，ref．4－K）． Chefoo is one of the ports opened to foreign residenee and trade by the treaty of 18.58 ，taking the place of Tŭng－（＇how－ foo（ 55 iniles to the W．N．W．），the city designatel in the treaty，but whieh possessed no suitable harbor．Steaners ply－ ing between Shanghai and Tientsin tonch here，and there is considerable trade by sailing slips with the other ports of China．The chief imports are woolens，cotton goorls，opium． and sugar．The chief exports are pulse．bean oil，bean－ cake，medicines，and strawbrid．In 1891 the total imports amounted to $\$ 10,234,200$ ，and the exports to $\$ 5,185,848$ ．In the same year $1.21 \%$ vessels，with it tomnage of 183,759 tons， entered the port．and 1，255，with a tonnage of 981,805 tons． cleared．The climate of Chifu is the most salubrious of all the treaty－ports of China，and the place is consecfuently much resorted to by foreigners from other parts of Clina in the summer months．Pop．（1sim）32，500．

R．Jilley．
Chehal）－Eddin，better Shehâh－Eddin，Abdel Ramman： b．at Damascus in 1003：d．there in 1067 ．He wrote Kitûb－ ar－raudhatain，or The book of the Two Gardens，which means the history of Nuretlin and Saladin．This work appeared also in an abringed form as Azhar－ar－raudhatain， or The Flouers of the Tiro Gurdens．

Cheha＇lis：a river of the state of Washington：rises in Lewis County，on the east side of the Coast Range：flows in a W．N．W．direetion throngh（＇hehalis Comnty ：enters Gray＇s Harbor，and is about a quarter of at mile wide at its month． It is navigable for stembouts，and its valley is extensive and fertile，producing oats，wheat，and potatoes．The inclosing hills are covered with dense forests of fir，cedar，spruce， maple，and ash．Total length about 125 miles．
Chehalis：city：capital of Lewis co，Wiash．（for location of country，see map of Washington．ref．6－C）；on Northern Pacific R．R．and Chelialis and South Bend K．R．，and at the confluence of the Chchalis and Newaukum rivers： 54 miles S．of Tacoma．It has five churehes and excellent graded schools：its industries are manntacturing and agriculture． It was fomded in 1884．Pop（18！0）1，800：（1893）estimaterl， 2,500 ．

Editor＂Bee．
Chelb－kiang．or＇lhe－kiang，chā－kyang＇（i．e．Crooked River，from the old name of the river which waters the pror－ ince，called the Tsien－T＇ang river since the eleventl cen－ tury）：the smallest of the（ighteen provinces of China； bonded S．by Fuh－kion，W．Wy Kiang－si and Ngan－lawei，N． by Kiang－su，and E．by the 亡．ellow Sica ； $11.585,692$ inlabi－ tants in 1882：area， 39,150 sq．miles．The southwestern part of the province is hilly，and profuces great quantities of excellent tea；the nothern and castern parts belong to the great delta plain，and produce silks．The principal towns are the capital，Jhang－（＇low－Foo，and the treaty－port of Nins－po．The Chusm islands，lying opposite Ning－jo at a distance of abont 50 miles，helong to this province．

Cheirolepis，kī－rol＇ĕe－pis［Gr．$\chi \in \iota p$ ，a hand $+\lambda \epsilon \pi / s$ ，seale， in allusion to the scale－covered 1 rectoral fins］：a genus of fossil fishes belonging to the fimily I＇aleomscider，found in the Devonian of Europe and Canada．The vertebral column was cartilaginons although the neural arches wero ossified，head large teeth small，pointed，or eylindrical，hody slender，and corered with small rhomboid seales．The fins， prrticularly the pectorals，are large，and the first ray of each is developed as a spine．

F．A．L．
 xefp．land $+\mu$ ávtis，diviner］：divination by inspection of the
lines in the palm of the hand: also called pretmestry. Cheiromaney eomes from hodia, and is of great antiquity. It was practiced at Rone and mbeh in vogue at the time of Jummal. It was cultivated by philow, hem and cedehrated sehowhen like Ilato, Aristotle, Galiem, Ahmotur Magms, and bhomy, Aristotle having fomm on an altar dedieated to Apollo a book on cheiromanes, writhen in letters of gold, sent is to Alexander as a work worthy of the attention of an investigating and lofty spirit. Cheirmancy phyed a very important part
 ish prople possessed thonsimds of cheiromancers. Solmon speaks of the art as having been profieted ammer the Thebrews. The Emparor lugustus was considered a distinguished practitioner. C'ardams, the author of a work on eheiromancy whinh is comsinlered one of the besi, deelares and proves that there are from the print of view of this art 150 kinds of hands. Trieassus requgizes only r0; Kenker will allow but $\boldsymbol{2 0}$, and Belot puts the mminer at 40 . This art was ingreat repute in Europe in the Miduld Ages. The hasis of the so-catled science is the three large. principal lines wheth are at once recognized in the palm of the ham. The first, the one nearest the fingers, is called the line of the heart: the second, in the middle of the hamd, the line of the heat; and the third, at the hase of the thmot, the line of life. These represent the trinity of human existemen: the heart, sensation; the heat, intelligenee; life, attion. There exisi outside of these three manin lines other important lines, all of which have a martientar significmee. Noreover. the palm of the hand is divided into different guarters, and the slight elevations beneath tha base of each finger are called mountains, each one having its partieular name. The line of the heart whon it is very well definel signifies strong and happeraffection; if the line is broken, it denotes inconstancy. "the line of the head in the sime way denotes st rong or weak mental faculties. The line of life, the most important of all. determines he its distinctness and cleames the length of life and liability to diseases, ete. Each one of the montains mentioned above is numed after the varions planets, from which they reveive, acording to their ereater or less development, favomble on unamable induences. It need hardly be added that the whole subject is phaced in the realm of charlatanism or of innocent amusement, aceording to the way in which it is practioed.

## (. II. Thurber.

Cheiron, kiron (in (ir. Xeipop): one of the Centaurs; the nohest specimen of a combination of the homan and animal forms created by the Greek imamination. Generally the centaur expresses the sensual amd satuge features of a man combined with the st rength and swiltness of a horse: fan to these gualities Cheiron afded justheses, wistom, and kinduess, Having bern instructed he Artemis and A pollo in humtines grmnatites, musio, and medicine. he in his: 1 urn breane the instructor of many heros- - Mchilles, 1 leraches, and othersin these arts. 'Tong hare with the othor ('entaurs. he wist expelled be the Lapitha from Mt. Pelion, but sarrilices contimned to be offered to him ewen alter his expulsion by the Magnesians; and the family of the ('he imblie, living in that neighborhood and distinguished for knowhedge in medicine was said to descend from him.

Cheironectes, kī-rō-nck'terz [Gr, xebp, hand + wix swim]: the yapock, or water-obossum (Chmonetes rarimy

fuw) a small marmanial of the family Didmphyrider. found from (inatemala to sonthern Brazil. It is abont * feet
in total length, clothert in soft. dense, woolly fur, white leelow, gray akwo marked with large patches of sooty black, ears larfe and hare tail long and naked, except the baxe where it is covered with fur. The hind feet are large and webled, and the animal, which is aquatic in its habits, frequenting small st reams, feedson crustacea, insiects, and fishes. Owing to its peculiar appearance and mode of life it was for a long time placed with the atters.

R.: 22 miles E. by N. of dackson: has excellent graded school and five churches; is the best produce-market in suuthern Nichigan. 'op. (1850) 1,160 : ( 1850 ) 1,356 ; (1894) 2.006 .

Editor of "Herale,"
Chelsea: shire town, Orange co., Vt. (for location of countr, sce map of Termont, ref. 5-C) ; 22 miles S. E. from Montpelier. Chelsea has an academy, 2 churches, and connty buildings; has nanufactories of shoes, lumber, and milk products. There are here excellent water privileges, and valuable granite formations (as yet unquarried). Manulacturing industries which locate here are exempted from taxation for a period of ten years. Pop. (1880) 1,462: (1890) 1,230.

Editor of "Herald."
Chelsea Hospifal : an asylum at Chelsea, England, for risablet or superannuated soldiers. The College for Religious Controversy, founded by James 1. in 1610, was torn down to make room for this hospital in 1682. It has acennmodations for about 660 persons, and is governed by a board of commissiners, comprising, ex-officio, the Lord President of the Coumiland the First Lord of the Treasury. It supports ahont 500 in-pensioners. who receive board, lodging, and clothing. All pensions granted to soldiers by the Briti=h Government are awarded by the commissioners of Chelsea Hospital, who are appointed by the crown. Out-pensioners mar become inmates when there are vacancies, by surrendering their ont-allowances, and inmates mar hecome out-pensioners at will. The institution is supported by Parliamentary appropriations. In 1892 the expenditures for the hospital were $£ 26,6 \%$, and for out-pensioners $£ 1,821, \% 00$. In 1892 there were 84,011 out-pensioncrs paid at the hospital.

Cheltenham, chelt num: a parlianentary borough and fashionable watering-place of Gloucestershire, England; on the Bristol and hirmingham hailway; 96 miles by the roat or 121 by railway W. N. W. of London (see map of England, ref. 11-(i). It is pleasantly situated in a picturesque valley on the Chelt, a small tributary of the Severn, and is sheltered on the E. and S. E. by a semicirele of the Cot.wold libls. It derivesits prosperity and impronce from its mineral springs, which contrin sulphates of soda and magnesia, with iorline, iron, and carlonic acid. It has elegant squares, teraces, ant creseonts, and momerons villas. interspered with gradons anm shrubln rics. The public promenales are amons the finest in tholand. It has ton or more churches, hesides 4. hapels of Dissonters, a grencral hompital, a theater, a zouilorisal garian, and a well-collowenl grammar selool fonneled in 157. Cheltenham is famons for its colleges amberhools. among whicts is the proprictary cellege for the sons of genthemen. "The boromar rethras one member to the Howse of ('ommons. l'op. (1501) 12.914.

Chemistry kemis-tri [Eng. derir. (serenteenth eentury) of chemist. Fs. chimiste. Mlod. Lat, chimistn for earlier aldimista with omission of the Arab. article al. The mediav. mame of the science was Span. alquimia, ltal. alchimin, O. Fr. alquimif, Lat. alchimia, all forms of Arab. $a l$-kimin $=a /$, the $+k i m i a$, prob. representing late Gr. xnueia, Eryptian art, from Whem, an old name of Egrpt. The worl may be merely a folk-etymological modificition of Gr. रupéa, pouring, infusion, adapting it to a supposed comnection with hikem. It was, at any rate, a supposed connection with $\chi$ vefia, ete.. which in the Renaissance produced the spellings alchymia, chymistry, chymist, etc.]: the science which deals with the composition of the various forms of matter of which the universe is made up, and with the changes in composition which these forms of matter underga. The name applied about the fonth century of the Christian era to the art which had for its object the transformation of the baser metals into the noble ones, as, for example, of silver into gold, was chemia ( $\chi \eta \mu$ ela). This, in turn, is said to be derived either from the Eryptian word Khem, or chêmi, the name of Egypt (sce the ctymology), or from a word meaning black. Whether, therefore chemiufirst signified the Egyptian art, or the occupation with a black snlbstance of importance to the alchemists, is uncertain. Certain it is that the earliest chemical work recorded is that done by the alchemists (see Alcheary), and for a long period the principal chemical work was done by them. Gradually othri objects were songht for, and a body of workers came to be engaged in earnest efforts to learn more of the composition of the things of the earth, and then the science of chemistry as we know it to-day took shape and grew rapidly. Looking at anything, the chemist first asks, "What does this consist of?" An example will illustrate the kind of answer he will get. Sufpose the thing is a piece of granite. He can see with the naked eye that the granite is made up of at least three different things, and by breaking it up and working carefully the three things can be separated from one another. He will discover that they are the three minerals quartz, feldspar, and mica. By treating each of these substances in turn in the proper way, each one can be shown to be made of simple things. 'Thus the quartz consists of silicon and oxygen: the feldspar, of silicon, oxygen, aluminium, and either potassium or sodium : and the miea, of silicon, oxygen, alunsinium, and potassium or sodium, with one or two other substances. Now the question presents itself, Can the substances just named, i. e. silicon, oxygen, aluminium, potassium, and sodimm, be further decomposed f And the answer is that although chemists have been working with these things since their discovery, and have subjected them to all the influences at their command, they have not liem able to get any simpler things from them. Hence thase simple snhatancesare called chemical elements. By work similar to that above referred to in comection wilh gramite, all things within reach of the chemist lave been found to be made up of not more than serenty elements. Dlost of these elements are, however. quite rare, most things with which we have to deal being matde up of about a dozen elements; and most of the chemical changes that are taking place around us involving only this small number of clements. It has been calculated that the solid crist of the earth is made np approximately as represented in the sulijoined table:

While osyen forms a large proportion of the solisl must of the farth, it forms a still larger proportion (eightmintlis) of water hy weight, and abont one-fifth ol the bulk of the air. Carhon is the principal element entering into Thestructure of living things; while hydrogen, oxygen, and nitrogen, also are essential constitumts of animals and Hants. Nit rogen forms four-fifths of the bulk of the air.

The first object of chemistry is to determine what efoments enter into the composition of things. Bul, slatling with this object in view, the chernist soon finds that many substances
that oecur in nature contain the same dements. Thus there are many compunds known that contain waly the che-nu-nts earbon, hydrogen, and oxyen. Gradually he reed ognizes the impurtane of dotmmining not only what elements are in the substance under examination, bint in what proportions by weight they are present. Work uf the first finh is calle ti qualitutie analyvis, while work of the seco ond kind is called quantitalice amalysis. By means of these two kinds of work mueth of the linowletge includecl in the science of chemiotry has low gained.

There is a thired kint of work whath has also ementributed very latgely to the development of chemistry. This is the opposite of analysis. It is synthestis, Fimbing that by various methols they were able to tear things apart on to demmese them, chemists naturally tried to make more complex from simpler things. In this waty they suceeded in making artifieially in the chemical laboratory not only many of the thing that occur in nature, but many mure that do not occmi in mature, and for years past chemists have hern working with hings of their own making much more than with hings furnished by mare.

Vafuable ats is a knowledge of the eomposition of things. both qualitatice and quantitatios, whether this knowledre be traned by unalysis or synthesis, chenistry would newer have been what it now is withont the aid of guiding thonghts that stimulate to work. In dealing with the problems of analysis and synthesis the chemist has impresed upon his mind the great face that two or more elements combine with wach other and form new things, and that the act of combination is a very wonderful and interesting one. He hing together the eloments oxygen and hydrogen, and finds that they cen be left in contict with euth other for any length of time in a closed vesed without change, hut that it the smallest spark be applied to the mixture, al fearful explosion ensues, the gases disappear for the most part, and a few drops of water are furmet. He will maturally ask what has happenel. Ile will be interested in the phenomenon for its own sake, but he will not be satisfied when he has learmod that the exposion aecompmied the act of combination between the clements hydrogen amd oxyen; and that the water is the product of the combination of the two elements; and that the elements rombine in the proportion of one part ly weight of hydrogen to eight parts by weirht of wyen. Can he not lean anything more enncorning the act: He can learn that when the gases combine there is a great elevation of temperature: that there is a simple relation between the volunes of the eombining gases; that when the act of combination is started in :my jart of a mixture of the two grases it proceets with enormons randity throughont the mass; that the volume of the water, in the form of gas or vapme, bears a simple relation to the volumes of the combining gases ; ant, indeed, he can learn much more. In such an investigation he wouk constantly le hrought face to face with the great funstion What is the cance of the eombination? What holds the hydrogen and oxygen logether in the compombl, water?
What is the eondition of things in the mass of the sras livWhat is the enntition of things in the mass of the gas lyydrogen, and in that of the gas oxygen? What chatige in the condition takes place when the two eombinet In this stage of his ingury he will mecessarily eall in his imatination. We has learned certain fucts in regard tw which there ean be no question. Ife hats lomm that a fact to-day is a fact tomorrow. Ife gains confidence in facts, and reengnizes that in his speculations as to causes he must always be guiled by the ficts. He strives to imagine a combtition of things that would leat to the results he is funifiar with. It he succedt, he proposes his hypollersis. which is a guess as ta the cause, and if the hypothesis be a grow one it sets others to thinking, and from thinking they go to work to see whether their thonghts are or are not well fommed. Thus a stury of facts leads to hypulheses and hyputhowe in turn leall to further stuly of the facto, whil chamistry grows.

