Certificate of Authenticity

I, who occupy the post of Acting Chief of Prisoners of War Information Office, hereby certify that the document hereto attached and entitled "Excerpt from TOKYO P.O.W. Camp monthly reports, May issue, 1943" is an exact excerpt from a document in the custody of this office.

On this 11th day of June, 1947

NAKANISHI, Sadaki (seal)

Excerpt from TOKYO P.O.W. Camp Monthly report
May issue, 1943

Through general examinations for bacterial infections given since January this year at the Army Medical College for the prisoners of War (Confined at this camp, and at the first, second, and fifth branch camps) it was found that 133 prisoners had dysentery amcebas, (7.9 per cent), 2 prisoners had dysentery germs (0.09 per cent), one prisoner had paratyphoide-B germs (0.04 per cent), 57 prisoners had diphtheria germs (2.4 per cent) and 77 prisoners had malaria germs (3.3 per cent).

In consequence, the prisoners with such disease germs were immediately isolated in each branch camp, and strict preventive measures were taken. At the same time, every effort is being exerted in treating the prisoners and checking the spread of diseases. However, the isolation of the prisoners with disease germs in every separate branch camp can not sufficiently be carried out due to the fact that it will add extra duties to the medical officers and that the building and repairing facilities within the camps and the disease preventive equipment are inadequate.

Consequently in order to successfully carry out the preventive measures, it was decided best to assemble and isolate all the prisoners who have disease germs in one place.

A report to this effect has been made to the authority and the preparation to establish attached wards has already begun.