A systematic study of chemical phenomona has been carried on for centurise nal the scione of chemistry now inrlates (1) a knowledge of an enormons mamker of furts: ( 2 ) lours gowerning these pats: (3) toypothoses as to the causers of the rogulatites which we eall laws: and (1) theoripes which are hyotheses that have hoon thomongly twand and found to hold grod. Whom an sulyed is priken of as as science it may he inferred that it has been develaneld to such an extont as on include all the pints mentioned. leates alone do mot constitute a semene now do facts and laws alone; there must be hypotheres, and sume of these must
have beome theories before the suligere they tenl with is entitled to rank as a science.
Hand in hand with the development of a science the appheation of the truthe of the science advances. Mankind is cur ready to make use of new dincomeries for it own imprownent, athl muth of the propress of the world from harbarisun to civilization is intimately connerden with the applientions of the treasures of sctane Chemistry has bech particulaty belpful in this respert. It has furnished the world with immorable mbistances which are of fumbamental importance, and withont which it is dillicult to sur how the world coald get aloner. Take, for example, the sulstanoe sulphuric acid. This is mot furnished by neture bat is manditetured in all exilized countrios by in poces devised by ehemints. This sumtanew is used in the mannfacture of the important compommi, sodia, which is heedelif the manufacture of glass ant soap; ; it is used further in the refining of petrolem, and in the pepstration of valuathe fortilizers. lis importance can ant he owrestimated. And so with many other substances. It is clear from what has treen saif then that we might have the seience of chemistry in all its fullucs without aldying it directly to the mas terial welfare of man. (the the other hand, it world the pessible to have many of the great chemieal industries wit hout the mit of the science, but, as a matter of liad, the growih of chemial intustries does to a very large extent to-thay depent upon the growth of the sembee while science alsu often profits by the growth of the inlutries.
In this cecopratia some of the principal factsof ehemistry and the principad chemiead industries are presented in indepembent articles arranged alphabetically; hat in order that an ind of the connection hetweet the facts may be mow clearly disecrned and some concention of the science gained. a briel aceonat of the history of the sulgect is given, together with a generat account of the present condition and chject of the selience.
Historical.-The ohd philosofhers were much given to specoulation and hat little to exprrimmt. Indent, the time is not far distant when working with the hande was considered benath loarned men. In the early ages there was much thinking without a sutficient hasis of facts. Many theoriex were pat forward that have sine been found to be at variance with the facts. Among the first chemical theories wols that of Aristothe regarding the eomposition of all forms of matter. Aecording to this theory af things are mate up of fon dements: cotled earth, nir: fire anel water, and the properties of a thing depend uph the popertion in whith these clements enter into it. This theory is profoundi, wal is evidently the resalt of a contemplation of the fads of matures. It wonld be interesting to disches it, but this wonh lead two far, and it mat suthece th note that the the ory surggests the posibility of converting one subatance into anOther by barging the prowtion of the ennstacht elements. The alchomists were engaged in chemical work whh this object in view. Their bighest objeet was the conversion of hata metals like leat. coplere and moreury into the nohle metals silver and gohd. For fiftern handred yeurs this abljeed was pushed with great industry hymy camest mon. What was the result? They fomit that what they were striving to accomplish centil not buecomplishod. Thay fombl that the metals can ner be comverted me into the other; that they can enter inte combination with other things and form new compounds, and that they whe becovered from these compounds without luss." This work lain the fumbation of our present conception of chemeral elements, which is plainly entirely ditlerent from that tiret held ly the alchemst:。 Now, we consider that sulstance a chemical ehement which cam not be decomparal by us into simpher substamere, and we hold that. so far as our bowe go, these remonts are quite indmentent of ome mother. Finther, while ravaged upon their chief froblem. the all chemints herane aequainted with a hoet at chemical facts. and bad the fomdations of the sefence of chemist ry.

In the first half of the dixtemth wentury, through the infhatece of Paractas, some of these who were engupd in work on chemionl substanems were secking another object. The value of some chemical sulstanees as remedies for discase hat hong bem rechgnized. Now, the importance of the chemical prosesese contantly taking phate in the human
 luction of the proprenbetanes intu the diseaven baly the normal chmieal condition cond probably be restared. The study of chemistry tow therefore a modical diredion. This perion is known as that of iutro-chomistry. It who
fruitful in the Hiscovery of new sulstances, especially such as produced changes in the condition of the human body. Paracelsus, the lather of iatro-chemistry, said: "The trie olject of chemistry is not to make gold, but to prepare medicines."

Toward the end of the seventeenth century much attention began to be given to the phenomena of combustion, and for a period of over a hundrel years the leathing chemists were engaged in work in this lime, guided hy a theory that was put forward by stahl. Before him Boyle anil others had added much to the knowledge of the chemistry of combustion, but it remained for Stahl to gather all the knowlerlge upon the subject together and propose the theory that was destined to exert such a powerful influence on the thoughts of chemists. This is the phlogiston theory. Aecording to this all combustible substances contain a common ingredient called phlogiston, which escapes in the process of combustion. The act of combustion consists in the escape of this ingredient. Some substances contain much phlogiston, and therefore burn easily: others contain little and burn with difficalty. Combustion leing one of the most common chemical phenomena, it is not surprising that this simple and comprehensive theory at once attracted attention and directed the thonghts of chemists. It held sway until the end of the eighteenth century, when Lavoisier succeeded in furnishing the true explanation of combastion, and, by so doing, in giving chemistry the direction which it has heen following ceer since. The phlogiston theory was the controlling theory for about 100 years. During most of that time the cfuestion as to the weight of sulistances was not regarded as an important one. Trie, balances came into nse, hut their use dirl not lead to valuable resnlts for some time. It was pointed out from time to time that some things increase in weight ly burning, as, for example, tin, lead, zinc. ete., and that this is plainly not in accordance with the phogiston theory. If sometling escapes in the act of hurning, then that which is left should always weigh less than the original substance. By way of reply it was saild by the upholders of the theory that the phlogiston might weigh less than nothing, and thos make the substance in which it was lighter by its prosence. It was not, however., until Lavoisier took up the sulject that the theory was foum to be incompetent to explain the facts, and that a much simpler and mueh more satisfactory explanation of combustion was presented.
Javoisier began his stullies a believer in the theory of phlogiston, lut the facts established by him, taken together with the discovery of oxygen made by Priestley at the same time, showed clearly that the canse of combustion is oxygen. Brielly stated. Lavoisier proved that when a certain weight of a substance is burned in the air, a certain weight of the air disappears as such, ind the substance increases in weight just as mach as the air loses. He also showed that the part of the air that is used up is identical with the oxygen discovered by Priestley and by scheele. which they had made by heating red oxide of mereury. His resulis are summed up, thus: When a substance burns it combines with oxygen, and the weight of the product forment is equal to the sum of the weights of the shtstance burned and of the noygen used up. There was no room for phlogiston. Nuthing escapes when combustion takes phace. Combustion is tur act of combination with oxygen. The explanation thas given is the mo we give to-tay.

As Lasoisier reached his great results by the aid of the balance, this instrument cume at once to be the ehief instrument of chemstry. The quantitative period of chemistry Was thas intronheed, and very soon new results of tundamental importance were achiered. Before spaking of these, howerer, one generalization should he noted, as it lies at the lasis of all chomistry. This is the law of the inglestructititity of malter, or the law of the conservation of mass, which may be stated thus:

Hitcnerer a change in the remposition of substances trkies phace the rumont of maller after the change is the stme as before the chanys.

Asuming that this law has always beld good, it follows that the amount of matter in the miverse is the same today as it was at the begimning. Transformations are constantly taking pace, but these involve no increase nor decrease in the total amount of mather. 'llow evidence pon which this law rests is furnished by the innumerable quantitative analyses that have been made simee the batance came into gencral use. Evary fact known points to its truth. It is the first great law of ehemistry. in the early
part of the nineteenth century Dalton diseovered two other important laws the truth of which has been verified by all subsegnent work. These are (1) the lun of definite proportions, and (2) the Jaue of mulliple proportions. The former is thus expressed:

Any given chemicrt compound alrays contains the same elements in exaclly the same proportion by weight.
The second thus:
If two elements form sewral compounds with each other, the different weights of one that combine with a fixed vecight of the other bear a simple rutio to each other.

The three laws mentioned are simply expressions of what has been found to hold true in all cases thus far examined. As the number of these is vers great, it is fitir to assume that the laws hold good also in cases not actually examined. These laws bear the same relation to the facts that every other law of nature does. They go bermu the facts and are an expression of facts known. It is. however, one thing to know a general fact or to know a hiw, and quite another thing to know the reason why the law holds good. We know that all bodies are attracted br the earth, and that ther fall when thrown in the air. This is a very remarkable fact, and one of immense importance. We know that it is true, as we have evilence of its truth every day. But yet we do not know why it is so. We say that the earth attricts other bolies by virtue of gravitation, but this does not lell us anything whiterer about the canse of the phenomenon. We might verify the law of universal attraction over and over again without getting any nearer to the explanation. So, too, we might rerify the important laws of definite and multiple proprortions over and over again without being able to give an answer to the question why do sulstances combine accorling to these laws. Here comes in the hypothesis.
Daiton not only discovered the laws, int he proposed an hynothesis which has since develoged into a theory, the most important and most fruitful theny of chemistry. This is the atomic theory. If we consiter any simple form of matter or element, such as iron, it is chear that there are two views which we may hold regarding the way the substance is made up. We know we can sublivide every piece of iron we can sce, no mater how small it may be; and though after a time the particles would hecome so small that we could no longer suldivide them, still we can imagine that hy more refined methods the proces of subdivision might be continued forever. If wa believe that such infinite subdivision is possible, we hold the hypothesis that matter is infinitely divisible. We can not prove this-we can only speculate in regard to it. Int we may also cmceive that after the process of subdivision has been carried on for a time until extremely minute particles have been reached, a limit will be fomd beyoml which the process of suludivision can not be carried. It we helieve this, we hold the hymothesis that matter is not infinitely divisible, amd this carrics with it the belief that matter comsists of indirisible parlicles, that is, of particles that can not be made smaller thy any means known to us. These larticles mar be called atims (trom the Greek äzonos, indivisible). Both of these hyrotheses have been held for ages. But the discussion in regard to the relative merits of the two was not 1 rofitable, becanse the facts known did nut make cither hypothesis necessary.
When, however, the laws of definite and multiple proportion were diseovered, balton saw that the conceltion of atoms might furmish the exphation of the laws. If each clement is made up of atons, the most prolable view is that every atom of a particular clement is like every other atom of that element. Among the propertios possissed by these atoms must he weight. It is probahle that the atoms of different elements have different woights. Jet us suppose now that when two clements combine chemically the action takes place lxtween the atoms. so that one atom of the one clement combines with one of the other, and so on throughont the mass. If in the mass of the one clement there were exactly as many atoms as in the mass of the other dement, both sulstances would cuter into combination completely: But if there were a larger number of atoms of one element then of the olher. then of the element of which the larger number of atoms is present some wonld be left uncombined. Sillmose. further, that the weights of the atoms of the two clements are to eachother as whe to ten. Then if when these two flemments are brought together they combine in the proportion of one atom of one to one athm of the other, the resulting companul will contain the elenents in the propror
fion of one part by weight of one to ton parts by waight of the other. Ur if in analyzing a compount if two plaments we find that it contains one part hy weiglt of ond to ten parts by weinht of the other. we shouli] conclume that the weirlats of the atoms of the two clement - Inar tal eath other the rationne toten. 'I'he atomice theory thas furnishos an axplamation of the fate smmaner up in the law of dedinite profortions. As the atoms are indivisible if two nements combine in mure than one propurtion they must alo se in the propertion of one atonn of one to two atons af tha wher. or one to threre or two to three or in somm other waty that Joes not involve a lroakiner down of single atoms. if, for exantphe, two wemonts, the wotathe of whose aforns aro as ane to ten. combine in the froportion of ame atome of ome fo one atom of the other, the resulting compunam will comlain the clement in the preportion of ome part by weight of one to tom parts hy Weight of the othor elemont. If the same elements comivine in the proportion of on atom of the tirat to t wo of the seoond, then the resultiner ronnpound will contain the clement - in the proportion of one pat hy wetght of on to twenty jable by weight of the othem, ind wo on. It will thus be ceen that the law of multiple poport ions, as well as that of dufinte propurtions, finds a sattisfatory explantion in the at omic thomy. Nll experionee in the theld uf ehmorstry tends to show that the atomie theory is well fonmbet. It has lacen the quite of chemists for nemely a humdred years, and it has leal them into most interesting fichls where they have male important dispoveries:

Thes atomic theory being areeptel, the detarmination of atomic weights Inecomes ane of the principal problams wit chomintry. sis many difliculties have bern encountered in this that some of the latalers hater entirely abmandond the use of the word atom, and spak of eqmimetents. An equivalont of an moment was that relative wright of the clement that. combined with one part by weipht of hychongen. Thus st parts of oxygen, 3-5 parts of chlonime so part. of hrominc. and 16 jatris of sulphar combline respertively
 and 16 aro sail to be the equivalents of these chements. Bat, unfortumately, there aro many elements that as not combine with hydrogan, amb some combine with it in moma than one proporion, so that the ditionalty of determining equivalento io as areat as that of determining atomice weorflts. Then it was proposed to call these imporiant weights rombining numbers and rombining uevighte. lat the nld dinicultics rematimet in spite of the new names. Noatime, through the aid of a large number of oberrvations. . 1 hemiots gralually came to reoomaize the ruth of a pemeralization that was made ly ivogedro in Italy at about the sume time that Jalton proposoll the atomic theory 'This sama generalization was also mate a little later hy Ampere, of France Arogadros law. as it is commonly called, is this: Cinder the stme condilions of pressure aind temperatura. rqual rahumes of all grasoons substances. whether ilemmotury or rompound, contrain the steme mumber of molecules.

Althoush this law wat distinotly stated in lsil, it cide mot exert moch intlumee om whomistry for monty hall at cembury. Then it eamo to bo meosuized ats a lirn fountation for spertilat ions on tha subjuet ol atomie weights, and its thuth is now
 ing to this law it is an easy matter to detmmine the mative weighto of the moleentes of all grasous sulstanems. but the molecule is mat the atom. It is, lowever, not dillienlt, know-
 eloment. to determine the atomios weioht from thesis. regards the distinction hetween atoms and maboondes, an example or two will makn this char. ('onmonon salt or
 chlorine Areonding to the theorse the smallest part in le of solium chloride is a molecoule. Bist eath molectala mosit he mate "y) of at teast cirne atom of sockimm and ono utom wf

 It may fe, however, that the moleenlo of an elemurnt is inlent theal with its atom, or the molecule may comsist uf twe threer, ar momer atoms. In the lattor case the atoms are belleved to he held in combination in tha same way as in the molecenle of a compenmal. The moserule of a compunm is therefore anade ap of atome of difforent kinds, while that of an cloment

 form the foumblation of what is [recturntly callard " mundern ehemistry.: With the adoption of these conceptims came a

1helinite and consistent system of atomice weights. upon which the great majority ol diemints were agreal. Thase are the ahomio weishats at presmi in use, and they are hased not conly upon Ivogialrós law, but umon a lama mass of otler "videnve.

Another law that is of value in commection with tha prohlem of the determination of atomio weights i- she law of boblong and Petit. discorered in 1sist. "Thin is expmoseded as [ollows: The spreific lupat of un cloment mullipliod by its atumir uright is a constant (celomet (f:-n).

Acoording io this, it is omly nocesatry to dedrmine the shodic leat of an element, amd divide this intu the comstant fios to get the atomic weight. What is meant by suectio heat will appear from the following: It is known that whon equal weights of different substances are uxposid to heat from the same source, they have differont tomperathres at the end of the same period of time from this it is clear that to raise equal weights of dillorent sulstane exs the same momber of elogreos ditierent quant ities of heat are neressary. ( iven exactly the same heatimepower, it takes abont thirt y two times as long to ratise the tomperature ni a pommal it water 10, 20, or 30 degrees as it takes formise the fomporature of a pound of meremy the simme momber of dermeen : or it takes thirly-t wo times eis much heref foraise the Fempratture of a found of watere 10, 20, or :0 alegrees as it lakes to rate the temperatme of a formad of merenry the samm manbur of degres's. The quantity of hat required tor ration the tomperatare of a given wedight of any mbatanc: at given number of degrees, as compared with the gnantity of hat requirel to rais $\boldsymbol{a}^{2}$ the temperatare of the same wight of water the same manher of derereoso is called the specilice hat of the mbstance. While the adoption of the system of atomie weight: now

 many ulace ways, there is one sbectal result that domands attontion even in this briol acoount. It has been shown by Nenclutedif, Lothar Nleyer, and frevimasty in a las satislactory way by Terlands, that the promerties of the
 weishts. Il yelrogen, the lightias element, with lowest atomis woight, does not fit into the system. Thecinning with that one which comos next in thr order of incrasing atomic wriglts, and arranging it with the following thirtema fle monts:imply with reference to the incruaing atomic weights, we lave this talble:

## Nitrogen, 11: Oxygen, 16 : Flumrine, 19 : <br> Phosphorus, 31 ; Sulphur, 32 ; Chorine, 35.5

In these two serics elements which we rocognige ats similar rome to stand in the same vertical line, ats lithium and su-
 and chorime, cte. But this is only the bermmins. F゙urbher examination showed that all the elements can be armarat in suries similar to the alose and thas a very intimate contnoction between the atomie weights and the froberties of the woments is known to exist. It will he noticed that the - hathas in the properties of the chments are furiotio. Henee the law governing the relations botwent the atomic worghts and projerties of the clements is known as the priodic lone: Ther rations can be expreserd in diticeront ways. 'l'lu sulyoined table, proposed hy Mendeleent, is the one must tommonly msed. In wher to aid in its interpretation a list of all the plements. with their symbels amblamite werehts, is ceiven tinat. In this list the nomes of tha most common chements are printed in smale campals amb these of the ramost eloments in ilalices.
LAST OF THE ELEMEXTS, THEIR SYMBOL= AXD ATOMIC WEAKHTS

LIST OF THE ELEMENTS, TUEIR SYMBOLS AND ATOMIC WEIGHTS.

In this table the atomic weights are given as in the original. Many of them differ slighty from the figures determined by the most accurate work.
family: its properties are the result of that particular weight. Further, it seems to follow that the elements are not entirely independent forms of matter, but that they are in all probability compounds of a small number of simple elements at present unknown to as. Of this, however, we have no evidence, and until some one succeds in isolating one or more of these ultimate elements it is almost useless to speculate in regard to them. See Argos and Spectrum (Helum).
From the earliest times chomists have speculated upon the constitution of matter, and some of the most prominent views that have been lek have been briefly referred to in the foregoing. The general acceptance of the atomie theory and of the notions of chemical combination presented by La roisier led to new ideas in regard to chemical constitution. In Lavoisier's system oxygen was the controlling element. Oxygen fomed acids and oxygen formed bases, and acids and bases formed salts with one another. Then early in this century the idea that electrieity was the canse of chenical combination was held by many, and was carnestly adro-

It will be seen that in Group I. are the metals of the alkalies; in Group 11. calcinm, strontium, and barium, magnesimm, zinc, and cadmium ; in Group 11. boron, aluminium. seandium, etc.; in Group IV. carbon, silicon, tin, lead; in Group V. nitrogen. phosphorus, arsenic, ete.: in Group V1. suphur, selenium, tellurium: in Group VII. fluorine, chlorine, bromine, and iodine. Detween the fonth series. enting with manganese, anl the next one, begiming with copper, there are three similar elements, iron, cobalt, and nickel. So, 100 , a similar group of three elements-ruthenium, rholium, and palladium-comes between the sixth and seventh series: and another, consisting of osmium, iridium, an! platinum, between the eleventh and twelfth. If we know the atomic weight of an element, we can tell approximately where it lrelongs in the table, and from its position we can determine its properties with consid rable aceuracy. When the table was first constructed three elements nuw incluted in it were not known. These are seandinm, gallium, and germanium. It was seen, however, that the gaps exinted, and it was predieted ly Mentelectf that elements would be found with atomic weights arproximately 4.t, 69, and T3, and that these elements wonld have certain properties which were dearly stated at the time. The predictions were confimed ly the subsequent disenvery of all three of these clements, anil their properties wore fomm to arree very chomely with the deseriptions given long before the elements were known. Unouestionably the properties of the elements are determined by their atomic weights. An clement whose atom weighs one hundred times as much as that of hydrogen must have certain propertios. It must combine with hydrugen and with oxygen in ertain proportions; it must be allicel to the members of the chorine
cated by Sir Humphry Dave and by Berzelins. According to the electro-chemical theories, ciery compound, howerer complex it may be, consists of two parts, one of which is electro-positive and the other electro-negative. In order that we may know the constitntion of a componnd accordiug to this theory, we must know what clements enter into it, the relative weights of the elements contained in the compound. This is expressed in the terms of the atomic theary hy saring that it contains certain atons. Thus sodium silphate is saill to consist of two atoms of sorlinm, four atoms of oxygen, and one atom of sulphur, and this is expressel hy the formula $\mathrm{Na}_{2} \mathrm{SO}_{4}$. But now, according to the electrochemical theory, this is made up of an electro-positive and an ehectro-negative part, and it ought to be possible to determine what these are by passing an clectric current through the compound in solntion, and noting what part goes to the positive pole and what to the negative. It is found that the part containing the sodium goes to the negative pole, and is itself, therefore positive, while the part containing the suhphur goes to the positive pole, and is therefore nega-
tive. This was expressed thus, $\mathrm{Na}_{2}{ }^{+} \mathrm{O} . \mathrm{SO}_{3}$. All formulas then came to be written in a similar way. But the electrochemical theory was found to lead to inconsistencies, and was finally abandoned. The so-called binary theory was an out erowth of the electro-chenical theory. It was not of broal application, having to deal mainly with salts. decorling to it every salt consists of two parts. At one time these f wo parts were hehl to be an acid and a base. Later they were a metal and an acil radical.
ifter the electro-cheminal was given up, it was recognized that while the number of compounds is enormous they fall
into a comparatively few elasser the members of eatel of which resemble some simple combomm which is the tyre of the class. The fond types to which compmame were reterent are hydrochforie acid, ('III, water, $11_{8}$ ), ammonis, N11 $1_{3}$ amb marsh gas ClI. Or the formulas of these typical compoumds may be written thus

I3y subst it uting other elements or groups of elements for the

 will be the: same as that of the simple ?ype. This so-called type theory served a viduabla jurpuse, and lot gradnally to the views at present held reeganding the constitution of - hemical (onmonds. These siews resulterl from the efforts uf many, amons whom may be mentioned Franklamd, Wैürtz, Jofmann. Whillianson, and liekule. It was, hewever, latrely due to Kiekulés cloar and comprehensive treat ment of thas subject of constitntime that chemists came to aceept the views now generally helal. In an important artiche published in 1858 he salid: " I consider it necessary, and in the present state of our knowledge I ronsider it posible, in many cases to go back to the dements themselres which make up the compond." It the presout time the expression constitution of a compound means the arrangement of the utoms emmposing the molecoule of the compound. It is believed that these atoms are connected or linked together in definite ways. and that by studying the decompositions and symtheses of a compunil it is jussible in flraw concolusions ins to the order in whichs the atoms are linked togrether. It is easily seen that different kinds of atoms have different linkine jowers. Thus hydrogen and ehlorine have this power in its simplest form. An atom of hydroaren can hold in combination but a single atom of chlorine, and an atom of chlorine can bold but a singlo atom of inydrogen. An atom of oxygen ean, howerer, hold two atoms ol hydrogen, Hu atom of nitrogen can hohl three atoms of hydrogen, and an atom of carbon can hold four atoms of hyitrogen. This power of an atom to hold a certain number of other atoms In combination is called ratence. sun] sometimes afomicity and, according to difterences like those referres] to, the elosmonts are divided into anivatont, biralonf, trievalent, qualricatent, acoording as they are like chlorinc. oxygen, nitrogen. or cartwn. The datermanation of the constitution of a chemical componnd involves then the following steps:
(1) The analysis. qualitative and quantitative :
(こ) The determination of the mokendar weight by the ain of A voralros law or some similar law ;
(3) 'The determination of 2lu molecular formala trom the results robtained in steps 1 and 2 :
(3) 'lhe determination of the way in which the atoms are linked together by a stuly of the decumpositions and symtheses of the comjomed.

## II O

The formula II- C' $^{\prime}-\left(C^{-}-()-11\right.$ represents the constitutisu of II
ordinary acetic acill as doterminerd hy the methoils roferredt to. It is a condensed slatement of is great many ficets that have been established by much work, and the fikets are axpressed in the terms of the thenry of atmms. the theory of mobectiles. the hyothesis of the linking of atonns. and the lypathesis of valence. Constitution, in the sense in whirl that worl has tren used, has no replomere tot the armatere sumt of atoms in space. It refors simply focentare icons: sut te directions. Quito recently. howerer, the stmely wf certan phenomena has leal to a conception uf ason-tithtion which dows involve the consibleration of spacer-pelat ionc, and a mew branch of chemistry has sprang up, known as stateandravsrey (y. e.). It wonld leal ton far to liscuss this subject here.

 far drawn in many cases as to thos -hape of thr moleronlocs.

 as to give promise of hrilliant sheresasi in the future.
 the sturly of cquestions gertaining directly os combunation and constitution, mad work of thi- kiml promises to yield
rich rewarals for rears to comr. Wost of the work is of such a kime as to be practioally inomaprohonsible, cxept to one who hats a thorongh knowledge is rhamistry and so the world at large lears very little of it. It is only when the results are of such a eharacter that they coul hatilized hy mankind that they conc to be known at all. Let a chemist discower a dyestuif or a medicine or a viry swert, or a rery pleasant-smelling sulbstance, and the world ferls that he has done something. 'The discovery of the antine dyes, of tho artilicial preparation of alizarin or 'Torkey red, of the sweet substance known as saecharin, of antijerine, of sulphonal, of eloral, of nitroglyerin, ete. of these the worlal hears laut of the countless thonsands of long-named substances whieh are eonstantly being described in the clumical jourmals, the world hears mothing and cares mothing. $1 t$ does not follow from this. however that these things are of mu impurtance. They may be of the very hisplest importance, and yet absolutely incomprebarsible to the world. Anythimer that adsances the science of chemistry even for a tery slight extent, is of importance for, loaving all other thonghts ont of consideration, it is only themers adrancement of the seience that further atpjlications of the sience become possible. But there is a highor arguncnt. Anything that gives sh cearer insight into the serertis of mature is of value to man. whether it be capable of direct apjlication to his material wants or not.

There is unother side of ehemistry of which no mention bas boen made thus far, and this side has been coming into wreater prominence within the last few years. A complete study of chemistry involves not only the subject of constitution, but that ol the natume of chemical action. Some ehemists are no longer satistiod with studying chemjoal eloments and chemical compounds ans sucti, but they have sousht to make ofservations during the progress of rhemical atotion, and thas to get an insight into the nature of the act. For various reasoms thete are serions difficultios in the way of such observations, but, rot withslanding these some progress has been made in this kind of study. 'l"his brancl of chemistry is generally eatled physical or genaral chemistry. It has been showin that the estent to Which two or more substances act upon one another is determined by the mass of the sulntances as well as by sommthing which is called the adlinity, and methods lave Imen devised for determining the affinity of cortain classes of subtances. The amome of heat evolved or absorbed in whemionl routions has been carefully measured in a large mumber of cases, and some conchasions of gromeral application have been reached. This suroial branth of physical chemistry is called thermo-chomistry. lionally, the study of solutions has led to somo very rimions restils. Pronifment amony these is the concuphion that many substameco. particnlarly the common weids, bases, and salts, are brokern down when dissolved in water. and that in the solutions these decomposition products or ions are prement. Tlus when soJimm chloride or common salt is disandred in water, it is hro lioved by many that it is broken down into the ions elolorine and solinin, and that there exist as surh in the solution. It is not meant by this that tho subtances we know achlorine and sodinm are present as such, hut the atoms of these elements highly charged with cleedricity $\ln$ the artiche on Sonctios ( $q$. $\quad$ r.) this sulaje will be presented somewhat more fully, thomerl it shonla he salil that this hypothesis has not yet taken it: limal place in chatomistry.
('homistry is taught very gemrally m schools, colleges.
 lamght, further, for the most purt for the purpuse of giving sume insight into the methots of natural sojober. C'lamial laturatories were the fist into which stadents were
 hailt fon insturtion and invertigation was that of liehige at the l nisersity of Giessen. Now hundradsof better expripurat fatmontorins are fomed in erery civilizal comativ, thongh there is hamily n laboratory that can foint to rieloreremits than these whtamed in the old Latmmary at Giessern. 'There art

 1 Hefintion of chemistry thans it was at 1 lhe sulset. It was thens stated that " chemistry is that seionew whielt hat th Neal with the cermpenition of the various foms of matter of which the unimese is mate up, athl with the chatere its
composition which these forms of matter undergo." If rishtly understoon, this definition is satisfactory; but from what has been said. it is clear that the chemist's task is not lone when he has determined the composition of substances. He must go further, and determine the constitution, and further still and strive to learn what the chemical reactions are that give rise to the compounds he deals with. He must investigate everything that is likely to help him in his etfort to discover what takes place when sulstances act upon one another chemically. His field is boundless, and new visions are apluming to hion at every advance.

Ira libmeen.
Chemmis. ken'mis (in Cr. Xé $\mu \mu \mathrm{s}$ ): a city of ancient Egypt; the mollern Ekhmim. Sice Egry, Asciext : Pavopolis.
Chemnitz, chem nits: a town of the hinglom of Saxony, Germany : in the cirele of Zwickau; on the Chemnitz river; $t \pm$ miles W.S. W. of Dresten (sce map of German Empire, ref. 5-(a). Chemnitz is the most important mantacturing fown in the kingdom, but ranks next to Leipzig and Dresden in population. It produces largely cheap cotion goods for the European and American markets. It is also engaged in the manufacture of silks and woolens, and in calieu-printing, and the construction of machinery, steam-engines, etc. It has several banclsome buildings, a gymmasium, an industrial school of great repute, technical schools, ete. It was formerly fortificel, but its walls have been converted into promenades. Chemmitz was an imperial city from the thirtcenth century to the seventeenth. Its prosperity was originally due to the linen-wearing of the Wends. Cotton-weaving was introdinced in 1\%90, and leveloped greatly after $183 \pm$ when the kingdom joined the customs union. Pop. (1895) 16t,01\%.
Chemitz (Lat. Chemmilius), Martis: Lutheran theologian; b. at Treuenbrictzen, in Brandenburg, Nov. 1529. Owing to straitened means his miversity course at Wittenberg Was bricf, and was confined mainly to the study of mathematics. Under the adrice of Melanchthon his theological studies were pursued privately, especially from 15.5052. while librarian of the Duke of Prussia. ILe became lecturer on Melanehthon's Loci at Wittenberg in 1559. From 10.54 to 1563 he was preacher in Brunswick, and delivered weekly theolorical lectures. He becume superintondent in 1506, and showed great organizing ablility. Ilis chief works were Extumen Concilii Trilentimi (1565-73), one of the ablest defenses of Protestantism: De Duabus Vaturis, an epoch-making treatise on the Incarnation : and the posthumous Loci Theologici (ingn), being a commentary on Melmehthon's system. He also begiun IItwmony of the Gospels, ancl was one of the anthors of the Formule of Concord. D. Apr. \&, 1586. Bossu't saill that Luther, Chemnitz, and (rerhard were three in a weries of Latheran theologians in which there was no fourth.
llexry E. dacobs.
Chemosh: the national deity of the Moabites ( $4 . \nu_{0}$ ) ; essentially the same as the Moluch of the Ammonites or the ('anaanitic Bial. Hlis worship was introduced into Jerusalem by sulomon.

## Chemsian : Sec Cammestax Ixdiaxs.

Che'muIpro: an open or treaty port on the west coast of Korea; 97 miles from scoul. the capital, with which it is
 (swe map of China, ref. $1-1$ ). There were only thre foreign fimms there in 1852, and the trate is mostly in the hands of ditmuse. The chief exports are hides and beans, ralued in 1888 at $\$ 000,000$ : the imports were mostly cotion and woolen goods, and were valued at $\$ 1,200,000$.

Chombng. shee-mŭng' : a river of New Tork; formel in Stenben rounty by the mion of the Conhocton and Tiogat rivers. It flows in an F.s. F. Alirection through Chemung Commy, and enters the North Branch of the Susquelamma about an mile below thens, in Bratford en, lia.
Chemung dronll: in U. S. geology, a prominent division of the Deroman system of rocks, characterizal by the upper marine famm of the Devonan. The rocks are tyically irregular alternations of shaly samdstmes, comare shates, anil Harey sandstons, characteristically brownish gray in color. named for Chemmer fomety, river, or town in sumern Sew lork, and outeropping over the sonthern half of the
western counties of New Fork State, as well as in the Appalachian region. Other rocks in Jowa in the Western States, and in Maine, are referred to the Chemmng group. Palwontologically the Chemung group is equivalent to the Upper Devonian of the Britisha and European classifications. Sce Glology ind I'alextology.
H.S. Wllliays.

Chenango liver: rises in Oncida co., N. I.; flows S. S. W. through Marlison and Chenango Counties; enters the Susquehanna at llinghamton. Length, 90 miles.

Cheney, Charles Edward, D. D.: cergyman: b.at Canandaigua, Untario co., N. Y., Feb. 12. 1836. II graduated at Hohart College. Geneva, X. Y.. in 185\%, and studied at the Theological seminary of Virginia. Nov. 91,1858 , he was ortined deacon and became assistant rector of St. Luke's church, Rochester. N. I. Subsequently he took charge of St. Paml's chureh at Harana, N. Y. (18.59), and in Mar., 1860. he was ordained a presbyter, and took charge of Christ chureh mission in Chicago. In consequence of his refusal to use the word "regencrate" in the baptismal offices, he incurred the displeasure of his diocesan. Bishop Whitehouse, and his trial for this offense has become historic. During this trial by an ecelesiastical court an injunction from the Superior Cont was ohtained by Melville IV. Fuller (now Chief Justice of the U.S.), Mr. (hener's counsel, on the gromen that his client could not have justice at the hands of the ceclesiastical tribunal as constituted. On a hearing the injunction was dissolsed, and the trial proceeded. MIr. Cheney was found guiltr and was suspended from the exercise of his sacerdatal functions for a stated time. Refusing to oliey the decision of the court, a new trial for contumacy followed, and on this ground-that of contumacy-he was finally deposed from the priesthood of the Protestant Episcopal Church. He received consecration as a bishop (Dec. 14. 1873), from the hands of the Rt. Rev. Dr. Cummins, late assistant Bishop of Kentucky, who had left the church of which he was a bishop with the view of founding an organization more in sympathy with the evangelical bocties who have not the episcopate. Dr. Chener still remains in eharge of Christ church. Chicago, the parishioners of which followed him into the Reformed Episcopal Church.
Cheney, Jons Yavee: poet; h. at Groveland. N. Y.. Dece 29, 1848: practicen law in New York till 1876, when he remored to San Francisco; has been Jibrarian of the public library since 188. Among his poens are Thisile Drift (1887) and Wood Blooms (1858).
II. A. B.

Chénier, shä ni-ā', Axdé Marie, de : poct ; bo in Constantinople, Oct. 30. 1:62, his father being consul-gemeral uf France, his mother a brautiful and cultivated Greek named Santi-l'Ilomaka before her marriage. He was educated in Paris, and early conceived a proformd cuthusian for Greek poetry and art. At sixten he proposed to translate Sappho. lle was, however, a serions student and, on the whole, had the intellectuals rmpathies of the eighteenth century rather than the romantic pasions of the nineteenth, of which he has so often been called an early reprenntative. In 1787 he went as secretary of legation to London. Where he lived somewhat glomily for a time, deriving little from England except an admiration for the English Constitution, which subsequently led him to oppose and denonnce the tendencies toward anarchy which apparel in the French Revolutionary movement. At the first outhreak of the Revolution, however, he hailed it with gladness. He retnrned to France and threw himself into the political whirl. But before long le found himself vehemently opposing the men into whose hands the direction of things hat fallen. Ite was arrested and after it time in prison guillotined July 25. 1794.

The enduring portion of Cheniers poetry is that which convers his love of heanty, his passion for intique art, his retlection upon the universe, rather than that which convers his political lowes and hates. His early death, however, left his work in a very matinishal and even fragmentary condition. Of his three longer prems. FImention, Ihermes, and Susemue, only the first is completal. The ILermes, in which the port attumpts a new version of the theme of Lacretins, De Rerum Xaturu, is the most interesting. Of his shorter poems, idyllic in form, several arr among the masterpieces of the French tongne: THereyle, la Liberté, le Mondiant, le Jeune Malude. His ode to "harlote corday and that to la doune Coplive are estally fimmons. See II. ile latouche, Notice sur Autré Chéner (is? ) ; siante-Benve, Crifiques el Porlraits (t. ii.), and liis ('tuseries de Lumdi (t. iv.): B. le Fou'tuieres, I'oésies d'André C'hénier, avec une étude (18T2);

Cherimos'er, or Chirimoy'a: the fruit of a species of Asosa ( $q . r$ ), of the Custard ipple family (Anonacect). It grows upon a spreading tree (A. cherimolia), 20 to 25 feet high, which is native of tropical America including the West Inclies. It is related to the bawpaw of the $\hat{U} . s$. (Asimina trilobrt), and bears ovate-lanceolate leaves which are silky underneath, solitary, brown, fragrant flowers, and clobose or oblong, greenish or purplish fruits which are from 2 to $\overline{5}$ or 6 inches in diameter. These fruits have a white flesh containing a fers lark-colored seeds, and are regarded as among the finest in the world. This and some jelated species have been long in cultivation is ornamental plants in conservatories.

Chermigoff' : a government (and city) of Litthe liussia The government is on the east bank of the Epuer Dnjeper, S. of Smolensk, and between Orel and Kursk on the E. and Poltava on the W. Area. 20.233 sit miles. It is an undulating plain, deply grooven with ravines, wooded and marshy in the north, dry and steppe-like in the south. The Disna river passes through the prowince, and is navigable. Corn, timber, linsed, brindy, and hemp are produced. Sugar is also extensively grown and mannfactured. Pop. (1853) 1,996, 250 : ( 1897 ) 2. $320,00 \%$. The people are mostly ( 86 per cent.) of Little Russian stock. Jews are numerous, and thero are a few Germans and Greeks. Chief towns, Nyezhin ( 50.000 ), Starodub ( $2,2,000$ ), Chernigotf $(20,000)$ (see map of Russia, ref. 8-C). The last is the capital, and is situated on the right bank of the Desna, $4: 6$ miles S . W . of Moscow. It is an ancient city, and was formerly of moch greater importance than now.

Cherry: a name applied to varions species of the gemus Prunus (family Kosccere), which are characterized by small, smonth fruits with a smooth stone, which is globular or appproximately so. There are mumerous species of cherries in various parts of the worl. falling into two groups designated by the inflorescence. In one gronp, to which garden cherries belong, the flowers are borne in umbel-like, nearly susile chasters: and in the other, to which belong the choke cherry anl wild black cherry. they are disposed in true racenies. The natural history of the eommon cherries is not well understood, but most botanists agree in referring them to two species-Prmues cerasus, comprising the Jorello type, and Irumus arium. comprising all the sweet cherries and the clase known as Dukes. Pomologists divide the uflspring of Prums acium intu several classes, bint most Americin writers make but three divisions-the " hearts," Chatracterized by heart-shaped fruit with sweet. tender llesh; the " higareans", with a firmer or mone moaty fosis; and the lokes, with aciul, juicy fruit. 'lohe Inkes are somotimes classed with the Morollos, and some writers regard them as

 remor Wesel, olion Ioanty: amoner the bigareans, Vapolemblbigatwith, Vollow, Spanish (known also as Tigarreath),

 Belle Dasailioue: umong Momblos, Vaglish Morello, Montmotency, bituly liidtumbl, Oatheim. Louis l'hilipuc. Cherries reguire a dry aml momeratuly strong suil. The $\lambda$ la\%fard is a luaf-wilal type of Promins arium. Which is ustal for storks "penn which to bud atme graft all the common cherries. TVie Jahshebstuck (I'remus muhulcb) is used as a
stock when dwarf trees are required. The Sand or Dwarf cherry (Prumus pumile). native to the U. S., is now coming into cultivation as a fruit-plant. In Japan chelries are popular as ornamental plants, the common species there being Prumus pseudocerasus.
L. H. Bailey.

Cherry-bird: See Cenar-bird.
Cherry Lanre]: a mame given to the evergreen cherrytrees, snch as the bay laurel. Prunus luurocerasus, a native of Asia; the Portngal lanrel, Prumus lusitanica, a native of Sonthern Europe; and the "mock orange" of the Southern U. S., Prunus coroliniuna. They are all prized as ornamental shrubs or trees, and all abound in poisonous hydrocyanic acid, especially in the kernels and leaves. They have also an essential oil, resembling that of bitter almonds. The leaves of the first-mentioned species are used in flavoring sances, etc.. and in preparing cherry-lanrel water; sometimes employed in medicine as a sedative, but its strength is variable, and it should not be nsed.
Cherryvale: city (founded in 1870); Montgomery co. Kan. (for location of county, see map of Kansas, ref. 8-l); on Atch., Top. and S. Fé, lían. City, Fort S., and M., and St. L. and san. F. R. Rs. ; 156 miles S. W. of Kansas City; has 2 fine schools, 6 churches, and natural gas, which supplies light and heat to the entire city. The city is situated in a farming district. Pop. (1880) 600; (1890) 2,104; (1895) 2,386.

Cherry Valley: village; Otsego co., N. Y. (for location of countr, see map of New York, ref. $5-I I) ; 68$ miles IV. of AIbany. It has an academy. Cherry Valley was the scene of a massacre by the Tories and Indians in the British service Oct. 11. 178. Thirty-two inhabitants, nearly all women and chiklren, were murdered, besides sixteen soldiers of the Continental army. The rest of the citizens were made prisoners and taken away, and all the buikdings were burned. The village is 6 miles from sharon Springs. and is a place of summer resort. Pop. (1880) 8.56 ; (1890) 685.

## Enitor of "Gazette:"

Chersiphron, ker'si-fron (in Gr. Xepot $\phi \rho \omega \nu$ ) : an cminent Cretan architect who flourished about 600 B . C. IIe thesigned the temple of Diana at Ephesus, one of the Seven Wonders of the world, but he died before it was finished. It was adorned with 127 Ionic columns of marble 60 feet high, and was 455 Roman feet in length.

Cherson: See Ǩherson.
Cher-sonesus, ker-sō-nee'sŭs (in Gr. Xepobvəoos): the ancient name of several peninsnlas of Enrope and Asia, as C'hersonesus Aurea Nalacea), Chersonesus Cimbrica (Jutland), Chersonesus Thracia (Gallipoli), and Chersonesus Taurica (Crimea).

Chert, or llornstone: a siliceous mineral: a varicty of g martz with many of the characters of flint, but differing from it in being of a tongher nature, and breaking with a splintery instead of a conchoiclal fracture. It is always massive, and is of varions colors-white, red, yellow, craç, and brown. It is common in the monntain limestone, oölite, and greensand formations; it sometimes forms rocks, and often contains petrifactions. The term chert is often applied to the siliceous concretions which oceur as nodules in limestone rocks. The limestone is said to be "cherty" when it contains so much of these concretions as to render it unfit for building and conversion into lime.
Cherub (ph. Cherubin or Cherubs) : a kind of wingen being mentioned in the surptures. Cherubim guatled Paradise (fron. iii. .84) sum prevented the return of fallen man, and cherubim were placed over the mercy-seat in the 1loly of llolies (Ex. xxxvii. s), and were wronght into the hangings of the temple (Ex. Xxvi. 1, 31: xxxvi. S, 3. ) : so in Solomon's temple ( 1 Kings vi. 23, sqq.) they overshadowed the ark. and carved mpon the duors and elsewhere were used as ornaments (I Kings vii. 29, B6). They symbolized the nearness and at the same time the inaccessilhility of God. They 'hyear as fon'-winged leings ot a gencrally human form in Christian art. Most writers regard them as angels, but many critics beljeve that they are symbols rather than real existinces. Acending to the simple, primitive angelology, chernham carried forl whon he appeateal in his glory on the ('arlh (l's. xtiii. 10) : ('f. Ezukiel's vinions (Ezek. i. 1!i ; x. 16; xi. 20), so also they are "alled "the wings of the wind," Lutring Gonl to the world (Ps. civ. 3 : ls. six. 1).

Egyptimn Queen (london. 1882). Dr. Forbes is of opinion that the Braantines received the game of chess from the Persians aljut the heminning of the seventh century of the Christian era, and that it was communieated to some central parts ul bumpe from Constantinople and from sjain in the next century.

The First Pinted Book:-The development and progress of chess has heen closely connected with the earlicet budding of literature in tliferent languages. A short treatise be Jacohns de Cessulis, entitled Liber de moribus homimum et offiris nobilium super lulo Scarorum. written abont the year 13010 1. D., was translated into English from a French version of Jehan de Vignar lor William Caxton, and bronght out in type in 14,9 at Cologne. under the title The Giume and Pirrye of the Chesse. I second enition was printed be the translator in 14:9 in London, and this is undoultenlly one of the first bouks issued in metal type in England, some whiters indeed claiming it to be absolutely the first.

Chess Libraries.-The literary elucilation of the game, with the branches that have develfoed in different enuntries, fills. in special chese libraries whicll have been collected by many amateurs and pmblic institutions, several thousands of rolumes, consisting of theoretical works, collections of actually plited games books on endings and problems, ches nerionlicals, ete. The largest of the well-known chess libraries are those of J. (r. White of Cleveland. 1.: Baron ron Hevdebrand und ler Lasa, Wieshaden, Germany; Charles A. Gilberg. Brooklyn. N. I.; and Eugene B. Cook, Hoboken. N. 3.

Theoretien Howks-Of the most prominent theorelical ches works that have appeared within about fort 5 -five years may to mentioned Bilgner's Mandbuch des Schachspiels. br Paron som Hesdebrand und der Laza (Leipzig, 1s43); The (hessplayer's Ifandboo)s. hy Iloward stamaton (London, 18(5): Des grosse Schuchtiandouch, br Zukertort and Dufrenne (Berlin. 1N:1): Teoria e Pratica del Gimoen degli Shlacchi, by (". Salvioli (Venice. 1s85): and The Modern Chess Instructor. part i., hy II. Steinitz (New York, 1889).

Collections of (i+mmes.-Separate collections of games played by masiers, with reliable annotations are most instructive and entertaining to amatens. and since the inauguration of great pulbic matches bet ween two selected players, or tournammats consisting of short enconters between a large mumber of compratitors, the publication of the ganes thus plaved forms a large portion of cmrrent chess literature. The most noteworthy books of that deseription are Chess shulies. comprising 1.000 Gumes (without annotations). whted by George Walker (Lonton. 1844): Stamfon's Chess Tonrmement (Lisilun. 18.9?): Book of the First Americtur ('hess Congress, by (i. II. Fiske (Nem York, 1859), Which is cspecially remarkable as it records the first public explots of the American chess genins. Pial Morphy: -Morphys. Goume of Chess. by Lowenthal (London, 18fin): The ('hess Comgress of $18 s^{2} \overbrace{0}$ ley Lowenthal and Medley (Lumdon, 189f): Transmetions of the British Cless Aswociation, by Lownthal and Medley (London. 1869): ('ongres Internctional des bichers, by Hhonse Fér d'Esclants,

Minchin (London, 18s品, with notes by Zukerturt, Stenitz, Mason, and Birl: Sixth Americen Chese Compress, by W. Steinitz (New York. 1s91): am] rarions huolis of (ruman chess congresses, by E. Shatlonpume wher anthors (Leipzig).

Chess Problems.-Compositions of problems, which are imaginary end positions lealing to mate in a reguired momber of moves, are almost lissuciated from the practical qume to the formation of a separate art, which has been called the wetry of chese. Phil, siamma, a mative of Aleppo, Srria, who was interpreter of Oriental latnguages to the King of England, is regarden as the fat her of this modem brand of chess science, which he inampated with a colleetion of 100 artificial +nd puritions, publi=hed in 173T, and the same anthor is the inventur of an ingenioms chess notation which has since heen moptend all thromsh (ermanys ame also by writers in other hanenages notath liy the Italian ( $\%$ Salvioli. It romsists in marking the horizomtal spuares of the hoard from teft to right with lettire from a to h, and the vertical ones, starting from the white side, with firures from 1 to 8 The eombination of a letter amb ligure thas denotes each "thare precisely.

Problem Toirnaments and Composers.-Shortly after the
institution of tournaments for players, public competitions, mostly of an international character, were alsw organized for problem composers in connection with chess congresses or by journals which publish a regular chess rolumn. There wre now so many moblem composers in different countries, who are recognized to be of the first rank, that it is too difficult to class and emmerate them. Bat it will perhaps be whly fair to slistinguish by name problem anthors who have win high prizes in international compritions, and who at the same time have been the leaders of proble m tiste in their puldished works. They are Ph. Klett and Kohtz aml Kock(1)korn (joint aththors) in Germanr: J. Berger, Anstrial F . Healy and B. G. Laws, Englanti: S. Loyd, America; E. Pradignat. France : and B. G. Valle Italy:

Chess Musters, Chrmpions, and Elindfold Plryers.-For the purposes of compurison between mental operations and plysical exereises. it is rery remarkalile that in chess as well as in sports the relative difference of strength between the highest experts is extremely difficult to determine, and is gencrilly almost imperceptible. The established tests of skill have often profluced elose results, and it is specially notable that in team matches of players selected by rival clubs or associations, which sometimes number as many as one humdrel a side, oceasional ties, i. e. equalities in the scoure of eatch party. have oceurred.

U'p to the early part of the nineteenth century ehesscelebrity was generally assigned only to anthors on the game, and of the rere few previous public trials of strength hetween reputed expurt- which are on record that of the ltalian Lerinarlo, called "El Puttino." who defeated the Spanish chess anthor, Ruy Lopez. at the court of Philip 11.. is noteworthy. The distinguished French musienl eomposer, Daniean, better known unter the name of Philidor, was the greatest chess player and writer on the game of the last centurr. and he added to his fame. after having frequently played single games from memory without sight of board or men. by successtully condecting in that maner two games a short time before lits death in 179.5. This has been leled to have been the first achierement of the kind until recently, when Prince Dadian of Mingrelia. a dislinguished Russian amateur, discovered in the Histoire Lrizerselle by G. Villani, 1539. an earlier record of a blindfold exhibition by a saracen of the name of Buceca, who about that time played two games withont board or men, and one game over the hoard simultaneonsly. But this performanee. Which was at the time considered quite astounding. has been since greatly excelled by varions masters. Zukertort phayed in that wat the greatest number of games. i. e. 16 . Louis Paulsen 14, Blackburne 12. Techigorin 10. Morphy and others 8.
Philitor's suceessor in holding the chess supremaey was De la Bourdomais, nlso a Frenchman. whose match games with the best English player of the time, Alex:mder Macdonnell, were the firs to be preserved in a collected form. De la Bourdomais died in Lomdon in 18f(1), and three years later a great match was organized at Paris between his pupil Saint-Amant and Ioward Stannton, of England, which was regarded as of an international character, and involving at least the European clampionship. The winner of that match. Stannton, alter having defeated some players of consilerable strength, among them the rising mister Harwitz, at large odds, becane the chief promoler of the dirst international tommament, which was held in connection with the first World's Exhibition of 1851 in London. ind was nstensibly intended to scttle the championship of the world. But in that tomrnament, as well as in the momerous sulsequent ones which have since been ortanizel, it was found imposible to frame satisfactory rule for the purpose of establishing an undisputed superiority, and such gencral contests are regarded by the best judses meroly as exeellent training for aspiring champions, aml a personal encounter in a large number of games between two selected players is held to be the superior test. In the first international tournament Prof. Andersan. of Breslan, was the chief victor, and Stamton took ouly the fourth prize. The latier had also been defeated ly the former it the persona! romd. but newertheless Staninton was still distinctly temed in 1858 the " aclenompedged Eirropean champion" in a challenge from Paul Morphy, of New Orleans, the most precocions genius that has ever appeared in the chess arena.
Morphys fitmons tour to Europe tonk place in the same vear. at the emb of which he hat defeated Lowenthal, Harrwitz, and Anderesen in matches, as woll as other formmost players in off-hand games, so decisively that the ditle of champion of the world wis assigned to him, though his
lesired match with Stanton did not come off，owing to the later＇s unwillingose to phay．After his retum to his native city the rommemater retirel from chess practier，chiedy on theonit of a nerrms disorder which wath the to private misfortunts，and perlatys in sonte measure to mental wer－ work at an early agr：He died in July，188t．Stanton also retired in 1sise and he died in 18.4.
In 1Nfig Stainitz，an Anstrian bom，hat rewident in the U．S．since 184：3，won the championship of the world in a match in Lonelun aqainat Prof．Andersen，and suceessfully defended the title matil 1 is 4 in various great matehes，of which the most notable were those agaims Zakertort in lan－ don，1s：：Phachurn in London，18：6；Zukertort again in New York，st．Lants，and N゙ew Orloms，18xG：Trehigorin in
 arain in llavana，ks？．In tsat he was lumton ly haker． Though he has not eampeded in any tournament since 1883, Steinit\％hed the best average remel in tournamonts acemb－ ing to the last computation publishod in 心． H hy W．Somne－ borm，the inventor of an ingenious and recomized mathemati－ cal system for the purpose．Steinitz has also won the great－ © bumber of ensecotive games in any single tournament．
The chief rivals of these clampions，hesithes their respee－ tive oppouents alrendy namets．who ciller hat no oportu－ nity of showing their fullest force or eke fell short of the highest suceess，were，in chromologieal arter，Batom won Heydebrand und der Lasa，Buckle，Hamphe，Neuman． Winawer，Englisch，Bum，Nackenzie，an！Weiss At the present time two most remarkable yomg players are in the fiedd，both matives of fermany－Dr．＇Tirrasioh，of Ninrem－ bures and E．Lasker，formerly of Berlin，but now resident in Englind．The former won in sucessein the thre tourna－ ments of Brestan in 1889．Manchester in 1890，and Dresten in tetre．Fach of those tonrnaments consisted only of one romed，and thoy were also inferior as publie testis to the domble－rom tommanent：of Lonton，188：3，and New Fork， 18＊9，in referenee to strength of competitors．But the sue－ cession of victories on the part of the German master is an astombing one，and is much enhaned by the fact that he only lust one single game in the last tomament，lut other－ wise wom or drew atl other granes in the thre compritions． He has however，never payed it match against any first－ chass player．Lasker has made a record whieh ranks him amone the greatest masters of the thay．He hats beaten such phayers an Mieses，Bnaclisch，and ron Bardetobet，has won two tumaments in England withont lowing more than one grane，mul has defeated Backhome and bird in matches without as single game heing seored against him．In 1s．94 he defeated Steinit\％in a match for the championship，of the world．

Inrehanstbility of Chess．－The infinite variety of possihle combinations in playing the grame atforls opportmities for the exprise of the highest ingennity．starting on the hacis that the lirst player has fwenty lifiomat moves at his disposal，for which．however，only the pawns and the two knifhtsare available，whie the other pienees are blocked according to the laws of the game，and that the opponent has iwenty difierent replies，under the sume restrictions for each one it is clear that the first mowe on each side，without ghine any farther，can the made in 400 ditferent ways！This mamber is therefore the mit in the arithmetical progression fir calculating the total of possible combinatims that may arise in phaying the game．Mathematicians have heen un－ able to arrive at an exact digure Gut Edwen Antheny，of Herefort，in an article pablished in the（1hess Players Chronicle， $1 \times$ an，has ermputed apmoximately that the num－ bur of ways of plating only the lirst ten moves on cach site is $166,515859,100,5-11,000,000,000,000,000$ ．

IInts for Letermers．－From such an appalling proluct of reckning，which aftur all only applies to the onnoner por－ tion of the game the difliculties in matering its intricaces would seron to he insurmonitathe．But experince has proved that this pactically illimitable mumber of combina－ tims presents mome serioms general difliculty to the ac－ guirement of profefence in the game of chese than it dars in the art of masic．which theoretically is aiso of infinite varicty：By mobting a reasonable method of training，it repures in reality no greater cffort of minh or＂xpmoture of time to learn the game sutlicjently for the purpoe of thomery enjoyment and appreciation of its attract ions as a fomblation for further improwement than a similar qualifi－ cation for ather acemplishments．Our whiee on the sub－ jeet mast of necessity be very briof，and we shall eontine ourselves to the must important points．After having ob－
tained the necessary clomentary knowhen in referener to the movemant－of the pieces and the laws of the game the lemper shouk alternate pradice and stmely with the greatest reqularity．＇Tuition under competent instruthes ：nd actual bhy with sumpribs will he of the grater assistance．The shily should ensist ehiefly in harning the orenings and in phaing ower attent ively selected games of tirst－chass masters． with analytieal comments by amotatoms of the bighest re－ pute．Rut the solving of real or artiticlat game poling and prohbme will alon be found of grent sepvien．In pactieng over the hamet the learner should very carly lorgin to flay on wen terms against the stronges opponents amablale． withont in the lean minding even the coptanty of defeat fur at long，time．The play with full forces is of an entirely
 vides．to that at odde，and a mueh better traning is alforded to the stadent in competing on equal tems thatu hy halitu－ ating himself to sart with an exerpiomal advantage．By mopting these methods systematieally a phayer will scus ancuire knmbledge and judgment of position that will fit him to attain a high stage of excellence．

Elemeytamy Deschation of tie Game．－The above dia－ gram shows the hav！and men arranged for stating play intween 1 wo parties．It shonh the specially motient that （racla tide has at white square on his rimht ham comer，amb that the white gmeen is phaced on a white sounce ame the black fure on on a blate spuate．

Tofafion．－The abbreviatol signs for the pipecs ant pawns in repotine the scores of game or in print atr K for king， O for puech，R for rook．l＇，for hishop，kit for knight，and for phwn．In the opening of the grame and sometimes throughon it is necessary to distinguish she cially the pieces on each sith．thus．Kill fir king＇s rook，（Qli for given＇s rook． klit fur king：knight，ofe．In dewignatiog the pawns the letter 1 ＇is added to the name of the pisee which he fronts． For instance．QliP for quern＇s rook＇s puwn，KK゙ト forking＇s knitht＇s pawn，KP for king＇s pawn．
Tho seputes are deseribed hy abling sy to the initial let－ turs of the piece placed at starting on tho front row，the figure：for the secont row，the figure ${ }^{3}$ for the thind row． and so on up to the figure $x_{0}$ ach party combting trom his own first or front row to the top．＂Thas，for instance the stgare on which the king＇s hithopstande woukt be matred Klas if white phaces iny man on that squate dat kiss when back phats a man to that symare．（The figure 1 is als）sumet imes lised insteat of sto or either is le ft out altu－ getluer when a sylate on the first ch front row is alluled the） The f urth sume on white＇s fifth row，conunting from left to right，would he called kit．
The ouject of the crame is to＂thedkate＂the adverst kinge，which menn－tontack him ins such an maner that he can nut offect his eseape．If the king and all other pieves are harebed in a position in which the saint king is not at－ tacloed or＂in clack，＂it is a statemate，＂and the game is drawn．

Norements of Ifon ant（ingtures．－The men mose to ra－ cant sifures，emi，with the exception of the knight，can fass
over only unoceupied squares．A eapture is effected by re－ moving the adversary＇s man and replacing it with the cap－ turing man．All captures are optional，excepting when checkmate can not otherwise be avoided．The king is of paramount importance，but his powers in play are limited， and he is weaker for the purposes of co－operation than queen or rook，but stronger than bishop or knight．He is the only piece that is not allowed to＂place himself in cheek，＂which means to expose himself to capture．The king moves to any adjoining square only，and eaptures in the same way unprotected pieces．Once during the game the king may ＂castle．＂This is effected with either look when no piece intervenes，the king not being in cheek，nor moring into cheek，nor passing any square commanded（attacked）by an adverse piece，by placing the rook on the square nest to the king，and then crossing over with the king to the square next to the rook．Either the king first or simultaneously king and rook should be touehed in earrying out that process． Castling with the queen＇s rook is deseribed in the notation by O－O－O（adopted from the German），or＂Castles（11＂or ＂Castles $Q$ sitle＂；the sign for castling with the $k R$ is $O-O$ ， ＂Castles KiR＂or＂C＇astles $\boldsymbol{K}$ side．＂

The queen is the most powerful piece on the boarl．She moves straight in all direetions，horizontally．vertically，and cliagonally，as long as she passes on unoecupied sçuares，or until she replaces an alverse man by capturing it．

The rooks move and capture horizontally and vertically， but not diagonally．

The bishops，which are slightly superior to the knights， move or capture diagonally in any direction，and in eonse－ quence a bishop always remains on squares of his original color．

The movement of the knight，or its method of eapturing， combines one move square and one oblique，landing the piece on any third sctuare of opposite eolor from the starting－ point，with power of overleaping men of either side．In the position in the above diagram either knight may move to 133 or R3 on the eorresponding side；in the middle of a free board a knight has eight moves．

The pawn moves，if lor the first time，one or two squares forward at the option of the player，but afterward only one square at a time forward．He captures，however，only on one of the two diagonal squares in front．Exceptionally． when a pawn stands on a fifth square，and the opponent，in accordance with his option，plays one of the adjoining pawns two squares，the former may capture the same as if the hostile man had only been moved one square．This is called ＂taking a pawn in passiug，＂or＂en passant，＂for whieh the abbreviation is e．p．The privilege of capturing en passant and the respective liability to being captured in that way is absolutely confined to pawns．A pawn on reaching the eighth square，counting from the front row of the same color．may be promoted into any piece of the same color， excepting the king．A player may therefore have two or more queens，three or more rooks，knights，or bishops，si－ multaneuusly on the board in the course of the game．Ac－ cording to the eode of laws of the British Chess Issnciation of $1 \times 62$ a player has the option of allowing such a pawn to remain unmovable，but liable to capture．The practical utility of such a case is hardly likely to arise in actual play， and this law is only ol importance in reference to construe－ tion of problems．

Modern Style and an Old Masterpicce．－It is now estab－ lished bevond any doubt，chielly through the best practical examples of modern masters anid the more recent researehes of theorists，that．scientilically correet play must be based on steady derelopment and ciremmspection with the view of hokline the balance of position it all points without sac－ rificing anr matcrial，and that the first more or the intack is only sulficient to secure a draw，which by best play un both sides shonld be the lugitimate result．It is also now generiblly accepted that the ling is a strong piece hoth for attack and delense，and＂arly agrgessions in lis direction are mostly Immature．Iet the slightest strategioal fault will often justify hrilliant sumpices of heavy material that will result in the recosery of more valabble force，or even in checkmating the opponent．Themeljeal analyses and praw－ tical expositions of masters have often profliced charming complications of that deseription，whidh will always pawe most entertaining to the shulent．One of the finest speei－ mens of that charactor is the suhovined gane，which was played betwend 1rof．Anderswn．onte of the worlis cham－ pions about forty years aso，sum llarr loffesne，（me of the strongest players of that time and a distinguished chess
anthor．The opening，an＂Evans gambit，＂is named after its inventor，Capt．Evans，the word gambit meaning the early saerifice of a pawn for the attack．
（－represents the word＂to，＂ch＂check，＂dul ch＂double check，＂dis ch＂discorered cheek，＂and x＂takes．＂）

## NOTES．

（a）This move constitutes the gambit anmed above，and it leads to a variety of most interestiug combiations in theory and ia prac－ tice．
（b）Some anthorities hold that the gambit ought to be refused by B－Kt3，and no doubt black obtains at least an equal game by that retreat
（c）The Russian master，Tschigoria，mefers castling at this junc－ ture to the present more hazardous attacking line，which gives up a aother pawn．The latter was，howeres，in general favor among ex－ aaother pawn．The latter was，howeres
（d）Herr Dufresue＇s favorite defpise，hut $P \times P$ has been since es－ tablished as superior，thongh it still leaves white with a very strong atlack．
（e） 9 Kt $\times \mathrm{P}$ would at least lose a piece by $10 \mathrm{R}-\mathrm{K} \mathrm{sq}, 10 \mathrm{P}-\mathrm{Q} 3$ ； $11 \mathrm{Kt} \times \mathrm{Kt}$（tbe attack might also be coutinued with $11 \mathrm{~B}-\mathrm{KK} 5$ ）； 11 $\therefore \mathrm{P} \times \mathrm{Kt}, 12 \mathrm{Q}-\mathrm{R} 4$ ch and wins．
（ $f$ ）Castling was undonbtedly preferable．The counter－attack is premature．
（g）He could not castle now on account of the reply $\mathrm{B} \times \mathrm{Kt}$ ，wianing
a piece． a piece．
（h）Loss of time，Which was of great importanee in this precarious position； $15, \ldots \mathrm{Kt-Q.5} ; 16 \mathrm{KKt}-\mathrm{Kt} 5$ ， $16 \mathrm{Kt}-\mathrm{K}^{2}$ ； $17 \mathrm{~B} \times \mathrm{P}, 17 \mathrm{Q}-\mathrm{R} 4$ was probably his best resource．
（i）The queen was now in danger by $\mathrm{Kt}-\mathrm{B} 6 \mathrm{ch}$ ．
（j）The initintion of a most elegant and profound combination．
（k）The key－move to one of the most beautiful problems that has ever been constructed in actinal play．
（l）Even if he had divined white＇s magnifient plan，which more clearly reveals itself on the next mose．he comld not have saved the

 (iin) Whereser the king moves to
(i) Wherer the king mores to the rephy B x it effects mate.

Chest. or Tlinirax: the part of the boly between the neck and the abdomen. It is a conienl easement formed of bones and cartilures joised together by museles and other soft tissues. It contains the heart and the great blood-vessels, the lmge, asophagus, various nerves, and other less important st ructures. The windpipe and the venons trmbs of the heat, neek, and arms enter the upper portion, which is hounded by the top of the starmum in fromt, by the first rib at the sites, and by the first thoracie vertera behimet. In the expanded part of the chest are the lungs, one to rither situ, and in the space between the lumes, mome toward the frent than the hark, is the heart and the great vessels lending to and leaving it. "lhis portion of the ehest is bounded by the stermm and costal cartibges and the ribs in front, hy the ribs at the side, ant hey the thomencertion of the spine behind. The lower orening of the thoma is closed by the eliaphragm, a musendo-membanons structure attarched to the end of the sternmm in front, the ribs at the sides, and the spine behind. The diaphragm arehes upward into the thonax, bat moves up and down with the respirations.

The thorax, as a whole, is hroader from side to side than frem hefore bakware. It ehanges its slape with the hreathing, beomine expanded by the elevation of the sternum and riks during inspiration, tud contracted and depressed during expiration. In pore abolominal loweathing the external shape of the thoras changes hut little, while intemally the eapacity is inereased and decreased by the deseent and astent of the arehing diaphragm.

Deformitics of the thorax are sery eommon, and usmally result from disense atfeeting the bones in early ehildhomi, such as rickets. A marked form of rachitie or rickety deformity is that known as "chiekn-breast." in which the chest is empresod laterally, and the stomum and anterior margins of the ribs may be male to protrute. Witla persons who suffer with rery long abdominal disense during childhond, the lower fart of the chest is frequontly much expanded: in individuals of phthiximal tendency the chest is prone to be thatemed and elongated. The potent ranse of deformity of the chest. which has frequently been overlonked, is the "mouth-breathing," resulting from chano nasal diverse in chathoot. The insufliciont chest expansion leads to ermbual adefomity of the chat, resembling
 sis or humbhack, marked defomities oceur. Limphysemat and asthma lead io a harredjek eformation of the ehes. Chest delormities while they are fomm resulting from disease may also comtritute to the ocentrence of disense by interfering with proper brathing and circulatim. Such effects may be ofviated, and the defomities themselves may be remosed by syatomie excreise and by qeneral care of the health.

Whahas lemper.
 boumed N. by Lancashive, from which it is separatol by
 fomdare $S$ by shopshite and Denifohene W. hy lelintshive and N. W. hy the lrish soa. It has a eoast on the Irish seat and the estmaries of the Jon and Musey. Area. 1,027 sfo miles. The surface is mostly lewel and well womb(al) the soil is a fortile clayey or sam! loam mapted to
 sambtune. The chief rivers bexides tha Dersey are the doe and Weaver. Coal, copper, and leal are fomed in the comeng. salt is mined in large gantities. Chevanx-do-Frise, she-vöd-freez': a Prench military term used aloo in Emolish: applied to large and stronir pirces of timber, from which wooden or iron spikes pri ject
in varions directions. Ther are emplored to impeate fhe atvance of cavalry or of a storming-party in a fortified plaee. Sometimes the cheral-de-frise consists of an iron tube, 6 feet long, in whieh there are twelre holes. The same number of spears are kept in the tube, and when reguired for use are inserted in the holes.
Chevanx-legers, -la'zha' (i. e. light horse) : a company of light cavalry created by Henry Tf., and used hy himas a kind of houschold troons. The company consisted originally only of s40 men, all noblemen. and ranked next the yerde dui corps. Afterward several other companies were alded, and the name lecame rey celchrated until, in $1: 50$. it disappeared from the Freneh army-rolls, the companies having been incorparated with the regular regiments of dragoons. Meamwhile the name had crossed the Rhine and not only the minor princes of Gemmany lun cren Austria created companies of chevan-legers. The name is frequently met with in accounts of the Napolennic wars, and was much used in Germans, lut has now disippeared there too.

Cheverus, shev'r-hŭs, or (Fr. pron.) sher'rüs', Jean Lovis Asse Madeleine Leffibrbe, D. D.: a Frenil cardinal and philanthropist : h. at llayenne, Ian. 2s. liss. Impriound by the revolutionists, he iled to Rugland on his release in 1702 ; surrendered his fortune to his lelatives and migrated to Boston in 1796 as a missionary. Here he endearel himself to the people ly his kindly relations to Protestants, who aidel hin in luilding churehes, by his bumane work anong the poor and those stricken by pestilence br his self-impoverishing generosity, and hy lis support of eflucational institutions. The was one of the founders of the Poston Athenaum: was appointed Bishop of Boston, Mass., in 1sus: returned to France in 1833 on account of his health: was made Bishop of Montalman; Archbishop of Bomeanx in tseb. and a car-
 by I. Ilmen-loubourg (Paris. 1837 : 3 Bl cal. 1842 : Eng. trans. Boston, 1839).
Cheves cheerz, Lavgdox, LL. D. : statesman and laryer ; b. in Abbeville distriet, S. C., Sept. 12. 1:id. IIe was a member of Congress from 1811 to 1816. and was speaker of the llonse of Representatives during one efssion (1814-15). In this position he voted against the bill to recharter the U. S. Bank in 1815, but he was afterward president of that bank (1819-99) ; also a supporter of nullification in South Carolina. 13. in Columbia, June 25, 185\%.
Cheviot lills: a mountain-range extending along the border hetween England and Scotland. The range is ahout 8.5 miles long. Its direction is nearly N. E. and S. W. The hirhest point is Cheviot Peak. whiel rises 9.676 feet aloove the level of the sea. The rocks of which the range is formen are porphyry trap, and mountain limestone. Gronse abount on these hills, which afford goot pasture, and are grazed by sheep, called Cheriots, which are famed for their wool. Their name is connected with the ballad of Chery Chase and many incidents of border warfare.
CherrenI, she-röl', Michel Elaide. 1IL. D.: chemist; b. at Angers, France, Aug. :31. 1786: pullished in 1893 Cliemical Researches on Fal sinbstances of Ammal origin, which did much to promute inlust thes and be ame director of the dyeworks at cioleclin in 1s.24. He succeded Vanquetim as Professor of Applied Chemisury in the Mnsemm of Natural History in 18?!. We publishell in 1839 an important work On the Lave of the Simultanenus Contrest of Colors and the Distributiom of Colored objerts. Among his other works is Lectures on Chrmistry -1pplied to the Ait of Dyeing (18:31). D. Apr. 10, 18st.

Chevron. shev rŭn [Fr., rafter. from a deriv, of Lat. faper, grat, i. e. leap of a goat ]: an ornament and batge of rank of gold or sitver lace, or of braid, worn on the sletve, deriving its nane from its resemblane in lorm to a pair of ralters. It is of French orimin. and has lipen used to denote perions of service in the ranks (eherons dinciemete) or the rank of non-eommissioned oflieers. The corporals and the varions srades of sergrant have from one to four cherrons, of different colors in different hranches of the service.

CuEvos. in heraldry, an ondinary representing the rafters of a house, and grinembly denoing the foumdation of his own family by the leataer. The chewron is formed of two lines, joiner at the fop, and descending to the extremity of the field in the form of a pair of rafters?

 two words meaning light and durli]: a combination of light and dark in at panting: a drawing: a print from wom-ent or metal, and the like. The term is "ope tally usel for the dowign in light and blatk of a paintays as dintinguishot from its colorderign and from its motit as a piece of accurate drawing. Thas ap pieture may the sitel to he prour
and coll in color, int valuable as a piece of chiaroscurothat is to say, the combination of light and dark parts and of difterent llegrees of light and dark is praised. It is sometimes said that the chimoscuro is not trathful or not accurate, meaning that the system of light and dark in the picture is not that of nature: but probably this is an erroneous use of the term, as chiaroscuro is an exclnsively artistical expression. It might he better to sar that the chiaroscuro is fine, but not taken from the light and shade of nature.

Ressell Stergis.
Chiarosenro Prints: prints in two or more colors made from wool-cuts by the nse of two or more blocks, each with a different-colored ink, These were common in Italy in the sixteenth century. and the nse ol them was revired in the eighteenth century in England.

Chiavari, kectita var-ré: a town of Italy: province of Genoa; on the Gulf of Rapallo at the mouth of the Sturla: 24 miles E. S. E, of Genoa (see map of ltaly. ref. 4-C). The streets are bordered with arcades and well-bilt houses. The town is inclosed by cultivated hills. and has many handsome villas in the environs. Here are several palaces and three churches; also manufactures of silk. lace, furniture. Fishing is carried on and marble is quarried in the neighborhood, Pop. 12,066.

Chiavistelli. keen-ăt-rues-tell lee. J_copo: b, 1621 : d. 1698 : Florentine painter: pupil Fah. Boschi and Baccio del Bianco: work of his is in the prefecture and in varions churches in Florence.
Chibchas and Chibchan Antiquities: The ancient nation of the Chibchas occnpicit the territory about the headwaters of the Magdalena river in Jew Grimata (see Indrass of south America); but more or less remote branches of the stock occupied a large part of the present republie of Colonbia, and remains attributable to them are found scattered now a great part of this area.
Buildings.- Beth the domestic and public edifices of the Chibchas were usually of perishable materials, as wood and plaster, so that in their teritory remmants of stone structures are rare. A few sites, however, are mentioned where such have been found. Perhaps the most characteristic is in the valley of sin Augustin. Trere the ruins of varions small temples or udoraturios have been discovered. They are constructed partly undergroumb, walls and ronf heing of large slabs of a compact fermginons sandstone, curefully dressed, amb bearing figures carven in relief. The interior chamber is rectangular. abont $\sigma$ feet in height, and 12 feet by 10 in area. In the ricinity many large and curious stone inages have been met with. earred with considerable expression and with a marked and varied individuality. Ther have a family likeness. being short and thick, alout 4 feet high, aul with an expresion of "ountenance apparently intended to strike terror into the observer.

Sepulchers.-ln most of the fertile valleps of the npper Magralena and its braches hurial-monds from 5 to 30 teet in height were numerous. They attracted the attention of the European settlers at an earty date as they were foum to contain an abmbluce of precions metal-gold and silver - which had heen buried with the dead. Goh was especialIy frequent. the forms into which it had been worked being figurines. cups and vases. permonal ornaments, and utensils. There have been instances reported where \&50,000 worth of this metal have bern extractel from a single tumulus. The consequence is that that $f$ 'w of them have escapel the attention of the treasure-seckers, who cared for nothing but the objerts in melal. thed for those only for their money value.

Rock Insrripioms.- Ahthongh it is not positively known that the Chihehts possensed a method of writing, there is some evidence to that effectand the paintings and carrings on rocks still to the seen in their territory prove that at least they undersanal it derelopued form of symbolic seriph. A mumber of such have then mentioned in varions fants of their territory, the two heot known being the "painted rock" at Sabra amb a pramuial inseribed rock at Gancoan on the river thicanorlat, buth of these contain fignes of men and of antmals, esperially the frow, which sems to have played an impurtant part in Chitichan muthology as the symbel of the gonl of the waters. The moninlithic pyramid of Gameza is bulieved to have bern intiticially carved into its precent slaze to sorve as a memorial of some important erent in trimal history: Unfortunately, an acentate copso of the inserfation has net been published."

Culendar Stones.-Another and peculiar class of Chibchan antiquities includes what have perhaps erroncously been called "calendar stones." These are small. hard stones, 6 or Tinches in length, or less, carved into curions shapes, with flat surfaces. on which are chiscled in low relief figures of various objects. The local archeolngist Duquesne, and following him Alexander ron Humboldt. explained these as calentars, and the figures upon them as day and month signs. This explanation has been rejected by later antiquaries, who prefer to regard them as molds on which thin plates of gold were hammered so as to preaent in the metal the figure in relief on the stone. To this it mar be objected that the figures are alwars in series of fives on the stones, and that they are not varied. lut are repetitions of the same. a frog, a fish. a drum, a quiver, ete., which would searcely be the case were they simply molds for goll-beating. Their real purpose has therefore not been decided.

Metal-tork.-The Chibchas were not aequainted with copper or bronze, and their trols and weapons were of stone or wood. The rivers of their conntry are however, rich in gold, and this they acquired unnsmal skill in working. They had learned the art of smelting and chasing, and of decoration in lonth low and high relief. Their eve for symmetry of form was excellent, and the gold vases probably showing the most correct form and finest workmanship of any on the American continent have been disinterred from their ancient sepulchers. They were one of the few American tribes who had a metallic currency, for which they used flat pieces of cold valued br measure and not weight.

Pollery.-The ceramic art hath been cultivated by the Chibehas to almost as great an extent as by the Peruvians. The jars and rases taken from the ancient mounds are nsually in a grayish clay. finely tempered, symmetrical in contour, and of varied designs, all, however, presenting an easily recognizahle family likeness. They rarely imitate aninal forms, and in this respeet these products differ from the wate brought from Peru.

rity the protucts, merehandise, and passengers from 111,000 miles of contributing lines. These lines have a trackage of 1.4:9) miles in the dity; the sin principal lepots are the Union, Wiseonsin Central, liock lsland, Hlinois (Patral (costing over \$ $1,000,0019$, Dearbom or Polk Street, and the North-wi-tern. From thae statinns $2 \pi .5$ throngh trains, 750 heal suburban. or accommoulation trains, and over 500 freight trains arrive and depart daily

Besides the malways, the carrying trate of Chicago is largely shared by the merchant marine service, the average number of vessels arriving and departing each year being a little over 10,000 , with a tonmage of $5,500,000$. These inchade many passenger stramers, which conneet the eity throngh Lake Michigan with Lakes Iluron, Superior, ind Erie throngh the Erio and Welland Canals with the ocean: and through the Illinois and Michigan Canal with the Mississippi river. Intramural transportation is facilitated by 629 miles of street-milways, 80 ot which are operated by cable, 306 by horses, and 22 by electricity, while 19 are elevated.

Churches:-There are 648 churches, divided denominationally as follows: Methorlist Episcopal, 128; Lutheran. 114 Roman (atholic. 101; Congregational, T2; Baptist, 58 Presbrterian, 46 ; Protestant Episcopal, 38; Jewish, 17 : Reformed Episcopal, 11 ; and all others, 63.

Educational Institutions.-The common schools are supported by taxation, and are free to all. The expenditnres for 1892 were $4,562,840$. The system is under the management of a looarl of education and city superintendent, ap pointed by the maver. In 1892 there were 230 schon] houses, 3,300 teachers to whom wore paid salaries amonuting to $8.55,5,31$, and an empollment of 150,543 pupils There are prinary, grammar, and high-school departments, an English high and manual-training sehool, and evening schools. I compulsory ellucation law is in force. There is also a nomal school for the etucation of public-school graduates desirons of becmning teachers, and in addition to the public or free schools there are nmerno kimlergartens, parochial schools, and privatu and sectitrian sehools. The old est college is the Nortiwesters Uxiversity (q. $\quad$ ? ). The Armoner Institute, a training-school for the promotion of inlustrial education, was establisheal in 1891 by Philip $D$ Armon and his family, who endowed it with $\$ 1, \% 00.000$. A spacions and substantial buihing has been erected, $1 \pi \mathrm{~h}$ by 6is feet, five stories in height, with rooms for hibrary, ehemical ant physical baboratories, lectures and recitations. The Chicago Athenamm, called "The People's C'ullege," was establishom in 18\%. It is openel daty and five erenings each week for nime months each year, and has a corps of thirtythree teachprs, Fonng men and women are entered at any time withont examination.

The mhlest of the theological colleges is the Chicaro Theological Seminary (Congregational), which was established in 185t. The MeCormick Theological Seminary is a Presbyterian instilution which was orgimizel and the first buildings erected in 1863, The W estern Theological Seminary is a new institution, established muler the control of the Protestant Episeupal C'lureh. The Baptist Union Theo logical seminary is now a part of the University of Chieago (see Citicago, Uyiversity (y). st. Ignatius College is.a lion man Cathutic institution, established in 1869. It is commeter by the Fathers of the Society of Jesus. st. Niavier's Acodemy is a Cathulic institution for the edncation ol' females. 1 t was estahlisheal in 184th, and is emolueted by the Sisters of Merer. The leading medical colleges are the bennet, Honwopathic Coblege of Physicians and surgeons, Hahnemam, and Rash. There ate also several colleges of dental surgery.
trit has fonmla ame in the Art Instituti. a magnificent structure located on Michigan Aveme amel cost ing S.0n0,000. It contains a splemidel callection of pictures, casts, and works of art, together valued at s. 5000,000 .

The dealemy of sciences was fonded in 1800. In 1890 Wat \& haw Latlin male it a donation of sion000, which, with other aid, enabled it to erect af fine bulding in Lincoln l'ark.

Libreries-The Chicaso Ilistorical suriety possesses the ohlest pmblie library in the city, begno when the society was organizel in 1s.3. It is not large, contaning only 6r,000 molumes, brome and unbound, but is rith in Amerie:mat original formments, perorts, and manmeripts. The Poblic Lathary in the larenet in the Northeret, contaming over 200,000 wolnmes. It was establishor in lsis, and is sum ported by eity taxatim, havery its home in the city-hall. It is a free circulatime librars, with ranling and referene romes. The Newhery library is momel atter its fonder Ifater 1. Newhery, who left in his will for its (stablish-
ment property from which has been realized over $\$ 3,500,000$. A temporary structure was erected and occupied in 1889. The library is for purposes of reference only, amb over 118,000 volimes, many of them rare and costly, have been conlected. 'The Chicago Law Institute has a fine law library in the countr building. The Crerar Library, with an endowment of over $\$ 2,000,000$ from John Crerar, is to be located on the south side, and, in aceordance with the founder's will, must be kep, free from sensational and skeptical works.

Churitable Institutions.-These comprise 11 asylums for children, 2 diet kitchens, 6 homes for the aged, 6 homes for women, 7 industrial schools, 7 day nurserics, 12 relief societies, 4 reformatories, $f$ dispensaries, 8 training-schools for murses, Conty and City Infirmary, and Insane llospital. Besides these there are the following hospitals: Alexian Brothers, Augustana, Baptist, Emergency, German, Marine, Porter Memorial. Mercy, Michael licece, P'restyterian, l'rovident, St. Elizabeth, St, Joseph, Sit. Lake's, Temperance, Wesley. Woman's. and the Women's and Chiddren's
Corermment.-The city is governed by a mayor, eleeted biennially, who receives a salary of 8.000 ; and a common council, comprosed (1894) of sixty-eight aldermen, whose terms are also two years, each of the thirty-four wards into which the eity is divided electing one cach yar. The other elective officers are a city clenk, treasurer, and attomer. The following are the ollicers appointed by the mavor and confirmed by the council: City comptroller, commissioner of public works, corporation conncil, city collector, prosecuting attorney, engimer, superintendents of the police department, public buildings, water otlice, streets, and schools, fire inarshal and other subordinate oflicers. The receipts of the city for 1893 were $\$ 3,670.926$, and the expenditures \$3? 489,673 . The total city debt amounted to $\$ 18,426,450$.

Police and Fire Departments.-The police force of the city, including a superintendent and assistant, secretary, chief inspector and 4 division inspectors. 16 captains, $\overline{2} 2$ lientonants, 36 patrol sergeauts, and 86 desk sergeants, numbers 3,171 : with 36 police stations, 35 patrol barns, 42 patrol wartuns, 4 ambulances, and 242 horses in use. Connected with the departuent is a bureau of identification, with the portraits of over 12,000 eriminals and measurements and descriptions of orer' 4,000 . It has also a detective department, 25 matrons to look after women and children arresterl, and an ellicient patrol-waron system. The cost of maintaining the force in 1483 was $8,5,569,355$.
The fire department consists of 1,037 ollicers and men, 73 stean-engines, 26 chemical engines, 31 hook-and-ladder trueks, 102 hook-and-lanker homses, 4 fire-buats, and 448 horses. 'l'he organization is directed by a fire marshal, a first and seeond assistant, secretary, a fire inspector, and 13 chicfs of battalions. Connected with the department is an insurance patrol, established in 1871. Firemen are retired on half pay after a continuous service of twenty years. The cost to the eity of the department in 1893 was $\$ 1.554 .850$.
Bunks-There are it national banks with an aggregate capital of s?1,300,000. and 26 state banks with ann aggregate capital of \$13,127,000. The total bink clearances for 1893 momnted to $\$ 4,676,960,968$, as against $\$ 5,1: 35,771,186$ in 189 .

Humfactures.-The mamfacturing indust ries of Chicago are second in magnitude only to those of New lork city. The U. A. censuns of 1890 shows that the namber of estab)lishments reporting was 0,050, representing 25. separate inlantries. These had a combined capital of sele.477.0:38, employed 203,108 persons, paid manally $\$ 119,146,3 a^{2}$ for wages and $838,614,84$ for materials, and han prodnets valned at \$6:2.184,1 to. Ot the separate industries, the slanghtering and meat-packing business was the largest in value of products, aggregating $0^{2} 03,325,092$. Clothing was next, with mutput raluch at s : 0,51 , 9.2 . Then followed foundries and mathine-shop prohnets, value se9,928,816; agricultural implements, *11,883,976; stem railway cars and furniture, wer \$12,000,000 each: wayns and carriages, $81,571.036$ soap and emulles, 85.987 .542 ; flistilled hiquors, $\$ 8,030,863$ and misedlancons ironwork, $85,018,159$. These figures show an increase over the census returns of 1880 of nearly 40 per cent. in the mmber of imfustries reported, of nearly 300 reer cent, in the number of establistments, and of over 400 per eent. in the amonnt of eapital invested.

Trade and Commerce.-'The recopts of grain, and flonr in its grain equivalent, in $1 \mathrm{~s}: 3$ aggregated $246,4 \mathrm{~m}_{2}^{2}, 966$ bush., more than in any previon year exept ts? ; the shipments for the yar argregated 19 , 3 ! 1,216 bush. Corn showed recejps of 91,205154 bush. ; shipments, $28,919,751$. Gats, re-
 grain clevators, with a combined calaty of 3 . The whome of the speculative grain trate of chienoro for 18:93, us indicaten by the boud of trath "loarine-homat.

 William R. Alaper, Fi, Benjamin Ambrow, Dhah Hoveg,

Henry G. Weston. J. F. Elder. Samnel WV. Duncan, Henry L. Murehouse, olames Il. Taylor, and Hun. Charles 1. Cubby were uppointed a committee to report on the seope loeation, funds, cte., of the institution. In May, 1sse, the board tonk financial action in a series of resolutions, immediatelr after the droption of which Mr. Gates annomnced a subscription of \$ 600.000 by Mr. Juhn D. Rockefeller. of New Fork, providing $\$ 400.000$ more should be pledged on or before June 1. 1890 . Vot only was the 8400, 000 secured. but also hooks, upparatus, anil a site for the institution valued at Sies.000. The site lies between Wrashington and Jackson Parks, amd fronts sonth on the Midway Plaisanee. Mr. Marchall Field contributed a block and a half of land and two and a half blocks more were purchased for $\$ 282.500$, thus providing a tract of four blocks, or some 35 acres. The muversity was incorporated in June. 18! 0 , the corporate name being "The Tniversity of Chieago." Twothirds of the members of the board of trustees and the president of the university must belong to the Baptist denomination. At the first inceting of the board of trustees after its incorporation. Prof. William Rainey Harper, of Yale University, was elected president. He entered upon the dnties of his oltice July 1, 1891. Before he accepted the presidency, the scope of the institution had been greatly enfarged. it first the establishment of a college only had been contemplated. President Harper felt that the institution should be a nniversity from the outset. Nr. Rockefeller, agreeing with this view, in Sept., 1890 . added $\$ 1.000,000$ to his former subscription, of which $\$ 800.000$ was designated for non-professional graduate instruction. Mr. Rockefeller further increased his endowment Fels, $23,18!2$, by $\$ 1,000$,(000, and Dec. 2\%. 1892, by $\$ 1,000,000$ more, making the total of his endowment $\$ 3.600,000$. The generat plan of the entire group of buildings was prepared before the work of construction was commenced. The central features of the plan are a university hall, scientific laboratories, musem, library, chajel, science hall, and gymnasium. Ibormitories intended to accommolate orer 2,000 students are arranged in quadrangles on the four corners of the site. The erection of huildings was bemm Nov, 26, 1891. The first buildings to be erected were the recitation building and a group of dormitories for the divinity school and university. In 1892 S. A. Kent. of Chicago, contrilunted \$ 150,000 for the erection and equipment of a chemical laboratory. The entire gronp of buildings will be of blue Bedford stone. The university berins its work with a great and valuable library. comprising numerous private libraries. but mainly consisting of a large collection purchased in Berlin, popularly known as the Calvary Library, which includes many rare mannseripts and the inost complete collection of dissertations from the universities of Europe in existence. In the spring of 1891 the executors and trustees of the estate of William B. Ogrten. the first mayor of Chicagn, assigned to the university $\% 0$ 解 cont, of that portion of the estate devoted ly the will of Mr. Ogden to benevolent purposes, to establish "The Orden Scientific School of the University of Chicagn." It is expecterl that at least \$300.000 will be realized hy the university from this source. The entire property of the miversity was rablued at the beginning of 1893 at more than $8,0100,000$. The university academy necupies the buillings formerly usert by the Theological Seminary at Morgan Park, and also those occupied by the Ihlmois Il ilitary Acmmony. The Baptist Union Theologrical Seminary, in accorlance with Mr. Ruckefeller's wishes, became the rivinity s(chonl of the university, and now occupies fuarters on the miversity site. The organization of the university embraces many novel features. The university work is ilishled into the miversity proper and the department of university extension. The miversity proper inchades (1) academios which may be either tirectly under the control of the univorsity or afliliated witl it : (2) colleges either in (hicago or at other points, the latter being also affiliated with the university upon certain definite terms: (3) graduate whonls, cither mon-professional or professonal. Tho colleg year is divinled into four quarters, beginning respertively oin the first dily of October. onmary, April, and July, aml eontinning iwelve weeks. The nniversity is thas in session the contire year. Students and professors may tak as their vacation any one of the fonr fuarters; the students may take two vacitions of six werks rach at two perimels of the yoar ar best suits their nemls and convenience. The courses of instruction are chassified as majors and minors; majors calling for tom honss and the minors five hours each pur week. Courses continue six weeks. Can-
didates for a degree must have finished satisfactorily 24 majors and 24 minors, or the equivalent of 36 majors, and each stument is required to take 1 major and 1 minor during each term of the quarter. Students may be graduated at any tme when they have completed the required work. Nonresident work is accepted under certain specific regulations. The graduate department. for which a large part of the endowment was given, will include some 21 schools, and offers some 40 fellowships. Instruction in the university began Oct., 1892 . with 111 instructors in its various faculties, and an attendance of 589 students.
C. 11. Thltrber.

Chieasaw Confederacy: See Natcuesan Indians; also Muskhogean Indins.

Chiceory. or suceory: an herb of the family Composite, sub-familr Liquliflorre. The common chiccory or succory (Cichorinem intybus) is a perennial plant found wild in most parts of Europe and naturalized in the U.S., growing in waysides, borders of fields, ete. It has a long carrotlike root of a brownish-yellow color, and white within. The stem rises 2 to 5 feet, the leaves resembliug those of the dandelion; the flowers rather large, beantifnl. and generally blue. Chiccory is extensively cultivated in Enrope for its roots and for feeding cattle with its leaves; and its cultivation has attracted some attention in America. The blanched leaves are sometimes uscd as a salad. To this gemus belongs also the endive. The dried and powdered roots of chiccory are much used as a substitute for coffee; also in the adulteration of that article.

Chichen" or Chichen Itza: a town of Mexico, in Tucatan; 18 miles $s$. W. of Falladolid (see map of Mexico. ref, i-I). Here are the remains of an ancient lown, comprising a rast ruined building 450 feet long, a pramid, the base of which is 550 feet square. and a remarkable domed edifice.

Chich'ester (ane. Rognum): an episcopal city of England; capital of Sussex; on the London, Brighton, and South Coast Railway; 17 miles E.N. E. of Portsmonth (see map of England, ref. $14-\mathrm{I}$ ). It stands on a plain between an arm of the sea and the South Downs. It is well built. and has clean wide streets. Here is a cathedral built in 1199 , which is 410 feet long by $92 \%$ wide. The town is connected by a canal with the sea, which is? miles distant. It was formerly the capital of the kingdom of Snssex. Chichester district sends a member to Parliament. Pop. (1891) 7.842.

Chickadee [a name derived from its note]: the popular name st the black cap titmouse (Parus atricapillus) and other American passerine birds of the same geons and of

nearly relited genera. The eommon chickadee is frequent all the year round throughout a great part of Eastern North America. and is one of the bravest and most cheerful of winter birds. It shares with several others the name snowbird, and its familiar cry and sprightly manners render it a great favorite with children. It nests in a linllow tree, and teeds on insects in their season and on secds in winter.

Clockalnom'iny : a river in the cast part of Virginia; rises abuut $\geqslant 0$ miles $N$. W. of Riehmond; tlows southeastward, amd after a course of abont Tomiles conters the James river. It forms the bommary hetween Ilenrico and Clarles (iity Comntis on the riwht, and Hamover. New Kent, and James c'ity on the left. The margins of the Chickahominy were the theator of the operations of Gen. Ma (lellinn oper ating ugainst Kichmond during May and Junc, 186\%. In cluse proximity to this river oecurred the battles of Seven Pines and Vair Oaks, May 31-June 1, 1862 : Mechaniesville, June 26; Gaines's Mill, June 27; Silvge's Station, June 29;

(Chieti ocempres the site of the ancient Teate a large and important city. the remains of which are still ri-itle. Among these are the ruins of a theater and several temples. Por, 20.43.
(Chiguecto (-liis-nek tō) Bay: an inlet in lbritich North America: is the notherm part of the Bay of Fundy, and extends between New Brunswick and Nova Seotia. It is atout 30 miles long.
Cligoe, chig $\overline{0}$, or Jigger: a small species of flea (Sarcopsyllu pentrans) occurring in tropical and semitropical America. In length it is but a tweuty-fifth of an inch. It lives a free life. especially in the sand. The fertilized femaale bores into the skin of the foot of man and of other animals. At first there is but a slight irritation and scarceIy noticeable itching, but soon the eggs begin to grow and these distend the ablumen of the mother to the size of a pea. As a result, inflammation and ulceration follows, which should be attended to at once, for if the roung jiggers he set free from the parent they can continue the trouble and death has resulted from neglect. They are usually extracted with the knife, hat care must be taken to remove all the egys. Iu the sonthern states the term jigger and chigue are often given to certain of the Ticks ( $q .8$. .) which attack man and other animals, but which belong to another zuölogical group.
J. S. Һ.
(hi- (or shi-) Hwang-Ti (i. e. First August Ruler): a ruler of China, who at the age of thirteen snceeeded his father, Prinee Chwang Siang. 246 B.c., and who, having completed the suljugation of the femdatory kingdoms of the Chow Dynasty. begun by his ancestors of the house of Ts'in, proclaimed himself First Universul Fmpror ( 221 b. c.). He divided his empire into thirtr-six provinees, and displaved great albility in consolifating it. constructing roads and canals and many fine public buildings. Among other things he drove out the Hiung Xî. or Huns, and other northern bartharians who threatened to overrun his empire. and built the great wall to prevent their return. (See Great Wall of (hiva.) His nane and memory, however, have for ever been remdered infamons by his destruction hy fire of all the records of the past. and of all writinge excep, those on medicine divination, and hnslandry. in order, firs. that he might arpear to succeeding ages as the first great emperor. and, second, that he might not be confromted by the hiterati with the ethical teachings of such philusiphers as Confucius and Mencins in carrying ont his ambitions schemes and despotic measures. Nearly 500 of the literati were also put to death. (Siee Chisese Literatcre.) In the twent y-cighth year of his reign he male a grand progress throngh bis dominions. risiting all the fameus mountains in the kingdon. Arrivel at the shore of the Eastern Sea the promontory of Shanting), he with great pomp and ceremony oftered solemn sarifices to the Lords of 17 eaven and Earth, of the lis and Yaxg ( $\%, \%$ ), the smm, mon, the fonr seasons. ote. The name of (lii-H wang-Ti is aliso intimately associated with the vagaries and superstitions of the Taoists s.ive Taosma, and espectially with the search tor the elixir of immortality. He dien in $\geqslant 10$ B. C., amd was succeeded lis his sim, a weakling, who reigned for seven rears, when the Ts in dymasty came to an emal.

silver dullars: imports for the same year were valued at
 tion, of which feti belonged to the state, and dr.f6is miles of telegraph lines, of whinh abont 6.900 belonged to the state.

Religion. - The oflicial religion of the state is laman Catholic but the public worship of other denominations is profected by the constitution. There are, however, but very few l'rotestant rongregations. The estates of the church were seized hy the fovernment at the time of the rewht and separation from spain. The president invests with their temporalitios the bishops, and the state pays atl ecclesiastics, but the salaries of the curates are small.

For the literature of Chile, see Spanish-Anericas Literature.

Government.-The constitution of the republic was framed. with cerlain important variations, on the model of the constitation of the L. S. The executive power is vested in a presilent. who is elected for fire years by electors chosen by popmlar vot,: is not eligible for re-election for the term immediately following : and is liable to impeachment for a rear atter the emd of his term, during which time he can not leave the country withont permission. He is assisted by a cabinet of six ministers, who are in charge of the seven idepartments of govermment. The president also is advised and held in cheek by a council of state of eleven members. five of whom are nominated hy him, and six by Congress. The legislature consists of a Senate and a Chamber of Deputies, the former of whom are elected for six years, the hatter for three. The senators, one for each three deputies, are chosen by direet vote of the people. The depnties, one for earh 30,000 or fraction in excess of 15.000 of the population, are also chosen by popular rote. In Jan., 18m, the total debt of the country, external and internal. issued and anthorized, inchuling the amount of praper money, was $\$ 124,667.512$ in silver. History. Northern Chile to lat. $37^{\circ}$ was a part of the dominions of the Thcers of Peru. The Spaniards under Almagro invaled it in 153.5. but soon returned to leru. The finat conquest was commencel by Valdivia in 1.541 and by 1550 was complete to lat. $30^{\circ}$ : - of that the Arancanians kept up the struggle for two centuries and were never entirely subducd. In 1810 Chile in common with many other Spanish provinces, rerolted against Spain: defeated at first. the rerolutionists finally sncceeded with the aid of Gen. San Martin, who marchel wer the Andes from Buenos Ayres. The independence of Chile was formally proclaimer on Tan. 1, 1818, although the last stronghoh of the Spaniards was not taken until 1820 . The constitution which had been adopted in 1824 was remoleled in 1805 in 1833 , and a few subsequent amemdments have been male. The country was reorganized by law in $1 \mathbf{5} \boldsymbol{5}$. In 1844 the independence of Chile was forinally recognized by treaty with the mother combtry. Botweon $1 \times 51$ and 1865 , during the presidency of Manuel Xont, the country was greatly adyanced in agriculture, mining amb commeree. In 1865 Chile and Peru were engaged in a war with shain, which continned with many vicisisitudes matil 1869 , when the dispute was ended throngh the mediation of the Goremment of the $\bar{L}$. $S$. After a successful war with Pron and Bolivia, extending over a periol of three years (1879-8:3), the northern frontier of Chile was alvanterl from 24 ' to 16 - 30

The turbulent condition of the country between 1886 and 1892 is of peculiar inturnt hecause of the dithentios in which the [.S. Government was involvet. The social organization of the country was fembal in its character, and it is not singular, therofore that for many years atter the gdoption if the republiem form of govemment it was strunarly consertative. The owners of the soil and the mines. offen descendants of the spanish conguerors const ituted an oligarchy which foum it not dithenat to control political affairs. As time passel on, howerer, molern ideas and liberal riaws came to be entertained. The clash hetween these itwas and those of the ohd comser wative party led to rewolutionary onthreaks, which embed (in 18:1) in the triumpli of liberaism and the atoption of some important anmentments to the econslitution. Is time pasitel on the spixit of inodern liberatism became mote and more prevalent. The conservative party fimally withlow from wetoral conteso and contented itself with exerosing simply a rat ratuing infuence. Is the liberal party grow in pwer it experifnees the common falt of heing split inte factimes and divided by atragghes for leatership ant office. The fresident has generally been connullal to ant in harmony with the majority in Congress, for the beatent that the mombers of his rahinet have been representatisen of the dominimt choment in

Congrens. and have been dismiwet whenever a vote of censure has lueen passed. With this limitation the power of the Chilian president is very great, embracing as it does the gempral civil service and all local officiats, excepting those of the cities, and all appointments in the army and navy as well as the telegraph and railroat service. Through the exercise of this power the president has uniformly been able to control the choice of his successor.

It the beginning of the recent revolution the most radical section of the liheral party bad its nucleus in a reform club in samt ingo, which was composed for the most part of young men of university elucation, of whom lialmaceda (q. r.) was the most conspichons. Haring entered Congress in 1868 he had risen to great distinction as a congressional leader and debater. As one of the foumders of the liberal party that had demanded iniportant changes in the constitution, he acquired great popularity and strength, and a little later alded to his reputation by his service as minister to the Argentine Republic during the Peruwian war. In 188.5 his popularity carried him into the presideney hy an overwhehming majority. The early part of his adininistration was characterized by great liberality and sucess. He camsed to be adupted a thorough system of popular educatim, the complete separation of church and state a system of normal schools, and extensire sehonl-honses. He secularized the cemeteries, cansed a civil marriage law to be adopted, and banished sectarian teaching from the schools and colleges. He also entered upon an clathrate sratem of intermal improvements, buikling railroads, const ructing harbors, proviting dre-docks, wharves, and piers. This remarkable prosperity, however, was but the antecedent of great dissension anit disorder. A part of the liberal members, thinking the president ras griug too far, united with the old conservative leaders, and the new union sneceded in orerthrowing his cabinet in 1888. Congress was sonn broken up into five separate facions. What were thought to be the arbitrary characteristics of the president led to hostility and revolt. A war ensued. The president issned a manifesto rintually assuming a dictatorship, athough disclaiming to be a dictator, and defending his acts on constitutional grounds. Before many months the contest tonk the torm of a war between lsalmaceda on the one hand, and the representatives of Congress, known as the Junti, on the other. Balmaceda, after nomerous engagements. Wis overwhelmed with defeat. Attempling to escape from santiago. he remained for a time concealed in the Argentine legation. where. in a fit of desperation on Dec. 19, 1s91, he took his life with his own hand.

During the whole of this struggle the partisans of the Junta were hostile to the Government of the U. S.. believing that Patrick Egan, their minister, hal conducted himself in a manner unfriendly to their cause. It was claimed that Egan's dispatches to his Government had belittled the importance of the rebellion. and had magnified Bahmaceda's strength. Exception was also taken to the fact that the U. S. minister hat atforded an asylum in the legation to fugitives from Bahacela's army: While this state of ferling was active two boats" crews from the U.S. warvessel Baltimore, while on shore, got into an altercation in a Irinking-saloon with some Chilian sailors. The testimony subsequently taken proved that siliors from the Baltimore knocked down one of the Chilians, wherenpon knives and other weapons were drawn, and finally the affair grew into a rict. The difficulty was not limited to the salom lut was taken into the street. and several T . S . sailors receivend dangerou* wonmes. Nimister Egan at once reported the indignity to the (iowernment at Wishington. The attack on sailors wearing the uniform of the D. S. was regarded in Washington an a national insult, and retress wal firmly but courteously demanderl. The provisional authorities in Chile not only refused satisfaction, but also to grant safe combuct to the men who had been assimulten), and demantied their surrendar on the gromm that they were criminals, The Gorcrument of the $\mathrm{L}^{\circ}$. S. in reply took vigorous measures by sending the Fotktown ant howton the Chile to lack up the denamil for satisfoction. The reply of the Chilian Government hat been conchad in language so offensive that no answer was retumet. on the apparance of the men-ofwar, however, President Mont1, who had now heen imflucted into oflice, directed the Minister of Foreign Abairs to withdraw the minsive mote, and to tember apologies, white compensation was made to the injured men anid the familice of the killetl. 'Thas the demands of the U. S. were satisficolority complied wilh.

## Chilula Indians: See IVEmsperan Indmas.

Chimara, ki-mee ra (in Gr. Xípaıa): a monster of classic mythologs, having the fore part that of a lion, the middle lhat of a goat, and the himd part that of a dragon. It was supposed to exhale flames of fire, In Jesiod's account Chimara was a danghter of 'l'yphaon and Echiclna, and wasted Lycia until Bellerojhon slew her. In modern lanortages the term chimera is applied to any wild or ineongroous fancy

Chimarida: the sole family of the order Molocephali, a group of cartilaginons marine fishes related to the sharks and rays. The ehimmas have a naked body whieh tapers gradually into tho long, filamentous tail. There are two

torsal fins, the first high. pointed, and armed with a spine; the secomi lone and low : anal variable; pectorals large. There are four cutting teeth in cach jaw. The males are provided with "claspers" and the heard lears a pointed, erectilo appendage which fits into a groove when depressed. "The cogrs hase a homy case. 'The spectes of the family are frw anill found in deep water. "Ilue lost known is Chimerere monsfrowe of liuropean sas. (: affizis is fomand on the east -
 mus C'ullorlymslous has the nose torminated liy a cartilagimous pronimenore embing in athy.
F. A. I.

Chimaknan Imdians: a linguistie family represented by twos small tribus the chimaknm and the Guilente. The original territory of the former, or astern, division embraced

Port Townsend. Port Ladlow. and Port Gamble. on Puget Sound. Windington. While probably never a large tribe, the Chimakmm were noted among their neighbors the Clallam, Makam, and others. for their mosually warlike habits, which seemed early to have diminished their numbers. In 185:3 they mumbered ninety sonls: in 1884 abont twentyfour surviver-fonm on the skokomish reservation and the remainder ne:n Port Townsent.

The Quileute, or western, division of the family inhabited the bauks of the Quilente river and the vacoast above and below. between the Makan on the $\Sigma$. and their kindred, the Hoh, on thes. The Quilente aplear to be the remmant of a more jowerfol body, and the isolation and position of this and the (lhimakum division suggest that the Chimakuan fimmily once occupied the coast of Puget sound and Straits of F'uca from Port Townsend to the Quileute country. The Dakan ant Clahlam. of the Wakashan and Salishan families respectively, who have held this area since historic times, appear to he intruler from Vancouver island, and it seems by no means improbable that the tribes they clispossessed were Chmaknan. There is traditionary evidence that the Chimakum came from the Quileute. 'Jhis latter tribe also owes its diminution in number to a phgnacions temency toward the neighboring amel more populous salishan tribes. In 1801 there were 245 living on the Pacific coast S . of C'ape Flattery: The Joh, a sulb-tribe of the Quileute, are under the Pbyalhup agency, and number about serenty.

Climalpownea: the thind warechiof or so-cal]ed "Emperor" of the Aztecs of 3exico: rulerl from $141 \%$ to 1428. according to some chonologies, but alcombing to others from 1410 to $14 \geqslant 2$. Ihe wis clected by the chiefs to succeed his brother, Initzilihuitl, Maxtla having usurped the chieftainship of the Tepanecs. Thmalpopoca tried to aid the legitimate ruler: Daxtha seized and imprisoned him, and he lung himall in the "age in which he was confined. Jincal descendants of Chimalponmea are still liviner in Nexicu.
H. II.s.

Chimaltenan'go: the name of a rlepartment and citr of Gratemala. The department lies on the northern slope of the main Siema in abont the middle of the state; is well watered and fertile : gold is foumd in the streans. The inhabitantsare Christianized Indians. devoted to the rearing of eattle and cultivation of soil. - Irea. 800 sq . milps. Pop. 57,000 . 'I'he town is in the delartment. 85 miles $\mathbb{W}$. of the city of Guatemala (see map of ('entral America, ref. 4-D). It has a considerable trulte. Pop. 14,000.

Chimarikan Indiaus: a linguistie family comprising the Chimariko and Chimáhkwe tribes formerly of Trinity co., ('al., the former inhabiting Trinty river from Burnt Ranch nowthward to the junction of the north and south forks, the latter residing on New river. a tributary of the 'Trinity.

Of the general characteristics of these two tribes very litthe is known. From the friendly Wintu tribes, their eastern and southem neighbors. they horrowed their mortuary customs and in part their medical practices. In lieu of tobaceo ther smokel the mistletoe. Their hunters were aceustomed to smear their bows and arrows with " medicine " to prevent the deer from detecting the hmman orlor.

By an early pioneer it is stated that the Chimarikan IndBans were orice as numerons as the Пupan. an Athapasean tribe aljoining them on the W. and s. Wr.. who, throngh constant argression particularly towati the Chimalakwe, from whom they exacted an ammal tribute finally succeerled in owerpowering the latter and in comuselting them to adopt unch of the Ilupat tongue. Thas it was that about 18.50 the ( 'himálakwe mmberod but two families, aggregating twentytive frisons. Who spoke the if own linguare.
Shlmon hal formed the charfatiole of subsistenee of the two thimarikan tribesup to the adrent of the whites into their territory, when the pollation of the streame from mining oprontonis rendered the fisheries of the ladians uncless, and comtimmed warfare masumb. In 18:6 but half a dozen ('himariko survived; a yar hefore omly three members of the ('himalakwe wero known to exist. In 1889. in llupâ rabley, a chimariko man, swonty on more years of agre. Was finmit, who wate then believid tolx (1) of two survirors of the tribe.

 dsia, which, exeluling itsifephutometes, his an area of nearly $1,300,000$ sq. miles, amd externels through twenty-tive degrees of $\mathrm{E} . \operatorname{lon}$. 98 to 123 ) and about twantrothree blogrees of $\mathcal{N}$. lat. $\left(18^{\circ} \mathrm{W}^{\prime}, 1041^{\circ}\right)$. It is lmmerlel on the $\mathcal{N}$. hy Mungolia,

which are known as the Gulfs of Liao-tung and Peh-Chih-li, the Ilwang-1Iai, or Yellow Sea, the Thong-llai, or Eastern Sea, and the China Sea: on the S. by the Nan-llai, or Southeru Sea, and by Tong-king (Tonquín) and Bumma: and on the W. by 'Tibet and Fistern Turkestan.

Name.-The name Clima is entirely unknown to the people of the country. It is mohably derived from Tisin. the name or the most powerful of the fendal states of ancient China. which finally became paramount. overturned the dynasty of Chow ( 1121 to 244 B. C.) and established under C'nI-HwaxG-Ti ( $q$. va) the short-lived dynasty of 'Ts'in, about $25.5 \mathrm{~B} . \mathrm{C}$. As Ts'in guarded the northwest part of the empire. occupying most of the present province of shensi and the regions beyond, it would naturally be the one with which travelers trom ll estern and Central Xsia wonld become first and best acquainted. From this arose perhaps the many variations of the name which we fiml applied in ancient times to this region, e. s. Sin (the Since of Ptolemy and the Simim of the Bible being the people of $\operatorname{Sin}$ ), Chin, Thin, Tsin-is-tan (the -tan or country of the Ts*in), and lastly ('hin-a or Chin-tan (compare -tan in Taluchistan. Afghanistan. Hindustam. etc.). the forms most commonly nsed by Chinese Buldhist writers. Among the Chinese themselves the eountry is must commonly known as Chung-huoh, or " Niddle Kingutom," a mame which takes us back to the feudal times of the Chow drnasty, when the imperial Jomain was called the "Central Kingrdom or State," as distinguished from the surrounding fendal kingdoms and the territories of the outlying "barbarians." Nany other names are in use among the people, such as T'ien Choo or "C'elential Dynasty" (from which probably comes our plurase "Celestial Empire"), in allusion perhaps to the claim of each succeeding dynasty that it has been commissioned by Hearen to rule. The name of the reigning dynasty is also minch used, generally preceded by Ta- rreat. as Tí Ming IVwoh, the "Great lllustrious Kingloun," from Ming." illustrions," the drnasty which began in 1368 and lasted until $164 \%$, when the present Ta Ts"ing or Great "Pure" Dymasty "recuived the appointment of Heaven "and displaced it, and China became Tr Jsing Finoh. the "Great Pure Country." In ancient elassical writings we also find mention of Serica (Serice in Ptolemy), the land of the Seres, and it is now well understood that the reference is to Chima is the land of the silkworm and of silk, from the Chinese word sze, for "silk as it comes from the coeoons."

In the Mildie Ages the country was most commonly known as Cathar, a corruption of Khitai, the Persian form of $K 7 i t-$ an. the name of a Tiatar tribe which first comes into notice in the fifth century of om era, and which was in possession of Forthem ("hina during the tenth and eleventh centuries. Mareo Polosineaks of China as Khitai. and by that name the conntry is still known among the linssians. Fee Catilay.
Prysical Fenteres. - China may ve deseribed as a series of basins sloping eastward to the Pacific from the great mountain masses of Central Asia which bound it on the W. and which extenl as far F. as the $112 t h$ or 113 th meridian. East of that line the country may be roughly divided into two parts: (1) a lilly region $\therefore$ of the Jang-tse, and (2) a great plain stretehing northward from the latitude of llanechow Bay some distance $S$. of the Yang-tas, almost to the latitude of Prking. where it mects the foot-hills of the eastern extensions and outliers of the great monntain-chains of the northwestern provinces.

Mountains. - In the mountainous helt of provinces which lies $W$. of the $110 t h$ meridian we find two distinct systems -the Kwйn-lŭn and the Ilimulayan. The former consists (1) of several nearly parallel ridges of groat height, reaching far above the sum-line at some points, which break off from the Kulknn or Kwn̆-lйn bange N. of Tibet, and take a gencrallys. E . or ふ. ふ. E. direction thronch Sze-chuen and part of llupeh, separating the Ya-lumg. the llin. the Kialing, and other considerable afluents of the Great River from one amother and from the Kin-sha-kiang or uppermost courses of the Ying-tse after it chters China proper. (2) In eastern extension of the $К$ wh̆n-hŭn chain, in f wo parallel ringes of 6,000 to 8,000 lect, theourh Kiansuh. Shens, and Shansi into Honan. These are known as the Tring-ling (or "Azure Nommains") and the Ft̂-nim Shan, amd divide the Wei and other tributarios of the Yollow river from the llan amy its aflluchts, which join the Vang-tse at Ilankow. (:3) 'The Pa-lins, or Kin-tiao (or" Nine Branch Mountains"): lhrown off by the Siush-ling, with a S. H. trentl, and forming the watersherl betwern the LIan and the Kixtling. which
 peak of this range are not as lofty ath thome of the Tsing-

 －tudion of kingranill，Pampelly．and bon lichanten．Conl，
both bituminous and anthracite，is foum in almost every province．most of it in prosimity to iron，and all readily ac－ cessible．The province of Honan alone has $21,000 \mathrm{st}$ ．miles of anthracite．declared by ron Richthoten to compare fit vorably with the best anywhere．The tutal coal area of the conntry has bepn estimated at $419,000 \mathrm{sq}$ ．miles．［＇ntil recent times this coal has never been worked to any depth or to any extent by the Chinese．（1）because it was illegal． all minetuls being claimet by the emperor：（2）because of the Fung－shui superstition isee Fux－shetr），which depre－ cates all tampering with the earth．lest the equilibrium of the elements be disturled and calamity result：and（3）be－ canse of the lack of engincering skill，and such．Western a！ pliances as the pmop（an thing unknown in China），which are essential in deep mining．since the establishment of native－ owned steamship，lines，howerer，a supply of steam－coal has become necessary，and now mining is in active operation under Government anspices and foreign superintendence， both in Chih－li（about 50 miles from Peking）and in North－ ern Formosil．Gold，silyer，leal，and tin are also abmolint． and Iuman has long heen known for its rich supplies of copper．Petrolemm and natural gas are found in sze－chuen， the gat being utilized to some extent in the great salt－mak－ ing industry for which that province is noted．

Loess．－This remarkable tormation，called＂lake luan＂ by Pumpelly and terrace deposit by some covers the prov－ inces of Chilh－li（except the alluvial part），Shansi，shensi N of the Tsing－ling range，Kinsu．and Xorthern Ilonan． and siretches east ward into Liao－tumg．It also covers large portions of shantumg and southern Honan，and big patches of it are found in the neighhorhood of the Tung－ting tanl Poyang Lakes：It is a hrownish－yellow，unstratifiefl，friable earth，with a highly porms tulular structure and a tendeney to vertical cleavage．which has a most marked effect on the scenery．The depth varies from a few inches to a thousand feet or more，and it is found at all altitudes，rounding the hillsides and filling the valleys．It is exceelingly fertile． but owing to its rery porous nature it demands a rainlali that would be excessive disewhere．It is in this region that the famines of Chim occur，in seasons when the rain is ton scant to fill the tubes and pores of the loess to bring up to the growing grain the chemical substances it needs．
Geologisis are not agreed as to the mode of the orimin of this peculiar formation．J＇umpelly and others hold that it is a marine or lacnstrine depersit．while Baron ron lifchthofen clams that it is of＂sulmeerial＂origin－that is，that it was carried by the wind from some region farther west ant de－ posited in its present pwition．In proof of this he points to the filet that it is full of forsil land－shells．and contains bones of land cfualrupeds．but no remains of either marine or fresh－water shells．sen Loess．
Prodects．－asrienture is the chief imdustry，and the most honorable．Erery arre of cultivable lam is cultivaterl with care；even the hillsites are teraced and thmed to ac－ count．The primeipal cereal in the sontherm．central，ant restern provinces is rice，which grows in standing water． In the north，owing chicfly to the porous nature of the soil． rice is not much grown．Ilere wheat，barley，millet，and maize are the chiof cercals．I＇nlse is also extensively grown． as well us tobacco，cotton，hemp，op，imm，and sugar－cone． Tea is grown on the hillsides（not in Gardens），expecially in the south．center，and west．The chief tea－exporting ports are Fuh－chow．IIankow，Amoy，and C＇anton．The tea of For－ mosa resembles that of Jitpan，but is superior in quality． （Ser Tea．）silk lonth for domestic use and for export is also produced extansively．Linong other products are cotton， （amphor，vogrdable or insect wax（see Pen－La），and mali－ （ines．Fruits of many kinls，including yrapes，preaches． apricots，pranges，lompits．knmpuats，lichees．primmons． ete，are grown．The native cottom is woven into a wry substantial harrow－wilth falmic on the hand looms of the comber：
（＇Lniste．－In a region sn large as China there must matu－ rally be much diversity of climate．In general is may lie said that it membles fant of the $L^{\circ}, S$ in its range of tem－ ！wature，except that while in North China the temperature is higher in smmure and lower in winter than in the corre－ ＊ponding promsion of the U．So，there is less lamiclity．The raing seacon of North China lasts for atmot six werks and the dry season for the rest of the year．In the sombth the heat is greater．ant so is the humidity．In the morth the rivers are frown owe during winter，and all navigation ceases．In sor－dhen donse furs prevail all winter，and the sun is sill dom swen．

Politeal Devisioxs－The number of provinces has varied at different periors．During the lling dynasty（136s－164：） there were thirteen provinces．In the period K＇ang－hi－ that of the second emperor of the present dynasty－it was ent up into eighteen provinces，and ever since Shih－pah Sruy．or＂the cighteen provinces，＂has been a common col－ loquial name for the country．In 1886，shortly after the French ditlienlty，the island of Taiwan，called Formosa by foreigners，was detached from Fuh－kien，ansl made into as separate province．In 1895 it was cefled to Japan．

 wpestend by the treaty of INtol．

This tarade is chictly with Great Britain and her colonies， Japan，the L＇．s．and the continent of Europe coming next in the order here given．In 1891 the total foreign imports amounted to over $1: 34,000.000$ taels（cotwongoods， $53.2!10,200$ ： ориим，28．353．156；metals， $7,254.448$ ：woolens， $4.695,256$ ； and sundries， $40.329 .59!$ taels）．The exports for the sime year were valuet att $100 .!4 \%$ ： 49 taels，mostly tea amb silk．

Heans of Commumicution．－The country is unfenced，and tracks（they can not be called roads）run everywhere．In the plain．wagons form the chief means of converauce， thonglı pack－animals and whecibarrows are also used．In the hilly parts pack－animals and mule－litters are resorted to，while in the mountainons parts porters and sedan chairs are employed．In the central and southern provinces con－ nected by the lang－tse，the lakes，and the canals，the means of travel are eonveniont and cheap．though slow．A railway is in operation in Chih－li，from the conl mines at Kaíphine to Hokow on the Peh－tang，thence vit Taku to Tientsin；thence to Shan－hai－kwan，at the E．end of the Great Wall and a lit－ the berond．In 18 st a line from Shanghai to Woosung， 12 miles in lenerth，was begun by some foreigners，and operated along half that distance for nearly a year，when it was pur－ chased by the（Thinese authorities and torn up．A trunk line from Peking to Hankow has been sanctioned．Tele－ graphs now connect Peking with the princijal cities of the country und with foreign countries．

Money，Weights and Measures．－The only coin used is the Casn $\left(q, v_{0}\right)$ ．Payments of small smms are marle in cosh： payments of larger sums are usually made in silver by weight．The unit is the liang（called tael by foreigners）． which is equal to $1 \frac{1}{3}$ oz a a oirdupois．The tatl is divided into tenths called trien or mace，and these again into tenths， called fün or camdureen．Sixteeu liung，or ounces．make a hin，or pound（equal $1 \frac{1}{3} \mathrm{lb}$ ，avoir．），called catty by foreigners． One hundred kin make one picul，equal to $183 \frac{1}{3}$ lb．avoir． Ten tsun，or inches，make a foot，which according to treaty stipulation is equal to $14_{3}^{\mathrm{L}}$ English inches．A $l i$ ，or native mile．equals about one－third of in English mile．

Ifistory．－＇The Chinese claim for themsclves a hoary an－ tifuity，the more extravagint of their writers gonig back several millions of years to letn－Kî．the first man，who eliscled himself ont of chans．Others begin with a great chieftain named Foh－hi，2sis B．c．，the first of the＂Five Rulers．＂The Buok of Mistory．edited by Confucius，begins with Jao， $2 \cdot 3$ ，B．C．，who，howerer，appears with a well－ developed governmental system．He was succeeded by shmn， 2055 в．c．，and he in turn by Yu，who had labored so success－ fully in remadring the great flood of the time of Silo that he was chosen first as the associate and then as the successor of Shun．These three（with Whn Wang of the twelfth cen－ tury B．c．）are the＂ancient kings＂lamed by Confucius for their virtue．（Gee Confuclanism．）From Iu to Chi－
 $1766 \mathrm{~B} . \mathrm{c}$ ），Shans（ $1766-1122$ ），and Chow（ 1122 to 219 B ．с．）． From the abolition of the feudal system and the consoliola－ tion uf the empire umler Chi－IIwang－ti down to the present dynasty twenty－nne dymaties have ruled over the conntry， sometimes only in purt．The most illustrions of these are the llan（ 20213 ．（ 0 to 200 A ．D．），the T＇ang（ $618-90 \pi$ ），the Sung（ $1660-1280$ ），the Ynen or Mongol dynast y（ $1280-1368$ ）， and the Jling（1368－164：3）．The Ilan，the T＇ang．and the sung are the periouls of greatest literary activity．The rulers of the presont on Tu－Tsing dynasty are Manchus，but the rule China on Chnese lines of polity，and bave practi－ cally lost their own nationality．The only really distinctive custom which the Manchus hive compelibed the（＇hinese to urloget is the wearing of the quene，or＂pigtail＂：and of the 14t oflicials who now form the supreme government of the （4mpire only ：e aro Manchus．

Oriminally calletl in to assist in suppressing the internal trubles which threatenal the overthrow of the Miner dy－ masty，they refused to witheraw when the whiect ol thar mission hatl been acommplisherl，but proceeded to eromper the conntry for themselves．In 1843 they prochamad the namble son of their own raler＇rien－ming ats the firnt em－ peror of the＇Fa－tsing dynasty，the mane whomen for lis roign－periond being Stueni－chi．ln the following period． kianchi，the monpire was fully connolidated．antl an era of areat prosprety as well a＊of litwry activity inangu－ rated．Tha ninth emberor of this dynasty now reigns．his reign－periml bring ealled Fimang－sin．Ile came to the throne in ドー．The grait events ut this dynast have been the open－ ing of the conntry to forcish tride，resilence，and fracel， the introuluction of stom mathinery，stembobats，railways．
and telerraphes，the establishment of diplonatic relations with 11 estern nations，and the protection accorded to those who profess，as well as to those who teacli，Christianity．

In connection with liorean internal tronbles in 1894 ， China became involved in a war with Japan，which resulted in the loss of most of her fleet，of the island of Fommosa（q．$x^{\prime}$ ）， ankl．for a time at least，of the seabotid of Liao－tung，and the great fortified ports of Port Arthir and Wei－hai－rivi（qq．c：）， besides the payment of a large money intemmity．（See Korka．）In 1 sig Gemany seized part ol Shastusg（q．v．）．
